to and under the East river to North Jane street, Long Island City, where it will connect with the new elevated lines in the borough of Queens. On the Manhattan side the new line will connect with the Broadway, Seventh avenue and Fifty-ninth street line. The new route is made necessary by the substitution of the river tunnel for the use of the Queensboro bridge, as at first proposed by the commission.

NORTH CAROLINA ROADS.—Residents of Louisburg, N. C., are said to be interested in a project to build a railroad from Louisburg southeast to a connection with the Atlantic Coast Line, probably at Rocky Mount, about 35 miles. Under the name of the Louisburg & Rocky Mount a company was organized last year to build a line between these two places. J. A. Turner, Louisburg, may be addressed.

OCMULGEE VALLEY.—This company, which is building a line from Lumber City, Ga., southwest to Jacksonville, about 20 miles, it is said, will open for freight service in October the first section of 14 miles from Lumber City in Telfair County. J. C. Work, chief engineer, Lumber City. (April 30, p. 955.)

OGDEN, LOGAN & IDAHO (ELECTRIC).—The Wellsville-Brigham City link of this road has been completed and operation was begun over the whole system on October 14. The road is 95 miles long and connects Huntsville, Ogden, Brigham City, Wellsville and Logan, Utah, and Preston, Idaho. The company was organized in the summer of 1914, when it took over the properties of the Ogden Rapid Transit and the Logan Rapid Transit companies and let a contract to the Utah Construction Company to unite and extend the lines. The Wellsville-Brigham City link was the last and most difficult part of the line to be constructed. The maximum grade is 2 per cent and the maximum curve 10 per cent. Concrete under-grade crossings were built near Merrills, Utah, where the line passes under the Oregon Short Line, and near Millville, Utah, and Summit, where it passes under highways.

PACIFIC ELECTRIC.—This road has awarded a contract to Robert Sherer & Co., Pacific Electric Building, Los Angeles, Cal., for grading the roadbed for a line between Hawthorne and Ionia avenues, Los Angeles, on the Redondo via Watts line. The cost is estimated at \$20,000. The Los Angeles city council has granted this road a franchise to build a single track railway on portions of Figueroa street, Denver avenue, Hoover street, Menlo avenue and Vermont avenue.

PASCAGOULA-MOSS POINT NORTHERN.—See Alabama & Mississippi.

PEARL & KAMPSVILLE.—J. E. Melick, 333 South Douglas avenue, Springfield, Ill., and associates have completed a survey for a railway between Pearl, Ill., and Kampsville, a distance of 11 miles. Grading has been begun. The road will connect with the Chicago & Alton at Pearl, and may be extended later to Hamburg, Ill.

PHILADELPHIA ROADS.—The McClintic-Marshall Company, Philadelphia, Pa., has been given the contract for the fabrication and erection of the steel superstructure on three sections of the Frankford elevated line in Philadelphia, extending from Girard avenue north to Unity street, Frankford. This company was the lowest bidder and offered to do the work for \$1,455,000. The same company also submitted the lowest bid at \$249,000 and an alternate bid of \$261,400, for the fourth section, from Girard avenue south to Callowhill street.

POTTSVILLE & ST. CLAIR (ELECTRIC).—Incorporated in Pennsylvania with \$13,200 capital, it is said, to build a three-mile electric line from Pottsville, Pa., north to St. Clair. W. B. Rockwell and I. G. Walborn, Pottsville, are incorporators.

SAN FRANCISCO, CAL., ROADS.—The board of public works will receive bids on the construction of a railway from Rosasco into the Hetch Hetchy valley until November 10. The line will be about 60 miles long and will be used in connection with the building of the city's water supply project.

SAN PEDRO, LOS ANGELES & SALT LAKE.—The Delta branch, which leaves the main line 133 miles from Salt Lake City and 650 miles from Los Angeles, and runs 13.3 miles northwesterly from Delta to Sugarville and Lucerne, Millard county, Utah, has been completed. The grading was done by the Delta Land & Water Company, which is developing this section under the Carey act. The maximum curvature is 6 per cent and the maxi-

mum grade is one-half of 1 per cent. Only one bridge of any size was built, an 18-ft. span constructed of piling and supporting the tracks 17 ft. above high water in the Deseret reservoir. Fifty thousand ft. B.M. of timber and 2,800 lb. of wrought and cast iron were used in this structure. The new line was ready for traffic October 1. (June 5, 1914, p. 1257.)

TEXAS ROADS.—At a meeting of farmers of the Pecos Valley region held recently at Buena Vista, Tex., preliminary steps were taken for the construction of a railroad from Girvin, Tex., or some point on the Kansas City, Mexico & Orient northwest to a connection with the Texas & Pacific either at Pecos or Barstow, about 80 miles. Vernon L. Sullivan, Fort Stockton, is chairman of a committee to promote the construction of such a line.

WESTERN MARYLAND.—This company is making surveys from a point on the Baltimore & Ohio near Hutchinson, W. Va., west to Wyatt, about eight miles, for a line to be built to develop coal fields. A charter will be obtained after definite location is made.

WHITE PINE MINING COMPANY.—This company has let a contract to the Smith-Byers-Sparks Company for two miles of spur track from the mine to the Chicago, Milwaukee & St. Paul.

RAILWAY STRUCTURES

BRANTFORD, ONT.—An officer of the Lake Erie & Northern writes that the location selected for the new station to be built by the Lake Erie & Northern in Brantford will probably be changed. The style of building has not yet been definitely decided upon.

BROOKLYN, N. Y.—The date for receiving bids for the construction of station finish work on the New Utrecht avenue elevated line, in the borough of Brooklyn, has been postponed from October 26 to November 5, 1915, by the New York Public Service Commission, First district.

BUFFALO, N. Y.—The Lehigh Valley has given a contract to the Eastern Concrete Steel Company, Buffalo, N. Y., for erecting a Bush type passenger train shed on Scott street, east of Washington street, and a contract to the American Bridge Company for fabricating the steel for the train shed, calling for 1,250 tons. The new structure will be 182½ ft. by 842 ft., and is part of the improvements being carried out in connection with the new terminal now under construction at Buffalo.

CLEVELAND, OHIO.—The city board of control has awarded contracts for grade crossing elimination at Union avenue as follows: To the Robert Grace Contracting Company, Pittsburgh, Pa., for the foundation approaches, at \$103,373; to the King Bridge Company, Cleveland, Ohio, for the steel superstructure at \$34,892.

CRESSON, PA.—An officer of the Pennsylvania Railroad writes regarding the report that a new bridge would be built at Cresson to replace the present structure that this work consisted of renewing the old girders spanning the main line tracks carrying the Cresson division tracks overhead. The new girders are of heavier section to provide for heavier equipment.

EAST ST. LOUIS, ILL.—The Wiggins Ferry Company will soon begin the construction of a modern river coal tippie at the foot of Trendley avenue.

LIMA, OHIO.—The Cincinnati, Hamilton & Dayton has commenced the construction of a power plant which will cost about \$25,000.

MIDDLETOWN, OHIO.—The Cincinnati, Hamilton & Dayton will begin immediately the construction of passenger stations at Middletown, Ohio, and at Miamisburg, to cost approximately \$7,000 each.

NASHVILLE, TENN.—The Nashville, Chattanooga & St. Louis is building a frame shed 50 ft. high and 116 ft. by 400 ft. to cost about \$12,000. The work is being carried out by the railroad company with its own forces.

WASHINGTON C. II., OHIO.—The Cullen & Vaughn Company, of Hamilton, Ohio, has been awarded a contract for a passenger station by the Baltimore & Ohio.

Railway Financial News

ARTESIAN BELT RAILWAY.—A press despatch from San Antonio, Tex., says that J. O. Terrell has been discharged as receiver of the Artesian Belt by the court of appeals.

DENVER & RIO GRANDE.—Benjamin Nicol and D. H. Taylor have been elected directors, succeeding J. F. Vaile and S. F. Pryor, resigned.

LOUISVILLE, HENDERSON & ST. LOUIS.—This company, controlled by the Louisville & Nashville, has made a mortgage to secure \$5,000,000 first mortgage 5 per cent consolidated bonds, of which \$2,500,000 will be reserved to retire the present issue of first mortgage bonds and \$700,000 will be issued to pay off floating debt.

MAINE CENTRAL.—Stockholders have approved of the retirement of \$10,000,000 outstanding stock of the Maine Central owned by the Maine Central Railways, and the issuance in place thereof of \$7,000,000 5 per cent first mortgage 25-year bonds and \$3,000,000 non-voting 5 per cent preferred stock.

NEW ORLEANS, MOBILE & CHICAGO.—The federal court has confirmed the sale of this property to the bondholders' protective committee. This committee represents all but \$561,300 of the outstanding \$13,613,200 bonds.

NEW YORK, NEW HAVEN & HARTFORD.—H. K. McHarg and Frederick F. Brewster have resigned as directors. See comments on this company's annual report elsewhere in this issue.

SALT LAKE TERMINAL COMPANY.—The International Trust Company, Denver, Col., is offering \$250,000 first mortgage 6 per cent bonds of June 1, 1915-1935, of the Salt Lake Terminal Company, guaranteed principal and interest by the Salt Lake & Ogden and the Salt Lake & Utah, at 101. The Salt Lake & Ogden is an interurban electric road between Salt Lake City and Ogden and the Salt Lake & Utah operates from Salt Lake City south via Provo to Spanish Forks, 60 miles.

WABASH.—See the election of the president of the new company under Railway Officers.

BRITISH RAILWAY LENGTHENS TRAIN SCHEDULES.—The London & North-Western has recently lengthened the schedules of a number of its fast express trains. The semi-official explanation is that with the present heavy traffic caused by naval and military requirements trains cannot keep time, and the new timings are arranged to secure greater punctuality.

INDIAN RAILWAY EXTENSION.—The opening of the Hardinge Bridge, across the Ganges river, has brought to the front questions of the best means of developing railway communication in the country lying north of the Ganges, which used to be known as Northern Bengal. Proposals put forward for further development include a standard gage line from Santahar to Siliguri; a standard-gage line from Ishurdi, through Rampur Boalia, to join the Katihari and Godagari line near Nachoul (or an alternative line from Nattore, through Rampur Boalia, to Godagari); a line on the metre gage from Malda to Santahar (or an alternative line on the same gage from near Shamsi, on the Katihari and Godagari Railway, to Bonarpara); a standard-gage line from Ishurdi to Patna, and on to Bhera; and a line from Bogra to Serajanj. Further extensions which should be taken in hand as soon as funds permit would be a standard gage line from the neighborhood of Rampur Boalia to the neighborhood of Dinagepur; a standard gage line from Ishurdi to Patna and Bhera; the conversion of the Santahar and Bonarpara line to the standard gage; and the conversion of the Godagari and Malda line to the standard gage as soon as traffic justifies it. The portion between Nachoul and Godagari would naturally be converted at the same time as the Nachoul and Ishurdi line is built, so as to concentrate transshipment at Nachoul. The doubling of the Katihar and Parbatipur line might also be proceeded with provided no other east and west line has been built.—*Engineering, London.*

ANNUAL REPORTS

STATEMENT OF THE AFFAIRS OF THE NEW YORK, NEW HAVEN & HARTFORD RAILROAD COMPANY FOR THE YEAR ENDING JUNE 30, 1915

INCOME ACCOUNT FOR THE YEAR ENDING JUNE 30, 1915.

	1915.	*Comparison with 1914. Increase or decrease.
Average Miles Operated.....	2,003.17	-43.12
RAILWAY OPERATING REVENUES:		
Freight	\$31,179,318.71	-\$1,297,320.54

Ratio of Operating Expenses to Total Operating Revenues	67.49%	-5.50%
Ratio of Operating Expenses and Taxes to Total Operating Revenues.....	71.69%	-6.60%

* 1914 figures have been revised to conform with classification effective July 1, 1914.
 † Includes \$161,761.61 revenue from milk handled on freight trains.
 Note.—The N. Y., N. H. & H. R. R. Co. Income Account does not include interest due from Subsidiary Companies unless earned by them.

OPERATING RESULTS

Miles Operated.—There was a decrease in average miles of road operated of 43.12 miles.
 The average miles of track maintained was 4,315.49 compared with 4,397.75 the previous year, a decrease of 82.26 miles.
 These decreases are mainly due to giving up certain trackage rights on the Boston & Albany and Boston & Maine and to the Central New England assuming operation of the line between Danbury, Connecticut, and Hopewell Junction, New York.

REVENUES

Total Operating Revenues decreased \$2,073,328.30, or 3.07%.
Freight.—Freight Revenue decreased \$1,297,320.54, or 3.99%. There were 23,842,023 tons of revenue freight carried during the year. This was a decrease of 1,154,815 tons. The number of tons of revenue freight carried one mile was 2,185,109,160, a decrease of 109,674,782 ton miles. The average distance haul of one ton of revenue freight this year was 91.65 miles as compared with 91.80 miles last year. The average amount received for each ton of freight was \$1.31453 as compared with \$1.29923 a year ago. The average revenue received per ton per mile was \$0.1434 this year, as against \$0.1415 last year.
 The average number of tons of revenue freight per revenue train mile was 333.17, an increase of 29.21 tons, or 9.61%. The average number of tons of revenue freight per loaded car mile this year was 15.59, as compared with 15.55 tons a year ago. The average number of freight cars (including caboose) per revenue train mile was 31.78 this year, as compared with 28.35 cars a year ago, an increase of 3.43 cars.
 Revenue freight train miles decreased 1,001,404 miles.
 The decrease in freight train mileage was due to better loading of cars, to heavier loading of trains account of rearrangement of locomotives and to decrease in business offered.

Passenger.—Passenger Revenue decreased \$633,037.26, or 2.29%. Excess Baggage Revenue decreased \$6,339.67, or 4.44%. Mail Revenue decreased \$7,154.75, or 0.99%. Express Revenue decreased \$140,013.29, or 4.91%. There were 78,172,698 revenue passengers carried during the year, a decrease of 9,010,843 passengers. Total number of revenue passengers carried one mile was 1,477,868,934, a decrease of 122,607,802 passenger miles. The average distance each revenue passenger was carried was 18.91 miles as compared with 18.36 miles last year. The average amount received from each passenger was \$.34553, as compared with \$.31708 last year. The average revenue per passenger per mile this year was \$.01828, as compared with \$.01727 a year ago.
 The average number of passengers per revenue train mile was 97, an increase of 1 passenger. The average number of passengers per revenue car mile was 25, the same as last year. The average number of passenger train cars per revenue train mile was 5, as compared with 4.88 cars a year ago.
 Revenue passenger train miles decreased 1,485,622 miles.

The decrease in passenger train mileage was due to rearranging service and taking off some trains that did not pay their operating expenses.
Other Transportation.—Other Transportation Revenue increased \$135,002.99, or 16.41%. This includes Special Train Service, revenue from Pullman service, Switching and Milk Revenue.

Incidental.—Incidental Revenue decreased \$54,142.07, or 2.6%. This account includes: dining car revenue, which decreased \$44,602.72, or 9.28%; revenue from restaurants, which decreased \$1,031.95, or 1.05%; other items such as Station and Train Privileges, Parcel Room Receipts, Storage, Demurrage, etc., which decreased \$144,971.63, or 11.41%; and revenue from electric current and other power sold, which increased \$136,464.23, or 59.35%.

Joint Facility.—Joint Facility Revenue decreased \$70,323.71, or 9.85%. This account includes your Company's proportion of revenue collected for the use of privileges in stations owned by other carriers and used jointly by this Company.

EXPENSES

Total Operating Expenses decreased \$5,106,386.20, or 10.37%.
Maintenance of Way and Structures.—The charge decreased \$1,101,823.60, or 12.48%. This general account took 11.82% of Operating Revenues, as compared with 13.09% a year ago.

A brief description of the character of the improvements made during the year is given below.

Grade crossings eliminated during the year for the greater safety of the public were:

State of Connecticut.....	9
State of Rhode Island.....	7
Total	16

The elimination of five grade crossings at Pawtucket and Central Falls, R. I., has been completed, together with new four-track location through the cities; also a new sixty-car bulk delivery yard, and other work incidental to the elimination scheme. The construction of a new passenger station for joint use of the cities is progressing and will be completed before the end of the year.

New Passenger Stations have been provided during the year at the following points: Brookfield, Conn.; Clinton, Mass. (joint station built by B. & M.); Haddam, Conn.; Pittsfield, Mass. (joint station built by B. & A.); South Worcester, Mass.; West Haven, Conn.; Pawtucket-Central Falls (temporary station).

The rebuilding of the Hartford passenger station is well under way, and the entire station facilities will soon be completed.

New Freight Stations have been built during the year at the following points: Brockton, Mass.; Brookfield, Conn.; New York, Pier 37, East River; Olneyville, R. I.

Improved facilities have been made at 7 other stations.
Improvements to Roadway and Track. There were 31.75 miles relaid with 107-pound rail, 90.22 miles with 100-pound rail, 25.33 miles with 90-pound rail, and 73.31 miles with rail weighing from 68 to 80 pounds per yard. There were placed in main line track 1,588,895 new ties, of which 97,256 were cross-ties. In sidings 408,643 ties were renewed. There were also 23.90 miles of track ballasted. During the year 10.21 miles of sidings and spurs were built.

Owned and leased track operated (excluding sidings), as of June 30, 1915, was laid with rail of the various weights per yard, as follows:

Weight 141 lb.	Miles	% of Total	Comparison of Miles with 1914	
			Increase	Decrease
141 lb.	.86	.0313
107	31.75	1.08	31.75
100	980.84	33.24	17.56
90	157.38	5.33	1.93
80	454.92	15.42	50.66
79	111.28	3.77	3.30
78	623.43	21.13	2.66
75	9.63	.3207
74	185.66	6.29	54.17
72	23.59	.80	9.74
70	174.12	5.90	7.52
68-67-66-60	157.75	5.35	18.21
56 or under	39.54	1.34	31.35
Total	2,950.75	100%	3.03

NOTE—All Steel Rail. With exception of sidings (not included in above figures) there is no iron rail in the track.

Signal and Interlocking Improvements and Additions have been made at 32 points on the system.

During the fiscal year 1915 33.67 miles of road and 109.54 miles of track were equipped with automatic block signals.

A new interlocking plant was installed at the junction with the Boston & Albany R. R. at Springfield, Mass.

Bridges—During the year 50 bridges, railroad and highway, were repaired, strengthened or renewed.

The realignment of the New Haven Company's tracks across Winthrop Cove at New London, Conn., including the construction of a solid embankment and twenty-two foot arch waterway, is progressing satisfactorily, and will, when finished, permit the abandonment of the wooden trestle and provide for a better approach to the proposed bridge over the Thames River. Location for this bridge has been approved by the United States Government and the Connecticut Public Utilities Commission, and plans of the substructure are completed.

Construction of the new concrete bridge carrying the New Haven Company's westbound track over three of the New York Central Company's tracks at Woodlawn, N. Y., has been completed.

Maintenance of Equipment.—The charge decreased \$611,948.08, or 5.89%. Included in Maintenance of Equipment are charges account of Depreciation, as prescribed by the Interstate Commerce Commission, as follows:

Steam Locomotives	\$294,927.38
Other Locomotives	77,268.68
Freight Train Cars	970,055.81
Passenger Train Cars	272,759.20
Floating Equipment	87,555.90
Work Equipment	21,867.56
Total	\$1,724,434.53

The equipment retired from service during the year resulted in the following charges to Operating Expenses:

Steam Locomotives	\$32,312.19
Other Locomotives	8,457.89
Freight Train Cars	404,457.80
Passenger Train Cars	68,236.68
Work Equipment	32,540.43
Total	\$546,004.99

The ratio of this general account to Operating Revenues was 14.96%, as compared with 15.41% a year ago.

Steam Locomotives.—Total number on active list June 30, 1914.... 1,204

From which should be deducted:

Engines retired from service during the year..... 39

Total on active list June 30, 1915..... 1,165

Thirty-six of the engines retired from service during the year were of light capacity, and in addition, their boilers would not meet the requirements of the Federal Boiler Inspection Act. Since the Company had no service that would justify going to the expense of repairing the engines, they were condemned.

The hauling capacity of the steam locomotives is as follows:

Active List	Number	Tractive Power Pounds	Total Weight on Drivers, Tons	Total Weight of Locomotives, Tons (exclusive of tenders)
Assigned June 30, 1914..	1,204	29,074,311	62,608	80,668
Added during fiscal year*		68,736	52	82
Total	1,204	29,143,047	62,660	80,750
Retired from service during year	39	569,447	1,145	2,454
As of June 30, 1915.....	1,165	28,573,600	61,515	78,296

* Increased account of superheaters applied and change from compound to simple cylinder locomotives.

The following statement shows the character and condition of the steam locomotives of the Company on June 30, 1915:

Wheel Arrangement	Owned 6-30-14	With-drawn	Owned 6-30-15	Total	Average Weight Each Locomotive Tons (exclusive of tender)	Average Tractive Power Pounds
< OO	16	6	10	23	23	15,674
< OO o o	3	2	1	47	33	10,066
< OOO	205	2	203	61	61	27,666

< o OOOO	35	..	35	76	69	32,546
< o o OOO	390	23	367	53	35	17,115
< o o OOO o	106	..	106	67	51	23,421
< o o OOO o o	12	..	12	100	53	24,956
< o o OOO o o o	88	..	88	122	75	35,513
Total	1,204	39	1,165	67	53	24,527
Condition				Number	Per Cent	
Good				989	84.9	
Fair				111	9.5	
In shop for repairs				41	3.5	
Stored awaiting repairs, to be repaired when suitable service demands				24	2.1	
				1,165	100.0	
No. of locomotives equipped with superheaters				82	7.04	

The 24 engines stored awaiting repairs are engines of light capacity assigned to no particular service. Should occasion arise requiring engines of this particular type they will be repaired and placed in active service.

As of June 30, there were 191 engines stored in good condition suitable for immediate service when requirements demand.

Electric Locomotives.—Hauling capacity and condition:

Active List	Number	*Tractive Power, Pounds	Total Weight On Drivers, Tons	Total Weight of Locomotives, Tons
Assigned June 30, 1914..	104	1,515,464	8,172	11,152
Retired during fiscal year	2	17,200	30	30
As of June 30, 1915.....	102	1,498,264	8,142	11,122

* 1 hour rating

The electric locomotives are in good condition, and during the year 48 received a general overhauling.

Cars in Passenger Service.—In addition to new equipment shown under Additions and Betterments, on page 42, the following equipment was received during the year under an Equipment Trust:

45 steel coaches
5 steel electric cars
10 steel combination baggage and smoking cars
50 steel baggage cars
10 steel baggage and mail cars

On June 30, 1915, there were 74 all-steel passenger train cars due from the Osgood Bradley Car Co. on the 1915 contract. Of this number there have been received since June 30, 1915:

24 baggage cars
20 coaches
10 smoking cars

Cars in Freight Service.—Of the total number of freight cars owned on June 30, 1915, 3,863, or 11.26%, were in need of repairs. The repairs needed vary from those requiring one hour of labor up to and including rebuilding.

The freight car repair shops are working full time and the force has been considerably increased during the past few months in order to reduce the number of bad order cars.

Traffic Expenses.—The charge decreased \$28,651.59, or 5.71%. The most noticeable decreases were in Superintendence and Advertising, while Outside Agencies and Industrial Bureau show increases.

This general account took 0.72% of Operating Revenues as compared with 0.74% last year.

Transportation Expenses.—The charge decreased \$3,020,169.46, or 11.19%. This general account took 36.65% of Operating Revenues this year, as compared with 40% a year ago, a decrease of 3.35%.

The miles run by revenue trains of all classes were 21,584,882, a decrease of 2,481,774, or 10.31%. The cost per revenue train mile for Transportation Expenses was \$1.11, compared with \$1.12 for last year, a decrease of 1 cent per mile.

Cost of fuel for revenue train and yard locomotives decreased \$826, 875.03 under the previous year, due to better weather conditions, a decrease in train miles and better work by officers and men in obtaining greater efficiency from coal burned.

Injuries to persons required the sum of \$792,795.18, a decrease of \$388,940.41 under the previous year. \$485,424.44 was on account of accidents occurring prior to July 1st, 1914. The estimated amount of unpaid personal injury claims on June 30, 1915, was \$697,608.69, as compared with \$1,042,597.17 on June 30, 1914, a decrease of \$344,988.48, or 33.09%.

The amount spent during the year for loss and damage, for injuries to persons, and for clearing wrecks was \$1,412,804.72, as compared with \$1,966,492.64 in 1914, a decrease of \$553,687.92. The cost of these items per revenue train mile was 6.55, as compared with 8.17 cents in 1914, a decrease of 1.62 cents. The reduction in the amount paid for injuries to persons and for loss and damage reflects the efforts put forth towards efficiency and safety which have brought about a reduction of accidents and damage to property.

Miscellaneous Operations.—(Covers Dining Car and Restaurant Service and Producing Power Sold.) The charge decreased \$22,392.99, or 3.64%. There was a reduction in the cost of operating the dining car service of \$71,554.67 under the previous year. The number of revenue meals served during the year was 378,540, a decrease of 64,212 meals as compared with the previous year.

There was a decrease in cost of operating restaurants of \$523.29 and an increase of \$49,684.97 in the cost of "Producing Power Sold."

This general account took 0.91% of Operating Revenues this year, the same as last year.

General Expenses.—The charge shows a decrease of \$312,876.70, or 16.26%, in spite of an increase in pensions of \$23,468.31 and an increase in valuation expenses of \$66,710.97.

The amount of pensions paid during the year was \$176,276.25, and the cost to the Company account of the federal act requiring valuation of railroads amounted to \$90,887.74.

The salaries and expenses of the general officers were reduced \$45,718.44, and law expenses were reduced \$180,707.06.

This general account took 2.46% of Operating Revenues, as compared with 2.85% a year ago.

Payrolls and Materials.—Total payrolls of the Company for the year for all classes of labor paid for directly were \$25,765,313.80, and the expenditures for materials of all kinds, excepting equipment, amounted to \$14,278,303.39.

Non-Operating Income. (Includes Dividends, Interest on Notes and Deposits, income from Lease of Road, etc.)—This account decreased \$1,966,473.54. No dividend was received from The New England Navigation Company this year and some of the subsidiary companies did not earn their fixed charges. The interest on the securities of those companies held by the New Haven Company was not included in income unless actually earned.

The decrease was offset in part by a larger dividend from the Central New England Railway Co.

Deductions from Gross Income. (Includes Hire of Equipment, Joint Facility Rents, Rent for Leased Roads, properties Operated at a Loss, Interest on Debt, etc.)—The charge decreased \$153,823.11, the principal decreases being in Interest on Debt and Miscellaneous Deductions. There were increases in Hire of Equipment, Joint Facility Rents, and Rent for Leased Roads.

FINANCIAL

Capital Stock.—The Massachusetts Public Service Commission recommended to the Massachusetts General Court that all of the capital stock outstanding in the hands of the public be validated under the laws of Massachusetts, and also recommended that the shares in the Company's treasury be retired and cancelled. The Massachusetts General Court validated the 1,571,179 shares in the hands of the public and the stockholders at a meeting held in New Haven, Connecticut, April 24th, 1915, author-

ized the retirement of the 228,991 shares held in the treasury, which shares were subsequently retired and cancelled.

Maturing Debt.—There will mature between October 1st, 1915, and June 30th, 1916, short-term notes, as follows:

October 26th, 1915.....	\$375,000.00
December 14th, 1915.....	75,000.00
December 28th, 1915.....	550,000.00
January 14th, 1916.....	1,705,000.00
May 1st, 1916.....	27,000,000.00
Total	\$29,705,000.00

CHANGES IN DEBT IN HANDS OF THE PUBLIC

DEBT AS OF JUNE 30, 1914

Mortgage Bonds	\$58,526,000.00
Debentures	155,779,100.00
Loans and Bills Payable.....	23,769,000.00
H. R. & P. C. R. R. One Year 5% Gold Notes, due May 1, 1915 (see note).....	10,000,000.00
	\$248,074,100.00

DEBT AS OF JUNE 30, 1915

Mortgage Bonds	\$58,354,000.00
Debentures	155,892,100.00
Loans and Bills Payable.....	30,139,000.00
	244,385,100.00
Net Decrease	\$3,689,000.00

ACCOUNTED FOR AS FOLLOWS:

MORTGAGE BONDS:	Increase	Decrease
Middletown Horse R. R. Co. 5% 1st Mortgage Bonds, due Dec. 1, 1914, paid off		\$150,000.00
Worcester & Conn. Eastern Ry. Co. 4½% 1st Mortgage Gold Bonds, due Jan. 1, 1943, purchased for Sinking Fund		22,000.00
DEBENTURES:		
Sale of Treasury holdings of 6% Convertible Debenture Certificates, due Jan. 15, 1948.....	\$113,000.00	
LOANS AND BILLS PAYABLE.....	6,370,000.00	
H. R. & P. C. R. R. C*, ONE YEAR 5% GOLD NOTES, DUE MAY 1ST, 1915, PAID OFF		10,000,000.00
	\$6,483,000.00	\$10,172,000.00
Actual decrease in debt.....	3,689,000.00	

NOTE: The Harlem River and Port Chester R. R. Co. One Year 5% Gold Notes amounting to \$10,000,000, which were in the hands of the public as of June 30th, 1914, were paid off during the fiscal year ended June 30th, 1915, from the proceeds of The New York, New Haven and Hartford Railroad Co. note issue of \$27,000,000, dated May 1st, 1915, the New Haven Company being reimbursed by The Harlem River and Port Chester Railroad Co. by an issue of Fifteen Year Prior Lien Debentures dated May 1st, 1915, these debentures now being carried in the Investment Account of the New Haven Company.

GENERAL REMARKS

The last two years have been the most critical in the history of the Company, and there has been difficulty in maintaining its integrity. In the last annual report you were fully informed of the terms of the proposed settlement with the United States Government. This settlement was confirmed by a decree of the United States District Court for the Southern District of New York entered October 17th, 1914, and the securities were transferred to the Trustees appointed thereunder. Since then these Trustees have been in exclusive control of the respective properties, namely, the Boston and Maine Railroad, the Connecticut trolleys and the Rhode Island trolleys.

Since July 1st, 1913, there has been a widespread depression in business, affecting adversely the earning power of your property. For example, the gross operating revenues compare as follows:

For the year ending June 30, 1913, \$70,458,790.09.
For the year ending June 30, 1914, \$67,452,592.01.
For the year ending June 30, 1915, \$65,379,263.71.

This business depression has also affected all of the subordinate properties in which your Company is interested, so that the returns to your Company from these properties for the last year were \$4,759,610.31 less than for the year ending June 30, 1913, and \$1,135,451.39 less than for the year ending June 30, 1914.

This large decrease in earnings and income made it necessary for the Company to retrench in every way.

Efficiency and Economy.—During the year continuous efforts were made to adopt efficient methods and to encourage economical practice.

There was a total saving in operating expenses of \$5,106,386.20 compared with a loss in operating revenues of..... 2,073,328.30

resulting in an increase in net revenue from railway operations of..... \$3,033,057.90

The most important savings were in Conducting Transportation, which decreased \$3,020,169.46, or 11.19%, and in General Expenses, which decreased \$312,876.70, or 16.26%.

The average load for each train was increased from 320.84 tons to 351.25 tons. This is a step in the right direction, but there is much chance for further economies through the purchase of heavier locomotives, the lengthening of sidetracks and the creation of better terminal facilities.

Condition of Property.—Although there was a reduction in expenses for Maintenance of Way and Structures and for Maintenance of Equipment, the property has been well maintained during the past year, and its track and structures are in better condition than for several years.

The amount spent per mile of track maintained was \$1,637.47, which is the largest amount in the history of the Company, except for the previous year, when \$1,853.06 was spent, due to unusually heavy rail renewals.

The same may be said about all classes of equipment, although the Company is somewhat behind in repairs to freight cars and in the varnishing and painting of passenger cars and locomotives.

Debts.—On June 30, 1915, the floating debt of the Company in the hands of the public was \$50,139,000, including \$20,000,000 6% Gold Notes of The New England Navigation Company due May 1, 1917, for which the New Haven Company, as the only stockholder, must be responsible.

The amount paid for interest and discount on short-term paper, including

The New England Navigation Company and The Harlem River and Port Chester Railroad Company for the last two years has been:

For the year ending June 30, 1914.....	\$4,483,366.48
For the year ending June 30, 1915.....	3,662,051.36

The company in the last two years has spent for the protection of its properties the following:

	1915	1914
For Additions and Betterments.....	\$1,358,261.86	\$4,083,669.57
For Grand Central Terminal Buildings, New York City.....	643,432.37	1,575,790.35
Advances to affiliated companies for improvements, betterments and fixed charges	1,272,365.14	1,959,479.09
	\$3,274,059.37	\$7,618,939.01

This total, \$10,892,998.38, has been obtained from earnings, from the sale of property and from cash on hand.

In spite of these large and unavoidable expenditures, by exercising care and postponing all improvements that could be put off with safety, the debt in the hands of the public of the New Haven Company, including The New England Navigation Company, has been reduced since July 1st, 1913, \$324,750.00; an increase in 1914 of \$3,364,250.00, but a decrease in 1915 of \$3,689,000.00.

Some further reductions can probably be made from the proceeds of property sold and from earnings, although the necessity for improvements and betterments is likely to take all surplus earnings until a definite financial plan is effective.

The total debt of the Company, in the hands of the public, excluding contingent liabilities, but including The New England Navigation Co. Gold Notes, for which the New Haven Company is responsible, is \$264,385,100.00, which means that for every \$100 of stock the Company has \$168.28 of debt.

Equipment Trust.—The Company leases 273 all-steel passenger equipment cars under two Lease and Conditional Sale Agreements, one with The Farmers' Loan and Trust Company, dated April 1, 1914, and the other dated November 2, 1914, with The Philadelphia Trust, Safe Deposit and Insurance Company.

The equipment is as follows, constructed at a total cost of \$4,216,889.00.

117 all-steel coaches
50 all-steel baggage cars
15 all-steel postal cars
28 all-steel smoking cars
10 all-steel combination baggage and smoking cars
10 all-steel combination baggage and mail cars
17 all-steel m. u. motor cars
26 all-steel m. u. trailer cars

273

The equipment trust certificates issued under the first agreement are known as "Series A," and those issued under the second agreement as "Series AA."

By the terms of the first agreement an initial payment was made of \$512,399.00 and "Series A" certificates were issued in the amount of \$2,490,000.00 par value, bearing interest at 5% per annum, payable semi-annually and redeemable in fifteen annual payments of \$166,000.00.

By the terms of the second agreement an initial payment was made of \$244,490.00, and "Series AA" certificates were issued in the amount of \$970,000.00 par value, bearing interest at 6% per annum, payable semi-annually and redeemable in twenty semi-annual payments of \$48,000.00 and \$49,000.00 respectively.

The Company pays as rental for these cars (annually in the one case, and semi-annually in the other) to the lessor-trustees under the agreements, an amount equal to the maturing certificates and interest on the outstanding certificates, and these rental payments, by the terms of both agreements, apply as purchase money toward the eventual ownership of the cars by the Company, in the event that no default in payment occurs. The initial payments of \$512,399.00 and \$244,490.00 respectively likewise were on account of rental, and also apply as payments on account of the purchase price of the cars.

New Legislation.—To place the Company in a better position legally to finance itself the charter of the Company and the laws of Connecticut, Massachusetts and Rhode Island were, at the request of the Company, so amended that with the authority of the stockholders and the Public Service Commissions, the Company can mortgage its property or issue preferred stock or do both.

A careful study is now being made of this subject, and the directors will make their recommendation to the stockholders at a later date.

Increase in Capital Since 1903.—On December 18, 1913, the Board of Directors appointed a special committee with power to employ accountants to make a thorough examination of the accounts of the Company. The examination was made by a representative of Price, Waterhouse & Company, who spent over a year on the work and made reports covering 392 pages. From these reports the following deductions were made:

From July 1, 1903, to June 30, 1915, the Company increased its capital obligations in the hands of the public as follows:

	Par Value
Capital Stock	\$87,216,800.00
Mortgage Bonds	54,136,000.00
Debentures	145,710,900.00
Short-Term Notes	30,139,000.00
Total N. Y., N. H. & H. R. R.	\$317,202,700.00
The New England Navigation Co. Colateral Gold Notes	20,000,000.00
New York, Westchester & Boston Ry. Co. Mortgage Bonds	19,200,000.00
The New York Connecting Railroad Co. one-half issue of Mortgage Bonds.....	8,000,000.00
Grand Total	\$364,402,700.00

This Company owns all of the shares of The New England Navigation Company and all but a few shares of the New York, Westchester & Boston Railroad Company and must protect the outstanding notes and bonds of those companies.

This Company and The Pennsylvania Railroad Company are the only stockholders of The New York Connecting Railroad Company and your Company must protect one-half of the bonds issued for that enterprise.

The New York, Westchester and Boston Railway and New York Connecting Railroad are important parts of the terminal development of your Company and should be retained for the benefit of the increasing volume of business passing to, from and through New York, Brooklyn, and Jersey City.

From sale or exchange of the above obligations there was received, including premiums..... \$388,049,309.88

Increase in Property Since 1903.—During the same period there was acquired additional property with book values as follows:

Additions and Betterments to The New York, New Haven and Hartford and leased lines and investment in securities of certain leased and controlled steam railroad lines.....	\$171,669,058.38
New York, Westchester & Boston Ry. Co.....	38,850,150.09
The New York Connecting Railroad Co.....	9,450,000.00
Grand Central Terminal Buildings, New York City.....	6,001,794.12

Total Steam Railroad and Terminal Properties..... \$225,971,002.59

OUTSIDE PROPERTIES

New York, Ontario and Western Railroad Stock.....	\$13,108,397.62
Rutland Railroad Securities.....	2,514,977.15
Gas and Water Power Companies.....	4,151,663.95
Miscellaneous Properties.....	1,475,673.13
Boston and Maine and Leased Line Stocks.....	31,079,668.75
Various Steamship Lines.....	14,242,718.81
Various Trolley Lines and Securities.....	100,527,389.53

Total Outside Investment..... \$167,100,488.94

Grand Total \$393,071,491.53

Losses.—Charges and credits to Profit and Loss have been made during the year, as shown on page 32. For causes that need not here be enumerated there have been decreases in the present value of some of the properties, and some actual losses have been entered on the books.

Unless industrial and general conditions change so as to restore the value and earning power of all transportation agencies, the Company will without doubt suffer considerable losses from the sale of those properties which the United States District Court has ordered sold. Whether these losses will be so great as to impair the capital stock of the Company cannot be determined until the sales of the various pieces of property have been made and until the valuation now being made by the Interstate Commerce Commission is completed. The directors therefore have thought it was not wise to make any general charges to Profit and Loss at this time, but simply to state that there may be large losses which may be offset all or in part by a proper valuation of the property.

Dividends.—The first three months of the current fiscal year show marked improvement in the earnings of the Company, both gross and net, but your directors cannot consider the declaration of any dividend until they are assured of the permanent financing of the Company. The amount of the possible loss in the sale of the properties that must be sold by order of the Federal Court, the existence of the large floating debt, and the need of money for making improvements, all affect the ability of the Company to pay dividends. It is hoped that the valuation of the property of the Company now being conducted by the Interstate Commerce Commission will result in an increased value over that now shown on the books and to that extent will offset any loss in the sale of the properties that must be sold under the decree of the Court.

From July 1, 1902, to June 30, 1915, the property has paid to its owners in dividends \$92,135,064.44. During the same period it has paid in wages on the New Haven and subsidiary companies, the net earnings of which helped to make up the dividend fund (except Boston & Maine and New York, Ontario & Western), \$402,488,811.53.

More Time Under Federal Decree.—Under the decree of the Federal Court some securities must be sold by January 1, 1917, some by July 1, 1917, and the remainder by July 1, 1919. The decree, however, provides that the Court may extend the time for good cause. The European War started after the agreement was made with the Government and has changed financial conditions in the whole world to such an extent that it would seem just for the Company to have more time within which to dispose of the various properties if no sales can be made on a reasonable basis within the period now fixed by the Court. At the proper time, if the properties have not been sold, the management will apply to the Court for an extension of time.

Suits for Restitution.—After earnest and thorough discussion and consideration, with the assistance, and in accordance with the advice of able counsel specially employed in these matters, the directors voted unanimously that any such suits, except the so-called "Billard Case," in which suit is now pending, would be long drawn out, full of complications and very expensive, and would result in nothing but a waste of the stockholders' money.

Sale of Property.—Every effort is now being made to sell at fair prices real estate and other property not needed to protect the Company in its future development, and with the proceeds to make improvements, to pay part of the floating debt or to purchase the Company's own securities in the market and thus reduce interest charges.

Boston and Albany Railroad.—A settlement was made with the New York Central Railroad Company as a result of the termination of the Boston and Albany Operating Agreement and the withdrawal from the Agreement for the acquisition of one-half interest in certain Trust Equipment provided by the New York Central for use on the Boston and Albany Railroad.

After all adjustments were made the net result of the participation in the operations of the Boston and Albany Railroad for the period July 1st, 1911, to January 31st, 1914, was a loss of \$168,601.55, which your Company paid, and the New York Central Company returned the working fund of \$750,000.00 advanced by your Company. The participation in the Trust Equipment Account was settled by the New York Central returning to your Company all payments made on that account, aggregating \$668,391.28.

Eastern Steamship Corporation.—Your Company, through the Navigation Company, owns securities of a book value of \$4,200,000 of the Eastern Steamship Corporation, which is in the hands of receivers. An effort is now being made to reorganize that corporation, but there will, without doubt, be a loss, and your Company will have to take securities of a different kind and participate in the loss.

New England Investment & Security Company.—Your company, through the Navigation Company, owns \$13,709,000 notes of the New England Investment & Security Company. Negotiations are now pending to put the corporate affairs of that Company on a simpler basis, in the belief that better results may be obtained for the owners of the property and for the public.

Need for Improvements.—It is necessary for your Company to spend considerable money in the next few years for improvements. A few of the larger items that must be considered are:

Rebuilding the Thames River Bridge, about.....	\$2,500,000.00
300 steel passenger cars (contracted for in 1913).....	3,600,000.00
100 steam engines of large capacity.....	2,500,000.00
3,000 freight cars.....	3,000,000.00
Electric equipment and facilities so as to get full benefit of electrification between New York and New Haven.....	1,500,000.00
Better ballast on important main and branch lines so as to increase safety, preserve ties and keep down dust.....	1,000,000.00
Improved and added signals so as to increase safety and capacity of road.....	1,000,000.00

Added trackage, yards, sidings, etc.....	3,000,000.00
Improved terminal facilities at many points so that better care can be taken of motive power, better working conditions created for employees and better service given to the public.....	4,000,000.00
	\$22,100,000.00

To this must be added an indeterminate amount for grade separations and many items of improvement to shops, bridges, passenger stations, small buildings, grade revisions so as to increase train tonnage, heavier rails, and advances to the New York Connecting and New York, Westchester & Boston Railroads, and to certain subordinate companies to enable them to sustain themselves until they are sold under court decree.

It is not too much to say that at least \$25,000,000 to \$30,000,000 should be spent in the next five years over and above ordinary operating expenses and fixed charges. Part of this money should be taken from earnings and part from the sale of property and securities.

Rates.—During the year the rates for local passengers were increased to 2½ cents a mile and for mileage tickets to 2¼ cents a mile.

On June 8 the New York Court of Appeals approved the decision of the lower court in annulling the order of the Public Service Commission of New York requiring the Company to reduce its increased passenger rates between New York State points.

In December, 1914, the Interstate Commerce Commission authorized an advance of freight rates applied for by the eastern roads. This increased the rates about five per cent on a limited part of this Company's business.

Throughout the year much progress has been made in revising class rates, merchandise and commodity rates, with the idea of removing discrimination.

Some rates have been increased and some have been reduced, but on the whole the rate basis is on a slightly higher plane.

Taxes.—There was a considerable decrease in the taxes paid by the Company for the last fiscal year, due to the decreased market value of the Company's securities, which was the basis for tax assessments in Connecticut and Massachusetts. The Connecticut law was changed at the last session of the Legislature to a gross income basis. On this account the taxes for the coming year will show an increase over the last year.

Valuation.—During the past year the forces of the Interstate Commerce Commission have been engaged actively in the work of valuation of the property of this Company, under the Act of Congress passed March 1, 1913.

The date of valuation of the property of your Company and its leased lines was fixed as of June 30, 1915, and that of the Central New England as of June 30, 1916.

The government roadway parties have made a cross-section survey of the roadbed and an inventory of the track material on about four hundred miles of road, the land parties have completed an investigation of the values of similar and adjoining land on about one hundred and twenty miles, the electrical party has completed its inventory of electrical construction on the Providence, Warren & Bristol and on the Norwich & Worcester and is now at work on the line between Hartford and Rockville, a telephone and telegraph party has just started, the structural parties have commenced the inventory of bridges, and will soon commence the inventory of buildings, the signal and interlocking party will begin during the fall and the equipment parties expect to commence the inspection of machinery and equipment in December.

It is hoped that these inventories will be completed prior to January 1, 1917, by which time the survey being made by the Company should be completed, there now remaining about 500 miles unfinished.

While the Act provides that the inventory of the property shall be made by the Commission, the Company is required to complete the survey of its lands; to furnish a large amount of information and data required of the carriers by the Commission; and to co-operate and aid the Commission in the valuation work.

A valuation department was organized in December, 1913, and \$115,064.51 has been expended to June 30, 1915. About 130 employees are now engaged in the work at a cost of approximately \$150,000.00 per year and it is expected that the entire cost will equal, if not exceed, \$500,000.00.

It is impossible to estimate when the whole work will be finished, but a tentative valuation may be reached some time during the year 1917.

Investigation by Public Service Commission of Massachusetts.—In the Massachusetts Act validating the Company's securities a provision was included directing the Public Service Commission to make an examination of the financial affairs of the Company. That investigation is now going on, and the Company is giving the Commission every assistance.

The relations between the state commissions, the Interstate Commerce Commission, and the Company have been frank and cordial, and the members of the various commissions have been receptive of suggestions and helpful with advice and action. The relations with the public and with the press have also been pleasant throughout the year.

The standing of the Company with the public and with public bodies has helped it to tide over a most serious period.

The road is solvent and its next most important problem is to adopt some comprehensive plan for handling its debts and providing funds for making those improvements which are essential.

The road is owned by the people who live along its lines, and your particular attention is directed to the classified list of stockholders on page 46 showing the large number who own a small amount of the stock. These stockholders can help themselves and the Company by taking an interest in its affairs.

The improved results for the year were obtained by hard, painstaking work, and a spirit of co-operation by the officers and men, for which the directors of the Company and the stockholders are thankful. Acknowledgment must also be made to the patrons of the road, to the press, and to the public authorities for their assistance.

Your attention is called to the statements of account of the New Haven Company and of each one of the subordinate properties.

Respectfully submitted,
By order of the Board of Directors,
HOWARD ELLIOTT,
Chairman.

STATEMENT OF CONTINGENT LIABILITIES.

JUNE 30, 1915.

Under the provisions of Section 4, Chapter 519, of the Acts of the General Court of the Commonwealth of Massachusetts, passed at its 1909 Session, The New York, New Haven and Hartford Railroad Company is authorized to guarantee the principal of, and the dividends and interest upon, the capital stock, bonds, notes and other evidences of indebtedness of Boston Railroad Holding Company. On June 15, 1910, the General Court of the Commonwealth of Massachusetts passed an act authorizing the issue of preferred stock (without voting power) of Boston Railroad Holding Company, in exchange for its four per cent. fifty-year Debentures dated November 1st, 1909; and on January 10th, 1911, the \$20,012,000.00 Debentures owned by The New York, New Haven and Hartford Railroad Company were exchanged for preferred stock. On June 30, 1915, there were held by the public 28,000 shares of preferred stock of Boston Railroad Holding Company, on which the guaranty of four per cent. cumulative dividends per annum and the payment of principal at one hundred per cent. on liquidation had been executed, and on the same date The New York, New Haven and Hartford Railroad Company owned the following stock, which is held by Trustees for the Company under decree of the Federal Court:

31,065 shares of Common Stock of Par Value...\$3,106,500.00
 244,939 shares of Preferred Stock of Par Value...24,493,900.00

THE NEW YORK, NEW HAVEN AND HARTFORD RAILROAD COMPANY

Is liable jointly with other roads for any deficiency on foreclosure of bonds of the Boston Terminal Company.

Guarantees the payment of principal and interest of the four per cent. First Mortgage Gold Bonds of the Central New England Railway Company

of the issue of January 1, 1911, to the amount of \$13,427,000.00. Guarantees four per cent. dividends on preferred stock of the New England Investment and Security Company, \$4,000,000.00, and payment of principal at one hundred five per cent. on liquidation; also guarantees the payment of principal, \$5,000,000.00 and interest of the New England Investment and Security Company fifteen-year Funding Gold Notes dated April 1, 1909.

Guarantees the payment of principal and interest of the Gold Debenture of The New England Navigation Company in case of termination of lease of the Old Colony Railroad Company, \$3,600,000.00.

Guarantees jointly and severally with The Pennsylvania Railroad Company the payment of the principal and interest of The New York Connecting Railroad Company First Mortgage four and one-half per cent. Gold Bonds due August 1, 1953, of the principal amount outstanding of \$16,000,000.00.

Guarantees the payment of principal and interest of the four per cent. fifty-year First and Refunding Mortgage Gold Bonds of the New York and Stamford Railway Company of the issue of November 1, 1908, to the amount of \$247,000.00.

Guarantees the payment of principal and interest of the four and one-half per cent. First Mortgage Gold Bonds of the New York, Westchester and Boston Railway Company of the issue of July 1, 1911, to the amount of \$19,200,000.00.

Guarantees four per cent. dividends on preferred stock of the Springfield Railway Companies, \$3,387,900.00, and payment of principal at one hundred five per cent. on liquidation.

ADDITIONS AND BETTERMENTS.

Owing to financial conditions, the expenditures for Additions and Betterments have been comparatively small and only cover work that was absolutely necessary.

The expenditures for the year ending June 30th, 1915, follow:
 New or improved bridges \$365,938.89
 Woodlawn, N. Y.-New Haven, Conn., electrification, control system, power plant, etc. 114,285.19
 Pittsfield, platform and tracks 14,362.95
 Middletown-Willimantic, Conn., improvements 12,102.36
 Stamford-New Haven, Conn., signals 22,097.97
 Olneyville, R. I., freight facilities 21,730.91
 Ellis, Mass., parallel highway 19,853.61
 Springfield, Mass., interlocking plant and track changes 14,408.37
 Increased weight of rail laid 90,908.78
 Hartford, Conn., yard facilities 10,429.65
 Elimination of Grade Crossings 38,416.07
 Sundry other additions and betterments 104,454.78
\$828,989.53

Less:
 Excess of Real Estate sold \$178,664.34
 Buildings and sidings abandoned 198,438.45
377,102.79
\$451,886.74

New Equipment, consisting of 6 club cars, 26 baggage cars, 50 cabooses, 2 derrick cars and 1 truck car, was received during the year and paid for out of cash.
 Cars were converted as follows: 39 box, 3 flat, 9 coal, 1 derrick car, 1 wrecking and 2 "Other passenger" train cars converted into "Other company service cars," 2 coal, 1 coach and 2 baggage cars into wrecking cars, 1 coal car into a derrick car, 2 postal cars into combination cars.
707,936.67
\$1,159,823.41

Less:
 Equipment put out of service: 25 passenger, 6 freight, 8 switch and 2 electric locomotives, 34 coach and smoking and 21 other passenger train cars, 1,078 coal and 355 other freight train cars, 78 work equipment cars.
958,195.34
\$ 201,628.07

These expenditures were disposed of as under:
 Charged to Road Suspense (account work not yet completed) \$508,004.18
 Charged to Equipment Suspense (account work not yet completed) 91,305.86
\$599,310.04
 Less:
 Credited to Cost of Road 56,117.44
 Credited to Equipment 341,564.53
\$397,681.97
\$ 201,628.07

NOTE.—Certain property of this Company is subject to a lien under a mortgage of the New York & New England Railroad Company to secure Boston Terminal Bonds of that Company to the amount of \$1,500,000, due April 1, 1939, bearing interest at 4 per cent.

ST. LOUIS SOUTHWESTERN RAILWAY COMPANY—TWENTY-FOURTH ANNUAL REPORT

OFFICE OF
 CHAIRMAN OF THE BOARD OF DIRECTORS.

NEW YORK, September 15, 1915.

To the Stockholders of the St. Louis Southwestern Railway Company:
 On behalf of the Board of Directors, I present herewith the Twenty-fourth Annual Report of your Company, for the fiscal year ended June 30, 1915.

The comprehensive report of the President, which follows, exhibits in detail the revenues, expenses and other results from operation, as well as the financial and physical condition of your property.

The fiscal year just closed has been fraught with many anxieties and diffi-

culties, as is a matter of common knowledge. The President has, in his report, reviewed, somewhat in detail, the adverse conditions resultant from the European war, explaining that the agricultural and industrial interests of the cotton growing sections of the South, especially, have been subjected to the most trying conditions experienced for many years, because of the difficulties encountered in marketing the largest crop of cotton ever produced and the low prices received for the staple. As cotton is essentially the "money crop" of the South, these conditions greatly restricted the purchasing power of the cotton growers and all branches of trade, and seriously affected the revenues of your Company as they did the revenues of other carriers operating in the same section of the country.

Owing to the unfavorable bond market, brought about by the general un-

settled financial conditions, the unsatisfactory rate situation and other influences, your Company, in common with other carriers, has been unable to market its bonds, issued on account of moneys advanced from its Treasury to cover expenditures for additions and betterments, at anything like fair prices. In order to provide necessary cash for current needs, it was found necessary, during the past year, to negotiate temporary loans, aggregating the sum of \$1,585,000.00 for which there was pledged as collateral free assets in the form of Treasury securities, as follows:

	Par Value
First Terminal and Unifying Mortgage Bonds— St. Louis Southwestern Ry. Co., 5%.....	\$2,420,000.00
First and Refunding Mortgage Bonds— Paragould Southeastern Ry. Co., 5%.....	250,000.00
First Mortgage Bonds— Southern Illinois & Missouri Bridge Co., 4%.....	600,000.00

Total \$3,270,000.00
Reference is here made to exhibit "R," to be found on page 48, containing a summary of property investments and advances unfunded, and pledged securities not necessary for control, held in the Company's Treasury, as of June 30, 1915. This statement does not include any of the securities owned by the company heretofore pledged as collateral, and it may be stated, as a matter of information, that the Company's Treasury may be reimbursed later on through bond issues or otherwise, for the amounts included in this exhibit on account of property investments and advances unfunded.

Exhibit "S" on page 49 furnishes, in a condensed form, an analysis of all resources, showing also how the same were applied during the fiscal year.

CAPITAL STOCK.

No change has been made in the Capital Stock of your Company during the current fiscal year.

FUNDED DEBT.

As shown by Exhibit "N," page 44, Funded Debt, including amount issued and held by or for company, has been increased \$185,000.00—explained as follows:

First Terminal and Unifying Mortgage Bonds Issued: For reimbursement of treasury on account of expenditures for addition and betterments made by the St. Louis Southwestern Ry. Co., and advances made to Proprietary, Affiliated and Controlled Companies, covering similar expenditures made by them to December 31, 1914, viz:	
St. Louis Southwestern Ry. Co.....	\$196,630.68
St. L. S.-W. Ry. Co. of Texas.....	311,369.32
	\$508,000.00

To acquire a like amount of First Refunding and Extension Mortgage Bonds of the Gray's Point Terminal Ry. Co.... 27,000.00

Total, Carried forward..... \$535,000.00

First Terminal and Unifying Mortgage Bonds Issued:
Brought forward..... \$535,000.00

Deduct:	
Equipment Trust Obligations matured and paid during year:	
Series—with Penn. Co. for Ins. on Lives and Granting Annuities.....	\$ 34,000.00
Series "A"—with U. S. Mort. and Trust Co. of N. Y.....	46,000.00
Series—Special Equip. Trust with The Phila. Trust, Safe Deposit and Ins. Co.....	66,000.00
Series "D"—with U. S. Trust Co. of New York.....	34,000.00
Series "E"—with Guaranty Trust Co. of New York.....	170,000.00
	350,000.00

Net increase this year (including bonds issued and held by, or for, Company)..... \$185,000.00

Decrease this year, in amount Outstanding in hands of Public, as shown by condensed general balance sheet (caused by payment during year of matured Equipment Trust Obligations, as listed above)..... \$350,000.00

The issuance of the securities, as above shown, was authorized, after full bearing, by the Public Service Commission of the State of Missouri.

The crop outlook is very encouraging and it is hoped that business conditions may improve during the ensuing year.

The faithful and efficient services of the Company's officers and employees, during the past year is acknowledged with pleasure.

For the Directors,

EDWIN GOULD,
Chairman.

OFFICE OF THE PRESIDENT.

ST. LOUIS, MO., September 1, 1915.

MR. EDWIN GOULD,
Chairman of the Board of Directors:

DEAR SIR:

The Annual Report of the Company for the fiscal year ended June 30, 1915, showing the results from operation during the year and the financial and physical condition of the property at the close of the year is submitted herewith.

During the year the average main track mileage operated was 1,753.8 miles, an increase of 18.9 miles over the preceding year. The main track mileage operated at the close of the fiscal year, June 30, 1915, was 1,753.8 miles the same as at the close of preceding year.

In the condensed statement, immediately following, will be found the financial results from operation for the fiscal year ended June 30, 1915, compared with the preceding year.

FINANCIAL RESULTS FROM OPERATION—ENTIRE SYSTEM.
INCOME STATEMENT FOR FISCAL YEAR.

ITEM.	Year Ended	Year Ended	+Increase —Decrease This Year.
	June 30, 1915.	June 30, 1914.

INCOME BALANCE TRANSFERRED TO PROFIT AND LOSS	\$ 280,993.28	\$ 335,770.92	—\$ 616,764.20

OPERATING REVENUES

During the fiscal year just closed the agricultural and industrial interests of the South have been subjected to the most trying conditions experienced in many years.

For a long time the South has relied on cotton as their staple money crop and when last year, the largest crop of cotton ever produced failed to find a ready market, as a result of the European war, the growers were compelled to sacrifice their cotton in order to satisfy their obligations.

Viewing these conditions, which are of a temporary nature, from a broad standpoint, they will, undoubtedly, in the long run, prove "a blessing in disguise" to the cotton growing sections of the South, for the reason that the farmers and other business interests have now been forced to a realization of the fact that if the South is to become prosperous, its agriculture must be put upon a permanent basis of diversification, which will provide a living at home and something to sell. Furthermore, the old system under which the credit business of the Southern farmer has so long been conducted is giving way, as a result of these changed conditions, to a more substantial form of rural credits.

From statistics prepared by the New Orleans Cotton Exchange, it is found that the average price for "middling cotton" during the past cotton year was 7.94c per pound as compared with 13.49c during the preceding year, and 12.20c for the year before; and the average commercial value per bale was \$41.04 against \$68.06 during the preceding year, and \$63.59 for the year before.

The difficulties encountered in marketing the cotton crop and the prevailing low prices, as above outlined, resulted in the stagnation of all lines of business throughout the Southwest and seriously affected the Operating Revenues, both freight and passenger, of this company, in common with other carriers operating in the same section of the country.

The total Operating Revenues for the current fiscal year amounted to \$10,627,861.12, a decrease of \$2,164,043.32 or 16.92%, compared with the preceding fiscal year.

OPERATING EXPENSES

During the fiscal year ended June 30, 1915, the total Operating Expenses amounted to the sum of \$8,361,153.66, a decrease of \$1,472,646.95, or 14.98% as compared with preceding year, and was sufficient to offset over 68% of the loss in operating revenues.

The ratio of Operating Expenses to Operating Revenues was 78.67% as against 76.88% during the preceding year, or an increase of 1.79%.

The several general operating expense accounts show increases and decreases as compared with preceding fiscal year as follows:

Maintenance of Way and Structures.....	Decrease	\$351,161.33	or 18.13%
Maintenance of Equipment.....	Decrease	586,712.05	or 22.03%
Traffic Expenses	Decrease	55,574.92	or 10.99%
Transportation Expenses	Decrease	344,127.89	or 8.29%
Miscellaneous Operations Expenses.....	Decrease	12,359.77	or 20.55%
General Expenses	Increase	6,787.28	or 1.32%
Transportation for Investment—Cr.....	Increase	129,498.27	—

The substantial reduction in Maintenance of Way and Structures has been accomplished without impairment of the physical property and is a practical illustration of the benefits derived from the policy, pursued in the past, of fully maintaining and gradually improving the roadway, bridges and buildings, and this policy will be continued.

The saving in expenses under Maintenance of Equipment was largely due to the limitation placed on the amount of appropriations for repairs to "bad-order" freight cars (which were out of service and not urgently needed on account of the limited traffic movement during the past year)—the repairs to this class of equipment being deferred until more favorable traffic conditions warranted the outlay.

The decrease in Transportation Expenses would have been more favorable had it not been for the fact that several very large judgments (growing out of claims for personal injuries, resulting from accidents in prior years), were rendered against the Company, and were settled and charged against Transportation Expenses during the current fiscal year.

The increase in General Expenses was due principally to the increase in the primary account "Valuation Expenses," included under this head.

INCREASED BURDENS

The operating results of these lines, in common with those of other carriers, have been seriously affected during the past few years by reason of the increased burdens imposed through legislative and regulative enactments, causing losses in passenger, freight, mail and express revenues, added expenses and increased interest charges on capital invested in unproductive facilities and permanent improvements at terminals and elsewhere, reluctantly made in compliance with Federal, State and other laws, or to satisfy public demands.

The enforcement of the maximum two cents per mile passenger fares resulted in a shrinkage in the passenger revenues of these lines of approximately \$320,000 during the year under review, and of about \$340,000 during the preceding year. As this loss in revenue did not grow out of any reduction in the service rendered, this shrinkage could not be offset by a corresponding reduction in expenses.

Losses have also been sustained in express and mail revenues through legislative enactments, or orders of regulating bodies, which, while reducing the revenues, could not be met by reductions in expenses. For example, these lines sustained a loss during the fiscal year of about \$70,000 in express revenue, which was due, principally, to the inroads made on express business through the introduction by the Federal Government of the "Parcels Post" and also by the reduction in express rates which was made effective February 1, 1914.

The inadequate compensation allowed by the Government for transporting the mails is an important question now engaging the earnest attention of railway executives who are urging for adoption, as fair and equitable, the existing weight basis amended by annual weighing, payment for apartment cars and payment for, or release from, side or terminal messenger service.

While the revenues have suffered losses due to the causes mentioned, expenses and taxes, on the other hand, have been materially increased—thus, for instance, the so-called "Full Crew Law" enacted by several of the States through which these lines operate, resulted in an added expense during the past year of approximately \$23,000; "Hours of Service Acts"

caused an increase of approximately \$14,000; "Semi-monthly pay day" requirements, and other expenditures of a similar nature, about \$16,000, and payments for "Injuries to Persons" increased about \$82,000.

The "normal income tax" of one per cent, imposed by the Federal Government, on the income derived by holders of the Company's so-called "Tax Free" bonds (which tax the company is compelled to assume under the conditions of such bonds), amounted during the current fiscal year to about \$11,000. On account of the ruling of the Government that this tax is in the nature of a contractual obligation, on the part of carriers, the amounts thus assumed and paid cannot be charged to "Railway Tax Accruals" and has, therefore, been charged against Income through the primary account "Miscellaneous Income Charges" as prescribed in the classifications of the Interstate Commerce Commission.

The burdens of the company are also being continually increased, from year to year, because of the demands of organized labor in the matter of increased pay, shorter hours, etc.

RATE SITUATION

MISSOURI.—In the preceding annual report reference was made to the suits begun by the Attorney General of the State of Missouri against the railroads operating in that state to recover the difference between the Missouri statutory freight rates and the rates charged by the carriers for transporting freight and passengers between points in the State of Missouri during the time the Missouri State-made rates were being contested. On the 29th day of June, 1915, the Supreme Court of Missouri held that these suits could not be maintained. No refunds, have therefore, been made in the State of Missouri.

During the past year applications have been filed with the Public Service Commission of Missouri, by this company and all of the large trunk lines operating in the State, for higher freight rates and passenger fares. Numerous hearings have been held at which the carriers and shippers submitted testimony. Briefs have been filed, and on July 15, 1915, the case was finally submitted and argued. It is hoped that the presentation of these applications will result in the establishment by the Public Service Commission of Missouri of more reasonable freight rates and passenger fares.

ARKANSAS.—Reference was also made in the preceding annual report, to the appointment, by the Federal Court in Arkansas, of a Special Master to receive and pass upon claims for refunds growing out of the collection by the carriers operating in that state, while the Arkansas rates were being contested, of freight rates and passenger fares in excess of the State-made rates. Freight claims aggregating 289,237.47 were presented to the Master against this company, of which \$208,160.13 were allowed. Passenger claims aggregating \$13,500.00 were presented to the Master, and of these, claims aggregating \$7,743.61 were allowed.

Exceptions were filed with the Court to the allowance of all of these claims but subsequently a compromise agreement was entered into, which provided for the settlement of the allowed freight claims at fifty per cent. (50%) of the amount allowed (with the exception of certain claims aggregating \$45,000.00, which are being contested on the ground that they are based upon interstate shipments which are not subject to the state rates), the payment of such claims to be made in scrip issued by this company, redeemable within two years, in payment for Arkansas intrastate freight charges.

The agreement also provided for settlement of the passenger claims at one hundred per cent. (100%) of the amount allowed, in scrip, redeemable within two years, in payment for Arkansas intrastate passenger fares.

On this basis, as of June 30, 1915, \$160,931.78 of the freight claims had been settled by the issuance of freight scrip amounting to \$80,465.89 and passenger claims aggregating \$6,487.49 by the issuance of passenger scrip of an equivalent amount.

Owing to the large amount of these claims and to the fact that the liability on account of the same related to operating revenues and operating expenses of previous fiscal periods, authority was obtained from the Interstate Commerce Commission, to charge the amounts paid in settlement of the claims in question, together with \$22,265.56, representing the cost of printing the scrip, legal and other expenses incident to the settlement of the claims, etc., to Profit and Loss direct, through the primary account "Delayed Income Debits."

The balance of the freight and passenger claims allowed, and uncontented, will no doubt be settled under the terms of the compromise agreement during the ensuing fiscal year.

Since the rendition of the decree of the Supreme Court of the United States in the Arkansas rate case, the Arkansas carriers have filed a joint application with the Arkansas Railroad Commission for increases in freight rates. Several volumes of testimony were submitted by the carriers in support of, and by the shippers, in opposition to, this application. As a result, the Arkansas Railroad Commission has promulgated a new tariff of freight rates, effective May 20, 1915, which will return to this company on its Arkansas intrastate freight business, revenue approximately seven per cent. (7%) greater than the revenue accruing under the old rates.

During the fiscal year under review, the United States District Court for the Eastern District of Arkansas has, upon the petition of this company, and other Arkansas carriers, temporarily enjoined the application of the State-made passenger fare of two (2) cents per mile in the State of Arkansas. Pending a hearing on the application for a permanent injunction (which will be had during the coming Fall), effective June 2nd, 1915, a passenger fare of three (3) cents per mile is being charged, which will favorably affect the revenue from passenger traffic.

TEXAS.—Application has also been filed by all of the carriers operating in the State of Texas for increases in freight rates in that state. Considerable testimony has been heard by the Texas Commission for and against such increases and briefs are now being prepared.

INTERSTATE.—After the decision of the Supreme Court of the United States in the Missouri and Arkansas rate cases this company was forced by competition, and other influences, to reduce its interstate passenger fares in Arkansas and Missouri to two (2) cents per mile. It now has application pending before the Interstate Commerce Commission to increase these fares to three (3) cents per mile.

These lines were parties to the application for increase in freight rates on certain commodities, in what is commonly known as the "Western Rate Advance Case," which was submitted to the Interstate Commerce Commission on June 26, 1915. While the decision in this case does authorize some advances, it was on the whole a distinct disappointment to the Western carriers.

Two important lumber cases have also been presented to, and determined by, the Interstate Commerce Commission during the year, resulting in increases in the interstate rates on hardwood lumber from a considerable producing territory, of from two (2) to five (5) cents per hundred (100) pounds.

AGRICULTURAL AND INDUSTRIAL

During the past year, and for a number of previous years, the Agricultural and Industrial Department of this company, and other carriers, as well as the Agricultural Press and the Government Demonstration forces, have been preaching diversification of crops, and while good seed was sown, it lay dormant in the minds of the people until a crisis overtook the South.

During the present crop season there is being raised, throughout the Cotton States, more corn, wheat, oats, rice, hay, garden-truck and live stock than ever before. The cotton acreage has been considerably reduced, as compared with last year, and while the growing crop is two or three weeks late, and has suffered some damage from the severe storm in the Southwest, which occurred in the latter part of August, 1915, the present prospects indicate a good yield.

It is impossible to predict, at this time, to what extent the recent action of Great Britain, and her war allies, in the placing of cotton on the contraband list, will demoralize the cotton market. However, excepting for this temporary restriction, cotton promises to take its proper place, that of the cash or money crop of the country. Many farmers will grow their living at home and be in position to bank or invest the money received from cotton.

The adverse financial conditions, resultant from the low price of cotton during the past year, has greatly reduced industrial operations throughout the territory contiguous to these lines. Very few individuals or business concerns have had, or could obtain, capital to proceed with new enterprises or with improvements, notwithstanding the fact that labor has been plentiful. Many of the large saw mills have been closed down a portion of the time, or running on part time, and this has thrown a large number of men out of employment; however, the latter part of the fiscal year has shown an improvement in this regard—some of the mills, which had temporarily closed down, have resumed operations on part time, resulting in an increased movement of lumber and raw material in the last few months.

There has been very little increase in the capitalization of banks and similar enterprises, in fact, the entire business interests of the Southwest have been simply "marking time," trusting that conditions would improve. That business conditions are gradually becoming better throughout the Southwest is evidenced by the more cheerful attitude of the people and increasing activity in many lines. Wholesale houses and jobbers, who have allowed their stocks to run extremely low, are restocking and their business is slowly resuming normal conditions.

FEDERAL VALUATION

Pursuant to the Act of Congress approved March 1, 1913, viz., "An Act to amend an Act entitled 'An Act to regulate commerce' approved February fourth, eighteen hundred and eighty-seven, and all Acts amendatory thereof by providing for a valuation of the several classes of property of carriers subject thereto and securing information concerning their stocks, bonds and other securities," this company was notified by the Government on October 6, 1914, that the Division of Valuation expected to begin surveys on this company's lines North of Texas about January 1, 1915, and that the date of valuation of all of this company's lines would be as of June 30, 1915.

No work of any importance has as yet been undertaken on the Texas lines by the Division of Valuation of the Interstate Commerce Commission, but it is expected that work will be commenced on those lines during the coming Fall, and the Engineering Department has been preparing maps and getting information in shape for this purpose.

On the lines North of Texas the Government field forces have been actively engaged on the work of valuation since November 12, 1914. Right-of-way schedules, as called for by the Division of Valuation, have been completed and filed with the Commission. The reproduction of all maps and profiles of the line are well underway and will be filed with the Commission shortly.

The Machinery Department has been busily engaged in making an inventory of all equipment, this work being well advanced.

The Accounting Branch of the Division of Valuation commenced work on the company's books on February 8, 1915, and is still engaged on that work.

The work accomplished by the several departments of the Government's field forces on the lines North of Texas, at the close of the fiscal year ended June 30, 1915, may be summarized as follows:

Roadway and Track—	
4 parties, commenced Nov. 12, 1914, completed March 26, 1915.	
Land—	
2 parties, commenced Jan. 7, 1915, completed May 15, 1915.	
Bridges and Buildings—	
2 parties, commenced Jan. 19, 1915, completed April 12, 1915.	
Telegraph and Signals—	
2 parties, commenced March 8, 1915, completed April 2, 1915.	
Each of the Government field parties was accompanied by representatives of this company, called "Pilots" with the view of pointing out all property of the railway company and calling attention to hidden quantities.	
The amounts expended by the St. Louis Southwestern Railway Lines in this work during the fiscal year ended June 30, 1915, and charged to "General Expenses—Valuation Expenses" are as follows:	
Maps (Field work, office work, etc.).....	\$3,891.86
Preparation of primary lists or inventories.....	2,339.40
Land Schedules, land cost data and information for valuation of lands	1,975.73
Construction Cost data for determining proper units.....	1,504.51
Pilots	3,414.71
Miscellaneous	1,686.60
Total	<u>\$14,812.81</u>

The foregoing statement includes only the pay and office, traveling and other expenses of officers and their assistants, clerks and attendants *specialy employed or assigned to valuation work*, and the cost of stationery and printing, engineering supplies, etc. Much time, thought and effort has been incidentally devoted to this work by the officers and employees of the Executive, Engineering, Legal, Accounting and Operating Departments of these lines, but no portion of the pay of such employees, not specially employed or assigned to such work, has been, or can be, charged against "Valuation Expenses" under the rules prescribed by the Interstate Commerce Commission.

The Act of Congress relating to Federal Valuation requires carriers to co-operate with, and aid the Interstate Commerce Commission in the valuation of their properties. Accordingly, the St. Louis Southwestern Railway Lines have appointed a Valuation Committee consisting of representatives of the Engineering, Legal and Accounting Departments.

The Presidents' Conference Committee, representing all carriers, has also appointed Engineering, Land and Accounting Committees, which committees, since the passage of the Act, have been in constant conference with Director Prouty and the Division of Valuation of the Interstate Commerce Commission as to many of the details involved in the practical work of making the valuation.

It would be difficult to overestimate the importance or magnitude of the task involved in the work of making the valuation.

This company, as well as the Presidents' Conference Committee, are alive to the far-reaching economic effect of the final valuations to be made, and the last named committee has appeared before the Interstate Commerce Commission orally and by printed brief for the purpose of discussing and reaching satisfactory conclusions on many of the important questions involved, and will continue its efforts along these lines.

SOUTHERN PACIFIC COMPANY—THIRTY-FIRST ANNUAL REPORT

REPORT OF THE BOARD OF DIRECTORS

New York, October 8, 1915.

To the Stockholders of the Southern Pacific Company:
Your Board of Directors submits this report of the operations of the Southern Pacific Company and of its Proprietary Companies for the fiscal year ended June 30, 1915.

PROPERTIES AND MILEAGE

The transportation lines constituting the Southern Pacific System, June 30, 1915, were as follows:

Divisions.	First Main Track.	Additional Main Track.	Sidings.	Ferries.	Water Lines.
A.—Mileage of lines belonging to or leased by Companies the capital stocks of which are principally owned by the Southern Pacific Company.					
(1)—Operated by the Southern Pacific Company under leases:					
Central Pacific Ry.....	2,235.68	256.04	870.20	9.90	125
Oregon & California R. R.....	692.48	2.85	167.87
Southern Pacific R. R.....	3,497.31	211.76	1,478.49	3.00	...
South Pacific Coast Ry.....	106.69	20.46	49.58	3.00	...
(2)—Operated by the owning Companies:					
Morgan's Louisiana & Texas Railroad and Steamship Co.	404.53	58.35	228.35	3.00	...
Louisiana Western R. R.....	207.74	...	70.08
Galveston, Harrisburg & San Antonio Ry.....	1,351.21	6.59	332.80
Houston, East & West Texas Ry.....	190.94	...	56.57
Houston & Shreveport R. R.....	40.72	.69	7.35
Houston & Texas Central R. R.	894.63	1.27	258.79
Southern Pacific Terminal Company.....	23.64
Arizona Eastern R. R.....	366.80	...	81.67
Corvallis & Eastern R. R.....	140.58	...	16.98
Southern Pacific Company....	4,683
B.—Mileage of lines belonging to Companies the capital stocks of which are principally owned by the Morgan's Louisiana & Texas R. R. & S. S. Co., but which are operated by the owning Companies.					
Iberia & Vermilion R. R.....	21.44	...	10.99
Direct Navigation Co.....	65
Total.....	10,618.89	561.47	3,855.85	18.90	4,873
Less operated jointly by Proprietary Cos.....	31.49	9.97	17.80
Total miles of road operated June 30, 1915.....	10,587.40	551.50	3,838.05	18.90	4,873
Total miles of road operated June 30, 1914.....	10,477.00	506.60	3,788.93	18.90	4,873
Increase.....	110.40	44.90	49.12

In addition to the mileage above tabulated the Southern Pacific Company solely controls through ownership of capital stock 890.46 miles of electric lines, and 1,458.09 miles of steam lines; and jointly controls (through ownership of capital stock in equal proportions with the Atchison, Topeka & Santa Fe Ry. Co.) 400.99 miles of the Northwestern Pacific Railroad and 62.93 miles of the Sunset Railway, an aggregate of 13,399.87 miles.

Since June 30, 1914, railways have been purchased by Proprietary Companies as follows:

HOUSTON & TEXAS CENTRAL RAILROAD.

Under authority of Chapter 40, Laws of the State of Texas, 1913, the Houston & Texas Central Railroad Company purchased as of July 1, 1914, the railroad and appurtenances of the Hearne & Brazos Valley Railroad Company, extending from Hearne to Stone City, Texas, a distance of 18.61 miles.

TEXAS & NEW ORLEANS RAILROAD.

Under authority of Chapter 54, Laws of the State of Texas, 1913, the Texas & New Orleans Railroad Company purchased as of July 1, 1914, the railroad and appurtenances of the Burr's Ferry, Brownel & Chester Railway Company, extending from Rockland to Turpentine, Texas, a distance of 11.89 miles.

INCOME FOR THE YEAR.

The income for the year ended June 30, 1915, of the Southern Pacific Company and of its Proprietary Companies, combined, excluding off-setting accounts, compared with last year, is as follows:

	This Year.	Last Year.	+ Increase. - Decrease.	Per Cent.
Average miles of road operated:				
Lines East of El Paso	3,534.12	3,459.16 +	74.96	2.17
Lines West of El Paso	7,020.12	6,962.49 +	57.63	.83
	10,554.24	10,421.65 +	132.59	1.27
Operating Income.				
Railway operating revenues.....	\$129,865,675.09	\$138,520,258.56	-\$8,654,583.47	6.25
Railway operating expenses.....	87,753,842.31	93,662,266.93 -	5,908,424.62	6.31
Net revenue from railway operations	\$42,111,832.78	\$44,857,991.63	-\$2,746,158.85	6.12
Railway tax accruals.	\$6,371,272.84	\$7,162,624.57 -	\$791,351.73	11.05
Uncollectible railway revenues.....	50,946.14 +	50,946.14
Total operating income.....	\$35,689,613.80	\$37,695,367.06	-\$2,005,753.26	5.32
Non-Operating Income.				
Rent from locomotives	\$72,612.74	\$239,269.60 -	\$166,656.86	69.65

Rent from passenger-train cars.....	282,448.41	212,944.78 +	69,503.63	32.64
Rent from floating equipment.....	80,759.03	2,609.58 +	78,149.45
Rent from work equipment.....	69,555.19	188,542.24 -	118,987.05	63.11
Joint facility rent income.....	473,475.01	472,424.65 +	1,050.36	.22
Income from lease of road.....	94,996.46	94,667.66 +	328.80	.35
Miscellaneous rent income.....	444,514.74	366,230.03 +	78,284.71	21.88
Miscellaneous non-operating physical property.....	298,358.19	225,476.78 +	72,881.41	32.32
Dividend income.....	4,478,250.00	3,656,276.04 +	821,973.96	22.48
Income from funded securities—Proprietary Companies.....	3,833,185.82	3,612,450.71 +	220,735.11	6.11
Income from funded securities—Affiliated and other companies.....	3,756,061.84	3,813,144.31 -	57,082.47	1.50
Income from unfunded securities and accounts.....	2,651,463.91	2,334,382.60 +	317,081.31	13.58
Income from sinking and other reserve funds.....	678,550.66	556,873.33 +	121,677.33	21.85
Miscellaneous income.	577,332.14	109,617.42 +	467,714.72	426.68

Total non-operating income.....	\$17,791,564.14	\$15,884,909.73 +	\$1,906,654.41	12.00
Gross income.....	\$53,481,177.94	\$53,580,276.79 -	\$99,098.85	.18

Deductions from Gross Income.				
Hire of freight cars—Debit balance.....	\$120,850.99	\$177,822.48 -	\$56,971.49	32.04
Rent for locomotives.	24,771.52	30,803.31 -	6,031.79	19.58
Rent for passenger-train cars.....	172,921.37	156,112.16 +	16,809.21	10.77
Rent for floating equipment.....	3,613.92	2,750.00 +	863.92	31.42
Rent for work equipment.....	6,960.69	9,397.65 -	2,436.96	25.93
Joint facility rents.....	358,839.75	297,571.04 +	61,268.71	20.59
Rent for leased roads.	717,904.21	707,437.62 +	10,466.59	1.48
Miscellaneous rents.....	647,940.60	612,209.59 +	35,731.01	5.84
Miscellaneous rent accruals.....	965,387.10	609,457.87 +	355,929.23	58.40
Interest on funded debt.....	28,939,034.71	27,415,733.89 +	1,523,300.82	5.56
Interest on unfunded debt.....	356,574.07	546,242.06 -	189,667.99	34.72
Amortization of discount on funded debt	237,540.56	505,476.92 -	267,936.36	53.00
Maintenance of investment organization...	125,981.31	159,056.90 -	33,075.59	20.79
Miscellaneous income charges.....	232,537.67	1,092,287.48 -	859,749.81	78.71
Total deductions from gross income	\$32,910,858.47	\$32,322,358.97 +	\$588,499.50	1.82
Net income.....	\$20,570,319.47	\$21,257,917.82 -	\$687,598.35	3.23

Disposition of Net Income.				
Income applied to sinking and other reserve funds.....	\$939,724.57	\$805,702.07 +	\$134,022.50	16.63
Income balance transferred to credit of Profit and Loss....	\$19,630,594.90	\$20,452,215.75 -	\$821,620.85	4.02

Per cent. on outstanding capital stock of Southern Pacific Company.....	7.20	7.50 -	.30	4.02
---	------	--------	-----	------

In the foregoing table the income has been classified in accordance with the regulations of the Interstate Commerce Commission, effective July 1, 1914. This change in the classification has necessitated a restatement of the figures for last year.

The details of Railway Operating Revenues and Railway Operating Expenses are fully dealt with under Transportation Operations.

The \$50,946.14 reported against Uncollectible Railway Revenues represents the amount of charges against companies and individuals, for transportation services rendered, which have been determined to be uncollectible, and which are debited to said account in accordance with regulations of the Interstate Commerce Commission, effective July 1, 1914. Similar charges in previous years were debited to Railway Operating Revenues.

The income for the year from rent of equipment exceeds its payments to other companies for rent of equipment by \$176,256.88. This is a decrease, as compared with last year, of \$90,223.72.

The principal item of increase in Miscellaneous Rent Income is the rental received from the City of Portland for the use of the Willamette River bridge, a one-half interest in which was acquired during the year.

Of the \$317,081.31 increase in Income from Unfunded Securities and Accounts, \$177,722.09 represents interest on increased investment advances to Affiliated Companies, and the remaining \$139,359.22 represents increased interest received on bank deposits, etc.

The increase of \$467,714.72 in Miscellaneous Income is the result, principally, of taking into the year's income the net receipts from the operations of the steamships Persia and Nile from July 1, 1913, to June 30, 1915; and of crediting to income, in accordance with the regulations of the Interstate Commerce Commission, interest on the Companies' own funds used for construction.

The increase in Miscellaneous Tax Accruals is the result, principally, of including in this account this year, in accordance with the regulations of the Interstate Commerce Commission, effective July 1, 1914, certain taxes which were included in Railway Tax Accruals last year.

The increase in Interest on Funded Debt is the result, principally, of the excess of interest accruing this year on the Five Per Cent. Twenty-

Year Convertible Bonds issued in June of last year over the interest accruing last year on the One-Year Five Per Cent. Secured Gold Notes retired in June of last year.

The decrease in the charge for Amortization of Discount on Funded Debt is the result, principally, of charging against last year's income the remainder of the discount on the \$26,000,000 of Southern Pacific Company One-Year Five Per Cent. Notes retired in June of last year.

The amounts reported against Maintenance of Investment Organization represent expenses of the Southern Pacific Company for other than railway operations, and the expenses of keeping up the corporate organizations of the Proprietary Companies, the properties of which are operated by the Southern Pacific Company under leases.

The decrease in Miscellaneous Income Charges is due to the fact that last year the charge for depreciation on rolling stock owned by the Southern Pacific Company and leased to other companies, was included in this account; while this year the corresponding charge is included in operating expenses, in accordance with the regulations of the Interstate Commerce Commission.

On June 30, 1915, the principal of advances to the Southern Pacific Railroad Company of Mexico amounted to \$33,993,894.69. Interest accruing on these advances has not been taken into the income of the Southern Pacific Company.

CAPITAL STOCK.

The capital stock of the Southern Pacific Company outstanding at the beginning of the year amounted to.....\$272,672,405.64 Issued during the year:

Common stock issued in exchange for a like amount of Five Per Cent. Twenty-Year Convertible Gold Bonds surrendered and cancelled..... 2,000.00

Amount of Southern Pacific Company stock outstanding June 30, 1915.....\$272,674,405.64

There was no change during the year in the capital stocks of the Proprietary Companies.

The amount outstanding June 30, 1915, was as follows:

Common stock\$315,800,572.00 Preferred stock 29,400,000.00 \$345,200,572.00

Stocks of Proprietary Companies outstanding June 30, 1915, were held as follows:

Owned by Southern Pacific Company.... \$344,767,400.00 Owned by Morgan's Louisiana & Texas R. R. & S. S. Co..... 350,000.00 In the hands of the public..... 83,172.00

Total\$345,200,572.00

FUNDED DEBT.

In December, 1914, to provide for the purchase of new equipment, an equipment trust known as "Southern Pacific Equipment Trust, Series C," was created, and an issue of \$1,170,000, par value, Four and One-Half Per Cent. Equipment Trust Certificates authorized, all of which were issued during the year, and, in accordance with the terms of the trust, guaranteed by the Southern Pacific Company.

Under an agreement made in December, 1914, between The Galveston, Harrisburg & San Antonio Ry. Co. and the holders of all of the outstanding Galveston, Harrisburg & San Antonio Ry. Co. Mexican and Pacific Extension Second Mortgage Six Per Cent. Income Bonds, \$3,815,000, par value, of the said bonds were retired; the rate of interest on the remaining \$2,539,000, par value, of such bonds still outstanding, was reduced to five per cent. per annum; the endorsement making such interest conditional was cancelled; all obligation, if any, of the Railway Company in respect to sinking fund payments accruing on or prior to January, 1, 1915, was released; and the payment of the principal of and interest on the \$2,539,000, par value, of such bonds still outstanding, was guaranteed by the Southern Pacific Company.

The funded and other fixed interest-bearing debt of the Southern Pacific Company and of its Proprietary Companies outstanding June 30, 1914, was as follows:

Southern Pacific Company.....\$203,226,336.58 Proprietary Companies 456,106,632.24

Total outstanding June 30, 1914.....\$659,332,968.82

Add:

First Mortgage Six Per Cent. Bonds of the Burr's Ferry, Brownell & Chester Ry. Co., the property of which was purchased by the Texas & New Orleans R. R. Co., July 1, 1914, subject to the mortgage indebtedness 165,000.00

\$659,497,968.82

Issued during the year:

Southern Pacific Company. Equipment Trust Certificates, Series C..... \$1,170,000.00 Five Per Cent. Twenty-Year Convertible Gold Bonds, balance of subscriptions 3,006,573.42 \$4,176,573.42

Southern Pacific Railroad Company. First Refunding Mortgage Four Per Cent. Bonds: Against outstanding old bonds retired \$21,000.00 Against expenditures for additions and betterments 6,585,500.00 6,606,500.00 10,783,073.42 \$670,281,042.24

Retired during the year:

Southern Pacific Company. San Francisco Terminal First Mortgage Four Per Cent. Bonds: Purchased from payments to sinking fund \$12,000.00 Five Per Cent. Twenty-Year Convertible Gold Bonds:

Retired in exchange for a like amount of Common Stock issued 2,000.00 Equipment Trust Certificates, Series A, due March 1, 1915, paid off. 1,012,000.00 Equipment Trust Certificates, Series B, due September 1, 1914, paid off 201,000.00 \$1,227,000.00

Central Pacific Railway Company.

Three and One-Half Per Cent. Mortgage Gold Bonds: Purchased from proceeds of sale of lands \$649,500.00 Purchased from proceeds of sale of securities 916,500.00 Purchased from payments to sinking fund 46,500.00 Bond scrip retired from general funds 25.00 \$1,612,525.00

First Refunding Mortgage Four Per Cent Bonds:

Purchased from payments to sinking fund 29,000.00 1,641,525.00

Galveston, Harrisburg & San Antonio Railway Company.

Second Mortgage Mexican and Pacific Six Per Cent. Income Bonds retired. 3,815,000.00 Houston & Texas Central Railroad Company.

First Mortgage Five Per Cent. Bonds: Purchased from proceeds of sale of lands \$154,000.00 Purchased from proceeds of sale of other mortgaged property 22,000.00 176,000.00

South Pacific Coast Railway Company.

First Mortgage Four Per Cent. Bonds: Purchased from payments to sinking fund 237,000.00

Southern Pacific Railroad Company.

First Refunding Mortgage Four Per Cent Gold Bonds: Purchased from payments to sinking fund 14,000.00

Texas & New Orleans Railroad Company.

ASSETS AND LIABILITIES

The value of the granted lands belonging to the Central Pacific Railway Company and to the Oregon and California Railroad Company, remaining unsold at the close of the year, is not included in the statement of the assets of the said companies.

The assets and liabilities of the Southern Pacific Company and of its Proprietary Companies, combined, on June 30, 1915, and the increases and decreases during the year, excluding the offsetting accounts between the Companies, summarized, were as follows:

	Total	Increase or Decrease.

(e) Figures in last year's report were based on commercial freight only. (f) Similar charges in previous years were debited to Railway Operating Revenues.

Since the opening of the Panama Canal, August 13, 1914, competition has been intensified and the gross revenue of the lines of this Company has been considerably reduced by a large increase in the number, capacity, and sailings of steamships between Atlantic and Pacific ports, which, by a material reduction of rates, have taken a substantial volume of freight that was formerly shipped over transcontinental railroads.

The business depression prevailing throughout the United States was aggravated on our lines by the outbreak of the European War. Some of the copper mines served by them were closed down and others were operated to about half normal capacity, which reduction of activity resulted in a large shrinkage of earnings from products of the mines and from the fuel consumed in their operation. The construction of new buildings was retarded and railroad construction and development almost entirely abandoned, these conditions causing a material decrease in revenue derived from lumber and other construction material. There was, moreover, a widely distributed decrease of earnings upon general merchandise and miscellaneous traffic.

These unfavorable conditions, and consequent general retrenchment in expenditures, have also affected both business and pleasure travel and have brought about a large reduction in passenger and related earnings, the former amounting to 41 per cent of the total reduction of \$8,654,583.47 in operating revenues. This reduction has been increased by serious inroads made upon local railroad travel by automobile competition, which the improvement of highways has encouraged and rapidly developed.

While these losses were offset to some extent by Exposition travel, the increased earnings derived from that source before the close of the year were not sufficient to affect materially the general results. Earnings from express business increased under a new and more favorable contract with the Express Company.

The net decrease in operating revenues of the Company was equivalent to 6.25 per cent., which is less than the average percentage of reduction in earnings of large railroad systems reporting to the Interstate Commerce Commission.

A readjustment of rates is now being made which is expected to check the diversion of traffic to the Canal steamship lines; a normal condition of the mining industry has been restored; and, as has been previously stated, passenger earnings since the beginning of the new fiscal year have been substantially increased by Exposition travel. The prospect of better earnings during the coming fiscal year is encouraging, but the extent and permanence of the improvement will depend upon the return of general confidence in the business world, the destruction of which, without doubt, has been the most potent influence that has held back a revival of business and investment in new enterprises.

Although railway operating revenues decreased \$8,654,583.47, or 6.25 per cent., total operating income decreased only \$2,005,753.26, or 5.32 per cent., owing to a decrease of \$5,908,424.62 in operating expenses, and \$791,351.73 in railway tax accruals. This reduction was effected in face of an increase of \$765,082.34, in price of locomotive fuel; of an increase of \$37,398.00 through higher wage schedules; of an increase of \$75,589.80 in valuation expenses; and of an increase of \$1,240,290.62 in charges to operating expenses for equipment depreciation and retirements, caused by including in this year's expenses \$1,190,432 to comply with Interstate Commerce Commission's classification, by which we were required to charge to operating expenses the depreciation portion of rental paid on equipment, which last year was charged to income account. But for these abnormal and uncontrollable charges total operating income would have shown an increase despite the large decrease in operating revenues.

These favorable results, attained under the most trying conditions as to new and intense competition, higher wages and fuel costs, increases in expenses due to costs of valuation, and increases in other operating expense items caused by compliance with new laws and rules of regulating bodies, in face of a decrease in volume of 6.63 per cent in freight and 4.94 per cent in passenger traffic caused by business depression, reflect great credit on your officers. For instance: Marked improvement was effected during the year in the use of locomotive fuel, each pound of which moved in freight service 6.83 per cent and in passenger service 2.85 per cent more gross ton miles than in the previous year. The saving thereby effected amounted to \$450,388 as compared with last year, and \$1,158,015 as compared with two years ago.

TRANSPORTATION OPERATIONS.

The results of the year's transportation operations compared with those of last year are as follows:

	This Year.	Last Year.	Increase or Decrease.	Per Cent.
Average miles of road operated	10,554.24	10,421.65	132.59	1.27

* The outstanding capital stock and funded debt include capital stocks and funded debt of Proprietary Companies of the par value of \$345,117,400 and \$81,010,849.53, respectively, a total of \$426,128,249.53, which securities are owned by the Southern Pacific Company or by Proprietary Companies, or are held in sinking funds of Proprietary Companies. The cost of these securities is included in the investments shown above. Of the said amount, stocks of the par value of \$249,653,161, which stand charged on the books at \$232,932,667.41, are pledged against the issue of Southern Pacific Company stock and bonds.

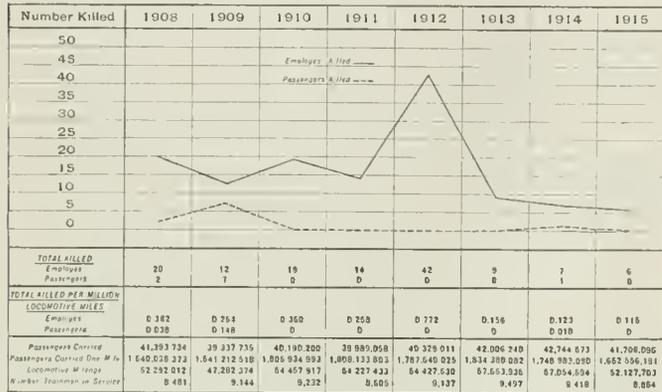

As shown by chart below, continued efforts were made to secure safer operation, as a result of which the number of fatalities and injuries was reduced and the payments on account of casualties and damages of all kinds were \$234,758.74 less than last year.

RAILWAY TAX ACCRUALS

The net operating revenue for the fiscal year ended June 30, 1915, amounted to \$42,111,832.78, whereof \$6,371,272.84, or nearly one-sixth, was paid in taxes. With an increase of 179.40 per cent in the mileage of all tracks operated during the life of the Company, taxes have increased \$5,511,767.78, or 641.27 per cent. The decrease in Railway Tax Accruals of \$791,351.73, or 11.05 per cent, compared with last year, is the result, principally, of charging to Miscellaneous Tax Accruals this year, in accordance with the new classification of the Interstate Commerce Commission, certain taxes which heretofore have been charged to Railway Tax Accruals; and to the decrease in such taxes as are based on gross operating revenue.

SAFETY OF OPERATION

During the past year, no passenger lost his life in a train accident, and, with but one exception, none has been killed in a train accident for SIX YEARS AND ELEVEN MONTHS, during which period 373,233,119 locomotive miles were run and 282,719,444 passengers were carried an average of 42.61 miles, or 12,045,555,744 passengers carried one mile. During the year 6 employees out of 8,664 lost their lives through train accidents in running 51,127,703 locomotive miles. Out of 38,833 employees engaged in pursuits not involving train movements, 15 lost their lives—an average of one fatality to every 810,300 days, or 2,200 years worked.

disposition in accordance with such policy as it may deem fitting under the circumstances* and at the same time secure to the defendants all the value the granting acts conferred upon the railroads; with the proviso that, if Congress does not act within six months, the Railroad Company may apply to the lower court for a modification of so much of the injunction as enjoined any disposition of the land or timber. In other words, if Congress does not act within the time named, the lower court should grant relief from the broad injunction against any sales of the lands, and should confine the injunction to sales in violation of the terms of the grant. It will be observed that any legislation which Congress may provide is subject to the condition that it must secure to the railroad all the value the granting acts conferred.

It would not be profitable or expedient at this time to speculate upon the possible action of Congress. The Railroad Company will be prepared to co-operate with Congress in securing appropriate modification of the original restrictions upon the sales of lands, BUT IT WILL INSIST UPON OBSERVANCE OF THE CONDITION THAT THE FULL VALUE CONFERRED BY THE GRANTING ACTS IS SECURED TO IT.

*The italics are ours.

FEDERAL LEGISLATION FORCING PACIFIC MAIL STEAMSHIP COMPANY OUT OF BUSINESS

The Southern Pacific Company owns 55.40 per cent of the capital stock of the Pacific Mail, an American steamship company, that has been operating lines of steamships on the Pacific ocean for the last 67 years.

The Act of Congress, approved March 4, 1915, generally known as the La Follette Act, becomes effective, as to vessels of the United States, November 4, 1915. The Company cannot continue operations under the terms of that Act without incurring heavy losses. Figures prepared by chartered accountants show that the Act would increase the expenses of its transpacific fleet as to wages and feeding crews, alone, by \$640,805 per annum. Other provisions of the Act, relating to lifeboat crews and to the Central America line, would swell this amount. The abnormally large surplus in 1915, due to higher rates following the withdrawal of Canadian Pacific and Japanese steamers in consequence of the European war, would not suffice to meet the increases in wages and feeding expenses only that the Act will demand. The stockholders of the Pacific Mail Steamship Company realized that the Company could not obey this oppressive law and exist, and, therefore, have authorized the sale of their vessels as a necessary condition precedent to the liquidation of the Company.

GENERAL

Dividends on the capital stock of your Company were declared during the year, payable as follows:

Table with 2 columns: Dividend description and Amount. Includes 1/2 per cent payable January 2, 1915; 1/2 per cent payable April 1, 1915; 1/2 per cent payable July 1, 1915; 1/2 per cent payable October 1, 1915.

Total \$16,360,464.32

The revolutionary disturbances on the line of the Southern Pacific Railroad Company of Mexico have continued. It is estimated that from the beginning of the Madero Revolution, in 1910, to June 30, 1915, the cost of property destroyed will approximate 3,124,000 pesos, equivalent to \$1,562,000. On account of these losses the Company filed claims with the Madero Government amounting to 287,953 pesos, all of which were approved but have not yet been paid. No further claims for property losses have been filed owing to the lack of a constitutional central government to which they could be presented. In addition to the above the Company has claims for freight and passenger service performed, for rental of road and equipment, and for material furnished to or confiscated by the various military authorities, amounting to 5,088,000 pesos. Bills for this amount (less 434,000 pesos received on account) will be filed with the proper authorities as soon as conditions permit. During the year only such maintenance work has been done as was absolutely necessary to render it possible to operate trains over those portions of the line which are open for traffic. The revenues during the year, including those derived from the transportation of troops and munitions of war, were slightly in excess of the expenditures for maintenance and operation.

In addition to the losses during the year from revolutionary causes, the Company suffered heavily from an unprecedented flood along the line in Sonora.

The continued revolutionary disturbances preclude any thought of completing, at the present time, the 99.47 miles of line from Tepic to La Quemada referred to in last year's report.

In addition to the completed lines of railway reported under Properties and Mileage, and the railway of the Southern Pacific Railroad Company of Mexico, hereinbefore mentioned, construction is progressing on the lines of the following companies, viz.:

CENTRAL PACIFIC RAILWAY:

Table with 5 columns: Line Name, Length of Projected Line (Miles), Track Completed (Miles), Grading Completed (Miles), Grading Progressing (Miles). Lists lines like Colfax to Blue Canon, Colusa & Hamilton, Willamette Pacific, etc.

The Board announces with sorrow the death, on May 19, 1915, of General Thomas H. Hubbard, a Director, and, on November 14, 1914, of Mr. H. A. Jones, Assistant Treasurer, of your Company. General Hubbard served as a Director and as Vice-President for many years prior to 1901, and was again elected a member of the Board shortly before his death. Mr. Jones was in the service from 1885 to the time of his death, serving as General Freight Agent, Freight Traffic Manager and Assistant Treasurer.

Under the pension system put into effect on January 1, 1903, seven hundred and forty-six employees are carried on the pension rolls of the rail and water lines. The payments to them for the year amounted to \$326,685.04.

By order of the Board of Directors, JULIUS KRUTTSCHNITT, Chairman of the Executive Committee.

GOVERNMENT ATTACK ON RIGHT TO CONTROL CENTRAL PACIFIC RAILWAY

In February, 1914, the United States, acting through the Attorney-General, brought suit in the United States District Court for the District of Utah, against the Southern Pacific Company and the Central Pacific Railway Company, to separate the two companies, on the ground that their union in one system was in violation of the Federal Anti-Trust Act of 1890, known as the Sherman law, and also in violation of the Pacific Railroad Acts, meaning the acts of Congress providing for the construction of the Union Pacific and Central Pacific Railroads. Since the last annual report, in which the nature of this litigation was explained, the testimony on both sides has been taken and the case has been fixed for argument in the lower court on December 1, 1915. It may be assumed that an appeal to the Supreme Court of the United States will be taken by the losing party. As the case will be submitted to the court for decision at an early date, it will serve no useful purpose to attempt now to predict the outcome.

GOVERNMENT ATTACK ON TITLE TO OIL LANDS

The last report contained the following statement:

"It follows, as a result of the decision in the Burke case, that proven fraud alone can avail to defeat our title to our oil lands. We know there was no fraud in obtaining the patents, and we may consider that the danger of losing the lands is now removed. Moreover, except as to a comparatively small quantity of land, in respect to which suits have already been instituted, the six years period of limitation is believed to be a bar even to a suit alleging fraud."

The Attorney-General of the United States, deeming it his duty not to abandon the pursuit of the Company's lands without a judicial investigation to determine whether or not our patents were fraudulently obtained, has renewed the litigation, specially alleging such fraud; and, in order to avoid the six years period of limitation, it has been further alleged that the Government was prevented from suing within the required time, by fraudulent concealment of its acts by the Railroad Company. There has been no final decision in these suits. The fact that they have been instituted does not lessen the confidence expressed in the last annual report as to our ability to sustain our title to the lands in question.

GOVERNMENT ATTACK ON THE TITLE TO THE OREGON AND CALIFORNIA RAILROAD'S LAND GRANT

In 1908 the United States brought suit against the Oregon and California Railroad Company and the Southern Pacific Company, to forfeit to the Government the unsold portion of the lands granted by act of Congress to aid in the construction of the Oregon and California Railroad. The ground of forfeiture mainly relied on was that some of the lands included in the grant had been sold in disregard of the requirements of the granting act, namely, that the lands should be sold to actual settlers only, for not more than \$2.50 per acre, and in quantities not exceeding 160 acres. The quantity of land involved amounted to about 2,300,000 acres.

The lower court decided in favor of the Government, but in June of this year the Supreme Court reversed the decision of the court below, and declared that the title of the railroad company to the unsold lands had not been forfeited and was unimpaired by the alleged grounds of forfeiture. The Supreme Court further decided that the lands were held subject to the original terms of the grant limiting sales to actual settlers, in quantities not exceeding 160 acres to any one purchaser and at prices not exceeding \$2.50 per acre. Recognizing that such restrictive covenants were not appropriate to lands of the character of those remaining unsold, the Court practically referred the matter to Congress, by enjoining any disposition of the unsold lands or of the timber thereon "until Congress shall have a reasonable opportunity to provide by legislation for their

*Illustrated.

The Lehigh Valley reports that at Catherine, N. Y., the town and the county authorities have joined in a request that the gates at a certain highway crossing be removed and an automatic signal installed instead; one of the audible-visible signals (enclosed disk) which are used extensively by this road, and were described

in the *Railway Age Gazette* June 19, 1914. This signal, lighted by acetylene, shows white, night and day, when no train is approaching. The request will be complied with. What varied reasons may have actuated the minds of these public officers we do not know; but their reported opinion, that a signal which is "independent of the human element, and always on the job" is safer than gates, with an attendant, corresponds with that of a

well-known careful and conservative railroad officer who, from a thorough analysis of the grade crossing accidents on a large road, reached this conclusion some years ago. The installation of gates, of watchmen and of automatic signals is often governed so much by immediate expediency that science and logic seem to be of no account whatever. But the subject ought to be explored. The whole grade crossing problem bristles with difficulties, and this is only one of them; but the difference in cost between a watchman or gate attendant and an automatic signal is so great that in every case where the expense of keeping men on duty is not justified, all necessary means should be employed to convince the municipal authorities that such is the fact.

The "Equipment and Supplies" column in the general news department of the *Railway Age Gazette* is once more beginning to look like "good old times." In the issue of October 22 the column reported orders for no less than 90 locomotives, 6,800 freight cars and 74,500 tons of rails, making the third week in October the best

thus far this year, with the exception of the third week in May, when the Pennsylvania placed its order for 50 engines and 16,145 cars. But in the issue of October 29 the record of the week before was shaded into insignificance. There were reported orders for 177 locomotives, 12,889 cars (counting only the orders since confirmed) and 40,000 tons of rails, omitting the Pennsylvania's order for 175,000 tons of rails, which came to our attention but a few hours after the paper had gone to press. It is interesting to observe that the orders for new locomotives reported in these two issues of the paper had a total value of approximately \$8,000,000; for passenger cars, \$240,000; for freight cars, nearly \$20,000,000, and for rails (including the Pennsylvania's order), \$8,000,000; a total of \$36,000,000 in contracts for rails and new equipment awarded by the railways of this country in a short space of but two weeks. Records kept by this paper show that the orders for locomotives, for domestic service only, this year to October 29 totalled 1,005, as compared with 848 reported to the end of October, 1914; that the domestic orders for freight cars totalled 71,398, as compared with 67,820 up to October 30, last year, and what is most important, that for the first time in 1915 orders for locomotives and freight cars passed those of 1914 for a like number of weeks. The "Equipment and Supplies" column is beyond all doubt the best barometer of conditions in the railway supply trade field.

The use of the telephone for train despatching is constantly increasing, and bids fair to become universal throughout the country; but if anybody thinks the Morse telegraph is dead and out of date, he is mistaken. A note printed in this issue tells how the Pennsylvania Railroad gave a dinner party at Philadelphia for

two of its Morse operators who took prizes at the San Francisco exposition. That, surely, is no sign that telegraphers are to be sent to the rear. Moreover, the increase in business just now is such that the Pennsylvania is hiring additional operators; and its school for station agents, at Bedford, Pa., which gives instruction in telegraphy and in other station-office work is still running, full blast, and looking for new pupils. A dinner may be a matter of sentiment; but hiring operators is cold business. The continued activity of this school is of interest, aside from any consideration of the technical differences between the telegraph and the telephone, in the evidence which it gives that the use of telephones is not to be made the occasion of a lowering of the grade of men (or women) to be employed for station work. It is not likely that the railroad company would be hiring many more telegraphers if satisfactory telephone operators could be hired at a much lower rate of pay. Looking only at the single task of sending and receiving messages or orders over the wire, the telephone makes it possible to use operators possessed of less intellectual ability than the telegraph requires; and in the first

\$36,000,000
in
Orders

Morse
Operators in
Demand

Automatic
Crossing
Signals

days of telephone despatching this was suggested as a possible means of saving money. But, as every railroad man knows, a station agent ought to be a very versatile person; and the simplification of a single one of his many tasks affords no justification for reducing his pay. In a less degree the same is true of one who does nothing but handle messages. Ability as a telegrapher may indicate a better mentality than is necessary for speaking into a telephone; but it is a mentality none too high for the general duties of a station operator.

SEVENTY YEARS YOUNG

IF the average ambitious young business or professional man of, say, 25 or 30 years, could determine what his career would be during the next 40 or 45 years, and what his position in life would be at the end of the time, he would be satisfied to determine that his career should be similar to Edward Payson Ripley's since he was 25 or 30, and that he should stand at 70 where Mr. Ripley stands now. Measured by every rational standard the Santa Fe's president at three score years and ten ranks among the most all-round successful men of his generation. The tribute paid by the dinner given him in Chicago last Saturday night on the occasion of his birthday was one of the most splendid ever received by any man and was as sincere and well-deserved as it was splendid.

Born in 1845, Mr. Ripley's life almost spans the history of railway transportation. Entering railway service 48 years ago, he has had his great difficulties to overcome and his hard battles to fight, but from then to now his progress in influence, in achievement and in reputation has been uninterrupted, so that to-day the prestige of his name and the authority of his wishes and opinions are greater than ever before. After a brief period of doubtful health a few years ago, he is again the very expression of hale robustness. Never did he have so many warm admirers and loving friends; never could he better enjoy a good book or a good game of golf. What more could any man ask for, much less hope for?

Our age and country are supposed to be addicted to commercialism. The American business man is often described as the personification of this spirit. The dinner to Mr. Ripley was attended by most of the leading railway men of this country and by many of the captains of industry and commerce in other lines. Everybody there knew that, measured by modern standards, Mr. Ripley is not a rich man. But nobody spoke or even thought of whether he is or not. He was honored as a business man who has demonstrated administrative efficiency of the highest order united to a disinterestedness which has caused him to think almost solely of how he could promote the interests of the investors who entrusted him with the management of their capital and of the public which his railway served. In other words, he was honored as one of the finest exemplars American industry has produced of that spirit of trusteeship which should dominate in the management of all large corporate enterprises, whether railways or industrial concerns. Mr. Ripley without his great ability would not stand where he does today. But neither would he stand there without the exalted sense of duty to his stockholders and bondholders and to the public, which he has always shown. And his possession and exemplification of the spirit of trusteeship have been as important elements in his career as his business capacity. With less ability and a less exalted sense of duty he might have made himself a much richer man, as many other men with less ability and a lower sense of duty have done. But while he would have been a richer man he would not have been so great a man. True greatness consists of character united to ability. Of the two elements character is very much the more important, and it was chiefly a tribute to character which was paid by those who gathered at the dinner to the head of the Santa Fe.

So long as even the business men of our country think so much more about how a business man serves others than about how he serves himself, it cannot truly be said that we are seriously dominated by commercialism. Probably in no other busi-

ness in this country do those engaged in it honor a man so little for serving himself and so much for serving others as in the railway business. That is the main reason why some railway men who have served themselves first and their stockholders and the public second are not in good repute among their fellows, while all railway men are uniting to do honor to the "Boss of the Santa Fe trail."

Mr. Ripley has achieved great things for those who have entrusted to him the management of their property. He has done far greater things for the public which their property serves. How much more he and the other great railway managers have done for the public than all the politicians, the legislatures and the commissions that have combined, in the name of the public, to impose restrictions and burdens on railway management!

NEW CONDITIONS IN THE PASSENGER DEPARTMENT

IN another part of this issue is given an account of the proceedings of the special meeting of the American Association of Passenger Traffic Officers held at French Lick, Ind., on October 26. This was one of the most satisfactory meetings ever held by the association, from the standpoint of the business transacted and the clear understanding reached on many important questions of common interest, and it is believed that the foundation was laid for a much more efficient consideration at meetings in the future of the matters with which the organization deals.

There has been in the past a tendency in some quarters to regard these meetings of the passenger officers as junkets, devoted largely to speech-making and entertainment, and the fact that the association is not a legislative body, and therefore cannot itself enforce its conclusions, but can only recommend them to the various territorial passenger associations for action, has sometimes made it appear that little progress has been made by it. But the record of the association for important achievements is a long one, and there has been, especially in the past few years, a marked tendency toward a more businesslike handling of the docket at each meeting. Not only was the determination to stick to business until the program was completed made manifest at the French Lick meeting, but plans were adopted which seem to lay the foundation for securing more prompt action on the recommendations of the association, by the appointment of a general conference committee to follow the more important subjects through the territorial associations. Moreover, the reference to the executive committee of a proposal to curtail entertainment and speech-making at future meetings indicated a disposition on the part of the members to do more serious work.

As Vice-President Daly of the New York Central pointed out in his address, there can be no question that the passenger department is assuming a new dignity in many ways, and that passenger earnings are coming to be considered as a more important factor in both gross and net revenues. The passenger department has often been regarded largely as a mere adjunct of the freight business, and this, in addition to the difficulty of ascertaining much about the cost of the service, has led to the conducting of the passenger service on an extravagant basis and has sometimes prevented serious consideration of some of the most important problems connected with its work. The passenger business, as well as the freight business in some respects, is passing through a stage of transition from a condition brought about largely as the result of a period of excessive competition when rates were made by men whose main consideration was the gross revenue and who possessed very little knowledge of the subtrahend in the form of operating expenses.

The recent orders of the Interstate Commerce Commission providing for a separation of the operating expense between freight and passenger service, and the decision of the Supreme Court that each branch of the service must stand on its own legs, seem likely to lead to new conditions in the passenger side of the business, which may help to secure a better return from the passenger service as well as give passenger officers a better opportunity of knowing something about the expenses chargeable to their depart-

ment, and consequently more about the relation of both rates and expenses to the net results. Many passenger officers feel that the fact that a good passenger man usually must be a good mixer has sometimes prevented recognition of their more solid qualities and the more serious features of their work, and are therefore looking forward to the day when the new conditions will prevail, and when the business under their supervision may be lifted from the position of an expense to that of a net revenue producer.

The fact that regulation of rates has passed into the hands of another set of men who know even less about the expense accounts than the railroad men, however much they may pretend to give consideration to the cost of service, has by no means taken their work out of the hands of the passenger officers; and the circumstance that they have been trained to keep in touch with the needs and wants of the public has in many ways adapted them for the very important work of educating the public regarding the conditions in the railroad business.

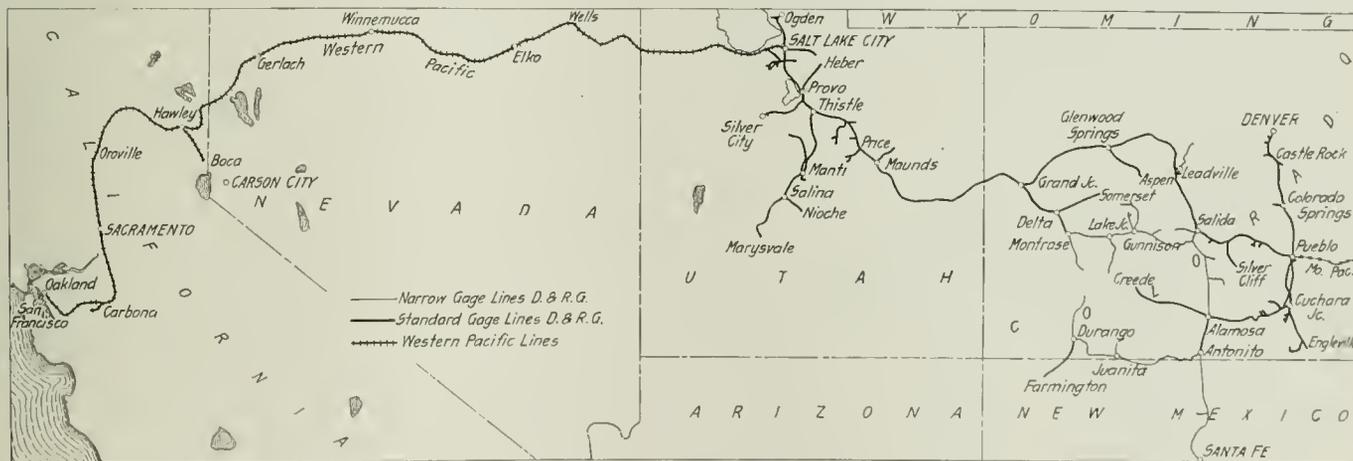

DENVER & RIO GRANDE

B. F. BUSH is president of both the Denver & Rio Grande and the Missouri Pacific, and he is much too good a railroad man to let the physical condition of a property in his charge run down if there is any way of getting the money to spend on needed maintenance. The fact appears to be, however, that the Denver & Rio Grande simply did not have and could not

Total operating revenues for the Denver & Rio Grande in the fiscal year ended June 30, 1915, amounted to \$21,823,000, a decrease as compared with the previous year of \$1,770,000. Total operating expenses amounted to \$14,290,000, a decrease as compared with the previous year of \$2,171,000. After paying fixed charges the company had a surplus of \$935,000, as against \$1,056,000 in the previous year. Cash on hand at the beginning of the year amounted to \$2,607,000, and at the end of the year to \$2,693,000. Leaving aside adjustments through profit and loss account the disposition of the surplus is accounted for by an additional investment in road and equipment of \$559,000, and the retirement of \$501,000 of funded debt and equipment trust certificates.

The Denver & Rio Grande guarantees the interest and sinking fund payments, but not the principal, of the Western Pacific's \$50,000,000 first mortgage 5 per cent bonds. The Western Pacific could not meet the interest charges on these bonds that fell due March 1, nor was the Denver & Rio Grande able to advance the Western Pacific the money. A receiver was appointed for the Western Pacific on March 5, and negotiations are now going on before a committee representing Western Pacific bondholders and the Denver & Rio Grande looking toward some readjustment of the relations between these two companies.

The Denver & Rio Grande operates an average of 2,571 miles of road. At the end of the year 1,791 miles of road operated was standard gage, and 786 miles was narrow gage.

The Denver & Rio Grande and the Western Pacific

get the money which it needed in 1915 for ample maintenance expenses. Maintenance of way expenses per mile of road in the fiscal year ended June 30, 1915, averaged \$988, which was equivalent to a reduction as compared with the previous year's maintenance expenditures of more than 25 per cent. If it had been possible to save sufficient in transportation expenses to meet the loss in operating revenue we may well believe from Mr. Bush's previous record and the showing he is making on the Missouri Pacific that this would have been done. As it was, a saving of 14 per cent was made in transportation expenses, with a decrease of only 7.62 per cent in the total ton mileage carried, and 7.48 per cent in the total passenger mileage carried. The average train load of freight was increased from 390 tons in 1914 to 433 tons in 1915, a remarkably good showing.

Repairs to some classes of buildings were almost suspended, as, for instance, fuel stations, on which \$58,000 was spent for repairs in 1914, and but \$4,000 in 1915, and shops and engine houses, on which \$94,000 was spent in 1914, and but \$26,000 in 1915. There was a very large saving made in track laying and surfacing, on which \$699,000 was spent in 1915, a decrease as compared with the previous year of \$255,000. On the other hand, \$578,000 was spent for ties, a decrease of but \$98,000, and \$128,000 was spent for rails, an increase of about \$9,000.

It will always be an expensive property to operate, so large a part of its mileage being in the Rocky mountains with heavy grades and difficult operating conditions. On the other hand, a large proportion of its traffic is coal and ore, and it received a ton-mile rate—1.186 cents in 1915, and 1.201 cents in 1914. The total tonnage of freight carried in 1915 was 10,103,000, of which 3,307,000 tons, or 32.7 per cent, was bituminous coal, and 3,342,000 tons, or 33.1 per cent, precious ore. Products of agriculture in 1915 furnished 638,000 tons, or 6.3 per cent of the total tonnage. This was 44,000 tons more than in the previous year. The loss in ore tonnage amounted to 955,000 tons, or 22.2 per cent. This reflects the depressed conditions in the copper industry in the first nine months of the year. In the last three months of the fiscal year conditions began to improve, and since the close of the year conditions in the copper markets have very greatly improved. The great natural resources of Colorado have only begun to be tapped as yet. There are vast possibilities for cattle raising, fruit growing and agricultural development in the state, as well as the further development of its gold, silver and copper mines. In time probably also the Western Pacific will be the means of securing a certain amount of through traffic which it will handle in connection with the Denver & Rio Grande, but with the physical characteristics of the country through which it

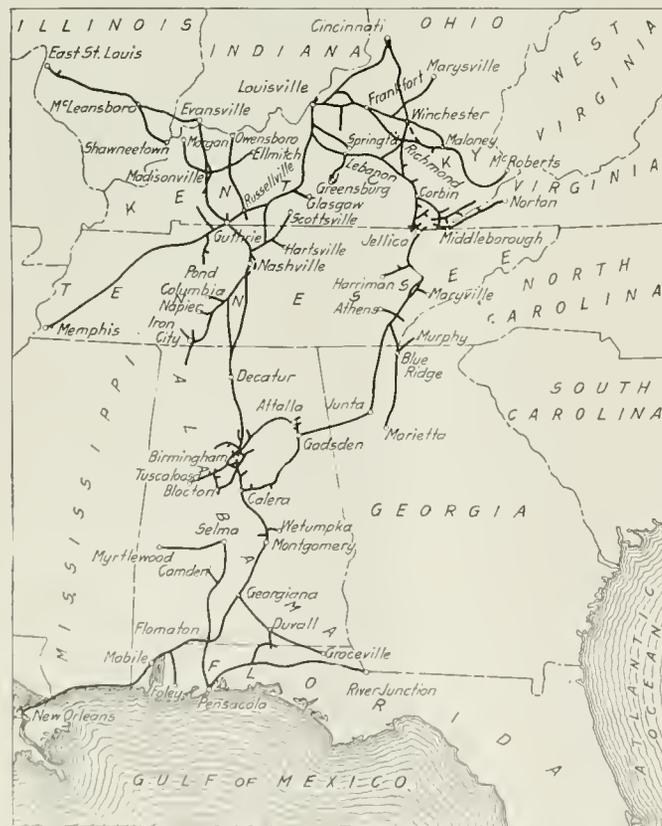

runs such as they are, and with the fact that the through business will have to be handled in competition with the Union Pacific, and therefore at rates which are low compared with what the Denver & Rio Grande can quite properly charge for its local traffic, it will probably be many years before the through business is very profitable.

The following table shows the principal figures for operation in 1915, as compared with 1914:

	1915	1914
Average mileage operated.....	2,571	2,583
Freight revenue.....	\$15,911,102	\$17,058,445
Passenger revenue.....	4,449,044	5,077,408
Total operating revenues.....	21,823,236	23,593,641
Maintenance of way and structures.....	2,541,539	3,406,852
Maintenance of equipment.....	3,992,351	4,318,512
Traffic expenses.....	477,425	497,431
Transportation expenses.....	6,290,955	7,311,843
Miscellaneous expenses.....	345,487	401,182
General expenses.....	651,215	585,069
Transportation for investment—Cr.....	9,302	60,320
Total operating expenses.....	14,289,671	16,460,569
Taxes.....	1,020,606	1,009,144
Operating income.....	6,511,607	6,123,564
Gross income.....	7,752,788	7,386,498
Net income.....	1,418,731	1,400,375
Appropriations for sinking funds and road and equipment.....	484,090	344,816
Surplus.....	934,640	1,055,559

LOUISVILLE & NASHVILLE

IF good business judgment, success in meeting competition, conservative financing, success in opposing or preventing unreasonable regulation, and economical operation had been combined for all the railroads in the United States in the same degree that they are in the Louisville & Nashville, the railroad problem would now be less pressing and dangerous for investors, railroad

The Louisville & Nashville

men and the general public than it is. This is strikingly brought out in a year like the one ended June 30, 1915.

The Louisville & Nashville operates 7,607 miles of road. The revenue from freight forwarded from the principal cities served by the road decreased as compared with the previous year, as follows: Cincinnati, 24 per cent; Louisville, 24 per cent; Owensboro, 17 per cent; Evansville, 25 per cent; Henderson, 19 per cent;

St. Louis and East St. Louis, 30 per cent; New Orleans, 6 per cent; Mobile, 21 per cent; Pensacola, 16 per cent; Selma, 25 per cent; Montgomery, 22 per cent; Birmingham, 25 per cent; Nashville, 11 per cent; Knoxville, 18 per cent. There was a loss of \$8,300,000, or 13.85 per cent, in operating revenues as compared with the previous year, the total operating revenues in 1915 amounting to \$51,606,000, or the smallest revenue since 1909. Operating expenses amounted to \$39,432,000 and net operating revenue to \$12,174,000, the smallest since 1908. After the payment of interest charges and rentals in 1915 the company had \$4,860,000 available for dividends. It paid 5 per cent on its \$72,000,000 stock, calling for \$3,600,000, and had, therefore, even in such a year of depression as 1915, a fair margin of safety. In 1914 there was \$6,645,000 surplus available for dividends and the company paid 7 per cent on its stock calling for \$5,040,000. Thus, in an average year the owners of the property paid the interest on the borrowed money put into it, took a profit of 7 per cent on the face value of their own investment, and invested in the property some additional capital in the form of surplus. In a bad year they cut expenses, took 5 per cent instead of 7 per cent profit, and maintained the policy of putting additional capital into the property in the form of surplus.

Total operating expenses in 1915 amounted to \$39,432,000, a decrease as compared with the previous year of \$5,551,000. Transportation expenses in 1915 amounted to \$17,450,000* and in 1914 to \$20,638,000, a decrease of \$3,188,000. The total number of passengers carried one mile was 499,879,000 in 1915, as compared with 577,421,000 in the previous year, or a decrease of 13.43 per cent. Passenger-train mileage amounted to 10,352,000 in 1915, a decrease of 2.79 per cent, as compared with the previous year. By far the greater part of the \$3,188,000 saving in transportation expenses was made, therefore, in freight service. The total ton mileage carried amounted to 5,144,000,000 in 1915, as against 5,512,000,000 in the previous year, a decrease of 6.67 per cent. The mileage run by revenue freight trains amounted to 14,162,000 in 1915, as against 18,004,000 in 1914, or a decrease of 21.34 per cent. The average trainload was 347 tons in 1915, as against 297 tons in the previous year, an increase of 17.16 per cent. This is a showing that the operating department may well be congratulated on. It is remarkably good.

The Louisville & Nashville divides its expenses between freight and passenger service. On the basis of this division the expenses per revenue train mile in freight service were 191.89 cents, comparing with 179.47 cents in the previous year, an increase of 6.92 per cent, as compared with an increase of 17.16 per cent in tonnage per train mile. In other words, the expense per ton per mile was reduced from 0.605 cents in 1914 to 0.553 cents in 1915, or by 8.60 per cent. The expenses per passenger-train mile were 99.99 cents in 1915, as compared with 101.60 cents in 1914, a decrease of 1.58 per cent.

It is interesting to note that the earnings per passenger-train mile in 1915 were \$1.21, and of freight, \$2.50, while expenses were 100 cents in passenger service and \$1.92 in freight service, leaving a net per train mile of 21 cents in passenger service and of 58 cents in freight service.

The company increased its funded debt outstanding in the hands of the public approximately \$6,000,000, by the sale of \$7,500,000 Lexington & Eastern first mortgage 5 per cent bonds and the retirement of various small amounts of bonds and equipment trust certificates. Approximately \$2,706,000 was spent for additions and betterment to road and \$2,019,000 for additions to equipment. The company had on hand at the end of the year \$9,894,000 cash and \$4,156,000 time drafts and deposits. At the beginning of the year there was \$13,710,000 cash, with no time drafts and deposits. There are no accounts and bills payable.

The Louisville & Nashville has been one of the very few railroad companies to charge depreciation on its road as well as on its equipment. The Interstate Commerce Commission rules for accounting have permitted such a charge ever since 1907 and

* The 1915 figures are in accordance with the new classification and the 1914 figures are not revised, but the totals for general accounts, such as transportation, are comparable.

now specifically provide for such a charge, but do not require it. The Louisville & Nashville had up to June 30, 1915, accrued \$10,718,000 depreciation on its road, which stands on its books at a cost of \$191,498,000, and had accrued \$18,684,000 on equipment, which stands on the books at a cost of \$54,522,000. This is very liberal depreciation. No one would question the soundness of this kind of accounting in a private business, and if a company is strong enough to do so, it would seem the sound method of procedure for a railroad corporation.

In the complaints against rates charged by the Louisville & Nashville brought before the Interstate Commerce Commission the commissioners themselves would probably acknowledge that the company was better able to defend its rates than the majority of other railroad companies, which is a convincing argument that the Louisville & Nashville is not charging excessive rates. Its shippers and the traveling public served by the road are, as a matter of fact, getting better service than would be possible if the company was not as financially strong as it is. The \$7,500,000 bonds were sold at a total discount of \$394,000, so that the railroad company secured new capital on about the same basis as the combined governments of England and France.

The following table shows the principal figures for operation in 1915, as compared with 1914:

	1915	1914
Mileage operated	7,607	7,507
Freight revenue	\$36,953,794	\$42,868,078
Passenger revenue	10,859,047	13,082,509
Total operating revenue	51,606,015	59,682,778
Maint. of way and structures	8,993,389	9,323,206
Maintenance of equipment	10,310,563	12,239,795
Traffic expenses	1,349,705	1,334,264
Transportation expenses	17,449,812	20,638,428
Miscellaneous expenses	212,660
General expenses	1,249,517	1,247,015
Transportation for investment—Cr.	133,857
Total operating expenses	39,431,789	44,782,708
Taxes	2,136,713	2,600,288
Operating income	10,031,448	12,288,155
Gross income	13,461,044	15,176,142
Net income	4,951,764	7,050,139
Appropriations	91,622	405,275
Dividends	3,600,000	5,040,000
Surplus	1,260,142	1,604,864

DETROIT, TOLEDO & IRONTON

A NEW company on March 1, 1914, took over the Detroit, Toledo & Ironton from the reorganization committee which had bought the road under foreclosure sale. The first annual report of the company is for the fiscal year ended June 30, 1915. Under the reorganization \$8,000,000 adjustment mortgage 5 per cent bonds were issued, on which interest charges up to January 1, 1919, are conditional on earnings. A first mortgage was placed on the property to secure an authorized issue of \$1,000,000 5 per cent bonds, of which \$950,000 were sold to raise money for the rehabilitation of the property. In the fiscal year ended June 30, 1915, the company fell short by \$132,000 of earning its operating expenses and the interest on these first mortgage bonds.

A change of policy, however, was adopted in December, which it is thought will greatly increase net earnings. The company cancelled all its tariffs on coal and coke tonnage which provided for hauling this freight at less than three mills per ton per mile. The new management's analysis of the situation was that by accepting coal at rates which yielded from two to three mills per ton per mile the road had to handle traffic that was unremunerative, and through congesting the road in September, October, November and December, when the greatest movement of other freight occurred, it made operation so expensive as to preclude the possibility of a reasonable operating ratio in the months of heaviest traffic. The experiment is a particularly interesting one.

The Detroit, Toledo & Ironton operates 441 miles of road, of which 341 miles is main single track, from Detroit to Ironton. From Ironton to the Kenova bridge across the Ohio river is the main line of the Norfolk & Western. Kenova is on the main line of the Chesapeake & Ohio, a short distance west of the

junction of the Elkhorn branch of the Chesapeake & Ohio with the main line. The Elkhorn branch at its southern extremity connects with the newly built extension of the Carolina, Clinchfield & Ohio. There is a route, therefore, from the Great Lakes to Charleston, S. C., on the southeastern seaboard. From the map which the Detroit, Toledo & Ohio includes with its first annual report it would appear that the company intends to make a bid for traffic over this route. A very early project in railroad planning in this country was for a so-called three C's route from Charleston to Chicago via Cincinnati. The difficulties of getting over the Blue Ridge and Allegheny mountains were so great that this early project was never carried out. The Clinchfield overcame these difficulties and such a route is now open. It would seem as if there were possibilities of developing a traffic in manufactures and merchandise southbound and in fruit and vegetables northbound over the route made by the Clinchfield and the Detroit, Toledo & Ironton.

Heretofore 56 per cent of the total tonnage carried by the Detroit, Toledo & Ironton has been products of mines, and a large proportion of this has been coal, on which the company got but a very meagre ton mile rate. The total tonnage of all classes of commodities carried in 1915 was 2,449,000, and of this, 30 per cent was manufactures as compared with 23 per cent in 1914. The freight density (ton miles per mile of road) in 1915 was 796,000 tons. The average trainload of freight was 477 tons in 1915 and 439 tons in 1914. The total operating revenue per mile of road was \$4,005 in 1915, comparing with \$3,431 in 1914. If the operation of the road is ever to prove profitable to its stockholders it will have to earn very much more than \$4,000 a mile. The present management, however, believes that the way to increase the earnings per mile is not to make a bid for traffic at any price, but to refuse traffic which cannot be handled at some margin of profit and to try to develop, through service and otherwise, other classes of traffic which will yield a margin of profit.

A comparison is made in the annual report of the company for the fiscal year ended June 30, 1915, between the operation in the last four months and the first eight months of that fiscal year. In the last four months the coal and coke tariffs which were considered unprofitable had been canceled. The revenue from coal and coke was \$77,000, or 16 per cent of the total revenue for the four months, whereas in the eight months previous the revenue from coal and coke had been \$522,000, or 41 per cent of the total revenue for that period. Other freight revenue in the four months amounted to \$336,000, or 69 per cent of the total revenue, and in the eight months to \$561,000, or 44 per cent of the total revenue. During the four months operating expenses amounted to \$400,000, or an operating ratio of 82 per cent, while in the eight months operating expenses amounted to \$1,233,000, or an operating ratio of 96 per cent. Thus, in the four months there was \$89,000 net operating revenue, while in the eight months there was but \$47,000 net.

Whether or not the management's diagnosis of the situation is correct cannot be definitely decided until two entire years of operation, one under the old system and one under the new, can be compared. All the indications are, from the twelve months' figures which are given, that the management is right.

The following table shows the principal figures for operation in 1915. No figures for 1914 are given because there are no directly comparable figures which are available:

	1915
Mileage operated	441
Coal and coke revenue	\$599,216
Other freight revenue	897,039
Passenger revenue	161,386
Total operating revenues	1,767,580
Maintenance of way and structures	231,839
Maintenance of equipment	275,478
Traffic expenses	48,400
Transportation expenses	1,009,288
General expenses	69,417
Total operating expenses	1,631,413
Taxes	88,200
Operating income	77,966
Gross income	123,887
Deficit	132,134

Letters to the Editor

SUPERHEATER LOCOMOTIVES AND GRADE REVISION

CHICAGO, ILL.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

In your issue of October 8, 1915, page 637, I note a letter by M. E., in which he expresses some doubts as to the ability of a practical man to assimilate some of the statements made in my article on "Superheater Locomotives and Grade Revision" in your issue of September 10, 1915, page 469. I am afraid that the practical man has not applied his practical knowledge to the case in point. The first thing I notice is the diagram on page 637. In this diagram the ordinates are spaced for "Tractive effort—pounds." The A. R. E. A. curves are taken from the tables on pages 469 and 470 of my article above referred to. These two tables show the *drawbar-pull*, the drawbar being at the rear of the tender. This is not tractive power at all, as subtractions have been made for the different kinds of friction usually found in the practical operation of a locomotive.

Another important feature of these figures seems to have been overlooked. These curves are only applicable to the locomotive under the condition of firing given. For the information of those interested in methods of calculation it may be stated that they are based on actual tests, the figures for the saturated steam locomotive being based on the tests made at the St. Louis World's Fair and those for the superheater being based on tests made at the Pennsylvania Railroad's testing plant at Altoona. The only assumption that has been made is that a pound of coal will evaporate a certain number of pounds of water when the grate areas and heating surfaces have a given ratio, this factor being ascertained by the tests cited. It has been found in the Altoona tests that a pound of coal will generate about the same weight of saturated and superheated (200 deg.) steam. However, the weights for a given volume are different. The basis I have used is coal consumption, the same amount of 11,000 b. t. u. coal being used per hour on each locomotive.*

The saturated steam locomotive will have to shorten its cut-off at 5 m. p. h., but the superheated steam will fill the cylinders at 8 m. p. h. At 5 m. p. h. for the saturated steam and 8 m. p. h. for the superheated steam, the two should have the same drawbar-pull. Each curve then follows laws of its own; the superheated steam being more nearly a perfect gas, the drawbar-pull does not decrease as rapidly. As to the difference between the two at 5 m. p. h., I do not know where "M. E." gets his figures. He finds a difference of 3,966 lbs. tractive power. The difference shown by Tables I and II in my article is 966 lbs. drawbar-pull. I am unable to say where the 3,000 lb. came from and must plead not guilty; 966 lb. drawbar-pull is a very small difference, and I very much doubt if any of our eagle-eyed practical men would be able to find it in actual operation. Apparently it is due to the superior "fluidity" of the superheated steam. In the calculation given the difference between the hauling capacity of the two locomotives on a 0.5 per cent grade at 5 m. p. h. is only 62 gross tons.

The A. L. C. curve plotted with these curves is misleading without an explanation. These two curves show the drawbar-pull of a saturated and superheated steam locomotive of the same drawbar horsepower up to 20 m. p. h. This simply means that less coal is fired per hour for the superheater than for the saturated steam locomotive. I have made an entirely different assumption, that is, that they both use the same amount of coal per hour, this amount being about the capacity of a good fireman. There will be a saving per gross ton mile but not per hour. The boiler horsepower of a saturated steam locomotive can be increased say 30 per cent, by adding a superheater, if the

heating surface is not lessened, and the same amount of coal is fired per hour. Operating conditions may be such that the old locomotive was powerful enough. In that case a large saving in fuel will be shown. In other cases the trains will be loaded heavier and faster time made. In this case the saving will be partly in fuel and partly in other operating expenses. A case is conceivable in which a line may be so congested that the extra power will be used entirely for speed and there will be no saving in fuel. However, there will be a saving elsewhere, probably in overtime.

"M. E." uses the following language: "At this speed the A. R. E. A. curve for *tractive effort* for a saturated steam locomotive shows 5,762 lb. From a practical point of view such figures will not substantiate service requirement." I agree with him exactly, but in no place have I used the term "tractive effort." The *drawbar-pull* is 5,672 lb. In the eastern territory with 15,000 B. t. u. coal this would be about 7,700 lb. In the first case $5,672 \div 5.4 = 1,051$ tons behind tender would be the tonnage, and in the second case $7,700 \div 5.4 = 1,425$ tons behind tender would be the tonnage at 35 m. p. h. maintained speed on a level grade and not the 323 tons given by "M. E."

This gets us around to the point of train resistance per gross ton for different average weights of car. "M. E." states that very few support the theory that train resistance does not increase between 4 and 30 m. p. h. I have seen votes taken where it was unanimously decided that it did not increase—also the reverse. As a matter of fact, this depends largely upon the kind of track. With 100 lb. rail the increase will not start until a higher speed is reached than for light rail and track. I have seen dynamometer records that ran as low as 4 lb.; others as high as 8 lb. In this problem I took the highest grade track. If "M. E." will plot a large number of points showing this data taken from dynamometer charts, he will have them spread over an area so large that it would not seem worth while to put a curve through them, although it can be done mathematically. The principal thing to do to get comparable figures is to get similar conditions. "M. E." also inquires, "Also in the case of time freight trains, do such theoretical calculations bear out practical service runs?" Page 469 of my article limited the calculations to slow freight. "Such theoretical calculations" may be made for time freight and may be expected to give correct results if the theory is understood and applied correctly.

In conclusion, I wish to disclaim any intention of asserting that there is any such thing as general economics in cases of this kind. Engine districts vary widely, and figures made for one have no relation to figures made for another. The same method may be used, however, and this is the question of greatest importance. Calculations of the sort which I have gone into only expect to get at a yearly average. Daily runs and similar special cases may be above or below the figures given. Some seem to object to "theoretical" computations in matters of this sort. There can be no other when one line has not been built. When a railroad finds that it cannot do business economically over an engine district it is going to do something about it if it has the money. That any calculations made are not infallible is well known, but it has always seemed to me that the correct point for a start in such matters is the locomotive. The whole district must be considered and not one or two grades.

PAUL M. LABACH.

THE PROGRESS OF THE AUSTRALIAN TRANSCONTINENTAL RAILWAY.—In a recent debate in the Victoria parliament on the Kalgoorlie to Port Augustus Railway Loan Bill, the minister for home affairs remarked that he had been informed that the railway would be opened for traffic by the end of next year. Up to July 17 between 700 and 800 miles of track had been laid out of the total length of 1,053 miles. Rails weighing 80 lb. per yard were being used, and the scheme allowed for a speed of 30 miles per hour, the curves and general characteristics of the railway permitting this speed.

* The curve marked A. L. C., shown by "M. E.," seems to have been made for 5,500 lb. of coal per hour. The B. t. u. apparently is taken at about 14,000.

Dinner to E. P. Ripley on Seventieth Birthday

Three Hundred Railroad Men and Other Associates Honor Santa Fe President After Twenty Years in Its Service

One of the most remarkable tributes ever paid to a man by his friends, associates and competitors was the dinner to Edward Payson Ripley, president of the Atchison, Topeka & Santa Fe, on the occasion of his seventieth birthday, which also marked for him the completion of 20 years as the head of the Santa Fe system.

The dinner was given by the officers and the directors of the company, at the Blackstone hotel, Chicago, on October 30, and was attended by over 300 personal friends, railroad men and other business associates of Mr. Ripley, including 200 Santa Fe men from all parts of the system, some of whom had been connected with the road throughout its history, and nearly all of the most prominent railway officers of the United States.

The banquet hall was decorated with flowers, foliage and fruits representing the products of the 13 states through which the Santa Fe system runs. An entire refrigerator car was required to transport them to Chicago. One of the most striking features of the decorations was a large Santa Fe emblem in electric lights, the mission cross, bearing the words, "Santa Fe," which vanished and were replaced by "Ripley."

Reverend Bernard Kelly, of Topeka, an old friend of Mr. Ripley, delivered the invocation at the dinner. The speakers were: Charles S. Gleed, president of the Missouri & Kansas Telephone Company; Victor Morawetz, formerly general counsel and chairman of the executive committee of the Santa Fe; George B. Harris, chairman of the Chicago, Burlington & Quincy; Frank Trumbull, chairman of the Missouri, Kansas & Texas, and the Chesapeake & Ohio; Gardiner Lathrop, general solicitor of the Santa Fe, and Mr. Ripley.

Walker D. Hines, general counsel of the Atchison, Topeka & Santa Fe, presided as toastmaster. In introducing

the first speaker, he referred to the electric light emblem, saying:

"When we speak of Mr. Ripley, we think of the Santa Fe, and when we speak of the Santa Fe, we think of Mr. Ripley. The two names seem almost interchangeable. The identity is so complete that we are almost disposed to assume that Mr. Ripley was born president of the Santa Fe, but such is not the case.

"Mr. Ripley was born and educated in Dorchester, Massachusetts, and then he worked four years in a wholesale dry goods house in Boston. At the age of 23, he began his railroad service, and for two years he was contracting agent for the fast freight line of the Pennsylvania System. Then he spent 20 years in the

service of the Burlington. He began as a clerk in the general eastern agent's office at Boston, later becoming general eastern agent. Then he became general freight agent, then traffic manager, and then the all-around qualities of his railroad capacity received a very striking recognition, for although all his training had been in the traffic department, he was transferred to the operating department and made general manager. In 1890 he left the Burlington and went to the St. Paul as third vice-president, in charge of traffic, and stayed there until January 1, 1896. Then began the presidency of the Santa Fe. At that time he had lived in Chicago for 18 years and he had been in the railroad business 28 years. He knew the traffic end and the operating end, and he knew the West.

"I want you now to hear what the Santa Fe's experience was before it came with Mr. Ripley. The best qualified man in the country to tell you that is my fellow-director Charles S. Gleed, of Topeka, Kan."

Mr. Gleed spoke on the subject, "The Old Santa Fe and the New," comparing the present situation of the road with the conditions that existed before the receivership.

Mr. Hines then introduced Victor Morawetz, stating he was the most active man in the reorganization of the Santa Fe, and that during the formative period of the new Santa Fe he was Mr. Ripley's most intimate associate in the financial management of the company. Mr. Morawetz spoke on the problems confronting the property when Mr. Ripley took charge of it and on the policies which Mr. Ripley put into effect, saying in part:

VICTOR MORAWETZ ON THE RE-ORGANIZATION OF THE SANTA FE

It is difficult at this time to realize the hopeless depression in business and the despondency in financial circles which prevailed at the time of the reorganization of the Santa Fe

system in 1895. It was only through the assistance of Messrs. Baring Brothers & Company, of London, that it became possible to form a syndicate to underwrite the payment.

It is small wonder, therefore, that the reorganization committee failed to foresee the great future of the Santa Fe system and to make adequate provision for its future capital requirements. For a number of years after the reorganization the work of reconstruction was seriously handicapped, because the only securities the company could sell were its general mortgage bonds, and the amount of these that could be issued was wholly insufficient. It was only after the commencement of the period of unparalleled and nation-wide business prosperity about

E. P. Ripley

15 years ago that the company's credit became sufficiently established to enable it thereafter to raise the new capital that was needed by the sale of debentures, convertible bonds and bonds secured by newly constructed lines.

All the railroad reorganizations planned at the time of the Santa Fe reorganization, and nearly all the reorganizations ever planned in the United States, have been faulty because they failed to make adequate provision for future capital requirements. Rarely if ever have railroad reorganizers realized the abounding vitality and the unceasing growth of the country and rarely have they appreciated sufficiently that in the United States a railway system must develop and grow with the country which it serves—that it must ever expand its capacity and improve its service.

Undoubtedly there will recur temporary periods of depression during which railroad earnings will fall off and railroad companies will find it impracticable to raise the new capital which they need. But, even during these periods of depression, population increases, the development of the country proceeds and wealth accumulates, and we know from experience that after each period of depression the prosperity of the country and the demand for additional railway facilities grow by leaps and bounds. Every railroad system, therefore, must be prepared, from time to time, to raise large amounts of new capital to enable it to furnish the additional facilities which the development of the country demands. It is, however, obvious—as obvious as a church by daylight—that in the long run neither the Santa Fe company, nor any other railway company in the United States, will be able to raise the necessary new capital, unless investors in securities feel assured that railroad companies will be permitted by the governmental authorities to charge for their services enough to enable them to pay the increasing costs of labor and of materials, and also to pay a satisfactory return to the holders of their bonds and stocks. Mr. Ripley has built up and perfected a railway system that serves the country well; but whether his work shall endure and in future years the Santa Fe system shall continue to serve the needs of the country will depend on the policy which the people may adopt and enforce through their railroad commissions.

When Mr. Ripley took charge of the Santa Fe system his first task was to improve the physical condition of the road and equipment as fast as the means at his disposal permitted. The Santa Fe soon became one of the leaders in the introduction of the latest improvements of equipment and machinery and generally in scientific railway management.

The results were due not only to Mr. Ripley's exceptional ability and sound judgment as a railway manager, but also to his rigid enforcement of those elementary principles which are essential to enduring success in the management of any business. By rule and by example he enforced the principle that no officer should have any interest that might be antagonistic to the interests of the company and that all should co-operate with singleness of purpose to secure the ultimate welfare of the company, without regard to any outside interest or influence. It was his view also that the finances of a great railway system should be managed with the utmost conservatism and regard for the safety of its security holders.

Mr. Ripley has done more than to build up a strong and prosperous railway system. He has helped to develop and enrich a large section of the country and, by his influence and his example, he has helped to extend sound and business-like methods of railway management throughout the United States.

Mr. Hines then introduced George B. Harris, who had been long associated with Mr. Ripley when both were on the Burlington and who was president of the Burlington during much of the time that Mr. Ripley has been president of the Santa Fe. Mr. Harris spoke on Mr. Ripley's relations with the presidents of other railroads, praising his fairness in his relations to his competitors.

Frank Trumbull was asked to speak particularly with reference to the public aspects of railroad problems and Mr. Ripley's relation thereto. After paying a tribute to Mr. Ripley, he said:

FRANK TRUMBULL ON RAILROAD REGULATION

The railroads of the United States as a whole are regulated by forty-nine interlocking directors—forty-eight states and the federal government. Freight cars go everywhere, shippers determine the routing of their freight; the Interstate Commerce Commission can determine divisions of through rates, and if the railroads of Texas, for example, be crippled, there is impairment and waste not only in Texas, but in every state.

Omitting figures, but stating facts, what is the situation of the railroads of the country, considered as a whole? Their net operating income for the fiscal year ended June 30, 1915, was not as great as in 1910, 1911 or 1912, and the loss in comparison with 1913 was even greater. There are now abundant crops and various signs of returning prosperity, but who shall say whether this is permanent or only hectic?

In the last four years probably not less than fifteen hundred million dollars have been dedicated by private investors to the public service in the form of additional railroad property, but the net operating income of the railroads has been diminished. Is it any wonder that the investor feels that he may continually be in a dentist's chair, and that there is practically no appetite for fresh railroad development, particularly at a time when investors can get high rates of interest and big profits otherwise? If fifteen hundred million dollars have been required during years of restricted business, why not that much or more in the years that are immediately ahead of us—years of possibly greatly increased traffic? Where is the reserve preparation for it? May not the shippers, while saving in rates, have risked their profits? I do not argue the question of government ownership. Government has owned the wagon roads of this country for three hundred years and they are sufficient answer. It would be interesting, would it not, to have a governmental valuation of the wagon roads showing, as in the case of the railroads, the original cost to date, the cost of reproduction, etc.

Many sincere and honest citizens ask why should not the railroads accept the same vicissitudes as general business. This is a proper question to ask and a proper one to answer. Government puts limitations upon the prices which railroads may charge and requires them to remain in business every day in the year whether or no. These are the two important features which differentiate the railway business from other business of the country. France has long since recognized this by guaranteeing to railroad owners minimum regional dividends. Great Britain has recently recognized it in temporarily taking over the management of its railways, by guaranteeing to their owners returns equal to those prior to the war. Is not security of investment as desirable for the peaceful development of a people as for war? Under present conditions, investors take all the risk of the ordinary fluctuations of business and the risk of contradictory and confusing regulation besides. And that, of course, means pure, unadulterated speculation.

I make no protest against regulation of railroads by public authority. Wise regulation is in the public interest, but if regulation is to be successful it must be responsible; it must be consistent; it must provide some sort of assurance to future investors as to treatment which they will receive. If the treatment is niggardly, even in a few states, railroad investment will be restricted. If the treatment is liberal, railroad investment and enterprise will be stimulated. The fundamental weakness of the present situation is that by reason of the inconsistency, the complexity, and often the contradictions, involved in the present system of regulation, the railroad officer cannot make any promises as to the treatment which investors in his property will receive. That is a difficult position in which to put any conscientious man, seeking additional capital. Again, no matter how well or satisfactorily the Interstate Commerce Commission may do its work, the entire fabric can be disarranged through counteracting influences of state commissions and legislative bodies.

In introducing Gardiner Lathrop, Mr. Hines said:

"The railroads have become a national institution and it is of vital importance to the public that the whole scheme of government regulation should be studied and overhauled.

When the time comes to do this I believe the public will realize the importance of giving careful consideration to the views of men like Mr. Ripley. It is inconceivable that the advice of men with such qualifications will be rejected in any public study of railroad matters. It may be said that the advice of railroad men is impaired by their self-interest, but I deny that any class in our country has a more direct or a more comprehensive interest in the successful rendition of public transportation service than the railroad men themselves. So I believe that one of the greatest functions of Mr. Ripley's career is still before him, and that is to aid in the improvement of governmental regulation.

"But now we come to the relationship which, though last in our arrangement here, is first and fundamental. It is where all of Mr. Ripley's great qualities appear the greatest and all his lovable qualities appear the most lovable, and that is his relationship with his officers and his employees."

An abstract of Mr. Lathrop's address follows:

GARDINER LATHROP ON RELATIONS WITH EMPLOYEES

It is my privilege tonight to speak of Mr. Ripley's relations to his employees, including officers in that good generic term. To his officers he has always given the fullest measure of confidence, the largest power of initiative and the greatest independence of action, at the same time holding them to the strictest accountability for the proper performance of their duties, and subjecting them to just but kindly criticism whenever the occasion demands it. Conferences upon matters of importance are invited and counsel freely furnished from the storehouse of a mind which, after years of study and experience, has become master of every department of railway service.

His dominant characteristics in dealing with his employees are justice and fairness, and like all big men he is plain in manner, easy of approach and always accessible, ready to hear and to heed what any employee, no matter what his position, may have to say. Every man is assured of fair treatment, and, if deserving, he receives promotion in the line of service. Not long ago the chief executive of another system wrote Mr. Ripley to suggest a man for vice-president. Mr. Ripley replied that he found his vice-presidents among his own employees and that his correspondent should do the same, thus rewarding good service and furnishing an incentive to all employees to do their work faithfully, in the knowledge that when their time comes they will be recognized.

It has been his policy, not only to guard the lives and limbs of the men under him by the promulgation of all necessary rules and the adoption of all safety devices of value, and the creation of a separate department to have this matter of safety in special charge, but also to foster a comprehensive hospital system, the support and management of which are participated in by both employees and officers.

In addition to this, the company several years ago, at his instance, established a pension system, being a pioneer in providing for a liberal minimum, whereby faithful employees, grown grey in the service, are enabled to retire at 65 upon a certain percentage of their wages, and to support their families and themselves in reasonable comfort.

But to my mind, the crowning act of his administration, in his relations with his men, was the establishment, at his suggestion and upon his initiative, of the system of reading rooms and club houses, not for the protection of life and limb, but for the mental, moral and social betterment of the men and of their wives and children as well.

At these reading rooms and club houses, which now represent a large investment, are provided by the railway system newspapers, periodicals and good books, baths and beds at a nominal price, and at Needles, on the desert, where the thermometer is always high, a capacious plunge, rational amusements and, from time to time, lectures and concerts. Here, not only the men, but their wives and children, have a place to go and read and get diversion, and become acquainted with each other. As a result, the saloon has been largely eliminated from the life of the men, their standards of living have been raised, and their inter-

course with their fellow-employees rendered more friendly.

But above and beyond all, this substantial manifestation of interest in their welfare has made the Santa Fe men one great family, with Mr. Ripley as the acknowledged head, and with the common object of good service to be striven for by all. As a result, a genuine sentimental attachment for the road has been developed with a loyalty and devotion to the company's interests unsurpassed, and the corporation, no longer soulless, has become instinct with a vitality whose spark was originally struck by our president, and whose development has been zealously fostered by him.

If let alone, the Santa Fe employees are reluctant to strike. When trouble threatened once, some time ago, the superintendent of the reading rooms overheard some men talking. One said, "As long as that man Ripley's heart is at the head of the Santa Fe, there will be no trouble." This tells, in awkward phrase, perhaps, the real secret of Mr. Ripley's success as the chief executive of a great railway system. He has a head capable of conceiving big things, with rare administrative power and an indomitable will to carry them into execution. But beneath the rugged exterior of this manly man beats a big heart, full of the milk of human kindness—safeguarding the lives and limbs of his employees, caring for them when sick and injured, ministering to the higher and better life of themselves and their families, and providing for their reasonable support when old age compels retirement. What wonder that the men admire, revere and love their chief!

MR. RIPLEY'S ADDRESS

As the 70 candles on the birthday cake burned low, Mr. Ripley addressed the gathering as follows:

Such things as have been said of and to me tonight are usually reserved for men's tombstones—perhaps on the theory that a disembodied spirit may read them without emotion; but being still in the flesh and human, they are to me pleasantly overpowering, even if not entirely deserved. Our friend Sancho Panza remarked wisely that, "We are all as God made us, and some of us a great deal worse"—and perhaps the most that any of us can claim is that he has not dissipated the natural gifts with which he started in life and has made good use of his natural talents, or, in Sancho Panza's language, has not made himself "worse."

And before proceeding I desire here to pay tribute of praise to her who joined her life to mine 44 years ago and has since provided the comforts and the rest of a quiet home, who has twice accompanied me through the valley of the shadow of death, who has watched over me mentally, morally and physically, and who is mainly responsible for such success as has been mine in conserving mind and body. I ask you, friends, to join me in drinking the health of my wife.

And, secondly, such success as has been mine has been due to those who have worked with me and than whom no more able and efficient men are in existence. No one man is of any possible consequence; no one man can accomplish anything in a large way without loyal and enthusiastic support. This support I have now and I have always had in unstinted measure—the "esprit de corps" of the Santa Fe has become known and is commented on by everybody everywhere, and I desire here publicly to declare my appreciation of it and to thank not only those present but the great body of employees.

Thanks should be extended to our directors for the cordial support that has always been ours and the liberal backing they have supplied for all schemes looking toward the welfare of employees. Of the original 15 directors but six are still living, but I desire to state that in not any of the 25 or 30 who have at various times served on the board has there ever been any sign of self-seeking or effort to secure personal advantage. Each man has been "Santa Fe all the way"—and his vote cast in what he considered the best interests of the company without reference to his own.

We make no idle boast when we talk of our solidarity and our "team work." We may confidently claim that there is as little friction in our machinery as in any institution of its magnitude

Dinner Given by Officers and Directors of the Santa Fe in Honor of President E. P. Ripley on his Seventieth Birthday, October 30, 1915

in the world. This condition begins with the directors—all busy men, with large outside interests, but all devoting their time and energies to the Santa Fe alone when in the board room; and it extends through all ranks and is ever noticeably present.

Nor is this loyalty and enthusiasm the result of laxness in discipline or lack of efficient supervision. Not only do the employees regard the company with a loyalty bordering on affection, but they perform their duties cheerfully and well. Not a day passes that travelers and others do not go out of their way to comment on the workmanlike and thorough manner in which things are done. I think the affection that men cherish for the railroad on which they were "raised" is very like that which one feels for his birthplace—the old home in which he played as a boy—it is a part of his earliest and happiest recollections, and no matter how far afield he may stray, or how high be his rise, he looks fondly back to the days of small things and to his old associations. But while we congratulate ourselves on what we have done, let us take heed lest we become conceited. We read that eternal vigilance is the price of liberty. Let us also remember that the higher one climbs the farther and harder will be his fall if he falls, and that we have established a reputation which requires continued effort for its maintenance.

Primarily, the corporation is organized for the benefit of the stockholders, but in safeguarding their interests those of the public must also be cared for. And in the interest of both stockholders and public it is important that the moral and physical welfare of the employee be also looked after. This three-fold duty—to the public, the employees and the owners—is sometimes perplexing, but I think we can claim with confidence that cases of doubt have generally resulted in a solution beneficial both to public and employee, and the stockholder represented by your directors and officers has been willing to subordinate his interest to the other two.

We have aimed at something more than a mere money-getting institution. We have sought to spread education and even culture where little of either previously existed. The Santa Fe has been an educational institution in many ways. It contributes the services of its engineers to counties and municipalities desiring expert advice. It graduates from its apprentice schools yearly something like 155 first-class mechanics; it maintains agricultural experts for the benefit of the farmer; it has set an example in architecture and has made life more attractive all over the southwest. Organized for profit and as a business venture, it has, I believe, fully lived up to its duties to the public as well as to its owners.

This is not the work of one man—it is that of everybody—and I account for it on the supposition that we all realize that the company is fair and just, that it has the welfare of its employees constantly in mind, and that it aims to reward merit. Long may the Santa Fe continue to keep the high position among the railroads of this country that it now occupies.

Nearly 20 years ago we began together what then appeared a somewhat doubtful struggle. We had 6,486 miles of road and not a mile of what to-day we would call good track. We had very little ballast, insufficient terminals, inferior power and mechanical appliances and our credit was not of the best. We earned in the first full fiscal year \$30,000,000. In the last fiscal year we operated nearly 12,000 miles, most of which could be classified as first-class track—about 1,000 miles of second track—and our power, equipment and terminals are second to none in the country; and last year we earned \$117,000,000 gross. In short, our mileage has increased 72 per cent, our capitalization 61 per cent and our earnings 284 per cent in the 20-year period.

Those of us who have been doing this work know that it has been accomplished in the face of many obstacles, and that it has not always been easy, but we also know that it has been an absorbingly interesting work, and that its success has been due to able support from above as well as from below.

Let us not on this occasion forget to acknowledge our debt to those who traveled with us over a portion of this long road, but who for various reasons left us—some of these like Walker, Higginson, Morton, Dun, Nicholson and Hurley, were taken from us to our great sorrow by death; others, like Kenna, Ken-

drick, Mudge, Biddle, Nixon, Gorman, Morawetz, Morse, left us for business reasons, or to fill high positions with other roads, and we are still fond of pointing to them as "Santa Fe exhibits;" their successors were once their pupils. We hope these, our graduates, will not lose their affection for Alma Mater.

Where all parts have been so well played it would be invidious to single out individual names, but I feel that I should call to your attention at this time the remarkable service performed by Victor Morawetz. His was the brain that conceived the plan of reorganization and his the mind that directed the policies of the company for many years. To him, more than to any one, is due the freedom from entangling alliances and the financial independence it is our fortune to enjoy. His high standards and his ability have helped more than any other cause to put the company in its present enviable position. He has a worthy successor in Mr. Hines, but his advent was after the main struggle and when the battle was more nearly won.

For myself, what can I say in appreciation of this occasion and of the feeling from which it grew. When the heart is fullest the speech is most halting. Association with you has been the greatest pleasure of my life. I cannot trust myself to say all that is in my heart. You have all been too good to me. This is the sunset glow. The shadows will soon begin to lengthen and the road grow more dim. But if I have lived to win the approbation of my contemporaries and to be of benefit to those with whom I have been associated, I can look with complacency on the signs of the closing day and go to my rest content.

CONGRATULATIONS BY THE BOARD OF DIRECTORS

Mr. Ripley's tribute to his wife caused the most affecting scene of the entire evening. Mrs. Ripley sat in the balcony and when Mr. Ripley proposed the toast, those present rose and with tears in the eyes of many, responded with cheer after cheer. Mr. Ripley received hundreds of telegrams of congratulations during the day, including many from men in the ranks. Each guest had written a personal tribute and these were all bound together and presented at the dinner. The Santa Fe board of directors met at Chicago during the day and adopted the following resolution:

"Resolved, That the board, on the occasion of its meeting in Chicago on the seventieth birthday of Mr. Ripley, tenders him its hearty congratulations, expresses its continually increasing appreciation of the great value of his services to the company and to the country, and declares its earnest wish for the continuance of his vigorous health and strength through many additional years."

The list of guests at the head table is as follows:

Theodore N. Vail, president, American Telephone & Telegraph Company; A. C. Bartlett, Hibbard, Spencer, Bartlett & Co.; William A. Fuller, J. J. Mitchell, president, Illinois Trust & Savings Bank; J. C. Stubbs, former traffic director, Harri-man Lines; Rev. Bernard Kelly, of Topeka, Kan.; J. M. Dickinson, receiver, Chicago, Rock Island & Pacific; Frank Trumbull, chairman, Missouri, Kansas & Texas and Chesapeake & Ohio; L. E. Johnson, president, Norfolk & Western; A. J. Earling, president, Chicago, Milwaukee & St. Paul; George B. Harris, chairman, Chicago, Burlington & Quincy; Marvin Hughitt, chairman, Chicago & North Western; Walker D. Hines, general counsel, Atchison, Topeka & Santa Fe; Edward P. Ripley, president, Atchison, Topeka & Santa Fe; Victor Morawetz, formerly general counsel and chairman executive committee, Atchison, Topeka & Santa Fe; Edward E. Ayer, Ayer & Lord Tie Company; Milton H. Smith, president, Louisville & Nashville; George M. Reynolds, president, Continental & Commercial National Bank; Gardiner Lathrop, general solicitor, Atchison, Topeka & Santa Fe; John S. Runnels, president, Pullman Company; C. S. Glead, chairman, Missouri & Kansas Telephone Company; David B. Jones, chairman, National Zinc Company; John F. Harris, Harris, Winthrop & Co.; Frederic A. Delano, Federal Reserve Board; J. J. Glessner, vice-president, International Harvester Company.

American Association of Passenger Traffic Officers

Committee Reports Included Those on Telegraph Cipher Code, Printing Folders and Charges for Checking Baggage

A special meeting of the American Association of Passenger Traffic Officers was held at the French Lick Springs hotel, French Lick, Ind., on October 26. President Alexander Hilton, passenger traffic manager of the St. Louis & San Francisco, presided, and there were about 100 members of the association in attendance. President Hilton in his opening remarks called attention to the fact that while the association is not a legislative body, and thus cannot put its recommendations into effect, it has an important function in originating and discussing subjects to be referred to the various territorial associations.

L. W. Landman, general passenger agent of the Michigan Central, presented a report from the executive committee on a universal telegraph cipher code for handling interline passenger traffic business, for the purpose of not only reducing the expenses of telegraphing for sleeping car reservations and similar matters, but also saving time in ciphering and deciphering and greatly improving the efficiency of the service. Mr. Landman gave an outline of a complete cipher code, invented by J. Edwin Dempsey, of Chicago, a code expert, formerly connected with the traffic department of the Chicago & North Western, who has compiled cipher codes for several large railroads, and is now at work on one for the Chicago, Milwaukee & St. Paul, and who has been engaged by the executive committee to devise a code for universal use. The method employed in ciphering is unique, being in many ways a departure from the styles in general use. The plan includes the code book, which need be placed only in the hands of such officers as desired, the agents requiring only single sheets containing parts of the code used in their regular routine, and by its use the number of words in a telegram ordering reservations, etc., may be very greatly reduced, as single words are used to cover a vast amount of information. The plan was declared to be very simple and easy of manipulation. Illustrations were presented of the translation of ordinary messages into the code, showing in some cases a reduction from 42 words into 3 or 4. The executive committee was very strongly in favor of the plan, believing that it presented possibilities for very large savings in expenses, and proposed to submit copies of the code to the passenger traffic officer of each railroad with a request for a statement as to whether they could adopt the plan. It was explained that the plan would only reach its maximum of efficiency if adopted by all lines. The salient point of the Dempsey cipher code is that it successfully harnesses all detail in such manner as to make necessary the use of only one or two code words in any given message and at the same time it makes such a phenomenal reduction in words, that the saving in tolls on messages sent over commercial wires is very great, while the railroad wires are relieved of a great amount of their burden. The committee was authorized to incur the expense necessary to submit a complete report, with samples of the code, and an estimate of the expense to each railroad.

C. A. Cairns, general passenger agent of the Chicago & North Western, presented a report as chairman of the standing committee on association ticket paper, stating that a patent had been granted on the association's form of multi-route ticket and outlining a plan for a blanket bond to be issued by a surety company for all printers licensed to use association paper. The report was adopted and the secretary authorized to put the plan into effect, with a resolution urging all lines not already doing so to make use of the association paper and standard colors for tickets.

The Committee on Official Digest of Fares and Divisions, O. P. McCarty, passenger traffic manager, Baltimore & Ohio, chairman, presented a report from Agent E. L. Bevington that the digest of fares, a comprehensive collection of the tariffs, arbitrations and passenger divisions of all lines, which has been found to be

of very great assistance to the general officers in passenger accounting matters, is now practically up to date and complete, except as to the fares in western territory, where the tariffs are under suspension by the Interstate Commerce Commission.

The Committee on Adjustment of Disputes Relative to Divisions of Passenger Fares, O. P. McCarty, chairman, reported that peace and harmony apparently prevails, as no disputes had been submitted to the committee since the last meeting.

A report was received from the territorial committees advising of the progress made on subjects referred to the territorial associations at the San Francisco meeting.

The Committee on the Printing of Folders and Other Advertising Matter and Economical Distribution Thereof, H. J. Phelps, general passenger agent, Illinois Central, chairman, reported that its recommendations for the curtailment of distribution of folders in hotels and other public places had been adopted by the Western, Transcontinental and Central passenger associations, but are not yet effective, except in the Central Passenger Association territory, pending the concurrence of other associations. On request the secretary read a report of the action in this respect of the Central Passenger Association, in which the folder committee had reduced the distribution from 1,141 places to about 600, by eliminating most cities of less than 10,000 population, and by a close supervision of the distribution. The Central Passenger Association committee reported that it had gone about as far as it could without the co-operation of other associations. After a discussion the present committee was discharged, as it had requested, and it was decided to appoint a new committee, composed of the chairmen of the territorial associations, to continue the work. In the discussion it was brought out that while the distribution of folders and other advertising matter has been reduced to a considerable extent, the money saved is the result of a closer supervision of the distribution and does not represent the withdrawal of any service to the public.

The Committee on an Additional Charge for the Checking of Baggage, A. B. Smith, general passenger agent, New York, New Haven & Hartford, chairman, presented a recommendation, which was adopted, that the territorial associations give consideration to a plan for establishing a 10-cent terminal charge for the checking of each piece of baggage possibly to be proposed in lieu of requiring a declaration of value on account of the unlimited liability imposed by the Cummins amendment. Several members expressed the opinion that such a plan would be accepted without opposition, if the reasons for such a charge were properly presented, and it was stated that several commercial associations had already indicated their willingness to accept such a plan.

The Committee on Revision of Joint Tariffs, J. P. Anderson, general passenger agent, Pennsylvania Railroad, chairman, was continued and allowed further time for presenting its report, with instructions to endeavor to work out a plan for the simplification of tariffs with a view to economy and to co-operate with the Interstate Commerce Commission.

No report was presented by the Committee on the Expense of Special Train Service for Organized Party Business, but it was decided that the committee should be convened at an early date at the call of the president.

The Committee on Economies in the Operation of City Ticket Offices, S. G. Warner, general passenger agent, Kansas City Southern, chairman, presented a report expressing the opinion that unnecessary expense is incurred in maintaining city ticket offices at excessive rentals caused by competition among the roads for locations, and that offices can be secured which will give equally satisfactory service to the public in sections where

the rents are lower. It was the opinion of the committee that generally the expense of maintaining city ticket offices in cities of less than 50,000 population is not justified; that foreign lines should secure locations on upper floors and that wherever possible it would be advisable for two or more lines to occupy joint offices. The report elicited a general discussion of the plans for consolidated ticket offices which have been adopted in St. Louis, Memphis and Dallas at a very large saving in rentals, but while there seemed to be a general agreement on the advantages of the plan where it has been tried, the opinion was expressed that local conditions in many cities would defeat such a plan, especially where the present leases expire at different times. The report was accepted as information, and the committee was continued to co-operate with local committees that may be appointed to investigate the subject.

The report of the standing joint committee of the American Association of Passenger Traffic Officers and the Association of American Railway Accounting Officers, W. A. Lalor, general passenger agent, Chicago, Burlington & Quincy, chairman, presented a report urging upon all carriers the adoption of a uniform interline ticket at the earliest consistent date which will provide a uniform place on all tickets for the punching of one-half fare, second-class and baggage checked, thereby facilitating the work of selling agents, conductors and the accounting department. This recommendation was adopted and referred to the standing ticket committee. A recommendation was also adopted that the placing of prepaid ticket orders by telegraph or telephone be discontinued on January 1. The question of prepaid ticket orders was generally discussed. Many members were not in favor of discontinuing the placing of prepaid orders by telegraph, but desired to impose a scale of charges to cover the cost of the service. It was stated that the New England lines for several years have made it a practice to require the purchaser to pay the cost of telegraphing, while the Texas lines have confined their practice to the sale of such orders across the counter, leaving it to the purchaser to forward the order. It was pointed out that the practice of telegraphing involved considerable additional service and frequently a large expense for telegraphing, and some members were of the opinion that it was no part of the business of a railroad to deliver cash with such orders, while others were of the opinion that the placing of such orders was a service which the carriers should render for a charge covering the cost.

There was a general discussion of the relations of passenger traffic officers with the Interstate Commerce Commission, state commissions and commercial bodies. The subject was introduced by President Hilton, who in his remarks impressed upon the members the importance of continuing the work begun last year by the passenger men in addressing public meetings on the needs for higher passenger fares in the state. Mr. Hilton said this work should be continued throughout the country wherever possible. C. F. Daly, vice-president of the New York Central, said that this was the most important subject on the docket of the association; that the work done by the passenger men in educating the public along these lines was worth five times the advance in freight rates which the roads received, and that nothing the passenger department can do is so important as educating the public as to the facts about the railroad business, the ignorance of which is responsible for much of the hostility to the railroads. Others spoke in the same strain, urging the importance of continuing the work and pointing to the fact that while no state legislature had restored the passenger fare they had passed little anti-railroad legislation.

Four topics on the docket were deferred for discussion at the next meeting, as follows: "Improved Advertising Methods;" "The Automobile and Its Effect on Passenger Traffic;" "New Plans for the Docket" and "New Contract for Printing Association Ticket Paper."

The subject of the advisability of the curtailment or abandonment of entertainment at meetings of the association, the abolishment of addresses of welcome by state and city officials, and representatives of local bodies at meetings of the associa-

tion, as well as the discontinuance of reports from co-operating associations except in special cases involving subjects of peculiar interest, were referred to the executive committee with the idea of restricting the program of meetings more closely to the business of the association.

The association went on record as being opposed to the use of specimens or imitation passenger tickets for advertising or other similar purposes foreign to the legitimate use of regular tickets. An amendment to the constitution was adopted, providing that in the case of railways having two or more officers with the title of passenger traffic manager, assistant passenger traffic manager, general passenger agent and general ticket agent, all or either of these officers shall be eligible for membership, and each shall be entitled to a vote. This supersedes the plan of taking votes by lines.

There was a long discussion of plans for making the work of the association more effective by the appointment of a general conference committee to consider prior to the meetings important questions submitted by members, or by the territorial associations, and to endeavor to promote action on subjects of inter-territorial interest by the territorial associations in the effort to secure harmony of action at a uniform date. It was decided to request each territorial association to appoint three members of a general conference committee to meet at the call of the president, as a temporary plan pending action to provide a more permanent arrangement by amendment of the constitution at the next meeting.

Following the meeting of the association there was a short meeting of the fraternal society. Secretary-Treasurer W. C. Hope, general passenger agent of the Central of New Jersey, presented a statement exhibiting a very satisfactory condition of its affairs.

Charles F. Daly, vice-president of the New York Central, an honorary member of the association, visited the meeting during the afternoon and by invitation gave an informal talk on the increasing importance of the passenger department, in which he paid a high tribute to the work of passenger men. He said that railroads formerly were inclined to consider the passenger department as the "gold lace" department, and more or less of a necessary evil, but that it is now coming to be regarded more from a standpoint of a revenue producer, because the executive officers are relying on their passenger departments as the most important influence on public sentiment toward the railroads, and because the attitude of the shippers of freight toward a road is largely determined by the impression they receive as passengers. Mr. Daly was formerly passenger traffic manager of the New York Central Lines East, and prior to his election as vice-president in charge of all traffic in 1908, his entire work had been in the passenger department. He said that the experience gained in passenger work had been invaluable to him as an executive officer, and had given him a point of view regarding his work not possessed by most executive officers.

SCOTTISH RAILWAYS HANDICAPPED BY LACK OF MEN.—The Scottish railways have been seriously handicapped by the large number of servants who have joined the colors. The Highland has been very badly hit, and this has had an unfortunate result in the locomotive department owing to a scarcity of fitters to carry out the necessary repairs. Private firms which have in hand some new locomotives for the Highland, and which could carry out some of the requisite repairs, have also been suffering from a scarcity of men, coupled with the fact that they have been engaged on government work. As a result of this shortage of locomotive power, the company's Buckie branch has had to be closed, and other restrictions were threatened. In consequence of representations to the Railway Executive Committee, a sub-committee of locomotive superintendents met at Perth on September 7, which, while protesting that none of the companies had an abundance of men or power, recognized that the Highland Company's position was particularly bad, and recommended that a number of engines and fitters be lent to it.—*The Engineer, London.*

CONCEALED DAMAGE*

By W. H. STREETER

Secretary, United Yard Masters' Association, Duluth, Minn.

One of the first things to be considered in a study of "concealed damage" is the loading of the car. Many car load shipments get away from their point of origin improperly loaded, owing to the fact that too much attention has been given by some over zealous warehouse foreman to reducing the cost of handling and loading freight and not enough to its proper stowing in the car. The results are that a few cents have been shaved from the pay roll of the warehouse and many dollars lost, by the car being rushed out improperly loaded.

To eliminate claims of this nature, or at least to greatly reduce them, an inspector looking after carload shipments and seeing that they were properly crated and stowed would more than earn his salary, for the time and expense attached to tracing claims of this nature that could be saved would more than offset the added expense of maintaining such inspection. A few cents more a ton added to the cost of handling in the warehouse would also greatly tend to reduce losses of this kind, and careful crating of all extra fragile shipments would be another step in the right direction. I do not mean to imply that they are not crated at this time, but some of the material used is not what it should be and what is used is sometimes applied in a very indifferent manner. Better material and better workmanship at a slightly increased cost would give better results all around.

Next in line we have the handling of car load shipments while in the yard. No matter how carefully rough handling of cars is watched there is always the possibility of its occurrence. To eliminate this phase of concealed damage, would not it be a practical part of the scheme to have what might be called a "switching inspector," whose duties would consist of traveling through the different parts of the yard where the work is going on, and educate the crews handling the cars on speed and distance? This is an all important factor in the switching of cars, and is something that takes a thoroughly competent man to judge safely. If the crew handling the cars are experts in this line, there is not apt to be much damage to any of the cars or their contents, but if they are not, the cars and the freight suffer, and to the inexperienced eye there is nothing to denote that such is taking place. This is where a switching inspector would have an opportunity to more than earn his salary. He would in no way have direct control over the crews as far as issuing orders or mapping out their work for them, but his efficiency would consist of working in conjunction with the yard master, traveling around through the yard and educating the men on the finer points of the work, giving advice where needed, and overseeing and coaching the work in general, as pertaining to the handling of the cars.

Taking up the possibility of "concealed damage" occurring while the car is being handled in trains en route from one point to another, it is not absolutely necessary that a car get mixed up in a wreck while en route for its contents to become damaged. In these days of long trains and heavy power, the straining and shaking that a car gets under the most favorable conditions are liable to result in the damage of some part of its contents and especially so when attention and care have not been exercised fully in seeing that the contents were properly stowed and secured before the car was allowed to leave its initial starting point.

Who is responsible for the claims that are constantly arising for "Concealed Damage" on through car load shipments that have come from a great distance, and have been handled by several roads? No one is in a position to say where and how the damage was done and it is for this reason that all of the roads that have anything to do with the handling of an interline car-load shipment are called upon to participate in the majority of the final settlements that are made for "con-

cealed damage." Would it not therefore be a good plan to create an office, to be filled by a thoroughly experienced and competent man, who would have for his special duties the inspecting of the actual conditions of all car load shipments originating off the line, this inspection to be made before the car and its contents are accepted unconditionally? In this manner if there had been any rough handling of the car prior to his inspection, and its contents had been damaged, proper notice could be given to the road making the delivery, a record taken and the fact that the damage was discovered before the car was accepted would be sufficient proof to guarantee the non-liability of the road for which the car was destined. This plan could be worked out as a joint inspection if necessary to reduce any exceptionally high cost, but no matter how handled, either jointly or otherwise, it would go a long way towards reducing the total amounts paid out in the course of a year for claims that would otherwise have been saddled onto the road making the inspection. Inspection of this kind could also be worked out to good advantage in the handling of perishable shipments, particularly fruits and similar commodities that call for careful stowing and watchful attention while en route.

Inspection of this kind, if faithfully carried out, would also be a very forceful incentive for all participating in the handling of a shipment to see that it was delivered to the consignee in first class condition. The time-worn and much-abused stereotyped phrase of "No rough handling while in my charge" would be relegated to ancient history, for the parties at fault would before long become fully cognizant of the fact that the responsibility could and most certainly would be placed where it rightfully belonged, and with this fact continually before them, more care would be exercised in all departments, rough handling of cars both on the road and in the yards would be reduced to a minimum, and the natural results would be that the factor of "concealed damage" would be reduced to one of the minor quantities, and shipments that had heretofore been delivered in anything but an O. K. condition could be surrendered to their consignee in first class order, and, if not, the road making the delivery would be in a position to say who was responsible for the damage, and the ensuing claim could be adjusted in a reasonably short period of time to the mutual satisfaction of all concerned. The fact remains, that, with a rigid inspection in force, more shipments would be delivered free from damage of any description, and more satisfaction derived from this by all concerned, than could possibly be gained from the adjustment of any claim, no matter how quickly adjusted or how liberal the settlement.

RUSSIAN REFRIGERATOR CARS.—In no European country has more attention been paid to refrigerator car problems than in Russia, and the war has not lessened activity in this direction. The Moscow-Kazan Railway has just come out with an ambitious program which provides for the construction of no fewer than 87 eight-wheeled "isothermic wagons," besides a considerable number of ice stores, including freezing rooms and an ice factory at Moscow with a capacity for 5,000 tons of merchandise. The total cost of these schemes is estimated at \$1,845,000. A project is also in hand for new cold storage facilities at Orenburg and plans for special cold stores at Astrakhan and other Caspian ports. Quite recently the first trainload of frozen meat and fish arrived at Petrograd from Astrakhan. All the merchandise bore the journey admirably, arriving in excellent condition. The Russian railways have taken a leaf from the books of the American lines by the provision of an exhibition or demonstration car. This is in the form of a museum refrigerator wagon and has been provided by the Causasian Railway, a line on which a constant refrigerated service is maintained between Moscow and the Northern Caucasus. The object of this particular vehicle is to give a practical demonstration to agriculturists and others within the territory of the Caucasian Railway of the possibilities in the way of refrigerated wagons, and the car is to journey a considerable distance, making stops at important centres en route.—

* Abstract of a paper presented before the convention of the United Yard Masters' Association, Seattle, Wash., July 15, 1915.

Completing the Mount Royal Tunnel into Montreal

This Project of the Canadian Northern Involves a Number of Interesting Details of Construction

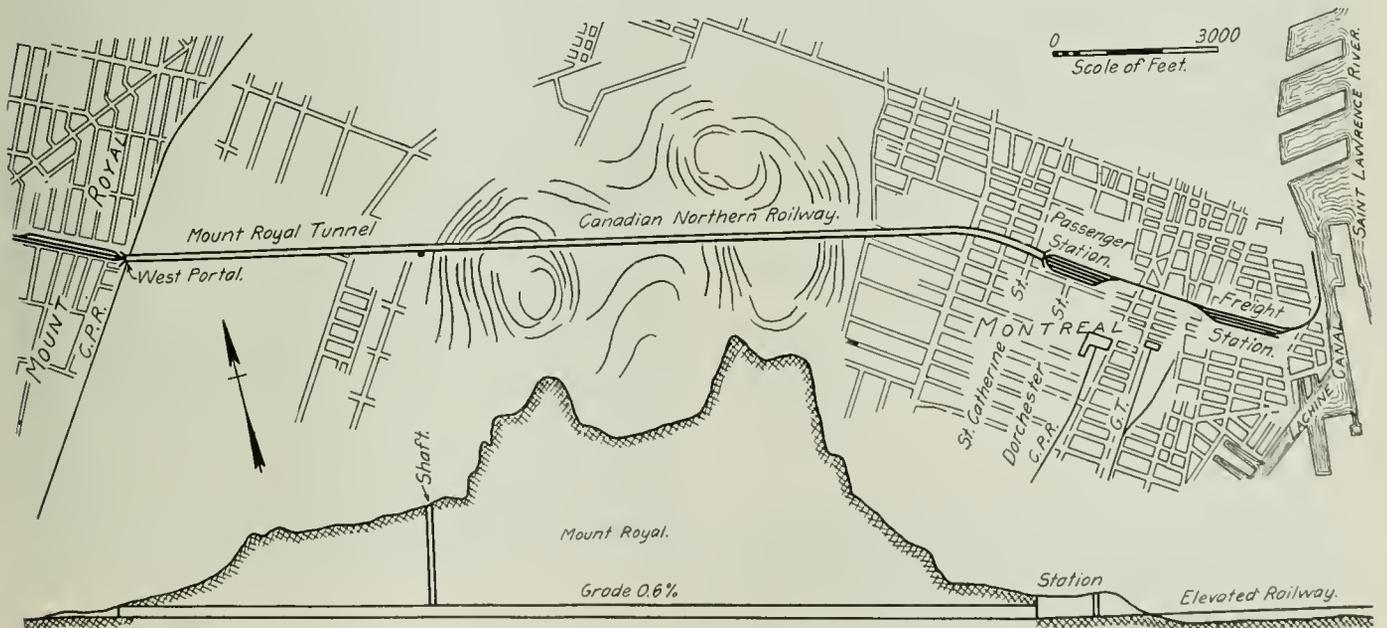

The Mount Royal tunnel, the most important link in the project of the Canadian Northern to secure an entrance into the business center of Montreal, is now nearing completion. The city occupies part of an island in the St. Lawrence river and is situated on a slope between the river and a long ridge 800 ft. high known as Mount Royal, a situation eliminating all approach by railroad except from the southwest and the northeast along the river, which routes are already fully occupied by the Canadian Pacific and the Grand Trunk. The Canadian Northern chose to reach the city by what is apparently the only remaining route, namely, a tunnel through the mountain from the northwest, a scheme which enabled it to select a terminal site of particularly strategic position in the heart of the city. A complete description of the tunnel and the proposed terminal and an account of the construction methods as far as they had been developed, was published in the *Railway Age Gazette* of October 10, 1913.

The Canadian Northern now has a terminal in the northeast portion of Montreal at some distance from the business center. This connects direct with its eastern lines, but the western con-

comotives will be used to haul transcontinental, express and local traffic which extends beyond the proposed electric zone, and multiple unit motor cars will be used for the traffic inside of that district. Eighty-ton locomotives will be used, capable of producing a speed of 50 miles an hour. The multiple unit cars will weigh 50 tons and will have a speed of 45 miles an hour and a seating capacity of 70 passengers. The power will be 2,400 volts direct current. The contact circuit will be of the overhead catenary type, the character of the climate making a third rail inadvisable outside of the tunnel. A substation for power conversion has been built near the west portal of the tunnel and an auxiliary steam plant is contemplated near the Black river as insurance against any interruption of service. A yard is also to be provided near Cartierville for the classification of freight and the transfer from steam to electric traction.

PROGRESS

The tunnel is being built for double track and is 23.5 ft. high by 31 ft. wide. It is located almost entirely in rock, Trenton

Plan and Profile of the Mount Royal Tunnel

nection is very circuitous. The main line west, which is not yet in operation, runs along the north side of the Island of Montreal, behind Mount Royal and follows along the northeast end of that ridge. The tunnel branch leaves the main line a mile or more east of Cartierville and enters the tunnel just west of the Outremont yard of the Canadian Pacific. The tunnel is 3.1 miles long and the proposed passenger terminal will be located immediately adjacent to the east portal between Mansfield and St. Monique streets and Cathcart and Laguachetiere streets, this site being one block southeast from St. Catherine street, the main shopping thoroughfare, and one block northeast of Dominion Square. As the tracks at the station will be 50 ft. below the level of Dorchester street, most of the station proper will be underground, with facilities arranged at various levels. The ground drops off rapidly toward the river and the plans provide for a future elevated railway over the lower part of the city for purposes of an elevated freight terminal and connections with the harbor. West of the west portal provision has been made for the model city—Mount Royal—a suburban project, the development of which is expected to pay a large part of the cost of the tunnel undertaking.

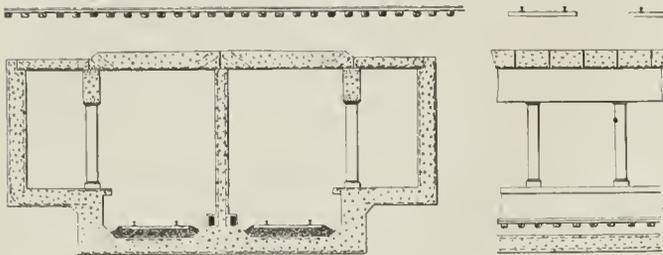

All trains through the tunnel will be operated electrically. Lo-

comotives and Essexite with igneous dikes. The construction work has been characterized by highly developed tunneling methods, resulting in rapid progress, including a record of 810 ft. of heading at one face in 31 working days, the highest rate of progress ever attained in America in rock of a like character up to that time. Center bottom headings were used, followed by breakups to remove the full section overhead, jumbo timbers being framed into the heading at the breakups so that the muck could be dropped directly into cars below. The benches were left until the last. The use of an intermediate shaft afforded a number of headings and thus permitted the use of several types of drill carriages with and without muck handling equipment. This gave a good opportunity for a comparison of the several systems and demonstrated the greater efficiency of the carriage providing for the removal of the muck from the face by means of a belt conveyor.

Practically all of the rock removed has been crushed for road material and concrete stone. All that is not used in tunnel masonry or on the railroad is sold for local consumption about Montreal. At the city end of the tunnel the rock is turned over to an outside company as it comes from the tunnel, but at the west

portal the tunnel company has built a large crushing plant with a capacity of 1,600 cu. yd. daily. At the same point a complete repair shop was also erected, which has been utilized as well for the construction of a large part of the tunneling and transportation equipment.

The meeting of the last two headings took place on December 10, 1913, and was followed rapidly by the completion of the overhead portion of the full section, except for the last half mile in the east end of the tunnel. The removal of the benches was

Sections through Station at Mount Royal Heights

delayed to the last to permit the use of a steam shovel to the best advantage, by carrying on the work progressively from the west end. The benches were shot down a sufficient distance in advance of the shovel to avoid possibility of interference. Bench drill carriages were used, which operated from 8 to 12 drills each. These carriages traveled down the heading, with arrangements at the sides overhanging the benches which carried the drills. The latter were the same as those used in the heading. A 1 1/4-cu. yd. Marion shovel was used, operating with compressed air. It was served by narrow gage tunnel cars having wooden boxes lined on the bottom and door ends with steel plates and handled by 6, 7 and 10-ton electric locomotives, taking power from an

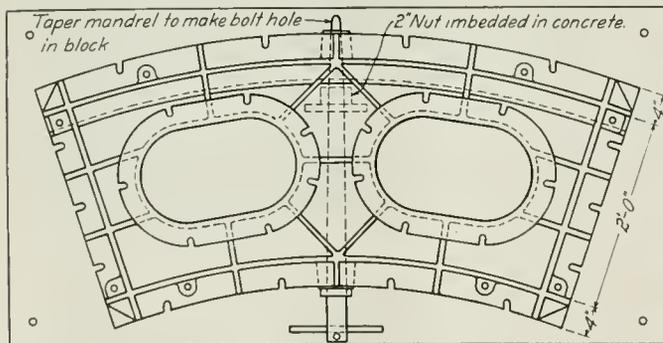

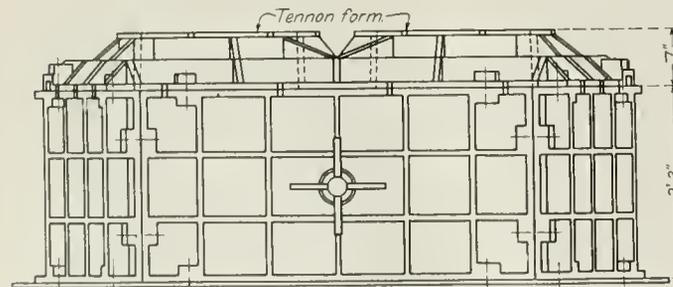

Plate 42" x 1/2" x 7'-0"
Top Plan

Flanged Cast Iron Sectional Forms for Tunnel Lining Blocks

overhead trolley wire carrying 220 volts direct current. The shovel commenced work at the west portal in August, 1914, and stopped in May, 1915, about one-half mile from the east portal, where the character of the roof necessitated a change in the method of tunneling.

For a distance of about 1,100 ft. east from the end of the shovel work the rock in the roof is of such a character that it is not safe to take out the full section without following immediately with timbering or lining. In the first 200 ft. the section has been

taken out complete, except for the bench and the roof has been timbered; for the remaining 900 ft. a bottom heading 16 ft. high by 12 ft. wide has been driven without lining. It has been decided not to proceed with this part of the tunnel until it is convenient to follow the excavation of the upper part of the section with a permanent concrete arch as fast as the rock is taken out, the benches to be removed later. As the concreting of the lining is progressing continuously from the west portal, this portion of the tunnel will be completed when the lining has been brought up from the west, a distance of 2 1/2 miles.

THE SHIELD SECTION

In the last 1,650 ft. of the tunnel on the city end a boulder clay appears at the top of the tunnel section, replacing the rock which dips down to the east so that at the east end of the tunnel the clay almost entirely replaces the rock. This soft top required a modification of the tunnel section and led to the adoption

Concrete Block Section and Shield, Center Wall on the Right

of the shield method of tunneling and the use of the self-supporting concrete tunnel lining blocks invented by John F. O'Rourke of New York. The tunnel section consists of two separate tubes each with a semi-circular top made of concrete arch voussoirs cast separately, set into position and supported on either side by concrete walls and in the middle by a dividing wall made up of 10 1/4-in., 65-lb. Bethlehem H-columns spaced 2 ft. 3 in. center to center and spanned by structural steel built-up lintels, all encased in concrete. The blocks are 2 ft. thick radially and 27 in. in the direction of the tunnel axis and were made in lengths of 5 ft. circumferentially. They have plain faces on the intrados and on the radial joints, but are provided on one vertical face with concrete keys or tenons 12 in. by 20 in. in section and 7 in. high, while the opposite face contains depressions of the same shape to engage the projections of the blocks in the adjacent ring of the arch.

A center bottom heading was used for this portion of the tunnel also, being made of sufficient width to permit the passage of muck cars on either side of the center wall columns subsequently erected. The roof was fully timbered and in places where the division between the clay and the rock comes below the top of the heading it was generally found necessary to timber the sides

as well. From this heading transverse drifts run at intervals up into the soft material on either side and from these drifts side headings were then driven longitudinally in the position of the two side walls, providing just sufficient width to permit the construction of forms and the concreting of the side walls from the level of the top of the sound rock to the springing line of the arches. The side drifts were generally at such an elevation relative to the center heading that the muck could be dropped directly into the cars. No rock was removed except for boulders encountered and such loose or unsatisfactory rock as was found overlying the solid rock stratum. The concrete for the branch walls was mixed by hand in the tunnel and passed into the drifts in buckets.

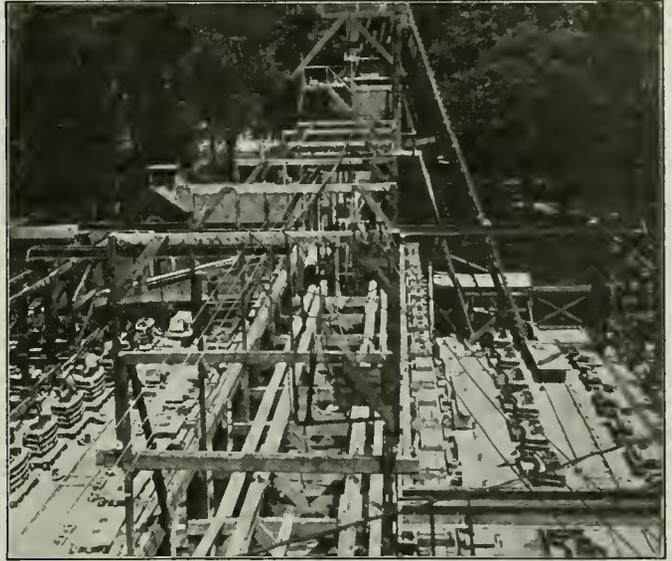

The shield is an application of common shield practice modified to suit the situation at hand, the parts of the two bores being joined at the center line and operated and advanced together. It was supported by and traveled on the previously built center and side walls. The shield consists of two semi-cylinders made

means of a 2-in. bolt which entered a hole in the center of the intrados and screwed into a 2-in. nut case in the center of the block. All operations of erectors and all of the advancing jacks were controlled by valves conveniently located in the operating gallery. The power was derived from water at a pressure of 3,000 to 6,000 lb. per sq. in. delivered in pipes from a duplex pump operated by compressed air and situated at some distance in the rear in a recess cut in the bench. The pump was moved forward from time

Shovel Removing the Bench Rock

of structural plates and stiffened by semi-circular structural steel diaphragms and girders which contain the operating galleries. The cylinders are of sufficient length to extend back over two or three of the rings of the arch last placed and project forward of them to form cutting edges or aprons under which the excavation was carried on. As the excavation was made the shield was advanced by means of 17 hydraulic jacks located on the circumference of the working galleries and bearing against the last completed rings of concrete blocks. An erector, a device for handling the concrete blocks, is pivoted under each working gallery and has four motions: rotation on the pivot by means of a pinion and ram-operated rack, radially by means of a ram within the erector arm, longitudinally in the direction of the axis of the pivot and rotation on the axis of the erector arm. By means of these four motions the concrete blocks were lifted from the cars, projected into the circle of the arch sufficiently in advance to clear the key lugs, rotated to line up with the key recesses of the ring last placed, brought into line vertically and then driven home, the keys entering the recesses. For the last operation the nearest shield jacks were brought into action to overcome frictional resistance between the blocks and were then left in bearing against the blocks to hold them in position with the assistance of the keys until all the blocks of a ring were in place, thus completing the arch. The head of the erector engaged the blocks by

Yard for Concreting Tunnel Lining Blocks

to time as the shield advanced to avoid excessive lengths of the high pressure pipes.

The blocks were built to give slightly open ring joints when in place, which were closed up as the work proceeded by means of a cement gun, while a grouting machine was used at night to close up the 2-in. bolt holes in the center of the blocks and fill all voids outside the rings. The excavation in advance of the shield was carried on in a space just sufficiently wide to permit the men to work, thus affording them a maximum protection against falls. The shield was shoved forward whenever a space of about 27 in.

Tunnel Excavated to Full Section—Before Lining

was available. As the excavation was only carried to a sufficient depth to clear the erectors as they are advanced, it was possible to drop all the material removed directly into cars in the heading below. The H-columns of the center walls were erected one at a time as the excavation advanced, and as they fouled the top timbers of the heading it was necessary to remove the latter at the same time. The bench was removed at some distance in the rear of the shield. Pneumatic hand drills were used and the shots were small to preclude any chance of injury to the blocks or to the

iron work of the center wall. The muck was loaded on to cars by hand.

The progress at the shield depended upon the number of men employed and the number of shifts working. For a considerable part of the time the shield was operated in a single 10-hour shift. The only work done at night was to place the center wall steel work and the grouting. With this program three rings were usually set in each bore each day. With 24-hour operation the progress would be increased to at least six rings a day.

All of the work with the shield method was in a portion of the tunnel with the least thickness of cover (from 30 ft. to 60 ft.), and was directly under a highly improved portion of the city. Because of this and the fact that the material is of a soft character, some trouble was experienced in the start with surface settlement, requiring the shoring and bracing of a few buildings, but with increased experience it was possible to avoid surface troubles almost entirely. At the intersection of McGill College avenue and St. Catherine street there is an intricate network of pipes for various utilities, including some large size water mains. As settlement in such a situation would be likely to have serious consequences, special precautions were taken. The street intersection was excavated to a slight depth below the pipes, and sills and props were placed in position so that the pipes could be jacked up if found necessary from daily observations. Planking was provided to afford a minimum disturbance of the street traffic. Spoil from the tunnel work at the city end which contained too much foreign matter to be passed through the rock crusher was brought up at the Dorchester street shaft and dumped into a bank on vacant property at this point where it was taken over by a contractor for disposal.

Another shaft was provided at Cathcart street and was used to supply the iron work for the center walls, the concrete material for the side walls and the concrete tunnel blocks from a material yard located close by. This yard included a plant for the manufacture of the concrete blocks. As shown in the accompanying photograph, this consists of a trestle through the middle of the layout about 20 ft. high with a yard on either side. At the street end of the trestle is a tower with bins which are supplied with concrete materials by means of a chain bucket hoist from a hopper at the street level. The mixer, carrying a small material storage bin, is supported on a truck which was run out to any desired position on the trestle to spout the concrete to forms in the yards below on either side.

The concrete block forms were made up of flanged cast iron sections bolted together and set on a steel plate supported on skids. The forms were arranged to fill the key lugs last and were fitted with a screw press arrangement designed to finish off the top of the key lugs to exact level and to insure perfect filling of all corners. It was found in practice that this device is unnecessary. The tenons were filled as high as possible, left for about an hour and then struck off to the level of the top of the form. The yards were served by traveling cranes equipped with hand chain hoists, for handling the form sections and the blocks. The latter were set on small flat cars and delivered to the Cathcart street shaft.

OTHER DETAILS

The lining of the tunnel, except in the shield section, is being carried on progressively from the west portal, using the pneumatic mixing and placing system. In the main, one double track arch is used, notched into the rock of the side walls, except when the rock is bad or broken wide and thin walls are required to cover the irregularities of the rock. Only the arch is being concreted at present. The placing of a center wall will be postponed except at such points where it will be required to assist in supporting the top, or to serve as an encasement for the steel columns of the concrete block section. Trimming of the side walls is carried on in advance of the lining.

West of the west portal the line will be in an open cut through the city of Mount Royal. However, west from the portal for a distance of 700 ft. the line will really be under cover, the first 300 ft. being cut and cover subway work and the remaining 400 ft.

comprising the local station of Mount Royal Heights. Part of the latter is under the Canadian Pacific tracks to provide grade separation of the two lines. This portion of the station has been completed and the cross section shown in the accompanying drawing illustrates the character of the station layout. Reinforced concrete was used throughout under the tracks. On account of the increased loading, a row of columns was required next to the edge of each of the platforms, and to avoid interference with traffic on the Canadian Pacific it was necessary to build the cover of unit slabs which were set in place after they had been cured.

It is expected that the tunnel will be ready for use soon and it is intended to commence operation before the Montreal passenger terminal is completed, as the initial traffic can be taken care of with much less extensive accommodations than is contemplated for the complete terminal. The traffic for which the terminal is to be designed will, of course, not be realized until the suburban development is well under way. The entire tunnel project is under the direction of S. P. Brown, chief engineer of the Mount Royal Tunnel and Terminal Company, Limited, the constructing corporation.

STATE LEGISLATION RELATING TO OPERATION

The Special Committee on Relations of Railway Operation to Legislation has issued Bulletin No. 73, including a table similar to that which has been issued in previous years, showing the classification of bills introduced and laws enacted relating to railway operation in the state legislatures which were in session in 1915. The statement shows that while the number of bills of this character introduced continues to be large, the number of laws enacted is considerably less than in 1913, the last year when most of the legislatures were in session. In 1915, 43 legislatures were in session and the number of bills introduced was 1,097, while the number of laws enacted was only 137. A comparison with the four preceding years is shown in the following table:

	1915	1914	1913	1912	1911
Legislatures in session.....	43	*14	42	*19	37
Bills introduced.....	1,097	236	1,395	292	512
Laws enacted	137	27	230	48	**

* Including special sessions.

** This data not compiled in 1911.

Bills relating to railway operation were enacted in 37 states. None were passed in Colorado, Georgia, Idaho, Utah, Washington or Wyoming of the states whose legislatures were in session. In addition to the reduction in the number of bills enacted there was also a marked change in the character of the laws passed, most of them relating to comparatively minor details of operation. The most numerous class of laws passed is grouped under the head "Miscellaneous," of which there were 27, while 154 bills of this character were introduced. The next most numerous class relates to service letters, time and manner of payment, of which 73 bills were introduced and 15 laws passed.

The most numerous class of bills introduced were those relating to employees, of which 348 were introduced and 30 became laws. Fifty-two of these related to size of crews, of which only one was enacted, this being in California; 116 to hours of service, of which 5 were enacted, in Alabama, Arkansas, Michigan, Oklahoma and Texas; and 64 to terms and conditions of employment, of which 9 were passed. Eighteen bills were introduced relating to voluntary arbitration, of which 3 were passed, in Indiana, Massachusetts and Michigan. A total of 83 bills were introduced relating to equipment, of which 12 became laws, including 1 relating to cabooses in Ohio, 4 to headlights in Alabama, Missouri, Nevada and New Mexico; 1 to repair of equipment in Arkansas and 6 to appliances required, in Arkansas, California, Connecticut, Maine, New Hampshire and Ohio. Seventy-nine bills were introduced relating to passenger trains, of which 11 became laws. These include 5 relating to the equipment of passenger trains, in Florida, Illinois, Kansas, New Hampshire and Rhode Island, out of 38 bills introduced, and 2 bills relating to the makeup of passenger trains, in Connecticut

and Vermont, out of 4 introduced. There were 48 bills introduced relating to freight trains, of which only 2 were passed, 1 of these relating to the speed of dead freight and 1 to the handling of explosives.

A total of 23 bills relating to cars were introduced, of which 3 were passed; 17 bills related to the furnishing of cars, of which 2 were passed, in Minnesota and in North Dakota, and 6 relating to demurrage and storage, of which 1 was passed, in Vermont. There were 11 bills relating to block and other signals, of which 1 bill relating to block and interlock was enacted into law in Arkansas, and 1 relating to switch lights in Missouri. There were 9 bills relating to clearances, of which 2 were passed, in Kansas and in Minnesota, 78 bills relating to crossings, of which 12 were passed, 17 bills requiring crossings, of which 5 were passed, in California, Kansas, North Carolina, South Dakota and Wisconsin. Twenty-six bills relating to crossing protection were introduced, of which 2 were passed, in Indiana and in New York, 35 relating to the separation of grades, of which 5 were passed in Indiana, Michigan, New York, South Carolina and Vermont. There were 64 bills introduced relating to maintenance of way, of which 10 were passed; 75 bills relating to stations, of which 11 were passed; 13 relating to hospitals and relief departments, of which 3 were passed; and 10 relating to the payment of claims, of which none were passed. Forty-three bills were introduced relating to trespassers, of which 3 were passed, in North Dakota, Vermont and West Virginia, and 11 relating to the destruction of property by trespassers, of which 5 were passed. There were 5 bills introduced relating to the reporting of accidents, of which 1 was passed.

California heads the list as to number of laws passed in any state, with a total of 14 out of 51 bills introduced. In Texas 8 laws were passed out of 36 bills introduced, and in Kansas 7 laws out of 64 bills introduced. The largest number of bills introduced was in Kansas, with 64. In Minnesota 60 bills were introduced and only 4 passed, and in Missouri 56 were introduced and only 5 passed.

LOSS AND DAMAGE COMMITTEES ON THE LEHIGH VALLEY

Since August 1, last, efforts leading to the reduction of loss and damage claims on the Lehigh Valley have been centered in the safety first committees, now known, instead, as the safety and loss and damage committees. These include a general loss and damage committee with the superintendent of transportation as its chairman, consisting of the assistant to the general manager, the assistant general solicitor, the freight claim agent, the traffic assistant, the chief of police and the general car inspector. There is also a bureau in the office of the superintendent of transportation maintained for the specific purpose of investigating and eliminating causes which lead to claim payments. To this bureau there is attached a corps of special agents assigned to specific territories covering the entire system who may be called upon to investigate an over, short or damage shipment even before a claim is filed.

When the idea was instituted it was necessary to increase

the size of the division and shop safety committees. The division committees, now known as the division safety and loss and damage committees, each consist of the superintendent who is also chairman, the assistant superintendent, the trainmaster, the chief train dispatcher, the master mechanic, a road foreman of engines, the division engineer, a supervisor of tracks, a supervisor of signals, a supervisor of bridges and buildings, the claims adjuster, the special agent and a police captain, yardmaster, foreman car inspector, roundhouse foreman, road engineer, yard engineer, foreman, conductor, yard clerk or checker, trainman, switchman, agent, section foreman and freight platform foreman. The supervisors, foremen and yardmasters each serve six months, and the men from the ranks are appointed by the division superintendent and also serve for the same length of time.

Reporting to the division committees are the shop safety and loss and damage committees at Sayre and Packerton, each consisting of one shop superintendent or general foreman of car repairs who acts as chairman, a general foreman, a subforeman or assistant, a foreman of car repairs, a foreman car inspector, a foreman of transfer of lading, a foreman of loaded car repairs, a general machine foreman, a shop adjuster, a piecework instructor and one man from each department. It will be seen that in choosing the committee members every effort is made to get the interest of the man on the job and to give him responsibility.

Each committeeman is expected to be constantly on the alert to prevent loss or damage; to keep the subject of preventing loss and damage constantly before his fellow employees, so as to impress them with its importance; to study the subject from the viewpoint of his own position, and to take proper action whenever the opportunity offers to prevent cause for claims. He is supposed to make suggestions to the chairman of the committee as to ways and means of effecting improvements in the handling of freight, and to take proper action upon suggestions leading to the prevention of loss and damage or regarding conditions to which attention is called by fellow employees.

All employees are asked to take particular care to help in eliminating the following more common causes for claims: Rough handling in starting and stopping trains, in switching at stations, on the road, and particularly in yards; improper stowing of freight in cars and warehouses; loading freight liable to be damaged by water into cars with leaky roofs and doors; rough handling of freight by employees in loading and unloading; failure to see that all package freight is properly marked, in accordance with marks shown on bill of lading and waybills; failure to trim down and brace freight before closing car doors; failure to clean cars before loading; failure to note exceptions in the case of freight damaged when received from shippers; signing bills of lading without positive knowledge that freight has been received, and failure to prevent pilfering of freight from cars or packages.

A great effort is being made to secure the co-operation of every employe who is in a position to help in any way. Every man is asked to be on the watch for things which may possibly be productive of damage claims, and to assure his communicating with the committee members special mailing cards are provided. These are addressed to the chairman of the division committee and may be obtained in the yardmasters' offices or from any committee member. An illustration of the card is given herewith. It is especially provided that cards containing information which may call attention to the action of fellow employees will not be used in the application of discipline, and that such matters are to be handled strictly through the usual channels only. All suggestions are handled by the division committees in so far as they have jurisdiction, and those that are accepted are announced in notices from the office of the superintendent. It is hoped not only to reduce the O. S. & D. claims considerably, but also to secure the good will of shippers and consignees by the prompt attention which is being paid to complaints of any kind.

The Suggestion Card Which May Be Mailed to the Chairmen of the Lehigh Valley's Division Loss and Damage Committees

Canadian Pacific Mountain Type Locomotives

The First Two Locomotives of This Type in Canada; the Leading Trucks are Equalized with the Driving Wheels

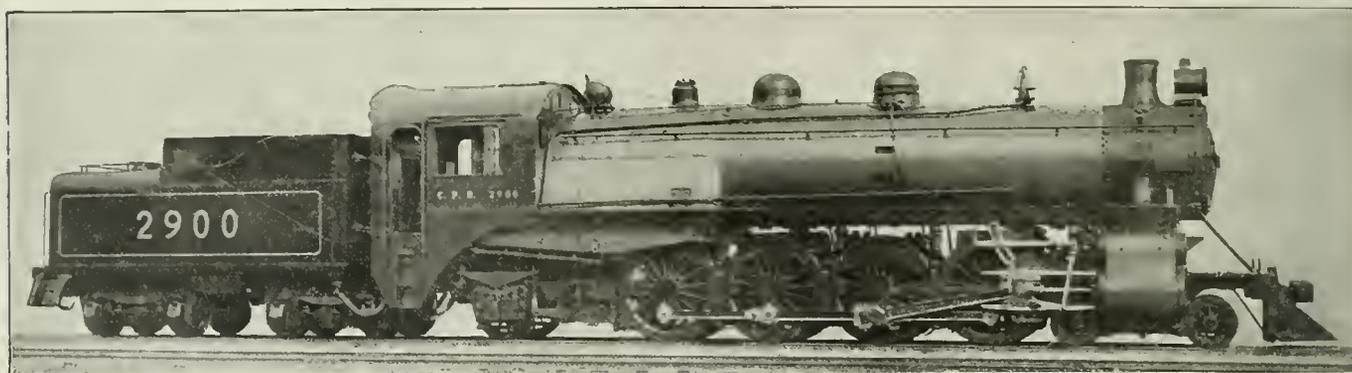

By W. H. WINTERROWD

Assistant Chief Mechanical Engineer, Canadian Pacific, Montreal, Que.

Because of the heavy grades on some divisions of the Canadian Pacific and on account of the desirability of maintaining schedule speeds with heavy trains without double-heading over these divisions, it became necessary to consider a type of locomotive more powerful than the Pacific type which is in use in the heavier passenger service. With this in view the company built and put in service in August, 1914, two Mountain type locomotives, which are the first of their type built in Canada. These locomotives were designed and built at the Angus shops, Montreal, and are identical in practically every respect with the exception of the boilers, one of which is equipped with a Gaines

By the American Locomotive Company's method of calculating boiler capacity, the boiler equipped with the Gaines combustion chamber is rated at approximately 110 per cent and the other boiler approximately 105 per cent. By the same method the boilers of the Pacific type locomotives are rated at approximately 90 per cent.

The firebox equipped with the Gaines combustion chamber is 7 ft. 4 $\frac{1}{2}$ in. wide and approximately 13 ft. 6 in. long at the mud ring. The grates extend toward the back tube sheet 7 ft. 11 in. and have an area of 59.6 sq. ft. At the front of the grates is placed the vertical brick wall of the combustion cham-

Canadian Pacific Mountain Type Locomotive with Gaines Combustion Chamber Firebox

combustion chamber firebox. They have 23 $\frac{1}{2}$ -in. by 32-in. cylinders, 70-in. driving wheels, and carry a boiler pressure of 200 lb.

Two classes of Pacific type locomotives have been in use, one with 22 $\frac{1}{2}$ -in. by 28-in. cylinders and 75-in. driving wheels, and the other with 21-in. by 28-in. cylinders and 69-in. driving wheels. The boilers of both classes carry a pressure of 200 lb. The class with the larger drivers and cylinders has a rated tractive effort of 32,100 lb., the total weight in working order, including the tender, being 361,000 lb. On account of bridge and right of way restrictions, the Mountain type locomotives are not as heavy as a number of locomotives of the same type in service in the United States. They have a rated tractive effort of 42,900 lb. and weigh 443,000 lb., including the tender. With an increase in weight of 22.7 per cent, an increase in tractive effort of 33.6 per cent has been obtained. The accompanying table compares briefly the Canadian Pacific Mountain type locomotives and some of the same type operating in the United States:

ber which is 10 in. thick and carries five vertical air passages, each 3 in. in diameter. The distance between the wall and the back tube sheet is 4 ft. 11 $\frac{1}{2}$ -in. The brick arch is carried on four 3 $\frac{1}{2}$ -in. arch tubes.

The mud ring is forged and slopes downward from both front and back toward the base of the vertical bridge wall. On account of the depth of the firebox the floor of the combustion chamber is raised above the level of the grates in order to clear the rear driving wheels, which extend into the firebox.

The tubes in the boiler of engine 2901, which are 25 ft. 4 $\frac{1}{2}$ in. long, were beaded into place before the boiler was applied to the frames, with the boiler turned upside down. The center sag of the tubes was then toward the top of the boiler and when it was righted the tubes tended to straighten out. A test showed that they were practically straight and up to the present time they have given no more trouble than the shorter tubes in engine 2900.

* Boiler equipped with Gaines combustion chamber.

Engine 2900 is equipped with the Gaines combustion chamber firebox. The boiler contains 210 2 $\frac{1}{4}$ -in. tubes and 30 5 $\frac{1}{4}$ -in. flues. The length over tube sheets is 20 ft. 8 $\frac{1}{2}$ in. The boiler of engine 2901 is equipped with an ordinary wide firebox and brick. It contains 43 2 $\frac{1}{4}$ -in. tubes, 136 2 $\frac{1}{2}$ -in. tubes and 30 5 $\frac{1}{4}$ -in. flues, the length over tube sheets being 25 ft. 4 $\frac{1}{2}$ in.

The equalizing system between the engine truck and driving wheels is that patented by H. A. Hoke, assistant engineer, Pennsylvania Railroad, and is in use on a number of Pennsylvania locomotives with four-wheel engine trucks. Its application to the Pennsylvania class E6s Atlantic type was described in the *Railway Age Gazette* for February 20, 1914, page 357. The

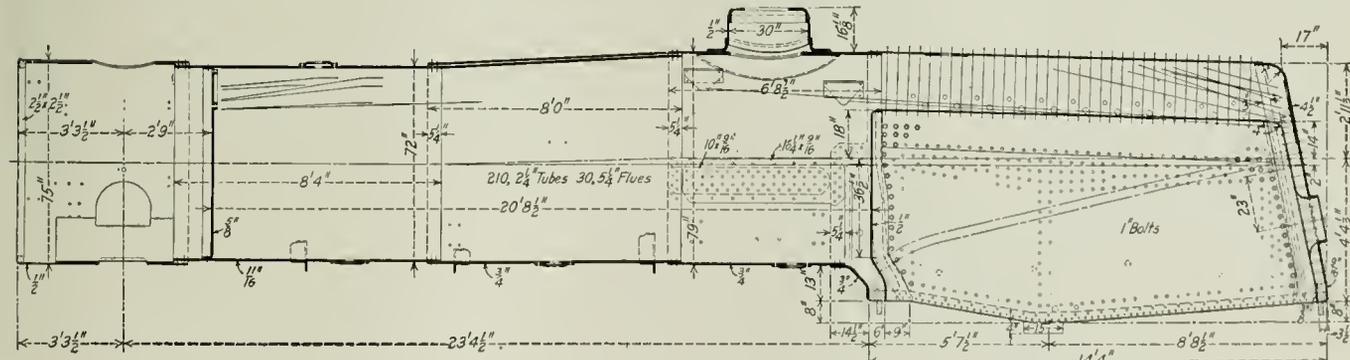

weight on the engine truck is equalized with the weight on the first and second pair of driving wheels, while the third and fourth pair of driving wheels are equalized with the trailer truck. The main equalizer fulcrum pin is supported in two steel castings fitted and bolted together directly beneath the cylinders. These castings serve also as a front frame cross tie, engine truck center casting guide and support for the engine truck safety hanger.

The engine truck center casting is made of cast steel. Its

Leading Truck of Canadian Pacific Mountain Type Locomotives

upper portion, which fits into the vertical guide, is made in the form of a hollow cylinder in the back of which is an opening through which the front end of the main equalizer passes. The bearing surface on the end of the equalizer is convex with a radius of 3½ in., and rests upon a concave cast steel equalizer seat supported by the engine truck center casting. This seat is provided with guiding ribs which engage the sides of the equalizer to prevent the seat from turning under the latter. The

Boiler of Engine 2900 with Gaines Firebox

lower part of the casting is rectangular in form and fits between transverse vertical walls on the cast steel frame cross tie, which form the guiding surfaces for the lateral swing of the truck in curving.

The truck is centered by double-faced wedges, the wearing faces of which are inclined 1 in. in 2½ in. The vertical guiding walls of the frame cross tie are joined at the ends to longitudinal vertical walls 4¼ in. high, thus forming a rectangular reservoir, open at the top, which is kept partly filled with oil for the lubrication of the centering wedges.

Through a reinforced extension on the front of the cross tie casting is a slot 2½ in. wide and 16 in. long formed on a radius of 2 ft. 8 in. Through this slot is passed the engine truck safety hanger, a wrought iron eye bolt 1¾ in. in diameter with a tee head on the bottom end. This is hung from the equalizer fulcrum.

The engine truck side frames are of steel cast integral with the journal box pedestals. They are of channel section and in the center of each is cast a spring seat in which rests a semi-elliptic spring. This is connected at the ends to inverted U-shaped equalizers, which span the journal boxes. Between the outer ends of these equalizers and the frame are placed coil springs, as shown in one of the illustrations. The wheel base

of the truck is 6 ft. 10 in., and in working order it weighs 11,250 lb. Actual service has demonstrated that this truck makes a very easy riding engine.

The cylinders are of cast iron and are the same as those used on the Canadian Pacific standard Mikado and ten-wheel type hump switch engines. In designing them particular attention was given to the steam and exhaust passages, which are unusually direct and of liberal cross sectional area. They are fitted with standard 12-in. piston valves.

The main frames of both engines are of vanadium cast steel and are cast integral with the front frames. The rear frames and the pedestal binders are of mild steel. Vanadium steel was also used in the crank pins.

The engines are both equipped with a screw reverse gear, the hand wheel, screw bearings, locking latch and position indicator of which are the same as those of the standard gear used on Pacific and Mikado type locomotives. In order to maintain the standard direction of movement for the top of the hand wheel, which is from left to right toward forward motion and from right to left to reverse, the threads on the screw are made left hand. The motion of the screw block is transmitted to the reach rod through a reverse lever, the motion of the rod thus being in the opposite direction from that of the block. The reach rod, which is very long on both engines, is made in three sections of extra heavy wrought iron pipe. The intermediate section works in a cast iron guide.

Both engines are equipped with Cole driving boxes on the main journals. These journals are 11 in. by 21 in., while the others are all 10 in. by 14 in. Canadian Pacific standard vestibule cabs are provided on both engines.

The tenders have a coal capacity of 12 tons, and a water capacity of 6,000 imperial gallons and are equipped with air-operated coal pushers. They are Canadian Pacific standard, known as the

combination type, in which the underframe forms a part of the tank structure.

The principal data and dimensions are given in the following table:

General Data	
	2900—Class H-1-a
Gage	4 ft. 8½ in.
Service	Passenger
Fuel	Bituminous
Traction effort	42,900 lb.
Weight in working order	286,000 lb.
Weight on drivers	192,000 lb.
Weight on leading truck	52,000 lb.
Weight on trailing truck	41,000 lb.

STRIKE OF FREIGHT HANDLERS IN BOSTON

Reference was made in a news item in last week's issue to the strike of freight handlers in Boston, which, from the railroad standpoint, has been settled, although the mayor and other city officials have continued their efforts to settle it along other lines.

At 10:20 on the morning of October 21, a committee representing between 500 and 600 freight handlers employed by the road called on President Hustis, of the Boston & Maine, and informed him that unless these men were granted an increase of 15 per cent. in their wages and pay for holidays, whether they worked or not, they would strike at 12 o'clock, or 1 hour and 40 minutes after the notice was given. The men had had a conference the previous morning with General Manager Pollock, but gave no ultimatum or intention of their purpose to strike. President Hustis pointed out that the rates of pay on the Boston & Maine were the same as those on other roads entering Boston, and that if it were true, as stated, that the other Boston roads were considering a revision of rates, the Boston & Maine would, of course, not ignore any adjustment that might be made. He informed them of the financial condition of the road, that the stockholders had been, and are, getting no return on their investment, and that the men had presented no argument as to why any increase should be granted other than that the men demanded it. The committee was urged to delay action until its statements about the intentions of other roads could be investigated, and their attention was called to the great responsibility it was assuming in ordering a strike in this summary manner, because if the strike was unsuccessful the men would be left in a sorry position.

The committee called a strike of the men, and the management at once took action to fill their places, the employees secured being largely residents of Boston or surrounding towns, who were in need of employment. They were paid \$2.30 for 10 hours' work, the rate of the men who struck, and the standard for steam roads in the territory. These men were secured with the understanding that they would be given regular employment if they were found to be adapted to the work.

James M. Curley, mayor of Boston, called a conference on October 23, with a view to adjusting the dispute, at which the road was represented by Attorney Charles S. Pierce, and the

mayor submitted a proposition that the men return to work at the old rates, pending submission of the entire matter to the State Board of Conciliation and Arbitration for adjudication. The mayor made the same proposition in a letter to Mr. Hustis, who replied, setting forth the facts in the case, and stating that the strikers had failed to recognize the orderly procedure established for dealing with such matters, that the men who took their places had been secured with the understanding that they would be given regular employment and that to discharge them and take back those who summarily left the service would be a breach of faith. A large number of men had been put at work and the conditions at the Boston freight stations on that date, October 25, were generally satisfactory. The mayor then repeated his request that Mr. Hustis attend a conference to be attended by officers of the chamber of commerce, the port directors, representatives of the freight handlers and of the Boston & Albany and New York, New Haven & Hartford, whose men had also gone on strike. Neither of the other two roads sent representatives to the conference, but Mr. Pierce, the attorney for the Boston & Maine, stated that its position was that there was nothing to arbitrate, as the places of the men had been filled and the work was being done satisfactorily. Mr. Hustis declined to attend the conference, saying this would but complicate the situation.

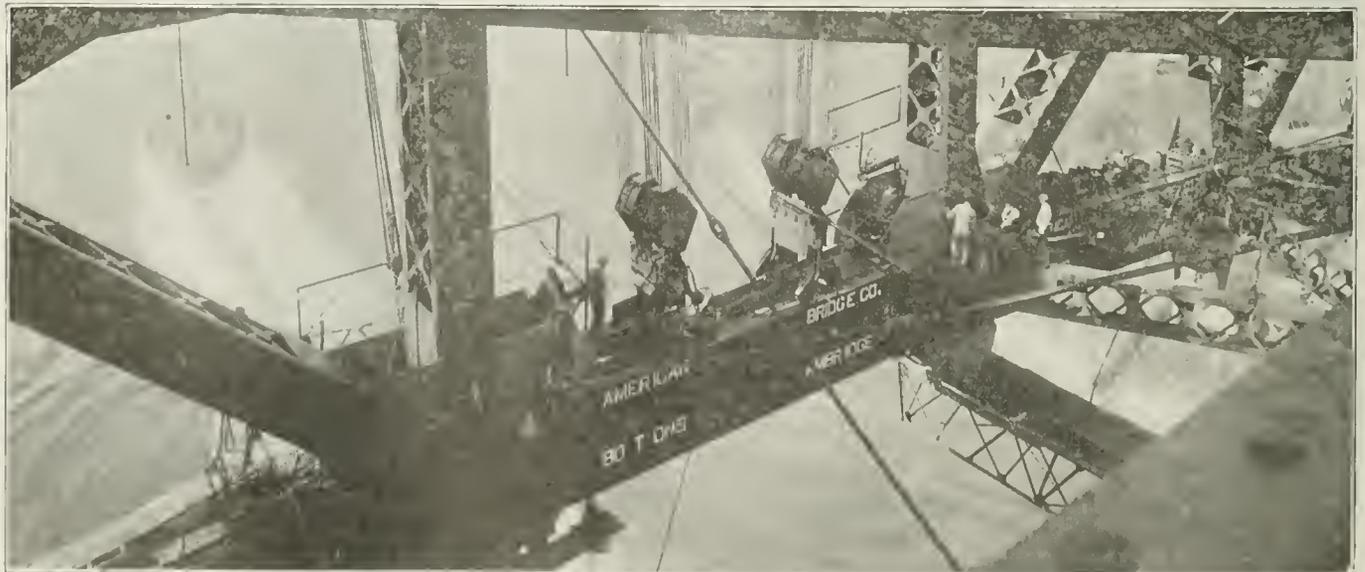

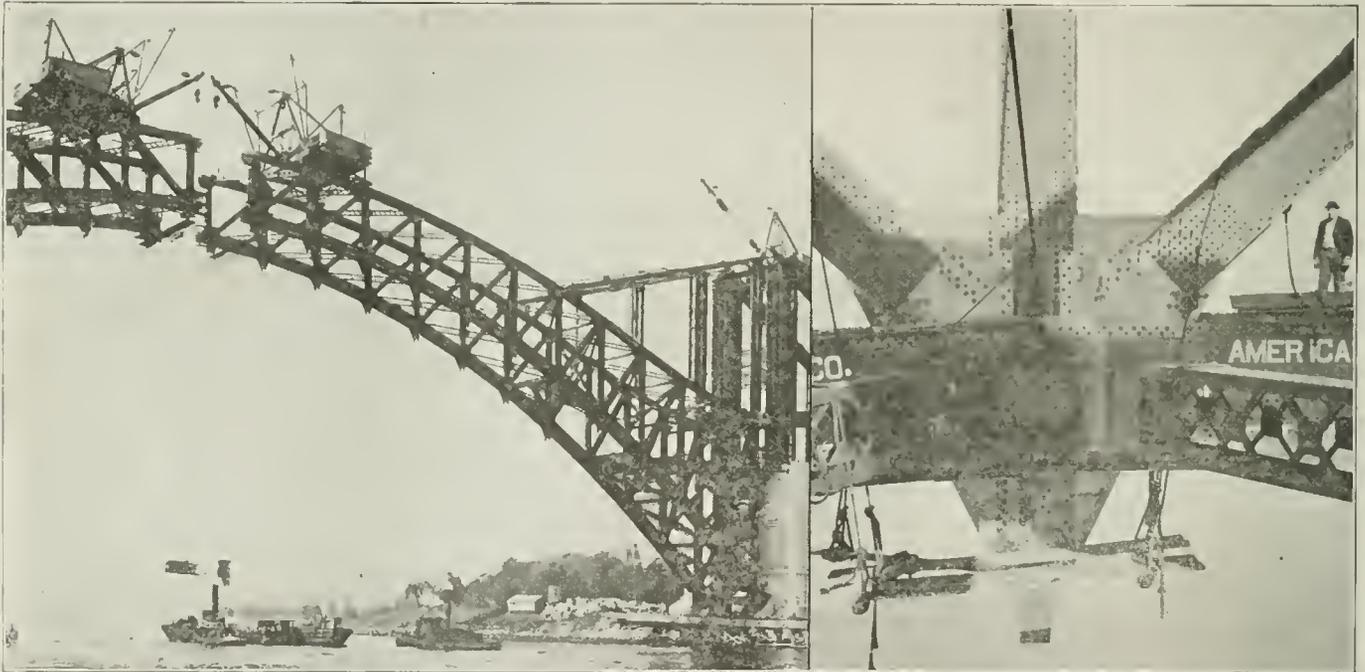

The mayor again repeated his request to Mr. Hustis for a conference, saying, "It is unwise, if not dangerous, to dispose of the question in such a summary manner," and that, in his opinion, "the sentiment of the community would strongly favor the payment of \$2.50 a day for 10 hours' work by able-bodied, intelligent men, skilled and experienced in their duty." Mr. Hustis declined to change his position, saying that the men were warned of the danger which might result from their proposed action and pointed out that the railroad had a public duty to perform, and when the freight handlers left their work the freight houses could not be closed and it could not cease the handling of shipments. It had, therefore, filled their places with other men with whom it could not break faith.

PROGRESS ON THE HELL GATE BRIDGE

On September 29 the closing members were placed in the gap at the crown of the Hell Gate arch, thus marking an important step in the completion of the New York Connecting Railway. The erection of this structure as two separate cantilevers by means of temporary backstays, was described in the *Railway Age Gazette*, September 3, page 422. The projecting arms were supported by ties passing over the saddles at the top of the backstays, where 3,000-ton hydraulic jacks (the largest ever built) were provided to afford the necessary adjustment in the position of the ends of the two halves of the arch. The initial application of the load of the cantilevers to these saddles was made by raising the jacks a total of 15 in., which placed the ends of the cantilevers several inches above the normal closing position.

On September 28, all of the steel was in place except that for the panel at the crown. Measurements across the gap checked the theoretical distance (after correction for temperature and elevation) by 5/16 in., which was the total error in the span of 1,017 ft. On September 30 the center panel sections of the bottom chord were lifted into place by the travelers standing on the two cantilever arms. It having been decided to make the closure at the panel point west from the center line, these bottom chord sections were bolted and drifted for full connection to the east cantilever. Likewise, the diagonals from the east top chords and the lower half of the opposite diagonals were set in place. The top chords and the upper portions of one set of diagonals were omitted.

The two halves of the arch were brought together on Friday, October 1, by lowering the saddle jacks on the backstays. The amount of lowering necessary to bring the bottom chord to contact checked exactly on the Wards' Island side and to 1/32 in. on the Long Island side. The calculated depression necessary

(Top)—Placing Center Top Chord Sections on October 4. (Center Left)—Hoisting Bottom Chord Section from Car Float. (Center Right)—Inside Elevation of Completed Bottom Chord Joint at Crown of Arch. (Bottom)—Placing Closing Member of Bottom Chord

to release the load on the backstays checked equally well. This operation was carried on under careful observation to the jack pressures, results were reported at frequent intervals by telephone. With the placing of the center top chord sections on October 4, the erection of the main members of the arch was completed. These top chord members were fully bolted in place on their east ends only, just sufficient bolts in slotted holes being provided at the other ends to insure alinement. The purpose of this arrangement is to provide for three-hinged action of the arch until all of the steel of the arch span is in place. Action as a two-hinged arch will then be obtained by riveting up the top chord complete.

Work is now proceeding with the removal of the backstays, which it is expected to finish by December 1. With these out of the way, the two travelers will proceed with the erection of the suspenders and the floor beams; and the excavations will be made for the footings of the piers for the approach trestle. The girders of the approach trestles, which have been in use as a part of the backstays, will be distributed along the trestles by a locomotive crane operating over a track to be laid alongside. Derrick cars or cranes working on the tracks above can then readily pick up the girders for erection. A locomotive crane will be used also for erection of the floor stringers of the arch.

In all, about 400,000 rivets will be required for the arch structure. Of these only about 10 per cent have been driven up to the present time, and it is estimated that a year will be required to complete this portion of the work. Thus far, the riveting is limited principally to the top chord. No rivets have been driven in the bottom chord splices.

Work on this structure is under the direction of Gustav Lindenthal, chief engineer of the New York Connecting Railroad. O. H. Ammann is assistant chief engineer, and H. W. Hudson is construction engineer.

ADJUSTABLE HUB PLATE

In the article describing the Smith adjustable hub plate, published on page 331 of the August 20 issue of the *Railway Age Gazette*, it was incorrectly stated that the adjustment of the hub plate was made by screwing in the grease plug shown in the outside of the wheel hub.

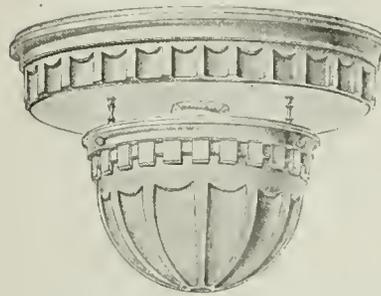

The plug referred to is a retaining plug, and a special grease cup is used for this purpose. This cup, as shown in the illustration, is inserted in place of the retaining plug, and by screwing in the plunger the grease is forced into the hub, forcing the hub plate out the required distance, after which the grease cup is replaced by the retaining plug. Otherwise the description of the device as given in the issue of August 20 is correct. The right for its use is sold by the Smith Locomotive Adjustable Hub Plate Company, Pittsburgh, Kan.

THE FREIGHT CLERK AT THE TELEPHONE. Answer promptly. Your patrons are business men. Speak with lips close to transmitter. Nothing is more annoying than to have a voice sound faint and unintelligible. Don't be in too great a hurry. Let your patron know that you understand what is wanted and he will not fret while you are securing the desired information. Don't hang up receiver too quickly. Be sure your customer is satisfied before you ring off. Do patrons complain that your phone is often busy? Tell the boss. He will have additional phones installed if they are needed. Remember that people will call your competitor and get in habit of giving him all their business if they cannot get you quickly. When request is made for rate, quote it and tell inquirer about your service and ask him for the business. Secure his address and have solicitor call on him. People appreciate attention shown them. It gets business.—*E. B. Wilkinson, Illinois Central.*

TWO NEW ILLUMINATION FIXTURES

Two interesting illumination fixtures have recently been developed, one for either large or small interiors, the other for exteriors. The interior fixture is known as the Brascolite and is of the semi-direct type. It comprises two definite features. There is a reflector of white enameled steel or vitreous china, which is secured in a horizontal position directly over the lamp and which contains the lamp socket in the center. Suspended from this reflector and enclosing the lamp is a white glass diffusing bowl. The fixture emits light in two ways. A considerable portion is diffused through the bowl, while the reflector above serves to reflect direct light from the lamp and reflected light from the inside surface

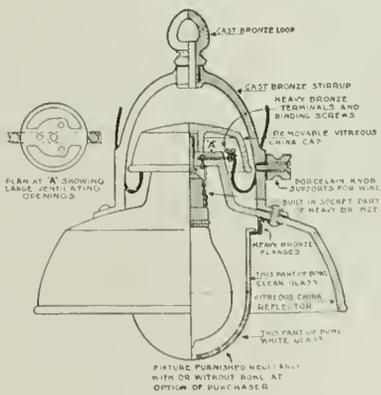

One Style of Brascolite Fixtures

of the bowl, the surface of the reflector being such that the reflected light is also diffused.

As the bowl is suspended some distance below the reflector, the lamp receives sufficient ventilation. The suspension is by means of three hooks, two of which may be unfastened to lower the bowl to the cleaning position, which permits convenient access to the lamp, the reflector and the interior of the bowl, for thorough cleaning. Aside from the efficiency of the illumination, this type of lamp has the advantage that it is independent of the condition of the ceiling for the effectiveness of the indirect lighting. The Brascolite fixture is made in a number of different styles, thus permitting selection to conform to the architectural treatment of the interior it is to occupy.

The principles embodied in the Brascolite fixture are used in a somewhat modified form in what is known as the Day Way

The Suspended Type Day Way Fixture

with the Brascolite fixture is reproduced in this lamp by the addition of a glass bowl, completely enclosing the lamp, ventilation in this case being supplied by means of two holes through the socket supports. This fixture may be used with either series or multiple circuits with large or small lighting units, thus making it adaptable to almost any form of outdoor service. As the fixture is almost entirely china or glass and the only metal parts are bronze, it offers high resistance to corrosive agencies. The fixtures described above are manufactured by the Luminous Unit Company, St. Louis, Mo.

FINNISH RAILWAYS. At the beginning of 1914 the total mileage of the Finnish State Railways, including 207 miles of line owned by private capital, but operated by the State lines, was 2,537. Finland has 2,765 miles of navigable waterways, of which, with the present facilities, it is estimated that the freight capacity is about 1,600,000 tons a year. The waterways as well as the railways are under the administration of the State.

General News Department

Baltimore & Ohio piers No. 34 and No. 35 at Locust Point, Baltimore, Md., were destroyed by fire on the night of August 27; estimated loss, including the contents of United States bonded warehouses, over \$500,000.

The loaded car movement on the Atchison, Topeka & Santa Fe last week, 35,244 cars, was 15 per cent greater than the loading for the corresponding week of the previous year and represents the highest record for a week in the history of the company. The increase in miscellaneous traffic was over 4,000 cars.

James J. Hill, in honor of whom a number of men have founded a professorship of transportation in the Graduate School of Business Administration, of Harvard University, has given to the university \$125,000, to be added to the like sum which was given by the founders. The letter of the founders was printed in the issue of the *Railway Age Gazette* for July 16, last, page 134.

The number of freight cars moved over the main line of the Pennsylvania Railroad in the month of October was 204,893, or about 1,000 more than in the preceding heaviest month which was March, 1912. The number of loaded cars included in the October number is 123,105. Shipments of coal are now very heavy. The company has more trainmen in its employ at the present time than ever before in its history.

On the Long Island Railroad in the month of October, 23 persons, while operating automobiles and other vehicles, violated the railroad's mandate to stop before starting over grade crossings. Only three people were injured, but this was due in the majority of cases largely to good luck. Twelve automobiles, five motor trucks, five wagons and one motorcycle make up the list. Twelve of these vehicles, mostly automobiles, plunged wildly through lowered gates, breaking eight of them.

The Nashville, Chattanooga & St. Louis has issued an order requiring that every employee who has anything to do with the handling of, or preparation of, food to be offered to the public in the dining cars or restaurants of the company shall first be examined. These examinations are to be held periodically, and no person who has been subjected to or who is suffering from any communicable disease is permitted to aid in the work, either in the diners or restaurants or private cars.

A meeting of representatives of the five principal railroad brotherhoods held in Faneuil Hall, Boston, last Sunday, was attended by about 1,000 men, said to represent brotherhoods in all parts of the United States. It was given out that a concerted movement was to be started to secure agreements with the railroads to limit the workday to eight hours, double pay to be given for all work done outside these hours. Brotherhood leaders in other important cities of the country are giving expression to this same purpose. The Boston meeting was followed by a dinner at the United States Hotel, at which the governor of Massachusetts was present; and he is quoted as saying: "It seems that the railroads are able to pay more than \$800,000 in this State for the expenses of lobbying, but that they are unable to pay some of their employees a living wage." The governor was a candidate for re-election. On Tuesday of this week the election occurred and he was defeated.

Export Coal Terminal at Charleston

The Southern Railway has completed its new export coal terminal at Charleston, S. C., at a cost of approximately \$600,000, and coal can now be loaded into ships at Charleston as rapidly and as cheaply as at any other American port. Freight rates have been so adjusted that coal operators shipping through Charleston will be on a parity with those exporting through Norfolk.

The coal handling machinery consists of a car dumper and a

loading tower, which are operated entirely by electric motors. They stand on a steel and concrete pier 375 ft. long fronting on water 30 ft. deep at low tide. The pier is connected with the mainland by a creosoted trestle 3,800 ft. long. Both the car dumper and the loading tower are movable and can be shifted to serve different hatches, so that when a ship is once tied up at the pier it is unnecessary to move it until a full cargo has been received. The capacity of the plant is from 1,500 to 2,000 tons an hour. In connection with the coal pier there is a storage yard of 400 cars capacity.

Rail Failures in New York

The New York State Public Service Commission, Second district, has written to the principal railroads within its jurisdiction calling attention to the necessity for great care in the inspection of rails in track. There has been a large increase in failures due to internal transverse fissures, the failures reported for the months named during 1914 and 1915, being as follows:

	1914	1915
July	12	12
August	5	16
September	5	32

The letter says that it is extremely essential that employees be cautioned to exert the utmost watchfulness in inspecting the track in order that as many of the rails as possible in which transverse fissures may develop and appear on the surface may be detected before complete failure.

The commission also urges that employees be warned to use great care in passing through automatic block territory after having observed an automatic signal in the stop position. A large number of the failures reported to the commission have been detected by means of the signals.

Protest Against the Moon Bill

The committee on railway mail pay, Ralph Peters, chairman, has issued a pamphlet of 30 pages, containing a strong protest, addressed to Congress and the public, against renewal of the efforts to pass the Moon mail pay bill. The measure was introduced in the last Congress, but failed to pass, although it was made a rider on the post office appropriation bill. The postmaster general has announced that it will be reintroduced when the new Congress opens in December, and will be pushed for speedy passage. This bill would empower the postmaster general, who is interested in the reduction of the postal deficit, to make the rates for carrying the mails, with the sole limitation that he could not exceed certain sums; and the penalty for each refusal to carry at his price might be \$5,000. The committee claims that the bill is really a delegation of legislative power to the postmaster general. The bill is analyzed paragraph by paragraph. It is shown that from end to end the measure does not specify a single definite rate that the railroads are to be paid, but in each instance leaves the determination of the rate to the postmaster general. It is shown also that supplementary grants of power, conferred by some of the closing paragraphs of the bill, would permit the postmaster general of his own motion to establish other systems of mail transportation totally different from the detailed plan which the bill purports to enact into law. The postmaster general could initiate these plans and put them into effect independently of the will of Congress and make them apply to all but the first-class mail.

The Trial of the New Haven Directors

Sessions of the Federal Court in New York before which the criminal suit against the eleven New Haven directors is being tried were held on Thursday and Friday of last week and were continued again this week, Wednesday, after a recess over the

holiday. The sessions on Thursday and Friday were taken up largely by a consideration of the acquisition by the New Haven of a number of trolley lines, the government attempting to show that the New Haven tried to monopolize the trolley transportation of New England. Much of the evidence submitted was in the form of the letter books of John M. Hall, president of the road before Mr. Mellen. Among the letters read were a number telling legislators to oppose or favor legislation, offering passes, and proposing other means of taking care of persons favoring the New Haven. One of the most interesting was that written January 21, 1897, to Charles F. Brooker, one of the defendants, saying in part: "Enclosed is a draft of a carefully drawn bill, which I want you to hand quietly to Representative Tucker of your city to be introduced as quietly as possible. This bill, if passed, will make the electric company widen a bridge and given them something to think about besides paralleling the New Haven. Representative Tucker must father the bill and nurse it. In no event must it be known that the New Haven had anything to do with it. We will make it all right with him and will provide some legislative support."

Mr. Mellen on Friday made a statement concerning these letters as follows:

"There was apparently introduced yesterday, under the heading of testimony of Charles S. Mellen a lot of matter that comes from identification of signatures, particularly letters of Judge Hall, the vice-president. I had no knowledge direct or indirect

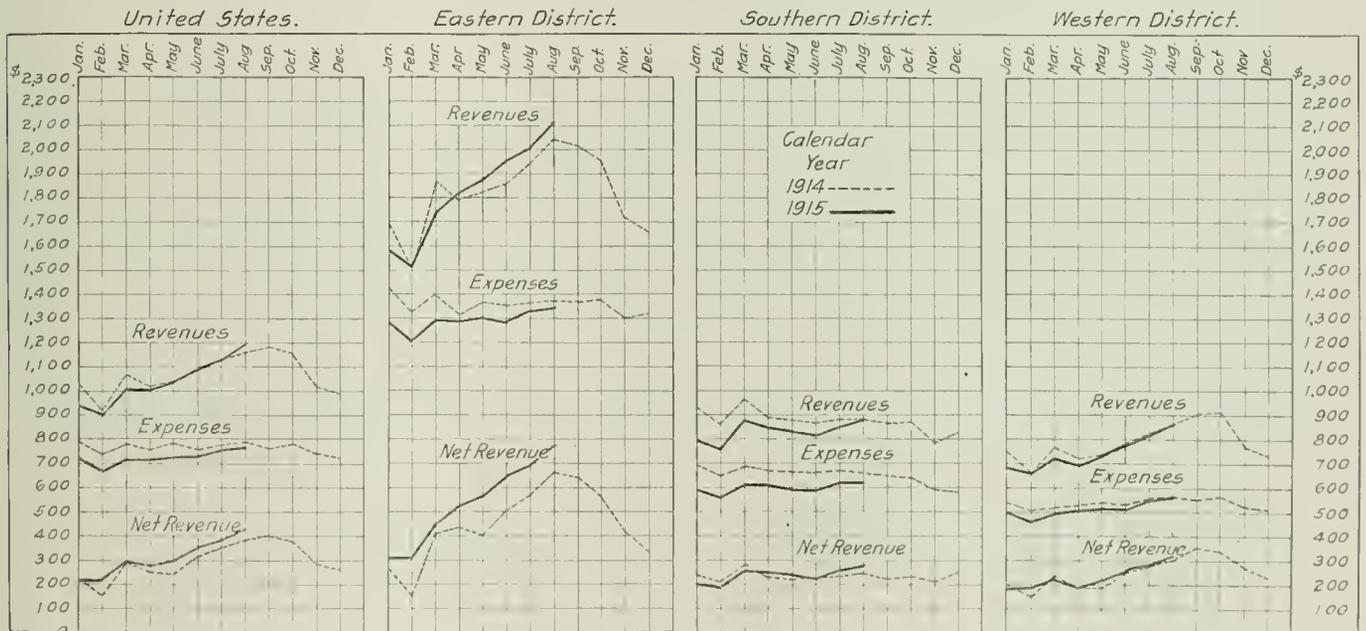

Summary of Revenues and Expenses of Steam Roads

The Bureau of Railway Economics' summary of revenues and expenses and comments thereon for August, 1915, are as follows:

Net operating income of the railways of the United States for August increased \$39 per mile, or 11.4 per cent as compared with August, 1914. In August, 1914, net operating income per mile was 0.8 per cent less than in August, 1913.

Total operating revenues amounted to \$272,306,183, an increase from 1914 of \$5,232,376. Operating expenses were \$174,879,773, a decrease of \$4,354,631. Net operating revenue amounted to \$97,426,410, an increase of \$9,587,007. Taxes amounted to \$11,600,099, an increase of \$312,530. This left \$85,738,540 for net operating income, available for rentals, interest on bonds, appropriations for improvements and new construction, and dividends. Operating revenues per mile of line averaged \$1,191, an increase of 1.3 per cent; operating expenses averaged \$765, a decrease of 3.0 per cent; net operating revenue per mile averaged \$426, an increase of 10.2 per cent, while net operating income per mile was \$375, an increase of 11.4 per cent. Taxes per mile increased 2.1 per cent. Railways operating 228,716 miles of line are covered by this summary, or about ninety per cent of the steam railway mileage in the United States.

Operating revenues of the eastern railways per mile show an increase of 3.6 per cent as compared with August, 1914, operating expenses decreased 2.1 per cent, net operating revenue increased

Monthly Revenues and Expenses Per Mile of Line in 1914 and 1915

regarding these matters. They come upon me like a burst of thunder. I cannot rest easy with it appearing even to the uninitiated, that I had any knowledge of such things existing, and I am paralyzed at the thought that for ten years I sat within reaching distance of those books and was not blown up."

In reply to a question by R. V. Lindabury of the counsel for the defense, Mr. Mellen also said: "I never had occasion to refer to them. I know of no director or officer who did refer to them. I had not the remotest knowledge that they were in existence until they were read in evidence."

After this Mr. Mellen left the stand and was not cross examined by the defense. On Friday also Charles C. Goodrich, general manager of the Hartford & New York (Steamboat) Transportation Company of which at one time he was president, told of the business of that company. The New Haven in 1901 entered into an agreement with this company concerning rates and confirming the activities of the boat line both as to ports and amended business done. In 1905, however, the New Haven bought it outright.

On Wednesday Mr. Goodrich was cross-examined by Charles F. Choate of counsel for the defense.

15.5 per cent, taxes increased 1.4 per cent, and operating income increased 17.3 per cent.

Operating revenues of the southern railways per mile decreased 1.2 per cent, operating expenses decreased 7.1 per cent, net operating revenue increased 15.9 per cent, taxes increased 2.5 per cent, and operating income increased 18.3 per cent.

Operating revenues of the western railways per mile show an increase of less than one-tenth of one per cent, operating expenses decreased 2.1 per cent, net operating revenue increased 3.8 per cent, taxes increased 2.9 per cent, and operating income increased 3.9 per cent.

The two months of the current fiscal year show an increase in total operating revenues per mile of line of 0.8 per cent as compared with the corresponding period of the preceding year, a decrease in operating expenses per mile of 3.8 per cent, an increase in net operating revenue per mile of 10.9 per cent, an increase in taxes per mile of 1.7 per cent, and an increase in net operating income per mile of 12.3 per cent.

The net operating income per mile increased 21.3 per cent in the east, increased 14.9 per cent in the south, and increased 3.1 per cent in the west.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF SEPTEMBER, 1915.

Table with columns: Name of Road, Average mileage operated during period, Operating revenues (Freight, Passenger, Total), Maintenance of way and structures, Traffic, Trans-shipment, Miscellaneous, Net railway operating income, Railway tax accruals, Operating income (comp. with last year), Increase (or decr.)

Fifty School Boys Killed

President Fairfax Harrison, of the Southern Railway Company reports that during the fiscal year ending with last June, 147 trespassers were killed on the tracks of that road. He urges the development of a public sentiment that will put an end to the hazardous practice of trespassing. He has prepared a map showing the point at which each trespasser was killed and "it looks like a map of the monuments on the Chickamauga battle field." . . . "Fully one-third of those killed were school boys, 'hopping' trains, and a large percentage were valuable wage-earners, walking on the tracks to or from their work. Very few were 'tramps.'"

The Deadly Automobile

The St. Louis Republic says: "St. Louis contains one-sixtieth of the urban population of the United States, and in October a round dozen of our people were killed in the city in automobile accidents; so that the annual automobile death rate in the cities of the United States would be 8,640, if the St. Louis rate in October should be maintained. All the railroads in this country do not kill many more than this in a year, including accidents to trespassers and in the shops. Leaving out trespassers, the St. Louis automobile death rate in October was worse than anything the railroads ever accomplished, yet we have cried aloud unto heaven against the railroads for their carelessness. Right now in this country there is no activity which needs to have the 'safety first' motto rubbed in, with jail sentences, half so badly as automobiling."

Pennsylvania Prize Winners

The latest news bulletin issued by the Pennsylvania Railroad contains portraits of four employees of the road who have lately taken prizes: C. Z. Moore, supervisor, Middletown, Pa., and L. R. Fleming, assistant supervisor, who jointly took the first prize for excellent track work this year, and George W. Smith, Jr., and Richard C. Bartley, telegraphers in the general office at Broad street station, Philadelphia, who took prizes at the International Telegraphic Tournament held at San Francisco in connection with the Panama-Pacific Exposition, August 27 and 28. The roadway prizes have already been noticed in the *Railway Age Gazette*. The two telegraphers named have taken prizes before, notably at Boston in 1908. At San Francisco, Mr. Bartley sent 40 railroad messages, without an error, in 28 minutes and 13 seconds, breaking all previous records. He also won the contest of hand versus machine sending, beating the men who used mechanical appliances by which one stroke of the finger makes any number of dots. Mr. Smith won the receiving contest by taking, without break or error, 40 railroad messages in 31 minutes, 12 seconds. Mr. Bartley has been in the service since 1889 and Mr. Smith since 1896. Both are sons of Pennsylvania Railroad employees. In honor of their success at the exposition, the two operators were given a dinner at Philadelphia, on September 7, by the officers and employees of the telegraph department of the road, J. C. Johnson, superintendent of telegraph, acting as toastmaster.

American Railway Association

The autumn session of the American Railway Association will be held at The Blackstone, Chicago, November 17. Reports will be presented by the committees on Transportation; on Maintenance; on Relations Between Railroads; on Explosives; on Electrical Working; on Legal and Traffic Relations; and on Movement of Empty Cars.

June Mechanical Conventions

Announcement was made in our issue of October 29, page 769, that a joint meeting of the executive committees of the Master Car Builders' Association, the American Railway Master Mechanics' Association and the Railway Supply Manufacturers' Association would be held at Cleveland, Ohio, on Monday, November 15. It has been decided to change the place of meeting to Chicago, as a number of the members of the executive committees of the two railroad associations will wish to attend a meeting of the Special Committee on Relations of Railway Operation to Legislation in Chicago on the following

day. The joint meeting will be held in the office of Secretary J. W. Taylor at 9:30 a. m. As previously noted, the object of the meeting will be to decide upon the dates for the June conventions as well as the place of meetings.

Central Railway Club

At the next meeting of the Central Railway Club, to be held on Friday, November 12, 1915, at the Hotel Statler, Buffalo, N. Y., an illustrated paper will be presented on the subject of "Rubber: From the Raw to the Finished Product." An inspection of the Hewitt Rubber Company's plant has been arranged for the afternoon, and an informal complimentary dinner at the Hotel Statler will precede the evening meeting. The ladies are invited to both the dinner and the club meeting.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, date of next or regular meetings and places of meeting.

- AIR BRAKE ASSOCIATION.—F. M. Nellis, 53 State St., Boston, Mass. Next convention, May 2-5, 1916, Atlanta, Ga.
- AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—F. A. Pontious, 455 Grand Central Station, Chicago. Next meeting, January, 1916, Atlanta, Ga.
- AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—H. C. Boardman, D. L. & W., Hoboken, N. J.
- AMERICAN ASSOCIATION OF FREIGHT AGENTS.—R. O. Wells, Illinois Central, East St. Louis, Ill. Next meeting, June 20-23, 1916, Cincinnati, O.
- AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hope, C. K. R. of N. J., 143 Liberty St., New York.
- AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—E. H. Harman, Room 101, Union Station, St. Louis, Mo.
- AMERICAN ELECTRIC RAILWAY ASSOCIATION.—E. B. Burritt, 8 W. 40th St., New York.
- AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOCIATION.—H. G. McCannoughy, 165 Broadway, New York.
- AMERICAN RAILROAD MASTER TINNERS', COPPERSMITHS' AND PIPEFITTERS' ASSOCIATION.—W. E. Jones, C. & N. W., 3814 Fulton St., Chicago.
- AMERICAN RAILWAY ASSOCIATION.—W. F. Allen, 75 Church St., New York. Next meeting, November 17, 1915, The Blackstone, Chicago.
- AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 17-19, 1916, New Orleans, La.
- AMERICAN RAILWAY ENGINEERING ASSOCIATION.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next convention, March 21-23, 1916, Chicago.
- AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—J. W. Taylor, 1112 Karpen Building, Chicago. Annual meeting, June, 1916.
- AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—Owen D. Kinsey, Illinois Central, Chicago. Annual meeting, July, 1916.
- AMERICAN SOCIETY FOR TESTING MATERIALS.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.
- AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York. Annual meeting, December 7-10, 1915, New York.
- AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, Supt. Timber Preservation, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 18-20, 1916, Chicago.
- ASSOCIATION OF AMERICAN RAILWAY ACCOUNTING OFFICERS.—E. R. Woodson, Rooms 1116-8, Woodward Bldg., Washington, D. C. Annual meeting, June 28, 1916, Hotel Statler, Detroit, Mich.
- ASSOCIATION OF MANUFACTURERS OF CHILLED CAR WHEELS.—George W. Lyndon, 1214 McCormick Bldg., Chicago. Semi-annual meeting with Master Car Builders' Association. Annual convention, October, 1916, Chicago.
- ASSOCIATION OF RAILWAY CLAIM AGENTS.—Willis H. Failing, N. Y. C., 3842 Grand Central Terminal, New York. Next meeting, May 19, 1916, Atlantic City, N. J.
- ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jus. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago.
- ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—P. W. Drew, Soo Line, 112 West Adams St., Chicago. Annual meeting, June 20-22, 1916, St. Paul, Minn.
- ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—G. P. Conard, 75 Church St., New York. Next meeting, December 14-15, 1915, St. Louis, Mo.
- BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—T. O. Jacobs, H. W. Johns-Manville Co., Chicago. Meetings with American Railway Bridge and Building Association.
- CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.
- CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.
- CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.
- ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh, Pa.
- FREIGHT CLAIM ASSOCIATION.—Warren P. Taylor, Traffic Manager, R. F. & P., Richmond, Va. Annual session, May 17, 1916, Washington, D. C.
- GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.
- INTERNATIONAL RAILWAY FUEL ASSOCIATION.—C. G. Hall, C. & F. I., 922 McCormick Bldg., Chicago. Annual meeting, May, 1916, Chicago.

INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 1126 W. Broadway, Winona, Minn.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, C. H. & D., Lima, Ohio. Next meeting, August, 1916, Chicago.

MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—T. I. Goodwin, C. R. I. & P., Eldon, Mo.

MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 95 Liberty St., New York. Annual convention, May 23-26, 1916, Hotel Hollenden, Cleveland, Ohio.

MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—A. P. Dane, B. & M., Reading, Mass. Next annual meeting, September 12-14, 1916, Wilmington, Del.

MASTER CAR BUILDERS' ASSOCIATION.—J. W. Taylor, 1112 Karpen Building, Chicago. Annual meeting, June, 1916.

NATIONAL RAILWAY APPLIANCE ASSOCIATION.—C. W. Kelly, 349 People's Gas Bldg., Chicago. Next convention, March, 1916, Chicago.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—E. N. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.

RAILROAD CLUB OF KANSAS CITY.—Claude Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Saturday in month, Kansas City.

RAILROAD MEN'S IMPROVEMENT SOCIETY.—J. B. Curran, Erie R. R., 50 Church St., New York. Meetings, alternate Thursdays, October to May, Assembly Rooms of Trunk Line Association, 143 Liberty St., New York.

RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 30 Church St., New York. Annual meeting, December, 1915, Waldorf-Astoria, Hotel, New York.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, 1063 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.

RAILWAY FIRE PROTECTION ASSOCIATION.—C. B. Edwards, Fire Ins. Agt., Mobile & Ohio, Mobile, Ala.

RAILWAY REAL ESTATE ASSOCIATION.—Frank C. Irvine, 1125 Pennsylvania Station, Pittsburgh, Pa. Annual meeting, October, 1916, Chicago.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Myers Bldg., Bethlehem, Pa. Next annual convention, September, 1916, Grand Hotel, Mackinac Island, Mich.

RAILWAY STOREKEEPERS' ASSOCIATION.—J. P. Murphy, N. Y. C. R. R., Box C, Collingwood, Ohio.

RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.—J. D. Conway, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with Master Car Builders' and Master Mechanics' Associations.

RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph Superintendents.

RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—L. C. Ryan, C. & N. W., Sterling, Ill. Next annual convention, September 19-22, 1916, New York.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

SALT LAKE TRANSPORTATION CLUB.—R. E. Rowland, David Keith Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

SOCIETY OF RAILWAY FINANCIAL OFFICERS.—Carl Nyquist, C. R. I. & P., 1134 La Salle St., Chicago.

SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, A. & W. P. R. R., Atlanta, Ga. Next meeting, April, 1916.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Piedmont Hotel, Atlanta.

TOLEDO TRANSPORTATION CLUB.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Body House, Toledo.

TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.

TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.

TRAFFIC CLUB OF NEWARK.—John J. Kautzmann, P. O. Box 238, Newark, N. J. Regular meetings, 1st Monday in month, except July and August, The Washington, 559 Broad St., Newark.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Waldorf-Astoria Hotel, New York.

TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Gen'l Agt., Erie R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings, bi-monthly, Pittsburgh.

TRAFFIC CLUB OF ST. LOUIS.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

TRAIN DESPATCHERS' ASSOCIATION OF AMERICA.—J. F. Mackie, 7122 Stewart Ave., Chicago. Next convention, June 21, 1916, Toronto, Ont.

TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, Superintendent's office, N. Y. C. R. R., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. R. R., East Buffalo, N. Y. Next meeting, September, 1916, Chicago.

UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, 1111 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.

WESTERN CANADA RAILWAY CLUB.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Building, Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

WESTERN SOCIETY OF ENGINEERS.—E. M. Layfield, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings. Annual meeting, 1st Wednesday after 1st Thursday in January, Chicago.

Traffic News

On October 30, service on the "Pacific Limited" of the Chicago & North Western was amplified by the addition of an all-steel observation buffet lounging car.

The Chicago, Rock Island & Pacific on October 31 discontinued its trains No. 69 and No. 70, running between Kansas City and St. Paul and Minneapolis.

The Union Pacific on October 31 discontinued two of its trains running between Kansas City and the Pacific coast by way of Denver; No. 101 westbound, and 120, eastbound.

The Chicago, Milwaukee & St. Paul has announced that, beginning on November 7, sleeping cars will be run between Chicago and Portland, Ore., on the "Columbian" train in connection with the Oregon-Washington Railroad & Navigation Company from Spokane to Portland. The departing time from Chicago will be changed from 10:10 a. m. to 8:30 a. m., and the train will arrive two hours earlier at Spokane, Seattle and Tacoma.

The receivers of the St. Louis & San Francisco, Wabash, Missouri, Kansas & Texas and Missouri Pacific, all of which are in the hands of the courts, were among the speakers at a dinner given by the Commercial Club of St. Louis on October 27, and in addresses pointed out the reasons for the present condition of the roads. B. F. Bush, receiver of the Missouri Pacific, declared that "in no other way than by an increase of rates can the carriers establish and maintain a credit so essential in the obtaining of new money to provide the required facilities and equipment." Other speakers who spoke along similar lines included J. W. Lusk, receiver of the St. Louis & San Francisco, C. E. Schaff, receiver of the Missouri, Kansas & Texas, E. F. Kearney, receiver of the Wabash, Festus J. Wade and E. C. Simmons.

Passenger officers of the St. Louis-Kansas City lines have decided to discontinue the midnight passenger trains between the two cities, and the new tables became effective on October 31. In January, 1914, the St. Louis-Kansas City lines discontinued their midnight trains and ran the remaining night trains on a 10½ hour schedule. On June 1, 1915, the midnight trains were restored. In a statement issued to the public it is explained that the roads have carefully watched the effect of this additional service and have determined that the volume of business does not justify running two night trains. They have therefore decided to run each one night train on a schedule of about nine hours. On some of the lines the trains leave both terminals at 11 p. m., arriving at 8 a. m. On others they leave both terminals between 9 and 11 o'clock, and arrive between 7 and 8. This meets the criticism directed against the former plan, that passengers only had one choice, because under the new adjustment there will be four different leaving times.

The Empire State Express

This famous train of the New York Central, the first regular long distance train in America to run at over 50 miles an hour, including stops, has begun its twenty-fifth year. It has covered a distance of 6,518,600 miles, equal to 14 round trips to the moon, and has carried approximately 8,000,000 passengers safely to their destinations. The record during these 24 years has been a remarkable one. Not one of its passengers has been fatally injured. One of its engineers for sixteen years was Dennis J. Cassin, who last year was awarded the Harriman bronze medal in recognition of his unblemished record of safety.

When the Empire State Express was first placed in service it weighed only 230 tons; now it weighs 780 tons. It was drawn by engines of the "870" class, and later by the famous "999" the locomotive that took the prize at the Chicago World's Fair. Nowadays that locomotive looks like a toy in comparison with the giant Pacific type, and it could hardly start the train, much less haul it on its fast schedule.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

Classification of Chairs

Opinion by the commission:

A proposed increased rating on common chairs in carloads in western classification territory, from fourth class, minimum 12,000 lb., to third class, minimum, 10,000 lb., is found not justified. (36 I. C. C., 243.)

Complaint Dismissed

A. B. Crouch Grain Company et al v. Atchison, Topeka & Santa Fe et al. Opinion by the commission:

The commission holds reasonable, the rule in various tariffs of the southwestern lines providing for deductions in the adjustment of claims for loss of grain in transit of certain percentages of loading weights as representing natural shrinkage. (36 I. C. C., 265.)

STATE COMMISSIONS

The Railroad Commission of Texas has granted the application of the St. Louis Southwestern for authority to remove and abandon "Morrill Spur," the order to become effective November 10. Chairman Allison Mayfield and Engineer R. D. Parker, of the commission, made an inspection of the line. Morrill Spur is seven miles in length, of which only 4½ miles is in operation. It was originally built for the accommodation of the Morrill Orchard Company.

The New York Public Service Commission, Second district, has ordered the New York Central to reconstruct a track over the coal pit of the Dundee Electric Lighting Plant, in the village of Dundee, Yates county. The railroad discontinued the track when the trestle over the coal pit was reported unsafe and refused to renew it except under an agreement making the lighting plant responsible for all detriment, damage suits, etc., and calling for \$5 annual rental; and the railroad proposed to reserve the privilege of removing the track on 30 days' notice. The road has now offered a new contract in which the indemnity clause is replaced by one in consonance with a recent decision of the commission in a similar case. The commission rules that the \$5 annual rental is reasonable, inasmuch as the structure is wholly on the railroad's right of way. It refuses, however, to authorize the termination of the contract on 30 days' notice. The commission has power to order the installation of a side-track or its continuance; but it permits a clause allowing discontinuance, "in accordance with law" on 30 days' notice.

COURT NEWS

Attorney General Barker, of Missouri, has announced that he is preparing to file suit in the United States Supreme Court to recover \$24,000,000 in alleged overcharges collected by the railroads of Missouri while the two-cent passenger fare and state freight rate laws were in litigation. A similar suit was dismissed by the Missouri Supreme Court.

The United States District Court at Philadelphia, October 28, filed its decree, in pursuance of the decision handed down last June, to the effect that the Central of New Jersey must divest itself of its ownership of the Lehigh & Wilkes Barre Coal Company. It is reported from Washington that the government will appeal the case to the Supreme Court, on the ground that the decision does not go far enough. The government aims to compel the separation of the Central of New Jersey from the Philadelphia & Reading.

"Engaged in Interstate Commerce"

The Alabama Supreme Court holds that an employee working at a coal chute coaling engines on an interstate railroad and required to serve interstate and intrastate trains is engaged in

"interstate commerce" within the federal employers' liability act.—*Southern v. Peters, Ala.*, 69 So. 611.

Delivery on Forged Bill of Lading

A bill of lading of a car load shipment consigned the freight to the order of Botsford & Barrett, and read "Botsford & Barret, per F. M. G., Shipper, Lapeer Grain Co., Churchill." Delivery was made by the final carrier on a forged bill of lading. In an action against the initial carrier for the value of the shipment, the Michigan Supreme Court holds that the bill of lading indicated that the Lapeer Grain Company, as well as Botsford & Barret, were shippers, and, as such shippers, their indorsement was necessary before the carrier was justified in making delivery, and a delivery on a forged bill of lading was no defense.—*Churchill v. Grand Trunk Western (Mich.)*, 154 N. W. 106.

Injuries to Persons on Track—Burden of Proof

A Tennessee statute declares that every railroad company shall keep a lookout, and when any person or any other obstruction appears on the track, take all means to prevent an accident; and that no company that observes such precautions shall be responsible for damage done to persons on its road. The Supreme Court of the state holds that one suing for the death of her intestate, killed on the defendant's road, has the burden of showing that the deceased was on the track or so near it as to be an obstruction before the railroad company is bound to show that it observed the statutory precautions.—*Cincinnati, N. O. & T. P. v. Brock (Tenn.)*, 178 S. W. 1115.

Instructions of Drover—Reasonableness

The Nebraska Supreme Court holds that a railroad is not bound to comply with every arbitrary request made by a shipper of live stock as to the place where the animals shall be unloaded and fed while in transit. It is only obliged to comply with such requests as may be reasonable; reasonableness to be decided by the jury. Cattle were shipped a distance requiring only 21 hours for the journey and no circumstances were present making it necessary that the animals be unloaded short of destination. It was held not to be negligence, as a matter of law, to fail to comply with a request of the shipper, made to the agent at point of shipment, that the cattle be unloaded at an intermediate point for food, water and rest.—*Keat v. C. & N. W. (Neb.)*, 154 N. W. 220.

Franchise Taxes on "Doing Business"—Lease

A railroad corporation incorporated under the New York Stock Corporation Law to take and possess the property and franchises of a domestic railroad company owning and operating a railroad in the state, acquired the property and franchises on a foreclosure sale, and leased the property and franchises, other than the franchise to exist as a corporation, for 999 years. Since the lease, it has held meetings of the stockholders for election of directors, who elected officers, and made annual capital stock reports, kept corporate accounts, and maintained corporate organization and an office in a sister state, while the railroad was operated by the lessee. The New York Appellate Division holds that it did business in the state, within New York Tax Law, section 182, imposing a tax for the privilege of "doing business" in the state.—*People ex rel. Lehigh v. Sohmer*, 154 N. Y. Supp 1054.

Damage by Fire Caused by Water Reaching Unslaked Lime

When a car containing a shipment of goods reached the carrier's yards, the water in a river, by reason of an unusual freshet, was 2¾ feet higher than the highest previous record. The water continued to rise until it reached unslaked lime in another car in the yards, causing a fire which destroyed the goods. In an action for damages the New York Appellate Division holds that the carrier's negligence, if it was negligent in placing the goods near the car of lime, was the proximate cause of their destruction. Whether the placing of the car near the car of unslaked lime was negligence was a question for the jury, as the carrier owed plaintiff an active duty to use reasonable care not to expose his property unnecessarily, and it knew or was chargeable with knowledge that, if the water reached the lime, a fire would naturally result, and presumably it knew or should

have known the contents of the car containing the lime.—Barnet v. New York Central, 1153 N. Y. Supp. 374.

Alabama Bonner Anti-Shipping Act Held Valid

A liquor dealer in Pensacola, Fla., filed a bill in the Alabama courts against a common carrier to compel it to receive at and transport from Pensacola to Ramer, Ala., a shipment of six quarts of whisky. The complainant, having received an order, accompanied by the requisite cash price, from a resident of Ramer, who was one of the complainant's customers, for the whisky, tendered the shipment to the defendant. The latter refused to receive it, assigning as the only reason for its refusal that the law of Alabama forbade the carrier's transportation and delivery to one consignee at a point in "dry territory" in Alabama of more than one quart of whisky in any four consecutive weeks, even though the shipment is tendered in another state. Ramer is in "dry territory." It was conceded that the shipment was only intended for the personal use of the consignee and his family. The carrier's refusal was based on the Bonner Anti-Shipping Bill, which became effective in Alabama on February 8, 1915. The Alabama Supreme Court holds that the act is a valid exercise of the police power of the state, and does not conflict with either the state or the federal Constitution. The Webb-Kenyon Law, which the court holds to be within the power of Congress to enact, prohibits the entering in interstate commerce of intoxicating liquors where the purpose is unlawful under valid state statutes, and any valid exercise of the police power of the states is not a regulation of interstate commerce. A decree granting relief was therefore reversed and the bill dismissed.—Southern Express Co. v. Whittle (Ala.), 69 So. 652.

Right of Way Granted by Congress Cannot Be Alienated—Adverse Possession

In 1862 the United States granted to the Central Pacific a strip of land 400 feet wide through the public lands of the United States in California for a right of way; also the odd-numbered sections of land lying within 10 miles of the line. It built its road on the strip, enclosing only 100 feet. It sold parts of a section through which the road ran to one Droge, who has remained in possession of that part of the 400-foot strip lying outside of the fences ever since their erection. The railroad never exercised any acts of ownership over these remaining portions. It has now claimed them in an action to recover possession of real property. The chief defenses were adverse possession for 41 years, with payment of taxes for that period, and that the action was barred by limitations and estoppel. The California Supreme Court holds that the action of Congress is a conclusive determination by the United States that the entire strip is necessary for railroad purposes, and the company may not alienate or dispose of any part of it for any other purposes. This was previously decided in Northern Pacific v. Townsend, 190 U. S. 267, 23 Sup. Ct. 671. The United States Supreme Court has established the rule that the federal courts will construe the grants of the general government without reference to the rules of construction adopted by the states for their grants. The effect of the grant in question was therefore to be determined in accordance with the decisions of the federal courts. The grant to the railroad was an estate in fee for a special public purpose, subject only to revert at the instance of the United States if the public use were not properly maintained.

It was claimed that the act of Congress of June 24, 1912, relating to Union Pacific lands in possession of individuals, was effective to perfect this California defendant's title, but the claim was not sustained. The act of 1912 was specially made applicable to the grant to the Union Pacific, and could not be extended by implication to the Central Pacific. Moreover, it has been decided that the act of 1912 is not retroactive. The railroad was not estopped from claiming the land because the defendant had paid a price for it based on the entire acreage of the subdivision, and that he had improved and cultivated the land while it was in his possession. He knew, at the time of the purchase, of the act of Congress. Moreover, estoppel could not operate to discontinue a public use, and divest a title which the company could not alienate or dispose of directly or indirectly. Judgment for the company was affirmed.—Central Pacific v. Droge (Cal.), 151 Pac. 663.

Railway Officers

Executive, Financial, Legal and Accounting

Charles A. Vilas has been appointed valuation attorney of the Chicago & North Western, effective November 1.

The federal court has appointed James A. Seddon special master in the receivership case of the Missouri, Kansas & Texas.

M. H. Smith, president of the Louisville & Nashville at Louisville, Ky., has been elected president also of the Lexington & Eastern, succeeding Arthur Cary. W. L. Mapother, first vice-president of the Louisville & Nashville, has been elected vice-president also of the Lexington & Eastern. J. H. Ellis, secretary of the Louisville & Nashville, and formerly also vice-president of the Lexington & Eastern, is now secretary of both roads, and W. M. Thompson is treasurer of both roads. All with headquarters at Louisville, Ky.

N. D. Maher, heretofore vice-president in charge of operation of the Norfolk & Western, with office at Roanoke, Va., has had his title changed to first vice-president, and in addition to his

duties as head of the operating department will, in case of the temporary absence or incapacity of the president, perform all the duties and exercise all the powers of the president. Mr. Maher was born at Blairsville, Pa., and began railway work in 1871. For two years he was engaged in making surveys on the Pittsburgh, Virginia & Charleston, and then was clerk in the office of the superintendent of transportation at Altoona, Pa., of its successor, the Pennsylvania Railroad. From 1874 to 1883, he was clerk in the general superintendent's office of the same road, and then to August, 1889, was

N. D. Maher

chief clerk to general manager of the Norfolk & Western. He subsequently served for one year as trainmaster of the Flat Top division, and then to June, 1901, was superintendent of the Pocahontas division of the same road. He then went to the Seaboard Air Line as general superintendent at Portsmouth, Va., and in January, 1903, returned to the service of the Norfolk & Western as general superintendent, remaining in that position until the following February, when he was promoted to general manager. From July, 1907, to November, 1912, he was also second vice-president, and since that time was vice-president in charge of operation of the same road, with office at Roanoke, Va.

V. D. Skipworth, assistant general manager of Sulzberger & Sons Company, Chicago, was recently elected a director of the Chicago & Alton. Mr. Skipworth was born on October 21, 1874, at Point Pleasant, Mo., and entered railway service in 1891 with the Kansas City, Osceola & Southern, now part of the St. Louis & San Francisco system. He became a telegraph operator and was successively agent, train dispatcher, superintendent and assistant general freight and passenger agent of this road. From 1899 to 1908 he was manager of the Cold Blast Transportation Company and the Lackawanna Livestock Transportation Company, and since 1908 he has been president and manager of these companies, representing the interests of the packinghouse of Sulzberger & Sons Company.

Operating

A. W. Woodruff, trainmaster of the Union Pacific at Green River, Wyo., has been transferred to Ogden, Utah, where he will

take over the duties of S. R. Toucey, promoted. The office of assistant superintendent at Ogden has been abolished. R. E. Brooks, chief dispatcher at Green River, Wyo., has been promoted to trainmaster, vice Mr. Woodruff. Effective November 1.

James F. Murphy, whose appointment as general manager of the Missouri Pacific-St. Louis, Iron Mountain & Southern has been announced, was born on April 6, 1870, at Peoria, Ill. He

J. F. Murphy

was educated in the common schools and entered railway service in 1887. In 1889 he left his position as yard clerk for the Peoria & Pekin Union to become a brakeman on the Chicago & Alton. In 1890 he became a switchman for the Peoria & Pekin Union, and from 1891 to 1897 served as yard clerk and switchman for the Kansas City, Ft. Scott & Memphis. From 1897 to 1901 he held the positions of assistant yardmaster, general yardmaster and trainmaster of terminals for the Kansas City Southern, at Kansas City, Mo. In 1901, he was appointed general yard-

master of the St. Louis & San Francisco, at Springfield, Mo., and in 1902, became superintendent of terminals for the Kansas City Southern, at Kansas City, Mo. In November, 1905, he entered the service of the Missouri Pacific as trainmaster, with headquarters at Coffeyville, Kans. On January 15, 1907, he was promoted to superintendent of the Memphis division, with headquarters at Wynne, Ark. Later he was transferred to the Central division of the Iron Mountain, and thence to the Arkansas division. On June 19, 1911, he was promoted to general superintendent of the Eastern district of the Missouri Pacific, with headquarters at St. Louis, Mo. He continued in this position until his recent appointment as general manager of the system.

John Cannon, whose appointment as general superintendent of the Eastern district of the Missouri Pacific-St. Louis, Iron Mountain & Southern, has been announced, was born on May 6,

J. Cannon

1872, at Cairo, Ill. He was educated in the public schools and entered railway service in 1886 as a laborer in the mechanical department of the Illinois Central. Until May 1, 1892, he served as messenger in the superintendent's department and held various clerkships in the same department; from May 1, 1892, to 1894, he was chief clerk to the assistant superintendent of the Chicago division. From 1894 to December 1, 1901, he was chief clerk to the superintendent of the Amboy and St. Louis divisions; from December 1, 1901, to the fall of 1903, he was chief clerk

to the general superintendent of transportation; from 1903, to June 1, 1904, assistant trainmaster of the St. Louis division; from June 1, 1904, to January, 1905, chief clerk to the general manager; from January to October, 1905, trainmaster of the Springfield and Chicago divisions. In October, 1905, he entered the service of the Missouri Pacific-St. Louis Iron Mountain &

Southern as superintendent of the Southern Kansas division at Coffeyville, Kan. Since then he has been transferred in the same capacity to Little Rock, Ark., DeSoto, Mo., Poplar Bluff, Mo., and Sedalia, Mo. In October, 1913, his headquarters as superintendent of the Eastern division were changed from Sedalia, Mo., to Springfield. His recent promotion will change his office to St. Louis, Mo.

Andrew P. Titus, who was appointed general manager of the Chicago & Alton on November 1, was born on April 11, 1873, on a farm near Princeton, N. J. He was educated at Princeton preparatory school and at Princeton College. He

A. P. Titus

entered railway service on July 1, 1890, in the car department of the Lake Shore & Michigan Southern, at Cleveland, Ohio. From 1893 to 1895, he was employed by a mining company in Mexico, and in June, 1895, returned to the Lake Shore at Cleveland, remaining there until May, 1900. From May, 1900, to November, 1905, he was car distributor and chief clerk to the superintendent of car service of the Wheeling & Lake Erie; from November, 1905, to May, 1907, he was superintendent of car

service of the same road, at Pittsburgh, Pa. From May, 1907, to July 1, 1912, he was assistant superintendent in charge of transportation at Canton, Ohio, and from the latter date to August, 1912, superintendent of the Toledo division of the same road. From August, 1912, to November 1, 1915, he was general superintendent of the Chicago & Alton, with headquarters at Chicago, Ill. The office of general superintendent has been abolished.

Lawrence A. Downs, superintendent of the Kentucky division of the Illinois Central, who has been appointed general superintendent of all lines south of the Ohio river

L. A. Downs

with headquarters at New Orleans, La., was born on May 9, 1872, at Greencastle, Ind., and graduated from Purdue University in 1894. The following February he began railway work with the Vandalia Railroad, and from March, 1896, to 1898, was in an engineering party on the Illinois Central. He then served as roadmaster from 1898 to March, 1907, on the Amboy, the Louisville, the Louisiana, the Springfield and the Chicago divisions. In March, 1907, he was appointed assistant chief engineer maintenance of way, remaining in that position until December 6, 1910, when he was ap-

pointed superintendent of the same road, and now becomes general superintendent of all the lines south of the Ohio river as above noted.

S. H. Barnes, general superintendent of the Missouri, Oklahoma & Gulf at Muskogee, Okla., having resigned, this office has been abolished and H. C. Ferris, one of the receivers, will assume the duties of chief operating officer with W. G. Humphrey, purchasing agent, as assistant chief operating officer. E.

A. Dewey, trainmaster at Muskogee, has been appointed superintendent and C. L. Bushnell has been appointed car accountant.

C. M. Walton has been appointed assistant trainmaster of the First and Second districts of the Grand Trunk, with headquarters at Island Pond, Vt.

L. A. Downs, superintendent of the Kentucky division of the Illinois Central, has been appointed general superintendent of all lines south of the Ohio river, with headquarters at New Orleans, La. He succeeds L. W. Baldwin, who has been appointed general manager of the Central of Georgia, with headquarters at Savannah, Ga. A portrait of Mr. Baldwin and a sketch of his railway career were published in the *Railway Age Gazette* of February 5, 1915, page 248.

T. J. Jones, superintendent of the Wabash at Moberly, Mo., has been appointed superintendent of transportation, with office at St. Louis, Mo., in place of H. Eicke, who has been appointed superintendent of the Chicago Terminal division, with office at Chicago, Ill., in place of H. W. Ballou, who at his own request has been granted leave of absence, on account of ill health, and W. H. Eckard, trainmaster at Stanberry, Mo., has been appointed superintendent of the Moberly division, with office at Moberly, in place of Mr. Jones, and G. S. Ward has been appointed chief special agent, with office at St. Louis, Mo.

William H. Penrith, who was appointed assistant general manager of the Chicago & Alton on November 1, was born on November 4, 1875, at St. Paul, Minn. He was educated in the grammar and high schools at Minneapolis, Minn., and entered railway service on June 1, 1897, with the Minneapolis & St. Louis. From June 1, 1897, to December 31, 1899, he held various clerical positions in the stores department of that railroad. From January 1, 1900, to July 31, 1902, he was chief clerk of the stores department; from August 1, 1902, to October 31, 1912, he was chief clerk of the mechanical department. From November 1, 1912, to February 28, 1914, he was general statistician in the office of the vice-president and general manager. On March 1, 1914, he left the service of the Minneapolis & St. Louis to become special statistician in the office of the president of the Chicago & Alton, at Chicago, Ill. He remained in this position until his recent appointment as assistant general manager. His headquarters will continue to be at Chicago.

Traffic

H. A. Johnson, whose appointment as traffic manager of the Colorado & Southern has been announced, entered railway service as an office boy in the general freight office of the Missouri, Kansas & Texas at Sedalia, Mo. From there he went to St. Louis, Mo., where he was chief clerk to the general freight agent of the Missouri Pacific; on December 4, 1882, he was appointed assistant general freight agent of that railroad, and on August 1, 1884, was appointed commercial agent, with headquarters at Chicago, Ill. On November 1, 1885, he was transferred to Atchison, Kans., and on January 1, 1886, was appointed assistant general freight agent of the Union Pacific. On January 1, 1889, he became general freight agent of the Kansas City, Ft. Scott & Memphis, now a part of the Frisco lines. He remained in this position until January 1, 1890, when he was appointed assistant general freight agent of the Union Pacific at Denver, Colo.; in July of the same year he was appointed general agent of the same road with headquarters at San Francisco, Cal. In August, 1892, he became traveling freight agent of the Great Northern, with office at Spokane, Wash., and in February, 1893,

H. A. Johnson

was promoted to division freight and passenger agent of the Pacific division of that road, with headquarters at Seattle, Wash. On January 1, 1894, he was appointed general agent in the freight department of the Union Pacific at Denver, Colo. On February 1, 1899, became general freight agent of the Colorado & Southern with office at Denver, and on March 1, of the same year, his jurisdiction was extended over the passenger business and his title changed to general freight and passenger agent. He held this position until October 12, 1915, when he was promoted to traffic manager of the same railroad.

H. R. Wilson has been appointed general freight and passenger agent of the Mississippi Central, with office at Hattiesburg, Miss., vice R. D. Moore, resigned.

W. B. McGroarty, agent of the freight department of the Southern Railway and the Piedmont Air Line at Baltimore, Md., has been appointed general agent, with office at Baltimore.

E. A. Peacock has been appointed commercial agent of the Trinity & Brazos Valley, with office at Ft. Worth, Texas. J. E. Meroney has been appointed commercial agent at Corsicana, Texas.

Roy L. Stall, district passenger solicitor of the Pennsylvania Railroad at New York, has been appointed division passenger agent of the Pittsburgh district, with office at Pittsburgh, Pa., succeeding Edgar Yungman, promoted.

Frank A. Hart, general agent of the Chicago, Burlington & Quincy, at Clinton, Iowa, has been appointed division freight and passenger agent, with headquarters at Quincy, Ill., and H. R. Freed has been appointed general agent at Clinton, vice Mr. Hart.

L. D. McCollum, commercial agent of the Atlantic Coast Line at Augusta, Ga., has been appointed commercial agent, with office at Columbia, S. C., vice D. Y. Monteith, resigned to engage in other business, and J. H. Kinard has been appointed commercial agent, with office at Augusta, vice Mr. McCollum.

Engineering and Rolling Stock

J. W. Baum, general foreman of the Lake Erie, Franklin & Clarion, at Clarion, Pa., has been appointed master mechanic, a new position, and the position of general foreman has been abolished.

R. A. Billingham, master mechanic of the Tennessee Central, at Nashville, Tenn., has been appointed mechanical superintendent, and the office of master mechanic has been abolished.

R. G. Jones, assistant engineer on the Northern division of the Grand Rapids & Indiana, at Grand Rapids, Mich., has been promoted to division engineer on the Southern division, at Ft. Wayne, Ind.

C. W. Hixson, signal supervisor of the Vandalia, at Terre Haute, Ind., has been appointed signal supervisor of the Pennsylvania Lines, with headquarters at Chicago, Ill., vice A. J. Seifert, deceased.

James F. McNamara, assistant roadmaster of the Yazoo & Mississippi Valley, at Greenwood, Miss., has been promoted to roadmaster of the Minnesota division of the Illinois Central, with office at Dubuque, Iowa, vice Thomas Quigley, transferred. Effective October 25.

H. H. Sheffer has been appointed signal supervisor of the Western division of the El Paso & Southwestern, with headquarters at Douglas, Ariz., and S. E. Tomlinson has been appointed signal supervisor of the Eastern division, with headquarters at Carrizozo, N. M. Effective November 1.

W. Homuth, formerly signal inspector of the Chicago & North Western, has been appointed assistant signal supervisor of the Chicago terminal, relieving E. E. Schultz, who has been assigned to duties as engineer in the office of the signal engineer. R. B. Arnold, signal inspector, has been appointed assistant engineer in charge of valuation.

J. L. Taylor, Jr., assistant division engineer of the Pennsylvania Lines West at New Castle, Pa., has been appointed assistant division engineer of the Pittsburgh division with office at Pittsburgh. R. D. McKeon, assistant division engineer of the Vandalia Railroad at Logansport, Ind., has been appointed assistant division engineer of the Erie and Ashtabula division of the Pennsylvania Lines West with office at New Castle, and

E. H. May, an assistant of the engineering corps of the Indianapolis division of the Pennsylvania Lines West, has been promoted to assistant division engineer of the Michigan division of the Vandalia Railroad, with office at Logansport, Ind.

R. H. Pinkham, assistant supervisor of the Pennsylvania Railroad, at Derry, Pa., has been promoted to division engineer of the Renovo division, with office at Renovo. H. D. Stowe, supervisor at Dunkirk, N. Y., and G. W. Curtiss, supervisor at Shamokin, Pa., have been appointed pilot engineers in the office of the valuation engineer, both with headquarters at Philadelphia.

W. E. Brown, supervisor of the Middle division of the Pennsylvania Railroad, at Hollidaysburg, Pa., has been appointed supervisor of the Pittsburgh division, with office at Derry, Pa. A. G. Follette, supervisor at Woodbury, N. J., has been appointed supervisor of the Shamokin division, with office at Shamokin, Pa. C. E. Whitlock, formerly supervisor of the Trenton division, and later in the office of the assistant to the general manager at Philadelphia, has been appointed supervisor of the Philadelphia Terminal division, with office at Philadelphia. H. A. John, supervisor at Salamanca, N. Y., has been appointed supervisor of the West Jersey & Seashore, with office at Woodbury, N. J. T. K. Minsker, assistant supervisor of the Pennsylvania Railroad at Bowie, Md., has been promoted to supervisor of the Buffalo division, with office at Dunkirk, N. Y., and F. X. Bradley, assistant supervisor at Derry, has been promoted to supervisor of the Allegheny division, with office at Salamanca, N. Y.

Joseph Weidel, whose appointment as valuation engineer of the Atchison, Topeka & Santa Fe was announced in these columns in August, has recently had his jurisdiction extended over the Gulf, Colorado & Santa Fe. Mr. Weidel started his professional career in 1895 as a draftsman in New York City. In 1899 he was employed as an assayer by the Buck Exploration Company at Durango, Mexico. From 1900 to 1902 he was employed by the Santa Fe in various capacities in Colorado, New Mexico and Kansas. In 1903 he was in the service of the Mexican Central as division engineer in the states of Coahuila and Vera Cruz. From 1904 to 1905 he was assistant engineer on the Santa Fe, and in 1906 construction engineer for the Hally & Swink Railway in Colorado. Returning to the Santa Fe he served one year as engineer on construction of the Raton tunnel at Trinidad, Colo., and two years as office engineer at Topeka, Kan. In 1912 and 1913, he had charge of the construction of the Pecos & Northern Texas, from Lubbock, Tex., to Texico, N. M. In 1914 he returned to the Santa Fe as an assistant engineer.

Purchasing

J. L. Woods, assistant purchasing agent of the Nashville, Chattanooga & St. Louis, at Nashville, Tenn., has been appointed purchasing agent, vice A. C. Taylor, assigned to other duties.

OBITUARY

John Kirk, superintendent of the Gary division of the Elgin, Joliet & Eastern, died at Gary, Ind., on November 2.

Daniel Elliott, division superintendent of the Atchison, Topeka & Santa Fe, at Amarillo, Tex., died on October 19.

Gardner I. Israel, general agent of the Delaware & Hudson, at Chicago, Ill., died on October 25, at the age of 38.

Thomas McGuire, division freight agent of the Pere Marquette at Grand Rapids, Mich., died in that city on October 23. He had been in the service of the railroad since 1891.

C. A. Anderson, trainmaster of the Chicago, Milwaukee & St. Paul at Mason City, Iowa, died on October 31 as the result of being run down by a switching locomotive in the yard.

H. M. McCartney, well known among railroad builders, died at Los Angeles, Cal., on October 16. During the construction of the Western Pacific he held the position of assistant chief engineer and also figured prominently in the construction of the Northern Pacific, the San Pedro, Los Angeles & Salt Lake and the Union Pacific. More recently he was connected with the land department of the Southern Pacific Company.

Equipment and Supplies

LOCOMOTIVE BUILDING

THE GEORGIA, SOUTHERN & FLORIDA is in the market for 2 passenger locomotives.

THE STANDARD OIL COMPANY, Whiting, Ind., is inquiring for prices on one switching locomotive.

THE RARITAN RIVER has ordered one Mikado type locomotive from the Baldwin Locomotive Works.

THE ALLEGHENY STEEL COMPANY has ordered one switching locomotive from the Baldwin Locomotive Works.

THE DETROIT TERMINAL has ordered one Consolidation type locomotive from the Baldwin Locomotive Works.

THE PORT HURON SOUTHERN has ordered one six-wheel switching locomotive from the Baldwin Locomotive Works.

THE PITTSBURGH & LAKE ERIE has ordered 10 Mikado type locomotives from the American Locomotive Company.

THE SUMPTER VALLEY has ordered one ten-wheel and one Mikado type locomotive from the Baldwin Locomotive Works.

THE EAST TENNESSEE & WESTERN NORTH CAROLINA has ordered one ten-wheel type locomotive from the Baldwin Locomotive Works.

THE WALTERBORO LUMBER COMPANY, Thayer, S. C., has ordered one Prairie type locomotive from the Baldwin Locomotive Works.

THE UNITED STEEL COMPANY, Canton, Ohio, has ordered one four-wheel switching locomotive and one six-wheel switching locomotive from the Baldwin Locomotive Works.

THE INTERSTATE RAILROAD, reported in the *Railway Age Gazette* of October 22 as having ordered 2 locomotives from the Baldwin Locomotive Works, has increased that order to 3 Consolidation type locomotives.

THE BETHLEHEM STEEL COMPANY has ordered 2 eight-wheel switching locomotives from the American Locomotive Company. These locomotives will have 22 by 28 in. cylinders, 51-in. driving wheels and a total weight in working order of 196,000 lb.

THE BALTIMORE & OHIO, reported in the *Railway Age Gazette* of October 22 as having ordered one Mallet type locomotive from the Baldwin Locomotive Works, has increased this order to 15 Mallet (2-8-8-2) type locomotives and has also ordered 15 Mallet type engines from the American Locomotive Company.

THE NEW ORLEANS & NORTH EASTERN, reported in the *Railway Age Gazette* of October 22 as having ordered 4 Mikado type locomotives from the Baldwin Locomotive Works, has increased that order to 6 locomotives, two of which will be used on its own lines and four on the Vicksburg, Shreveport & Pacific.

THE PENNSYLVANIA RAILROAD was noted in last week's issue as having ordered 75 Mikado type locomotives from the Baldwin Locomotive Works. These engines are ordered on the 1916 equipment program, and are to be used on the Lines East of Pittsburgh. They are to be of the L-1-s type, and will be similar to the locomotive described in the *Railway Age Gazette* of July 3, 1914, page 12.

THE CENTRAL OF GEORGIA, as stated in a recent issue, has ordered 8 Mikado type locomotives and 4 Pacific type locomotives from the Lima Locomotive Corporation. The Mikado type engines will have the same principal dimensions as those ordered by the Illinois Central. The Pacific type locomotives will have 23 by 28 in. cylinders, 69-in. driving wheels and a total weight of 222,300 lb.

THE ILLINOIS CENTRAL, as slated recently, has ordered 47 Mikado type locomotives from the Lima Locomotive Corporation, all of which will have 27 by 30 in. cylinders, 63-in. driving power of 51,630 lb. and a total weight in working order of 284,400 lb. The 3 Santa Fe type locomotives, ordered from the American Locomotive Company, will have 29 by 32-in. cylinders,

63-in. driving wheels, a weight on driving wheels of 274,000 lb., a tractive effort of 67,173 lb. and a total weight in working order of 346,000 lb.

THE PEKIN-KALGAN RAILWAY has ordered 4 Mikado type and 2 Pacific type locomotives from the American Locomotive Company. The Mikado type locomotives will have 20 by 28 in. cylinders, 50-in. driving wheels and a total weight in working order of 186,000 lb. The Pacific type locomotives will have 20 by 26 in. cylinders, 62-in. driving wheels and a total weight in working order of 183,000 lb.

THE MUSCATINE-IOWA CITY RAILWAY, Muscatine, Iowa, has leased the Montezuma branch of the Chicago, Rock Island & Pacific, running from Muscatine, Ia., to Montezuma, 87 miles, and proposes to operate the line with gas-electric power instead of steam. It has already begun negotiations for the purchase of the necessary freight locomotives and passenger cars. The arrangement for the lease is to become effective on January 1, 1916.

THE CINCINNATI, INDIANAPOLIS & WESTERN was incorrectly reported in last week's issue as having ordered 42 locomotives from the Lima Locomotive Corporation. The company placed orders for but 35 locomotives, the order having been divided as follows: Lima Locomotive Corporation, 8 Mikado type and 7 six-wheel switching locomotives, and the Baldwin Locomotive Works, 10 ten-wheel and 10 Consolidation type locomotives.

CAR BUILDING

THE MISSOURI, KANSAS & TEXAS is inquiring for 2,000 coal cars.

THE BINGHAM & GARFIELD is inquiring for prices on 125 freight cars.

THE NORTHERN PACIFIC is inquiring for prices on 1,000 center constructions.

THE DENVER & RIO GRANDE is inquiring for prices on 10 steel passenger coaches.

THE MUSCATINE-IOWA CITY RAILWAY.—See item under Locomotive Building.

THE MINNEAPOLIS & ST. LOUIS has ordered 500 40-ton box cars from the Bettendorf Company.

THE MICHIGAN CENTRAL has ordered 150 40-ton box cars from the Canadian Car & Foundry Company.

THE ATCHISON, TOPEKA & SANTA FE has ordered 400 steel cars for ties from the Haskell & Barker Car Company.

THE BIRMINGHAM SOUTHERN has issued inquiries for 50 70-ton hopper cars, 25 70-ton flat cars and 15 50-ton box cars.

THE CENTRAL OF NEW JERSEY has ordered 1,000 box, 1,000 hopper and 250 insulated box cars for ice from the Standard Steel Car Company.

THE GEORGIA, SOUTHERN & FLORIDA is in the market for two passenger coaches, 130 steel gondola coal cars and 375 steel underframe box cars.

THE CHESAPEAKE & OHIO, reported in last week's issue as being in the market for 1,000 70-ton coal cars, has ordered these cars from the Standard Steel Car Company.

THE PENNSYLVANIA EQUIPMENT COMPANY, Philadelphia, Pa., is in the market for one or two second hand caboose cars. It is also inquiring for 25 flat and 5, 30-ton box cars, for southern delivery.

THE DELAWARE, LACKAWANNA & WESTERN, reported in last week's issue as being in the market for 500 hopper cars, will also purchase 1,000 steel underframe box cars and 500 gondola cars.

THE BALTIMORE & OHIO, reported in an unconfirmed item in last week's issue as having ordered 1,000 hopper cars from the Cambria Steel Company, ordered 2,000 hopper cars from that company and has also ordered 500 box car bodies from the Ralston Steel Car Company.

THE LOUISVILLE & NASHVILLE reported in an unconfirmed item in the *Railway Age Gazette* of last week as having ordered 1,000

steel underframe box cars from the Mount Vernon Car Manufacturing Company, ordered only 1,000 steel underframes from that company and will build the cars in its own shops. This company will also build 400 gondola cars in its own shops.

THE PENNSYLVANIA has issued inquiries for 9,000 freight cars to replace old equipment. Of these 6,000 will be for the Lines East, and 3,000 for the Lines West of Pittsburgh. The company has also issued inquiries for 50 coaches, 50 combination baggage and express cars and 7 horse express cars for the Lines East and 18 coaches, 20 baggage cars, 6 dining cars and 16 combination passenger and baggage and combination baggage and mail cars for the Lines West.

THE NEW YORK CENTRAL was reported in last week's issue as having placed orders for several thousand cars. More recent advices give the division of the order as follows: Standard Steel Car Company, 4,500 55-ton composite gondola cars; Haskell & Barker Car Company, 1,500 automobile cars; Pullman Company, 1,000 automobile cars, and the American Car & Foundry Company, 1,000 automobile cars, a total of 8,000 cars. These orders are in addition to orders placed in September or early in October for 5,500 cars, only 3,500 of which have been previously reported. The orders for 5,500 cars noted included the following: Pressed Steel Car Company, 1,500 gondola cars, of which 500 were for the New York Central proper and 1,000 for the Pittsburgh & Lake Erie; Standard Steel Car Company, 1,500 gondola cars, of which 500 were likewise for the New York Central, and 1,000 for the Pittsburgh & Lake Erie; Haskell & Barker Car Company, 1,000 automobile cars, for the Michigan Central; American Car & Foundry Company, 1,000 box cars, including 500 for the New York Central and 500 for the Cincinnati Northern, and the Barney & Smith Car Company, 500 box cars for the New York Central. The orders placed for the New York Central proper were not previously reported. Of the 4,500 gondola cars ordered from the Standard Steel Car Company on the new order, 3,000 are to be for the New York Central, 500 for the Michigan Central and 1,000 for the Pittsburgh & Lake Erie. The 3,500 automobile cars to be built by the Haskell & Barker Car Company, the American Car & Foundry Company and the Pullman Company are ordered for the Michigan Central.

IRON AND STEEL

THE NEW YORK CENTRAL has ordered 5,000 tons of rails from the Lackawanna Steel Company.

THE CHICAGO GREAT WESTERN has ordered 7,500 tons of 85-lb. rails from the Illinois Steel Company for March delivery.

THE BOSTON & MAINE has ordered 25,000 tons of rails for 1916 delivery, of which 15,000 tons have been ordered from the Lackawanna Steel Company.

THE PENNSYLVANIA RAILROAD has ordered 175,000 tons of rails for 1916 delivery, as follows: 70,000 tons from the Illinois Steel Company, 7,000 tons from the Carnegie Steel Company, 38,500 tons from the Cambria Steel Company, 38,500 tons from the Pennsylvania Steel Company, 10,500 tons from the Lackawanna Steel Company, and 10,500 tons from the Bethlehem Steel Company.

SIGNALING

THE CHICAGO, INDIANAPOLIS & LOUISVILLE will install a 24-lever Saxby & Farmer mechanical interlocking plant at the crossing of its line with the Grand Trunk, at Haskell's, Ind. The material has been ordered from the Union Switch & Signal Company, and the work will be done by the road's forces.

THE ATCHISON, TOPEKA & SANTA FE will install an all-electric interlocking plant at Mission street, Los Angeles, Cal. The material for the installation was furnished by the General Railway Signal Company, and comprises an 80-lever, model 2, unit lever type interlocking machine, with 62 working levers and 18 spare spaces; three-position, upper-quadrant, model 2-A high signals and two-position, lower-quadrant, model 2-A high signals; three-position, upper-quadrant, model 2-A dwarf signals and two-position, lower-quadrant, model 3 dwarf signals, also model 2 switch machines. The work will be done by the road's forces.

Supply Trade News

The American Steel Foundries will soon begin work on a new addition to its plant at Indiana Harbor, Ind. A structure 320 ft. by 200 ft. will be erected.

M. E. Hamilton, northwest railroad representative of the Garlock Packing Company, of Chicago, with headquarters at St. Paul, Minn., has resigned to become general air brake inspector of the St. Louis & San Francisco. Mr. Hamilton was in the service of the Garlock Packing Company for four and one-half years.

The Chicago Railway Signal & Supply Company opened two new branch offices, on October 15, one located at 407 Confederation building, Winnipeg, Man., and the other at 320 Kearns building, Salt Lake City, Utah. W. Reynolds will have charge of the company's Canadian interests, and C. H. Jones will act as representative for the western district, centering at Salt Lake City.

William H. Donner, president of the Cambria Steel Company, has exercised an option for one-half the Pennsylvania company's holdings in the Pennsylvania Steel Company, and has purchased approximately 45,800 shares of 7 per cent non-cumulative preferred and 46,950 shares of common stock. This means that the proposed purchase of the Pennsylvania Steel Company by the Bethlehem Steel interests cannot take place and paves the way for the contemplated merger of the Pennsylvania and Cambria Steel Companies.

TRADE PUBLICATIONS

LOCOMOTIVE APPLIANCES.—The Franklin Railway Supply Company, New York, has recently issued Bulletin No. 166, describing and illustrating the Franklin automatic adjustable driving box wedge.

HORIZONTAL GAS ENGINES.—The National Transit Company, Oil City, Pa., has issued Bulletin No. 403, describing its horizontal gas engines ranging from 30 to 80 h. p. The book is illustrated with photographs and drawings of the various parts.

SCHERZER ROLLING LIFT BRIDGES.—The Scherzer Rolling Lift Bridge Company, Chicago, has issued a booklet describing its type of bridges and the merits of this design. It also contains an extended list of this type of bridges on various railways in the country. The book is well illustrated with examples of typical structures.

KAHN MESH FOR REINFORCING CONCRETE.—The Trussed Concrete Steel Company, Youngstown, Ohio, has issued a 32-page pamphlet describing Kahn mesh expanded metal. The booklet illustrates the various purposes for which this material may be used and gives a number of slab tables. Several standard plans for highway box culverts are also included.

CEMENT AND CONCRETE.—Robert W. Hunt & Co., engineers, Chicago, have issued a booklet containing information and specifications concerning the testing of cement and concrete aggregates, including the standard specifications for Portland cement adopted by the American Society for Testing Materials and approved by the American Society of Civil Engineers.

INSPECTION AND TESTS. The engineering firm of Robert W. Hunt & Co., Chicago, has recently issued a booklet explaining the work of the engineering division of that company's bureau of inspection, tests and consultation. The book goes into some detail concerning the aims of the organization and the duties of its various departmental sub-divisions. The company is prepared to make examinations and reports on public utilities, power plants, industrial plants, etc. It may also be called upon for consultation and designing with reference to power plant design, industrial plants, and railway equipment. Its construction and testing department, in addition, is in a position to supervise the construction of power and other plants and to supervise also tests of electrical and mechanical apparatus at the manufacturer's works or at the plant after installation.

Railway Construction

BELLINGHAM, MT. BAKER & SPOKANE.—The contract for the first 16 miles of this railway—from Bellingham, Wash., to Deming, Seattle, Wash. The maximum grade on the first 16 miles is 1 1/10 per cent, but as yet grading has not been begun. Ultimately, it is the purpose of the company to extend from Deming, up the north fork of the Nooksack river, across the mountains to the headwaters of the Methow river, down the Methow to the Columbia river, along the Columbia to the Spokane river, thence to Spokane, and finally to the state boundary line. Steam motive power will be used. President, J. E. Morrison, 1515 Tenth avenue, West Seattle, Wash.; chief engineer, C. E. Wingate, McLeod hotel, Bellingham, Wash.

BOSTON SUBWAYS.—Bids are wanted until November 11, by B. Leighton Beal, secretary of the Boston Transit Commission, for building section G of the Dorchester tunnel. This section is located in Dorchester avenue between West Fourth street and Old Colony avenue, South Boston, Mass. The section is about 1,200 ft. long and will be mainly of reinforced concrete construction.

GULF, TEXAS & WESTERN.—According to press reports arrangements are being made to build extensions of this road, which is now in operation from Mineral Wells, Tex., to Seymour, 108 miles. It is understood that an extension will be built from Salesville east to Fort Worth, about 50 miles, and the original intention to extend the road west from Seymour to Lubbock will also be carried out in the near future.

LINVILLE RIVER.—Construction work is reported under way on the extension of this road from Montezuma, N. C., northeast to Foscoe, 12 miles. A contract was let last July to W. S. Whiting, Elizabethton, Tenn., to carry out this work. The company now operates a 14-mile line from Pineola northwest via Montezuma to Cranberry. (July 9, p. 81.)

RHODE ISLAND ROADS.—Plans are being made for a proposed municipally owned line in Providence, R. I., to be built from the city sea wall at Field's Point to connect with the tracks of the New York, New Haven & Hartford and the Southern New England.

SAN FRANCISCO, CAL., ROADS.—The Board of Public Works of this city will receive bids on November 24 for the construction of a railway from Rosasco, Tuolumne county, to the Hetch-Hetchy dam site. The railroad will be 67.7 miles in length, will have a maximum grade of 4 per cent, and a maximum curve of 30 deg. About 16,000 cu. yd. of material will be handled per mile. One bridge, 220 ft. long will be built over the Tuolumne river, involving the use of 470,000 lb. of steel for the structure itself and 130,000 lb. for girder approaches. The railway will be used to transport material to the site of the Hetch-Hetchy dam and the aqueduct leading from it. Steam motive power will be used, but as yet no definite inquiries for equipment have been made. The plans also contemplate the construction of oil tanks, water tanks and 50 miles of telephone line. M. M. O'Shaughnessy, city engineer, San Francisco, Cal.

VAN HORN VALLEY.—Grading is in progress on this road from Van Horn, Tex., north. Three thousand cu. yd. of material is being handled per mile. Out of some 70 miles of grading to be done, 15 per cent has been completed. R. H. Owen, 816 Reserve Bank building, Kansas City, Mo., is president.

RAILWAY STRUCTURES

ARGENTINE, KAN. Plans are being prepared by the Atchison, Topeka & Santa Fe for a large frame addition to the car repair shed here. The new structure will be 522 ft. by 93, and will cost approximately \$45,000.

BRONXVILLE, N. Y. A contract has been given by the New York Central to the Fort Pitt Bridge Works, Pittsburgh, Pa., for fabricating the steel superstructures of a 63-ft. railroad bridge, also for a highway bridge about 62½ ft. long. These

bridges are to have concrete abutments. This is part of the improvements being carried out in connection with the construction of a new street at Bronxville. Bids were received in September for the excavation, masonry, paving, erection of the steel work, etc., but contracts for this work have not yet been let.

BROOKLYN, N. Y.—The New York Dock Company will carry out improvements on the Brooklyn waterfront between Fulton street and Atlantic avenue at a cost of \$1,250,000. The work calls for the replacement of the existing piers, which are about 400 ft. long, by five new piers, to be from 640 to 750 ft. long.

The New York Municipal Railway Corporation has applied to the New York Public Service Commission, First district, for permission to enter into a contract with the George W. McNulty Company, for the construction of the Coney Island terminal of its elevated lines.

BUFFALO, N. Y.—An officer of the Delaware, Lackawanna & Western writes that the company will reconstruct its lake coal trestle at Buffalo. Some of the work will be done by the railroad with company forces, and the Buffalo Dock & Dredging Company will probably carry out the work at North Pier, Buffalo.

EAST ST. LOUIS, ILL.—A contract has been awarded to the Weller Manufacturing Company, of Chicago, Ill., for the machinery and structural steel to be used in the construction of a coal tippie for the Wiggins Ferry Company. The work of installation will be done by company forces. The coal transfer will be operated by a tram car on a cable way actuated by electric hoists. The hopper trestle and motor house will be constructed of timber; the hopper, tram car and cradle of steel. The new station will have a capacity of 150 tons per hour, and will cost approximately \$11,500, exclusive of the earth approach to the hopper trestle. (October 29, p. 829.)

JAMAICA, N. Y.—Work is now under way on the elevation of about a mile of the Long Island Railroad tracks through Hollis and over the Holban freight yard. About 400,000 cu. yd. of fill will be used. The grade crossings at Farmer avenue and at Hamilton avenue will be eliminated and the grade of the entire Holban freight yard will be changed, so as to permit of the highway going between the network of tracks in the yard. The three-track main line traversing this section will be raised 14 or 15 ft., and the highways will be depressed 3 or 4 feet. The cost of the improvements will be about \$400,000.

PHILADELPHIA, PA.—In connection with the opening of Emerald street under the tracks of the Richmond branch of the Philadelphia & Reading, a three-span deckbridge is to be built by the railroad, to carry 16 tracks, at a cost of \$72,800. The bridge will be supported on concrete masonry abutments at the house lines, and upon steel girders and columns at the curb lines of the street. The bridge floor proper is to be composed of I-beams encased in concrete and will be waterproofed with a layer of asphalt mastic 1½ in. thick. Contracts for the work have been let as follows: For the bridge abutments and removal of core to C. P. Bower, Philadelphia, Pa.; for the superstructure of the bridge, ready for encasement, to the American Bridge Company, Philadelphia, and for waterproofing the bridge, to the Barber Asphalt Paving Company, Philadelphia.

SOUTH BEND, IND.—This municipality has been granted the authority to order grade separation on the New York Central right of way and at present is raising funds to cover its share of the expense. No definite plans of construction have yet been adopted.

ST. LOUIS, MO.—The contract for constructing the Chouteau avenue viaduct over the Missouri Pacific and St. Louis & San Francisco tracks, has been let to F. C. Mueller & Co., of this city. The viaduct will be a reinforced concrete structure, consisting of 30 flat slab spans, 28 to 36 ft. in length, supported on piers extending to rock foundation. The estimated cost of the structure is \$150,000; pavements and surface improvements, \$35,000; real estate, \$35,000; property damages, \$45,000. The railroads and the city will share the cost as follows: Missouri Pacific, \$150,000; St. Louis & San Francisco, \$35,000; street railway, \$10,000; city of St. Louis, the balance.

SUNBURY, PA.—The Philadelphia & Reading has filed plans with the Pennsylvania State Water Supply Commission for permission to reconstruct its bridge across the Susquehanna river at Sunbury. (Sept. 24, p. 586.)

Railway Financial News

BOSTON & MAINE.—The minority stockholders' protective committee has sent out a circular protesting against the proposed reorganization. The circular says, in part:

"Boston & Maine was valued by the commonwealth of Massachusetts as late as 1906 at \$165 per share, and the question arises as to the bearing of this valuation upon present conditions. To what extent have real values suffered legitimate depreciation? Total sales of the stock in the intervening period have been exceedingly small; fluctuations in this limited market cannot properly be used as a barometer of credit in connection with the outstanding obligations of this corporation.

"Boston & Maine as a physical property has substantially appreciated rather than depreciated within the past few years. Recent earnings would seem to refute the claim that a reorganization is immediately necessary and tend to make the suggestion of receivership a more or less empty threat. The position taken by the Interstate Commerce Commission in the Rock Island case may be regarded as a fair warning that merely speculative railroad receiverships will not be tolerated.

"Such reorganization as is projected would permanently fund a large volume of obligations that are declared to be of doubtful validity. It also particularly threatens the integrity of minority interests, for the reason that it would mean an assessment of from \$30 to \$50 per share on all the stock. The result would be the wiping-out of thousands of individual holdings. All stock of the Boston & Maine has been issued under specific guaranty of general law that it should forever remain unassessable."

CHICAGO GREAT WESTERN.—The directors have declared a dividend of 1 per cent on the preferred stock, payable December 1. This is the first dividend declared since the reorganization of 1909. Dividends on the preferred stock have been cumulative at the rate of 4 per cent a year since June 30, 1914.

CHICAGO, ROCK ISLAND & PACIFIC.—The Montezuma branch, running from Muscatine to Montezuma, Iowa, 87 miles, has been leased to the Muscatine-Iowa City Railway, which proposes to operate the line with gas-electric cars for both passenger and freight. The arrangement becomes effective on January 1, 1916.

CHICAGO, ROCK ISLAND & PACIFIC.—As previously announced, the protective committee, Charles A. Peabody, chairman, representing the refunding 4 per cent bonds, has asked for the deposit of these bonds. N. L. Amster, of Boston, has given out a statement criticising the committee for their "attack" on the credit of the company just at this time. It is understood that the Kendrick report on the capital needs of the property to put it in good physical shape is about ready, or has just been submitted, and the committee's action in calling for the deposit of bonds is said to be because of the nature of this report. This cannot, however, be confirmed.

HOUSTON & BRAZOS VALLEY.—On the application of general creditors Judge Burns of the United States district court has appointed G. C. Morris receiver of the Houston & Brazos Valley, which runs from Anchor, Tex., to Freeport, 25 miles.

NATIONAL RAILWAYS OF MEXICO.—The stockholders' meeting was held in Mexico City on October 31. The Mexican and New York boards of directors were elected. The Mexican board consists of Acting Foreign Minister Jesus Acuna, Carlos Basove y del Castillo, Minister of Finance Luis Cabrera, three lawyers, Jose Diego Fernandez, Aquiles Eloduy and Fernando Gonzales; Gabriel Mancera, an engineer; sub-Secretary of Finance Rafael Nieto, Alberto J. Pani, an engineer; Jose Simon, manager of the Banco Nacional Mexicano, and Rafael Zubarán Capmany, ex-minister of the interior. The New York board consists of Juan N. Amader, an attorney; Dr. Alfredo Caturmeli, William Edmund Curtis, Jerome Hanauer, Roberto V. Pesquera, Walter F. Losen, Charles H. Sabin, Richard Schuster and Henry Wehrhane.

*Illustrated.

At the recent meeting of the American Association of Passenger Traffic Officers a committee report was adopted recommending that the various territorial passenger associations give serious consideration to a plan for imposing a 10-cent terminal charge for the checking of baggage. Such a plan has been suggested before, and, as the *Railway Age Gazette* has pointed out, there are numerous reasons why there should be a difference in the charges paid by those for whom the railroad checks baggage and those for whom it does not. European roads generally charge for handling all baggage in excess of a very small free allowance, and certainly the passenger for whom the railroad checks and handles a 150-lb. trunk receives a greater service than the man who cares for his own hand baggage enroute, but checks it at a

Proposed Charge for Checking Baggage

parcel room at either end of his journey for a charge of 10 cents for 24 hours or less. But there is an additional reason now in justification of a charge for baggage that did not formerly exist. The Cummins amendment has increased the liability of the railroads for loss or damage to baggage, and in order to protect themselves the eastern roads are requiring a declaration of value and imposing an insurance charge if the value exceeds \$100. This declaration costs the railroads something for clerical work and has aroused a good deal of complaint as being a nuisance to the passenger. It was the thought of members of the committee of passenger officers that the charge for checking baggage might be proposed as a substitute for the declaration of value and to cover not only a part of the expense of handling baggage but the insurance element. The adoption of a baggage charge would undoubtedly be attended with the difficulty usually experienced in attempting to withdraw a concession that has once been granted, but now that the railroads have something to trade, the plan might appeal to many who object strongly to the declaration of value.

There recently have appeared in the *Railway Age Gazette* several letters and articles complaining about and criticizing the position in which a large majority of general office clerks on railways find themselves. There is ample justification for many of these complaints and criticisms. The work of general office clerks is of no small importance, and the total wages paid to them exceed the salaries paid to the officers. The total salaries paid to all officers of Classes 1 and 2 roads in the year ended June 30, 1913, was \$42,776,142. The total wages paid to general office clerks in the same year amounted to \$69,443,296. The number of general office clerks in that year was no less than 84,267. Considering the number of these employees, the amount of their total compensation and the importance of their work, it is plain that they should be so selected, organized and promoted as to get the very best results from their services. This should be done both out of consideration for the rights and interests of the employees and the welfare of the railways. The clerks are not organized into unions, and this imposes on the managements a special duty to spare no effort to treat them fairly and develop among them the greatest loyalty and efficiency. If there is any railway in the country which has lived up to these principles it has succeeded in keeping the fact a profound secret. Many of the complaints and criticisms we have published, while justified, have been chiefly destructive in their character. We publish in another column this week a letter from a railway officer who has had experience in handling general offices and who suggests a constructive plan for improving the position of the clerk. His plan may possibly not be the best that could be suggested, but it has the merit of having been tried and of having worked successfully. His letter is therefore entitled to wide reading and careful consideration.

A Plan for Improving the Railway Clerk

THE REVIVAL OF BUSINESS

MOST of the discussion about railroads for a long time has been centered around their troubles. Attention is now being directed to the more favorable aspects of their situation, and many railroad officers whose chief concern for years has been to reduce expenses wherever possible and sometimes where it has seemed impossible, now find their hands filled with the work of handling the business offered them.

Evidence is accumulating that the tide has turned and that general business is rapidly returning to a condition of prosperity, with good consequent effect on the welfare of the railroads and the railroad supply industry. After a long depression, followed by a considerable period of uncertainty, the change has come so suddenly as to leave some doubt for a time as to its permanency. However, while allowance must be

made for the extraordinary activity in certain lines, such as the automobile business, and particularly for the stimulating effect of the large orders for war materials, the upward tendency during the past month or so has been so marked that more confidence is being manifested than at any time since the war began. This confidence is reflected not only in the statements of bankers and other prominent business men regarding the rapid improvement in general business, but in the reports of railroad traffic and earnings and the large orders for rails, locomotives, cars and other supplies that have been placed during the past few weeks by the railroads.

For August the railroads of the country reported an increase in total operating revenues of 1.3 per cent, and in net operating revenues of 10.2 per cent, per mile. This showing was made possible, of course, by the continuance of the program of drastic economy. Preliminary reports from large roads operating 117,734 miles compiled by the Interstate Commerce Commission indicate an increase in total operating revenues per mile from \$1,219 in September, 1914, to \$1,295 in September, 1915, or 6.2 per cent, and in net operating revenues per mile from \$408 to \$484, or 18 per cent. This also represents a gain, in both gross and net, over September, 1913, when a similar compilation by the commission showed that total operating revenues were \$1,235 per mile and net operating revenues were \$397 per mile, and over September, 1912, when total operating revenues were \$1,200 and net operating revenues \$424. The gross earnings reports of 32 roads available for October show increases of 8.63 for the first week, 11.98 for the second and 17.49 for the third over 1914. Any enthusiasm aroused by comparisons with 1914 should be tempered by recollection of the exceedingly poor showing made in that year; but net gains as compared with both 1912 and 1913 are gratifying indeed. In September the gross earnings of the Pennsylvania Railroad were \$20,817,361, the largest in any one month in the company's history, except August and October, 1913, and the net earnings, \$7,282,021, were the largest in any month in its history.

The earnings figures are reinforced by the increasing frequency of reports of scarcity of equipment and congestion of traffic, and by the fact that several of the largest railroads in the country have in the past few days reported record car loading figures. The Santa Fe in the week ending October 30 had the largest loaded car movement in its history, the Burlington on October 17 and 18 set a new record for 48 hours; the Pennsylvania's middle division in October broke its record for a month, and the Missouri Pacific in October had the heaviest freight traffic in its history.

The report on surpluses and shortages of freight cars issued by the American Railway Association for October 1 showed a surplus of 88,061 cars, as compared with 191,309 on September 1, and 133,382 on October 1, 1914. There was also a shortage of 9,762 cars. The statement for November 1, which is just out, shows a large part of this surplus wiped out and a considerable increase in the shortage, which makes the net surplus less than it has been at any time since October, 1913. Reports of increasing freight traffic come from all sections of the country, western roads feeling particularly the effects of the steady growth in the grain movement, which promises to be greater than ever before. The eastern roads are profiting by the heavy shipments of iron and steel, as well as of manufactured goods, which indicate a large gain in general business during the past two or three weeks, which is also being felt by the western roads. There have also been heavy shipments of ore. In the South, while the cotton crop is smaller than usual, its value will be higher than that of last year, and as a result of the more diversified character of that territory's agriculture during the year conditions are showing a marked improvement. The traffic of the transcontinental lines is being considerably stimulated by the closing of the Panama Canal since September 20 by slides, which it is reported may cause a cessation of canal traffic for the rest of the year.

Evidences of a renewed buying activity on the part of the

railroads are numerous. In last week's issue we called attention to the large orders for cars and locomotives placed in the last two months. Even more remarkable has been the rush to place early orders for rails and track material. Since October 1, the *Railway Age Gazette* has reported in its news columns orders for 653,000 tons of rails, which represents an expenditure of over \$19,000,000. Including 107,500 tons reported in our columns in September, this makes a total expenditure of over \$24,000,000 for rails alone. With this rail there were placed orders for at least \$3,000,000 worth of track fastenings. It has been the practice of the railways in previous years to place their rail orders about the first of the year, but this year, on account of the congestion in the steel mills caused by the buying from abroad, they are beginning them much earlier than usual to secure delivery at the time the rails will be needed. The Pennsylvania has just bought 175,000 tons for its 1916 requirements. Its 1915 order was placed as late as June. The Rock Island has just been authorized to buy 40,000 tons of rails.

If the confidence aroused by the improvement within the past few weeks is sustained, railroad men will enter upon the new year with sentiments of relief and satisfaction. But it will take many months of good business for most of the roads to make up for the effects of the depression, and for many of them even a large increase in traffic will not suffice. A railroad's condition is not determined by gross earnings alone and the recent increases in net are largely artificial. They are the result of the very rigid economies that the railroads have been forced to practice and which cannot be continued without detriment to both service and property. The increase in traffic will entail large increases in expenses and the labor organizations are already beginning movements for an eight-hour day and for increases in rates of pay. If successful, these would cause increases in operating expenses, which, in the absence of heavy advances in rates, would soon absorb the enlarged net earnings now being shown. The improvement in conditions in the railway supply field are notable and gratifying; but, nowadays, the problems presented to the managements of the railways in years of good business are hardly less numerous and difficult than those presented in years of bad business.

Some roads are not even in a position to take full advantage of the sudden appearance of prosperity. While the shippers are clamoring for cars, many cars are not available for use, because, in some instances at least, their owners have kept themselves out of bankruptcy only by deferring expenditures for their repair until a more propitious time, and could not afford to repair them until they were sure they would be needed.

WHAT IS AN "EIGHT-HOUR DAY"?

THE large organizations of railway train employees are beginning another concerted nation-wide movement for increases in wages. This time they are going to ask for the adoption of a nominal 8-hour day in train service. The movement is of tremendous importance to both the railways and the public. Its success would cause, directly and indirectly, advances in operating expenses amounting to hundreds of millions of dollars annually, in addition to those which have occurred within recent years. The past increase in expenses have created a need for general advances in rates. The further increases in expenses that would be caused by accession to the demands of the employees would render imperative additional general increases in rates. The question presented is, therefore, not one which concerns only the employees and the railways. It equally concerns the public, which would have to foot most of the bill.

When any class of men or of organizations start a movement of such vast importance the question as to what is really being sought cannot be asked too explicitly or answered too early. The railways and the public are therefore justified in at once interrogating the leaders of the labor unions as to whether when they say they want an 8-hour day they mean exactly what they say. Or do they use the words "eight-hour day" in a different

sense from that in which these words are ordinarily understood.

The 8-hour day already has been established for working men in many branches of commerce and industry. In every line where it now prevails it means that employees work not only a *maximum* of 8 hours, but also a *minimum* of 8 hours, for a day's wage. The conditions of work and bases of wages in railway train service are entirely different from what they are in any other industry. This fact and the reasons for it must be made entirely clear to the public before it will be able to weigh the arguments, pro and con, which doubtless will be presented in the discussion of the so-called "eight-hour day" in train service. The public, until correctly informed, will naturally assume, when it is stated that railway train employees now have a 10-hour day, and want an 8-hour day, that this means that they all now work 10 hours for a day's wage, and want to work only 8 hours for a day's wage. If this assumption were correct there could hardly be presented any argument against an 8-hour day in railway train service that cannot be presented against an 8-hour day in any other line of industry. But the facts are, that in railway train service practically no employees now work more than 10 hours for a day's wage, and that thousands work less than 10 hours, and even less than 8 or than 6, and in some cases less than 4 hours, for a day's wage. The reason for this is that in train service wages are based, not merely on *hours worked*, but also, and mainly, on *miles run*; and that when the requisite *miles* have been made the employee gets a day's wage no matter how few hours he has worked.

In freight service the working day consists of 10 hours work or 100 miles run. If an employee either works more than 10 hours or runs more than 100 miles he receives overtime. If he runs more than 100 miles in less than 10 hours he receives overtime for the *excess mileage*, and if he runs less than 100 miles in more than 10 hours he receives overtime for the *excess hours*. The largest number of train employees is engaged in through freight service. The evidence introduced by the railways in Western territory in the recent arbitration of the controversy between them and their engineers and firemen showed that in the typical month of October, 1910, their engineers and firemen in through freight service worked an average of only 8.3 hours for pay for 100 miles, which is the equivalent of a day's pay. Evidence introduced in the same hearing showed that in the typical month of October, 1913, the engineers and firemen in through freight service worked an average of only 8.2 hours for pay for 100 miles. In way freight service the hours are longer than in through freight service, but on the other hand, in passenger service they are shorter. In passenger service in the West the basis of a day's wage at present is 6 hours and 40 minutes' work or 100 miles run, and in Eastern territory the basis is 5 hours' work or 100 miles run. Railway train employees are not working 10 hours a day, as they are leading the public to believe. Considering the situation as a whole complete data might show that on the average they are not now working an average of more than 8 hours for a day's wage. The spokesmen of the brotherhoods are beginning to fill the newspapers with statements to the effect that some railway train employees work 12, 14 and 16 hours a day. But they do not state the additional related fact that every train employee who works more than 10 hours receives overtime for the entire excess, and that thousands of train employees are regularly receiving a day's wage for working less, and in many cases much less, than 10 hours.

The foregoing facts show why we have headed this editorial with the question, "What is an eight-hour day?" Do the railway brotherhoods, in demanding the 8-hour day, mean not only that employees who are now working a *maximum* of 10 hours for a day's wage shall in future work only a *maximum* of 8 hours, but also that the employees who are now working only 3 or 4, or 5 or 6, or 7 hours for a day's wage shall in future work a *minimum* of 8 hours? In other words, do they desire, as the public is being led to infer, that employment and wages in railway train service shall be put on the same basis as employment and service in other lines of industry where the 8-hour day prevails? Or are they really asking that 8 hours shall merely be made the *maximum* working day in railway train service, and that the thousands of employees

who now work less than this shall be allowed to continue to work less, with the result that on the average the working day in this service will be made only 7 or 6, or 5 hours?

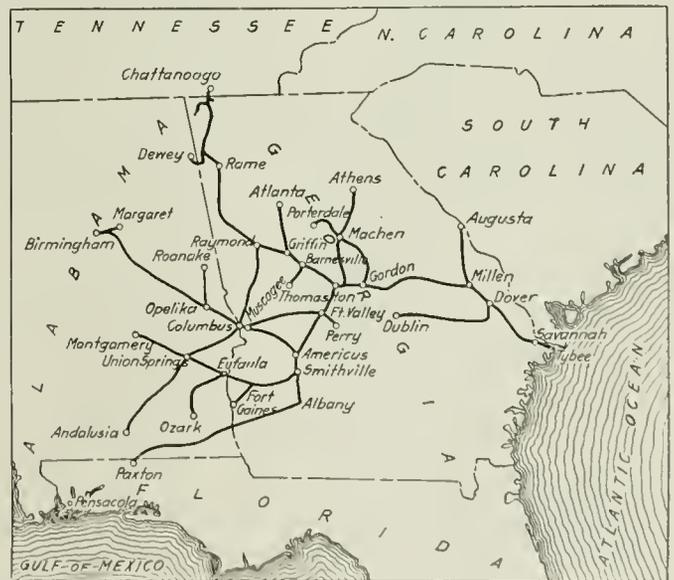

There is no doubt in the mind of any person who is well informed regarding the existing wage schedules in railway service that what the brotherhoods are really seeking is to establish 8 hours as the maximum and to retain the arrangements under which many of them work less than 8 hours. In fairness to the public and the railways the brotherhoods ought to be frank and explicit. Instead of merely saying that they want an "eight-hour day" they ought to state what is their definition of an 8-hour day. So long as they fail to do this they will rest under the suspicion of attempting to mislead the public and to prevent enlightening discussion of their true proposition.

CENTRAL OF GEORGIA

THE Central of Georgia made steady gains in gross revenue from 1909 to 1912, held these gains through 1913, and had the largest gross revenue in its history in 1914. In that year it earned \$14,327,000. The 1914 revenues were 40 per cent greater than in 1905. In 1915 the revenues dropped back more than half way to the 1905 figure, total operating revenues amounting to \$12,108,000, or less than 20 per cent greater than the 1905 revenues.

The Central of Georgia operates 1,924 miles. A majority of its \$20,000,000 stock is owned by the Illinois Central, which was also adversely affected by the business depression in the South and could not well afford to suffer any reduction of income through the passing or cutting down of dividends on the Central of Georgia.

The total loss of \$2,218,000 in revenues of the Central of

The Central of Georgia

Georgia was made up by a reduction in operating expenses of \$1,812,000, and by an extra dividend of \$400,000 declared on the Ocean Steamship Company stock, which stock is held by the Central of Georgia. The net income of the Central of Georgia available for dividends in 1915 was \$1,202,000 as against \$1,091,000 in 1914. In 1914 dividends on the preferred stock only had been declared, calling for \$900,000. In 1915 a 5 per cent dividend on the \$5,000,000 common stock was declared, making the total dividend payments \$1,150,000.

As has been pointed out in comments on the annual reports of other southeastern roads, all forms of industry in the South came almost to a standstill during the early months of the European war and passenger travel was very much smaller. The total tonnage of freight carried by the Central of Georgia in 1915 was 4,903,000, comparing with 5,631,000 carried in 1914.

The tonnage of cotton carried was 260,000 as against 234,000 the year before, and of cotton seed and cotton seed meal, 482,000 tons in 1915 as against 349,000 tons in 1914. It will be seen, therefore, how much more important to the earnings of the Central of Georgia the price of cotton is than the actual tonnage moved. The loss to the planters through low prices is reflected in a movement of but 932,000 tons of manufacturers over the Central of Georgia in 1915 as against 1,443,000 tons in 1914. On the other hand, depression in the lumber trade means both loss of tonnage of that commodity and loss of tonnage of other commodities because of the reduced buying power of those dependent on the lumber industry. The total tonnage of lumber carried by the Central of Georgia in 1915 was 460,000 tons, comparing with 715,000 tons carried in 1914.

To make a saving of \$1,812,000 in operating expenses it was necessary to cut pretty drastically the expenditures of every department. Transportation expenses amounted to \$4,254,000, a saving as compared with the previous year of \$760,000. There was a considerable saving in yard expenses, in the operation of joint terminals, in station agents' pay and in the pay of labor at stations. There was also a large reduction in the payments for injuries to persons, the total payments in 1915 amounting to \$199,000, which is less by \$189,000 than the payments in 1914, and a reduction in the payments for loss and damage to freight, the payments on this account in 1915 amounting to \$95,000, or \$51,000 less than in 1914. A saving was also made in wages of engineers and trainmen because of a smaller amount of traffic handled. A gain was made in trainloading, the average trainload in 1915 being 360 tons, including company and revenue freight, as against 347 tons in 1914.

Maintenance of way and structures cost \$1,654,000 in 1915, or \$462,000 (21.81 per cent) less than in 1914. Maintenance of equipment cost \$2,247,000, or \$584,000 (20.64 per cent) less than in 1914. Cuts of over 20 per cent in maintenance seem rather drastic. The largest cuts were made in the expenditure for timber for bridges, trestles and culverts, \$140,000 in 1915 as compared with \$285,000 in 1914; and in ordinary repairs of roadbed and track, \$282,000 being spent on these accounts in 1915 as against \$360,000 in 1914; and repairs to buildings, \$100,000 being spent on these accounts in 1915 as against \$172,000 in 1914.

There was a total of \$491,000 spent for additions and betterment. There was a total of \$491,000 spent for additions and betterments, all but a very small part of which was for additions and betterments to road, the largest expenditure being for track material other than rails and ties.

Cash on hand at the end of the year totaled \$881,000, or about \$39,000 less than at the beginning of the year, and loans and bills payable amounted to \$3,665,000, an increase as compared with the previous year of \$345,000.

If the Central of Georgia were an independent road with a large number of small stockholders the management might possibly be criticised for its policy in regard to maintenance retrenchments and adding further to floating debt while paying dividends on both preferred and common stock. The fact that the majority of the stock is held by a single large, rich corporation, which is strong enough to take care of the Central of Georgia's needs when the time for permanent financing of the floating debt comes, puts a somewhat different aspect on the case.

The following table shows the principal figures for operation in 1915 as compared with 1914:

	1915	1914
Average mileage operated.....	1,924	1,924
Freight revenue	\$7,859,378	\$9,169,090
Passenger revenue	3,001,184	3,815,474
Total operating revenues.....	12,108,184	14,326,575
Maintenance of way and structures.....	1,654,258	2,115,848
Maintenance of equipment.....	2,246,873	2,831,182
Traffic expenses	407,174	429,583
Transportation expenses	4,254,257	5,014,502
Miscellaneous expenses	18,145	21,473
General expenses	418,398	373,086
Transportation for investment—Cr.....	25,592
Total operating expenses.....	8,973,512	10,785,764
Taxes	576,544	631,596

	1915	1914
Operating income.....	\$2,547,633	\$2,909,214
Gross income	3,903,631	3,808,001
Net income	1,202,005	1,091,042
Dividends	1,150,000	900,000
Surplus	52,005	191,042

ST. LOUIS & SAN FRANCISCO

THE St. Louis & San Francisco reduced its operating ratio in the fiscal year ended June 30, 1915, to 69.45, comparing with 74.06 in the previous fiscal year. Total income amounted to \$11,671,000 in 1915, an increase of \$1,417,000, or 13.8 per cent, as compared with the previous year. This would be at the rate of 7 per cent on a capitalization of about \$31,800 per mile. It is conceivable that through the expenditure of further sums on grade reduction and heavier locomotives the operating ratio of the St. Louis & San Francisco could be brought down to 65 or even to 63 or 64; but even this would not allow operating income sufficient to yield a fair rate of return on anything like the cost of reproduction new of the 5,252 miles of road which is now being operated by the receivers unless the volume of traffic should increase by 20 to 30 per cent.

The good showing made in net was due to cutting down expenses even more than commensurate with smaller business. Total operating revenues in 1915 amounted to \$42,975,000, a decrease as compared with the previous year of \$1,949,000, or 4.3 per cent. Total operating expenses amounted to \$29,839,000, a decrease as compared with the previous year of \$3,432,000, or 10.3 per cent. The amount spent for maintenance in 1914 was abnormally high, the receivers having had to make extensive repairs and renewals to put the property into safe operating condition, and to take up previously deferred maintenance. In 1915 \$6,088,000 was spent on maintenance of way, which was less by \$1,674,000, or 21.6 per cent, than in the previous year. In 1914 there were 3,269,000 ties used on the renewals. This would be equivalent to approximately 1,250 miles of track. The total miles of track, including second track and side tracks, of the St. Louis & San Francisco, including also 196 miles of trackage rights, was about 6,800 miles. The renewal of ties in all classes of tracks, including branch lines and side tracks, of more than one-sixth of the total number, is, of course, obviously abnormally high. In 1915 tie renewals totaled 1,367,000. The amount charged to expenses for ties in 1915 was \$678,000, a decrease as compared with the previous year of \$1,219,000, or 64.3 per cent. The smaller tie renewal also decreased the amounts spent for track laying and surfacing, the total on that account being \$1,733,000 in 1915, a decrease as compared with the previous year of \$262,000, or 13.1 per cent.

Maintenance of equipment cost \$7,162,000 in 1915, a decrease as compared with the previous year of \$331,000, or 4.4 per cent. There was a decrease of \$837,000, or 22.9 per cent, in the amount spent for repairs, depreciation and retirements (the receivers' report does not separate these three accounts) of freight-train cars, the total in 1915 being \$2,818,000.

The following table shows the percentage of each class of expenses to total operating revenues:

	1915	1914
Maintenance of way and structures.....	14.17	17.28
Maintenance of equipment.....	16.67	16.68
Traffic expenses	1.98	2.07
Transportation expenses	34.13	35.08
General expenses	2.76	2.95
Transportation for investment—Cr.....	0.26
Total	69.45	74.06

Transportation expenses amounted to \$14,668,000 in 1915, a decrease as compared with the previous year of \$1,093,000, or 6.9 per cent. This compares with the decrease in business handled as follows: The total ton miles of all freight, including company, was 3,554,000,000 in 1915, or 16,000,000 (less than half of one per cent) less than in 1914; the total number of passenger miles was 495,600,000 in 1915, a decrease of 39,500,000 (about 7.5 per cent).

The results of the physical betterment of the property and the freight loss and damage preventive campaign show up in fine shape, as does also the saving made in fuel expenses. Loss and damage to freight cost \$316,000 in 1915, a reduction as com-

pared with 1914 of \$198,000, or 38.5 per cent. The 1914 loss and damage to freight was 5.8 per cent less than in 1913. Clearing wrecks in 1915 cost \$72,650, a decrease of \$55,307, or 43.2 per cent, as compared with 1914. Fuel for train locomotives cost \$2,515,000 in 1915, or \$253,000 (9.1 per cent) less than in 1914. Total locomotive mileage amounted to 24,257,000 miles, a decrease of 1,907,000 miles, or 7.3 per cent. The average trainload of all freight was 378 tons in 1915, as against 351 tons in 1914, an increase of 27 tons. There were on an average 17.14 loaded cars and 8.14 empty cars to the train in 1915, comparing with 16.71 loaded cars and 7.85 empty cars in 1914. The revenue per ton per mile in 1915 was 9.5 mills, and in 1914, 10 mills.

The total tonnage of revenue freight carried in 1915 was 18,762,000, comparing with 19,906,000 in 1914. The large difference between the reduction in ton mileage (less than half of

nage of lumber and other forest products carried was 3,304,000.

The St. Louis & San Francisco's interest charges, rentals and sinking funds, and the annual proportion of the amortization of discount on funded debt totaled \$13,353,000, so that with total income of \$11,671,000, from the receivers' operations for the year showed a deficit of \$1,285,000. Interest, however, totaling \$6,829,000 was not paid by the receivers, so that the company's cash position at the end of the year was considerably better than at the beginning. Cash on hand amounted to \$3,261,000 on June 30, 1915, as compared with \$979,000 on June 30, 1914. Loans and bills payable amounted to \$1,079,000 in 1915, comparing with \$1,350,000 at the beginning of the year.

In discussing maintenance of equipment expenses it was mentioned that depreciation and repairs are not shown separately. It is evident, however, that the receivers are charging a very

The St. Louis & San Francisco

one per cent) and the reduction in total number of tons carried (5.75 per cent) was due to the considerably longer average haul in 1915 for revenue freight. This figure was 165 miles in 1915, as against 152 miles in 1914. Of the total tonnage of revenue freight carried in 1915 28.37 per cent was bituminous coal and 7.29 per cent stone and like articles. Products of agriculture in 1915 furnished 19.74 per cent of the total tonnage, as against 15.60 per cent furnished by products of agriculture in 1914. Wheat alone in 1915 furnished 1,024,000 tons, comparing with 483,000 tons carried in 1914. The Frisco, like other roads, felt severely the depression in the lumber trade. The total tonnage of lumber and other forest products in 1915 was 2,741,000; in 1914, itself a year of depression in the lumber trade, the total ton-

small amount for depreciation. The total accrued depreciation on equipment since 1907 is but \$774,000. In discussing a possible operating ratio for the Frisco when it is taken out of the hands of receivers it must be borne in mind that charges for depreciation on equipment under the new ruling of the Interstate Commerce Commission will presumably be very much higher than those which have been made by the receiver during the court's administration of the property.

The following table shows the principal figures for operation in 1915 as compared with 1914:

	1915	1914
Average mileage operated	5,252	5,250
Freight revenue	\$29,485,596	\$30,202,400
Passenger revenue	10,623,295	11,563,844

	1915	1914
Total operating revenues.....	\$42,974,573	\$44,923,569
Maintenance of way and structures.....	6,088,312	7,762,324
Maintenance of equipment.....	7,162,021	7,492,700
Traffic expenses.....	849,839	929,037
Transportation expenses.....	14,667,524	15,760,663
General expenses.....	1,185,269	1,325,876
Transportation for investment—Cr.....	113,928	
Total operating expenses.....	29,839,038	33,270,600
Taxes.....	2,016,706	2,149,215
Operating income.....	11,098,924	9,503,754
Gross income.....	11,670,767	10,253,665
Deficit*	1,284,672	2,828,142

* In 1915 there was \$6,828,394 interest due but not paid by the receivers, and in 1914 \$4,012,546. These sums were treated as paid in arriving at the deficit shown.

MINNEAPOLIS, ST. PAUL & SAULT STE. MARIE

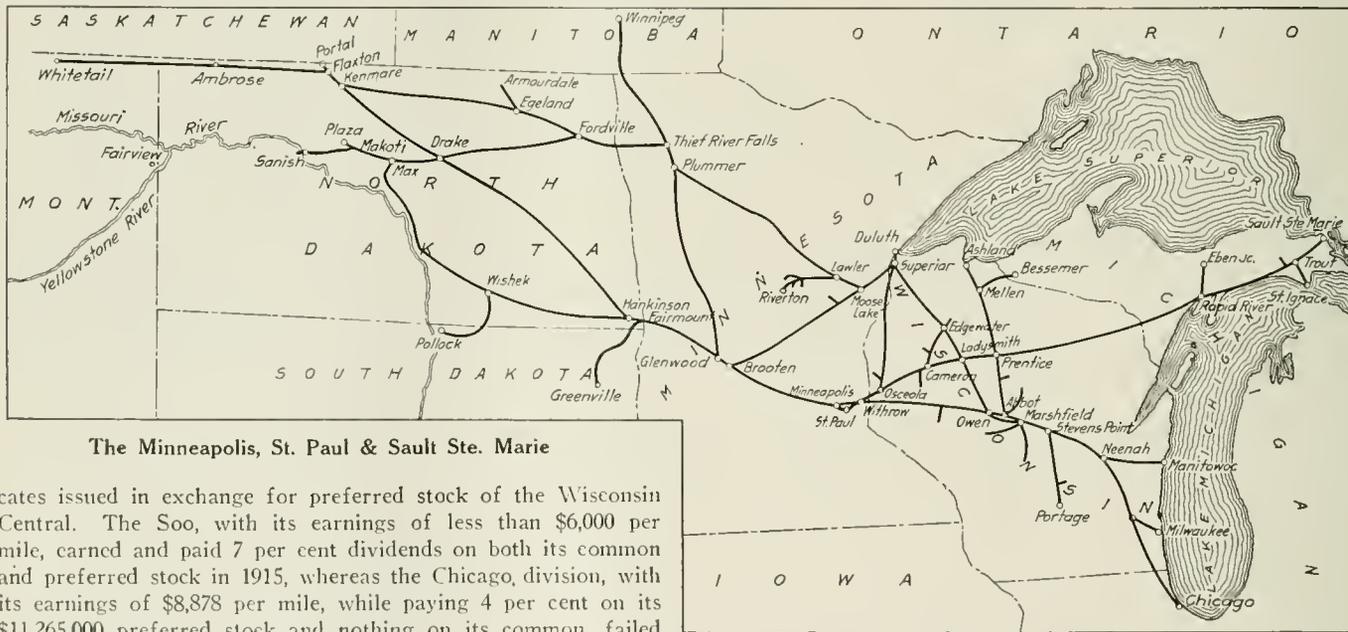

There is an interesting contrast between the showing made by the Chicago division of the Minneapolis, St. Paul & Sault Ste. Marie (the Wisconsin Central) and the Soo itself in the fiscal year ended June 30, 1915. In a normal year the Chicago division earns between \$9,000 and \$10,000 per mile of road, and the Minneapolis, St. Paul & Sault Ste. Marie between \$6,000 and \$7,000 per mile of road. In the fiscal year ended June 30, 1915, the Chicago division earned a total of \$9,945,000, or an average of \$8,872 per mile on the 1,120 miles operated; the Soo earned a total of \$17,818,000, or an average on the 3,044 miles operated of \$5,854. The Soo owns \$3,658,000 Wisconsin Central common stock and leases the Wisconsin Central (the Chicago division) by guaranteeing 4 per cent on the leased line certifi-

464 tons in 1914. The operating ratio on the Soo in 1915 was 62.1, comparing with 65.2 in 1914, and on the Chicago division 67.9 in 1915 and 67.5 in 1914. The Chicago division lies almost wholly within the state of Wisconsin. The Soo crosses the state with its line from Minneapolis to Sault Ste. Marie, but the greater part of its mileage is in Minnesota and North Dakota.

The Soo carried 7,312,000 tons of revenue freight in 1915 as against 7,203,000 tons in 1914. Of the total in 1915 19 per cent was grain, 19 per cent lumber, 11 per cent other forest products and 14 per cent ores, with but 4 per cent merchandise. The Chicago division carried 6,039,000 tons in 1915 as against 6,442,000 tons in 1914, and of the 1915 total 4 per cent was grain, 14 per cent lumber, 12 per cent other forest products, 15 per cent ores, 5 per cent merchandise, and 9 per cent bituminous coal. The average length of haul on the Soo was 209 miles and on the Chicago division 172 miles. The operating expenses per train-mile for all classes of service were \$1.62 on the Soo and \$1.57 on the Chicago division.

The combined figures for the system show total operating revenues of \$27,763,000 in 1915 as compared with \$29,306,000 in 1914. Operating expenses amounted to \$17,811,000 as against \$19,354,000. There were slightly higher fixed charges and taxes in 1915 than in 1914 and the combined net available for dividends was \$3,111,000 in 1915 as against \$3,371,000 in 1914.

Crops were good last year, but this year's crops, especially of wheat, are much the best that the territory served by the

The Minneapolis, St. Paul & Sault Ste. Marie

ates issued in exchange for preferred stock of the Wisconsin Central. The Soo, with its earnings of less than \$6,000 per mile, earned and paid 7 per cent dividends on both its common and preferred stock in 1915, whereas the Chicago division, with its earnings of \$8,878 per mile, while paying 4 per cent on its \$11,265,000 preferred stock and nothing on its common, failed to earn the preferred dividends by more than \$300,000. Since the Soo and the Chicago division are operated as one system, the difference in profitableness of operation to the stockholders is an illustration of the difference in capitalization of different roads and of the difference of expense of operating roads under different conditions, even when they are in the same general section of the country; still more important is the difference made by different ton-mile and passenger-mile rates.

The Soo has total debt outstanding averaging \$25,464 per mile and the Wisconsin Central \$38,005 per mile. Stock outstanding per mile of the Soo amounts to \$12,421; of the Wisconsin Central to \$24,457. The freight density on the Soo in 1915 was 501,000 tons one mile per mile of road, and on the Chicago division 927,000 tons one mile per mile of road. The average receipts per ton per mile on the Soo were 8.24 mills, and on the Chicago division 6.97 mills. The passenger density on the Soo was 61,736, and on the Chicago division 94,311. The average rate per passenger per mile on the Soo was 2.028 cents, and on the Chicago division 1.888 cents. The average trainload of freight on the Soo was 396 tons in 1915 as against 404 tons in 1914, and on the Chicago division 456 tons in 1915 as against

Minneapolis, St. Paul & Sault Ste. Marie system has ever known. The prospects are therefore that in the present year the system will make a very much better showing than it did in the fiscal year ended June 30, 1915.

The following table shows the principal figures for operation for the Soo and for the Chicago division (the old Wisconsin Central) separately in 1915 as compared with 1914:

	Soo		Chicago Division	
	1915	1914	1915	1914
Average mileage operated.....	3,044	2,982	1,120	1,123
Freight revenue.....	\$12,576,374	\$12,764,423	\$7,237,915	\$7,630,500
Passenger revenue.....	3,810,891	4,436,911	1,994,824	2,227,958
Total operating revenues.....	17,817,855	18,717,689	9,945,370	10,588,533
Maint. of way and struct.....	2,096,307	2,405,187	1,211,190	1,220,082

Letters to the Editor

A PLAN FOR IMPROVING THE POSITION OF RAILWAY CLERKS

NEW YORK

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

The letter under the heading "A Clerk's Plea," appearing in your issue of September 10, page 459, quotes the following striking paragraph from an article by George M. Basford, which appeared in your paper of July 23, page 150:

Railroad clerks are a neglected crowd of competent and incompetent men—usually in blind-alley jobs with no training and no outlook.

The remedy suggested in the letter referred to is the writing of books and the founding of schools to train railroad clerks to do their work intelligently. Without expressing any opinion as to the practicability of that suggestion, I wish to offer another, which might be characterized as a first aid, because it is concrete and specific and can be put into effect in any individual organization, large or small, in a very short time and with very little effort. Briefly, it is this:

(1) Beginning at the bottom, where most beginnings are made, abolish the office boy. He is the first fellow in a "blind-alley" job with no training and no prospects. He is generally a youngster who should be in school; paid about \$25.00 per month for doing indifferently work which teaches him little or nothing and affords little opportunity to attain even a minor clerical position. Abolish him and substitute a minor clerkship at \$40.00 or \$50.00 per month. For this sum you can have the pick of high school graduating classes—or, perhaps, if the position is given sufficient dignity, even better. Many young men desirous of entering railroad service would accept such a place if it definitely led somewhere, as hereinafter proposed. Here select the raw material and select it carefully. The work would be of the simplest and the applicant should be told plainly that he is being well paid for the privilege of selection rather than because it is expected his services will really be worth the price paid in the beginning. Accept him on trial. If he proves good material, retain him; otherwise correct the mistake at once and make a change. This will be justice to the man as well as to the company for which he works. It is of great importance to start right.

(2) Grade the office. Establish a regular and recognized progression from the student's position to chief clerk. Beginning with \$50.00 for the student clerk, establish the salaries in rotation, say by \$5.00 steps, to the top—\$55.00, \$60.00, \$65.00, \$70.00, \$75.00, and so on. If necessary to have two or more positions at one salary—say three at \$75.00, three at \$80.00, two at \$85.00, for example—fix the rank of these positions. Make the three \$75.00 positions, for instance, Nos. 1, 2 and 3, so that the clerk reaching the first of these desks from the \$70.00 job shall next pass to No. 2 desk and then to No. 3 desk and then to an \$80.00 position.

(3) When a vacancy occurs somewhere in the line, roll the wheel; shove every man below up one notch and close the gap. Have every one in the force understand that he will not only be permitted to advance, but will be compelled to do so and that, when he can't keep up with the procession, he will be either (see paragraph 4) placed in a rest position temporarily or asked to seek employment elsewhere at something for which he is better fitted.

(4) As the pace may prove too rapid for some, who, nevertheless, will develop if allowed more time, create rest stations along the line—positions in which men who are backward may be held for a time until they catch up and then be put back in the procession. Seventy dollar, \$75.00 and \$80.00 desks, where there is more than one desk paying the same salary, afford opportunities to do this. One of the series may be set to one side to provide a stopping place for those employees who

can go forward and wish to do so, but cannot go so fast.

(5) Results: Every man in the organization, knowing where he goes next, will be looking forward to that position and will be busy observing it and learning about it. Knowing who will follow him, he will be expected also to train that man as his understudy—and this work goes on constantly; it does not await the change; it anticipates it. Hence, when the change is made, the way has already been prepared and the painful process of learning a new desk and teaching a green man the old one at the same time is avoided. Everybody takes an interest. Everybody is "up on the bit"—looking forward, hopeful, enthusiastic, confident. Everybody is being educated in the most practical possible way. An office so organized will soon have several men who can handle several desks. The bugaboo of sickness and vacation time will disappear. The work of the absentee is performed easily—divided between two or three or four, who know how it is done. The student desk is frequently vacated for the next step up, and another recruit is carefully selected; and this choice raw material is trained systematically and absorbed into the organization—a continual infusion of new blood. Weak spots are uncovered, lazy ones and incompetents are eliminated. It may be hard on them, but it is good for the company and for the kind of men the company wants. I saw an example lately, when a change was made on a correspondence desk, of the danger of leaving a man too long in one job. This man had a fine memory, and he depended upon it and neglected to cross index the files, as he was expected to do. When he left there was chaos. It would not have happened under the system here explained, or, at least, it would not have long continued. This man would have either kept up his indices, or an early change would have disclosed his omission to do so in time so it could easily be corrected, and the clerk—in case he remained with the organization—would have been disciplined.

(6) Modifications and objections: No plan, however excellent, is self-executing. Nothing will take the place of office administration, and no practice can be established that will not require exceptions. That is what heads of departments are for. It will occur that certain men, while absolutely unfitted for some kinds of work, may still be useful at other tasks. If wise selection of students is made, these instances will be rare; but, when they do occur, account will have to be taken of them and some temporary modification made, while adhering generally to the plan. Sometimes changes will follow each other so quickly that men will not have become seasoned in the last position taken. In such cases a halt will have to be called and the vacancy filled from outside or from another department; but this does not argue against the plan as a whole. The office can be graded and the regular progression can generally be followed. If necessary to lighten work on some desks and increase it on others to accomplish this, that is easily done. More than one line of progression may be necessary, especially in large offices. If so, use more than one; that is a detail to be worked out by the intelligence of the chiefs, which they are paid for possessing and using. The dead level is deadly. Even the stenographers' desks should be graded and the "new man" (or girl) should take the least important work and the least pay and progress as there are changes above. One objection urged is that a change near the top changes the whole line. It is not an objection. It is a recommendation. The study necessary to prepare men for these changes has been going on constantly. There is little or no confusion when the change occurs. Everybody gets an advance; everybody is happy; every man has his interest aroused anew by new duties, by the knowledge that he is learning, that he is progressing, that he is no longer in a "blind-alley with no training and no outlook." He is being trained. He has an outlook. He is in the procession and he is going somewhere. It is the difference between a stream of living water and a stagnant pool; and,

(7) It has been tried and it works.

A SYMPATHIZER WITH THE CLERKS.

THE COLD STRAIGHTENING OF RAILS

PITTSBURGH, Pa.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

Captain Robert W. Hunt's article on the cold straightening of rails in the *Railway Age Gazette* of October 22, page 726, is timely and to the point. Especially is he correct in saying that now is an opportune time to consider this question.

The question as to the advisability of increasing the length of the rails beyond 33 ft. is being given serious consideration and it, as well as the question of cold straightening, involves modification of the hot bed equipment of the mills. It is therefore desirable that the two questions be considered simultaneously in order to avoid unnecessary changes in the hot beds.

More metal in the base of the rail has been advocated in order to minimize the necessity of cold straightening, but until more care is used in cambering and spacing rails on the hot beds the remedy will hardly produce expected results. It seems to be a prevalent opinion that by greater care in the cambering of rails and proper spacing on the hot beds a finished rail can be produced sufficiently straight to require little if any cold straightening. If this should prove to be a fact there would be no justification for delays in conforming to such practice. Cold straightening is, to say the least, extremely undesirable. While it may be too soon to subscribe to the belief that internal transverse fissures are caused entirely by cold straightening, it still is not difficult to believe that a considerable proportion of such fissures result from that cause.

Railroad maintenance of way engineers have a part to play in bringing about a satisfactory solution of this question. It will not be possible to produce an absolutely straight rail without cold straightening; therefore, in order to get rails that have been little or not at all cold straightened, the engineers should be willing to accept rails that are not entirely straight. Such rails will not pile nicely and will perhaps offend the habit of mind of the man on the ground by their appearance and by little annoyances in the handling. The great benefit to be obtained is, however, "Worth the Candle," at least such is the opinion of many careful and constant observers. The maintenance of way engineer, therefore, should "go along" in this movement.

The users of rail will welcome any effort of the manufacturers to produce a no-gag rail and will, I believe, co-operate to the best of their ability for that purpose.

J. T. ATWOOD
Chief Engineer, Pittsburgh & Lake Erie.

GAGGING OF RAILS AND TRANSVERSE FISSURES

BALTIMORE, Md.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

Referring to the discussion of the cold straightening of rails by Captain Robert W. Hunt, which appeared in the *Railway Age Gazette* of October 22, page 726, this is very interesting as well as an important subject and is deserving of more thought than is being given at the present time. The cold gagging of rails certainly does not benefit it any, as it must necessarily be strained beyond its elastic limit in order to straighten it. It is difficult to determine the amount of damage sustained by the rail, but rails that could be rolled and be practically straight without the use of gagging would seem to be desirable.

The reason that rails are not perfectly straight in cooling is probably due to their different temperatures when they pass through the cambering machine. Some of it is also possibly due to the irregular way in which they are allowed to cool on the cooling beds. The cambering machine should be made to give the right camber to each rail according to its temperature, and if this were done we would probably get practically straight rails without gagging.

I do not know that it is proven that the gagging causes interior transverse fissures. Our experience is that all the transverse fissures we have found have been in open hearth steel,

with the exception of possibly some low phosphorous, high carbon, Bessemer rail. Therefore, if they were due to gagging alone, it would seem that we would have had more of them in Bessemer steel. We have found large transverse fissures in rails about two inches apart. It is our opinion that the transverse fissures start from a broken fibre somewhere in the head of the rail, due to that particular fibre being overstrained in some way, probably the result of a combination of internal strains, due to cooling, together with the component of the vertical and horizontal forces produced by the heavy wheel loads. After this fibre once breaks, the repeated wave motion through the rails, caused by innumerable wheels passing over them, causes a detailed fracture to spread from this center until we get the silvery spot as noted when the final fracture takes place.

With a tendency to the heavier sections, there might be difficulty in laying such rails without having a straight edge or template to lay the rail to, and the heavier the sections the more difficulty would be experienced in spiking the rail to line. However, with a cambering machine, if the rails were cambered according to the temperature, we might expect to get rails practically straight without gagging, but the indications are that this would not overcome the transverse fissure.

A. W. THOMPSON
Third Vice-President, Baltimore & Ohio.

A PLAN TO REDUCE PILFERAGE

WHITE HORSE, Y. T.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

I have been reading with great interest some of the late articles in the *Railway Age Gazette* in regard to various methods of reducing freight claims.

In a great number of cases damaged packages result from improper loading and careless handling. However, I believe the largest number of loss and damage claims result from pilferage. With the package requirements of today's classifications it is evident that most packages are strong enough to afford adequate protection to the commodities they contain but it is obvious that no packages have been so constructed as to prevent pilferage.

During my experience I have noted that in a great many cases where packages have been recovered after being bad order in transit no-account rough teamsters watch for a loose nail or board in order to secure a notation of "evidence of recovering, etc." In fact, the contents may be O. K. upon delivery to the teamster but in view of the notation he could lift some of the contents; and naturally the railway company would be liable.

My idea to reduce loss and damage claims would be to cord and seal all packages when they are first found to be in bad order. A small lead seal and inexpensive cord, such as is used on bonded baggage and express, could be used. As they are easily applied this would not take over a minute for each package and would in no way result in congestion.

As all employees, such as agents, yard clerks, freight conductors, etc., are supplied with a sealing iron, it could be used for this purpose as well as for sealing cars with the station seal. By the number of the seal pilferage or improper handling could be easily traced and steps could be taken to prevent such occurrences. As most pilferage is due to petty thieves, sealed packages would retard their efforts in that direction. I believe that if such a plan were put into effect by the carriers on packages after they were first recovered it would prevent further loss and reduce the number of freight claims to a great extent, because a recovered case, when examined at a transfer point and found to be short, will generally be short several more articles on arrival at destination. Also I believe that when shippers came to see the benefit of the protection afforded it would be only a short time before they would adopt a similar plan and seal and cord all their packages. Then in case of damage or pilferage the number of the seal would show where it took place. This plan would also insure more careful attention by employees and bring about their co-operation in reducing freight claims.

R. B. HYETT.

Electrification of the Pennsylvania at Philadelphia

Made Necessary by the Congestion of the Broad Street Station; Chestnut Hill Branch to Be Electrified Also

The electrification of the suburban service of the Pennsylvania between Broad Street station, Philadelphia, and Paoli is the first work of this nature undertaken by that company in the vicinity of Philadelphia. Its primary purpose is to increase the capacity of Broad Street station and relieve congestion at that terminal. This station is of the stub-end type, having 16 station tracks approached by 6 main line and 3 yard tracks on an elevated railroad which crosses the Schuylkill river from West Philadelphia. At this point the routes divide toward the north for New York, toward the south to Washington and toward the west to Pittsburgh.

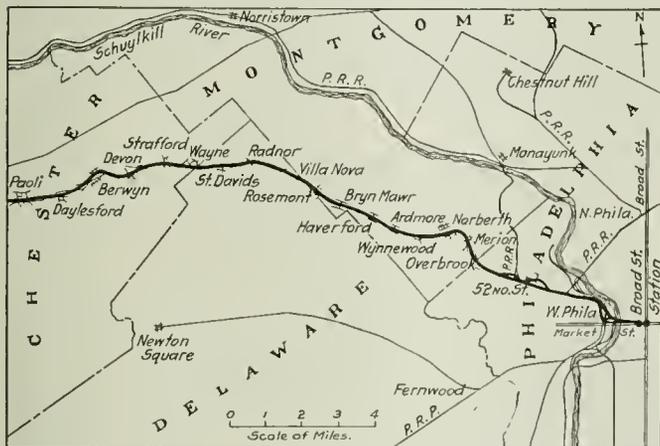

In addition to the through passenger service accommodated at Broad Street station, there is an extensive suburban service extending over six different routes. The growth of all business in recent years has been such that the limit in capacity of the station has been reached and many plans have been formulated

pay interest on the investment, which, in this case, includes the most expensive portion of the work in that the entire Broad Street terminal with an elaborate yard and restricted property lines and approaches thereto form a part of the construction required for a relatively small amount of train service. This is not an unfavorable result under the circumstances, meaning as it does that the increased capacity thus obtained will in part, at least, be self-sustaining, whereas increased capacity by physical enlargement would give no direct return on the heavy investment. In addition there are the other contingent and important advantages of electrification such as the higher speed of trains, more punctual service, especially in bad weather, and more cleanly and attractive conditions for the traveling public.

THE ELECTRIC SYSTEM

An analysis of service conditions and cost estimates covering all available electric systems led to the conclusion that one using a high voltage overhead contact wire and one which eliminated moving machinery in substations for the supply of power was most suitable and also the most economical from the standpoints both of first and operating costs. In arriving at a conclusion as to the system, primary importance was attached to the feature of possible long-distance operation over the entire divisions affected, rather than to the requirements for present short suburban electric service. In this case 11,000-volt, single-phase 25-cycle power is supplied directly to the trains from the overhead catenary trolley system.

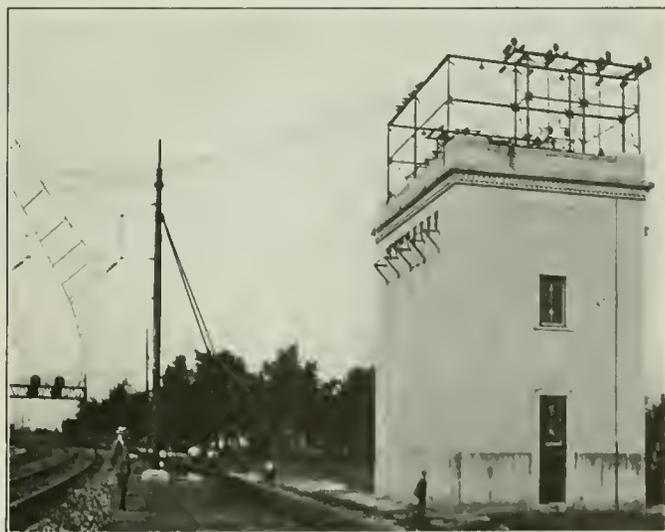

While the studies which preceded this work involved the pos-

Map Showing Electrified Portion of the Pennsylvania Between Philadelphia and Paoli

and discussed for relief by physical enlargement of the station and its approaches, or by rerouting movements. All of these plans involve extensive reconstruction and would require much time for their accomplishment so that some more expeditious method of obtaining relief was desirable. The possibilities of electric traction as a means to this end were studied by committees of operating officials and their analyses and estimates indicated that during rush hours the relief which would be secured by the electrification of the Paoli suburban service alone would be equivalent to increasing the station capacity by an amount equivalent to reducing the total number of trains by about 8 per cent. A similar increase in capacity would result from the electrification of other suburban lines; work in connection with one of these, the Chestnut Hill branch, has already commenced. This increase in capacity is effected by the elimination of the shifting back and forth from one track to another of cars, while the movement of empty power is avoided. There is also some gain in capacity resulting from the quicker acceleration of trains and the shorter length of track occupied by a given train when the steam locomotive is not required. Relief thus afforded by electrification of the Paoli and Chestnut Hill lines is estimated to be sufficient to take care of the normal growth of business for the next seven or eight years and the period of relief can be further extended by the electrification of other suburban lines, should the trial of this initial electric service meet expectations.

It is estimated that under electric operation there will be a sufficient saving in operating costs, as compared with steam, to

Transformer Substation for Reducing Voltage at Paoli, Pa.

sible future electrification of several different railway divisions and classes of service, the present installation covers only the suburban passenger service from Philadelphia westerly to Paoli on the main line of the Philadelphia division and involves about 43 trains each way per day. From Broad Street station the main tracks are electrified for 20 route miles, including also a coach yard at West Philadelphia and a coach and repair yard at the end of the electrified section at Paoli. The present electrification embraces about 93 miles of track.

TRANSMISSION

Power at 25 cycles and 13,200 volts for traction purposes is purchased from the Philadelphia Electric Company and is delivered to the railroad at a substation on the westerly bank of

the Schuylkill river opposite the main generating station, the connection between the power house and the substation consisting of armored submarine cables under the river. On the west bank of the river, the submarine cables are connected to paper-insulated, lead-covered cables, installed in clay ducts. Switchboard meters are provided on each of the incoming 13,200 volt feeders. From this substation, known as the Arsenal Bridge substation, there are four 44,000-volt, single-phase transmission lines to the West Philadelphia substation. These four lines will tee into the West Philadelphia substation. Two of them continue on to the Bryn Mawr and Paoli substations and the other two will go to the Chestnut Hill substation later.

The four transmission lines are carried on brackets on the side of the elevated structure between the Arsenal Bridge substation and the West Philadelphia substation. Beyond this point they are carried on the catenary supporting structures. Along the right-of-way the lines are carried on both sides of the tracks.

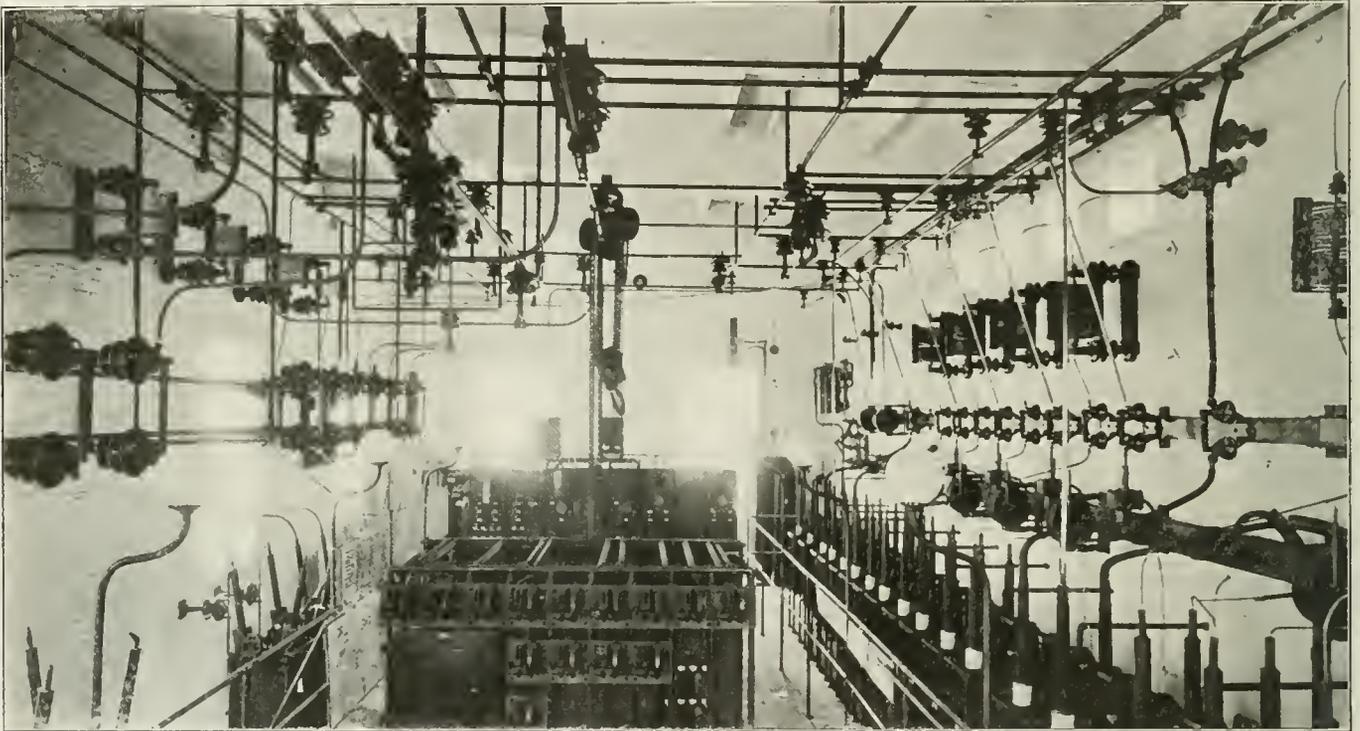

These insulators withstand the following tests: Dry flashover, 165,000 volts; wet flashover, 120,000 volts; puncture, 250,000 volts. After erection, the transmission lines were tested out at a potential of 66,000 volts, or three times the working pressure, to ground.

SUBSTATIONS

The substation equipment is housed in substantial fireproof brick buildings adjacent to the tracks. The lightning arrester equipment and high-tension feeder sectionalizing switches are located on the roof; the bus bars and switching equipment on the second floor, and the transformers on the ground floor. The installed capacity of the substations are as follows:

Arsenal Bridge	3—5,000 K.V.A. step-up	transformers
West Philadelphia	2—2,000 K.V.A. step-down	transformers
Bryn Mawr	2—2,000 K.V.A. step-down	transformers
Paoli	2—2,000 K.V.A. step-down	transformers

Space is provided in all substations for 100 per cent increase

Arrangement of Apparatus in a Typical Substation

Horn gap switches for sectionalizing are installed on the roofs of the West Philadelphia, Bryn Mawr and Paoli substations and lightning arresters on the roofs of all substations.

The transmission lines are 2/0—7 strand, hard-drawn copper wires, spaced 5 ft. apart where the two wires of a single-phase feeder are on the same cross arm. Where there is more than one circuit on a pole the vertical spacing is 3 ft. 6 in. The lines are protected by a 3/8-in. steel ground wire on the top of the poles. Where the transmission lines pass under highway bridges, the ground wire is dead-ended on the bridge structure and the wires are carried on post-type insulators.

At the Arsenal Bridge substation, the lines are protected by relays which operate on overload and on an unbalanced load in either leg caused by a ground. In the other substations the relays operate only differentially, and in case of a ground between substations the circuit on which the trouble occurs will be cut out first in three of the substations and finally at the Arsenal Bridge substation. Overload relays are provided in the 13,200-volt lines at the Philadelphia Electric Company's power station and reverse current relays in these feeders in the Arsenal Bridge substation.

The pin type porcelain insulators used on the transmission lines are 8 7/16 in. high and 12 in. in diameter, made up of 4 parts

in capacity. The transformers in all substations are of the 25-cycle, single-phase, oil-insulated, water-cooled type. The primaries of the step-up transformers in the Arsenal Bridge substation are wound for 13,000 volts and the secondaries for 44,000 volts. The primaries of the step-down transformers in the other substations are wound for 44,000 volts and the secondaries for 11,000 volts. The lightning arresters on all 44,000-volt and 11,000-volt lines are of the electrolytic type and are located on the roofs of substations. The circuit breakers are automatic and remote controlled. In general all power wiring is bare and copper tubing or solid wire is used.

Power for the opening and closing of oil circuit breakers is obtained from the 44,000 or 11,000, 25-cycle buses. Two transformers are provided in each substation, stepping down to 440 and 220 volts.

Except in the West Philadelphia substation where the power director or system operator is located there are no attendants. A switchboard, with the necessary instruments, controllers and indicating lamps, is provided in signal towers near the Arsenal Bridge, Bryn Mawr and Paoli substations. Telephones are provided in all substations and the signal towers controlling them so that the power director is in constant touch with all substations and tower men.

CATENARY SYSTEM

In order to try out the various types of structures and details considered for this work, an experimental four-track section about a mile long was completely equipped in the fall of 1913. An examination and study of this led to the adoption of what

Tubular Cross-Catenary Bridge Before Longitudinal Wires Were Erected

is called the "tubular cross-catenary bridge" for carrying the catenary trolley wires.

One of the photographs shows one of these structures before any longitudinal wires were erected. On either side of the tracks a tubular steel pole is set and grouted into a concrete foundation. Each pole has a double guy anchoring the pole away from the tracks. Spanning the tracks between the poles are the two cross wires forming the cross catenary bridge which carries the longitudinal wires. This type of structure has been used through-

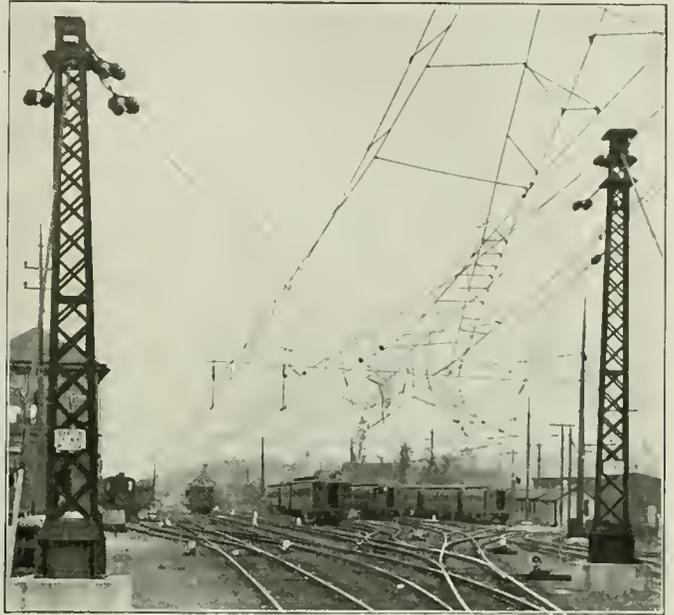

Catenary System Over Curved Track

out wherever the property or arrangement of tracks will permit. Where there is no room for guying, self-supporting structural steel posts have been used.

The tubular poles are built of various lengths, sizes and weights of steel pipe welded together. The guys are solid steel rods with heavy turnbuckles near the ground end to permit of adjustment. Numerous experiments and tests of different forms of guy anchors were made to determine the holding power and economy, and the anchors adopted are of the dead-weight type, consisting of a concrete slab reinforced with old rails held in place by the weight of the soil above. Where the guy rods pass up through the soil they are protected against corrosion by means of a steel pipe, the space between the pipe and rod being

filled with grout. Each catenary structure or bridge is grounded by means of a copper plate buried in coke. The guy rods are attached to the pole by means of heavy steel castings.

The cross wires are of extra high-tension galvanized steel strand, the upper strand usually being $\frac{3}{4}$ in. and the lower one $\frac{1}{2}$ in. in diameter. Both are socketed at each end, and at one side a turnbuckle is installed to permit adjustment. The top and bottom crosswires are joined together by a vertical $\frac{3}{4}$ -in. rod

Catenary Construction at the Paoli Yard

and suitable malleable iron clamps, etc., at the points where the insulators carrying the longitudinal wires are located.

Each insulator consists of three suspension type units, the porcelain being 8 in. in diameter and the flashover value of the three being many times that of the line voltage. The cross wire bridges are located about 300 ft. apart on tangents, but are closer on curves. After the bridges were erected, insulators

Special Car for Erecting Catenary Work; Removable Outriggers Make it Possible to Work Over Track Alongside Without Interruption to Traffic

were suspended over the center of the track on tangents and offset towards the outside of the curve on curved track. After the insulators were erected, the main messenger wire was strung out and suspended from them. This is a $\frac{1}{2}$ -in. extra high tension 7-strand double-galvanized steel cable, having a sag of

5 ft. in a span of 300 ft. Every mile or two this messenger is socketed and dead-ended on one of the heavy structural signal bridges which are spaced about $\frac{1}{2}$ mile apart.

Every 15 ft. on curved track and 30 ft. on tangent track a hanger supports the lower two wires from the messenger wire. The top one of these two wires, called the auxiliary messenger, is of No. 0 round B. & S. copper and its purpose is to give suitable current capacity to the system. The bottom wire is the contact or trolley wire and is a No. 3/0 grooved B. & S. "phono-electric." Both these wires are carried in a vertical plane generally about 22 ft. above the top of the rail except where they drop down to pass under an overhead highway bridge having insufficient clearance to permit this height.

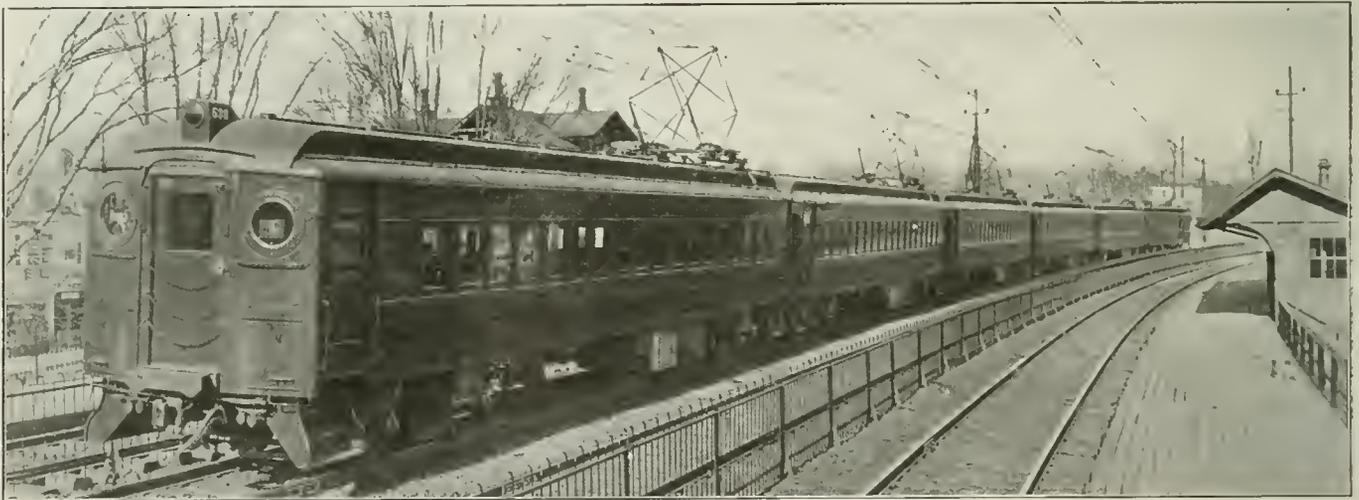

In the Terminal division, which includes the first five miles from Broad Street station, where the steam locomotive traffic is very dense, and there is much smoke and corrosive gas, a non-corrodible tube hanger is used. Some of the tube is Monel metal, while the balance is a bronze mixture containing 90 per cent copper. On the Philadelphia division, where there is relatively less steam traffic, wrought iron strap hangers 1 in. wide

BONDING

The rails are bonded with pin-type expanded terminal bonds. To furnish a circuit for the return of the traction current to the substations, one end of the bond has a terminal solidly welded to the bond while the other end has a soldered terminal. This enables the bond to be installed by being slipped back of the splice bar without the necessity of removing it. Each rail of the main line tracks is double-bonded throughout, each rail joint having two No. 1/0 B. & S. bonds. Through the interlockings only one rail of each track is bonded, but all of the traction rails are connected together.

The track rails are sectionalized at each signal block by means of insulating splices and the traction current flows through impedance bonds connected around these insulated joints. These impedance bonds allow the passage of the traction current, but at the same time sectionalize the track so far as the 60-cycle signal current is concerned.

In order to minimize the inductive effect of the traction currents on adjacent telephone and telegraph wires, a special system of booster transformers has been installed. This consists of

Multiple Unit Train on the Electrified Portion of the Pennsylvania at Philadelphia

by 3/16 in. thick are used. The main messenger cable at the hanger clip is protected from corrosion by a collar of zinc inside of the annealed brass or Monel metal clip, which is bolted to the hanger strap.

On tangents, the casting at the bottom of the hangers holds the auxiliary messenger only and the trolley wire is, in turn, supported from this auxiliary messenger every 15 ft. at points equidistant from the hanger. This insures a flexible or smooth riding trolley wire. On curves the two lower wires do not hang directly beneath the messenger, but the whole system swings into a curved plane until a balance is reached between its weight and the tension in the wires. The tensions in both the auxiliary messenger and trolley wires are selected so that in extreme hot weather there will be enough tension to prevent sagging and yet in extreme cold weather the contraction will not cause stresses beyond the elastic limit. The catenary system over each of the four main tracks is separated electrically from those over the other tracks, and trolley sectionalizing points with switches are provided at all crossovers so that sections of the line may be cut out of service temporarily for repairs.

An interesting detail in the erection of this catenary work was the use of cars, the top platforms of which could be raised or lowered readily by means of chain hoists. The cars were also equipped with removable outriggers so that in the four-track section the work could be erected completely over one of a pair of tracks without in any way interfering with the regular steam traffic on this track.

In order fully to protect the trainmen, general orders have been issued that no men are allowed on top of any car in the electrified zone.

series or booster transformers mounted on the signal bridges and located about a mile apart.

CAR EQUIPMENT

Standard suburban steel coaches of the type used in the regular steam service are being used for the electric service. This was made possible by the fact that the requirements for mounting electric apparatus on the cars had been thoroughly considered at the time when the steel car was first introduced.

The rolling stock consists of 93 standard all-steel cars, 82 of which are passenger, 9 combined passenger and baggage and 2 combined baggage and mail cars. All cars are motor cars, as no trailers will be operated in this service.

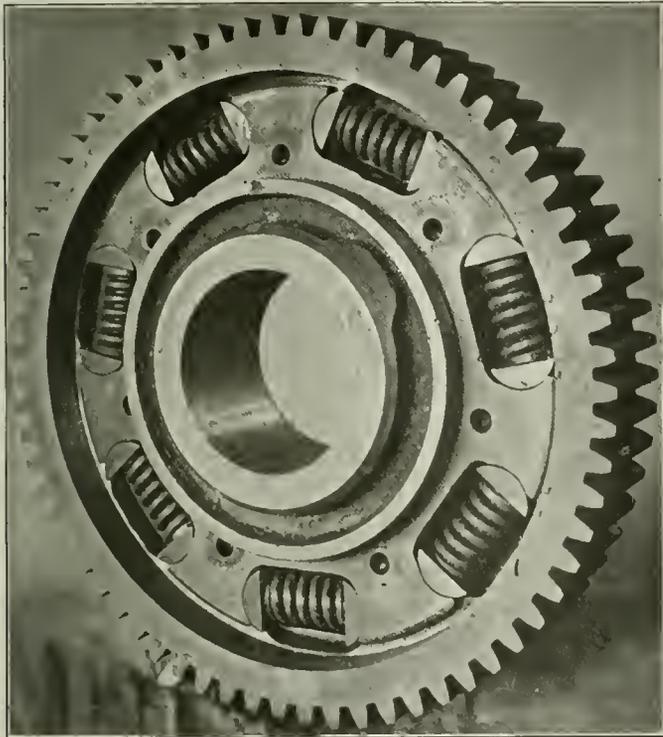

The equipment of each car consists of two 225-h.p., single-phase, air blast-cooled, doubly-fed motors, mounted on one truck, with automatic acceleration, battery control equipment, and automatic multiple unit electric air-brake equipment. The cars are designed for double end operation. Current is collected from the overhead wire by the pantograph trolley and is conducted to the main transformer through the line switch (oil circuit breaker).

The motors, which are connected in series, are started and operated up to approximately 15 m.p.h. as repulsion motors, with the auxiliary or compensating field, the armature, and the main field in series. With these series connections, the armature is short-circuited through resistance. Resistance is also inserted in series with the motors on the first step and is cut out on the second step. The third step changes the connections to energize the auxiliary field from one portion of the transformer and the armature and main field, connected

in series, from another portion of the transformer, thus affording doubly fed connections. The armature short-circuit is removed when operating as doubly fed motors. Subsequent steps are obtained by increasing the motor voltages.

The master controller drum is energized from the motor generator set, in parallel with the battery, through a control plug, and moving the master controller handle to the right or to the left energizes the proper control circuit for forward or for reverse movement of the train. The closing of the unit switches is governed by a current limit switch. Ten control wires between cars are necessary to operate cars in trains with one of these wires performing the dual function of the third operating wire, and the "trolley unlock" wire.

Each motor has an hourly rating of 225 h.p. and a continuous rating of 200 h.p. when ventilated with 1,200 cubic feet of air

Flexible Gear with Cover Plate Removed

per minute. The flexible gear is made up of a rim, on which the teeth are cut, a center, a cover plate and spring details. The rim is spring mounted on the center, the periphery of the center and the cover plate acting as the bearing surfaces for the rim.

The pantagraph is of especially light construction. The springs which raise it are designed to give flexibility to the framework, so that in operation a slight dragging of the trolley takes place, resulting in its following the wire much closer than with a rigid framework. The trolley is lowered and unlocked by air at 70-lb. pressure. A small hand pump is provided for unlocking the trolley when no air pressure is available.

The "safety first" principle has been carried out in the provision of a grounding device of novel design. Steps for mounting to the roof are provided at one corner of the car only and a lever is placed on the roof at this corner. When one climbs to the top of the car, this lever is thrown up, thus locking the trolley in the down position and grounding the entire framework.

The line switch is air operated and is closed by energizing a control circuit from the master controller plug. The transformer is of the 2-circuit air-blast type and is suspended from the center sill of the car as close to the motor truck as possible. Ventilating air is taken in at the low-tension end and is

discharged at the high-tension end through especially constructed hoods which cover the air outlets to prevent the entrance of rain and wheel wash.

Nine electro-pneumatic operated switches of standard construction are mounted in one group. The master controllers are of the single-handle type. Nine controller positions are provided; an emergency or "dead man's" position in the center, and an "off," first, second and third running positions, for both forward and reverse movements. The controller drum is spring returned, and, if released, will return to the middle or emergency position. In this position, the control is cut off and a valve magnet is energized which releases air from and operates a brake pipe relay, thus applying the emergency brake. Each controller also has two push button switches for unlocking or lowering the trolley. Control energy is obtained from a motor generator operating in parallel with a battery.

A line or voltage relay is provided for cutting the direct current control generator from battery, and also to operate two small emergency lights, and headlights in case the traction power should fail.

The fan for ventilating the transformer and motor is a 21-in. single inlet Sirocco wheel, and is mounted on the shaft of the motor which drives the compressor. The motor drives the fan continuously. Air for the ventilation of the transformer and motors is taken in at the side of the cars through a louvre. The air intake box is designed with a baffle and screen to prevent the entrance of moisture or foreign material to the fan.

The air-brake equipment is designed so that it may be used either in steam or electric service, and differs from the ordinary pneumatic brake in that the brake pipe reduction is made on each car by means of electric control instead of being made entirely with the engineer's brake valve. The addition of electric control to the pneumatic brake does not change its function in any way but shortens the time required to get the brakes applied on all cars.

The motorman's brake valve contains both electric contacts and pneumatic parts, the electric portions being mounted above the pneumatic portions. There are six positions: (1) the release and running, (2) the electric holding, (3) the handle off, (4) lap, (5) service and (6) emergency. The first named position is to the left and in this position all train brakes are released and the system charged. The "electric holding" position, as the name implies, holds the train brakes through the electric control system but recharges the system. Pneumatically, this position is identical with the release and running position. All ports are closed in the "handle off" position, and the handle may be removed; in the "lap" position, the ports are also closed. The "service" and "emergency" positions are for applying the brakes for service or emergency application. In making a service application, a limiting valve in conjunction with the brake valve allows a maximum reduction of 20 lb. in the brake pipe. A small cut-out plug is provided for cutting out the electric operation when desirable.

The main reservoir pressure carried is 100 lb. and the brake pipe pressure is 70 lb. To permit the operation of these equipments in steam service, where the brake pipe pressure is 110 lb., without making adjustment, a main reservoir bypass and limiting valve is employed. By its use the same cylinder pressure is secured in making an emergency application in either steam or electric service, although the operation of the universal valve is the same for either. In steam operation, the pipe line, which is used as a main reservoir line in electric service, is used as a signal line.

Trains of from two to seven cars are operated in regular service, the average acceleration on a straight level track being approximately 1 mile per hour per second up to 30 m.p.h. with a balancing speed of 60 m.p.h.

CAR INSPECTION BUILDING

A substantial and completely equipped car inspection building has been constructed at the Paoli yard. This is planned to serve not only the cars required for the present electrification but

also for the cars required by certain other divisions when electrified. Adjacent to the inspection building proper is a small service building which contains boilers for heating, locker and wash rooms, air compressors and motor generators for supplying power for the tools and signals.

SIGNALS

Throughout the electrified zone, it was necessary to change the existing direct current track circuits to alternating current track circuits and to provide impedance bonds which permit the return of the 25-cycle traction current, but sectionalize the various track circuits so far as the 60-cycle current is concerned.

In the electrified portion of the Philadelphia division, the old form of semaphore signals have been replaced by those of the electric-light type in which different rows of five lights each with suitable lenses indicate the various positions of clear, caution and danger.

To provide proper vertical clearance for the catenary wires, as well as to provide points for anchoring them, practically all the old signal bridges in the electrified zone were replaced with ones of considerably heavier design. In order to nullify the

liable intercommunication by telephone is possible between any parts of the whole system.

The design and construction of the electric installation was carried out by Gibbs & Hill, consulting electrical engineers for the company, in co-operation with the engineering department and the officials of the road. All construction except that of substation buildings and inspection building, which were covered by outside contracts, was carried out by a specially organized force. The mounting of the multiple unit car equipment on the cars was carried out by the railroad forces at the Altoona shops under the direction of the motive power department. The signal equipment and changes in telegraph and telephone lines were designed and installed under the direction of the signal and telegraph departments, respectively.

The following is a partial list of the manufacturing concerns which furnished the principal items of plant and equipment: Motor car equipments, transformers, etc., Westinghouse Electric & Manufacturing Company; structural poles and bridges, McClintic Marshall Company; tubular poles, National Tube Company; steel messenger, cross span and ground wire, J. A. Roebling's Sons Company; copper transmission and secondary messenger wire, Waelarke Wire Company; special bronze trolley wire,

Car Inspection Building at Paoli

induction effect of the traction current in the signal circuits of adjacent tracks, resonant shunts have been installed which permit the local induced currents to be shunted around the track relays and thus avoid disturbing the signal circuits.

Following the heavy sleet storm of March, 1914, which caused so much damage to the overhead wires in the eastern states, the railroad decided to put certain portions of its telephone and telegraph wires underground and this has now been done throughout the electrified zone. Along the main line this underground conduit consists of a 6 single ducts of 3-in. bore, part of which are clay conduit and part bituminized fiber. The conduit bank is protected with concrete on all sides. There are concrete manholes every 400 ft. or less. In order to minimize inductive disturbances from the traction circuits, the conduit is located as near the edge of the right-of-way and as far from the tracks as practicable, though in some places it is just beyond the end of the ties on the outside track.

On top of this bank of conduits, the main signal power feeder carrying 60-cycle, 3,400-volt current is carried, the lead-sheathed cable being run in a pump-log duct which is afterwards filled with pitch. In addition to the usual telephone facilities between substations and between the electric power director and the train dispatchers, permanent telephone boxes are located at every signal bridge throughout the electrified zone and prompt, re-

Vare, and electro-pneumatic air brake, Westinghouse Air Brake Company.

PROPOSED IRISH RATE INCREASE.—Owing to increased cost of operation, notice has been given by the Midland Great Western Railway (Ireland) Company of its intention to increase (subject to the statutory maxima) the rate for merchandise traffic between all stations on its system for all classes. The altered rates are made effective October 1, 1915. The increases range from 2d. (4 cents) on rates exceeding 1s. (25 cents) and not exceeding 2s. per ton, to 7s. 5d. (\$1.85) on rates exceeding 72s. 6d. (\$18.12) and not exceeding 75s. (\$18.75) per ton, while rates of 75s. per ton and upwards are to be increased 7s. 8d. (\$1.90) per ton. The proposed scale of increase is very much higher than that introduced on English railways in July, 1913, which ranged from a ½d. increase on 1s. rates, to 3s. 1d. (77 cents) increase on 78s. 1d. (\$19.50) rates, and 4s. increase on rates exceeding 98s. 11d. (\$24.72).

The Relations of the Railways and the Public*

A Discussion of the Policy of Government Transportation Regulation, Both as It Is and as It Ought to Be

BY L. E. JOHNSON

President, Norfolk & Western

I have accepted your invitation to address you in the belief that it indicates your interest in the railway problem. That there is such a problem all agree, however much they may differ as to its true nature and proper solution; and it is a problem in which it is very desirable that the more intelligent and public-spirited of our citizens, such as those composing this society, shall actively interest themselves. Not only is it desirable that they should do this, but it is their positive duty. On the way the railway question is finally settled will greatly depend the welfare of the nation. Public opinion will determine whether it will be settled right. In order that public opinion may cause it to be settled right the public must have good leadership; and that leadership should be furnished by men such as you.

It is generally recognized that to solve the problem presented there should be changes made in the relations existing between the people and the governments of the states and the nation, on the one hand, and the managements and owners of the railways on the other hand. Some people believe these changes should be effected by the adoption of government ownership and management of the railways. Others believe the needed changes should be accomplished by modifications in the present policy of regulation, in which latter class I place myself.

OBJECTIONS TO GOVERNMENT OWNERSHIP

I believe a majority of the people think at present that the adoption of government ownership would not promote the public welfare, but would have the opposite result. There are a very few countries, Prussia affording the best example, where state railways have been managed with a considerable degree of success, but in most countries both the economic and political results of government management have been bad. Forty years ago an Italian commission which had thoroughly studied the subject expressed the opinion that under government ownership politics would corrupt the railroads and the railroads would corrupt politics. This view has been supported by the experience of Italy itself and by that of France, of Australia, of Canada, and of every other country where the conditions have been such as to make it possible for politics to affect government management. Nowhere else, perhaps, has the deplorable influence which politics is almost certain in a democratic country to exert on government railway management been more strikingly illustrated than in our next-door neighbor, Canada.

Since 1867 the Dominion has owned and operated the Intercolonial Railway, and since 1873, the Prince Edward Island Railway. These lines now have a mileage of 1,734 miles. Never in a single year since the government acquired it has the Prince Edward Island earned even its operating expenses, to say nothing of interest on the investment in it. The Intercolonial in the 47 years it has been under government management has failed by \$8,500,000 to earn its operating expenses, to say nothing of interest on the large investment which the people of Canada have made in it. Other railways in eastern Canada owned by private companies have charged practically the same rates as these government railways and have been operated at a profit.

In 1904 the government began the construction of the National Transcontinental Railway from Moncton to Winnipeg. The official estimate of its cost was \$61,415,000, or \$31,083 a mile. At the end of 1914 the line had not been provided with equipment or adequate terminals, and yet up to that time there had been spent on it \$173,000,000, or about \$99,000 per mile. A government commission appointed to investigate its construction

denounced it as enormously wasteful, and the Grand Trunk Pacific, to which it had been intended to lease the line for operation, refused to take it over because it could not afford to pay three per cent interest on the excessive expenditure which had been made.

The explanation of the wasteful construction of the National Transcontinental is the same as the explanation of the wasteful operation of the Intercolonial. The work was done on political rather than business lines. The principle of the "pork barrel" had dominated the management and construction of government railways in Canada as it has the development of waterways, the erection of public buildings and a good many other matters in this country.

The experience of other countries and the conditions in our own warn us that we cannot afford to try the experiment of government ownership of railways here; at least, not until our government management would not be rendered impossible by politics of the "pork barrel" variety.

THE ALTERNATIVE

There is only one alternative to government ownership. This is a system of wise and fair regulation. Railway managers are often accused of not recognizing this fact. They are often charged with being opposed not merely to effective regulation, but to any regulation. I deny this. I know the consensus of opinion of our railway managers, and I assert emphatically that they are not opposed to any regulation or to effective regulation, but that they appreciate the need of it and are as strongly and sincerely in favor of it as any other class of our citizens, because they know that this is the only alternative to government ownership, and as patriotic citizens they are opposed to government ownership. They would be in favor of it even in the absence of the danger of government ownership, because they recognize the fact that effective regulation, if it be also wise and fair, will promote the interests and protect the rights not only of the general public, but also of the owners, the officers and the employees of the railways themselves.

All intelligent railway men recognize the fact that there have been in the past shortcomings and abuses in the management of some, if not all, of our railways and that government regulation has helped to correct some of these. They concede that there are still such shortcomings and abuses and that government regulation can, and ought to, help to correct them. But they also believe that there are some very serious shortcomings and abuses in the present system of regulation; that in consequence it is doing harm as well as good; and that unless it is radically changed and raised to a higher plane of efficiency and fairness, it will fail in the long run to do much of the good that the public desires and will do much harm, which the public does not intend.

MAIN PURPOSES OF REGULATION

The three main purposes of government regulation should be to further the economy, efficiency and safety of railway operation; to cause rates to be reasonable and non-discriminatory; and to make investment in railway securities safe and attractive.

It is generally recognized that regulation should seek to improve railway service and to make rates fair and reasonable. It is not so generally recognized that it should aim to improve railway securities as investments, but there are some very good reasons why it should do this. In the first place, if either railway management or government regulation is such as to make investors in general afraid to buy railway bonds and stocks, the companies will be unable to get enough capital to make their serv-

*An address before the Western Society of Engineers at Chicago on November 2, 1915.

ice good and adequate. In the second place, not only is the railway business a very large industry, but it is also one which can be put on such a basis as to make it both feasible and desirable for large numbers of people of small means to invest in it. The degree to which they will be thrifty is likely to depend largely on the opportunities open to them for the safe and profitable investment of any amounts, however small, which they may save. But the trend of our economic and industrial affairs for some years has been such as to reduce rather than to increase the number of the kinds of openings which formerly existed for the class of small investors. Corporate organizations have been growing in size and number and driving out the small concerns in which the small investor used to put his capital. The best substitute we can offer for the opportunity to invest in small properties is the opportunity to acquire with reasonable safety small interests in large concerns, such as our railways and industrial corporations. This opportunity can be afforded only by having these concerns both managed and regulated honestly and wisely and in the interest of those who invest in their securities as well as in the interest of those who buy their goods and services or who are employed by them. There is just as much reason, from the standpoint of the general welfare, why our government should seek to make small investments in our industrial and railway corporations profitable and safe as why they should try to make small investments in our farms attractive and safe. The more widely the ownership of property in a country is diffused the more stable will be its institutions and the more certain its prosperity.

METHODS OF REGULATION

If regulation is to be wise it must be done by bodies having some expert knowledge of railway matters. A commission may have such knowledge, but a legislative body cannot have it. If regulation is to be fair, it must be free from political and other influences that will tend to divert it from its proper purposes. A commission may be comparatively free from political influence, but a legislative body cannot be. For these and other reasons the function of regulation should be delegated chiefly to commissions.

A commission whose members are appointed for long terms is less likely to be influenced by political and other influences tending to impair its fairness and efficiency than one whose members are elected for short terms. Therefore, members of commissions should be appointed and their terms of office should be long. Indeed, I am inclined to believe that it would be conducive to their greatest fairness and efficiency if their members, like our federal judges, were appointed for life.

In most important respects, from the standpoint of the public, our railways constitute a single transportation system extending into every part of the country. Regulation should, therefore, be directed toward promoting the interests of the nation as a whole. But clearly, regulation should not be allowed to further the interests of some classes of the people at the expense of the people as a whole, or to promote the interests of some localities and sections at the expense of the country as a whole. Therefore, regulation should be made as consistent and uniform as is practicable, and regulation by communities and states should be subordinated to that of the nation.

Regulation should not be such as to make railways unprofitable, because this would hamper their development and thereby hamper the development and impair the prosperity of the entire nation.

These principles all seem obvious and fundamental. Are they observed as well as they should be?

INCONSISTENCIES OF PRESENT REGULATION

There is not one of them which is not violated. The nation has created the Interstate Commerce Commission and 45 states have created railroad or public service commissions. Nominally, these are all expert bodies, and theoretically, the legislatures and Congress have delegated to them the function of regulation. In practice the legislatures and Congress at almost every session, without investigation, impose on the railways burdens and re-

quirements affecting operation and rates, the desirability and reasonableness of which ought to be left to be determined by the commissions after investigation. Within the last four years there have been 3,016 bills introduced in the state legislatures for the regulation of operation alone, of which 436 have been passed. The members of many state railroad commissions are elected and, of course, in their election political considerations and not their special fitness for their duties govern. Even when they are appointed they often are selected, not because of their special fitness, but for political reasons. It is inevitable that bodies thus constituted should not be expert and impartial to the degree that they ought to be. The want of impartiality of some of them is illustrated by the facts that seven state commissions appeared as parties against the railways in the five per cent rate case and that 16 state commissions have appeared as parties against the railways in the cases involving advances in freight and passenger rates in western territory.

Furthermore, state regulation is usually controlled largely by local considerations and directed to the furtherance of the supposed interests of the people of the state at the expense of the interests of the people of the nation. Finally, almost all of our regulation is directed toward restricting the net earnings of the railways within the narrowest limits that the courts will permit.

As much of the legislation passed is enacted without sufficiently thorough previous investigation, it is necessarily arbitrary. As there is almost no co-operation between the various state commissions, or between them and the Interstate Commerce Commission, and almost no co-ordination of their activities, it naturally results that the requirements imposed on the railways are often inconsistent and even conflicting. As the legislation passed, and even the orders sometimes issued by the commissions, often are secured almost entirely at the instance of and under pressure from certain well-organized classes of persons, it is not surprising that their intent and effect often is to promote the interests of these classes at the expense of the railways and the rest of the public.

The inconsistencies between the regulation of the states themselves and between that of the states and the national government are illustrated by the fact that while numerous states have adopted legislation regarding train crews or headlights, the federal government has not done so, and that there are wide variations between the provisions of the laws of the states and of the nation regarding the hours of service of railway employees.

DISCRIMINATIONS PRODUCED BY PRESENT REGULATION

The regulation of rates by the various states and by the federal government originally was intended largely, and in the case of the federal government, mainly, to correct unfair discrimination. It has produced a good effect by correcting many such discriminations; but it is now producing bad effects by actually creating other and equally unfair discriminations. For example, at a time when the interstate passenger rates of the railways in most parts of the country were three cents a mile, numerous states passed laws reducing state rates to two cents a mile. In some states railways got these laws set aside as confiscatory. In others, in order to avoid discrimination between state and interstate rates, they reduced the interstate rates also to two cents. In the five per cent case the Interstate Commission indicated that it believed that these low passenger rates were not yielding enough revenue to cover the part of railway expenses properly chargeable to passenger service and that the railways should raise them. The railways in eastern territory did raise the interstate passenger fares to 2½ cents a mile and tried to get the state legislatures to increase the state rates. This the legislatures did not do, and, in consequence, there has resulted an unjust discrimination between state and interstate travel brought about by the inconsistent policies of the regulating authorities representing the public itself.

There are likewise unfair discriminations in freight rates due to the same causes. In the Shreveport case the Interstate Commerce Commission called attention to the fact that an unfair

discrimination had been effected between certain state rates between certain points in Texas and certain interstate rates between Shreveport, La., and the same points in Texas, by the rate-making policy of the Texas railroad commission. Again, in the western freight rate case, it refused to allow certain advances in rates on live stock because certain of the interstate rates involved were already higher than corresponding rates fixed by legislative enactments or by the orders of state commissions.

If you turn to the field of regulation of the financial management of the railways you will find somewhat similar conditions. Practically all of our railway corporations have been chartered by the states which have created them. Some states have been lax in creating and regulating railway corporations. This laxity has left the door wide open for corporations created by these states to go forth into other states and handle their financial affairs in ways perhaps condemned by the public opinion of the country. On the other hand, other states, such as Texas, have imposed such stringent regulations on the financial management of railways within their borders as seriously to hamper their development and even to make them heavy burdens on the parts of the same railway systems in other states.

INCREASED COSTS OF OPERATION AND DECREASED EARNINGS

The period during which the present system of regulation has been applied dates from about 10 years ago. This period has been, as you know, one of steadily and rapidly increasing costs of operation. This has been partly due to our policy of regulation, but mainly to the higher standards of service which the public has expected, to increases in taxes and to advances in wages which railway labor has demanded and which boards of arbitration organized under federal law have granted.

The 8 or 10 years prior to 1906 and 1907 were years of steadily and even rapidly increasing railway net earnings. Those since have been years of just as steadily and rapidly declining net earnings. This is not true of every individual road. There are a number of individual railways which, because of exceptionally good management or unusually fortunate situations, have continued to prosper, and some of them are even more prosperous than they were 10 years ago. But these roads are no more typical than are certain roads at the other extreme which, because of bad management or unfortunate situations, have declined into the depths of adversity. It is the situation of the railways as a whole, not that of individual lines, which it is important for us to consider.

According to the latest available statistics there are now 82 railways in the hands of receivers, having a mileage of 41,988 miles and a capitalization of \$2,264,000,000. This is the greatest mileage ever in the hands of receivers in this country. It is a significant fact that the mileage of bankrupt roads is larger in proportion in the Southwest, where the policy of regulation has been the most repressive, than in any other section. Furthermore, the construction of new mileage and the improvement of the facilities of that already existing have been seriously curtailed. The new mileage built has shown a downward tendency since 1906 and was smaller in 1914 than in any year since 1895. There have been heavy reductions in the purchases of equipment and supplies; and, in consequence, many thousands of men have been thrown out of work in both the railway and the railway supply businesses and every line of commerce and industry has been adversely affected.

Now, I would not be understood as attributing the unsatisfactory conditions entirely to regulation. There would no doubt have been large increases in the operating expenses and taxes of the railways if the policy of regulation had never been begun. The great faults of regulation have been that, first, in many ways it has unwisely and unnecessarily enhanced the increases in expenses, and that, second, it has at the same time prevented most of the increases in rates which these increases in expenses made desirable, and, indeed, in the face of these increases in expenses, has actually compelled many reductions in rates. The average annual wage of railway employees was 43 per cent higher in 1914 than in 1898 and average taxes per mile were 140 per cent

greater; yet the average passenger rate and the average freight rate were actually lower after these increases in wages and taxes had occurred than before. Under an entirely intelligent and fair policy of regulation the public authorities would have co-operated with the managements of the railways in their efforts to solve the problems presented by the great and rapid increases in their expenses and taxes. Under the policy actually followed regulation has made their problem more difficult and complicated, with the results just mentioned.

Now it may be said that the railways have brought upon themselves much of the trouble from which they are suffering. I admit that. On the whole, the managements of our railways have been as able, as honest and as efficient as those of any other railways or other large corporate business in the world. But, as I have already conceded, many mistakes have been made and many offenses have been committed by them. It is because of these things that, as railway men now admit, regulation became desirable for the protection and benefit of the public and even of the railways themselves. But is the fact that the managements of the railways have not always been wise and fair any reason for adopting and persisting in a policy of unwise and unfair regulation? Clearly not. Is it not evident that the policy of regulation which has been followed has not established, and is not adapted to establish, satisfactory relations between the railways and the public? Is it not evident that it has not been promoting, and is not adapted to promote, the purposes which regulation ought to promote? It is not making the operation of railways more economical and efficient. It is substituting new forms or unfair discrimination in rates for those which have been abolished. It is preventing rates from being so adjusted as to meet the increasing demands on railway revenues. It is helping to make railway securities unattractive rather than attractive both to the large investor and the small investor, and is forcing the railways to sell bonds to raise capital when they ought to be selling stock and to sell short time notes when they ought to be selling bonds, thereby rendering them financially top-heavy and incapable of weathering the financial storms which are sure to break over us in the future as in the past. In order to establish satisfactory and beneficent relations between the railways and the public, our regulation of railways, as well as our management of them, must be put on a sound basis.

REGULATION SHOULD BE IN HANDS OF EXPERTS

The remedy for the defects in our policy of regulation seems to me obvious. It should not be destroyed, but it should be made less rigid and more flexible, less restrictive and more constructive, less the work of amateurs and more the work of experts. The legislatures should cease passing without investigation arbitrary laws for the regulation of features of the railway business with which their members, from lack of time and want of special knowledge, cannot possibly become competent to deal, and leave the performance of the function of regulation almost entirely to commissions. The commissions should be made in fact as well as in theory impartial bodies of experts. The state commissions should be restricted to the regulation of purely local and state matters and the Interstate Commerce Commission should be expressly authorized and required by law to overrule the state authorities when they adopt regulations the effect of which is to interfere with and burden the commerce of other states and the commerce of the nation as a whole. There may be reasons for applying some different rules in states in which the conditions differ as widely as they do in Massachusetts and Arizona; but there cannot be any good reason for applying widely different and wholly inconsistent requirements in states adjacent to each other, such as Nebraska and Kansas, or Massachusetts and Connecticut; and there certainly cannot be any good reason why a state government should apply one rule in a state and the federal government should apply an entirely different rule in the same state. Both these things are done now. There can be no good reason why a state passenger should be allowed to travel for two cents a mile in a state when the Interstate Commerce Commission has held that 2½ cents is a reasonable rate for interstate

travel in that same state, which is what is being done at the present time.

There can be no good reason why a state law in Texas, for example, should prescribe certain hours of work for railway employees engaged in state commerce when a federal law prescribes different hours for all railway employees engaged in interstate commerce, which is what is being done now. There can be no good reason why the Interstate Commerce Commission should hold that the earnings of the railways in eastern territory are not as large as they should be in the interest of the public, and that at the same time the states should be allowed to prevent the increases in earnings which the Interstate Commerce Commission holds should be permitted in the interests of the public. Yet this is being done now.

At the same time that state regulation is being improved and brought into a proper relationship of subordination to and coordination with federal regulation, there ought to be changes made in the organization of the Interstate Commerce Commission which will better fit it for the performance of its added duties. I personally would favor increasing the salaries of its members and having them appointed for life. Their duties are as important as those of any other officers of the government, and their positions should be made such that they will be attractive to the ablest men in the country and that the incumbents will be immune from political and all other improper influences. When these and other changes have been made which will strengthen the commission and increase its independence, I believe it would be both safe and desirable to increase its powers in several directions. If there is to be regulation of operation this should be done by the Interstate Commerce Commission. If there is to be regulation of the issuance of railway securities, as there already is in some of the states, the necessary authority, with proper restrictions, should be delegated to the Interstate Commerce Commission.

I. C. C. SHOULD HAVE POWER TO RAISE AS WELL AS TO LOWER RATES

At the same time the commission should be empowered to raise rates which it regards as too low, as well as to reduce rates which it thinks are too high; and this power should apply to state rates when the commission regards them either as unremunerative or as working an unfair discrimination against interstate commerce. The commission is now greatly hampered in its regulation of rates by the fact that the law authorizes it to fix maximum rates, but gives it no power to fix minimum rates. The law requires it to make rates reasonable, but gives it no power to make them reasonable if the defect in them happens to be that they are unreasonably low.

Our policy of regulation has thus far been one-sided. It has been tacitly predicated upon the assumption that its sole purpose should be to protect the rights and promote the interests of those who use the service of railways and who work for them. It has too often ignored the fact that those who invest in railway securities are also a class of our citizens possessing exactly an equal claim to have their rights protected and their interests promoted by the government. What is even more serious and important, those who have been responsible for our policy of regulation too often have not recognized the fact that the interests of the patrons of the railways and their employees will suffer if the rights and interests of the investors in them are not protected and promoted. It is only by the investment of adequate additional capital in railways that their facilities may be sufficiently improved and expanded. Furthermore, it is only by the investment of additional capital in the railways that there will be created an increased demand for labor on them; and the increase in the employment they afford will be in proportion to the increase in the investment in them. Therefore the only policy of regulation of railways which will confer the maximum benefits practicable on each class that is directly interested and on the public as a whole will be one which will equally consider the rights and interests of the traveler, the shipper, the employee and the investor.

STEEL GONDOLAS FOR THE RUSSIAN GOVERNMENT

Included in the car equipment, orders for which have recently been placed in this country by the Russian Imperial Government, are 5,000 steel gondola cars for general service, which are now being built at the McKees Rocks (Pa.) plant of the Pressed Steel Car Company. The design of these cars was prepared by the builders, and aside from the couplers and buffers, which are of the type generally used in Europe, and are the Russian standard, it follows very closely a similar design built for service on American railways. The car is 8 ft. 11 in. high from top of rail to top of sides, and has a length of 44 ft. 4½ in. over the buffers. The rated carrying capacity is 50 metric tons, about 110,000 lb., and the light weight about 46,000 lb. One of the requirements is that the car must stand a test load of 75 metric tons uniformly distributed without permanent set, a requirement which the completed car has satisfactorily met.

The bodies are 40 ft. long by 9 ft. 6¾ in. wide by 4 ft. 4 in. high inside. Drop doors are provided in the floor on both sides throughout the length, making the car about 99 per cent self-clearing when loaded with coal or similar material. The doors are operated by the Pressed Steel Car Company's creeping shaft device, and rest directly on the shafts when in the closed position. The chains, which wind on drums, are only employed for lifting the doors and to hold the shaft in place under them when in the closed position, stops being provided to engage both sides of each door when they are dropped. The ends are made of 2¼-in. planks, reinforced all around with 2½-in. by 2½-in. by ¼-in. angles bolted to them. They are secured with links at the end sill in such a manner that they may be dropped into the car when not required, thus facilitating the transportation of long materials.

The center sill construction is continuous from end sill to end sill, and consists of two 5/16-in. bent plates riveted to a 4-in. rolled tee at the top and each reinforced at the bottom with a 3½-in. by 3½-in. angle. Malleable iron center braces are provided at the bolsters and pressed steel braces at the cross ties. The end sills are ¾-in. pressed steel, reinforced with pressed channels extending between the side sills and center sills. They are braced at the rear of the buffers with pressed channels, which transmit the major portion of the buffing shock to the center sills. The bolsters and cross ties are pressed diaphragms reinforced with plates and angles.

The sides are ¼-in. steel plates in three sections, supported by seven pressed steel side stakes located at the bolsters and cross ties. They are reinforced at the top with 4-in. rolled steel bulb angles extending the full length of the car. Near the bottom the side sheets are sloped in at an angle of about 60 deg.; the lower edges are flanged outward, and rest on the end sills, bolsters and cross ties, to which they are riveted. The bottom of the flanges are flush with the lower side of the cover plates on the bolsters and cross ties, thus permitting the doors to be tightly closed all around.

The drop doors, of which there are eight on each side, are made of ¼-in. steel flanged on all sides, and supported on three forged hinge straps which are pin connected to malleable iron hinge butts riveted to the center sills. Besides the hinge straps, there are two 2½-in. by 2½-in. by 3/16-in. angle stiffeners extending crosswise of the car and one 3-in. rolled Z-bar extending lengthwise of the car, near the outside, on each door. The door stops are placed to secure a discharge opening about two feet deep between the trucks, but due to the large diameter of the wheels, the openings over the trucks are somewhat less.

The Russian Westinghouse air brake equipment with 10-in. cylinders is being applied. Although it is generally similar, it differs somewhat in detail from the freight car equipment used in this country. The foundation brake rigging closely follows the standard practice in this country, but involves the use of a tension spring to insure proper release of the brake shoes. The couplings are the hook and link type, each made up of nine drop forgings of special heat-treated steel. The finished coup-

ling is required to withstand a test load of 30 tons without permanent set. The side buffers are Russian standard, except that coil springs have been used in place of volute.

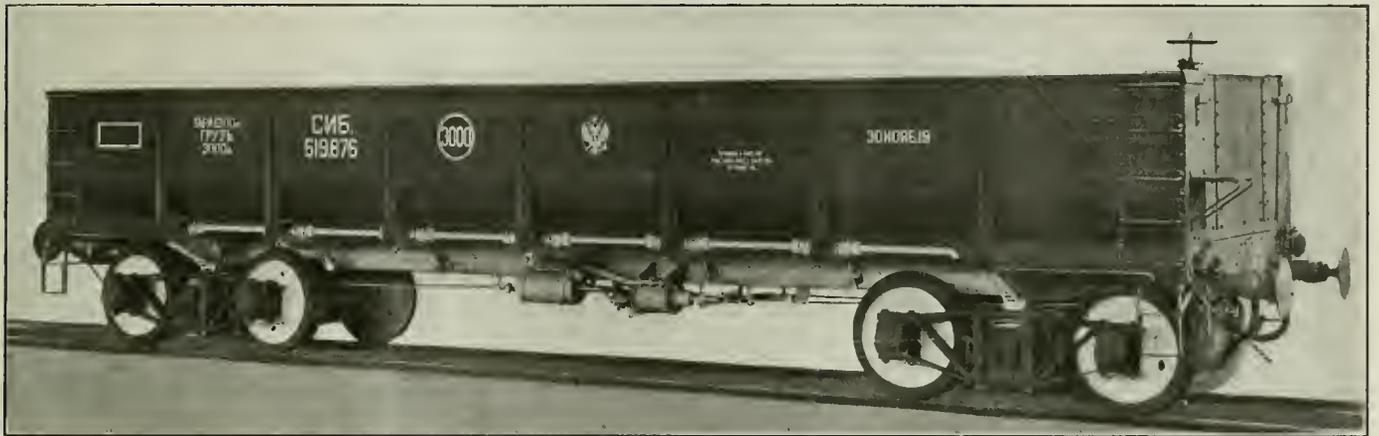

The trucks are of the arch bar type, having a 6-ft. 3-in. wheel base, and follow the lines of the M. C. B. standard construction, though somewhat larger, due to the use of 41 5/16-in. wheels and 5-ft. gage. They have bolsters of the pressed steel bath tub type with cast steel center plates of M. C. B. contour and adjustable malleable iron side bearings. The journal boxes are malleable iron of M. C. B. type, with drop forged wedges. The arch bars are 6-in. by 1 1/4-in. open hearth steel, and the tie bars are 5-in. by 5/8-in. They are secured to cast steel column posts with 1 3/4-in. bolts, and to the journal boxes with 1 1/4-in. bolts. The wheels are rolled steel with flange and tread of the Russian standard, which differs only slightly from the M. C. B. standard contour. They are being manufactured by the Carnegie Steel Company, and weigh nearly 1,200 lb. each. The axles are of steel with journals, collars and dust-guard fits the same as the standard M. C. B. axle for 100,000-lb. capacity

The settlement in June was thought to be final, but because of a certain amount of unrest negotiations were again begun with the result that, effective October 23, the bonus paid under the February and June agreements has been revised as follows:

	Present bonus	Revised bonus
	per week	
Employees 18 years of age and upwards whose standard rate of wage is 30s. per week or more.....	2s.	5s.
Employees 18 years of age and upwards whose standard rate of wage is under 30s. per week.....	3s.	5s.
Employees under 18 years of age, except boys engaged since January 1, 1915, at rates of wages which exceed by 2s. 6d. or more the rates usually paid to boys occupying positions similar to those in which such newly-engaged boys are working.....	1s. 6d.	2s. 6d.

The arrangement is on the flat rate basis and differs in that respect from the previous settlements, which provided for larger bonuses to the lower rated men.

The revised arrangement is to remain in force until notice shall have been received by the railways from the government discontinuing the present control agreement whereby the rail-

Russian Government Steel Gondola of 110,000-lb. Capacity

cars. Except for the increase in length because of the wider gage, the principle difference is in the wheel fit. Instead of the collar, which forms a shoulder back of the wheel hub, the axle is reduced in diameter at this point below the diameter of the wheel fit.

After being built, the cars are knocked down, packed and shipped to New York, going by water from that port to Vladivostok, via the Panama canal. At Vladivostok they will be assembled and placed in service.

ENGLISH RAILWAY MEN'S WAR BONUS

The general managers of the English railways have recently come to an agreement—the third—with their employees “engaged in the manipulation of traffic,” whereby there will be a further increase in the war bonus amounting to \$15,000,000 or \$20,000,000 yearly for the remainder of the war. It will be remembered that last February (*Railway Age Gazette*, March 12, 1915, page 447) the English railways made an adjustment with the National Union of Railway Men and the Associated Societies of Locomotive Engineers and Firemen calling for an increase in wages or a bonus to compensate for the increased expenses arising from the war. The amount was fixed at 3s. (75 cents) a week to employees 18 years of age and older embraced in the “conciliation scheme” whose regular rate of wages was under 30s. (\$7.50) per week and 2s. (50 cents) to employees who received 30s. or more. This arrangement was effective February 15, but there was a clause providing that the adjustment might be reviewed at the end of three months. In June, accordingly, the matter was again taken up and the continuance of the bonus on the same basis was agreed to, subject to the extension to boys of an allowance of 1s. 6d. a week.

ways are being operated for the nation by a committee of general managers. It shall thereafter be subject to discontinuance by one month's notice on either side, it being provided that thereupon the “conciliation scheme” will again be put in operation. It is hoped that this adjustment will be final, the two unions having undertaken “that during the pendency of this agreement they will not present to the railway companies any fresh demands for increased bonus or wages or general alterations in conditions of service, and that they will not give countenance or support either to a demand on the part of any of their members to reopen the settlement now made or to any strike that might be entered upon in furtherance of such demands.”

As in the former case the railways will probably extend the bonus to employees not in the “conciliation scheme.” The estimated cost of the bonus hitherto paid to the entire staff was about \$20,000,000 yearly. The increased bonus will bring this up to from \$35,000,000 to \$40,000,000 yearly.

ENGLISH RAILWAY MEN AS MUNITIONS EXPERTS.—Three of the principal officers of the North-Eastern Railway of England are now engaged at the ministry of munitions. E. C. Geddes, deputy general manager, and lieutenant-colonel in the railway and engineer staff corps, is one of Lloyd George's principal assistants; temporary lieutenant-colonel R. L. Wedgewood, chief goods and traffic manager, lately acting as deputy director of railway transport in France, has been recalled to an appointment in the munitions department; and Vincent L. Raven, chief mechanical engineer, has been appointed acting chief superintendent of ordnance factories at Woolwich. Mr. Geddes served in the operating department of the Baltimore & Ohio from 1890 to 1895 and later served for a number of years in India. Mr. Raven has been chief mechanical superintendent since 1910.

HENRY U. MUDGE

Henry U. Mudge, president and chief executive officer of the Chicago, Rock Island & Pacific, resigned on November 5, and is to be elected president of the Denver & Rio Grande, with office in Denver, Colo., succeeding Arthur Coppell, of New York, who was elected president temporarily on November 4, in place of B. F. Bush. Mr. Mudge was expected to be elected at the meeting last week, but it was found to be necessary first to elect him a director.

Mr. Mudge has been connected with the Rock Island since May 1, 1905, when he became second vice-president in charge of operation. He was elected president on December 1, 1909. He was appointed co-receiver of the property on April 19, but resigned that position on September 28, and was immediately appointed chief executive officer at the request of Receiver Dickinson that he remain in charge of the operation of the road.

As explained in a statement issued by Mr. Copell after the meeting last week the directors of the Denver & Rio Grande have decided that the best interests of the property will be served by having a president who can be located in Colorado and who has no connection with other roads. Recently the president of the Denver & Rio Grande has held the same office on the Missouri Pacific, the Iron Mountain and the Western Pacific. It is understood that a compromise has been arranged with the holders of the Western Pacific bonds, the interest of which was guaranteed by the Denver & Rio Grande, which will relieve that road of a part of its liability and make possible a reorganization of the Western Pacific.

Before going to the Rock Island most of Mr. Mudge's railroad experience had been with the Atchison, Topeka & Santa Fe, on which he started at the age of 16 as section hand and water boy on construction work, and which he left in 1905 as general manager.

In taking charge of the operation of the Denver & Rio Grande, Mr. Mudge, therefore, will be returning to a territory with which he has been familiar throughout his career, and in which he was particularly engaged for many years as superintendent of the Rio Grande and Western division and later as general superintendent of the Western grand division of the Santa Fe.

While working in the construction gang he learned telegraphy and soon became an operator. By hard, conscientious work and painstaking mastery of details successive promotions came rapidly, but naturally, and without any spectacular jumps, so that when Mr. Mudge became a general officer he had had a thorough experience in every branch of the operating department, in the telegraph office, in the train service, at the dispatcher's desk, and as roadmaster, trainmaster, assistant superintendent and superintendent.

Mr. Mudge to an unusual degree has always been popular with and possessed the confidence and respect of his subordinates, and as a president his democratic manners, his fairness and practical common sense, and his open and above-board methods of doing business have made him especially popular with his subordinates and associates in the railroad field and with the patrons of the road. Newspaper men have always liked Mr. Mudge because there has never been any difficulty in obtaining from him a candid and fair statement of any situation that figured in the news of the road, and because he has usually been willing to give the news when it is news and without waiting for the disentangling of official red tape.

Whatever may be said in criticism of the Rock Island's financial transactions can by no means be applied to its retiring

president. It is rather on the Rock Island's record for operation, under the conditions it has had to face, that he is to be judged. As Receiver Dickinson pointed out in a statement to the public following Mr. Mudge's resignation as receiver, "it should be understood that there was a marked differentiation between him and most of the other directors, in that the transaction for which he voted as a director was presented and acted upon at a meeting at which he was elected a director, and immediately upon his election, and also in that he was not a stockholder either of the Rock Island Company of New Jersey or the Chicago, Rock Island & Pacific Railroad Company of Iowa." The syndicate purchase of the Rock Island, the reorganization of its board and the organization of the two holding companies took place in 1901 and 1902, and the purchase of the Frisco and Alton stock in 1903, all while Mr. Mudge was general manager of the Santa Fe, and in no way connected with the Rock Island while the other financial transactions criticized by the Interstate Commerce Commission were either accomplished before he went to the road, or before he became a director, with the exception of the sale of the

Henry U. Mudge

Frisco stock, to which Receiver Dickinson referred in the statement.

Mr. Mudge was born on June 9, 1856, at Minden, Mich., and was educated in the common schools. He entered railway service in 1872 as a section hand and water boy with the Atchison, Topeka & Santa Fe, and soon became telegraph operator. He later held various positions in the operating department until July, 1889, when he was appointed superintendent, and in May, 1893, became general superintendent of the Western grand division and then of the Eastern grand division of the same road. From February 1, 1896, to January 1, 1900, he was general superintendent of the reorganized property. On January 1, 1900, he was appointed general manager of the same road, and on May 1, 1905, left to become second vice-president of the Chicago, Rock Island & Pacific. During the past year he has been president of the American Railway Association.

Selling Railway Supplies to European Countries

Our Manufacturers Must Germanize Their Foreign Sales
Methods and Observe a Broad Spirit of Square Dealing

By WALTER S. HIATT
Our Special European Correspondent

The United States has at last become the creditor of Europe. A precedence in international business has been thrust upon us and at last we have our great chance. How shall we use it?

Europe must obtain from us not only war munitions and supplies, food and clothes, but also the necessities of reconstruction, for it is not too much to say that the reconstruction period has already begun. Despite the secrecy maintained about such matters now, it is known that at least \$10,000,000 worth of railway supply contracts has already been awarded in France alone, and it is certain that during the next two years the manufacturers of American railway materials of every description will find in Europe an ever-extending market for their products. Owing to the wear and destruction of railway material resulting from the war, American manufacturers will be called upon to do a large part in rebuilding the European railways and in re-equipping them with freight and passenger cars and locomotives.

rich at once, or to do a billion-dollar business. They must not take the attitude that Europe will trade willy-nilly, for thereby they will curtail their orders and will kill off the future business that may come long after the war is over, since Europe will even have to rebuild her machine shops, buy new tools and new machinery for the making of the ultimate product.

The American must understand that Europe would rather not buy from us, and we can't blame the Europeans. The American must understand that we are looked upon as neutrals who are enriching themselves at the expense of the misfortunes of others. This feeling is just as strong in Germany as it is among the allied nations. In Italy, when you tell people you are an American, they turn up their noses, so to speak, and ask why we don't come over and help whip the terrible Austro-Germans. In Germany they say to you: "We've always been friends, we've traded together for many years, we are almost blood allies, and yet you

Women Turning Out Shells in Short-Handed Factories in France Where Machinery of Peace Was Once Made

While every factory in Europe is occupied in turning out war munitions, and every man is either at the front or busy behind the lines in the factories making cartridges, bombs, shells, cannon, there is little energy available for the work of peace. This does not apply to France alone, although in that country for nearly a year railway supply factories and even the railroad shops have been occupied with war work, and now every factory possible is turning out aeroplanes, shells, ammunition or cannon. This condition applies also to Germany, where for at least a year every factory in the empire has been busy along the same lines and in a greater degree. It applies to Russia, where the factories and shops have always been comparatively few. It applies to Austria, and to a large degree in England, where 500 factories of all kinds are working overtime to turn out war material.

But while Europe *must* buy machine products from the United States, our manufacturers will not profit to the full from this opportunity if they do not observe a few sane rules. They must learn to do business in Europe's way. They must study tariffs and ocean freights. They must not use the opportunity to turn out poor and imperfect material. They must overcome the prejudices that naturally arise between people who are not accustomed to do business together. They must not expect to get

Americans in order to make some money desert us and go over to the Allies."

In France people are more polite about it. They don't say anything at all. Recently I was walking through a hospital train with Herbert Corey, the newspaper correspondent and humorist. All the soldier hospital men were quite courteous and smiling, despite their private griefs. "You don't have to guess twice to know what these fellows *think* of us," said Mr. Corey. "They think we should have a gun in our hands pointed at the Germans. And the worst of it is, that's what every German *said* when I was over the frontier."

To get down to business details, the American firm that wants to sell in Europe has a lot of other prejudices to overcome. First of all, it must learn how to write a business letter in the European way. Then it must learn that an agent right on the spot is the only medium of getting business, that one country is enough for the agent to conquer at a time, and this agent should speak the language of the country, that he should learn the country's ways, and should learn to do business without intermediaries, crooked or otherwise. Of course, this agent should be an American who thoroughly knows his own firm, its products, and those of its competitors. Further, this agent should be fully

accredited, should have European bank references to inspire confidence in him and in his firm's ability to keep a contract honestly.

DEALING WITH GO-BETWEENS

A book might be written on the question of intermediaries alone. So far we have looked too much on the amusing side of this question. Much of the harassing part of war sales has come through experiences with these intermediaries. Not representing anything or anybody, their main object in life is to get some quick money. The quickest way they know of is to find what concern is about to be awarded a contract, to get this information a week or so ahead of anybody else, and then inform the concern's representative on the ground that he will get the contract if he will agree to pay a commission to the intermediary, who generally claims he must divide it with the firm, railroad company or government awarding the contract. If there is no agent on the ground the intermediary cables the firm direct.

What is the firm or agent to do? A lot of honest time and money has been spent trying to get that contract. Generally the intermediary is given the benefit of the doubt and gets the commission. I will not say that he does not sometimes or often divide it with the agent of the purchaser. It is a common practice all over Europe, for instance, to make presents at Christmas or New Year's, or on other occasions, to buyers. But in the case of railroad purchases, which are made by the chief of a department, as sanctioned by the president of the road, it is hard to believe that these men would accept this sort of money. The first purpose of these men must be to make purchases that will be a credit to the road, that will stand up under long wear, and if the material is faulty both the buying engineer and the selling firm are injured in reputation.

The experience of the American agents I have talked to varies. One man selling artificial limbs on large orders made up his mind when he came not to promise a cent of commission to anybody, and he has gathered all the business he can handle. Another man, representing a group of New England firms, after six months of feeling his way has come to the conclusion that it is best to smooth the way by presents to the smaller fellows and commissions to the more important ones. He claims that otherwise the selling agent is merely listened to politely, given a hearing but not the order, that the buyers do not look on such commissions as plain graft but as payment for a service rendered the seller in getting a contract.

There is another side to the question of doing business through an intermediary, particularly when the latter is not an employee of the government or company making the purchase, but rather merely a person with friends at court. He may lose a good contract for a selling agent. He is generally a native of the country where the business is being done and he is pretty well known. If he openly introduces an agent to the buying engineer, for instance, that engineer may at once be prejudiced against the agent. Further, the buyer realizes that this hanger-on is known to others and that if the contract is closed he, as buyer, will get the credit of having been involved in a shady transaction.

WHEN GO-BETWEENS INJURE A SELLER

It was because of these under-the-table deals, manoeuvred by dishonest and unscrupulous natives of European nations at war, that each of these governments has finally been forced to jail some of its buying agents, that in England the native manufacturers are now only allowed a profit of 10 per cent on their output of government supplies, that in Russia, the home of honest graft, some of them have been shot, and that France, which originally sent a commission to New York to do its buying, finally placed all its contracts in the hands of J. P. Morgan & Co.

I know of one very fine American, honest as the day is long, who has been trying since last spring to sell a certain badly needed product in Europe and on very advantageous terms of credit to the buyer. Not speaking any foreign language, in the beginning he took into his confidence a certain group of intermediaries who had established offices in one of the big European cities where they were trying to sell war and other materials

of all kinds. This good American located his offices with this group, and to date he has done very little business and will probably never do much. He is in bad company, and in so deep he cannot get out. The little business he has done has been so shared that his profit will be next to nothing. He will probably go home at last believing that all European business men are dishonest and that he failed to do a reasonable business because he did not offer their price.

Every American consul, every one of Uncle Sam's commercial agents from the Department of Commerce and every American business man one meets in Europe has a stock of incidents to tell about these intermediaries. A member of one Chicago firm spent three months in Europe trying to sell his product. When he was about to give up in disgust his home office cabled him that a large order had just been placed through another agent. This other agent proved to be a pharmacist who, learning of the contract, had taken the firm's name at random out of a directory, cabled for its prices, and on the basis of it submitted a bid.

Another American agent wanted to sell a certain line to the Belgian army. As he had a German name, his bid was rejected. However, a French grocer, having put in a bid, was awarded the contract, which he turned over to the man with the German name. Incidentally, he got a higher price.

SELLING OF RAILWAY MATERIAL

Of course, many of these incidents relate to army supplies, the selling of which can hardly be called business. In selling machinery and railway supplies a different class of men is met. The buyer knows exactly what he wants, though he is not so sure about the price, since the new elements of high ocean freights and inflated war prices have entered into the sales. For instance, an American agent for car axles heard that a certain Italian railway was in a hurry to place a large order, but desired advance samples. As he had no samples with him, he picked up one of French manufacture that corresponded to that made by his firm, packed it and labelled it as a transoceanic shipment from Havre, and sent it on to Italy. He received a polite reply from the Italian company stating that when he was ready to submit an American sample his bid would be considered. The Italian buyer had at once recognized the axle's make.

This American agent was acting in good faith, and would have delivered an axle up to specifications, but such methods are discrediting. Indeed, the American agent is at present in a difficult position. His only competitors worth considering are the English, and the English have had scores of years of Continental selling experience, while the American is only learning. Then, the American is an unknown factor to the European buyer. The latter probably has never been in America, he doesn't know our reliable firms, and he doesn't understand American terms, except in such simple materials as car wheels or axles. The very rapidity with which the American agent is willing to do business; his push, bordering on bluff; his evident intention to do business in spite of every obstacle, tends to bewilder the European when it does not arouse his suspicion.

If the American hastily concludes that because one Italian or one Frenchman is willing to take money, all the high officers of a railway are dishonest, it is not unreasonable to suppose that these same high officials entertain their doubts of the American. Neither knows the ways of the other, but he establishes in his own mind an opinion as to the kind of a person with whom he is doing business. Neither has yet learned that, as a general rule, the high officials of a factory or of a railroad on either side of the water are probably men of sterling character and of absolute integrity. I personally have found that there is nowhere on earth a better type of business man than the high-grade Spaniard, Englishman, Frenchman or German. It may take some time to discover this man, just as it would for a foreigner to discover such men among us, but once you find him you can depend on him.

While this article is being written the French railways are concluding arrangements to make large purchases of material in

the United States. Notwithstanding that there are a few American railway supply men in France, the buying agents of these roads are bewildered. They do not know where to go to place their bids and do not know what American firms can be relied on to keep their contracts. In one case, the officers of a road, knowing the *Railway Age Gazette* as a standard publication, took a list of names from among its advertisers and asked these firms to submit bids. Then they asked all the American railway men with which they were acquainted to give them impartial advice on the reliability of the firms, and yet these were firms that are supposed to have an international reputation.

Of course, the contracts are being made on a cash delivery basis, with each party putting up five per cent of the value of the contract in money as a guarantee; but what the Frenchmen wanted they wanted in a hurry. They wanted to be sure of having deliveries on time and in good order. This difficulty of getting together on the same plane is one of the chief things American agents must overcome, and only time and fair dealing will do it. These conditions are a combination of inertia, lack of information, and a grain of suspicion. Take the case of sales of American coal abroad this winter. France, Italy, Spain, perhaps Switzerland, must wind up by buying our coal. Yet they are putting it off as long as possible, meanwhile using up their old stocks. Some are securing small quantities from England in the meantime, simply because they know how to do business with England and know English coal in English terms. Aside from the question of price, into this coal selling enters an equation that arises in the sale of any material or product. The French have become used to briquette coal; that is, coal delivered to the consumer, not loose, but in small blocks, and it is natural that this coal is preferred to loose coal, although the latter is cheaper.

OVERCOMING FOREIGN PREJUDICES

The business of selling seems to be merely a matter of price agreements, with one party able to pay and the other able to deliver. Yet as many elements enter into this business as in the manufacture of a highly specialized article. I went into the subject of American sales with the director of one of the French railways, a man whose position corresponds to that of a general manager with plenary powers in the United States. He pointed out many reasons why the French, at least, should be able to trade with Americans, one of which is the similarity of national temperament. The average American and the average Frenchman, he said, were cordial in manner, rather talkative, frequently permitting sentiment to enter into a business transaction, as opposed to the strict aloofness of the Englishman and the heaviness of the German.

So at once it is seen that personality enters into a business agreement. Analyze personality and you will find its relationship to politeness and the manner of presenting a proposition. The personality of the Frenchman forms one of the chief difficulties of selling to him. His personality prevents him from buying an article that everybody else has or that pleases all others. If he has never fully acquired a liking for moving pictures, chewing gum, or the telephone to the same extent as other nations, the explanation is found in his personality. Possibly this is why he would rather repair an old locomotive than buy a new one. If he buys an automobile, he wants it built to suit his individual taste, and the same factor enters into his purchase of a steel rail or a crane or a car. Given this matter of personality, consider also that French machine models are different in detail from American makes, and some of the difficulties of selling are understood.

Of course, the war and the need of immediate deliveries have modified the conditions and standards of normal times. The war brings in new conditions. For instance, one large order for freight cars made this August was contracted for delivery at some French port. In a second and larger order from an American firm it was stipulated that the cars not only be delivered at some French port, but that labor be furnished to put the parts together and set up the cars ready for use on the tracks.

This condition was made partly because of the scarcity of French labor and partly because Frenchmen, being unused to the cars, might find difficulty in setting them up.

Of the large contracts already awarded in France for railway material some went to English firms despite the evident desire of the French to buy in America and their need of using advantageously their part of the recent Anglo-French loan. The American firms that went without the business failed partly because of their lack of information as to how to get it. Of course, with ocean freights four times as high as in peace times, and with the United States criminally lacking in her own ships, a big difficulty at once confronted every American firm after this business. Some of the firms lost the business because they sought it by mail, because they did not have the right kind of agents on the ground, or because they did not co-operate with their agents. If Europe knows little of us, we do not know much more about her ways. Some firms, for instance, submitted bids in English and sent their letters under a two-cent or a four-cent stamp, neglectful of the fact that foreign letters carry foreign postage. This last may be due to the ignorance of a stenographer, but it is a detail that no European firm would overlook. I saw some dozens of such letters thrown into the waste-basket.

GIVE YOUR AGENT A HELPING HAND

Occasionally agents sent over to get business are not given proper bank references, and frequently are not furnished with funds to keep them for the months they must be on the job. I have heard many stories from both Europeans and from Americans long established in Europe about the failure of American firms to get business.

I think one reason is that the American does not mix enough with the people of the country, he does not attempt to make serious acquaintances and friendships among them so he can learn their habits of thought. Instead, like the English, he sticks too much to other Americans and hence goes around in a worn little circle that is not in contact with the ways of the country.

Sometimes the failure to get business is the fault of the agent who succumbs for a few weeks after his arrival to the night life of the big cities. He suffers a relapse after this period of fast living, becomes homesick, lonesome, neglects his opportunities, and then goes home declaring it is impossible to do business with foreigners.

Sometimes the failure comes because the firm at home does not hold up its end. Now that the war is on, letters and cables are apt to go astray, and a lost message may be very important to the man on the ground, though it may seem of little consequence to the man in the office at home. Business people in Europe, in peace time as well as war time, make a practice of duplicating their letters and often of repeating their cables so that one or the other will be sure to arrive at its destination. They number each letter, they also confirm any previous letter received or sent so that their correspondent will know in just what state the correspondence stands. The larger houses number their cables as well. A neglect of these details discourages and disgusts the agent and results in confusion, misunderstanding and failure to get business.

Firms that wish to do a permanent European business would do well to study the methods of the International Harvester Company, which has done a handsome business here for a number of years in agricultural implements. It has an American as a head sales agent, who in turn employs traveling men native to the country who deal directly with the buyer. Another good example of such successful methods is found in the case of the American typewriter manufacturers, who have been established in Europe for the past dozen years, and have competed with French machines despite the maximum tariff on American manufactures.

The manufacturer who is told that there is no business in Europe for him might consider the success of an American laundry machine man. This man came to Europe for pleasure some years ago and discovered that at his hotel he could not get

his laundry back overnight, as in an American hotel. He traveled about for a time, talking to hotel men, studying European laundry methods, and finally set his agents to work and established a line for which there was apparently no demand and against which there were many prejudices. I recently saw some of his machinery doing the laundry work for the passenger and sleeping cars of one of France's railroads.

I have noted but one important American railway supply company properly established on the continent. While it has offices in London, as have several other such companies, its officers understand that London is as far away from the continent for business purposes as is Chicago from New York. Nearly a year ago it foresaw the war and the reconstruction business and sent over a trusted American representative to open offices and begin to lay the groundwork for contracts. This firm backs up its agent in every detail. This agent takes small orders, waits for the big ones, and the result is that he is getting more business than he expected and in the long run will have a near-monopoly of American contracts in his line. Will his competitors wonder why?

It is the failing of Americans to wish to give good advice, to tell the other fellow how best to run his business. Recently a writer in a financial publication, after some European observation, advanced the opinion that America would be called upon to reconstruct the peace machinery of Belgium and France, but that the sales would end after a few years because of the after-the-war competition and the low wages that would prevail because of the poverty, and the consequent low cost of production. This writer neglected the very patent reconstruction needs of Germany, of Russia and of other countries. His reasoning seems hardly in keeping with many facts. But accepting it, these few years of business will mount into hundreds of millions of sales.

If the manufacturers and the business men of the United States would profit fully from their situation as representatives of the most fortunate of peoples, if they would distance the growing war-fed prosperity of England, and if they would now lay the foundation for the after-the-war prosperity and activity of Europe, they must really build their own ships, they must further educate themselves internationally and they must lay aside loose talk about Europe going flat broke after the war, for it won't, not even Germany. In short, they must Germanize their foreign sales methods. And with all this, they must retain their fine spirit of charity and helpfulness, of square dealing, of giving the other fellow a chance to make an honest penny, which the Germans would not.

While too many Americans, like too many Frenchmen, Russians, Englishmen, Hollanders, Norwegians, Swiss have sought to squeeze every cent of profit out of war sales, to get rich through the sorrows and burdens of distracted Europe, some Americans have sold as honestly as they could. One American automobile firm has all through the war given automobiles on request to transport the wounded, and this fact is now widely known. Is this not a fine business asset?

MOVING MEXICAN TROOPS BY RAILROAD

A movement which was unique in the history of American railroading took place on October 28 and 30 when the Texas lines of the Southern Pacific and the El Paso & Southwestern were called upon to handle a body of federal Mexican troops from the boundary line at Eagle Pass, Texas, through the United States to Douglas, Arizona, where the troops were needed by the Carranza forces to oppose an expected attack by the army under General Villa on the border city of Agua Prieta.

The troops were moved in eight trains, two freight and six passenger. There were 5,199 Mexicans, with an escort of 259 United States troops.

The equipment required consisted of 8 baggage, 79 coaches, 8 tourist, 29 box, 2 flat, 26 stock cars and 1 armored car.

While notice of the movement was rather short, and came at a time when there was a heavy excursion business, as well as

movements of United States troops in the same territory, the entire equipment was furnished and assembled by the Southern Pacific without delay, many of the coaches being handled a distance of 738 miles to the loading point. Eagle Pass, the border point at which the movement originated, is located on a branch line 378 miles from Houston, where the general headquarters of the Southern Pacific (Sunset-Central lines) are maintained, and 169 miles from the headquarters of the division. The distance did not, however, hamper the railroad officials in the prompt and efficient handling of this movement, the eight trains being made up, loaded and moved out between 6:30 p. m., October 28, and 2:05 p. m., October 30. The last train reached Douglas at 3:30 a. m., November 1.

An interesting phase of the movement is the location of the lines of these roads, which for several hundred miles border on Mexican territory under the control of General Villa. While it was the intention of the government and the railroad officials that the prospective movement be given no publicity, a newspaper despatch from Eagle Pass gave advance notice, and it was rumored that attempts would be made by Villa sympathizers to cross the border and interrupt the movement by dynamiting bridges or wrecking the trains. This contingency was provided against by thorough patrolling of the tracks by United States troops, and the entire eight trains went through without interruption.

BUELL'S CAB SIGNAL AND AUTOMATIC TRAIN STOP

The cab signal and automatic stop system of J. W. Buell, which has undergone tests on a passenger locomotive of the Cincinnati, New Orleans & Texas Pacific for many months, has proved so satisfactory in its operation that the proprietor has offered it to the Interstate Commerce Commission for test by the engineers of the commission. He reports that in some hundreds of tests of the distinctive features of the system, there has been no failure except on the side of safety. These tests have not included application of the brakes, but in every case the brake-applying valve has been opened and air exhausted, the same as would be the case in regular service, the exhaust being from the main reservoir instead of from the equalizing reservoir as in actual operation. Neither have the tests included track relays, the aim being to get a large number of operations, which, under ordinary conditions would not be possible, the road being clear, usually, for the express trains on which the tests were made.

This system operates by means of an electric circuit from a battery in the cab, through the wheels of the locomotive and the rails of the track, the front truck of the locomotive being insulated from the main frame. With this arrangement this circuit is normally closed through that part of the track which for the time being lies between the rear truck wheel and the front driving wheel; and the electro-magnet in the circuit holds the air valve closed. Application of the brakes is effected by opening (or weakening) the electric circuit, which can be done at any pair of rail joints (opposite each other) by the use of the ordinary insulation.

The latest tests have been made on locomotive No. 804, which runs between Ludlow, Ky., and Danville, on trains 11 and 12. At a half dozen distant signals, track joints have been arranged to cause the operation of the engine mechanism; the roadside apparatus being set against the train whenever tests are to be made.

The insulation between the engine and its truck consists of vulcanized fiber, $\frac{1}{8}$ in. thick. The piece of fiber is made cup shape and is fitted into the lower center casting. Above this is a steel cup of the same shape, and the edges of the fiber project 3 in. above the metal rim, this to prevent foreign metallic substances from making a short circuit. The centerpin is surrounded for its whole length by a hard fiber thimble.

The circuits are illustrated in Fig. 2. The battery, 6, ener-

gizes four parallel circuits, *A*, *B*, *C*, and *D*. Circuit *A*, energizing coil 7, is called the control circuit. From the positive side of the battery 6+ it runs through wire *A+* to the front truck of the locomotive, thence to the rails of the track and to the driving wheels and by wire *A3*, as shown by the broken line, to coil 7.

Circuit *B* energizing coil 8, is carried through the normally closed push button *B+*. This circuit also goes around the push button by wires *C3* and *C4* to a circuit breaker, 92, controlled by air pressure. To restore the apparatus after the brakes have been applied, the engineman must open the circuit through coil 8 by depressing the push button; and the circuit breaker, 92, prevents the operation of the button from having any effect until after the air has actually been exhausted.

Circuit *C*, called the working circuit, passes through contacts

When by reason of encountering the insulated joints the current through coil 7 is weakened, that through coil 8 is strengthened by means of the bridge wire *a b*; this causes 8 to attract the armature 12, breaking contacts 9, 10, which opens circuit *C* and de-energizes the valve-holding magnet, which causes the application of the brakes. By the opening of contacts 9, 10, a stronger current is made to flow through circuit *D*, causing the lamps to burn with increased intensity. The resistance of *R'* and of the magnet *VHM* and the lamps is so adjusted that normally the lamps burn at low incandescence. This gives constant

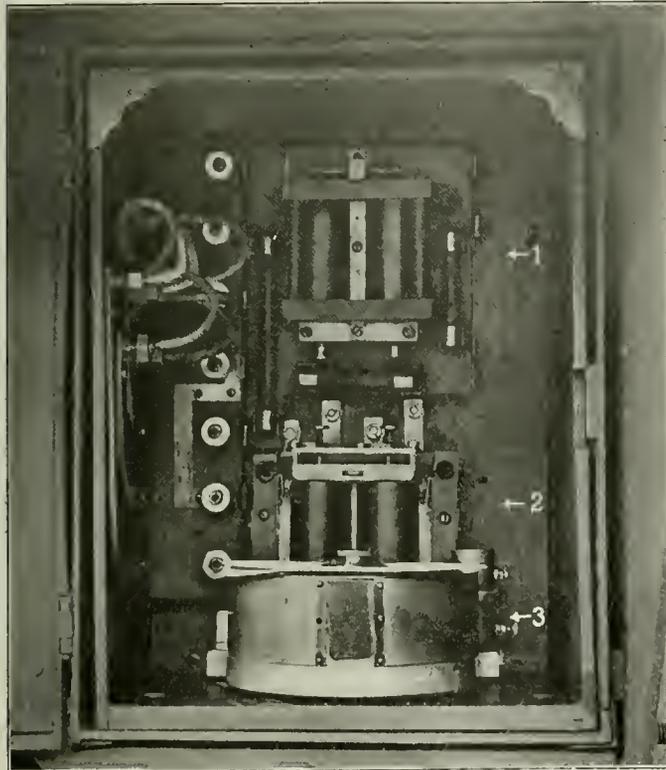

Fig. 1—Buell Cab Signal and Automatic Stop

Note—1, Governing Magnets; 2, Valve-Holding Magnet; 3, Recorder.

9 and 10 of armature 12 and controls the valve holding magnet *VHM*.

Circuit *D* energizes four electric lamps, *L*, arranged in parallel.

As shown in the illustration, the engine is entering the block section which controls track relay *TR*. This relay is energized by the track battery at the far end of the section, so long as the section is clear; and its armature, by closing the contact *k*, prevents the operation of the cab signal and train stop by making a path for the current from the front wheels past the insulated joints *j* and *j'*. If the section which the train is entering is occupied by a preceding train, track relay *TR* will be de-energized, contact *k* will be opened and the passage of the locomotive over the insulated joint in the track will interrupt the current in circuit *A*. For a distant indication relay *TR* would be so connected as to be controlled by the condition of the track circuit next farther in advance.

In the experimental installations the track relay is so wound that its response to the passage of an engine is slow; so that if the road ahead is clear, the engine will not have caused the opening of point *k* before the leading driving wheels have passed the insulated joints.

Each of the two coils, 7 and 8, is wound to the same resistance.

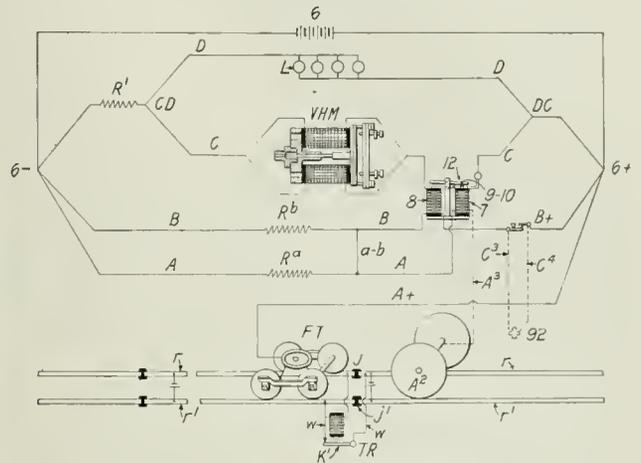

Fig. 2—Circuits of Buell's Cab Signal and Automatic Stop

evidence of the integrity of the circuit. The release of air caused by the operation of *VHM* continues until the engineman opens the circuit at the push button, which de-energizes coil 8 and allows armature 12 to again be attracted by coil 7.

The release of air, applying the brakes, also actuates the recorder which makes a punch mark in a paper disk every time the brakes are applied. The disk is revolved by clockwork, so as to make a record of the time and also, if adjusted for the purpose, a record of the location.

It will be seen that the engine carries only two instruments, the governing magnet, 7, 8, and the valve holding magnet.

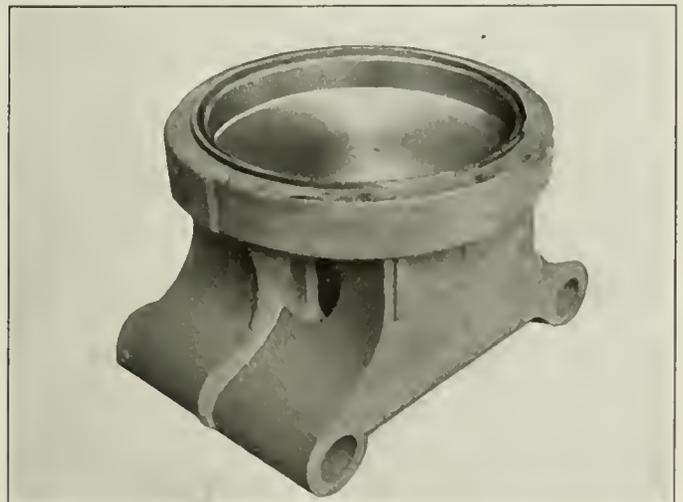

Fig.3—Insulated Center Plate, Front Truck of Locomotive

These are mounted in a box 18 in. x 24 in. x 12 in. (Fig. 1), fixed beneath the cab on the engineman's side.

This apparatus is made by the Buell Signal & Train Control Company, Washington, D. C. It is a development of several years of experiments, and the effects of jar and vibration are said to have been wholly overcome. The cost of equipping a locomotive is given as \$200. Where automatic block signals are in service the roadside equipment will cost but \$10 a block.

FEDERAL LOCOMOTIVE INSPECTION

At the conference between the representatives of the railroads and of the Federal Bureau of Locomotive Boiler Inspection, held in Washington the latter part of last August, the rules for locomotive and tender inspection submitted by the railroads and those submitted by the bureau were discussed and an agreement was reached on all rules except Rules 18, 29, and 31, regarding automatic bell ringers and locomotive headlights, as noted in the *Railway Age Gazette* of September 3, page 426. As a substitute for these rules the committee representing the railroads submitted the following:

"Bells and Bell Ringers.— Each locomotive shall be provided with a bell so arranged and equipped that it may be operated from the engineer's cab."

"Locomotive Headlight.— In order that the engineman shall have sufficient illumination ahead of the engine to allow him to readily perform his duties while operating in and out of passenger terminals and industrial sidings, while switching in yard, and to readily locate whistle posts, yard limit and crossing signs and such other land marks en route, a headlight on a road locomotive shall not at any time during service have apparent beam candlepower less than the following; the readings to be made in a vertical plane 25 ft. ahead of the focal center and referred to points at various stations in the reference plane:

READINGS AT CENTER OF REFERENCE PLANE

Reading point ahead of focal center	Apparent beam candlepower
500 ft.	Not less than 450 cp.
600 ft.	Not less than 400 cp.
700 ft.	Not less than 500 cp.
800 ft.	Not less than 500 cp.
900 ft.	Not less than 500 cp.
1,000 ft.	Not less than 500 cp.

AVERAGE SIDE READINGS (AVERAGE OF READINGS TAKEN AT EACH STATION 20 FT. EACH SIDE OF THE CENTER)

Reading points ahead of focal center	Apparent beam candlepower
50 ft.	Not less than 30 cp.
100 ft.	Not less than 110 cp.
200 ft.	Not less than 225 cp.
300 ft.	Not less than 315 cp.
400 ft.	Not less than 350 cp.

"The above readings are to be considered independent of the location of the headlight, the source and intensity of light, the design of the reflector, etc."

The locomotive headlight rule was based on the report of the committee on Locomotive Headlights of the Master Mechanics' Association, which was abstracted in the *Daily Railway Age Gazette* of June 17, 1914, page 1457.

A hearing was held before the Interstate Commerce Commission on September 28 and 29, concerning the contested rules and in the latter part of October the Special Committee on Relations of Railway Operation to Legislation representing the railroads, filed with the Commission a brief of the arguments against these three contested rules. The brief contained an abstract of the testimony presented at the above-mentioned hearing, bringing out the important features tending to show the inadequacy of these rules. The argument submitted in the brief consists of the following three points: "First, the rule for the inspection of locomotive headlights, filed by the carriers and recommended by the Master Mechanics' Association, is a definite, safe and practical rule, and scientifically adequate for all the purposes and uses of a locomotive headlight. Second, the proposed rule is unsafe and improper. Third, the Boiler Inspection Act of 1911, as amended by the Act of March 1, 1915, imposed no duty and confers no authority upon the Interstate Commerce Commission, other than to approve or to modify rules for the inspection of locomotives and their appurtenance."

Under the first point it is contended by the railroads that the conclusions of the committee of the Master Mechanics' Association, which experimented with locomotive headlights, were based on the practical results of exhaustive tests and that the recommendations were a scientific statement of the conclusion. It was believed practicable to leave the headlight matter to the judgment of the officers of the different roads, but if a general

rule is to be adopted it should, it was contended, be such as will meet the condition of the roads which have completely signaled their lines and which have a dense traffic and multiple tracks, so that the danger claimed to be inherent in the operation of a high-power headlight upon railroads operating under such conditions will not be present.

The greatest objection to the rule proposed by the Bureau of Locomotive Boiler Inspection, it was argued, is that it is indefinite and incapable of being reduced to a specification from which headlights could be made or reproduced. This rule, as it is presented, uses the terms "normal vision," "normal weather conditions." It was pointed out that there is practically no definition of "normal vision" and that "normal weather conditions" would be a variable quantity in different sections of the country, as well as at different altitudes in the same section of the country.

Testimony was presented by Mr. Crittenden, of the Bureau of Standards, to the effect that under the Bureau's rule, in case of a dispute as to whether or not a given headlight complies with the rule, it would be impossible for anybody to settle that dispute, because the rule is not sufficiently definite and does not provide a measurement possible to absolutely determine whether or not a headlight conforms to the rule. When asked in what respect this rule is indefinite, he stated: "It provides that a person with normal vision shall see an object the size of a man at a distance of 1,000 ft. I believe no person could undertake to determine that with certainty, because the distance at which you can see an object depends not merely upon whether it is dark or not, but upon the background against which you see it and upon the general amount of light and the surroundings, and upon the condition of the atmosphere. Moreover, what you mean by normal vision is not definitely established. That is, if we go to an oculist, he tells us we are of normal vision if we can see type of a certain size at a certain distance, but he makes no test whatever of the amount of light which we need in order to see that print. . . . I would naturally expect, therefore, aside from the other uncertain conditions, that different observers would be presumably able to see an object at different distances with the same light, and therefore without more definite specifications I would not want to attempt to say that any particular light was or was not strong enough to enable one to see an object at a certain distance."

The testimony also showed that there is no such thing as normal weather conditions, unless the term is strictly applied to very narrow limits of territory and to particular seasons of the year. The brief goes on to show the results of tests on various roads, and enumerates a number of accidents claimed to have resulted from the use of high-power headlights.

The third point brought out in the argument of the special committee was presented for the purpose of showing that nowhere in the Act of 1911 or in the Act of 1915 is there a requirement or even a permission, direct or indirect, to the Bureau of Locomotive Boiler Inspection, or to any other body or person, to require a particular kind of construction, or a particular type of equipment, the requirements being fully and solely as to inspection. This is intended to show that the Bureau of Locomotive Boiler Inspection has no authority to specify what should be placed on the locomotive, this applying to the automatic bell ringers as well as the locomotive headlights.

The Bureau of Locomotive Boiler Inspection has 15 days in which to file a brief giving its side of argument, and then the railroads will have 10 days more to file a return brief before the matter will be decided by the Interstate Commerce Commission.

RUSSIAN RAILWAYS AND PRIVATE ENTERPRISE.—The Russian Government is examining the project of a new railway to connect with ports on the Black and Azoff Seas. It is proposed to let the construction of this new line to "private enterprise."

THE BAGDAD RAILWAY.—The portion of the Bagdad Railway, 24 miles in length, from Teven to Rasul, has been inspected by a technical committee and was open for traffic on August 23.

EDUCATION FOR RAILWAY WORK*

By SAMUEL O. DUNN

Education for railway and other business work is now passing through the stage of doubt, discussion and development that education for professional work passed through a half century or more ago. The courses of study and methods of instruction are as yet incomplete and imperfect, and there are many "practical" men who are still skeptical whether a man will stand a better chance of success in business if he takes a course in business administration or if he omits it and gets into business younger. A recent event has significance as indicating that many of our most prominent business leaders are convinced that college training for railway work is desirable. I refer to the foundation of the James J. Hill Professorship of Transportation at Harvard University. The contributors to the endowment of this chair included many of the leading financiers and railway managers of the country. Mr. Hill would not have permitted a chair of transportation to be established in his name, and these other eminent men would not have endowed it, if they had not believed in college training for railway work. Therefore, if any of the young men and women who have enrolled in the transportation courses at Northwestern have doubts as to the wisdom of their action aroused by the comments of "practical" men they can comfort themselves with the reflection that "practical" men of real eminence have signified their belief in college courses in the most unmistakable manner.

Pursuing studies in college is, of course, not the only way in which one can acquire the broad knowledge and the understanding of fundamental principles which are the best fruits of a liberal education. They may be acquired by study without any guidance except one's own. But one thing may be said on this subject without hesitation or reservation. This is, that broad knowledge and an understanding of the fundamental principles of one's business or profession are essential to great success; and that no one can get these without becoming and throughout his life remaining a good student.

The question arises, then, in what way is one most likely to become a good student? I myself am not a college graduate. I never went to college at all. I have, however, been a pretty diligent student all my life. Possibly, therefore, you might expect from me the opinion that a man is as likely to become a good student, and may become as good a student, by his own unaided and unguided efforts as under the stimulus and direction received in college. I hold no such view. You had as well expect a man to learn to play golf as well without instruction as with it, or to become as accomplished a violinist without instruction as with it, as to expect a man to become as good a student without a college training as with it. There are men who play golf well, there are even men who perform creditably on the violin, who never had any instruction. But most of the good golf players and good violinists have taken lessons; and the better they play the more confidently may it be assumed that at some stage of their careers they had instruction from competent teachers.

Likewise, most good students are college men; and the better students they are the safer you are in assuming that they are college men. There are a few men of such energy and natural ability that they will achieve a moderate, or perhaps even a great success in their chosen line of work without a college training, without other advantages, and even in spite of great disadvantages. But college training, whether along business or professional lines, would not make these men of power less powerful; and to men of less natural parts it is almost essential to enable them to make the most of themselves.

So I say to the young man who expects to enter railway work, and to the man who already is in railway work and wants to advance, devote all the time and energy you can to the acquisition of a broad knowledge and an understanding of the funda-

mental principles of the railway business, because with these you can hope to achieve a satisfactory success and without them you cannot. Do your studying in college if you can. If you can't go to college, at least study systematically and constantly the literature of your business—the books, the magazine articles and the periodicals devoted to it—and all the literature which even indirectly bears upon it.

Some railway men are likely to raise the question whether the colleges really do impart knowledge and help to an understanding of fundamental principles in their courses on transportation. It is a regrettable fact that their skepticism is not entirely causeless. There is much teaching regarding railway matters in our universities which is not satisfactory. No one has any right to criticize a professor of economics or of transportation or of any other subject for drawing his own conclusions from well authenticated facts, no matter how irrational the conclusions may seem. But the public, the railways, and most of all, the students in our schools have a right to demand that those who assume the responsibility of giving instruction concerning railway matters shall make sure they know the facts about them before they try to teach others. Unfortunately, there are some professors in our universities who seem more anxious to impress their own social and economic theories on their students than to impart to them real knowledge, and who do not take the trouble to ascertain the data on which their social and economic theories ought to be grounded. Unfortunately, some of them know a great deal more about so-called "social justice" than they do about transportation. I have read books and articles and heard addresses on railway subjects by professors in our universities engaged in giving courses in railway economics in which there were advanced pretentious theories, and, at the same time, disclosed a startling ignorance concerning the real history, organization, operation, management, wages, rates and financial results of our railways. Too many of our professors are content to study railway matters mainly through the reports of investigating committees, commissions and courts. These reports deal chiefly with what Professor Ripley of Harvard has aptly called the pathology of the business, and a man had as well try to learn the state of health of the human race by studying the sick brought into a hospital, or to get information concerning the domestic life of a people by attending the proceedings of its divorce courts, as to try to get a broad and correct knowledge of the railway business of this country by studying the reports of investigating committees and railroad commissions. The point of view of some teachers was illustrated recently when a professor of economics in one of our large universities, in an address before an important economic society, asked why it is that every time a railway is investigated there is something rotten found. The obvious answer is that only railways which have given strong reason for the suspicion that there is something rotten in them are investigated. Before college courses in transportation and railway economics generally will command the respect and confidence it is desirable they should, the teaching of these studies must be raised to a higher plane, and this will not be accomplished until the teaching is done by men who devote themselves to the acquisition of a thorough and intimate knowledge of the actual facts regarding the railway business before they begin to formulate theories about it. In order that a professor or an editor or anybody else outside the business may acquire this thorough and intimate knowledge of it he must not only master the literature pertaining to it, but he must also get and keep in close touch with the industry itself and with the men who are managing it as well as with those who are regulating it. One of the main reasons for the shortcomings of the teaching regarding railway matters in this country is that many of the professors do not get and keep in this close touch with the transportation industry.

It is not my purpose, however, to imply that all the teaching of railway matters in our universities is open to criticism. There are numerous professors who have devoted years to the industrious, intelligent and painstaking study of railway operating,

* An address at the annual opening of the Commerce School of Northwestern University, Chicago, September 24.

traffic and financial matters, and who, if their teaching is as good as their writing, are competent to serve as guides in investigating and reasoning about these matters.

I am frequently asked by railway men to furnish a list of books on railway subjects which it may be advantageous for them to read or that will be suitable to place in reading rooms or libraries. I have prepared a list of 39 books dealing with railway operation, organization, traffic, finance, etc., which I usually furnish in response to such requests; and I found in looking over the list this morning that 19 of the books in it were written by men who at the time they were written were teaching or lecturing in universities, while two others were written by men who were at the time graduate students in transportation. The books in this list are all accepted as authoritative in their respective fields, and the fact that a clear majority of them was produced in our universities is a high tribute to the class of work in this field which is being done in a number of our schools.

But there are some railway men who regard themselves as highly "practical" who question whether college courses in transportation can be made of much value even when the teachers are learned and able and the pupils are industrious and studious.

There are two arguments which can be made in support of the value of the scientific investigation and study of transportation which seem to be conclusive. One is based on theoretical grounds. The other is based on the careers of railway men themselves.

What, essentially, is it that we learn when we intelligently study the subject of transportation in statistics, books, lectures and so on? First, we learn what has been the experience of those who have actually done practical work in this field. Now, the experience of others has most valuable lessons for us. It is true that one's own experience is, in a sense and an important sense, his best teacher. But, after all, any one person's experience is necessarily very limited, and therefore he who never learns except by his own experience never learns much. Secondly, by the study of transportation subjects we learn how those who have given time and thought to these matters have reasoned about them, the conclusions which they have reached, and the fundamental principles which they have established. Now, any man, in order to do good work, must act on rational grounds. And does it not go without saying that one is more likely to act on rational grounds if he knows how others have reasoned when they have been confronted with the same problems that he meets, and what conclusions they have reached and what principles they have established, then if he is ignorant of these things?

The experience of railway men themselves on which I base the argument for the scientific investigation and study of transportation matters as an essential to real success in railway service is the experience of those who have made the greatest successes in that service. A large majority of the higher officers of our railways have not had college educations and have risen from the lowest ranks of employees. This might be superficially assumed to indicate that college training and "book learning" are hindrances rather than helps to advancement in this field. No assumption could be more incorrect. The main reason why there is only a minority of college men among the higher officers of our railways is that the number of college men who enter any business is small compared with the total number who enter it; that this is as true of the railway as of any other business, and that therefore the number of college men who rise to the top is bound to be small compared with the total number who thus rise. The number of college men holding high positions on our railways is, however, very large in proportion to the number of college men who enter the business. The railways of the United States in 1913 had 1,815,239 employees. Of these, 4,400 were classified by the Interstate Commerce Commission as general officers; and of the general officers no less than 1,076, or 25 per cent, are shown by the Biographical Directory of Railway

Officials to have received a college training. These were divided as follows:

Chairmen of executive boards and presidents.....	67
Vice-presidents	85
General managers, general superintendents and division superintendents	160
General solicitors, general counsel, general attorneys and commerce counsel	113
Traffic managers, general and assistant general freight agents.....	65
Secretaries, treasurers, auditors or controllers.....	76
Mechanical superintendents, mechanical and electrical engineers.....	91
Chief engineers, consulting engineers and engineers of roadway or maintenance	265
Miscellaneous, including purchasing agents, general passenger agents, general baggage agents, etc.....	154

Considering how small a part of those who enter railway service are college men, the fact that from this small part have been recruited one-fourth of all the general officers is as high a tribute as could be paid to the value of a college training. A large majority of these men took engineering courses in which they applied themselves directly to the study of railway civil and mechanical engineering, these being the first specifically railway subjects taught. Now that our educational institutions are giving an increasing amount of attention to railway work in all of its branches, the proportion of officers recruited from among college-trained men may be expected to increase.

The value in railway work of a broad education is further illustrated by the fact that a large majority of the higher officers who are not college men are students in the best sense of that word. I have had opportunity during a rather active life to come in contact with men in many walks of life, and I venture the opinion that there is not in this country another class of business or professional men which excels the higher officers of our railways as a body, in that many-sided intelligence which can be acquired only by a combination of wide reading and study and intense practical experience. And those higher officers of the railways who have not had college training owe almost, if not quite, as much of their success to the broad knowledge and the understanding of fundamental principles which they have derived from study as do those who are college men. A striking illustration is afforded by the head of one of our largest railway systems—a man whose name is recognized all over the world as that of an operating executive of long practical experience, of boundless energy and of great ability. This man, who began active railway work in one of the lowest ranks of the service, states that he reached the turning point in his career when he stumbled on a copy of Wellington's book on "Economics of Railroad Location." From that time he became a student railway man as well as a practical one, and he has ever since been as intense and energetic in his study of railway literature as in the performance of his daily work. He knows the literature of his business thoroughly, and you seldom meet him that he does not start a discussion of some new book or article on transportation he has just read. He is, besides, a good amateur connoisseur in painting, he plays the violin and he has very recently begun the study of French! And that man, among other things, has spent \$110,000,000 in improvements on his railway within the last five years. Of such material are our great railway managers made.

Even though broad knowledge and an understanding of fundamental principles would have been of less value in the railway business in the past than they have been, they would be indispensable to the highest success in this business in the future. In the past there was nobody that it was especially important to the railway manager that he should please but the owners of the property, and it was not especially important that his subordinates should please anybody but him. Now the management must not only run the property successfully from the stockholders' point of view, but it must justify to the public and to regulating bodies representing the public everything that it does, act on sound principles. If they must act on sound principles, But if people must be prepared to justify all they do, they must act on sound principles. If they must act on sound principles, they must know what principles are sound. But an understanding of sound principles and of the conditions and reasons on

which they are based is never attained except by hard study and careful thinking. Therefore, the changes which have occurred within recent years in the conditions under which railways are managed have made a liberal education more necessary to great success in the railway business than ever before. I do not mean that it has made a college education more necessary, but that it has made a liberal education more necessary, whether acquired in college or out of college. The increasing demands and power of labor organizations, the large advances in wages, the insistence of the public on better service, the regulation of railway rates and all phases of operation—these and other conditions are rendering essential greater engineering skill, more ability in handling men, more knowledge of economics, greater aptness for diplomacy, more knowledge of and a broader outlook on public affairs, than were formerly required. The railway having become fully recognized as a quasi-public concern, its officers are becoming recognized as quasi-public officers. Therefore, they need the best qualities of the business man united to the best qualities of the statesman.

Theirs is a high calling. It is also a very difficult calling. Whether private ownership and management of railways will be continued in this country will depend largely on how the managers of the railways measure up to the demands of their calling; and how they will measure up to them will depend largely on whether the men now in the business and those who enter in future give as much attention in proportion to the theoretical, the scientific and the ethical side of their business as to its practical side.

RAILWAY DEVELOPMENT ASSOCIATION

The semi-annual meeting of the Railway Development Association was held at the Hotel McAlpin, New York, this week, beginning Tuesday, November 9, John C. Emig (C., C., C. & St. L.), presiding. The association was welcomed to the city by Chamberlain Bruere for Mayor Mitchel.

The first paper presented was by John F. Fox, immigration agent of the Northern Pacific, on the subject of "Immigration Field Work." Mr. Fox said that settlers who become good, thrifty, prosperous and productive citizens and the expanding industrial enterprises they create and foster are the two chief factors upon which the future success and well-being of a railway are founded. Immigrants may be secured by advertising, by personal solicitation, or by exhibits at country fairs or other places, but every effort should be made to secure only that sort of immigration which will result in material benefit to the settler as well as to the railroad.

In the discussion of Mr. Fox's paper considerable attention was paid to the land locator or real estate shark and to the frauds frequently worked on settlers by unscrupulous land agents. Several speakers believed that the matter should be more carefully looked after by the national or state governments, some proposing that these men be licensed or bonded. The matter was left with a special committee which proposed a resolution adopted by the convention urging Congress to license such locators as a protection to homeseekers.

ADDRESS BY GEORGE A. POST

George A. Post, president of the Railway Business Association, was expected to speak on the subject of "General Railroad Business." Finding that title slightly too broad, however, he spoke on "Corkscrews and Other Openers." An abstract of Mr. Post's address follows:

The men who constitute this association are "openers" of a high degree of efficiency. You are close students of the opportunities afforded by your respective lines. You are more fortunate than are some other departments of railway operation, in that you are constantly brought in contact with the public, and are made aware of their necessities and their diverse viewpoints. You know that your railroads must have ever increasing volume of traffic; you know that this means that productivity of everything that requires transportation must be aug-

mented by every available resource that human ingenuity and persistence can devise. You must make plans, and strive to execute them, that will attract favorable consideration of what you have to offer. You must dream dreams, and seek to have them materialize into profitable realities.

It is for you to match your wits against those of the parties with whom you deal, and see to it that they get what they actually need for their purposes, which will at the same time be profitable to the railway. They must not get away with anything they are not entitled to, and which, if they did, would be injurious to your company. You gentlemen know that nothing can happen to your railway that could be more serious than for you to overreach and put some scheme across that would leave a sore feeling in the hearts of those with whom you deal. A grievance, however small, that is left to rankle, grows and spreads like a prairie fire, and in the end the railway gets by far the worst of it.

Whatever may be the faults of our regulatory system, now in vogue in our states and the nation—and there are many serious ones—it cannot be denied that much good for the public and the railways has been evolved thereby. That there has come about during the past few years a better feeling toward the railroads than existed at one time, there can be no doubt. A reason for this is that the public now knows a great deal about the problems that harass the railroads, and the difficulties under which they are operating. They have had their eyes opened. Railway officers, once reticent from habit, or unaccustomed to public speaking, have found that reticence will not satisfy the public demand for information, and that hesitant speech conveys the idea of ignorance, or unwillingness to answer, when they are haled before public bodies for interrogation as to railway affairs. In other words, they have had to "open up."

I have been an eye-witness of many ordeals through which railway officials have passed during the past seven years. I have seen men of high station thoroughly discomfited by their lack of equipment for forensic fray. It was not because they were not able administrators, fitted by experience and wisdom to preside over the destinies of invested capital, but because they could not concisely, incisively and persuasively tell the things they knew. But they have been apt pupils, and to-day there is a large number who, with easy pose and fluent tongue, win applause as they appear upon the rostrum, and inspire confidence at the bar of inquiry.

It is largely because of this attitude of the railways toward the public, and their acquired ability to make cogent statements, whereby a better comprehension of railway facts is vouchsafed, that the attitude of the public has become so much more favorable toward the railways. Instead of turning deaf ears to railway officials when they tell of their situation and financial perils, thoughtful people now listen and take heed. After all, there are but few folks who bait the railways as a business, and these make a living by doing so. The more people know about the railways, the more meagre will become the menu of the professional baiter. The general public realize that anything that really and seriously cripples our railroads, hurts the public as much as, if not more than, the railroads.

As the incalculable importance of our railroads is opened up to the view of the public, the greater is the public appreciation of the wisdom of fair treatment of them by the public. Some things fortunately have been opened up regarding past railway manipulations that have been discreditable, and that have filled the air with the stench of iniquity. Their exposure has been a splendid job too. They cannot and must not ever occur again. Secrets give birth to suspicions. This is a day for everybody to get out into the open. Things done in the open are quite sure to be circumspect. Railroad operations are now open and above board. The public knows, or it may know if it so desires.

"General Railroad Business" is, I recall, what your program says I am to talk about. Well, the general business of railroads is to act as "openers." Do they do it? Are there vast areas

of land awaiting the tiller? They are opened to settlement by a railroad. Would we open the mountains and make them disgorge their buried treasures of gold, silver, copper, iron or coal? Bring us a railroad, is the demand. Would you open a factory, and hope to be prosperous, without a railroad? How do we open up markets? With railroads, of course! Do cities wax great and are they peopled by busy artisans, whose fabrications reach to all parts of the globe? They have been opened to nation-wide and world-wide commerce by railroads. When railroad business is *general*, things are wide-open. When it isn't, they are closed. When we think of business in general, we inquire: What are the railroads doing?

INTENSIVE AGRICULTURE

W. H. Olin, agricultural commissioner of the Denver & Rio Grande, gave a brief address on intensive agriculture. Mr. Olin's road does a large business in potatoes, the quantity shipped yearly from that territory to distant points amounting to 7,500 carloads. He gave an interesting sketch of his investigations and studies to learn the best kinds of potatoes to be raised on different soils and the best kinds to satisfy different classes of buyers. Furnishing officers of other roads with information about traffic conditions on his line, he received in return useful lists of jobbers on those other roads to whom he could recommend the shipment of potatoes.

In the discussion on this address, J. C. Clair (Ill. Cent.), told of the activities of his department in promoting the sale of Southern fruit and vegetables in northern cities. Information as to marketing was circulated among the farmers in the South by means of photographs. Truck farmers in Tennessee have been induced to form an organization for the dissemination of information, and the road proposes to send men there to give specific instruction as to the best methods of packing for northern markets. In Louisiana, whence the Illinois Central has a large movement of strawberries, the road has employed the best talent to go among the farmers and show them how to get rid of a serious pest that reduced the strawberry crop last year. The information which was developed on this subject has been given to the Agricultural Department at Washington. This year the road has taken out of Tangipahoa parish, Louisiana, about 1,250 cars of strawberries and the American Express Company about the same number.

EXPORT TRAFFIC

This was the subject of a paper by W. S. Kies, vice-president of the National City Bank, New York City. Merchants and manufacturers all over the country still need much advice and instruction concerning the best methods of learning the wants and the wishes of buyers in South America and other comparatively new markets, and Mr. Kies pointed out to the railroad men how they, both in the public interest and in their own, could disseminate this information fully as well as any other class. Our foodstuff exports have become secondary to those of manufactured products, and the present opportunity to extend on a permanent basis our trade in factory products in the markets which our European rivals are temporarily forced to neglect should be more properly cultivated.

The sooner the American people come to recognize the fact that the permanent extension of our American trade in manufactured goods is absolutely essential to our continued domestic prosperity and rightful position in international trade, Mr. Kies declared, the more rapidly and efficiently shall we be able to develop foreign markets. Our national life is becoming more and more dependent on our manufacturing industries and new markets are necessary through which to maintain a capacity output on the most economical basis.

HIGHEST FUNCTION OF THE INDUSTRIAL DEPARTMENT

W. W. Wood (B. & O.) delivered a carefully prepared address on "What Makes the Department Permanent." Discussing the constant changes in railroad customs and ideals, he gave

interesting details of the early history of the Baltimore & Ohio, which had no vice-president until 1866 and no officer with the title of general manager until 1884. Railroad managers of the earlier days made mistakes, of course, and a common fault was arrogance toward the public. This culminated in what has been called the "public-be-damned spirit"; and about that time arose the industrial department. This department, more than any other, is truly a servant of the public. Of all departments, except this, it may be said that at least a part of its functions are not public; but there should be at least one railroad department that is always wide open to the public; and the industrial department is that one.

The railroad officer dealing with the public should give the real reasons for his decisions. Telling people simply that you do not see your way clear to do so and so does not go in these days. It is good to compel yourself to formulate reasons that will be acceptable; possibly in the formulation you will see more clearly, will reverse yourself, and give your customer a more favorable answer.

We are in many cases the mediator between the traffic or the operating department and a shipping. This is an important function. The speaker cited cases where it took 45 days to get approval of a new side track. Half that time may defeat the plans of a prospective industry. It is our duty to prevent such unreasonable slowness.

Every industrial agent should keep himself very fully and minutely informed as to the character of his freight territory; all of it. It is his business to gather and record this information better than any one else can do it. And he must remember that his studies ought to be largely for the future. If a certain district, large or small, finds its source of raw materials has failed or is becoming more costly, why can you not jump in and see that an economical substitute is furnished from the mines or forests on your line? To keep fully abreast of the times is our duty not only to ourselves and our employers, but also to the public. If we do not keep up to date we are liable to find the government stepping in and supplanting the carriers. If the railroads do not do their very best, we shall wake up some morning and find ourselves reporting to the Department of Commerce!

Following this paper, C. C. Dana (A. T. & S. F.) spoke of on "Eliminating Competition by Locating Industries on Joint Tracks." He emphasized the necessity of complete frankness with the public. Excessive fear of competitors, or excessive zeal in circumventing them, will fail. It is quite possible to induce a city to encourage a new industry which cannot possibly succeed in that location; but to do so is a grave mistake. Railroads ought to combine and deal with cities jointly. Acting in this way, and having made a thorough industrial survey of a city, it is to the interest of the railroads to act together. To eliminate unnecessary strife the railroads, going to a city which desires new industries, should ask to have appointed a citizens' committee to select locations for industries. This frankness and impartiality will make friends; and no road is harmed, for no one can get all the traffic of a given factory, anyway.

Mr. Wood's and Mr. Dana's papers were discussed together. J. C. Emig (C. C. C. & St. L.) said that it was the policy of his company to encourage joint locations on the tracks of two or more roads.

D. E. King (Mo. Pac.) spoke of the duty of the industrial commissioner to mold public opinion. The industrial commissioner often is better able to do this than any other department of the railway; and a commissioner, doing this well, will find the other departments coming to him for aid in matters of this kind. It is practicable even to shape the views of people on political subjects. Where two or three roads enter the same city, the railroad men, by acting in unison, disarm prejudice and can enlighten the people on transportation matters to mutual profit.

F. A. Spink, traffic manager of the Belt Railway of Chicago, agreed with Mr. Dana that the day of exclusive terminal privileges is fast passing. In most cities reciprocal switching arrangements are now in effect. In Chicago a manufacturer finds little or no advantage in an exclusive location, neither does the road

enjoying that exclusive arrangement. Frankness with competing roads does away with much friction. If a prospective new industry is worth going after everybody knows it. The industrial commissioner needs constantly to work for efficiency within the railroad organization. To be six weeks in answering a request from a prospective new customer when the matter might be settled in six days—or perhaps six hours—by going direct to the officer who has authority, is absurd and wasteful. It is the industrial commissioner's duty to get such obstacles removed.

J. C. Clair (I. C.).—At competitive points the railroads should not only act in unison, they should take the initiative in securing action by municipal officers looking to economical construction and operation. The railroads may well do what they can to promote the establishment of a manufacturing district in growing cities. Interurban roads should be encouraged; by the facilities which they give to the people they will promote travel on steam railroads. The wide-awake industrial commissioner does not confine himself to industries situated on his own line. You may now and then do a fine thing for your own road by cultivating business in a city many miles away from the line.

R. W. Hockaday (M. K. & T.) agreeing with previous speakers in regard to co-operation among rival railroads and also in the matter of getting growing towns to set aside a manufacturing district, gave examples of what he had done in this respect in Oklahoma. His road is at all times ready to take its chances with competitors at any joint location.

CO-OPERATION WITH COMMERCIAL BODIES

This was the subject of an address by Richard C. O'Keefe, general secretary of the Buffalo Chamber of Commerce. Mr. O'Keefe outlined the early history of railroads in America, showing that co-operation between the public and the owners of the railroads was natural. The federal government, the individual states and cities by the hundreds encouraged the building of railroads and gave their money; and in every way showed that transportation was a vital part of the life and progress of any community. The pioneer railroad builders did not get their money in Wall street, they got it from men actively interested in local commercial enterprises. The federal government aided railroads to a considerable extent, and under slightly different circumstances would, no doubt, have gone much farther. Indeed, freedom from regulation was, in the early railroad era, a form of aid. The speaker enumerated a dozen states which gave aid to railroads. The state of New York aided them to the extent of \$8,300,000, of which sum only \$750,000 was ever paid back. The city of Buffalo took a substantial interest in the Buffalo, New York & Philadelphia and the Buffalo & Jamestown.

Mr. O'Keefe finds that the railroads do not seem to desire to co-operate with commercial bodies. Why should not the carriers co-operate with business men in the cities in the same way that they do with the farmers? Commercial men are annoyed by the fact that railroad representatives lack the authority to settle matters until after tedious correspondence with headquarters. The merchants are the real friends of the railroads, as witness the recent action of the Merchants' Association of New York City in making a thorough investigation of the question of mail pay and publishing a report favorable to the railroads.

AGRICULTURE

This was the title of an extemporaneous talk by Professor Alva Agee, director of the New Jersey State College of Agriculture, New Brunswick, N. J. Professor Agee gave an illuminating mass of facts concerning what is needed to improve agriculture and the interest which the railroads have in this subject. Railroads could be named, he said, the stock of which would increase 50 per cent in value if all of the land tributary to their lines were brought up to its full productivity. The railroads and the agricultural colleges are natural friends, as the colleges were created for the very purpose of making the country more fruitful.

Do not aim solely at the production of heavy and bulky freight. Diversity is what makes the people of a given territory

prosperous, and it is to your advantage to encourage such agriculture as is profitable to the people, whether it does or does not make heavy tonnage directly.

Railroads can well afford to carry lime for the farmers at cost. Nine-tenths of all the land between the Mississippi river and the Atlantic ocean could be made more fertile by the addition of lime; at least a ton on every acre every four or five years. Carry this lime at cost and you will make yourselves rich thereby. The speaker congratulated the railroads on their agricultural demonstration trains. Moreover, the country railroad station is one of the best places in which to display charts and other instructive matter for the benefit of farmers. The problem of soil fertility is unbounded in its possibilities and every encouragement should be given to our research institutions which are enlightening the public on this matter.

FRUIT GROWING

This was the subject of a talk by J. H. Hale, the well-known peach grower of Connecticut, who is also a member of the Public Utilities Commission of that state. Mr. Hale gave an interesting sketch of the progress of civilization from the time when fruit was cultivated primarily to get something to drink—cider or wine—down to the middle of the nineteenth century, when the fruit traffic began to have commercial importance. The consumption of fruit must continue to grow, as the people learn its virtues. Fruit is the only important food that is perfectly fit for use without the cooking, the killing and the machine work necessary with other substances. In 1885 there was no long-distance traffic in cantaloupes and none whatever in carload lots. Now, 25,000 cars of this fruit are moved yearly. In 1890 Mr. Hale, reporting for the census, predicted that in 1900 southern California would ship 10,000 cars of oranges and lemons and was called wildly extravagant; the event proved that his guess was only half large enough. Now, the movement is 45,000 cars yearly. Of all kinds of fruit he estimated that the railroad movement in this country is 200,000 cars annually, producing a revenue of fifty or sixty millions.

Do not overdo the promotion of fruit traffic. Georgia became prominent as a peach state 25 years ago; by 1905 it had 18,000,000 peach trees; then thousands of small farmers got the fever and there was much waste by poor management; and today the state has perhaps only 8,000,000 trees, but these are under intelligent care. The railroads—the Central of Georgia, the Southern, the Atlantic Coast Line—have given the peach growers excellent service. Mr. Hale, commending what Professor Agee had said about lime, told of how, by persistent efforts with the carriers and with the producers of lime, he had been able to get a large reduction on the former prohibitive price of \$8 a ton for lime for his lands in Connecticut, and now was improving them rapidly by the use of this fertilizer.

The railroads could greatly expand the fruit business by promoting the shipment of carload lots to smaller places. Towns of from 5,000 to 12,000 inhabitants now go to larger cities when, with suitable encouragement, and a lower minimum carload weight, they would get fruit direct from the orchards and thus there would follow an increased consumption.

Wednesday afternoon was devoted to a steamboat trip around New York harbor.

THE BANQUET

The toastmaster at the dinner on Wednesday evening was S. C. Mead, secretary of the Merchants' Association of New York, and the speakers were Howard Elliott, president of the New Haven; John W. Weeks, Senator from Massachusetts, and Ralph Peters, president of the Long Island.

Mr. Elliott confined his attention largely to the work of the association considering its activities from the three standpoints of immigration, agricultural development and the encouraging of a friendly feeling towards the railways on the part of the public. Mr. Elliott also made a strong plea in his address for a proper regard for the needs of the country's transportation system.

"The load upon the transportation business has been very

General News Department

The Chicago & North Western has made an advance of five per cent in the wages of station agents, telegraphers and levermen.

The shops and roundhouse of the Chicago & Illinois Midland at Taylorville, Ill., were destroyed by fire November 4; loss \$65,000.

Telegraph operators and agents on the Chicago & Alton have presented a demand for a 15 per cent increase in pay and changes in working conditions.

At a public hearing in Boston, November 5, officers of the New York, New Haven & Hartford presented testimony to the effect that the current of the stream in the Cap Cod canal is so strong that the foundations of the railroad company's bridges across the canal—two of them—are threatened. Testimony of marine men was introduced to the effect that to prevent damage to the banks of the canal by the tidal currents, it will be necessary to build a lock or locks.

A chrysanthemum plant with a spread of 15 feet constituted a freight shipment carried by the New York Central recently from Dobbs Ferry, N. Y., to Cleveland, Ohio. The plant is covered with 1,200 blossoms making it literally a gigantic bouquet. It was conveyed on an open car which had been made specially to carry heavy ordinance, and was packed on edge with the lower edge resting only about 6 inches above the rails. The plant is to be exhibited in a flower show at Cleveland, November 10-15.

The Interstate Commerce Commission has just issued an order requiring every common carrier whose property is to be valued to prepare and file with the commission at Washington within six months a statement showing the name and date of the incorporation and the date of organization. It also requires a description of the railroad or portion of the railroad constructed by each separate corporation, with complete data as to mileage and termini, the length of time which such railroad was operated by each corporation and the proceedings by which any corporations were dissolved. This order also requires the filing of a diagrammatic chart showing graphically the development of the present corporate ownership of the property, to be made like a sample chart of the Cincinnati, Hamilton & Dayton, prepared by the commission.

Lackawanna Cut-Off Opened

The new line of the Delaware, Lackawanna & Western, between Clark's Summit, Pa., and Hallstead, 40 miles long, was put in use on Saturday, November 6. Brief dedicatory exercises were held at Nicholson, on Saturday afternoon, the governor of Pennsylvania making a short address.

An account of the work on this improvement, including views of the Tunkhannock viaduct, the largest concrete bridge in the world, was printed in the *Railway Age Gazette* last week, page 809. Elimination of curves and grades by this cut-off will enable through trains to make their runs in considerably less time; but schedules will not be materially shortened at present.

American Honored in China

A cablegram from Peking announces that the Chinese government has awarded to George Bronson Rea the grand prize, including among other things several thousand dollars for a national system of railways. Mr. Rea is an American engineer and journalist and the editor of the *Far Eastern Review*. His scheme of railways comprises a system of 20 trunk lines aggregating some 11,000 miles of line and attains a special importance because it attempts to get away from the present manner of building railways in China whereby financing and construction have been fitted to the policies of foreign governments.

Mr. Rea was at one time deputy director general of the Chinese National Railway Corporation, serving as such under Dr. Sun Yat-sen, who, after he had resigned the presidency, was

empowered to build all the future railways in China. While holding this position he negotiated a contract for 1,000 miles of railway to cost \$60,000,000 with Pauling & Co., of London, which with contracts for 4,000 miles was never carried out because Dr. Sun became implicated in the revolution against President Yuan Shih-Kai. Mr. Rea, however, later became adviser or technical secretary to the ministry of communications and was requested to design another national plan more in accord with the strategical needs of the government. It was about this time, December, 1913, that the competition was decided upon and engineers were invited to submit their plans with full statistics as to population, trade, cost and revenues and full data on the commercial and strategic importance of the proposed lines. Mr. Rea was on the way to completing negotiations with railway constructors of England, France, Germany and the United States for the financing and construction of 10,000 miles to cost \$500,000,000 on the basis of Chinese participation in an international company when Dr. Chen Chin-tao, the financial expert of China, intervened. Before matters could be straightened out the present war broke out and negotiations were broken off.

Trial of the New Haven Directors

The government attorneys who are attempting before Judge Hunt, of the Federal Court, in New York, to show how the New Haven throttled competition in New England spent Thursday and Friday of last week in bringing out the relations of the company with the Joy Steamship Company. The New Haven made successful efforts to prevent the boat line from leasing boats and at times had to establish special rates for water transportation. Mr. Dunbaugh, at one time president of the Joy Line and also its head for two years after the New Haven had bought out the line in 1905, was on the stand on Friday. He was cross-examined by Charles F. Choate for the defense, Mr. Choate aiming to show that the Joy Line before 1905 cut the regular rates, sometimes made special rates to shippers and absorbed some pier delivery charges, whereupon the New Haven had to take steps to protect itself. The witness expressed the opinion that the arrangement made in 1905 resulted in better service.

Chester W. Chapin, former owner of the Central New England, testified on Monday relative to that roads attempt to secure access to Springfield, Mass., in which it was successful despite the hostility of the New Haven. In 1904 Mr. Chapin sold his interest in the Central New England to the New Haven.

Mr. Chapin was followed by Mr. Mellen, who again took the stand to testify concerning the New Haven's activities while he was president. At this time the government introduced the following letter written to President Hall, November 21, 1895, Mr. Mellen being at that time president of the Northern Pacific:

"My idea of the Central New England has been never to handle it as a through line as it is run today. My idea is to operate it from Hartford to Poughkeepsie as a local road, merely giving service sufficient to take care of local traffic. It is an acquisition necessary to the New Haven as a second step to the acquisition of the New England, as otherwise it would develop into a formidable competitor."

Mr. Mellen on Wednesday told how as president of the New Haven in 1901 he acquired control of the Central New England for only \$5,000,000, whereupon William Rockefeller congratulated him for the acquisition at that low price.

Mr. Mellen wrote to J. P. Morgan in March, 1901, regarding the Poughkeepsie Eastern, which was in receivership, and was not making operating expenses, but owned valuable terminals, saying: "The Poughkeepsie Eastern has a nuisance and real estate value on account of terminals in Poughkeepsie which we could use. I have not the authority to purchase the Poughkeepsie Eastern, which is worth \$150,000, but I think we could depend upon the indulgence of the directors if we overstep our authority and ask approval afterwards."

At the request of one of the government attorneys, Mr. Mellen explained what he meant "nuisance value" by saying: "I

objected very seriously to seeing any property I could use belonging to anybody but the New Haven."

Mr. Mellen on Wednesday testified regarding the New Haven's attempts to hinder water competition and concerning its purchase of a number of competing water lines.

Progress of Federal Valuation

The President's Conference Committee for the federal valuation of the railroads in the United States has issued the following statement, showing the progress of the federal field parties to September 30, 1915:

Road	Date Division Valuation Forces Began Work	Miles of Road	Road and Track	Total miles inspected and inventoried to date			Telegraph and Telephone	Total miles "Adjacent Similar Land" inspected

*Field work of Roadway and Track parties, completed.

used as the basis for rates throughout the western territory, and if an advance of five cents an hour were extended throughout the western territory the additional expenditure involved would run into millions, whereas if it were not extended outside of the Chicago switching district, an additional burden would be placed on the commerce of Chicago.

The railroad managers are not entirely clear as to whether the local committees are backed by the Brotherhood of Railroad Trainmen organization, as the brotherhood has recently joined the movement for an eight-hour day, while the Chicago switchmen are asking for the advance in pay on the basis of their present working day. It is understood that the Brother-

Chicago Switchmen Ask Advance in Pay

A committee representing the switchmen employed in the Chicago switching district who are members of the Brotherhood of Railroad Trainmen has presented to the 18 railroads entering Chicago on which their members are employed a request for an advance in pay of five cents an hour over the rates provided for in the agreement of April 17, 1913; and the railroads have appointed a Conference Committee of Managers, of which George Hannauer, general manager of the Indiana Harbor Belt, is chairman, to negotiate with representatives of the switchmen.

There are now about 3,000 switchmen employed in the Chicago district on the roads on whom the demand has been made, who are receiving the following rates: Night foremen, 40 cents; night switchmen, 38 cents; day foremen, 38 cents; day switchmen, 35 cents. It is estimated by the railways that to grant the five cent increase demanded would increase their expenses by \$500,000 a year. The members of the Switchmen's Union who are employed on nine of the roads have not submitted demands, but the managers point out that any increase given to the members of the Brotherhood of Railroad Trainmen would have to be given to all switchmen in the Chicago district, which would include a total of 5,000 men, and would involve a total additional expenditure of \$700,000 a year. The railroads also say that the increase in wages could not be confined to the Chicago district, as the rates of pay prevailing in Chicago are

hood of Railroad Trainmen at a recent meeting at Cleveland passed resolutions practically condemning the Chicago switchmen on the ground that their actions might tend to jeopardize the movement for an eight-hour day.

The Conference Committee of Managers consists of the following: George Hannauer, general manager, Indiana Harbor Belt Railroad, chairman; J. H. Brinkerhoff, general superintendent, Belt Railway, vice-chairman; H. O. Dunkle, general manager, Erie; W. J. Towne, assistant general manager, Chicago & North Western; P. L. Rupp, superintendent of terminals, Chicago, Milwaukee & St. Paul; E. T. Whiter, assistant general manager, Pennsylvania Lines West; J. F. Keegan, superintendent, Baltimore & Ohio; W. J. O'Brien, general superintendent, Chicago Junction Railway, and G. W. Berry, superintendent of terminals, Illinois Central.

The switchmen are represented by J. W. Richert, chairman, and W. W. McKirchy, secretary of the association of local committees of the Brotherhood of Railroad Trainmen.

New York Railroad Club

At the next meeting of the New York Railroad Club, to be held Friday, November 19, in the Engineering Societies' building, 29 West Thirty-ninth street, New York, a paper will be presented by George D. Snyder, deputy chief engineer of the Hudson & Manhattan, on "Railroads and National Defense." This is also the annual meeting of the club.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, date of next or regular meetings, and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the *Railway Age Gazette* for each month.

- AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—F. A. Pontious, 455 Grand Central Station, Chicago. Next meeting, January, 1916, Atlanta, Ga.
- AMERICAN RAILWAY ASSOCIATION.—W. F. Allen, 75 Church St., New York. Next meeting, November 17, 1915, The Blackstone, Chicago.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.
- AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York. Annual meeting, December 7-10, 1915, New York.
- AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, Supt. Timber Preservation, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 18-20, 1916, Chicago.
- ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—G. P. Conard, 75 Church St., New York. Next meeting, December 14-15, 1915, St. Louis, Mo.
- CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.
- CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.
- CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.
- ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh, Pa.
- GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.
- NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.
- NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.
- NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—E. N. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.
- PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.
- RAILROAD CLUB OF KANSAS CITY.—Claude Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Saturday in month, Kansas City.
- RAILROAD MEN'S IMPROVEMENT SOCIETY.—J. B. Curran, Erie R. R., 50 Church St., New York. Meetings, alternate Thursdays, October to May, Assembly Rooms of Trunk Line Association, 143 Liberty St., New York.
- RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 30 Church St., New York. Annual meeting, December, 1915, Waldorf-Astoria, Hotel, New York.
- RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.
- RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.
- ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.
- SALT LAKE TRANSPORTATION CLUB.—R. E. Rowland, David Keith Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.
- SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Piedmont Hotel, Atlanta.
- TOLEDO TRANSPORTATION CLUB.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Booddy House, Toledo.
- TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.
- TRAFFIC CLUB OF NEWARK.—John J. Kautzmann, P. O. Box 238, Newark, N. J. Regular meetings, 1st Monday in month, except July and August, The Washington, 559 Broad St., Newark.
- TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Waldorf-Astoria Hotel, New York.
- TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Gen'l Agt., Erie R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings, bi-monthly, Pittsburgh.
- TRAFFIC CLUB OF ST. LOUIS.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.
- TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, Superintendent's office, N. Y. C. R. R., Detroit, Mich. Meetings monthly, Normandic Hotel, Detroit.
- UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, 1111 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.
- WESTERN CANADA RAILWAY CLUB.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.
- WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Building, Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.
- WESTERN SOCIETY OF ENGINEERS.—E. M. Layfield, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings. Annual meeting, 1st Wednesday after 1st Thursday in January, Chicago.

Traffic News

The Missouri Pacific has put into effect an improved time table of suburban trains on its line into St. Louis, shortening the time of many of them.

The Baltimore & Ohio, the Chesapeake & Ohio and the Norfolk & Western announce that beginning December 15 there will be an advance of about 15 cents a ton in the rates on coal from the mines in West Virginia to western points.

The registered tonnage passed through the canals at Sault Ste. Marie, Mich., and Ontario, during October amounted to 9,283,260 net tons. The total freight amounted to 11,557,851 short tons, of which 9,399,436 was eastbound and 2,158,415 was westbound. The total number of vessel passages was 3,231.

The Georgia College of Agriculture is running an instruction train over a large part of the railways of the state, the itinerary providing for stops at 200 towns, and trips to occupy about 100 days. Pure-bred animals will be carried on the train to be exhibited. The United States Bureau of Animal Industry and the railroads will co-operate with the state officers.

It is announced in West Virginia that the railroads carrying coal from that state to western points have decided not to make the proposed advance of 15 cents a ton in the rate for transportation which had been decided upon with a view of putting it into effect on December 15. The shippers are said to have convinced the roads that a large falling-off in traffic would result.

The meeting of the Southern Classification Committee, scheduled for Chicago on November 8, has been indefinitely postponed, because a number of important lines were unable to be represented on account of a number of Interstate Commerce Commission cases being set for hearing and the great pressure under which southern roads are now working in making a revision of their tariffs to become effective on January 1.

The Missouri Pacific and the St. Louis, Iron Mountain & Southern have announced a new passenger train which is to be put in service on December 1, from St. Louis to Houston, Dallas, Galveston, Fort Worth and San Antonio. The train is to be called the Sunshine Special, and will leave St. Louis at 6:15 p. m., considerably shortening the running time between St. Louis and Texas points. The Missouri, Kansas & Texas also announced an additional train from St. Louis to San Antonio, to be put in service on December 1, to leave St. Louis about 6:30 p. m., and arrive in San Antonio at 9:30 the following evening.

The temporary rate of \$3 a ton, announced by the Panama Railroad on October 6, for the transfer of freight between steamers on the Atlantic and Pacific oceans, on account of the closing of the canal by slides, was cancelled effective on October 31, and rates ranging from \$2 to \$15 a ton, according to classification, were to be put in effect. The announcement of the new rates, however, caused several protests from ship owners, which were followed by an announcement that the secretary of war has decided that in view of the many questions involved in changing from the \$3 flat rate to the classified rate, the flat rate will be temporarily continued under the conditions now in effect until he has had a full opportunity to thoroughly investigate the subject. During the month of August, according to the Canal Record, for the first time since February, the cost of the items charged to operation and maintenance of the canal was more than the amount of tolls collected. The deficit amounted to \$63,177, which reduces the excess of tolls over expenses for the present fiscal year from \$117,570 at the end of July, to \$54,392 at the end of August. The charges for dredging in the Gaillard cut during August were nearly half of the total expense of operation and maintenance.

THE ALTAI RAILWAY OF SIBERIA.—The construction of the Altai Railway is reported to be almost completed. It will soon be opened to traffic. This new line will serve the richest grain and mining areas of Siberia. Its present length is 500 miles. Its central offices will be in Barnaul.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The commission has denied the petition of the carriers for a rehearing of the Western advance freight case. It has, however, on its own initiative, ordered an investigation of rates, rules, and practices of Western railroads in relation to the transportation of live stock, fresh meats, and packing-house products. These commodities are among those on which the roads sought to have rates increased. No reason was assigned for the refusal to reopen the case.

Alleging that none of the benefits expected from the original Shreveport rate case have accrued to Shreveport or the neighboring territory, the Railroad Commission of Louisiana has filed another complaint with the Interstate Commerce Commission asking in effect that the class freight rate scale prescribed by the commission in its original and supplemental orders be made to apply intrastate in Texas. It is asserted that by reason of the competitive conditions now surrounding traffic between Shreveport and Texas points, the relief sought in the original petition and the supplemental petition will not be obtained until an investigation is made by the commission of the interstate rates from and to Shreveport, to and from all points on the lines of the respondents in the state of Texas.

Rates on Distillers' Supplies

Kentucky Distilleries & Warehouse Company v. Louisville & Nashville, et al. Opinion by Commissioner Meyer.

The commission finds unreasonable the present rates of the Louisville & Nashville on distillers' supplies, consisting of corn, rye, malt, empty barrels and glass bottles from Louisville, Ky., and Cincinnati, Ohio, to Kellers, Silver Creek, Lair, Athertonville, New Hope, Coon Hollow and Withrow, Ky. Rates in effect prior to February 10, 1910, are ordered. (36 I. C. C., 293.)

STATE COMMISSIONS

The Alabama Public Service Commission—which, by a law passed this year, has taken the place of the former state railroad commission—has denied an application of the railroads for authority to continue beyond December 1 a ten per cent advance in certain freight rates which is now in effect and which was authorized some months since. The commission holds that business is now resuming a normal condition and that the order permitting the advance was intended only to cover the period of serious depression.

The Illinois Public Utilities Commission began a hearing at Chicago on November 9, on the tariffs filed by the railways providing for a general five per cent advance in intrastate freight rates. The tariffs were filed about the time of the Interstate Commerce Commission's decision in the general five per cent advance case, but have been suspended from time to time by the commission. Tuesday, Wednesday, Thursday and Friday of this week were set aside for a general presentation of the case, including financial and accounting matters, the first two days to be devoted to respondents' evidence and the next two days to protestants' evidence and rebuttal. Separate hearings on individual commodities have been set for later dates up to January 13, 1916.

COURT NEWS

The United States district court in Omaha, Neb., has granted a temporary injunction restraining the enforcement of the Nebraska two-cent passenger fare law, so far as the Missouri Pacific is concerned.

Misrouting Does Not Cause Liability for Shippers' Act

A railroad contracted to route horses through a certain town and failed to do so. The shipper's agents, upon their failure to appear on the expected train, wired to destination to a commission house to take charge of the animals when they arrived.

The commission house did so, putting them in a stockyard's barn, where they contracted stockyard's fever and subsequently died. In an action for their loss the Wisconsin Supreme Court held that the railroad was not liable, since the loss was not the result of its misrouting, but of the act of the shipper through his agents.—*Rosenthal v. C. & N. W.* (Wis.), 154 N. W. 367.

Twenty-Eight Hour Law—"Opportunity to Rest"

The federal district court in North Dakota holds that the construction of section 3 of the 28-hour law, providing that when animals are carried in cars in which they can and do have opportunity to rest, the provisions as to unloading shall not apply is for the court and not for the jury. It holds that the section deals with the structure of a car in which animals are transported, without taking into account the habits of animals, and where a car is so constructed that animals transported therein, such as horses, have no opportunity to rest by lying down, the carrier must unload them, "opportunity to rest" meaning opportunity to lie down; and the fact that horses often take their rest standing cannot be taken into consideration.—*Northwestern Pacific v. Finch*, 225 Fed. 676.

Safe Place to Work

Action was brought for the death of a fireman, killed while his engine was shifting cars in a street in Philadelphia. It appeared that the clearance between the tracks was about two feet less than the standard, but it also appeared the sidings had been located under proper municipal authority, and had been in use for 15 years. While rounding a curve near which a car was temporarily standing on the adjoining track, the fireman leaned out beyond the tender and came in contact with the car. It was held by the Circuit Court of Appeals, Third circuit, that the railroad company was not bound to foresee the fireman's action and therefore to construct its tracks in such a manner as to guard against an event so remote and so unlikely to occur, and was not liable for the result.—*Reese v. Reading*, C. C. A., 225 Fed. 518.

Animals on Tracks—Private Crossings

A railroad company agreed that in consideration of a land owner's conveyance of a right of way through his farm it would construct a grade crossing, with gates which might be left open at the land owner's risk. A Washington statute requires railroad companies to fence their right of way, and permits owners of land on both sides of the right of way to put in gates at a crossing for their own use, while another statute requires land owners to keep crossing gates closed. The owner of the land left the gates open, and horses strayed through the crossing to the other portion of the farm and from there out to the country road. At a distant point they entered the railroad's right of way and were run down. In an action for their loss the Washington Supreme Court held that, while the contract supplanted the statutes as between the parties, the railroad company could not escape liability on the contractual grounds; the plaintiff assuming the risk of leaving the crossing open only in so far as accidents might happen on the crossing.—*Snodgrass v. Spokane & Inland Empire* (Wash.), 151 Pac. 815.

Injury to Trespasser on Yard Track

Action was brought for the killing of plaintiff's infant son on defendant's track. The railroad had fences along both sides of its right of way within yard limits, and had posted notices to prevent trespassing. After these had been ignored and broken down, the company continued to warn trespassers and children from the right of way, though both adults and children frequently crossed the tracks. The Michigan Supreme Court holds that there was no express or implied invitation to cross the tracks at that place, and those doing so were trespassers or licensees. It is well settled that railroads are not required to fence their yard limits, and a failure to do so is not evidence of negligence. The child suddenly appeared on the track when the train was within 200 feet of him, and too near to be stopped before striking him. It was held that the accident resulted from the sudden and unanticipated act of the child itself, which could not be foreseen, or, in the reasonable operation of the road, guarded against, and there was no liability for its death.—*Hoover v. Detroit, G. H. & M.* (Mich.), 154 N. W. 94.

Railway Officers

Executive, Financial, Legal and Accounting

T. S. Ford, auditor of the San Antonio, Uvalde & Gulf, at San Antonio, Tex., has resigned, effective December 1.

J. L. Goree has been appointed assistant general attorney of the Chicago, Rock Island & Pacific, with office at Chicago, Ill.

Charles A. Vilas, whose appointment to the position of valuation attorney of the Chicago & North Western, as announced

C. A. Vilas

in the *Railway Age Gazette* of last week, was born at Madison, Wis., on September 21, 1878. He received his education at the University of Wisconsin, graduating from that university in 1899, and from the Wisconsin Law School in 1901. From 1901 to 1909 he engaged in private practice in the city of Milwaukee, Wis. He first entered railway service on June 1, 1909, when he was engaged by the Chicago & North Western as general attorney assigned to office work. In 1914 he was assigned to trial work in Cook county. In his present capacity as valuation attorney he has been assigned to legal duties in connection with the federal valuation of the road.

Col. Wells H. Blodgett, general counsel for the receivers of the Wabash, retired from active service with the reorganization of the company on November 1. He was born at Downers Grove, Ill., in 1839, and was educated at the Illinois Institute at Wheaton, Ill. In 1873 he entered railway service as assistant attorney for the St. Louis, Kansas City & Northern, and from 1874 to 1879 served as general attorney for the same road. From 1879 to 1884 he was general solicitor for the Wabash, St. Louis & Pacific; from 1884 to 1889, general counsel for the receivers of the Wabash Lines; from 1889 to August 8, 1901, general solicitor for the Wabash Railroad, and from August 18, 1911, to November 1,

W. H. Blodgett

1915, general counsel for the receivers of the same road. He served through the Civil War in the volunteer service, and was mustered out in July, 1865, as colonel of the Forty-eighth Regiment, Missouri Volunteers.

E. M. Durham, Jr., has been appointed general agent of the Cincinnati, New Orleans & Texas Pacific with headquarters at Chattanooga, Tenn., reporting to the president or vice-president.

E. M. Willis, secretary to the president of the New York, New Haven & Hartford, has been appointed assistant to the president with office at Boston, Mass. Mr. Willis is a director of the Berkshire Street Railway Company, the Vermont Company, the Hoosick Falls Railroad Company and the Old Colony.

He formerly served as assistant chief clerk to President Elliott on the Northern Pacific.

Arthur Coppel, of Maitland, Coppel & Co., New York, N. Y., has been elected president of the Denver & Rio Grande, succeeding B. F. Bush. It is understood that the election is temporary and that H. U. Mudge, who has just resigned as chief executive officer of the Chicago, Rock Island & Pacific, will be elected shortly.

The Wabash Railway having taken over the property of the Wabash Railroad on November 1, the following appointments are announced: J. E. Taussig, assistant to the president; J. L. Minnis, general solicitor; S. E. Cotter, general manager; F. L. O'Leary, local treasurer; T. J. Tobin, auditor; W. C. Maxwell, general traffic manager; T. J. Frier, purchasing and supply agent, and Dr. M. P. Parrish, chief surgeon, all with headquarters at St. Louis, Mo.

At a meeting of the directors of the Chicago, Rock Island & Pacific in Chicago on November 5, John G. Shedd, president of Marshall Field & Co., Chicago, was elected chairman of the board, and N. L. Amster, of Boston, was elected chairman of the executive committee, succeeding T. M. Schumacher, who resigned both offices some time ago. J. M. Dickinson, receiver, also has announced the appointment of J. E. Gorman, vice-president, in charge of traffic and chief traffic officer for the receiver, as chief executive officer, succeeding H. U. Mudge, who resigned that office and as president and director.

Traffic

Elmer H. Wood, whose retirement as freight traffic manager of the Union Pacific has been announced in these columns, was born on January 12, 1854, at Clarkston, Monroe County, N. Y. He was educated at Grand Prairie Seminary, and entered railway service in 1875. From November, 1875, to June, 1876, he was station agent and chief clerk in the general freight and passenger department of the Chicago & Pacific. From 1876 to 1884, he was chief clerk to the general agent of the Union Pacific, at Chicago, Ill. From 1884 to 1888, he was general agent in the freight department of the same road at Chicago. From 1888 to 1889, he was chief clerk in the general freight department

E. H. Wood

at Kansas City, Mo. From 1889 to June 1, 1898, he was assistant general freight agent of the same railroad at Omaha, Neb. From June 1, 1898, to October 30, 1911, he was general freight agent, and on November 1, 1911, was promoted to freight traffic manager, with office in the same city. Ill health caused his recent retirement from the service of the road.

W. M. Hardin, commercial agent of the Minneapolis & St. Louis at Minneapolis, Minn., has been appointed assistant general freight agent, with headquarters in the same city.

Erwin C. Meyer, formerly traffic manager for the Banner Buggy Company, has been appointed commercial agent for the Chicago & Alton at Birmingham, Ala., vice C. R. Prince, resigned. Effective November 1.

Charles A. Call, general passenger and freight agent of the New York, Westchester & Boston, at New York, has been appointed manager of the industrial bureau of the New York, New Haven & Hartford, with office at Boston, Mass., to succeed W. H. Seeley, who has resigned to go into other business. Mr. Call began railway work in 1883 in the passenger department of the New York & New England. In 1898 he was appointed passenger agent at Boston, and in 1905, was appointed general

agent of the passenger department of the New York, New Haven & Hartford at New York City. In 1908 he became general agent of the New Haven at Boston in charge of the general office and in 1912 was appointed general passenger and freight agent of the New York, Westchester & Boston.

Operating

P. A. Ellerman, traveling chef of the Lehigh Valley, has been appointed superintendent of dining car service, with headquarters at Easton, Pa., succeeding G. E. Cooledge, resigned.

Joseph M. Boyd, trainmaster of the Northern Pacific at Dickinson, N. D., has been transferred to the Rocky Mountain division, with headquarters at Missoula, Mont., vice D. J. Hagerty, resigned. Effective November 1.

David S. Farley has been appointed superintendent of the Plains division of the Atchison, Topeka & Santa Fe, at Amarillo, Tex. Mr. Farley entered the service of the Santa Fe on October 15, 1887, in the local freight station at Denver, Colo. From that time until July, 1899, he held various clerical positions for Santa Fe in that city. From August 1, to August 18, 1899, he handled Santa Fe accounts for the Colorado & Southern; from August 18, 1899, to May 12, 1900, he was chief clerk to the agent of the Santa Fe, at Pueblo, Colo.; from May 12, 1900, to August 1, 1907, he was chief clerk to the superintendent in charge of the station, at Kansas City, Mo.; from August 1, 1907, to July, 1915, he was superintendent and agent at Kansas City. In July, 1915, he was called to Amarillo, Tex., to take the place of Daniel Elliott, superintendent of the Plains division, who had been forced to leave active service on account of illness.

D. S. Farley

E. B. Heath, trainmaster and traveling engineer of the Spokane, Portland & Seattle, has been promoted to assistant superintendent of the Spokane & Inland Empire and the Spokane Traction Company, with headquarters at Spokane, Wash.

Homer W. Loomis, trainmaster of the New York Central at Hillsdale, Mich., has been promoted to the same position on the main line at Toledo, Ohio. J. J. Crowley, assistant trainmaster at Elkhart, Ind., has been appointed to succeed Mr. Loomis at Hillsdale.

F. L. Sheppard, general superintendent of the New Jersey division of the Pennsylvania Railroad, at New York, has been granted leave of absence on account of illness, and C. S. Krick, superintendent of the Philadelphia Terminal division at West Philadelphia, Pa., will temporarily assume all the duties of the general superintendent, with the title of acting general superintendent, with headquarters at New York.

J. H. Carlisle, superintendent of the Clifton Forge division of the Chesapeake & Ohio, at Clifton Forge, Va., has been appointed assistant to the general superintendent of transportation with headquarters at Richmond, Va. F. S. Rockwell, trainmaster at Silver Grove, Ky., has been appointed superintendent of the Clifton Forge division with headquarters at Clifton Forge, Va., vice Mr. Carlisle, and D. T. Evans, road foreman of engines at Silver Grove has been appointed trainmaster of the Cincinnati division with headquarters at Covington, Ky., vice Mr. Rockwell.

F. E. Lewis, superintendent of dining cars and hotels for the Union Pacific Railroad, has been appointed manager of dining cars and hotels for the Union Pacific System. E. C. Sutton, assistant superintendent of dining cars and hotels of the Union Pacific Railroad, has been promoted to superintendent of dining cars and hotels to succeed F. E. Lewis. H. A. Hansen has been appointed

assistant superintendent of dining cars and hotels for the railroad, vice E. C. Sutton, promoted. The headquarters of all three officers will be at Omaha, Neb., and their appointments were effective November 1.

H. E. Allen, superintendent of the Louisiana division of the Chicago, Rock Island & Pacific, at El Dorado, Ark., has been transferred to the Nebraska division, with headquarters at Fairbury, Neb., vice W. A. Sheahan, resigned. D. Van Hecke, superintendent of the Amarillo division, with headquarters at Amarillo, Tex., has been appointed superintendent of the Louisiana division, to succeed Mr. Allen. H. J. Sewell, trainmaster at El Reno, Okla., has been appointed acting superintendent of the Amarillo division of the Chicago, Rock Island & Gulf, with headquarters at Amarillo, Tex., vice D. Van Hecke, resigned. Appointments effective November 1.

Thomas E. Hill, superintendent of the Louisiana division of the Illinois Central, has been appointed superintendent of the Kentucky division, with office at Louisville, Ky., vice L. A. Downs, promoted. George M. Patterson, superintendent of the Springfield division, with headquarters at Clinton, Ill., has been transferred to McComb, Miss., to become superintendent of the Louisiana division. The jurisdiction of the Louisiana division has been changed so as no longer to include the New Orleans terminals. F. D. Mooney, terminal superintendent, has been appointed superintendent of the New Orleans terminal division. Joseph W. Hevron, trainmaster at Kankakee, Ill., has been promoted to superintendent at Clinton, Ill., vice G. M. Patterson. C. A. Thelan has been appointed trainmaster at Kankakee to succeed Mr. Hevron.

Beginning on November 15, the Ozark division of the St. Louis & San Francisco, will be consolidated with the Southeastern division, the combined divisions to be known as the Southern division. R. F. Carr, superintendent of the Southeastern division, will be superintendent of the Southern division. J. P. Hulehan, assistant superintendent of the General division, with headquarters at Ft. Smith, Ark., has been appointed assistant superintendent of the Southern division, with office at Thayer, Mo. C. H. Hensley, assistant superintendent of the Ozark division, at Thayer, Mo., has been assigned to other duties. That portion of the Red River division of the Frisco, which extends from Sapulpa, Okla., to Sherman, Tex., will be added to the Southwestern division, effective November 15. C. F. Hopkins, present superintendent of the Southwestern division, will continue in that position. J. M. Chandler, superintendent of the Red River division, with office at Francis, Okla., has been appointed assistant superintendent of the Southwestern division, with headquarters at Oklahoma City, Okla., succeeding W. M. Coombs, assigned to other duties. J. W. Claiborne, superintendent of the River and Cape division, with office at Chaffee, Mo., has been appointed assistant superintendent of the Southwestern division at Sapulpa, Okla., vice W. H. Hutchison, assigned to other duties. C. F. Kirshner, assistant superintendent of station service of the Red River division, has been assigned to other duties, this position having been abolished. That part of the Red River division of the Frisco extending from Hope, Ark., to Ardmore, Okla., will be added to the Central division, effective November 15. C. H. Baltzell, superintendent of the Ozark division, at Thayer, Mo., will be transferred to the Central division as superintendent, with headquarters at Ft. Smith, Ark. W. G. Koch, superintendent of the General division, under the present organization, has been appointed assistant superintendent of the new division and will continue to have headquarters at Ft. Smith. The Northern division of the Frisco will be increased to include the Kansas division, effective November 15. O. H. McCarty, superintendent of the Northern division, will continue in that position for the Northern division, with headquarters at Ft. Scott, Kan. H. H. Brown, superintendent of the Kansas division, has been appointed superintendent of the Western division, with headquarters at Enid, Okla., vice C. T. Mason, transferred. B. S. Shirk, assistant superintendent of the Eastern division, at Springfield, Mo., has been appointed assistant superintendent of the Western division. J. W. Marring and George Bailey, assistant superintendents of the Western division, have been assigned to other duties. F. E. Branaman, assistant superintendent of the Eastern division as Springfield, Mo., has been appointed assistant superintendent of the Western division, with headquarters at Enid, Okla., vice J. W. Claiborne, transferred. C. T. Mason, superintendent of the Western division, at Enid, Okla., has been appointed assistant

superintendent of the Eastern division, vice B. S. Shirk. The position of assistant superintendent of station service of the Eastern division, has been abolished.

Engineering and Rolling Stock

J. H. Baker has been appointed roadmaster on the Crows Nest subdivision of the Canadian Pacific with headquarters at Lethbridge, Alta., in place of J. Carlson.

W. L. Kinsell, chief clerk to David Van Alostyne, assistant to the vice-president of the New York, New Haven & Hartford, has been appointed assistant shop superintendent at Readville, Mass.

J. M. Campbell, roadmaster of district 2 of the Manitoba division of the Canadian Pacific with headquarters at Winnipeg, Man., has joined the force of engineers which has left Canada to work on railways in Russia.

E. L. Landorph, resident engineer of district 2 of the Manitoba division of the Canadian Pacific with headquarters at Winnipeg, Man., has been appointed resident engineer of district 1 of the Manitoba division with office at Kenora, Ont., succeeding T. D. Ruggles, resigned.

J. L. Starkie has been appointed assistant engineer of the Atchison, Topeka & Santa Fe, with headquarters in Galveston, Tex., succeeding E. H. Olson. R. C. Emmett has been appointed acting roadmaster on the New Mexico division, with headquarters in Las Vegas, N. M., vice L. Lenehan.

M. E. Hamilton, northwest railroad representative of the Garlock Packing Company, with headquarters at St. Paul, Minn., has been appointed general air brake inspector of the St. Louis & San Francisco, effective November 1. Mr. Hamilton was formerly general air brake instructor on the Atchison, Topeka & Santa Fe.

Frank R. Judd, whose appointment as engineer of buildings of the Illinois Central has been announced in these columns, was born in Hamilton, Ont., on May 28, 1882. He attended the Chicago Manual Training School from 1896 to 1899, and entered railway service on October 18, 1899, with the Illinois Central. From that time until November, 1909, he did drafting and field work for the Illinois Central, the Chicago, Rock Island & Pacific, and the Crane Company of Chicago. From November, 1909, to December, 1913, he was chief draftsman of the bridge and building department of the Illinois Central, and from December, 1913, until February, 1915, was assistant engineer in charge of a joint depot and track elevation project at Memphis, Tenn. From February, 1915, to October, 1915, he was in charge of special surveys, track plans and building designs at Chicago. By virtue of his recent appointment he became engineer of buildings of the same railroad with office at Chicago.

Purchasing

F. B. Calhoun has been appointed division storekeeper of the Atchison, Topeka & Santa Fe, at Waynoka, Okla., vice Erle Preston. R. L. Stewart, division storekeeper at Dodge City, Kan., has been appointed division storekeeper at Wellington, Kan., vice Louis Mathiasmier, transferred to the Topeka general store. H. W. Hallenbeck, division storekeeper at Belen, N. M., has been transferred to Dodge City, vice R. L. Stewart. Erle Preston, division storekeeper at Waynoka, Okla., has been transferred to Belen, N. Mex., succeeding H. W. Hallenbeck.

George G. Yeomans, formerly assistant to the president of the Wabash, has been appointed purchasing agent of the New York, New Haven & Hartford, with headquarters at Boston, Mass., succeeding H. A. Fabian, resigned, effective November 15. Mr. Yeomans was in the service of the Chicago, Burlington & Quincy for 23 years, and during that period worked in practically every position in the purchasing agent's office, including the position of purchasing agent, which he filled for seven years. About 1905 he resigned to become assistant to President C. F. Delano, of the Wabash, leaving in 1911, when the road went into the hands of receivers. Since that time he has made a specialty of investigating methods of purchasing and handling supplies on various large roads, including the Santa Fe, the Baltimore & Ohio, the Chicago & North Western, the New York, New Haven & Hartford and others.

OBITUARY

R. S. Stephens, until June 1, 1913, purchasing agent at Houston, Tex., for the Galveston, Harrisburg & San Antonio, the Houston & Texas Central, and the Texas & New Orleans, died at his home in Houston on November 2.

Daniel Elliott, superintendent of the Plains division of the Atchison, Topeka & Santa Fe, died at his home in Amarillo, Tex., on October 19. He was born on October 19, 1856, in Northfield, Vt., and entered railway service at the age of sixteen. In 1882 he was employed by the Santa Fe for the first time as a brakeman on the Atchison branch. In less than a year he was promoted to yard foreman at Las Vegas, N. M., and later was appointed roadmaster with headquarters at the same place. In 1908 he was appointed superintendent of the Plains division, with office at Amarillo, Tex. Poor health forced him to retire from active service in July, 1915.

W. F. Allen

William Frederick Allen, general secretary of the American Railway Association and its predecessors, since 1875, and manager of the Official Rail-

W. F. Allen

way Guide since 1873, died on November 9 at his home in South Orange, N. J. Mr. Allen was one of the most widely known men in American railroad life. He was born October 9, 1846, at Bordentown, N. J., and received his education in the Bordentown Model School and the Episcopal Academy in Philadelphia. He began railway service in May, 1862, as a rodman in an engineering corps of the Camden & Amboy, becoming in May, 1863, assistant engineer of the same road. From February, 1868 to 1872, he was resident engineer of the West Jersey Railroad. In 1872 he entered the service of the National Railway Publication Company, and shortly afterwards was made assistant editor of the Official Railway Guide. In June, 1873, he became the editor and manager of the Guide, and has been at the head of it ever since. In April, 1875, he was appointed secretary of the General Time Convention and in October, 1877, of the Southern Railway Time Convention. In April, 1886, the American Railway Association succeeded these organizations and Mr. Allen continued as secretary; and in June, 1909, his title was made general secretary and treasurer which positions he held until his death.

In 1910 Mr. Allen was elected vice-president of the National Railway Publication Company and since 1914 had been its president. At the time of his death he was also secretary of the General Managers' Association of New York and the Bureau for the Safe Transportation of Explosives.

In his capacity as secretary of the American Railway Association Mr. Allen has become intimately acquainted with a larger number of railway managers than any other man in the country; and he has had a corresponding measure of influence. The presidency of the association has been held successively by different men, from different parts of the country, but the secretaryship has been a permanent feature, and his administration of the office has been an important element in the association's prosperity.

Outside the railroad world Mr. Allen was known chiefly as the "father of standard time." To him was referred for solution, in 1881, the problem of working out a standard of time reckoning that would obviate the confusion resulting from the use of the fifty-odd standards then prevailing on the railroads in the United States. His report was submitted to the Association in 1883. It provided for an elastic boundary line between the hour zones, instead of a strictly longitudinal division; and

in its details fixed every point at which the hour change was to be made, and embodied every practical provision for putting the system into immediate effect. The report was unanimously endorsed by the Association, and Mr. Allen thereupon accomplished the unique diplomatic task of securing its adoption by the numerous diverse interests whose approval was essential to success. In this work he had the co-operation of the Cambridge and the National Observatories.

The change in the operating time tables of the many different railroads was made at noon, eastern time, on Sunday, November 18, 1883, without delay or disturbance. For this achievement Mr. Allen was elected to honorary membership in many American and foreign scientific societies, and received the honorary degree of master of science from Princeton University. Mr. Allen was a delegate of the United States Government to the International Meridian Conference in 1884, and to the International Railway Congress at Paris in 1900. He was a delegate of the American Railway Association to the International Railway Congresses at London, 1895; Paris, 1900; Washington, 1905; Berne, 1910. Since 1910 he has been a member of the Permanent Commission of the Congress Association.

In 1905 he had charge of all the arrangements for the session at Washington. For his services in connection with the Congress he was decorated by the order of Leopold by the Belgian government.

James F. DeVoy, assistant superintendent of motive power for the Chicago, Milwaukee & St. Paul, at Milwaukee, Wis., died at his home in that city on November 5, following an illness of eight months. He was born in Ithaca, N. Y., on June 23, 1866, and graduated from Cornell University in 1888. During his college career he won distinction not only as a football player and crew man, but as an honor student in the college of mechanical engineering. Following his graduation he entered the service of the New York Central in its mechanical department, where he remained for seven years. He was then employed by the American Locomotive Company both at Dunkirk, N. Y., and Schenectady.

J. F. DeVoy

Fifteen years ago he came to Milwaukee as chief draftsman in the mechanical department of the Chicago, Milwaukee & St. Paul. On September 1, 1902, he was promoted to mechanical engineer, and on April 15, 1910, he was appointed assistant superintendent of motive power. At the time of his death he was a member of the executive committee of the American Railway Master Mechanics' Association, a member of the committee on design, maintenance and operation of electric rolling stock and also a member of the committee on brake shoes and brake beam equipment and the coupler committee of the Master Car Builders' Association. From 1910 to 1911, he was president of the Western Railway Club.

LOST.—The San Pedro, Los Angeles & Salt Lake, the "Salt Lake Route," has issued a "Special Bulletin on Freight Handling," which says: "LOST, between Salt Lake City, Utah, and East San Pedro, California, since 1910, through a hole in the treasury known as the 'freight claim leak,' a quarter of a million dollars. Owner, Salt Lake Route. No reward; it is gone forever. . . . A freight claim payment does nobody good. It does not even put the claimant in statu quo. He may have lost a customer, the customer a sale. An engineman receiving \$6 a day who, by rough handling, causes a freight claim of \$10 would better have lain off that day. A trainman drawing \$100 a month who causes \$150 damage to merchandise can count that month lost, so far as his value as a revenue producer is concerned.—Howard Elliott, Salt Lake Route.

Equipment and Supplies

LOCOMOTIVE BUILDING

THE ERIE is in the market for 10 Pacific type locomotives.

THE CHICAGO & EASTERN ILLINOIS will purchase five Mikado type locomotives.

THE STANDARD OIL COMPANY, Whiting, Ind., has issued an inquiry for another locomotive.

THE NEW YORK, NEW HAVEN & HARTFORD has issued inquiries for 30 Mikado type locomotives.

THE TOLEDO, ST. LOUIS & WESTERN is inquiring for prices on five Consolidation type locomotives.

THE MOBILE & OHIO has ordered one Mikado type locomotive from the Baldwin Locomotive Works.

THE KIN HAN RAILWAY is inquiring for a number of ten-wheel locomotives.

THE GEORGIA SOUTHERN & FLORIDA, recently reported as being in the market for two passenger locomotives, has ordered two ten-wheel locomotives from the Baldwin Locomotive Works.

THE DES MOINES UNION has ordered 2 six-wheel switching locomotives from the Baldwin Locomotive Works.

THE YOUNGSTOWN SHEET & TUBE COMPANY has ordered two six-wheel switching locomotives from the Baldwin Locomotive Works.

THE BIRMINGHAM SOUTHERN is inquiring for prices on two six-wheel switching locomotives and one Consolidation type locomotive.

THE PENNSYLVANIA RAILROAD, which recently placed an order for 75 Mikado type locomotives with the Baldwin Locomotive Works, has issued additional inquiries for 155 more locomotives, including 45 freight and 60 switching locomotives for the Lines East, and 50 freight locomotives for the Lines West of Pittsburgh. With the 75 engines already contracted for this makes a total of 230 locomotives. It is also further reported that the Pennsylvania Lines West have ordered 53 Consolidation type locomotives from the Lima Locomotive Corporation and 10 Consolidation type locomotives from the American Locomotive Company, but this item has not been confirmed.

THE ATCHISON, TOPEKA & SANTA FE, as stated recently, ordered 30 Mikado type superheater locomotives from the Baldwin Locomotive Works, all of which will have 25-in. by 32-in. cylinders, 57-in. driving wheels, a boiler pressure of 200 lb., a weight on driving wheels of 220,200 lb., a tractive effort of 59,600 lb., and a total weight in working order of 283,700 lb. The locomotives will be oil burners. The tenders will have six-wheel trucks, 10,000-gallon water tanks, and 3,300-gallon oil tanks.

CAR BUILDING

THE VIRGINIAN has issued inquiries for 250 40-ton box cars.

THE DULUTH & IRON RANGE is inquiring for 750 50-ton ore cars.

THE LEHIGH VALLEY is negotiating for the purchase of two dining cars.

THE CONSOLIDATION COAL COMPANY is in the market for 1,400 Gondola cars.

THE DULUTH, MISSABE & NORTHERN is inquiring for 1,000 50-ton ore cars.

THE CHICAGO, BURLINGTON & QUINCY is in the market for 54 passenger train cars.

THE WESTERN PACIFIC has ordered 1,000 40-ton box cars from the Pullman Company.

THE PHILADELPHIA & READING has ordered 20 coaches and 10

combination cars from the Harlan & Hollingsworth Corporation.

THE CHICAGO, ROCK ISLAND & PACIFIC has cancelled its inquiry for 500 center constructions.

THE NEW YORK, ONTARIO & WESTERN is contemplating the purchase of possibly 500 freight cars.

THE NEW YORK, NEW HAVEN & HARTFORD is in the market for 20 milk cars and 50 refrigerator cars.

THE ERIE has cancelled an order for 200 automobile cars recently given the Pressed Steel Car Company.

SWIFT & Co., of Chicago, have ordered 150 center constructions from the Western Steel Car & Foundry Company.

THE BINGHAM & GARFIELD was reported in last week's issue as being in the market for 125 freight cars. These include 100 ore and 25 gondola cars.

THE MONTOUR RAILROAD is reported to have given the Standard Steel Car Company an order for 800 steel car bodies. This item has not been confirmed.

THE PENNSYLVANIA EQUIPMENT COMPANY is in the market for five 50-ton capacity flat bottom gondola cars either all steel or with steel underframes and strong wooden bodies.

THE DELAWARE, LACKAWANNA & WESTERN is in the market for 10 60-ft. express cars and 2 dining cars, and, as previously noted, will also purchase 1,000 box and 500 gondola cars.

THE MISSOURI, KANSAS & TEXAS, as stated last week, is inquiring for prices on 2,000 coal cars. The specifications provide for gondola cars, 41 ft. long, with a capacity of 50 tons.

THE FRENCH GOVERNMENT has ordered 1,000 four-wheel box cars from the Standard Steel Car Company. The cars will be built at the plant of the Keith Car & Manufacturing Company, Sagamore, Mass.

THE MUSCATINE & IOWA CITY has ordered 4 R. E. 70-B-11 gas electric motor cars from the General Electric Company, and will also purchase some gas-electric locomotives. See item in Railway Financial News.

THE INTERBOROUGH RAPID TRANSIT has issued inquiries for 311 steel subway cars for use on the company's new lines in the boroughs of Bronx and Queens. Included there are 234 motor cars and 77 trailers.

THE LOUISVILLE & NASHVILLE has ordered 400 underframes from the Pressed Steel Car Company. They are to be used, it is understood, for 400 gondola cars, reported in last week's issue, which the company will build in its own shops.

THE TORONTO SUBURBAN has ordered six steel coaches from the Preston Car & Coach Company, Limited. These will be center entrance interurban cars, 61 ft. long over vestibules; they will be mounted on Standard Motor Truck Company trucks, and will be equipped for 1,500 volt D. C.

THE LAKE ERIE & WESTERN has ordered eight steel frame coaches from the Preston Car & Coach Company, Limited. The cars will be 60 ft. long, will be mounted on Baldwin trucks, and will have all the features of a steam coach, including end doors, buffing attachments and M. C. B. draw bars. They are equipped for 1,500 volt D. C. with multiple unit control, and automatic air brakes.

THE PENNSYLVANIA'S inquiry for freight cars, mentioned in last week's issue, includes 1,000 box and 5,000 gondola cars for the Lines East, and 1,000 automobile box and 2,000 gondola cars for the Lines West of Pittsburgh, a total of 9,000 cars. Inquiries have also been issued for 240 passenger cars, including 100 coaches, 20 passenger and baggage cars, 55 baggage cars and 5 horse express cars, a total of 180 passenger train cars, for the Lines East, and for 18 coaches, 4 passenger and baggage cars, 6 dining cars, 12 baggage and mail cars and 20 baggage cars, a total of 60 cars, for the Lines West.

IRON AND STEEL

THE MAINE CENTRAL is in the market for 10,000 tons of rails.

THE BALTIMORE & OHIO is inquiring for 300 tons of steel for a small pier shed.

THE CHESAPEAKE & OHIO has ordered 2,250 tons of rails from the Pennsylvania Steel Company.

THE NORFOLK & WESTERN is inquiring for prices on 2,000 tons of steel for a pier shed at Norfolk, Va.

THE CINCINNATI, HAMILTON & DAYTON is regarded to have ordered 6,000 tons of rails from the Steel Corporation.

THE CHICAGO & NORTH WESTERN has ordered 405 tons of steel from the Allen & Milwaukee Bridge Company for a terminal grain elevator at Milwaukee, Wis.

THE CHICAGO, ROCK ISLAND & PACIFIC.—Jacob M. Dickinson, receiver, has been authorized by the Federal Court to purchase 40,000 tons of rails for 1916 delivery.

THE DULUTH & IRON RANGE has ordered 10,000 tons of steel for an ore dock at Two Harbors, Minn., the contract to include approaches, ore spouts, doors and fittings.

THE CHICAGO, MILWAUKEE & ST. PAUL has ordered 110 tons of steel from the American Bridge Company, to be used for two 49-ft. approach spans and intermediate floor beams.

THE NASHVILLE, CHATTANOOGA & ST. LOUIS is reported to have ordered 7,000 tons of rails from the Tennessee Coal, Iron & Railroad Company in addition to orders previously placed.

THE ILLINOIS CENTRAL, reported in the *Railway Age Gazette* of October 22 as having ordered 15,000 tons of rails from the Illinois Steel Company, and in the October 29 issue as having ordered an additional 5,000 tons from the same company, has increased its order to include another 10,000 tons. As the company has also ordered 15,000 tons of rails from the Tennessee Coal, Iron & Railroad Company, this makes a total of 45,000 tons.

SIGNALING

The Union Pacific will install approximately seven miles of two-arm, lower-quadrant Union Switch & Signal Company, style B, automatic block signals between East Ogden, Utah, and Gateway, on the line which has recently been double-tracked.

The Galveston, Harrisburg & San Antonio will shortly begin the construction of a 16-lever mechanical interlocking plant, with full approach and detector locking, at the crossing of its line with the International & Great Northern, at San Antonio, Tex.

BRITISH RAILWAY MEN ENLIST WITHOUT PERMISSION.—Although strict injunctions have been laid down by the Railway Executive Committee stipulating that railway men must not offer themselves for military or naval service without first obtaining the permission of their superior officer, many cases have, nevertheless, occurred in the different branches where men have taken the matter into their own hands and enlisted without troubling to inquire whether or not their services could be spared. In the majority of cases, up to the present, no action has been taken to bring these men back to their ordinary duties, the only difference drawn between members who have obtained permission and those who have not, being that in the latter case all connection with the company has been severed and the men entered up in the staff books as resigned. The efficient carrying on of transport work is quite as important to the country as the manufacture of munitions, and it is a mistaken idea of patriotism which prompts the men thus to desert.—*Railway Gazette, London*

THE RAILWAY MEN OF THE SOUTH AFRICAN RAILWAYS WITH THE COLORS.—According to the annual report of the Union of South African Railways, out of a white staff of 31,000, 3,922 men, or 12 per cent, were on active service during the recent rebellion. The South African Engineer Corps, a unit of 650 strong, under the command of two railway officials was composed almost entirely of railway officers. The duties performed by the corps were of the first importance to the success of the operations. At the outset it was faced with difficulties in landing heavy railway material and rolling stock at places where such appliances, as existed, had been largely destroyed. The work of discharge had to be completed hurriedly to enable work to be started on shore, and many contrivances were resorted to in connection with the landing work. Extensive repairs to existing railways, damaged by the enemy, had to be undertaken. For one short section of 10 miles the huc was damaged in 900 places.

Supply Trade News

Elmer B. Vau Patten has been appointed sales representative of the Acme Supply Company, with headquarters at Chicago, Ill.

R. W. Burnett, for many years general master car builder of the Canadian Pacific, has been elected vice-president of the National Car Equipment Company, of Chicago, Ill.

The Toledo Scale Company announces that H. O. Hem, formerly of Kansas City, Mo., has become a member of its engineering staff in the capacity of consulting engineer, and has opened office at Toledo, Ohio.

Guy E. Tripp, chairman of the Westinghouse Electric & Manufacturing Company, is quoted as saying: "The total of war orders booked by Westinghouse Electric and subsidiaries amounts to approximately \$94,000,000. This includes firm orders, orders subject to cancellation for undelivered goods by payment of an agreed profit, and orders subject to cancellation on undelivered goods on three months' notice to stop work. Out of a total of \$18,695,000 5 per cent convertible bonds issued, approximately \$11,500,000 have already been converted."

Judge Hazel in the United States circuit court for the western district of New York on November 4 handed down a decision holding that the present standard car lighting equipment, involving the use of an ampere-hour meter to control battery charging, as put out by the U. S. Light & Heat Corporation, Niagara Falls, N. Y., does not come under the injunction or the accounting ordered in the prior decision sustaining the Creveling Patent 747,686 recently handed down also by Judge Hazel. It was maintained by the owners of this patent that the decision was broad enough to cover the use of the ampere-hour meter system of car lighting as put out by the U. S. Light & Heat Corporation, and it was sought to bring this system into the accounting ordered by the court.

The United States circuit court of appeals for the fourth circuit, at Richmond, Va., on November 6 handed down a decision affirming that of District Judge Rose, of Baltimore, in the suit of John B. Tate v. the Baltimore & Ohio, directing a verdict for the defendant. The Tate Patent sued on, No. 643,560, dated February 13, 1900, which was for a furnace bearer or expansion pad, was held by Judge Rose and by the court of appeals to be invalid and fully anticipated by the Sharp British Patent No. 3558 of 1879. The decision is of importance to a number of railroads, as the suit was an attempt to cover, and collect damages of \$22,477.50 for, the use of the well-known expansion attachment of the firebox to the frames through the mud ring instead of through the side sheets, and if the decision of the court of appeals had been adverse to the Baltimore & Ohio, other of the numerous roads using this attachment, which has been applied to locomotives in the United States as early as 1862, would doubtless have been attacked. The case was argued by O. E. Edwards, Jr., of New York, for the plaintiff, Tate, and by William A. Redding and J. Snowden Bell, of New York, for the Baltimore & Ohio.

TRADE PUBLICATIONS

SELF ROTATING HAMMER DRILLS.—The Chicago Pneumatic Tool Company, Chicago, has issued a booklet describing its "Hammer" drills for drilling rock and similar work. This booklet describes in detail and illustrates the various parts of this apparatus.

IRON PIPE.—The A. M. Byers Company has recently issued Bulletin No. 26, dealing with the excellencies of Byers genuine wrought iron black and galvanized tubing, casing, line pipe and drive pipe. The bulletin contains considerable useful information about Byers pipe, such as its resistance to corrosion, fabricating qualities, welding qualities, specifications for genuine wrought iron pipe and details about hand puddling, rolling of muck bar, skelp, etc. In the back of the book are complete tables showing not only list prices, but dimensions, areas, hydrostatic tests, etc. There are also given specific cases showing the superior rust resistance of Byers in the same service as cheaper grades of pipe.

Railway Construction

ALTUS, ROSWELL & PACIFIC.—Construction work is to be resumed, it is said, on the first section of about 100 miles between Memphis, Tex., and Lubbock. This line was projected in 1911. The plans call for building an extension from Lubbock west to Roswell, N. M., also an extension east to Altus, Okla. T. C. Nobles, Houston and associates are back of the project.

CANADIAN GOVERNMENT RAILWAYS.—According to press reports, surveys are now being made by the Intercolonial from Painsec, N. B., through Baie Verte, Tidnish and Pugwash, thence to Truro, N. S., for a revised location for portions of the line. The surveys between Truro and the Nova Scotia-New Brunswick boundary are about finished and survey work on the section in New Brunswick will be finished in December.

It is reported that the National Transcontinental will build about three miles of line to the proposed site of a large pulp mill to be built at Neclands, Ont., which is 30 miles west of Cochrane.

CANADIAN NORTHERN.—Train service on the Ontario division has been extended from Reul, Algoma, northwest to Port Arthur, 543 miles. The Carlton subdivision of the Western division has been extended from Laird, Sask., west to Carlton, eight miles.

DETROIT, BAY CITY & WESTERN.—This road has been extended from Sandusky, Mich., south to Peck, 11 miles.

EDMONTON, DUNVEGAN & BRITISH COLUMBIA.—Work is now under way on the branch line from Spirit river, Alta., to the Grand Prairie settlement. J. Timothy is the contractor. The route is from Spirit river settlement, thence crossing Burnt river and Bad Seal river, and via Lake Clermont to Grand Prairie City on the Beaver river, 60 miles. The maximum grade will be 1 per cent and the maximum curvature 6 deg. The only difficult work on the line will be at the crossing of Saddle mountain. The grading work is about 60 per cent finished, and is expected to be completed by December of this year, and track laying will be completed early in 1916. (Oct. 15, p. 714.)

FARNHAM & GRANBY.—Application is being made to the Dominion parliament for an extension of time, it is said, to build the projected line from the Canadian Pacific, near Farnham, Que., north to Granby, thence northeasterly to Windsor Mills or to Richmond, about 60 miles. Pringle, Thompson, Burgess & Cote, Ottawa, Ont., are solicitors for applicants. (March 13, p. 555.)

GULF, COLORADO & SANTA FE.—Bids were received recently, it is said, for rebuilding the Gulf and Interstate division from High Island, Tex., to Port Bolivar, 27 miles, to replace the damage caused by storm and flood. It is probable that the line will be constructed over a new route to extend along East Galveston bay instead of along the shore of the Gulf of Mexico. This will increase the distance three or four miles.

INTERCOLONIAL RAILWAY.—See Canadian Government Railways.

JACKSON-TINNEY LUMBER COMPANY'S LINE.—This company is planning to build a logging road, about six miles long, extending southwest from Wadley, Ala. Contracts for the work are to be let at once. W. J. Tinney, president, Talladega, Ala.

KANSAS CITY & TIFFANY SPRINGS.—This company was incorporated under the Missouri laws on November 2, and proposes to construct a railway from Kansas City, Mo., to Tiffany Springs, Platte county, a distance of about 15 miles. The incorporators are T. N. Smith, Charles J. Smith, Bayless Steele and C. W. Chandler, of Kansas City, Mo.; J. N. Baird and Henry G. Post, Kansas City, Kan., and Robert Engelman, of Parkville, Mo.

LINVILLE RIVER.—An officer writes that work is now under way on the extension from the existing line at Montezuma, N. C., which has an altitude of 3,800 ft., via Grand Father mountain to Shulls Mills on Watauga river, 14 miles. The work is being carried out by H. C. McCrary, Knoxville, Tenn., and involves handling about 10,000 cu. yd. to the mile. The maximum grade

is 3½ per cent and the maximum curvature 22 deg. Some of the track has already been laid on the extension. The principal commodities the line will carry are lumber, bark and wood. The company now operates a 14-mile line from Pineola, northwest via Montezuma to Cranberry, where connection is made with the East Tennessee & Western North Carolina. (Nov. 5, p. 879.)

McComb & Magnolia Railway & Light Company.—See Mississippi Roads.

MISSISSIPPI ROADS (ELECTRIC).—Surveys are now being made by X. A. Kramer, Magnolia, Miss., it is said, for an interurban electric line to be built from Summit, Miss., south via McComb and Fernwood to Magnolia, about 12 miles. G. M. Walker, New York, is said to be interested. The McComb & Magnolia Railway & Light Company is said to have been incorporated recently with a capital of \$500,000, by M. R. Walker, S. M. Jones and others.

MUSCATINE & IOWA CITY.—This company has been incorporated for the purpose of operating a railway between Muscatine, Iowa, and Iowa City. The capital is \$400,000, of which \$100,000 will be common, and \$300,000 preferred stock.

NASHVILLE & EASTERN ELECTRIC.—An incorporator of this company is reported as saying that construction work will be started at once on an electric line from a connection with the Nashville, Chattanooga & St. Louis, at Lebanon, Tenn., south-east to Smithville, about 35 miles. The Myers Construction Company of Chicago is to build the line. (See Tennessee Roads, July 2, p. 39.)

NEW YORK SUBWAYS.—The New York Public Service Commission, First district, has approved the award by the New York Municipal Railway Corporation of a contract to Connors Brothers Company, Inc., the lowest bidder, at \$726,168, for the construction of the second section of the new elevated railroad in Jamaica avenue. The work will include the erection of the steel work between Walnut street and Cliffside avenue, in the borough of Queens. (October 15, p. 714.)

The commission has approved the award of a contract by the New York Municipal Railway Corporation to the Charles A. Myers Contracting Company, Inc., for grading, removing existing tracks, laying new tracks and special work, installing contact rail and other electrical work, etc., in the improvements now being made by the company in the Fresh Pond yard in the borough of Queens. The contract amounts to \$17,123.

Bids are wanted by the commission on November 23, for track installation on the White Plains Road extension of the existing subway. The White Plains Road extension is a three-track elevated line from the terminus of the Lenox avenue branch of the existing subway at One Hundred and Eightieth street, north to Two Hundred and Forty-first street, near the northern city boundary, in the borough of the Bronx.

OCILLA SOUTHERN.—The section of this road between Rochelle, Ga., and Hawkinsville, via Pope City, 25 miles, has been opened for business. (April 30, p. 955.)

OIL FIELDS & SANTA FE. The connecting links of this road—from Pemeta, Okla., to Oilton, and from Pemeta to Drumwright, have been completed.

OREGON, CALIFORNIA & EASTERN.—Surveying work is now in progress on this road under the direction of N. H. Bogue. The maximum grade will not exceed 2 per cent, and the maximum curvature 8 deg. The grading cost is estimated at \$6,000 per mile. Robert E. Strahorn, president, Portland, Ore. (October 22, p. 779.)

PIEDMONT & NORTHERN (ELECTRIC).—A contract is reported let to the Charlotte Construction Company, and work is now under way on the construction of a branch from Belmont Junction, N. C., to Belmont, four miles. A sub-contract for grading work is reported let to P. R. Huffstetler, Gastonia, N. C.

RAILWAY VALLEY RAILWAY.—This company is building, with its own forces, a one-mile branch from Morris avenue, Springfield, N. J., to Vauxhall Road.

SAPULPA & OIL FIELDS (ELECTRIC). This road is being built from Depew, Okla., to Drumwright, a distance of 16.4 miles. Approximately 5 per cent of the grading has been completed under the direction of Joseph T. Lantry, superintendent of construction. About 25,000 cu. yds. of material is being handled per

mile. J. A. Frates, general superintendent of the first district of the St. Louis & San Francisco, at Springfield, Mo., is president of the road. J. T. Lantry may be reached at Tulsa, Okla.

TEANAWAY LOGGING RAILWAY.—Incorporated in the state of Washington by the Cascade Lumber Company, which owns a large mill in North Yakima, Wash., and has extensive timber holdings in the Cascade mountains, to build a 12-mile logging road to connect with the Northern Pacific main line, also to build seven or eight miles of branches. R. E. Slaughter, president, Hudson, Wis.

TEXAS ROADS.—A proposition has been submitted to residents of Krum, Tex., and Denton for the construction of a short railroad between these two places, which would connect the Gulf, Colorado & Santa Fe with the Texas & Pacific. It is understood that work will be started on the line in the near future. E. P. Turner, Dallas and associates are back of the project.

TORONTO SUBURBAN (ELECTRIC).—Track has been laid, it is said, on the extension from Lambton, Ont., to Guelph, 46 miles, over the Humber river bridge, to the junction with the present line on Dundas street at Lambton park, and ballasting work is now under way. Sub-stations are also being put up at Georgetown and at Guelph and a car barn is being built at Lambton park. The company expects to let contracts for the catenary line equipment in the near future. (May 14, p. 1034.)

WISCONSIN & NORTHERN.—This road has been extended from Van Ostrand, Wis., north to Lily, 13.1 miles. (May 28, p. 1140.)

RAILWAY STRUCTURES

ADEL, GA.—Construction work has been started on a new station in Adel, it is said, for the Georgia & Florida.

ARDMORE, OKLA.—The Oklahoma, New Mexico & Pacific has let a contract for a combination shop and engine house to Redpath & Co., of this city. The building will have a concrete foundation, galvanized iron sides and Genasco roof. Its dimensions will be 70 ft. by 80. About 70 per cent of the work has been completed, and the approximate cost is estimated at \$6,000. W. J. Stoneburner, Ardmore, Okla., general superintendent; W. T. Buck, Ft. Worth, Tex., architect.

BELLEVILLE, ONT.—Application has been made by the Canadian Pacific for an order to elevate the tracks within the city of Belleville to allow for the construction of subways and for building an interswitching track with the Canadian Northern Ontario.

BELMONT, N. C.—According to press reports the Piedmont & Northern is planning to build a combined freight and passenger station at Belmont.

BROOKLYN, N. Y.—The New York Public Service Commission, First district, has denied the request of the New York Municipal Railway Corporation for permission to let the contract for the construction of the Coney Island terminal to the George W. McNulty Company without competitive bidding. (Nov. 5, p. 880.)

The commission has opened bids for the construction of station finish for 11 stations on the New Utrecht avenue elevated line in the borough of Brooklyn. (October 29, p. 829.)

COUNCIL BLUFFS, IOWA.—The Roberts & Schaefer Company, of Chicago, has been awarded a contract by the Chicago Great Western for a fireproof coaling plant of 100 tons capacity, to be a duplicate of the plant now being built for the railroad at Clarion, Ia.

DALLAS, TEX.—The Union Terminal Company is drawing up plans for a power plant, to cost about \$10,000, and two signal towers, to cost \$20,000. They will be of reinforced concrete and steel construction.

DARLING, ONT.—According to press reports a contract has been let to the Foundation Company, Montreal, Que., for building a bridge at Darling, on the Toronto-Sudbury line of the Canadian Pacific. The cost of the new structure will be about \$50,000.

DERRY, PA.—The Pennsylvania Railroad will rebuild the engine house at Derry, at a cost of \$35,000. This is a renewal of the present facilities, and the work will be carried to completion this year.

FRECPORT, PA.—The Pennsylvania Railroad has given a contract to the Henry Shenk Company, Pittsburgh, Pa., for building a new freight station at Freeport.

GALLUP, N. M.—The Atchison, Topeka & Santa Fe is preparing preliminary sketches for a combination depot, hotel, refinery and office building, to be approximately 250 ft. by 60 ft., and two stories in height.

GRAY BULL, WYO.—Fire damaged the Chicago, Burlington & Quincy roundhouse recently. Plans are being prepared to repair the building.

MOUNT VERNON, N. Y.—The New York Central has let to the R. H. Howes Construction Company, 105 West Fortieth street, New York City, the contract for a new passenger station in this city. Piles for the foundation are being driven, and work on the station proper will be begun within a few weeks. The building is to be modern Italian Renaissance, of rough texture brick, limestone trimmings and tile roof. This building is on the new four-track line (nearer the Bronx river than the present two-track line), which was begun over four years ago and which is just now being finished.

NASHVILLE, TENN.—The Nashville, Chattanooga & St. Louis, the Nashville Railway & Lighting Company and the city of Nashville will replace the present steel girder bridge over Cedar street, used as an overhead crossing by the railroad, it is said, with a concrete slab structure, to be about 78 ft. long. The old masonry abutments will be used as part of the new abutments. Plans for this improvement are being made by the railroad company's engineering staff, but the work will be carried out by contracts under the supervision of the city engineer.

NEWKIRK, OKLA.—The Atchison, Topcka & Santa Fe has sent plans and specifications for a combination depot to prospective bidders. The building will be approximately 178 ft. by 43 ft., will have brick walls and tile roof, and will cost about \$20,000.

PILOT ROCK JUNCTION, ORE.—The Oregon-Washington Railroad & Navigation Company has awarded a contract to the Roberts & Schaefer Company, of Chicago, for the construction of a 250-ton, standard counterbalanced bucket locomotive coaling station. The plant will be of reinforced concrete construction, and will be equipped to weigh all coal before passing it to tenders.

REGINA, SASK.—An officer of the Grand Trunk Pacific is quoted as saying that this road expects to proceed with the construction early next spring, of the terminal facilities at Regina and at three other points in the province of Saskatchewan, under an agreement with the provincial government.

SPRINGFIELD, MO.—Fire of unknown origin destroyed the mill, shop and coach repair department of the St. Louis & San Francisco reclamation plant on November 2. Four passenger coaches were lost.

TAYLORVILLE, ILL.—A fire, which originated in the boiler room of the Chicago & Illinois Midland shops on November 4, destroyed the roundhouse, car shops, offices and storerooms. Two locomotives also were damaged. The company plans to replace the structures as soon as possible. The loss incurred is not definitely known, but it is estimated at from \$65,000 to \$80,000.

WINDBER, PA.—New freight and passenger facilities for the Pennsylvania Railroad have been authorized for Windber, at an estimated cost of \$12,000. The freight facilities will be separate from the passenger facilities. Bids have been received for the erection of a freight station, and the contract for this work will work will be undertaken on the passenger station.

NORWEGIAN STATE RAILWAYS.—The state railway construction in Norway is progressing on a very large scale, although some of the important work now in hand will not be completed at the time originally intended. Thus the Doore railway and the Ramna railway were to have been ready in 1917, but neither undertaking will be completed at that time. According to the railway plan of 1908 the railways which it comprised were calculated to cost \$13,600,000, but the actual expenditure has now been put at \$23,200,000. Alterations and further new lines, which have been decided on later, were calculated to entail an aggregate expenditure of \$9,400,000, but they will, it has transpired, cost some \$2,700,000 more than originally calculated.

Railway Financial News

BIRMINGHAM, ENDSLEY & BESSEMER.—This property was sold under foreclosure recently and bought for \$700,000 by J. D. Kirkpatrick, representing the bondholders' committee.

CHICAGO, ROCK ISLAND & PACIFIC.—N. L. Amster has been elected chairman of the executive committee, succeeding T. M. Schumacher. John G. Shedd, J. S. Morron, N. J. French, Charles Hayden, Charles G. Dawes and E. D. Hulbert are the other members of the executive committee.

KANSAS CITY, MEXICO & ORIENT.—An application has been made to the Kansas Public Utilities Commission for permission to issue \$51,238,000 securities by a new company which is to take over the Kansas City, Mexico & Orient, now in the hands of receivers.

LEWISBURG & NORTHERN.—See Louisville & Nashville.

LOUISVILLE & NASHVILLE.—This company has taken over the Lewisburg & Northern. The Lewisburg & Northern runs from Bentwood, Tenn., to the Alabama state line.

MISSOURI, KANSAS & TEXAS.—All interest due November 1 on Missouri Pacific certificates was suspended, there being a provision for 30 days' grace in interest on the \$19,000,000 6 per cent notes and six months' grace on the Missouri, Kansas & Texas extension 5 per cent bonds, the Missouri, Kansas & Oklahoma first mortgage 5 per cent bonds, the Dallas & Waco first mortgage 5 per cent bonds and the Boonville Railroad Bridge first mortgage 5 per cent bonds.

SOUTHERN PACIFIC.—Reports have been current for some time that a syndicate was being formed for the purchase of \$38,292,400 Southern Pacific stock, which was sold by the Union Pacific to the Pennsylvania Railroad. The firms whose names have been connected with this syndicate by report are Kuhn, Loeb & Co., Hallgarten & Co., Hayden, Stone & Co. and Bernard M. Baruch. It is said that the Pennsylvania has not accepted any offer made by any syndicate so far.

THE MUSCATINE & IOWA CITY.—As was briefly indicated last week, this company was incorporated under the laws of Iowa on October 25, and has leased from Chicago, Rock Island & Pacific the line that extends from Muscatine, Iowa, to Montezuma, 87.3 miles; the line from Thornburg, Iowa, to What Cheer, 4.7 miles, and the line from Iowa Junction, Iowa, to Iowa City, a distance of 11.8 miles. The Muscatine & Iowa City will take over this property on January 1, 1916, under a lease of 50 years, and will operate and maintain it exclusively, the Rock Island withdrawing all of its service. The new road will conduct freight, passenger, express, mail and all other forms of common carrier business, and will use for passenger service General Electric Company self-propelled gasoline electric motor cars of the G. E. type, R. E. 70-B-11, four of which have been ordered. For freight purposes gas electric locomotives of the G. E. type 404-G-114-4-GE-205-D will be used. Temporarily steam will be the motive power. The officers of the new corporation are as follows: A. D. Bowen, president; F. O. Block, vice-president; S. W. Mercer, vice-president; W. R. Jayne, secretary; E. L. McCole, treasurer; C. D. Van Hecke, general manager. The main offices of the company are in the Hershey building, Muscatine, Iowa.

WABASH.—The secretary of state of Missouri has declined to grant a license to the new Wabash Railway Company to operate in Missouri, on the ground that an act of the Missouri legislature of April, 1913, prohibits such operation unless the railroad is incorporated in the state. He has therefore returned to the company the check for \$19,665, tendered in payment of the license fee. The secretary of state offered, however, to assist in having the matter presented to the courts in case the railroad is of the opinion that the statute is not applicable. President Kearney has announced that the decision of the secretary of state will not interfere with the operation of the road, and that probably action will be taken as soon as possible to test the law.

ANNUAL REPORT

MINNEAPOLIS, ST. PAUL & SAULT STE. MARIE RAILWAY COMPANY—TWENTY-SEVENTH ANNUAL REPORT

FOR THE FISCAL YEAR ENDED JUNE 30, 1915

Including Chicago Division (Wisconsin Central)

Submitted herewith is a report for the fiscal year ended June 30, 1915. The Gross Earnings, Operating Expenses, Fixed Charges, Surplus, etc., are as shown in the following condensed statement.

	Soo Line.	Chicago Division.	Soo Line System.
Gross Earnings	\$17,817,855.04	\$9,945,369.76	\$27,763,224.80
Operating Expenses.....	11,059,594.21	6,751,779.60	17,811,373.81
Net Earnings.....	\$6,758,260.83	\$3,193,590.16	\$9,951,850.99
Income from other sources..	1,043,965.49	61,280.75	1,105,246.24
Total Income.....	\$7,802,226.32	\$3,254,870.91	\$11,057,097.23
Fixed Charges, Taxes, etc...	4,828,222.39	3,118,138.78	7,946,361.17

Surplus Income..... \$2,974,003.93 \$136,732.13 \$3,110,736.06
 Dealing with the entire system and comparing the year's results with those of the preceding year, the Gross Earnings decreased \$1,542,997.79, Net Earnings decreased \$112.90, and the Surplus Income decreased \$260,462.26. The decrease in Freight Revenue was \$580,633.33, largely due to decreased shipments of lumber, manufactured iron, machinery, building materials and agricultural implements. Attention has been called in previous reports to the increase in live stock shipments; there was a further increase during the year. Shipments of iron ore also show an increase and with the development of the Cuyuna Range there should be a continued increase in shipments of this commodity.

The decrease in Passenger Revenue was \$859,153.95, due to depressed business conditions, but it has been found impossible to materially reduce the passenger train expenses. Your attention is called to the fact that while the Passenger Revenue decreased thirteen per cent, the decrease in miles run by passenger trains was but five and one-half per cent.

Maintenance expense shows a decrease of \$904,685.14. Owing to the decreased business handled our facilities have not been fully employed. The large expenditures in previous years for permanent bridge and road work and for new equipment have contributed to the reductions in Maintenance expenses.

Transportation expenses show a decrease of \$466,075.90, caused partly by decrease in business handled. Every effort consistent with the safe conduct of the business has been made to reduce transportation expenses.

During the year the company purchased the railroad and property of the Fairmount & Veblen Railway Company, extending from Fairmount, North Dakota, to Grenville, South Dakota, a distance of 87 miles, and commenced operation of same July 1st, 1915. The company also purchased the railroad and railroad property of the Minnesota Northwestern Electric Railway Company, extending northeast from Thief River Falls, Minnesota, a distance of 18.55 miles. The Minnesota Northwestern Electric Railway Company will continue to operate the property under lease from this Company.

The only new construction in progress at this time is an extension

Contingent Liabilities:
 As joint maker with the Central Terminal Railway Company of Illinois of Bonds secured by mortgage on property of the Central Terminal Railway Company

4% Leased Line Certificates of the Minneapolis, St. Paul & Sault Ste. Marie Railway Company, issued in exchange for Preferred Stock of the Wisconsin Central Railway Company, held therefor.....	\$8,000,000.00
	11,169,600.00

from Van Hook, North Dakota, to the Missouri River, a distance of ten miles.

During the year there has been expended for Additions and Betterments \$723,829.64.

Equipment changes amounting to \$72,230.66 are fully shown in detail on pages 26 and 43.

The Company purchased 400 forty-ton capacity steel frame box cars and 100 forty-ton capacity steel frame automobile cars, which were delivered during August, 1915, and six switching locomotives for delivery in December, 1915.

The outstanding funded debt was increased during the year by the sale of

Minneapolis, St. Paul & Sault Ste. Marie Railway Company
First Consolidated Mortgage Five Per Cent Bonds..... \$2,637,000.00
Wisconsin Central Railway Company, Three Year Five

Per Cent Secured Gold Notes..... 1,000,000.00
\$3,637,000.00

The outstanding funded debt was decreased during the year by the retirement of

Minneapolis, St. Paul & Sault Ste. Marie Ry. Co.:

Equipment Trust Obligations \$982,000.00
Wisconsin Central Railway Company:

Equipment Trust Obligations..... 367,500.40
First General Mortgage Bonds..... 12,000.00
M. & S. E. Div. P. M. M. Bonds..... 5,000.00

\$1,366,500.40

During the year the Company has continued its efforts to assist in the development of the territory tributary to its lines. The results have been exceedingly satisfactory.

The Northwestern States have an excellent grain crop this year. This should produce considerable increase in tonnage and if general business conditions improve the results for the current fiscal year should show much improvement. The property is in condition to economically handle a largely increased business.

Respectfully submitted,
E. PENNINGTON,
President.

Engineering and Maintenance of Way Edition and four Maintenance of Way Convention daily issues, North America, \$1; foreign, \$2.

Entered at the Post Office at New York, N. Y., as mail matter of the second class.

WE GUARANTEE, that of this issue (the monthly Engineering and Maintenance Edition) 10,750 copies were printed; that of these 10,750 copies 7,270 were mailed to regular paid subscribers to the weekly edition, 1,846 to subscribers who get the Engineering and Maintenance Edition only, 135 were provided for counter and news companies' sales, 1,034 were mailed to advertisers, exchanges and correspondents, and 465 were provided for new subscriptions, samples, copies lost in the mail and office use; that the total copies printed this year to date were 433,450, an average of 9,222 copies a week.

The RAILWAY AGE GAZETTE and all other Simmons-Boardman publications are members of the Audit Bureau of Circulations.

*Illustrated.

The importance of making a careful economic study of the distribution of power between the various divisions of a road and the benefits that will accrue from such a study when the purchase of new or additional power is considered is forcefully illustrated in the article on Mikado Versus Consolidation Locomotive by N. D. Ballantine, printed elsewhere in this issue. Mr. Ballantine outlines the method followed by the Rock Island for the determination of the most economic distribution of power between four divisions of that road, and while the conditions obtaining on the Rock Island controlled, to a certain extent, the method of procedure, the outline will serve as a guide to others desiring to make a similar study. In the problems discussed, Consolidation locomotives using saturated steam were compared with Mikado locomotives using superheated steam and having a tractive effort 46 per cent greater than the Consolidations. With both types of locomotives loaded to their full rating a saving would naturally be expected by the use of the Mikados, but the low loading efficiencies (51.3 per cent on Division A) obtained in the study make it interesting to note that the Mikados proved to be the most economical engines. Division B, having the highest loading efficiency, showed the greatest saving, namely, 23.3 per cent. These results should make it plain that in order to know exactly what is actually being accomplished some such study should be made. With the data obtained from such investigations the opportunities for study with resultant increases in efficiency are almost unlimited and if similar studies are made before the purchase of new or additional power there is no question but that the power bought would more efficiently meet the traffic requirements with ultimate saving in the investment and operation.

The postoffice department evidently intends to continue its fight to prevent the compensation of the railways for carrying the mails from being put on a remunerative basis; and it is not scrupulous in its choice of weapons. The lack of fairness it has shown and is still showing regarding this matter should warn people who are disposed to favor extensions of government ownership and operation of business concerns. As the department is so arbitrary and unfair may we not assume that a government management of the telegraphs or the railroads might also be arbitrary and unfair? These thoughts are suggested by a statement prepared by the department and published in the newspapers on November 14. This shows that the railways of certain territories are to receive an increase in their mail compensation, and might convey the impression that the increase is due to advances in the mail rates. In fact, it will be due to increases in the amount of mail traffic handled. The department points out that there is active competition between the railways for an opportunity to carry mails on certain routes, and concludes that this is "good evidence of the unjustness of the oft-repeated assertion that the railroads are handling the mails at a loss." This logic is as imbecile as the want of efficiency shown in managing most of the affairs of the department. The two routes to which the department's statement specifically refers are those between New York and Chicago and between Chicago and Minneapolis. The mail traffic on these routes is extremely dense. Now, no one claims that the railways do not make a profit from the mail traffic on the densest routes in the country. What is claimed is that their compensation for carrying the mail on all routes, those on which the traffic is light as well as those on which it is heavy, is inadequate. Furthermore, active competition for the mail business on every route would prove nothing as to the remunerativeness of the rates. If a man had a sum of money to lend, and the law prohibited him from receiving more than two per cent interest, he probably would accept it, although he might denounce as unjust a statute which prohibited him from receiving less than six, or even eight per cent. He would be better off with two per cent than with nothing at all. The

Economical Distribution and Purchase of Power

The "Profitableness" of Railway Mail Pay

case of the railways is analogous. A road would rather carry the mail if it earned only two, or even one per cent, on the investment in facilities devoted to that service than not to carry it at all. As, however, railways need to earn six or seven per cent on their business, as a whole, and as the mail traffic is of such a character that it can easily afford to pay rates which will yield a fair profit, the roads, very naturally, complain of legislation and department orders which have been shown to restrict them to a return on their mail traffic smaller than the return they derive from handling either freight, passengers or express. The government is constantly preaching to private corporations the doctrine of equity in transacting their business, but there is not a business concern in the United States which is as petty and unfair in its business methods, or is as pertinacious in seeking unfair discriminations from the railways, as is the postoffice department; nor is there one which defends its course with such fallacious and dishonest arguments.

TEN DOLLARS FOR A DIALOGUE

ONE of the significant remarks at the recent "safety first" meetings in Philadelphia, reported in the *Railway Age Gazette* October 29, was that of F. T. Bowler, one of the Pennsylvania's committeemen, who said that in admonishing fellow-employees he made enemies for himself. In giving advice that is not asked for, on subjects which the person addressed thinks he knows fully already, one always runs that risk. And yet the safety-first propaganda owes much of its progress to just this thing; stirring up men's minds on matters in which they had thought they needed no further light. How is it done? Or, rather, what is the best way in which to do this disagreeable thing with the least friction? Pages and pages, and whole books, have been written, but the rules to be followed are still vague and shadowy.

In this paucity of acceptable theory we may do well to study actual practice. Who has succeeded in giving undesired advice with pleasant results? What did the other fellow say? Give the readers of the *Railway Age Gazette* the whole conversation. For the three best dialogues of this character, concerning "safety-first," we will pay ten dollars each. The thing desired is actual experience; report conversations verbatim. Dialogues should not contain more than three or four hundred words each, but very good ones will be accepted even if longer. After the best three the regular rate will be paid for others which are used. All must reach New York by December 31.

Each writer should give all necessary explanations, and, in particular, his own position and that of the person spoken to, whether superior, inferior or equal. Writers must give their names, but matter may be published without names where mutually agreeable.

"THE OUTLOOK" ON RAILROAD RECEIVERSHIPS

WHEN a paper with such breadth of vision and reputation for scholarly accuracy as *The Outlook* makes an absurd blunder in discussing railroad receiverships and regulation it is pretty good evidence of how much there still is to be done in the way of frank discussion of railroad problems before these problems will be understood by the great majority of educated people. *The Outlook* agrees with the *Railway Age Gazette* that state regulation as opposed to and conflicting with federal regulation is pernicious. But *The Outlook* is a bit suspicious that in a recent article discussing railway receiverships the *Railway Age Gazette* was attempting "to discredit the general principles of government regulation." It would, indeed, take a hardened fighter of the old school of railroad men to come out now in favor of the abolition of government regulation of railroads.

The Outlook adds: "If government regulation can be applied successfully to railways through receiverships it is certainly possible to apply it successfully through a federal commission."

Would *The Outlook* say that because a federal court can appoint a manager for a bankrupt dry goods firm, this is proof that the United States government can regulate the dry goods business of the country? There is no more connection between regulation and receivership in the one case than in the other. A receiver is a man appointed by a court, as an officer of the court, to so administer a business as to preserve the assets for the benefit of the creditors, the stockholders and all others who may be concerned; and he performs the functions of management, not of regulation. Regulation may and often does assume some of the functions of administration. It is a matter for the courts to determine just how far in each case regulation can go without depriving the owner of rights which under the constitution can be taken from him only by due process of law.

The Outlook says that railway receiverships have been generally successful financially. What this can mean it is difficult to see. A receivership is successful if it preserves intact the assets of the creditors of the bankrupt corporation. In the case of a railroad company, the most important asset which it has is its earning power. This can be conserved through a wise policy of maintenance, a sound and aggressive bid for traffic and the economical conduct of the business of transportation. The court which assumes charge of a property when it is taken out of the hands of its owners appoints one or more receivers. Often one of these receivers is a lawyer, the other an operating man—a railroad man. If, however, a lawyer only is appointed as receiver, his first step is invariably to appoint an operating man as his representative to run the railroad, and this man manages the railroad, whether his title be receiver or chief operating officer for the receiver. In the one case he reports directly to the court in the same way as the president of a solvent railroad company reports to the directors; in the other case he reports to the receiver, who in turn reports to the court. In any event, the seeming success of the receiver always is due to the fact that he can and does use in operating and improving the property parts of the earnings which a manager for a private corporation would have to pay out in interest. If this is "financial success" it is a queer kind!

Would *The Outlook* suggest that the Interstate Commerce Commission appoint a chief operating officer for each one of the railroad companies of the United States, which officer should report to it instead of the board of directors? Only so could there be any analogy between the administration of a railroad property under receivership and the regulation of railroads by the Interstate Commerce Commission; and this would not be government regulation, but government management.

THE SCARCITY OF FREIGHT CARS

A SHORT time ago the remark was made in these columns that "this year, talk of a car shortage would seem as music to the ears not only of railroad officers, but of most business men also." Since that time, somewhat unexpectedly, the band has begun to play. But while most people are inclined to welcome the sound as the herald of returning prosperity there are some discords. If business conditions during the past two years had not been such that the roads were more worried about the large actual number of surplus cars than about possible shortages of equipment they might have had more money to buy more new cars before they were needed. As it has happened, the revival of business has succeeded the long period of depression so suddenly that the large surpluses have melted away almost over night, and shortages are appearing in many parts of the country—shortages of box cars in Central Freight Association territory and the Northwest, and of coal cars in Trunk Line and Central Freight Association territory.

The monthly bulletin of the Committee on Relations between Railroads of the American Railway Association for November 1 showed a shortage of 26,628 cars and a surplus of 52,867, the smallest net surplus since the fall of 1913, the surplus having been reduced by 35,474 in October and by 103,248 in September. For 90 per cent of the time since 1907 the American Railway

Association has reported large surpluses, but now the shippers are filling the newspapers with complaints because they cannot get cars and the Interstate Commerce Commission and some of the state commissions are issuing the usual circulars urging the railroads and shippers to co-operate by handling and releasing cars as promptly as possible. The Interstate Commerce Commission also urges the railroads to endeavor to improve their methods of operation of terminals.

All of this sounds very much like old times, but some of the conditions which are at the bottom of the present situation emphasize the need of a remedy different from those that usually are suggested. The failure of car supply is ordinarily a failure of car movement. In the present case it is largely caused by a shortage of vessel capacity as a result of the European war. There has been for some time a serious congestion of freight at New York and to a less extent at other Atlantic and Gulf ports. The movement of export grain and of many other articles for export, including war materials, is very heavy, and the trunk lines have many miles of side tracks at the ports filled with delayed cars. It is reported that over 50,000 cars, nearly twice the amount of the shortages reported for the entire country, are thus tied up in the vicinity of New York alone, and it was recently estimated that there was ready for export at New York harbor five times as much freight as the available vessels could take.

The situation has been aggravated by the closing of the Panama Canal by slides since September 20. While the Panama Railroad has trans-shipped a large amount of the freight that had started through the canal before the slides occurred, the closing of the canal has resulted in much congestion of freight at the Gulf ports and the number of boats that have taken their cargoes around South America or the Cape of Good Hope has appreciably diminished the vessel capacity available at the United States ports.

Meanwhile, as there is no demurrage or storage charge on export grain and very little charge on other export freight, the accumulation at the ports continues to be increased by shipments from the interior, and thousands of cars are being used as warehouses, while shippers that want cars are clamoring for them elsewhere. If adequate demurrage and storage could be charged shippers would not keep sending shipments to the congested ports, but would hold back some of their freight until there appeared some chance of its being loaded into vessels.

A similar situation arose at Galveston in August, 1914, immediately after the war started, when an enormous congestion of freight was caused by the shortage of vessels, and so much demurrage accrued that Commissioner Clark of the Interstate Commerce Commission recommended to the roads that demurrage be cancelled, without admitting, however, "that the principle of demurrage on export grain is wrong or a mistaken one." Commissioner Clark at that time was dealing with an unprecedented situation. No one had warning of the war and the shippers had a right to expect that vessels would be available for their shipments. But now the war has been in progress for over 15 months. The scarcity of ships is well understood, and a penalty for sending export shipments to points of congestion without having made some arrangements for their disposition would not be unjust and would help to relieve the congestion.

The railroads themselves have been unable to agree on a demurrage or storage charge, for the usual reason that some roads have preferred to please the shippers who do not like to pay demurrage. The Committee on Relations between Railways in its report to the American Railway Association, at its meeting on Wednesday, said: "One cause of delay to box cars has been that it has not usually been practicable to charge demurrage on cars loaded with export grain consigned to elevators located at the seaboard. Your committee has represented to the traffic associations that the greatest congestions have occurred when the export elevators are filled with grain, and it is, therefore, impossible to unload the cars consigned to them. The point has further been made that this situation would be improved if the storage rates applicable to grain in the elevators should

also apply to the grain in cars which cannot be unloaded into the elevators." The report added that the railway traffic associations have taken up the suggestion and that it had been hoped that the arrangement could go into effect as of December 1, at all Atlantic and Gulf ports; but Arthur Hale, chairman of the committee, stated at the meeting that the hopes had not been well founded.

The Interstate Commerce Commission has tried to bring about co-operation between the railroads and the shippers to minimize car shortages by prompt handling of cars. If it would promote the efforts to establish a demurrage or storage charge on export shipments something tangible might be accomplished toward the alleviation of such situations as the present one, and their prevention in future. The commission, by immediately calling representatives of the carriers and of the leading boards of trade together at Washington and keeping them there until they agreed upon something, without the long, painful process of hearings and the usual procedure, could apply the remedy in time to do some good this year.

MISSOURI COMMISSION ALLOWS RATE ADVANCES

THE Missouri Public Service Commission has just rendered a decision, reported elsewhere in this issue, which is unique in the annals of state railway regulation. It allows not only a general advance in passenger fares but an increase in freight rates, which, with some exceptions, is estimated to average about 5 per cent. Orders of state commissions ordering extensive reductions in both freight and passenger rates are not unknown, and several commissions have recently authorized increases either in freight rates or in passenger fares, but this is believed to be the first case on record of a voluntary, comprehensive decision by a state commission affecting both branches of the service favorable to the requests of the carriers.

The railroads are not given all they asked for. They had requested a passenger rate of 3 cents a mile in place of the present rate of 2 cents, and the commission has granted them permission to charge 2½ cents a mile for one-way tickets, 2¼ cents for round-trip tickets and 2 cents for mileage books. They had asked for general increases in freight rates and the commission has excepted some commodities and reduced the proposed advance on others. But considering the circumstances, the long and unsuccessful fight the railroads have waged in the courts and the fact that the commission is overruling the acts of the state legislature, the commission is to be congratulated on an act of broad statesmanship.

The decision includes some 300 typewritten pages, and printed copies have not yet been distributed, but extracts from the opinion, which is unanimous, make it clear that the commissioners were convinced that regulation of railway rates downward has gone altogether too far, that to obtain good railroad service it is necessary to encourage further investment, and that it is unjust to penalize all of the carriers for individual instances of corporate mismanagement. It is also noted that the commission finds from the evidence that the reduction of passenger fares from 3 cents to 2 cents a mile was not compensated by an increase in traffic. The passenger rates, which the railroads are allowed to advance, were reduced by the legislature in 1907 and the freight rates in 1905, and in 1907 by the legislature. Temporary injunctions were secured by the roads in the federal court, but in 1913 the United States Supreme Court decided that the railroads had not succeeded in proving the rates confiscatory. As the condition of the railroads became steadily worse, the way for an appeal to the commission was paved by a decision of the state supreme court in the case of the Missouri Southern, holding that the act creating the public service commission and authorizing it to pass upon the reasonableness of rates had given the commission jurisdiction to set aside the statutory rates.

As would naturally be expected in Missouri, the commission was not easily convinced and its decision was not reached until after a most thorough investigation and a protracted series of hearings in which the railroads presented a voluminous record

of statistical and other evidence. Moreover, its action was not taken until most of the railway mileage of the state had passed into the hands of receivers. Missouri having been "shown," it would seem that a large number of other states, which are still trying to reduce rates or are opposing increases or in which applications for advances are still pending, might find it profitable to give serious consideration to so excellent an example before their railways reach the extreme condition which has prompted such a reversal of policy in that state.

THE COMMISSION AND WESTERN FREIGHT RATES

THE Interstate Commerce Commission has denied the petition of the railways for a rehearing of the case involving advances in western freight rates. This is disappointing, as by this action the commission again, in effect, declines to pass on the question as to whether the net earnings of the western lines are adequate. Many persons will continue to believe that both the railways and the public were entitled to be told by the commission what conclusion it reached on this point. The data that were presented in its opinion seem to demonstrate the inadequacy of the roads' earnings, but as long as the commission dodges committing itself as to this matter neither the railways nor the shippers will know just where they stand.

At the same time that it refused to reopen the rate advance case, the commission took a step which seems commendable, important and significant. It issued an order on its own motion for a general inquiry into rates on live stock, dressed meat and packing house products in Western Classification territory. In its decision in the western rate advance case it refused increases in the rates on live stock because there were some state rates which already were lower than the interstate rates. The railways, in their petition for a rehearing, argued that it should have upheld the proposed interstate rates if they were reasonable and made the states advance the intrastate rates to the same basis. They contended that the action of the commission in letting rates fixed by state authority control its policy in regulating interstate rates was an abdication of the paramount authority of the federal government over interstate commerce. The issuance of the order for a general investigation of the rates on live stock and packing house products may mean that the commission intends to ascertain the exact relations which do exist between the rates, state and interstate, and then to take such action as may be necessary to eliminate existing discriminations.

That unfair discriminations in the rates on live stock and packing house products do exist is charged by many shippers and conceded by the traffic managers of most of the railways. Some of these discriminations grow out of the fact that the state rates made by public authorities are lower than the corresponding interstate rates. Others grow out of the action of certain railways in making interstate rates which are unduly low as compared with other rates in the same territory. The investigation on which the commission is entering will enable it to determine what are the extent and nature of the existing discriminations.

It is not charged that any of the discriminations now alleged grow out of the fixing of any rates that are too high. They grow out of the fixing by state authorities and by the railways themselves of some rates which are too low. If the commission decides that this is the situation, how will it proceed to remedy it? The act to regulate commerce gives it authority to reduce interstate rates and prevent advances in them in order to prevent excessive charges or remedy unfair discriminations; but it does not give it express authority to require an advance in any rate, state or interstate, or to prevent a reduction in any rate. Members of the commission have contended that it should be given authority to fix minimum as well as maximum rates. Many railway men and economists have taken the same view. The *Railway Age Gazette* long has advocated legislation empowering the commission to fix minimum rates. It seems highly probable that one of the main results of the investigation just

ordered will be the disclosure of a situation arguing unanswerably for legislation empowering the commission to fix minimum rates; and another important result is likely to be the disclosure of facts demonstrating that the commission cannot deal effectively with interstate commerce without exercising authority over the activities of state regulating bodies.

BALTIMORE & OHIO

A YEAR ago four men out of five, not officers of the Baltimore & Ohio, who had been following that company's monthly earnings fairly closely, would have said that there was hardly a chance for the Baltimore & Ohio to earn its 5 per cent dividend in the fiscal year ended June 30, 1915. It earned that dividend with a margin of \$771,000. The optimism of a year ago of the Baltimore & Ohio officers was a considerable factor in the success which has been achieved.

Operating revenues in the fiscal year ended June 30, 1915, amounted to \$91,816,000, a decrease as compared with the previous year of \$7,348,000, or 7.41 per cent. Operating expenses amounted to \$63,926,000 in 1915, a saving of \$10,478,000, or 14.08 per cent, and of this saving almost exactly half, or \$5,731,000, was in transportation expenses, and of the remainder \$2,112,000 was a saving in maintenance of way, which represents the difference between the normal expenditures in a normal year—1915—and in 1914, when so much replacement work had to be done after the unprecedented floods. Income from rent, interest and other sources not directly connected with the operation of the road showed a decrease of \$873,000, and interest charges and hire of equipment an increase of \$655,000, so that of the \$3,056,000 increase in operating income due to the proportionally larger decrease in expenses as compared with loss in revenues, there was \$1,523,000 saved for net available for common dividends, making the total in 1915 \$8,368,000. Five per cent dividends on the common call for \$7,597,000.

For the first time since 1909 the Baltimore & Ohio's operating ratio was below 70. In 1910 total operating expenses amounted to \$63,196,000 and the operating ratio was 70.09; in 1915 total operating expenses amounted to \$63,926,000 and the operating ratio was 69.62. The ton mileage handled in 1910 was 12,024,584,000; in 1915, 12,415,384,000. The passengers carried one mile in 1910 were 763,449,000; in 1915, 714,368,000. Since 1910 there have been increases in wage schedules of all classes of employees in train service ranging from 5 to 15 per cent. The cost of wages of enginemen and firemen per 100 miles was \$8.66 in 1910 and \$10.61 in 1915; the cost of engine house expenses per 100 miles was \$1.78 in 1910 and \$2.40 in 1915; the cost of fuel per 100 miles was \$8.16 in 1910 and \$9.63 in 1915; the cost of water per 100 miles was 60 cents in 1910 and 87 cents in 1915. The total cost of transportation expenses in 1910 was \$29,739,000, and in 1915 \$34,255,000; but net operating income in 1910 was \$26,968,000, and in 1915 \$27,890,000. Interest charges in these five years have increased from \$14,938,000 to \$22,428,000; in other words, about the same amount of business was handled in 1915 as in 1910, with a materially higher wage schedule in effect, and still the management was able to show a slightly larger net operating income in 1915 than in 1910; but this result was achieved only through the expenditure of additional borrowed capital, the interest charges on which amount to between seven and eight million dollars. In other words, with a slightly smaller net operating revenue in 1910 than in 1915 the owners of the property had a profit of \$15,832,000 in 1910 and \$10,723,000 in 1915.

The somewhat extended comparison with 1910 is worth while because it is essential to keep it in mind while studying the results obtained on the Baltimore & Ohio in 1915 as compared with 1914. The showing made in the reduction of expenses this year as compared with last year is so brilliant that if this showing is not kept in proper relation with the history of the railroad company's operations over a period of years it will give a quite wrong impression of the factors which go to make up the present railroad problem.

The saving of \$5,731,000, or 14.33 per cent, in transportation expenses, with a decrease of 7.71 per cent in ton mileage and 13.65 per cent in passenger mileage, is the combined result of the economies which come from improved facilities and the economies which come from a more effective effort of the individuals that go to make up an organization through the improvement in the organization itself. As an example of the first class, the completion of the Magnolia cut-off has made it possible to increase the eastbound slow freight trainload to 6,180 gross tons, an increase of 36.36 per cent. The importance of this Magnolia cut-off may be in part understood by the fact that the freight density on the line between Patterson Creek, W. Va., and Cherry Run, 57 miles, is over 24,000,000 ton miles per mile of road. As an example of the second class, it might be pointed out that by the end of the fiscal year the actual results being obtained on the Cumberland division averaged above 90 per cent of the theoretically perfect train loading and wage costs.

Some of the detail accounts under transportation expenses are worth mention. Wages of train engineers in 1915 amounted to \$4,730,000, a decrease of \$980,000; fuel for train locomotives cost \$4,850,000, a decrease of \$788,000; wages of trainmen amounted to \$4,703,000, a decrease of \$785,000; wages of yard conductors and brakemen amounted to \$2,160,000, a decrease of \$540,000; loss and damage to freight cost \$1,177,000, a decrease of \$424,000.

The average revenue trainload in 1915 was 692 short tons as compared with 645 short tons in 1914. The percentage of loaded car mileage to total car mileage was 61.16 in 1915 and 63.24 in 1914. The average tons of freight per loaded car was 27.44 in 1915 as against 26.97 in 1914. The average length of haul per ton was 201 miles in 1915 and 194 miles in 1914. A larger proportion of bituminous coal moved east in 1915 than in 1914. This gave a longer average haul and also gave a better average ton-mile rate. The ton-mile rate on coal in 1915 was 3.77 mills as against 3.76 mills in 1914. The average ton-mile rate on traffic other than coal was 7.10 mills in 1915 and 7.16 mills in 1914.

The total tonnage of freight handled by the Baltimore & Ohio

of equipment expenses in 1915 probably represents in part the efforts of the department to make these economies effective.

The Baltimore & Ohio spent \$3,745,000 for additions and betterments to road and \$4,232,000 for additions to equipment. The net increase in the outstanding securities was \$3,992,000. The company had \$16,718,000 cash on hand at the end of the year and total current assets, including this cash, of \$35,348,000. There were no loans and bills payable, and total current liabilities amounted to \$17,810,000.

The following table shows the principal figures for operation in 1915 as compared with 1914:

	1915	1914
Average mileage operated	4,535	4,515

PERE MARQUETTE

SELDOM, if ever, has there been a more drastic and thoroughgoing attempt to operate a bankrupt railroad economically than that made by the receivers and officers of the Pere Marquette in the fiscal year ended June 30, 1915. In the previous fiscal year the receivers showed a loss from operation, before the payment of interest charges, rentals or taxes, of \$1,119,000. In 1915 the net operating revenues amounted to \$4,584,000, a difference as between the two years of \$5,703,000, accounted for by an increase in revenues of \$1,113,000 and a decrease in the expense of handling the business and of maintaining the property of \$4,590,000.

The Pere Marquette operates 2,322 miles of road. The com-

The Baltimore & Ohio

pany has been in receivership since 1912, having taken over the property from a former receivership in 1907. If it were probable that the company could make as good a showing over a series of years as it did in the fiscal year ended June 30, 1915, and could count on an increase in net proportional to the normal increase in gross, there might be some ray of hope for some classes of securityholders. It may be that such a showing will be possible, but the figures for 1915 do not conclusively demonstrate this.

Full credit is due to the operating officers for the remarkably good showing which is made in transportation expenses. Revenue ton mileage carried totaled 1,967,000,000, an increase of 158,000,000 ton miles, or about 8.8 per cent. Passenger mileage

in 1915 was 64,376,000 tons. Of this, 29,618,000 tons, or 46.01 per cent, was bituminous coal. This compares with 34,105,000 tons of bituminous coal carried in 1914, forming 47.19 per cent of the total tonnage of that year. On the other hand, the tonnage of agricultural products totaled 4,191,000 tons in 1915, or 6.51 per cent of the total tonnage, comparing with 3,523,000 tons carried in 1914, or 4.88 per cent of the total tonnage of that year.

Maintenance of equipment cost \$16,003,000 in 1915, a decrease of \$1,147,000. This is a decrease of 6.69 per cent and compares with a decrease in locomotive mileage of 9.5 per cent; of freight car mileage of 6.2 per cent, and of passenger car mileage of 4.8 per cent. There was possibly room for economies in the mechanical department in 1914 and the reduction in maintenance

amounted to 199,700,000, a decrease of about 3.5 per cent. Transportation expenses amounted to \$7,023,000, a decrease of 7.6 per cent. The average trainload of revenue freight was 498 tons in 1915, as against 459 tons in 1914. The passenger-train mileage was 3,643,000 miles, a decrease of about one per cent. There was an increase in the empty car mileage of 26.12 per cent, partly due to the routing of empty cars over the Pere Marquette by other roads which preferred to avoid paying per diem rather than hold the cars for loads, and the efforts of the Pere Marquette itself to get rid of its foreign cars. Under these conditions, especially the two noted—that of only a very slight cutting down of passenger service and the much heavier empty freight car movement—a saving of 7.6 per cent in transportation expenses is well worth comment.

The saving was made primarily because of the interest which was aroused in all classes of officers and employees in the efforts of the management to make the best possible showing. There was a large saving in fuel cost, ascribed partly to more economical buying and partly to greater efficiency in consumption, a part of the credit for the latter saving being given to the fact that a larger number of superheater locomotives were in service during 1915 than in 1914. The energy and ingenuity of everybody have been directed to making large or small savings. Local freight train service has been reduced without, it is thought, inconveniencing the shippers; both station expenses and train supply expenses have been zealously guarded, and the results speak for themselves. Paul H. King is the operating receiver and his co-receiver is W. E. Waters. In their report they especially express their appreciation of the work done by the general officers and conclude their report as follows: "Personally it has never before been our pleasure to be associated with men more interested in the work at hand, more untiring in their efforts, or more loyal to the property they all serve, and

considerably less than will be required on an average over a series of years for maintenance of way and structures. Repairs per locomotive in 1915 cost \$2,828; per passenger-train car, \$535, and per freight-train car, \$66. These figures for repairs of equipment are not so low as to preclude the possibility of keeping them at about this rate. On the other hand, they are not high enough to permit of any probable further reduction, and if further economies in transportation expenses are to be effected, considerable sums will have to be charged to expenses for retirement of equipment, the company having 48 eight-wheel locomotives and 50 Mogul locomotives of light tractive power. The principal freight power is made up of 166 Consolidations, with 10 Mikados as the only modern heavy freight engines.

It is impossible to give even an adequate summary of the quite unusually comprehensive report made by the receivers. It is recommended, however, that any one who is interested in the question which is of so vital importance at present—the interfering state and federal regulation of railroads—read the report of the officers of the court who are administering the affairs of a railroad which has been largely at the mercy of state regulation.

The following table shows the principal figures for operation in 1915 as compared with 1914:

	1915	1914
Average mileage operated	2,314	2,324
Freight revenue	\$12,562,523	\$11,435,126

NEW BOOKS

Investors and Money-Makers. By F. W. Taussig, Henry Lee Professor of Economics, Harvard University. Published by the Macmillan Company, New York.

This little book of 138 pages gives the substance of lectures delivered at Brown University in celebration of the one hundred and fiftieth anniversary of the university's foundation. The lectures cover a much broader field than would be suggested by the title. The relations between the workman and the employer, between the individual and society, and between the desire for individual gain and the desire to be of service to the community as a whole are discussed in a searching but common sense way which makes unusually interesting reading. Professor Taussig, while sympathizing with the views of the workman and with his limitations and understanding his difficulties discards entirely the sentimental in his discussion. He shows clearly that it is the desire for personal gain which is the motive power behind the actions of people in the great majority of cases. He believes that the present economic organization, while tending to stimulate the instinct of contrivance, which is the instinct that is exercised by the inventor in the capitalist employer, often smothers it in the hired laborer. He recognizes that the individualistic system turns an inborn bent to the contriving of those things which are of general service; but he believes that something of the same result could be obtained in a collectivist society. He believes, however, that deliberate regard for general welfare is within the possibilities of a private business as well as a public. He cherishes no expectations of a radical change in our present economic system, but is hopeful that present tendencies will correct the worst abuses of this system and develop the feeling of interdependence and of responsibility on the part of the individual to society as a whole.

The Pere Marquette

the showing which we have been able to make during the year was largely due to their efforts."

For all the substantial and praiseworthy success which has been made in reducing transportation expenses only about one-fifth of the total saving in expenses was made in this account. Maintenance of way and structures cost \$2,000,000 in 1915, a decrease as compared with the previous year of \$996,000, or 33 per cent, and maintenance of equipment cost \$3,493,000, a decrease as compared with the previous year of \$2,995,000, or 46 per cent. While it is undoubtedly true, as the receivers point out, that a large part of the maintenance of equipment and a certain part of the maintenance of way expense reductions were due to the fact of abnormally high expenditures in 1914, it is by no means conclusively demonstrated that the 1915 rate of expenditures for maintenance can be continued without detriment to the property. In 1915 maintenance of way and structure expenditures averaged \$864 per mile operated. Under present conditions of operation, with the necessity for heavy rails, ballast, etc., and probable cost of track labor, \$864 appears to be

Mikado Versus Consolidation Locomotives

A Study for the Purpose of Determining the Economical Distribution of Power from a Net Revenue Standpoint

By N. D. BALLANTINE

Assistant to Chief Operating Officer, Rock Island Lines

For the purpose of determining the relative merits of the Mikado and Consolidation locomotives on certain divisions of the Rock Island, a study was made under practical operating conditions, which showed, among other things, where a given number of locomotives of each type could be used to the best advantage from a net operating revenue standpoint. The month selected for the study was during a period of heaviest traffic, when there was a constant demand for power; the data was tabulated subsequent to the performance, and none of the division officials knew that such a study was to be made, hence the freedom from chances for preferential handling of either class of power. The records made currently were tabulated and

freights; combined slow and fast freights; and slow and fast freights on the round-trip basis, the latter figures, for the sake of brevity, being used in this article. None of the divisions on which these locomotives were used have a very large percentage of their traffic of a low grade which will admit being held any considerable length of time for tonnage, the controlling business being made up of merchandise, live stock, packing-house products and perishable freight, which fact makes a study of this nature all the more necessary. The detail information as shown permits a variety of deductions to be drawn directly or by combinations, many of which will be apparent on inspection; a few of them will be pointed out, however.

carefully checked against train sheets, train registers, roundhouse registers, work sheets and fuel tickets. Every practical means was used to secure correct information. There are some apparent discrepancies with respect to the maintenance features, which it is thought were due to the fact that the Mikado locomotives were practically new, there being no question about the expense for heavy repairs made during such a limited time not being as correct a basis as it would be if a year's figures were used. These being the only figures available, they were used, and as they are clearly set out, one can accept or ignore that portion of the study if desired.

The study covers the performance in freight service other than local or way freights and work trains on four divisions for 31 days of the same month, of 27 Mikado superheater locomotives of 57,000 lb. tractive power, making 71,000 miles, and 59 Consolidation saturated steam locomotives of 39,000 lb. tractive power, making 116,275 miles. A total of 262,815,000 gross ton miles was handled, of which the Mikados were responsible for 48 per cent.

No attempt was made to include or compare the expense of maintenance of way and structures, general expenses, supervision, station service, yard service, train supplies, loss and damage and a number of other factors in operating expenses, a variation of which would not be appreciably affected by the class of power handling it. The items included do not purport to represent the total actual cost of handling traffic, but it is thought they include the essential variable items that can practically be located and that are of sufficient importance to justify their inclusion in a study which does not contemplate a degree of refinement in costs to produce figures accurate to the fifth or sixth decimal part of a cent.

In tabulating the data for our own use, it was separated to show the items in the *direction of traffic* for slow freights, fast

Table A shows the locomotive utilization, and it is interesting to note the variation in the mechanical department detention on the various divisions. On three divisions it was less for the Mikados, and on the other division, where most of the Mikados were located, it was considerably more, averaging for all divisions 45 minutes more than for the Consolidations. The terminal delay varied from 3 hrs. 11 min. to 7 hrs. 34 min., depending on local conditions; but it is interesting to note that on the division where the greatest volume of traffic was moving, the terminal delay was the lowest for both classes of engines. The time between terminals varied from 7 hrs. 6 min. to 10 hrs. 6 min., averaging for all Mikados but 14 min. less per day than for all Consolidations. The actual running time varied from 5 hrs. 5 min. to 6 hrs. 51 min., averaging for all Mikados 29 min. less per day than for the Consolidations. The miles per hour between terminals varied from 10 hrs. 7 min. to 18 hrs. averaging 14 hrs. for the Mikados, or 0.7 m. p. h. less than the Consolidations. The miles per hour when actually running varied from 17-hrs. 1 min. to 23 hrs. 6 min., averaging 20 hrs. 2 min. for the Mikados, or 0.2 m. p. h. more than the Consolidations. The delays per 100 miles, meeting trains, varied from 42 min. for the Consolidations to 1 hr. 44 min. for the Mikados, averaging 1 hr. 36 min. for the Mikados, or 43 min. (equal to 81 per cent) more than for the Consolidations. This fact may or may not be due to longer trains, but as the 43 min. increase is more than 8 per cent of the total time between terminals for the Mikados, its significance should be studied more in detail. The average delay per 100 miles doing station work only varied 4 minutes.

The gross ton miles per day varied for the Consolidations from 121,669 to 223,980, or 18-1 per cent, and for the Mikados from 130,800 to 273,780, or 210 per cent, while the average for all Consolidations was 154,600 and for the Mikados 205,600, or

33 per cent more than the Consolidations. It should be recalled that the Mikados have 46 per cent more tractive power. The gross ton-miles per hour when actually running varied for the Consolidations from 20,077 to 32,698, or 63 per cent, and for the Mikados from 25,700 to 42,644, or 66 per cent, while the average for all Consolidations was 24,081, and for the Mikados 34,730, or 44 per cent more than the Consolidations. It should be

the Consolidation locomotives than on any other division. It should be borne in mind that the figures given are for round-trips and an analysis of the figures covering only the *direction of traffic* may produce somewhat different results. In reality, it is *directional* figures which are of the most vital moment to the study, particularly where the traffic is unbalanced to an appreciable degree, high loading efficiency in the direction of traffic being a

it is not within 13 per cent of its efficiency as compared with the Consolidations from a ton-mile standpoint.

Table B indicates by divisions the number of locomotives, locomotive days, mileage and average miles per day, gross ton-miles and gross tons per train-mile, and loading efficiency. It will be noticed from the gross ton-miles produced that there is quite a difference in the volume of business handled on the various divisions; there was also a difference in the class of the traffic. It will be noted that on each division the Mikados made from 13 to 17 miles less per day than the Consolidations, the percentage for all Mikados during the entire period being 7 per cent less. It should also be noted that the division upon which both classes of locomotives made the highest mileage per day was that upon which the length of the average trip was the greatest. The distance between terminals generally has a very important bearing upon the miles per day locomotives make and that it increases with the distance between terminals is to be expected, as it decreases the roundhouse handling and yard terminal delays per 100 miles; hence, the importance of running locomotives through terminals or making turn-arounds if the power is in condition to permit this being done without unduly increasing engine failures.

The gross tons per train mile for the Mikados varied from 28 to 56 per cent more than that handled by the Consolidations; the average for all divisions is 43 per cent, or about 3 per cent less than the difference in tractive power, indicating that, as a whole, there was less loading efficiency obtained with Mikados than with the Consolidations.

This is reflected more clearly in the loading efficiency column which shows that Division B, while having but four locomotives, had a condition which enabled it to obtain a higher efficiency with the Mikados than on any other division, and this regardless of the fact that it also obtained a higher loading efficiency with

the cabooses. These figures per thousand gross ton-miles vary from 3.1 cents for the Consolidations on Division C, to 6.8 cents for the Mikados on Division D; for all Mikados it amounts to 4.8 cents, or about 12 per cent of the costs enumerated, while for all Consolidations it amounts to 4 cents, or 8.3 per cent of the costs enumerated. Special mention is made of this point for the reason that for certain purposes it is essential to include such items, while for others they probably should not be included; for example, if the question is one dependent on the type of new locomotives to be purchased, or the question of additional locomotives, it manifestly should be included; if, however, it is a question of once having the equipment and of determining the best location for its utilization, interest and depreciation will accrue regardless, and can as well be omitted for purpose of an immediate comparison. It will be noted the costs for the variables listed, run from 31 cents for the Mikados on Division C to 54.7 cents on Division A, and for the Consolidations from 39.9 cents on Division C to 58.3 cents on Division B, while for all Mikados it was 38 cents as compared with 48.3 cents for the Consolidations.

A glance at Table A might cause one to feel that the proper place to put the Mikados would be where they would produce the most gross ton miles per day or hour, in which event it would point to Division C, as on this division they produced 273,790 gross ton miles per day, or 42,644 gross ton miles per hour when actually running. What we are trying to determine, however, is whether it is more economical to keep the Mikado on a particular division as opposed to another division. Let us compare Divisions B and C. By referring to Table C and Division C it is noted the cost per 1,000 gross ton miles is 8.9 cents less for the Mikados than for Consolidations, and as the Mikados produce 273,790 gross ton miles per day, this is equivalent to their saving \$24.36 per day, while by referring to Division B, it will be noted

the Mikados save 13.6 cents per 1,000 gross ton miles, which with the 174,109 gross ton miles they produce per day, makes a saving of \$23.68, a difference of only 68 cents in favor of Division C. As previously referred to, however, the maintenance feature was known to be a little uncertain, and inspection indicates the running and classified repairs on Division B was 6.1 cents as against 4.1 cents on Division C, or nearly 50 per cent more. With such a wide difference in this item, it would not be unfair to average the two, or eliminate the feature; in either of which events, it will indicate that the greatest saving per day can be effected on Division B.

A knowledge of local conditions is, of course, an advantage in making such an analysis, as in this particular instance it is known that with the volume of traffic moving on Division B, and the necessity for protecting local work, it would not be economical to place any more Mikados on that division under present traffic conditions. The above analysis indicates in this specific case, economy in operation to use a Mikado locomotive on a division where it will not produce within 65 per cent of the ton miles which it produces on another division, a condition which will doubtless appeal to many as an anomaly.

In this connection there might also be pointed out the relation existing between handling tonnage with large versus small power when the train mile unit is used. It is frequently considered by some, that increasing the size of power and being able to utilize it as efficiently as the smaller power, thus reducing train miles, will bring about a reduction in expenses equivalent to the cost of a train mile saved; but that this is a fallacy, can, I think, easily be pointed out from the data contained in the above tables. For example, the costs on Division A per 1,000 gross ton miles for the Mikados were 54.7 cents, the average tons per train were 1,500, therefore the cost per train mile was 82 cents. The cost for the Consolidations per 1,000 gross ton miles was 56 cents, the average tons per train was 1,170, therefore the cost per train mile was 65.5 cents. Here there was an increase of 330 tons in tons per train mile with an increase of 16.5 cents in the cost per train mile. Inasmuch as the Mikado handles 330 tons more than the Consolidation it will take 3.55 Mikado trains to save one Consolidation train mile. Inasmuch as each Mikado train costs $16\frac{1}{2}$ cents more per train mile than the Consolidation the product of $16\frac{1}{2} \times 3.55$ equals 58.5 cents, or 7 cents less than the cost for a Consolidation train mile. In other words, the real saving per train mile is 7 cents instead of $65\frac{1}{2}$ cents as might be roughly estimated.

When such a narrow margin of saving exists as shown in this case, it is worth while investigating the matter very carefully, considering another factor, namely the interest on "additions and betterments" which were necessary to especially provide for the Mikados' repairs, housing, turning and their safe movement over the road. The feature of "additions and betterments" is one which should always be taken into account when considering change from small to large units; after they have once been made, as there is no way to get away from the interest charge thereon, it is of course, unnecessary to consider them if the two divisions to be compared have the necessary facilities; if, however, one division has the facilities and the question arises about transferring some of its power to another division which is not provided with the facilities, then in order to determine the propriety of switching a given amount of power to such division the determination should be made upon the new division's economy including interest on "additions and betterments" versus the equipped Division's economy, excluding the interest on those expenditures already made.

Consideration of the effect upon maintenance of way and structures due to the use of the larger locomotives has been purposely avoided, for the reason that it is still a moot question among engineers. The above study should indicate that a variety of angles exist from which to approach this subject, as well as the importance of having the detail information such as is set forth currently prepared. Unless it is prepared currently, much of it is impractical to secure and thus precludes a definite knowledge of many vital items. Also, in making any such study the actual traffic conditions must be carefully considered.

BUREAU REPORT ON ARDMORE EXPLOSION

Colonel B. W. Dunn, chief inspector of the railroads' Bureau of Explosives, has issued Special Bulletin No. 2, giving the results of his investigation of the explosion of gasoline at Ardmore, Okla., September 27, when 39 persons were killed and several scores injured, and when property was destroyed to the extent of \$500,000 to \$1,000,000. The action of President Ripley, of the Atchison, Topeka & Santa Fe, in offering to pay for the damages, though not accepting responsibility on behalf of the road, was noticed in the *Railway Age Gazette*, October 15, page 703.

Colonel Dunn says that the accident was caused by the escape of a large quantity of inflammable vapors from a tank car "whose lading was billed as gasoline," this being due in part to insufficient space in the top of the tank for the expansion of the liquid. The gasoline was loaded at a temperature of 50 deg. F., while the temperature at Ardmore for two days, while the car had been standing on a side track there, was 93 deg. in the shade.

The immediate cause of the disaster, however, was the removal of the dome cap of the tank car by an employee of the consignee, while the tank was subjected to interior pressure. Such removal is forbidden by the government regulations. The bureau has records of five serious accidents (not explosions) in the past four years from this cause. The safety valves on the car at Ardmore had shown the existence of interior pressure by their continual popping, and the railroad called for a man from the refinery of the consignee to take charge of the car. This man, in consequence of ignorance or carelessness, neglected to cool the car before taking off the cap; and he paid the penalty with his life. The regulations say that tank cars in cases like this must have at least 2 per cent vacant space; and in this case the outdoor temperatures were so high that probably more than 2 per cent was needed, but the actual space left when the tank was loaded was not much over 1 per cent.

Colonel Dunn gives no details of the exact cause or nature of the explosion or explosions; and, indeed, he says that heretofore errors of this kind have resulted in serious fires, but not in explosions. In this case the first explosion occurred about one minute after the man had taken off the cap and had descended to the ground.

The report recommends the distribution of the bulletin among railroad officers and employees, for information, and the careful instruction of employees in all the rules, but says that beyond that no special instructions are needed at this time. Proposals to change the rules will, however, be taken under consideration. Special insulated tank cars are now prescribed for any product with a vapor tension exceeding 10 lb. per square inch; and Colonel Dunn recommends shippers to provide themselves with these cars. Those who have used them are more than satisfied with their service; they prevent losses during transit, and these losses, with ordinary cars, have been considerable.

LIQUID FUEL ON ROUMANIAN RAILWAYS.—For the past few years the consumption of liquid fuel on the Roumanian railways has been steadily increasing, and though the figures of consumption for the past year do not reach those for the preceding 12 months, it must not be inferred that the use of oil fuel for the Roumanian State locomotives has reached its zenith. As a matter of fact, the opposite is the case, for the decrease for the past 12 months in the consumption is explained by the reduced traffic upon the lines owing to the European war. During the 12 months the engines consumed about 198,000 tons, which is a decline of just over 6,000 tons when compared with the figures for the preceding 12 months. To-day no less than 85 per cent of the locomotives on the Roumanian railways use liquid fuel in preference to coal, there being 751 engines regularly using oil out of a total of 873 working on the various State railways. The value of the consumed oil for the past 12 months is estimated at \$1,300,000, admittedly a low figure, yet due to former contracts for supply having been made by the state.

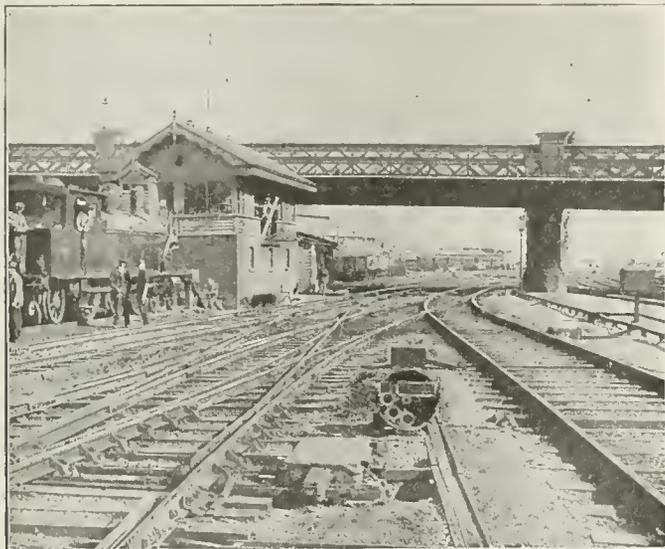

Electric Interlocking at Adelaide, South Australia

First Use of Speed Signaling and Three-Position Upper Quadrant Indications in the Southern Hemisphere

By C. G. PILKINGTON

Engineer for Signals and Yards, South Australian Railways

The recent enlargement of the passenger terminal of the South Australian Railways at Adelaide, South Australia, made necessary by a rapidly increasing suburban traffic in this important south coast city, involved an increase in the number of platforms from 6 to 13, extensive changes in the track layout, and the duplication of main lines from Adelaide Wye to the terminal station. These changes required a complete revision

Terminal Yard Cabin; Three-Position Dwarf Signal in the Foreground

of the terminal yard interlocking, which consisted of 67 mechanical levers, and also of the South Line Junction mechanical plant, containing 42 levers. This latter plant and a similar one at Torrens Bridge Junction, with 35 levers, controlled the two legs of Adelaide Wye.

The cramped position of the yard interlocking and lack of space for mechanical connections practically precluded the extension of the mechanical frame to handle the final layout, and electro-mechanical working offered practically no better solution. The matter finally resolved itself into a question of straight power interlocking, and after careful consideration of the various types, the General Railway Signal Company's dynamic indication, all-electric system was selected as being best adapted to conditions, and an apparatus of 100 levers and 36 spare spaces was installed.

Since these changes would require the rebuilding of the South Line Junction plant, it was found that one power plant between the two junctions at the Wye, replacing both mechanical plants, would effect a substantial saving through the reduction in operating expenses, which, capitalized, would more than pay for the cost of the installation of the power scheme. Accordingly it was decided to install a second machine of the same type at the Adelaide Wye, consisting of 43 levers and 13 spare spaces. These installations are unique in that the South Australian Government Railway management is a pioneer south of the "line" in using all-electric interlocking, speed signaling, the three-position upper quadrant signal with yellow light for caution, and permissive automatic signals.

INSTALLING A NEW SYSTEM

Scheme No. 3 of the Railway Signal Association's recommendation for speed signaling was adopted. This gives ade-

quate information to the enginemen; it reduces the signal arrangement to two combinations of arms for the absolute signals and two combinations of arms for the permissive signals, and finally, because of this simplicity, it makes an economical installation. It should be understood here that the signal practice, as well as the railway methods as a whole, were up to this installation patterned after the British Board of Trade requirements. British signal practice, of course, is based on route signaling, and under the old arrangement at the station, at least one of the inbound lines to the station had six arms, or one for each platform. Therefore, to continue this scheme for the three approach mains either meant nine or ten arms for each signal location, or the use of three signals with route indicators below the arms, giving the platform number.

Hence, after careful study and discussion between the operating and the engineering branches the officers of the former declared themselves willing to try the American scheme of upper quadrant speed signaling and the yellow light for "caution." As the old scheme required the use of only two lights, red and green, it will be apparent that this was a decided revolution for

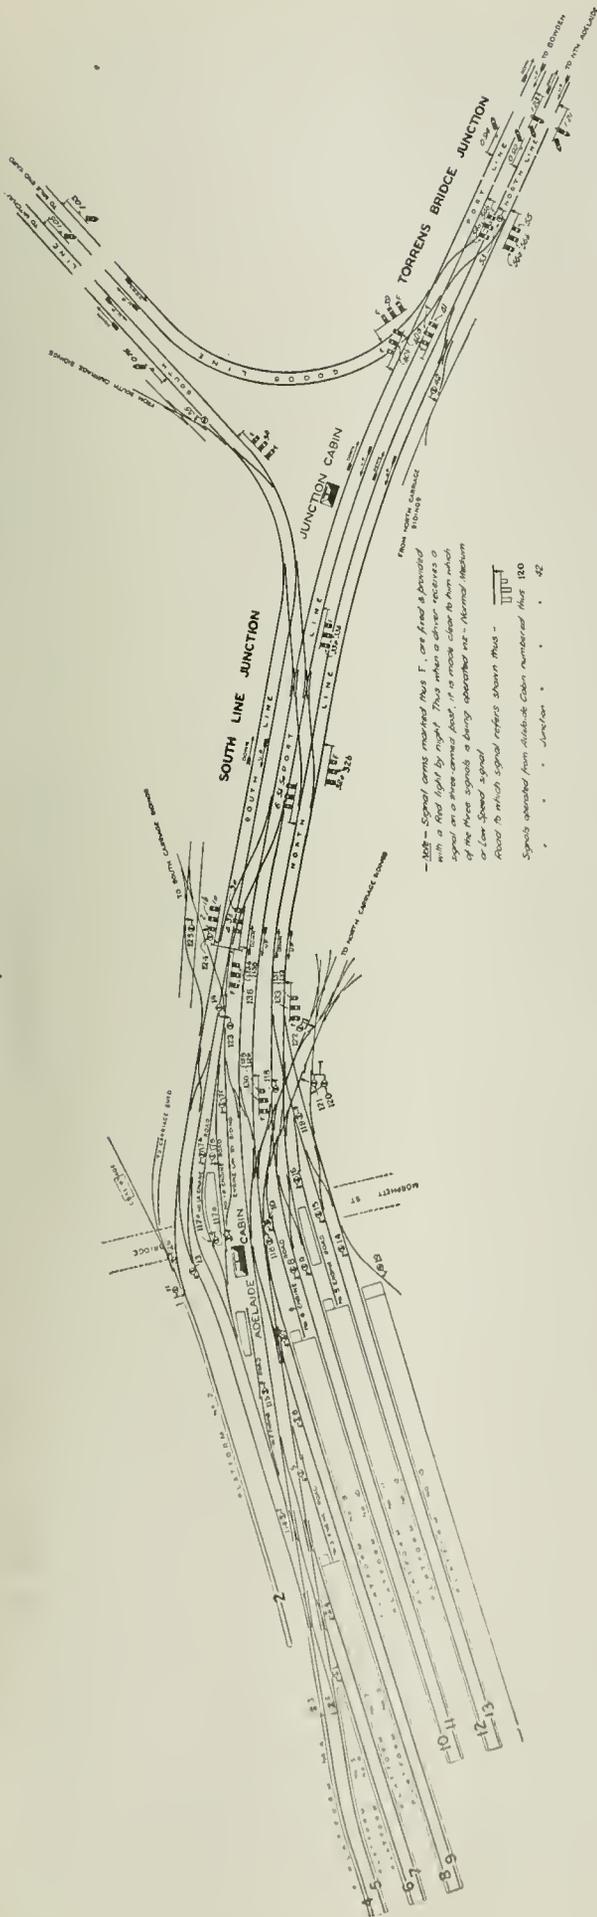

Station Platforms and Tracks from Morphett Street Bridge

the operating branch, and meant discarding everything except the red light and horizontal position of the arm for "stop" and the green light for "proceed." The top or normal speed arm indicates the authorized speed for the vicinity; the medium speed arm indicates 15 miles an hour (it was the desire to make this 20 miles an hour, but it was necessary to limit it to 15 on account of the general use of 1 in 8 compounds); and the low speed arm indicates 10 miles an hour.

A signal diagram about 13 ft. long showing the yard and Wye was made and fastened to a large table in a building adjacent to the yard cabin. Small working models of the various signals about 10 in. high were furnished and the two head signalmen in the yard cabin took turns instructing classes of the enginemen and guards. The men having been previously furnished with copies of the rule book, were required to arrange the signal indications for imaginary train moves through both plants. That this time was well spent was proved after the plants went into service, for so far as is known no delays or confusion resulted from the enginemen not being able to grasp the new indications promptly.

Although the absolute block had been consistently maintained prior to the new signaling, and the rules required trains to come to a full stop before passing a horizontal distant signal arm, the enginemen soon saw the advantage of the permissive auto-

Electric Interlocking at Adelaide, Australia Passenger Terminal

matic signals which took the place of the starting and distant signals, and proper observance of these permissive signals has materially expedited traffic during the rush hours. Absolute lock and block is maintained between all cabins, but the installations between yard cabin, South Line Junction, Mile End, Torrens Bridge, Bowden and North Adelaide were removed and automatic signals, with continuous track circuit, without manual control, were installed.

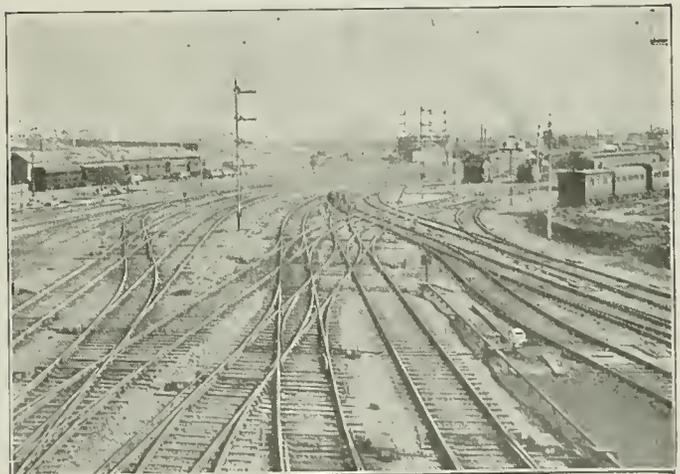

CABINS

The existing yard cabin, being a substantial building and in a most suitable position, was used; but the depth of the power machine is less than 3 ft. and it was set up on the same floor and parallel with the mechanical machine. This made it easy for the signalmen to pass from the old to the new when the plant went into service.

The Wye cabin is a new brick building, built on the edge of the embankment with the battery room in the basement, relay room and power board on the first floor and operating room on the second floor. The location is such as to give an uninterrupted view of the three legs of the Wye. Both machines are of the G. R. S. multiple unit type.

SIGNALS AND SWITCHES

The incoming signals at the yard plant for the three mains—North, Port and South—are Model 2-A three-arm posts, one

Terminal Yard from Morphett Street Bridge, Looking Toward the Junction

of which is placed on the signal bridge with the Wye signals. As the station is dead end, the top arms are immovable, and the medium speed arms, which are semi-automatic, stick, work from 0 deg. to 45 deg. only. The "calling on" or lower arms work in two positions also and are controlled by two levers. One of these levers controls movements into the platforms when occupied, and the other lever is used for a movement into the coal stages. The coal stages are much nearer to the signals, and the signalman can only let an engine into them by pulling the lever for that purpose.

The platform starting signals are three-position, Model 2-A dwarfs—0 deg. to 45 deg. lever control, and 45 deg. to 90 deg. semi-automatic non-stick, the third position being controlled through the track circuits and the outbound home signals at the Wye plant. The back up dwarfs and carriage siding starters are of the two-position, Model 3, solenoid type. The dwarf signal spectacles are enameled steel round disks about 22 in. in diameter, with the arm indicated in red on a white background. These dwarfs are considered a great improvement over the small arm type. At the Wye the three-arm signal arrangement was carried out for all interlocked signals; but the normal, medium or calling on arms are fixed in all cases where they are not required.

The Model 4-A switch machines were used for all single switches and compounds as well as catch points. Hayes derails are used, except at the siding derails, some of which are catch points and others Hayes derails. These siding derails are operated mechanically from the detector bar connection on the switch machine at the switch through the medium of switch and lock movements. The standard fittings of the General Railway Signal Company were employed, the only change necessary being that occasioned by the 5-ft. 3-in. gage, which is standard in this state. As the switches are supported on cast iron chairs, raising the rail about 2 in. off the tie plates, this permitted the No. 1 or switch tie plate to be laid without set, while still keeping the cover of the machine below the top of the rail.

The rail section is 80-lb. and the ties of Jarrah. This timber is much harder than any with which American railway men are familiar, all holes for dog spikes as well as coach screws being drilled. The Australian practice is to use round iron spreader rods, but the American arrangement of flat rods and point lugs was adopted so as to simplify the fitting of insulations and switch adjustments.

CIRCUITS

The track circuits are of the single rail type; that is to say, no insulations were placed in the negative rail, as the negative rails were all bonded together, forming the negative return to the storage battery in the cabin. Both Weber and Continuous joints of the 4-bolt type were installed to enable a test to be made to determine what type of insulated joint should be adopted for future work. The American oak in the Weber joints eventually will be replaced by Jarrah timber, as it is believed longer life will be secured thereby.

The control circuits are patterned very closely after the specifications of the R. S. A. All running signals are detected through switch boxes on facing switches and all catch points and Hayes derails are equipped with point detection for dwarf signals. Route locking for all high signals at the yard and Wye plants is secured by the use of normal indication locks on the signal levers, the route being held until the front of the train has reached the last track circuit in the route. No detector bars were employed for protecting switches, the detector track circuits with lever locks being used in lieu thereof.

G. R. S. relays were used throughout, carbon to copper contacts for 110-volt signal circuits, and silver to carbon for all other circuits. Standard 4-ohm relays were used for the automatic signals and 11-ohm relays for the interlocking circuits. The line relays were 1,000 ohm except where the control voltage was 110, in which case 2,000 ohm external was added.

As the ravages of the white ant are severe in South Australia, Oregon pine, because of the ease with which it can be worked, was used for all trunking, first being thoroughly soaked in "Carbolinum Avenarions" wood preservative, a dipping trough being built for this purpose. Pointed Jarrah stakes, rough sawed, 3 in. by 4 in. by 3 ft., were used to support the trunking line. Two stakes side by side were employed where the line exceeded 7 in. in width.

The power for the plants is furnished from duplicate sets of 200-volt to 110-volt d. c. motor generators placed in the same power house as the vacuum car cleaning equipment, at a point about midway between the yard and Wye cabins. It is a matter of interest to know that the total energy required for the operation of switches and signals at the two plants probably would not be equal to half a dozen 16 c. p. lamps burning continuously.

The construction work was carried out by the contractors, R. W. Cameron & Co., with local labor under the direction of two skilled men brought out from America to direct the work. Considering the fact that the maintainers required educating in the art of power signaling, in addition to the instruction of enginemen and signalmen, the plants have been working with a most satisfactory smoothness, and all the advantages anticipated, and more, have been realized.

RAILWAY DEVELOPMENT ASSOCIATION

The proceedings of the first two days of the convention of the Railway Development Association, held in New York City, November 9, 10 and 11, were reported in the *Railway Age Gazette* last week, page 909. On the third day, Thursday, the convention sat only from 10 to 1 o'clock. The principal business was the discussion of three papers: "Markets and Rural Organization," by G. C. White, United States Department of Agriculture; "Opportunities in the Making," by W. P. Hartman (G. R. & I.), and Harbor Development (New York), by Thomas O. McGill.

Mr. Hartman was the first speaker. His activities have been mostly with the farmers. He makes it a point to attend to the wants of the men already on the ground, even if new-comers may thus be neglected. His road has five experimental farms, the largest of which is one of 80 acres at Howard City, Mich. This is a region of poor soil and the lessons taught to farmers are correspondingly valuable. On two of the company's farms operations are carried on jointly with local farmers. One of the company's enterprises in this connection is a picnic grove which has helped to make the road's propaganda popular. Committees in the towns get up local fairs and co-operate in the picnic business, furnishing, perhaps, free coffee and ice-cream. In discussing the question of promoting good markets, Mr. Hartman cited examples to justify the view, not only of himself, but of apparently all railroad industrial agents, that the main objective must be the improvement of the quality of products.

H. B. Fullerton (L. I.) in the discussion of this paper, again emphasized the importance of markets. The farmer has been instructed in the production of his wares, and has made improvements; and yet he has come short of the desired prosperity because of the difficulty of always finding satisfactory markets. The United States Agricultural Department has lately established a market bureau, in this matter taking action which, if it had followed the lessons taught by the experience of the Long Island road, it would have done nine years ago.

Another member called attention to the importance of promoting markets impartially for all farmers and shippers. It is easy sometimes to help the grower who produces the very finest products; but what is wanted is a market for every shipper who will conform to prescribed standards. In New York State there is now a state standard for apples, and any grower may pack his apples in accordance with this standard and get the corresponding advantage. Good results have already been made manifest.

G. E. Cassel (N. & W.) described the lecture train which has been run recently over his road, giving instruction to the farmers by lectures and also exhibiting blooded animals. Both state and federal lecturers went with this train. Mr. Cassel pointed out some of the insuperable difficulties in maintaining ideal conditions year after year. This present year southern farmers have suffered large losses on potatoes, from causes which no one has been able to control. The railroads cannot do everything; it should be a constant aim to get farmers into the habit of watching markets on their own account. The discussion was closed by a short exchange of experiences in dealing with unenterprising farmers. The railroad agent who goes into a farming community must expect to find some lethargy and some opposition; his best course, as a usual thing, is to pass by the opposers, and seek men who are receptive.

Mr. White's paper began with a careful description of the organization and activities of his office at Washington. One of the difficulties in starting was to secure competent men for field agents. Most of those who were employed were men with commercial experience. The department has encouraged local co-operative associations of shippers of farm products; has investigated city markets and their location as related to the railroads, and has made market surveys of a number of cities. The transportation section, of which Mr. White has immediate charge, has a valuable library which is made use of in answering a great

variety of questions from all over the country. He is preparing to issue a bulletin on preventable freight claims. Market information has been gathered and edited concerning strawberries, cantaloupes, tomatoes and peaches; and this information, prepared daily in the market season, has been freely given out by telegraph to all persons who were willing to pay the telegraph tolls. The bureau was of material benefit to the Southern Pacific in disposing of the fruit crop in the Imperial Valley, Southern California. These activities have had to do with perishable products; but there is need of a similar organization to disseminate information by mail regarding markets for farm products less perishable. To enable the government to estimate fruit and vegetable markets with satisfactory accuracy, it is necessary that the railroads be willing to inform it of all diversions of carload freight en route.

Mr. White had found that many traffic managers do not properly cultivate the acquaintance of farmers; and on many roads he thinks there ought to be a more numerous force of traffic men. The railroads have a large field for enterprise where they might help those farmers who raise a variety of products, but who cannot ship carload lots of any one product.

In the discussion of this paper, W. H. Olin (D. & R. G.), said that he had been indebted to Mr. White's bureau for telegraphic reports which were of assistance in finding markets for cantaloupes. Mr. Hartman spoke of the importance of securing competent managers or secretaries for local market associations, citing an example of such an association which failed, and by its failure discouraged the farmers, when the only trouble was that an incompetent man was put at the helm.

The point was brought out that the railroad man who acts as a market agent, seeking good markets for farmers, is useful, but that for every man of this sort a large railroad should have at least four men to act as field instructors. Cases were cited where peaches, sweet potatoes and other commodities had to be thrown away, not because there was not a market for good products, but because the quality of the goods or the method of packing had been unsatisfactory.

Mr. McGill's address was mainly a sketch of the activities of state and city officers during the past four or five years in their work of improving docks and other terminal facilities in and around New York City. He explained the serious obstacles which had been the cause of the very slow progress. In two years about 45 acres of new or improved dock space has been provided by the city. At present piers 1,000 ft. long are being built on the Hudson river, between Forty-fourth and Forty-sixth streets. These piers involved great expense and delicate engineering problems. Piers now under construction in South Brooklyn will provide important additional space. The New Haven Railroad is building eight new piers on the East river front. The Marginal Railway, being built in South Brooklyn, will save manufacturers important cartage costs. Intelligent foresight would have provided some of these facilities many years ago. If the city of New York could be as enterprising as are some of the railroads it could reduce the cost of living in the city six per cent.

THE ENGLISH RAILWAY MEN'S WAR BONUS.—The increased war bonus which was detailed in the *Railway Age Gazette* of November 12, will apply to the salaried as well as the wages staff who are receiving not more than £150 (\$720) per annum, and who have previously been in receipt of war bonus. Thus railway clerks 18 years of age or upwards whose salary is at the rate of 30s. (\$7.50) per week or more and who have been receiving 2s. (50 cents) per week war bonus, and those under 18 years of age whose pay is less than 30s. per week, and who have been receiving 3s. (75 cents) per week bonus, will now in each case receive 5s. (\$1.25) per week. Further, those employees of the railroads under 18 years of age who have received war bonus at 1s. 6d. (36 cents) per week will in future receive 2s. 6d. (60 cents) per week. This liberal provision was put in effect on October 16.

THE FUEL DEPARTMENT—A CONSTRUCTIVE CRITICISM*

BY L. G. PLANT

Fuel Engineer, Seaboard Air Line

Were it possible to obtain a composite picture of the fuel department as it does, or does not, exist on each railroad, to compare the "average" with the "potential" fuel department, the comparison would invite criticism from at least a dozen standpoints fundamental to the success of a department responsible for the efficient selection, distribution and use of locomotive fuel. This criticism may apply in no particular instance; it is the average situation that is concerned. The conspicuous results that have been obtained on a few roads indicate how much remains to be accomplished on American railroads as a whole before the fuel department can be regarded as an entire success.

The fuel department has failed to establish its position in the organization of the railroad; it has never been recognized as an essential and integral part, equal in importance to the transportation, engineering and mechanical departments. In the original structure of the railroad only those departments essential to actual operation were included. Efficiency in operation has not until recently been given the attention it has always received in private enterprises where ownership is more intimately identified with the operation of the business. A department responsible for the efficient selection, distribution and use of locomotive fuel is essential to efficiency in railroad operation. To appreciate its importance, one has only to review the expenditures for fuel on American railroads or to consider the cost of this item on his own road in comparison with other operating costs. The position and responsibilities of the fuel department should be as well defined as that of any other department. It should afford a legitimate and effective means for dealing with the fuel problem in co-operation with other departments, not an opportunity for some individual or faction to exploit fuel efficiency at the expense of these other departments.

The fuel department has never developed any well-defined form of organization. The organization of the average fuel department is haphazard, its responsibilities are vague and it may be misplaced in its affiliation with another department. The transportation, engineering and mechanical departments have each a generally accepted type of organization found to be the most practical and efficient; the same should apply to a fuel department. This department should be responsible for efficiency in the selection, distribution and use of locomotive fuel. It should include two elements: One experienced in the use of coal, the handling and drafting of locomotives; the other technical, familiar with available fuels, their preparation and relative efficiency. The first element should include only experienced engineers whose personality assures them the co-operation of the men whose work they supervise; the latter offers an attractive field for the technical graduate in railroad work. The organization of a separate department to supervise the selection, distribution and use of fuel may be justified under some circumstances; otherwise this work should unquestionably be conducted under the direction of the mechanical department. It must be borne in mind that the mechanical department is at all times held responsible for the satisfactory performance as well as the maintenance of motive power. The fact that fuel is a transportation charge does not justify the transportation department in attempting to supervise details of a mechanical or technical nature.

The fuel department has not yet adopted standard methods for supervising the selection, inspection, distribution and use of locomotive fuel. Local conditions may require some variation in the form of organization, the character and extent of supervision, the inspection and distribution of fuel; but there is so little variation in the purpose of the fuel department, the men and materials with which it deals are so generally alike, that there is an excellent opportunity for the wider application of those methods that have been found most successful. Wherever

*A paper presented before the New England Railway Club, November 9, 1915.

fuel economy has been given considerable attention some strong points in connection with this work have usually been developed. The organization of the fuel department may be unusually well arranged, the supervision over fuel use may be very thorough or the inspection of coal may be particularly effective. A complete study of the work being done on each railroad and of the results obtained in reducing fuel consumption would be of the greatest value towards raising the general average of efficiency in the fuel department. It is interesting to know that the United States Bureau of Mines is contemplating a detailed investigation to determine what steps are being taken by each railroad in the country to improve fuel efficiency; but it would be unfortunate if the government should undertake this work before a single railroad association had completed a similar investigation and before the railroads can exhibit a more uniform standard of fuel efficiency.

The fuel department has not been successful in arousing any widespread interest in fuel economy. Fuel consumption is, in a sense, the pulse of the railroad. It not only responds to the manner in which the locomotive is handled, but it reflects the condition of the engine and, in a measure, the condition of the track. It is sensitive to delays at terminals and on the road, and is directly affected by train loading. Hence, the co-operation of practically all departments is essential to securing maximum fuel efficiency. A division fuel committee, developed along lines similar to the safety committee, has been suggested as an effective means for enlisting co-operation. Its membership on each division should include an engineman and fireman from both passenger and freight service, and a roundhouse foreman from each important terminal. The division superintendent, chief train despatcher, master mechanic, road foreman of engines and fuel supervisor, if any, should complete the personnel of the committee. Meetings may be held monthly, at which all matters pertaining to the economical use of fuel can be discussed. Besides arousing a more general interest in fuel efficiency, these discussions will develop surprising breadth and result in a fund of valuable suggestions.

Failure to provide supervision in proportion to that found in any other branch of railroad service is the most conspicuous defect in the average fuel department. The best ratio of supervision generally in effect is that of one travelling representative of the mechanical or fuel department to 50 engine crews. A well-managed shop usually provides a better ratio of supervision, although the potential saving in the shop is a fraction of the possible saving on the locomotive. Furthermore, this comparison does not reveal so great a discrepancy between the wages of the shopmen and their foreman as may be found between the enginemen and the road foremen, where in many instances the road foreman earns considerably less than many of the men whose work he supervises. There are certain well-established methods for the economical handling of locomotives that will not be described here; the necessity for adequate supervision to insure their enforcement, however, is emphasized. Supervision over fuel use at terminals is equally important, as the opportunity usually exists for making a greater saving at terminals than on the road, in proportion to the fuel used. Supervision over the condition of the motive power is incident to the foregoing. Locomotives must be properly maintained if economical results are to be expected; but in this there is much detail, neglect of which will not actually cripple an engine, so that constant supervision is essential. Supervision must, in fact, cover every activity in the operation of the railroad in which fuel is a factor.

Education in the economical use of fuel is a relatively neglected feature in the work of the fuel department. Instruction in the use of the air brake and many other details connected with railroad operation is considered necessary. The air brake instruction car has become an established institution; why not a fuel instruction car? The necessity for such a car is perhaps not so urgent, the results to be obtained are not so tangible, but the possibilities are just as great. Education does not necessarily imply an instruction car, but it can probably be conducted to

the best advantage through this means. The success of an instruction car depends upon the personality of its management, and, to a certain extent, upon the calibre of the men it is intended to reach. Instruction should be arranged for both enginemen and firemen. Cars designed for this purpose are equipped with a simple apparatus for demonstrating the process of combustion and a screen where pictures may be effectively used to illustrate details in connection with the proper firing of locomotives. Motion pictures can be used to the greatest advantage and these should be taken to illustrate local conditions. The value of this car simply as an "advertisement" for fuel economy must not be overlooked.

The fuel department has not furnished any tangible incentive for exercising economy in the use of fuel. One of the earliest attempts at fuel economy was the money premium awarded enginemen for saving coal. This has been discarded because it was impossible to award premiums with accuracy and fairness and because it was objectionable to the enginemen as a whole. The individual fuel performance record, however, remains as the best possible incentive that can be offered, provided an accurate and effective record can be published currently. The average fuel record is a failure because it disregards the effect of conditions beyond the control of the enginemen. It includes his performance with light, as well as with full tonnage trains, and superheater engines are often compared on the same sheet with engines using saturated steam. If based on correct principles, a very satisfactory and effective record can be computed without facilities for weighing individual coal issues. A record of every engine movement must be kept, giving the name of the engineman, the coal consumed, the freight ton-miles or passenger car-miles, as the case may be, and the coal consumption per ton- or per car-mile. This record is based on daily reports received from each terminal and is posted daily in a book similar to the familiar car record. Where operating conditions are taken into account and the engineman's weekly or monthly average includes only records made with tonnage trains under normal conditions, the record will prove a very fair estimate of the engineman's relative standing. This work must not become simply a routine clerical matter; the records require individual attention and a good performance deserves personal recognition. The performance records should be bulletined promptly after the close of each period. The bulletins can be effectively designed with two columns, one showing enginemen above the average in red type; the other, enginemen below the average in blue type. The various types of engines and classes of service may be grouped separately. Such a record can be maintained at a cost of less than one dollar per month for each engine in service and will prove a conspicuous success towards stimulating interest in fuel economy.

The average fuel department has not assumed the same responsibility for efficiency in the selection of fuel as for economy in its use. The selection of coal is more frequently a matter of price than the result of a thorough study of available fuels. The cheapest fuel may not represent an ultimate saving, while higher priced coal should not be considered without assured facilities for utilizing its potential value. The breadth of selection is, of course, considerably greater where purchase is not confined to mines located upon the line of road. The fuel department should make a thorough study of available fuels, including comparative tests between coals from each field. These tests may be conducted upon a single engine operating preferably in passenger service and the evaporation per pound of coal carefully determined as an index to the relative value of the fuels tested. Where, as in some instances, a 10 per cent variation in efficiency has been found between coals obtainable at the same price, the value of these tests is obvious. There are few sections of this country that do not afford some undeveloped opportunity for effecting a reduction in fuel costs through utilizing inferior grades of fuel. For instance, it has been shown in a test that Texas lignite could be burned more cheaply than other fuels available in the Southwest; this fuel is so well adapted to the requirements of the locomotive stoker that its use on large

stoker-equipped engines in that territory would doubtless result in an important economic saving. The adaptation of locomotives to cheaper fuels is consistent with other economies undertaken by the fuel department.

The fuel department has not shown the same discrimination in the purchase of coal as is exercised in the purchase of many other materials. Specifications for coal are not as easily framed nor as readily applied. Following its investigation of available fuels, the fuel department should frame specifications adjusted to the character of the coal obtainable. Where mine run coal is purchased, the best percentage of lump and the lowest percentage of ash that may be expected with careful preparation are the most important items in the specification. Where coal is prepared over screens or through washers, the preparation should be specified in detail. B.t.u. specifications cannot be applied to locomotive fuel; the expense of sampling and analyzing is alone prohibitive. The laboratory investigation of coal should precede rather than follow its purchase.

Where the fuel department has recognized the necessity for fuel inspection, it has seldom appreciated its possibilities. The fuel inspector is usually the only representative of the railroad who remains in touch with the mine operators. He is responsible for the careful preparation of the coal and can very materially assist the operator in maintaining good standards. Being familiar with both the preparation and use of fuel, he is in a position to recommend some improvement in the method of preparation or the trial of a cheaper grade of coal. He can materially assist the transportation department in the handling of equipment to and from the mines, especially when the mines are not located upon the line of road. The inspector should have authority to reject, without question, coal inferior to the specifications in any detail. He may, for instance, suggest facilities for cleaning the coal or a method that will increase the percentage of lump; he may recommend the use of a 4-in. in place of a 6-in. coal from a certain mine; or, he may advise the transportation department of an impending shutdown at the mines and otherwise make his services of value to that department. The inspection of coal should be constructive rather than purely critical; where possible, it should be assigned to men with some technical ability.

The fuel department has given comparatively little attention to the economical distribution of locomotive fuel. Distribution of fuel is a matter in which convenience and expediency are generally the controlling factors. Important questions relating to the effect of foreign freight, the necessity for storage and the actual cost of distributing coal upon the line of road, enter into the problem of economical distribution. The effect of foreign freight should be considered in connection with the purchase of coal. The necessity for storing coal depends upon fluctuations in its price and other current conditions affecting each railroad. The distribution of coal should be arranged and supervised by the fuel department. A careful estimate of the actual cost of moving company coal should be made in place of estimating this cost upon an arbitrary charge per ton-mile. The relative cost of coal at each chute, quality considered, should be determined and a schedule arranged requiring engines to take as large a portion of coal as possible at points in their district where the cost is lowest. Observance of this schedule will result in an indirect but substantial saving.

The charge that the fuel department has failed to take its part in developing the economy devices that have made the efficiency and capacity of the modern locomotive possible, is perhaps an unfair one. It is generally assumed that it is not within the scope of this department to attempt this phase of the fuel problem. From a broad standpoint, however, why should this be so; why is credit for the introduction of the superheater and the brick arch largely due the manufacturer? Apparently the fuel department has neither time nor money for perfecting new devices; in some instances it has not even the facilities for giving them a fair trial. It is an unfortunate commentary on the fuel department that manufacturers of important economy devices must keep traveling representatives on the railroads to insure their proper use and maintenance.

Reviewing the foregoing, the success of the fuel department depends upon the following factors:

Recognition.—The railroads must recognize the fuel department as essential. It should be considered a logical branch of the mechanical department with a definite responsibility for efficiency in the selection, distribution and use of locomotive fuel.

Organization.—The fuel department should comprise an organization associated with the mechanical department. It should have a direct representation upon the road which will supplement rather than duplicate the organization of traveling engineers for the mechanical department. It should include a technical staff to assist in the testing and selection of fuel, to conduct its inspection and to investigate devices and methods affecting fuel use. It should further include a small office organization for handling routine matters and computing individual fuel records.

Standardization.—Methods for obtaining maximum efficiency in the handling and use of fuel should be standardized. This should be the result of a thorough study of the best practices in effect on each railroad. If the railroads do not make this study and do not effect a more uniform standard of fuel efficiency, it is probable that the United States government will.

Co-operation.—The fuel department must enlist the co-operation of every other department. The personality of the department and the spirit in which it is conducted are very important factors. The division fuel committee should be as widely established as the safety committee.

Supervision.—The mechanical department should provide supervision over the operation of locomotives to the extent that the performance of every engine and engine crew may be personally observed within a period of 60 days. This supervision may be divided with the fuel department, affording the latter a direct representation in the form of fuel supervisors. While the fuel supervisors can concentrate upon details concerning fuel use, their work should otherwise supplement the regular duties of the traveling engineers. Their compensation should be such that it will not prove a limiting factor in their selection.

Education.—Adequate supervision implies a degree of education, but to this should be added education of a more thorough and systematic character. The organization of the department should include an instructor qualified through experience and personality to conduct an educational course designed to reach all concerned in the handling of locomotive fuel. Where possible an instruction car should be provided.

Enthusiasm.—Where individual efficiency is concerned enthusiasm is a vital factor. The competitive fuel record presents one of the best incentives for enthusiasm among the men, upon whom results ultimately depend.

Breadth.—The scope as well as the spirit of the fuel department must be broad. The selection of fuel should represent a balance between theoretical and practical considerations;—its inspection should be "constructive." The policy of the fuel department toward the invention and use of new devices must be progressive—it should play a leading role in the conservation of fuel.

DISCUSSION

H. C. Oviatt, assistant mechanical superintendent, New York, New Haven & Hartford, said that practically the same organization as that outlined in Mr. Plant's paper is employed on that road. Including the road foremen of engines, there is one supervisor to about every 40 enginemen. He did not believe it advisable to attempt to check up enginemen too closely without having some means of knowing the actual amount of coal placed on the tender.

R. D. Smith, superintendent of motive power and rolling stock, Boston & Albany, believed in personal contact and co-operation with enginemen and firemen in bringing about economy in fuel consumption. This was also emphasized by Henry Bartlett, chief mechanical engineer of the Boston & Maine, who also referred to the importance of keeping similar grades of coal at both ends of a run. Mr. Bradley, fuel supervisor of the

Boston & Maine, advocated a central bureau to deal with all departments concerning fuel. In referring to the use of performance sheets for checking up enginemen, he gave it as his belief that any performance sheet was a great deal better than none.

W. J. Cunningham, president's assistant, Boston & Maine, dwelt on the effect of guesses as to the amount of fuel placed on a tender and the varying conditions on the road on fuel consumption and fuel consumption records. H. C. Oviatt also stated that, while he has never been able to find a satisfactory method of using the individual record, he believes in such records if it is possible to work them out satisfactorily. In closing, Mr. Plant explained in more detail the system of records employed on the Seaboard Air Line, which was described in the *Railway Age Gazette*, April 3, 1914, page 788.

MISSOURI COMMISSION ALLOWS GENERAL ADVANCES IN RATES

The Missouri Public Service Commission, in a decision rendered on November 13, allowed the railroads a general advance in passenger fares and advances in freight rates, with a few exceptions, making an average advance, it is estimated, of five per cent, effective on January 1, 1916. The railroads had asked for an advance in passenger fares from two to three cents a mile. The commission authorizes a fare of 2½ cents a mile on one-way tickets, 2¼ cents a mile on round trip tickets and 2 cents a mile on mileage books of 500 or 1,000 miles. The freight rate advances in many cases are less than those asked by the railroads.

The commission finds from the testimony that a minimum passenger rate of two cents a mile does not give the carriers two cents a mile for each mile a passenger is hauled, because of the necessity of the carriers to constantly meet each other's short line rates. The commission also finds that the reduction in passenger rates from three cents a mile to two cents a mile has not resulted in an increase in traffic. The minimum charge for carrying a passenger is reduced by the commission from 10 to 5 cents. It is provided that each full fare ticket shall carry with it the privilege of carrying 150 lb. of baggage and each half fare ticket 75 lb. The commission also orders that the rate for excess baggage shall be 15 per cent of the 2½-cent rate. As to joint line freight rates, the order provides that where a shipment moves from one line of road to another through mileage rates shall be applied as a maximum, with small arbitraries added to cover the additional service of switching and other incidentals. Grain rates are readjusted by provision for a lower rate on corn than applies on wheat, and a provision that the rate on grain shall include transit arrangements, terminal allowances and the usual absorption of switching charges. Increases are allowed on some livestock rates and decreases made on others. There is an advance on some classes of stone and a reduction in others. On the following commodities the application of the roads for increases was denied: Hard coal, soft coal, fuel oil, barytes, ore, ore products, mill logs, drain tiles, sewer pipes, canned goods, ice, hay, straw, broom corn, flour and feed.

The rates which are now advanced were reduced by the legislature, the freight rates in 1905 and in 1907, and the passenger rates in 1907. Temporary injunctions were secured from the federal court, and in 1913 the rates were put in effect after a decision by the United States Supreme court that the roads had not proved the rate laws confiscatory. The decision follows a long series of hearings at which elaborate statistical and other evidence was placed before the commission by the carriers.

The decision, which was written by Commissioners John Kenish and H. B. Shaw, and concurred in by the other commissioners, says that there is no doubt that the financial problems of the railroads operating in the state, as well as those in the entire country, have been made more acute by the European war; that the operating expenses of the roads have increased from year to year, due to increases in wages, increased cost of

material and by other matters over which they have had no control, and that these conditions are not peculiar to Missouri, but apply generally throughout the United States. The decision comprises some 300 typewritten pages. Some extracts from the opinion are as follows:

"The carriers must be enabled to afford safe and adequate service to the public, meet their financial obligations and maintain dividends in such manner as to encourage further investments in railways and their stocks and bonds in this state, in order that such railroads may be able to perform the increasing duties demanded by the public.

"This state still needs many miles of new steam and inter-urban railroads to aid in its fuller development and the construction of such roads will require much new capital.

"We have carefully examined and considered all the evidence; we have also investigated the passenger rates of other states for comparative purposes, taking into consideration the similarity and geographical conditions as well as the density of population and difficulties of operation, together with the increased cost of operation not offset by increased revenue.

"We believe that all classes of passenger fares should be made reasonable and just, so as to encourage passenger travel. The automobile and the jitney which have come in the last few years and since the passage of the 2-cent rate, have doubtless reduced the short local passenger earnings of the roads of this state. What will be the future reductions no one can tell.

"When it is considered that we are asked to fix one schedule of rates that will be reasonable for 14 railroads serving territory dissimilar in cost of construction, in destiny and character of traffic, some containing large commercial centers and forming valuable connections with other carriers, while others do not, it is apparent, however well informed the commission should be as to the value of the property upon which the carrier is entitled to earn a reasonable return, no adjustment of the rates could be expected in which equal results would follow as to the return received by each carrier.

"The rates fixed will doubtless prove more profitable to some of the carriers than to others, nor do we think a general schedule is open to criticism because of that fact.

"For a carrier should not be denied all benefit of the advantage that comes from favorable location and from the efficient and economical management of its property.

"The most we can hope to accomplish is that the schedule of rates which we shall adopt, considering all of the carriers and all of the intrastate traffic devoted thereto, will be just and reasonable and will yield a reasonable average return on the value of such property."

It was contended by the railroads that higher freight rates are more necessary in some parts of the state than in others, but the opinion says that the evidence offered fails to justify a recognition by the commission of the state into A and B territories for the application of the proposed higher rates.

ELECTRIC RAILWAY IN SWEDEN.—The electrification of the railway from Kiruna to Riksgransen, in the extreme north of Sweden, is now complete. It is the first line on which the Swedish State Railways have employed hydraulically generated energy for railway traction. The line is also noteworthy by reason of the fact that a large section of it is within the Arctic Circle, where 50 deg. of frost are often experienced in the winter. It was to deal with the transport of iron ore from the mines which are located at the southern end of the railway to the Norwegian frontier that the electrification was undertaken.

LONDON & SOUTH WESTERN RAILWAY ELECTRIFICATION.—The first portion of this company's newly electrified lines, from Waterloo station, in London, to Wimbledon (through East Putney), was opened for traffic on October 25; the second portion of the electrified system (Waterloo, Barnes, Richmond, Kingston, Wimbledon, Clapham Junction, Waterloo) was nearly ready for operation at that time.

The Efficiency of French Women as Railway Workers

There Are Now 25,000 Satisfactorily Filling Such Positions as Porters, Car Cleaners, Conductors or Agents

By WALTER S. HIATT

Our Special European Correspondent

The labor problem of Europe is slowly finding a solution.

The railroads of France, for instance, are to-day making one of the first absolute tests yet made on a large scale among civilized nations of woman's ability to fill man's place fully in one of the most hazardous of occupations. The test has already shown that in some respects woman is not merely the equal but the superior of man in his allotted field of manual labor.

The first street car I boarded on landing in France many months ago had a woman conductor and a woman motorman. Since then the employment of women has grown apace and one of the most important interior tasks of France, as is the case with other nations of Europe, has been the adaptation of women to places once regarded as belonging exclusively to men. It is, however, not a question of the invasion of men's places by women, or of the exploitation of female labor, but, rather, of getting the work of the country done at all.

The employment of large numbers of women on the railways has made woman's entry into the field of transportation more

munitions factories or at the front, or else crippled beyond the capacity of manual labor. In view of the fact that the latter condition will have a lasting result and since there will be so many widows and other women forced to earn their own living henceforth, it is time to ask if woman is making good in her new occupation. There can be no doubt of it, and that answer has a meaning not only for Europe but for the United States,

than a curious or passing phase of the war. Her working on railways is a result of urgent necessity and has long since passed the experimental stage. The work of German prisoners has been limited to the handling of freight at ocean ports and is considered a makeshift. The native male population is busy in

Women Cleaners at Work in Paris Yards of the P. L. M.

where we know women as stenographers, as clerks, telephone operators, but where, notwithstanding woman's invasion of industry, we do not know women as railroad telegraph operators, porters, ticket-sellers in railway stations, car conductors or car and locomotive cleaners.

Be it said in passing that Europe has for a long time been used to seeing woman as a manual laborer in the fields, as a fruit vendor, a janitor, a grocer, or as a railway grade crossing tender. It does not entertain any sense of pity, or of shame, if you will, in seeing her at a man's job. It watches her work from the standpoint of results. The laboring man once even watched her work with jealousy, feeling that her success meant lower wages and fewer places for him. Her work in the fields was such this year, however, that in France certainly it called forth the admiration and gratitude of the whole nation, for with less land to cultivate owing to the German invasion, she actually obtained a more abundant harvest than man had secured in past years. A Frenchman who had travelled throughout the country and seen the woman's wonderful work in the fields, jokingly said to me: "Would it not be a good thing to keep the men at war?" But for her active hands the munitions factories could not have been kept going at their high speed; but for her the entire post-office system of the country would have broken down under the double strain resulting from the enormous free military correspondence. Unspoiled by too much prosperity or by false

standards of social and economic equality, she works with a will and does her task well down to the last detail.

It is in the highly specialized work of the railroads, however, that the real test of her abilities has come. There are to date in France no less than 25,000 women occupying such positions as subway guards, conductors, station masters, porters, carpenters, clerks, platform cleaners, or cleaners of cars and locomotives, and each month sees this number increase as the men are taken out of the offices and put to work in the operating and shop departments. Months ago the telephone service was turned over to the women, and but recently the railway telegraph lines in the Paris station of the Paris-Lyon-Mediterranee railway began to be operated by women. In the south of France, on the Southern railway, women have replaced men as porters and freight handlers in large numbers.

On the State Railways alone, but one of the six great systems of France, more than 5,000 women are already employed, and they are on an equal footing with the men. While preference is given to the widows and daughters of employees, other women may enter the service after examination, and once in the service they become entitled to participation in the sick benefits and pension funds of the men. On this railway women are permitted to hold the position of station master (*chef de halte*) at village stops. Here, as on some of the other systems, uniformed women also travel as attendants or porters on the expresses and other through trains, their work being primarily to keep the first, second and third-class cars clean during the journey. On the Paris-Orleans system women hold positions as station agents at some of the important small cities, attending to all the duties of ticket selling, checking baggage and handling freight.

This expansion of woman's work on the French railways has been so rapid that the French public does not realize its extent, or has not paused to notice, so greatly has the war absorbed attention and upset old notions of fitness. For all that, the railway heads are closely studying woman's capabilities, as they must, in their splendid effort to keep their roads going smoothly. Every day the war lasts the railway officers must use a little more ingenuity to make ends meet, they must make old material wear a little longer, they must adapt old material to new uses, and one of their many heavy tasks is that of stretching the work of the decreasing amount of trained labor, putting women in places where men are not absolutely needed.

WOMEN CAR CLEANERS

Offhand, it is safe to say that women have not failed these railroad chiefs and particularly is this true of women engaged in lighter duties or in those places where courtesy counts. The most surprising test of woman's adaptability to a man's job I saw in the yards of the Gare de Lyon, the Paris terminal of the Paris-Lyon-Mediterranee railway. The chiefs of this railway have never hesitated to adopt any means, however novel, to accomplish a given end. When I visited its yards its officers had just come to the very definite conclusion that in many respects woman's labor was a factor worth considering even in normal times, and particularly in matters of railway cleanliness, where their work was far superior to that of men. I went to the yards where the women were at work amid the busy rush of moving trains. The foreman in charge of car and locomotive cleaning told me that in times of peace he had employed some 200 men on passenger cars, but that now he had but 105 men left. He had 80 women, the number of which he was gradually increasing, who had taken the place of the missing men. He explained that while these women were somewhat slower at cleaning the outsides of cars, which were washed with water and then dried with a squeegee, he found them not only quicker but neater with the inside work.

"Those women really clean cars," he said, and to prove his statement took me to some cars then in the hands of the women cleaners. The latter were not in uniform. Their hands and faces were quite clean and bore none of the traces of soot and grime familiar to the man cleaner. Those on the outside of

the cars, armed with buckets of water and squeegees, were grooming them down, making the paint shine as if the cars belonged to the train of the President of the Republic. "Look how that brass work shines," continued the foreman. "Never have I been able to get men to polish it so. The only difficulty with the women is that they can't do the outside work very quickly, as it tires them to lift their arms."

The insides of the cars, whether first, second, or third class, were clean and neat as new pins. The windows shone like those of a London haberdasher. There was not a spot of grease or coal dust on the tan-brown cloth cushions. The lace curtains placed over the cushions to protect them from wear were newly laundered and looked as sweet as those of a parlor. The linoleum floors were as spotless as a Holland kitchen floor. I was surprised, because French trains used to be very dirty. Surely war has some compensations!

We walked through the cars where the women were busy with their soap and water, brushes and vacuum cleaners. The foreman tipped his cap in the pleasant French way, and the women smiled, proud of their work. I remarked that none of them were young.

"Oh, that's quite right," he answered. "The women we employ are all over thirty and we make a rule about their age. These women were chosen from 500. It won't do to employ young women. For one thing the older women are stronger and healthier; they know how to work and they know just how much they can do. Then, there isn't any foolishness about them, no joking with the men in the yards.

"There are only two objections I have found with women for railroad work. One is that they can't do much overhead work."

"And the other?" I asked.

"Would you believe it," said the foreman, "they're not afraid of trains. I can't get it into their heads that a train in motion is a dangerous thing to the most experienced railroad man. However, they are so cool in their ways that so far there have been no accidents."

"On the whole, then, they are quite efficient?" I asked.

"Indeed, there is no grumbling or back-talk from them ever. They do what they are told to the best of their ability. Besides, they neither drink nor steal."

WOMEN ENGINE CLEANERS

When I went across the Seine to find out how satisfactory the manual work of the women employed in the yards of the Paris terminal of the Orleans system had been, I heard the same story of woman's efficiency, though lively regret was expressed that the war had forced more women than ever into men's occupations.

In the yards of one railway the women had worked so well that a number of the stronger and more capable had been promoted to the cleaning of locomotives, which is surely a man's job. All engineers become careful to a fault about their engines and the French engineers are no exception. It was explained to me that since these women had been employed the engineers had been satisfied, for the first time perhaps since the war began. I watched the women at work. They were clambering over the engine, oiling it, rubbing it down, in a matter-of-fact manner, much as if they were scouring their kitchen floors, handling their oil cans and cotton waste with surprising ease. Here, too, they went about the job cheerfully.

"They've fallen in love with those engines, that's plain," laughed the foreman.

While there is no doubt now that after the war these women will be continued as car cleaners, it is yet a question as to how long they will be employed on the locomotives.

The same results obtained on these great railway lines have also been secured by the Metropolitan's subway lines in Paris. Its chief of personnel expressed himself to me as more than satisfied with their work. "There had been so many complaints about the untidy condition of the platforms," he explained, "that some months ago I replaced 75 men by as many women, and since then there has been an astonishing improvement.

Where the men left dust and papers in every corner, and failed to mop the concrete, leaving it sticky, slippery and alive with dirt, women have so cleaned the platforms that they look each day as clean as the day they were laid."

This officer further said that from a company point of view the work of all the other women employees had proven on the whole as satisfactory as that of the men who had been called away to do soldier duty. The company before the war employed 2,500 persons, 300 of which were women ticket-sellers. Since the war 515 men have been replaced by as many women, who act as conductors and guards and ticket punchers at the platform entrances. Most of these women are wives or relatives of the men mobilized as soldiers.

WOMEN EMPLOYEES MORE COURTEOUS

In an address before the New England Railway Club last January on "Making Friends," Roy V. Wright, managing editor of the *Railway Age Gazette*, said: "It behooves railway executives to bend every energy toward making friends with the public," and also, "ordinary acts are sure to cause friction unless courtesy is used as a lubricant."

Fine lessons in courtesy to the public are being given just now all over France by these women railway employees to an extent that is notable even in a country that prides itself on the politeness of all of its people, rich and poor.

Consider the women of the Paris Metropolitan. First, and despite their newness to their work, they are thoroughly efficient in answering questions regarding directions. Any subway, because of its winding underground passages and blinding lights, is confusing except to the habitual user. Paris just now is full of strangers, crippled and wounded French soldiers, soldiers on leave from the front, refugees and people who do not know their way about, and these women ticket-sellers and ticket-punchers show a surprising quickness in setting the stranger aright and doing so patiently and politely. This subway cuts under Paris in a dozen different directions; it has no less than 200 stations, no less than 50 transfer stations, and at that I have never seen a stranger fail to secure proper information or to secure this information promptly and courteously.

It must not be inferred that Paris is not crowded in war time, that it has not its rush hours like New York or Chicago, or that these women are not sometimes sorely tried in their duties. It is true that the Paris crowd of war-time is a quieter and more preoccupied crowd than the lively crowd of peace; universal suffering has tamed it, saddened it, and made it forbearing. For all this, there are periods during its rush hours when everyone is scrambling to get to or from work, or when crowds troop along at a Brooklyn-Bridge rate, and are impatient at delays.

For instance, the station at the Place de l'Opera is mobbed every evening towards six o'clock, and there a few months ago I noted the disputes that arose between the patrons and one of the men ticket-punchers whose duty it was to close a wicket to the platform before the train went on its way. This man, who was mobilized and therefore empowered to arrest turbulent passengers, was frequently nagged by people who arrived just as he was closing the wicket barring entrance to the platform. Later he was replaced by a woman, and either because of the subtle influence a woman exerts because she is a woman or because of her defensive smile as she barred the way in the course of her duty, those disputes have ceased. So much for the heart of Paris.

In the populous suburbs towards St. Denis and Pantin, where the very poor people live and work, the tramways are more commonly used. Disputes between men car conductors and men passengers were formerly rather frequent, but now they have materially decreased because of the magic smile of the woman conductors.

These women have but one fault—that is, if it is a fault. She is kind-hearted where soldiers are concerned. At car stops she cries out: "Soldiers enter first!" and frequently she forgets to collect their fares.

REPORT OF SPECIAL COMMITTEE

The Special Committee on Relations of Railway Operation to Legislation has issued its semi-annual report, showing that 235 railway companies operating 224,610 miles, are supporting the work of the committee. The report says in part: In response to Circular 70, May 3, 1915, the committee was authorized to apply to the Interstate Commerce Commission for an extension of time within which freight cars must be brought into conformity with the United States safety appliance standards. The application for an extension of two years from July 1, 1916, was made on July 6, 1915. A hearing was set by the Interstate Commerce Commission for September 28, 1915.

The data presented by the railways indicated that on July 1, 1916, there would be approximately 356,000 cars not equipped; that there had been expended to June 30, 1915, approximately \$30,482,000; and that to complete the work would require an estimated expenditure of \$13,860,000. It was also shown that cars in service prior to July 1, 1911, had been brought into conformity with the standards at the following rates:

Six months ending:	Number of Cars Equipped
December 31, 1911.....	36,720
June 30, 1912.....	86,777
December 31, 1912.....	133,203
June 30, 1913.....	154,149
December 31, 1913.....	167,165
June 30, 1914.....	154,430
December 31, 1914.....	173,223
June 30, 1915.....	182,332

The commission has not yet made any order on the subject.

In response to Circular 69, March 10, 1915, the committee was authorized to represent a large number of railways in the formulation of the rules and instructions for the inspection of locomotives and tenders required under the law passed March 4, 1915. A meeting of officers of the mechanical departments was called on May 25, in Chicago, and certain rules were formulated to serve as a basis for discussion before the matter was presented to the Interstate Commerce Commission; these rules were very generally filed by the railways.

It having become apparent that the passage of this act was to be used as a means to secure the installation of high-intensity headlights under all conditions of traffic, the committee called for certain information to enable it to meet the situation thus presented. In the meantime the chief inspector of locomotive boilers formulated a code of rules and sent it to the railways generally. A meeting was thereupon called at which these rules were carefully considered, and a series of conferences was held between the chief inspector of locomotive boilers and his assistants, the committee representing the railways and representatives of the employees. At this conference agreement was reached on all the rules submitted, except those relating to automatic bell ringers and high-intensity headlights. A hearing on the rules and instructions was called by the Interstate Commerce Commission for September 28 and 29, and after further conference with the chief inspector and the representatives of the employees on the preceding day, the matter was submitted to the commission for determination. The hearing continued until October 2, inclusive.

All parties agreed in asking the commission that all of the rules, with the exception of those relating to automatic bell ringers and high-intensity headlights, be made effective at such time as the commission might find it practicable to issue this order.

In view of the probable effort to secure legislation, specifying standard horizontal and vertical clearances, the sub-committee of engineering officers has been following the matter and will suggest a course of action in case the emergency presents itself.

The 43 legislatures which were in session during 1915 have all adjourned. In these there were introduced 1,097 bills affecting railway operation, of which 137 were enacted into law. This compares with similar figures for 1913 of 1,395 bills introduced and 230 laws enacted.

The character of the legislation enacted is indicative of a modification in the attitude of legislative bodies toward railway matters. This condition is due to a variety of causes, but there

can be little doubt but that the method of presentation on the part of the railways has contributed greatly to the result.

Beginning in 1911, the principle of handling matters pending before state legislatures through committees of operating officers, appointed by concerted action on the part of the railways interested, was inaugurated. In the two following years, this method of procedure was extended until nearly all of the states west of the Mississippi river, together with Ohio, Indiana and Michigan, had such committees, and during the year just passed the same form of organization was used.

The course pursued by these committees differed in the several states as the conditions required, but it is the consensus of opinion of the chairmen of all these committees that despite the loss of time involved in attendance upon the legislature, the handling of matters in this manner has been largely instrumental, not only in presenting the passage of much legislation urged by special interests, but in the establishment of more satisfactory relations between the members of the legislatures and the representatives of the railways, through the straightforward presentation of the facts and arguments in each case.

FUTURE METHODS

Whether the above method of carrying on the work in the several states will be sufficient to meet future needs is a problem. So long as bills are dealt with with practical finality in committees the presentation of the railways' arguments through individuals is effective, but a tendency is noted for committees to report out bills, not only with their approval, but in some cases with their disapproval, which has the effect of throwing the ultimate decision into the legislature itself. No argument is possible before the legislature, and in many instances a large proportion of its membership are uninformed as to the merits of a given proposition.

This is further complicated by the quite general practice on the part of various organizations of pledging individual legislators to certain courses of action in advance of their election.

To meet this situation, in some of the states extensive newspaper advertising was successfully utilized; in others, a large number of circulars of an informing character were issued to the public.

POSSIBLE RAILWAY SECURITIES LEGISLATION

By W. L. STODDARD

WASHINGTON, D. C., November 17.

According to an apparently authentic rumor in circulation here, the Interstate Commerce Commission will not, in its forthcoming annual report, renew its recommendation for the federal regulation of the issue of railroad securities. Those who are in a position to secure information on this subject declare, furthermore, that the President has determined to abandon the railroad securities bill, which was one of the chief items in the Democratic trust program.

It is probable that the commission's report will set forth its reasons for this change in policy, and such an explanation will be awaited with considerable interest. The Rayburn bill, which passed the house last year, was generally understood to be the commission's bill, and members of the commission, both at that time and since have publicly declared it to be their opinion that this legislation is of pressing necessity.

Of course, failure upon the part of the administration and the Interstate Commerce Commission to urge this measure at the present time would not mean that the measure in question could not be taken up independently and passed by both houses of Congress. If the advocates of federal regulation of railroad securities make known their will with sufficient emphasis, Congress is sure to respond to a certain degree. The case of the immigration bill is one in point—a measure finally vetoed by the President, but passed by Congress in spite of his lack of support, and, as a matter of interesting record, nearly passed by a Democratic house over the veto of a President of the same party.

Back of the railroad securities bill there lies a growing mass of favorable opinion. As far ago as 1885 the senate committee which framed the original interstate commerce act called attention to the evils arising from lack of regulation of railroad finance. It is interesting to recall that the late Senator Cullom of Illinois was chairman of that committee and may himself have written these words:

"This pernicious practice (fictitious capitalization, popularly known as stock watering), has unquestionably done more to create and keep alive a popular feeling of hostility against the railroads of the United States than any other one cause. It has imposed a serious and continuous illegitimate burden upon commerce. Excessive capitalization operates as a mortgage upon the industry of the country."

Apparently, however, not till the passage by the house of the Mann-Elkins Act of 1910 was federal security regulation advanced beyond the stage of denunciation and recommendation. That act amended the original interstate commerce act and gave the commission control over the issuance of railroad securities. The senate killed the section and substituted a provision for a commission to investigate the whole subject. Hence the Hadley Railroad Securities Commission, whose report declared that "accurate knowledge of the facts concerning the issue of securities and the expenditure of their profits is a matter of the utmost importance. It is the one thing on which the federal government can effectively insist today; it is the fundamental thing which must serve as a basis for whatever additional regulation may be desirable in the future."

In this historical connection it is also worth noting that the platforms of the big parties have declared for railroad security regulation. "We favor . . ." said the Democratic platform of 1912, "legislation preventing over-issue of stocks and bonds by interstate railroads, express companies, telegraph and telephone lines."

In both the house and senate there are many members of the party in power who will unquestionably make the point that the railroad securities bill has been before the country long enough to warrant Congress in enacting it without further delay. Some of the Democratic senators and representatives will undoubtedly argue that the party must redeem its platform pledge on this question, if it is to appeal successfully to the people to be returned to power in 1916. These arguments will be not without weight, and they may possibly be not without effect upon the situation.

It is rumored that the Interstate Commerce Commission, if it refers at all to the railroad security question, will suggest that doubtful points in the legislation hitherto presented to congress cannot be completely and satisfactorily settled until the valuation work is finally concluded—three or four years hence at the least. However, this is only a rumor and incapable of official confirmation at this time.

The overwhelming vote for the Rayburn bill in the house on June 5, 1914, may be an indication of its present strength with that institution. The yeas were 325, the nays 12; those answering "present" numbered 2, and 94 failed to vote.

THE RAILWAYS OF GREECE.—There are about 950 miles of railway at present open to traffic in the so-called "Old Kingdom," *i. e.*, the territory occupied by Greece before the conclusion of the second Balkan war, while the new provinces possess a further 1,720 miles. An ambitious program of new lines has been drawn up, as the Turks have never constructed a single mile in Epirus or Crete, while in Macedonia they have contented themselves with such main arteries as were absolutely necessary. Two lines, with a length of 60 miles, are proposed in Crete, while Macedonia is to have five, with a total length of 320 miles. The most important of these, the Calambaka-Sarowitz line (100 miles), not only runs through a district hitherto absolutely devoid of modern transport facilities, but is of great strategical importance, as it will enable troops to be concentrated rapidly on the north-east frontiers.

AMERICAN RAILWAY ASSOCIATION

The fall session of the American Railway Association was held at the Blackstone hotel, Chicago, on Wednesday, November 17. There were present 250 members and associate members represented by 195 delegates. The executive committee reported a membership of 403, operating 278,950 miles. The executive committee reported that J. E. Fairbanks had been appointed general secretary and treasurer to fill the unexpired term of W. F. Allen, who died last week. H. J. Forster was appointed assistant treasurer.

The committee on transportation reported that it had completed its work on the revision of the standard code of train rules, block signals and interlocking rules, upon which it has been engaged since July, 1911. The codes as presented by the committee were approved by the association. The committee expressed the belief that the rules are adequate to fulfill all the exigencies of train operation.

The committee on maintenance reported that it would issue a circular of inquiry concerning rules governing the determination of physical and educational qualifications of employees to ascertain whether a necessity exists for a further amendment of these rules. The committee presented specifications for high carbon steel joint bars and specifications for heat-treated oil-quenched steel joint bars, as recommended by the American Railway Engineering Association. These were approved. The committee also presented amendments to the specifications for carbon steel rails, which were approved.

The committee on the safe transportation of explosives and other dangerous articles called attention to the necessity for uniformity in connection with the carriage of dangerous articles by passengers in passenger cars. It also called attention to the large amounts of explosives and ammunition now being transported and to the fact that no explosion or fire has occurred in handling this material. Attention was also called to the necessity of active interest on the part of all operating officials in the enforcement of the regulations prescribed by the Interstate Commerce Commission covering the transportation of gasoline.

The committee on electrical working reported that it has had under consideration the question of third-rail working conductor clearances, and submitted diagrams covering the clearances for rolling equipment, which interchanges between different roads and clearances for work equipment which does not leave the individual road. From information obtained, the committee is of the opinion that it would be unwise to extend the design nearer to the rail than at present. Attention was called to the National Electrical Safety Code which is being prepared by the Bureau of Standards of the Department of Commerce, and on the recommendation of the committee it was authorized to represent the association at hearings on this subject.

The committee on relations between railroads reported that it has approved the applications of eight roads to join the per diem rules agreement and has rejected the applications of three roads. It has reported to the executive committee on the eligibility of five roads to become associate members of the association and has rejected the application of one road. It has recommended the restoration of one road to the per diem rules agreement and it has passed upon the withdrawal of one road. In view of the last report of the Interstate Commerce Commission in the industrial railways case the committee is now recommending for admission to the per diem rules agreement, on proper application and approval of railroads which are recognized by the Interstate Commerce Commission as common carriers.

With the report was submitted a report of the committee on packing, marking and handling of freight, which has been conducting its work in accordance with the resolution passed by the association at its last meeting, and has been securing the co-operation of the traffic, accounting and freight claim organizations and departments. Statistics were submitted showing a

saving of over \$3,500,000 in loss and damage payments for the first six months of the year 1915 on 99 roads, as compared with six months of 1914, indicating the increased interest taken in this important subject and that the efforts of the railroads are meeting with success. There was also submitted a report of the committee on weighing, stating that negotiations with the United States Bureau of Standards and with the traffic associations in regard to the free testing of railway master scales by the government scale testing equipment had been successful, and that a program has been submitted to the members of the American Railway Association under which the government will test free, annually, all railway master scales, and in addition, in the states where there are no railway master scales, one scale which will be agreed upon between the bureau and the association. In return the railways undertake to move the government testing equipment to the designated scales without charge. The committee also reported on per diem, car service, switching reclaims, storage, national track storage rules, collection of waybill revenue, business, mail claim papers and statistics. The executive committee has now authorized the resumption of a monthly car location report, and this is being received and tabulated for the use of the members of the association, beginning with November 1.

Additional amendments to the code of LCL rules and rules for loading carload shipments of flour were presented and approved. Recommendations for a number of changes in the per diem and car service rules were approved.

The following were elected members of the committee on the safe transportation of explosives and other dangerous articles: New York Central, Norfolk & Western and the Pennsylvania. The following were elected members of the committee on electrical working: Delaware, Lackawanna & Western, New York Central and New York, New Haven & Hartford. C. W. Gallo-way, general manager, Baltimore & Ohio, and W. B. Storey, vice-president, Atchison, Topeka & Santa Fe., were elected members of the committee on nomination. The next session of the association will be held in New York, May 17, 1916.

REPORT ON COLLISION AT ORIENT, OHIO

The Interstate Commerce Commission has issued a report, dated October 12, giving the conclusions of H. W. Belnap, chief of the division of safety, on the causes of the rear collision on the Baltimore & Ohio South Western at Orient, Ohio, August 12, about 3 a. m., when seven passengers were killed. The facts of this collision were reported in the *Railway Age Gazette* September 17, page 504; and the present report agrees substantially with the statement then made, but goes much more fully into detail. Special attention is called to the fact that the car in which the passengers were killed was of wooden construction, with open platforms. It was built in 1883.

It will be recalled that the freight train, which ran into the rear of the standing passenger train, had been following it for about 10 miles under a rule requiring it to be run under control; and that it had been flagged more than once, both trains being compelled to move at low speed because of the damaged condition of the track due to heavy rain. The engineman of the freight claimed that he was running under control approaching Orient, but that the heavy rain which was falling interfered with his vision and also prevented sand from becoming effective on the rails; but the event proved that he was not running under control. The grade was descending, about 26 ft. per mile, and there was a view of the standing train from about 750 ft. back. The passenger train stopped short of the station to take water.

The inspector holds the freight engineman mainly responsible for his disregard of the rule requiring him to run under control at all times after being passed by the passenger train until he should reach the next telegraph station [i. e., for about 20 miles]; but the conductor and flagman of the passenger train also are censured for not flagging, in strict accordance with rule 99, and also for not throwing off fuses.

The rule under which the freight was running is made specially for cases where a freight is passed by a passenger train at a non-telegraph siding; in that case it may follow the passenger after ten minutes, running under control. Mr. Behnap interprets this rule as being intended to provide for the movement of a train which had entered a block and for some reason was unable to clear the block for a following passenger train and was compelled to take a siding, to be passed, where no means of communication were available. In other words, it is a provision for unexpected emergencies. But in this case the side track where the freight had waited was less than a mile from the entrance to the block section, and there was a telephone by which the conductor could communicate with the block station. To have enforced the absolute block system the freight would have had to be kept 21 miles back of the passenger train. Prior to April 1, 1914, the block sections were much shorter than 21 miles, but on that date certain night offices were discontinued. If, says the report, it was safe and expedient to thus lengthen the block sections, it was the duty of the road to restore them, or at least to enforce the absolute block system, whenever the volume of traffic was increased, or a special passenger train was to be moved at night.

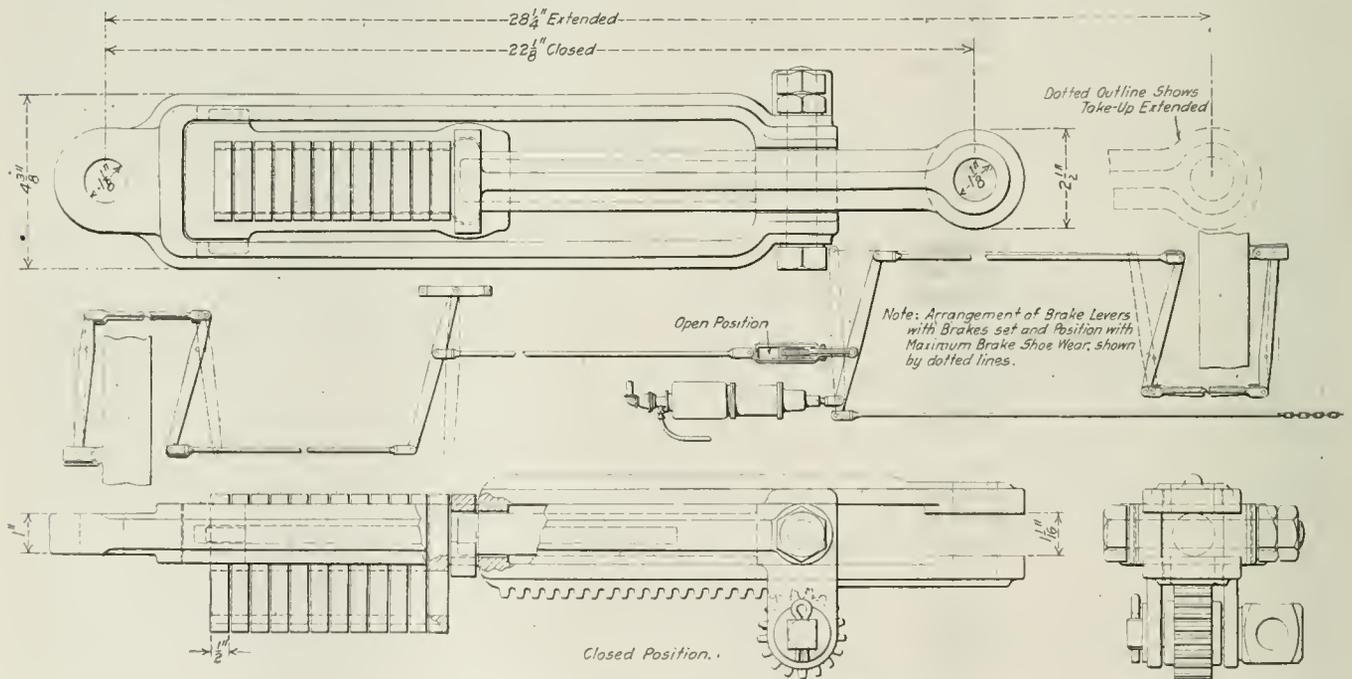

MANUAL SLACK ADJUSTER

A manually operated slack adjuster for use on freight equipment has recently been placed on the market by the H. W. Johns-Manville Company, New York. The purpose of the device is to make it unnecessary to crawl under each truck in order to take up slack due to brake shoe wear, a task both dangerous

which is cored a hole $1\frac{1}{8}$ in. in diameter. Lugs on the inner end of the double yoke fit into grooves in the side of the body, thus holding the end of the yoke in position and guiding the relative movement of the two parts. The jaw at the open end of the body is closed by a block of rectangular section on the end of a thrust rod, the upper and lower faces of this block serving as a guide for the open end of the double yoke. The thrust rod, which is about 9 in. long, extends back on the center line of the body and passes through the cored hole in the throat of the double yoke.

Within the closed part of the yoke are placed 12 thrust blocks, each one-half in. thick. The width of the opening between the sides of the yoke is increased at the throat to permit the passage of the retaining lugs on the ends of these blocks. A key block is inserted in this opening when the device is assembled and is locked by the thrust rod, which passes through a hole in the block. The thrust blocks have a length of 3 in. between the retaining lugs and through the lower end of each is a hole $1\frac{1}{8}$ in. in diameter. When the blocks are raised until the lugs on the lower ends are brought in contact with the yoke these holes are in line with the thrust rod, thus permitting the yoke to be moved to the position shown by the broken lines in the drawing.

When slack is to be adjusted, the brakes are set lightly in order to show the piston travel. A pinion secured to the body meshes with a rack on one side of the yoke. By inserting a short bar in the capstan head of the pin which holds the pinion in place, the yoke may be moved back, thus shortening the length of the cylinder tie rod. As soon as the rod has been shortened one-half in. one of the thrust blocks will be released from the end of the thrust rod and will drop to its lower posi-

Manual Slack Adjuster for Freight Equipment

and difficult of performance. The device is located in the cylinder tie rod, where it is easily accessible, and but one adjustment is necessary for both trucks. The adjustment is made when the brakes are applied lightly so that correct piston travel may be obtained without trial adjustments.

The location of the device in the brake rigging as well as its construction are shown in the drawing. Adjustment is effected between the body of the device and a double yoke sliding within the body. The body is a malleable iron casting about 18 in. long of yoke form, the closed end being provided with a tongue which is connected to the end of the tie rod. The double yoke consists of two parts the sides of which are turned at right angles to each other. These two parts join at a throat through

tion by gravity. The other blocks follow successively for each succeeding one-half in. adjustment. In the lower position the solid portion of the block is opposed to the end of the thrust rod, thus preventing the return of the parts to the original position. The adjustment is continued till the piston travel has been reduced to standard. The total adjustment of 6 in. provided by the device is sufficient to take care of maximum brake shoe wear.

DRILLING TEMPERED STEEL.—To drill tempered steel or other hard material (even glass) use a drill tempered as hard as possible and camphor and turpentine, equal parts, in place of oil, on the drill.—Power.

Maintenance of Way Section

While any predictions regarding the weather to be expected this winter are very likely to prove widely inaccurate, the general expectation is that we are due to have a season of severity. The past year already has been one of hard trials for the maintenance of way department. Storms and washouts have been unusually frequent, while the rainfall has been considerably above normal in nearly all parts of the country. As a result, it has been difficult to maintain the track to its proper standards. At the same time, maintenance of way expenditures have been restricted so that it has been necessary to cope with these unfavorable conditions with less than the usual allowances of materials and men. Under normal conditions in the larger part of the country there now remains only a short time in which to get the track in proper condition for the winter. With the outlook before us, and the experiences of the past summer, the maintenance officer will only take reasonable precautions if he makes a special effort to get his track into the best possible shape in the short time remaining.

Preparing for the Winter

While the use of tie plates is now quite general, many ties are still being removed from track because of being badly rail cut rather than because of failure from decay. A desire to utilize the remaining life of the timber has led on some roads to the practice of turning the ties over and returning them to their original location in the main track. While from the standpoint of decay, such a tie is still good for considerable further service, there are serious objections to this practice, as pointed out elsewhere in this issue by W. E. Schott. A tie is not only required to transmit the vertical load from the rail to the ballast, but also to absorb lateral stresses. An old tie which has been turned over will show a materially decreased resistance to spreading rail and will be harder to hold to line, surface and gage. The cost of track maintenance will therefore increase. With the increasing cost of ties it is highly desirable to secure the maximum life from them. However, as the service required in high speed main lines is especially severe and as ties are also required for side and yard tracks subject to less exacting service conditions, it would seem advisable to use them there. Even under these conditions one must be careful that the cost of replacing a tie of this kind in a secondary track combined with the increased cost of maintenance does not exceed the value of the remaining life of the tie, just as in reclaiming scrap, constant care is necessary to prevent the cost of reclaiming material from exceeding its value after being reclaimed.

CHANGING THE FISCAL YEAR

ALMOST without exception, railway maintenance of way officers individually favor changing the fiscal year so that it will end on December 31 instead of June 30, as the most important single step which can be taken to increase the efficiency of this department. At the same time, no concerted movement to secure this change has been started by these officers through their associations, although this would be a natural course to take, as it is the maintenance of way department which is most directly affected by the present fiscal year.

There has been a general impression that the only serious opposition to this change would arise among accounting officers, who would have to adjust their records to correspond with the

new year. For this reason the attitude of the railway accountants, as reflected by the action of the Association of American Railway Accounting Officers, is highly illuminating and encouraging. At its last convention, a committee reported the results of a canvass of members representing 200 railroads with an aggregate mileage of 271,857. Of these, members representing 130 roads operating 212,542 miles, or 78 per cent of the total mileage, favored making the suggested change, while those representing only 38 roads with 17 per cent of the total mileage opposed the change, and those from 32 roads with 5 per cent of the mileage did not vote.

The Association of Accounting Officers has not stopped with this vote, but is continuing the agitation, and at the recent convention of the National Association of Railway Commissioners at San Francisco, the president of the Association of American Railway Accounting Officers addressed the railway commissioners on this subject. While the co-operation of both the national and state commissions would be necessary to make such a change, there is reason to believe that this would not be difficult to secure if the railways were united in favoring the change. Now that the accounting officers have taken the lead in the movement for this improvement, it is to be hoped that the engineering and maintenance of way officers, individually and through their respective organizations, will give all possible help. No subject now before the American Railway Engineering Association or the Maintenance committee of the American Railway Association is more important. There has never been a time when it would seem that conditions were so ripe for making the proposed change.

PROPER RECORDS OF REINFORCED CONCRETE STRUCTURES

THE investigation of old steel structures for the purpose of determining their ability to carry increased loading is an important part of the work of the bridge engineer's office. Reinforced concrete structures are, as a rule, of such recent origin that the investigation of their ability to carry increased loading has not yet been called for, except perhaps in the case of culverts under deep embankments, which are to be widened or increased in height. However, it is only a question of time until train loads will have increased to such an extent as to raise the question of the carrying capacity of certain classes of the concrete structures we are building to-day.

The old plans of steel bridges, if on file, will play an important part in these investigations, but for purposes of checking the old plans and determining the state of preservation of the structure, frequent inspections are, of course, necessary, even to the extent of scaling and calipering the individual members. When the old plans are not available, detailed measurements are imperative.

The investigation of an old concrete structure presents a difficulty not arising in the case of a steel bridge. Once the former is completed, the record plan offers the only means of knowing the details of its construction. Subsequent inspection will give an idea of the quality of the concrete and perhaps disclose something of the state of preservation of any reinforcement it may contain, but it cannot disclose such details as the percentage of reinforcement, the number of stirrups or in the case of a culvert, even the thickness of the slabs. Superficial information, such as it would be possible to obtain by conversation with some one engaged in the construction work, would be valueless; for, just as we may find it necessary to order the heavy power off a steel bridge because of inadequate pin plates

or flange riveting, so the weak feature of a concrete girder may be the improper spacing of stirrups or inadequate bond lengths.

In view of such facts, the need of a complete record of a concrete structure is obvious. Not only should the design plans be complete as to detail, but all alterations made by the construction forces should be made a matter of record. The field man is frequently inclined to express his contempt for the office man, and may even intimate that he changes the plans sent to him to suit himself, or that he builds according to his own ideas because the office plans have not arrived in time. Aside from the incorrectness of such a position from the standpoint of administration or the proper subdivision of duties, it is especially serious in connection with the preservation of adequate records. Without question, the field man must occasionally modify the plans sent him to suit unforeseen contingencies, particularly with respect to foundations. It should be an invariable rule, however, to make an accurate record of all such changes that are required. This applies no less to the maintenance officer, who has to make emergency repairs or extensions upon the structure already built, in accordance with old plans, standard plans or designs of his own. No matter what plan or method is used, he should do his part to see that an accurate record is made of the structure as he built it.

THE MAINTENANCE OF WAY ASSOCIATIONS

THE successful conventions of the Roadmasters' and Maintenance of Way Association, held in Chicago, September 7-10, and of the American Railway Bridge & Building Association, held in Detroit, on October 19-21, which were reported in the Maintenance of Way Sections for those months, bring to the attention of railway officers the work that these and the other maintenance of way associations are doing. The common purpose of all of these organizations is to develop and standardize methods and materials in their respective fields and thereby increase the economy of railway operation. For this reason they deserve the support and co-operation of the railways.

The position of the American Railway Engineering Association is recognized in the railway world and we refer here more particularly to the other associations in this field, the support of which is not so universal. At the present time some railways urge their men to attend the meetings of these organizations and pay their expenses. Other railways not only do not pay the expenses of their men but even discourage or prohibit them from attending. This is wrong. It is just as important and beneficial for the roadmaster or supervisor of bridges and buildings to be familiar with the latest developments in his line and to take advantage of the advanced methods brought out in his association as for the higher officer. One has only to compare methods on different roads to realize how rapidly materials and methods are changing.

There is a feeling in some quarters that the minor associations should be combined with the American Railway Engineering Association and that all the work should be done through it. If this plan were carried out it would mean the dissolution of the present associations without changing the American Railway Engineering Association to any appreciable extent, for this latter organization approaches the common problems from a standpoint different from that of the smaller associations and the members of these other associations would not feel free to take the floor in discussion with their superior officers.

There is, however, a field for the closer correlation of the work of the various associations, striving as they are towards the one common end of the improvement of railway maintenance of way. This should not take the form of dictation or censorship by the American Railway Engineering Association, but rather the work should be so divided that each association would confine its studies to its particular sphere of activity and the work of all the organizations would harmonize rather than overlap.

It has been seriously suggested that the reports of all railway

association committees be submitted to the American Railway Association for approval before their presentation to their respective associations. This would not appear to be practical, both because of the delay which would necessarily ensue and because of the spirit of resentment which would be created by the exercise of censorship. The same results can be secured more satisfactorily by the roads stating their positions on various, important matters to their more capable men and then urging them to attend and present these views at the conventions of different associations. It has been further suggested that a plan be worked out whereby the recommendations of the smaller maintenance of way associations may be passed on to the American Railway Engineering Association for its approval and incorporation in its Manual. In this way practices could be standardized and the results of the work of the smaller associations made available for all.

At the present time there are four associations in the maintenance of way field in addition to the American Railway Engineering Association, viz., the Bridge & Building Association, the Roadmasters' Association, the Maintenance of Way Master Painters' Association and the American Wood Preservers' Association, the last-named being composed only partially of railway men. If the work of these associations were properly organized and directed there would be no necessity for the organization of other associations, for if this is carried beyond a certain point it serves only to divide and weaken the activities of all. As at present organized, and in view of the work they are doing, the railways can well afford to lend their support to the existing associations by encouraging the men to participate in their activities. In this way only can the work of these associations be made of the most value to the roads.

NEW BOOKS

Field Engineering. By William H. Searles. Seventeenth edition, revised and enlarged by William H. Searles and Howard Chapin Ives, professor of railroad engineering, Worcester Polytechnic Institute. Size 4 in. by 6½ in., 632 pages, bound in flexible leather. Published by John Wiley & Sons, New York City. Price, \$3.

This edition of one of the oldest and best known handbooks for railway engineers has been extensively revised to meet the changes which have taken place since the publication of the last previous edition, 11 years ago. It also contains over 100 pages more than the previous edition. The principal changes have been in the chapters on Maximum Economy of Grades and Curves, Reversed Curves, Spiral Curves, Earthwork Tables and Diagrams, Turnouts and Crossings and Calculation of Earthwork. The section on tables is also greatly enlarged, the principal addition being the earthwork tables and the data on spirals. Other new data in the book come under the heads of metric curves, velocity heads, grade angles, barometric heights, temperature coefficient, stadia reduction and mean refractions in declination.

The A B C of Iron and Steel. Edited by A. O. Backert. Size 8 in. by 11 in., 338 pages, bound in cloth. Published by The Penton Publishing Company, Cleveland, Ohio. Price, \$5.

As indicated by the title, this book is a popular though comprehensive exposition of the iron and steel industry, intended for the layman or for the technical man in other lines who desires specific information somewhat remote from his own field. The separate chapters are by different authors. The treatment in each case is descriptive of the present practice and also historical. The 222 illustrations are of a high character and add much to the value of the book. There are five chapters on mining ores and transportation, two on the manufacture of coke, and other chapters on the manufacture of pig iron, wrought iron, crucible, Bessemer and open hearth steel, rolling mill practice, wire and wire rods, and three chapters on castings. The closing chapter describes the electric furnace and its use. Sixty-four pages are devoted to statistics and a manufacturers' directory.

Letters to the Editor

A GRADUATED WAGE SCALE

PROWERS, Colo.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

The ideas set forth in the letter from J. L. Coss in the *Railway Age Gazette* of July 16, in regard to the training of section laborers, are good as far as they go, but I believe the plan of working the men on a graduated wage basis is a better one. Thus, if a man goes to work the first of August, put him on at \$1.35 per day. If he proves to be a good man after a few months pay him a higher scale of \$1.60, and after he has worked a year put him on a maximum wage of \$1.80 or \$2 per day.

If the railways were to do this they would find that the work of their foremen would improve 100 per cent because the men would have something to work for and would give a better grade of work and more of it. As it is now a new man who never saw a railway before receives the same wages as a man who has worked for years. Under these circumstances a foreman cannot expect first-class work out of his older men, while a new man is inefficient because he does not know how to do the work. I believe a foreman can train his own men better than some one else can train them for him, as each man has a different way of doing things. If some one else trained the men it would make it very hard for the foreman as well as for the men.

TURNING TIES OVER

SAN FRANCISCO, Cal.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

Whenever track forces are engaged in raising track out of face this work is generally accompanied by a heavy renewal of track ties. Almost everywhere except on lines of late construction we find thousands of ties, especially cypress and redwood ties, which are still in a good condition, as far as the timber is concerned, but which are cut down under the rail base from $\frac{1}{2}$ in. to 2 in. on account of having had no tie plates. In such cases most foremen, with the sanction of their roadmasters, are in the habit of turning those ties over.

There is no question but that by so doing any piece of track will look neater after the job is finished; but in place of improving the actual condition of such track distinct harm has been done. In the first place, the thickness of the timber under the rail is exactly the same. Even if the ties are turned end for end the cut part is still directly under rail and the actual increase of rail support is practically nil. The really bad effects of this tie turning though will appear from one to two months after the job is finished. About this time that piece of track will get rough and upon investigation it will be found that most of those turned ties are churning more or less, according to the quality of the ballast. The dirt or fine ballast will rise in mounds on both sides of those ties and most of them will be found swinging.

As every experienced trackman knows, the most difficult place to tamp a tie is directly under the rail. It is a procedure which is watched closely by every foreman when performing this kind of work. No doubt this was supervised closely when all those redwood and cypress ties were turned over, but, notwithstanding, it is almost impossible to get those cut places in the ties properly packed with dirt or ballast, especially when shoveled tamped. Directly under the rail there was left a small space where there was no dirt, or, at the best, loose dirt, as this space could not be reached with tools, leaving an air space, and this same space, through compression by the weight of every passing engine and car, acting like an air cushion, has started to force all dirt from under the tie to the surface.

Retamping those ties is only a temporary relief of very short

duration. The only remedy for this churning is to adze down to the depth of those cuts for about 8 or 10 in. from each side. It is a question, though, if this would be economical or if it would not be cheaper to prohibit this turning of ties altogether on main lines and use only new ties in all these cases, putting the cut ties only in side tracks or using them as fence posts or for other purposes, especially since they are inclined to break easily where cut out.

ELEVATING CURVES IN YARDS

LOS ANGELES, N. Mex.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

My experience in yard work has led me to discontinue elevating curves in a yard when there is slow traffic, as I have found that if such curves, regardless of their degree of curvature, are gaged to 4 ft. $8\frac{1}{4}$ -in., or $\frac{1}{4}$ -in. tight, one will experience less trouble in maintaining correct gage. The wheel produces less wear on the inner rail, prevents the rail from cutting into the tie and the track remains in surface and alinement longer. I have noted quite often that where turnouts were elevated back of the frogs they have been a constant source of trouble in maintaining gage, surface and alinement. I have also noted quite often on curves from $\frac{1}{4}$ to $\frac{1}{2}$ -in. wide gage in yards that the excessive pressure on the inner rail causes it to cant outward and the gage to widen very rapidly. It is understood that the gage of trucks is 4 ft. 8 in. from flange to flange, so why should it become necessary to leave curves wide gage even on the main line?

The writer put up one 5-deg. curve on main line, leaving the gage $\frac{1}{4}$ -in. tight, and also a 4-deg. curve to standard gage. Both curves were equal as to timber, surface and alinement. The 4-deg. curve needed attention two years after it had been put up because the gage spread on account of the inner rail cutting into the ties. The ties then had to be adzed and the rail reset, gaged and given the proper elevation, while the 5-deg. curve remained in good condition for at least two years longer and held its uniform gage, surface and alinement.

A curve properly put up is easily maintained regardless of the degree of curvature. One will experience very little trouble in maintaining a curve of good timber, gage, surface and alinement. I have noted places where section foremen were unable to tell when a curve was uniform, and the spreading of the track seemed to be their trouble. They kept on gaging until the ties were spike killed, putting all the blame on big engines with long trailers. Upon examination I found the curves put up with improper elevation both on the body of the curve and on the easement. A car travels as a single body and the force of the car does not reach its full effect until the car is wholly upon the curve; therefore the approach and runoff on curves on high speed track should have the proper elevation and alinement or trouble will never end.

HENRY KOCH

Section Foreman, El Paso & Southwestern.

PENNSYLVANIA LINES ANNUAL TRACK INSPECTION

The annual track inspection of the Pennsylvania Lines west of Pittsburgh was made on October 5-8, inclusive, by the general manager and his staff, including the chief engineers maintenance of way and their assistants, the general and division superintendents, the division engineers, assistant division engineers and supervisors, traveling by special train. The inspection covered the main line of the Panhandle from Pittsburgh to Chicago and of the Fort Wayne from Chicago to Pittsburgh. The first prize for the best supervisor's subdivision based on line and surface was awarded to William Ballenger, supervisor, Indianapolis division, Bradford, Ohio. The prize for the best supervisor's subdivision based on all points was awarded to Henry Rice, supervisor, Indianapolis division, Urbana, Ohio. The prize for the best track foreman's section based on line and surface was awarded to Fred Manning, track foreman, also of the Indianapolis division.

The Proper Repair of Tools for Track Maintenance

Work on This Equipment Should be Done in a Limited Number of Shops Under Adequate Administration

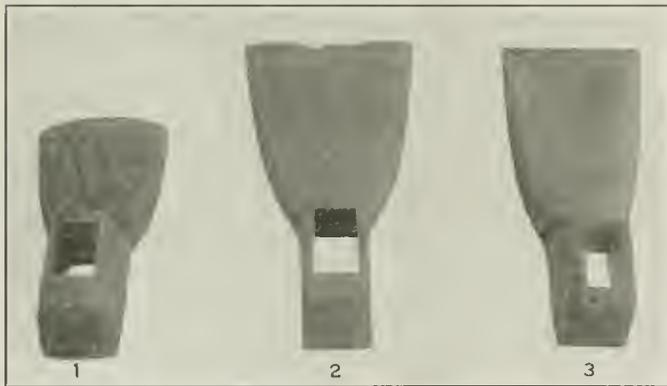

By M. E. CARROLL

While many large and serious problems confront the master mechanic in his daily work, there is one which, while comparatively small in magnitude, is nevertheless always present and therefore aggravating. That is the problem of repairing track tools for the maintenance of way department.

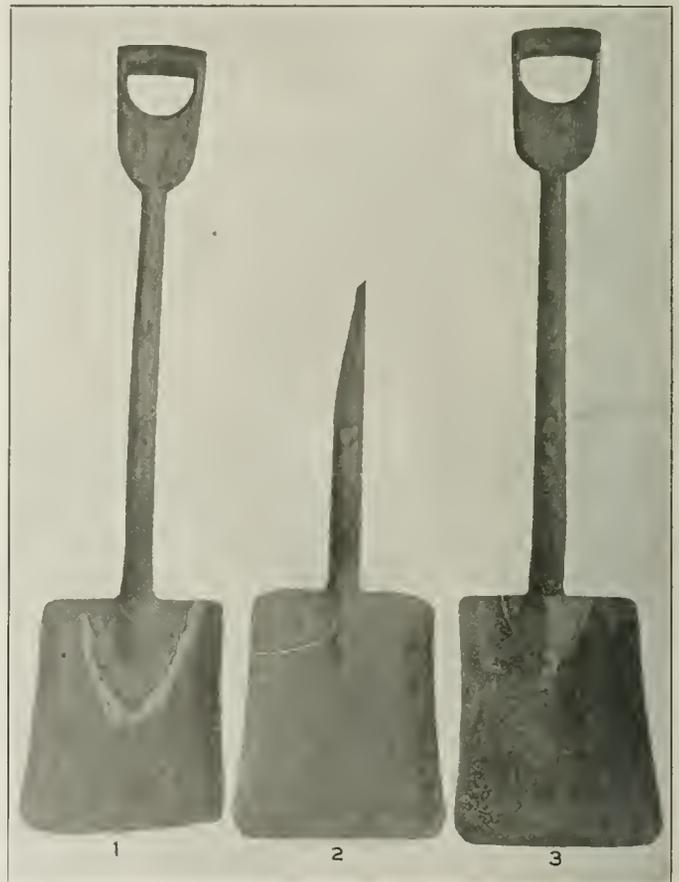

In the average railroad shop, it is considered a small task to forge a locomotive main rod, to build a new tender or to perform any similar work for which the shop may be equipped. However, it seems a tremendous task to repair a few track chisels, dress a dozen tamping picks or put a track jack in good working order. This is not because these tasks are at all difficult, nor because the shop is not equipped for doing the work, or lacks mechanics sufficiently experienced to properly perform it, but rather because such work is a little out of the ordinary. If every locomotive had a few tamping picks as part of the equipment, or if every box car carried a rail drill, the shops would be accustomed to handling and repairing such items and consider it part of the regular daily routine. It is the unusual duty which we somehow associate as belonging to the other fellow and not belonging to us which is the hardest to perform.

Track tools are articles which must be used every day on each

most railroads is the concentration of this work at fewer shops. Where supply cars are operated, all worn and repairable track tools should be gathered up from each track gang and delivered at only one or two shops on the entire system. This will increase the number of each kind of tools to be repaired at that shop, making it possible to keep certain mechanics regularly occupied in doing this work. In consequence they will become expert and turn out repaired tools which will give service equivalent to new ones. The time of these mechanics can be charged direct to the proper operating account or to the division superintendent, and the master mechanic will therefore not need to feel that he is being robbed of time which rightfully belongs to his locomotives

(1) Ground Down Until Worn Out. (2) Could be Put in Shape by Track Forces Without Being Sent to the Shop. (3) Has Been Reground Ready for Further Use

(1) Scrap Shovel with a Good Handle. (2) Scrap Shovel with a Good Blade. (3) A Serviceable Shovel Made by Piecing Together a Good Handle and a Good Blade Taken from Scrap Shovels

railroad system and in connection with such use, tools will wear out and sometimes become broken. The railroads do not earn money in sufficient quantities to permit them to throw away these worn or broken tools and they must therefore be sent to the shops for repair. It is the customary practice on most railroads to permit each foreman to bundle up a few spike mauls and chisels and a claw bar or two, sending them in a baggage car to the nearest division shops with a request to have them repaired and returned to him. It is not unusual for a section foreman to telegraph the master mechanic that his track drill or track jack is broken and is coming on "No. 21 today" with a request to have it repaired and returned "tomorrow morning."

There is scarcely a division railroad shop anywhere that is equipped properly to repair track tools because there is not enough of this work to occupy the full time of any mechanic. The very irregularity of delivery of the old tools to the shop is one of the reasons why the mechanics cannot be occupied regularly on work of this kind. When performed hurriedly and considered as an outside job to be rushed and disposed of in the easiest manner possible, it is small wonder that these repairs are sometimes improperly or indifferently made. The result is poor service and loss of time and money when the track forces attempt to use them.

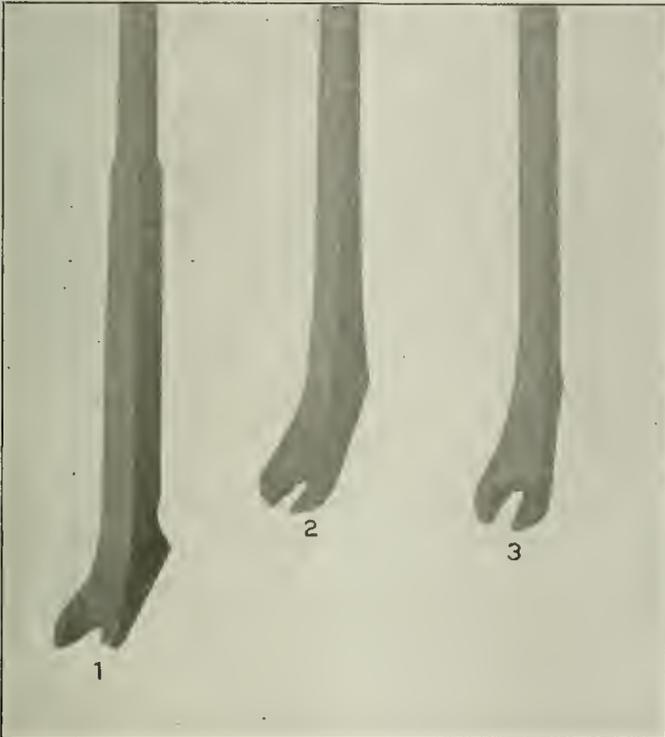

The first remedy needed to improve the condition existing on

and cars. By concentrating tools in this manner, the smaller shops are relieved entirely of this kind of work and the division track forces escape the necessity of using indifferently repaired tools. When we have successfully concentrated this work at one or two shops and have perfected a system of gathering up all of the tools on the system regularly, making repairs and delivering them to the shops as suggested, it becomes an easy problem properly to organize the forces and equip the shop for handling the work.

The most difficult track tool to repair properly is the claw bar. Not one railroad blacksmith in twenty can take a badly worn claw bar and shape it so it will readily take and hold the head of a track spike imbedded in a hard wood tie, or temper it so that it will not break or the claws spread when in use. If, how-

ever, we can accumulate two or three hundred claw bars in one shop every month, we can keep one fire working on claw bars almost constantly and employ an expert for repairing them. Some claw bars will be received which are so badly worn that there is not enough steel left to dress them down properly, or perhaps one of the claws may be broken off entirely. Instead of consigning such a bar to the scrap pile, the claw should be cut off and the bar placed under a Bradley hammer and drawn down to make a standard lining bar. This operation will show a net saving of about 35 cents on each bar.

Where a fire is worked constantly to repair track picks with a small power hammer for making the welds, it is astonishing how cheaply these picks can be dressed down and re-tempered ready for use. Many picks will be received which are worn down so short as to make it impossible to re-dress them for

(1) Very Difficult to Repair, but Can Easily be Made into a Serviceable Lining Bar. (2) Can be Repaired Easily by a Competent Blacksmith. (3) An Example of Good Repairing

further use, and it is the customary practice to weld new steel and form new ends on them. The average railroad is not paying more than 35 cents each for new clay picks and 45 cents each for new tamping picks and if much welding is done on the old pick, it is going to cost more than a new one. It will be found the best practice to limit the welding of picks to the putting on of new points. If the tamping end of a pick is worn so it cannot be refaced to make a serviceable pick, the tamping end should be cut off and the end sharpened to make a clay pick. When both ends of a clay pick are worn down too short for repointing, the pick may well be scrapped. Some tool manufacturers make a practice of furnishing short tamping ends for picks, also the claw ends for claw bar, which can be welded onto the old pick and old bar, but unless shop costs are watched very closely, these welded tools will cost more than new ones.

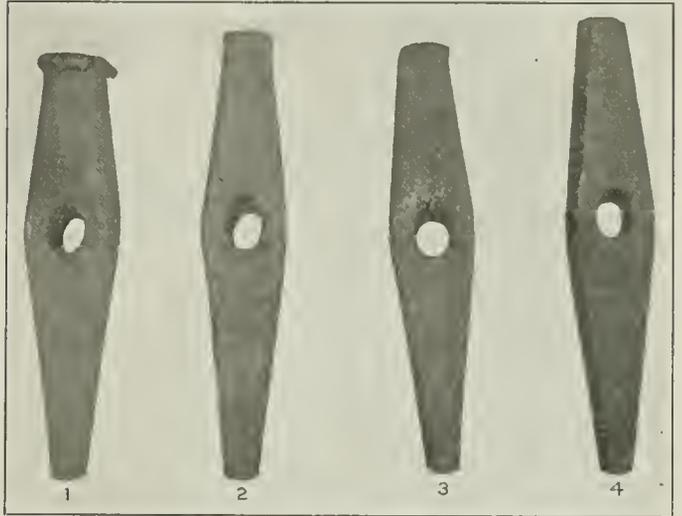

When bent lining bars are sent in for repairs, in addition to straightening and re-dressing points, the bar should be tempered so it will not bend readily when re-issued for use.

The repairs of tamping bars should be handled much the same as tamping picks, the face of the bar being re-dressed when there is enough steel and if worn too short for re-dressing, the tamping end should be cut off and the remainder of the bar used for general purposes as bar steel.

Much care should be given to the dressing and tempering of

spike mauls, this being a very important tool in track work, and personal injury accidents are likely to result if improperly repaired spike mauls are sent out for use. It is impossible to strike a true blow on a track spike or the head of a track chisel if the face of the maul is not finished true, and if tempered too hard, pieces are likely to chip off and fly. If, on the other hand, the spike maul is tempered too soft, it will give only a few days service and will then come back to the shop.

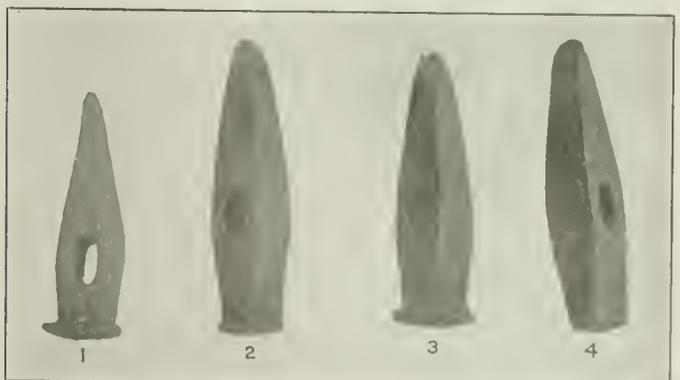

A tool which causes a great deal of trouble to a track gang

(1) Improperly Tempered When Repaired. (2) Should Have Been Ground by Track Forces Instead of Being Sent to the Shop. (3) Unserviceable, Unless It is Repaired. (4) An Example of Good Repairing

is the track chisel. It is no uncommon thing to use six or eight chisels in cutting one rail, whereas one good track chisel properly handled should easily cut 15 or 20 rails. The first requisite of a track chisel is good steel, a matter for the attention of the Purchasing department, and in making repairs, it is equally necessary to shape and temper the cutting edge properly and to dress the head so that pieces will not chip off when struck by the hammer.

It is a serious mistake for track gangs to use track jacks which are not in perfect working order and equally wrong for shops to return jacks for use when not properly repaired. The rack bar of a track jack can be dressed up easily by a competent smith, making it equal to a new one, and the main or body casting

(1) Improperly Repaired Track Chisel. (2) Could Have Been Repaired by the Section Gang on a Grinding Wheel Instead of Sending It to the Shop. (3) Must be Repaired by a Blacksmith. (4) An Example of Good Repairing

if slightly bent or distorted, may be straightened in the fire if carefully handled. The remaining parts, if worn too badly to give the proper fit, can be replaced with new parts at such small expense that it usually does not pay to do much shop work on them.

The repair parts for track drills on the other hand are relatively

more expensive and quite a saving can be made if intelligent work is done by the man assigned to repair the drilling machines. A track drill is usually sent to the shop because it has been abused in service, rather than worn out, and a small amount of work will put such machine in first-class condition for further service.

There are two track tools which get out of order in service very easily and show defects which are difficult for the average track foreman to detect, namely, the track gage and the track level. The accuracy of these two tools is vital to the success of the track foreman in making and maintaining good track, and when repaired in the shops, the utmost care should be taken to see that repairs are made in such manner that the tools will give reasonable service. A rigid test for accuracy should be applied to every gage or level before it is issued for service. In repairing the Huntington track gage (this being the one made of gas pipe with malleable end castings), it is not good practice to plug and re-drill rivet holes in the pipe if the end castings are loose. The castings cannot remain tight with such repairs and it is better economy to use the old pipe for making pipe nipples and repair the track gage by applying a new piece of pipe.

In re-setting the spirit level in a track level, care should be taken to remove all of the old setting and see that the new glass is fully protected on all sides by fresh plaster of Paris. Not only should the level be carefully tested after repairs are completed, but the supply car clerk or other person making the delivery to the track forces should repeat this test at the time the delivery is made, so that only accurate track levels, as well as gages, shall be issued for use.

The use of tool grinders, such as are handled by most of the tool manufacturers at this time, should be encouraged among the track gangs, so that the grinding of edged tools and a certain amount of tool dressing may be done on the road, thus enabling the men to keep their tools in service a greater length of time before sending them to the shops.

The problem of repairing railroad track tools is a serious one with every maintenance of way officer, and with most master mechanics. It can never be satisfactorily handled unless the work is first systematized and made a definite part of the daily routine of some shop organization. To make this effective, tools must be gathered up regularly from the railroad as described, brought to some designated shop and there given thorough and effective repairs by a well organized and experienced shop force. Not only will these repairs be made at less cost than when made indiscriminately at all shop points, but tools will be repaired under this system which might be scrapped by the ordinary shop mechanic, and the repaired tools when returned to service will give much better results.

ABSTRACT OF ENGINEERING ARTICLES

The following articles of special interest to engineers and maintenance of way men, to which readers of this section may wish to refer, have appeared in the *Railway Age Gazette* since October 22, 1915:

Elimination of the Tower Grove Crossing, St. Louis.—The Missouri Pacific and the Frisco have recently completed the separation of grades at Tower Grove and Vandeventer avenues. The structures and the methods of construction were described in an illustrated article in the issue of October 29, page 799.

Completing the Summit Cut-Off of the Lackawanna.—This project was finished with the completion of the Tankhannock viaduct, the largest concrete viaduct ever built, and was placed in service on November 7. The interesting details of the last work on this structure and others forming a part of the project were described in an illustrated article in the issue of October 29, page 809.

Completing the Mt. Royal Tunnel at Montreal.—This tunnel, which will provide an entrance for the Canadian Northern Railway into the heart of Montreal is nearing completion. Construction details of the more recent work on this project were described in an illustrated article in the issue of November 5, page 857.

Progress on the Hell Gate Bridge.—The closing members of the 1,000 ft. arch were placed on September 29; the details of this step in the work were described in a short article accompanied by a page of photographs in the issue of November 5, page 865.

The Cold Straightening of Rails.—J. T. Atwood, chief engineer, Pittsburgh & Lake Erie, discussed this question in a Letter to the Editor in the issue of November 12, page 888.

Gauging of Rails in Transverse Fissures.—A discussion of this subject in connection with the Cold Straightening of Rails in the form of a Letter to the Editor by A. W. Thompson, third vice-president, Baltimore & Ohio, was published in the issue of November 12, page 888.

Electrification of the Pennsylvania at Philadelphia.—The Pennsylvania

Railroad has just recently completed the electrification of its line from Philadelphia to Paoli, a distance of 20 miles, for suburban service. The plant, equipment and construction involved in this project were described in detail in an illustrated article in the issue of November 12, page 889.

THE STABILITY OF UNANCHORED TANKS

By C. R. KNOWLES

General Foreman of Water Service, Illinois Central

The stability of unanchored railway water tanks has been the subject of more or less discussion from time to time, with advocates both for and against the practice of anchoring the tower of the tank to the foundation. Some authorities have claimed that the tower of tank should be firmly anchored to the foundation in all cases, while others have insisted that anchorage was unnecessary with railway water tanks 24 ft. to 30 ft. in diameter on standard 12-post towers 30 ft. high and under.

In view of this difference of opinion, it may be interesting to note the fact that three unanchored standard 20 ft. by 30 ft. wood tanks on the Louisiana division of the Illinois Central withstood the hurricane of September 29, 1915, with no more damage than the unroofing of one of the tanks. The tanks in question are located at Government Yard, New Orleans; La Branch, La., and Hammond, La. The tower of the tank at New Orleans is a 12-post steel tower, well braced with a floor system of "I" beams, the total height from the top of foundation to bottom of the tank being 20 ft. The tower of the tank at La Branch is constructed of 12 in. by 12 in. creosoted posts, each bent being braced with two sets of 6 in. by 8 in. braces, and the floor system consisting of 12 in. by 12 in. caps and 4 in. by 14 in. floor joists. The total height from the top of foundation to bottom of tank was 20 ft. The tank at Hammond, La., is on a 28-ft. tower of the same type of construction as that at La Branch.

The storm began on the night of September 28 with rain and a gradually increasing northeast wind. By 7 o'clock on the morning of the 29th, the wind had increased to a gale of 40 miles per hour, and during the day both wind and rain increased in intensity until between 5 and 5:30 p. m. when the weather bureau reported there was a sustained wind velocity of over 80 miles per hour and velocities up to 120 and 130 miles per hour for the hardest gusts, with a minimum barometer reading of 28.11 in. At about 6 p. m. there was a slight lull in the wind and shortly after a reversal of direction, with very high velocities for the greater part of the night, but not nearly so high as during the afternoon.

A large electric power station and concrete stack located directly across the street from the New Orleans tank were destroyed, and the Government Yard roundhouse, a frame structure about 200 ft. distant from the tank, was partly demolished. This tank was full of water throughout the duration of the storm and was not damaged in the least.

The La Branch tank is located 20 miles north of New Orleans in an exposed position near the shore of Lake Ponchartrain and among 12 or 15 houses, including the store and pumping plant of a drainage company. The tank and pump house are the only structures left standing. This tank was full of water when the storm began, but water connections to houses, which were destroyed during the storm, were broken, letting the water out of tank through openings aggregating perhaps a 2-in. stream. In addition to the wind at La Branch, the level of Lake Ponchartrain was raised about 12 ft., throwing about 7 ft. of water over the top of the rail and washing away both tracks. There was no damage done to this tank and but little to the pumping station.

The Hammond tank is 54 miles north of New Orleans and, while not directly in the path of the storm, it stood perhaps the most severe test of the three, as this tank was unroofed during the early part of the night of the 29th, and the valve to the tank spout pulled out, allowing the tank to empty through a 10-in. opening. Not more than 30 or 40 minutes were consumed in the water running out of the tank. As a result, the tank undoubtedly stood a great wind pressure while empty. This strain was especially severe on account of the height of the tower.

Railway Roadside Water Tanks for Locomotive Supply*

Important Details of Construction and Maintenance With Comparative Costs of Wood and Steel Structures

Up to within the past few years, the standard tanks rarely exceed 50,000 or 60,000 gal., while the standard roadside tanks on many lines today include tanks holding 100,000 to 150,000 gal. While the tendency of the railroads within the past few years has been to erect tanks of greater capacity, the development along this line has been all too slow and the efficiency of the water service is impaired in many cases to a great extent by small tanks. Particularly is this true at terminals, where a large number of engines take water in a limited time, and at roadside stations where it is necessary to employ night pumpers, thus materially increasing the cost of water. It is not economy to erect a tank good for a life of 30 or 40 years and then find within a few years that it is too small to supply the demand for water without continuous pumping.

The construction of large permanent tanks has been handicapped to some extent by the fact that, where tanks were located adjacent to tracks, the uncertainty of track changes and other construction features often prevented the selection of permanent locations. The result is that many of the tanks constructed are more or less temporary structures. By installing penstocks it is possible to select a permanent location that will not be affected by future construction changes. It is now the practice on many roads to erect the tanks remote from the tracks and deliver water through penstocks. In addition to permitting a more satisfactory location of a tank there are many other arguments in favor of this practice in preference to taking water direct from the tank.

The height of the tower or frame of the tank will be determined by the size of the outlet pipe. A 12-in. penstock with a 14-in. main will deliver 4,000 gal. per minute with approximately the same loss of head as a 10-in. penstock with a 12-in. main delivering 2,750 gal. per minute, or an 8-in. penstock with a 10-in. main delivering 1,750 gal. per minute.

The standard height of tank for locomotive supply is usually 20 ft. from top of rail to bottom of tank. With from 16 to 20 ft. of water in a tank, a 12-in. penstock with 1,000 ft. of 14 in. main will deliver from 3,500 to 4,000 gal. per minute, and for economic reasons, it would not be practical to exceed a height of 20 ft. to the bottom of the tank in ordinary practice.

SUB-STRUCTURE

There has been but little variation in the methods of constructing frames or towers for wood tanks, the common practice being to use a 12-post structure of 12-in. by 12-in. timber braced according to the height. Steel frames for wood tanks and in a great many instances for flat-bottomed steel tanks have also been of the 12-post type. The American Railway Engineering Association found in 1910, in answer to inquiries sent out, that of the roads reporting, 82 per cent of the 50,000 gal. tanks had 12 posts, 10 per cent 16 to 26 posts and 8 per cent had 4 posts. Of the 75,000 gal. tanks reported 100 per cent had 12 posts with two exceptions, one with 21 posts and one with 16 posts. Of the 100,000 gal. tanks 100 per cent had 12-post frames with one exception of 4 posts. The general practice of constructing 12-post tank supports is explained in the fact that with a 12-post structure it is possible to secure a better distribution of the load than with a lesser number of posts, and to support every part of the tank bottom without an elaborate floor system. It also permits a good distribution of the foundation load. Treated timber will prove more economical than untreated for the construction of towers for flat-bottom tanks, notwithstanding its higher first cost, as treated timber will have a much longer life and does not require painting.

A treated timber tower is more economical than either a steel

or an untreated wood tower for towers of standard height for locomotive supply. A steel tower will undoubtedly prove more economical and satisfactory for tanks on elevations greater than 20 ft.

WOOD TANKS

Most of the water tanks used for railway water service in the past have been constructed of wood, and while other materials are being used extensively for this purpose, there is no question but that timber will continue to enter into the construction of tanks of 100,000 gal. capacity, and under.

The life of timber in a water tank will vary widely with climatic conditions and with other factors which cause or prevent decay. The mechanical strain or wear a tank may be subjected to will also affect the life of the timber. Many tanks have been replaced, not so much because of the deterioration of the tank itself as of the decay of the structure supporting the tank, or more probably the decay of the floor and chime joists immediately supporting the tank bottom. All these factors have to be given consideration so far as the length of life and the general utility of various timbers and other material used in wood tanks are concerned.

The life of a wood water tank, no matter of what kind, depends largely upon the care in selecting and inspecting the timber entering into the construction. It is needless to say that the best selection and best quality of a cheaper timber will give a better and more lasting tank than a poor selection of high-priced timber. Few railroads properly specify a tank in their inquiries. They may give elaborate specifications for the hoopage, as well as for the dimensions of the tank itself, and may specify the kind of timber that shall be used, but they do not rigidly specify and inspect the quality and grade of timber to be furnished.

The average life of the various timbers entering into the construction of water tanks is about as follows:

Cypress	40 years
Redwood	30 "
Cedar	30 "
White pine	20 "
Douglas fir	16 "

To secure this life the most rigid specifications and inspection must be adhered to. Cypress is beyond question the best timber for the construction of water tanks. Next is the Pacific Coast redwood, which is an admirable tank material, but is little used in the central and eastern states. Eastern cedar, which is practically the only one of the cedars available for tanks, makes an excellent tank when the best grade is obtained. White pine is also a very good tank material, but is rarely available in suitable sizes and lengths for large tanks. Douglas fir is obtainable in almost any size and length, but is of comparatively short life.

A 20-ft. by 30-ft. water tank, consisting of staves and bottom planks, should be made of tank stock, heart red cypress, sound, seasoned, out of wind, free from shakes, sap, pitch pockets or streaks, unsound knots, loose knots, knots in clusters and large knots extending through the material. Small loose or unsound knots may be bored out and the holes thoroughly plugged with the same material as the tank. Material having knots in the edges should not be accepted.

Staves shall be 6 to 8 in. wide and 20 ft. long, of uniform width end to end, and 3 in. thick, with the edges accurately planed on radial lines from the center of the tub. The croze in each stave should be 3 in. in the clear from the end of the stave with a $\frac{5}{8}$ -in. gain and should be accurately cut to uniform dimensions on one circle for all staves. Three one-inch dowel pins made of the same material as the staves should be furnished with each stave, and the staves should be bored for dowel pins properly spaced. The bottom planks should be 12 in. wide and 3 in. thick.

* Abstract of a report presented at the convention of the American Railway Bridge and Building Association, held in Detroit, Oct. 19-21.

The bottom should be 30 ft. in diameter with a 3½ in. chamfer. All pieces should be full length without splicing, and every joint machine-made and perfect. The planks should be joined by one-inch dowel pins on 30-in. centers, of the same material as the bottom.

While the material in the tub is perhaps of the first importance, it does not embrace the entire structure. The frame, frost box and roof are constructed of entirely different timber than the tank proper. When these various features of tank construction are given consideration, it would not be fair to base the life of wood tanks altogether on the life of cypress or other timbers entering into the construction of the tub. Where the structure consists of a wood tank mounted on a steel or treated timber frame, the question of the life of the structure as a whole is further complicated. The life of the treated frame will depend on the treatment applied to the timber and may represent a longer or shorter life than the tank. As a means of fixing the approximate life of wood tanks on different types of frames the following tables are submitted:

The following table shows the life of various timbers suitable for the construction of tank frames:

Long leaf pine, untreated	10 years
Long leaf pine, treated with creosote	25 "
Long leaf pine, treated with zinc-chloride	15 "
Loblolly pine, untreated	3 "
Loblolly pine, treated with creosote	25 "
Loblolly pine, treated with zinc-chloride	15 "
White oak, untreated	15 "

The table below shows the life of hoops:

Flat steel hoops	3 to 5 years
Flat iron hoops	15 "
Oval steel hoops	6 "
Round steel hoops	10 "

When properly manufactured, a machine-made wood tank is better than one framed by hand. Of course, if the proper care is not taken with the machine, or if the machines are not properly set for each tank it is very likely that the framing or jointing will be poorly done.

The tank bottom should be carefully laid out, doweled and put together by hand. It is then scribed and cut to circle on a band saw, dressed and chamfered and the planks marked and numbered consecutively. The staves are then put on the tank and driven up, making the complete tank ready for the hoops. This enables the inspector to examine the tank carefully from the inside as well as the outside for possible defects in the lumber that may have escaped the timber inspector and the machine operators. There are virtually four inspections of the timber before it is shipped and the possibility of inadvertently overlooking a defective stave or bottom plank is remote.

While the tank is set up each stave should be marked consecutively, its position on the tank bottom also marked and a number corresponding with the number of the stave placed in the proper place on the tank bottom. This not only insures a perfect fit of the tank throughout, but simplifies and lessens the work of erection in the field.

The hoops comprise the most important feature in the maintenance of water tanks. With very few exceptions tank failures may be traced directly to the failure of the hoops. Flat hoops have been used almost universally up to the last few years, and as practically all of the older tanks are equipped with them, it is a popular belief that the flat hoop is more subject to failure than any other shape. This is probably true if the hoops are not constructed of the proper material and given the proper attention. So far as corrosion is concerned the flat hoop has a greater surface exposed than a hoop of different section; 40 per cent of this surface is next to the staves. Aside from presenting a greater surface to the corrosive elements this leaves 40 per cent of the hoop inaccessible to inspection. On the other hand it is easier to apply, forms a more uniform bearing against the stave, does not crush the fibre of the wood, conforms more readily to the circle of the tank, can be secured more readily for repairs than the odd shapes (with the exception of round hoops), will not break as easily as a hoop of different section, and lends in part at least to the life of the stave the loss due to corrosion.

Round hoops have come into general use only within the

past few years, chiefly through the efforts of the insurance people. Round hoops are required on tanks used for sprinkler and other fire protection systems. The round hoop lends itself readily to inspection; any corrosion or deterioration may be easily seen and the whole surface of the hoop is painted more readily. One great objection to this type of hoop is the little bearing it has on the stave, which has a tendency to cut into the wood, crushing the fiber and inducing decay. This decay is further aggravated by the accumulation of dirt, cinders and moisture in the pocket formed by the upper half of the hoop.

Oval hoops or half round hoops have not come into general practice, while at the same time they have much to commend their use. They have the advantages both of the flat and half round hoop in that they give an even flat bearing to the stave and are heavier at the center like the round hoops, and they are not so quickly weakened by corrosion. The principal objection that could be offered to this type of hoop is that it is much harder to apply than either the flat or the round hoop on account of the difficulty in making it conform to the circle of the tank. The rigidity of this hoop is also objectionable in the fact that when the staves are softened by partial decay there is a tendency for the hoops to straighten out and throw the tank out of round, especially if the tank is empty or only partly filled with water. Various methods are used to fasten the lugs to the hoops, but it would appear that riveting is the most popular and economical method of applying them to the flat hoops. The method of applying lugs to other types of hoops will depend largely on the shape of the hoops. The single bolt is generally accepted as preferable to the double bolt for the reason that it is easier to apply it and there is a uniform pull on the lug and hoop. With the double bolts there is a danger of breaking the lug or shearing off the rivets unless great care is used to keep the bolts pulled up uniform in tightening the hoops.

Several factors enter into the life of a tank hoop, the most important being the material of which the hoop is constructed. The hoop should be constructed of wrought iron, but as few railroads pay much attention to this feature the hoops usually furnished are of steel. In fact there is a question as to whether wrought iron may be purchased in the open market in suitable sizes for tank hoops. The question of the quality of iron is of far more importance than the shape of the hoop. The seeming indifference of the many railroads to this feature compels the few who insist on wrought iron to pay a premium on the cost of hoops that even at the best do not come up to the standard that should be maintained.

Eliminating the question of adding to the appearance of the structure, the utility of a roof on a water tank is divided between frost prevention and protection from dirt. In the northern states there is no question as to the necessity of the roof on account of protection from frost, but it may be assumed that where the tank is not affected by frost, or the water is not used for drinking purposes, the only advantage in a roof is to add to the sightliness of the structure.

As a matter of frost prevention in cold climates there is no doubt but that water tanks should be well roofed. Decks constructed with double layers of dressed and matched boards with building paper between are of great value as a protection from frost. The objection to this type of roof and decks so constructed with the joists beneath them is that they are subject to rapid decay, on account of moisture and poor ventilation. Some roads are constructing the deck of two layers of 2-in. by 8-in. timbers spaced ¼ in. apart. It is claimed that this is as nearly frost proof as the double decking and it certainly is more substantial as far as decay is concerned. The roof should be conical of 1½ in. to 1 ft. pitch, with 14-in. eaves. The roofing material should be a good composition roofing, or good felt, with tar and gravel.

There are several points of primary consideration in the protection of water tanks and tank fixtures from frost. The protection required will be determined by climatic conditions and should be designed to afford protection against the most severe weather conditions likely to prevail. This condition can not be

based altogether on a minimum temperature, but upon the duration of low temperatures as well.

The source of water supply is another important feature. Where water is pumped from streams or ponds, the temperature is lower than where pumped from wells. As a result more insulation is required where surface water is used than with an underground supply. Where the pumping is continuous, or nearly so, and there is practically a constant flow of water to the tank, less protection is required than where the pumping is intermittent.

Where it is difficult to protect the supply line from frost properly, the pipe should be extended to the top of the tank and the line drained when not in use. The best type of frost box for supply pipes to wood tanks is one constructed of dressed and matched lumber, and lined with building paper with alternate 2-in. air spaces, the number of air spaces required varying with weather conditions. Five air spaces should be effective against a minimum temperature of 30 deg. below zero. It is important that the frost box extend into the ground well below the frost line to get the benefit of the radiation from the earth. That part of the box below the ground should be of concrete or brick. It is unnecessary to carry the air spaces below the ground, but the joint at the top of the foundation should be absolutely tight. The lumber used in the construction of a frost box should be thoroughly seasoned to prevent shrinkage, and the box should be made as nearly air tight as possible.

Some northern roads completely house in their smaller tanks, and heat them with stoves or steam. The usual type of construction is octagonal in shape, ceiled and lined with building paper between the walls. This leaves a dead air space between the inner and outer walls. The wall is carried about two feet above the top of the tank and the entire structure is housed in. The method is applicable only to the smaller tanks, is very expensive and is a bad fire risk. Where pumps are operated by steam it is sometimes practical to run the exhaust pipe through the frost box and tank. This is a safe and effective method of protection from frost, but is practical only where the tanks are in close proximity to the pumping stations.

In extremely cold climates, the usual method is to house in the sub-structure of the tank and install stoves, extending the stove pipes up through the tank, the portion through the tank being standard wrought iron pipe. This method is effective, but offers a hazardous fire risk, as well as requiring a great deal of attention to keep up the fires.

It is often difficult, if not impossible, to keep the outlet pipe and valve from freezing without a stove or heater of some kind, but they should not be used if there is any other practical method to follow, as by using stoves under wood tanks the fire risk is increased ten-fold. The outlet valve should be kept in good condition, as leakage will cause ice to form in the outlet pipe. Locomotives on many roads are equipped with small sections of steam hose for thawing out outlet pipes and valves. Another effective method is to bring the end of the spout down over the stack of the locomotive and turn on the blower. This throws a hot blast against the outlet pipe and will thaw out a heavy accumulation of ice in a very short time. This should be used only as a last resort, as it plays havoc with the spout on account of the intense heat.

The winters vary in severity to such an extent in different parts of the country and the tanks constructed present such varied types that it is difficult to present methods of frost proofing applicable to all cases. However, the conclusion may be drawn that, with the modern type of wood tank construction delivering water to locomotives through penstocks, the riser pipes may be effectually protected by properly constructed frost boxes provided the consumption of water per 24 hr. is equal to the capacity of the tank. In the extreme north, where the winters are most severe and where the water consumption is small, a frost box would hardly prove adequate as the water in the tank itself may freeze solid. Under these conditions a heater of some kind must be provided to keep the ice from forming. In some cases the riser pipes of steel tanks are surrounded by wood frost

boxes with air spaces as protection from frost. This is not good practice as it hastens the corrosion of the steel and does not permit proper inspection and painting. The best method of protecting a conical bottom steel tank from frost is by installing a stove or other heater in the riser pipe. The flat bottom steel tank may be protected in the same manner as the wood tank.

STEEL TANKS

The comparative life and value of wood and steel tanks has been the subject of much discussion, each type of tank having its more or less disinterested champions. While no doubt there are wood tanks in existence that will justify the strongest claims of the advocates of that type of tank, such cases can not be taken as examples of what can be expected of tanks constructed at the present time, for the reason that select tank timber is becoming more difficult to obtain year by year. Also the tanks cited as to long life of timber are smaller tanks than are being constructed today. Forty years ago a wood tank rarely if ever exceeded 20 ft. in diameter with 14 to 16 ft. staves, while many of the modern wood tanks are 30 ft. in diameter with 18 to 20 ft. staves. The mechanical wear on a larger tank is undoubtedly greater than on a small tank and deterioration is more rapid accordingly. On the other hand it would not be consistent to attempt to base the life of a modern steel tank on the life of an iron tank as constructed 30 or 40 years ago, as corrosion will necessarily be greater with the steel tank. There are

Dimensions of Standard Steel Railway Water Tanks

no examples of steel railway water tanks that may be quoted to show the extreme life of steel tanks, as they were not in general use previous to 20 or 25 years ago.

In an attempt to arrive at some definite conclusion as to the comparative value of wood and steel tanks the following table has been prepared. The estimated life of each tank is given as 40 years, which would probably be the extreme life of either tank. The data regarding the wood tank is based on a clear heart red cypress with wrought iron hoops, creosoted pine frame and concrete foundation. The cost of the steel tank is based on a price for the tank complete erected on a foundation furnished by the railroad. The foundation in each case is figured on the basis of 60 yd. of concrete at a cost of \$8 per yard. The freight rate is based on a haul of 400 miles on all material entering into the construction of the tanks except the sand and gravel used in the foundation, which is based on a haul of 50 miles. The insurance rate on the wood tank is based on 1 per cent per annum. The cost of painting the wood tank covers the wood tub, hoops, frost box and roof only, for the frame, being creosoted, does not require painting. The cost of painting the steel tank is based on two coats of paint inside and outside every four years. The cost of the steel tank is based on 5-16 in. steel throughout.

It will be noted that the capitalized cost to build and perpetuate a 100,000-gal. wood tank is \$4,907.82, while the cost to build and perpetuate a steel tank of the same capacity is \$4,111.24; this leaves a balance in favor of the steel tank of \$396.59, and indicates that the steel tank is more economical than the wood tank. Perhaps the most important point in favor of a steel tank with a conical bottom over the wood tank is that a great deal of the suspended matter is precipitated in the mud drum. This mud drum may be cleaned very readily without taking the tank

out of service by simply opening the washout valve, while with the wood tank it is necessary to take the tank out of service at least once a year and more frequently where muddy water is used. The settling drum of the steel tank undoubtedly takes a great deal of the suspended matter from the water that can not be removed with a wood tank, and the advantage of removing this matter through the washout valve of the tank rather than from the locomotives in the roundhouse is apparent. It would appear that there is but little deterioration in a steel tank where the surface of the sheets is always covered with water and it is quite possible that it would be necessary to paint only the inside

intermediate position the car straddles the section so that part of the load is transmitted to the sections on either side. It is the practice to estimate from the observation, the nature of the real sectional error, the adjustment being made in accordance with this estimate. It is also possible to determine the errors mathematically. Let E_L, E_2, E_3 and E_R be the observed errors of the scale reading for the four positions of the car shown in the figure and let e_L, e_2 and e_R represent the actual errors of the several sections for a concentrated load of 100,000 lb. Assume the distance between sections to be 12.5 ft. and the distance between the axles of the car as 5 ft. Then with a 100,000 lb. car

ADJUSTING RAILROAD TRACK SCALES

For the sake of simplicity it will be assumed in this discussion that the track scale is provided with articulated loading girders, or, in other words, that the car-loading is applied to the several scale sections by means of a series of simple beams. As the reading of the weigh beam is the sum of the loads applied to it through the train of levers from the several sections, the errors in the multiplication of any or all of the sections are added algebraically to give what we may designate as the "observed error" on the weigh beam. If we could apply a load to only one section at a time in making a test, the error of that section alone would be apparent at once on the weigh beam, but this would be possible only if we could have a test car with a single pair of wheels. As soon as we have more than one pair of wheels, the load is

in position over the left end of the scale the load carried by section L is 80,000 lb., and that carried by section 2 is 20,000 lb., and the reading of the scale is

$$100,000 + E_L = (80,000 + \frac{80,000}{100,000} e_L) + (20,000 \frac{20,000}{100,000} e_2) \text{ then}$$

$$E_L = 0.8 e_L + 0.2 e_2 \text{ (where } E_L, e_L \text{ and } e_2 \text{ are negative or positive quantities).}$$

In the same way we find for Sec. 2 that

$$E_2 = 0.1 e_L + 8 e_2 + 0.1 e_3$$

$$\text{and } E_3 = 0.1 e_2 + 0.8 e_3 + 0.1 e_R$$

$$E_R = 0.2 e_3 + 0.8 e_R$$

Thus we have four equations and four unknowns e_L, e_2, e_3 and e_R , for which to solve simultaneously. Though the theory is simple the solution requires considerable tedious, painstaking effort.

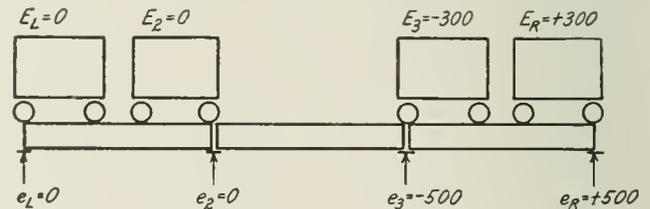

Fig. 2—Simplified Method of Placing Test Loads

This same condition is responsible for the difficulty experienced in making a trial adjustment by correcting for an estimated actual error, as the estimate will generally be far from correct because the error observed may be the sum of the errors on all three of the sections carrying the load.

It is possible, however, to use a system of placing the test load which will greatly simplify the mathematical solution and likewise make the trial adjustment a matter of definite steps, eliminating the guess work entirely. Assume the car placed successively in the positions shown in Fig. 2. Then according to the method given above we can write the equations,

$$E_L = 0.8 e_L + 0.2 e_2$$

$$E_2 = 0.2 e_L + 0.8 e_3$$

Here we have two equations with only two unknowns, e_L and e_3 , and the solution is a simple matter. Two similar equations can be written for the determination of e_2 and e_R . It is also possible to solve the above equations to give the general form, $e_1 = (E_1 - E_2) N + E_2$, where N is a constant depending upon the dis-

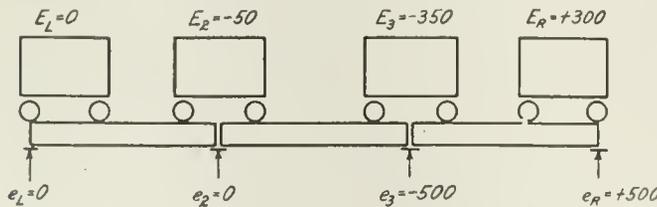

Fig. 1—Customary Method of Testing Scale Sections

distributed to two or more sections, and the errors of the several sections are recorded together. For this reason a two-truck test car would prove entirely impracticable and a four-wheel car should have a short wheel base, at least shorter than the distance between sections, as will be shown later.

In testing, the cars are commonly placed successively in the positions shown in Fig. 1, and it should be noted that in each

tance between axles and the spacing of sections. Values of N for different values of these two variables are computed readily from which a diagram like that shown in Fig. 3 may be obtained.

It should be noted that the values of N are relatively large for long wheel base test cars. It follows then from the formula that

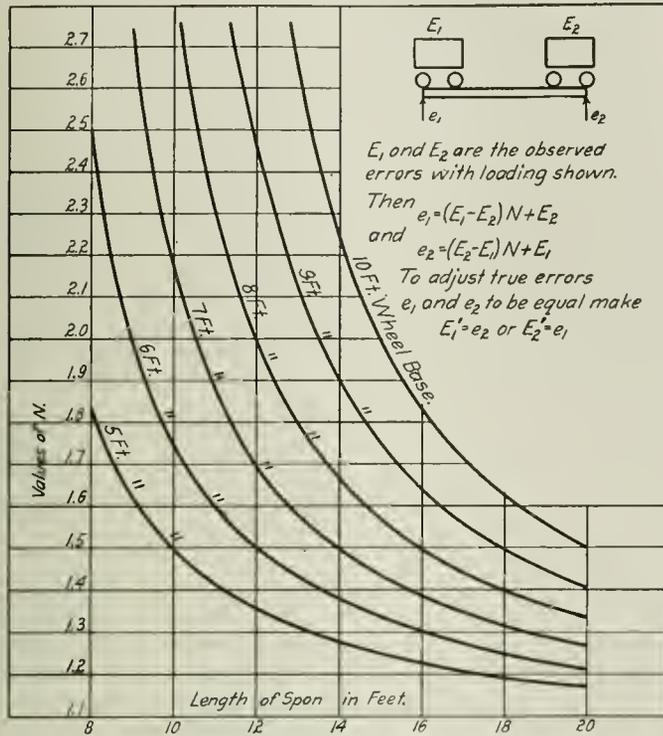

Fig. 3—Values of Constant-N, for Different Lengths of Spans

the longer the wheel base of the test car used the greater will be the difference between the errors of the sections and the observed values, and the use of a test car with a long wheel base makes the proposed method more necessary than if a short test car is used.

For the scale under consideration which has 12.5 ft. spans, we find the value of N for a 5-ft. wheel base test truck to be equal to 1.33. If we assume, for example, that $E_3 = -300$ lb. and $E_R = +300$ lb. and use this value in the formula we find that $e_3 = (-300 - +300) 1.33 + 300 = -500$ lb. If the leverage is then adjusted so that the observed error of section R is -500 lb., the observed error of section 3 would be -500 lb., and the actual errors of both sections would be -500 lb. Both sections

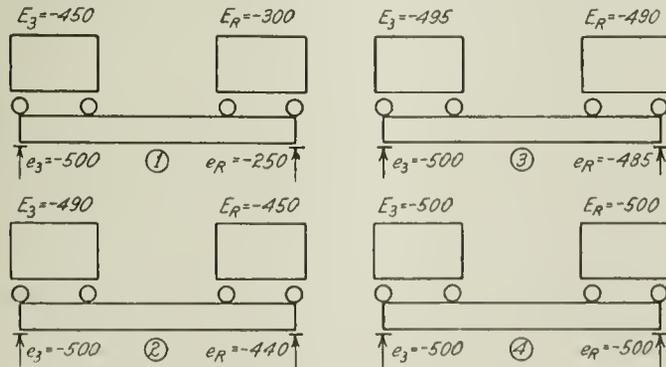

Fig. 4—Adjusting a Scale by Trial

are then corrected by moving the nose iron on the center extension lever.

Instead of using the foregoing method of finding the value to which section R is to be adjusted, the correct result may be obtained by trial. If E_R is made -300 lb., E_3 will be -450 lb. (see Fig. 4.) Then E_R is made -450 lb. and E_3 becomes -490 and so on until E_R equals -500 lb., and E_3 equals -500 lb. The real errors of sections 3 and R are under these conditions both

equal to -500 lb., and when the right end is then quickened by 500 lb. the sectional errors disappear.

In the case of a five or six section scale, where it is desired to bring the errors of three sections to the same value, the method of procedure is as follows: The two sections nearest the fifth lever are first made to have the same real errors as previously outlined. The errors observed for the offset positions of the truck on the span between these two sections will then be equal to the real errors of the sections. The end section is then adjusted until the observed error for the position of the truck adjacent to the end section is equal to the real errors of the other two sections or the errors observed when these two sections are in a condition of adjustment.

Thus far the discussion has been applied to scales of the articulated type, but the method may be applied with advantage to scales having continuous girders, as can be shown from the re-

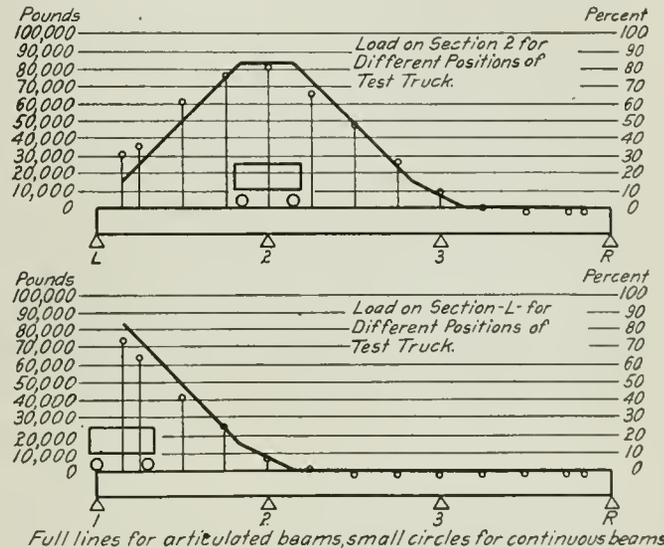

Fig. 5—Distribution of Load for Different Positions of the Test Car

sults of tests made to compare the distribution on scales with continuous girders to that on scales with simple beams. This is shown in Fig. 5. Any ordinate to the heavy full line in the upper diagram represents the amount of the load carried by section 2, as calculated for simple beams, when the center of the car coincides with that ordinate. In other words, the line represents what is known as an influence line. In the same way the vertical distance to each of the small circles is the concentration on section 2, when the center of the car coincides with the ordinate through that circle, as determined by actual experiment on a continuous girder scale. The lower figure gives the same data relative to section L. It is to be noted that the agreement is close, but of particular importance is the fact with the continuous girder as well as with the simple beams, with both wheels in the space between two sections no load is transferred to any other section than the two between which the load is placed.

It is advisable then, when adjusting a track scale either of the articulated or continuous girder type, to use the offset method of

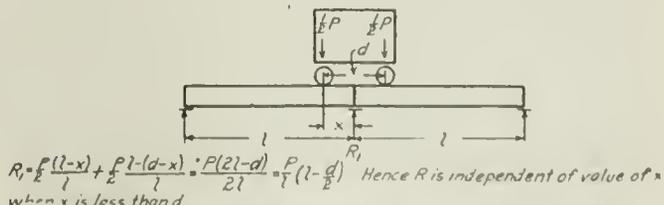

Fig. 6—Relation of Center Concentration to Position of Load

loading as explained. The use of a relatively long wheel base test truck makes this method even more necessary. The placing of one wheel over the section instead of straddling does not reduce the proportion of the load carried on the section, for as

shown in Fig. 6 the section concentration is constant as the truck passes over it.

The advantages of the off-section loading may then be summarized as follows:

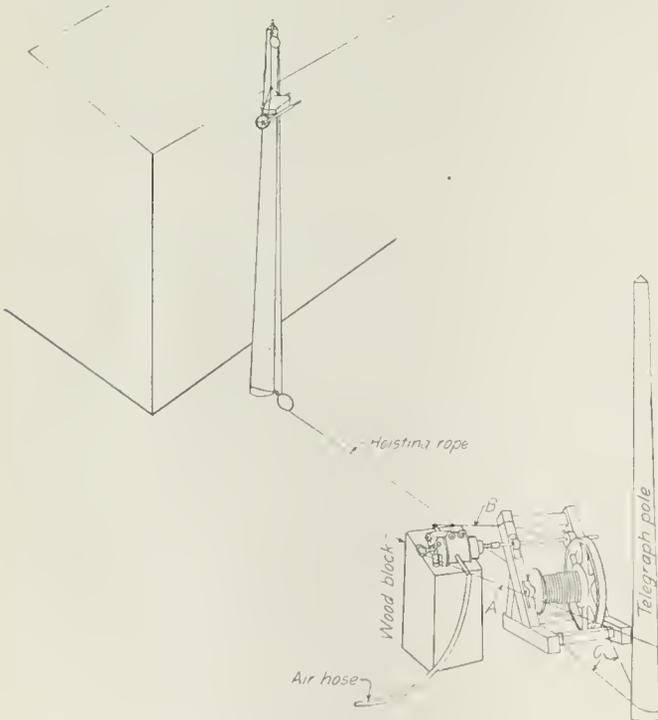

- (1) The load concentration on the section is the same as if the truck is centered over the section.
- (2) The resulting observed errors are composed of the errors of only two sections.
- (3) The nature of the sectional errors is easily determined from the observed errors.
- (4) Whether or not the formula is used the adjustment of the multiplication of track scales is simplified.

This article is taken in part from a paper presented before the last convention of the American Scale Men's Association, at Washington, D. C., by H. L. Van Keuren, of the United States Bureau of Standards, Washington, D. C.

USING A PNEUMATIC DRILL MOTOR AS A HOISTING ENGINE

By V. T. KROPIDLOWSKI
Chicago & North Western, Winona, Minn.

It is surprising to note the many uses to which an air motor may be adapted. Only a short time ago a bridge and building gang was engaged in renewing a gravel roof on a machine shop. Gravel was being hoisted to the roof by the wheelbarrow-full by three men working with a windlass. The idea occurred to someone to replace the three men at the windlass with a motor secured from the shops. As this motor requires but one man to operate it, the two men were relieved for other work, while

Manner of Attaching a Motor to Hoist Gravel to a Roof

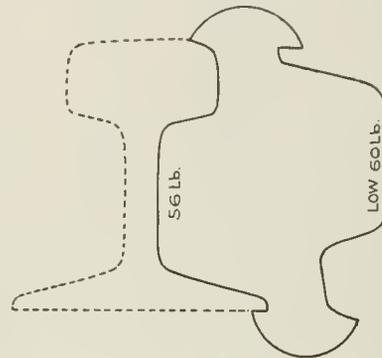

three wheelbarrows of gravel were handled in this way to one by the men. The motor was attached as shown in the accompanying sketch. The windlass was anchored to a nearby telegraph pole by two ropes "C," as shown in the sketch. The motor was placed on a wooden block to bring it to a height so that its socket was on a level with the crank shaft of the windlass. The motor was then anchored to the block with a light chain, and to keep it from moving it was further held in place by wires "A" and "B." While it was necessary to fit a square socket to the crank shaft, this required very little work, as a Morse taper with a square socket was secured from the shop

and this was made to fit by filing the square of the crank shaft slightly. At first a No. 2 Little Giant motor was tried, but this was found too small and a No. 0 motor was substituted. This latter motor was able to hoist a heaped wheelbarrow of gravel without any difficulty.

A RAIL TEMPLAT FOR USE IN VALUATION INVENTORY

By F. V. PURCELL
Assistant Engineer, Chicago & Eastern Illinois, Chicago

On most railroads the various weights of rail used in sidings and spur tracks vary by such small differences that it is difficult to distinguish the weight without spending considerable time and energy in measuring the individual rails, especially where the base of rail has become more or less imbedded in the ground. An added obstacle is the fact that the weight was usually not stamped on these old rails. However, each railroad has in the past adopted certain sections of the different weights of rail

Rail Templet for 56 and 60-lb Rails

for main track use, which in later years have been used on sidings and by making a templet of every section of rail which is known to have been used, it is possible to identify the rails very readily. These templates may be made of tin and if made like the one shown in the drawing, two sections of rail may be shown on each templet. This device has proven valuable to parties making inventories on valuation surveys.

INFLUENCE OF TEMPERATURE ON THE STRENGTH OF CONCRETE

Bulletin No. 81 of the Engineering Experiment Station of the University of Illinois contains a report by A. B. McDaniel of tests made to determine the variation in the strength of concrete cured at various temperatures. The test specimens were 6 by 6-in. cylinders, 6-in. cubes and 8-in. by 16-in. cylinders, the concrete being 1:2:4 and the storage temperatures varying from 95 deg. F. to 26 deg. F. Diagrams of compressive strength of the specimens at the ages of 3, 7, 10, 14 and 28 days, plotted against temperature show a surprisingly uniform increase of strength with higher temperatures. Tests on specimens subjected to a variation in temperature accord with the well known effect of freezing and thawing upon green concrete. As a limitation upon the practical application of the results of these tests in estimating the strength of actual concrete structures, it is well to call attention to the small size of the specimens. In large masses of concrete the conditions might be greatly different because of the effect of the heat generated by the chemical reaction of setting.

BRIDGE AND BUILDING CONVENTION AT NEW ORLEANS

At the closing session of the convention of the American Railway Bridge & Building Association, at Detroit, on October 21, it was decided to hold the next annual convention at New Orleans, La., on October 17-19, 1916.

Difficult Grade Crossing Elimination in Albany, N. Y.

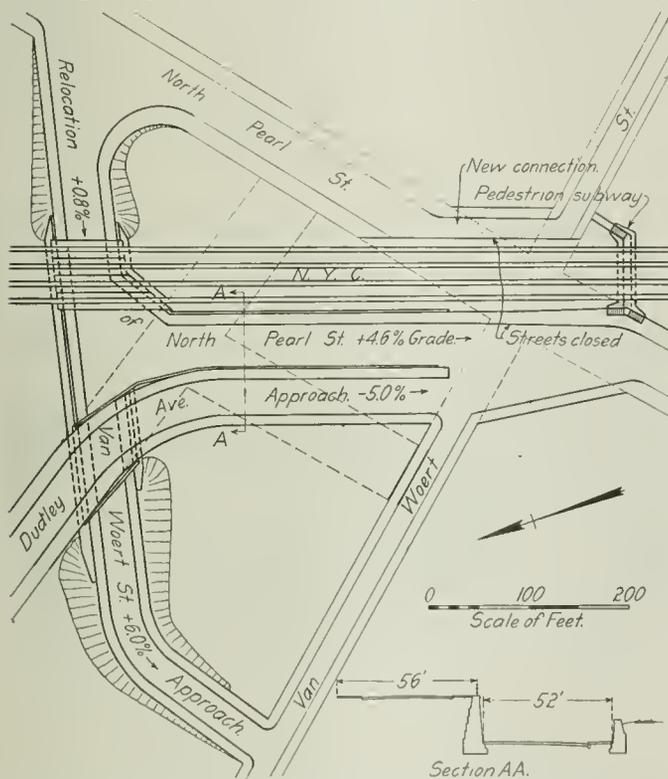

A Description of the Measures Adopted at a Particularly Busy Intersection and of the Structures Erected

The New York Central has recently completed the solution of its grade crossing problem in the city of Albany, N. Y., by the elimination of the grade crossings at North Pearl and Van Woert streets. For an understanding of the importance of this work, and of the difficulties that have been overcome, it is necessary to point out certain prevailing conditions. The crossings are at a point on the railroad where railroad traffic is extremely heavy and congested. There are four main line tracks, consisting of two westerly tracks, numbered 1 and 2, for all local and through passenger trains, and a few fast freight trains; and two easterly tracks, numbered 3 and 4, for all freight, consisting of that leading to the interchange with the Boston & Albany, at Rensselaer, New York Central Hudson division freight, Albany local freight, besides light engines used to push the trains up the West Albany

the case was reconsidered with the result that the final method of eliminating the crossings was determined upon.

In the new layout the location of both the tracks and streets are changed. The track changes consist in straightening the alignment by replacing a 4 deg. 30 min. reverse curve with a tangent formed by producing the tangent over the Broadway bridge. This affords more economic operation, especially since the tracks are on about a 1.5 per cent grade.

The street changes consist in detouring North Pearl street and carrying it under the tracks through a subway located about

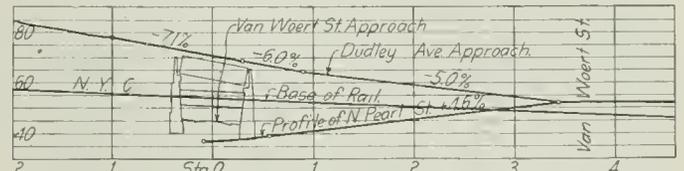

Ground Plan in the Vicinity of North Pearl and Van Woert Streets

hill, which ascends westerly from the crossings. A record of train movements taken in November, 1911, showed an average of 155 movements for the 11 hours, from 7 a. m. to 6 p. m., or a train movement over the crossings about every four minutes.

The street traffic consists not only of that along North Pearl street, a main artery leading north from the city, but also that of Van Woert street, a much used thoroughfare leading from a residential section to the city's industries and river front. Observations made in November, 1911, showed an average number of vehicles and pedestrians during the corresponding period of 11 hours, of 1,626 on North Pearl street, and 1,586 on Van Woert street, or 3,212 over the crossing.

The original order of the Public Service Commission called for the elimination of these grade crossings within the lines of North Pearl and Van Woert streets by means of a subway. It was found, however, on account of the unreasonable prices claimed by the property owners for land and damages, that the cost of the elimination would be extremely high. After considering this, and the further fact that the amount of money the state had available with which to pay its share of the cost was limited,

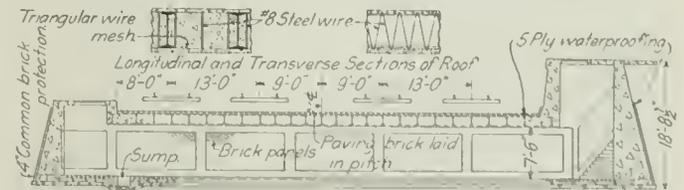

Profile of New Location of Dudley Avenue and North Pearl Streets and New York Central Tracks

400 ft. northerly of the existing grade crossing, in constructing a new street leading from the subway to Van Woert street on the west, and in extending Dudley avenue at a high level over the Van Woert street approach, to a plaza, where the new streets connect with the old. A portion of the space occupied by the old track alignment is utilized for the construction of a new street connecting North Pearl and Van Woert streets east of the tracks.

To reduce the damage to property, the low level North Pearl street approach and the high level Dudley avenue extension are placed directly adjacent to each other and the railroad tracks, being separated by mass type retaining walls supported on 40-ft. timber piles.

The bridges, one carrying the tracks over the North Pearl street, and the other carrying Dudley avenue over the Van Woert street approach, are both steel structures supported on solid concrete mass abutments having timber pile foundations. Both bridges have clear spans, it being deemed advisable to preserve unobstructed streets in order to permit of better views. The design of these bridges offers some interesting features.

The railroad bridge is a four-track through plate girder struc-

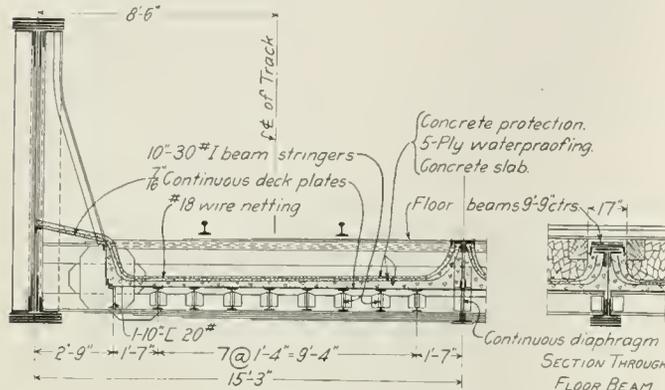

Longitudinal Section Through Pedestrian Subway

ture, with three girders and a ballasted floor. In an effort to improve traffic conditions, an angle is introduced in the east street line half way under the bridge, which necessitates an unsymmetrical structure, the west girder being 106 ft. 6 in. long, the center girder 72 ft. 6 in. long, and the east girder 68 ft. 6 in. long. Pin bearings are used for the long west girder, in order to maintain the coping lines unbroken and to avoid the use of excessively high pedestals under the center and east girders. The pin bearing at the expansion end of the west girder, where rollers are used, is made on the web of the girders, instead of on a casting bolted to the bottom flange.

In order to provide adequate drainage and to minimize the large amount of excavation for the approaches, a bridge with a shallow floor was desirable. To obtain the restricted floor depth and

avoid the undesirable through floor construction, a special design was adopted, consisting of transverse floor beams spaced 9 ft. 9 in. apart with their top flanges as close to the underside of the rails as possible, supporting longitudinal 10-in I-beams covered with a continuous top deck plate.

On the center lines between girders are placed steel diaphragms having the same depth as the floor beams, and attached to the webs of the latter by means of connection angles. These diaphragms are made continuous by means of cover plates passing

Floor Details of the Through Girder Span for the North Pearl Street Subway

over and under the flanges of the floor beams and riveted to them, and connecting the flanges of the successive diaphragms. The object of the diaphragms is to distribute the wheel loads and produce an even deflection in the floor. They also provide a convenient stop for the waterproofing, making practicable the complete waterproofing of one track at a time.

The girders are spaced 30 ft. 6 in. center to center, and the steel deck has a width of 25 ft. 6 in., thus leaving a space 2 ft. 6 in. wide along each girder. Along the outer edges of the steel deck are riveted fascia girders with their top flanges at the same elevation as the flanges of the floor beams. This arrangement gives sufficient space for the ties and ballast, reduces the weight to a minimum and permits convenient inspection and maintenance of the floor beam connections. The open spaces are covered by reinforced concrete slabs made continuous with the concrete protection over the waterproofing.

The design of the floor produces depressions or pockets, each of which is drained through nipples screwed into the deck plate

On this mortar course is laid a waterproofing course, consisting of five thicknesses of tarred felt, one of which is reinforced with cotton fabric and six moppings of coal tar pitch. The waterproofing membrane is carried up to the underside of the top flanges. Over the membrane is placed a protection course of mortar reinforced with wire netting.

The bridge carrying Dudley avenue over the Van Woert street approach consists of six deck plate girders spanning the street and supporting on their top flanges I-beams transverse to the roadway, which in turn support the roadway, consisting of a brick pavement on reinforced concrete slabs, and sidewalks of reinforced concrete.

This bridge is designed for the following moving loads in addition to the dead load:

On the roadway two trucks weighing 18 tons each, and a uniform load of 100 lb. per sq. ft.

On the sidewalks a uniform load of 100 lb. per sq. ft.

An impact allowance of $\frac{150}{L + 300}$ times the live load stress.

In order to connect with the existing Dudley avenue as laid out, it was necessary to use a 7-per cent grade and introduce about a 29-deg. curve, which of necessity occurs directly at the point of crossing the Van Woert street approach, which is on a 6-per cent grade. The combination of grades, skew and curvature complicated the layout and some ingenuity was required to work out a suitable roadway over the bridge, which is accomplished by warping the surface.

A subway to accommodate pedestrians is installed in the vicinity of the original crossing. The subway is 8 ft. wide and

Looking North—Pearl Street Incline and Subway on Right, Dudley Avenue Approach on Left

has 7 ft. 6 in. headroom. Its floor is reinforced against hydrostatic pressure, the walls are of gravity section and the roof is constructed of I-beams encased in concrete. The whole subway is waterproofed by a continuous membrane consisting of five plies of felt, the middle one being reinforced. This concrete filling between roof I-beams is reinforced with wire mesh laid under the I-beams and securely wired to rods laid across the top.

The subway is drained by a gutter along one wall leading to a sump at the easterly end. From there a pipe with trap and back-water valve carries the drainage to Van Woert street sewer. The subway is electric lighted and has vault lights to give natural light during the daytime. The monotonous appearance of the concrete is relieved by a series of brick panels constructed of buff tapestry brick. The kiosks over the entrance are constructed of cement plaster on wire mesh.

The railroad made all track and signal changes, including the support of the tracks on timber falsework during the construction of the two subways, with its own forces. The other work was done under contract. Substructural and approach work was done by the Walsh Construction Company, of Davenport, Iowa; steel fabrication by the Fort Pitt Bridge Works, of New York City; and the steel erection and waterproofing by the Johnson-Gifford Company, of New York City.

In addition to the track work, the approximate main quantities involved in the improvement are 50,000 cu. yd. of earth excava-

Looking East Down Van Woert Street Approach Under Dudley Avenue

and discharges into longitudinal gutters, which connect with downspouts located in the face of the south abutment, the downspouts emptying into a city sewer. The nipples have flared tops, and extend about 1 1/2 in. above the deck plate, this space being taken up by a course of 1:3 Portland cement mortar carried up against the sides of the floor beams, diaphragms and fascia girders.

tion, 7,000 cu. yd. of concrete, 30,000 ft. of timber piles, 4,000 ft. of steel sheet piling, 9,000 sq. yd. of brick and stone block pavement, 34,000 sq. ft. of concrete walk, and 500 tons of steel.

Owing to the congested location, and to the fact that westerly from this location the tracks run up grade for a considerable distance through a cut, and on the east the tracks run into the city, the problem of disposing of the excavated material economically had to be solved. This was accomplished by teaming the greater part of it to the Albany Basin improvement on the Hudson river front, where the railroad required considerable filling. Some that could not be used in this way was hauled by train to a point just south of Rensselaer, and used to widen out the roadbed for future additional tracks and strengthening some weak spots in the roadbed in this vicinity.

Considerable trouble and expense was entailed due to the character of the subsoil encountered, which consisted, below the elevation of footings, of about 3 or 4 ft. of blue clay and then a stratum of soft yielding material composed of blue clay, sand and water, for a depth of about 30 ft. to hard pan. As an illustration of the condition of this stratum a 2-in. pipe was driven about 10 ft. into the ground and when some heavy timbers were dropped in its vicinity, a jet of sand, clay and water was forced up through the pipe and about five ft. into the air.

Perhaps the greatest difficulty to be overcome was to allow uninterrupted train movements during the process of constructing the undercrossing and particularly during the erection and waterproofing of the steel bridge. With the exception of causing a little slower movements of trains than usual, the steel was erected and the floor waterproofed free from interference from traffic, by the following procedure:

Falsework piles were driven under tracks 2, 3 and 4, and for a temporary track outside the east girder, the tracks being all shifted to the east after the falsework was completed and before

that by reason of the crossing relocation, traffic along the street has been allowed to go on undisturbed. By an intermediate track shift the original crossings will be undisturbed until street traffic is turned into the new street and undercrossing.

This work was carried out under an order of the Public Service Commission, Second District, dated June 12, 1913, and in accordance with Section 91 of the Railroad law. Under the law the railroad company will pay 50 per cent of the cost of the improvement, the city of Albany 25 per cent and the State of New York 25 per cent. Under the law, the railroad company prepared the plans and did the work. In accordance therewith

Looking West—Tracks on Pearl Street Subway in Foreground Dudley Avenue Bridge Over Van Woert Street Approach in the Distance

the work was done under the supervision of G. W. Kittredge, chief engineer, and J. W. Pfau, engineer of construction. E. B. Menez, district engineer, at Albany, N. Y., had direct charge of the construction.

THE RAPID IMPROVEMENT OF A SECTION

BY KENNETH L. VAN AUKEN

Instances frequently occur where it is necessary to assign a new foreman to a section for the purpose of making a rapid improvement in the condition of the track, to insure safety or to obtain conformity with the required standards. There are many reasons for poor condition of a track, among which might be mentioned, lack of labor or poor labor, an incompetent or neglectful foreman, curtailment of appropriations for track work, track on a new grade, or emergency work, such as wash-outs, whereby the section forces have been diverted from their regular duties.

When a new foreman is given a section which has been improperly maintained, he will find enough work for ten gangs of the size he is usually allowed. Nevertheless, he will generally be expected to restore the track to the required standard without even the help of an extra gang. Even if an extra gang were furnished, it would be necessary for the section gang to follow out a program of rapid improvement for the entire section in advance of the extra gang. The foreman will probably find that the track needs surfacing out of face. However, there will be certain places which are rougher and need attention worse than others. The foreman should therefore make it a positive rule always to do the most important thing first and he should bear this in mind on starting out from the section house each day.

It is very difficult for a section foreman to do this kind of work, which one supervisor has aptly called "skirmishing." As a rule, section forces, both foremen and laborers, are trained

Kiosk Approach to Pedestrian Subway

the excavation for the abutments was started. In the temporary locations, track 1 was in the permanent location of track 2, etc. The girders were then set in place between tracks, and when everything was in readiness for the erection of the steel floor to support tracks 1 and 2 in permanent locations the traffic on temporary tracks 1 and 2 was carried for twelve hours on track 2, to permit the erection of the floor free from traffic interference. This portion of the work was completed in the time allotted, and track 1 placed in its original position. The erection of floor to support tracks 3 and 4 was carried out in the same manner.

The waterproofing of the floor which carries track 1 in permanent location was first completed free from traffic interference, track 1 was then shifted to its permanent position, and the balance of the bridge was waterproofed in a similar manner.

In taking care of street traffic during the construction period, a point in favor of the method of elimination is emphasized;

to be thorough, keeping in mind, quality rather than quantity. For instance, they are accustomed to tamp track with tamping bars or picks, dress it up, line up the shoulder and ballast line and leave everything in first-class condition. There are other reasons why a foreman dislikes to run over a section hurriedly, spotting out only the worst places; a good foreman will take pride in his work and will be careful to leave nothing behind him which could be criticised by another good trackman or which he could not be proud of himself. Sometimes the foreman will even go so far as to neglect or ignore the orders of the roadmaster, who is constantly riding over the track and is therefore able to locate the roughest spots, or he may postpone fulfilling his superior's instructions because he is trying to complete some other work. This is a great detriment to the work in most cases and should not be allowed. To prevent this the roadmaster should check up carefully to see that his orders are obeyed immediately. On the other hand, there are many foremen who would improve the section quickly and do only the work which requires immediate attention if they knew just what was necessary or had had some experience in this class of work, and it is believed that the following hints may be of value to such men.

Of course, the first thing which a foreman will do on taking over a new section is to make a trip over it on a hand car or motor car, or possibly walk over it, to familiarize himself with the conditions on the section. When making this preliminary inspection he should look carefully for dangerous places in the track, such as low joints on the high sides of curves, low bridge approaches, alinement at highway and railway crossings, the condition of switches (especially facing point switches), low joints alternately on one side and then on the other, skeleton track or track without a shoulder of ballast, churning ties, etc. He may be able to make the inspection thorough enough to make recommendations regarding water pockets, slides, or soft spots in cuts. He can then order the ballast or other material necessary to put the track in a safe condition.

As in all other work, the most important part of the foreman's duties is to lay out the work in the order in which it is to be done. If it is desired to cover the entire section in ten days, for instance, the foreman should divide his section into approximately 10 equal parts, unless some natural division points, such as bridges, suggest themselves. It may also be necessary to lay out unequal sections because some parts of the track will require much more work than others. The foreman should determine, however, to cover his entire section in not more than ten days; seven days would be even better. When raising bad spots, the foreman will find it advantageous to walk ahead of the gang in the morning with a piece of chalk, marking the joints which he wishes to raise by two crosses on the base of the rail, one on each side of the joint, locating these crosses so that they will include between them all the ties that it is necessary to tamp at that particular point. After the foreman has marked off the places on the section which he intends to cover that day, he should return to the gang immediately.

As it is only possible to employ a few men when beginning any piece of work, for instance in surfacing, it is advisable to take part of the gang ahead when there is still some dressing up to be done, leaving the remainder of the gang to finish. After a sufficient amount of track has been raised, the remainder of the gang, with the exception of possibly one man, may be brought ahead. In this manner all the men can be kept constantly at work. The same holds true when lining up a highway crossing. As it will be impossible to employ all of the men in taking up the crossing planks without carrying an unusually large number of lining bars, pinch bars, etc., the work of tearing up the crossings should be done preferably by a few men while the others are finishing up the preceding job. Likewise, after the low joints have been raised in a crossing and it has been lined, all of the gang save two may be taken ahead, leaving these two to replace and spike down the planks and do whatever dressing is necessary.

Wherever a little gaging or spiking is necessary, a couple of

men should remain to do this work, though they should if possible be kept in sight of the foreman. It may sometimes be necessary to take a good share of the gang out of sight of two or three of the men; for instance, around a curve in a cut, and in this case the foreman should leave men whom he can trust to keep at work, even though they are not under direct supervision.

The curves, of course, will require prompt attention. Low joints, in the high side of the track especially, may cause a derailment and wide gage is dangerous. It is possible during the preliminary inspection, to spot cases of wide gage by noting places where the outside rail has drawn away from the inside spike. Bridge approaches will almost always require some attention and they should be raised at least 100 ft. or more back from the bridge rather than only one rail length, as is frequently done. The track should be raised about two inches, particularly if the embankment is settling rapidly, thus obviating the necessity of giving the bridge approaches further attention until after a storm. The foreman should be careful when raising bridge approaches not to run too far back on the track (as he will often be tempted to do because the track is rough), but he must remember that there are other places which need attention first.

Usually the track through highway crossings is neglected because of the extra work involved in taking up and replacing the planks. Of course, this is the result of slovenly work, but when a section has deteriorated through any of the causes previously mentioned, usually the crossings will have suffered. The foreman should be careful to take out the local kinks at the crossing but should also be sure that the track lines up properly with the tangent for some distance each way before he puts down the planks again. The same might be said of railroad crossings, but as it takes a long time to line these up correctly it would be best to let them remain until after the preliminary work on the entire section has been done, unless they are very badly out of line. Wherever there is a piece of skeleton track, or a lack of ballast on the shoulder, the foreman should correct these conditions at the earliest opportunity as sun kinks are likely to develop and cause wrecks. The best treatment for these is to order the gravel and spread it just as soon as it arrives. If the gravel is spread in the middle of the track it will not be necessary to dress off the shoulder or the center immediately, as the weight of the ballast will be sufficient to hold the track.

Churning joints are quickly recognized by a good trackman and will receive his attention in running over the track for the first time, because he knows that the seriousness of the condition does not show up in a case of this kind except when a train is running over the joint. A joint may appear to be only two inches low, but since it has no foundation it may sink three or even four inches when the wheels of a train pass over it. Churning joints should therefore have early attention.

To summarize, the preliminary work of a foreman on a new section should be confined first, to places which are actually dangerous, and second, to such other places in the track as are in particularly bad condition compared with the rest of the bad track on the section. The foreman who will pocket his pride and quickly improve the worst spots, will probably escape the censure of the roadmaster and higher officers and gain for himself credit for having improved the track materially in a very short space of time.

EARLY RAILROADING

The Columbia & Philadelphia Railroad, now a part of the Pennsylvania Railroad, was completed as a single track line in 1834. At first all freight was hauled by teams, and because of battles between opposing teamsters in the first year, it was at once double-tracked. Excepting the inclined planes at Columbia and Philadelphia, the first 1,800 ft. long and rising 90 ft., and the second 2,805 ft. long and rising 187 ft., the maximum grade of the road was 30 ft. per mile, and the minimum radius of curva-

ture 631 ft. The track was mainly constructed with stone blocks and edge rails, with wooden sills at intervals. The rails were secured to the stones by spikes driven into locust plugs inserted into holes drilled for the purpose. To overcome the tendency to spread, 7-in. by 7-in. ties 7 ft. 6 in. long were added at 4-ft. intervals. The first locomotives drew 20 tons of freight over the 82 miles in 10 hours.

The trip from Philadelphia to Pittsburgh was made by the Columbia & Philadelphia, from Philadelphia to Columbia, by canal along the east bank of the Susquehanna, thence across to the west bank and along the Juniata to Hollidaysburg; then by the inclined planes of the old Portage Railroad over the Allegheny mountains to Johnstown and thence by steam packet down the Kiskiminetas and Allegheny rivers to Pittsburgh. (Journal of the Franklin Institute, 1840.)

CONCRETE FLOOR TROUBLES

By MACRAE D. CAMPBELL

From the large number of methods advocated as preventives or remedies for concrete-floor troubles, it might seem to the uninformed that concrete is unsuited to floor construction. This is far from the truth, as concrete is as efficient in floors as in walls or any other part of a building. With concrete floors laid with care, using the best materials and workmanship, none of the too frequent complaints should prevail.

One of the most frequent causes for complaint is "dusting." Extensive investigations have conclusively fixed the cause of this trouble on the failure to observe one or more of certain fundamental requirements, which if observed would have led to success. Dusting may have its cause in any one of quite a formidable list of omissions. The strength and wearing qualities of a concrete floor, particularly the wearing quality of the surface, depend very largely on the quality of material used in making the concrete, the kind of workmanship displayed in placing, and also on the proper protection of the concrete for a sufficient period to complete the early hardening of the floor.

Contributing causes of dusting have been definitely fixed in the use of too fine sand, dirty sand, soft sand, too lean a mixture, improper or insufficient mixing, too much time allowed to elapse between placing and finishing, using mixtures too dry or too wet and the use of dryers (dry cement with or without sand) to dry out the surface so that it may be quickly troweled to the desired finish, permitting the surface to dry out so rapidly that there is insufficient water present to complete hydration or crystallization of the cement, that is, neglecting to protect the surface with a moist covering of earth until early hardening has been completed.

In two-course work when a thin top or wearing surface is placed on a base which has already hardened, there is likely to be dusting because there is no possibility of the base absorbing the excess water from the top course and any excess must get away through evaporation from the top surface. This excess of moisture on the surface prevents troweling to the desired finish until after early hardening has commenced, or invites frequent troweling which results in bringing an excess of cement to the surface and separates some of it from the aggregate and thus impairs the wearing quality of the surface.

Disposing of the question of cement used in floor construction by stating that any one of several well-known brands are known to be manufactured so as to meet specifications of the American Society for Testing Materials, particular attention must be given when preparing concrete mixtures for floor construction, to selecting clean, hard, durable, well-graded aggregates and to proportioning them so that voids will be eliminated as nearly as possible. The use of granite screenings for aggregate in the wearing course to insure a harder and more homogeneous surface has met with considerable success. Various hard or flinty sands and even garnet and carborundum grit have been used in the top course and show remarkable resistance to abrasion. But dusting is not necessarily the result of abrasion of aggregates,

rather it is the result of improper bond between the cement and fine aggregates which permits the fine particles of grit to become loosened from the cement binder, thus subjecting the cement itself to the wear of traffic. This goes on repeatedly after a manner that might almost be referred to as disintegration. This fault, provided materials have been all they should be, results solely from failure to protect the finished concrete by means of a covering of moist earth or sawdust for from 10 days to two weeks to insure complete early hardening.

Materials can be governed by specifications and although it is possible to specify careful supervision and workmanship, it is not always possible to define what these mean or to secure them after having defined them. Since so many thoroughly satisfactory concrete floors have been obtained by following the specifications of the American Concrete Institute, it should be evident that dissatisfaction with other floors results from the neglect of some vital factor.

Floor requirements in certain types of railroad construction are well met by concrete. Some stations may be advantageously floored with concrete; and such construction is adapted to machine shops and roundhouses. Fault is sometimes found with concrete floors in machine shops and roundhouses where naturally much oil is spilled on the surface in the course of time and claims have been made that oil causes disintegration of concrete. This is hardly tenable since there are many instances where concrete oil storage tanks have given satisfactory service and after years of use, a careful examination of the surfaces exposed to oil show no disintegration. The secret of success lies in a well-proportioned concrete mixture that produces an impenetrable surface as well as mass.

There are a number of treatments that may be applied to floors that have caused trouble from dusting, which will allay this trouble, but most of these require renewing from time to time. A mixture of linseed oil and turpentine has been found effective when painted on the surface, likewise a treatment consisting of several applications of a sodium silicate solution which acts by combining with free salts in the cement to form an insoluble compound. In some cases the top may be ground down with one of the common types of floor polishing machines as is done in polishing or surfacing mosaic floor.

This brings to mind the suitability of what are commonly referred to as terrazzo floors, for stations, sometimes referred to as Venetian floors. Careful cost figures that have been kept on many pieces of such construction show that terrazzo or Venetian floors may be laid for a lower cost than any other form of decorative floor. Marble mosaic averages from 60 to 75 cents per sq. ft.; ceramic tile, 35 to 50 cents per sq. ft., and terrazzo, from 20 to 30 cents per sq. ft.

Just as there is in all construction work considerable difference of opinion as to so-called best methods, so there is a wide variation in the specifications which have been drawn up by different engineers, architects or builders covering terrazzo floor construction. This floor has a number of attractive possibilities. There is no limit to the variety of surface finish which may be secured by carefully selecting the aggregate. Crystalline limestone of all obtainable colors may be used singly or in combination. Relatively soft aggregates of uniform hardness are desirable. Different kinds and colors of marbles also may be used, and likewise the cement mortar in the mixture used to bond or bind the particles together and in place may be varied in color by the use of mineral pigments. The finished terrazzo floor should show not less than 80 per cent of aggregate surface.

Terrazzo floors are laid both on the top of a concrete base supported by an earth foundation and over wood or exposed steel sub-floor construction. In the last two cases the terrazzo should be underlaid with a well-lapped course of hard roofing felt or waterproof building paper. The foundation course should consist of concrete mixed in the proportions 1:2½:4. Enough water should be added to make a medium wet consistency. Concrete should be deposited 4 in. thick. Upon this foundation course there should at once be laid a ½ inch layer of 1:2 cement mortar. Within 24 hr. after placing the foundation, a ½-in. to 1-in. layer

of cement and marble chips, or whatever aggregate for the surface is selected, should be mixed to the consistency of a stiff paste and deposited. The marble chips should vary in size from a pea up to $\frac{3}{4}$ in. in the largest dimension. The proportions of this mixture may vary from 1:1 $\frac{1}{2}$ to 1:2 $\frac{1}{2}$. The cement marble layer should be spread so evenly that the broad surfaces of the marble particles will turn upward, then should be tamped thoroughly and rolled with a heavy roller weighing not less than 100 lb. to the foot, and preferably more.

After protecting this surface with a moist covering for two or three days, the preliminary surfacing or grinding may be done by using a lubricant of water and pure cement, grinding being done by one of the rotary types of floor polishing machines. In 10 days or more the floor may be ground again to its final surface. The degree of polish will depend upon the hardness attained by the cement and the thoroughness with which it has been protected during hardening. Ingenuity of the individual worker will suggest quite a variation in details of terrazzo construction. There is a considerable latitude for introducing pleasing border effects, even inlaying certain designs in the floor proper.

Frequently the question arises as to the necessity for using reinforcement in the floor when a terrazzo surface finish is contemplated. Best practice seems to indicate that for areas of 75 sq. ft. or less, or in buildings where all settlement has occurred and further settlement is not likely, or in places where the underlying floor slab is thick, say from 4 in. upward, reinforcing is unnecessary. It seems advisable, however, to introduce suitable reinforcing in locations where the construction may be subjected to constant vibration, in new buildings where there is certain to be subsequent settlement, where the concrete floor slab is not very thick, and where the terrazzo is to be laid over wood sub-floor construction.

LINING A DOUBLE TRACK RAILWAY TUNNEL UNDER TRAFFIC

BY RODMAN MEACHAM

General Manager, Meacham Contracting Co., Hopkinsville, Ky.

The Diana tunnel of the Louisville & Nashville is located about 65 miles south of Nashville, Tenn., on its new double track, low grade main line to Birmingham. The tunnel is 1,520 ft. in length. It was excavated through limestone and shale formation, and required temporary roof timbering throughout. This timber had to be removed in the north end for the concrete section, but was left in place in the south 1,200 ft. of the tunnel, where, after it was demonstrated that timbering would be necessary, the excavated section was enlarged.

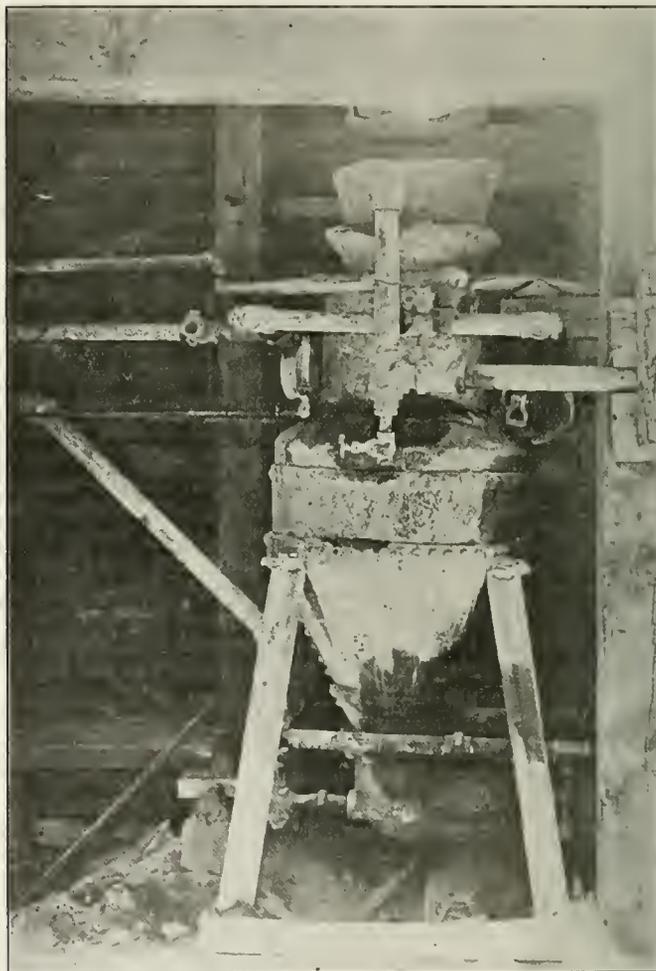

It was the intention at first to pour the side walls, using an incline and hoist to elevate the cars of mixed concrete up to the springing line, where they could be dumped directly into the side walls, and the concrete for the arch section to dump on a platform and shovel and pack it into the arch by hand. After investigating the pneumatic method of placing concrete, however, the estimate indicated the economy of blowing concrete through an 8-in. pipe directly into place, using a steel tunnel form built to the full section of the tunnel. This method permitted trains to pass through the tunnel without interfering with the concreting work and made it possible to pour the full section of the tunnel in a single operation. It also eliminated a cumbersome incline and hoist which probably would have caused some delays to the regular traffic of the road.

The pneumatic method was therefore adopted for the work, in conjunction with two 35-ft. sections of steel forms of the Blaw type, built on travelers. The work was started on January 19, 1915, and was completed on October 22, a total interval of nine months, during which there was an average of 20 trains per day through the tunnel, with a total delay of traffic of less than two hours. This is considered unusual, as some delays were fully expected. The speed of all trains through the tunnel was restricted to six miles an hour while the work was in progress.

FORMS

The traveling forms are shown in the accompanying drawing. They consisted of steel plate side walls to the springing line and 2 $\frac{1}{2}$ -in. by 5 $\frac{1}{2}$ -in. yellow pine lagging over the arch section. The side walls were stiffened with vertical I-beams and two waling pieces of two 4-in. by 8-in. timbers placed horizontally against these I-beams, through which anchors passed. These anchors were fastened to the rock side walls with split point anchor bolts set into the rock about 10 in. to afford rigid supports for the side wall forms.

Two diagonal tie rods and one horizontal tie rod were also placed near the bottom of the form to hold it rigid while being moved, but these were found unnecessary after the first move and were discarded, thereby removing all obstructions to traffic. It was necessary to build the footing course of concrete ahead

View of the Pneumatic Mixer Set Up Under the Bins at the North Portal of Diana Tunnel

of the forms so that the bottom steel plate would fit up against the concrete footing, as shown in the sketch.

In moving the forms the doors M-7 at the haunch of the arch were first opened. The 16-in. jacks were then lowered about 2 in., bringing the arch section away from the concrete. After this, the diagonal braces B-1 were unbolted and the turn buckles M-1 were pulled in to move the side walls away from the concrete at the springing line of the arch. The wall forms were pulled away from the concrete at the base by inserting a crowbar between the rails, on which the forms traveled, and the steel frame which carried the wheels, and prying the forms away. This was possible, as there was enough play in the wheel axles to allow for the side movement.

The forms were first set up at the south end of the tunnel, one at the portal and the other about 350 ft. in. As the lining was placed they were moved north 35 ft. at a time until form

No. 2 reached the center of the tunnel, and form No. 1 reached the starting point of form No. 2. After form No. 2 reached the center of the tunnel it was moved ahead to a point about 350 ft. from the north end, and form No. 1 was moved ahead to the center of the tunnel to continue the work where the other form had left off.

THE PNEUMATIC MIXER PLANT

During the first half of the work the pneumatic mixer was located about 75 ft. outside the south portal, after which it was moved to the north portal. At the south end the mixer was in a deep approach cut and the top of the cement house and of the stone and sand bins erected above the mixer was some 30 ft. below the top of the rock sides of the cut. A large pile

View Showing "Y" in Delivery Pipe, Forms and Roof Timbering

of spoil rock excavated from the tunnel had been deposited on the east side of the cut above the mixer plant. This rock was crushed on the site, screened and dropped through a gravity chute into the bin below within the cut. Sand was brought in cars from Jacksons Lake, Ala., and unloaded into the bins by means of a derrick set at the top of the cut, which handled a large bottom-dump bucket.

When the bins were built, the mixer was placed beneath with a measuring hopper directly above it for measuring 10 cu. ft. batches. A working platform was built at a convenient level for the measuring hopper. This platform was extended to the full area underneath the bins and was used for cement storage. The bins for stone and sand above contained space for about 140 cu. yd. each. The cement storage capacity was about four cars.

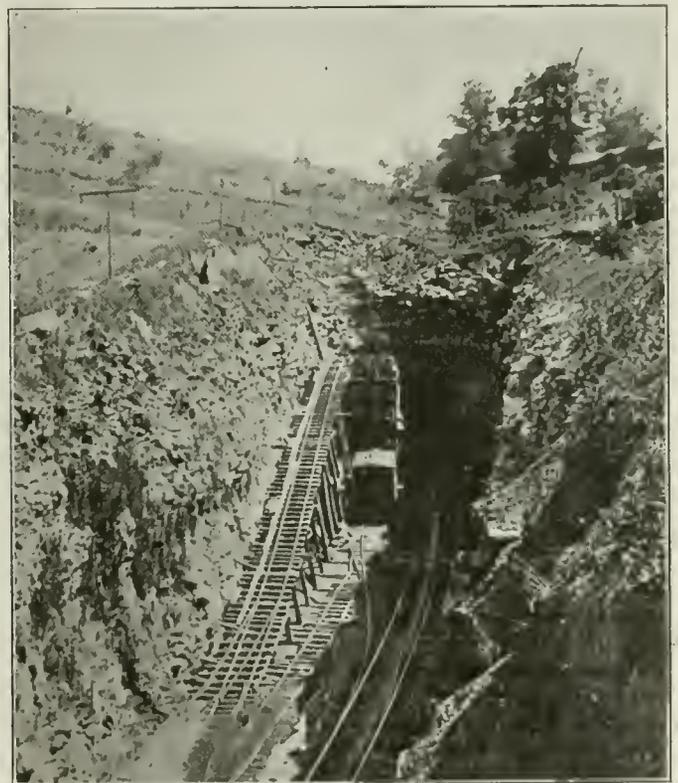

METHOD OF HANDLING

From the pneumatic mixer an 8-in. standard steel pipe was carried to the forms. The pipe was laid along the ground. At the forms it turned vertically with a long radius, 90-deg. elbow, and at the top just before turning horizontally through the bulkhead over the crown of the arch it was divided by means of a "Y" connection into two 8-in. lines which passed over the crown of the arch. The "Y" connection is particularly useful in a double track tunnel where the width of the crown is so great that it is difficult to change the pipe rapidly in directing the concrete from one side wall to the other. As shown in one of the photographs, it consists of a casting with "Y" branches at about 22½ deg. deflection. The concrete passes through one of the branches and is obstructed in the other branch by means of a sliding plate. To switch the flow of concrete from one branch to the other, it is only necessary to slide the plate from one side to the other. This is done by a couple of blows from a sledge and requires but a second's time, so that it may be accomplished after one batch has passed and before another batch is blown

through, without the necessity of holding up or even notifying the operator of the pneumatic mixer.

The two 8-in. pipes passing over the crown of the arch reach about 20 ft. or midway into the forms, and at that point they turn through 90-deg. elbows to each side wall. At the end of the elbow a 9-ft. length of 8-in. hose is suspended. While the concreting is going on two men with ropes attached to the end of this hose station themselves at the ends of the form so that they can pull the hose forward and back and deposit the concrete evenly along the side wall. After sufficient concrete has been poured to bring the side wall up from 2 to 6 ft., depending on the thickness, the concrete is diverted through the other side of the "Y" and deposited in the opposite side wall to balance the weight against the forms.

When the concrete reaches a point too high for the use of the hose, this is detached while concreting is going on at the other side. Concrete is then discharged directly from the elbow until the space is filled close to the end of the elbow. During this period of the pouring the concrete is distributed by means of hoes and concrete rakes. This brings the level of the concrete up to a point nearly level with the top of

Looking South Toward the Mixing Plant Set Up at the North Portal of Diana Tunnel

the barrel of the arch form, and leaves remaining to be filled a space approximately 10 ft. wide and from zero at the sides to 18 in. in height over the crown. The 90-deg. elbows are then removed from the ends of the pipe and a short hose is attached to one of the 8-in. pipes, the other pipe being removed. Concrete is then shot against the rear and built up to the end of the hose, after which this hose is removed and the concrete is shot straight ahead from the end of the pipe until the key is completed.

At the north end of the tunnel the temporary timbering was removed as concreting progressed. Considerable breakage in the roof left cavities of various depths which it was necessary to fill either with concrete or with some variety of packing. Where packing was used it was placed with the pneumatic machine. The material consisted of a mixture of 75 per cent limestone screenings and 25 per cent sand. This was blown in, filling the cavity completely and packing it tightly so that the

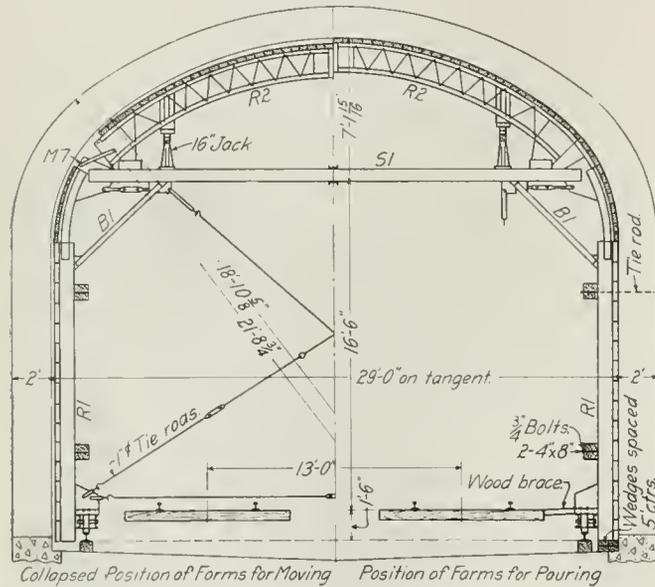

weight or any pressure from rock settlement was evenly distributed over the barrel of the arch through the packing.

The compressor plant consisted of two Ingersoll-Rand steam-driven compressors, which delivered about 1,000 ft. of free air per minute at the mixing plant. The same steam plant and a Cameron duplex pump furnished water for construction purposes and for the camps.

GENERAL

After the mixer plant was moved from the south to the north portal the crusher plant was located about 2,000 ft. north of the mixer. This required handling the crushed material in 4-yd. narrow gage dump cars hauled by dinky locomotives. These cars were hauled from the crusher plant to the base of an incline at the bins and were pulled up the incline by means of a cable from a Munday hoisting engine, located under the bins. A view of this plant as located at the north portal is shown in one of the photographs.

It was found that the 8-in. pipe used wore out first at the joints, as the pipe was thinnest there on account of the threads.

Cross Section of the Tunnel

At the beginning of the work 1,000 ft. of standard pipe was purchased, and after the work was half completed 300 ft. of well casing with Van Stone joints was purchased. This well casing was found to be well adapted and did not give trouble through the wearing at the joints that the standard pipe did. Another advantage of the Van Stone joints was their flexibility, as about 5 deg. deflection could be obtained in this joint without straining the flange. Of the entire amount of pipe purchased, which was bought second-hand, about half was still in very good condition at the close of the work, after having some 11,000 yd. of concrete blown through it.

The elbows used consisted of cast manganese steel and of bent pipe. The manganese steel elbows were purchased at the beginning of the work and were still in good shape at the end, having shown very little wear. The manganese steel elbows were, however, very heavy, weighing about 400 lb. for a 90-deg. bend. For this reason the pipe bends were used over the crown of the arch, where the handling of the pipe was difficult. The pipe bends weighed about 125 lb. each and were worn through on the outside of the curve. When worn through a "half sole" or patch was clamped over the worn part, which usually lasted for another 500 yd.

At the beginning of the work the engineers permitted the moving of the forms after six days, but after a time this period was reduced to four days. In all there were 41 form sections, each of approximately 35 ft. and containing about 250 cu. yd. in each section. The longest distance which concrete was transported was 925 ft. and the average distance was about 400 ft. The

average time required to concrete one 35-ft. section was approximately 24 hr., although some forms were filled in 15 hr. The number of men required to mix and place the concrete was 13, including 3 men in the bins, 1 operating the gate levers, 1 to level off the measuring hopper containing the hatch, 1 man on cement, 1 mixer operator, 1 man on the conveyor pipe, 1 attending to the bulkheads and 1 foreman and 4 men helping in the forms. A gang of 10 men was employed constructing footings and moving and setting the forms.

The work was done by the Meacham Contracting Co., Hopkinsville, Ky., sub-contractors for Walton & Co., Falls Mills, Va., who excavated the tunnel. C. B. Fritchie was superintendent in charge of the work for the Meacham Contracting Co.

The forms were furnished by the Blaw Co., Pittsburgh, and the pneumatic mixer and conveyor was furnished by the Concrete Mixing & Placing Co., Chicago. The work was done under the supervision of H. C. Williams, chief engineer of construction for the Louisville & Nashville, and Geo. B. Bryson, resident engineer in direct charge for the railroad.

MAINTENANCE OF WAY MASTER PAINTERS' CONVENTION

The Maintenance of Way Master Painters' Association held its twelfth annual convention at the American Hotel Annex, St. Louis, Mo., on October 19, 20 and 21, with about 40 members and guests in attendance. Owing to vacancies in the offices of president and secretary-treasurer, F. C. Rieboldt (C. M. & St. P.), Milwaukee, presided and E. H. Brown (Painters' Magazine), New York, acted as secretary.

Martin Kane (D. & H.) read a paper on the sanding of depots and other structures. Sanding is a necessary evil because only by adopting this process is it possible to preserve the interior finish of some stations, particularly the toilet rooms. He has found it possible to obtain a white finish by the use of white sand. J. T. Lewis (Wabash) stated that this road sanded the outside, but not the inside of its stations and that it was his experience

Sign Painting Crew with Outfit Motor Car and Crossing Sign Scaffold

that while sanding prevented writing, it did not necessarily prevent carving. A. E. Wilson (N. Y., N. H. & H.) and Charles Johnson (C. & N. W.) reported a tendency of sanded paint to peel on certain classes of wood.

A. E. Wilson (N. Y., N. H. & H.), Hartford, Conn., read a paper on the proper method of cleaning bridges and other steel structures. He called attention to the fact that the maintenance of way painter had conditions to contend with that did not concern painters in other lines, such as brine drippings, hot cinders, contraction and expansion, engine gases, etc. Unless the fine rust is removed from steelwork corrosion continues under the coating, regardless of the paint used. It was his experience that the only way to clean properly was by means of the sand blast. Heavy scale may be removed by means of hammers and chisels, but the fine rust next to the steel can be removed only by the blast. He

has found this method much cheaper than hand work and also much more permanent. The machine he uses is a 150-ft. machine which can also be used for general work, such as drilling, riveting, etc. It supplies air for two nozzles. It is advisable to have the painters follow the sand blast very closely with the paint, as iron takes a light coat of rust very quickly. H. B. Wilson (B. & L. E.) and J. H. Barkley (I. C.) reported higher cost with the sand blast than for hand cleaning. Attention was called to the expense of spurring out the compressor car for anything but a very large job. H. E. Conrad (P. R. R.) called attention to the advantage of the sand blast where compressed air was available from interlocking plants or other sources. M. F. Ebel (C. H. & D.) reported trouble with pin point rust spots on surfaces painted over sand blast work.

A paper on the method of painting maintenance of way signs was read by O. Stubstad (C. & N. W.), in which he advocated the painting of signs on the ground rather than taking them up and painting them in the shop. The equipment for this work is restricted to what can be placed on a hand car and consists of a scaffold composed of two U-shaped bars and two planks, a 7-ft. ladder, paint and brushes. The crew consists of three painters and the foreman. The operation consists briefly of hanging the U-shaped bars over the sign and laying on the planks, the whole being arranged so that a painter sits on each side of the sign. First they paint the sign white and then with a little clean waste rub the fresh white paint off the black letters and retrace them with a 1-in. flat varnish brush. While the two painters are thus engaged on the sign, the third man paints the flanger signs, whistle posts, etc. After a little experience the men complete one sign in 35 min. and cover an average of $7\frac{1}{2}$ miles of line per day. This progress was with a hand car. After a motor car had been substituted more progress was made, not only because of the speed with which the men were transferred from one sign to the next, but because of the better time made on the signs, the average being reduced to about 25 min. The men had an opportunity to rest while being moved rather than becoming tired from pumping the hand car. According to the method outlined, all the work was finished up at one time and no second trips were required except when it was necessary to do two-coat work on signs which were in bad condition. It is not advisable to do this kind of work during the hottest part of the summer, as the reflection of the sign in a man's face combined with the direct rays of the sun on his back are almost unbearable. Experience is also reported in connection with the new signs required in the state of Minnesota, in which red letters are specified. Difficulty was experienced because of the tendency of the red paint to bleed into the white. M. F. Ebel, H. B. Wilson and Martin Kane disagreed with the author of the paper and favored making two trips over the line, one to paint the body of the sign and the second to stencil on the letters. It was their opinion that tracing over the old letters was much more expensive than stenciling.

"Railway Paint Specifications—Why?" was the title of a paper by Philip L. Maury (The Sherwin-Williams Company). Other questions discussed on the floor were: The Oil Waxing and Varnishing of Hardwood Floors in Station Buildings; Door Jams; Fillers for Checked or Cracked Plastered Walls; Method of Treating Smoke Stacks; Best Formula for Treating Galvanized Iron Before Painting; Treatment for the Ends of Steel Girders, and Methods of Treating Office Furniture.

The question, "Shall the Maintenance of Way Master Painters Unite or Amalgamate with the Master Car and Locomotive Painters," brought forth considerable adverse comment and led to the unanimous adoption of a resolution that it was the sense of that association that they do not amalgamate with the Locomotive and Car Painters' Association.

In the closing business Philadelphia was selected as the place for the next convention, to be held on October 17, 18 and 19, 1916. The following officers were elected: President, Fred C. Rieboldt, C. M. & St. P., Milwaukee, Wis.; first vice-president, H. E. Conrad, P. R. R., Huntington, Pa.; second vice-president, A. E. Wilson, N. Y., N. H. & H., Hartford, Conn.; secretary-treasurer,

F. W. Hagar, F. W. & D., Fort Worth, Texas. An executive committee was appointed by the president consisting of J. H. Barkley, I. C.; A. B. Phelps, N. Y. C.; Martin Kane, D. & H.; H. E. Conrad, P. R. R.; O. Stubstad, C. & N. W.

PAINT AS AN AID IN MAKING THE PUBLIC MORE FRIENDLY TO THE RAILROADS

BY EDWARD HURST BROWN
The Painters' Magazine, New York

The current time table of the Delaware, Lackawanna & Western contains an editorial the opening paragraph of which is so much in line with the thought that suggested the subject I have chosen that I will quote it here: "Realizing the value of a good first impression whenever opportunity offers, the Lackawanna Railroad has endeavored to transform the ugly and commonplace into something more inviting and to contribute its share to the town's attractiveness by beautifying the station surroundings, thereby making them a credit to the town and railroad alike."

This policy shows not only a liberal spirit on the part of the railroad management, but it indicates also that the officers of this road have caught the trend of public sentiment in this country. There is a civic pride in every community which prompts it to put its best foot forward. Every town, no matter how small, wants to make the best possible impression upon strangers, whether they are visiting in the town or passing through it. The railroad station is naturally the first building that the stranger sees, and first impressions are very strong.

To many railroad officers the only use for paint on the station building is to preserve it from the ravages of the elements. Standard colors are chosen because they are cheap or because a station can go for a long time without repainting if a dingy iron oxide paint trimmed with black or some other equally cheerful color scheme has been chosen as the standard station color. But citizens judge the railroad by the condition of its buildings in their own town, and if this is such as to cause passengers on trains to get a bad impression of the town, one can be pretty sure the railroad will not have very many strong friends in that particular place.

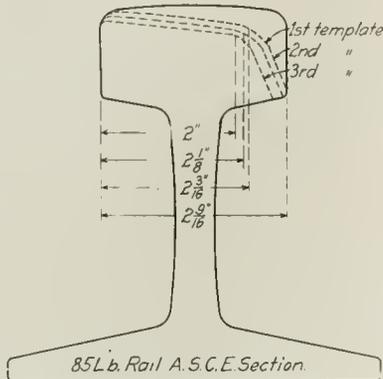

A few years ago a trade newspaper man of St. Louis, Allen W. Clark, conceived the idea of educating the public to an appreciation of better surroundings, to the beautifying of the towns with flowers and shrubbery, and to keeping their houses better painted. He started a movement that has grown to great proportions. Influential trade organizations have backed up this movement and subscribed liberally to it. Local boards of trade and health departments have given valuable assistance and the campaign has become a great movement.

Will our railroads do their part by cleaning up and painting stations and other buildings and thus make this country of ours a cleaner, neater, brighter America? If they do assist in the good work, if they show they are in touch with a movement that is making toward national prosperity and developing a spirit of civic pride in our various communities, they will win the good will of the people. They can endorse this movement in a practical way by keeping their station grounds clean, and planted with flowers where possible, and their stations well painted, and also make some effort to replace the commonplace color schemes that so many roads have adopted with more attractive combinations of colors, selected by men whose training has made them students of color harmony, and whose knowledge of the properties of paint and pigment will enable them to combine utility and durability with attractiveness and good taste. Let the railroads be the first and not the last to clean up and paint up. Then they will truly find that paint is a great help toward winning friendship of the public.

SYRIAN RAILWAY EXTENSION.—It is reported that the railway line from Isifahie to Radju was opened on October 20. The Syrian Railway thus extends some 20 miles nearer the already completed tunnel at Bakdje. The section of the railway just opened is part of the line which, when completed, will link Aleppo with Alexandretta and join up the Syrian Railway with the Konia-Adana line.

A TEMPLAT FOR CURVE-WORN RAIL

At a recent convention of the Roadmasters' Association, much interest was shown in the discussion regarding the time when curve-worn rail should be removed from the track and various limits were suggested. William Shea, roadmaster, Chicago, Milwaukee & St. Paul, Ottumwa, Iowa, has prepared three templets, duplicates of which he has given each foreman for his use in determining when the rail on the high side of curves should receive attention. These templets were prepared for 85-lb. A. S. C. E. rail, which is the section generally used on that division. This rail has a head 2 9/16 in. wide when new. When the rail is worn to the point that templet No. 1, with a width of head of 2 3/16 in. fits it, the foreman notifies the roadmaster. When the rail is worn to a point corresponding with templet No. 2, with a 2 1/8 in. width of head, the foreman makes a further report, following which the roadmaster personally inspects the rail and orders new rail to replace it. When the rail is worn to correspond with the third templet with a head of 2 in., it is replaced with new rail. By this method the roadmaster is kept advised regarding all rail seriously curve-worn and a uniform standard of renewal is maintained instead of leaving each individual curve to the judgment of the foreman in charge of that respective territory.

Templet for Measuring Curve-Worn Rail

TIE PURCHASES IN CANADA DURING 1914

A bulletin prepared by the forestry branch of the Canadian Department of the Interior under the direction of R. H. Campbell, director of forestry, reports the purchase of 19,403,646 cross ties, valued at \$8,664,914 during 1914 by Canadian railways. The companies reported comprise 47 steam railways and 31 electric railways. Of the total number purchased 1,447,576 were treated with preservatives. This represents 7 per cent of the total against 10 per cent in 1913.

The cross ties purchased in 1914 showed a decrease of 2.4 per cent from those of 1913, while the decrease from 1912 to 1913 was 6.7 per cent. Jack pine makes the most suitable tie material of the cheaper, more abundant woods of Canada. It has headed the list since 1911, when it took the place of white cedar, a more durable wood, but one of which the supply is rapidly becoming exhausted. These two woods have formed the greater part of the ties purchased in past years and together form over half the total in 1914.

The average price paid for ties by the railways in 1914 showed only a slight increase over 1913. The prices in the last five years have been as follows:

1910.....	38	cents
1911.....	39	cents
1912.....	44	cents
1913.....	43	cents
1914.....	45	cents

The accompanying table shows the ties bought by steam railways in Canada in 1914. In June of that year there was about 38,000 miles of steam railway right of way in the Dominion. Over 32,000 miles of this was in operation and ties had already been laid on practically all of the remaining mileage. The total number of ties purchased by the steam roads in that year, 19,196,208, represents an average of 500 ties to the mile. A large proportion of these, however, were used on new construction at the rate of about 3,000 ties to the mile.

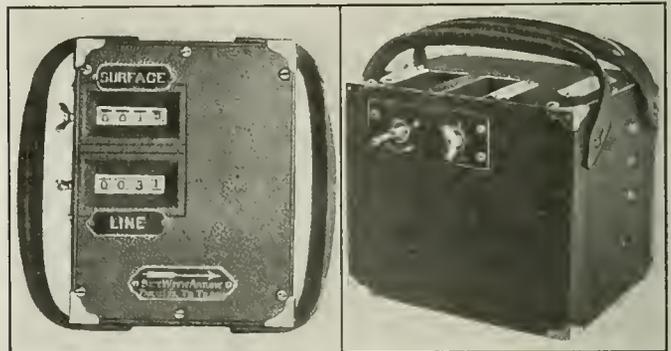

Detailed Record of Ties Purchased by Steam Roads in Canada in 1914.

Kind of Wood.	Number.	Value.	Av. Val.	Per cent.
Total	19,196,208	\$8,545,057	0.45	100.0
Jack pine	8,355,518	3,610,885	0.43	43.5
Cedar	2,574,920	1,232,925	0.48	13.4
Tamarack	1,478,512	646,674	0.44	7.7
Douglas fir	1,452,238	537,374	0.37	7.6
Hemlock	1,369,376	566,502	0.41	7.1
Western larch	1,121,347	459,643	0.41	5.8

THE VAUGHAN TRACK INDICATOR

The Vaughan track indicator is an instrument designed to show the condition of the line and surface of track by mechanical means. The results are given in terms of the sum of all the line swings or surface jolts on any given section of track. In the operation of this instrument, motion is transmitted by car movements to two pendulums, one simple pendulum hanging vertically on ball bearings and one duplex pendulum supported horizontally by a spring bar. The horizontal pendulum is made duplex, being composed of two pendulums with different periods of oscillation, so that there can be no possibility of its period of

Two Views of the Vaughan Track Indicator

oscillation synchronizing with the joint swing a car will sometimes have at certain speeds. Motion of the pendulums is transmitted through ball ratchets to the ball bearing counters, from which the readings are taken. The ball ratchets are sensitive and will record very small movements of the pendulums. As the riding qualities of the car will have some influence on the readings, the instrument should be always carried, if possible, in the same car at about the same speed.

The Vaughan track indicator is a compact instrument measuring 6 in. by 6 1/2 by 8 in., fitted with handles. The finish is in black grain leather with all metal nickel plated. It is manufactured and sold by the M. W. Supply Company, Philadelphia, Pa.

REPAIRING FROGS AND SWITCHES ON THE KATY

BY GEORGE P. WHITE

Blacksmith Foreman, Missouri, Kansas & Texas; Parsons, Kans.

At the Parsons (Kans.) shop of the Missouri, Kansas & Texas, many frogs and switches are repaired. One of the recent developments in this work is the application of Oxweld equipment. Several switch points which were built up by the oxy-acetylene process have now been in service for six months and are apparently good for several months' additional wear. In fact, about

the same service is being secured from the repaired points as from new ones. The average cost to repair them in this manner is \$1.25 as against an average cost of \$2.25 for manufacturing new points. While only a few frogs have been repaired in this manner, they are also giving good service.

In addition to making repairs at Parsons, a special car is moved over the road, fully equipped to make repairs to frogs and switches out on the line. Three men accompany this outfit, making light repairs wherever necessary, where such repairs can be made without removing the frogs from the track. The movements of this car are directed by the general manager's office and the car is transferred from one division to another as the amount of work warrants, while on each division the work is outlined by the superintendent. By handling this class of repairs in this manner, it is unnecessary to carry a large number of frogs in stock, as the man in charge of this road repair gang also acts as an inspector, advising in advance when it is necessary to replace certain frogs. With this plan it is also possible to materially reduce the cost of repairs as compared with the practice of allowing the frogs to remain in the track until it is necessary to remove them and then send them into the shop for heavy repairs.

CONSTRUCTION WORK ON THE AMUR (SIBERIAN) RAILWAY

By W. A. D. SHORT

Siberian Russia is a country of vast expanse and distances, the extent of which is not generally appreciated in this country. The area of this part of Russia is 4,833,496 square miles, or 1,276,496 square miles larger than the United States proper, including Alaska. The leading occupation of this country is agriculture, but the country contains considerable mineral wealth, including gold, platinum, silver, iron, lead, etc.

The first determined effort to open up this country and territory was made by the construction of the Trans-Siberian Railway, ground for which was broken in 1891. This road connects

no automatic tie unloaders, rail unloaders, or track layers, as are now being used in this country. The ties used at first are, as a rule, half sections of trees. The trouble is not taken to hew the ties out of the trees in order to give plane surfaces on two sides. Instead they are laid with the flat surface down and are then grooved on the top to receive the "T" rail, generally weighing about 60 lb. to the yard and 24 ft. long. The angle bars have 4 holes and are similar in shape to the American type. As a suspension joint is used these bars are strengthened by addi-

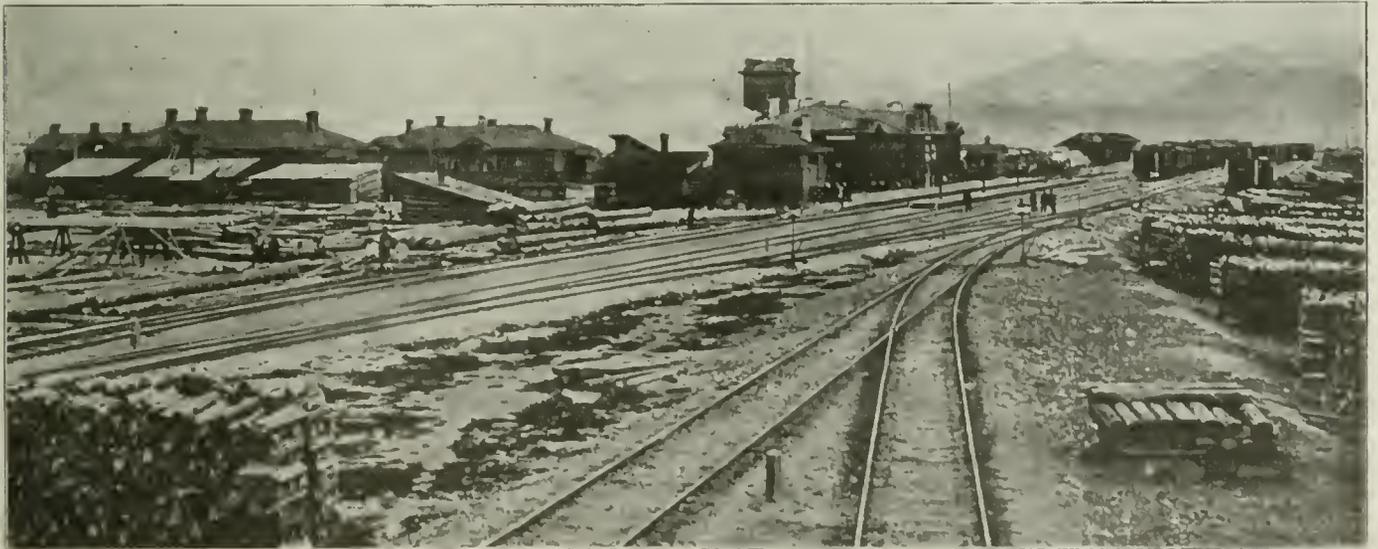

Laying New Track on Half-Round Ties

tional metal in the center, extending on either side of the joint proper. The rails are laid with broken joints and 12 ties per rail length.

The grading on this line was done by hand and horse scrapers and plows, there being no steam shovel work. Construction camps and camp-cars for the laborers are unknown. The engineers sometimes have camp-cars in which they make their headquarters during the actual laying of track. But the laborers have to shift for themselves and erect tents or sleep on the ground as best they can. This is a great hardship at times, particularly as the Amur line traverses mosquito-laden forests for miles.

When the line is completed substantial houses are built every

An Important Station and Fuel Depot

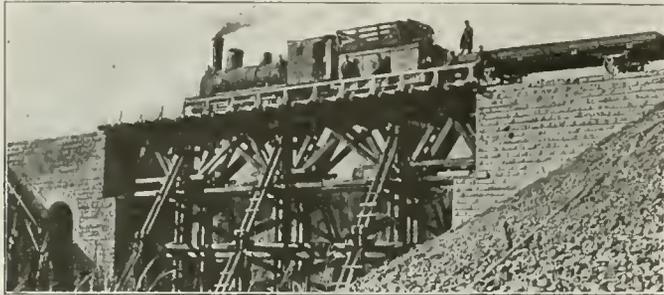

the city of Cheliabinsk with Vladivostok, on the Pacific Ocean, 4,000 miles away to the East. The western terminus is, in turn, 1,525 miles from Petrograd. Therefore the total length, in a continuous line, of this railway in Russian territory is 5,525 miles. In addition branches and extensions have been built, notable among which is the Amur route.

The Russian engineers learned most of their methods of construction and equipment from the Americans, as several years ago a large number of them were serving apprenticeships in American railway shops and on engineering corps. There are

two miles for the track walkers and their families to reside in. Some of these houses are 300 miles from the nearest village, town, or doctor and the track walker sees no one excepting his family and a passing train for days at a time, as there are no inhabitants of these woods and the American "hobo" is unknown. On account of the vast forests and ease of procuring, wood is used as fuel by the locomotives and at important stations, as well as intermediate points, fuel depots are established which have the appearance of American stave yards.

In the illustration of the temporary false work for the bridge

over the Kachu river, it is interesting to note the substantial stone work construction of the permanent abutments. Run-off archways are placed under the centers of the abutments to take care of excessive floods and back wash, which take the place of the wing walls of American construction, particularly of concrete abutments. The form of construction of the bents and the bracing for the stringers and deck is different from our type, and

Falsework Over Kachu River

at the same time heavier than would be used by American engineers for temporary trestle work, but this strength of construction was probably carried out in anticipation of excessively heavy floods before the installation of the permanent span. This trestle work has now been supplanted by a deep single girder span.

CHICAGO, MILWAUKEE & ST. PAUL ROADMASTERS' ASSOCIATION

The ninth annual meeting of the Chicago, Milwaukee & St. Paul Roadmasters' Association was held at the Republican House, Milwaukee, on November 2, 3 and 4, with about 40 roadmasters present. Membership in this association is limited to the roadmasters of the Chicago, Milwaukee & St. Paul, practically all of whom are included. A three-day convention is held annually at some central point on this road, at which problems of general interest to these men are discussed.

The association has annual dues of \$1 and elects officers from year to year. Committees are selected to present reports upon assigned subjects. The control of this organization is entirely in the hands of the roadmasters, the higher officers taking no active part, but attending frequently. The association is encouraged by the railroad, which provides a stenographer to report the discussion, and prints the proceedings for free distribution among the members.

In addition to providing for a free interchange of ideas among the members, all of whom are working to the same standards, this association provides an opportunity for officers in other departments to present matters of mutual interest. Thus, at the recent meeting in Milwaukee, the auditor of material accounts presented to the men several proposed forms for the keeping of time and material records, which forms were the subject of extended discussion and criticism. Likewise, the tie agent presented subjects of interest to his department. While the recommendations of this association are not binding upon the officers of the road, they are given serious consideration, the proceedings going to all maintenance and operating officers.

In addition to the free exchange of ideas, it is felt that this association is a material aid in the standardization of work over the system, clearing up many points not thoroughly understood. As all the men are using the same materials and working under the same general instructions, many topics can be discussed to advantage in such an association which could not be taken up in an organization composed of men from different roads.

Among the subjects considered at the recent meeting were the following: Are We Getting the Maximum Amount of Work Done for the Money Expended for Section Labor as Now Handled, or Can We Get Better Results by Allowing the Road-

master to Have the Labor More Evenly Distributed Throughout the Year? What Should be the Cost Per Mile in Section Labor, of Maintaining Track in First Class Condition on Class A, B and C Divisions? What are the Defects in the Materials Furnished for Our Standard Split Switches and What Can Be Done to Remedy Such Defects? Are Our Present Standard Tool Houses Large Enough for the Requirements of Section Gangs and If Not, What Should be the Dimensions of a Section Tool House? What is the Best and Most Economical Cattle Guard to be Used on All Classes of Divisions? What is the Best Time to Apply Rail Anchors and do Extra Gangs or Section Gangs do the Best Work?

The officers elected for the following year were: President, J. C. Burke, roadmaster, Cedar Rapids, Ia.; Vice-President, J. D. Boland, roadmaster, Sanborn, Ia.; Secretary-Treasurer, W. H. Kofmehl, roadmaster, Elgin, Ill. The next meeting will be held at Seattle, Wash., to give the men an opportunity to see their Western lines.

EARLY TONNAGE STUDIES

The following paragraph, taken from a report made by Luther Hother Hage, engineer of the West Feliciana Railroad (now a part of the Illinois Central system), dated May 24, 1836, is of interest in these days of low grades and heavy tonnage trains as indicating not only the limitations of 80 years ago, but the lead which the United States assumed in freight transportation in those early days and the importance attached to tonnage at that time:

"Eleven years ago the best locomotive engines manufactured in England had a power equal to convey 40 tons at the rate of 6 miles an hour. It was then admitted that these engines were susceptible of great improvements, but the idea was divided that 'any possible improvement' could enable them to proceed at double the velocity named. Four years after this the average rate of traveling was 15 miles an hour on the Liverpool & Manchester Railway. Thrice the velocity first named has been attained 5 years ago, and is now daily performed on some of the railways in this country. The original design of having stationary engines on the Liverpool & Manchester Railway at the Sutton and Rainhill planes was abandoned, and locomotive engines were found capable of surmounting their grade of 55 ft. per mile. The progressive improvements in the construction of these engines in our own country have attained to such a degree of perfection that they are under all circumstances capable of generating an adequate power of steam to overcome the adhesion of the wheels to the surface of the rails, while those of English construction are unable to keep up a sufficient supply. On the Columbia Railroad in Pennsylvania, where an inclination of 45 ft. per mile has been introduced, the 'Canal Commissioners' have reported that 'the majority of the American engines in their ordinary trips draw a gross load of 75 tons. One of them has drawn 100 tons and several others from 80 to 90 tons over the highest grade on the road.' More was done in December, 1834, on the Baltimore & Ohio Railroad, where a locomotive engine passed over the plaues at Parr's Ridge, ascending $2/3$ mile at the average rise of 264 ft. per mile, with two cars full of passengers, making with the tender, 11 tons exclusive of its own weight of $7\frac{1}{2}$ tons. Applying the known power of engines of the same construction as those intended for this road, namely, that they have drawn 75 tons up an inclination of 45 ft. rise in a mile, such engines would be capable of ascending the steepest grade upon this road with a gross weight of 48 tons. This would enable such an engine to take more than 9 loaded cars from the Mississippi river toward Woodville. In the opposite direction I am unable to make any calculations of the quantity of burden an engine will move; I presume, however, that 80 tons gross or more than 17 loaded cars may be brought in a train from the interior to the Mississippi river by one locomotive, as the steepest grade of the road in this direction has an ascent of but 30.4 ft. to a mile."

General News Department

In press despatches of November 13 it is announced that the railways throughout Mexico will pass from military to civil control December 6 under a decree of General Carranza, head of the de facto government.

The Chicago, Milwaukee & St. Paul announces the opening to traffic of the Puget Sound & Willapa Harbor Railway, a branch 66 miles long, running from Willapa Harbor, Wash., to Maytown on the Gray's Harbor branch.

According to the Canal Record, excavation from the Gaillard Cut, on account of the slides in the Panama Canal, during October amounted to 1,079,663 cu. yd., compared with 1,052,586 cu. yd. in September, 991,879 cu. yd. in August and 692,109 cu. yd. in July. In October 872,952 cu. yd. were taken from the base of the Culebra slides.

During September the Southern Railway disbursed for labor, material, supplies and other purposes \$4,129,787, of which \$3,660,518, or 88.64 per cent, was paid to the individuals and industries in the South. This amount represents more than 90 per cent of the moneys paid to the company for transportation by people situated on the lines.

The Chicago switchmen who, as reported last week, have filed demands for increases in pay, have asked the roads to defer action looking to the fixing of a date for a conference. It is understood that this request is due to the fact that the switchmen have been called off by the officers of their brotherhood because of the feeling that they might jeopardize the campaign for an eight-hour day.

The President of the United States has appointed a "Board of First-Aid Standardization" with a view to making available for possible military use the first-aid activities of various industries in time of peace. Dr. S. C. Plummer, of Chicago, chief surgeon of the Chicago, Rock Island & Pacific, and representing the American Association of Railway Surgeons, is a member of the board. The purpose of the board is to standardize first-aid packages and equipment, the means of transporting wounded persons and first-aid instruction.

The Baltimore & Ohio has issued for its employees a treatise on first aid to the injured prepared by Dr. Joseph F. Tearney, chief medical examiner of the road. Discussing the effect of alcoholic liquors given in connection with sickness or accident, Dr. Tearney says: "Whiskey, even in small teaspoonful doses, increases the tendency to bleeding. When given in the somewhat larger quantity, known as the ordinary 'drink,' the first effect of stimulation is followed by a corresponding depression, so that, when the surgeon arrives, he will have to lose valuable time in combating this depression, in addition to that caused by the shock of the accident. . . . If the sympathetic friend with the bottle tries to deaden pain with whiskey, he may produce intoxication and it is difficult to put a half-drunken man under an anaesthetic. It may be asked why the surgeon sometimes gives whiskey; the answer is that he knows how much to use and when not to use any. . . . Make it your iron-bound rule to allow the patient to have no whiskey or other alcoholic liquor."

As announced in a previous issue, the first annual track and field meet of the Missouri, Kansas & Texas Athletic Association was held at Denison, Tex., on November 6. The association was organized largely for the purpose of bringing the employees together and to promote good fellowship, and nearly 4,000 employees were present. Those from out of town were brought to Denison in six special trains, and every district on the system was represented in the contest, as well as several of the officers, including W. A. Webb, chief operating officer, and H. F. Anderson, general superintendent. A large number of other officers was present. The C. E. Schaff trophy, donated by Receiver Schaff, which is to be contested for annually, was awarded to the Denison district, and was presented by Vice President Whitehead in the absence of Mr. Schaff. Gold, silver and bronze medals were awarded to the winners of the individual events and

were presented by General Manager W. E. Williams. The officers report that the spirit with which the employees have entered into the activities of the association has been very pleasing and indicates that the organization will be very helpful in many respects. The city of Denison declared a holiday for the occasion and many features of entertainment were arranged for the visitors.

Over three-quarters of the new men employed in the Boston freight houses, following the strike of October 21, are reported as having proved satisfactory for permanent employment; and the reports of "settlements" which have appeared in the newspapers within the last week evidently have no serious meaning except that the roads, in accordance with the attitude which they announced at the outset, have taken back strikers, as individuals, insofar as there was room for them. The marked increase in the volume of freight during the past month also has ameliorated the condition of the strikers somewhat. It is said that some of the men who struck were affiliated with the American Federation of Labor and some with the Knights of Labor; but the chief officers of these organizations were not consulted. The mayor of the city and the governor of the state seem to have been the only persons of prominence who espoused the cause of the strikers. The Boston News Bureau says that the misled members of the freight handlers' unions have had to lose not only several weeks' wages while they have been idle, but also, even when taken back, their record rating; and continues: "A halt has apparently been called upon the arrogance of union labor leaders in disregarding the public's convenience, pecuniary interest and general welfare. The Boston roads, in 'standing up in their boots' in this situation, have set an example that everybody should commend. * * * As often happens in such strike episodes, the hardships involved have borne particularly on the older members of the union, who had little appetite for striking but were overruled in the union councils by the more vociferous and impetuous younger members and their leaders."

"A Corporation with a Soul"

Citizens of Ardmore, Okla., have erected in a prominent location a billboard bearing the words "Great is the Santa Fe. One Corporation with a Soul." This was done as a mark of appreciation for the promptness with which President Ripley, of the Santa Fe, agreed to settle for all damages resulting from the recent explosion of a tank car on the company's tracks at Ardmore in which many people were killed and a large amount of property was destroyed. Without admitting its liability for the accident, the company suggested the appointment of a board of arbitrators from the citizens of the city to pass upon the amount of settlement in each case.

Reduction in Loss and Damage Claims on the North Western

The Chicago & North Western, which during the last year and a half has been conducting a special campaign for the reduction of loss and damage claims, in the fiscal year ended June 30, 1915, showed a decrease of \$238,860 in its payments for loss or damage to freight, a reduction of about 20 per cent, whereas the freight revenue decreased only 3.8 per cent. Largely as the result of the campaign, 40,000 less claims were presented than during the year before. H. C. Howe, freight claim agent, has just issued a circular to all agents of the company and other employees, announcing November 16 and November 24 as special claim prevention days, with the idea that special efforts made on these days to avoid the causes for loss and damage to freight will tend to promote more careful habits on other days. The circular says that "every day is claim prevention day, but the above dates are to be extraordinary," and an especial effort is to be made to show a still greater improvement during the coming year. This campaign is handled by the freight claim agent, who has five inspectors traveling all of the time inspecting

the loading and unloading of freight, and instructing employees in proper methods. Special effort is also made to trace the over, short and damage reports to ascertain causes and endeavor to eliminate damage in future by bringing the matter to the attention of the employees at fault, without discipline. A pamphlet has been distributed among the agents of the road, in which are a large number of illustrations showing improper methods of loading and handling freight, and their results, together with the proper methods.

Applicable also on the X. Y. & Z.

General Manager Robert S. Parsons of the Erie Lines West has issued to enginemen a circular which, according to the *Cleveland Leader*, includes the following:

"If you were a passenger seated at a car window, or sleeping in a berth, you would not like to have a locomotive whistle blown just opposite you, giving you a severe attack of the 'jumps.'

"If you were a passenger you would not like to have the train come to a stop with a jolt rough enough to break the articles in your traveling bag and give you a general shaking up.

"Yet these annoyances occur every day, and many times a day, on the Erie Railroad—all because you do not realize the situation in which the passengers are placed. There is no rule or regulation that can stop these practices. It rests entirely upon your good nature and thoughtfulness. Will you strive to make an improvement?"

Texas Repair Shed Law

The Supreme Court of Texas has rendered a decision holding constitutional the law of that state which requires the maintenance by railroads of suitable sheds for employees when repairing cars. The case was that of the state against the International & Great Northern, on appeal from Harris county. The lower court held that the law was unconstitutional, but this decision is now reversed. The strict enforcement of the law will call for the construction of many repair sheds.

The lower courts held the law unconstitutional because vague and meaningless; but Associate Justice Yantis cites similar language in statutes that have stood the test of constitutionality before the United States Supreme Court.

The car shed law requires the erection and maintenance of a building or shed by every person, corporation, or receiver engaged in constructing or repairing railroad cars, and provides penalties of from \$50 to \$100 for each 10 days of its violation. The law has several exemptions by the terms of which each corporation, etc., would be absolved from its penalties. Among these exemptions is the provision that the act shall not apply at "points where it is necessary to make light repairs only." A general demurrer was sustained to the state's petition upon the ground that the act was too indefinite in its terms to enforceable, the trial court holding that the term "light repair" is a relative term and wholly unintelligible.

The Supreme Court holds that because the act is penal in its nature it should be strictly construed. It notes in the opinion, however, that the term "light repairs" is used in a provision exempting from suit and not in a portion of the act which penalizes an infraction of its provisions. . . . "We think the term 'light repairs' makes plain the intent of the legislators, and that the industries affected by the legislation will not suffer from a failure to understand its meaning; and that the courts and juries will find no difficulty in determining from the facts in each case whether the repairs were 'light' or otherwise."

Mail Pay on Middle West Roads

The Postmaster General announces the completion of the mail pay adjustments for the next four years on all railroads in the Third Contract Section. The third section handles the heaviest bulk of mail of all the sections. It embraces Ohio, Indiana, Illinois, Michigan, Minnesota, Wisconsin, Iowa and Missouri. The adjustments are based on a complete weighing during 105 days, February 18 to June 2.

The statement says: "The pay of all the roads in this territory, for four years, is fixed at \$20,073,484.36 a year. The weighing showed that an average of 2,862 tons of mail was being carried each day in over 4,000 trains.

"The eager competition among the railroads to share in the mail pay is shown by the fact that they will receive annually

more than \$200,000 less than the maximum allowed by law, because certain lines between common points accept a lower rate of pay in order to retain the carriage of through mails. In such case the Department gives the companies operating the more expensive [longer] lines the opportunity of meeting the cheapest rate and retain the mails. This the railroads are always willing to do.

"A conspicuous instance of this is found between Chicago and Minneapolis. Between these cities the Chicago & North-Western is the cheaper on account of shorter distance and land-grant deductions. The Chicago, Milwaukee & St. Paul, which has carried the bulk of the mails for many years, accepts the lower rate of the North-Western on all through mails, and thereby its pay on this one route is reduced \$112,000 yearly. The New York Central carried competitive mails between New York and Chicago at the lower short-line rate, with a reduction of \$95,000 a year in its compensation.

"Postal officials think the alacrity with which the railroads agree to these reductions and their efforts before each weighing to secure additional mails by offering expedited or new train service as inducement are good evidence of the unjustness of the often-repeated assertion that the railroads are handling the mails at a loss. . . . No less than 793 train weighers, 321 station weighers, 59 verifiers at railway mail service division headquarters and 58 tabulators and computers in the Department at Washington were employed in the weighing this year, at a cost of \$381,948. This is more than \$97,000 less than the cost of the last weighing in the third section, an economy effected through the adoption of improved methods, supervision direct from the Department and tabulation of results in Washington instead of in the field, as formerly. The saving during the last four years has been over \$280,000."

The New Haven Trial

Charles S. Mellen was characterized as an adverse witness while testifying Thursday, November 11 for the government in the criminal suit against New Haven directors for violating the Sherman Law. The government attorney, R. L. Batts, expressed the opinion that Mr. Mellen "has shown a willingness to answer questions concerning every fact which we have proved by other testimony, but he has shown a different disposition where the defence of his own conduct is involved. I think I should have a certain latitude in asking him questions as if he were in a measure an adverse witness."

The remark was made in connection with Mr. Mellen's testimony concerning the New Haven's dealings with competing lines, and particularly with the Enterprise Line. The government brought out that the United States Transportation company was established to meet the competition of this steamship company, and that its affairs were wound up and its properties taken over by another New Haven company, immediately after the Enterprise Line became bankrupt and went out of business. The government attorney made a strong effort to show that the New Haven tried to conceal its activities in this and other cases.

Considerable attention was paid on Thursday and Friday to the New Haven's relations with Charles W. Morse. In 1907 Morse controlling extensive water traffic, offered the New Haven \$20,000,000 for its boat lines, or \$14,000,000 more than their cost to the railroad. Mr. Mellen, it appears, argued strongly in favor of accepting the offer but the board of directors was strongly against so doing, being influenced largely by a statement of ex-president Roosevelt's to the effect that he was fearful of the success of Morse's proposed steamship monopoly and preferred the present situation. The New Haven took steps to protect itself against Morse and in that connection secured an interest in the Merchants & Miners Transportation Company and the Windsor Line which had been amalgamated with it. Mr. Mellen in 1912 proposed to acquire the minority stock and secure majority control. He planned by this means to extend the New Haven's steamship lines to include a service from Boston to Galveston, and later from Boston via the Panama Canal to Pacific coast points. The scheme was to buy the minority stock of the Merchants & Miners Transportation company and to have that company inaugurate the additional service. He expected that the New Haven, for some time, would have a loss on this business, and did not want minority holders to suffer this loss. These ambitious plans to extend New Haven's steamship monopoly were suggested and

stimulated by directors of the port of Boston and other Boston interests who wanted cotton brought direct from Galveston to Boston by steamer; but they were not carried out because of the passage of the Panama Canal Act, divorcing water and railway lines.

The testimony then turned to the relations with the Metropolitan Line. The latter in 1905 operated freight boats on the outside route between New York and Boston. It later established a passenger service, using the Harvard and Yale. Thereupon the New Haven put in service in competition the freight steamers Old Colony, Bunker Hill and Massachusetts, these later being converted into passenger boats when the New Haven acquired control of the Metropolitan Line and transferred the Harvard and Yale to the Pacific coast. On Monday this was gone over in more detail, but so confused did matters become that Judge Hunt finally had to call a halt and ask the counsel to submit a written statement of the Metropolitan situation.

On Tuesday, November 15, Mr. Mellen was questioned about the acquisition of trolley lines. Judge Hunt ruled that the government could go ahead in its proof that the 65 trolley lines acquired by the New Haven, were taken over for the purpose of interstate commerce.

On Wednesday, H. W. Goodall, of San Francisco, testified concerning the Pacific Navigation Company, which leased from the Pacific Company, a subsidiary of the Metropolitan Steamship Company, of New Jersey, the steamers Harvard and Yale. Mr. Mellen was again on the stand in the afternoon.

June Mechanical Conventions

The meeting of the executive committee of the Master Car Builders' Association, the American Railway Master Mechanics' Association and the Railway Supply Manufacturers' Association was held in Chicago on November 15. It was decided that the next annual convention of the Master Car Builders' and the Master Mechanics' Associations would be held at Atlantic City, starting June 14, the Master Car Builders' convention being held first and the Master Mechanics' convention the following Monday. The city of Chicago would undoubtedly have been chosen as the convention meeting place had the Municipal Pier been ready for occupancy at that time. It is believed that in future years the June conventions will be held at that place.

Western Railway Club

At the November meeting of the Western Railway Club, which was held in the Fort Dearborn hotel, Chicago, November 16, a paper was presented on "The Prevention of Loss and Damage Freight Claims," by G. E. Whitlam, superintendent freight loss and damage claims, St. Louis & San Francisco Railroad, Springfield, Mo. Mr. Whitlam outlined the system followed by the Frisco for the prevention of loss and damage claims, giving a brief history of the organization from its inception, and showing the beneficial results accruing from the claim prevention campaign. A complete description of the work the Frisco has been doing along these lines was published in a series of articles in the *Railway Age Gazette* last spring, the first article appearing in the issue of April 9, 1915, page 779, the second article appearing April 16, 1915, page 817, and the third article appearing April 23, 1915, page 891.

Plans for March Convention Exhibits

A meeting of the board of directors of the National Railway Appliances Association was held at Chicago on November 12, to discuss plans for the annual exhibit of the association in connection with the convention of the American Railway Engineering Association, which is to be held on March 20 to 23, inclusive. C. W. Kelly, of the Kelly-Derby Company, Chicago, secretary, treasurer and director of the exhibits for the association, reported that over 80 per cent of the exhibit space has already been signed for. The exhibit will occupy the entire main floor of the Coliseum and Annex, a total of 36,600 sq. ft. of exhibit space, and the floor plan has been changed so that approximately 1,000 sq. ft. will be added to the available exhibit space as compared with previous years. A number of important improvements has also been decided upon for the arrangement of the exhibit space, especially in the Annex, and in the decoration and lighting system. In the Coliseum 27,026 sq. ft. of space has been allotted and in the Annex 2,885 sq. ft., leaving 3,625 sq. ft. in the Coliseum and 3,112 sq. ft. in the Annex unallotted.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, date of next or regular meetings, and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the *Railway Age Gazette* for each month.

- AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—F. A. Pontious, 455 Grand Central Station, Chicago. Next meeting, January, 1916, Atlanta, Ga.
- AMERICAN RAILWAY ASSOCIATION.—W. F. Allen, 75 Church St., New York. Next meeting, November 17, 1915, The Blackstone, Chicago.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3rd Wednesday in month, except July and August, 220 W. 57th St., New York.
- AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York. Annual meeting, December 7-10, 1915, New York.
- AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, Supt. Timber Preservation, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 18-20, 1916, Chicago.
- ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—G. P. Conard, 75 Church St., New York. Next meeting, December 14-15, 1915, St. Louis, Mo.
- CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.
- CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.
- CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.
- ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh, Pa.
- GENERAL SUPERINTENDENT'S ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.
- NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.
- NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.
- NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—E. N. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.
- PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Retchford, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.
- RAILROAD CLUB OF KANSAS CITY.—Claude Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Saturday in month, Kansas City.
- RAILROAD MEN'S IMPROVEMENT SOCIETY.—J. B. Curran, Erie R. R., 50 Church St., New York. Meetings, alternate Thursdays, October to May, Assembly Rooms of Trunk Line Association, 143 Liberty St., New York.
- RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 30 Church St., New York. Annual meeting, December, 1915, Waldorf-Astoria Hotel, New York.
- RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.
- RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.
- ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.
- SALT LAKE TRANSPORTATION CLUB.—R. E. Rowland, David Keith, Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.
- SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Piedmont Hotel, Atlanta.
- TOLEDO TRANSPORTATION CLUB.—Hilly S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.
- TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.
- TRAFFIC CLUB OF NEWARK.—John J. Kautzmann, P. O. Box 238, Newark, N. J. Regular meetings, 1st Monday in month, except July and August, The Washington, 559 Broad St., Newark.
- TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Waldorf-Astoria Hotel, New York.
- TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Gen'l Agt., Erie, R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings, bi-monthly, Pittsburgh.
- TRAFFIC CLUB OF ST. LOUIS.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.
- TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, Superintendent's office, N. Y. C. R. R., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.
- UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, 1111 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.
- WESTERN CANADA RAILWAY CLUB.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.
- WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Building, Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.
- WESTERN SOCIETY OF ENGINEERS.—F. M. Layfield, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings. Annual meeting, 1st Wednesday after 1st Thursday in January, Chicago.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF SEPTEMBER, 1915

Table with columns: Name of Road, Average mileage operated during period, Operating revenues (Freight, Passenger, Total), Maintenance of Way and structures, Equipment, Traffic, Trans- portation, Miscel- laneous, General, Total, Net railway operation, Railway tax accruals, Operating income (or loss), Increase (or decr.) comp. with last year.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF SEPTEMBER, 1915—CONTINUED.

Name of Road.	Average mileage operated during period.			Operating revenues.			Maintenance of way and structures.			Operating expenses.			Net from railway operation.	Railway tax accruals.	Operating income (or loss).	Increase (or decr.) comp. with last year.
	Freight.	Passenger.	Total (inc. misc.).	Freight.	Passenger.	Total.	Way and structures.	Equipment.	Traffic.	Trans- portation.	Miscel- laneous.	General.				
St. Louis, Brownsville & Mexico.	548	\$77,620	\$289,564	\$41,895	\$36,989	\$5,409	\$10,304	\$167,980	\$110,935	6,537	\$10,304	\$6,500	\$121,984	\$23,536	\$115,053	\$5,240

Traffic News

The Denver & Rio Grande no longer issues rebate checks to passengers paying cash fare on trains when they might have bought tickets; the extra ten cents collected is retained by the company.

It is announced at Ottawa that the Canadian Northern will begin running passenger trains through to the Pacific coast November 22, arrangements having been made with the Great Northern Railway for the use of that company's station at Vancouver.

The Southern Pacific is asking bids for two large freight steamships to be used in coastwise traffic between New York and the Gulf of Mexico. At present this company is using between Galveston and Atlantic ports eight extra steamships chartered from other lines.

"The Philadelphia Passenger Association" is the name of an organization which has been formed in that city by railway and steamship traffic men; president, S. B. Barnitz, Pennsylvania Railroad; secretary, J. M. Stuard, Pennsylvania Railroad. It is proposed to have luncheons every Tuesday at the Adelphi hotel.

The Baltimore & Ohio reports carrying over its line a shipment of rails for the Pacific coast which filled 1,900 cars. Cars are in demand just now, and so special agents of the company have gone west with the rails to make sure that they are moved promptly on their western trip and that the cars are returned as soon as possible after being unloaded.

The United States war department has announced a hearing to be held at Chicago on November 16, on the application of the governor of Illinois for approval by the war department of the plan for an 8-ft. waterway from the lower end of the Sanitary Canal to Utica, Ill., on the Illinois river, which was authorized by the Illinois legislature by act of May 27. The hearing will be held before W. B. Judson, Lieut. Col. Corps of Engineers, United States army, and shippers and others who are interested have been invited to attend and express their views at the hearing.

The damage done by the storm at Galveston last August, combined with the stoppage of freight at the Panama Canal, together with a great increase of shipments in all directions, has caused an unprecedented congestion of freight at Gulf ports. During the last two weeks 18 ships have cleared from Galveston for Atlantic ports, and the Southern Pacific is now sending out from there an average of one ship every day. At New Orleans the company has had to refuse all eastbound freight and may have to keep up the embargo for some little time longer.

The Georgia State Railroad Commission has refused to authorize the Southern Express Company to make increases in its charges for transportation of merchandise, which, according to the application of the company, would have amounted to about four per cent. The commission says that because of the abnormal conditions prevailing during the past year, it will be impossible to decide whether or not the increases granted in 1914 have been sufficient. It is suggested that after the end of the present fiscal year the express company make another application.

Representatives of the Chicago Association of Commerce, the Illinois Manufacturers' Association, the National Industrial Traffic League and a number of other commercial associations, as well as of the railroads in Central Freight Association territory, appeared at a hearing before the Treasury Department at Washington last week to protest against an order requiring exporters to prepare and forward with their freight an original export declaration and an abstract thereof, to accompany the same to the port of exportation, stating the actual cost and the market value, at the time and place of shipment, and the name, flag and motive power of the ship on which the shipment is to be carried. Representatives of the shippers declared that compliance with this order was impracticable, while the representatives of the carriers thought it would be their duty to refuse shipments unless the order was strictly complied with.

Traffic Club of New York

The annual meeting and election of officers of the Traffic Club of New York will be held at the Waldorf-Astoria Hotel on Tuesday evening, November 23. In connection with the meeting there will be an informal dinner at 7 o'clock.

Official Freight Classification Committee

The roads in official classification territory, comprising all the lines in the Central Freight Association, Trunk Line and New England territories, have organized the "Official Classification Committee," to begin operations December 1. This committee, of four members, will supersede the present arrangement, which calls for a committee of large membership, composed of active freight representatives of a number of lines. This new permanent committee will remain in continual session, and thereby avoid the difficulties incident to handling official classification matters at large general meetings.

The new committee consists of R. N. Collyer, chairman; J. W. Allison, now assistant general freight agent of the Baltimore & Ohio Southwestern; D. T. Lawrence, general freight agent of the Central Vermont, and F. W. Smith, of the Uniform Classification Committee. The office will be at Trunk Line headquarters, 143 Liberty street, New York.

It will now be possible for skippers interested in classification matters to get the questions they desire before the committee for immediate consideration, and delays incident to the former practice will be avoided.

New Florida Passenger Trains

Announcement is made that a new passenger train is to be put in service on November 21, between Chicago and Jacksonville, Fla., via Cincinnati and Atlanta, over the Pennsylvania Lines, Louisville & Nashville, Central of Georgia, Georgia Southern & Florida and Atlantic Coast Line. The new train is to be called "The Southland," and will leave Chicago at 12:01 a. m. daily. It will have through drawing-room sleeping cars and coaches between Chicago and Jacksonville with dining car and observation car south of Cincinnati. Sleeping cars will also be run daily between Indianapolis and Jacksonville via Louisville, and between Grand Rapids and Jacksonville semi-weekly. The train will arrive at Jacksonville at 8:45 the second morning. Northbound it will leave Jacksonville at 8:20 p. m., and arrive at Chicago at 7:45 the second morning. The "Royal Palm" train between Chicago and Jacksonville over the Cleveland, Cincinnati, Chicago & St. Louis, the Queen & Crescent and the Southern Railway, under its new winter schedule, effective November 1, leaves Chicago at 7:20 a. m. and arrives at Jacksonville at 8:40 the second evening. In addition to the "Royal Palm," the "Florida Special," between Cincinnati and Jacksonville, effective on November 21, will leave Cincinnati at 8:10 p. m., arriving at Jacksonville the next evening at 8:50, and northbound will leave Jacksonville at 7:10 a. m., arriving at Cincinnati the next morning at 8:10.

Hearing on Illinois Five Per Cent Rate Case

Representatives of the Illinois railroads at a hearing before the Illinois Public Utilities Commission last week, made the general presentation of their case for a 5 per cent general advance in intrastate freight rates in Illinois, with the exception of the rates on grain and those on coal. The coal rates it is proposed to advance 10 cents a ton. The railroads were represented by E. C. Kramer of the Southern Railway, and A. P. Humburg, commerce attorney for the Illinois Central. The tariffs were filed with the commission in October, 1914.

Mr. Kramer made an opening statement outlining the railroads' testimony, which was based largely on statistics for 26 roads operating 81 per cent of the mileage in the state, making comparisons between the years 1908 and 1914. These figures showed that the total operating revenues of the roads had increased from \$131,741,000 in 1908, to \$169,991,000 in 1914, but that the net railway operating income had decreased from \$33,414,000 to \$28,865,000, or 18.6 per cent, on Illinois business alone, whereas on the entire systems of the roads the net railway operating income had increased 3.85 per cent. The roads had separated their revenues and expenses between Illinois business and interstate business and between freight and passenger business. In 1908 the roads had earned a return of 5.66

per cent, and in 1914 of only 4.13 per cent on their valuation, taking the assessed valuation fixed by the board of equalization as 70 per cent of the real value. Capitalizing the net revenue at 7 per cent in 1908, this would include an investment of \$112,743,000 paying no returns in that year, and of \$286,940,000 paying no return in 1914. In 1908 the roads had earned 7 per cent on a valuation of \$50,844 a mile, and in 1914, on a valuation of only \$41,387 a mile. The increase in revenue from the rates asked is estimated at \$2,000,000 a year, or less than the increase in taxes. The increase in wages due to higher wage scales, from 1908 to 1914 was \$33,273,000, and in 1894 alone was \$10,800,000, or five times the amount of the increase in revenue asked. Mr. Kramer said that the statistics would probably show that the railroads ought to begin by advancing passenger rates, but that the commission could not help them in this respect, as the passenger rates are fixed by the legislature. He admitted that a showing might be made of some rates that are lower in adjoining states, but said that the roads intended to try to secure some advances on these rates in other states; that it would not be fair for the Illinois commission to withhold its decision of the case pending action in Indiana, nor for the Indiana commission to await the action in Illinois.

The witnesses for the railroads were S. M. Felton, president, Chicago Great Western; W. J. Jackson, receiver, Chicago & Eastern Illinois, and L. E. Wettling, statistician for all roads. Mr. Felton referred to the constantly narrowing margin between earnings and expenses and the increases in wages to employees, saying that the average rate per day had increased from \$2.27 in 1908 to \$2.55 in 1914, and that the increase per mile of line was \$2,251. Labor costs per train mile had increased from 98 cents to \$1.26. The expenses for maintenance of way and structures had increased from \$16,790,445 to \$22,037,869, or from \$1,788 to \$2,212 per mile. Maintenance of equipment expenses had increased from \$2,017 to \$3,303 per mile. Meanwhile the revenue per mile had decreased from 6.72 mills to 6.23 mills. Large reductions in freight rates were made by the legislature in 1906, and in passenger rates in 1907. Rigid economy in operation had enabled the roads to increase their average revenue per train mile from \$2.57 to \$3.13, but, he said, it is not reasonable to expect a much further increase in economy in operation. The average tonnage per train had been increased from 382 to 502, and the average tonnage per loaded car from 18.91 to 20.96. Operating expenses had increased from \$92,966,377 to \$131,227,505. Taxes had increased \$2,300,000. He also spoke of the increased difficulty of financing, saying that a railroad that does not pay a dividend cannot sell its bonds at a fair price. Mr. Jackson testified regarding increases in wages and in other operating expenses caused by legislation, and Mr. Wettling explained the detail statistics.

The advance was opposed by the Chicago Association of Commerce and a number of other shippers' organizations on the ground that the present Illinois rates are higher than the Central Freight Association rates for interstate traffic.

New Haven Football Traffic

On the occasion of the Yale-Princeton football game last Saturday the New York, New Haven & Hartford in less than four hours unloaded at New Haven 20,232 passengers, a record performance for a Yale-Princeton game. Of the total of 20,232 passengers 13,277 were carried in special and regular trains from New York and 6,955 from Boston and other points. It required the use of 23 special trains and 22 regular trains. Leaving New Haven after the game, 20 special and 22 regular trains carried 19,678 passengers, most of whom were on special trains leaving between 5 p. m. and 7 p. m. There were no mishaps of any kind. Of the 45 trains in the forenoon, regular and special, 32 were on time and the others were but a few minutes late. The total number of minutes late of all trains arriving in New Haven during the morning was 113, or an average of about 2½ minutes per train. All trains from New York City were drawn by electric motors. The first train left New York at 7.56 a. m. and the last at 11.25 a. m. The special instructions of the operating department filled a 20-page pamphlet. Special telephones were installed at various points in yards and terminals to facilitate the movement of trains, and officers of the traffic, operating, engineering and mechanical departments were stationed at different points on the route to be on hand in case their help were needed.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

Examiner Watkins of the Interstate Commerce Commission will hold a hearing in St. Louis on November 29 on some additional advances in western freight rates proposed by the roads after the beginning of the general western rate advance case, on which hearings were held at Chicago in the spring.

A hearing was begun before an examiner of the Interstate Commerce Commission at St. Louis on November 15, on a complaint filed by the Business Men's League of St. Louis, charging discrimination against St. Louis and in favor of certain Illinois merchants because the interstate rates charged them from St. Louis are higher than the intrastate rates from Chicago and other points within the state. The commission is asked to remove the discrimination by advancing the Illinois rates. A large number of representatives of shippers and railroads and of the Illinois Public Utilities Commission attended the hearing, which has to do with both freight and passenger rates.

Increased Rates not Justified

J. G. Peppard Seed Company v. Atchison, Topeka & Santa Fe. Opinion by the Commission.

The commission finds that the carriers have not justified an increase in proportional rates on sorghum seed and cane seed in carloads from Kansas City, Mo., to destinations in Texas. (36, I. C. C. 311.)

Complaint Dismissed

New Jersey Zinc Company v. Central of New Jersey. Opinion by the Commission.

The commission finds that the assessment of demurrage on carload shipments of zinc ore forwarded to Jersey City, N. J., for export, but not exported on account of war conditions, was not unreasonable. (36, I. C. C. 289.)

Detention Charges on Heater Cars

Providence Fruit & Produce Exchange v. Maine Central et al. Opinion by the commission.

Effective November 1, 1914, the New England carriers established what are termed detention charges, applicable during the winter months, on cars provided with heating apparatus. These charges are assessed after the expiration of the two-day free demurrage period at the rate of \$1 per car per day for the first two days, and \$2 per car per day for each succeeding day, and are additional to the demurrage charge of \$1 per day.

The commission finds that these charges, on the whole, are not unreasonable. It has held uniformly that carriers may impose charges necessary to compel the removal of freight from the carriers' terminals and the prompt release of equipment, and in several cases has sanctioned detention charges equal to the charges assailed. The carriers will be expected, however, to modify their tariffs containing the detention charges to conform to the rules governing the waiver of demurrage charges because of weather interference or because of lurching in transit. (36, I. C. C. 307.)

STATE COMMISSIONS

J. Sergeant Cram, a member of the New York State Public Service Commission, first district, reporting on an investigation of safety at highway crossings on the Long Island Railroad, recommends that the commission issue an order requiring the railroad company to increase its supervision over the flagmen, especially during the late night and early morning hours; and he holds that the working day of 12 hours ought to be reduced to 8 hours, and the minimum pay of \$1.50 a day increased to at least \$2. The company employs 300 crossing flagmen within the limits of New York City, of whom 241 receive \$1.50 a day. There is only one supervisor or inspector of gatemen for the territory within New York City.

COURT NEWS

The United States District Court at Pittsburgh, Pa., in a case against the Pennsylvania Railroad, holds that a common carrier need not furnish special cars for shipments of oil. A decision of the Interstate Commerce Commission requiring the road to supply enough cars to move the output of the refineries of the Crew-Levick Company and the Pennsylvania Paraffine Works was suspended and ordered annulled. "The law," says the decision, "confers upon the Interstate Commerce Commission power to regulate the use of facilities possessed by the railroad; but there is nothing in it to compel a railroad to acquire facilities it does not possess, or to acquire better facilities than those it possesses. . . . The commission exceeded its statutory powers." Judge W. H. S. Thompson dissented from the majority opinion, holding that the decision would open the way for discrimination by railroads.

Mileage Ticket Good for Holder's Wife

The Supreme Court of the United States on Monday last, in a case which arose on the Southern Railway, held, in an opinion by Justice Hughes, that rules governing the use of mileage books are to be construed literally and that the provision forfeiting the book, or tickets issued in exchange therefor, if presented by other than the "original purchaser" means exactly what it says. But the court construes the rule as not working a forfeiture if the book is presented by the "original purchaser," even if presented for the fare of another passenger.

Samuel J. Campbell purchased two 1,000-mile tickets in North Carolina for an interstate journey. He exchanged the coupons from the book for the necessary mileage in tickets covering transportation for himself and wife. When he presented the tickets the conductor took up the coupon book, holding that Campbell had forfeited the book by presenting transportation for his wife.

The court held that so long as the tickets and mileage book were presented by the "original purchaser" the rule of forfeiture did not apply, no matter who rode on the transportation.

Walking Along Tracks Contributory Negligence Under Wisconsin Statute

In an action for damages for death caused by being knocked down by a switch engine while walking along the track, it was assumed by the Wisconsin Supreme Court that the deceased was a licensee and not a trespasser. A Wisconsin statute makes it unlawful for any person other than those connected with or employed upon the railroad to walk along the track of any railroad except when such track shall be laid along public streets. Assuming that this alone would not charge the deceased with contributory negligence, the court held that it went a long way in that direction. Taken along with the facts that it was a dark night, that warning notices were posted, and that it would be difficult or impossible to avoid passing trains, it was held to require a finding of contributory negligence. Where the act is manifestly dangerous and there is no overmastering necessity requiring that such act be done, the fact that others had the hardihood or the carelessness to take the same risk cannot be taken to authorize the injured party to voluntarily expose himself and yet recover for the injuries sustained by him in direct consequence of such exposure.—*Zemke v. C. & N. W. (Wis.)*, 154 N. W. 364.

Railroad's Right to Remove Switch

In 1897 a railroad, at the expense of the owner of a warehouse, built a track to the warehouse, under an agreement providing that on 10 days' notice it might discontinue it, on paying to the owner the value of the part removed. In 1907 the New York Public Service Commissions Law was enacted, section 27 of which empowered the commission, in case a railroad failed to install a switch upon due application, to investigate and order its establishment, and upon application of a railroad to order a discontinuance of any switch. In 1906 Interstate Commerce Act, section 1, was amended so as to give similar powers to that commission, without specifically providing for the discontinuance of sidings. The New York Appellate Division, in an action to enjoin the removal of the track, holds that even though, in the absence of statute, it was within the

railroad's discretion to build and discontinue sidings and to remove those built at its own expense, yet as the plaintiff's track was constructed at its expense, defendant could not deprive plaintiff of it without reserving the right to do so; that the intervention of the commission was not authorized, unless the parties were unable to agree, and that, as the reservation was a partial surrender of the railroad's right to remove the track at will, it was an agreement not nullified by the statutes.—*Adikes v. Long Island*, 151 N. Y. Supp. 49.

Injuries to Passengers—Contributory Negligence

A brakeman, when told that a passenger desired to alight at a station and go to a hotel there, informed him that the station was on one side of the track and the hotel on the other, and that when the train reached there he would show the passenger where to get off. The brakeman, on reaching the station, at or about the time he opened the door leading down to the steps of the car, said to the passenger, "There is your hotel." The passenger alighted while the train was in motion, and was injured. In an action for his injuries the federal district court of California, S. D., held that the railroad was not guilty of any negligence, for the conduct of the brakeman was not an invitation or instruction to the passenger to alight, nor an inducement to the passenger to get into a place of danger, causing him to fall from the car. The night was dark, the train was moving at a considerable speed, and the passenger, who was encumbered with a grip, was unfamiliar with the condition of the ground. It was held that he was guilty, as a matter of law, of contributory negligence, precluding a recovery for injuries sustained.—*Murray v. Southern Pacific*, 225 Fed. 297.

Libel in Letter by Passenger to Railroad Complaining of Conductor's Conduct

The California supreme court has affirmed a judgment of the district court of appeals, Third District (150 Pac. 1005), awarding \$5,000 damages to a railroad conductor who was thrown out of his employment, with little prospect of getting another position, as the result of a letter sent by the defendant, a passenger, to the company's general passenger agent, in which it was stated that the conductor had spoken roughly to a passenger who had boarded the train by mistake, and in reply to another passenger who spoke about the heat of the car had used loud and vulgar language, referring to the trainmen's reasons for having it hot. The letter also stated that on two former occasions within six months the writer had seen similar exhibitions of coarse and disagreeable deportment on the part of the conductor, and ascribed such conduct to the influence of liquor. The court of appeals held the letter to be libelous per se. The supreme court gives no reason for its decision beyond the statement that the jury evidently found that in the writing and publication of the letter the defendant was actuated by actual malice toward the plaintiff; but it did not agree with the opinion of the court of appeals that before libelous matter can be privileged it must appear that it was and is substantially true.

In commenting upon these decisions the California Law Review discusses the question whether one publishing a libel in response to a public notice will be accorded the same protection as one acting upon a personal request. In general, all instances of privilege have as a basis the making of a statement in the discharge of some public or private duty or interest, whether legal or moral. Development in this branch of the law has been marked by a widening of the interest or duty necessary to make a privileged occasion. The modern tendency is to apply the rule liberally, having regard for the general welfare of society; so that it is privileged not only to give a character to a former servant, at the request of a prospective employer, but even, as has been held, to volunteer information to a person interested where it is right in the interests of that person or of society that he should be informed. "In view of this development," the Review continues, "it would seem but natural to extend the rule of privilege to the new situation, where the request for information appears in the form of notices to the public at large. If information given at the request of the recipient is privileged and voluntary communications intended to benefit society are also being held privileged, it seems but just that the giving of information to one interested, at his public request, and for the benefit of himself and society, should also be privileged."—*Adams v. Cameron (Cal.)*, 151 Pac. 286.

Lessee to Pay Taxes

The Supreme Court of the United States, in an opinion by Justice McReynolds, decides in favor of the State of New Jersey in its suit to collect taxes from the Lehigh Valley as lessee of the right of way and property of the Morris Canal. The railroad company had resisted the payment of accumulated taxes amounting to about \$900,000 under exemption provided in the charter from the State of New Jersey to the Morris Canal & Banking Company. The Court of Errors and Appeals of New Jersey had held the railroad liable to taxes. The action of the Supreme Court affirms that judgment. The case has been before courts for many years. Under the original grant the canal and its appurtenances were exempted from taxation, provided it be maintained for navigation. In 1871 the company was allowed to sell or lease. The Supreme Court holds that the right to sell conferred on the company in 1871 did not carry exemption of taxes and that such an exemption only followed when the original company used the canal for navigation; and that, after leasing, the privilege of exemption lapsed. The case involved taxes amounting to about \$900,000 paid by the company to the state under protest.

Diamonds as "Baggage"

In an action for the loss of the contents of a passenger's trunk, among which was said to have been a diamond, it was contended that the diamond was not properly baggage, and that the railroad, therefore, would not be liable as an insurer. Articles of extraordinary value are not properly classed as baggage, as, for example, papers or memoranda of great and special importance in business, or jewelry of exceptional value. The question as to what is properly baggage for which the carrier is liable as an insurer is, the Nebraska Supreme Court holds, a mixed question of law and fact. If the evidence is without substantial conflict it is ordinarily one of law for the court, but if it depends on facts from which reasonable men might draw either conclusion, the question is for the jury under proper instructions. If the property is not properly baggage, the carrier would still be liable if its loss was caused by its own gross negligence, but not if it is caused by accident, or the act of some third party, or even by ordinary negligence of the carrier. A diamond is an article having market value, and it is error to instruct a jury that the measure of damages for its loss is to be determined by what it is worth to the owner and not by what it would bring on the market.—Gibbons v. Chicago, B. & Q. (Neb.), 154 N. W. 226.

Crossing Accident—Signals, Gates or Flagman—Excessive Speed Not Necessarily Negligence

In an action for damages to an automobile in a crossing collision in a town it appeared that the driver of the automobile, as he approached the crossing, was looking down and listening to the engine of the automobile, while the other occupants of the car were joking and "kidding" those in another automobile which they had outspeeded. None of them gave any attention whatever to the fact that they were approaching a crossing. The Maine supreme court held that there was gross carelessness in the management of the automobile, and that all the people in the car were negligent.

The railroad did not maintain a flagman, gates or automatic signals at the crossing, but it was held that this did not constitute negligence on its part, as no request therefor had ever been made by the town authorities or by any public commission of the state; there were no deep cuts or embankments or high blocks of buildings to prevent a traveler hearing the whistle and bell and the noise of an approaching train, and the trains over the crossing were light and few in number. The train was running at ten to fifteen miles an hour, in violation of a Maine statute providing that no engine or train shall run across a highway near the compact part of a town at a speed greater than six miles an hour, unless a flagman, gates or automatic signals are maintained there. It was held that this fact, though competent evidence on the question whether the train was run at a dangerous rate of speed, was not conclusive of the railroad's negligence.

The evidence was held insufficient to warrant a finding of negligence on the part of the railroad. Conant v. Grand Trunk (Me.), 95 Atl. 444.

Railway Officers

Executive, Financial, Legal and Accounting

H. U. Mudge has been elected president of the Denver & Rio Grande, succeeding Arthur Coppell, who was recently elected temporary president.

Elmer A. Howard, real estate and industrial agent for the Chicago, Burlington & Quincy, with headquarters at Chicago, Ill., has been elected vice-president, with jurisdiction over land and industrial departments, and will perform such other duties as may be assigned to him.

James E. Gorman, whose appointment as chief executive officer for the receiver of the Chicago, Rock Island & Pacific, with office at Chicago, has been announced in these columns, was born

December 3, 1863, in Chicago, and received his education at Holy Family school in that city. He began railway work in August 1877, as a car number taker on the Chicago, Burlington & Quincy, and during the following 16 years held various clerical positions with the Burlington, the Chicago, Rock Island & Pacific, the Chicago & North Western, the Chicago, Santa Fe & California, now a part of the Atchison, Topeka & Santa Fe; the Illinois Central and the Atchison, Topeka & Santa Fe, and also with the Chicago Lumber Company. He was appointed traffic

J. E. Gorman

manager of Joy Morton & Co., in December, 1893, and in March, 1895, was made chief clerk to the traffic manager of the Atchison, Topeka & Santa Fe. Six months later he was appointed assistant general freight agent, which position he held four years. He was then made general freight agent, and in April, 1904, was appointed assistant freight traffic manager. He was appointed freight traffic manager in March, 1905, which position he held until December 1, 1909, when he was elected first vice-president in charge of traffic of the Chicago, Rock Island & Pacific.

W. S. McChesney was re-elected president of the Wiggins Ferry Company at the annual stockholders' meeting on November 8. Charles E. Schaff, receiver of the Missouri, Kansas & Texas, was elected vice-president to succeed E. B. Pryor, resigned; C. A. Vinnedge was re-elected secretary and auditor, and F. C. Dabb was rechosen treasurer. E. F. Kearney, president of the Wabash, was elected a member of the board, succeeding E. B. Pryor; and T. C. Powell, vice-president of the Southern, and Alexander Robertson, chief operating officer of the Missouri Pacific-St. Louis, Iron Mountain & Southern, were named as the other directors.

Edward B. Pryor, receiver of the Wabash, retired from active railway service with the reorganization of the company on November 1. Mr. Pryor was born on March 8, 1854, at Fayetteville, W. Va., and entered the ranks of railroad employees in 1880. From that time until 1887, he held the consecutive positions of clerk, general bookkeeper, and chief clerk of general accounts for the Wabash, St. Louis & Pacific. From 1887 to January 1, 1903, he was assistant auditor of the same road, and its successor, the Wabash. From July 1, 1900, to January 1, 1903, he was also assistant to the vice president of the same railroad. From January 1, 1903, to October 18, 1905, he was assistant to the president, and from that time until his retirement vice-president in charge of the treasury and accounting departments. Since December 18, 1911, he has also been a receiver of the railroad. Mr. Pryor will devote his time to the presidency of

the State National Bank of St. Louis, Mo., to which he was elected last year.

Operating

G. A. Stokes has been appointed superintendent of terminals of the Grand Trunk, with office at Port Huron, Mich., vice F. J. McKee, promoted.

George E. Graham has been appointed general manager of the Dominion Atlantic, with office at Kentville, N. S., in place of P. Giffkins, retired.

Richard L. Malone has been appointed trainmaster of the Illinois Central at Fordham, Ill., vice Charles A. Phelan, transferred. Effective November 15.

E. E. Lillie, superintendent of the Spokane & Inland Empire, has been appointed assistant superintendent of telegraph of the Great Northern, with headquarters at St. Paul, Minn. Effective November 1.

Joseph W. Hevron, whose appointment as superintendent of the Springfield division of the Illinois Central has been announced, was born at Rockport, Ind., on February 23, 1880. After enjoying a common school education he entered railway service on April 1, 1894, on what is now the St. Louis division of the Southern. In August, 1898, he entered the employ of the St. Louis, Peoria & Northern, now a part of the Illinois Central, as an operator and yard clerk, and remained with this company until its absorption by the Illinois Central in 1899. On December 25, 1899, he became a telegrapher for the Illinois Central at Gilman, Ill. On March 17, 1900, he was promoted to operator in the despatcher's office at Kankakee, Ill., and on May 1, 1900, was appointed train despatcher in the same office. On January 16, 1907, he was promoted to chief train despatcher of the Chicago, Bloomington, Pontiac & Tracy district, and on July 15, 1913, was made trainmaster of the same district. On November 15, 1915, he was promoted to the superintendency of the Springfield division with office at Clinton, Ill.

Samuel R. Toucey, whose appointment as superintendent of the Wyoming division of the Union Pacific was recently announced, was born at Minneapolis, Minn., on January 24, 1878. In September, 1895, he became a clerk in the service of the Eastern Minnesota and the Northern Steamship Company — now the Great Northern. In December, 1895, he became a freight solicitor for the Lehigh Valley and continued in this position until August, 1896, when he returned to the Great Northern. He held various clerical positions with this company until November, 1898, when he entered the employ of the Chicago, Burlington & Quincy. He remained with this company as rate clerk and stenographer until November, 1900, when he again returned to the Great Northern. He served this road as stenographer, assistant chief clerk and chief clerk to the general superintendent until February, 1903. After taking the company's special student course and subsequently spending several months at Larimore, N. D., as clerk to the division superintendent, he entered the operating department of the Chicago, Rock Island & Pacific, in December, 1903. In February, 1904, he became stenographer and clerk to the general superintendent of the Union Pacific; from April, 1904, to March, 1906, he was private secretary to the president; from March, 1906, to February, 1907, he was trainmaster on the Colorado division, with office at Denver, Colo. From February, 1907, to April, 1907, he was assigned to special duty in connection with the train and enginemen's schedules, at Chicago, Ill. On April 1, 1907, he was appointed assistant superintendent of the Colorado division, with office at

S. R. Toucey

Denver, Colo. In October, 1914, he was transferred to the Wyoming division, and on November 1, 1915, was promoted to superintendent of that division, with headquarters at Cheyenne, Wyo.

T. J. Jones, whose appointment as superintendent of transportation for the Wabash has been announced, was born at Foristell, St. Charles county, Mo., on January 26, 1874. He received a common school education, and in 1888 entered railway service with the Wabash as a messenger. He has been continuously in the service of the same road ever since, and has held the following positions: telegraph operator, yard clerk, yardmaster, train despatcher and trainmaster. On December 1, 1910, he was promoted to division superintendent, at Moberly, Mo., where he remained until his appointment as superintendent of transportation, with headquarters at St. Louis, Mo., effective November 1.

The general manager of the Canadian Government Railways announces that the Grand Trunk Pacific Telegraph Company has been appointed supervisory agent of telegraphs on the Transcontinental between Moncton, N. B., and Winnipeg, Man., including the Lake Superior branch to Fort William. The telegraph company will have charge of all matters appertaining to the construction and maintenance of telegraphs and telephone lines and operation of railroad and commercial telegraphs. The officers of the Grand Trunk Pacific Telegraph Company having jurisdiction are: H. Hulatt, manager of telegraphs, Montreal, Que.; F. T. Caldwell, division superintendent of telegraphs, Winnipeg, Man., and Thomas Rodger, supervisor, Montreal. Mr. Hulatt is also manager of telegraph of the Grand Trunk and the Grand Trunk Pacific.

Traffic

Frank P. Eyman, who was promoted to freight traffic manager of the Chicago & North Western on November 10, was born on October 5, 1856. He was educated at Oberlin college. In 1873 he entered railway service as agent and operator of the Baltimore & Ohio, following which he was cashier and agent of the Denver & Rio Grande, at Antonito, Colo. From 1880 to 1882, he served as telegraph operator and agent for the North Western; from 1882 to 1887, he was traveling freight agent for the same railroad. From 1887 to 1896, he was stationed at Milwaukee, Wis., as contracting freight agent and local agent, and from 1896 to February 1, 1900, he was general agent, at Chicago, Ill. August 1, 1910, he was from that time until assistant general freight agent, with office in the same city; from August 1, 1910, until his recent promotion he has been assistant freight traffic manager.

F. P. Eyman

W. S. Cookson, assistant general passenger agent of the Grand Trunk at Montreal, Que., has been appointed general passenger agent, and C. W. Johnston, assistant to passenger traffic manager at Montreal, succeeds Mr. Cookson. The positions of assistant passenger traffic manager and assistant to passenger traffic manager have been abolished.

A. G. Reynolds has been appointed commercial agent of the San Antonio & Aransas Pass, with headquarters at Lockhart, Tex.

Frank F. Fouts, general agent of the Denver & Rio Grande at Ogden, Utah, has been appointed to a similar position on the Ogden, Logan & Idaho and hereafter will attend to the freight business of both roads in that city.

William P. Hinton, assistant passenger traffic manager of the

Grand Trunk and the Grand Trunk Pacific, with office at Montreal, Que., has been appointed traffic manager of the Grand Trunk Pacific and the National Transcontinental, with headquarters at Winnipeg, Man. G. A. McNicholl has been appointed assistant general freight and passenger agent of the Grand Trunk Pacific with jurisdiction west of Prince George, B. C., with headquarters at Prince Rupert, B. C. A photograph and sketch of Mr. Hinton were published on November 6, 1914, page 876.

Henry W. Beyers, who was appointed assistant freight traffic manager of the Chicago & North Western on November 10, was

H. W. Beyers

born at Toledo, Ohio, on March 26, 1870. He entered the service of the Chicago & North Western in 1883 as clerk in the office of the commercial agent at Chicago, Ill. From 1892 to 1897 he was stationed at Cleveland, Ohio, as general agent, and from 1897 to 1900, held the same position at Philadelphia, Pa. From 1900 to 1906 he was general agent at Chicago, and from 1906 up to the time of his recent appointment, has been assistant general freight agent, with headquarters at Chicago, Ill. His entire career has been in the service of the Chicago & North Western.

N. J. Lee, chief clerk of the passenger department of the New York, New Haven & Hartford, at New Haven, Conn., has been appointed general agent, with headquarters at New Haven.

Samuel L. Seymour, who has been appointed assistant to freight traffic manager of the Pennsylvania Railroad, with headquarters at Pittsburgh, Pa., was born on August 14, 1849,

S. L. Seymour

at Cleveland, Ohio, and was educated in the common schools of Buffalo, N. Y. He began railway work on October 22, 1868, with the Pennsylvania Railroad, and until December, 1882, served on the Northern Central. He was chief clerk in the office of the general western freight agent at Buffalo, until May, 1876, and then to April, 1879, was western passenger agent. From April, 1879, to December, 1882, he was western passenger and freight agent. From December, 1882, to June, 1890, he was division freight agent of the Pennsylvania Railroad (Philadelphia & Erie division)

and of the Northern Central (Susquehanna, Shamokin, Ehoira & Canadaigua divisions) at Williamsport, Pa. In June, 1890, he was transferred as division freight agent to Pittsburgh, Pa., which position he held at the time of his recent appointment as assistant to freight traffic manager of the same road, as above noted.

C. R. Phoenix, commercial agent of the Illinois Central at Pittsburgh, Pa., has been appointed general eastern agent with headquarters at New York, N. Y., vice W. E. Downing, deceased. W. B. Ryan, commercial agent at Little Rock, Ark.,

has been appointed to succeed Mr. Phoenix at Pittsburgh. Hugh Hardin, traveling freight agent at Dallas, Tex., has been promoted to commercial agent at Little Rock, Ark., vice Mr. Ryan.

Samuel L. Seymour, division freight agent of the Pennsylvania Railroad at Pittsburgh, Pa., has been appointed assistant to freight traffic manager, with headquarters at Pittsburgh; Vernon C. Williams, division freight agent of the New Jersey division at Philadelphia, has been appointed division freight agent of the Western Pennsylvania division, with office at Pittsburgh, succeeding Mr. Seymour; Harold A. Haines, division freight agent at Baltimore, has been appointed division freight agent at Philadelphia, succeeding Mr. Williams. Walter S. Franklin, Jr., southern freight agent of the Pennsylvania System at Atlanta, Ga., has been promoted to division freight agent at Baltimore, succeeding Mr. Haines.

Marvin Hughitt, Jr., who was appointed general traffic manager of the Chicago & North Western on November 10, was born on September 24, 1861, at Bloomington, Ill. He entered railway service in the general freight department of the North Western in 1881, and has remained continuously with the road since that time. From February 1, 1887, to January 1, 1893, he was division freight agent; from January 1, 1893, to October 1, 1896, he served as assistant general freight agent; and from October 1, 1896, to February 1, 1900, as general freight agent. From February 1, 1900, up to the time of his recent promotion he has been freight traffic manager of the road. His headquarters will continue to be in Chicago, Ill.

J. W. Allison, assistant general freight agent of the Baltimore & Ohio Southwestern, with office at Cincinnati, Ohio; D. T. Lawrence, general freight agent of the Central Vermont, with office at St. Albans, Vt., and F. W. Smith, a member of the Uniform Classification Committee, with office at Chicago, have been appointed members of the Official Classification Committee with office at 143 Liberty street, New York City. (See item in Traffic News.)

Engineering and Rolling Stock

A. E. Tripplett, assistant superintendent of the Galveston, Harrisburg & San Antonio, at Victoria, Tex., has been appointed division engineer of the Missouri, Kansas & Texas, at Parsons, Tex.

Purchasing

George G. Yeomans, whose appointment as purchasing agent of the New York, New Haven & Hartford, with headquarters at Boston, Mass., has already been announced in these columns, was born on January 11, 1860, at Trenton, N. J., and graduated from Princeton University. He began railway work in 1882, as rail inspector on the Chicago, Burlington & Quincy. From 1884 to 1886, he was a clerk in the purchasing department, and then to 1891, was chief clerk of the same department. From 1891 to March, 1898, he was assistant purchasing agent, and in March, 1898 was promoted to purchasing agent of the same system, remaining in that position until July, 1905. He served from July to October, 1905, as assistant to first vice-president of the Wabash Railroad and as assistant to president of the Wheeling & Lake Erie, the Wabash Pittsburgh Terminal, the Pittsburgh Terminal Railroad Coal Company and the West Side Belt. From October, 1905, to March, 1912, he was assistant to president of the same roads. Since March, 1912, he has made a specialty of investigating methods of purchasing and handling supplies on various large railroads.

OBITUARY

R. B. Salmons, master mechanic of the Louisville & Nashville at Covington, Ky., since July 1, 1913, died on November 3, at Covington.

C. L. Loop, vice-president of the Southern Express Company at Chattanooga, Tenn., died at his home in that city on November 17, at the age of 76.

C. C. Wentworth, principal assistant engineer of the Norfolk & Western since February, 1903, died on November 11 at his home in Roanoke, Va.

George L. Lang, who was superintendent of telegraph of the Cincinnati, New Orleans & Texas Pacific and the Alabama Great Southern previous to August, 1906, died at Chattanooga, Tenn., on November 13, at the age of 72.

Equipment and Supplies

LOCOMOTIVE BUILDING

THE VIRGINIAN RAILWAY is in the market for one Mallet type locomotive.

THE LAKE SUPERIOR & ISHPEMING is inquiring for prices on two Mikado type locomotives.

THE ELGIN, JOLIET & EASTERN is inquiring for prices on 18 Mikado type and 9 switching locomotives.

THE DULUTH, MISSABE & NORTHERN is inquiring for prices on two Mallet and four Santa Fe type locomotives.

THE STANDARD OIL COMPANY, Whiting, Ind., has ordered one six-wheel switching locomotive from the American Locomotive Company, and has withdrawn its inquiry, mentioned last week, for an additional locomotive.

THE MISSOURI, KANSAS & TEXAS has ordered 5 superheater Pacific type locomotives from the American Locomotive Company. These locomotives will have 25 by 28 in. cylinders, 73 in. driving wheels, and a total weight in working order of 272,000 lb.

THE BOSTON & ALBANY has ordered 4 superheater Mallet (2-6-6-2) type locomotives from the American Locomotive Company. These locomotives will have 22½ and 34 by 32 in. cylinders, 57 in. driving wheels and a total weight in working order of 354,000 lb.

THE NEW YORK, NEW HAVEN & HARTFORD has ordered 33 superheater Mikado type locomotives from the American Locomotive Company. Of these, 25 will have 25 by 30 in. cylinders, 63 in. driving wheels and a total weight in working order of 260,000 lb. The other 8 will have 26 by 32 in. cylinders, 63 in. driving wheels and a total weight in working order of 325,000 lb.

THE BIRMINGHAM SOUTHERN, reported in the issue of last week as being in the market for 3 locomotives, has ordered one Consolidation type and 2 six-wheel switching locomotives from the American Locomotive Company. All three locomotives will be equipped with superheaters. The Consolidation type locomotive will have 23 by 28 in. cylinders, 53 in. driving wheels, and a total weight in working order of 202,000 lb. The switching locomotives will have 22 by 26 in. cylinders, 52 in. driving wheels and a total weight in working order of 160,000 lb.

CAR BUILDING

THE ILLINOIS CENTRAL is inquiring for 40 air dump cars.

THE LEHIGH VALLEY is in the market for 15 caboose cars.

THE DENVER & RIO GRANDE is inquiring for 1,000 box cars.

THE LONG ISLAND RAILROAD is inquiring for 100 50-ton composite gondola cars.

THE NORTHERN PACIFIC has ordered 1,000 center constructions from the Western Steel Car & Foundry Company.

THE VIRGINIAN, reported in last week's issue as being in the market for 250 40-ton box cars, is in the market for box-car bodies only.

THE CINCINNATI, INDIANAPOLIS & WESTERN has ordered 450 box and 200 other freight cars from the Haskell & Barker Car Company.

THE WESTERN MARYLAND is reported to have increased its recent order with the Pullman Company for 2,000 hopper cars to 3,000. This item has not been confirmed.

THE COPPER RANGE, reported in the *Railway Age Gazette* of October 1, as being in the market for 40 ore cars, has ordered 50 ore cars from the Pressed Steel Car Company.

LAKE ERIE & NORTHERN.—Through an error in the printshop it was incorrectly reported in last week's issue that the Lake Erie & Western had ordered 8 steel frame coaches from the Preston Car & Coach Company, Inc. These cars were ordered

by the Lake Erie & Northern, a new road, whose main offices are at Brantford, Ont. William P. Kellett is general manager.

THE NEW YORK, CHICAGO & ST. LOUIS has ordered 600 center constructions from the Pressed Steel Car Company, and has also given the latter an order to repair 300 hopper cars.

THE CHESAPEAKE & OHIO, reported in the *Railway Age Gazette* of November 5, as having ordered 1,000 70-ton coal cars from the Standard Steel Car Company, is now reported to have increased that order to 2,000 cars. It is also reported as contemplating the purchase of 10 express cars.

THE CHICAGO, BURLINGTON & QUINCY, reported in an unconfirmed item in the issue of last week, as being in the market for 54 passenger cars, has issued inquiries for eight dining, five mail, 15 chair and nine passenger and baggage cars and 17 coaches, two of which will be provided with smoking compartments.

THE NEW YORK CENTRAL has ordered 1,000 55-ton self-clearing hopper cars from the Standard Steel Car Company for the Pittsburgh & Lake Erie, this order being additional to orders previously reported. It has also ordered 500 box cars from the Haskell & Barker Car Company, and 500 from the American Car & Foundry Company. These two orders for box cars were included in the original quota for these companies, but were later cut off and are now re-established. It is understood that the New York Central will also order more freight cars.

IRON AND STEEL

THE CHICAGO, ST. PAUL, MINNEAPOLIS & OMAHA has ordered 10,000 tons of rails from the Lackawanna Steel Company.

THE OGDEN, LOGAN & IDAHO has ordered 184 tons of steel from the American Bridge Company for shops and car barns at Ogden, Utah.

THE PHILADELPHIA & READING has divided an order for 12,000 tons of rails among the Pennsylvania Steel Company, the Bethlehem Steel Company and the Carnegie Steel Company.

THE CHICAGO, ROCK ISLAND & PACIFIC has ordered 40,000 tons of 90 and 100 lb. rails from the Illinois Steel Company. Deliveries will begin next April and extend until October.

THE CHICAGO & NORTH WESTERN has ordered 30,000 tons of rails from the Illinois Steel Company and 1,000 tons from the Cambria Steel Company. This is the total order placed for next year's requirements and includes the order for 15,000 tons reported in these columns on October 8.

SIGNALING

THE IMPERIAL GOVERNMENT RAILWAYS OF JAPAN have given the Hall Switch & Signal Company an order for 42 two-arm signals with necessary relays, lightning arresters, etc.

WOMEN RAILWAY WORKERS IN ENGLAND.—Fred W. West, goods superintendent for the London district of the South-Eastern & Chatham Railway, has recently written informatively on the reorganization of the staff that was inevitable as the result of the large percentage of the experienced employees of all grades "loyally responding" to Lord Kitchener's call for more men. In regard to the employment of women, Mr. West says it would be unreasonable to expect either any young woman or any young man without previous experience adequately to replace men of experience in a business involving so much training and technical knowledge as the railway, consequently it was considered good, if not quite as economical, when it was found that three untrained girls could fairly undertake two trained men's duties. It seemed that what they lacked in experience they gained in enthusiasm, and there is no reason to doubt that if they apply themselves to the cult of the railway with the same pertinacity and thoroughness that they are showing at present they will quickly become very proficient. Mr. West adds:—"Women, as well as men, will learn after this war is over, if not before, that there is a dignity in what is known as 'manual labour,' never previously fully realized, and, further, that Nature no more intended woman to be inactive in winning the necessaries of life than the lioness."—*Railway Gazette, London.*

Supply Trade News

Joseph G. Crane, eastern railway representative of the Lowe Brothers Company, Dayton, Ohio, has moved his office from 54 Hudson street, Jersey City, N. J., to 101 Park avenue, New York City.

The Sharon (Pa.) plant of the American Steel Foundries started molding this week. This is the last of the company's plants to reopen to meet the pressing demands of the present revival of business.

E. H. Poetler, assistant traffic manager of the Barrett Manufacturing Company, with office at Chicago, has been appointed to a new position in charge of the railway sales department, with office at New York, N. Y.

Frederic H. Poor, who since the incorporation in December, 1909, of the S. K. F. Ball Bearing Company, of New York, has been its general manager, has recently severed his connection with that organization, and has opened an office of his own at 30 Church street, New York.

L. J. Hotchkiss, recently with Bates & Rogers, contractors, Chicago, has opened an office as consulting civil engineer, Monadnock Block, Chicago, and will specialize in construction layouts. Mr. Hotchkiss was formerly assistant bridge engineer of the Chicago, Burlington & Quincy.

On November 16, Judge Hazel in the United States Court for the Western district of New York, signed an order fixing December 7, 1915, as the time for a hearing on the application of the Safety Car Heating & Lighting Company, New York, for an injunction against the ampere-hour meter control system of car lighting under the Creveling patent No. 747686.

The S. K. F. Ball Bearing Company, of Hartford, Conn., recently incorporated with a capital of \$2,000,000, to take over the business of the S. K. F. Ball Bearing Company, of New York, a house importing ball bearings made in Sweden, is about to erect a factory at Hartford, Conn. The new company has acquired the right to manufacture the S. K. F. ball bearings, formerly made in Sweden. Its directors are: Frank A. Vanderlip, of the National City Bank; B. M. W. Hanson, vice-president of Pratt & Whitney; Franklin B. Kirkbride, 7 Wall street, New York; A. Carlander and S. Wingquist, directors of the Swedish S. K. F. Company, which is a large holder in the new American corporation, and B. G. Prytz, who will act as president.

J. Leonard Replogle, vice-president and general manager of sales of the American Vanadium Company since March 1, 1915, and prior to that vice-president and general manager of sales of the Cambria Steel Company, on November 12 purchased from the Pennsylvania company approximately 240,000 shares of stock in the Cambria company at a price of almost \$15,000,000. He is acting, it is understood, for a syndicate, composed, among others, of E. T. Stotsbury of Drexel & Co., Philadelphia, and A. W. Mellon and R. B. Bellon of the Mellon National Bank of Pittsburgh, who are buying for purposes of investment. Mr. Replogle's holdings do not give him control of the Cambria Steel Company. The latter is capitalized at \$50,000,000, of which \$45,000,000 is outstanding in shares of \$50 par value. The Pennsylvania company (Pennsylvania Lines west of Pittsburgh, a short time ago held \$22,504,000 of this, or slightly over 51 per cent. It later sold 98,000 shares in the open market and recently William H. Donner, president of the Pennsylvania and Cambria Steel Companies, exercised options for the purchase of 112,000 shares. Mr. Donner was negotiating for an option on or for the purchase of the remainder of the Pennsylvania Company's holds, when Mr. Replogle also made an offer. It is understood that the syndicate for which Mr. Replogle is acting controls more than the 240,000 shares acquired from the Pennsylvania Company, but it is not believed that they have a majority control. Mr. Donner and H. C. Frick had been taking action leading to a possible merger of the Pennsylvania and Cambria Steel Companies. Whether this will now be carried out is a question. The *Railway Age Gazette* printed a photograph and sketch of Mr. Replogle in the issue of February 5, 1915, page 249.

TRADE PUBLICATIONS

CONDENSERS.—The Mesta Machine Company, Pittsburgh, Pa., has recently issued Bulletin R, dealing with the Mesta barometric condensers made by that company.

FLORIDA EAST COAST.—The passenger department of the Florida East Coast has recently issued an especially attractive illustrated booklet, describing the hotels and resorts of the state of Florida.

STORAGE BATTERIES.—Bulletin No. 12, recently issued by the General Lead Batteries Company, Newark, N. J., deals with the use of the hydrometer syringe made by that company and tells how to recharge batteries.

CAR DOOR FASTENERS.—Circular No. 54, recently issued by the National Malleable Castings Company, Cleveland, Ohio, describes and illustrates the company's line of National safety car door fasteners, handles, stops and fittings.

FLOORING.—The Standard Asphalt & Rubber Company, Chicago, has issued a 24-page pamphlet containing 42 photographs showing installations of Sarco mineral rubber floors and waterproofing in buildings and other structures.

LUMBER.—The Gum Lumber Manufacturers' Association, Memphis, Tenn., has recently issued a booklet containing technical information about red gum. A number of illustrations are given, for the purpose of showing the graining and other characteristics.

BULB SECTIONS.—The Carnegie Steel Company, Pittsburgh, has issued a pamphlet containing tables and data on all the sections which they now roll in bulb angles and bulb beams. This is in response to an increased demand for this class of material for use in steel car construction and particularly for steel ship building in the United States and elsewhere.

WATERPROOFING EXPOSED WALLS.—The Minwax Company, New York City, has issued bulletin No. 2 of the series of pamphlets on the subject of waterproofing. This issue deals with the waterproofing of exposed walls, both with Minwax clear waterproofing for external use and Minwax damp-proofing for internal use. The bulletin also contains specifications for these materials and photographs of a number of buildings in which these materials have been used.

WATER LIFTED BY COMPRESSED AIR.—The Ingersoll-Rand Company, New York City, has published an 80-page pamphlet describing the air lift pump and its advantages for various purposes in connection with underground waters. The principles of the air lift system of pumping are explained and a description is given of the equipment required, including four pages cataloguing the Ingersoll-Rand standard steam-driven air compressors suitable in connection with this work. There are also eight pages of tables on friction of pipes and other data of value in connection with the handling of water by means of compressed air.

STEEL SHEET PILING, TENTH EDITION.—The Carnegie Steel Company, Pittsburgh, Pa., has just issued a pamphlet superseding a previous edition published in 1912, which describes steel sheet piling for use in cofferdam construction, retaining walls and similar work. The pamphlet contains the necessary data relative to the sections and much information concerning their various uses and the operations connected with the application of these plans. It also contains a general discussion of earth and water pressures and the computation of bracing systems for cofferdams, retaining walls, etc., and information on the weights of materials, strength of hoisting ropes, capacity of tackles, concrete, bearing power of piles, etc., which would be of value to foundation engineers.

DRILLS.—The Ingersoll-Rand Company, New York City, has issued a 128-page pamphlet on the subject of core drilling, which is a comprehensive treatise on the subject. It explains the value of cores in determining the character, order, thickness and extent of materials below the earth's surface, differentiates between diamond drill and the Calyx drill, and describes in detail the equipment necessary for this purpose, with particular reference to the bits. This is followed by a discussion of construction methods and results obtained. Thirty-one pages are devoted to descriptions of the complete core drill plants of various styles and sizes manufactured by the Ingersoll-Rand Company.

Railway Construction

BOYNE CITY, GAYLORD & ALPENA.—An extension is projected from a point east of Atlanta, Mich., towards Alpena, nine miles.

CAPE BRETON.—Surveys have been made to build an extension from St. Peters, N. S., northeast to Sydney, 60 miles. The company now operates a 31-mile line from St. Peters west to Point Tupper.

CENTRAL OF OREGON.—This company's plans call for building 77 miles between Union, Ore., and Walla Walla, Wash., also a branch from Union to Medical Springs, 22 miles. The company now operates 18 miles from Union Junction east to Union, thence north to Cove, also a branch from Union west to Hot Lake, eight miles.

CHAMPLAIN & SANFORD.—This company plans to build a line from Sanford Lake, N. Y., east to Fort Ticonderoga, about 60 miles. Most of the right of way has been secured, but actual work has not yet been started. E. Scharson, president, 71 Broadway, New York. (See New York Roads, March 26, p. 720.)

COLORADO, WYOMING & EASTERN.—Surveys have been made for building a new line from the existing line at North Gate, Colo., southwest to Hayden, 90 miles. The company now operates a line from Laramie, Wyo., west to Centennial, thence south via North Gate, Colo., to Coalmont, 111.1 miles.

GULF COAST RAILWAY.—Incorporated in Florida to build from Venice, Fla., southeast to Placida, 22 miles. This is the line proposed by the Southern Investment Company. The incorporators include L. M. Williams and S. H. Bemiss, Richmond, Va., and T. C. Williams, Sarasota, Fla. (See Florida Roads, July 16, p. 143.)

KENT NORTHERN.—This company plans to build a 42-mile line, from Kent Junction, N. B., southwest to Chipman, about 50 miles. Surveys are now being made. The company operates a 27-mile line from Kent Junction, where a connection is made with the Intercolonial east to Richibucto.

NEW YORK SUBWAYS.—The New York Public Service Commission, First district, is asking for bids for the construction of two sections of the Dual System of rapid transit in the City of New York. Bids are to be opened on November 30 for Section No. 2 of Routes Nos. 19 and 22, being the elevated extension of the Southern boulevard and Westchester avenue branch of the Lexington avenue subway, extending northerly over Westchester avenue, the Bronx, from a point near the intersection of Whitlock avenue to Pelham Bay Park. Bids are to be opened on December 7 for the construction of Section No. 3 of Route No. 8, comprising the tunnel section under the East river from Fourteenth street in the borough of Manhattan to North Seventh street in the borough of Brooklyn. Route No. 8 will extend from Sixth avenue, Manhattan, to North Seventh street in the borough of Brooklyn, thence through various streets and private property to a connection with the Broadway elevated line.

The commission has given a contract to Murphy Brothers, Brooklyn, the lowest bidder at \$7,421, for the construction of the storm drain for the Queensboro subway in the borough of Queens. This subway is now being operated between the borough of Manhattan and Long Island City. It is to be extended on the Queens side to the Queensboro bridge plaza and to a connection with the Astoria and Corona elevated railroads. Bids have been received by the commission for the installation of tracks on the Queensboro subway extension, the Astoria elevated line and the Corona elevated line. George S. Bennett, who offered to do the work for \$204,000, was the lowest bidder.

PACIFIC GREAT EASTERN.—President J. W. Stewart of this company, which is building from Vancouver, B. C., north to Prince George, 480 miles, is quoted as saying that satisfactory progress has been made on the construction of the main line. The grading of the entire line is finished except on the Howe Sound section between Horseshoe Bay and Squamish, about 30 miles, and about 30 miles of light work near Horse Lake.

During the past year track has been extended north of Squamish to a point some miles beyond Lillooet, and the contractor is now operating train service between these towns under an agreement with the company. He is also maintaining train service on the North Vancouver-Horseshoe Bay section. Track-laying work is now under way. (July 16, p. 143.)

PIEDMONT & NORTHERN (ELECTRIC).—A contract has been given to the Charlotte Grading Company, Charlotte, N. C., and work is now under way on the branch line from Belmont Junction, N. C., to Belmont, about 4 miles. The work will be light and involves handling 10,000 cu. yd. to the mile. The maximum grade will be 3 per cent and the maximum curvature 13 deg. The company expects to develop on the branch a traffic in cotton factory products, cotton and coal. (November 12, p. 923.)

SALT LAKE & UTAH (ELECTRIC).—This railroad has awarded the contract for grading an extension from Spanish Fork, Utah, to Payson to the Wasatch Grading Company. The approximate fill per mile will be 10,000 cu. yd., the maximum grade about 1 per cent and the maximum curvature 4 deg. Grading has just been begun, and the track laying will be done by company forces. The company will also construct the three short ballast-deck timber trestles found necessary in the survey. The extension will be six miles long. W. R. Armstrong, general manager and chief engineer, Salt Lake City, Utah.

SPANISH PEAK LUMBER COMPANY, QUINCY, CAL.—This company has awarded a contract to the United States Steel Products Company for a tramway from Spanish Ranch to Gray's Flat, about six miles. The contract price is about \$36,000.

WILLIAMSPORT, NESSLE & MARTINSBURG.—Work is now under way on the section from Nettle, W. Va., to Cherry Hill, two miles. The work is being carried out with company forces. The plans call for a line from Williamsport to Martinsburg, 15 miles. Surveys have been made. John Carmichael, president, Hagerstown, Md. (August 27, p. 409.)

RAILWAY STRUCTURES

BELMONT, N. C.—The Piedmont & Northern will build a combined freight and passenger station, to be of brick construction, at Belmont. See this company under Railway Construction.

BROOKLYN, N. Y.—The New York Public Service Commission, First district, has given a contract to A. L. Guidone & Son, Incorporated, the lowest bidder at \$513,656, for the construction of station finish on Section No. 2 of Route No. 39. This work is on the New Utrecht avenue elevated railroad in the borough of Brooklyn. The steel structure for this section is nearing completion.

MACON, GA.—The general contract has been given to J. Henry Miller, Inc., Baltimore, Md., for building the union station at Macon. The new station is to be of stone, brick and steel construction and is to cost about \$500,000. It will be used jointly by the Central of Georgia, the Southern Railway and the Georgia Southern & Florida. (September 24, p. 586.)

MEXIA, TEX.—The Houston & Texas Central has begun work on a new station, one story in height, 25 ft. wide and 123 ft. long. It will be a brick structure with asbestos shingle roof, and will cost about \$9,500. About 5 per cent of the work has been completed. F. T. Jeans, superintendent bridges and buildings, Ennis, Tex.

MILWAUKEE, WIS.—The Chicago & Milwaukee Electric is building a bridge over the Chicago, Milwaukee & St. Paul tracks just south of the city. It will consist of a 185-ft. skew through girder span, a 140-ft. truss span and a 55-ft. skew deck girder span. Concrete abutments and piers have been built by company forces and the contract for the steel work has been let to the Wisconsin Bridge & Iron Company. (Noted under Iron and Steel, October 15.)

MOUNT VERNON, N. Y.—Plans have been agreed upon by all interested for a six-span concrete viaduct connecting Broad street, Mount Vernon, with Vermont avenue, Yonkers, over the tracks of the New York Central and over the Bronx river. The Public Service Commission is expected to issue the necessary order in the near future. This viaduct will cost about \$80,000.

Railway Financial News

ATCHISON, TOPEKA & SANTA FE.—Ogden Mills, of New York, has been elected a director, succeeding Thomas P. Fowler, deceased.

CINCINNATI, INDIANAPOLIS & WESTERN.—The Ohio Public Service Commission has approved of the issue of \$2,675,000 first mortgage 5 per cent 50-year bonds, \$5,350,000 6 per cent non-cumulative preferred stock and \$5,350,000 common stock by the new company, the Cincinnati, Indianapolis & Western Railroad, which bought at foreclosure sale the Cincinnati, Indianapolis & Western Railway, a subsidiary of the Cincinnati, Hamilton & Dayton. The old company operated 381 miles of road, of which 361 miles was owned.

CHICAGO, ROCK ISLAND & PACIFIC.—The following is a summary of the report of J. W. Kendrick, who has been employed to make an estimate of the needs of the property. His report is in regard to a period of five years:

The full amount of the savings or economies suggested will not be realized until the last year, that is the year ending June 30, 1921. The major part of the capital expenditures should be made during the first three years or up to June 30, 1919, and the money so required is estimated to be \$27,000,000, divided among the various accounts as follows:

ESTIMATED CAPITAL EXPENDITURES TO JUNE 30, 1919.

Grade revision, new lines, sidings and second track.....	\$ 6,008,000
New freight locomotives.....	1,000,000
Improvements to existing equipment—cars and engines..	3,442,000
Rails.....	750,000
Ballast and bank widening.....	3,587,000
Tie plates.....	3,000,000
Yards and terminals.....	2,207,000
Track motor cars.....	176,000
Bridges.....	280,000
Track elevation and grade separation.....	3,392,000
Fences.....	309,000
Telegraph and telephone.....	275,000
Signals.....	291,000
Miscellaneous.....	2,487,000
Total.....	\$27,204,000

It is believed that this amount of money, judiciously expended, will result in putting the Rock Island in good physical condition and by the exercise of close supervision it is estimated that the net annual saving in operating expenses for the fiscal year ending June 30, 1919, will amount to about \$5,050,000. Four thousand freight cars have been purchased by the receiver and by the expenditures recommended in connection with the equipment reinforcement and betterment, some 5,000 additional freight cars will be put into serviceable condition and will result in an estimated reduction in hire of equipment charges amounting to \$700,000 per annum. By the cancellation and modification of certain leases there should also be a reduction in rentals amounting to \$319,000. The expenditures will cause an increase in interest on funded and unfunded debt in 1919 over 1915 of \$1,588,000.

Applying these estimates to the year ending June 30, 1919, and assuming that the gross operating revenue increases at the same rate it has during the past five years, the income account for the year ending June 30, 1919, will be as follows:

INCOME ACCOUNT 1919.

Railway operating revenue.....	\$74,550,000
Operating expenses.....	50,918,000
Operating ratio, per cent.....	68.3%
Net revenue from railway operation.....	23,632,000
Taxes and uncollectible revenue.....	3,986,000
Total railway operating income.....	19,646,000
Other income.....	1,368,000
Total income.....	21,014,000
Hire of equipment, Dr.....	\$ 556,000
Rent of other equipment.....	453,000
Joint facilities and other rents.....	1,304,000
Rent for leased roads.....	332,000
Interest on funded and unfunded debt.....	13,724,000
Other income charges.....	342,000
Total deductions.....	16,711,000
Balance of income.....	\$ 4,303,000

During 1920 and 1921 \$4,000,000 should be expended annually for additions and betterments and by the end of the

fiscal year 1921 it is believed all of the estimated economies should be realized. On this basis the operating ratio for 1921 will be 64.1 per cent and the income account will be as follows:

INCOME ACCOUNT 1921.

Railway operating revenue.....	\$76,350,000
Operating expenses.....	48,940,000
Operating ratio, per cent.....	64.1%
Net revenue from railway operation.....	27,410,000
Taxes and uncollectible revenue.....	4,286,000
Total railway operating income.....	23,124,000
Other income.....	1,368,000
Total income.....	24,492,000
Hire of equipment, Dr.....	\$ 556,000
Rent of other equipment.....	453,000
Joint facilities and other rents.....	1,304,000
Rent for leased roads.....	332,000
Interest on funded and unfunded debt.....	14,124,000
Other income charges.....	342,000
Total deductions.....	17,111,000
Balance of income.....	\$ 7,381,000

See also Trinity & Brazos Valley.

COLORADO & SOUTHERN.—See Trinity & Brazos Valley.

KANSAS CITY, OZARK & SOUTHERN.—The receiver has fixed November 18 for the winding up of the receiver's affairs, some time after which a reorganized company will take over the property.

NEW ORLEANS, TEXAS & MEXICO.—This former subsidiary of the St. Louis & San Francisco was sold at public auction on November 15 to Walter L. Taylor, representing the bondholders' protective committee, for \$6,000,000.

NEW YORK, NEW HAVEN & HARTFORD.—F. T. Maxwell has been elected a member of the executive committee of the New York, New Haven & Hartford, succeeding H. K. McHarg.

PENNSYLVANIA.—It is announced that this company has sold the balance of its holdings, said to be about 240,000 shares, of Cambria steel stock. Cambria steel has been selling in the open market between \$65 and \$70 per share.

SOUTHERN PACIFIC.—F. D. Underwood, president of the Erie, has been elected a director of the Southern Pacific, succeeding C. N. Bliss, resigned. Announcement was made that this change had nothing to do with any traffic relations between the Erie and Southern Pacific but was the result of a desire on the part of the Southern Pacific to secure as a director one of the ablest operating officers in the country.

ST. LOUIS & SAN FRANCISCO.—Representatives of the reorganization committees under the receivers have submitted to the Missouri Public Service Commission an outline of the plan of reorganization of the St. Louis & San Francisco. The reorganization managers are Speyer & Co. and J. & W. Seligman & Co., both of New York. The mileage to be taken over by the new company totals 5,155; the total capitalization is to be \$327,211,188, as against the present total capitalization of \$356,890,056; the fixed and contingent charges of the new company will be \$13,524,119, or a reduction of 47.64 per cent as compared with the present fixed charges. An assessment of \$50 a share is to be made on stockholders of the old company, who have the privilege, however, of paying \$5 in cash and paying the remaining \$45 in 18 months. Stockholders are to receive for their assessment and surrender of old stock 85 per cent in new stock and \$50 in first mortgage bonds. See also New Orleans, Texas & Mexico.

TRINITY & BRAZOS VALLEY.—A correspondent at Houston, Tex., writes that Louis W. Hill and other officers of the Great Northern and the Chicago, Burlington & Quincy, which latter road controls the Colorado & Southern, made an inspection trip over the Trinity & Brazos Valley in the process of negotiations for taking over the half interest formerly held by the Chicago, Rock Island & Pacific (the other half interest now being held by the Colorado & Southern) in this property.

FORTY THOUSAND DOGS.—The Baltimore & Ohio reports that the transportation of hunting and pet dogs was a source of \$10,000 revenue to the road last year, according to the records of the baggage department; 40,000 dogs at 25 cents each; and all were handled without a claim for loss or injury.

ANNUAL REPORT

BALTIMORE AND OHIO RAILROAD COMPANY—EIGHTY-NINTH ANNUAL REPORT

Office of the Baltimore & Ohio Railroad Company.

BALTIMORE, Md., October 27, 1915.

To the Stockholders of the Baltimore & Ohio Railroad Company:

The president and directors of the company submit herewith report of the affairs of the company for the fiscal year ended June 30, 1915.

Except where otherwise indicated, the comparisons shown herein are with the figures for the preceding fiscal year. The income and capital accounts for the year are stated in accordance with the new accounting classifications as prescribed by the Interstate Commerce Commission, effective July 1, 1914, and in order that such comparisons may be properly made, the figures for the preceding year have been recast, so far as practicable, and consequently do not agree in detail with the figures published in the last annual report.

MILEAGE AND EQUIPMENT.

The statements in this report show the results of the operation of the lines directly controlled and operated by your company, embracing:

	First Main Track.	Total of All Tracks.
Miles (owned)	4,458.97	8,803.17
Miles (trackage rights).....	76.30	204.10
Total miles operated.....	<u>4,535.27</u>	<u>9,007.27</u>

as shown in Table 28.

There has been an increase during the year in total first main track mileage operated of 57.05 miles, which was occasioned by the acquisition of the Moorefield and Virginia Branch, 36.61 miles; the construction of the Magnolia Cut-off, 13.14 miles; the extension of branch lines, 5.34 miles, and certain other adjustments, 1.96 miles.

The equipment of the company at June 30, 1915, consisted of 2,399 locomotives, 1,261 passenger cars, 86,097 freight cars, 3,163 work cars and 144 pieces of floating equipment, as shown in detail in Table 27.

RESULTS FROM OPERATION.

The general income account of the company will be found in Table 1. The total railway operating revenues were \$91,815,797.34, a decrease of \$7,348,212.63, or 7.41 per cent.

The total railway operating expenses were \$63,925,507.74, a decrease of \$10,477,880.78, or 14.08 per cent.

The ratio of operating expenses to total revenues was 69.62 per cent., compared with 75.03 per cent. for the previous year.

The net revenue from railway operations was \$27,890,289.60, an increase of \$3,129,668.15, or 12.64 per cent.

The gross income from the year's operations was sufficient to enable your company to meet its fixed and other charges, to pay the established four per cent. dividend upon the preferred stock and five per cent. upon the common stock, and leave a surplus of \$771,473.86.

FREIGHT REVENUES AND STATISTICS.

Freight revenue was \$70,780,808.51, a decrease of \$5,617,908.11, or 7.35 per cent., and constituted 77.09 per cent. of total railway operating revenues, as against 77.04 per cent. last year.

The Interstate Commerce Commission has ordered, effective July 1, 1914, that all statistics, with respect to tons and tonnage, be adjusted to the basis of 2,000 pounds per ton, without regard to the customary weight of the ton as waybilled. The statistics heretofore published have been on the basis of the weight of the ton as waybilled, and as a large proportion of your company's tonnage is waybilled at 2,240 pounds to the ton, as prescribed by tariffs, the effect of the recent requirements of the commission is to materially increase the number of tons as reported. The traffic statistics, Table 12 and Table 13-A, for the years 1915 and 1914, are given on the new basis, but in order that comparisons for the ten-year period may be continued, the statistics given in Table 13-B are stated on the basis of the tons as waybilled.

The tons of revenue freight carried were 64,375,595, a decrease of 7,891,465 tons, or 10.92 per cent., and the tons carried one mile were 12,970,894,074, a decrease of 1,083,527,427 tons, or 7.71 per cent. As indicating the traffic density of the system the revenue ton miles per mile of road were 2,860,005 tons, a decrease of 252,534 tons., or 8.11 per cent. The average distance each ton was carried was 201 49-100 miles, a gain of 7 1-100 miles over the previous year. Freight revenue per mile of road was \$15,606.75, a decrease of \$1,312.77, or 7.76 per cent., and the revenue per freight train mile was \$3.77 81-100, an increase of 26 99-100 cents, or 7.69 per cent. The average earnings per ton per mile were 5 46-100 mills, an increase of 2-100 mills. The increase in the average rate per ton per mile, and in the average distance each ton was carried is mainly due to a larger proportion of the coal shipments being consigned to the ports of Baltimore and New York. Freight traffic statistics are given in Tables 12 and 13.

The statement of commodities carried, Table 14, shows a substantial increase in the grouping of products of agriculture of 668,164 tons, or 18.97 per cent. There was, however, a very large decrease in the items comprised in the grouping of products of mines, amounting to 7,520,045 tons, or 15.42 per cent. under the previous year. The decrease in Products of Mines and of Manufactures reflects the depression in the steel trade and allied industries throughout the greater part of the year.

PASSENGER REVENUES AND STATISTICS.

Passenger revenue amounted to \$14,059,940.41, a decrease of \$1,830,050.54, or 11.52 per cent. These earnings constitute 15.31 per cent. of total earnings, compared with 16.02 per cent. for last year.

The number of passengers carried was 20,581,992, a decrease of 2,166,078, or 9.52 per cent.; the number of passengers carried one mile was 714,368,423, a decrease of 112,910,193, or 13.65 per cent., and the average distance each passenger was carried was 34.71 miles, a decrease of 1 66-100 miles. Of the decrease in passenger earnings, approximately \$800,000 was due to the cessation of immigrant business occasioned by the disturbed conditions in Europe, and the remaining portion of the decrease reflects the general depression in business. The average rate per passenger per mile for the year was 1 968-1000 cents, an increase over the previous year of 47-1000 cents, due in part to the withdrawal of special rate features and the increase in certain fares. The average earnings from each passenger decreased 1 54-100 cents. These and other statistics relating to passenger traffic will be found in Tables 10 and 11.

MISCELLANEOUS REVENUES.

Mail revenue was \$1,236,076.68, an increase of \$21,733.61 over the preceding year.

Express revenue was \$1,818,452.68, a decrease of \$31,761.15. That this decrease was not greater in a year of general depression, is due largely to the earnest co-operation and great activity displayed by the Wells

Fargo Express Company in building up this branch of the service.

Other transportation revenue, in which is included earnings from switching and special train service, transportation of milk, excess baggage, water transfers, etc., shows a net decrease of \$44,338.20, mainly from excess baggage charges and water transfers.

Revenue from sources other than transportation, in which is included earnings from dining cars, station privileges, storage, grain elevators, joint facilities, etc., shows a net increase of \$154,111.76, principally occasioned by the increase in earnings from elevators, due to the larger movement of grain.

OPERATING EXPENSES.

The total operating expenses for the year were \$63,925,507.74, compared with \$74,403,388.52 for last year, a decrease of \$10,477,880.78, or 14.08 per cent.

The total maintenance of way and structures expenses were \$8,985,626.86, a decrease of \$3,432,808.11, or 27.64 per cent. It should be noted in this connection that maintenance of way expenses for the previous year included a charge of \$2,112,084.98 directly attributable to the disastrous floods of March, 1913, which had no counterpart in the operations of the present fiscal year. These expenses include \$556,452.15, covering replacement and revision of facilities incident to additions and betterments. The roadway and structures have been properly maintained.

The total maintenance of equipment expenses were \$16,002,588.53, a decrease of \$1,147,186.68, or 6.69 per cent. Included in these expenses is a charge for depreciation of equipment amounting to \$2,810,415.80.

The total of all maintenance expenses for the year was \$24,988,215.39, and compared with the same expenses for the preceding year shows a decrease of \$4,579,994.79, or 15.49 per cent. These expenses for the year represent 27.22 per cent. of total operating revenues, as compared with 29.82 per cent. the preceding year.

The total transportation expenses for the year were \$34,254,572.05 and, compared with last year \$39,985,496.44, show a decrease of \$5,730,924.39, or 14.33 per cent. These expenses were 37.31 per cent. of total operating revenues, as compared with 40.32 per cent. the preceding year. Co-incident with the decrease in transportation costs and directly contributing thereto was the heavier freight train load, which was 692.35 tons this year against 645.37 tons for the previous year, an increase of 46.98 tons, or 7.28 per cent. There was a decrease in revenue freight train miles of 3,042,622 miles, or 13.97 per cent., notwithstanding the revenue freight handled one mile decreased but 7.71 per cent.

The traffic expenses decreased \$247,329.82, or 11.49 per cent., due mainly to less expenditure for outside agencies and for printing tariffs, etc.

The Interstate Commerce Commission classification of outside operations was abolished, effective July 1, 1914. The greater portion of the expenses formerly charged to those accounts are now charged direct to other accounts; a minor portion, however, is still segregated and included in miscellaneous operations, and the fluctuations therein for the year were immaterial.

The general expenses increased \$92,664.23, due, principally, to increased expense of the relief department on account of increase in pension payments and to the difference in method of charging appropriations made to that department.

The credit item of transportation for investment is a new requirement of the Interstate Commerce Commission. The amount included therein represents the reasonable cost of transporting men and material for construction work and is charged to the cost of such work.

TAXES.

Railway tax accruals amounted to \$3,289,611.04, and taxes charged to miscellaneous tax accruals amounted to \$213,463.32, or a total of all taxes for the year of \$3,503,074.36, an increase of \$59,926.33. Taxes for the year were 3.82 per cent. of total operating revenues.

INCOME ACCOUNT.

Nonoperating income, in which is included rentals from property and equipment, dividends and interest on securities owned, etc., decreased \$872,569.82, due to the exclusion from the income of the year of any interest accruing on obligations of the Cincinnati, Hamilton & Dayton Railway Company now held by your company.

Deductions from gross income, in which is included rentals paid for the use of equipment and property, interest on funded and unfunded debt, etc., increased \$654,529.68, occasioned by increase in certain rentals paid and larger interest charges incident to increased capital obligations.

The net income for the year amounted to \$10,780,881.33, an increase of \$1,530,856.95 over the preceding year, out of which dividends at the rate of four per cent. per annum were paid on the preferred stock of the company, amounting to \$2,354,521.28. After deducting this amount and required appropriations for sinking and other reserve funds, the balance transferred to profit and loss was \$8,368,727.07.

PROFIT AND LOSS.

The amount to the credit of profit and loss at the beginning of the fiscal year was \$32,804,187.74, which amount was increased to \$41,172,914.81 by the addition of the surplus income earned during the year as shown above. Dividends at the rate of five per cent. per annum, amounting to \$7,597,253.21, were declared on the common stock of the company and charged to profit and loss, and there was also charged to this account during the year the net amount of \$1,000,147.69, included in which is \$897,970.95 for discount and expenses on securities sold during the same period. The balance to the credit of profit and loss, which represents the excess book value of assets over liabilities, at the close of the year is \$32,575,513.91.

THE FIVE PER CENT. RATE CASE.

Because of the steady and constant increase in the costs of operation due to matters of a continuing character, such as wage increases, legislative requirements, and the necessity of maintaining higher standards in maintenance and operation, there had been a marked decline in the rate of return in net operating income upon the property investment of the railroads generally during the past several years. Owing to the inadequacy, under these conditions, of the then existing rates, your company joined with other railroads serving official classification territory in proceedings before the Interstate Commerce Commission, seeking to secure approval of a uniform advance in freight rates of five per cent.

Following the original and supplemental petitions of the railroads in the matter, and after hearings and investigations extending over more than a year, the Interstate Commerce Commission, in December, 1914, approved an advance in the freight rates in the so-called official classification territory, which includes the territory served by your company, of approximately five per cent., except on certain commodities such as bituminous and anthracite coal, coke, iron ore, etc., and on traffic moving via lake and rail, which exceptions apply to about one-half of the freight traffic of your company. The Commission also approved of advances in certain passenger rates and some other miscellaneous charges. The revised

rates on interstate traffic became effective generally in March, 1915, but the application for authority to adjust interstate rates is still pending in some of the States; therefore, the full effect on your company's revenues cannot now be determined.

In that part of the decision devoted to their findings as to the adequacy of present revenues, the Commission, among other things, stated:

"In view of a tendency towards a diminishing net operating income as shown by the facts described we are of opinion that the net operating income of the railroads in official classification territory, taken as a whole, is smaller than is demanded in the interest of both the general public and the railroads; and it is our duty and our purpose to aid, so far as we legally may, in the solution of the problem as to the course that the carriers may pursue to meet the situation."

While granting approximately only one-half of the immediate relief asked for by the railroads, it should be encouraging to those interested in railroads and in the proper industrial development of this country to know that the Commission treated the question before it in a broad way, and recognized, unanimously, the necessities of the carriers for additional revenues and declared its purpose to aid, so far as it legally may, in the solution of the problem as to the course that the carriers may pursue to meet the situation. It is believed that the inquiry has also served to bring about a much better understanding of the railroad situation by all interested or concerned in that question, and that because of this clearer understanding the shippers, the railroads and the regulatory agencies of the public will all in the future be better able to satisfactorily work out the many problems incident to the governmental regulation of the public utilities.

CHANGES IN CORPORATE RELATIONS.

Continuing the programme begun in 1912 for the purpose of simplifying the title to properties underlying the several System mortgages and of reducing the number of corporate entities comprising the System, thereby affording a more comprehensive basis for future financing, The Baltimore and Ohio Railroad Company during the year acquired the fee title to the property of the following corporations owning railroads in the State of Ohio, the operations of which properties are included in the System's income account as heretofore, viz.:

The Central Ohio Railroad Company, as reorganized	142.72 miles
Sandusky, Mansfield and Newark Railroad Company, as reorganized	116.25 "
The Columbus and Cincinnati Midland Railroad Company	69.80 "
The Ohio Midland Railroad Company	43.86 "
The Cleveland, Loraine and Wheeling Railway Company	191.14 "
The Pittsburgh, Painesville and Fairport Railway Company	49.86 "
The Trumbull and Mahoning Railroad Company	8.64 "
The Mahoning Valley Western Railway Company	43.07 "
The Eastern Ohio Railroad Company	16.90 "
The Akron and Chicago Junction Railroad Company	77.30 "
The Cleveland, Wooster and Muskingum Valley Railroad Company	35.73 "
The Pittsburgh, Cleveland and Toledo Railroad Company	36.81 "
	<u>832.08 miles.</u>

The fee of that portion of The Pittsburgh, Cleveland and Toledo Railroad Company, lying wholly within the State of Pennsylvania, 9.85 miles, was acquired by The Pittsburgh and Western Railroad Company, the entire capital stock of the latter being owned by your Company.

The Baltimore and Ohio Railroad Company also acquired the fee title to the property formerly owned by the Moorefield and Virginia Railroad Company, 36.61 miles, which had heretofore been operated separately, but was included in the operations of the System for the fiscal year.

The purchase price of these properties represented the investment of your Company in the securities of, and capital advances to, the corporations mentioned above at the time of acquisition. The total amount of your investment has not been changed by reason of such purchases, the effect being merely to alter the form of the investment and to simplify the accounts on the general books of the Company.

The purchase of these properties, except in the case of the Moorefields and Virginia Railroad Company, did not increase or change the miles of road of the System, but did, however, increase the miles of road owned in fee by The Baltimore and Ohio Railroad Company to the extent of 868.69 miles. The length of road now owned in fee is 2,188.75 miles, or 49.13 per cent. of the mileage comprising the System.

GENERAL BALANCE SHEET.

The general balance sheet, stated generally in the form now prescribed by the Interstate Commerce Commission, is shown in Table 2, and the principal differences in the assets and liabilities of the Company, as compared with the previous year, are as follows:

ASSETS.

The grouping of investments, in which is included the capital assets of the Company, shows an increase for the year of \$9,195,985.07 made up as follows, viz.:

Net charge to road	\$6,538,144.22
Net charge to equipment	2,082,090.69
Miscellaneous investments (net)	575,750.16
	<u>\$9,195,985.07</u>

The grouping of current assets shows a decrease of \$24,734,033.96. Of this decrease \$17,751,244.53 is in cash and is due to the inclusion last year of \$20,000,000.00 in this item to pay a like amount of one-year secured notes, which matured and were paid July 1, 1914. There was a decrease in special deposits of \$1,900,947.53, due to payments for additional equipment acquired for the equipment trust of 1913, and a decrease in material and supplies of \$1,935,412.98. The increases in groupings of deferred assets and unadjusted debits are normal fluctuations incident to the business.

LIABILITIES.

There were no additional issues of capital stock during the year. The grouping of long term debt, i. e., funded debt shows an increase of \$3,991,833.34 accounted for as follows:

Obligations issued during the year—	
Four and one-half per cent. secured gold notes—	
Series "A," maturing June 1, 1917	\$20,000,000.00
Series "B," maturing June 1, 1918	20,000,000.00
	<u>\$40,000,000.00</u>
Issued to retire \$35,000,000.00 one-year notes, matured June 1, 1915, and for other corporate purposes.	

First mortgage bonds	\$1,000,000.00
Issued under provision of the mortgage, in recoupment of construction expenditures	
Hampshire Southern R. R. Co. (Moorefield & Virginia R. R. Co.) first mortgage bonds, assumed	5,000.00
	<u>\$41,005,000.00</u>
Obligations retired during the year—	
Baltimore & Ohio equipment trust of 1912	\$1,000,000.00
Series "C," paid at maturity.	
Baltimore & Ohio equipment trust of 1913	1,000,000.00
Series "B," paid at maturity.	
Baltimore & Ohio R. R. Co., Loan No. 6 of 1853	6,000.00
Purchased and retired.	
Real estate mortgages and ground liens, liquidated	7,166.66
Baltimore & Ohio R. R. Co., one-year secured notes	35,000.00
	<u>37,013,166.66</u>
Paid at maturity—June 1, 1915.	
Net increase	<u>\$3,991,833.34</u>

Current liabilities show a decrease of \$21,484,875.37 due, principally to the payment at maturity, July 1, 1914, of \$20,000,000.00 of one-year secured notes, the balance of the decrease being in the accounts interest matured unpaid, unmatured dividends unpaid, etc.

Deferred liabilities decreased \$470,620.68, resulting from the operations of the relief department and smaller aggregate amounts withheld from contractor's estimates. Unadjusted credits increased \$1,407,635.80, the major portion of which represents the net increase in accrued depreciation on equipment.

Incident to the acquisition of the fee of certain properties in Ohio, there was restored to the investment account of road \$2,793,197.90 of capital expenditures for additions and betterments, which had heretofore been charged to income or surplus, and this change accounts for the increase in the item additions to property through income and surplus.

EQUIPMENT TRUSTS.

The status of the equipment trusts at June 30, 1915, follows:

Baltimore & Ohio equipment trust of February, 1912:	
Total outstanding June 30, 1914	\$8,000,000.00
Matured and paid during the year—	
Series "C"—paid February 1, 1915	1,000,000.00
Outstanding June 30, 1915	<u>\$7,000,000.00</u>
Baltimore & Ohio equipment trust of 1913:	
Total outstanding June 30, 1914	\$9,000,000.00
Matured and paid during the year—	
Series "B"—paid April 1, 1915	1,000,000.00
Outstanding June 30, 1915	<u>8,000,000.00</u>
Total equipment trust obligations outstanding June 30, 1915	<u>\$15,000,000.00</u>

Each of these trust was issued in ten series of \$1,000,000.00, one series of each trust maturing annually.

ADDITIONS TO ROAD AND EQUIPMENT.

The total expenditures charged to road account were \$3,744,946.32. These charges are shown in Table 6, where they are grouped under the more important accounts of the road and equipment classification.

The total capital expenditures for equipment during the year aggregated \$4,231,882.19, as shown on page 12. Table 27 shows the equipment in service and the various changes occurring therein during the year.

ROAD.

The work of constructing the roadway for new double track line and relocation of parts of the old line between Okonoko and Orleans Road, W. Va., known as the Magnoli Cut-off improvement, has been completed. One track has been laid and was put in operation December 6, 1914. The laying of the second track has been held in abeyance. With the use of this improvement it has been possible to increase the eastbound slow freight train load to 6,180 gross tons, an increase of 36.36 per cent. The operations in this territory have been greatly facilitated by this improvement, the distance has been shortened 5.78 miles and the helper station at Hansrote has been eliminated, which latter constituted a serious interference with the movement of traffic by reason of eastbound trains requiring assistance over a section of the road where traffic is of the greatest density. While the new line has been opened but a little more than six months, substantial economies in transportation costs have already been effected and the movement of traffic much facilitated. With the handling of a greater volume of business the benefits derived will be proportionately larger. This improvement, together with others heretofore made, gives a continuous three-track line between Patterson Creek and Cherry Run, W. Va., a distance of 57 miles, which section has the greatest traffic density of the system, at times in excess of 24,000,000 ton miles per mile of road per annum.

No new construction work of any magnitude is now under way, but miscellaneous expenditures, as shown in detail in Table 6, were made during the year for the betterment and improvement of the property, some of the more important items were as follows:

An electric transformer station, to enable the utilization of purchased power, was erected at Camden Station, Baltimore, Md.

A new passenger station was constructed at Berkeley Springs, W. Va., and a new combination station and office building was completed at Strasburg Junction, Va.

During the year three new interlocking plants were built, and four were reconstructed and rearranged.

Automatic signals were installed over seven miles of double track, and 10.6 miles of westbound track between Orleans Road and Magnolia, W. Va. Controlled manual block signals were provided for 14.7 miles of single track, and a large number of safety devices were installed for the protection of switches, grade crossings, etc.

The alignment near Seventy-fifth street, Chicago, Ill., was corrected, eliminating 194 degrees of curvature, making it possible to operate the heaviest power on this part of the line and dispensing with a slow order over six miles of road.

The work of eliminating the grade crossing of Concord Pike, near Concord, Del., was completed, as was also the Washington Road crossing at Elkridge, Md.

The Ludlow Avenue Viaduct, Cincinnati, Ohio, which was opened for traffic on June 15, 1914, has now been entirely completed, and substantial progress has also been made in constructing the Hopple Street Viaduct in the same city.

The undergrade crossing at Twenty-eighth street, Lorain, Ohio, was completed.

Important bridges were constructed during the year over the Monongahela River at Wheeling Junction, Pa.; over Central avenue, Madisonville, Ohio, and over the Potomac River at Magnolia and Kessler, W. Va., the latter two being incident to the Magnolia Cut-off.

To permit the operation of heavier locomotives the bridges between Akron Junction and Cleveland, Ohio, have been rebuilt or strengthened so as to carry engines weighing over 220,000 pounds.

EQUIPMENT.

Total book value of equipment June 30, 1914, was.....\$107,756,046.72
 During the year the following additions to equipment were made:
 34 locomotives, 6 passenger cars, 1,781 freight cars, and 9 work cars, and payments were made amounting to..... \$2,749,194.06
 And 5 passenger cars, 7,564 freight cars and 1 work car were reconstructed, involving a net charge to the equipment account of..... 1,482,688.13

4,231,882.19

\$111,987,928.91

During the year the following equipment was put out of service and credited to investment in equipment: 7 passenger cars, 3,603 freight cars, 419 work cars, 1 car float, and 1 lighter, having a book value of..... 2,149,791.50

Making the gross book value of equipment.....\$109,838,137.41

From this should be deducted:

Accrued depreciation on equipment in service as follows:
 Amount at credit, June 30, 1914..... \$15,025,071.35
 Amount charged to expenses for depreciation, year ended June 30, 1915. 2,810,415.80

\$17,835,487.15

Less: Charges against this account for depreciation accrued on equipment put out of service during the year..... 1,705,733.07

Balance to credit of accrued depreciation on equipment in service, June 30, 1915..... 16,129,754.08

Making net value of equipment June 30, 1915.....\$93,708,383.33

In continuation of the policy inaugurated several years ago of strengthening certain classes of equipment, during the year 7,564 freight cars were rebuilt with steel underframes and bolsters and equipped with heavy draft gear to better fit them for present operating requirements.

At the end of the year 203 locomotives, that had undergone thorough repairs, were in storage awaiting traffic development.

The percentage of steel freight cars, including cars with steel underframes and steel center sills, to the total revenue freight equipment at June 30, 1915, was 81.38 per cent., as compared with 72.77 per cent. last year and 38.83 per cent. at June 30, 1909.

Of the new equipment acquired during the year, 31 locomotives and 1,195 steel freight cars were purchased under the provisions of the Baltimore & Ohio equipment trust of 1913.

Contracts have been entered into for the purchase of 50 steel passenger cars and 2,000 all steel freight cars, to be delivered during the coming fiscal year.

RELIEF DEPARTMENT.

The railroad company assumes general charge of the relief department; furnishes office room and furniture, gives the service of its officers and employes and the use of its facilities; becomes the custodian of its funds with full responsibility therefor, and guarantees the true and faithful performance of the obligations of the department.

RELIEF FEATURE.

The total number of members of this feature is 50,591. The total payments for all benefits since the inauguration of this feature, May 1, 1880, to June 30, 1915, amount to \$20,096,882.93. A statement of the operations of this feature, which provides accident, sick, and death benefits for employes, is shown on the first page of Table 26.

SAVINGS FEATURE.

This feature combines the advantages of a savings and loan association, through which employes and their immediate dependents may invest their accumulated savings, and from which they may obtain funds for the purchase of homes to be repaid through easy monthly instalments. As an incentive to employes to save the railroad company guarantees four per cent. interest on all such deposits. During the past year this feature paid to depositors \$416,295.91, being five per cent. on deposits, after which there was a balance of \$48,178.18 carried to the surplus account. On June 30, 1915, there were 8,937 depositors, with total deposits of \$8,787,816.22, an average of \$982.21. During the year 1,394 new loans were made and 541 loans were paid off, leaving in force and effect at June 30, 1915, a total of 6,114 loans, amounting to \$5,536,842.22. Since the inauguration of this feature, August 1, 1882, loans to the aggregate amount of \$16,326,128.72 have been made, assisting employes in acquiring real estate to this extent. A statement of the operations of this feature will be found in Table 26.

PENSION FEATURE.

Pension payments to superannuated and infirm employes constitute a special payroll and are charged to operating expenses, the total amount so charged during the year being \$287,835.99.

During the year 200 names were added to the pension roll and 87 were removed by reason of death, leaving 1,036 as the total number of pensioners on June 30, 1915. The average age of pensioners at June 30, 1915, was over seventy years.

A report of the operations of the department will be distributed to members.

INDUSTRIAL DEPARTMENT.

One hundred and thirty-eight new industries, manufacturing and commercial, were located on or immediately adjacent to the line during the year, from which the company expects to derive substantial freight revenues. One hundred and thirteen side tracks were constructed; eighty-seven to newly located industries and twenty-six to industries previously located, but without side track facilities.

INSURANCE FUND.

A summary of the operations of this feature for the year ended June 30, 1915, and a statement of the assets and liabilities are shown in Table 25. The surplus in this reserve fund at June 30, 1915, was \$1,503,680.30.

SUBSIDIARY LINES.

The income accounts of the following lines, the capital stock of which is owned by your company, but which are operated separately, are shown in the following exhibits, viz:

	Miles.	Net Income.
"A" The Staten Island Railway Company.....	12.65	\$3,180.08
"B" The Staten Island Rapid Transit Railway Company	10.89	288,044.25
"C" The Sandy Valley and Elkhorn Railway Company	30.57	77,689.92
"D" The Baltimore and Ohio Chicago Terminal Railroad Company.....	79.42	131,783.29
	<u>133.53</u>	<u>\$500,697.54</u>

The net income of the Sandy Valley and Elkhorn Railway Company was transferred and included in the income account of The Baltimore and Ohio Railroad Company, and the balance, \$423,007.62, was credited to the profit and loss accounts of the respective companies.

THE CINCINNATI, HAMILTON AND DAYTON RAILWAY CO.

This property is still in the hands of Receivers, and while plans for its reorganization are now being considered, the subject has not progressed sufficiently to justify any conclusion at this time as to the ultimate effect of the reorganization upon your Company; consequently, there is nothing to add to the full statement made in this connection in the previous annual report, except that your Company has made no further advances to or on account of the Cincinnati Company other than to pay the interest accruing during the year on the \$7,500,000.00 First and Refunding Mortgage Four Per Cent Bonds outstanding and bearing the guarantee of your Company. As previously noted, there was excluded from the income account of The Baltimore and Ohio Railroad Company for the year all interest accruing on obligations of the Cincinnati Company now held by your Company, aggregating \$22,695,144, so that the full weight of any income losses from this source has been met. The capital losses cannot yet be determined and adjusted.

The President and Directors renew their acknowledgment of the loyal and efficient services of the officers and employes during the past year.

By order of the Board,
 DANIEL WILLARD,
 President.

CONDENSED INCOME ACCOUNT FOR YEAR.

Total railway operating revenues, rail lines	\$91,815,797.34	\$7,348,212.63 Dec.
Total railway operating expenses, rail lines	63,925,507.74	10,477,880.78 Dec.
Net revenue from railway operations	<u>\$27,890,289.60</u>	<u>\$3,129,668.15 Inc.</u>
Percentage of expenses to earnings.....	69.62%	5.41% Dec.

*Illustrated.

A number of Oklahoma grain dealers are pressing the railroads to pay for grain damaged by the recent storm at Galveston.

An Early Bird That Started Too Soon

\$1,400 for damage to a shipment of grain by salt water, and was based, not on the invoice value, but on the Galveston price,

But whatever may be decided as to the liability of the railroads, one claim that has been brought to our attention will never have to be paid. This claim was filed with one of the roads for some

for the entire contents of the car. The grain was shipped about August 5, and should have reached Galveston about August 9, but as a matter of fact, owing to an error in the billing, the car was held up at Ft. Worth, over 300 miles away, and did not leave that point en route to Galveston until several days after the storm was over. After investigation the railroad advised the claimant that the car was nowhere near Galveston during the storm, and the latter explained that he had merely assumed that his freight had been damaged and had placed his claim promptly in order to be sure to get it in within the time limit. The incident clearly illustrates the entire willingness of some of the shippers of this country to sell their product to the railway carriers at a price including their regular profit!

The San Francisco Examiner contends in a recent editorial that the 82 railroads which the *Railway Age Gazette* has shown were on October 1 in the hands of receivers deserve no pity. It computes their average capitalization per mile at \$54,000. It adds: "Now, the average railroad capitalized at \$54,000 a mile is on the way to

Railroad Capitalization and Bankruptcy

the receiver when the first rail is laid and the first spike is driven. That means at least \$20,000 a mile of dishonest capitalization—of wind and water—and a railroad cannot run on either of those elements. It is just such dishonestly capitalized corporations that induce and require regulation. In order to keep going they have to charge more than the traffic will bear." The answers to such foolish statements as these are so numerous it is difficult to choose which to use. Their implication is that the "average railroad" should not be capitalized for over \$34,000 a mile. There is not a system of standard gage railways on earth which is not capitalized for much more than this. The Examiner is an ardent advocate of government ownership. Let us test the intelligence and fairness of its statement by the average costs of construction per mile reported by typical systems of railways owned entirely, or practically entirely, by governments. The following are the average costs of construction per mile reported for the state railways of certain countries: New Zealand, \$53,789; Denmark, \$62,763; Victoria, \$63,519; New South Wales, \$75,200; Japan, \$89,102; Italy, \$158,185. In Germany, where most of the railways are owned by the government, the average cost of construction is reported as \$116,365; and in Belgium, to which the same statement applies, it is reported as \$216,143. The average cost of construction of the National Transcontinental Railway, which has recently been built by the government of Canada, was about \$99,000, without equipment or adequate terminals. The government of the United States, in connection with the building of the Panama Canal, reconstructed the Panama Railroad. Colonel Goethals testified that up to November 1, 1911, this reconstruction work had cost \$167,000 a mile, and that it would reach \$226,190 a mile. From these statistics of state railways scattered all over the world the reader will be obliged to draw one of two conclusions. He will probably conclude that since it costs the average government a great deal more than \$54,000 a mile to build an "average railroad" a policy of regulation which contributes toward the bankruptcy of private railways having only this average capitalization is of very doubtful fairness or wisdom. On the other hand, if he agrees with the San Francisco Examiner that a capitalization of \$54,000 a mile "means at least \$20,000 a mile of dishonest capitalization," and that a railroad with such a capitalization must "charge more than the traffic will bear in order to keep going," what must he conclude as to the intelligence or consistency of a paper which denounces private railways with a capitalization of only \$54,000 and defends a policy of regulation, and at the same time advocates a policy of government ownership which results in capitalizations varying from \$54,000 to over \$200,000?

PREPAREDNESS FOR PROSPERITY

AT a time when the press is filled with pleas for adequate measures for national defense, a more pressing and immediate need is being overlooked, namely preparedness for prosperity. In passing from a cycle of depression to a period of renewed enterprise and business activity, the railroads are facing a critical time in their history. Already roads are experiencing difficulty in handling increased freight traffic; the surplus of cars has been reduced to a negligible figure and car shortages are rapidly assuming alarming proportions.

We have already pointed out that the car shortage is partly due to the congestion of freight at the ports caused by a shortage of vessel capacity, but a review of the orders for cars during the past two years is illuminating. In 1914, the railways contracted for 80,000 cars, or approximately one-half as many as in 1913, one-third the number ordered in 1912 and decidedly less than the total ordered in any previous year since 1901, except 1908. Up to November 19 of the present year, our reports show that 85,000 freight cars have been ordered for domestic service, which is not a marked improvement over the record of 1914. When one considers that approximately 150,000 cars are required annually to replace wornout equipment alone, it is evident that the railroads are not fully prepared to carry the traffic of a normal year.

Unusual conditions in the steel industry emphasize the necessity for ordering more rolling stock, and at once. A prominent car builder estimates that less than two-thirds of the steel required for car contracts now placed will be delivered before July 1, 1916, delaying the completion of cars until late in the summer, and states, further, that little or no equipment ordered after January 1 can be completed before the close of the year. The present demand for steel is unprecedented; plants are working to capacity and contracts now under way will keep them busy for many months to come.

Conditions in the steel market have been changing so rapidly of late that it has been difficult for railroad men to keep fully informed concerning them. Up to a short time ago the railroads and other purchasers were out of the market to such an extent that the mills were running on a greatly decreased production and prompt deliveries could be secured for any order given. Almost over night conditions changed. The unfilled tonnage of the United States Steel Corporation and other steel companies has risen rapidly and orders are still being taken far in excess of the current output. Because of this the Steel Corporation withdrew quotations in the foreign markets a few days ago. This condition has developed at a time when the production has increased rapidly. Less than a month ago the new plant of the Minnesota Steel Company, a subsidiary of the Steel Corporation at Duluth, was opened. The Cambria Steel Company made a new high record for output on October and other mills have established similar records.

The immediate effect of this condition on the railroads has been to make it practically impossible for them to secure early deliveries. This has led to the placing of orders for rails and similar products considerably earlier than in previous years, until at the present time, most of the large orders for rails for next year have been placed and those still unplaced are being accepted only for late delivery. As an instance, the Rock Island was unable to secure early delivery on its order of 40,000 tons of rails placed two weeks ago.

The situation in the steel market has affected the railways in another way. Many of their materials are purchased from supply concerns, which in turn buy their steel from the mills. After long periods of slack business, these concerns are sharing in the revival of purchases, but are being confronted with the same conditions in the steel market as the railways, and are now finding difficulty in securing the steel to fill their orders. This is true of such specialties as tie plates and other track fastenings, as well as of car and bridge materials. Some supply concerns are now practically out of the market, not because they are running to full capacity, but because they are unable to secure the neces-

sary steel. This condition makes it necessary for the railways to follow up their heavy rail and equipment purchases with those for the specialties which they will require to secure even delayed 1916 delivery.

The prices for cars have risen from 15 to 20 per cent in the past six months, and there is no hope of an early decline. But with the prospect of increasingly slow deliveries and serious shortages of cars, price no longer remains a prime consideration. The railroads are not only struggling for long deferred and deserved profits, but for public favor; after years of misguided abuse and destructive interference they have gradually gained adherents to their point of view and broken popular prejudice against them. Much of the difficulty the railroads have experienced in the way of hostile regulation can be traced to the car shortage of 1906-1907. Failure on the part of the carriers to cope with the traffic of 1916 will wipe out much that has been gained in this direction and will revive "down with the railroads" as an effective slogan for ranting muckrakers and demagogues.

The reasons why the railroads have not been adding to their equipment as rapidly as in former years should be self-evident by this time. They have not been in a financial condition to do so until it became certain that the equipment would be needed. It is easy enough to say that the railroads should have bought cars a while ago when prices were low, but if the railroads generally had been able to place orders the prices would not have been low and only a few strong roads were in a position to take advantage of the opportunity.

THE REAL L. C. L. PROBLEM

LARGELY because of the relatively small tonnage included in the l.c.l. business, this class of railway traffic has not received the attention of operating officers that it has deserved. It is primarily for this reason that there has been so little change in the methods of handling it in recent years in the average freight house. But many of the men directly engaged in this branch of railway operation are fully alive to its importance and to the opportunities for improvement. The attention which many of them are giving to the subject is indicated by the interest shown in the contest conducted by the *Railway Age Gazette* on the Handling of L. C. L. Freight which closed recently, and in the number of contributions received. The two prize-winning papers are published elsewhere in this issue and others will be published from time to time in later issues.

In common with other terminal facilities, those for the handling of l.c.l. freight are generally inadequate for the present volume of business and are unsuited in design for the most modern and economical methods of operation. But, unlike the case of classification yards, where the best means of securing improved facilities is to move further out of the city, where larger space can be obtained at more reasonable rates, l.c.l. freight houses must remain close to the industrial centers if they are to perform their functions properly. This means that expansion of the facilities is possible only at heavy expense; and, therefore, expansion is deferred longer than would otherwise be the case. As a result the problem in most freight houses is not the inauguration of methods adapted for the operation of new and modern facilities, but the utilization of the existing facilities to the best advantage.

This problem may be attacked from a number of standpoints—the installation of improved equipment, the rearrangement of methods to eliminate lost motion, increasing the capacity of the men by securing their interested co-operation, etc. A few years ago the hand truck was the universal instrument for freight house operation. Since that time the four-wheel platform truck has appeared, followed by the motor truck. Each type of equipment has its particular field and much care should be exercised in so arranging the work and instructing the men that the combined equipment shall be used to the best advantage. It is no more economical to use a motor truck for a very short haul than it is to use a hand truck for a long haul.

However much practical railway men may and do criticise time and motion studies, an elementary study of this kind will reveal many sources of lost motion in freight house operation, the removal of which will increase the efficiency of the house without adding to the burden of the laborers. Theoretically, every freight house foreman is watching for opportunities for making such improvements; practically, in the rush of his regular duties, he often fails to observe and remove cross trucking and other causes of inefficiency.

A great opportunity for improvement and one quite generally realized is in the best utilization of the labor employed. In the average freight house operating on a flat rate wage basis there is a certain "professional" pace, generally set by the slowest trucker, which is followed by all truckers and which therefore regulates the speed of operation of the house. Any means to increase this speed will decrease the time required for trucking and increase the tonnage of freight handled per man. The bonus system is the common incentive for this purpose. By its use the men share in any increased production on their part, and it is interesting to note that nearly all the contributions to this contest have favored its use.

As we said before, the problem in freight house operation is not to determine what would be most advisable under ideal conditions, but rather what can be done under the conditions which actually exist. A dollar saved in the operation of a freight house is just as large and just as valuable to the railroad as one saved by any other operating economy.

LOSS AND DAMAGE PAYMENTS

AFTER having conducted a "safety first" campaign for the prevention of accidents to persons for several years with remarkable success, the railroads have recently achieved some very good results by applying "safety first" principles to the handling of freight. The Committee on Packing, Marking and Handling of Freight, in its recent report to the American Railway Association, submitted statistics showing that 99 roads had saved \$3,500,000 by the reduction of their payments for loss and damage to freight during the first six months of 1915 as compared with a similar period in 1914. This reduction is about 22 per cent and as the freight revenues for this period indicate a much smaller decrease, the statistics mean not only an absolute saving, but an improvement in relation to the volume of the traffic. "It would appear from these figures," the committee says, "that the railroads have checked the tide in payments for loss and damage, which has been rising, and rising rapidly, since the fiscal year 1909."

This represents only one of the ways in which the railroads have been increasing their efficiency, but that it is an exceedingly important one is indicated by the fact that the freight loss and damage payments of the railways of the United States and Canada for the fiscal year 1914 amounted to \$36,000,000. This is one-tenth of Mr. Brandeis' million dollars a day, but a reduction of 22 per cent in this account, if continued for a year, would probably result in a greater actual saving than could be accomplished by the adoption of most of his suggestions.

The dimensions of the problem are shown in the following table giving the amounts paid on account of loss of, and damage to, freight by the railways of the United States for the last 10 years for which the figures are available, in comparison with the freight revenues for each year:

	Loss and damage payments	Freight revenue	Percentage of freight revenues
1905.....	\$19,782,692	\$1,450,772,838	1.35
1906.....	21,086,219	1,640,386,655	1.28
1907.....	25,796,083	1,823,651,998	1.41
1908.....	27,368,664	1,655,419,108	1.65
1909.....	24,754,508	1,677,614,678	1.48
1910.....	21,756,671	1,925,553,036	1.13
1911.....	24,589,215	1,925,950,887	1.27
1912.....	25,031,181	1,968,598,630	1.27
1913.....	30,885,454	2,198,930,565	1.40
1914.....	33,279,057	2,114,698,000	1.57

It will be noted that the loss and damage payments bear a very close relation to the volume of traffic as indicated by the

earnings, and that they increased in the years 1906, 1907 and 1908, not only absolutely, but in proportion to the freight revenues. Probably this was because of the increases in traffic in the preceding years, since, of course, claims are paid after the occurrence of the loss or damage. This explains the increase from 1907 to 1908 in spite of the decrease in earnings, and the decrease from 1908 to 1909 in spite of the increase in earnings. From 1909 until 1914 there was a steady gain in freight business and we would therefore naturally expect to find that the loss and damage payments increased from 1910 on. The percentages indicate, however, that the increases in loss and damage were usually more pronounced than the increases in earnings, and that the reductions have been more marked than the corresponding decreases in the volume of business. This would seem to mean that much of the loss and damage is caused by the haste that naturally accompanies the handling of a rush of business.

Some of the principal causes usually ascribed for the rapid increase in loss and damage are the greater shocks to cars and contests due to the use of larger cars and longer trains, the increasing use of hump yards, carelessness in marking, packing and loading, and the use of flimsy packing containers by shippers.

The very gratifying improvement shown recently has been achieved by unremitting effort both on the part of many individual railroads and on the part of many railroad associations in which the National Industrial Traffic League, representing the shippers, has co-operated. Especial credit is due to the Committee on Packing, Marking and Handling of Freight, which is a sub-committee of the Committee on Relations Between Railroads of the American Railway Association. The committee calls attention to the fact that these savings "took place at the period when the railroads had secured very nearly uniform instructions for packing and marking, when an improved inspection of shipments had been generally inaugurated through the individual railroads and inspection bureaus, when more railroads than ever before had organized departments to supervise loss and damage, and when general interest in this important subject had been spread more widely than ever before." It is also the belief of members of the committee that the shippers are assisting by giving more care to the preparation of goods for shipment, and the committee expresses the opinion that the economies will be continued so that next spring a further reduction will be shown.

The *Railway Age Gazette* has described at length the loss and damage campaigns which have been waged for several years on the Atchison, Topeka & Santa Fe, and the St. Louis & San Francisco, and some very successful results have recently been shown also by many other roads, either with or without a special organization for the purpose of educating their employees in proper methods and habits of carefulness and shippers in proper packing. The Santa Fe has reduced its loss and damage payments from 1.92 per cent of gross freight receipts in 1909 to .96 per cent in 1915. The Frisco, in the fiscal year 1915, reduced its loss payments on this account by 42.4 per cent as compared with the year before, while the gross freight revenue decreased only 1.7 per cent. In 1914 the claim payments were 1.68 per cent of the freight revenue and in 1915 only .98 per cent. The Illinois Central reduced its payments for loss and damage to freight in the fiscal year 1915 by 27.48 per cent, while the freight earnings decreased 6 per cent, and the Chicago & North Western in the same year reduced its loss and damage payments by 20 per cent, whereas the freight revenue decreased only 3.8 per cent.

Payments for loss and damage represent an economic waste that adds to the cost of transportation without benefit to anyone. Most shippers would greatly prefer to sell their goods to their customers than to a railroad, while the railroad that pays a claim suffers an absolute loss. The entire subject suggests a large field for improvement by active co-operation between the two parties most directly interested.

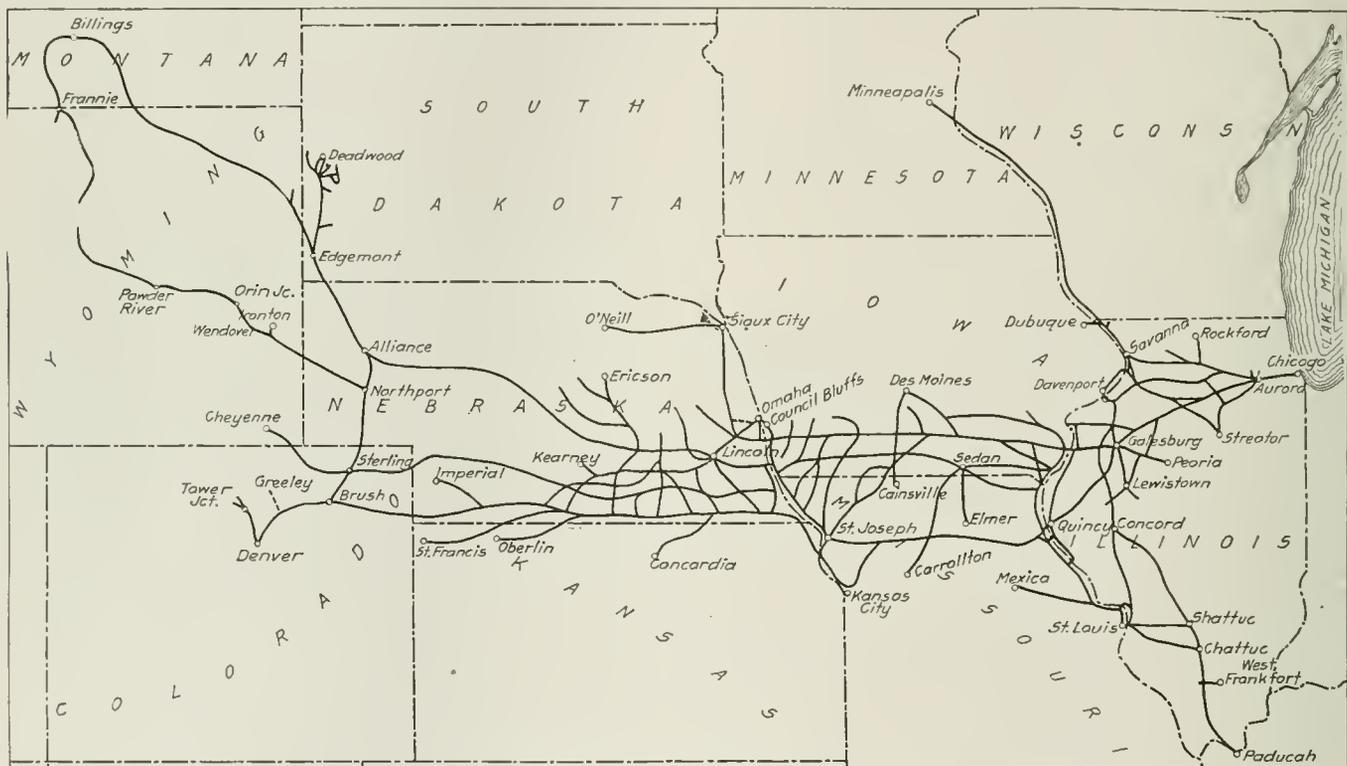

CHICAGO, BURLINGTON & QUINCY

THE commercial reviews this week are more optimistic in regard to buying by all classes of people than they have been at any time in the past few years. It is a rather interesting fact that this activity in buying by consumers, retailers and jobbers could have been, insofar as actual conditions of buying power are concerned, manifested last fall in many of the corn-raising states just as well as this year. The corn crop this year is a bumper one, but so was last year's crop. The farmers in Iowa, Kansas and Nebraska had the money to spend last fall, but they were almost as conservative, apparently, in their expenditures as were the people in the East or New England, where the European war had actually cut into the income of large classes of wage earners and business men.

This is particularly well illustrated by the experience of the Chicago, Burlington & Quincy in the fiscal year ended June 30, 1915. The Burlington runs through the very heart of the corn-

tons, and in 1914 to 223,000 tons; the tonnage of agricultural implements to 209,000 tons in 1915, comparing with 237,000 tons in 1914; of cement, brick and lime to 1,773,000 tons in 1915, comparing with 1,820,000 tons in 1914. The tonnage of bituminous coal carried in 1915 amounted to 9,413,000 tons; in 1914 to 10,069,000 tons. The present prosperity, therefore, of the corn-raising states at any rate, is founded on the savings of one very profitable year, added to the receipts which are now coming in from a second extraordinarily large crop.

The Burlington more than made up the loss of \$2,562,000 in revenue by a saving of \$2,783,000 in expenses, total operating expenses amounting to \$60,441,000 in 1915 as compared with \$63,225,000 in 1914. Of the saving in expenses \$817,000 was in maintenance of way, \$785,000 in maintenance of equipment and \$1,182,000 in transportation expenses. Probably nearly all of the saving in maintenance of way was because of cheaper track labor and a more efficient use of this labor. The showing in maintenance of equipment expenses is accounted for by the fact

The Chicago, Burlington & Quincy

raising belt and from 12 to 15 per cent of its total tonnage is made up of grain. In 1915 the road handled 4,635,000 tons of grain as against 4,309,000 tons in 1914; but the volume of grain raised and shipped in the states served by the road is only one of the factors in the prosperity of the farmers. The farmer not only had an extraordinarily large crop of corn, but he got very high prices for it. We would expect to find, therefore, that with this extraordinarily large buying power of the farmers and with the passenger business created by the expositions in California, a road like the Burlington would have shown greatly increased earnings. Just the opposite was true, however.

Total operating revenues amounted to \$91,125,000 in 1915, a decrease as compared with 1914 of \$2,562,000. Passenger revenue amounted to \$20,186,000, a decrease of \$1,558,000, and freight revenue to \$62,509,000, a decrease of \$290,000. The falling off in passenger revenue is probably directly attributable to conservatism in expenditures by eastern people who would under ordinary circumstances go to California in the winter, and also probably to conservatism on the part of the people living in the territory served by the Burlington. Further evidence of this conservatism in expenditures is shown by the fact that the tonnage of household goods carried by the Burlington in 1915 amounted to 213,000

that whereas the freight-train car renewals—original cost of cars scrapped less depreciation and salvage—was \$855,000 in 1914, there was a credit to this account of \$39,000 in 1915. The saving in transportation expenses was much more than proportionate to the falling off in business handled. The total passenger mileage in 1915 was 1,079,000,000, a decrease of 73,000,000, or between 6 and 7 per cent. The ton mileage handled totaled 8,527,000,000 in 1915, a decrease of 85,000,000, or less than 1 per cent. The average trainload of freight was 492 tons in 1915 as against 479 tons in 1914. The average number of empty cars per train was 12.44 as against 11.80 in 1914; of loaded cars per train 25.56 as against 25.09. The average number of tons per loaded car mile was 19.23 as against 19.08. The increase in gross trainload, therefore, was considerably larger than the increase shown in trainload of freight.

The Burlington retired 71 locomotives during the year and added 35, which changes made the average tractive power 30,808 lb. in 1915 as against 29,549 lb. in 1914. The fact that the Burlington made no charge for freight-train car renewals has been previously mentioned. The table showing equipment added and retired, however, shows that the company added 2,647 freight cars to its equipment and retired 2,289.

The total expenditure for additions and betterments during the year was \$7,509,000, of which \$942,000 was for equipment, while of the remaining \$6,566,000, \$2,357,000 was for land for transportation purposes, \$789,000 for grading, \$631,000 for rails and \$541,000 for bridges, trestles and culverts. All of the expenditure for equipment was charged to income, and of the additions and betterments, \$2,399,000 was charged to income, and of the remainder \$1,769,000 was for new lines. The total outstanding funded debt at the end of 1915 was \$181,690,000, comparing with \$182,568,600 outstanding at the beginning of the year. Cash on hand at the end of the year amounted to \$7,123,000, comparing with \$6,516,000 on hand at the beginning of the year. There were at the beginning of the year \$1,900,000 loans and bills payable, which were paid off during the year, leaving no loans and bills payable on June 30, 1915. It is interesting to note that the audited vouchers and wages unpaid at the beginning of the year was \$9,204,000, and at the end of the year \$6,047,000.

The new form of balance sheet prescribed by the Interstate Commerce Commission when applied to the Burlington's accounts brings out in a striking way the investment that has been made in that property since the Hill interests took it over. The total corporate surplus amounts to \$168,859,000. Of this, \$30,487,000 is additions to property since June 30, 1907, through income; \$14,642,000 funded debt retired through income, and \$22,109,000 sinking fund reserves. The total long-term debt of the Burlington is only \$181,690,000.

The following table shows the principal figures for operation in 1915 as compared with 1914:

	1915	1914
Average mileage operated.....	9,339	9,140
Freight revenue	\$62,509,484	\$62,799,188
Passenger revenue	20,185,564	21,743,507
Total operating revenues.....	91,125,061	93,687,141
Maintenance of way and structures.....	11,360,210	12,010,977
Maintenance of equipment.....	15,415,123	16,035,205
Traffic expenses	1,629,676	1,634,672
Transportation expenses	29,117,164	30,224,524
Miscellaneous expenses	832,154	921,586
General expenses	2,087,041	2,397,888
Total operating expenses.....	60,441,367	63,224,853
Taxes	4,081,508	4,016,658
Operating income	26,578,028	26,445,631
Gross income	27,802,098	27,739,989
Net income	19,041,919	18,807,202
Sinking funds	1,753,007	1,692,795
Dividends	8,867,128	8,867,128
Appropriation for additions and betterments.....	3,340,669	5,715,875
Surplus	5,081,115	2,531,404

CHICAGO GREAT WESTERN

It has been six years since the Chicago Great Western was taken out of the hands of receivers. The reorganization was under the auspices of J. P. Morgan & Co. and the new company was given every opportunity to make of the property a profitable railroad. Stockholders of the old company had been assessed \$15 a share and \$10,000,000 cash was provided for immediate expenditure for betterments; fixed charges were unusually conservative—the funded debt in 1915 being only at the rate of \$26,866 per mile, and carrying only 4 per cent interest charges. A very careful plan of rehabilitation had been drawn up calling for the expenditure of between fifteen and eighteen million dollars during the first three years of the new company's management of the property. As a matter of fact, in the first three years up to June 30, 1912, a total of \$14,284,000 had been spent for additions and betterments to road and equipment.

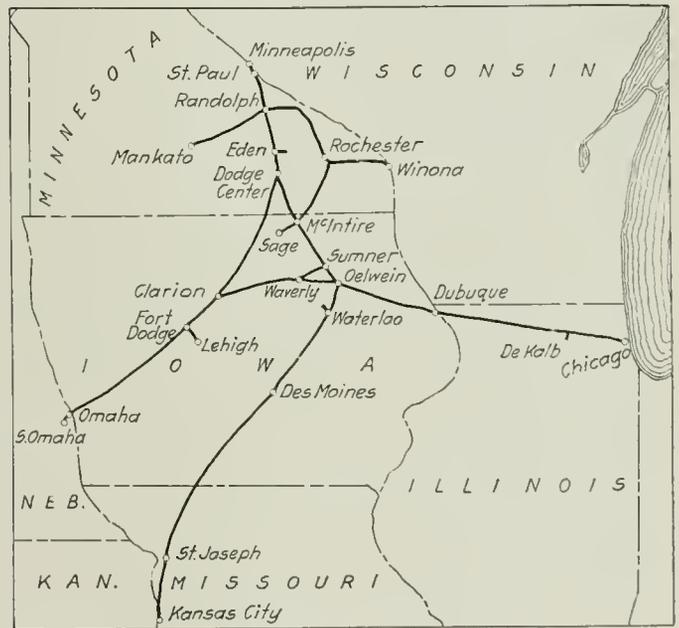

While the fiscal year ended June 30, 1915, was one of business depression, crops were unusually good in the corn belt and in 1914 about 27 per cent of the total tonnage of freight carried by the Chicago Great Western was grain.

Total operating revenues of the Chicago Great Western, however, in 1915 amounted to \$13,921,000, or \$429,000 less than in 1914. Operating expenses amounted to \$10,447,000, a decrease as compared with the previous year of \$477,000. After the payment of rentals and fixed charges the company had \$868,000 net income, comparing with \$896,000 in 1914. There is a total of \$89,150,000 outstanding stock, so that this net income would have been less than one per cent on the total stock, and since

the stock is divided into about equal parts of preferred and common, the net income would have been less than two per cent on the preferred stock. Something is obviously wrong.

The company's operating ratio in 1915 was about 75 per cent. The average ton-mile rate was 7 mills and the average rate per passenger per mile was 1.95 cents. When compared with the average freight and passenger rates on eastern roads these rates do not seem low, but for the character of traffic handled by the Chicago Great Western they are entirely too low. It is the character of traffic handled and the rate received per ton-mile and per passenger-mile which explains probably in large part the high operating ratio. The average trainload of all freight was 574 tons in 1915, an increase of 62 tons, or 12.16 per cent as compared with 1914. This is a particularly good showing, especially in view of the fact that Mr. Felton points out that the movement of traffic in 1915 was most irregular, "so much so that no estimates could be made in advance so as to secure its most economical handling."

The loss in revenue from freight was entirely due to a lower ton-mile rate, the total ton mileage handled amounting to 1,378,500,000 in 1915 as compared with 1,364,000,000 in 1914. The passenger mileage handled totaled 157,642,000 as compared with

The Chicago Great Western

160,199,000 in 1914. The ton-mile rate in 1915 was 7.0 mills, and in 1914 7.3 mills; the rate per passenger per mile was 1.95 cents in 1915 and 2.00 cents in 1914.

The reorganization plan of 1909 called attention to the fact that gross earnings per mile on the 818 miles of the Chicago Great Western proper, exclusive of the 657 additional miles which the company leases and operates, were at the rate of \$10,202 in 1906 and \$10,830 in 1907. As a matter of fact, however, the average earnings per mile of road operated, including all of the mileage operated, were \$7,283 in 1906, and \$7,727 in 1907, and \$9,749 in 1915. The freight density in 1915 was 965,400 tons one mile per mile of road.

One other factor should be mentioned. The interest charges are very low, but the company has to pay a large sum for joint facility rents. This amounted to \$694,000 in 1915 and was an increase as compared with the previous year of \$133,000, or nearly 24 per cent. Taxes are also an undue burden. In 1915 they amounted to \$580,000, an increase over the previous year of \$81,000, and over 1909 of \$351,000, or 65.42 per cent. In 1915 \$498,000 was spent for additions and betterments to road and \$691,000 for additions to equipment. No new securities were issued during the year and the company had on hand at the end of the year \$2,776,000 cash, with no bills payable, comparing with \$2,577,000 cash on hand at the end of the previous year, with no bills payable.

President Felton, in his annual report to stockholders, says: "The average net income for the past six years has amounted to \$2,243,205. The decisions of the courts have indicated 7 per cent as a reasonable return on railroad property. If this amount is capitalized at 7 per cent, it would mean the value of the road and its equipment is but \$22,726 per mile. A physical valuation of the property, when completed by the Interstate Commerce Commission, in accordance with the present law, in all probability will disclose a value of at least double that amount. The 41 railroads in the western rate case showed a return at 7 per cent on but \$28,048 per mile in 1914. It would seem, therefore, that the efforts of the officers of this company and others in the western territory to secure increased rates were fully warranted. This situation has been placed before the various commissions and taxing bodies, and yet no substantial relief has been secured."

The following table shows the principal figures for operation in 1915 as compared with 1914:

	1915	1914
Average mileage operated.....	1,428	1,496
Freight revenue.....	\$9,645,527	\$9,956,308
Passenger revenue.....	3,074,050	3,205,992
Total operating revenues.....	13,920,685	14,349,739
Maintenance of way and structures.....	1,876,924	2,033,781
Maintenance of equipment.....	2,398,216	2,390,863
Traffic expenses.....	561,526	577,769
Transportation expenses.....	5,150,730	5,431,829
Miscellaneous expenses.....	85,868	79,354
General expenses.....	384,092	410,038
Transportation for investment—Cr.....	10,789
Total operating expenses.....	10,446,567	10,923,634
Taxes.....	580,026	498,764
Operating income.....	2,889,931	2,927,341
Gross income.....	3,136,149	3,073,480
Net income.....	868,194	895,970

CHICAGO & EASTERN ILLINOIS

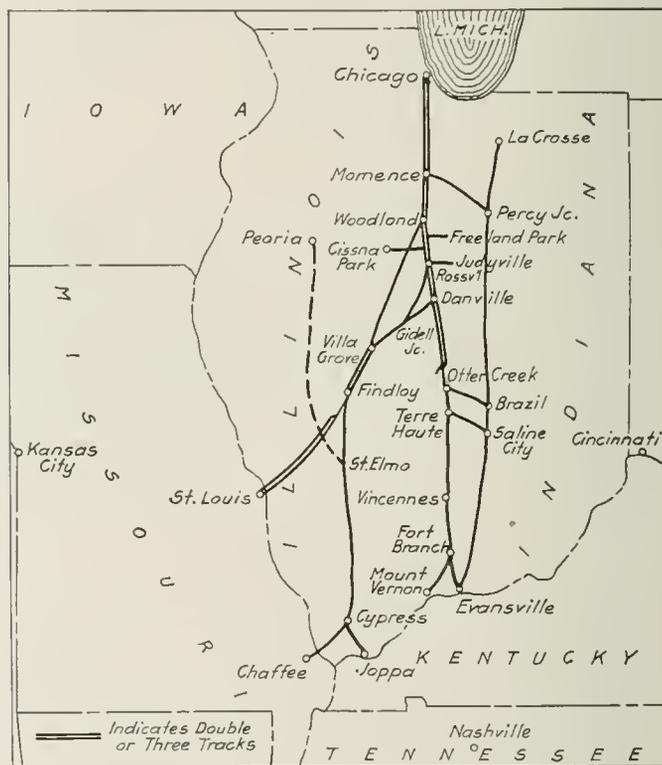

It is hard to see why the St. Louis & San Francisco should have ever been willing to guarantee 6 per cent on the Chicago & Eastern Illinois preferred stock and 10 per cent on the common stock. In the fiscal year ended June 30, 1915, the Chicago & Eastern Illinois, which is being operated by a receiver, had a deficit, after providing for all fixed charges exclusive of anything on the stock, of \$1,844,000. Even so it did slightly better, insofar as operating income is concerned, than in 1914. The operating income, which is the amount available for rentals, interest charges and dividends, was \$1,967,000 in 1915, and \$1,917,000 in 1914.

The Chicago & Eastern Illinois operates 1,282 miles of road. This includes the Evansville & Indianapolis, which was taken over in 1911. In May, 1913, both the St. Louis & San Francisco and the Chicago & Eastern Illinois went in the hands of receivers. Previously the Chicago & Eastern Illinois was controlled by and operated in connection with the St. Louis & San Francisco, the Frisco having issued its own certificates of deposit for preferred and common stock of the Chicago & Eastern Illinois and guaranteed 6 per cent on the certificates issued for the preferred, and 10 per cent on the certificates issued for the common. In the fiscal year ended June 30, 1912—the first in which the Evansville & Indianapolis was included with the Chicago & Eastern Illinois—there was \$3,889,000 operating income, and the company paid 6 per cent on its preferred and 5 per cent on its common, leaving the remaining 5 per cent on the common to be made up by the Frisco. Operating revenues in 1912 amounted to \$15,216,000, comparing with \$14,211,000 in the fiscal year ended June 30, 1915. Expenses, on the other hand, amounted to \$10,900,000 in 1912, and to \$11,606,000 in 1915, but nearly all the difference was in the amount spent for maintenance. In 1915 \$2,253,000 was spent for maintenance of way, and \$3,172,000 for maintenance of equipment; in 1912 \$1,463,000 for maintenance of way, and \$2,778,000 for maintenance of equipment. Time has apparently proved that the maintenance charges in 1912 and the years following up to the receivership were not adequate for the upkeep of the property to the most economical standard. Transportation expenses in 1912 amounted to \$5,811,000, and in 1915 to \$5,375,000.

The Chicago & Eastern Illinois handles a large volume of

bituminous coal traffic, and also a large business of merchandise and manufactures originating in Chicago and other middle western cities destined for the South. The business depression, and especially the very severe depression in the South, caused a loss of revenue in 1915 as compared with 1914 of 9.1 per cent. The total tonnage of freight handled amounted to 12,733,000 in 1915, as against 13,804,000 tons in 1914. The tonnage of bituminous coal in 1915 was 6,587,000, or 51.73 per cent of the total tonnage, and in 1914 bituminous coal tonnage amounted to 7,477,000 tons, or 54.17 per cent of the total tonnage handled in that year. There was a falling off of 890,000 tons, or 11.90 per cent, in 1915 as compared with 1914. Total passengers carried amounted to 4,441,000 in 1915 as against 5,149,000 in 1914.

With a loss of 9.1 per cent in operating revenue there was a saving of 11.3 per cent in operating expenses, the total in 1915 being \$11,606,000. Transportation expenses amounted to \$5,375,000, which was \$541,000, or 9.1 per cent, less than in 1914. This was just commensurate, therefore, with the loss in revenue. The greater part of the saving was therefore through smaller expenditures for maintenance, and particularly maintenance of equipment. In 1915 \$3,172,000 was spent on this account, or 22.6 per cent less than in 1914. Undoubtedly 1914

The Chicago & Eastern Illinois

was an abnormal year for maintenance of equipment expenses, the receiver finding it necessary, probably, to spend large sums for deferred maintenance. The following table shows the percentage of each class of expenses to total operating revenues in 1915 and 1914:

	1915	1914
Maintenance of way and structures.....	15.85	14.41
Maintenance of equipment.....	22.32	26.22
Traffic expenses.....	1.90	1.83
Transportation expenses.....	37.82	37.84
Miscellaneous expenses.....	0.67	0.71
General expenses.....	3.12	2.70
Transportation for investment—Cr.....	0.10
Total.....	81.67	83.71

It will be seen that the maintenance of equipment expenses still take an unusually large proportion of operating revenues, notwithstanding the big cut in 1915 as compared with 1914.

The Chicago & Eastern Illinois received an average ton-mile rate on its revenue freight of 5.3 mills in 1915, and a passenger-mile rate of 1.84 cents. Both rates are very low, and this is

an important factor in the high operating ratio—81.67 per cent.

The court ordered the receiver, beginning March 25, 1915, to pay no interest on mortgage indebtedness, and further ordered in November, 1914, that no interest be paid on bills payable.

The Colorado & Southern

Of the \$4,395,000 interest and rentals accrued during the year, \$2,262,000 was not paid, and the receivers, therefore, had a surplus from operation of \$418,000. An extensive program of maintenance was undertaken on April 1, which included the laying of 10,000 tons of 90-lb. rail and the relaying of worn rail in light traffic lines, and this program was completed late this fall. With the improvement in condition of equipment, which was brought about by the taking up of deferred maintenance in 1914, and also to some extent in 1915, and with the improvement in the condition of roadbed and track, which has now been completed, the Chicago & Eastern Illinois ought to be in shape to handle traffic more economically than it did in the year ended June 30, 1915.

The following table shows the principal figures for operation in 1915 as compared with 1914:

	1915	1914
Average mileage operated.....	1,282	1,283
Freight revenue.....	\$10,295,909	\$11,324,292
Passenger revenue.....	2,755,021	2,963,222
Total operating revenues.....	14,210,602	15,633,625
Maintenance of way and structures.....	2,252,547	2,252,846
Maintenance of equipment.....	3,171,644	4,099,023
Traffic expenses.....	282,201	286,468
Transportation expenses.....	5,374,796	5,915,407
Miscellaneous expenses.....	95,756	105,956
General expenses.....	442,643	442,789
Transportation for investment—Cr.....	13,682	
Total operating expenses.....	11,605,905	13,086,489
Taxes.....	636,000	630,500
Operating income.....	1,967,224	1,916,636
Gross income.....	2,550,591	3,035,966
Deficit.....	*1,844,497	*1,525,892

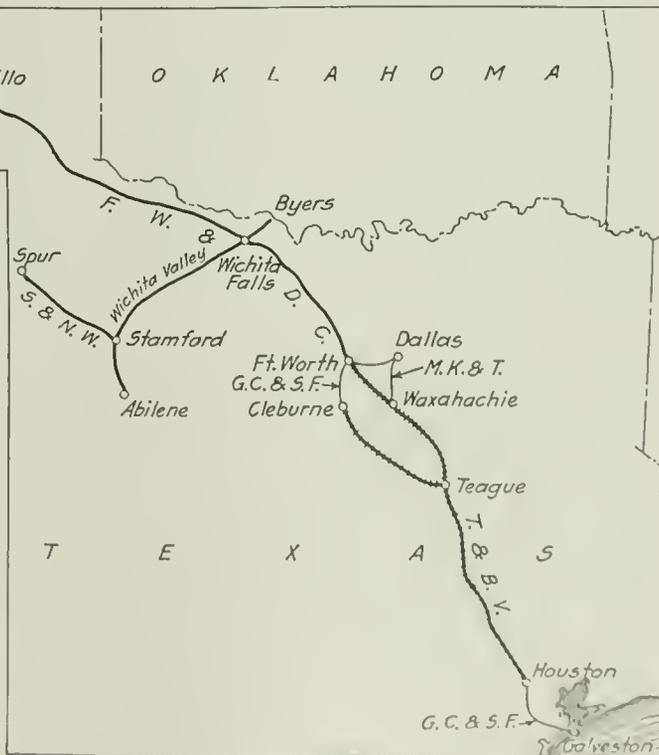

* This deficit is arrived at after subtracting interest and rentals due. As a matter of fact, in 1915 the receivers did not pay \$2,262,000 interest due and in 1914 \$517,000 interest due.

COLORADO & SOUTHERN

THE Colorado & Southern's operating revenues for the fiscal year ended June 30, 1915, compared favorably with 1914 partly because that year was adversely affected by the Colorado Fuel & Iron Company's miners' strike and partly because of the large export grain movement which took place in 1915 via the gulf ports. The total operating revenues of \$13,223,000 in 1914 were the smallest in any year since 1906. In 1915 total operating revenues amounted to \$14,091,000; operating expenses amounted to \$10,011,000, comparing with \$9,746,000 in the previous year, and after the payment of taxes there was a net operating income available for interest charges, rentals, dividends, etc., of \$3,446,000 as compared with \$2,821,000 in 1914. This would be 7 per cent on \$26,700 per mile operated.

The Colorado & Southern owns a half interest in the Trinity & Brazos Valley, which runs from Ft. Worth, Tex., to Houston. The Chicago, Rock Island & Pacific owns the other half interest and the Trinity & Brazos Valley was put into the hands of a receiver in June, 1914. The Colorado & Southern received no interest on its investment in this property during the 1915 fiscal year, so that there was a loss of income from sources other than operation of \$455,000. The net corporate income available for dividends, after the payment of rentals and interest charges, was \$554,000. No dividends were paid and this amount was carried to the credit of profit and loss.

The increase in revenue was entirely from freight. In 1915 71 per cent of total revenues were from freight and 23 per cent from passengers. The total ton mileage in 1915 was 983,465,000, an increase as compared with the previous year of 107,337,000. Of the total in 1915 937,171,000 ton miles was on the standard gage lines and 10,294,000 on the narrow gage lines. The Colorado & Southern operates 1,522 miles of standard gage track and 318 miles of narrow gage. The freight density

on the standard gage is 639,000 tons one mile per mile of road, and on the narrow gage 32,000. The revenue per ton per mile from freight was 1.013 cents in 1915 and 1.033 cents in 1914. Of the total 6,450,000 tons of freight carried by the Colorado & Southern in 1915, 65 per cent originated on this system and 35 per cent was delivered to it from other roads. Of the total tonnage carried 23 per cent was furnished by bitu-

minous coal and 10 per cent by lignite. Either the ton-mile rate is very low or the average haul very short for lignite coal, since the tonnage was 10 per cent of the total tonnage, whereas the revenue was but 4 per cent of the total freight revenue. On the other hand, while the tonnage of bituminous coal was 23 per cent of the total tonnage, the revenue from it was 19.62 per cent. Of the total tonnage carried in 1915 24.84 per cent was agricultural products, and of this, approximately 60 per cent originated on the Colorado & Southern.

With an increase of over 12 per cent in the ton mileage, transportation expenses amounted to \$4,881,000 as against \$5,055,000 in 1914. The trainload of revenue freight on the standard gage averaged 318 tons in 1915 as against 302 tons in 1914. On narrow gage the average trainload was 75 tons in 1915 and 84 tons in 1914. The average for the entire system was 308 in 1915 and 291 in 1914. Carloading was very slightly better on the standard gage lines, but the principal gain in trainloading was made through longer trains. The average number of freight cars per train for standard gage was 25.55 in 1915 as against 24.46 in 1914. It is interesting to note that the passenger-train miles in 1915 were 2,550,000, a decrease as compared with the previous year of 272,000, comparing with a decrease of but 2.5 per cent in passengers carried one mile. The saving in transportation expenses was fairly evenly distributed among the primary accounts.

The company increased its outstanding debt by the issue of \$1,120,000 Fort Worth & Denver City equipment trust notes and the retirement of certain bonds under sinking funds, making the net increase in debt \$789,000. A total of \$1,111,000 was spent for additions and betterments, of which \$955,000 was for equipment. The principal items of new equipment were five Santa Fe type superheater locomotives with mechanical stokers and 10 Mikado superheater oil-burning locomotives and 1,200 steel center sill box cars. At the end of the year there was \$1,562,000 cash on hand, with no loans and bills payable.

The table shows the figures for operation in 1915 and 1914:

	1915	1914
Average mileage operated.....	1,840	1,866
Freight revenue	\$9,960,044	\$9,053,885
Passenger revenue	3,294,688	3,345,489
Total operating revenues.....	14,090,516	13,222,737
Maintenance of way and structures.....	1,728,254	1,818,146
Maintenance of equipment.....	2,691,585	2,184,784
Traffic expenses	215,446	216,445
Transportation expenses	4,881,074	5,055,016
General expenses	494,489	471,611
Total operating expenses	10,010,848	9,746,003
Taxes	616,053	638,450
Operating income	3,445,566	2,821,328
Gross income	3,903,442	3,711,731
Net income	553,767	406,151
Dividends		340,266
Surplus	553,767	65,885

NEW BOOKS

Proceedings of the American Society for Testing Materials. Size 6 in. by 9 in., Part 1, 485 pages; Part 2, 477 pages; illustrated. Published by the society. Price, paper \$5, cloth \$5.50 and half leather \$6, each.

Part 1 contains the 29 committee reports presented at the last convention, held in Atlantic City on June 22-26, 1915, with discussions of them. Among the reports of special interest to railway men are those on Finishing Temperatures of Rails; Accelerated Tests of Cement; Standard Tests of Concrete and Concrete Aggregates; Preservative Coatings for Structural Materials; Standard Specifications for Coal; Standard Specifications for Timber; Waterproofing Materials, and Standard Tests of Insulating Materials.

Part 2 contains the 25 technical papers presented before the same meeting with discussions. Among those papers of special interest are: Battery Zincs; Some Causes of Defective Service, by Robert Job and F. F. White; The Effect of Finer Grinding and a Higher SO₂ Content Upon the Physical Properties of Portland Cement, by P. H. Bates; A Fungus Bed Test of Wood Preservatives, by Cloyd M. Chapman, and The New Physical and Chemical Laboratory of the Pennsylvania Railroad Company at Altoona, by C. D. Young.

These volumes are arranged and printed to the same high standards governing previous proceedings of this society.

Letters to the Editor

CHEMICAL FIRE EXTINGUISHERS

MOBILE, Ala.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

Referring to pages 691, 692, 693 and 694 of your issue of October 15, 1915, giving an account of the second annual meeting of the Railway Fire Protection Association in Chicago, October 5-7, 1915, I beg to direct your attention to comments on the report of the committee on hand fire extinguishing apparatus shown on page 692, reading in part as follows:

"From data secured in reply to questions sent out, it was found that all roads agree on the value of the chemical extinguisher and barrels and buckets, 55 per cent of those reporting stating that they do not use this apparatus and 50 per cent of those who do use them state that they are not recommended."

The percentages referred to above had reference to the hand grenades and the dry powder type and not to the chemical extinguishers or barrels and buckets. For your information I quote the following from the committee's report:

"From data, secured from members of the association in reply to questions sent out, it is determined that all the roads agree on the value of the chemical extinguisher and barrels and buckets as standard forms of first-aid apparatus, and that nearly all of them agree on the undesirability of the hand grenades and dry powder type, 65 per cent of those reporting stating that they do not use this form of apparatus and 50 per cent of those who do use them state that they are not recommended."

C. B. EDWARDS

Secretary, Railway Fire Protection Association.

THE CAB SIGNALS AND AUTOMATIC STOPS AT OROVILLE

SAN FRANCISCO.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

Your issue of October 29 contains a letter under the heading, "Oroville Signalling Criticized," signed "M. Tainer." The letter contains so many incorrect and unwarranted statements that without desire for controversy, some reply is needed. Criticism is expected, but it is only right also to expect it to be made in a spirit of fairness and based on thorough knowledge of all details of the system and of its operation, tests and records. The letter in question does not show that spirit of fair play to which we are justly entitled, nor is its writer competent to pass judgment without much greater familiarity with the system and its appliances than he has had opportunity to acquire. The latter part of his first paragraph condemns expenditure in the effort to improve conditions for safety in railway operation and is indicative of the narrowness of his criticisms following. The few who have joined in financing this particular effort are not of small caliber and are well satisfied with the success already attained.

"M. Tainer" states that our devices are arranged on the open circuit plan and implies that they will not detect their own failures. Both statement and implication are entirely wrong. The system is *not* arranged on the open circuit plan. The description published in your issue of October 8 does not disclose in detail the methods of protection used. Complete information on this point was not given on account of certain pending patent applications. All of the circuits used, on engine and roadside, are arranged entirely as closed circuits. The apparently normally open contact at signal locations is thoroughly protected against failure in operation by a protective relay positively connected across the point into normally closed circuits. Two prominent signal engineers, after examination of our circuits and inspection and tests of our relays, have been satisfied that our protective features are effective and reliable and free us from any danger in the use of the contact point in question. The open circuit practically does not exist in this system.

The apparatus on the engine is far from being complicated

and we have been unable to detect any point in it where any weather conditions can have detrimental effect upon operation. The energization or action of the magnets cannot be affected by the severest cold or frost, nor can the magnetic current induced be scattered or interfered with by snow, ice, water or mud lying in its path. The engine signal-valve and the train-stop appliance are not subject to moisture or lubricatory troubles through extreme cold. The air system is less liable to troubles than much of the Westinghouse. All circuits and instruments are fully equal to the best in use under extreme climatic conditions.

The line circuits, except in overlap, require less wires than for semaphore signals, two wires for the three signals and the automatic stop, as against three wires for the three-position semaphore. As to cost of an installation, we are in better position than "M. Tainer" to make comparisons and can state that the complete system, including all road and locomotive equipment, can be installed per railroad district or division at the same or lower cost than a good semaphore system covering the same conditions.

Current consumption is not in excess of that required for semaphore signals. It is to be noted that the setting of signals ahead of and behind a moving train requires no extra current consumption, such setting being obtained simply by the opening or closing of the line relay circuits. Practically no current is consumed by track magnets except for the very brief interval of actual delivery of a signal, a period of ten to fifteen seconds for delivery of current of five amperes at ten volts.

Failure of contact 35 to close when it should, or failure of relay 9 to pick up its armature through exhaustion of battery 26, have been absolutely covered in our protective system earlier referred to. The working of the back-contact has been made more certain and secure than the front-contact of any type of relay now in service. The wiring of the engine equipment is so arranged as to effectually guard against any failure of the apparatus through cross connections and this has been amply demonstrated in actual practice. Also the air system is so arranged that the breaking or leaking of any pipe or connection will cause instant and positive indication of the leak.

As to overlap, we make no argument for or against its use. That is beside the question since the one overlap of the Oroville installation is provided solely to meet certain conditions and limitations which would similarly control in a semaphore system under the same conditions and space limits. This overlap has no bearing whatever on the location of automatic stops, a fact not grasped by "M. Tainer." In a cab-signal system the locations for giving signals are of necessity quite different from those used for giving roadside signals. The cab-signal must be given at the point where the semaphore signal ordinarily comes first into clear view. In either system the spacing between signals is the same, giving the engineer equal time in each to act on one signal before receiving another. In this installation the stop signal is received in the cab at braking distance in advance [rear] of the usual semaphore stop signal location and the automatic stop is given at this semaphore, provided the train is run past this point, the block end being at braking distance beyond. The overlap, whether good, bad or indifferent, is no more an essential part of this system than it is of the roadside signal system. We do not claim that the Oroville installation is an ideal one. It is too limited in extent and too hampered by present unusual district terminal conditions to be held as a model. Its chief purpose is to demonstrate that signals and brake applications can be successfully and reliably transmitted to moving trains without the use of mechanical or electrical contacts with roadbed apparatus and operated without disarrangement or improper delay of traffic. We are prepared to successfully demonstrate these essential points and with greatly increased safety in railway operation; also to show that the system can be so arranged and operated as to give complete protection everywhere.

In this installation the upper surface of track-magnets is 14½ in. above the top of rails and the lower face of receiving-coils is 3 in. above the upper surface of track-magnets, giving the receiving-coils a height slightly above the maximum height of pilot above

rails as used on this road. The clearance between track-magnets and receiving-coils may be materially increased by lowering the track-magnets, with reliable transmission operation still assured. Also track-magnets may be placed with their upper surfaces even somewhat below the rails' upper level and the receiving-coils considerably lowered before reaching a level where reasonable plow protection cannot ensure their safety.

The action of the dashpots of the time-limit relay has been proved perfectly regular and reliable. Humidity and temperature have no effect upon them and no lubrication or packing of any kind is used in them. They consist simply of a graphite piston running true in a polished bronze cylinder. After long use no wear is perceptible.

The liability of non-operation of armature 14 of relay 9 and contact 35 has been fully guarded and covered in the protective features previously noted.

The use of time-limit relays is essential for economical battery consumption in the case of roads using energy supplied from any form of battery, but this form of relay may be dispensed with when current is derived from a power plant, as the increased current consumption occasioned by its non-use is then not sufficient to greatly affect the economy of the system. This particular relay has, however, been developed to the point of entire reliability under heavy use. They very closely resemble the ordinary free-acting type and particular care has been taken in design and construction to make all parts of this instrument extremely free working, to guard against any possible chance of sticking.

The use of the local track circuit where one rail is common to two circuits has, under our provisions, proved perfectly reliable. We have been able to completely guard against failure from the varying condition due to poor insulation, broken or loose connections, broken rails, etc. This short track section is not expensive in installation or maintenance. Under our arrangements it does not introduce complications or interference with connected track-circuits.

The attention of the engineer need not be at all diverted from his watch ahead, in order to observe the cab-signals. He cannot well escape noting the light signal given above or beside his forward window and he cannot fail to hear and recognize the signal also given by the whistles of distinctly different tone. The single act needed to stop both light and whistle is performed without taking his eyes from track or gauges.

The substitution of cab-signals for wayside ones does not make difficult a check of the display of signals. The use of a very simple and inexpensive recording device not only makes such a check possible, but establishes an indisputable record.

We have had no trouble in obtaining satisfactory maintenance. In our experience with this system, the maintainer of average ability has no difficulty in locating troubles and in determining, when the trouble has been located, whether or not it has been removed.

It would be unwise to place sole dependence on cab-signals and we do not do so. "M. Tainer" has overlooked the two-light marker placed at each automatic-stop location. This marker displays continuously the clear signal when the block ahead is clear, or a stop signal if the block ahead is occupied. More than braking distance is provided from the distant point at which these marker lights are clearly visible, before the block end can be reached. Even were the entire signal apparatus disabled, the engineer still has the marker at each automatic-stop location to guide him. Only by a serious accident to the locomotive could all the signal-indicating apparatus and the automatic-stop appliance be rendered non-operative. Means have been provided for readily cutting out any section where trouble develops without interfering with other sections. The locomotive apparatus has proved more reliable in operation than semaphore arms, according to the records of semaphore performance.

The statement made that the automatic stop should not be applied when speed is being reduced to bring the train to a stop before the home signal is reached is correct. As has been stated, in the Oroville installation, the automatic stop is placed at the home signal and the stop operated there should attempt be made

to pass that point with the home signal set at stop. If desired, however, an automatic stop can be located at any point in advance [rear] of the home signal and its action regulated to pass a train running at such reducing speed as will bring the train to a stop at the home signal. Further, in this system, when brakes are applied by the stopping device, their release is impossible until the train has been brought to a stop. The stopping device gives only the service application and the engineer is not prevented from increasing the application; but he cannot decrease it. This automatic stop feature may separately—that is, without the cab-signals—be applied as an auxiliary device to any existing semaphore installation and be non-operative unless the attempt is made to run past a semaphore stop signal or be made operative only at a predetermined rate of speed.

In conclusion, we desire to go on record as fully recognizing the vital importance of heeding the final judgment of practical and conservative signal experts in the fundamental principles governing design, construction and operation of circuits and apparatus. It is our constant effort to fully meet and cover all such established rules and principles. This we believe we have accomplished and on this basis we claim the right of fair and unprejudiced consideration, an element entirely foreign to the letter signed "M. Tainer."

F. F. BOSTWICK

President, The National Safety Appliance Company.

AN ANSWER TO "A CLERK'S PLEA"

CHICAGO, ILL.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

Having been employed for some 12 or 14 years in various clerical capacities and in different departments by several of the more important transportation interests, I am keenly interested in the subject discussed in the letter published in your issue of September 10, page 459, and fully agree with the statement that the inefficiency of railroad employees is an issue that warrants the serious consideration of executives and officers.

The indictment in this plea is puerile, and leads one to believe that the author has grossly exaggerated his lack of knowledge of certain movements designed to develop efficiency. Surely no one, unless he has spent his time at some lonely whistle station in the West, would be uninformed as to the mediums existing for this purpose.

Railroad employees may be divided into two classes; so may all other employees, so are bees in the hive—workers and drones. There are those employees who place their employers' interests (even though it be a corporation) above their own, realizing that their success is contingent to a great extent on the success of operation and cherishing the hope that their efforts will be recognized and rewarded; and they frequently are. There is also that class who regard their position as a place "in out of the wet" and are incapable of diverting their minds from their pleasures, the clock and pay-day.

To my mind it is inconceivable that the efforts of various educational institutions, publishing houses, railroad journals and others have fallen on barren ground, and I am positive that the public at large is well informed with respect thereto and that this clerk may be the exception that there is to all rules.

In regard to the matter of schools, there is hardly a university in the country that does not have a course covering some phase of transportation and commerce. There are also several correspondence schools devoting their activity to the development of efficiency in certain of the many branches of railroading. The fees charged are nominal and the item of expense is not sufficient to deter an ambitious railroad man from acquiring knowledge that will stand him in good stead.

As to books, there are so many that every phase of railroading from the clipping of coupons to the destruction of weeds has been well covered. Many of these books are to be found on the shelves of the public libraries of even the smaller municipalities. There are also excellent addresses given by prominent men in transportation work, from time to time, which are reported through the medium of the daily press, periodicals, etc.

To my mind, the solution of this question rests primarily on three things: The elevation of the educational and moral qualifications for admission to the service, the pursuit of a special educational plan with regard to those now in the service designed to promote their greater efficiency and familiarize them with the practical and economic questions concerning their vocation, and a fair and impartial basis of reward for their efficiency.

Two barriers to rapid advancement that I have noted are the observance of seniority in filling vacancies and the fact that certain desks are paid rather than their incumbents. As to the former, the mere fact that a man may have served 10, 20 or 40 years in a given office or department is not conclusive evidence as to his efficiency. Indeed, it is sometimes stated that this in itself is proof of inefficiency and lack of ambition. Be that as it may, if the higher positions are filled by men of this sort of avenues of progress are effectively closed to the ambitious employee.

Under the desk payment plan, the management may decide that the maximum figure for tariff clerks will be \$100, for rate quotation clerks \$75, for stenographers \$60 and so on. Irrespective of how efficient an employee may be who occupies a position in one of these classes, the possibility of his securing additional money in that particular position is precluded by this policy, the wisdom of which is open to question. It is not surprising, therefore, that an employee, finding his advance hard and being unable to obtain any additional remuneration or broaden his experience in connection with the duties he is now efficiently performing, begins to lose interest and may finally cast his lot with the incompetents.

The business of the railroad is manufacturing and selling transportation, and the lowliest employee to some degree assists in the sale of that product, and his inefficiency is frequently responsible for a loss which has no place in a well-organized and a well-regulated business.

Through the medium of the universities, the correspondence school, etc., a quantity of desirable timber is placed in the field annually, and seemingly the man who has bought, paid for and completed a vocational course should be given the preference over others who are not so equipped. Most all companies are engaged in some way or another in an educational plan to develop employees. For the most part this has been confined to machine shop practice and operating department employees by the apprenticing of student employees. Several lines, however, have a well-developed course in transportation embracing varied subjects, which is at the disposal of such employees as are inclined to take up the work.

In conclusion, I offer a suggestion which comes from the clerks themselves through a publication of theirs: "During the dull or ordinary times clerks should be shifted from one position to another, so that they may become familiar with the various tasks necessary to the running of the office. In busy seasons such training may make comparatively easy an increase of the force in some departments and a decrease of the force in others, thus reducing and eliminating the necessity of discharging experienced workers. When new workers are added only minor positions will be affected, and the net results will be the lessening of the total yearly mistakes." This plan also has its advantages in that it may uncover a man who is not particularly fitted for the position he may be occupying but is an exceptionally efficient employee on some other work in the same department.

The writer is convinced that the efficiency of the office rank and file may be greatly enhanced by the utilization of effective educational methods and mediums now available, and from the progress made in the past it is probable that the transportation interests will not fail to place their approval on these methods and thereby elevate the railroad job to the dignity of a profession.

La Salle Extension University.

Transverse Fissures the Result of Rail Gagging

Intergranular and Coalescent Types Caused by Local Application of Gag to Base and Head of Rail Respectively

BY P. H. DUDLEY

Consulting Engineer, New York Central Lines.

The cold straightening of rails after they leave the hotbeds is an important subject. The value of smoothness and stability of track has been recognized by railroad officials for many years, as indicated by the large outlays for stiffer rails, sufficient ballast, and efficient labor to maintain the surface of the track.

To make the present steel rails with large mechanical properties as girders is a series of theoretical and practical problems, and the old adage, "strike when the iron is hot," is true of each

transitory deflection to their position in the equilibrium depression under the passing wheel loads, but the undulations decrease with the increased stiffness and smoothness of the rails on the same roadbed.

Fig. 9 is a track indicator diagram of the surface undulations of the N. Y. C. & H. R. 4½-in. 65-lb. rail used in 1881. This had a narrow deep head, made from the recommendations of a committee of the American Society of Civil Engineers in 1873.

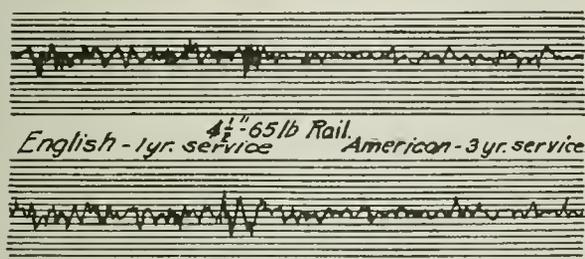

Fig. 9.

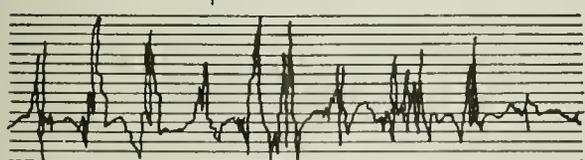

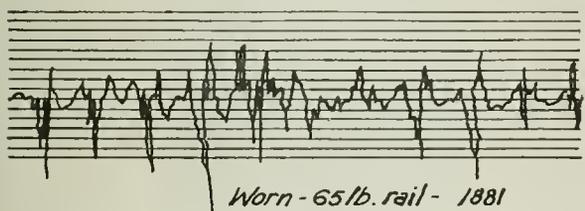

Fig. 10.

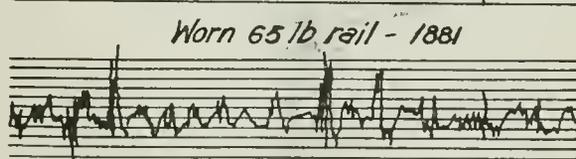

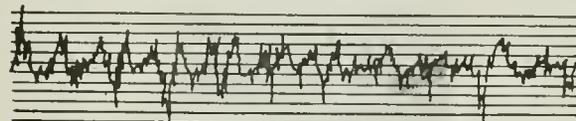

Fig. 11.

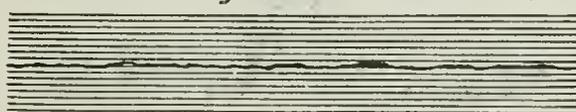

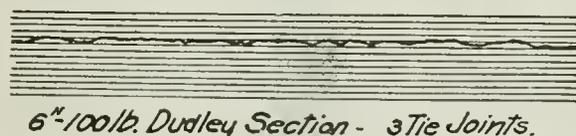

Fig. 16

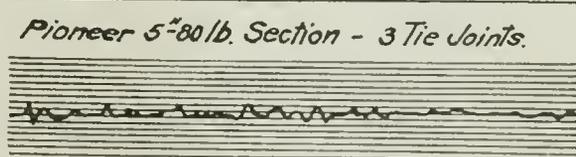

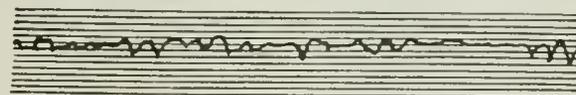

Fig. 17

Track Indicator Diagrams of Various Rail Sections Showing Their Surface Undulations

stage in its logical order—selecting the ores, smelting them in the blast furnace, making the steel in the open hearth furnace, teeming the ingots, stripping, then promptly charging them into the reheating furnaces, blooming the ingots, reheating the blooms, rolling the blooms into bars at suitable temperatures, hot sawing the rails, cambering, cooling and recalescence on the hotbeds, then cold straightening, inspecting, drilling the rails and loading on cars for shipment. The rails are then laid in the tracks where the metal of the section receives the "Twentieth Century" or other trains through the individual wheel loads, carries and distributes the strains in ample length of the section to the cross-ties, ballast and roadbed at 60 or more miles per hour, which can be repeated many times daily for years of service.

The raising of the standards of the track and the introduction of stiffer rails to accomplish this, is interesting history which can be illustrated by diagrams of my track inspection for a number of years. These will be limited to the indications of the surface undulations and joints of the two lines of rails which have been copied from my report in the Proceedings of the International Railway Congress, Sixth Session, Paris, 1900, where more complete diagrams of track inspections are reproduced.

These show the effect of the flexible roadbed inaugurated by John B. Jervis in 1832 after he opened the Mohawk & Hudson Railroad, Aug. 9, 1831, constructed with rigid supports for his strap iron rails. This is in the sense that, from the trackman's surface, the rails, crossties, ballast and roadbed undergo a

The spacing of the horizontal lines for the vertical undulations of the rails by the track indicator was 1/10 in., and the scale for length, 1 in. of paper to 50 ft. of track. These have been reduced about one-half in the illustrations.

The first part of Fig. 9 is a diagram of English rails, hot straightened, while the smoother part is of American rails which had been in service three years. The American rails were all cambered as they came from the rolls, and the general surface was smoother than that of the English rails.

Fig. 10 shows rails which had been in the track for several years; the joints were low and the receiving ends cut out, while a few of the rails were rough originally. The diagram was representative of the condition of tracks of light rails from 1878 to 1884 on the trunk lines, after about 8 to 10 years' service. Then the rails were taken up, the receiving ends cut off and redrilled, and the rails were relaid.

Fig. 11 shows rails with some receiving ends cut out at the

joints, though the rails themselves had a wavy surface. The crossties under all of these 4½-in. rails cut out under the seats and were destroyed by mechanical abrasion rather than decay. The generated dynamic wheel effects were large for moderate speeds. There was a general opinion among operating officials between 1870 and 1885 that the dynamic shocks on the iron and early light steel sections were nearly in proportion to the square of the speeds, and freight trains were limited to 12 and 15 miles per hour. Freight train crews which exceeded 16 miles per hour were disciplined on some roads.

We are unable to appreciate the difficulties of operation of the railroads on the early tracks, from our present standards. My track indicator ran over a few rail 4½-ft. lengths of the early fish-bellied rails with mitre chair joints, in a siding of the B. & A., and the average undulations were at the rate of 41 ft. per mile instead of 2 ft. in our best tracks. I ran over

Fig. 18—Intergranular Type. This illustrates the General Type of the Intergranular Nucleus and Is the More Common from the Fact That Rails Are Cambered as a Rule to Cool Low on the Hotbeds and Then Gagged Upon the Base

a few miles of 12 to 18-ft. iron rails, with chair joints, on the poorest track, and the undulations average 27 ft. per mile. Each joint gave severe shocks and the speed was limited to 12 miles per hour for the light equipment.

Fig. 17 shows the diagram of the N. Y. C. & H. R. pioneer 5-in. 80-lb. section, rolled by Capt. Hunt at Troy, in April, 1884—a short period for the present development. These rails Capt. Hunt was obliged to straighten upon short span supports, the same as had been used for the limber 4½-in. 65-lb. rails. The surface was “kinky” and the trackmen were never able to surface those rails to the value which was expected from their stiffness. They were removed from the high speed tracks as soon as smoother rails were obtained at the mills. When a sufficient mileage of the 5-in. 80-lb. rails was laid—over 60 per cent stiffer than the former 4½-in. 65-lb. section—the “Empire State Express” was installed on October 26, 1891.

I estimated and stated upon the condensed diagrams of the track inspection of the Boston & Albany in 1883 that with the stiff, smooth rails and good ballast they could reduce the undulations in their tracks to between the 15th and 16th lines on my condensed diagrams. This was after I had designed the N. Y. C. & H. R. 5-in. 80-lb. rail, but before it was rolled.

I distributed the metal in the B. & A. 95-lb. section in 1890, commenced rolling it in 1891, and completed the entire line in 1897. The undulations for the 400 miles of track were nearly uniform on the heavy gradients and averaged 15.42 lines on the condensed diagrams, confirming my estimate of 1883.

When I rolled the B. & A. 95-lb. section in 1891 and the

stiffer sections of the 5¾-in. 80-lb. and the 6-in. 100-lb. rail, with several others, in 1892, I had stipulated in the specifications that the supports in the straightening presses should be widened from 24 or 30 in. to 40 or 44 in. This resulted in a smoother finished surface and line of the rails than previously secured. The knowledge of what could and should be done was an important factor in securing the desired results.

Fig. 16 is the track indicator diagram of the 6-in. 100-lb. Dudley section in which the vertical undulations of the track were less than 1/10 in. The surface of the rails in the track was comparatively smooth, and the joints are not even indicated. The undulations in the track, which averaged 8 ft. per mile on the light rails in 1881, were reduced to 2 ft. per mile in 1892 by the use of the 6-in. 100-lb. rails on the same roadbed, with an added threefold capacity and stability of the track.

The determinations of the stremmatograph of the unit stresses in stiff rails under the subdivided wheel loads of the present heavier equipment show their favorable distribution through the metal of the section to the crossties and roadbed. These determinations furnish the explanation of the increased capacity and stability of the track of the 6-in. 100-lb. rail on the same roadbed over the former light sections as a more efficient engineering structure to distribute the effect of the wheel loads to the roadbed.

The knowledge acquired in the past 31 years in the design and use of stiff sections of steel rails to develop the high standards of track shows that the rails which are not smooth in the bearing surface of the head cannot be laid and maintained in surface by the trackmen as desired and expected from the stiffness and weight of the section. This is a condition of

Fig. 19—Coalescent Type of Interior Transverse Fissure. Transverse View Showing the Nucleus—a Crack Under the Bearing Surface. Rail Gagged on the Head

the steel beyond the ability of the trackmen to correct, which is intensified yearly by wear and deformation of section until the rails require renewal for smooth riding track.

To maintain the present rate of progress secured in transportation for the past quarter of a century improved methods are now required to finish the stiff rails without surface irregularities or injury to the metal. The hot stiff rails should be cambered to cool uniformly on the hotbeds, and these should be provided with automatic mechanism to space and move forward one rail at a time so that each can bend back and forth during the recalescence of the base, and then the head, without contact with adjacent rails. This needed improvement in the finish of the rails must be done through the study and co-operation of the manufacturers and consumers to produce the definite effect of smooth rails without unduly stressed metal. Each party to make and use a rail must know and be familiar with what has and can be done and the limitations, or misunderstandings will replace what should be mutual work and confidence. The consumers use and make the service tests, while the results of the past trials must be returned to the manufacturers with analysis of the facts and the reason why the conditions of service tests were not fulfilled as required for the progress of transportation.

The design of rail sections of large mechanical properties for the necessary girder stiffness and strength, involves an increase of metal, and therefore requires a higher degree of perfection of the mechanism to finish properly the stiff rails, essential for present and future transportation. Those with even heavy bases when spaced, do not cool sufficiently straight on the hotbeds to be used without correction, while the irregularities of cooling nearly straight are increased when the rails are bunched on the hotbeds.

To straighten either low or high rails from the hotbeds, of any section, the principle involved is that the metal of the neutral surface of the section does not change its length, while that above or below it must; that when the metal of the head requires to be lengthened, the base must be shortened, and that when the head requires to be shortened, the base must be lengthened. The present method is to apply the gag locally to put a permanent set in the metal, but it concentrates its effect in two or three inches of the head or base, and therefore puts and leaves internal strains in the metal where the gag is applied. These, when severe, often develop in service into half-moon breaks in the base, sometimes resulting in the complete fracture of the rail. The gag applied locally is one of the contributory causes for the development of the interior trans-

central core to make them hollow sometimes develop an interior transverse fissure from a slightly serrated surface on the wall of the hole in the drill. Pneumatic tamping bars of high grades of steel which have been broken and then repaired by "V" welds, the entire surface not being completely united, have also developed interior transverse fissures from the imperfect portions of the weld, and fractured the rods.

The coalescent type of interior transverse fissures develops

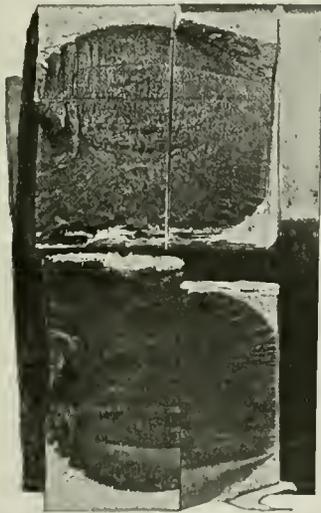

Fig. 20—Top View of Rail, Shown in Fig. 19, Uncapped and Sawed Twice to Uncap the Full Imprint of the Gag

verse fissures, the intergranular type when applied to the base (Fig. 18), and the coalescent type, when applied to the head (Figs. 19, 20, 21 and 22).

The improved method desired is, more efficient hotbed control, then mechanism to distribute its work to straighten the rails equally to each inch of length respectively of the head and base.

The gag applied locally on the head of the rail to straighten it, must produce longitudinal shearing strains under the bearing surface to upset and shorten the metal. When there are delayed transformations in the head of a rail from the higher metallographic entities to those of the lower temperatures as the hot rail cools, the gag subsequently in cold straightening may leave its imprint and uncap the nonductile metal.

There is still confusion in the minds of engineers of maintenance of way in reference to the interior transverse fissures, for they often designate those as "transverse fissures," which are of an entirely different character and origin. The interior transverse fissures develop from an injury or defect in the interior of the head, while a "transverse fissure" in the rail head develops from metal hardened in the bearing surface under slipping drivers, which becomes checked, and then by slow detail develops downward through the head and web, until the entire section may be fractured.

The development of "transverse fissures" in pneumatic tamping bars and drills, usually occurs from a slight defect in the exterior of the metal. Drills made from steel cast around a

Fig. 21—Coalescent Type of Interior Transverse Fissure, Gagged upon the Head. The Crack or Nucleus Shows Beneath the Bearing Surface

from a longitudinal imprint of the gag or uncapping of the nonductile metal. The metal of the edge of the crack, $\frac{3}{8}$ to $\frac{1}{2}$ -in. under the bearing surface, checks and becomes the nucleus, and by its coalescence starts the development of the vertical interior transverse fissure, which finally fractures the rail. It is characteristic of the coalescent type that the development of the verti-

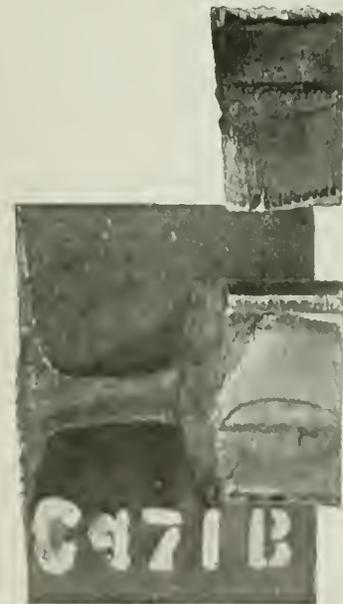

Fig. 22—Top View of Fig. 21, Showing Imprint of the Gag on the Rail Head, with Cap Above

cal interior transverse fissure follows the internal shearing strains of the edge of the gag nearest to the supports of the straightening presses. Therefore, while we find a similarity of effect, we must expect slightly different traces of its manner of coalescence and subsequent development.

I have, for the New York Central Lines, sent several

assistant supervisors of track who are technical graduates, to the steel mills to take a short course in the manufacture and inspection of rails, which is of great service to them in their maintenance work. They become familiar with the successive steps of manufacture and their significance to the service of the rail as a girder in the track to carry the moving equipment, and when they see the rust spots on the new rails in the track, they know they are the local permanent sets in the metal, produced by the gag to straighten the rails by the present method. This enables them to follow and criticize and understand my investigation of the contributory causes and classification of the intergranular and coalescent types of interior transverse fissures.

The education of 25 years with locomotives with increased total loads subdivided by more wheels and similarly constructed equipment running over the smooth rails, proves that lessening the undulations of the track, reduced the generated wheel effects, therefore train resistance, and rendered possible the increase of more than an equivalent percentage of paying loads on the same roadbed, essential to reduce the cost of transportation per pound or ton, the revenues of which are restricted by law.

It has taken years of service to realize what was indicated by theory and calculation, and then secured only by attention to every detail of manufacture of rails, equipment and their use, which must still be continued.

NATIONAL INDUSTRIAL TRAFFIC LEAGUE

The annual meeting of the National Industrial Traffic League was held at Chicago on November 17 and 18. A special committee, of which F. B. Montgomery, traffic manager of the International Harvester Company, was chairman, presented a report and a resolution, which was adopted, declaring the league to be in favor of the upbuilding of the American merchant marine under the authority of Congress. The report expressed the opinion that the United States should have a merchant marine comparable with that of other large maritime nations, in time of war to be subsidiary to the navy, and that there is little or no prospect of such a merchant marine being constructed and operated within the next several years by private capital. Therefore, the committee felt that the only apparent method at this time of securing a merchant marine of any appreciable number of boats is to support the administration in its recommendation that the government either construct, maintain and operate a merchant marine or furnish sufficient capital to build a reasonable number of boats to be leased to private individuals or corporations.

A special committee was appointed to consider the question of the liability clause in sidetrack leases and agreements. It was stated that the railroads are inserting in their new leases a clause which imposes liability upon the shippers for almost anything that may happen on the property.

On the recommendation of the Legislative Committee the league went on record in favor of the proposal to reorganize the Interstate Commerce Commission by the appointment of two additional members and the organization of the commission into divisions or departments. On the subject of the right of appeal from negative orders of the Interstate Commerce Commission, which had been on the association's docket at several meetings, after a general discussion it was agreed that apparently the shipper has an equal right in this respect with the carrier, and it was decided to take no action. At the recommendation of the committee, the president of the league was authorized to communicate with the Interstate Commerce Commission to see if there is any objection to a plan for amending the law or rules of practice of the commission to give litigants the right to review findings of examiners, and file exceptions and objections prior to the decision by the commission. The Legislative Committee was also instructed to follow the proposed legislation to increase the liability of ocean carriers. It was decided to lay on the table the subject of a uniform code of track storage rules, it being the sense of the meeting that such rules should give consideration to local questions.

In connection with the report of the Bill of Lading Committee, the previous action of the league in favoring a clean bill of lading, a simple common law receipt for freight, was reaffirmed and the committee was instructed to endeavor to secure a consolidation of the proposed hearings on export and domestic bills of lading.

The Freight Claim Committee reported that the Freight Claim Association of the carriers had called a conference to consider the entire subject of concealed loss and damage to freight, to be held on December 15, to which representatives of the shippers were invited, and a special committee of seven was appointed for this purpose. The committee reported progress on its compilation of a manual of instructions for shipping clerks and the committee was authorized to proceed with its publication, with the approval of the executive committee. Several letters had been received from representatives of the carriers, expressing a willingness to co-operate in the work.

The Classification Committee reported concerning the reorganization of the Official Classification Committee as a permanent standing committee, and expressed the approval of the league, which had advocated such a plan and has urged the Southern Classification Committee to adopt a similar plan. A report of the committee opposing the unit basis for establishing classification ratings was adopted.

J. M. Belleville, who attended the recent meeting of the National Association of Railway Commissioners as a special representative of the league, made a report suggesting greater co-operation between the league and the association, and between the chairmen of committees of the two associations on subjects in which the league was interested. At the San Francisco meeting he had been given the privilege of the floor and had participated in the discussion of all subjects in which the league is interested. It was proposed to send the chairmen of all of the league committees to attend the next meeting of the association.

A special committee on the handling of l.c.l. freight at transfer points reported that it had found many cases of delay due to operating conditions, in which cars were not handled in the order of arrival. It was decided that this was a question pertaining to the operating department, and the subject was referred to the executive committee to take up with the American Railway Association or other representatives of the carriers.

The Committee on Uniform Classification reported regarding the progress of the Uniform Classification Committee of the carriers, saying that it was proceeding as fast as the territorial classification committees can assimilate its work.

The Committee on Weighing submitted a report on the code of rules for the weighing of l.c.l. freight proposed by the American Railway Association, recommending that they be adopted with two minor changes. The report was adopted with instructions to the committee to continue its negotiations with the American Railway Association.

On the recommendation of the Legislative Committee, the Executive Committee was instructed to bring the subject of reparation to the attention of the Interstate Commerce Commission, with the representation that in every case where a rate is found unreasonable, complainant should be awarded reparation from the date of his complaint, at least, and that in every case involving the question of reasonableness of rates where reparation is asked the Interstate Commerce Commission shall be asked to fix the point of time at which the rates became unreasonable.

The annual dinner of the association was held at the Congress hotel on Wednesday evening. E. J. McVann, manager traffic bureau, Commercial Club of Omaha, spoke on the work of the league, and Col. George T. Buckingham, president, Chicago branch, National Security League, spoke on the subject of Preparedness.

Officers for the ensuing year were elected as follows: President, G. M. Freer, manager traffic department, Cincinnati Chamber of Commerce; vice-president, W. H. Chandler, manager transportation department, Boston Chamber of Commerce; secretary and treasurer, O. F. Bell, traffic manager, Crane Company, Chicago.

The Economical Handling of L. C. L. Freight Traffic

The Two Prize-Winning Papers Received in the Contest
Which Closed August 1. Practical Plans Described

Thirty-seven contributions were received in the contest on the Handling of L. C. L. Freight, which closed August 1. These papers were turned over to T. J. Foley, general manager, Illinois Central; E. H. Lee, vice-president and chief engineer, Chicago & Western Indiana, and C. B. Rodgers, assistant to vice-president, Chicago, Burlington & Quincy, who awarded the first prize to C. B. Anderson, agent, C. & E. I., Chicago, and second prize to C. G. Johnson, supervisor of station service, M., St. P. & S. S. M., Minneapolis, Minn.

Other contributors to this contest included: W. J. Northup, agent, D. L. & W., Secaucus, N. J.; A. E. Aumiller, chief clerk to agent, P. R. R., Harrisburg, Pa.; William L. Burt, assistant freight trainmaster, P. R. R., Jersey City, N. J.; William J. Collins, freight agent, D. L. & W., Syracuse, N. Y.; J. C. Goodsell, assistant agent, C., St. P., M. & O., Minneapolis, Minn.; W. F. Hebard, The Buda Company, Chicago; W. H. Gatchell, superintendent of agencies, Southern, Washington, D. C.; Henry A. Goetz, Chicago; Don M. Neiswanger, traveling agent, N. Y., N. H. & H., Boston; D. A. Tomlinson, assistant engineer, C. & W. I., Chicago; M. R. Sutherland, United States civil engineer, Cleveland, Ohio; H. W. Davies, Cent. of Ga., Savannah, Ga.; W. L. Campbell, B. & O., Baltimore; T. Russell, general foreman, I. C., Chicago; J. R. Jackson, assistant engineer tests, A., T. & S. F., Chicago; H. F. Kaho, district agent, M. P., Kansas City, Mo.; J. R. Ness, agent, A., T. & S. F., Wichita, Kan.; J. W. Lawhead, agent, C. R. I. & P., Blue Island, Ill.; J. H. Torney, assistant manager, S. P., New York City; C. I. Heckman, lake freight agent, L. V., New York City; H. M. Gain, trainmaster, G. T., Belleville, Ont.; C. A. Pennington, superintendent of terminals, C., C., & St. L. and C. & O., Louisville, Ky.; H. S. Jaynes, St. Paul, Minn.; Thomas F. Maher, general foreman, M., St. P. & S. S. M., Chicago; S. E. Miller, inspector of transportation, B. & M., Boston; F. G. Schultz, soliciting freight agent, N. Y. C., Pittsburgh; J. Mifflin, freight agent, P. R. R., New York City; Charles W. Brown, assistant superintendent, L. & N. E., South Bethlehem, Pa.; Frank Robinson, general agent, B. & M., Nashua, N. H.; C. H. Brown, agent, N. & W., Columbus, Ohio; F. H. Garner, transportation inspector, U. P., Omaha, Neb.; J. L. Coss, dispatcher, C., R. I. & P., Haileyville, Okla.; Leland Wadsworth, agent, Troy, N. Y.; M. S. Wise, assistant to general manager, M. & O., Mobile, Ala., and James P. O'Connor, Great Notch, N. J.

The two prize winning papers are published here and others will follow in early issues.

FIRST PRIZE—HOW THE OPERATION OF ONE LOCAL FREIGHT STATION WAS IMPROVED

By C. B. ANDERSON

Agent, Chicago & Eastern Illinois; Chicago, Ill.

What can be done to increase the capacity of the present freight station? Can this be accomplished without increasing the cost of operation? These questions, paramount in the minds of many local freight agents to-day, have been solved to a large extent by the innovations which have been introduced in the operation of the Chicago freight station of the Chicago & Eastern Illinois.

In different localities somewhat different methods are employed in handling l.c.l. freight, dependent on the facilities, the class of freight handled and local practices. The station layout consists of freight houses or platforms varying in dimensions and served by certain adjacent tracks, which have in most cases been enlarged or extended from time to time in an effort to accommodate the increasing requirements, but, as a result, have become expensive to operate under old methods. In some of the larger terminals, additional space cannot be obtained for de-

velopment, pending a complete rearrangement of the terminals. The future may provide for the double-decking of freight houses to obtain better and greater use of the space occupied, but this is something beyond the agent's control and he must deal with the conditions as they now exist.

The two-wheel hand truck is still the principal tool used, although four-wheel trucks and low dollies are used in some houses for handling certain commodities. At many points those in charge of such terminals have been endeavoring to relieve congestion and increase the efficiency by developing new methods and introducing new tools. The Chicago & Eastern Illinois has made considerable progress along these lines during the last three years; first, by adopting the individual bonus system; and, second, by the use of four-wheel trucks and motors.

An individual bonus system, similar to that in use on the Atchison, Topeka & Santa Fe, was put into effect in October, 1912. Separate schedules were made for checkers, callers, truckers, stowers and delivery men, also for the general foreman and his assistants. To prepare these schedules it was necessary to make a time study of each of the different classes of work performed and obtain accurate information as to the tonnage handled per hour by the different groups in handling the different classes of freight. It is generally conceded that past performances will indicate about 67 per cent efficiency, and from the figures obtained in this study the 100 per cent basis was established. The men are paid a graduated bonus for all work performed above 67 per cent efficiency, and at 90 per cent efficiency are given a bonus equal to 10 per cent of their wages. With each per cent of efficiency over 90 per cent the bonus is increased 1 per cent.

As the outbound house is operated under the no-gang drop-truck system, the schedule for the truckers and motormen is based on pooling all the tonnage handled through that house. All of the other schedules, however, are based on the individual tonnage handled. The schedules for the foremen are based on the efficiency obtained on the work under their supervision. In order to compile the bonus data, additional clerical expense was incurred amounting to \$110 per month, which is charged to the freight handling cost.

Under this plan, our men have increased their earnings 8 per cent to 12 per cent, and in some cases exceptionally good men earn a bonus equal to 25 per cent or 30 per cent of their wages. The increase in efficiency due to this bonus plan has effected a net saving in our cost of at least four cents per ton.

Co-operation is essential to the success of an organization, and any plan that provides for a division of the profits insures that co-operation. In my judgment, the individual bonus plan is an improvement on the pool bonus, in that it recognizes individual effort and places the reward where it belongs. It also enables a foreman to weed out the drones and build up a force of competent men.

It has been our experience that as the men are satisfied, they seldom leave the service voluntarily, and we are not required to train new men constantly. As they become more familiar with our work they are able to perform their duties with more speed and accuracy; consequently, the quality of the work performed has improved rather than deteriorated.

From July, 1912, to June, 1913, various storage-battery motor trucks were experimented with at the outbound freight house in an effort to determine the practicability of using them for freight handling. The truck makers advocated their use as a single unit, loading the freight on the motors at the receiving door and running them into the cars in which the freight was to be unloaded. While it was found that the trucking cost could be reduced more than one-half on the tonnage handled in this way,

two or three power trucks would haul but a small percentage of the total tonnage, as too much time was lost in loading and unloading. It was conceived that better results could be obtained by loading the freight on four-wheel trucks or dollies and using the motors as tractors to move the trucks in trains to the cars. As we had 12 four-wheel trucks and 6 dollies at this time, we equipped them with chains for coupling and continued our investigations along these lines. The results obtained from this system convinced us that this was the practical line on which motor trucks could be developed.

Finally, in June, 1913, we purchased three motor trucks and 36 four-wheel trucks of the "Reynolds" type, equipped with chains for coupling, and set to work in earnest to develop the tractor system of handling freight. Since then we have added to our equipment so that at the present time we have a total of 125 four-wheel trucks and 20 low dollies, and have practically eliminated the use of the two-wheel hand truck in the outbound freight house. Recently we have replaced the chain couplings with automatic couplers, which overcome the delay in coupling and uncoupling, and put a finishing touch to the system. This equipment is handling in the neighborhood of 750 tons of freight per day, which was formerly handled with 300 hand trucks; and 40 less truckers are required to handle the same tonnage. From this it will be readily seen that we have relieved congestion and increased our capacity. Since the installation of motors in our house, two other railroads in Chicago have adopted this tractor system of freight handling and a third road will soon put it in.

I am of the opinion that a large saving can be made in any outbound freight house with the use of four-wheel trucks, even where the trucking distance will not justify the use of the motors. A four-wheel truck occupies practically the same floor space as a loaded two-wheel truck and will carry from three to five times as much tonnage. If a good trucking floor is provided, one man can move as much tonnage with a four-wheel truck as four men with hand trucks, and with less effort. Where the trucking distance is more than 500 ft., I believe a further saving can be accomplished by the use of the motor trucks. Our records show that the four-wheel trucks and motors have enabled us to reduce our trucking cost about 8 cents a ton.

The original cost of the four-wheel trucks, dollies and motor trucks called for an expenditure of approximately \$8,000. The main item of expense for maintenance is for batteries, which, with proper care, should give two or three years' service. A charging panel has been installed in the outbound house and the motor trucks are given a five-hour charge during the night. The cost of current will not exceed \$20 per truck per month. A competent battery man is employed who is also capable of looking after the mechanical features of the motor trucks. His salary is also charged to the freight handling cost.

In order to outline briefly our system of handling outbound freight (which, with the exception of the trucking system, does not differ materially from the methods used by other lines in Chicago) it will be necessary to describe our house and track layout. The house proper is 844 ft. in length with a covered platform extending 890 ft. south, or a total maximum trucking distance of 1,734 ft. The house has a width of 21 ft. inside, with the exception of a distance of about 250 ft., occupied by the tunnel shaft and tracks, where the width is 28 ft. The platform is 20 to 25 ft. in width for a distance of 200 ft., the balance being about 11 ft. wide. Four tracks furnish a spotting of 75 cars adjacent to the house proper, while from one to three tracks located at the platform permit an additional setting of about 50 cars.

Freight is received from teams and tunnel and by car; an average of about 50 carloads of transfer and trap car freight being received daily, which must be unloaded and the cars used for outbound loading. The checkers' booths have been torn out and dial scales placed between two receiving doors. The checker's table is also located in this space, and to eliminate lost motion teams are allowed to back up to both doors at the same time. The checker and his caller, after taking off and checking

one load, immediately turn to the other door and commence to check the second load while the driver of the empty wagon is tying up his ropes and preparing to leave the yard. No delay occurs in handling the second load, by waiting for the teamster to back in and loosen his ropes, as is caused where a single door is operated.

After the freight is weighed and marked by the caller, who chalks the block number on the packages, it is pushed out on the floor to be taken to the designated car by the motors making regular trips through the house. Two men are located on the floor, who sort the trains in set-out order at different points in the house. The loads are set out by the motors and taken into the car by the stower, who is furnished with lists of the stations loading in the four cars under his supervision, and is held responsible for misloading. He is required to check the destination of each package (without regard to chalk marks) as it is placed in the car, and in the event of freight being sent to the wrong car, he notifies the foreman or loading inspector and holds the freight on the platform adjacent to his runway. He also confers with the loading inspector in regard to any freight for points regarding which he is in doubt. On account of the stower's importance under our system, his wages were increased about two years ago from the Chicago rate of 23 cents to 25 cents an hour.

The loading inspector is provided with a loading schedule. He goes among the cars throughout the day, inspecting the loading and instructing the stowmen, and has proved very useful in preventing errors in loading. Another inspector is employed to revise the loading from the shipping tickets. In case he develops that a checker has sent freight to the wrong car, the ticket is sent to the inspector in the house, who arranges to get the freight into the proper car.

Freight from the tunnel is handled very much the same way as that received by team, except that more men are used. The freight is all weighed on portable automatic scales, then marked up and loaded on four-wheel trucks and is sent to the cars.

In handling freight from the cars, a truck loader is used in addition to the caller. Tickets covering mail order business are sorted in alphabetical order according to destination, and the block numbers are put on such tickets before they are turned over to the checkers. This enables them to turn to the tickets and check the item readily as it is called, and the freight is then loaded on four-wheel trucks in peddler loads. It is customary to make several peddler loads to take freight for certain divisions of the house, each package being marked with chalk. This enables the motor to handle the mixed loads to a break-bulk point and from there they are handled by truckers, who distribute the packages at the proper runways. Peddler loads are also made in connection with the door and tunnel freight whenever it is found impracticable to attempt to get straight truck loads.

Our trucking distance has been increased approximately 600 ft. since 1911 on account of additional package cars added to our schedule during this period. We have also assumed several additional items of overhead expense on account of the new system adopted, and an increase in rate given the stowmen, as already stated. Regardless of this, a comparison of the cost of handling practically the same tonnage of l.c.l. outbound freight for June, 1911 and 1915, shows a decrease of 7.8 cents per ton.

Stowers085	.105
Total cost per ton.....	\$.486	\$.408

In an exhaustive analysis of hand-trucking prepared by experts about a year ago, it was found that the average trucking cost increased approximately 3 cents a ton with every increase of 100 ft. in the length of the house. Particular attention is, therefore, directed to the remarkable showing made in our trucking cost, which clearly indicates that with the tractor system the trucking distance is material only to a limited extent.

Our inbound house at Chicago is 800 ft. in length and 60 ft. wide, with a covered platform 150 ft. long of the same width, making a total length of 950 ft. This house is served by two tracks with a capacity of 50 cars. The house is divided into three sections, the two end ones being used for city freight and the center section for transfer freight. The freight for city delivery is taken to the nearest city section and the transfer freight unloaded at any point is taken to the center section. This minimizes our trucking on all freight handled.

The unloading force is organized in gangs consisting of a checker, a caller and three truckers. Two-wheel hand trucks are used. Prior to adopting the bonus system, each delivery clerk used a trucker. Since that time the truckers on the delivery side of the house have been dispensed with and the deliverymen now handle the freight. One or two men are furnished to assist in loading pianos and other heavy or bulky freight, when required.

Prior to January, 1913, the blind tally system was used, which required that practically all transfer freight be unloaded in the house and later rechecked and handled to team, tunnel car or railroad car, as the case might be. At that time, we changed to the present system of handling all freight with the freight bills. We do not receive all of the billing ahead of the cars, by any means, but obtain a sufficient quantity to get the men started in the morning and by special effort are able to supply the balance without interfering with the work.

This method enables the checkers unloading cars to dispose of most of the transfer shipments with one handling by sending the freight direct to the teams or tunnel, or to cars marked up for other roads to which we make delivery by car. Only the smaller shipments to be delivered by team are unloaded in the house and they are placed at designated locations in the transfer section by the unloading gangs; freight for each road being kept together for convenience in making delivery. The location of each line in the transfer section is indicated by a wooden sign. With this arrangement in effect, we rehandle less than 50 per cent of our transfer freight, require fewer delivery clerks, relieve congestion and effect more prompt deliveries.

In making a comparison of the cost of handling l.c.l. freight inbound for the months of June, 1911 and 1915, we show a decrease of 8.8 cents per ton, about one-half of which we attribute to increased effort on the part of the men, due to the bonus incentive, and the other, half to various changes in system.

SECOND PRIZE—IMPORTANT PRINCIPLES IN THE HANDLING OF L. C. L. FREIGHT

By C. G. JOHNSON

Supervisor of Station Service, Minneapolis, St. Paul & Sault Ste. Marie, Minneapolis, Minn.

The figures used in the compilation of the cost of handling less than carload freight at the larger warehouses of the majority of the railroads of the United States are arrived at by so many different methods, both as regards the tonnage handled and the expense of handling, as to make them very unreliable for a comparison of the handling cost per ton at one warehouse with that at another. Car load freight handled through the house by the warehouse force is often included and credit taken on the same basis as for l.c.l., while freight handled at industries and team tracks, moving as l.c.l. and unloaded or loaded by the consignee or shipper, is often included in the tonnage of the warehouse. Credit is sometimes taken twice for freight received, forwarded or transferred and sometimes for all of these divisions, when one handling is all to which they are entitled. The figures covering the tonnage are often obtained

from the monthly abstracts of the waybills, from the daily tonnage report or from the freight received and freight forwarded registers of waybills, all of which are, in a great measure, inaccurate for tonnage statistics.

There are, in my opinion, only three divisions of freight that may be used consistently in computing the cost of the handling of less than carload freight; freight received (covering that freight unloaded from cars for delivery); freight forwarded (covering that freight received at warehouse doors for outbound movement); and freight transferred (covering that freight handled from car to car. One handling of each of these divisions may be used consistently, if we are to establish a reliable cost figure.

The proper method of determining the actual tonnage handled, in, out and transferred, is as follows: For freight received, figures should be taken from the station record of the expense bill, the document used in checking the inbound freight, using only that tonnage covering articles actually checked. For freight forwarded, figures should be taken from the shipping tickets, using tonnage shown thereon as actually checked. For freight transferred, figures should be taken from the transfer record, using tonnage shown thereon as actually checked. This information should be compiled daily.

Although all of the above suggestions may be observed and the cost of handling as shown be slight, it does not necessarily follow that the freight has been handled economically. It may be handled at a low figure, in so far as the initial cost is concerned, but it may have been loaded without regard to intelligent handling; it may have been loaded in the wrong car, or station order may not have been observed; it may not have been trucked or stowed safely, or after it is in the cars it may not have been handled carefully in the switching service, in trains or in the unloading. When we speak of the economical handling of l.c.l. freight we must consider that it must be received, loaded, unloaded and delivered in good condition, or it has lost its economical feature.

In a great measure, the unintelligent handling of l.c.l. freight is due to lack of supervision and a lack of the proper education of check clerks, callers and stowmen as to their duties. It is to be deplored, but it is true, that check clerks, callers and stowmen are generally ignorant of the rules of the classification under which they work, especially as regards the proper marking and packing of freight shipments. There seems to me to be only one remedy, and that is to educate the check clerks along the lines of intelligent handling, pay them well and insist upon their observance of the instructions issued by the railway and the rules of the classification. Agents, as a rule, do not work closely with check clerks, stowmen and callers, but leave the entire handling of the warehouse to the foreman. In my opinion, this is improper. Agents should call the foremen, check clerks, stowmen and delivery clerks into conference at intervals and make them realize that they are an integral part of the organization and that it is within their power to solve the problem of economical freight handling.

THE OUT-BOUND FREIGHT HOUSE

A first-class floor is necessary, maple being preferred. Freight can be handled on a good maple floor approximately 16 per cent faster than on an ordinary rough board floor or on a rough concrete floor. Check clerks should be on their feet near the freight to observe marks and the condition of packages. It is a mistake to provide check clerks with closed booths, as they are not in a position while in these booths to see the freight they are checking, but depend on the caller entirely. Callers being lower salaried employees, should not be depended on to any great extent.

Check clerks should see that sufficient trucks, preferably four-wheel, are provided on the floor near the door. If two-wheel trucks are used, wooden racks should be provided to fit on the shoes of the trucks. The most satisfactory rack is 32 in. high, 24 in. wide at the bottom, 30 in. wide at the top and concave at top. This rack will fit between the handles on the front of

truck as well as on the shoe, and when properly used, will increase the tonnage capacity of the trucks 100 per cent. A strict drop-truck system should be maintained, no freight being allowed to go to the floor, but all loaded on trucks when received.

A line running the entire length of the warehouse on the car side should be painted on the floor, denoting the dead line behind which all loaded trucks should be placed to avoid congestion in the warehouse, leaving a runway open and allowing trucks to be placed conveniently for handling by truckers and stowmen.

Check clerks should be provided with a copy of the current freight classification in order that they may know what freight should be accepted. They should also be provided with an accommodation list, showing all firms entitled to credit, in order to protect prepaid collections on outbound shipments.

Each receiving door should be provided with an automatic scale for the rapid weighing of freight. Weighing of freight is an important factor in the protection of revenue, and as freight is generally received in a rush, rapid weighing is necessary. A door should be reserved for the receipt of small packages in order that the congestion may be relieved at the regular receiving doors.

Each check clerk should be supplied with a caller. When freight is presented, the check clerk should separate the shipping order from the balance of the tickets and enter on it the block or symbol number of the car into which the freight is to be loaded, lining up the shipping orders in alphabetical order as to stations, for convenient checking. What is known as blocking the tickets—that is, placing the symbol number of the car thereon—is sometimes done in the foreman's office of the outbound house, and when it is possible to handle it in this manner it is best, as it places the responsibility on one man. A caller should call the consignee's name and destination and should use the greatest care to see that the calling agrees with the marks upon packages. The check clerk should not depend on the caller, but should be on his feet near the freight, and should closely observe all marks on packages, seeing that all old marks are effaced and that no shipment is received that is improperly marked or packed, or that does not comply in every way with the rules of the classification.

Check clerks should keep an accurate record of freight checked by them and render a report daily to the warehouse foreman covering. Immediately after freight has been checked and the shipping orders blocked with symbol numbers of the car they should be sent to the tonnage clerk for the preparation of tonnage statistics.

All freight should be plainly marked with the symbol number of the car into which it is to be loaded. Truckmen should not be permitted to enter the outbound cars without permission, and then only in cases of emergency, in order that loitering in cars may be eliminated and that the delays caused by the unloading of trucks or waiting for the stowmen may be avoided and that the truck haul may be shortened with only a slight increase in the work of stowmen. Truckmen should move freight from behind the dead line to a point near the door of car runs to which the freight is to be loaded. Trucks should be placed with the shoe near the wall with handles outward, where they will be readily accessible to stowmen.

The number of cars that may be properly stowed by one man depends on the tonnage of the cars and their location on tracks. If all cars are in one run, as high as eleven may be stowed by one man successfully. Stowmen should understand the intelligent stowing of freight, the importance of loading the freight into the proper car, of pulling nails from the sides and floors of cars, and of removing old placards and train cards from cars. They should handle all freight from behind the dead line in the warehouse near the cars, into the cars, stow the freight and return the empty trucks to the opposite side of the warehouse near the receiving doors.

A skeleton loading along the sides and end of car should be observed and freight piled high, temporarily. At the close of the day's loading they should break down all freight in the cars and satisfy themselves that it will ride safely.

When freight is erroneously marked to a car, a report should be made by the stowmen to the foreman in order that the responsibility may be located and action taken to avoid a recurrence. Forms should be provided stowmen for this purpose.

Waybills should be mailed to destination agents in order that they may be expensed prior to the arrival of the freight and the station record of the expense bill used as a checking tally, the cars moving on slip way bills. These bills should be compiled in the foreman's office.

All shipping tickets should be sent from the foreman's office, direct to the waybilling department, and there separated into car order, the symbol numbers being used in the distribution. Waybilling clerks should be furnished with a copy of the daily loading schedule, from which they should obtain the car numbers. The shipping ticket bearing only the symbol number makes it necessary that they use care in the waybilling of car numbers and as a result few errors are made.

Waybill clerks should be prohibited from waybilling any item that does not show as having been checked on the shipping ticket and the ticket should be returned to the warehouse for a verification of the check. All shipping tickets should be completely revised against the waybills as soon as waybilled and a check made on the original waybill. This insures correct way-billing. Waybills should be numbered with a numbering machine and thrown into a distributing case, all waybills covering less than carload freight being distributed under the block or symbol number, and afterward, if covering a way car, in station order for the convenience of the conductor. The waybill pouching clerk should be impressed with the importance of proper pouching, as a waybill incorrectly pouched means that the freight covered thereby will check over at one point and short at another.

As all waybills for one car are distributed together, they should be mailed in that order, to facilitate the expensing at destination. All waybills mailed should be covered by a register and care should be taken to see that they move on the first available train. Envelopes in which waybills are enclosed should be marked with large type, "RUSH—WAYBILLS," in order that the receiving agent may readily separate them from other registered material.

HANDLING THE INBOUND FREIGHT

The inbound cars should be placed at night, if possible, and be ready for unloading at 7 a. m. The house should be subdivided into sections, alphabetically arranged for the handling of miscellaneous shipments. Boards 14 in. by 14 in. in size should be provided for each section, placed in a conspicuous position on posts in the warehouse or on the wall of the house and lettered in large-sized letters. Shipments for large concerns, connecting lines of railways or steamships, transfer companies, hold pile and over pile, should be each allotted a space sufficient to accommodate the ordinary run, and these sections should be indicated by symbol numbers conspicuously placed.

A loose leaf record should be provided for the register of all through waybills covering freight transferred or passing. The expense desk will furnish the house with a station record of expense bills arranged in car order for a checking tally. Check clerks should arrange the station records furnished by the expense desk in alphabetical order as to consignees for each car, using an alphabetical index between the station records for rapid handling.

All freight apparently damaged or recoopered should be sent to the hold pile to be handled by the O. S. & D. department, and the disposition should be shown on the station record. The shipment should remain there until a complete inventory is made, and the extent of the damage ascertained, and should not be delivered until released by the O. S. & D. department. Local freight checking over should be run to the over pile and be held there until cleared by the O. S. & D. department for delivery.

Arrival notices should be served by messenger when possible, and by mail otherwise, immediately on the unloading of the freight. Subsequent notices should be issued each week thereafter, and after a second notice, if still unclaimed, the shipper should be notified and asked to furnish disposition. Perishable

shipments that are refused or uncalled for should be sold to the best advantage without delay. Delivery clerks should see that teamsters and other parties receiving freight are not permitted to enter cars or allowed to move freight from the warehouse without their permission.

Storage should be assessed on all shipments remaining in the house over the free time regardless of the fact that bills have been paid, to keep the warehouse clean of freight and to give the consignees first-class service. The waiving of storage charges congests warehouses and cripples the service.

A blind check should be made of the warehouse at least twice a month and the check compared with the expense bills in the cashier's office. This will keep the house free from irregularities, and in many instances effect delivery of shipments that otherwise might remain on hand indefinitely, causing dissatisfaction on the part of the consignee. Street addresses are sometimes left off the expense bills or are not waybilled, although the packages bear the address, and a notice is issued without it. A warehouse check detects these errors. Over freight run to the wrong section is also detected and promptly forwarded to destination.

If a freight warehouse exceeds 600 ft. in length the use of electric trucks for the handling of the outbound business, especially, will save money, provided the trucks are four-wheel and large dollies are used with them, as trailers. One man should be assigned to handle the motor truck and one man to act as a switchman to make couplings, set out the trailers, etc. Where electric trucks, four-wheel trailers and dollies are used, what is known as "peddler" trucks may be successfully loaded and trucked. The longer the truck haul the more economical electric trucks prove. A good motor truck will take five and six fully loaded four-wheel trailer trucks per trip. Sufficient low dollies, especially constructed for the handling of barrel oil, sugar, heavy cases of dry goods, heavy machinery, gasoline engines, etc., should be provided, as these commodities cannot be loaded to advantage on regular four-wheel trucks.

There is now being manufactured a low four-wheel truck that is being used very successfully at a large transfer point recently visited by the writer, in the handling of less than carload freight. All freight is trucked by hand and moved on these trucks, two-wheel trucks being used only for the loading of freight on the four-wheelers, and by the stowmen. At warehouses and transfers where the truck haul is short, freight can be handled by this method at a cost of, approximately, 15 per cent less than by the use of two-wheel trucks fitted with racks. As increased train tonnage decreases the transportation cost per ton-mile, so will the use of four-wheel trucks increase the tonnage of freight handled per truck haul and correspondingly decrease the cost per ton of handling less than carload freight.

There is no more important subject in connection with the handling of less than carload freight than the proper marking and packing of freight shipments, nor is there any greater contributing cause toward loss and damage claims than the failure on the part of railway employees to observe the exceedingly simple rules governing. All employees should be made to realize the fact that a shipment bearing only one marked destination will invariably reach that destination with despatch, while if allowed to move forward bearing two or more marked destinations, it will probably be forwarded to the wrong destination, delayed or possibly lost.

Freight should not be received unless packages are marked in accordance with the rules of the railway and the classification, nor should any package be received that is unfit for transportation. It is an injustice not only to the railways to receive freight improperly marked or packed, but to the shipper and consignee as well.

INVESTIGATION OF IRREGULARITIES

Over, short, or damage reports should be made covering all irregularities, no matter how trivial. Unless the agent at the loading station is advised of the irregularities found against the loading, he will not know of them and will assume that his loading is good. O. S. & D. reports should be investigated by the operating department, and a bureau should be provided for

the exclusive handling of these investigations, either in the superintendent's office of each division, or in the office of the general superintendent of each district. All irregularities should be investigated thoroughly, the responsibility determined, and the proper party charged with the error. A sufficient number of men who are experienced in the handling of less than carload freight should investigate personally the actual handling of the freight and see that rules are complied with, that methods are installed that will increase the efficiency of the service, that the warehouse organizations are efficient and that proper supervision is exercised, not only in the loading and unloading of freight at the warehouses, but in the handling of freight by trainmen.

A bulletin should be issued by the bureau monthly, showing the irregularities charged to the various stations, in order that agents may know just how freight is being handled at their stations. This bulletin should include irregularities chargeable to train crews in order that division superintendents, conductors and trainmasters may take the necessary steps to improve the handling by the crews.

A bonus should be allowed to all classes of warehouse employees for services performed in excess of their regular duties. Employees should be compensated according to their individual efforts. This will act as an incentive to them to put forth their best efforts, in order that they may exceed the work required for the regular wage, and receive the additional compensation. A penalty should be imposed for all irregularities chargeable to the employees. As penalties will reduce the bonus earned, it necessarily follows that employees will endeavor to avoid errors.

THE RAILROADS AND THE PEOPLE*

BY WILLIAM SPROULE
President, Southern Pacific Company

The primary relation of the railroads and the people is that the railroads sell transportation to the people. To many minds this relation disposes of the subject. The common notion is that the people have nothing more to do with it than may be necessary to obtain their transportation at the lowest price. If the buyers of bread had a voice in the fixing of its price, bread would be cheaper, indeed. If the buyers of meat had a voice in the price of meat, it would not be long before the price would drop so low that the farmer would find it without profit to grow livestock. But the people have a voice in the fixing of rates for transportation and the buyer of transportation concerns himself little with the question as to what effect the price has upon the railroads. The price is seldom low enough to satisfy the purchaser. If he is satisfied, his satisfaction with any given transportation rate or rate condition is only temporary. The mere lapse of time suffices to create further demands that the service be rendered for less money. This follows the impulse of self-interest. We all know that this impulse is not always safe or sound.

There is an epigram that in a kingdom of the blind a one-eyed man is king. A hard task before the railroads is on the one hand to correct the impressions which serve for opinions among people blinded by what appears to be their self-interest, and on the other hand to contend against that kind of one-eyed domination of the railroads which keeps one eye upon popular opinion without an eye of vision for what is necessary to bring the greatest good to the greatest number. Yet there is a conjunction of interest which so far has hardly been perceived, but which is sufficient to warrant the railroads and the people in taking counsel together for promotion of the common safety.

THE PUBLIC AS INVESTORS

There are in the United States over 250,000 miles of steam railroad, which have about 600,000 shareholders and about 1,750,000 employees. This figures, roughly, one shareholder to three employees. If you will average the railroad shareholders they will stand within 700 yards of each other along every mile of steam railroad in the nation. This means that throughout the United

*Abstract of an address presented at the Annual Convention of the American Bankers Association, at Seattle, Wash., Sept. 7, 1915.

States each shareholder would be in plain sight of two other shareholders along the right of way. Yet because of the free and easy way in which the public has attached to the railroad properties the names of well-known men, the people generally have a vague belief that the railroads are owned by a very few wealthy people. The facts run to the contrary. The railroads are owned by a great army of the people; people who have put all their savings into railroad shares until 600,000 of them are direct owners. It requires no argument, unless we argue the obvious, to show that if the savings the people have had thus entered into railroad ownership prove to be secure, and the returns to them, as the owners of the money, prove to be attractive, there will be little trouble in obtaining from them and others like them more money for improving the railroads which now serve the people, and for extending them into sections whose development is standing still because of the lack of railroad service. As a question of public policy is it not fundamentally sound that the rights of these hundreds of thousands of saving and prudent people should be given as serious consideration as any other factor in the railroad question? Is it not obvious that there should be accorded to them the same full measure of solicitude which is extended to other human factors prominently before us in all industrial discussions?

But there are still other hundreds of thousands of people who have a personal interest in the railroads. Those whom our political saviors call the common people (why they are called common I do not know) are the chief users of the savings banks of this nation. These savings banks have for their depositors about 11,000,000 of the people. These savings banks carry between eight hundred and nine hundred millions of dollars in railroad bonds and stocks.

It is hardly necessary to refer to state and other banks and trust companies, whose holdings in protection of their depositors and in the conduct of their business count up to several hundred millions of dollars more. This aspect of the subject carries us into still wider fields. Among the large holders of railroad securities the life insurance companies are of vast importance to the people. In the United States there are over 34,000,000 life insurance policies.

THE INTEREST OF THE EMPLOYEES

As already stated, there are over 250,000 miles of steam railroad in the United States, with a roster of about 1,750,000 men. This is a vast army, even in these days of vast armies that affect us with awe. This army of the people relies directly upon the railroads for its livelihood. It has the right to adequate consideration by the government. This consideration it has only in part received.

There has been no recognition of the fact that working hours may be shortened, conditions of labor may be made ideal, safety may be attained, crews may be stuffed full to overflowing and yet the prosperity of this army of people fails simply because the railroads lack the ability to earn enough to keep the men at work, much less to expand, improve and extend the lines and the service. It is to the direct interest of the employees and those dependent directly upon them for their subsistence that the railroads have prosperous earnings.

It is to the further interest of the employees that shareholders also have prosperous returns, for the employees cannot safely forget that, averaged over the American system of railroads, one shareholder means three employees. To maintain and operate the railroads takes not the shareholder alone or the employee alone; it requires them both, and they stand as numbers only in the ratio of three to one. Theirs is in reality a common interest in obtaining adequate earnings.

One blade cannot for long cut into gross earnings without bringing into activity the other blade which cuts expenses. Of expenses over 45 per cent are for wages. In fact, 70 per cent of all the disbursements of the railroads, even when taxes, interest and dividends are included, are for three items of wages, fuel and supplies. The railroads give good wages ungrudgingly. The con-

tentions are rarely upon the wage schedule itself, but upon need- less and embarrassing and complicated incidentals. What the railroads have to contend and urge, notwithstanding their desire to pay their employees well, is the plain fact that the railroads have not adequate income out of which to pay these wages. In the two decades from 1894 to 1914 the revenues from operations of the steam railroads increased 183 per cent, but expenses of operation increased 200 per cent. The numbers of employees increased 118 per cent., while the compensation of employees increased 213 per cent. I will state it in another way: with the rates of 1904 as a unit, the railroads would have earned about \$160,000,000 more than the earnings in 1914. While the railroad revenues were thus reduced in the sum of \$160,000,000, the compensation paid to employees was in the same time increased by something over \$100,000,000.

This process cannot keep up indefinitely. As an economic question it is impossible that the compensation of employees can continue to increase while the compensation of employers continues to decline.

So we could move along into the various phases of human activity, only to find that the railroads and the people have interests in common to an extent the people do not yet realize, but when they do realize they will wake up in their might to the fact that the railroads' prosperity is their prosperity. The people will rise to acknowledge that it is the function of the government to be watchful of their interests as a whole, and then the one-eyed man no longer can be king.

They will insist, in the interests of all the people, that the railroads be maintained in a condition of physical and financial strength and that they be released from "the tyranny of prejudice" and relieved from the paralysis of uncertainty. Whether it be the shareholder, the bank depositor, the holder of insurance policies, the railroad employees and their people, or the public generally, all will do well to remember that amid the loose and casual talk about watered stock and over-capitalization it is no longer seriously contended that the railroad properties of the United States are worth less than the amount of their capital. Yet the earning power of the railroads upon the capital employed has so declined that at the present time out of every \$100 of gross earnings which comes into the treasury \$14 has to be set aside to pay interest upon bonds, although the bonds bear but a moderate rate of interest. These bonds were taken up, on faith in the earning power of the properties, and were issued in compliance with the laws of the land. They are held in this country and abroad, and this young and great nation can well see to it that the earning power of its railroad activities is maintained. Especially is this so since it is known throughout the world that the railroads have been under government scrutiny and control for more than a generation. It is true that railroad financial administration may be criticized in spots, and just criticism is wise, but they are like certain dramatic points in a picture; they catch the attention, but they do not tell the story. The people, instead, may be invited to survey the whole history of American railroading, from its pioneer beginnings, through unmapped difficulties and through periods of crisis when great administrators pledged their personal fortunes to save the properties, down to the present moment, and in a wide survey of 50 years it will be acknowledged that as a bank may fail without imperiling the banking system, so the long ordeal through which the American railroads have passed still finds the moral basis of railroad management upon a very high plane in which the American people may take becoming pride.

It is time for the railroads and the people to take counsel together, for the uncertainty which touched the railroads first has reached to the people. This nation needs prosperity more than it needs anything else. No business prospers by repression. The effect and influences of government should be stimulating or they are a failure. The American people prosper together. When we prosper we are all prosperous. The pursuit of life, liberty and happiness has prosperity for its reward, the railroads and the people in conjunction and alike.

Locomotives Ordered in America for Foreign Countries

Engines Built by American Locomotive Co. for Greece,
Serbia, Belgium and Russia Have Many Unique Features

The past year has seen an enormous increase in the exports from the United States, brought about by conditions incident to the war in Europe. The railway equipment building industry is one of those affected by these conditions, large foreign orders for both locomotives and cars having been placed from time to time. During the past few months the American Locomotive Company has delivered a total of 177 locomotives on foreign orders, in most of which early delivery was an important factor. It is of interest to note the extent to which American practice has been followed in the design of these locomotives.

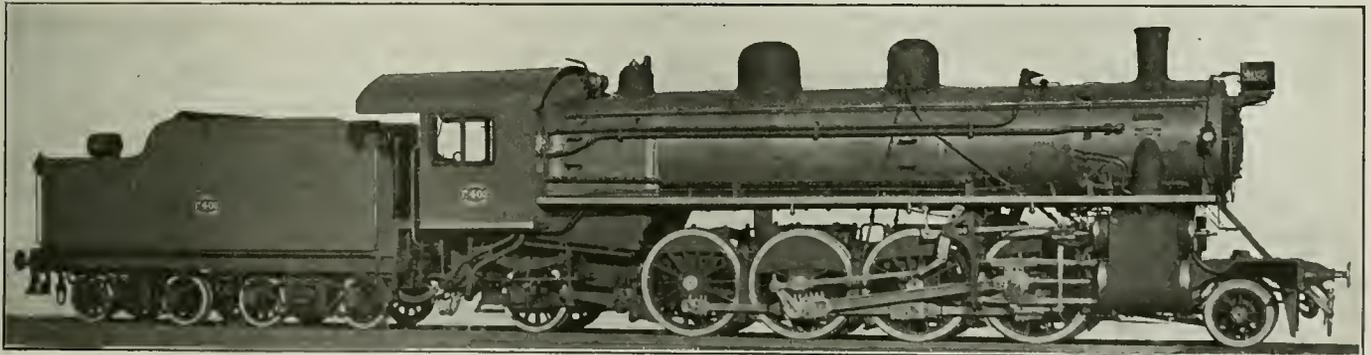

The largest single order was that of the Russian government for 100 locomotives of the 2-10-0 type, which were described and illustrated in the *Railway Age Gazette* for September 10, 1915, page 474. The other orders were for 20 2-8-2 type locomotives for the Greek government railways, 10 locomotives of the 2-6-6-2 and 12 of the 2-8-0 type for the Serbian government, 20 0-6-0 type tank locomotives for the Belgian state railways and 15 locomotives of the 2-6-0 type for the Russian government.

The 2-8-2 type locomotives delivered to the Greek government will be tested on a section of road 43 kilometers (26.72 miles) long, having a gage of 4 ft. 8 11/16 in. Most of the curves are 300 meters (984.3 ft.) radius and for a distance of 2.17 miles the grades vary from .45 per cent to 2 per cent; then for a dis-

458 sq. ft. The grate area is 34.7 sq. ft. While the heating and grate surfaces are smaller than would be considered good practice in this country, they are as large as could be obtained within the imposed limitations of weight, and in comparison with continental locomotives they represent liberal proportions.

Among the details of special interest are the cylinder safety valves, by-pass valves and water gage cocks. The cylinder safety valves are similar to the builder's standard cylinder head relief valve with the exception of the alteration necessary to permit attachment to the ends of the cylinder barrel. Provision was made in the alteration, for the cylinder cock connection, thus avoiding any additional holes in the cylinder barrel. The by-pass valve differs from practice in the United States in that it is operated from the cab by a system of levers. The water gage cocks are designed to close automatically in case the glass breaks.

The design of these locomotives follows American practice with the exception of bolt threads. All outside connections and parts subject to interchange have international threads. Metric threads were used on all bolts, boiler studs and staybolts. The engines are provided with steam heat equipment, electric headlights on both ends, self-centering valve stem guides, the latest Cole trailing trucks, screw reverse gears, Le Chatelaier water brakes, speed recorders and pyrometers. The engines and tenders

Locomotive of the 2-8-2 Type for the Greek Government

tance of 18.64 miles there is a continuous grade of 2 per cent. This is followed by a down grade of 2 per cent about 4 miles long and the remainder of the section is level. A guarantee was given that the locomotives would haul over this line a train of 250 metric tons (275.6 short tons) back of the tender at a speed of 25 kilometers (15.53 miles) per hour on the continuous 2 per cent grade and at 60 kilometers (37.28 miles) per hour on the level, or a train of 190 metric tons (209.5 short tons) back of the tender at 40 kilometers (24.86 miles) per hour on the 2 per cent grade and at least 80 kilometers (49.71 miles) per hour on the level. Having a specified axle weight limit of 15 metric tons (33,080 lb.), these engines, with a weight on drivers of 131,800 lb. and a total weight of 187,500 lb., are as large as it was possible to build. With 23-in. by 26-in. cylinders, a boiler pressure of 170 lb. and 60-in. drivers, they have a tractive effort of 33,200 lb.

The boiler is of the straight top radial stay type. It is 61 in. inside diameter at the front end and is fitted with 134 2-in. tubes, 19 ft. long, a 21-unit Schmidt superheater and a brick arch supported on tubes. The firebox is of copper and is 83 3/4 in. long by 59 3/4 in. wide. The tubes are steel, but have copper ends 6 in. long at the firebox end and all water-space stays are copper, with tell-tale holes drilled in both ends. There is a total evaporating heating surface of 2,031 sq. ft., of which 1,881 sq. ft. is in the tubes and flues, and a superheater heating surface of

are equipped with vacuum automatic brakes, which are now in use on the Greek roads. The use of air brakes is contemplated and the engines are arranged so that they may be applied with the least possible trouble.

On February 9 an order was received from the Serbian government for 10 2-6-6-2 Mallet locomotives of new design. All drawing room work was done in 19 working days; the first engine had been designed, built, tested, knocked down and shipped on April 8.

These 10 Mallets and the 12 Consolidation locomotives have outside frames, which were necessitated by a gage of only 30 in. As many details as possible were made interchangeable between the two classes. The Mallet engines have a total weight of 126,000 lb. and cylinders 13 in. and 20 1/2 in. in diameter by 20 in. stroke. The driving wheels are 36 in. in diameter and boiler pressure is 200 lb. They are fitted with the builder's system of compounding and have a tractive effort working compound of 24,300 lb. Working simple the tractive effort is 29,200 lb. The boiler is of the straight top type, 52 in. in diameter at the front end and has 157 2-in. tubes, 15 ft. 1 1/2 in. in length. By means of a brick wall, a grate 85 in. long by 39 1/4 in. wide is installed in a firebox 114 1/8 in. long by 39 1/4 in. wide.

An order for seven Consolidation engines was received from the Serbian government on January 12, which was increased to 12 on January 28. Five of the engines were shipped on March

11 and the remaining seven on March 18. The Consolidation locomotives have a total weight of 80,500 lb., cylinders 15 in. in diameter by 20-in. stroke, carry a steam pressure of 160 lb. and have a tractive effort of 17,000 lb. The boiler is of the straight top type, 47 $\frac{7}{8}$ in. in diameter at the front end and is fitted with 126 2-in. tubes 15 ft. 1 $\frac{1}{2}$ in. in length; the firebox is 48 3/16 in. long by 39 $\frac{1}{4}$ in. wide. The builder's standard methods of construction were followed in these engines throughout.

In Belgium the use of overhead trolley wires is prohibited and, although electric traction is used in the cities, all interurban

sheets extend from the bottom of the frames to the bottom of the side tanks. Five swinging doors on each side allow access to the moving parts. The engines are arranged for operation from either end. The throttle and reverse lever handles are fitted with steel links which hold the latch levers open when the engine is being operated from the opposite end. A hand-operated automobile horn is installed on each end.

Early delivery being an important consideration in the order for 100 locomotives of the 2-10-0 type for the Russian government, it is of interest to note the time spent in the design and

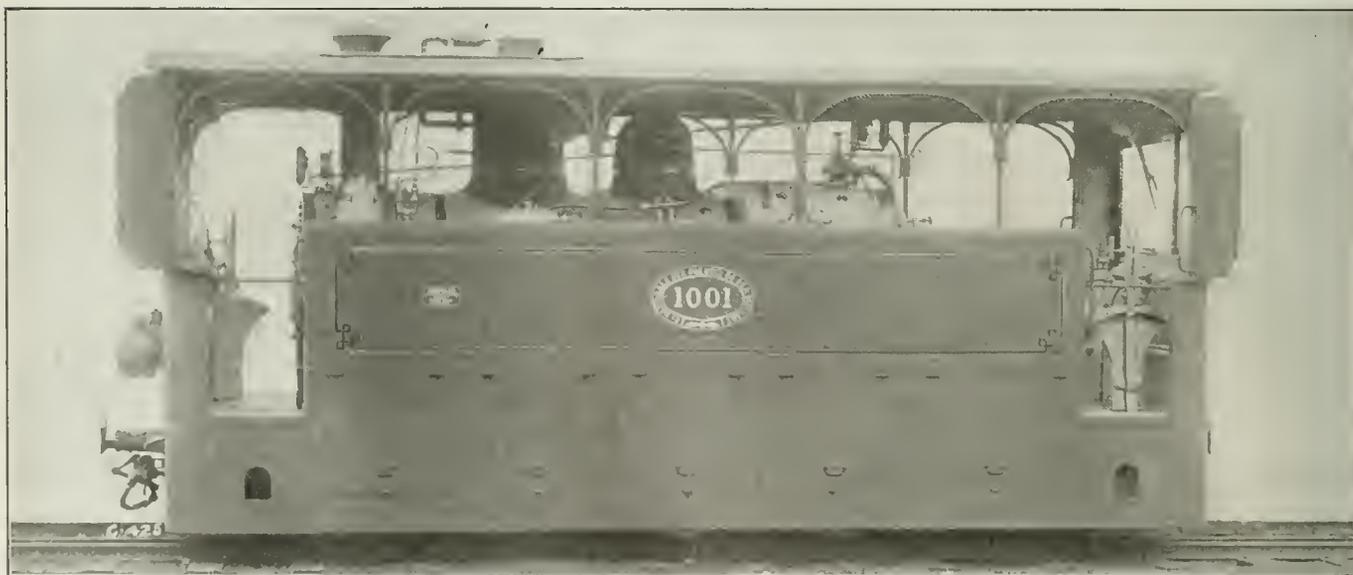

Narrow-Gage Mallet Locomotive with Outside Frames for the Serbian Government

traffic is handled by small steam locomotives of unique design. These engines haul passengers and produce to the distributing centers in the large cities, the tracks connecting with the electric lines. An order for 20 tank locomotives for this purpose was placed by the Belgian state railways on June 2, the first engine being shipped on August 19. The gage of the track on which they operate is 39 $\frac{3}{8}$ in. and the total weight in running order is 58,900 lb. Having cylinders 11 $\frac{1}{2}$ in. in diameter by 16 in.-stroke, driving wheels 34 in. in diameter and a steam pressure of 180 lb., they have a tractive effort of 9,520 lb. The boiler is of the Belpaire type, 42 in. in diameter at the front end, and is designed to burn coal briquettes. It is fitted with 144 tubes 1 $\frac{1}{2}$ in. in

construction of these engines. Drawing room work was started on June 19. The design was an entirely new one and was completed and the material ordered by July 15. The first locomotive had been built, tested under its own steam, knocked down, boxed and shipped by August 18.

The cylinders of these engines are provided with by-pass valves, a unique feature of which is an arrangement whereby they are controlled by superheater damper cylinder. Ordinarily the damper cylinder receives steam from the steam pipe and therefore does not operate until a short time after the throttle has opened. But the by-pass valves must close immediately when the throttle is opened. This necessitated changing the

Double-End Narrow-Gage Locomotive for the Belgian State Railways

diameter and 6 ft. 4 in. long. The firebox is 42 in. long by 28 $\frac{1}{4}$ in. wide and is designed to drop down between the frames for repairs. Ten engines have steel tubes and steel fireboxes and the other 10 have brass tubes, copper fireboxes and copper staybolts.

As the soil is of a very sandy nature, all running gear is enclosed to exclude dust. Having outside frames, the enclosing

steam connection for the damper cylinder from the cylinder steam pipe to the turret, with an intervening control valve connected to the throttle. By this change steam is instantaneously admitted to the damper cylinder when the throttle is opened and the by-pass valves are immediately closed. In a similar way the by-pass valves are immediately opened when the throttle is closed.

On July 2 the Russian government ordered 15 2-6-0 type locomotives for the Peter and Great Fortress Reval. This was an entirely new design, American practice being followed, and the first engine was shipped on September 10. These engines are built for 750-m.m. (29.53-in.) gage track and weigh but 37,265 lb. in working order. The cylinders are 11 in. by 16 in., the boilers carry 165 lb. pressure and, with wheels 33½ in. in diameter, the tractive effort is 8,100 lb. The boiler is of the straight top type and has 504 sq. ft. of heating surface. Soft coal is burned on a grate of 9.3 sq. ft. area. The tender is of the four-wheel rigid pedestal type and has a water capacity of 700 gal. and carries 1½ tons of coal.

REPORT OF COMMITTEE ON RELATIONS BETWEEN RAILROADS

The report of the Committee on Relations between Railroads, presented at the meeting of the American Railway Association, held in Chicago on November 17, was briefly referred to in our account of the meeting published in the issue of November 19. We are now able to present more fully some of the more important features of the report, together with the action taken by the association on some of the committee's recommendations.

LOSS AND DAMAGE TO FREIGHT

The report of the Sub-Committee on Packing, Marking and Handling of Freight, showing a reduction of about 22 per cent, or over \$3,500,000, in loss and damage payments during the first six months of 1915, as compared to a similar period in 1914, by 99 roads, was mentioned in last week's issue. As the operating revenues for this period indicate a smaller percentage of decrease, not only is an absolute saving indicated, but also a saving as compared with the freight revenue. It would appear from these figures that the railroads have checked the tide in payments for loss and damage which has been rising rapidly since the fiscal year 1909, and it is hoped that next spring a further reduction will be shown. It should be noted, the committee says, that these savings took place in a period when the railroads had secured very nearly uniform instructions for packing and marking, when an improved inspection of shipments had been generally inaugurated through individual railroads and inspection bureaus, when more railroads than ever before had organized departments to supervise loss and damage, and when general interest in this important subject had been spread more widely than ever before. It is the belief of members of the committee that the shippers are assisting by giving more care to the preparation of goods for shipment. The committee believes that these economies will be continued, but this can only be secured by strict enforcement of the rules.

The committee reported that the code of l.c.l. rules approved by the association a year ago has been endorsed by the Freight Claim Association and the American Association of Freight Agents, and has been adopted by a very considerable number of railroads. As a new edition is necessary, a number of changes proposed by the committee were adopted. The committee believes that its adoption and enforcement by any railroad will inevitably result in economy in the matter of loss and damage. The report also stated that a number of members have materially reduced their claims for loss and damage by introducing what is termed an affirmative check or double check system in loading their cars with l.c.l. freight.

The committee stated that the point has been made that some of the systems mentioned are not, strictly speaking, affirmative or double-check systems. While the committee recognizes that this may be the case, these systems have had good results on the roads that have adopted them, and the committee thought it best to print them, as well as the others, without specific recommendations in regard to any of the systems, but in the hope that the railroads generally will experiment with them and give the committee their suggestions. It is hoped that with further experience in this important matter it may be possible for the com-

mittee to recommend for adoption one system for checking l.c.l. freight into cars. The description given by the committee is as follows:

DOUBLE-CHECK SYSTEMS FOR LOADING L. C. L. FREIGHT

The object of a double-check system is to establish an affirmative loading record which will show conclusively each step in the handling of freight from the time it is received until deposited in the proper car, and that all packages are in safe condition for transportation, properly marked and carefully stowed.

I

At way stations all freight received should be carefully checked against shipping order, this check to include inspection for classification, weight, packing and marking, and should also be in accordance with the code of L. C. L. Rules, as approved by the American Railway Association. Waybill should be prepared leaving car number blank, and freight then moved to loading platform, where, upon arrival of the local freight train, it must be stowed under the supervision of the agent and the local conductor, who will check each piece of freight against the waybill and see that the correct car number is inserted. The agent should also insert car number on shipping order or on office copy of waybill.

II

At stations where only a few cars are loaded daily the responsibility for proper loading and stowing rests entirely with the agent. Cars placed for loading at these stations must be inspected as prescribed in the "Rules for the Inspection and Certification of Box Cars, Before Loading with Freight Subject to Damage," as approved by the American Railway Association. The best results can be obtained where two or three men are employed if one checks the freight on receipt against the shipping order and another checks the freight into the car against the waybill or shipping order. If waybill is used for checking, loading record will be inserted in office copy.

III

At large stations it may be possible to adopt one of the several systems hereinafter described without any additional cost and frequently by rearrangement of the warehouse force, which will result in a reduction in the cost of handling freight. Any of these plans may be used regardless of whether the freight house force is employed on a tonnage, bonus or daily pay basis.

All cars placed for loading l.c.l. freight must be inspected as prescribed by the "Rules for the Inspection and Certification of Box Cars, Before Loading with Freight Subject to Damage," as approved by the American Railway Association.

Each car is given a loading number. Cars bearing the same loading numbers are placed in the same position each day, when practicable.

Each package is checked against the shipping order when received.

A double check can be obtained by having receiving clerks stationed at warehouse doors check freight into the warehouse from the dray onto the truck, and a stowman or loading clerk, located at the car, check from the truck into the car.

The double-check systems in use may be described as follows:

(a) The loading number is indorsed upon the shipping order. After freight is loaded on the truck, the loading number of the car is marked on the top package and the shipping order is sent with the truck to the car, where a re-checker checks each package into the car, tallying it on the shipping order.

(b) The loading number is indorsed upon the shipping order and is marked on each package. The trucker takes the load to the car designated by the number on the top package. The shipping order is sent direct to the office. An assistant foreman inspects each package after it is actually in the car and puts a distinguishing check mark thereon before it is stowed.

(c) Receiving clerks are furnished with a supply of consecutively numbered ballots. When freight is received serial number of the ballot is shown on the shipping order and the loading number of the car marked on the ballot, which is handed

to the trucker, who takes freight to the car designated. In each car there is a supply of ballots bearing the loading number. The trucker returns both ballots for verification. Ballots are checked against the shipping orders to ascertain if freight was sent to the right car.

(d) Each shipping order is given a consecutive number as received. The loading number is indorsed on the shipping order and marked on the top package of the truck, except in cases where the truck carries freight for more than one car, when each package should be marked. Receiving clerks are furnished with a supply of ballots provided with space for loading number, number of pieces, consecutive number on shipping order, check clerk's initials and the date. This ballot is sent with the truck to the car. Stowman removes ballot and checks the number of pieces and loading number. After the freight is stowed, ballot is checked against the billing and filed.

IV

At transfer stations each car is given a loading number and placed in the same position each day when practicable.

(a) Waybills are abstracted as received with destinations in alphabetical order. Consecutively numbered ballots with stub attached bearing the same number are furnished check clerks. As freight is brought from car being transferred, ballot is given to the trucker showing the loading number of the car into which freight is to be loaded and the same information is also shown on the stub, with letter designating the trucker who deposits ballot in the car. Stubs are examined frequently to see that freight is in the right car. Stubs of the ballots are checked against the abstract sheet, which also shows loading number of the car into which freight is to be loaded and consecutive number of the ballots.

(b) With each truckload of freight the trucker is given a ballot which shows the loading number of the car. When freight is deposited in the car a ballot is taken therefrom which bears the loading number and also the initials and number of the car. Both ballots are returned and an indorsement is made upon the billing showing the initials and number of the car into which the freight was loaded. Waybills are then examined to see if freight was loaded into the proper car.

(c) The loading number is marked on waybills covering cars to be transferred and in the space provided for is shown the initials and the number of the car into which freight is to be loaded. Each waybill is given a Veri-check number. If more than one shipment is on the same waybill, each consignment is numbered. With each truckload of freight the trucker is given a Veri-check slip on which is shown the loading number, check clerk's initials, Veri-check number and number of pieces on the truck. This is deposited in the car and checked throughout the day to see that the freight is properly loaded. When loading is completed the Veri-check slips are checked against the waybills.

VARIOUS RECOMMENDATIONS

The committee also recommended a number of amendments in the rules governing methods for loading carload shipments of flour, and a code of rules governing methods for handling carload shipments of cement and plaster, which were adopted by the association. The committee also recommended a resolution, which was adopted, that at large flour loading centers cars furnished to mills should be inspected by a joint representative for all lines, and a certificate of inspection be attached to each car, to be filed by the agent at loading points for future reference.

The committee is still urging upon the American Association of Accounting Officers the advantages of through interline billing and is furnishing that association with cases where loss and damage has resulted from errors in rebilling. This matter is also under consideration by the Southeastern Freight Association. The committee has made a number of recommendations for the various classification committees, tending to the improvement of containers, and especially to the strapping or scaling of boxes of boots and shoes, dry goods and other high-class commodities especially subject to pilfering. Representa-

tives of the committee have attended recent hearings of the classifications committees, and will be represented at all subsequent hearings which involve questions of marking or packing freight.

The committee is considering, among other subjects, the following questions: Scaling of freight cars, robbery of cars without breaking seals, loading rules for carloads of various commodities, packing and loading of news print paper, containers and loading of palm oil, cocoanut oil, linseed oil, etc., pulpboard and fibreboard containers, packing of l.c.l. stoves, elimination of the "one in ten" marking rule, and loss of gas tubes and other metal containers.

WEIGHING

The report of the Committee on Weighing, announcing arrangements for the free testing of railway master scales by the government scale testing equipment, was noted in the report published in last week's issue. The committee reported that the railways are confronted with a new difficulty in the matter of weighing. The industries of the country, as represented by the Committee on Weighing of the National Industrial Traffic League, are taking the position that the marked tares on railway freight cars are generally inaccurate, and are making this a basis for claiming that every shipper shall have the right to require railways to light-weight every freight car, before it is loaded, free of charge. The committee does not believe that the expense of such an arrangement is justified, but stated that to prove this it will be necessary for the railways to take still further action in promptly re-weighing and re-marking their own cars, as well as foreign cars upon their lines. The Master Car Builders' Association has increased the fee for re-light-weighting and re-marking of foreign freight cars, but the amount provided does not appear to be sufficient to pay the per diem on the foreign car while it is being held out of service. The committee, therefore, recommended the adoption of a new per diem rule, providing for a two-days' reclaim on freight cars which are re-light-weighted and re-marked.

The National Code of Weighing Rules applying to carload freight has been generally adopted by all roads west of the Alleghenies. The adoption by eastern roads has been postponed, pending the result of negotiations regarding certain questions involving the weighing of empty cars for shippers and consignees. The need of a set of rules for the weighing of l.c.l. freight is apparent, the committee says, and it has formulated a set of l.c.l. weighing rules which is being considered by the National Industrial Traffic League. The proposed code was approved. On the recommendation of the committee a request was made upon the Association of American Railway Accounting Officers for some slight changes in billing forms to facilitate the giving of the necessary information as to weighing.

CAR SERVICE

On the recommendation of the Association of Transportation and Car Accounting Officers a revision of Form H, summary of per diem and passenger car mileage, and Rules 13 and 14 of the code of per diem rules were approved. Amendments were also approved in per diem Rules 15, 19 and 20, eliminating all reference to the transmission of embargo notices, to provide that the Commission on Car Service enforce the observance of car service Rules 1 to 4 on the complaint of any party, and to provide a two-days' reclaim against the owning road on freight cars which are re-weighted and re-marked. A new form T, on which cars held for delivery may be properly reported, in accordance with per diem Rule 14, was adopted.

The committee has taken part in the meetings of the Committee on Movement of Empty Freight Cars, and in its opinion the most fruitful cause for unnecessary empty mileage has been the practice of returning foreign cars empty and loading home cars in the same direction. To remove this cause the committee recommended changes in car service Rules 2 and 3, which were adopted. Car service Rule 2 authorizes the loading of foreign cars "in the direction of the home road." This expression has never been defined, and under the proposed changes, to deter-

mine the direction of the home road, the continent is divided into 17 groups, which are numbered, as shown on a map accompanying the report. The group number of the point at which the car is standing should be first ascertained on the map, and the group number or numbers of the home road should then be ascertained from an alphabetical list compiled for this purpose. When the number of the group in which the car is standing is ascertained the groups which are in the direction of the home road may be found on a chart prepared for this purpose, in the intersecting square to the right of the location of the car and below the home group.

The committee concurs with the Committee on Movement of Empty Cars in recommending a thorough enforcement of the home route card system, as indicated in car service Rules 5 and 19, and attention was called to the fact that this system was made obligatory upon all subscribers to the per diem rules agreement after December 31, 1915. The effective date for the use of the continuous home route card was postponed until July 1, 1916.

On the recommendation of the committee interpretations of car service Rules 16 and 18 were adopted.

DEMURRAGE

In view of the amendments to the car demurrage rules which have recently gone into effect the committee did not recommend any changes in the rules. The committee stated that one cause of delay to box cars has been that it has not usually been practicable to charge demurrage on cars loaded with export grain consigned to elevators located at the seaboard. The committee has represented to the traffic associations that the greatest congestions have occurred when the export elevators are filled with grain, and it is therefore impossible to unload the cars consigned to them. The point has further been made that this situation would be improved if the storage rates applicable to grain in the elevators should also apply to the grain in cars which cannot be unloaded into the elevators. The traffic associations have taken up this suggestion and the committee had hoped that the arrangement could go into effect on December 1 at all Atlantic and Gulf ports. The chairman reported, however, that he regretted that the hope had not been well founded.

The committee has received reports showing extreme delays to cars loaded with automobiles, and has represented to the National Industrial Traffic League and to the automobile trade generally, the necessity of an increased rate on certain cars similar to the increased rate recently approved for refrigerator cars, which has had such a good effect. The committee has been unable to convince the trade that an increase in the demurrage rate is necessary, but the automobile manufacturers are using all the influence they can to secure prompt unloading. The committee is continuing the collection of information, and if the efforts of the manufacturers to secure prompt unloading of cars are ineffective, the committee will again press the question of an increased rate.

Changes in the definitions and in Rule 2 of the code of switching reclaim rules were adopted. An amendment was also approved in storage Rule 4, and it was decided that the storage rule should not apply on tank cars of crude petroleum during process of loading in or on railroad premises between October 1 and March 31, inclusive, when the cars are loaded north of parallel 35.

A form of rubber stamps to be used in connection with claim papers forwarded by railroad business mail was adopted on the recommendation of the committee.

SIAM-FEDERATED MALAY STATES RAILWAYS.—With regard to the proposed linking-up of the Siamese Southern Railway with the Federated Malay States system, it is stated that a point at Kampong Rantan Panjang has been fixed up as the place at which the two systems will be connected, the new survey of the Siamese line to the Kelantan boundary having been completed, while the Federated Malay States Railways Administration has completed its line to the Golok River, the frontier between Siam and Kelantan.

FRENCH RAILWAY ACCIDENTS IN WAR-TIME

BY WALTER S. HIATT
Our Special European Correspondent

While no statistics are yet available to give a comparison of the number of passenger train accidents in time of war and peace, it is certain that the French railways have until the present been remarkably free from accidents involving fatalities to passengers.

But two accidents of importance from the French point of view, and in France railway accidents are closely watched by the public, have occurred during the past eight months. One of these was that at Rochefort on the State Railway Lines, May 17 last, when seven employees were injured, and the other that at Saint-Cyr-de-Favieres, October 9, on the line of the Paris-Lyon-Mediterranee, when 17 soldiers were killed and more than 30 injured.

Although death is an everyday affair now, with thousands of men killed or wounded each day at the front, both of these accidents were widely recorded in the newspapers, and this goes to show how seriously a railway accident is regarded in France.

The accident in May consisted of the derailment of the Nantes-Bordeaux express in the early hours of the morning. The investigation held concerning it developed the fact that a steamship smokestack, improperly loaded, had dropped off a freight train preceding the express and remained on the track. The locomotive and tender of the express train were derailed while the baggage and mail cars were telescoped. The seven employees in these two cars were injured. The passengers in the other cars escaped with a bad shaking up.

The second accident referred to resulted in the largest number of fatalities of any accident that has taken place in France for many years. It occurred at 6:50 a. m., October 10. The train was a special, loaded with soldiers on leave from the front. Just after the train left Saint-Cyr-de-Favieres, a way station below Lyons in the south of France, it broke in two on an up-grade and six passenger coaches running wild returned to the station which the train had just left and there jumped the track and rolled into a ravine. Only a dozen of the soldiers in the six cars were able to continue their journey. The rest were taken to hospitals in Saint-Etienne and Roanne. The investigation into the accident has not yet determined whether it was due primarily to an old and worn coupling or to improper handling of the train by the engineer.

The whole subject of railway accidents has in past years interested France as much as it has the United States and according to carefully compiled statistics in normal years there is but one passenger killed to 32,000,000 carried, and but one injured to 1,300,000 carried.

The growing safety of railroad travel was strikingly pointed out by M. Sartiaux, in the Annales des Ponts et Chaussées, who showed that between the years 1835 and 1875, a period of 40 years, 1,781,403,687 passengers were carried in France and that of this number one was killed to 5,178,490 carried and one injured to 580,450 carried. In the 40-year period since 1875 railroad travel has tripled in safety.

M. Sartiaux developed the curious fact that stage-coach travel of olden times was far more dangerous, one passenger being killed to 335,000 carried and one injured to 50,000 carried.

There is no doubt, however, that during this year while the war is on, the number of fatalities in other than train accidents and not to passengers, but to soldiers acting as track guards, will be strikingly large. Every railway station and mile of track is now under guard, day and night, and these soldier guards, not being railroad men, have yet to learn to protect themselves from passing trains. The accidents to soldiers have been particularly frequent at night and about guarded tunnels.

Otherwise, owing to the careful manner in which railway stations and tracks all over France are fenced in and the highway grade crossings are protected by gates, there are rarely any fatalities to trespassers or to persons not actually on board trains.

Passenger train accidents are generally due to derailments and the proportion of passenger train accidents to freight accidents is as one to 12. Thus, in an average of 12 derailments there are eight of road freight trains, one of passenger trains and three derailments in freight yard trains.

Taking an average of 20 derailments, two are caused by track conditions, seven by defective car or locomotive material, nine by the lack of care of trainmen and two by unknown causes.

The most prolific season for train accidents in France is the autumn. Thus, of eight derailments, three occur then, in part because of fogs, rain and colder weather; two occur in the spring, two in winter and one in summer.

RAILROAD BROTHERHOODS BUSY

By W. L. STODDARD

WASHINGTON, D. C., November 24.

The railroad brotherhoods have a new and possibly a powerful ally in Washington in the Industrial Relations Committee, which has just opened its offices here. This committee, as has been announced in the daily press, is a lineal descendant of the U. S. Commission on Industrial Relations, whose existence automatically terminated by law in August. The chairman of the commission, Frank Walsh, becomes chairman of the committee; the three labor members of the commission remain with Walsh, and to this group are added eight others, six men and two women, all more or less well known as sympathetic with the program and purposes of labor. Of particular significance to the readers of this correspondence is the fact that one of the three labor members of the committee is Austin B. Garrettson, president of the Order of Railway Conductors.

Basil M. Manly and George P. West, Mr. Walsh's most active lieutenants on the commission, have charge of the Washington office of the committee. The following paragraphs are based, in part, upon a talk with these gentlemen:

Exactly what the Industrial Relations Committee can do is, very naturally, an open question at this time. Judging, however, by its intentions it has an active, if brief, future before it. The general plan is to agitate, lobby and work for the recommendations of the Manly report to the Commission on Industrial Relations, and to serve labor, organized and unorganized, as a kind of field campaign staff. Back of the committee is the support of the most powerful unions in the country. The American Federation of Labor has offered its sympathy and co-operation; the United Mine Workers are understood to have subscribed to its war chest; the industrial unionists and their friends are looking to the committee for help; and many unattached "radicals" and labor people see in it a tool or weapon to be used in the various movements in which they are involved.

At its hearings in Chicago the Industrial Relations Commission collected a large mass of testimony on craft organization and industrial organization. In its files also is said to be testimony, admirable at least for the purposes of agitation, bearing on the attitude of railroads toward labor, railroad police, the use of arms in railroad strikes, and so forth. This material the committee apparently plans to utilize whenever it sees fit. The personnel of the committee as a whole probably endorses the industrial union idea as against the plan of craft organization, and a clever use of what has been gathered on this subject would unquestionably tend to stimulate discussion and action.

In the Manly report of the Industrial Relations Commission it was recommended that Congress prohibit tipping of employees of public service corporations engaged in interstate commerce; that employees engaged in the Pullman service be included in the hours of service law; that the Public Health Service should devise a code of sanitary regulations for railroad construction camps; that Congress should prohibit railroads from inducing their employees to sign releases of liability for accidents; that Congress should prohibit the railroads from requiring employees to contribute to benefit funds and allow them to participate in

the management of all benefit funds and other funds; that the employment of private police on railroads should be regulated by federal statute; and that the states should assume full responsibility for protecting railroad property and preventing trespass. In addition, both the Manly report and the so-called Commons report recommended that the Newlands act be extended in several directions.

These legislative recommendations the Industrial Committee declares that it will urge upon Congress by every means in its power. This means that bills will be introduced, possibly in both chambers, by sympathetic senators and representatives; that hearings will be demanded and perhaps granted; that agitation along new lines for new labor legislation will be started, with all that this entails. Publicity was the keynote of the now extinct commission. Publicity will be the keynote of the new committee, and such publicity as can be turned out on the questions at issue are certain to complicate an already complex situation. If this lobby actually proves to be a fraction as efficient as its predecessor, overburdened statesmen may well groan under the new loads placed on their shoulders through its agency.

In this connection the recently announced movement of the four railroad brotherhoods looking toward demanding an eight-hour day is interesting thoughtful men in Washington profoundly. Members of Congress and government officials unite in regarding this as one of the most significant and serious announcements in the railroad world for many months. The firemen and engineers of the southern associations met here early this week in order to discuss this matter in its various phases. This concerted movement of the four organizations is apparently in line with the tendency of labor, railroad and non-railroad, to get together for its own ends and to secure help and assistance by co-operating with other elements bound in the same general direction—elements well represented by the Industrial Committee.

* * * * *

The Labor Gazette presents this month comparative figures on unemployment on railroads, drawn from the annual reports of the various railways filed with the Interstate Commerce Commission:

"For 55 leading transportation systems which up to the close of October had submitted their reports, it was found that 12 per cent more were employed in 1914 than in 1915, and that 10 per cent more was paid in wages by these companies in 1915 than in 1914. The comparative totals for the 55 railroads considered as one system are as follows:

	Total Compensation of Employees on 55 Railroads		
	1914	1915	Increase over 1915
Total Number of Employees.....	278,248	245,209	33,039
Total compensation.....	\$220,605,085	\$198,633,390	\$21,971,695

"The 55 railroads, as can be seen above, employed 33,039 more men, and paid \$21,971,695 more in wages in 1914 than in 1915."

THE URUGUAYAN RAILWAYS.—The operating details given by the general manager of the Central Uruguay Railway of Monte Video in the report for the year ending June 30 last show that the management did its best to cope with the very unfavorable situation created by the European war, coming on the top of a commercial crisis in the Uruguayan republic. With the decrease of 14.18 per cent in the gross earnings of the "combined system" it was possible to reduce the train-mileage by 16 per cent, but owing to the exceptionally heavy traffic the car mileage was only 6.08 per cent less than in the preceding year. The average number of cars per train was 24.37 as against 21.80, an increase of 2.57, due to the return to a mixed train service, and to the heavy cattle traffic which is always hauled in complete train loads. There was an increase in receipts per train-mile. Working expenses were reduced by 9.64 per cent, all expenditure being reduced to a minimum.

The Country's Railroads and National Defense*

The Use Made of Our Railways in the Civil and Spanish Wars and a Discussion of What Should Be Done Today

BY GEORGE D. SNYDER

Deputy Chief Engineer, Hudson & Manhattan

Military men were somewhat slow to realize the great use that could be made of railroads and the influence they would have on their campaigns, until our Civil War. The tremendous use of railroads in that conflict demonstrated what a great assistance they were to armies, and since then all nations make great use of railways in their war plans. Germany studied the railroad problem prior to the Franco-German war, and in that conflict made extensive use of the railways in mobilizing and concentrating its troops. The French, not having sufficiently studied the problem and not contemplating the loss of Paris, were seriously handicapped. The railroad system, being built to accommodate civil commerce only, radiated from Paris to the provinces, and, when Paris was invested, many of the provinces not occupied by the Germans were cut off from each other, as the only transfer junctions were in this beleaguered city. Since then, to obviate this difficulty, France has built numerous connecting links to join these radiating lines outside of Paris.

Most European nations have a staff of officers studying the railroad problems in time of peace, who are prepared to take over and operate the railroads for military purposes in time of war. These nations also have bodies of troops trained as railway construction corps, for use in construction, repair and maintenance of railroads in the zone of military activity. As these nations mostly have state-owned railways, the training of the officers and troops in time of peace can be readily arranged.

It would seem that the United States is behindhand in this matter, as the only officers of the army who have relations with the railroads in time of peace are those of the quartermaster's department, who arrange for army transportation, but these relations are purely on a commercial basis, and our army has no corps of officers skilled in railroad operation, maintenance and construction, nor a body of troops, in either the regular service or the militia, trained in the construction and repair of railways. These elements in our army would have to be recruited, organized and equipped after the beginning of a war. Our general staff has studied this matter and has prepared regulations governing the use of railways, both within the theatre of war and without. These regulations are partly based on the practice during the civil war and partly on the studies of the general staff. They are embodied in Field Service Regulations, United States Army, 1914, Part III, Article V and Article VII, and place the operation, maintenance and construction of all military railroads in advance of the base, under the corps of engineers, which would be assisted by such other officers and civilians as would be necessary. The army has also issued various manuals on this subject. One of these is "Professional Paper No. 32, Corps of Engineers, U. S. Army, Military Railways, by Major William D. Connor, Corps of Engineers, U. S. Army," which contains much valuable information as to railroads and military railroads. Part IV of the Engineers' Field Manual is devoted to railroads and includes information and regulations as to location, construction, operation and maintenance in the theatre of war.

Apparently we are not deficient in literature on this subject, but evidently need to devise means to utilize the wonderful resources in organization, men and material, of the railroads of the country.

The engineer officers of our army have no opportunity to practice the art of railroad operation, construction and maintenance in time of peace; neither have our railroad officers any opportunity to acquire the military knowledge they should have in order to perform their railroad duties efficiently in the zone of military hostilities.

It is believed that by the co-operation of our army officers and our leading railway officials, much good would result. The nation can count in the future, as in the past, on the railroads doing their share in any emergency, but by getting together in time of peace, much needless friction and misunderstanding can be prevented.

Much light can be obtained on this problem by a study of the way it was handled during the civil war, and in this case the government had to rely on practical railroad men from civil life as there was no department of the army competent to handle it.

In the early days of the war a conference of the officials of the loyal roads was held with the government officials, and rates for the transportation of troops and supplies were agreed on, which were adhered to throughout the war in spite of a depreciated currency and rising prices.

At the very outbreak of the war, Thomas A. Scott, then vice-president of the Pennsylvania Railroad, was called to the government's assistance and succeeded in reopening railway communication between Philadelphia and Washington, opening a line by way of Annapolis and Perryville. On May 23, 1861, Mr. Scott was appointed general manager, government railways and telegraphs, and immediately proceeded to place the army transportation on a business basis. On August 1, 1861, he was appointed assistant secretary of war, being the first to hold this office, but he resigned June 1, 1862, resumed his duties with the Pennsylvania, and soon afterwards became its president.

By an act of Congress of January 31, 1862, the president was authorized to take charge of the railways and telegraph lines in the United States, and on May 25, 1862, the president issued an order, taking possession of all railways in the United States, but outside the zone of hostilities this possession was only nominal, and as long as preference was given to military transportation, the operation of the railroads was not interfered with. Within the theater of war, however, the railroads were actually operated by the war department. David Craig McCallum, on February 11, 1862, was appointed colonel and additional aide-de-camp, and assigned as military director and superintendent of railroads in the United States, a position which he held until the close of the war; and he was later promoted to the grade of brevet brigadier general, and still later to brevet major general.

McCallum was a practical railroad man. He was at first an architect and builder, but was afterwards a constructor of railroad bridges, and then became general superintendent of the Erie Railroad. He seems to have managed the military railroads in a thoroughly efficient manner. Numerous other experienced railroad men entered this department of the government service and it seems to have been administered with unusual efficiency. The principal trouble with the department was the tendency of the military commanders to interfere with railway operation. In endeavoring to operate single-track railways by the telegraphic train order system, the wires would often be pre-empted by military messages, so that train orders could not be sent. Trains had then to be operated by flagging ahead—a very slow and uneconomical method. Drastic orders had to be issued to prevent this interference. The military officers at times did more to interrupt the smooth operation of the railroads than the raids of the enemy. Finally special order No. 337 was issued by the war department under date of November 10, 1862, one paragraph of which was as follows:

"No officer, whatever his rank, will interfere with the running of the cars or engines as directed by the director of military railways or of his agents. Anyone who so interferes will be dismissed from the service for disobedience of orders."

The promulgation and enforcement of this order permitted the successful operation of the military railways by those trained in this work.

*A paper read before the New York Railroad Club, November 19.

Another railroad man who also did notable work with the military railroads was Colonel E. C. Smeed, afterwards chief engineer of the Union Pacific. Before the war he had extensive experience with high, wooden, railway trestle bridges, having been employed on the construction of the first Portage viaduct of the Erie Railroad, and also on the numerous high trestles on the Catawissa Railroad. He was placed in charge of bridge construction and performed some notable feats, one of which was the construction of the Potomac Creek bridge, 400 ft. long, 100 ft. high, and containing over two million feet of lumber cut in the woods nearby, in nine working days with common soldier labor. This is the bridge that Lincoln passed over and said "There is nothing in it but bean poles and corn stalks."

The bridge department became so efficient that the negroes said "The Yanks could build bridges in less time than the Reds could burn them down."

On the conclusion of the war this military railway organization was disbanded with the rest of the volunteer army, and the army was reduced to its peace proportions without any organization or corps of officers to continue this railroad work. The Spanish war found us no better prepared or organized to handle our railroad problems than we were in 1861; only the problems were much simpler and easier. Our railroads were not well prepared to deliver troops at mobilization camps located at points without proper terminal facilities, nor did proper facilities exist for the concentration of troops, supplies and baggage at points of embarkation, but the railroads made every effort to remedy these defects and to create the necessary facilities.

The engineer troops of the regular army were augmented by three regiments of volunteer engineers, but no engineer railway troops were formed and, as it turned out, none were seriously needed.

The above facts and the use of railways in the civil war, fade into insignificance compared with the use of these agents in the present European war.

As this country is now considering the state of its defense, and as its railways form such an important element in this problem, it would seem to be a fitting time for the railroad men and the army officials to get together. A board of eminent civilian inventors, scientists and engineers are assisting the sea soldiers in their problems, and it is believed that the railroad men could perform equally valuable services for our land soldiers. There should be a railway section of the general staff of the army which should be assisted by an advisory board of railway operating officials, engineers and contractors, including representatives of the railway supply houses.

Some of the things that could be accomplished by discussion between the railroad and army men are as follows: the preparation of regulations governing the military railways within and outside the zone of hostilities; the ascertaining of the best means of recruiting, organizing and training engineer railway troops; discussion of the best means of affording opportunity for officers of the army to obtain practical experience in railway operation, maintenance and construction; the arranging of means for railroad men to obtain some military training by instruction camps similar to the business men's training camps held during the past year, etc.; discussion of the proper railroad facilities to be provided at mobilization and concentration camps for the rapid entraining and detraining of troops, their equipment and supplies.

Those who wish to study this subject further will find valuable matter in "The Operation and Maintenance of a Railroad in a Theatre of War" by Major W. D. Connor, Corps of Engineers, United States Army. Journal of the Military Service Institution, volume xxxvii, page 234 and page 445, 1905.

DISCUSSION

Col. B. W. Dunn, chief inspector, Bureau of Explosives, opened the discussion, giving it as his opinion that the American Railway Association should keep in close touch with the general staff of the United States Army and make such preliminary arrangements as would provide smooth working of the railways in the moving of troops and supplies in the case of war. He suggested that

army officers be appointed temporarily to railway positions such as assistant to the general manager in order that they might obtain some knowledge of actual railway operating conditions.

Major-Gen. Leonard Wood, commander of the Department of the East, U. S. Army, stated that the one word before all others on this question is organization. This applies to the army, but beyond that it applies to the system of handling the forces of the country back of the army. He emphasized the remarks of Colonel Dunn and advocated the formation of a railway brigade which would be experienced in quick repair work, as army engineers are not capable of doing this class of work quickly and efficiently. The organization should be thought out well in advance and should be such that the country's railway systems would be turned over to government use under its own management. Such a railway organization is vital to the success of placing of railroads in a proper position in case of war and also in the case of its being necessary to invade other countries. In the latter case, the repair organization would be required to rebuild and repair railways in the invaded district.

Colonel McClellan, of the Quartermasters' branch of the war department, spoke of the mistakes made in the movement of troops to Tampa in 1898, stating that many of these were entirely unnecessary. He considered the suggestions of Mr. Snyder's paper fundamental and gave as his opinion that something must be done at once in preparing and working out a plan for using the railroads in wartime. It should be remembered that the movement of troops in large numbers practically puts a railroad out of business for other purposes.

Colonel Baker, of the Quartermasters' branch of the war department, emphasized the remarks made by some of the previous speakers and stated that the war department has been in touch with all the passenger associations of the country and is perfecting plans for the movement of troops and also making arrangements as to the expeditious movement of the impedimenta which necessarily accompany them. Arrangements have also been perfected for the marking of cars as to what branch of the army the contents are intended for. This saves much time and will avoid much of the trouble experienced in 1898. There should also be a close arrangement between the war department and the railroads for providing extra side tracks wherever needed and all railroad departments should be brought into close alliance with the officers of the army. Colonel Baker stated that it is probable that the proposed new army bill will provide for a reserve corps which will include railroad men of all branches who can be used in a directing capacity.

Others who took part in the discussion and advocated similar arrangements between the government and the railways were: F. E. Herriman, Col. Charles McKinstry, William Barclay Parsons, Capt. A. R. Piper, Lieut. Col. E. W. V. C. Lucas, and F. Stanwood Menken, president of the National Security League.

ALTAI RAILWAY IN SIBERIA OPENED.—Traffic on the Altai Railway in Central Asia opened on Wednesday, 14 months earlier than the date contemplated. The railway has a total length of 501 miles. The new line opens up a huge and wealthy region of Siberia which has hitherto been deprived of means of communication.

BRITISH RAIL EXPORT.—The war is still exerting an exceedingly depressing influence upon British rail exports, which amounted in September only to 15,800 tons, as compared with 39,185 tons in September, 1914, and 26,283 tons in September, 1913. The aggregate shipments to September 30, this year, were 205,952 tons, as compared with 365,939 tons in the first nine months of 1914 and 379,105 tons in the first nine months of 1913. The colonial demand, which is still the mainstay of the export rail trade, was as follows during the first three-quarters of the last three years:

	1915.	1914.	1913.
	Tons.	Tons.	Tons.
South Africa	33,980	47,564	48,330
British India	37,714	123,342	103,527
Australia	55,973	107,115	96,185
New Zealand	17,932	15,259	26,275
Canada	9	122	300

USING TIME-TABLES TO APPEAL TO SHIPPERS

The Southern Railway is using space in its time-table folders to urge shippers to co-operate with the road in its campaign to reduce the number of claims for loss and damage to freight. In the October folder a page is devoted to the following appeal to shippers, signed by W. H. Gatchell, superintendent of agencies:

"Did it ever occur to you to take a look every now and then through your shipping department to see how your people are boxing, crating, barreling, sacking or bailing your goods for transportation, to satisfy yourself that they are giving the necessary protection to the property you are shipping out to your customers and to see that your shipments are properly marked, with old marks erased and the bills of lading carefully and legibly made. If not, try it—you will find it interesting.

"Many shippers have thanked us for bringing to their attention instances of bad packing, use of inferior containers, illegible marking and poorly written bills of lading, of which they were not cognizant.

"You appreciate, we are sure, what all of this means to you and to the carrier in making a safe and accurate delivery of your property to the consignee.

"Your co-operation is necessary. We need your assistance. We want to help you. Won't you help us?

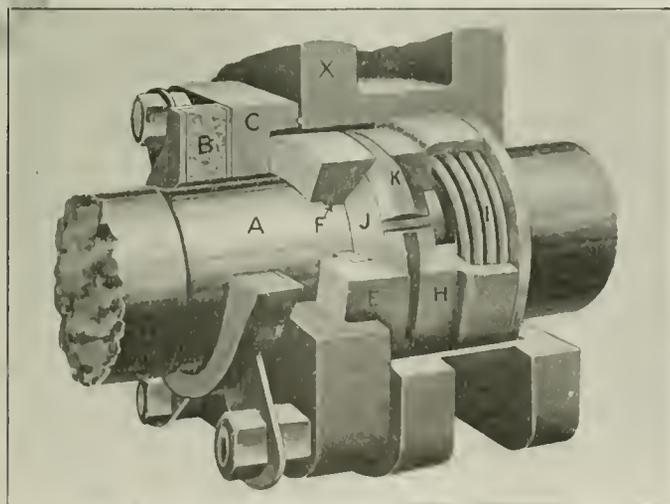

"Freight properly packed and correctly marked is already half-way to destination.

"There is no section of the South that the Southern does not serve. Please help us to do it effectively."

One prominent shipper on the line wrote to Mr. Gatchell that after reading this article he had ordered the expenditure of \$10,000 a year for better packing of his company's freight shipments.

SULLIVAN METALLIC PACKING

The process of applying packing to the pistons and valve rods of locomotives presents very little difficulty. It is only necessary that the packing be of a material that will not melt at the temperature of steam, and will still be soft enough not to injure the rod. If this packing is bored out to an exact fit on the rod it will be tight. As the engine continues in service, however, the ring will become worn. A packing is thus desirable that will permit of continued wear until the packing rings are worn out. A packing ring that is cut square across the ring is believed to

Sullivan Piston and Valve Stem Packing

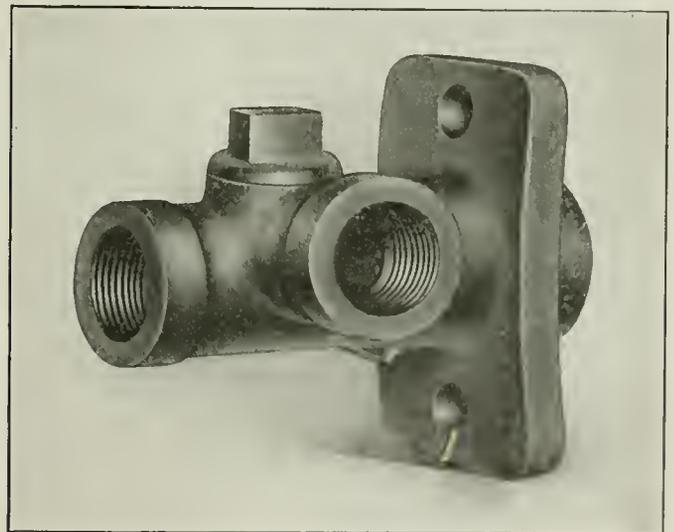

be preferable to one which is cut tangentially, as in the latter case the short ends are liable to become broken, thus permitting blows. Where the square cut ring is used there must be a clearance between the segments of each ring, and in order to make the packing tight two rings must be used, having the parting of their segments staggered. These rings will wear until the ends

of the segments come in contact, when the ends should be filed to give the proper clearance. Another desirable feature is to have the packing rings maintain a uniform bearing on the rods so that the ring will wear evenly throughout its bearing surface.

To meet these conditions the Jerome-Edwards Metallic Packing Company, Chicago, has placed on the market the improved Sullivan piston and valve stem packing. In the illustration, *A* is the piston rod; *B*, the swab cup; *C*, the gland; *E*, the vibrating cup; *F*, the brass ring; *H*, a combined spring case and follower; *I*, the spring; *J*, the cone packing ring with a double bevel; *K*, the second packing ring; and *X*, the stuffing box. From this construction it will be seen that the spring *I* presses the packing ring *K* against the packing ring *J* (with the double bevel), forcing it onto the rod and at the same time against the vibrating cup *E*, which, being beveled, also forces it against the rod. With this construction steam leaks between the rod and the packing ring, or between the outside of the packing ring and the inside of the vibrating cup, are eliminated; in addition, the double bevel on the cone ring, *J*, tends to keep it central and the wear will thus be uniform.

SMOKEBOX BLOWER FITTING

The illustration shows a locomotive blower fitting which is provided with a flange for direct attachment to the side of the smokebox. It has three pipe connections, the inside connection leading to the blower nozzle, the right angle connection

Smokebox Blower Connection

to the blower pipe in the cab, and the other to the roundhouse blower connection. A check valve, readily accessible through the cap shown in the illustration, automatically closes the roundhouse blower connection when the engine blower is in operation. It raises when the roundhouse blower is in operation and allows steam to pass into the smokebox. All passages are made for 1¼-in. pipe. It is manufactured by the Bairo Brass & Joint Company, Chicago.

A NEW PORT FOR RUSSIAN PRODUCE.—The new railway from the Russian capital to Ekaterina, a port in the Arctic which is free from ice throughout the year, was to have been open for war traffic at the beginning of November. This new line has been built under the direction of American engineers, an army of 10,000 men, mostly prisoners, having been employed upon it. The terminus on the edge of the Arctic is Ekaterina, on the northern coast of the Gulf of Kola, where large docks and sheds have been constructed. This new railway is double tracked, 1,220 miles long, and has been built in six months. Boats unable to reach Archangel will be able to go to Ekaterina at all seasons of the year.

General News Department

The shops of the Norfolk Southern at Newbern, N. C., were destroyed by fire on November 16; loss, \$200,000. Two locomotives were damaged and several freight cars were burnt up.

The American Railway Association has abolished the office of general agent held by Arthur Hale. Mr. Hale will retain the office of Chairman of the Committee on Relations between Railroads.

The Nashville, Chattanooga & St. Louis reports that its expenses for clearing wrecks in the last fiscal year amounted to only \$6,521, which is equal to 59 cents out of every \$1,000 revenue received. Taking the records of all the railroads in the southern group, it appears that the average cost of clearing wrecks was \$2.40 to every \$1,000 gross revenue.

Martin H. Conroy, a contractor, of Brooklyn, N. Y., has been convicted of manslaughter in the second degree for causing the death of John H. Joyce, a special officer of the Long Island Railroad, by running against him with his automobile on September 9 last at a highway grade crossing; and has been sentenced to three months' imprisonment. Conroy started to run around other automobiles which had been stopped at the crossing; witnesses testified that he ran down Joyce at 40 miles an hour.

In the United States district court at Cleveland, Ohio, November 18, the Delaware & Hudson Company and F. D. Underwood, president of the Erie Railroad, were fined \$1,000 and \$2,500 respectively for violation of law in allowing passengers to ride in a private car without exacting the extra charge prescribed for such accommodation. President Underwood carried the passengers in his car from a point in Ohio to Binghamton, N. Y., and the car was taken east from Binghamton by the Delaware & Hudson. This action of the court follows indictments found last May.

The eastern associations of general chairmen of the Brotherhood of Locomotive Engineers and the Brotherhood of Locomotive Firemen and Enginemen, in a joint session at Cleveland on November 17, decided to join the Brotherhood of Railroad Trainmen and the Order of Railway Conductors in their campaign for an 8-hour day and time and a half for overtime. It is said that formal action on this movement is to be taken at a meeting of the executive committee of the four brotherhoods at Chicago on December 15, when the formal ballot for a referendum vote of all of the members of the organization will be prepared.

Disastrous Collision Near Columbus, Ga.

In a butting collision between a northbound passenger train and a southbound special carrying a show, on the Central of Georgia, four miles east of Columbus, Ga., on Monday of this week, 7 or more persons were killed and a large number injured. The engines of both trains were wrecked; the cars of the passenger train were of steel and were not badly damaged. Of the 28 cars in the show train, 10 or more were wrecked and destroyed by fire and large numbers of wild animals as well as many tame ones were killed. A number of wild animals escaped.

Tribute to Memory of W. F. Allen

The American Railway Association at its meeting in Chicago on November 17, adopted the following resolution:

"In memory of William Frederick Allen, secretary of The American Railway Association from the date of its organization, April, 1886, to November 9, 1915; general secretary and treasurer from June, 1909, to November 9, 1915, secretary of the General Time Convention from April, 1875, and secretary of the Southern Railway Time Convention from October, 1877, until their consolidation in 1886 at which time The American Railway Association was created; originator of the idea of Standard Time, a system by which all the railways of the United States are operated.

"Mr. Allen's industry and loyal co-operation with his associates during a period of 40 years were always most helpful and welcome to them, and they record with profound sorrow his death at his home in South Orange, New Jersey, on the afternoon of November 9, 1915, in the seventieth year of his age.

"His great ability, high character and forceful and amiable personality endeared him to all who knew him, and inspired their admiration, friendship and esteem. In his death the association has lost an able and resourceful officer, and his friends and associates deeply mourn the loss of a friend and counsellor.

"Resolved, That this tribute to his memory be inscribed on the minutes of this association, and that an engrossed copy be delivered to his family, to whom The American Railway Association tenders its sympathy in their great sorrow."

Demands of St. Louis Switchmen

The Brotherhood of Railroad Trainmen has presented to the Terminal Railroad Association of St. Louis a demand for an 8-hour day, time and one-half for overtime, and increases in rates of pay for the switchmen employed by that road; but it is proposed to include in the eight hours 30 minutes for lunch, so that the men would actually work only 7½ hours, instead of 10, as at present. The rates of pay demanded are in some cases higher than those now paid for 10 hours. The proposed rates are \$4 a day or 50 cents an hour for foremen, in place of the present rates of 40 cents an hour for night foremen and 38 cents for day foremen, and for helpers \$3.70 a day, or 46¼ cents an hour in place of the present rates of 37 cents for night men and 35 cents for day men. The increases asked, therefore, are more than 25 per cent per hour. After having in the past secured higher rates for night work the men now propose to apply the higher rates for day work also.

The demand for time and one-half for all overtime in excess of 8 hours is based on the present rates and would result in overtime rates of 60 cents an hour for night foremen, or one and a half times the regular hourly rate, 57 cents for day foremen, or 1.43 times the regular hourly rate, 55½ cents for night helpers, or 1.18 times the regular rate and 52½ cents for day helpers, or only 1.11 times the regular hourly rate.

The standard meal hour rules on this and other roads now provide for one full hour off about the middle of the day, and if for any reason the time is not allowed within the limits fixed, the men are paid for the hour and given 30 minutes under pay in which to eat the meal. Now they propose to be given only 30 minutes for lunch, but to include that time in the 8 hours for which they are to be paid, and if the 30-minute lunch period is not allowed in the fifth hour after starting work they demand double-time pay for each minute the lunch time is delayed after 4½ hours. They further demand that they be not required to take meals in the yards of other roads; so that if a man is working in another yard when his meal time arrives he will collect extra pay for the time required to take him back to his own yard.

The demands also contain other provisions restricting the amount and character of the work to be required of switchmen, etc., and provide that at least 95 per cent of the switchmen employed shall be members of the B. R. T.

Reunion of B. C. R. & N. Men

A reunion of 1,483 old employees and officers of the Burlington, Cedar Rapids & Northern Railway, which is now a part of the Rock Island system, was held at Cedar Rapids, on October 1 and 2, and was attended by men who had worked on the road previous to its absorption 13 years ago, who had come from all parts of the country, many of them now being prominent railway officers on other roads, and including 200 now employed on the Rock Island. The program included the reception and registration, a picnic and dinner at Bever Park,

and a fellowship meeting in the evening of October 1, at which speeches were made by George A. Merrill, division superintendent of the Chicago, Rock Island & Pacific; James E. Hannigan, chairman of the Southwestern Passenger Association, formerly general passenger and ticket agent of the B. C. R. & N.; Gerrit Fort, passenger traffic manager, Union Pacific system, formerly a clerk on the B. C. R. & N., and others. On the following day the party visited the old general office building of the road, decorated the graves of deceased employees at the local cemeteries, and enjoyed a ride on an original B. C. R. & N. train, made up of the first engine and cars used on the road. Those who attended the reunion agreed that it was one of the most successful affairs of the kind ever held, and it was decided to have more reunions in future of the same kind.

The New Haven Trial

Mr. Mellen, testifying on Monday for the government in the action against the former directors of the New Haven to show conspiracy to violate the Sherman Anti-Trust law, said that Mr. Roosevelt, then president, in 1907 advised him to buy the Boston & Maine. "But he told me," Mr. Mellen said, "that he could not do anything to help me out if the New Haven got into trouble over the deal. Roosevelt said, 'If you do anything, you do it at your own risk, and you must not come back to me; but I would advise you to buy.'"

The stock of the Boston & Maine was acquired by the New Haven on July 13, 1907, through the exchange of 109,948 shares of one company for a like quantity of stock of the other. The Massachusetts legislature, however, by the Cole act, passed on June 27, 1907, forbade the New Haven to purchase more stock or to vote the stock of the Boston & Maine already held, and this condition lasted until in the summer of 1908 a bill was passed permitting the New Haven to acquire the Boston & Maine.

When Mr. Mellen spoke to Mr. Roosevelt the latter first sent him to Franklin K. Lane, then an Interstate Commerce Commissioner. There had been a suspicion at the time that the Boston & Maine might be acquired by the Canadian Pacific or the Grand Trunk. Mr. Lane was particularly appreciative of the danger of permitting the railroads of the country to fall under alien control and was chiefly interested, according to Mr. Mellen in the military aspect.

On Monday when the government attempted to put in evidence showing that New Haven had used improper means to promote legislation in Massachusetts, relating to the Boston Railroad Holding Company, the court on objections by the defense ruled that the defendants could not be tried on any offense not included in the indictment. The court said the indictment did not charge that the defendants had used bribery.

On Tuesday, R. L. Batts, counsel of the government, took up the transaction whereby John L. Billard, the Meriden, Conn., coal dealer, about June, 1908, paid the New Haven \$13,742,500 for 109,948 shares of the Boston & Maine, after the Massachusetts legislature had passed an act requiring the New Haven road to divest itself of its Boston & Maine interests. In response to questions, Mr. Mellen said:

"About the time we had decided to sell the New Haven's shares of Boston & Maine stock, Mr. Billard, whom I had known about fifteen years as a reputable coal dealer in Meriden, came to my office by appointment. He said that he would like to buy our Boston & Maine stock. He said frankly that he did not have enough money to buy the stock. I told him that we had to get rid of it and we would be glad to help anybody who would step into our shoes and take the Boston & Maine stock off our hands at \$125 a share. As a result of our negotiations I made arrangements with Mr. James Stillman of the National City Bank to lend Mr. Billard \$11,000,000 upon the Boston & Maine stock. Then in addition to the \$11,000,000 which Mr. Billard was able to pay us in cash he gave us his note for \$2,742,500, making a total of \$13,742,500 for the stock." Mr. Billard was later loaned various sums of money all of which he returned with interest. In connection with these loans Mr. Mellen consulted nobody, merely authorizing the treasurer of the New England Navigation Company to pay the needed amounts. A letter to the house of representatives of Massachusetts was read showing that the transactions with Billard were bona fide and that there was no understanding or agreement affecting the contract or ultimate destination of the Boston & Maine stock turned over to him.

Monday De Lancy Nicoll, of counsel for the defense, filed a

brief in support of a motion to have the court and jury taken on an extended trip over the New Haven.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, date of next or regular meetings, and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

- AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—F. A. Pontious, 455 Grand Central Station, Chicago. Next meeting, January, 1916, Atlanta, Ga.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3rd Wednesday in month, except July and August, 220 W. 57th St., New York.
- AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York. Annual meeting, December 7-10, 1915, New York.
- AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, Supt. Timber Preservation, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 18-20, 1916, Chicago.
- ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—G. P. Conard, 75 Church St., New York. Next meeting, December 14-15, 1915, St. Louis, Mo.
- CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.
- CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.
- CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.
- ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh, Pa.
- GENERAL SUPERINTENDENT'S ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.
- NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.
- NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.
- NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—E. N. Frankenberger, 623 Brishane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.
- PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.
- RAILROAD CLUB OF KANSAS CITY.—Claude Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Saturday in month, Kansas City.
- RAILROAD MEN'S IMPROVEMENT SOCIETY.—J. B. Curran, Erie R. R., 50 Church St., New York. Meetings, alternate Thursdays, October to May, Assembly Rooms of Trunk Line Association, 143 Liberty St., New York.
- RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 30 Church St., New York. Annual meeting, December, 1915, Waldorf-Astoria Hotel, New York.
- RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.
- RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.
- ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.
- SALT LAKE TRANSPORTATION CLUB.—R. E. Rowland, David Keith, Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.
- SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Piedmont Hotel, Atlanta.
- TOLEDO TRANSPORTATION CLUB.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Booddy House, Toledo.
- TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.
- TRAFFIC CLUB OF NEWARK.—John J. Kautzmain, P. O. Box 238, Newark, N. J. Regular meetings, 1st Monday in month, except July and August, The Washington, 559 Broad St., Newark.
- TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings, 1st Tuesday in month, except June, July and August, Waldorf-Astoria Hotel, New York.
- TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Gen'l Agt., Eric, R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings, bi-monthly, Pittsburgh.
- TRAFFIC CLUB OF ST. LOUIS.—A. F. Verson, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.
- TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, Superintendent's office, N. Y. C. R. R., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.
- UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, 1111 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.
- WESTERN CANADA RAILWAY CLUB.—L. Koh, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.
- WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Building, Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.
- WESTERN SOCIETY OF ENGINEERS.—E. M. Layheld, 1715 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings. Annual meeting, 1st Wednesday after 1st Thursday in January, Chicago.

REVENUES AND EXPENSES OF RAILWAYS

THREE MONTHS OF FISCAL YEAR ENDING JUNE 30, 1916

Table with columns: Name of Road, Average mileage operated during period, Freight, Passenger, Total, Operating revenues, Maintenance of way and structures, Equipment, Traffic, Transportation, Miscellaneous, General, Total, Net railway operation, Railway tax accruals, Operating income (or loss), Increase (or decrease) last year.

Name of Road.	Average mileage operated during period.	Operating revenues			Maintenance of way and equipment			Operating expenses			Net from railway operation.	Railway tax accruals.	Operating income (or loss).	Increase (or decrease) comp. with last year.
		Freight.	Passenger.	Total (inc. misc.).	Structures.	Equipment.	Traffic.	Portation.	Miscellaneous.	General.

Traffic News

In an address before the Traffic Club of Chicago on November 17, Gov. E. L. Phillipp, of Wisconsin, advocated an extension of the powers of the Interstate Commerce Commission over railroad regulation in the interest of centralized regulation and a reduction of the powers of the state commissions.

The Merchants' Association of New York has adopted a report recommending an amendment of the Cummins law regulating agreements between carriers and shippers in regard to liability for loss of freight or baggage. The proposed amendment clarifies the language relating to declarations of value by owners and shippers and stipulates that it shall not be unlawful for persons tendering property for transportation by express or as baggage to declare less than the actual value.

Dr. J. Y. Porter, chief of the Florida State Health Department, is preparing a health instruction display which is to fill three passenger cars and is to be taken around to all of the principal cities and towns in the state, the railroads having promised to co-operate in the enterprise and to transport the cars free. One of the cars will have a gasoline engine and electric apparatus and will show motion pictures; another will be equipped as a model sanitary home, and the third will contain instructive placards dealing with drugs, patent medicines and other things.

The movement of freight through the open ports of entry on the Rio Grande border into those parts of Mexico that are under control of the de facto government, is so great that the connecting lines are wholly unable to handle it promptly. The closing of the El Paso gateway to shipment destined for the region where Carranza authority exists has caused the Southern Pacific to divert all of its Mexican traffic to Eagle Pass. This has caused a blockade of freight there. The Mexican railroads are so short of cars that they can handle the traffic only in comparatively small lots. Large shipments of grain, machinery and other goods are also passing through the Laredo and the Brownsville gateways. The train movement on the Mexican lines is expected to materially improve within a short time. The shops are busy repairing old cars and engines and in building new freight cars. It is announced that all the divisions in Carranza territory are now open for regular passenger traffic, though the trains do not seem to run on any prescribed schedule.

Missouri Passenger Fare Advance Inconsiderable

The executive officers of the Missouri railroads have issued a statement calling attention to the fact that the increase in passenger fares allowed by the Missouri Public Service Commission is very small. The statement says that the impression prevails throughout the state that the railroads have been given the privilege of advancing their rates from 2 to 2½ cents a mile, and that this is a misconception, "as the conditions under which the advance is permitted prevent the railroads from getting it." The statement continues:

"The advance to 2½ cents cannot be made except upon the condition that round-trip tickets be sold at 2¼ cents a mile, and that 500 and 1,000 mile tickets, good for bearer and any number of persons for one year, be sold at 2 cents a mile.

"The sale of round-trip tickets at 2¼ cents is equivalent to a reduction of 10 per cent from the rate of 2½ cents.

"The sale of a mileage ticket at 2 cents that can be used by any number of persons is equivalent to a reduction of 20 per cent from the rate of 2½ cents and brings the purchase of these tickets within the reach of the great majority of travelers.

"The order of the commission further provides that the same facilities in travel shall be extended to the passenger purchasing transportation at 2 cents a mile as are extended to the passenger paying the higher rate.

"These conditions will make the present confiscatory rate of 2 cents a mile the prevailing rate for transportation under the order of the commission.

"Passengers would buy these mileage tickets to such an extent as to prevent the railroads, for at least one year, from getting the benefit from any substantial raise in passenger fare under the order of the commission.

"The opinion is advanced by the commission that the sale

of mileage tickets under the conditions outlined will increase travel. This theory is refuted by the actual experience of the Missouri railroads under the present 2-cent rate, which the commission admits has not increased travel sufficiently to offset the loss in revenue.

"Our opinion with respect to the effect of the changes permitted in freight rates will require more time and study, but in the meantime we are forced to the conclusion that the order, as applied to passenger rates, will result in a very small increase in revenue."

Governor Major of Missouri has criticized the decision of the commission, the members of which he appointed, declaring that he does not believe the railroads are entitled to increased rates.

Exports and Imports in September

A new record of \$300,000,000 as the value of the exports from the United States in September, 1915, gives especial interest to the statistics of foreign trade for that month just published. The Bureau of Foreign and Domestic Commerce, complying with numerous requests for advance information as to the articles making up that trade, has prepared condensed tables giving the value of the various articles and classes of articles exported. The total for September was \$300,700,000, as compared with \$156,100,000 in September, 1914. For the nine months ending with September, 1915, the total was \$2,532,500,000 as compared with \$1,467,400,000 for 1914. The largest item on the list is breadstuffs, of which \$423,400,000 was exported in the nine months as compared with \$172,800,000 in a similar period in 1914. Increased arrivals of raw materials and diminished purchases of manufacturers are the leading facts disclosed by the import statistics for September, 1915. The total was \$151,200,000, as compared with \$139,700,000 in 1914. For the nine months ending with September, 1915, the total was \$1,302,100,000 as compared with \$1,410,100,000 in 1914.

New York Export Traffic

A steamship chartering agent, quoted in a New York paper, says that much of the delay suffered by export freight at the present time is due to slow movements on the Great Lakes, especially in connection with wheat.

"We haven't had any boats delayed in New York on account of congestion here. Grain comes through from Buffalo in forty-eight hours. We have had some of our boats delayed as long as a week, however, on account of the condition of lake traffic. One of our boats was delayed five days at the Eric elevator. Last week we had a boat leave that had been delayed seven days.

"The owner of such a boat loses about \$1,000 every day that it is delayed. He can not charge demurrage, however, unless it takes more than five days, not including Sundays, to load the vessel. Demurrage is now \$750 a day on a ship, while before the war it was only \$150. The average rate on grain to England is now 17 shillings a quarter (480 pounds), while before the war it was 3 shillings 6 pence. The grain congestion here in New York now is not a flea bite to what it was in Baltimore and Newport News after the fire at the grain elevators a couple of months ago.

"The railroad people say that there is a shortage of ships. Well, we could use more if we could get them, but there were never before so many ships entering and leaving the port of New York. About a week ago we had twenty-two steamers to our consignment loading in this port. As I remember, in times of peace we seldom had more than thirteen or fourteen steamers here at once."

New York grain men say that some shippers are diverting their freight to other ports—Baltimore, Philadelphia, Boston and Portland. The volume of business shipped through New York exceeds all records.

Railroad men say that the congestion of freight is rapidly reaching the point where there is no money in the traffic for the railroads. Every day it costs more to handle the business on account of the additional cost of switching and the cost of delay to tied-up cars.

On the West Shore road last week loaded cars were standing on practically every side track from New York to Buffalo, 7,000 cars in all. Nevertheless, 4,500 cars a day are moved in and out of New York.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The commission has changed from December 1 to January 1 the date on which anthracite coal rates shall be reduced in accordance with its recent order. This is the second postponement in the anthracite case. Coal operators in the Wyoming region of Pennsylvania asked for a rehearing in relation to the proposed rates on the smaller sizes, alleging that the new orders were unjust when the rates were compared with those for the large sizes.

The Excelsior and Flax Tow Cases

Opinion by the commission.

The commission in *Keogh v. Chicago, Burlington & Quincy* (24 I. C. C., 606) decided in 1912 that the carrier's rates on excelsior, which were then higher than the flax-tow rates, from St. Paul to Chicago and points taking the same rates, St. Louis, Kansas City and Omaha were unreasonable to the extent that they exceeded the rates on flax-tow to the same points. Some of the carriers lowered the rates on excelsior to the flax-tow rates, but later proposed increases in the latter rates instead. The commission found that the increases were justified to Chicago and Peoria. It now finds that increased rates may be established as follows: From St. Paul, Minneapolis, and Minnesota Transfer, to Sioux City, 17 cents per 100 pounds; to Omaha and other Missouri River cities, to and including Kansas City, 20 cents per 100 pounds; from Dubuque, Iowa, to the Missouri River cities, Omaha to Kansas City, inclusive, 17 cents per 100 pounds. Increased rates to Des Moines are not allowed. (I. C. C., 349.)

Hearing on Illinois-Missouri Interstate Rates

A hearing on the complaint of the Business Men's League of St. Louis, charging discrimination in the interstate rates, both freight and passenger, from St. Louis to Illinois points as compared with the intrastate rates applicable from Chicago to the same points, was held before an examiner of the Interstate Commerce Commission at St. Louis last week. S. G. Hatch, passenger traffic manager of the Illinois Central, testified that many Illinois people who formerly went to St. Louis for business or pleasure are now going to Chicago because of the lower passenger fare at the state rate of two cents a mile, as compared with the interstate rate of 2½ cents. J. H. Cherry, assistant general freight agent of the Illinois Central, presented numerous statistical exhibits on the freight rates and traffic from St. Louis and Chicago to Illinois points, showing that St. Louis shippers are required to pay the five per cent increase allowed by the Interstate Commerce Commission, while the intrastate rates remain as before. Other railroad officers who testified expressed the opinion that the situation discriminates against St. Louis and in favor of Chicago.

J. D. McNamara, general passenger agent of the Wabash, testified that at Granite City, Ill., the sale of tickets to Chicago had increased 879 per cent since the situation became known generally. At East St. Louis the increase had been 170 per cent, and at Chicago the sales of tickets to Granite City increased 561 per cent and to East St. Louis 222 per cent, as passengers could buy tickets to those points at two cents a mile and then buy separate tickets to St. Louis. E. E. MacLeod, chairman of the Western Passenger Association, told of the efforts made by the railroads to obtain an increase in the rates in Illinois. Others who testified were George J. Charlton, passenger traffic manager of the Chicago & Alton, F. E. Webster, chief of Tariff Bureau, Chicago & Eastern Illinois, and F. L. Thompson, assistant chief engineer, Illinois Central.

Fourth Section Applications

In re class and commodity rates from Louisville, Ky., and Cincinnati, Ohio, to Alexandria, Va. Opinion by the Commission.

The commission grants the application of the Southern Railway for authority to continue to charge class and commodity rates from Cincinnati, Ohio, to Alexandria, Va., in connection with

the Cincinnati, New Orleans & Texas Pacific via Harriman Junction, Tenn., lower than rates on like traffic to intermediate points on the Southern Railway between Alexandria and Orange, Va.

It denies the authority to continue to charge class and commodity rates from Louisville, Ky., and Cincinnati, Ohio, to Alexandria, Va., in connection with the Chesapeake & Ohio via Orange, Va., lower than rates to intermediate points on the Southern Railway between Alexandria and Orange, Va. (36 I. C. C., 317.)

In re through rates from Buffalo, Pittsburgh and Central freight association territories. Opinion by the Commission.

The rates applied on through shipments from points in central freight association and Buffalo-Pittsburgh territories to points south of the Ohio and east of the Mississippi rivers exceed in some instances the aggregates of the intermediate rates. The commission holds that carriers have not justified the continuance of such rates and fourth section relief is denied; effective February 1, 1916.

One of the principal objections of the carriers north of the Ohio river to the construction of rates on combination of the intermediate rates is the present method of dividing such rates, which they allege is inequitable. They assert that the divisions demanded by the southern lines are excessive, and that they are forced in some cases to accept less than their local rates to the river. The commission has frequently held that the failure of carriers to agree upon divisions of joint rates does not justify the imposition of unreasonable rates. It would still less justify rates specifically violative of the statute. (36 I. C. C., 325.)

STATE COMMISSIONS

The Massachusetts Public Service Commission has dismissed a petition from the town of Revere for an order to compel the Boston & Maine to move the present or build a new station in Revere at a cost of about \$34,000 to \$47,000. The petition has been pending since 1913.

The Railroad Commission of Louisiana has cancelled its order, issued in June, 1914, requiring the Illinois Central to stop trains numbers 1 and 2 on flag, at Amite City, and the order issued in July, 1914, requiring the New Orleans, Texas & Mexico to stop trains 1 and 2 at Lottie. These cancellations are made because the courts have declared the orders unlawful. The present notice says:

"The Lottie case was heard before three federal judges and it was held that the order was void because it interfered with interstate commerce. * * * The Supreme Court of the United States has handed down several decisions involving orders adopted by the railroad commission of various states holding that where there was adequate service otherwise afforded, the requiring of interstate trains to stop at such stations amounts to an unlawful burden upon interstate commerce. * * * Our counsel has carefully examined this and other decisions and we consider that further litigation over the order in question would be useless. * * *

In addition to its decision allowing general increases in freight and passenger rates in Missouri, which was reported in last week's issue, the Missouri Public Service Commission at the same time issued its decision in a number of other cases. In one of these it ordered the restoration of Pullman sleeping cars by the Missouri Pacific on trains running between St. Louis and Joplin. These cars were taken off last spring on the ground that it did not pay to run them, the bulk of the through travel between the points named being carried by a shorter line. In view of the fact that the road will be able now to charge a higher passenger fare, the commission has ordered the service restored for a period of one year. The commission also granted the application of the roads for permission to put into effect as to Missouri intrastate traffic, the rule of the national car demurrage code increasing the demurrage charge for refrigerator cars. The commission also granted permission to the Missouri Southern to increase its passenger fare from two to three cents a mile, and also to increase its carload freight rates by approximately seven per cent. Officers of the passenger departments of a number of St. Louis roads, at an informal conference in that city last week expressed the opinion that the passenger fare increase will be largely neutralized by the more general use of mileage tickets at 2 cents a mile. The commission requires these to be made transferable and they are interchangeable as between the different roads.

PERSONNEL OF COMMISSIONS

Charles R. Russell has been appointed the fifth member of the Massachusetts Public Service Commission, succeeding Clinton White.

COURT NEWS

The hearing before Judge Youmans, of the United States District Court, at Oklahoma City, on the application of the railroads for an injunction restraining the enforcement of the Oklahoma two-cent fare law, was resumed on November 17, and is expected to last several weeks.

The Supreme Court of Massachusetts has declared unconstitutional the law of the state which provided that employees in and about steam railroad stations "shall not be employed for more than nine hours in ten hours' time, the additional hour to be allowed as a lay-off." It is held that the question was governed by a decision of the United States Supreme Court, which decided that a statute prohibiting labor for more than ten hours a day in an ordinarily healthy occupation was an "illegal interference with the rights of the individuals, both employers and employees, to make contracts regarding labor upon such terms as they think best."

Federal Safety Appliances Act Supersedes State Laws

The Indiana supreme court holds that the federal safety appliances act supersedes and invalidates the state safety appliances act, requiring railroads to provide grabirons and handholds on the side and ends of every car, so that no action for the penalty under the state law can be maintained.—*Southern Ry. Co. v. Railroad Commission (Ind.)*, 109 N. E. 759.

Liability for Loss at Sea by Connecting Carrier

The North Carolina supreme court holds that the Carmack amendment to the interstate commerce act allows the initial carrier, on being sued, to avail itself of defenses or of limitations of liability open under the federal statutes to the carrier causing the loss, although the shipment was lost at sea by a connecting carrier.—*Brinson & Kramer v. Norfolk Southern (N. Car.)* 86 S. E. 371.

Employment Contracts—Half Wages During Disability

The Kansas supreme court holds that while a railroad company could not enter into a general business of writing accident insurance policies, it has the incidental power to embody in its contracts of employment a provision that it will pay partial wages in case of disablement, in consideration of a deduction to be made from each pay check.—*McAdow v. Kansas City Western (Kan.)* 151 Pac. 1113.

Liability of Injury to Freight

The South Carolina supreme court holds that, where fruit was shipped over several connecting lines, and injured by delay in transit, the terminal carrier was liable only for such proportion of the total loss as occurred while the fruit was in its custody; and it was not liable for such proportion of the injury as resulted from the temporizing of the shipper before receiving the fruit.—*Trakas v. Southern Ry. Co. (S. Car.)* 86 S. E. 492.

Johnson Grass—Proof of Source

In an action for damages for the defendant railroad's act in allowing Johnson grass to go to seed on its right of way, there was evidence that Johnson grass on the plaintiff's property might have come from other sources. The Texas Court of Civil Appeals held that the jury was properly charged that the plaintiff was bound to show the amount of his damage caused solely by the defendant's act.—*Missouri, K. & T. v. Forrest (Tex.)*, 179 S. W. 273.

Waiver of Stipulation as to Claims for Damages

A shipper did not present his claim in the form stipulated in the bill of lading, but notified the railroad's general freight agent of the damages to the goods. Negotiations followed without the railroad objecting that the shipper had lost his right because the claim was not made in the proper way. In an action for

damages the Arkansas supreme court holds the railroad had waived its right to object to the manner of presentation of the claim.—*St. Louis, I. M. & S. v. Laser Grain Co. (Ark.)*, 179 S. W. 189.

Notice and Time for Bringing Suit

The Arkansas supreme court holds that where a railroad has established two rates for live stock, one under an unrestricted contract, and the other a lower rate, limiting liability, and the shipper accepts without inquiring the lower rate, it is not necessary, to bind the shipper to the contract, that the agent should call his attention to the higher rate and to expressly offer it to him; and stipulations as to notice and time of bringing suit are not thereby rendered void.—*St. Louis S. W. v. I. W. Haynie & Co. (Ark.)*, 175 S. W. 170.

Assumption of Risk by Employee

The Massachusetts supreme court holds that an experienced foreman of an emergency crew in charge of an electric zone on a railroad, whose contract of employment was to repair defects in the electric wire system, and who knew and appreciated the manifestly dangerous character of the work as well as the company, assumed the risk, and the company owed him no duty, and could not be guilty of negligence or liable for his death while working among the feed wires without first having the power shut off.—*Ashton v. B. & M. (Mass.)*, 109 N. E. 820.

Remedy Under Carmack Amendment Exclusive

The Georgia court of appeals holds that a suit for damages based on the provisions of a Georgia statute cannot be maintained against the last of several connecting carriers, if the loss or damage to the shipment occurred in the course of interstate transportation; for under the provisions of the Carmack amendment the initial carrier alone is liable for damages for interstate shipments, and under the federal regulations of interstate commerce (which supersedes all state regulation upon the same subject) the remedy against the initial carrier is exclusive.—*Southern Ry. Co. v. Bennett (Ga.)* 86 S. E. 418.

Flooding Land—Limitation of Damages

A railroad, by allowing the ditch along its roadbed to become filled up, periodically inundated the adjacent farming lands, depositing gravel and cinders. In an action by the owners of the land the Tennessee Supreme Court holds that the only damages recoverable were those caused by the deposit of gravel within the period of the statute of limitations, taking the value of the land at the beginning of the period as normal, although it was then covered with gravel deposited by previous floodings, as to which the plaintiffs' causes of action were barred.—*Cincinnati, N. O. & T. P. v. Roddy (Tenn.)*, 179 S. W. 143.

Flooding Caused by Construction of Line—Right of Way Purchased from Injured Party

Action was brought for damages for the washing away of a piece of the plaintiff's land and certain fences by the diversion of water from a creek as the result of the construction of a railroad. The railroad had bought the right of way from the plaintiff. The Kentucky Court of Appeals holds that when a right of way is bought by a railroad company, and on this right of way it builds its line, it is only liable to the party from whom it purchased the right of way for negligence in the construction or operation of the road.—*Roberts v. Sandy Valley & Elkhorn (Ky.)*, 179 S. W. 228.

Children as Trespassers in Yards

The switching yards of a railroad were close to a large public school and young children had been in the habit of playing on or near the tracks. One of the children was attracted by some machinery on a car, and climbed up to see it. A string of cars without any lookout on the front was run against the car, and the boy was thrown to the ground, and died from injuries received. In an action for his death the railroad's main contention was that as the boy was a trespasser it was not bound to anticipate his presence, or to use more than ordinary care in the transaction of its business. The Nebraska Supreme Court held

that, ordinarily, this was the proper principle of law; but it held that the circumstance of the proximity of the school took the case out of this rule; ordinary care demands that in switching cars due regard be paid to such conditions. Failure to inclose the tracks and neglect on the part of the switchmen to observe whether children are on the cars or tracks when a train is being backed in, may constitute actionable negligence.—*Krummack v. Missouri Pacific* (Neb.) 154 N. W. 541.

Limitation of Time for Bringing Suit

Live stock was damaged while being held by a railroad company at destination to compel payment of freight charges. In an action for damages the Arkansas supreme court holds that the company had the right to insist that suit for such damages be brought within six months in accordance with a stipulation to that effect in the bill of lading. If the company was entitled to charge the freight demanded it had the right to hold the shipment until it was paid; if it was not, and wrongfully held the shipment, it was still liable for such refusal to deliver as a common carrier, and answerable therefor only in accordance with the stipulation.—*Kansas City Southern v. Bull* (Ark.), 179 S. W. 172.

Grazing Land—"Speculative Value"

Suit in equity was brought by the Northern Pacific in the Washington courts to compel Benton county to cancel as excessive certain taxes levied on railroad lands. The evidence showed that, as the land is now, it is unfit for any use other than grazing. It is arid land covered with sagebrush, and in part covered with rocks and sand. It has no present sale value other than as spring grazing land for sheep, being too dry to pasture cattle. It was admitted that the land could have no other value, unless something that no one could see, or even define as a probability, existed. It was held by the Washington Supreme Court that the assessment, which appeared to be based on the probable value of the land in the event of a successful system of irrigation, was based on a figure grossly in excess of the value of the land, not at its fair cash value, as the law requires, but at a value not arising even to the dignity of a speculative value; "speculative value" being based on a probability of value within at least the span of a lifetime.—*Northern Pacific v. Benton County* (Wash.) 151 Pac. 1123.

New York Workmen's Compensation Law Sustained

The New York State Court of Appeals, in a suit against the New York Central & Hudson River, decided, this week, that until the Federal government passes a workmen's compensation law, the New York State Workmen's Compensation law applies to railroad employees engaged in interstate commerce.

While tamping ties, plaintiff was struck in the eye by a stone which flew up from the roadbed. The railroad company contended that at the time the man was engaged in interstate commerce and that therefore the Federal employers' liability act measured his right, insisting that there could be no recovery under the Federal law because the injury was a mere accident and not the result of negligence. The contention of the attorney-general was that the compensation law and the Federal statute cannot reasonably be said to cover the same subject matter in view of the different principles that underlie the two statutes, the different purpose sought to be accomplished by them, the restriction of the application of the Federal statute to negligence cases and the broad scope of the state's statute, taking in all industrial accidents, regardless of fault and the different method by which redress is obtained under the two statutes. This view is sustained in the present decision.

The Court of Appeals, Judge Seabury writing the opinion, holds that congress has recognized the differences between these two kinds of statutes and has limited its act to negligence cases and did not intend to enter the field of compensation for industrial accidents, but left that field open for occupancy by the state. Whenever congress shall enter upon this field, all state regulations in conflict with federal authority will be abrogated. The court also holds that the compensation law does not impose any unreasonable condition upon interstate commerce.

A large number of other cases will be affected by this decision. The case will undoubtedly be taken to the United States Supreme Court.

Railway Officers

Executive, Financial, Legal and Accounting

E. A. Merrill, chief clerk in the secretary's office of the Southern Railway, at New York, has been appointed assistant secretary, with office at New York.

F. B. Grier, general solicitor of the Charleston & Western Carolina with office at Greenwood, S. C., has been elected president, succeeding J. B. Cleveland, A. W. Anderson, general manager, Augusta, Ga., has been elected also second vice-president, succeeding J. Kenly.

Elmer A. Howard, whose election as vice-president of the Chicago, Burlington & Quincy, with jurisdiction over the land and industrial departments, was announced last week, was born at Fairfield, Iowa, on July 18, 1858. He was educated in the public schools and attended the University of Iowa for one year. At the age of 18 he entered the employ of the Burlington as telegrapher and station agent at Fairfield, Iowa, and remained in that position for eight years. In 1885, he entered the Indian service under the Cleveland administration. He resigned as Indian agent in 1887, to go into the banking business at Fairfield, Iowa, and in 1900 was appointed national bank examiner for the state of Iowa. In 1903

E. A. Howard

he returned to the service of the Burlington, and for the past seven years has been real estate and industrial commissioner. Mr. Howard is also chairman of the executive committee of the Chicago Union Station Company.

C. R. Capps, vice-president of the Seaboard Air Line at Norfolk, Va., has been elected first vice-president; W. L. Seddon, first assistant to president, at Norfolk, has been elected vice-president, and W. R. Bonsal, president of the Carolina, Atlantic & Western, also the Charlotte, Monroe & Columbia, has been elected vice-president of the Seaboard Air Line.

J. E. Taussig, whose appointment as assistant to the president of the Wabash has been announced, was born on May 4, 1865, at St. Louis, Mo. He was educated in private schools at London, England; Brussels, Belgium, and Darmstadt, Germany. He entered railway service in 1882 as clerk in the freight office of the St. Louis Bridge & Tunnel Railroad. From 1885 to 1886 he was agent for the Ft. Scott, Wichita & Western; from 1886 to 1887, chief clerk to the general manager of the New York, Providence & Boston; from 1887 to 1888, chief clerk in the office of the trainmaster of the Missouri Pacific, at Wichita, Kan.; from 1888 to 1891, chief train dispatcher of the same road, at Winfield, Kan.; from 1891 to 1892, agent of the Wheeling Bridge & Terminal Railway, at Wheeling, W. Va.; from 1892 to May, 1900, superintendent of the same road. From May, 1900, to May, 1901, he held the position of assistant to the general manager of the Wheeling & Lake Erie, at Cleveland, Ohio; from May, 1901, to December, 1904, he was superintendent of telegraph of the same road, at Canton, Ohio; from December, 1904, to February, 1911, superintendent of terminals of the Wabash, at St. Louis, Mo.; from February, 1911, to July, 1912, superintendent of terminals of the Houston & Texas Central and the Galveston, Harrisburg & San Antonio, at Houston, Tex.; and from July, 1912, to July, 1913, superintendent of the Houston division of the latter road. On August 3, 1913, he was appointed special represen-

tative on the staff of E. F. Kearney, first vice-president of the Texas & Pacific, and in September, 1913, was appointed superintendent of transportation for the same road. From July, 1914, to July, 1915, he was general superintendent of the Texas & Pacific, at Dallas, Tex.

Operating

C. S. Lake, general superintendent of the Seaboard Air Line at Norfolk, Va., has been appointed general manager.

H. E. Barber has been appointed chief dispatcher of the East St. Louis & Suburban and the Alton, Granite & St. Louis Traction, vice Mr. Hume, resigned, effective November 15.

F. J. DeGrief, trainmaster of the Lake Erie & Western, with headquarters at Lafayette, Ind., has been appointed superintendent of the Peoria division, with headquarters at the same place, succeeding C. C. Arnold, deceased. The office of trainmaster has been abolished.

P. R. Albright, assistant general manager of the Atlantic Coast Line at Wilmington, N. C., has been elected general manager, vice W. N. Royall, resigned on account of ill health; J. N. Brand, general superintendent at Jacksonville, Fla., has been appointed assistant general manager with headquarters at Wilmington; J. C. Murchison, superintendent at Charleston, S. C., has been appointed general superintendent of the Third division with headquarters at Jacksonville; J. P. Walker, assistant superintendent at Charleston, has been appointed superintendent with headquarters at Charleston and T. W. Hansell, assistant superintendent at Sanford, Fla., has been appointed superintendent with headquarters at Sanford.

Traffic

C. E. Emerson has been appointed district freight and passenger agent of the San Pedro, Los Angeles & Salt Lake, with headquarters at Cincinnati, Ohio.

F. D. Hammer, traveling passenger agent of the Wabash at Kansas City, Mo., has been promoted to district passenger agent, with headquarters at Houston, Texas, effective December 1.

Benton M. Bukey has been appointed assistant general passenger agent of the Atchison, Topeka & Santa Fe, with headquarters in Washington, D. C., on November 6, 1879. He received a high school education, and entered railroading in that city on November 18, 1899, in the accounting department of the Southern Railway, with headquarters at Chicago, Ill. Mr. Bukey was born at Williamstown, Wood County, W. Va., on November 18, 1899, when he entered the employ of the Chicago, Burlington & Quincy, in the office of the auditor of ticket accounts, at Chicago, Ill. In November, 1904, he became a rate clerk in the passenger department of the same road, and in April, 1905, went to St. Louis, Mo., to perform the same kind of service for the Missouri Pacific. He was in the service of the Missouri, Kansas & Texas in the same capacity from August, 1906, to October, 1906. Since that time he has been continuously in the passenger department of the Santa Fe at Chicago, Ill. In September, 1908, he was promoted from rate clerk to chief rate clerk, and in September, 1909, was appointed chief clerk to the passenger traffic manager, the position which he held up to the time of his recent promotion.

B. M. Bukey

J. S. Houston, assistant general freight and passenger agent

of the Texas & Pacific and the International & Great Northern, announces the removal of the freight and passenger offices in Chicago, Ill., to suite 415, Marquette building, 140 South Dearborn street.

L. A. Ripley, commercial agent of the Georgia Railroad at Cincinnati, Ohio, has been promoted to general agent, and W. C. Bewley, commercial agent at Jacksonville, Fla., has been transferred to Cincinnati as an assistant to Mr. Ripley.

Frank G. Smith has been appointed district passenger agent of the Chicago Great Western, with headquarters at Cleveland, Ohio, vice Harry L. Wyand, resigned, to engage in other business. Effective November 22.

Albert Kelling, chief clerk in the traffic department of the Oregon-Washington Railroad & Navigation Company, has been appointed assistant general freight agent to succeed J. R. Stein, who resigned a few months ago.

J. C. Ewing, commercial agent of the Ft. Dodge, Des Moines & Southern, at Minneapolis, Minn., has been promoted to assistant general freight and passenger agent, with office in the same city. The office of commercial agent has been abolished.

J. L. Park, general freight agent of the St. Louis Southwestern, has assumed the duties formerly discharged by the vice-president in charge of freight traffic, the latter office having been abolished. H. E. Farrell has been vice-president in charge of freight traffic since April 22, 1912. The title of J. D. Watson, heretofore assistant freight traffic manager, has been changed to assistant general freight agent.

Edwin A. Dawson, manager of the Union Line, will be retired from active work on December 1, under the pension rules of the company, after 53 years of active service with the Pennsylvania system. Mr. Dawson was born at Pittsburgh, Pa., November 22, 1845. He entered the service of the Pittsburgh, Fort Wayne & Chicago in 1862, as a yard clerk at Pennsylvania station, Pittsburgh, and later occupied various clerical positions with that company. In 1864 he became a member of Company B of the 193d Pennsylvania Volunteers. This regiment was detailed for duty along the lines of the Northern Central and Philadelphia, Baltimore & Washington Railways immediately after the Earley raid.

E. A. Dawson

Mr. Dawson re-entered railway service with the Allegheny Valley in 1865, and remained with that line three years, at the end of which time he was made local agent at Pittsburgh. In 1868 he entered the service of the Union Line, then the Union Railroad & Transportation Company, at Pittsburgh. In 1878 he was transferred to Columbus as assistant to D. S. Gray, then western manager of the Union Line. He received his appointment as assistant to western manager on October 1, 1883, and on April 1, 1886, he became western superintendent, with headquarters at Columbus, Ohio. On April 1, 1888, his office was removed to Chicago. On January 1, 1896, Mr. Dawson was appointed acting manager, and on July 15, 1896, he was made manager of the Union Line, with headquarters at Chicago.

Engineering and Rolling Stock

Claude E. Cox, who has been appointed engineer of estimates of the Chicago Union Station Company, was born at Brownstown, Ind., on December 28, 1878. He graduated from high school at Worthington, Ind., and entered railway service in January, 1901. His first position was rodman on the

Indianapolis & Vincennes division of the Pennsylvania Lines West; later he was appointed senior of the corps for the Indianapolis terminals, at Indianapolis, Ind. In November, 1904, he was appointed engineer in charge of location and construction for the Duluth, St. Cloud, Glencoe & Mankato, now a subsidiary of the Chicago, Milwaukee & St. Paul, in southern Minnesota. In December, 1905, he was appointed assistant engineer in the office of the district engineer of the St. Paul, at Minneapolis, Minn. In January, 1910, he was transferred to Aberdeen, S. D., where he was assistant engineer in charge of the construction of engine and passenger terminals. He came to the Chicago office of the St. Paul in January, 1912, where he was assigned to valuation work, and shortly afterward appointed assistant valuation engineer, a position which he held up to the time of his recent appointment as engineer of estimates for the Union Station Company.

J. H. Weed, maintenance of way inspector of the St. Louis & San Francisco, has been appointed roadmaster of the River and Cape division. C. R. Gray, Jr., maintenance of way inspector, has been appointed roadmaster of the Western division. H. R. Irvine, inspector maintenance of way, has also been appointed roadmaster for the Western division.

Purchasing

James L. Woods, whose appointment to the position of purchasing agent of the Nashville, Chattanooga & St. Louis with

J. L. Woods

headquarters at Nashville, Tenn., has been announced in these columns, was born at Belfast, Tenn., December 9, 1875. He was educated in the common schools at that place and later attended the Haynes McLean school at Lewisburg, Tenn., and the Winchester Normal School at Winchester, Tenn. In the spring of 1897 he entered the service of the Nashville, Chattanooga & St. Louis as a clerk in the general passenger department. From the early part of 1898 to October 1 of that year he was a clerk in the division superintendent's office at Tullahoma, Tenn. From October, 1898, to

February 12, 1914, he served in various clerical capacities in the Atlanta freight agency at Atlanta, becoming chief clerk. From that position he was promoted to the position of assistant purchasing agent at Nashville.

A. J. Sweing, chief clerk to the purchasing agent of the Wabash, has been appointed general storekeeper, with headquarters at St. Louis, Mo. This is a newly-created office.

C. H. Rothgary, assistant storekeeper of the Baltimore & Ohio at Cleveland, Ohio, has been appointed storekeeper at Lorain, Ohio, vice H. J. Cobb, resigned. W. D. Francis has been appointed assistant storekeeper at Cleveland to succeed Mr. Rothgary.

OBITUARY

C. C. Arnold, superintendent of the Peoria division of the Lake Erie & Western, at Lafayette, Ind., died at his home in that city on November 15.

RAILWAY ACCIDENTS IN THE UNITED KINGDOM.—If the number of passengers killed in the Quintinshill accident be accepted as 225, the number killed in train accidents during the present year is 252: Ilford, January 1, 10; Kinsale, January 28, 2; Smithly Bridge, March 18, 3; Quintinshill, May 22, 225; Pollokshaws, August 14, 1; Weedon, August 14, 10; Newark, September 6, 1. In 1889, 88 passengers were killed, including 80 in the Armagh accident.—*The Engineer, London.*

Equipment and Supplies

LOCOMOTIVE BUILDING

THE SOUTHERN is in the market for a number of locomotives.

THE TAVARES & GULF is in the market for 2 ten-wheel locomotives.

THE WAYNESBURG & WASHINGTON is contemplating the purchase of one freight locomotive.

THE ST. PAUL UNION DEPOT has ordered 2 switching locomotives from the Lima Locomotive Corporation.

THE CINCINNATI, INDIANAPOLIS & WESTERN which recently ordered 35 locomotives has issued inquiries for 5 ten-wheel locomotives.

THE OAHU RAILWAY & LAND COMPANY, Honolulu, Hawaii, has ordered one ten-wheel, one Consolidation type and one six-wheel switching locomotives from the American Locomotive Company.

THE ARTHUR IRON MINING COMPANY, St. Paul, Minn., reported in the issue of October 22 as being in the market for 8 locomotives, has ordered 8 switching locomotives from the Lima Locomotive Corporation.

NEW YORK, NEW HAVEN & HARTFORD.—President Howard Elliott, in an address before the Boston Art Club on November 20, outlined needed betterments to the road to cost \$32,000,000, including \$9,100,000 for 300 all-steel passenger train cars, 100 steam locomotives and 3,000 freight cars. Just when this equipment apparently would be acquired by the New Haven, however, was not apparent.

THE ELGIN, JOLIET & EASTERN has ordered 18 superheater Mikado and 9 eight-wheel superheater switching locomotives from the American Locomotive Company. The Mikado locomotives will have 28 by 30-in. cylinders, 63-in. driving wheels and a total weight in working order of 307,000 lb. The switching locomotives will have 24 by 28-in. cylinders, 51-in. driving wheels and a total weight in working order of 217,000 lb.

THE PENNSYLVANIA LINES WEST, reported in the *Railway Age Gazette* of November 12 as being in the market for 50 freight locomotives, has ordered 48 superheater Consolidation locomotives from the American Locomotive Company and 15 of the same type from the Lima Locomotive Corporation. Of these 63 locomotives 50 will be used by the Pennsylvania Company, 10 by the Vandalia and 3 by the Grand Rapids & Indiana. The locomotives ordered from the American Locomotive Company will have 26 by 28-in. cylinders, 62-in. driving wheels and a total weight in working order of 253,000 lb. each. The report in the issue of November 12 that the Pennsylvania Lines West had ordered 53 locomotives from the Lima Locomotive Corporation and 10 from the American Locomotive Company was incorrect.

CAR BUILDING

NEW YORK, NEW HAVEN & HARTFORD.—See item under Locomotive Building.

THE KANSAS CITY SOUTHERN is inquiring for prices on 200 gondola car bodies.

THE SOUTHERN RAILWAY is reported to be in the market for a large number of cars.

THE CANADIAN PACIFIC will build 250 refrigerator cars in its own shops at Montreal.

THE ERIE has ordered 13 all-steel suburban coaches from the Pressed Steel Car Company.

THE LONG ISLAND has issued inquiries for 6 parlor cars, 10 baggage cars and 25 trailer coaches.

THE CHICAGO & ALTON has ordered 150 composite gondola car bodies from the Haskell & Barker Car Company.

THE MINNEAPOLIS, ST. PAUL & SAULT STE. MARIE RAILWAY

has ordered 200 50-ton ore cars from the American Car & Foundry Company.

THE BUTTE, ANACONDA & PACIFIC has ordered one combination mail and baggage car from the American Car & Foundry Company.

THE CALUMET & ARIZONA MINING COMPANY is inquiring for one caboose car, 2 box cars, 4 flat cars, one coach and one combination coach.

DENVER & RIO GRANDE. The report in last week's issue to the effect that this company is in the market for 1,000 box cars has been denied.

THE DELAWARE, LACKAWANNA & WESTERN has ordered two dining cars from the Pullman Company and 500 hopper cars from the American Car & Foundry Company.

THE MONONGAHELA CONNECTING is inquiring for prices on 65 120-ton drop bottom gondola cars, 10 100-ton flat cars and 25 to 50 40-ton coke cars.

THE NASHVILLE, CHATTANOOGA & St. LOUIS will build 500 40-ton box cars in its own shops in addition to the 500 reported in the *Railway Age Gazette* of October 15.

THE MISSOURI, KANSAS & TEXAS is inquiring for prices on 500 general service cars in addition to the 2,000 composite gondola cars reported in the *Railway Age Gazette* of November 12.

THE MONTOUR RAILROAD reported in an unconfirmed item in the issue of November 12 as having ordered 800 steel car bodies from the Standard Steel Car Company ordered but 400 steel car bodies from that company.

THE WESTERN MARYLAND was reported in an unconfirmed item in last week's issue as having increased its order for hopper cars recently given the Pullman Company from 2,000 to 3,000. This item has since been confirmed.

THE INTERBOROUGH RAPID TRANSIT, reported in the *Railway Age Gazette* of November 12, as being in the market for 311 all-steel subway cars, has ordered 234 motor car bodies and 77 trailer car bodies from the Pullman Company.

THE CINCINNATI, INDIANAPOLIS & WESTERN, reported in last week's issue as having ordered 650 freight cars from the Haskell & Barker Car Company, ordered 450 40-ton box cars; 50 40-ton stock cars; 40 40-ton flat cars; 50 50-ton gondola cars; 50 50-ton hopper cars and 20 caboose cars from that company.

THE NEW YORK MUNICIPAL will soon place orders for an additional 100 subway cars for the Sea Beach Line. These cars will bring the total number of cars ordered by this company to 400, the 300 cars previously ordered having been obtained from the American Car & Foundry Company on three different orders.

IRON AND STEEL

THE NORFOLK & WESTERN has ordered 12,000 tons of rails from the Carnegie Steel Company.

THE CINCINNATI, INDIANAPOLIS & WESTERN has ordered 1,500 tons of bridge material from the American Bridge Company.

THE NORTHERN PACIFIC has ordered 20,000 tons of rails from the Illinois Steel Company, the Lackawanna Steel Company and the Bethlehem Steel Company.

NEW YORK SUBWAYS. Bids for the supply of special work for the Lexington avenue subway from its junction with the existing subway at the Grand Central Station, New York, to One Hundred and Thirty-eighth street, in the borough of the Bronx, will be received by the Public Service Commission for the First district on December 7. The special work called for includes all frogs, switches and cross-overs for the line, comprising 19 separate pieces.

SIGNALING

THE CHICAGO, INDIANAPOLIS & LOUISVILLE is to install mechanical interlocking at the crossing of its line with the Grand Trunk at Haskells, Ind. The machine will have 24 levers and the distant signals will be power operated.

Supply Trade News

Harry D. Rohman, who was recently appointed chief electrical engineer of the Franklin Railway Supply Company, New York, was born in Switzerland in 1883. Upon his graduation

Harry D. Rohman

as an electrical engineer from the technical schools of Zurich, he entered the works of the Oerlikon Electrical Construction Company. There he was afforded an opportunity of combining a practical training with the theory of engineering, and in 1903 qualified as an electrical engineer, with experience in high and low tension and A. C. and D. C. work, especially electrical traction. Later he entered the service of J. Stone & Co., London, and gradually worked up through its various departments until in 1910 he was appointed chief of the testing and experimental

departments. In April, 1914, he was appointed chief assistant electrical engineer, and held that position until October 1, 1915, when he entered the service of the Franklin Railway Supply Company as noted above. Mr. Rohman speaks several languages and has had an extensive experience in all European countries, including the Balkan states, and in South Africa and the Belgian Congo.

L. T. Burwell, formerly with the M. W. Supply Company, Philadelphia, Pa., has become associated with the Q & C Company, New York.

J. M. Spangler, formerly with the Railroad Supply Company, Chicago, has recently entered the service of the National Carbon Company, Cleveland, Ohio.

W. H. Crawford has been appointed Pacific coast representative of the Simmen Automatic Railway Signal Company, Buffalo, N. Y. Mr. Crawford will have offices at 609 Spalding building, Portland, Ore.

G. C. Pool, formerly with Guilford S. Wood, Chicago, and previous to that with the Acme Supply Company, Chicago, has become connected with the Q & C Company, New York. His attention will be given particularly to Q & C devices for locomotives and cars.

James Forgie, a consulting engineer of New York has been awarded the Telford gold medal by the Institution of Civil Engineers ((Great Britain) in recognition of his paper on "The Laxaxalpan Aqueduct Tunnels in Mexico" and his achievements in engineering. Mr. Forgie has been prominently identified with the solution of rapid transit problems in cities, having been engaged on the Pennsylvania and Hudson & Manhattan tubes in New York, the underground railways of London and other tunneling and subaqueous construction work.

The Roberts & Schaefer Company has been awarded a contract by the Oregon-Washington Railroad & Navigation Company for the immediate installation of a 250-ton two-track reinforced concrete standard counterbalanced bucket locomotive coaling plant at Pilot Rock Junction, Ore. This plant will have automatic coal handling machinery, and will be arranged with equipment to weigh all coal passing to locomotives. The contract price is \$17,500. The company has also been authorized by the Chicago Great Western to build at Council Bluffs, Iowa, a duplicate of

the fireproof standard counterbalanced locomotive bucket coal-plant with automatic operation, which has been installed at Clarion, Iowa, making the fifth plant of this type installed by the Roberts & Schaefer Company for this road. The contract price of the latter is \$10,300.

Isaac M. Cate, a large stockholder, has renewed his attack on the organization and management of the American Locomotive Company by sending first to the directors and now to the other stockholders a 58-page printed letter reciting the findings of his accountants and other details. Mr. Cate first attacked the management of the company in February, 1912, directing his efforts against Waldo H. Marshall, president, and a number of other officers particularly. The board authorized an inquiry of Mr. Cate's charges of mismanagement, waste and misconduct, but the report of the committee of inquiry did not support Mr. Cate. In September, 1914, Sylvanus L. Schoonmaker was elected chairman of the board. This appeased Mr. Cate for a time, but not for long. Mr. Cate in his present letter seeks to discount the ability of the present management of the company. Concerning its war orders, he says: "Those in your company who did not make automobiles at a profit or develop the superheater or build locomotives in competition with the Baldwins are not the men to extract profits from shrapnel shells. The contract for shells was taken on April 15, with everything laid out for speedy preparations. There have been nearly six months of preparation. If the production of shells is subject to such prodigious cost as my accountant finds pervades the organization it will not be possible to compete with other institutions."

TRADE PUBLICATIONS

SIMPLEX LETTERING TEMPLETS.—The Keuffel & Esser Company, New York, has issued a leaflet describing its transparent dylonite templets for lettering, engineering and architectural drawing, etc. The templet contains two holes with perforations of different sizes by means of which the letters of the alphabet and numerals may be spaced correctly and outlined. Glass and Payzant pens suitable for use with these templets are also described.

TWO NEW REELS.—Keuffel & Esser Company, New York, has issued a leaflet describing a four-arm folding reel for use with tapes or flat chains $\frac{1}{4}$ in. wide and from 100 to 500 ft. long. Its advantage lies in the fact that it may be folded when not in use, and carried in the pocket. The Colorado steel reel is also described and is intended for tapes from 100 to 600 ft. long, up to 5/16 in. wide. It has a long folding handle, which locks into an opening at either end of the frame, and thus prevents the tape from unwinding.

LUBRICATING DEVICES.—The Richardson-Phenix Company, Milwaukee, Wis., has recently issued bulletins Nos. 50 and 60 dealing, respectively, with the Phenix force feed lubricator and the Richardson Model "M" sight feed oil pump. The former booklet contains a complete description of the Phenix ratchet type lubricator and also describes the new Model "T" device. Illustrations are given showing the construction and operation of the lubricators. Bulletin No. 60 relates to the Model "M" lubricator. Interesting illustrations show the process of manufacture from the raw material to the finished lubricators on the test rack and give a good idea of the manner in which the pumps are drilled and milled from a solid block of cast iron. Other items of interest are a description of the new Richardson air spray attachment, and the steam and electric attachments for heating the oil in the lubricator reservoir.

BRITISH LOCOMOTIVE EXPORTS.—There was a slight improvement in British locomotive exports in September, the value of the shipments for the month having been about \$1,454,500, as compared with \$1,439,590 in September, 1914, and \$1,395,525 in September, 1913. The improvement was due to an increase in the value of the deliveries to the Argentine Republic during the month to \$118,720, as compared with \$31,855 and \$274,775. South Africa imported locomotives in September to the value of \$189,330, as compared with \$61,105 and \$133,185, but there was a great falling off in the deliveries to India and Australia.

Railway Construction

AMERICUS, HAWKINSVILLE & EASTERN.—Work on the remaining sections of this line from Games, Ga., to Hawkinsville, 27 miles, and from Flint river to Americus, 18 miles, is now under way. J. S. Morton, Byromville, Ga., is the contractor. The company was organized to build from Americus, Ga., northeast to Hawkinsville, 55 miles. (September 24, p. 585.)

ATLANTIC COAST LINE.—Work is now under way on a connection between the Monticello branch and the Fanlew branch, Fla., 1.3 miles; contract for the work has been let to J. F. Lamb, Thomasville, Ga. The company is also building an extension of the Hollywood spur in South Carolina, south about 4.5 miles; contract let to W. Z. Williams & Co., Macon, Ga.

BAY POINT & CLAYTON.—This company is building an extension from Cowell, Cal., to Clayton, 2.5 miles. The company now operates a line from Bay Point, Cal., to Cowell, 10 miles.

BELLINGHAM & NORTHERN.—This company plans to build an extension from Goshen, Wash., to Welcome, 11 miles. The company now operates a line from Bellingham, Wash., to Glacier, 44 miles.

CHARLES CITY WESTERN ELECTRIC.—This company has completed work on an extension from Charles City, Ia., to Colwell, eight miles.

ELECTRIC SHORT LINE.—On the line building from Winsted, Minn., west to Hutchinson, 45 miles, grading on a section of 18.25 miles is expected to be finished in about ten days. Track laying is now under way from Winsted west and the company expects to have the new extension in operation by January, 1916. In addition, about 2.5 miles of side track and track for a Y at a Hutchinson is expected to be finished. On the line now in operation from Minneapolis to Winsted, 60 miles, about 4 miles of side tracks, mostly at terminals in Minneapolis, Lyndale, Watertown, Hazleton and Winsted were laid in 1915. During 1916 the company expects to build about 50 miles of new line. (Sept. 10, p. 487.)

FORT DODGE, DES MOINES & SOUTHERN (ELECTRIC).—Work is now under way on a six-mile section from Swanwood Junction, Iowa, to Des Moines. (August 13, p. 1301.)

FORT WORTH BELT.—This company is now building 2 miles of team tracks at Fort Worth, Tex.

HETCH HETCHY.—This company has grading work finished on 9 miles of the line building from Rosasco, Cal., on the Sierra Railway to Hetch Hetchy dam site, 67 miles. The work is being carried out by the Utah Construction Company. M. M. O'Shaughnessy, San Francisco, Cal., may be addressed. (See San Francisco Roads, Nov. 5, p. 879.)

MATTAWAMKEAG & NORTHERN.—Financial arrangements have been made, it is said, for the construction of a line from Mattawamkeag, Me., northwest via East Millinocket to Millinocket, 23 miles. A charter to build the line has been given to C. W. Mullen and I. B. Wood, of Bangor; A. Weatherbee, Lincoln, and F. J. Rich, Mattawamkeag. Stone & Webster, of Boston, Mass., are the fiscal agents, and have already made a survey for this line.

MEXICO & SANTA FE (ELECTRIC).—This company has been incorporated in Missouri to operate an electric railway from Mexico, Mo., to a point in Monroe county, 16 miles distant. The incorporators are: J. A. Botts, W. W. Mundy, M. W. Beamer and J. P. Canthorn, of Molino, Mo., and T. C. Botts, J. D. Bates and W. W. Botts, of Mexico. The construction of the road has been practically completed.

NEW YORK SUBWAY. The contract for track-laying on the new rapid transit lines in the borough of Queens has been awarded by the New York Public Service Commission, First District, to the Thomas Crimmins Contracting Company, the lowest bidders, for \$204,898. The contract includes the extension of the Queensboro subway from its present terminus at Jackson and Van Alst avenues, in Queens, to the Queensboro bridge plaza; the elevated railroad from the Queensboro bridge

plaza northward to Ditmars avenue, Astoria, and the elevated railroad from the Queensboro bridge plaza northeasterly to Alburts avenue, Corona.

NORFOLK, WASHINGTON & NEW YORK.—Organized to build from Newport News, Va., to Washington, D. C., 159 miles, with a branch down the Northern neck, 50 miles long. Surveys and estimates have been completed and the right of way is about secured. The company expects to begin construction work in the near future. Channing M. Ward, president, Richmond, Va.

PHILADELPHIA ROADS.—Bids are wanted by A. M. Taylor, director of city transit at Philadelphia, Pa., for the following work: On December 7, for the concrete column foundations and piers for about 4,000 linear ft. of a two-track elevated railway in Frankford avenue from Unity street to Dyre street, Philadelphia, Pa. Bids are wanted on December 14 for the steel superstructure and appurtenant work for a two-track elevated railway in Frankford avenue from Unity street to Dyre street, comprising about 4,000 linear ft. of structure. (October 29, 1915, p. 828.)

PINE BLUFF & NORTHERN.—This company plans to build an extension from Cullor, Ark., to Pine Bluff, 35 miles. The company now operates an 8-mile line from McCreanor to Cullor.

QUEBEC CENTRAL.—This railroad has projected an extension from English Lake, Que., to a point in the township of Dionne, L'Islet county, about 25 miles.

ROACH TIMBER COMPANY'S LINES.—Grading work has been finished on five miles of the line projected east from Sutherlin, Ore. The company will probably begin grading work in the near future on an additional section. W. L. Roach, president, Muscatine, Iowa. (October 22, p. 779.)

SUTHERLIN, COOS BAY & EASTERN.—The company has finished the survey and partially graded the line from Sutherlin, Ore., to Hinkle Creek, 14 miles. The delay in securing the necessary right of way, and the general condition of the lumber market at present does not encourage carrying on the work. It is expected that construction work on the line will be carried out next spring. J. F. Luse, Sutherlin, may be addressed.

TIDEWATER SECURITIES CORPORATION.—Grading work has been finished on the line building from Alabama Port, Ala., to Cedar Point, 3.2 miles. T. W. Nichol, chief engineer, Mobile. (April 2, p. 768.)

WATAUGA & YADKIN RIVER.—Surveys are now being made for an 8-mile extension to be built between Darby, N. C., and Rogers Mills.

WAUSHARA COUNTY.—This company is building with its own forces from Red Granite, Wis., to Pay Sippi, over 8 miles. Grading has been finished on six miles. A. L. Christofferson, president, Pay Sippi, Wis.

RAILWAY STRUCTURES

ALLENTOWN, PA.—The Central of New Jersey has given a contract to the Pennsylvania Steel Company, Steelton, Pa., for fabricating and erecting the steel superstructure of new bridges to be built over the Lehigh river at Allentown. The improvements include 3 double track, deck plate girders, with ballasted floors, each span to be 90 ft. long. The work calls for 500 tons of steel and 1,300 cu. yd. of concrete for the piers. The estimated cost of the improvements will be \$52,500. Bids for the masonry piers have not yet been asked for.

AURORA, ILL.—A fire, the origin of which is not known, destroyed a warehouse belonging to the Chicago, Burlington & Quincy on November 13. The gross loss, including the structure and contents, has been estimated at \$150,000. A temporary storehouse has already been secured by the company, and plans for a new building are now being prepared.

BEAUMONT, TEX.—The Texarkana & Ft. Smith will open bids on a new passenger depot on November 27. It will be a one-story, stucco structure, 46 ft. by 223 ft., with tile roof, steam heat and electric lighting. C. E. Johnston, chief engineer, 510 Kansas City Southern Railway building, Kansas City, Mo.

Railway Financial News

ALABAMA, TENNESSEE & NORTHERN.—On application of the Guaranty Trust Company representing a bondholders' committee, the United States District Court at Mobile, Ala., Judge Toulmin, on Monday of this week appointed John T. Cochrane, of Mobile, and M. W. Thompson, of New York, receivers for this property. Mr. Cochrane is president of the road and Mr. Thompson is president of the Railway Development Corporation, a holding company which has been organized to represent New York interests. The line of the road extends from Reform, Ala., southward 185 miles to Calvert, Ala., 34 miles north of Mobile. The security holders have a plan for extending the road northward from Reform to an intersection with the St. Louis & San Francisco. The company has outstanding in bonds \$3,882,000, in notes \$1,235,000 and in car trust certificates \$180,000.

ST. LOUIS & SAN FRANCISCO.—Further details have been given out of the plan for the reorganization of this company. The reorganized company will take over all the mileage of the old company (including the Kansas City, Fort Scott & Memphis lease), with the exception of the New Orleans, Texas & Mexico and the Chicago & Eastern Illinois.

The mileage of the new system, upon which the new bond issue will be secured, is 3,852.76 miles of first track and 1,009.16 miles of second and side track; total, 4,861.92 miles. To this may be added, in case of acquisition, the Quanah, Acme & Pacific mileage, 80.80 miles. The reorganization plan provides for:

Prior liens undisturbed, 5s-6s, due 1931.....	\$9,484,000
New issue of prior lien mortgage bonds.....	250,000,000
Cumulative adjustment mortgage bonds, maturing July 1, 1955.....	75,000,000
Income mortgage bonds, maturing July 1, 1960 authorized.....	75,000,000
<i>Capital Stock</i>	
Preferred stock 6 per cent redeemable at 100, authorized.....	200,000,000
Common stock, authorized.....	250,000,000
<i>Securities to be Presently Issued</i>	
Prior lien mortgage bonds, viz.:	
In partial exchange for existing securities embraced in the plan.....	93,398,500
Sold to purchase syndicate.....	25,000,000
For the corporate purposes of the new company....	6,811,500

Total	\$125,210,000
Balance reserved for future requirements under restrictions of mortgage.....	\$124,790,000
The outstanding prior lien mortgage bonds shall be as follows: \$93,398,500, series "A" 4 per cent, maturing July 1, 1950, redeemable at 100 and accrued interest; \$31,811,500, series "B," 5 per cent, maturing July 1, 1950, redeemable at 105 and accrued interest.	

<i>Cumulative Adjustments Gold Bonds</i>	
Rate not to exceed 6 per cent, as may be determined at time of issue:	
In partial exchange for the existing securities embraced in plan.....	\$40,545,737
(To be designated as series "A" 6 per cent, due July 1, 1955, callable at 100.)	
Reserved for future use under restrictions of mortgage	34,454,263
<i>Income Mortgage Gold Bonds</i>	
To be issued in exchange for existing securities....	38,661,200
(Designated as series "A" 6 per cent convertible, maturing July 1, 1960, redeemable at 100.)	
Reserved for future use under restrictions of mortgage	36,338,800

Total	\$75,000,000
Reserve bonds may be issued with interest not to exceed 6 per cent per annum, to be determined by board at time of issue.	
Rate per mile of new securities to be presently issued: Prior lien mortgage 4s and 5s, \$27,700; cumulative adjustment 6s, \$8,400; noncumulative income mortgage 6s, \$8,000. Total, \$44,100.	
Preferred stock, \$1,450; common stock, \$10,900. Total, \$12,350.	
Total capitalization, bonds and stock, \$56,450.	
Capital stock to be presently issued: Preferred stock, 6 per cent, redeemable at \$100, \$7,000,000; balance reserved for conversion of income bonds, \$75,000,000; reserved for future corporate uses, \$118,000,000.	
Common stock to be presently issued, \$53,000,000; reserved for corporate uses, \$197,000,000.

During the year the line extending southerly from Laurel, Mont., has been completed to Orin Junction, Wyo.; and the connection between Guernsey and Wendover should be ready for operation by December 1st of this year. The building of these tracks completes a line from Northport, Neb., to Billings, Mont., 532 miles in length, which will soon be an important line in the operations of the Company in that territory, as well as being a part of the plan for a low grade line between the Missouri River and Billings.

\$378,549.53 has been expended for second track, and there have been placed in operation during the year 104.58 miles of main track, 13.31 miles of second track and 55.93 miles of other tracks.

Heavy and continuing rains during the early summer caused floods which did considerable damage, particularly in parts of Wyoming, Kansas, Nebraska, Missouri, Illinois and Iowa, necessitating heavy expenditures in the month of June; and like conditions extended into July and August of this year.

A bridge across the Ohio River at Metropolis, Ill., is in process of construction by the Paducah & Illinois R. R. Co., a company whose capital stock is owned by your Company and the Nashville, Chattanooga & St. Louis Ry. Co. This new bridge will enable your Company to better compete with other north and south lines, for business to and from the south.

The complete reconstruction of the bridge across the Missouri River at Kansas City is well under way and will probably be completed in 1916. The old bridge was built in 1868-69 and is single tracked. The new bridge will be a double tracked, thoroughly modern, steel structure on concrete piers.

The new Kansas City Terminal Railway plant, with its passenger station and extensive passenger and freight facilities, was opened on November 1,

1914. It was constructed by the Kansas City Terminal Railway Company, an organization consisting of all of the important Kansas City lines.
The Denver Union Terminal Railway, which is used by all the railroads of that city, is being remodeled and upon completion will be a thoroughly modern terminal.

The Chicago Union Station Co. has been organized by your Company, the Pennsylvania Lines and the Chicago, Milwaukee & St. Paul Ry. Work preparatory to the construction of a modern passenger terminal in Chicago has been begun and the structure, when completed, will not only avoid the serious congestion of the present station, by furnishing ample room for present needs, but will also allow for expansion of business in the future.

Other passenger stations and freight depots have been constructed where required.

The ruling grade between Chicago and Aurora has been reduced to .3%, which will result in more economical handling of tonnage rated freight trains between Mendota and Chicago and avoid reduced tonnage east of Aurora.

Following is the report of the General Auditor, with statements prepared by him.

By order of the Board of Directors.

HALE HOLDEN, President.

COLORADO & SOUTHERN RAILWAY COMPANY—SIXTEENTH ANNUAL REPORT

To the Stockholders of the Colorado & Southern Railway Company:

Herewith is submitted the Sixteenth Annual Report of this Company, for the year ended June 30, 1915.

There are included the reports of A. D. Parker, Vice-President, and J. H. Bradbury, General Auditor.

By order of the Board of Directors,

HALE HOLDEN,
President.

MR. HALE HOLDEN,
President,

Chicago, Ill.

DEAR SIR:—I herewith submit the report for the fiscal year ended June 30, 1915, which report combines the operations and affairs of the lines operated by the companies named on the previous page, and which are herein designated as the

	14,143.27	Extinguishment of Discount on Securities Sold.....	10,300.80	
	61,382.56	Sinking Funds.....	61,029.76	
	62,538.37	Miscellaneous Deductions..	202,768.49	
	\$ 3,349,674.99	Total Deductions.....	\$ 3,305,580.09	

	\$ 553,766.55	Net Corporate Income..	\$ 406,151.13	
--	---------------	------------------------	---------------	--

		Dividends.....	340,265.84	
--	--	----------------	------------	--

	\$ 553,766.55	Surplus.....	\$ 65,885.29	
--	---------------	--------------	--------------	--

Compared with the preceding year, the total operating revenues show an increase of \$867,778.42, or 6.56%. The operating expenses show an increase of \$264,845.58, or 2.71%. The net operating revenue shows an increase of \$602,932.84, or 17.34%.

Adjustment in tax accruals makes the taxes show a decrease of \$22,396.84, or 3.50%. The taxes as assessed and paid, however, differed little from the previous year.

Operating Income shows an increase of \$624,237.73, or 22.12%. The percentage of operating revenues required for operating expenses was 71.05%, as compared with 73.71% in the previous year. It required 72.81% of the Gross Corporate Income to meet interest on funded debt this year, as compared with 76.86% in the previous year.

Credits to Other Income on account of Miscellaneous interest show a decrease of \$455,103.24. This is due to the fact that this Company received no interest during the year on their investment in securities of the Trinity & Brazos Valley Railway Company.

As reflected on pages 17 and 19 there was appropriated from surplus \$1,000,000.00 to establish a reserve to provide for possible losses arising out of the depreciation in value of the securities of certain railroads owned by The Colorado and Southern Railway Company.

During the fiscal year the following securities have been issued and added to the Long Term Debt of these Companies:

Fort Worth & Denver City Railway Company Equipment Trust, Series C.....	\$1,120,000.00
---	----------------

and the following Long Term Debt obligations have been retired:

First Mortgage Bonds of C. S. & C. C. D. Ry. Co. through Sinking Fund.....	\$ 58,000.00
Deferred Rentals under Equipment Leases.....	273,226.18
Making net increase in Long Term Debt of.....	\$ 788,773.82

There were charges to capital account aggregating \$1,110,895.63 for Additions and Betterments to property. Of this amount there was expended for:

Structures and Machinery.....	\$ 16,380.41
Substituting permanent bridges for wooded ones.....	40,302.26
Laying tie plates, main line.....	59,700.55
Additional Equipment.....	954,555.37
Various other Additions and Betterments.....	39,957.04

New equipment purchased and placed in service during the year included:

Five Santa Fe Type automatic stoking and superheated locomotives of 73,440 pounds tractive power each.	
Ten Mikado Type oil-burning, superheated locomotives of 52,300 pounds tractive power each.	
1,200 40-foot steel center-sill box cars, forty-ton capacity.	
300 40-foot steel center-sill stock cars, forty-ton capacity.	
200 steel gondola coal cars, fifty-ton capacity.	

During the year a number of spur tracks and industry tracks were abandoned as they were of no further service to the Company, and credits equal to the original cost of the property were passed to the various Additions and Betterments accounts.

The following equipment was condemned and credited to Property Account:

Sixteen steam locomotives, five passenger train cars, six hundred fifty-nine freight train cars and seventeen work cars.

During the fiscal year there was credited to Property Account the Discount on Securities of this Company sold between July 1, 1909, and June 30, 1910.

During the year the movement of Products of Agriculture has shown a substantial gain, both in respect to the tonnage moved and the revenue received.

Products of Animals show a slight decrease. The tonnage and revenue from Products of Mines have not returned to the normal capacity, and still show a considerable decrease from what this Company was accustomed to handle in previous years. The total tonnage handled and the total freight revenue received show a substantial increase over the previous year. Present prospects would indicate an increased tonnage of both Products of Mines and Products of Agriculture over the lines of this Company's property during the next year.

It was noted last year that the property of The Trinity & Brazos Valley Railway Company was placed in the hands of a Receiver on June 16, 1914, and was operated during the year by such Receiver. His operating results show a net operating revenue of \$49,594.24, against which net revenue, taxes and miscellaneous items were charged, creating a net deficit to Income for the twelve months of \$42,626.96.

A recent contract has been made by the Receiver whereby he will be able to operate freight trains between Fort Worth and Waxahachie over the Houston & Texas Central Railway, making a direct connection at Fort Worth with the Colorado & Southern Lines. This, it is believed, will increase the earnings of the Receiver.

The following statistical tables have been compiled in the form required for the annual report of carriers to the Interstate Commerce Commission:

GENERAL NEWS SECTION..... 1064

*Illustrated.

It appears that the optimism inspired by the generosity of the Missouri Public Service Commission, in allowing the railroads

**The Commission
Giveth and the
Commission
Taketth Away**

of the state to make general advances in their freight and passenger rates, was to a certain extent unfounded. The commission authorized the roads to charge 2½ cents a mile for one-way tickets, 2¼ cents a mile for round trip tickets and 2 cents a mile for mileage books, whereas the roads had asked for a fare of 3 cents a mile in place of the existing fare of 2 cents. The decision, while granting less than the railroad men had declared necessary, bore the semblance of a well-intended compromise, at least. But the executive officers of the Missouri roads, after a study of the commission's order, point out that "the conditions under which

the advance is permitted prevent the railroads from getting it," because they are required to sell 500 and 1,000 mile mileage tickets, good for bearer and any number of persons, to be used within one year, at the rate of 2 cents a mile. Under these conditions it is evident that the sale of individual one-way or round trip tickets will be materially reduced. Mileage books are ordinarily sold under certain restrictions which confine their use to persons who travel extensively, such as commercial travelers, on the theory that a wholesale business is entitled to a reduced rate. The order of the commission brings the purchase of these tickets within the reach of the majority of travelers at a reduction of 20 per cent under the rate for one-way tickets and makes possible a practice which prevailed in New England when the standard rate was 3 cents. Hotels, saloons, grocery, cigar and drug stores, and even many local capitalists with \$100 or so to risk, used to buy Boston & Maine mileage books at 2 cents a mile and rent them out to anyone they were willing to trust to return the book with payment for the mileage used at 2¼ cents a mile. This plan of scalping was taken advantage of by people who did not travel enough to warrant the investment of the price of a book of their own and who were therefore not entitled to the reduced rate. The commission advances the threadbare argument that the sale of mileage tickets at this low rate will increase travel, while admitting elsewhere in its opinion that the present 2-cent fare has not increased travel sufficiently to offset the loss in revenue.

The New York Times recently published a large number of figures taken from "Statistics of Railways, 1904-1914, United States," a bulletin issued by the Bureau

Omitted Columns

in

"The Omitted Table"

of Railway Economics. These figures show—although the bulletin itself does not call attention to the fact—that for years the expenses and taxes of the railways have been increasing much faster than their earnings. Under the caption, "The Omitted Table," the Des Moines Register and Leader editorially castigates the New York Times for not having published a table showing the dividends the railways paid during this period. The Freeport (Ill.) Bulletin takes the matter up and chastises the "railway statisticians" for not having presented these figures. The "railway statisticians" were not guilty of the offense attributed to them. The very statistics regarding dividends which the Freeport Bulletin quotes from the Des Moines Register and Leader were taken by it from page 14 of the bulletin compiled and published by the reviled "railway statisticians." The Register and Leader and the Bulletin make much of the fact that the increase in the total dividends declared during this period was 100 per cent. The implication is that the railroads were abnormally prosperous. But, curiously enough, the virtuous Register and Leader, in calling attention to "The Omitted Table," itself omitted certain columns from that same table. These columns showed, among other things, that in 1904 42.53 per cent of the railway stock outstanding did not receive a cent of dividend, the average paid on all stock being only 3.5 per cent; and that in 1914, 35 per cent of the stock received no dividend, the average on the total being only 5.2 per cent. Furthermore, total dividends paid in 1914 were swelled abnormally by a distribution of \$80,000,000 made by the Harriman system in connection with its dissolution under a decree of the United States Supreme Court. The average percentage paid in 1913 was only 4.28. Why has the average dividend increased only from 3.5 to 5.2 per cent, while the total dividends paid have increased 100 per cent? The answer is that between 1904 and 1914 the investment in the road and equipment of the railways of the United States increased, according to the statistics of the Interstate Commerce Commission, from \$10,511,537,131 to \$16,936,097,810, or 61 per cent, a great part of which represented capital raised by the sale of stock. In the absence of the large extra disbursement made by the Harriman lines in the effectuation of their dissolution the dividends paid in 1914 would have been only 64 per cent greater than in 1904, although, as already shown, 43 per cent of all the stock outstanding in 1904 received not a cent of dividend. When

the ostentatiously knowing and virtuous Register and Leader set out to correct the New York Times, why did it not finish the story?

The right to hire a man to work ten hours a day, in an ordinarily healthful occupation—if the employee is willing to enter into such a contract—is one of the primary rights enjoyed by everybody under the constitution. This salutary declaration of fundamental law was delivered by the United States Supreme Court, and has just been

reaffirmed by the Supreme Court of Massachusetts, as reported last week, page 1026. In other words, laws limiting hours of labor have no just basis except as it is found in the actual needs of the individual or of society. It would be well if this principle were enunciated more frequently by the press and other leaders of public opinion. The higher courts, speaking only at infrequent intervals, and to restricted audiences, seem to be our only impressive mouthpieces for this and many cognate truths, which are of the first importance. This Massachusetts law, under which a criminal indictment was found against the Boston & Maine, limited station-baggage-men's hours to nine a day, and included also other employees around passenger stations, such as crossing tenders. It was a flagrant illustration of the "progressive" character of the labor leaders' demands. They first got a law limiting street railway mens' hours; then, the next year—we speak from memory—a similar law making the day an hour shorter; and then the same thing applied to steam railroad employees. Except for the mandate of the court, the successive legislatures apparently could have been induced easily to keep on till the work day was reduced to six hours, or less; or until the labor leader should become ashamed of his own audacity and turn his efforts in some other direction. Not the least noticeable of the harmful tendencies in matters connected with labor legislation is the attitude of the press in its attempts always to be friendly to "the masses." This Massachusetts decision, as printed in the New York Tribune, is headed "Robs Men of Rest Hour." Instead of working from say, 7 to 5, with an hour out for dinner, the station men—unless they can show that they are overworked—will have to work the old-fashioned day, 7 to 6, with one hour out. There may be some occupations in which, for social reasons, the working day should be restricted to 10 hours or less by law; but these must be very few; and certainly that of station baggage-men is not one of them.

THE SMOKE NUISANCE AND ELECTRIFICATION IN CHICAGO

FOR some years there has been a vigorous agitation in favor of legislation to require the railways entering Chicago to electrify their terminals in that city. The principal, and in fact almost the only, argument for such action has been the contention that it is needed to reduce the smoke nuisance. About four years ago the Association of Commerce, the leading civic organization of the city, took a hand in the matter. It created a commission to investigate thoroughly the subject of smoke prevention and electrification of railroad terminals. Four of the members were appointed by the city, four by the railroads and nine by the Association of Commerce. The commission employed a strong staff of experts and made the most comprehensive study, both of smoke prevention and of electrification of terminals ever conducted. The necessary funds were furnished by the railroads.

The conclusions reached by the commission in its report, which has just been made public, and an abstract of which is published in another column, may be briefly summarized. It finds that smoke in the atmosphere probably does not have the deleterious effects on the health usually attributed to it. It finds further that steam locomotives cause only 10 per cent of the total smoke in Chicago. This is only one-half as much as is attributed to furnaces for metallurgical and manufacturing

processes, or low-pressure steam and other stationary heating plants, and only one-fourth as much as is attributed to high-pressure steam and stationary heating plants. Therefore, electrification of all the terminals would not remedy, and in fact would cause only a small and temporary reduction in the smoke nuisance.

As to electrification, the commission has ascertained that its application to all the terminals in Chicago would include 3,476 miles of track, which exceeds the entire mileage of steam railways thus far electrified in the entire world. It does not believe that the best system for electric operation has yet been definitely enough determined to justify, from a technical or a practical point of view, legislation requiring the carrying out at present of such an enormous project. It finds, however, that electrification is technically practical, but financially impractical. The estimated cost in Chicago would be \$178,127,230. Railways which have investigated the subject individually report, however, that for practical operating reasons it would be necessary for them to extend electrification beyond the zone covered by the commission, and this would increase the total cost to \$274,440,630. The commission finds that electrification would make it practicable to effect certain operating economies, but on the other hand, it would cause an enormous increase in fixed charges, and the annual loss which it would cause is placed at \$14,600,000. The loss on the basis of the railways' estimate as to the mileage, which for practical reasons it would be necessary to include, would be much larger.

It is not reasonably to be expected that this report will be received favorably by those who have been agitating the question of electrification in Chicago. But it will be much easier to find fault with the commission than to controvert the evidence it presents or to refute its conclusions. Its finding that smoke it not so harmful to health as has been assumed is important, but not necessarily decisive, since most people will not find it agreeable to live in an atmosphere of smoke, even though assured that its only effect is as a producer of dirt. The evidence given that Chicago is not as smoky as some other cities is rather damaging to the atmosphere of these other cities than creditable to that of Chicago.

Of widely different significance are the data presented showing the relatively small amount of the smoke nuisance which is fairly attributed to steam locomotives. The facts presented demonstrate that legislation requiring electrification cannot be justified by the effect which would be produced on the smoke nuisance, for after the money had been spent, the improvement effected would be so small as not to be noticeable. Electrification would involve the construction of large power houses, which themselves would emit smoke, and in consequence the net reduction in smoke is estimated by the commission at only 5 per cent.

It is being alleged in some quarters that the commission has wasted time and money in investigating the question of the electrification of all the city's terminals, it being asserted that this is not the end toward which the agitation has been directed. But the demand has been for the electrification of all terminals, as can be demonstrated by the records. Every proposed ordinance which has been drafted has provided for general electrification. Furthermore, if it is the electrification of only certain suburban lines that is demanded, then the smoke nuisance has nothing to do with the matter, because the electrification of only a few lines would not materially reduce even the amount of locomotive smoke produced. The commission shows that locomotives engaged in suburban service on all roads contribute only 1.54 per cent of the visible smoke, 1.97 per cent of the dust and cinders of smoke, and less than 1 per cent of the total polluting gases discharged into the atmosphere.

There can hardly be any serious exception taken to the commission's conclusion that, even though electrification in Chicago were desirable, it would be almost impossible to decide what system should be adopted. The Chicago problem involves 38 railroads, as against only 37 steam roads throughout the world

that have been partially electrified. It involves a network of tracks and yards incomparably more extensive and complicated than exists elsewhere. Its solution could not be carried out by individual lines, but would involve joint action by all. In determining the system to be adopted, each line necessarily would think of the conditions on its lines outside of Chicago with which it would have to deal if the use of electricity should be extended. It would, therefore, be impossible to get experts voluntarily to agree as to what system should be adopted in Chicago, and if some system should be adopted under the compulsion of law it is probable that future experience would demonstrate that great and costly mistakes had been made. In view of these views, it would be the height of folly to incur the risk of an investment of \$275,000,000, or even of \$178,000,000, to secure a reduction of perhaps 5 per cent in the smoke in the atmosphere of a single city.

In spite of the engineering and operating difficulties in the way, the commission finds that electrification is technically feasible, but decides that it is financially impracticable. The reasons it presents for this conclusion appear incontrovertible. The Chicago lines, under the requirements of city ordinances, already have spent \$80,000,000 for track elevation and must spend a total of \$150,000,000. They have invested many millions in passenger terminals, and must invest literally hundreds of millions more. If the cost of electrification, in addition to that of these other improvements, were to be spread over their entire traffic, people throughout the country would be required to pay for investments which would benefit Chicago alone. If rates were so adjusted as to make the traffic of Chicago bear the load of all the actual and proposed expenditures, the effects would be disastrous for Chicago. Track elevation and electrification would involve an investment of \$5,000 per mile for every mile of line owned by all the railways entering that city. Certainly, no such enormous burden should be imposed on the railways directly and on the commerce of the country as a whole, or on that of Chicago alone, except for reasons of the greatest potency. That the entire burden, if imposed, would have to be borne by commerce is clear, since the laws do not permit the city to meet any part of the expenditure by taxation.

As already indicated, the commission finds the project "financially impracticable." Each road would have to raise its share of the necessary capital. But while some roads would have no trouble in doing so, others would find it impossible. There are a number of lines running into Chicago which are very weak financially. Three of the important lines are in the hands of receivers, and another has just emerged from bankruptcy. Such roads find it very hard to get new capital, even for improvements which might yield a good return on the investment. But electrification is not in this class of improvements. On most roads it would cause an increase in fixed charges greatly exceeding the savings in operating expenses. Weak roads would therefore find it impossible to raise new capital for this purpose. There are a number of switching and terminal lines which lie almost entirely within the Chicago district. They would be unable to offset by increase in their net earnings outside of Chicago any part of the increase in fixed charges which electrification would cause.

The commission specifically says that its conclusions relate only to electrification of all the steam railroad terminals of Chicago. They have no application to the electrification of the suburban lines of individual railways. It is contended in some quarters that certain suburban lines should be operated by electricity, both for the good of the city and because the roads would benefit by the increase in traffic, and reductions in operating expenses, it is claimed, would result. This argument may have some validity, but the question as to whether it is desirable from the railroad standpoint for certain suburban lines to be electrified is one which their officers are competent to determine. There can be no question regarding the desirability and probability of an increase in electrification of steam railroads; but the problems to be solved are numerous, and they will not

be solved by action on the part of public authorities, who do not possess the expert knowledge necessary for guidance in such matters, or who arbitrarily refuse to give full consideration to all the interests affected.

INCREASING EFFICIENCY AS INDICATED BY LARGER TRAIN LOADS

WHILE the business depression and other unfavorable conditions during the past few years have compelled the railroads to practice a degree of economy that undoubtedly has been too drastic for their best interests and for those of the public they serve, the necessities of the situation have had a salutary effect in one respect in stimulating efforts toward the greatest efficiency.

In the fiscal year 1915 the gross earnings of the railroads of the United States were \$163,000,000 less than in 1914, but the roads succeeded in reducing their operating expenses by \$186,000,000. Nearly half of the reduction was in maintenance expenditures, and much of it represents deferred maintenance that must be made up some time. A little over half of the saving, however, was in transportation expenses, which were reduced 9 per cent per mile. This represents a real saving, which was accomplished by more efficient methods of operation.

One of the most effective ways of improving railroad efficiency is to increase the number of tons of freight per train. Out of 35 important roads whose annual reports for the fiscal year 1915 are available, 28 show increases in their tonnage per freight train, as compared with the previous year, while only 7 show decreases, the average gain for these roads being 22 tons per train, or from an average of 482 tons in 1914 to 504 tons in 1915. The most remarkable feature of this showing is that it was accomplished in a year when most roads had decreases in freight traffic, and when, therefore, the difficulty of increasing train loads was especially great. The list of roads, with their average tons per freight train for 1915 and 1914, is as follows:

Road	Average tons per train		Road	Average tons per train	
	1915	1914		1915	1914

* Revenue freight only.

An especially noteworthy feature of the improvement in 1915 is the fact that the general average was pulled down by many branch lines where but one train a day is run, particularly in the west, because it was impossible on such lines to reduce train mileage to offset the lighter tonnage, and the increases shown for the systems represent a much greater proportionate improvement on the busier divisions.

Handling a greater tonnage without a proportionate increase in the number of trains has been for many years one of the most vital factors in enabling the railroads of the United States to stand as well as they have an almost continuous reduction of rates in connection with constantly increasing expenses. An examination of their trainload figures reveals an amazing record of increased efficiency. In 1891 the average number of tons per freight train was 179.8, in 1901 it was 307.8 and in 1914 it had increased to 451.8, a gain in 20 years of 152 per cent, and in 10 years of 47 per cent. During most of these years the volume of traffic was increasing, and the only way by which it

could be handled with the available facilities was by increasing the trainload. When traffic declined in 1908, as compared with 1907, the trainload also declined from 357 to 352 tons. With that exception it has increased in every year since 1904. But in 1914, as compared with 1913, and in 1915 as compared with 1914, the traffic declined. The fact that the roads have gone on increasing their train tonnage during these years makes a remarkable showing and indicates clearly the great exertions made by the operating officers to reduce expenses.

In 1894 the railroads of the United States hauled 80,335,000,000 tons of freight one mile and in 1914 a total of 288,319,000,000 tons one mile. This is an increase of 259 per cent; but it was handled with only 42 per cent more train miles. The 1914 ton mileage also represents an increase of 65 per cent over that of 1904, which was 174,522,000, but it required an increase of only 12.5 per cent in train miles. In other words, to have handled the traffic of 1914 with the average train of 1894 would have required running 1,600,000,000 train miles instead of 638,000,000. The saving, 962,000,000 train miles, is 150 per cent of the train miles actually run in 1914.

The average cost of operation per train mile for all trains as shown by the Interstate Commerce Commission reports, was \$1.31 in 1904 and \$1.77 in 1914. The cost per train mile in freight service is considerably higher than the average for both freight and passenger service. While it is impossible to state exactly the average cost of operation for a freight train mile it is evident that a saving of 962,000,000 train miles means a saving of hundreds of millions of dollars annually in operating expenses. When compared with this actual accomplishment, Louis D. Brandeis' "scientific management" schemes for saving the railroads a million dollars a day pale into insignificance. Even the average loading of 307.8 tons in 1904 would have required running 936,000,000 train miles in 1914, instead of the 638,000,000 actually run, so that the saving as compared with 10 years before was 298,000,000 train miles. This was accomplished both by using larger cars, by loading more tons of freight into a car and by using more cars per train. The average number of loaded cars per train was increased from 17.4 in 1904 to 21.4 in 1914, while the average number of tons per loaded car was increased from 17.7 to 21.1.

The amount of the *increase* in tons per train from 1904 to 1914 alone is greater than the total average tons per train for the railways in most other countries. Outside of Canada and Mexico, Germany is the only country in the world whose railways come anywhere near ours in train loading. The figures for some of the principal countries for 1912 are as follows: Canada, 325.3; Germany, 240.4; Mexico, 224.1; India, 184.4; Austria, 180.5; Roumania, 143.7; France, 141.7; Holland, 137.1; Switzerland, 132.8; Japan, 110.7; South Australia, 109.6.

The heavy train loading is the principal element in making possible the low freight rates charged and high wages paid in the United States as compared with foreign countries. The operating expenses for a heavy train are somewhat higher than for a lighter train, because the engine crews receive higher wages on the larger engines, the fuel consumption is greater, the trains often require a longer time in getting over a division, and the increased supervision necessary to secure the most economical loading adds something to the payrolls. These increases per train, however, are more than offset by the reduction in the number of trains run. It is almost true that revenues are measured by ton miles and expenses by train miles.

In view of this showing of savings in operating expenses, the question naturally arises as to why so many railways are complaining that they are in a bad plight financially. This is due partly to the fact that the economy in operation secured by increasing trainloads is partly offset by the increase in investment and fixed charges that it is necessary to incur in order to effect this economy. The investment in reductions in grades and curvature, in heavier rails, more powerful locomotives and longer sidings and passing and yard tracks has greatly increased total interest charges. But the greatest increase in outgo

has been caused by the heavy advances in wages. The railroads in 1914 paid over \$300,000,000 more in compensation to their employees than they would have paid on the basis of the wages in effect in 1904. Without the increase in the average freight trainload, with the consequent savings effected, most of the railways, in the absence of large increases in rates, would have been in the hands of receivers. On many roads the increases in wages, fixed charges and other expenses actually have come faster than trainloads could be increased, and other economies could be effected, and the results have been disastrous.

MISSOURI, KANSAS & TEXAS

THE Missouri, Kansas & Texas has completed the valuation of its property in Oklahoma and has made an estimate of the valuation in Missouri and Kansas based on the Oklahoma valuation. This estimate places the original cost, with additions and betterments, of the system in the three states, exclusive of Texas, at \$58,370 per mile (the company operates 1,660 miles in these three states). The cost of reproduction new is placed at \$68,604 per mile. In the fiscal year ended June 30, 1915, operating income amounted to \$8,603,000. This would be 7 per cent on a capitalization of \$34,000 per mile on the total 3,604 miles of railroad operated.

In 1915 operating income was the largest in the history of the company. The operating ratio in 1915 was 69.81 per cent, the first time this ratio has been below 70 since 1907, and in that year there was allowed for maintenance only 11.13 per cent of the total revenue as against 13.92 per cent in 1915. The operating ratio in 1914 was 72.77 per cent, but the actual economies effected are greater than would be shown by the comparison between 72.77 and 69.81, because the average revenue per ton per mile in 1915 was 9.9 mills as against 10.9 mills in 1914, a decrease of 9.2 per cent. The revenue per passenger per mile was less than half of one per cent greater in 1915 than in 1914, being 2.26 cents. The average revenue trainload in 1915 was 310 tons, comparing with 268 tons in 1914, an increase of 42 tons, or 15.7 per cent.

Total operating revenues in 1915 amounted to \$32,899,000, an increase of \$981,000. The freight revenue was \$22,397,000, an increase of \$2,169,000 over the previous year, and the passenger revenue was \$8,096,000, or \$1,009,000 less than in 1914. The total tonnage of revenue freight in 1915 was 10,135,000, an increase as compared with the previous year of 1,013,000 tons. The total ton mileage of revenue freight was 2,263,782,000, an increase of 413,190,000 ton-miles, or 22.3 per cent. The mileage run by revenue freight locomotives was 7,172,000, an increase of 222,000, or 3.2 per cent.

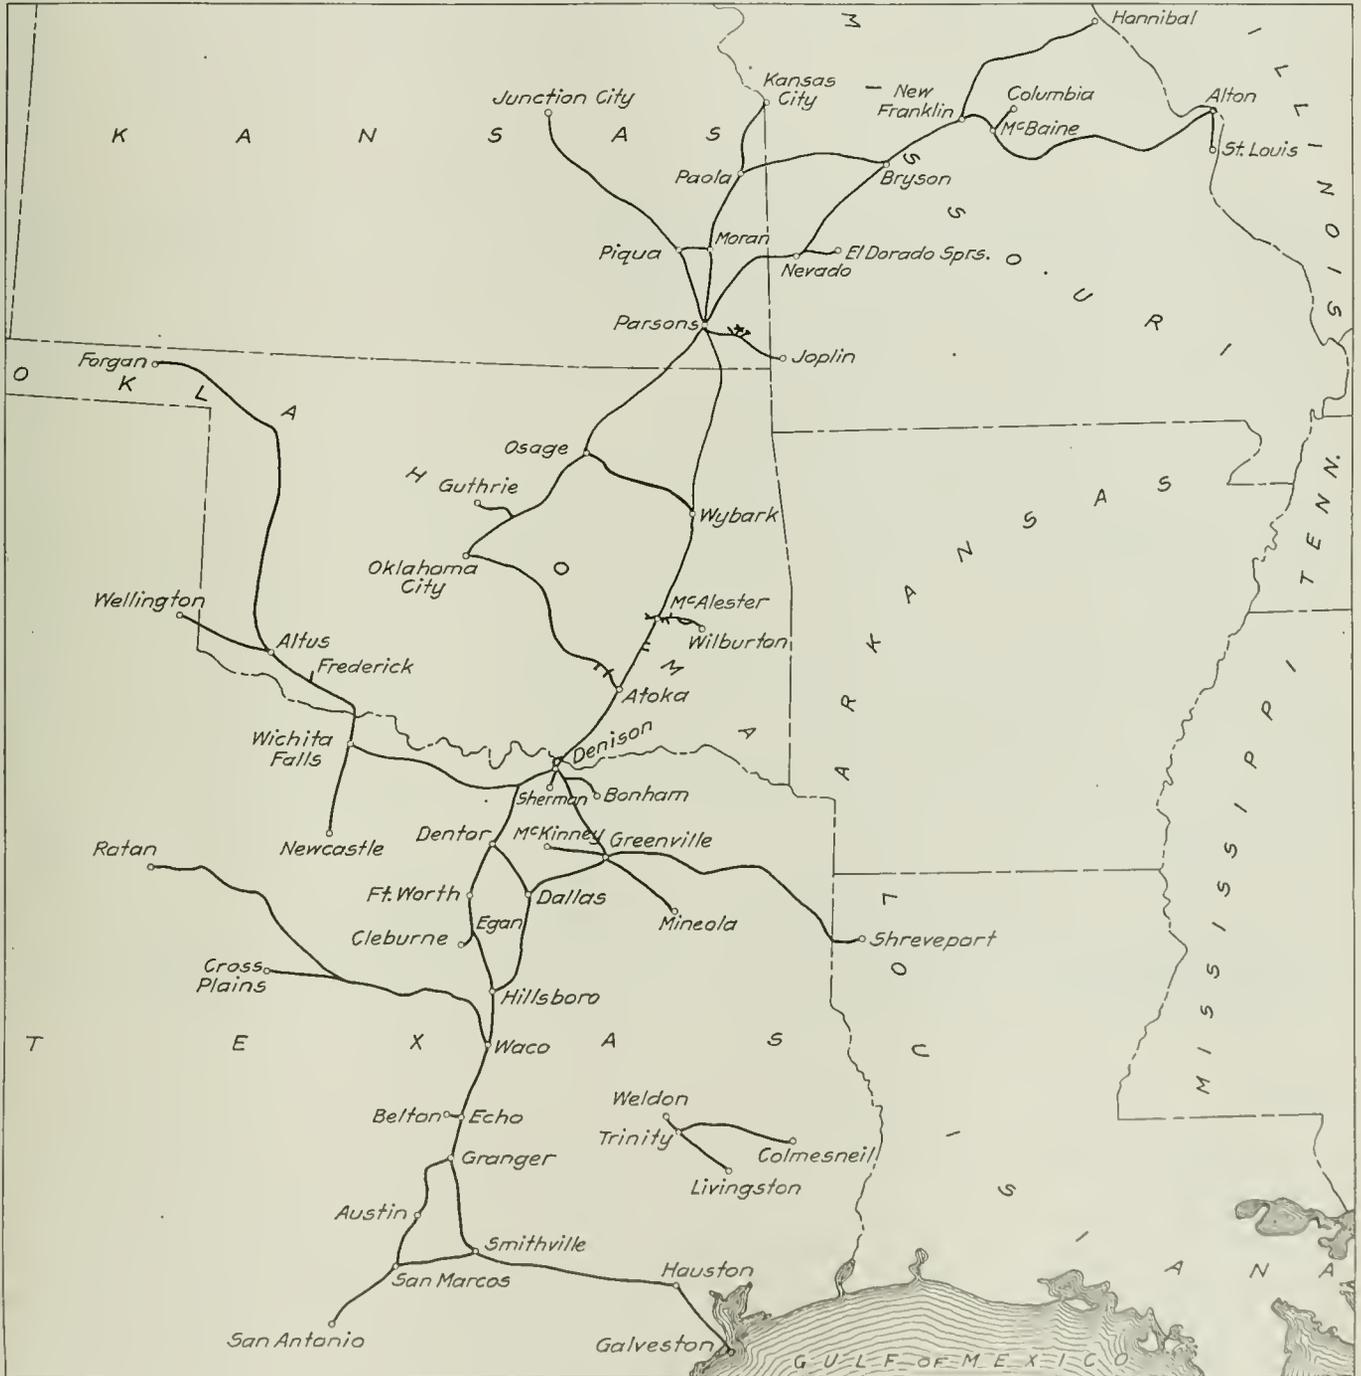

The total number of passengers carried was 6,556,000, a decrease of 779,000, and the passenger mileage was 358,631,000, a decrease of 45,403,000, or 11.2 per cent. Passenger-train mileage was 7,353,000, a decrease of 405,000 train-miles, or 5.2 per cent.

Assuming that the cost per passenger-train mile was approximately the same in 1915 as in 1914, which is a fairly safe assumption, it is fair to arbitrarily make a guess at a figure for the total operating expenses, including taxes and general expenses per train-mile, for passenger service and to assign this figure to the passenger service for both years so as to get some rough figure by which to measure the reduction in expenses per ton-mile of freight. Taking \$1.25 as the average cost per passenger-train mile, the total passenger expenses in 1915 would have been \$9,201,250, and in 1914, \$9,697,500.

In 1915 over 22 per cent more tons were carried one mile than in 1914, at a cost in 1915 less by over \$200,000 than in 1914. There are four principal factors which have brought about this result. In 1914 operating conditions were extraordinarily bad, and while there were floods in 1915 also, conditions were not quite so bad as in the previous year. The organization which has been built up since the new management took hold of the property five years ago has been showing from year to year greater facility in the economical operation of the property. In July, 1914, 30 new Mikado locomotives were placed

in service. In 1915 for the first time the Missouri, Kansas & Texas secured a substantial tonnage of crude petroleum, giving it a traffic which could be moved in heavy tonnage trains north-bound. Each one of these factors is important, although the first one mentioned is probably of much the least importance and the crude petroleum traffic possibly the most interesting. In 1914, 199,000 tons of crude petroleum was hauled. This was only a little over 2.18 per cent of the total traffic handled. In

As previously mentioned, total operating expenses amounted to \$22,968,000, a decrease of 1 per cent. There was spent on maintenance of way \$4,503,000, or but \$72,000 less than in the previous year, and on maintenance of equipment \$4,579,000, which was \$645,000 more than in the previous year. When the present management took the Missouri, Kansas & Texas there was a large amount of deferred maintenance, of equipment especially. In 1915, \$2,508 was spent for repairs per locomotive,

Missouri, Kansas & Texas

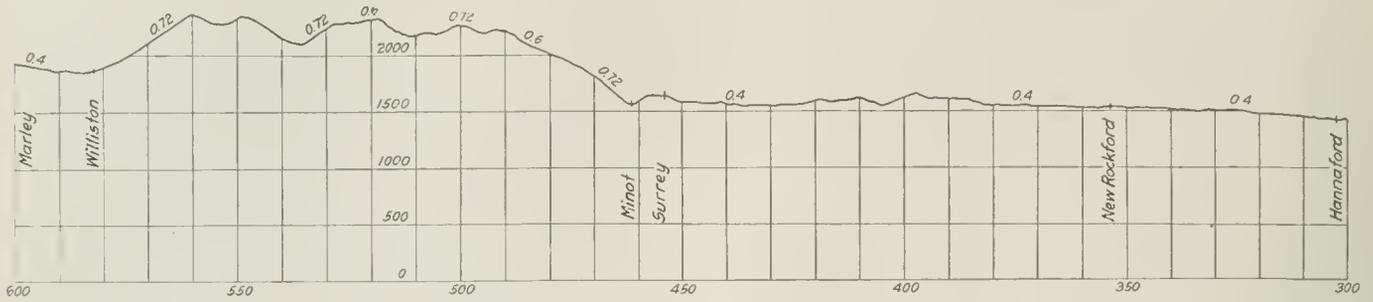

1915, 1,056,000 tons of crude petroleum was hauled, or 10.42 per cent of the total tonnage in that year. There was a large increase in the tonnage of grain carried, the total in 1915 amounting to 2,499,000 tons, an increase of 471,000 tons over the previous year. This was the result of large crops and of extraordinarily large shipments of grain for export via gulf ports on account of the war. The tonnage of coal in 1915 amounted to 1,571,000 tons, a decrease of 400,000 tons as compared with the previous year, the decrease being due to general business depression.

\$658 per passenger-train car and \$60 per freight train car. At the end of the year 19.3 per cent of the locomotives owned and 6.73 per cent of the freight cars owned were undergoing or awaiting repairs. Since the close of the fiscal year the equipment has been brought up to a satisfactory standard for the first time in a number of years.

During the year under review, the company spent \$1,494,000 for additions and betterments, exclusive of additions to equipment. Ballast and track laying and surfacing were the most important items of betterment expenditures. There was also

\$165,000 spent for land for transportation purposes. During the year \$1,062,000 was spent for new equipment, and equipment having a cost of \$713,000 was retired. A \$646,000 issue of Mis-

Kansas & Texas on September 26 have been discussed previously in these columns. The annual report which has been issued emphasizes the point which was made in that discussion, namely,

Profile of Great Northern Low Grade Line from St. Paul to Seattle

souri, Kansas & Texas, of Texas equipment trust 5 per cent notes was sold, and various issues of notes and bonds were retired or

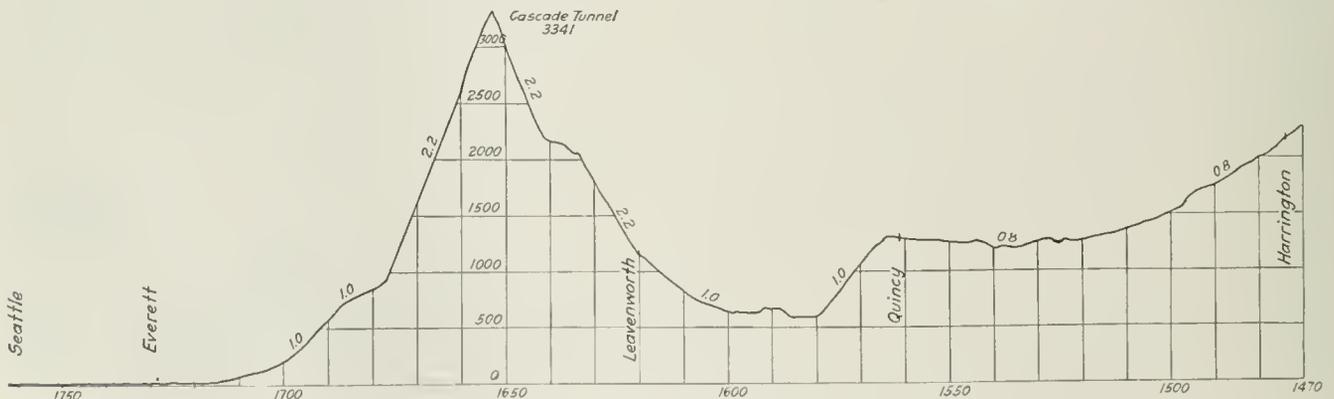

that the receivership was not because the results of operation of the property were bad, but because of special circumstances

Profile of Great Northern Low Grade Line from St. Paul to Seattle

bought for the sinking fund, making a net decrease in the outstanding funded debt of \$379,000. On June 30 there was a total

beyond the control of the management. The Missouri, Kansas & Texas is working its problems out. Its revenue freight train-

Profile of Great Northern Low Grade Line from St. Paul to Seattle

of \$1,039,000 cash, which included \$497,000 cash deposited to pay interest, and there was \$2,810,000 loans and bills payable. After paying expenses, taxes, rentals and all interest charges, the Missouri, Kansas & Texas had a net income available for dividends of \$1,475,00, an increase as compared with the previous year of \$936,000. No dividends were paid and this amount was carried to the credit of profit and loss.

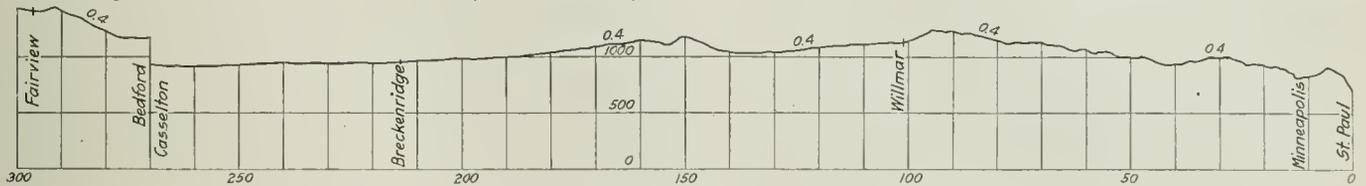

The causes which led up to the receivership of the Missouri,

load was uneconomically low. It has been increased by 38 per cent since 1911. Its relations with Texas have been friendly where they were previously hostile. The company has secured strong banking support, and what is now essential is that it should get a square deal from the state railroad commissions and state legislatures.

The following table shows the principal figures for operation in 1915 as compared with 1914:

	1915	1914
Average mileage operated.....	3,825	3,825
Freight revenue.....	\$22,397,364	\$20,228,337
Passenger revenue.....	8,096,063	9,105,242
Total operating revenues.....	32,898,759	31,917,924
Maintenance of way and structures.....	4,502,567	4,574,726
Maintenance of equipment.....	4,579,464	3,934,119
Traffic expenses.....	657,215	737,766
Transportation expenses.....	12,080,328	12,408,688
Miscellaneous expenses.....	267,515	504,713
General expenses.....	1,037,434	1,217,009

against which no securities have been issued. In 1915 apparently the Great Northern was under no necessity of making an uneconomically drastic cut in maintenance appropriations. Total operating revenues in the fiscal year ended June 30, 1915, amounted to \$67,163,000, a decrease as compared with the previous year of \$9,692,000, or 13 per cent. There was \$3,194,000 saved in transportation expenses; a cut in maintenance expenses

Profile of Great Northern Low Grade Line from St. Paul to Seattle

Transportation for investment-Cr.....	186,932	150,188
Total operating expenses.....	22,967,592	23,226,832
Taxes.....	1,327,871	1,499,521
Operating income*.....	8,603,296	7,299,548
Gross income.....	8,818,130	7,516,927
Net income.....	1,474,985	539,227
Dividends.....	261,429	261,429
Surplus.....	1,474,985	277,798

exactly in proportion to the falling off in revenue would have saved an additional \$3,000,000; the company had \$3,800,000 surplus above its dividend requirements; or a total of nearly \$10,000,000, while loss in revenue was but \$9,692,000.

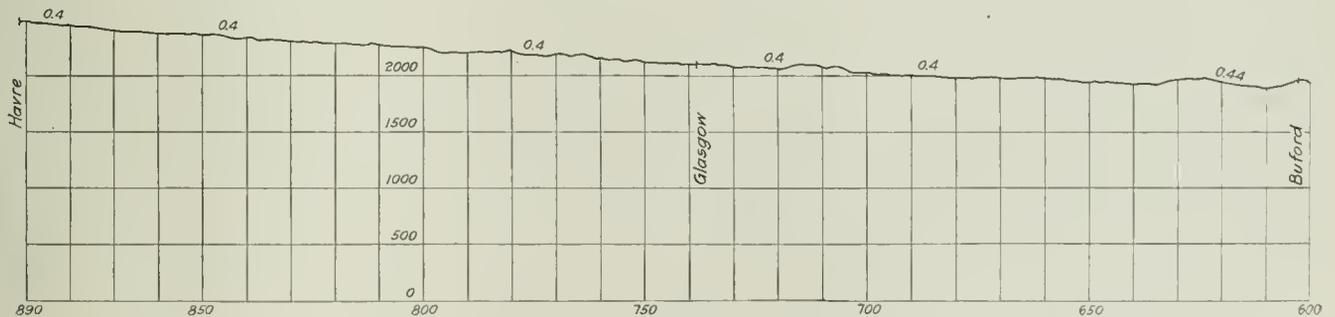

* The figures for operating income, gross income, etc., are not absolutely accurately comparable because of changed rules regarding accounting put into effect by the Interstate Commerce Commission, but are approximately comparable.

In concluding his report in 1914, President Hill said: "The company's roadbed, tracks and equipment have been fully maintained and greatly improved. The season's track work was finished by the end of July, a large amount of delayed bridge work was completed, heavy shop forces, maintained during last winter, have been materially decreased, so that, for at least the first half of the coming fiscal year, the expenses of maintenance and betterments should be greatly reduced."

GREAT NORTHERN

THE Great Northern is one of the few railroads in North America that could cut maintenance of way expenses 36 per cent and maintenance of equipment 31 per cent and not lay itself

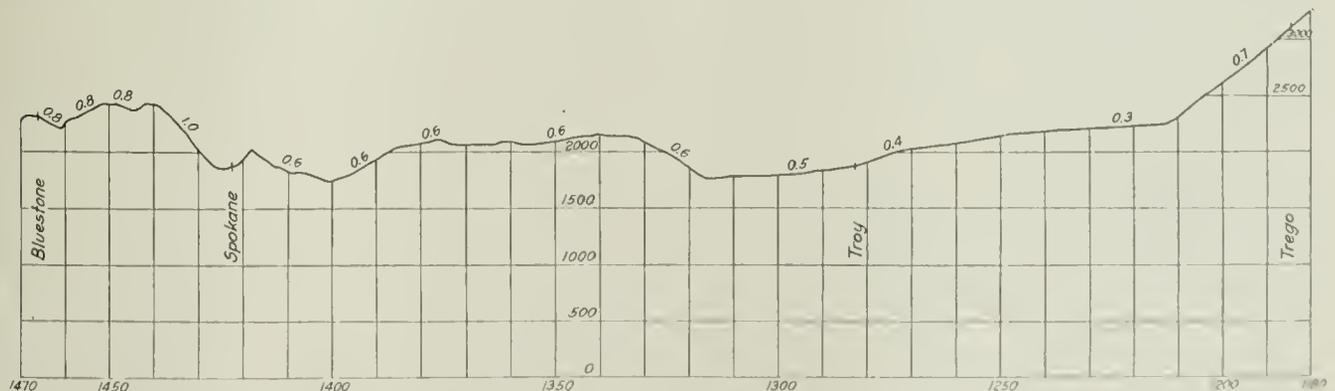

for a great many years the Great Northern has been working toward certain standards, both in trainloading and in main-

Profile of Great Northern Low Grade Line from St. Paul to Seattle

open to the suspicion of inadequate maintenance. This it did in 1915. The Great Northern, like the Southern Pacific, has never been through a receivership; it has never had to live on its own

tenance. These standards in maintenance were reached, apparently, in 1914. It was known, as will be seen from Mr. Hill's statement, that it would be much cheaper to maintain these

Profile of Great Northern Low Grade Line from St. Paul to Seattle

The profile from St. Paul to Surrey is via the new Surrey line, which gives better grades than the old St. Paul line via Fargo. The mileage is only approximately correct, nothing being allowed for a short connection between Castleton and Bedford, for which a profile was not available. The portion of the old main line between Surrey and Grand Forks is shown on the Duluth-Surrey profile on the following page.

fat, if the expression may be permitted. On the other hand, there has been invested in the property approximately \$80,000,000*

standards than it had been to attain them. How much cheaper it was, however, possibly came as a surprise even to the Great Northern management. This is the real explanation of the cut in maintenance figures.

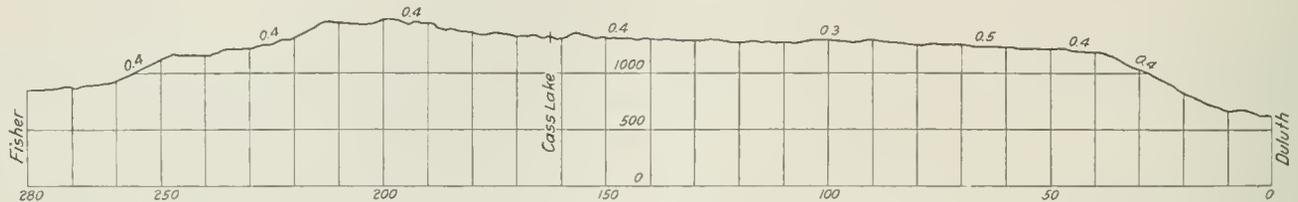

* This is arrived at by taking the sum of the fund for permanent improvements and betterments, the cost of additions and betterments made and paid for from that fund, and the profit and loss credit, and subtracting from it the cash on hand.

In the fiscal year ended June 30, 1915, it would appear from

the railroad annual reports which have appeared so far, that there have been larger economies made in transportation expenses by railroads generally than in any year in the last decade. It has only been within the last few years that conditions on many roads were thought to permit the attention being given to heavier trainloading that has been the fundamental principle of Hill railroad operation. The comparison for many roads therefore between 1914 and 1915 is more favorable than it would have been had they set a "Hill" standard in past years. On the other hand, it is possibly the results obtained on the Great Northern in 1915 that made James J. Hill remark recently that he believed that if he were starting over again he would set the peg for trainloading higher than he did.

The ton mileage of freight on the Great Northern in 1915

the line running to Great Falls and Billings. This continuous movement of through trains from the Pacific ocean to St. Paul, with a minimum of service on branch lines and with an insistence on heavy carloading, is the explanation of the Great Northern's success. The vast sums of money which have been invested in the property have been spent with the single purpose of making a transportation machine which would perform its functions at the least possible cost for repairs, renewals or operation. In the carrying out of this scheme, complicated details have been avoided through the adoption of simple standards, and local conditions have been made to adjust themselves to these standards rather than compelling the modification or complication of the standards. An analogous development has taken place in the organization. At least four of the superintendents

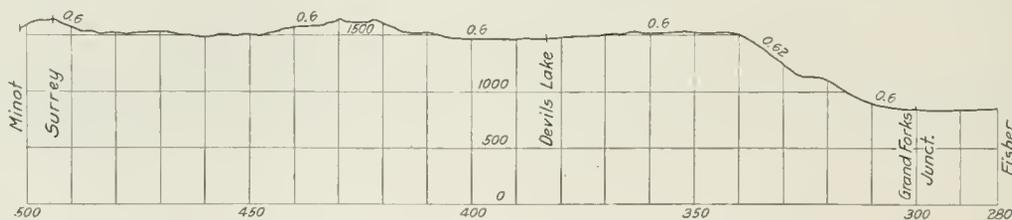

Profile of the Great Northern Line from Surrey to Duluth

was 6,598,341,000, a decrease as compared with the previous year of 17.80 per cent. There was a loss in iron ore tonnage of 4,341,000, or 31.57 per cent, and a loss in the copper ore tonnage of 1,398,000 tons, or 71.57 per cent. These, of course, are the heavy loading commodities. The average trainload in 1915 was 650 tons and in 1914, 663 tons. This is a decrease of less than 2 per cent. It is often pointed out in connection with the Great Northern's remarkably heavy trainload that it has a very large ore business moving from the Missabe range to Duluth. Grades and traffic conditions here permit of enormous trainloads, and when this tonnage is included in the general average make a comparison between the Great Northern and other northwestern transcontinental roads not entirely accurate. Excluding entirely the iron ore tonnage handled from the range to the head of the lakes, the average revenue trainload on the Great Northern in 1915 was 556 tons. The average trainload of revenue freight

now on the Great Northern began railroad work in the section house.

This brief resumé of the Great Northern's history is by way of saying that when the operations in 1915 compare very favorably with the previous year, a very high standard of comparison is being used. During 1915 the company spent a total of \$3,145,000 on additions and betterments, exclusive of additions to equipment. The total spent for equipment was \$1,771,000. A very liberal policy has been pursued toward charges for depreciation. The total to the credit of this account on June 30, 1915, was \$26,542,000, and when the annual report says that this represents "full depreciation to that date (June 30, 1915), on all equipment then in service," the statement may be taken at its full face value. The company had on hand, as was previously mentioned, at the end of the year \$11,591,000 cash and \$10,365,000 bills receivable, with no notes and bills payable, and total cur-

Profile of the Great Northern Line from Surrey to Duluth

The ore tonnage from the iron range passes over only about 75 miles of the eastern end of this line.

from and to the range was 3,174 tons. This is based on ore train movement both ways, that is, a combination of light and empty ore train mileage. It will readily be seen how much of a handicap in the average trainload figures a decrease of 32 per cent in ore tonnage was, and it is a high compliment to the management that average trainloading fell off less than 2 per cent.

The Great Northern has a mass of branch lines which necessitate local freights and light trainloads, but so thoroughly has the principle of heavy trainloading been inculcated in the organization that, exclusive of ore tonnage, the trainload was 556 tons. The heavy movement of traffic is eastbound. Through freight trains are run from Seattle to St. Paul with a full tonnage rating, including equipment behind the drawbar, of over 3,000 tons. There is electric service on the 2.2 grade shown in the accompanying profile up to and through Cascade tunnel, and helper service on the .8 and 1.8 grade up to Summit. At one point only is it necessary to fill out and this is at Cut Bank, where there is ample opportunity to use cars brought in from

rent liabilities of \$6,884,000, which included the unpaid coupons due July 1, 1915, amounting to approximately \$2,769,000.

The following table shows the principal figures for operation in 1915 as compared with 1914:

	1915	1914
Average mileage operated.....	8,061	7,781
Freight revenue	\$47,147,314	\$55,084,925
Passenger revenue	13,164,857	15,224,463
Total operating revenues.....	67,162,858	76,854,938
Maint. of way and structures.....	8,270,354	12,831,671
Maintenance of equipment.....	7,152,302	10,322,198
Traffic expenses	1,167,536	1,360,564

Chicago Association of Commerce Smoke-Abatement Report

The Electrification of Railway Terminals Is Considered Technically Feasible but Financially Impracticable

The complete electrification of the Chicago railroad terminals as a means of abating smoke is technically practical, but financially impracticable. This is the finding of the Chicago Association of Commerce Committee of Investigation on Smoke-Abatement and Electrification of Railway Terminals, which has been studying the problem since early in 1911. The committee, in addition, holds that the elimination of steam locomotives alone would produce a hardly perceptible betterment of the Chicago atmosphere, and urges the appointment of a permanent Municipal Pure Air Commission which both through instruction and coercion shall reduce all sources of air pollution to a minimum.

The association committee, as a result of its painstaking investigations, reaches the following conclusions:

That the minimum cost of electrification as a means in smoke-abatement would be	\$178,127,230
That the more probable cost, due to the necessity for improvements and rearrangements, which would be precipitated by electrification, would be	\$274,440,630
That the least net annual operating deficit produced by electrification would be	\$14,609,743

That Chicago, under the state constitution, cannot aid in meeting this expense.

That an arbitrary or tax on terminal traffic to support the capital for electrification would constitute a burden upon the business interests of Chicago.

That the cost would be so heavy that no court would uphold an electrification ordinance.

That the Chicago electrification would equal the combined electrifications of the whole world, would involve problems never heretofore met, and would be the first ever undertaken for air betterment where terminals were adequate from an operating viewpoint.

That before the steam locomotive is eliminated pollution must first be reduced to a minimum from the three more damaging services, high-pressure steam plants, metallurgical and other manufacturing furnaces and domestic fires.

That the steam locomotive stands third among smoke-producing services, using but 12 per cent of the fuel consumed, and that its elimination would reduce the gaseous pollution of the air only 5 per cent and the solid pollution less than 4 per cent.

That electrification, hydro-electric and other long-distance transmission being inapplicable, would add power-house smoke in quantities sufficient to offset much of the gain through elimination of locomotive smoke.

That suburban passenger services, such as those of the Illinois Central and other roads, produce but 1.54 per cent of the total visible smoke, and 1.97 per cent of all the dust and cinders.

That electrification would involve at least 3,476.4 miles of track.

That electrification would subtract only 1,291,282 tons of coal from the total of 21,208,886 tons now consumed annually in the city.

That all smoke regulation in Chicago and elsewhere has erred in confining itself to the visible aspects of smoke, whereas the really harmful factors are the invisible gases and the solids of combustion, sulphurous gas and mineral dust in particular.

That, despite the fact that Chicago burns more coal annually than any other large city—eight tons per capita as against four for Manchester and one and one-half for Berlin—its air is better than that of most large cities.

That, in Chicago air, the products of combustion constitute only two-thirds the total pollution, the other third being due to avoidable and unavoidable dirt from the general activities of the city and from poor municipal housekeeping.

PRACTICABILITY OF ELECTRIFICATION

As regards the financial practicability of electrification the committee submits these findings:

"The complete electrification of the railroad terminals of Chicago as a betterment to be brought about by the railroads through the investment of free capital is, under present-day conditions, financially impracticable.

"The financial practicability, under present-day conditions, of electrification as it might be applied to individual roads or to a single service of individual roads, is a matter which has not been investigated by the committee and concerning which no opinion is expressed.

"The credit of the individual railroads, the properties of which make up the Chicago railroad terminals, differs greatly. Some have high credit and could secure funds for almost any project which their managements might care to propose; others must prove the profitable character of a particular project before underwriters would consider the placement of their securities; others would find it difficult to borrow on reasonable terms even if the particular project for which the funds are sought promises some return; and still others are in the hands of receivers, their administrative function being performed by the courts. These facts cannot be overlooked in estimating what portion of the potential credit of the railroads is available for the purpose of electrification.

"Certain railroads making up the Chicago terminals operate entirely within the prescribed zone, while for others the great predominance of traffic lies outside the terminal limits. There is more to this contrast than is implied by the fact that some of the roads involved are switching roads while others are long-haul freight and passenger roads. Complete electrification, from a financial point of view, would affect but a relatively small part of the fixed investments of some roads, while for others it would require practically the rebuilding of the property.

"Electrification is a matter which may present greater advantages in connection with certain classes of service than with other classes; for example, the electrification of a railroad having a large suburban business would be more effective in developing opinion favorable to the railroad concerned than the electrification of a road the activities of which are wholly those of freight switching yards. A few only depend upon passenger traffic within the city limits for any considerable amount of their revenue. A larger number derive passenger revenue within the terminals from the movement of through passengers only; while other roads perform little passenger service or no passenger service at all.

"The extent to which individual railroads have recently made large capital expenditures for terminal improvements, track elevation and enlargement of facilities in Chicago, and the extent to which they are committed to further expenditure for these purposes, must have a material bearing on their ability to make expenditures for new projects."

The committee holds that the city might well be expected to share in the burden of electrification, seeing that it would be undertaken for the public benefit, but a perusal of court decisions shows that this is impossible. Moreover, the report points out that it would be impossible for the city, under present constitutional and statutory limitations, at least for some years to come, to raise the necessary funds without the issuance of bonds beyond the authorized limit.

Realizing that many public spirited citizens will not understand its decision, in the light of reports of electrifications in New York and elsewhere, the committee points out the essential differences between electrification here and those installations that have so far taken place. Nowhere in the world, has a steam

railroad been electrified to avoid the pollution of a city's atmosphere. Nowhere has a terminal been electrified when that terminal has been satisfactory from an operating standpoint. No electrification in existence, either in America or abroad, is comparable, in scope and diversity of service, with that involved in the electrification of the Chicago terminals. A wide gap exists between that which has been accomplished and that which would have to be done before local electrification would become a success.

"Some of the electrifications that have been most widely heralded as such were in fact only a subordinate, though necessary part of a greater scheme for terminal enlargement. The New York Central, the New York, New Haven & Hartford, and the Pennsylvania electrifications are not alone projects of electrification; primarily they are an essential detail of a new tunnel entry into the heart of New York City. These projects must necessarily stand upon a different basis than the Chicago proposal, where physical conditions absolutely requiring electrification are lacking and where physical conditions and the nature of the traffic would make electrification extremely difficult."

Notwithstanding the engineering difficulties that would have to be overcome in electrifying the terminals, the committee believes that these difficulties can be surmounted. Its work leads it to the conclusion that the only feasible means of electrification will be by the overhead contact system or trolley. Great obstacles exist to the installation of any system, but it is believed the trolley wire more nearly meets all demands than the third rail. The committee states its conclusions as follows:

"(1) A limited mileage of track in Chicago (approximately 1 per cent of the total) cannot be equipped with any system of contact. The electrification of this not technically feasible.

"(2) While the third-rail system of contact might be extensively used in Chicago, there are, at intervals throughout a considerable percentage of the total trackage, conditions which would make difficult the use of this form of contact. The third rail is applied with difficulty wherever special track work abounds, where street and railroad crossings occur at frequent intervals, and in switching yards. In locations where employees must be between or must cross tracks, as in freight yards, it constitutes a physical obstruction which is highly objectionable. For these reasons the third rail is not considered feasible for general use in the Chicago terminals.

"(3) The facts developed show that any form of overhead contact which can be placed high enough above the rail to give the clearance necessary to permit men to ride and perform necessary duties on the tops of freight cars, is not objectionable from a technical point of view. The application of an overhead contact system to the terminals of Chicago will, however, require the contact wire to be lowered in many places in order that it may pass under structures presenting minimum clearance. The great number of points at which the contact wire must be lowered will require the installation of many warning devices, or the enforcement of rigid rules governing the presence of trainmen on tops of cars."

AIR POLLUTION

The study of atmospheric pollution carried on by the committee is said to be by far the most extensive and scientific ever attempted. All the committee's figures, both on smoke and on electrification, are for the year 1912. The total annual per capita consumption of coal in the city limits was 7.7 tons. The average square-mile consumption of coal within the city limits was 10,797 tons for steam locomotives as against 79,436 tons for all other services combined. In the industrial centers and the heavily populated districts the steam locomotive coal consumption and smoke production is small when compared with the total volume for all sources. In outlying districts where the population is small and where there is no grouping of industries, the steam locomotive sometimes becomes the greatest smoke producer. In only 4 out of the 27 districts in which the area under consideration was divided do steam locomotives use more than

half the total fuel consumed, and these districts are sparsely populated and have very limited smoke-producing services other than smoke from residence chimneys.

High-pressure steam power and heating plants are the principal smoke producers, metallurgical furnaces and other similar manufacturing fires come second, steam locomotives third, and low-pressure steam and other heating plants (domestic fires) fourth. Metallurgical furnaces and other similar manufacturing fires were found guilty of producing 64.26 per cent of all the solids due to combustion, which constitute two-thirds of the total solid pollution of Chicago air. High-pressure steam plants were found to rank second, with a production of 19.34 per cent, low-pressure steam and other domestic fires with 8.6 per cent and steam locomotives with 7.47 per cent, giving them fourth place.

High-pressure steam stationary power and heating plants consume 41.7 per cent of the total fuel used in the city. They are responsible for 44.5 per cent of the visible smoke, and for 19.34 per cent of the total solids, ranking second in this particular. They are responsible for 45 per cent of the total polluting gases of combustion and rank first in this division.

Low-pressure steam and other heating plants (domestic fires) consume 23.63 per cent of the city's coal. They are responsible for 3.93 per cent of the visible smoke, for 8.60 per cent of the solids in smoke and for .23 per cent of the total gases of combustion. In connection with their solid constituents these fires are responsible for 57 per cent of the total hydro-carbons or sooty materials, which makes their smoke the most damaging of any to clothing and similar articles.

The steam locomotive was ascertained to hold fourth place as a coal-consuming service. Of the total consumed, however, 98 per cent is bituminous, practically all of which comes from the fields of Illinois and Indiana. The steam locomotive "gets in bad" as its smoke is rather highly visible because, being emitted near the ground, the public gets the full benefit of the sulphurous fumes and because the cinders emitted, being heavy, fall close to the right of way, making somewhat intensive local pollution but adding little to the general dust of the air. The following is a summing up of the contribution of locomotives, to the smoke nuisance:

"Locomotives in suburban passenger service contribute 1.54 per cent of the visible smoke, 1.97 per cent of the dust and cinders of smoke, and 0.74 per cent of the polluting gases of smoke discharged annually into the atmosphere of Chicago.

"Locomotives in through passenger service contribute 2.07 per cent of the visible smoke, 1.80 per cent of the dust and cinders of smoke, and 0.89 per cent of the polluting gases.

"Locomotives in all passenger services combined, including suburban passenger, through passenger and passenger transfer, contribute 3.80 per cent of the visible smoke, 3.81 per cent of the dust and cinders of smoke, and 1.73 per cent of the polluting gases.

"Locomotives in road freight service contribute 2.01 per cent of the visible smoke, 1.18 per cent of the dust and cinders of smoke, and 0.66 per cent of the polluting gases.

"Locomotives in yard freight service contribute 10.25 per cent of the visible smoke, 1.73 per cent of the dust and cinders of smoke, and 5.17 per cent of the polluting gases.

"Locomotives in all freight services, including road freight, yard freight and freight transfer services, contribute 16.85 per cent of the visible smoke, 3.34 per cent of the dust and cinders of smoke, and 7.57 per cent of the polluting gases."

As a result of its investigation into air pollution the committee finds that one-third comes from sources other than combustion. The air is filled with vegetable, animal and mineral matter which rises from the various activities of the city.

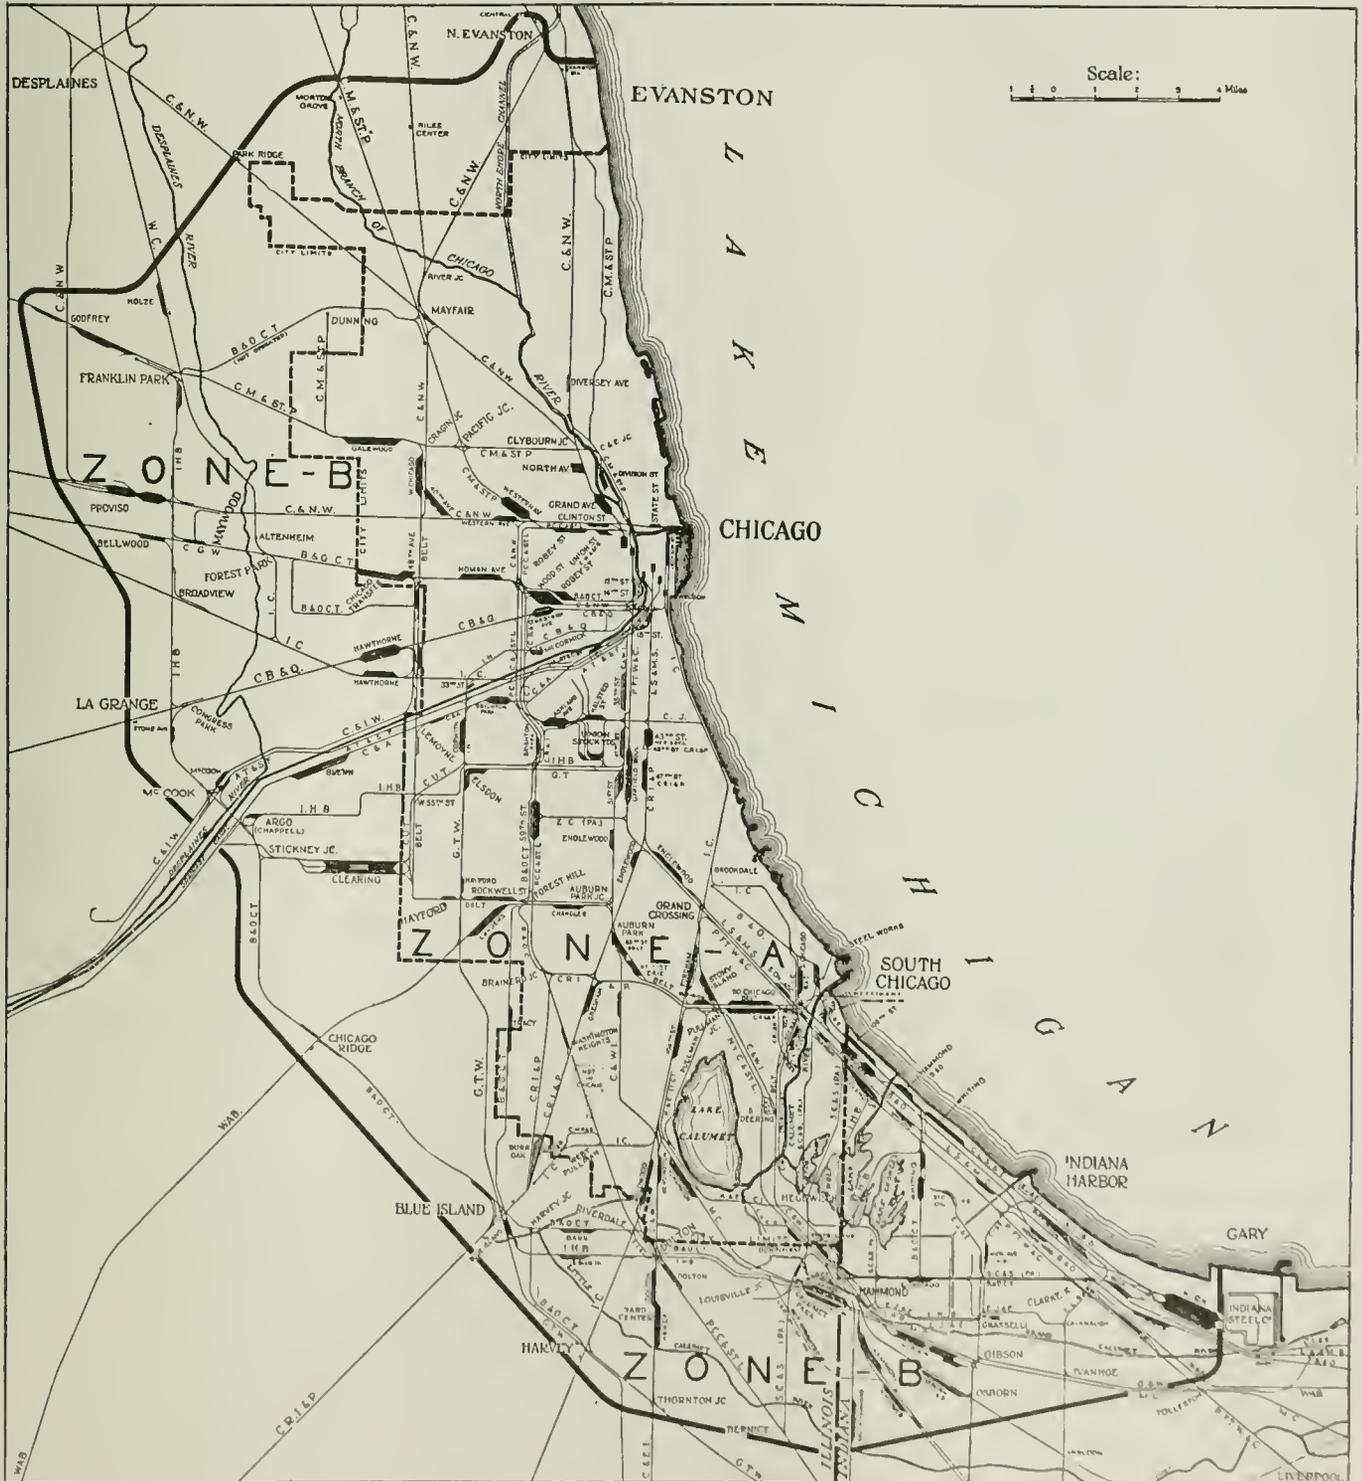

"If all the fires in Chicago were stopped, dust and dirt in the atmosphere would remain. Atmospheric pollution cannot be reduced to a minimum through attention to smoke abatement alone. In order to accomplish its reduction attention must be given to all of those processes and activities of the city which give rise to dust or which deal with the collection and disposal of city dirt and waste."

STUDIES OF OTHER SYSTEMS

As a preliminary to its study of electrification the committee made an investigation into other methods of conducting transportation. It had been hoped that some type of self-propelling motor might be found, and the danger, engineering difficulty and expense of electrification be avoided. But this hope was not justified. The systems studied were the internal combustion

road service, the power requirements of heavy and diversified traffic are still beyond the gasolene-driven unit. The Diesel oil-burning marine engine has the power, but neither type is self-starting, an imperative requirement for switching work.

Much, also, had been hoped from the storage battery, but it was found to lack power, to be too expensive and to share with electrification the disadvantage of producing power-house smoke. The internal combustion motors are also smoke-producing and

Map of the Chicago Terminal Area Included in the Smoke-Abatement Investigation

motor with mechanical drive, electric drive, compressed air drive, hydraulic drive, and a direct-connected motor, the compressed-air motor, the hot-water motor and the electric storage-battery motor.

While it was found that progress had been made in adapting the gasolene engine to the requirements of light or special rail-

are regarded as adding a new hazard of operation through their fuel tanks. Compressed-air and hot-water motors were found impractical, but their use is suggested on those sections that cannot be electrified.

"There is available at this time," says the report, "no form of locomotive, carrying its own power, capable of handling the

traffic of the Chicago railroad terminals which could be substituted for the steam locomotive, and there is no prospect of the immediate development of any such locomotive."

After studying all electrifications now in existence or planned, both in this country and abroad, the committee finds that of the total of 15 American installations, 9 were undertaken because of operation in subways or tunnels, 1 as an experiment to test out economy in long-distance passenger service, 2 to hold suburban business, 1 was equipped for initial electric operation because of charter requirements, and 2 for the purpose of utilizing water power instead of coal.

ELECTRIFICATION ELSEWHERE

Of the foreign electrifications all English lines are classed as suburban. None conducts heavy electric locomotive service and none freight service except in a very minor degree. Practically all electric service is confined to suburban and interurban traffic handled by motor cars. In France the Orleans railway confines its electric locomotive operation to passenger trains through a subway entrance into an underground terminal. It also operates electrically a suburban motor car train service on a line connected with this terminal. The Midi electrification is, in its present stage, experimental only, and for heavy-grade lines where hydro-electric power may be substituted for steam.

In Germany no considerable heavy electric main line traction is as yet in operation; the Dessau-Bitterfeld is a short line and has been operated only in experimental service to test out apparatus and methods. The Magdeburg-Leipzig-Halle line, an important extension of which the Dessau-Bitterfeld line will form a part, when completed will represent the first German trunk line electrification, and the Lauban-Königszell line will represent a second such electrification. Both are predicted upon the production of cheap centralized power either from very low-grade coal or from hydro-electric plants. While both of these lines will conduct a heavy electric locomotive passenger and freight service, neither will conduct a freight-switching service comparable with that in the Chicago terminals. In Switzerland the Loetschberg line and the Simplon tunnel line were electrified primarily because of tunnel operation; other Swiss electrifications are for light multiple unit train service only. All Swiss electrifications utilize cheap water power instead of the more expensive coal fuel. In Italy the Giovi with its branches is the only road which operates heavy electric service. The secondary lines in foreign countries operate a service which is entirely different from American operation, and resembles our interurban.

THE CHICAGO PROBLEM

Thirty-eight steam railroads would be involved in the Chicago project, as against 37 for the rest of the world. Of the Chicago roads 25 maintain passenger and freight service and 23 are classed as trunk lines, while 13 perform transfer or switching service only. Eight of the trunk lines have no main tracks within the city limits but operate trains into the Chicago terminals over the tracks of other companies. Twelve railroads operate wholly within the area of investigation.

It was found that the Chicago mileage would be nearly twice that of all other electrically operated mileage in America, and, exclusive of foreign light-service lines, would be about 15 per cent greater than all existing electrifications in the world. The committee's plan involves several times as much yard track mileage as do all existing American electrifications. The number of electric locomotives required would be approximately 4 times that of all now in service in America and $2\frac{1}{2}$ times the number in the whole world.

Of switching service, which constitutes 59 per cent of the total locomotive mileage and presents a grave problem in that it has never been attempted electrically on a large scale, it has been ascertained that yard freight-switching services, on the basis of car-miles, is more than 65 times as great as that on all existing electrified steam roads in America.

"No similar service elsewhere is handled electrically in any

considerable volume except that on the Giovi railroad of the Italian State Railways and on the New York, New Haven & Hartford in America. The latter operates, in part electrically and in part by steam locomotives, 3 freight yards having in the aggregate 72.7 miles of track, requiring about 90,000 electric locomotive-hours per year and handling about 2,500,000 car-miles per year in switching and transfer service. The freight yard traffic of the Chicago terminals aggregates approximately 3,430,000 locomotive-hours per annum and approximately 164,400,000 car-miles per annum in switching and transfer service."

In its study of air pollution the committee states that even the comparatively small reduction to be expected from electrification is made less significant when it is recollected that substantial progress in recent years has been made in reducing the smoke from locomotives in Chicago. There is every reason to believe also that the process has not yet reached its maximum. The improvement has resulted both from embellishments in locomotive design and from the exercise of greater skill in operation.

"Among the more important changes in design which have aided in smoke abatement are the enlargement of grates, which has resulted in lower rates of combustion per unit area of grate, and consequently in a reduction in the amount of solids in locomotive smoke; the adoption of the brick arch in locomotive fire-boxes, by means of which a reduction in the amount both of visible smoke and of the solid constituents of smoke has been effected; the more efficient design of draft appliances, by which the air currents stimulating the fire have been modified and smoke production diminished; the introduction of superheaters, whereby the efficiency of the locomotive as a whole has been increased, the amount of fuel required for the performance of a given service diminished and the volume of smoke diminished; and the introduction of steam jets and other appliances especially designed to diminish visible smoke.

"Meanwhile, the amount of smoke emitted within the city has been greatly reduced through the exercise of diligence and skill in the operation of locomotives. The importance given this aspect of the matter by the railroads of Chicago is to be seen in the number of smoke inspectors which they have employed.

"When, therefore, the fact is set forth that electrification will serve to reduce the amount of visible smoke entering the atmosphere of Chicago, by 20 per cent, it should not be forgotten that progress in locomotive design and practice, without electrification, has operated and will continue to operate to bring about a reduction which, if smaller than that to be effected through electrification, is nevertheless material; and when emphasis is given the fact that electrification will serve to reduce the amount of the solid constituents of smoke and the gaseous products of combustion entering the atmosphere of Chicago, by 5 per cent, it should not be forgotten that progress in locomotive design and operation can very likely be depended upon to bring about an equal reduction."

"The electric operation of Chicago's railroad terminals must depend upon the existence and operation of a steam-driven electric generating station. The conclusion has been reached that a single power-station, located near the south branch of the Chicago river in the vicinity of Ashland avenue, would satisfactorily meet all requirements. The load center, under the plan of electrification as already defined, falls within the limits of the Union Stock Yards. The location indicated is not far from this point and is such as satisfies other requirements of the problem."

The committee believes that the highest degree of efficiency in electrification can only be secured by joint procedure by all the roads. "It is inconceivable that the different railroads will undertake such a work independently. It may be argued that a course necessary in the case of one railroad may prove quite unnecessary in the case of another, and yet the fullest measure of technical success in the electrification can only be secured when individual interests and preference are subordinate to the requirements of a general plan."

The committee's plan contemplates the electrification of all track within the city limits and the conclusion of electrified

trackage on each railroad as close outside the city limits as is practical. The mileage involved by this conception may be summarized as follows:

1. Main track	Miles. 1,475.59
2. Yard track	1,456.64
3. Industrial track owned by railroads.....	277.19
4. Industrial track, railroad repair track and shop track so located in streets at grade, in buildings or under structures employed in industrial processes as to require some type of self-propelling motor	37.26
Total	3,476.40

While in general the committee decided to terminate electrification at the first convenient point outside the city limits, this could not be accomplished on certain roads which conduct a suburban passenger service. It would be impracticable to operate these frequent suburban trains part way by electricity and part way by steam. It has hence been decided that certain lines must be partially electrified beyond the limit of complete electrification, to the terminals of the suburban service. Through passenger and all freight trains are to be operated by steam on the partially electrified extensions, which will be for use only by multiple-unit suburban trains.

As yet no system of electric traction has been developed which can be accepted as standard for all conditions on all railroads. If it were decided to proceed at once with the electrification of the Chicago terminals, it would be difficult for any group of men to choose a system which would not be criticized by other men as able as those upon whom the choice of the system depended.

The system selected for Chicago must be suitable not only for passenger terminals and through line work, but also for yard switching and transfer work. It must be applicable to the requirements of railroads having a heavy suburban traffic, and also to those roads conducting freight-yard and switching service. It must not only be satisfactory in its application to the terminal portion of a trunk line railroad, but it must lend itself to an indefinite extension of the limits of electrification over other and adjoining portions of the road. Obviously, the project must be regarded as too important to permit of the introduction of methods in any way questionable, or of a type of construction of untried value. Furthermore, it is not permissible to consider any methods which might serve to tide over a temporary condition anticipating the later selection of a permanent and stable system.

After obtaining complete engineering data on these three systems, the committee selected the third as cheapest and most desirable:

- 1—Third rail contact, direct current at 600 volts.
- 2—Overhead contact, direct current at 2,400 volts.
- 3—Overhead contact, single-phase current at 11,000 volts.

The third-rail system was given up as the least practical of the three because of the difficulties to be met. Not only would the presence of the third rail be a danger to employees in the yards and make necessary a large amount of reconstruction, but there would be trouble in operating trains, owing to the large number of gaps in the third rail due to switches, street intersection and other such obstructions. It is estimated by the committee that a total of about 75 miles of track in Chicago could not be equipped by the third-rail system. Another objection to the third rail is the fact that except in very unusual sleet storms, service through the trolley wire would not be interrupted, whereas both sleet and drifting snow furnish a serious problem with the third rail. The rail is also a danger to property and life in case of wreck.

The difficulties of trolley installation would also be great, but less, it is believed, than those attending the use of the third rail. The great trouble found is with low bridges and other structures over the tracks. A sufficient clearance to permit employees to ride on tops of cars cannot be obtained throughout the Chicago terminals.

The adoption of the overhead contact (trolley) system would permit the use of either a high-voltage direct current or an alternating current of much higher voltage. The use of the

first would result in damage to property by electrolysis. The use of the second would "kill" telephone and telegraph wires adjacent to the tracks, through inductive interference. Both conditions could be remedied, though with difficulty and at considerable expense.

The committee finds that it would make no practical difference whether the roads manufactured their own electric power or purchased it from public service corporations. Electricity would, it is concluded, neither increase nor decrease the dangers of operation. Added dangers would be introduced, but compensating safety in other directions would offset these.

The committee has made an effort to arrive at the incidental advantages that would accrue to the railroads through electrification. The change would give some increased capacity in existing trackage and terminals. In locations where operation under present-day conditions is congested, it would give relief, and in locations where there is at present no congestion, electrification would constitute, in effect, an enlargement of existing facilities and hence would postpone the day when additional facilities would be required.

Electrification would contribute to increased celerity and reliability in train movement. It would open the way to more intensive use of railroad property, both in this manner and by making double-decked freight and passenger terminal stations possible. It would also make possible the erection of buildings over tracks, but this value is regarded as speculative and, as a present-day asset, small. Electrification would give the roads an asset in the use of electric service beyond that required for trains. It would benefit the roads through the increased convenience and comfort of passengers and it would also give the roads whatever advantage accrued, entirely indeterminate, through the lessening of smoke.

COST OF ELECTRIFICATION

In arriving at the cost of electrification, the committee based its work on 1912 operation, extended to meet conditions if electrification were to begin in 1916 and be completed in 1922. The following accounting statement shows why the committee holds that electrification is financially impossible. The deficit on the minimum outlay of \$178,127,230 would be too great:

I. ANNUAL CHARGES:	
1. Interest	\$8,906,362
2. Depreciation	7,808,278
3. Replacement of dissipated assets.....	231,796
4. Indeterminate charges	
Total charges	\$16,946,436
II. ANNUAL REVENUES:	
1. Increase in net revenues.....	\$2,336,693
2. Indeterminate benefits	
Total credits	\$2,336,693
Balance, annual deficit on investment.....	\$14,609,743

The investigations show that electrified operation for all the railroads taken together and disregarding depreciation and interest would result in a decrease in operating expenses. Under steam operation, those accounts that would be affected one way or the other by electrification show a total of \$10,931,064. Under operation by the 600-volt direct-current third-rail system, the total would be \$8,442,298, with the 2,400-volt direct-current system it would be \$7,355,771 and with the 11,000-volt alternating-current system it would be \$7,140,495. The installation of these three systems would result in a saving in operating expenses respectively of \$2,491,766, \$3,578,293 and \$3,793,569.

This saving, however, is in part nullified by new expenses due to the operation of stations that would have to be established at the end of electrified tracks to provide for a transfer of trains from electric to steam locomotives, and also by the waste and consequent loss due to operating over shortened steam railroad divisions, which have surrendered part of their mileage to make the new terminal electric divisions. The engineers' estimates place the added expense under the first item at \$1,546,113 and the added expense under the second at \$450,000. This would leave the net saving in operating expenses, to follow electrification, at \$495,653 for the third rail system, \$1,582,180

for the direct-current trolley system and \$1,797,456 for the alternating-current trolley system.

Following the work of the committee, a number of the Chicago railroads have made a study of the cost which would be imposed upon them in excess of those set forth by the committee. Eight of these railroads have filed with the committee the results of their investigations. The reports thus submitted have been analyzed with results which are set forth as follows:

ESTIMATES OF INDETERMINATE COSTS OF EIGHT RAILROADS

1. Costs due to an extension of the mileage of electrification over that provided by the committee's estimates.....	\$20,872,500
2. Precipitated costs principally for track elevation.....	29,198,400
3. Total cost to the eight railroad corporations in excess of that necessary to electrification under the plan of the committee	50,070,900
4. The committee's estimate of the cost of electrification for the eight railroads.....	92,599,908
5. The excess costs, including costs due to extension of the plan and precipitated costs, in per cent of those which are covered by the committee's estimates.....	54.07 per cent

The committee's estimates of the net cost of electrification for all the roads of Chicago totals \$178,127,230. Therefore, carrying forward the same ratio, the committee finds that the total added and precipitated costs for all the railroads would amount to \$96,313,400.

Upon this basis, the total capital requirement imposed by electrification would be:

That incident to the development of a minimum plan as estimated by the committee.....	\$178,127,230
That required to cover precipitated costs and costs due to extension of plan	96,313,400
Total	\$274,440,630

For example, in fixing the limits to be observed by the Chicago, Burlington & Quincy, the committee has specified complete electrification to Hawthorne, 6.8 miles, and partial electrification to provide for suburban service only to Downers Grove, 21.3 miles from the city terminal. In reviewing the work of the committee, the officers of this road have reached the conclusion that if they were required to electrify it would be necessary to provide for the electric operation of freight service to Eola, 33.4 miles from Chicago, and for suburban service to Aurora, 37.4 miles from the city terminal.

The committee sees an ultimate and large cost due to imitation of Chicago by other cities. "It is apparent also, that Chicago's claim to the benefits of electrification are in no way different from those which might be urged by many other cities with which Chicago railroads connect; that compulsory electrification, if achieved for Chicago, may in due time be secured by all the larger cities of the country. The cost, therefore, which might be imposed upon the railroads as a whole by the compulsory electrification of Chicago's terminals would be confiscatory."

RESPONSIBILITY OF EACH SERVICE FOR SMOKE POLLUTION WITHIN CHICAGO, ON PERCENTAGE BASIS

	Visible smoke per cent	Solids of smoke per cent	Total of smoke per cent	Gaseous carbon per cent	Gaseous sulphur per cent
Steam locomotives.....	22.06	7.47	10.31	10.11	18.22
Steam vessels	0.74	0.33	0.60	0.55	0.45
High pressure steam stationary power and heating plants	44.49	19.34	44.96	40.68	53.70
Low pressure steam and other stationary heating plants	3.93	8.60	23.00	23.06	19.73
Gas and coke plants.....	0.15				
Furnaces for metallurgical, manufacturing and other processes	28.63	64.26	21.13	25.60	7.90

One-third of all air pollution is due to dirt other than that of combustion. These percentages refer to the remaining two-thirds.

The committee was appointed in March, 1911, and consisted of four members appointed by the mayor, four appointed by the railroads and nine appointed by the Chicago Association of Commerce. The late Horace G. Burt was chief engineer for the committee until May, 1913, and was succeeded by W. F. M. Goss, dean of the Engineering Department, University of Illinois. The report was submitted to the association at a dinner on Wednesday evening, December 1.

FREIGHT CONGESTION AT THE ATLANTIC SEABOARD

The congestion of freight at New York, caused primarily by the lack, during the last few weeks, of vessels to take goods to Europe and to South America, has continued to grow more acute; and a similar condition now prevails at Philadelphia and at Baltimore. In contrast with like occasions in former years, there seems to be no disposition, at any of the congested ports, to charge the serious and costly delays to lack of cars or engines or track room. In addition to ocean vessel scarcity, some shipments at New York have been delayed because the lighters which take the freight from the railroad docks to ocean vessels are all overcrowded with traffic; and certain embargoes cover not only freight for export, but also domestic shipments which must be lightered.

On Saturday last, the Delaware, Lackawanna & Western placed an embargo on eastbound freight intended for export, except shipments for which vessels had already been engaged. The company had then over 5,000 loaded freight cars on its lines waiting to be unloaded at New York.

On Monday of this week the Pennsylvania Railroad placed an embargo on all flour and lumber to be exported or lightered at New York and on grain for export through Philadelphia and Baltimore. The Baltimore & Ohio placed an embargo on all iron and steel products for export through the port of New York.

Roads which have placed no embargoes have nevertheless been making all possible efforts to have shippers in the West hold back grain and other freight destined for Europe. The quantity of wheat in elevators at New York harbor at the present time is nearly double the quantity in store at the same time last year; and the wheat from Canada now on the road, consigned to ports in the United States, mainly New York, is estimated to amount to ten million bushels.

Navigation on the Great Lakes will close November 12; and the quantity of grain now afloat at Buffalo or near there is estimated at five million bushels.

The trunk lines have filed with the Interstate Commerce Commission notices that beginning January 1 the number of days free storage to be allowed at seaboard terminals on export package and piece freight, on local bills of lading, will be 15 days instead of 30 days, whether held in railroad warehouses or in cars. On grain billed through to foreign ports, the free time has been and continues to be unlimited, when held in cars, and until 10 days after it is loaded into elevators.

Two or three firms have taken American vessels from the Pacific trade and assigned them to the New York-Europe route for grain carrying, but this relief, like that due to the shortening of free storage, will not be of benefit before January. Moreover, there is a lack of unloading facilities in European ports that foreshadows even greater delays than are now known. Europe is suffering from a serious labor shortage, which will interfere greatly with the return of vessels to this country.

At Chicago, on Saturday last, the congestion at the seaboard terminals was given as a reason for a considerable weakening in the price of wheat. At Pittsburgh a number of steel mills and blast furnaces have been curtailing production for the reason, it is said, that shipping facilities are congested and coke cannot be procured promptly.

On Tuesday of this week the presidents of the Trunk Lines, at the invitation of President Samuel Rea, of the Pennsylvania, met in New York, and after a full discussion of the railroad situation and the conditions of ocean service appointed a committee of operating officers to meet daily in New York with a view to dealing with all matters connected with the freight congestion in the mutual interest of all the roads and of the public. This committee will seek the co-operation of shippers as well as of the steamship companies and will do everything possible to avoid declaring a general embargo. Besides all the trunk line presidents there were present at the conference Theodore Voorhees, of the Philadelphia & Reading; W. G. Besler, of the

Central of New Jersey; James H. Hustis, of the Boston & Maine, and C. R. Gray, of the Western Maryland. The roads will take similar joint action at Boston, Baltimore and Philadelphia.

The New York Committee will address itself to the equalization of conditions on the different roads, those which have placed no embargoes having felt extra pressure since embargoes were placed by other carriers. The committee finds that at the present time (December 1) the number of cars of freight on the tracks of the trunk lines at and destined for New York City terminals is about forty thousand; and that probably ninety per cent of these cars contain freight which is to be exported or which must be lightered for local delivery in the harbor.

The Pennsylvania Railroad gives details of the congestion on the lines of that company as follows:

"There were on November 30 on hand on the various divisions east of Pittsburgh and Erie 6,151 cars of freight for export and lighterage at New York. The location of these cars is as follows:

Greenville	1,335
Harsimus Cove	523
Meadows	91
Waverly	1
West Morrisville.....	21
Trenton Division	15
Moving New York Division.....	89
Stored West Morrisville.....	92
Stored Bristol	44
Stored between Rahway and Elizabeth.....	410
At Morrisville to be drilled.....	88
Stored Waldo avenue.....	37
Total in New Jersey.....	2,746
<i>Other divisions</i>	
Eastern Pennsylvania Division.....	1,766
Moving Eastern Pennsylvania Division.....	176
Western Pennsylvania Division.....	623
Philadelphia Terminal Division.....	34
Maryland Division	163
Central Division	328
New York, Philadelphia & Norfolk Railroad.....	124
Delaware Division	191
Total	3,405
Total east of Pittsburgh and Erie.....	6,151

"In addition to the lighterage freight being held in cars, there have been unloaded on piers in New York some 2,000 carloads, which is now awaiting orders. A special bureau, in charge of operating, traffic and accounting officers, has been established in New York to handle this extraordinary situation. This bureau keeps careful records of exactly where these cars are located, so that when ordered by a shipper for delivery they can be picked out and forwarded with the least possible delay.

"Another special bureau has been established to take charge of the local freight situation on the New York division. There are on various divisions of the railroad at the present time, exclusive of cars of freight for lighterage, some 7,000 cars of slow freight for delivery or movement through the New York terminal district. This includes some 2,000 cars for New England points. Records corrected every twelve hours show the exact location of each of these cars.

"These methods have proved effective in keeping the railroad open, and there is no congestion in the movement of west-bound freight.

"There are at present stored at different points on the road 450 cars of flour and 125 cars of lumber under through bills of lading for export through New York. In addition to the 1,000,000 bushels of grain in the Girard Point elevator at Philadelphia, there are 1,778 cars—2,600,000 bushels—of export grain on hand to go through that elevator, many of them being held at points west of Philadelphia until they can be taken care of.

"In addition to the 2,000,000 bushels of grain in the Baltimore elevator there are 2,829 cars of export grain on hand destined to go through that elevator. Seventeen boats are in Baltimore Harbor to-day to load grain; 5 of these have already received their cargoes. It is very indefinite what boats are expected at Baltimore the next week. However, space at Baltimore has

been contracted for up to December 15 that will require 32 boats. The average capacity of a boat is 250,000 bushels."

WHY TEXAS RAILROADS ARE IN RECEIVERS' HANDS

Henry N. Pope, president of the Farmers' Union of Texas, recently made a statement through Texas newspapers, calling on the men who manage railroad properties to "speak out" as to the responsibility for railroad receiverships in the Southwest. Following are replies to Mr. Pope's statement made by C. E. Schaff, receiver of the Missouri, Kansas & Texas, and by W. B. Scott, president of the Sunset-Central Lines. Mr. Schaff said in part:

"Commenting on the fact that railways comprising 30 per cent of the mileage in the state of Texas, and 45 per cent of the railroad investment in the state, are now in the hands of receivers, Mr. Pope has suggested that the people would like to have the 'plain truth from the men who manage the properties' as to the underlying causes of these receiverships. So far as the Missouri, Kansas & Texas is concerned, the 'plain truth' is, as usual, quite simple. The road's revenues, limited by federal and state agencies, have not kept pace with the increases in its expenses—increases that the management has been entirely unable to escape, and for which in most instances the management is not responsible. As a result its credit has been impaired and it has been unable to refund maturing obligations.

"Direct reply to any one of the specific inquiries Mr. Pope makes would not cover the situation. There are peculiar conditions, bearing on the financial situation of each carrier. In no case, however, would these peculiar conditions have resulted in bankruptcy except for general conditions affecting all. It is to these general conditions that thought must be directed before the present unsatisfactory condition can be corrected.

"To contend that the 'roads were unwisely built,' in the face of unanimous agreement that the Southwest needs improved, rather than impaired transportation, is useless. To say that the receiverships are due to 'manipulation by railroad financiers,' or to 'unnecessary expenses forced by law,' or to 'lack of revenue and improper expenditure,' or to 'mismanagement of the properties' would be inaccurate, even though any one of these elements may have contributed to bring bankruptcy in a special case. It is idle to disregard specific instances of 'manipulation by railroad financiers' as factors in developing adverse public sentiment which has encouraged legislatures and public service commissions to pursue unreasonable regulatory policies. It is equally idle to ignore the obvious fact that legislatures and public service commissions have utterly disregarded repeated warnings by railway managers that continuing decreases in net operating returns, due to increased operating expenses without proportionate increase in operating revenues, must result in disaster.

"Whatever may be said of 'financial management' will not change the fact developed in figures compiled by the Interstate Commerce Commission that between the years 1907 and 1914 the increase in cost of road and equipment of 41 western railways was \$1,250,000,000, while between the same years there was an actual decrease in their net operating income of \$23,500,000. In short, these railroads after increasing the actual investment in their properties, had less money with which to pay a return on investment than they had before. These figures are not affected by financial management, good or bad. Increases in gross earnings have been more than swallowed up by increasing wages to employees, increasing taxes, and increasing expenditures enforced by impractical regulatory policies that have not benefited the public. In the past eight years railroad taxes have practically doubled. In the same period the gross operating income of American railways has increased only 24 per cent, while their gross operating expenses have increased 40 per cent.

"Federal and state agencies have operated to hold earnings down so that the carrier has had so small a margin in periods of normal business activity that his margin entirely disappeared during the depressed periods. In the case of the Missouri, Kan-

sas & Texas, during the years from 1907 to 1914, operating revenues per mile declined from \$8,523 to \$8,241 or 3.3 per cent. Operating expenses increased from \$5,735 per mile to \$6,469, or 12 per cent, and operating income decreased from \$2,770 per mile to \$1,772, or 36 per cent. In these figures are to be found the outstanding reasons for the receivership.

"The road simply has not been permitted to make earnings that would provide a return on invested capital. The same condition applies to all carriers, and it clearly explains the impairment of railroad credit. So long as the regulating authorities do not permit railway earnings that will provide proper return on invested capital, regardless of the value of the service rendered the public, the public must expect carriers to become bankrupt, just as do individuals who do not operate on proper business margins.

"Responsibility may rest on some railway managements for conditions against which the public may have complained properly. No railroad man should find fault with government effort to prevent dishonest or unfair transportation practices. Such effort constructively directed will help rather than hinder the carriers. But such efforts alone will not help carriers to provide a return on invested capital, which they must do if the present unsatisfactory condition is to be remedied. And so long as the public does not discharge its duty to see to it that the regulating authorities give the railroads fair treatment, the public should expect to assume a large share of responsibility for railway bankruptcy."

Mr. Scott said in part:

"In my judgment, the Texas roads now in the hands of their creditors are there because of the simple fact that they cannot, with the existing freight rates, meet their current expenses and give the people what the people, the legislatures and the commissions demand. The candle must not be consumed at both ends.

"Business to be successful must earn net returns while its permanency is carefully maintained. Railroads are nowise different from commercial establishments in this respect, as witness the extent of the present receiverships in Texas and the number of roads included therein. Revenues must equal expense of operation, interest on obligations, taxes and renewals, to say nothing of rails and additional conveniences. When earnings fall off retrenchment necessarily follows, and this means fewer employees, reduction and impairment of service, and economies that sometimes seriously affect the maintenance that makes for safety and comfort, but which cannot be avoided.

"The old-time bugaboos—watered stock, over-capitalization, top-heavy bonds and incompetent administration—have no place in the operation of a trunk-line road. Mismanagement is quickly followed by a change of administration, while the roads which were established years since could not be built to-day for almost double the stock and bonds which represent their obligations.

"The roads which have contributed to the development of Texas were not unwisely built, even though they were projected at a time when money was scarce and when the state was barren of immediate results, the builders having only their own faith in the prospective upbuilding of the state, based upon a knowledge of the productivity of the soil and the opportunities which awaited the man of ambition and energy.

"For the last 10 years the Texas railroads have been beset upon every side. Legislation has decreased their earning powers while increasing their expenses and liabilities. Increase in labor charges and prices of material represent additional factors that have gradually lessened the earnings, while constant manipulation of rates, rate situations and changes in jobbing and competitive centers have reduced compensation for service all along the line.

"A casual examination of the following statistics, which relate to the Sunset-Central lines only, will, I am sure, convey a few of our arguments more forcefully than any I think I could present:

"Expenditures on account of state, federal and municipal re-

quirements and safety devices, \$2,200,000; the storm damage during the last two years amounted to \$900,000; personal injury payments, Texas, \$165 per mile in 1906; personal injury payments, Texas, \$275 per mile in 1914; personal injury payments, entire United States in 1913 constituted .985 per cent of earnings, while in Texas during the same year this expense was 2.472 per cent of the earnings; mail earnings per passenger train mile, 10.4c in 1906; mail earnings per passenger train mile, 7.2c in 1914; increased price fuel oil, 1915 over 1906, 109 per cent; increase in all classes of labor from 20 per cent to 90 per cent, 1915, compared with 1900.

"Freight rates instead of being readjusted to conform to changed conditions have been gradually lowered in most of the tariffs until the minima are from 20 per cent to 70 per cent and the maxima from 10 per cent to 50 per cent lower than the railroad commission considered reasonable more than 20 years ago, while many important items of expense have doubled.

"The whole situation resolves itself into a plain business proposition. The people rightfully demand safe and reliable transportation. This means good roadbed, new ties, heavy rail, first-class motive power, good passenger cars with modern conveniences, sound bridges, comfortable depots for passengers, convenient and adequate facilities for freight. All of these cost money, more money than the average Texas road can provide under the present conditions.

"Increase in labor and material changes, taxes, personal injury verdicts, flood and storm damages, should be met by additional earnings, and as earnings are reflected in rates of transportation it follows the rates should be revised upward instead of downward, and the roads given an opportunity of meeting their obligations to the public upon a broad and fair basis. Prosecution and persecution, baiting and browbeating, should be shelved, and instead there should be put into effect a spirit of mutual understanding and help and recognition of the great community of interest which makes the railroads and the public and particularly the farming public, positively dependent each upon the other."

RAILWAY HOTEL IN RHODESIA.—A \$250,000 palatial hotel, now building at Victoria Falls, in Africa, is to be opened next year. It has been leased to the Rhodesia Railways (Ltd.).

SUBSIDIZED CARRIERS.—Local branches of the New York Central have severely felt, during the past summer, the competition of automobiles run over state highways. The 'bus lines make trips at convenient hours for many people, but they run over a state-built road bed, doing a public-utility business without Public Service regulation, charging what they please and operating when they please. Their service may be discontinued during the winter months, when passenger trains are generally operated in this section at a loss. A railroad is responsible for accidents to passengers or goods. No guarantee holds good with auto buses or freight stages, unless the owner happens to carry heavy liability insurance. In fact, the advantages given the average 'bus operator practically make him a state-subsidized competitor of the railroad.—*Watertown (N. Y.) Herald*.

A COLOSSAL COAL TRAIN.—The English sometimes smile at the American's love for striking statistics. That has not prevented one Englishman, nevertheless, from compiling the following: On the Midland Railway the quantity of coal and coke consumed during one year is over 1,830,013 tons. If this were represented by a single block of Derbyshire coal, the block would be over 1,000 ft. long and wide and over 60 ft. in height. All the people in Derbyshire could stand in comfort on this block, which would outweigh the entire population of England and Wales. If the year's coal and coke were placed in railway cars, each carrying 10 tons, the resultant train with its engines (3,014 of them) would be long enough to reach from St. Pancras to the extreme north of Scotland. The cost to the Midland Company of this fuel is \$9.30 per minute—over \$13,220 per day, and more than \$5,000,000 a year.

Four-Wheel Trucks for Passenger Train Equipment*

A Discussion of the Fundamental Factors of Design and of the Ability of This Type of Truck to Fulfill Them

By Roy V. WRIGHT

The Pennsylvania Railroad uses four-wheel trucks under all of its passenger coaches, although the P 70 class, 70 ft. in length and having a seating capacity of 88, weigh light from 118,000 to 122,000 lb. Loaded with passengers they weigh about 135,000 lb., and never more than 140,000 lb. It is the standard practice on that system to use such trucks under all passenger equipment cars weighing less than 120,000 to 125,000 lb., except for so-called load-carrying cars, including baggage-express, mail, baggage-mail, etc., which are designed to weigh over 140,000 lb. when loaded. The light weight of the bodies of the Pennsylvania P 70 coaches—and these are now standard on that system—varies from 93,000 to 96,000 lb. It is assumed that these cars regularly carry as much weight in passengers and hand baggage as coaches on other roads, inasmuch as they seat 88 persons, or several more than the maximum provided for in the standard coaches of most roads. It is the practice on the great majority of railroads to use six-wheel trucks under coach bodies weighing much less than this, comparatively few roads using four-wheel trucks under bodies weighing more than 85,000 lb. and many of them using six-wheel trucks under bodies weighing even less than this.

FACTORS IN DESIGN

In designing the trucks for a passenger coach four features must be kept in mind and generally in the following order as to importance, although there may be some question as to the relative value of the last two:

(1) They must be designed for safety.

(2) They must ride smoothly, for travelers are particular as to this in these days and will desert a road with rough-riding cars if a competitor furnishes better service. With heavy steel cars operated in long trains at high speed and with the locomotives taxed to the limit of their capacity it is difficult to operate and brake the trains without occasional roughness and jolts, and a factor such as truck design cannot be allowed to contribute further to the rough riding.

(3) The weight of the truck must be kept to a minimum if for no other reason than the effect on the cost of conducting transportation.

(4) The truck should be designed with a view to keeping the cost of maintenance as low as possible. Here, as in the requirement for safety, it is desirable to have as few parts as possible and of simple construction.

DOES THE FOUR-WHEEL TRUCK MEET THESE REQUIREMENTS?

How does the four-wheel truck meet these requirements under the heavy passenger equipment in service on the Pennsylvania Railroad?

(1) The four-wheel truck of modern steel construction which has been in use on that system for a number of years has given splendid satisfaction so far as safety is concerned. As on other roads some trouble has been experienced with hot boxes, and it was at first thought that the journal-bearing area was too small. The use of larger bearing areas does not seem to have materially improved conditions, and it is now believed that the difficulty is entirely due to dirt or gritty matter entering the journal boxes. The problem then becomes one of improving the journal box lid and dust guard to prevent this, rather than to increase the diameter or length of the journals.

There has been no breakage of axles except for three cases due to defective material when the first steel trucks were introduced many years ago. No physical weakness has developed in

any of the parts in the ten years the trucks have been in service, so that as far as safety is concerned there can be no question. The possibility of accident would seem to be less with the four-wheel truck because of the smaller number of parts that are required.

(2) There seems to be a feeling on the part of some mechanical engineers that the four-wheel truck, with its shorter wheel base (7 or 8 ft. as compared with 10 to 11 ft. for the

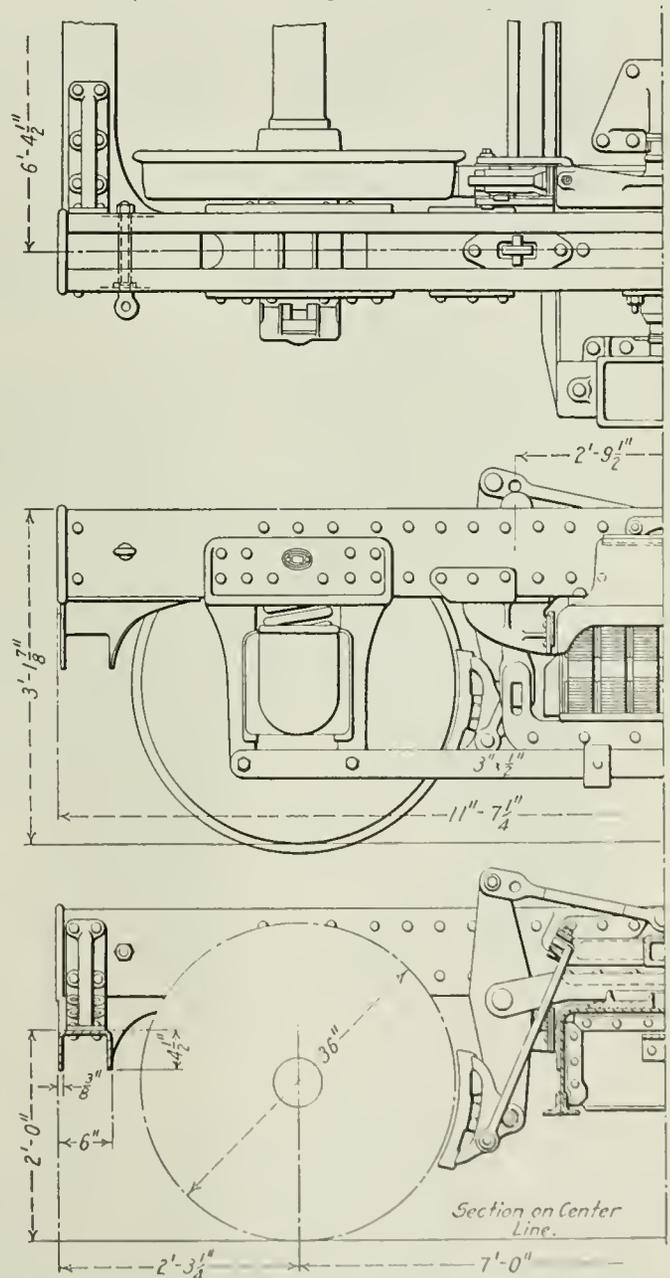

Fig. 1—One End of Original Four-Wheel Steel Passenger Car Truck Before the Application of the Clasp Brakes; Pennsylvania Railroad

six-wheel truck) will ride less easily than the six-wheel truck. With coil springs over the journals, elliptical springs under the bolster, and provision for lateral motion of the bolster, it would seem that there ought not to be much difference in this respect.

Experiments show that much of the rough riding or jolting on passenger coaches has been due to the method of anchor-

* From a paper to be presented at the December, 1915, meeting of the American Society of Mechanical Engineers, New York.

ing the top of the dead lever to the truck frame. The unbalanced forces in the truck when the brakes are applied tend to tilt the truck frame out of horizontal alinement, thus causing a "jerky" action. By anchoring the dead lever to the body under-

frame this is eliminated. This development is comparatively recent and affects the six-wheel as well as the four-wheel truck. The effect of anchoring the dead lever to the truck frame has possibly been more noticeable on the four-wheel truck, because

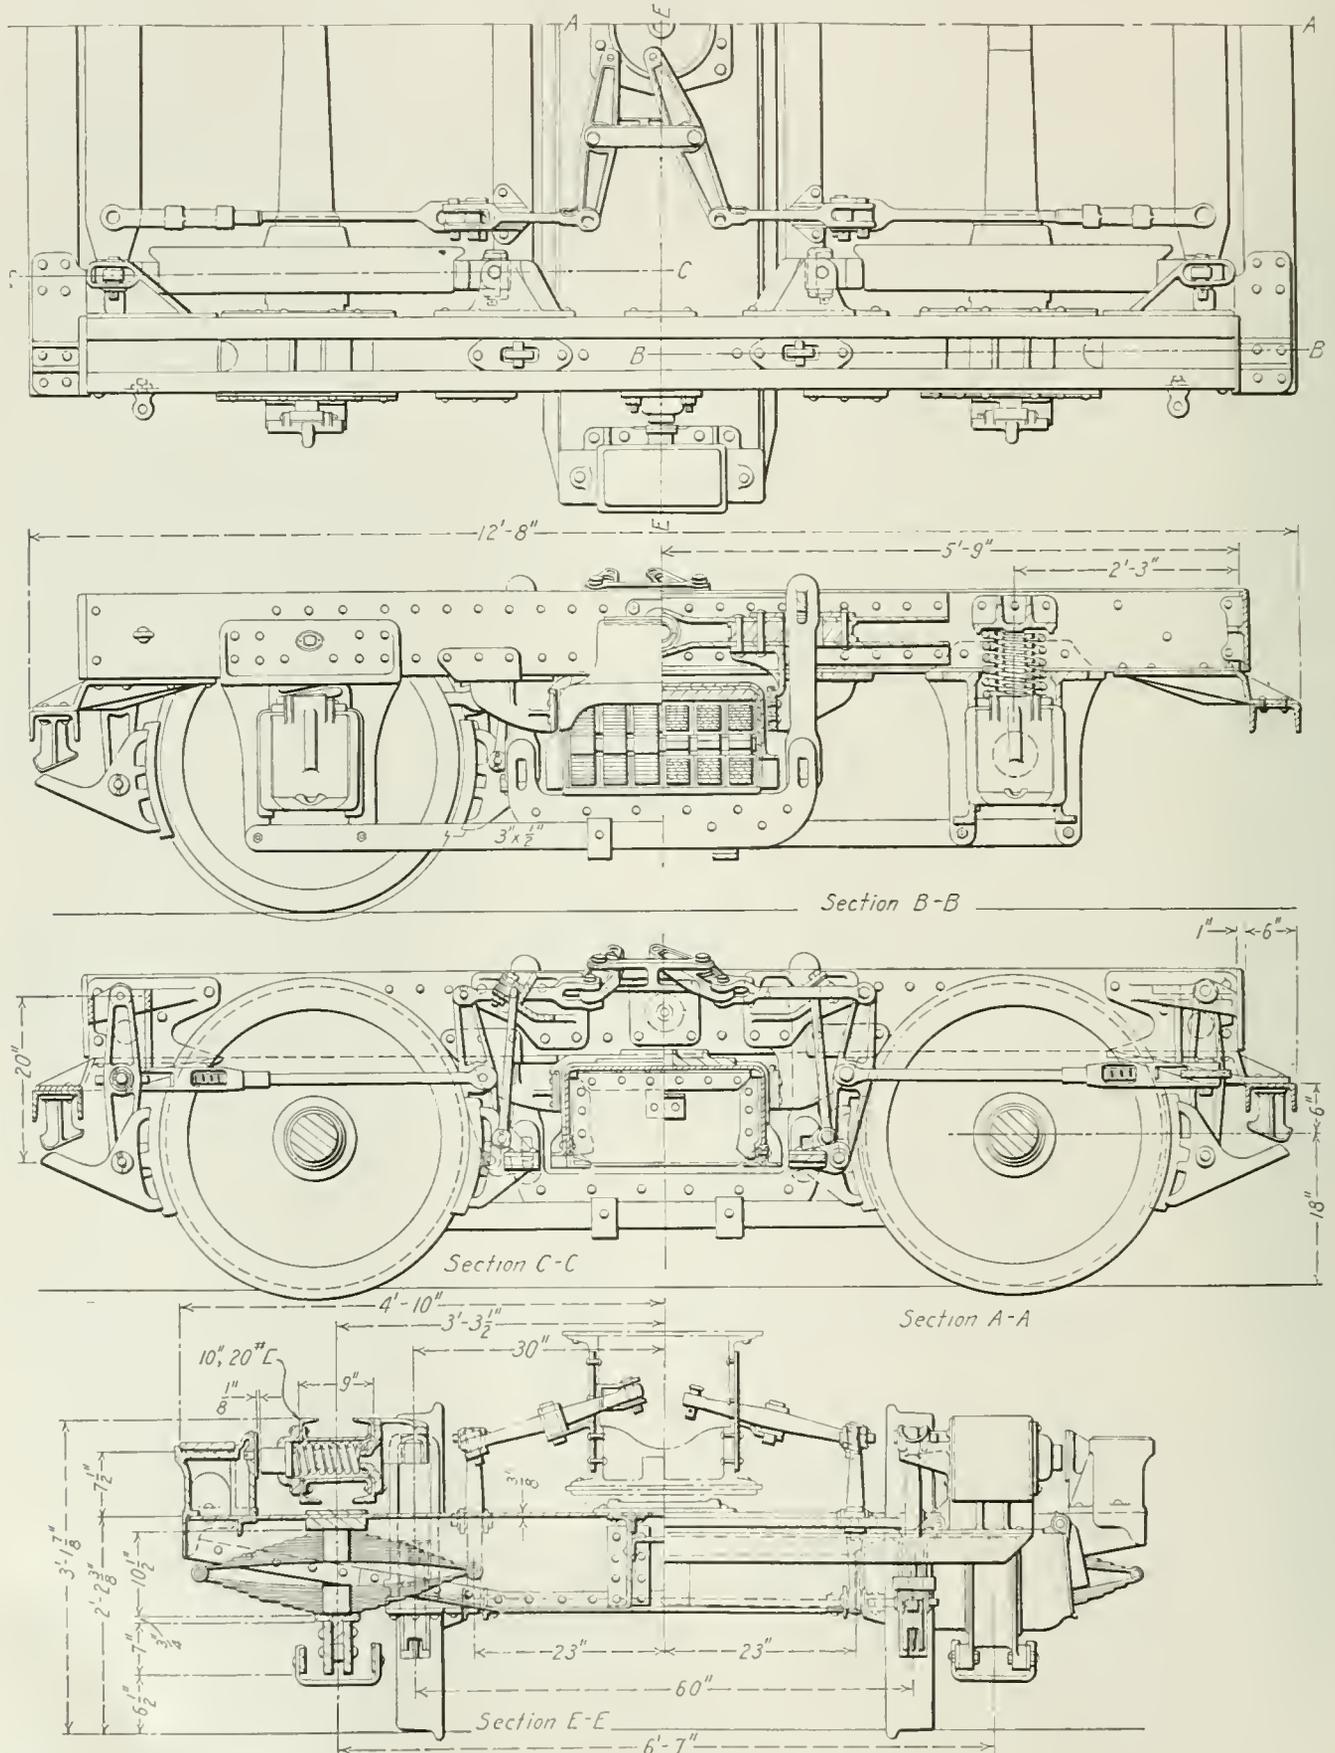

Fig. 2—Original Four-Wheel Steel Passenger Car Truck with Clasp Brakes Applied; Pennsylvania Railroad

one-to-one dead levers are used, resulting in a greater pull on the frame than in the case of the six-wheel truck; then, too, the resisting moment is less because of the shorter wheel base of the four-wheel truck. This improvement has been patented.

(3) There is a wide variation in the weights of different types of steel passenger car trucks, but it is probably fair to state that a pair of four-wheel trucks will weigh from 10,000 to 15,000 lb., or more, less than a pair of six-wheel trucks having the same carrying capacity. In other words, for the same total

weight of car the one with four-wheel trucks will carry ten to fifteen thousand pounds more loading or body weight, or with the same weight of body the total weight of the car with four-wheel trucks will be from 10,000 to 15,000 lb. less than the one with six-wheel trucks. For a car weighing 120,000 lb. and equipped with four-wheel trucks this means a saving of from 8 to 11 per cent in total weight as compared with what it would be if six-wheel trucks were used. On most roads it is the practice to carry car bodies weighing more than 85,000 lb. on six-

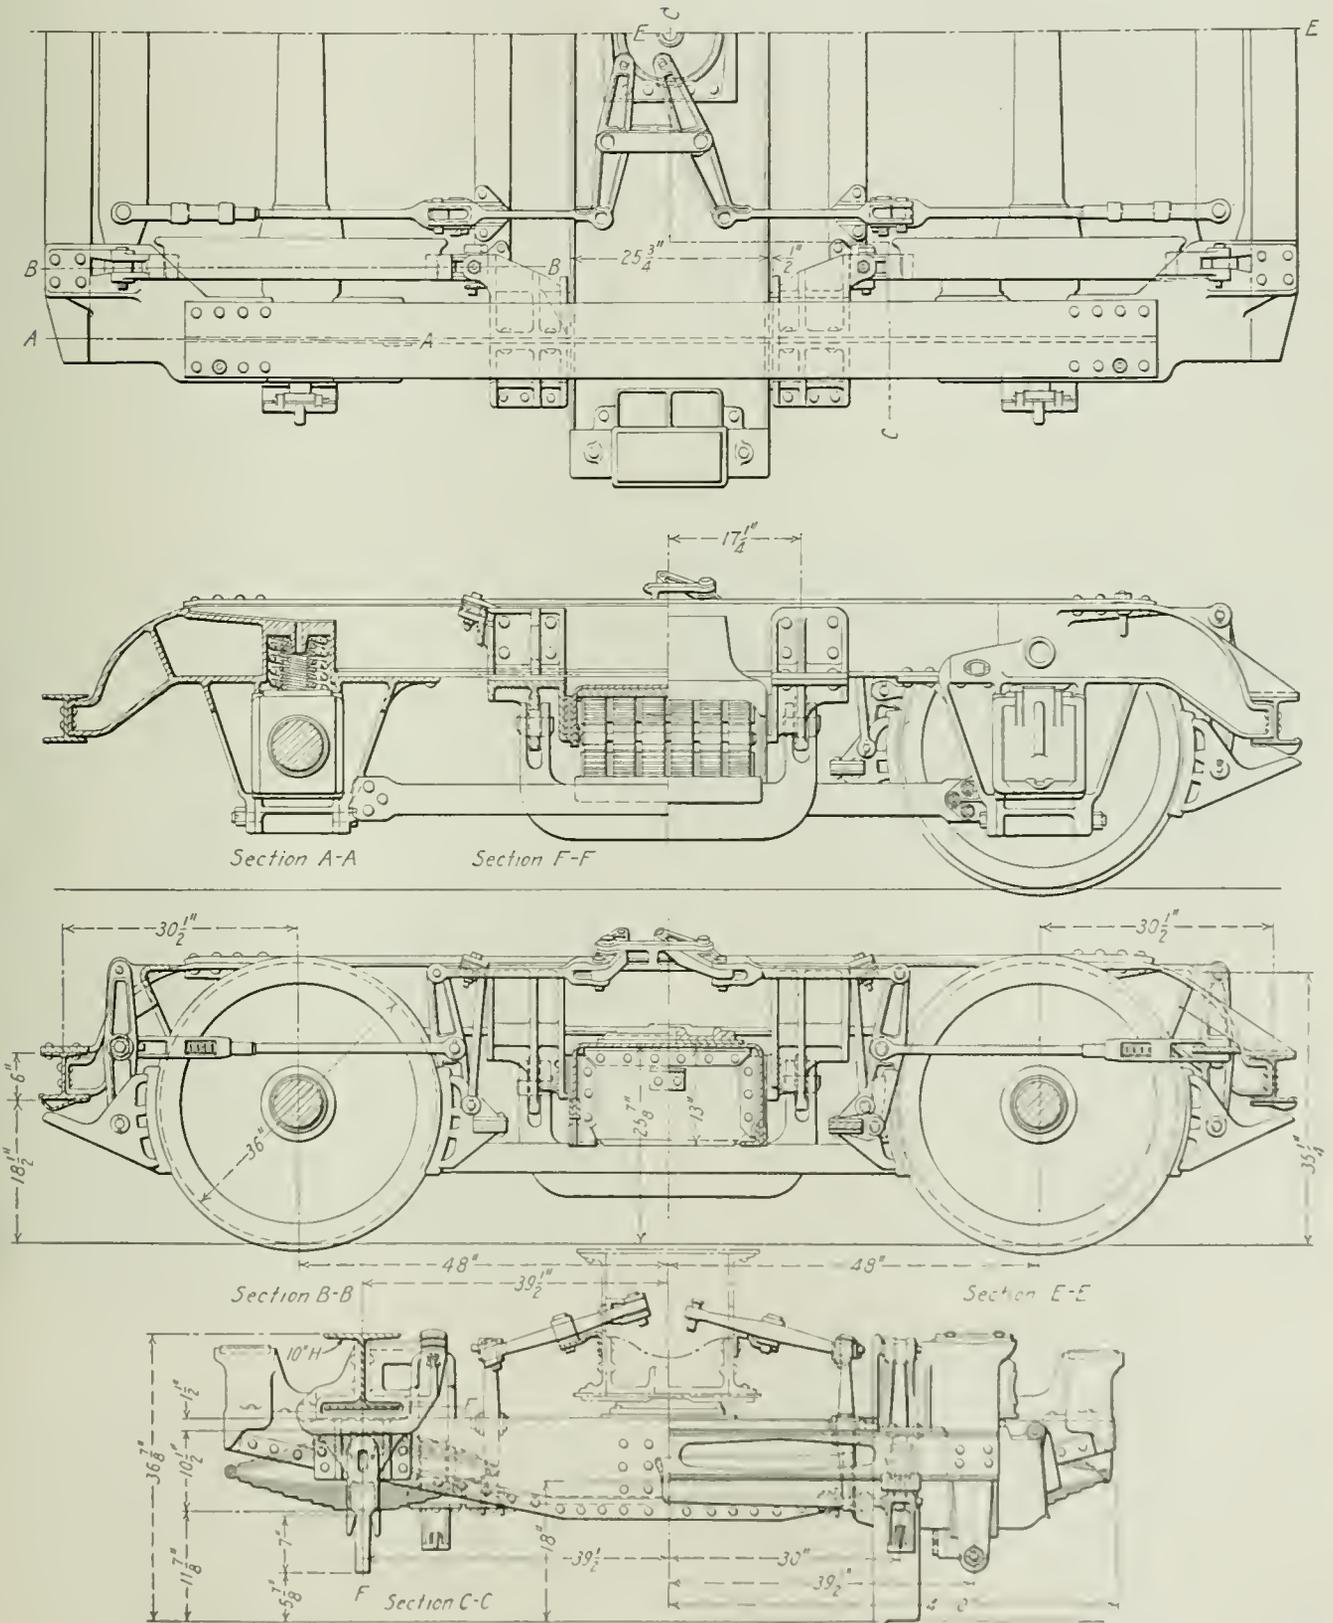

Fig. 3—Present Standard Four-Wheel Steel Passenger Car Truck; Pennsylvania Railroad

wheel trucks, which weigh fully 15,000 lb. per car more than four-wheel trucks. A locomotive that can haul eight cars equipped with such six-wheel trucks over a given division will haul nine cars of the same seating capacity having four-wheel trucks—a saving much to be desired.

(4) Roughly speaking, the cost of maintenance of a steel passenger car truck may be said to be very nearly in proportion to the number of its wheels and axles, these with the brake shoes being the parts subjected to the greatest wear and requiring frequent repairs and renewals. While no exhaustive data is available as to the comparative cost of repairs and maintenance of six-wheel and four-wheel trucks of the same carrying capacity, they are said by those who have checked these costs to be at least 50 per cent greater for the six-wheel truck than for the four-wheel truck.

DEVELOPMENT OF PENNSYLVANIA FOUR-WHEEL TRUCK

As a partial check on these conclusions, it is proposed to briefly review the development of the four-wheel steel truck for passenger cars on the Pennsylvania Railroad. From the outset and throughout this development the aim has been to reduce the number of parts to a minimum and make the construction as simple as possible. The problem has been complicated somewhat by the necessity of providing for the application of motors to the trucks used under motor cars in electrified districts and also by the application within the past few years of the clasp brakes, which are now standard on the Pennsylvania for all four-wheel trucks and for all new passenger equipment trucks.

In designing the first four-wheel steel trucks in the early part of 1905 it was aimed to use them under the largest coach possible and keep within the M. C. B. load limits for 5-in. x 9-in. axles. Shortly after the trucks had been placed in service three of the axles broke in the wheel seat, where the stress is least. Investigation finally showed that the breakage was due to defects in manufacturing caused by a faulty furnace which had been discarded shortly after these axles were made. In the meantime, however, as a measure of absolute safety, it was decided to increase the axles on existing cars $\frac{1}{2}$ in. in diameter and on new cars go to the next larger size standard M. C. B. axle, the $5\frac{1}{2}$ -in. x 10-in. Because of hot box troubles the length of journal was afterward increased to 11 in., although experience has since indicated, as previously noted, that the trouble was probably due more to dirt getting into the journal box than the lack of journal bearing area. The $5\frac{1}{2}$ -in. x 11-in. journal is now standard for all four-wheel as well as six-wheel trucks.

In going from the wood to the steel construction spring planks, axle guards and brake beams were done away with, the brake levers being attached directly to the brake heads. Each side frame was formed of two 10-in. 20-lb. channels, with the flanges turned inward and forming a box girder construction. The channels were spaced so as to measure 9 in. over-all. This was done to provide sufficient strength for resisting the lateral stresses, a requirement which has been overlooked in some designs. To check or limit the lateral motion or swaying of the bolster a spring arrangement was used, as shown in the drawing.

The subsequent use of clasp brakes made it necessary to modify this design somewhat. Fig. 2 shows the details of this modified design, which in general is practically the same as the original design, other than the braking arrangement, except for changes in the end construction of the frame to provide for the outside brakes. The detail of the original end construction is shown in Fig. 1. The end rail in the original design, which was formed of a $\frac{3}{4}$ -in. plate pressed in the form of an inverted U, 6 in. in width, was changed to make room for the brake levers. The outside brakeheads in the case of the clasp brakes are attached to the lower ends of the brake levers, which are anchored at the top to castings riveted to the ends of the side frames. A 6-in. channel with flanges turned

downward connects these castings and forms the end rail. It was also necessary to add brakehead tie bars because of the impossibility of connecting the tension rods for the outer brakeheads direct to the brake lever. It should be noted, however, that this brakehead tie bar is a simple rectangular bar and that the brake tension rod connects to it as close to the brakehead as possible. Obviously the weight and the cost of maintenance of this tie bar is much less than for a brakebeam where the force is applied at the middle. All of the brake levers, including both the dead and live levers, are made the same size and are interchangeable except for the drilling.

The peculiar form of the outer brakehead is noticeable. In the first application of the clasp brakes the ordinary type of brakehead was used, with springs to hold it balanced when hanging loose. These springs were difficult to maintain and were done away with by redesigning the brakehead and adding the tail piece. When the brakehead hangs loose this tail piece rests against a casting which is riveted to the underside of the end rail. When the brake is applied there is a clearance of $\frac{1}{2}$ in. between the brakehead tail piece and the rest. This device has given most satisfactory results.

The next development was a modification of this design to provide for the application of a motor for use under motor cars on electrified divisions. To do this it was found necessary to increase the wheel base from 7 ft. to 8 ft. 6 in. Transoms were also added to support the lip of the motor and the bolster design was modified slightly; otherwise the same parts were used as in the original design.

The next development was a radical one, the box girder sideframe being replaced by a Bethlehem 10-in. 54-lb. H-beam, thus simplifying the design as to construction by reducing the number of parts and still providing sufficient moment to resist the side stresses. As shown in Fig. 3, the journal box pedestal casting has a projection to which the top of the lever for the outside brake is anchored and which also supports the end rail, a 6-in H-beam. The H-beam which forms the side frame has its lower flange and web cut away over part of the journal box pedestal casting and is strongly riveted to it through both the upper and lower flanges. The casting which was formerly used on the end rail to balance the brakehead was replaced by a steel clip which is sprung over and welded to the lower flanges of the end rail.

Another noticeable change was the shortening of the bolster hangers, thus limiting the amount of side swing and making it possible to do away with the complicated spring mechanism which was formerly used to check and limit the lateral motion of the bolster with the longer hangers. Before making this change the springs were gradually blocked and finally wedged solid on a number of the cars. As this had no noticeable effect on the smooth riding, it was decided to discard the springs entirely.

The more important of these changes, that is, the side frame construction and the change in the hanging of the bolster, were first made on four-wheel trucks for suburban cars, several hundred of which were built. These trucks, however, were of lighter construction than those used under the standard coaches and will not be considered in this discussion. The details of this improved truck as designed for use under standard coaches are shown in Fig. 3.

THE BAGDAD RAILWAY.—The Sofia correspondent of a Holland paper writing on the progress of the Bagdad Railway, points out that there is now only wanting the completion of the Bagdad tunnel, which was pierced in May, and upon which work is now being prosecuted with all available energy, and the 24 miles of railway through the Taurus mountains—the most difficult piece of the whole line, in which about 70 tunnels, viaducts, and other engineering works occur. It is hoped that the work will be completed in the course of next year. The continuation of the line from Bagdad has proceeded north to Tekrif 90 miles.

A Large Track Depression Project at Minneapolis

The Chicago, Milwaukee & St. Paul is Building Concrete Street Viaducts to Eliminate 37 Grade Crossings

By C. N. BAINBRIDGE

Office Engineer, Chicago, Milwaukee & St. Paul, Chicago

One of the largest projects for the elimination of grade crossings recently undertaken is the depression of the tracks of the Hastings and Dakota division of the Chicago, Milwaukee & St. Paul through the southwest part of Minneapolis. With but few exceptions, the elimination of grade crossings in cities has been brought about by the elevation of the tracks and the depression of the streets. In the work described herein, these methods are reversed, i. e., the tracks are being depressed from 18 to 20 ft., and the streets are being elevated from 2 to 4 ft. and carried across the depression on bridges. Thirty-seven grade crossings are to be eliminated and the depression extends for approximately three miles.

Just prior to the completion of the Puget Sound extension from Mobridge to Seattle in 1909, the double tracking of the line from Minneapolis through Aberdeen to Mobridge was commenced and the grading has now been practically completed from Minneapolis to Aberdeen, with the exception of a short stretch at the eastern terminus, which is being constructed as fast as the track depression progresses.

In the latter part of December, 1910, the St. Paul was ordered by city ordinance to depress its tracks westward through the city from Hiawatha avenue to Irving avenue, and to carry over its tracks on bridges, all streets within these limits which crossed the right of way at grade. Previous to the passage of this ordinance, Fourth and Fifth avenues, which are located about midway of the depression, formed natural undercrossings with the tracks due to the topography of the site. The ordinance

A Building Being Underpinned by Concrete Columns

requires that the street which originally passed under the tracks at Fourth avenue shall be carried over the tracks on a viaduct. Fifth avenue, however, is a less important street, and the ordinance allows this to become a grade crossing, thereby avoiding considerable property damages. Hennepin avenue, situated at the west end of the depression, had previously (in 1897) been carried across the tracks and no further change was required.

Work was started at the west end early in 1912, and has been carried on continuously, with the exception of two or three months during the winter seasons. The project is now approximately 75 per cent completed, and it is the intention to complete the work in the fall of 1916.

The tracks which are to be depressed pass through a portion of the better residence district of Minneapolis and although numerous industries line the right of way for the greater part of the distance, it was desirable to have the finished work give as pleasing an effect as possible. Considerable attention was, therefore, given to the selection of the most suitable type of bridge. The tracks cross practically all of the streets at an angle of approximately 90 deg. and the right of way was of sufficient width throughout, with one or two exceptions, where additional land had to be bought, to adopt a uniform span bridge. Although there was some variation in the width of streets and roadways as required by the city, it was thought that probably unit construction (building slab and bent units at a central plant and lifting them into place) could be adopted. Accordingly designs were made and estimates and methods of erection were studied, but after due consideration, it was decided

A Shovel Taking a Third Cut

to abandon the idea of unit construction and build the structures in place, for the following reasons:

(1) About 50 per cent of the concrete in each bridge would have to be built in place in both bridges, of unit construction and those of monolithic construction. This would have required a movable plant for the abutments, as well as a stationary plant for the slabs and bents, if the structures had been built as units.

(2) Estimates showed that a larger yardage of concrete would be required in the unit than in the monolithic construction, as well as more steel, due to erection stresses and simple instead of continuous beam action.

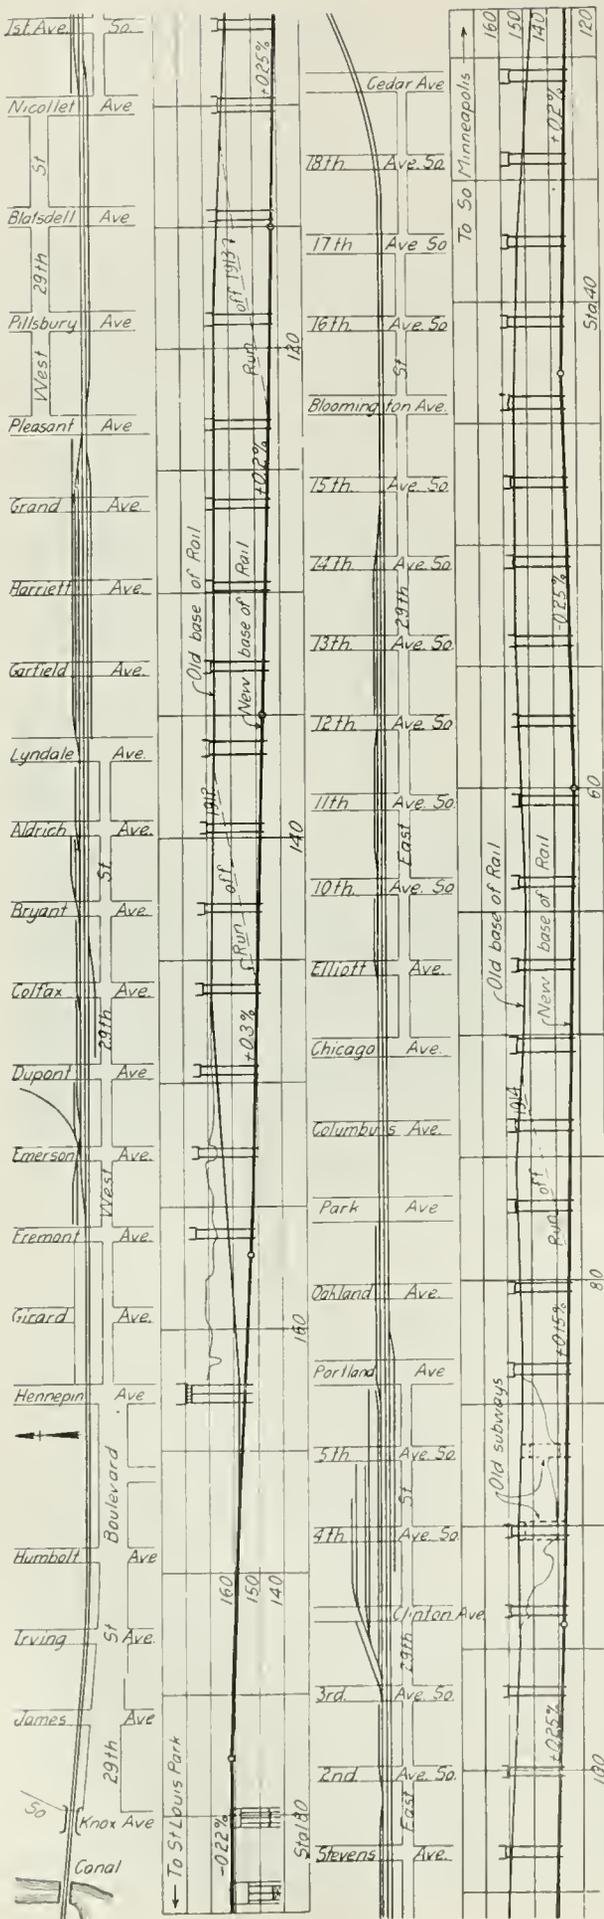

(3) The work would extend over three or four seasons, and in order to run the stationary plant efficiently, all the work on the different units would have to be done continuously, covering a period of about nine months. This would have necessitated space for the storage of some of the slabs and bents for from one to two years, besides tying up a considerable amount of money for a long time before the structures would really be required.

(4) The mixing and placing of concrete would have been cheaper in the unit construction than it is in the monolithic construction, provided the stationary plant were run efficiently and a large number of the units were alike, so that the forms could have been used to advantage. It was estimated, however, that this difference in cost would be practically balanced by the additional yardage and additional cost of storing and erecting units after they were made.

(5) In the case of unit construction, it would have been necessary to know beforehand just how each crossing was to be treated, and no changes could have been made later without disassembling units already made. The monolithic construction had the advantage over the unit construction in that it allows a modification of the bridges to meet local conditions up to the time each bridge is built.

(6) Owing to the excessive weight of the units, it would have been necessary to alter the heaviest erecting equipment of the railway in order that it might lift and swing these slabs into position. This would have prevented the use of the equipment for other work for two or three years.

(7) In the case of unit construction, there would have been occasion to interfere with traffic to a greater extent than with the monolithic

Layout and Profile of the Track Depression

construction. This would be caused by the hauling of the different units from the storage yard or plant to the bridge; shifting the position of the derrick car from one track to another, to facilitate the placing of the units; and, finally, the placing of the units themselves, which would weigh from 35 to 45 tons. These would have to be lifted and swung a considerable distance, making the chance of accident greater with the unit system than with the monolithic system.

BRIDGES

The type of structure finally adopted is that shown in the accompanying drawing. The bridges are of reinforced concrete and conform to a uniform design. On account of the various widths of roadways, the structures vary in width from 48 ft. to 68 ft. overall, including the roadway, two 8-ft. sidewalks and hand railings; and with the exception of two structures, they consist of three spans, the center one being 29 ft. 6 in., and the side spans 29 ft. in the clear. They are supported at the ends on abutments, and at the third points on skeleton piers or columns. This arrangement permits placing two main tracks under the center span. The side spans cover the slope of the cut where only two main tracks are depressed, but they are of sufficient width to allow the placing of two additional tracks on either side for industrial purposes or railway use, as conditions require, with the alteration of abutments only.

The two exceptions noted above, one at Fourth avenue and the other at Clinton avenue, are of 10 spans and 6 spans respectively, and carry those streets across a team yard which will be located about midway of the depression. Entrance to the team yard is to be made from Twenty-ninth street, which parallels the tracks, and also from Fifth avenue, which, as previously mentioned, is to become a grade crossing. The clearance over the main tracks is 18 ft. 6 in., and that over the side tracks or industry tracks is 18 ft.

The abutments used under these bridges are of three types:

- (1) The small bank abutment used on bridges which do not make provisions for industry tracks under the side span.
- (2) The intermediate height abutment, which is high enough to provide for one track under the side span.
- (3) The high abutment, which is high enough to provide for two tracks under the side span.

The small bank abutments are of the ordinary gravity type. They are but 9 ft. high from bridge seat to foundation. The footing is 2 ft. thick, and the toe projects 12 in. beyond the network. The abutments extend the full width of the street and have retaining walls, which extend back to the right of way line. They are built in two sections for the narrower streets, and in three sections for streets of 80- and 100-ft. widths. The intermediate height abutments are of the reinforced concrete counterfort type, and are 19 ft. high from bridge seat to foundation. The toe projects 3 ft. 6 in. beyond the face of abutment and the footing is stepped in the rear. Counterforts are provided every 12 ft. The high abutments are of the reinforced concrete counterfort type, and are 24 ft. 6 in. high from bridge seat to footing. The toe extends 4 ft. 6 in. in front of the abutment and is 3 ft. 6 in. deep. The base is stepped twice in the rear, the total width of base being 15 ft. 6 in. The bridge seat on all abutments is 18 in. wide, not including a 4-in. coping; 1:3:6 concrete was used in the gravity abutments, and 1:2½:5 concrete in the reinforced type.

The piers of the bridges are 25 ft. 6 in. high and consist of four, five or six columns, depending on the width of the bridges, and rest on spread footings of plain concrete. The columns are 2 ft. square, spaced about 11 ft. 6 in. center to center. The footings were poured in one run, reinforcing bars projecting about 4 ft. above the construction joint to form a splice with the main reinforcing steel in the columns. A key block 14 in. square is placed at the construction joint at the base of each column. The cross girders connecting the top of the columns are cast with the floor beams. These girders are 2 ft. thick and 4 ft. 6 in. deep and are joined to the columns by circular arches, which add materially to the strength and appearance of the structure. They are reinforced as a continuous beam with straight bars in the top and bottom and with stirrups and bent-up bars. The fillets or curved portion are reinforced with

bars placed at 45 deg. The footings are of 1:3:6 plain concrete and the remainder of the bent is 1:2:4 concrete.

The accompanying illustration shows also the saddle which is used to protect the sewers crossing the right of way. This consists of an 8-in. layer of concrete forming an arch, reinforced with 3/4-in. bars along the intrados and 1/2-in. bars along the extrados. A 1-in. layer of felt is placed between the concrete covering and the top of the sewer.

The floors of the bridges are of the T-beam type, are 3 ft. 6 in. deep, including 5 in. of paving, and are built continuous from abutment to abutment, a distance of 91 ft. 6 in., expansion joints being placed at the bridge seats. The stems of the beams under the roadway are 13 in. wide, spaced 5 ft. center to center. The sidewalk slab has a span of 8 ft. The outer beam under the sidewalk was given the form of three 3-centered arches for appearance. All other beams are straight on the bottom with fillets at the supports. The beams are figured as continuous for three spans and are reinforced with 1-in. and 3/4-in. bars, part of which are bent up near the supports to provide for shear and negative moment over the supports. Vertical stirrups are also used in reinforcing for shear. As a precaution against cracks, due to any unequal settlement which might occur at the abutments or piers, a small excess of steel is placed over the center supports and in the beams. The foundations are for the most part of good gravel, and, as the structures are designed for a bearing of only 2.5 tons per sq. ft. on the foundations, the danger of unequal settlement is slight.

The slabs between the T-beams vary in thickness from 6 1/2 in. to 11 in., to provide for the crown of roadway and the grade on the bridge. They are reinforced with straight and bent 1/2-in. bars spaced 6 in. center to center. The sidewalk slabs are 5 1/2-in.

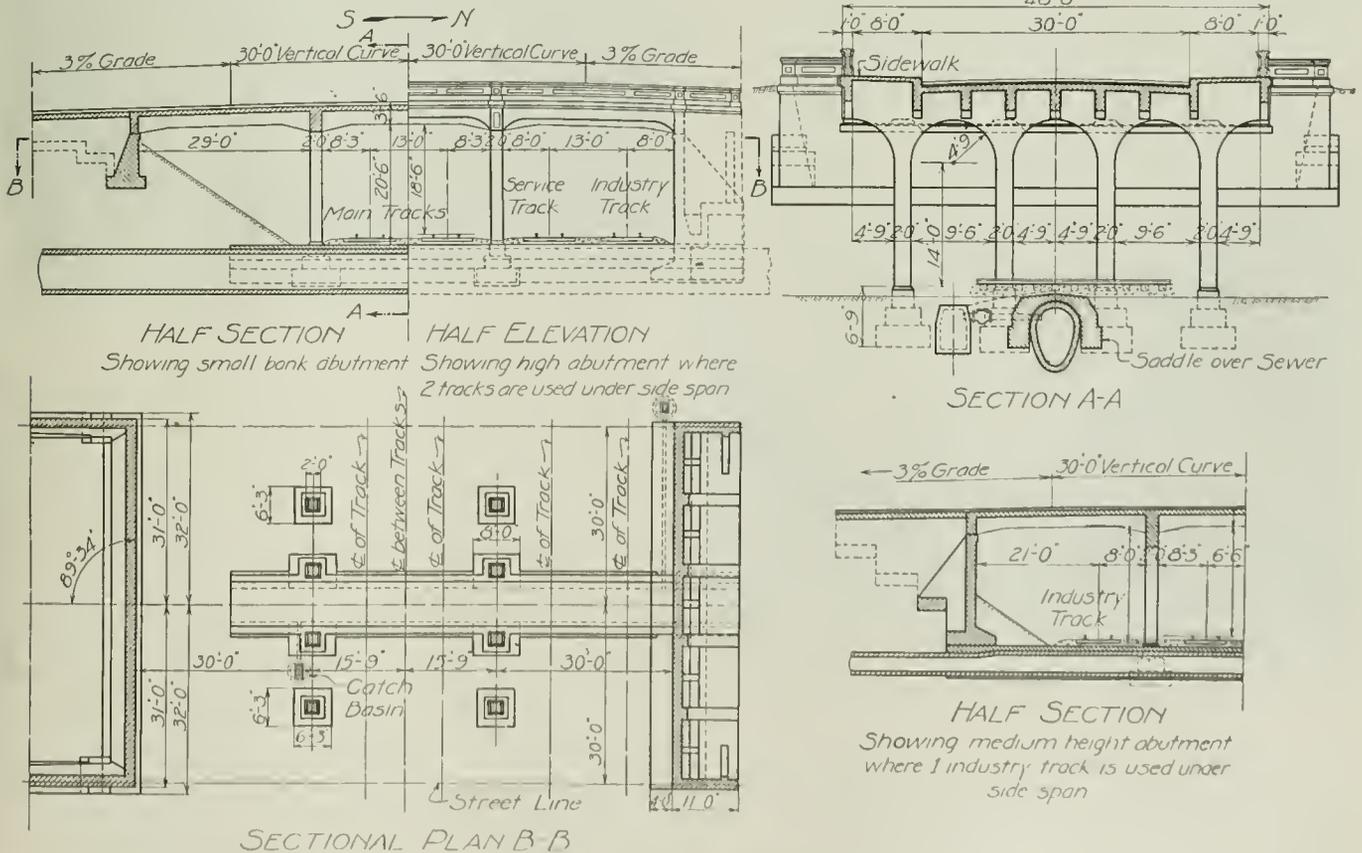

reinforced concrete and is built in place, after the floor is completed.

Water and gas mains as well as numerous conduits of various utility companies were encountered at the majority of the streets. Ledges are provided on the side of the stems of adjacent

The Concrete Plant—A Temporary Foot Bridge in the Background

T-beams to carry the conduits across the bridges. At first the gas and water mains were carried across the depression beneath the abutments and tracks. The cost of this, however, proved to be excessive and provisions are now made to carry the water pipes across under the bridge floors in a similar man-

Typical Plan of Reinforced Concrete Viaducts

thick, have a 1-in. finishing coat on top, and are reinforced with 1/2-in. bent bars spaced 7 in. center to center. Concrete in the slabs, beams and cross girders is of 1:2:4 mix. A layer of 1:2 cement mortar is placed in the bottom of all beams and slabs to a sufficient depth to insure the covering of all bars before any concrete is poured. The hand rail is of the solid type

ner to that used for the conduits. A compressed fiber covering of about 3 in. in thickness is placed around the pipes, the fiber being moulded to fit the pipe. Wrought pipe with screw threads is used across the bridges in place of the usual cast iron pipe.

The bridges which do not carry street cars are designed to carry a moving concentrated load of 24 tons on two axles at

5-ft. gage and a load of 100 lb. per sq. ft. upon the remaining portion of the roadway. The six bridges which carry street cars are designed to carry two 40-ton cars and 100 lb. per sq. ft. upon the remaining portion of the roadway. The live loads are increased 50 per cent to provide for impact.

INDUSTRIES AND INDUSTRY TRACK FACILITIES

The majority of the industries are located on the north side of the tracks, Twenty-ninth street being adjacent to the right of way on the south side for nearly the full length of the depression. The presence of these industries introduced special problems and was the cause of considerable delay and numerous controversies.

The industrial concerns maintained that the railway company was liable for the cost of all changes to industries and industry tracks made necessary to continue service on the lower level after the main tracks had been depressed. The railway company, on the other hand, contended that the tracks were lowered by order of the city authorities as a measure of public safety, and not for the benefits, nor on the initiative of the railroad, and that therefore the industries should make any adjustments required at their own expense and also pay the cost of changing the tracks serving them. Litigation was avoided when the railway company decided, because of the many switches and the great amount of switching which would otherwise come off of the main track, to construct a third track from which to serve the industry spurs. As in practically all cases the right of way was only wide enough to depress two main tracks without resorting to retaining walls, the railway company contributed to the industries an amount approximately equivalent to what it would have had to expend to construct a retaining wall, within the right of way, adequate to provide for the third track, if the spur tracks were absent. The industries expended this money in altering their plants and providing the spur tracks, while the railroad was relieved from any further responsibility for retaining adjacent lands. Notwithstanding this decision of the railroad company, the result to the industries in providing

Elevation of a Typical Viaduct—Elevator for Raising Coal on the Right

themselves with industry tracks and adjusting their plants to the lower level, was a very large and burdensome expense, and it was also a large additional burden to the railroad.

There are about 20 industries situated along the depression and no two were treated alike. Each industry required special treatment to meet the requirements of the particular situation. For the most part, each industry handled its work with its own engineers, although the railroad assisted to a considerable extent with suggestions. In some cases where the buildings were old and of little value, they were torn down and the entire property excavated to the new track level and new buildings constructed. Other concerns underpinned the buildings, and added

shipping and receiving floors beneath, while still others allowed the slopes to extend under the building, supporting the buildings on skeleton framework. The accompanying photographs illustrate some of the methods used in solving the various problems.

CONSTRUCTION

The excavation work is being done with a 65-ton Bucyrus shovel, the material being removed by two trains of 20 standard gage 12-yd. air dump cars each. The excavated material varies from sand to gravel and is used largely for filling a site for a freight yard at Bass Lake, about nine miles from the depression, and also for taking out some sags in the main track immediately west of the work. The excavation for the abutments is made in many instances in advance of the shovel, the material being thrown in front of the abutment site and then loaded on cars as the shovel passes. Where this is impossible, material is loaded on wagons by hand and used for grading the street approaches to the bridges. Two train crews are employed to handle the cars to and from Bass Lake, each crew spotting its own cars at the shovel. A third crew and engine handle the cars at the yard, using a spreader.

In lowering the tracks, two methods were employed. The first 5,000 ft. of right of way is largely confined between private

A Building Underpinned by a Masonry Wall

property and was not of sufficient width to allow a temporary operating track to be constructed, without one or more shifts, while excavation to the final grade was being made. Excavation was consequently made in stages, the shovel making several cuts while the operating track was shifted several times to lower levels, before reaching its final position. The shovel worked in cuts of a length of about 2,500 ft., which is equivalent to about eight city blocks, with temporary run-offs to meet the original grade of the tracks on grades of from 2.5 to 3 per cent. On the remainder of the work, however, a temporary operating track was constructed along Twenty-ninth street, which is parallel and adjacent to the right of way. This permitted the shovel to operate in the cut unrestricted by regular train movements. After the shovel had started and was in operation, it was necessary to block traffic on seven or eight adjacent streets, until the excavation was completed to the final grade. A temporary timber bridge was then erected at one street to provide for street traffic until some one of the concrete bridges could be constructed and opened to traffic.

At the six streets where street car traffic had to be handled, a temporary bridge for street car traffic spanning the first cut of the shovel was constructed as soon as the shovel had made its first cut across the street. After the shovel passed through for the second time, however, street car traffic was discontinued across the cut and passengers were required to transfer from cars on one side of the cut to cars waiting on the other side,

crossing the cut by steps leading down into the portion excavated in the first stages. As the shovel progressed and the cut became deeper, an overhead foot bridge was provided, which was lowered after each trip of the shovel, until on the approximate grade of the final bridge. The abutments for the bridges carrying street car traffic were, as a rule, in course of construction before street car traffic was discontinued, and the bridge was completed as soon as possible after service was discontinued.

For the first two seasons of work, stationary stiff leg derricks were erected at each bridge site at the original ground level and in such a position as to reach any portion of the structure. This allowed the derrick to be used in erecting the falsework, forms and reinforcing, and for placing the concrete for the whole bridge. During this last season, however, A-frame derricks fitted with hand crabs or hoists were used to erect the falsework and forms. The concrete was then placed from a portable concrete plant, traveling on the construction track at the low level. This consisted of a ½-yd. mixer of the drum type, mounted at the rear of a flat car. Following this was a track pile driver converted into an elevator, using the leads as guides for a specially designed ½-yd. dump bucket with the discharge door at the bottom of the forward side. The concrete was raised and then conveyed to the forms by chutes. The accompanying illustration shows the complete concreting plant in operation. Owing to the similarity of the bridges, unit forms are being employed to good advantage and are being used from three to five times with but slight alterations.

In all, there will be about 900,000 cu. yd. of material excavated about 33,000 cu. yd. of concrete and 900 tons of reinforcing bars will be required for the bridges, abutments and retaining walls.

According to usual practice on the St. Paul, the work is being done by company forces under the direction of C. F. Loweth, chief engineer. The plans are prepared under the direction of H. C. Lothholz, acting engineer of design, and the construction work is in charge of W. R. Powrie, district engineer, Minneapolis.

THE SHIPPING BILL

BY W. L. STODDARD

WASHINGTON, DEC. 1

Signs are increasing that the fight for the shipping bill, which is to be one of the most important items in the Administration's program this winter, will be of more than cursory interest to the railroads. The congestion of freight in the east, due to lack of ships, is being used as an argument for government-owned freighters, and in a despatch from Washington early in the week, bearing all the marks of official inspiration, it is declared that the Interstate Commerce Commission, at the suggestion of the President, has been investigating ocean freight rates and the relations between rail carriers in the United States and transatlantic steamship companies. Some of the information thus collected, it is declared, reveals close relations between the land and sea carriers, "particularly in matters connected with through freight shipments from interior points to foreign ports. If power is granted to the shipping board to prescribe reasonable rates for steamship traffic, it probably would include the power to fix, possibly in conjunction with the Interstate Commerce Commission, joint through rates from the interior to ports in other countries."

In this connection it may be well to state that from interviews had with officers of the Administration who are in the thick of the work for the shipping bill, it would seem that the bill is almost certain to be received very favorably by Congress. During the last year, so the reports which come to Administration leaders have it, there has been a decided change of sentiment for the measure, and in spite of the opposition, traceable to the foreign shipowners and those who are constitutionally against government ownership, the President's pet scheme will have pleasant, if not absolutely successful, sailing in Congressional waters.

George W. Norris, former director of wharves at Philadelphia, made a statement here the other day which was issued by the

Democratic committee as part of the propaganda for the shipping bill. "The conditions which exist in ocean transportation," said Mr. Norris, "and the theory upon which government intervention must be justified, are so wholly different from the railroad situation that there can be neither analogy nor comparison between the two. Moreover, as the government intervention would probably be temporary—ultimately yielding the field to private capital—and would probably show a balance on the wrong side of the ledger, the opponents of government ownership of railroads should rather welcome the experiment as likely to prove an illuminating object-lesson."

Interesting comments on the proposed shipping bill from a New England railroad man, E. D. Codman, former president of the Fitchburg Railroad, are contained in an interview, which is here presented for the first time. Mr. Codman believes that the government merchant marine line offers the only means of overcoming the discrimination enforced by the "shipping pool" against Atlantic seaboard ports.

His statement follows:

"Because I see no other way of relieving Boston of the burden of discrimination laid upon her commerce by the foreign-owned shipping pool, I feel I can endorse the idea of placing in commission a government-owned merchant marine. This government-owned service would seem to be able to deal with the present situation by establishing a fair transportation rate between here and Europe. At the same time it would give ports such as Boston a chance to enter on equitable terms the competition for the trade of South America.

"Take, for example, the rates from this port to Liverpool. We are so much nearer Liverpool than is New York to that English port, that a vessel can make a little better than eleven trips from Boston to Liverpool and back while she would be making ten trips from New York to Liverpool and back. Applied to freight rates, that saving in time should make a difference in our favor, and applied to passengers it should amount to enough to pay a \$5 fare from New York to Boston on a first-class passenger.

"Yet under the conditions established by the shipping combine on the Atlantic, the railroads carrying a shipment from Chicago to be sent to Liverpool are allowed practically only the same amount to deliver that shipment on the docks in Boston as to deliver it on the pier in New York. On both exports and imports the rates allowed the railroads are so low as to afford only a slight profit. The fact that there is less profit in bringing shipments by rail to Boston than to New York discourages the railroads from developing their service here. Boston is the victim of this discrimination. Only when her ocean rates to Europe are readjusted on a basis of the shorter distance can she hope to get a fair chance at the export business. The trouble lies in the fact that the foreign-controlled shipping pool has arbitrary control of the rates.

"If the United States government will build and operate, or control the operation of, a merchant marine that will enter upon the task of correcting this injustice, the whole country will be the gainer. The public loses whenever rates are fixed on any other basis than that of a fair price for the service rendered, as in the case of ocean freight transportation. Let the government put on a line of ships temporarily, and the shipping pool will have to meet the rates which a government board shall determine are fair for the distance from Boston to Liverpool.

"I do not believe in government ownership of shipping where private capital can and does render equal service for a fair price. But I do believe that where private capital is so combined, and under control so far removed from the action of public opinion, as is the case with our trans-Atlantic shipping, and where it fails so notably to render to the public a reasonable service at a fair price, the government should step in with its own corrective power. The corrective power in this instance is not the legal regulation of the rates to be charged by the privately owned lines, but the temporary establishing of a shipping line which will set the desired standard of service.

"Boston will be the gainer if this is done."

General News Department

The trains of the Delaware, Lackawanna & Western and the New York, Ontario & Western now run to and from the new passenger station of the New York Central at Utica, N. Y., making that the union station for the city.

The Denver & Rio Grande announces that after the end of this year the dining cars of that road will carry no intoxicating liquors. This rule is to apply not only in Colorado, where a prohibitory law goes into effect on January 1, but also in Utah and New Mexico.

A. D. Parker, vice-president of the Colorado & Southern, has announced that contracts covering the handling of business for the Colorado Midland between Denver and Colorado Springs over the Colorado & Southern, will be terminated on May 1, as part of a plan to rearrange division points.

Homer B. Vanderblue, assistant professor of transportation at Northwestern University School of Commerce, has been awarded the second prize of \$500, awarded annually by Hart, Schaffner & Marx, for essays on economic subjects. Mr. Vanderblue's paper was on the subject of "Railroad Valuation."

The Massachusetts Public Service Commission is making another investigation of the capital, expenditures and investments of the New York, New Haven & Hartford, and will assess the cost of it, up to \$10,000, against the company. Accountants are examining the company's books and a public hearing will be given by the commission on December 7.

The Coconino Water Development and Stock Company, recently organized in Arizona, proposes to lay 200 miles of pipe to supply water to the desert stations on the line of the Atchison, Topeka & Santa Fe between Ash Fork and Angell, about 90 miles, and also to the tourist resort towns on the rim of the Grand Canyon. The water is to be obtained by drilling wells on the slope of San Francisco Peak, about 10 miles north of Flagstaff.

The legislature of Georgia, which has just finished an extra session, has created a commission of five persons to have power to lease the Western & Atlantic Railroad, owned by the state. The chairman of the commission is Governor N. E. Harris and another member is C. M. Candler, chairman of the State Railroad Commission. The Western & Atlantic is now operated by the Nashville, Chattanooga & St. Louis under a lease which expires in 1919.

A. W. Newton, assistant to president of the Chicago, Burlington & Quincy, has been appointed chairman of the Engineering Committee, western group, Presidents' Conference Committee for the Federal Valuation of the Railways, succeeding H. C. Phillips, who was appointed assistant general secretary of the Presidents' Conference Committee some time ago. C. F. Loweth has been made a member of the Engineering Committee, western group, Presidents' Conference Committee.

R. C. Richards, chairman of the Central Safety Committee of the Chicago & North Western, in issuing a bulletin to employees calling for more general use of postal cards prepared by the division safety committee, on which employees or patrons are invited to make suggestions for making railroad operation safer and more satisfactory to the public, calls attention to the fact that from January 1, 1911, to September 1 last, 24,176 recommendations were made on the safety postal cards and otherwise, of which 23,502 were adopted and have already been put into effect.

Indictments were returned last week by the federal grand jury at Kansas City against the St. Louis & San Francisco and the Union Pacific railroads and the Western Tie & Timber Company, of St. Louis, charging an illegal reduction by which the timber company paid less than the lawful tariff rates for transportation of oak ties. The president of the timber company has given out a statement that the reduction of the rates arose

from a readjustment of divisions between the two railroads, and that according to the traffic departments and attorneys the proper rate was paid.

The Southern Railway, as a result of two years' attention to the education of special apprentices, has now in its employ, in the roadway department, 13 student apprentices, of whom seven have been promoted to the position of assistant supervisor. The company seeks to enlist in its service young men of technical training, who were born and bred in the South, and is at all times looking out for graduates of the leading southern universities. Special attention is given not only to scholastic attainment but also to personality, as judged by teachers and fellow students; and special consideration is accorded also to men who wholly or in part have paid their own way through college. Students have to begin on the road as common section laborers.

Victor Carlstrom, a Swede, riding in a Curtiss biplane of a new type, with a motor of 160 h.p., flew last week from Toronto, Ont., to New York City, by a route said to be about 600 miles long, in 400 minutes, or at the rate of 90 miles an hour. This, however, was not the inclusive time, as the aviator was compelled to stop over at Binghamton because of dizziness, due partly to a strong wind and partly to ill health. The 6 hours and 40 minutes represents the time actually on the wing. Most of the journey was made at a height of about 5,000 ft. The railroad lines of the Delaware, Lackawanna & Western and the Erie were the aviator's guides for most of the way. He started with 146 gallons of gasoline and with a total dead weight of about 960 lb.

The attorney-general of Texas proposes to get a receiver appointed for the Pacific Fruit Express in order to compel payment of a large sum of money which is alleged to be due on account of a tax of 3 per cent on its gross receipts from intra-state business since October 1, 1909—if the court grants the application which has been filed. The Pacific Fruit Express has no permit to do business in Texas, but its cars have been run extensively in the state for many years. If the officers accept service and come into court there will be a straight contest of the legal right of the state to tax the gross receipts of private car lines. Cars of a large number of private car lines are run in Texas, but it is said that very few of them have observed the gross-receipt tax law.

The Western Association of Short Line Railroads, with office in San Francisco, is conducting a publicity campaign in the interest of an increase in railway mail pay, and is sending to newspapers articles giving information regarding the effect of the present low rates on the short line railroads. The association says that "this matter is most vital to the little railroads in the mountain districts and the Pacific coast. These roads are none of them prospering, most of them are losing money, and a few are in the hands of a receiver. The association is composed of these small roads. We think that the government should be as fair to us as other shippers, and we believe that rates for mail pay should be fixed by the Interstate Commerce Commission."

Smoke Abatement in Chicago

The report of the Chicago Association of Commerce Committee on smoke abatement, which was presented at a dinner at Chicago, December 1, is reported in another column. The report was presented by Judge Jesse Holdom of the Illinois Appellate Court, as chairman of the committee. Harry A. Wheeler, vice-president of the Union Trust Company, spoke on the "History and Problems of the Committee." Harrison B. Riley, president of the Chicago Title & Trust Company, spoke on the "Arguments and Conclusion of the Report," and Charles L. Dering, president of the Chicago Association of Commerce, accepted the report on behalf of the association.

Committee on Prevention of Accidents at Highway Crossings

At the recent meeting of the American Railway Association, on the recommendation of the executive committee, the president appointed a Special Committee on the Prevention of Accidents at Grade Crossings, consisting of seven members, with James A. McCrea, general manager of the Long Island, as chairman, representing the railroads of the country territorially to consider the whole question. The other members of the committee are J. Q. Van Winkle, assistant to general manager, Cleveland, Cincinnati, Chicago & St. Louis Railway; C. L. Bardo, general manager, New York, New Haven & Hartford; L. E. Jeffries, general attorney, Southern; Howard Elliott, San Pedro, Los Angeles & Salt Lake; W. J. Towne, assistant general manager, Chicago & North Western, and W. R. Scott, vice-president and general manager, Southern Pacific.

St. Paul Electrification Tests

On November 13 the Chicago, Milwaukee & St. Paul made a test of one of the new electric locomotives which has just been received for operation on the Rocky Mountain division. This test was made on the tracks of the Butte, Anaconda & Pacific, as power is not yet available on the St. Paul. This locomotive, weighing 284 tons, took an ore train with 4,660 tons trailing load down a 1 per cent grade from Butte at a maximum speed of 25 miles an hour, reducing to 16 miles an hour on a portion of the line with heavy curvature and to a minimum of 7 miles an hour. Regenerative braking was applied on the descending grade, returning 21 per cent of the current to the line. As there was only 2,200 volts on this line at the time the test was made and as the St. Paul line will operate at 3,000 volts, it is estimated theoretically that on this basis 52.5 per cent of the power would have been returned on the St. Paul line on the 2 per cent mountain grade or 38.1 per cent on a 1 per cent grade. This same locomotive took this train up a 0.4 per cent grade into Anaconda on this low voltage. Three locomotives have now been received. Additional exhaustive tests of the locomotives will be conducted on the 2 per cent grades over the Rocky Mountains next week.

Street Accidents in New York City

The New York State Public Service Commission, First District, reports a marked decrease in casualties to persons on railroads and street railroads in that district [New York City, population about 5,000,000] for the month of October, 1915. Only 12 persons were killed during the month, which is the smallest total in the history of the Commission. The largest number of fatalities ever reported, 67, was in September, 1907. This was within three months after the creation of the Public Service Commission and two years before the Commission issued orders for the installation of efficient fenders and wheelguards on street surface railroad cars. These devices, together with the improved types of cars installed by the companies, the installation of air brakes, and quite recently the establishment of the near-side stop for street cars, have resulted in materially reducing the number of fatal accidents. When the Commission was created the number of persons killed ranged from 500 to 600 a year. This has been practically reduced 50 per cent, though there has been a great increase in traffic. Of the total of 5,395 accidents 3,920 occurred on surface lines, 950 on subway and elevated lines, 509 on standard railroad lines, 12 on railroad terminal [freight] and 3 on motor bus lines. Of the killed 6 met death on the surface lines, 4 on the subway and elevated lines, 1 on railroad lines and 1 on a railroad terminal line.

Strict Discipline

The Altoona Tribune reports, evidently on authentic information, that 28 employees of the Pennsylvania Railroad were disciplined during the week ending November 14 by the superintendent of the Middle division.

For running past a stop signal, a passenger engine man was suspended a week, and another was reprimanded for failing to stop and report a medium-speed signal light out. Overlooking orders brought a trip suspension for a passenger engine man and a reprimand for his fireman. A passenger conductor was suspended two days for failing to look after his train properly, another was suspended two days for failing to notify his engine man of restricted speed. For failing to make proper

car record report, one freight conductor was reprimanded. For intoxication off duty, a yard conductor was suspended two weeks, and another was reprimanded for failing to deliver manifests. A third yard conductor was reprimanded for despatching a train without manifest, while a yard flagman was reprimanded for sitting on rail. A passenger fireman was reprimanded for improper firing and a freight fireman was suspended a trip for collision.

Reprimands and suspensions of brakemen were imposed as follows: A passenger brakeman for starting train before car was loaded; a yard brakeman for drinking off duty and making false statement about the offense; for draft collision, five brakemen reprimanded; leaving work without permission, yard brakeman suspended; and sleeping on duty, one telephone exchange operator demoted to position of extra telephone operator.

The New Haven Trial

Charles S. Mellen, testifying for the government in the trial in the Federal Court in New York on Monday last, said that John L. Billard, the Meriden coal dealer, was such a good friend to the New York, New Haven & Hartford that if "my directors had asked me to take a pound of flesh out of him, he would have willingly gone off bleeding." Mr. Billard, as noted in last week's issue, held a large block of Boston & Maine shares for the New Haven for more than a year and then sold it back to the latter. Mr. Billard, it appears, willingly gave up a nominal profit of \$2,750,000 for an actual profit of \$150,000. The New Haven settled with him, in 1909, for \$450,000, but he gave up \$300,000 of it to Frank Brown, a Connecticut lawyer who had helped him to get the charter of the Billard Company and wanted, according to Mr. Mellen, to give \$50,000 to him. After this settlement, Billard endorsed the stock of the Billard Company to Mr. Mellen and the latter held it for two years when it was turned back to Mr. Billard.

A large part of the session on Tuesday was devoted to a discussion as to whether the government should be allowed to submit testimony concerning the New York, Westchester & Boston. This road is entirely an intrastate road, its mileage all being in the state of New York. The government contends that, under the company's charter, it was projected into Connecticut for the purpose of operating a through line into New England and that control was sought by the New Haven to prevent dangerous competition. R. V. Lindabury, for the defence, argued that the route set forth in the charter was re-located and that not only was the road not built beyond the New York state line, but was not so projected when the New Haven acquired control.

Judge Hunt, after hearing an hour and a half of argument, reserved decision.

On Wednesday the matter of the Westchester evidence was again taken up, Judge Hunt finally holding that all reference in regard to the road must be excluded. This is an important element in favor of the defence.

Government Ownership Too Near Home

(From an Editorial in the New York Commercial)

Once in a while the light breaks in on the most rabid advocates of public ownership. A daily paper of large circulation in New York city essays to occupy the field of champion of public ownership of all public utilities from railroads down to "jitney" cabs, but once in a while its editor receives a slap on the wrist from some federal or municipal clerk and then he talks right out in school. Something of the kind happened over in Brooklyn the other day and the champion of public ownership, of the sacredness of the civil service list and of the irrevocable rights of policemen to hold their jobs, now calls for somebody's head.

Having investigated complaints concerning the attitude of employees in the Brooklyn Department of Licenses this newspaper says editorially, "these superior gentlemen look down contemptuously upon men and women who appear before them," and it reminds them that they are paid and hired by the people and are not occupying hereditary offices. They are reminded that various things might happen to them, such as the discovery of the possibility of reducing their number and getting better work from those remaining by a little judicious discipline. The commissioner is asked to interest himself in this matter, for, as our contemporary very truly says, "the first thing to do is to make the

government respectable in the person of the officials with whom foreigners deal."

If the president of some great corporation said such things he would be hauled over the coals by the newspaper that printed "those cruel words." If an employe of a public service corporation should make a slip the corporation would have to go with him if this newspaper would have its say. But, if such a complaint based on sufficient evidence were made by this newspaper or any citizen, any public service corporation or any store would dismiss the offending employe on the spot.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, date of next or regular meetings and places of meeting.

- AIR BRAKE ASSOCIATION.—F. M. Nellis, 53 State St., Boston, Mass. Next convention, May 2-5, 1916, Atlanta, Ga.
- AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—F. A. Pontious, 455 Grand Central Station, Chicago. Next meeting, January, 1916, Atlanta, Ga.
- AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—H. C. Boardman, D., L. & W., Hoboken, N. J.
- AMERICAN ASSOCIATION OF FREIGHT AGENTS.—R. O. Wells, Illinois Central, East St. Louis, Ill. Next meeting, June 20-23, 1916, Cincinnati, O.
- AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York.
- AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—E. H. Harman, Room 101, Union Station, St. Louis, Mo.
- AMERICAN ELECTRIC RAILWAY ASSOCIATION.—E. B. Burritt, 8 W. 40th St., New York.
- AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOCIATION.—H. G. McCornaghy, 165 Broadway, New York.
- AMERICAN RAILROAD MASTER TINNERS', COPPERSMITHS' AND PIPEFITTERS' ASSOCIATION.—W. E. Jones, C. & N. W., 3814 Fulton St., Chicago.
- AMERICAN RAILWAY ASSOCIATION.—W. F. Allen, 75 Church St., New York. Next meeting, November 17, 1915, The Blackstone, Chicago.
- AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 17-19, 1916, New Orleans, La.
- AMERICAN RAILWAY ENGINEERING ASSOCIATION.—E. H. Frisch, 900 S. Michigan Ave., Chicago. Next convention, March 21-23, 1916, Chicago.
- AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—J. W. Taylor, 1112 Karpen Building, Chicago. Annual meeting, June, 1916.
- AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—Owen D. Kinsey, Illinois Central, Chicago. Annual meeting, July, 1916.
- AMERICAN SOCIETY FOR TESTING MATERIALS.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.
- AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York. Annual meeting, December 7-10, 1915, New York.
- AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, Supt. Timber Preservation, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 18-20, 1916, Chicago.
- ASSOCIATION OF AMERICAN RAILWAY ACCOUNTING OFFICERS.—E. R. Woodson, Rooms 1116-8, Woodward Bldg., Washington, D. C. Annual meeting, June 28, 1916, Hotel Statler, Detroit, Mich.
- ASSOCIATION OF MANUFACTURERS OF CHILLED CAR WHEELS.—George W. Lyndon, 1214 McCormick Bldg., Chicago. Semi-annual meeting with Master Car Builders' Association. Annual convention, October, 1916, Chicago.
- ASSOCIATION OF RAILWAY CLAIM AGENTS.—Willis H. Failing, N. Y. C., 3842 Grand Central Terminal, New York. Next meeting, May 19, 1916, Atlantic City, N. J.
- ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago.
- ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—P. W. Drew, Soo Line, 112 West Adams St., Chicago. Annual meeting, June 20-22, 1916, St. Paul, Minn.
- ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—G. P. Conrad, 75 Church St., New York. Next meeting, December 14-15, 1915, St. Louis, Mo.
- BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—T. O. Jacobs, Jr., W. Johns-Manville Co., Chicago. Meetings with American Railway Bridge and Building Association.
- CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.
- CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.
- CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.
- ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hilcs, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh, Pa.
- FREIGHT CLAIM ASSOCIATION.—Walter P. Taylor, Traffic Manager, R. F. & P., Richmond, Va. Annual session, May 17, 1916, Washington, D. C.
- GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.
- INTERNATIONAL RAILWAY FUEL ASSOCIATION.—C. G. Hall, C. & E. 1., 922 McCormick Bldg., Chicago. Annual meeting, May, 1916, Chicago.
- INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Haff, 1126 W. Broadway, Winona, Minn.
- INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, C. H. & D., Lima, Ohio. Next meeting, August, 1916, Chicago.
- MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—T. I. Goodwin, C. R. I. & P., Eldon, Mo.
- MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 95 Liberty St., New York. Annual convention, May 23-26, 1916, Hotel Hollenden, Cleveland, Ohio.
- MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—A. P. Dane, B. & M., Reading, Mass. Next annual meeting, September 12-14, 1916, Wilmington, Del.
- MASTER CAR BUILDERS' ASSOCIATION.—J. W. Taylor, 1112 Karpen Building, Chicago. Annual meeting, June, 1916.
- NATIONAL RAILWAY APPLIANCE ASSOCIATION.—C. W. Kelly, 349 People's Gas Bldg., Chicago. Next convention, March 1916, Chicago.
- NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meeting, 2d Tuesday in month, except June, July, August and September, Boston.
- NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meeting, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.
- NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—E. N. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.
- PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.
- RAILROAD CLUB OF KANSAS CITY.—Claude Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Saturday in month, Kansas City.
- RAILROAD MEN'S IMPROVEMENT SOCIETY.—J. B. Curran, Eric R. R., 50 Church St., New York. Meetings, alternate Thursdays, October to May, Assembly Rooms of Trunk Line Association, 143 Liberty St., New York.
- RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 30 Church St., New York. Annual meeting, December, 1915, Waldorf-Astoria Hotel, New York.
- RAILWAY CLUB OF PITTSBURGH.—J. P. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.
- RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, 1063 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.
- RAILWAY FIRE PROTECTION ASSOCIATION.—C. B. Edwards, Fire Ins. Agt., Mobile & Ohio, Mobile, Ala.
- RAILWAY REAL ESTATE ASSOCIATION.—Frank C. Irvine, 1125 Pennsylvania Station, Pittsburgh, Pa. Annual meeting, October, 1916, Chicago.
- RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Myers Bldg., Bethlehem, Pa. Next annual convention, September, 1916, Grand Hotel, Mackinac Island, Mich.
- RAILWAY STOREKEEPERS' ASSOCIATION.—J. P. Murphy, N. Y. C. R. R., Box C, Collingwood, Ohio.
- RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.—J. D. Conway, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with Master Car Builders' and Master Mechanics' Associations.
- RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph Superintendents.
- RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.
- ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—L. C. Ryan, C. & N. W., Sterling Ill. Next annual convention, September 19-22, 1916, New York.
- ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.
- SALT LAKE TRANSPORTATION CLUB.—R. E. Rowland, David Keith Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.
- SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.
- SOCIETY OF RAILWAY FINANCIAL OFFICERS.—Carl Nyquist, C. R. I. & P., 1134 La Salle St. Sta., Chicago.
- SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, A. & W. P. R. R., Atlanta Ga. Next meeting, April, 1916.
- SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Piedmont Hotel, Atlanta.
- TOLEDO TRANSPORTATION CLUB.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.
- TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramaco Iron Works, Hillburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.
- TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.
- TRAFFIC CLUB OF NEWARK.—Roy S. Bushy, Firemen's Bldg., Newark, N. J. Regular meetings, 1st Monday in month, except July and August, The Washington, 559 Broad St., Newark.
- TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Waldorf-Astoria Hotel, New York.
- TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Gen'l Agt., Erie R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings, bi-monthly, Pittsburgh.
- TRAFFIC CLUB OF ST. LOUIS.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings, October to May.
- TRAIN DESPATCHERS' ASSOCIATION OF AMERICA.—J. F. Mackie, 7122 Stewart Ave., Chicago. Next convention, June 21, 1916, Toronto, Ont.
- TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, Superintendent's office, N. Y. C. R. R., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.
- TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. R. R., East Buffalo, N. Y. Next meeting, September, 1916, Chicago.
- UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, 1111 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.
- WESTERN CANADA RAILWAY CLUB.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.
- WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Building, Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.
- WESTERN SOCIETY OF ENGINEERS.—E. M. Layfield, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings. Annual meeting, 1st Wednesday after 1st Thursday in January, Chicago.

Traffic News

President Fred Zimmerman and a delegation of members of the Chicago Traffic Club called on President Wilson on November 19, to invite the President to address the club at its ninth annual dinner to be held in Chicago on a date yet to be chosen. The President has taken the matter under advisement and will give the club his answer at a later date.

In an announcement of new Florida passenger train service in our issue of November 19, page 978, the schedule of the "Royal Palm," the train between Chicago and Jacksonville via the Southern, Queen & Crescent and Big Four, was incorrectly stated. On November 21, the schedule of this train was changed to leave Chicago at 10:05 p. m., arriving at Jacksonville at 7:40 the second morning.

The "Dixie Limited" train, running between Chicago and Jacksonville, Fla., over the Chicago & Eastern Illinois, Louisville & Nashville, Nashville, Chattanooga & St. Louis, Central of Georgia, Georgia Southern & Florida and Atlantic Coast Line, will be put in service for the winter on January 10, leaving Chicago at 11:30 a. m., and arriving at Jacksonville at 7:30 p. m., the second day. Northbound, the train leaves Jacksonville at 9:35 a. m. and arrives at Chicago at 5:55 p. m.

Merchants of Atlanta, Ga., have started a campaign against increases in freight rates, from northern points to southeastern cities, recently granted the railroads by the Interstate Commerce Commission; and at a meeting, on Tuesday last, the wholesalers, retailers and jobbers agreed on the appointment of a committee to raise \$10,000 to finance the project. Attorneys have been retained to ask the suspension of the proposed rates, which would go into effect January 1. The merchants declare that the new rates, if they become effective, will cost Atlanta shippers \$500,000 a year above their present freight bills. They say that the railroads are preparing also to advance intrastate freight rates, and this they will oppose.

During the month of September, as in August, the expenses charged to the operation and maintenance of the Panama Canal were in excess of the tolls collected on vessels making use of the canal, according to the Canal Record. The shortage was \$63,177. During September, 1914, the second month of canal operation, the tolls exceeded the cost of operation and maintenance by \$63,601. The shortage was caused by the closing of the canal on account of slides during nearly one-half of the month. More than one-half of the total charges for operation and maintenance in September, 1915, represents the cost of dredging operations, which amounted to \$259,604, as compared with \$31,545 in September, 1914.

The traffic officers of the Missouri railroads held a conference at St. Louis on November 23, to consider the decision of the Missouri Public Service Commission, allowing general increases in freight and passenger rates, and adjourned subject to the call of the chair, Thomas R. Morrow, solicitor for Missouri of the Atchison, Topeka & Santa Fe. Three committees were appointed, with Joseph Bryson of the Missouri, Kansas & Texas, as chairman of the legal committee; J. M. Johnson of the Missouri Pacific, chairman of the freight committee, and Alexander Hilton of the St. Louis & San Francisco, chairman of the passenger committee, to study the decision in comparison with the present rates, and render a report at the subsequent meeting on the effect of the decision in detail. The commission has changed the effective date of the new rates from January 1 to January 20.

Increase of Fares on the New York Central

The New York Central has notified the New York State Public Service Commission that local one-way passenger fares in that state will be advanced on January 1 to the basis of 2½ cents a mile, except between Albany and Buffalo, on the main line, where the rates are limited by charter to two cents a mile. Between New York City and Albany, 142 miles, the advance is from \$3.10 to \$3.58.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

Import Rates on Brewers' Rice

Opinion by Commissioner Clark:

Because of informal complaints filed with the commission, to determine the propriety of the import rates on brewers' rice from gulf ports to various destinations which were lower than the domestic rates, a hearing was had under a general order of the commission which provides for an investigation into the relationship between import and domestic rates.

The commission finds that since the import rates on brewers' rice from gulf ports are not made with relation to the domestic rates, but are controlled by and made differentials under the import rates on brewers' rice from north Atlantic ports, the circumstances surrounding those rates are substantially dissimilar from those surrounding the domestic rates, and that the allegation of discrimination, except where the differential in import rates is greater than the recognized differentials between the gulf ports and the north Atlantic ports, has not been proven.

It also holds that the relationship between the import and domestic rates on brewers' rice from gulf ports to Pueblo, Colo., Salt Lake City, Utah, and other points at which similar rate relationships obtain, is unjustly discriminatory, and that where defendants maintain from the gulf ports import rates on brewers' rice that are more than 6 cents lower than the import rates from New York to the same points, it is discriminatory to charge higher rates on domestic than on import shipments. (36 I. C. C., 389.)

Rates on Bituminous Coal to Mississippi Valley Territory

Brownville Cotton, Oil & Ice Company v. Louisville Nashville. Opinion by the Commission:

This proceeding involves a petition by the carriers to be allowed to continue to charge rates on coal from mines in Illinois, Kentucky, Tennessee and Alabama to points in Mississippi valley territory that are lower than rates on like traffic to intermediate points.

The mines in Illinois from which these rates apply are situated in the southern part of that state and are served by the Mobile & Ohio and Illinois Central. The mines in Kentucky are divided into two groups, one of which, known as the eastern group, is in the extreme eastern portion of that state, and the other, known as the western group, is in the western-central section of the state. The principal lines operating from these mines to Mississippi valley territory are the Illinois Central and the Louisville & Nashville from the western group, and the Louisville & Nashville from the eastern group. The Tennessee mines are situated in the eastern part of that state on the lines of the Southern, the Louisville & Nashville and the Nashville, Chattanooga & St. Louis. The mines in Alabama are situated for the most part in the northwestern portion of that state. The lines from these mines to Mississippi valley points are the Southern, the Northern Alabama, the Illinois Central, the St. Louis & San Francisco, the Mobile & Ohio and the Alabama Great Southern and their connections.

The territory of destination described as Mississippi valley territory consists of all that section of the United States east of the Mississippi river and south of the Ohio river lying on and west of a line formed by the Nashville, Chattanooga & St. Louis from Paducah, Ky., to Paris, Tenn., the Louisville & Nashville from Paris to Milan, Tenn., the Illinois Central from Milan to Jackson, Tenn., the Mobile & Ohio from Jackson to Mobile, Ala., and includes also stations on the line of the Mobile & Ohio east of West Point, Miss., to and including Columbus, Miss.

The commission's findings are as follows:

The carriers are authorized to continue lower rates to Memphis, Tenn., Natchez, Miss., Baton Rouge, Bayou Sara, Plantation group, Kenner and New Orleans, La., and group, Gultport, Miss., and Mobile, Ala., than to intermediate points.

They may continue rates from mines in Illinois and Kentucky to Greenville and Vicksburg, Miss., lower than rates to intermediate points.

Authority to continue rates on coal via indirect routes from mines in Illinois, Kentucky, Tennessee and Alabama to junction and common points in Mississippi valley territory lower than rates to intermediate points is granted.

Authority to continue rates on coal from mines in Illinois and Kentucky to Bemis, Gibbs, Humboldt, Jackson, McKenzie, Milan, Paris, Union City, Martin and Rives, Tenn., lower than rates to intermediate points is denied.

Authority to continue rates via direct lines from Alabama mines to Aberdeen, Ackerman, Columbus, Ellisville, Enterprise, Hattiesburg, Holly Springs, Jackson, Laurel, Newton, Meridian, Starkville, Vicksburg and West Point, Miss., and Grand Junction and Middletown, Tenn., lower than rates to intermediate points is denied.

Reasonable maximum rates on bituminous coal from mines in Illinois, Kentucky and Alabama to Dyersburg, Tenn., Grenada, Oxford and Kosciusko, Miss., and other points are prescribed. (36 I. C. C., 401.)

Extension of Time to Comply with Safety Appliance Acts

The commission has granted a further extension of 12 months from July 1, 1916, to the time within which the carriers must make their freight train cars conform to the safety appliance acts. By an order of the commission dated March 13, 1911, issued in conformance with an act of Congress approved April 14, 1910, the carriers were allowed an extension of time of five years from July 1, 1911. By the present order the former order is extended one year.

The commission's order of March 13, 1911, was as follows:

(a) Carriers are not required to change the breaks from right to left side on steel or steel underframe cars with platform end sills, or to change the end ladders on such cars, except when such appliances are renewed, at which time they must be made to comply with the standards prescribed in said order of March 13, 1911.

(b) Carriers are granted an extension of five years from July 1, 1911, to change the location of brakes on all cars other than those designated in paragraph (a) to comply with the standards prescribed in said order.

(c) Carriers are granted an extension of five years from July 1, 1911, to comply with the standards prescribed in said order in respect of all brake specifications contained therein, other than those designated in paragraph (a) and (b), on cars of all classes.

(d) Carriers are not required to make changes to secure additional end-ladder clearance on cars that have 10 or more inches end-ladder clearance, within 30 inches of side of car, until car is shopped for work amounting to practically rebuilding body of car, at which time they must be made to comply with the standards prescribed in said order.

(e) Carriers are granted an extension of five years from July 1, 1911, to change cars having less than 10 inches end-ladder clearance, within 30 inches of side of car, to comply with the standards prescribed in said order.

(f) Carriers are granted an extension of five years from July 1, 1911, to change and apply all other appliances on freight cars to comply with the standards prescribed in said order, except that when a car is shopped for work amounting to practically rebuilding body of car, it must then be equipped according to the standards prescribed in said order in respect to handholds, running boards, ladders, sill steps, and brake staffs: *Provided*, That the extension of time herein granted is not to be construed as relieving carriers from complying with the provisions of section 4 of the act of March 2, 1893, as amended April 1, 1896, and March 2, 1903.

(g) Carriers are not required to change the location of handholds (except end handholds under end sills), ladders, sill steps, brake wheels, and brake staffs on freight-train cars where the appliances are within 3 inches of the required location, except that when cars undergo regular repairs they must then be made to comply with the standards prescribed in said order.

The petitioning roads operate a large percentage of the total railway mileage of the United States. A hearing was had at Washington, D. C., on September 28, 1915.

It is urged as a principal basis for relief that the carriers have acted in good faith and have made an earnest effort to comply with the commission's requirements, but that because of the financial and, to a certain extent, the physical difficulties involved, they will not be able fully to meet these requirements within the prescribed time. The proceeding involves only freight cars, locomotives and passengers having been made to comply with the act within the required time.

Out of a total of 2,025,254 cars in service on July 1, 1911, on roads having a total mileage of about 232,000 miles, it is estimated by the carriers that 1,669,064 cars, or about 82 per cent, will be either equipped in accordance with the order or removed from service by July 1, 1916, leaving about 356,000 cars still unequipped on that date. No information is available which will show, for the purpose of comparison, the yearly progress made in equipping the above 1,669,064 cars. The following table, however, compiled from data submitted by the

carriers indicates the progress of equipment with respect to 89 lines having a total mileage of 203,652 miles and an individual mileage of approximately 300 miles or over, and will perhaps afford a more comprehensive view of the general situation:

Cars in service July 1, 1911.....	1,849,222
Cars equipped year ended June 30—	
1912	122,213
1913	283,599
1914	315,184
1915	336,938
Total cars equipped June 30, 1915.....	1,057,934
Estimated number of cars to be equipped or removed from service year ending June 30, 1916.....	483,432
Estimated number of cars equipped by July 1, 1916.....	1,541,366
Estimated number of cars unequipped on July 1, 1916.....	307,856

It thus appears that about 57 per cent of the above cars were equipped on June 30, 1915, and that it is estimated that about 83 per cent will be either equipped or removed from service by July 1, 1916.

It may be conceded that the year ending June 30, 1914, was an abnormal one in railroading and that the general business depression during that period had a marked effect upon the volume of traffic, resulting in a large decrease in revenue. Notwithstanding these conditions it appears that, while there are a number of exceptions as to individual roads, the figures as a whole show a gradual increase in the number of cars equipped during each successive year and that the greatest number of cars was equipped in 1914 and 1915. It is perhaps proper to take into consideration that some time was consumed in making the necessary preparation and preliminary plans for an undertaking of this magnitude, involving, it is stated, an expenditure of about \$45,000,000. It is also doubtless true that as the carriers gained a more thorough working knowledge of the requirements they were in a position to equip a large number of cars in a given period.

It is asserted that unless a further extension is granted over a third of a million freight cars must be withdrawn from service until such time as they can be equipped and that this will result in congestion on storage and repair tracks and in hardship and inconvenience to the shipping public as well as to the railroads.

In view of these latter considerations and of the progress made under all circumstances by the carriers as a whole, the commission believes that sufficient cause exists for some further extension, though it is not convinced on the showing made that many of those roads which will still have a large percentage of unequipped cars on July 1, 1916, could not, by the exercise of somewhat more diligent effort and without undue hardship, have made considerably greater progress.

The commission believes that a sufficient extension of time would be 12 months. The order applies only to paragraphs (b), (c), (d) and (f). As to the matters in the other paragraphs the carriers have already been granted an indefinite extension of time. (36 I. C. C., 371.)

STATE COMMISSIONS

The Chicago & North Western, Chicago, Milwaukee & St. Paul, Chicago, St. Paul, Minneapolis & Omaha, and Minneapolis, St. Louis & Sault Ste. Marie have filed petitions with the Wisconsin Railroad Commission asking authority to increase freight rates within the state.

Attorneys for the receivers of the Missouri & North Arkansas have filed a motion with the Missouri Public Service Commission for a rehearing and modification of the commission's recent decision authorizing a limited increase of passenger and freight rates in Missouri. The petition declares that the rates allowed by the commission will not yield enough revenue to the Missouri & North Arkansas to enable it to maintain service.

The Louisiana Railroad Commission, after an investigation, has granted the application of the Illinois Central for authority to discontinue Frenier, La., as an agency station. Investigation showed that the storm on September 29 destroyed the entire settlement and all of the company's facilities at that point. All vestige of the little settlement in and around the station has been destroyed and the people formerly living there have either been drowned or have moved away.

The Louisiana Railroad Commission has ordered a general

investigation of the collection by conductors on passenger trains of one cent a mile additional, with a maximum of 10 cents, when tickets are not bought. The commission is thinking of prohibiting such penalties. The commission has also ordered a general investigation with a view to requiring railroads in the state to issue interchangeable excess baggage coupon books, or to accept penny script coupons for excess baggage between points in the state.

The contract of the New York, New Haven & Hartford and the Boston & Maine with the Joseph, Joseph & Brothers Company of Cincinnati, by which the railroads are selling their scrap iron to the Cincinnati firm for about \$1,500,000 a year, is being investigated by the Massachusetts Public Service Commission, on the complaint of Perry, Buxton & Doane Company of Boston, another junk dealer. The New Haven has decided not to renew the contract for next year. The Boston & Maine has not renewed its part of it, but defends it as being the most businesslike method for the disposal of its scrap.

COURT NEWS

The Wabash has filed a petition in the Missouri Supreme Court for a writ of mandamus to compel the secretary of state to issue a license to the new company to operate in Missouri. The secretary of state recently refused to do so on the ground that the laws of the state require the company to be incorporated in Missouri.

Free Pass Invalid

The Pennsylvania Superior Court holds that an agreement in the nature of a free pass for life between a railroad company and a prospective shipper is invalid where the consideration mentioned is \$1.00, and the proof is to the effect that the pass was merely a gratuity in recognition of past kindnesses—Pittsburgh & Lake Erie v. Peterson, 58 Pa. Sup. Ct. 44.

Fires—Right to Pile Wood on Right of Way

Action was brought against a railroad for damages for negligently burning two buildings adjoining the company's right of way. The fire started in the station, spread to a pile of seasoned pine, which had been delivered for shipment and was waiting until cars were ready. From this the fire appeared to have extended to the plaintiff's buildings. The only negligence relied on was permitting wood [lumber] to remain on the right of way. The North Carolina Supreme Court held that, as wood is a recognized and necessary commodity, with no extra hazards in its transportation or shipment, and as the railroad was compelled by law to receive it, and could only store it on its right of way, in the absence of evidence that the wood was placed at an improper place or improperly piled, there was no evidence of negligence.—Kemp v. Norfolk Southern (N. Car.) 86 S. E. 621.

Void Commission Order to Connect With Another Road

The St. Louis & San Francisco was convicted and fined for failing to obey an order of the Arkansas Railroad Commission to maintain a joint interchange track with the Kansas City & Memphis at Fayetteville. The order was based on a petition signed by 17 corporations and partnerships and one natural person. The Arkansas Supreme Court, on appeal, held the order to be void, as not being signed by 15 bona fide citizens residing within the territory affected, within the direct terms of the statute, since "bona fide citizens," as there used, means permanent residents as distinguished from sojourners, and refers to individuals to the exclusion of corporations and copartnerships.—St. Louis & S. F. (Ark.) 179 S. W. 342.

Consignor's Right to Sue

A consignor of lumber shipped on a straight bill of lading sued for negligence in transportation, attempting to prove that he had thereby been compelled to pay additional and increased freight charges. The only proof of this was a paid freight bill, which did not show whether it was paid by the consignor or the consignee. As goods thus shipped became the property of the consignee at the time of delivery to the railroad, nothing else appearing, he is prima facie liable for the freight, and in the absence of proof to the contrary it would be presumed that

he paid it. The North Carolina Supreme Court therefore held that the consignor was not entitled to recover.—Ellington & Guy v. Norfolk Southern (N. Car.) 86 S. E. 693.

Noncompliance With Headlight Statute

Action was brought for personal injury to an employee of an express company, who, in the course of his duty, was walking near a track in the Chicago & North Western's station in Milwaukee. As he knew, a train was past due, and he was hurrying. It was at night and the station was well lighted. The train came in and he was struck from behind by the pilot of the engine. Violation of the Wisconsin headlight statute was charged. The trial court directed a verdict for the defendant on the ground of contributory negligence, holding also that the headlight statute was so indefinite and uncertain as to be impracticable of enforcement, and was therefore void.

On appeal, the Wisconsin Supreme Court did not consider the question of the constitutionality of the headlight statute, holding that the vicinity of the accident must have been so brilliantly lighted by the nine arc lights that no more efficient headlight was necessary, and insufficient headlights had no casual connection with the damages claimed. The judgment against the employee was affirmed.—Smith v. C. & N. W. (Wis.) 154 N. W. 623.

Release of Railroad's Liability by Pullman Car Cook

Action was brought for the death of a Pullman car cook, alleged to have been caused by the negligence of the C., B. & Q. in operating its railroad in the state of Colorado. The cook's employment contract, in the Pullman company's usual form, was executed in Pennsylvania. It obligated the deceased to go wherever he was required in the service, and he renounced the rights of a passenger. The deceased was in no sense an employee of the railroad.

If the contract of employment and the release had been in Colorado, they would have been a complete defense in a suit for injuries not resulting in death. Both under the Colorado decisions and the federal decisions interpreting the common law, the deceased was not a passenger. An agreement that, in consideration of employment with the Pullman Company, the railroad should under no circumstances be liable for injuries or death of a Pullman Company porter not an employee of the railroad has been held to be not against public policy, and to cover injuries caused by the negligence of the railroad's employees, even though such negligence is not specifically mentioned in the contract. Denver & Rio Grande v. Whan, 39 Colo., 230, 89 Pac. 39; Robinson v. B. & O., 237 U. S. 84. The last point was expressly decided in Russell v. P., C. C. & St. L., 157 Ind. 305, 61 N. E. 678.

The plaintiff contended, however, that though the law of Colorado, where the tort was committed, governed the right of action, the employment contract and release were void in Pennsylvania, where executed, and therefore could not be availed of in defense in any jurisdiction. The Circuit Court of Appeals, Seventh circuit, pointed out that the Pennsylvania courts do not declare such a release null and void, even if made in Pennsylvania, but merely hold it contrary to the public policy of the state, and therefore unenforceable as a defense when the tort is committed in Pennsylvania; and that, too, though the release was valid where executed. On the other hand, if the injury occurred in a state which recognized the release as valid, the Pennsylvania courts enforce it, even though the contract was made in Pennsylvania. Moreover, the validity of the release as a defense in an action of tort is governed by the law of the place of injury. And, as Colorado has no statutory provision relating thereto, the federal courts, interpreting the common law, would, in any event, enforce the release as a bar for damages arising from the negligence in Colorado of the railroad's employees.

The Colorado statute as to wrongful death gives a right of action whenever the death of a person shall be caused by wrongful act, neglect or default of another, and the act is such as would, if death had not ensued, have entitled the party injured to maintain an action for damages. As the widow's action, therefore, was maintainable only if the deceased could have brought action if death had not ensued, the release constituted a bar to her suit. Lindsay v. Chicago, Burlington & Quincy, C. C. A., 226 Fed. 23.

Railway Officers

Executive, Financial, Legal and Accounting

H. D. Pollard has been elected president of the Wrightsville & Tennille, succeeding A. F. Daley, deceased.

H. P. McMillan has been appointed auditor of the San Antonio, Uvalde & Gulf, with office at San Antonio, Tex., vice T. S. Ford, resigned.

Edgar W. Sprague has been appointed assistant general claim agent of the Yazoo & Mississippi Valley with office at Memphis, Tenn., effective December 1.

Charles A. Leggo has been appointed assistant secretary of the Chicago, St. Paul, Minneapolis & Omaha, with office at Hudson, Wis. Effective December 1.

William Mueller has been appointed assistant tax commissioner of the Chicago, St. Paul, Minneapolis & Omaha, with office at St. Paul, Minn. Effective December 1.

John D. Caldwell, assistant secretary of the Chicago, St. Paul, Minneapolis & Omaha at Chicago, Ill., has been elected secretary with office in the same city. Effective December 1. He is also secretary of the Chicago & North Western.

T. A. Polleys, secretary and right of way and tax commissioner of the Chicago, St. Paul, Minneapolis & Omaha at Hudson, Wis., has been appointed tax commissioner of the Chicago & North Western and the Omaha, with office at Chicago, Ill., vice F. P. Crandon, retired under the pension rules. Effective December 1.

B. A. Worthington, who has been elected president of the Cincinnati, Indianapolis & Western, was born on November 20, 1861, at Sacramento, Cal. He was educated in the public schools at Sacramento and entered railway service on July 1, 1874, as telegraph messenger of the Central Pacific, now part of the Southern Pacific, at Sacramento, and later was telegraph operator of the same road. From 1877 to 1882 he was commercial operator of the Western Union Telegraph Company and then to 1888 he was chief clerk and secretary to the general master mechanic of the Southern Pacific at Sacramento. From 1888 to 1895 he was chief clerk and secretary to the vice-president and general manager of that road at San Francisco, Cal. In July, 1895, he became chief clerk and secretary to the assistant to the president, and from 1898 to 1901 he was in charge of tonnage rating of locomotives on that road. In July, 1901, he was appointed superintendent of the Tucson division of the Southern Pacific at Tucson, Ariz. In October of the same year he became superintendent of the Coast division, with headquarters at San Francisco, and from August 20, 1903, to April 1, 1904, he was assistant to Julius Kruttschnitt, general manager at San Francisco. From April 1, 1904, to February, 1905, he was assistant director of maintenance and operation of the Harriman Lines (Southern Pacific and Union Pacific Systems) at Chicago. He was then elected vice-president and general manager of the Oregon Railroad & Navigation Company, and from June 1, 1905, to June, 1908, he was first vice-president of the Wheeling & Lake Erie, the Wabash-Pittsburg Terminal Railway and

B. A. Worthington

the West Side Belt Railroad, comprising the Wabash lines east of Toledo, O. From September, 1905, to June, 1908, he was also general manager of the same lines. In June, 1908, he became general receiver of the Wheeling & Lake Erie, with office at Cleveland, O. On July 1, 1912, he was elected president and general manager of the Chicago & Alton, and later became president of the Lorain & West Virginian.

Henry B. Hull, chief claim agent of the Illinois Central, has been appointed general claim agent, the position of chief claim agent having been abolished. His office will continue to be at Chicago, Ill. Philip M. Gatch has been appointed assistant general claim agent with jurisdiction over lines south of the Ohio river, with offices at Chicago.

W. O. Bunger, freight claim agent of the Chicago, Rock Island & Pacific, has been appointed general superintendent of freight claims, in charge of loss and damage claims and their prevention, with office at Chicago, Ill. The office of freight claim agent has been abolished. F. W. Main, assistant freight claim agent, has been appointed auditor freight overcharge claims, with office at Chicago. G. W. Loderhose has been appointed assistant general superintendent of freight claims, with headquarters at Chicago. Effective December 1.

The Cincinnati, Indianapolis & Western on December 1 took over the operation of the line from Hamilton, O., to Springfield, Ill., and the branch from Sidell, Ill., to Olney, Ill., heretofore operated by the Cincinnati, Hamilton & Dayton. The new company will have trackage rights over the C., H. & D. between Cincinnati and Hamilton. The officers are as follows, and all will have headquarters at Indianapolis, Ind.: B. A. Worthington, president; C. F. Smith, assistant to the president; J. G. Moore, secretary and assistant counsel; F. B. Brown, auditor; D. J. Curran, treasurer; J. A. Simmons, general traffic manager; M. V. Hynes, general superintendent; H. F. Passel, chief engineer; Edward Boas, superintendent motive power; W. H. Betticher, master car builder; H. Lewis, manager purchases and supplies; J. L. Powell, superintendent car service and accounting; L. E. Smith, freight claim agent.

Operating

M. O. Connor has been appointed terminal trainmaster of the Georgia & Florida with office at Augusta, Ga.

D. J. Madden has been appointed trainmaster of the Mahoning division of the Erie, with headquarters at Cleveland, Ohio. Effective December 1.

H. J. Humphrey has been appointed acting superintendent of car service of the Canadian Pacific eastern lines with office at Montreal, Que., vice W. Fansley, transferred.

H. H. Morris, assistant superintendent of the Huntington and Big Sandy divisions of the Chesapeake & Ohio, at Huntington, W. Va., has resigned to go into other business.

G. L. Candler, superintendent of transportation, with office at Savannah, Ga., has been appointed general superintendent of the Central of Georgia, vice J. T. Johnson, deceased.

J. W. Smith, assistant superintendent of the Indiana Harbor Belt at Gibson, Ind., has been promoted to superintendent, and the office of assistant superintendent has been abolished.

H. E. McGee, trainmaster of the Missouri, Kansas & Texas, at Smithville, Tex., has been promoted to division superintendent with headquarters at Greenville, Tex. E. E. Hanna has been appointed trainmaster to succeed Mr. McGee at Smithville.

L. L. McIntyre, trainmaster of the Carolina, Clinchfield & Ohio at Erwin, Tenn., has been appointed superintendent, with office at Erwin. W. T. Wohlford, assistant trainmaster at Dante, Va., has been appointed trainmaster with office at Erwin, vice Mr. McIntyre.

W. R. Cahill, acting superintendent of the Missouri, Kansas & Texas, at Wichita Falls, Tex., has been transferred in the same capacity to Smithville, to take the place of C. A. Thanheiser, who has been given an indefinite leave of absence on account of ill health.

John J. Mantell, superintendent of the Wyoming division of the Erie at Dummore, Pa., has been appointed superintendent of ter-

minals, with offices at Jersey City, N. J., vice Eugene R. Allen, resigned. Augustus E. Ruffer assistant superintendent at Jersey City, has been appointed superintendent of the Wyoming division, vice Mr. J. J. Mantell, and Harold R. Cole succeeds Mr. Ruffer.

P. R. Albright, whose appointment as general manager of the Atlantic Coast Line, with headquarters at Wilmington, N. C., has already been announced in these columns, was born on June 26, 1866, at Greensboro, N. C., and was educated in the public schools. He began railway work on August 1, 1888, as a clerk to the general superintendent of the Cape Fear & Yadkin Valley, now a part of the Atlantic Coast Line. He subsequently served as chief clerk to the general superintendent and chief clerk to the general manager of the same road until September, 1898. He then organized the North Carolina Demurrage Bureau, and served as manager of that bureau until March 1, 1904. He went to the Atlantic Coast Line in March, 1904, as assistant to general manager. On November 17, 1914, he was appointed assistant general manager, which position he held at the time of his recent appointment as general manager of the same road, as above noted.

John Colin Murchison, who has been appointed general superintendent of the Atlantic Coast Line with headquarters at Jacksonville, Fla., as has already been announced in these columns, was born on September 8, 1867, at Gulf, N. C., and was educated in the public schools. He has began railway work on February 11, 1885, with the Cape Fear & Yadkin Valley, serving first as clerk and operator at Greensboro, N. C., and later as operator at Fayetteville. In May, 1886, he was appointed despatcher, and in September, 1890, was made master of trains. From February, 1899, to the following January he was train-master on the Atlantic Coast Line, and then for about five years was out of railway work. In 1905 he returned to the service of the Atlantic Coast Line as superintendent at Rocky Mount, N. C. Two years later he was transferred as superintendent to Wilmington, N. C., and from 1907 to 1915 served as superintendent at Charleston, S. C. On October 12, 1915, he was appointed assistant general superintendent at Jacksonville, Fla., and the following month was made general superintendent with headquarters at Jacksonville, of the same road, as above noted.

Traffic

Cecil Wray Johnston, whose appointment as assistant general passenger agent of the Grand Trunk, with headquarters at Montreal, Que., has already been announced in these columns,

C. W. Johnston

was born on July 27, 1879, at Actonvale, Que. He was educated in the Elementary School, Sherbrooke Academy, and St. Francis College, Richmond, Que. He began railway work on September 1, 1897, with the Grand Trunk, as clerk and operator at Richmond. In April, 1899, he was transferred as clerk to Berlin, N. H. From June, 1899, to the following November, he was relieving operator and agent at Island Pond, Vt., and Portland, Maine district. In December, 1899, he was appointed day operator at Sherbrooke, Que., and in March, 1900, became a clerk in the audit department at Montreal. From June, 1901, to June, 1902, he was ticket clerk, and then to December 31, 1904, was traveling passenger agent. On January 1, 1905, he was appointed excursion clerk at Montreal of the same road, and later was transferred to the Grand Trunk Pacific at Winnipeg, Man. He returned to the Grand Trunk in February, 1912, as chief clerk to the passenger traffic manager at Montreal. Two years later he was appointed assistant to passenger traffic manager at Montreal,

which position he held at the time of his recent appointment as assistant general passenger agent of the same road, as above noted.

H. C. Cassels has been appointed general agent of the Georgia & Florida with office at Augusta, Ga.

Julian Nance has been appointed district freight agent of the Union Pacific, with headquarters at Kansas City, Mo.

Frank W. Smith, a member of the Committee on Uniform Classification, with headquarters at Chicago, Ill., has been appointed a member of the reorganized Official Classification Committee, with headquarters at New York City.

F. W. Smith

Before becoming a member of the Uniform Classification Committee Mr. Smith was for a period of 20 years connected with the New York, Ontario & Western, with office at New York City. His first position was that of general baggage agent, to which he was appointed on February 1, 1889. On September 1, 1893, he was appointed chief clerk in the general freight and passenger department. On December 30, 1902, he was made assistant general freight and passenger agent, in which position he served until September 15, 1908, when he was appointed to his present position as a member of the Uniform Classification Committee at Chicago. His new appointment as a member of the Official Classification Committee become effective on December 1.

D. T. Lawrence, whose appointment as a member of the Official Classification Committee, with office at New York City, has been announced, was born at Marysville, Ohio, on July 20, 1871. He

D. T. Lawrence

entered railway service in March, 1890, as an office boy in the general office of the Central New England & Western at Poughkeepsie, N. Y. He remained with this road at Poughkeepsie and Hartford, Conn., until November, 1892, in the successive capacities of office boy, stenographer and clerk. From November, 1892, until May, 1899, he was stenographer, clerk and soliciting agent for the National Despatch Fast Freight Line, at Boston, Mass. He was appointed New England agent of this line in May, 1899, at the same time assuming the duties of agent of the Great Eastern Fast Freight Line. In May, 1903, he was made manager of the National Despatch-Great Eastern Line, a consolidation of the National Despatch and the Fast Freight, with headquarters at Buffalo, N. Y. He remained in this position for eight years, with office first at Buffalo, N. Y., and later at Boston, Mass. In May, 1911, he was appointed general freight agent of the Central Vermont with headquarters at St. Albans, Vt.

W. V. Powell has been appointed industrial commissioner of the St. Louis Southwestern, with office at St. Louis, Mo., in charge of industrial and immigration matters. W. R. Beattie,

agricultural and industrial commissioner, has been relieved of the duties pertaining to industrial and immigration matters and will hereafter hold the position of agricultural commissioner.

Wallace S. Cookson, whose appointment as general passenger agent of the Grand Trunk, with headquarters at Montreal, Que., has already been announced in these columns, was born on June 12, 1871, at Port Jervis, N. Y., and was educated in the public schools. He began railway work in 1887, with the Erie; from 1890, to 1899, he was assistant ticket agent on the Chicago & Western Indiana. From 1899, to May, 1909, he served as chief clerk in the general passenger department of the Grand Trunk at Chicago. On May 1, 1909, he was appointed assistant general passenger agent of the Grand Trunk, with office at Chicago. He was transferred as assistant general passenger agent in June, 1910, to Montreal, Que., remaining in that position until his recent appointment as general passenger agent of the same road, as above noted.

W. S. Cookson

H. P. Barlow has been appointed right of way commissioner of the Chicago, St. Paul, Minneapolis & Omaha, with office at St. Paul, Minn. Effective December 1.

C. A. Leggo has been appointed right of way agent of the Chicago, St. Paul, Minneapolis & Omaha, with headquarters at St. Paul, Minn. Effective December 1.

Henry R. McLean, contracting freight agent of the Central of Georgia at Atlanta, Ga., has been appointed commercial agent with office at Macon, vice W. B. Morgan, transferred.

Harry Gower, freight traffic manager of the Chicago, Rock Island & Pacific, with office at Chicago, Ill., retired from service on December 1. Mr. Gower was born in England on May 31, 1853, and entered railway service in 1878, as a clerk in the auditing department of the Rock Island. He has remained with the same railroad ever since, in the consecutive capacities of chief clerk, freight auditing department, until October 7, 1881; chief clerk, general freight department, October 7, 1881, to April, 1887; second assistant general freight agent, April, 1887, to March 1, 1888, first assistant general freight agent, March 1, 1888, to March, 1896; general freight agent, March, 1896, to March 1, 1899; assistant freight traffic manager, March 1, 1899, to January 15, 1906; and of freight traffic manager, January 15, 1906, to December 1, 1915.

H. Gower

S. H. Johnson, assistant freight traffic manager of the Chicago, Rock Island & Pacific, has been promoted to freight traffic manager to succeed H. Gower, resigned. Effective December 1.

C. C. Graves, traffic manager of the Carolina, Atlantic & Western and the Charlotte, Monroe & Columbia at Hamlet, N. C.,

has been appointed assistant general freight agent of the Seaboard Air Line with headquarters at Hamlet.

George H. Corse, Jr., special agent of the passenger department of the Union Pacific System, has been appointed foreign passenger agent of the system. His office will remain at Chicago, Ill., and his new appointment was effective November 29,

In the sketch of Benton M. Bukey, published in our issue of November 26, page 1028, a number of typographical errors occurred. The correct sketch follows: Benton M. Bukey has been appointed assistant general passenger agent of the Atchison, Topeka & Santa Fe, with headquarters at Chicago, Ill. Mr. Bukey was born at Williamstown, Wood County, W. Va., on November 6, 1879. He received a high school education in Washington, D. C., and entered railway service in that city on November 18, 1899, in the accounting department of the Southern. He remained in Washington until July, 1903, when he entered the employ of the Chicago, Burlington & Quincy, in the office of the auditor of ticket accounts, at Chicago, Ill. In November, 1904, he became a rate clerk in the passenger department of the same road, and in April, 1905, went to St. Louis, Mo., to perform the same kind of service for the Missouri Pacific. He was in the service of the Missouri, Kansas & Texas in the same capacity from August, 1906, to October, 1906. Since that time he has been continuously in the passenger department of the Santa Fe at Chicago, Ill. In September, 1908, he was promoted from rate clerk to chief rate clerk, and in September, 1909, was appointed chief clerk to the passenger traffic manager, the position which he held up to the time of his recent promotion.

Engineering and Rolling Stock

G. F. Shull, acting master mechanic of the Carolina, Clinchfield & Ohio at Erwin, Tenn., has been appointed master mechanic, with office at Erwin.

E. F. Gates, assistant signal supervisor of the Portland division of the Boston & Maine, has been appointed signal supervisor succeeding George W. Hayward, deceased.

Ed. Sheffield, assistant signal supervisor of the Texas & New Orleans during the leave of absence of L. H. Feldhake, has been appointed acting signal supervisor of the Houston & Texas Central.

L. Finegan, superintendent of shops of the Baltimore & Ohio at Glenwood, Pittsburgh, Pa., has been appointed superintendent of shops at Mount Clare, Baltimore, Md., vice P. Conniff, assigned to other duties.

A. A. Kurzejka has been appointed chief carpenter of the Iowa and Minnesota division of the Chicago, Milwaukee & St. Paul, with headquarters at Minneapolis, Minn., vice Michael Caton, resigned on account of ill health.

H. A. English has been appointed master mechanic of the Canadian Northern, Central division, with office at Winnipeg, Man., vice G. H. Hedge promoted. C. J. Quantic has been appointed master mechanic of the Pacific division, with office at Port Mann, B. C.

E. A. Cuthbertson, signal inspector of the Northern Pacific, with headquarters at Sand Point, Ida., has been appointed supervisor of signals for the lines east of Mandan, N. D., succeeding W. M. O'Laughlin, resigned to accept a position with the Interstate Commerce Commission.

OBITUARY

George Hayward, supervisor of signals of the Connecticut & Passumpsic division of the Boston & Maine, Springfield, Mass., died on October 20, 1915, from injuries caused by a fall from a signal ladder.

Walter J. Bell, who was superintendent of the Columbus division of the Southern Railway at Williamson, Ga., previous to January, 1914, died on November 22, at his home in Atlanta, Ga., at the age of 58.

INDIAN RAILWAY ENLISTMENTS.—The report of the South India Railway states that out of a staff of 83 European officers 16 have volunteered for and have joined the army for active service, as have also 21 European and four native subordinates of the Indian establishment, and two men from the London office.

Equipment and Supplies

LOCOMOTIVE BUILDING

THE DETROIT, TOLEDO & IRONTON is in the market for a number of heavy freight locomotives.

THE DULUTH & IRON RANGE has ordered three Mikado type locomotives from the Baldwin Locomotive Works.

THE CARNEGIE STEEL COMPANY has ordered one six-wheel switching locomotive from the American Locomotive Company.

THE LAKE ERIE & NORTHERN has ordered three electric locomotives from the Westinghouse Electric & Manufacturing Company.

THE TUCSON, CORNELIA & GILA BEND has ordered one Mogul type and one switching locomotive from the American Locomotive Company, and is in the market for four more locomotives. John C. Greenway, general manager, Gila Bend, Ariz.

THE DULUTH, MISSABE & NORTHERN, reported in the *Railway Age Gazette* of November 19 as inquiring for prices on two Mallet and four Santa Fe type locomotives, has ordered two Mallet and six Santa Fe type locomotives from the Baldwin Locomotive Works.

THE CALUMET & ARIZONA MINING COMPANY has ordered one Mogul type locomotive and one 6-wheel switching locomotive from the American Locomotive Company. The Mogul type locomotive will have 19 by 26-in. cylinders, 56-in. driving wheels and a total weight in working order of 140,000 lb., and the switching locomotive will have 19 by 26-in. cylinders, 50-in. driving wheels and a total weight in working order of 133,000 lb.

CAR BUILDING

THE LEHIGH VALLEY is in the market for 500 automobile cars.

THE MISSOURI, KANSAS & TEXAS is inquiring for prices on 1,000 stock cars.

THE ATCHISON, TOPEKA & SANTA FE is reported as inquiring for 25 concentrate cars.

THE DELAWARE & HUDSON is in the market for 1,000 underframes for twin hopper coal cars.

THE RUTLAND is in the market for freight cars and is asking prices on 1,000, 2,000 or 5,000 cars.

THE MISSOURI, KANSAS & TEXAS is in the market for 4 dining cars, 2 postal cars and 15 baggage cars.

THE DULUTH & IRON RANGE has ordered 250 50-ton ore cars from the American Car & Foundry Company.

THE UTAH COPPER COMPANY is reported to have ordered 100 ore cars from the Pressed Steel Car Company.

THE DELAWARE, LACKAWANNA & WESTERN has ordered 1,000 box cars from the American Car & Foundry Company.

THE PENNSYLVANIA RAILROAD has ordered 12 combination baggage and mail cars, and six dining cars from the Pullman Company.

THE PENNSYLVANIA RAILROAD has withdrawn its recent inquiry for freight cars, it having been found that the prices quoted were too high.

THE MINNEAPOLIS & ST. LOUIS, which recently ordered 500 box cars from the Bettendorf Company, is now inquiring for 1,000 additional box cars.

THE DULUTH, MISSABE & NORTHERN has ordered 1,000 50-ton ore cars from the Western Steel Car & Foundry Company and 200 50-ton general service cars from the Pullman Company.

THE GEORGIA SOUTHERN & FLORIDA has ordered 2 combination passenger and baggage cars from the Pressed Steel Car Company and 130 40-ton gondola and 373 30-ton steel underframe box cars from the Lenoir Car Works.

THE INTERBOROUGH RAPID TRANSIT, reported in last week's

issue of the *Railway Age Gazette* as having given the Pullman Company an order for 311 subway car bodies, has also ordered 405 trailer trucks and 246 motor car trucks from that company.

THE NEW YORK, NEW HAVEN & HARTFORD has authorized the Osgood-Bradley Company to proceed with the construction of 50 baggage cars, 5 postal cars, 10 combination baggage and smoking cars, 5 combination baggage and mail cars, 10 smoking cars and 20 coaches, all of which will be of all-steel construction.

THE CENTRAL RAILROAD OF NEW JERSEY was incorrectly reported in an item in the *Railway Age Gazette* of November 5 as, having given the Standard Steel Car Company an order for 1,000 box cars, 1,000 hopper cars and 250 insulated box cars for ice. The company's orders were for 3,250 cars and were as follows: Pressed Steel Car Company, 1,000 110,000-lb. capacity hopper cars; Standard Steel Car Company, 1,000 110,000-lb. capacity hopper cars and 500 box cars; American Car & Foundry Company, 500 box cars and 250 insulated ice cars.

IRON AND STEEL

THE CHICAGO & EASTERN ILLINOIS has ordered 10,000 tons of rails from the Illinois Steel Company.

THE MISSOURI, KANSAS & TEXAS has ordered 15,000 tons of rails from the Illinois Steel Company.

THE SOUTHERN PACIFIC has ordered 20,000 tons of rails from the Tennessee Coal, Iron & Railroad Company.

THE ST. LOUIS, IRON MOUNTAIN & SOUTHERN, B. F. Bush, receiver, has been authorized by the federal court to expend \$175,000 for rails.

THE CHICAGO, BURLINGTON & QUINCY has purchased 15,000 tons of 90-lb. rails from the Colorado Fuel & Iron Company in addition to the tonnage reported on October 1.

THE MISSOURI PACIFIC, B. F. Bush, receiver, has been authorized by the federal court to expend \$530,630 for new rails and \$273,220 for the improvement of roadway and equipment.

TRACK SPECIALTIES

THE CHICAGO, BURLINGTON & QUINCY has ordered 6,000 tons of tie plates from the Interstate Iron & Steel Company and 1,200 tons from the Railroad Supply Company.

MACHINERY AND TOOLS

THE GREAT NORTHERN is in the market for the following list of machines and tools: One 16-in. motor-driven engine lathe with a 12-ft. bed; one 28-in. upright swing drill press with revolving table (not geared) and one 2-h.p. 250-volt d.c. motor to be belted to the driving pulley; two motor-driven pipe-threading machines with tools and motors; one 24-in. stroke shaper without traveling head, with tools and motor; one motor-driven, square base, emery grinder; one 48-in. by 6-in. motor-driven grinding stone with cast iron trough and motor; one 1,500-lb. single-frame steam hammer, with tools and one set of steel dies; two 50-in. by 54-in. by 24-in. square base, steel, stationary blast forges; one 18-in. motor-driven, vertical, wood-boring machine with adjustable table, having attachment for boring angles; one motor-driven, iron box frame rip-saw table, with attachment for raising table and cutting bevels, one motor-driven, 30-in. engine lathe with 18-ft. bed; one motor-driven, half universal radial drill with capacity to drill 2-in. holes, complete with tools and motor.

SIGNALING

THE EL PASO & SOUTHWESTERN proposes to install automatic block signals during the coming year on its line between Lee, Ariz., and Moores Spur, 25 miles.

THE SAN PEDRO, LOS ANGELES & SALT LAKE plans to install automatic block signals during the coming year on its line between Los Angeles, Cal., and Riverside, 58 miles. A manual interlocking plant is being put in at Magnolia avenue, Riverside, where the line is crossed by the Pacific Electric Railway. This machine will have 12 levers.

Supply Trade News

The Pere Marquette is inquiring for 500,000 ft. of lumber for car repairs.

The Western Electric Company has moved its Detroit headquarters from 263 Franklin street to larger quarters at Kirby and Dequinde streets.

The Chicago, Milwaukee & St. Paul has purchased 2,000,000 ft. of fir car decking on the Pacific coast. The lumber will be used in the Milwaukee shops.

The Electric Cable Company announces the opening of a western sales office at 122 South Michigan avenue, Chicago, Ill., in charge of James M. Brown, manager.

W. B. Wise, New York manager of the Adams & Elting Company, Chicago, has been appointed assistant to the president of Flint & Chester, Inc., with headquarters in New York.

L. H. Zintgraff & Co. is the name of a new company which has been established with an office at 200 Security Building, St. Louis, Mo., to deal in foundry, mine and mill supplies.

George R. Henderson, consulting engineer of the Baldwin Locomotive Works, has resigned from that position and opened an independent office as consulting engineer at 1321 Walnut street, Philadelphia.

The directors of the Baldwin Locomotive Works have declared the regular semi-annual dividend of 3½ per cent on the preferred stock, payable January 1, but no dividend has been declared on the common stock.

Benjamin M. Jones, president of B. M. Jones & Co., Inc., Boston, Mass., died at his home in Boston, November 26, age 78 years. Mr. Jones early entered the metal importing business, and dealt largely in railroad specialties.

Frank R. Peters, formerly with J. Stone & Co., London, has joined the electrical staff of the Franklin Railway Supply Company. This company has also secured the services of C. B. Little, one of the electrical engineers of the Baltimore & Ohio.

Flint & Chester, Inc., New York, have taken the exclusive sales agency for the United States and Canada for the National Graphite Lubricator Company, Scranton, Pa. The lubricators made by the latter have been adopted by 11 railroads and installed on 40 others.

The Chicago Railway Signal & Supply Company has completed arrangements for the opening of branch offices, as follows: F. N. Rumbling, to be known as Southern Pacific Coast representative, will be located in the Pacific Electric Building, Los Angeles, Calif.; S. J. Stjernstedt Pacific Coast representative, in 502 Rialto Building, San Francisco, and the Pacific Northwest representative is W. Frank Carr, Central Building, Seattle, Wash.

The National Lumber & Creosoting Company has established an office at 1209 Commerce building, Kansas City, Mo., in charge of M. K. Trumbull, vice-president, who was formerly principal assistant engineer of the Chicago & Western Indiana, and the Belt Railway of Chicago. He has been vice-president of the National Lumber & Creosoting Company for the past two years. The company's special lines are cross ties, switch ties, piling, poles, timbers, lumber, fence posts, etc., creosoted and untreated.

An opinion filed November 20 by the United States Circuit Court for the First District holds that the non-metallic flexible conduit or tubing, known as Duraduct, manufactured by the Tubular Woven Fabric Company, Pawtucket, R. I., is an infringement of the letters patent of H. G. Osburn, owned by the National Metal Molding Company, of Pittsburgh. The suit was first heard by the United States District Court of Rhode Island, and then taken to the Court of Appeals, the decision of which is final.

The Roberts & Schaefer Company, Chicago, has been awarded a contract by the Oregon-Washington Railroad & Navigation Company to build a coaling plant at The Dalles, Ore. It will be a reinforced concrete, fireproof, 150-ton plant with weighing facilities to record all coal passing to locomotives on two tracks,

complete with sand handling equipment. This will be the third structure of this kind being erected for this company. The contract price will be \$16,500. The Roberts & Schaefer Company will also design and build a counterbalanced bucket locomotive coaling plant for the Canton car shops of the Pennsylvania at Baltimore.

A change has been made in the control of the Reed-Prentice Company, manufacturers of machine tools, Worcester, Mass., a majority interest in the company having been acquired by investors headed by Robert F. Herrick, president of the Pacific Mills, chairman of the Saco-Lowell Shops, and an officer of other large corporations. On November 26 new directors were elected as follows: Robert F. Herrick, Malcolm Donald, Robert C. Morse, Henry P. Kendall, George C. Lee, Frank A. Drury, Homer Gage and Albert E. Newton. New officers have also been elected as follows: Robert F. Herrick, president; Jeremiah J. Mackin, treasurer and clerk; Charles M. Thayer, general counsel. Albert E. Newton will retain his position as vice-president and general manager.

The Westinghouse Electric & Manufacturing Company announces a number of changes in the supply department, which have recently been put into effect. S. A. Chase, formerly special representative; T. J. Pace, formerly in charge of the illuminating and rectifier divisions, and Carl G. Schluederberg, formerly head of switchboard sales, have been appointed assistants to the manager, J. J. Gibson. C. E. Stephens, engineer of lighting, has been appointed manager of the illuminating section to succeed Mr. Pace. C. Streamer, formerly head of the order division, succeeds Mr. Schluederberg as manager of the switchboard section, and A. P. Joseph is appointed head of the order section to succeed Mr. Streamer. M. C. Morrow, formerly of the Philadelphia office, is appointed manager of the appliance section, which is a combination of the former heating, fan, motor and ozonizer divisions of the supply department. M. C. Rypinski, formerly manager of the D. and S. division of the New York office, becomes manager of the meter section. The power department, E. H. Sniffin, manager, also announces the following section managers: W. H. Garrett, contracts; J. G. Worker, stokers, and H. D. Storer, auxiliaries.

TRADE PUBLICATIONS

BOND WIRE PROTECTORS.—The P. & M. Company, Chicago, has issued a pamphlet describing its bond wire protectors and their method of installation, with sketches and photographs showing their manner of application to the various types of joints.

CORRUGATED CULVERTS.—The Canton Culvert & Silo Company, Canton, Ohio, has issued standard specifications for corrugated metal culverts for use by railway engineers using this form of construction. These specifications are not limited to any single style of culvert, but are intended to insure first class material and workmanship.

DAYLIGHT AND VENTILATION.—The Detroit Steel Products Company, Detroit, Mich., has issued a booklet containing information concerning the construction of roundhouses, train sheds, machine shops, freight houses and other railway structures, with special reference to the facilities for securing light and ventilation. The book also contains a number of illustrations showing typical railway structures in which "Fenestra" products have been used.

THE POPULAR PARCEL POST.—No less than 500 additional men will assist the regular force of United States railway mail employees [in New England] in handling the Christmas mail rush this year. Superintendent Van Dervoort, of the railway mail service, says that there is unmistakable evidence that the mail rush will be heavy. The parcel post mail it is expected will be greater than ever, due principally to the increase of the weight limit to 50 pounds. One innovation this year will be the service of extra trains between New York and Boston to carry Christmas mail, which will be "worked" during the trip. This will lighten the work of the clerks at the railroad terminals. Extra postal spaces have been procured in the railroad stations in Boston, Worcester, Albany, White River Junction, Portland and Bangor. Postmaster Murray plans to have 300 extra clerks and carriers at work. These men will be drawn from the civil service eligible list.—*Boston Journal*.

Railway Construction

BALTIMORE & OHIO.—Application has been made to the Public Service Commission of Maryland, it is said, for permission to build, under the name of the Washington County Railroad, a single track line from Hagerstown, Md., to Security, about 3.5 miles. It is estimated that it will cost about \$110,000 to build the line.

CHARLES CITY WESTERN (ELECTRIC).—This company, which operates a 13-mile line from Charles City, Iowa, southwest to Marble Rock, has completed work on an extension from Charles City to Colwell, eight miles.

CUMBERLAND & MANCHESTER.—A contract has been given to the Read Construction Company, Barbourville, Ky., to build from Barbourville, Ky., north to Manchester, 24 miles, and construction work is now under way. Charles F. Heidrick, president, Barbourville, Ky. (June 25, p. 1497.)

DULUTH & NORTHERN MINNESOTA.—Work is now under way on an extension from Harlan, Minn., to Temperance river, 7 miles.

EASTERN PENNSYLVANIA RAILWAYS.—See Pottsville & St. Clair.

HELENA SOUTHERN.—This company is the successor of the Three Forks, Helena & Madison Valley, which was organized to build from Helena, Mont., south to Yellowstone National Park, about 150 miles. On the section from Three Forks to Radersburg, 25 miles, about 15 miles has been graded. Construction work has been suspended but will probably be resumed by January, 1916. E. A. Tennis, president, Salina, Kan.

HUDSON BAY RAILWAY.—Construction work is now under way by J. D. McArthur, Winnipeg, Man., building from mile 241 to the Hudson Bay terminus at mile 424, in the province of Manitoba.

KANSAS CITY, MEXICO & ORIENT.—Construction work on the 17 miles from San Angelo, Tex., south to Cristoval, may be carried out next spring and the section completed by July 1, 1916. This is the first section of the branch projected from San Angelo south via Cristoval, Eldorado and Sonora to Del Rio, about 160 miles. Grading work has already been finished on 94.6 miles and track laid on 2.7 miles.

MANTAWNEY RAILROAD.—An officer writes that grading work is now under way on the line building from Stowe, Pa., north-east to Allentown and Bethlehem, 52 miles. The Highley Construction Company has the contract to build the line. A. E. Lehman, chief engineer, 717 Walnut Street, Philadelphia.

MARSHALL & EAST TEXAS.—This company now operates a line from Winnsboro, Tex., southeast to Elysian Fields, 91.7 miles. It has projected and partly surveyed an extension from Winnsboro to Paris, 60.5 miles, also an extension from Elysian Fields to the Sabine river, 98 miles.

NEW IBERIA & NORTHERN.—This company, which operates a line from Port Barre, La., southeast to Shadyside, 88 miles, has projected an extension from Oaklawn to New Orleans, 93.5 miles. An extension is also projected from Port Barre to the Sabine river, 107 miles.

NEW YORK SUBWAYS.—The Coast & Lake Contracting Corporation submitted the lowest bid at \$53,930 for the installation of tracks on the White Plains road extension of the Lenox avenue branch of the existing subway. This work is in the borough of the Bronx. (November 12, p. 923.)

OSARKS RAILWAY.—Surveys have been made, and it is expected that actual construction work will be started in December on the line from Rothville to Mountain Home, Ark., 10 miles. The contract has been given to the Blodgett Construction Company, Kansas City. K. V. Loba, president, Mountain Home. (September 3, p. 419.)

PELHAM & HAVANA.—Construction work is now under way on the extension from Darsey, Fla., southwest to Havana, 6

miles. The company now operates 19.3 miles from Cairo, Ga., southwest to Darsey, Fla. (August 6, p. 257.)

POTTSVILLE & ST. CLAIR ELECTRIC.—Grading work is now being carried out by the J. G. White Engineering Corporation on a line from Pottsville, Pa., to St. Clair, 2.3 miles. The work involves handling about 5,000 cu. yd. to the mile, 60 per cent of which will be hard shale. There will be five steel bridges on the line of from 60 ft. to 80 ft. each. Contracts for the steel superstructures of three bridges are yet to be let. The line will provide a short route for the Eastern Pennsylvania Railways. W. B. Rockville, president, Pottsville. (October 29, p. 828.)

SALINA NORTHERN.—Work is now under way on the section of this road from Lincoln Center, Kan., northwest to Osborne and Downs, 60 miles. The company now operates 36 miles of line from Lincoln Center southeast to Salina. The contractors include: A. J. Canaday; Eby Construction Company; Dick Eastes; E. S. Kelly; A. H. Carter; W. Burton; D. E. Dutcher; P. H. Smith and A. M. Colvin, all of Lincoln, Kan. An extension is projected from Salina south to Wichita. Surveys are being made for second track work between Lincoln and Osborne and Downs, on 10 miles.

SOUTH DAKOTA ROADS.—John Rosholt, Minneapolis, Minn., is said to be back of a project to build a line from Bruton, S. D., to Ortonville, Minn.

TEXAS, OKLAHOMA & EASTERN.—An officer writes that this company has built during 1915 about 30 miles of temporary logging roads in Oklahoma.

THREE FORKS, HELENA & MADISON VALLEY.—See Helena Southern.

TRINITY VALLEY & NORTHERN.—This company, which operates a line from Dayton, Tex., north to Lumm, 18 miles, has projected an extension from Lumm to Lamb, nine miles.

WASHINGTON COUNTY.—See Baltimore & Ohio.

WEST FORK LOGGING COMPANY.—This company has completed a branch railroad, running from West Fork, Wash., where it connects with the Tacoma Eastern, one and one-half miles up the east fork of the Tilton river. The company's five-mile spur up the west fork is, at the present time, being extended one mile farther. Construction work is being done by company forces, and Tacoma & Eastern equipment is used. L. T. Murray, president, Lindberg, Wash.

RAILWAY STRUCTURES

BALTIMORE, MD.—The Baltimore & Ohio has let contracts for the construction of the large new coal pier at Curtis Bay, Baltimore, to cost about \$1,500,000 as follows: For the dredging work and building the superstructure and bulkhead to H. S. Kerbaugh, Inc., Baltimore and New York; the grading work will be done by Smith-McCormick, Easton, Pa. The conveying machinery will be furnished by the Robbins Belt Company, New York, while the car dumpers will be installed by the McMyler Interstate Company, Cleveland. The thawing shed, in which the coal in carloads will be placed in cold weather prior to being dumped over the pier, will be built by the Surety Engineering Company, New York. It is intended to use reinforced Gunite applied by the cement gun on the walls of the building, the apparatus and crew for applying the Gunite being furnished by the Cement-Gun Company, Inc., New York. All the work will be started at once, and it is expected that the new improvement will be ready for operation during the season of 1916. The pier will have a capacity of 10,000,000 tons a year. (September 24, p. 855.)

BRONXVILLE, N. Y.—A contract has been let to the Transit Construction Company, Mt. Vernon, N. Y., by the New York Central, for the elimination of the grade crossing over the Harlem division tracks at Pondfield road, Bronxville.

CHICAGO, ILL.—The general contract for the new freight house and warehouse which is being built for the Pennsylvania lines, has been awarded to the George A. Fuller Company of Chicago, Ill. The total cost of the building will be about \$2,500,000.

The Chicago & North Western has awarded the general contract for its new grain elevator at 118th street and Calumet river to the Witherspoon Engler Construction Company of

Chicago, Ill. The elevator proper will be a reinforced concrete structure, having a river house frontage of 270 ft. for receiving and delivering grain from and to boats, a series of 39 circular storage bins in the rear of the river house, a working house 77 ft. by 287 ft. in the rear of the bins, and a track shed covering four tracks in the rear of the working house. The combined storage capacity of all the bins will be 2,500,000 bushels, and plans permit the future construction of additional bins until an ultimate capacity of 10,000,000 bushels is reached. The marine leg will allow the removal of grain from boats to any port of the elevator at the rate of 20,000 bu. an hour and the loading of grain from the elevator into vessels at the rate of 120,000 bu. an hour. The four-track receiving yard will have a capacity of 300 cars and the storage yard a capacity of 600 cars. The elevator will be fitted to receive 120,000 bu. an hour from cars. About 5,000 tons of steel will be used in construction of the elevator. The Armour Grain Company has arranged to lease the structure when completed.

CLARION, IOWA.—The Chicago Great Western has let a contract to John Jacobson, of Marshalltown, Iowa, for the construction of an icehouse, which will have the same specifications as the one to be built at Council Bluffs. (See item under Council Bluffs, Iowa.)

COUNCIL BLUFFS, IOWA.—The Chicago Great Western has let a contract to John Jacobson, of Marshalltown, Iowa, for the construction of a one-story, timber icehouse, with a cinder floor and J. M. asbestos roofing. The building will be 34 ft. wide by 63 ft. long, and will cost about \$5,000.

FREEMPORT, ILL.—The Illinois Central has completed plans for the enlargement of a roundhouse and the extension of a tool house. Three 90-ft. stalls will be added to the roundhouse and 14 stalls will be lengthened from 90 ft. to 100 ft., at a probable cost of about \$30,000. The addition to the tool house will be a one-story brick structure, 38 ft. by 62 ft. Construction work has been deferred until next spring.

GRAY BULL, WYO.—The roundhouse of the Chicago, Burlington & Quincy, recently destroyed by fire, is now being replaced. The new structure will consist of five 81-ft. stalls, and is being built of timber at a probable cost of about \$5,000. Company forces are doing the work.

NORTH PLATTE, NEB.—The Union Pacific station, baggage room and hotel burned to the ground on Tuesday evening, November 16. The company began the construction of a temporary frame building the morning after the fire, and plans are now being prepared for a permanent structure. The loss has been estimated at \$50,000.

PEMBROKE, VA.—Officers of Giles county have appropriated \$8,400, it is said, for the construction of a bridge across New river. It is understood that the Norfolk & Western will pay \$10,000 additional towards the cost of the bridge.

PLAINSBORO, N. J.—The Pennsylvania Railroad is building a highway bridge over its tracks at Plainsboro, to replace the present structure.

SIoux CITY, IOWA.—C. W. Ginby & Co., of Chicago, Ill., have received a contract to build a freight house for the Chicago & North Western. It will be a brick structure 40 ft. by 1,050 ft., 238 ft. of which will be 2 stories high and the remainder 1 story. The roof will be supported by steel trusses. The total cost of the building, including all incidental improvements, will be about \$175,000.

THE RAILWAYS IN SWEDEN.—The management of the government-owned railroads in Sweden has already prepared its budget for 1917, and is asking for an appropriation of \$1,894,700 for new construction work, which is \$400,000 more than it obtained for 1916. It is planning its construction work two years ahead.

SCOTTISH TRAIN SERVICES CURTAILED.—The passenger train services of the Caledonian and North British Railway Companies since Monday, November 15, have been somewhat curtailed. The curtailment has been brought about by so many employees of the companies having joined the colors and the tax imposed on the resources of the companies in the matter of locomotive power and rolling-stock in meeting the present abnormal requirements. The English services are not affected.

Railway Financial News

ATCHISON, TOPEKA & SANTA FE.—This company is to sell through J. P. Morgan & Co., \$10,000,000 preferred stock at 98½. The preferred stock pays dividends at the rate of 5 per cent. On June 30, 1915, the company had outstanding \$114,173,730 preferred stock.

BALTIMORE & OHIO.—This company has sold \$60,000,000 refunding and general mortgage 5 per cent bonds to Kuhn, Loeb & Co. and Speyer & Co., both of New York, at 97. The syndicate which will participate in the underwriting of these bonds will get their bonds at 98, and an offering will be made to the public at a price probably in the neighborhood of par. These are the first bonds to be issued under the new refunding and general mortgage. In the letter which Daniel Willard, president of the Baltimore & Ohio, wrote to the bankers who have taken the bonds, the following paragraphs occur:

"The refunding and general mortgage will be secured on practically the entire system of railroads of the Baltimore & Ohio, comprising about 4,486 miles of first track, about 1,257 miles of second track and about 3,318 miles of other track and upon the equipment of the company, or its interest therein, having a present net value after depreciation of over \$79,000,000. It will further cover the passenger and freight terminals of the company in Philadelphia, Baltimore, Pittsburgh and Chicago and the freight terminals at Staten Island, N. Y., in Cincinnati and Washington, as well as the company's one-half stock interest in the Washington Terminal Company and its one-half ownership of the joint yards at Washington.

"The mortgage will be a direct lien on about 2,272 miles of first track, 605 miles of second track and 1,761 miles of other track of the above mentioned mileage and a lien, through the deposit of bonds, and in most cases all, and in no case less than 96 per cent of the capital stock of each of the companies owning the same upon the remaining mileage.

"The 4½ per cent convertible gold bonds of the company, amounting to \$63,250,000, in accordance with the terms thereof, will be secured pari passu with the bonds issued under the new refunding and general mortgage."

Of the proceeds of the sale of these bonds, \$40,000,000 will be used to refund a like amount of notes maturing in 1917 and 1918.

CHESAPEAKE & OHIO.—Montgomery, Clothier & Tyler, New York, are offering \$1,000,000 Chesapeake & Ohio Northern first mortgage 5 per cent bonds of October 1, 1915-1945, guaranteed principal and interest by the Chesapeake & Ohio. The Chesapeake & Ohio Northern is a subsidiary of the Chesapeake & Ohio, which is building a bridge across the Ohio river and 30 miles of railroad, to give the Chesapeake & Ohio a direct connection to Toledo and the Lakes in connection with the Hocking Valley, which is controlled by the Chesapeake & Ohio. The Chesapeake & Ohio has subscribed at par, to be paid in cash, for \$3,000,000 of the authorized \$3,500,000 stock of the Chesapeake & Ohio Northern. The bonds are secured by a closed mortgage and represent one-fourth or less of the actual cost of the property on which they are secured.

CHICAGO, ROCK ISLAND & PACIFIC.—The debenture bondholders' protective committee now asks the deposit of the 5 per cent debenture bonds, on which interest is in default, with the Bankers Trust Company, of New York, or the First Trust & Savings Bank, of Chicago. When the committee was first formed, deposits were not asked for.

CINCINNATI, HAMILTON & DAYTON.—The bondholders' protective committee, Charles H. Sabin, chairman, has notified bondholders who have deposited their bonds that the committee proposed to sell deposited bonds at \$700 per \$1,000 bond to Kuhn, Loeb & Co. Any bondholder who desires to withdraw his bonds may do so before December 15 on the payment of \$6.30 per bond to cover the expenses of the committee.

NEW ORLEANS, TEXAS & MEXICO.—This property has been sold under foreclosure for \$6,000,000 to representatives of the reorganization committee.

* Illustrated.

The recommendation of President Wilson that a commission be appointed to study and make recommendations regarding the entire subject of regulation of railways is one which it is to be hoped will receive favorable action at the present session of Congress. The situation with respect to regulation is very unsatisfactory. There are needless and harmful duplications and conflicts between state and federal regulation. Until recently the net earnings of the railways were steadily decreasing, with the result that their purchases were narrowly restricted and new construction was almost entirely stopped. These conditions were due to the fact that their expenses and taxes had greatly increased without any compensating advance in rates; in fact, there had been reductions in rates. More recently there has been an enormous in-

A Commission on Railway Regulation

crease in railway traffic and net earnings are now very large; but owing to weather and other favorable conditions it has been possible this fall to keep expenses down to a basis where they cannot long be held, and therefore the present very large net earnings must be regarded as somewhat abnormal. It is to be feared that unless the present policy of regulation is changed, the railways will soon be caught in another cycle of increasing expenses and taxes and declining net earnings. The policy of regulation should be made more flexible and constructive. The country, owing to the European war, is face to face with unprecedented conditions, and in order to meet them successfully it will need a prosperous and efficient transportation system. The rights of the public should be fully protected, but it is as much the function and duty of the government to further the interests of the public in respect to railways as to protect its rights with regard to them. A commission composed of the right kind of men should be able to offer recommendations, the adoption of which would help greatly in the solution of this momentous problem of regulation.

Those labor-union legislators who a year or two ago wanted a law under which enginemen should be notified in advance when surprise tests were to be made, will be pleased with a recent decision of the Supreme Court of Kansas, reported in another column, approving, in principle, the verdict of a jury which required the Atchison, Topeka & Santa Fe to pay damages to an engineman who was hurt by jumping off his engine to avoid injury by an impending collision, which collision was due to his own error or carelessness in running past a block signal which was set at stop. The court did, indeed, grant a new trial, on technicalities, and it may be that the net amount of damages (\$4,165) as named in the verdict, will be reduced—or increased. But the main point stands: that an engineman who deliberately or by gross carelessness runs into a train ahead, the block system being adequate, and the signals being set against him, may go into court and get a part of the blame shifted to the shoulders of the railroad company! Two of the judges of the court saw straight, and dissented from the majority opinion; but only two. For the railroad the principal lesson is, perhaps, to make the signal rules more simple and absolute. The space interval system should be adequate in itself, and independent. With a complete and thorough block system, that engineman would not have had any written papers on which his lawyer could trump up the charge that the railroad company (the dispatcher) had led the poor runner into trouble.

A Court's Idea of Block Signals

In his report to the city of Dallas, Tex., on the subject of grade separation, abstracted elsewhere in this issue, John F. Wallace offers an interesting solution of this problem. Instead of presenting plans for the complete elevation or depression of tracks in their present location, he suggests the diverting of a large part of the railway traffic now passing through the heart of the city to a proposed belt line in the outskirts, thereby removing in large measure, the necessity for grade separation. This plan involves the immediate withdrawal from the midst of the city of all but switching operations, which will be carried on preferably at night, and the ultimate removal of many of the tracks and the industries served by them. The plan of restricting the use of tracks has been carried out successfully in other cities and with some readjustments would probably not seriously affect the present commercial business of Dallas. The ultimate abandonment of the tracks, however, is a more serious matter, and will no doubt concern many of the industries as well as the railroads. Instances may be cited where railways have abandoned individual side tracks or short sections of line rather than incur the heavy additional expense of grade separation, but it has seldom been proposed to abandon or restrict the use of as extended trackage

A Substitute For Grade Separation

The recommendation of President Wilson that a commission be appointed to study and make recommendations regarding the entire subject of regulation of railways is one which it is to be hoped will receive favorable action at the present session of Congress. The situation with respect to regulation is very unsatisfactory. There are needless and harmful duplications and conflicts between state and federal regulation. Until recently the net earnings of the railways were steadily decreasing, with the result that their purchases were narrowly restricted and new construction was almost entirely stopped. These conditions were due to the fact that their expenses and taxes had greatly increased without any compensating advance in rates; in fact, there had been reductions in rates. More recently there has been an enormous in-

as in this instance. However, the fact that the belt line can be built for a small part of the cost of grade separation may have an important bearing.

INVERTING THE ORDER OF PROGRESS

THE agitation for legislation to require all of the railways of Chicago to electrify their terminals is a good example of many misdirected attempts to promote progress. The report of the Committee on Smoke Abatement and Electrification of Terminals of the Association of Commerce is not a blow to electrification in general. It is merely a blow to an attempt to compel the application of electric power to a particular set of conditions. At this time the demand for electrification of terminals has been based mainly on the ground that it would eliminate the smoke nuisance. The report shows that it would eliminate only about five per cent of it. But perhaps this is not the most forceful argument against the plan. Perhaps the most potent argument is that legislation that would require general electrification in Chicago would be an attempt to reverse the natural order of things, and, instead of furthering the progress of electrification, might set it back.

In the history of modern industrial affairs small developments have always led the way to large ones. The first steam locomotive was not a Mallet with all the modern appliances. The first telephone installation was not one of 500,000 telephones. The first automobile was not a twin-six. The "Tom Thumb" was followed by steam locomotives of somewhat greater size, power, and complexity. They were followed by others of still greater size, power and complexity, and thus developments up to the modern locomotive were worked out step by step, each being largely a result of those preceding and being based on the test of experience. The same thing may be said in a general way regarding the telephone, the automobile, the modern steamship, the large factory and the great corporation.

Thus far the use of electricity as a motive power has developed along similar lines. It has been only a few years since an electric street railway was a novelty. Presently electricity supplanted the horse and the cable. Then came the interurban trolley; and a few years ago began the application of electricity to heavy traction. The progress has been steady and even rapid; but like progress along other lines, it has always been from small things to greater; and that it has taken place at all has been because each larger development has been based on the test of experience with preceding smaller developments.

Now, the proposal to require all the railway terminals of Chicago to be electrified is a move in the wrong direction because it is inconsistent with all ordered progress. There is not a single case where even a few railways, either under compulsion or voluntarily, have simultaneously electrified all of their terminals, passenger and freight, in a large industrial center. People sometimes talk as if this has been done in New York. Most of the passenger and freight terminals serving New York City are in Hoboken, Jersey City and other places outside of New York City, and none of the freight terminals have been electrified except those of the New Haven. The railway terminals in Chicago constitute the largest and most complicated system in any city on earth. And yet, contrary to all precedent and to all the principles of ordered progress, it is proposed to require the largest and most complex system to be electrified first. The railways are not to be allowed to await the results of the installation and operation of electric power in smaller terminals where similar, but less gigantic and complicated, problems would be met. They must solve the biggest problem of all first, and because a committee of the leading business men of Chicago has reported adversely on the project, the committee is treated by the local newspapers and city fathers as unfair and lacking in public spirit.

In spite of this adverse report there is a movement in the city council to pass an ordinance requiring general electrification. If an ordinance is passed it will be contested in the

courts, and in view of the data collected by the committee of the Association of Commerce, it is improbable that any court of competent jurisdiction would uphold it. Such an ordinance would be merely an act to start a lawsuit.

While these are the facts, they do not by any means indicate that the progress of electrification is to be arrested. On the contrary, it probably will go forward rapidly, for there are numerous places where the adoption of electric power can be justified by reasons forceful from the standpoints of both the railways and the public. It is significant that a number of the roads entering Chicago are showing they appreciate the advantages that may be derived from the use of electricity under favorable conditions by making installations on other parts of their lines. This is true, for example, of the New York Central, the Pennsylvania and the Chicago, Milwaukee & St. Paul. Railways which do not enter Chicago are also making installations in various parts of the country. It will not be surprising if some of the roads decide in a comparatively short time to electrify certain of their Chicago suburban lines. Every step of this kind will yield experience which will help in the solution of the major problems of electrification; and doubtless the time will come when it will be both technically and financially feasible for all the terminals of Chicago to be electrified. But, as already intimated, true progress in this field, as in others, will, in the future as in the past, come gradually, although perhaps rapidly; and certainly the best results will not be secured in this or in any other field by attempting to coerce engineers and capitalists into trying to solve the biggest and most complicated and difficult problems first.

Meantime, the railroads owe it to themselves and to the public to continue to study the problem of electrification with a view to extending it wherever such action will be conducive to public safety, health and convenience.

DEMURRAGE AS A CURE FOR CONGESTION AND CAR SHORTAGE

CONCERTED action to relieve the enormous congestion of freight at the Atlantic seaboard and gulf ports is being taken not only by the railways directly concerned, but by the American Railway Association, on behalf of all the railways, for the purpose of averting a serious car shortage in every part of the United States. Such a shortage, with its disastrous effect on the commerce of the country, is threatened by the conditions at the ports, caused by the unprecedented volume of export shipments and the shortage of ocean transportation facilities.

While committees of railroad officers are holding daily meetings for the purpose of doing everything in their power to relieve the local situation at New York, Boston, Baltimore and Philadelphia, without declaring a general embargo, the American Railway Association, through its Committee on Relations between Railroads and its Executive Committee, has formulated a more comprehensive plan which was submitted on Thursday to the Interstate Commerce Commission providing for a strengthening of the demurrage rules long advocated by railroad officers. It is believed that this plan, if adopted, would not only alleviate the present situation at the ports, but prevent the even more serious effects on general business conditions which are liable to result from the tying up of so many cars when shippers are clamoring for them elsewhere, and also do much to minimize car shortage in the future.

It is proposed as the first step to reduce the free time allowed to the seaboard and gulf ports, both on export and domestic freight, and the tariffs have already been filed with the Interstate Commerce Commission to become effective on January 1. This is for the purpose of discouraging the practice of sending shipments to the ports before arrangements are made for their disposition on arrival and would prevent adding to the accumulation until some of the freight now on hand can be cleaned up. It is also proposed to advance the

demurrage charge on freight cars by a progressive scale of rates increasing after cars have been held for three days beyond the free time, for the purpose of inducing more prompt handling of cars by shippers and consignees throughout the country. A third step in this plan is to abolish the average agreement in the present demurrage rules, which railroad officers assert has been a most prolific source of freight car detention.

The Interstate Commerce Commission was asked to give prompt approval of these changes in order that the carriers may make them effective immediately.

The Committee on Relations Between Railroads after a special investigation and careful deliberation has formulated the plan outlined, and the Executive Committee has approved resolutions setting forth its details with the reasons therefor, to be presented to the commission, together with facts and figures, demonstrating the necessity of some such procedure to meet the exigencies of the situation. In the event of unforeseen obstacles to immediate action on the part of the commission the resolutions provide that the two committees shall be called into emergency session at Washington to take such further steps as may be deemed necessary, to the extent of petitioning Congress to confer upon the Interstate Commerce Commission such powers as may be lacking.

In a recent issue the *Railway Age Gazette* called attention to the fact that the present situation is due to a scarcity of vessel capacity rather than to such a shortage of rail facilities as has caused scarcity of freight cars in other years. We ventured to suggest that the Interstate Commerce Commission might do something to relieve the situation by waiving formality and promptly calling a conference of railroad men and shippers with a view to establishing more stringent demurrage and shortage rules. Since then the conditions have rapidly grown worse. The tracks leading into New York, and to a less extent into Boston, Philadelphia, Baltimore and the gulf ports, are congested with so many thousands of cars that cannot be unloaded that several of the railways have been compelled to place embargoes against additional shipments in order to prevent still worse confusion, and that they may not be blocked against westbound shipments. The congestion of cars loaded with export business is seriously hindering the handling of domestic business. This state of affairs has been explained to the Interstate Commerce Commission.

In support of the proposed increase in the demurrage rate, it is pointed out in the resolutions of the Committee on Relations Between Railroads that since the present rate of \$1 a day was adopted the cost of construction, the carrying capacity, and consequently the earning power, of a freight car have been greatly increased; that the adoption of a higher demurrage rate in California, which was approved by the Interstate Commerce Commission in 1912, and the higher rate in effect in Arizona, with no average agreement, have resulted in the practical elimination of undue detention of equipment, with consequent reduction of demurrage collections. It is also declared that the Canadian roads at times have secured the permission of the Canadian railroad commission to establish a progressive demurrage rate higher than the normal rate, which has operated to the advantage of that country, but that the higher rate in Canada than in the United States has operated indirectly to the disadvantage of the public, the shippers and the railroads of the United States.

The proposed demurrage rule makes no change in the present provision, to which there are several exceptions, for 48 hours free time and a rate of \$1 per day thereafter, for the first three days, but would impose a charge of \$3 per day for detention for the next succeeding three days and \$5 a day thereafter. This is the rule recently applied to refrigerator cars which was approved by the Interstate Commerce Commission in the form suggested by the shippers as a compromise. It has worked very satisfactorily in preventing the detention of refrigerator cars and thus increasing the efficiency of the available car supply. It has been shown that the average

freight car is in the hands of shippers or consignees, for loading or unloading, more than one-third of the time. A car is far more valuable for transportation than for storage purposes, and the man who uses it for a warehouse, even at the rate of \$1 a day, is not only depriving the railroad of the opportunity to make it earn several times that amount, but is also preventing some other shipper from obtaining prompt transportation of his freight. A higher demurrage rate therefore reduces the number of cars used for storage and increases the number available for transportation.

The free time allowed on export freight has always been excessive. The tariffs which are now before the commission for approval or suspension provide for the reduction of free time at the ports from 30 to 15 days on export freight not covered by through export bills of lading, which will not be issued unless the shipper can show that vessel space has been arranged for. The eastern roads have also asked authority to establish on less than the 30 days' statutory notice the same storage charge on export grain in cars which would be applied if the grain were stored at elevators. This rule is to apply at Boston, New York, Philadelphia, Baltimore, Norfolk and Newport News, and it is expected that the roads serving the gulf ports will take similar action if the commission gives the desired authority to the eastern roads.

This will prevent the sending of grain to points where it is known that the elevators cannot handle additional shipments.

Demurrage officers of the railways for two years have been advocating the abolition of the average agreement, by which shippers or consignees are allowed credits for releasing cars in less than the free time that may be used to offset detentions after the free time on other cars. One of the principal objections to the average rule is that large shippers who have every reason to load outbound shipments as promptly as possible in their own interest are enabled by it to accumulate credits which they use to offset the demurrage which should accrue for their undue delays in unloading inbound cars, thus removing the incentive to release those cars promptly. Elevators, which require only a very short time to load a car of grain, are given credits which make it possible to waste a great deal of time in unloading cars of other commodities which they receive.

The proposals of the American Railway Association for such vital changes in the demurrage rules constitute a rather ambitious program, but they should have been adopted long before the emergency arose. The present difficulty differs from similar situations which have existed in other years principally in the immediate cause. The effect is much the same as if it were due to an inadequate car supply and a lack of railroad terminal facilities. Under a system of regulation which so closely restricts the earning power it is a practical impossibility for the railways to own at all times a large enough surplus of cars to enable them to promptly supply all demands for them in the rush season of business, much less to be able to meet all emergencies. If the demands for cars cannot be more evenly distributed throughout the year, and if the shippers and the public are not willing to allow railroads to be prosperous enough to maintain at all times a supply of cars as large as the maximum number that may be needed at any time, it will be possible for them to handle the business of the country with reasonable expedition only by obtaining the maximum service from each car.

This means that it will be necessary for the shippers to cut down the time the cars are in their possession so that they may be used more for the purpose for which they were intended. With a demurrage rate of only \$1 a day it frequently is profitable to a shipper to keep a car out of service, but with a rate more closely approximating its value for transportation the shipper is more likely to spend his money for warehouse or loading and unloading facilities, and the car will spend more time in motion.

THE RAILROADS AND PREPAREDNESS

THE important part which railways have played in all the great wars of modern times is familiar to students of history. Germany has been especially proficient in developing and using transportation lines as an important element in her policy of militarism. To this were largely due her speedy successes in the wars with Austria in 1866 and in France in 1870-71. To this also has been largely due the ability she has shown to stand off her numerically stronger enemies in the present war.

There has been in progress lately a vigorous agitation for the adoption of a program of preparedness in the United States. Only very recently has anything been said about the necessity for recognizing and treating our railway system as one of the most vital factors in such a program. This phase of the subject was discussed by George D. Snyder, in a paper before the New York Railroad Club on November 19. An article dealing with it which has attracted widespread attention was contributed by President Charles H. Markham, of the Illinois Central, to a recent issue of the *Economic World*, and a forceful address on "Preparedness and our Railroads" was delivered by George Dallas Dixon, vice-president in charge of traffic of the Pennsylvania Railroad, before the International Trade Conference at New York City on December 6.

As Mr. Dixon points out, the part that railways would play in a war in the United States, where the seacoast is so extended, the area so great and the distances so long, would be even more important than their role in the hostilities in Europe. A railway system which was properly organized and in good physical condition might prove the salvation of the country. One which was not well organized and in good physical condition might render futile the most elaborate and skillful plans for the development merely of the army and navy.

With regard to organization, Mr. Markham has made a suggestion of great pertinence and importance. In case of war, it would be necessary, in order to raise the railways to the maximum efficiency, to have their management and operation directed by a central administration, which would, of course, be a part of the federal government. Mr. Markham has proposed a conference between representatives of the government and of the railways to work out a plan of organization and administration for the railways as a single system, which would immediately and automatically be put into effect in case of hostilities on a large scale. The railways of Great Britain, as he points out, like our own, are owned by numerous private companies. Such a plan was devised in England over 40 years ago, and was promptly put into effect on the beginning of the present war. Under this scheme the British railways are directed as a single unit by a committee of their own general managers with the president of the Board of Trade as ex-officio chairman. The results have shown that government ownership is by no means necessary to render railways an efficient arm of the military service. The railways of Great Britain seem to have given at least as good an account of themselves as any organization or agency used by the English in the present war. Mr. Markham's suggestion merits serious consideration and action in one form or another.

As all who have discussed this subject have pointed out the physical condition of the railways in case of war would be of vital consequence. On their physical condition would depend the facility and safety with which they could handle large bodies of troops. As the government does not own the railways it cannot by the direct use of its funds put them into the physical condition that the national defense requires they should be in. On the other hand, the shape they will be put in by their owners and managers will necessarily depend on their earnings; the amount of their earnings will depend on the way in which they are regulated, and they are regulated by the governments of the nation and the states. Therefore, the public authorities will indirectly determine the state of physical efficiency to which they will be brought and our policy of regulation will be either a favorable or an adverse factor in our policy of national defense. The policy of regulation now being followed is adverse to the de-

velopment of the railways to the highest state of physical efficiency, and is therefore antagonistic to an intelligent policy of preparedness. It is of great importance that this fact should be brought home to the public and to those influential in the affairs of government.

SEABOARD AIR LINE

ALL the roads in the South faced a very serious situation on the outbreak of the war in August, 1914. The Seaboard Air Line was no exception. However, the methods adopted for effecting economies were so successful as to result in a surplus of \$342,000 after the payment of expenses, interest charges and the regular 5 per cent on the adjustment mortgage bonds. The prospects for the fiscal year July 1, 1914-June 30, 1915, had been bright; before the outbreak of the war a dividend of 1 per cent had been declared on the preferred stock, payable August 15, 1914, calling for \$239,000; this of course had to be paid and was paid out of surplus. The falling off in total operating revenues amounted to 16.29 per cent, total revenues in 1915 being \$21,280,000 as against \$25,421,000 in 1914. To offset the loss of \$4,140,000 in revenue there was a reduction of \$2,541,000 in operating expenses, the total in 1915 being \$14,923,000. Besides this saving in operating expenses a notable saving in hire of equipment was made. In 1914 the Seaboard Air Line had to pay out \$266,000 on this account. In 1915 this had been changed to a net receipt of \$86,000, or a saving of \$352,000 to the company.

The loss in revenue was very large. The business of the South immediately after the outbreak of the war came almost to a standstill. Passenger business was much below normal and certain classes of freight business almost ceased to move. The tonnage of fertilizers for the fiscal year ended June 30, 1915, was 569,000 as against 994,000 in the previous year. The tonnage of phosphate was 446,000 tons in 1915 as against 1,027,000 tons in the previous year. To add to the depression caused by the war there were unfavorable weather conditions which made the movement of perishable vegetables unusually small, the tonnage in 1915 being 113,000 tons as against 146,000 tons in the previous year. The total tonnage of revenue freight in 1915 was 8,479,000, and in 1914, 10,411,000. The total number of passengers carried in 1915 was 4,224,000, and in 1914, 5,147,000.

It was out of the question to make all of the necessary reduction in expenses in transportation expenses, but these expenses were reduced by 16.8 per cent, or in greater proportion, even, than the reduction in business; and as usual it was found impossible to reduce passenger-train expenses to correspond with the falling off in business. Station expenses could not be reduced much. These factors were more than offset by quite remarkably large reductions in expenses, such as fuel, in which a saving of 23.3 per cent was made, and stationery, where a saving of 26.3 per cent was made. A very considerable part of the loss in passenger business was in local business, and the Seaboard Air Line in a great number of cases required the permission of the state commissions before it could take off local trains. The company was successful in securing the co-operation of these state commissions, but notwithstanding the best efforts of the management, passenger-train mileage could be reduced by 4 per cent only, the total passenger-train mileage in 1915 being 5,754,000. The falling off in passengers carried one mile was 14 per cent, the total in 1915 being 211,817,000. This, of course, is suspended business, and with the return of prosperity has not only been made up but is showing a normal increase over normal years. The remainder of the saving in transportation expenses was in freight service. The average revenue train load was 289 tons in 1915, an increase over the previous year of 26 tons, or about 10 per cent. The reduction in freight-train mileage amounted to 22.5 per cent, the total freight-train mileage in 1915 being 4,330,000.

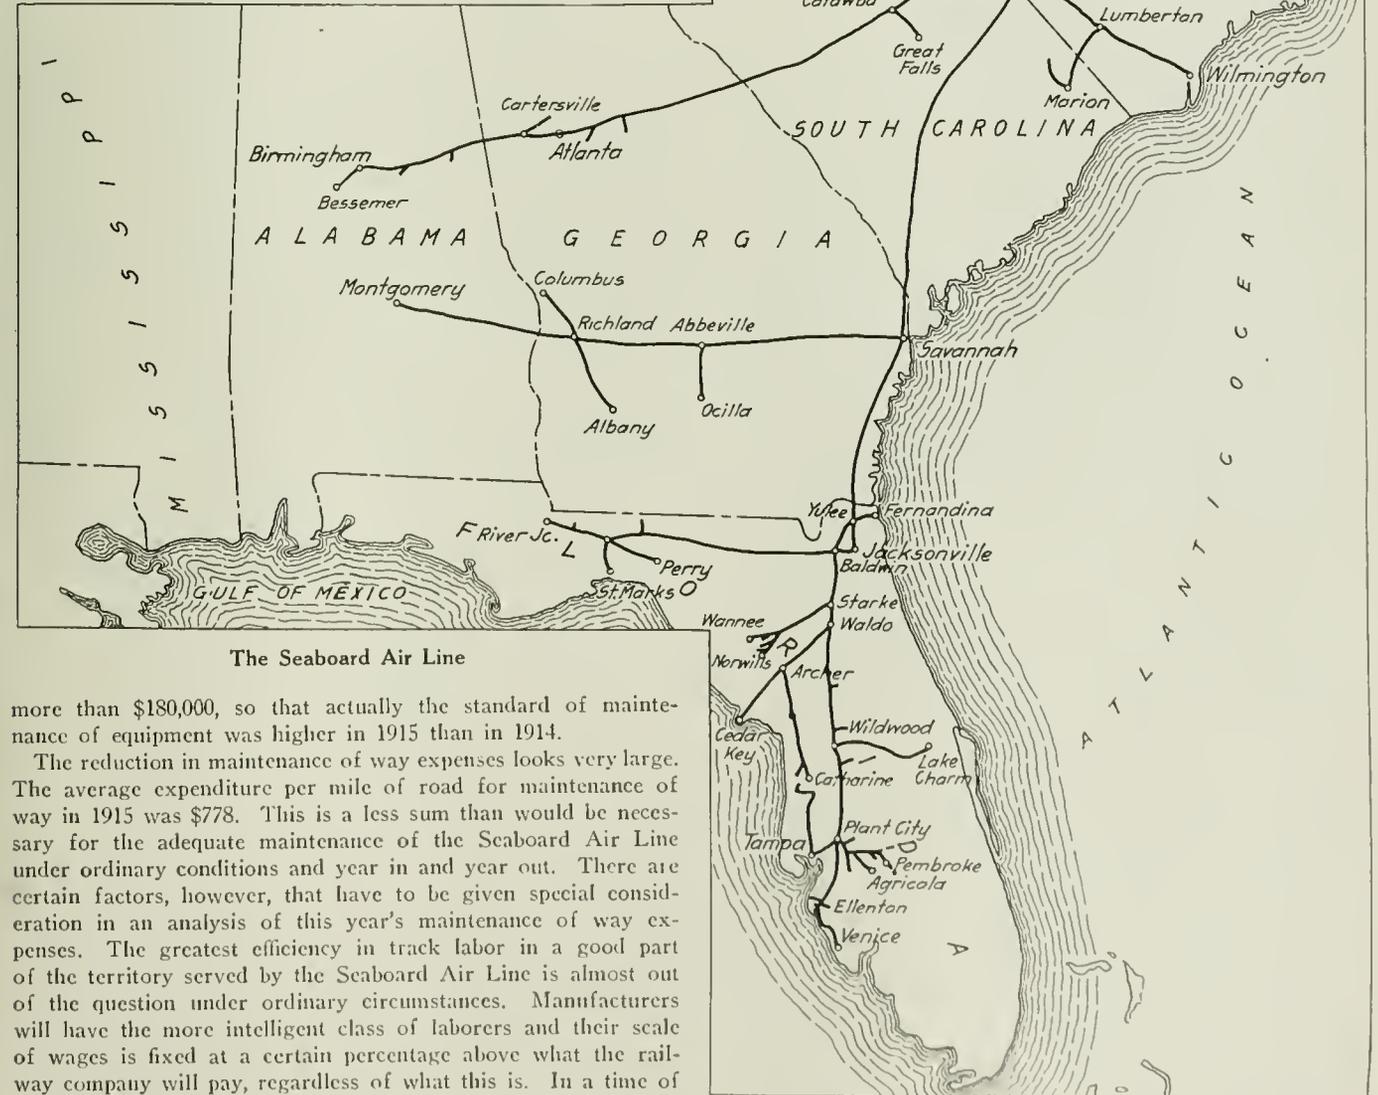

A very comprehensive system of detail supervision over train performance had been inaugurated previous to 1914. With the great falling off in business in 1915 operating officers and employees naturally took a more than ordinary interest in trying to effect economies, and the lessons learned from the system

of daily reports of individual train performance, which the Seaboard had had in effect previously, were applied with more than ordinary effectiveness. In addition to the saving of \$1,578,000 in transportation expenses, there was a saving of \$719,000 in maintenance of way expenses and \$285,000 in maintenance of equipment, the total spent for maintenance of way in 1915 being \$2,415,000, and for maintenance of equipment, \$3,176,000. The following table shows the ratio of each class of expenses to total operating revenue:

	1915	1914
Maintenance of way and structures.....	11.35	12.33
Maintenance of equipment.....	14.92	13.62
Traffic expenses	3.59	3.13
Transportation expenses	36.62	36.86
Miscellaneous expenses	0.53	0.52
General expenses	3.12*	2.45
Total	70.12	68.70

*The increase is due entirely to valuation expenses.

The reduction in maintenance of way expenses amounted to 22.9 per cent and in maintenance of equipment to 8.2 per cent. It will be noted that maintenance of equipment was not reduced in proportion to the reduction in train-miles, and there was, moreover, a very considerable saving made through the reclamation of scrap material. The saving from this alone was

The Seaboard Air Line

more than \$180,000, so that actually the standard of maintenance of equipment was higher in 1915 than in 1914.

The reduction in maintenance of way expenses looks very large. The average expenditure per mile of road for maintenance of way in 1915 was \$778. This is a less sum than would be necessary for the adequate maintenance of the Seaboard Air Line under ordinary conditions and year in and year out. There are certain factors, however, that have to be given special consideration in an analysis of this year's maintenance of way expenses. The greatest efficiency in track labor in a good part of the territory served by the Seaboard Air Line is almost out of the question under ordinary circumstances. Manufacturers will have the more intelligent class of laborers and their scale of wages is fixed at a certain percentage above what the railway company will pay, regardless of what this is. In a time of depression, however, a considerable proportion of this more intelligent class of labor is thrown out of work, and the railroad then has a chance to make a selection and to secure a very much larger amount and quality of work per dollar paid in wages than it would under normal circumstances. The program of betterment work was discontinued wherever this could economically be done, and there was a consequent considerable saving in maintenance of way expenses which are incidental to better-

ment work. The scrap reclamation campaign which helped reduce maintenance of equipment expenses also helped in reducing maintenance of way expenses. Ties and lumber also were much cheaper. A policy toward rail renewal was pursued which, although not particularly liberal, was adequate for the safety of the property and of train operation and was justified by conditions.

At the end of the fiscal year 1915 the company had \$1,056,000 cash on hand, in addition to \$839,000 on special deposit to meet

interest on funded debt and equipment trust obligations matured or about to mature, and had loans and bills payable of \$504,000.

Since the close of the fiscal year conditions in the Southeast have greatly improved. Everywhere there are reports of restricted areas planted to cotton, with much more diversified agriculture; cotton prices are better than even the most opti-

mistic cotton planters had hoped for a year ago, and it is in just such roads as the Seaboard Air Line, well managed, conservatively financed and serving a territory that was particularly hard hit by the war, that we may expect to see the largest proportional increase in credit. Such an experience as the Seaboard has gone through is a real test of the inherent value of the property, and under this test the road has shown up particularly well.

The following table shows the principal figures for operation in 1915 as compared with 1914:

	1915	1914
Average mileage operated.....	3,106	3,084
Freight revenue	\$14,324,670	\$17,307,034
Passenger revenue	4,576,795	5,430,531
Total operating revenues.....	21,280,463	25,420,503
Maintenance of way and structures.....	2,414,866	3,133,831
Maintenance of equipment.....	3,175,642	3,460,964
Traffic expenses	764,298	796,893
Transportation expenses	7,792,905	9,370,682
Miscellaneous expenses	114,014	131,235
General expenses	663,066	623,023
Transportation for investment—Cr.....	2,258	52,922
Total operating expenses.....	14,922,534	17,463,706
Taxes	1,062,247	999,000
Operating income	5,295,682	6,957,797
Gross income	5,720,623	6,990,570
Net income	1,591,632	2,924,216
Interest on income bonds.....	1,250,000	1,250,000

NEW BOOKS

Railway Accounts and Finance. By J. Alfred Fisher. Published by George Allen & Co., London. United States agents, D. Van Nostrand Company, New York. Price \$4.

This is the third edition. The book is a comprehensive description of the accounting system which in one modified form or another is in use on most of the larger English railways. It is of interest and value to American railroad officers because of the opportunity which it affords to translate the compilation of railroad accounts into terms other than those universally used in this country. The English terminology is quite different from ours. Since, however, the object of railroad accounting is the same in both countries, this English discussion of the subject, from the very fact that it makes the American railroad accounting officer analyze the terms used, is of value, since it forces attention on the facts back of the terms.

The English accounting system is divided into four departments: The "traffic department," which can roughly be translated the station accounts of passenger and freight revenue; the "expenditure," which, includes the expenses for maintenance, both of way and of equipment, and station expenses and most of our transportation expenses, as well as stores department accounts; the "secretary's department," which would in this country be called secretary and treasurer's, this department having charge of both the issue of securities and the custody of cash; and finally the "accountant's department," which includes the auditing department, the station ledger office and the bookkeeper's office.

In the preface to the third edition of his book Mr. Fisher discusses ton-mile statistics and apparently leans to the view held by the majority of English railroad officers that ton-mile statistics for English railways would be of no value. The first reason given in the minority report of the committee which was appointed by the Board of Trade to investigate this subject before the passage of the act of parliament which prescribed a form of accounts for English railroads is so much in the spirit of the English controversy on this point, and is evidently approved by Mr. Fisher, that it is worth quoting: "That practically no instance had been brought to the notice of the committee of any definite increase of earnings or decrease of expenditure in any specific case, which was the result of the use of the ton-mile figures, and which could not, and ought not to, have been brought about by other means, and that 'every witness who supported the ton-mile statistics was challenged to produce such concrete cases, and not one could do so.'"

Mr. Fisher's introduction to his book is admirable. He states clearly the sources of income and the destination of outgo, and distinguishes between receipts on capital account and revenues, and expenditures on capital account and expenses.

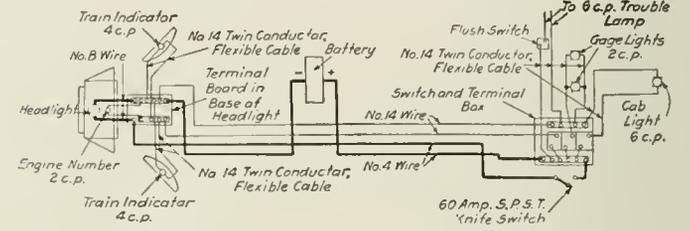

Letters to the Editor

SIX-VOLT INCANDESCENT HEADLIGHTS

SAN FRANCISCO, Cal.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

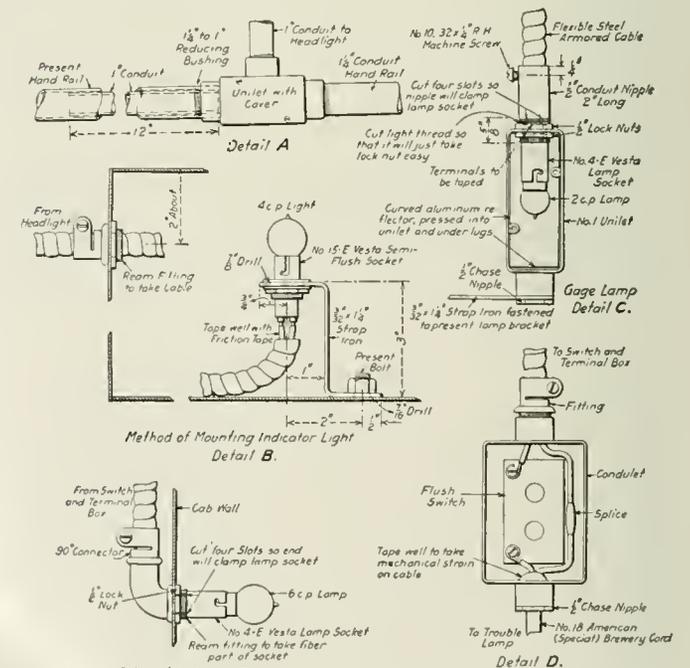

Your issue of October 29 contains a contribution on page 796 with respect to cab lights and other improvements, wherein a dispatcher pleads for a reading lamp, conveniently placed, for the engineman to read his orders. About a year and a half ago the Pacific System of the Southern Pacific Company replaced all its acetylene headlights with incandescent lamps of the auto-

Wiring Diagram for Headlight and Cab Lights

mobile headlight type, but of larger size. The idea of automobile lighting was carried throughout the entire installation, even to the fittings employed in the cabs and to a portable trouble lamp on a long cord, to take the place of the old smoking torch. One of the illustrations shows the type of automobile light fittings that in practice has been found satisfactory, except that under extreme summer desert temperature combined with high boiler temperatures, fittings that are made of moulded rubber, or its equivalent, have softened. These are now being replaced with fittings of the vitrified type.

In placing the lamps, particularly those in the cab, the prin-

Fittings Used in Southern Pacific Electric Headlight Installation

ciple followed has been to direct the necessary amount of light upon the spot where it is needed and to cut off all extraneous light, with the result that very small lamps give entirely satisfactory illumination and the sensitiveness of the engine crew's eyes is not diminished unnecessarily.

There are now 900 of these headlights in service and their performance has been remarkable. The old acetylene or arc headlight reflector can be used by simply covering the openings. A new opening should be cut in the vertex of the reflector and

the incandescent lamp, with its focusing device, inserted from the rear. Lamps for six-volt circuits, especially in the sizes used for headlight purposes (108 watts) have filaments very strong and heavy, consequently they can be wound into an exceedingly small cylinder not more than $\frac{1}{8}$ in. in diameter by $\frac{1}{8}$ in. long. This can be placed very accurately in the focus of the reflector, and the result is a concentrated beam of light of very great penetration, the beam candle-power measuring approximately 1,046,000, while the mean spherical candle-power of the lamp itself is only 140. On the other hand, if a wide beam of less power is needed, as for example on crooked track in the mountains, an adjustment of the focus brings about this result. There is no flickering or jumping of the light, as is the ordinary experience with the arc headlight; and, furthermore, while the arc lamp has a mean spherical candle-power intensity of from 800 to 900 candles, according to conditions of the lamp and length of arc, its beam candle-power, with the same reflector is only 165,000.

Certain manufacturers of 32-volt arc headlight outfits, endeavoring by brute force to equal the results obtained with the six-volt incandescent lamp, are using 32-volt incandescent lamps, burned up to 37 volts, in the same reflectors, in the hope of securing equal illumination by forcing the candle-power. On account of the necessity of the longer filament in the 32-volt lamp, this hope cannot be realized; in fact, tests show that even under these conditions the beam candle-power is less than one-half that of the six-volt lamp. Furthermore, the steam consumption of the turbo generators designed for arc headlight purposes is from 250 to 450 lb. per hour, while that of the most recent six-volt turbo generator for cah lighting is less than 50 lb. of steam per hour, and the cost of installation is slightly in favor of the six-volt outfit.

The portable trouble lamp was hung convenient to the engineman's head and by it he read his train orders, until it became evident that the portable light was also convenient around automobiles, of which our enginemen seem to have many. In fact, the practical results indicate that they found the trouble lamps more useful in the automobiles than in the engine. We are now replacing the trouble lamp with a fixed lamp over the engineman's head with a switch convenient to the engineman's head.

For the reason that these installations were somewhat rushed, owing to legal requirements, there was not sufficient time to develop a suitable electric generator, and we found it necessary to use a battery, with stationary charging stations at the locomotive turning points, where the locomotives leave their exhausted

batteries and take full batteries, just as they take their supplies of sand, lubricant and water.

A. H. BABCOCK
Consulting Electrical Engineer, Southern Pacific.

STRAIGHTENING RAILS IN THE MILL

NEW YORK CITY.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:
I thoroughly agree with the views of Captain Hunt, expressed in his letter in the *Railway Age Gazette* of October 22, page 726, that the present methods of cold straightening rails are injurious to the material and are doubtless indirectly responsible for a considerable number of rail failures. I believe, however, that the improvement should be in the mill methods and not by the acceptance by railroads of rail not entirely straight. We would not care to accept rails out of line and surface and depend upon the ordinary methods of track laying to correct the trouble.

E. E. ADAMS
Chief Engineer, Union Pacific System.

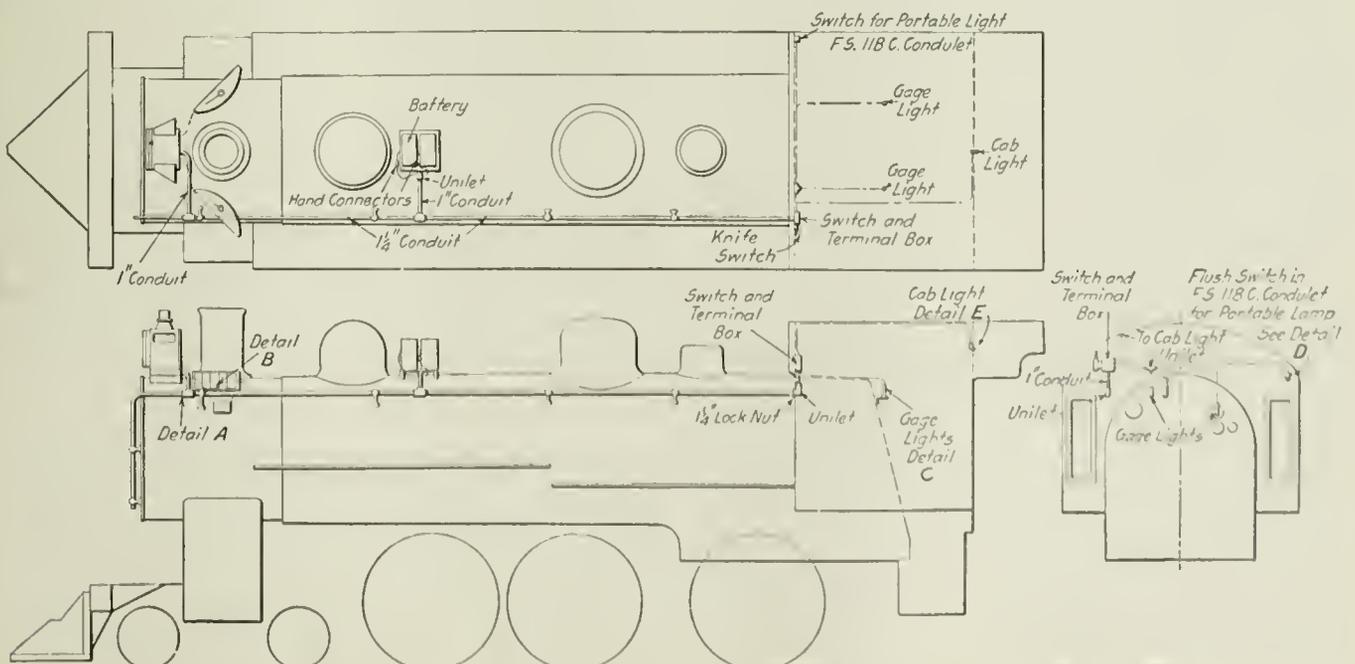

DEUS EX MACHINA

BY FRANCIS W. LANE

When the Western Advance case is settled and all the exhibits are filed;
When Thorne has discharged all his venom and respondents have ceased to get riled;
We may rest—and, faith, we shall need it,—and gather our senses a few,
Till the Master of rate regulation gets busy and starts something new.

And they that shall win will be happy, and they that shall lose will be sore;
None shall know till the Master has spoken, nor bank on the verdict before;
None can precedent quote with assurance, nor can cite a decision in bar;
Let us hope the Master digests well—the day it's decreed where we are.

For only the Master determines, and only the Master can tell
Whether railways shall thrive a while longer or plunge straight downward to (receiverships);
So we work for the joy of working, and handle each separate car
On the advice of the Commerce Commission, the Master of things as they are.

Southern Pacific Incandescent Electric Headlight Equipment

Importance of Railroads in a Plan of Preparedness*

Why Their Efficiency Is as Vital as That of Army and Navy in a Sound Scheme of National Defense

BY GEORGE DALLAS DIXON

Vice-President in Charge of Traffic, Pennsylvania Railroad

If the word should be flashed over this country that war had been declared and that the United States was about to enter into a conflict with another great world power, our condition of preparedness—what had been done and what had been left undone—would at once become the most immediately vital question before the American people.

War has not been declared. It is not imminent nor, so far we can see, even probable, and we hope that it never will be. But we have been compelled—even though unwillingly—to consider possibilities, and already national preparedness is being given much thought.

It has often occurred to me that in all the discussions of this subject, one of its most important phases, possibly its most important, has been overlooked by the majority of people. I refer to transportation. Taking everything into consideration, it is really a great question whether it is not every bit as important that our railroads should be prepared for national defense as it is that our Navy and our Army should be prepared.

MILITARY PLANS MUST BE FOR DEFENSE

As we are virtually pledged against another war of aggression, our military plans must necessarily be plans of defense, with a greater Navy, primarily, and a greater Army, secondarily, as the most obvious needs. There is danger, however, that the very obviousness of these necessities in any plan of preparedness may blind the eyes of Americans to another necessity which is less obvious but by no means any less vital, and that is adequate preparation for the mobilization and co-ordination of the internal resources of the country.

This means good railroads. Not merely as good as we have now, but better.

Suppose that a hostile army was about to invade our land. Can we exaggerate the importance that would then attach to an internal transportation system at the highest state of efficiency, with every facility ready to render the maximum of service, whether in the rapid assembling and transportation of troops, the movement of munitions, or the carrying of the materials required for the erection of the new plants that would probably be necessary to meet the enormous demands for military supplies?

Just for the sake of argument, imagine that the United States were attacked by some foreign power—England, or Germany, or France, or Italy, or Russia, or Japan, or any other great nation. Consider the diversity of the problems that would have to be met in any one of such contingencies, and then ask the question, What part would the American railroads play in the scheme of national defense and what would be expected of them under such circumstances?

THE VALUE OF RAILROADS IN PREPAREDNESS

There are, to be sure, abundant commercial reasons why it would well repay the American people to conserve and encourage their railroad systems and make their more rapid expansion and upbuilding possible. Well-constructed, well-equipped, properly manned, skillfully managed and solvent railroads are necessary to a healthy state of business. But as a military resource, a vital element in preparedness, they will be valuable beyond the possibility of expression in terms of money.

During the period from which we are just emerging, when business was, to say the least, quiet, our railroads were unable, for financial reasons, to improve their properties in anticipation of a return to what I might call a prosperous era. Their earnings

were not sufficient to warrant investors in supplying the capital needed to provide facilities for a greatly enlarged traffic, nor were they enough to enable the roads to put by a surplus for better cars, heavier bridges, more modern signals and all of those things which go to make up a good railroad, but which, except to a very small extent, do not increase a railroad's earning power.

Private capital is ready today to invest in our American railroads and needs only the assurance that the people and the Government wish to see it allowed a fair and reasonable return.

Just consider how helpful it would be now to the country's welfare if our railroads had the facilities needed at this very moment to handle our export commerce—I might almost say, under existing circumstances, the world's commerce.

RAILROADS SHOULD BE PREPARED FOR ANY EMERGENCY

Certainly the present situation in which the railroads of this country find themselves should be adequate proof to the people that our railroads should be prepared for any possible emergency, whether it be to handle an extraordinary quantity of traffic as is now being offered for transportation, or for any extraordinary service the Government might call on them to perform.

The very existence of the Nation, in the unhappy event of a war, might well hinge upon the ability of our interior transportation systems to bear the tremendous burden that would be put upon them, without collapsing. To be certain of so doing, they need great strength, much more than, as a whole, they have today.

The war in Europe has taught no surer lesson than this, that great forces of men, however courageous or admirably trained, are of little military value without the means of moving them with promptness and order and of keeping their many needs continuously supplied. This means transportation facilities that can be counted on to work with the smoothness and certainty of a machine. Without such facilities, all other preparations are useless, and the effort put into them wasted.

The railroads have played an important part in all the great wars of the last three-quarters of a century, that is, in every principal struggle of nations and rulers since the wars of Napoleon. But never before have they assumed the importance that they hold in the present war. Practically every great campaign in Europe during the last fourteen months has centered, at some crucial stage, about the possession of a railway line or junction point, control of which meant rail communication, or the loss of it, for one side or the other. The whole land campaign in the Balkan states, and the intricacies and ramifications and intrigues of diplomacy that have accompanied it, resolve themselves into a struggle, on the one hand, to establish a line of railroad communication between Central Europe and Turkey, and, on the other hand, to prevent the establishment of such a line.

THE STRENGTH OF THE GERMANS

The ability of the Germanic allies, thus far, to exist within the "Iron Ring" and not only to prevent it from contracting with a crushing pressure, but to push it back here and there and even to break through it in places, is of course due to many factors, but certainly to none more than to that perfection of plans and facilities for railroad transportation in every direction, at any time, which was one of the principal elements in Teutonic preparedness. By her railroads Germany has kept her armies and material resources liquid and they have flowed from

*From an address before the International Trade Conference, New York City, December 6.

one frontier to another with the swiftness and smoothness of water.

The German railroads were built and developed, under a militaristic system, with a first eye for military use. Our railroads were built by private capital to serve the needs of the commerce of a non-militant people, and are in themselves commercial enterprises. This, however, in no way detracts from their value for military purposes, since economic law has seen to it that they connect the centers from which men and supplies must be drawn in case of war.

A WISE INVESTMENT

The American people can make no wiser investment in military preparedness, and can buy no stronger assurance for the preservation of the Nation's integrity, than by allowing their privately owned railroads sufficient income at all times:

1. To bring all track and roadway up to standard conditions and maintain it thus.
2. To construct the double, triple and quadruple tracking and to make the terminal extensions and improvements that are required now, by the needs of peace, and which would be of immeasurably greater value if the railroads were ever called upon to assist in military operations.
3. To acquire sufficient supplies of locomotives and cars of modern types, and to reconstruct or replace all obsolete equipment.
4. To hold in the service a sufficient number of well-trained, well-paid and satisfied men, both officers and employes, to assure prompt and efficient operation in any emergency.

Some railroad systems are substantially in this condition at the present time, but many, less fortunately situated, are not. If all were enabled to become so, within a reasonable time, the Nation would be possessed of a military resource of inestimable value.

WHAT COULD THE PENNSYLVANIA RAILROAD OFFER OUR NATION?

To gain a more vivid idea of what our railroads could be—and ought to be—as factors in preparedness and as elements in an adequate plan of national defense, let us turn our thoughts to some concrete facts. Let us, for example, take the Pennsylvania Railroad System, with its associated lines, and consider what part it could play and what it could offer the nation in time of need.

In the first place it could offer a trained and disciplined army of more than 200,000 men for the performance of those indispensable transportation services without which the army and navy forces would be helpless.

It would probably not be within the province of any railroad management to decide where its men could perform the greatest service—on the battlefield, or in engine, train and shop—or to interfere with personal freedom as to enlistment, but the government would no doubt decide that every consideration of wisdom lay in maintaining the organization of this and other railroad systems substantially intact.

The English railroads sent a considerable number of men to the trenches early in the war, but in the first few weeks of the struggle England learned the value—indeed, the absolute necessity—of unhampered transportation, even though the actual battlefields are not on British soil. Both England and France have learned the lesson of the extreme unwisdom of sending to the front those men who have the special mechanical and other training and experience needed to keep up with the enormous demands made upon the national resources for production and transportation.

Secondly, the Pennsylvania Railroad could offer the nation a physical transportation system which handles the most extensive commercial railway traffic in the world—a system embracing more than 11,000 miles of line and over 26,000 miles of track, with terminals in the three largest cities of the country and in eight out of the ten largest centers of population.

The locomotives owned by the Pennsylvania Railroad System have power sufficient to haul, simultaneously, over any ordinary grades, soldier trains of 100,000 cars in all. These trains could

move an army of from 5,000,000 to 6,000,000 men and would fill a stretch of track as long as the system's main line from New York to Washington and from Philadelphia to Chicago.

In addition to carrying facilities this system has vast shop resources and a great body of skilled mechanics. The railroad shops at Altoona, Pa., alone—the largest of their kind in existence—employ 12,000 hands, a large proportion of whom are highly trained machinists. Counting all the shops on the Pennsylvania System, the total of men who might be called upon for specialized service is 64,600.

The Pennsylvania Railroad has in its service many other men highly trained in the professions and trades, or in special duties which from the standpoint of preparedness might make them invaluable to the nation.

It serves fifteen states and the District of Columbia, having a combined population of more than 40,000,000, or nearly half of all the people in the United States. In this great population there are probably 8,000,000 able-bodied men of military age, with the transportation facilities at hand for quickly mobilizing them.

In the territory served by this system is located much more than half of the fixed and liquid wealth of the country. It embraces the metropolis of the nation and its Capital, as well as the principal centers of finance, of foreign trade, of iron and steel production, of ship-building, of the manufacture of armor, heavy ordnance and powder, of meat packing, of the grain traffic and of various other important industries and commercial pursuits.

It so happens that because of geographical location, and by reason of the fact that it links together these principal centers of population and of industrial, mineral and agricultural wealth and production, the Pennsylvania Railroad System as an aid in defense, as in peaceful commerce, would inevitably hold a place among the transportation systems second to none.

A NATIONAL ASSET

But the Pennsylvania is only one of the nation's great railroads. For military purposes all of our railroads would have to be regarded from the viewpoint of their possibilities as one system, and the nation can ill afford to allow any part of this country-wide system of 250,000 miles of steel highways to deteriorate or to continue anywhere impoverished or inefficient, for what I have said of the importance to the nation of the Pennsylvania Railroad System applies, in a varying degree, to all railroads.

WHAT WOULD THE RAILROADS MEAN IN TIME OF WAR?

If the railroads have meant so much to France, England and Germany at war, with their comparatively small areas and relatively short distances, what would they mean to this country, under a like circumstance, with great cities 3,000 miles apart, with a population of almost 100,000,000 scattered over 2,974,000 square miles of territory and confronted with the immediate necessity of greatly increasing the industrial output and transporting the products to the place of utilization, of developing untouched and remote resources and of organizing and mobilizing large armies?

If our railroads are ever called upon to assist in the nation's defense, what would it be worth to the American people to have allowed these railroads the necessary funds required for the needed double and quadruple tracking, extension of lines, modernizing of all equipment, and the enlargement of the terminal facilities necessary to prevent congestion?

What would happen to America if its railroad transportation system broke down when called upon by the people of the country to aid in her defense? These are pertinent questions.

Next, then, to an adequate army and navy, if not indeed of equal importance, is the condition of the railroads of the United States as a factor in national preparedness. Only railroads of the highest efficiency can truly unify the country and keep its resources of men, money and materials in a liquid and mobile state. As a military precaution, if for no other reason, it

would be in the highest degree wise and profitable for the American people to see to it that their railroads have sufficient financial resources to be able to serve this end properly; and that the federal and state governments accord them treatment which will insure their healthy growth at all times.

TRAIN ACCIDENTS IN OCTOBER¹

The following is a list of the most notable train accidents that occurred on railways of the United States in the month of October, 1915:

COLLISIONS

Date	Road	Place	Kind of Accident.	Kind of Train.	Kil'd.	Inj'd.
3.	Ch., R. I. & Pac.	Rome	bc	P. & F.	0	8

OTHER ACCIDENTS.

Date	Road	Place	Cause of Accident.	Kind of Train.	Kil'd.	Inj'd.
2.	H. & Tex. Cent.	Austin	Boiler	P.	0	0

The trains in collision near Rome, Ill., on the 3rd were a northbound pasenger and a southbound freight. Both engines were wrecked, and 20 freight cars were badly damaged. The passenger cars were of steel and were not badly damaged. Eight passengers were injured.

The trains in collision near Tye River, Va., on the 9th were northbound express No. 38 and southbound local passenger train No. 19. Both engines and four cars were badly damaged. One baggageman was killed and 3 passengers, all on the southbound train, were injured. Three employees and one other person were injured. The cause of the collision was the failure of the southbound train to approach the meeting point under control.

The trains in collision at Angora, N. D., on the 16th, were a westbound passenger, No. 7, and an eastbound freight. The engineman of the passenger train was killed and 27 passengers, five employees and two other persons were injured. Angora was the appointed meeting place for these trains and the freight was at a standstill on the main track; the passenger came on at uncontrollable speed and failed to enter the side track, as it should have done, to clear the freight. It appears that both the engineman and the fireman of the passenger train overlooked an order, which they held, requiring them to take the side track at Angora.

The trains in collision at Agawam, Okla., on the morning of the 19th were southbound passenger No. 11 and northbound freight No. 98. Both engines, two baggage cars and ten freight cars were wrecked. Three trainmen and four trespassers were killed and forty-five passengers and two trainmen were injured. The southbound train had run past the appointed meeting station.

The trains in collision at Beaver Falls, Pa., on the 22nd of October were eastbound passenger trains, a local running into the rear of a preceding express train which was discharging passengers at the station. Four passengers were injured. The local train had stopped at the automatic signal at the entrance of the block section, but then went on at too high speed.

The trains in collision at Dalton, Ga., on the morning of the 30th about 4 o'clock were a southbound regular freight and a northbound extra. One engineman was killed.

The train derailed near San Luis Obispo, Cal., on the 2nd was a northbound express and the engine and two passenger cars fell down a bank. The fireman was killed and two trainmen were injured. The derailment was caused by running too fast where the speed was limited by a time-table rule.

The train derailed at Mount Zion, S. C., on the 10th was eastbound passenger No. 46, and the baggage car and two passenger cars were overturned. The coaches were of steel and all of the personal injuries were reported as slight.

The passenger train derailed near Randolph, Kan., on the 16th consisted of only two cars, a passenger car and a gasoline motor. The derailment occurred on a bank at the approach to a bridge where, in consequence of a freshet in the Fancy river, the earth had been washed way, but not sufficiently to change the appearance of the surface of the roadbed. The forward end of the passenger car was almost immediately submerged in the river and 11 passengers were drowned, three others being seriously injured. The stream had suddenly risen about 8 or 10 feet because of a cloudburst, 8 miles above, where 5 inches of rain had fallen within a very short time.

The train derailed near Brownsville, Tex., on the 18th was a southbound passenger, and the engine was overturned, causing the death of the engineman. Three passengers were killed and several were injured. The derailment occurred about 11 p. m., and it is believed that it was due to obstructions placed on the track by Mexican bandits. As soon as the train was stopped the bandits entered the passenger car and began shooting.

The train derailed near Hollis, Ga., on the 21st was a southbound passenger, and 8 passengers were injured. In the train were a number of freight cars and one of these, a tank car, ran off the track, carrying with it two box cars into a creek.

The train derailed near Milford, N. Y., on the 21st was a special, consisting of a locomotive and one car, the locomotive moving backwards. The train was running at about 20 miles an hour, and the tender was the first vehicle to leave the track. The engine fell over on its side and one end of the car fell down a bank. One trainman was injured. The cause of the derailment is reported as unknown.

The train derailed near Champaign, Ill., on the 25th was eastbound passenger No. 18, and the engine and three cars were ditched. No person was injured. The derailment was due to a broken frog.

The train involved in the accident near Austin, Tex., on the 2nd was westbound passenger No. 51, and the cause was the explosion of the boiler of the locomotive. The train was running about 20 miles an hour, but the engineman and fireman, as well as all other persons, escaped without serious injury.

THE RELATIVE MERITS OF ROAD AND RAILWAY IN WAR.—Some interesting calculations have lately been made by General Shumsky, the Russian military expert, as to the relative military advantages of road and rail transport. Where small bodies of troops are concerned, the railway is always preferable, and troops can be conveyed 12 miles in 20 to 30 minutes, while the journey by road would occupy not less than 6 hours. But the transportation of large masses of soldiers is quite another matter. An army corps, for instance, would require 144 trains, and according to General Shumsky, who has presumably in mind conditions which do not necessarily obtain in this country, not more than 50 trains a day could be run. Hence, an army corps, with its transport and artillery would require about four or five days for a railway journey of 12 miles. The deduction is that the value of railways for military purposes is not constant, and that the utility of railways is greater for long journeys than where the distance which troops have to be conveyed is only short. Obviously this depends on the number of tracks, the amount of locomotives and rolling-stock, and the platform and siding accommodation, etc., at the disposal of a commander. Conditions in Germany are more favorable than in Russia, owing to the much greater density of the German railway network, and the far higher number of parallel lines, the latter being an important strategical factor.—*Railway Gazette, London.*

¹Abbreviations and marks used in Accident List:

The Elimination of Grade Crossings in Dallas, Tex.

A Report on the Situation in That City Favors a Belt Line as a Better Solution Than Track Elevation

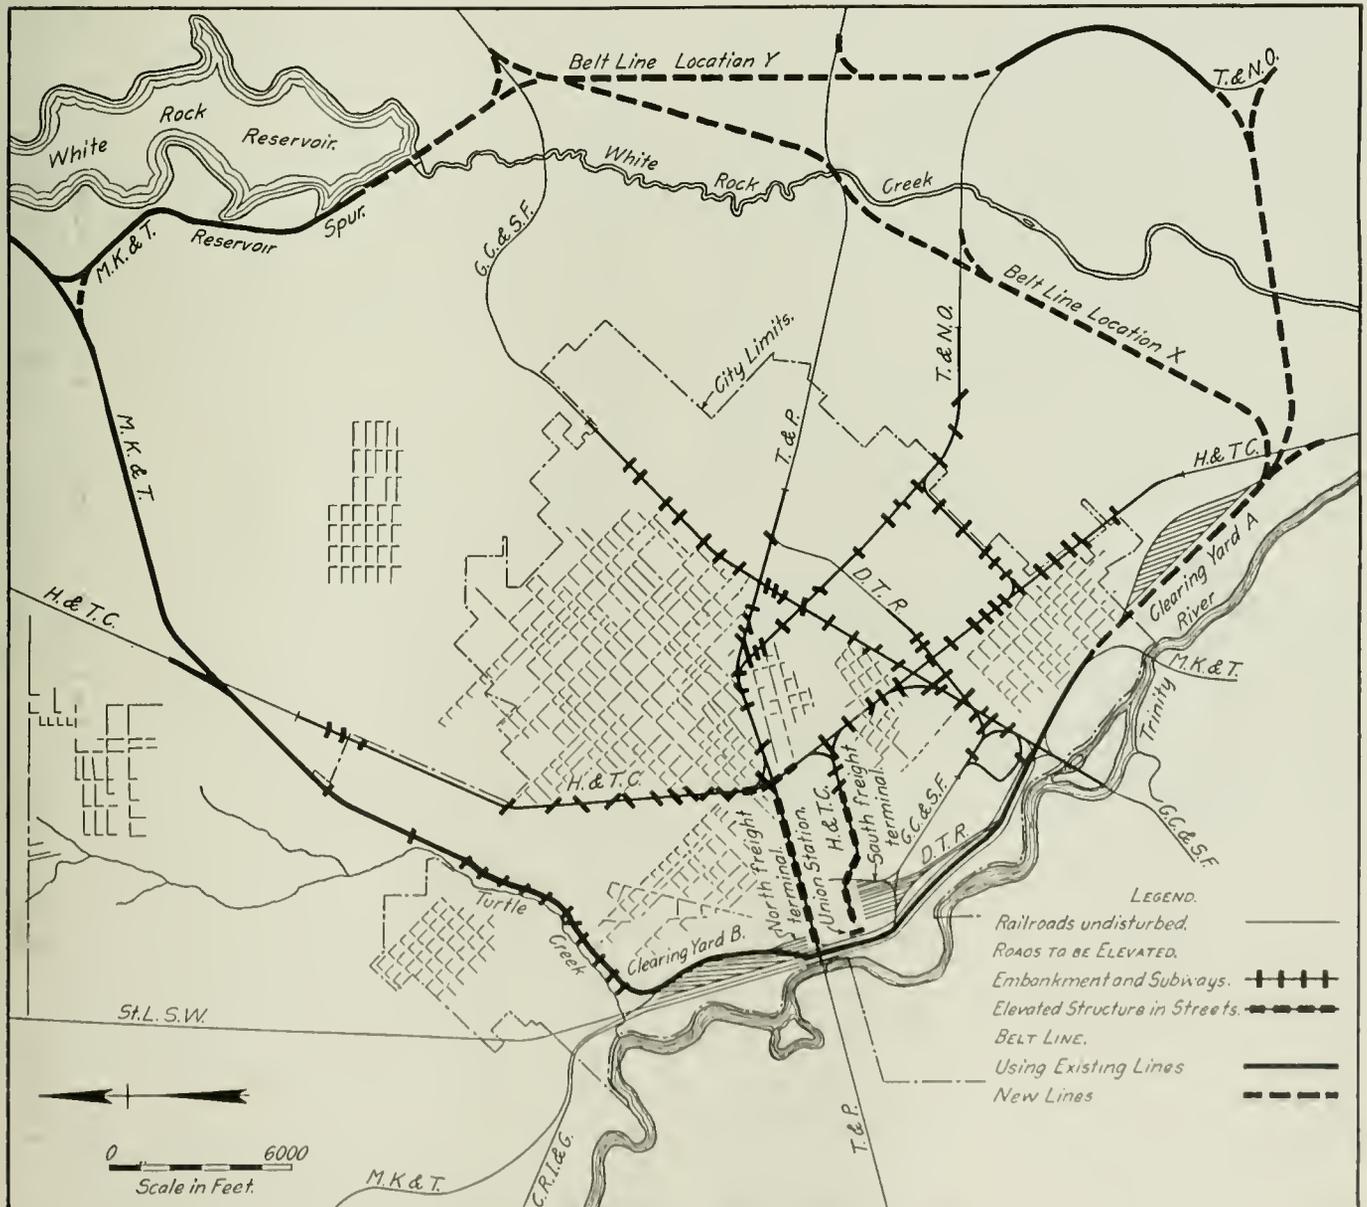

After several years of agitation for grade crossing elimination, the city of Dallas, Tex., retained John F. Wallace to make a study of the situation. His report, presented to the city on November 26, outlines a comprehensive plan for track elevation at an estimated cost of \$5,000,000. He strongly advocated, however, an alternative in the form of a belt line around the city to cost only \$900,000, which would remove so large a part of the railroad traffic from the congested portion of the city as to make grade separation unnecessary. The following is an abstract of the report:

THE PRESENT SITUATION

Dallas has a population estimated between 111,000 and 130,000 with an area of 17 sq. miles inside the city limits, in addition to

the growth of the city and pass through it in various directions. While the principal commercial development is segregated along the Texas & Pacific and in the vicinity of the Trinity river, industries are scattered pretty generally along the various lines. Similarly the character of the residential districts throughout the city suffers frequent variation because of the way the city has been cut up by the railroad lines.

The railroads entering and serving Dallas at the present time are the Texas & Pacific, the Houston & Texas Central, the Texas & New Orleans, the Gulf, Colorado & Santa Fe, the Missouri, Kansas & Texas, the St. Louis Southwestern, the Dallas Terminal Railway & Union Depot Company and the Chicago, Rock Island & Gulf. They own 77 miles of track within the city limits and use four passenger stations, 10 freight

Map of Dallas, Showing Plans for Track Elevation and Belt Line

considerable urban development outside. The railroad layout is typical of the American cities located in relatively level country. The railroads followed the lines of least resistance during

houses and numerous team yards, engine terminals and shops. Freight and passenger business of the St. Louis, San Francisco & Texas is handled into Dallas over the Gulf, Colorado &

Santa Fe. The valuation of the railroad property within the city on the basis of replacing new in kind modified by the condition of the property at the time of examination, exclusive of right of way for franchise values, aggregates in excess of \$1,000,000.

At the present time a union depot is being built by the Union Terminal Company, the stock of which is owned by the various roads, all of which will use the new station when it is completed. The station will be of the through type with 10 station tracks, 3 express tracks and considerable space for future development, and it is anticipated that it will provide adequate facilities for a great many years. The plan also includes provision for engine and coach terminals and is expected to represent an ultimate investment of about \$5,000,000.

TRACK ELEVATION

A careful study of the local conditions showed that track elevation with a limited amount of street depression offers the most feasible solution of the grade separation problem. This affects all tracks within the city limits except those immediately along the river front, hence the roads most seriously affected are the Texas & Pacific and the Houston & Texas Central, which pass through the heart of the city, while the tracks of the St. Louis Southwestern and the Chicago, Rock Island & Gulf would not be disturbed. A small portion of the Dallas Terminal Railway & Union Depot Co. tracks would be elevated and also the Greenville branch of the Missouri, Kansas & Texas, but the other lines of that road would not be changed. It is not practical or necessary to provide under crossings for all streets now crossing the tracks, and in the plan prepared as a basis for estimates about one hundred subways have been provided where they seemed most desirable from a study of the situation. In certain cases relocation of streets was found desirable.

The estimates are based on the use of embankments with retaining walls where a limited width of right of way makes them necessary, with unit construction reinforced concrete subways having lines of intermediate supports at the center line of street and at each curb line. In certain places where the railroads occupy streets for about a mile each on the Texas & Pacific and the Houston & Texas Central, and which it would be necessary to maintain for street traffic after the tracks are elevated, the plan provides for a continuous elevated steel structure. The total estimated cost of the work is \$4,785,000, of which \$4,675,000 represents the cost of track elevation, and \$110,000 represents the cost of changes to the industries. No recommendation is made for the apportionment of this cost, but references are given to methods of proportioning which have been used in other states and municipalities.

There are about 160 railroad grade crossings within the city limits, and the cost to provide, operate and maintain crossing gates at all of these is estimated at \$3,264,000. Of this \$64,000 represents the first cost of the equipment, while \$3,200,000 represents the capitalization at 5 per cent of the operating and maintenance expenses.

A BELT LINE

The topography of the city of Dallas and the location of the routes of the various railroads entering the city present an almost ideal situation for a belt line, over which all of the railroads could reach the new union station, and the local freight facilities, and thus decrease traffic on the tracks passing through the heart of the city to a sufficient extent to remove the need for grade crossing elimination. It is also believed that the construction of the belt line would encourage the removal of the industries from their present locations to points on the belt line, so that ultimately the tracks within the bounds of the belt line could be removed to the advantage of both the railroads and the city.

As seen in the accompanying map, the chief advantage of the situation lies in the fact that the absence of streets crossing the Trinity river at the track grade permits one side of the belt line to be placed along the river front close to the busi-

ness center, while the topography along Turtle creek is such that the Greenville branch of the Missouri, Kansas & Texas which follows this creek may be used advantageously as an outlet for the belt line to the unoccupied country on the north, with a minimum of expense for grade separation. Along the Trinity river from Turtle creek to the Missouri, Kansas & Texas bridge it is proposed to use the tracks of that road and the Union Terminal Company, with such additional facilities as may be found necessary. The rest of the belt line on the south and east would be new construction, two locations being suggested for a portion of the distance. This portion of the line is in relatively unoccupied territory, crossing few highways of any importance. The map shows two suggested clearing yards at *A* and *B* for the classification of freight of all the roads entering the city. It may develop on further study that it would be more desirable to have each road provide its own yard facilities at various points on the belt line. Layouts are also suggested for groups of local freight houses just north and south of the Union station, and a plan for reaching certain of the industries located in the immediate vicinity should it be decided to remove some of the existing routes.

The methods of construction and operation had best be left to the railroads themselves, but it is thought that the functions of the Union Terminal Company might be extended for this purpose. The plan adopted by the Indianapolis Union Terminal Company for operation and apportionment of expenses is suggested as a model.

The estimated cost of the belt line is \$900,000, of which \$500,000 represents the cost of new construction and \$400,000 the cost of grade separation for two tracks along the Turtle creek line of the Missouri, Kansas & Texas. To the above total must be added the value of facilities contributed by the various roads, less the salvage of trackage and facilities in the central portion of the city, which could be discontinued. The value of new real estate required is assumed as offset by the property of the railroad which may be vacated by the rearrangement.

DISPOSITION OF RAILROAD TRACKS

With the belt line established there is no question but that the ultimate solution of the problem would be the entire removal of the tracks within the city limits other than those necessary to reach the local freight facilities and such industries as are located immediately adjacent to the belt line. As mentioned before, the presence of the railroads has had an undesirable influence on the development of the residence district. It is believed that their removal would result in an expansion of the better residence districts by the elimination of the poorer residence districts now bordering the railroads, and thereby add materially to the taxable value. A further suggestion is to utilize the rights of way which could thus be vacated for the purpose of providing new streets, which, with certain existing streets, could serve as a basis for a system of through main thoroughfares. Street rearrangements of this kind also offer a suitable opportunity for the establishment of a civic center.

The probable readjustment of franchises with the local transportation company in Dallas in the near future offers another solution, in that it might be possible to turn the tracks over to this company, to form a part of a rehabilitated transportation system to be used for the purpose of rapid transit and also for switching service to the industries. The latter necessarily would have to be conducted during the night hours and under such precautions as to speed and flagmen as to protect the street traffic of the city.

An attempt to bring about the removal of these tracks immediately would probably not be desirable, but is put forward as an ultimate solution toward which the city should work. It may be found that the satisfactory arrangement, at least for the present, would be an arrangement between the railroads and the city which would restrict future industrial development to the portions of the city naturally segregated for industrial purposes, and the gradual removal of existing facilities to this district.

The Electrification of the Railways of Chicago

The Technical Phases of This Problem as Presented in the Report of the Smoke Abatement Commission

The report on Smoke Abatement and the Electrification of Railway Terminals of Chicago, made to the Chicago Association of Commerce on December 1, was abstracted in the issue of last week, page 1047. This report, comprising nearly 1,200 pages, contains the results of the most thorough investigation ever made of a problem involving the electrification of a large mileage of steam railway terminals. For this reason and also because of the complexity of the Chicago situation the following article is presented, abstracting in greater detail those portions of the report referring to the physical problems involved in the electrification of the steam railways within the terminal district of Chicago. In later issues other parts of the report will be similarly summarized. Unless otherwise stated all figures are for 1912.

PRESENT FACILITIES

Thirty-eight steam railroads are directly involved, including 23 trunk lines handling both freight and passenger service, 10 switching or belt lines and 5 industrial railroads. There are also over 1,600 industries having track connections with these railways, to a single one of which, the packing industry, nearly 1,000 cars, are delivered daily. In addition to the mileage controlled through direct ownership, a number of the railroads also have trackage arrangements permitting them to operate over the tracks of numerous other roads. There is also a considerable mileage owned jointly by two or more lines.

The mileage under consideration for electrification comprises a total of 3,476.40 miles of track, including 1,475.59 miles of main tracks, 1,456.64 miles of yard tracks and 277.19 miles of industrial tracks owned by railroads. This mileage is distributed over nearly every portion of Chicago. As illustrating the progressive character of the growth of the railway terminals with that of the city of Chicago, there are 78 miles of yard tracks within one mile of the City Hall and 219 miles within two miles. Within six miles, embracing 33 per cent of the area of the city, are 955 miles of yard tracks or over 50 per cent of all the yard tracks in the city.

Within the limits of the investigation there are 362 grade crossings between steam railroads, while the grades have been separated at 113 other crossings. Up to December 31, 1914, 169 miles of line and 1,079 miles of tracks had been elevated, while the elevation of 16 miles of line and 72.34 miles of tracks additional was provided for by ordinances. Approximately 70 per cent of the right of way is protected by fences, walls or buildings. An equivalent of 800 miles of single main track is protected by automatic signals. There are also 131 interlocking plants in this area.

There are six large passenger terminals in Chicago excluding the Van Buren and Randolph street suburban stations of the Illinois Central—the North Western, the Union, the La Salle street, the Grand Central, the Dearborn and the Central stations. At these and the two suburban stations referred to above 11,099,783 through and 42,119,593 suburban passengers were handled during 1912.

Less-than-carload freight is received and delivered through 69 freight houses, which handled 8,549,630 tons of freight in 1912. All the principal freight houses are located with 1¼ miles of the postoffice. There are also 62.97 miles of team tracks in the city, the largest yard being that of the Chicago & North Western at Grand avenue, which contains 5.5 miles of track. There are also 67 principal and 51 minor switching yards for the handling of carload freight within the city limits in addition to 40 principal and 19 minor yards outside the city, but within the zone of investigation. Other terminal facilities in this area include 65 engine houses containing a total of 1,129 stalls. Within the city limits there are 125 shop buildings of various types, 51 coaling

stations and 93 water stations. There are also 12 large passenger coach yards. Many of these terminal buildings are of brick or concrete and are of recent construction.

To secure the necessary data regarding present actual traffic conditions, forms were prepared for the tabulation of the essential information regarding each separate class of service. Full data was collected on these forms for five periods of one week each during the year. The information collected in this way was supplemented by a large number of field tests and observations. About 470,000 cards were required for the collection of the data regarding freight service and 348,000 for passenger service, each card showing the work of one engine or run, the hours worked, the termini, the amount of coal consumed, etc.

While any studies must necessarily be based upon present conditions, all plans and estimates of cost must be based upon conditions that will exist at the time the work is completed. This required the preparation of a tentative construction program by which it was estimated that if the work was undertaken in 1916 it would not be completed until 1922. On this basis it was necessary to estimate the increase in traffic which may reasonably be expected and the total demands of 1922. As a result of these studies it is estimated that the traffic shown in Table 1 will exist in 1922:

TABLE 1—ESTIMATE OF FUTURE GROWTH

	1912	Per cent annual increase over 1912	1922	Per cent increase over 1912
Miles of track.....	3,988	3.1	5,220	30.8
Number of through passengers	11,099,783	4.0	15,540,000	40.3
Number of suburban passengers	42,119,593	1.2	45,100,000	7.2
Number of through passenger trains	579	1.7	650	12.3
Number of suburban passenger trains	793	0.2	812	2.4
Tons of l.c.t. freight handled	8,549,630	4.0	10,140,000	18.8
Number of freight cars handled	14,826,739	4.2	20,950,000	41.3

THE ELECTRIFICATION PROBLEM.

After studying various proposed substitutes for the steam locomotive in the form of self-propelled cars and locomotives the commission came to the conclusion that the complete elimination of the steam locomotive in the railroad terminals of Chicago would, under present conditions, necessitate the abandonment of the service or the complete electrification of these terminals. A study was, therefore, made of existing steam railroad electrification in the United States and elsewhere to determine the practicability of its application to the Chicago situation.

Portions of 15 American and 22 foreign railroads, or a total of 37 roads, have been electrified up to the present time, as compared with 38 involved in Chicago. The total mileage of all American and foreign electrified steam lines is 3,007 as compared with 3,439 miles proposed in Chicago.

TABLE 2—MILEAGE OF AMERICAN AND FOREIGN STEAM RAILROAD ELECTRIFICATIONS

Classes	Route Miles	Miles of main Track	Miles of other Track	Total Miles of track
Total American	596.98	1,275.14	453.63	1,728.77
Total foreign	941.31	1,294.98	240.97	1,535.95
Total foreign, excluding "light service"	723.92	1,045.59	232.56	1,278.15
Grand total, all countries.....	1,538.29	2,570.12	694.60	3,264.72
Grand total, all countries, excluding "light service".....	1,320.90	2,320.73	686.19	3,006.92
Mileage to be electrified in Chicago	565.20	1,475.59	1,963.55	3,439.14

The study of these installations showed that they had been made to meet special operating requirements such as heavy grades, tunnels, etc.; to take advantage of cheap water power where the cost of coal is high; to meet the requirements of a growing suburban traffic where a frequent service and many

stops are necessary; to increase the capacity of stub end terminals; to experiment with the effect in stimulating traffic or to meet the competition of interurban railways. It was found that in no instance had a road electrified its terminals to avoid the pollution of the air where operating conditions are satisfactory.

A study of traffic conditions showed that the number of through passenger trains required by the traffic of Chicago terminals is 85 per cent of the total number of such trains at present operated electrically on all American steam railroads, while the number of suburban trains is approximately one-half the number of such trains at present operated electrically in America. Freight traffic, exclusive of switching service, is approximately 10 times greater in Chicago than on all existing electrified steam railroads in America, while yard freight switching service is more than 65 times as great. The only freight yards of any consequence operated electrically in this country are three yards on the New Haven with approximately 72.7 miles of track.

TABLE 3—THE CHICAGO TRAFFIC FOR ONE DAY

1—THROUGH PASSENGER SERVICE:	
Number of railroads operating.....	23
Average number of through passenger trains handled per week day.....	579
Locomotive miles.....	11,430
Per cent of all services.....	15.8
2—SUBURBAN PASSENGER SERVICE:	
Number of railroad operating.....	13
Average number of suburban trains handled per week day.....	793
Locomotive miles.....	12,296
Per cent of all services.....	17.0
3—ROAD FREIGHT SERVICE:	
Number of railroads operating.....	25
Locomotive miles.....	5,756
Per cent of all services.....	8.0
4—YARD SERVICE:	
Number of railroads operating.....	39
Locomotive miles.....	30,790
Per cent of all services.....	42.5
5—FREIGHT TRANSFER SERVICE:	
Number of railroads operating.....	32
Locomotive miles.....	10,993
Per cent of all services.....	15.2
6—PASSENGER TRANSFER SERVICE:	
Number of railroads operating.....	16
Locomotive miles.....	1,083
Per cent of all services.....	1.5
Locomotive mileage for all switching services.....	42,866
Per cent of all services.....	59.3

The number of multiple-unit cars, including both motors and trailers, required for the Chicago service would be 66 per cent of the total number of such cars in service on all electrified American steam roads, while the number of electric locomotives required in Chicago would be approximately four times the number now in service on all American electrified steam roads, and approximately 2½ times the number now in service on all electrified steam roads in the world.

As a result of its study of the experience gained on other installations the commission states that it has been demonstrated that trains of any weight can be hauled electrically at any required speed, provided the necessary amount of electrical power can be conveyed to the train motors; that where appliances can be properly installed and maintained, in view of local conditions, electric traction has been found to be reliable; and that under ordinary railroad conditions the introduction of electricity does not materially affect the hazard of railroad operation.

TECHNICAL PROBLEMS

The commission then entered into a detailed study of the engineering features of the problem. In this it assumed that the railroads would provide their own facilities for the generation and distribution of power, and that transmission lines in all cases would be of open wire construction on steel poles along the right of way, carrying current at 33,000 volts. This did not contemplate that each road would build its own individual power stations, but that all the roads would act as a unit in providing their common power supply rather than purchase power from outside sources.

The most important element of an electric traction system is the contact system, and it was given special attention. The

Chicago terminals present conditions which are unprecedented in complexity and magnitude in this regard, and which offer many difficulties affecting the application of any single form of contact system. In determining upon the practicability of the third rail, detailed studies were made on six railroads, on which it is found that there would be 3,834 gaps in the third rail more than 25 ft. in length. Of these 2,216 would be unimportant, as they would be short or at points where trains could coast over them, while 881 could be reduced so that proper operation could be maintained. The remaining 737 gaps, averaging more than 115 ft. in length, would require the use of an overhead third rail conductor. There is also some trackage on which it would not be possible to install a third rail or overhead conductor rail. The extent of this mileage on one road alone amounted to 11.65 miles. There is also objection to the third rail because of the necessity of employees working on both sides of the cars in the terminals, repair yards, etc.

In studying the advisability of overhead conductor wires the question of clearance becomes a serious one. Not only must these wires be placed at a suitable height to permit the contact to be made from a moving train, but it is desirable that they be maintained at a height sufficient to clear trainmen on the tops of cars. This would require that the clearance under overhead bridges should not be less than 25 ft., or where trainmen are barred from the tops of the cars, 16 ft. 6 in. An examination of the clearances in the Chicago terminals shows that there are now 492 permanent structures which do not have the full clearance. Of these 221 cannot be changed without great inconvenience and expense.

Under present rules trainmen are required to be on the tops of cars of road freight and transfer trains when approaching stations and railroad crossings and on the top of the head car of transfer trains when being pushed by locomotives. Trainmen also ride on the tops of cars in the hump and other classification yards. At a meeting of railway operating men to consider this question it was their conclusion that the exclusion of men from the tops of cars would make impossible the operation of the Chicago terminals. It was, however, the conclusion of the commission that with the installation of suitable warning devices the overhead contact system would be found practicable. This system also suffers relatively little from interference from storms as compared with the third rail. While sleet formations on the contact wires cause some sparking, they do not interfere with the movement of trains except in the case of a most unusual storm.

In the event of electrification the present signal system used by 23 roads in the Chicago terminals could not be employed. Likewise, the use of direct current would require careful design and construction to avoid the introduction of difficulties arising from electrolytic action, while the use of alternating current would require special care to avoid inductive interferences with existing telephone and telephone circuits. It is not believed, however, that either of these difficulties is serious enough to affect the practicability of any general scheme of electrification.

THE LIMITS OF THE ELECTRIFIED LINES

Before proceeding to make an estimate of the cost of any installation it was necessary to determine the limits to which electrification should be carried. Instead of attempting to establish a zone of electrification, the extent of the trackage to be electrified was determined for each individual road. In this it was the idea to terminate complete electrification at the first satisfactory point beyond the city limits. In the case of railroads having large yards, shops or other facilities a short distance beyond the city limits, the point where they are located was selected as the terminus for complete electrification. With those roads presenting no such features a location was selected as near the city limits as practicable, which afforded sufficient land on which to develop the necessary terminal and transfer facilities. For the North Western, the Western Indiana, the Burlington, the Rock Island, the Illinois Central, the Lake Shore and the Fort Wayne, estimates were made for further partial

electrification to the limits of their suburban territories to permit the operation of all suburban service electrically, while at the same time changing from electric to steam operation for through passenger and freight service a short distance beyond the city limits. The trackage to be electrified on each railroad and the limits of the electrification are indicated in Table 4:

TABLE 4—TRackage TO BE ELECTRIFIED ON EACH RAILROAD IN THE CHICAGO TERMINALS (Basis of 1912)

Railroad	Outside Limits	Miles from Passenger Station	Miles of Main Track	Miles of Other Track	Adjacent Industrial of Track Privately Owned	Total Miles of Track to be Electrically Equipped

Totals	1,475.59	1,733.83	229.72	3,439.14

The plans for this electrification involve the establishment of 30 new transfer yards, 50 groups of facilities for the maintenance of electric equipment, and 25 groups of facilities for the maintenance of steam equipment, the enlargement of 5 groups of existing facilities for the maintenance of steam equipment, and the abandonment or removal to new locations of 39 groups of facilities for the care of steam equipment.

As yet, the commission decided, no system of electric traction has been developed which can be accepted as standard for all conditions on all railroads. If it were decided to proceed at once with the electrification of the Chicago terminals, it would be difficult for any group of men to choose a system which would not be criticised by others as able as those upon whom the choice of the system devolved. There are many factors affecting the choice of a system, some of which are based upon known technical facts and others of which are the outgrowth of local conditions. The system selected for Chicago must be suitable not only for passenger terminal and main line work, but also for yard switching and transfer work. It must be applicable, the commission found, to the requirements of railroads having a heavy suburban traffic and also to those of roads conducting freight yard and switching service. It must not only be satisfactory in its application to the terminal portion of a trunk line railroad, but it must lend itself to an indefinite extension of the limits of electrification over other and adjoining portions of the road. It is furthermore essential that the rolling equipment of the system selected shall be capable of operating over the tracks of all railroads in the electrified zone.

At the present time no one system will perfectly meet the requirements of the Chicago terminals. For this reason the commission prepared estimates of the costs of three different systems, the third rail contact with direct current at 600 volts; overhead contact with direct current at 2,400 volts, and overhead contact, single-phase current at 11,000 volts. The estimates for the two overhead contact systems were prepared for all the railroads within the proposed limits of electrification, while those for the third rail system were developed for one road and the cost determined in this manner was extended to cover the entire terminals.

As described above, the amount of traffic to be handled daily was estimated carefully for five different periods in 1912, from information secured from a study of all train movements within the limits of the zone under investigation. From this Table 5 was prepared showing the total number of ton miles to be handled electrically in each class of service during the average day.

TABLE 5—TOTAL NUMBER OF TON-MILES TO BE HANDLED ELECTRICALLY IN EACH SERVICE (Basis of 1912)

Service	2,400-Volt D. C. System		11,000-Volt A. C. System	
	Ton-Miles	Ton-Miles	Ton-Miles	Ton-Miles
Yard	9,554,316	9,554,316	9,554,316	9,554,316
Road freight	6,242,988	6,242,988	6,242,988	6,242,988
Freight transfer	8,252,126	8,252,126	8,252,126	8,252,126
Passenger transfer	375,678	375,678	375,678	375,678
Through passenger	4,529,575	4,529,575	4,574,025	4,574,025
Suburban passenger with locomotives	1,168,885	1,168,885	1,187,065	1,187,065
Suburban passenger with multiple-unit cars	2,844,231	2,844,231	2,692,109	2,692,109
Make-up and put-away	723,126	723,126	730,496	730,496
Totals of all combined	33,690,925	33,690,925	33,689,332	33,689,332

The energy units adopted for the operation of the different classes of service are shown in Table 6:

TABLE 6—ENERGY UNITS ADOPTED FOR ELECTRIC OPERATION

Service	Watt-Hours at the Pantograph	
	2,400-Volt D. C. System	11,000-Volt A. C. System
Yard	59	60
Road freight	25	28
Freight transfer	35	38
Passenger transfer	30	30
Through passenger	36	37
Suburban passenger with locomotives	63	63
Suburban passenger with multiple-unit cars	74	71
Make-up and put-away	30	30

On the basis of the 2,400-volt direct current system one central power station and 11 substations have been tentatively located in the terminal area, these substations carrying a total average hourly load of 78,608 kilowatt hours and a maximum of 125,700, with a load factor of 62.5 per cent. With the 11,000-volt, alternating current system, 31 substations would be required with an average hourly load of 73,550 kilowatt hours and a maximum of 114,600, with a load factor of 64.2 per cent. With the 2,400-volt direct current system the average hourly requirements at the pantograph of all the roads is estimated at 62,023 kilowatt hours and the maximum at 109,258 kilowatt hours, of which the Chicago & North Western alone will require 19.37 per cent, or more than twice that of any other individual road.

ENGLISH RAILWAY STOPS RESERVING SEATS.—The Great Northern Railway, beginning November 18, ceased, until further notice, to convey luggage in advance and to reserve seats for passengers. A probable reason for this action is that many consignees who have been sending their parcels by freight are now sending them by passenger train. The charges for the latter are considerably higher, but the transit is quicker, as while there are delays the accommodation on station premises for parcels traffic is generally so limited that the station staff is only too anxious to get rid of it.

ANGLO-RUSSIAN TRANS-SCANDINAVIAN RAIL ROUTE.—It is reported that at last an agreement has been reached with the Swedish government on the rules to govern the transport of private goods between Russia, Sweden, Norway and England, either outwards or inwards, for want of which the traffic had been very unreliable hitherto.

WILLIAM HENRY WILLIAMS

W. H. Williams, vice-president of the Delaware & Hudson, has been elected chairman of the board of directors and chairman of the executive committee of the new company which has taken over the Wabash after reorganization. Mr. Williams was recently elected a director of the Missouri Pacific. Kuhn, Loeb & Co. are the bankers who carried out the reorganization of the Wabash and are now working out the reorganization of the Missouri Pacific. They are also the bankers for the Delaware & Hudson. Mr. Williams will make his office in New York and will continue to act as vice-president of the Delaware & Hudson. It is seldom that a man of 41—Mr. Williams was born in June, 1874—has the broad responsibilities and broad opportunities in railroad work which are here presented.

Mr. Williams has been in railroad work since he was 16, and since 1901 has been an officer reporting directly to L. F. Loree, who was general manager of the Pennsylvania Lines West when Mr. Williams became his secretary, and who was later president of the Rock Island and president of the Baltimore & Ohio, and is now president of the Delaware & Hudson. Mr. Loree's ability to inspire his subordinates to an extraordinary output of work amounts to genius. In W. H. Williams he found a man of nervous, high-strung temperament, a remarkably keen, analytical mind, and a man capable of taking the faintest hint or suggestion, making the idea his own and carrying it out. Mr. Loree is a financier with broad interests as well as a railroad man, and the close association which Mr. Williams has enjoyed with him gave an opportunity for the younger man to study financial affairs of the first importance from an inside point of view as it were. He combines a quite varied experience in railroad affairs, as his service record shows, with an intimate knowledge of the financial problems which are often so little understood by railroad officers all of whose service has been on the road. When the Hadley Securities Commission was making its investigation of the question of government regulation of the issuance of railroad company securities W. H. Williams presented a discussion of the fundamental principles of financing railroads that in some ways showed a keener analysis of the facts and the principles involved than that furnished by any of the very prominent and very distinguished men who put their knowledge at the disposal of the commission.

Kuhn, Loeb & Co., have been conspicuously successful in the railroads they have financed. Nevertheless the bankers' point of view is quite different from that of the railroad executive, and it is particularly important in the case of the Missouri Pacific and Wabash that, on the one hand, the needs of the property should be thoroughly understood and, on the other, that a wise and conservative policy of financing these needs should be pursued. It is in this field that Mr. Williams can

perform a great service for two very important railroad properties. Furthermore, many of the financial disasters which have overtaken railroads have been due, at least in part, to the fact that the board of directors and the bankers financing the company have not been really cognizant of what was going on. There is little chance of this happening with W. H. Williams as chairman of the board. With his power of analysis is combined also fertility of resource in finding ways of obviating difficulties. He is above all an indefatigable worker.

William H. Williams was born at Athens, Ohio, and attended the Toledo (Ohio) public schools and the Beaver Valley Business College. He began work as a cashier in the local freight station of the Pennsylvania Lines West at Toledo in May, 1890. The following year he became an assistant on the engineering

W. H. Williams

corps of the Pittsburgh & Lake Erie, and in 1892 was given a job as stenographer to the superintendent of telegraph on the Pennsylvania Lines West. A few months later he went into the office of Joseph Wood, who was then general manager of the Pennsylvania Lines West, working as stenographer for Mr. Wood until January, 1896. In that year L. F. Loree was made general manager of the Lines West and Mr. Wood became third vice-president. Mr. Williams became Mr. Loree's secretary, and acted also as chief clerk to Mr. Wood. When Mr. Loree became president of the Baltimore & Ohio, Mr. Williams was made assistant secretary of that company and acted also as assistant to the general manager. Mr. Loree went to the Rock Island in 1904, and Mr. Williams was made superintendent of freight transportation, yard and station service on the St. Louis & San Francisco, which was then under the same management as the Rock Island, from April 1 to October 6. For the two years 1905-1907 Mr. Williams was statistician for the General Managers' Association and also traffic manager of the Merchants' and Manufacturers' Association and the Chamber

of Commerce of Pittsburgh. Mr. Loree became president of the Delaware & Hudson in 1907 and offered Mr. Williams a position as his assistant, which offer was accepted, and a few months later Mr. Williams was made third vice-president.

LIGHT RAILWAYS AND THE WAR.—Some particulars have already been given in regard to the use which the Germans have made of narrow-gage light railways in Belgium. According to accounts from a Russian source similar methods are being employed on the Eastern front. For communicating with the rear the German army uses special "removal railways" of 2-ft. gage, the track for which was prepared in large quantities before war broke out. The speed attained is said to be nine miles an hour, which is good enough in the circumstances, and of course compares very favorably with the best that could be attained by road. Twenty-four trains can be run in 24 hours, and special attention has been paid to quickness of construction.

Mutual Beneficial Association on the Pennsylvania

An Organization of the Employees of This Road without Walking Delegates and No Strike Clause in Its By-Laws

By N. F. DOUGHERTY

Editor of the Mutual Beneficial Association Magazine

Employees of the Pennsylvania Railroad have formed an organization which promises to be a step forward in the direction of solving the question that has been giving so much concern to government and business in the past generation—namely, the solution of the labor problem. There have been many schemes, plans and even attempts to work out this problem, but they have usually proved to have been poorly planned or have lacked support. We believe that a brief outline of our plan would be of interest to the readers of the *Railway Age Gazette*.

The plan of the Mutual Beneficial Association of Pennsylvania Railroad employees is somewhat similar to that of labor organizations, in that it advocates the collective principle whereby the employee shall have a voice in determining the conditions under which he labors, but from this point on it differs in the following principles: The first exception is that it is an association made up exclusively of Pennsylvania Railroad employees. The walking delegate, the labor exploiter and the high-salaried labor official are given no opportunity to live by the toil of their fellow worker. The second exception is that there is no strike clause in the by-laws. The organizers took the position that the strike clause is the real factor that is keeping capital and labor apart rather than getting them together.

It might be well, however, to outline the aims and purpose of the association, as well as the reasons why the organizers think it a better method to settle the differences between capital and labor than the propaganda now followed and advocated by leaders of organized labor.

PLAN AND METHODS

The purpose of the Mutual Beneficial Association is to give the employees of the Pennsylvania Railroad all the advantages that can be gained by organization and at the same time protect them from the disadvantages that are to be found in many kindred organizations.

The method in seeking adjustments or improvements in pay or working conditions is to meet the officers of the road in an honest, friendly spirit, with threats of force and violence farthest from our thoughts. The advantage in this method is that both sides enter the game with their cards face up on the table, thus minimizing the danger of subterfuge and deception and permitting the discussion of every question on its merits alone. An agreement satisfactory to both sides is bound to result from such a method. We do not see how there could be any other result in this day of intelligence.

The Mutual Beneficial Association is one of the very few organizations with a membership composed exclusively of employees of a single corporation and also one of the very few operating under state charters. It is conceded that a chartered organization is infinitely safer, guarding much more effectively the interests of its membership and carrying with it supervision and inspection of its operation and books by state officers.

The by-laws provide for the election of committees of adjustment, giving to every member an organized method by which his interests and rights may be conserved and promoted.

The insurance rates are sound and lower than the same class of insurance can be procured for elsewhere. The rates are sound because, first, they were worked out by an expert actuary and have been approved by the National Fraternal Congress; and, second, they are also approved by the State Department of Insurance. The rates are lower because the insurance fund cannot be drawn on to pay high-salaried officers or to support grievance and legislative committees. Our premise

is that these are not, and never will be, necessary under the co-operative plan on which our association is built.

The dues are based on an insurance table and not on assessment. Every cent paid, outside of local dues, goes to the insurance fund. The insurance covers total disability as well as death, the one rate covering both. If a member is so disabled by the loss of a hand, a foot or an eye, or by insanity or paralysis, so that he cannot follow his regular occupation he is paid the total amount of his certificate. If a member leaves the service of the Pennsylvania Railroad he is permitted to continue his insurance.

It would take too much space to incorporate the entire insurance table here, but enough can be given so that a comparison may be made with other insurance rates of the same class:

Age	Class A, \$25C		Class B, \$500		Class C, \$1,000		Class D, \$1,500		Class E, \$2,000	
	An- nual	Month- ly	An- nual	Month- ly	An- nual	Month- ly	An- nual	Month- ly	An- nual	Month- ly
20.....	\$3.93	\$0.34	\$7.86	\$0.68	\$15.72	\$1.35	\$23.58	\$2.03	\$31.44	\$2.70
25.....	4.08	.35	8.15	.70	16.30	1.40	24.45	2.10	32.60	2.80
30.....	4.22	.37	8.44	.73	16.88	1.45	25.32	2.18	33.76	2.90
35.....	4.37	.38	8.73	.75	17.46	1.50	26.19	2.25	34.92	3.00
40.....	4.51	.39	9.02	.78	18.04	1.55	27.06	2.33	36.08	3.10
45.....	4.81	.42	9.61	.83	19.21	1.65	28.82	2.48	38.42	3.30

Local assemblies are permitted under the by-laws to conduct a fund for temporary disability due to sickness or accident. This fund is conducted and controlled by the local assemblies. Several of the local assemblies have established such funds and are maintaining them successfully.

The by-laws provide for co-operative buying. Some of the local assemblies have accomplished much along this line. The plan followed is to arrange with local merchants to make a reduction on goods purchased by members of the association. We hope in the near future to appoint a committee to study this question with the idea of working out a plan for buying direct from the producer.

The association takes in all classes of employees. It is less than two years old and has a membership of over 5,000 and is growing rapidly. If the present interest and growth continue it will be but a few years until a majority of the employees are members.

ADVANTAGES OF THE PLAN

We will show why our method is the better one for working out the problems of capital and labor. We want to make it very clear that we not only have no quarrel with organized labor, but, on the other hand, we think that organized labor has done much to clear the ground and make possible such a movement as that represented by the Mutual Beneficial Association. There are two principal features in the labor movement. First, collective bargaining. We are in hearty accord with this principle, but prefer to call it collective representation. A request represents the desire of an entire class and not of an individual, but the word bargaining seems to carry with it a bartering which is based more on the strength than the justice of the cause. The difference here is only one of words—and we prefer representation to bargaining. Second, the method of procedure. The method in common practice today is for the workers to present their questions relating to wages and working conditions for adjustment, and then the employer and employee discuss each question with the idea of reaching a common ground of agreement. Naturally each side always tries to make the best bargain possible. We agree, to this extent, with the method of procedure; but together with the presentation of questions for adjustment is that bugaboo of present-day business conditions—the threat of strike unless the

demands are granted. We disagree with this and think our method the better one. A threat simply means displaying of force, and in a question of force justice is lost sight of and the stronger side wins irrespective of any economic argument whatsoever.

The Mutual Beneficial Association principle holds that the threat weakens the whole cause. We argue that should we be the weaker side we lose all, because in a question of force a concession is a sign of weakness, and for this reason the stronger side will make no concession. On the other hand, if we are stronger we will force concessions beyond what the economic conditions will stand, the result being that the employer must sacrifice goods, service or the interest of some other group of employees. An adjustment of this kind is only a temporary makeshift and in the course of time will react in the form of bankruptcy or general reduction in force. The financial conditions of the railroads in the country today prove this. The recent broadcast reductions in all industries are also another proof.

Our argument is that better and more permanent adjustments can be made by perfect frankness and honesty on both sides. Our plan is to work out our questions for adjustment on a basis of the cost and conditions of living; on wages and conditions in other industries; on the character of service; and then present our claim from the standpoint of equity with no threat of force. We feel quite confident in saying that our adjustment will be much more liberal than if we accompanied our request with the common alternative, because there would be no fear on the part of the employer that a concession would be an entering wedge to force further concessions. He would be relieved of the fear of strikes and their expense, as well as the expense necessary to guard against them. The funds thus released would be enjoyed by the employee in the form of higher wages and better working conditions. It would entirely remove the present spirit of barter and jockeying for advantage, and instead all questions would be settled in a spirit of justice. Good feeling and friendliness and a closer knitting together of interests would result.

The plan of the organizers of the Mutual Beneficial Association being to adjust the question between the officers and employees of our railroad by a round-table conference instead of by threats of force, it was necessary to get the official attitude toward such a movement, because the principle being that of co-operation, it takes two sides to co-operate, and the views of the officers were necessary. The answer from the officers was that if an organization were formed on the basis outlined (the by-laws embody the basis presented) there was no question but that they would meet their employees through the representatives of such an organization; and the sincerity of this statement has been proved by the spirit with which our committees have been met. It is a matter of public record that several of the highest officers of our company favor the collective principle and do welcome an organization of their own employees when it is entirely free from outside influences. This is exactly the principle of the United States government; that is, to work out its own problems without becoming involved by entangling alliances with foreign governments.

This must not be understood as a promise of support or help in any way from the officers of the road, but simply an announcement of a policy which has been made to the public through the press as well as to us. Quite a number of officers at various points on the railroad are not only members but are taking very active interest in the local assembly meetings in order to meet the employees on common ground and do what they can to improve working conditions.

CONTRAST WITH LABOR UNION METHODS

We have already given credit to organized labor for the great work that it has done. This work has been of the ground-clearing order, and though it has in a very great degree been a groping in the darkness, it has been educational to the extent

that the needs of labor and the ability and willingness of capital to supply these needs have been very clearly defined.

Anyone who has studied the labor question has no doubt noted three distinct groups, each holding a different opinion as to how the question should be worked out.

First, those who believe in the immediate and complete elimination of private property; the government to control both production and distribution.

Second, those who believe that the workers should get a greater share of the profits of the industry, and have organized to secure a more equitable distribution by force.

Third, those who believe that the workers should share more in the profits of industry, both financially and by better working conditions, but who do not believe that force is necessary to accomplish this end, and who hold that more permanent and satisfactory adjustments can be made by obeying the laws of economics. Their plan to accomplish this end is by conference and co-operation between employer and employee.

We belong to the third class and we think we have taken a step in advance of the others. As we pointed out before, when force is the weapon used to get adjustments, it goes without argument that both sides will be guided by their strength, and instead of justice and honesty being the actuating principles in such adjustments each side will study every means to circumvent the other. There is bargaining and jockeying for advantage and the justice and economic sides of the question are lost sight of. Such agreements are only makeshifts and compromises, neither side is satisfied, discontent continues, and while more compromises might be made, the end is bound to be either a strike or bankruptcy of the industry.

It might not be out of place here to state an ideal which we should all cherish and always hold before us as an ultimate goal, though every step toward this goal must be a constructive and not a destructive one, else we shall have to retrace our steps in each case and reconstruct all that we have destroyed. The ideal we wish to picture is that we hope to see the day when government will so control distribution that poverty will be unknown, and when every man, woman and child will not only be protected against hunger and cold, but will enjoy a distribution on such a basis that they will be able to command the real pleasures of living and not have their lives distorted and cramped by a mere existence in the struggle for the bare necessities. We are living in a wonderful age, and it is often difficult to see things as they really are, yet a retrospective glance over any previous period will bring with it astonishing realization of the changes in every line of human endeavor. One example that concerns us more than any other is that in the United States, about the middle of the nineteenth century, workmen were contending to be allowed to start work at 6:00 a.m. and stop at 6:00 p.m., instead of starting at 5:00 a.m. and quitting at 7:00 p.m. This is history. How many of us now even work from 6:00 a.m. to 6:00 p.m.?

An experiment that may advance us toward the ideal expressed is the present idea of government by commission. It might solve the question. It might fail. In any event it is certainly worthy of a trial. This trial is being made with little or no disturbance to government or business. Experiments on this basis are safer, but we must bear in mind that any new plan advocated is a theory and must be experimented with before its utility is proved. This is the reason we are so strongly opposed to the complete upsetting of any proven practice and the employment of something entirely new. The slightest changes sometimes upset both government and business, and the greater the change the greater the danger. We must not forget that our present practices and customs were all theories at one time and continued to be theories until their utility was proved by actual experience, and while all present practices might not give us everything we think we are entitled to, let us not forget that at the time they were put into effect they marked a great improvement over those in force previous to that time. We should not close our minds to a thought or theory because it is new. Rather should we in good faith care-

fully consider things which appear commendable no matter how much they may conflict with contemporary usage. The final acceptance or rejection of any proposition may safely be left to calm and unbiased deliberation. It cannot harm us much then if we sometimes make mistakes, because we have been open and honest in arriving at our conclusions.

Economic conditions are passing through the great crucible of change. The day of the Croesus is passing. The great individual fortune will soon be a thing of the past, not because some radical is jealous of the success of another man, but because both government and business are coming to recognize that it gives one man too much power. This is not a new thought, and the men wielding the power and enjoying the prerogatives of these great fortunes have so expressed themselves.

An encouraging movement, showing clearly the tendencies of the times, is that the federal and state departments of labor report more than 90 per cent of the industries of the country co-operating with them to improve conditions. This fact establishes conclusively to us that the organization of the Mutual Beneficial Association is opportune, and that our principle, once established, will spread throughout the land and influence all industries. It is also a matter of record that many industries have co-operated with and supported national and state officers in enacting child labor, compensation and conciliation laws.

It is our plan to build up such an organization that we shall be consulted on all these movements, and then, together with the employer and statesman, discuss and agree on what is the wise and safe thing to do—and then do it. We shall only reach the great end of an ideal government when statesmen, capitalists and workers co-operate in a common cause for the good of all.

THE PRESIDENT'S MESSAGE

By W. L. STODDARD

WASHINGTON, December, 7, 1915

Two unexpected passages in the President's message, delivered to Congress on Tuesday, related to the railroads and transportation. The first occurred in Mr. Wilson's discussion of the necessity of mobilizing our economic resources. Mr. Wilson intimated that he contemplates calling together for consultation with the directing officers of the army and navy "men of recognized leadership and ability from among those of our citizens who are thoroughly familiar, for example, with the transportation facilities of the country, and are therefore competent to advise how they may best be co-ordinated when the need arises." The second passage was the final recommendation of the message. The exact text of what the President said, which, it should be pointed out, differs from that of the printed copy generally published in the newspapers, is as follows:

"In the meantime may I make this suggestion? The transportation problem is an exceedingly serious one in this country. There has from time to time of late been reason to fear that our railroads would not much longer be able to cope with it successfully, as at present equipped and co-ordinated. I suggest that it would be wise to provide for a commission of inquiry to ascertain by a thorough canvass of the whole question whether our laws as at present framed and administered are as serviceable as they might be in the solution of this problem. It is obviously a problem that lies at the very foundation of our efficiency as a people. Such an inquiry ought to draw out every new circumstance and opinion worth considering, and we need to know all sides of the matter if we mean to do anything in the field of national legislation.

"No one, I am sure, would wish to take any backward step. The regulation of the railways of the country by a federal commission has had admirable results and has fully justified the hopes and expectations of those by whom the policy of regulation was originally proposed. The question is not what we should undo. It is, whether there is anything else we can do that would supply us with effective means, in the very process of

regulation, for bettering the conditions under which the railroads are operated and for making them more useful servants of the country as a whole. It seems to me that it might be the part of wisdom, therefore, before further legislation in this field is attempted, to look at the whole problem of co-ordination and efficiency in the full light of a fresh assessment, of circumstance and opinion, as a guide to dealing with the several parts of it."

It is yet, of course, too early to learn what the effect of this recommendation upon Congress will be. Senator Oscar Underwood, formerly administration leader in the House, has spoken publicly in favor of the proposed commission. But it is probably well within the truth to say that the idea does not meet in Washington with that hearty and ready response which goes out to legislative proposals that obviously fill a long-felt want.

In some quarters there is a disposition to say that the proposal is merely a play for time and a scheme to prevent the consideration of the railroad securities bill, originally a part of the Wilson program. Others declare that the country has had enough recently of commissions of inquiry and too little of constructive work growing out of their recommendations. More instantaneously popular with the statesmen here would doubtless have been a strong recommendation of the Rayburn bill, a recommendation that the Interstate Commerce Commission be increased in size so as to be able to handle its growing tasks more readily and promptly, or a recommendation for the creation of a permanent, non-partisan wage board, under the Interstate Commerce Commission, for the purpose of facilitating arbitrations at present conducted under the Newlands act.

The question of time and money will be large factors in any consideration of the President's proposal by Congress this winter. The session will be jammed with business and politics as never before for many years. Revenue is low and much thought must be given to methods of raising it. Regular services of the government will probably be the sufferers from this situation, for appropriations will be cut to the bone and then the bone will be scraped bare. With this condition, it is pointed out here, there will be no haste on the part of either the House or the Senate to rush through a bill embodying the recommendations for a new governmental body, requiring the expenditure for a new purpose of several thousands of dollars.

Of course, if the railroad world should get in behind this scheme and push, it might go through. But so far the idea is a new one to those who follow railroad matters fairly closely, and it would be regarded by many here as surprising if the carriers were all of a sudden to abandon their usual activities in the field of legislation and urge the establishment of a commission for the apparent purpose of reviewing ground already reviewed and re-reviewed year after year in the immediate past.

ROAD TRIALS TO DETERMINE TONNAGE RATING

By E. S. BARNUM

During the past few years there has been considerable discussion on the subject of scientific train loading and it seems to have been generally accepted that the best and simplest system yet devised is that of adjusted tonnage. In this system a car factor is added to the flat tonnage of each car in order to equalize the difference in drawbar pull necessary to haul empty trains and loaded trains of the same total tonnage. It is also a matter of general agreement that, despite lengthy and involved formulas any mathematically determined rating and adjustment factor can be accepted as approximately correct only. It must be checked and modified by actual road observation. With a dynamometer car and a corps of train observers it is a simple matter to obtain accurate ratings for each division. Comparatively few roads, however, are so equipped and in many cases it is necessary that the division staff be able to conduct the necessary tests. In such cases the method of procedure outlined herein may be found of considerable value.

The first step in establishing tonnage rating is the determina-

tion of the ruling grade in each direction over the division under consideration. This should not be a momentum grade but one long enough so that the locomotive will be called upon to develop full tractive effort before the summit is reached; it should not be overlooked, however, that local conditions such as a time table stops may change what would otherwise be a momentum grade into the ruling grade for the division.

With the ruling grade known the make-up of the test trains should next be considered. Under present day conditions with trains made up of both wood and steel equipment it is necessary to have a car factor covering both classes of equipment. The determination of such a factor requires the use of the following test trains:

- All-steel trains, empties
- All-steel trains, loads
- All-wood trains, empties
- All-wood trains, loads
- Combined wood and steel trains, loads and empties

In each case the train should be provided with a single locomotive at the head-end and a pusher at the rear end. With the train at rest on the ruling grade, it should be made up of enough cars so that the head-end locomotive is unable to take slack and start the train alone. Cars should now be taken off by the pusher engine, one at a time, until the head-end locomotive is able to start the train without assistance. The train should be still further reduced until the head-end locomotive is able to start the train and bring it up to a speed of 10 miles an hour on the grade.

After completing the series of tests we have a record of the number and weight of the cars in five trains representing five sets of loading conditions; the gross weight of the cars is considered in each case. If we let *x* represent the adjustment factor the formula for the adjusted tonnage may be stated as follows:

$$\text{Flat tonnage} + \text{number of cars} \times x = \text{adjusted tonnage.}$$

In the table the weight and number of cars are substituted in the above formula for each make-up of the train operating

Data for Determination of Adjustment Factor on a 0.3 per cent Grade. Tractive Effort of Locomotive = 39,688 lb.

Loading conditions	Actual tons	No. cars	Adjusted tonnage equation
(1) Wood, loads and empties.....	2,489	74	2,489+74x
(2) Wood, loads and empties.....	2,549	72	2,549+72x
(3) Wood, empties.....	1,914	107	1,914+107x
(4) Steel, loads.....	2,983	40	2,983+40x
(5) Steel, empties.....	2,152	99	2,152+99x

on a .3 per cent grade. As all of these expressions represent the same tonnage rating they may be equated in pairs and solved for the unknown adjustment factor. The results are as follows:

- 1 and 5, $x = 14$ tons
 - 1 and 4, $x = 14.5$ tons
 - 1 and 3, $x = 17$ tons
 - 5 and 2, $x = 15$ tons
 - 5 and 4, $x = 14$ tons
 - 3 and 4, $x = 16$ tons
 - 3 and 2, $x = 18$ tons
 - 2 and 4, $x = 13.5$ tons
- Average, $x = 15.2$ tons

It will be noted that the expressions in lines 1 and 2 and lines 3 and 5 are not equated since the actual tonnages in each case are too nearly alike.

By substituting the value of the adjustment factor above determined in the formula for adjusted tonnage, the following adjusted tonnage is obtained for each of the trains recorded in the table:

- (1) $2,489 + 74 \times 15 = 3,599$
- (2) $2,549 + 72 \times 15 = 3,629$
- (3) $1,914 + 107 \times 15 = 3,519$
- (4) $2,983 + 40 \times 15 = 3,583$
- (5) $2,152 + 99 \times 15 = 3,637$

$$\text{Average adjusted tonnage} = 3,593$$

With a car factor of 15 tons the adjusted tonnage therefore becomes 3,593 or practically 3,600 tons for the locomotive class and grade conditions assumed. Over a long division it might not be considered good policy from a transportation standpoint to maintain this full tonnage, but this does not alter the fact that for average conditions it is a properly determined tonnage rating. It is, of course, a fair weather rating and should be subject to reductions for adverse weather conditions.

RAILROAD CONDITIONS IN MEXICO

An interesting account of the deplorable condition of the Mexican railways as the result of the warfare in that country is published by the Chicago Daily News from its special correspondent at Mexico City, who reports that instead of being ready to handle the commerce of the country when peace is restored most of the rolling stock of the National Railways system has been destroyed. He quotes Alberto J. Pani, director general of the Constitutionalist lines, as declaring that more than 70 per cent of the standard-gage cars of the system have been destroyed and that less than 16 per cent are available for commercial purposes. The remaining 14 per cent are said to be either laid up for repairs or are being used by soldiers. The correspondent says in part:

"The service is sufficient to move the necessities of life, prevent starvation in the cities and carry those absolutely obliged to travel. Freight for the most part does not move and those who can postpone trips do so rather than face the hardships.

"Closing of the Panama Canal would naturally throw much of that transcontinental business on the road across the isthmus of Tehuantepec. But it cannot handle it, as its one-time rolling stock is gone and the steamship companies cannot get guaranties from the government that their shipments will be protected from bandits in the short distance overland between the oceans. Vessels again are making the long trip around the Horn.

"In Vera Cruz the big warehouses are crammed to the roofs, the terminal company has just notified consignees that storage charges will be doubled, but they are helpless to move the goods even if charges are increased tenfold, as there are not enough cars. With the government recognized, steamships from New York have resumed weekly sailings and are unloading thousands more tons of freight on the Vera Cruz docks.

"Most of the railroad property has been destroyed in the last 18 months. It is the hardest blow at the nation's prosperity in the entire six years of revolutions. Hardly a station has not been burned between Monterey and Mexico City. Along all the roads are overturned locomotives, remains of wrecked cars, twisted rails and other signs of ruin. With railroad transportation cut off cities are isolated, mines, mills and factories are silent, fields uncultivated, stores empty and the countryside relapsing to primitive condition because supplies cannot be brought in or produce shipped out.

"The figures of Director-General Pani on the rolling stock destroyed and that now available for commercial use were:

	—Cars—		—Locomotives—	
	Brd.	Nar.	Brd.	Nar.
In service June 30, 1914.....	15,700	3,267	762	223
Destroyed.....	11,025	1,342	422	74
Remaining.....	4,675	1,925	340	149

These are divided, according to Mr. Pani, as follows:

In military service.....	1,000	300	100	15
In repair shops.....	1,050	125	115	45
In commercial work.....	2,625	1,500	125	89

"These figures were compiled before the destruction of the Orizaba shops and the rolling stock standing in them. Every day has meant more cars and locomotives retired from service on account of wrecks, breakdowns and other incidents. To one who has ridden through the country where two-thirds of the cars one sees are inhabited by officers and soldiers and their families it would appear that Mr. Pani is also very lenient in estimating the number of cars in military service."

Director-General Pani is quoted as saying that the government expects to continue controlling the majority of the stock of the railroads, and that the law which gave the government the right to take over the railroads in war time requires that they be returned to the company in operating condition, and that an indemnity be paid, based on the earnings for the previous five years, with 10 per cent additional. Regarding plans for the restoration of service, he says:

"We plan first to purchase enough passenger cars to re-establish the former service between Laredo and Mexico City. Plans now are being made also for the purchase of freight cars, rails

and other material. A single order for 1,000,000 ties has been placed. As fast as we get possession the shops are opened up. All are at work repairing rolling stock. The military still gets first claim on the service, but each day its demands diminish and in the same proportion is increased the equipment which the roads can place at the disposition of the public for the transportation of passengers and freight."

1914 RAIL FAILURE STATISTICS

The American Railway Engineering Association has just published the statistics of rail failures for the year ending October 31, 1914. This information was compiled from data furnished by various railroads, and includes 6,262,712 tons of rail rolled

the average, the failures per 10,000 tons of Bessemer rail were about twice those of open hearth rail.

The accompanying tables give Association's statistics for the tons of rail, the total number of failures and the failures per 10,000 tons by years.

LOSS AND DAMAGE BUREAU FOR ROCK ISLAND

The Chicago, Rock Island & Pacific announces the organization of a system loss and damage committee with the assistant to the chief operating officer as chairman and the general superintendent of freight claims as secretary. The committee will include the general managers, superintendent of car service, superintendent of refrigerator service, division superintendents, supervisor of weights, chief special agents, special agents, general mechanical superintendents, mechanical engineer of car construction, general storkeeper, general freight agent, general livestock agent, general baggage agent, freight auditors and the freight agents at the principal terminals.

In the circular issued to all operating department employees, A. C. Ridgway, chief operating officer, points out that \$1,385,737, or 3.12 per cent, of the Rock Island freight revenue during the fiscal year 1914 was paid on account of freight loss and damage claims. In 1915, \$1,285,100, or only 2.7 per cent was paid. Had last year's ratio of claim payments to revenue prevailed this year, the road would have paid \$198,292 more than it did pay. It is stated that the efforts of all who aided in bringing about this improved condition are appreciated, but it has been decided to inaugurate a still more vigorous permanent campaign to prevent claims. The circular points out that claim payments are an operating charge, and that claim prevention is an operating function, by the exercise of which to the fullest extent it is hoped to bring about a still further substantial reduction in claim payments through the reorganization of the claim department. On December 1 the office of freight claim agent was abolished. W. O. Bunker, who has been freight claim agent, has been appointed general superintendent of freight claims, reporting direct to the chief operating officer, the duties of the new organization being to prevent loss and damage freight claims through greater supervision and a more intense study of the causes, for which a liberal increase in the traveling force has been provided.

The system loss and damage committee will meet semi-annually during January and July, the first meeting to be held in July, 1916. Other employees will be invited as local conditions at the time justify, and special committees will be appointed to report upon various matters. Action taken at the meetings will form the basis for modifications of the practice from time to

in the years 1909-1914, inclusive. The basis of comparison is the number of failures per 10,000 tons laid for each year's rolling from the date laid until October 31, 1914. A comparison with the statistics compiled last year indicates that on the average there is a gradual decrease for all of the mills in the rate of rail failures of rollings for the successive years since 1908, with which year's rolling the records were started. Also, on

time. The circular says: "Suggestions for the prevention of loss and damage claims made to the general superintendent of freight claims will be cheerfully received and carefully considered. Only through the heartiest co-operation of every employee can the best results be obtained and the management earnestly solicits your full support in helping to reduce the

REMOVAL OF LOCOMOTIVE SMOKE FROM COVERED TRACKS

There are many instances where railroads could make much better use of property at terminals if the smoke from locomotives could be removed. In the larger cities it would mean that

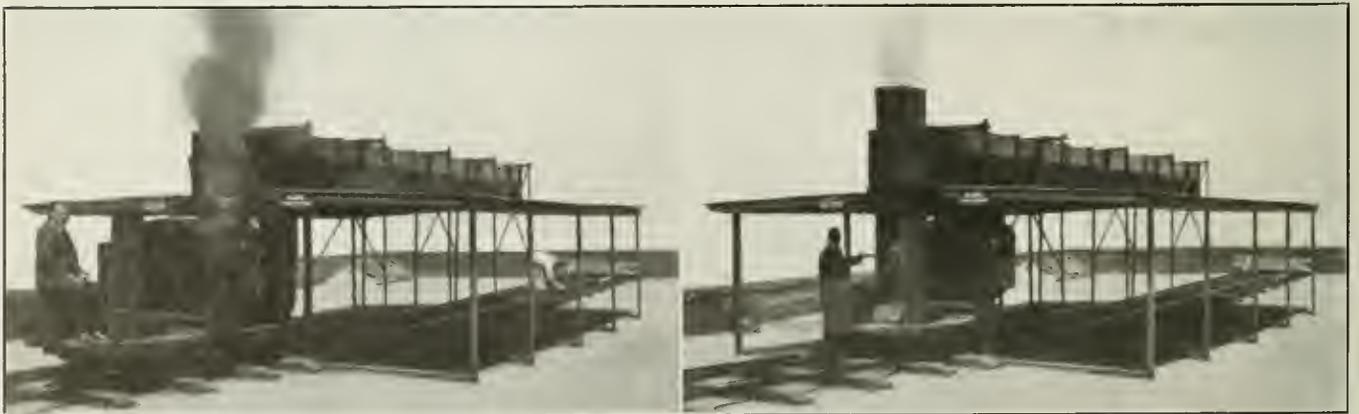

Arrangement for Removing Smoke from Covered Tracks

heavy drain which loss and damage claims are inflicting upon the treasury, and providing better service to the patrons of the road."

In a circular to all freight agents, Mr. Bunker states that after December 1 it will be unnecessary to make over, short and damage reports in duplicate, but one copy of such reports is to be

space now occupied by train sheds and warehouse tracks could be built over with good-size buildings.

A method for removing locomotive smoke from covered tracks has been devised and patented by the Hg Electric Ventilating Company, Chicago. The arrangement is clearly shown in the illustration. A smoke duct is placed immediately above the

Dummy Locomotive Entering Experimental Train Shed

Locomotive in the Train Shed, with Blowers in Operation

made and mailed to the general superintendent of freight claims at Chicago.

The report, including the stub, should be completely filled in with all the information called for, and the stubs must not be detached as is now the practice on some divisions. Reports of adjustments of over and short reports will also be mailed to the general superintendent of freight claims.

middle of the track. This is provided with a series of shutters, each so arranged that as a locomotive passes under them they will be raised by a shoe attached to the locomotive stack. The ducts over the tracks terminate in a main duct extending across the tracks at one end. At the end of the main duct a battery of suction fans is placed for the purpose of creating a substantial initial draft in the ducts. When there are no locomotives under

the ducts a damper automatically closes from the main duct, thus reducing the load on the fan.

To ascertain to some degree the service that could be performed by this system a working model has been constructed on the roof of the company's building at Whiting and Wells streets, Chicago. One of the photographs shows a dummy locomotive entering the train shed. The large volume of smoke is produced by burning tar paper and this smoke is forced up the stack, which corresponds to a full-size locomotive stack, by a high-pressure blower operating at a speed of approximately 3,000 ft. per minute. The stack is equipped with a shut-off gage so as to give intermittent puffs of smoke similar to those obtained on a locomotive when in operation. The second photograph shows the locomotive under the smoke duct, no smoke being apparent under the shed.

CAST STEEL SIDE FRAME WITH RE-ENTRANT FLANGES

The drawing shows a recently developed cast steel truck side frame which is now being used by the Pennsylvania Railroad. The principal feature of the design is the use of channel sections and channels with re-entrant flanges instead of angle and I-sections. The distribution of metal has been carefully considered and a well balanced structure obtained, effecting a uniformity of flexibility under the action of the vertical stresses due to both static and dynamic loading.

Where unbalanced sections are used in the design of cast steel truck frames, the unequal strains set up in the metal in cooling result in a distortion of the casting. This distortion is corrected

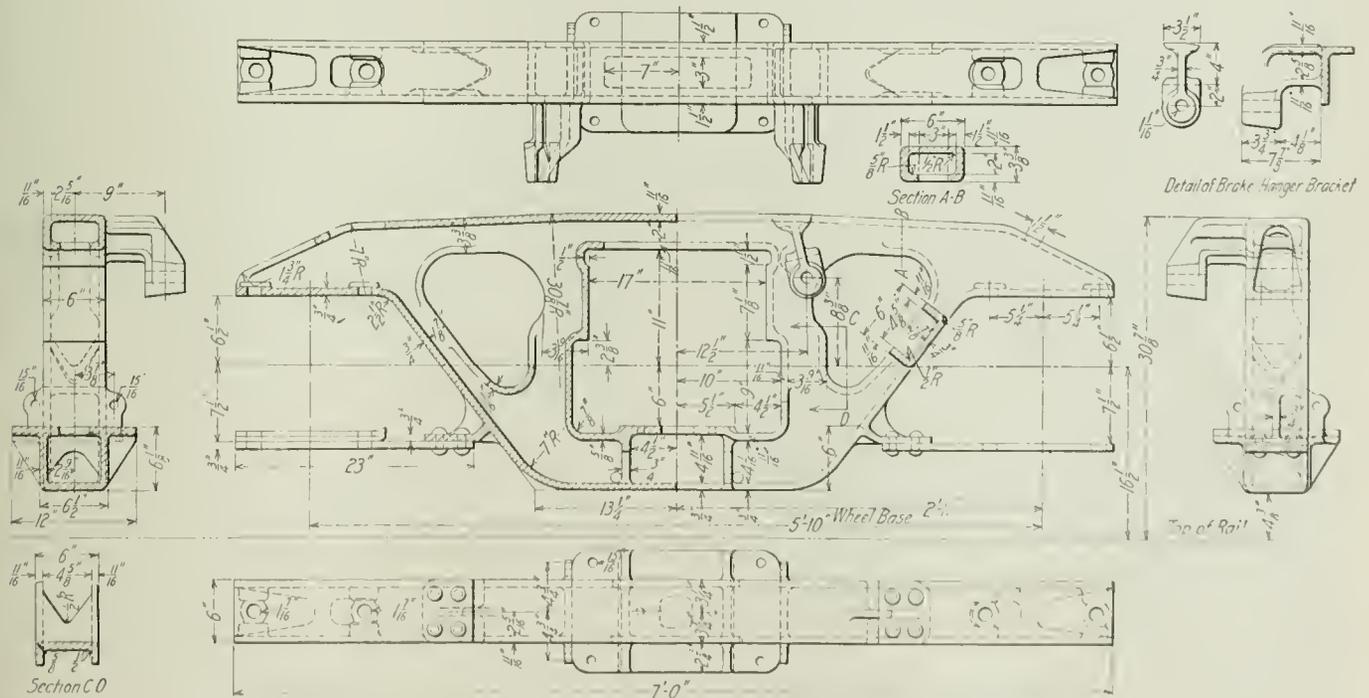

section and, therefore, at a point where the unit stress is considerably reduced.

After thorough tests of the Benners side frame, it has been adopted by the Pennsylvania Railroad and the Pennsylvania Lines West, now being in service under several thousand freight cars. The patents are controlled by Edwin H. Benners, 50 Church street, New York.

BUSINESS REVIVAL IN MEXICO

As a result of a recent conference between Alberto J. Pani, director of the so-called Constitutional Railways of Mexico, which embrace those lines of the National Railways that are in territory under control of General Carranza, and officers of the Southern Pacific, the latter agreed to furnish passenger cars for the through passenger service that has just been established between Eagle Pass and the City of Mexico. Pullman cars are run through between New Orleans and the Mexican capital. Provision has also been made for furnishing freight cars for through service, thus obviating the necessity of transferring goods at the border. The Southern Pacific has announced that freight service has been resumed by way of Eagle Pass, including connections to Monterey and Torreón. Freight may be billed to Eagle Pass and arrangements made through custom brokers for the movement beyond of carload shipments without transfer.

For a long time past the Southern Pacific and the other American roads leading to the border have refused to permit their cars to go into Mexico on account of the danger of destruction by revolutionary factions. The condition in the region that is under control of Carranza has improved until it is now believed

The Benners Truck Side Frame

by placing the casting when cool under the straightening press, the result being that the metal at certain points is subjected to a stress beyond the elastic limit. Certain weak points are, therefore, developed in the casting at the outset, their strength being very uncertain. Cracks tend to start at these points, which result in the ultimate failure of the casting. The symmetrical and well balanced design of the Benners side frame is such that the castings come out of the sand in perfect shape and the use of the straightening press is entirely unnecessary.

The Benners frame has no outwardly extending flanges, such as are found in castings of angular or I-sections, which always tend to develop cracks at the edges. The use of re-entrant flanges brings the edge of the material nearer the neutral axis of the

safe to resume the former practice of running through cars, both passenger and freight. Mr. Pani is now in the East for the purpose of ordering new engines and cars.

The International & Great Northern announces that freight in carloads will now be taken for shipment to Mexico by way of Laredo. The Laredo gateway has been closed to railroad freight traffic since February 10, 1913

A Boston Notice - The Smederesvo Kragujevac railway in northern Serbia, the Mitrowiza Wutschitrn-Katschanik-Skoplje railway in southern Serbia, and the Radujevac Zajecar Knjazevac line on the eastern front must be what they call transconsonantal roads. Youth's Companion.

A GREAT PUBLIC TRUST*

By A. J. COUNTY

Special Assistant to President, Pennsylvania Railroad

Don't balk at the word "trust" because it has been abused. It means confidence, reliance and loyalty. No better words can be used in describing the relation between the stock and security holders of the Pennsylvania Railroad Company and the management and organization of that company. Our trust in this instance consists chiefly of persons, property and money of a value and magnitude exceedingly difficult to express. In the last year over 180,000,000 persons confided the safety of their lives to the employees of the Pennsylvania Railroad system, a total greater than the combined population of England, Germany and Austria-Hungary, and not a single life was lost. Over 300,000,000 tons of freight were also shipped over our lines, having a value to this and other countries of several billions of dollars. To the high standard and regularity of this public service for over sixty-five years the present prosperous position of the state of Pennsylvania is in no small measure due. It has brought a much greater prosperity to the territory it serves by developing the natural resources, such as coal, iron, steel, oil, timber and manufactured products, by making them accessible to the most distant markets. It has also opened up avenues of employment and has been itself a large consumer of these products and materials.

That part of our great trust with which I especially desire to deal is that of money, without which our trust could not have been founded and without which it cannot exist. I cannot accurately estimate the value of lives and property entrusted to the employees of the system, but I can measure the value of the money given to its directors and management to invest in the railroad business. The investment in road and equipment of the 84 companies that now compose the railroad system amounts to about a billion and a half dollars. To best illustrate how this money has reached us and intimate the responsibility of each employee, I have, out of this number of companies, selected the parent—the Pennsylvania Railroad Company—the lines of which extend from the Atlantic ocean on the east to Pittsburgh and Erie on the west. For over six and a half decades this railroad has been in operation, and not only have a great many individuals, including women and children, invested their savings in its stock, but savings funds, insurance companies and many banking and other institutions have long considered its securities an attractive investment for their funds.

Now, instead of investing their moneys in real estate, building associations, saving funds, banking institutions, industrial and manufacturing companies, or the many other diversified fields of investment, these persons had sufficient confidence in the Pennsylvania Railroad management and employees to say, "Here is our money which we have earned in our business and saved from our wages against a rainy day; we, our children and our business are dependent upon the dividends from this investment, and we trust to you so to use and protect it that we will be sure of a reasonable return each year." To-day there are 94,000 stockholders in the Pennsylvania Railroad Company alone, representing all persons in the community, from the working man to the millionaire. Nearly one-half of the total number are women, and the average number of our share holdings is slightly over 100 shares for each stockholder. We must be discharging our trust with fidelity, for the number of stockholders is constantly increasing, not only here, but abroad, notwithstanding the European war and the great need there of converting securities into cash. One of the early incidents in connection with the European war was the prompt steps taken by the Pennsylvania Railroad to insure the regular receipt of dividends by stockholders on the continent. This illustrates the solicitude which the company has for its foreign stockholders under the present trying conditions. A great many of our stockholders, we are happy to say, not only travel upon our trains, but live in the districts where the lines are located, and thus have an opportunity

to observe how the railroad is operated and to judge the ability and faithfulness of the officers and employees.

As the result of the confidence of the stockholders in purchasing the parent company's stock and the willingness of investors to buy its bonds, the company has to-day a magnificent property devoted to the public service representing the investment of a billion and a half dollars in the railroads and equipment constituting the Pennsylvania system. This trust cannot be one-sided; we must preserve it. Each day's work should, therefore, be begun with a sense of the great trust of persons, property and money put into the hands of every officer and employee, and if each one does not satisfactorily perform that duty, it affects the other working trustees. No greater trust exists than the custody of other people's money, and we should work more zealously to safeguard this money than if it were our own. The present great body of employees must follow the successful policies and traditions of their predecessors. To show the spirit which is now and has been a dominant factor in the prosperous condition of the company, I quote from a statement made by a former president of the company over twenty years ago: "The moment this company forgets that its duty is to be at the head of the list of the carrying companies of the United States, and ceases to have the ambition to become the first in the world, that moment do I wish to pass from its management." And to him is attributed the phrase, "Improvements on the Pennsylvania Railroad cannot cease. The end of progress is the beginning of decay."

There are many officers and employees who are stockholders in the company, and we can expect more and nothing would intensify the interest of the employees in the welfare of the company more than for each employee to make it a part of his ambition to own at least one share of its stock. It requires only about \$57 at present to buy a share. We might profit from the example of the many men and women stockholders who have invested their moneys in the Pennsylvania Railroad's stock to create this great public trust. They were given no guarantee that their shares, which have cost them as high as \$75 per share, would receive dividends regularly, but their confidence has been rewarded, for in 65 years not a single calendar year has passed in which a return was not paid them upon their stock.

Suppose for a moment the management and working organization should become disloyal or indifferent to this great trust confided to us. What would be the result? The stockholders would, of course, receive lower and unreasonable returns upon their investment and much suffering would ensue, but this would not be one-sided, for it would quickly react against the officers and employees in a loss of confidence, and if it did not cause a sale of the investment by the owners, there would be a refusal to entrust additional moneys to our management. No law or commission can make people invest money in a railroad, or continue an investment already made. To accomplish that result requires confidence in the integrity and ability of those to whom their money has been entrusted, and an adequate and regular return comparing favorably with the dividends paid by other companies. But with the continuation of that confidence justified by the payment of fair dividends, these people are encouraged to place more of their moneys in our stock and securities. This enables us to continue enlarging the company's plant and facilities to render a high and regular standard of public service sufficient to keep pace with the expansion of business. Their additional investment also insures employment and promotion for ourselves and others, and as a result the stockholders and the employees are performing a valuable public service in the upbuilding and continued prosperity of our great country.

EQUIPMENT ON THE RAILWAYS OF GREAT BRITAIN.—According to the Railway Returns for 1913 there were on December 31 of that year 12,118 tender engines, 8,697 tank engines, and 12,315 tenders on the railways of England and Wales; 2,043 tender engines, 806 tank engines and 2,049 tenders in Scotland, and 631 tender engines, 340 tank engines and 607 tenders in Ireland.

*From the Mutual Magazine published by the Mutual Beneficial Association of Pennsylvania Railroad Employees.

General News Department

The freight house of the Erie Railroad at Paterson, N. J., was partly destroyed by fire on the night of December 7, together with two freight cars. Estimated total loss, \$25,000.

The dining cars of the Pennsylvania Lines west of Pittsburgh now serve coffee (and also other drinks) in vacuum pots which keep the liquids hot throughout a meal, or even for several hours.

The shops of the Missouri, Kansas & Texas at Sedalia, Mo., have been ordered to run seven days in the week; nine hours a day on week days and eight hours on Sundays. A similar announcement was made last week by the Huntingdon & Broad Top Mountain Railroad.

Tests of the operation of electric locomotives on the Chicago, Milwaukee & St. Paul electrified line in Montana were held on December 8, when officers and directors of the road and officers of the General Electric Company made an inspection trip over the line in a test train consisting of three special cars and one of the new electric locomotives. The test included travel at various speeds up to 70 miles an hour and with various tonnages.

Harry E. Duey, a brakeman of the Pennsylvania Railroad has been awarded a medal by the Interstate Commerce Commission for saving the life of a small child which was playing on the track a short distance ahead of the train in which Duey was riding. He climbed out of the cab of the locomotive to the front end and succeeded in pushing the child off the track. His feat was noticed in the *Railway Age Gazette* September 3, page 430. The medal was accompanied by a commendation letter from President Wilson.

The report of the Chicago Association of Commerce committee on smoke abatement and electrification, declaring the electrification of the railroads in Chicago to be financially impracticable, was presented to the Chicago city council at its meeting on Monday evening, and was referred without comment to the railway terminals committee. The council then adopted unanimously by a viva voce vote an order directing the committee on railway terminals to "take up for immediate consideration the subject of electrification of steam railways within the city of Chicago, and to report to the council at an early date such ordinance or ordinances as in its judgment may be necessary to bring about the adoption of electricity as a transportation power where steam power is now employed." This action was also taken practically without discussion.

A Remarkable Improvement in Train Loading

In an editorial in last week's issue attention was called to the large increases in freight train loading in 1915 as compared with 1914, shown by nearly all of the roads whose annual reports we had received. We have since received the report of the Chicago, Terre Haute & Southeastern, which has increased its average number of tons of freight per train mile from 558.81 in 1913 and 669.01 in 1914 to 739.54 in 1915.

Land Valuation

Thomas W. Hulme, general secretary of the Presidents' Conference Committee for the federal valuation of the railroads, has sent a circular to the carriers suggesting that where the rights of way or other operating property of two or more carriers are so located or are of such character that their values are necessarily related, such carriers can well co-operate in securing information as to the value of this property, in this way avoiding duplications, decreasing the cost of making the valuation and securing values which are in harmony and which the carriers will be able to sustain.

It has also been arranged that territorial meetings be held at various points, attended by representatives of the carriers to discuss the progress made in securing land cost data and other problems which are arising from time to time.

American International Corporation

Frank A. Vanderlip, president of the National City Bank, New York City, announces that this concern has been formed for the purpose of establishing trade relations with foreign countries. The corporation has 20 directors, representing all lines of business. Included in the list are William E. Corey, James J. Hill, Otto H. Kahn, Robert S. Lovett (chairman of the executive committee of the Union Pacific), Charles A. Stone, and Edwin S. Webster. Mr. Vanderlip says that the corporation is not a mere money-making enterprise; it will stand for the development of America along international lines, and will endeavor to assist in financing the rehabilitation of industries in foreign countries.

J. G. White Co. in Brazil

The Latin-American Public Works Corporation is a concern which has been organized in the interests of the J. G. White Management Corporation, New York, for operations in foreign countries; and it is announced that negotiations are going on which are expected to result in a contract under which the Brazilian State Railways will be operated by the J. G. White interests. Reports indicate that negotiations are well on the way to completion; but the principal holders of the bonds of these Brazilian roads are in England and France, and to get their approval is likely to require several months.

The new project does not call for ownership by American interests of the Brazilian railway system. That ownership will remain with the Brazilian Government. The Government has leased its railways to English and French capitalists for a period of years, and it is understood that the Latin-American Public Works Corporation merely plans to take over the lease for the unexpired term. The project, however, will carry with it the necessity of financing for new equipment and possibly for new construction. This financing may call for the sale of South American securities in the New York market.

Recommendation on Change in Fiscal Year

At the last meeting of the National Association of Railway Commissioners in San Francisco the committee on statistics and accounts, of which B. H. Meyer of the Interstate Commerce Commission was chairman presented the following recommendation:

"In connection with the matter of annual reports required of carriers, representation has recently been made by the Association of American Railway Accounting Officers that the reporting year should be changed to the calendar year. The reasons urged for the change seem to have much merit. One obstacle in the way of change lies in the fact that several state statutes definitely fix June 30 for the close of the reporting year. The federal law gives to the Interstate Commerce Commission the option of changing this by a general rule to December 31, so far as reports to that commission are concerned. It is recommended by this committee that the various state commissions seek to procure corresponding amendment of state laws so as to give the state commissions the option of changing, if after a full and careful consideration of the matter they shall conclude that such change of date is desirable."

National Foreign Trade Convention

The National Trade Council has announced the preliminary program for the third national foreign trade convention to be held at New Orleans, La., on January 27, 28 and 29, by the council in co-operation with the New Orleans Association of Commerce. The convention has been called to enable American business men constructively to discuss the necessary national policy for extending foreign trade, and the council will lay before the convention results of investigations of the most pressing problems in connection with foreign trade. The time of the convention will be largely reserved for general discussion and there will be group sessions in which all delegates will have an

opportunity to participate. Among the prepared addresses which have been announced are the following: "World Trade Conditions After the European War," by Alba B. Johnson, president Baldwin Locomotive Works; "Foreign Investment of American Capital as an Aid to Our Foreign Trade," by James A. Farrell, president of the United States Steel Corporation. The group sessions will include a discussion on "Co-operative Foreign Selling," by Charles M. Muchnic, vice-president of the American Locomotive Sales Corporation; and "The Smaller Manufacturer in Foreign Trade," by William Pigott, vice-president, Seattle Car & Foundry Company. At the banquet on January 28, Fairfax Harrison, president of the Southern Railway, will speak on "The Relation of American Railroads to the Development of Foreign Trade." Special facilities will be afforded those seeking detailed information at the convention regarding either foreign markets or trading methods, a number of broadly experienced exporters and importers having offered their services for consultation by delegates.

Another Investigation of the New Haven

The investigation of the affairs of the New York, New Haven & Hartford, by the Public Service Commission, by order of the legislature of Massachusetts, was begun at Boston on Tuesday of this week, as had been announced. The action of the legislature, last spring, in empowering the railroad company to proceed with its plans for reorganization appears to have been conditioned on the approval of numerous past acts by the Public Service Commission, or on approval by the legislature of a report to be made by the commission after making an investigation.

President Howard Elliott laid before the commission a long statement answering questions which had been sent to the company some time since. In opening the hearing the chairman of the commission said that the road had done numerous things under its Connecticut or its Rhode Island charter which the State of Massachusetts did not approve, and the purpose of the hearing was to see what could be done about this. It is desired to determine what ought to be done to bring the New Haven system into harmony with the laws of Massachusetts. The principal subject in the mind of the chairman, apparently, is that of the investments of the road in outside property.

Mr. Elliott, explaining the acquisition of the Central New England, said that this line had been a boon to New England commercial interests. More than 1,000 cars a day have come into New England over this line during the past month. Control of the New York, Ontario & Western helps the New Haven to protect its coal supply and also gives it a voice in making through freight rates to the west. The New York, Westchester & Boston does not yet earn its operating expenses, but in time it will prove of great value to the New Haven. The New Haven's half interest in the New York Connecting Railway will be useful as relieving congestion at the Grand Central Terminal and cheapening the transfer of freight to and from New Jersey lines. The Rutland Railroad is valuable as a route to Montreal and also a freight route to Chicago. Mr. Elliott hopes that after a time the government will allow this road to resume the running of boats to and from the Great Lakes.

American Railway Association Plan for Remedying Congestion

The Committee on Relations Between Railroads of the American Railway Association has adopted resolutions, which have been approved by the Executive Committee, proposing changes in the demurrage rules for the purpose of relieving the congestion of export freight at the ports as well as to promote a freer distribution of freight cars at all times. Arrangements were made for the resolutions to be presented to the Interstate Commerce Commission at Washington on Thursday of this week with a request for immediate action, by a subcommittee of the Committee on Relations Between Railroads, consisting of Arthur Hale, chairman Committee on Relations Between Railroads; C. M. Sheaffer, general superintendent transportation, Pennsylvania Lines; W. A. Worthington, vice-president and assistant to the chairman, Southern Pacific; E. H. Coapman, vice-president and general manager, Southern; George E. Evans, fourth vice-president, Louisville & Nashville, and W. L. Park, vice-president, Illinois Central. The resolutions are as follows:

"Whereas, there exists throughout the United States a shortage of freight cars, due, largely, to the abnormal exporting of the products of agriculture, merchandise and manufactured articles, together with an insufficiency of ocean transportation

facilities, causing to be imminent and certain a rapid extension of such car shortage to every part of the United States, threatening to restrict and curtail very seriously business transactions and commercial activities of every description,

"Whereas, a large amount of export commodities, particularly war munitions, is, on account of uncertainty of the condition of the monetary exchange and credit, due to the European war, necessarily contracted for on a cash basis loaded upon cars without regard to the probabilities of trans-shipment at United States ocean ports, resulting not only in the misuse of freight cars, but also in abnormal detention, causing congestions and delays to normal business and traffic; and,

"Whereas, since the present demurrage rate was first established, the cost of car construction, the carrying capacity and, consequently, the earning power of a freight car has been greatly enlarged; and,

"Whereas, the adoption of a higher demurrage rate in California, which was approved by the Interstate Commerce Commission, December 2, 1912, and in Arizona, with no average agreement, has resulted in smaller demurrage collections in the aggregate, and in the practical elimination of undue detention to equipment; and,

"Whereas, the Canadian railroads have, at times, invoked the good offices of the railroad commission of that country to make effective and operative a progressive demurrage rate in excess of the normal rate which, while proven effective to obtain the release and prevent the misuse of freight equipment, and to be in the general interest of the public welfare of that country, at the same time when in effect operates, indirectly, to the disadvantage of the public, the shippers and the railroads of the United States; and,

"Whereas, the Committee on Relations Between Railroads of the American Railway Association has been specially directed to take such action as the exigencies of the situation warrant and has, after careful investigation and deliberation, concluded that the most expeditious and effective methods to relieve the situation are to reduce the free time at the seaboard and gulf ports, both on domestic and export business (which subject is now before the Interstate Commerce Commission), and by the adoption of a progressive demurrage rate, and by the elimination of Rule 9, Average Agreement, which has from the experience of the past several years been clearly demonstrated to be one of the most prolific sources of freight car detention, be it therefore

"Resolved, that the demurrage rules be amended as follows:

48 hours free time, after which a charge of

\$1 per day for three days,

\$3 per day for next succeeding three days,

and thereafter \$5 a day (the present rates on refrigerator cars), such rates to be submitted to the Interstate Commerce Commission, with the request for its prompt approval, in order to enable the carriers to promulgate and make effective at once these rates on all freight equipment,

"Resolved, that the carriers be authorized by the Interstate Commerce Commission to immediately cancel Rule 9, Average Agreement,

"Resolved, that arrangements be made to present at once this resolution to the Interstate Commerce Commission, and to furnish that body with such information, in connection with the conditions above recited, as may enable and induce that honorable body to act in the premises with such promptness as the exigencies of the situation demand,

"Resolved, that in the event of unforeseen obstacles to the immediate action on the part of the Interstate Commerce Commission, the Committee on Relations Between Railroads, together with the Executive Committee, be called into emergency session at Washington, to take such further steps as may be deemed necessary in the premises, to the extent of petitioning the Congress to confer upon the Interstate Commerce Commission such powers as may be lacking, or taking such other action to remedy the situation as may be deemed necessary."

Trial of the New Haven Directors

Charles S. Mellen, again on the stand in the trial of the 11 New Haven directors in the Federal Court in New York, admitted last Thursday (December 2), that the New Haven spent probably \$120,000 to block proposed extensions of the Grand Trunk into southern New England. The Grand Trunk had proposed to build a line from a junction with its subsidiary, the New London Northern, operated by Central Vermont, at Palmer, Mass., to Providence, R. I. According to Mr. Mellen, the real contest

between the two systems began in 1910, when he and C. M. Hays (then president of the Grand Trunk) agreed, as Mr. Mellen thought, that the Grand Trunk would sell the New London Northern to the New Haven and the latter would transfer control of the New York, Ontario & Western to the Grand Trunk. Immediately thereafter, however, Mr. Hays announced his intention of building from Palmer to Providence, but, because the Grand Trunk proposed, according to Mr. Mellen, to use the New Haven's facilities in Providence and to eliminate grade crossings, entailing expense to the New Haven, the latter opposed the charter in the Rhode Island legislature. Mr. Mellen also spent \$50,000 in the "collection and dissemination" of information to show that the Grand Trunk was violating obligations to the Canadian government in building the extension. After that, Mellen said, he bought a couple of farms in the neighborhood of Southbridge and Palmer, one of which "was peculiarly valuable as a location for a railroad. It was a perpendicular farm located in a notch," he said, "and I hoped to spend my declining years on it."

Mr. Mellen also spent about \$60,000 of New Haven money in opposing the other project of the Grand Trunk, the line from White River Junction to Boston. He at once took steps to extend the Sullivan County Railroad, a Boston & Maine subsidiary parallel to the Central Vermont.

After Mr. Hays' death in the Titanic disaster, Mr. Mellen came to an agreement with his successor, E. J. Chamberlain, whereby presumably the Grand Trunk was to stop work on the Providence extension in return for trackage rights over the New Haven. Work was stopped in October, 1912, and simultaneously the construction of Sullivan County extension was abandoned. The agreement, however, was never put in documentary form, and never, in fact, got beyond the stage of a memorandum.

The stoppage of work on the Palmer-Providence line aroused considerable popular feeling in New England and resulted at once in a grand jury investigation. Mr. Mellen testified that he had asked to go before the grand jury, for he desired to take all the responsibility in order to shield J. P. Morgan. "I thought," he said, "that by telling a good, straightforward story to the grand jury I could put the whole investigation on the bum. I thought I could straighten the whole matter out satisfactorily. I wanted to take the responsibility and keep Morgan out of it. I was afraid he had done something—I didn't know what—and I wanted to keep him out of the nasty mess."

Mr. Mellen completed his testimony for the government on Friday. On Monday he was subjected to cross examination, and in answer to questions by Charles F. Choate, for the defense, declared that it was the Federal government and not the ex-directors who were responsible for the financial misfortunes of the New Haven. The New Haven's ex-president told of the efforts he took to limit the grand jury investigation to the Grand Trunk deal. The New Haven's financial affairs were at that time, January, 1913, in a critical condition. "In January, 1912, we had issued a series of one-year notes, and we had a comprehensive plan for funding them. After what happened it failed, and we had to renew the notes in December, 1912, for another year at a higher rate of interest.

"Mr. Swacker's investigation did exactly what I expected it to do. It practically ruined the New Haven for a time, if not permanently. I could not imagine anything worse happening to the company than what did happen through the intervention of the Federal government. Up to the time of the government's investigation, or persecution, or whatever you like to call it, the company's reputation had been of the highest and its shares were selling far above par.

"I knew if I could limit the scope of the investigation it would be to the advantage of the road, and I knew it would mean my own reindictment and destruction. They accomplished that at once, and later they accomplished the other. We met refusal when we wished to renew our notes. Our stock came tumbling down. We had to carry a great floating debt, and we have not been able to fund it to this day."

Mr. Mellen thought that the Providence extension would never have been profitable; that it was not designed for the purpose of legitimate competition with the New Haven, but as a threat to force the hand of the New Haven. In 1908 the New Haven entered into an agreement with the Canadian Pacific whereby all of the New Haven's territory was opened to that road through Newport, Vt., and the Boston & Maine. Mr. Mellen was ready to give the Grand Trunk the same advantages, but Mr. Hays wanted much more.

Mr. Mellen in the cross examination on Tuesday brought out

that in his opinion the acquisition of other rail lines in practically every case resulted not only in efficiency of operation, but in better service and lower rates for the territory served.

The defense won an important point in the afternoon when Judge Hunt ruled that the defense might show the legislative enactments of various states and decisions of official boards, departments or commissions as their justification for acts now alleged by the government to have been in furtherance of a conspiracy to monopolize the transportation facilities of New England. Later, however, the judge limited this ruling to cases where the records should show that the action was definitely based on the alleged cause.

Mr. Mellen in the cross-examination on Wednesday enlarged further upon the benefits gained by the consolidation of the railway interests of New England and drew attention to the favorable opinions expressed in this connection by various governmental and other authorities. One interesting thing he brought out was the value of a united system from a military point of view.

"The route from New York to Boston by the New Haven," he explained, "from Boston to Portland by the Boston & Maine, from Portland to Bangor by the Maine Central, and from Bangor to St. John's, New Brunswick, by the Canadian Pacific Railway, is the most important military base line in the country. It is a most useful thing to the country at large to have it nearly all under one control."

Report on Weedon Derailment

The British Board of Trade has issued the report of Lieut. Colonel Druith on the wreck of the Irish Mail of the London & Northwestern, near Weedon, on August 14th last, when 10 passengers were killed and 21 were injured. Colonel Druith finds that the derailment was caused by the loss of a split pin from the end of one of the crank pins of a locomotive passing at high speed on an adjoining track. The loss of the split pin caused the screw washer holding the front end of the side rod, on the leading crank pin, to back off, resulting in the dropping of the front end of the side rod. This train was stopped before serious damage resulted, none of the wheels leaving the track; in dropping, however, the end of the side rod was bent outward, and in striking the end of a tie on the adjoining track, it pushed the track sideways enough to throw both rails partly out of line and narrow the gage. The Irish Mail came on a few seconds later and was derailed, as described.

The split pin, the loss of which was the primary cause of the accident, had been applied a few minutes before while the train was standing at the Rugby station, and the investigation indicated the probability that in the endeavor not to delay the train, sufficient attention was not given to the proper splitting of the pin after it was driven home. The crank-pin washer had right-hand threads and, being on the right-hand side of the engine, would be loosened and unscrewed by the friction of the side rod end when running ahead. It was suggested at the inquiry that the screw washers on the right-hand side of the engine should be fitted with left-hand threads, so that the tendency would be for the crank pins to screw themselves into the washer when the engine is running. Commenting on this point, Colonel Druith says: "This is a matter for experiment, and if the result is in accordance with the suggested action, it is certainly a desirable change to make."

A Complaint to the Governor

John J. Dillon, commissioner of the New York State Department of Foods and Markets, who has ordered ten carloads of alfalfa to be sent from Syracuse to New York City, but who has been notified by the Delaware, Lackawanna & Western that the freight cannot be taken, has complained to the governor of the state, charging that the action of the road is instigated by the dealers in hay in New York who receive their supplies from points outside of New York state and who fear the competition of the alfalfa. The commissioner says that he is endeavoring to aid the Alfalfa Growers' Association of Onondaga county, the members of which have 30,000 tons of surplus product for sale. It is said that the New York Central and the Lehigh Valley had refused to take the freight before it was offered to the Lackawanna. The Lackawanna agreed to have ten cars in New York by November 30, but subsequently notified the shipper that the freight could not be taken because of the congested condition of the railroad.

Bureau of Explosives

N. D. Maher, president of the Bureau for the Safe Transportation of Explosives and other Dangerous Articles (75 Church street, New York) announces that J. E. Fairbanks has been appointed secretary and treasurer in place of W. F. Allen, deceased, and that H. J. Foster has been appointed assistant treasurer.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, date of next or regular meetings, and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

- AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—F. A. Pontious, 455 Grand Central Station, Chicago. Next meeting, January, 1916, Atlanta, Ga.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.
- AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York. Annual meeting, December 7-10, 1915, New York.
- AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, Supt. Timber Preservation, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 18-20, 1916, Chicago.
- ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—G. P. Conrad, 75 Church St., New York. Next meeting, December 14-15, 1915, St. Louis, Mo.
- CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.
- CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.
- CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.
- ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh, Pa.
