an aggregate premium of a little over \$56,000 yearly. One-half of this is paid by the employees and one-half by the company.

Summary of Revenues and Expenses of Large Steam Roads

The following figures were compiled by the Interstate Commerce Commission from monthly reports of operating revenues and expenses of large steam roads for June, 1915. No reports are included for roads whose operating revenues for the year ended June 30, 1915, did not reach \$1,000,000.

noticed recently by the Brooklyn Rapid Transit Company, Brooklyn, N. Y. (August 20, page 361), that over 5,200 employees have applied for insurance under the plan. A notice has been sent to all employees that the insurance will go into effect, as to all those who have applied for it, at noon, September 15. The applications, which had been received up to the 15th, and which constitute, therefore, the initial group, involve

Santa Fe Invites Suggestions from Stockholders

The Atchison, Topeka & Santa Fe, in sending out its September dividend checks and notices of the annual meeting to be held on October 28, in addition to asking for the usual proxy, has included the following paragraph:

"The fact that stockholders of the large corporations of the country seldom attend meetings or exercise their right to criti-

cize the management, or otherwise express opinion, is often commented on unfavorably and is sometimes claimed to be responsible for instances of mismanagement resulting in disaster. Your directors, in soliciting your proxy, do so because it is necessary that a quorum be present either by representation or in person. Any stockholder has the right, and is hereby requested, to make either at the meeting or in writing such suggestions or criticisms as may appear to him for the advantage of the company."

Texas Railways Urge Laws Against Trespassing

The Texas railways are conducting a campaign in the interest of adequate laws to prohibit trespassing. As a part of this campaign the Central Safety First Committee of the International & Great Northern has issued a bulletin calling attention to the large number of trespassers killed on the railways every year, and urging school teachers, employers of labor, ministers, parents and others to do everything in their power to educate those within their sphere of influence regarding the evils of trespassing. The circular states that during the last 13 years the International & Great Northern has carried on its trains nearly 20,000,000 passengers without killing or even maiming a single passenger in train accidents, "which proves that the International & Great Northern is a very safe road for passengers"; but that during the same period its trains killed or seriously injured over 500 people while trespassing on its yards and along the right of way, "which proves that the I. & G. N., like other railways, is a very unsafe place to walk upon."

Vice-President W. A. Webb, of the Missouri, Kansas & Texas, has issued a similar circular to all employees of the operating department, in which he says that more lives would be saved by the enforcement of laws against trespassing than by providing steel cars, installing block signals and abolishing grade crossings.

Pan-American Scientific Congress

The second Pan-American Scientific Congress is to be held at the office of the Pan-American Union, Washington, D. C., December 27, 1915, to January 8, 1916. The program is divided into nine main sections. The engineering section will be presided over by Gen. W. H. Bixby, formerly chief of the United States Army Engineers, as chairman, and the section on transportation, commerce, finance and taxation by L. S. Rowe, as chairman. The meetings of the engineering section will be devoted to such subjects as relate to water and land transportation and various problems of interest in the engineering sciences. The engineering committee has proposed for the series of special Pan-American conferences to be discussed by all of the participating countries the following topic: "Desirability and practicability of establishing a uniform railroad gage in Pan-America, and especially in Central and South America."

Railway Fire Protection Association

The second annual meeting of the Railway Fire Protection Association will be held October 5, 6 and 7, 1915, in the east room of Hotel La Salle, Chicago. The program of the convention follows:

TUESDAY, OCTOBER 5.

Morning Session, 10 A.M.

Roll call; Reading of minutes of last meeting; address of president; report of executive committee; address by T. C. Powell, vice-president, Alabama Great Southern.

Afternoon Session, 2 P.M.

Report on rules and regulations for the prevention of fire and protection of property. Robert Scott (A. C. L.) chairman.

WEDNESDAY, OCTOBER 6.

Morning Session, 10 A.M.

Report on fire prevention and protection in coaling stations. A. D. Brooks (I. C.) chairman.

Report on fire prevention and protection in grain elevators. Anson Murphy (A. G. S.) chairman.

Report on fire prevention and protection in terminal, classification and storage yards. G. A. Hays (U. S. Steel Corp.) chairman.

Afternoon Session, 2 P.M.

Report on cotton hazards. E. B. Berry (So. Ry.) chairman.

Report on oil burning appliances. J. S. Richards (Sunset Central) chairman.

Report on hand fire extinguishing apparatus. N. Searle (So. Pac.) chairman.

Visit to Illinois Central shops at Burnside.

THURSDAY, OCTOBER 7.

Morning Session, 10 A.M.

Report on statistics and forms. F. R. Auston (C. & E. I.) chairman.

Report on electric hazards. T. S. Potts (C., H. & D.) chairman.

Address by F. A. Silcox, district forester of the United States Forest Service, at Missoula, Mont., entitled, "The Railroads and Forest Fires."

Report on locomotive spark and ash pan hazard. H. W. Colson (A., B. & A.) chairman.

Afternoon Session, 2 P.M.

Report on fire prevention and protection of stations, freight depots and warehouses. W. S. Maryon (So. Ry.) chairman.

Unfinished business, new business; election of officers and executive committee.

Chief Interchange Car Inspectors' and Car Foremen's Convention

The seventeenth annual convention of the Chief Interchange Car Inspectors' and Car Foremen's Association was held at Murphy's Hotel, Richmond, Va., September 14 to 16, 1915, F. H. Hanson, assistant master car builder, New York Central, presiding. The meeting was opened with an invocation by the Rev. J. J. Scherer, and the association was welcomed on behalf of the state of Virginia by Attorney-General John G. Pollard, representing Governor Stuart, and on behalf of the city of Richmond by Mayor Geo. Ainslie. T. J. O'Donnell, arbitrator, Niagara Frontier Car Inspection Association, Buffalo, N. Y., responded for the association. President Hanson then delivered an address, calling attention to the greater uniformity of interpretation and improved enforcement of the rules of interchange resulting from the work of the association and laying stress on a number of conditions where further improvement is needed. H. Boutet, chief interchange car inspector, Cincinnati, Ohio, briefly sketched the development of the association and brought out the fact that a gain of 61 had been made in membership during the past year. After the reading of a number of communications the association took up the discussion of the revised rules of interchange.

The following supply companies had exhibits at the convention:

Boss Nut Company, Chicago and New York.—Boss nuts. Represented by J. W. Fogg.

Duff Manufacturing Company, Pittsburgh, Pa.—No. 119 Barrett jack; 50-ton high-speed ball-bearing jack with Cyclone lowering device; 25-ton journal jack. Represented by E. A. Johnson and C. A. Methfessel.

Grip Nut Company, Chicago.—Several types of Grip nuts; Riehle testing machine demonstrating their holding power and durability under repeated reapplications. Represented by H. E. Passmore.

Hale & Kilburn, Philadelphia, Pa.—Passenger car seats. Represented by R. H. Pilson.

McCord & Co., Chicago.—Pressed steel journal boxes. Represented by H. E. Creer.

Norton, A. O., Inc., Boston, Mass. High-speed self-lowering jack. Represented by H. J. Wilson.

Standard Heat & Ventilating Company, Richmond, Va.—Unitherm steam heat equipment, Standard end train line valve and steam heat hose couplers; Standard ventilator. Represented by L. B. Rhodes.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, date of next or regular meetings, and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—H. C. Boardman, D. L. & W., Hoboken, N. J. Next meeting, October 21-23, 1915, Boston, Mass.

AMERICAN ELECTRIC RAILWAY ASSOCIATION.—E. B. Burritt, 8 W. 40th St. New York. Annual convention, October 4-8, 1915, San Francisco, Cal.

AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOCIATION.—H. G. McConaughy, 165 Broadway, New York. Meetings with American Electric Railway Association.

AMERICAN RAILWAY ASSOCIATION.—W. F. Allen, 75 Church St., New York. Next meeting, November 17, 1915, Chicago.

AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 19-21, 1915, Detroit, Mich.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.

ASSOCIATION OF MANUFACTURERS OF CHILLED CAR WHEELS.—George W. Lyndon, 1214 McCormick Bldg., Chicago. Annual meeting, 2d Tuesday in October, 1915, New York.

ASSOCIATION OF RAILWAY ELECTRIC ENGINEERS.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Annual meeting, October, 1915.

BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meetings with American Railway Bridge and Building Association.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—T. I. Goodwin, C. R. I. & P., Eldon, Mo. Next meeting, October 19-21, 1915, St. Louis, Mo.

MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—A. P. Dane, B. & M., Reading, Mass. Next convention, September 14-16, 1915, Detroit, Mich.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—E. N. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.

RAILROAD CLUB OF KANSAS CITY.—Claude Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Saturday in month, Kansas City.

RAILROAD MEN'S IMPROVEMENT SOCIETY.—J. B. Cuffan, Erie R. R., 50 Church St., New York. Meetings, alternate Thursdays, October to May. Assembly Rooms of Trunk Line Association, 143 Liberty St., New York.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.

RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, 1063 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.

RAILWAY FIRE PROTECTION ASSOCIATION.—C. B. Edwards, Fire Ins. Agt., Mobile & Ohio, Mobile, Ala. Next meeting, October 5-7, 1915, Chicago.

RAILWAY REAL ESTATE ASSOCIATION.—F. C. Irvine, 1125 Penn. St., Pittsburgh, Pa. Next meeting, October 13, 1915, Chicago.

RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

SALT LAKE TRANSPORTATION CLUB.—R. E. Rowland, David Keith Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

SOCIETY OF RAILWAY FINANCIAL OFFICERS.—Carl Nyquist, C. R. I. & P., 1134 La Salle St. Sta., Chicago. Annual meeting, October 19-21, Colorado Springs, Colo.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Piedmont Hotel, Atlanta.

TOLEDO TRANSPORTATION CLUB.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.

TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.

TRAFFIC CLUB OF NEWARK.—John J. Kautzmann, P. O. Box 238, Newark, N. J. Regular meetings, 1st Monday in month, except July and August, The Washington, 559 Broad St., Newark.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Hotel Astor, New York.

TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Gen'l Agt., Erie R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings bi-monthly, Pittsburgh.

TRAFFIC CLUB OF ST. LOUIS.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.

TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, Superintendent's office, N. Y. C. R. R., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. R. R., East Buffalo, N. Y. Annual meeting, September 7-19, 1915, Chicago.

UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, 1111 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.

WESTERN CANADA RAILWAY CLUB.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Building, Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.

WESTERN SOCIETY OF ENGINEERS.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings. Annual meeting, 1st Wednesday after 1st Thursday in January, Chicago.

Traffic News

The Chicago, Milwaukee & St. Paul, on September 15, added an observation car service to all of its through trains between Chicago and the Pacific coast.

Numerous facts which are of interest in connection with the movement to secure South American trade for industries in this country have been made the subject of a letter which the Pennsylvania Railroad has sent to the boards of trade of 70 cities and towns along its lines.

The Canadian Pacific has issued a new tariff covering shipments of fruits and vegetables from British Columbia to eastern points, making a number of important reductions in rates to enable the producers to reach eastern markets in an extensive territory. Many of through rates are provided to stations off the lines of the Canadian Pacific.

The Northern Pacific has notified the Public Service Commission of Washington of its decision not to make a reduction of rates asked by eastern Washington and Oregon farmers for the shipment of wheat eastbound for export. The officers of the road do not believe that any rate it could afford to make would divert the crop from the Puget sound ports.

The Pennsylvania Railroad has issued a new and enlarged edition of its directory of fruit, vegetable and produce growers. It will contain the names of more than 10,000 farmers, truckmen and orchardists in New York, New Jersey, Pennsylvania, Delaware, Maryland and Virginia. The directory will classify each grower according to the principal character of his produce, and there will be six classes, namely: Apples, white potatoes, sweet potatoes, cabbages, onions and general produce.

An involuntary petition in bankruptcy against the Chicago, St. Louis & Gulf Transportation Company, operating a steamboat line between LaSalle, Ill., and New Orleans, La., via the Illinois and Mississippi rivers, was filed in the United States district court at Chicago last week, and a receiver was appointed. This company began service a few months ago after making many announcements of its intention to operate a fast service at rates far below those of the railroads.

The western roads presented at Washington this week, Wednesday, their petition to reopen the freight rate case. They ask the commission to vacate its order permitting certain advances and to allow the carriers to submit arguments to show that the increases which have been allowed are not sufficient to afford reasonable compensation. Another petition was submitted by W. E. Lamb, attorney for the Illinois Coal Operators' Association and others, which recited that the order entered by the commission had resulted in making rates on coal from points in Illinois south of Chicago relatively higher than from lake points.

Traffic—Evening Classes in Traffic Work

The LaSalle Extension University of Chicago, which for several years has conducted correspondence courses in railway traffic work, announces the inauguration of a plan of resident class work in specialized courses relating to railway traffic matters, to begin on September 28. The instruction will take up, among other subjects, railway organization and management, government regulation, the legal aspect and liability of common carriers, classification and rate-making methods and principles, ocean traffic and trade, foreign commerce, railway accounting and industrial traffic organization. The class work will be conducted in the evenings at the Lake View building, 162 Michigan avenue, Chicago, where commodious class rooms have been established. In addition to the university officers and instructors the class room work will be presided over by practical traffic men in railway and industrial service. The traffic work of the LaSalle Extension University is in charge of John P. Curran, who has been connected with the Central Freight Association for six years, and a large number of prominent railway officers and industrial traffic men constitute the advisory board. Several railways have arranged to pay for courses for their employees.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The New Orleans Joint Traffic Bureau has filed a complaint with the Interstate Commerce Commission against the rates on beet and cane sugar from New Orleans to points in the south-east, which are alleged to be discriminatory in comparison with the rates on similar commodities from New York and Philadelphia to the same destinations in the southeast.

Complaints of merchants of Charleston, S. C., against the principal railroads for alleged discrimination in freight rates in favor of Wilmington, N. C., were the subject of hearings by George N. Brown, representing the Interstate Commerce Commission at Charleston, September 10 and 11. The hearing was adjourned to a date, to be named, in the latter part of October, at Washington.

Free Storage of Coal at Perth Amboy, N. J.

Plymouth Coal Company v. Lehigh Valley. Opinion by Commissioner Hall:

For more than 25 years prior to June 1, 1913, defendant's tariffs provided that cars containing anthracite coal forwarded to Perth Amboy for transshipment by boat and held at that port would not be subject to car-service charges. It was further provided that limited free storage at Perth Amboy was available to shippers and that space there would be allotted to them on the basis of the tonnage for the previous year of their respective shipments over the piers. Such free storage was limited in time to a period of two years. After the expiration of that time a charge of 15 cents per gross ton per month or fraction thereof was assessed.

Effective June 1, 1913, defendant filed tariffs canceling the provisions outlined above and providing, first, that the privilege of storing coal in bins at Perth Amboy had been withdrawn and that anthracite coal which was unloaded by defendant for the purpose of releasing needed car equipment would be subject to storage charge in the same amount as would have accrued under its car demurrage rules and regulations; and, second, that cars containing anthracite coal consigned to and held at Perth Amboy and various other points for transshipment by water would be subject to demurrage at the rate of \$1 per car per day, computed on the average plan, allowing an average detention of five days per car free of charge.

The commission finds that the carrier has justified these charges, and also holds that the demurrage regulations on coal awaiting transshipment at this point are reasonable (36, I. C. C., 140).

Joint Rates with the East Jersey Railroad & Terminal Co.

East Jersey Railroad & Terminal Company v. Central of New Jersey, et al. Opinion by Commissioner Hall:

The East Jersey Railroad is a corporation operating a short narrow gage railway from a junction with the Central of New Jersey in Bayonne, N. J., south to a pier on the Kill von Kull, and in conjunction therewith, a fleet of tugs and barges in New York harbor. The Southern Cotton Oil Company, the complainant, and the Edible Products Company, each of which has a plant on the line of the terminal company, are principally interested. They contribute about one-third of the rail revenue of the terminal company, but do not control it.

For a number of years prior to April, 1914, the defendants participated with the terminal company in joint rates between various points and New York, including points in New York harbor within the established lighterage limits. Joint rates to New York, which are generally the same as to Bayonne, included lighterage to points in New York harbor within the lighterage limits or on board vessels for export. Under those tariffs certain transit services were available to industries at Bayonne, N. J., on the line of the terminal company. The commission finds that the carriers have not justified a cancellation of these joint rates made April, 1914, and a proposal to assess on traffic from points on the terminal company's rails

that company's local rail rate of one cent a 100 lb., and its lighterage charge of three cents a 100 lb., in addition to the rate to Bayonne (36 I. C. C., 146).

STATE COMMISSIONS

The Public Service Commission of West Virginia has dismissed a petition asking for regulation of jitney carriages in Charleston, holding that the question is a local one which can be dealt with more appropriately by the city.

The Texas Railroad Commission, which has been holding hearings on the application of the railroads of the state for a general advance of 15 per cent. in freight rates, has disapproved the recommendation of attorneys for the commission calling for an indefinite postponement of the final hearing, pending the settlement of questions arising from the decision of the Interstate Commerce Commission in the Shreveport rate case. During the past week witnesses for the state commission have introduced evidence based on their examinations of the carriers' books, for the purpose of showing that lines in Texas have been "milked" by parent corporations outside the state.

PERSONNEL OF COMMISSIONS

Charles A. Russell, of Gloucester, has been appointed a member of the Massachusetts Public Service Commission, taking the place of Clinton White, who retired several months ago.

COURT NEWS

Excessive Damages

The New York Appellate Division holds that a verdict of \$22,750 for the death of a foreman engaged in repairing electrical appliances on a railroad, who earned \$105 a month, and paid to his wife \$90 to \$95 monthly, was excessive, and a reduction to \$15,000 was within the trial court's discretion (Millette v. N. Y., W. & B., 154 N. Y. Supp., 792).

Liability for Taxes as Between Lessor and Lessee

In 1871 a New York railroad leased its property to another corporation, which agreed to pay to the lessor a small cash rental and 8 per cent dividends on the lessor's capital stock directly to the lessor's stockholders. The lease also required the lessee to pay all taxes levied on the property demised and on the business done by the railroad, but provided that it should not be required to pay the present income tax on the dividends, or any tax thereon imposed or thereafter to be imposed by whatever name it might be called. The Federal officers, in levying the income tax under the act of congress of October 3, 1913, treated the income from the dividends as part of the lessor's income and levied the tax accordingly, thereby exempting the stockholders from any liability for an income tax on such dividends. The lessor sued to compel the lessee to repay to it the amount of this tax. The New York Appellate Division holds that the present income tax clearly came within the spirit of the clause exempting the lessee from paying the "income tax," and could not be considered a tax on the property or business, and the lessor's complaint was accordingly dismissed (Rensselaer & Saratoga v. Delaware & Hudson, 154 N. Y. Supp., 739).

Excise Tax on Corporations—"Engaged in Business"

During the greater part of 1910 the Snake River Valley Company owned a line, which it leased to the Oregon Railroad & Navigation Co. for five years. The O., R. & N. operated the line, and was obligated by the lease to pay all expense of maintenance and renewal taxes on the property, and other incidental expenses, but was entitled to retain from the rental the cost of certain permanent improvements made. For the greater part of 1910, while the lease was in force, the lessor maintained its offices, transferred stock, collected and deposited the rental, and expended such sums as were necessary, in maintaining its corporate existence, including the state corporation tax. Before the end of the year the lease was canceled by mutual consent, and the lessor immediately sold and transferred all of the property, and from the proceeds paid its bonded and other indebtedness. The

Circuit Court of Appeals, Ninth Circuit, holds that the lessor was not "engaged in business" during the year, within the meaning of the corporation tax act, and that it was not subject to the excise tax imposed thereby (*Miller v. Snake River Valley*, C. C. A., 223 Fed., 946).

Limitation of Liability—Authority of Shipper's Agent

An interstate carrier's tariffs provided two rates on household goods, the lower being based on a declared value. Unknown to the railroad, a shipper's agent had no authority to declare value, but he signed a release, declaring the value of goods to be not above that on which the rate was based. Part of the shipment was never delivered. In an action for its loss the Federal court (Michigan) holds that the railroad was justified in relying on the authority of the agent tendering the shipment to sign such a contract, and the shipper was bound by it (*American Brake S. & F. Co. v. Pere Marquette*, 223 Fed., 1018).

Claims Under Workmen's Compensation Act

A lineman in the employ of an interstate railroad was engaged in erecting a new telegraph line when a violent rainstorm arose. The railroad provided no shelter for such an emergency, though it made no deduction of wages for interference with the work. The lineman, with others, took shelter under some cars on a side track. An engine of another railroad moved these cars and the lineman was badly injured. In proceedings under the New York Workmen's Compensation Act, the New York Appellate Division holds that the injury was "accidental" within the meaning of the act and arose "out of and in the course of his employment," so that an award of compensation was properly made (*Moore v. Lehigh Valley*, 154 N. Y. Supp., 620).

The Illinois Central has filed in the United States District Court at Danville, Ill., a petition for an order restraining the Interstate Commerce Commission from continuing an investigation growing out of complaints of Illinois coal operators, asking the commission to assess damages against the railroad for failure to furnish cars. The railroad asks that the commission's investigation be stopped and the case be tried in the courts at once.

Injuries to Trespassers and Employees

The Circuit Court of Appeals, Ninth Circuit, holds that a railroad employee who was killed while constructing a temporary bridge over which the railroad intended to move interstate trains, was employed in interstate commerce, within the Federal Employees' Liability Act, since that work was not independent of the interstate commerce in which the railroad was engaged (*Columbia & P. S. v. Sauter*, C. C. A., 223 Fed., 604).

The Texas Supreme Court holds that a railroad yard clerk required to check up cars in trains and take their numbers to make a proper report thereof, is not, while walking through the yard, engaged in interstate commerce within the Federal Employees' Liability Act, in the absence of anything to show his connection with an interstate freight train in the yard or anything to show his purpose in walking through the yard, or the character of the work done by him (*Pecos & N. T. v. Rosenbloom*, Tex., 177 S. W., 952).

A Quebec, M. & S. car left a point in Pennsylvania for a point in Maine, and then came empty to a point in New York, where it was taken to the Delaware & Hudson's car shop. While it was being repaired the head of a nail flew up and struck an employee's eye. When it left the shop the car was taken empty to a point in New York state and loaded for an interstate trip. The New York Appellate division holds that the actual work on the car at the time of the injury determined whether it was interstate or intrastate work, and that the employee had no remedy under the Federal Employees' Liability Act, but only under the State Workmen's Compensation Act (*Parsons v. Delaware & Hudson*, 153 N. Y. Supp., 179).

In an action for personal injuries it appeared that the plaintiff, a minor, was injured by the fall of a bank of earth forming a cave, near the defendant's right of way in a cut formed by the right of way. The plaintiff had taken refuge in the cave to escape a shower, and after the shower remained there with some companions at play. The wires of the railroad fence in the vicinity were down, and the railroad was chargeable with notice

of trespass of boys on the track, and might, by reasonable diligence, have acquired knowledge of the cave, which was attractive to children. It was held by the Oregon Supreme Court that negligence being the infraction of a legal obligation due from one person to another, and the defendant, owing no duty to the plaintiff, who was a trespasser, except not to negligently or recklessly injure him, it was not liable (*Haynes v. Oregon-Washington R. & U.*, Ore., 150 Pac., 286).

A section foreman of a railroad engaged in interstate commerce, went out with a crew to repair a broken joint in the track. While returning he assisted his crew to lift their hand-car from the track to clear it for a freight train made up of cars destined both to intrastate and interstate points. One of the crew gave out and this threw an extra weight on the foreman, whose back was injured. The Texas Court of Civil Appeals held that he was "engaged in interstate commerce" within the Federal Employees' Liability Act. It also held that he assumed the risk incidental to helping his crew to lift their car from the track, and could not recover, since the Federal Act leaves the defense of assumed risk open to the employer (except where the employer's violation of any statute enacted for the safety of the employees contributed to the injury) notwithstanding that the defense of assumed risk does not obtain under the state statutes (*Texas & P. v. White*, Tex., 177 S. W., 1185).

Crossing Accident—Insufficient Proof of Negligence

In an action against a railroad for injury to an automobile at a crossing, it appeared that the plaintiff, on a dark night, was driving a touring car toward the defendant's crossing at a speed of from 12 to 13 miles an hour. He was familiar with the road and knew that the tracks were there. His automobile had lighted headlights of ordinary brilliancy. When about 20 feet away he saw something on the crossing. He could have stopped in from 12 to 15 feet. He did not stop or slacken speed, but attempted to go around the obstruction. When he had gone five or six feet further he put on his brakes, but nevertheless hit a freight car which was momentarily standing on the crossing, and the automobile was damaged. The New Jersey Supreme Court held that the railroad had the right, in the reasonable and safe operation of the railroad, to stop its car for a reasonable length of time on the crossing. There was no evidence of unreasonable operation of the train. There was, therefore, no proof of negligence of the railroad forming the proximate cause of the injury and motions for nonsuit and for a direction of a verdict for the defendant should have been sustained (*Jacobson v. N. Y., S. & W.* (N. J.), 94 Atl., 577).

Measure of Damages to Valuable Goods

A bill of lading for a shipment of raw silk provided that "the amount of any loss or damage for which any carrier is liable shall be computed on the basis of the value of the property, * * * unless a lower value has been represented in writing by the shipper or has been agreed upon, * * * in any of which events such lower value shall be the maximum amount to govern such computation." The following clause was stamped on the bill: "Liability limited to one dollar per pound. The consignor of this property has the option of shipping same at a higher rate without limitation as to value in case of loss or damage from causes which would make the carrier liable, but agrees to the specified valuation named in case of loss or damage * * * because of the lower rate thereby accorded for transportation." The silk was damaged by being knocked from the car in a collision for which the railroad was liable. Claim was made based on the theory that the rule to be applied in calculating loss was the same as would be applied when computing a particular average loss under a policy of marine insurance. The Circuit Court of Appeals, Second Circuit, held that the case was not one of insurance; but the question was, what was the meaning of the two clauses? They were consistent and should be construed together. The court, therefore, held that the specified sum of one dollar a pound was not a limitation of the carrier's liability, but an agreed conventional valuation, which, under these provisions, was to be taken as the real value of the goods for the purpose of computing the amount of the carrier's liability; and that the measure of such liability was only the difference between the damaged value of the goods and their value at one dollar a pound. (*Duplan Silk Co. v. Lehigh Valley*, C. C. A., 223 Fed., 600).

Railway Officers

Executive, Financial, Legal and Accounting

B. A. Worthington, receiver of the Cincinnati, Indianapolis & Western, has been appointed vice-president and general manager. See item in Financial News.

E. N. Heigho, president, general manager and traffic manager of the Pacific & Idaho Northern, has been appointed receiver, and will also act as general manager, traffic manager, treasurer and purchasing agent. W. P. Briggs continues as general attorney. T. Cox, formerly acting auditor, is now auditor. F. D. Stover, formerly assistant secretary and assistant treasurer, is now assistant treasurer. E. D. Perkins continues as assistant traffic manager. A. H. O'Leary continues as superintendent, and L. L. Collier, acting master mechanic, is now master mechanic. All with headquarters at New Meadows, Idaho.

Operating

Ben B. Johnson has been appointed chief dispatcher and division operator of the Pasco division of the Northern Pacific, with headquarters at Pasco, Wash., vice E. J. Moran, promoted.

J. P. Walker, assistant engineer of the valuation department of the Atlantic Coast Line, at Petersburg, Va., has been appointed assistant superintendent of the Charleston district, with office at Charleston, S. C.

J. Kirk, superintendent of the Gary division of the Elgin, Joliet & Eastern, has been granted leave of absence on account of ill health. C. H. Doorley, superintendent of terminals at Joliet, Ill., has been appointed acting superintendent of the Gary division. The office of superintendent of Joliet terminals has been abolished. Effective September 15.

Kepler Johnson, trainmaster on the Southern division of the Chicago, Rock Island & Gulf, at Ft. Worth, Texas, has been appointed trainmaster on the Arkansas division of the Chicago, Rock Island & Pacific, with headquarters at Little Rock, Ark., vice W. A. Hyde, who has been transferred as trainmaster to the Southern division of the Chicago, Rock Island & Gulf, with headquarters at Ft. Worth, Tex.

John J. Pelley, superintendent of the Tennessee division of the Illinois Central, has been appointed superintendent of the Memphis division of the Yazoo & Mississippi Valley, with headquarters at Memphis, vice Bess A. Porter, transferred. John M. Egan has been appointed to succeed Mr. Pelley as superintendent of the Tennessee division of the I. C., with headquarters at Fulton, Ky. Effective September 15.

E. Wilson, superintendent of the Ft. Worth division of the International & Great Northern, has been appointed trainmaster on the San Antonio division with headquarters at San Antonio, Tex., vice J. L. Otis, resigned. J. C. Resch, assistant superintendent of the Gulf division, with headquarters at Palestine, Tex., has been appointed superintendent of the Fort Worth division, with headquarters at Mart, Tex., vice E. Wilson, transferred. G. P. Wolf has been appointed assistant superintendent of the Gulf division, with headquarters at Palestine, vice J. C. Resch, promoted. Effective September 1.

Traffic

J. L. Harris has been appointed general live stock agent of the Chicago & Alton with headquarters at Chicago, Ill.

P. A. Powers has been appointed general agent of the Chicago & Eastern Illinois, with headquarters at Lennox, Ill.

F. M. Miller, commercial agent of the Toledo, St. Louis & Western, at Los Angeles, Cal., has been appointed general agent with headquarters at the same place. Effective September 1.

George H. Kummer, whose appointment as assistant general freight agent of the Chicago & Eastern Illinois, has been announced, was born in Keokuk, Iowa, on March 6, 1870. He was educated in the common and high schools and in 1886 entered railway service as an office boy in the office of the superintendent

and division freight agent of the Chicago, Rock Island & Pacific at Keokuk. In 1887 he was appointed clerk in the same office, and in 1890 was promoted to chief clerk of the joint local office of the Rock Island and the Pittsburgh, Cincinnati, Chicago & St. Louis at Washington Heights, Ill. In 1891 he went to Topeka, Kan., to become a clerk in the auditor's office of the Atchison, Topeka & Santa Fe. In 1892 he was clerk in the freight auditor's office of the Rock Island in Chicago. In 1893 he was appointed traffic clerk in the general freight office of the same road; in 1894 soliciting freight agent, headquarters in Chicago; in 1896 clerk in the Chicago office of the P., C., C. & St. L.; in 1898 assistant to the traffic manager of the Glucose Sugar Refining Company, Chicago; in 1899 contracting freight agent of the Frisco Lines in Chicago; in 1902 traveling freight agent, Frisco Lines, Chicago; in 1904 division freight agent of the Chicago & Eastern Illinois, at Salem, Ill.; 1911, general agent, Frisco Lines, Chicago; from December 9, 1912, to September 1, 1915, coal freight agent of the C. & E. I., with headquarters in Chicago; September 1, 1915, assistant general freight agent of C. & E. I., Chicago.

J. A. Simmons, division freight agent of the Cincinnati Hamilton & Dayton, at Indianapolis, Ind., has been appointed general freight and passenger agent of the Cincinnati, Indianapolis & Western.

Theron O. Jennings, whose appointment as freight traffic manager of the Chicago & Eastern Illinois was announced in our issue of two weeks ago, was born in Wauke, Iowa, on October

9, 1873. He received a high school education and entered railway service in 1892 as a clerk in the local freight office of the Des Moines Union Railway, at Des Moines, Iowa. In 1895 he was appointed freight solicitor of the Chicago, Rock Island & Pacific, with headquarters at Des Moines. Since that time he has been appointed to the following positions: Freight solicitor of the Rock Island at Kansas City, Mo., 1898; traveling freight agent of the Rock Island, with headquarters at Kansas City, Mo., 1900; division freight agent of the Rock Island at Chicago, Ill.,

T. O. Jennings

1902; general agent of the same road at Milwaukee, Wis., 1903; freight claim agent of the Chicago & Eastern Illinois, with headquarters at Chicago, 1907; general agent of the same road at Chicago, 1908; assistant general freight agent at Chicago, 1910; general freight agent, Chicago, 1912; and freight traffic manager, with headquarters at Chicago, September 1, 1915.

Engineering and Rolling Stock

F. K. Bennett, supervisor of the Minneapolis & St. Louis, at Monmouth, Ill., has been appointed valuation engineer, with office at Minneapolis, Minn.

James P. Nelson, member of the valuation committee of the Chesapeake & Ohio, and the Chesapeake & Ohio of Indiana, has been placed in charge of the engineering work of the committee.

E. J. Harris, master mechanic of the Chicago, Rock Island & Pacific at Trenton, Mo., has been appointed acting mechanical superintendent of the Second district with headquarters at Topeka, Kan., succeeding G. W. Lillie, resigned, and P. Linthicum, assistant superintendent of shops at Silvis, Ill., has been appointed acting master mechanic of the Missouri division with headquarters at Trenton, Mo., vice Mr. Harris. Effective September 15.

W. O. Thompson, district master car builder of the New York Central at East Buffalo, N. Y., has been appointed to the office

of superintendent rolling stock for the lines west of Buffalo with headquarters at Cleveland, Ohio. The car department thus becomes entirely separated from the motive power department, this condition now existing on all the New York Central Lines, with the exception of the Boston & Albany and the Pittsburgh & Lake Erie. R. L. Chandler, general piece work inspector, has been appointed district master car builder of operating district No. 2, to succeed W. O. Thompson, promoted.

T. A. Albright, foreman engineer of the Texas & Pacific, has been appointed road master mechanic, with headquarters at Marshall, Texas. J. J. Carey, master mechanic at Marshall, has been appointed superintendent of shops in that city. F. W. Boardman has been appointed assistant to the mechanical superintendent, with headquarters at Marshall. W. M. Schmalzreid has been appointed general inspector of passenger and freight cars for the system, with headquarters also at Marshall, Texas. J. S. Schneider, machine shop foreman, has been promoted to general foreman in charge of the erecting and machine shop at Marshall.

OBITUARY

J. B. Rishel, division freight agent of the Chicago, Rock Island & Pacific at Hutchinson, Kan., died in that city on September 10.

William L. White, general agent of the Pere Marquette, at Milwaukee, Wis., died on September 6, after 18 years of service with the road.

James E. Stagg, vice-president of the Durham & Southern, with headquarters at Durham, N. C., died in that city on September 10.

Colin Studds, assistant general passenger agent of the Pennsylvania Railroad, with office at Philadelphia, Pa., died on September 11, at his home in Wayne, at the age of 54.

Winfield S. Tinsman, chairman of the General Managers' Association of Chicago, and chairman of the Association of Western Railways, died at Rochester, Minn., on Wednesday of this week after an operation on his throat. Mr. Tinsman had been in bad health for over two years. He was born September 8, 1867, at Berryville, N. Y. He graduated from the public schools in May, 1882, and began railway work in the same year with the Chicago, Rock Island & Pacific. He was consecutively messenger for three years; telegraph operator from 1885 to 1887; train dispatcher from March, 1888, to August, 1890; chief train dispatcher for the next seven years, all at Trenton, Mo., and trainmaster at Horton, Kan., from October, 1897, to May, 1901. He

was then made superintendent of Chicago terminals, and from May, 1902, to June, 1905, was superintendent, first of the Oklahoma and later of the Missouri divisions, and from 1905 to 1906 was general superintendent of the Choctaw district. He was then appointed general superintendent of the Southwestern district, then was assistant general manager for a year from April, 1907, and was then manager of the Southern and Choctaw districts until December, 1909. In the latter month he was made general manager of the entire system. From February, 1911, to February, 1912, he was general manager of the First district, and then to October, 1912, was assistant to the president, all with the Rock Island. Mr. Tinsman then was appointed chairman of the General Managers' Association of Chicago, and later chairman of the Association of Western Railways.

Winfield S. Tinsman

Equipment and Supplies

LOCOMOTIVE BUILDING

THE ANN ARBOR has ordered 3 Mikado type locomotives, with 27 by 30-in. cylinders, from the Lima Locomotive Corporation.

THE TEXAS & PACIFIC, reported in the *Railway Age Gazette* of last week as having ordered a number of locomotives from the Baldwin Locomotive Works, has ordered 13 locomotives from that company.

THE ERIE, which was reported in the *Railway Age Gazette* of September 3 as having ordered 5 Santa Fe type locomotives from the American Locomotive Company, has placed additional orders for 28 locomotives of the same type. The total order for 33 locomotives has been divided as follows: American Locomotive Company, 18; Baldwin Locomotive Works, 10, and Lima Locomotive Corporation, 5.

THE CHICAGO, ST. PAUL, MINNEAPOLIS & OMAHA was reported in the *Railway Age Gazette* of last week as having ordered 4 Pacific type and 6 Mikado type locomotives from the American Locomotive Company. The Pacific type locomotives will have 25 by 28-in. cylinders, 75-in. driving wheels and a total weight in working order of 260,000 lb. The Mikado type locomotives will have 27 by 32-in. cylinders, 61-in. driving wheels and a total weight in working order of 302,000 lb.

THE CHICAGO & NORTH WESTERN was reported in an unconfirmed item in the *Railway Age Gazette* of September 10 as having ordered 12 Pacific type, 12 Mikado type, 10 switching and one narrow-gage locomotives from the American Locomotive Company. This order has now been confirmed. Six of the Pacific type locomotives will have 25 by 28-in. cylinders, 75-in. driving wheels and a total weight in working order of 260,000 lb. and 6 will have 22 by 26-in. cylinders, 69-in. driving wheels and a total weight in working order of 302,000 lb. The 12 Mikado type locomotives will have 27 by 32-in. cylinders, 61-in. driving wheels and a total weight in working order of 165,000 lb. The 10 six-wheel switching locomotives will have 21 by 28-in. cylinders, 51-in. driving wheels and a total weight in working order of 165,000 lb. The narrow-gage Mogul type locomotive will have 12 by 18-in. cylinders, 43-in. driving wheels and a total weight in working order of 55,000 lb.

CAR BUILDING

THE MINNEAPOLIS & ST. LOUIS is in the market for 100 box cars.

THE CHICAGO & NORTH WESTERN is in the market for 500 ore cars.

THE ERIE has ordered 300 all-steel drop-end gondola cars from the Standard Steel Car Company.

THE BUTTE, ANACONDA & PACIFIC has ordered 100 50-ton ore cars from the Western Steel Car & Foundry Company.

THE ILLINOIS CENTRAL is in the market for 1,000 refrigerator cars. It is also inquiring for 500 fruit cars and 500 box cars for the Central of Georgia.

THE WHEELING & LAKE ERIE, W. M. Duncan, receiver, has been granted permission by the federal court to issue certificates for the purchase of new cars. The petition asked for the issuance of \$2,000,000 in certificates, but only one-half of this amount was granted.

IRON AND STEEL

THE HAVANA CENTRAL has ordered 1,500 tons of rails from the Bethlehem Steel Company.

THE LOUISVILLE & NASHVILLE has ordered 13,000 tons of rails from the Tennessee Coal, Iron & Railroad Company.

THE ATLANTIC COAST LINE has ordered 20,000 tons of rails from the Tennessee Coal, Iron & Railroad Company.

THE ATCHISON, TOPEKA & SANTA FE has ordered 35,000 tons of 90-lb. rails from the Colorado Fuel & Iron Company.

Supply Trade News

W. H. P. Fisher has been appointed sales manager of the L. M. Booth Company of New York, manufacturers of the Booth water softeners. Mr. Fisher has been selling water softening plants to railroads for 12 years. He will make his headquarters at the engineering department of the company in Jersey City, N. J.

The Hydraulic Press Manufacturing Company, Mount Gilead, Ohio, has been awarded two prizes by the International Jury of Awards at the Panama-Pacific International Exhibition. They are the grand prize from the department of agriculture for press machines and a gold medal from the department of machinery for forcing presses and equipment.

Walter H. Evans, of Chicago, has been appointed western railroad department manager of the U. S. Metal & Manufacturing Company, New York. Mr. Evans was recently manager of the motor gear department of the Edgar Allen American Manganese Steel Company, Chicago, and previous to his connection with this company was connected with several electric and steam roads in the capacity of master mechanic and superintendent of motive power. Mr. Evans will make his headquarters in the McCormick Building, Chicago.

The Roberts & Schaefer Company, Chicago, engineers and contractors, has been awarded a contract by the Louisville & Nashville for a large automatic electric coal-handling equipment for Pensacola, Fla., using duplicate hoist, having an elevating capacity of 400 tons an hour. The same company has also been awarded a contract by the Canadian Northern Pacific for a large standard counterbalanced bucket locomotive coaling plant with automatic elevating equipment for immediate installation at Kamloops Junction, B. C. The contract price was \$12,000.

In reply to a request on the part of the Iron Age for a statement as to the operations at Eddystone, Pa., in which the Baldwin Locomotive Works is interested, S. M. Vaucain, vice-president of the company, has briefly recounted the various activities as follows: The Baldwin Locomotive Works is engaged in filling large export orders for locomotives and their parts, including wheels, tires, axles and various forgings. The company now has 11,500 men on its payroll. The Remington Arms Company of Delaware has leased a number of buildings which the Baldwin Locomotive Works has erected, suitable for the manufacture by the Remington Company of a large number of military rifles which are to be exported. This plant when running full will probably employ 15,000 men. The Eddystone Munitions Company has leased from the Baldwin Locomotive Works buildings which the latter has erected on its property at Eddystone. The manufacture of munitions by the company will probably employ 10,000 men. The Baldwin Works contemplates building on the river front at Eddystone a pier or bulkhead so that shipments of all classes of products made by the companies mentioned may be made direct, without transshipment at New York or any other port.

Among the 23 members of the Naval Advisory Board of Inventions selected by Josephus Daniels, Secretary of the Navy, on the advice of eleven of the engineering and scientific societies, there are a number of appointments of special interest to the railway supply field. The appointments included among others: W. R. Whitney, Schenectady, N. Y., director of the research laboratory of the General Electric Company, selected by the American Chemical Society; Frank Julian Sprague, New York, consulting engineer for the Sprague Electric Works, the Otis Elevator Company, and the General Electric Company, and founder of the Sprague Electric Railway Motor Company, selected by the American Institute of Electrical Engineers; Benjamin G. Lamme, Pittsburgh, Pa., chief engineer of the Westinghouse Electric & Manufacturing Company, a leader in the development of alternating current apparatus and a pioneer in the development of direct current apparatus for railway lighting and power work, selected also by the Institute of Electrical Engineers; Peter Cooper Hewitt, New York, inventor of the electric lamp, selected by the Inventors' Guild; William Lau-

rence Saunders, New York, chairman of the board, Ingersoll-Rand Company, New York, selected by the American Institute of Mining Engineers, and William Leroy Emmet, Schenectady, N. Y., engineer, General Electric Company, who designed and directed the development of the Curtis turbine, selected by the American Society of Mechanical Engineers. Arthur Craven, chief engineer of the New York Public Service Commission, First District, is also one of the members, having been selected on the advice of the American Society of Civil Engineers.

American Locomotive Company

The recently issued annual report of the American Locomotive Company for the fiscal year ended June 30, 1915, shows that in that period the company experienced the worst depression of business of the 14 years of its existence. The gross earnings totaled but \$9,303,298, or \$20,684,140 less than the \$29,987,438 of 1914. The 1915 gross earnings, in addition, were about 17 per cent of the gross earnings of \$54,868,175 for 1913, and were less than one-half of the gross earnings of \$19,008,634 for 1909, which was the worst previous year.

The gross earnings for the year just closed lacked \$451,297 of meeting the manufacturing, administrative, and other expenditures incurred in operations, and as there was charged off for depreciation \$1,040,684, the total loss for the year was \$1,491,980 as compared with a profit of \$2,076,127 in the previous year. The 7 per cent preferred dividend of \$1,750,000 was paid from surplus and the total reduction in that account was \$3,241,980, leaving a balance on June 30, 1915, of \$8,293,678.

The report says that the productive operations of the company as a whole averaged about 17 per cent of capacity and at times ran as low as 8 per cent. The Schenectady and Cooke plants were the only ones of the company's eight plants which were not closed entirely or for a large part of the year. The company should expect a better year in 1916. It has secured large foreign orders for both shells and locomotives and on June 30, 1915, it had \$5,838,235 of locomotive orders on its books as compared with \$4,162,356 on June 30, 1914.

The combined balance sheet for the American Locomotive Company and the Montreal Locomotive Works, Ltd., on June 30, was as follows:

ASSETS.		
Cost of property		\$52,209,638
Securities owned		748,499
Convertible assets—		
Cash assets	\$15,409,479	
Accounts collectible	6,160,137	
Bills receivable	1,646,567	
Accrued interest	40,145	
Material and supplies	2,440,714	
Contract work in course of construction.....	1,738,651	
Locomotives, snow plows, etc., in stock.....	269,232	
	27,704,926	
Sundry deferred charges		61,135
Notes discounted (per contra).....		148,031
		\$80,872,228
LIABILITIES.		
Capital stock—		
Preferred	\$25,000,000	
Common	25,000,000	
	\$50,000,000	
Bonded debt of constituent companies.....		1,932,000
Current Liabilities—		
Gold notes outstanding	3,666,000	
Accounts payable	14,156,918	
Income tax withheld at source.....	818	
Accrued interest	26,480	
Unclaimed interest	907	
Dividend on preferred stock payable July 21, 1915.	437,500	
	\$18,288,713	
Endorsements (per contra)		148,031
Depreciation reserve		1,005,307
Reserve for loss in liquidation of automobile business.....		964,858
Reserve for additions and betterments		239,641
Profit and loss surplus, June 30, 1915.....		8,293,678
		\$80,872,228

TRADE PUBLICATIONS

ARMCO IRON.—The American Rolling Mill Company, Middletown, Ohio, has issued a booklet describing the products made from Armco iron. This gives in some detail the various forms in which this material is produced and the manner of application in various forms of construction.

VERTICAL OIL ENGINES.—This is the title of Bulletin No. 501, recently issued by the National Transit Company, Department of Machinery, Oil City, Pa. The booklet deals particularly with the type VT-13, two-cycle, single-cylinder, vertical oil engines, made by this company, and it contains detailed descriptions of the machine itself and its parts.

Railway Construction

ATCHISON, TOPEKA & SANTA FE.—This company will build a branch, it is said, from Seligman, Ariz., south into the Bagdad copper country and the Hillside mining district. The Bagdad Copper Company has been carrying on extensive development work in the Hillside district and the new branch is to be built to provide an outlet for ore from the company's mines.

BALTIMORE & OHIO.—An officer writes regarding the report that the Baltimore & Ohio will build a line from its Hagerstown branch, Maryland, to the plant of the Security Cement Company, about four miles, that the plans have not yet been completed, but the company expects to decide upon this work soon.

CANADIAN NORTHERN.—This company is building two miles of additional tracks in the yards at Port Arthur, Ont., and at Fort William, and is also putting in new sidings and extending the yards at various points on the line between Port Arthur and Winnipeg, Man. The line from Winnipeg, Man., to Grand Marais is being extended to Victoria Beach, 15 miles, and it is expected that the grading, bridging and track laying will be completed this year. The Thunderhill branch, which extends from Thunderhill Junction, Man., west to Preeceville, Sask., 72 miles, is being extended beyond that place. Grading work on a 21-mile line from Canora north to connect with the Thunderhill branch at Sturgis, two miles east of Preeceville, was completed in 1914, and it is expected that the track laying and ballasting will be finished this year. Grading was also finished during 1914 on a branch from Wroxton, Sask., west via the Neepawa-Russell-Ross Junction line into Yorkton, Sask., 26 miles, and the track laying and ballasting will be completed this year. An extension of the line now in operation from Delisle, Sask., south to Tichfield, and from Tichfield west to Elrose, is projected southeast from Tichfield to Findlater on the Regina branch. An extension is also projected from Elrose west towards Edmonton, about 250 miles, on which grading has been finished to Eston, 35 miles, and track laying and ballasting on this section will be completed this year. The Cowan Construction Company is grading an additional section of 30 miles. The company also expects to complete this year the ballasting work and track laying on the extension from Bienfait, Sask., west to Estevan, 9 miles. Grading work is now under way by the Northern Construction Company on a line from Calgary, Alta., south to MacLeod, 103 miles, and is expected to be finished this year. A section of about 17 miles has already been graded.

CANADIAN PACIFIC.—On the Weyburn-Lethbridge branch from Weyburn, Sask., to Lethbridge, Alta., the line is now in operation at the west end from Lethbridge to Stirling, 18.9 miles, and from Stirling east to Foremost, 49.2 miles, a total of 68.1 miles. Grading was finished last year easterly from Foremost to Pakowki, 25 miles, and track laying on this section will be carried out at once. It is expected that this work will be finished by October 1.

CLEVELAND & OHIO CENTRAL ELECTRIC.—This road has let the contract for its first 55 miles of track from Cleveland, Ohio, to Wooster, to the Lathrop-Shea & Henwood Company, Buffalo, N. Y.

DOVER, MILLERSBURG & WESTERN (Electric)—Plans are being made to start work, it is said, on a line from Canal Dover, Ohio, west via Sugar Creek to Millersburg, about 25 miles. F. F. Phillips, Canal Dover, is said to be interested.

ELECTRIC SHORT LINE.—This company has awarded the contract for building the extension from Winsted, Minn., west to Hutchinson, 45 miles, to H. F. Balch & Co., Minneapolis (September 10, p. 487).

GREAT FALLS & SOUTHWESTERN.—Incorporated to construct a railroad 60 miles long from Ulm, Mont., 11 miles east of Great Falls, on the Great Northern, to Hound creek.

HOUSTON & RICHMOND INTERURBAN.—See Houston, Richmond & San Antonio Interurban.

HOUSTON, RICHMOND & SAN ANTONIO INTERURBAN.—The charter of the Houston & Richmond Interurban is to be amended,

it is said, to change the name of the Houston, Richmond & San Antonio, and to increase its capital to \$250,000. A preliminary survey has been made over two routes for a line from Houston west to San Antonio, about 215 miles. One of the surveys is via Richmond, Rosenberg, Gonzales and Seguin to San Antonio, and the other survey is via Richmond, Wharton and Yoakum. E. Kennedy, of Houston, and residents of that city are back of the project.

MONONGAHELA VALLEY TRACTION.—A preliminary survey has been made for a line, it is said from Weston, W. Va., southwest to Glenville, about 25 miles, but the company has not yet decided to carry out the work. Between Clarksburg and Salem, W. Va., surveys have been completed and location made for a 6-mile extension of the line now in operation on about 6 miles from Clarksburg west via O'Neil.

NORTH CAROLINA ROADS.—Work on a lumber road has been finished by the Kinston Manufacturing Company, it is said, from a connection with the Kinston Carolina Railroad, at Pink Hill, N. C., south to Beulaville, 10 miles. An extension of the line may be built south to Chinquapin, 8 miles, or to Maple Hill, about 20 miles. J. T. Deal or J. H. Canady, president, Chamber of Commerce, Kinston, may be addressed.

NORFOLK & WESTERN.—The report of this company for the year ended June 30, 1915, shows that on the Virginia-Carolina Railway, the North Carolina division was completed and was put in operation in May to Elkland on the Ashe-Watauga county Line, N. C., 48.64 miles. The New River, Holston & Western built an extension from Rocky Gap, Va., to Suitars in Bland county, Va., 13.87 miles, which was completed and put in operation in September, 1914. The Tug River & Kentucky bridge over Tug river in Kentucky, was built and track was laid on 0.89 miles to Blackberry creek, and grading work on the line up Blackberry creek to the mouth of Peters Fork, 1.38 miles, has been completed. The Williamson & Pond Creek is building at Leckie, W. Va., a spur 1.03 miles long, with a Y connection 0.15 miles to reach operations of the Leckie Collieries Company, and the Burkeville to Pamplin low grade connecting line is under construction from Pamplin, Va., to Burkeville, 36.93 miles. The Jacobs Fork branch is under construction from its junction with the Dry Fork branch at Rift, W. Va., to the operation of the New River & Pocahontas Consolidated Coal Company, 3.93 miles, and the grading work is about 75 per cent completed. The Cucumber branch of Jacobs Fork branch, 1.28 miles long, to other operations of the same company, is also under construction, and the grading work is 90 per cent completed.

OREGON SHORT LINE.—This road has completed the so-called "Loop" line, which circles the valley from Idaho Falls, Idaho, to St. Anthony. For the present the line will be used only for freight.

POND FORK RAILWAY.—Incorporated in West Virginia with \$26,000 capital and headquarters at Huntington. The plans call for building a line from Madison, W. Va., up Pond Fork of Coal river to the headwaters of Pond Fork, about 25 miles. The incorporators include R. M. Baker, II, Fitzpatrick, J. William A. Read & Co., New York, are reported to haveington, W. Va.

SOUTHWESTERN POWER, LIGHT & RAILWAY.—Under this name a company was recently organized in Texas with a capital of \$12,000,000, it is said, to build an interurban electric line between Denison, Tex., and Oklahoma City, Okla., about 150 miles. Power for the operation of the line will be provided by a group of hydro-electric plants which the company proposes to construct in southern Oklahoma. W. T. Croslen, president, Denison.

TENNESSEE RAILWAY.—Work is now under way building an extension of eight miles from Charley's Branch, Tenn., up New river, to a point about 45 miles south of Oneida, and about three miles air line from Petros. The extension to Petros will be considerably longer than three miles by the route the railroad will follow. J. E. Rodes, Nashville, Tenn., and the Harriman Construction Company, Harriman, Tenn., are the contractors. The work involves handling about 10,000 cu. yd. to the mile. The maximum grade on the main line will be 1.4 per cent, and the maximum curvature 14 deg. On branch lines to be built the maximum grade will be 3 per cent and the maximum curvature 16 deg. There will be several timber bridges on the line of from 10 to 40 ft. high and from 40 ft. to 600 ft. long

RAILWAY STRUCTURES

ALBERTA, CANADA.—The Edmonton, Dunvegan & British Columbia has awarded the contract for constructing a bridge over Smoky river to the Dominion Bridge Company, Ltd., Winnipeg, Man. The structure will consist of two 85-ft. deck plate girder approach spans, six 128-ft. deck truss spans, and one 125-ft. through truss span. Approximately 1,100 tons of steel will be required.

AMARILLO, TEX.—F. M. Bisbee, chief engineer, western lines of the Atchison, Topeka & Santa Fe, is receiving bids for the construction of an addition to the Santa Fe office building here. The improvements will approximate \$35,000.

BALTIMORE, MD.—The Baltimore & Ohio has completed plans for a new coal pier to be built on Curtis Bay, Baltimore, but the work has not yet been authorized.

CHARLESTON, S. C.—Contracts have been let by the Charleston Southern, it is said, for building trestles and foundations for drawbridges as follows: For one bridge over Stono river to the Charleston Engineering & Contracting Company, Charleston, S. C., and for another bridge over the same river to the Simons-Mayrant Company, Charleston; over the Edisto river to the Dawson Engineering Company, Charleston, and over Ashley river near Hampton Park to the Jefferson Construction Company, New Orleans, La. The railroad company plans to build a total of eight drawbridges in connection with the line to be built from Charleston southwest to Savannah, Ga.

CHICAGO, ILL.—The Chicago & Western Indiana has awarded the contract for placing concrete piling for abutments and piers at Eightieth street and Eighty-first street subways to the Raymond Concrete Pile Company of New York and Chicago.

Great Lakes Dredge & Dock Company has the contract for the substructure for the bridge which the Chicago & North Western plans to build over the North branch of the Chicago river. It will be a three-track, 180-ft., single-leaf bascule structure.

COFFEYVILLE, KAN.—Clements & Lavery have been awarded a contract for the construction of the terminal building of the Union Traction Company in this city. It will be a two-story 96-ft. by 143-ft. brick and steel structure and will cost about \$40,000.

THE DALLES, ORE.—Nettleton, Bruce & Eschbach, of Seattle, Wash., have the contract for the construction of a roundhouse, machine shop and power plant for the Oregon-Washington Railroad & Navigation Company. Estimated cost \$50,000.

JOPLIN, MO.—The city has voted a bond issue of \$13,000 to pay its share of the cost of a viaduct over the tracks of the Kansas City Southern. The municipality bears one-third of the cost, and the Kansas City Southern and the Missouri, Kansas & Texas the remainder. Plans have been prepared by the railroads.

MACON, GA.—Plans have been filed with the Railroad Commission of Georgia for the new union passenger station to be built in Macon. It is expected that the plans will be approved and that bids will be asked for the work in the near future. The main structure will consist of a center building about 84 ft. wide and about 245 ft. long. In addition to the main building there will be a baggage and mail room about 72 ft. by 109 ft. and an express room about 72 ft. by 147 ft. The buildings will be of brick construction or other fireproof material.

MYAKKA CITY, FLA.—The East & West Coast has given a contract to T. R. Bryant, Wyakka City, it is said, for putting up a new station at that place.

QUINCY JUNCTION, CAL.—The Western Pacific has let a contract for 630 tons of steel for a viaduct here to the American Bridge Company.

WATERLOO, IOWA.—The Illinois Central roundhouse here is being remodeled to accommodate larger motive power and equipment. T. S. Leake & Co. of Chicago have the contract.

WEST TULSA, OKLA.—Fairbanks, Morse & Co. have been awarded the contract for the new coaling station of the St. Louis & San Francisco to be built here. The plant will be a reinforced concrete structure of the "V" bucket type, with 300 tons capacity. The station will include a steam sand drier with a capacity of one cubic yard per hour.

Railway Financial News

BUFFALO & SUSQUEHANNA RAILWAY.—Morgan G. Bogue, representing the bondholders, has bought this railroad at a receivers' sale for \$300,000. At the sale the electric railway interests recently reported as likely to buy the property were conspicuous by their absence.

CHICAGO, ROCK ISLAND & PACIFIC.—N. L. Amster, chairman of the committee representing minority stockholders, on September 14, arranged for the payment of \$410,000 interest on bonds and issued the following statement:

"Our committee has succeeded in getting stockholders whom it represents to take \$410,000 receivers' certificates. The court, among its friends in Chicago, has disposed of the remaining \$90,000. The court will authorize the certificates and has been informed as to the institutions in New York and Chicago in which the money that has been pledged for the certificates has been or will be deposited.

"The company will have plenty of money out of earnings to pay the interest due October 1, and I believe that the same will be true with respect to the January 1 obligations. The court and the stockholders whom I represent were unwilling to see further inconveniences and loss to the stockholders as a result of the principal of the \$20,000,000 debentures being declared due at this time because of default on the interest. We shall now have six months within which to work out a readjustment plan."

Judge George A. Carpenter, in the United States District Court at Chicago, on September 15, ordered the receivers to bring action in the Federal Court at New York against present and former directors of the company for the recovery of \$6,000,000, alleged to have been wrongfully expended in the acquisition and subsequent divorcing of the Frisco lines. The defendants to be named are Daniel G. Reid, R. A. Jackson, W. H. Graham, Ogden Mills, E. S. Moore, William H. Moore, F. L. Hine, George G. McMurtry and G. T. Boggs. The action of Judge Carpenter is based on a report by William Howard Taft, who had been engaged as special counsel.

CINCINNATI, HAMILTON & DAYTON.—See Cincinnati, Indianapolis & Western.

CINCINNATI, INDIANAPOLIS & WESTERN.—This company, a subsidiary of the Cincinnati, Hamilton & Dayton, owning that part of its system west of Hamilton, Ohio, aggregating 361 miles of line, has been sold at foreclosure to the joint reorganization committee representing the bondholders of the company at the upset price of \$3,500,000, representing the two mortgages of \$2,100,000 and \$1,400,000, respectively, held against the road.

William A. Read & Co., New York, are reported to have obtained the support of a large proportion of the bondholders in a plan of reorganization which involves replacing the present bond issues with stock and raising new capital. The plan contemplates the operation of the road independently of the Cincinnati, Hamilton & Dayton.

B. A. Worthington is vice-president and general manager.

MAINE CENTRAL.—At the annual meeting, October 20, stockholders will be asked to vote on retiring \$10,000,000 of the road's outstanding stock and the issuance in place thereof of \$3,000,000 of preferred stock, to receive 5 per cent. per annum in dividends and to have no voting power, and \$7,000,000 25-year first mortgage bonds bearing interest at a rate of not exceeding 5 per cent.

PACIFIC & IDAHO NORTHERN.—E. M. Heigho, president, has been appointed receiver of this company on a voluntary petition for receivership.

THE RAILWAYS OF BRAZIL.—Although larger in area than the United States, Great Britain, Holland, Belgium, Portugal and Spain combined, Brazil ranks twelfth among the nations of the world in extent of railroad mileage. This may help to explain why Brazil has only 23,000,000 inhabitants. A considerable percentage of the Brazilian railroads is owned and operated by the government.—*The South American*.

GENERAL NEWS SECTION	573

* Illustrated.

In the design of all-steel equipment for both passenger and freight service the engineer has of necessity carefully considered the details from a practical construction standpoint. The painter whose most important duty is to protect the steel equipment from corrosion, in addition to providing a neat and pleasing appearance, finds by sad experience that he is severely handicapped by details of construction that had proved entirely satisfactory in the wooden equipment. This was clearly brought out during the recent convention of the Master Car and Locomotive Painters' Association, a report of which is printed elsewhere in this issue. Attention was called to many details that should receive

more careful attention in this respect. Every effort should be made to secure maximum life from the steel equipment, and here the master painter with his knowledge and experience can be of material assistance to steel car designers.

The drastic economies to which the railways have been driven recently are clearly reflected in the Interstate Commerce Commission's compilation of the returns for

Railway Returns Class I roads for the fiscal year, which were reported in last week's issue, page 539. These are roads earning \$1,000,000 gross or more. Their total operating

revenues were \$163,404,055 less than for the year 1914, which also showed a decrease of \$65,691,076 as compared with 1913. The managements were able, however, to reduce operating expenses by \$186,244,099, and taxes declined \$2,765,192, leaving a net gain of \$24,991,787, or 2.6 per cent per mile in (net) operating income. It should be noted that this gain is to be compared with the results of a year in which there was a decrease of \$118,657,668 in (net) operating income. Reduced to a mileage basis, the decrease in total revenues was 6.3 per cent, while operating expenses were reduced 9.3 per cent, and the increase of net operating revenues was 1.8 per cent. Freight earnings per mile were reduced from \$9,200, in 1914, to \$8,701, in 1915; passenger earnings from \$3,038 to \$2,757, and express earnings from \$960 to \$302. The reduction in operating expenses per mile was from \$9,801 to \$8,894, or \$907, of which \$449 was in transportation expenses, \$209 in maintenance of way and structures and \$177 in maintenance of equipment. The saving in transportation is, of course, a real saving, but as nearly half of the total reduction in expenses was effected in the maintenance accounts it is to be feared that much of the small improvement in net for the year was gained only by deferring many needed expenditures on roadway and equipment to some future date. The increases in net operating revenue are entirely attributable to the more favorable showing of the Eastern roads in 1915 than in 1914. The Western and Southern groups of lines show decreases both in total and in net operating revenues in spite of reductions in operating expenses. The relatively more favorable showing of the gross and net earnings of the Eastern roads was partly due to the fact that the advances in freight rates allowed by the Interstate Commerce Commission in the five per cent case were in effect a part of the year.

In a recent issue the *Railway Age Gazette* called attention to the fact that while the number of passengers and employees killed by our railways is showing a very gratifying reduction in recent years, the number of trespassers killed, which for the last 25 years has averaged 53 per cent of all persons killed by railways, continues to increase. The accident bulletin just issued by the Interstate Commerce Commission for January, February and March of this year, and the bulletin for the preceding quarter, show that during the last six months for which the figures are available the proportion of trespassers killed was even greater than it has been in the past. For the six months the two bulletins report a total of 3,662 persons killed in all kinds of accidents, exclusive of industrial accidents; and of these 2,165, or nearly 60 per cent, were trespassers. During the same time only 79 passengers and 908 employees were killed, and only 424 persons other than trespassers were killed at grade crossings. In train accidents only 14 passengers and 106 employees were killed, while only one passenger in each quarter was killed in a collision, making only two in six months. During this period the number of passengers carried one mile was approximately 17,629,000,000. Collision accidents are those the public hears most about; but at this rate the average passenger could travel continuously at a speed of 60 miles an hour for 16,770 years before meeting death

**Trespassing
Accidents
Still Increase**

in a collision! Our statute books contain a mass of legislation designed to prevent accidents to passengers and employees, and at grade crossings, but the railways cannot secure the enforcement of what meager laws there are to prevent trespassing, although in six months 32 times as many trespassers as passengers, over twice as many trespassers as employees, and five times as many trespassers as persons at grade crossings, were killed. Most of our safety legislation is directed against train accidents or defects of equipment. It seems to take little cognizance of the human element. Yet in six months only 143 persons were killed in train accidents, while no less than 3,262, or 89 per cent of the total, were killed by falling from cars or engines, while getting on or off cars or engines, or by being struck or run over by engines or cars at stations, yards, highway grade crossings or at other places. In other words, these accidents were largely attributable to carelessness or willingness to take a chance on the part of the victims themselves.

INTERMINABLE LITIGATION AND HAIR-SPLITTING

Woe unto you—! for ye tithe mint and anise and cummin, and have left undone the weightier matters of the law; justice, mercy, . . .—Matthew, chap. 23, verse 23.

IT is some little time now since the editorial matter in the *Railway Age Gazette* has been so distinctively scriptural as to call for the introduction of this old custom of putting a text, verbatim, at the head of the column; but the appositeness of these words of the Son of God appears nowadays with such painful frequency in the court news column, and elsewhere in railway transactions, that we make no apology for thus reverting to fundamental truth.

One question alone, that of whether, in a given freight-car movement, an employee is or is not engaged in interstate commerce is the cause of an immense amount of hair-splitting. It must have afforded hundreds of days' work for the lawyers and the judges during the past few years; and this question, in relation to the hours of service law, is now being superseded, as a main item on the daily menu of legal news, by the same question as related to the law concerning liability for damages for bodily injury. And in connection with this last feature the liability laws of individual states are undergoing such an interminable succession of changes that the crop of lawsuits seems likely to keep up forever.

In our issue of August 27, page 406, the records tell how the courts of three states, New Jersey, Illinois and Kentucky, wrestled with such vital questions as whether a man going to repair a whistle rod on a switching engine is engaged in interstate commerce; the same question as to a boy who built fires in engines, but who assisted in moving an engine for the purpose of getting a barrel of oil, which was to undergo the very irregular process of being transported in interstate commerce on a locomotive; and a third question which is of similar character, but which we should not want to try to repeat here without the aid of a blackboard and an algebraic framework. In another case (August 20, page 365) a court was called on to decide whether the Southern Pacific Company operated a railroad in New York City! Readers interested in these things will have noticed the case reported August 13, page 298, wherein the law forbidding the running of freight trains with chain couplings and without air brakes was rigidly enforced by the court, although the railroad company had secured substantial safety by moving the train at very low speed.

It is true, of course, that, in these litigated cases, the sin referred to in the Scripture which we have cited is not committed by the same authority that does the hair-splitting. The courts do the hair-splitting, and in the majority of cases, no doubt, believe that the course taken is unavoidable. For the neglect of the weightier matters, the blame rests not on the courts but on congress, or a legislature or (sometimes) on the executive department of the government. The Interstate Commerce Commission itself is not free from criticism in the direc-

tion here referred to. Its members frequently find themselves responsible for a series of acts affecting a given person, or a given city or a given railroad, which embody both of the two elements constituting the offense here condemned in Scripture. However, the citizen who himself suffers injustice in the transportation field or who feels the burdens that weigh on his community or his line of business cannot blame the commission alone; nor congress, nor the President, nor the courts, nor the state legislatures; no one branch can be singled out. It is government as a whole. The railroads are ruled by the government, and the government has not learned its business. Putting it another way, and speaking the language of democracy, it might be said that the people are trying to govern themselves wisely, but do not know how.

There is another phase of this question of incompetent government, namely, the inability of the judges to understand the technicalities of the railway service. It is a case of this kind, a decision in the Circuit Court of Appeals, Seventh circuit, handed down August 6, interpreting the hours of service law as related to railway employees who transmit information by telephone, which has led to the foregoing reflections. The report was printed in last week's issue. It is scarcely to be wondered at that the judges nod now and then. They can see what utterly fantastic and futile ideas must have prevailed in the legislative bodies where these grotesque statutes were adopted, and it must often be that only by the sternest devotion to duty can the judge keep himself awake during the tedious arguments of the lawyers over shades of meaning so fine that only some chemico-photographic process—no faculty of the human brain—can distinguish them.

In the case referred to in the decision hinges on the meaning of the term "orders" as relating to train orders. Every railroad man knows that this term, "train orders," commonly shortened to "orders," means those orders of the train despatcher, always put in writing, which direct some person either to move or to restrain a train, *with relation to the right to the use of the track*. But one train can occupy a given piece of track at a given time, and a main function of train orders is to prevent everybody from doing anything that may tend to violate this axiom. If an engineman makes any move toward violation he is risking lives and valuable property, and hence "orders" have special importance. Every order is repeated by the recipient, word for word, in the hearing of the one who gives it. Any communication to an engineman which deals with matters less grave is not classed as "orders." The distinction between "orders" and all lesser writings is defined by the superintendent with great care and particularity. The labor-union philanthropists who drafted this law tried to recognize the true character of orders—they had no hope of getting the law passed unless they restricted this clause to communications ostensibly important—but in trying to make it sufficiently inclusive they went too far, and included all orders "affecting" train movements. A telegram ordering a quart of ice cream for the president's private car might "affect" the movement of a train, if the boy delivering the ice cream should be a few minutes late. Finding no solid ground on which strictly to define "orders," Judge Mack, in this case, allows the term to apply to the sending of information by telephone to guide a signalman at a crossing as to which of two roads should be given the preference in a given situation where trains of both are ready to cross. It cannot be that the Supreme Court, if appealed to, will support this decision. The railroad, in its claim that the switch tender in the shanty only imparted information, was on solid ground.

If the report, as printed, gives the whole of the argument, the railroad, in the words that we have italicized, conceded too much. The towerman was not bound to obey; was not bound, finally, to deal with the rival trains in accordance with the information given five minutes before the trains arrived. In three minutes' time conditions might be so changed as to change his decision. His real authority as to movement of trains over

the crossing, came from another source, not from the man who telephoned from the shanty.

But none of these technicalities weighed with Judges Baker, Kohlsaot and Mack. In the sentences which we have italicized they approve as an "order," affecting the safety of the public, a telephone message, conveying information which, so far as concerns any definite relation to safety, might have been wholly ignored, without harm; and which at most would tend to prevent a few minutes' delay to a passenger train.

If this decision holds, and if this is a wise and beneficent law, the provision for a nine-hour day can be almost indefinitely extended. We may expect the labor leaders next to "organize" the office boys so as to espouse the cause of the messenger whom the superintendent sends to ask a question of the train despatcher. The telephone girls in the hotels ought to come next; they ask questions which may "affect" the movement of trains. In the meantime these wise law-givers permit trainmen—with whom the danger from mental inefficiency is as great as with telephone operators—to work 16 hours.

And if Judge Mack is correct, in a case like this, in taking into consideration all the remote influences which may affect the safety of a train movement—"regularity of service at one point might well prevent an accident at another point"—he is at liberty to go on and justify the most fantastic legislative restrictions on railway operation. The wife of the ticket agent who asks him to stop on the way to the office to give an order to the grocer, or who impairs his mental balance or his financial integrity by spending too much money at the milliner's, may find herself guilty of blocking the wheels of interstate commerce and impairing the safety of passenger travel!

A GOVERNMENT VIEW OF GOVERNMENT MANAGEMENT

WHEN the campaign for the establishment of the parcel post was going on, its advocates claimed that it would confer numerous benefits on the people, and especially the common people, of the United States. The service rendered by it would be much better than that of the express companies. The rates charged would be much lower. The function performed by the middleman in the interchange of commodities between urban and rural communities would be eliminated. For this and various other reasons the cost of living would be reduced. The superiority of public-spirited government management over greedy private management would be clearly demonstrated.

The parcel post has now been in operation for three years. It is time to inquire whether its management and results have been as good as predicted. Inquiry into this matter is worth while, not only because it is desirable to know how the parcel post is working, but also because of the light which the way it is being managed must throw on the way larger business undertakings would be managed under government ownership. Some persons advocate government ownership and management of telegraphs and telephones, and even of railways, making claims as to the way they would be run similar to those which were made as to the way the parcel post would be run.

At this interesting juncture information as to the way the parcel post actually has been managed and as to its results is at hand. It has been furnished by an investigating committee representing congress, the body which created the parcel post, and composed of both senators and representatives. Its chairman was J. L. Bristow, then a senator from Kansas. While this report is most significant and instructive, very much less publicity has been given to its contents than was received by the claims made before it was established as to what the parcel post would do.

The parcel post was to serve and benefit all classes. The report of the Bristow committee shows that the service it has rendered to, and the benefits it has conferred on, the large mail order houses have been vastly greater than the service it has rendered to, and the benefits it has conferred on, all of the rest

of the public together. The committee received reports regarding the parcel post business handled during six consecutive weeks by 37,745 postoffices out of a total of 56,974. The postoffices which did not report are nearly all small, and therefore the data collected cover practically all the business done. "It is a significant fact," says the committee, "that only 697 postoffices reported outgoing parcel post business in excess of their incoming business. In other words, 98.15 per cent received more parcel matter than they sent out, and only 1.85 per cent despatched a greater number of parcels than they received from other offices." "Even more illuminating," in the committee's language, is the fact that 46,514,699, or 60 per cent of the 77,539,521 parcels despatched, were sent from New York City (not including Brooklyn) and Chicago.

"The tremendous amount of merchandise sent out by the mail order houses of these cities is," it adds, "of course, the explanation of this condition. The amount, moreover, of the parcel post business which originates in these two cities is greatly in excess of that shown by the reports of the postmasters, because large houses in these cities ship by freight their catalogues and great quantities of their merchandise to many distributing centers, such as Jacksonville, Fla.; Little Rock, Ark.; Evansville, Ind.; Cedar Rapids, Iowa; Salina, Kan.; Augusta, Me.; Hattiesburg, Miss.; Jefferson City, Mo., and Billings, Mont., and the catalogues and merchandise are then distributed through the mail by these smaller offices and are reported to the committee and to the department as mail originating in these offices. * * * It appears, indeed, that the volume of parcel post business from these (mail order) sources exceeds that received from all other sources combined."

One of the ways in which it was confidently predicted that the parcel post would be utilized was by farmers sending their products direct to consumers in cities. The committee says that by the data compiled by it "the failure of the parcel post thus far to justify the predictions made for it as a means of direct transportation from the farmer to the consumer of farm products is, in fact, clearly indicated." As compared with the total parcel post business the amount originating on the farms has been negligible.

The service of the parcel post was not only to benefit all, but was to be far superior to that of the express companies. The Bristow committee finds that thus far its service has been very unsatisfactory. When the mail consisted almost entirely of letters and papers it was the practice to use sacks as containers for mail in transit. Government departments have never been notable for adapting their methods to new conditions and requirements; and the postoffice department has been slipping parcel post matter in the same sacks as other mail. The postmaster general in his report for the year ending June 30, 1914, said, "From actual count it has been found that the damage loss to ordinary parcels while in the mails is one-tenth of one per cent of the entire number handled. Damage loss has been due to improper packing rather than to the method of handling." The Bristow committee declares that information obtained by it from postmasters "does not confirm either of these statements.

* * * The experience of postmasters demonstrated that the percentage of damage is unnecessarily high, as the direct result of crude methods of handling employed by the department * * * These things are related not as isolated instances, but as the common practice in the handling of the mails, and it is stated that even when parcels are conspicuously marked 'fragile' they are often inclosed in the same sack with heavy hardware."

The committee criticizes the department for throwing sacks of mail containing parcel post matter from moving trains. It appeared to it "self-evident that fourth-class mail matter, even when well packed and heavily wrapped, cannot with safety be thrown to the ground from a rapidly moving train. * * * The express companies have not found it necessary to adopt the policy of throwing merchandise off moving trains for the sake of expediting delivery." The committee found evidence of many

other kinds of inefficiency, and reports that the failure of postal employees to exercise proper care in handling the mails is a weakness of the parcel post system which it certainly "lies within the power of the department to remedy speedily and effectively; but there is abundant evidence that the weakness exists to a marked degree. Sacks of mail are thrown into and out of vehicles used by mail messengers; they are thrown and kicked from mail cars to station platforms; they are trampled upon by postal employees and other persons; they are exposed to rain and snow without protection. Not all railway mail clerks and mail messengers are guilty of these practices; but the practices are common in the service, and were made the subject of comment by hundreds of postmasters."

Those who oppose government ownership and management of different kinds of business repeatedly are met with the argument that the service rendered by the postoffice department is efficient. The foregoing statements of fact can hardly be denied to be authoritative, and they hardly indicate that degree of superiority often attributed to the postal service.

Since the inauguration of the parcel post the postoffice department has greatly developed the system of concentrating mails for sorting and rehandling at terminal postoffices, thereby reducing the amount of this work done on trains. The Postmaster General has declared that this system is of value because it promotes economy and furthers the expeditious handling of the mails. The investigating committee declares, however, that the information it gathered "is sufficient to make it clear that whatever economy is now being effected by the use of this method is effected at the expense of the efficiency of the service in the expeditious delivery of parcel mail. * * * The public," it adds, "is vitally interested in securing, and has a right to expect, transportation service that offers expeditious delivery as well as reasonable security from damage to parcels in transit. It is the claim of the express companies that they are giving a service that is superior to the parcel post in both these respects, and in so far as the use of the terminal railway postoffice plan is contributing to delay in the delivery of fourth class mail matter, it is working to the detriment of the postal service."

One of the ways in which the express companies allege that their service is superior to that of the postoffice department is in their facilities for tracing parcels which fail to arrive at destination. With the exception of insured and C. O. D. parcels, no record is kept of the receipt or delivery of fourth-class mail, and it is impossible to trace an ordinary piece of parcel mail. The express companies, on the other hand, use a system of way-billing all parcels. The department handles millions of extremely small packages, the average revenue from which is small, and "under these conditions," the committee concludes, "it will not be possible for the postoffice department to give as complete and reliable a service for all parcels as is possible for express companies."

Even when parcel post matter is insured and a record of it is kept, the results of attempts to recover lost packages are very unsatisfactory. The department estimates that 800,000,000 parcels are handled annually by mail. Only approximately 13,000,000, or 1.63 per cent, of these are insured. "In the case of 98.37 per cent of the present parcel post business, therefore, the public is without indemnity against loss and without means for tracing parcels which fail to reach the addressees. * * * The fact that many persons prefer to intrust their valuable parcels to express shipments and are using the parcel post only for the transportation of articles of slight value undoubtedly accounts to some degree for this condition. Reports received from postmasters, however, indicate that a further reason for this lack of general patronage of the insurance system is to be found in the fact that experience with the department's operation of the insurance plan has not tended to create confidence in it. The general criticism is that the system in use in the adjudication of claims for loss or damage is so complicated and involves such delay in settlement that much dissatisfaction has resulted among patrons." And yet, advocates of government ownership com-

plain that private railways are slow about settling claims!

The foregoing are some of the principal criticisms made by the joint committee of the parcel post service. The committee also had much fault to find with the very radical changes in rates and weight limits which have been made by orders of the postmaster general. One of these orders practically abolished the first zone on which rates were based, thereby making the rates for the first zone cover also the second zone. It is, as the committee says, a well known principle of transportation that the through rate ordinarily should not be more than the sum of the local rates. In fact, this principle has been specifically enforced against the railways of the United States by its embodiment in a provision of the act to regulate commerce. While the railways are required to observe this principle, the postoffice department, as a result of the order of the postmaster general practically abolishing the first zone, flagrantly violates it. For instance, if a package weighing 20 lb. is sent from St. Louis to Emporia, Kan., through Kansas City without stopping, the rate is 83 cents. If, however, the package goes from St. Louis to Kansas City, is delivered there and then remailed to Emporia, Kan., the rate is, St. Louis to Kansas City, 44 cents; Kansas City to Emporia, 24 cents; total, 68 cents. "That," says the committee, "is repeated all over the United States. * * * Rates which make possible such a practice cannot be defended. They violate one of the cardinal principles of transportation." The unfair discrimination involved is obvious. If a railroad president should order rates to be made as the postmaster general has done, he could be indicted by a federal grand jury and put in jail for violating the act to regulate commerce.

The Moon bill to regulate the compensation of the railways for carrying the mail, which was introduced in congress at the last session, would give the postmaster general practically arbitrary power to fix the mail pay of the railways. There are persons who express confidence that he would exercise this power wisely and fairly. The postmaster general has already the power to make changes in the parcel service and rates, and the Bristow committee says of the way he exercised it: "The committee's study of the effects of these orders convinces it that the exercise thus far made of the power lodged in the postmaster general to change rates and weight limits has been, in several respects, unfortunate for the service. * * * No other change made by departmental order has been so inequitable as the one which practically merges the first and second zones."

The advocates of the parcel post controverted the argument made against it that it would help the mail order houses at the expense of the country merchants. With reference to this zone order, however, the Bristow committee says, "Its effect is to benefit especially the mail order houses by giving them an undue advantage over the local dealers in transportation service. Under the zone scheme now in effect, a mail order house can establish a branch agency in the territory which the concern seeks to reach, and within a radial distance of 150 miles from the location of such agency, the mail order house gets exactly the same rate as the government charges the local merchant, who ships only a few miles, notwithstanding the marked difference in the cost of the transportation service rendered." For example, if a mail order house ships a 50 lb. parcel from Kansas City to Bavaria, Kan., which is 193 miles by rail, but within a radial distance of 150 miles, it pays 54 cents. If a merchant at Salina, Kan., ships a parcel to Bavaria, a distance of seven miles, he likewise pays 54 cents. The Bristow committee adds that "this example stated could be duplicated in every part of the United States."

This is the way the government of the United States conducts its parcel post business. And at the same time it passes laws and maintains an Interstate Commerce Commission to prevent railways from discriminating in favor of big concerns and against little concerns! Consistency is a jewel, but apparently one which Uncle Sam does not prize.

The accounts of the postoffice department always have been kept in such a way that it has been difficult to make even an intelligent guess as to the expense incurred in rendering any class

of service. This is true as to the parcel post service and, furthermore, nobody knows how much revenue is being derived from it. The Bristow committee says: "The law originally made provision for a special stamp by which the receipts could, with some accuracy, be obtained, but the refusal of the department to use the special stamp as the law provided that it should, and the further merging of third and fourth class postage has thrown the whole accounting system into complete confusion." This sounds like accusing the department of being a law-breaker. And in spite of the fact that it is absolutely impossible for anybody to find out either what the parcel post earns or what it costs, there are many silly people who talk about it being a "success," and who even tell you that it is profitable!

The government by the inauguration of the parcel post engaged in the business of transporting commodities in competition with the express companies and the railways. The foregoing from the report of the Bristow committee shows how remarkably efficient a manager of a transportation concern the government has thus far shown itself to be. It started out to establish an agency which would benefit the entire public, but it has so run it as to benefit almost nobody but a few wealthy mail order houses in the large cities. It was going to use this agency to reduce the cost of living, but the cost of living has not been affected. It was going to render a much better service than the express companies, but a congressional investigating committee is forced repeatedly to contrast government methods unfavorably with those of the express companies. The government prohibits unfair discrimination by railways, but in the service and rates of its own parcel post it commits discriminations which, if committed by the railways, would cause them and their officers to be indicted. Through the Interstate Commerce Commission the government prescribes the accounts which must be kept by the railways; and then it keeps the books of its parcel post in such a way as to cause a congressional committee to say that "it has thrown the whole accounting system (of the postal department) into complete confusion."

We commend this excellent example of government management of a transportation system to the consideration of all those who want the government to own and manage the railways. If the government manages a comparatively small and trifling business like that of the parcel post in this way, upon what ground can it be contended by any rational human being that it would wisely and efficiently manage the enormously larger and more complex business of our railways?

NEW BOOKS

The Railway Library for 1914. Compiled by Slason Thompson, director of the Bureau of Railway News and Statistics, Chicago, Ill. 465 pages. 5 in. by 8 in. Bound in cloth. Published by the author, 1529 Railway Exchange, Chicago. Price \$1.

This is the sixth edition of Mr. Thompson's annual compilation of noteworthy addresses and papers delivered during the year on railway subjects. It contains 47 articles and addresses, mostly dealing with the railway problems of the present day by some of the most prominent railway officers and students of railway questions. To form a background the volume opens with a chapter from Seymour Dunbar's "History of Travel in America," which deals with stage-coaching in the days just before the railway came. Then follows a series of addresses and a series of papers on railway valuation and taxation, railway mail pay, parcel post and express rates. These include articles from various publications, including several which have appeared in the *Railway Age Gazette*. The subject of government ownership is treated in articles by Seth Low, W. M. Acworth and former Senator Jonathan Bourne, Jr. Several articles are devoted to the part the railway companies are playing in the European war. The concluding chapter of the volume consists of the annual statistical report of the Bureau of Railway News and Statistics.

Letters to the Editor

DOESN'T LIKE THE GROSS TON

MONTREAL

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

That we are creatures of habit no one will attempt to deny. But when we admit this, we generally mean that it is our own habits to which we are slaves. As a matter of fact, however, we are as much the slaves of habits handed down to us as of our own.

For instance, what is the gross ton but a habit handed down to us from the Lord knows who? And can anyone say why we should continue to use it?

What is the use of it? Did you ever stop to think what it costs us in clerical work, taking the country as a whole?

It is cumbersome, costly and useless. It leads to many errors, wicked thoughts and cuss words. Why not throw it overboard, as the other Jonah was thrown over. If a whale wants to swallow it to use in making up his books, let him. He is all gross, anyway.

Seriously, I believe there are a great number of people who would be glad to get away from it, but they want a lead. Won't you be the one to give it to them?

General Storekeeper, Grand Trunk Railway

STATISTICS THAT ARE WORTH WHILE IN RAILROAD MANAGEMENT

DETROIT, Mich.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

Railroad statistics are of two kinds—one represents the tabulation of data setting forth facts applying to the details of railroad operation, the result of much labor and painstaking elaboration, compiled for the purpose of showing *what has been done*. This class of statistics belongs to the realm of the schoolmaster who performs endless duties day by day regardless of how much benefit results from his labor aside from the presentation of facts. The other kind of statistics represents tabulations having for their purpose constructive efficiency and showing *what should be done*. The difference between these two kinds of statistics is the difference between an acceptance of what seems to be the inevitable on the one hand and what is believed to be intrinsically beneficial on the other hand.

Successful railroad operation is elusive. It is so complicated under established regulations, and its ramifications are so far reaching, that the strongest and most efficient manager will readily confess that there is still something for him to learn. Managerial duties as well as the duties of other officers are so engrossing that specialists will henceforth become an important factor in maintaining the equilibrium of a well-poised management.

A certain railroad in Central Classification territory has been burdened with a repetition of receiverships. Its name in the past has been a by-word for all that was hopeless. Upon recent reorganization a study was made of its operating cost and fixed charges as compared with its revenues. From this study was deduced certain facts clearly established as to costs prevailing and *actually accruing*, both as to anticipated upkeep, or maintenance, operation and administration, with due regard for the elimination of all waste and needless expense. These units of results of actual operating cost were applied to other units of fixed charges and maturities. The result produced the unit that had to be maintained for a livelihood *bare of profit*. From this stage it was easy to proceed to reach units of revenues which were required to produce *profitable results*.

This analysis or study constituted the premises or basis upon which was built a comprehensive statistical system by which is

determined within five days after the handling of freight the average ton-mile revenue rate applying. This ton-mile rate is carried along cumulatively for the fiscal year as it progresses, and thus is made the barometer as to profit within quick hauling distance of the watchful manager and traffic official. A detail of the business of each station as to commodities and ton-mile rates applicable thereto, together with the unprofitable tonnage carried, separately stated, is a part of the tabulation, also available within five days after the close of each week. Freight constitutes 85 per cent of the revenues of the railroad referred to, and is the prime factor in its earnings.

These statistics are not only constructively efficient, but are vital in the profitable operation of the road, and will serve to illustrate what is meant in the caption, "Statistics That Are Worth While in Railroad Management."

REPLYING TO "A CLERK'S PLEA"

WASHINGTON, D. C.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

The article entitled "A Clerk's Plea," written by M. S., on page 459 of your September 10 issue, is certainly a very strong plea for better education of the railroad clerk. I must, however, take exception to that paragraph reading:

"It is an irony of life to neglect the greatest things. Take the greatest industry of the country—agriculture—and it is surprising to learn how few are the institutions teaching us to be good farmers. Step to the next largest field, the railroad field, and you will find no school at all."

In writing the above paragraph, I fear that M. S. has overlooked the various state agricultural colleges and the Department of Agriculture of the United States, which maintains various experimental farms and issues farm bulletins with all of the advantages, ideas and experiments. And stepping to the next largest field, the railroad, that there is no school in which a clerk may acquire knowledge. There are several institutions throughout the country that make a specialty of this particular branch of education.

But before we speak of the school, let us first investigate to what extent the clerk employed in the railroad office has used the means which are at his elbow. If he is a clerk in the traffic department he must know something of tariffs, the adjustment of rates, and the construction of the tariffs. Has the clerk ever read Interstate Commerce Commission Circular 18-A, which describes the form of tariff? Does he know how many forms of concurrence are issued, and the application of each? Has he ever taken a tariff and read it through from cover to cover, or does he only use it as a reference? Has he ever read a bill of lading? Does he know that the "Official Guide" carries mileage of railroads in the front part of the book? Does he know that it gives stations and distances between depots as well as carrying time tables? Has he ever read the Act to Regulate Commerce, with its amendments? Has he ever read the Conference Bulletin No. 6, giving interpretations of the commission, and certain administrative rulings?

These are commonplace publications. My long experience in railroad offices prompts these many questions. It does look queer for a tariff man who constructs a freight tariff to go ahead without consulting his specifications which are included in circular 18-A. You would think it queer if a builder put up a building without reading his specifications—but it is done every day with tariffs.

What I have said about the traffic man, may be said of the accounting department clerk. I dare say that few of them have read the various accounting department circulars, issued by the Interstate Commerce Commission, but depend entirely on their chief clerks and others for guidance in the various accounts chargeable.

The trouble is that there are not enough men who have read Elbert Hubbard's little book about "Delivering a Message to Garcia." I believe that there is just as much chance for promo-

tion and advancement among clerks as in any department of commerce. I believe that there is just as much chance for recognition of ability and merit as there would be in any commercial organization. And if the clerks would apply themselves to the means at hand, their advancement would be more rapid than it is at the present time. I know of good clerks who are conscientious, and as loyal to the company as any set of men, but they are not loyal to themselves, by seeking every avenue of opinion and grasping every opportunity to acquire greater knowledge about their particular work.

I remember a newspaper that stated that in its Sunday edition it was going to give the name and picture of the smartest man in the town; in the Sunday edition it published a picture of a very insignificant looking man, who was the "Answers to Correspondence" editor of the paper. His entire knowledge consisted of knowing where to go to get information. If the railroad clerk would examine the various circulars, pamphlets, tariffs, newspapers, etc., that come under his observation, not to memorize them, but to know where to go for certain kinds of information, and if he would make that his maxim, he would soon be recognized in the office as the man who could "deliver a message to Garcia."

Agent Official Freight Traffic Directory.

THE RAILWAYS OF CHILI

NEW YORK

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

A map has been compiled and issued recently by the government of Chili, which shows all the railways, with profiles, lengths of steamship routes between ports and to the principal ports of the world, and considerable detailed data regarding the length and gage of the lines, which differs somewhat from that hitherto available. The length given includes all branches and all lines actually under construction in 1914. There is a total length of 130 kilometers of double track of the 5 ft. 6 in. gage.

Gage Feet	Meters	Length Kilometers
5 ft. 6 in.	1.676	2,577*
4 " 0 "	1.445**	29
4 " 8 1/2 "	1.435	725
4 " 2 "	1.270	184
3 " 0 "	1.067	451
3 " 3 3/8 "	1.000	3,561***
2 " 6 "	0.762	648
2 " 5 1/2 "	0.750	10
2 " 0 "	0.600	317
Total		8,502 Kms

- ** Electric lines.
- * Length of main line track, 2,707 kms.
- *** Includes Antofagasta 657 kms. changing from 2 ft. 6 in. to meter.

Definite studies (final locations) have been made of the last link in the Longitudinal Railway, from Arica to Zapiga, 278 kms., which is not included in the above. Most of the lines are owned and operated by the Government, the distribution being as follows:

Government	5,502
Private	3,000
	<u>8,502</u>

There are 160 kms. of rack railway, and two sections of mixed gage, from Ovalle to Coquimbo and La Serena (5 ft. 6 in. and meter gage), and from Toledo to Paipote (4 ft. 8 1/2 in. and meter gage).

F. LAVIS
Consulting Engineer.

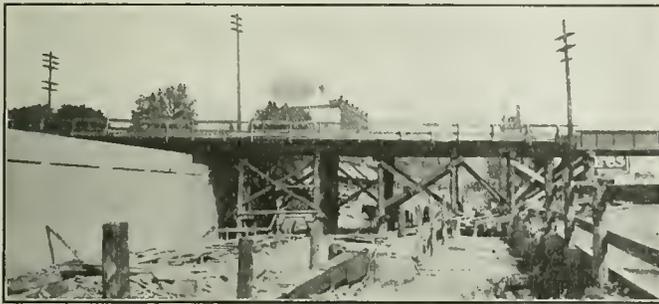

THE SUEZ CANAL.—During the first six months of the current year, 1,750 ships passed through the Suez Canal, paying passenger and transit dues to the amount of about \$8,750,000. The corresponding movement in the first half of 1914 was 2,571 ships, and the amount paid was in the neighborhood of \$13,000,000. If one deducts the number of German, Austrian and Turkish ships which passed through the canal in the first half of 1914, and also allow for the dues paid by them, the figures for 1915 are little below what has come to be regarded as the normal level.

Grade Crossing Elimination in North Toronto, Ontario

The Canadian Pacific Is Completing the Elevation of Its Track for 2½ Miles at a Cost of \$2,750,000

The Canadian Pacific is completing the elevation of its tracks in North Toronto for a distance of about 2½ miles, which involves the building of a new passenger station at North Toronto and the rebuilding of two local freight yards. This line of the Canadian Pacific is the original main line and crosses the highland a little more than two miles back from the lake front in the northern part of Toronto, and is about four miles shorter than the line which makes a detour south through the business district of the city. This line also avoids the grades necessary to reach the lower ground at the lake front. The traffic at the present time consists of two passenger trains and an average of five freight trains in each direction, and while this is relatively light, it promises to be much greater in the future. The line had been double tracked previously as far as the viaduct 80 ft. high over the Don valley, which at this point is a part of Reservoir Park.

The presence of the railroad has made an industrial district

Yonge Street Showing Excavation for Street Depression

of the territory immediately adjacent to the tracks, but outside of this it is entirely a high-class residence district, particularly the St. Clair avenue district, of relatively recent development, two blocks north on a ridge overlooking the tracks. It was largely the presence of this rapidly developing residential district, accessible from the business center of Toronto only by streets crossing the railroad, which was really responsible for the movement for the elimination of the grade crossings.

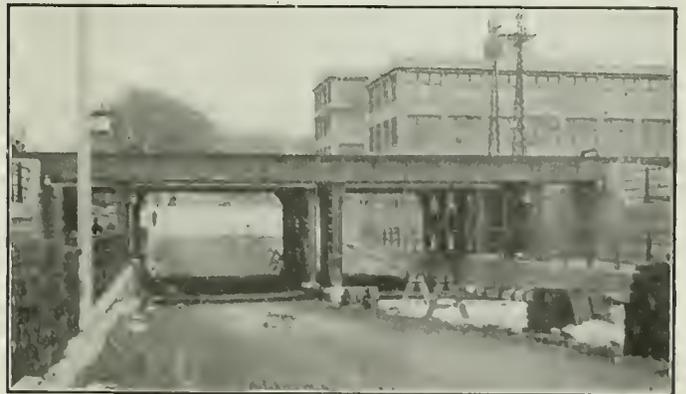

The project starts on the west at a grade crossing at Dufferin street with a 0.4 per cent ascending grade for a distance of 1,700 ft. to the first subway at Dovercourt road. From there east the grade is level, or nearly so, as far as Avenue road, a distance of 1¾ miles, where a 0.4 per cent grade rises eastward for 1,000 ft. to the Yonge street subway. From Yonge street there is a 0.5 per cent descending grade which brings the track to the original grade 1,800 ft. farther east at the west end of the Don valley bridge. Summerhill avenue, just west of this bridge, will continue to be a grade crossing for the present. There are tentative plans to divert this street to a location under the end of the ravine bridge, a scheme which the topography of the site will readily permit.

Subways have been provided at Dovercourt road, Ossington avenue, Shaw street, Christie street, Bathhurst street, Howland avenue, Spadina road, Davenport road, Avenue road and Yonge street. Albany avenue and Huron streets have been closed. A number of other streets which did not cross the railroad previous to the track elevation continue closed at present. Bridgeman street was extended from Albany street to Bathhurst street so that the former might have an outlet through the Howland avenue subway. Davenport road and Poplar Plain road, which previously intersected just south of the tracks, have been relocated between Dupont street and McPherson

avenue to provide for a single square subway instead of two skew subways.

The Canadian Northern Ontario, desiring to obtain access to North Toronto, has arranged with the Canadian Pacific for the joint use of two tracks from a junction near Dovercourt road to Avenue road. These joint tracks are at 13 ft. centers and occupy equal portions of the Canadian Pacific right of way and of the lands acquired by the Canadian Northern Ontario immediately to the north. A service track is being provided to the north of the joint tracks for the Canadian Northern Ontario and a similar track for the Canadian Pacific on the south. The latter track, however, is placed 26 ft. southerly of the nearest joint track, in order to permit the construction of an additional main line track when this becomes necessary. It is understood the cost of this section of the work will be borne equally by the two railway companies and that the Canadian Northern Ontario will acquire the use, conjointly with the Canadian Pacific, of the Union Station and facilities which the latter is constructing between Avenue road and Summerhill avenue.

The city of Toronto bears 25 per cent of the estimated cost of grade separation based upon the elevation of two tracks only, including the property damages. The street car company pays 10 per cent of the cost of the Avenue road subway which they occupy with two tracks, also on the basis of the elevation of two tracks. The cost of the Yonge street subway is subdivided somewhat differently. When the line was built in 1880 the railway company agreed to provide a subway having

Christie Street Subway

a head-room of 14 ft. at its own expense whenever the city so desired.

In this grade separation consideration was given to the large industrial development alongside the railway tracks, and as a means to facilitate further development in this direction, the tracks were raised to such a height only as would permit the existing sidings, some 21 in all, to be retained at their original level for loading purposes, and to be brought up to the south service track on grades of not more than 2 per cent. With few exceptions this has been obtained without the use of retaining walls or trestles, and was further facilitated by dropping the service track between subways on 0.4 per cent grades, as shown on the profile.

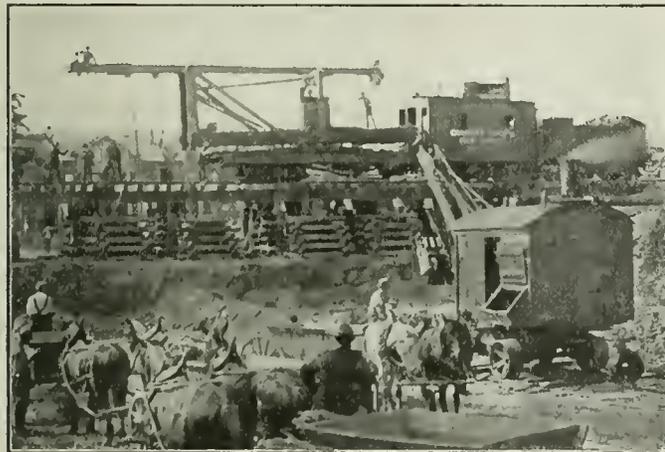

At the inception of the project, the Canadian Pacific had two team yards, one east and one west of Yonge street. No change was required in the yard west of Yonge street, which also includes a small freight station, other than to provide a 2 per cent approach grade descending from the west. The

so that with a 13-ft. spacing of tracks, the adjacent girders of adjoining tracks are 1 ft. 4 in. center to center, connected at intervals by diaphragms. In the same way, no double-strength columns are used, as there is an independent bent for each track made up of two single-strength columns connected by cross bracing. In all, 6,400,000 lb. of structural steel were used in the subways. The Dominion Bridge Company fabricated and erected all of the subways except that for Avenue road, which was furnished complete by the Canadian Bridge Company.

All of the subway floors are protected by a membrane waterproofing which was made by Simes & Brother, Toronto. It consists of a layer of building paper followed by three layers of burlap and two layers of tar felt, all mopped down with pure rock asphalt and covered with another layer of building paper. The membrane was protected by an asphalt mastic of varying thickness graded to provide drainage. The backs of all abutments and retaining walls are covered with a waterproof membrane but without the mastic protection.

NORTH TORONTO PASSENGER STATION

The North Toronto passenger station of the Canadian Pacific, located south of the tracks, some 500 ft. west of Yonge street, will be replaced by a new station in a more convenient

Replacing Tie Cribs with Pile Trestle at Subway

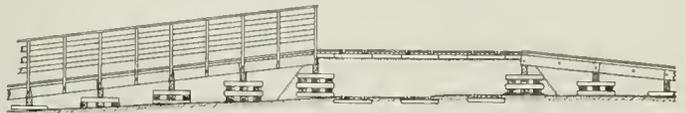

location on the east side of Yonge street, south of the tracks. This will consist of a building 80 ft. by 120 ft., separate from the track structure, with a baggage room to the north under the tracks which will be served by a driveway, also under the tracks east of the Yonge street subway. Three baggage truck elevators will be provided to give access to the platform overhead. From the station building a passage way east of the baggage room will lead to two passenger stairways for access to the platforms. The track layout at the station includes six tracks. There will be two freight tracks in the center with two westbound passenger tracks on the north and two eastbound passenger tracks on the south side. Each pair of passenger tracks is spaced 31 ft. center to center, with an island platform 1,100 ft. long between. On the south side, next to the station, there will be a baggage platform 260 ft. long, to serve the southernmost passenger tracks only. In connection with the new work, Yonge street has been increased in width 20 ft. between Marlborough and Shaftesbury avenues, a distance of about 750 ft.

GRADING

From Dufferin street to Avenue road the tracks were raised in place, the raise in the streets being made in an interesting manner by the use of tie cribs. The first operation was to place the tracks at the street crossings on stringers and mud sills, restricting this operation to one-half of the street at a

time while traffic was permitted on the other half. As fast as the tracks were raised on the filling, corresponding raises were made at the street crossings by jacking up these tracks on the stringers and building cribs of cross ties to support them. To facilitate the work the tracks were raised about 8 in. at a time, corresponding approximately to the thickness of the ties used in the cribs. When the tracks had been raised to the full elevation the tie cribs were replaced by pile bents, as illustrated in the accompanying photograph, which supported the tracks during the excavation for the street depression, the construction of the masonry substructures and until the steel work could be erected.

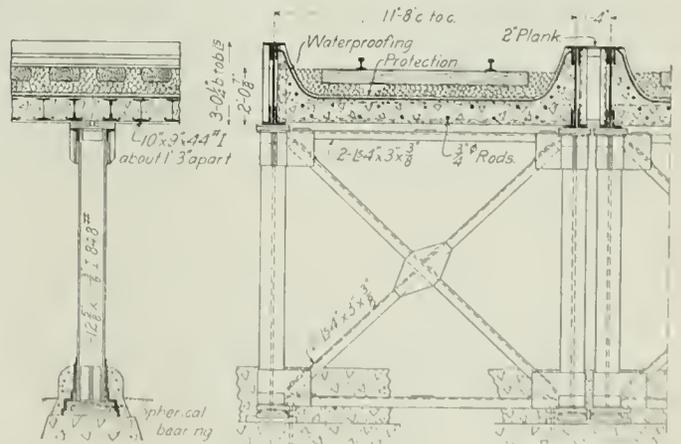

From Avenue road to Yonge street the situation did not permit of this method, necessitating the use of a single track

Temporary Grade Crossings—Blocked Up as Tracks Were Raised

trestle for that distance. Filling material was unloaded from this while trains were operated over a single track on the lower level. As soon as the embankment had been placed to a sufficient width to permit laying a track on the new grade to one side of the track on the trestle, trains were transferred to this new track, and the rest of the fill completed.

The use of tie cribs for raising the tracks interrupted the street traffic as soon as the initial lift was made. For this reason temporary crossings were provided at Huron street, Albany avenue and Delaware avenue, which were not to be provided with subways. To accomplish this with the least number of changes the tracks were humped up at these points as much as possible without disturbing the adjacent streets on either side or resorting to excessive grades. Temporary crossing planks were put down, supporting the approaches to either side of the new embankment on tie cribs similar to those used for raising the tracks at the other streets. These were raised from time to time as additional lifts were made on the tracks. All of the filling for the track elevation came from a shovel cut adjacent to the main track at Leaside two miles east. In all, 350,000 cu. yd. of filling were used.

Details of Subway Steel Work

Work was started in the fall of 1912, and continued to date except for a delay of six months in the spring of 1913, when an appeal was made to the Privy Council to have the tracks raised to a higher level than that authorized by the Railway Commission, thus reducing the depression of the streets. This objection, however, was not sustained. The work will be complete by the end of this year. The tracks have been elevated and the last work will be the completion of the passenger station and the Yonge street subway.

The work has been handled by the engineering department of

the Canadian Pacific under the direction of J. M. R. Fairbairn, assistant chief engineer, and A. L. Hertzberg, division engineer, with B. Ripley, assistant engineer in immediate charge. The structures were designed under the direction of P. B. Motley, bridge engineer.

WASHING LOCOMOTIVE SMOKE*

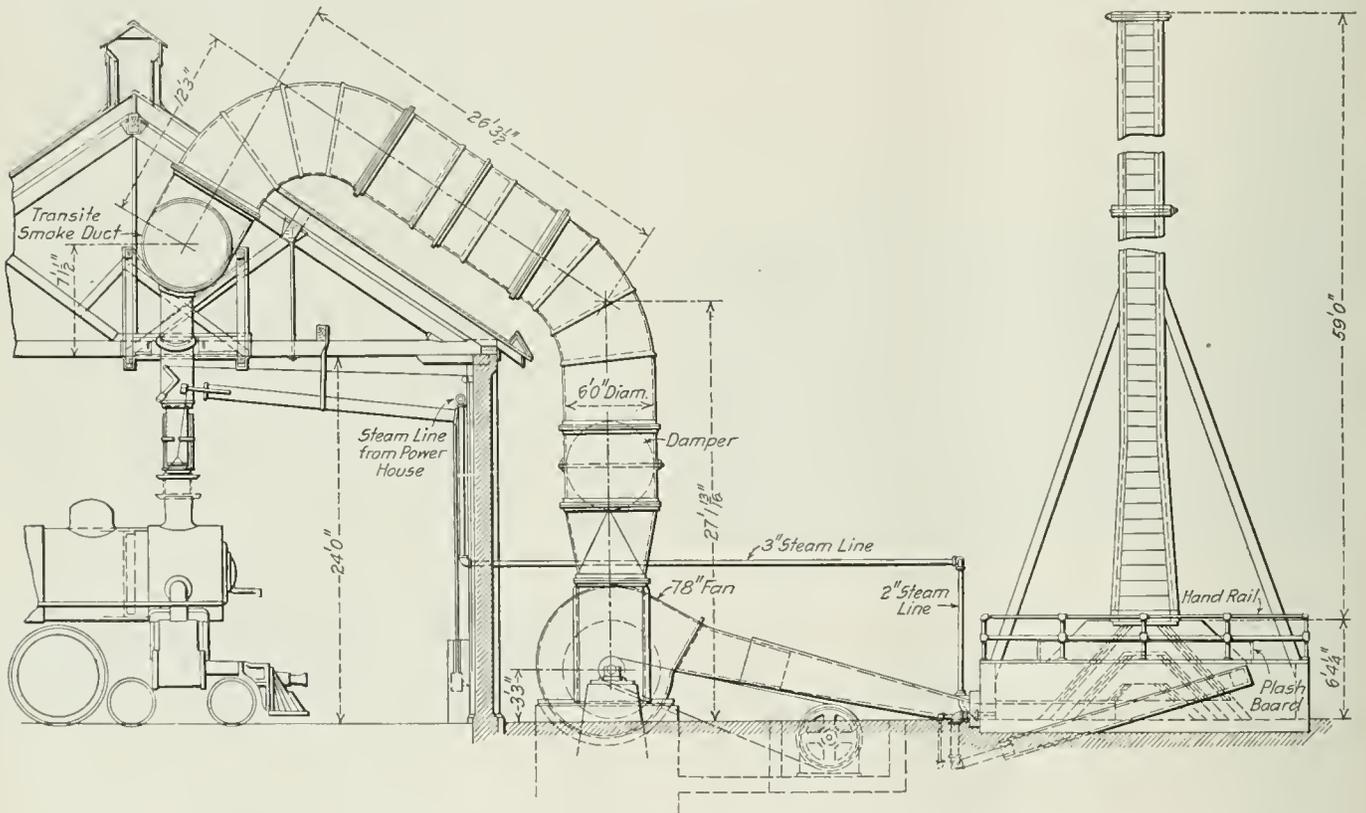

By M. D. FRANEY

Master Mechanic, New York Central, Elkhart, Ind.

The New York Central engine house in Chicago is located at Englewood station, near Indiana avenue and 63d street. It is adjacent to the White City, a popular amusement park, and surrounded by a very desirable residential district. The citizens are very insistent on the abatement of smoke, and object to the excessive use of the blower which is sometimes necessary for this purpose. While the New York Central locomotives west of Buffalo are equipped with the steam jet smoke consumer, which induces a flow of air above the fire and under the brick arch, and large blower capacity consisting of two 1½-in. blowers, one on the right and one on the left side, it is found that these

plant was built at Elkhart, Ind., capable of taking care of one locomotive, which gave results beyond expectation. To more thoroughly test the device, an experimental plant was built at Collinwood, Ohio, to take care of several locomotives. With the data collected from this experimental plant, the present smoke washer at Englewood was designed and constructed. The only drawback was in securing material that would withstand the powerful action of the various acids resulting from the combination of the gases, the solids and water.

The Englewood engine house has 30 stalls, in which from 80 to 100 locomotives are handled every 24 hours. It is built without a single smoke jack leading direct to the atmosphere. In washing the smoke, a large concrete tank is used, 22 ft. by 32 ft. This is subdivided by separating walls into three basins, each of which is lined on the interior with dressed lumber set in about 1½ in. from the concrete. The space between the concrete and the lining is filled with tar. Wooden pins, instead of nails, are used for fastening the lining, in order to resist the action of the acids. The drawings show the plan and elevation of the tank, the stack, the three hoods, the three ducts connecting the fan with the concrete basin, the fan and motor and the elbow

Locomotive Smoke-washing Plant at the Englewood Engine House

appliances are of little assistance in the elimination of smoke when building a new fire in a cold locomotive. This was the great problem which confronted the mechanical officers of the New York Central in 1910, when it was found necessary to build a new engine house and terminal facilities at the Englewood station.

O. M. Foster, master mechanic in this territory at that time, after a careful study of smoke-washing devices which had been tried at other places with partial success, conceived the idea of forcing the smoke through a large body of water, by means of a fan separating the unconsumed carbon from the gas, permitting the latter to escape through a high stack and holding the carbon and other solids in suspension in the water. D. R. MacBain, superintendent of motive power, who had made a life-long study of smoke-abatement devices, approved of the plan. A small

connecting the fan with the large smoke duct in the engine house to which the smoke jacks connect.

A large smoke duct, 60 in. in diameter at the center and tapering to 36 in. at the ends, extends around the engine house just under the roof and directly above the smoke stacks of the locomotives when the latter are headed in and standing in normal position. This smoke duct was built of transite material, and is connected with drop pipes leading down to each pit. In each of these drop pipes is a damper which is closed when the jack is not in use. Leading from each drop pipe is a telescopic jack made of cast iron and supported from the roof. These telescopic jacks have vertical, lateral and longitudinal movement to accommodate different positions of the locomotive stack. They are raised and lowered by a walking beam, counterbalanced with a weight and operated from the wall of the engine house. The damper is opened and closed from this same point.

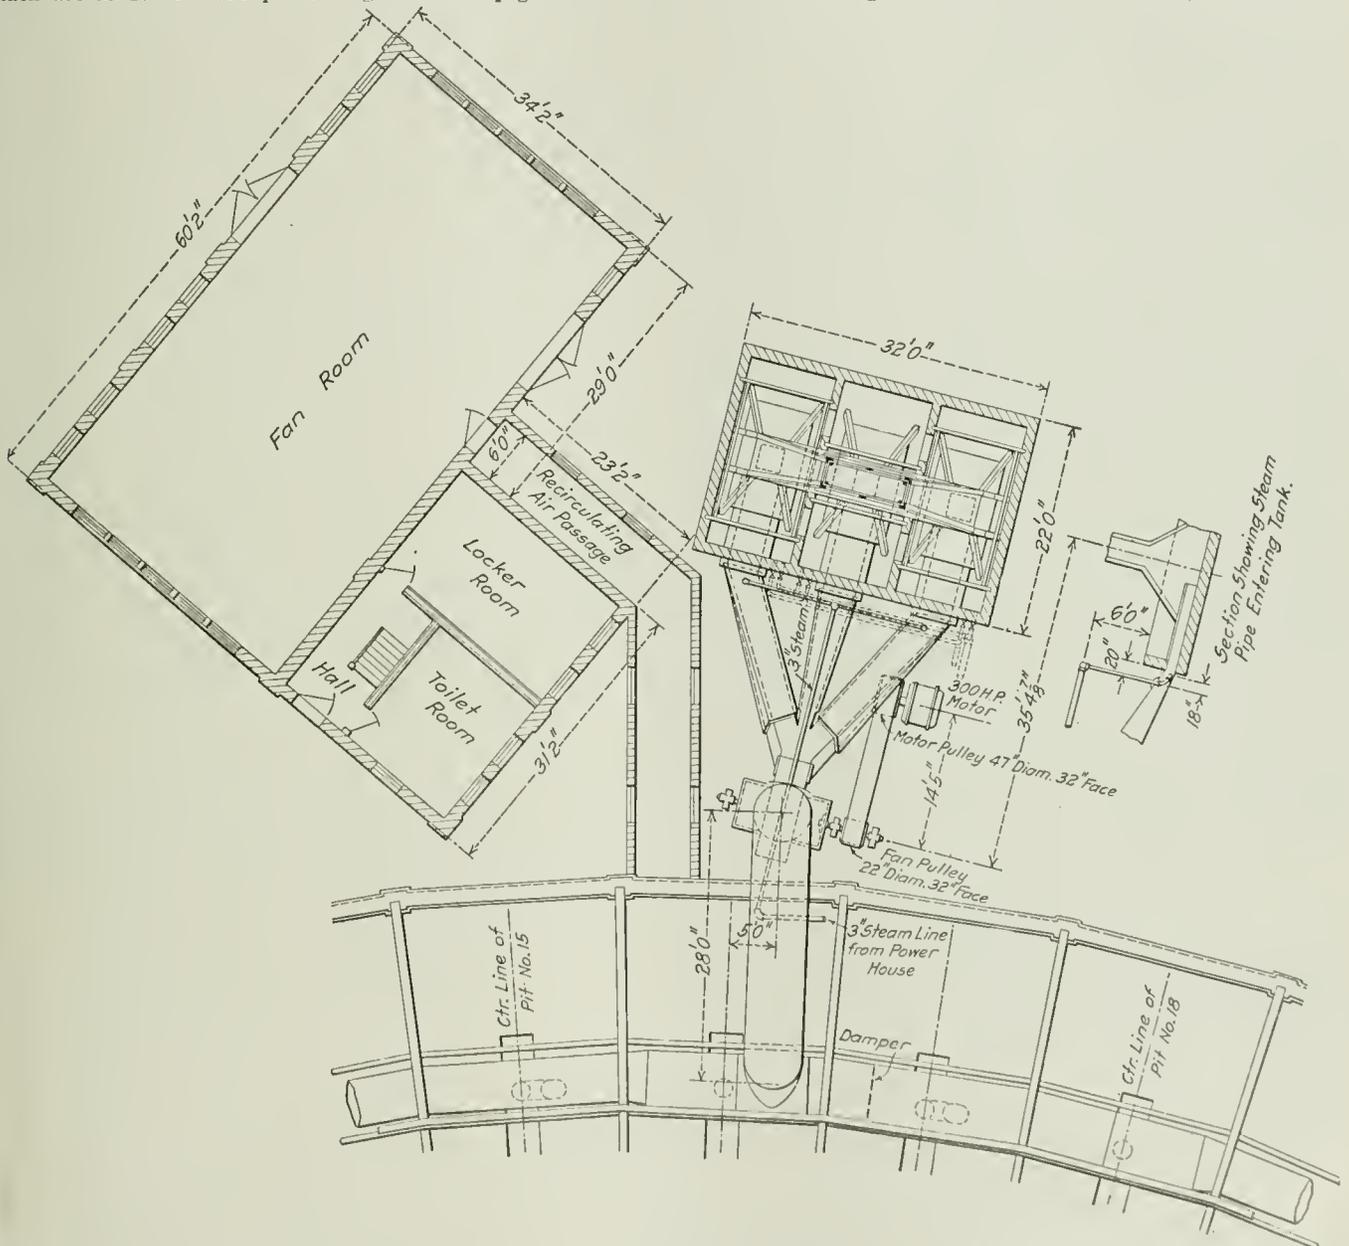

Near the center of the house a large elbow connects into the

* Abstract of a paper presented at the tenth annual convention of the International Association for the Prevention of Smoke.

top of the 60-in. transite duct and leads down to a 78-in. steel plate, double-inlet fan, capable of handling 68,000 cu. ft. of gases at 500 deg. per minute, at a total static pressure of 14 in. at the fan outlet, and at a speed of 950 r.p.m. The fan is belt-driven by a 300 hp. constant speed, 300-400 r.p.m. motor. A smoke duct leads from the fan to each of the three concrete basins, the outlet to each duct coming directly under the hoods referred to above. There are three hoods in each tank. The top of the interior hood is open, while the top of the second hood is closed similar to a bell; the top of the third or outer hood is open and connects with the stack, which is approximately 60 ft. high. The three smoke ducts leading from the fan, the hoods and the stack are made of wood pinned together with pegs instead of

gases are forced from the fan through the three smoke ducts into the water, passing out into the first hood. The water being thoroughly agitated at this point by the steam jets referred to, the gases are engulfed by the spray and wave action of the water and pass out through the top of the first hood into the second hood or bell, which, it will be remembered, has a closed top. They are forced down below the lower edge of this hood and pass to the third hood, and out of the water into the stack.

The carbons and solids are separated from the gases as they are forced through the water and rise to the top of the water in the tank in the form of a black, foamy scum. The gases pass out through the stack as a white vapor, practically odorless. In handling 80 locomotives in 24 hours, from 8 to 10

Plan of Locomotive Smoke-washing Plant at the Englewood (Chicago) Engine House of the New York Central

nails. The lower portions of the three hoods extend down in the concrete basin and are submerged in the water.

An 8-in. hole is provided in each of the separating walls to insure a uniform level of water in the three basins. A special overflow pipe is provided to maintain 14 in. of water in the tanks and to prevent the carbon from escaping into the sewer. A 1¼-in. high-pressure steam jet, with proper elbow and nozzle pointing towards the outlet, is located in each of the three ducts and close to the concrete tank. The purpose of these steam jets is to accelerate and thoroughly mix the gases with the water and prevent them passing through the water in large bubbles. The

barrels of carbon are obtained from the smoke washer. This has the appearance of lampblack, and is thoroughly steam-dried after it is taken from the smoke washer. An analysis of this material is as follows:

Moisture	3.0 per cent
Carbon	87.6 per cent
Sulphur	2.6 per cent
Iron oxide	8.1 per cent
Silica	1.8 per cent
Calcium oxide	trace

The sulphur and sulphuric acids are retained in the water. The city smoke department of Chicago and the nearby residents

are well pleased with the results obtained and on numerous occasions have complimented the plant very highly. The estimated cost of making such an installation is from \$15,000 to \$18,000, where the property conditions are favorable. Owing to the property conditions and to the fact that the Englewood plant is an experimental one, the actual cost was somewhat greater. We made an investigation some time ago as to the cost of operation:

COST OF OPERATION PER DAY OF 24 HOURS	
Water, 18,255 gallons, @ 7 cents per M.	\$1.28
Coal, 10.86 tons, @ \$1.75 per ton.	19.00
Electricity, 3,360 kilowatt hrs., @ \$0.0129.	43.34
Total	\$63.62

SAVING EFFECTED BY THE USE OF WASHER PER DAY OF 24 HOURS	
Fires maintained	\$40.80
New fires built	7.11
Reduced electrical cost due to sliding scale rate.	8.52
Total	\$56.43

This makes the net cost of operating the washer \$7.19 per day of 24 hours (\$63.62 less \$56.43). It is expected that we will be able to find a profitable use for the lampblack reclaimed by the smoke washer. This would, of course, result in still further decreasing the net cost of operation and might possibly show a profit.

We have found that where the fires are properly started the draft from the fan is sufficient to draw off the gases from the locomotive without the use of the blower. This means a decided reduction in the amount of water used, due to not using the steam blower, and also means a decided saving in coal consumption, due to the reduced draft. While we have quoted the results of some tests, it is difficult to obtain a set figure as to the amount of coal and water consumed by an engine at a terminal, due to varying conditions, such as smoke restrictions, temperature of the weather, and the human element or fire-up men. However, the tests showed to our entire satisfaction that the coal and water consumption is materially reduced on engines stored under the smoke jack and influenced by the draft of the smoke washer fan. The temperature of the firebox is more even and the fire-up man is able to handle a larger number of locomotives.

This smoke washer is operated under patents controlled by the American Smoke Washing Company, incorporated in Illinois, of which S. K. Dickerson, 5120 Greenwood avenue, Chicago, is secretary.

ACCIDENT BULLETIN No. 55

The Interstate Commerce Commission has issued Accident Bulletin No. 55, containing the record of railway accidents in the United States during January, February and March, 1915. The number of persons killed in train accidents was 65, and of injured 1,972. The total number of casualties of all classes reported, including industrial accidents, was 37,078; or 1,650 killed and 35,428 injured. The accidents are summarized as follows:

TABLE No. 1.—Casualties to persons—Steam railways.

Causes	Passengers		Employees (including employees not on duty)		Other persons (trespassers and non-trespassers)		Total persons	
	In-	Jured	In-	Jured	In-	Jured	In-	Jured
Train accidents.								
Collisions	1	478	13	364	2	26	16	868

1912	3,903	217	4,251	3,368,125

The usual tables are given, classifying certain kinds of accidents in detail. Twenty accidents during this quarter were investigated by the inspectors. The accidents occurred as follows:

Chic. Burl. & Quincy	Liberty, Mo.	Jan. 1	Butting collision
St. Louis & S. F.	Olathe, Kans.	Jan. 3	Derailment
Minn. & St. Louis	Emmons, Minn.	Jan. 4	Derailment
Wabash	Runnells, Iowa	Jan. 15	Derailment
Seaboard Air Line	Osgood, N. C.	Jan. 19	Derailment
Erie	Glen Eyre, Pa.	Jan. 23	Derailment
Pennsylvania	Sizerville, Pa.	Jan. 30	Side collision
Atlantic Coast Line	Callahan, Fla.	Jan. 30	Derailment
Cin., Georgetown & Port.	Fair Oak, Ohio	Feb. 1	Butting collision
Pennsylvania	Irving, N. Y.	Feb. 2	Rear collision
Oregon Short Line	American Falls, Idaho	Feb. 5	Derailment
Balt. & Ohio	Youngstown, Ohio	Feb. 19	Derailment
Denver & Rio G.	Fountain, Colo.	Feb. 22	Derailment
Nevada-Cal-Oregon	Horse Lake, Cal.	Feb. 23	Rear collision
Denver & Rio G.	Glenwood Springs, Colo.	Mar. 2	Derailment
Chic. & East Ill.	Shelburn, Ind.	Mar. 4	Derailment
A. T. & S. Fe.	Elsinore In., Cal.	Mar. 5	Derailment
Wabash	Garber, Ill.	Mar. 5	Butting collision
Wabash	Strahan, Iowa	Mar. 16	Derailment
Ahnapee & West.	Forestville, Wis.	Mar. 29	Derailment

Electric railways reporting to the commission (not included in the foregoing statistics) had 76 persons killed during the quarter, and 1,023 injured; and there were 32 collisions and 14 derailments. Train accidents are charged with four fatalities. The total number of passengers killed from all causes was 4; and of employees 8 (3 in industrial accidents). The number of trespassers struck or run over by cars was 83 (20 killed and 63 injured).

Annual Meeting of the Railway Signal Association

Review of Committee Reports, Discussions and Other Business at the Convention Held in Salt Lake City Last Week

The twentieth annual convention of the Railway Signal Association was held in the Hotel Utah, Salt Lake City, Utah, September 14, 15 and 16, President T. S. Stevens, signal engineer of the Atchison, Topeka & Santa Fe, in the chair. The attendance was particularly representative of the western signal men, the total registration being 238.

After an invocation and an address of welcome by S. C. Park, mayor of Salt Lake City, President Stevens read his annual address. He emphasized particularly the responsibility of the individual members in the conduct of the association's affairs, urging careful attention to the selection of the very best available men for the officers and to the casting of individual votes on propositions submitted to letter ballot. He also emphasized the need of the members co-operating with the managing officers of the association to increase its practical value by adopting the conclusions of the Board of Direction as a guide for actual practice whenever possible; and if the result of the association's efforts cannot be adopted, constructive criticism should be submitted as a help in correcting errors.

The report of the secretary-treasurer showed a membership of 1,257, an increase of 20 during the past year, and a very satisfactory financial condition.

SIGNALING PRACTICE

The report of Committee I covered switch indicators, economics of signal maintenance, capacity of single-track and a reference to the A. R. A. clearance diagram. The adopted clause covering the requisites of installation for switch indicators, specifically relates to the use of such indicators on roads of two or more tracks. After a careful study of the conditions obtaining on single-track, the committee presented the following statements of practice, with the recommendation that they be submitted to letter ballot for adoption, and if passed, be inserted in the Manual following the requisites of installation for switch indicators.

(1) Where there are signals governing movements in both directions located so near a switch that trainmen at the switch can observe their indications, such signals will give the necessary information and switch indicators are unnecessary.

(2) Where a signal governing in one direction is located as above and a signal governing in the opposite direction is not so located, a switch indicator may be used to give the information not obtainable from a signal.

(3) Where signals governing in both directions are not located as above, two switch indicators may be used, one for each direction.

(4) Each switch indicator may, as to trains in one direction, serve the same purposes and be controlled in the same way as on lines of two or more tracks.

(5) In the case of a system in which a train moving beyond one passing siding controls signals governing movements between that passing siding and the next, a switch indicator may be so controlled as to indicate the approach of a train at and from the signal located adjacent to the next passing siding.

A final report on the economics of signal maintenance was submitted, containing the following conclusions: Because the main controlling power of signal apparatus is electrical and because the special training required is so different, a combination of signal and track forces is not recommended as a means of obtaining economy and efficiency in signal maintenance. Occasionally it will be found practicable and economical to combine forces engaged in maintaining electrical features on a railroad with those maintaining signals; but as a general proposition economy and efficiency will be produced to a higher degree by co-operation than by combination, and this rests entirely with the officer in charge, in the arrangement of the forces available.

A monograph by F. L. Dodgson, consulting engineer of the General Railway Signal Company, was presented in connection with the report on the capacity of single-track. This paper

analyzed the effect of passing siding location on the capacity of single-track and developed formulae for determining the theoretically correct locations of a given number of passing sidings on a given piece of single-track road to secure the maximum capacity in trains per day and for determining the theoretical number of trains that can be run with a given number and arrangement of sidings.

The committee recommended that a statement be inserted in the Manual to the effect that the recommended standard for limiting clearance lines for third rail and permanent way structures and rolling equipment, adopted by the American Railway Association, may be found in the latest issue of the Proceedings of that association. This action was considered preferable to reproducing the diagram in the Manual, because it is subject to revision by the A. R. A., and in case of revision a period of many months might elapse before the correct diagram could be placed in the Manual.

Discussion.—R. M. Phinney (C. & N. W.) presented, by letter, several suggestions on the proposed additional requisites for switch indicators, including a revision of the previously adopted clause, a combination of the first three paragraphs into one, and an alternative revision of the wording in paragraph 1, to cover the objection that, under certain conditions, the signals referred to do not give the necessary information. In view of the apparent merit in the suggestion the chairman, C. C. Anthony (P. R. R.), suggested that the subject be referred back to the committee and a motion to that effect was carried. In a brief discussion on the study of the relation of passing track location and line capacity, Mr. Dodgson said that further investigation led him to believe that lap sidings increase the capacity of a railway line three-fourths of a train per high speed train run, as compared with the capacity of the line when single sidings are provided.

MECHANICAL INTERLOCKING

Committee II presented a code of specifications for electro-mechanical interlocking. The discussion brought out a number of points in which the proposed specifications differ from the mechanical interlocking specifications, and for this reason the subject was referred back to the committee.

POWER INTERLOCKING

Committee III, on Power Interlocking, submitted specifications for fiber conduit, incandescent lamps and electro-pneumatic interlocking, which were recommended for submission to letter ballot.

The specifications for fiber conduit were referred back to the committee following numerous suggestions by Mr. Anthony based on quotations from the specifications of the Pennsylvania Railroad. The other two specifications were accepted with minor connections brought out in the discussion.

AUTOMATIC BLOCK

Committee IV submitted revised specifications for crystallized copper sulphate with a recommendation for its acceptance and submission to letter ballot. These specifications, as now revised, cover, in the opinion of the committee, a product which can be furnished by the manufacturers without an increase over present prices, and which will give the railroads a satisfactory article.

The specifications were accepted practically without change.

MANUAL BLOCK

Committee V submitted for consideration and submission to letter ballot the following codes of instructions: Testing and maintaining dry cells, maintaining gravity cells and maintaining

caustic soda cells. The report was accepted for submission to letter ballot.

STANDARD DESIGNS

Committee VI submitted 21 revised drawings and 6 new drawings, as follows:

No.	Title	Journal Reference
1010	Crank and Jaw Pins (New)	March, page 67
1015	One-inch Signal Pipe and Coupling	March, page 68
1020	Guide Clamps, Brackets and Caps, etc.	March, page 69
1021	Guide Clamps for Vertical Connections	March, page 70
1022	Guide Supports and Caps for, etc.	March, page 71
1023	Guides for Vertical Connections on Signals	March, page 72
1024	Crank Bracket Fittings for Pipe Post	March, page 73
1025	Crank Bracket Fittings for Pipe Post	March, page 74
1026	Ladders for Mechanical Ground Masts	March, page 75
1027	Ladder Parts	March, page 76
1028	Ladders for Bracket Posts, etc.	March, page 77
1029	Ladder Clamps and Stays	March, page 77
1043	One-arm Mechanical Ground Signal (New)	
1044	Two-arm Mechanical Ground Signal (New)	
1045	Three-arm Mechanical Ground Signal (New)	
1056	Terminal Blocks	May, page 145
1059	Clamp for Base of Ground Masts	May, page 146
1065	Blade for Upper-Quadrant Signals	May, page 147
1070	Binding Post	May, page 148
1196	Guides for Vertical Connection on Bracket Posts	March, page 78
1197	Two-lever Wall Machine (New)	
1198	Crank Brackets and Bracket Posts	March, page 79
1233	Mechanical Dwarf Signal Spectacle, etc.	Sept. 14, page 538
1360	Tang Ends and Screw Jaws	May, page 149
1361	Adjusting Crank and Assembly	May, page 150
1397	Two-lever Wall Machine (New)	
	Plate III, Symbols (Revised)	March, page 80

In addition to the above, drawing No. 1233, mechanical dwarf signal spectacles and lamp bracket support was re-submitted for approval.

The committee has under consideration the desirability of standardizing a switch-and-lock movement, arranging the fittings to make it universal so that the crank may be reversible on its pivot, thus providing the means of applying the movement to a lifting block derail by reversing the crank and admitting of the lock and operating rods being contiguous, which cannot be done with the present standard movement. The revised movement which the committee has under consideration would be more costly than some of the present smaller movements, and a short discussion as to the need of such a standard was therefore requested. The committee also has under consideration further revision of the approved signal symbols. The manufacturers have appointed representatives to confer with the committee on this subject. A sub-committee has been investigating the desirability of standardizing the sizes of roundels and lenses primarily to reduce to the minimum the number of sizes used. This sub-committee is also looking into the matter of standardizing hand lamp globes.

All of the plans were accepted for submission to letter ballot and several members spoke in favor of the proposed new switch and lock movement, offering suggestions for the committee's benefit.

RELAYS

Committee VII recommended that no changes be made in the present specifications for relays until a thorough investigation can be made to determine just what is needed. One of the important changes will be the standardization of parts. This matter has been referred to the manufacturers' representatives, with the request that they reach an agreement on as many parts as possible.

The committee is of the opinion, first, that the ideal relay should pick up and release at the same point, and that a practical relay can perhaps be made that will approach that ideal condition more closely than the present design; second, the energy required for operating the relay should be increased; the amount of current consumed in operating the relay should more nearly approach the total amount of current supplied to the track circuit; third, a more economical, though perhaps more costly, relay can be designed, one that will require less energy, or one that will give a wider margin with the same expenditure of energy. It is believed that a relay can be designed that will be practically free from failure to release because of broken-rail conditions, provided there is no serious interference from foreign current. An abstract of the results of tests made by various roads to determine the proper drop-away values for track re-

lays was presented. Also, the results of a series of tests made at Purdue University on some four-point relays, one each from four different manufacturers. The resistance measured in these tests seemed to indicate that with the contact materials now in use, each contact should have a pressure of not less than 1½ ounces. The matter of material and dimensions for contact and contact springs has been discussed by the committee, and while this cannot be specified definitely, it is thought the same result can be obtained by specifying the contact resistance after a certain number of operations.

A series of tests made on the Buffalo, Rochester & Pittsburgh showed the resistance occasioned by an engine and a string of empty flat cars on the main line to be .000277 ohm, and with one truck of a flat car within the fouling section of a siding that was seldom used, to be .0382 ohm. In the latter case the signal for that block did not go to the stop position. These tests show the necessity for maintaining fouling sections in first-class condition if they are to insure adequate protection. In an investigation of the reasons for adopting the present standard four-ohm track relay, by James Anderson, signal inspector, New York Central, Lines West, the conclusion is reached that a low resistance relay will (one) readily detect broken rails; (two) be operative in places where low ballast resistance would make a high resistance relay inoperative, and (three) fail to release where conditions prevent a low wheel resistance from being maintained. On the other hand, a high-resistance relay will (one) readily shunt out with a high wheel resistance, (two) be inoperative in places where low ballast resistance prevails, and (three) fail to release with broken rails. The committee requested an expression from the members on the following points: (1) Is it desirable to express pick-up and drop-away resistance of all relays under 100 ohms, in volts, and milliamperes? (2) Shall we adopt a maximum of .7 ohms resistance and a maximum average of .5 ohms, for 500,000 operations? (3) Shall we recommend the use of 4-ohm track relays of not more than four front contacts per relay? (4) Shall we continue the 4-ohm relay as a standard type relay? (5) Is it desirable to raise the drop-away point of the 4-ohm relay?

Discussion.—It was the sense of the convention that the questions raised by the committee should be settled by investigation and research rather than by discussion, and the members limited themselves, therefore, to discussing the methods used by the committee so far and the lines along which future investigation could profitably be directed. Mr. Anthony complimented the committee on the start that has been made and expressed the hope that it would be possible to determine that combination of the controllable features of the track circuit which will give the best results.

ELECTRIC RAILWAY AND A. C. SIGNALING

Committee VIII submitted descriptive data covering installations of alternating current signals on 19 steam and electric roads, and specifications for reactors for line and track circuits. It was also recommended that the committee be assigned the duty of re-editing all alternating current signal write-ups which it has furnished and all other prominent articles written on alternating current signaling, this material to be put in shape for publication for the information of the members of the association and others. The report was accepted without discussion.

STORAGE BATTERY AND CHARGING EQUIPMENT

Committee X submitted for acceptance as information data in regard to ordering lead stationary storage battery of types other than pure lead, also data covering typical cost of current for line charging storage battery. It was recommended that the description of storage battery, lead type, appearing in the Manual, be eliminated as obsolete and misleading, and not of sufficient importance to warrant revising. The committee presented for the approval of the convention and submission to letter ballot, the specifications for nickel-iron-alkaline storage battery, including the corrections requested at the May meeting. It reported that considerable work has been done on a com-

bined hydrometer and thermometer for stationary storage battery work, and it is hoped this will be ready for the association by another year.

The report was accepted without discussion.

ELECTRICAL TESTING

The special committee on Electrical Testing presented a progress report, with a request for constructive discussion for the guidance of the committee in future work.

Discussion.—Paul Dinkel (S. P.), G. K. Thomas (A. T. & S. F.), C. C. Anthony (P. R. R.) and G. H. Dryden (B. & O.) outlined the practice on their lines for the testing of circuits and apparatus. Mr. Anthony mentioned the use of a card record to show the result of tests of every single-wire circuit on some divisions of the Pennsylvania. W. H. Elliott (N. Y. C.) gave the following causes of insulation failures on the New York Central, as determined from a three-year record:

Mice eating insulation	50	per cent.
Broken conductors	30	" "
Bad joints	10	" "
Failure through mechanical injury.....	5	" "
Direct failure of insulation.....	5	" "

LIGHTNING PROTECTION

The special committee on Lightning Protection presented for the approval of the convention and for submission to letter ballot the following: Requisites for lightning arresters for signaling, requisites for choke coils for signaling, and specifications for vacuum-gap lightning arresters. The requisites were presented in revised form, after considering the suggestions offered at the last stated meeting. The report was accepted after a brief discussion.

CLOSING BUSINESS

The following officers were elected for the coming year: President, W. J. Eck, signal and electrical engineer, Southern Railway, Washington, D. C.; first vice-president, Charles A. Dunham, signal engineer, Great Northern, St. Paul, Minn.; second vice-president, W. H. Elliott, signal engineer, New York Central, Lines East, Albany, N. Y.; secretary-treasurer, C. C. Rosenberg, Bethlehem, Pa.; directors, C. J. Kelloway, signal engineer, Atlantic Coast Line, Wilmington, N. C.; A. H. Yocum, signal engineer, Philadelphia & Reading, Philadelphia, Pa.; J. C. Mill, signal engineer, Chicago, Milwaukee & St. Paul, Milwaukee, Wis.; and W. M. Vandersluis, signal engineer, Illinois Central, Chicago; nominating committee, F. C. Stuart, signal engineer, Elgin, Joliet & Eastern, Joliet, Ill.; Oswald Frantzen, supervisor of signals, New York, New Haven & Hartford, Boston, Mass.; P. F. Bikle, assistant foreman of signals, Pennsylvania Railroad, Johnstown, Pa., and J. P. Spoerl, signal foreman, Chicago & North Western, West Chicago, Ill. The Grand Hotel, Mackinac Island, Mich., was chosen as the place for the 1916 meeting.

ENTERTAINMENT

The annual dinner on Wednesday night was addressed by L. R. Clausen, formerly signal engineer of the Chicago, Milwaukee & St. Paul, and for several years one of the most active members of the association, and by Governor Spry, of Utah. The western team defeated the easterners in the annual ball game on Thursday afternoon by a score of 6 to 1. Other entertainment features included a trip to Emigration Canyon for the ladies, and to Salt Air Beach for the entire party, a special organ recital in the Mormon tabernacle and the annual ball.

S. A. A. ELECTION

At the annual business meeting of the Signal Appliance Association the following officers were elected for the coming year: Chairman, E. E. Hudson, Thomas A. Edison, Inc., New York; vice-chairman, E. M. Fisher, Fairbanks-Morse Co., Chicago; secretary-treasurer, F. W. Edmunds, Dressel Railway Lamp Works, New York; executive committee, L. Thomas, General Railway Signal Co., Chicago; J. M. Fitzgerald, Railroad Supply

Co., Chicago; J. V. Westcott, Q & C Co., Chicago; J. Warren Young, Kerite Insulated Wire & Cable Co., New York, and F. C. Lavarack, United Electric Apparatus Co., New York.

THE FREIGHT TERMINAL*

BY C. M. HIMMELBERGER
Superintendent, Raritan River Railroad

The freight and passenger terminals of a large railroad system may be likened to an immense stomach in which the function of digesting and assimilating the traffic is constantly taking place. As in the process of digestion, there are many functions taking place simultaneously, but all co-ordinated with a single end in view.

The operation of a freight terminal has become an extremely important part of railway service. It might be said that it is far more important in its relation to the prompt handling of traffic than actual road service. This is due to the necessity for handling promptly voluminous traffic through numerous arteries in a congested district without the means of expansion found in other branches of the service, and a generally accepted practice of using the terminal district as a storage ground for all classes of traffic.

Successful operation depends primarily on a well-planned track layout. The operating officers may possess every qualification necessary, but their efforts will, to a large extent, be fruitless, if the design of the yard is such as to prevent the free and uninterrupted movement of the traffic.

To handle a freight terminal successfully demands an efficient organization, controlled by practical men, preferably those who have worked up through the ranks, and who have displayed ability to handle and develop the latent qualities of subordinates; men who are broad-minded, fair in their dealings with the public and employees, and who possess the necessary tact to protect fully the interests of the company without antagonizing shippers who are not familiar with the complex nature of the handling of traffic through a busy terminal.

The terminal trainmaster, the general yard master, and the freight agent should, from time to time, hold joint staff meetings, at which there should be representatives of all classes of assistants in charge of the distribution of traffic in the different districts of territories which comprise the general terminal district.

For the successful operation of a yard, the yard office should be supplied with a good card waybill rack, preferably along the lines of that recommended by Mr. Droege in his book on "Freight Terminals and Trains," which allows a quick selection of the card waybills desired when cars are ready for movement.

It has been contended that it is good practice to have the yard clerks (instead of conductors) in the initial yard prepare the train record for cars forwarded, and to hold them responsible for the condition of the cars, shipments, seal records, correct initials and numbers, and the accompanying card waybills, thereby relieving the conductor of work of this character, enabling him to move the train from a yard with the least possible delay.

This method is a most economical means of handling matters in connection with outbound movement of cars, as it eliminates holding an entire crew and the payment of their wages during the time that the conductor is checking his train and correcting the errors which may be found. Assuming that the average time of a crew, from the time it is called or arrives in a yard until the time of leaving, is approximately one hour, the saving in expense of holding the train for the purpose of checking is quite apparent when comparing the wages paid to a full crew, against the service of one yard clerk while engaged in this work. This practice is also of additional benefit, as it shortens the time classification tracks are occupied by trains.

The quick and successful operation of the terminal depends to a large extent on the ability of the general yard office force

* Abstract of a paper read before a meeting of the New York Railroad Club, September 17.

to furnish information at a moment's notice regarding the location of cars, and to know the time necessary to place cars promptly at industrial plants, piers and docks for outgoing steamers, etc.

Another important factor in the efficient operation of a terminal district is the close contact and co-operation of the car distributor, chief despatcher, general yard master and the terminal train master. The close association of the car distributor with the chief despatcher's office, thus giving him a thorough knowledge of the conditions of the territory, will enable him to distribute cars throughout the different arteries leading out of the terminal district to much better advantage than if there was not this close co-operation.

Discussion—The paper was discussed by a number of the members. T. F. McCarthy, trainmaster of the Lehigh Valley, said that conditions frequently made it impossible to increase the size of freight terminals in large centers and that necessary increases in capacity had to be brought about by greater efficiency of operation. This greater efficiency is to be attained primarily by organization. J. P. Bougher, chief clerk in the car record department of the Reading, emphasized the importance of the car record office and the necessity for accurate reports. W. E. Gordon, division trainmaster of the Central of New Jersey, at Jersey City, also emphasized the task of the operating officer in increasing the capacity of an inflexible yard layout. He also referred to the freight terminal problem in New York, and spoke of the value of outlying yards.

THE FIRST FRENCH BRIDGE BUILT IN WAR TIME

BY WALTER S. HIATT*

An important work of peace has just been completed in France in the form of a new bridge across the river Seine at Rouen recently opened to traffic as a part of the railroad line from Paris to Havre.

This bridge is but one of the many pieces of engineering and construction work now going on all over France. Its completion is noteworthy not only because the bridge is the first important engineering job completed during this year of war on the continent, but also because it indicates how smoothly life goes on behind the battle lines in the Republic of France.

"Why build a fine new bridge when you may have to destroy

war; and then it was resumed with the result that the bridge was thrown open to traffic on July 21.

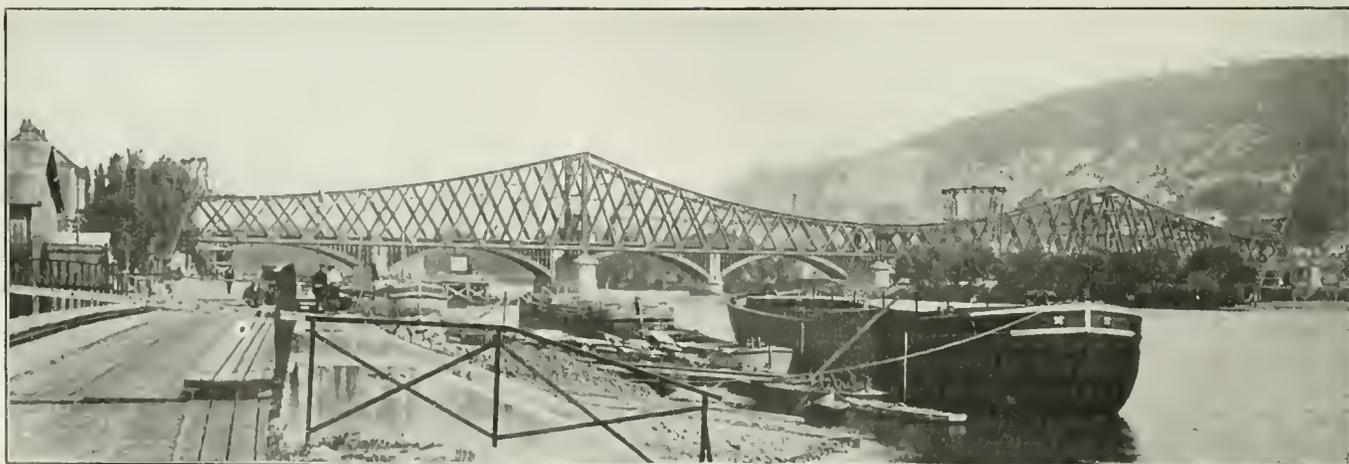

Otherwise the new bridge has a certain interest in that it replaces one built 70 years ago for the first railroad ever built between Paris and Rouen. The old bridge was built by the English, strangely enough, within a stone's throw of the place where William the Conqueror died. The English railroad and its bridge afterwards, in 1856, passed into the hands of a French company, that of the West, and this company was in 1909 taken over by the French government.

The old viaduct stone bridge, always termed the "English bridge," with its eight cast-iron arches, each 135 ft. long, had been in such poor condition for a number of years that but one train at a time was permitted to pass over it and then but slowly.

The government has been rapidly improving this line (which the stockholders and directors of the West company had gradually let deteriorate), beginning with the period when the government voted to take it over and make of it a state railroad; and this new bridge was one of the necessary improvements. Not only did the old one constitute an element of danger, as will be readily recalled by every American who has passed over it after leaving ship at Havre or who has been on a visit to the ancient city of Rouen, but it was an obstacle to the heavy traffic out of the Gare St. Lazare at Paris, which daily handles the largest number of trains of any railroad terminal in the world.

With the declaration of war and the heavy movements of English troops, of munitions of war and of hospital trains over the line, the completion of the bridge became yet more necessary.

The new bridge is 1,065 ft. long, some 165 ft. more than the width of the Seine at this point. One of its piers rests on the island of Brouilly, near the river's north shore. It is of the cantilever type, the steel superstructure being divided into four sections. The third one opens for a space of 285 ft. to permit the passage of vessels on the river Seine to or from Paris. The photograph is taken from the upper side of the bridge or from the direction of Paris, the city of Rouen lying to the left of chalk hill of St. Catherine, under which is one of the five old tunnels on this main line from Paris to Havre. A peculiar fact about these tunnels, which have not yet been widened, is that they still limit the size of the freight and passenger cars used throughout the West system. The tunnels were built small originally to accommodate cars not much larger than the old stage-coaches after which they were modeled.

New Bridge at Rouen, France; the Arches and Piers of the Old Bridge Which It Replaces May Be Seen in the Background

it again for military reasons?" I asked one of the construction engineers of the government-owned Western Railway, to which line the bridge belongs.

"Why, the war is over so far as that bridge is concerned," he replied.

This work of peace was begun two and a half years ago; it was interrupted for a few months during the early part of the

The French are rather proud of this bridge, not only because of its completion in war time, but also because the Pacific type locomotives may now be used for the fast trains. These engines are 50 tons in weight and haul 300-ton trains at a speed of 70 miles an hour. When the war is over and when coal is less scarce and passengers more numerous, it is planned to run expresses from Paris to Havre, a distance of 84 miles, in about two hours, instead of the three hours formerly required.

Master Car and Locomotive Painters' Convention

Reports on Flat Color vs. Enamel Color, Metal Protection, and Design and Protection of Steel Passenger Cars

The forty-sixth annual convention of the Master Car and Locomotive Painters' Association was held at Detroit, Mich., September 14-16. H. Hengeveld, first vice-president, presided under the direction of T. J. Hutchinson, the president, who on account of illness was unable to carry on the physical duties of a presiding officer. The convention was opened with prayer, and the association was welcomed to the city by the mayor, Oscar C. Marx.

President Hutchinson, in his address, commented on the valuable work the Test Committee of the association has done in testing the various kinds of paints placed on the market for different classes of service. He favored further consideration of standard letters and numerals for stenciling all classes of freight cars, believing that there is yet much to be done in providing a more legible letter and numerals with the ultimate advantages of reducing the chances for error when recording car initials and numbers.

PREPARED PAINTS FOR METAL SURFACES

Henry A. Gardner, assistant director, The Institute of Industrial Research, Inc., Washington, D. C., presented an interesting paper on this subject, an abstract of which follows:

In designing protective coatings for metal the modern practice has been to apply the results available from researches into the cause of corrosion. These results have shown that materials of a basic nature, or substances which contain soluble chromates, prevent the rusting of iron. For this reason pigments of a basic nature or pigments containing the chromate radical have come into wide use in the manufacture of protective paints. That they are the best pigments for this purpose has been proved not only in practice, but also in the Atlantic City tests,* which were made on a series of 300 large steel panels, using nearly 100 different pigment paints. Applying the results of these tests to the practical manufacture of protective coatings, the writer will discuss the use of the various pigments under separate headings, taking up the composition of the most widely used colors for metal painting, namely, red, gray, black, and green. Most of the paints outlined herewith are suitable for the painting of structural steel, bridges, steel railroad cars and equipment, ornamental ironwork, poles, posts and for general work on metal surfaces.

Red Lead Priming Paints.—It is well understood that one of the most valuable properties of red lead is its ability to set up to a hard, elastic film that shuts out moisture and gases which are apt to cause corrosion. This cementing action is due to the presence of unburnt litharge, a pigment which rapidly reacts upon linseed oil to form a lead linoleate compound. It will readily be seen, therefore, that red lead free from litharge has no cementing action and should not be considered more protective than iron oxide or any other similar neutral pigment. It is thoroughly essential that red lead should be highly basic and should contain a considerable percentage of litharge, if it is to protect iron from corrosion. It is a growing custom to use prepared red-lead paints made from finely divided red lead ground to a fluid condition in linseed oil. Such paints remain in excellent condition for a long period of time. They have a high protective value and are well suited for general purposes. They are used extensively for priming steel vessels. The Navy Department has found that inert pigments, such as silica and asbestos, give good results when used in ready mixed red-lead paints, their action being to prevent settling of the red lead upon storage.

A specification which may be used by the grinder when purchasing dry red lead for the manufacture of prepared paints is given herewith:

1. The dry pigment to be the best quality, free from all adulterants, and to contain not less than 85 per cent nor more than 90 per cent Pb_2O_3 , the remainder being practically pure lead monoxide (PbO).

2. It shall contain not more than 0.1 per cent of metallic lead, nor more than 0.1 per cent of alkali figured as Na_2O .

3. It shall be of such fineness that not more than 0.5 per cent remains after washing with water through a No. 21 silk bolting-cloth sieve.

NOTE—If desired, the gram weight of the red lead may be specified. Extremely light, fluffy red lead should run from 10 to 13 grams per cubic inch. Medium red lead will run from 13 to 16 grams per cubic inch. Heavy red lead will run from 17 to 19 grams per cubic inch.

Composition of Red-Lead Priming Paints.—The cost of red-lead paints is a subject of vital importance to the large user. Red lead may be produced in different physical states. Ordinarily the grade that has been overburned is extremely heavy, 1 cu. in. weighing from 18 to 20 grams. For the production of a paint from such red lead, according to the formula used by one large consumer, the following quantities would be required:

Red lead.....	26 lbs.
Linseed oil.....	26 gills
Petroleum spirits.....	3 gills
Drier	3 gills

This would produce approximately 12/5 gal. of paint. Each gallon would contain about 20 lb. of red lead, the actual cost of the red lead itself being in the neighborhood of \$1.60. A red lead of a much better protective value, containing from 10 to 12 per cent of free litharge and produced in an extremely fine physical state of comminution, so that 1 cu. in. would not weigh over 12 to 15 grams, would produce a paint of exactly the same body on the following formula:

Red lead.....	20 lbs.
Raw linseed oil.....	26 gills
Turpentine	3 gills
Drier	3 gills

This would produce approximately 1 1/3 gals. of paint, each gallon of which would contain about 15 lb. of red lead, the actual cost of the dry pigment per gallon being in the neighborhood of \$1.20. Red lead of still lighter gram weight could be used, so that a still smaller quantity of pigment would be required per gallon of oil. The durability of such paints should compare favorably with those containing very high percentages of red lead of high gram weight. Pigments of an extremely light nature, such as lampblack, grind in very large quantities of oil, yet their films are more elastic and durable than many paints which are composed of much pigment and little oil.

Red Paints.—Iron oxide has always been one of the most widely used pigments for the manufacture of protective coatings. Oxides that are free from acid or soluble substances give the best results. There are many grades, from the brilliant Indian reds, containing 98 per cent, down to the natural mined brown shale oxides, containing from 30 to 60 per cent of ferric oxide, the balance being silica, clay, etc. Venetian reds, consisting of about equal parts of ferric oxide and calcium sulphate, are also quite widely used. It is customary to add to iron oxides from 10 to 20 per cent of zinc chromate, zinc oxide, or red lead, in order to make them rust inhibitive. Such red paints are widely used for application to tin roofs, metal siding and general structural steel. Red paints made from basic lead chromate (American vermilion), the pigment which gave the best results in the Atlantic City tests, would doubtless be the most economical in the long run, but the high cost will probably prevent their use to any great extent. The use of a percentage of basic chromate of lead in iron-oxide paints is to be approved.

Gray Paints.—Mixtures of white lead (basic carbonate or basic sulphate) and zinc oxide, tinted gray with carbon black,

*For full description of tests and further information see Proc. Amer. Soc. for Test. Mater., Vol. IX, 1909, pp. 203 and 204; Vol. X, 1910, pp. 79-86; Vol. XI, 1911, pp. 192-194; Vol. XIII, 1913, pp. 369-371; Vol. XIV, 1914, pp. 259 and 260.

are widely used for this purpose and give excellent results in every climate.

A valuable rust-inhibitive coating for general priming or finishing work may be prepared from sublimed blue lead. The use of two parts of blue lead and one part of linseed oil containing about 5 per cent of turpentine drier makes a paint of the right consistency. This may be purchased in prepared form. The rust-inhibitive value of this pigment is due to the high percentage of lead oxide (litharge). When purchased ground to a paste in 10 parts of oil, there should be added approximately 5 gals. of linseed oil and 1 pt. of drier for use. A specification for blue lead for use in metallic paints is given herewith.

	Minimum.	Maximum.
Lead sulphate.....	44 per cent	52 per cent
Lead oxide.....	33 per cent	40 per cent
Lead sulphide.....		0.5 per cent
Lead sulphite.....		3.5 per cent
Zinc oxide.....		3.0 per cent

Black Paints.—Black paints are often preferred for the finishing coat on steelwork, carbonaceous paints being unsuited for application direct to the metal on account of their rust-stimulative action. Carbon pigments, such as gas carbon black, oil black, artificial and natural graphite (flake and amorphous) are usually the base pigments used in black paints. Silica and other earth pigments may be combined with the carbon. The slow-drying nature of such paints is lessened by the addition of litharge. The use of boiled linseed oil as a vehicle is advisable.

Magnetic black oxide of iron (precipitated) forms an excellent black protective paint when ground in linseed oil. The slightly basic character of this pigment accounts for its inhibitive value. The natural variety of black magnetic oxide of iron is also suitable for this purpose, but should be tested for freedom from soluble acid impurities before use. Willow charcoal is not made in commercial quantity; its use, therefore, will be restricted. Its inhibitive value depends on the basic nature of the impurities present.

Green Paints.—Mixtures of zinc chromate and Prussian blue in oil are highly inhibitive and have proved satisfactory in long service tests. Chrome yellow tinted with black oxide of iron to an olive shade is permanent and protective. Chrome green made from lead chromate and Prussian blue is generally used when precipitated upon a barytes base.

Painting Galvanized Iron.—Roofing, siding, railing, drain pipes, cornice work, etc., constructed of galvanized iron require painting if they are to be kept in a good state of preservation. Paints are apt to peel from galvanized iron on account of the smooth, spangled surface. This condition, however, is obviated by first treating the metal before painting with a solution of copper salts. Such a solution may be prepared by dissolving 4 oz. of copper acetate, copper chloride or copper sulphate in one gallon of water. By brushing on this solution the galvanized iron is roughened, a thin deposit of copper being plated out over the surface. After an hour or so, the surface may be lightly brushed and then painted with a thoroughly inhibitive oil paint. Firmly adhering films are thus produced.

Painting Tinned Surfaces.—Tin plate, such as is used for roofing and siding, will rapidly corrode unless protected by paint. The pin-holes present in the tin coating on the steel base metal act as pockets to catch moisture, which causes rust spots and pit-holes. Before applying paint to the sheets it is advisable to rub the surface of the tin with a cotton rag saturated with benzene or turpentine. This will remove the palm oil that is present on the surface and allow the paint to firmly adhere. Iron-oxide paints containing an inhibitive pigment are widely used for preserving tin. The use of 15 to 20 per cent of zinc oxide, red lead or zinc chromate with a neutral bright iron oxide produces an excellent paint. The partial use of boiled linseed oil or kanri gum mixing varnish will add to the gloss and water resistance. Such paints are also suited for use on metal shingles and pressed-steel siding—plain black, galvanized or tinned. For dipping purposes, turpentine or high boiling point mineral spirits should be used for thinning. Cheap driers containing a low boiling point benzene should be avoided.

TEST COMMITTEE REPORT

The tests conducted by the several Master Painters' Associations and Committee D-1 of the American Society for Testing Materials have given definite results that may be summed up as follows: First, a composition paint made from a combination of several pigments will give better results than a single pigment paint; second, the pigment contained in a paint should be selected to meet the requirements of the service and the nature of the material it is expected to protect; third, carbon is not a rust inhibitive pigment, and it is generally acknowledged that carbon paints do not make a good primer for steel but there is no doubt but what carbon paints make the best cover or body coating for steel structures exposed to the action of alkali or acids. Tests have proved that paints should be selected to meet service and climatic conditions.

The test committee this year devoted its time to the study of paint vehicles. It is believed that the efficiency of linseed oil for paint purposes can be greatly increased by different forms of treatment, and that treated oils properly thinned will produce better paint vehicles at reduced cost than can be obtained by the use of raw linseed oil. The committee conducted tests along these lines, preparing films from different grades of linseed and china wood oil. It was found that practically all of the air dried films absorbed a higher degree of water than the baked film of the same material, showing that the baking closes up the pores and binds the several coats together better than the air drying method. The committee contended that a heat-treated oil containing a percentage of volatile oil sufficient to make it flow freely, will give better protection to steel than an oil that absorbs a high percentage of water. The results of the tests on steel plates demonstrated this. In substantiation of these conclusions quotations were read from a paper presented by Maximilian Toch, published in the June number of the Industrial and Engineering Chemistry, and also a quotation published in the same journal from Henry A. Gardner.

The test committee consisted of J. W. Gibbons, chairman (A., T. & S. F.); J. McCarthy (G. T.); W. H. Dutton (L. V.), and W. A. Buchanan (D., L. & W.).

PAINT COLOR VS. ENAMEL COLOR

Two papers were presented on this subject, one by M. L. Shaffer, of the Pennsylvania, and the other by J. B. Shuttleworth, of the Boston & Albany. Mr. Shaffer said in part:

It has been thoroughly demonstrated by tests extending over many years that the advantages in the use of a properly prepared varnish color are much greater than might be expected. In car work it has been the aim of the painter to make as elastic a foundation as possible, and experience has shown that if a color is applied that has been properly mixed with a rubbing varnish in the form of an enamel the general principle of elasticity is carried through the entire operation of painting.

There are many other distinct practical advantages which may be briefly noted as follows: First, the color being ground in varnish can be applied heavier and consequently will especially on repair work, tend to fill up and repair any slight imperfections on the surface. Second, the varnish color will hold out the succeeding varnish coats much better than will a flat color. By the use of a standard varnish color one coat of clear finishing varnish may be entirely eliminated, thus saving not only the cost of such a coat but the labor cost of application. Third, owing to the nature of the varnish used in making these enamels the color is more permanent and much less likely to fade.

Mr. Shuttleworth spoke strongly in favor of the enameled color over the old flat color, substantiating very clearly the claims made by Mr. Shaffer.

DESIGN AND PROTECTION OF STEEL PASSENGER CARS

Two papers were presented on this subject, one by John D. Wright of the Baltimore & Ohio and the other by George War-

lick of the Chicago, Rock Island & Pacific. Mr. Wright said in part: Both the design and construction of steel cars have a direct influence on the paint coatings which are applied to protect the metal, and they in turn determine in a large measure the life of the vehicle. From observations made on steel passenger equipment cars that have been in service for some time it appears that steel roofs, decks, deck screens, sash and doors are the principal parts to be considered, so far as the relation of the design and construction to the preservation of metal is concerned. A canvas roof if properly applied and painted at the outset is more evenly preserved than the all-steel roof, and it can remain longer in service without being repainted. On the steel cars the deck screens are objectionable because they form pockets in which the gases from tunnels and the cinders and moisture may collect, finally destroying the paint coating and starting corrosion. They are, furthermore, objectionable because the corrosion, which takes place back of the screens, cannot be detected without removing the screen frame. The arched roof with ventilators is preferred to the projecting surfaces common with the deck or clerestory construction.

It is strongly urged that for both the exterior and interior finish of steel cars smooth, level steel sheets be used in order to reduce the number of coats of surfacer and the amount of glazing and puttying to be done, to say nothing of the sandpapering and rubbing necessary to secure a good finished surface. Rough sheets require too much paint material to make a level surface. From past experience it would appear that the steel window sash cannot well be protected by paint, and they do not seem to be an improvement over the wood sash for use in steel equipment. Steel doors have also given a lot of trouble, having rusted out entirely after a few years' service.

The following is an abstract of Mr. Warlick's paper: In the construction of steel cars the body should be as plain as possible. No countersunk rivets or butt joints should be used. Open corners should be eliminated as far as possible, as they will hold dust and moisture, ultimately causing corrosion. Sharp corners should also be eliminated, and the joints should be soldered inside and out. Better results would be obtained were the Gothic sash not used, and the deck should be plain without projections that will hold the dust, cinders and moisture. Roofs should be plain and without the standing seams; where the side and deck panels are used they should be bent in one piece. The arch type of roof is preferred to the deck roof on steel equipment for this reason. Better results will be obtained if the interior of the steel car is finished in wood, as expansion and contraction on the steel finish cause the paint to crack.

Discussion.—The members strongly favored smooth steel sheets, claiming that the extra cost of these sheets will be fully warranted from the painting and maintenance standpoint. Some roads use aluminum doors with good success. Other members also spoke strongly in favor of the canvas roof on steel equipment; others objected to the use of screens which have been applied in many cases in the same manner as on wooden equipment. Mr. Hutchinson called attention to the stainless steel, manufactured by the Firth Sterling Steel Company, which might offer a solution to some of the difficulties experienced where excessive corrosion takes place.

PRICE VERSUS QUALITY IN BUYING PAINT STOCK

W. O. Quest of the Pittsburgh & Lake Erie presented a paper on this subject, an abstract of which follows:

In many instances the secret paint mixtures which have been sold by reliable paint manufacturers, and have proved to be of the first quality, cannot be safely imitated, regardless of the physical chemistry or the claims of the maker of the imitation, whose usual effort is to make and sell his product at such a low price that it is almost irresistible to a close buyer. A large percentage of the successful and fast surfacing systems of today are the original productions of the railway car and locomotive paint shop, and as a rule such specialty paints are recognized for their merits and worth and not by the price for which they are sold. The labor for applying the paint, costing ever so much

more than the very best of paint stock, makes the enforced use of a cheap and inefficient paint stock almost a criminal waste of valuable time and money.

Something new and cheap in the form of paint or varnish is at least dangerous until it has proved its worth. Mistakes in purchasing paint material can never be remedied without large expense. The painter should be consulted when a change of the quality of the paint is contemplated.

MAINTENANCE OF ENAMEL COLOR VERSUS VARNISH FINISH

Two papers were presented on this subject, one by E. B. Stair of the Atlanta & West Point, and the other by J. W. Quarles of the Chesapeake & Ohio. An abstract of Mr. Stair's paper follows:

When considering an exterior finish of enamel or varnish color compared to the regular varnish finish it can be said that the former will not wear or clean as easily and economically as the latter. With the enamel or varnish color the same luster is not obtained as with the clear varnish of a good quality. Several years ago a body enamel Pullman color was used on the exterior of several coaches, and it was found that the working qualities of the product were such that it was anything but a pleasure to apply, and the appearance of the job was not as satisfactory as that obtained from the varnish finish. It also did not wear as well, nor did it clean as easily nor as cheaply as the varnish finished job. We had some postal cars finished on the interior with white enamel and it proved to be more expensive to clean than cars finished with a varnish over the enamel, as the dirt penetrated into the enamel, requiring considerable rubbing to get it out.

The following is an abstract of Mr. Quarles' paper:

There is no question but that the varnish finish will give much better service as regards wear or durability, where the varnish is of a grade as good as the enamel or varnish color. The enamel or varnish color being soft and easily cut will wear out more quickly with the friction of cleaning than will the varnish finish. Any color pigment or matter mixed with the varnish is certain to weaken the elasticity according to the strength of the coloring matter required to produce an opaque varnish color. If a low grade of varnish is to be used in finishing, the good grade of enamel or varnish color would be preferred on passenger equipment.

PROTECTING STEEL WITH PAINT

P. J. Burns, foreman painter of Hoboken shops of the Pennsylvania, read a brief paper on this subject, an abstract of which follows:

The initial rusting of steel invariably commences on the sharp edges and minute projections existing on iron and steel surfaces, which proves that it is practically impossible to obtain a uniform protection when a brush is used in applying the paint. The lasting qualities of the "smalted" signs are well known. We have come to the conclusion that by substituting a very fine sawdust for the sand, using it in the same manner, and by painting over the sawdust we can secure a very much better metal protective coating. This might be carried farther by having a coating of fresh paint with a substance that will completely cover the metal and fill up all the small holes and cracks, cover the rivets and in fact form a ground for the subsequent coating. There is a large variety of materials that may be used, such as abestine, cement or any inert pigment. The finishing coat can be made very heavy and applied freely so as to completely cover the material.

INTERIOR FINISH OF STEEL PASSENGER CARS

A paper by J. C. F. Kunkel, Pennsylvania Railroad, discussed the most practical and economical method of maintaining the interior of steel passenger cars, whether grained or painted, appearances being considered. Mr. Kunkel outlined several of the troubles experienced with paint on the interior of steel cars, stating that the more elastic the protecting coat the better would be the result. He recommended the straight color finish instead of graining or stippling, as the marred parts of the

car can be repaired with far less expense and time, the color to be of a light tint, which will not require a high finish and will not show irregularities so prominently.

Discussion.—Several members stated that they had found it very difficult to make satisfactory repairs on the interior of the car where it was stippled or grained. For that reason the straight color finish is strongly favored, some members advocating the wood interior finish for that specific reason. However, as the steel equipment has not been in service sufficiently long, no definite action was taken on this subject.

OTHER BUSINESS

The following officers were elected for the ensuing year: President, H. Hengevelt, Atlantic Coast Line; first vice-president, John F. Gearhart, Pennsylvania; second vice-president, J. W. Gibbons, Atchison, Topeka & Santa Fe; secretary-treasurer, Albert P. Dane, Boston & Maine. The secretary reported a membership of 292. Wilmington, Del., received the largest number of votes for the next place of meeting.

A BANKER'S VIEW OF THE RAILROAD QUESTION*

By A. B. LEACH

President, Investment Bankers' Association of America.

Through our membership there has been placed in this country and in Europe a very large percentage of all of the railroad bonds and stocks, the proceeds of which have served to build up that magnificent system of transportation lines which this country has been proud of. Savings banks, insurance companies and the general investment public are the owners today of these securities, while a considerable proportion of them is held abroad. In view of this situation a very strong and able committee of our members attended a session of the Interstate Commerce Commission when the eastern railroad rate question was under consideration. They presented, with all possible emphasis, the investor's position in relation to the rate question, that the railroads should be granted the increase asked for. Whatever may have been the errors or failures or mistakes of mind or purpose in the issuing of some of these securities, the fact remains that the railroads have become a very important, if not the most important, industry of this country and the investments in railroad securities form a very large percentage of the security for the savings of our people in more than one way. The railroads today are facing new conditions. They face them—

- In the character of the service they are called upon to render;
- In the enormous volume of freight and passenger traffic to be handled;
- In the new equipment necessary; safety appliances prescribed by commissions;
- In the always pressing need of new terminals, additional tracks and sidings.

The Interstate Commerce Commission seems to place great stress upon the need of physical valuation of railroads, and seems to believe that the physical valuation should be made a basis for the interest return upon the capital actually shown in physical property today and the rates should be made on that as a base.

I submit to the just and reasonable consideration of the American people, and primarily the American shipping and business men, whether in any business in which we are connected, which has taken a number of years to build up, it would be fair to make its valuation depend absolutely on the physical property available. Vast sums of money have been spent not only in development, but also for intangible assets. I do not mean now that necessarily we should capitalize franchises and rights, for from the commission's viewpoint these rights and franchises are not an asset, but are available only to earn a deficit. The physical valuation of the railway properties will cost a large sum of money (running into many millions), but it will be

of little value and practically obsolete when completed, and serve but a small purpose in just and reasonable rate making. The difference to the farmer in the sale of his products, the difference to the merchant in the cost of his goods, the difference to any shipper in the advance of rates requested by the railroads, is so small that it is practically a negligible quantity.

May I not submit, too, that the watchword of Americans and America is "progress"? The past of each and every one of us is full of mistakes and regrets. Today let us have confidence and feel assured that from our errors and mistakes of the past we can reach to higher levels of progress and development for our country and our common good. Whatever the railroads' history in the past has been signifies but little at present to the railroads and the communities they serve unless it teaches us fair treatment for each other and common efforts for the common good.

Let us not forget that the railroads are furnishing the life currents of a large portion of the country; they are the largest employers of labor, they are the largest purchasers of supplies and materials, they constitute one of the greatest, if not the greatest, of American industries. The Interstate Commerce Commission—I find no fault and make no criticisms, but simply make the statement—was appointed not alone as guardian of the shipper, but also as the guardian of the railroads, and if our railroads are to succeed, a new vision and a new disposition on the part of this commission and of the state commissions must be brought about by the pressure of public sentiment, by the pressure of business, by the pressure of the investor.

In this great West the need for additional railroad facilities, additional mileage, is felt constantly. Increased railroad facilities can do more—and will do more—to develop the country than any other one agency. Take away from the investment world the confidence in railroad securities, the staunch belief that investments in railroads will always receive fair treatment, and the railways of the country face bankruptcy. I could name a long list of railroads which have fallen by the wayside, and are now in the hands of receivers, and although I will agree with the most radical as to the mistakes or errors—and crimes, if you will—that have been committed in the handling of some of these properties, I will say to you, nevertheless, that today is the time to forget; let us leave the past behind.

The new thought that is in the mind of the railroad managers today is explained by the plan of the Atchison management, carried out by what is known as the "Harmony Special." The railroads are prepared and ready to meet the public on a fair basis, on the basis of service, on the basis of mutual justice. But the public, and public sentiment, should meet the railroads in a similar manner.

What would it benefit the state of Colorado, what would it benefit the country as a whole, if as a punishment of the sins of the past the railroad mileage of the country were forced into the hands of a receiver, if lack of confidence in this great American industry is abroad and consequently new developments cease? I insist there is none. I would like to leave with the convention, I would like to leave with the state of Colorado, I would like to leave with the vast western world, of which I am proud to be a son, the thought that the day has come for a new alinement of public thought, and of public effort, when we shall all join, the shippers, the railroads, the investment world, on the basis that with the conditions of today the need for fair treatment accorded to the railroads is imperative, and that from today on the public should give the commission and their servants to understand, if recent developments have not already taught that lesson, that what this country needs is service, what we need is good equipment, what we need is railroads prepared to push developments, and this can only be realized by such fair treatment of the railroads as will restore the confidence of the investment public. Until that time, and I believe and hope it is coming nearer every day, we shall not get back that degree of prosperity of which this abundantly resourceful country, when given a fair chance, is capable.

* From the President's address to the Investment Bankers' Association at its annual convention at Denver, Colo., on September 20, 1915.

Recent Progress in the Federal Valuation Work

The Methods Are Being Revised and Standardized
and Increased Results Secured in All Departments

With the covering of 3,870 miles of line by the federal roadway and track valuation parties in June, and 4,060 miles in July, Director Charles A. Prouty feels assured that his original estimate of 50,000 miles of road valued per year will be reached and maintained from now on, and that the field work will be completed by January 1, 1920, the date originally set. This is borne out by the fact that the progress noted above has been made in a season of unusual rainfall with correspondingly heavy interference with field work and also by the fact that increased efficiency may be expected from month to month as the men become increasingly familiar with their duties. The original estimates of the director were based upon the placing of 16 roadway and track parties in each district, but in view of the progress which is now being made with 12 parties in each district, it is doubtful if the additional parties will be required to cover the allotted mileage. It is not considered

to show all the property of the carriers. The exact point to which this detail should be carried is hard to determine, as there is a wide difference of opinion among railway men themselves. In many instances the government forces are grouping the component units of an article into one item, believing that even if the estimates of individual units vary considerably, the average will be correct within all practical limits. At the same time, increased attention is being given to this subject and the men are being furnished with information showing the relative values of the different units making up the whole.

On September 1, roadway and track parties had completed the inventory on about 30,000 miles of road and 40,000 miles of track. Field work has been entirely completed and tentative reports have been prepared for the commission on a number of roads, including the Texas Midland, the New Orleans, Texas & Mexico, the San Pedro, Los Angeles & Salt Lake,

Excavation Across Embankment Showing Extent of Settlement

advisable to attempt to cover much in excess of 50,000 miles per year because of the large amount of incidental and office work which must keep pace with the field work.

The amount of line which may be covered properly by a roadway and track party in a day is a difficult one to determine. It is to the interest of the government and the railroads alike, that, having started, the work be completed as soon as possible. In view of the expense to the government, there is also a desire that each party cover the maximum number of miles per day. In some instances this has led to complaint on the part of the roads that the work was being done too hastily and that the data was not being collected in sufficient detail

and the Atlanta, Birmingham & Atlantic. Among the larger roads on which roadway and track parties are now engaged are the Boston & Maine (6 parties), the New York, New Haven & Hartford (3 parties), the Big Four (5 parties), the Pere Marquette (1 party), the Illinois Central (4 parties), the Chicago, Rock Island & Pacific (8 parties), the Great Northern (8 parties), and the Chicago, Milwaukee & St. Paul (4 parties).

Awaiting the receipt of the information requested from the roads in Valuation Order No. 14, dated February 9, 1915, regarding unit prices, no values have been assigned to the units of materials. The government computers have the quantities

figured closely up to the field parties and have entered these quantities on the final summary sheets, so that on the determination of the unit prices, it will be a comparatively simple problem to apply them to these quantities and to arrive at the cost.

REVISION OF FIELD METHODS

With the expansion and increased experience gained with the continuation of this work, important modifications in methods are being made. One of the most important changes has been in the adoption of the "type" method of making the field inventory on the Boston & Maine, and later on the Pennsylvania and other roads. With this method many details are grouped into types, corresponding to the standards of the road under valuation. With many items such as culverts, concrete box drains, turnouts, etc., this can be done readily. It is only necessary then to designate the types and to measure the special dimensions of the individual units, as for instance, the length and diameter of concrete pipes, when taking the field notes. Unit quantities are established for these various types, which also reduce the computation work materially. With the adoption of the "type" method on the Boston & Maine, a special form of notes was adopted, providing for the computation of all quantities on the original data sheets. These sheets are made in duplicate and one copy is furnished to the road. In this way it receives a duplicate of the original field notes and computations rather than an entirely separate copy.

Another method followed extensively on the Boston & Maine is that of making borings in embankments wherever there is any indication of settlement. Many of the lines along the coast cross salt marshes, while other lines further inland pass over fresh water swamps. The settlement in such banks consists in compressing the water out of the upper strata of the original ground without creating the mud waves frequently found in other parts of the country. A chance excavation across an abandoned embankment revealed the condition shown in one of the accompanying photographs. In this particular instance the original ground line had settled $1\frac{1}{2}$ ft. under an embankment only $3\frac{1}{2}$ ft. high.

Because of the prevalence of this condition, the carrier secured two wash boring machines and borings are now made in embankments at all points where it is thought that such settlement may exist. These outfits follow at some distance after the roadway parties and make borings either in the center of the track or on the shoulders of the fill at points designated by the pilot with the roadway party. A government inspector accompanies each wash-boring party and the carrier will insist that all extra quantities discovered in this way be added to the original yardage figures. Another deviation from the original methods of organizing roadway and track parties is in the formation of such parties jointly by employees of the government and the carrier. On the inauguration of the valuation work, all field notes were taken by the government forces and the railroad furnished only a pilot with each party to point out to the government engineers all elements of value. Where a road desired to secure its own data to check the government figures, it made an entirely independent survey, creating a duplication of work. Largely to avoid this the Boston & Albany and the government have organized a joint party composed of two government and the remainder railroad employees. As worked out on this road, one of the government men is chief of party and the other is the recorder taking the notes. The railroad receives a copy of all notes taken. In addition to avoiding duplication of work, this method has the advantage from the standpoint of the government of reducing materially the costs of the surveys, while from the railroad standpoint the employment of a large number of the party gives a closer control over the speed and accuracy of the work and insures that the work be covered in sufficient detail to meet its desires. A similar method has been worked out for two parties on the Big Four. On the Chicago, Rock Island & Pacific, this plan has been further modified to two parties on the Chicago terminals so that

the railroad puts on the entire parties and takes all notes, and the government only sends a pilot with each party to see that the work is performed in accordance with the government standards and to receive a copy of all notes taken. These will be checked later by the government so far as may seem necessary.

In general, the lines originally established to divide the country into five districts are being adhered to with the exception that when one district undertakes work on a line, the general principle has been established that this district will continue the valuation on that road, even though this takes it into other districts. This eliminates the necessity of one railroad dealing with two or more district organizations. Thus, the Eastern district is planning to cover the Baltimore & Ohio system as far west as Chicago and St. Louis, crossing the southern and entering the central districts. The Southern district has already covered the lines of the Big Four in Illinois in the central

Wash Boring Outfit to Determine the Amount of Settlement of Embankment

district. The Western district is valuing all lines of the Rock Island outside of the Chicago terminals, although a large portion of these lines lie in the central district, while the Pacific district is covering all the lines of the Great Northern as far east as Duluth.

Wherever practicable, the roadway parties depend upon train service to carry them from their camps to work and no motor cars are provided for them. The bridge, building and signal parties are supplied with motor cars, as their work is more scattered.

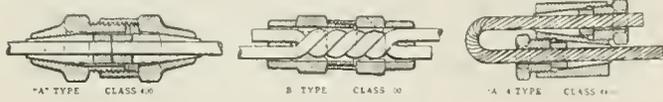

BRIDGE, BUILDING AND TELEGRAPH WORK

It has not been definitely decided at this time whether in valuing the buildings, this valuation should be based upon unit prices per cubic foot of volume or per square foot of floor area, or on a detailed inventory of materials. This subject is now receiving the serious consideration of the government officers and definite instructions will be issued in the near future. At the present time the method followed in the central district is based primarily upon a bill of material. Where standards exist on the different roads, bills of material are made up carefully for these and applied so far as practical to structures found on the line. The detail with which the notes are taken in the field depends upon the extent to which the buildings be-

FARGO'S CABLE CONNECTORS

The illustrations show typical designs of strong and well made connectors which have recently been brought out by the Fargo Manufacturing Company, Poughkeepsie, N. Y., and which have found favor on a number of railroads for both telegraph and signal wires.

Type "A" (Fig. 1) is a compression device by means of which the butt ends of cables are brought together so tightly at the joints that the conductivity secured is practically as high

Figs. 1, 2 and 3—Fargo Clamps

as if the metal were actually welded together. In type "B" (Fig. 2) the ends of wires or cables are twisted together in much the same manner that a lineman makes connections, except that the work of twisting is done by means of a wrench. The result is that each joint is uniform, with the least expenditure of time and skill. With either type of connector there is no dependence on the case as a conductor. Both types are made in a variety of forms.

The compression type of connector is made up of two coup-

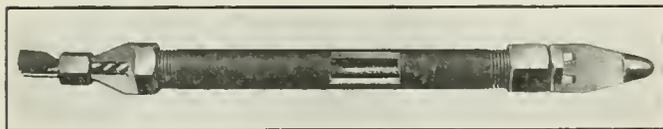

Fig. 4—Ground Wire Connection

plings or sleeves, male and female, and two cone-shaped grips with composition ends where they grip together. The cable ends that are to be connected pass through these gripping cones and when the couplings are screwed together the grips are wedged against the cables. At the same time the grips are drawn toward each other, so that the cable ends can be pressed one against the other as tightly as may be desired.

The type "A" connections are used also for guy wires, span wires, and, in fact, for all uses where cables are ordinarily

poles, is shown in Fig. 4. The upper end (left in the picture) has a type "B" connector, and the lower end type "A."

With all these designs much time is saved in installation as all the work involved is pushing the cable ends into the grip and then screwing up several turns on the male casting. One lineman is said to place one of these cable grips in six minutes. The connections are made either with single or with double grips in series.

The same general principle is applied to cable locking, bus-bar

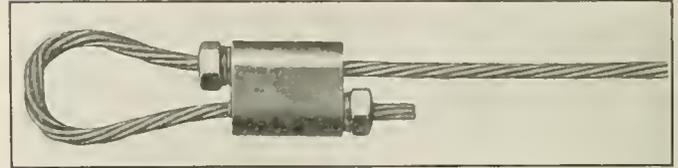

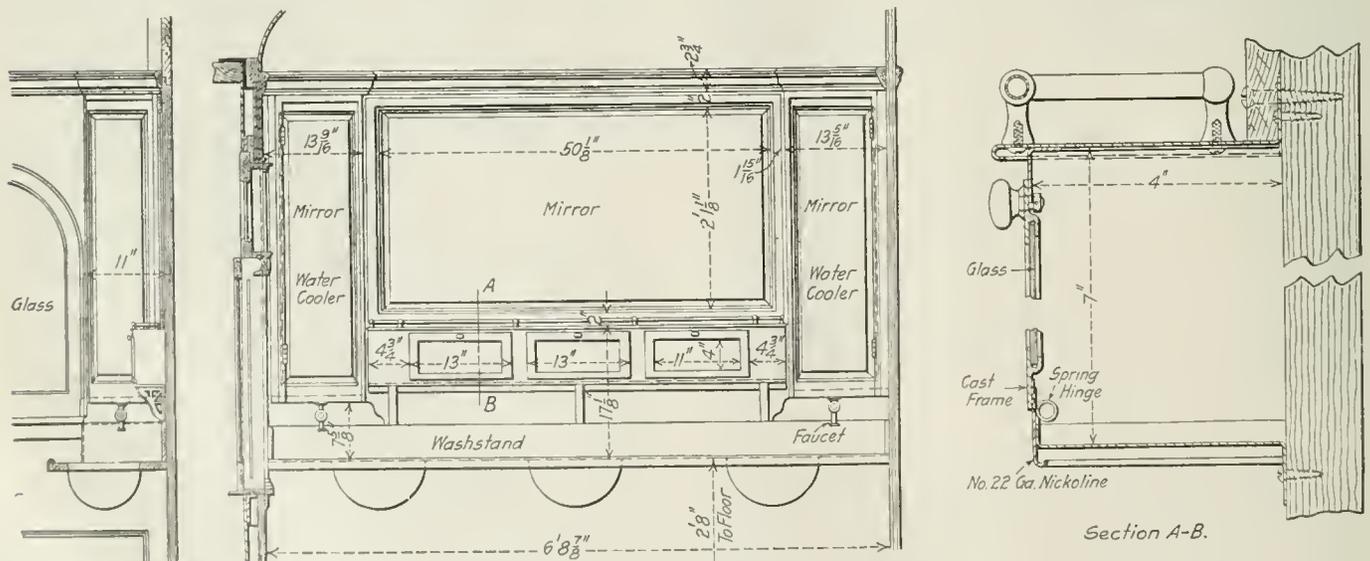

Fig. 5—Fargo Clamp; Type A4400

connections, guy terminals with bolts that thread into the dead-ending insulator, terminal connections, ground points and even wye, ell and tee connections. These various devices are made up merely by changing the shape of the casting that takes the place of the coupling in the straight cable connection.

Type "B" is made in practically all the forms suitable for the type "A" construction. Connections of this type are made for either single or double joints, the latter being provided for by an extra section of couplings with a central diaphragm containing two holes for the cables. This forms the joint in two twisted sections in series with each other.

SLEEPING CAR TOWEL RECEPTACLE

When towels are placed in the overhead racks ordinarily used in the toilet rooms of sleeping cars they are likely to collect more or less dust and become saturated with the odor of coal smoke. In order to avoid this, the Canadian Northern is using in its sleeping cars a closed receptacle for towels, as shown in the drawing. This is of metal construction, with glass doors in front, and is placed directly over the wash basin

Closed Receptacle for Clean Towels in Sleeping Cars

spliced. In one design of steel cable grip the gripping cones are set side by side in a single casting, the pressure on the cable being applied by stuffing boxes that are screwed against the ends of the gripping cones (Figs. 3 and 5).

A simple and compact design for fastening a wire to a ground point, as used for lightning arresters, and for ground wires on

in the toilet rooms so as to be most convenient for passengers. The doors are provided with spring hinges so that they close automatically.

This towel cupboard was developed in the office of A. L. Graburn, mechanical engineer of the Canadian Northern, Toronto, Ont.

General News Department

The locomotive forces at the Terre Haute (Ind.) shops of the Vandalia have been working on full time—54 hours per week—since the first of the month. The men in the car department have been working on this basis for some time.

The Wabash Railroad has made advances in the wages of station agents and telegraphers, to begin November 1, amounting to nine per cent. The 12-hour work day for agents will in most cases be reduced to ten hours. The overtime rate of pay, 25 cents an hour, will be advanced to 35 cents an hour.

The valuation committee of the National Association of Railroad Commissioners is circularizing the different state railway commissions with the idea of organizing a bureau at Washington to represent the state commissions in connection with the Interstate Commerce Commission's valuation of railroad property.

The express messenger on train No. 25 of the Lake Erie & Western, arriving at Indianapolis on the evening of September 15, reported that near Arcadia, 28 miles northeast of Indianapolis, he had been robbed. The single robber, after intimidating the messenger with a revolver, is said to have carried away money and jewelry valued at several thousand dollars.

The waiting rooms in the stations of the Nashville, Chattanooga & St. Louis are to be adorned with pictures of interesting views and agricultural scenes along the company's lines. Several hundred pictures have been made and will be enlarged and framed. The idea is not only to turn the prospective passenger's mind toward agriculture and show him the possibilities of the territory through which he will shortly be traveling, but also to brighten the appearance of the waiting rooms and break the monotony of the usual tariffs and time tables.

The New Hampshire Public Service Commission held hearings at Concord this week in connection with its investigation of the affairs of the Boston & Maine. Testimony was given to the effect that since January 1, 1912, the expenditures of the railroad in New Hampshire to influence legislation have amounted to \$841,267, of which \$258,132 went for payments to attorneys and \$116,811 for advertisements. Over \$25,000 is said to have been spent in a campaign in opposition to the extension of the Grand Trunk southward, through New Hampshire toward Boston.

The United States Civil Service Commission announces examinations October 20 for the following positions in the department of valuation of the Interstate Commerce Commission: junior architect, junior structural engineer, junior telegraph and telephone engineer, junior signal engineer, junior mechanical engineer, junior electrical engineer and junior civil engineer. Candidates for all these offices must be between the ages of 21 and 36, and the salaries range from \$720 to \$1,680 a year, except for junior architect, where the salaries will range from \$1,200 to \$1,680.

The Lehigh Valley Railroad, following the example of the authorities of the Pennsylvania Railroad and the city of New York, has made a thorough physical examination of all persons having to do with the preparation or serving of food in public places—that is, of all dining car employees. One hundred per cent. was the condition reported. The examination included also the workers in the headquarters of the dining car department at Easton, Pa. The company had its own surgeons make the examination, and a strict standard, including personal cleanliness, was adhered to. These examinations will be made periodically.

The Maryland State Industrial Accident Commission has reopened the question whether it has jurisdiction in cases involving accidental personal injuries to railroad employees engaged in interstate commerce, where the accident was not caused by the negligence of the employers. Some time ago the commission decided in the negative. A section of the Maryland compensation law provides that no compensation shall be paid in cases where

the Federal Employers' Liability Act applies. But the federal act provides compensation only in case of an accident where the railroad shall be found negligent. The Maryland act provides compensation in all cases except where it shall be shown that the employee caused the accident. The question arises whether the Maryland law applies in cases of accident to an interstate employee where the railroad cannot be shown to have been negligent.

Strikes of laborers occurred this week at a number of freight stations in New York (Manhattan) and at Weehawken and Communipaw, on the New Jersey side of the Hudson river. At the waterside stations of the New York Central, at Sixtieth street, New York, 250 men struck for an increase of 50 per cent in the rates of pay for work done on Sundays and holidays; and the demand was granted. Several hundred freight handlers at the Baltimore & Ohio terminus on Staten Island struck. There were strikes of freight handlers at the Lehigh Valley station in Communipaw. About 300 men in the freight houses of the New York, New Haven & Hartford at New Haven, Conn., struck on the 16th. There appears to be no general organization and it was expected that the trouble at New York would be short lived, many new men having been taken on; but embargoes on perishable freight were placed by two roads on Wednesday.

Employees' Life Insurance on the Brooklyn Rapid Transit Lines

The announcement of the Brooklyn Rapid Transit Company, Brooklyn, N. Y., that over 5,200 of its employees had applied for insurance under the plan of group life insurance, which was announced last July, was noticed briefly last week. This insurance is secured by a special arrangement with the Travelers' Insurance Company, of Hartford, Conn. The insurance became effective September 15. Inasmuch as more than 5,000 employees (65 per cent of all those eligible) have applied for the insurance, no physical examination will be required. Employees who are now eligible for the insurance as the result of having served two years in the employ of the road will be allowed until January 1, 1916, to come into the group without physical examination. After that date any employee who was eligible for the insurance prior to September 15, 1915, will be admitted to the group only upon a physical examination. In the case of employees who become eligible for the insurance hereafter, by the completion of their two years of service, the arrangement between the railroad company and the insurance company provides that such employees may be admitted to the group without physical examination if they apply for the insurance within six months after the date upon which they become eligible for it.

The applications thus far received call for aggregate premiums of \$56,000 a year. One half of this is paid by the employees and one half by the road.

The circular issued by the company says that this insurance is the cheapest life insurance that has ever been offered under a group plan toward which the employee contributes. For employees under 32 years of age the share of the premium which they will be called upon to pay (for \$1,000 insurance) will be about 7 cents a week. The premium increases slightly as age advances, but these increases are small. For example, those 50 years old pay a little over 13 cents a week; those 60 years, 26 cents. As before announced, a faithful employee, retired under the company's pension plan, will obtain what is equivalent for him to a paid up policy for \$1,000.

Special privileges have been obtained whereby any employee leaving the road may within a limited time obtain any one of the regular life or endowment policies issued by the insurance company without physical examination. Employees who are insured in the group not only are not penalized in case they leave the service and thereby drop out of the B. R. T. group, but are placed in a better position than if they had undertaken to insure as individuals at the age when they insured with the group, for in that case they would have had to undergo a physical examination.

Railway Revenues and Expenses for the Fiscal Year

Total operating revenues of the railways in the United States for the fiscal year ending June 30, 1915, amounted to \$2,889,029,457, or \$166,404,055 less than in 1914, according to the compilation of the Bureau of Railway Economics, giving the complete figures for the revenues and expenses of Class 1 roads, those having annual revenues of over \$1,000,000. By drastic economies the operating expenses were reduced to \$2,032,689,894, a decrease of \$186,244,099. Net operating revenue as a result shows an increase of \$22,840,044, to \$856,339,581. Total operating revenues averaged \$12,641 per mile, a reduction of 6.3 per cent; operating expenses averaged \$8,894 per mile, a decrease of 9.3 per cent, and net operating revenues averaged \$3,747 per mile, an increase of 1.8 per cent. Taxes amounted to \$133,993,519, a decrease of \$2,765,192, or 3 per cent per mile, while operating income was \$721,705,717, an increase of \$24,991,787, or 2.6 per mile. These figures cover 228,554 miles of line.

It should be noted that the decrease in total revenues in 1915 comes after a decrease of \$65,691,076 in 1914, as compared with 1913, and that the slight gain in operating income is obtained by comparison with a year in which there was a decrease in this item of \$118,657,668. And as nearly half of the reduction in expenses represents decreases in the maintenance accounts it is apparent that the small improvement in net for the year was gained only

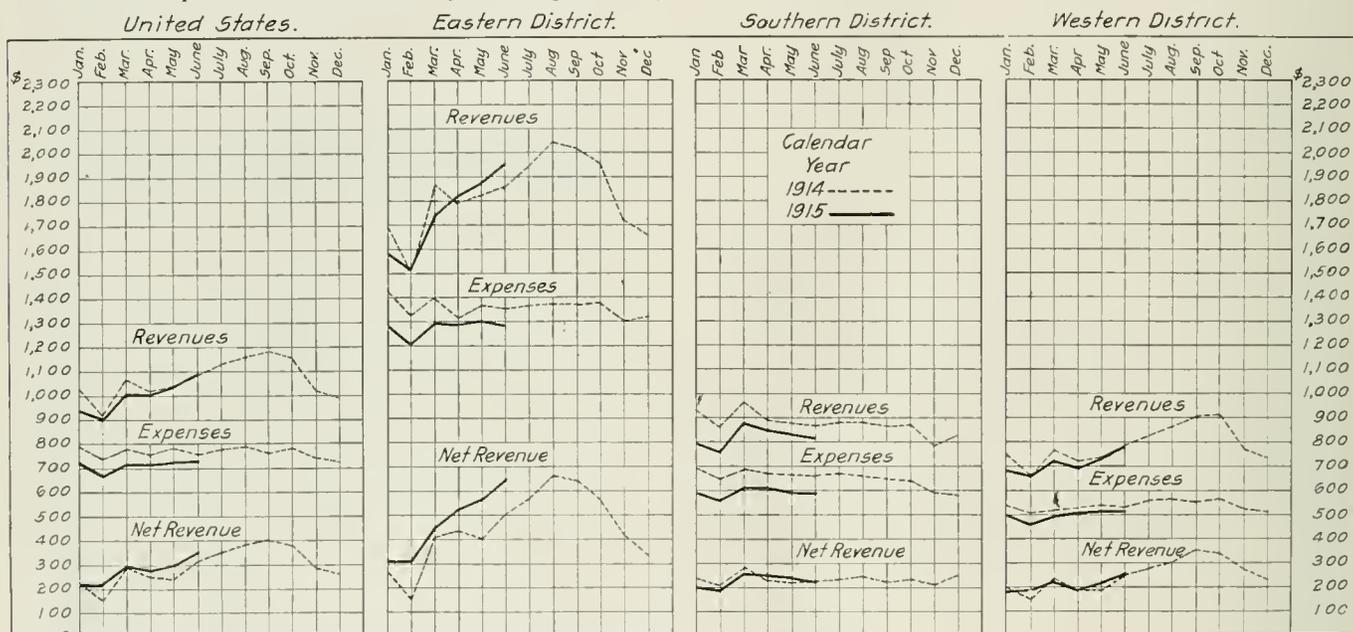

in all parts of the country. In June, 1914, net operating income per mile was 9.8 per cent less than in June, 1913.

Total operating revenues amounted to \$249,489,452, an increase from 1914 of \$366,431. Operating expenses were \$167,147,556, a decrease of \$12,080,015. Net operating revenue amounted to \$82,341,896, an increase of \$12,446,446. Taxes amounted to \$11,345,126, a decrease of \$516,782. This left \$70,860,953 for net operating income.

Operating revenues per mile of line averaged \$1,090 in June, a decrease of 0.6 per cent. Since aggregate revenues increased slightly, this decrease per mile is due to an increase in mileage of 1,700 miles. Operating expenses per mile averaged \$730, a decrease of 7.4 per cent; net operating revenue per mile averaged \$360, an increase of 16.9 per cent; taxes per mile were \$49, a decrease of 5.1 per cent. Net operating income was \$310, an increase of 21.2 per cent. Railways operating 228,827 miles are covered by this summary, or about 90 per cent of the steam railway mileage in the United States.

Operating revenues of the Eastern railways per mile increased 3.3 per cent, as compared with June, 1914, operating expenses decreased 7.4 per cent, net operating revenue increased 33.4 per cent, taxes increased 2.1 per cent, and operating income increased 39.2 per cent.

Operating revenues of the Southern railways per mile show a

Monthly Revenues and Expenses per Mile of Line in 1914 and 1915

by deferring many needed expenditures on roadway and equipment to some future date.

The increases in net operating revenue are entirely attributable to the more favorable showing of the Eastern roads in 1915 than in 1914. The Western and Southern group of lines show decreases both in total operating revenue and in net in spite of reductions in operating expenses. The relatively more favorable showing of the gross and net earnings of the Eastern roads was partly due to the fact that the advances in freight rates allowed by the Interstate Commerce Commission in the 5 per cent case were in effect a part of the year.

Reduced to a per-mile basis, the operating revenues of the Eastern group of railways decreased 4.9 per cent; operating expenses decreased 10 per cent; net operating revenue increased 11.5 per cent; taxes decreased 1.9 per cent; operating income increased 14.4 per cent. On a similar per-mile basis, the operating revenues of the Southern railways decreased 10.4 per cent; operating expenses decreased 10 per cent; net operating revenue decreased 11.3 per cent; taxes decreased 3.6 per cent; operating income decreased 12 per cent. Again, on a per-mile basis, the Western railways shows a decrease in operating revenues of 5.6 per cent; a decrease in operating revenue of 1.6 per cent; a decrease in taxes of 3.7 per cent; a decrease in operating income of 1.3 per cent.

Net operating income for June increased \$54 per mile, or 21.2 per cent, as compared with June, 1914. This increase was almost entirely due to reductions in expenses, which have been effected

decrease of 5.9 per cent, operating expenses decreased 9.4 per cent, net operating revenue increased 5.0 per cent, taxes decreased 7.2 per cent, and operating income increased 7.4 per cent.

Operating revenues of the Western railways per mile decreased 2.7 per cent, operating expenses decreased 6.3 per cent, net operating revenue increased 5.3 per cent, taxes decreased 10.3 per cent, and operating income increased 8.4 per cent.

Yale Engineering Association

The Yale Engineering Association, now being organized along the lines of similar associations conducted by the engineering graduates of other universities, will hold its first meeting in New Haven early in November. This association has as its primary objects: to help the educational work at Yale; to establish cordial and mutually helpful relations between Yale engineers, and, in general, to come into association with similar college engineering organizations for the promotion of good fellowship and engineering knowledge, to encourage Yale men to join the national technical societies, etc. The organization will appeal most strongly to those engaged in engineering, transportation and manufacturing, but any Yale graduate will be eligible for membership. The officers are: president, Edwin M. Herr, president of the Westinghouse Electric & Manufacturing Company; vice-president, Harry N. Covell, works manager of the Lidgerwood Manufacturing Company, Brooklyn, N. Y., and secretary-treasurer, Richard T. Dana, consulting engineer.

OPERATING RETURNS OF RAILWAYS FOR THE FISCAL YEARS ENDING JUNE 30, 1914 AND 1915

(Compiled by the Bureau of Railway Economics from returns to the Interstate Commerce Commission of railways having annual operating revenues above \$1,000,000)

Table with columns: Road, Average miles operated 1915, Operating Revenues, Operating Expenses, Net Operating Revenue, Taxes, Operating Income, and Per Cent of increase. Rows include Eastern District (Ann Arbor, Atlantic & St. Lawrence, Baltimore & Ohio, etc.) and Western District (California Pacific, Central New England, etc.).

* Less than one-tenth of one per cent. dd Decrease or deficit. id Increase or deficit.

OPERATING RETURNS OF RAILWAYS FOR THE FISCAL YEAR ENDING JUNE 30, 1914 AND 1915. (Continued)

(Compiled by the Bureau of Railway Economics from returns to the Interstate Commerce Commission of railways having annual operating revenues above \$1,000,000)

Table with columns: Road, Average miles operated, Operating Revenues, Operating Expenses, Net Operating Revenue, Taxes, Operating Income. Rows include Eastern District (Vandalia, Walhalla, etc.) and Western District (Chicago & Alton, etc.).

a Returns for 1914 and 1915 are not fully comparable. dd Increase or deficit. * Less than one-tenth of one per cent.

OPERATING RETURNS OF RAILWAYS FOR THE FISCAL YEARS ENDING JUNE 30, 1914 AND 1915. (Continued)

(Compiled by the Bureau of Railway Economics from returns to the Interstate Commerce Commission of railroads having annual operating revenues above \$1,000,000)

Table with columns: Average miles operated 1915, Operating Revenues (1915, 1914, % increase), Operating Expenses (1915, 1914, % increase), Net Operating Revenue (1915, 1914, % increase), Taxes (1915, 1914, % increase), Operating Income (1915, 1914, % increase). Rows include various railroads like Western District, Colorado, Missouri Pacific, etc.

a Returns for 1914 and 1915 are not fully comparable. dd Decrease or deficit. dd Increase or deficit. * Less than one-tenth of one per cent.

Proper Handling of Equipment

At the September meeting of the Western Railway Club, E. E. Betts, superintendent of transportation of the Chicago & North Western, presented a paper on "The Promotion of the Proper Handling of Equipment." Believing that there was no more complete information on that subject than was contained in the report of the special committee of the General Superintendents' Association of Chicago, of which he was chairman, he presented that report to the club, in full. This was published in the *Railway Age Gazette* of August 13, 1915, on page 281.

The American Electric Railway Association

The thirty-fourth annual convention of the American Electric Railway Association will be held in San Francisco, Cal., from October 4 to 8. Simultaneously there will also be held the annual conventions of the American Electric Railway Accountants' Association, the American Electric Railway Engineering Association, the American Electric Railway Claims Association, the American Electric Railway Transportation and Traffic Association and the American Electric Railway Manufacturers' Association.

The following is the program of the American Electric Railway Association:

MONDAY, OCTOBER 4

9:30 a. m. to 5:00 p. m.

Registration.

TUESDAY, OCTOBER 5

Morning session, 9:30 a. m. to 12:30 p. m.

Address of welcome by Hiram W. Johnson, governor of California.

Annual address of the president; annual report of executive committee; annual report of secretary-treasurer; appointment of committees on: (a) resolutions; (b) nominations, and (c) recommendations contained in the president's address.

Reports of committees on: (a) subjects; (b) education; (c) representing association at the American Good Roads Congress; (d) valuation, and (e) national joint committee on overhead and underground line construction.

Address on "Welfare Work" by Jesse W. Lilienthal, president of the United Railroads of San Francisco. Followed by general discussion.

Reports of committees on: (f) company membership; (g) company section medal; (h) federal relations; (i) Anthony N. Brady medal; and (j) compensation for carrying United States mail.

WEDNESDAY, OCTOBER 6

Morning session, 9:30 a. m. to 12:30 p. m.

Reports of committees on: (a) electrolysis; (b) ways and means; (c) company sections and individual membership; (d) dues of company section members; (e) changes in constitution and by-laws; (f) relations with state and sectional associations, and (g) public relations.

Address on Evils of Government by Jonathan Bourne, Jr., former United States Senator. Followed by general discussion.

Reports of committees on: (h) operation of motor vehicles; (i) Aera advisory; (j) insurance, and (k) standard for car loading.

THURSDAY, OCTOBER 7

Morning session, 9:30 a. m. to 12:30 p. m.

Reports of committee on: (a) cost of passenger transportation service.

Address on the "Foundation Principles of the Valuation of Electric Railways" by Bion J. Arnold, chairman of the board of supervising engineers, Chicago traction. Followed by general discussion.

Reports of committees on: (b) taxation matters; (c) on recommendations contained in president's address; (d) resolutions, and (e) nominations.

Unfinished business; election of officers; installation of officers; adjournment.

FRIDAY, OCTOBER 8

11:30 a. m.

Presentation of Testimonial from Panama-Pacific Exposition Company, commemorative of the 1915 meeting by exposition officers.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, date of next or regular meetings, and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the *Railway Age Gazette* for each month.

- AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—H. C. Boardman, D. L. & W., Hoboken, N. J. Next meeting, October 21-23, 1915, Boston, Mass.
- AMERICAN ELECTRIC RAILWAY ASSOCIATION.—E. B. Burritt, 8 W. 40th St., New York. Annual convention, October 4-8, 1915, San Francisco, Cal.
- AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOCIATION.—H. G. McConnaughy, 165 Broadway, New York. Meetings with American Electric Railway Association.
- AMERICAN RAILWAY ASSOCIATION.—W. F. Allen, 75 Church St., New York. Next meeting, November, 17, 1915, Chicago.
- AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 19-21, 1915, Detroit, Mich.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.
- ASSOCIATION OF MANUFACTURERS OF CHILLED CAR WHEELS.—George W. Lyndon, 1214 McCormick Bldg., Chicago. Annual meeting, 2d Tuesday in October, 1915, New York.
- ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Annual meeting, October, 1915.
- BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meetings with American Railway Bridge and Building Association.
- CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.
- CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.
- CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.
- ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.
- GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.
- MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—T. I. Goodwin, C. R. I. & P., Eldon, Mo. Next meeting, October 19-21, 1915, St. Louis, Mo.
- NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.
- NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.
- NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—E. N. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.
- PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.
- RAILROAD CLUB OF KANSAS CITY.—Claude Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Saturday in month, Kansas City.
- RAILROAD MEN'S IMPROVEMENT SOCIETY.—J. B. Curran, Erie R. R., 50 Church St., New York. Meetings, alternate Thursdays, October to May. Assembly Rooms of Trunk Line Association, 143 Liberty St., New York.
- RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.
- RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, 1063 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.
- RAILWAY FIRE PROTECTION ASSOCIATION.—C. B. Edwards, Fire Ins. Agt., Mobile & Ohio, Mobile, Ala. Next meeting, October 5-7, 1915, Chicago.
- RAILWAY REAL ESTATE ASSOCIATION.—Frank C. Irvine, 1125 Pennsylvania Station, Pittsburgh, Pa. Next meeting, October 13, 1915, Chicago.
- RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.
- ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.
- SALT LAKE TRANSPORTATION CLUB.—R. E. Rowland, David Keith Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.
- SOCIETY OF RAILWAY FINANCIAL OFFICERS.—Carl Nyquist, C. R. I. & P., 1134 La Salle St. Sta., Chicago. Annual meeting, October 19-21, Colorado Springs, Colo.
- SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Piedmont Hotel, Atlanta.
- TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.
- TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Hotel Astor, New York.
- UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, 1111 Newhouse Bldg., Salt Lake City Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.
- WESTERN CANADA RAILWAY CLUB.—L. Ken, Immigration Agt., Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.
- WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Building, Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.
- WESTERN SOCIETY OF ENGINEERS.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings. Annual meeting, 1st Wednesday after 1st Thursday in January, Chicago.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF JUNE, 1915

Name of road.	Average mileage operated during period.		Operating revenues.		Operating expenses.		Net revenue from operation.	Railway tax accruals.	Operating income (or loss).	Increase (or decrease) last year.				
	Freight.	Passenger.	Total.	Inc. misc.	Way and structures.	Maintenance of equipment.					Traffic.	Trans- portation.	Miscel- lanous.	General.

Traffic News

The number of vessels moved through the American locks at the Sault Ste. Marie canal on Saturday, September 18, was 118, the largest movement ever recorded in one day.

The Western Classification Committee has announced a hearing to be held on October 1, on application for changes in ratings, rules, etc., in Classification No. 53, on musical instruments and wooden ware.

Announcement was made by the War Department at Washington on Monday of this week that because of a landslide near Gold Hill the Panama Canal would be closed to traffic probably for at least ten days.

Eugene Morris, chairman of the Central Freight Association, has issued an amended export rate tariff giving rates from shipping centers in Central Freight Association territory to Pacific coast terminals, effective on September 15.

The Trans-Missouri Freight Bureau has been absorbed by the Western Trunk Line Committee. W. A. Poteet, who was chairman of the former at Kansas City, has moved part of his office force to the Chicago office of the Western Trunk Line Committee and will be assistant to Chairman E. B. Boyd.

Representatives of lumber associations from all parts of the country held a conference at Chicago on September 15 to discuss the proposed investigation by the Interstate Commerce Commission of lumber rates and classification. The lumbermen are seeking a number of important changes in classification.

A meeting of the Official Classification Committee was held in New York on September 21st for consideration of subjects enumerated in Docket No. 24, including recommendations of the Committee on Uniform Classification and other matters. A later hearing will be held in the rooms of the Central Freight Association, Chicago, on October 6.

The Missouri, Oklahoma & Gulf of Texas has recently begun operation over its own rails to the following points in Texas: Plano, Carrollton, Dallas, Ft. Worth and North Ft. Worth. Traffic arrangements have been effected with the Missouri Pacific whereby the M. O. & G. now runs a fast through freight train leaving daily from Kansas City for these cities.

The College of Commerce of the University of Cincinnati has announced the opening of its evening classes in traffic management and problems of the traffic manager on September 23. The traffic courses are in charge of Guy M. Freer, traffic manager of the Cincinnati Chamber of Commerce, and W. S. Groom, traffic manager of the Whitaker Paper Company.

The Atlanta & St. Andrews Bay Railroad, which runs from Dothan, Ala., southward 82 miles to Panama City on the Gulf of Mexico, has made an arrangement with the Steamship "Brunswick" for a rail and water freight line to and from New Orleans; and proposes to carry cotton through from Dothan to New Orleans at a rate of 13 cents per 100 lb., less than all rail rates between those two points.

In addition to the five demonstration farms now operated by the Nashville, Chattanooga & St. Louis under the supervision of Special Agent Joseph H. Judd, arrangements have been made for a new demonstration farm at Martin, Tenn., which will be in cultivation next year. At present the company operates farms at Decherd, Sewanee, Murfreesboro, Tullahoma and Dickson. With the farm at Martin the total acreage will be increased to 425.

The Salt Lake & Ogden, an electric line operating between Ogden and Salt Lake City, has filed tariffs with the Interstate Commerce Commission, effective on October 1, the giving through rates which will be put in effect as the result of a new traffic arrangement with the Ogden, Logan & Idaho. The road heretofore has not considered itself subject to the jurisdiction of the Interstate Commerce Commission, as it operates entirely in Utah.

The Chicago, Milwaukee & St. Paul and the Chicago & North Western have filed tariffs with the Interstate Commerce

Commission effective on October 1, cancelling the application of the Illinois classification to traffic moving between Milwaukee and points in the state of Illinois and St. Louis, Mo., and the substitution of the Western classification. The Merchants' & Manufacturers' Association of Milwaukee has announced its intention of protesting against the proposed change to the Interstate Commerce Commission and of asking for a suspension of the tariffs.

At the hearing before Judge Youmans of the United States district court at Oklahoma City on the application of the Oklahoma roads for an injunction to restrain the operation of the Oklahoma two-cent fare law. H. C. Phillips, secretary of the president's conference committee on valuation and formerly valuation engineer of the Atchison, Topeka & Santa Fe, testified in detail regarding the valuation of that road's property in Oklahoma. A. L. Conrad, statistician for the Atchison, Topeka & Santa Fe, introduced an exhibit showing the cost of preparing for the trial of rate cases in Oklahoma. In the year 1913 alone this road spent for this purpose \$111,980 in Oklahoma.

Milk Rates on the Boston & Maine

The Boston & Maine has given notice in Boston that there will be a general revision of rates for the transportation of milk to that city; whereat there is much loud protest. The protests are from dealers and consumers, or alleged spokesmen for consumers, who fear that the cost of their milk is to be increased. From those whose rates will be reduced nothing is heard. The company puts its case frankly before the public in an advertisement in the newspapers, which says:

"The Boston & Maine Railroad, subject to the approval of the public authorities, plans to revise its charges for transporting milk. Some points have rates only by passenger train, other only by freight, and some points by both. Where a freight rate exists, it is three-fourths of the passenger train rate. There are also variations in the rates at different points similarly situated. The result of all this is to give much lower rates from Maine and Northern New Hampshire than from Vermont. For example, Foxcroft, Maine, 256 miles from Boston, has a leased car freight rate of \$37 a day, while a similar shipment from Vergennes, Vermont, 213 miles from Boston, pays a passenger rate of \$63.96 a day.

The management believes the freight rate should be abolished, and that the passenger rates should be rearranged to give the same rate to localities similarly situated. With that end in view, it has prepared a new tariff, lowering rates in some cases, raising them in some others, and doing away with the freight rates in all.

The new rates are lower than those charged by other railroads entering Boston, and lower than those into New York or any other large city.

No carload rate to [from] any point within 165 miles of Boston is increased. Those between 75 and 150 miles are reduced to make the basis uniform.

The largest increase at any one point on the can rate to Boston, in baggage car service, is two cents, or less than a quarter of a cent a quart.

The longest journey of any leased car today is 284 miles. The largest increase to Boston on the leased car rate of the large shippers is less than one-third of a cent a quart. This is for a distance of 300 miles. For shorter distances this increase is smaller.

Cream retails at from three to six times the price of milk, this price being fixed on the amount of butter fat it contains. Cream is now carried at the milk rate. If it is damaged or spilled, the railroad must pay the owner the cream price. Because of this, the new rate for cream has been made one and one-half times the milk rate.

THE MADEIRA-MAMORE RAILWAY OF BRAZIL.—The Madeira-Mamore Railway, probably the most isolated railway in the world, is located far in the interior of South America and affords a means of getting around a chain of dangerous rapids which prevent navigation through portions of the Madeira, Mamore and Beni rivers. The route followed by the railway was surveyed a number of years ago by Colonel George Church, a distinguished American engineer. Most of the party died from diseases due to the climate. Several attempts were made before the road was finally built.—*The South American*.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The commission has extended the effective date of its order in the Western Rate Advance Case in so far as it relates to packing house products from September 30 to December 31.

Commissioner Clark held a hearing at the Hotel LaSalle in Chicago, on September 17, on the application of the Southern Pacific for permission to continue the operation of the vessels of the Associated Oil Company, a subsidiary of the railroad, under the provisions of the Panama canal act.

The Louisiana Railroad Commission has filed a complaint with the Interstate Commerce Commission, making 17 Texas roads defendants, asking the commission to extend the effects of the Shreveport rate case order to the connections and subsidiaries of the principal defendants. A hearing was held at New Orleans on September 17.

A hearing will be held at the office of the commission in Washington on September 28 and 29 to consider the code of rules prepared by the chief inspector of locomotive boilers in accordance with the law approved March 4, 1915, extending the provisions of the boiler inspection act to include the entire locomotive and tender. These rules, excepting rules numbered 18, 29, and 31, were agreed to at a conference held in Washington, August 23 to 28, 1915, between the chief inspector of locomotive boilers, a committee representing and authorized to act for the carriers, and a committee representing railway employees.

At a hearing before Examiner Gutheim at St. Louis on September 15, representatives of St. Louis shippers presented evidence in support of their complaint that recent advances in interstate freight and passenger rates affecting shipments from St. Louis into Illinois territory are discriminatory as compared with the rates from Chicago to the same points, which were not advanced because the Illinois Public Service Commission has thus far declined to allow any advances in the rates under its jurisdiction. The St. Louis witnesses contended that the discriminations were having a serious effect on their business in competition with Chicago.

Supplemental Hearing on Western Rate Advances

Examiner E. W. Hines, of the Interstate Commerce Commission, began a hearing at the Hotel LaSalle, Chicago, on September 20, on proposed advances in freight rates on the railroads running west of Chicago, on a number of commodities on which advanced rates were filed during the progress of the hearings in the western rate advance case, and which were therefore postponed until a hearing which was originally set for July. The carriers postponed the advances so that the hearing might be held in September. The hearing involves rates on agricultural implements, canned goods and furniture, beer and liquor, boots and shoes, cement, clothing, granite and marble, iron and steel, wire, lumber, lime, machinery, oil, paper, steel rails, ties, structural iron, sugar, sandstone and other commodities, as well as several proposed changes in rules.

Rates on Lumber from the South to Ohio River Crossings

In re Rates on Lumber from Southern Points to the Ohio River Crossings and Other Points. Opinion by Commissioner McChord:

The original report in this case permitted the carriers to increase their rates to the north bank Ohio river points from the territory east of the Mississippi river in those instances in which such increases were necessary to effect a spread of one cent per 100 lb. between opposite points at the same crossing. The former finding is now modified for the purpose of aligning the rates of the Louisville & Nashville to St. Louis from stations on its line south of Decatur, Ala., with the rates of the other lines serving the same general territory, and to permit the rates from Helena, Ark., to Cairo, Ill., and St. Louis, Mo., to be increased to the Memphis basis. (36 I. C. C., 137.)

STATE COMMISSIONS

The California Railroad Commission has refused to sanction for intrastate shipments increases in express rates equivalent to those recently granted by the Interstate Commerce Commission.

The Nebraska Railway Commission, after a conference with a number of railroad officers, has announced that it will consider allowing a number of exceptions to the long and short haul rule when the railroads submit a list of instances in which the present rule is said to work a hardship.

The Louisiana Railroad Commission has ordered the railroads entering New Orleans to prepare and file with the commission not later than January 1 a tariff of reasonable rates, rules and regulations for the joint handling of freight between points within the switching district of the city of New Orleans.

The Louisiana Railroad Commission has issued an order authorizing the railroads operating in the state to use Southern Classification No. 41 and supplements 1, 3 and 4 thereof, on Louisiana business, but supplements 2, 5 and 6 have been objected to by the New Orleans Joint Traffic Bureau and the Baton Rouge Chamber of Commerce, and are ordered held in abeyance until further notice.

PERSONNEL OF COMMISSIONS

A. Z. Patterson, private secretary of Governor Major of Missouri, has been appointed assistant counsel of the public service commission in charge of the legal work in connection with the valuation of railroad property in the state.

COURT NEWS

Passenger's Duty to Board Right Train

The Georgia Supreme Court holds that it is the duty of the purchaser of a ticket, or one who desires to become a passenger on a train, to ascertain, before boarding it, that it stops at his station. Where he fails to do so, and the train is not scheduled to stop there, the railroad may eject him at the last regular stopping place before reaching the desired destination.—*Southern Ry. Co. v. Bailey* (Ga.), 85 S. E. 847.

Segregation of Races—Exception

The Alabama Supreme Court holds that the provisions of the statute providing for separate accommodations on trains for white and negro passengers, and making it a misdemeanor for a person to go into and ride on a coach to which he does not belong, do not apply where a white sheriff attempts to travel with a negro prisoner, and hence the two cannot be assigned to separate coaches. In such a case the conductor may, in his discretion, assign them to any coach or compartment of the train.—*Spenny v. Mobile & Ohio* (Ala.), 68 So. 870.

Liability for Freight—Undisclosed Principal

The Alabama Court of Appeals holds that a consignor of goods cannot change or escape his liability as such after entering into the contract of shipment and dealing with the railroad as the consignor, by notifying the railroad after his shipment has been carried to its destination and rejected by the consignee that he was acting merely as the agent of the true consignor, when that fact was not previously disclosed in the transaction.—*Cincinnati, N. O. & T. P. v. Vredenburg Sawmill Co.* (Ala.), 69 So. 228.

This principle was applied in another case, where oranges were consigned to a commission merchant for sale. Through mistake the railroad company made an undercharge, which the commission merchant refused to make good, having already sent the proceeds to the shipper. The commission merchant had not previously informed the railroad company that he was not the owner of the goods. It was held that he was liable for the undercharge.—*S. F. Cornelius & Co. v. Central of Georgia* (Ala.), 69 So. 331.

Maintaining Flagmen at Crossings

The Erie sought the review of an order of the New Jersey Board of Public Utility Commissioners requiring the maintenance of flagmen at two crossings during the 24 hours of the day. At each of the crossings there was the ordinary crossing sign and also approach boards reading "Railroad Crossing, 500 Feet." In addition there was an automatic audible signal, a bell which would start ringing when a train was 2,000 ft. from the crossing. The New Jersey Supreme Court held that the order was too broad and should be limited to requiring the road to keep a flagman on duty at the crossings covering the operation of all [regular?] trains over such crossings.—*Erie v. Board* (N. J.), 95 Atl. 177.

Duty Toward Person Voluntarily Assisting Station Agent

In an action for injury caused by a heavy trunk falling on the plaintiff's foot the Georgia Court of Appeals holds that one who, at the request of a station agent, who has no apparent authority to employ other servants, voluntarily undertakes to assist in loading a trunk, is a mere volunteer, and the company owes him no duty except that which it owes to a trespasser; that is, not to injure him willfully and wantonly after his peril is discovered. The position of the plaintiff at one end of the trunk was not so obviously perilous to the porter at the other end as to charge the porter (and through him the company) with willful and wanton negligence in letting his end of the trunk fall to the ground.—*Southern Ry. Co. v. Duke* (Ga.), 85 S. E. 975.

Rights of Railroad in Crossing Another

The statutory right of one railroad to cross another is in the first instance dependent upon a reasonable necessity for such a crossing; and, where such a necessity is shown, the crossing sought must be so located and constructed as not to inflict any unnecessary injury upon the road to be crossed. But, the Alabama Supreme Court holds, the statutes which give the right to cross do not require that there shall be no injury whatever to the rights of the road crossed, or require the selection of the place and mode which will least injure the company crossed, without regard to the interests and necessities of the crossing company, which must also be considered, and the question determined according to the circumstances of the particular case. The right to cross, though given in general terms, is not confined to the main tracks of either road, but applies to sidings and all tracks, and the making of one crossing, or even of several, does not necessarily exhaust the general right to cross.—*Mobile & Birmingham v. Louisville & Nashville* (Ala.), 68 So. 905.

EFFECT OF WAR ON RAILROADS IN MEXICO.—As a result of the four years' warfare and the purposeless destruction which has proceeded throughout the Republic of Mexico, there is hardly a line which has not been reduced either to uselessness or to hopeless wreck. Not since the first track was laid in Mexico in 1857, has such a condition been known. The Mexican Railway, the pioneer enterprise of the state, is, perhaps, in the most parlous condition and worse off than it has been at any time since the revolution began. The entire track, with the exception of about 25 miles out of Mexico City, which, for a short while, was operated intermittently by the company, has been out of its control since November 18 last. Since then an immense amount of destruction—mostly of a mischievous character—has been committed; miles of the track have been torn up, and a great deal of the equipment has been removed from the company's stores and distributed over other railways. The position of the Mexican Southern is hardly less serious. General Carranza took possession of the Interoceanic Railway (of which the Southern is a leased line) in August last; the Interoceanic has been out of possession ever since, and the military opposition has been continuous. There does not appear to have been quite so much destruction committed on the property of the Mexican Southern. The National Railways of Mexico, which now include the lines of the Central Railway, are likewise in a serious condition. The Vera Cruz Railway, a British undertaking, is more or less in the same condition, while the Mexican Northwestern is described as a wreck from end to end. * * * The restoration of these railways will require scores of millions of dollars.—*Railway Gazette, London.*

Railway Officers

Executive, Financial, Legal and Accounting

E. F. Bromhall has been appointed secretary of the Missouri, Kansas & Texas, with headquarters at Parsons, Kan., succeeding W. R. Snedaker, assigned to other duties.

Sidney Aronstein has been elected vice-president of the Georgia Coast & Piedmont, in charge of territorial development, with headquarters at New York City, succeeding T. D. Rhodes, resigned.

Operating

W. H. Haley has been appointed superintendent of car service of the Missouri Pacific, with office at St. Louis, Mo., vice W. I. Stine, resigned to enter the service of the American Refrigerator Transit Company.

L. U. Morris, superintendent of the eastern division of the El Paso & Southwestern at Tucumcari, N. M., has been appointed general superintendent of the system with headquarters at El Paso, Tex., vice G. F. Hawks, promoted. C. D. Beeth, trainmaster on the eastern division, has been promoted to the position left vacant by Mr. Morris. C. B. Eifort has been appointed trainmaster to succeed Mr. Beeth at Tucumcari.

T. S. Mahoney, superintendent of the transcontinental division of the Texas & Pacific, has been transferred from Texarkana, Tex., to Ft. Worth, where he will take charge of the Ft. Worth division, into which have been consolidated the transcontinental and joint track divisions and the Ft. Worth terminals. G. B. Johnson, superintendent of the joint division, and A. E. Pistole, superintendent of terminals, have been transferred to other duties.

Engineering and Rolling Stock

Frederick E. Morrow, who was appointed assistant chief engineer of the Chicago & Western Indiana and the Belt Railway Company, of Chicago, on September 1, graduated from the civil engineering course, at Purdue University in 1904. From June to November of that year he was employed in the engineering department of the Illinois Steel Company. From that time until April, 1907, he was in the service of the Chicago & North Western in the consecutive capacities of rodman, instrument man and assistant engineer. He then took a position as field engineer in the division of track and roadway of the Board of Supervising Engineers, Chicago Traction, which he held during the rehabilitation of the Chicago surface lines. In April, 1910, he entered the C.

F. E. Morrow

& W. I. organization as office engineer. In March, 1913, he was promoted to principal assistant engineer, and held this position until his recent appointment as assistant chief engineer of both the C. & W. I. and the Belt Railway.

A. A. McCree has been appointed roadmaster of the Northern Pacific, with headquarters at Tacoma, Wash. Effective September 16.

J. R. Holman, chief engineer of the Oregon-Washington Railroad & Navigation Company, has been granted an indefinite leave of absence. Samuel Murray, bridge engineer, has been appointed acting chief engineer, with headquarters at Portland, Ore. Effective September 14.

W. O. Thompson, whose appointment as superintendent of rolling stock of the New York Central for the lines west of Buffalo, with headquarters at Cleveland, Ohio, has already been announced in these columns, was born in July, 1861, at Clayton, Mich., and was educated at Adrian, Mich., high schools. He began railway work in 1880, on the Ft. Wayne, Jackson & Saginaw, and remained with that road until it became a part of the Lake Shore & Michigan Southern. From 1884 to 1890 he served as a locomotive engineer, and then was appointed traveling engineer of the Lake Shore & Michigan Southern, remaining in that position until August, 1893. He was then engine despatcher from 1893 to 1900 on the same road. In 1901 he was appointed general locomotive inspector of the New York Central & Hudson River. The following year he was appointed superintendent of motive power on the Rome, Watertown & Ogdensburg division, and in 1907 became district master car builder at East Buffalo, N. Y., which position he held at the time of his recent appointment as superintendent of rolling stock for the New York Central lines west of Buffalo, as above noted.

W. O. Thompson

appointed general locomotive inspector of the New York Central & Hudson River. The following year he was appointed superintendent of motive power on the Rome, Watertown & Ogdensburg division, and in 1907 became district master car builder at East Buffalo, N. Y., which position he held at the time of his recent appointment as superintendent of rolling stock for the New York Central lines west of Buffalo, as above noted.

Traffic

G. G. Early, chief of tariff bureau, of the Wabash Pittsburgh Terminal and the West Side Belt Railroad, has been appointed assistant general freight agent of these lines, with office at Pittsburgh, Pa., and his former position has been abolished.

E. S. Morgan, general southwestern freight agent of the Queen & Crescent Route at Dallas, Tex., having resigned to engage in other business, the position of general southwestern freight agent has been abolished. G. C. Whitney, commercial agent at Greensboro, N. C., has been appointed commercial agent, with office at Dallas; L. R. Gardner, traveling freight agent at San Antonio, has been promoted to commercial agent, and E. J. West has been appointed commercial agent at Greensboro, succeeding Mr. Whitney.

W. M. Kirkpatrick, assistant freight traffic manager, eastern lines, of the Canadian Pacific with office at Montreal, Que., having been appointed an officer in the army, the following appointments are made until he returns to the company's service: H. E. Macdonell, general freight agent at Montreal, will perform the present duties of the assistant freight traffic manager; E. N. Todd, division freight agent at Montreal, will perform the duties of the general freight agent; A. O. Secord, district freight agent at Ottawa, Ont., will perform the duties of the division freight agent with office at Montreal, and J. J. Kelly will perform the duties of the district freight agent with office at Ottawa, Ont.

OBITUARY

A. J. Seifert, signal supervisor of the Chicago terminals division of the Pennsylvania Lines West, died on September 9.

William F. Fitch, formerly president of the Duluth South Shore & Atlantic, died at Marquette, Mich., at the age of 76. Mr. Fitch was born at Circleville, Ohio, on June 28, 1839, and entered railway service on October 14, 1851, as clerk in the general manager's office of the Chicago & North Western. His rise from the ranks to a position of consequence was rapid and in 1866 he became general manager of the Fremont, Elkhorn & Missouri Valley and Sioux City & Pacific railroads. In 1888 he was appointed general manager of the Duluth, South Shore & Atlantic, a position which he held until 1911. From 1888 until 1902 he also held the vice-presidency of the road, and from 1902 until 1911 the presidency.

Equipment and Supplies

LOCOMOTIVE BUILDING

THE HAVANA CENTRAL has ordered one 60-ton electric locomotive from the General Electric Company.

THE FAIRCHILD & NORTHEASTERN has ordered one Prairie type locomotive from Lima Locomotive Corporation. This locomotive will have 16 by 24 in. cylinders.

THE TEXAS & PACIFIC, reported in the *Railway Age Gazette* of last week as having ordered 13 locomotives from the Baldwin Locomotive Works, has ordered 7 Santa Fe type and 6 switching locomotives from that company.

THE NORFOLK & WESTERN has ordered 30 Mallet type (2-6-6-2) locomotives from the American Locomotive Company. These locomotives will have 22 and 35 by 32-in. cylinders, 56-in. driving wheels and a total weight in working order of 406,000 lb. They will be equipped with superheaters.

CHICAGO & NORTH WESTERN.—In the item in the *Railway Age Gazette* of last week giving the details of this company's recent order for 45 locomotives placed with the American Locomotive Company, the total weight in working order of six of the Pacific type locomotives was incorrectly given as 302,000 lb. instead of 229,000 lb. and that of the 12 Mikado type locomotives was incorrectly given as 165,000 lb. instead of 302,000 lb.

CAR BUILDING

THE CENTRAL OF GEORGIA is inquiring for prices on five passenger cars.

THE CINCINNATI, INDIANAPOLIS & WESTERN is inquiring for prices on 1,000 40-ton box cars.

THE BUFFALO, ROCHESTER & PITTSBURGH is inquiring for prices on 899 steel underframes for installation on old wooden box cars.

THE NEW YORK CENTRAL has ordered 1,000 freight cars each from the Standard Steel Car Company and the Pressed Steel Car Company for the Pittsburgh & Lake Erie, and 500 box cars from the American Car & Foundry Company for the Cincinnati Northern.

THE SOUTHERN RAILWAY, which has recently had 1,000 cars rebuilt and provided with steel under frames by the Lenoir Car Works and by various of the company's shops, will have another 1,000 cars repaired in like manner. It is hoped to have the work completed in time for the cars to be used in the fall crop movement.

IRON AND STEEL

THE PENNSYLVANIA has ordered 2,500 tons of steel for pier sheds at Greenville, N. J., from the McClintic-Marshall Company.

THE CHICAGO & NORTH WESTERN has ordered 228 tons of steel for the Webster avenue (Chicago) subway from the Chicago Bridge & Iron Company.

THE ALASKA ENGINEERING COMMISSION has ordered 5,000 tons of rails from the Colorado Fuel & Iron Company to be used on the main line of the government railroad from Seward, Alaska.

THE TOLEDO, ST. LOUIS & WESTERN has ordered 1,500 tons of rails from the Carnegie Steel Company, 1,000 tons of rails from the Lackawanna Steel Company and 500 tons from the Cambria Steel Company.

SIGNALING

THE GRAND TRUNK has contracted with the Federal Signal Company for the installation of a mechanical interlocking plant at the crossing of the Grand Trunk and the Canadian Pacific at Abbotsford, Quebec.

Supply Trade News

The Standard Steel Car Company is reported to be equipping its plant at New Castle to turn out a large order for shells.

The William Graver Tank Works, East Chicago, Ind., has received an order for three oil storage tanks from the Atchison, Topeka & Santa Fe. They will be erected at Silsbee, Brownwood and Cleburne, Tex.

The Chicago & North Western is in the market for 15,000 piles to be used in the foundation work for the new grain elevator to be erected at One Hundred and Eighteenth street and the Calumet river, Chicago, Ill.

The Pere Marquette has ordered 4,000 cross ties from the Indiana Tie Company, Evansville, Ind., and 1,000,000 feet of switch ties from the W. S. Mercereau Lumber Company, Parkersburg, W. Va. All of the material is for 1916 work.

Foster Milliken, formerly president of Milliken Brothers, Staten Island, N. Y., has been elected president of the McNab & Harlin Manufacturing Company, New York, manufacturers of brass, iron and steel valves, cocks and fittings.

President C. A. Starbuck, of the New York Air Brake Company, has announced that that company has closed a contract for an additional order for cartridge cases amounting to \$3,675,000, bringing the total amount of orders now on the books for war material to \$20,242,600.

R. W. Gillispie, New York district sales manager of the Pennsylvania Steel Company, has been appointed general manager of sales, succeeding John C. Jay, Jr., who has resigned from his position as vice-president and general manager of sales to become chairman of the Maxwell Motor Company.

The J. W. Murray Contracting Company, Kansas City, Mo., has been awarded the contract for building dikes for the St. Louis & San Francisco along the Trinity river, between Beaumont, Tex., and Houston; and has also received a contract from the Missouri, Kansas & Texas for work on the Brazos river, near Belasco, Tex.

The S. K. F. Ball Bearing Company was incorporated in Hartford, September 4, with \$2,000,000 capitalization, to engage in the manufacture of ball bearings. The former American S. K. F. Ball Bearing Company has been a selling organization for the bearings made by the parent Swiss Company known as the Aktie Bolaget Svenska Kullagerfabriken of Gothenburg. The new company will build a factory at Hartford to manufacture bearings in this country, but the S. K. F. steel will be imported from Sweden.

The directors of the Westinghouse Electric & Manufacturing Company, at a meeting held on September 22, declared a quarterly dividend of 1½ per cent on the common stock, thus raising the annual dividend rate from 4 to 6 per cent. The income from purely domestic business during the last quarter was considered sufficient to warrant the 1½ per cent quarterly rate. The Westinghouse Company, according to a statement made by Chairman Guy E. Tripp, has received firm contracts for the manufacture of war supplies aggregating approximately \$60,000,000, the greater portion of which is a contract for rifles, which is to be executed at factories in New England especially acquired for the purpose. This rifle business contributed nothing to the earnings for the quarter.

TRADE PUBLICATIONS

DEFEATING RUST.—The American Rolling Mill Company, Middletown, Ohio, has issued an attractive illustrated booklet giving the story of ingot iron, describing the qualities of this material, its method of manufacture, and the various uses to which it is adapted. The book is illustrated with a number of typical illustrations of these uses.

CENTRIFUGAL PUMPS.—Catalog H-2, recently issued by the Lea-Courtenay Company, Newark, N. J., describes and illus-

brates the various types and sizes of Lea-Courtenay centrifugal pumps. The booklet, containing 64 pages, is divided into 12 chapters, dealing respectively with the care taken in the manufacture of this company's product and the characteristics of the pump. The booklet is profusely illustrated.

SAND-BLAST APPARATUS.—The Mott Sand Blast Manufacturing Company, New York, has issued four folders dealing with the following sand-blast apparatus which it manufactures: the Mott direct-pressure sand-blast machine, hose type; the Mott sand-blast tumbling barrel; revolving table and cabinet, type G; the Mott type P. V. S. double sand-blast tumbling barrel and Mott sand-blast accessories.

RAILROAD SPECIALTIES.—The Q & C Company, New York, has issued an elaborate catalogue, illustrated in colors, describing its various products, including the Bonzano joint, the Vaughan rail anchor, tie plates and other track appliances, Ajax vestibule diaphragms, snow flangers and the Ross-Schofield system of circulation for locomotive boilers. The various features are illustrated in detail separately and in actual service.

STORAGE BATTERIES.—The Titan Storage Battery Company, Newark, N. J., has issued a very attractive catalogue relative to the company's line of storage batteries. The booklet touches upon the company itself and its aims, and treats of Titan storage batteries under the following heads: storage battery parts; elementary theory of the storage battery; Titan pasted plates, measurements, etc. Colored illustrations are given of the batteries and their parts.

THE RAILWAY RAIL.—The Pennsylvania Steel Company and the Maryland Steel Company are issuing a pamphlet describing in an interesting manner the origin and development of the railway rail, prepared by G. P. Raidabaugh. The various steps from the wooden tram rail of the seventeenth century to the 125-lb. Pennsylvania sections are described in detail with sketches. This book is valuable at this time of general interest in the steel-rail question.

STRUCTURAL STEEL BEAMS.—The Carnegie Steel Company, Pittsburgh, has issued a pamphlet on structural beams, second edition. This booklet gives dimensions and properties of a new standard of light, wide base I-beams, in sizes ranging from 8 in. to 27 in. It has been decided to roll these supplementary beams to meet a demand for beams of greater stiffness and smaller load-carrying capacity, which will be found suitable for use in certain classes of office buildings, light shop buildings and special classes of floor construction.

BALTIMORE & OHIO.—The historical booklet entitled "The Blue and the Gray," recently issued by the Baltimore & Ohio, is something unusual and interesting enough to deserve special mention. The folder contains 36 pages filled with an interesting description of the historic territory traversed by the lines of the railroad. The book, naturally, deals mainly with the civil war. It names the many points of interest from a historical standpoint and tells briefly what happened at each of these places. There is a chronological list of those battles of the civil war which occurred on or near the lines of the railroad and a map on which are designated the points at which these battles were fought.

DISTANT CONTROL ELIMINATES TRAIN STOPS.—This is the title given to Bulletin 131, recently issued by the General Railway Signal Company, Rochester, N. Y. The booklet deals with the operation of outlying passing siding switches by the G-R-S low voltage or "distant-control" switch machine, a device which was described in the *Railway Age Gazette* of March 19, 1915, page 678. The first installation of a low-voltage switch machine was in connection with a piece of single track on the Northern Pacific at Bozeman tunnel, Mont. This installation was described in detail in an article in the issue of April 16, page 831. The bulletin shows how distant-control eliminates train stops and notes the saving gained thereby. Besides containing a description and illustrations of the machine it also contains a number of wiring diagrams for different kinds of installations.

TRANS-AUSTRALIAN RAILWAY.—The work of constructing the Trans-Australian Railway, which will connect Western Australia with the Eastern States, is being pushed ahead at a good rate. The rails are now laid over a distance of 543 miles.

Railway Construction

AMERICUS, HAWKINSVILLE & EASTERN.—Arrangements have been made with western capitalists, it is said, to finance the construction of a line from Americus, Ga., northeast via Byromville to Hawkinsville, about 55 miles, and it is expected that the work will be started in October. J. S. Morton, Americus, president of the Georgia Lumber Company, may be addressed. (See Americus, Flint River & Gaines, July 2, page 38.)

CHARLESTON SOUTHERN.—Contracts are reported let by this company for work on the line to be built between Charleston, S. C., and Savannah, Ga., as follows: To the Gadsden Contracting Company, Savannah, a section of ten miles on the Savannah end of the line; to L. S. Wood, Gaffney, S. C., for work near Charleston and to M. Schiltz, Charlotte, N. C., for 12 miles south of this section. W. Z. Williams & Co., Macon, Ga., will fill in temporary trestles for 2 miles south of Ashepo river and 2 miles north of Edisto river. (August 27, p. 409.)

FT. WAYNE, DECATUR & SOUTHERN.—Incorporated in Indiana with \$10,000 capital to build an electric line between Ft. Wayne, Ind., Decatur, Monroe, Berne, Ceylon, Geneva, Bryant, Portland, Winchester, Lynn, Fountain City and Richmond. It is said that the company will take over the property of the Ft. Wayne & Springfield, which operates a line from Ft. Wayne south to Decatur, 21.6 miles. The incorporators include J. H. Koenig, C. Oetting, C. Dirkson and M. Gerke.

FT. WAYNE & SPRINGFIELD.—See Ft. Wayne, Decatur & Southern.

KANKAKEE & URBANA TRACTION.—Grading has been begun on the extension of this road from Ludlow, Ill., to Panton, a distance of about five miles. The plans call for one bridge 90 ft. long, the contract for which has been let to the Central States Bridge Company, of Indianapolis, Ind.

OKLAHOMA UNION TRACTION.—See Tulsa Traction.

PHILADELPHIA ROADS.—Bids are wanted until October 19 by A. M. Taylor, director, department of city transit, Philadelphia, Pa., for the steel superstructure and appurtenant work for a two-track elevated railway on the following sections: in Front street on a section comprising about 4,074 linear ft., and another section of about 7,128 linear ft.; in Kensington avenue, on about 7,769 linear ft., and in Kensington avenue and Frankford avenue on about 7,653 linear ft. (July 23, page 182.)

PHOENIXVILLE, VALLEY FORGE & STRAFFORD ELECTRIC.—Plans have been made to build a seven-mile extension, it is said, from Valley Forge, Pa., east to a connection with the Philadelphia & Western at Bridgeport.

SOUTH SAN FRANCISCO RAILROAD & POWER CO.—This company will let a contract within 90 days for a half mile of grading between Holy Cross, Cal., and South San Francisco.

TEXAS & PACIFIC.—This company has under consideration plans for the construction of a branch line, it is said, to be built from either Big Springs, Tex., or Midland, northwest to Seminole.

TULSA (OKLA.) TRACTION.—This company was recently incorporated in Oklahoma with \$100,000 capital, it is said, to succeed the Oklahoma Union Traction Company. A line will be built south of Tulsa, Okla., to Sapulpa and Okmulgee, and on the north to Collinsville. The company now operates six miles of single track to Orcutt Lake. G. C. Stebbins, president; and B. C. Redgreaves, superintendent.

RAILWAY STRUCTURES

BALTIMORE, MD.—The board of directors of the Baltimore & Ohio has authorized the construction of the large coal pier in the Curtis Bay terminal, Baltimore, and it is said that bids for the work will be asked for and the work started at once. The new pier will cost about \$1,500,000. Its capacity will be 10,000,000 tons a year. It will be of steel 700 ft long by 115 ft wide. The breakage of coal will be overcome by means of a

system of belts which will be run at speeds varying from 250 ft. to 500 ft. a minute, leading to movable towers which will load into vessels on either side of the pier. The individual car dumpers will be able to handle cars 53 ft. long and will unload forty of the largest cars in one hour. (September 17, p. 548.)

GREENVILLE, N. J.—The Pennsylvania Railroad has asked for bids on revised plans for the construction of a new pier at Greenville, N. J.

JOHNSTOWN, PA.—The Pennsylvania Railroad has given a contract to W. H. Fissell & Co., New York, for building the superstructure of a new passenger station in Johnstown, Pa., to cost over \$120,000. The building will be constructed of red tapestry brick and stone, and the interior will be finished in marble and tile. There will be two island platforms, each 900 feet long, from which access to the station will be by means of two tunnels, one for passengers and the other for baggage. The new station will be built just west of the present station. (December 4, p. 1068.)

KINNICKINNICK, WIS.—The Barnett & Record Company, Minneapolis, Minn., has the contract for the erection of the superstructure of the 1,000,000-bu. elevator being built here by the Chicago & North Western. The elevator will be of reinforced concrete and steel construction and will cost in the neighborhood of \$900,000.

MACON, GA.—Bids are wanted by A. Fellheimer, architect, 7 East Forty-second street, New York, for building the union station to be used jointly by the Central of Georgia, the Southern Railway, and the Georgia Southern & Florida. The proposed structure is to be of stone, brick and steel construction. It will be three stories high, 80 feet wide and 250 feet long. The work is to be started in October and will cost about \$500,000. (September 17, p. 548.)

OELWEIN, IOWA.—The contract for the reconstruction of the Chicago Great Western storehouse, destroyed by fire the early part of August, has been let to the Blackhawk Construction Company, of Waterloo, Iowa. It will be a reinforced concrete structure. (August 20, p. 369.)

OIL CITY, PA.—The Pennsylvania Railroad has submitted revised plans to the War Department for a railroad bridge to be built over the Allegheny river at Oil City.

ROANOKE, VA.—The work now under way on an extension of the Norfolk & Western engine erecting shop at Roanoke, Va., is a continuation of the building begun in 1912, and extended a second time in 1914. The building is 110 ft. wide, 48 ft. high to the bottom of the trusses, and the present extension is to be 150 ft. long. It will have steel frame and trusses, slate roof, brick walls on one side, and galvanized siding above the level of the machine shop roof on the opposite side, at which point it will connect with the machine shop. The building will be equipped with crane runways for 100, 15, 10 and 5 ton cranes, which are now in use in the completed portion of the building. The new structure is to be used for building and repairing heavy locomotives and will replace the present brick building used for the same purpose. The Virginia Bridge & Iron Company, Roanoke, has the contract for furnishing and fabricating the steel work, and the Norfolk & Western forces have constructed the foundations and will erect the building. The improvements are to cost about \$60,000, and the work will be finished this year. No new equipment will be required.

ST. JOSEPH, MO.—A comprehensive investigation of the grade crossings, terminal and depot facilities in this city is being made by a joint committee representing the Missouri Public Service Commission, the railways and the local Commerce Club.

SUNBURY, PA.—According to press reports the Philadelphia & Reading has adopted plans for building a railroad bridge over the Susquehanna river at Sunbury. The plans call for a 13-span steel girder bridge to carry single track. The new bridge is to be built to replace the light structure now in use.

WILLOW SPRINGS, MO.—The St. Louis & San Francisco has let the contract for a reinforced concrete coaling plant here to Fairbanks, Morse & Co. The plant will be of the "V" bucket type, will have 250-tons capacity, and will include a steam sand drier of one cubic yard capacity per hour.

Railway Financial News

BALTIMORE & OHIO.—Charles W. Harkness has been elected a director, succeeding Norman B. Ream, deceased.

HUDSON & MANHATTAN.—The New York Public Service Commission, first district, has granted this company permission to issue \$615,500 in bonds to reimburse the company for money expended in improving its plant, retiring underlying mortgages and for rolling stock. The bonds are to bear five per cent interest and run until February 1, 1957. There are to be sold to net the company not less than 80 per cent of the par value, and the order provides for the amortization during the life of the bonds of the discount and expense of sale.

MISSOURI PACIFIC.—A suit for foreclosure against this property was filed in the district court in St. Louis on September 19 by the Guarantee Trust Company of New York and B. F. Edwards of St. Louis.

NEW JERSEY & PENNSYLVANIA.—The property of this road was sold at auction September 21 to J. Irving Demarest, of Sewaren, N. J., owner of a quarry near the road at New Germantown. The line of the road extends from Morristown, N. J., southward 25 miles. No trains have been run for many months, the company being unable to keep the track in a condition fit for use. The price paid at this sale was said to be \$29,000. The sale cannot be consummated until it has been approved by the Court, in whose hands the road is held.

NEW YORK, NEW HAVEN & HARTFORD.—Charles F. Brooker, Charles M. Pratt, Lewis Cass Ledyard, Henry K. McHarg and Frederick F. Brewster, former directors of this company, indicted and awaiting trial before the district court in New York for alleged violation of the anti-trust law, have petitioned the court for separate trials.

PENNSYLVANIA RAILROAD.—This company on September 1, 1915, had an even 94,000 stockholders. This is an increase of 3,381 in a year, and is the largest number of stockholders ever reported for this or any other railroad in the world. Each stockholder on September 1 owned an average of 106.23 shares, or 3.96 shares less than the average holdings 12 months ago. Included in the total number of stockholders there were 45,428 women—1,743 more than last year—holding nearly a one-third interest in the property. Of the entire 94,000 stockholders 33,053 were in Pennsylvania, 16,024 lived in New York state, 16,366 in New England, 16,671 elsewhere in the United States and 11,886 in foreign countries. There were 62 more foreign stockholders on September 1, 1915, than on the same date in 1914, and 64 more than in July, 1914.

VIRGINIA & SOUTHWESTERN.—Robert L. Pennington, of Bristol, Tenn., has been elected a director to fill a vacancy.

THE BUSIEST PASSENGER STATION IN ENGLAND.—In an interview reported in a recent issue of the New York Times Magazine, H. W. Thornton, formerly general manager of the Long Island, and now general manager of the Great Eastern of England, made the statement that: "With one exception, and that is the St. Lazare station in Paris, there are more trains in and out of the Liverpool street station, which is the London terminus of the Great Eastern system, than any other railway station in the world. The Great Eastern serves territory generally known as East Anglia, but there are other roads also touching this section, which in a sense gives the Great Eastern some competition, though upon the whole, it has the eastern counties to itself. From 6 o'clock in the morning to 9:30, also of the morning, there are 278 trains arriving in the Liverpool street station, and the number of passengers alighting therefrom during these three hours and a half is about 75,000. During the entire 24 hours there are almost 700 trains arriving in the station, and about the same number departing therefrom, making a grand total of trains in and out of the station every 24 hours of about 1,400. So you see it requires the highest efficiency in the staff and the working force of the road to care for so many trains, so close to one another, to insure safety and promptness."

GENERAL NEWS SECTION..... 613

*Illustrated.

The principal value of the International Engineering Congress, held in San Francisco last week, as far as railway men are concerned, lies in the character of the papers presented. The attendance at the meetings of the railway section was by no means representative of the railway engineers of the country, or even of the West, and the discussions on most of the papers were either perfunctory or entirely lacking. This does not imply, however, that the Congress was unsuccessful. On account of the vast scope covered by such international gatherings, the long periods that elapse between meetings, and the fact that all papers presented are written by individuals rather than by committees, it is not to be expected that the subjects will be handled in a manner that lends itself easily to discussion. The papers are essentially reviews of engineering practise and discussions of recent developments. For this reason, only brief abstracts have been taken

from most of them for use in the report published elsewhere in this issue. The complete volume of the proceedings of this section of the Congress will be valuable to many students of railway engineering both within and without railway organizations, but it is manifestly impossible for the *Railway Age Gazette* to do more than suggest the nature of the material that will be available in these proceedings when published.

In its opinion in the western freight rate advance case, the Interstate Commerce Commission left its attitude toward two

Rehearing of the Western Rate Case

important questions very doubtful. It did not state its conclusion as to whether the western lines needed an increase in their net revenues, although both the railways and those opposing advances in rates asked it to do so. It also failed to make clear its position on the question of state interference with interstate commerce. It refused to grant certain advances in interstate rates on the ground that there were lower state rates fixed by state authorities; but just to what extent it intends to let state regulation control interstate regulation it did not make clear. The attorneys of the railways in their brief for a rehearing, an abstract of which is published elsewhere in this issue, present a masterly argument for the commission to make clear its exact position respecting these matters. It is to be hoped that the commission will decide to do this. It either believes, or it does not believe, that the western lines need larger net revenues, and it ought to answer them one way or the other, so that they may act accordingly. It either intends, or it does not intend, to let rates fixed by state authorities control it in regulating interstate rates, and it ought to enlighten the carriers on this point so that they may know definitely how they must proceed to get the relief to which they consider themselves entitled. Such decisions as that in the western case, which really decided nothing, leave the railways in a state of uncertainty which is bad for them, and bad for business in general; and regulation which produces such results does not command or deserve respect and confidence.

With the inclusion of the Missouri, Kansas & Texas the mileage of railways in the United States in the hands of receivers is

42,000 Miles of Railway in Receiverships

now greater than it has ever been before. According to the *Railway Age Gazette's* record, the addition of the 3,865 miles of the Missouri, Kansas & Texas system makes a total of 82 railways, operating 41,988 miles of line, and with a total capitalization of \$2,264,000,000, now being operated by receivers. This is more than one-sixth of the railway mileage in the United States, and exceeds the total railway mileage of any other country in the world except European and Asiatic Russia combined. The total par value of securities outstanding of roads being operated by receivers represents about 15 per cent of the total capitalization of the railways of the United States, and is greater than the total capitalization of all the railways of any other country in the world outside of Russia, Great Britain, Germany and France. This is a record of insolvency unparalleled in history. The largest mileage of roads in receiverships previously recorded, according to the Interstate Commerce Commission's reports, was for the fiscal year ending June 30, 1894, when 192 roads, operating 40,818 miles of line, and with a capitalization of about \$2,500,000,000 or about 25 per cent of the total capitalization at that time, were being operated under the direction of the courts. It will be noted that with a greater mileage the capitalization of the roads now in receiverships is less than that of the roads bankrupt in 1894. The proportion of the total mileage in receivers' hands in 1894 was not quite one-fourth. The large mileage of roads in the hands of receivers in that year was, of course, accounted for principally by the effect of the panic of 1893, 126 of the roads that were insolvent on June 30, 1894, having become so during the fiscal year, and 35 during 1893. At the end of the fiscal year 1895, there were 169 roads

in receiverships, operating 37,855 miles and having at total capitalization of \$2,439,000,000, and on June 30, 1896, 151 roads, with a mileage of 30,475 and a capitalization of \$1,742,000,000. The present large mileage is made up chiefly of roads that have gone into receiverships comparatively recently.

A practical and startling demonstration of what may be accomplished by giving special attention to the training and coaching of employees in the right way of doing their work, and of securing their hearty co-operation in seeing that it is done in that way, has taken place on the St. Louis & San Francisco during the past year.

**A
Remarkable
Record**

The campaign on that road to reduce loss and damage to freight, which was purely educational in character, was described in the *Railway Age Gazette* of April 9, 16 and 23. The aim was to save \$200,000 during the fiscal year. The auditor's figures, which are now available, show that while the gross freight revenue for 1914-15 was \$28,182,181, as compared with \$28,654,454 for the previous year, a falling off of 1.7 per cent, the freight loss and damage claim payments dropped from \$482,038 to \$277,801, making a saving of \$204,237, or 42.4 per cent. If the gross freight revenue had not fallen off, and if the same rate of loss and damage applied, the saving would still have been over \$200,000. In 1913-14 the claim payments per thousand dollars of gross freight revenue amounted to \$16.82 on the Frisco, or about the average for all of the railroads in the country. For the year 1914-15 this figure dropped to \$9.86, a record which is equaled by very few other roads. During the year 22,905 freight claim preventive postals were turned in to the various committees, each one calling attention to some feature which was thought to be defective and which needed correction in order to remove the danger of further loss and damage. The slogan for the present fiscal year is another reduction of \$100,000 in freight loss and damage-claim payments.

THE MISSOURI, KANSAS & TEXAS RECEIVERSHIP

ON Monday of this week C. E. Schaff, president of the Missouri, Kansas & Texas, was appointed receiver in a suit brought by creditors with the acquiescence of the board of directors. The receivership was not the result of the failure of the operating department to make good; neither was it directly the result of such financial mistakes as were made in the cases of the St. Louis & San Francisco and the Chicago, Rock Island & Pacific. The company has strong banking support and the faith of the holders of large blocks of its securities. In 1913 it was able to sell \$19,000,000 secured two-year 5 per cent notes and the greater part of these notes was taken by bankers and financially strong individuals. The notes fell due May 1, 1915. Eventually 95 per cent of them, representing all of the notes held by those who were in a position to know the condition of the company, were extended. Active work has been done on a plan for a reorganization of the company's finances and the strong banking interests of J. & W. Seligman & Co. and Hallgarten & Co. have been secured for the carrying out of this plan.

The direct cause of the receivership is apparently that the suits brought by the holders of five per cent of the notes which matured May 1 last threatened the interests of other creditors and the integrity of working capital. While presumably the Missouri, Kansas & Texas reorganization will not be by any means as drastic as that of the Missouri Pacific, the receivership is another instance where voluntary reorganization of a fundamentally sound, although over-bonded, railroad could not be worked out even when banking support was available. It is easy to argue that it would be far better for all concerned to avoid the expense of receivership and submit to a voluntary reorganization and certain sacrifices, but the only instances where such theoretically wise self-interest can be put into practice is where a very large majority of securities are held by a few strong interests, as has been the case with the Western Maryland.

The holders of the five per cent of the 5 per cent notes which were not extended, by insisting on payment in cash and refusing to make a temporary sacrifice which the holders of many times that number of notes are willing to make, act in a selfish way, but there are always certain classes of lawyers and their clients who take a chance of making a profit by holding out on any proposition which requires an abatement of the letter of their legal right.

The Missouri, Kansas & Texas mortgages securing the bonds underlying the consolidated mortgage so restrict financing that the consolidated mortgage is necessarily a complicated structure superimposed on other mortgages, and although some such arrangement was absolutely necessary, it does not permit of as cheap financing as the earning power of the property deserves. There is, moreover, too large a proportion of Missouri, Kansas & Texas funded debt to stock.

Of course the Missouri, Kansas & Texas had extraordinarily bad luck in the fiscal year ended June 30, 1914. Unprecedented floods caused both expensive interruptions to traffic and expensive replacement work. Even so, however, the operating economies this past year have been such as to show a net operating income for the year ended June 30, 1915, of \$7,192,000, or more than 19 per cent greater than that for the year before, and a surplus of \$1,475,000 after the payment of interest charges will be shown for the year.

The indirect and underlying causes of the Missouri, Kansas & Texas receivership are the restrictions placed on economical financing by the mortgages prior to the consolidated mortgage; the confiscatory policy pursued for years by the legislature of Texas toward Texas railroads, which attitude, however, has been in good measure abandoned; vicious restrictions of the south-western states under the form of regulation; rates which were too low either because of competition or of nibbling by state commissions, and failure years ago to develop a northbound low grade traffic, such as the timber which some of the other south-western roads have.

The receivership will permit the elimination of the mortgage restrictions and presumably a reduction in fixed charges. The attitude of the state of Texas, as mentioned above, has already changed materially and the Missouri, Kansas & Texas management has gone far toward gaining the confidence of Texas people, and steps are already under way for the development of a profitable traffic northbound. What the rate situation in the south-west will be is only a matter of conjecture. It would seem as if the time had almost come when people had begun to realize the irreparable injury which was being done by demagogic railroad regulation.

TWO SYSTEMS OF STATE RAILWAYS

IN the report of the International Engineering Congress at San Francisco, which is published elsewhere in this issue, there are given abstracts of two papers which throw light on the question of government management of railways.

One is a paper on the railways of India, and indicates, as does most of the other available evidence, that the management of the state railways of that country has been successful. The article shows that these lines are profitable and other data might be cited indicating that, considering all the conditions, their capitalization is low, their service good and their rates reasonable.

The other paper referred to relates to the railways of Italy. Most of these lines are owned and operated by the government. Most of them always have been owned by it, although the state railways were leased to private companies from 1865 for varying periods of years, and again from 1885 to 1905. The author of the article on the Italian railways tries to show that government management since 1905 has been successful, or at least more successful than private management was.

Most people who are familiar not only with the results of the Italian railways in recent years, but also with their history, will be very slow to accept the view either that public manage-

easily earning 7 per cent on its then outstanding stock. It was a road, however, depending entirely on the traffic which it could originate on its own lines, or which was destined for points on its own lines, and it served a highly competitive territory. Competition is growing keener in the northwest every year. To get this competitive business it is often necessary to give a freight service and a passenger service that would not under normal conditions be justified by the traffic and rates. The St. Paul's competitors are the Northern Pacific; the Great Northern; the Minneapolis, St. Paul & Sault Ste. Marie; the Chicago, Burlington & Quincy, and the Chicago & North Western. The Hill Lines, of course, have their western outlet, the Soo has the Canadian Pacific, the Chicago & North Western has particularly close traffic relations with the Union Pacific. While, therefore, the St. Paul was apparently prosperous before it built to the coast, each year has shown the effects of the continually growing competition which the road has to meet and the impossibility of successfully meeting this competition and of reducing expenses, or rather of holding down expenses on local business.

Developing a new railroad is a slow process at best and requires a high degree of steadfast courage and even faith. The St. Paul's line from Mobridge, S. D., to Seattle and Tacoma, Wash., has been in operation since 1909. It is not even yet bringing to the system sufficient traffic to offset increased expenses of the rest of the system and to pay a fair return on the cost of its construction. The history of the transcontinental lines of the northwest, however, and the present development of that section of the country are such as to strengthen rather than weaken the belief with which the building of the Pacific coast extension was undertaken that in time it would be the salvation of the system.

The Hill Lines, the Soo and the North Western all feel the drain of competitive business in the territory east of the Missouri river. But these roads have built up also a through traffic which earns good revenue and can be handled economically. It would appear that it is the building up of a profitable through traffic, with resulting economies in transportation expenses, that will within a few years restore the earning power of the St. Paul, which has been adversely affected by conditions in the last four or five years. This is discussing the question, of course, as it affects the next decade of development of the property. The immediate prospects for large earnings this fall and winter from the movement of the unprecedented large crops apparently assure a prosperous year for 1916.

The falling off of \$2,178,000 in 1915 in operating revenues is less than what will be shown probably by a like mileage of most of the St. Paul's competitors. Revenue freight carried one mile totaled 8,186,000,000 tons, an increase of 1.32 per cent, but the revenue per ton mile was 7.813 mills in 1915, a decrease of 3.28 per cent as compared with the previous year. The number of passengers carried one mile was 858,500,000, a decrease as compared with the previous year of 5.91 per cent.

With only a very small falling off in freight traffic, there was a reduction in transportation expenses of \$1,151,000, the total transportation expenses in 1915 amounting to \$35,698,000. The following table shows the ratio of each class of expenses to total operating revenues:

	1915	1914
Maintenance of Way and Structures.....	11.35	11.45
Maintenance of Equipment.....	15.03	14.56
Traffic Expenses.....	1.92	1.92
Transportation Expenses.....	39.04	39.36
Miscellaneous Operations.....	0.79	0.83
General Expenses.....	2.04	1.78
Transportation for Investment—Credit.....	2.39	2.72
Total Operating Expenses.....	67.78	67.18

Transportation for investment—credit—is a subtraction from expenses representing a charge made by the company to itself for carrying company material. In 1915 the credit under this heading was \$2,183,000, in 1914, \$2,548,000. This looks rather large in both years, but as a matter of fact the amount of company freight carried by the St. Paul is large. The total ton mileage of company freight in 1915 was 1,439,000,000, in 1914, 1,597,000,000.

The average train load is not large, 390 tons in 1915 and 380 tons in 1914. In addition there was company freight which brought the total train load up to 459 tons in 1915 and 454 tons

in 1914. Such a large part of the St. Paul's traffic is local traffic, and so much of it has to be moved promptly without waiting for the opportunity to get a full train load, that, unless we remember what a network of branch lines the St. Paul has, we are apt to forget how difficult it is to make a good showing in train load when compared with a road having few branches and heavy through traffic on its main line. When the through traffic on the St. Paul becomes fully developed the train load figures should be very considerably higher than they now are. It will be noted that the company does a large passenger business. Of the total revenue, about 70 per cent is derived from freight and the other 30 from passenger and service incidental to passenger service. Both the quantity and the quality of the St. Paul's passenger business tend to make for a fairly high operating ratio. The St. Paul has the affection of travelers in the northwest and of citizens of St. Paul and Minneapolis to a remarkable degree. Even in the rather trying years through which the company has just passed the high standard of passenger service which the company has set for itself has been adhered to, and this policy, like that of refusing to stint on maintenance, leaves the company in a strong position to take advantage of better times.

The prospects for 1916 are bright. Never have there been such wheat and oat crops in the territory served by the St. Paul. Farmers of the Dakotas and Montana have cut an unheard-of crop of wheat and oats, and in some cases will probably get a bumper crop of corn also, although the frost probably will get some of the more northern corn. Hundreds of miles of land on which twelve bushels an acre of wheat was an average crop and twenty bushels a bumper crop have raised this year thirty to thirty-five bushels of wheat, and that planted to oats has raised 60 to 70 bushels per acre. The wheat has only barely started to move, so that the monthly earnings since the close of the fiscal year have not begun in the slightest to reflect the revenue which the road will earn from this year's crops. The less direct result which will come because of the traffic created by the prosperity of the farmers will be felt for two or three years.

The following table shows the principal figures for 1915 compared with 1914:

	1915	1914
Average Mileage Operated.....	10,053	9,684
Freight Revenue.....	\$63,953,799	65,315,755
Passenger Revenue.....	17,952,428	18,961,225
Total Operating Revenues.....	91,435,374	93,613,700
Maintenance of Way and Structures.....	10,377,185	10,722,100
Maintenance of Equipment.....	13,737,535	13,625,096
Traffic Expenses.....	1,756,801	1,799,621
Transportation Expenses.....	35,697,961	36,848,934
Miscellaneous.....	722,635	778,716
General Expenses.....	1,862,939	1,664,079
Transportation for Investment—Credit.....	2,183,355	2,548,245
Total Operating Expenses.....	61,971,701	62,690,301
Taxes.....	4,746,721	4,106,557
Operating Income.....	24,716,952	26,606,555
Gross Corporate Income.....	28,366,665	30,081,656
Net Corporate Income.....	11,968,283	15,476,286
Dividends.....	13,951,711	13,928,976
Surplus.....	*1,983,428	1,547,310

* Deficit.

HOCKING VALLEY

THE Hocking Valley was formerly owned jointly by five trunk lines, but control of it was bought in 1909 by the Chesapeake & Ohio. The company operates 352 miles of road running from the Ohio coal fields to Toledo. It has outstanding \$11,000,000 stock, of which the Chesapeake & Ohio owns \$8,825,800. A part of the Hocking Valley and the Toledo & Ohio Central, which is controlled by the New York Central, is operated as a double-track system, loads moving on one line and empties returning on the other. Heretofore the interchange of freight between the Chesapeake & Ohio and Hocking Valley has been over the Kanawha & Michigan, but, as mentioned in the comments on the Chesapeake & Ohio's annual report, printed in this issue, the Chesapeake & Ohio has sold its half interest in the Kanawha & Michigan and is now building an extension which, in conjunction with trackage rights, will give it a direct connection with the Hocking Valley.

Most, if not all, of the roads running north and south and serving the lakes will probably show a falling off in earnings due to the business depression of last year. In the case of the

Hocking Valley this was probably made worse by the fact that the Chesapeake & Ohio was shipping so much coal east that it sent as little as it conveniently could over the Kanawha & Michigan to the Hocking Valley.

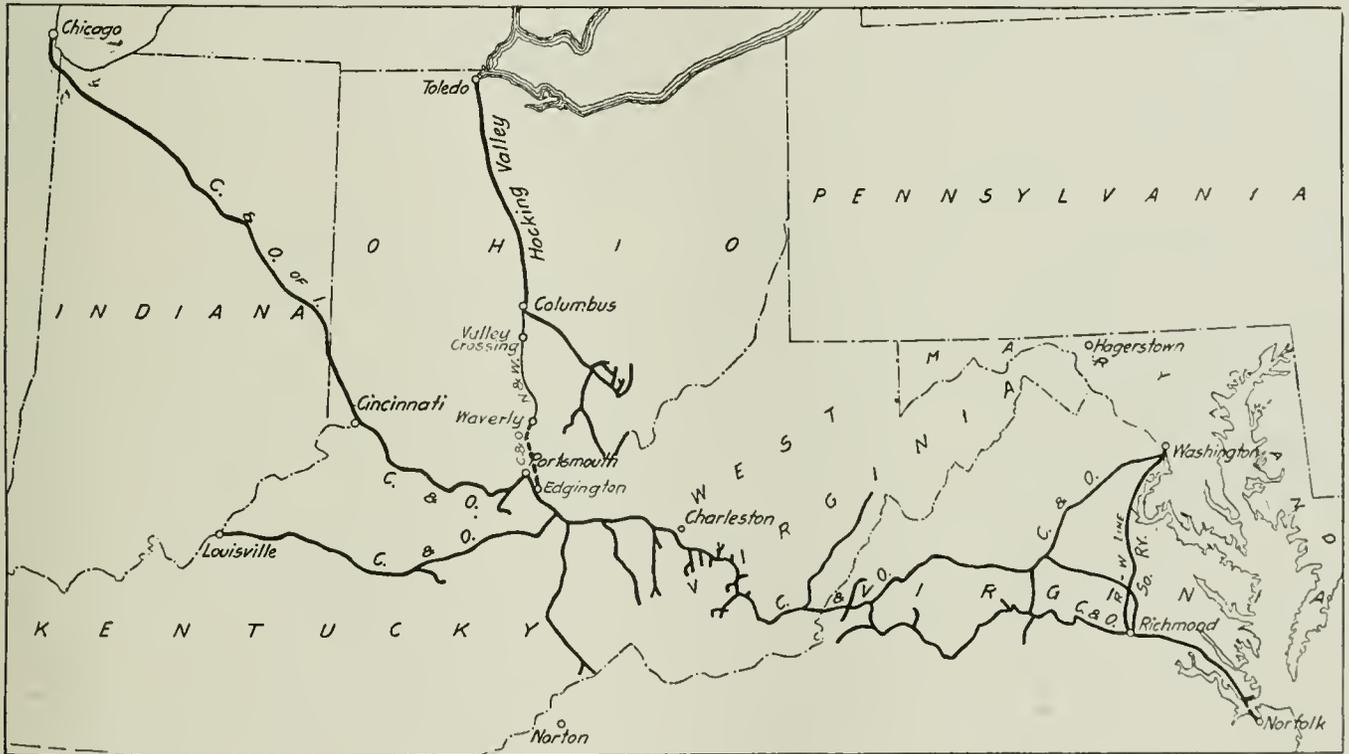

Total operating revenues of the Hocking Valley in 1915 amounted to \$6,181,000, a decrease as compared with the previous year of 12 per cent. Total operating expenses amounted to \$4,184,000, a decrease of 12.9 per cent. After the payment of rentals, taxes and interest there was \$493,000 available for dividends as compared with \$956,000 in the previous year. Dividends of 4 per cent were paid in 1915 as compared with 8 per cent in the previous year.

The principal reductions in operating expenses were in maintenance of equipment, on which there was spent \$1,159,000, or 20.7 per cent less than in 1914, and transportation expenses, which amounted to \$2,035,000, or 14.9 per cent less than in the previous year. The average revenue trainload in 1914 was just 1,000 tons, and even this high trainload was increased in 1915 to 1,035 tons. Including company freight, the trainload in 1915 was 1,068 tons, and the tons per locomotive, 922. With a decrease of 10.9 per cent in revenue ton mileage there was a

Taxes	\$418,522	\$451,136
Net operating income	1,578,261	1,763,263
Gross corporate income	1,871,152	2,215,182
Net income	493,402	955,741
Dividends	439,980	879,960
Surplus	53,422	75,781

CHESAPEAKE & OHIO

A CONDITION of the sale of \$33,000,000 Chesapeake & Ohio notes in 1914 was that \$2,000,000 should be spent from income for additions to the property in the fiscal year ended June 30, 1915; \$3,000,000 in the next year, and \$4,000,000 in each of the next three succeeding years. After the payment of 1 per cent dividends the company had a surplus for the year ended June 30, 1915, of \$2,036,000. From this amount and current funds there was spent a net total of \$3,024,000 on additions to road and equipment. No securities were sold during the year and the amount of outstanding equipment trust certificates was reduced from \$8,382,000 at the beginning of the year to \$6,413,000 at the end of the year. It will be seen, therefore, that the company not only spent somewhat over the required \$2,000,000 from this year's income, but about a million from the income of other years for additions and betterments.

The Chesapeake & Ohio and the Hocking Valley

decrease of 13.9 per cent in freight train mileage, while there was an increase in the percentage of empty car mileage from 43.8 in 1914 to 44.7 in 1915. The average length of haul on the Hocking Valley for freight was 129 miles in 1915 as against 125 miles in the previous year.

At the end of the year the company had on hand \$833,000 cash, with loans and bills payable of \$1,100,000. Since the close of the fiscal year the company has been showing a very considerable increase in business.

The following table shows the principal figures for operation in 1915 compared with 1914:

	1915	1914
Average mileage operated.....	352	352
Freight revenue	\$4,912,982	\$5,601,382
Passenger revenue	832,733	910,311
Total operating revenue	6,181,153	7,021,145
Maintenance of way and structures.....	707,207	668,455
Maintenance of equipment.....	1,158,671	1,460,653
Traffic expenses	110,916	107,576
Transportation expenses	2,033,491	2,391,640
Miscellaneous expenses		1,483
General expenses	172,602	175,422
Total operating expenses	4,184,370	4,803,747

It may be recalled that the Norfolk & Western's operating revenues for the fiscal year ended June 30, 1915, were about 3.73 per cent less than in the previous year. The Chesapeake & Ohio's operating revenues on the other hand were 5.35 per cent greater in 1915 than in the previous year, and totaled in 1915, \$39,464,000. By far the greater part of this gain in revenues was from the transportation of coal and coke. The total revenue tonnage of coal and coke in 1915 was 21,326,000, an increase over the previous year of 10.8 per cent. On June 1, 1914, the new coal pier of the Chesapeake & Ohio, at Newport News, was put in operation. The Chesapeake & Ohio was the last of the three roads running from West Virginia coal fields to Norfolk to build a steel electrically-operated coal-dumping pier, both the Virginian Railway and the Norfolk & Western having had piers in operation in 1914. The comparison of coal tonnage in 1915 and 1914 on the Chesapeake & Ohio, therefore, should be made with the explanation that in 1914 the Chesapeake & Ohio was probably not getting the proportion of export coal business to which it would have been entitled had it had facilities equal

to its two competitors. The Chesapeake & Ohio had also added to its coal car equipment previous to June, 1914, so that it was in a strong position to promptly move the coal of the operators on its lines, thus enabling them to take full advantage of the demand which the war has created for export coal.

With the present activity in the iron and steel trades and Canadian manufacturing plants there will be a large increase in movement of coal west and northbound from West Virginia. The Chesapeake & Ohio's average ton-mile rate on coal is but 3.06 mills. On some of this which moves west and which is now being delivered to the Kanawha & Michigan for haul over the Hocking Valley to the lakes the Chesapeake & Ohio gets a short and expensive haul. It may be recalled that arrangements were made in 1914 for the sale of the Chesapeake & Ohio's half interest in the majority stock of the Kanawha & Michigan. This sale was made at a profit to the Chesapeake & Ohio of \$1,119,000. A subsidiary company is now building a line from Edginton, Ky., to Waverly, Ohio, about 30 miles. At Waverly connection will be made with the Norfolk & Western over which trackage rights have been secured to a connection with the Hocking Valley, at Columbus, Ohio. The Hocking Valley is controlled by the Chesapeake & Ohio through ownership of the majority of its stock. This new connection will give the Chesapeake & Ohio a haul of two to three times as long on its coal for Toledo as it has when it delivers to the Kanawha & Michigan. Since the expense of loading, making up trains, etc., will be the same, the profit on the business will be very greatly increased when the new line is completed.

The net income available for dividends and for improvements to the property under the terms of the note sale in 1914 mentioned was \$2,664,000 in 1915, as compared with \$2,972,000 in the previous year. In 1915 only one per cent was paid in dividends, while in 1914 four per cent was paid. The 1915 net would have been much larger except that in 1915 the Hocking Valley paid only 4 per cent dividends on the \$8,825,800 stock which the Chesapeake & Ohio owns, whereas in 1914 eight per cent was paid by the Hocking Valley. This alone makes a difference of more than \$350,000, and the company spent about one million dollars more on maintenance in 1915 than in 1914.

Transportation expenses amounted to \$12,896,000 in 1915, an increase over the previous year of \$364,000, or 2.9 per cent. The total revenue ton mileage was 8,138,000,000, an increase over the previous year of 1,074,000,000, or 15.2 per cent. The passengers carried one mile totaled 269,000,000, as against 292,000,000 the year before, a decrease of 7.6 per cent. Freight train mileage totaled 8,979,000, an increase of 680,000, or 10.6 per cent, and the passenger-train mileage totaled 5,009,000, an increase of 222,000, or 4.2 per cent. The average revenue train-load freight in 1915 was 906 tons and in 1914 870 tons, an increase last year of 4.1 per cent. The gain in trainloading was made entirely through a heavier gross load pulled per locomotive, the average number of loaded cars per train being 28 in 1915 and 28.1 in 1914, while the average number of empty cars was 19.4 in 1915, as against 17.7 in 1914. The average load per loaded car was 32.3 in 1915 and 30.9 tons in 1914.

The total tonnage of all commodities carried on the Chesapeake & Ohio in 1915 was 30,048,000. Of this, 70.25 per cent was bituminous coal, 6.40 per cent lumber, and 3.92 per cent grain. The principal changes, as compared with the previous year, were an increase of more than 12 per cent in tonnage of bituminous coal; an increase of more than 140 per cent in tonnage of grain, and a decrease of nearly 14 per cent in the tonnage of lumber. There was also, of course, a big increase in the tonnage of livestock, probably principally horses, the total tonnage in 1915 being 106,000, as against 46,000 in the previous year.

The company spent \$4,695,000 in 1915 for maintenance of way. This is an increase of \$545,000 over the previous year, or a little over 13 per cent. By far the largest single item of increase was the expenditure for ties, a great deal of tie renewal work having been done this last year. The amount spent for ties in 1915 was \$2,136,000, an increase as compared with the previous year of \$513,000. There was also, of course,

the expenditure for maintenance of the new coal pier, which amounted to \$105,000, in 1915.

Maintenance of equipment cost \$8,243,000, an increase over the previous year of \$415,000. The average repairs per locomotive amounted to \$3,013 in 1915, and \$2,740 in 1914; the average expenditure for repairs of freight-train cars was \$82 in 1915, and \$74 in 1914; and for passenger-train cars, \$921 and \$909, respectively. Of the total locomotives and freight cars in service 11 per cent of each were awaiting or undergoing heavy and general repairs at the close of the year. This seems a rather high percentage.

The prospects for the present year are that there will be a further increase in coal traffic eastbound and a very much increased coal traffic westbound and northbound. Passenger business also ought to be better, and the Hocking Valley's prospects for a good year, as mentioned elsewhere, are good.

The following table shows the principal figures for operation in 1915, compared with 1914:

	1915	1914
Average mileage operated.....	2,369	2,346
Freight revenue.....	\$31,288,537	\$28,866,516
Passenger revenue.....	5,696,088	6,098,059
Total operating revenue.....	39,464,037	37,459,864
Maintenance of way and structures.....	4,694,522	4,149,457
Maintenance of equipment.....	8,243,170	7,827,660
Traffic expenses.....	650,406	669,283
Transportation expenses.....	12,896,079	12,532,329
Miscellaneous expenses.....	232,347	248,347
General expenses.....	873,883	986,822
Transportation for investment—Cr.....	33,994
Total operating expenses.....	27,556,414	26,413,899
Taxes.....	1,349,497	1,330,935
Net operating income.....	10,558,126	9,715,030
Gross income.....	11,576,346	11,859,681
Net income.....	2,663,537	2,971,815
Dividends.....	627,816	2,511,264
Surplus.....	2,035,721	460,551

NEW BOOKS

Poor's Manual of Industrials for 1915. Bound in cloth; 2,872 pages; size, 6 in. by 9 in. Published by Poor's Manual Company, 80 Lafayette street, New York. Price \$5.

The sixth edition of Poor's Manual of Industrials contains 412 more text pages than the fifth or 1914 edition, the increase resulting from the inclusion of a large number of new statements of industrial companies presented for the first time in manual form. Poor's Manual Company now issues three manuals. The Manual of Railroads has been issued for 49 years and has long been recognized as an authority. Of the Manual of Public Utilities but three editions have been issued, and of the Manual of Industrials the present volume is the sixth. The last relates primarily to manufacturing, mining and miscellaneous companies and contains 2,872 pages, being the largest of the three. It contains information relative to the capital stock, directors and officers of the various companies and also, when such are obtainable, income accounts, balance sheets and other important data, all of which would otherwise be almost inaccessible. One of its valuable sections is the Railroad Appendix, containing data of railroads and utilities received too late for publication in the other two manuals.

Oxy-Acetylene Welding and Cutting. By Calvin F. Swingle, M.E. 190 pages, 4½ in. by 6½ in. Illustrated. Bound in leather or cloth. Published by Frederick J. Drake & Co., Chicago. Price, \$1.50 in leather; \$1.00 in cloth.

This book is intended as a practical treatise on the subject of welding and cutting with the oxy-acetylene flame, and only so much of the theory pertaining to the subject has been included as will enable the practical man to acquire a thorough working understanding of the subject. After an introductory chapter dealing briefly with the adaptability of various methods of welding, several chapters are devoted to welding flames and the properties and methods of handling the gases most commonly used. This portion of the book is confined largely to the oxy-acetylene flame, which has the widest practical application, and touches only briefly on other gases which have been used with oxygen to a less extent in welding and cutting operations. The equipment used in welding and cutting is next discussed, after which the operation of the plant and the practices followed in welding and cutting are taken up. A final brief chapter is devoted to the subject of carbon removal with the oxygen torch. The book contains a large number of illustrations and a number of tables.

Railways Ask Rehearing of Western Rate Case

Request Specific Findings on Adequacy of Carriers' Revenues and Relation of State and Interstate Rates

The committee of attorneys, representing the western railways, of which C. C. Wright, general solicitor of the Chicago & North Western, is chairman, on September 25 filed its petition with the Interstate Commerce Commission, asking the commission to grant a rehearing and reargument of the western rate advance case and to modify the findings and order of July 30, in regard to the following particulars:

As to the request of the respondents and protestants for a finding by the commission upon the question of the adequacy of the revenues of the carriers. Upon the reasonableness of the proposed rates on grain and grain products, livestock, packing house products, fresh meats and hides (except as the same were allowed), fertilizer and fertilizer materials and cotton piece goods.

The respondents pray that the findings in the order be modified so as to permit the carriers to make effective the rates in the tariffs directed to be cancelled, and that if there is, in the opinion of the commission, evidence raising a serious question as to the proper relation of the state rates to the proposed rates, then that the commission shall order an investigation as to the relation of such state rates to interstate rates, in which the relation may be properly determined by the commission, and may allow the petitioners to establish such rates as are in its opinion just and reasonable, and require the carriers to remove any discriminations which may be found to exist by reason of lower state rates.

REASONS FOR A REHEARING

The following is an abstract of the statement of the carriers as to why they are entitled to a reargument and to a modification of the opinion:

There are some things in the opinion of the commission in this case which are so vital, not only as affecting the advances proposed, but also as affecting the ultimate welfare of the railroads and of the public, that we do not hesitate to ask this commission to reopen the case that they may be more fully presented. With a record of more than 15,000 pages and the voluminous exhibits contained in this case, it is not at all strange that the members of the commission who did not hear the testimony should fail to gather its full import, and what may be said in criticism of the opinion is not in criticism of the actions of individual members of the commission. We desire, however, to speak plainly as to the effects of this opinion, both upon the transportation problems of this country and upon the future of this commission. The almost unlimited power of the commission makes it imperative that it shall most carefully consider and weigh the effect of its opinions upon so important questions as those here raised. In view of the fact that there is no adequate review of the commission's opinion, it is the more proper that reargument of the questions be granted.

THE NEEDS OF THE CARRIERS FOR ADDITIONAL REVENUE

The rules of the commission recently adopted required that the parties to a proceeding before it shall state distinctly the findings which are desired. The carriers in their brief specifically asked for a finding upon the sufficiency of the revenues of the carriers. The principal brief for the protestants also contains a request for a finding on this subject. The first paragraph of their brief is as follows: "Are western railroads entitled to more revenue through advanced freight rates, is the issue presented in this case?" It will thus be seen that this issue was specifically joined. Elaborate proof was introduced by both sides. It is a question which is important alike to the railroads and to the public to know what the policy of this commission is to be.

A few pertinent facts may properly be called to the attention of the commission as bearing upon this question. In 1910 various carriers undertook some general advances in rates. In the opinion in the eastern case, it is pointed out that the question presented was the need of additional revenue. In the western freight advance case it was held that the revenues must play a not inconsiderable part in arriving at a final judgment, and the commission epitomized the grounds of justification of the advances in the phrase: "We need the money." It is true that in both cases the commission held that the carriers had not shown the inadequacy of their revenues. It is, however, noteworthy that the commission in those cases not only distinctly passed upon the issue presented in this case, but that it said to the same carriers that now appear before the commission that if in the future they felt their rates were not sufficient to give an *adequate return*, they would find the door of the commission open to them. This implied a promise on the part of the commission that they would at such future time pass upon that question.

In the entire history of the commission, so far as we are able to determine, from that time since, there has never been any indication of a change in the views of the commission. Certainly there has been no change in the law. On the other hand, in the recent so-called five per cent case, the eastern carriers renewed their application for an increase in rates, based solely upon the need of additional revenue. The commission in that case, as now constituted, considered the question and rendered its decision based upon its conclusions as to the need of additional revenue.

We recognize that it does not necessarily follow that a particular rate has been justified by a showing that the revenues of the carriers are insufficient. However, the fact of the insufficiency of revenue is one of the fundamental questions which underlies and must underlie a general advance in rates. The western carriers did not base their claim *entirely* upon the inadequacy of revenues, but they harkened to the advice of this commission and introduced evidence of the comparative returns upon various commodities.

In every other general advance rate case the commission has not only considered but has passed upon the question of the sufficiency of revenues, and the carriers in this case therefore ask that that matter may be distinctly passed on. It is important to the carriers and to the public to know the conclusion which the commission arrived at upon this question. If the commission shall find that the present revenues are adequate, then the railroads and the public must adjust themselves to the service which will allow the carriers from those revenues to secure the fair return guaranteed by the law. The public likewise is interested in this matter, as, depending upon the permanent policy of this commission may ultimately depend the question of whether railroads shall continue to be operated by private capital under efficient government regulation and control, or shall be operated by state and governmental authorities.

THE FINDINGS OF THE COMMISSION

Many of the facts upon which the conclusion as to the adequacy or inadequacy of revenues must rest have been determined. It was found, among other things, that the carriers are required to pay a higher average percentage for borrowed capital than heretofore; that they are paying higher prices for many materials and higher wages for most kinds of labor; that in meeting the increased cost with increased prices for service they are subject to certain disabilities not similarly encountered by many other industries; that the relative equal

depreciation of the carriers' credit with credit generally is not evidence of the adequacy or inadequacy of their present revenues (it should be noted that the carriers never contended that it was); that their net corporate income cannot be accepted as the measure of the adequacy or inadequacy of present rates (the carriers did not so contend and did not present the data as to net corporate income); that the increased percentage of bonds to capital obligations indicates a growing disinclination to invest in railroad stocks and a growing unwillingness to accept the prospect of dividends as a sufficient incentive to assume the risk of railroad proprietorship. It also found that the relative profitableness of the business, taking the roads as a whole, has declined since 1901; that the main cause effecting this result has been an increase in expenditure not offset by an increase in receipts.

The tables presented beyond question show that the same statement is true comparing 1910 with present conditions. It may be said generally that the contentions of the carriers in this case as to the financial needs and the basis upon which they should be determined have been sustained by the commission with the possible exception as to the value of the roads. The operating ratio is found to have increased materially. The substantial integrity of the carriers' accounts has been approved. The fact of the decreasing net return from operations is shown to be due to the increased wages and taxes and maintenance, and to be from causes beyond the control of the carriers. Every fact that was found in the five per cent case by the commission upon which it based its conclusion that the carriers needed additional revenue has either been found in the present case by the commission or is supported by uncontradicted testimony. Parallel columns of the findings and results of the findings as between the five per cent case and the present case demonstrate that the showing in this case is clearer and upon a more substantial basis than that presented in the five per cent case. The needs of the carriers are shown to be greater and the insufficiency of the revenue is more marked.

Inasmuch as the opinion refers to certain returns upon stock of some of the carriers, we direct the commission's attention to the fact that the carriers presented their case upon the *operating* income from the property devoted to the public service and not upon the *corporate* income as compared with the capitalization. That this test is not a test of the adequacy or inadequacy of revenues, the commission has held. If a test is to be made of the corporate income as compared to the capitalization, or the return upon the stock of the company, then the question of the financial management of various carriers would become a much more important element than when the *railway operating income* and the value of the physical property is considered. The injury from financial mismanagement is primarily and directly to the stockholders and bondholders of the carriers. It is, we believe, however, a very small element when the *operating* revenues are compared to the value of the property. To put the matter more concretely, if it were conceded that a road had been financially mismanaged, it would not in any way affect the amount of commodities to be moved upon that road. The present case includes not the single road but all of the roads. The commodities which were handled by these roads were exactly the same, whether the one line of road or all of the roads had been financially mismanaged. If there had never been in times past a dollar misspent by any of the roads it would not in any particular affect the gross revenues to be derived by the carriers in this section, as that must depend upon the amount of commodities and the rates charged. The effect upon the *operating* revenues would therefore be nil. Its effect upon the *net operating income* could only be predicated upon the fact of mismanagement of the *property*, not its *finances*, or upon *unlawful expenditures which were charged to operating costs*. In the present case there is no evidence to indicate that the *property* of any of these roads has been mismanaged. The operating ratios on the Rock Island, which has been recently criticized by the commission, are shown to be

substantially the same as on other lines in that section. There is no evidence in this case of any improper charges against the operating expenses since 1902. The carriers did not present this case to the commission upon the claims of roads that were in the hands of a receiver, or upon the claim that the roads were entitled to any definite rate of return from *corporate income*. It was and is contended that the net operating revenues are insufficient to allow a return upon the value of the properties equivalent to what the courts have said is the lowest level of reasonableness.

It is needless to point out to this commission that this case is one of a series involving other commodities, and involving passenger rates. The same question must be before this commission in all of those cases, as it has been stipulated that this record shall be a part of the record in the other cases. This makes it appear to be very proper that we ask that this case be reopened, and that the opinion may be modified in the light of a reargument and the arguments which shall be presented in those cases.

A NEW DOCTRINE

Overshadowing all questions of the amount of revenue involved, there arises the question of whether this commission shall surrender the power and duties of the federal government which Congress has reposed in the commission. We believe that the announcement of the commission in this case as to its policy as to advance rates where there are lower state rates is the most startling one that has ever come from the commission. We put the matter strongly and desire to make our views as plain as possible. It must be that we misunderstand the opinion, or the opinion is the result of an entire misconception, both of the law and the facts.

The commission has in the past repeatedly held that there was no greater presumption attaching to state-made rates than attaches to the voluntary rates of carriers. State-made rates may be introduced for comparative purposes the same as voluntarily-made rates. They are evidential in character and not controlling.

In the now celebrated Shreveport case, which was affirmed by the Supreme Court of the United States, this commission established the doctrine that it is the duty of the Interstate Commerce Commission to determine *for itself the reasonableness of interstate rates*. When reasonable interstate rates have been determined by the Interstate Commerce Commission, it has the jurisdiction to determine whether lower rates, established by a carrier voluntarily or by a carrier under the direction of the state authorities, are unjustly discriminatory. This commission never assumed the right to consider or determine in any way the reasonableness of state rates as such. The Supreme Court fully sustained the commission, and in substance said: The paramount rights in relation to determining the reasonableness of interstate rates is in the Interstate Commerce Commission and this commission has the power, and, when its jurisdiction is invoked, must exercise the duty of determining whether lower rates fixed under an order of the state discriminate unjustly against the interstate shipper. When such determination has been made by the Interstate Commerce Commission, the law says to the carrier, you may remove that discrimination, even if by so doing you charge higher rates than fixed by the state authorities for the movement within the state.

For the purpose of the discussion of this particular question, if it be conceded that every state rate was lower than the interstate rate, it could not affect the reasonableness *per se* of the interstate rate. In the eastern advance rate case and in the western advance rate case, the commission held that its duty in passing upon an increased rate is identical with its duty in passing upon the reasonableness of a rate when complaint has been made. The only effect of the amendment to Section 15 of the act giving the commission the power to suspend rates was to allow the commission to determine in advance of the effective date of the rates the same questions which it must determine if the rates had gone into effect and a complaint been made

as to their reasonableness or discriminatory character. If it be, however, the doctrine that in an advance rate case the carriers must assume the burden of showing that the lower state rates are unreasonable, then the commission would be called upon to exercise jurisdiction over state rates and to determine a matter which has not been committed to the commission. We direct particular attention to the Shreveport case. Whatever may have been the individual opinions prior to that decision, it is now the law upon the subject of the duties and powers of this commission. The commission found the commodity rates enforced on the railroads from Shreveport to be just and reasonable and that there were lower rates on the same commodities carried from Texas points under similar conditions. The commission did not say because there were lower rates carried in Texas therefore you must reduce your interstate rates. It did say that the commission, acting as the representative of the federal government, must determine, according to *its judgment*, the reasonableness of the interstate rates, and if the carriers by reason of the compulsion of some other body maintained lower rates which were discriminatory, the discrimination must be removed.

The Supreme Court appreciated the very lucid statement of the commission upon that subject. The court adopted the conclusion of the commission, that it was empowered and therefore it was its duty to determine the reasonableness of the interstate rates by standards of its own.

AUTHORITY CONFERRED UPON THE COMMISSION IN PASSING UPON
ADVANCED RATES PRIOR TO THEIR EFFECTIVE DATE

The commission, without the matter having been discussed in argument, and we believe without full comprehension of the effect of their statement, assumed that the use of the word "propriety" in Section 15 of the act to regulate commerce extends the authority of the commission so that it may go outside of the ordinary questions, which it may determine upon a charge that a rate is unreasonable and discriminatory, and determine the "propriety" of the rates. It is said, "Propriety is a broader and more inclusive term than reasonableness." Just what is meant is left uncertain in the opinion of the commission, but it evidently must be either the exercise of such judgment as the management of a carrier might exercise, or of that judgment which a purely legislative body might exercise. That it was not the intention of Congress to confer such power upon the commission, must be evident for various reasons. The commission has never so considered it heretofore. In the western rate advance case in 1911 the commission distinctly and positively disclaimed any other or different power in relation to a hearing upon suspended rates than it possessed in relation to rates under attack. It also stated that the commission was not the general manager of railroad companies. It seems clear that the duties delegated to the commission are not the purely legislative ones which must be involved in the determination of propriety of rates, if such determination is to be based on other than fixed rules. That Congress did not so intend, appears to be very plain from the context of the act. The word "propriety" is limited to a determination of the same matters which must be determined when a rate is attacked; that is, the unreasonableness and discriminatory character of the rates. To hold otherwise and extend the meaning of the word "propriety" to embrace the judgment of the commission upon outside matters other than the reasonableness or unreasonableness of the rates and the discriminatory or undiscriminatory character thereof, is contrary to all the canons of statutory construction.

If, however, a broad definition of propriety as being something other and beyond the fixed standards and rules is the meaning in this statute, then the statute itself is in violation of the provisions of the constitution that require the separation of the powers of government. The Supreme Court has distinctly passed upon such questions. The legislature cannot delegate its power to make a law, but it can make a law to delegate a power to determine some fact or state of things upon which

the law makes or intends to make its own action depend. The construction of the statute which makes "propriety" mean something broader than those terms included in the other paragraphs of the law would be such a delegation of legislative power.

Before the commission commits itself to a doctrine so subversive of the position which it has taken in all of its previous decisions, without the matter having been discussed in the hearing so far had, would seem to justify the carriers in a request that they have an opportunity to be heard upon the matter.

PROCEDURE WHEN STATE RATES ARE LOWER THAN INTERSTATE RATES

As before pointed out, it is the settled doctrine of the Supreme Court that the Interstate Commerce Commission *must determine the reasonableness of the interstate rates according to its standards and judgment*; that the Interstate Commerce Commission *is the sole judge of the relation which the state rate shall bear to the interstate rate*.

It therefore becomes important in considering an advance rate case to see by what method the Interstate Commerce Commission can fully discharge its duty. That it cannot so do by simply denying the carriers the right to establish rates, which are otherwise reasonable, solely because there are lower rates would seem to be apparent. To adopt that course is to allow the states to determine the relation of state and interstate rates. By this method, no advance on interstate rates to the reasonable basis determined by the Interstate Commerce Commission could be made until a similar advance was made in state rates. It appears in this case that the state rates on livestock and some other commodities are lower than the present interstate rates, and of course lower than the proposed interstate rates, and it becomes important to determine what course the commission should pursue in such case, if, in its judgment, the proposed interstate rates are reasonable. In relation to grain and grain products, a similar condition existed as to minimum weight on grain products. The interstate minimum is in many cases higher at the present time and it was proposed to make the interstate minimum still higher. In that case the commission approved of the increase in the interstate minimum and disposed of the very urgent claim of discrimination which was presented by the protestants.

In the matter of coal rates it is true that the proposed rates were higher than some state rates for a similar distance, and probably under substantially similar conditions, yet the commission permitted the advance in rates. The same condition that existed in relation to the minimum weights on grain products exists in relation to livestock rates. The rates in different states are different, and it would be impossible for the commission to fit the interstate rate to each state rate. "To do so would result in state regulation of interstate commerce."

The commission in this case, we believe, adopted the proper method in relation to minimums on grain products and to the rates on coal. As we understand it, this was in line with the previous course of this commission. The commission cited the Shreveport case and the St. Louis grain case as authority for the different course in livestock than was taken with relation to the grain products and the coal rates. Those cases were complaints as to existing rates, and there was directly put in issue the relation between state and interstate rates.

In an advance rate case that is not *directly* in issue. The carriers cannot bring it into the case. They file tariffs. These are suspended pending investigation. That suspension, however, *gives no notice to a party using the state rate* that the measure of his rate is to be investigated; and therefore it appears that in an advance rate case, the commission cannot determine the relation of the state to the interstate rates. Such apparently was its view in the establishment of the express rates, and particularly allowing an advance in the express rates when there are many lower state rates. There was before this commission and is now pending before it a case where the state-made express rates are so very much lower than the rates fixed by the Interstate Commerce Commission that carloads of posts

are being shipped by express at a less charge than the third class freight rates. Notwithstanding this complaint the commission allowed the advance in the interstate express rates. The evidence, on file with the commission in that case, will disclose that the discrepancies between the interstate express rates and the state express rates of South Dakota are even greater than the discrepancies between the interstate and state livestock rates. In view of the consistent course of the commission heretofore, the carriers ought not to have been expected to have met that issue or to argue it, and this rehearing is asked that they may have the advantage of an opportunity to discuss that question.

Again, in the five per cent case, the advances were allowed in spite of the fact that the state rates were lower. The fact that there might possibly be a discrimination affected by the putting into effect of interstate rates, reasonable in themselves, did not make it necessary to deny the interstate advances. That this course is eminently proper is illustrated by the fact that there is now pending before the Interstate Commerce Commission a complaint of the St. Louis Business Men's League versus the railroads in which they seek to remove the discrimination which was produced by this order of the Interstate Commerce Commission. The same course was pursued in relation to the express rates. Sioux City brought an action to remove the discrimination incident to the rates fixed by the Interstate Commerce Commission and the lower South Dakota rates.

REMEDY FOR STATE DISCRIMINATION AGAINST INTERSTATE COMMERCE

If the rates are otherwise just and reasonable, it would not seem to be improper to allow them to go into effect and to order the removal of any impropriety that may exist by reason of lower state-made rates. Upon the present basis as outlined by the commission, that could not be done. We suggest the proper remedy and ask that a hearing may be had upon it. First, the commission should pass upon the reasonableness and justice of the proposed interstate rates without regard to the relation to state rates. If, having found the proposed interstate rates reasonable, but that there were lower state rates which might be discriminatory, the commission should allow reasonable interstate rates to go into effect and proceed to an investigation of the relation of the state rates to the interstate rates.

It is not the thought of the carriers in this case that the evidence is sufficiently definite to warrant the commission in a finding of unjust discrimination as between state and interstate rates for the reasons hereafter set forth. For this reason and because it was not consonant with the prior practice of this commission, the carriers did not undertake such a task. It would require that they search their whole tariff records, and make negative proof as to a great many rates.

However, if the commission should find that the evidence is sufficient to show discrimination, it ought, either *to allow the advance rate to go into effect and order the discrimination removed, or it should allow the advance rate to go into effect and order a general investigation to determine the proper relation of the state rates to the interstate rates.*

We do not suggest the first of these courses because of the doubt as to the jurisdiction of the commission to make an order removing the discrimination in an advance rate case without having given definite notice that the relation of the state and interstate rates will be considered. The latter course would seem to be the one which is consonant with prior practice and with reason. The prior practice has not been to order a general hearing upon the relation of the state and interstate rates, but to await a complaint. If, however, there is sufficient evidence produced to the commission in an advance rate case of this kind to indicate that there is a serious question as to the propriety of the relation between the state and interstate rates which will become effective, the commission ought not to wait for the individual complaints.

We have presented in the motion a request that this be done. It is very apparent that as the matter is now left, assuming that the proposed livestock rates are reasonable, in and of themselves,

the carriers are effectually tied up so that they may never secure an advance in livestock rates unless they can be able to convince the commissions of some eight or more states. In other words, the Interstate Commerce Commission cannot permit the carriers to earn the fair rates upon interstate business unless the state commissions permit them so to do. The attitude of the state commissions in this case indicates the chance the carriers would have in such an undertaking. This would be a surrender of the prerogative of this commission, and allow the states to fix the *relation* of state to interstate rates. The course suggested above obviates this difficulty and maintains the power and authority of the Interstate Commerce Commission over interstate rates and the relation to state rates.

The least that could be done under such a condition, as we view it, would be to postpone the final determination as to allowing advance rates to go into effect until that general investigation of the relation of rates can be had.

What has been said in relation particularly to livestock rates would apply to packing-house products, fresh meats and some other commodities. We understand that the protestants in relation to coal rates have asked for a rehearing, and they ask that the doctrine applied to the livestock be applied to coal. As we view it, the commission took the proper course in relation to the coal rates, and the remedy of the protestants as to coal rates is not in a rehearing but in a complaint to remove the discrimination on account of lower rates.

(That portion of the petition dealing at length with the decision as to specific commodities is here omitted.—EDITOR.)

EFFECT OF THE DOCTRINE ANNOUNCED

We think that the only safe way to maintain the authority of an administrative body like the Interstate Commerce Commission is to adhere to certain rules and standards. This is clearly indicated in the repeated decisions of the Supreme Court. In the discharge of its duties and in determining the facts, it is in the exercise of quasi-judicial functions. It seems it was the intention of Congress that this commission should act upon the evidence and make its conclusions according to the rules and standards fixed by Congress. The respect which this commission has gained in the public mind has, we believe, been largely due to the fact that it is discharging its duties in an impartial and judicial manner. And in order that there may be success in the regulation of railroads, it is of course apparent that a uniform line or policy must be adhered to. There cannot be a different basis in each case. The strength of the common law arose from its adherence to fixed principles. It is not necessary that a hide-bound adherence to precedents be established. It is, however, proper, and we believe necessary that the commission act according to some standards and rules. Such was the evident intention of Congress. Such is the view of the Supreme Court. It gives dignity and power and authority to the commission. The effect of this opinion as we look at it, and as generally considered, not only by the respondents but also by the protestants and by the public, is to depart from the rules and standards which have heretofore been established. If a substantial reliance cannot be placed upon the maintenance of the standards by which the reasonableness of rates shall be determined, the deserved prestige of the commission will soon be lost. If this commission shall finally determine to abandon its prior standards, it ought to clearly so indicate, and to say that its opinions in the prior cases have been wrong. It ought not, however, to abandon its prior standards until it shall have had the advantage of the fullest discussion wherein those standards are directly involved. It ought to place its opinion in such clear and definite mold that the matter may be presented to the courts for determination whether it can act upon its own notions of propriety in determining the reasonableness of rates or whether it shall be governed by the rules and standards fixed by Congress.

The petition is signed by C. C. Wright, general solicitor, Chicago & North Western; T. J. Norton, general attorney, Atchison, Topeka & Santa Fe; W. F. Dickinson, general attorney, Chicago,

Rock Island & Pacific; C. S. Burg, interstate commerce counsel, Missouri, Kansas & Texas; A. P. Humburg, commerce attorney, Illinois Central; R. B. Scott, general attorney, Chicago, Burlington & Quincy, committee of attorneys for the carriers.

TRANSCONTINENTAL ROADS PROPOSE FURTHER REDUCTIONS IN RATES TO MEET CANAL COMPETITION

Increasing competition of the water lines using the Panama Canal, which has impelled the transcontinental lines to make reductions on a large number of additional commodities to the Pacific coast, was described by witnesses for the railroads and for the shippers at a hearing before Examiner Thurtell, of the Interstate Commerce Commission in Chicago, which was begun on September 23, in support of the petition of the railroads for authority to establish reduced rates from eastern to Pacific coast terminal points. The commodities on which the carriers asked relief from the original fourth section order of the Interstate Commerce Commission in the intermountain rate cases, are included in a supplement to Schedule C, which included the commodities on which the commission allowed relief on account of the canal competition in its decision rendered last January. It is a list of 156 items, including several hundred commodities.

Paul P. Hastings, assistant general freight agent of the Atchison, Topeka & Santa Fe at San Francisco, testified on behalf of the transcontinental railways and introduced as an exhibit the list of commodities, together with the present rail rates from the eastern part of the United States, included in groups A to J of the transcontinental tariff, to Pacific coast terminals, a list of representative points of origin for each commodity, the water rates which have been quoted by the water lines through the Panama Canal during the past year, the tonnage of movement via the water lines, and a column of remarks giving explanations, as to each commodity, of the reasons why it was necessary to reduce the rates. Mr. Hastings explained that at the time of the application of the roads last fall for relief on the Schedule C commodities the canal had just been opened and the roads were not thoroughly posted as to the extent of the competition. Since that time they have found many commodities on which the movement from the eastern part of the United States has been almost entirely by water from points as far west as Chicago and the Mississippi river, including a number of commodities which have never been considered subject to water competition.

After the rendering of the commission's decision in January representatives of the transcontinental roads held a meeting in Chicago to consider the situation and remained in session from March 1 till about a month ago, considering the requests from shippers for changes in the rail rates to meet the new competition by the water lines. About 200 shippers had submitted questions or petitions regarding the rates necessary to meet water competition direct to the Interstate Commerce Commission, which had furnished copies to the roads, and between 200 and 300 shippers had appeared personally before the committee and explained why a reduction in their rates was necessary if they were to continue to do business on the Pacific coast in competition with the seaboard shippers.

Mr. Hastings said that the list of commodities on which the reductions were now proposed included only about one-tenth of those on which the shippers had asked reductions, and represented the results of the most thorough investigation on the part of the roads as to the necessity for reductions and the rates which would be necessary to apply. He said that the articles included in the supplements are affected by the same circumstances and the same kind of competition as the articles in Schedule C, as disclosed by the investigations of the railroad traffic men and information furnished to them by shippers and their agents regarding the rate, volume of tonnage, packing conditions, and the proportion of business which the railroads could expect to retain by adjustments in their rates. To some

extent, he said, the petition also asked for a further relief on some articles included in Schedule C. The entire list includes only commodities on which the railroads have reached the conclusion that it is necessary to make a carload rate of less than \$1 per 100 lb., or a less than carload rate of \$1.50 or less.

In another exhibit Mr. Hastings gave a compilation of the local rates from interior points to New York on the same commodities, and the water rates from Boston, New York and Philadelphia added to make the through rates to the Pacific coast. He also gave a statement of the number of vessels operated through the canal westbound, with general merchandise cargoes for the four months' period ended September 5, from the Atlantic to the Pacific coast. If a vessel passed through the canal more than once it was only counted once. The list is as follows: American-Hawaiian Steamship Company, 21; Grace & Company, 2; Luckenbach Steamship Company, 10; Panama-Pacific Steamship Company, 2; Isthmian Steamship Company, 1; Crowell & Thurlow, 2; Tallac Steamship Company, 1; Boston and Virginia Transportation Company, 2; Western Steam & Navigation Company, 1. A number of lines, he said, had discontinued operation through the canal because of the greater profit, since the European war began, in chartering their vessels for ocean trade. A number of small lines which had engaged in the service at first had dropped out, but others had taken their place. During the year since the canal has been opened the water-borne tonnage from the Atlantic to the Pacific coast has been about double what it was the year before. At the previous hearing he had estimated that the tonnage through the canal of American traffic from the Atlantic seaboard to the Pacific coast ports would amount to about 1,000,000 tons. In the 11 months ended with July 1, the tonnage had amounted to 900,000 tons.

Mr. Hastings then took his first exhibit, and item by item explained for each commodity the justification for each of the rates proposed, and the reasons why it was necessary to make reductions to keep the middle western shippers in business. He said the information as to the water rates had been obtained from bills of lading and freight bills and had been furnished to the railroads by shippers, as examples of the rates quoted to them by the steamship lines, although the water rates had fluctuated greatly.

Mr. Hastings was followed by a number of shippers from various points in the middle west, who explained how they were affected in their competition with eastern shippers for the Pacific coast business. For example, a shipper of buckwheat flour at Janesville, Wis., testified that he had formerly been able to ship flour to the Pacific coast on even terms with the New York shipper, because he had a milling-in-transit rate of 90 cents, which allowed him to take buckwheat from New York and mill it and lay it down on the Pacific coast at the same rate paid by the New York shipper direct. With the opening of the canal the miller in interior New York was able to ship to the Pacific coast for 40 cents; 10 cents for the rail haul to New York and 30 cents for the water haul; a reduction of 50 cents under the all-rail rate. He said that if the railroads could make the proposed rate of 75 cents he could retain a portion of his business on the Pacific coast, but that a differential of 10 cents in favor of the water rate would influence the movement.

THE SAO PAULO RAILWAY OF BRAZIL. The Sao Paulo Railway, 134 miles in length, produces more revenue per mile than any other railway in the Western Hemisphere. The line extends from Santos, via Sao Paulo, to Jundiaby, with a branch to Braganina. The railway enjoys a monopoly of the traffic between Sao Paulo and Santos, and every year carries over one-half of the world's supply of coffee. Dividends of 14 per cent and upwards are paid annually. The railway is one of the best maintained properties in South America. At Sao Paulo a magnificent passenger station has been erected, while excellent terminals are owned at Santos. *The South American.*

International Engineering Congress at San Francisco

An Abstract of the Papers and Discussions Relative to Railroads at the Meeting Held September 20-25

The International Engineering Congress, organized and conducted under the auspices of the American Society of Civil Engineers, the American Society of Mechanical Engineers, the American Institute of Mining Engineers, the American Institute of Electrical Engineers, and the Society of Naval Architects and Marine Engineers was held in the new Auditorium in the civic center of San Francisco, Cal., September 20-25. Two general sessions were held, on Monday morning and one Saturday morning, and in addition 52 section sessions were held for the presentation and discussion of papers on 11 general subjects. About 230 papers had been prepared in advance of the meeting by authors representing 18 countries. The attendance at the Congress totaled 830.

The general session on Monday was opened by William F. Durand, of Leland Stanford University, chairman of the Congress, who introduced Governor George W. Goethals, of the Canal Zone, honorary president of the Congress. After addresses of welcome by the mayor of San Francisco and the president of the Panama-Pacific Exposition, General Goethals addressed the meeting on the central theme of the Congress, the construction of the Panama canal. He touched only on the general features which were not covered by the technical papers presented later before the Panama canal section, paying tribute to many engineers connected with the work more or less directly, without whose efforts the success of the project would not have been so striking. Among the men mentioned were George M. Totten, in charge of the early construction work on the Panama Railroad; the early French engineers, who failed largely on account of mal-administration; Colonel Gorgas and others who practically exterminated yellow fever; John F. Wallace and John F. Stevens, the preceding chief engineers, and W. G. Bierd and Ralph Budd, who assisted materially in the reconstruction, operation and maintenance of the Panama Railroad.

Railway engineering occupied five sessions and abstracts of the papers presented are given herewith. A paper on "The Mechanical Problem of Electric Locomotives," presented before the third session on electrical engineering, and one on the "Commercial and Trade Aspects of the Panama Canal," presented at the session relating to the canal, have also been abstracted because of their interest to railway men.

ITALIAN RAILWAYS

BY PROF. LUIGI LUIGGI

Former Member of the Italian State Railway Board, Rome, Italy

The railways of Italy can be divided into "principal lines," owned and operated by the state, about 9,500 miles; and "secondary lines," owned and operated by many private companies, about 3,500 miles. The latter act as feeders and reach places in the mountains where an ordinary line could not run at a profit. Italy being generally hilly, and in some parts mountainous, railways are costly to construct, and operation is expensive owing to heavy gradients (up to 1 in 40 and in a few cases even 1 in 28) and to the fact that all the coal is imported. The working expenses in 1913 on the state lines were \$11,200 per mile.

On the other hand, the revenue is rather low, as in Italy there are no great mines or forests, and the goods traffic consists principally of agricultural products, which, in general, cannot afford a high tariff. The passenger rates also are very moderate. In 1913-14 the revenue of the state railways was \$13,750 per mile, which makes the operating ratio 81.5.

Tariffs are rather low—the law requires that for the first-class tickets the rate shall not exceed two cents per kilometer;

for second-class, $1\frac{1}{2}$ cents; and for third-class, one cent. On a few lines there is a fourth-class, at $\frac{3}{4}$ cent per kilometer. These rather trying conditions are aggravated by a law which requires that on all lines three trains, at least, must be run daily. Thus, on several lines many trains run almost empty, especially in winter.

By this arrangement the financial situation of the state railways and private companies cannot be very flourishing. The result of the high operating ratio and high cost of the lines is that the traffic barely pays an interest of 1.6 per cent on the invested capital, and for some private lines there is a deficit, so that the state is obliged to pay annual subsidies of from \$1,000 to \$3,000 per mile of line. In such cases after 50 to 70 years the lines become state property.

Although from a financial point of view this policy may not seem satisfactory, the results from the standpoint of the national interests are important. Many regions of Italy were still very backward up to some years ago; agriculture was rudimentary and the population poor and ignorant. The construction of state railways was a national duty, to bring moral and material progress into those regions, regardless of high cost of the lines, which were difficult to build owing to mountains, ravines and malarial zones.

Thanks to this provident policy, the state railways, with their "differential tariffs," have cemented the political unity of Italy and given an enormous impetus to commerce. Agriculture is improving, especially in the south, and new industries are being started, especially in the north. The railways, with their low rates, are a great help in exchanging the products of the different provinces.

The most marked improvements have taken place since the advent of the State Railway Board, in 1905. Before that time the railways, although for the greater part belonging to the state, were worked by three private companies whose interests were different from those of the state. Each company worked its system with the object of getting the largest revenue with the smallest expenditure; therefore, tariffs were kept at the highest rate allowed by law, trains were slow and barely sufficient for the local needs, the rolling stock was old and not kept in good repair, and the personnel was under-paid and dissatisfied. Strikes were becoming alarmingly frequent. Parliament protested; and in 1905, when the contracts with the private companies expired, the state took over the control of all its own railways, and of a few other private lines necessary for the public interests.

This was a daring act and was especially risky from a financial point of view. Happily the government was lucky in securing the services of a most competent specialist in railway administration in the person of Comm. Riccardo Bianchi, formerly general manager of the Sicilian railways, who was given sufficient liberty of action to meet the many and serious difficulties which had to be overcome. The lines were put in good working order by renewing the permanent way, doubling many trunk lines and sidings, and improving the stations and shops. Then the rolling stock was renewed and augmented, and more and faster trains were run on the main lines. The tariffs were rearranged to facilitate the transportation of agricultural products for long distances, and a "differential tariff" for passengers was started, by which the rates per mile diminish with the increase of the journey. The personnel was also improved, so that strikes became more rare and easily settled, and the service was greatly benefited.

From a technical point of view, Italian railways present interest both for the large number of bridges, viaducts and

tunnels, which are a consequence of the hilly character of the country, and for the traction, either by electric or by steam locomotives. Large span bridges, steel girders or metallic arches are a necessity, and among these the most notable are the steel girders of the several bridges across the Po, and the 360-ft. steel arch bridge of Paderno. The most notable masonry bridge is that over the Adda, with a 236-ft. granite 3-hinged arch. There is also a handsome concrete bridge of three 100-ft. arches on the Bologna-Brindisi line at Fiume Rosso. Reinforced concrete bridges are in favor only for small spans, although on some secondary lines reinforced concrete arches of 100 ft. span are now under construction. It is in the matter of tunnels that Italian railways offer the greatest interest.

When the new state administration took over the lines, in 1905, it was confronted by a sudden and rapid increase of traffic, which continued steadily until it had actually doubled in 1912. The problem of traction was aggravated not only by the material difficulties of the profile of the line, but by the antiquated and dilapidated condition of the locomotives. This difficulty was overcome by adopting new types of steam locomotives on ordinary lines, and electric locomotives on steep inclines. Thus the problem of the great cost of coal was solved, for hydro-electric power in Italy is cheap.

Three types of steam locomotives were adopted; an 0-10-0 type for very heavy grades, a 4-6-2 (Pacific) type for fast passenger trains, and a 2-8-0 (Consolidation) type for mixed passenger and freight traffic. The first two are four-cylinder simple engines equipped with Schmidt superheaters, the second weighing close to 200,000 lb., and the third is a two-cylinder simple engine weighing 147,000 lb.

The distinctive feature of Italian electric locomotives is their operation by the three-phase system. It was adopted for the first time on lines where there are gradients up to 1 in 40 and long tunnels, where smoke is a serious drawback. Water power being cheap, it was possible to haul trains up these inclines at double the speed hitherto acquired, thus solving the problem of congestion of traffic, which was becoming pressing. On private lines, electric traction on the mono-phase and tri-phase systems has also been applied, but not on such a large scale as on the government lines.

The best of the electric locomotives used work on the tri-phase system, and were built by the Italian Westinghouse Company. There are 152 of these in service, and 40 more are in construction. These, coupled one at the head and another at the tail of a train weighing 400 tons, can go on an incline of 1 in 40 at the normal speed of 31 miles an hour. When coming down, the motors act as generators of current, and thus about 50 per cent of the energy is utilized.

It is difficult to say in general terms whether state management of railways is to be encouraged or not. As far as it concerns Italian railways—and considering how matters stood up to 1905—it would have been almost impossible to continue under private management. Thus state administration became automatically an absolute necessity. On the other hand, it must be said that in a country where parliament is all powerful state management is rather risky, especially from the financial point of view, and in regard to the discipline of the personnel. Happily, the government was very wise in appointing Comm. Riccardo Bianchi as president of the board of directors, a man of great experience and firmness, coupled with exquisite tact, who proved to be the right man in the right place.

THE STATUS OF INDIAN RAILWAYS

By VICTOR BAYLEY

Assistant Secretary, Railway Board, Simla, India

At the end of the year 1913-14,* the mileage of Indian railways open to traffic and under construction or sanctioned was as follows:

	Open	Under construction or sanctioned
5 ft. 6 in. gage	17,641 miles	932 miles
3 ft. 3 in. (meter) gage	14,389 miles	821 miles
2 ft. 6 in. gage	2,174 miles	578 miles
2 ft. 0 in. gage	454 miles	112 miles
Total	34,656 miles	2,443 miles

STATE CONTROL.

Indian railways are more or less under government control. The nature of the control varies from absolute ownership to mild supervision coupled with the power of purchase. The government also has certain control regarding maximum and minimum rates, matters affecting the safety of working, etc. The following list shows the ways in which railways are connected with the government:

Class 1. Railways Whose Accounts Pass Through Government Accounts—		
I. State Railways Worked by the State.....		7,264 miles
II. State Railways Worked by Companies.....		18,568 miles
Class 2. Railways Whose Accounts do not Pass Through Government Accounts—		
III. District Board's Lines.....		166 miles
IV. Branch Line Companies Assisted by Government...		1,420 miles
V. Companies' Lines Guaranteed by Native States.....		721 miles
VI. Companies' Lines Assisted by Government.....		2,646 miles
VII. Native State Lines.....		3,643 miles
VIII. Miscellaneous		228 miles
Total		34,656 miles

The railways shown under Class 1 are the state railways of India, and their accounts form part of the finances of the government of India. These railways are the property of the government; they are officered by government officers; their revenues are part of the general revenues of the country, and all capital sums required are provided by the government. In the case of railways shown in Class 2 the relation to the government is not so close, but owing to the responsibility assumed by the government for payment of interest, etc., in many cases, it assumes a measure of control, which is, however, not so intimate as in the case of Class 1.

The state railways worked by companies are the property of the government but have been leased to private companies. The first railways in India were constructed and worked by companies, under favorable terms as to government guarantee of interest, which proved to be so advantageous to the companies and disadvantageous to the government that the earliest opportunity was taken to purchase them. Certain of these lines became state railways, and others became those now under consideration. The government has entered into contracts with the companies, the broad features of which are (1) that the company shall have a small working capital in the concern on which the government guarantees interest at rates from 2 to 3½ per cent; (2) that the company shall receive a share of the surplus profits earned by their efforts calculated on a fixed proportion agreed upon or in proportion to the capital contribution made by the company; (3) that the company shall keep the railway in good order; (4) that the government shall have power to terminate the contract after due notice, and repay the company's capital at par.

The interest of the government is to see that fresh capital put into the concern is well spent, that the line and rolling stock are kept in good order, and that a profit is earned by good management. The interest of the company is mainly in making the most of the railway as a dividend-earning investment during its period of tenure. The policy of the government is to conclude long term agreements with the companies and renew the agreements as they fall in, with possibly a revision of the terms if this is expedient. The companies' administration is loyally and efficiently carried out, and the result is a substantial addition to the revenues of the country, and also the declaration of substantial dividends for the companies' shareholders.

District boards have been established in certain localities as a measure toward giving the inhabitants a measure of control

* The financial year runs from April 1 to March 31. Thus the year 1913-14 means the year April 1, 1913, to March 31, 1914.

over their own domestic politics. In a few cases they have shown praiseworthy ability and have accumulated surpluses which they have been permitted to invest in the construction of light feeder railways. In such cases the assistance rendered by the government is practically confined to giving the land required, free of cost, to the district board and in using its good offices in the preliminary negotiations. The government takes no share of the profits and only reserves the right to purchase the line in certain contingencies. As a rule, the railway is worked by the main line with which it connects for an agreed percentage of its gross earnings. This development of a form of state ownership (since a district board is a form of government) is interesting as an example of Indian enterprise.

Branch line companies assisted by the government are a modern development. One of their objects has been to provide an outlet for the savings of the people. Indians are shy of investing their savings in industrial enterprises, and require definite assurances of profit before they will come forward. The government, therefore, recently published an ordinance inviting proposals for the construction of branch lines to the existing systems from promoters, and engaged, after being satisfied as to the financial prospects of the proposed branch and the reliability of the promoters, to render assistance by giving free land and a guarantee of 3½ per cent on the capital invested; or a rebate out of the net earnings of the main line, with which the branch connects, derived from interchange traffic, sufficient to make up, together with the net earnings of the branch, a sum equal to 5 per cent on its capital. A combination of guarantee and rebate terms may be permitted. In return the government retains the right to share equally with the branch line company all profits above 5 per cent and to purchase the line after a term of years.

The success of this agency for financing feeder railways is assured. Apart from 21 branches, aggregating 1,420 miles, already in operation under these or similar terms, concessions have been granted to six more companies to operate an aggregate of 224 miles, and proposals are under examination involving the construction of 2,257 miles of railway at a capital outlay of \$40,000,000. It is interesting that short feeder lines on the 2 ft. 6 in. gage have so far proved most attractive to promoters.

Companies' lines guaranteed by native states are the result of a peculiarity of British administration whereby certain parts of India are under the rule of native chiefs. Certain progressive states have desired to shoulder the guarantees normally given by the government and to reap for themselves the benefits arising from railway construction within their borders. Such railways are practically independent of government control, except in so far as the government is responsible for the safety of the working and the good administration of the railway as forming a part of the administration of the native state.

Companies' lines assisted by the government are built by companies receiving miscellaneous forms of government assistance. They are liable to be bought up by the government as their agreements fall in. They are practically independent of government control, except in so far as the government is concerned in safe working and in eventual purchase.

Native state lines are under the rule of native chiefs. Some of these native states are prosperous and under an enlightened ruler surplus revenues may, by government sanction, be invested in railway construction. In this way a considerable mileage of native-state-owned railway has been built. Some of these railways are worked by the native state and others by companies. Others again are worked by the main system to which they are branches for a percentage of the gross earnings. The government is interested in the good management of the lines, and in some cases exercises control over maximum and minimum rates, but, on the whole, government control sits lightly.

FINANCIAL RESULTS

Taking first the railways mentioned in Class I, i. e., the State

Railways of India, the financial results, in United States dollars, for the year 1913-14, are as follows:

Capital outlay (booked cost)	\$1,495,443,000
Gross revenue	188,196,000
Working expenses	100,374,000
Net revenue	87,822,000
Percentage of working expenses on gross revenue.....	53%
Percentage of net revenue on capital outlay.....	5.9%

If the state railways were a private business concern, the net revenue of 87.8 million dollars would be available for the declaration of a dividend, etc. It was actually applied as follows:

Interest charges on capital borrowed for direct application to works and also for purchase of railways.....	\$46,278,000
Annuities in purchase of railways.....	15,015,000
Payments in redemption of capital.....	4,833,000

Total charges on net revenue.....	\$64,126,000
Net profit to government from state railways.....	23,696,000

Although the accounts of the railways in Class 2 do not pass through government accounts, their results of working are available for addition to the above figures in order to view the results of working the entire body of Indian railways considered as a whole. The financial results for the year 1913-14 are as follows:

Capital outlay (booked cost)	\$1,650,300,000
Gross revenue	211,951,000
Working expenses	109,768,000
Net revenue	102,183,000
Percentage of working expenses on gross revenue.....	52%
Percentage of net revenue on capital outlay.....	6.2%

Comparison of these figures with those for the state railways alone, given above, show the preponderating importance of the state railways; in fact, the state railway administration controls railways on which the capital outlay is 90 per cent of that of all Indian railways and whose gross revenues are 89 per cent of those of all Indian railways.

STATE RAILWAY ADMINISTRATION

The state railways are controlled by the railway board, consisting of a president and two members, and are divided into eleven separate concerns, of which three are worked by the state and eight by companies. Each of these railways is administered by an agent (general manager), who is responsible to the railway board for the efficient working of his railway. A system of delegation of powers places the agents in an independent position for all practical purposes. Broadly speaking, the object aimed at is that the agents shall settle for themselves all details of management and the railway board shall possess control over major questions of policy and finance.

The railway board with its staff forms a distinct railway department of the government of India, the portfolio of which is held by the member of council who has charge of the Commerce and Industry Department. The government of India again is responsible to the British government in the person of the secretary of state for India. Here again a system of delegation of authority from the secretary of state to the government of India and from the government of India to the railway board, has resulted in a workable scheme wherein only questions of the first importance need to be referred to higher authority. A slight complication is introduced by the fact that all the eight companies which are engaged in working state property are constituted in England, and the boards of directors of these companies naturally exercise authority over the agents of their railways. Smoothness of working is assisted by the fact that an official of the India office is appointed to sit on the board of directors of the companies, and that by a delegation of their powers the directors are usually content to leave the management of their property in India to the agent, subject to their retaining control of important matters.

The state already owns 90 per cent of the railway property in India, and if it chooses to exercise the power it possesses under the purchase clauses of its agreements with the remaining 10 per cent can become the owner of all railways in India,

in time. Whether such powers will be exerted when the time comes, as each agreement falls in, will probably be determined by the circumstances of each case on its own merits. There is no reason to regret the policy of acquirement in the past, as the state railways are returning handsome profits to the government. The strong position they occupy will be augmented as the payment of terminable annuities for the purchase of railways ceases. The capital value of the state railways is believed to be considerably in excess of the book value, owing to the policy of applying certain sums from revenue to works involving a degree of betterment.

THE STATUS OF CHINESE RAILWAYS

By CHARLES DAVIS JAMESON

Supervising Engineer and Architect to the Imperial Chinese Board of Foreign Affairs, Peking, China.

The first definite plan for a railway in China was a petition by the foreign merchants in Shanghai, mostly English and Americans, dated July 20, 1863, which was not granted. In 1864, Sir McDonald Stephenson, an eminent British engineer, arrived in China to impress the advantages of railways on China, but his scheme was pigeonholed. The next scheme was the Woosung Railway, from Shanghai on the Huangpu river to Woosung at its mouth, a distance of 12 miles. On June 30, 1876, the road was opened for traffic for a distance of five miles, but the Chinese authorities wanted no foreign railway. Eventually the Chinese government bought the railway and demolished it. During 1887 to 1893 there was constructed on the Island of Formosa, then a part of China, some 60 miles of metre-gage railway, by the Chinese. The construction was of inferior quality, and the work was stopped by orders from Peking; the railway gradually went to pieces until the taking over of Formosa by the Japanese in 1896. About 1870 there was organized the China Merchant Steam Navigation Company, with a fleet of coast steamers, Chinese capital and under Chinese management. Much coal was needed. The Kaiping coal mines at Tongshan were 29 miles from the nearest point of delivery on the sea, and railways were proposed, but the imperial sanction was revoked, and a canal decided upon. This canal could not reach the mines by seven miles, and a tramway with mule power was constructed. The tramway and canal were finished in 1881.

Thus was inaugurated China's railway system. In 1887 the railway was completed from Tangshan, via Tongku, to Tientsin; in 1894, from Tangshan to Shanhai Quan, and in 1897, from Tientsin to Peking. The government of China had, by 1898, realized two points regarding the introduction of railways: First, the necessity of railways, and, second, the impossibility of procuring Chinese capital for the building of railways. The Chinese would not subscribe because of a lack of confidence in the government. The result was the railway concessions.

In Peking, 1898 was the year of concession hunters. The whole world was represented. Some represented bona fide syndicates. Many represented hopes and were hunting for both concession and syndicate. Then was seen the difference between the methods of the continental and the Anglo-Saxon. The English and American would not sign until every detail of the agreement was satisfactory. The Belgian or French would sign almost any agreement that gave them the absolute right to the work and then fight out the details later. The continentals then, and ever since, have had the cream of the railway concessions, and they have done the work they agreed to do. The British also have done most excellent work in all the railways they have built. An American syndicate was granted a concession for the Hankow-Canton Railway, did but little work, and later was bought out by the Chinese government, and the line is now being built by British money and British engineers.

All the railways of China, with the exception of a few short lines usually for some special purpose, are government owned and government run. They are under the ministry of communication located in Peking. On all the railways having a

foreign indebtedness, certain positions are filled by foreigners with necessary foreign assistants. The nationality of these foreign employees, in every case, follows the nationality of the syndicate furnishing the capital, except in subordinate positions. From this one can see the small opportunities there are in China for Americans in railway employment. American participation in the construction of Chinese railways has been, to say the least, unfortunate, and, of course, the non-participation of Americans in this work has militated strongly against the purchase of American rolling stock, locomotives and railway material. There are now some 6,200 miles in operation, and between 8,000 and 9,000 miles under construction, location, or for which definite agreements between the Chinese government and foreign syndicates have been signed, for either financing and constructing, or for merely financing. Less than 300 miles of this amount comes to America.

The freight rates in China are high—what the traffic will bear and often a little more. In North China the coal rate is \$2.05 for 300 miles. On the Peking-Mukden Railway the rates are: First class per ton, 5 cents per mile; second class per ton, 3½ cents per mile; third class per ton, 1¾ cents per mile; dangerous, 5 to 7¾ cents per picul (133 lb.).

ELECTRIC MOTIVE POWER IN THE OPERATION OF RAILROADS

By E. H. MCHENRY

The first serious consideration of the application of electric traction to heavy railroad service was undertaken by Henry Villard, who appointed a commission early in 1892, of which the writer was a member, to investigate and report on the feasibility of electrically equipping the main line of the Northern Pacific. No substantial progress was made apart from the completion of a schedule of service requirements and general specifications for an electric locomotive substantially as constructed in the course of the following year by the North American Company.

The subsequent evolution at first separated into two distinct lines of progress; in one of which the primitive type of motor cars hauling one or more trailers was simply substituted for the steam locomotive previously used, from which the powerful high-speed trains of to-day have grown.

The necessity for some form of motive power better adapted to conditions of tunnel operation forced the almost simultaneous development of an electric locomotive of sufficient power to afford a satisfactory and efficient substitute for the steam engine then in use. The first commercially practical engines of this kind were operated by the Baltimore & Ohio through its Baltimore tunnel in 1905. The present list of tunnels so operated is a long one.

Next in the order of time and importance, electric traction was adopted in large terminals, to which it is peculiarly well adapted. By an act of the New York State Legislature the New York Central and the New Haven were required to electrify within the City of New York, on or before July 1, 1908. The magnitude, complexity and high traffic density involved in this terminal made necessary the solution of many new and formidable problems on a much higher plane of operation than had been previously attempted, and no less remarkable is the Pennsylvania's great passenger terminal in New York City. Other railroad terminals have been electrified in this country and abroad, some of which antedate the two most prominent examples already cited.

Electric switching was initiated very early and has now reached an advanced stage, best represented in the Mott Haven yard of the New York Central & Hudson River, the Sunnyside yard of the Pennsylvania and the Oak Point and Harlem river yards of the New York, New Haven & Hartford—all within the city limits of New York.

The Long Island was the first steam road to equip its lines for passenger travel on an extensive scale (1905), and the Spokane & Inland Empire was the first to attempt long distance

heavy freight traffic in 1906. Later and more advanced examples of railroad electrification of this class in the United States are afforded by the Norfolk & Western, Baltimore & Ohio; Chicago, Milwaukee & Puget Sound and the New York, Westchester & Boston.

The inability of the electric locomotive to flexibly utilize its available horsepower by inversely varying speed and tractive effort is a severe handicap under some conditions. Another factor which undoubtedly exercises a deterrent effect upon the more rapid adoption of electric traction is the number and diversity of the types now under trial, together with the yet unsettled opinions of the specialists in this field. Electric traction also labors under disabilities of restricted radius of operation, which limits commercial efficiency. This is a temporary disadvantage, however, and grows less as the zone limits are enlarged. Also the greater freedom and flexibility of operation within the zone limits applies in compensation. Electric traction leads to the necessity for an intricate and highly developed system of inter-related and inter-dependent power stations, line equipment and locomotives requiring more highly specialized and better paid labor for its proper maintenance and operation.

Induction may seriously impair telegraph and telephone service in adjacent circuits, and is more particularly incident to single-phase operation. Electrolysis may cause great damage to pipe systems, underground cables and all metal structure, but its effects are practically confined to direct current operation. Among the minor difficulties should be noted those arising in the transition stage in changing from steam to electric power, more particularly those incident to train lighting and heating; mixed steam and electric operation; engine transfers; track signals; restricted interchangeability of engines and cars and other difficulties of adaptation. These difficulties are greatest in the earlier stages of the transition, but rapidly diminish in both absolute and relative importance as the zone of electric operation is extended.

A better utilization of the possibilities of the electric locomotive is probable, which in one important particular compares very unfavorably with the steam engine of the same horsepower capacity, as it cannot effectively utilize its rated capacity throughout the same wide range of variable speed and tractive effort, which has the effect of greatly limiting its field of usefulness.

A further and promising opportunity is presented for reducing and limiting the present great expenditures incurred for maintenance of equipment and maintenance of way and structures. There is also a pronounced tendency in electric engine design to eliminate all reciprocating parts, including connecting rods, pins, jack shafts and counterweights in order to reduce wheel loads, machinery friction and maintenance charges.

It is also probable that some form of multiple unit control will be developed for the operation of freight trains which will relieve and distribute the present excessive strains on draft rigging, track and bridges, which will require the equipment of freight trains with a system of control circuits. The necessity for such equipment seems close at hand, in connection with similar requirements for electro-pneumatic brake control and the growing need for better means of communication throughout the length of modern freight trains.

A comprehensive review of the results already obtained, and of the attractive possibilities indicated by the experience of later years, leads to the conclusion that the field in which electric traction may be profitably applied is much larger than generally understood, and that there are many existing opportunities for capital investments upon a large scale which will earn from 10 to 20 per cent with reasonable certainty. While the art is not yet fully developed in some applications, in many others all present practical requirements may be met with added advantages of great value and profit, and there is consequently little reason to doubt a continued development and further expansion in the field of electric traction as soon as the financial and legislative conditions permit.

ELECTRIC MOTIVE POWER IN THE OPERATION OF RAILROADS

By WILLIAM HOOD

Chief Engineer, Southern Pacific

In considering the question of electric motive power versus steam locomotives, the probability of the electric motive power being proper for adoption is evidently greater on a new than on an existing railroad. This question is especially important when the existing railroad is an extensive suburban system, with steam locomotives and cars of special adaptation to the service and not suitable for general use on a steam-operated main line, and which suburban system is giving satisfactory returns on the investment. In such a case the change to electrical operation may transform a satisfactory remunerative property into a heavily losing investment for a disastrously long period.

The probabilities of the propriety of electrical operation are greatest on a new main line railroad, next greatest on an existing main line railroad when the equipment, other than motive power equipment, will not be changed, next greatest on one or more operating divisions of an existing main line railroad, when the equipment, other than motive power equipment, will not be changed, and least on a railroad when electrification involves scrapping or nearly corresponding salvage value of existing equipment.

The question of whether or not to adopt electric motive power on a portion, for instance on an operating division, of a main line elsewhere operated by steam locomotives is especially likely to be taken under advisement in reference to a mountain operating division having a steep grade system of considerable length, the electric operation at first glance appearing particularly attractive on such a piece of railroad.

Evidently such a railroad if already built with a double track is more conveniently operated either with electric locomotives or with steam locomotives, than if built with only a single main line track. The opinion that is sometimes entertained, however, that in cases where a single-track road is already overburdened with traffic as handled by steam locomotives, the substitution of electric locomotives will materially postpone the expenditure necessary for double tracking the road is not always correct, excepting with the condition that an unusual and, perhaps properly termed, unreasonable and impracticable amount of electric power is available at a cost that can be properly contemplated.

The reason for this condition is that on a single-track mountain railroad operating division with a steep grade system and having a considerable number of daily passenger trains throughout the year, the time of passage of these trains over the mountain division cannot be materially modified, owing to necessary business adjustment of times of departure from and arrival at important terminals. And with a considerable freight traffic at all times, and perhaps several times the average freight traffic at certain seasons of the year it is necessary to move a number of freight trains of maximum practicable size one after the other, and as near as practicable to each other, up the steep grade, at such periods of the twenty-four-hour day as will least interfere with the passenger train movements.

This is accomplished without difficulty with steam locomotives, but with electric operation, not only must the adequate number of electric locomotives be on hand for meeting these traffic conditions, but the amount of electric power available must correspond to the special traffic requirements.

In general, a transportation company will find it impolitic to attempt to equalize power production and fluctuating consumption on so large a scale by entering the market and selling power to suitable consumers in competition with power producing companies regularly in the business of supplying the market. This results in the cost of power to a railroad company for operating a mountain division being, in effect, equal to the entire cost of operating the power house or houses and their related plants plus the entire fixed charges, without very material

variation in this cost on account of variations in amount of traffic as between seasons of the year or as between the several years. The cost of power under these conditions then has no direct relation to the actual power expenditure for conducting transportation, and in a way is analogous to the fixed charges pertaining to power-plant installation, as well as to the fixed charges pertaining to the cost of the railroad itself, which fixed charges are constant, regardless of traffic fluctuations.

In general, the cost of double tracking a mountain division will be so great that it should not be done until absolutely necessary, especially in view of possible failure of traffic to increase or even remain constant, on account, for instance, of the construction of competitive lines, entered into judiciously or otherwise. Evidently on light grade railroads the question of amount of installation of power plant versus fluctuations of traffic is less serious.

The reduction in the necessary production of electric energy by the returning to the line of energy produced by the control of descending trains on a mountain division, electrically operated, might be worth the expense of installation of the necessary appliances as effecting some fuel saving in a steam-power electric-generating station; but when the electric energy is developed in a water-power station, the power saving would be of doubtful value, and in particular because, as heretofore outlined, the cost of power so produced is not per kilowatt hour or any usual function, but is essentially so much per year, regardless of any ordinary fluctuations of power requirements.

The increasing cost of fuel for steam locomotives or for steam electric-generating plant tends to hasten the time when railroads will be operated by electric power generated by hydraulic plants, particularly on mountain grades. Presumably much more would have been accomplished in this direction if the national laws and regulations had been so modified as to give to railroad companies the necessary confidence to enable them to make the very large investment required.

THE MECHANICAL PROBLEM OF THE ELECTRIC LOCOMOTIVE

By G. M. EATON

Engineer Railway Division, Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.

The stresses due to the static and dynamic interactions of the various elements of the transmission systems of crank-and-rod coupled electric locomotives have been the subject of an active discussion during recent years, and elaborate formulae for the approximation of existing stresses have been developed. It is the purpose of this paper to approach the static problem from a somewhat different angle than has been previously employed.

On a steam locomotive the pistons, piston rods, main rods, and main driving axle constitute a statically determinate system, the indicator diagram and the masses of the various elements supplying all the data necessary for a complete analysis of static and dynamic phenomena. In contrast with this determinate mechanism, practically all electric locomotive crank-and-rod drives are statically indeterminate, to the extent that no accurate general formulae can be derived that will determine the distribution of tractive effort between the near and far rods at all points of revolution.

If the material of the shafts, crank pins, bearings, framing, etc., were absolutely rigid and appreciable play existed in the various pin and journal bearings, a sudden interchange of load between the near and far sides would occur at points approximately 45 deg. from the plane of shaft centers. For the sake of uniformity, anti-clockwise rotation, with the near crank 90 deg. ahead of the far crank, will be adopted in all cases.

It is evident that the near rod, when on the dead center, can carry no load, since it hangs loosely on its pins. As rotation occurs the near rod will continue in its relaxed position (if the material is rigid) until it approaches the 45-deg. position. There will then be a sudden transfer of load to the near rod. It will

be assumed that when the cranks are on the 45-deg. points, the tractive effort is equally divided between the two rods. It is evident that when one rod and its pin are in the plane of the shaft centers, the entire tractive effort is carried by the rod whose cranks are at 90 deg. from the plane of centers. The stress imposed on the rod in this 90-deg. position will be termed a 100 per cent stress. Further, as the far rod approaches the plane of the shaft centers, the stress during the period in which the rod transmits the entire tractive effort will increase to a greater value than the 100 per cent stress, following the law $P = \frac{\sin A}{100\%}$

where P is the rod stress and A is the angle between the crank and the line of shaft centers.

Maximum Stress Conditions.—Abandoning the inaccurate assumption of rigid material, the point at which the stress on the far rod is a maximum can be approximately determined by a cut-and-dry method that will be described later. It is first necessary to analyze briefly the various conditions under which the maximum stress may occur.

These conditions will fall under the following general heads:

Regular service—

- Slipping wheels at maximum adhesion.
- Running at maximum speed (rod whipping).
- Running at critical speed (resonance).
- Brake application.

Emergencies—

- Flashing or bucking of motors.
- Errors of assembly.
- Collision, derailment, etc.

Method for Determining Maximum Stress.—The approximate method for determining the maximum stress, after the maximum condition is determined, is as follows:

Assume all dimensions of a specific transmission, including all pin and journal clearances, and including the framing in which the shafts are mounted. Examine the specific transmission with a view to determining which of the following deflections, etc., are of magnitude worthy of consideration:

1. Torsion of the driving shaft.
2. Bending of the driving shaft.
3. Elimination of clearance in the driving shaft bearings.
- *4. Compression of the driving-shaft bearing brasses.
- *5. Torsion of the driving crank.
- *6. Bending of the driving crank.
7. Bending of the driven-crank pin.
8. Elimination of clearance in the driving-pin bearing.
- *9. Compression of the driving-pin bushing.
10. Compression or elongation of the connecting rod.
- *11. Compression of the driven-pin bushing.
12. Elimination of clearance in the driven-pin bearing.
13. Bending of the driven-crank pin.
- *14. Bending of the driven crank.
- *15. Torsion of the driven crank.
- *16. Compression of the driven-shaft bearing brasses.
17. Elimination of clearance in the driven-shaft bearing.
18. Bending of the driven shaft.
19. Torsion of the driven shaft
20. Bending of the locomotive framing.
21. Torsion of the locomotive framing.

In electric locomotive practice, in the United States, the parts usually approximate rigidity closely enough to make it safe to neglect the starred items, 4, 5, 6, 9, 11, 14, 15 and 16. In studying any new design, however, all twenty-one items should be roughly evaluated in a preliminary survey, before eliminating any from further consideration.

The position where the far rod will be subjected to maximum static stress will, evidently, be between the position $A = 90$ deg. and $A = 45$ deg. Select a point about midway between these two positions and assume arbitrarily a definite division of effort between the near and far rods. Start with the near driving-crank pin as origin and locate by rectilinear co-ordinates the following points of the transmission in the order named, making allowance for clearing and for essential deflections: Near driving-shaft bearing; far driving-shaft bearing; far driving-crank pin; far driven-crank pin; far driven-shaft bearing; near driven-shaft bearing, and near drive-crank pin.

Calculate the distance between the near driving-crank pin and the near driven-crank pin. If this distance checks with the length of the near rod, under the assumed stress and clearance conditions, then the assumed distribution between the near and far rods is approximately correct. If the rod length fails to check, the distribution assumption must be altered and the calculations repeated. Having determined the distribution for one point, analyze adjacent points in the same manner. The analysis of three or four points will determine the maximum point with sufficient accuracy for all practical purposes. The very laborious and approximate method outlined above is offered with a full realization of the errors involved. It is, however, the most accurate method the writer has been able to devise and has been successful in actual use.

With the material, proportions, and clearances customary in electric locomotive practice in the United States, and at 40 per cent rail adhesion, the above method shows a maximum static stress on the rods of about 15 per cent in excess of that imposed at the 90 deg. position. This stress will be referred to as the 115 per cent stress. This value is approximately correct under the assumed conditions, both for the transmission from the motor shaft to the jack-shaft, and from the jack-shaft to the axle. This stress occurs practically at the point where the other point comes into action. It is evident that the maximum stress will vary in the following manner:

First, the maximum stress will vary as an inverse function of flexibility. This constitutes an argument in favor of heat-treated and alloy steels, since high unit stresses, and therefore greater deflections, are permissible; second, the maximum stress will vary as an inverse function of the load; third, the maximum stress will vary as a direct function of the speed (with motors of series characteristics); fourth, the maximum stress will vary as a direct function of pin and journal clearances.

In none of the above features are the arguments necessarily conclusive. They must be balanced against the other existing arguments for the purpose of selecting that compromise offering the greatest overall advantage. Having once arrived at the figure 115 per cent for maximum static stress under a definite set of conditions, it is sufficiently accurate to use this figure for all designs consistently worked out in accordance with the same general practice. For any radical departure of practice, a specific maximum stress should be derived.

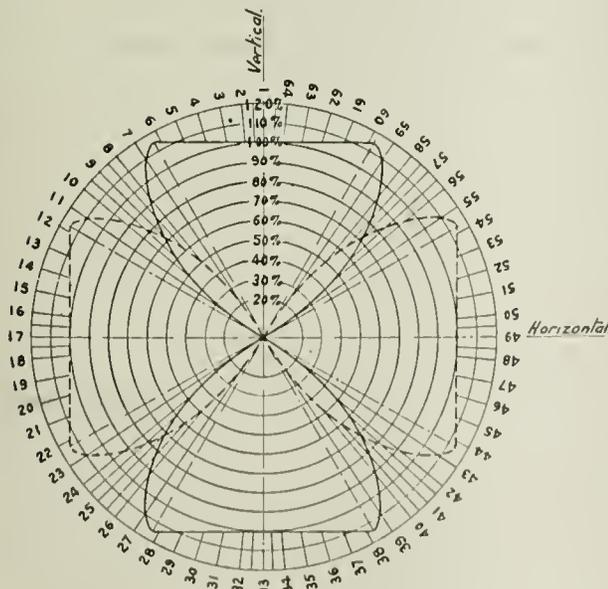

Fig. 1

Polar Diagrams.—It now becomes possible to construct an approximate polar diagram, Fig. 1, which will be characteristic for all cases of driving and driven shafts, crank-and-rod connected, whose maximum stress is 115 per cent. Points 1 to 6, inclusive, are correct, and points 7, 8, 10 and 11 are approximations, the

curve being so constructed that it is a fair curve; and, at the same time, the sum of the turning movements on the near and far cranks is always equal to the constant turning movement of the motor.

With motors of series characteristics, as the speed increases, the tractive effort decreases. The deflections, therefore, decrease and the clearances assume a greater importance as the speed increases. There will be some deflections, and the maximum rod stress will probably never reach the limiting value of $\frac{100\%}{\sin 45^\circ} = 141$ per cent. This 141 per cent stress might be reached, or even exceeded, if the interchange of effort between the near and far rods were accompanied by a shock. However, the rod is, at high speed, always held in intimate contact with its pin by centrifugal force.

Without going through the elaborate deflection calculation, the maximum condition that may be expected is closely approximated by Fig. 2, where the law $P = \frac{100\%}{\sin A}$ is assumed to apply, except over a very acute angle of interchange of effort between the near

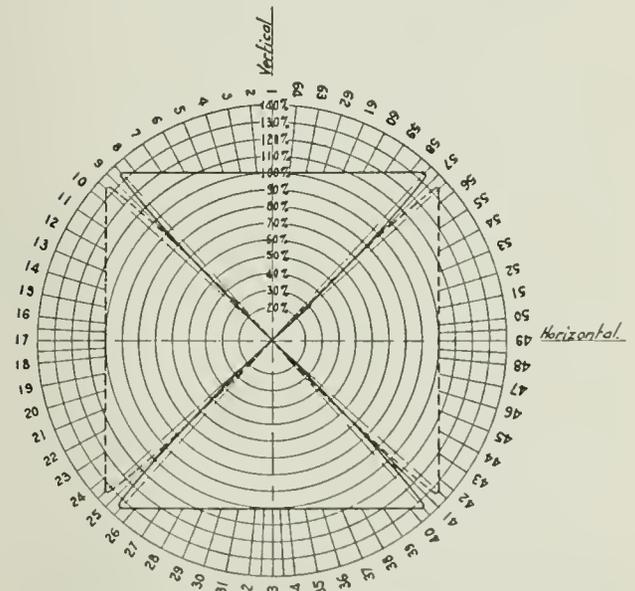

Fig. 2

and far rods. In case of a motor flash, and attendant high pressure at high speed, considerable deflection will occur because of continual intimate contact of the rods and pins. The action of the pin will be a rolling from a driving to a retarding position in the rod bushing, rather than a jumping across the bearing clearance. Figs 1 and 2 form the basis for which pressure diagrams may be plotted for the various shafts, bearings, etc., in the transmission of various types of crank-and-rod coupled electric locomotives at a maximum tractive effort, and also at maximum speed where the design is such that the maximum stresses are 115 per cent and 135 per cent respectively.

[The remainder of the paper contained a discussion of polar diagrams of the pressures on the crank pin, rod bushing, jack shaft and its bearing for maximum speed and maximum adhesion conditions for three types of crank-driven electric locomotives.—EDITOR.]

COMMERCIAL AND TRADE ASPECTS OF THE PANAMA CANAL

By EMORY R. JOHNSON

Professor of Transportation and Commerce, University of Pennsylvania

The Panama Canal was constructed primarily to shorten the length and time of ocean voyages. The people of the eastern and southern parts of the United States are interested in the Panama Canal, first, because it affords a shorter highway to the west coast of the United States; secondly, because it reduces the distance to the west coast of South America; and,

thirdly, because of the opening of a shorter route to Australasia and the Orient. The people of the western section of the United States are benefited by the Panama Canal because it gives them readier access to the markets of Europe and the eastern part of the United States, while the manufacturers and traders of Europe are benefited by securing a shorter and more direct route to the west coast of the three Americas.

The best test of the value of the Panama Canal will be the use made of it by the commerce of the world, and particularly by the shipping engaged in American commerce. The canal was opened for traffic August 15, 1914, before it was fully completed. Since it was opened for traffic, slides in the Gaillard (Culebra) Cut have, on a few occasions, interrupted the use of the canal for periods of one to five days, and these interruptions to traffic have doubtless somewhat delayed the establishment of regular services through the canal, and have possibly made the increase in the traffic of the waterway somewhat slower than the gain otherwise would have been. The conflict in Europe started shortly before the canal was opened, and all advance estimates as to the use that would have been made of the canal have been thrown out of line by the war which has temporarily stopped the commerce of some nations and has seriously interfered with the international trade of most countries. It is probable that the European war has cut in half the tonnage of the Panama Canal traffic.

The use made of the Panama Canal by American manufacturers and traders will depend upon the extent to which the steamship lines operating through the canal are able to compete with the rail lines connecting the eastern and western parts of the United States for traffic originating or terminating at interior points. It is too early to reason with any degree of finality concerning the ability of the coastwise carriers to secure traffic between the Mississippi Valley and the Rocky Mountain states. There is no doubt, however, that the rail and water lines will actively compete for large west-coast shipments to and from all points between the Atlantic seaboard and places as far west as St. Paul and St. Louis. For the most part, the traffic of the eastern part of the United States will move to the west-coast states by rail, but there will be active and continuous competition for a portion of this traffic.

There has been apprehension on the part of manufacturers in the central section of the United States and also on the part of the railroad companies whose lines connect the Mississippi Valley with the Pacific Coast lest the Panama Canal may cause the rates coastwise between the two seaboard to be so much lower than the rates all-rail or by rail-and-ocean between the section extending from the Allegheny Mountains to the Missouri River and the section along and tributary to the west coast as to make it impossible for some producers at interior points to compete successfully with producers at or near the seaboard, and in consequence to bring about the shifting of some industries from the Mississippi Valley to the Atlantic seaboard states and to cause new industries to be located near the seaboard rather than in the inland cities.

Producers located at inland points will, without doubt, have to pay higher rates on goods shipped in either direction between the eastern and western sections of the United States, and producers located at or near the Atlantic and Gulf seaboard will enjoy lower rates than can be secured by producers at interior points, not only on traffic between the two seaboard of the United States, but on shipments to and from western South America, Australasia and the Orient. The influence of the canal on the location of industries may, however, be easily exaggerated. The United States as a whole is so large, its industries are so varied and so widely distributed through the country, and the interstate commerce by rail is so many times greater than the entire traffic through the canal will ever be that the commerce by way of the canal between the two seaboard of the United States and between either of those seaboard and foreign countries can be only one of the many forces that will influence the location of industries. The greatest

factor determining the location of industries in the United States is the domestic market. A second, and a most influential, factor is the source of raw materials. While freight rates are a third influence that determines where plants shall be constructed and industries be conducted, freight rates are not the strongest influence determining the distribution of industries. It often happens that the ability to ship by rail to all points of the country with despatch and with a minimum handling of goods will cause an industry to locate at an inland point, although by locating at or near a seaport lower freight rates could be obtained.

It was the states on the Pacific Coast that had the greatest interest in the construction of the canal. Manufacturing being in an early stage of development, those states were, before the opening of the canal, obliged to secure manufactured goods mostly by rail, and to pay high freight rates for the long and expensive haul from the eastern and central sections of the country over the Rocky Mountains barrier. Likewise, the people of the west coast section had to pay high freight rates on their grain, lumber, fruit, fish and other staple products. The Panama Canal has enabled the west coast of the United States to reach the markets of both sides of the Atlantic readily and inexpensively, and has prepared the way for the expansion of west-coast industries at an even more rapid rate than has thus far characterized their development.

Shortly before the canal route became available, the Supreme Court upheld the decisions of the Interstate Commerce Commission in the Intermountain Rate cases and the commission issued an order establishing the percentage adjustment between the through rates to the west coast and the rates to intermediate intermountain points. Had that system of percentage adjustments remained unchanged, the effect of the canal upon through rates by rail between the two seaboard would have been to have determined automatically the rates to intermediate intermountain points. The Pacific railroads, supported by certain business interests in the Middle West, were, however, desirous of securing authority to reduce rates by rail from the Middle West to the Pacific Coast without being obliged thereby to lower the charges to intermediate places in the Rocky Mountain territory; and the Interstate Commerce Commission was petitioned to permit the reduction of some through rates without making a change in the intermediate charges. In other words, the Interstate Commerce Commission was petitioned to modify its decisions in the Spokane and Reno cases; and, after hearings held in October, 1914, the Interstate Commerce Commission, in an opinion rendered January 29, 1915, permitted the railroads under certain limitations to reduce the through rates to the west coast without lowering the charges to intermediate points in the Rocky Mountain territory on a list of articles, including the commodities for the transportation of which the competition between the rail and water lines is most active. This rate adjustment indicates concretely the effect which the Panama Canal has actually had upon the rates of the transcontinental railroads.

OTHER PAPERS

A paper on "Railways" was presented by William Barclay Parsons, consulting engineer, New York, N. Y. This paper contained a summary in figures to show how railways have grown in the various countries of the world, with their equipment, what the earnings have been and are, the rates charged for service, the conditions of employment of the working staffs and the varying methods of ownership and governmental control. The author recognized that many of the figures are approximate, that omissions are frequent and that some of the statistics are not comparable on account of the varying methods of reporting in different countries, but hoped that this first attempt to set forth a measure of the railways of the world may lead to other efforts whereby statistics as complete and full as possible may be compiled.

A paper on "The Status of the Railways of North and South

America" was given by F. Lavis, consulting engineer, New York City. The introduction of this paper is a discussion of the relation between the economic development of the two continents and its bearing on the financing and construction of railroads. This was followed by a general review of the railway situation in each country. The observations in regard to the United States and a number of the South American countries were based largely on the writer's personal practice.

"The Status of Railroads and Tramways in the Netherlands East Indies," was presented by E. P. Wellenstein, Netherland Indian government railway's engineer. Railroads in the Netherland East Indies are characterized by light traffic, light construction and relatively high rates in order to afford a reasonable return on the investment. The lines are either government-owned or privately-owned, with charters providing for eventual government ownership. Some of the charters provide for government guarantee of dividends. Tramways form an important feature of the development.

"Economic Considerations Controlling and Governing the Building of New Lines," was the title of a paper by John F. Stevens, New York City. The conditions under which the present railway systems of the United States have grown up, he pointed out, are very different from those prevailing in any other civilized country in the world. Owing to the rapid growth of the country, the development of the railroads has been correspondingly rapid and decidedly haphazard. The situation at the present time is entirely different; the necessity for new main lines is not manifest and further development will be concerned almost entirely with branch lines and terminals. Railroad planning and building is an exact science and not a rule-of-thumb matter, and all projects for further development should receive most careful and conservative consideration before construction commences. This applies particularly to the establishment of ruling grades and maximum rates of curvature, the elimination of pusher grades and the initial construction of permanent work. Economize out on the line, but not at stations nor at terminals proper.

William Hood, chief engineer, Southern Pacific, in a paper entitled, "The Locating of a New Line," discussed the designing of the grade system and center line of a road whose terminals have been fixed, touching on the temporary use of sharp curvature to reduce cost, the co-ordination of grades to reduce to a minimum the number of classes of locomotives required, the use of easement curves, field work in locating the line, compensation of grades on curves, and the comparison of alternative lines.

G. M. Eaton (Westinghouse Electric & Manufacturing Company), in discussing Mr. Hood's paper, called attention to a factor which may influence the location of main trunk line railroads in the future to a much greater extent than it has in the past, viz., the certainty that the line will be operated electrically. On account of the shorter wheelbase of electric locomotives, it may be practicable to adopt sharper curves, and in view of the great short time overload capacity of the electric locomotive, heavier grades for short distances need not be prohibited in such a line.

Mr. Hood replied to the above suggestions that while these factors could well be considered in locating a road which it is absolutely known will be operated only by electricity, this certainty is very difficult to determine in present-day work. Even allowing for important developments in the electrification of main line steam roads and the construction of new lines of this class for electric operation, it is probable that many will retain steam engines for some classes of service or may be forced to change back to steam operation entirely, so that a road located according to the best practice of to-day is still preferable. Such a line can be operated fully as economically by electricity as one designed according to the suggested factors, and he considered it injudicious to attempt to effect some slight savings in the cost of the line by adopting a location that cannot be operated economically with steam.

David Wilson, Johannesburg, S. A., submitted a paper on "The Locating of a New Line." This was an account of the standards and practices of the South African railways in the construction of new line. The methods follow very closely those of early railroad construction in the United States.

A paper on "Tunnels," by Charles S. Churchill, assistant to president, Norfolk & Western, gave an account of the most important tunnels now under construction or recently completed in America. Most of these have been previously described in engineering periodicals. The Snoqualmie tunnel on a change of line in the Cascade mountains, on the Chicago, Milwaukee & St. Paul, is single track, 11,890 ft. long, and was completed in January, 1915. It is in hard rock and was excavated with a bottom heading from one end and with a top heading from the other end. It is lined with concrete. The Sandy Ridge tunnel is on the Elkhorn extension of the Carolina, Clinchfield & Ohio, single track, and 7,804 ft. long. It was driven through sandstone and slate by the top heading and sub-bench method. The concrete lining was not placed until after the tunnel was opened for traffic. The double track Nicholson tunnel, 3,630 ft. long, on the change of line of the Delaware, Lackawanna & Western, is an example of a tunnel driven in soft rock, clay and gravel, requiring full timbering throughout. The Mount Royal tunnel, Montreal, and the Seattle tunnel are examples of tunnels built to gain access to important terminals. The Rogers Pass tunnel, now being constructed by the Canadian Pacific for a change of line in the Selkirk mountains, will be the longest tunnel in North America. The pioneer drift method is being used.

"Tunnels Recently Constructed in Italy," was the title of a paper by Prof. Dr. Luigi Luiggi, Rome, Italy. The Italian railways are characterized by the number and length of their tunnels, not only in the Alpine district but throughout the length of the Italian peninsula. Most of the tunnels described were of difficult construction because of their location in soft or disintegrating rock and limestone containing large caves. Of special interest is the Gattico tunnel, in which a 610-ft. section was constructed by use of pneumatic caissons driven vertically from the surface 200 ft. above the crown of the tunnel. The use of modern tunneling machinery, largely of American make, is quite general.

In a paper entitled, "The Railway Tunnels of Switzerland," R. Winkler, director of the Technical Division of the Swiss Railway Department, Bern, Switzerland, brought out the fact that the number of railway bridges and tunnels, determined by the topography of Switzerland, is very great, and there are certain lines which consist of practically an unbroken series of this construction. On January 1, 1915, there were 627 tunnels with a total length of 175.01 miles in operation or under construction.

The paper discussed the tunnels of more than 2,000 m. (6,560 ft.) in length, covering the most important conditions affecting construction work prosecuted during the last ten years.

"The Reconstruction of the Panama Railroad," was the title of a paper by Frederick Mears, member Alaska Engineering Commission, Washington, D. C. The reconstruction of the Panama Canal involved two separate processes. The first step was the rehabilitation of the old French line substantially on its original location, including the double-tracking of 37 miles, and the addition of extensive passing tracks and yards, to take care of the traffic incidental to the building of the canal. The second step was to rebuild the entire railroad on a new location in order to raise the line above the level of the water in the Gatun and Miraflores lakes and make a detour around Gold Hill to avoid the Gaillard cut. The most formidable problem was encountered in the great embankments across the arms of Gatun lake, involving over 5,000,000 cu. yds. of embankment, a large part of which was rock. Bridges were quite an item, the two largest ones being those over the Chagres and Gatun rivers, the latter including a 100-ft. plate girder bascule span. A tunnel 636 ft. long was required at Miraflores.

A paper on "Railway Construction Methods and Equipment in Australia" was presented by Maurice E. Kernot, chief engi-

neer, railway construction, Melbourne, Victoria, Australia.

In a paper on "Railway Construction Methods and Equipment," William G. Sloan, chief engineer, McArthur Bros. Co., New York, outlined the development and present status of railway construction in this country, discussing the subject under seven headings, viz., Clearing and Grubbing, Handling Material from Excavations and into Embankments, Tunnelling, Bridge Construction, Track Laying, Ballasting, and the Construction of Miscellaneous Structures.

Under the title "Track and Roadbed," George H. Pegram, chief engineer Interborough Rapid Transit Company, New York City, gave a brief review of American practice on this subject and covered both steam and electric lines, with special attention to electric lines having exceptionally heavy high speed traffic. A set of specifications for the treatment and use of crossties was given and the paper closed with a review of the present rail situation in America.

J. E. Greiner, consulting engineer, Baltimore & Ohio, Baltimore, Md., gave a paper on "American Railroad Bridges." As now constructed they are the result of an evolution which may be divided into three periods. The first, extending to 1865, was largely a period of temporary construction in which the designers were governed very largely by judgment. During the second, ending in 1890, scientific designing became general, and the pin connected steel truss was developed. The third period brings us to the present. The influences bringing about the present state of development may be designated briefly as the increase in train loads, necessitating heavier structures; the increase in speed necessitating stiffer ones; the introduction of new materials of construction, such as modern structural steel and the alloys and special steel of recent introduction, and reinforced concrete; the improvement in machinery for shop use, and the development of derricks and other equipment for the erection, which has very largely increased the weight of members and the use of field rivets. As examples of modern tendencies, the most important ones include the reinforced concrete and timber ballast decks, the encasing of I-beam spans in concrete, the use of long plate girders, the decreased use of pin connected trusses, and the substitution of riveted trusses for greatly increased span lengths, the exploitation of many patented types of bascule bridges and the general tendency to use stiff connections and bracing wherever possible. An account of the development of the Cooper wheel loading was followed by a discussion of the present tendency of locomotive development and unit stresses in structural steel to the conclusion that little or no increase in the strength of bridges over that provided at present is necessary to fully anticipate all possible increase in the rolling loads on railroad tracks.

Mr. Greiner's paper was discussed by C. F. Loweth (C. M. & St. P.), who took exception to the inference in the paper that open deck timber trestles should only be built on lines of light traffic or branch lines. While it is recognized by all engineers that a more permanent type of structure is preferable, the necessity for utilizing to the best advantage the limited amount which is available for bridge work on the average railroad each year frequently requires the use of structures which would not be built if additional expenditures were allowable.

While the contents of a paper on "Recent Locomotive Developments," by George R. Henderson, consulting engineer, The Baldwin Locomotive Works, Philadelphia, is a matter of common knowledge to railroad men in the United States, the paper was an excellent one from the standpoint of the foreign railroad officer. It described the transition from the American, Consolidation and Ten-Wheel types to the corresponding types having trailing trucks, namely, the Atlantic, Mikado and Pacific types, with the resulting increase in boiler capacity, giving higher speeds with equal tractive effect or vice versa. An outline was given of the development of the Mallet type, with a somewhat more lengthy description of the "Triplex compound." Under the headings, "Details of Construction" and "Adjuncts and Specialties," mention was made of the substitution of cast steel for wrought steel, the use of alloys and heat treated steels, the substitution of the

Walschaert valve gear for the Stevenson link motion, improvements in boiler and firebox design, the superheater, the pneumatic coal pusher and stoker, and the use of oil as a fuel.

The paper by Arnold Stucki, consulting engineer, Pittsburgh, Pa., on "Rolling Stock Other than Motive Power," dealt with the car equipment used by the railroads of the United States of America and Canada pointing out the improvements made during the last decade in the various types of passenger and freight cars and special parts.

"The Floating Equipment of a Railroad," was the title of a paper by F. L. DuBosque, assistant engineer of floating equipment of the Pennsylvania, New York City. Most of the railroads approaching New York from the west and south have their terminals on the west side of the Hudson river, necessitating a water transfer for all passengers and freight having destination east of the river. In consequence these railroads have developed a number of standard types of floating equipment. The most common of these is the Hudson river passenger ferryboat with a screw propeller at each end, a steel hull and a wooden superstructure. An all-steel fireproof ferryboat used on the Delaware river is suggested as an improvement over the prevailing Hudson river type. Car floats for freight service are of two types, pier floats and transfer floats. The former are used for delivery to freight stations on piers where the cars are unloaded without removal from the floats. The latter are used for the transfer of cars from one side of the river to tracks on the other side, and are larger and of heavier construction, usually steel. One of the most interesting problems involved in the operation of floats is the construction of satisfactory bridges for the transfer of cars to and from the floats with varying heights of tide. The delivery of freight to steamship piers and to manufacturing plants is usually made in house barges propelled by tugs or in self-propelled barges, the latter usually being constructed of steel. Other types of equipment are the hand-power and steam-power derrick barges and coal barges. All equipment which is not self-propelling is handled by means of tugs of various sizes, many of them very powerful, so that tows sometimes contain as many as 28 boats. A small size of tug is employed at the docks for service which corresponds very closely to the switching of cars.

The paper on "Railway Terminals," by B. F. Cresson, chief engineer, Board of Commerce and Navigation of the State of New Jersey, contained a general discussion of the relation of terminals to railroad systems and to economic conditions in the larger cities and a detailed statement of the terminal situation in six cities, New York, Chicago, Buffalo, Cleveland, St. Louis and New Orleans.

Charles Hansel, in a paper on "Signals and Interlocking," gave a brief review of the development of the automatic block system, placing particular stress on the development of the alternating current signal track system and the adoption of the upper quadrant semaphore signal. The automatic train control was designated as another important development, which was discussed at some length.

A paper on "Preservative Treatment of Timber," by Howard F. Weiss, director, Forest Products Laboratory, and Clyde H. Teesdale, in charge of wood preservation, Forest Products Laboratory, Madison, Wis., presented a general review of the results obtained in the United States in preserving wood. The authors attempted to do this by showing, first, the quantity of wood preservatives used and amount of timber treated annually, and, second, the extent to which the various treatments have prolonged the natural life of wood.

RAILWAY CONSTRUCTION IN INDIA.—The following work on railway projects has been sanctioned by the Indian authorities: Surveys by the Eastern Bengal State Railway of the 36 miles between Serajgunj and Bogra, and by the Bhavnagai Durbai of a metre gage railway, about 56 miles long, from Savarkundia via Dongar to Mahuva, with a branch from Dongar to Port Albert Victoria, and the construction by the Junagadh of a line, 60 miles long, between Varavaland and Una.

WELFARE WORK AT PITCAIRN FREIGHT TRANSFER

The remarkable improvement made during the past two or three years in the management of the personnel at the freight transfer station of the Pennsylvania Railroad at Pitcairn, Pa., 16 miles east of Pittsburgh, was noticed in the *Railway Age Gazette* of September 3, pages 413 and 430. Here, under the management of George F. Wagner, agent, a force of 318 laborers has been kept in service for two years with no change; only one man was taken on, and he was an addition to the force. It is hardly correct to call these activities "welfare work" in the restricted and technical sense in which that term is now used, for the welfare of the employees is only one of the beneficial results. The results from a cold and strictly business standpoint are equally noteworthy, and all that has been done would have been fully justified as a good thing for the railroad company from the narrowest motives of self-interest. And 99 per cent of these men are foreign born, another fact which will give interest to the additional details here given concerning this station and its management.

The work done at this transfer station was formerly done at Pittsburgh, but was crowded out of the city several years

The assistant labor foremen and the shipping clerks, one of whom is assigned to each gang of four truckers and one loader, are all Americans.

Under former conditions the proximity of the numerous large manufacturing concerns fostered the habit of "floating" and it was not uncommon to lose a hundred men a month, principally because another job was close at hand and to be had for the asking. The men who left did not usually better themselves; they merely wanted change, apparently; and many of them would in time drift back to the Transfer and be re-employed, if they were needed, and if they were of satisfactory quality. It goes without saying that this constant "floating" was demoralizing to the whole force.

The Pitcairn sheds are not noted for beauty, being plain, low wooden structures. The agent who set out to improve conditions had, therefore, no aid either from the architect or from any committee on art or esthetics; but he made a good beginning by covering the whole with a coat of white-wash. This, they say, acted like a tonic on all hands, and seems to have suggested other ideas of tidiness. It began to be easier to keep tracks and platforms clear of rubbish and all foreign matter; and an order was issued to burn or send to the dump every day all sweepings and litter. Getting rid of the rub-

Some of the Freight Handlers at "Pittsburgh Transfer," Pitcairn, Pa., Pennsylvania Railroad

ago. Pitcairn is the main freight-train terminal for the Pittsburgh division. Between Pitcairn and Pittsburgh there is a long chain of manufacturing towns which have a distinct influence on the labor problem at the Transfer. The labor supply in this district has, for many years, been very largely foreign and the percentage of native-born laborers has decreased steadily year by year. The total number of men employed at the transfer is 464, of whom 318 work on the platforms as truckers and laborers. Nearly all of these are natives of central Europe, the large majority coming from Austria-Hungary. A creditable number of them have become citizens of the United States, yet a considerable part of the whole body has only a limited knowledge of the English language. This ignorance of English was, of course, a drawback, as the trucking of miscellaneous freight into and out of cars demands something more than mere brawn; but at the present time all can read and speak English with satisfactory proficiency.

The agent's force, aside from the clerical department, consists of one general foreman in charge of floor operation day and night, and two assistant general foremen, one day and one night. There are ten assistant labor foremen, five day and five night, in charge of the work in different parts of the house.

At Pittsburgh, it was found, soon brought another improvement; the rats were exterminated. This was an emigration of no small proportions, as the station is a large one (the platforms accommodate 402 cars).

Next came the Spring; and a little plot of grass and of blooming flowers was soon seen where only cinders had bloomed before; and the workmen at once took an interest in this minor feature. The men, discussing the matter among themselves, concluded that an American flag was needed, and with contributions of ten cents apiece, no more and no less, a fund was raised to buy it; and with a tubular steel pole, furnished by the railroad company, the flag was raised. The flag raising, though not ostentatious, was, from a local standpoint, a notable event, and there were a few brief speeches and some music by the Pitcairn shop band.

The appreciation accorded these outside activities served only to emphasize such lacks as there were inside, and before long the agent mustered the courage to acquaint the superintendent with the needs inside the building; and with the cordial cooperation of this officer and others, there was soon installed a ventilated steel locker for each man; and this improvement was followed with shower baths, porcelain enamel washstands,

supplied with hot and cold water, and a system of absolutely odorless water closets and urinals. The drinking water is now supplied by sanitary fountains and the water, which comes direct from the mountain back of the village, is cooled by iced coils.

The men have a comfortable room in which to eat their luncheons, and facilities are provided for heating food and for simple cooking. The truckers have one large lunchroom lined with cement, both the floor and the wainscoting. All these fixtures are of first quality and the facilities are adequate to the number of men who wish to use them.

Every one of these improvements is now in as good condition as when it was new, and cleanliness is maintained every day. The floor of the cement-lined lunchroom just mentioned is sanded every day with white sand.

When the men are idle they may smoke in rooms provided for that purpose; and in these rooms they play checkers, dominoes and other games of skill. Outdoors there is a place where they may pitch quoits.

The Victor Victrola which furnishes music at noontime was bought by the men themselves; and with it there is a good assortment of records. That the workmen have music in their souls is evident from the pleasure that they take in listening to great artists and famous bands. Now and then the sheds are favored with a concert by the Pitcairn shop band, of 40 pieces, and this also is warmly appreciated.

These contributions to the comfort of the men have in a very definite way promoted contentment, and the officers of the road feel quite sure that whatever cost has been incurred was wiped out long since. Not the least effective means of keeping in sympathetic touch with the men is a "suggestion box" provided for the purpose of enabling any employee to submit ideas that may occur to him in the way of improving methods of work; and Mr. Wagner says that he is indebted to the men for many excellent ideas. He is personally acquainted with each one of the 318 men comprising the house force, and he takes care to keep the acquaintance alive; that is to say, he makes it a point to have a little talk with each man at least once a week. Tale-bearing is not tolerated. Where a foreman notices a tendency to carelessness the man at fault is warned; and if, after continued warning, there is no improvement the offender finds himself reduced in rank. Thus an offending shipping clerk may become a stowman, a stowman a trucker and a trucker a laborer. All understand, however, that a position which has been lost may be regained by subsequent good conduct; and, in fact, men do thus recover their places. Commendation for good work is given freely, and there are said to be no vicious cases to deal with.

Every available means is taken to facilitate the freight work. Hinged counterbalanced bridges are provided for trucking across tracks, so that the fact that one of two or three tracks is not occupied by cars, does not hinder ready access from the platform to cars beyond. The abolition of the old practice of trucking through several cars, hindered as it is by the obstacles due to differences in heights of floors and sometimes bulky freight in cars which have to be passed through, has made easier the work of trucking, has added to the earning capacity of the men, and has reduced the number and importance of bills for damage to freight and injury to persons.

Most of the trucking along the platforms longitudinally, that is, in lines parallel to the track, is done on flat steel tread plates laid in the shed floors and countersunk. With these it is found that in many cases a trucker can move a load twice as heavy as he would dare to take over the ordinary plank floor.

The men are grouped in gangs, and are paid by the ton of freight handled. A gang is composed of a shipping clerk, a loader and four truckers. Each gang knows approximately what is its standing as compared with other gangs, and enough rivalry is kept up to secure a good degree of accuracy in the work. There have been seasons, when freight was unusually

heavy, when some outside men had to be employed; and, on the other hand, during dull periods the regular men are laid off, one day at a time, each man taking his turn.

As may well be supposed, the men have now been so long at this station that their acquaintance with details is complete. Every man knows exactly where to find a car for any point to which cars are loaded; and he knows that right in that same spot he will find a car for the same point to-morrow, next week or next month; that is to say, indefinitely, until a formal change is ordered and announced.

Every man knows his duty and also knows that it is the duty of the foreman to exact constant faithfulness. No one is pampered; there is no confusion, no lack of order and no idleness when there is work to be done.

THE FRENCH RAILROADS AS SECURITY BROKERS

BY WALTER S. HIATT*

The old practice of the French railroads of selling new issues of stocks and bonds directly to the public through the railway stations is proving very useful in connection with present issues of new loans and as a means of helping the government in its campaign to collect gold coin. Because the small investor in France has been educated through long years to buy railroad stocks and bonds directly from the companies, as has been pointed out in an article in the *Railway Age Gazette* of August 6, in the present war crisis the railroads forced to make new loans are able to get money in France without too much difficulty.

Contrary to the impression of the outside world, which has underestimated the enduring power of accumulated wealth, there is still an astonishing amount of money in the hands of the saving French people, and large amounts of it are going into the purchase of railway securities. One notable indication of the presence of this money yet in the hands of the public is shown in the statement of the Bank of France which is collecting gold for the government. Last May the government called on the public to let it have its hidden gold, to aid it in maintaining its credit abroad. To date no less than \$150,000,000 worth of gold has been turned in at the hundred odd branches of the Bank of France. It is estimated by French financial experts that counting the gold actually coined in France during the past 15 years and the billion dollars worth of gold in bank vaults, another billion dollars worth is yet in the hands of the public.

In view of their rôle as brokers in handling their own securities the various railroad companies are helping in the gold collection by opening special windows in all their larger stations for the exchange of their own securities or paper money for gold coin, which coin is duly turned over to the Bank of France. No less than \$5,000,000 in gold has been obtained at the instance of railway employees, either through soliciting their friends or else taking the gold out of their own savings. The railway companies are also turning in gold out of their own treasuries, the Northern Railway having as early as May 21 made a first deposit of 3,000,000 francs, and later the Paris-Lyon-Mediterranean of 3,500,000 francs.

In regard to their own finances, practically every railroad in France, because of reduced earnings and the necessity of repairs and upkeep, has put out new loans this summer. These loans have done reasonably well, because of the old selling relation with the public. Had the railroads been forced to place the loans entirely through bankers, the money would perhaps have come in more slowly, and it certainly would have been necessary to pay far more than the customary rates for the service.

The case of the Northern Railway, normally the best paying of all the French roads, is interesting because it has suffered most from the war. Virtually one-half of its 2,300 miles of

*Our Special European Correspondent.

line are either in the hands of the Germans, or else so near the front as to be impossible of normal operation. The other half of its available line runs from Paris into the war zone, and yields a smaller return than usual, since the army is using it for military purposes, refusing its passenger trains to travelers and its freight trains to commercial traffic except under strict surveillance.

The result is that the earnings of this railroad are less than half those of a peace year. In 1912 the net earnings were \$25,000,000, the gross receipts being \$65,000,000, and expenses \$40,000,000. For the year ending December 31, 1914, including five war months, the receipts fell off \$19,000,000, the total for the year being barely \$48,000,000, with expenses of \$37,000,000. Of this sum but \$6,000,000 was received from the government for war transportation, which sum cannot in any sense be considered an adequate compensation for its huge losses of freight and passenger business and the destruction of its depots,

this stock has not further decreased because the French holder does not readily sacrifice a stock that he feels will eventually return to normal. For these reasons this company's new \$40,000,000 issue of 5 per cent bonds, made to meet war deficits of all kinds, has fared far better than could have been expected.

These bonds are on sale at every railroad station of the company, according to French railroad custom, and hand bills are there posted notifying the public of the issue. At the smaller places the station masters, as on all the roads, have charge of the sale and receive small commissions from the company for bonds sold. The company is thus able to reach the small investing public of the little towns and villages. The people do not have to apply to bankers or brokers to make the purchase and, indeed, effect a small saving by this direct buying from the company. Neither the company nor the public is forced to pay a broker's commission on these sales.

At the stations in the larger cities, as in Paris, the companies

The Bank and Security Sales Room in the Paris Offices of the Southern Railway of France

bridges and tracks. The decreases in revenues as between 1913 and 1914 were as follows: Passenger traffic, \$7,500,000; slow freight, \$16,000,000; fast freight, \$2,500,000; cattle, \$200,000; mail and other, \$200,000.

The enormity of these decreases will be realized if it is understood that normally this road's passenger receipts are \$20,000,000, and its freight receipts \$36,000,000. At one stroke the German invasion cut off \$12,500,000 in coal and coke freights from the mines of northern France and Belgium. It must be borne in mind that, notwithstanding these losses, operating expenses have continued over one-half its lines.

In the face of such disaster, its stock (*actions*), originally issued at \$80 (400 francs), and quoted at the high figure of 1,727 francs (\$315) the day before war was declared, are now quoted on the Bourse at 1,215 francs, a drop of about \$100. That this stock has not decreased more after 11 months of war is due to the confidence of the holders in the value of the stock, and to the fact that the company is paying its interest as usual, not having sought to take advantage of the moratorium. Finally

have big reception rooms fitted up to accommodate this business, the room being not unlike that of a bank, with special windows for each class of buyers and each class of securities, and for the payment of interest as the securities mature. Not only the small buyers come to these rooms, but brokers, bankers and officers of private organizations who wish to make larger investments of capital. Of course, the companies do not attempt to supplant altogether the selling role of the broker or banker. Thus, once the new stocks or bonds have been issued and sold, the companies do not attempt to handle them further. The only railroad in France that does not to day use this method of reaching the public is the State Railway, which, however, does business directly with the public at the offices of the Minister of Finance.

One of the good features of this method, from purely a railroad point of view, is that railroad employees themselves are led to invest their savings in the company for which they work and thereby their personal interest in the welfare of their employer is stimulated. It has also been pointed out to me by

officers explaining the direct method of sales that the people living along a railroad line and investing in its securities naturally desire the prosperity of the railroad, and that this reduces the number of people who loosely consider the railroad a public enemy.

In the case of the Southern Railway (Chemin de Fer du Midi), the rôle of broker has been carried out so far that the railway virtually has a bank in its general offices in Paris. Here it is its own banker. It not only sells its stocks and bonds but makes short-time loans to other banks and commercial houses as a part of its daily business.

To illustrate how well its system works, one of its directors explained to me that, two years ago, the company decided to build a new hotel at a certain point on its line as an attraction for tourists. It organized a private hotel company and asked a banking firm to sell for it the 14,000 bonds issued to obtain money to build the hotel. The banking firm was able to sell but 5,000 of the bonds. Then the railway undertook the sale itself, at its own stations, and within a few months was able to dispose of the other 9,000 bonds. At this Paris banking office the company further settles all of its large bills, again acting as its own banker.

The company has had the direct sales system in force since 1860, and has during that time handled all of its own loans. Whenever it has put out a new loan, say 100,000 bonds at 500

francs, it advertised the fact on the billboard space at all its stations.

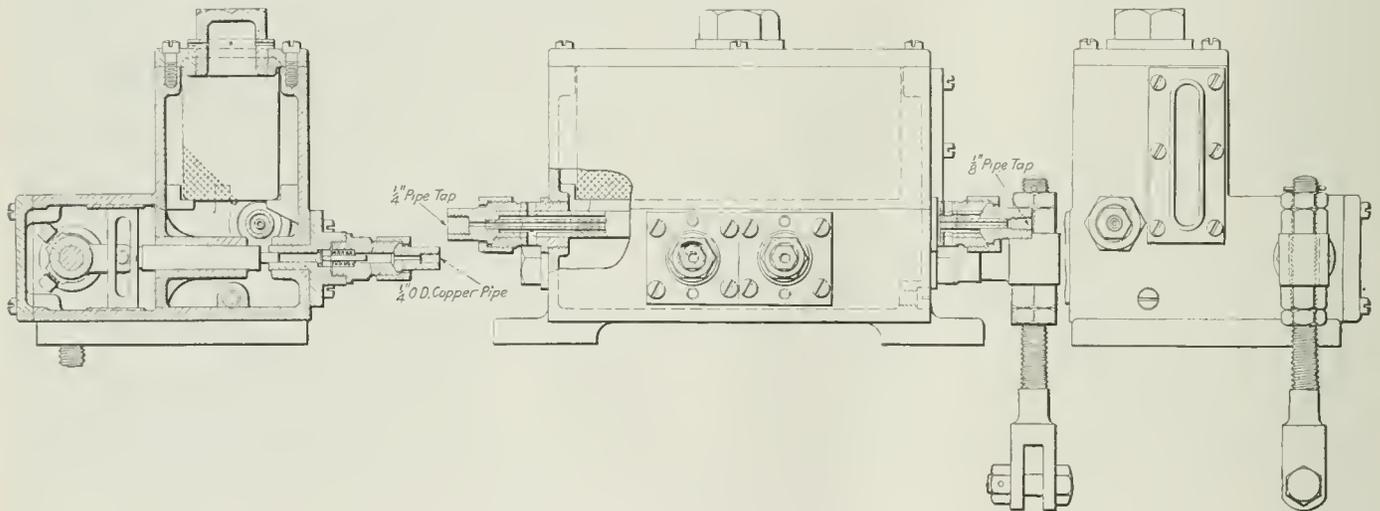

There are four windows at this Paris office maintained for the investor. While the clerks at these windows in slack times do other company accounting work, the same clerks are always at hand and ready to engage in the work of selling with which they are familiar. The customer begins at the first and central window, stating the amount of money he wishes to invest, and whether he wishes a bond issued in his name or merely in blank. He then passes to window number two, where he pays for the bond or bonds, and receives a receipt. At window number three he receives his bond. He comes back to window number four to collect his interest twice a year, or else collects it by mail. At this window there is also maintained, as a protection to the investor, an information service regarding lost or stolen securities. If an outside banker pays the interest on a coupon or purchases a security, he does so at his own risk.

The officers of the Southern Railway who went into the details of their system, when I explained that it seemed on the surface that it might be modified for the use of American railways stated that the system had stood the test of long years and that it was satisfactory from many points of view in the way of stimulating public confidence and interest in their business. They further declared that it was inexpensive, and that in this war year it had rendered great service in that the ma-

FORCE FEED CYLINDER LUBRICATOR

The force feed lubricator, shown in the drawing, is designed for use in lubricating locomotive cylinders. It is of the double action type and is manufactured by the Nathan Manufacturing Company, New York.

By referring to the detail drawing of the lubricator it will be seen that it is directly operated without the use of a ratchet. The lever attachment to the lubricator is designed to be connected in any suitable manner with a reciprocating part of the engine, the length of the arm being adjustable to suit the amplitude of the motion. The oscillating shaft to which the lever is attached is provided with arms in the lubricator which are pin-connected to slotted crossheads on the ends of the pump plunger, the arrangement being such that for each complete cycle or revolution of the engine two complete cycles of the pump plungers are produced. Oil is thus forced into the steam passages twice during each revolution by the use of but one plunger for each cylinder. The plunger is shown in the drawing at the end of its forcing stroke. At the other end of the stroke it is drawn back from the end of the barrel, thus allowing the

Nathan Force Feed Cylinder Lubricator

oil to enter directly from the reservoir. A spring operated check valve prevents the back flow of oil from the lubricator pipe.

The oil reservoir contains a small exhaust steam heater of a novel design. Steam from the air pump exhaust passes through a small pipe extending from end to end of the reservoir, the condensation being carried from the lubricator to any convenient point under the engine. Surrounding the steam pipe is a larger pipe with openings to the atmosphere at either end of the reservoir, providing for a circulation of air about the steam pipe and preventing overheating of the oil in the lubricator.

THE RAILWAY GAGES OF THE INDIAN PROVINCE OF ASSAM.—At a railway conference begun on June 30, at Shillong, in Assam, and attended by members and representatives of all the various interests in Assam, including steamer companies, it was decided that there should be only two gages in Assam, the metre and 2 ft. gages. The gage of any proposed line is to be selected on its merits, but in general the metre gage will be adopted for the Surma Valley and the 2 ft. gage for the sparsely populated portions of the Assam valley. It was also decided to lay the meter gage on the feeder lines in the Surma valley, connecting the three subdivisional headquarters of Hailakandi, Maulvibazar and Habigang with the Assam-Bengal Railway.

General News Department

The State Department, at Washington, which is trying to decide which faction should be recognized as the government of Mexico finds its efforts blocked by the impossibility of keeping up railroad communication between Vera Cruz and the city of Mexico. A freight train carrying supplies from the coast to Mexico City was blown up by bandits. A long bridge of the Interoceanic Railway, 25 miles from Vera Cruz, was destroyed. A press despatch from San Diego, Cal., reports that at Torres, a small town 70 miles north of Guaymas, Mexico, a Southern Pacific passenger train was burned September 24, by a band of Yaqui Indians, and that 80 passengers, forced to stay in the cars were thus put to death.

C. Stanley Sale, who since November, 1913, has been editor for the Chicago Association of Commerce Committee of Investigation on Smoke Abatement and Electrification of Railway Terminals, and who for two years, 1907-1908, was associate editor of the *Railway Age*, has been appointed assistant to the director of the engineering experiment station and instructor in civil engineering at the University of Illinois. Mr. Sale was graduated from Purdue University in 1906, and was for one year assistant engineer of the Florida East Coast Railway. Before becoming connected with the electrification committee he was for two years secretary and general manager of the Engineering Publishing Company, Indianapolis, Ind.

Disturbances among freight handlers on the docks of New York City, reported last week, have continued, but, so far as the railroads are concerned, the employment of new men,

or of men drawn from other departments of the railroad service seems to have been successful in keeping freight moving, though with considerable delay. Many of the men who struck are returning and being taken back. In addition to the railroads named last week, large numbers of men left their work at the docks of the New York, New Haven & Hartford Railroad and of the Metropolitan and Maine Steamship companies. The demands of the strikers in most cases were for an increase of the rate of pay from 20 cents an hour to 25 cents. No strong organization of laborers seems to be prominent, yet it is reported from Washington that the secretary of labor has appointed a conciliator, John A. Moffatt, to take up questions presented by 900 freight handlers of the Pennsylvania Railroad in Jersey City. The difficulties this week seem to have been more serious at the piers of the transatlantic steamship lines and the claim has been made that agitators, working supposedly in the interest of Germany and Austria, have incited the strikes. It is said that at piers where no materials for the French and English governments were being loaded there was no trouble.

Revenues and Expenses of Express Companies for May, 1915

The following statement, which is subject to revision, has been compiled by the Interstate Commerce Commission from the monthly reports of operating revenues and expenses of the principal express companies for May, 1915:

The Erie Barge Canal

The New York State Court of Claims has before it 2,440 claims demanding \$62,000,000 from the state for damage occasioned by the construction of the barge canal. The next term of the court opens in Rochester on October 4. Claims for lands taken in New York county for barge canal terminal purposes aggregate \$2,106,000 and in Queens \$1,190,000. Other large sums claimed are \$10,000,000 in Herkimer, \$5,326,000 in Saratoga, \$3,678,000 in Wayne, \$3,861,000 in Monroe, and \$5,761,000 in Rensselaer. Claims arising from leakage and damage caused by the old canals amount to \$128,623.

Brownell's Automatic Stop

A mechanical-trip automatic train stop, invented by George W. Brownell, of St. Albans, Vt., has been tried on a sidetrack of the Central Vermont Railway at that place. Mr. Brownell places a ramp on the ties between the rails of the track and, by means of a sliding tripper, suspended from the locomotive frame, causes the lifting of a valve on the engine as the ramp is passed, applying the air-brakes. The ramp is moved into or out of position by a dog, turned by a shaft connected to the visual signal. To prevent trouble from freezing, the ramp is supported in a trough, which, in winter, contains salt. The air apparatus, on the locomotive, moves a piston in a double cylinder, so arranged as to exhaust, at first, only a part of the air necessary to make a service application, further reduction, as may be demanded, being provided for by suitable adjustments.

Railroad Abuses Charged

The United States Commission on Industrial Relations (the Walsh Commission) has filed, at Washington, what is said to be its final report. It recommends inspection of railroad labor camps by the United States Public Health Service and contains drastic criticism of construction camps, railroad benefit associations conducted by the managers of the roads, and so-called private armies maintained by railroads. The commission recommends the assumption by the States of the task of protecting private property as a remedy for the alleged evils. Some of the abuses declared to exist are the following:

Unsanitary railroad construction camps, overcrowded and improperly equipped; overcharging at the commissary and grafting by foremen, "voluntary" benefit associations in which membership is often compulsory and in which the employees have no voice; the establishment by some railroads of large arsenals of arms and ammunition, the recruiting of gunmen from detective agencies, the usurpation by these forces of the functions of the State and the various encroachments on the rights of private citizens.

To carry out the ideas of the commission a number of bills will be introduced in Congress.

Crossing Accidents on the Long Island

J. A. McCrea, general manager of the Long Island Railroad, has issued a review of his experiences with reckless automobilists during the past summer, giving detailed accounts of cases of carelessness, inexperience, or deliberate recklessness, of drivers, which has led to deaths, injuries and damage.

Since January 1 eighty-five automobiles and several motorcycles and wagons have been deliberately driven through lowered gates. In fifty of these cases the gates were broken.

For publication of warnings and exhortations in the advertising columns of newspapers the railroad has spent in the last three months, \$4,327; this went to 176 newspapers in New York City, Brooklyn, and on Long Island. Twenty-five crossing gates have been painted with black and white stripes.

Heavy gates made of telegraph poles have been placed at one of the crossings leading to Long Beach, and another at Central Islip. Thirteen large signs, most of them electrically lighted at night, have been put up. The hours between five and eight in the evening seem to be most productive of reckless driving. On several occasions the crossing watchmen have been run into while at their posts and have been either killed or injured. On September 9, at Hempstead Turnpike, Queens, 5:15

P. M., an automobile driven at high speed struck and killed crossing watchman, J. P. Joyce, who was warning the driver to keep back, so gates could be lowered for an approaching train.

"We want the people to know just what we have done," said Mr. McCrea, "so that they will not accuse the railroad of carelessness when some of the reckless drivers are hit by trains. To prevent automobile accidents we have adopted every suggestion that was at all feasible; but it is quite clear that the railroad alone will not be able to do very much. Accidents will occur unless the State and township authorities take up the subject vigorously. We are going to continue our campaign, and I hope next summer we shall be able to think of something sufficiently startling to arrest the attention of those reckless drivers with whom it seems utterly useless to reason."

Disastrous Explosion at Ardmore, Oklahoma

By the explosion of a tank car containing gasoline, standing on the track near the union station at Ardmore, Okla., on Monday last, 40 or more persons were killed and buildings were damaged to the extent of about \$500,000. Repairers were at work on the car and it is supposed that a spark caused by a workman's hammer ignited vapors which had escaped from the car, which was one of 250 barrels capacity. It is said that much of the damage was due to dynamite, in the freight house, exploded by the shock caused by the gasoline explosion. Most of the fatal injuries to persons appear to have occurred in frame buildings which fell. Burning liquid was thrown many hundred feet and fires were started in 20 buildings. About 200 persons were injured, many of them being rescued with much difficulty because of the great volume of smoke from fires. Included in the property destroyed were 30 freight cars in the yard of the Gulf, Colorado & Santa Fe.

Traffic Club of New York

The regular meetings of the Traffic Club of New York will henceforth be held at the Waldorf-Astoria Hotel instead of at the Hotel Astor as formerly.

Engineers' Society of Western Pennsylvania

The regular bimonthly meeting of the mechanical section of the Engineers' Society of Western Pennsylvania will be held in the society rooms in the Oliver building, Pittsburgh, on October 5. The subject of the meeting will be "Gas Welding and Cutting—A Symposium." Papers will be presented by C. K. Bryce, engineer of the Oxweld Acetylene Company, Newark, N. J., on "Use in Welding Heavy Parts"; by J. B. Henry, general superintendent of the Union Steel Casting Company, Pittsburgh, Pa., on "Use in Steel Foundries," and by A. F. Mitchell, assistant to superintendent of the armor plate department of the Carnegie Steel Company at Homestead on "Use in Steel Mills."

Convention of National Association of Railway Commissioners

The twenty-seventh annual convention of the National Association of Railway Commissioners is to be held in San Francisco on October 12-16. A new feature of the convention this year is to be the allotment of 45 minutes at the beginning of each day's session for 5 or 10 minutes' discussion by each commission represented on the most important developments of the year relating to its work. This is to be a discussion of the methods of the work rather than the work accomplished. Judson C. Clements, of the Interstate Commerce Commission, and E. W. Bemis, of Chicago, are to address the association on matters pertaining to the work of the commissioners. A reception and banquet will be tendered the association by the Exposition Commission on Wednesday, October 13, at which addresses will be made by the governor and lieutenant-governor of California. Most of the time of the meetings is to be given up to the presentation and discussion of the various committee reports. The secretary of the association is William H. Connolly, 1319 Columbia road, Washington, D. C.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, date of next or regular meetings, and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

- AIR BRAKE ASSOCIATION.**—F. M. Nellis, 53 State St., Boston, Mass. Next convention, May 2-5, 1916, Atlanta, Ga.
- AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.**—F. A. Pontious, 455 Grand Central Station, Chicago. Annual meeting, July, 1916.
- AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.**—H. C. Boardman, D. L. & W., Hoboken, N. J. Next meeting, October 21-23, 1915, Boston, Mass.
- AMERICAN ASSOCIATION OF FREIGHT AGENTS.**—R. O. Wells, Illinois Central, East St. Louis, Ill. Next meeting June 20-23, 1916, Cincinnati, O.
- AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.**—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York. Next meeting, October 26-27, 1915, French Lick Springs Hotel, French Lick Springs, Ind.
- AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.**—E. H. Harman, Room 101, Union Station, St. Louis, Mo.
- AMERICAN ELECTRIC RAILWAY ASSOCIATION.**—E. B. Burritt, 8 W. 40th St., New York. Annual convention, October 4-8, 1915, San Francisco, Cal.
- AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOCIATION.**—H. G. McConnaughy, 165 Broadway, New York. Meetings with American Electric Railway Association.
- AMERICAN RAILROAD MASTER TINNERS', COPPERSMITHS' AND PIPEFITTERS' ASSOCIATION.**—W. E. Jones, C. & N. W., 3814 Fulton St., Chicago.
- AMERICAN RAILWAY ASSOCIATION.**—W. F. Allen, 75 Church St., New York. Next meeting, November 17, 1915, Chicago.
- AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.**—C. A. Lichty, C. & N. W., Chicago. Next convention, October 19-21, 1915, Detroit, Mich.
- AMERICAN RAILWAY ENGINEERING ASSOCIATION.**—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next convention, March 21-23, 1916, Chicago.
- AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.**—J. W. Taylor, 1112 Karpen Building, Chicago. Annual meeting, June, 1916.
- AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.**—Owen D. Kinsey, Illinois Central, Chicago. Annual meeting, July, 1916.
- AMERICAN SOCIETY FOR TESTING MATERIALS.**—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.**—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.
- AMERICAN SOCIETY OF MECHANICAL ENGINEERS.**—Calvin W. Rice, 29 W. 39th St., New York. Annual meeting, December 7-10, 1915, New York.
- AMERICAN WOOD PRESERVERS' ASSOCIATION.**—F. J. Angier, Supt. Timber Preservation, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 18-20, 1916, Chicago.
- ASSOCIATION OF AMERICAN RAILWAY ACCOUNTING OFFICERS.**—E. R. Woodson, Rooms 1116-8, Woodward Bldg., Washington, D. C. Annual meeting, June 28, 1916, Detroit, Mich.
- ASSOCIATION OF MANUFACTURERS OF CHILLED CAR WHEELS.**—George W. Lyndon, 1214 McCormick Bldg., Chicago. Annual meeting, 2d Tuesday in October, 1915, New York.
- ASSOCIATION OF RAILWAY CLAIM AGENTS.**—Willis H. Failing, N. Y. C., 3842 Grand Central Terminal, New York. Next meeting, May 19, 1916, Atlantic City, N. J.
- ASSOCIATION OF RAILWAY ELECTRIC ENGINEERS.**—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Annual meeting, October 18-24, 1915, Chicago.
- ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.**—P. W. Drew, Soo Line, 112 West Adams St., Chicago. Annual meeting, June 20-22, 1916, St. Paul, Minn.
- ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.**—G. P. Conard, 75 Church St., New York. Next meeting, December 14-15, 1915, St. Louis, Mo.
- BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.**—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meetings with American Railway Bridge and Building Association.
- CANADIAN RAILWAY CLUB.**—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.
- CANADIAN SOCIETY OF CIVIL ENGINEERS.**—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.**—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.
- CENTRAL RAILWAY CLUB.**—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Stabler, Buffalo, N. Y.
- ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.**—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.
- FREIGHT CLAIM ASSOCIATION.**—Warren P. Taylor, Traffic Manager, R. E. & P., Richmond, Va. Annual session, May 17, 1916, Washington, D. C.
- GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.**—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.
- INTERNATIONAL RAILWAY FULL ASSOCIATION.**—C. G. Hall, C. & E. L., 922 McCormick Bldg., Chicago. Annual meeting, May, 1916, Chicago.
- INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.**—Wm. Hall, 1126 W. Broadway, Winona, Minn.
- INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.**—A. L. Woodworth, C. H. & D., Lima, Ohio. Next meeting, August, 1916, Chicago.
- MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.**—T. I. Goodwin, C. R. I. & P., Eldon, Mo. Next meeting, October 19-21, 1915, St. Louis, Mo.
- MASTER BOILER MAKERS' ASSOCIATION.**—Harry D. Vought, 95 Liberty St., New York.
- AND CANADA.**—A. P. Dane, B. & M., Reading, Mass. Next annual meeting September, 1916, Wilmington, Del.
- MASTER CAR BUILDERS' ASSOCIATION.**—J. W. Taylor, 1112 Karpen Building, Chicago. Annual meeting, June, 1916.
- NATIONAL RAILWAY APPLIANCE ASSOCIATION.**—C. W. Kelly, 349 People's Gas Bldg., Chicago. Next convention, March, 1916, Chicago.
- NEW ENGLAND RAILROAD CLUB.**—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.
- NEW YORK RAILROAD CLUB.**—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.
- NIAGARA FRONTIER CAR MEN'S ASSOCIATION.**—E. N. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.
- PEORIA ASSOCIATION OF RAILROAD OFFICERS.**—M. W. Rotchford, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.
- RAILROAD CLUB OF KANSAS CITY.**—Claude Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Saturday in month, Kansas City.
- RAILROAD MEN'S IMPROVEMENT SOCIETY.**—J. B. Curran, Eric R. R., 50 Church St., New York. Meetings, alternate Thursdays, October to May, Assembly Rooms of Trunk Line Association, 143 Liberty St., New York.
- RAILWAY BUSINESS ASSOCIATION.**—Frank W. Noxon, 30 Church St., New York. Annual meeting, December, 1915, Waldorf-Astoria Hotel, New York.
- RAILWAY CLUB OF PITTSBURGH.**—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.
- RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.**—J. Scribner, 1063 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.
- RAILWAY FIRE PROTECTION ASSOCIATION.**—C. B. Edwards, Fire Ins. Agt., Mobile & Ohio, Mobile, Ala. Next meeting, October 5-7, 1915, Chicago.
- RAILWAY REAL ESTATE ASSOCIATION.**—Frank C. Irvine, 1125 Pennsylvania Station, Pittsburgh, Pa. Next meeting, October 13, 1915, Chicago.
- RAILWAY SIGNAL ASSOCIATION.**—C. C. Rosenberg, Myers Bldg., Bethlehem, Pa. Next annual convention, September, 1916, Grand Hotel, Mackinac Island, Mich.
- RAILWAY STOREKEEPERS' ASSOCIATION.**—J. P. Murphy, N. Y. C. R. R., Box C, Collingwood, Ohio.
- RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.**—J. D. Conway, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with Master Car Builders' and Master Mechanics' Associations.
- RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.**—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph Superintendents.
- RICHMOND RAILROAD CLUB.**—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.
- ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.**—L. C. Ryan, C. & N. W., Sterling, Ill. Next annual convention, September 19-22, 1916, Chicago.
- ST. LOUIS RAILWAY CLUB.**—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.
- SALT LAKE TRANSPORTATION CLUB.**—R. E. Rowland, David Keith Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.
- SIGNAL APPLIANCE ASSOCIATION.**—F. W. Edmunds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.
- SOCIETY OF RAILWAY FINANCIAL OFFICERS.**—Carl Nyquist, C. R. I. & P., 1134 La Salle St. Sta., Chicago. Annual meeting, October 19-21, Colorado Springs, Colo.
- SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.**—E. W. Sandwich, A. & W. P. R. R., Atlanta, Ga. Annual meeting, January, 1916.
- SOUTHERN & SOUTHWESTERN RAILWAY CLUB.**—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Piedmont Hotel, Atlanta.
- TOLEDO TRANSPORTATION CLUB.**—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.
- TRACK SUPPLY ASSOCIATION.**—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.
- TRAFFIC CLUB OF CHICAGO.**—W. H. Wharton, La Salle Hotel, Chicago.
- TRAFFIC CLUB OF NEWARK.**—John J. Kautzmann, P. O. Box 238, Newark, N. J. Regular meetings, 1st Monday in month, except July and August, The Washington, 559 Broad St., Newark.
- TRAFFIC CLUB OF NEW YORK.**—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Waldorf-Astoria Hotel, New York.
- TRAFFIC CLUB OF PITTSBURGH.**—D. L. Wells, Gen'l Agt., Eric R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings bi-monthly, Pittsburgh.
- TRAFFIC CLUB OF ST. LOUIS.**—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.
- TRAIN DISPATCHERS' ASSOCIATION OF AMERICA.**—J. F. Mackie, 7122 Stewart Ave., Chicago. Next convention, June 21, 1916, Toronto, Ont.
- TRANSPORTATION CLUB OF DETROIT.**—W. R. Hutlev, Superintendent's office, N. Y. C. R. R., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.
- TRAVELING ENGINEERS' ASSOCIATION.**—W. O. Thompson, N. Y. C. R. R., East Buffalo, N. Y. Next meeting, September, 1916, Chicago.
- UTAH SOCIETY OF ENGINEERS.**—Frank W. Moore, 1111 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.
- WESTERN CANADA RAILWAY CLUB.**—L. Kor, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.
- WESTERN RAILWAY CLUB.**—J. W. Taylor, 1112 Karpen Building, Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.
- WESTERN SOCIETY OF ENGINEERS.**—J. H. Waddell, 135 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings. Annual meeting, 1st Wednesday after 1st Thursday in January, Chicago.

Traffic News

The "Oriental Limited" train of the Chicago, Burlington & Quincy and the Great Northern, running between Chicago and Seattle, Wash., has arrived at Seattle on time 507 times in 530 days. Most of the delays have been due to blasting in connection with tunnel construction in the Rocky mountains.

Governor Fielder, of New Jersey, has appointed a committee of 24 citizens—public officers and business men—to present to the Interstate Commerce Commission a formal complaint, alleging discrimination against New Jersey in freight rates from the North and West, referring especially to shipments destined to New York harbor.

The counties of La Salle, Bureau and Putnam, Illinois, have been quarantined against the foot-and-mouth disease by an order of the United States Department of Agriculture. This action is taken owing to the discovery of the disease in two herds of cattle in La Salle county. The Department has concentrated its field force of veterinarians and inspectors on suppressing the outbreak in Illinois. At present 71 federal veterinarians and 54 assistants are at work in and around the suspected territory, making farm to farm examinations, disposing of infected herds, disinfecting premises and arranging for local quarantines to prevent the spread of the disease from infected farms to their neighbors. Co-operating with the department force is a large force of Illinois state veterinarians and inspectors.

Supplemental Hearing on Western Rate Advances

As mentioned in last week's issue, Examiner E. W. Hines, of the Interstate Commerce Commission, held a hearing in Chicago last week on advances in freight rates proposed by the railways in Western Trunk Line and Southwestern Tariff Committee territory on a number of commodities which were filed too late to be heard in connection with the Western rate advance case, and which have been suspended by the commission to December 29. It was announced on behalf of the carriers that the tariffs advancing rates on furniture would be withdrawn, pending conferences with the shippers, and that new tariffs would be filed at a later date. The principal advance under consideration was that on agricultural implements of two cents per 100 lb. throughout most of the territory, effected by advancing these articles to Class A. The principal testimony on these rates was given by E. B. Boyd, chairman of the Western Trunk Line Committee, who testified that at the present rates agricultural implements are not bearing their proper share of the burden of transportation. Additional testimony was given by W. A. Poteet, vice-chairman of the Western Trunk Line Committee, and testimony on behalf of the protesting shippers was given by C. T. Bradford, assistant traffic manager of the International Harvester Company. R. G. Brown, assistant general freight agent of the Chicago, Rock Island & Pacific, testified in behalf of the carriers regarding the proposed advance of one cent per 100 lb. in the rates on canned goods. In addition to representatives of commercial organizations and individual shippers, the state railway commissions of Iowa, Minnesota and Kansas were represented among the protestants.

THE WATER POWER POSSIBILITIES OF RUSSIA.—Without considering the Caucasus, the trans-Caspian region, or eastern Siberia, there are still in Russia proper great sources of hydraulic energy. In the northwest are the falls and rapids of various rivers, for example, the Volkhov with 30,000 to 50,000 horsepower, the Msta with 30,000, the Narova with 40,000 to 70,000, the eastern Duna with 120,000 and the Niemen. In the north again the Olonetz region offers a number of available power sites, as do the rivers which flow into the Arctic. In the Ural Mountains energy could be obtained from lakes and from the rivers Chusovaya and Bielaia, and on the Valdai plateau are sites for power development. In the south and southwest are the falls of the Dniester, 120,000 to 200,000 horsepower, and the rapids of the Dniester and the central Bug.—*The Engineering Magazine.*

Commission and Court News

STATE COMMISSIONS

The Illinois Public Utilities Commission has again suspended the tariffs providing for an increase of 5 per cent in freight rates in the state, filed by the railroads after the Interstate Commerce Commission had allowed a similar advance on interstate rates. The rates have now been suspended until December 15.

At the hearing before the Texas Railroad Commission last week on the application of the railroads of the state for authority to increase intrastate freight rates by 15 per cent, attorneys for the commission made a motion that the commission reserve its decision in the case until the railroads have filed complete answers to all the questions propounded during the hearing on which the commission ordered the roads to furnish the desired information.

The Montana Railroad Commission, acting on the complaint of the Polleys Lumber Company, of Missoula, has ordered reductions in the rates for the transportation of lumber to the principal points in the state, the reductions varying from 10 to 15 per cent. Complainants averred that their business in lumber, all of low grade, suffered from the competition of dealers on the Pacific coast, who make large quantities of high grade lumber and can afford to sell their low grade product at any price that can be obtained. The chairman of the commission, J. H. Hall, dissented from the opinion of the majority, holding that larger reductions should have been made. He would require that the rates on lumber in carloads should never exceed 8.39 mills per ton mile, which is said to be the average received from all lumber carried by the Northern Pacific.

Representatives of various organizations of shippers in Illinois held a conference with the Illinois Public Utilities Commission on September 21, for the purpose of discussing what action the commission should take in reference to a complaint filed by the Business Men's League of St. Louis with the Interstate Commerce Commission, alleging that freight and passenger rates from St. Louis to Illinois points are discriminatory as compared with the rates in effect from Illinois points to East St. Louis, which were not advanced at the time the interstate rates were advanced by order of the Interstate Commerce Commission in the 5 per cent rate case.

The Public Service Commission, of Missouri, has dismissed the complaint of the firemen's brotherhood against the principal railroads in that state asking the commission to order the equipment of switching engines with headlights, on both ends, of sufficient power to enable the engineman to see a box car 400 ft. away. The commission is enjoined by statute to require safe and adequate facilities, but it holds that in this matter the state law is superseded by congressional action, and therefore is of no effect. In the work done by switching engines the separation of interstate traffic from intrastate is impracticable, and, Congress having taken action, the jurisdiction of the state commission is nullified. Reference is had particularly to the act of March 4, 1915, by which Congress, in legislating concerning inspection of locomotives by federal authority, took jurisdiction over the entire locomotive and tender and all parts and appurtenances thereof.

Steam and Electric Roads Must Be Friendly

In an opinion by Commissioner Hodson, the New York State Public Service Commission, Second District, has ordered the New York Central and the International [Electric] Railway to provide facilities for the switching of freight between the two roads at Lockport, and to agree on a reasonable switching tariff. This is the oldest case before the commission, having been filed in 1908. Commissioner Hodson says that the long delay is due to the fact that a number of similar cases were pending in the courts and commissions of other states, and that a case parallel to this has only recently been decided by the United States Supreme Court. He says that the carriers

themselves should have adjusted the problem long ago. The decision holds that the present service is unreasonably inadequate, inconvenient and expensive, as well as possibly discriminatory, and that neither the law nor an order to enforce it will be confiscatory, following the just rendered decision of the United States Supreme Court in a Michigan case. The Erie Railroad and the International, which uses the line of the Erie into Lockport, alleged that it was a condition of the lease between the two that no road other than the Erie should participate in freight originating on its line leased to the International.

The opinion shows that when a car of freight arrives in Lockport on one road, consigned to a plant on the other road, the consignee must either unload and haul the contents across the city in a wagon, or must allow the car to be hauled 14 miles back to North Tonawanda, there switched to the other road and hauled 14 miles again to his plant, subjecting him not only to this delay, but to a switching charge of upward of \$30. There are several places in both the upper and lower parts of Lockport where these two railroads could be joined by a switch, and where there are ample opportunities to have sufficient storage tracks to hold all the cars which might be placed there at any one time for delivery from one road to the other. The city and the commercial bodies stand pledged to assist the railroads in the acquirement of necessary private property. There are plants in Lockport contiguous to both roads, and the steam locomotives of the New York Central and the electric engines of the International haul cars over the same tracks to and from these plants.

Commissioner Hodson says:

"The underlying theory of the roads seems to be the maintenance of competition, while the complainants seek to invoke the more modern theory of regulation. * * * Both carriers seem to forget that they have no prescriptive right to the freight business at Lockport." * * * The clause in the International-Erie lease confining the International switching to Erie business is qualified by the phrase "unless required by law to do so," and Commissioner Hodson says that the time has arrived when the law should require such special switching service to be extended and made general in accordance with the demand of the complainants.

COURT NEWS

The recent decision of the Missouri Public Service Commission, awarding a certificate of public necessity and convenience to the Kansas City Connecting Railroad, and authorizing the company to construct and operate a terminal and eight miles of tracks on the Missouri side of the Kansas City Stock Yards, was sustained in a decision on September 21 by the Cole County Circuit Court at Jefferson City, Mo. The trunk line railroads which had appealed from the order of the commission filed notice that they would appeal from the decision to the state Supreme Court.

"Engaged in Interstate Commerce"

The Circuit Court of Appeals, Fifth circuit, holds that an employee, while cleaning stencils used by the company to mark cars owned and used by it in interstate commerce, was not engaged in interstate commerce within the act.—*Illinois Central v. Rogers*, C. C. A., 221 Fed. 52.

The Pennsylvania Supreme Court holds that an employee was "engaged in interstate commerce" when he was injured from being struck by a passenger train while he was waiting for a freight train to pass over another track on which he was bonding together rails with copper wires, where the tracks were used in interstate commerce.—*Glunt v. Pennsylvania* (Pa.), 95 Atl. 109.

Repair Shop Employees—Fellow-Servant Rule

A car repairer was injured by a heavy casting which fell on him from the top of a cab when the engine was passing from the roundhouse. The Michigan Supreme Court held that the injury was due to no failure of the railroad to furnish a safe place to work, but to the negligence of the fellow-servant operating the locomotive, for which the railroad was not liable. The Michigan act abrogating the common-law fellow-servant rule as

applied to railroad employees expressly excepts employees working in shops or offices, and the plaintiff was within this exception.—*Revolinski v. Manistee & N. E.* (Mich.), 152 N. W. 941.

Recovery for Loss of Profits—Notice as to Use

A cotton gin was delayed in transit and recovery was sought for loss of business caused by the delay. The Alabama Court of Appeals held that notice of the particular use to which the gin was to be put could not be implied merely from the circumstances of the shipment, being in the ginning season, so as to authorize recovery. There were many uses to which the gin could be put other than operation for profit. It might have been bought to resell, or to lease, or ordered for a customer, or for demonstration, and the like.—*Illinois Central v. Brothers* (Ala.), 67 So. 628.

Intrastate Shipments—Division of Rates

The Texas Court of Civil Appeals holds that the Railroad Commission, under the statute authorizing the commission to fix the pro rata part of charges received by each of two or more connecting carriers and to establish joint rates, etc., has authority to order a division of revenue accruing to connecting carriers under freight rates on coal not belonging to either carrier. But it also holds that on an intrastate shipment a carrier is not entitled to the benefit of a joint rate on its own line for carrying its own property, in the absence of contract therefor; and an order of the Railroad Commission, which permits a carrier to charge freight rates for hauling its own property over its own road, and to participate in a through rate for so doing, permits an unjust discrimination, in violation of the statute.—*Rio Grande & Eagle Pass v. Railroad Commission* (Tex.), 175 S. W. 1116.

Fireman's Contributory Negligence Diminishing Damages

Action was brought under the federal employers' liability act against a railroad by a fireman for injuries caused by his engineer disregarding stop signals, and running into a train. There was clear evidence showing negligence by the engineer. The substantial question was as to the effect of the fireman's conduct. He saw the green signal requiring the train to slacken speed and called it to the engineer, but, when it became evident that the engineer was paying no attention to the caution, the fireman did nothing further to insure that the signal be obeyed. The Circuit Court of Appeals, Sixth circuit, held that he was guilty of contributory negligence, diminishing his damages, as provided by the statute. His inaction was not excusable because of his supposition that the signal had been changed to a white signal before they passed it; this supposition being based on nothing except the fact that the engineer failed to slacken.—*Pennsylvania v. Sheeley* (C. C. A.), 221 Fed. 901.

The New York "Jitney" Law

The New York Supreme Court, Justice Hasbrouck, considering the so-called "jitney bus" law, holds that the following classes of vehicles must secure the consent of local authorities and apply to the Public Service Commission for a certificate of public convenience and necessity, namely: (a) A bus line; (b) a stage route; (c) a motor vehicle line or route; (d) a vehicle in connection with a bus line, a stage route, a motor vehicle line or route; (e) a vehicle carrying passengers at a rate of fare of fifteen cents or less for each passenger within the limits of a city; (f) a vehicle carrying passengers in competition with another common carrier which is required by law to obtain the consent of the local authorities of said city to operate over the streets thereof.

Practically all operators of bus lines in the cities of the state are liable to procedure under the penalty clause of the Public Service Commission Law unless they secure the permission of the city authorities and the certificate of the Public Service Commission. It is held that in the case of Elmer G. Booth, of Rochester, the license of the city of Rochester, granted before this law took effect, does not relieve Booth from the necessity of getting the consents of the city authorities under the new law and of the Public Service Commission.

Railway Officers

Executive, Financial, Legal and Accounting

S. H. Reams, agent of the Seaboard Air Line at Savannah, Ga., has been elected vice-president of the Durham & Southern, with headquarters at Durham, N. C., vice J. E. Stagg, deceased.

C. E. Schaff, president of the Missouri, Kansas & Texas, and of the Missouri, Kansas & Texas Railway of Texas, with office at St. Louis, Mo., has been appointed receiver of both companies.

O. G. Parsley, vice-president of the Missouri, Oklahoma & Gulf of Texas, has removed his offices from Kansas City, Mo., to Ft. Worth, Tex., where he has assumed charge of traffic and operation in Texas.

H. U. Mudge, president and co-receiver of the Chicago, Rock Island & Pacific, has resigned as receiver and has been appointed by Jacob M. Dickinson, the sole remaining receiver, chief executive officer for the receiver. See an item in Financial News under Chicago, Rock Island & Pacific.

Operating

J. E. Votaw has been appointed assistant general manager of the Memphis, Dallas & Gulf, with headquarters at Nashville, Ark.

E. Lambert has been appointed trainmaster of the New York Central, with headquarters at Syracuse, N. Y., and W. E. Nelson has been appointed trainmaster, with headquarters at Lyons, N. Y.

Robert King, division superintendent of the Canadian Pacific at London, Ont., has been appointed division superintendent of the National Transcontinental, with headquarters at Winnipeg, Man.

A. E. Pistole, superintendent of terminals of the Texas & Pacific at Ft. Worth, Texas, has been appointed trainmaster of the Ft. Worth subdivision of the Rio Grande division, with headquarters at Baird, Texas.

J. K. Yohe, Jr., trainmaster of the Baltimore & Ohio at Connellsville, Pa., has been appointed assistant superintendent, with headquarters at Cumberland, Md., and C. M. Stone, assistant trainmaster at Smithfield, Pa., has been appointed trainmaster, with office at Connellsville.

John T. Broderick, chief clerk to the third vice-president of the Baltimore & Ohio at Baltimore, Md., has been promoted to supervisor of special bureaus of the operating department, in charge of the safety first department, agreements and contracts, records and reports of federal and state commissions, free transportation and the employees' magazine.

M. Seargeant, inspector of transportation of the Louisville & Nashville at Jackson, Ky., has been appointed superintendent of the Eastern Kentucky division and J. R. Pates has been appointed master of trains. The Eastern Kentucky division includes the Louisville & Atlantic Railroad and that part of the Lexington & Eastern Railway from Maloney to McRoberts, Ky. Division headquarters are at Ravenna, Ky. The rest of the Lexington & Eastern, from Lexington to Maloney will be the Lexington & Eastern branch, and will be added to the Kentucky division of the Louisville & Nashville.

Traffic

N. C. Spangler, division freight agent of the Baltimore & Ohio, at Chillicothe, Ohio, has resigned to go into other business.

A. A. Boyle has been appointed commercial agent of the Missouri & North Arkansas, with headquarters at Birmingham, Ala.

C. J. Chisam, assistant general freight agent of the Chicago Great Western at Omaha, Neb., has been appointed general agent, with office at Los Angeles, Cal., vice M. F. Collins, resigned.

J. S. Houston, assistant general freight agent of the International & Great Northern, with headquarters at St. Louis, Mo., has been promoted to assistant general freight and passenger

agent, with headquarters at St. Louis and Chicago. Effective October 1.

David H. Hilton has been appointed general eastern agent of the Chicago, Indianapolis & Louisville, with headquarters at New York.

L. C. Finkle, has been appointed commercial agent of the Atlantic Coast Line, with office at Cincinnati, Ohio, vice E. H. Smith, resigned.

L. Osborn has been appointed division freight agent of the Chicago, Rock Island & Pacific, with headquarters at Hutchinson, Kan., vice J. B. Rishel, deceased. Effective October 1.

A. C. Littlejohn, traveling freight agent of the Queen & Crescent Despatch, has been appointed commercial agent, with headquarters in New Orleans, La., vice A. B. Collins, transferred.

Edgar Yungman, division passenger agent of the Pennsylvania Railroad, at Pittsburgh, Pa., has been appointed assistant general passenger agent with headquarters at Philadelphia, succeeding

Colin Studds, deceased. Mr. Yungman was born on August 24, 1867, at Tamaqua, Pa., and was educated in the public schools of Camden, N. J. He entered the service of the Pennsylvania Railroad on August 14, 1883, as a clerk in the passenger department at Philadelphia, Pa., and after serving in various positions in that department was made passenger agent of the Baltimore district at Baltimore, Md., in October, 1902. The following year he was transferred to the Southeastern district at Washington, D. C., and later in the same year was appointed chief clerk of the passenger

department at Philadelphia. In December, 1907, he was appointed division ticket agent of the Philadelphia & Erie division and the Northern Central Railway at Williamsport, Pa., and in April, 1910, was transferred to Pittsburgh as division ticket agent of the Western Pennsylvania and Allegheny divisions. In March, 1913, when the passenger department of the Pennsylvania Lines East of Pittsburgh and Erie was reorganized, Mr. Yungman was promoted to division passenger agent at Pittsburgh, which position he held at the time of his recent appointment as assistant general passenger agent of the same road as above noted.

F. W. Robinson, assistant traffic manager of the Oregon-Washington Railroad & Navigation Company, has been appointed traffic manager at Portland, Ore., to succeed R. B. Miller, resigned. Effective November 1.

Al J. Hirschman, traveling freight agent of the St. Louis Southwestern of Texas, has been appointed general traveling agent with headquarters at Ft. Worth, Tex., vice Claude Wilson, resigned. Effective September 10.

R. E. Larmour, assistant general freight agent of the Canadian Pacific at Vancouver, B. C., has been appointed general agent of the freight department, with office at New York, succeeding W. F. Stevenson, deceased.

M. W. Burns has been appointed general southwestern agent of the Chicago & Eastern Illinois, with headquarters at Chicago, Ill. George H. Hume has been appointed commercial agent, with headquarters in Chicago, vice M. W. Burns, promoted. Effective September 20.

E. L. Goff, division freight agent of the Chicago, Rock Island & Pacific, with headquarters at Davenport, Iowa, will assume the duties of S. F. Boyd, district freight and passenger agent in Davenport, on October 1. Mr. Goff's title will be divi-

E. Yungman

sion freight and passenger agent. Mr. Boyd, who has been in the employ of the Rock Island for about 35 years, has been retired on a pension, and his jurisdiction, extending over Davenport, Iowa, Moline and Rock Island, Ill., has been added to that of Mr. Goff.

J. W. Daniel, J. M. Hansell and J. S. Smith have been appointed commercial agents of the Missouri, Oklahoma & Gulf of Texas, with headquarters at Houston, Sherman and Ft. Worth, Texas, respectively. Effective September 1. H. W. Ross, general freight and passenger agent, with headquarters at Denison, Tex., has resigned.

Engineering and Rolling Stock

William Henry Haley, whose appointment as superintendent of car service of the Missouri Pacific—St. Louis, Iron Mountain & Southern was announced last week, was born on July 27,

1872, at Dundee, Mo. After a grammar school education he entered railway service as messenger boy for the Terminal Railroad Association of St. Louis on August 15, 1888. He held consecutively the positions of yard clerk and car accountant for the same association and on January 10, 1901, was appointed general yard clerk of the Missouri Pacific at St. Louis, Mo., a position which he held until October 1, 1904. From that date until June 16, 1905, he held the same position for the Missouri Pacific and the St. Louis, Iron Mountain & Southern; from June, 1905, until June 1, 1907,

he was car clerk of the St. Louis terminal division of the same roads; from June, 1907, to May 8, 1912, freight distributor of these railroads. Up to the time of his recent appointment as superintendent of car service, noted above, he was superintendent of the American Refrigerator Transit Company at St. Louis.

Ralph L. Chandler, whose appointment as district master car builder of the New York Central, with headquarters at East Buffalo, N. Y., has already been announced in these columns,

was born on June 4, 1875, at Milford, N. Y., and was educated in the public and high schools of Buffalo, N. Y. He began railway work on June 28, 1891, with the New York Central & Hudson River and served as machinist's apprentice until October, 1894. He was then to December of the following year a machine hand in the mill of the Pullman Company at Buffalo. From January, 1896, to September, 1897, he was car builder with the American Car & Foundry Company, at Buffalo, and then re-entered the service of the New York Central & Hudson River as car

repairer. He was promoted to foreman in January, 1898, becoming assistant general foreman in September, 1900, and three years later was appointed piece work foreman on the western

division. In January, 1911, he was appointed superintendent of shops at East Buffalo, and the following August was made division general foreman of the Pennsylvania division of the same road. On October 22, 1912, he was promoted to supervisor of piece work, covering the car and locomotive departments, which position he held at the time of his recent appointment as district master car builder of the New York Central, with headquarters at the East Buffalo, N. Y., car shops, as above noted.

William Victor Wicks has been promoted from locomotive engineer of the Northern Pacific to the position of road foreman of engines.

W. B. Wood has been appointed acting assistant superintendent of shops of the Chicago, Rock Island & Pacific at Silvis, Ill., vice P. Linthicum, promoted.

Grant W. Lillie, who resigned recently as mechanical superintendent of the Second district of the Chicago, Rock Island & Pacific, at Topeka, Kan., has been appointed master mechanic of the Bingham & Garfield. His headquarters will be at Magna, Utah.

A. J. Mayham, master mechanic of the Spokane & Inland Empire, with headquarters at Spokane, Wash., has resigned, and D. I. Clough, master mechanic of the Oregon Electric and the United Railways, at Portland, Ore., has had his jurisdiction extended to include that of Mr. Mayham.

H. S. Hills has been appointed master mechanic of the Eastern Kentucky division of the Louisville & Nashville, and J. O. Ely, roadmaster of the Lexington & Eastern at Jackson, Ky., has been appointed roadmaster of the Eastern Kentucky division of the Louisville & Nashville. See item in Operating Officers.

Purchasing

W. L. Peabody, storekeeper of the Lake Superior division of the Northern Pacific, with headquarters at Duluth, Minn., has been appointed storekeeper of the St. Paul division, with office at Mississippi street, St. Paul, Minn. G. C. Harpe has been appointed storekeeper of the Lake Superior division to succeed W. L. Peabody, transferred.

OBITUARY

Rudolph Ellis, a director of the Pennsylvania Railroad, died on September 22, at his home at Bryn Mawr, Pa., at the age of 78.

John T. Johnson, general superintendent of the Central of Georgia at Savannah, Ga., died in that city on September 21. He was born in December, 1862, in Hanover county, Va., and began railway work in 1879 as a brakeman on the Chesapeake & Ohio. Subsequently he served as conductor on the same road. Since 1886 he had been in the continuous service of the Central of Georgia, serving consecutively as conductor, yardmaster and trainmaster until 1898, when he was appointed superintendent. From 1903 to January, 1905, he was superintendent of transportation; then was appointed general superintendent of transportation, and since 1906 was general superintendent.

Frank A. Durban, general attorney of the Baltimore & Ohio in the states of Ohio and Indiana, with headquarters at Zanesville, Ohio, died, as has been previously noted, in an official car on a Baltimore & Ohio train, near Cumberland, Md., on September 8, while returning to his home from Atlantic City, where he had gone for his health. Mr. Durban was born in Zanesville on November 10, 1859, and was educated in the public schools of that city and at the University of Michigan, where he completed the law course in 1879. In May, 1891, he became local counsel for the Baltimore & Ohio and later general counsel of the Zanesville & Ohio River, now the Little Kanawha division of the B. & O., and local attorney for the Cincinnati & Muskingum Valley, and for the Zanesville Street Railway. He became solicitor for the Cincinnati & Muskingum Valley in 1901 and continued in that capacity after it was absorbed by the Pennsylvania. In January, 1904, he succeeded J. H. Collins as division counsel for the B. & O. and on July 1, 1909, became general attorney for Indiana and Ohio. He also held various offices of responsibility with subsidiary roads and had served as president of the Zanesville & Ohio, the Detroit, Toledo & Ironton, and the Ann Arbor.

Equipment and Supplies

LOCOMOTIVE BUILDING

THE NORFOLK & WESTERN is in the market for 10 Mountain type locomotives.

THE CHICAGO JUNCTION is in the market for 10 six-wheel switching locomotives.

THE MINNEAPOLIS & ST. LOUIS is in the market for 15 Santa Fe type locomotives.

THE PHILADELPHIA & READING has ordered 20 Mikado type locomotives from the Baldwin Locomotive Works.

THE PUBLIC BELT RAILROAD OF NEW ORLEANS has ordered 5 switching locomotives from the Baldwin Locomotive Works.

THE CINCINNATI, INDIANAPOLIS & WESTERN is in the market for 48 locomotives, including a number of Mikado type, Pacific type and switching locomotives.

THE RUSSIAN GOVERNMENT is said to be contemplating the purchase of 150 locomotives in addition to the 400 now being built by the Baldwin Locomotive Works, the American Locomotive Company and the Canadian Locomotive Corporation.

THE CUPEY SUGAR COMPANY has ordered one four-wheel saddle tank locomotive from the American Locomotive Company for export to Cuba. This locomotive will have 11 by 16 in. cylinders, 33-in. driving wheels and a total weight in working order of 39,000 lb.

THE PUNTA ALEGRA SUGAR COMPANY has ordered one four-wheel saddle tank locomotive and two Mogul type locomotives from the American Locomotive Company for export to Cuba. The saddle tank locomotive will have 11 by 16 in. cylinders, 33-in. driving wheels and a total weight in working order of 39,000 lb., and the Mogul type locomotives will have 12 by 18 in. cylinders, 34½-in. driving wheels and a total weight in working order of 50,000 lb.

CAR BUILDING

THE COPPER RANGE is in the market for 40 ore cars.

THE MICHIGAN ALKALI COMPANY is inquiring for prices on 30 hopper cars.

THE NEW YORK, NEW HAVEN & HARTFORD is in the market for 2 dining cars.

THE PHILADELPHIA & READING has issued inquiries for 1,000 gondola or hopper cars.

THE SAN PEDRO, LOS ANGELES & SALT LAKE has ordered 5 caboose cars from the Pullman Company.

THE CENTRAL OF NEW JERSEY has ordered 25 coaches and 5 baggage cars from Harlan & Hollingsworth Corporation.

THE LA BELLE IRON WORKS, Steubenville, Ohio, has ordered 5 30-ft. 200,000-lb. capacity flat cars from the Ralston Steel Car Company.

THE BALTIMORE & OHIO has given the Western Steel Car & Foundry Company an order to repair 250 box cars and the Ryan Car Company an order to repair 500 box cars.

THE CENTRAL OF GEORGIA, reported in last week's issue as inquiring for 5 passenger cars, is in the market for 1 baggage and mail car and 4 baggage and express cars.

THE WESTERN MARYLAND has ordered 200 automobile cars from the Western Steel Car & Foundry Company and 650 70-ton gondola cars from the Standard Steel Car Company.

THE MINNEAPOLIS & ST. LOUIS, reported in the *Railway Age Gazette*, of September 17, as being in the market for 100 box cars, is now said to have increased its inquiry to 1,000 cars.

THE CHICAGO & NORTH WESTERN, reported in the *Railway Age Gazette* of September 17 as being in the market for 500 ore

cars, has ordered these cars from the American Car & Foundry Company.

THE DELAWARE & HUDSON has ordered 9 72-ft. all steel passenger coaches with smoking compartments, and 6 60-ft. all steel baggage cars from the American Car & Foundry Company, and 9 72-ft. all steel passenger coaches with smoking compartments from the Barney & Smith Car Company.

IRON AND STEEL

THE ERIE has ordered 20,000 tons of rails from the Illinois Steel Company.

THE WHEELING & LAKE ERIE has ordered 21,000 tons of rails from the Illinois Steel Company.

THE PERE MARQUETTE has ordered 17,000 tons of rails from the Algoma Steel Corporation.

THE SEABOARD AIR LINE has ordered 7,000 tons of rails from the United States Steel Corporation.

THE CHICAGO, BURLINGTON & QUINCY has ordered 18,000 tons of rails from the Illinois Steel Company.

THE WESTERN MARYLAND has ordered 500 tons of bridge material from the Fort Pitt Bridge Works.

THE BALTIMORE & OHIO has ordered 600 tons of structural material from the American Bridge Company for a new freight station at Pittsburgh.

THE NEW YORK CENTRAL has ordered 55,000 tons of rails from the Illinois Steel Company, 55,000 tons from the Lackawanna Steel Company and 10,000 tons from the Cambria Steel Company for 1916 delivery.

THE CHICAGO & NORTH WESTERN has ordered 600 tons of steel from the American Bridge Company for a record and office building.

THE PENNSYLVANIA has ordered 810 tons of steel from the American Bridge Company for a coal-handling plant, to be built at Baltimore, Md., and has ordered 400 tons of arch steel centers from the Phoenix Bridge Company for the bridge to be erected at Manayunk, Pa.

MACHINERY AND TOOLS

THE PENNSYLVANIA RAILROAD is in the market for some punching and shearing machinery and a 40-ton gantry crane for the Altoona shops.

THE PENNSYLVANIA EQUIPMENT COMPANY is in the market for a second-hand turntable, 50 ft. long, with a capacity of 40 or 50 tons or heavier.

SIGNALING

THE LOUISVILLE & NASHVILLE has authorized the installation of automatic block signals on the line between La Follette, Ky., and Etowah, 113 miles. It is estimated that the cost will be \$178,000.

CONSULAR REGULATIONS OF FOREIGN COUNTRIES (Canada and Latin America).—This is the title of tariff series No. 24, recently issued by the Bureau of Foreign and Domestic Commerce. The pamphlet contains a complete description of the shipping documents required in all Latin-American countries and Canada, gives facsimiles of consular invoices used in such countries, and points out such peculiar features as may be overlooked by the average exporter. The material has been compiled with great care, the chapter for each country having been submitted for revision to the consular representative of that country in the United States. Some American banking institutions and commission houses have also been consulted, and it is believed that by using this publication the average exporter will be able to prepare his shipping documents in correct form and save his customer in Latin-America from fines and delays in the delivery of his goods. The bulletin contains 66 pages and may be obtained from the Superintendent of Documents, Washington, D. C., for 10 cents a copy.

Supply Trade News

The Algoma Steel Corporation, Ltd., will install additional open-hearth furnaces at the Sault Ste. Marie plant.

After a four months' test the Schroeder Headlight Company has received an order for its headlights from the Baltimore & Ohio Southwestern.

The Pratt & Whitney Company, New York, has moved its Chicago sales office to the Sharples building on Washington boulevard and Jefferson street.

Fairbanks, Morse & Co. have received a contract from the New York, Ontario & Western for a conveyor-type coaling station of large capacity to be erected at Utica, N. Y.

The Franklin Railway Supply Company, New York, has opened an office in the Transportation building, Montreal, Canada, in charge of J. S. Coffin, Jr., Canadian sales manager.

The Loco Light Company, Indianapolis, Ind., has been incorporated for the manufacture of headlights, with a capital of \$10,000, and directors, R. H. Pyle, L. J. Isbell, G. D. Thornton.

W. E. Hardy, who has been in charge of the sales of the mechanical rubber goods division of the Diamond Rubber Company and the B. F. Goodrich Company, has been appointed sales manager of the Boston Belting Company, Boston, Mass.

The Q & C Company, New York, has secured exclusive control of the Peffer air brake hose protector, which was previously sold by the Railway Economy Device Company, Chicago. This device will henceforth be known as the Q & C-Peffer hose protector.

T. W. Weaver, director of purchases of the Power & Mining Machinery Company, Cudahy, Wis., has become associated with L. E. Meidinger in the management of the Milwaukee office of A. M. Castle & Co., Chicago, and George M. Rider, formerly in the iron and steel brokerage business in Kansas City, has been placed in charge of the company's office at Kansas City.

Roland L. Taylor, a member of the firm of William A. Read & Co., New York, has completed negotiations for the purchase of the Midvale Steel Company, Nicetown, Philadelphia, Pa., for a syndicate headed by William Ellis Corey, at one time president of the United States Steel Corporation. Charles J. Harrah, the founder of the company and its president for 28 years, has resigned from his position as president and director, and Charles B. Dunn and Howard Sellers have also resigned as directors. James F. Sullivan, the vice-president, has resigned, and has been succeeded by W. P. Barba, the present general manager. The vacancies in the board will be filled by the election of William E. Corey, Percy A. Rockefeller and Samuel F. Pryor. Mr. Pryor is also a director of the Baldwin Locomotive Works. Joseph Entwistle, a stenographer, is at present in the position of president, but William E. Corey will be elected president shortly. The Midvale Steel Company is engaged in the manufacture of axles, wheels, steel parts, forgings, etc. It is also well equipped to supply cannon, armor plate and other munitions of war, but has done but little in that line during the present war. It is expected that it will immediately secure a number of large orders for munitions. It is also rumored that the Midvale Steel Company may be but one of a number of companies which will be secured by the same interests.

The du Pont powder interests have made a large investment in shares of the Baldwin Locomotive Works. It has been reported that they have secured enough of the stock to give them control, but Pierre S. du Pont, the president of the du Pont de Nemours Company, has refused either to confirm or deny the report. The Baldwin Locomotive Works has been a corporation in its present form only since June 7, 1911. At that time it acquired the property of Baldwin Locomotive Works, incorporated June 7, 1909, to take over the entire property of Burnham, Williams & Co., which had been operating the business known as Baldwin Locomotive Works, founded in 1831, by Matthias Baldwin. The company's present outstanding capital stock totals \$40,000,000, of which \$20,000,000 is common, and \$20,000,000 7 per cent cumulative preferred, having equal and full voting

power with the common stock. The Baldwin Locomotive Works is said to be working on war orders, having an aggregate value of \$140,000,000. Some details of these orders were given in the *Railway Age Gazette* of September 17, page 546. The Baldwin Locomotive Works may, as defined by its charter, manufacture only locomotives, trucks, railway and industrial equipment and parts thereof, castings and forgings, and engage in the sale of articles manufactured by it. For that reason it has established the Eddystone Munitions Company for the purpose of taking care of its orders for munitions, but it is understood that it will soon obtain a new charter which will give it the right to manufacture munitions of war itself.

TRADE PUBLICATIONS

WATER TUBE BOILERS.—The A. D. Granger Company, New York, has issued Bulletin No. 2 describing and illustrating the company's Oswego internally fired water tube boilers.

SCREW-CUTTING TOOLS.—The Wells Brothers Company Division of the Greenfield Tap & Die Corporation, Greenfield, Mass., has recently issued catalog 34 relative to the company's line of screw-cutting tools and machinery. The booklet contains a large number of new devices and improvements on old ones, and, like its predecessors, stands in the front rank as a reference book in this line.

CHAIN DRIVES.—Publication No. 14, recently issued by the Morse Chain Company, Ithaca, N. Y., bears the appropriate title: "A Chain of Evidence." The booklet deals in particular with large power drives. It explains the advantages of silent chain drives and touches upon the superiority of Morse silent chain, mentioning among other things the economics secured through the use of the Morse rocker-joint which differentiates Morse chain from that of other makes. The catalog contains a number of interesting illustrations, including views of the largest chain drive in the world, a 5,000 h.p. Morse drive in the Ox Bow Hydro-Electric Plant, Snake River, Copperfield, Ore., and of the chain drive installation on the 300 h.p. McKeen gasoline switching locomotive built for the Motley County Railway which was described in the *Railway Age Gazette* of January 15, 1915, page 101.

LOCOMOTIVES.—The Baldwin Locomotive Works has recently issued Record No. 81, describing and illustrating the triple articulated or Triplex locomotive recently built by that company for the Erie, and Bulletin No. 82, showing a number of views of Baldwin locomotives for export. The former booklet contains a detailed description of the Matt H. Shay, as the locomotive has been named, well illustrated by half-tone views of the locomotive and various of its parts and line drawings showing the side elevation and cross sections. There are a number of pages dealing also with the Erie's Santa Fe type locomotive. The booklet dealing with locomotives for export contains views of a number of locomotives supplied on recent orders. The introduction touches upon the favorable position of the company as to export business and contains the interesting statement that the Baldwin Locomotive Works has been exporting locomotives since 1838, when two engines were shipped to Cuba. The illustrations given include views of the Pacific type locomotive built for New Zealand, the Pechot type locomotive built for the French government, the Mallet type engine built for the Archangel railway of Russia and a number of others.

ENGLISH RAILWAYS AND THE GOLD SUPPLY.—In furtherance of the desire expressed by the Chancellor of the Exchequer that the postoffice and all public departments charged with the duty of making cash payments shall use notes instead of gold coins wherever possible, and that the public shall co-operate in this policy, we understand that the railway companies are issuing instructions to all passenger stations, goods depots and offices in charge of the receipt of moneys to pay all gold received from the public into the banks instead of returning it into circulation. By these means railway looking and receiving offices will fall into line with the postoffices in the conservation of the gold supply of the country, whilst economy will further result by the discontinuance of the use of gold as a medium for the payment of wages to railway employees.—*Railway Gazette, London*

Railway Construction

ABERDEEN RAILROAD (ELECTRIC).—Incorporated in South Dakota to construct an electric railway and capitalized at \$250,000. Incorporators: S. C. Hedger, Charles A. Howard, Charles N. Harris.

CHESAPEAKE & OHIO.—Under the name of the Pond Fork Railway, plans have been made to build a line up Pond Fork of Coal river in Boone county, W. Va., to the head of Pond Fork, about 20 miles. The principal commodities the new line will carry are lumber and coal. (See Pond Fork Railway, Sept. 17, p. 547.)

CHICAGO, MILWAUKEE & ST. PAUL.—The report of this company for the year ended June 30, 1915, shows that the Seattle, Port Angeles & Western has under construction a line from Fairmount, Jefferson county, Washington, west via Port Angeles to Earles in Clallam county, 62 miles. The section of this line west of Port Angeles, about 24 miles, has been completed and was put in operation in January, 1915. The construction of second main track and grade reduction work on the Chicago & Council Bluffs division, in Iowa, was completed in June, 1915, between Green Island and Manilla, 270 miles. The work which was temporarily suspended on the Hastings & Dakota division has been resumed and 178.70 miles was finished and put in operation in June, 1915. New sections of second main track were completed and placed in operation on the Chicago & Council Bluffs division, from one mile east of Delmar, Iowa, to Lost Nation, 12.80 miles; Elberon to Capron, 40.46 miles; Coon Rapids to Manilla, 31.90 miles, a total of 85.16 miles, and on the Hastings & Dakota division, from Hopkins, Minn., to Cologne, 23.87 miles; Minnesota Falls to Great Northern tower, 5.80 miles; west of Montevideo, to double track switch, 10.09 miles, a total of 39.76 miles. The work of depressing the tracks from Hiawatha avenue to Hennepin avenue, in Minneapolis, Minn., about three miles, was delayed during the past year. It includes the elimination of 37 grade crossings. About 64 per cent of the work has been finished and the company plans to complete all this work during the season of 1916. Work on the elevation of the tracks along Bloomingdale road, in Chicago, 2.4 miles, is finished on about 95 per cent. This work includes the elimination of 35 grade crossings. The elevation of tracks in Milwaukee, Wis., from Kinnickinnick avenue to Fowler street, and from Clinton street to First avenue, 1.4 miles, was finished on 30 per cent and it will take about two years to complete the work which includes the elimination of 14 grade crossings. Considerable progress has been made in connection with the elevation of tracks on the Chicago & Evanston division from Montrose avenue to Howard avenue, Chicago, 4.4 miles. Of the total work 30 per cent is finished, and it will probably take about two years to complete this work, which will eliminate 36 grade crossings. The line from Lewistown, Mont., to Great Falls, 137 miles, was completed and opened for operation early in September, 1914. The grading of the Choteau line, from Great Falls, Mont., to Agawam, 70 miles, is completed, but track laying has been temporarily suspended. Construction work on the Newwood River line, a logging road extending 18.25 miles northwesterly from Merrill, Wis., was completed and the line was placed in operation in December, 1914. The construction of the Snoqualmie tunnel at the summit of the Cascade mountains was completed, and the tunnel placed in operation in June, 1915.

CUDAHY PACKING COMPANY'S LINE.—Cameron, Joyce & Co., Kansas City, Mo., has been awarded a contract by the Cudahy Packing Company for grading, bridge construction and track laying from Fowler, Kan., to silicate beds, eight miles distant.

DOVER, MILLERSBURG & WESTERN (ELECTRIC).—Grading will soon be begun on this road, which will extend from Canal Dover, Ohio, to Millersburg, a distance of 37 miles. Ben George, secretary and treasurer, Canal Dover, Ohio; D. F. A. Wheelock, chief engineer, Warren, Pa.

ERIE.—This company plans to carry out the double-tracking work and grade reduction for which surveys have been made

on about 36 miles in Lake, Porter and La Porte counties, Indiana, as soon as the work is authorized. This work when finished will complete the double-tracking of the Chicago & Erie. (December 18, p. 1165.)

KINSTON BELT LINE.—Incorporated in North Carolina with \$25,000 capital to build a belt line of steam railroad around the city of Kinston, N. C., and an electric car line through the city streets. The lines are to carry both passengers and freight. The incorporators are J. T. Deal, M. L. German, W. S. Spottswood and G. V. Cowper.

LAKE ERIE & EASTERN.—Double tracking work on about two miles of this road has been authorized to be carried out this year.

LUCERNE & AURELIA CROWN.—It is planned to begin work in the spring of 1916 on this line from Lucerne, Wash., to Aurelia Crown Mines, 16 miles. The final survey is now in progress and the average grade is to be less than 3 per cent. There will be six or seven bridges with an average length of from 50 to 60 ft. each and one tunnel about 400 ft. long. Among the structures contemplated in connection with the road are two stations, a warehouse, machine shop and wharf on Lake Chelan. The railway will serve the Aurelia Crown Company, by which it will be controlled, and its principal traffic will be about 2,000 tons of ore per day down grade and machinery and supplies for the mine up grade. O. Robert Dahl, president, Box 187, Seattle, Wash.

NEW YORK, CHICAGO & ST. LOUIS.—On September 1 this road began an extensive grade elimination project in Cleveland, Ohio, under the direction of A. J. Himes, engineer of grade-crossing elimination. The program includes the depression of tracks from Fulton road to Detroit avenue—a distance of about two and one-half miles, the construction of a four-track roadbed, and the erection of 13 reinforced concrete bridges and numerous retaining walls. About 1,600 tons of steel and 43,000 cu. yd. of concrete will be utilized, 750,000 cu. yd. of material will be removed from the excavations and 25,000 cu. yd. filled in at the street approaches. The work is being done by company forces, and will cost in the neighborhood of \$2,900,000.

NEW YORK SUBWAYS.—The War Department having granted a satisfactory form of permit for the construction of a tunnel under the East river from Fourteenth street, New York, in the borough of Manhattan, to North Seventh street, in the borough of Brooklyn, bids for the construction of the tunnel will probably be asked for in the near future.

PHILADELPHIA & READING.—An officer writes regarding the report that this company will build a short line from Wilmington, Del., to a point opposite the du Pont Powder Company's plant at Carney Point, N. J., that the matter is under way, but nothing definite has yet been decided upon.

POND FORK RAILWAY.—See Chesapeake & Ohio.

SOUTH DAKOTA SHORT LINE.—Incorporation has been asked for in South Dakota by this company with a capital of \$2,000,000 to build a railway from Mitchell, S. D., northwest to Pierre, 130 miles. The proposed line will pass through the counties of Davison, Aurora, Jerauld, Buffalo, Hyde and Hughes. The farmers along the proposed route have been asked to subscribe to stock. G. W. Adams, Council Bluffs, Iowa, is the promoter. N. Johnson, Mount Vernon, S. D., A. J. Hughes, J. E. Ziebach, F. E. Swartout and J. Jorgenson, Gann Valley; G. M. Schumway, and E. H. Scott, Letcher, are directors.

SOUTHERN RAILWAY.—Contracts have been let for second track work between Greenville, S. C., and Easley, 11.5 miles, it is said, to H. J. Dunavant & Co., Knoxville, Tenn., and from Easley to Central, 15 miles, to M. M. Elkan, Macon, Ga.

SOUTHWESTERN LIGHT, POWER & RAILWAY.—Contracts have been given to the Arbuckle Construction & Improvement Company to build this line, also for constructing a power station at Davis and repair shops at Arbuckle. The company was organized recently in Texas with a capital of \$12,000,000 to build an interurban electric line between Denison, Tex., and Oklahoma City, Okla., about 176 miles. W. T. Croslen, president; W. P. Woolsep, general manager, Oklahoma City, Okla. (Sept. 17, p. 547.)

WRIGHTSVILLE, ADRIAN & LYONS.—The rights and property of this company were recently sold to F. J. Garbutt, Sandersville, Ga., and it is said that the new owner will complete and operate the line. The company was organized to build from Wrightsville, Ga., southeast via Adrian to Lyons, about 40 miles, with a number of extensions. Grading work was finished in 1910 on about 35 miles.

RAILWAY STRUCTURES

BROOKLYN, N. Y.—The New York Public Service Commission, First district, will open bids on October 26 for the station finish construction of 11 stations on the New Utrecht avenue elevated railroad between Tenth avenue and Coney Island in the borough of Brooklyn.

BUFFALO, N. Y.—The Delaware, Lackawanna & Western has filed plans for the construction of a power station on Ohio street, in connection with the new passenger station now under construction.

CHICAGO, ILL.—Officers of the Chicago Union Station Company appeared before the Illinois Public Utilities Commission on September 21, at a hearing in support of their petition for an order authorizing the issuance of \$50,000,000 first mortgage, 4½ per cent gold bonds for 50 years, to purchase land and construct the proposed new Union station, and for an order approving the operating agreement between the roads that will own the terminal.

COLUMBIA, S. C.—A contract has been given by the Seaboard Air Line to Jonas & Garretson, Columbia, for building a reinforced concrete bridge over Blanding street, in Columbia. The bridge will be about 110 ft. long, and will cost about \$15,000.

DURANGO, IOWA.—The Chicago Great Western is building a bridge here consisting of three 70-ft. through plate girders, resting on two concrete piers and two concrete abutments. The work is being done by company forces and the estimated cost is \$25,000.

FREESPORT, ILL.—The Illinois Central is planning to build three washroom buildings for the benefit of its shop employees, carmen, enginemen and firemen. The buildings will contain lavatories and individual lockers, and shower baths will be provided for the enginemen and firemen. The structures will be brick and will represent a total cost of about \$20,000.

GRASS VALLEY, CAL.—The shop building of the Nevada County Narrow Gage recently damaged by fire is being rebuilt. The estimated loss is \$30,000.

GREENVILLE, N. J.—The Pennsylvania Railroad has given a contract to Henry Steers, Incorporated, New York, to build the new pier at Greenville (September 24, p. 586).

KANSAS CITY, KAN.—This municipality has granted the Kansas Southern a 20-year franchise which carries with it obligations in connection with future viaducts at Fifth, Seventh and Twelfth streets, and a bridge over the Kansas river to meet the requirements of the Kaw Valley Drainage District. It is doubtful whether any of this work will be begun within the next year.

NEW HOOPER, WASH.—The Oregon-Washington Railroad & Navigation Company will build a bridge over the Palouse river consisting of three 70-ft. through plate girder spans on concrete piers and abutments. Substructure bids were received by S. Murray, acting chief engineer, until September 20.

OELWEIN, IOWA.—The Chicago Great Western freight house, the contract for which was reported in our issue of last week as having been let to the Black Hawk Construction Company, of Waterloo, Iowa, will be a two-story brick structure, with reinforced concrete floors, columns and roof. The Barton spider-web flat-slab type of floor and roof construction will be used. The dimensions will be 100 ft. by 100 ft. and the estimated cost about \$22,000.

TIPTON, IND.—The Lake Erie & Western is constructing a concrete machine shop, 40 ft. by 120 ft. to replace the building destroyed by fire some time ago.

Railway Financial News

CHICAGO, MILWAUKEE & ST. PAUL.—See editorial comments elsewhere in this issue on the annual report.

CHESAPEAKE & OHIO.—See editorial comments elsewhere in this issue on the annual report.

CHICAGO, ROCK ISLAND & PACIFIC.—H. U. Mudge, president and co-receiver of the Chicago, Rock Island & Pacific, has resigned as receiver and has been appointed chief executive officer for the receiver, Jacob M. Dickinson remaining sole receiver. Mr. Dickinson gave out the following statement in regard to Mr. Mudge's resignation and new appointment:

"I knew nothing about Mr. Mudge's resignation until I saw it in the paper this morning on my arrival from Memphis. It was a great surprise and a matter of deep personal regret to me.

"The ground upon which he put it, the fact of it becoming my duty to sue him and other directors, was one for him to determine. It should, however, be understood that there was a marked differentiation between him and most of the other directors, in that the transaction for which he voted as a director was presented and acted upon at a meeting at which he was elected a director, and immediately after his election, and also in that he was not a stockholder either of the Rock Island Company of New Jersey or the Chicago, Rock Island & Pacific Railroad Company of Iowa.

"As soon as I heard of the resignation of Mr. Mudge I went to Judge Carpenter and stated that I would regard it as a misfortune to those interested in the Rock Island lines for Mr. Mudge to resign unless he would consent to remain in charge of the operation of the road under the receiver. Judge Carpenter expressed the hope that his services could be retained. Mr. Mudge agreed to continue his services."

DELAWARE & HUDSON.—The New York Public Service Commission has been asked to authorize an issue of \$14,451,000 5 per cent 20-year convertible bonds of the Delaware & Hudson to be dated October 1, 1915. The proceeds from the sale of these bonds are to be used to retire \$13,973,000 4 per cent convertible debentures due June 15, 1916. Authority is also asked for the issue of stock to provide for the conversion of the bonds.

HOCKING VALLEY.—See editorial comments elsewhere in this issue on the annual report.

MISSOURI, KANSAS & TEXAS.—A protective committee has been formed for the first and refunding 4 per cent bonds consisting of Alexander J. Hemphill, chairman of the board of the Guaranty Trust Company; Charles A. Peabody, president of the Mutual Life Insurance Company; W. A. Day, president of the Equitable Life Assurance Society; E. S. Marston, president of the Farmers' Loan & Trust Company, all of New York, and A. A. Jackson, vice-president of the Girard Trust Company, Philadelphia. Protective committees are also being formed for the general mortgage 4½ per cent bonds by the New York Trust Company and for the second mortgage 4 per cent bonds by the Union Trust Company, New York.

See editorial comments elsewhere in this issue on the appointment of C. E. Schaff, president, as receiver.

PENNSYLVANIA RAILROAD.—The New Jersey Public Utilities Commission has approved of the consolidation of the Camden & Burlington County, the Vincentown branch of the Burlington County Railroad, and the Mount Holly, Lumberton & Medford under the corporate title of the Camden & Burlington County Railroad. All of these companies are subsidiaries of the Pennsylvania.

COKE REPLACING COAL IN SWEDEN.—Sweden's importation of German coke is reported as exceptional recently. It is caused by the high prices of coal in England and the freights. Many Swedish steamers as well as state and private railroads are now using coke, either alone or mixed with coal or wood, with apparently good results as coke imports are continually increasing.—*Iron Age*.

ANNUAL REPORTS

THE CHESAPEAKE AND OHIO RAILWAY COMPANY, THIRTY-SEVENTH ANNUAL REPORT

RICHMOND, VA., September 16, 1915.

To THE STOCKHOLDERS:

The Thirty-seventh Annual Report of the Board of Directors, for the fiscal year ended June 30, 1915, is herewith submitted.

The average mileage operated during the year by The Chesapeake and Ohio Lines was 2,369.2 miles, an increase over the previous year of 23.4 miles. The mileage at the end of the year was 2,371.7 miles, an increase of 4.3 miles over mileage on June 30, 1914.

RESULTS FOR THE YEAR

Operating Revenues were.....	\$39,464,036.99
(Increase \$2,004,173.10, or 5.35%.)	
Operating Expenses were.....	27,556,413.50
(Increase \$1,142,514.99, or 4.33%.)	
Net Operating Revenue was.....	\$11,907,623.49
(Increase \$861,658.11, or 7.80%.)	
Taxes were.....	1,349,496.96
(Increase \$18,562.07, or 1.39%.)	
Operating Income, Taxes deducted, was.....	\$10,558,126.53
(Increase \$843,096.04, or 8.69%.)	
Miscellaneous Income was.....	1,018,219.08
(Decrease \$1,126,431.18, or 52.52%.)	
Rentals and Other Payments were.....	\$11,576,345.61
(Decrease \$138,449.99, or 14.52%.)	
Income for the year available for interest was.....	\$10,761,578.48
(Decrease \$144,885.15, or 1.33%.)	
Interest (75.25% of amount available) amounted to.....	8,098,041.86
(Increase \$163,394.02, or 2.06%.)	
Net Income for the year, equivalent to 4.24% on capital stock outstanding, amounted to.....	\$2,663,536.62
(Decrease \$308,279.17, or 10.37%.)	
Dividend paid during the year: One dividend of 1%.....	627,816.00
Remainder.....	\$2,035,720.62

FINANCIAL

The changes in funded debt in the hands of the public during the year were as follows:

4 per cent. Big Sandy Ry. First Mortgage Bonds.....	Retired	\$82,000.00
4 per cent. Coal River Ry. First Mortgage Bonds.....		36,000.00
4 per cent. Greenbrier Ry. First Mortgage Bonds.....		20,000.00
4 per cent. Raleigh & Southwestern Ry. First Mortgage Bonds.....		23,000.00
Equipment Trust Obligations.....		1,514,392.00
Decrease.....		\$1,675,392.00

Other changes in obligations shown under funded debt on Balance Sheet of June 30, 1915, were:

	Increase	Payments
5 per cent. First Lien and Improvement Mortgage Bonds.....	\$3,147,000.00	
6 per cent. Equipment Contracts—General Equipment Co.....		\$16,800.00
5 per cent. Equipment Contract—Standard Steel Car Co.....		583,252.23
5 per cent. Equipment Contract—Central Locomotive and Car Works.....	159,750.00	56,537.15
6 per cent. Equipment Contract—American Locomotive Co.....	147,300.00	104,876.60
	\$3,454,050.00	\$761,465.98
Net Increase.....	2,692,584.02	

The five per cent. First Lien and Improvement Mortgage Bonds were issued during the year for additions and betterments and other capital purposes. The entire issue of these bonds, \$40,270,000 face amount, is pledged as collateral for your Company's Five Year 5% Secured Gold Notes, no part of the unissued notes having been sold during the year.

Mention was made in last year's report of the sale of your Company's holdings of the capital stock of The Kanawha and Michigan Railway Company. The transaction was completed October 7, 1914, netting your Company a profit of \$1,119,315.50, which sum was transferred to Surplus. The proceeds of the sale were deposited with the Trustee under the First Lien and Improvement Mortgage and will be re-invested in improvements and investments, which is permitted under that Mortgage.

Your Company acquired during the year 479 shares of the Capital Stock of The Chesapeake and Ohio Northern Railway Company and additional shares of stock of White Sulphur Springs, Incorporated, and of Logan and Southern Railway Company. Additional First Mortgage Bonds of Elkhorn and Beaver Valley Railway Company were acquired at par in reimbursement for advances made for construction purposes.

Further shares of stock and First Mortgage Bonds of The Chesapeake and Ohio Railway Company of Indiana were issued in respect of the cost of certain additions and betterments made to that line and were pledged under your Company's First Lien and Improvement Mortgage.

A statement of charges to property accounts will be found on page 16, showing a net addition of \$3,024,127.55; that is, \$1,045,134.97 was added to cost of road and \$1,978,992.58 was added to cost of equipment.

A schedule of securities owned June 30, 1915, will be found on page 17.

During the past six years your Company's increase in capital liabilities in hands of the public, its principal acquisitions of stocks and bonds of other companies, and its expenditures for equipment branch line construction, second track and other additions and betterments, have been as follows:

CAPITAL OBLIGATIONS ISSUED OR ASSUMED:

	PAR VALUE.
General Mortgage 4½% Bonds.....	\$3,716,000.00
First Consolidated Mortgage 5% Bonds.....	2,000,000.00

Equipment:

Additional equipment acquired less retireals	\$18,865,092.67		
(Excluding \$33,248.59 expended on Chicago Line to April 30, 1915, for which securities have been acquired.)			
Costing		\$68,001,635.85	

GENERAL REMARKS

The equipment inventory as of June 30, 1915, was as follows:

Locomotives owned	605	Inc.	19
Locomotives leased	212	Dec.	27
Total	817	Dec.	8
Passenger train cars owned.....	358	Dec.	8
Passenger train cars leased.....	29
Total	387	Dec.	8
Freight train and miscellaneous cars owned	23,911	Inc.	1,603
Freight train cars leased.....	22,435	Dec.	387
Total	46,346	Inc.	1,216

The changes during the year in the accrued depreciation of equipment were as follows:

Balance to credit of account June 30, 1914.....	\$4,212,541.93		
Amount credited during year ended June 30, 1915, by charges to:			
Operating expenses	\$786,491.51		
Charges to account for:			
Accrued depreciation on equipment retired during year—20 locomotives, 6 passenger, 1,060 freight and work cars.....	\$92,227.62		
Accrued depreciation on cars changed in class during year...	2,526.15		
		94,753.77	
			691,737.74
Balance to credit of account June 30, 1915.....			\$4,904,279.67

	1915	1914		
Operating Revenues amounted to	\$39,464,036.99	\$37,459,863.89	Inc.	\$2,004,173.10
Net Operating Revenue.....	\$11,907,623.49	\$11,045,965.38	Inc.	861,658.11
Operating Ratio	69.8%	70.5%	Dec.	.7%
Tons of Revenue Freight carried one mile.....	8,138,347,516	7,064,650,082	Inc.	1,073,697,434
Revenue train load, tons	906	870	Inc.	36
Revenue tons per loaded car	32.3	30.9	Inc.	1.4

New industries were established during the year as follows: 16 manufacturing of farm implements and farm products, 15 manufacturing of lumber products, and 30 manufacturing of mineral, metal and other products. At the close of the year there were 215 companies organized for producing coal and coke on your Company's lines, with a total of 338 separate mines, of which 319 were in actual operation. Of the 1,219 coke ovens 445 were in blast, and of the 10 iron furnaces, having a total daily capacity of 1,490 tons, 6 are in operation, with a total daily capacity of 950 tons of pig iron. 214 new settlers located in your Company's territory during the year, these settlers having purchased 49,011 acres of land from private parties, with an investment of \$1,288,811.

An extension of Pine Creek Branch of Logan and Southern Railway, eight-tenths of a mile, has been completed.

The construction of about thirty miles of the Chesapeake and Ohio Northern Railway has been begun, during the year, from a point near Edgington, Kentucky, to a point near Waverly, Ohio, on the Norfolk and Western Railway, including a steel bridge across the Ohio River, which is expected to be completed in the fall of 1916. Arrangements have been concluded by The Chesapeake and Ohio Northern Railway Company with the Norfolk and Western Railway Company by which trackage rights are secured over the Norfolk and Western Railway from a connection near Waverly, Ohio, to the line of the Hocking Valley Railway at Valley Crossing near Columbus, Ohio, which provides a through route from your Company's main line to the line of the Hocking Valley Railway.

The revenue coal and coke tonnage was \$21,325,742, an increase of 10.8 per cent; other revenue freight tonnage was 8,722,712, an increase of 3.0 per cent. Total revenue tonnage was 30,048,454 tons, an increase of 8.4 per cent. Freight revenue was \$31,288,536.62, an increase of 8.4 per cent. Freight train mileage was 8,979,417 miles, an increase of 10.6 per cent. Revenue ton miles were 8,138,347,516, an increase of 15.2 per cent. Ton mile revenue was 3.84 mills, a decrease of 6.1 per cent. Revenue per freight train mile was \$3.484, a decrease of 2.0 per cent. Revenue tonnage per train mile was 906 tons, an increase of 4.1 per cent; including Company's freight, the tonnage per train mile was 962 tons, an increase of 3.8 per cent. Tonnage per locomotive, including Company's freight, was 870 tons, an increase of 5.2 per cent. Revenue tonnage per loaded car was 32.3 tons, an increase of 4.5 per cent. Tons of revenue freight carried one mile per mile of road were 3,435,061, an increase of 14.1 per cent.

There were 6,487,803 passengers carried, a decrease of 0.1 per cent. The number carried one mile was 269,379,558, a decrease of 7.6 per cent. Passenger revenue was \$5,696,088.37, a decrease of 6.6 per cent. Revenue per passenger per mile was 2.115 cents, an increase of 1.1 per cent. Number of passengers carried one mile per mile of road was 113,700, a decrease of 8.5 per cent. Passenger train mileage was 5,008,603, a decrease of 4.2 per cent. Passenger revenue per train mile was \$1.137, a decrease of 2.5 per cent; including mail and express, it was \$1.345, a decrease of 1.7 per cent. Passenger service train revenue per train mile was \$1.375, a decrease of 1.8 per cent.

There were 7,353.2 tons of new rails (3,054.1 tons 100 lb. and 4,299.1 tons 90-lb.) equal to 49.8 track miles, used in renewal of existing main tracks. 2,252 tons of relaying rail were laid in various parts of the line, with an aggregate expenditure of \$29,359.00. 13,500 tons of 100 lb., 3,500

tons of 90 lb. and 500 tons of 125 lb. rail were purchased after July 1, 1915, a portion of which has been laid prior to the date of this report.

The average amount expended for repairs per locomotive operated was \$3,013.29; per passenger train car \$920.85; per freight train car \$81.88.

Mr. Frank A. Vanderlip resigned as a director and member of the Executive Committee on August 20, 1914, and Mr. Charles E. Gramam was elected a director and member of the Executive Committee on that date to succeed Mr. Vanderlip.

The Board renews its acknowledgment to the officers and employees for faithful and efficient services performed during the year.

By order of the Board of Directors.

GEO. W. STEVENS,

President.

FRANK TRUMBULL,
Chairman.

THE CHESAPEAKE AND OHIO LINES

GENERAL INCOME ACCOUNT

For Year ended June 30, 1915, and Comparison with Year ended June 30, 1914.

Table 2.

THE HOCKING VALLEY RAILWAY COMPANY SIXTEENTH ANNUAL REPORT

COLUMBUS, Ohio, September 16, 1915.

To the Stockholders:

The Sixteenth Annual Report of the Board of Directors, for the fiscal year ended June 30, 1915, is herewith submitted.

The average mileage operated during the year was 351.7 miles, an increase over the previous year of .2 miles. The mileage at the end of the year was 351.1 miles. See schedule on page 8.

RESULTS FOR THE YEAR

Operating Revenues were.....	\$6,181,152.97
(Decrease \$839,992.10 or 11.96%.)	
Operating Expenses were.....	4,184,370.00
(Decrease \$619,376.51 or 12.89%.)	
Net Operating Revenue was.....	\$1,996,782.97
(Decrease \$220,615.59 or 9.95%.)	
Taxes were	418,522.15
(Decrease \$32,614.12 or 7.23%.)	

Operating Income, Taxes deducted, was.....	\$1,578,260.82
(Decrease \$188,001.47 or 10.64%.)	
Miscellaneous Income was.....	292,890.78
(Decrease \$156,029.12 or 34.76%.)	
Rentals and Other Payments were.....	\$1,871,151.60
(Decrease \$79,640.09 or 71.79%.)	31,298.34
Income for the year available for interest was.....	\$1,830,853.26
(Decrease \$264,390.50 or 12.56%.)	
Interest (73.18% of amount available) amounted to.....	1,346,450.88
(Increase \$197,947.83 or 17.24%.)	
Net Income for the year amounted to.....	\$493,402.38
(Decrease \$462,338.33 or 48.37%.)	
Dividends paid during the year:	
One dividend of 3%.....	\$329,985.00
One dividend of 1%.....	109,995.00
	<u>439,980.00</u>
Remainder	\$53,422.38

FINANCIAL

The changes in funded debt shown by balance sheet of June 30, 1915, as compared with June 30, 1914, consisted in the annual payments of \$496,000 on equipment trusts, and in the retirement of \$4,000,000 face amount one-year 5% gold notes by the issue and sale of \$4,000,000 face amount one-year 6% gold notes maturing November 1, 1915.

The District Court of the United States for the Southern District of Ohio, Eastern Division, in a suit brought by the Attorney General of the United States, enjoined your Company and others from owning and controlling any interest in the Sunday Creek Company, a corporation all the stock of which had been acquired in the interest of your Company and The Toledo and Ohio Central Railway Company, the stock owned by your Company having been pledged under its First Consolidated Mortgage. The stock was accordingly sold for \$50,000, of which amount \$43,136.87 was received by the Trustee under this Company's First Consolidated Mortgage in lieu of the stock released. The Court entered an order on December 10, 1914, approving this sale of the stock and the refunding of debentures of the Sunday Creek Company held by the railroads by the delivery by the purchaser of a like par amount of general mortgage bonds of that Company.

An analysis of the property accounts will be found on pages 12 and 13, by reference to which it will be seen that additions and betterments were made during the year to the net amount of \$164,243.29, due to \$831,826.15 added to cost of equipment, and to \$230,624.20 added to and \$893,207.06 deducted from cost of road, this deduction being made necessary because of the sale—referred to in the last annual report—of the old dock property on the west side of the Maumee River at Toledo to the Pennsylvania Company.

During the past six years your Company's net addition to property accounts has been as follows:

Equipment	\$3,763,008.90
Additions and Betterments	2,592,162.82
	\$6,355,171.72

GENERAL REMARKS

The equipment in service June 30, 1915, consisted of:
 Locomotives owned..... 148
 Locomotives leased under equipment trusts..... 8

Total locomotives	156	No change
Passenger train cars owned.....	86	No change
Freight train and miscellaneous cars owned.....	9,680	Increase 25
Freight train cars leased under equipment trusts.....	5,346	Increase 790
Freight train cars under special trust.....	47	Increase 47

Total freight train cars..... 15,073 Increase 862
 The changes during the year in accrued depreciation of equipment account were as follows:

Balance to credit of account June 30, 1914.....	\$1,019,628.37
Amount credited during year ended June 30, 1915, by charges to operating expenses	\$212,304.92
Charges to account for:	
Accrued depreciation on equipment retired during year—81 freight and work cars.....	\$4,221.35
Accrued depreciation on cars changed in class during year.....	282.86
	4,504.21
	207,800.71
Balance to credit of account June 30, 1915.....	\$1,227,429.08

The strike by coal miners in the Hocking district, referred to in the last annual report, extended into August of this fiscal year, which, combined with the general business depression throughout the year and with the loss of traffic as a result of the sale by The Chesapeake and Ohio Railway Company of its stock interest in The Kanawha and Michigan Railway Company, brought about a loss of freight traffic and revenues as follows:

	1915.	1914.	Decrease.
Tons of revenue freight carried one mile	1,171,899,998	1,315,425,895	143,525,897
Operating revenues	\$6,181,152.97	\$7,021,145.07	\$839,992.10
Net operating revenue.....	\$1,996,782.97	\$2,217,398.56	\$220,615.59

The Chesapeake and Ohio Northern Railway Company is constructing a bridge across the Ohio River near Sciotoville, Ohio, and a line of railroad which connects the main line of The Chesapeake and Ohio Railway Company with the Norfolk & Western Railway near Waverly, Ohio, and it has obtained trackage rights over the Norfolk & Western Railway from that point to Valley Crossing, near Columbus, Ohio, where it will connect with the tracks of your Company. It is expected that this line will be completed before January 1, 1917.

The revenue train load increased from 1,000 to 1,035 tons, and revenue tons per loaded car from 36.9 to 37 tons.

The new dock and terminal yard on the east side of the Maumee River at Toledo has been in use throughout the year, and the yard now consists of 17.7 miles of track with a working capacity of 1,600 cars. The Kerrs Run extension of the Pomeroy Belt Railway, 1.6 miles, to the new mine of the Peacock Coal Company, was completed. The old light 80-ft. double track girder bridge at Sugar Grove was replaced by a modern heavy 90-ft. bridge of similar type.

The revenue coal and coke tonnage was 6,271,163 tons, a decrease of 14.4%; other revenue freight tonnage was 2,842,376 tons, a decrease of 10.2%. Total revenue tonnage was 9,113,539 tons, a decrease of 13.1%. Freight revenue was \$4,912,982.33, a decrease of 12.3%. Freight train mileage was 1,132,206 miles, a decrease of 13.9%. Revenue ton miles were 1,171,899,998, a decrease of 10.9%. Ton mile revenue was 4.19 mills, a decrease of 1.6%. Revenue per freight train mile was \$4.339, an increase of 1.9%. Revenue tonnage per train mile was 1,035 tons, an increase of 3.5%; including Company's freight, the tonnage per train mile was 1,068 tons, an increase of 3.1%. Tonnage per locomotive, including Company's freight, was 922 tons, an increase of 2.3%. Revenue tonnage per loaded car was 37 tons, an increase of .3%. Tons of revenue freight carried one mile per mile of road were 3,332,101, a decrease of 11%.

There were 1,810,037 passengers carried, a decrease of 16.1%. The number of passengers carried one mile on steam trains was 44,267,279, a decrease of 10%. Passenger revenue was \$832,733.36, a decrease of 8.5%. Revenue per passenger per mile of steam trains was 1.844 cents, an increase of 2.2%. The number of passengers carried on steam trains one mile per mile of road was 125,867, a decrease of 10.1%. Passenger train mileage of steam trains was 708,859, a decrease of 9%. Passenger revenue per train mile of steam trains was \$1.152, an increase of 1.1%; including mail and express it was \$1.311, an increase of 1.2%. Passenger service train revenue per train mile was \$1.371, an increase of 1.6%.

There were 1,196 tons of new 100-lb. rails, equal to 7.6 track miles, and 811 tons of new 90-lb. rails, equal to 5.7 track miles, used in the renewal of existing main tracks.

The average amount expended for repairs per locomotive was \$1,940.75; per passenger train car \$462.54; per freight train car \$35.58.

Appreciative acknowledgment is hereby made of efficient services during the year of officers and employees.

By order of the Board of Directors.

GEO. W. STEVENS,
President.

FRANK TRUMBULL,
Chairman.

ACQUISITION OF THE GREAT FALLS TERMINAL RAILWAY

The railway of the Great Falls Terminal Railway Company was constructed at Great Falls, Montana, as a terminal facility of the Great Falls-Lewistown Line. There are 3.45 miles of this railway, all of which has been electrified and is being operated very economically with electric locomotives. It was deemed advisable, both on account of economy and efficiency in operation, to take over these terminals and make them a part of the St. Paul System.

Accordingly, the Great Falls Terminal Railway Company conveyed all of its railway property and franchises to this Company by deed dated November 5th, 1914, since which date this Company has operated such railway as a part of its system and as the owner thereof.

SEATTLE, PORT ANGELES & WESTERN RAILWAY

The Seattle, Port Angeles & Western Railway, the outstanding capital stock of which is all owned by this Company, has under active construction a line of railway extending from Fairmount, Jefferson County, Wash., westerly through Port Angeles to Earles, a point in Clallam County, Wash., a distance of approximately 62 miles. That portion of the line west of Port Angeles, approximately 24 miles, has been completed and was placed in operation in January, 1915.

This line taps the rich timber country of the Olympic Peninsula and is proving to be an excellent feeder for the St. Paul System.

MILES OF TRACK, JUNE 30, 1915

Owned solely by this Company:			
Main track	9,617.22		
Second main track	1,023.50		
Third main track	21.72		
Fourth main track	13.11		
Connection tracks	46.98		
Yard tracks, sidings and spur tracks	3,104.48	13,827.01	
Owned jointly with other Companies:			
Main track	103.45		
Second main track	6.14		
Third main track	1.94		
Fourth main track	1.93		
Connection track	5.92		
Yard tracks, sidings and spur tracks	175.34	294.72	
Used by this Company under contracts:			
Main track	354.94		
Second main track	76.47		
Third main track	1.14	432.55	
Total miles of track		14,554.28	
Average miles of main track in operation during the year:			
Owned solely	9,603.62 miles		
Owned jointly	103.36 "		
Used under contracts	345.60 "		
Total average miles operated		10,052.58 miles	

The lines of road of this Company are located in the following States:	
Wisconsin	1,823.59 miles
Illinois	415.04 "
Iowa	1,868.61 "
Minnesota	1,244.90 "
North Dakota	379.93 "
South Dakota	1,794.89 "
Misouri	140.27 "
Michigan	179.98 "
Montana	1,056.11 "
Idaho	197.37 "
Washington	619.98 "
Total length of main track owned solely and jointly	9,720.67 miles

EQUIPMENT

During the year twenty-five locomotives and forty cars of various classes have been purchased or built, as follows:

25 Locomotives	3 Observation Sleeping Cars
1 Dining Car	4 Parlor Cars
1 Mail and Baggage Cars	2 Observation Parlor Cars
2 Passenger and Baggage Cars	2 Cafe Observation Cars
10 Passenger Cars	1 Track Scale Test Car
13 Sleeping Cars	

During the year eleven locomotives and one thousand four hundred and

sixty-one cars of various classes were destroyed by wreck or fire, sold or taken down on account of small capacity, as follows:

11 Locomotives	26 Refrigerator Cars
1 Passenger Car	2 Refrigerator Express Cars
1 Passenger and Baggage Car	2 Vegetable Cars
1 Mail and Baggage Car	15 Ballast Cars
1117 Box Cars	13 Caboose Cars
68 Stock Cars	22 Cinder Dump Cars
179 Flat and Coal Cars	5 Work Train Cars
9 Ore Cars	

The original cost of the equipment retired has been credited to Property Investment—Road and Equipment.

PROPERTY INVESTMENT—ROAD AND EQUIPMENT

Equipment	\$818,501.82
Purchase of Great Falls Terminal Ry.	855,902.47
New Branch Lines and Extensions	2,074,731.86
New Additional Main Tracks and Reducing Grade and Perfecting Line	4,461,992.91
Other Additions and Betterments	7,737,238.07
	\$15,948,367.13
Credit—Property retired or converted	4,451,350.23
Total as shown by detailed statement on page 38 of this report	\$11,497,016.90

IMPROVEMENTS AUTHORIZED

EQUIPMENT

Authority has been given for the purchase or building of additional equipment, as follows:

7 Sleeping-Observation Cars.
2 Lounging-Observation Cars
also to convert 231 forty thousand pounds capacity box cars into cinder-dump cars.

ADDITIONAL MAIN TRACKS

The construction of the second main track and grade reduction work on the Chicago and Council Bluffs Division in Iowa was completed on June 30th, 1915, between Green Island and Manilla, Iowa, a distance of 270 miles. On account of unfavorable business conditions, it was deemed advisable to temporarily suspend the work on the Hastings and Dakota Division, but the work has been resumed and 178.70 miles were completed and placed in operation June 30th, 1915.

On June 30th, 1915, the following new sections of second main track were completed and placed in operation:

Chicago and Council Bluffs Division in Iowa:	
One mile east of Delmar to Lost Nation, Iowa	12.80 miles
Eloercon to Capron, Iowa	40.46 "
Coon Rapids to Manilla, Iowa	31.90 "
Total	85.16 miles

Hastings and Dakota Division:

Hopkins to Cologne, Minn.	23.87 miles
Minnesota Falls to Gt. Northern Tower, Minn.	5.80 "
West of Montevideo, Minn., to Double Track Switch	10.09 "
Total	39.76 miles

AUTOMATIC BLOCK SIGNALS

During the year ending June 30th, 1915, installations of automatic block signals have been completed, as follows:

La Crosse Division:	
Portage to North La Crosse, Wis.	104.1 miles
River Division:	
Bridge Switch to Minnesota City, Minn.	30.5 "
Hastings and Dakota Division:	
Summit to one mile east of Milbank, S. D.	23.1 "
Chicago and Council Bluffs Division in Iowa:	
Green Island to Capron, Iowa	152.9 "
Slater to Coon Rapids, Iowa	51.8 "
Idaho Division:	
Center Street, Spokane, to Northern Pacific Crossing	1.4 "
Spokane	1.4 "

Since June 30th automatic signals have also been placed in service on the Chicago and Council Bluffs Division in Iowa, between Coon Rapids and Manilla. These installations comprise a total of 395.2 miles and make the automatic block practically continuous from Chicago to Minneapolis and from Chicago to Manilla.

The installation of automatic signals on the Hastings and Dakota Division from Hopkins to Cologne, Minnesota, a distance of 21.5 miles, is now in progress and will be completed in the near future.

The installation of automatic signals on the Rocky Mountain Division from Butte Yard to Finlen, a distance of 16 miles, has been authorized, and work will be started in the near future.

ELIMINATION OF GRADE CROSSINGS

The work of depressing the tracks of the Hastings and Dakota Division, from Iliawatha avenue to Hennepin avenue, in the city of Minneapolis, a distance of about three miles, was somewhat delayed during the past year. It includes the elimination of thirty-seven grade crossings. On June 30th, 1915, however, the work was about 64% completed, and it is planned to complete all of this work during the season of 1916.

The elevation of the tracks along the Bloomingdale Road, in the city of Chicago, which includes the elimination of 35 grade crossings and extends for a distance of 2.4 miles, was about 95% completed on June 30th, 1915.

The elevation of tracks in the city of Milwaukee has been somewhat delayed during the past fiscal year. This work extends from Kinnickinnick avenue to Fowler street, and from Clinton street to First avenue, a distance of 1.4 miles, and on June 30th, 1915, was 30% completed. It is estimated that it will take at least two years to complete this work, and when completed 14 grade crossings will have been eliminated in that city.

Considerable progress has been made in connection with the elevation of tracks on the Chicago and Evanston Division from Montrose avenue to Howard avenue, Chicago, a distance of 4.4 miles, and on June 30th, 1915, this work was 30% completed. It will probably take at least two years to complete this track elevation work which will eliminate 36 grade crossings.

NEW LINES AND EXTENSIONS

The line of railway from Lewistown to Great Falls, Montana, a distance of 137 miles, was completed and opened for operations early in September, 1914.

The grading of the Chateau Line, extending from Great Falls to Arawam, Montana, a distance of 70 miles, is completed, but track laying has been temporarily suspended.

Construction work on the Newwood River Line, a logging road, extending 18.25 miles northwesterly from Merrill, Wis., was completed and the line placed in operation in December, 1914.

TUNNELS

The construction of the Snoqualmie Tunnel, at the summit of the Cascade Mountains, was completed and the tunnel placed in operation on January 17th, 1915. The opening of this tunnel shortens the main line of the Coast Division 3.6 miles, eliminates interruptions from snow slides, and also eliminates 6.4 miles of ruling grade.

ELECTRIFICATION

The electrification of the Puget Sound Lines, which was commenced in April, 1914, has made such progress that the line between Deer Lodge and Three Forks, a distance of 114.4 miles, will be ready for full electric operation during the Spring of 1916. The electrification of the second division, between Three Forks and Harlowton, a distance of 114.2 miles, was commenced in April, 1915, and it is probable that this division will be ready for operation early in 1917.

RESERVE FOR ACCRUED DEPRECIATION

At the close of the fiscal year, ending June 30th, 1914, there was at the credit of Reserve for Accrued Depreciation the sum of \$6,398,789.90.

A certain percentage of the total cost of equipment, aggregating \$1,376,091.46, has been credited to this Reserve for the estimated depreciation of locomotives, passenger train cars, freight train cars and work train cars accrued during the year.

There has been charged to this Reserve an amount of \$177,816.39, representing the accrued depreciation, previously credited, on locomotives and cars destroyed, sold or taken down.

The balance of this Reserve, June 30th, 1915, as shown on page 24, is \$7,597,064.97, which represents the estimated depreciation of rolling stock subsequent to June 30th, 1907.

CAPITAL STOCK

At the close of the last fiscal year the share capital of the Company amounted to \$233,130,300.00 and consisted of \$116,855,400.00 of Common Stock and \$116,274,900.00 of Preferred Stock. It has been increased during this fiscal year by \$506,000.00 of Common Stock issued and sold. The total amount of Capital Stock at the close of this fiscal year is \$233,636,300.00, of which \$434,400.00 is held by the Company.

FUNDED DEBT

At the close of the last fiscal year the Funded Debt of the Company was \$486,881,154.66.

It has been decreased during the fiscal year by \$4,748,000.00 Terminal Mortgage bonds retired.

The amount of bonds at the close of this fiscal year is \$482,133,154.66, of which \$123,893,800.00 are in the Treasury of the Company and \$358,239,354.66 are outstanding.

TREASURY BONDS

At the close of the last fiscal year the amount of the Company's bonds in its treasury was \$153,572,500.00.

It has been decreased as follows:

General and Refunding Mortgage 4½% bonds sold.....	\$589,000.00
General and Refunding Mortgage 5% Convertible bonds sold	29,089,700.00
Total decrease	\$29,678,700.00
	=====

At the close of this fiscal year bonds in treasury amounted to \$123,893,800.00, as follows:

General and Refunding Mortgage Bonds, available for the acquisition of additional property or for other additions and betterments	\$107,310,800.00
Bonds certified by trustees, to reimburse the Company for expenditures from earnings for additional property acquired, for other additions and betterments and available for such corporate purposes as the Board of Directors may authorize: General and Refunding Mortgage Bonds....	\$16,424,000.00
General Mortgage Bonds.....	159,000.00
Total	\$123,893,800.00

OPERATING REVENUES

The Operating Revenues for the year were \$91,435,374.26—a decrease of \$2,178,325.72 compared with the previous year.

The revenue from freight traffic was \$63,953,798.62—69.95% of total revenue—a decrease of \$1,361,956.17, or 2.09%.

The number of tons of freight carried was 32,959,392—a decrease of 47,885 tons, or .14%.

The following classes of commodities show an increase compared with the previous year: Products of Agriculture, 580,423 tons; Products of Animals, 205,829 tons; Products of Mines, 559,555 tons. The following commodities show a decrease: Products of Forests, 545,140 tons; Manufactures, 404,937 tons, and Commodities Not Specified, 443,615 tons.

The number of tons of all agricultural products carried during the year was 7,742,673 tons—an increase compared with the previous year of 8.10%. Agricultural products comprised 23.40% of the total tonnage carried, compared with 21.70% of the total tonnage of last year.

The number of tons of commodities other than agricultural products carried during the year was 25,216,719 tons—a decrease compared with the previous year of 628,308 tons, or 2.43% the per cent of the total being 76.51% against 78.30% last year.

The number of tons of revenue freight carried one mile was 8,185,988,375—an increase of 106,298,870, or 1.32%. The revenue per ton per mile was .7813 cent—a decrease of .0265 cent, or 3.28%. The average miles each ton of revenue freight was carried was 248.37 miles—an increase of 3.58 miles, or 1.46%.

The number of tons of revenue freight carried per loaded car was 16,835, against 16,498 last year—an increase of 2.04%. The number of tons of revenue freight per freight and mixed train mile was 390.21, against 379.78 last year—an increase of 2.75%. The revenue from freight per freight and mixed train mile was \$3.0486, as against \$3.0678 last year—a decrease of .63%.

The revenue from passenger traffic during the year was \$17,952,428.18—19.63% of the total revenue—a decrease of \$1,008,796.40, compared with the previous year, or 5.32%.

The number of passengers carried was 16,065,456—a decrease of 360,560, or 2.20%. The number of passengers carried one mile was 858,452,321—a decrease of 53,923,494, or 5.91%.

The revenue per passenger per mile was 2.091 cents—an increase of .013 cent, or .63%. The average miles each passenger was carried was 53.43 miles—a decrease of 2.11 miles, or 3.80%.

OPERATING EXPENSES

The Operating Expenses for the year were \$61,971,701.03, a decrease of \$918,600.21, compared with the previous year.

The expenses of Maintenance of Way and Structures were \$10,377,184.60; Maintenance of Equipment, \$13,737,535.32; Traffic Expenses, \$1,756,800.69; Transportation Expenses, \$35,697,961.43; Miscellaneous, \$722,635.21; General Expenses, \$1,862,938.89; and Transportation for Investment—Cr., \$2,183,355.11.

There was an increase in Maintenance of Equipment of \$112,439.68; in General Expenses of \$198,859.92 (due largely to the additional help required in preparing statistics for the Western Advance Rate Passenger and Freight Cases before the Interstate and State Commissions) and Transportation for Investment—Cr., \$364,889.50.

There was a decrease in Maintenance of Way and Structures of \$344,915.08; in Traffic Expenses of \$42,820.78; in Transportation Expenses of \$1,150,972.29; and in Miscellaneous Operations of \$56,081.16.

During the year 39 steel bridges, aggregating 2,980 feet in length, and 12 masonry bridges, aggregating 1,603 feet in length, were built—replacing 4,026 feet of wooden bridges, 407 feet of iron bridges and 150 feet of embankment; and 19,025 feet of wooden culverts were replaced with iron and concrete pipe. About 3 miles of pile bridges were filled with earth, 44 bridges having been completely filled and 43 reduced in length by filling.

SUBSIDIARY COMPANIES

The operation for the fiscal year of the Subsidiary Companies named below show the following results:

These companies are operated independently, and their Revenues and Expenses are not included in the statement of the Chicago, Milwaukee & St. Paul Railway Company, shown on page 7 of this report.

TACOMA EASTERN RAILROAD COMPANY

PURCHASE OF THE RAILWAY ELECTRICAL ENGINEER

The *Railway Electrical Engineer*, which is now published by the Wray Publishing Company, at Chicago, has been bought by the Simmons-Boardman Publishing Company, the publisher of the *Railway Age Gazette*, *The Signal Engineer* and the *Railway Age Gazette, Mechanical Edition*. Beginning with November it will be issued by the Simmons-Boardman Publishing Company from its New York office, Woolworth Building, New York City. It will not be consolidated with any of the other periodicals of this company, but will be continued as a separate monthly publication. Edward Wray, heretofore publisher of the *Railway Electrical Engineer*, will remain with the paper, becoming business manager.

The use of electricity on steam railways has for some years been fast becoming more varied and extensive. One needs but refer to its increasing adoption for the lighting of trains and in connection with the operation of shop machinery and block signals for an illustration of this statement. Of even greater significance is the progress which has been made in the electrification of steam railways. While the mileage which has been electrified is comparatively small, the number and variety of the pieces of work that have been carried out and that are under consideration are great; and there is ample reason for believing that within the comparatively near future there will be a material increase in the mileage.

It is evident that there is a large field of usefulness for a publication devoted especially to the technical details of the numerous problems raised by the increasing use of electricity on steam railways. It is to this field that the *Railway Electrical Engineer* has devoted itself in the past with much success. It is to this field that, under its new management, it will continue to devote itself; and since, under the new management, it will be able to command the services of a larger staff of experts in the field of railway transportation, it is to be hoped and expected that it will be able to cover its field even more successfully. The readers of the *Railway Age Gazette* will profit also by the addition of a strong electrical engineering staff.

Recently the Interstate Commerce Commission's valuation forces have been making more rapid progress. In part, of course, this is probably due to the fact that the organization is becoming more skilled, but it must be remembered that it would be folly of the most expensive kind to sacrifice accuracy for speed. One party recently "valued" a rather difficult line at an average of something faster than four miles per eight-hour day. On an old line, where it is difficult to determine where the original surface of a hill through which a cut has been made was, where ballast may have worked down to a great depth in some places and be comparatively shallow in others, where the only way to determine the proportion of various kinds of ties is to inspect considerable portions of each mile, and where structures are of varying degrees of age and of material and of original cost, it would seem that to cover four miles in an eight-hour day, the cross section party, which was the slowest party, consisting of two I. C. C. inspectors and one railroad man, means either that the commission has secured remarkably efficient men or that guesses are being pretty freely used. All through the hearing before the commission, reported elsewhere in this issue, insistence was placed on the vital necessity for absolute mathematical accuracy in the collection of data. Nothing would be so fatal to a valuation, if it were to be attacked in a court of law, as to show that the commission's data on

*Illustrated.

which the valuation was based were inaccurate or incorrect. In the interests of all concerned, therefore, it is of utmost importance that accuracy shall not be sacrificed for speed.

In an editorial in the *Railway Age Gazette* for September 24, page 549, on "Railway Returns for the Fiscal Year," it was erroneously stated that the express earnings of the railways per mile had been reduced from \$960 in 1914 to \$302 in 1915. The \$960 item for 1914, as shown in the Interstate Commerce Commission's summary, includes earnings from mail, express and other transportation combined, while for 1915 these three classes of earnings are separated, as follows: Mail, \$249; express, \$302, and other transportation, \$366, making a total of \$917, which is comparable with the \$960 for 1914. Also these three items should have been bracketed in the table published on page 539, to show the true comparison with the 1914 figures.

Erroneous Statement
as to
Express Earnings

At the recent convention of the Traveling Engineers' Association favorable action was taken on the recommendation that arrangements be made with the International Railway Fuel Association to hold the conventions of the two associations on consecutive dates for the purpose of enabling those who are members of both associations to attend both conventions with a reduction in the amount of time they are absent from their roads. This is a step in the right direction and shows a disposition on the part of the railroad men to get the most they can out of the time spent away from their offices. Such an arrangement in the case of these associations is especially logical, as there are many men who are members of both organizations, there being numerous subjects considered in the Fuel Association of direct interest to the traveling engineer. The plan should receive the hearty support of the higher mechanical officers, who would find it much to the advantage of their roads to have their men attend both conventions. The making of final arrangements was left to the executive committees of the two associations.

The cab-signal and automatic-stop installation lately put in use on the Western Pacific at Oroville, California, and described on another page of this issue, will command widespread interest; and this notwithstanding the inventor's apparent indifference to some of the demands of conservative signal engineers. It is the first example, anywhere, even for a short distance, of automatic block signaling—maintenance of the space interval between trains without the intervention of signalmen—where no visual roadside signals are provided, and the report of the experience of twenty or more enginemen with this arrangement will be awaited with active curiosity by railroad men everywhere. It is also the first serious attempt to employ magnetic induction for an automatic stop. As in some quite respectable experiments made before now, the dangers of the "open circuit" are boldly faced, and large dependence is placed on excellence of material and workmanship and first-class care and inspection; though railroad officers are always demanding appliances which will be safe in spite of deficiencies in these respects. The boldness of the proprietor is evidenced also in the provision of apparatus which, apparently, has been multiplied regardless of expense; and the reduction of the capacity of the railroad by the use of the overlap has for him no terrors. For satisfactory tests the absence of a severely cold climate is a great disadvantage; but in other respects this installation should afford opportunity for making numerous instructive studies, and it is to be hoped not only that thorough studies will be made, but that the world will be given the benefit of them.

"RAILROAD BANKRUPTCY"

UNDER the above caption the Des Moines Register and Leader refers to an editorial in the *Railway Age Gazette* of October 1, showing that the mileage of railways in the hands of receivers in the United States is now greater than at any past time. The Register and Leader remarks that these statistics were published just when the western rate case had been reopened. We assure our esteemed but somewhat suspicious contemporary that this was entirely a coincidence. It just happened that the receivership record was broken at the very time when the western rate case was being reopened. If it had been broken earlier we would have mentioned the fact sooner. The Register and Leader also comments on the fact that we published the statistics "unaccompanied with any explanation of causes, or suggestion of remedies," and remarks that why this was done "must be left open to conjecture." It need not remain open to conjecture any longer. The *Railway Age Gazette* in every case where a large railway has become bankrupt has presented what it has regarded as the explanation. It has also repeatedly suggested what it believes are the remedies for the conditions which are putting so many railways into the hands of receivers. We supposed that our views on this general subject were familiar to our readers. Since, however, our contemporary apparently desires us to repeat them we shall gladly do so.

Evidently the Register and Leader has not been so diligent a reader of our columns as it must be if it is to keep correctly informed regarding developments in the field of transportation in this country. Because of this lack of diligence on its part it uses language indicating that it assumes that the *Railway Age Gazette* attributes the grief to which all the bankrupt roads have come entirely to government regulation. This assumption is not correct. The *Railway Age Gazette* knows as well as the Register and Leader, and perhaps even better, not only that the troubles of numerous roads are due largely to their own mismanagement, but also some of the forms which this mismanagement has taken. For example, we recognize the fact, and always have, that the Wabash became bankrupt chiefly because it was overcapitalized and because its credit was unwisely used in various ventures, especially in securing a very expensive entrance into Pittsburgh. We have said in past issues that the Rock Island was brought to its present plight largely because the Reid-Moore interests, for their own selfish purposes, piled one holding company on another, thereby putting a strain on the earning capacity of the property which it could not hope to stand, except under highly favorable business conditions, and because these interests made investments of the road's assets in outside properties in which it was neither wise nor righteous for them to make such investments. Likewise, we have pointed out that the necessity for the receivership of the Frisco was produced largely by forms of financial mismanagement which few railway men would care to try to defend.

But it is not a fact, as the Register and Leader implies, that in not a single case has a railway recently become bankrupt without having been wrecked by "bad management or worse." Where, for example, was the "bad management or worse" on the Missouri, Kansas & Texas? The only crime that its management has committed, so far as we have ever heard, is that of issuing more short time notes, to raise money for needed improvements, than it could get renewed. It would not have issued the short time notes if it could have issued bonds at a reasonable rate of interest, and it would not have issued bonds if it could have sold stock at a reasonable price. The management and operation of the property appear actually to have been better when it became bankrupt than they ever were before.

The same thing may be said of many other railways that are now insolvent. There are in this country 82 railways, large and small, in the hands of receivers. Where is the evidence that the plight of every one of them, or of more than a few of them,

is due to mismanagement? It has not been forthcoming. But suppose it is a fact that the railways which are broke are those which have been the poorest managed. Has that any significance? Is it to be assumed that the best managed and strongest will become bankrupt first? Naturally it is the weakest, whether from poor management or other causes, that first go down. If a man has a cold it usually settles in the weakest part of his organism. Is the fact that it settles in a weak spot any reason for neglecting it? People die from pneumonia or tuberculosis who proceed on that theory. So if the fact that the railways which are considered the weakest are going into the hands of receivers is not recognized as indicating a serious condition for our entire railway system, the ultimate results will be disastrous for all the railways.

The Register and Leader says that "if there were any predisposing cause for universal railroad bankruptcy outside of the bond and stock operations of the railroad speculators" the *Railway Age Gazette* would doubtless set it forth, "with great clearness and force." There is such a "predisposing cause" and since our contemporary both wants and needs light on the subject we shall take pleasure in shedding it. In numerous instances there have been special reasons, taking more particularly the form of financial mismanagement, why individual roads have gone into the hands of receivers. But there have also been extremely strong and unfavorable "predisposing causes" affecting almost all of the roads, and these influences have been more or less largely responsible for the failure of every road that has become bankrupt. Furthermore, unless the force of these influences is mitigated there will be a steadily increasing number of roads turned over to the courts for operation. Since the Register and Leader has mentioned the western rate case, we shall refer especially to figures for the roads directly interested in that case.

In its opinion in the western rate case (page 521), the Interstate Commerce Commission quotes statistics introduced by the carriers showing that in the six years from 1907 to 1913 the increase in the cost of road and equipment of 41 western roads was \$1,070,000,000, and that the increase in their net operating income was only \$12,300,000. The increase in net operating income was only sufficient to yield 1.2 per cent on the increase in cost of road and equipment. In the same opinion (page 521) the commission gives figures compiled by itself for 26 western roads showing that during the same six years the increase in their investment in road and equipment was \$990,000,000, and that the increase in their net operating income was only \$7,300,000. Therefore, the increase in net operating income was sufficient to yield a return of only 7/10 of 1 per cent on the increase in property invested. In the same opinion the commission specifically vouches for the correctness of the statistics of the roads regarding increases in property investment since 1907. In other words, the increase in net returns was far less than adequate to pay bare interest on the added investment. Advancing a year further, we find that between 1907 and 1914 the increase in cost of road and equipment of 41 western railways was \$1,235,876,642, while between the same years there was an actual decrease in their net operating income of \$23,599,435. In other words, after increasing the investment in their properties \$1,235,000,000 they had less net money with which to pay a return on investment than they had before. It should be noted that these figures are not affected by the financial management of the roads, whether good or bad. They are based on actual investment, actual earnings, actual expenses and actual taxes, and have no reference to capitalization, and it is hard to see how the relations between them could have been different, no matter how different the financial management of individual properties might have been.

Why has the operating income of these roads been declining while the investment in them has been increasing? Here are some of the reasons. Between 1907 and 1914 the average annual wage per railway employee in the western district increased 22.6 per cent. During the same period taxes per mile on the western lines increased from \$226.24 to \$426.67, or over 70 per cent. It

is easy to see the effect of these increases in wages and taxes on the financial position of the 41 roads that are parties to the western rate case. Between 1907 and 1914 the total operating revenues per mile of these roads increased from \$8,704 to \$9,267, or 6.4 per cent. Their operating expenses and taxes increased, meantime, from \$6,084 to \$7,110, or 16.8 per cent. The result was that their operating income declined from \$2,620 to \$2,157, or 17.3 per cent. It will be noted that this reduction in net took place in spite of the fact that there was an increase in gross, and this increase in gross merely reflects the fact that the railways handled more traffic and rendered more service per mile to the public at the end of the period than at its beginning.

Now, turning to the cases of individual properties, let us examine the figures of certain of the roads which have become bankrupt. Perhaps they also will throw some light on the nature of what the Register and Leader has so happily called the "predisposing cause for universal bankruptcy." If we should find that these individual roads enjoyed an increase in their net return and become bankrupt in spite of that, this would be conclusive reason for attributing their downfall solely to financial mismanagement. But as a matter of fact, in every case they have had heavy reductions in their *net return from operation*, as indeed has been true of a very large majority of the railways in western territory, regardless of whether they have been well or ill managed financially.

The following comparisons are all for the years 1907 to 1914. The operating revenues per mile of the Missouri Pacific increased from \$6,378 to \$6,790, or 6.4 per cent. Its operating expenses and taxes increased from \$4,754 to \$5,954, or 25 per cent, and in consequence its operating income decreased from \$1,624 to \$836, or 48 per cent. The operating revenues per mile of the St. Louis & San Francisco increased from \$7,735 to \$8,540, or 10.4 per cent. Its operating expenses and taxes increased from \$5,059 to \$6,585, or 36 per cent, and its operating income decreased from \$2,676 to \$1,955, or 26.9 per cent. The operating revenues per mile of the Wahash increased from \$10,904 to \$11,933, or 9.5 per cent. Its operating expenses and taxes increased from \$8,468 to \$11,095, or 31 per cent, and its operating income decreased from \$2,436 to \$838, or 65 per cent. The operating revenues per mile of the Rock Island lines increased from \$7,821 to \$8,313, or 6.2 per cent. Their operating expenses and taxes increased from \$5,696 to \$6,859, or 20 per cent, and their operating income decreased from \$2,125 to \$1,454, or 31 per cent. The Missouri, Kansas & Texas had a different experience from any of these roads. It had a decrease in total earnings per mile as well as in net return. Its operating revenues per mile declined from \$8,523 to \$8,241, or 3.3 per cent. Its operating expenses increased from \$5,753 to \$6,469, or 12 per cent, and its operating income decreased from \$2,770 to \$1,772, or 36 per cent.

The foregoing figures make it clear that these roads were not reduced to bankruptcy, as is so often implied, solely by financial mismanagement. They suffered during these seven years reductions in the net return per mile available for capital purposes varying from 27 to 65 per cent; and all the railways involved in the western rate case suffered an average reduction of 17 per cent. There are a few strong roads that have come through in fine shape, but a large majority would be suffering from the effects of the heavy reduction in their net return if the financial management of all had been as good as that of the best. Now, why did these reductions in net return occur when operating revenues were increasing? Simply because wages and taxes increased and the regulating authorities would not allow the increases in rates that were required to offset the unavoidable increases in outgo.

The Register and Leader, by implication, called on the *Railway Age Gazette* not only to state the causes of "railroad bankruptcy," but also to suggest the remedies. We are not averse to trying to do so. The Register and Leader doubtless will be surprised to find that one of the remedies we suggest is that the Interstate Commerce Commission be given some form of authority to regulate the issuance of railroad securities which will make impossible such financial mismanagement as has oc-

curred on the Rock Island, the Frisco, the Wabash and other roads. It may also be surprised to learn that we began advocating this kind of legislation before the Hadley Railroad Securities Commission made its report, which probably was before it was advocated by the esteemed Register and Leader. But, as the facts clearly show, no amount of regulation of securities in the past would have prevented financial distress on the part of many railways, simply because their financial distress is due mainly to the circumstance that their expenses and taxes have been increasing faster than their earnings. Regulation of the issuance of securities would not have prevented the reduction of net return from operation in the past, and it would not cause an increase in net return from operations in the future. The only thing which will make the net return of most of the railways adequate is the application of the second remedy we suggest, viz., an increase in rates; and the needed increase in rates cannot be obtained except with the consent of the regulating authorities. Because the regulating authorities have refused the needed increase in rates in the past they must shoulder their share of responsibility for the fact that there are now more miles of railways in the hands of receivers than ever before. If they continue to refuse it they will have to shoulder their share of responsibility for the additional bankruptcies that will occur.

When allusion is made to the unsatisfactory condition to which the railways of the country have been brought some people grow red in the face and shout, "Regulation!" But that is not the entire explanation. It is only part of it. Other people, when the same subject is mentioned, get red in the face and bellow, "Wall street!" That is not the entire explanation, either. The trouble is due mainly to a combination of regulation and Wall street, with a dash of labor unionism to add spice. This, at least, is the explanation of the *Railway Age Gazette*. If the Des Moines Register and Leader, or any other authority, can offer a better one it would be both welcome and useful.

GRADE CROSSING ELIMINATION

THE railroads entering the city of Chicago have spent, to date, about \$75,000,000 for the elimination of grade crossings within the city limits. It is understood that this work is to be continued until all tracks in the city have been elevated, at an ultimate cost to the companies of more than \$150,000,000. Without question, the roads have enjoyed some return for the money expended in the way of economies of operation from increased speed of trains, elimination of crossing watchmen, and also from a reduction in damage claims. The inference that these savings represent a reasonable return on the investment is, however, without foundation. It is doubtful if the most reasonable estimate of the savings would be over 25 per cent of the interest charge. The reports of the Chicago Track Elevation Commission have cited a number of material advantages accruing to the public, among which are mentioned the saving in time to people using the streets and the reduction in fire hazard owing to the elimination of delays to fire-fighting apparatus, but these are advantages which are too intangible to be measured in figures of dollars and cents.

It is clear, therefore, that this vast outlay requires justification in terms not expressed in dollars and cents, and is to be justified presumably by the reduction attained in loss of life and limb from grade crossing accidents. Unfortunately, there are no records of grade crossing accidents available antedating the inception of track elevation. The earliest authentic records are for the year 1899, after the raising of the tracks had been in progress for seven years. As shown in the accompanying diagram, there has been a noticeable reduction in the number of these accidents, and it is but fair to point out that this reduction does not represent the full effect, since it has taken place during an enormous increase in the population.

Granting that we cannot measure lives in cash, and assuming

that separation of grades in Chicago has been amply justified by the results attained, it will be interesting to note the lack of interest of the public in measures to reduce accidents from other causes. The question arises, whether money being spent in Chicago for track elevation would not cause a greater reduction in accidents if expended along other lines.

In 1914, 31 persons were killed and 111 were injured by trains crossing city streets. In the same year 100 others were killed and 148 were injured by being hit or run over by trains at points not on public streets. By far the most of these were trespassers, many of whom were on the tracks that have been elevated, yet these accidents concern the city so little that it offers the railroads almost no assistance or even encouragement in their efforts to reduce trespassing. That there has been an enormous increase in accidents to pedestrians because of automobiles is generally known, but the situation thus created does not often receive forcible expression and actual statistics such as we give below for the city of Chicago are rarely given publicity.

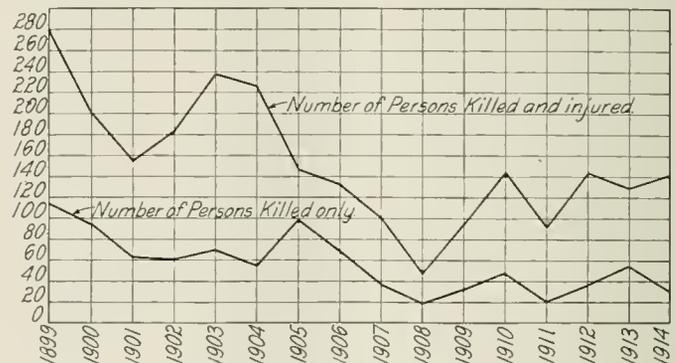

COMPARISON OF CASUALTIES TO PERSONS AT GRADE CROSSINGS OF RAILROADS AND STREETS, WITH CASUALTIES TO PEDESTRIANS WHO WERE STRUCK OR RUN OVER BY VEHICLES ON STREETS*

Year	Grade Crossing Accidents		Run Over or Struck by Vehicles	
	No. Killed	No. Injured	No. Killed	No. Injured
1905	99	48	34	602
1906	68	65	45	643
1907	38	62	48	774
1908	20	27	53	878
1909	33	63	57	1124
1910	48	96	52**	946**
1911	20	72	103	1843
1912	37	107	75	2530
1913	54	77	86	3012
1914	31	111	143	3455

* Not including street cars.

** Record is for automobiles only. Record for other vehicles was not available.

In comparison with the figures for street vehicle accidents, those for the grade crossing accidents are insignificant, yet the appalling increase in the former during the last 10 years has

Record of Casualties at Grade Crossings of Streets and Railroads in Chicago for 16 Years

excited no demand for remedial measures other than suggestions to introduce auto-dodging into the curriculum of the public schools and the passing of traffic regulations that are violated daily by most of the motorists.

A large part of the growing demand for elimination of grade crossings is a direct result of the increase in the use of motor vehicles, particularly in rural districts. In many cases, as for instance on the Long Island Railroad, conditions have become serious, not because of an increase in the railroad traffic, but on account of the marked change in the character and density of the highway traffic. Notwithstanding this, the railroad is receiving scant co-operation from the public in its efforts to prevent accidents.

The public habit of requiring the railroad to "pay the piper" is especially evident in connection with this problem. Grade separation agitation in rural communities generally subsides very quickly when it becomes apparent that the state commission proposes to place a material portion of the burden of expense on the town or county. Plans for track changes which promise numerous damage claims against the city must be discarded for

others which reduce the potential damages, although they result in much greater expense to the railroad. Park boards insist that track elevation structures must beautify the boulevards (at the railroad's expense) as well as separate the grades.

That the railways must do their part notwithstanding apathy on the part of the people concerning other related matters can be illustrated no better than by a comparison of conditions on a well-known Chicago boulevard with those on a line of railroad parallel to the boulevard less than three blocks away. The railroad tracks are being elevated at a cost of \$3,000,000. Assuming that this work is justified, the fact remains that the trains are short, the crossings are well protected by gates and watchmen, and to cross the tracks involves small delay and occasions no alarm. Not so with the boulevard. The traffic is continuous and at only one crossing is it ever interrupted for the benefit of traffic on the cross street. At all the other streets within three miles the pedestrian is able to cross only by "making a run for it" and a timid individual may have to wait minutes for a sufficient lull in the traffic to venture off the curb. The hazards to the pedestrian in crossing this boulevard are much greater than those incurred in crossing the railroad; but no one has yet suggested elevation of the boulevard.

THE VALUATION HEARING AT WASHINGTON

ONE fundamental difficulty with the valuation of railroads is that there is no generally agreed on definition of value. In a sense, the brief and the oral argument presented by the President's Conference Committee of the railroads to the Interstate Commerce Commission, in the hearing on the principles which govern in the federal valuation of railroad property, was an attempt to get before the commission a description of what must be included as value, which cannot be taken away without due process of law. Some of the questions asked by the commissioners and by representatives of the state commissions might be taken as indicating that they thought that the railroad companies were attempting to play a game of "heads I win, tails you lose," in their definition of value. Thus, if a railroad received a right-of-way free 30 years ago, it claims that the determining factor in value—not, of course, the sole factor, but still the determining factor—is the estimated cost of that right-of-way were it to be acquired today through purchase or condemnation proceedings; while, on the other hand, it claims a higher value for land which is to be used for railroad purposes than would be the value of that land were it to be bought for agricultural or other purposes.

Again, in the question of depreciation and appreciation the railroad company claims that the added value which comes with the seasoning of a railroad roadbed should be an element in determining its value and that this appreciation should be allowed for; while, on the other hand, it claims that no allowance should be made for depreciation based on a theoretical estimate of the length of life of classes of material which are being continually renewed in the ordinary course of maintenance.

If, however, a careful study is made of the brief filed by Pierce Butler and his associates on behalf of the Presidents' Conference Committee, it will be seen that any such construction put on these arguments is erroneous. In the first place, it must be remembered that all that Mr. Butler is trying to do is to enumerate and describe the elements which go to make up value. There is no attempt made to urge on the commission an acceptance of any theories as to what weight should be given to these elements or as to how they should be combined to finally determine value. It must be remembered that there are three cost figures which the commission is to report to Congress. These are original cost, the cost of reproduction new and the cost of reproduction less depreciation. Now, if we keep to cost and try to avoid as much as possible the use of the word value, the position taken by the carrier's counsel would seem to be entirely logical. The railroad companies do not contend that in determining value the original cost of right-of-way cannot be taken into consideration. On the other hand, they specifically furnish the figures for the deter-

mination of this original cost as nearly as possible. What they do argue is that when a distinct cost, the cost of reproduction new, is to be determined the original cost has no bearing whatsoever on the facts. Regardless of what may be the theories of any one as to the right of a railroad company to participate in the increment in general values which takes place with the passage of time and the growth of population, these theories are not and should not be a factor in determining a question of fact, namely, what would be the cost of reproduction new of a given railroad property? This is something that is so, regardless of whether the man who determines it is a socialist or a firm believer in the sacredness of the rights of property.

CHICAGO & NORTH WESTERN

THE Chicago & North Western had to handle almost as much business in 1915 as in 1914, notwithstanding the fact that the company received \$3,780,000 less revenue in 1915 than in 1914. The really remarkable thing, however, is that in handling almost as great an amount of business the company was able to save in expenses \$3,930,000, so that its net operating revenues were actually slightly greater in 1915 than in 1914.

The explanation of the decrease in revenues is that the company received a ton-mile rate lower by 3.45 per cent in 1915 than in 1914 and the average passenger journey was shorter by 2.76 per cent and receipts per passenger per mile were less by 1.09 per cent. The explanation of the lower freight rate is in part presumably the result of the difference in the proportion of the various classes of commodities carried and like the lower passenger rate is the result of the working of the Minnesota rate case decision.

The Chicago & North Western operates 8,108 miles of road, of which 907 miles have second track, and included in this 907 miles is 104 miles which has third track and 95 miles which has fourth track. As will be seen from the map, the company has a double-track main line of heavy traffic density from Chicago to Omaha and a line in connection with the Chicago, St. Paul, Minneapolis & Omaha mostly double track from Chicago to Minneapolis. It has a network of lines in Wisconsin, another network in Iowa, and a main line and branches extending into the Dakota wheat country and across the northern part of Nebraska into Wyoming.

In 1915 the company handled 6,216,000,000 ton-mile of revenue freight, which was a decrease of less than a quarter of one per cent from the ton mileage handled the year before. Freight revenue amounted to \$51,924,000, a falling off of \$2,066,000, or 3.8 per cent as compared with the year before. The revenue per ton per mile was 8.4 mills in 1915 as against 8.7 mills the year before.

The total number of passengers carried amounted to 33,080,000, a decrease of less than one per cent as compared with the previous year. Passengers one mile was less by 3.68 per cent, the average distance traveled per passenger being 34.17 miles as against 35.14 miles the year before. Apparently this means a falling off in through passenger business, due presumably to the unsettled business conditions and economies which they necessitated. It is hard enough to reduce passenger train mileage to meet a falling off in local business and it is almost impossible to reduce train mileage to correspond with the falling off in through business; that is why passengers carried rather than passenger mileage is a criterion of passenger business in this case and why the statement that there was almost as much business that had to be handled in 1915 as in 1914 is justified despite the smaller passenger mileage. The average rate per passenger per mile was 1.82 cents as compared with 1.84 cents, a decrease of 1.09 per cent.

Total operating expenses amounted to \$56,372,000, a decrease, as previously mentioned, of \$3,930,000 as compared with the year before. More than half of this decrease is accounted for by a saving in transportation expenses, the total transportation expenses in 1915 being \$29,753,000, or \$2,196,000 less than in the

previous year. This is a real achievement, to cut down transportation expenses while doing as big a business as heretofore in the face of the present trend of prices. The largest single item of saving was in fuel for train locomotives, which cost \$5,083,000 in 1915, a decrease as compared with the previous year of \$964,000. The total freight train mileage was 17,251,000, which was less by 5.81 per cent than in the previous year, and the trainload of all freight east of the Missouri river was 480 tons, an increase of 8.44 per cent over the previous year, and for the whole road 443 tons, an increase of 7.68 per cent. Two other large items of saving were in payments for loss and damage to freight and injuries to persons. Payments on these two accounts in 1915 amounted to \$1,827,000, a decrease of \$458,000.

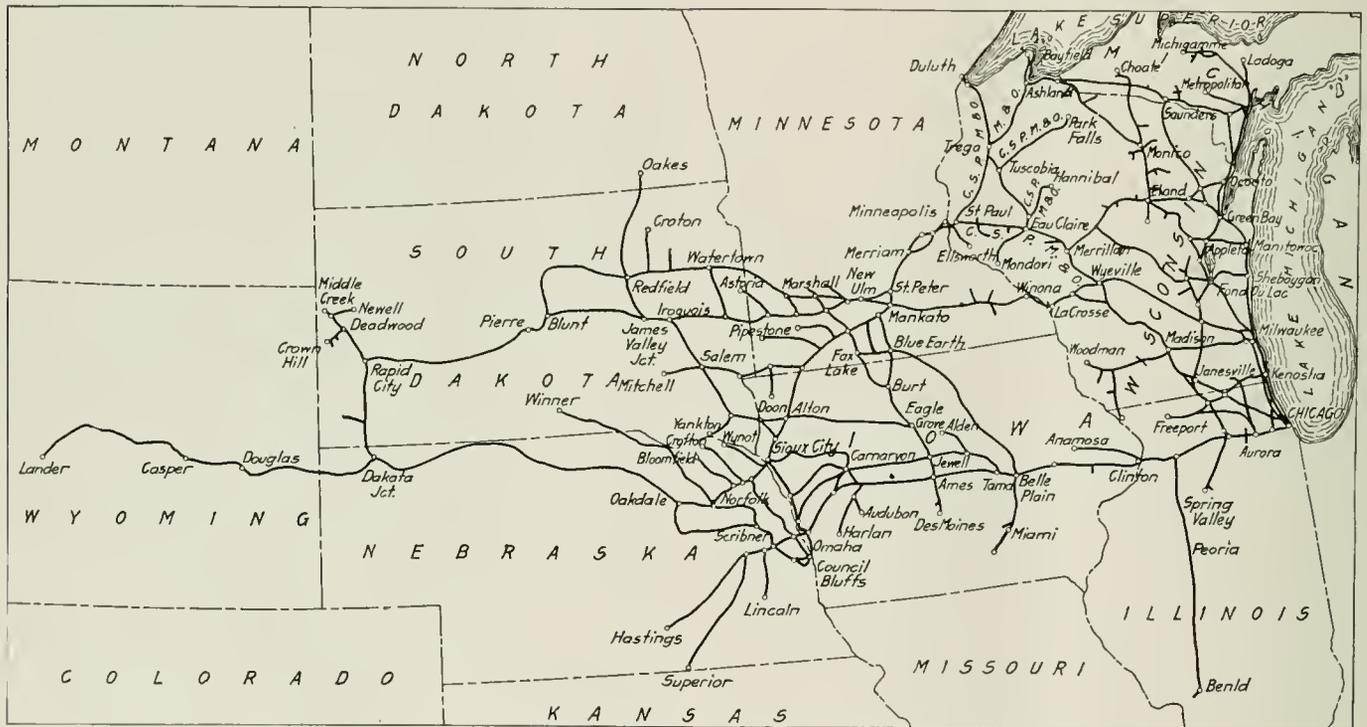

The remainder of the saving in expenses was made in a smaller expenditure for maintenance of way and structures. The expenditure on this account in 1915 was \$10,451,000, which was less by \$1,762,000 than the previous year, the larger items of saving being in roadway maintenance and track laying and surfacing, in rails, in ties, and in maintenance of structures.

There was no cut in maintenance of equipment expenses,

ever, on the North Western is pursued it will in a short time bring up the depreciation reserve to a very much larger figure.

The Chicago & North Western is, of course, one of the financially very strong roads of the United States. In 1915 a total of \$8,185,000 was spent for additions and betterments to property, of which \$4,769,000 was for equipment and the remainder for extensions, track elevation, buildings and betterment of roadway, etc. Notwithstanding this large additional investment in its property, the outstanding securities showed a net decrease of \$4,298,000. The company sold \$10,000,000 general mortgage 5 per cent bonds, due 1987, and redeemed \$12,669,000 7 per cent bonds which matured February 1, 1915, and various other small issues. At the beginning of the year there was \$19,459,000 cash on hand and at the end of the year \$9,778,000. There were no accounts and bills payable, and total current liabilities amounted to \$10,753,000 as against total current assets of \$19,386,000, which included, of course, the cash mentioned above.

As was pointed out last week in the comments on the Chicago, Milwaukee & St. Paul's annual report, the crops in much of the territory reached by the North Western are far and away the

The Chicago & North Western and the Chicago, St. Paul, Minneapolis & Omaha

which totaled \$12,649,000 in 1915, or \$290,000 more than in the previous year. A saving was made of \$224,000 in repairs of locomotives, the total in 1915 being \$4,111,000; but this was much more than offset by very largely increased charges for depreciation, \$605,000 being charged for depreciation of locomotives, which is more by \$122,000 than was charged in the previous year, and \$1,360,000 for depreciation of freight cars, which is more by \$436,000 than was charged in the previous year. The Interstate Commerce Commission's new rules for charging depreciation, under which the railroad company is ordered to charge a rate sufficient to extinguish the cost of equipment by the time it is retired, were in effect in 1915. The balance to the credit of the equipment reserve accounts at the beginning of the year was \$6,089,000 and at the end of the year, after debits for accrued depreciation on equipment retired, a credit of \$8,149,000. This is not a large amount compared with a road which has been very liberal in its depreciation charges, as, for instance, the Atchison, Topcka & Santa Fe, which at the end of 1915 had \$23,953,000 reserved for accrued depreciation. The Santa Fe, of course, operates 11,136 miles of road as against the North Western's 8,108. If the present policy, how-

best that have ever been harvested and the outlook, therefore, for the present year is particularly good. The purchase by the North Western of 40 locomotives and 5,000 freight cars puts it in a good position to take advantage of increased traffic.

The following table shows the principal figures for operation in 1915 compared with 1914:

	1915	1914
Average mileage operated.....	8,108	8,071
Freight revenue	\$51,923,861	\$53,989,475
Passenger revenue	20,528,443	21,540,543
Total operating revenues.....	80,779,675	84,559,335
Maintenance of way and structures.....	10,450,739	12,213,095
Maintenance of equipment.....	12,648,935	12,358,488
Traffic expenses	1,288,448	1,331,856
Transportation expenses	29,753,444	31,949,238
Miscellaneous expenses	604,058	665,516
General expenses	1,764,487	1,783,383
Transportation for investment—Cr.....	138,539
Total operating expenses.....	56,371,573	60,301,575
Taxes	4,516,943	4,252,790
Operating income	19,883,905	20,004,969
Gross income	22,683,904	23,245,927
Net income	11,914,049	12,306,142
Sinking funds	204,054	200,473
Dividends	10,899,615	10,899,615
Surplus	810,380	1,206,055

CHICAGO, ST. PAUL, MINNEAPOLIS & OMAHA

THE Chicago, St. Paul, Minneapolis & Omaha operates 1,753 miles of road. It is a subsidiary of the Chicago & North Western, and the operation of the two properties is in close harmony. The Omaha forms a natural part of the North Western system, providing feeder and main lines in Wisconsin, Minnesota, and extending down into the corner formed by Iowa, South Dakota and Nebraska.

The Chicago, St. Paul, Minneapolis & Omaha is a granger road with the greater part of its freight traffic such as would originate or be destined for an agricultural country. It has very little heavy loading traffic and little that can move in through full tonnage train loads. It is highly competitive territory where it is often necessary to give frequent freight service to get the business.

Total operating revenues in 1915 amounted to \$17,841,000, a decrease of \$369,000 as compared with the previous year; but, unlike the North Western, all of this increase was accounted for by a falling off in passenger revenues, total freight revenue amounting to \$11,523,000, or \$96,000 more than in the previous year. Operating expenses amounted to \$12,108,000, a decrease of \$727,000 as compared with the previous year. Rental payments and interest charges were somewhat higher, as were also taxes, so that the net available for dividends amounted to \$2,219,000, an increase of \$197,000 over the previous year. The company paid 7 per cent dividends on both its preferred and common stock, calling for \$2,087,000.

The saving in expenses was very largely made through smaller expenditures for maintenance of way, the total in 1915 being \$1,957,000, or \$670,000 less than in the previous year. There was \$229,000 spent for ties, or a little less than half as much as was spent in the previous year, and smaller expenditures for bridges, trestles and culverts, and roadway maintenance and track laying.

Transportation expenses cost \$6,738,000, or \$195,000 less than in the previous year. The ton mileage of revenue freight totaled 1,336,000,000, an increase compared with the previous year of 3.24 per cent, and the number of passengers carried totaled 4,768,000, a decrease of 2.34 per cent. Passengers carried one mile decreased by 5.39 per cent, the average passenger journey being but 52.92 miles as against 54.63 miles in the previous year. Like the North Western, the Omaha showed a lower ton-mile rate and passenger-mile rate, due in part, of course, to the Minnesota rate decision. The average ton-mile rate in 1915 was 8.6 mills as against 8.8 mills in the previous year, and the passenger-mile rate was 1.975 cents as against 2.031 cents in the previous year.

Like the North Western, the Omaha made a substantial gain in its trainloading, the total trainload in 1915 being 360 tons as against a trainload of 331 tons in 1914, an increase of 8.91 per cent. There was no change in the amount of stock or bonds outstanding during the year and \$565,000 was spent for additions and betterments, against which, however, was charged the original cost of equipment retired, leaving a net expenditure on property account of \$73,000.

The following table shows the principal figures for operation in 1915 compared with 1914:

	1915	1914
Average mileage operated.....	1,753	1,748
Freight revenue	\$11,523,103	\$11,427,563
Passenger revenue	4,983,700	5,415,710
Total operating revenues.....	17,841,348	18,210,083
Maintenance of way and structures.....	1,956,803	2,627,189
Maintenance of equipment.....	2,476,957	2,303,125
Traffic expenses	344,363	357,570
Transportation expenses	6,737,697	6,932,903
Miscellaneous expenses	178,411	182,462
General expenses	433,205	431,169
Transportation for investment Cr.....	19,839
Total operating expenses	12,107,598	12,834,117

Letters to the Editor

SUPFRHEATER LOCOMOTIVES AND GRADE REVISION

CHELSEA, Mass.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

In your issue of September 10, 1915, there appears an article on "Superheater Locomotives and Grade Revision." The author has presented a very interesting summary on the effect of superheating the steam in present saturated steam locomotives and its bearing on the question of grade revision. However, the basis of the computations and the results therefrom are so unusual that to the practical man who is in close touch with locomotive performance and the effect of superheated steam, the figures as presented serve to open the question of doubt, with a result of making the conclusions of the author of the article questionable. The method adopted by the American Railway Engineering Association and published in its Manual for 1911, was used for calculating the drawbar-pull of

Tractive Effort Curves for Typical Locomotives on Basis of A. R. E. A. and American Locomotive Company Formulas

the assumed locomotive. The locomotive is of Consolidation type, with the following principal characteristics:

Grate area, sq. ft.....	50
Heating surface, sq. ft.....	3,318
Diameter of drivers, ins.....	63
Steam pressure, lb. per sq. in.....	200
Coal consumption (while working steam) per hr., lb.....	4,000
Coal, B. t. u. value.....	11,000
Cylinders, in.....	22 x 30
Wt. of locomotive and tender in working order, lb.....	344,000

The author also assumes that train resistance in pounds per train remains constant between the speeds of 4 and 30 m. p. h., i. e., that a 32.5 ton car will have a true train resistance of 5.4 lb. per ton at speeds of 4 to 30 m. p. h. As a matter of fact, very few support this theory, as compared with the more accepted one that resistance increases with speed for the same car weight, i. e., the resistance for a 32.5 ton car at 30 m. p. h. should be about 50 per cent greater than the resistance at 5 m. p. h.

In the chart shown herewith there are drawn four locomotive tractive effort curves. The two curves marked "A.R.E.A." were plotted direct from the calculations presented for saturated and superheater locomotives in the article to which reference has been made. The two curves marked "A.L.C." are plotted from calculations which resulted from using the method suggested by the American Locomotive Company. From inspection of these curves it is evident that there is a wide divergence in the

basic theories for determining tractive effort at a speed of say 35 m. p. h., also that the difference in tractive effort due to superheating varies. According to the A.R.E.A. calculations for tractive effort at a speed of 5 m. p. h., the gain in tractive effort due to superheating is 3,966 lb. or 11.8 per cent. At a speed of 8 m. p. h. the increase in tractive effort, due to superheating is 8,452 lb., or 29.9 per cent. If this is so, why is it in actual practice under comparable conditions impossible to get a superheater locomotive to haul more tons up a five-mile grade, where sustained maximum tractive effort and a speed of 5 m. p. h. is required? It is true that differences instead of totals are dealt with here, but it was on this basis that the computations were made as presented in the article referred to. Adding to this an increased fuel economy of 35 per cent, due to application of brick arch and superheater, the steam locomotive would represent itself as the most efficient power plant.

At a speed of 35 m. p. h., the "A.R.E.A." curve gives an increase in tractive effort due to superheating of 73.3 per cent, while the "A.L.C." curve gives an increase of only 6.5 per cent. It is evident there is a wide variation in the theoretical results obtained from superheating. At this speed the "A.R.E.A." curve for tractive effort for a saturated steam locomotive shows 5,672 lb. From a practical point of view such figures will not substantiate service requirements. By allowing 91 tons weight on drivers, 12 tons on the truck and 70 tons for weight of tender of the assumed locomotive the resistances at 35 m. p. h. would be:

Machine friction	at 22.2 lb. per ton.....	2,020 lb.
Truck friction	at 8.0 lb. per ton.....	96 lb.
Tender friction	at 8.0 lb. per ton.....	560 lb.
Atmospheric friction	at V^2 lb. per ton.....	408 lb.
	3	Total..... 3,084 lb.

This leaves 5,672 — 3,084 = 2,588 lb. tractive effort available on level tangent track. This available drawbar-pull would handle 323 tons at 32.5 tons per car, or approximately 10 cars. Now in all fairness is it not ridiculous to think a large consolidation type saturated steam locomotive of 39,000 lb. tractive effort is only capable of handling 323 tons at a speed of 35 m. p. h. on level tangent track? It might be well to recall the action of comparable freight locomotives, when, due to a passenger engine failure, their service was required at the head of a passenger train whose schedule speed required higher running speeds than 35 m. p. h. Also in the case of time freight trains, do such theoretical calculations bear out practical service runs?

To answer such questions I will call on the man who constantly is in touch with the actual operation of steam locomotives, both saturated and superheated in every-day service.

M. E.

FACTOR OF ADHESION

SCRANTON, PA.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

In your issue of June 25 last a letter of mine comments on a previous article by E. F. Givin on the above subject, in which he makes a plea for the locomotive with a low factor of adhesion. Again on page 454 of your issue of September 15, in an interesting contribution, he presents his case more in detail.

My contention was that as conditions naturally varied, not only with each road and each division, but with each subdivision of service, that when practical the power should be specialized to meet a particular set of conditions.

Among other variable factors, that of adhesion holds a place of some importance. It seems to me, however, that it is not vital, as is for instance boiler capacity, and should not be permitted, more than a score of other debatable points, to unduly influence design. A profound respect for all these important, and often conflicting requirements, suggests caution in a final pronouncement.

In the example cited by Mr. Givin, in your issue of September 10, I am unable to reach his ultimate conclusion. Let us analyze

this case. Briefly, he contends that, of two units, alike in all respects except in tractive effort, the one with the lower factor of adhesion (four) would handle increased tonnage over the sister engine with a factor of five, in practically inverse ratio of the factors. Or to put it in another way, the tonnage rating is based on tractive effort, which in the engine of low adhesion is 25 per cent in excess of its opponent. Immediately following is the statement that a locomotive can handle considerably more tonnage than it will start. I believe this latter is a generally accepted fact.

I concur, therefore, in the primary conclusion that, for certain service, say drag freight, starting ability is the factor that should determine tonnage rating. With modern power, built to usual proportions, this ability is determined by adhesion, and not by tractive effort. This is evidently where our opinions differ.

Given perfect rail conditions, and even admitting the liberal use of sand, it requires great skill to start full tonnage, without slipping, especially if working with superheat. Usual proportions include a factor of adhesion ranging from four to five, the ratios under discussion, and I believe there does not exist such an engine which is unable to slip its wheels under any rail conditions. This result is accentuated by careless handling. I believe that any experienced engineman will endorse these two last statements.

If this be admitted, and there seems to be abundant evidence to support it, we arrive at a practical condition, which discredits the theoretical data advanced in Mr. Givin's argument. This data may be correct too, as far as it goes, but like all such experimental information, must be accepted with some reservation, and used with judgment, and such modification as experience warrants.

For instance, the element of high temperature, probably lacking in the experiments which resulted in the factors submitted, is very much in evidence practically. Therefore, I conclude that the two machines under discussion would each start and handle the same tonnage, their ability in this direction being determined by the total weight on drivers and not by tractive effort. This would continue until a certain critical speed was attained, which might be higher for the engine of excess power, though it is probable that here the boiler capacity would be the determining factor. In any case the speed, if on the level, would probably be well over 50 m.p.h. for both. This is sufficient for the character of the service.

So far I have shown only equality for the engine of lower power. I now wish to present some points of superiority. If a locomotive cannot use its full tractive effort for starting a load, the excess is not only valueless for that purpose, but becomes an embarrassment. The human factor has to be given consideration. Not every engineer is equally skillful or even tempered, and many a train has been stalled by the engineman using poor judgment and losing his temper, when he could not "hold her down." The higher factor of adhesion gives an engineman increased confidence and coolness, and his ability to handle his train is improved in direct proportion.

Fluctuation in the tractive effort is a most important factor in determining the ability of a steam locomotive to hold the rail. In the common two-cylinder type this variation is reduced as the cut-off is advanced, resulting in a more even turning moment of adhesion, and it again scores.

In maintenance, the high factor engine, being comparatively free from the jars and strains, due to frequent slippage, will make a better showing in shop repairs and probably appear less frequently on the machinery failure sheets.

The larger cylinder volume and more frequent racing of the engine with excess power, mean increased steam consumption, while creating fire conditions that reduce boiler capacity and efficiency.

Many other minor reasons are available, but I believe those above are sufficient to defend the position I have taken on this subject.

GORDON BAXTER

How French Hospital Trains Help to Save the Wounded

The French Have Equipped 250 Trains and Perfected an Organization for Carrying Wounded to Hospitals

By WALTER S. HIATT

Our Special European Correspondent.

As the war goes on the railroad stands out more and more clearly as the inalienable servant of the warring armies. In the beginning it served in its normal capacity as a carrier of troops and supplies, as has already been told in these columns. It remains to be told how France has organized, reorganized, and now perfected, an intricate hospital train service, about which revolves every other service for the wounded. If the lives of more soldiers have not been lost, if the predicted epidemic of disease, say of cholera, has not raged in the trench country and back into France—and I have the word of Dr. Alexis Carrel, of the Rockefeller Auxiliary Hospital at Compeigne for it—it has been due to the careful and rapid transportation of troops all this past summer. Be it understood that the greatest enemy of the wounded soldier is not the bullet or shell, but the infection which sets in as soon as he is wounded, the bullet or shell hav-

car, each its selected set of officers and nurses who never leave it, each its allowance for supplies, its special equipment and its special duties. While the five different railroad companies continue to carry their accounts separately for commercial freight and passenger traffic, from the point of view of the war department they constitute a single immense company, every car and track of which is at the service of the government. Thus, every morning the seventh direction of the Minister of War receives by telegraph information as to the exact location of each of these trains and issues orders as to where they shall proceed.

The wonderful part about this service is the minimum of cost for operation. Although no less than \$160,000,000 is being spent for the wounded this year by the seventh direction, \$114,860,000 having already been spent for the first nine months of the year, aside from a sum equally as great spent by private charity, but a comparatively small part of this money has gone into the hospital trains. In large part the money has gone and is going for the supplies needed by the 15,000 physicians at the front or behind the lines, to purchase automobile ambulances, to buy stretchers and medicines, and to keep up the 800,000 beds for the wounded located in public and private hospitals, châteaux, homes, hotels, at the watering places, and, indeed, under almost every roof reared to the sky of sunny France.

The organization controlling these trains is particularly remarkable in that it was born of a necessity which no one but railroad men could understand until the past spring. Literally millions upon millions of men and women, mindful of their own loved ones, have been and are giving of their time and their money to the wounded. But while everybody could visualize the need for stretchers, for additional hospitals, or for motor ambulances for use on the battlefields, or to meet trains at interior railway stations, and to carry the wounded to the hospitals, but few could understand that it was a matter of life and death to fit trains properly for the carrying of the wounded during a brief 10 or 20 hours. So it was only this spring that there came any public realization of the need of organizing the work of the trains. The work that had been done had been carried on by a few railroad men and train surgeons clamoring for money from public or private sources. Finally they were understood and each city of France began to contribute money, then a few Americans contributed money, and now, with the service in good order, funds are available from other quarters.

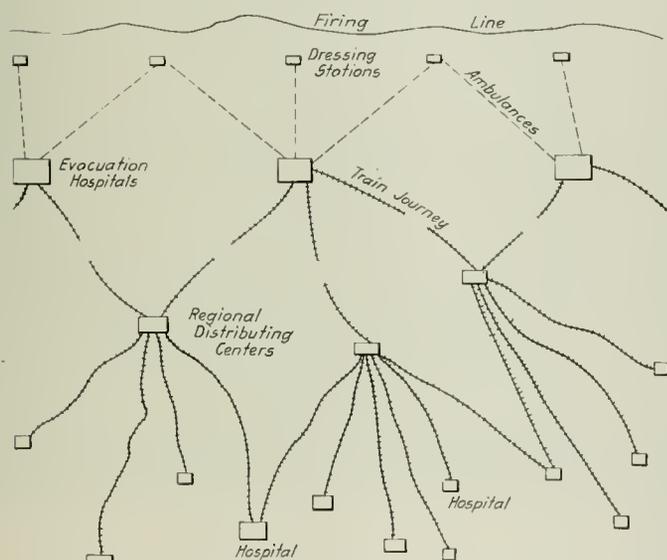

Diagram Showing How the Wounded Are Distributed to Hospitals in the Various Parts of France

ing carried into the flesh soiled pieces of his clothing. It then becomes a race against time and distance to get the man into a real hospital where his wound can be washed and disinfected. As now organized the staffs of the hospital trains undertake to wash the soldiers' wounds *en route* if necessary.

Beginning before the war with seven hospital trains, kept almost for show, since nobody could foresee the need for hundreds of trains and thousands of specially equipped cars, sufficient to carry a half million wounded a month, there have been slowly prepared in France no less than 250 thoroughly equipped hospital trains, composed of 4,000 cars or one-thirteenth the total number of passenger cars used on all the roads of the United States. Each train is composed on an average of 16 cars which form an indivisible unit, carrying from 200 to 400 wounded, according as they are sit up or lie down. The total capacity of these 250 trains is about 100,000 wounded. It is estimated that to date, including German wounded, who are treated as well as the French, nearly 1,500,000 men have been carried from the front to the hospitals in France in these trains.

TRAINS LIKE HOSPITAL SHIPS

Each train is as perfectly organized as a hospital ship. Each has its number, each has red cross emblems painted on every

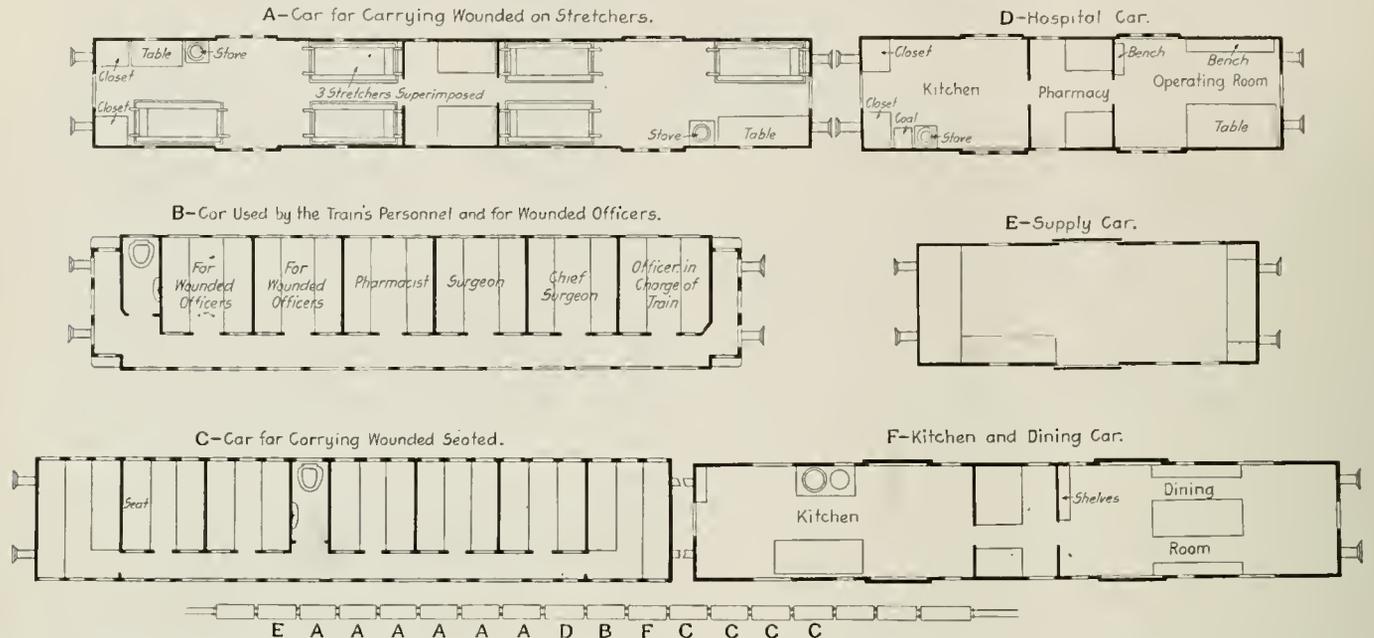

A NEW FACTOR IN RAILROADING

The hospital train on a large scale is really a new factor in railroading. Before this war and as early as 1889, M. de la Morandiere, an engineer of the old Western Railway of France, built some model cars which were shown at the French International Exposition. Later a few trains were built in Belgium and Switzerland primarily for the purpose of transporting sick people to the medicinal springs at Lourdes in the south of France. The cars on some of the Swiss trains, which have been used several times this year to transport exchanged French and German wounded home over neutral territory, may be compared to some of the tourist or emigrant sleeping cars found west of Chicago. They are corridor cars, with center aisles, and two rows of beds on either side, each bed having running water nearby. One of the curious features is a large mirror provided for each bed.

At the beginning of the war, by August 20, 1914, only the seven hospital trains mentioned above were in use. The half-million or so soldiers wounded during August, September, and early October of 1914, were lucky to get to any kind of a train,

though in the latter month no less than 600 had been improvised. If they were put on a train, it was composed of some of the 400,000 freight cars, hastily filled with straw or of the 35,000 passenger cars where the badly wounded at best had to lie on a cushioned seat. They were shoved therein and moved slowly

cited this August in the Chamber of Deputies, during an attack on the hospital service of the army, by a deputy who told how 1,400 wounded were sent into one of the 18 hospital regions of France when in this region there was no room for more. The train surgeons ran from village to village and from hospital to

This train consists of 16 cars, the first car, designated C, being the second car behind the tender. It carries 296 wounded men, including 108 on stretchers in the six cars (18 to a car), designated A; 176 seated in the four cars designated C and 12 officers in Car B. Although it is not so designated in the plan, the first car of the train is probably for the nurses. A hospital car similar to the one here marked D was described in the issue of August 20.

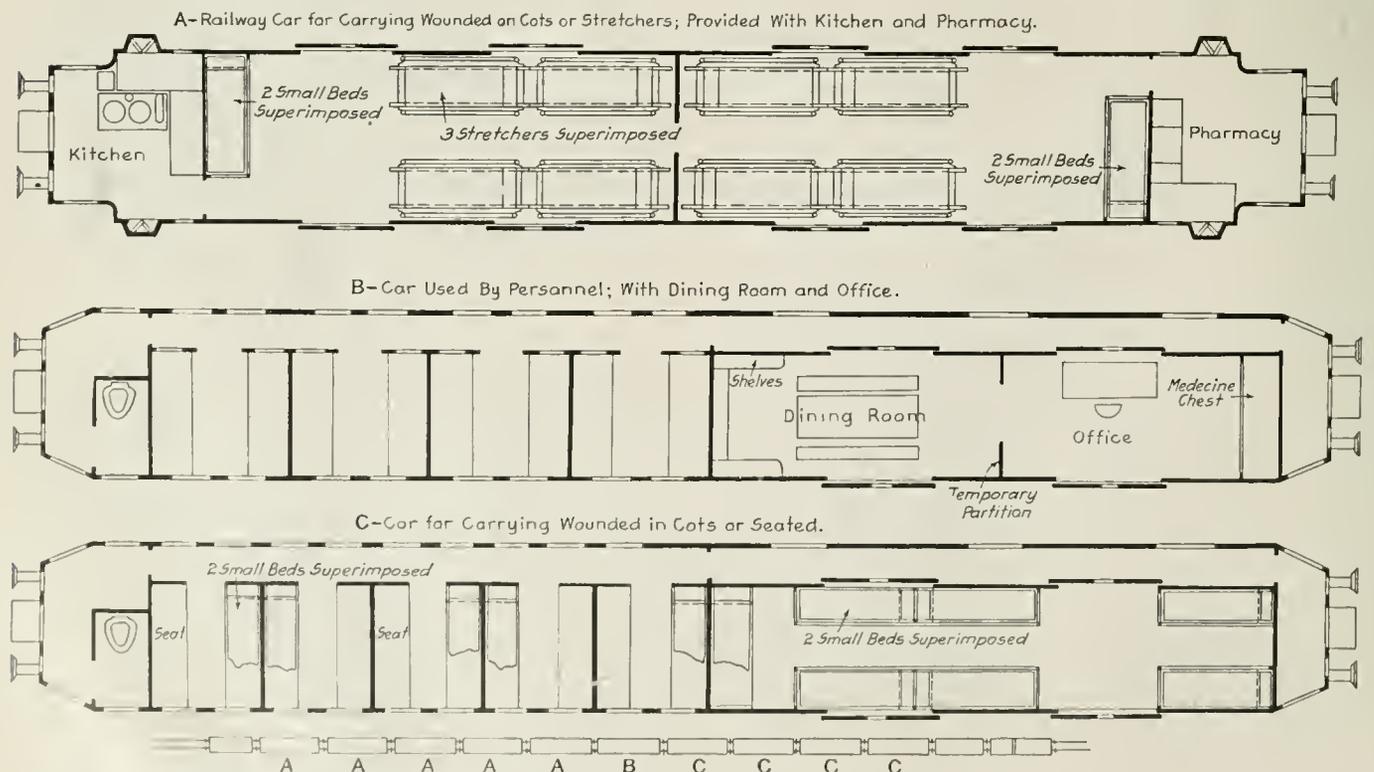

Plan of a Typical French "Sanitary Train"

to some hospital. Often they went for two or three days without water or nourishment or medical treatment. Many died from the jolting, even in the cushioned passenger cars where the jar was still too severe to be borne by the badly wounded.

hospital, asking beds for the 1,400 wounded in their care, but were told everywhere that there were no more beds, and finally had to take the train into the neighboring region.

The conditions existing as late as October 1, 1914, were

The period of these wandering trains of cars unequipped for carrying the wounded, however, has passed. Scientific study of

This 12-car train, made up of remodeled passenger train cars, each approximately 65 ft. in length, carries 296 wounded men, 120 on stretchers, 116 on beds and 60 seated. The five cars designated A each carry 24 on stretchers and 4 on beds; the four cars designated C each carry 24 on beds and 15 seated. The nurses' car is presumably the one immediately behind the tender.

Plan of a French Ambulance Train Improvised from Passenger Train Cars

the conditions has brought about mechanical improvements that are notable, considering the means at hand. One of these improvements, that of a train surgeon, Dr. H. L. Beltzer, will doubtless find world-wide application, because of the possibility of adapting it to any type of railroad car or field automobile.

DETAILS OF TRAIN ORGANIZATION

Through the courtesy of the Minister of War I was lately given an opportunity to see just how this service is organized on which the lives of so many thousands of wounded depend.

A Surgeon's Device for Carrying Wounded That Avoids Rebuilding Continental Passenger Cars

Before the wounded are finally distributed in the 18 hospital regions of France, they pass through several stages of handling. Beginning at the firing line, which is divided into 16 ambulance divisions for the entire French army and where each division makes its preparations for battle just as much as does an army general, the wounded men are gathered up by company, battalion, and regimental stretcher carriers and taken to a temporary field station, possibly not more than a mile from the trenches.

There they are placed in automobile ambulances according to the nature of their wounds, and directed toward a center for treatment or discharge, known as the hospital of evacuation. This ambulance transportation service is of the greatest importance. The automobiles work in groups of 11, but four of them being used primarily for carrying the wounded. Five are each fitted up for a special surgical use. One serves solely as a sterilization organ, carrying in it antiseptic washes and boilers for heating water. A second is used for radiographic purposes. In it photographs are taken showing the nature of the wounds, and a surgeon may immediately proceed to an operation, if the case is urgent. A third five-ton truck carries medicinal and surgical supplies, with electric searchlights large enough to light a tent or wagon where the surgeons are working. Two other heavy trucks are fitted to carry stretchers and

coverings sufficient for 100 wounded. Another truck carries the camp equipment for the nurses, including their cooking utensils, and their supplies of cotton and bandages. This last truck also serves as a supply carrier for provisioning the other ten ambulances. There are no less than 60 men detailed to such a group, including a chief surgeon, 7 assistants, 26 nurses and 17 chauffeurs. Not a few of these Red Cross helpers are Americans, there being a total of 2,000 Americans helping all over France.

These motors discharge their wounded at a point behind the lines, known as the evacuation center. The wounded are here tagged according to the gravity of their condition, a white card for a slight wound, a red for a serious wound, and a blue for a wound of medium gravity. Each wounded man is provided with a paper stating his condition, his company, his name, and the place where he was wounded and is directed with his effects toward a general distribution railroad center. This intermediate transportation is made either by train, by automobile ambulance or by hospital canal boat, according to circumstances. There are 19 of these great railway distribution centers placed at intervals all over France, the total governed by nine divisional stations, which are in turn governed by the seventh direction of the Minister of War. The 19 distribution centers discharge their wounded in 18 regions, one or more centers to a region.

A Car in Permanent Train No. 5, Showing the Arrangement of Beds

The wounded arrive at these centers in one of three kinds of trains, permanent rolling hospitals, semi-permanent, or improvised. The permanent trains handle the badly wounded (grand blessés) exclusively, the semi-permanent the wounded which must lie down but are not yet considered in a very serious condition, and the improvised trains the wounded which are able to sit upright.

Arrived in one of the 18 regions, the wounded are then distributed according to their wounds in hospitals specially adapted for their treatment. The seriously wounded, say about the body, are sent to practically any general hospital, but those suffering from nervous shock, or eye wounds are generally directed to Paris, where the largest number of special hospitals are located.

Those soldiers who are suffering from typhoid fever, are likely to be sent to the watering places, like Vichy or Biarritz. This division of regions into centers of special treatment forms at once one of the most complicated and interesting details of the whole method of railroading the wounded.

THE HOSPITAL TRAIN AS A UNIT

There are special railroad experts detailed at the office of the seventh direction of the Minister of War who keep in touch with every hospital car and train in France, just as a chief train dispatcher does with his freight and passenger trains. Every morning these experts receive reports showing the position of trains unloading in the various regions and indicating the trains needed at the front. When a battle is being prepared at one or more points along the front, they make their preparations just as does the chief surgeon of the army corps involved. These railroad experts, taken from their ordinary duties with some one of the individual companies, know that an attack involving so and so many men means that they will have to provide so and so many trains at the evacuation hospitals to carry away the wounded. Hence there are always reserve trains on hand ready to carry the wounded back to life.

By special permission I was able to visit two of these re-

A Stretcher Frame Adapted for Use in Motor Ambulances or Freight Cars

serve trains, semi-permanent No. 22 and permanent No. 5. This latter train, in charge of Doctors Jacob and Paillard, had been in service nearly 14 months at the time I visited it. During that period it had carried 4,100 seriously wounded men and had lost but five of them. The train had just been disinfected by having its interior washed with alkaline water and *cau de javel*, and fumigated with sulphur smoke. The trench flies that had followed the train were driven away by a free use of cresyl. All trace of the wounded passengers had been removed and the beds were fresh and sweet as could be desired. The train consisted of 16 cars, several being of the corridor type, with connecting platforms, unlike the old type of French car. There were 256 beds in the eight cars of the train set aside for the wounded, these being placed on either side of the corridor. The hospital crew of the train consisted of 33 men, including a chief surgeon, an assistant surgeon, a provision officer, a sergeant and 28 nurses. Eight of the cars were used for hospital purposes, other than the transport of wounded. One of them, placed in the center of the eight transport cars, was a pharmacy and operating car, a freight car made over at the expense of W. B. Hardy, of Chicago. On its side, near the red

cross emblem, was painted the American flag. At the end of the train trailed the car in which lived the 28 nurses. At the head, next the engine, there was a provision car, a short box car fitted up with closets for linen and blankets, and drawers for the storing of wine, sugar, rice, coffee, meats and vegetables. Behind it came a car for the surgeons and a kitchen car containing also space for the storing of dirty linen and cotton, this material having to be burned so infectious disease might not be spread.

A NOTABLE INVENTION FOR SHOCK PREVENTION

The visit to semi-permanent train No. 22 was of special interest, because there I was shown a new kind of hospital bed that is being adopted on the English and French hospital trains. The big obstacle to carrying the wounded soldiers comfortably has been the lack of the proper kind of beds. There are comparatively few sleeping cars and even these are too heavy for the carrying of large numbers of wounded. There were, however, large numbers of third class passenger cars of the corridor type. They were rather heavy, but the chief obstacle to their use was that they had to be cleared of their old transverse seats and provided instead with iron cots. One of the illustrations shows the installation of such cots in permanent train No. 5. All this took time, money and workmen; and these three elements were lacking. Besides this, there is a further objection in the case of the very badly wounded to the use of a sleeping car, or to the use of beds at all, because they have to be moved from their stretchers in order to be placed in the car and this not only may mean loss of time, but horrible suffering.

Dr. H. L. Beltzer, the surgeon in charge of train No. 22, last spring devised a frame support for stretchers which is about the simplest thing yet found for the transportation of wounded men either in ambulances or railroad cars. A view of one of these frames is shown herewith. In its simplest form the frame makes it possible to utilize any English or continental passenger car without a single change in the seating arrangement without injuring the car in any manner, and without installing in it a single bed. When the stretcher is placed in the frame, its handles are fitted into a set of iron rings, each held by a wrought iron spring, and these springs take up any kind of shock, whether up or down or backward or forwards. When the train arrives at its destination, there is no shifting of the wounded man, when he is loaded into an ambulance. The stretcher goes with him right to the hospital. In other words, the device means that a man can be carried from the battlefield to a hospital hundreds of miles away without a change of bed.

The device, with certain adaptations, also has the widest application for any kind of freight car. It could also be used in American cars. Dr. Beltzer showed me his operating car and one or two other cars which he had fitted up with a series of slightly different frames provided with strong springs and planted in the very center of the car, each frame supporting six stretchers, three stretchers to a side, the nurses having room to pass the frames on either side of the car. Dr. Beltzer has carried many wounded men in this manner, keeping them on their stretchers either from the battle field or the motor ambulances, and during the 10, 20 or 30 hours they have spent in the freight cars on the train, they felt no shock of any description. In some test cases he made at Havre for English hospital officers, he had engines bump the cars severely without disturbing the occupants of the frames.

REMOVAL OF BELGIAN RAILWAYS.—The Belgian Government has addressed to all neutral States a protest against the action of the Germans in removing the permanent way of Belgian railways. The Belgian Government points out that the decision of the German authorities will necessarily hamper the trade and business of a large part of the population, and protests energetically against this fresh violation of the laws and customs of war.

American Locomotive Builders and Foreign Trade

Manufacturers Must Be Allowed to Combine for Foreign Selling; Testimony Before Federal Trade Commission

By WALDON FAWCETT

Railway equipment and supplies "Made in the U. S. of A." can continue to hold a place in the foreign market only if American manufacturers are allowed to combine for foreign selling. This, in substance, is the information given to the new Federal Trade Commission by leaders in the field of railroad outfitting. Moreover, contrary to the impression in some quarters, the situation with respect to American-made locomotives is represented to be much the same as with regard to rails, signal apparatus and shop machinery.

"We have done fairly well," said Charles M. Muchnic, vice-president of the American Locomotive Sales Corporation, in discussing the foreign sales of his concern, "but we cannot make much further progress unless we are allowed to co-operate." The same view has been advanced by other manufacturers of rails, rolling stock, etc., who have appeared in person before the new "supreme court of business," or have communicated their views in writing.

Waldo H. Marshall, president of the American Locomotive Company, was the witness who initiated, on the part of the Trade Commission, the new line of thought to the effect that American railway supply houses may need that same latitude with respect to "team work" abroad that seems essential in other lines. This aspect of the situation came as a revelation to the Federal body because several witnesses from other fields of industry had taken it upon themselves to say that whereas the Baldwin Locomotive Works and similar concerns might need no smoothing of the pathway of foreign selling, these leaders in the railway field were in a far more fortunate position than manufacturers in some other lines.

But even the American Locomotive Company finds limitations placed upon its selling campaigns, President Marshall pointed out. Said he: "Our company is a pretty fair sized one and we do carry sales expenses entirely for ourselves in certain parts of the world where we think the volume of business that we can obtain is going to be sufficient to justify that expense, but there are other parts of the world in which we would like to get some business and where we feel that we cannot afford to have our own representatives. The cost, year in and year out, would be far greater than any profits we would ever get on that business.

"Even with companies of our size, selling expense is quite a question at all times. We have had our own men at three different points in South America, besides agency connections and banking connections. In South Africa we cover the situation pretty well. In China, Japan, Korea, etc., we have our own men. But in other parts of the world, for instance in Australia, we would not think of having any representative direct from home. We get into some of those territories and feel that the only way in which we can afford to cover them at all is by some arrangement with a commission house, and we try to get a house that handles lines of goods that would make them more or less familiar with machinery so that they can represent us fairly well. But, after all, they are only transmitters, you might say, of information between the two parties because they do not understand locomotive construction enough to furnish any engineering information except as they may get it from us. Then there are other places where we cannot afford to pay any commissions at all—on any fixed basis plus a commission—and unless the party is willing to take it entirely on a commission basis we have to do without representation."

The purpose of the Federal Trade Commission in taking up, as the first work following the completion of its organization, this current investigation of foreign trade conditions is to ascertain whether there should be recommended to Congress at its

next session the amendment of the Sherman and other anti-trust laws now on the statute books. The need for prompt consideration of the problems involved is realized by reason of the competitive conditions likely to prevail in almost all fields following the close of the present European war. As matters stand to-day American manufacturers of railway equipment and all other articles of commerce must face in every foreign mart a united opposition—that is, competitors banded together for the purpose of curtailing selling expenses and preventing reckless price cutting through bidding against one another. American firms have been deterred from joining hands to meet such competition through fear of the anti-trust laws which supposedly prohibit combinations of all kinds. The proposition then, that is before the newly-created Federal Trade Commission for recommendation to Congress, is whether the hampering laws should be so amended as to allow combinations of American manufacturers in the export trade through continuing to prohibit such pools or agreements in the domestic field.

While the locomotive builders are speaking two words for themselves before the Federal Commission in urging that joint selling agencies be sanctioned, they are incidentally saying one word for the smaller manufacturers in the field of railway equipment and supplies—the latter presumably being more seriously handicapped than the locomotive firms. Speaking of the need of permitting American manufacturers in the railway field to combine, Vice-President Muchnic said: "I believe that unless such permission is granted the small manufacturer will be unable to get his share of the foreign business. At the present time most of the exports in railway materials and iron and steel products are made by large manufacturers, and it seems to me that this in itself is convincing proof of the necessity of co-operation between manufacturers.

"The principal reason why the large manufacturer is able to command a large share of the export trade is because of the capital he commands and of the well-trained sales organization which it has taken years of persevering effort to develop. It is utterly impossible for the small manufacturer to command either the capital or such foreign sales organizations, and therefore, unless the situation, as it is at present, is changed, the small manufacturer will eventually be barred from participating in any part of the foreign trade."

Whereas the locomotive men have urged that they be given a free hand in making sales arrangements overseas they have, one and all, made it clear that joint selling to be effective must be allowable to the various firms in the railway field and not restricted to non-competing firms. "You might think," explained Mr. Marshall, "that if selling combinations are to be effective it would be very easy for manufacturers in different lines—perhaps that are non-competitive entirely—to choose a representative, and perhaps let him conduct the business for ten different concerns in a certain country, but that presents a very difficult situation for the reason that it is hard to get one man that knows enough about ten different lines of goods to represent them effectively and intelligently. The better way would be to allow those who are competitive at home, or who are very nearly competitive at home, to get together and in that way they can get representation that will be intelligent and efficient and cover their lines of goods thoroughly."

In answer to a question from one of the commissioners, the locomotive builder declared his belief that under such an arrangement there would be confidence on the part of the various participating concerns that each would get a square deal from the selling agent. "That is one reason," he explained, "why I

think the arrangement should be more or less voluntarily entered into, and my idea is that in most lines of trade they would not be necessarily large organizations. They would be of moderate size."

The Comite des Forges of France was cited to the Federal Trade Commission as, perhaps, an ideal example of co-operation between locomotive builders. The French combine was portrayed as fixing prices on the various types of locomotives and apportioning the aggregate orders in proportion to the output of the various plants. "After an experience of over ten years this arrangement has worked out entirely satisfactorily, as far as I know, to the government, the purchasers, and the manufacturers," said Mr. Muchnic in commenting on the French system. It is his idea that if such a plan could be established in the industry in the United States there would result "not a rivalry of prices among the manufacturers, but an effort on the part of each one to turn out a better product than his competitor."

In the capacity of compiler of facts for Congress the Federal Trade Commission has, this past few weeks, manifested an exceptional curiosity as to the status of the American export trade in locomotives and railway rolling stock, and in the nature and extent of the foreign competition encountered. Information supplied to the commission by the witnesses above quoted and others is to the effect that under normal conditions fully 90 per cent of the output of all locomotive shops in Great Britain goes to foreign countries, while in the case of Germany 50 to 60 per cent of the total production is shipped abroad, as compared with exports from the United States that represent 8 to 10 per cent of the total output. "So we have hardly touched the possibilities of the export trade as compared with the Europeans," commented one of the executives who appeared before the trade inquisitors.

When one of the commissioners asked whether British builders can turn out a locomotive more cheaply than can an American concern there was opened up an extended discussion of what were put forward by the practical locomotive men as the two main factors that to-day enter into the export trade in American locomotives and railway supplies. One of these is the circumstance that foreign trade in railway equipment will follow investments. The other is that the volume of our export trade will be, to a great extent, measured by our success in inducing foreigners to adopt American railroad standards. "Our principal work in developing our foreign business," explained Mr. Muchnic, "has been not so much in meeting the competition of foreign builders as to prevail upon foreign engineers to accept our types of locomotives."

To drive home his point he cited the situation in Argentina where he said fully 90 per cent of the railroads belong to British companies, and it is tacitly understood by the local engineers, as well as the London boards, that no foreign manufacturer will be allowed to supply equipment unless it is a question of urgent need and delivery. This situation in South America is reputed to cut American builders off from orders for 250 to 300 locomotives per year.

Many of the foreign orders for locomotives that have come to the United States were landed, the commissioners were told, because of the ability of firms here to make prompt delivery. Emphasis was also laid on the fact that present-day conditions with respect to the acceptance of American standard equipment on roads built and operated by foreign engineers, are but temporary—as temporary as the present European war. For instance, it is only because the foreign-built and foreign-managed roads in South American, China, India, etc., cannot now obtain equipment constructed to the English, French, German or Belgian standards, to which they have heretofore subscribed, that they are, for the time being, impelled to accept the American standard type of construction. But on the other hand there was cited the success of American equipment firms in securing repeat orders from the government-owned roads of Argentina and Brazil, and despite the fact that foreign standards are predominant on the neighboring privately-owned railroads where close relations exist between the consultant engineers and the supply houses.

"We must not only have American investments, but we must have American engineers to manage the railways in South America," declared one of the executives. "The prejudice of foreign engineers is indescribable. They look upon any product from any other country than their own as absolutely worthless." In illustration of the dangers of foreign influence there was cited the situation that has lately developed in Brazil on the railway system which Mr. Farquhar established some 10 or 12 years ago by the consolidation and development of a number of small railways partly owned by French, Belgian, English and Brazilian companies. With the inauguration of the new enterprise an American staff was installed and American manufacturers supplied all the rolling stock, but the continued adherence to American standards is represented to be now in jeopardy, owing to a change of management.

A concrete example of what American investments will do for American sales of railway equipment is to be found, the commission has been informed, in the situation on the Hukuang Railways of China, a system financed by four groups of bankers—American, French, English and German—with the result that an agreement was reached that in the purchase of equipment such as rails, bridges, cars and locomotives the standard of the country of a successful bidder is to be accepted. Heretofore, so the Trade Commission has been informed, American firms have supplied locomotives to practically all the Chinese railroads operated by the government and to roads dominated by Japanese engineers, but to none of the lines controlled by the British and Germans.

The extent to which German bankers have co-operated with German supply houses to beat American competition was brought out by the president of the American Locomotive Company, in explaining the need of better credit arrangements in the export field. Speaking of the experiences of his firm in the Latin-American field he said: "If we had to deal through a German bank we felt that practically everything that occurred in regard to our transaction which could be found out from the outside was known to our competitors. The amount of money that we were paid for our locomotives was known to that bank to the last dollar. If there were public tenders it might have been known anyway; but if there were private tenders they had the advantage of all that knowledge. They often knew all that we paid for freight, and everything of that kind, and we felt that at times we saw the evidence of that knowledge when it came to the next bidding."

Developing this aspect of the subject he said: "I do not believe that America's export business will ever be of satisfactory volume until the banking arrangements are such—the credits and so on—that our people will invest in foreign countries. In South America if English capital has gone to build railroads, then when the money came to be spent for new equipment it would naturally be spent at home. And we know of cases where they have paid higher prices at home—where they did it knowingly and openly to favor the home market—because the capital came from that country. That has given the English and German manufacturers large advantages in certain countries."

That the credit problem complicates, in the estimation of President Marshall, the whole selling proposition was disclosed when he remarked: "I do not think that the small concern can afford to send out a man of large enough caliber to represent them alone, intelligently, in the foreign field, for he not only must know his business as a salesman, as he would know it at home, but he must be big enough and broad enough, at the present moment, at least, to be depended upon to some considerable extent in regard to credits." Reverting later to this subject of selling railway equipment he commented: "The more intricate the manufactured article that is shipped abroad, the more necessity there is for intelligent representation of it in the foreign market."

RUSSIAN RAILWAYS AND THE WAR.—The Russian Minister of Ways of Communication is asking for extra credit amounting to about \$2,400,000 to strengthen the railways owing to the war.

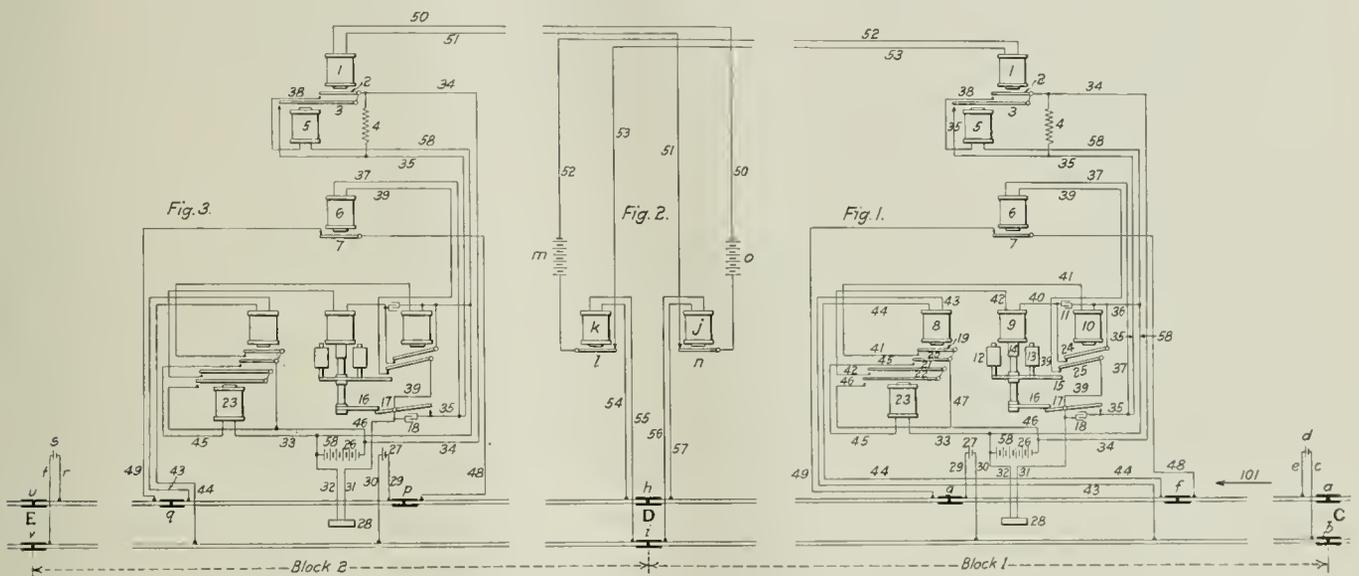

Cab Signals and Automatic Stops on the Western Pacific

Five Miles Block Signaled; No Disks, No Semaphores.
Automatic Train Stops Controlled by Magnetic Induction

At Oroville, Cal., on the Western Pacific, 66 miles north of Sacramento, the National Safety Appliance Company, of San Francisco, has installed on five miles of the road, single track, an automatic block system which works wholly by audible and visual indications in the locomotive cab and by automatic train stops, no visual roadside signals being provided, except small light signals, one at each automatic stop location, called markers. These are for the information of any engineman who has been stopped. A red light indicates that the track magnet is still in condition to apply brakes, while green indicates that the section ahead has been cleared and that the train can proceed. Twenty locomotives have been equipped with the

magnet boxes clear the gage line of the track 10 inches, and midway between the rails there is a space of 8½ inches. Each magnet box is 6 inches wide. The receiving coils, on the locomotive, are fixed to a cross-bar attached to the rear end of the leading truck of the tender, as shown in Fig. 11. Each coil passes over its corresponding track magnet with a clearance of 3 inches.

Each track magnet is enclosed in a separate substantial water-tight metal box, and the receiving coils are equally well protected. The roadside batteries, for energizing the track magnet, controlled by the track circuit as in ordinary automatic block signaling, are of 10 volts capacity. The track

Figs. 1, 2 and 3—Automatic Stop Circuits for Two Block Sections, Single Track

apparatus. The system works by magnetic induction. There are no moving parts on the roadway and none on the locomotive, other than relays, signal valves, and the air-pressure mechanism for applying brakes.

A section of the road, about two miles long, is shown in Fig. 5. The letters G, Y and R indicate respectively the points at which green, yellow and red light indications are given in the cab. For example, a train moving west from B2 toward C1, C2 and so on, when the track beyond D4 is occupied, will receive a yellow indication at B2, indicating caution; a red indication at C1, indicating stop, and, if these are not heeded, will have its brakes applied at C2. This leaves the distance from C2 to D4 in which to bring the train to a stop. If the track is clear, a green indication is given at B2, assuring a clear road to C2, and a green indication at C2 indicates clear through the next block. The de-energizing of the track relays provides also for giving caution and stop signals, and for automatic stop impulses to trains coming from the opposite direction.

The apparatus consists principally of "track magnets," fixed to the ties, and energized by roadside batteries "receiving coils," carried on the locomotive, and engine apparatus consisting of relays (four), storage battery, air valves for applying brakes and giving audible cab signals, and three electric lights. There is a registering apparatus which counts the operations of the automatic stop.

The track magnets are fixed between the rails, one to give the clear indication, one for caution, one for stop, and one for the train stop apparatus. The photograph, Fig. 9, shows a location where only three are required. On each side the

magnets are normally de-energized, and are energized only when a locomotive approaches within 66 feet.

The proprietors have sent us the drawings, Figs. 1, 2, 3, 4, 6 and 7, with accompanying descriptive matter, from which we take the following:

Fig. 4 shows a track-magnet in place and directly over it a receiving coil (a a) connected in series with a relay (b) and a

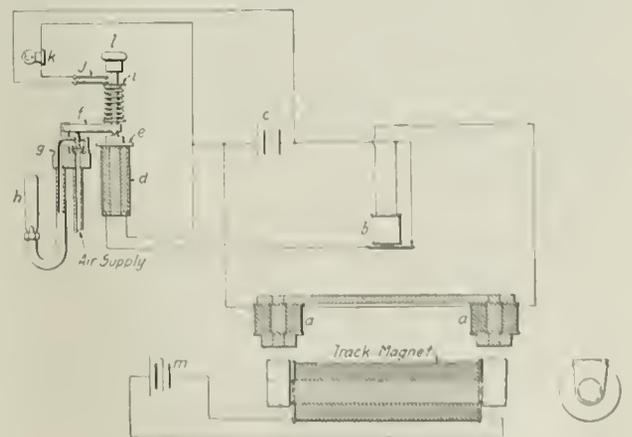

Fig. 4—Circuits on Locomotive

battery (c) and other engine-cab apparatus (d, e, f, g, h, i, j, k, l). The receiving coil and the coils of relay b are of relatively high resistance and use but .028 amp. current constant for each set. The relay magnets are powerful and the contact is not

opened by engine vibrations. The current from battery *c* is not essential to perfect relay operation, but is used to give protection against the breaking or loosening of any wire or connection.

As the engine moves and the receiving coil passes through the field of the energized track-magnet, a current is generated in it which is more powerful than, and flows in opposite direction to, the current from battery *c* normally circulating in the receiving coil and relay. This induced current momentarily reverses the magnetism of relay *b*, permitting its armature to drop (though it is immediately re-attracted to normal position), opening the circuit to the cab apparatus. This interruption of the circuit de-energizes momentarily the iron-clad magnet *d*, causing the release of its armature *e*, which normally is held to the poles of the magnet. Lever *f* is then lifted by the air pressure from the engine main air reservoir, and the air unseats the valve and flows through the valve casing to pipe *g*, thus causing whistle *h* to blow. At the same time the disk *i*, attached to the armature stem, and rising with it, closes the contact at *j* and lights the lamp *k*. The armature of magnet *d* is now too far away to be attracted by the magnet, and is restored to normal position only when knob *l* is depressed. Pressing this knob opens contact *j*, thus cutting out the signal light, and it reseats the air valve. The engine has passed beyond the track magnet and armature *e* is held down by current from *b* and the supply of air is cut off from the signal whistle, stopping it.

The foregoing description applies to each of the three sets of apparatus provided for the operation of the regulation signals—clear, caution and stop—and each set consists of the apparatus described, namely, receiving coil, relay, electrically controlled air valve, signal whistle and colored lamp. A fourth set of the same apparatus, omitting the lamp, is provided to actuate the automatic stop and is operated in the same manner as described except that valve *g* is a vent instead of a supply valve. The alarm whistle of the automatic stop is located in the base of the automatic stop valve apparatus. When the automatic stop has been operated, pressure on knob *l* restores the vent valve to normal position, but the service application of brakes has been made and the brakes cannot be released until the train is stopped, when the engineman must get down on the ground and close a valve.

Provision is made for operating in either direction on the same track, the necessary reversal of the operation of the receiving coils, when an engine has been turned around, being provided for by a reversing switch.

The track magnet, Figs. 4 and 14, is fixed in a heavy case, 15 7/8 in. long, 5 in. wide and 5 in. high (extreme height from ties 7 in.). The cover is flanged over sides and ends and is bolted down on water-tight gaskets. The leadout wires run through insulated water-tight stuffing boxes. The magnet requires an energizing circuit of 5 amperes at 10 volts. Normal operation takes current for 15 seconds only. Protection against loose brake-rods, etc., is afforded by a pine block 48 in. long, covered with a 1/4 in. steel plate, as shown in the photograph, Fig. 9.

The locomotive receiving coil (Figs. 10 and 11) consists of two cores of Norway iron, wound in the form of a circular bobbin. The cores project through the bobbins and are fixed at the lower end to pole-faces. The projecting upper ends of cores are secured to a connecting iron bar. Connecting wires pass through a pipe attached to the lower parts of the coil cases. The coil cases are of cast brass and 4 1/2 in. in diameter. The length over all of the encased apparatus is 18 3/8 in., the distance between coil cases being 9 1/2 in.

Four receiving coils form an engine set, one each for the clear, the caution, and the stop signals, and one for automatic stop operation. These receiving coils are arranged in pairs, bolted, pole-faces down, to an iron cross-bar (Fig. 11), which is supported by brackets extending back from the forward truck of the tender. Receiving coils will receive magnetic impulse from

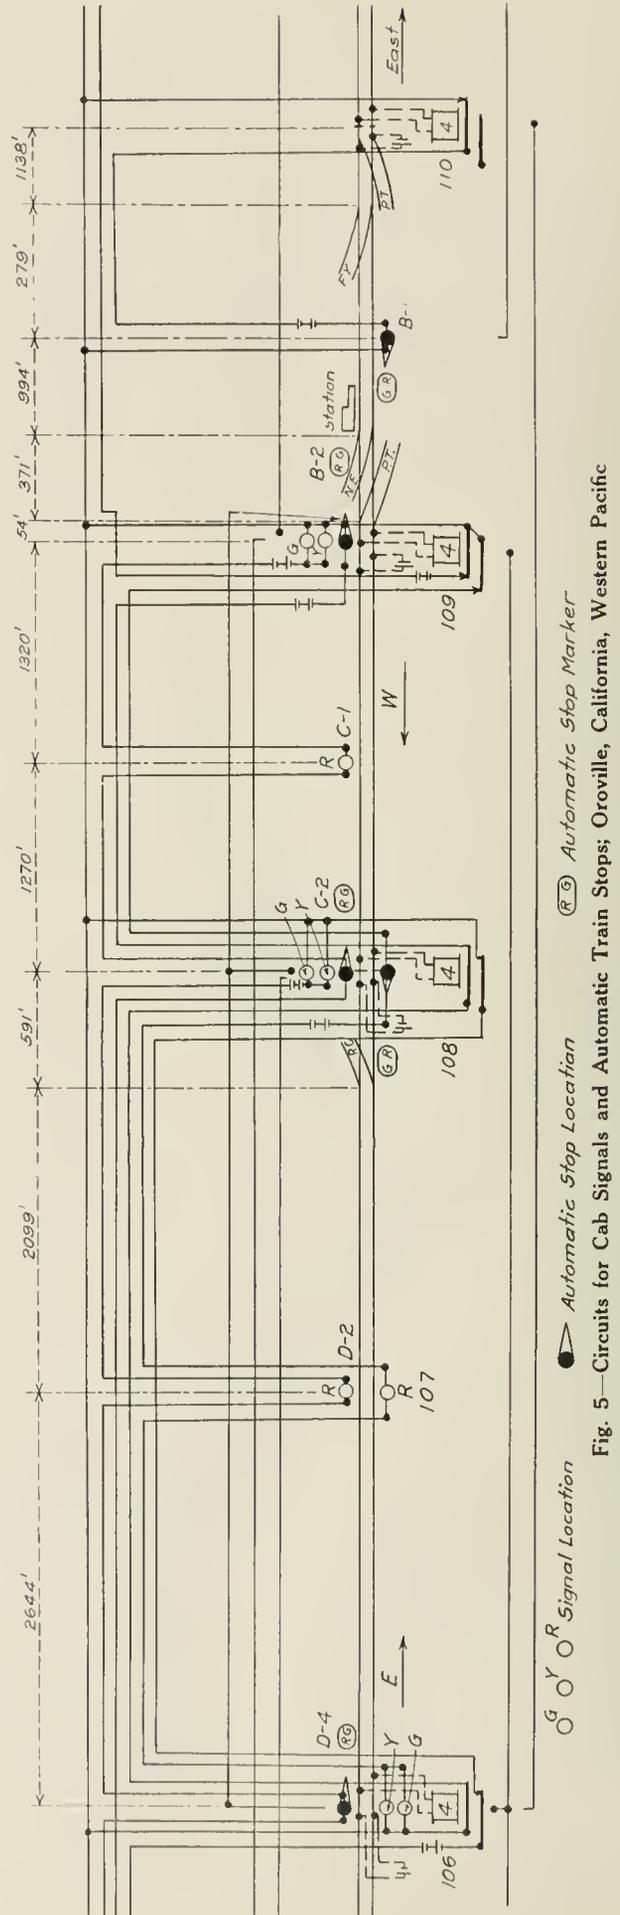

Fig. 5—Circuits for Cab Signals and Automatic Train Stops; Oroville, California, Western Pacific

their respective track-magnets even should they be 2 in. off centers. Wires from the receiving coils are connected through a substantial connecting plug to the iron relay box bolted to the side sill of the tender.

The air valves (Fig. 12 and *g* Fig. 4) are located in the engine cab with the restore knobs convenient to the engine-man's hand. A locked and water-tight case contains these four valves, three for the signal lamps and whistles, and the fourth

out preventing the engineman from giving an emergency application.

Description and Operation—The brake pipe is connected with application cylinder 1 by suitable pipe and fittings. In this cylinder a chamber is formed by the two piston heads 2 and 3, piston head 3 fitting into the small end of the cylinder, and both heads fitting airtight in normal position. Piston rod 4 is fastened with screw threads to both heads, and piston head 3 is

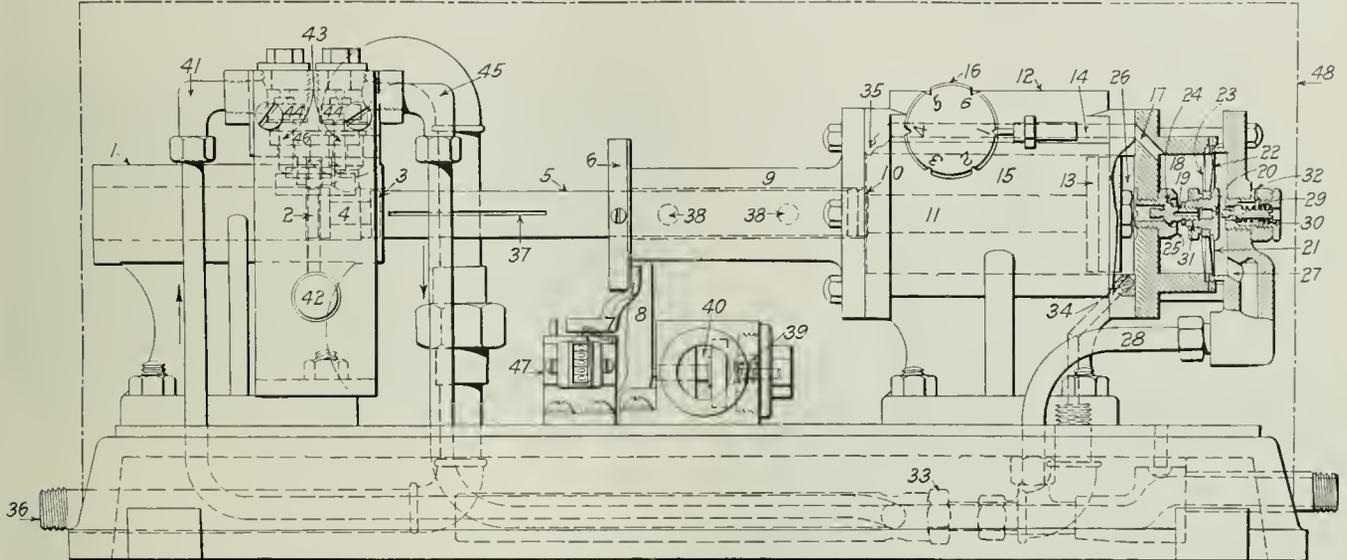

Fig. 6—Brake Applying Apparatus

for the automatic stop. Each of the four valves has the connections, etc., indicated in Fig. 4, by the letters *d, e, f, g, h, i, j, k, l*.

The valve magnet is connected with the engine relay and with the 2-cell Edison storage battery of 2.5 v. and 125 ampere hours capacity, as shown in Fig. 4. Each valve takes a constant current of .25 amp.

The valve casing is 1 3/4 in. wide, 12 in. high and 5/8 in. thick. Height over all (case, knobs and whistles) 20 3/4 in.

Outside the lower right-hand corner of the valve case is a

fastened to application tube 5, each having the same diameter. Disk 6 is fastened to application tube 5 and bears against levers 7 and 8. Lever 7 is held against disk 6 by a spring which operates application counter 47 when disk 6 is moved from the normal position shown. Application tube 5 passes through cylinder 9 and is connected with piston head 10 by a loose joint which eliminates strain due to any unevenness of cylinders. Piston head 10 fits airtight for the entire length of its cylinder (9) and is fastened to piston rod 11, which passes through graduating cylinder 12. The other end of rod 11 is fastened to

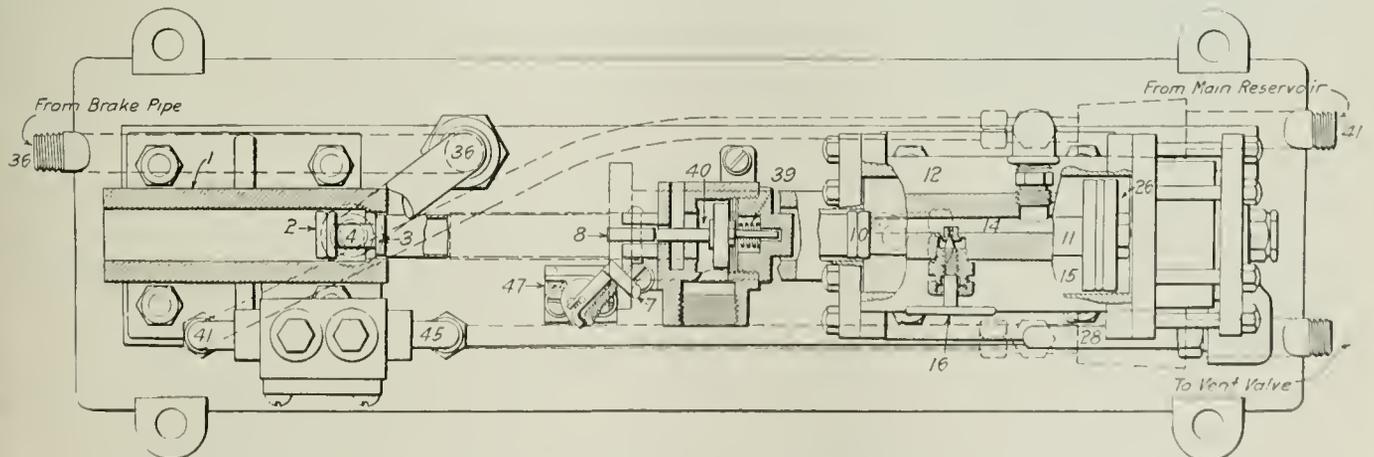

Fig. 7—Brake Applying Apparatus Plan

reversing switch. When the switch point is on one extreme end of the quadrant, connections are made for moving in one direction. The center is neutral, with current switched off, allowing valves to go to "danger." When the point is on the other end of quadrant, connections are made for moving in the opposite direction.

THE AUTOMATIC TRAIN STOP

This is illustrated in Figs 6, 7 and 13. It is worked by compressed air. The connections are such that it applies the brakes only when stop signals have been disregarded, and it is designed to give only the regular service application of brakes, yet with-

piston head 13, which fits airtight the entire length of cylinder 12. Main reservoir air pressure is connected by suitable pipe and fittings to the main air passage 14 in the upper part of graduating cylinder 12. The air in chamber 15, formed by piston heads 10 and 13, is supplied from passage 14 through restricted port 35, the air flow being regulated by application adjustment needle valve 16. The pressure in chamber 15, acting on the larger area of piston head 13, forces it to the extreme right or normal position, carrying with it piston head 10, of smaller diameter.

The diaphragm valve takes its supply from the main air pass-

age 14, through passage 17 into chamber 18, thence through passage 19 and restricted port 20, of fixed capacity, into chamber 21. As the air pressure builds up in chamber 21, diaphragm 22 is deflected toward chamber 18, carrying with it diaphragm 23, which is of smaller area than diaphragm 22. This causes valve 24 to close into seat 25, thus shutting off pressure from chamber 26. Air pressure in chamber 21 flows through passage 27 into controlling pipe 28, and thence by suitable pipe and fittings to the venting valve connected with the controlled air valve in the cab (Fig. 12).

The opening of the valve, when a stop is to be made, reduces

the deflection of the diaphragms and the remaining pressure escapes to the atmosphere by valve 29 through port 32. All this results in unseating valve 24, allowing pressure to flow from passage 14 through 17, 18 and 24 (open) into chamber 26. This chamber is filled, and air escaping through restricted port 34 (of fixed capacity) causes whistle 33 to blow. The air

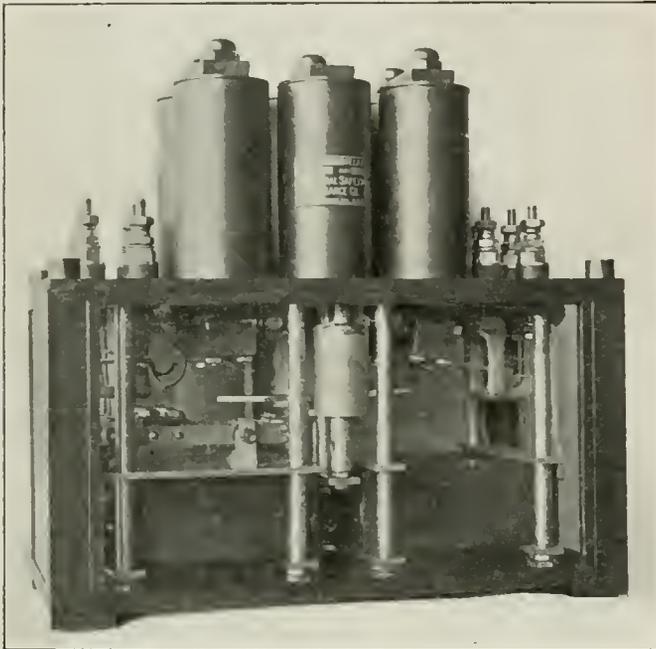

Fig. 8—Time Limit Relay
[See 8, 9 and 10, Fig. 1]

Fig. 9—Track Magnet

the pressure in chamber 21, causing the diaphragms to deflect toward chamber 21. The port 20 then closes into contact with valve stem 29, thus shutting off the supply from chamber 18 and forcing valve 29 against spring 30 until diaphragm stud 31 is in contact with the valve seat stud of valve 29. This controls

capacity of passage 34 is very much less than the capacity of valve 24, hence pressure is built up in chamber 26. When the pressure in chamber 26 equals the pressure in chamber 15, its superior force against the greater area of piston 13 causes piston 10 to move toward application cylinder 1. At the same time the pressure in chamber 15 is forced back through restricted passage 35. The speed of the movement of these pistons is regulated by application adjustment valve 16, which controls the flow of pressure forced from chamber 15.

The movement of piston 10 carries with it piston head 13, piston rod 11, application tube 5, with disk 6, piston head 3, piston rod 4, and piston head 2. This operation causes piston head 3 to travel with application tube 5 into the larger portion of cylinder 1, from which the brake-pipe pressure, entering at 36, passes into application cylinder 5, through slot 37, and thence exhausts to atmosphere through holes 38, which are normally covered, in cylinder 9. The speed of travel of application tube 5 and attached pistons is so regulated—by the

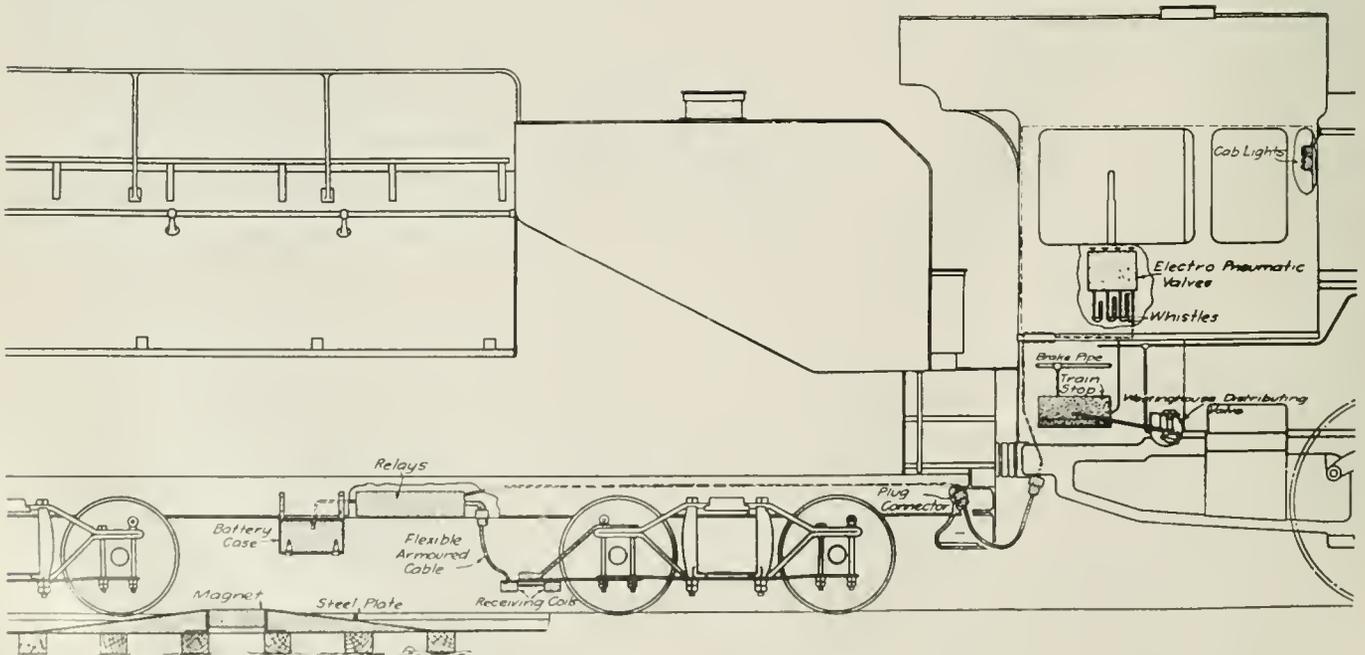

Fig. 10—Automatic Stop and Cab Signal—National Safety Appliance Company

adjustment of needle valve 16—as to reduce the brake-pipe pressure only to the extent requisite for a service application of brakes.

Valve 40 is connected by suitable pipe and fittings to the exhaust port of the engine distributing valve. When disk 6 moves, in company with tube 5, to which it is attached, lever 8 is released, permitting spring 39 to close valve 40, thus shutting off the distributing valve exhaust and preventing the engine-man from releasing the brakes until the automatic stop mechanism is again restored to normal position. Restoration can be made only by first pressing the electric vent valve knob in the cab and then pushing release valve button 42 on the tandem or duplex valve, which button (42) can only be reached through the ground.

The tandem or duplex valve is back of the plate carrying its valve button 42 and is shown in dotted lines. This valve takes its air supply from the pipe supplying graduating cylinder 12, the air entering at 41. When release button 42 is pressed in, it raises valve stems 43, allowing the air entering at 41 to pass valve seats 44 and through chamber 46 to outlet 45, thence through connecting tubing to controlling pipe 28 and through passage 27 into chamber 21, there building pressure superior to the escapement to atmosphere through the small port 32. The increased pressure in chamber 21 causes diaphragms 22 and 23 to deflect toward chamber 18, increasing its pressure to the closing of valve 24, thus cutting off the supply of chamber 26 and so to whistle 33, which quickly exhausts the air pressure in chamber 26. Pressure in chamber 26 being exhausted, the pistons will move

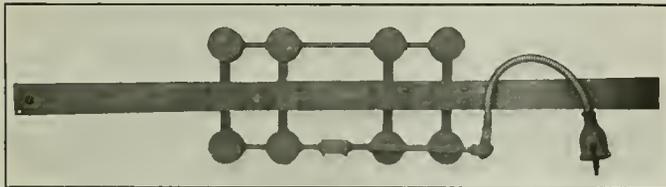

Fig. 11—Receiving Coils on Locomotive—Top View

back at once to their normal position, valve 40 reopened and the engine-man can release the brakes and proceed, subject to the signal indication of the automatic roadside marker at each automatic stop location. Whenever a train is stopped by the operation of the automatic stop device, record is made by the automatic application counter 47.

The entire automatic stop mechanism is kept free from dirt by a tight cover, outlined by line 48. This is sealed.

When two or more locomotives are used in the same train, and the automatic stop is operative only on the leader, the standard double-heading cock under the brake valve (in the cab) is displaced by a three-port cock, one port of which controls the brake pipe pressure to the automatic brake valve, one the main reservoir pressure to the automatic stop, and the other the brake pipe pressure to the automatic stop. Hence, when this cock—normally sealed open to prevent wrong use—is closed on all locomotives except the leader, both the automatic brake valve and the automatic stop are cut out.

ROADSIDE APPARATUS

Figs. 3, 2 and 1 show the automatic stop circuits in the roadside apparatus of two complete blocks. The operation of the clear, caution and stop signals is controlled in exactly the same manner.

Block 1 is insulated from adjacent rail sections at *a, b, h, i*. Block 2 is insulated at *h, i, u, v*. At each signal location two more insulating joints are used, *f, g, p, q*. These joints do not break the main track circuit, which is shunted around them by wires 48 and 49 through contact lever 7 of protective relay 6. The disarrangement or failure of any of the apparatus, batteries or wiring, will cause this protective relay to drop its armature, thus opening the track circuit and causing the display of stop signals.

Block 1 is supplied with track battery at *d*, which through wires

56 and 57 energizes the track relay, Fig. 2, which, by means of line wires 50 and 51, controls line relay 1, Fig. 3.

Block 2 has its track battery at the far end, and through wires 54 and 55 controls track relay *k*, Fig. 2. This relay, by means of line wires 52 and 53, controls line relay 1, Fig. 1.

Suppose two trains from opposite directions enter the blocks, as shown, at the same instant. Relays *j* and *k*, Fig. 2, drop their armatures, causing the line relays 1, 1 in turn to open. Referring now to Fig. 1, line relay 1, opening, closes contacts 38 and 35. Armature 2, through wires 34 and 38, closes magnet 5 and locks armature 3 against contact 35.

The circuits just mentioned are now in condition to energize the train-stop track-magnet; but no further movement of any part takes place until the forward truck of the engine passes insulating joint *f*, assuming a train moving in the direction of arrow 101. At insulating joint *g* a local track battery 27 is connected to the rails by wires 29 and 30. Current from this battery is prevented from disturbing the main track circuit by insulating joints *f* and *g*, two rail lengths apart. At *f* wires 43 and 44 run

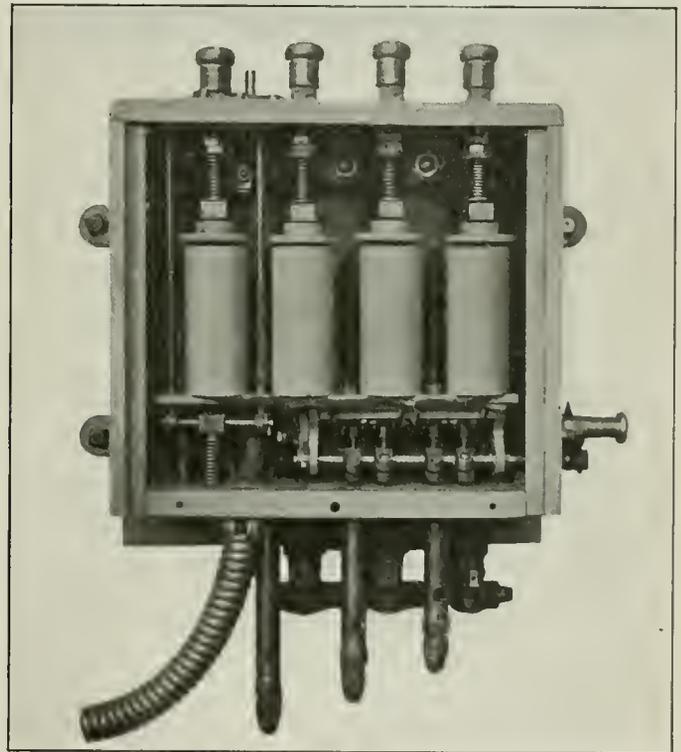

Fig. 12—Air Valves

to magnet 8 of the time limit relay and normally battery 27 holds up armatures 19, 20, 21 and 22 of relay 8, thus holding contacts 41, 42, 45 and 46 open. The forward truck of the engine, as it passes joint *f*, shunts magnet 8. Armature 20 is connected by wires 47 and 46 with one pole of battery 26, and when it drops it closes a circuit through wires 33 and 45 to magnet 23. The action of this magnet is to lock armatures 21 and 22 securely against contacts 42 and 46.

As armatures 21 and 22 drop, current travels from battery 26 through wire 46 to armature 22, thence to armature 21, thence through contact and wire 42 to solenoid 9, thence through wire 40 to armature 24, thence through wires 36 and 58 to the other pole of the battery. The action of this solenoid is to instantly draw up its core 14, to which is attached a frame connected to the pistons of two dashpots 12 and 13, and which also carries two projections 16 and 15. Arm 16 normally depresses lever 17; the action of 15 is to lift armatures 24 and 25 to a point where they can be retained by magnet 10, which cannot attract them from the distance at which they are normally set. As the core 14 reaches the end of its travel the circuit of solenoid 9 is broken by reason

of armature 24 being attracted and held by magnet 10, the circuit of 10 being closed through armature 19 and wires 47 and 46 to one pole of the battery and through wire 41, magnet 10, wires 36 and 58 to the other pole.

As the plunger 14 rises the projection 16 allows the right hand end of lever 17 to descend, closing the circuit to the track magnet 28. This circuit is through wire 32 from battery 26, thence through magnet and wire 31 to lever 17, to wire 35, to armature 3 of relay 1, thence by wire 34 to the other pole of the battery.

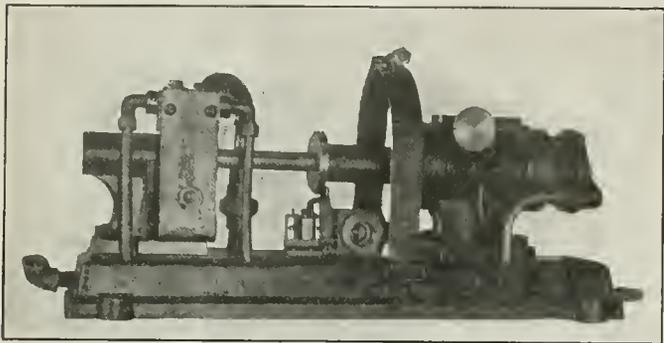

Fig. 13—Brake-Aplying Apparatus

Dashpots are so arranged that their retarding action takes place on the downward movement of the plunger 14, current remaining on the track magnet until the projection 16 has again depressed the lever 17, thus opening the circuit of the track wire in the external circuit will produce the same result. Should magnet. The magnet box contacts cannot be set for another operation until the train has cleared the short rail section from *f* to *g*, allowing current to again pass through magnet 8, which attracts its armatures, thus breaking the circuit of magnet 10, which allows armatures 24 and 25 to return to their normal position.

To recapitulate, reading Figs. 3, 2 and 1, from right to left, and following the behavior of the relays in the operation of the two automatic stops arranged for opposing train movements, we note, first, that the track circuits are shown as extending from *C* to *D*, and from *D* to *E*. These circuits include standard neutral type relays *k* and *j*, controlling line relays 1, 1, which in turn control the automatic stop magnets on the ties, 28, 28.

Suppose two opposing trains entering the blocks as shown, one at *C* and the other at *E*: as the trains enter the blocks,

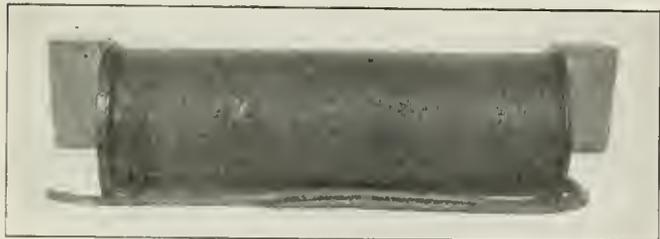

Fig. 14—Track Magnet

the track battery is shunted and relays *k* and *j* open, thus opening the circuits of line relays 1, 1. Thus the westbound train, moving in the direction of the arrow, 101, opens the circuit of battery *o*, Fig. 2, wires 50 and 51, and actuates the proper instruments to stop the eastbound train by application of the brakes at 28, Fig. 3; while the eastbound train protects itself against the westbound, in the same manner, by opening the circuit of battery *m*, Fig. 2. No further movement of the roadside instruments will take place until the forward truck of the engine—assuming that an engine from the east, moving in the direction of the arrow, 101, is the first to arrive—moves on to the short insulated section of track *f*, *g*. As soon as the

engine enters this short section (the length of two rails), relay 9, Fig. 1, lifts 16 and allows the right hand end of lever 17, to drop and close the circuit to energize the track magnet 28, thus transmitting the impulse to the receiving device on the engine and setting in operation the apparatus for applying brakes. The eastbound train will be stopped in the same way, there being room for each train to be brought to rest before reaching *D*. The time-limit relays are so adjusted that they energize the track magnet 28, only for a sufficient time to communicate an impulse to the slowest train, after which they automatically cut out the track magnet until the train clears the insulated rail section, *f*, *g* (or *p*, *q*), upon which they reset themselves ready for the next operation.

The foregoing paragraph, it will be remembered, refers only to an automatic stop. In a complete system relay *j* might have other contacts, arranged to protect the westbound train from eastbound trains, farther back, by giving warnings at suitable distances; or to set stop-apparatus, or signaling apparatus, in its own rear.

The action of the protective relay 6 is as follows:

With the line and time-limit relays in their normal position, relay 6 is connected across the open contact between lever 17 and wire 35 by means of wire 39 to armature 25, thence by wire 39 to lever 17, thence by wire 31 to track magnet 28, thence by wire 32

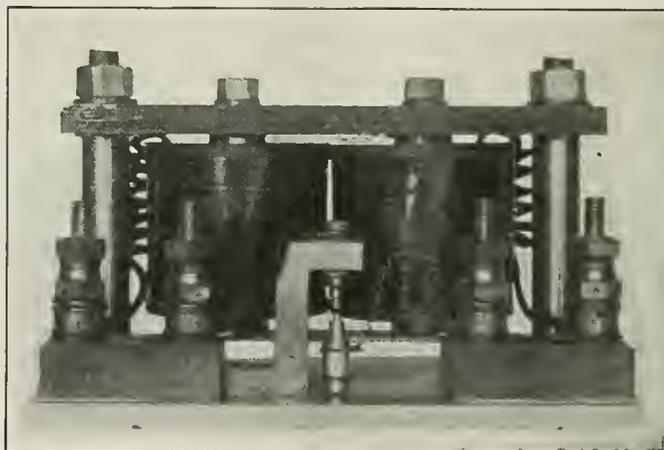

Fig. 15—Locomotive Relay

to one pole of battery 26. The other side of the circuit is from 6 by wire 37 to wire 35, thence to a high resistance 4 bridged across the terminals of armature 3 and contact 35, thence by wire 34 to the other pole of the battery. The relay 6 is of high resistance and the resistance connected in series with it at 4 reduces its operating current to an amount just sufficient to enable it to securely retain its armature 7. Any diminution of the voltage of the battery 26 below its normal safe operating point will weaken magnet 6, thus dropping armature 7, which will open the track circuit and set the proper stop signals. The breaking of any of the track battery 27 or its connections 29 or 30 fail; or if wires 43 or 44 leading to magnet 8 should be broken (causing plunger 14 to be operated) then relay 6 will be cut out by the opening of the contact between armature 25 and wire 39. The opening of these contacts in the ordinary course of delivering a signal produces no effect, as the track circuit has already been opened by the entrance of a train into the block.

The condensers at 11 and 18 are connected across the contacts shown to dissipate the inductive spark occurring on breaking the circuit. Auxiliary carbon contacts (not shown) are also provided between lever 17 and contact 35 to further protect the contacts against sparking.

This system has been developed and installed by the National Safety Appliance Company, of San Francisco, as before stated; and the general arrangement, as well as most of the appliances, has been designed by W. S. Levin, chief engineer of that company.

Interstate Commerce Commission Hearing on Valuation

Railroads Urge the Commission to Co-operate with Them in Establishing Fundamental Principles to Be Used

On Thursday and Friday of last week the Interstate Commerce Commission heard oral argument on valuation matters conducted by Pierce Butler and other counsel for the President's Conference Committee of the railroads. The oral argument was based on a brief of 544 pages which the counsel had previously filed with the commission. There were a few members of the state commissions present, and Director Prouty, of the valuation work, was present. The commissioners, Director Prouty and Milo R. Maltbie, now employed by the commission, asked questions, but no witnesses were heard. The representatives of the state commissions, after the railroad companies' oral argument was completed, asked for ninety days in which to file a brief and also asked for a hearing at which they could present oral argument. The Interstate Commerce Commission gave them 60 days in which to file a brief, but did not set any date for oral argument.

The following is an abstract of the brief and oral argument presented by the railroads' counsel:

Under the act of Congress of March 1, 1913, the Interstate Commerce Commission is required to ascertain and report on the value of the constituent parts of the transportation system subject to the act to regulate commerce. This system comprises, roughly, 250,000 miles of line and with securities outstanding in the hands of the public totaling, approximately, \$15,330,000,000. The act requires the railroads to co-operate with and aid the commission in the valuation.

REASONS FOR THE ENACTMENT OF THE VALUATION ACT

In the year following the creation of the Interstate Commerce Commission it urged the necessity for valuation, and in 1913, and again in later years urged Congress to pass an act which would require a valuation. Summarizing the various references in the Interstate Commerce Commission's annual report to valuation, the principal reasons which the commission advanced for urging it were:

(1) To obtain a trustworthy estimate of the relations existing between the present worth of railroad property and its cost to its proprietors.

(2) In determining whether rates as fixed by the government are confiscatory.

(3) In connection with railway taxation.

(4) In the ascertainment of a proper depreciation reserve.

(5) In testing the accuracy of the balance sheets of the carriers.

(6) As a help in the organization of railway statistics in general.

(7) In determining whether the railroads are under or over capitalized.

The Adamson bill contained in its title the words "physical valuation," but the body of the bill was not limited to the physical valuation, and the Senate struck out the word physical in the title when it amended the bill. The Senate committee reporting on the bill, said, "These terms [governing all elements of value attaching to the property of common carriers for rate-making purposes] accepted by recognized authority, are: (1) The original cost to date; (2) cost of reproduction new; (3) cost of reproduction less depreciation; (4) other values and elements of value, that is, intangible values.

COST OF REPRODUCTION NEW

In arriving at reproduction cost, the weight which the figures may have as evidence of *value* should not control or substantially affect the methods employed or the conceptions adopted for making the estimate. Reproduction estimates should be based

on reasonable prices and present methods of doing the work. Everything now in existence except the road which is to be the subject of the investigation is to be assumed to be in existence in getting at this cost of reproduction new. The historical construction of the property or similar properties may be an aid in determining the present cost of reproduction insofar as it shows overhead costs, costs incidental to accidents, etc. A plan of engineering should be laid out exactly as if a new road were to be constructed. The procedure should be the same in making estimates of costs as would be the case if the work was actually to be done. Thus means of transportation other than the property of the railroad to be reproduced will be available and means of transportation over the railroad itself will develop with the progress of the work. Allowance must be made for the seasoning of a railroad property and where there is appreciation as in the case of roadbed such appreciation should be taken into account.

It is the cost of reproduction new of the identical and not of another or substituted stretch of road that is required by the law. Original records of grading quantities when corroborated furnish better evidence than present measurement. In determining the cost of reproduction new, there must be taken into consideration present or original conditions, ascertainment of grading quantities to be included in the reproduction inventory and the time required to reproduce the property. Furthermore, the form and manner in which the road shall be reproduced must be determined and the overhead charges estimated, these charges to include engineering contingencies, interest during construction, taxes and promotion organization and administration. Allowance must also be made for materials on hand and working capital.

THE DETERMINATION OF UNIT PRICES

The prices to be used in the valuation should be arrived at by a consideration of prevailing prices. Price tendencies and conditions affecting labor and material markets during a reasonable period of time next preceding and at the date as of which the valuation is to be made, should also be used, due consideration being given to the existence or non-existence of active railroad construction during the period. The importance of the subject of unit prices is so great and so many different elements enter into a proper consideration of it, some of which depend on local conditions and peculiar circumstances, that no prices ought to be applied even tentatively by the government valuation forces without the fullest consultation with representatives of the company whose property is to be valued. [Director Prouty stated that in the west so much difficulty had been experienced in getting an agreement between the forces of the commission and the railroad company that work along certain lines was being carried on and reports on it made by subordinates without submission of these reports of the railroad company's engineers. This method was very urgently objected to by counsel for the roads.]

APPRECIATION AND DEPRECIATION

Appreciation includes both seasoning and adaptation, and both of these should be taken into consideration. A newly built railroad has no greater length of life than an old railroad properly maintained. The only depreciation, therefore, which should be taken into consideration is that due to neglect of maintenance. The element of accrued depreciation, that is, the loss of service life in the simple properties of a railroad, the same being still in place and in useful serviceable condition, should not be considered as an element of depreciation, because, as has been demonstrated, this element does not affect the value of the rail

road and the sole and only purpose of the valuation act is to ascertain the value. An attempt to estimate accrued depreciation is nothing but a guess and the result obtained is worthless. The amount of deferred maintenance, however, can be ascertained through personal inspection and the courts have held that in determining the cost of reproduction less depreciation, the only depreciation involved is that which actually exists at the time and which is capable of measurement; in other words, deferred maintenance.

A proper condition for economical operation should be determined for each piece of road and on the basis of this depreciation should be figured. In other words, if the estimated life of a rail is 15 years, no depreciation should be figured against rail which has been in track for five years so long as the railroad company is renewing each year the rails that need to be renewed and thus keeping its track up to the proper operating standard. Property should be inspected jointly by representatives of the valuation forces and of the railroad company and every reasonable effort made to agree, first, on the question of whether there is any deferred maintenance and, secondly, on the amount of it, if any. The only purpose of determining depreciation is to ascertain whether or not the value of the property has been preserved and only to the extent that it has not been preserved is there depreciation. Property should be classified as follows:

Items and groups of properties which appreciate.

Items for which cost of reproduction less depreciation and cost of reproduction new are the same.

Track.

Machinery, tools and equipment.

Remaining classes.

LAND

The same principle should be used in determining the value of land used for railroad purposes that is now used in condemnation proceedings. Railroad property is private property. The value that is required to be found is the entire value. It is not within the power of Congress to provide that any value or element of value shall be excluded from consideration in any case to which the provisions of the fifth and fourteenth amendments of the constitution apply for the protection of private property. It makes no difference how the railroad company came to acquire the land which it has so long, of course, as it acquired it legally. The value to be determined is the value which should be assigned if the property were to be taken under condemnation proceedings. There is a theory known as the trustee theory which assumes that there exists between the public and every railroad the relation of principal and agent, or of beneficiary and trustee. No such relation exists. The public does not owe a railroad the money that the latter has invested in its property, nor has it any legal or moral right to appropriate the rewards of success. The right to regulate the charges of those engaged in a public calling or to regulate the selling prices of commodities rests on the power of police and not on ownership, legal or equitable, of the property. Some of the advocates of the trustee theory frankly admit that the law is settled against them and they insist that the Supreme Court must reverse itself. Manifestly, the commission has no power either to reverse the court or amend the constitution.

The value of land for terminal purposes or for right of way cannot be determined without also taking into consideration the use for which it is to be put. The right of way of a railroad is more valuable than an equal acreage of land lying adjacent to it used for agricultural purposes.

[Commissioner Hall asked what would be the line of argument in a case where, when the railroad was built, the land was not under irrigation and was bought for \$1.25 an acre. Later irrigation was introduced and the value of land for agricultural purposes increased to \$100 an acre. Counsel for the railroads maintained that the value which should be taken was the value that would have to be taken if all other conditions were the same as they are now, except that the railroad was not there. In other words, that if a road were now to be built

through this territory, the price which would have to be paid for land would be at least as high as its value for agricultural purposes. It was conceded, however, that there might be a conceivable case in which land for railroad purposes would be less valuable than for some other purposes, but it was argued that in this case the railroad would not be built and that, therefore, if a railroad was built it was evidence that the land for railroad purposes was more valuable, or at least as valuable, as the land for other purposes.]

It is the property and not the cost of it of which the owner may not be deprived without due process of law. The Minnesota cases do not condemn the reproduction method of valuing land when reasonably applied. The court condemned the particular method used in the Northern Pacific case, because of defects it found therein and which are specified in the opinion. The phrase "the fair average of the normal market value of land in the vicinity having a similar character," and again the phrase "the fair average market value of similar land in the vicinity without additions by the use of multipliers or others to cover hypothetical outlays" are not to be read to mean market value for general—not including railway—purposes. These phrases mean prices which the company would now have to pay to carve an equivalent right-of-way out of adjacent lands having a similar character and value.

A compilation was made by counsel for the railroads showing land acquired by railroads for building extensions, branch lines and double track, etc., in the last ten years and a general average was then made to compare the cost which the railroad company had to pay for land, for railroad purposes, with that which would have had to have been paid for the same land for other purposes. The price which would have had to have been paid for all the land for other purposes was approximately 40 per cent of the price which the railroad company had to pay. It is the experience of railroad companies in recent times which should be made the basis of the estimate as to how much more land is worth for railroad purposes than for other purposes.

[The question was asked as to whether, if the Pennsylvania Railroad did not exist today, it would not be very easy to obtain land grants, cheap right-of-way, etc., for the building of this road. Counsel for the railroads replied that it is impossible to go off into pure speculation, that the best answer to the question is to be found in the experience of railroads which are today building a new line, extensions or branches, and this experience shows that the railroad has to pay very considerably more than would some one who was acquiring the land for other purposes.]

"USED FOR PURPOSES OF A COMMON CARRIER"

The law broadly divides the property of a railroad into two classes, that which is for the company's purposes as a common carrier and that for purposes other than those of a common carrier. Furthermore, the second class includes both property owned and property used for purposes as a common carrier; thus the Armour Car Lines could not be valued under the law as the property of that company because the law applies only to common carriers and that company is not a common carrier. All property, therefore, used by an operating carrier, whether owned by it or not, must be included in the inventory of the operating carrier. All joint facilities should appear in the reproduction inventory of each carrier and in addition to the original cost, cost of reproduction new and cost of reproduction less depreciation, a full statement as to the ownership of the facilities, a full statement as to the use made of the facilities by each carrier using same, together with the rates and obligations in that regard, and a full statement as to whether carriers pay for the facilities and in what amounts, and the consideration for such payments should be shown. When all these facts are properly before the commission, then will be the time to formulate the rule for the determination and apportionment of such value.

ADDITIONS PAID FOR EARNINGS

All the property of the carrier, whether paid for out of cap-

ital or earnings, or whether received as a gift, is to be included in the value on which the carrier is entitled to return. The assumption that a surplus of earnings is prima facie evidence of unreasonable rates in the past, is wholly wrong. There is no necessity for the company to actually pay out in dividends surplus and then ask its stockholders to invest an amount equal to the dividend in the property to make the investment of surplus a new investment and an investment of property which belongs to the stockholder. The only equitable assumption is that the rates charged are reasonable and that the fact that a particular railroad company can earn a surplus is because it is economically located and operated, and that good business judgment has been used in its management. Additions and betterments made out of earnings or surplus are, of course, subject to taxation on the same principles and to the same extent as if they had been paid for out of capital, and the Supreme Court of Washington has specifically pointed out in a recent case that there cannot be one value for purposes of taxation and another value for the purpose of establishing reasonable rates.

OTHER VALUES AND ELEMENTS OF VALUE

The other elements of value which may be called the intangible values, but which nevertheless are as substantial and as real as any physical values, may be divided as between values which attach to specific pieces of property, units or parts of property and values which attach to the property as a whole. Each particular case must be studied to determine the value which attaches to specific pieces of property; thus if a railroad company owns a piece of right-of-way or terminal which renders all the service which the owning carrier can require therefrom, and in addition the owner receives a substantial revenue from some other railroad, this value should be taken into consideration.

There are five classes of values which attach to the property as a whole and can be valued together.

1. That element of value which results whenever the separate articles of physical property constituting a railroad are joined together, not simply by a unity of ownership, but in a unity of use.

2. Going concern value is that element of value, in addition to the sum of the values of its component parts, which results from the fact that the plant is in operation and has an established business—i. e., in active and successful operation earning revenue.

3. That element which represents the earning capacity of the property due to its favorable location with reference to command of traffic, including the existence of traffic producing industries along its lines, its advantage of connections with other carriers, the potential traffic in its tributary territory and all other features bearing upon its present and prospective traffic earning capacity.

4. That element of value resulting from economy of operation, due to gradient, alignment and other physical characteristics, climatic conditions, adequacy of terminals, equipment and other facilities, fuel supply, efficiency of operating organization and all other features bearing upon the cost of operation and maintenance.

5. That element of value represented by franchises and privileges.

EXPORTS OF RAILS FROM THE UNITED KINGDOM.—The exports of rails from the United Kingdom in August showed some increase as compared with the corresponding month of 1914, although they were not up to the level of August, 1913. The change observable was due, to some extent, to an increased colonial demand, the shipments to South Africa rising to 4,742 tons, as compared with 180 tons; those to Australia to 13,848 tons, as compared with 6,227 tons; and those to New Zealand to 2,314 tons, as compared with 1,070 tons. The deliveries to British India declined, however, to 3,595 tons, as compared with 8,303 tons.

THE GREтна COLLISION

The disastrous collision on the Caledonian Railway at Quintinshill, May 22, last, when a train filled with troops ran at high speed into a local passenger train, was reported in the *Railway Age Gazette*, June 11, pages 1227 and 1242. The report of the Board of Trade inspector, Lieut. Col. E. Druitt, just at hand, gives the total casualties as 473 (227 killed and 246 injured), by far the largest record for a single train wreck that we can recall. The number of killed is 66 more than the number reported in June, but it includes 28 persons who at first were included in the list of injured. This total includes 82 bodies recovered but not recognizable because of the effects of the fire. The inspector expresses the hope that few if any of the persons fatally burned were conscious when the fire reached them. Of the total number of killed 215 were in the troop train, 7 in the express train which ran into the wreck a minute after the collision occurred, and 2 in the local passenger train. The number of employees killed was 3 and of injured 4.

Discussing the cause of the collision, the inspector recounts various things done or omitted which led up to the fatal error, or which were potentially dangerous; but he devotes his principal paragraph to the use of track circuits as safeguards against the giving of false clear signals at interlockings. But, he says, if a place like Quintinshill is to be fitted with track circuits, "it means that every signal box on a main line is to be fully provided with this device, on both tracks, between the home and starting signals; and Quintinshill would be one of the last places to be so fitted, for it is little more than a block post and all the tracks are in full view of the signalman."

The error of the signalman, in forgetting the presence, within a hundred feet of his window, of a standing passenger train, from which he had himself alighted a few minutes before, is, in view of the results, staggering. There was no question concerning incompetence, or liquor drinking or distraction by any unusual circumstance. There were two or three trainmen in the cabin but no nonsense or anything to disturb the signalman. There were some contradictions in the testimony, which the inspector could not clear up, but the main fact was not affected by them. Concluding his observations on this branch of the subject the inspector says:

"The means provided at the present time by the company for reminding signalmen of any vehicles standing within their control at such a place as Quintinshill should have been sufficient, if the signalmen concerned had only carried out the ordinary simple rules of block working and regulations laid down for the purpose, and paid proper attention to their duties. Also, it is much to be regretted that some signalmen do not look out of their signal-boxes to see if the line over which an approaching train is to run is clear of any obstacle before lowering the signals. It takes only a brief interval to do so, and many collisions could be prevented if this simple precaution was always taken. Had Tinsley looked along the up line on this occasion, he could not have helped seeing the 6:10 local train standing only a short distance away."

The inspector devotes a page to the fire, which, starting from coals spilled out of two or more fireboxes, became uncontrollable in a few minutes. There was no water supply available, even the tenders of the locomotives having been emptied by being ruptured in the collision. Fire engines from Carlisle, ten miles away, reached the scene *three hours* after the collision. The inspector repeats former recommendations that all passenger cars be lighted by electricity, at the same time saying that this fire was not due to the use of other illuminants.

GERMAN STEEL PRODUCTION.—The total German production of steel ingots and steel castings, including Luxemburg, in 1914, amounted to 14,973,106 tons, as against 18,949,929 tons in 1913. The figures for steel finished products, including rails, girders, sections, forgings, etc., were 13,011,438 tons in 1914, as against 16,518,950 tons in the preceding year.

Pennsylvania Track Elevation Through Wilkinsburg, Pa.

Five Tracks Are Being Raised Through Suburb East of Pittsburgh, Work Carried on Under Heavy Traffic

The Pennsylvania Railroad is now completing the elevation of its main line through Wilkinsburg, a suburb of Pittsburgh, work which has been carried on under exceptionally heavy traffic. Wilkinsburg is located on the main line of the Pittsburgh division, seven miles east of Pittsburgh, between the Brilliant cutoff connection and Port Perry. This portion of the line carries all passenger and freight traffic coming from the East for Pittsburgh or beyond, including all through freight traffic which is diverted via the Brilliant cutoff to avoid congestion in the Pittsburgh terminals. In addition there is a heavy suburban traffic which alone requires 70 trains daily.

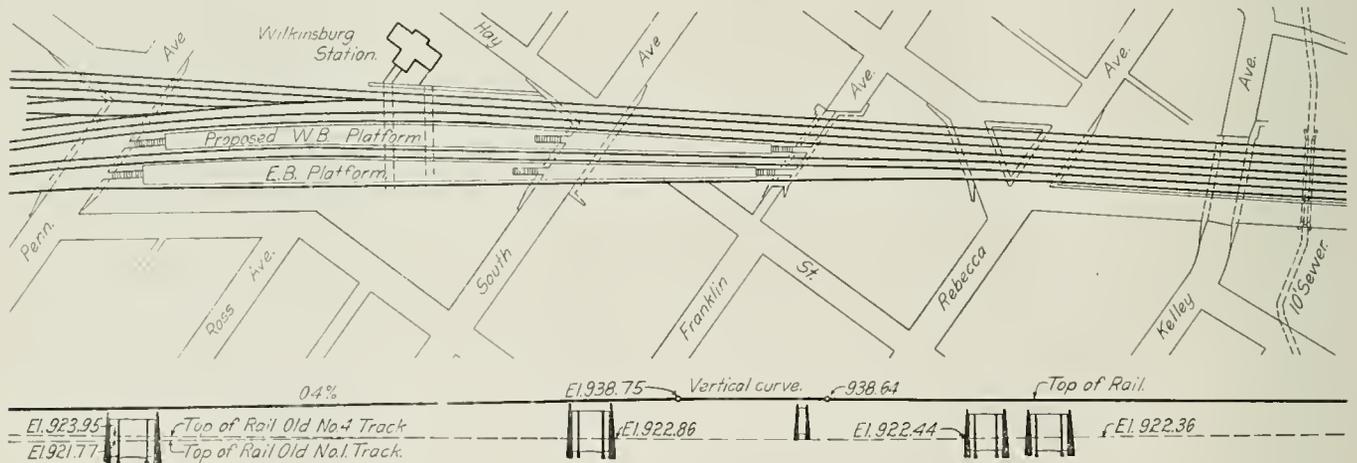

The present layout provides for five tracks, two eastbound and two westbound, with a service track in the middle to serve a yard located between the two double track main lines just west of Wilkinsburg. All structures have been laid out, however, to permit ready revision in the future for the addition of a double track freight line along the north side, which will connect with the cutoff. The present work is a continuation of grade separation recently completed in the city of Pittsburgh immediately west, and naturally follows that work, for, although the borough of Wilkinsburg is separated from Pittsburgh politically, there is no real physical separation, and the density of the population in the former approximately equals that of the adjoining portion of the larger city. The conditions leading to

of the borough of Swissvale on overhead viaducts, so that the matter of grade separation in that vicinity has already been solved.

The new profile provides for a 0.4 per cent grade rising eastward from the previous work in Pittsburgh for a distance of 2,400 ft., reaching a summit on a vertical curve at Franklin avenue and then descending for 5,400 ft. on a 0.3 per cent grade, which reaches the old grade line a few hundred feet east of the Edgewood station. There are four street and three pedestrian subways, besides the old subways at Kelly avenue and Race street, and the passenger and baggage subways required for a new passenger station at Wilkinsburg.

SUBWAYS

Commencing on the west the first subway is that at Penn avenue, one of the most important streets in the city of Pittsburgh, and a part of the original Pittsburgh and Greensburg turnpike, now to be incorporated in the proposed Lincoln highway. The situation is complicated by the junction of Penn avenue with Pitt street within the limits of the subway, because the latter must be provided for in the subway north from the intersection. South of the intersection Pitt street has been closed as far as the railroad right of way line, but will be connected to Penn avenue south of the railroad by a short street

General Plan and Profile of the Track Elevation Through Wilkinsburg

grade separation in Wilkinsburg were emphasized by the fact that most of the important streets crossed the tracks at an angle of $57\frac{1}{2}$ deg., thereby increasing the danger at the crossings under the prevailing heavy traffic on both the railroad and the streets. In three cases street intersections were located on the railroad tracks.

While not as rough as much of the country in the vicinity of Pittsburgh, the location of the railroad through Wilkinsburg presents considerable irregularity in topography which had been taken advantage of in the past to provide two subways under the tracks in natural depressions. One at Kelly avenue is used by a street car line, with the crown of the roadway about 26 ft. below the old base of rail level, the street also crossing under Pennwood avenue, which parallels the tracks along the south right of way line from Rebecca avenue to Lincoln avenue. The other subway is at Race street, Edgewood, near the east end of the present project. East of the Race street subway the railroad is in a cut for some distance crossed by numerous streets

parallel with the south right of way line. The subway has been built to provide eventually for 11 tracks, and gives a head room of 15 ft. In Penn avenue, which is 60 ft. wide, there are lines of supports at the curbs and on the center line of the street, forming two roadways having a clear width of 17 ft. each. In Pitt street, which is 50 ft. wide, there are lines of supports at the curbs only, leaving an unobstructed driveway 30 ft. clear.

The first seven tracks from the south end of the subway are supported on an all-reinforced concrete structure consisting of two mass abutments with reinforced concrete bents for intermediate supports covered by reinforced concrete slabs. Each bent consists of a row of columns surmounted by semi-circular arches, the columns being spaced to bring one arch under each track, a design commonly used in structures of this kind, and worked out in this case with exceptionally good proportions. In a number of cases the distance, center to center of tracks, is considerably more than the ordinary track spacing, and in such instances for the sake of economy, an open space has been left

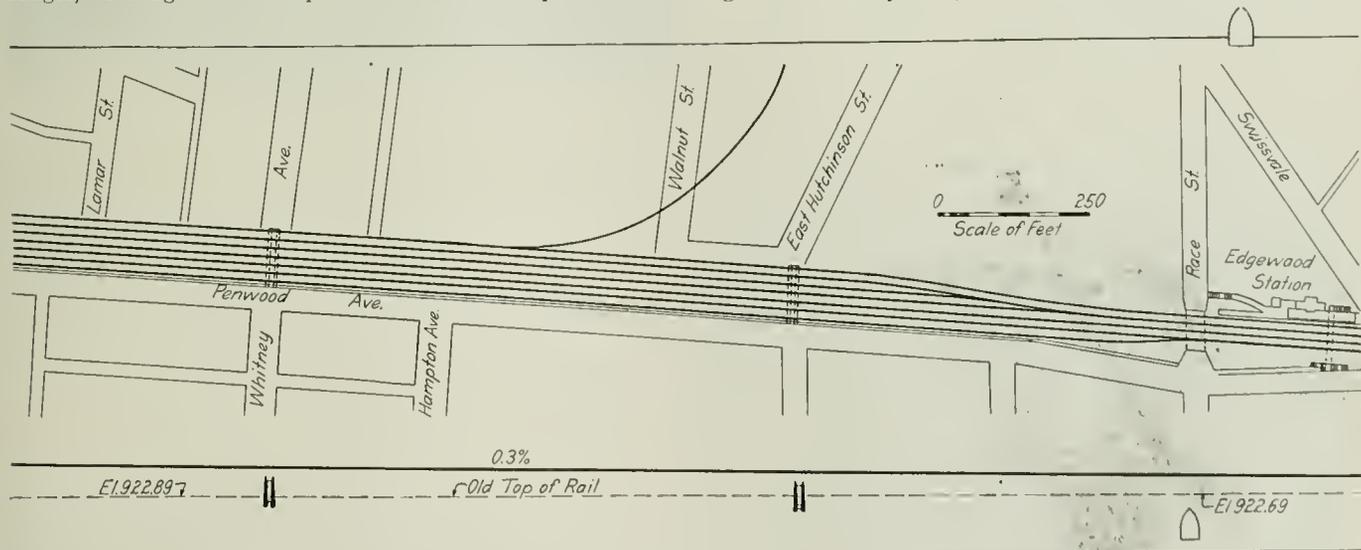

between the slabs of adjacent tracks, also breaking the continuity of the bents beneath. This was accomplished in a simple way by cutting through the arch in the plane of the face of the slab, a width of slab being selected that would cut off the arch at or near the crown. The same treatment was used at the ends of the bent on the south parapet of the structure, the effectiveness of this treatment being well shown in one of the accompanying photographs. The slabs which serve as the superstructure of the subway follow the standard practice of the Pennsylvania Railroad. The abutments are of mass concrete with a stepped back, and have the exposed faces broken up into horizontal courses 24 in. deep by the use of V-molds. This has the advantage that it breaks up the surface and tends to conceal any irregularities in the texture or shade of the concrete finish.

Owing to the complications resulting from the intersection of Pitt street with Penn avenue under the subway it was necessary to adopt steel construction for the four north tracks. In fact, these conditions resulted in the use of some rather heavy girders and columns, one of the latter carrying a concentration of 1,335,000 lb. The columns and the sway bracing between them are inclosed in concrete to give an appearance similar to that of the concrete bents at the other end of the subway, the arches between the posts being three-centered instead of semi-circular on account of the wider spacing of the steel columns. The floor, which is of the ballast type, consists of transverse 1-beams encased in concrete. Where the tracks and the girders are spaced 13 ft. center to center, the beams are 18 in. 55 lb. I-beams, spaced 2 ft. center to center. The concrete encasement has a minimum depth of 2 in. over the tops of the I-beams, and extends up the sides of the girders to the under side of the top flanges, forming channel-shaped beds for the reception of the

curbs on both streets. It will provide eventually for seven tracks with a spacing of 22 ft. between the first and second, and 25 ft. between the third and fourth tracks (counting from the south) to allow for platforms for the new Wilkinsburg station. In all other cases the spacing of the tracks is 13 ft. The minimum head room of the subway is 14 ft.

At Franklin avenue there is a pedestrian subway 7 ft. 6 in. high and 16 ft. wide with a concrete slab cover. Wood street and Rebecca avenue also intersect near the center line of the right of way, but a rearrangement was made, relocating the end of Wood street to intersect Rebecca avenue south of the tracks. This gave two separate subways of seven tracks each, with 14½ ft. head room, and both of the same width and the same type of construction as the South avenue subway. Wood street and Rebecca avenue also have a connection north of the tracks by a new short street 30 ft. wide parallel to the tracks. By this arrangement there is a triangle of embankment approximately 110 ft. on a side between the two subways and the new street, which is entirely surrounded by retaining walls and abutments. It was concluded that this was a more satisfactory solution than a single subway structure of sufficient length to embrace both streets.

As stated previously, there has been a subway at Kelly avenue for some time, passing under the tracks and also under Pennwood avenue. The latter was formerly on a level with the tracks all the way from Rebecca avenue to near Race street, but is now separated from them for the entire distance by a retaining wall varying from 6 ft. to 16½ ft. in height, the difference in grade at Kelly avenue being 16 ft. It was unnecessary to make any change in the old structure, which is a 40-ft. segmental masonry arch, on account of the increased embank-

General Plan and Profile of the Track Elevation Through Wilkinsburg

ballast which is pitched toward the center under the ties to afford drainage. The entire top surface is covered with a membrane waterproofing, protected under the tracks by ½ inch of cement mortar and a course of bricks laid flat to give a thickness of about 2 in. Up the sides of the troughs the protection consists of a thin shell of reinforced concrete. In order to save material and reduce the dead load the concrete encasement is not solid to the bottom of the I-beams, but is hollowed out on the under side between them to form rectangular troughs 15 in. deep. All concrete work in the floor is reinforced with wire mesh. The outside girders on the north side of the structure are encased in concrete and paneled to give an appearance similar to the parapet of the concrete slabs on the south side.

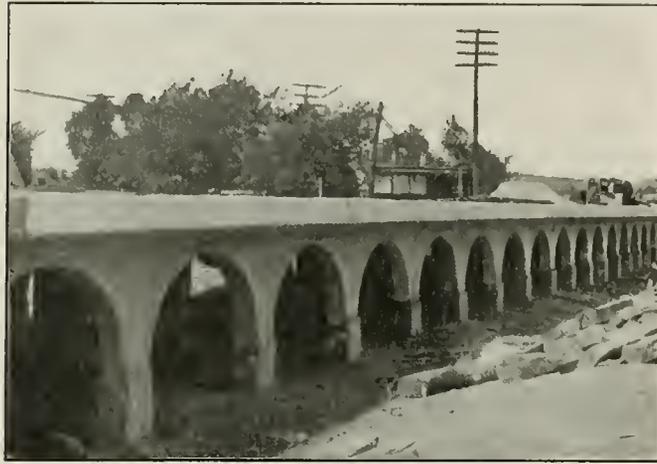

The subway at South avenue and Hay street is similar in layout to the Penn avenue subway, but the superstructure is all of structural steel. There are intermediate supports at the curb lines only, leaving an unobstructed driveway 30 ft. wide between

ment load, but the structure was extended on the north end to provide for two additional tracks. On account of the greater height available this extension was made a semi-circular arch instead of a segmental arch, and as shown in one of the accompanying photographs, the use of V-grooves to break up the concrete surfaces, has been used with a pleasing effect. To avoid overloading the arch ring the retaining wall between the tracks and Pennwood avenue was not supported on the arch, but was designed to span across the opening from supports on either side carried on concrete piles.

Between Kelly avenue and Race street the tracks have not been elevated a sufficient amount to permit the construction of any regular street subways, but two pedestrian subways, 8 ft. wide by 7½ ft. high, have been provided, one at Whitney avenue and one at Hutchinson avenue. These subways are entirely of concrete, and with the exception of the south end of the Whitney avenue subway, stairways were necessary to get

down to the level of the subway floors. As shown in the accompanying photograph the entrances to the subways are protected by suitable hand railings and lamp posts. Adequate illumination was also provided for the interior.

At Race street there is an old four-track 40-ft. segmental arch subway of ashlar masonry, which adjoins the Edgewood suburban passenger station. No change is required at this sub-

East-Bound Platform, Wilkinsburg Station

way other than to raise the parapet and wing walls about 8 ft. and connect the southwest wing wall with the new Penawood avenue retaining wall. The track elevation will result in no material changes in the Edgewood station at this time.

THE WILKINSBURG STATION

One of the most important features of the project is the new Wilkinsburg passenger station. The site of the old station at Franklin avenue and Wood street was deemed unsuitable, so

Whitney Avenue Pedestrian Subway

a new site was selected at the intersection of Ross avenue and Hay street. The building is to be located in the center of a triangular plot bounded by the embankment retaining wall, Hay street and a 20-ft. alley, known as Sawyer way. It is symmetrical with and faces down Ross avenue, giving it a conspicuous location. It consists of a central portion 34 ft. by 50 ft., occupied entirely by the general waiting room, with symmetrical

wings on either side. The east wing contains the ticket office and a waiting room and toilet room for women. The west wing contains a news-stand and a waiting room and toilet room for men. On the track side three wide doors communicate with a lobby 16 ft. by 36 ft., from which access is had by a closed corridor, to a 12-ft. tunnel under the tracks leading to the platform stairways. A covered platform between the station proper and the railroad retaining wall, serves as a baggage room, from which a separate 12-ft. tunnel leads to baggage truck elevators. Brick with stone trim will be used for the exterior of the building, and with adequate space around the same for treatment with lawns and shrubbery, it will give a pleasing appearance.

The arrangement of the platform facilities for the station were complicated by the fact that the immediate location of

Kelly Avenue Subway—North Extension

the westbound track does not conform to the proposed future arrangement, when the two freight tracks will be provided on the north side. This made it necessary to provide a temporary wooden platform for the westbound tracks and three sets of stairways and elevators, one for the eastbound platform and one each for the two locations for the westbound platform. The platforms vary from 15 ft. to 37 ft. in width on account of the curves in the tracks, and are between 900 and 1,000 ft. long.

Communication with the street has been effectively worked out. There are stairways to the Penn avenue and South avenue subways and the pedestrian subway in Franklin avenue as well as stairways both east and west from the station subway. The latter has an outlet on the south side which connects by a walk

Race Street Subway

with Pitt street and South avenue. The stairways are of concrete, between concrete retaining walls extended into the embankment from the subway abutments. The steps are fitted with flat type Universal safety treads, built monolithic with the

concrete. The platforms are of the high type, involving some interesting details. The permanent eastbound platform consists of a reinforced concrete slab 8½ in. thick, spanning between transverse concrete beams 9 ft. center to center. These beams are supported on three rows of reinforced concrete posts, extending through the fill and in turn resting on concrete piles. A 1½ in. asphalt mastic cover serves as a wearing surface and as waterproofing. As the tops of these platforms are 4 ft. 4 in. above the base of rail, there is a clear space of 3 ft. 6 in. between the top of the fill and the under side of the slab, which has been partly screened by building false arches between the outside columns. Similar construction is used for the platforms

holes cut in the top of the sanitary sewer readily served as catch basins.

CONSTRUCTION

The foundations for the structures were sufficiently good to permit the use of natural foundation, except in such cases where the line traversed ravines or gullies subsequently filled. At such points it was out of the question to carry foundations down to the original ground surface, and the use of wood piles was not

North Elevation, Penn Avenue Subway

over the South avenue subway, except that the transverse concrete beams rest directly on the top flanges of the track girders and instead of single arch openings between the beams, three openings are provided 2 ft. wide with semi-circular tops. These openings assist materially in lighting the subway underneath

SEWER CONSTRUCTION

An independent project, carried on simultaneously by the track elevation forces is the reconstruction of a large masonry storm sewer just east of Kelly avenue. This sewer consisted of a semi-circular arch 6 ft. wide carried on 4-ft. bench walls for a length equal to the width of the right of way and joined on either end by a 10 ft. sewer. The borough of Wilkinsburg has required the railroad to enlarge the old sewer to 10 ft. to correspond with the portions outside of the right of way, maintaining that the 6-ft. section was no longer adequate, owing to the faster runoff to be obtained with the great increase in the relative proportion of the drainage area covered by impervious

Details of the Penn Avenue Subway, Stairway to Platform

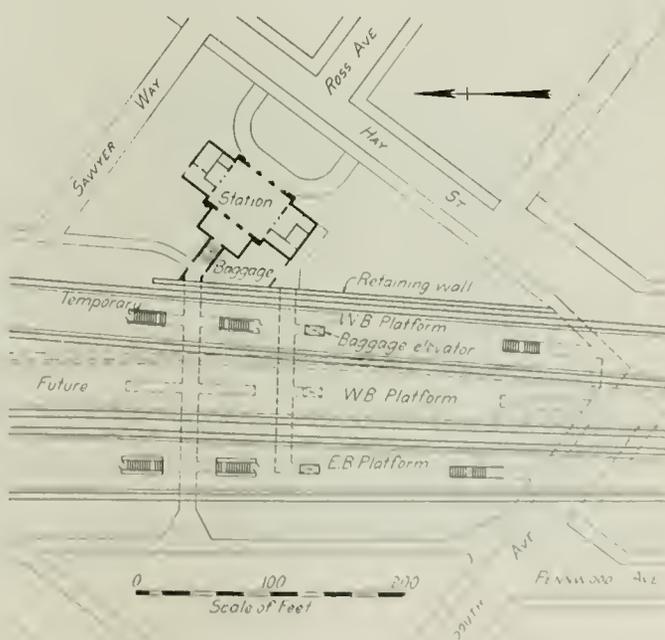

permissible, because of the low level of the ground water, in all, a situation naturally suggesting the use of concrete piles. Simplex, reinforced concrete piles were selected and proved satisfactory, both as to ease of construction and quality of the finished product. Two piles uncovered by chance in the sewer tunnel, were found to be in excellent condition, showing perfect form and sound concrete. The piles were loaded to 30 tons each, and were driven with a 3,000 lb. drop hammer, the fall of the hammer not exceeding 15 ft.

A uniform finish was secured on the concrete surfaces of the walls and subways by rubbing with carborundum brick as

South Elevation, Penn Avenue Subway

surfaces, in consequence of the construction of pavements and buildings. As the invert of the sewer is 50 ft. below the new track level, tunneling was obviously the only feasible method for reconstruction. The material encountered being clay, it was necessary to follow the heading very close with the timbering. The procedure adopted was to take down the old arch, widen out and take down the bench on one side and rebuild it 4 ft. further out. By this scheme one bench was saved. The new arch ring is of reinforced concrete. A 30 in. cast iron pipe sanitary sewer under the invert of the storm sewer offered a simple means of drainage during construction, as temporary

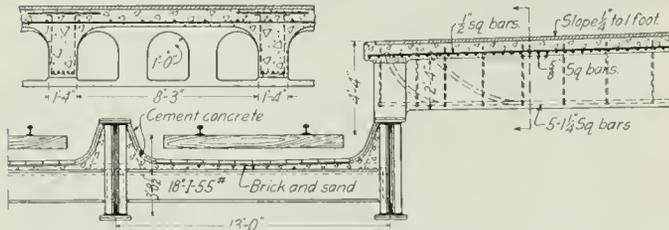

Layout of Wilkinsburg Passenger Station

soon as the forms were removed. In the subways the lighting was greatly improved by the use of white surfaces, secured by applying a wash consisting of "Skim Coat" mixed with neat cement immediately after the rubbing was finished. The white

surface also adds materially to the appearance of the structures.

Owing to lack of head room for falsework, it was necessary to cast the slabs for the Penn avenue subway away from the site and to set them in place after they had been cured. The old freight yard at Hay street and Rebecca avenue was selected for this purpose. The slabs were set by two 100-ton wrecking cranes, several of the slabs weighing 70 tons. The setting of the slabs, as well as the erection of the structural steel work, was done by company forces. All masonry work is being built by the Dravo Construction Company, of Pittsburgh, which also

South Avenue and Hay Street Subway—Details of Track Floor and Platform

has the contract for the excavation, depressing the streets and grading for the new passenger station grounds and the new freight yard west of Penn avenue.

An interesting and rather unusual feature of the work was the doing of all filling by contract, including the raising of the tracks. The John F. Casey Company was the contractor for the filling, which was made entirely with granulated slag delivered on cars by the railroad company. The work is also out of the ordinary, because of the expensive method of filling which it was necessary to pursue on account of the extremely heavy traffic, which precluded the withdrawal of any track from service for more than a few minutes at a time. The tracks were raised in lifts small enough to permit the passage of trains at all times. At Penn avenue they were raised in place on filling which had to be removed later to provide for the subway. This method was superseded at the other streets by the use of cribs of cross ties to support the falsework deck for the tracks. These cribs were built up as the tracks were raised, and were replaced

and Hutchinson avenues. The company will eventually raise the tracks to a 0.3 per cent grade line.

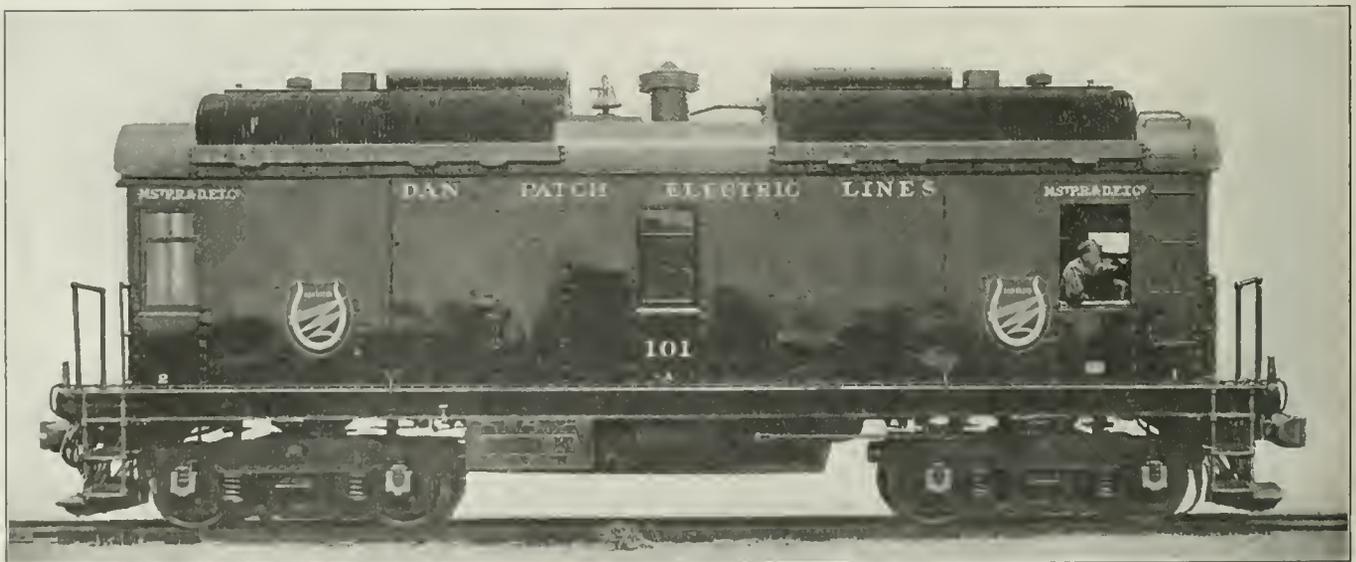

The work is being handled under the direction of A. C. Shand, chief engineer, Pennsylvania Railroad, and under the immediate supervision of F. M. Sawyer, assistant engineer, Johnstown, Pa. A. L. Ware is engineer in charge at Wilkesburg.

60-TON GAS-ELECTRIC LOCOMOTIVE

The Minneapolis, St. Paul, Rochester & Dubuque Electric Traction Company, operating what is popularly known as the "Dan Patch" electric lines, has recently put in service three 60-ton gas-electric locomotives for freight, passenger and terminal service. These are somewhat similar in design, although heavier than the 57-ton gas-electric locomotive,* which has been in successful operation daily for the past year or more from Minneapolis to Mankato, Minn. The four gas-electric locomotives, as well as 13 gas-electric motor cars which the railway has purchased, were designed and built by the General Electric Company. This is said to be the first railroad in the world operated entirely with gas-electric service.

The railway extends south from Minneapolis to Mankato, a distance of 107 miles. About midway of the line a branch runs northeast from Northfield to Randolph, 7 miles distant. The severest grade on the present line is 2 per cent. About 25 miles south of Minneapolis, at Orchard Gardens station, several thousand acres of farm land have been divided into 5 and 10-acre tracts by the company, and are being sold to residents of Minneapolis and St. Paul, many of whom have erected houses and travel to and from their places of business in the city each day.

Four through trains daily each way, one of which is a limited parlor car train, constitute the normal passenger schedule. The limited makes the run of 107 miles, including four stops, in 3 hr. 25 min.; the other trains require 4 hr. 5 min. for the trip. This service is supplemented by local trains between certain points of the line and the terminals, and by excursion trains during the summer season as occasion requires. One 70-ft. gas-electric motor car, seating 89 passengers, normally

60-Ton Gas-Electric Locomotive for the Dan Patch Electric Lines

after the final lift had been made by frame bents on mud sills. The granulated slag proved to be a very efficient material for filling. It packed very hard almost immediately with little or no subsequent settlement. East of Rebecca avenue the contractor's work covered filling only a 0.5 per cent grade line, which is sufficient to clear the pedestrian subways at Whitney

makes the run; when travel is somewhat heavy, a trailer is added to this; and for excursions and extra heavy traffic, a train is made up of trailer cars drawn by a 60-ton gas-electric locomotive.

The new 60-ton locomotives are double ended and are built

* See *Railway Age Gazette*, November 14, 1913, page 916.

with the box type of cab extending nearly the entire length of the underframe; all the weight is on the drivers. The truck clearances allow for 100 ft. minimum radius curvature. The power plant consists of two generating sets similar to the one used in the gas-electric motor cars. Only an engineer is required to operate the locomotive.

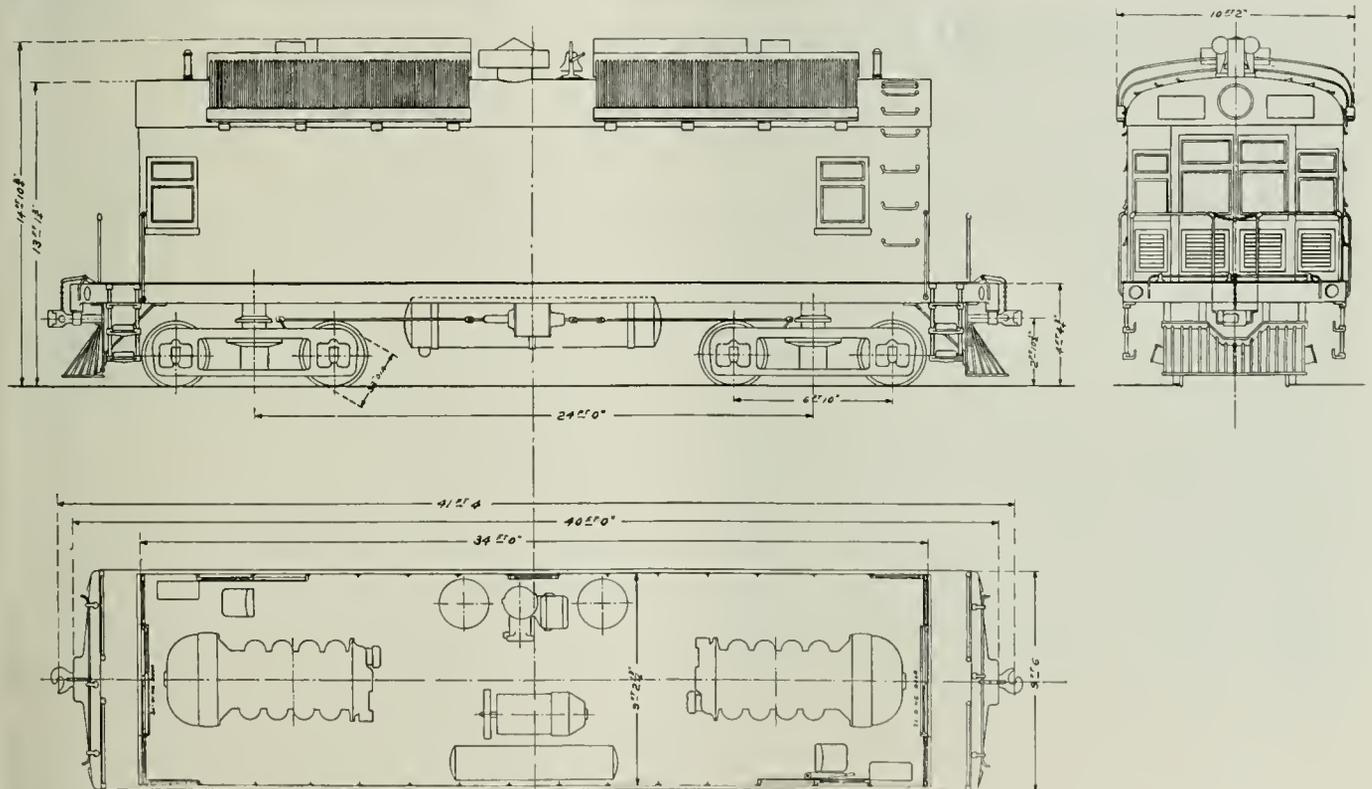

The box cab is of all-steel construction, and both ends are removable to permit the installation of the apparatus. The interior is not divided into compartments. The generating sets and the controllers are installed in each end, while the auxiliary lighting set, air compressor and storage tanks are grouped in the central section. The operator's seat at the side of each end of the cab affords a clear view ahead of both sides of the track.

The underframe of the locomotive consists of 10-in., 30 lb. channels, which extend the entire length of the platform, and are tied together by heavy end frame cast steel buffers and bolster plates, each channel being riveted to the webs of the end frame castings and bolted to the top and bottom bolster plates. The bolsters are built up of 12-in. by 1 1/8-in. steel plates.

from either end, in accordance with the requirements of the trailing train load.

Compressed air for starting is taken from the main reservoirs of the air brake system, which are built with surplus capacity. The two main single-cylinder air compressors are driven from the crankshafts of the main engines, have a displacement of 22.5 cu. ft. of free air per min. at the rated speed and are fitted with automatic governors to maintain a constant pressure. Greater flexibility of control and economy of operation result through electrical transmission of the energy. The engines can rotate at normal speed irrespective of the speed of the locomotive and deliver their maximum power, a feature of great advantage on grades, in case of snow storms or other emergency conditions involving sudden, heavy current demands.

There is also an auxiliary gas-electric set, the function of which is to furnish power for lighting the cab, headlights and train coaches, and for pumping an initial charge of air to fill the tanks and start the main engines. This set is started by hand. It consists of a vertical, 750 r. p. m., 4-cylinder, 4-cycle gasolene engine, which is direct-connected to a 5 kw., 65-volt,

General Arrangement of the Gas-Electric Locomotive for Use on the Dan Patch Electric Lines

Cross sills are riveted in where it is necessary to support equipment hung below the frame.

The two four-wheel swivel trucks are of the plate frame swing bolster type, designed for heavy freight work and conform to M C B standards. The side frames are built up of steel boiler plate. The truck bolster, of the swinging type, is built up of channels and pressed steel plates.

Each of the two gas-electric generating sets for the power plant equipment is composed of a 175 hp., 550 r. p. m., 8-cylinder, 4-cycle gasolene engine of the "V" type, which is direct-connected to a 600-volt, commutating pole, compound-wound electric generator with an outboard bearing supported by brackets bolted to the magnet frame. The cylinders are 8 in. by 10 in. Ignition is accomplished with low tension magnetos and the sets are started by air pressure in the same way as in the gas-electric motor cars, with the additional feature that after one set is running, the second may be started from the first electrically. The control is so arranged that either one or both of the generating units may be used to operate the locomotive

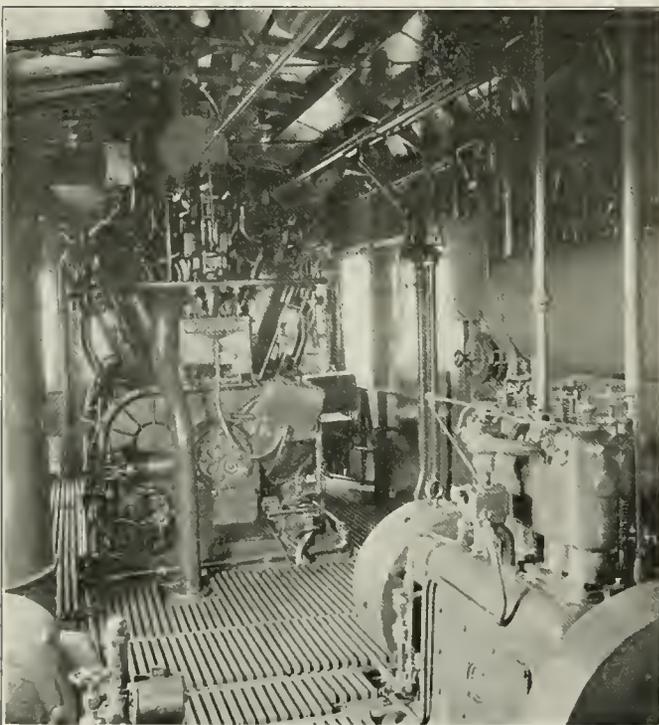

commutating pole, compound-wound, electric generator. The cylinders are 3 in. by 6 in., and ignition is effected by a high tension magneto. The air compressor on the 65-volt circuit is a 2-cylinder, motor-driven, and has a piston displacement of 25 cu. ft. per min. when pumping against a tank pressure of 90 lb per sq. in. Air is taken from the cab interior through screens, and is delivered to the three reservoirs, each 87 1/2 in. by 18 in., installed at one side of the cab in the center and connected in series, thereby affording an opportunity for radiation of heat and condensation of moisture before entering the brake cylinders. After starting the main engines, the governor on this motor-driven set cuts it out and all air is supplied by the air compressors on the main engine.

Mounted on the axles with nose suspension are four GE-205-D, 600-volt, series, commutating pole, oil-lubricated, box frame, railway motors having an hourly rating of 100 hp. each. All four axles are therefore driving axles, a forged pinion being mounted on each armature shaft and meshing into a corresponding cast steel split gear mounted on the axle. The gear ratio

is 58 to 17 teeth, a reduction of 3.41, which is especially adapted for freight and terminal switching service, as it affords maximum tractive effort at starting and at low speeds. The motors are ventilated by a special vacuum system in conjunction with the engines.

The control of the motor equipments is similar to that of the standard gas-electric motor cars, a type P-53 controller being installed in each end. Two motors are, however, connected permanently in parallel and these two pairs, operated like single motors, are placed progressively in series and parallel. The controller provides seven running stops in series and six in parallel, without rheostats in the main circuit. There are also two additional points for shunting the series fields, making a total of 15 efficient running points.

Inasmuch as electrical energy is transmitted directly, there are no losses through the intervention of mechanical change-speed gearing. To produce the smooth and rapid acceleration, the speed changes of the motors are effected by governing the

Interior of Cab of Gas-Electric Locomotive

voltage through varying the strength of the generator fields, which is accomplished by the movement of one handle on the controller. Separate handles are provided for throttling the engine and for reversing the motors. The latter is accomplished instantly by changing the motor connections in the usual manner, without stopping the engines, which always rotate in the same direction. This allows the train to be brought to a stop quickly, independent of the brakes, in an emergency.

The principal data and dimensions applying to the locomotive are as follows:

Track gage	4 ft. 8½ in.
Total weight	120,000 lb.
Weight per axle	30,000 lb.
Maximum tractive effort	32,200 lb.
Length between knuckle faces of couplers	41 ft. 4 in.
Length over cab	34 ft.
Height over-all	14 ft. 10¼ in.
Width over-all	10 ft. 2 in.
Total wheel base	24 ft.
Rigid wheel base	6 ft. 10 in.

RAILWAY EXTENSION IN GREECE. The first rail of the Loussa-Salonika Railroad was recently laid at Pappapouli. By this line Athens and all ancient Greece will be in communication with the rest of the mainland of Europe.

LEGITIMATE FREEDOM FOR RAILROADS

[J. J. Hill in New York Times]

The railroad is the least common multiple of all national industry. Its expansion is an indispensable condition of growth. Like every other activity in the world requiring the investment of capital, it not only will not grow, it will contract if laws and regulations prevent it from earning a reasonable profit. If the railroad had existed at the time our Constitution was framed, there is little doubt that the states would have been forbidden to legislate concerning it, exactly as they were to tax imports. As in the case of the tariff, the regulation of railways should be in the hands of an expert nonpartisan commission, on which both they and the public should have fair representation, with power to act subject only to review by the courts.

As for the foreign carrying trade, American ships need only the same freedom from hampering regulations that those of other countries enjoy to restore the old precedence of our merchant marine. With ocean and land carriers free to make joint rates on export business to get the trade, as those of other nations are not merely permitted but encouraged to do, our foreign trade would take the same precedence that events have given to our international financial position.

COMPARATIVE SUMMARY OF FREIGHT CARS IN SERVICE

The tables on the two pages immediately following show the number of freight cars in service on all of the important railroads of the country in 1913 and 1914 and in 1900 and 1914. It will be noted that narrow-gage cars are excluded, as well as non-revenue cars, but that cars used to carry company freight are included. The railways are grouped under the heads of New England roads, trunk line roads, Southern classification roads, Central classification roads and Western classification roads.

The tables show the number of cars in service, the number of cars per mile of road, average length of haul, freight cars per thousand freight car miles and per thousand ton miles, the average rate per ton per mile, and the freight cars in service per thousand dollars of freight earnings.

The table does not show the capacity of cars and, of course, roads which show a decrease in the number of cars may have cars with a larger total capacity despite the smaller number.

ENGLISH RAILWAYMEN AND THE WAR.—The chairman of the English Railway Executive Committee has recently issued a list showing that to August 31, 1915, the total number of men from the railways of the United Kingdom who had enlisted was 92,658, that being no less than 14.9 per cent of the total of 621,588 men employed on the railways of the United Kingdom at the beginning of the war. The enlistments from the staffs of a number of the important railways are given herewith:

Company	Total number of men employed at commencement of war	Total number of men who have enlisted to August 31, 1915	Percentage of men enlisted to total number employed
Caledonian	23,766	2,794	11.8
Great Central	34,505	5,021	14.55
Great Eastern	33,676	4,889	14.5
Great Northern	34,458	4,479	13.0
Great Western	79,150	13,965	17.6
Lancashire & Yorkshire	37,812	6,191	16.37
London, Brighton & South Coast	16,269	2,205	13.55
London & North-Western	93,106	16,317	17.52
London & South-Western	24,270	2,988	12.23
Metropolitan	3,249	572	17.5
Metropolitan District	2,499	769	30.0
Midland	74,964	10,983	14.65
North British	24,858	2,500	10.06
North-Eastern	54,462	7,866	14.44
*South-Eastern & Chatham	23,092	2,689	11.64
Railway Clearing House	3,090	713	23.07

* The figure of 2,689 represents men who had enlisted to July 31, 1915.

COMPARATIVE SUMMARY OF FREIGHT CARS IN SERVICE ON RAILROADS OF THE UNITED STATES—1913 AND 1914.

Note.—Narrow gauge cars excluded. Non-revenue cars excluded. Company freight included.

Table with columns: Miles, Freight Cars (1913, 1914), Per cent. of increase, Average length of haul, Rate per ton mile, Freight cars per \$1,000 rev. ton miles, Freight cars per \$1,000 rev. ton miles. Rows include NE England Roads, Trunk Line Railroads, Southern Classification, Central Classification, Western Classification.

COMPARATIVE SUMMARY OF FREIGHT CARS IN SERVICE ON RAILROADS OF THE UNITED STATES—1900 AND 1914.

Table with columns: Name of Railroad, Miles (1900, 1914), Freight Cars (Per 1,000 freight car miles, 1900, 1914), Rate per ton mile (dollars, 1900, 1914), Freight cars per \$1,000 freight earnings (1900, 1914). Rows include New England Roads, Trunk Line Roads, Southern Classification, and Western Classification.

Note.—Narrow-gauge cars excluded. Non-revenue cars excluded. Company freight included.

* 1914 operations of Iowa Central R. R. Co. included in Minneapolis & St. Louis R. R. Co.
* Before consolidation with other companies.

General News Department

The Brotherhood of Railroad Trainmen has addressed to the general managers of all railroads entering Chicago a request for an increase of pay of 5 cents an hour for switchmen.

Telephones have been put in use for train despatching on the Ohio division of the Baltimore & Ohio Southwestern between Cincinnati and Parkersburg, 195 miles. Telephones were already in use on the lines from Cincinnati to Seymour, Ind., and from Seymour to Louisville.

A hurricane which passed over New Orleans and vicinity September 29 is reported to have caused upward of 300 deaths, mostly in situations remote from cities, and money damage roughly estimated at \$1,000,000. The roadbed of the Louisville & Nashville was seriously damaged at many places along the line from New Orleans to Ocean Springs, Miss., 83 miles. Long bridges at Bay St. Louis and at Rigolets were badly damaged.

One of the 50 electric locomotives being delivered by the General Electric Company to the Chicago, Milwaukee & St. Paul for use on the line between Harlowton, Mont., and Avery, Idaho, was placed on exhibition this week at the Union Station in Chicago. These locomotives are to be put in service sometime in November. The locomotives weigh 260 tons each, have 8 pairs of driving wheels, are 112 ft. long over all and are designed for operation with direct current at 3,000 volts.

A press despatch October 3 from Imlay, Nev., reports damage by earthquake shocks for a hundred miles along the line of the Southern Pacific. Several water tanks toppled from their high supports and one at Lovelock crushed the end of a dwelling. People fled from their homes in night clothing at many places. Slow orders were issued to all trains when the third shock was felt at 11 o'clock on the night of the third. At Golconda, Nev., a piece of track sank five inches. All the towns named are between Sparks and Battle Mountain.

The United States Civil Service Commission announces examinations, November 2, for eight positions under the department of valuation of the Interstate Commerce Commission, all of them being places in which special weight will be given to experience in valuation and unit cost work. Each candidate must be between 25 and 45 years old and the salaries, in all of the positions, range from \$1,800 to \$2,700 yearly. The positions are: Senior architect, second grade; senior structural engineer, second grade; senior electrical engineer, second grade; senior mechanical engineer, second grade; senior telegraph engineer, second grade; senior telephone engineer, second grade; senior signal engineer, second grade, and senior civil engineer, second grade.

C. W. Galloway, general manager of the Baltimore & Ohio, proposes to send letters, embodying suggestions for personal safety, to automobilists who take risks at crossings. This was decided upon because of the alarming increase in accidents during the past year, when 29 automobiles were struck by trains on the Baltimore & Ohio, an increase of 17 accidents and 23 deaths. Observations will be taken from time to time at busy street crossings, and, with the co-operation of State authorities, license numbers will be secured and owners addressed personally. At Uniontown, Pa., on September 12, 729 automobiles crossed the railroad tracks at Fayette street between 6 o'clock in the morning and 6 at night, and only 28 were stopped to ascertain whether or not a train was approaching, 24 of them being stopped by a train using the crossing; and of the 701 vehicles violating the rules, 705 did not even slacken speed. "It is horrifying," says Mr. Galloway, "to contemplate the disregard which some drivers have for their own safety. . . . Trainmen are trained to be mindful of their personal safety and the safety of others. They are impressed with the importance of sounding whistle signals at highway crossings and when approaching stations, yet there are automobilists who will approach railroad stations without signalling or ascertaining in any way whether it is safe to cross. Engineers serve for years before they are entrusted with the operation of a locomotive, while automobilists, sometimes with

an hour's instruction, jeopardize the lives of themselves and others by recklessly crossing tracks."

Completion of Hell Gate Arch

Work on the Hell Gate Bridge (New York Harbor) of the New York Connecting Railroad, which was the subject of an illustrated description in the *Railway Age Gazette*, September 3, page 422, has now progressed so far that the two halves of the great arch were joined together on October 1. On that day Samuel Rea (president of the Pennsylvania), as president of the New York Connecting Railroad Company, sent the following message to Gustav Lindenthal, chief engineer in charge:

"I heartily congratulate you as designer and chief engineer of the East River arch bridge upon the closing of that great arch to-day. I deeply regret I cannot be present to witness the physical linking in New York City of the New Haven and Pennsylvania systems. It is now over 25 years since, with our friend, the late Oliver W. Barnes, we decided that a bridge and railroad crossing the East River at this point should be constructed to connect the New England railroads with the trunk lines serving the West and South, and Mr. Barnes organized the New York Connecting Railroad Company, which was acquired later by the Pennsylvania and New Haven companies.

"Within eighteen months I hope we shall see the completion of the New York Connecting Railroad and of the Seventh avenue subway in Manhattan, which will conclude the Pennsylvania Railroad Company's comprehensive programme for terminal development in and through New York City, adopted thirteen years ago under the presidency of A. J. Cassatt. With these projects completed, full opportunity will be afforded to measure the benefit of the New York terminal improvements to the public, the country at large and the company."

Hearing on Locomotive Rules

At a hearing before the Interstate Commerce Commission, at Washington, September 28 and the four following days, the proposed standard rules for the inspection of locomotives and tenders were the subject of testimony by representatives of the railroad, and members of the Enginemen's Brotherhood; also by Chief Inspector Frank McManany. As to 58 rules on which there was agreement among all interested, a joint recommendation was submitted to the commission, with a request for the early issuance of an order. A large part of the time of the hearing was taken up with a discussion of the proposed rules requiring automatic bell-ringers and headlights of high intensity, both of which were advocated by the enginemen and opposed by the railroads. The roads were allowed 30 days in which to file a brief, and the other side 15 days for counter briefs, and then the roads will have 10 days in which to reply.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, date of next or regular meetings, and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the *Railway Age Gazette* for each month.

- AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—H. C. Boardman, D. L. & W., Hoboken, N. J. Next meeting, October 21-23, 1915, Boston, Mass.
- AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York. Next meeting, October 26-27, 1915, French Lick Springs Hotel, French Lick Springs, Ind.
- AMERICAN ELECTRIC RAILWAY ASSOCIATION.—E. B. Burtell, S. W. 4th St., New York. Annual convention, October 4-8, 1915, San Francisco, Cal.
- AMERICAN RAILWAY ASSOCIATION.—W. F. Allen, 75 Church St., New York. Next meeting, November 17, 1915, Chicago.
- AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lighty, C. & N. W., Chicago. Next convention, October 1-3, 1915, Detroit, Mich.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Walter Hunt, 290 W. 57th St., New York. Regular meetings, 1st and 3rd Wednesday in month, except July and August, 290 W. 57th St., New York.
- AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York. Annual meeting, December 7-10, 1915, New York.

Traffic News

The Chicago, Milwaukee & St. Paul has recently introduced a new plate service in the dining cars of all trains except the Pioneer Limited, by which passengers who do not care for full portions can obtain half orders at a considerable reduction in price.

The Baltimore & Ohio has opened its large new storage warehouse at Pittsburgh, Pa., at Second avenue and Try street. The warehouse is seven stories high and absolutely fireproof. Each floor has windows on all four sides and is well lighted and can also be well ventilated, and commodious elevator service is provided.

Following the suggestion of the governor of the state, the Public Service Commission of Pennsylvania has made a study of the main route of the "Lincoln highway" through that state, 331 miles, with a view to improving the safety of the road at crossings of railways; and it finds, according to the estimates of the engineer of the commission, that to abolish all of these grade crossings will cost \$8,340,000.

The Baltimore & Ohio reports the arrival in Baltimore of a single shipment of lumber from Hoquiam, Wash., filling 100 cars. This lumber was cypress—3,000,000 feet—to be used in the construction of the plant of the United States Industrial Alcohol Company, at Curtis Bay, Baltimore. The lumber came over the Chicago, Milwaukee & St. Paul to Chicago and made the journey through in 17 days.

Traveling Passenger Agents

The American Association of Traveling Passenger Agents, at its meeting in Boston this week, chose William D. Woods, of St. Louis, president for the ensuing year and G. G. Noble, of Philadelphia, vice-president. The meeting next year will be held at Philadelphia.

Panama Canal Blocked for a Month

The landslide which blocked the Panama Canal at Gold Hill, September 20, has been followed by others, and it is announced this week that vessels cannot pass through before November 1.

At least 1,000,000 yards of earth must be removed. On Tuesday the steamer Finland from New York was waiting, with 300 passengers aboard, and another vessel of the same line was waiting on the Pacific side. Both these vessels have also large cargoes of freight. The quantity of freight in vessels waiting to pass through the canal is so great that it could not be transported over the Panama Railroad in less than a month. Colonel Chester Harding, engineer in charge of the canal, has recommended that tolls already paid by waiting vessels be refunded.

ELECTRIFICATION IN ENGLAND.—It is stated that experiments have been commenced on the electrified section of the North-Eastern Railway from Shildon to Newport, and the company hopes to open the line to traffic by the end of the month. This will constitute the first application in the British Isles of electric locomotives to heavy goods traffic, though, as is well known, this system has worked successfully in the United States and on the Continent, notably in Italy. Two small electric locomotives have, however, been in operation for ten years from the Quay-side, Newcastle, to Trafalgar sidings, their use being due to a desire for cleaner working in the tunnel. The line now electrified was decided on for the first experiments because there are no steep gradients or any great obstacles to electrification. Also the traffic is almost entirely heavy goods, feeding the blast furnaces at Erimus sidings, Newport, near Middlesbrough, so that the working results will be easily ascertainable. An overhead system is employed, with two bow collectors on each engine. Altogether there will be ten locomotives, of which nine are already built at the company's Darlington works and tested. They are eight-wheeled, with a motor driving each axle, and can each haul a load of 1,000 tons. Power will be supplied at 1,500 volts to the overhead conductors, which will be about 17½ ft. above rail level.—*The Engineer, London.*

- ASSOCIATION OF MANUFACTURERS OF CHILLED CAR WHEELS.—George W. Lyndon, 1214 McCormick Bldg., Chicago. Annual meeting, 2d Tuesday in October, 1915, New York.
- ASSOCIATION OF RAILWAY ELECTRIC ENGINEERS.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Annual meeting, October 18-24, 1915, Chicago.
- ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—G. P. Conard, 75 Church St., New York. Next meeting, December 14-15, 1915, St. Louis, Mo.
- BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meetings with American Railway Bridge and Building Association.
- CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.
- CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Klue, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.
- CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.
- ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.
- GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.
- MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—T. J. Goodwin, C. R. I. & P., Eldon, Mo. Next meeting, October 19-21, 1915, St. Louis, Mo.
- NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.
- NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.
- NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—E. N. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.
- PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.
- RAILROAD CLUB OF KANSAS CITY.—Claude Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Saturday in month, Kansas City.
- RAILROAD MEN'S IMPROVEMENT SOCIETY.—J. B. Curran, Erie R. R., 50 Church St., New York. Meetings, alternate Thursdays, October to May, Assembly Rooms of Trunk Line Association, 143 Liberty St., New York.
- RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 30 Church St., New York. Annual meeting, December, 1915. Waldorf-Astoria Hotel, New York.
- RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.
- RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, 1063 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.
- RAILWAY FIRE PROTECTION ASSOCIATION.—C. B. Edwards, Fire Ins. Agt., Mobile & Ohio, Mobile, Ala. Next meeting, October 5-7, 1915, Chicago.
- RAILWAY REAL ESTATE ASSOCIATION.—Frank C. Irvine, 1125 Pennsylvania Station, Pittsburgh, Pa. Next meeting, October 13, 1915, Chicago.
- RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.
- ST. LOUIS RAILWAY CLUB.—B. W. Fraumenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.
- SALT LAKE TRANSPORTATION CLUB.—R. E. Rowland, David Keith Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.
- SOCIETY OF RAILWAY FINANCIAL OFFICERS.—Carl Nyquist, C. R. I. & P., 1134 La Salle St. Sta., Chicago. Annual meeting, October 19-21, Colorado Springs, Colo.
- SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Piedmont Hotel, Atlanta.
- TOLEDO TRANSPORTATION CLUB.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boodly House, Toledo.
- TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.
- TRAFFIC CLUB OF NEWARK.—John J. Kautzmann, P. O. Box 238, Newark, N. J. Regular meetings, 1st Monday in month, except July and August, The Washington, 559 Broad St., Newark.
- TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Waldorf-Astoria Hotel, New York.
- TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Gen'l Agt., Erie R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings bi-monthly, Pittsburgh.
- TRAFFIC CLUB OF ST. LOUIS.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.
- TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, Superintendent's office, N. Y. C. R. R., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.
- UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, 1111 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.
- WESTERN CANADA RAILWAY CLUB.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.
- WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Building, Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.
- WESTERN SOCIETY OF ENGINEERS.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings. Annual meeting, 1st Wednesday after 1st Thursday in January, Chicago.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The hearings before Examiner Hines of the Interstate Commerce Commission at Chicago, on proposed advances on a number of commodities in Western trunk line and Southwestern Tariff Committee territory, were concluded on October 4.

Commercial organizations of Madison, Beloit, Janesville, Stoughton and Watertown, Wisconsin, have filed a complaint with the Interstate Commerce Commission alleging discrimination against them in favor of Chicago, Rockford and Freeport, and other Illinois cities, Milwaukee, Wis., and Dubuque and Clinton, Iowa.

Examiner Gutheim held a hearing at Chicago, beginning on September 29, on the application of the railroads operating steamboat lines on the Great Lakes for authority to make general advances in the lake-and-rail rates, equal in cents per hundred pounds to the advances on all-rail rates resulting from the decision of the Interstate Commerce Commission in the five per cent case. Representatives of some of the principal commercial associations appeared in opposition to the advances. C. C. McCain, chairman of the Trunk Line Association, and H. S. Noble, assistant general manager of the Mutual Transit Company, were among the principal witnesses for the railroads.

STATE COMMISSIONS

The hearing before the Texas Railroad Commission on the application of the railroads of the state for a general increase in freight rates which has been in progress for several weeks at Austin, Tex., was concluded on September 30.

The Railroad Commission of Montana has ordered reductions in the rates for transportation of slack coal from the Bear creek district over the Montana, Wyoming & Southern, and the Northern Pacific. For different distances the rates on slack coal must be from 10 to 25 cents lower than those on lump coal.

The New York State Public Service Commission, Second district, in an opinion by Commissioner Carr, has refused to authorize the discontinuance of passenger service on the Mahopac Falls Railroad, operated by the New York Central as a branch of the Harlem road, though it appears that such passenger operation is at a loss. It is held that the commission is without power to permit a railroad corporation to cease to perform the functions for which it was chartered. Commissioner Carr points out that, while the commission is without power to permit the railroad to discontinue service, called for in its charter, should trains be taken off, a complaint would then bring squarely before the commission the question of whether or not the road was rendering adequate service.

The Maryland Public Service Commission, in an opinion by Commissioner Henry, has dismissed the application of the Chesapeake & Curtis Bay Railroad for authority to exercise its franchise to operate its short railroad on the northerly side of Curtis Bay, Baltimore, and to issue \$50,000 capital stock. The commission finds that there is no public necessity for the road. The track lies entirely on the land of the United States Asphalt Refining Company, and the line is operated as a plant facility by that company. The cost of operation is about \$18,000 a year, and the commission finds that the asphalt company is proposing to incorporate as a common carrier mainly or wholly for the purpose of securing through freight rates with the Baltimore & Ohio and other roads. Commissioner Henry says that the industries in that section already have ample facilities and another common carrier should not be established; it is "better to hold to strict accountability responsible carriers, capable of meeting the reasonable requirements of business, than to try to establish conditions whereby such carriers may be forced to divide rates with mere plant facilities, incapable of general service, and which can only live by sapping the vitality of other roads."

Report on Phoenixville Accident

John P. Dohoney, investigator of accidents, has made his report to the Pennsylvania Public Service Commission on the accident in a tunnel on the Philadelphia & Reading, at Phoenixville, Pa., September 28, when nine workmen were killed and nine others injured. The work train, on which these men were employed, had just entered the tunnel, on the southbound track, and had stopped when a southbound passenger train, running on the northbound track, and moving at about ten miles an hour, ran into the men, who were walking along the track and, as it appears, struck more than one-third of the gang of fifty. The principal explanation given is that the conductor of the work train had given proper notice or instructions to the foreman and the workmen before entering the tunnel; but the State inspector says that this notice, if heard at all, was misunderstood; and that a written order should have been given to the foreman, explaining the proposed movement. The workmen were all foreigners, mostly Italian. They had been engaged for two weeks in the work of widening the tunnel.

PERSONNEL OF COMMISSIONS

J. H. Prior, assistant chief engineer of the Illinois Public Utilities Commission, has been appointed chief engineer of that commission, with headquarters at Springfield, Ill. Mr. Prior received his education at the Armour Institute of Technology and at the University of Chicago. From 1905 to 1914 he was engineer of design of the Chicago, Milwaukee & St. Paul, including its Puget Sound extension, with headquarters at Chicago. In that capacity he made two of the earliest valuations of railroad properties required by State authorities, these being valuations of the structures of the St. Paul in Minnesota in 1906 and in South Dakota in 1907. His present appointment dates from September 9.

J. H. Prior

COURT NEWS

In the United States District Court at New York City, October 4, the Grand Jury returned an indictment against the Delaware, Lackawanna & Western charging violation of law in failing to collect demurrage on coal consigned to the Delaware, Lackawanna & Western Coal Company. The shipments on which the indictment is based were made between October, 1912, and October, 1914, and the demurrage charges involved amount to \$298.

"Passenger"

The Pennsylvania Supreme Court holds that a workman who boards a laborers' train without permission for the purpose of securing employment is not a passenger and cannot recover for injuries sustained by reason of a defective handlebar.—*Schifalacqua v. Atlantic City R. Co.* (Pa.), 95 Atl. 260.

Hours of Service—Offices "Continuously" Operated

The Circuit Court of Appeals, Sixth Circuit, holds that a telegraph office operated from 4:30 a. m. to 9:30 p. m., subject to negligible intermissions, and a telegraph office operated from 6:30 to 11 p. m., subject to negligible intermissions, are not offices operated only during the daytime, but are offices operated during the day and night, within the hours of service act—*United States v. Grand Rapids & Indiana* (C. C. A.), 221 Fed. 607.

Reasonable Notice of Claim Always Essential

In an action for damages to a shipment of livestock under a contract providing that any claim for damage should be made within five days, it was undisputed that the damage to the stock was not ascertainable within that time, and it was held by the South Carolina Supreme Court that the stipulation was unreasonable and void. But that fact did not excuse the shipper from giving reasonable notice. The question of whether reasonable notice was given, the facts being undisputed and susceptible of only one reasonable inference, was a question of law for the court. The mere fact that the railroad company's veterinary surgeon examined the stock and reported the result of his examination to one of the company's officers was not enough to warrant a reasonable inference of a waiver of the stipulation.—*Crawford v. Southern Ry. Co. (S. C.)*, 86 S. E. 19.

Injury to Freight from Inherent Qualities—Presumptions

Injury from inherent qualities, the Georgia Court of Appeals holds, is somewhat in the nature of damage resulting from the act of God; and in the more recent development as to the rules in regard to the liability of carriers it has been held that they are not liable for loss or damage due to the inherent qualities of the goods carried. When the goods composing a shipment are of such intrinsic character as to be self-destructive, or incapable of safe transportation, the presumption that damage which accrues in the course of the transportation was due to the negligence of the carrier is rebutted by showing that the damage was due to the inherent qualities of the shipment. It is only when it is shown that the carrier actually receipts for a shipment as in good order that the presumption becomes conclusive.—*Capital City Oil Co. v. Central of Georgia (Ga.)*, 86 S. E. 57.

Crossing Accident—Contributory Negligence

The California Supreme Court holds that a person approaching a track, which is itself a warning of danger, must take advantage of every reasonable opportunity to look and listen. He has no right to depend upon the custom of engineers to give appropriate signals, or even upon a duty to give such signals enjoined by law. The driver of a motor car, on a clear afternoon, approached a crossing, and came to a stop about 35 ft. from the track, where obstructions made it impossible to see trains approaching. Hearing no noise and seeing no smoke, he started to cross the track on a down-grade, and first saw a train at a point about 17 ft. from the rail, the first point at which his view in that direction was unobstructed. He then endeavored to stop his car and was struck. It was held that he was guilty of contributory negligence as a matter of law, and could not recover for his injuries.—*Griffin v. San Pedro, L. A. & S. L. (Cal.)*, 151 Pac. 282.

Hours of Service—"Emergency"—Telegraph Operator

An operator of the Atlantic Coast Line working from 4 p. m. until midnight at a continuously operated office at Kenly, N. C., was subpoenaed as a witness in an action tried on May 26, and obtained permission from the chief dispatcher at Rocky Mount to obey the subpoena, with the understanding that he would return to Kenly about 2:30 p. m. The case was not reached for trial until about 4 p. m., and about 1 p. m. the operator wired the dispatcher that he would be delayed; and the next train from Rocky Mount to Kenly did not reach Kenly until 10 p. m. The operator reached Kenly about 7:30 p. m. but, when requested to return to duty, reported that he was sick. One of the other operators therefore worked from 8 a. m. until 8 p. m., and the other from 8 p. m. until 8 a. m. on the morning of the 27th. The Federal District Court, E. D., North Carolina, holds that the excessive hours of the first of these operators was due to an emergency, and the railroad was not liable for the statutory penalty. "Emergency" it held to be synonymous with "exigency," meaning something arising suddenly, out of the current of events; any event or occasional combination of circumstances calling for immediate action or remedy; a pressing necessity; a sudden and unexpected happening, or an unforeseen occurrence or condition. But as it did not appear that the chief dispatcher was not promptly notified that the opera-

tor was sick, and there was no suggestion that he did not have an extra operator at Rocky Mount, it was held that there was no emergency or casualty excusing the company's act in allowing the second operator to work three hours, on the morning of the 27th, more than the hours allowed by statute.—*United States v. Atlantic Coast Line Co.*, 224 Fed. 160.

Width of Roundhouse Doorway

An engineer and hostler at a roundhouse attempted to mount a moving engine which was being brought out by his fireman at a point from three to eight feet within the doorway, and was caught between the tender and the doorway and killed. The engine was of the large modern type, and the clearance between its overhang and the side of the doorway was but eight inches, while in newer roundhouses a larger clearance was provided. The deceased was not directed nor required to mount the engine at that point, and the danger of doing so was obvious. In an action for his death the Circuit Court of Appeals, Second Circuit, held that the width of the doorway being sufficient for all ordinary and proper uses, the railroad was not chargeable with negligence because it was not made wider.—*Hogan v. New York Central (C. C. A.)*, 223 Fed. 890.

Hours of Service—Station Agent Acting as Telegrapher

A railroad company discharged one of its three operators at a station operated continuously, and after making inquiries to obtain an additional operator, instructed the station agent to work three hours a day as agent, and six hours as telegraph operator, and that he should not work in excess of nine hours. The agent found himself required by the exigencies of the situation to work 12 hours a day as agent in addition to 5 hours as operator. The Circuit Court of Appeals, Ninth Circuit, holds this to be a violation of the hours of service statute, as the agent was within the prohibition of the statute, and under the circumstances it was not a harsh application of the statute to hold that the company had knowledge of all the acts of all its officers and agents, especially as it would seem that it was charged with actual knowledge of the agent's excessive service.—*Oregon-Washington R. & N. Co. v. United States (C. C. A.)*, 233 Fed. 596.

Revocation of License to Use Waiting Room

In an action for injuries in being ejected from a waiting room, it appeared that plaintiff went to the station between one and two a. m., and found, on offering to buy a ticket, that the first available train left at seven a. m., and that the ticket agent had left for the night. Plaintiff said that the telegraph operator, who was in charge of the station, told him that he could remain in the waiting room until the train was due, but that within an hour he told him that it was against the rules of the company for him to remain there, and ordered him out, using profane language. Going out in the dark, he walked off the unlighted platform on to the track and was injured. The telegraph operator told another story, but for the purposes of the case the plaintiff's testimony was considered. The Alabama Supreme Court held that the company was properly allowed to prove an order of the Alabama Railroad Commission requiring station rooms to be open at least an hour before train time. That order established, prima facie, at least, one hour as a reasonable time. It was held that the plaintiff was entitled only to such provision as the law required for the general public. He had no right to expect or demand the use of the company's waiting room for five or six hours in advance of the departure of the first train on which he could take passage. Although he had been allowed to remain in the room, that indulgence was a mere license, which might be withdrawn at any time, provided there was no trenching upon the reasonable time which must be allowed to persons intending to become passengers. For the agent, in revoking the plaintiff's license, which he had a right to do, to swear at him, was no assault; it might be considered as a grievous breach of good manners, but was not an injury for which the law undertakes to furnish redress, at least in an action counting solely on bodily injuries. For the injuries from falling off the platform the railroad was not liable, the plaintiff being merely a licensee.—*Widener v. Alabama Great Southern (Ala.)*, 69 So. 558.

Railway Officers

Executive, Financial, Legal and Accounting

A. L. Burford has been appointed assistant general attorney of the St. Louis Southwestern, with headquarters at St. Louis, effective October 1.

Theodore F. Brown, assistant auditor of the Star Union Line at Pittsburgh, Pa., was retired on a pension on September 1, after nearly 53 years' service.

L. F. Linney has been appointed auditor of the Pacific & Idaho Northern, with headquarters at New Meadows, Idaho, vice T. Cox, resigned. Effective October 1.

C. E. Schaff, receiver of the Missouri, Kansas & Texas, announces the following appointments: C. N. Whitehead, vice-president, as assistant to the receiver; W. A. Webb, vice-president in charge of operation, chief operating officer; C. Haile, vice-president in charge of traffic, chief traffic officer; G. T. Cutts, controller, chief accounting officer; Frank Johnson, general treasurer, treasurer for the receiver; E. T. Nelson, treasurer in Kansas, assistant treasurer and paymaster for the receiver; J. B. Barnes, assistant secretary and assistant treasurer, agent for the receiver. J. M. Bryson retains his position as general counsel. All of these officers will have headquarters at St. Louis, Mo., except W. A. Webb, whose office is at Dallas, Tex.; E. T. Nelson, whose office is at Parsons, Kan., and J. B. Barnes, whose office is at New York, N. Y.

Operating

The title of E. W. Grice, assistant to president of the Chesapeake & Ohio at Richmond, Va., has been changed to general superintendent of transportation.

George B. Johnson, superintendent of the joint track division of the Texas & Pacific at Ft. Worth, Tex., has been appointed chief dispatcher of the new Ft. Worth division with headquarters in the same city.

Clarence C. Beeth, whose appointment as superintendent of the Eastern division of the El Paso & Southwestern has been announced in these columns, was born on October 5, 1874, at Muncie, Ind. He enjoyed a common school education, and on January 1, 1890, entered the employ of the Atchison, Topeka & Santa Fe. He remained with this road successively as telegraph operator, agent, train dispatcher and chief dispatcher until January 1, 1909, when he resigned as chief dispatcher at Dodge City, Kan., to become trainmaster of the El Paso & Southwestern at Tucumcari, N. M. He remained in this position until September 1, 1915, when he was promoted to superintendent of the Eastern division, with headquarters at the same place.

H. Hulatt has been appointed manager of telegraph of the Grand Trunk and the Grand Trunk Pacific, vice A. B. Smith, resigned on account of ill health. Mr. Hulatt will report to the vice-president in charge of operation of the Grand Trunk at Montreal, Que., and to the vice-president and general manager of the Grand Trunk Pacific at Winnipeg, Man. Mr. Hulatt was born in London, Eng., and entered the service of the Grand Trunk Pacific in 1907, and was Mr. Smith's principal assistant in the construction of the Grand Trunk Pacific telegraph lines. In January, 1913, he was appointed commercial and traffic superintendent of the telegraph department, with headquarters at Winnipeg, in charge of lines west of Fort William, Ont.

Traffic

Leo Feit, chief clerk of the freight department of the Wheeling & Lake Erie at Cleveland, Ohio, has been appointed chief of the tariff bureau.

S. Y. Henderson, commercial agent of the Ocilla Southern at Hawkinsville, Ga., has been appointed general freight and passenger agent, with headquarters at Hawkinsville.

H. McFarlane has been appointed assistant traffic manager of the Pacific & Idaho Northern, with headquarters at New Meadows, Idaho, vice E. D. Perkins, resigned. Effective October 1.

Edward F. Lee, soliciting freight agent of the Western Maryland at Baltimore, Md., has been appointed commercial agent with office at Baltimore, succeeding C. B. Oakley, who has been transferred to St. Louis.

Frank Wisner Robinson, whose appointment as traffic manager of the Oregon-Washington Railroad & Navigation Company was announced last week, was born at Cherryville, Kan., on May 22,

F. W. Robinson

1874. He entered railway service on April 1, 1889, and until September, 1899, was employed in the passenger and freight accounting departments of the Union Pacific. From September, 1899, to January 1, 1906, he was in the freight traffic department of that road at Omaha, Neb.; from January 1, 1906, to January 1, 1910, he was chief clerk to the director of traffic of the Union Pacific - Southern Pacific System at Chicago; from January 1 to August 1, 1910, assistant general freight agent of the Oregon-Washington Railroad & Navigation Company at Portland, Ore.; from August 1, 1910, to May 15, 1912, general freight agent of the same road; from May 15, 1912, to February 20, 1913, assistant to director of traffic of the Union Pacific-Southern Pacific System, and from February, 1913, to November 1, 1915, assistant traffic manager of the Oregon-Washington Railroad & Navigation Company.

Russell S. Underwood, formerly manager of the Mount Jewett Route, operated by the Baltimore & Ohio and the Erie, has been appointed special representative of the freight department of the Baltimore & Ohio, with headquarters at Baltimore, Md.

R. F. Hill has been appointed assistant general freight and passenger agent of the Toronto, Hamilton & Buffalo with office at Hamilton, Ont. He entered the service of this company in July, 1906, and served in the office of the master mechanic at Hamilton until the following September, when he was transferred to the general freight and passenger agent's office. He subsequently served for three years as stenographer and then consecutively as soliciting freight agent and rate clerk. In May, 1915, he was appointed chief clerk and now becomes assistant general freight and passenger agent of the same road as above noted.

Engineering and Rolling Stock

F. O. Haymond, superintendent of the Bingham & Garfield, with headquarters at Magna, Utah, has been appointed also assistant superintendent of the motive power and car departments.

W. B. Combs, master mechanic of the Macon, Dublin & Savannah, at Macon, Ga., having resigned to accept service with the government, the office of master mechanic has been abolished, and L. B. Jones has been appointed general foreman in charge of the mechanical department.

Curtis C. Westfall has been appointed engineer of bridges of the Illinois Central, with headquarters at Chicago, vice Maro Johnson, engineer of bridges and buildings, assigned to special work. Frank R. Judd has been appointed engineer of buildings, with headquarters at Chicago. Effective October 1.

A. C. Watson, division engineer of the Pennsylvania Lines West with headquarters at Logansport, Ind., has been appointed division engineer of the Cleveland & Pittsburgh division with headquarters at Cleveland, vice E. F. McCrea, deceased. J. K. Sherman, assistant engineer at Pittsburgh, has been appointed division engineer with headquarters at Zanesville, Ohio, vice W. E. Guignon, transferred. Effective October 1.

Frederick Knight Bennett, recently appointed valuation engineer of the Minneapolis & St. Louis, with office at Minneapolis, Minn., entered railway service in the spring of 1895 as rodman on the Lehigh Valley. He was continuously in the service of this road until March, 1909, as assistant engineer on maintenance, assistant engineer, engineering department, assistant engineer in charge of office and accounts, supervisor of tracks, and division engineer. From March, 1909, until June, 1911, he was engineer in charge of reconstruction on the Missouri Pacific; from June, 1911, to June, 1912, he was assistant engineer with the engineer maintenance of way of the same road, at Kansas City, Mo.; from June, 1912, to June, 1913, assistant engineer with the chief engineer at St. Louis, Mo.; June, 1913, to June, 1914, division engineer of the Missouri, Kansas & Texas; June, 1914, to March, 1915, assistant engineer of valuation of the Great Northern, at St. Paul, Minn., and Spokane, Wash.; March, 1915, to September 1, 1915, division supervisor of the Minneapolis & St. Louis, eastern division.

F. K. Bennett

Purchasing

William D. Stokes has been appointed assistant general storekeeper of the Illinois Central, with headquarters at Memphis, Tenn., vice William S. Morehead, transferred. Mr. Morehead has been appointed division storekeeper at McComb, Miss., vice Frank P. Dugan, transferred. Mr. Dugan has been appointed division storekeeper at Vicksburg, Miss., vice Eugene D. Meissonnier, resigned. Appointments effective October 1.

OBITUARY

B. E. Rice, general industrial agent of the Norfolk Southern with office at Norfolk, Va., died on September 27, at Washington, D. C., at the age of 58.

Lowell M. Palmer, of Brooklyn, N. Y., who died at Stamford, Conn., September 30, at the age of 70, was prominently identified with transportation for many years, having been proprietor of important freight terminal docks in Brooklyn. He was also engaged in lightering, and it is said that it was his boat line that first carried freight cars by floats to Brooklyn.

THE MANILA RAILWAY.—All the steam railway lines in Luzon are owned and operated by the Manila Railway Company. From the report of its annual meeting in London it appears that the operations during the last fiscal year showed a decreased revenue. This is attributed primarily to the short rice crop, which reduced the freight business directly and to the European war, which affected both the freight and passenger business by limiting the spending power of the agricultural population. At the same time there was an increase in operating expenses, mainly owing to the opening of traffic over a considerable mileage of new line. The company has contracts with the Philippine Government for the construction of several new lines, with a guarantee of the bond issues; and work on certain of these lines had reached sections which could not be remunerative in themselves and would be chiefly sources of expense until the portions of the lines beyond them were completed and opened. Since the beginning of the war, moreover, it had been impossible to sell the guaranteed bonds, and the company therefore determined for the present to reduce its construction to the minimum necessary to link up certain sections as yet disconnected, an arrangement which was agreed to by the Philippine Government. In spite of these difficulties the report emphasizes the fact that the financial situation of the company is in general quite satisfactory.

Equipment and Supplies

LOCOMOTIVE BUILDING

THE CENTRAL OF GEORGIA is inquiring for prices on 8 Mikado type and 4 Pacific type locomotives.

THE SIOUX CITY TERMINAL has ordered one six-wheel switching locomotive from the American Locomotive Company. This locomotive will have 19 by 24 in. cylinders and a total weight in working order of 117,000 lb.

THE ILLINOIS CENTRAL, reported in the *Railway Age Gazette* of September 10 as inquiring for prices on 50 Mikado type locomotives, has changed its inquiry to 47 Mikado type locomotives and 3 Santa Fe type locomotives for hump yard switching service.

THE CHICAGO JUNCTION has ordered two superheater six-wheel switching locomotives from the American Locomotive Company. These locomotives will have 20 by 26 in. cylinders, 51 in. driving wheels, a total weight in working order of 149,000 lb., and a steam pressure of 180 lb.

CAR BUILDING

THE ATLANTIC COAST LINE is in the market for 200 40-ton flat cars.

THE MISSOURI, KANSAS & TEXAS is inquiring for 50 steel underframes.

THE ERIE has ordered 200 automobile cars from the Pressed Steel Car Company.

THE RUSSIAN GOVERNMENT is reported to be contemplating the purchase of 7,000 freight cars.

THE TENNESSEE COPPER COMPANY is in the market for 12 50-ton steel underframe flat cars.

THE AMERICAN STEEL & WIRE COMPANY has ordered 50 tank cars from the German-American Car Company.

THE CAMPBELL'S CREEK COAL COMPANY has ordered 100 gondola cars from the American Car & Foundry Company.

THE EMLENTON REFINING COMPANY, Emlenton, Pa., has ordered 100 gondola cars from the American Car & Foundry Company.

THE NEW YORK CENTRAL is reported to have ordered 500 freight cars for the Michigan Central from the Haskell & Barker Car Company, in addition to a similar order for a like number of cars reported in the *Railway Age Gazette* of August 20.

THE WHEELING & LAKE ERIE has ordered 750 gondola cars from the Standard Steel Car Company, and 200 steel automobile cars from the Western Steel Car & Foundry Company. These cars were incorrectly reported in last week's issue as having been ordered by the Western Maryland.

IRON AND STEEL

THE BOSTON & MAINE is in the market for 25,000 tons of rails.

THE CHICAGO & NORTH WESTERN has ordered 15,000 tons of rails from the Illinois Steel Company.

THE BALTIMORE & OHIO has ordered from 10,000 to 15,000 tons of rails from the Pennsylvania Steel Company.

THE NASHVILLE, CHATTANOOGA & ST. LOUIS has ordered 8,000 tons of rails from the Tennessee Coal, Iron & Railroad Company.

THE SOUTHERN has ordered 10,000 tons of rails from the Tennessee Coal, Iron & Railroad Company, and 2,000 tons from the Pennsylvania Steel Company.

THE INTERBOROUGH RAPID TRANSIT has ordered 200 tons of steel from Levering & Gerrigues, for a subway station at Long Island City.

Supply Trade News

H. G. Prout has resigned from his position as president of the Hall Switch & Signal Company.

The directors of the Westinghouse Air Brake Company have declared the regular quarterly dividend of \$2 a share.

The Cincinnati Screw Company, Twightwee, Ohio, has purchased the plant and equipment of the Cincinnati Screw & Tap Company, and will start full operation shortly.

The Gibraltar Manufacturing Company, which for the last two years has had a selling arrangement with Mason, Davis & Co. for the sale of the Gibraltar bumping post, has terminated that arrangement and opened offices at 332 Monadnock Block, Chicago, where it will handle this business on its own account.

Robert E. Belknap, district sales manager of the Pennsylvania Steel Company at Chicago, has been transferred to the New York office as district sales manager, succeeding R. W. Gillespie, recently appointed general manager of sales. Thomas Blagden, Jr., has been appointed assistant sales manager at New York, and R. W. Reid, who has been assistant sales manager in the New York district, has been appointed district sales manager at Steelton, Pa.

Charles M. Schwab, president of the Bethlehem Steel Company, is understood to be negotiating with the directors of the Pennsylvania Railroad for the purchase of the latter's controlling interest in the Pennsylvania Steel Company. A conference was held in New York on Tuesday, but none of the details have been made public. On January 1, 1915, the outstanding stock of the Pennsylvania Steel Company consisted of \$20,560,800 preferred and \$10,750,000 common. The Pennsylvania Company (Pennsylvania Lines West) on December 31, 1914, owned \$9,158,300 of the preferred and \$7,388,900 of the common. The steel company is a New Jersey corporation. It controls: the Pennsylvania Steel Company of Pennsylvania, which operates a plant at Steelton, Pa., for the manufacture of rails, railway materials, structural work; the Maryland Steel Company, operating a plant at Sparrow's Point, Md.; the Penn-Mary Coal Company, and the Spanish-American Iron Company owning ore properties in Cuba.

The Westinghouse Electric & Manufacturing Company announces the following awards received at the Panama-Pacific Exposition: The grand prize on the 4,000 hp., 650-volt d.c. double unit Pennsylvania electric locomotive mounted on a turntable under the dome of the Transportation Palace. The medal of honor on alternating current and direct current industrial motor and control apparatus, on precision instruments, on Le Blanc condensers, on motor-generator sets for moving picture machines and on high voltage oil switches. The gold medal on a number of different classes of apparatus among which are steam turbines, alternating and direct current generators, alternating and direct current railway motors, transformers, rectifiers, starting, lighting and ignition systems, switchboards and accessories, and mining locomotives. The Westinghouse Electric & Manufacturing Company was also awarded the gold medal for the most complete and attractive installation in the Palace of Transportation. It also received a number of silver and bronze medals.

Alva C. Dinkey, president of the Carnegie Steel Company, has resigned from that position to become president of the Midvale Steel Company. Mr. Dinkey has been in the steel business for something like 36 years. He was born at Weatherly, Pa., on February 20, 1866, and received his education in the public schools of Weatherly and Braddock. On May 21, 1879, he became a water boy in the Edgar Thompson Steel Works, remaining in these works until 1885 when he secured a position as machinist with the Pittsburgh Locomotive Works, Allegheny, Pa. From 1889 to 1893 he served as secretary to the superintendent of the Homestead Steel Works of the Carnegie Steel Company. In 1893 he was made electrician and in 1898 superintendent of the electric light and power plant. The following year he was appointed assistant to the general superintendent of the

Homestead works, succeeding to the position of general superintendent in 1901. On August 1, 1903, he was elected president of the Carnegie Steel Company and has occupied that position up to the present time. Mr. Dinkey is a member of the American Society of Electrical Engineers, the American Society of Mechanical Engineers, the American Institute of Mining Engineers and a number of other important societies.

The Midvale Steel & Ordnance Company was incorporated in Delaware on October 5 with a capital stock of \$100,000,000 to engage in the manufacture of iron, steel and all other metals and articles of commerce manufactured out of such metals, to buy and sell firearms, shrapnel, ordnance and ammunition of every kind and description, to buy, sell, manufacture and deal generally in articles of machinery used in the manufacture of ordnance and ammunition, and to produce ores and minerals and manufacture and deal in the products and by-products thereof. The incorporators were: Herbert E. Latter and Norman P. Coffin of Wilmington, Del., and Clement M. Egner of Elkton, Md. The capital stock of the new company will be issued in \$2,000,000 shares of only one class of \$50 par value. Of the total of \$100,000,000, \$70,000,000 will be issued to provide working capital and to purchase over 98 per cent of the capital stock of the Midvale Steel Company, Nicetown, Pa.; all of the capital stock of Worth Brothers, Coatesville, Pa.; all of the property and business of the Coatesville Rolling Mill Company, and all the capital stock of the Remington Arms Company, of Delaware (a separate organization from the Remington Arms & Ammunition Company, Ilion, N. Y.), which is working on a contract of 2,000,000 rifles for the British Government at Eddystone, Pa. The company has also under option 300,000,000 tons of iron ore. The following are the directors and officers of the Midvale Steel & Ordnance Company: Directors—William E. Corey, Albert H. Wiggin, Samuel F. Pryor, Ambrose Monell, Frank A. Vanderlip, Alva C. Dinkey, Samuel M. Vaucain, William P. Barba, Percy A. Rockefeller, Charles H. Sabin, Marcellus Hartley Dodge and Frederic W. Allen. Officers—president, W. E. Corey; vice-president, A. C. Dinkey; secretary and treasurer, William B. Dickson.

The Carnegie Steel Company

Homer D. Williams, general superintendent of the Duquesne Steel Works, has been elected president of the Carnegie Steel Company, succeeding Alva C. Dinkey, resigned to become president of the Midvale Steel Company, and William Whigham, formerly assistant to the president of the Carnegie Steel Company, has been elected a vice-president. Edward Hamilton, assistant general superintendent of the Duquesne Works, succeeds Mr. Williams as general superintendent.

Mr. Williams, the new president of the company, has been in the steel business since 1880. He was born at Johnstown, Pa., on August 19, 1863, and was educated in the public schools at that place. In 1880 he entered the laboratory of the Cambria Steel Company as a carbon boy. In 1885, however, he left to take a special course at Lehigh University in chemistry and metallurgy. For a short period he was chemist in the Joliet Works of the Illinois Steel Company and for two years chemist at the Colby Mine at Bessemer. He later served five years as superintendent of the Bessemer department and rail mill of the Colorado Fuel & Iron Company. In 1897 he entered the service of the Maryland Steel Company, but in 1899 was placed in charge of the Bessemer department of the Homestead Steel Works of the Carnegie Steel Company. In 1902 he became general superintendent of the works, but in 1903 was transferred to a similar position at the Duquesne Steel Works and it is the latter position he leaves to take up his new duties.

Mr. Whigham has served as assistant to the president of the Carnegie Steel Company since 1905. He was born at Camden, Pa., on January 4, 1866, and graduated from Stevens Institute of Technology with the degree of mechanical engineer in 1888. In 1890 he became a draftsman with Thomas Carlin's Sons, Allegheny, Pa., in 1892 taking a similar position with Julian Kennedy and later with the Carnegie Steel Company. In 1897 he became steam engineer of the Homestead Works of the company and in 1901 superintendent of the Howard Axle Works. In 1905, as noted above, he was made assistant to the president of the company.

Railway Construction

ARKANSAS ROADS (ELECTRIC).—Surveys are being made, it is said, to build an electric line from Guion, Ark., north to Melbourne, about 10 miles. A. C. Veach, Gravette, Ark., is the promoter.

ATCHISON, TOPEKA & SANTA FE.—The Railroad Commission of the state of California on September 20 ordered this company to build a standard-gage line, connecting the gap between Temecula, in Riverside county, Cal., and Oceanside, in San Diego county. Such a line would provide direct rail connection between San Bernardino, Riverside, and the interior of Riverside county and the port of San Diego. The commission suggests two routes which may be followed, one from Temecula to Fallbrook, 12 miles, and the other from Temecula via Rainbow Valley to Oceanside, 33 miles.

BEAVER, MEAD & ENGLEWOOD.—The grading on this road has been nearly completed, and the track laying, now in progress, is about three-fourths done. The railway when completed will extend from Forgan, Okla., in a southerly direction to Beaver. The maximum grade is 1 per cent, and there are three bridges, one 14-ft. frame structure, which has been completed, a 70-ft. piling bridge, and a 350-ft. pile trestle. The Beaver Construction Company, of Beaver, is doing the work. A locomotive and a combination coach and box car have been purchased. L. A. Walton, Beaver, Okla., chief engineer.

BELLEVIEW & WESTERN.—This company has been incorporated to build a railway from Graniteville, Mo., to Belleview, a distance of about three miles. Capital, \$40,000; among the incorporators are William R. Orthwein and Louis Hudson, of St. Louis, and J. H. Long, of Belleview.

CHICAGO, MILWAUKEE & ST. PAUL.—This road is filling in 14,000 ft. of timber trestles between Seattle, Wash., and Tacoma. The work is being done by company forces and will require 215,000 cu. yd. of fill.

CINCINNATI, NEW ORLEANS & TEXAS PACIFIC.—According to press reports, surveys are now being made for carrying out double tracking work between Somerset, Ky., and Flat Rock. (July 23, p. 181.)

LONG ISLAND RAILROAD.—This company has applied to the New York Public Service Commission, First district, for permission to build and operate a two-track branch line from Flushing, Long Island, to Creedmore, in the borough of Queens, 5.4 miles. The company has also asked the commission to determine the manner in which the proposed line shall cross certain streets and the tracks of a surface car line. The new branch will provide a more direct route from the borough of Manhattan to Creedmore than by the existing branch line, which leaves the main line at Floral Park.

The Woodside-Winfield cut-off, in the borough of Queens, which was built by the Long Island, to eliminate a number of grade crossings, besides improving the alinement by cutting out 150 degrees of curvatures, will be put in operation on October 17.

MIDLAND & NORTHWESTERN.—Residents of Midland, Tex., have entered into an agreement with the Texas & Pacific, it is said, to build a railway from Midland northwest to Seminole, 60 miles. The Texas & Pacific is to furnish the rails and equipment, and T. J. O'Donnell, banker and stockman of Midland, and associates are to furnish the right of way and provide all labor for the construction of the proposed line, which is to be operated by the Texas & Pacific. The town of Midland has raised a bonus of \$100,000 in aid of the project and other large donations will be made by the towns of Andrews, Shafter Lake and Seminole.

NORFOLK & WESTERN.—A contract has been let recently to J. J. Boxley & Co., Roanoke, Va., for double tracking two miles of this road between Berton, Va., and Eggleston, on New river, and the work has already been started.

SAVANNAH & NORTHWESTERN.—Surveys are reported being made for a proposed extension from St. Clair, Ga., northwest

to either Thomson, Camak or Norwood, about 30 miles. The company now operates a line from Savannah northwest to St. Clair, 108.6 miles.

SOUTH CAROLINA ROADS (ELECTRIC).—According to press reports, the Chamber of Commerce of Sumter, S. C., is interested in a project to build a line from Sumter, S. C., east to Shiloh, thence via Turbeville to Olanta, about 32 miles. E. I. Reardon, Sumter, is secretary of a committee in charge of surveys, rights of way, etc., and R. F. McLellan is chief engineer.

SOUTHERN RAILWAY.—Contracts for double tracking work on additional sections of this road were let recently, it is said, as follows: To W. W. Boxley & Co., Roanoke, Va., for the section from Arrowhead to Elma, 20 miles; to the Hall-Crawford Construction Company, Macon, Ga., for the section from Sycamore to Gretna, 4 miles, and to Robert Russell, Danville, Va., for the section from Whittle to Dry Fork, 9.7 miles. (October 1, p. 622.)

TEXAS ROADS.—Arrangements are being made, it is said, to build a line from Ballinger, Tex., where a connection is to be made with the Gulf, Colorado & Santa Fe west to a crossing of the Kansas City, Mexico & Orient at Bronte, thence to Robert Lee, about 40 miles. T. H. Wheelis, Chicago, Ill., and associates are said to be back of the project.

TORRINGTON-THOMASTON TRACTION.—Incorporated with \$300,000 capital to build from Torrington, Conn., south to Thomaston, 10 miles. H. Mann, president, Torrington; H. M. Guernsey, vice-president, Thomaston, and G. B. Goodwin, treasurer, Torrington.

RAILWAY STRUCTURES

ALBANY, N. Y.—The Delaware & Hudson Company, co-operating with officers of the city in plans to beautify "The Plaza" has notified the mayor of its willingness to put up an addition, 184 feet long, to its large new office building. The extension is designed to be built south of the large central tower, and to be five stories high, corresponding to the architectural design of the present structure. It will cost about \$225,000.

AURORA, ILL.—The new terminal building of the Aurora, Elgin & Chicago (Electric), at Main street and Broadway, has been opened. The South Broadway transfer station has been discontinued and all transferring from interurban to city cars is now done in the new station. The sixth floor of the building is occupied by the general offices of the company, which were moved here from Wheaton, Ill. The second, third, fourth and fifth floors have been sublet as office suites.

BALTIMORE, MD.—The Pennsylvania Railroad has given a contract to Arthur McMullin, New York, for building the new concrete pier at Canton, Md. The improvements will cost about \$200,000. (Aug. 27, p. 409.)

CLEVELAND, OHIO.—The New York Central, Pennsylvania Lines, Cleveland & Pittsburgh and the Cleveland, Cincinnati, Chicago & St. Louis have accepted the ordinance providing for the erection of the proposed new union passenger terminal.

DESHLER, OHIO.—The Baltimore & Ohio and the Cincinnati, Hamilton & Dayton are building a joint passenger station here, which will cost approximately \$10,125. The building is in the process of construction, and is about half done. George Georngenson, Hamilton, Ohio, contractor. (Sept. 3, p. 449.)

EVANSVILLE, IND.—The Illinois Central will soon let a contract for the construction of a two-story freight house here. It will be a brick structure, 40 ft. by 170 ft., with a basement under part of the building, and office room on the second floor. The present freight house, a frame building, will be extended 100 ft.

FREEMONT, ILL.—The Illinois Central has let the contract for three washroom buildings (mentioned last week), and a pump house, to T. S. Leake & Co., of Chicago. The buildings will be one-story structures with brick walls, concrete floors and composition roofs. In compliance with the state law similar buildings have been put up at East St. Louis, Ill., and Clinton, and are now in the course of construction at Carbondale and Burnside (Chicago). The largest structures will be two two-

story buildings at Burnside, with facilities for 1,500 and 1,000 men, respectively, dimensions of 53 ft. by 95 ft. and 43 ft. by 86 ft. Each of the other three points has or will have two buildings, except East St. Louis, which has a third building which was remodeled from a frame structure. The Drumm Construction Company, of Chicago, did the work at East St. Louis, the Harbeck Company had the contract at Clinton, and is doing the work at Carbondale, and Joseph E. Nelson & Sons, of Chicago, have the contract for the buildings at Burnside.

FT. WAYNE, IND.—The municipality has let a contract to the Moellering Construction Company of this city for its portion of the work to be done in the elevation of tracks over Osage street. The estimated cost of the work is \$26,850. The New York, Chicago & St. Louis and the Lake Shore & Michigan Southern will do their part of the work with company forces, at an approximate cost of \$66,737 to the former road and \$17,400 to the latter.

MACON, GA.—The Central of Georgia has given a contract to the Virginia Bridge Company for fabricating and erecting a steel viaduct over the tracks of the Georgia Southern & Florida, also over Fourth, Fifth, Hazel and Ash streets, Macon. The structure will include one 60-ft. deck span, one 45-ft., thirty-five 30-ft., thirteen 20-ft. deck spans and three 45-ft. through spans on steel bents, and will require about 935 tons of structural steel. The work includes about 1,400 cu. yd. of plain concrete masonry, 100 cu. yd. of reinforced concrete, and 120,000 ft. board measure of timber and ties. The total estimated cost of the whole, including tracks, filling, etc., will be about \$165,000.

MARSHALL, TEX.—Fire destroyed the coach and paint shop, a storeroom and several passenger coaches and freight cars of the Texas & Pacific on October 1.

NONCONNAH, TENN.—The Illinois Central will build a steel structure, 176 ft. by 1,200 ft., equipped for repairing wooden cars. The contract for the construction work has not yet been let, but about 1,000 tons of steel have been ordered from the American Bridge Company.

PHILADELPHIA, PA.—The Pennsylvania Railroad has given a contract to the McNichol Paving & Contracting Co., for building a 1,500-ft. concrete retaining wall on the north side of Lehigh avenue, from Tulip to Aramingo streets, in Philadelphia.

A contract is reported let by the Department of Public Works to Peoples Brothers at \$34,500 for building a bridge on the line of Fifty-fourth street over the tracks of the Philadelphia, Baltimore & Washington. It is to be a reinforced concrete structure, 60 ft. wide and 146 ft. between abutments. The Pennsylvania Railroad will pay part of the cost of this bridge.

VANCOUVER, B. C.—Work on the Vancouver terminals of the Canadian Northern Pacific is now under way. To date 2,000,000 yd. out of a total of 3,250,000 to be reclaimed at the head of False creek have been filled in. Bids are being received on a reinforced concrete sea wall, which will be built to close the head of the creek from tide water. The specifications include the following quantities: foundation excavation (wet) 450 cu. yd., concrete 4,950 cu. yd., reinforcing steel 305,000 lb., concrete piles 15,900 l. ft., creosoted fir piles 12,200 l. ft., asphalt 2,820 sq. yd., rock fill 15,500 cu. yd., square timber No. 1 common 19,500 f. b. m., iron in timber including U-bolts 5,500 lb., 255 spring coils.

ACCIDENTS IN THE STREETS OF LONDON.—From a government return it appears that 637 fatal accidents were caused in the metropolitan police district last year by vehicles in the streets. Non-fatal accidents numbered 25,239. Compared with the previous year's return, the fatal accidents have grown from 579 to 637 and the non-fatal from 18,944 to 25,239. The increase may be due in some measure to the darkening of the streets during the last quarter of the year. In the city of London there were 19 fatal accidents, as compared with 17, and 1,253 non-fatal as against 1,210 in the previous year. Dr. Waldo, the city coroner, who quotes these figures, attributes the comparative fewness of traffic accidents in the city to the excellence of the city police, the thorough and prompt manner in which means are taken for preventing accidents, and the superior legal powers in regard to traffic which the city possesses. The coroner, however, pleads for still more street refuges, more police at traffic points, and more life-guards or fenders for heavy motors. *The Engineer, London.*

Railway Financial News

BOSTON & MAINE.—Stockholders of the Fitchburg Railroad, which is leased to the Boston & Maine, have voted to cancel their authorization of \$2,500,000 bonds made in 1914 and which bonds were never issued, and to authorize a sale of \$3,175,000 bonds, the proceeds to be used to pay at maturity \$500,000 4 per cent bonds due July 1, 1916, and to pay off floating debt and the obligations to the Boston & Maine for improvements made under the terms of the lease.

CANADIAN PACIFIC.—General Frank S. Meighen has been elected a director, succeeding Sir William Van Horne, deceased.

CHICAGO & NORTH WESTERN.—See comments on the company's annual report elsewhere in this issue.

CHICAGO, ROCK ISLAND & PACIFIC.—Both stockholders' committees have agreed on the following as candidates for the vacancies to be filled on the board of directors at the annual meeting on October 14 and these candidates have agreed to serve: Edmond D. Hulbert, president, Merchants Loan & Savings Bank, Chicago; Charles G. Dawes, president, Central Trust Company, Chicago; John R. Moron, president, Atlas Portland Cement Company; Judge Nathaniel French, Davenport, Iowa; William B. Thompson, director, Federal Reserve Bank, New York, and J. W. Burdick, president, West Penn Steel Company.

Under order of the court the receiver has paid all principal and interest, due October 1, on equipment obligations, the total payment amounting to about \$3,000,000.

CHICAGO, ST. PAUL, MINNEAPOLIS & OMAHA.—See comments on the company's annual report elsewhere in this issue.

DELAWARE & HUDSON.—The New York Public Service Commission has authorized the Delaware & Hudson to issue \$14,451,000 5 per cent 20-year convertible bonds. (See *Railway Age Gazette* of October 1, 1915, p. 623.)

MARYLAND & PENNSYLVANIA.—No interest is to be paid on the \$900,000 income bonds, the interest not having been earned. Interest payments are made in April and October, and the last payment of 2 per cent was made in April, 1914. The yearly rate from 1902 until 1914 was 4 per cent.

MISSOURI, KANSAS & TEXAS.—The protective committee for the first and refunding 4 per cent bonds, consisting of A. J. Hemphill, Charles A. Peabody, W. A. Day and A. A. Jackson, has taken as an additional member Colgate Hoyt, of Colgate Hoyt & Co., New York.

A protective committee consisting of F. N. B. Close, Robert C. Drayton, R. Walter Leigh, William W. McClench and John W. Stedman, with P. D. Bogue, secretary, has been formed for the Texas & Oklahoma first mortgage 5 per cent bonds. The committee asks only the filing of names and addresses and amounts of holdings.

NEW YORK, NEW HAVEN & HARTFORD.—Judge Hunt, in the United State district court, has denied the application of Charles F. Brooker, Lewis Cass Ledyard, Henry K. McHarg, Charles M. Pratt and Frederick F. Brewster for a separate trial from Edward D. Robbins in the Sherman anti-trust suit which has been brought against directors and former directors of the New York, New Haven & Hartford. The court granted the request of Alexander Cochrane, who entered the New Haven board in 1909. Mr. Cochrane's case was considered to be in the same class as that of George F. Baker, T. DeWitt Cuyler, Theodore N. Vail, Francis T. Maxwell and Edward Milligan. These defendants have already been granted a separate trial.

CHINESE RAILWAY ACCOUNTS.—Steps have been taken by the Minister of Communications at Peking to have the accounting systems devised by the Unification of Accounts Commission introduced on the various Chinese railways. In accordance with this decision the Minister of Communications has notified the various railways that inspectors of accounts will be sent to the different railways from time to time to examine the accounts and to keep in close touch with the accounting work.

ANNUAL REPORTS

CHICAGO AND NORTH WESTERN RAILWAY COMPANY, FIFTY-SIXTH ANNUAL REPORT

REPORT OF THE BOARD OF DIRECTORS

To the Stockholders of the Chicago and North Western Railway Company:
The Board of Directors submit herewith their report of the operations and affairs of the Chicago and North Western Railway Company for the fiscal year ending June 30, 1915.

The Interstate Commerce Commission having prescribed new classifications of accounts, effective July 1, 1914, the results for the preceding year shown in this report have been partially revised for the purpose of comparison.

Average number of miles operated, 8,107.82.	
OPERATING REVENUES:	
Freight	\$51,923,860.74
Passenger	20,528,443.46
Other Transportation	6,694,249.64
Incidental	6,633,121.46
Total (Operating Revenues)	\$80,779,675.30
OPERATING EXPENSES (69.78 per cent. of Operating Revenues)	56,371,573.04
Net Revenue from Railway Operations	\$24,408,102.26
RAILWAY TAX ACCRUALS (5.59 per cent. of Operating Revenues)	\$4,516,943.10
UNCOLLECTIBLE RAILWAY REVENUES	7,254.64
	4,524,197.74

Railway Operating Income	\$19,883,904.52
NON-OPERATING INCOME:	
Rental Income	\$ 484,441.71
Dividend Income	1,600,227.00
Income from Funded Securities	5,505.83
Income from Unfunded Securities and Accounts, and Other Items	709,825.41
Total Non-Operating Income	2,799,999.95
Gross Income	\$22,683,904.47

DEDUCTIONS FROM GROSS INCOME:	
Rental Payments	\$1,066,043.00
Interest on Funded Debt	9,595,615.81
Other Deductions	108,196.57
Total Deductions from Gross Income	10,769,855.38
Net Income	\$11,914,049.09

DISPOSITION OF NET INCOME:	
Sinking Funds	\$ 204,053.75
Dividends—	
8% on Preferred Stock	1,791,600.00
7% on Common Stock	9,108,015.00
Total Appropriations	11,103,668.75
Balance Income for the year	\$ 810,380.34

The results as compared with the preceding fiscal year were as follows:
Freight Revenue decreased..... \$2,065,614.69
Passenger Revenue decreased..... 1,012,099.33
Other Transportation Revenue decreased..... 563,402.66
Incidental Revenue decreased..... 138,542.73

Total Operating Revenues decreased	\$3,779,659.41
Operating Expenses decreased	3,930,002.26
Net Revenue from Railway Operations increased	\$ 150,342.85
Railway Tax Accruals increased	\$264,152.81
Uncollectible Railway Revenues increased	7,254.64
	271,407.45
Railway Operating Income decreased	\$ 121,064.60

Of the Operating Expenses for the current fiscal year \$32,920,365.11, or 58.40 per cent., was paid employes for Labor, as compared with \$34,098,916.25, or 56.55 per cent., paid during the preceding fiscal year. The decrease of \$1,178,551.14 in the amount paid is accounted for as follows:
Decrease account less time worked..... \$1,226,711.22
Increase account higher rates of compensation..... 48,160.08
Total..... \$1,178,551.14

FREIGHT TRAFFIC

The details of Freight Traffic for the year ending June 30, 1915, compared with the preceding year, were as follows:

	1914		1915		Amount	Per Cent.
	1914	1915	1914	1915		
FREIGHT REVENUE	\$53,989,475.43	\$51,923,860.74	\$2,065,614.69	3.83		
				Decrease		Per Cent.
TONS OF REVENUE FREIGHT CARRIED	43,309,643	40,399,215	6,720,428	6.72	Dec.	
TONS OF REVENUE FREIGHT CARRIED ONE MILE	6,220,944,171	6,216,280,599	4,663,572	.22	Dec.	
AVERAGE REVENUE RECEIVED PER TON	\$1.25	\$1.29	3.20	3.20	Inc.	
AVERAGE REVENUE RECEIVED PER TON PER MILE	.87 of a cent	.84 of a cent	3.45	3.45	Dec.	
AVERAGE DISTANCE EACH REVENUE TON WAS HAULED	143.85 miles	153.87 miles	6.97	6.97	Inc.	
MILEAGE OF FREIGHT AND MIXED TRAINS	18,314,329	17,250,535	5.81	5.81	Dec.	
AVERAGE NUMBER OF TONS OF ALL FREIGHT CARRIED PER TRAIN MILE:						
East of Missouri River	442.36	479.68	8.44	8.44	Inc.	
West of Missouri River	205.95	203.49	1.19	1.19	Dec.	
Whole Road	411.48	443.10	7.68	7.68	Inc.	

AVERAGE NUMBER OF TONS OF ALL FREIGHT CARRIED PER LOADED CAR MILE	20.31	21.11	3.94	Inc.
AVERAGE FREIGHT REVENUE PER TRAIN MILE	\$2.95	\$3.01	2.03	Inc.

PASSENGER TRAFFIC

The details of Passenger Traffic for the year ending June 30, 1915, compared with the preceding year, were as follows:

	1914		1915		Amount	Per Cent.
	1914	1915	1914	1915		
PASSENGER REVENUE	\$21,540,542.79	\$20,528,443.46	\$1,012,099.33	4.70		
				Decrease		Per Cent.
REVENUE PASSENGERS CARRIED	33,389,428	33,079,550	289,878	.93	Dec.	
REVENUE PASSENGERS CARRIED ONE MILE	1,173,435,140	1,130,297,641	43,137,499	3.68	Dec.	
AVERAGE FARE PAID PER PASSENGER	65 cents	62 cents	4.62	4.62	Dec.	
AVERAGE RATE PAID PER PASSENGER PER MILE	1.84 cents	1.82 cents	1.09	1.09	Dec.	
AVERAGE DISTANCE TRAVELED PER REVENUE PASSENGER	35.14 miles	34.17 miles	2.76	2.76	Dec.	
MILEAGE OF PASSENGER AND MIXED TRAINS	21,537,781	21,372,414	66,367	.77	Dec.	
AVERAGE PASSENGER-TRAIN REVENUE PER TRAIN MILE	\$1.27	\$1.22	3.94	3.94	Dec.	

MAINTENANCE OF WAY AND STRUCTURES

The total Operating Expenses of the Company for the year ending June 30, 1915, were \$56,371,573.04; of this amount \$10,450,739.45 was for charges pertaining to the Maintenance of Way and Structures. Included in these charges is a large part of the cost of 59,969 tons of steel rails, the greater portion of which was laid in replacement of rails of lighter weight in 441.23 miles of track; also the cost of 2,583,111 new ties.

The charges for Maintenance of Way and Structures also include a portion of the cost of ballasting 49.08 miles of track with crushed stone, 146.34 miles with gravel, and 21.44 miles with cinders; the erection, in place of wooden structures, of 55 new steel bridges on masonry, aggregating 3,550 feet in length and containing 3,885 tons of bridge metal; and the replacement of other wooden structures with masonry arch and box culverts and cast-iron pipes, the openings being filled with earth. The wooden structures replaced by permanent work aggregate 8,929 feet in length.

The charges on account of Maintenance of Way and Structures for the year ending June 30, 1915, compared with the preceding year, were:

	1914		1915		Amount	Per Cent.
	1914	1915	1914	1915		
COST OF RAILS:						
New steel rails	\$1,212,258.90	\$698,965.82	\$513,293.08	42.32	Dec.	
Usable and re-rolled rails	996,460.61	842,610.97	153,849.64	15.44	Dec.	
Less value of old rails and other items	\$2,208,719.51	\$1,541,576.79	\$667,142.72	30.22	Dec.	
Net charge for rails	\$724,355.98	\$350,268.91	\$374,087.07	51.64	Dec.	
COST OF TIES	1,762,313.18	1,547,651.05	214,662.13	12.18	Dec.	
COST OF BALLAST	227,056.25	117,254.77	109,801.48	48.34	Dec.	
COST OF OTHER TRACK MATERIAL	539,118.33	375,613.88	163,504.45	30.33	Dec.	

ROADWAY AND TRACK LABOR AND OTHER EXPENSES	5,073,539.12	4,486,656.40	586,882.72	11.57	Dec.
--	--------------	--------------	------------	-------	------

Total Charges for Roadway and Track	\$8,326,382.86	\$6,877,445.01	\$1,448,937.85	17.54	Dec.
-------------------------------------	----------------	----------------	----------------	-------	------

Other Charges Account Maintenance of Way and Structures were:

BRIDGES, TRESTLES AND CULVERTS	937,863.85	833,833.69	104,030.16	11.09	Dec.
ROAD CROSSINGS, FENCES, ETC.	331,200.62	296,673.21	34,527.41	10.44	Dec.
SIGNALS AND INTERLOCKERS	434,770.48	419,141.63	15,628.85	3.60	Dec.
BUILDINGS, FIXTURES AND GROUNDS	1,229,186.84	995,745.24	233,441.60	19.07	Dec.
DOCKS AND WHARVES	53,975.41	88,452.05	34,476.64	64.10	Inc.
SUPERINTENDENCE	522,712.02	515,022.78	7,689.24	1.47	Dec.
ROADWAY TOOLS AND SUPPLIES	150,540.57	130,502.96	20,037.61	13.31	Dec.
SUNDRY MISCELLANEOUS CHARGES	226,462.07	293,922.88	67,460.81	29.78	Inc.

Total Charges Account Maintenance of Way and Structures	\$12,213,094.72	\$10,450,739.45	\$1,762,355.27	14.43	Dec.
---	-----------------	-----------------	----------------	-------	------

The above charges for Maintenance of Way and Structures for the current year amount to 18.54 per cent of the total Operating Expenses, as compared with 20.25 per cent for the preceding fiscal year.

MAINTENANCE OF EQUIPMENT

The charges on account of Maintenance of Equipment for the year ending June 30, 1915, compared with the preceding year, were as follows:

	1914		1915		Amount	Per Cent.
	1914	1915	1914	1915		
LOCOMOTIVES	\$4,831,466.36	\$4,740,217.79	\$91,248.57	1.89	Dec.	
PASSENGER-TRAIN CARS	1,252,013.63	1,268,877.15	16,863.52	1.34	Inc.	
FREIGHT-TRAIN CARS	5,445,489.09	5,873,407.23	427,918.14	7.86	Inc.	
WORK EQUIPMENT	145,882.97	156,987.57	11,104.60	7.61	Inc.	
SHOP MACHINERY AND TOOLS	229,921.15	170,396.43	59,524.72	25.89	Dec.	
Superintendence	359,527.39	354,854.54	4,672.85	1.30	Dec.	
SUNDRY MISCELLANEOUS CHARGES	94,187.14	84,194.47	9,992.67	10.62	Dec.	

Total Charges Account Maintenance of Equipment	\$12,358,487.73	\$12,648,935.18	\$290,447.45	2.35	Inc.
--	-----------------	-----------------	--------------	------	------

The above charges for Maintenance of Equipment for the current year amount to 22.44 per cent of the total Operating Expenses, as compared with 20.49 per cent for the preceding fiscal year.

RESERVE FOR ACCRUED DEPRECIATION ON EQUIPMENT

At the close of the preceding fiscal year there was a balance to the credit of the Equipment Reserve Accounts of.....	\$6,089,239.37
During the year ending June 30, 1915, there was credited to the Equipment Reserve Accounts on account of charges to Operating Expenses for Accrued Depreciation.....	2,323,461.58
	\$8,412,700.95

And there was charged during the year against the above amount the Accrued Depreciation previously credited this account on Equipment retired or transferred from one class of service to another.....

Leaving a balance to the credit of the Equipment Reserve Accounts on June 30, 1915, of.....	\$8,149,419.47
---	----------------

TRANSPORTATION EXPENSES

The Transportation Expenses of the Company for the year ending June 30, 1915, were \$29,753,444.06, or 52.78 per cent of the total Operating Expenses. Of this amount \$19,268,640.36, or 64.76 per cent, was charged for labor; \$5,842,571.64, or 19.64 per cent, was charged for fuel for locomotives; and \$4,642,232.06, or 15.60 per cent, was charged for supplies and miscellaneous items. The decrease in the Transportation Expenses for the year ending June 30, 1915, as compared with the preceding fiscal year, was \$2,195,793.88, or 6.87 per cent, distributed as follows:

Decrease in amount charged for labor.....	\$ 547,529.01
Decrease in amount charged for fuel for locomotives.....	1,063,155.48
Decrease in amount charged for supplies and miscellaneous items.....	585,109.39
	\$2,195,793.88

CAPITAL STOCK

There was no change during the year in the Capital Stock and Scrip of the Company.

The Company's authorized Capital Stock is Two Hundred Million Dollars (\$200,000,000.00), of which the following has been issued to June 30, 1915:

Common Stock and Scrip held by the Public.....	\$130,117,028.82
Common Stock and Scrip owned by the Company.....	2,338,502.15
Total Common Stock and Scrip.....	\$132,455,530.97
Preferred Stock and Scrip held by the Public.....	\$22,395,120.00
Preferred Stock and Scrip owned by the Company.....	3,834.56
Total Preferred Stock and Scrip.....	22,398,954.56
Total Capital Stock and Scrip, June 30, 1915.....	\$154,854,485.53

FUNDED DEBT

At the close of the preceding fiscal year the amount of Funded Debt, exclusive of Bonds in the Treasury and Due from Trustee, was.....

The above amount has been decreased during the year ending June 30, 1915, by Bonds and Equipment Trust Certificates redeemed or transferred, as follows:

C. & N. W. Ry. Consolidated Sinking Fund Currency of 1915, 7%, matured February 1, 1915, viz.:	
Redeemed.....	\$12,669,000.00
Unpresented and transferred to "Current Liabilities".....	163,000.00
	\$12,832,000.00
C. & N. W. Ry. Equipment Trust Certificates of 1912, 4½%, redeemed, viz.:	
Series A.....	\$300,000.00
Series B.....	300,000.00
Series C.....	400,000.00
	1,000,000.00
C. & N. W. Ry. Sinking Fund of 1879, 6%, redeemed.....	6,000.00
C. & N. W. Ry. Sinking Fund of 1879, 5%, redeemed.....	183,000.00
M. L. S. & W. Ry. Extension and Improvement Sinking Fund Mortgage, 5% redeemed.....	26,000.00
C. & N. W. Ry. Sinking Fund Debentures of 1933, 5%, redeemed.....	251,000.00
Total Funded Debt Redeemed or Transferred.....	14,298,000.00
	\$200,581,000.00

And the above amount has been increased by Bonds sold during the year, as follows:

C. & N. W. Ry. General Mortgage Gold Bonds of 1987, 5%, sold to re-imburse the Company for past expenditures made for construction and in redeeming matured bonds.....

	10,000,000.00
--	---------------

Total, June 30, 1915.....	\$210,581,000.00
---------------------------	------------------

Net Decrease during the year.....

	4,298,000.00
--	--------------

BONDS IN THE TREASURY AND DUE FROM TRUSTEE

At the close of the preceding fiscal year the amount of the Company's Bonds in the Treasury and due from Trustee was.....

The above amount has been increased during the year ending June 30, 1915, as follows:

C. & N. W. Ry. 5% Sinking Fund Bonds of 1879, REDEEMED.....	\$59,000.00
M. L. S. & W. Ry. 5% EXTENSION AND IMPROVEMENT SINKING FUND MORTGAGE BONDS, REDEEMED.....	17,000.00
C. & N. W. Ry. 5% SINKING FUND DEBENTURES of 1933 REDEEMED.....	131,000.00
C. & N. W. Ry. GENERAL MORTGAGE GOLD BONDS OF 1987 DUE FROM TRUSTEE IN EXCHANGE FOR BONDS RETIRED, VIZ.:	
C. & N. W. Ry. Consolidated Sinking Fund Currency, 7%.....	\$12,669,000.00
C. & N. W. Ry. Sinking Fund Bonds of 1879, 6%.....	6,000.00
C. & N. W. Ry. Sinking Fund Bonds of 1879, 5%.....	124,000.00

M. L. S. & W. Ry. Extension and Improvement Sinking Fund Mortgage, 5%.....	38,000.00
C. & N. W. Ry. Sinking Fund Debentures of 1933, 5%.....	124,000.00
	12,961,000.00
C. & N. W. Ry. GENERAL MORTGAGE GOLD BONDS OF 1987, DUE FROM TRUSTEE ON ACCOUNT OF CONSTRUCTION EXPENDITURES MADE DURING THE YEAR.....	1,000,000.00
	14,168,000.00
	\$18,341,000.00

The Bonds on hand and due from Trustee have been decreased during the year, as follows:

C. & N. W. Ry. GENERAL MORTGAGE GOLD BONDS OF 1987, 5% SOLD TO REIMBURSE THE COMPANY FOR PAST EXPENDITURES MADE FOR CONSTRUCTION AND IN REDEEMING MATURED BONDS.....	\$10,000,000.00
M. L. S. & W. Ry. EXTENSION AND IMPROVEMENT SINKING FUND MORTGAGE, 5% BONDS, RETIRED.....	29,000.00
C. & N. W. Ry. 5% SINKING FUND DEBENTURES OF 1933, RETIRED.....	4,000.00

	10,433,000.00
Total, June 30, 1915.....	\$7,908,000.00
Net Increase during the year.....	\$3,735,000.00

CONSTRUCTION

The construction charges for the year ending June 30, 1915, were as follows:

ON ACCOUNT OF ELEVATING TRACKS, viz.:	
In River Forest, Illinois.....	\$142,738.84
Greenfield Avenue north, Milwaukee, Wis.....	285,188.73
	\$427,927.57
ON ACCOUNT OF EXTENSIONS, viz.:	
Kingston Extension, Wisconsin..... 15.60 Miles	\$94,515.11
Koepenick Extension, Wisconsin..... 7.19	96,956.29
	191,471.40
SUNDRY CONSTRUCTION:	
Land for Transportation Purposes.....	\$ 97,224.99
Buildings and Fixtures.....	459,039.15
Bridges, Trestles and Culverts.....	692,157.60
New Sidings, Yard Tracks and Spurs to Industries.....	227,333.74
Crossings and Signs.....	61,530.87
Signals and Interlockers.....	52,532.99
Reduction of Grade between Nelson and Peoria, Illinois.....	289,482.40
Betterment of Roadway and Track.....	694,869.53
Shop Machinery.....	50,490.41
Miscellaneous Construction, including Fences, Wharves and Docks, and other items.....	94,201.65
	2,718,863.33

EQUIPMENT:	
40 Steam Locomotives, 5,000 Freight-train Cars, 70 Passenger-train Cars, and 260 Work Equipment Cars.....	\$6,292,698.95
Improvement of Equipment.....	403,681.03
	\$6,696,379.98

Less Original Cost of Equipment Retired, as follows:	
30 Locomotives.....	\$236,780.30
2,639 Freight-train Cars.....	1,420,108.78
26 Passenger-train Cars.....	190,725.47
285 Work Equipment Cars.....	47,754.46
Other Items.....	32,169.29
	1,927,538.30
	4,768,841.68

Account Cost of Milwaukee, Sparta and North Western Railway.....	\$8,107,103.98
Account Cost of Des Plaines Valley Railway.....	14,340.44
Account Cost of St. Louis, Peoria and North Western Railway.....	10,602.87
	53,273.65
	\$8,185,320.94

LANDS

During the year ending June 30, 1915, 3,663.84 acres and 88 town lots of the Company's Land Grant lands were sold for the total consideration of \$41,698.01. The number of acres remaining in the several Grants June 30, 1915, amounted to 327,530.81 acres, of which 18,790.19 acres were under contract for sale, leaving unsold 308,740.62 acres.

Appended hereto may be found statements, accounts, and statistics relating to the business of the fiscal year, and the condition of the Company's affairs on June 30, 1915.

By order of the Board of Directors

CHICAGO, SAINT PAUL, MINNEAPOLIS AND OMAHA RAILWAY COMPANY, THIRTY-FOURTH ANNUAL REPORT

REPORT OF THE BOARD OF DIRECTORS

To the Stockholders of the Chicago, Saint Paul, Minneapolis and Omaha Railway Company:

The Board of Directors submit herewith their report of the operations and affairs of the Chicago, Saint Paul, Minneapolis and Omaha Railway Company for the fiscal year ending June 30, 1915.

The Interstate Commerce Commission having prescribed new Classifications of Accounts, effective July 1, 1914, the results for the preceding year, shown in this report, have been partially revised for the purpose of comparison.

Average number of miles operated, 1,752.81.

OPERATING REVENUES:	
Freight	\$11,523,103.44
Passenger	4,983,699.89
Other Transportation	1,022,194.88
Incidental	312,349.47

Total Operating Revenues..... \$17,841,347.68
 OPERATING EXPENSES (67.86 per cent of Operating Revenues)..... 12,107,597.51

Net Revenue from Railway Operations..... \$ 5,733,750.17
 RAILWAY TAX ACCRUALS (5.69 per cent of Operating Revenues)..... \$1,015,028.61
 UNCOLLECTIBLE RAILWAY REVENUES..... 4,834.59

Railway Operating Income..... \$ 4,713,886.97
 NONOPERATING INCOME:
 Rental Income..... \$269,811.98
 Dividend Income..... 46,351.00
 Income from Funded Securities..... 15,220.00
 Income from Unfunded Securities and Accounts and other items..... 24,111.61

Total Nonoperating Income..... 355,494.59

Gross Income..... \$ 5,069,381.56

DEDUCTIONS FROM GROSS INCOME:
 Rental Payments..... \$ 673,696.23
 Interest on Funded Debt..... 2,152,312.50
 Other Deductions..... 24,288.17
 Total Deductions from Gross Income..... 2,850,296.90

Net Income..... \$ 2,219,084.66

DISPOSITION OF NET INCOME:
 Dividends—
 7% on Preferred Stock..... \$ 787,976.00
 7% on Common Stock..... 1,298,934.00
 2,086,910.00

Balance Income for the year..... \$ 132,174.66

The results as compared with the preceding fiscal year were as follows:
 Passenger Revenue decreased..... \$432,010.30
 Other Transportation Revenue decreased.... 48,848.70
 \$480,859.00

Freight Revenue increased..... \$ 95,540.20
 Incidental Revenue increased..... 16,583.09
 112,123.29

Total Operating Revenues decreased..... \$368,735.71
 Operating Expenses decreased..... 726,519.41

Net Revenue from Railway Operations increased..... \$357,783.70
 Railway Tax Accruals increased..... \$ 41,745.78
 Uncollectible Railway Revenues increased.. 4,834.59

Railway Operating Income increased..... \$311,203.33

Of the Operating Expenses for the current fiscal year \$6,599,357.35, or 54.51 per cent, was paid employees for labor, as compared with \$6,966,716.33, or 54.28 per cent, paid during the preceding fiscal year. The decrease of \$367,358.98 in the amount paid is accounted for as follows:

Decrease account less time worked..... \$306,417.18
 Decrease account lower rates of compensation..... 60,941.80

\$367,358.98

PASSENGER TRAFFIC

The Details of Passenger Traffic for the year ending June 30, 1915, compared with the preceding year, were as follows:

	1914		1915		—DECREASE—	
	Amount	Per Cent	Amount	Per Cent	Amount	Per Cent
PASSENGER REVENUE	\$5,415,710.19		\$4,983,699.89		\$432,010.30	7.98
PASSENGERS CARRIED	4,881,961		4,767,826		114,135	2.34 Dec.
PASSENGERS CARRIED ONE MILE	266,685,999		252,305,000		143,999	5.39 Dec.
AVERAGE FARE PAID PER PASSENGER	110.93 cents		104.53 cents		6.40 cents	5.77 Dec.
AVERAGE RATE PAID PER PASSENGER PER MILE	2.031 cents		1.975 cents		0.056 cents	2.76 Dec.
AVERAGE DISTANCE TRAVELLED PER PASSENGER	54.63 miles		52.92 miles		1.71 miles	3.13 Dec.
MILEAGE OF REVENUE PASSENGER AND MIXED TRAINS	4,510,639		4,349,764		160,875	3.57 Dec.
AVERAGE PASSENGER TRAIN REVENUE PER TRAIN MILE	\$1.40		\$1.34		0.06	4.29 Dec.

FREIGHT TRAFFIC

The details of Freight Traffic for the year ending June 30, 1915, compared with the preceding year, were as follows:

	1914		1915		—INCREASE—	
	Amount	Per Cent	Amount	Per Cent	Amount	Per Cent
FREIGHT REVENUE	\$11,427,563.24		\$11,523,103.44		\$95,540.20	.84
TONS OF REVENUE FREIGHT CARRIED	8,466,632		8,794,488		327,856	3.87 Inc.
TONS OF REVENUE FREIGHT CARRIED ONE MILE	1,294,143,291		1,336,106,367		41,963,076	3.24 Inc.
AVERAGE REVENUE RECEIVED PER TON	\$1.35		\$1.31		0.04	2.96 Dec.

	1914	1915	Increase or Decrease
AVERAGE REVENUE RECEIVED PER TON PER MILE	.88 of a cent	.86 of a cent	2.27 Dec.
AVERAGE DISTANCE EACH REVENUE TON WAS HAULED	152.85 miles	151.93 miles	.60 Dec.
MILEAGE OF FREIGHT AND MIXED TRAINS	4,255,990	4,026,069	5.40 Dec.
AVERAGE NUMBER OF TONS OF ALL FREIGHT CARRIED PER TRAIN MILE	330.67	360.13	8.91 Inc.
AVERAGE NUMBER OF TONS OF ALL FREIGHT CARRIED PER LOADED CAR MILE	19.39	20.39	5.16 Inc.
AVERAGE FREIGHT REVENUE PER TRAIN MILE	\$2.69	\$2.86	6.32 Inc.

MAINTENANCE OF WAY AND STRUCTURES

The total Operating Expenses of the Company for the year ending June 30, 1915, were \$12,107,597.51; of this amount \$1,956,803.49 was for charges pertaining to Maintenance of Way and Structures. Included in these charges are \$130,942.38 for steel rails, \$229,376.56 for ties, and the cost of re-balling 24.01 miles with gravel and cinders, also part cost of replacing 1,934 feet of wooden bridging with permanent work.

During the year 11,408 tons of new steel rails and 6,446 tons of usable and re-rolled steel rails were laid in track, a greater portion of which replaced rails of lighter weight; 372,974 ties of all descriptions were laid in renewals.

The details of the charges to Maintenance of Way and Structures for the year, compared with the previous year, were as follows:

	1914	1915	Increase or Decrease
COST OF RAILS:			
New steel rails	\$392,057.11	\$362,580.63	\$29,476.48 Dec.
Usable and re-rolled rails	143,572.52	138,315.69	5,256.83 Dec.
	\$535,629.63	\$500,896.32	\$34,733.31 Dec.
Less value of old rails and other items	366,663.79	369,953.94	3,290.15 Inc.
Net charge for rails	\$168,965.84	\$130,942.38	\$38,023.46 Dec.
COST OF TIES:			
Cost of Ties	525,024.76	229,376.56	295,648.20 Dec.
Cost of Ballast	51,996.80	20,270.06	31,726.74 Dec.
COST OF OTHER TRACK MATERIAL:			
	89,442.67	117,233.06	27,790.39 Inc.
Carried forward	\$835,430.07	\$497,822.06	\$337,608.01 Dec.
Brought forward	1914	1915	Increase or Decrease
ROADWAY AND TRACK LABOR AND OTHER EXPENSES	\$835,430.07	\$497,822.06	\$337,608.01 Dec.
	860,749.04	774,745.18	86,003.86 Dec.

Total Charges for Roadway and Track..... \$1,696,179.11
 Other Charges Account of Maintenance of Way and Structures were as follows:

	1914	1915	Increase or Decrease
BRIDGES, TRESTLES AND CULVERTS	295,994.49	159,950.88	136,043.61 Dec.
ROAD CROSSINGS, FENCES, ETC.	70,010.91	64,003.35	6,007.56 Dec.
SIGNALS AND INTERLOCKING PLANTS	30,288.21	28,082.14	2,206.07 Dec.
BUILDINGS, FIXTURES AND GROUNDS	244,206.25	207,458.28	36,747.97 Dec.
DOCKS AND WHARVES	2,636.23	Cr. 96.30	2,732.53 Dec.
SUPERINTENDENCE	111,551.70	107,451.21	4,100.49 Dec.
ROADWAY TOOLS AND SUPPLIES	23,742.73	24,502.41	759.68 Dec.
SUNDRY MISCELLANEOUS CHARGES	152,578.97	92,884.28	59,694.69 Dec.

Total Charges Account of Maintenance of Way and Structures..... \$2,627,188.60
 The above charges for Maintenance of Way and Structures for the current year amount to 16.16 per cent of the total Operating Expenses, as compared with 20.47 per cent for the preceding fiscal year.

MAINTENANCE OF EQUIPMENT

The charges on account of Maintenance of Equipment for the year ending June 30, 1915, compared with the preceding year, were as follows:

	1914	1915	Increase or Decrease
LOCOMOTIVES	\$915,313.10	\$975,126.79	\$59,813.69 Inc.
FREIGHT-TRAIN CARS	923,035.34	1,061,967.59	138,932.25 Inc.
PASSENGER-TRAIN CARS	287,841.23	265,800.71	22,040.52 Dec.
WORK EQUIPMENT	33,067.42	35,127.09	2,059.67 Inc.
SHOP MACHINERY AND TOOLS	33,788.02	31,300.56	2,487.46 Dec.
SUPERINTENDENCE	63,083.97	68,929.43	5,845.46 Inc.
SUNDRY MISCELLANEOUS CHARGES	46,995.43	38,704.54	8,290.89 Dec.

Total Charges Account of Maintenance of Equipment..... \$2,303,124.51
 The above charges for Maintenance of Equipment for the current year amount to 20.46 per cent of the total Operating Expenses, as compared with 17.95 per cent for the preceding fiscal year.

TRANSPORTATION EXPENSES

The Transportation Expenses of the Company for the year were \$6,737,697.17, or 55.65 per cent of the Total Operating Expenses. Of this amount \$3,639,774.85, or 54.02 per cent, was for labor; \$1,922,464.65, or 28.53 per cent, was for fuel for locomotives; and \$1,175,457.67, or 17.45 per cent, was for supplies and miscellaneous items.

The total decrease in the charges as compared with the preceding year was \$195,205.38, distributed as follows:

Decrease in amount charged for labor	\$188,447.73
Decrease in amount charged for fuel for locomotives	121,627.28
Increase in amount charged for supplies and miscellaneous items	114,869.63
	\$195,205.38

By order of the Board of Directors,
 WILLIAM A. GARDNER, President.

An editorial on the licensing of structural engineers in Illinois, in the *Railway Age Gazette* of September 10, called attention to the fact that the law provides for the granting of licenses to engineers from other states in which similar laws are in effect, and stated further that no such law has been passed by any other state.

The Licensing of Engineers

A. A. Woods, superintendent on the Queen & Crescent, calls attention to the fact that the state of Louisiana passed a law in 1908, requiring a license for the practice of civil engineering and surveying. This statute does not define the terms "civil engineering" or "surveying," nor does it state what is to be understood as constituting the "practice" of these professions. The fact that the candidates for licenses in civil engineering are to be examined only in "natural philosophy or physics," in

addition to the branches mentioned for surveyors, throws no further light on the subject other than to indicate unlimited discretion on the part of the board of examiners. It is not known what attitude will be taken by the Illinois board concerning the holders of licenses in Louisiana. This example illustrates the variety of conditions to which the railroads crossing state lines would be subjected, if other states should follow the example of Illinois and Louisiana.

The British Board of Trade report of the returns of the railways of the United Kingdom for the calendar year 1914 is contained in a single page, which is published elsewhere in this issue. Only a few of the most important figures, such as those for mileage, capitalization, earnings and expenditures are given, in place of the usual volume of statistics comprising 100 or more pages, and it is announced that, in consequence of the war, no further returns will be published for the year. Total revenues amounted to \$677,731,860, including the estimated amount receivable under the government's guaranty, given when it took control of the roads for military purposes on August 5, of compensation for any decrease in net receipts for the period during which the government retained possession of them, as compared with the corresponding period of the previous year. The gross earnings were \$1,715,000 less than in 1913, but approximately \$50,000,000 more than in 1912. Expenses, on the other hand, increased \$4,145,000, so that the net income was \$5,861,000 less than in 1913, but almost \$18,000,000 more than in 1912. Some indication of the volume of traffic is afforded by the train mileage figures, which show a decrease of 5,518,000 miles as compared with 1913, most of which was in freight, although there was a large increase over previous years with the exception of 1913. Under the exigencies of military traffic, however, these figures probably include a large empty mileage. The ratio of expenses to revenues was 63.3, in 1914, against 62.6, in 1913, and the percentage of net income to paid-up capital was 3.79, in 1914, against 3.90, in 1913. The total paid-up capital in 1914 amounted to \$6,518,338,920, or \$275,000 a mile, an increase for the year of about \$35,045,000, while the main line mileage during the year increased only 10 miles to 23,701, and the mileage of single track increased 258 miles.

The constitutional convention of New York state, which has recently adjourned, submits to the people an amendment which, if adopted, will make the public service commissionerships constitutional offices; in other words, partisan legislatures cannot abolish the commissions on the whim of a moment. As everybody is agreed that "regulation has come to stay," this is a salutary change. The proposed amendment leaves the powers of removal and appointment just as they are now; the members' terms of office, five years, remain unchanged, and the objections to the amendment, voiced in some newspapers, based on the argument that the reasonable powers of the legislature and the governor will be curtailed, is groundless. It will be remembered that these two commissions were created in Governor Hughes' time one to have supervision over the public utilities of New York City, the other over the public utilities of the rest of the state. The commissioners are appointed by the governor; the salary is \$15,000 a year, and the original idea was to get the best men available regardless of political affiliations. This ideal, however, has not been lived up to, and for the last few years the commissionerships have been considered political plums at the disposal of the governor. This bad condition is little improved. The responsibility of a governor, in making appointments like these, is akin to that of the President in appointing judges for the federal courts, but only rarely do the citizens of New York elect a governor who appreciates this. If governors would

British Railway Returns

make appointments to commissions from men best fitted to hold such positions and not as rewards for political support, then truly government regulation would have an opportunity which it seldom has had in this country. It might be the very legitimate ambition of a railroad man, a professor of economics, or an engineer, to step from competitive work into the judicial-administrative capacity of public service commissioner. While the salary would not be comparable to that of the vice-president of a large railroad or to the earnings of a successful engineer, it would carry a dignity, a responsibility and an authority in somewhat the same way that an appointment to the Supreme Court does; and that ought to go far toward making up for money loss.

RAILROAD BANKRUPTCY

A SIXTH of the mileage of all the railroads in the United States is being operated by receivers and 66 per cent of all the roads in receivers' hands is in the Southwest. There is only approximately 32 per cent of the railroad mileage for the entire United States shown in the accompanying map, which covers the Southwest and some additional territory, while 66 per cent, or nearly 28,000 miles out of the total of approximately 42,000 miles of road that are in receivers' hands, is shown on this map.

The following is a list of all the roads now being operated by receivers:

RECEIVERSHIPS JANUARY 1, 1915			
	Miles	Outstanding Stock	Total Funded Debt
Apalachicola Northern	102	3,000,000	2,000,000
Arkansas, Louisiana & Gulf	61	1,230,100	1,230,000

Total Mileage, 41,988; Total Capitalization, \$2,264,002,178

It will be noted that the only roads of any importance that are in receivers' hands and are not at least in part on the map of the Southwest are the Western Pacific, operating 946 miles; the Colorado Midland, operating 338; the Georgia & Florida, operating 350, and the Algoma Central & Hudson Bay, operating 332 miles. A part of the Pere Marquette is shown on the map, but most of it is not.

With the problem before bankers and railroad managements, of restoring the bankrupt railroads to a condition of solvency, it becomes essential that the conditions which brought about bankruptcy should be studied and analyzed in a spirit of entire candor. A successful termination of the conditions which now exist can be arrived at only if the causes which brought about these receiverships are removed. It is believed that a study of the accompanying map will help in this analysis.

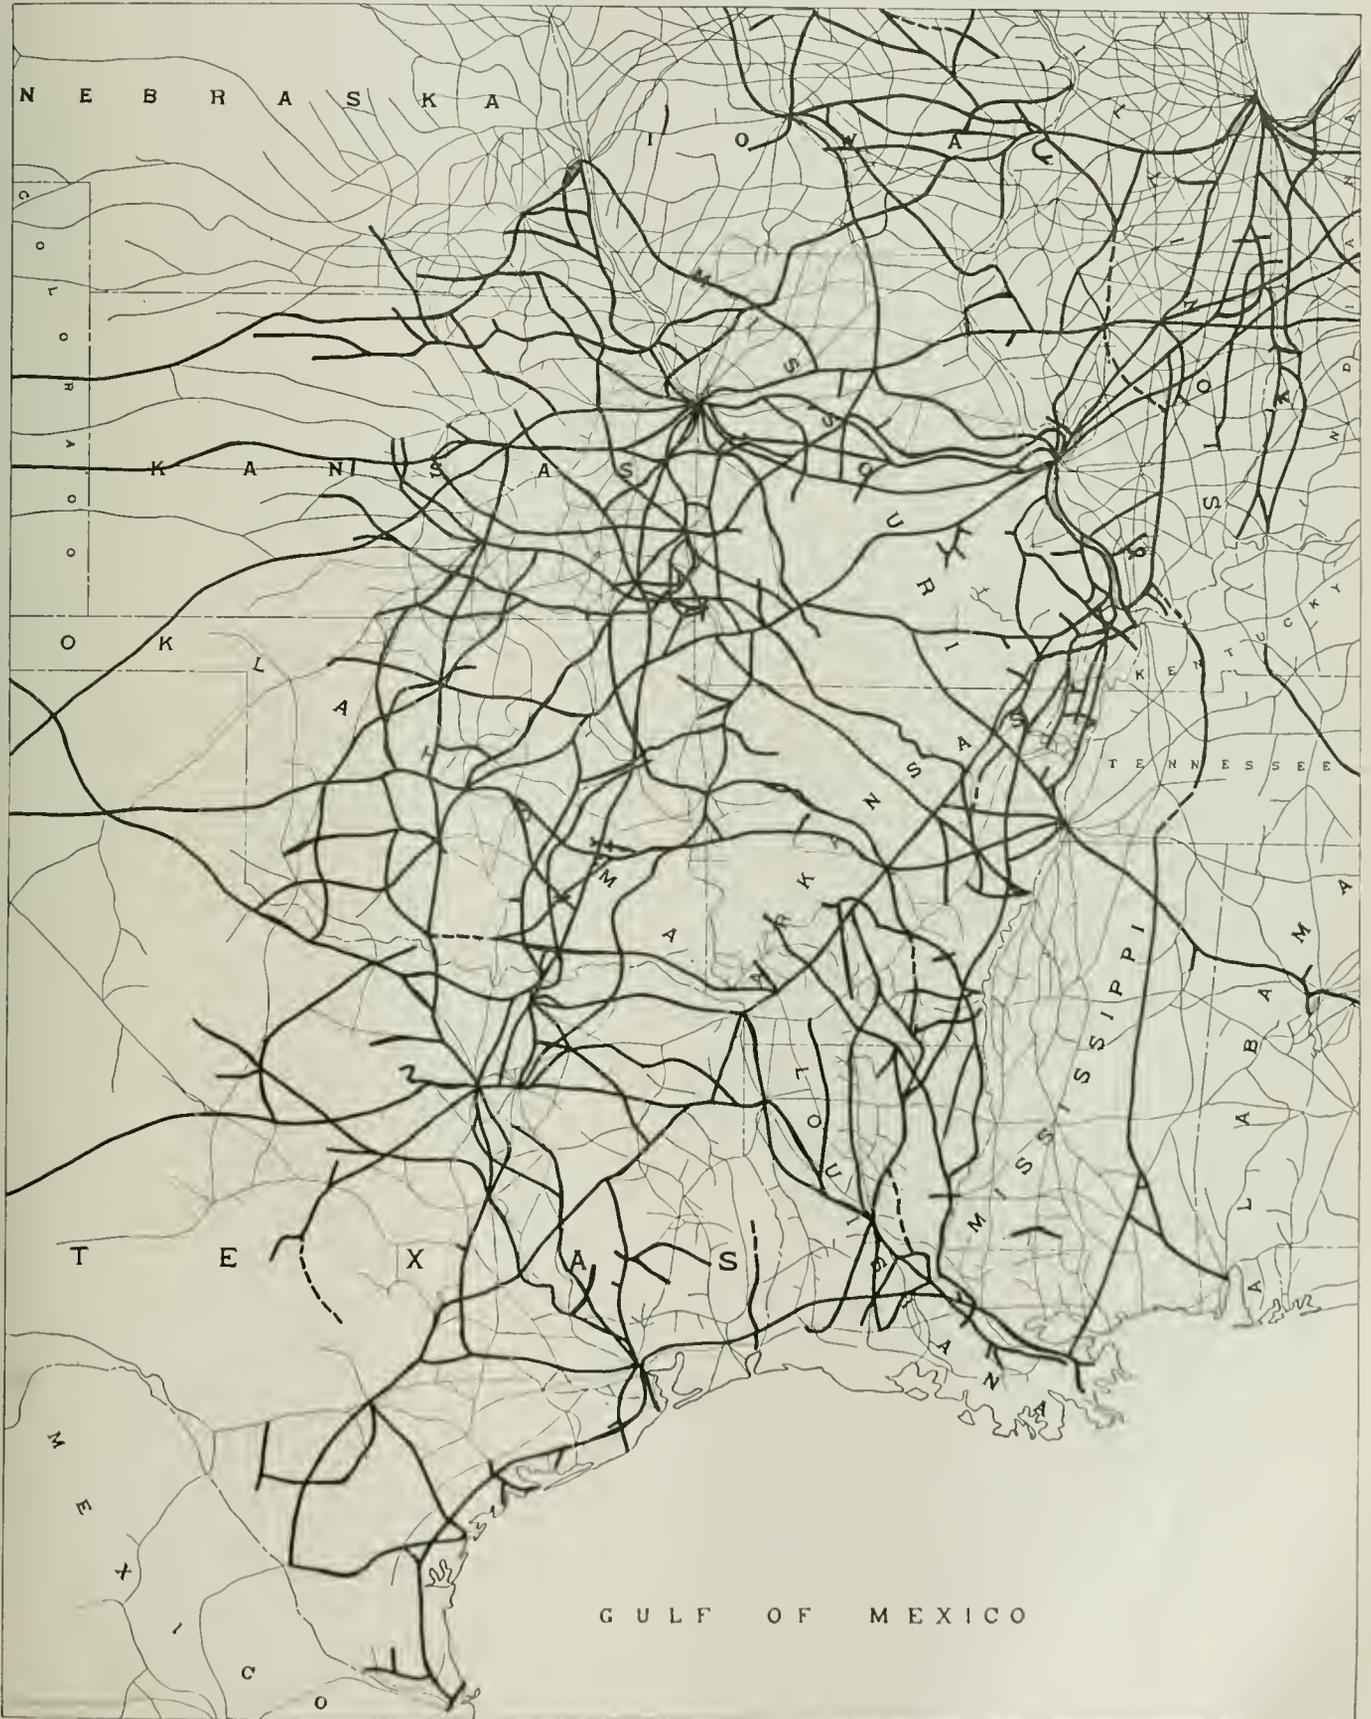

If the roads which are in the hands of receivers and are not shown on this map have certain features in common with the southwestern roads, this might be some clue to the facts which we are trying to get at. The condition of the Western Pacific doubtless is due mainly to the fact that it is a new road in a territory which is largely undeveloped. That might be said of certain individual lines of some of the southwestern roads that are in the hands of receivers, but it is obviously not a characteristic of all the roads, or of any appreciable portion of them. The Pere Marquette, only a very small part of which is shown on the map, lies largely in Michigan. Its bankruptcy was due in part to the fact that when the company was reorganized following a previous bankruptcy the reorganization was not drastic enough; that means that the earning power of the company was overestimated. Competitive conditions may have something to do with this, but the most important factor is the restrictions which are placed on rates by the state of Michigan. The Pere Marquette also has too large a proportion of funded debt to stock. The roads in the hands of receivers in the Southwest all have the last two characteristics. They have been the victims of pernicious state regulation and they all have too large a proportion of their capital securities in the form of bonds or fixed interest-bearing notes. The southwestern states have indulged in railway regulation to a greater extent than any other three states in the union. It is unlawful to double-head a freight train in Texas so as to obtain the economies of heavier trainloading. This is only one instance of state regulation, but it is mentioned as a sample of the length to which the southwestern states have gone in attempting to cripple the earning power of their railroads.

A factor which has been much commented on in connection with the receiverships in the Southwest has been the refusal of the bankers to renew maturing obligations. In some instances this may have been due to enforced conservatism on the part of the bankers, but in other instances it is not true. Take the case of the Missouri Pacific. Kuhn, Loeb & Co. stood ready to give the strongest kind of financial support, but smallness of the earning power of the road necessitated so drastic a reduction in fixed charges that security holders could only be compelled

to make the sacrifice through the medium of railway receivership.

No one can study the history of the roads of Texas with an open mind and not come to the conclusion that state regulation, as it has been practiced in the past there, is directly responsible for the failure of any Texas road to be profitable to its owners.

No one can study with an open mind the laws of Missouri, Oklahoma and Arkansas and not be convinced that state restrictions on railroad operation have been one of the principal causes of the conditions which now exist in the southwestern states.

Map of the Railroads of the Southwest Showing by Heavy Lines the Roads in Receivership

If the Southwest had been experiencing a long period of business depression, if there had been crop failures, if a city like Dallas had had a boom and it had gone flat and this had been characteristic of other cities throughout this region; if prices for agricultural products had been abnormally low, we might assign any one of these as a prime cause of the disproportionate railroad mileage in the hands of receivers in the Southwest; but no one of these conditions has existed. The farmers have been growing rich; real estate values in the cities have increased phenomenally; building has been going on in the Southwest even when the East was in a state of stagnation; prices for agricultural products have been high and steady, with the exception, of course, of cotton; the railroad business is the only business, barring lumber, that has gone from bad to worse in the Southwest.

Is it any wonder, therefore, that bankers are reluctant to put new capital into the railroads of this section of the country? Let each man who has a savings bank account or a life insurance policy ask himself whether he really hopes that part of the assets of his savings bank or life insurance company is invested in southwestern railroad securities. Would the trustee of an estate be justified in buying southwestern railroad bonds? These questions are quite vital. It is not a matter of speculation as to the future; it is a matter of an unbiased study of the past.

The Southwest is not so amply supplied with railroads that there need be no new railroads built to develop the country; but who would have the temerity to try to promote a new road on the face of the accompanying map? But more immediate than this question is that of who will have the courage to underwrite a reorganization of the companies now in the hands of receivers.

Too large a proportion of fixed charges has been an important factor in all of the southwestern receiverships. To induce bondholders to accept stock in payment for their claims it will be necessary to give this stock a fair prospect of earning a substantial return, 7 per cent at least in average years, and a prospect of having very much more than this in prosperous years so as to offset the certainty that it will have to forego profits in years of bad crops or a business depression. If you are to reduce the fixed charges by persuading part of the debtors of the company to become owners with the business risks that ownership must assume, you have got to hold out prospects of business profits which are higher than would be the interest ordinarily demanded by a lender on security. All the unbounded optimism that is to be found in Oklahoma and Texas cannot persuade an investor that a southwestern railroad company's securities look good unless there is some substantial assurance that the railroads as well as other forms of industry are to be allowed to participate in the prosperity of that country. Optimism, even enthusiasm, over the Southwest is justified, but it is obvious that the railroads have not heretofore gotten their share of the wealth which they have been such an important factor in creating.

While the Southwest is worse than the rest of the country in regard to its railroad situation, figures for the entire United States make a far from good showing. Making a rough estimate based on the net operating income as shown by the figures compiled by the Bureau of Railway Economics for the fiscal year ended June 30, 1915, and taking the capitalization of the railroad companies at the beginning of that fiscal year, the net operating income of only between 40,000 and 45,000 miles of road will apparently show 6 per cent or more on the total face value of outstanding securities. In other words, the mileage of railroads which are earning 6 per cent or better on the total of their securities is only about as great as the mileage of railroads which are bankrupt. Six per cent is not a sufficient return to hold out to an investor to induce him to subscribe for stock, and yet nearly five-sixths of the mileage of railroads in the United States will not show 6 per cent in 1915, according to our estimates.

"HEALTHY RIVALRY AND STRIVING"

THE order of the Interstate Commerce Commission requiring the railways to dispose of their boat lines on the Great Lakes is having an effect very different from that anticipated by Congress when it passed the law under which the commission's order was issued, and by the commission itself when it made its decision. The law (the Panama Canal Act) provided that if the commission considered that any water service other than through the canal which was being rendered by railways "is being operated in the interest of the public and is of advantage to the convenience and commerce of the people," it might extend indefinitely the time during which the railways might continue to render it.

The commission, in its opinion on May 7, 1915, which was written by Chairman McChord, held, in effect, that the service being rendered by the lake boats owned by railways was not in the interest of the public. It said, "On a water course where boats and boat lines are free from domination or control by the railroads, and where they are left to survive as their merit or the ingenuity of their owners makes possible, there will be, and always is, a healthy rivalry and striving between such boat lines and with paralleling railroads for all suitable and available traffic. * * * The condition is one which results in the beneficial use of the waterways accruing to the shippers."

Thus confident was the commission in the expression of its views, although there were facts on every hand to contradict them. Now it is found that instead of promoting competition between the lake lines and the rail lines, the order has thus far resulted only in curtailment of boat line service and higher water rates; and a still further curtailment will result after December 15, the date on which the railroads are required to cease operating boat lines on the lakes. Several of the boats already disposed of by the roads are to be taken out of the lake service entirely, and, so far as is known, no independent service is forthcoming to take their place.

That the divorce of the lake and rail line does not present a pleasing prospect to the shippers is indicated by the petition which the Chicago Board of Trade, probably the most important organization of shippers interested in lake transportation, has just filed with the Interstate Commerce Commission, asking for permission to intervene in the rehearing asked by the Lehigh Valley and for a postponement of the order until the commission shall have heard further evidence on behalf of the shippers. The Board of Trade has also asked similar organizations in other cities to join it in seeking a postponement of the order until they can present their reasons for desiring a continuance of the boat service by the railways.

The Board of Trade says in its petition that for many years, "there has been for the most part, adequate facilities in the way of boats" for shipments from Chicago to Buffalo and other lake ports; that "the rates have been regulated largely by the supply and demand for transportation," but that the disposal by the railroads of their interest in a number of boats "has had the effect of decreasing the supply of said boats and enormously advancing the charges for transportation of grain via water," and that "the disruption and curtailment of said means of water transportation will be destructive of the business of and highly injurious to many cities and towns." "Unless immediate action is taken," the letter to other organizations says, "the shippers will either have no boat line service at all, or an irregular and unsatisfactory service, with perhaps rates no lower, and possibly higher than are being paid at the present time. The result will be an increased cost to the consumers, producers and shippers."

For many years a great majority of the service on the lakes has been rendered by vessels owned by large industrial corporations and handling only their freight, and by boat lines controlled by the railways. The amount of service rendered by so-called "independent" lines—that is, lines owned neither by the big industrial corporations nor by the railways—has been extremely small. In other words, the service to the public has

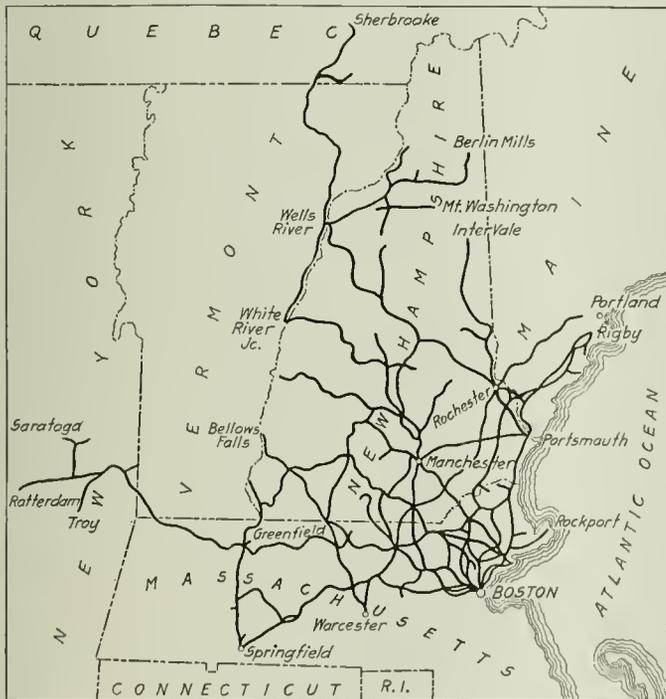

been rendered almost solely by railway boat lines. It has been assumed by many that if the competition of railroad boats were withdrawn there would at once spring up independent lines to render adequate service. But, as already indicated, the independent boat lines are no more forthcoming than is sufficient good service on our improved rivers and other inland waterways.

The reason why this is the case is that every good business man who seriously investigates the subject soon becomes convinced that an independent boat line on an inland waterway cannot ordinarily compete with the paralleling railroads in soliciting traffic and rendering satisfactory service in handling it. Perhaps this fact, which long has been patent to many of those who have studied the relations between rail and water transportation in this and other countries, will now be brought home by the hard logic of experience to those in high places who sometimes regulate first, and find out afterward the conditions to which the regulation is to be applied.

BOSTON & MAINE

EVERY officer and every employee of the Boston & Maine ought to read at least so much of the company's annual report as is contained in the last two paragraphs of the president's remarks. President Hustis says:

"No business, much less one performing public service, can

The Boston & Maine

produce its best results while doubt or uncertainty as to its future exists. Despite such a condition there is encouragement in the fact that there has been an improvement in the service as well as in the net results of operation.

"The helpful attitude of the public and the press generally, and the loyalty and faithful service of officers and employees, have contributed to and made these results possible. It is, therefore, in no perfunctory spirit that the board expresses its appreciation."

Throughout the report there is a note, not exactly of optimism, but of confidence to meet whatever difficulties the future may have in store, that is better than optimism.

The Boston & Maine operates 2,252 miles of steam railroad, of which but 707 miles is owned and the remaining 1,545 miles is leased. The majority of the Boston & Maine \$12,655,000 stock was owned by the New York, New Haven & Hartford through the medium of the Boston Railroad Holding Company. This stock is now deposited with a board of trustees approved of

by the United States courts in accordance with the settlement of the anti-trust suit brought against the New York, New Haven & Hartford.

There are three principal problems for which the Boston & Maine management has to find a solution. The company had at the beginning of the fiscal year which ended June 30, 1915, \$24,310,000 floating debt in the form of notes, all of which were due on or before March 2, 1915. The company's interest charges on its funded debt amount to \$1,755,000 and on its unfunded debt to \$1,272,000. In addition to this, however, the leases of the lines which it operates but does not own call for \$5,589,000 annually. The fixed charge, therefore, on the leased roads is at the rate of \$3,600 per mile, which is more than can be earned under present conditions with any margin of safety. Most of the leases run for very long terms and the only way in which the rentals can be decreased is through some compromise between the Boston & Maine and stockholders of the leased lines. A part of this problem is in the laws of the New England states in which the road operates, which, as at present on the statute books, make a voluntary reorganization impossible. The third problem is the profitable operation of the railroad.

The management was able to persuade the holders of the great majority of the notes representing floating debt to extend these notes not only once, but twice, and as the situation now stands there are \$17,337,000 notes outstanding, which amount will be further reduced to \$13,500,000 under the plan which the noteholders have accepted of receiving a part of what is due them in Maine Railway Companies' notes, but which \$13,500,000 will fall due March 2, 1916.

The legislation necessary to permit a reorganization of the company was secured in Maine and Massachusetts, but not in Vermont or New Hampshire. The management is hopeful, however, that a way will yet be found to keep the property intact. The plans to accomplish this presumably call for some sacrifices on the part of the stockholders of the leased roads, but it is hoped that these stockholders will agree to share something of the burden which must be borne by the other Boston & Maine security holders.

A very good start has been made in the operating problem, notwithstanding the fact that 1915 was a year of business depression in New England. Total operating revenues of the Boston & Maine amounted to \$46,673,000 in the fiscal year ended June 30, 1915, a decrease as compared with the previous year of 3.09 per cent. The falling off in revenue was equally distributed between freight and passenger service. Total operating expenses amounted to \$35,910,000, a decrease as compared with the previous year of 7.58 per cent. The operating ratio was reduced from 80.68 in 1914 to 76.94 in 1915. The company failed by only \$334,000 of earning a net sufficient to meet its interest charges and rentals. In 1914 there was a deficit of \$2,045,000. The saving in expenses was made through a reduction of 14.54 per cent in maintenance of equipment expenses and 9.99 per cent in transportation expenses. Maintenance of equipment cost \$6,695,000 in 1915. Repairs per locomotive mile cost 8.51 cents. This was a reduction of 6.79 per cent as compared with the previous year. The repairs of freight cars cost \$2,457,000 in 1915, a decrease of \$534,000. It is safe to say that nearly if not all of the reduction in maintenance of equipment expenses was due to the more economical performance of the work, the same or higher standards of repairs being held to in 1915. The fact that the Billerica shops of the Boston & Maine were in operation during all of the 1915 fiscal year and only part of the 1914 fiscal year is one factor that made the saving in maintenance of equipment expenses possible; and the other was better and more economical work done by the mechanical department.

Transportation expenses amounted to \$20,178,000, a decrease as compared with the previous year of \$2,240,000, or about 10 per cent. The ton mileage of revenue freight carried totaled 2,416,000,000, a decrease of 8.30 per cent, and the total number of passengers carried was 43,472,000, a decrease as compared with the previous year of 7.57 per cent. The average trainload

of revenue freight was 333 tons in 1915, an increase as compared with the previous year of 19.06 per cent. All of this increase in trainloading was due to heavier tonnage pulled behind the drawbar, the mileage of loaded cars being 153,000,000, a decrease of 7.92 per cent as compared with the previous year, while the mileage of empty cars amounted to 58,000,000, an increase of 1.63 per cent.

The principal savings in transportation expenses were in fuel for train locomotives, which cost \$3,644,000 in 1915, or \$587,000 less than in the previous year; a decrease in the wages of yard conductors and brakemen, which cost \$1,096,000 in 1915, or \$210,000 less than in the previous year; and reductions in the amounts paid for station employees, fuel for yard locomotives, train enginemen and trainmen.

One specific economy which has been effected deserves mention. The amount of materials and supplies on hand was reduced from \$5,702,000 in 1914 to \$4,139,000 in 1915. This result was obtained through the establishment of a stores department and the vesting of this department with the necessary authority and responsibility.

The following table shows the principal figures for operation in 1915 as compared with 1914:

	1915	1914
Average mileage operated.....	2,252	2,252
Freight revenue.....	\$27,042,879	\$27,912,397
Passenger revenue.....	15,502,197	16,111,548
Total operating revenues.....	46,673,049	48,160,286
Maint. of way and structures.....	7,195,081	6,700,913
Maintenance of equipment.....	6,695,420	7,835,146
Traffic expenses.....	443,690	466,600
Transportation expenses.....	20,193,692	22,434,904
Miscellaneous expenses.....	200,170	248,878
General expenses.....	181,720	1,169,778
Total operating expenses.....	35,909,772	38,856,319
Taxes.....	1,978,223	2,059,017
Operating income.....	8,779,110	7,245,050
Gross income.....	9,983,584	9,151,645
Net loss.....	334,462	2,044,742

ATCHISON, TOPEKA & SANTA FE

THE tonnage of agricultural products carried by the Atchison, Topeka & Santa Fe in 1915 was 6,932,000 and formed 26.57 per cent of the total tonnage of revenue freight carried, comparing with 5,000,000 tons of agricultural products carried

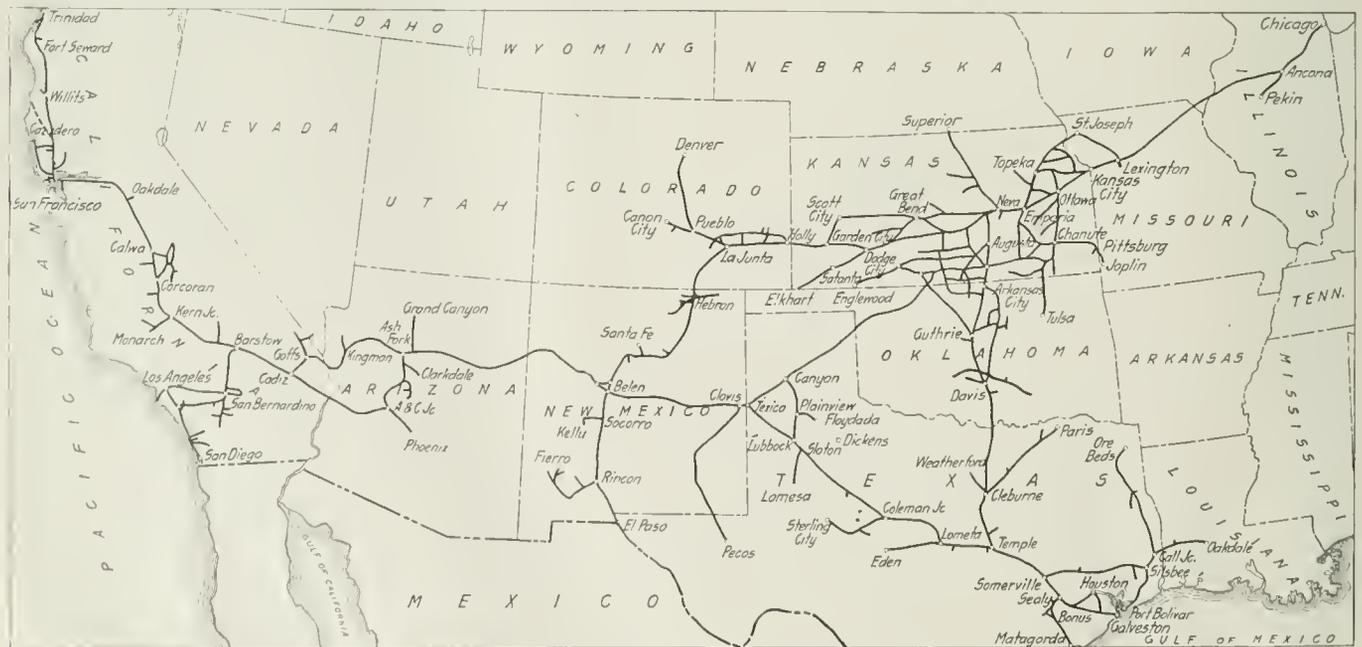

tural products in western Texas and western Oklahoma was phenomenal, and also that the Kansas and Oklahoma wheat was largely exported through Galveston, giving the Santa Fe the longest possible haul, combined to make both the gross and net earnings of the company the largest in its history.

The Atchison, Topeka & Santa Fe operates 11,136 miles of railroad. While it has a large mileage in the Southwest, unlike some of the other large roads which serve that territory, it has a very profitable through business and a very profitable business in California. The development of the property has been conservative, but remarkably good judgment has been shown and no time has been wasted in getting into new territory which was being developed.

In the fiscal year ended June 30, 1915, the company earned \$117,666,000 from operation, an increase as compared with the previous year of \$6,556,000. Operating expenses amounted to \$76,092,000, an increase of \$2,622,000. This gave the company an operating ratio of 64.67 in 1915 as against 66.12 in 1914. The business handled increased in greater proportion than the revenue. The total ton mileage of revenue freight was 8,263,000,000 as against 7,316,000,000. The average revenue per ton per mile was 9.47 mills as against 10.07 mills the year before. The number of passengers carried one mile was 1,342,000,000, as compared with 1,310,000,000 the year before. The average revenue per passenger per mile was 2.074 cents as against 2.175 cents in the previous year.

This increase of 12.33 per cent in freight business and 2.41 per cent in passenger business was handled with an increase in transportation expenses of approximately 2½ per cent. The average total trainload of freight was 442 tons in 1915, an increase as compared with the previous year of 5.13 per cent. The success in holding down transportation expenses is all the more noteworthy in view of the fact that the Santa Fe was very liberal in putting on additional passenger service, the passenger train mileage being increased by 4.98 per cent to accommodate the increase of 2.41 per cent in passenger mileage.

The Panama-Pacific Exposition created some traffic, which, however, was probably offset to a considerable extent by economies in traveling expenses of people affected by the business depression in the East. Much of the Panama-Pacific Exposition

The Atchison, Topeka & Santa Fe

in 1914, which formed 19.97 per cent of the total tonnage carried in that year. The average length of haul of all freight in 1915 was 317 miles as against 292 miles the year before. The fact that the wheat crop of Kansas was the largest in the history of the state and that the yield of nearly all classes of agricul-

business is done at excursion rates, which leave small margin for profit.

In connection with passenger business special mention should be made of the new union passenger station at Kansas City, which was opened on November 1, 1914. President Ripley says

of this: "The new facilities constitute one of the largest and most complete passenger terminals in the country and represent a very large investment. The heavy fixed charge which this investment entails and the maintenance and operation of these extensive facilities place a large expense upon the Kansas City railroads, all of whom are using the new station; however, the new facilities are a great accommodation to the public and, of course, materially improve operating conditions at Kansas City."

The Santa Fe is liberal in its expenditures for maintenance. In 1915, \$16,514,000 was spent for maintenance of way, an increase compared with the previous year of \$1,089,000. This is at the rate of \$1,486 per mile of road as compared with \$1,403 the year before. There was spent on maintenance of equipment \$19,765,000, an increase as compared with the previous year of \$551,000. In addition to this ample maintenance expenditure, the company spent \$12,041,000 for additions and betterments to its property and its equipment. Of this, \$4,248,000 was for construction or acquisition of new lines, \$5,116,000 for additions and betterments to fixed property, and \$2,464,000 for additions to equipment.

Furthermore, the Santa Fe has been very liberal in its charges for depreciation on equipment. The amount accrued on this account, after charging out the depreciation on equipment destroyed, is now \$23,953,000.

The Atchison is one of the soundest railroad companies financially in the entire United States. Its policy of making additions and betterments from income has been farsighted, the stockholders having taken only a part of the profits which belong to them and have invested a considerable proportion of the remainder each year in betterments. Of the total face value of securities outstanding less than half is funded debt, the funded debt at the end of 1915 amounting to \$310,975,000, and the stock to \$314,663,000. With an expenditure of more than \$12,000,000 in 1915 on property account, there was a decrease in the amount of funded debt outstanding of \$2,218,000 and an increase in stock outstanding, due to the conversion of convertible bonds into stock, of \$4,678,000.

The Atchison, Topeka & Santa Fe is pre-eminently a road belonging to investors. No single financial interest controls the company and its policy is dictated by the efforts of the management to conduct the company's affairs in the interests of its security holders, large and small. Notwithstanding all the facts and circumstances in the company's favor, the rate of return earned on property investment was but 5.40 per cent in 1915; and, as President Ripley points out, the fact that the company is able to pay a 6 per cent dividend on its common stock is only because it pays slightly more than 4 per cent on its funded debt. When the governments of England and France are offering their notes at a better than 5 per cent basis, there does not appear to be any immediate possibility of any railroad company, no matter how strong, being able to sell new bonds on a 4 per cent basis.

Is it any wonder that President Ripley is a pessimist on the railroad situation in general and an optimist on Atchison? This year's Atchison annual report is both good reading to Atchison security holders and a warning so plain as to be unmistakable in regard to the railroad situation in general and, of course, especially to roads west of Chicago.

The principal figures for operation in 1915 and 1914 were:

	1915	1914
Average mileage operated.....	11,115	10,909
Freight revenue.....	\$80,504,393	\$73,638,388
Passenger revenue.....	27,823,064	28,497,233
Total operating revenues.....	117,665,587	111,109,770
Maintenance of way and structures.....	16,514,468	15,425,730
Maintenance of equipment.....	19,764,535	19,213,343
Traffic expenses.....	2,649,175	2,521,774
Transportation expenses.....	34,827,705	33,899,108
General expenses.....	2,476,595	2,409,379
Total operating expenses.....	76,091,554	73,469,334
Taxes.....	5,497,317	5,525,585
Operating income.....	36,051,401	32,114,851
Gross income.....	39,048,551	34,289,204
Net income.....	24,130,892	20,183,965
Dividends.....	17,550,017	17,400,440
Appropriated for additions and betterments....	6,513,397	2,719,318

NEW BOOKS

Official Handbook of the Panama Canal. 58 pages. 6 in. by 9 in. Illustrated. Published by Government Printing Office, Washington, D. C.

In this book the United States government has brought together some very interesting material regarding the construction and operation of the Panama Canal and the traffic passing through it. It contains chapters showing the distances saved in trade routes between important points by the canal route, how a vessel is handled through the canal, facilities for shipping, savings in cost of operation by use of the canal taken from specific instances, tolls, use of the canal by sailing ships, the effect of the canal on the navy, various features of construction, and traffic routes. The chapter on shipping facilities especially gives a large amount of official information which is valuable to shippers making use of the canal route.

Fuel Association Proceedings. Edited by C. G. Hall, secretary of the association. 398 pages, 6 in. by 9 in. Published by the association, C. G. Hall, McCormick building, Chicago, secretary. Price \$1.00, bound in red morocco, and 50 cents, bound in paper.

This is the report of the seventh annual convention of the International Railway Fuel Association. This year the association considered the use of pulverized fuel on locomotives in a very comprehensive manner, and has, it is believed, the most complete information ever printed on this subject. The discussion contains many practical suggestions from the experiences of those who have used powdered fuel in stationary boiler service. A very complete report was made of the locomotive stoker situation. Other papers were presented on coal preparation, smoke prevention, fuel stations, fuel oil for locomotive use, storage of coal and the arrangement of front ends, ash pans, grates, etc.

Statistics of Railways of the United States 1904 to 1914. Bulletin No. 81, issued by the Bureau of Railway Economics, Washington, D. C.; 67 pages. 6 in. by 9 in. Bound in paper.

This is the third edition of the Bureau's annual series of compilations of statistics of the United States by ten-year periods. Bulletin No. 66, giving the statistics for the years 1900 to 1912, was issued last year and Bulletin No. 75, giving the figures for the years 1903 to 1913, was issued in March of this year. In publishing Bulletin No. 81, covering the figures for the period 1904 to 1914, the Bureau gives the most complete information yet available regarding railway results in the fiscal year 1914, compiled with the purpose of presenting in a form adapted for convenient reference the principal aspects of railway operation as shown by the official statistics.

The railway tabulations are based upon official data published by the Interstate Commerce Commission for each fiscal year, and tabulations concerning population and area are based upon the reports of the Census Bureau. The statistics are published in 76 tables, classified under the following heads: Population and Area; Railway Mileage; Capital Securities and Dividends; Revenues, Expenses and Taxes; Employees and Compensation; Equipment; Freight Traffic Statistics; Passenger Traffic Statistics and Accidents, the various tables under each head giving the principal details for each year. Where such division is suitable the figures are reduced to a mileage basis. The arrangement of the tabulations renders this bulletin of especial advantage from the standpoint of convenient reference because it brings together in comparable form the figures for 11 years, thus doing away with the necessity for consulting the different volumes of the Interstate Commerce Commission's statistics, and also because it includes the official figures for many of the most important details of the 1914 operations in advance of their publication by the Interstate Commerce Commission.

An especially convenient feature of the arrangement is the recasting of the figures for years prior to 1911, according to the three districts—eastern, western and Southern, which the commission has used since 1911, in place of the ten territorial groups used before that time. This makes it possible to obtain an accurate comparison of statistics for the various years without the necessity of combining the group figures.

Letters to the Editor

ELECTRIC LOCOMOTIVES ON THE BALTIMORE & OHIO

WASHINGTON, D. C.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

In the paper entitled "Electric Motive Power in the Operation of Railroads" by E. H. McHenry, published in the *Railway Age Gazette*, October 1, page 602, there appears the statement that "the first commercially practical engines of this kind were operated by the Baltimore & Ohio through its Baltimore tunnel in 1905." This is evidently a misprint, as the first electric locomotives were put in operation by this road in its belt line tunnel under the city of Baltimore in 1895.

HUGH G. BOUTELL.

AN ANSWER TO "A CLERK'S PLEA"

MUNHALL, Pa.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

The article, "A Clerk's Plea," by M. S., in your issue of September 10, is worthy of consideration by employee and employer alike—because both are vitally interested, or concerned—and his remarks apply to all clerical work, in large corporations as well as railroad offices.

Broadly and generally speaking, the vital principle involved (the lack of which is probably the cause of much of the incompetency of the men, as well as the ignorance of the employer as to their competency or incompetency) is co-operation. Co-operation, fully exemplified, will promote harmony, greater accuracy and efficiency, eliminate "dead timber" and suggest better wages. It is absolutely necessary among the men themselves, as it will suggest closer co-operation between them and their immediate superior; if there be a lack of this virtue between the superior and his men, it probably is because the superior, in his wisdom, foolishly lets the subordinate work out his own experience, instead of giving him the benefit of his own long experience, and thereby lightening his own burdens. The men must therefore take the initiative, and promotion by seniority will be suggested, as it will be difficult, under such circumstances, to pick out the best man. It will result in the survival of the fittest.

Wherever a man is found as being the first on the job, intelligent, interested, loyal and energetic in the pursuit of his duties, the last to leave his post, and then leaving only when all is done that can absolutely be done, that man, regardless of organizations, unions, or other affiliations, is bound to be finally recognized. Patience, however, is a virtue which not many of us possess, but which possessing pays well in the long run; also "The Lord helps them that help themselves" is a saying which, while much disparaged, contains a great truth. "A Clerk's Plea" exposes the individual, personal weaknesses of humanity generally, which each individual must overcome himself in order to succeed; no one is forced to learn; we are all free agents, having man's estate. If we do not exercise our given talents, we must accept the consequences.

The man who interests himself in his work and tries to learn more than he is paid to learn or do, soon commands attention from his superior, and it is so easy to do this, that the wonder is so few try to do it, if for nothing else than to be happy. The man who wants to learn and get along will always find a way to learn, and will be made to go along, because there are so few.

The world does not owe us a living, as so many think. We owe it to ourselves to work in the world, by the sweat of our brows, and the reward of our labors will be satisfaction, contentment, and joy in well doing. The great majority, however, do not sweat much. The hard-working, conscientious man, who has the interests of his company at heart, is, as M. S. says,

scarce, and such a man, if not recognized, will soon seek new fields for his ability; no such man ever stays long in the company of "duffers"; and again the clerk, with heart and soul, who enters railroad service because of the recognition which this great industry offers, is bound to succeed, because such clerks are few.

In taking up railroad work to make it one's profession, one does not and cannot stick in an office. To succeed finally as a professional railroad man, one must get an insight into the practical workings of the various departments—braking, conducting, operating yards, despatching, surveying, engineering—or at least of some of them; there is no such "profession" as clerking, any more than there is as "grocerying." There are clerks and clerks. Anyone who can wield a pencil or pen must, of necessity, call himself a "clerk" if he be so employed; one great trouble with clerks is that there are so many of them, and being also a field in which women enter more readily than any other "man field," wages are probably lower, except in executive positions. Then again, to crowd this field still more, the average young fellow, when he leaves school, wants to get into an office, because he can be dressed up. He does not like to come or go from home in overalls, or a working shirt, while learning a trade which would in all probability carry him around the world without a dollar in his pocket. He prefers to accept the office job, and only realizes when it is too late that he has idled his time away, reading the "sporting edition," playing billiards, and loafing around street corners, instead of cultivating some useful study, which could affect or have some relation to his daily work.

Mr. Basford in his article in the issue of July 23 said: "Many of the best high officials have been clerks; they did not rise because they were clerks, but in spite of that fact." That is the keynote to every condition in life; to succeed in spite of circumstances. If a man be a clerk he can make himself a very excellent clerk, if he so wills, but the great majority do not so will, and waken up too late to the fact that opportunity has knocked and passed on.

A man in any line may be a steady, plodding kind of a fellow, following the beaten track, with no initiative at all, satisfied with his bread and butter, and contented with this condition; but this man is bound to be passed by the man with red blood in his veins, ambitious, who exercises his brain and promotes energy all round by his activity, mentally and physically, in the office, field, or factory, and who knows all the time that he will succeed.

"A Clerk's Plea," after reading it carefully, seems to me to be a misnomer; it should have been termed "A Clerk's Whine."

M. S. says: "We may be honest and earnest in our efforts, but the lack of specific knowledge, etc., etc.," and then he asks, "Is it our fault? If it is, our failure to do the right thing has not been pointed out to us"; why are there no schools for us, and why don't competent men write books for us, and why this and why that? Is it our fault? Of course, it is your fault; you can take or lead a horse to the well, but you cannot make him drink; where there's a will there's a way; and if you don't at first succeed, try, try again.

Experience is, probably, after all, the best teacher for the everyday affairs of life, and if those of us who have learned our lesson in the school of experience would have a little patience and co-operate with the younger and ignorant element (who must display their ignorance, in order to profit from the experience of their elders, and that, too, in a much shorter time), it will do much to eliminate such complaints as those advanced by M. S.

I sympathize with all that M. S. says, but a "man's a man for a' that," must be proved by the man.

K. LEAN.

ENGLISH RAILWAY STATIONS CLOSED.—The North-Eastern Railway recently decided that, owing to the enlistment of railwaymen and the consequent shortage of staff, a number of its stations would be temporarily closed, effective Monday, September 20.

Electrification of 440.5 Miles of the St. Paul

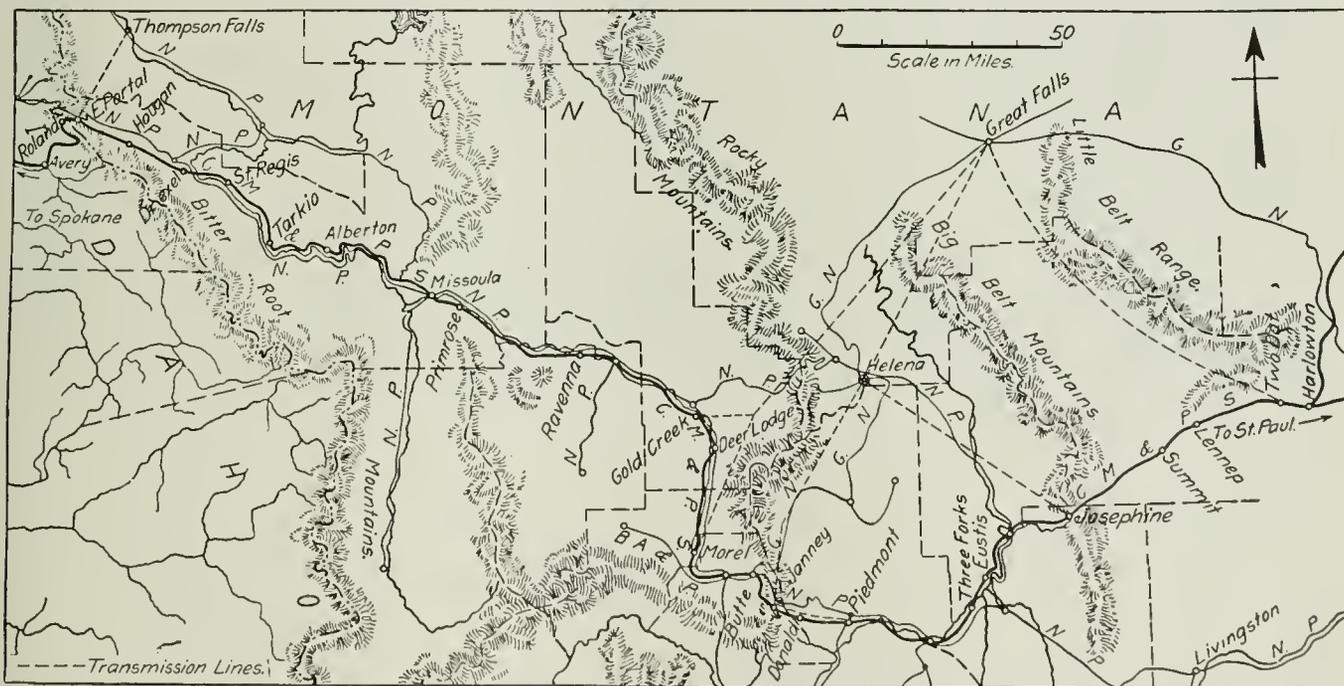

A Description of the New Construction Work on Four Entire Engine Districts with Heavy Mountain Grade

The Chicago, Milwaukee & St. Paul is now actively engaged in the electrification of 440.5 miles of main line and 141 miles of side and yard tracks on its Puget Sound extension between Harlowton, Mont., and Avery, Idaho. This includes the Rocky Mountain and Missoula divisions with four engine districts and intermediate terminals at Three Forks, Deer Lodge and Alberton, Mont. Work on the district between Three Forks and Deer Lodge, including 113 miles of line and 168 miles of all tracks, is now practically completed and it is expected that this section will be ready for electric operation shortly after November 1. The electrification of the eastern district between Three Forks and Harlowton is also nearing completion and it will be placed in service soon after January 1, 1916. Work is also under way on the two western districts comprising the Missoula division and it is expected that this division will be operated electrically by January 1, 1917. This entire project involves an expenditure estimated at \$15,000,000.

This project is of special interest to railway men for a number of reasons. With only one or two exceptions, all previous

Summit, 45 miles west of Harlowton, at an elevation of 5,795 ft., with a one per cent grade 14 miles long on the east slope and a one per cent grade 44 miles long on the west slope. The length of this latter grade presents one of the most serious problems encountered in this installation. The Rocky Mountains are crossed at Donald, 124 miles west of Summit and 18 miles east of Butte, at an elevation of 6,350 ft. The eastern slope includes 20.8 miles of two per cent grade and the western slope 10 miles of 1.66 per cent grade. The third district between Deer Lodge and Alberton descends continuously westward on a maximum grade of 0.4 per cent. The crossing of the Bitter Root mountains is made at Roland, Idaho, at an elevation of 4,200 ft. The summit is reached by 12 miles of 1.7 per cent grade on the east slope and 24 miles of 1.7 per cent grade on the west side. Over 6,250 ft. of rise and fall is overcome between Harlowton and Avery.

As would be expected in such mountainous country, the curvature is heavy, the maximum degree of curve being 10 deg. There are 36 tunnels between Harlowton and Avery, 16 of which

Map of the Electrified Line and Sources of Power Supply

electrification installations have been made to relieve local smoke conditions in cities or tunnels or to reduce congestion at certain specific points, and not primarily to effect economies of operation. This project of the St. Paul is being developed to reduce the cost of operation, the smoke problem being negligible, and there being no traffic congestion as this line is single track with only a moderate traffic. Also, while other installations have been of limited mileage and have only served to create constructive mileage for train crews in most cases, this supersedes steam operation on four entire engine districts, affording opportunity for the full development of economies in yard as well as line operation, and for the working out of methods for electrical operation on a much larger scale than heretofore possible.

PHYSICAL AND TRAFFIC CONDITIONS

Between Harlowton and Avery this line crosses the Belt, Rocky and Bitter Root mountains. The Belt mountains are crossed at

are on the western slope of the Bitter Root mountains. The longest is the St. Paul Pass tunnel at the summit of the Bitter Root mountains, 8,751 ft. in length.

The traffic consists of two heavy transcontinental passenger trains with a third local passenger train between Harlowton and Butte, and an average of four tonnage freight trains each way daily, with a local freight every second day. The freight traffic amounts to about 15,000 gross tonnage daily. Under ordinary conditions the prevailing tonnage is eastbound and consists largely of grain, lumber and other dead freight. Normally one-time freight is able to handle all eastbound expedite business. Westbound, nearly all the traffic consists of merchandise and other time freight.

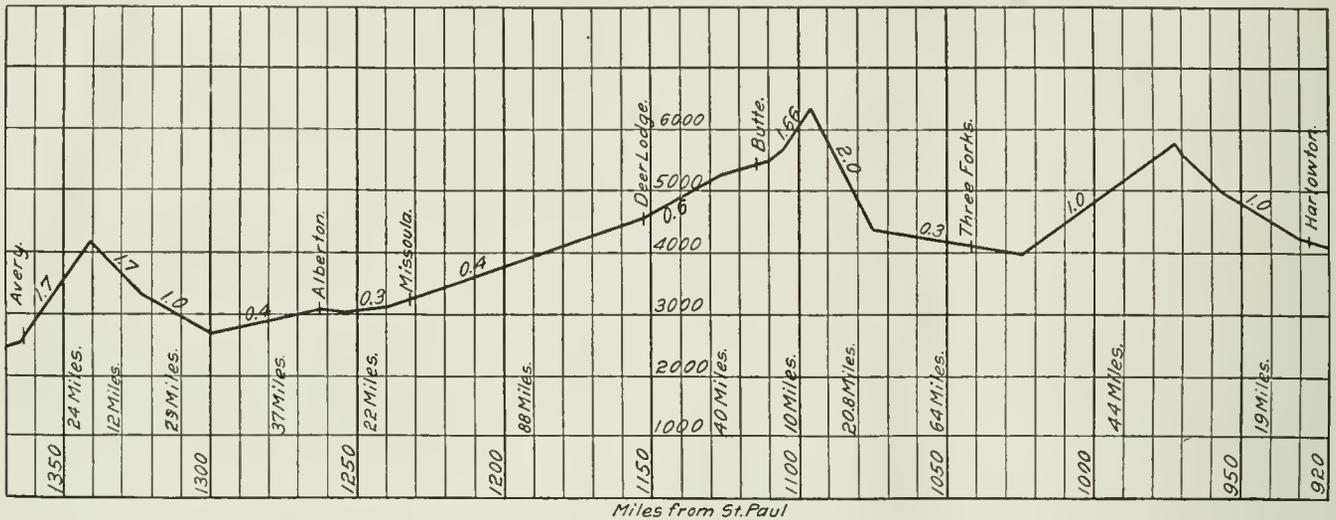

The local traffic originating within the limits of the electrified zone is relatively small, Butte and Missoula being the only cities of any importance. While the St. Paul brings considerable freight into Butte, it is the latest road into the city and reaches many industries only through connecting lines.

At the present time a 2,000-ton train is hauled up one per cent grade with one Mallet road engine. Helpers are added on the heavier grades, 7 engines being held in this service on the Rocky Mountain division, as compared with an average of 23 road engines.

Only three short branches connect with the main line between Harlowton and Avery and these will not be electrified at present. A considerable amount of business originates along the Great Falls line, which connects with the main line at Harlowton, but practically all this goes east. Almost all the traffic handled

tion of light tonnage. Power is secured by contract with the Montana Power Company at the unusually low price of 0.536 cents per kw. hour, based on a 60 per cent load factor.

Important operating economies are expected from this development, but because of the numerous new problems to be solved, many of the proposed methods of operation are only tentative and subject to wide variations as they are put in practice. One of the important innovations which will be introduced is that of running freight and passenger engines over two districts, changing crews at the intermediate terminals. While trains

Profile of the Electrified Portion of the Chicago, Milwaukee & St. Paul

therefore, comes from points west of Avery. This traffic is growing regularly and the electrical equipment now being installed is capable of handling a tonnage train in each direction every two hours, or nearly double the present business.

SPECIAL CONSIDERATIONS

One of the considerations leading to the decision to electrify this portion of the St. Paul was the favorable results secured from the electrification of the Butte, Anaconda & Pacific, which parallels the St. Paul west from Butte for a short distance. As described by J. B. Cox in the *Railway Age Gazette* of December 25, 1914, the first year's electric operation of this line showed an increase of 33 per cent in the average train load and a saving in operating expenses equal to 20 per cent return on the investment.

Such savings are brought about in large measure by the high cost of coal and the cheapness of electric power. The St. Paul secures the coal used in this district from company mines located

will be inspected at Three Forks and Alberton and bad-order cars set out, the delays at these points will be small compared with present methods of operation, while it will be necessary to maintain only a few men at these points. At Harlowton, Deer Lodge and Avery, the engines will be inspected, but they will be sent through the shop only after they have made about 2,000 miles.

Another feature of special interest is the regenerative system of operation of the electric locomotives by which the surplus energy not required to hold the trains on the descending grades will be returned to the line for further use. By this means not only will there be added safety on the heavy grades, as the regular air brake equipment will be held in reserve for emergency use, but the excessive wear on wheels and brake shoes will be eliminated. Of secondary importance is the returning of the surplus power to the line, affording a material saving in power consumption, the arrangement with the power company providing that the railroad is given credit for all energy returned.

The Piedmont Substation and Bungalows

on its line at Roundup, Mont., 70 miles east of Harlowton, giving an average haul over this zone of 300 miles. This coal costs an average of \$2.75 per ton at the point of use. It also provides about 1,000 tons of westbound traffic daily, although this is not as serious as might be supposed, as it is in the direc-

While the amount of power so returned can only be estimated within wide limits and will depend on the distribution of trains and other conditions, it has been estimated that 15 per cent to 18 per cent should be recovered in this way. The speeds of trains descending grades will not be fixed arbitrarily, but

will instead be left in the control of the engineer within broad limits.

Another original and interesting feature is the power limiting and indicating system which is being installed, by which the speeds of trains and the amount of power consumed will be fixed by the load despatcher. In this way, to avoid excessive peak loads, the despatcher can limit the amount of power taken by any train, assisting passenger and other preferred trains and holding back secondary trains. As far as practicable trains will also be so spaced that a descending train will be returning power to the line when others are ascending.

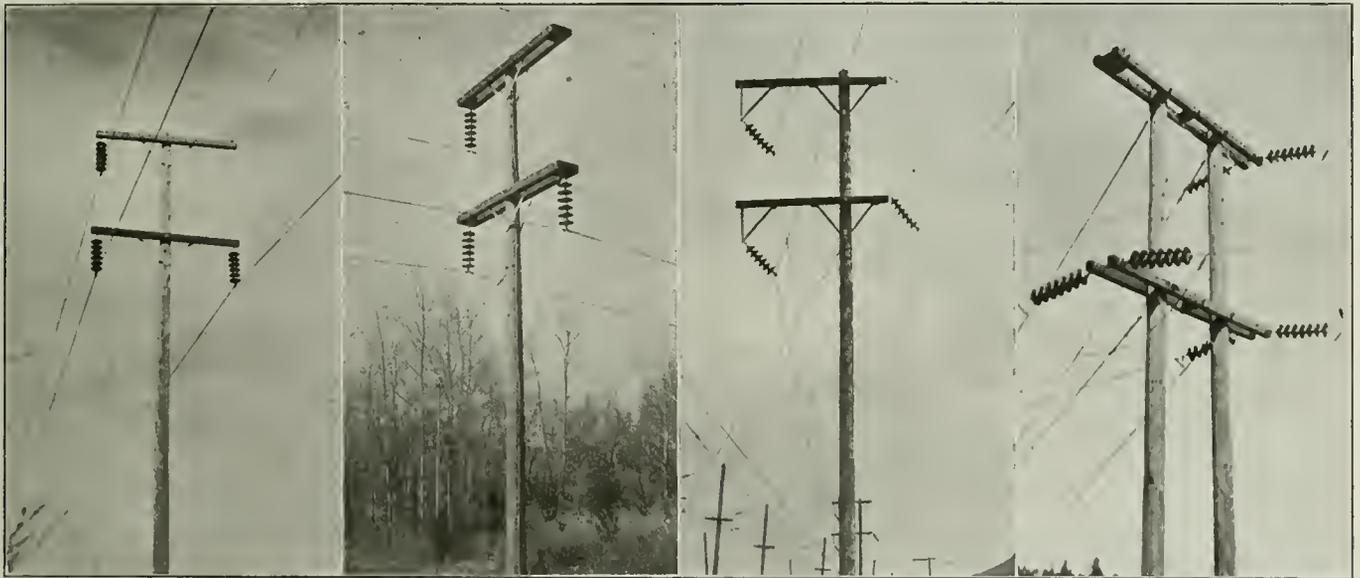

THE POWER SUPPLY

Power is secured from the Montana Power Company and is delivered by this company at the right of way at substations located at Two Dot, Josephine, Piedmont, Janney, Morel, Gold Creek and East Portal. With the exception of that delivered at East Portal, all power comes from the hydro-electric developments at Great Falls, the road lying roughly in the arc of a circle

sumption. They are located at Two Dot, Summit, Josephine, Eustis, Piedmont, Janney, Morel, Gold Creek, Ravenna, Primrose, Tarkio, Drexel, East Portal and Avery. In all cases the points of delivery of energy by the power company are at substations to permit one attendant to operate the switches on both lines.

The substation buildings are of permanent construction throughout, with concrete foundations, brick walls and concrete roofs carried on steel purlins and roof trusses. To provide proper ventilation for the motor generator sets, the foundations for this equipment are arched with a basement underneath and openings in the exterior walls for air inlets. The supply of air is controlled by steel sash operated as butterfly valves. All sash in the main buildings are also of steel and are controlled by chains or rods.

The floors are of concrete and contain conduits carrying power transmission lines to the various equipment units. The only conduits exposed to view are those for building lighting and those leading to the outside feeder system. A standard gage

Standard Transmission Line Construction (1) on Tangent with 300-ft. Spans. (2) On Tangent with Spans of 450 Feet. (3) On Curves up to 10 Degrees. (4) On Curves Between 10 Degrees and 30 Degrees

of a radius of about 100 miles, with Great Falls as the center. The power delivered at East Portal is generated at Thompson Falls, a relatively recent development. The power plants developed and proposed by this company have a total capacity of 244,000 hp., while large storage reservoirs are in service, insuring an ample continuous supply of power. By this arrangement, the railroad secures power without the necessity of making the large initial investment which would otherwise be required, while, by combining this with its large commercial load, the power company is able to sell the power cheaper than if it all went to the railroad.

This power is brought to the right of way as 100,000-volt, 3-phase, 60-cycle alternating current. To deliver it at the required places it was necessary to construct 100 miles of transmission line to reach Two Dot, 54 miles to reach Josephine, and 135 miles to reach Morel. In the vicinity of Butte, power was secured by tapping existing lines. These new lines consist of two 45-ft. wooden poles spaced 10 ft. 6 in. apart, and supporting a wooden cross arm 22 ft. long. Three transmission wires are supported from this cross arm by suspension insulators, one between the two poles and one near each end. Twelve of these supports were built per mile.

THE SUBSTATIONS

Fourteen substations are being built between Harlowton and Avery. They are spaced an average distance of 33 miles apart, the exact locations depending on the grades and the power con-

track is built in the floor on which will be operated a steel car or truck to transfer heavy equipment from one part of the building to another. A steel turntable is also being installed.

The roof consists of reinforced concrete slabs 3 in. thick supported on steel trusses and covered with a five-ply tar and gravel roof. All substations are built with flat roofs except those at Drexel, East Portal and Avery, which are provided with pitched roofs because of the very heavy snowfall in the Bitter Root mountains. Otherwise they are of the same construction as the other stations except that the horn gaps for the lightning arresters are placed indoors, increasing the size of the buildings somewhat.

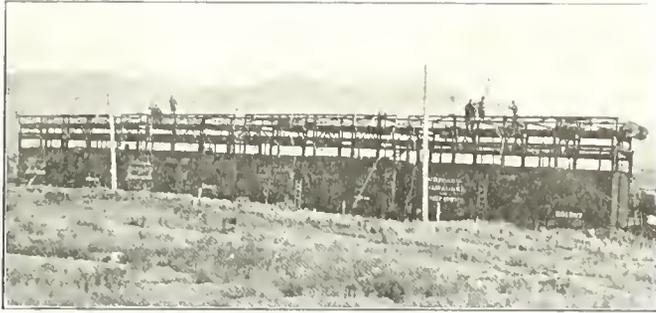

The substations are divided into two rooms, the motor generator or low tension room, and the transformer or high tension room. The partition is of brick, with two tin-clad doors for protection. One corner of the motor generator room is partitioned off and, with a bay built onto the building, forms the office. The interior walls are painted white above a green wainscot five feet high. All doors, sash and other exposed steel, conduits and substation equipment are painted black.

At the substations the 100,000-volt, 60-cycle, 3-phase alternating current is converted to 3,000-volt direct current. On delivery at the substations this 100,000 volt current passes through oil switches to the high tension bus, from which it is conducted through further oil switches to the transformers, emerging at 2,300 volts a.c. The current is then led through suitable

switches to the motor generator sets, leaving at 3,000 volts d.c., and passing through control switches on the switchboard to the feeder system at this potential.

The transformers are rated 1,900 and 2,500 k.v.a. and are provided with four 2 1/2 per cent voltage taps and 50 per cent motor starting taps.

In the standard station the motor generator sets comprise a 60 cycle synchronous motor, driving two 1,500-volt d.c. generators connected permanently in series for 3,000 volts. The fields of both the synchronous motors and the direct current generators are separately excited by small generators direct connected to each end of the motor generator shaft. The direct current

Erecting the Overhead Work

generators are compound wound and will maintain constant potential up to 150 per cent overload with a capacity for momentary overloads up to three times their normal rating. To insure good commutation on these overloads, the generators are equipped with commutation poles and compensating pole face windings. The synchronous motors will also be used as synchronous condensers and it is expected that the transmission line voltage can be regulated in this way so as to eliminate any effect of the fluctuating load.

The transformers weigh 28 tons and the motor generator sets 66 tons. They are assembled in units of a maximum weight of 10 tons each to permit handling readily. A hand-operated traveling crane in the motor generator room and a triple chain block hoist in the transformer room, each with a capacity of 10 tons, are installed to handle the equipment.

The substation at East Portal has a transformer room 30 ft. by 170 ft. and a motor generator room 40 ft. by 77 ft., with the ridge of roof 55 ft. above the ground. The two unit substations have transformer rooms 30 ft. by 87 ft., and motor generator rooms 40 ft. by 60 ft., while the three-unit substations have transformer rooms 30 ft. by 101 ft., and motor generator rooms 40 ft. by 77 ft. The height of roof of the flat top buildings is about 45 ft.

The source of water supply at the substations varies with the local conditions and includes deep wells, springs and streams. To insure adequate pressure, underground steel pneumatic tanks are installed, with electrically-driven pumps equipped with auxiliary air pumps. These pumps are automatic, starting and stopping at given pressures.

Special attention has been given to the provision of attractive bungalows and surroundings at the more or less isolated locations of the substations to make the living conditions of the operators as good as possible. To this end one four-room and one five-room bungalow of attractive design have been built at each substation as homes for the operators. These buildings are equipped with electric lights and running water. Each station layout is designed and painted differently to give it individuality.

THE TRANSMISSION LINE

The power distribution system includes the transmission line, the positive or outgoing feeder system, the overhead contact system and the negative or return system. A 100,000-volt transmission line, entirely independent of the power company's line, extends from Two Dot to Morel and from Gold Creek to Avery. In general, this line is located on the right of way, although it leaves it at numerous places where distance can be saved, and it passes over the summits of all tunnels. Disconnecting switches are placed in the line on each side of each substation, permitting power to be taken from either direction and providing relief from break-ins or trouble on any individual section of the line.

The construction of a 100,000-volt line along a right of way on which there are telegraph and telephone lines involves special problems in itself, the telephone being used for despatching purposes and the telegraph for commercial business. To reduce the interference as much as possible, the transmission line is

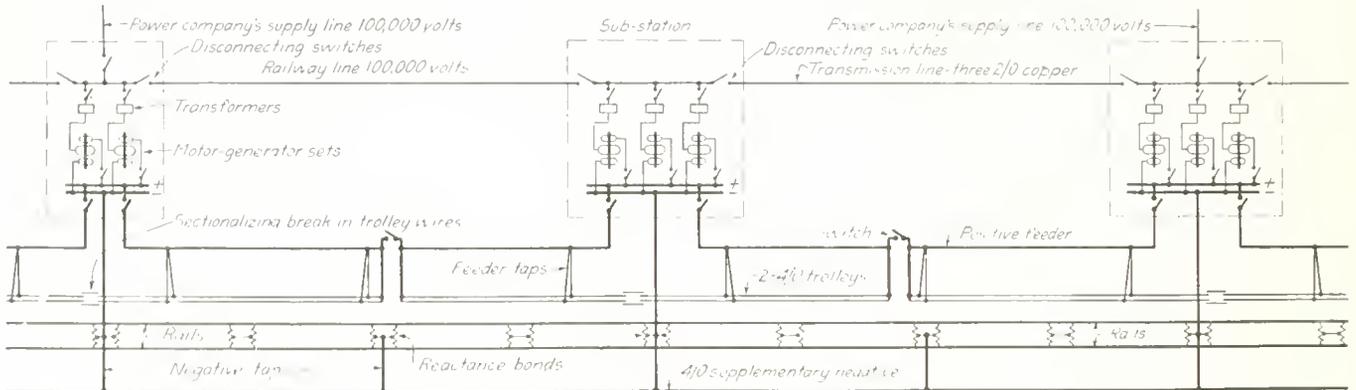

Diagram Showing the Transmission and Distribution System

Because of the difference in power demands, the generating equipment varies somewhat. At Piedmont and Janney three 1,500 kw. motor generator sets have been installed, while at all other stations between Harlowton and Deer Lodge two 2,000 kw. motor generator set are being installed. At East Portal, near the western end, the largest substation will be built, containing three 2,000 kw. motor generator sets. This station will also receive two taps from the power company's transmission line, while provision will be made for a future second transmission line belonging to the railway company westward as a precautionary measure, because of the heavy snowfall in this vicinity.

located on the side of the track opposite the other lines and near the right of way fence. At points where the telegraph lines formerly crossed over the track, they are placed underground to prevent physical contact with the transmission line under any conditions. Where the transmission line crosses the telegraph line, it is strengthened to give it a greater factor of safety.

The transmission line is built with Idaho cedar poles 45 ft. and 50 ft. long, with a minimum diameter at the top of 8 in. The cross-arms are of Washington fir and are 4 3/4 in. by 5 3/4 in. in cross section. For tangent work braces of 1/4 in. by 2 in. galvanized steel are added. Three conductor wires are carried, each

consisting of six strands of copper with a hemp core. The copper is 0.15 in. in diameter and the completed conductor 0.45 in. The hemp core is saturated with a preservative compound, making it impervious to moisture, and is used to increase the size of the conductor. The standard distance between poles on tangents on level ground is 300 ft. Where the length of the individual wires supported by a pole is 450 ft. and over, double cross-arms are used as shown in one of the photographs. In marshy ground or where the poles are exposed to side wash, they are guyed and banked with rock.

For curve and angle work where the angle does not exceed 10 deg., the cross-arms are offset to provide the desired clearance between the wire and the pole and they are more heavily braced. For angles between 10 deg. and 30 deg. a two-pole structure heavily guyed and fitted with double arms and insulators is used, supporting the transmission wires at the level of the cross-arms.

The standard suspension insulator with six discs is employed, this type requiring 340,000 volts to arc over it when dry and 250,000 volts when wet. At anchorage and heavy strain points an insulator with seven additional discs is used for further protection.

In addition to the one conductor wire the upper cross-arm carries an uninsulated ground wire of $\frac{3}{8}$ -in. Siemens Martin steel strand, grounded at every pole with a wire of the same size. This is provided as additional protection from lightning, both for the line insulators and the substation equipment.

THE FEEDER AND TROLLEY CONSTRUCTION

The outgoing feeder system consists of one or two lines of standard bare copper cable of either 13/16 in. or 1 in. diameter. For the greater part of the distance a single line of the smaller cable is used, but on the heavier grades two feeders are required. The feeder is connected with the trolley wire at intervals of 1,000 ft. by bare 9/16 in. copper strand cable, as shown in one of the photographs.

Disconnecting switches are inserted in the feeder line on each side of each substation. Sectionalizing switches are also in-

tion complete instructions will be issued to all employees concerned, instructing them regarding the purpose and manner of using these switches.

The feeder system is carried on the common pole line with the trolley system. The poles are of Idaho cedar 40 ft. long and 8 in. minimum diameter at the top. They are spaced 150 ft. apart on tangents, the spacing decreasing in multiples of 15 ft. on curves to a minimum of 90 ft. They are set on an outward batter of $\frac{1}{2}$ in. to 1 ft. on tangents and slightly more on curves. Special forms of pole construction were adopted on the numerous bridges on this line as shown in the accompanying photographs. On through girder structures, the poles rest on

Standard Trolley Construction—Trolley Construction on Tangents with Feeder Tap (left); "Pull Overs" on a Heavy Curve (center); Steady Braces and Feeder Tap on Light Curve (right)

two angles placed back to back outside the girder. The base is held in place by a U-bolt passing around it and bolted to a short angle which is in turn riveted to the other angles. Another U-bolt near the top of the girder holds the pole in position. On deck girders the poles are supported by brackets framed of angle irons with U-bolt connections at the top and bottom. On pile trestles two 3-in. by 12-in. timbers are bolted

Overhead Construction for Two Tracks (left); Overhead Construction in Three Forks Yard (right)

stalled beyond the outlying switches at each yard and passing track, and at each end of all long tunnels, enabling any section of the line to be cut out at the time of a derailment, or for any other reason, without disturbing operation beyond the adjacent stations. Likewise, in case of an accident damaging both the track and trolley line, any section of the line can be "killed" and repair work conducted simultaneous with that on the track. These sectionalizing switches are mounted high on the trolley pole, removing all "live" parts from the operator, while the operating handle is placed about five feet above the ground and is locked with a switchlock, making it accessible to any properly authorized employee. Shortly before a district is placed in opera-

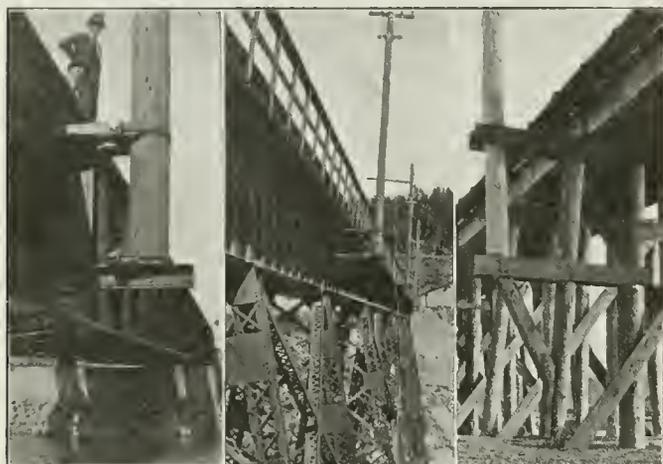

tion to the two piles at one side of a bent, projecting beyond the bent and supported at the outer end by knee braces. The pole rests on this and is held in place by a second set of 3-in. by 12-in. timbers projecting beyond the pile cap and bolted through the pole.

A cross-arm of Washington fir $3\frac{3}{4}$ in. by $4\frac{3}{4}$ in. in cross section carries the feeder wires. The messenger and trolley wires are supported by a bracket arm consisting of a $2\frac{1}{2}$ -in. by $2\frac{1}{2}$ -in. by $5/16$ -in. tee iron with a $5/8$ -in. truss rod extending from a connection near the outer end to the top of the pole.

The overhead contact system consists of the messenger and trolley wires, both of which are anchored at intervals of a

mile. The messenger wire is a seven-strand galvanized steel cable $\frac{1}{2}$ in. in diameter, supported directly from the bracket arms. The trolley system is unusual in that two 4/0 copper contact wires are provided, both of which are supported at intervals of 15 ft. from the messenger wire by hangers, spaced $7\frac{1}{2}$ ft. apart and supporting the two trolley wires alternately at an elevation of 24 ft. 2 in. above the top of rail. This form of construction with two wires, one of which is always flexible, permits the collection of heavy current with the current collector without sparking or excessive heating under the two extremes of heavy current consumption and high speed. Only one trolley wire is provided for yard and side tracks.

On curves up to six degrees and on curve easements steady braces are placed on each bracket arm to pull the trolley wires over, as shown in one of the photographs. On curves sharper than this a "backbone" consisting of a galvanized steel strand extends from pole to pole with "pull-offs" connecting with the messenger and trolley wires. The number of "pull-offs" depends on the degree of curve.

Special Construction on Through Girder Bridges (left); Steel Viaducts (center); Pile Trestles (right)

A special form of construction is provided in tunnels. Two suspension insulators attached to the roof of the tunnel 28 in. apart support a 3-in. 4-lb. inverted channel which carries the messenger wire and the two feeder wires spaced 6 in. at each side.

Where there is more than one track two-pole span construction is used. The maximum number of tracks spanned is nine in Deer Lodge yard. In yards the cross catenary span supports an intermediate or "steady" span which in turn supports the messenger wire. It is not designed to relieve the cross catenary of any load but is adopted simply to steady the messenger wire.

The negative or return system consists of the track rails and an auxiliary ground wire. The track rails are bonded with $\frac{5}{8}$ -in. copper bonds placed either under or outside the angle bars, depending on the type of joint in use. The return ground wire consists of a $\frac{1}{2}$ -in. copper cable carried on the top of the trolley poles without insulators. It is connected to the rails at every second signal station. In addition to providing protection for trackmen, this ground wire, located above the trolley, feeder and signal wires, affords effective protection from lightning for all these circuits and eliminates the necessity for lightning arresters for the first two. At tunnels the ground wire is hung from the side wall about six feet above the track.

THE LOCOMOTIVES

At the present time 43 locomotives have been ordered, the first of which are now being delivered. These locomotives are the first to be built for so high a potential as 3,000 volts d. c. The passenger and freight locomotives are similar in all respects

except that the former have a gear ratio permitting the hauling of a trailing load of 800 tons at 60 miles per hour. The passenger locomotives are also provided with oil-fired steam-heating outfits for the heating of the trains. The interchangeability of parts for these freight and passenger locomotives will be of material assistance in the maintenance of this equipment.

The cab consists of two sections each approximately 52 ft.

A Sectionalizing Switch Beyond the End of a Passing Track

long. The outer end of each section contains a compartment for the engineer and helper and the remainder is occupied by the equipment. The engineer's compartment is double lined, with hair felt insulation, while a 3,000-volt heater driven by a small motor removes the cold air from the floor. Each locomotive carries eight motors, each with a normal one-hour rating of 430 hp. and a continuous rating of 375 hp. or a total continuous rating of 3,000 hp. With a 30-per cent co-efficient of friction the tractive effort available for starting trains is approximately 135,600 lb. Each motor is twin-gearred to its driving axle, a pinion being mounted on each end of the armature shaft. The rim of the gear is mounted in such a way that its relation with the spider is fixed by springs, allowing flexibility between the two. The motor is of the commutating pole type with openings for forced ventilation provided by a motor-driven

blower in the cab. Each locomotive is equipped with a speed recorder and with flange oilers provided with an electric heater. The headlight is of the incandescant type with a 30-volt, 150-watt lamp. Each locomotive is also provided with a watt-hour meter showing the amount of power consumed at any time, which will be of value in figuring the cost of moving any particular train or class of traffic. Each half of the locomotive is equipped with an air compressor working against a pressure of 135 lb. in the main reservoir. Each compressor has a capacity sufficient to hold an ordinary train on these grades.

The passenger locomotives are designed to haul 800 tons on all grades up to two per cent and will maintain the present schedule with 650 tons. With trains heavier than this or on grades of two per cent, a second locomotive will be added. They are expected to handle such trains at a minimum speed of 30 miles an hour, while the maximum allowable speed is 60 miles per hour. The speed down the heavy grades is limited to 25 miles an hour by the operating rules of the road. Short local passenger trains will be operated by single units or half locomotives. In descending grades, the passenger locomotives are so arranged that one-half may be returning power to the line while the second unit will provide lights for the train or charge

Total length of locomotive.....	112 ft.
Rigid wheel base.....	10 ft. 6 in.
Voltage	3,000 d.c.
Voltage per motor.....	1,500 d.c.
Horsepower rating, one hour, each motor.....	430
Horsepower rating, continuous, each motor.....	375
Horsepower rating, one hour, complete locomotive.....	3,440
Horsepower rating, continuous, complete locomotive.....	3,000
Trailing load capacity, 2 per cent grade.....	1,250 tons
Trailing load capacity, 1 per cent grade.....	2,500 tons
Approximate speed at these loads and grades.....	16 m.p.h.

This electrification has necessitated the changing over of the present automatic signals to alternating current. These signals now extend from Three Forks to Lennep, 78 miles, from Piedmont to Butte, 37 miles, and from St. Regis to Hagan, 19 miles. Additional signals are now authorized between Butte and Finlen, 13 miles. These are being built not alone to eliminate electrical interference, but also to improve the view of the signals by placing them lower and in new locations.

This installation is being made under the direction of C. A. Goodnow, assistant to the president, and R. Beeuwkes, electrical engineer of the St. Paul. The General Electric Co., Schenectady, N. Y., is building all equipment. The Montana Power Company is the contractor for the construction of the transmission and trolley lines and for the installation of the substation equip-

One of the Electric Locomotives

the storage batteries. These functions are interchangeable and under the control of the engineer.

The freight locomotives are designed to haul 2,500 tons trailing on one per cent grades at a speed of 16.8 miles per hour. On all other grades in this line a second locomotive will enable trains of the same weight to be handled. The maximum speed of the freight locomotives is 30 miles per hour, while freight trains are limited to 15 miles per hour descending the heavy grades.

Six electric locomotives will be assigned to helper service on the Rocky Mountain division. With the original installation on this division, switching service will demand one electric locomotive each at Three Forks, Butte and Deer Lodge. With the completion of the work to Avery an additional switching locomotive will be required at Alberton. Special facilities will be provided at Deer Lodge for the maintenance of the electrical equipment.

The general characteristics of the locomotives are given below:

Total weight	284 tons
Weight on drivers.....	226 tons
Weight on each guiding truck.....	58 tons
Number of driving axles.....	8
Number of motors.....	8

ment. All building work is being done by company forces. The work on the first district was started in June, 1914, but was suspended nearly all summer by labor disturbances, so that it really began about a year ago.

THE ENGLISH RAILWAYMEN'S WAGES QUESTION.—The question of a proposed increase of wages in substitution for the war bonus granted to railwaymen in February last has been under discussion by the executive committee of the National Union of Railwaymen, which has forwarded a request to the railway companies to receive a deputation on the matter. The railway companies have now before them the men's request for an advance of wages and also for a joint conference on the question, but no definite arrangements in either respect have yet been concluded. Meanwhile, the executive committee of the National Union of Railwaymen have strongly deprecated any precipitate ill-advised or sectional strike in this hour of national crisis. A railway conciliation board meeting at Cardiff has satisfactorily settled the dispute of the Taff Vale engine drivers and firemen over reductions in grade and pay, which at one time threatened to give rise to considerable trouble.—*Railway Gazette, London.*

ANNUAL REPORT OF THE RAILWAYS OF THE UNITED KINGDOM

The commercial department of the British Board of Trade has given out the following report of the railways of the United Kingdom, for the calendar year 1914, with comparative figures for the previous year. It is stated that on account of the war, no further statistics for the year will be published:

SUMMARY FOR THE YEAR 1914, WITH COMPARATIVE FIGURES FOR 1913.		
MILEAGE OF LINES OPEN FOR TRAFFIC.	1914.	1913.
Running lines:	Miles.	Miles.
First track	23,701	23,691
Second track	13,403	13,392
Third track	1,648	1,619
Fourth track	1,277	1,254
Over four tracks reduced to single track	706	700
Sidings reduced to single track.....	14,928	14,749
Total of single track, including sidings	55,663	55,405
AUTHORIZED CAPITAL.		
Shares and stock.....	\$5,046,016,500†	\$4,885,481,250
Loans and debenture stocks.....	1,989,110,520	1,979,521,740
Total	\$7,035,127,020†	\$6,865,002,720
PAID-UP CAPITAL. (The figures preceded by (*) show the nominal additions to capital included in the figures above.)		
Ordinary	\$2,399,824,260	\$2,396,291,040
Preferential	*453,520,620	*451,134,360
Guaranteed	173,990,430	1,724,308,560

Total	1,711,536,480	1,699,605,180
	*216,517,860	*216,513,000
Total	\$6,518,338,920	\$6,483,293,460
	*968,026,580	*965,784,060
ENGINE MILEAGE.		
Train-miles, including empty trains run for traffic purposes on either the forward or the return journey:	Miles.	Miles.
Coaching (passenger)	273,659,000	273,495,000
Goods	156,007,000	161,684,000
Mixed	666,000	672,000
Total	430,332,000	435,851,000
Shunting miles:		
Coaching (passenger)	18,910,000	18,665,000
Goods	116,110,000	119,142,000
Mixed	59,000	58,000
Total	135,079,000	137,865,000
Other miles (assisting, light, &c.).....	55,828,000	54,608,000
Total engine miles.....	621,239,000	628,324,000
REVENUE RECEIPTS AND EXPENDITURE.		
Total receipts (including miscellaneous net receipts)	\$676,016,280††	\$677,731,860
Expenditure	428,520,780	424,375,200
NET INCOME	\$247,495,500	\$253,356,660

†Including nominal additions to the amount of \$142,470,900 which were excluded from the total for 1913.

††Including the estimated amount receivable by the Companies, under agreement with the Government, in respect of the control of British railways during the period from August 5 to December 31.

RAILWAY CONSTRUCTION IN BRITISH SOUTH AFRICA.—The fact that a passenger may now enter a compartment at Johannesburg Station and alight at Walvis Bay without change is indicative of the transportation enterprise and expedition which have been taking place in the last few months on the southwest border of the Cape and in the territory lately held by the Germans. In the course of one of the numerous speeches which General Botha has been making recently, he stated that the total number of miles of railway construction since Union until the end of July, 1915, was 1,449, while another 950 miles would be ready at the end of this year.

ELECTRIFICATION IN SICILY.—A Milan syndicate has submitted to the Italian Government a scheme for the electrification of the light railways on the Island of Sicily, the total length of which is about 625 miles. According to the project, the necessary current would be taken from the generating station of the Societa Elettrica della Sicilia Orientale, and converted from three-phase to single-phase current at 50,000 volts at a large converting station to be established at Nicosia. Fourteen transformer and distributing stations would also be established along the railways, where the voltage would be transformed to a working pressure of 11,000 volts.

CHILLED IRON WHEELS

The Association of Manufacturers of Chilled Iron Wheels met in New York on October 12. In addressing the meeting George W. Lyndon said in part:

It is gratifying to know that the chilled iron wheel has not only been able to maintain itself as the wheel standard of the United States and Canada, but it is beginning to supplant the European standards, as evidenced by the fact that several manufacturers of this association are supplying chilled iron wheels in large quantities to the French and Russian governments.

That our flange recommendations are in the line of improvement is fully demonstrated by the fact that we have at the present time over one-half million wheels running that are finding their way through the present track construction without any complaints. The flange used on special wheels is 3/32 in. thicker than the M. C. B. flange and the flange as shown in our final argument is 3/16 in. thicker at the gaging point than the M. C. B. flange.

It is our purpose to have a sufficient amount of metal in reserve in order to enable us to design a chilled iron wheel of 950 lb., or heavier; in other words, we are building for the future. We do not want the limits of the possibilities of the chilled iron wheel confined by the limitations of flange design. We want no unreasonable restrictions in the use of the chilled iron wheel.

In March of this year we submitted to the chairman of the wheel committee of the M. C. B. Association a new set of standard specifications recommending the following:

650 lb. wheel—brake pressure.....19,000 lb.
750 lb. wheel—brake pressure.....32,200 lb.
850 lb. wheel—brake pressure.....40,000 lb.

and detailed drawings of M. C. B. types of wheels and arch plate type of wheels.

There is absolutely no limit of weight in the case of steel wheels, but when it comes to a design of chilled iron wheels, all sorts of restrictions follow. We all know what an additional 25 lb. of iron will do to any of the standard M. C. B. wheels in the matter of drop and thermal test, and the proof of this is manifest in our 625 lb. M. C. B. pattern which we were enabled to re-design in the year of 1909 by the additional allowance of only 10 lb. of metal.

There are some tests which would establish the chilled iron wheel on a much firmer basis and I believe would be advantageous to all manufacturers. The tests that I refer to are comparative tests of the chilled iron wheel and the steel wheel.

1: Relative wearing values when rotating on a steel rail under various loads, the tread wear and flange wear to be observed separately.

2: Abrasion of rail under various conditions of loading.

3: Determination of the intensity of heating stresses in all parts of the chilled iron wheel, namely, single plate, intersection of plates, front plate, back plate, brackets, etc.

4: Analysis of the thermal test. Intensity of stresses in various parts of the wheel, and effect of thickening the thermal ring, increasing and decreasing the temperature of the iron, etc. The thermal test should be made an intelligent one instead of the present crude affair that is supposedly alike for all weights of wheels.

5: Determination of stresses in the hub and plates of the chilled iron wheel due to pressing on axles. Variation in stresses due to various classes of machining.

COAL AND IRON IN NEW SOUTH WALES.—The total quantity of coal raised in New South Wales to the end of 1914 is estimated at 202,400,767 tons, valued at \$380,000,000. The output for the year 1914 amounted to 10,390,622 tons, valued at \$18,500,000. The coal exported during the year amounted to 5,868,033 tons, valued at \$15,750,000. The quantity of pig-iron made in the State during 1914 from native ores was 75,150 tons, the value of which is estimated at \$1,250,000.

Annual Meeting of Railway Fire Protection Association

Abstracts of Papers and Committee Reports on Various Methods of Fire Prevention and Fire Protection

The second annual meeting of the Railway Fire Protection Association was held in the Hotel La Salle, Chicago, on October 5, 6 and 7, with 125 members and guests in attendance. President F. H. Elmore, superintendent of insurance of the Southern Railway, presided, and in his president's address spoke of the enlarging field of the association, and referred to the possibility of the establishment of uniform standards of railroad fire prevention with the association as the authority for the best ideas and methods.

ADDRESS BY T. C. POWELL

T. C. Powell, vice-president of the Queen & Crescent, delivered an address on the importance of fire prevention work, outlining the results of work of this kind on the Cincinnati, New Orleans & Texas Pacific. After the management had been confronted with the fact that the fire losses were increasing and the insurance premiums advancing, it concluded in 1908 a contract for periodical inspection of the entire property. The beneficial effects were shown by the fact that whereas for the three years preceding the contract, the average fire losses were over \$23,000 per annum, the average for the next two years was less than \$6,000. In the fiscal year 1913 the fire loss was less than \$3,000, the lowest for 16 years. Comparing the period during which the road did not have expert insurance inspection, but depended upon general instructions to guard against fire, with that during which it had the benefit of such inspection, Mr. Powell showed that from November, 1902, to June, 1908, \$111,495 was paid in premiums, and the insurance companies paid on account of fire losses, \$1,717,926, whereas during the period from June, 1908, to June, 1915, inclusive, the company paid in premiums \$89,639, while the insurance companies paid on account of fire losses, only \$44,750, and by reason of the close inspection the total premium for the year just concluded is less than 60 per cent of what it was 10 years ago, although the property value has increased more than 60 per cent.

The bridge and building department is required to submit to the insurance inspector plans for all buildings erected or additions to or changes in existing buildings, on the theory that if an ounce of prevention is worth a pound of cure, an ounce will go further and be more effective if applied at the beginning.

Abstracts of the committee reports are as follows:

RULES FOR PREVENTION OF FIRES AND PROTECTION OF PROPERTY

The committee on rules for prevention of fires and protection of property submitted a report of which the following is an abstract:

The committee deemed it advisable to make the rules of such a general character that they would apply to and be acceptable by all railroads and deal with hazards that are common to all.

It is believed that the all-important question relating to rules is their enforcement, and we believe this can best be accomplished by securing the fullest co-operation of all departments of the railroad service. Insurance department managers and their inspection forces should work closely with the operating heads in studying the economic side of the waste from fire, and this will most likely lead to a united effort to find the remedy and its application.

Especial heed has been paid to the suggestion of our executive committee, in giving consideration to the causes of fires, in the preparation of these rules. It is our conclusion that the chief causes are carelessness and ignorance, although it is also recognized that the transportation business is attended by hazards that are peculiar thereto. Therefore, these are the hazards that have received most careful consideration at the hands of this committee.

As to the form in which the rules are to be placed before those by whom they are to be observed, it has been found that the most common practice followed by railroads is to print them in bold type on heavy cardboard and post them conspicuously about the premises, and this practical method we recommend in order to best reach the masses of employees. It is also considered most advisable that the language be mandatory, rather than suggestive.

In the preparation of these rules, in view of the close relationship existing between the terms fire protection and fire prevention, it was not deemed advisable to make an attempt to divide them.

To our minds fire prevention deals mainly with arrangement and construction of buildings and the guarding of hazards. Good housekeeping methods should be so emphasized under authority as to enforce a strict compliance. It is the feeling of this committee that too much stress cannot be put upon the importance of looking out for those things that will prevent fires. It should be indelibly impressed upon the mind of every employee that it is his duty to conserve the property by elimination of the fire waste just as it is to prevent destruction by any other agency. It is urged that an active campaign be carried on at all times by the individual roads with a view of ever keeping this subject before the men employed in every branch of the service. This can probably best be done by the issuing of circulars or bulletins from time to time by executives, worded in such a manner as to forcibly call attention to these subjects.

The task of creating sentiment in favor of fire prevention is no small one, inasmuch as it calls for a breaking away from habits or practices that have grown to be a custom on account of their long standing. For instance, take that of smoking in and around stations by employees and patrons; these people, as a rule, have a feeling that the prohibition of this privilege is a serious interference with their personal liberty, and that such a rule should not be inflicted upon them. Nevertheless, it is true that many fires have their origin from this very source.

Like the movement for "safety first," it must be shown that those who are called upon to take these precautions are to become beneficiaries in part, at least. It should be clearly pointed out that conservation of property and preservation of life are the things we are striving after. A good point, and one that often carries the argument home to most men in the rank and file is, that lack of employment and consequent financial loss to them invariably follows in case of destruction of facilities.

In this connection we commend to the most careful consideration of members of this association the various bulletins issued last year by the Committee on Hazards—particularly Bulletin No. 1, dealing with care of the property.

In its broadest sense fire protection has a threefold significance and embraces: (1) The means of safeguarding or abolishing causes which originate fires; (2) the provision of means which may confine fire to the space in which it originates, and (3) the adequate means of fire extinguishment.

If it were safe to foster the doctrine that fire protection only has to do with the putting out of fire, it would be a comparatively simple matter to formulate rules under this head. It is considered advisable, however, that the word "protection" be accepted and dealt with in the broadest sense. The necessary means of fire extinguishment, always in readiness for effective service, is the final reserve relied upon when oversight or opportunity to prevent the hazard from starting fire has failed.

In every branch of endeavor, changes are continually taking

place which call for the most careful and thorough study on the part of fire protection engineers in taking care of increased, or entirely new, hazards that continually present themselves. The thought which should be ever present with those in charge of terminals and shop property is that the fire protection must keep pace with the growth and importance of the properties. It too often happens that terminals, shop and other properties are extended and enlarged without a corresponding increase in the fire-fighting facilities. The result is inevitable, for when the conflagration comes, it is soon found that the small quantity of hose, the limited number of hydrants and lack of water spell not only "oversight," but "disaster" as well.

For consideration at the next annual meeting, the committee submitted a draft of 24 rules, which are to be considered as a working basis only and which are to be amplified to meet local conditions by the individual members:

The report is signed by Robert Scott (A. C. L.), chairman; G. L. Ball (A. T. & S. F.); J. S. Rockwell (B. R. & P.); C. N. Rambo (N. & W.); W. T. Witter (So.).

COALING STATIONS

The Committee on Fire Prevention and Protection at Coaling Stations, A. D. Brooks, Illinois Central, chairman, submitted a report classifying coaling stations, describing the construction of the principal types in use, with methods of operation and their hazards, showing how to protect them, how to prevent fires in them, and comparing the life and cost of concrete, metal and wooden stations.

GRAIN ELEVATORS

The Committee on Fire Prevention and Protection in Grain Elevators submitted specifications for the construction of various classes of elevators and their apparatus with a view to eliminating fire hazards, followed by a general discussion of methods of prevention and protection.

COTTON HAZARDS

The Committee on Cotton Hazards, E. B. Berry, Southern, chairman, submitted a report outlining the conditions pertaining to the handling and transportation of cotton and the liability of the railroad for damage to cotton while in its possession. The report also discussed the various classes of hazards for the different kinds of cotton and submitted for the consideration of the association a series of recommended rules for fire prevention in the transportation of cotton. The committee also described some tests of a method of fireproofing cotton bales conducted by the Cotton Protective Company in April, under the supervision of the Oklahoma Fire Prevention Bureau. This consists of dipping the cotton bales in a chemical solution and is intended not only to fireproof the cotton, but to protect it against other kinds of damage. A bale of cotton which had been so treated was brought into the room and lighted matches, cigarettes and cigars were placed on the exposed surface of the cotton with no effect except a slight singeing or charring of the surface. It was stated that under this method of treatment cotton can be dipped and loaded for shipment within an hour, and it is claimed that it can be moved on flat cars as safely as in box cars. The Southeastern Underwriters' Association has offered a reduction in the insurance rates on treated cotton. The committee expressed the opinion that all cotton-carrying lines should co-operate and lend their support to this new treatment, not only for the purpose of reducing fire waste, but the prevention of country damage and dry rot.

OIL BURNING APPLIANCES

The Committee on Oil Burning Appliances, J. S. Richards, Sunset Central Lines, chairman, submitted a set of rules and requirements for the storage and use of fuel oil and for the construction and installation of oil burning equipment, accompanied by a series of plates showing how a safe fuel oil installation can be made. The committee reported that it had been in correspondence with the various railroads with a view to finding

just what practices were in effect, and what appliances were being used by the different roads. Particular attention was paid to the manner of installation of the various devices, as well as to the methods adopted in operation relative to the increased fire hazard due to the presence of oil burning appliances in and around various shops. The general rule, particularly in the installation of the oil burning devices, seems to be from the standpoint of economy rather than to minimize the extra hazards created through the use of oil as a fuel, as nearly all of the devices examined were home-made and constructed along the ground lines of those found on the market. There seems to be no set rule in effect governing the size or capacity of the regulating valve, which constitutes a source of increasing fire hazards in that the oil control in some instances is rather crude, relying on the flames to consume the vapor as it becomes atomized, regardless of the fact that the flow of oil and supply could be materially reduced in many cases, and thus effect a saving as well as reduce the fire hazard. The large increase in the consumption of fuel oil by the railroads is due in a great measure to the increase in steel rolling equipment, largely increasing the fire hazard, and it seems important that there should be some set rule governing the installation and use of oil burning devices. The committee recommended the adoption of the rules of the National Board of Fire Underwriters as a standard in the installation of oil burning devices, with one exception regarding its specifications as to automatic stop and drain valve installations.

HAND FIRE EXTINGUISHING APPARATUS

The Committee on Hand Fire Extinguishing Apparatus, N. Searls, Southern Pacific, chairman, submitted a report of its investigation of hand fire extinguishing apparatus, including chemical extinguishers, water barrels and buckets, dry sand and the various forms of hand grenades and dry powder extinguishers. The committee said that only in the most general way could recommendations for any standard be formulated that would satisfactorily meet the various conditions imposed on the railroads of this country. From data secured in reply to questions sent out it was found that all roads agree on the value of the chemical extinguisher and barrels and buckets, 55 per cent of those reporting stating that they do not use this form of apparatus and 50 per cent of those who do use them state that they are not recommended. The bulk of the report consisted of a discussion of the various types of apparatus with recommendations as to the best methods of adapting these forms of apparatus to the various conditions.

TERMINAL CLASSIFICATION AND STORAGE YARDS

The Committee on Fire Prevention and Protection in Terminal Classification and Storage Yards, Gilbert C. Hays, United States Steel Corporation, chairman, submitted a report classifying the hazards as follows:

Common Hazards—Sparks from locomotives; adjacent property; tramps and trespassers; burning rubbish; dry grass and weeds; spontaneous combustion.

Risks—Doors of wooden cars left open; hay; rubbish; straw and paper, etc., left in cars, grass and weeds growing along storage tracks, tramps building fires on floors of wooden cars, smoking, etc., trespassers and small boys playing in and around same; fires from exposing property and storage of cars on dead tracks.

Prevention.—Sparks from locomotives cause many fires in storage, terminal and classification yards, and the following suggestions and rules; which are in effect on the Baltimore & Ohio System, have a tendency to keep down the losses from these causes. Someone is held responsible to see before cars are stored in yards, etc., that all hay, straw and other rubbish has been removed from all wooden cars, and that all doors are closed securely as well as the traps to ice boxes and refrigerators. Rubbish should not be allowed to accumulate about cars stored, and all grass, weeds and small growth should be cleaned out. Cars should not be stored near hazardous risks or where

they would be exposed from the burning of adjacent property.

Where there is a large number of wooden cars subject to a conflagration, they should be set, whenever practicable, so they will be accessible in case of fire for the purpose of either extinguishing the fire or moving the cars out of danger. Ample facilities should be arranged for prompt removal in case of fire.

Cars should never be stored on stub or dead end tracks, they should be uncoupled at least every ten cars and a space of not less than 20 ft. between each cut; also when practicable a row of steel cars should be set between the lines of wooden cars.

The question of providing efficient watchman service should be considered, the watchman should be instructed just what to do in case of fire, the proper persons to notify to procure assistance of locomotives for removing cars should a fire occur. The service of a watchman is possibly most needed during the winter season when tramps are liable to build fires on the floors of stored cars; there is also the opportunity for sparks from locomotives setting fires at all seasons; also the risk from trespassers on the property and small boys playing in and around same. Watchmen should be familiar as to obtaining assistance from city fire department or local brigades if they are available for service.

Protection.—Standard 2-way fire hydrants, 300 ft. apart, on 6 in. mains, with standard hose houses and 300 ft. of approved hose in each house, with nozzles, wrenches, bars, axes, lanterns, etc. (100 ft. of hose to be attached to hydrants at all times and the rest to be laid on shelves), should be installed throughout the yards where possible. A gate valve to be placed with one outlet so that additional hose connection can be made without

A more elaborate method of protection is the installation of monitor nozzles on stand-pipes located throughout the yard or terminal on proper size mains, the nozzles so arranged as to be operated by one person or can be left alone. This makes a very efficient protection as it does away with the carrying and handling of hose, etc.

Where this more elaborate protection is not possible, water barrels with two pails to each should be installed 100 feet apart throughout the entire yard, and we especially recommend the installation of the fire pump on shifting engines as being one of the most effective devices.

Summary.—The protection of storage yards is one of the weakest features in connection with railway fire protection, for while a large number of railroads spend thousands of dollars to protect their shop and warehouse properties, little or no provision is made for the protection of car storage yards. In these days of retrenchment it is difficult to obtain authority for spending any considerable amount of money for fire protection purposes, and it is equally difficult to get the operating officers to appreciate how necessary it is to adequately protect a storage yard.

STATISTICS AND FORMS

The Committee on Statistics and Forms, F. R. Austin, Chicago & Eastern Illinois, chairman; submitted statistics based on reports from 41 roads, representing approximately 100,000 miles of line, giving a classification of fire losses, including both railroad property and lading, for the two calendar years, 1913 and 1914. The classification of fire losses by causes is shown in the following table:

Causes.	1914		1913		Total 2 years		Per Cent.
	No.	Loss	No.	Loss	No.	Loss	
Adjacent property	314	\$191,316.00	291	\$131,061.15	605	\$322,377.15	5.3
Asbes and hot cinders	122	25,117.79	179	26,095.78	301	51,213.57	2.7
Coal from engine fire boxes	257	93,166.88	236	24,707.95	493	117,874.83	4.4
Electric wires	74	106,722.32	58	87,453.74	132	194,176.06	1.2
Explosions	30	46,503.64	49	26,866.34	79	73,369.98	.7
Forest fires	16	7,251.92	24	31,280.34	40	38,532.26	.3
Fuses	2	52.91	6	2,377.74	8	2,430.65	.1
Friction hot boxes, etc.	61	66,103.72	55	23,938.96	116	90,042.68	1.2
Gasoline, oils, etc.	41	36,445.54	38	18,532.00	79	54,977.54	.7
Heating appliances and flues	523	328,140.78	439	133,320.83	962	561,461.61	8.5
Incendiary	175	150,318.88	174	167,320.83	349	317,798.51	3.1
Lighting appliances	94	350,721.97	113	15,937.14	207	366,659.11	1.8
Lightning	39	16,223.53	44	8,068.21	83	24,291.74	.7
Matches	64	21,543.45	104	27,599.49	168	49,142.94	1.5
Rubbish, burning	67	16,638.97	83	21,410.54	150	38,049.51	1.3
Smoking	108	71,887.65	48	26,924.72	156	98,812.37	1.4
Spark from locomotive	1,529	486,964.95	1,479	412,212.95	3,008	899,177.90	26.7
Spontaneous combustion	213	107,775.13	180	151,077.20	393	258,852.33	3.5
Torches	65	28,158.02	77	29,268.90	142	57,426.92	1.3
Tramps and trespassers	344	153,547.02	180	214,036.93	524	367,583.95	4.7
Unknown	1,180	637,116.93	1,442	867,369.79	2,622	1,504,486.72	23.3
Waste and wooden lockers	12	1,321.25	19	12,614.84	31	13,936.09	.3
Wrecks	61	93,143.29	80	124,271.76	141	217,415.05	1.3
Miscellaneous	246	84,164.70	206	49,409.73	452	133,574.43	4.0
TOTAL	5,637	\$3,120,347.24	5,604	\$2,633,316.66	11,241	\$5,753,663.90	100.0
Average loss per fire		\$553.55		\$469.90		\$511.85	

shutting off the water. All hose connections and couplings should conform with the standard of the city or town in which the plant is located.

Strings of cars should be cut every 10 car lengths entirely across the yards, with an open space of 20 ft. maintained at all times. Cars lacking draw bars and couplings should be chained together to permit the pulling of an entire string in case of fire without breaks.

Switching engines should be equipped with steam fire extinguishing device, such as the Nathan or other devices used by the Rock Island and several other roads.

Water mains should be of the proper size to supply all fire hydrants and laid where practicable in a loop system, eliminating all dead ends. Water should be supplied through fire pumps of sufficient capacity to supply sufficient number of hose streams to compete with large fires. Supply to fire pump should be from two different sources when available. Drilled fire brigades should be organized so as to be familiar with the method of fighting fires.

A second table gave a classification of fire losses by location. Out of a total fire loss of \$5,658,232 in two years, \$1,639,300 was attributed to rolling equipment. The next largest sources of loss outside of miscellaneous were merchandise in transit, \$527,287; shops, buildings and contents, \$389,648; elevators, \$345,634; and passenger and combination stations and contents.

The committee reported that the gathering and compiling of statistics of this kind by a committee has worked out unsatisfactorily, and recommended that the committee be discontinued and that one person be appointed as a statistician to gather such data as the association requires, and that he be paid for his services.

ELECTRICAL HAZARDS

The Committee on Electrical Hazards submitted a report on the hazards to electric lighting installations, based on the rules and regulations of the National Electric code, which is the accepted standard for electric wiring and apparatus. The bulk of the report was devoted to a discussion of various causes of

hazards and to various types of electrical appliances, giving in parallel columns, the cause of the hazard, the probable effect, and references to the code for methods of remedying the trouble or correcting the defects. The one great cause for electrical fire hazards, the committee found, is poor insulation. The committee recommended that all electrical work be required to be installed strictly according to the rules and requirements of the National Electric code.

The Committee on Locomotive Sparks and Ash Pans Hazards, H. W. Colson, Atlanta, Birmingham & Atlantic, chairman, presented a progress report.

The Committee on Stations, Freight Depots and Warehouses, W. S. Maryon, Southern, chairman, submitted a report, showing that the percentage of loss in this class of property is high, and the destruction entails a loss above the actual value of the property in crippling operation, and resultant loss of revenue. Reports of the committee on statistics and forms read before the meeting, last year, showed a loss for the five-year-period from 1909 to 1913 of approximately \$731,000, on stations and warehouses, out of a total of \$6,158,000. To these figures should be added a percentage of loss on merchandise in transit destroyed in buildings, bringing the loss on this class of property to about one-sixth of the total. The need of reduction of the loss is obvious.

At the morning session on October 7, the meeting was addressed by F. A. Silcox, district forester of the United States Forest Service at Missoula, Mont., on the subject, "The Railroads and Forest Fires."

Following the session on Wednesday morning the association held an informal luncheon at the Hotel LaSalle, and following the afternoon session the members paid a visit to the Illinois Central shops at Burnside. At the Thursday session a series of motion pictures were shown, illustrating a trip through the Underwriters' Laboratories in Chicago.

The officers of the association were all re-elected: President, F. H. Elmore, superintendent of insurance, Southern Railway, Washington, D. C.; vice-president, Paul Hevener, superintendent of insurance department, Rock Island Lines, Chicago, Ill.; secretary-treasurer, C. B. Edwards, fire insurance agent, Mobile & Ohio, Mobile, Ala. C. S. Sherwin was elected in place of W. L. Lawrence, of the Delaware & Hudson, on the executive committee.

WHAT THE COMMERCIAL AGENT CAN DO FOR THE SHIPPER*

BY CARL K. LANDES

General Agent, Freight Department, Minneapolis, St. Paul & Sault Ste. Marie, Cincinnati, Ohio

For the purpose of this discussion the designation commercial freight agent must necessarily embrace every one engaged in the solicitation of freight. The contracting agent, the traveling freight agent, the commercial agent and the general agent are all working in similar ways to secure freight for the railroads.

To the question, "What can a commercial freight agent do for a shipper?" the answer is, "Manifest always a beneficent interest in the shipper's welfare, and try to be of helpful, practical service:

"By tracing shipments when requested to do so and giving replies promptly enough to make them of real value.

"By working for the quick settlement of all just claims that are brought to his attention.

"By endeavoring to interest the railroad purchasing agent in a manufacturer's product, to the mutual advantage of the shipper and the railroad when both believe in reciprocity.

"By furnishing, when possible, advance information regarding contemplated changes in rates and rules.

"By co-operating toward the adjustment of unfair rate conditions.

"By suggesting names of possible users of the product of a factory.

"By helping the shipper to secure equipment without unnecessary delay, and as business continues to improve the value of this service will increase in proportion.

"By supplying information regarding export tariff, customs duties and regulations governing shipments to foreign countries.

"By furnishing shippers with estimates of prospective business conditions throughout the territory traversed by his road."

This might be an opportune time to say that those who are interested in the Northwest should prepare to take advantage of the improved business conditions which soon will prevail in that section. The grain crops in the northwestern states of Minnesota, North and South Dakota and Montana are enormous, and the Soo Line alone is making preparations to handle 75,000 carloads of grain. At prevailing prices such a crop ought to distribute about \$70,000,000 among farmers located along our line. This money possibly may be spent by the farmers principally for automobiles, but other commodities also will be in great demand, and the thing to do is to be prepared to supply the demand.

Shippers, I think, generally understand that a commercial freight agent's office is equipped to furnish information and supply service along the lines mentioned, and that the commercial freight agent is earnestly desirous that shippers avail themselves as often as possible of the facilities of his office.

The visitor to Havana is struck by the frequency with which he encounters the mysterious sign reading simply—"Ask Mr. Foster!" but the mystery clears somewhat when he learns that "Mr. Foster" has his agents posted at different public places throughout the city, and that those agents are specially equipped to give the uncertain tourist definite information regarding all rates, routes, departures and arrivals about which the tourist may inquire. These agents also carry a full line of tickets to the good theaters or, for that matter, to European and Asiatic ports of call, and are instructed to endeavor to sell each tourist at least one of these tickets before allowing him to leave.

Now, I should like to have pasted upon the wall of every shipper's office a sign reading, "Ask the commercial freight agent," just to remind shippers to avail themselves of our facilities to furnish information and, incidentally, afford us an opportunity to ask for the privilege of demonstrating our ability to handle carloads and less than carloads with promptness and despatch.

Commercial freight agents of all other lines feel the same. All are anxious to be of service, realizing that to secure and hold business they must be courteous, considerate and willing to co-operate with the shipper in any just and laudable enterprise.

This attitude of the commercial freight agent is simply a reflection of the attitude of the present-day progressive executives of our most efficient railroads, and is in direct contrast to the old "Public be damned" policy that may have prevailed during earlier days, but fortunately exists now only in history.

The efforts that are now being made by many railroad executives to impress patrons with their sincere desire for harmonious relations are pronounced, practical and costly. Sir Thomas Shaughnessy, president of the Canadian Pacific, in a recent address to employees, impressed upon them that while they should continue to labor devotedly and loyally for the intelligent advancement of the company's affairs, they should never forget their duties to the public and should be unflinching in courtesy.

The slogan of the Soo Line is—"Safety and Courtesy Always!"

The Santa Fe recently has inaugurated what is called the "Harmony Special." One week in every month some of the officers, including the president, vice-presidents, general manager, freight, passenger and publicity agents, are drafted for a trip over a division of the road. The train stops at each station long enough to permit the officials aboard to talk with the patrons of the railroad. E. P. Ripley, president of the Santa Fe, recently stated that the "campaign was a success from the start and that now it is part of every official's duty to perform a harmony stunt when occasion demands."

So you see the officials of the railroads, from the highest to the lowest, want to be the friends of their patrons and they want their patrons to reciprocate their friendship.

* An address before the Traffic Branch of the Cincinnati Chamber of Commerce, on September 13, 1915.

Once upon a time there was a man who started out to make friends among his fellow men by resolving that for three months he would say something good about anyone whose name happened to be mentioned in his presence. He kept his resolution and he made hosts of friends. Therefore, I am going to ask you to resolve for the next 90 days to say something good about every railroad that is mentioned in your presence.

I. C. C. ACCIDENT REPORTS

The statistical office of the Interstate Commerce Commission may be supposed now to be wrestling with the mass of facts which, under the revised regulations, have been reported to it concerning accidents on railways during the month of July, 1915, the first month in which the new rules were in effect; and the results when summarized will show some figures which will tax the capacity of the statistician's adding machine; figures showing the number of hours that employees of the railways have worked during the month. This requirement of a statement of "man-hours" and of train and locomotive mileage is responsible for the most noticeable addition to the list of facts called for

L, M, S, meaning respectively collisions, derailments, boiler accidents, other locomotive accidents (not involving collisions or derailments), miscellaneous train accidents and train service accidents. "S a" would indicate an accident to a man engaged in uncoupling air and steam hose or safety chains; "S b" an accident while coupling or uncoupling cars; "S t" insufficient clearances; "S d" getting on or off cars, etc.; "S e" falling from cars, etc.; "S f" miscellaneous accidents to employees on duty on or about a train in connection with its operation; "S g" miscellaneous accidents, on or around trains, to persons other than employees.

The statement of the cause, question 16, is to be taken as a catch line, the full statement being entered under question 51; but in this case question 51 is left blank, the person making out the report having concluded, apparently, that the accident was not of sufficient importance to call for further detail. The legal department of a railroad, which always must gather all possible facts which may be needed in case the victim of an accident should sue for damages, would, of course, require, in a report like this, a considerable list of answers throwing light on the circumstances attending the accident; but these would

MONTHLY REPORT OF RAILWAY ACCIDENTS.										T
Name of reporting carrier (1) Oakland & Eastport R.R.				Report to the Interstate Commerce Commission for the month of July , 191 5

Form T, Government Accident Reports; Size of the Whole Blank, Eight and One-Half by Eleven Inches

Here reduced one-eighth in width, and space for answer to question 51 cut off.

by the new rules. Regardless, however, of the substance of the reports, the changes in form have imposed an immense amount of work on the railroad clerks who make them out.

The style of the principal blank, form T, is shown in a facsimile printed herewith, filled out with a statement, slightly disguised, of an accident that occurred in New York State in July. An examination of this form will give an idea of the character of the present requirements.

In the answer to the sixth question, the letter S indicates that this is a train service accident, and i indicates that the victim was struck by a locomotive or car at a highway grade crossing. The capital letters used in this place on the blank are C, D, B,

have no particular value for the Interstate Commerce Commission.

In column b, under question 21, the letter K means that the person injured in this accident is to be classed among "Other non-trespassers not on trains." The letter A in this column would indicate employees on duty; B employees not on duty; C passengers on passenger trains; D passengers on other trains; E passengers not on trains, and so on. Class A, employees on duty, is divided into 68 sub-classes. For example: (1) general officers \$3,000 per annum and upward; (2) general officers below \$3,000 per annum; (6) clerks, below \$900 per annum, except sub-class 37, telegrapher-clerks; (20) electricians; (31) em-

ployees in outside agencies, except numbers 5, 6, 7 and 30. Sub-class 7 includes messengers and attendants, and sub-class 30 traveling agents and solicitors.

Question 51 calls for substantially the same information that has been required by the old forms, the chief difference being that heretofore the superintendent responsible for the report had considerable freedom to use his own judgment as to the extent to which he would explain the details, except in the more serious accidents; whereas, according to the regulations as now formulated, much detail is required in the case of every accident reported, no matter how relatively unimportant it may be.

Besides form T there are three others, F, R and V. Form F is a monthly statement of fatalities developed from previously reported injuries. Form R is a supplementary report to accompany form T, in the case of an accident due to a broken rail, calling for all available facts, under 39 heads, which may serve to explain the cause of the breakage of the rail.

Form V ("verification"), one to be sent in for each month, contains the oath of the officer sending the report, and a comparative statement showing the total number of non-train accidents happening during the month and the number of casualties resulting therefrom. For these accidents no form T report is required. Form V divides persons into six classes, namely, shopmen, stationmen, trackmen, bridge and building men, other employees, all other persons, and 11 classes of accidents (or causes), as follows: 71, working machinery, engines, motors, etc.; 72, transmission apparatus, belts, gears, shafting, ropes, etc.; 73, use of hand tools, apparatus, etc.; 74, flying particles; 75, explosives, inflammable, hot or corrosive substances; 76, electric currents; 77, collapse, fall, etc., of objects; 78 falls of person; 79, handling rails, ties, bridge timbers, etc.; 80, handling freight or supplies; 81, miscellaneous industrial causes.

At the bottom of each column, following the total number of killed or injured in that column, there is a space for the total number of "man-hours," that is to say, the aggregate number of hours worked during the month by all employees subject to industrial casualties in the classes named; and following this a statement of the average number of casualties per million man-hours.

Judging by the figures compiled by one New York railroad it may be estimated that the total number of "man-hours" reported by the railroads of the whole country for the month of July will aggregate about 393,359,950. Apparently the number of hours worked by these men on the railroads of America in a year will, therefore, aggregate between four and five billions; or, in a period of more active business, perhaps more than the larger number mentioned. These figures represent, it is to be remembered, only those employees who are subject to the classes of casualties named in the 11 items quoted above. As item 78, "falls of persons," covers a class of accidents to which almost everybody is liable, it would seem that these figures ought to include employees in every department. On the road above referred to 31 per cent of the hours reported were those worked by shopmen; 5 per cent by stationmen; 34 per cent by trackmen; 9 per cent by bridge and building men and 21 per cent by other employees.

From the standpoint of the railroad (as well as in the interest of all students of the records) uniformity, as between the federal and state regulations, is an important desideratum in the compilation of these reports; and this fact seems to be receiving increased appreciation. By inquiry of the different commissions we find that eight states—Colorado, Maryland, Montana, New York, North Dakota, Pennsylvania, West Virginia and Wisconsin—have taken or intend soon to take action to make their requirements in regard to railroad accidents correspond to those of the federal government. The rules of the Interstate Commerce Commission now call for such full, complete and detailed statements of every accident which is of public interest in connection with the question of the safety of railroad travel and operation that, without doubt, every state can get all the information reasonably needed for the state records by asking

for carbon copies of the reports sent to Washington. An order providing for the acceptance of these carbons would, therefore, seem to be reasonable in any state; but, as we see, only eight states have explicitly declared themselves on this point up to the present time. In a number of other states the requirement of the regulations is (in less detail) for about the same facts as are called for by the Interstate Commerce Commission's rules, but on blanks in which the details are differently arranged. This difference adds to the railroads' clerical work, while affording very little advantage; none at all so far as the outside observer can see. The officers of these states, however, in most cases, seem very scrupulous in their determination to suffer no derogation of the dignity and independence of their respective states. Quite likely, however, there will be other states which will fall into line with the eight above named. In Arizona it is understood that the Commission intends to accept reports made according to the I. C. C. formula. From a number of states no answer has been received to the inquiry which we sent. In Oregon all statistics of accidents now go to the Industrial Accident Commission.

This article has to do with the forms of reports. As to the substance of the information that belongs in a report of this kind—what amount and what kind of information is worth giving—there are numerous unsettled questions. The question as to how the different states will settle these details—or whether they will be left unsettled, as has been the situation in a number of states in the past—is an interesting one. Possibly the results of the operation of the Interstate Commerce Commission's plans may, in the next few months, throw some light on it.

REPRESSING TRESPASSERS ON THE NEW HAVEN

The New York, New Haven & Hartford is keeping up a vigorous campaign for the discouragement and prevention of trespassing on the tracks of the company. Signs to the num-

Saving Time or Saving Life?

Saving time sometimes means losing life.

A few minutes saved by walking on or crossing railroad tracks may mean your permanent disablement or death.

Five thousand, four hundred and seventy-one persons who trespassed on railroad property in the United States in 1914 were killed.

Every life so lost is an economic loss to the community.

Trespassing on railroad property is forbidden because of the danger it means to YOU.

You can reduce this annual waste of human life by not trespassing on the railroad tracks and right of way and by urging others not to do so.

THE NEW YORK, NEW HAVEN AND HARTFORD RAILROAD CO.

DANGER OF Trespassing on the Railroad

TRESPASSING on railroad property costs almost as many lives in a year in this country as does the dreadful disease of SCARLET FEVER. The estimated number of deaths from SCARLET FEVER in the United States in the year 1912 was 6731.

The number of persons killed while trespassing on the railroad in the year 1914 was 5471. Most of those who fell victims to this dreadful disease were unaware of the danger they were in and thus could not avoid it.

Those who were killed while trespassing on the railroads could have avoided the danger they were in, but failed to do so.

Every time you TRESPASS on the railroad you are putting your life knowingly and needlessly in danger.

AVOID DANGER WHEN YOU KNOW IT IS AROUND.

THE NEW YORK, NEW HAVEN AND HARTFORD RAILROAD CO.

Typical Bulletins Used in the New Haven Campaign to Discourage Trespassing

ber of 10,000 have been posted along the company's lines, warning all persons not having business on the premises to keep off. Renewed efforts have been made to obtain the active cooperation of magistrates, prosecuting officers and other local authorities. School superintendents and proprietors of factories have been called upon to render active assistance wherever possible.

With a view to agitating the subject from every possible angle a half-dozen different bulletins have been prepared setting forth the dangers of trespassing in such a way that he who runs may read. About 180,000 of these placards are to be posted. Facsimiles of two of them are shown herewith

Railroad Locomotive Repair Shop Organization

Efficiency and Output Can Be Considerably Increased
By Giving More Critical Attention to This Feature

By HENRY GARDNER

The old-fashioned railroad shop organization is well known; it consisted of a shop superintendent, or master mechanic, followed in line by an assistant superintendent and general foreman and a number of shop foremen, one for each department. In a shop of this kind the superintendent, assistant superintendent and general foreman have to bear all the burdens of administration and supervision; frequently there is no assistant superintendent in the organization, the whole load being carried by the superintendent and general foreman. Under this type of strictly line organization there are great possibilities for a glaring waste of time and effort by the supervisory force. These overloaded officers, continually goaded for output, must at the same time hold discipline meetings every day and must pass on all applicants for employment; they must be familiar with all piecework schedules and continually add new prices; they must see that all belts, motors, machines and cranes are kept in repair and must handle the apprentices, constantly instructing and moving and encouraging them.

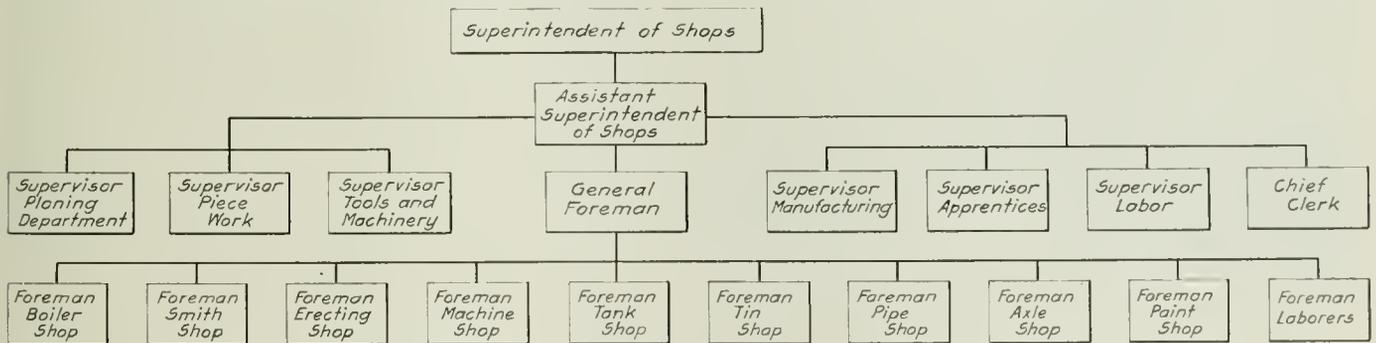

It is safe to say that no one man, or three men, can do justice to all of these duties in a shop of any appreciable size, and it is a foregone conclusion that they will frequently overlap one another in the performance of their work. An instance is recalled where three men in an old-fashioned line organization shop went over the same ground daily, one after the other, and often it was found that a sub-foreman had been told to do the same thing by each one of these three men in succession.

In the majority of railroad shops to-day the strictly line organi-

the composite line and staff organization if the maximum quantity and quality of output, at a minimum cost, are to be obtained.

A proper organization for a large railroad locomotive repair shop is shown by the accompanying chart. Here is a combination line and staff organization. The superintendent of shops has an assistant who has a general foreman next in line in charge of all departments, as is customary. But the staff is the vital part of the whole organization, and is directly responsible for the economic and effective management of the entire plant; the line, below the superintendence, is wholly in charge of output.

On the staff are six supervisors and a chief clerk as follows: A supervisor of piecework, or other wage payment system; a supervisor of routing, scheduling and despatching in all departments; a supervisor of apprentices whose important duties are well known; a supervisor of tools and machinery in charge of the repair and purchase and installation of all new machine and hand tools, cranes, etc., about the plant; a supervisor of manufacturing who is in direct charge of all shop orders and manufactured material either for outside shops and enginehouses or for local consumption and stock, and finally a supervisor of labor, whose office may be called the employment department; this man employs and discharges all men and administers discipline for all employees in and about the plant. The duties of the chief clerk are well known and established. The form of organization shown by the chart is distinctively up-to-date and is representative of tried and successful types. With this arrange-

An Ideal Form of Organization for a Large Locomotive Repair Shop

zation is in effect; there is no attempt made to plan, schedule or despatch the work in the various departments and almost any foreman can hire or discharge men, with or without just cause. The result of this state of affairs is as might be expected—low output, great waste of labor and material, with a high cost of repairs, and a general lack of system and order. The machine equipment is neglected or repaired in a makeshift manner and the money wasted in misuse and abuse of belting alone would pay for many new machines in a year. Cutting tools are dressed and hardened by guess, by the eye; no such thing as an electric furnace or a pyrometer is known.

In this same hypothetical but very typical shop, apprentices, if hired at all, are exploited by being kept on one machine for a year or more, and no serious attempt is made by any one to properly instruct them. If the shop is run on a day work basis the supervising officers must be constantly on the move to maintain the output; if the shop uses piecework to any extent an eternal personal vigilance must be exerted to keep up the quality as well as the quantity of output. These old-fashioned practices are now conceded to be wholly inadequate, especially for the larger shops, and the strictly line organization must give way to

ment the several and specific duties of each staff man are carefully defined and all overlapping and doubling of work by the supervising force is eliminated.

The first duty of the superintendent of a locomotive repair shop is to study quantity and quality of output. He should spend at least three-fourths of his time on this work, if he is to actually earn his salary. All clerical work, letter writing, etc., performed by a shop superintendent is a dead loss to the railroad and nine-tenths of this work should be turned over to his assistant and his chief clerk. A railroad shop superintendent has been known to spend an entire day with hammer and chisel and file surrounded by a loyal and admiring group made up of the assistant superintendent, the general foreman, the erecting shop foreman, the machine shop foreman and two skilled mechanics. But what became of the shop and the departments controlled by these men during that day? Obviously the loss to the company measured in dollars would be considerable.

The modern railroad shop superintendent must be more than a practical man and a good handler of men; he must be a superintendent in the same sense of the word as applied to similar positions in the strictly manufacturing shops. What else is a railroad

shop but a manufacturing plant, and how is it in any way different in so far as opportunities for saving and economy are presented? The shop superintendent should spend a part of his time planning and developing original and improvement work and he should have available up-to-date records of the output in all departments and should keep close watch over the cost of repairs. In connection with these duties the following records are suggested for the superintendent's office; these may be expanded or modified to suit local requirements, and they are better made in chart form, as a graphic diagram gives accurately an exact picture of conditions which cannot be so impressively presented in any other manner.

For a nine-hour day these formulae should be worked out each month and platted in diagram form:

- (1) $\frac{\text{Total engines out per month} \times 9}{\text{Total man-hours per month.}} = \text{Engines out, per man, per day.}$
- (2) $\frac{\text{Labor cost (payroll) per mo.} \times 9}{\text{Total man-hours per month.}} = \text{Labor cost of output per man per day.}$
- (3) $\frac{\text{Material cost per month} \times 9}{\text{Total man-hours per month.}} = \text{Material cost of output per man per day.}$
- (4) $\frac{\text{Labor cost per month}}{\text{Engines desp. per mo.}} = \text{Labor cost per engine despatched.}$
- (5) $\frac{\text{Material cost per month}}{\text{Engines desp. per mo.}} = \text{Material cost per engine despatched.}$
- (6) $\frac{\text{Man-hours per month.}}{\text{Engines desp. per mo.}} = \left\{ \begin{array}{l} \text{Number of hours it takes one man to turn} \\ \text{out one locomotive.} \end{array} \right.$

The above six formulae may be further subdivided to include each separate shop or department as the need for such data arises, or if a special study of some one department appears to be demanded by lowered output or faulty conditions. The percentage of material and labor costs should also be carefully watched and a chart may be made to show this each month. For example, the total material cost for all repairs for one month may be \$30,000, and the corresponding labor cost \$50,000. From this it is evident that material costs are running 37½ per cent. of total and labor costs 62½ per cent., which may be considered a fairly good condition for the average shop to-day.

As indicated by the organization chart the responsibilities of the assistant shop superintendent are the same as the superintendent, since in the event of the superintendent leaving suddenly or gaining a promotion the assistant superintendent should immediately fill his superior's position without appreciably disturbing the organization or the quantity and quality of the output. The duties of the assistant superintendent should be primarily to run the shop and get the required output. He should study and arrange for the charts and data required by the superintendent and should aim in every way to run the entire plant as if his superior were not there to supervise him. A great deal of time is wasted by shop superintendents and their assistants in habitually walking about the plant visiting every department superficially each day. The gain to the shop as a whole by this procedure is practically nothing. Many a railroad shop superintendent and his assistant walk miles, day after day, conscientiously going over the same old beaten path at about the same hour at least twice each day; the foremen and workmen anticipate the visits and, of course, are all on their best behavior.

The most important duty of an assistant superintendent in any organization should be to make an exhaustive study of each department of the shop; say the boiler shop, to start with. He should turn over all other routine duties to the chief clerk and staff men and general foreman and live for a month in this department, working with the foreman as his assistant, in a sense, for the entire day, if it be from 7 a. m. to 6 p. m. In this way an exact knowledge of details may be obtained and faults corrected or eliminated which otherwise would never have been even seen. A close, individual, departmental study of this kind has never failed to result in a great reduction in manufacturing costs as well as an increase in general effectiveness and frequently a decrease in payroll as a by-product. If a month cannot be spared, two weeks, or even one week, spent by the assistant superintendent in each and every department of the plant each year will work wonders. Finally, an up-to-date shop superintendent, as

well as his assistant, should visit other shops frequently and keep constantly posted as to the best methods and practices; they should also read the technical papers carefully, always watchful for labor saving devices and methods for cutting costs and eliminating wastes.

Next in line to the assistant superintendent is the general foreman. He is one of the most important men in the organization, and his duties have wholly to do with the prime object of running the shop, viz., to deliver repaired locomotives. He must be of an extremely active or motive type and must have exceptional ability for instructing and handling men and increasing production. The general foreman works with the seven staff men as occasion arises, in an advisory capacity, but he does not report to any of them or direct them. The general foreman runs the shop with a line and staff organization, exactly as in the old-time line organization, with the exception that a multitude of duties are removed from him so that he becomes virtually an output specialist.

The general foreman and the supervisor of the planning department should be closely allied and preferably their offices should open together so that the daily delay reports may be taken up at once by the general foreman and the causes traced and rectified. It is good practice for the supervisor of the planning department to give the general foreman a slip each morning stating the number and class of repairs of engines that are to be brought in, and it is the duty of this office to see that the departments are at all times equalized. The duties of the staff men are indicated by their titles; the scope of this article will not admit of further details.

The form of force organization required below the general foreman is so varied and depends so much upon local conditions that it must be sufficient to give simply a few general suggestions. The writer has made more than fifty individual charts for a single plant, illustrating departmental apportionment of skilled mechanics, shop hands, or handy men, and laborers; each shop must work these details out for itself—no hard and fast rules can be laid down. Great care should be taken to organize the working gangs with the proper proportion of skilled and unskilled men. Do not have sub-foremen, if needed at all, with no men reporting solely and directly to them; a sub-foreman, or assistant foreman, should always have full authority to direct the men under his charge. Workmen should not be required to report to or receive orders from more than one man, if friction is to be wholly eliminated. The working forces should be divided into small gangs under working leaders, which is better than dividing the whole responsibility between two or three leading foremen; this arrangement will cut down the cost of supervision and place the responsibility and supervision more nearly where the work is actually performed. Specialization is undoubtedly correct for the railroad shop and it must be developed to the fullest extent in every department. Making one man responsible for one class of work not only increases his earnings and his interest in his work, but it enables him to do the best work in a manner satisfactory both to himself and to the railroad. Over specialization is preferable to under specialization.

There is always some discussion as to the relative merits or demerits of two well-known forms of erecting shop organization. The first aims to have the pits divided into blocks of six or eight pits and places one foreman in charge of each block. The other method considers the whole erecting shop as a unit, and has the foremen in charge of gangs, which do special lines of work, and travel up and down over the entire shop, visiting every pit in the order that the work is required. In a shop using a scheduling and despatching system, the former organization is preferable, since accurate comparisons of output for each foreman may be obtained and platted from month to month and a close supervision of his record is very stimulating; moreover, a friendly and healthy rivalry is maintained, thereby keeping up that all-important enthusiasm and "esprit de corps" which, after all, is the great fundamental cause for human excellence. Engines coming into the shop should be divided equally between the foremen as far as possible, so that no one man will obtain unfair advantage

due to the improper selection and distribution of the repairs.

More important even than the distribution of the force organization of a railroad shop is the planning and despatching department in charge of one of the staff supervisors, reporting to the assistant shop superintendent. The work of planning for the admission of engines to the shop naturally assumes more importance than the correct placing of forces, since it is easily possible to bring in too many engines requiring one kind of repairs and thereby disarrange and disorganize the most carefully planned and effective grouping of forces which may have been established to meet certain fixed conditions. The balance of a shop plays a most important part in its successful and economical administration and this is where the supervisor in charge of scheduling and despatching comes in; he must, as far as possible, keep the ratio of classified repairs constant and change that ratio only as may be necessary to prevent overloading some department which may have unexpectedly fallen behind.

For example, let us assume that a shop has been very carefully organized, a man clipped off here or added there until the entire plant is working at maximum efficiency. Then let us assume that 45 per cent of all engines turned out are to have new fireboxes, that 15 per cent are to have new cylinders, that 10 per cent are to have one or more new fireboxes or flue sheets, and that 30 per cent are to receive simply general repairs to machinery with flues removed and safe-ended and with tires turned. Now let us suppose that the exigencies of the service make it impossible to obtain for this shop more than 20 per cent of engines needing general repairs and that 55 per cent of all engines arriving need new fireboxes, and that 25 per cent need new cylinders; what, then, for the time being, has become of our carefully planned organization both as to men and machines? The intelligent selection of engines has a very noticeable effect on the cost of repairs as well as on the mean output; this is much more apparent in large shops where the organization is less flexible and usually highly specialized.

A locomotive repair shop is primarily a plant for manufacturing and maintaining power units needed for marketing the commodity, transportation, which the railroad company sells to the public, and in order to enable the company to sell its product to the best advantage the shop must at all times be ready to supply the operating department with the locomotives needed. This demand for power varies appreciably with the seasons and other causes, national and international, so that it is not always possible to keep a fixed percentage of engines of certain classes available for shopping, which have also made their required mileage in service. The division superintendent and the superintendent of motive power should, however, co-operate closely with the local shop management, as no shop can deliver a constant maximum output from month to month which will satisfy the operating officials if it is not properly supplied with the kinds of repairs for which it has been organized. The ideal state of affairs exists when engines come in for repairs in a constant flow from month to month, and there is in normal times for every railroad a nearly constant direct ratio between the number of locomotives in service and the number requiring repairs; so far as conditions will allow, this ratio should be maintained.

Planning, scheduling and routing and despatching may be depended on to suggest and create the force organization needed. To a degree the organization will automatically adjust itself to the many variable working conditions so plainly brought to light by the accurate records resulting from the systematic scheduling and routing and despatching of all operations and material through all departments of the shop. With one well-known form of modern routing system the use of the despatch board tells at once which department is late or ahead and, provided the shop is using the normal repair ratios, suggests the changes in organization or equipment necessary to build up a department and consequently equalize the shops. The best shop organization can make but an outward show of efficiency without a planning department as outlined. To the casual observer the shop may be speeded up to its maximum intensity, but a careful analysis of

conditions will soon expose many weaknesses and wastes of labor and material.

Modern combination staff and line organizations must be more generally employed if our railroad shops are to keep pace with the increasing demands made by the management for reductions in maintenance costs needed to offset government regulation of freight rates and the ever-increasing demands of organized labor. Finally, the statement may now be made authoritatively that increases of output up to 25 per cent have been recorded in several large railroad shops using in greater part the modern organization described in this article, and it is conclusively beyond argument that similar or greater increases in output, with consistent decreases in labor and material costs, may be assured to any large railroad shop whose officers and their superiors have the foresight and courage to adopt these correct principles.

CLOCK-WORK TIME-LOCK FOR ELECTRIC INTERLOCKING MACHINE

On the "Model 2" unit-lever interlocking machines used at the Grand Central Terminal, New York City, there are now in use a number of clock-work time-releases or time-locks, made by the General Railway Signal Company, which are so simple and compact that all of the machinery for a release is enclosed within a box fixed on the top of the lever which it is to govern, the whole being no wider than the body of the "lever"; and the operation of the releases during a period of 12 months has been so satisfactory that all other devices for this purpose heretofore used at this interlocking are declared to be inferior.

The time release performs the function of a detector bar or

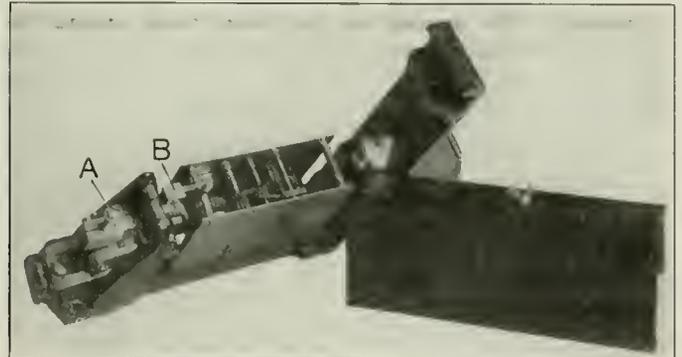

Fig. 1—Clock-Work Time-Lock for "Model 2" Unit Lever Interlocking Machine

detector track circuit; or, rather, it lengthens the time limit which ought to be imposed by a given detector circuit. For example, at D V interlocking, Spuyten Duyvil, 10 miles out from the terminus (see diagram), there is a release on the lever for signal 73, which signal, when cleared, gives a route from A, Track 6, through switches 81, 83, 85, 87 to B, Track 4. When a train makes this movement the arm of signal 73 can go back to the normal or stop position as soon as the engine passes it; and, without the restraint imposed by the time release mechanism, the lever also could be put back to normal. But the distance from switch 81 to switch 87 is so great that, before a slow train could reach, say, switch 85, an absent-minded signalman, having put lever 73 normal and having thereby released the mechanical interlocking, could move switch 85 in front of the train and thus turn it on to Track 2, which might be a dangerous movement. The time release therefore by deferring the restoration of lever 73, for, say, 35 seconds, serves for that length of time the same purpose as a detector bar extending from signal 73 to Track 4.

The clock-work apparatus is adjustable, so that any desired interval of time may be interposed, after the signal arm has been restored to the normal position, before the lever can be restored fully to the normal position.

The apparatus is fixed on the upper part of the signal lever

in the machine. A cam surface engages with a plunger and, through the medium of a rocker arm, forces the locking member to the locked position. Arranged in suitable relation to the rocker arm is another arm which drives the timing mechanism. In this arm is an adjustment screw *A*, Fig. 1, which determines the distance that the timing mechanism can be moved. Provision is made for adjusting the time from five seconds to two

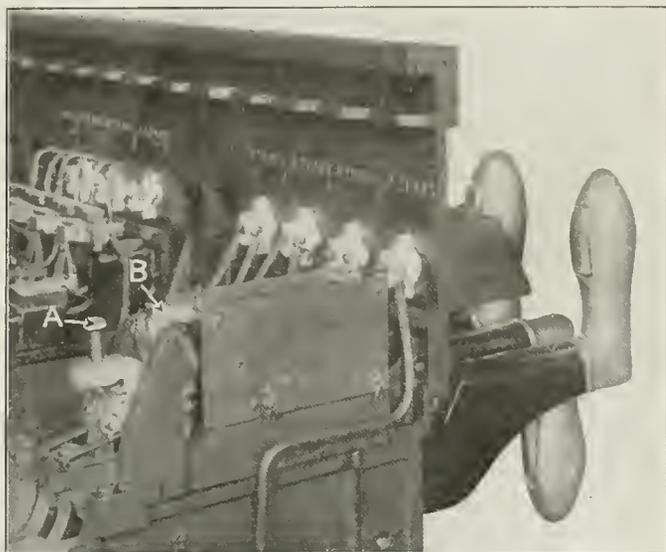

Fig. 2—Clock-Work Time-Lock

minutes. The moving of the lever from normal to reverse causes the lock plunger to move to the locked position, and it is latched there; and at the same time the lever winds up the spring in the timing mechanism, setting it forward the amount determined as proper for that particular application, this being in all cases fixed as may be determined locally in each case.

The mechanism remains in this position during the time the lever is reversed. When the lever is moved to the normal indication position the plunger on the rocker arm is free to drop into the depressed portion of the cam, on the lever; and the mechanism is left free to be driven backward by the action of

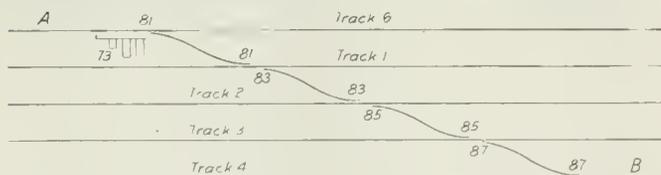

Fig. 3—Crossovers at Spuyten Duyvil

the spring, which was wound up at the time the lever was moved to the reversed position.

At the expiration of the time limit, the clockwork mechanism has moved to a point where it releases the latch (*B*, Fig. 2) which has been holding the lock plunger in engagement with the lever. The plunger is then snapped out by the action of the spring.

It will be noted that the locking plunger is not only forced into the locking position, but that the plunger remains in the full locked position until the end of the time interval. There is thus complete uniformity in action and no tendency to round the corners of the plunger or of the locking notch in the lever.

This device is so designed that it is mounted on the top of the lever guide in the same manner as the electric lever locks, without any change in adjacent parts. In this particular installation the device is used solely as a mechanical time lock; but it can with slight changes be made to close or to open electric circuits in conjunction with switch locking.

A cover is provided for the protection of the parts. It is shown (off) in Fig. 1. It can be sealed so that the adjustment

cannot be altered by unauthorized persons. The device is operated independently of the indication mechanism and, therefore, the indication system may be either battery or dynamic.

For the foregoing information and illustrations we are indebted to H. S. Balliet, signal engineer of the electric division of the New York Central.

PROPER MANAGEMENT OF FREIGHT-CAR SERVICE*

By J. R. CAVANAGH

Superintendent of Car Service Cleveland, Cincinnati, Chicago & St. Louis

I still believe that a general car pool, under the joint jurisdiction and supervision of the American Railway Association, the Master Car Builders' Association and the general traffic associations, would produce excellent results; especially if a scheme could be worked out for making all car repair shops "pool" shops so that when cars come into the "pool" shops they will be brought up to a certain unit of standardization. It should be arranged that none of the lines, parties to the pool, shall individually add any cars to its equipment except through the pool organization, and ownership should be based on a percentage (interest in the pool) basis, or as may be agreed upon.

For illustration: If the Kansas City Southern owns 11 per cent of the box car equipment and desires to increase its allotment to 15 per cent, and it could be shown that this was necessary or reasonable, the board of directors would so approve, and the Kansas City Southern could then add such additional box cars to its allotment as would increase its percentage to 15. If, however, it could be shown, by the board of directors, that such increase on the part of the Kansas City Southern was not necessary, or would be met by a general increase in the equipment of the pool, the Kansas City Southern would be charged with an additional 2½ per cent as against the 4 per cent which it desired to add, on the theory that it would get the benefit of the increased percentage of the other members of the pool in the use of their cars during the greater portion of the period when the other members do not need the cars.

My idea would be for all of the freight cars to be put into the pool. In order to obviate the various methods of classification of cars and the necessity for an equipment guide to determine what the car is, the cars should be marked with a specific pool mark.

For illustration: The first initial would indicate the classification such as:

- A—automobile or furniture cars;
- B—box cars;
- C—coke cars;
- D—dump cars;
- F—flat cars;
- G—gondola cars;
- H—bopper bottom cars.

The second letter to indicate the length, such as:

- A—60 feet long and under;
- B—55 feet long and under;
- C—50 feet long and under;
- D—45 feet long and under;
- E—40 feet long and under;
- G—36 feet long and under.

The third letter to indicate the capacity, such as:

- A—250,000 lb. and under;
- B—225,000 lb. and under;
- C—200,000 lb. and under;
- D—175,000 lb. and under;
- E—150,000 lb. and under;
- G—125,000 lb. and under;
- H—110,000 lb. and under;
- J—100,000 lb. and under;
- K—80,000 lb. and under.

Therefore, if a box car is 36 feet long and of 80,000 lb. capacity, the first initial or marking on the car would be "B" for box car, the second initial would be "G" for 36 feet long, and the third letter would be "K" for 80,000 lb. capacity. Thus, all pool cars of this class would be marked "B-G-K" and allotted their series according to the number of cars owned in such pool.

For illustration: A road having 14,000 cars would be given

* Abstract of written discussion of E. E. Betts' paper presented at the September meeting of the Western Railway Club, as noted in the *Railway Age Gazette* of September 24, page 578.

the items required for the schedule to be put on the map, but is designed also for use in compiling the information required on DV. Forms Nos. 107 and 108 for the schedule of land to be filed with the Interstate Commerce Commission, as required in order No. 7, dated November 21, 1914.

The men obtain the information for right of way from the files of the office of the real estate agent. As they are assigned an entire section, the records are gone through by counties, the data being abstracted as found. In consequence, no special search of the records for a particular parcel of land is required unless it is missing when the complete file has been covered. Data as to sidetrack contracts are taken from the files of the engineering department, and recorded on the blanks provided, from which they are eventually copied on DV. Form 135.

When all the right of way sheets of a given district are finished they are given to a typist, who prepares the schedule summary in the form and order required for the map. This shows the parcel number, grantor, grantee, instrument, date, record index and custodian's number. A heading at the top of the sheet gives the date, sheet number, division and valuation section. Two carbon copies are made, one of which is a backed tissue carbon to permit blue printing the schedule on the working print of the map furnished to the field forces. The identification heading at the top of the schedule appears on those working blue prints but will, of course, be omitted when the schedule is placed on the finished maps.

In plotting, the draftsmen work on as long a roll of the detail paper as the alinement will permit. The conventional sheets are indicated roughly. The tracers make sheets of the standard 54-in. length. A material saving in time was obtained by the use of rubber stamps. Each tracer is given a sheet of detail paper upon which have been stamped to correct scale and proportions all conventional signs, names of counties, township numbers, figures from 0 to 9 for the various sizes of numerals used, the abbreviation N.V.¼, etc. By sliding this sheet under the tracing cloth to the proper position the various figures can be traced accurately and quickly. Recently greater efficiency has been obtained by the use of Ockerson printing devices for the same purpose, by means of which the various items are printed directly on the tracing cloth. A printing press has also been installed for printing the titles. To save time in setting them up, cuts have been purchased, giving the combinations of letters and words most frequently used. Another time-saving device is a power eraser made by attaching flexible dental shafting to the shaft of a very small electric motor operated from the lighting circuit. A common red pencil eraser cut roughly to the shape of a disc serves as the rubber.

The draftsmen are under the immediate direction of two squad foremen who assist the plotters in looking for information, investigate disputed points and check the drawings. They also follow up any searches for missing data which have been referred to the real estate department. The drawings are checked by these men principally for specification requirements, hidden quantities, right of way, etc. The complete check is obtained by the use of the working blue prints by the field forces and by furnishing the real estate department with prints to check for right of way. An independent squad of draftsmen corrects the tracings for errors discovered by the field forces and by the real estate department.

The organization under the direction of the real estate agent is at work preparing the schedule of land according to D. V. Forms 107 and 108. For this purpose they use the "Reports of Costs and Value of Right of Way and Real Estate" prepared by the plotters in the valuation office, checking the information which the plotters have entered and supplying the remaining data. This requires a search of all the records of the railroad. All new real estate records are kept and indexed in the office of the real estate agent, but old records are in the files of the auditor, except such as are filed in the construction correspondence in the chief engineer's office. The work is further complicated by the fact that the Big Four, like most other roads,

has absorbed a great many small corporations, each with independent records. In spite of these obstacles, about 500 miles of line had been scheduled by the first of August, all records being carefully indexed as the work was carried along in order that easy reference may be had to the original records.

AN INDEX-RECORD OF STATION AGENTS

R. L. White, superintendent's office, Southern Railway, Memphis, Tenn., sends us the following description of a chronological record and an index of the forces at the stations on his division, which he has found useful in an office where there are a number of clerks who have occasion frequently to correspond with stations or to refer to station business. This record was devised as a remedy for the constant inconvenience felt before anything of the kind was in use. The need of such an aid as this would be felt, of course, not only in a superintendent's office, but in the other departments which have to deal with stations—those of the general passenger agent, the general freight agent, the claim agent, etc.

The scheme requires two books (or two halves of a single book)—one, Book A, in which the names of the persons (employed in the classes to be dealt with) for the whole division are arranged alphabetically, a page for each letter; and the other, B, in which there is a page for each station, with numbered lines, constituting a chronological record for that station.

Take for example the case of a new man employed on the division (A. A. Adams). He is assigned to service at Montague station, which, we will say, is a new station. He is first entered on the Montague page of Book B, which gives the necessary information for Book A (see below). He is then recorded in Book A (the A page), which is an index to Book B. Here the entry is page 1, line 1.

Later on Adams goes to another station, Nomad, and his record at Montague is closed. He then appears on page 2, which is the station agency record for Nomad. After being so entered on Book B, his record on Book A has added to it another item—namely, page 2, line 1.

This same method is followed out in recording the service of Cashier B. B. Bond, first at Montague and then at Nomad; proper record being entered on both agency sheets, and then on page B, of the alphabetical record, which shows service at two different places.

When information is desired as to who is agent or cashier at Montague, it is only necessary to turn to the Montague station page of Book B; when information is desired as to any person, search is made on the page of Book A headed with the initial of his surname.

When the page covering the Montague agency is filled out it can still be known as page 1, the next page being made 1-A.

* This space when left blank, indicates that the person is still in service at that station in the capacity shown.

General News Department

The Interior Department at Washington reports the completion of a section of the new Government railroad in Alaska, 20 miles long. It is said that this line begins at Anchorage, at the mouth of Ship creek (which flows into Knik Arm) and runs in a northerly direction toward the Matanuska coal field. This would seem to indicate that the branch to this coal field is to be the first section of the road to be finished.

The "post office" or mail room in the general office building of the Baltimore & Ohio at Baltimore is now equipped with lock boxes, in the same style as a government post office; and each office in the building, having a key to the box assigned to it in the mail room, sends for its letters at any time of the day or night, as may be desired. This mail room at Baltimore handles about 35,000 pieces of mail every 24 hours, most of these being, of course, railroad service letters.

R. P. Kyle, safety supervisor of the El Paso & Southwestern, in his second annual report, shows a marked diminution in the number of casualties to employees. Taking the years 1913, 1914 and 1915 in order, the records of employees killed have shown 12, 7, 2; and of injured 493, 455, 406. Only two passengers were injured during the past year and none killed; but in the column headed "trespassers and others" the casualties for the three years named, 1913, 1914, 1915, are killed, 9, 10, 12; injured, 22, 32, 45.

The Wisconsin conservation commission has received from the Chicago, Milwaukee & St. Paul an appeal for protection from the colony of beaver which have taken it upon themselves to construct a number of dams along Bear creek in Oneida county, causing the water to back up and flood the railroad company's right of way in the vicinity of Merrill and Goodnow. As beaver is protected by law, the railroad could not kill or trap the animals, even though their dams are causing wash-outs.

A westbound express train of the Baltimore & Ohio was stopped by robbers near Central station, W. Va., on the morning of October 8, about 2 o'clock, and a large quantity of registered mail was carried off. Included in the loot were 90 packages of unsigned bank notes, in transit from Washington to banks in western states. The robbers moved the engine and mail car three miles forward from the place where the train was stopped, and there they were taken into an automobile which was waiting in charge of an accomplice.

President Ripley, of the Atchison, Topeka & Santa Fe, on September 5 addressed a telegram to the Mayor of Ardmore, Okla., offering to settle all claims for personal injury and property losses resulting from the explosion of a tank car of gasoline on the company's tracks at Ardmore on September 22. Mr. Ripley made it plain that the railroad was not assuming liability for the accident. The verdict of the coroner's jury was that the accident was caused "through negligence of the Santa Fe Railroad Company and its employees, but said negligence was not felonious."

The Gulf Hurricane

The damage done by the storm of September 29 to the tracks of the Louisville & Nashville proved so serious that both freight and passenger trains are still being detoured by way of the Gulf & Ship Island and the New Orleans & North Eastern, by way of Hattiesburg. The distance from Gulfport to New Orleans by this route is 180 miles, as compared with 67 miles by the L. & N. Two complete passenger trains are run each way daily, and from four to six freight trains. On October 5 the line had been made passable from Mobile as far west as Bay St. Louis.

The damage to the track of the New Orleans & North Eastern was not very extensive, but traffic was suspended from Wednesday, September 29, until Sunday, October 3, mainly because of the loss of telegraph, telephone and block signal wires which

hampered the roadway department in assembling men and material for repair work. The water in Lake Pontchartrain did not subside until Friday evening. On the trestle of this road across the lake, six miles long, it was necessary to drive only 17 new piles. It was necessary to use single track between South Point and Citrus, 10 miles, until October 8.

Service over the Illinois Central's main line to New Orleans, on which 18 miles of double-track was washed out between New Orleans and Hammond, was resumed on October 8, when a new single track over this line was completed. While the main line was cut, service was maintained by detouring via the Yazoo & Mississippi Valley from New Orleans to Baton Rouge, and thence to Hammond via the Illinois Central.

Dinner to President Ripley

The officers and directors of the Atchison, Topeka & Santa Fe will give a dinner to President E. P. Ripley at the Blackstone hotel, Chicago, on Saturday evening, October 30, on the occasion of Mr. Ripley's seventieth birthday. The guests will number about 300, and will include intimate friends of Mr. Ripley, men with whom he has been closely associated in business, and the chairmen and presidents of the leading railways of the country.

Decisions of Accounting Officers

The Association of Railway Accounting Officers has in preparation a book containing a synopsis of all decisions and recommendations of the association relating to passenger accounts up to April, 1915. The book will contain the association's standard passenger forms and will be bound in cloth. Each member will receive a copy of the book free.

Extra copies, or copies for non-members, will be furnished at 75 cents each. The secretary of the association is E. R. Woodson, Woodward building, Washington, D. C.

Signalmen Imprisoned

Signalman Tinsley, chiefly responsible for the disastrous collision at Quintinshill (Gretna), Scotland, May 22 last, was tried for manslaughter in court at Edinburgh, September 15, and was sentenced to three years' penal servitude. The night signalman, Mechan, who was just going off duty at the time the error occurred, was sentenced to imprisonment for 18 months. Fireman Hutchinson, who was in the cabin at the time, was tried for manslaughter, but acquitted. The fireman had gone into the cabin in accordance with the rule to see that the signalman made no mistake which should endanger his train, standing near by; and he neglected to correct the signalman's error in not putting a collar on the signal lever as a precaution against improper movement of that lever. This collision was reported in the *Railway Age Gazette* of June 11, and October 8.

Reorganization of Association of Western Railways

A change has been made in the organization of the Association of Western Railways. Heretofore the chairman of the General Managers' Association of Chicago has been also chairman of the Association of Western Railways and chairman of its executive committee. Under the new plan the executive committee of the association will elect at its first meeting of each year a chairman of the committee, who shall also be ex-officio chairman of an advisory committee, appointed by the executive committee and consisting of eight of its members. W. G. Bierd, president of the Chicago & Alton, has been elected chairman of the executive committee and of the advisory committee. The executive committee will select an executive secretary, who may also be chairman of the General Managers' Association of Chicago. As noted elsewhere, J. W. Higgins, general manager of the Missouri Pacific, has been appointed chairman of the General Man-

agers' Association of Chicago and also executive secretary of the Association of Western Railways. Regular meetings of the advisory committee are to be held every two months on fixed dates at Chicago, and special meetings may be called at other times. The executive committee will obtain labor statistics from the different railroads, in addition to making investigations of other matters of interest to the railroads, reporting to the advisory committee, and will maintain a bureau of statistics for the compilation of such statistical and other historical matter as may from time to time be required by the advisory committee.

The New England Railroad Club

At the regular monthly meeting of the New England Railroad Club, to be held at the New American House, Boston, Mass., on Tuesday evening, October 19, an illustrated paper will be presented by F. M. Davison, of the Boston & Albany, entitled "Architecture in Railroad Work."

New York Railroad Club

At the regular monthly meeting of the New York Railroad Club to be held in the Engineering Societies' Building, 29 West 39th street, New York, on Friday evening, October 15, a paper will be presented by W. R. McKeen, consulting engineer, motor cars, of the Union Pacific, on the "Value of Motor Cars to Railroad Systems."

Railroad Men's Improvement Society

At the first meeting for the season the Railroad Men's Improvement Society held at the Meridian Club, 90 West street, New York, on October 7, a paper was presented by George P. Barker, president of the Efficiency Club of New York, entitled "Increasing Efficiency in Business." The paper dealt entirely with human efficiency and aimed to show how a man should try to bring out the elements of success existing in him.

National Safety Council

The Fourth Annual Safety Congress of the National Safety Council is to be held at the Bellevue-Stratford Hotel, Philadelphia, October 19, 20 and 21. This organization, composed of large industrial concerns in all parts of the United States, has now become an important body, its convention last year at Chicago having brought together about 1,500 delegates. It is expected that the meeting this year will draw a still larger number. All branches of industrial and civic life are represented in the different sections. At the general session on Tuesday, the 19th, W. C. Wilson, claims attorney of the Delaware, Lackawanna & Western, will deliver an address on Public Safety and the Railroads.

The meetings of the railroad section are to be held on Wednesday, October 20, from 9 a. m. to 5 p. m., and on Thursday, the 21st, from 9:30 a. m. until noon. The chairman of this section is Marcus A. Dow, general safety agent of the New York Central Lines, New York City. After the opening address by the chairman there will be a discussion of Mr. Wilson's paper (delivered the day before). R. C. Richards, Chicago & North Western, will speak on the value of the National Safety Council to railroads. Other subjects and speakers are as follows: Automobile Accidents, J. C. Rose, chief claim agent, Pennsylvania Railroad; Prizes to Committeemen, by W. C. Wilson, D. L. & W.; How to Maintain Interest in Safety Work, by W. B. Spaulding, claims attorney, St. Louis & San Francisco; How to Reach Non-English Speaking Employees, by Isaiah Hale, Atchison, Topeka & Santa Fe; Moving Pictures and How to Get Good Films, by C. H. Blakemore, Norfolk & Western. C. T. Banks, safety supervisor of the Erie, will also speak.

The papers which are named on the program are not expected to take up the whole of the time, and opportunity will be allowed for full and free discussions. Railroad officers interested in safety work may introduce any relevant topic. All railroads are invited to be represented, without regard to whether they are or are not members of the National Safety Council.

The president of the National Safety Council is R. W. Campbell, of the Illinois Steel Company, and one of the vice-presidents is R. C. Richards, of the Chicago & North Western. The secretary is W. H. Cameron, Chicago.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, date of next or regular meetings, and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

- AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—H. C. Boardman, D. L. & W., Hoboken, N. J. Next meeting, October 21-23, 1915, Boston, Mass.
- AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York. Next meeting, October 26-27, 1915, French Lick Springs Hotel, French Lick Springs, Ind.
- AMERICAN RAILWAY ASSOCIATION.—W. F. Allen, 75 Church St., New York. Next meeting, November 17, 1915, Chicago.
- AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 19-21, 1915, Detroit, Mich.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.
- AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York. Annual meeting, December 7-10, 1915, New York.
- ASSOCIATION OF RAILWAY ELECTRIC ENGINEERS.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Annual meeting, October 18-24, 1915, Chicago.
- ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—G. P. Conard, 75 Church St., New York. Next meeting, December 14-15, 1915, St. Louis, Mo.
- BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meetings with American Railway Bridge and Building Association.
- CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.
- CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.
- CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.
- ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.
- GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.
- MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—T. I. Goodwin, C. R. I. & P., Eldon, Mo. Next meeting, October 19-21, 1915, St. Louis, Mo.
- NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.
- NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.
- NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—E. N. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.
- PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.
- RAILROAD CLUB OF KANSAS CITY.—Claude Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Saturday in month, Kansas City.
- RAILROAD MEN'S IMPROVEMENT SOCIETY.—J. B. Curran, Erie R. R., 50 Church St., New York. Meetings, alternate Thursdays, October to May, Assembly Rooms of Trunk Line Association, 143 Liberty St., New York.
- RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 30 Church St., New York. Annual meeting, December, 1915. Waldorf-Astoria Hotel, New York.
- RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.
- RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, 1063 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.
- RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.
- ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.
- SOCIETY OF RAILWAY FINANCIAL OFFICERS.—Carl Nyquist, C. R. I. & P., 1134 La Salle St. Sta., Chicago. Annual meeting, October 19-21, Colorado Springs, Colo.
- SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Piedmont Hotel, Atlanta.
- TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.
- TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Waldorf-Astoria Hotel, New York.
- TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Gen'l Agt., Erie R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings bi-monthly, Pittsburgh.
- TRAFFIC CLUB OF ST. LOUIS.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.
- UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, 1111 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.
- WESTERN CANADA RAILWAY CLUB.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.
- WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Building, Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.
- WESTERN SOCIETY OF ENGINEERS.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings. Annual meeting, 1st Wednesday after 1st Thursday in January, Chicago.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF JULY, 1915

Name of road.	Average mileage operated during period.		Operating revenues.		Maintenance of way and equipment.				Operating expenses.				Net from railway operation.	Railway tax accruals.	Operating income (or loss).	Increase (or decrease) last year.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF AUGUST, 1915. — (Continued)

Table with columns: Name of road, Average mileage operated during period, Operating revenues (Freight, Passenger, Total inc. misc.), Maintenance of way and structures, Equipment, Traffic, Trans-shipment, Miscellaneours, General, Total, Net railway operation, Railway tax accruals, Operating income (or loss), Increase (or decr.) comp. with last year.

REVENUES AND EXPENSES OF RAILWAYS

TWO MONTHS OF FISCAL YEAR ENDING JUNE 30, 1916 - (Continued)

Table with columns: Name of road, Average mileage operated during period, Operating revenues (Freight, Passenger, inc. misc., Total), Maintenance of Way and structures, Equipment, Traffic, Trans- portation, Miscel- laneous, General, Total, Net from railway operation, Railway tax accruals, Operating income (or loss), Increase (or decr.) comp. with last year.

REVENUES AND EXPENSES OF RAILWAYS

TWO MONTHS OF FISCAL YEAR ENDING JUNE 30, 1916—Continued

Table with columns: Name of Road, Average mileage operated during period, Operating revenues, Maintenance of way and structures, Traffic, Transportation, General, Net from railway, Operating income (or loss), and Increase (or decrease) comp. with last year. Rows include various railroads like Grand Trunk Western, Great Northern, Gulf, Colorado & Santa Fe, etc.

Traffic News

W. L. Taylor, attorney for the Chicago, Indianapolis & Louisville, will address the Transportation Club of Indianapolis at its monthly dinner on October 18, on the subject of "The Panama Canal; Its Effect on the World's Transportation."

The New York, New Haven & Hartford announces that on its "Merchants' Limited" express train, leaving New York for Boston and Boston for New York at 5 p. m., two dining cars are now run. On one of them a regular dinner will be served, at \$1.25, while on the other food may be ordered by the card.

The New York Central announces that the Twentieth Century Limited during the six months ended with August 31, arrived in New York on time 177 times, was 5 minutes late once, and was over 5 minutes late only 6 times. It also arrived in Chicago 177 times on time and was over 5 minutes late 7 times.

The United States Department of Agriculture announces that all federal restrictions on the movement of livestock because of foot-and-mouth disease have been removed in the states of Indiana, Michigan and Virginia. The whole country, with the exception of northern Illinois, is now practically free. The Union Stock Yards in Chicago are classed as a restricted area, in which livestock may be moved for immediate slaughter only.

The transcontinental railways have filed an application with the Interstate Commerce Commission for a fourth section order allowing them to extend to Pittsburgh territory the 55-cent rate on iron and steel articles, which now applies from Chicago and Mississippi river crossings to the Pacific coast. The steamship lines operating through the Panama Canal have announced their intention of opposing the rate by asking for a suspension of the tariffs.

It is now expected that the Panama canal may be blocked by the landslide two or three months, and the officers in charge will set no date when traffic can be resumed. It is estimated that ten million cubic yards of earth may be in motion. Of the ships detained on the Atlantic and the Pacific sides, aggregating more than 100, a considerable number have already been sent around Cape Horn. It is expected that ship owners desiring to transfer cargoes across the Isthmus by railroad will be allowed to do so at a rate of three dollars a ton.

Canadian Northern Excursion to the Coast

The first passenger train to run through from Montreal and Toronto to the Pacific coast terminus of the Canadian Northern left Toronto and Montreal on the evening of October 12. It carried officers of the road, members of the Canadian Parliament, newspaper men and a large number of other invited guests.

Car Surpluses and Shortages

The American Railway Association's committee on relations between railroads, Arthur Hale, chairman, has issued statistical statement No. 9, giving a summary of freight car surpluses and shortages for October 1, 1915, with comparisons.

The total surplus on October 1, 1915, was 88,061; on September 1, 1915, 191,309, and on October 1, 1914, 133,382.

The surplus for September 1, 1915, shown above includes figures reported since the issue of statistical statement No. 8.

There is a general decrease in surplus under September 1, 1915, chiefly in groups 2 and 4 (East), group 5 (Southeast), group 6 (Central North), group 8 (Central), group 10 (West) and group 11 (Canada), in box cars; there being a considerable decrease in groups 6 and 11. There is also a decrease in the surplus of coal cars, chiefly in groups 2 (East) and 3 (Central North).

The total shortage on October 1, 1915, was 9,762; on September 1, 1915, 6,300, and on October 1, 1914, 2,355.

The shortage for September 1, 1915, shown above includes figures reported since the issue of statistical statement No. 8.

There is a general increase in shortage over September 1, 1915,

excepting in group 2 (East) and group 3 (Central North), where there are slight decreases in the shortage of box cars; and in group 4 (East) where there is a decrease in the shortage of coal cars.

The figures by classes of cars follow:

Classes	Surplus	Shortage
Box	41,622	5,368
Flat	6,993	325
Coal and Gondola	16,563	3,251
Other	22,883	818
	88,061	9,762

Chicago Board of Trade Wants Railway Lake Service Continued

The Chicago Board of Trade has filed a petition with the Interstate Commerce Commission asking for permission to intervene in the case of the Lehigh Valley for a rehearing on its application to continue the operation of its lake lines. The board of trade also asks that the commission's order, effective on December 15, requiring the railroads to dispose of their lake lines, be postponed until the commission has heard further evidence on behalf of shippers interested in water transportation over the Great Lakes. The board of trade has also sent communications to other commercial organizations, suggesting a conference to be held with the purpose of sending a representative committee to Washington, asking for a postponement of the order and for a further hearing.

The board says in its petition to the commission, that for many years there has been "for the most part adequate facilities" in the way of boats on the Great Lakes, and that the "rates have been regulated largely by supply and demand," but that since several of the railroads have disposed of their interests in boat lines, the effect has been "to decrease the supply of boats and enormously advance the charges for transportation of grain" via water to eastern ports from Chicago; that these conditions "threaten to disrupt the means of transportation on which many members of your petitioner have long been depending for the marketing of their commodities, and which the geographical location of the city of Chicago entitles said members to rely upon, and that the disruption of, and curtailment of said means of water transportation will be destructive of the business of, and highly injurious to your petitioner, various members in the city of Chicago and many cities and towns located in the interior of the United States, which have been for many years past accustomed to ship the products of the farm through the port of Chicago."

In its letter to other organizations the board says that as a result of the commission's order, the port of Chicago and other Lake Michigan and Lake Superior points will be without regular boat line service to and from the east for the transportation of package freight, and in addition thereto the shippers of bulk grain will be deprived of the use of the so-called package boat lines for carrying bulk grain to Buffalo. Already, it says, some of the boats have been withdrawn from service, and the rates have been increased, and there is not sufficient boat space for the accommodation of package freight.

THE LONDON & SOUTH-WESTERN ELECTRIFICATION.—The London & South-Western has recently inaugurated electric traction on its London suburban lines and the new electric trains will soon be running between Waterloo and Wimbledon. Their use will be extended later. The trains used consist of three cars—a motor car at each end with a trailer between. There are two motors of 275 h.p. each per motor car, so that the total rating per train is 1,100 h.p. This is a much higher allowance than on the Metropolitan District, which gives 500 h.p. for two cars (motor car and trailer), or on the London tube railways, which have 500 h.p. for three cars (motor car and two trailers). The London & South-Western electric rolling stock is, however, much larger and heavier than that of the other lines mentioned. The carriages are standard British railway bogie coaches, and this, taken with the weight of the electric equipment on two cars out of every three, produces a heavy train in proportion to the number of cars composing it. It is evident that on the South-Western lines it is intended to develop high speed between the stations and to have a high rate of acceleration after each stop. There ought to be a great improvement in schedule speed as compared with the leisurely jog-trot of the existing suburban steam trains, and in fact, the South-Western's suburban traffic should be revolutionized. *Railway Gazette, London.*

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The commission has suspended from November 1 to February 29 tariffs of seven New England roads proposing increased rates on milk and cream to Boston and other points.

Oral arguments on the application of the western railroads for advances in interstate passenger fares were presented before the Interstate Commerce Commission at Washington last week, by attorneys for the western railroads and by the representatives of the protesting state railway commissions.

The American Livestock Association, the National Wool Growers' Association, the Cattle Raisers' Association of Texas and the Corn Belt Meat Producers' Association have entered a protest with the Interstate Commerce Commission against granting a rehearing of the western rate advance case.

The Interstate Commerce Commission has extended from December 1 to December 15 the time within which railroads operating boat lines on the Great Lakes are required to dispose of their interests in the boats, in accordance with the commission's order of May 7, under the Panama Canal Act. The change was made to permit the companies to finish the navigation season.

Rates to La Crosse, Wis.

In re rates on agricultural implements and other commodities between La Crosse, Wis., and other points and St. Paul, Minn., and other points. Opinion by Commissioner Clements:

The commission finds that the carriers have not justified increased rates on agricultural implements, wagons, beer, conductor pipe, iron roofing, building and roofing paper, structural iron, linseed oil, etc., between La Crosse and other Wisconsin points taking the same rates and Minneapolis, St. Paul, Minnesota Transfer and Duluth, Minn., and other points.

The carriers contended that the existing rates were too low, and that the rates in this general section had recently been disturbed by the establishment in Minnesota of rates based upon mileage, and that this necessitated a readjustment in certain interstate rates, the proposed rates to and from La Crosse generally being the same as those established for the intrastate haul between Winona and the Minnesota points of origin or destination involved.

The commission believes, however, that there may be justification on a more adequate record for changes in the present adjustment of the rates involved in the present case. (36 I. C., 151.)

STATE COMMISSIONS

The Public Service Commission of New Hampshire has directed the railroads of the state to submit for approval regulations for providing stakes and wire for shipments of lumber on open cars. This order is in accordance with a law passed by the last legislature, designed to prohibit carriers from requiring shippers to bear the expense of stakes and wires. The idea of enforcing this rule as regards interstate shipments appears to have been given up.

COURT NEWS

Right to Build Across Highways

The Louisiana Supreme Court holds that a railroad company has an implied right to build across a highway, since otherwise the right granted by article 271 of the constitution "to construct and operate a railroad between any points within this state" would have to be abandoned. In exercising the right to cross, a railroad may obstruct the highway and the public be temporarily or perhaps permanently, compelled to find their own way around the obstruction; but such obstruction would not constitute an altering or changing, within the meaning of the statute.—*Police Jury v. Tremont & G. Ry. Co. (La.)*, 67 So. 829.

"Passenger Train" May Consist Mainly of Freight Cars

In a suit upon a contract under which a subscriber agreed to pay \$50 provided the railroad ran a regular passenger train along a specified route within two years, the Georgia Court of Appeals holds that a train operated on a fixed schedule is a "passenger train" within the meaning of the contract, if the train includes one or more cars for the accommodation and carriage of passengers under the regulations imposed by law for the transportation of passengers, notwithstanding it may include cars used exclusively for the transportation of freight.—*Power v. Gainesville & Northwestern (Ga.)*, 86 S. E. 61.

Income Tax—Lessee's Agreement to Pay

A railroad company leased its property to another company by a lease which provided that the lessee should "pay all taxes and assessments . . . upon the yearly payments herein agreed to be made by the party of the second part to the party of the first part for the payment or collection of which . . . the said party of the first part would otherwise be liable," and that the lessee should "pay all taxes . . . which, during the continuance of the term hereby demised, shall . . . be . . . imposed on the demised premises; . . . all payments required to be made by the party of the first part during the term of this indenture . . . shall be assumed and discharged by the party of the second part as if the party of the second part were primarily liable for the same." The Pennsylvania Supreme Court held that the lessor, having paid a tax under the federal income tax act on the income received under the lease, was entitled to recover it from the successor of the lessee.—*North Pennsylvania v. Reading (Pa.)*, 95 Atl. 100.

Passengers on Freight Trains—Degree of Care Required

In an action for personal injury due to a violent jolt while riding in a caboose, the Circuit Court of Appeals for the Eighth circuit holds that an instruction to the jury that under the laws of Arkansas the defendant was required to carry passengers for hire upon its local freight trains, but not required to equip its cabooses like passenger cars, that one traveling in the caboose of a local freight train is bound to know that it is subject to more violent jerks in stopping and starting than passenger trains, and that the plaintiff assumed the risk of injury from any usual or ordinary jerk, stated the law correctly.—*Kansas City Southern v. Clinton, C. C. A.*, 224 Fed. 896.

Independent Negligent Act of Employee

A railroad employee working at a coal chute coaling engines engaged in interstate commerce was injured while lifting the wheel of a coal buggy out of the hole it had broken in the rotten floor over which he was wheeling coal to the tippie. In an action against the railroad for his injuries the Alabama Supreme Court held that his act in lifting the buggy after it had fallen was an independent act and the proximate cause of the injury; and hence the negligence of the railroad company in failing to maintain a proper floor was not the continuous sequence proximately causing the injury, and it was not liable.—*Southern v. Peters, Ala.*, 69 So. 611.

Expert Evidence as to Type of Derail Required

A locomotive engineer was killed by derailment at a derailling switch where a side track nine miles long ran into the main track. In a suit for damages the fact was cited that some derailling switches are very short, these usually being used in yards, while others are from 50 ft. to 250 ft. long, being in the nature of diverging tracks and being used generally where main tracks come together; and it was claimed that this siding 9 miles long was of the nature of a main track. The court found, however, that the class to which a track should be assigned depended on the use made of it, rather than its length; and also found that the derail with the long diverging track was customarily used where trains might be expected to run at high speed. The United States Circuit Court of Appeals, second circuit, holds that the question of which type should have been used at this particular place was an engineering problem, which should not have been left to the jury's decision.—(*New York Central v. Banker, C. C. A.*, 224 Fed., 351).

Railway Officers

Executive, Financial, Legal and Accounting

E. R. Cassidy has been appointed claim agent of the New Orleans Great Northern, with office at Bogalusa, La., vice F. D. Blue, resigned.

Oliver G. Browne has been appointed assistant chief claim agent of the New York Central with headquarters at New York, vice Willis H. Failing, resigned, to accept service with another company.

Operating

John Wilfred Higgins, who has been appointed chairman of the General Managers' Association of Chicago and executive secretary of the Association of Western Railways, was born on

J. W. Higgins

October 12, 1864, at Newport, R. I. He entered railway service in October, 1879, as a messenger boy on the Illinois Central, and has since then held the following positions in railway service: June, 1881, to November, 1881, track laborer on the Illinois Central and the Toledo, Peoria & Western; December, 1881, to June, 1883, switchman on the Illinois Central; June, 1883, to August, 1883, telegraph operator; August, 1883, to October, 1884, freight and passenger brakeman and baggageman; October, 1884, to October, 1889, freight conductor; October, 1889, to April,

1890, chief clerk to the superintendent of the Chicago division; April, 1890, to December, 1891, trainmaster on the Centralia district of the Chicago division; December, 1891, to February, 1892, chief clerk to the general superintendent. From February to June, 1892, he was assistant superintendent of the Louisiana division, and from June, 1892, to January, 1893, superintendent of the same division. From January to April, 1893, he was superintendent of terminals of the Illinois Central and Yazoo & Mississippi Valley at New Orleans, La.; April, 1893, to April, 1896, superintendent of terminals at Chicago, Ill.; April, 1896, to April, 1899, superintendent of the Amboy division; May 1, 1899, to January 1, 1901, superintendent of transportation; January 1, 1901, to July, 1903, general superintendent of transportation of Illinois Central system. From September, 1903, to February, 1904, he was assistant superintendent of the Eastern division of the Grand Trunk; from February, 1904, to December, 1904, assistant superintendent of the Middle division of the same road; December, 1904, to March, 1905, inspector of transportation of the Missouri Pacific system; March 1, 1905, to January 1, 1912, assistant general manager, and from January 1, 1912, to November 1, 1915, general manager of the same system. His new appointment takes effect on November 1.

A. W. McClelland has been appointed chief dispatcher of the Northern Pacific with headquarters at Staples, Minn., vice A. M. Deverell, resigned. Effective October 1.

H. W. Gillette, assistant chief dispatcher of the Northern Pacific, has been promoted to chief dispatcher with headquarters at Jamestown, N. D., vice J. J. Mulroy, promoted. Effective October 1.

W. A. Kingsland, auditor of the Quebec lines of the Canadian Northern at Quebec, Que., has been appointed general superintendent of the Quebec lines with headquarters at Montreal, succeeding F. M. Spaidal, deceased.

Samuel Nicholson, trainmaster of the Norfolk & Western at Crewe, Pa., has been appointed assistant superintendent of the Norfolk division, with office at Petersburg, Va., and J. T. Ellett has been appointed trainmaster of the Norfolk division, with office at Crewe, vice Mr. Nicholson.

L. U. Morris, whose appointment as general superintendent of the El Paso & Southwestern has been announced, was born on November 7, 1873, at Winfield, Kan. He entered railway service on March 7, 1888, as office boy in the superintendent's office of the Atchison, Topeka & Santa Fe, at San Marcial, N. M. He remained with this road until September 18, 1905. During that time he successively held the following positions: telegraph operator, station agent, brakeman, conductor, trainmaster and division superintendent at Wellington, Kan. From September 18, 1905, until September, 1915, he was superintendent of the Eastern division of the El Paso & Southwestern, with headquarters at Tucumcari, N. M.

John J. Pelley, whose appointment as superintendent of the Yazoo & Mississippi Valley has been announced, entered the service of the Illinois Central as track apprentice on August 29, 1900. On August 1, 1904, he was appointed supervisor on the Indiana division, and on November 1, 1905, was transferred to the Memphis division of the Yazoo & Mississippi Valley. On January 15, 1908, he was appointed roadmaster on the Louisiana division of the Illinois Central, with headquarters at New Orleans, La. On June 6, 1911, he was transferred to the Tennessee division, and on May 10, 1912, was appointed superintendent of that division, with headquarters at Fulton, Ky. He remained there until September 15, 1915, when he was appointed to his present position.

P. J. Flynn, whose appointment as superintendent, districts 2 and 3, Central division, Canadian Northern, has been announced in these columns, was born at Fishers, N. Y., on November 22, 1872. He entered railway service on April 1, 1888, and since that time has held the following positions: until August 1, 1891, yard clerk of the Lehigh Valley, at Buffalo, N. Y.; from August 1, 1891, to April 1, 1892, night yardmaster same road, at Buffalo, N. Y.; from April 1, 1892, to January 24, 1894, yardmaster at the Tift Farm yards of the same road, at Buffalo, N. Y.; from January 24, 1894, to November 1, 1898, general yardmaster of the same road, at Manchester, N. Y. On November 1, 1898, he was appointed assistant trainmaster of the Pennsylvania division of the same road, and on April 1, 1901, was appointed general yardmaster, at Sayre, Pa.; from February 1 to August 1, 1905, he was general yardmaster for the New York, New Haven & Hartford, at Worcester, Mass.; from August 1, 1905, to February 1, 1907, he was general yardmaster in charge of terminals for the same road, at Providence, R. I.; from February 1, 1907, to October 1, 1908, general yardmaster in charge of terminals for the Lehigh Valley, at Buffalo, N. Y.; from October 1, 1908, to January 1, 1913, trainmaster of the same road, at Buffalo, N. Y. From January 1, 1913, to August, 1915, he was terminals manager, Winnipeg joint terminals, of the Canadian Northern, the Grand Trunk and the National Transcontinental, at Winnipeg, Man.

Traffic

F. P. Kinney has been appointed assistant general freight agent of the New York, New Haven & Hartford Railroad and the Central New England, with headquarters at New Haven, Conn.

W. T. Bennett has been appointed agriculturist of the Central of Georgia with office at Savannah, Ga., succeeding T. G. Chastain, and W. C. Shannon has been appointed commercial agent with headquarters at Philadelphia, Pa., vice F. A. MacBride.

Edward Eden, district freight agent of the Canadian Pacific, at Omaha, Neb., has been promoted to assistant export freight agent, with headquarters at Chicago, Ill. C. E. Decker has been appointed to the position left vacant by Mr. Eden. G. C. Cochran has been appointed district freight agent, with headquarters at Detroit, Mich., vice E. Olson, resigned.

Charles S. Lee, passenger traffic manager of the Lehigh Valley at New York, will retire from active service on October 31. Mr. Lee has been in continuous charge of the passenger traffic of this company for 22 years, and with the retirement of Mr. Lee the position of passenger traffic manager will be abol-

ished. A portrait of Mr. Lee and a sketch of his railway career were published in the *Railway Age Gazette* of December 4, 1914, page 1065.

C. H. Mitchell, general agent of the Chicago, Milwaukee & St. Paul at Duluth, Minn., has been appointed division freight and passenger agent at Great Falls, Mont., vice P. H. Scanlon, who has been appointed commercial agent at Helena, Mont. G. M. Bowman, commercial agent at Cincinnati, Ohio, succeeds C. H. Mitchell as general agent at Duluth, Minn. T. P. Casey, Canadian freight and passenger agent, with headquarters at Toronto, Ont., has been appointed commercial agent at Cincinnati, vice G. M. Bowman.

Richard Benjamin Miller, whose resignation as traffic manager of the Oregon-Washington Railroad & Navigation Company has been announced, was born at Silver City, Idaho, on April 8, 1870. He entered railway service in 1886 as office boy in the employ of the Oregon Railway & Navigation Company. From October 1, 1897, to September 1, 1901, he was assistant freight agent of the same company; from September 1, 1901, to May 15, he was general freight and passenger agent of the Southern Pacific lines in Oregon; from May 15, 1902, to January 1, 1910, general freight agent of the Oregon Railroad & Navigation Company; from September 15, 1905, to November 1, 1911, he was also general freight agent of the Southern Pacific lines in Oregon;

from January 1, to December 23, 1910, also traffic manager of the Oregon Railroad & Navigation Company and the Oregon-Washington Railroad; from December 23, 1910, to November 1, 1911, traffic manager of the Oregon-Washington Railroad & Navigation Company, a merger of the Oregon Railroad & Navigation Company and the Oregon-Washington Railroad; from November 1, 1911, when the O. W. R. & N. Company and the Southern Pacific were segregated, until November 1, 1915, traffic manager of the former road.

Engineering and Rolling Stock

L. E. Faulkner, division engineer of the Mississippi Central at Hattiesburg, Miss., has been appointed chief engineer with office at Hattiesburg.

J. E. Gould has been appointed master mechanic of the Charlotte Harbor & Northern with office at Arcadia, Fla., vice W. H. McAmis, resigned to accept service elsewhere.

A. L. Graburn, mechanical engineer of the Canadian Northern at Toronto, Ont., has been appointed assistant superintendent of rolling stock of the Eastern lines, with office at Toronto, Ont.

V. R. Walling, first assistant engineer of the Chicago & Western Indiana, has been appointed principal assistant engineer, in charge of construction and maintenance, with office at Chicago.

August Fredericks has been appointed roadmaster of the Chicago, Milwaukee & St. Paul at Elgin, Ill., to succeed W. H. Kofmehl, resigned to join the sales force of the Chicago Malleable Castings Company.

W. W. Greenland, assistant engineer of the Wabash at Moberly, Mo., has been appointed engineer maintenance of way of the Western division, with headquarters at Moberly. E. Shelah, formerly engineer maintenance of way of the Decatur division, has been appointed engineer maintenance of way of the Springfield division, with headquarters at Springfield, Ill.

A. E. Eager, superintendent of shops of the Canadian Northern, at Winnipeg, Man., has been appointed assistant superin-

tendent of rolling stock, with headquarters at the same city. A. McCowan, general car foreman, has been appointed supervisor of car work, at Winnipeg. H. W. Andrew, coach yard foreman at Winnipeg, has been appointed general car foreman, with headquarters at the same place, vice A. McCowan, promoted.

J. L. Hodgson, master car builder of the Grand Trunk, has been appointed general car foreman of the National Transcontinental, in charge of the car department at Transcona, Man., and of the car department at divisional points, Transcona to Ft. William inclusive, with office at Transcona. J. A. Mitchell has been appointed general foreman in charge of motive power, at Transcona.

C. E. Brooks, acting superintendent of motive power of the Grand Trunk Pacific, has been appointed superintendent of motive power, with office at Transcona, Man. He will also assume the duties of master car builder, J. L. Hodgson having resigned to enter the service of the National Transcontinental. E. Hacking, car foreman, at Prince George, B. C., has been appointed general car foreman, with headquarters at Transcona, Man. R. P. Graves, resident engineer, at Ft. William, Ont., has been transferred west of Winnipeg, Man.

Purchasing

C. E. Lepard, heretofore employed in the office of the locomotive foreman of the Canadian Northern at Regina, Sask., has been appointed division storekeeper, at that city, vice J. Butterfield, enlisted for active service.

OBITUARY

Thomas Powell Fowler, formerly from January, 1886, to September, 1912, president of the New York, Ontario & Western, died on October 12, at his summer home at Warwick, N. Y.

Mr. Fowler was born on October 26, 1851, at Newburgh, N. Y., and graduated from Columbia Law School. In 1879 he became a director of the Shenango & Allegheny, now a part of the Bessemer & Lake Erie. Two years later he was elected a director of the Lehigh & Hudson River and in 1883 became a director of the West Pennsylvania & Shenango Connecting. In March, 1884, he was appointed receiver of the Shenango & Allegheny, and later in the same month was elected president of that road, and in July of that year became a director of the New York, Ontario & Western. In 1886 he

became a director also of the Carthage & Adirondack. Mr. Fowler was elected president of the New York, Ontario & Western in January, 1886, resigning from that position, also as director of the same road, on September 25, 1912. A sketch of Mr. Fowler and of his work on the New York, Ontario & Western was published in the *Railway Age Gazette* of September 27, 1912, p. 582.

O. F. Cole, chief engineer of the Arkansas, Louisiana & Gulf, died at Crossell, Ark., on September 27.

Benjamin S. Cable, formerly general attorney of the Chicago, Rock Island & Pacific, was killed in an automobile accident at Ipswich, Mass., on September 27. A graduate of Yale and the Columbia Law School, he entered the practice of law in Chicago, and for a number of years, up to 1909, served the Rock Island lines as local attorney, assistant general attorney and general attorney. During the Taft administration he was assistant secretary of commerce and labor.

T. P. Fowler

Equipment and Supplies

LOCOMOTIVE BUILDING

THE ATCHISON, TOPEKA & SANTA FE is reported as contemplating the purchase of 30 Mikado type locomotives.

THE WABASH will install superheaters on 45 Mikado type locomotives at its Decatur, Ill., shops. It is now completing the installation of superheaters on 18 engines, thus making 63 altogether.

CAR BUILDING

THE ANACONDA COPPER MINING COMPANY is inquiring for 14 dump cars.

THE CINCINNATI, HAMILTON & DAYTON is inquiring for 500 underframes.

THE ATCHISON, TOPEKA & SANTA FE is inquiring for prices on 400 steel tie cars.

THE MISSOURI, KANSAS & TEXAS has been authorized by the court to purchase 200 ballast cars.

THE NEW YORK CENTRAL, reported in last week's issue of the *Railway Age Gazette* as having ordered 500 freight cars for the Michigan Central from the Haskell & Barker Car Company, ordered 500 automobile cars from this company.

THE CINCINNATI, INDIANAPOLIS & WESTERN, B. A. Worthington, general manager, Indianapolis, Ind., has issued tentative inquiries for 15 steel coaches, 3 steel postal cars, 9 steel baggage cars and 1 steel dining car. It is also formally inquiring for 20 eight-wheel caboose, 350 box, 80 flat, 50 hopper, 100 to 150 general service, 100 to 150 gondola, 50 stock and 100 automobile cars.

IRON AND STEEL

THE PITTSBURGH & LAKE ERIE has ordered 5,000 tons of rails from the Carnegie Steel Company.

THE NEW YORK, CHICAGO & ST. LOUIS has ordered 2,500 tons of rails from the Carnegie Steel Company.

THE JAMESTOWN RAILWAY has ordered 550 tons of structural steel from the Empire Structural Steel Company.

THE PHILADELPHIA & READING has ordered 3,000 tons of steel from the Pennsylvania Steel Company for a bridge at Sunbury, Pa.

THE ILLINOIS CENTRAL has ordered 1,000 tons of steel from the American Bridge Company for a car repair shop at Nonconnah, Tenn.

THE NORTHERN PACIFIC has ordered 813 tons of steel from the American Bridge Company for grade separation bridges at Spokane, Wash.

THE CHICAGO & MILWAUKEE ELECTRIC has ordered 225 tons of steel from the Wisconsin Bridge & Iron Company for a bridge near Milwaukee, Wis.

THE BALTIMORE & OHIO has divided an order for 62,500 tons of rails among the Maryland Steel Company, the Cambria Steel Company, the Carnegie Steel Company and the Illinois Steel Company.

BRITISH LOCOMOTIVE EXPORTS.—There was some improvement in August in the exports of locomotives from the United Kingdom, the increase occurring especially in shipments to British India. The value of the exports to the Argentine Republic rallied in August to \$220,000, as compared with \$45,000 in August, 1914, and \$450,000 in August, 1913. The aggregate value of the shipments in all directions in August was \$1,400,000, as compared with \$1,050,000 and \$1,500,000.

Supply Trade News

W. M. White has resigned as sales manager of The Esterline Company, of Indianapolis, Ind., manufacturers of "Golden Glow" headlights.

The Bucyrus Company, South Milwaukee, Wis., has opened an office at 900 Hibernian Building, Los Angeles, Cal., in charge of G. H. Hutchinson.

Fairbanks, Morse & Co. have been awarded a contract by the Detroit Terminal Railroad for a conveyor type coaling station of large capacity to be erected at North Detroit, Mich.

Ambrose N. Diehl has been appointed assistant superintendent of the Duquesne steel works of the Carnegie Steel Company, succeeding Edward J. Hamilton, recently made general superintendent.

Robert E. Belknap, whose appointment as district sales manager of the Pennsylvania Steel Company and the Maryland Steel Company at New York City was announced in this column

last week, graduated from Johns Hopkins University in 1897, and in the following year aided in the construction of the Eighth avenue and Sixth avenue underground trolley conduits for the Metropolitan Street Railway of New York city, as assistant to the engineer of the National Contracting Company. In 1901 he entered the employ of the Pennsylvania Steel Company and Maryland Steel Company. After a thorough training in the rail, frog and switch departments, billet mill, steel foundry and bridge shop, and the forging, machine and marine departments, he was attached to the general sales office at Steelton, Pa. In July, 1902, he came to the then new Chicago sales office as assistant sales agent and western representative, and in 1906 was made district sales manager. Mr. Belknap was president of the National Railway Appliances Association for the year 1911-12.

The Fargo Manufacturing Company, Inc., Poughkeepsie, N. Y., manufacturers of electrical connectors and cable grips, has opened a New York City office in the Vanderbilt Concourse building, 52 Vanderbilt avenue.

Early in the year Joseph T. Ryerson & Son announced a contest for a trade name for its line of tool steel. A \$100 prize was offered for the best name, and over 10,000 names were entered in the contest. The judges have decided on the word "Ryolite" as the winning name.

The Roberts & Schaefer Company, Chicago, has recently received a contract from the Nashville, Chattanooga & St. Loms for the construction of a modern fireproof reinforced concrete coaling plant at Cowan, Tenn. The plant will be designed to coal locomotives on four tracks and equipped with automatic electric elevating facilities supplying coal to a 250-ton storage pocket. The contract price is about \$17,500.

H. A. Varney, general sales manager of the National Boiler Washing Company, Chicago, has resigned to become manager of the railroad department of the Smith-Totman Company with offices in the People's Gas Building, Chicago. Mr. Varney was born at Spencer, Iowa, on September 9, 1877, and was educated at the public schools of his native city and at the Iowa Agricultural College. He came into the railway supply field in

R. E. Belknap

1906 as a member of the construction force of the W. L. Miller Heating Company. He joined the sales force of the National Boiler Washington Company in 1909, and was later promoted to the position with that company which he now resigns.

The Union Switch & Signal Company announces the appointment of George A. Blackmore as general sales manager in charge of the activities of the New York, Montreal and Atlanta offices, with headquarters at New York. Resident managers A. Dean and T. H. Patenall, of New York and Montreal, respectively, and sales engineer Brastow, of Atlanta, will report to him. He will eventually be located at Swissvale in charge of sales, construction and commercial engineering. A sketch and photograph of Mr. Blackmore appeared in the *Railway Age Gazette* of September 4, 1914, at the time he went to the Bryant Zinc Company, New York, as its vice-president.

TRADE PUBLICATIONS

FACTORY AND OFFICE EQUIPMENT.—The Manufacturing Equipment & Engineering Company, Boston, Mass., has recently issued three books relating respectively to the company's sanitary bubbling fountains, its line of sanitary washbowls and its metal lockers for factory, office and other use.

METHODS OF CONSTRUCTING LARGE CAPACITY DEEP WELLS.—The American Well Works has issued a bulletin explaining the advantages of drilled wells having a diameter as large as 30 in. The methods used in drilling these large diameter wells and the special equipment necessary are described in detail.

STEAM SHOVELS.—The American Steel Dredge Company, Fort Wayne, Ind., has issued Bulletin No. 10, describing the company's "single-line" revolving steam shovels. The booklet is well illustrated with both photographs and diagrams, and claims increased efficiency for the excavator through reduced friction and a wider digging angle.

KEROSENE TORCHES.—The Hauck Manufacturing Company, Brooklyn, N. Y., has recently issued bulletin No. 60, entitled, *Saving Ways in Busy Shops*, dealing with the company's burners and furnaces for kerosene and other oil fuel. The booklet contains a number of illustrations of the various burners and others showing the work which may be done by them.

SAVING SET-UPS IN RAILROAD SHOPS.—This is the title of a booklet which has recently been issued by the Lucas Machine Tool Company, Cleveland, Ohio. The booklet relates particularly to the Lucas "Precision" boring, drilling and milling machine and aims to show wherein that machine is productive of efficiency in the railroad shop. The catalog is well illustrated and attractively gotten up.

MINWAX PRODUCTS.—The Minwax Company, New York City, has issued Bulletin No. 1 of a proposed series, which gives briefly a description of its system of waterproofing, with the specifications; and photographs of the use of this material on numerous structures, including the Martin's Creek viaduct of the Lackawanna, this product being used on this structure as well as on the Tunkhannock viaduct.

FLUE TOOLS.—Gustav Wiedeke & Co., Dayton, Ohio, have recently issued a 96-page catalog descriptive of the Ideal flue tools manufactured by the company. The booklet describes and illustrates the line of Wiedeke Ideal tube expanders, cutters and accessories. Each tool mentioned is described and in connection with the description there are given specifications, price lists, and detailed views of the tool and its parts.

FIREPROOF FLOORS AND BEARING PARTITIONS OF PRESSED STEEL CONSTRUCTION.—This pamphlet issued by the Trussed Concrete Steel Company, Youngstown, Ohio, illustrates the use of a form of fire-resisting construction involving the use of Kahn pressed steel I-beams and H-studs. Fifteen standard sections are provided, of depths varying from 3 to 12 in. and having an appearance somewhat similar to the standard rolled I-beam. They are made of two pressed steel troughs riveted together back to back, the edges of the bases being turned in to a depth of $\frac{1}{2}$ in. The pamphlet illustrates the wide flexibility with which this form of structural material may be applied. In general, it is intended to covers the studs and beams on each side with a metal lath or mesh such as Hy-Rib, to facilitate the application of concrete surfaces.

Railway Construction

ATCHISON, TOPEKA & SANTA FE.—The report of this company for the year ended June 30, 1915, shows that the Minkler Southern, from Minkler, Cal., to Exeter, aggregating with two short branches, 43.71 miles, was completed and opened for traffic in October, 1914, and an extension from Exeter to Lindsay, 6.95 miles, has since been built, and placed in operation. The Oil Fields & Santa Fe was formed to buy certain lines extending from Cushing, Okla., to Pemeta, and from Jennings to Oilton, reaching the Cushing oil field. A line from Pemeta to Oilton, connecting these railroads and an extension from Pemeta to Drumright are now under construction, a total of about 27 miles, including the lines that have been bought and those now under construction. On the Northwestern Pacific, which is owned jointly by the Santa Fe and the Southern Pacific, track laying has been finished on the gap between Willets, Cal., and Shively, which are 105.64 miles apart, and the line was placed in operation in July, 1915.

ATHABASCA & FORT VERMILLION.—The preliminary survey being made for the line projected from Athabasca, Alta., northwesterly to Trout Lake and to Fort Vermillion, about 300 miles, has been made to Wabiscaw, it is said, and two possible points located for building a bridge over the Athabasca river. A. C. Galbraith, chief engineer. (June 25, p. 1497.)

DALLAS & SOUTHWESTERN TRACTION.—This company, which was organized to build an electric line from Dallas, Tex., south, has surveyors now in the field, it is said, locating the line from Dallas southwest via Cleburne, and Glen Rose to Stephenville, about 100 miles. It is said that financial arrangements have been made and construction work will be started as soon as survey now in progress between Stephenville and Glen Rose is finished. E. P. Turner, president, Dallas. (Aug. 13, p. 301.)

DENVER & RIO GRANDE.—This road is making a preliminary survey for a line from Alamosa, Colo., to Durango.

EDMONTON, DUNVEGAN & BRITISH COLUMBIA.—Track laying on the extension of this road is reported finished on a temporary bridge over the Big Smoky river at mileage 290 from Edmonton, Alta., and track laying is under way to the Spirit river, on 67 miles additional. A permanent bridge is being built over the Big Smoky river. The line is now in operation from Edmonton, Alta., to McLennan, 261.7 miles. Grading work on an additional line through the Grande Prairie district is under way on about 60 miles, and the company expects to have the track laying completed on this section during 1915. (July 30, p. 619.)

LULA-HOMER RAILROAD.—An officer writes that the plans call for building from Belton, Ga., southeast to Homer, thence east via Cinesville to Hartwell and then northeast to Anderson, S. C., 82 miles. Grading work has been finished on 73 per cent of the section from Lula to Homer. The contract for all the grading, erection of buildings and track laying, also for equipping the line, has been let to W. J. Redmond, Atlanta, Ga., and construction work will be started on October 15. Arrangements have been made to dispose of a bond issue of \$165,000 6 per cent 40-year gold bonds. C. J. Hood, president of the Northeastern Banking Association, is president of the railroad, Commerce, Ga. D. G. Ziegler, chief engineer, Lula, Ga. (March 26, p. 720.)

MINKLER SOUTHERN.—See Atchison, Topeka & Santa Fe.

NEW YORK SUBWAYS.—The New York Public Service Commission, First district, has approved the plans and form of contract for the reconstruction of the Brighton Beach elevated line in the borough of Brooklyn. This involves the reconstruction of the line from Church avenue north to Malbone street and the widening of this section from two to four tracks, also the reconstruction of three stations, at a cost of from \$750,000 to \$1,000,000. From Sheepshead Bay south the line is to be elevated into Coney Island and four-tracked. The line is also to be connected by a new two-track subway branch through Flatbush avenue at Malbone street with the Fourth avenue subway near the Long Island terminal at Atlantic and Flatbush avenues.

The commission has approved the contract and plans for the construction of foundations and structure of Section No. 2 of the Jamaica elevated extension. This comprises 2.2 miles of two-track elevated railroad from Walnut street along Jamaica avenue to Cliffside avenue. The commission has also approved the form of contract for the erection of steel for additional tracks on the Myrtle avenue line from Willoughby avenue to Palmetto street, and for certain additional work on the Lutheran Cemetery line.

NORTHWESTERN PACIFIC.—See Atchison, Topeka & Santa Fe.

OIL FIELDS & SANTA FE.—See Atchison, Topeka & Santa Fe.

SALT LAKE & OGDEN (ELECTRIC).—This road is laying a second track between Orchard station, Utah, and Clinton station, a distance of about three miles. Grading has been completed and rails will be laid upon receipt of ties. A combined roadway and aqueduct overhead crossing will be built to eliminate a grade crossing. The viaduct will be 40 ft. long and will be built by company forces. Bids for steel opened on October 5.

SOUTH CAROLINA ROADS (ELECTRIC).—Surveys have been made for a line to be built from Sumter, S. C., east via Goodwill, in Shiloh township, to Turbeville, thence northeast to Olanta, 32 miles. The line may eventually be extended from Olanta southeast to Lake City, in all about 47 miles. Rights of way have been secured on about 75 per cent of the section between Olanta and Sumter, and free station sites and terminal sites will be guaranteed on this section. The Chamber of Commerce of Sumter has paid for the necessary surveys and owns the title to three-fourths of the right of way, and is looking for capital to build and operate the line. The promoters expect that the line will develop a traffic in timber, cotton, corn, tobacco, livestock and general farm products. Residents of Sardinia, in Clarendon county, about four miles from Turbeville, want a branch built north to Turbeville. E. I. Reardon is managing secretary of the Chamber of Commerce at Sumter. (Oct. 8, p. 670.)

SOUTH DAKOTA & WESTERN.—This company has filed articles of incorporation in South Dakota with a capital of \$1,000,000 and headquarters at Yankton. The plans call for building from Mitchell, in Davison county, S. D., southwesterly through Davison, Aurora, Douglas and Charles Mix counties to Platte in that county, thence northwest to a point in Brule county near Chamberlain, about 80 miles. The incorporators included W. L. Bruce, W. E. Heaton, A. A. Loft, E. A. Bruce and J. J. Orr, all of Yankton, S. D.

ST. JOHN & QUEBEC.—The Provincial government of New Brunswick has taken over the charter of this company and after an adjustment and settlement of outstanding claims arising out of the construction of the 120 miles between Gagetown, N. B., and Centreville have been arranged, will complete the construction of the line. The company was organized to build from Grand Falls, N. B., southeast following the St. John river to St. John, about 210 miles. The sections yet to be built are from Centreville north to Grand Falls and from Gagetown south to St. John. The section from Fredericton to Centreville, 88 miles, is now being operated by the Canadian Government Railways. (June 4, p. 1182.)

RAILWAY STRUCTURES

BEAUMONT, TEX.—This city is asking for bids on the construction of a proposed municipal freight terminal. Bids will be received on November 2, and specifications provide that the terminal must be completed by February 15, 1916.

KANSAS CITY, MO.—James Stewart & Co. of New York have been awarded a contract for the superstructure of a new addition to the Chicago, Milwaukee & St. Paul elevator. The improvement involves reinforced concrete construction and will cost in the neighborhood of \$65,000.

MARSHALL, TEX.—The Texas & Pacific is preparing plans for new shops to replace those destroyed recently by fire.

NASHOTAH, WIS.—The Chicago, Milwaukee & St. Paul has awarded a contract for a new station to Gunder Anderson of Oconomowoc, Wis. It will be a tile and concrete structure and will cost about \$10,000.

Railway Financial News

CAROLINA, ATLANTIC & WESTERN.—See Seaboard Air Line.

HOCKING VALLEY.—Kuhn, Loeb & Co. and the National City Bank, both of New York, bought from the Hocking Valley and sold to the public \$4,000,000 two-year 5 per cent notes. The proceeds will be used to pay off a like amount of one-year 6 per cent notes which mature November 1.

LEXINGTON & EASTERN.—See Louisville & Nashville.

LOUISVILLE & NASHVILLE.—The Lexington & Eastern, which runs from a point on the Louisville & Nashville to a point in the eastern Kentucky coal fields, about 100 miles, has been taken over by the Louisville & Nashville.

George C. Jenkins, of Baltimore, has been elected a director of the Louisville & Nashville, succeeding Michael Jenkins.

MISSOURI PACIFIC.—The Union Trust Company of New York, as trustee of the first and refunding mortgage of the St. Louis, Iron Mountain & Southern, has begun suit in the federal district court at St. Louis to foreclose this mortgage.

SEABOARD AIR LINE.—Directors approved the consolidation of the Seaboard Air Line with the Carolina, Atlantic & Western. Common stock of the new company to the amount of \$40,041,000 is to be issued in equal exchange for the old Seaboard stock, of which there is \$37,516,000, and for the Carolina, Atlantic and Western stock, of which there is \$2,525,000. Of the \$27,280,000 new preferred stock \$2,280,000 is to be exchanged for an equal amount of the 5 per cent refunding bonds of the Carolina, Atlantic & Western. This stock is to bear 6 per cent non-cumulative dividends. The balance is to be exchanged for an equal amount of old Seaboard preferred. The dividend rate on this class of new preferred will be the same as at present, 4 per cent regular, with an additional 2 per cent after 4 per cent is paid on the common.

WABASH.—The Wall Street Journal comments on the Wabash reorganization as follows:

A total of \$39,498,928 first refunding and extension 4 per cent bonds out of a total issue of \$40,600,000 were deposited with the reorganization committee under an agreement to underwrite the cash assessment not subscribed for by the stockholders. After it was determined how many stockholders had paid their assessments it was announced that the proportion of the total assessment required from the refunding 4 per cent bondholders would be \$654.82 per \$1,000 bond, indicating that only about 4 per cent of the stockholders paid their assessment and that the bondholders were therefore obligated for the payment of the balance of the \$27,720,000 cash to be raised by assessment or for a total of \$26,583,480.

Out of the \$39,498,928 deposited bonds which agreed to underwrite the cash assessment, 98.5 per cent have either paid in the initial instalment of 10 per cent or have paid their obligation in full. The 1.5 per cent which have not paid so far, probably represents deferred payments which will be received in the course of a few days, inasmuch as the final day for receiving payment was only last Saturday. It is expected that eventually all the deposited bonds will make payment, inasmuch as no protest of any kind has been received from any bondholders concerning the plan of reorganization or the amount of the payment which fell upon them. The very small amount of undeposited bonds is said to represent foreign and isolated holdings that cannot be reached.

FREIGHT TRAFFIC RECEIPTS OF GERMAN STATE RAILWAYS.—It is reported from Berlin that the freight traffic of the German State railways to the end of the first year of war has almost reached the normal amount of the previous year. In August, 1914, they amounted to 41.6 per cent of the previous year; in January, 1915, 90.1 per cent; June, 1915, 96.1 per cent, and in July, 1915, 97.6 per cent of the previous year. If the frontier region traffic, which, owing to the state of war, has specially suffered, say about 2 per cent be deducted, then the figure for the previous year is almost exactly the same.

ANNUAL REPORT

ATCHISON, TOPEKA & SANTA FE RAILWAY COMPANY—TWENTIETH ANNUAL REPORT

OFFICE OF
THE ATCHISON, TOPEKA & SANTA FE RAILWAY SYSTEM
No. 5 Nassau Street, New York City

SEPTEMBER 14, 1915.

To the Stockholders:

Your Directors submit the following report for the fiscal year July 1, 1914, to June 30, 1915, inclusive:

The Lines comprising the Atchison System, the operations of which are embraced in the following statements, are as follows:

	June 30, 1915	June 30, 1914
Atchison, Topeka & Santa Fe Railway.....	8,513.48 miles	8,339.72 miles
Rio Grande, El Paso & Santa Fe Railroad...	20.22 "	20.22 "
Gulf, Colorado & Santa Fe Railway.....	1,937.71 "	1,595.89 "
Pecos & Northern Texas Railway.....	665.02 "	569.79 "
Panhandle & Santa Fe Railway.....	665.02 "	179.16 "
Texas & Gulf Railway	665.02 "	125.49 "
Gulf & Interstate Railway of Texas.....	665.02 "	71.33 "
Concho, San Saba & Llano Valley Railroad..	665.02 "	59.63 "
	<u>11,136.43</u> "	<u>10,961.23</u> "

Increase during the year 175.20 miles.

The average mileage operated during the fiscal year ending June 30, 1915, was 11,114.52 miles, being an increase of 206.00 miles as compared with the average mileage operated during the preceding fiscal year.

Under leases effective July 1, 1914, the lines of the Pecos & Northern Texas Railway north of Sweetwater, Texas, were operated by the Panhandle & Santa Fe Railway, and the lines of the Texas & Gulf Railway, Gulf & Interstate Railway of Texas, Concho, San Saba & Llano Valley Railroad and Pecos & Northern Texas Railway south of Sweetwater by the Gulf, Colorado & Santa Fe Railway.

In addition to lines covered by this report there were completed on June 30, 1915, 25.70 miles of additional line, all of which will be ready for operation in the near future.

The Company also controls, through ownership of stocks and bonds, other lines aggregating 228.92 miles, and is interested jointly with other companies in 606.08 miles.

For detailed statement of present mileage and of changes in mileage since last Annual Report, see pages 43 to 47.

INCOME STATEMENT

The following is a summary of the transactions of the System for the years ending June 30, 1914, and 1915:

	1914	1915
Operating Revenues	\$111,109,769.86	\$117,665,587.46
Operating Expenses	73,469,333.68	76,091,553.69
Net Operating Revenue	\$37,640,436.18	\$41,574,033.77
Taxes	5,525,585.30	5,497,316.77
Uncollectible Railway Revenues.....	25,316.43
Operating Income	\$32,114,850.88	\$36,051,400.57
Other Income	2,174,353.12	2,997,150.47
Gross Corporate Income	\$34,289,204.00	\$39,048,551.04
Rentals and Other Charges (see note)....	1,218,827.08	2,131,942.03
Interest on Bonds, including accrued interest on Adjustment Bonds	\$33,070,376.92	\$36,916,609.01
Net Corporate Income (representing amount available for dividends and surplus and for necessary but unproductive or only partially productive expenditures)	\$20,183,964.69	\$24,130,861.91
From the net corporate income for the year the following sums have been deducted:		
DIVIDENDS ON PREFERRED STOCK—		
No. 33 (2½%) paid Feb. 1, 1915	\$2,854,343.25	
No. 34 (2½%) paid Aug. 2, 1915	2,854,343.25	
	\$5,708,686.50	
DIVIDENDS ON COMMON STOCK—		
No. 37 (1½%) paid Sept. 1, 1914	\$2,942,407.50	
No. 38 (1½%) paid Dec. 1, 1914	2,942,632.50	
No. 39, (1½%) paid Mar. 1, 1915	2,959,147.50	
No. 40 (1½%) paid June 1, 1915	2,997,142.50	
	11,841,330.00	
Appropriation for Fuel Reserve Fund	54,502.78	
California-Arizona Lines Bonds Sinking Fund	12,945.67	
Appropriated for Additions and Betterments	6,513,396.96	
	\$24,130,861.91	
Surplus to credit of Profit and Loss June 30, 1914.....	\$20,569,800.81	
Additions to Profit and Loss Account (Sundry Adjustments)	11,421.10	
Surplus to credit of Profit and Loss June 30, 1915.....	\$20,581,221.91	

NOTE. The increase of \$913,114.95 in "Rentals and Other Charges" occurs chiefly in the item "Hire of Equipment," due mainly to the large grain crop and the necessity for using "foreign" cars to a greater extent than usual in handling it.

Income from sources other than earnings from operation consisted of interest on cash in banks and sums collected as interest and dividends upon bonds and stocks of companies, the operations of which are not included in the System accounts.

CAPITAL EXPENDITURES AND REDUCTION OF BOOK VALUES

The total charges to Capital Account, as shown by the General Balance Sheet, page 26, at June 30, 1915, aggregated \$683,855,314.09 as compared

with \$671,814,299.94 at June 30, 1914, an increase during the year of \$12,041,014.15, which analyzes as follows:

Construction and acquisition of new mileage, including the acquisition of bonds and stocks of other railway and terminal companies:		
Dodge City & Cimarron Valley Ry.....	\$11,430.34	
Eastern Ry. of New Mexico	5,243.10	
Grand Canyon Ry.....	18,405.75	
Minkler Southern Ry.....	370,888.27	
Oil Fields & Santa Fe Ry.....	370,072.20	
Northwestern Pacific R. Ry.....	155,800.00	
Rocky Mountain & Santa Fe Ry.....	3,000,000.00	
Union Passenger Depot Co. of Galveston...	292,565.87	
Verde Valley Ry.....	24,000.00	
	\$4,248,405.53	
Additions and Betterments—System Lines:		
Fixed Property	\$5,115,796.42	
Additional Equipment	2,464,431.34	
Betterments to Equipment	21,121.05	
	7,601,348.81	
Fuel Lands and Other Properties:		
Real Estate held for future use.....	\$154,038.72	
Tie and Timber Lands	23,700.91	
Miscellaneous Items	112,757.67	
	290,497.30	
Other Investments	219,689.34	
Total Charges	\$12,359,940.98	
Reduction of Book Values:		
California, Arizona & Santa Fe Ry.....	\$4,299.11	
San Francisco Terminal Property.....	6,000.00	
Western Oklahoma Ry.....	44,645.10	
Ice Plant, Belen	12,000.00	
Ice Plant, San Bernardino.....	59,792.89	
Santa Barbara Tie & Pole Co.....	7,189.73	
Fuel Lands	185,000.00	
	318,926.83	
Net Increase in Capital Account during the year.....	\$12,041,014.15	

The item of \$2,464,431.34 for "Additional Equipment" analyzes as follows:	
727 Freight-Train Cars	\$907,775.40
142 Passenger-Train Cars	2,455,292.99
1,927 Miscellaneous Work Cars	250,114.36
5 Miscellaneous Equipment	2,793.97
	\$3,615,976.72
Less—Value of Equipment retired during the year as follows:	
47 Locomotives	\$198,078.47
2,789 Freight-Train Cars	881,085.34
10 Passenger-Train Cars	30,259.48
107 Miscellaneous Work Cars	37,381.97
Adjustment of charges for locomotives received in prior year....	4,740.12
	\$1,151,545.38
	\$2,464,431.34

Net Increase in Capital Account during the year.....\$12,041,014.15

The item of \$2,464,431.34 for "Additional Equipment" analyzes as follows:

727 Freight-Train Cars	\$907,775.40
142 Passenger-Train Cars	2,455,292.99
1,927 Miscellaneous Work Cars	250,114.36
5 Miscellaneous Equipment	2,793.97
	\$3,615,976.72
Less—Value of Equipment retired during the year as follows:	
47 Locomotives	\$198,078.47
2,789 Freight-Train Cars	881,085.34
10 Passenger-Train Cars	30,259.48
107 Miscellaneous Work Cars	37,381.97
Adjustment of charges for locomotives received in prior year....	4,740.12
	\$1,151,545.38
	\$2,464,431.34

The 1,927 miscellaneous work cars included in equipment added and the 2,789 freight-train cars reported as retired include 1,925 cars, which, being permanently assigned to work service, were relettered in work service equipment series during the year and transferred from freight equipment to work service equipment at their depreciated value at time of relettering.

In addition to the equipment reported retired as above, 33 freight-train cars leased from the Oklahoma Central Railroad Co. were also retired during the year and liability therefor included in Other Unadjusted Credits in the General Balance Sheet.

MAINTENANCE OF EQUIPMENT

The following statement shows the sums charged to Operating Expenses for Maintenance of Equipment during each year since July 1, 1896:

Year ending June 30	Average Operated Mileage	Total Expenditure	Expenditure per Mile
1897	6,443.81	\$3,443,884.82	\$534.45
1898	6,936.02	4,659,277.99	671.75
1899	7,032.62	4,810,795.64	684.07
1900	7,341.34	5,267,832.40	717.56
1901	7,807.31	6,257,456.57	801.49
1902	7,855.38	7,864,951.25	1,001.22
1903	7,965.13	8,510,543.09	1,068.48
1904	8,179.59	10,006,135.41	1,223.31
1905	8,305.40	10,914,864.47	1,314.19
1906	8,433.99	10,720,040.43	1,271.05
1907	9,273.15	11,779,846.64	1,270.32
1908	9,415.01	14,246,621.44	1,513.18
1909	9,794.86	13,903,897.37	1,419.51
1910	9,916.33	15,560,047.44	1,569.13
1911	10,350.13	16,686,145.45	1,612.17
1912	10,627.92	16,521,231.41	1,554.51
1913	10,750.31	19,415,224.63	1,806.02
1914	10,908.52	19,100,724.51	1,750.99
1915	11,114.52	19,764,535.40	1,778.26

For the year ending June 30, 1915, maintenance charges, including renewals and depreciation, averaged as follows:

Per locomotive	\$4,600.26
Per freight car	1.674
Per passenger car	128.99
Per freight car mile	0.119
Per passenger car, including mail and express.....	1,203.56
Per passenger car mile	0.139

The foregoing average maintenance charges include a proportion of unlocated expenditures for Maintenance of Equipment charged to Superintendence, Shop Machinery, Injuries to Persons, Insurance, Stationery and Printing, Other Expenses, and Maintaining Joint Equipment at Terminals. Refrigerator cars are not taken into consideration in arriving at freight car averages, such cars being operated by The Santa Fe Refrigerator Despatch Company, which bears the expense of their maintenance.

MAINTENANCE OF WAY AND STRUCTURES

The following statement shows the sums charged to Operating Expenses for Maintenance of Way and Structures during each year since July 1, 1896:

Year ending June 30.	Average Operated Mileage.	Total Expenditure.	Expenditure per Mile.
1897	6,443.81	\$6,282,923.15	\$975.03
1898	6,936.02	8,281,397.88	1,193.97
1899	7,032.62	7,672,107.62	1,090.93
1900	7,341.34	6,354,372.10	865.56
1901	7,807.31	6,433,840.36	824.08
1902	7,855.38	6,141,466.39	781.82
1903	7,965.13	9,304,892.04	1,168.20
1904	8,179.59	9,170,234.07	1,121.11
1905	8,305.40	11,385,418.33	1,370.85
1906	8,433.99	12,475,407.97	1,479.18
1907	9,273.15	15,286,062.66	1,648.42
1908	9,415.01	14,120,828.02	1,499.82
1909	9,794.86	12,884,406.81	1,315.43
1910	9,916.33	17,807,136.20	1,795.74
1911	10,350.13	16,059,786.90	1,551.65
1912	10,627.92	16,076,833.75	1,512.70
1913	10,750.31	18,054,413.03	1,679.43
1914	10,908.52	15,308,780.25	1,403.38
1915	11,114.52	16,514,467.89	1,485.85

COMPARISON OF OPERATING RESULTS

The following is a statement of revenues and expenses of the System for the fiscal year ending June 30, 1915, in comparison with the previous year:

	Year Ending June 30, 1915.	Year Ending June 30, 1914.	Increase.	Decrease.
OPERATING REVENUES:				
Freight	\$80,504,393.33	\$73,638,388.01	\$6,866,005.32	
Passenger	27,823,063.87	28,497,232.68		\$674,168.81
Mail, Express and Miscel.	9,338,130.26	8,974,149.17	363,981.09	
Total Operating Revenues	\$117,665,587.46	\$111,109,769.86	\$6,555,817.60	
OPERATING EXPENSES:				
Maintenance of Way & Structures	\$16,514,467.89	\$15,425,729.81	\$1,088,738.08	
Maintenance of Equipment	19,764,535.40	19,213,342.69	551,192.71	
Traffic	2,649,174.86	2,521,773.79	127,401.07	
Transportation—Rail Line	34,827,705.34	33,899,108.43	928,596.91	
General	2,476,595.20	2,409,378.96	67,216.24	
Transportation for Invest.—Cr.	140,925.00			\$140,925.00
Total Operating Expenses	\$76,091,553.69	\$73,469,333.68	\$2,622,220.01	
Net Operating Revenue	\$41,574,033.77	\$37,640,436.18	\$3,933,597.59	
Ratio of Operating Expenses to Operating Revenues.	64.67	66.12		1.45

Credits in italics.
NOTE.—The Operating Expenses by general accounts used for comparative purposes are not the same as shown in the last annual report, but are revised in accordance with Classification of Operating Expenses as prescribed by the Interstate Commerce Commission, effective July 1, 1914.

The average tons of freight (revenue and company) per loaded car mile increased from 18.75 to 19.71, or 5.12 per cent.

The average tons of freight (revenue and company) carried per freight-train mile (freight and mixed) increased from 420.45 to 442.04, or 5.13 per cent.

The average freight revenue per freight-train mile increased from \$3.47 to \$3.55, or 2.31 per cent.

The average passenger revenue per passenger-train mile decreased from \$1.17 to \$1.09, or 6.84 per cent.

The average passenger train revenue per passenger-train mile decreased from \$1.45 to \$1.37, or 5.52 per cent.

The tons of freight carried one mile (revenue and company) increased 1,099,152,546, or 12.33 per cent., while miles run by freight cars (loaded and empty) in freight and mixed trains increased 66,620,201, or 9.82 per cent., and the mileage of such trains increased 1,450,897, or 6.84 per cent.

The number of passengers carried one mile increased 31,618,391, or 2.41 per cent., while miles run by passenger cars in passenger and mixed trains increased 10,362,341, or 7.41 per cent., and the mileage of such trains increased 1,213,955, or 4.98 per cent.

While freight operating revenues increased 9.32 per cent., the freight service rendered, as measured by tons transported one mile, increased 12.33 per cent.; and while earnings from passengers carried decreased 2.37 per cent., the passenger service rendered, as measured by passengers carried one mile, increased 2.41 per cent.

The following is a consolidated statement of the business of the System for each fiscal year during the period since January 1, 1896:

Fiscal Year Ending June 30.	Average Miles Operated.	Gross Revenues, Including Income from Other Sources.	Expenses, Including Taxes, Rentals and Other Charges.	Interest on Bonds.	Net Corporate Income.
1897 (18 mos.)	6,443.81	\$44,532,628.99	\$36,038,455.30	\$8,440,387.91	\$5,1785.78
1898	6,936.02	39,396,126.41	30,513,553.17	7,045,988.30	1,836,584.94
1899	7,032.62	40,762,933.47	29,332,964.11	7,241,972.00	4,187,997.36
1900	7,341.34	46,498,899.04	29,414,427.56	7,345,166.50	9,739,304.98
1901	7,807.31	54,807,379.78	34,502,039.87	7,830,810.83	12,474,529.08
1902	7,855.38	60,275,944.33	36,272,432.45	8,438,985.00	15,564,526.88
1903	7,965.13	63,668,390.99	40,635,576.48	9,134,485.24	13,898,329.27
1904	8,179.59	69,419,975.41	44,641,434.10	9,418,770.00	15,359,771.31
1905	8,305.40	69,189,739.65	47,815,883.50	9,611,510.09	11,742,346.06
1906	8,433.99	79,390,749.05	51,035,355.71	10,622,181.20	17,733,209.12
1907	9,273.15	94,436,574.08	61,779,916.16	11,487,934.70	21,168,723.82
1908	9,415.01	91,289,770.61	65,031,582.67	12,579,301.77	13,678,886.17
1909	9,794.86	95,424,091.89	61,458,019.13	13,548,081.93	20,417,990.81
1910	9,916.33	107,543,250.16	75,133,314.54	11,984,151.36	20,425,784.26

Fiscal Year Ending June 30.	Average Miles Operated.	Gross Revenues, Including Income from Other Sources.	Expenses, Including Taxes, Rentals and Other Charges.	Interest on Bonds.	Net Corporate Income.
1911	10,350.13	109,772,481.69	75,689,094.83	12,712,319.31	21,371,067.55
1912	10,627.92	110,322,328.13	77,001,227.38	13,660,859.50	19,660,241.25
1913	10,750.31	119,411,875.94	83,432,816.21	13,825,325.50	22,153,734.33
1914	10,908.52	113,284,122.98	80,213,746.06	12,886,412.23	20,183,964.69
1915	11,114.52	120,662,737.93	83,746,128.92	12,785,747.10	24,130,861.91

The following statement shows the gross operating revenues of the System (exclusive of income from other sources) per mile of road operated for each fiscal year since July 1, 1896:

Year Ending June 30.	Gross Operating Revenues.	Average per Mile of Road.
1897	\$30,621,230.10	\$4,752.04
1898	39,214,099.24	5,653.69
1899	40,513,498.63	5,760.80
1900	46,232,078.23	6,297.49
1901	54,474,822.61	6,977.41
1902	59,135,085.53	7,527.97
1903	62,350,397.28	7,827.92
1904	68,171,200.18	8,334.31
1905	68,375,837.25	8,232.70
1906	78,044,347.25	9,253.55
1907	93,683,406.91	10,102.65
1908	90,617,796.38	9,624.82
1909	94,265,716.87	9,624.00
1910	104,993,194.67	10,587.91
1911	107,565,115.62	10,392.63
1912	107,752,359.91	10,138.61
1913	116,896,251.98	10,873.75
1914	111,109,769.86	10,185.60
1915	117,665,587.46	10,586.65

The following statement shows the development of the freight and passenger revenues of the System since July 1, 1896:

Year Ending June 30.	Freight Revenue.	Passenger Revenue.
1897	\$22,067,686.77	\$5,574,288.31
1898	28,588,716.76	7,347,361.59
1899	29,492,586.63	8,126,141.85
1900	33,729,332.83	9,334,661.57
1901	39,052,557.43	11,678,017.25
1902	41,815,607.05	13,439,384.57
1903	44,622,438.71	13,469,985.78
1904	47,762,653.23	15,433,773.63
1905	47,408,982.36	16,045,380.27
1906	54,598,902.82	18,013,988.56
1907	65,500,309.42	21,171,629.08
1908	61,848,638.51	21,643,427.49
1909	64,212,638.10	22,734,505.32
1910	71,194,055.59	25,437,181.98
1911	71,787,200.89	27,204,867.66
1912	71,529,574.67	27,453,525.41
1913	78,190,923.18	29,425,922.44
1914	73,638,388.01	28,497,232.68
1915	80,504,393.33	27,823,063.87

PROPERTY INVESTMENT AND RATE OF RETURN.

The development of the Company's business and of its efficiency have been due principally to the very large expenditures (over \$308,000,000) which have been made in the extension and improvement of the property since January 1, 1896. In order to make such expenditures, your Company has raised since 1896 over \$218,000,000 of "new money" by the sale of bonds which are now outstanding or which (in the case of many of the Convertible Bonds sold) are represented by Common Stock now outstanding.

The following statement shows, for each year, the amount of investment, the amount of net income applicable to bond interest, dividends, improvement of property and strengthening of credit, and the rate of return which such net income represents on the amount of the investment.

Year Ending June 30.	Property Investment.*	Income Applicable to Bond Interest, Dividends, Improvement of Property and Strengthening of Credit.†	Per Cent. of Property Investment.
1896 (6 months)	\$372,104,262.77	\$2,432,870.06	.65
1897	387,957,477.68	6,070,364.45	1.57
1898	392,169,842.02	8,871,947.26	2.26
1899	399,527,444.30	11,409,315.36	2.86
1900	407,187,811.22	17,064,850.91	4.19
1901	419,541,440.17	21,106,714.38	5.05
1902	439,911,035.33	23,921,018.14	5.44
1903	454,290,057.89	23,032,814.51	5.07
1904	466,273,139.34	24,778,541.31	5.31
1905	473,020,998.79	21,353,856.15	4.51
1906	496,782,342.35	28,355,393.34	5.71
1907	519,004,129.48	32,724,274.07	6.31
1908	541,727,328.96	25,633,510.34	4.73
1909	548,251,270.97	33,523,437.28	6.11
1910	585,948,031.56	32,387,712.39	5.53
1911	620,833,307.37	34,102,511.86	5.49
1912	635,182,282.35	33,321,100.75	5.25
1913	657,128,078.35	36,078,744.55	5.49
1914	671,814,299.94	33,070,376.92	4.92
1915	683,855,314.09	36,928,030.11	5.40
Annual Average	\$508,625,494.75	\$24,436,276.11	4.90

*The amounts above shown as "Property Investment" do not include anything for necessary working capital such as materials and supplies and cash. Ordinarily such necessary working capital considerably exceeds \$35,000,000.

†In the years 1901 to 1908 the "Property Investment" was reduced by "writing off" sums aggregating \$21,066,685.78, which sums are excluded from the "Property Investment" as above stated.

The figures for the years 1910 to 1914, inclusive, are not the same as shown in the corresponding table of annual report for the previous year, but are revised to conform to the Interstate Commerce Commission's classification of "General Balance Sheet Accounts," effective July 1, 1914.

†The "Income" shown above is determined after allowing for adjustments made through profit and loss.

The striking fact emphasized by the foregoing statement is that the earnings on the entire investment are now not much more than five per cent.

per annum, and it must be borne in mind that of these earnings it is necessary to appropriate a considerable amount each year for additions and betterments to preserve the Company's credit.

The ability of your Company, under the conditions which this statement exhibits, to pay six per cent. on the common stock, is due to the fact that it pays an average of only slightly more than four per cent. on its bonded debt, much of the bonded debt having been created when money could be obtained at or near four per cent.

CAPITAL STOCK AND FUNDED DEBT.

The outstanding Capital Stock (deducting stock in treasury) on June 30, 1914, consisted of:

Common	\$195,811,500.00	
Preferred	114,173,730.00	
		\$309,985,230.00

Issued during the year:

Common Stock issued in exchange for Convertible Bonds retired	4,678,000.00
---	--------------

Capital Stock outstanding June 30, 1915:

Common	\$200,489,500.00
Preferred	114,173,730.00
	<u>\$314,663,230.00</u>

The outstanding Funded Debt of the System (deducting bonds in the treasury) amounted on June 30, 1914, to..... \$313,193,648.50

The following changes in the Funded Debt occurred during the year:

Obligations Issued:

Convertible 4% Bonds.....	\$ 977,000.00	
Rocky Mountain Division 4% Bonds.....	3,000,000.00	
California-Arizona Lines First and Refunding Mortgage 4½% Bonds.....	10,866.90	3,987,866.90

Obligations Purchased or Retired:

Serial Debenture 4% Bonds.....	\$5,000.00	
Convertible 4% Bonds.....	4,678,000.00	
California-Arizona Lines First and Refunding Mortgage 4½% Bonds.....	9,733.00	
Chicago & St. Louis Ry. Co. First Mortgage 6% Bonds	1,498,000.00	
Funded Debt Matured Unpaid included in General Balance Sheet under "Current Liabilities"	15,500.00	6,206,233.00

Decrease of Funded Debt..... \$ 2,218,366.10

Total System Funded Debt outstanding June 30, 1915..... \$310,975,282.40

Interest charges for year ending June 30, 1916, will be approximately \$12,678,840, or an average monthly charge of about \$1,056,570. In making this approximation, exchanges of Convertible Bonds for Common Stock made since June 30, 1915, aggregating \$2,007,000, are considered.

TREASURY.

Neither this Company nor any of its auxiliaries has any notes or bills outstanding.

The Company held in its treasury on June 30, 1915, \$21,186,791.95 cash, and had available \$5,278,000 General Mortgage Bonds, including bonds not yet certified by the Trustee. The Company also has in the treasury unpledged a large amount of stocks and bonds of other companies, of which part are carried in the balance sheet as Investments and part are included under Railroads, Franchises and Other Property.

During the year \$977,000 of Convertible Four Per Cent. Bonds, which formed part of the Company's treasury assets, were sold for cash, realizing \$997,702.50.

FUEL RESERVE FUND.

The fund has been increased during the year by appropriations of income, as follows:

Amount of credit of Fund June 30, 1914.....	\$1,778,332.02
Added during the year.....	54,502.78

In Fund June 30, 1915..... \$1,832,834.80

MINKLER SOUTHERN RAILWAY.

This line, from Minkler to Exeter, California, aggregating, with two short branches, 43.71 miles, was completed and opened for traffic on October 1, 1914. An extension, from Exeter to Lindsay, a distance of 6.95 miles, has since been constructed and will be placed in operation October 1, 1915.

OKLAHOMA CENTRAL RAILROAD.

This line, extending from Chickasha, Oklahoma, to Lehigh, Oklahoma, a distance of 133 miles, crossing your main line at Purcell and Byars, was leased by your Company effective August 1, 1914, for a term of five years, and has since that date been operated as a part of its System. The line serves a fairly good agricultural country, but the main purpose in leasing it was to secure coal from the Lehigh fields for use on the System and to permit of supplying the demand for coal at points in northern Texas.

OIL FIELDS & SANTA FE RAILWAY.

This company was formed to acquire certain lines extending from Cushing to Pemeta, Oklahoma, and from Jennings to Oilton, Oklahoma, tapping the so-called Cushing Oil Field, which is an important source of supply for fuel oil. A line from Pemeta to Oilton, connecting the railroads purchased, and an extension from Pemeta to Drumwright are now under construction. The lines acquired, together with those now being built, will aggregate about 27 miles of railway, which, upon the completion of construction, will be operated, under lease, by your Company as a part of its system, and will, it is believed, make a valuable feeder to your main line, with which it connects at Cushing.

OKLAND WHARF PROPERTY.

The facilities on your Company's water frontage at Oakland, California, referred to under the above caption in the last annual report, were placed in operation July 1, 1915, though not fully completed.

ROCKY MOUNTAIN & SANTA FE RAILWAY.

Reference was made in the last annual report to an agreement with the St. Louis, Rocky Mountain & Pacific Company, under which your Company took possession of this line (then known as the St. Louis, Rocky Mountain & Pacific Railway) on August 1, 1913, under a certain contract of purchase. The conditions of the purchase contract have been met and \$3,000,000 of Four Per Cent. Rocky Mountain Division Bonds have been issued in acquisition of the stock and indebtedness of the Rocky Mountain & Santa Fe Railway Company, which owns this line; and the line has been leased to your Company.

NORTHWESTERN PACIFIC RAILROAD COMPANY.

Track laying on the line of this Company (whose capital stock is owned one-half by your Company and one-half by the Southern Pacific Company) from Willets to Shively, a distance of 105.64 miles, has been completed, and the line was placed in operation on July 1, 1915. This construction closes the gap in the mileage and has made possible the establishment of through train service between Eureka on the north and San Francisco Bay on the south.

UNION PASSENGER STATION, KANSAS CITY.

The new facilities constitute one of the largest and most complete passenger terminals in the country and represent a very large investment. The heavy fixed charge which this investment entails and the maintenance and operation of these extensive facilities place a large expense upon the Kansas City railroads, all of whom are using the new station; however, the new facilities are a great accommodation to the public and, of course, materially improve operating conditions at Kansas City.

TAXES.

Instead of showing the customary large increase, the fiscal year just closed shows a decrease in taxes of \$28,268.53. The tax accruals for the fiscal year ending June 30, 1914, were \$5,525,585.30, while the accruals for the fiscal year ending June 30, 1915, were but \$5,497,316.77. However, information so far received pertaining to assessments and rates for the present fiscal year indicates the decrease was temporary only and that we will this year show another substantial increase.

In the report of last year your attention was called to the alarming growth of public expenditures, and the fear was expressed that expenditures for good roads were likely to assume large proportions. States are vying with states, and counties with counties, and the worst fears of a year ago are being realized. Road improvement and construction projects are approved and bond issues voted with but little regard to the ability of the taxpayers to bear the burden and with even less consideration of the utility and permanency of the roads. Yuma County, Arizona, well illustrates the recklessness with which people are now spending money. This county with a population of but 7,730 and but little wealth other than railroad property and having a bonded indebtedness of \$138,791 has just approved a bond issue of \$500,000 for the improvement of its highways.

Your officials are doing everything in their power to check the unwise and improper expenditure of public funds by arousing the taxpayers and by encouraging associations of taxpayers to fight for efficiency and economy. Their efforts have generally borne good fruit and encourage them to carry on the struggle.

REVISED ACCOUNTING RULES OF THE INTERSTATE COMMERCE COMMISSION.

The Interstate Commerce Commission issued, effective July 1, 1907, its first classifications, pursuant to the Act to Regulate Commerce, as amended, with the purpose of establishing a uniform system of accounts for steam roads. These classifications related to operating revenues and expenses, expenditures for land and equipment, and locomotive, car, and train miles; later these were followed by instructions pertaining to income, profit and loss and balance sheet accounts. These classifications, which had been under review for a considerable period, were revised and reissued effective July 1, 1914. Certain expenditures which formerly at the option of the carriers were chargeable to Operating Expenses, are, under the revised classifications, obligatory charges to Capital Account. As a result of these changes the operating expenses of your Company for the year covered by this report were relieved of charges aggregating upwards of \$600,000, with corresponding increase in the charges to Additions and Betterments as compared with what they would otherwise have been. The greater part of this amount represents transportation charges on men employed and material used in improvement work, increased weight of second-hand rail, and necessary fastenings and appurtenances applied during the year in track renewals. The revised classifications also account for the change in the form of the general balance sheet as shown on pages 26 and 27 of this report.

GENERAL.

The year has been the largest as to earnings, both gross and net, in the history of the Company. Two reasons contributed mainly to this result, viz.: the unprecedented wheat crop of Kansas and the largely increased yield of agricultural products of all kinds in the so-called "Plains Country" in Western Texas and Western Oklahoma. These two items were more than sufficient to overcome a falling off of \$1,304,472.05 in net revenue of the lines west of Albuquerque.

The wheat of Kansas and Oklahoma was largely exported via Galveston, thus giving your properties the longest possible haul and the largest possible earnings, and this has created so marked an improvement in business of your Texas lines as to make their net earnings much more than ever before.

The Panama-Pacific Exposition at San Francisco and the Panama-California Exposition at San Diego have created some passenger business, but at such low rates as to afford little if any profit.

Relations with the general public, especially that portion residing along the line, are quite satisfactory, but contest is being made as to rates in various states before both commissions and courts. There is little demur to the proposition that the railroads need more money, but each class of shippers is firm in the view that the increase should not come from it.

The general merchandise rates all over the country (now lower than anywhere else in the world) could be doubled and the ordinary living expense of each family would be so little increased that the head of the family would not know of this advance unless somebody told him. A large part of the trouble about rates comes from certain classes of middle men who contribute little to the prosperity of the country, but who are well organized and consequently influential.

It is too early to measure accurately the effect of the Panama Canal. But it is evident that the loss of revenue on that account is very substantial and already it probably is considerably in excess of \$1,000,000 per year.

Governor John G. McCullough, a director of this Company, passed away on May 29, 1915. His sound judgment and wide experience in railroad work, as well as his activities in public life, enabled him to render most valuable service to the Company and his associates on the Board. His familiarity with the affairs of the Company and conditions in its territory gained from frequent trips over the property testified to the responsibility he felt was attached to his directorship. It is proper, therefore, that there should be given place in this report for this expression of sorrow for the great loss the Company has sustained by his death.

Your Directors are pleased to record their appreciation of loyal and efficient service by officers and employees.

EDWARD P. RIPLEY,
President.

A letter to the editor, by Robert W. Hunt, on another page, reviews the development of rail straightening and calls attention

The Cold Straightening of Rails

to the constant danger of serious injury to the rail as a result of the rough treatment which it now receives while undergoing this process. The elimination of occasion for concern from this cause by a departure from the present practice in the straightening of rails will not solve the rail problem, but it does seem to offer an opportunity for improvement and merits consideration. The letter confirms the findings of Dr. P. H. Dudley, as reported by him in the discussion of the report of the Rail Committee of the American Railway Engineering Association last March, although the solution of the problem offered differs somewhat in detail from that suggested by Dr. Dudley. Captain Hunt's plan will meet with approbation from some sources and also with no less emphatic objection. Bowed rails will not pile and load into cars as conveniently as straight ones, and it is to be expected that the laying of such rail on tangent track will be a source of some inconvenience and result in increased labor cost. These and other objections must be answered. We hope that Captain Hunt's letter will call forth discussion of this question raised from all points of view.

The Panama Canal in the fiscal year ending June 30, 1915, cost the taxpayers of the United States about \$10,000,000. This sum represents the interest at 3 per cent on the cost of the canal, less the amount by which the tolls earned during the year exceeded the expenses of canal operation and maintenance. Some of the taxpayers, including the owners of steamship lines and shippers of freight to and from the Atlantic and Pacific seaboard territory, have profited greatly by the canal and doubtless are satisfied to pay a share of the expense. Others, including the shippers of the Middle West and the railroads, have been injured in their business, but they pay their share of the taxes just the same. The tolls earned by the canal during the year amounted to \$4,343,383, and the expenses of operation and maintenance to \$4,066,727. This makes the excess of tolls earned over expenses amount to \$276,656, and, according to the Canal Record, the official publication of the Panama Canal, which publishes the figures, this "represents a profit of 6.7 per cent on the expenditure for operation and maintenance alone, not counting anything for interest on the money invested or for depreciation of plant." If the railroads of the United States could keep their accounts in this way there would not now be nearly 42,000 miles of road in the hands of receivers. If the railroads could calculate their profits as a percentage of their expenses they would present a striking appearance of prosperity, since a road with an operating ratio of 70 would show a "profit" of approximately 42 per cent. This is not, however, the most important difference between the methods of accounting of the canal authorities and the railways. The immediate cause for the receivership of a railroad is usually its inability to pay the interest on its bonds. Government enterprises encounter no such difficulty, because their accounts usually include only receipts and expenditures, and the little matter of interest on bonds is taken care of elsewhere. This enables the Canal Record to use the word "profit," whereas the *Railway Age Gazette* in a review of the year's operations of a railroad that had earned less than one-fortieth of the interest on its investment would be obliged to employ some expression signifying "deficit." The Canal Record does not attempt to conceal the facts. In the last paragraph of its review it says: "If, however, consideration be given to the interest on the money invested, which is a regular consideration from a commercial point of view, the profit vanishes. The money invested by the United States in the enterprise is approximately \$360,000,000. The interest on this at 3 per cent

Financial Results of the Panama Canal

(which is the rate of interest on the last bonds issued for the canal work) amounts to \$10,800,000." In the discussion of a railroad's annual report this rather troublesome detail usually demands a degree of attention somewhat earlier in the story. The revenues of the Panama Railroad and its steamship line were \$2,787,056 and \$2,642,457, respectively, while the expenses were \$2,607,479 and \$2,142,603, giving a net revenue from rail and steamship operations of \$679,430. The net cost of other business operations in connection with the canal during the year was \$2,469,642, and the canal zone government cost \$288,887. With a profit of \$71,234 from commissary operations, deficits from the operation of the Hotel Washington and of plantations, and a revenue from land rentals, the total revenues of the combined canal, railroad and steamship enterprise were \$19,236,818, and the total expenses were \$18,283,315, leaving an excess of revenues over expenses of \$953,502, which would not go very far toward paying interest on the investment.

RAILROAD BANKRUPTCY

IN last week's issue of the *Railway Age Gazette* there was a table showing the mileage and outstanding securities of each one of the roads now in the hands of receivers. It may be recalled that this mileage amounted to one-sixth of the total mileage of railroads in the United States. The total par value of securities issued against this approximately 42,000 miles of road in the hands of receivers is \$2,264,000,000, or about \$54,000 per mile. Of the total 41,988 miles in receivers' hands, 34,902 miles are Class 1 roads reporting monthly earnings to the Interstate Commerce Commission, and the revenues, expenses and net operating income for these roads were published in the *Railway Age Gazette* of September 24. Net operating income is the total amount which the company has left after paying its operating expenses and taxes. From this it must pay the interest on its bonds, its rentals and its dividends to its stockholders.

If the railroad business were in a prosperous condition, and bankers and investors had confidence in the stability of railroad earnings, a company which was earning 7 per cent on the total cost of its property, if one-third of its capital was raised through the sale of bonds and two-thirds through the sale of stock, would have stock selling at approximately par and bonds on a 5 per cent basis, and assuming that the company had sold its bonds at about a 5 per cent basis, the company could, with a fair degree of safety, pay 6 per cent dividends. In other words, net income equal to 7 per cent on total capitalization would provide for 5 per cent on borrowed money, 6 per cent on stock, and a fair margin of safety in the form of surplus.

The Pennsylvania is a 6 per cent stock and is now selling at about 114 per cent of par; the Southern Pacific is paying 6 per cent and is selling at about 96 per cent of par; the Atchison, Topeka & Santa Fe is paying 6 per cent, and its stock is selling at about 106 per cent of par. Some of the bonds of these roads are selling on a lower yield basis than 5 per cent, but new bonds certainly could not be sold at anything less than 5 per cent. Investors are assuming that there will be the necessary fair margin of safety over the 6 per cent on the stock—that is, that these companies are likely to earn about 7 per cent on their total capitalization. Taking 7 per cent, therefore, as a fair minimum which net operating income ought to average on total capitalization, it is interesting to see what capitalization per mile of line each one of the roads in the hands of receivers could be given on the basis of its 1915 net operating income. The following table shows these figures:

* Deficit.

(a) Capitalization on which net operating income would yield 7 per cent.
 (b) Capitalization per mile on which net operating income would yield 7 per cent.

The average capitalization per mile on which all the 34,902 miles of road reporting monthly earnings to the Interstate Commerce Commission could earn 7 per cent is \$22,858. This on its face is utterly inadequate. Of the roads in the hands of receivers only two are earning a net operating income which would be 7 per cent on anything that might conceivably be their actual cost per mile. These are the St. Louis & San Francisco, earning 7 per cent on \$35,376 per mile, and the Missouri, Kansas & Texas, earning 7 per cent on \$31,730 per mile.

At the recent hearing on valuation it was pointed out that the best method of arriving at estimates of the present cost of reproduction of the railroads in the United States would be to base the estimates on the actual experience of companies which have built new mileage recently. The Pacific coast extension of the Chicago, Milwaukee & St. Paul cost at the very least an average of from sixty to seventy thousand dollars per mile. This may be somewhat higher than would be the cost of building the entire St. Louis & San Francisco, but probably not a great deal higher, when we taken into consideration stations, yards, shops, right of way and equipment; but the St. Louis & San Francisco and the Missouri, Kansas & Texas are in a class by themselves among the roads in the hands of receivers. The International & Great Northern is earning 7 per cent on less than \$10,000 per mile; the Chicago & Eastern Illinois, a far more expensive road to build per mile than the average of the St. Louis & San Francisco, is earning 7 per cent on only \$21,921 per mile; the Missouri Pacific, running through a territory where the right of way alone, including the terminals, would amount to more than six thousand dollars a mile, is earning 7 per cent on \$19,462 per mile.

There are only three possible assumptions: Either that these roads are not needed by the country which they serve and that the loss which investors have sustained and which they face is due to the business mistake of building them, and that therefore a scaling down of securities to represent the earning power of the roads could not be considered confiscation; or that these roads are being operated so poorly that the wastes, if eliminated, would make up the difference between 7 per cent on the amount shown per mile in our table and 7 per cent on what the roads would actually cost to build; or, lastly, that rates fixed by state commissions and the Interstate Commerce Commission are low to the point which is plainly confiscatory as affecting these roads. Since most of the business is competitive, if these roads are to have higher rates their competitors also must be given higher rates. Whether or not there would be any way of compelling commissions to do this through the courts is questionable, but this is a larger question than simply a legal one. The commissions and public opinion must in the end be guided by economic principles, from which there is no escape.

As to whether or not the roads should have been built and are needed to serve the territory which they now serve, it would be interesting to stop their operation for just one day and then receive the opinion of the people living in the territory served.

ILLINOIS CENTRAL

THE Illinois Central made a saving in transportation expenses in the fiscal year ended June 30, 1915, enough to offset almost half of the loss in operating revenue due to business depression and especially to the depression in the lumber business and in the South. In 1915 total operating revenues amounted to \$61,700,000, a decrease as compared with the previous year of \$4,173,000, or 6.34 per cent. Transportation expenses amounted to \$22,300,000, a decrease as compared with the previous year of \$1,850,000, or 7.66 per cent. The reduction in transportation

locomotives, and a reduction in payments for loss and damage to freight of 27.48 per cent. The trainload of revenue and company freight in 1915 was 523 tons as against 488 tons the year before, and the showing per locomotive mile was even better, the average tons of freight per revenue service locomotive mile being 509 in 1915 as against 471 in 1914.

In addition to the reduction in transportation expenses there was a reduction in both maintenance of way and maintenance of equipment, total operating expenses amounting to \$47,570,000, a decrease as compared with the previous year of \$3,205,000.

The Illinois Central and the Central of Georgia

expenses in greater proportion than the reduction in business is credited to the substitution of superheater locomotives on main line for saturated steam locomotives; a successful fuel economy campaign, which was probably also helped by the superheater

Interest charges were less, but rentals of other roads considerably more, so that the net income, after the payment of fixed charges and rentals, was \$6,859,000 in 1915 as against \$8,139,000 in 1914. The 5 per cent dividends called for \$5,465,000, so that

in the fiscal year 1915 the company had a surplus of \$1,240,000.

The expense for maintenance of way and structures was \$8,839,000 in 1915, a reduction of 3.98 per cent, most of which reduction was the result of \$217,000 less spent for rails and \$206,000 less for general repairs of roadway and track, the latter item being affected by the fact that the 1914 expenses on this account were abnormally large because of the charges to maintenance incidental to betterment work and new construction work at Memphis. In 1915 a liberal policy as to tie renewals was pursued, the tie renewals being equal to 673 miles of track, or nearly 9 per cent of all ties in track, including sidings.

Maintenance of equipment cost \$13,892,000, or 4.26 per cent less than in the preceding year, and the reduction was the result of repairs to fewer freight-train cars due, at least in part, to a reduction in freight car mileage. The company spent \$2,351,000 for additions and betterments to its own line, but of this, \$624,000 was transferred to "miscellaneous physical property." In addition there was \$6,094,000 advanced to subsidiary companies. The Illinois Central also spent \$2,503,000 for new equipment, against which there was issued \$1,980,000 equipment trust certificates, series C. On July 1, \$10,780,000 4½ per cent notes matured and were paid, the company having had on hand June 30, 1914, \$10,859,000 cash. At the end of the year the company had \$2,586,000 cash and during the year had borrowed \$1,000,000. Total current liabilities, including this \$1,000,000 loans and bills payable, amounted at the end of the year to \$15,304,000 and current assets, including the cash mentioned previously, to \$20,415,000.

The total tonnage of freight carried on the Illinois Central in 1915 was 31,309,000, comparing with 32,343,000 carried the year before. Of the total carried in 1915, 45.15 per cent was products of mines, 19.00 per cent products of agriculture, 12.48 per cent lumber and 8.28 per cent manufactures. The tonnage

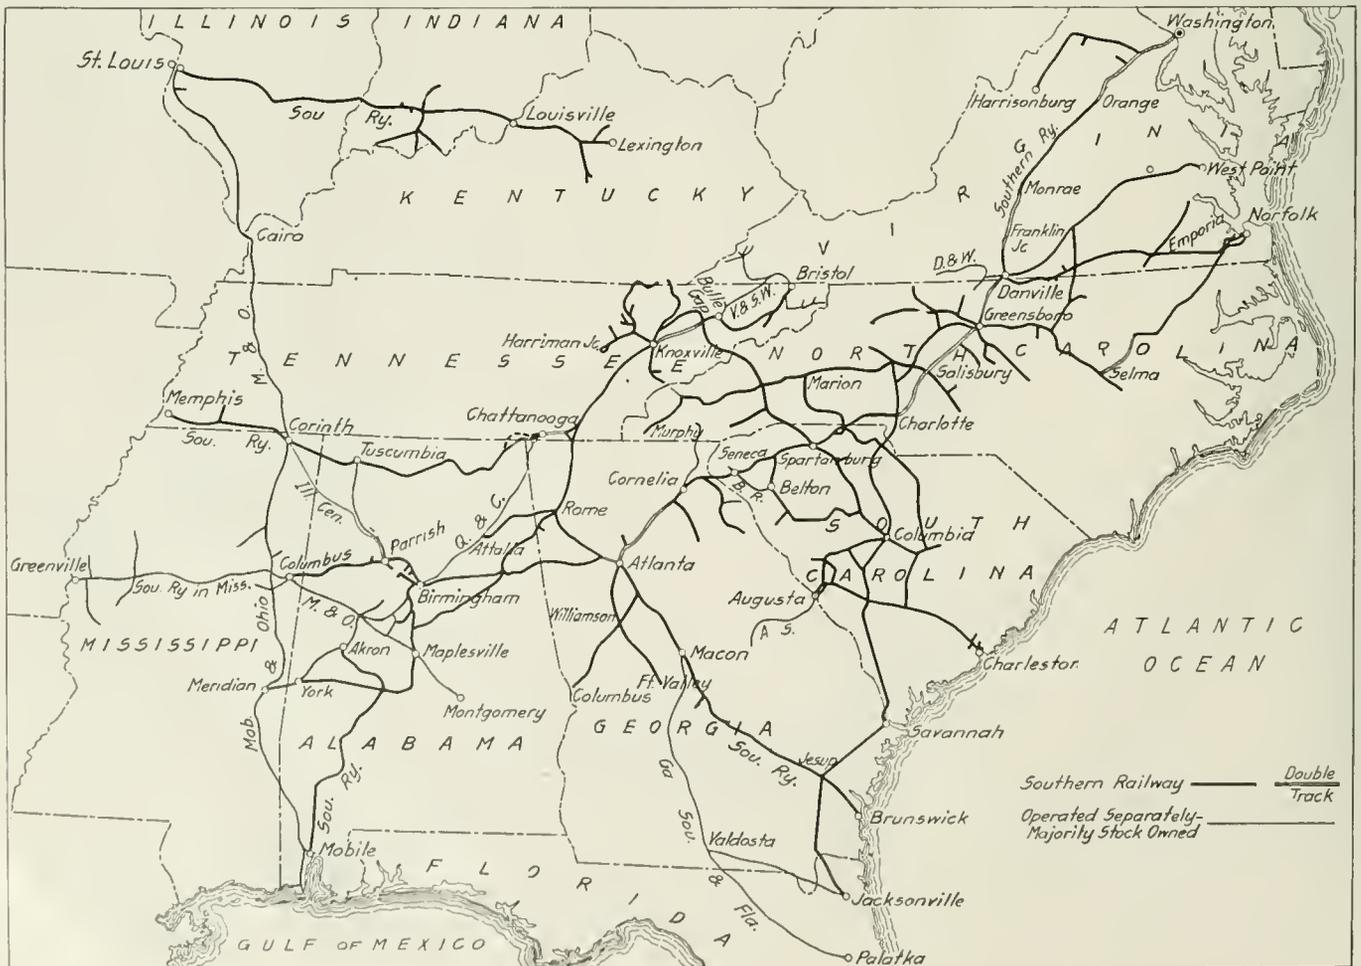

of products of mines was 14,136,000, as compared with 13,843,000 in 1914. On the other hand, the tonnage of lumber was 3,906,000 in 1915 as against 4,804,000 in 1914.

The following table shows the principal figures for operation in 1915 as compared with 1914:

	1915.	1914.
Average mileage operated.....	4,770	4,769
Freight revenue.....	\$41,212,271	\$43,871,272

Surplus.....	1,240,460	2,632,381

SOUTHERN RAILWAY

IN 1908 a sudden loss of \$3,716,000 in total operating revenues of the Southern Railway, representing a decrease, as compared with the previous year, of 6.56 per cent., caused the almost entire suspension of capital expenditures and, taken in connection with the after-panic conditions of that year, threatened the company with receivership. In the fiscal year ended June 30, 1915, there was a loss of \$8,551,000 in operating revenues, representing a decrease of 12.09 per cent., as compared with the previous year, and the company was able, by the suspension of dividends on its preferred stock and economies in operation, to get through the year with a surplus of \$1,523,000, or only half a million dollars less than the previous year. Additions and betterment work, for which money had been raised in 1914, was continued, according to the original program, with the result that new money was spent in the South at the very time when

The Southern Railway

the states in that part of the country were most in need of it.

A suggestion of how this result was accomplished is contained in the statement that the increase in ton miles of revenue freight carried per mile of road in 1915 was 28.35 per cent. greater than in 1908, while the freight-train mileage in 1915 was 18.98 less than in 1908.

The loss in revenue in 1915 was sudden, almost beyond comprehension. In August there was a decrease in revenue, as compared with the same month of the year before, of 1.20 per cent.; in September, 8.33 per cent.; in October, 18.47; in November, 20.06; in December, 19.97, and in January, 18.93. As President Harrison says, "the South practically suspended for a time its industrial activities."

As briefly stated as possible, the general methods by which the management met this crisis were, a frank statement of its problems to the people of the South, with an explanation of the necessity for reducing passenger service so as to, in some measure, offset decrease in business; an appeal to the loyalty of its employees for redoubled efforts toward economy and efficiency; a generous sacrifice on the part of the officers in accepting a reduction in salaries, and a new effort on the part of the management to effect economies through better and more constant supervision; the application of the most scientific methods of operation, and ingenuity in devising means of handling business more economically.

State commissions and the most intelligent public opinion of the South gave their hearty co-operation in an attempt to reduce passenger service, and with a reduction of 14.57 per cent. in passengers carried one mile, there was a reduction of 8.29 per cent. in passenger-train mileage, and there was furthermore a reduction of 5.33 per cent. in transportation costs per passenger-train mile for enginemen, trainmen and fuel.

In describing the response of the officers and employees to the needs of the company, President Harrison says: "There has never been a year of the company's history in which the stockholders have had as much reason for pride in and appreciation of the officers and employees, their work, their spirit, their loyal self-sacrifice. The manner in which a grave emergency was met and dealt with illustrates at its best that discipline which distinguishes a true organization for a mere co-operative society. Our organization, which has in recent years been built and cemented by a strict adherence to the principle of promotion for merit and reliance upon men made on the road, who have faithfully stood by during all our vicissitudes, has proven in this year of need the greatest of the company's assets, for it has fought a losing fight and won."

The remarkable results obtained by supervision and more scientific railroading deserve far more space than can possibly be given to them in this review of the company's 1915 fiscal year. The Southern Railway operates 7,022 miles of line. There are seven main lines and a great net work of branch lines.

These main lines run from Potomac Yard (just outside of Washington, D. C.) to Atlanta, Ga., 644 miles; from Atlanta to Birmingham, Ala., 167 miles; from Salisbury, N. C., to Morristown, Tenn., 228 miles; from Bristol, Tenn., to Chattanooga, Tenn., 242 miles; from Greensboro, N. C., to Pinners Point, Va. (opposite Norfolk), 267 miles; from Ashville, N. C., to Columbia, S. C., 163 miles, and from Chattanooga, Tenn., to Brunswick, Ga., 428 miles, a total of 2,139 miles.

The program of physical betterment of the property which was begun in 1907 and was interrupted in 1908, and work on which has been carried on ever since, provides for grade reduction and double tracking of the main lines with the heaviest density, the principal main lines being that from Washington to Atlanta, with the introduction of automatic block signals, the elimination of grade crossings, the improvement of yard facilities and the reconstruction of a large number of passenger stations. All of these expenditures, except the last, contribute more or less directly to more economical operation. The branch lines even yet are more than adequate for the greatest traffic which they have ever had to handle or will have to handle in the near future.

Freight to or from points on branch lines is handled in local trains.

Not only have ratings been established for through freight trains, but astonishing results have been obtained by increasing the loading of local trains. The rating and heavier loading of locomotives in local train service began in March, 1914. In that month the average trainload for local trains was 192 tons. In June, 1915, the average trainload was 362 tons, or an increase of 88.50 per cent. The average trainload for the entire system was 382 tons in 1915 as against 339 tons in 1914, an increase of 12.71 per cent. In 1915, on 14 heavy traffic divisions in the direction of heavy traffic, 94.90 per cent. of available locomotive power was utilized, as against 87.40 per cent. in 1914, and in the direction of light traffic, 77.80 per cent., as against 71.50 per cent. Some idea of how these results were obtained may be gained from the fact that in 1914 through freights on one division handled 14,157,000 gross ton miles, with 9,405 engine miles, and local freights handled 2,826,000 gross ton miles, with 4,780 engine miles. In 1915 through freights handled 3,743,000 gross ton miles, with 1,732 engine miles, and local freights, 7,704,000 gross ton miles, with 3,975 engine miles. Thus by better loading the tons per engine mile in through freight service was increased by 43.60 per cent., and by a shifting of freight into local service and better loading the tons per engine mile in local freights increased by 228 per cent. On all 14 of the heavy traffic divisions the average increase in net tons per engine mile for through freights in June, 1915, as compared with June, 1914, was 13.70 per cent., and for local freights, 62.30 per cent. The results of this kind of supervision and resulting improvement in operating methods are reflected in transportation expenses, which amounted in 1915 to \$22,758,000, or \$2,956,000 (11.50 per cent) less than in 1914.

Maintenance expenses were cut to meet the reduction in business; but President Harrison says that owing to the "splendid responses to the emergency by officers and men charged with maintenance," the physical condition of the roadway and structures is better than it has ever been. Maintenance of way cost \$8,452,000 in 1915, a decrease as compared with the previous year of \$831,000, or 8.95 per cent.

Maintenance of equipment in 1915 cost \$10,691,000, a decrease as compared with the previous year of \$1,443,000, or 11.89 per cent. The only deferred maintenance, President Harrison says, is in repairs to freight cars.

The fact that only one passenger was killed in a train accident, and he was standing on the platform of a car is good evidence of the physical condition of the property.

As previously mentioned, \$11,022,000 was spent for additions and betterments, of which \$9,005,000 was for roadway and structures, and \$2,017,000 for equipment. The largest items of expenditure for additions and betterments were for second track and line revision on the Danville division, \$2,060,000, and on the Washington division, \$1,676,000, and for new and enlarged yards, \$1,890,000.

At the end of the year the company had \$3,075,000 cash, \$2,127,000 time deposits and \$2,932,000 special deposits, comparing with \$2,955,000 cash, \$9,649,000 time deposits and \$7,583,000 special deposits at the beginning of the year. Loans and bills payable remained unchanged, at \$455,000.

The South has made remarkable progress both in agriculture and in manufacture in the last ten years and the sudden closing of the cotton markets of Europe to its principal cash product stopped this progress only temporarily. On the other hand, the low cotton prices of 1914 greatly stimulated a development which had been going on for some years looking toward more diversified agriculture in the South. The South may be expected in the future to provide the bulk of its own food supplies, with some surplus for sale. This will rob the possibility of a year of very low cotton prices of its worst terrors. As a matter of fact, agricultural conditions in the South this fall are extraordinarily good. The cotton crop is small, but prices are much higher than any one would have predicted six months ago and the left-over supply of last year's crop and this year's crop will apparently

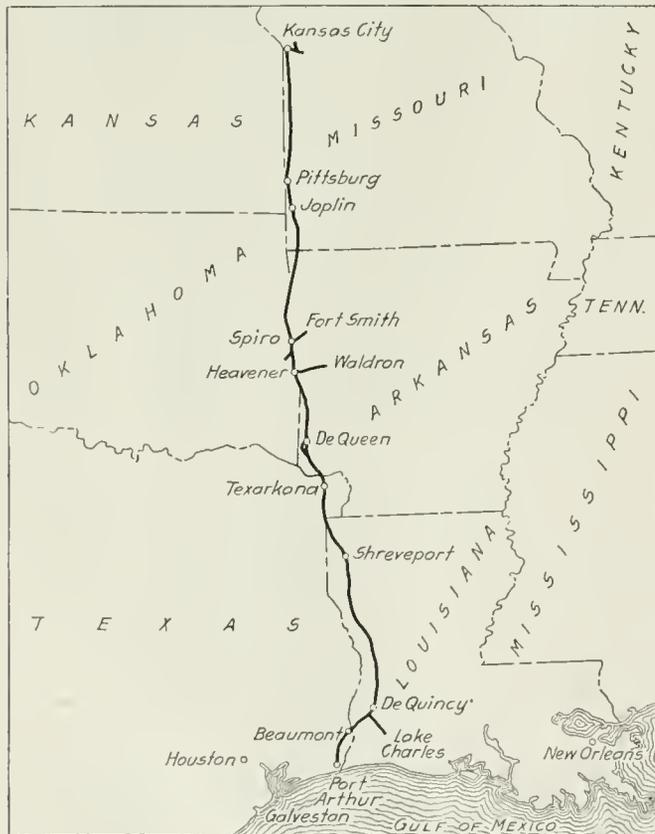

both be fairly well consumed, giving the planters a chance to start with a clean slate next year.

The following table shows the principal figures for operation in 1915, as compared with 1914:

	1915.	1914.
Average mileage operated.....	7,031	7,033
Freight revenue.....	\$40,458,858	\$45,632,207
Passenger revenue.....	16,175,674	19,016,099
Total operating revenues.....	62,199,510	70,750,997
Maint. of way and structures.....	8,452,119	9,283,239

Dividends.....		2,700,000
Surplus.....	1,656,682	2,139,706

KANSAS CITY SOUTHERN

THE field forces of the Interstate Commerce Commission completed their surveys and inventories of the Kansas City Southern in April, 1915. The results of the valuation of the property have not been made public, but it is interesting to note that the total cost of federal valuation to date to the company has been \$112,796. The present market price of the total outstanding securities would put a valuation of more than \$71,000 per mile on the Kansas City Southern. The total par value of all

The Kansas City Southern

the securities outstanding would put a value of about \$118,000 per mile on the property. The net operating income of the company in the fiscal year ended June 30, 1915, was \$2,983,000. This would be 7 per cent on about \$53,000 per mile.

Total operating revenues in 1915 amounted to \$10,036,000, a decrease as compared with the previous year of \$935,000. Total operating expenses amounted to \$6,479,000, a decrease as compared with the previous year of \$431,000. The Kansas City Southern is all main line and all single track, except for 18 miles of double track. The freight density (ton miles per mile of road) in 1915 was 1,451,000 tons, comparing with 1,377,000 tons in the previous year. Passenger density was 77,161 in 1915 and

88,684 in the previous year. The average ton mile rate in 1915 was 6.85 mills, and in 1914, 7.77 mills; the receipts per passenger per mile were 2.212 cents in 1915 and 2.311 cents in 1914. The total trainload of freight, including company freight, was 582 tons in 1915 and 545 tons in 1914. The falling off in revenue is ascribed by the management to a loss of \$1,376,000 because of general business depression and disturbed conditions in the South resulting from the European war, and of \$72,000 in express revenue caused principally by the extension of the parcels post. This was partially offset by an increase of \$423,000 from abundant crops and conditions favoring export trade, \$81,000 due to larger movement of asphalt from southern refineries and of black strap molasses for use in the manufacture of mixed stock feed, and increased revenue from the mails following reweighing.

Maintenance of way and structures cost \$1,132,000, a decrease of about \$12,000 as compared with the year before; but the actual decrease in the amount spent in maintenance of the property was about \$61,000, the difference being caused by book-keeping charges in accordance with the Interstate Commerce Commission's rules for amortization of abandoned property.

Maintenance of equipment expenses amounted to \$1,185,000, a decrease of \$167,000 as compared with the year before. This decrease, the management thinks, is due to a saving made because of the improved condition of equipment.

Transportation expenses amounted to \$3,397,000, a saving as compared with the previous year of \$274,000. This is in part due to the larger average trainload of freight and in part to savings in yard service, station service and to a reduction of \$18,600 in payments for injuries to persons, etc.

Although freight revenue amounted to \$7,731,000 in 1915, a decrease of \$526,000, the total ton mileage of revenue freight was 1,129,000,000, an increase as compared with the previous year of 66,000,000 ton miles. The rate per ton mile of 6.85 mills in 1915, mentioned previously, compares with a rate per ton mile of 7.77 mills in 1914. The lower average rate is due to a smaller tonnage of high-class traffic and a large proportion of low class traffic. The saving in transportation expenses is especially noteworthy, because it was made despite the fact that the volume of freight business handled was greater in 1915 than in 1914.

The table shows the figures for operation in 1915 and 1914:

	1915	1914
Mileage operated.....	837	828
Freight revenue.....	\$7,731,118	\$8,257,449

NEW BOOKS

North Pacific Ports. Second edition. Bound in cloth; 421 pages; size, 5 in. by 7 in. Compiled and published by the Terminal Publishing Company, Inc., 802 Pacific Building, Seattle, Wash.

This is properly termed the Pacific shipping year book. It is a compilation of useful marine, exporting and importing information for Alaska and the western coasts of the United States and Canada and contains much data relative to the essential features of each of the Pacific ports from Nome to San Diego. There are given, for example, the harbor regulations, the charges for wharfage, pilotage, storage and other services assessed against a ship or cargo, information concerning the steamship lines plying from each of the ports, lists of docks and piers, etc. While the book is intended primarily for the ship owner, exporter or importer, railroad men desiring to become conversant with Pacific coast conditions will find in it much of value. The 1915 edition contains nearly 100 pages more than the first edition and has been otherwise improved.

Letters to the Editor

THE ACHIEVEMENTS OF THE STATE RAILWAY LINES OF GERMANY

LONDON, Eng.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

I read with not a little amusement in the *Railway Age Gazette* of September 3 Mr. Wile's story of "the amazing ability of the Kaiser's staff and field marshals to fling not only regiments, brigades and divisions, but entire army corps and even whole armies, from East to West, and back again from West to East, as emergency requires."

I am sure, as Mr. Wile says, that "many an American traffic manager," who knows what it is to move a mere 100,000 men without baggage to and from a baseball game, "will acknowledge that the job of switching a couple of million armed men, with full artillery equipment, back and forth incessantly, week in and week out through an area corresponding roughly to the states of Ohio, Michigan, Indiana, Iowa, Kentucky, Missouri, Wisconsin and Tennessee" will not only say that "represents as big a piece of 'railroading' as ever was tackled," but that it represents a piece of "railroading" that no man ever has tackled or will tackle!

Let us see what it would mean to do it. An army corps of 40,000 men with its complement of horses, guns, ammunition, baggage, ambulances, field kitchens, etc., requires, according to English reckoning, 160 trains. We are, of course, accustomed to short trains moved at high speed, and we give our men much more room than continental armies are allowed. As nearly as I can make out, the French railways, which have published very full statistics, have moved on the average more like 300 to 350 men in a train. Let us assume the maximum that the Germans could move to be 500; then an army corps would require 80 trains; a couple of million men—that is fifty army corps—would require 4,000 trains. Now what is the capacity of a railway? The French mobilization scheme on the main lines allowed for a train every 10 minutes for 66 hours out of 72. And I think no practical railway man would undertake more than this. This means a capacity of 200,000 men in three days. And to do this implied the command of at least four first-class stations, amply equipped with siding accommodation, loading appliances, coal supplies, etc., at the forwarding end, and similar accommodation at the receiving end. The French did it in their own country according to a prepared scheme. Can anybody imagine that the Germans could do as much on an improvised scheme, with the broken down railroads of Belgium at one end and the broken down and mainly single-track lines of Poland and Galicia at the other? How many distinct routes the Germans had available I cannot say. But it is clear that they would have needed at least 10 first-class double lines, cleared—not lines only, but stations as well—of all other traffic of any kind whatsoever. Where the Germans got the vehicles to hold a couple of million men or the engines to haul them, where they side-tracked them for the three days before the return journey began, I know not; and Mr. Wile does not tell us.

So much for possibilities; now for actualities. The French and Russian general staffs—whose business it is to know from prisoners' regimental badges and other information available what troops are in front of them—have never suggested that there have been any great movements of German troops from the one frontier to the other. I have inquired from the two men in this country probably most competent to answer what is their impression. The answers were private, so I am not at liberty to give my informants' names. The one writes: "Mr. Wile's statement is, of course, an absurd exaggeration. . . . When the necessity arose for strengthening the Germans in the

East, various army corps were from time to time moved east from the West, but the movement was never very large, and the greatest transfer appears to have taken place during the last three months, when about nine divisions (190,000 men) were transferred in this manner." My other correspondent writes: "The statement is quite ridiculous. The most that have ever been moved from West to East has been a corps at a time, if that, and it took anything from a week to 10 days."

I think when the history of the war comes to be written these two statements will be found somewhat nearer the truth than Mr. Wile's fantastic tale of "switching a couple of millions week in and week out" from one front to the other. It is worth noticing that the official statement of the German general staff, which Mr. Wile translates, deals entirely with generalities. It is not unusual for Germans to survey their work and to find it very good. But it would have been more interesting to outside observers, had they copied the example of the French, and given us precise figures of what they did actually accomplish.

One of my correspondents says: "The largest operation of the sort in the war so far was the transport of three whole army corps from the Aisne to Flanders"—not 800 to 1,000 miles, but, say, 150—"in one week by the French railways nearly a year ago."

W. M. ACWORTH.

FIGHTING SHY OF A HARD JOB

RICHMOND, Va.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

One hears much discussion among railway men as to whether the valuation of railways is to be based on "original cost to date," or on "cost of reproduction new," as if there were to be a choice between the two methods. I have noticed that railway men are almost a unit in favor of "reproduction new." This is where they are making a mistake. From the standpoint of the clerks, who are supposed to do this work, there is reason to fight "original cost," for it is a heartbreaking task to dig it out on account of the way most of the records have been kept. But from the standpoint of the owners, or stockholders, the roads should insist on original cost as a basis of valuation, instead of fighting it. Many of the railroads in this country can be reproduced new for 50 per cent of what they cost originally, and if the roads themselves do not dig up this original cost, who is going to do it? Who has any interest in doing it except the owners?

When Congress had the valuation bill before it, many reasons were given for its passage. Two of these were, as a basis for making rates and as a basis for government purchase. For both these purposes it seems to me self-evident that the owners of the property are vitally interested in having the first cost price considered in placing a legal value on their property, which will run from 20 per cent to 50 per cent higher than any cost that can be estimated for reproduction new. The fact is that the higher officers of the railways, as a rule, have not found time to give the matter their personal study. It has been observed that they all shy at it, and turn it over to subordinates. It sifts down to where the accounting officer details several clerks, whom he can most readily spare, to "work it up." Those clerks feel that they have a snap, and without much study of what they are to do and no particular interest fire away on some item, say buildings, to find the original cost. They immediately bump into a stone wall, or what feels like one. The records are not in shape to pick this up readily. It requires intelligent and patient effort and experience with building matters, so the clerks immediately raise a cry that it cannot be done, no records, etc. They tell the chief clerk it cannot be done; he tells his superior and so on, back to the commission, until the commission seems now inclined to believe that original cost to date must be abandoned to a large extent and estimated cost of reproduction depended upon.

The writer has assisted several roads in this work and has had long service in construction accounting, and is therefore

entitled to an opinion. I do not know of anyone who has looked up more of those things than I have, and I will say that I have never found anything yet that the cost could not be found in some way, if the records have not been destroyed, which is not the case in 99 per cent of the roads. The records are generally well preserved, but are crude and scattered, and it requires work to unravel them. Can the railways afford not to do it at any cost of labor? The cost of reproduction new must be estimated, of course. This is up to the commission, but the original cost is the job of the owners of the property. It is not a question of which method shall be used, as many seem to think; both methods must necessarily be used to arrive at a just valuation, which lies somewhere between the two. The only hope of the carriers to get the value they are entitled to is by presenting data showing their original cost to date.

A. P. T.

COLD STRAIGHTENING OF RAILS

CHICAGO

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

The cold straightening of iron rails was originally accomplished by the use of a 40-lb. sledge wielded, as I remember it, by a stalwart Welshman, and the picture of his slinging the sledge, as well as that of his subsequent refreshment from bread and cheese and a jug of ale, is very clear in my memory. As the size of the rail sections and output of the mills were increased, mechanical means of straightening became necessary, and the rail-straightening press was invented. The first ones were of the crocodile type copied from the squeezers used to press the balls of puddled iron into blooms, later changed to a machine with a straight plunger driven eccentrically, and, except for increased weight and power, it is to-day about the same machine, continuing to transmit the force of its blows to the rail through a wedge-shaped gag.

The early hot-straightening was an operation involving heavy and hot labor; the camber or sweep being given to the rails by manually placing them head up on curved plates and hammering them into place with wooden mauls. This involved turning the curved rail over onto the hot bed, by seizing it at each end with tongs, and there was always the danger of putting a twist in it while so doing. The rails were pushed along the hot beds by hand power, and care was subsequently exercised by turning them at various stages of their cooling. This all required time and severe and exhausting labor. The situation brought the revolutionary invention of A. J. Gustin, embracing an automatic curving or cambering machine and mechanical means of sliding the rails along the hot beds. The Gustin device was improved upon and gradually superseded by the cambering machine designed by William Clark, and all later mills have been equipped on those lines.

The objections to gagging steel rails during the operation of cold straightening them have long been recognized, and generally appreciated by engineers familiar with the details of rail making; but, while a number of efforts have been made to perform cold straightening through some other means, the rail press and its brutal gagging still hold the field in all countries where steel rails are manufactured. To obtain the desired results, the rail has to receive blows which shall send the metal beyond its elastic limit, and as frequently a rail will receive a number of such blows, it is easy to understand the cause of many otherwise mysterious breakages of rails in service, and I am confident that most of the dreaded and somewhat mysterious transverse fissures had their origin during the cold straightening operation.

The writer, by written articles and earnest speech, has for years called attention to the dangers incident to the cold straightening of rails by gagging, and I early introduced into rail specifications demands for the reduction of gagging to a minimum through more careful treatment of the rails during the hot straightening process, and undoubtedly much good has been accomplished through such provisions. As the weight and speed

of rolling stock have increased, railway track construction and maintenance have progressed, and thus the requirements for straight line and surface of the rails have also grown, and unless this was met by more careful work on the hot beds, the cold gagging was certain to be more severe.

In the designing of practically all of the more recent rail sections it has been sought to have the metal so distributed that undue stresses shall not be developed during any part of their making, and much good has been accomplished. Just at present the question as to the practicability of increasing the standard length of rails beyond 33 ft. is being seriously considered by railway engineers, and many of them realize that such increase will add to the straightening troubles. If the length is materially increased, it will necessitate alterations in the hot bed equipment of most, if not all, of the rail mills, as well as some alterations in the locations of their cold straightening presses, drill presses, etc., and will be liable to augment the cold straightening troubles and, therefore, I think it would now be well to consider the desirability and practicability of adopting radically new straightening requirements. I feel confident that with careful and skilful manipulation of the rail cambering machines, and carefully constructed and ample and well protected hot beds, about all of the current sectioned rails can be so manipulated that they will require but little if any cold gagging. Indeed, I believe that in a short time the cold press could be almost if not entirely eliminated; but this would require a willingness on the part of the railway engineers to accept rails which would not be absolutely straight, so far as having sweeps in either their line or surface or both. Such sweeps need not be so great but that with present track laying methods the rails could be spiked straight when laid, and thus the danger of incipient or actual ruptures from cold gagging be eliminated. Of course, to begin with kinks would have to be gagged out, but I think that, as a principle, rails with kinks should be rejected, and, if so, that penalty would soon lead to their non-production. It would be a radical departure, and, in my judgment, should be introduced in a conservative manner, letting the progressive steps be taken as they become justified by experience, and I am confident that many if not all rail makers would welcome such an innovation—shall I say progress—and that in a short time we would be getting satisfactory results.

ROBERT W. HUNT.

WITH RAILROADS IT'S DIFFERENT

BY FRANCIS W. LANE

If in European travel you should meet death by a shell, or a German submarine blow up your boat, there is glory in the story which your friends will love to tell, and for you it doesn't matter; you're the goat. When a juggernaut automobile knocks you down upon the street—whether you or it's the one that didn't stop—on the whole, it is a trifle, even though the wreck's complete and your remnants are collected by a cop. But with railroads it is different. If, perchance, a flying train strews anatomy of yours along the track, there is only one thing certain, it will not occur again; but your ghost is almost sure to wander back. You stroll along the roadway and flip the moving car, and, to duck the con, you sit upon the step; you don't appear to figure you've no business where you are and, unless you're pinched for trespass, don't get hep. When you travel, merest trifles set aquiver every nerve; if you pinch your little finger in the door, or you lose your equilibrium in scooting round a curve, you will damn that measly road forevermore. You will charge the grossest crime, negligence in operation, even though you had no business to be there; curse the managing officials, fill the air with lamentation, and cavort around and rip and tear your hair. In Europe they are killing men by thousands every day; over here we drown a shipload at a dock; our juggernaut automobiles mostly kill what's in their way; but it takes a jolt by rail to give a shock!

Annual Meeting of Railway Real Estate Association

New Organization Holds Its First Convention at Chicago for Discussion of Land and Tax Matters

The first annual meeting of the Railway Real Estate Association, whose recent organization was reported in the *Railway Age Gazette* of June 11, page 1256, was held at the Hotel La Salle, Chicago, on October 13 and 14. The membership of the association is now 79, of which over half were in attendance at the first meeting. President F. P. Crandon, tax commissioner of the Chicago & North Western, presided, and after brief addresses by the officers and other preliminary business the program was devoted principally to the reading and discussion of papers.

W. W. Baldwin, vice-president of the Chicago, Burlington & Quincy, addressed the meeting on the subject of recently proposed changes in the tax laws of Illinois, and changes in the constitution of the state as applied to taxation, which he said would strike out every clause requiring uniformity as to methods of taxation based on a valuation of the property, in order to exempt certain classes of property from taxation and to place the entire burden on other classes. This, he said, would undoubtedly increase the taxes paid by large corporations, including the railroads, and the effect would be very apparent when the state enters upon a plan of heavy expenditures for road improvements.

VALUATION OF RAILWAY LAND

William A. Cokeley, right of way and claim agent of the New York, Westchester & Boston, read a paper on "Valuation of Railway Land," of which the following is an abstract:

In the examinations being made by the Interstate Commerce Commission, relative to the valuation of railroads, the land appraisers engaged in the work, having access to books, data, etc., both public and private, have brought to light many instances of land valuations of specific parcels, widely divergent in amounts. How this condition was brought about can only be conjectured, but it will prove mighty embarrassing, in the event of litigation, if the valuation of the property in question, as offered in evidence by the railroad, happens to differ materially in amount from that placed upon it by the land appraisers.

A likely explanation is that different valuations were made by employees. It is known that in many instances, attorneys have aided directors in making a good showing by appreciating land values, in order to justify the issuance and sale of bonds. Attempts also have been made, successfully at times, to beat tax valuations and assessments by similar tactics, and values have been enhanced or reduced as the exigency demanded.

Fortunately the day of the expert retained from time to time, in order to appreciate or depreciate the value of the land holdings of a railroad is over. The new order of affairs, relative to regulation of business corporations, has lessened the desire to adhere to such methods and they have been practically eliminated.

If we have not adjusted ourselves to this new order, how can we? By conducting the affairs of the real estate department as carefully, methodically and scientifically as the engineering department is conducted.

By this I do not mean that appraisals or values of land can be made by formula, but our methods must be just as illuminating as the computations of the engineers. How many of us can furnish a description showing the physical character of the parcels that go to make up the holdings of the property under our charge? How many can show, by any record at their command, just what prompted and justified them in valuing a piece of property at a greater amount than was paid for it? If our system is not elastic enough to permit us to establish and keep such a record, then we should immediately institute a reform and devise a form which will accomplish the desired

result. After a form has been devised an inspection of the physical character of the entire property, parcel by parcel, should be in order—a mental photograph formed and notes made. A reconnaissance of adjoining or adjacent property should also be made and notes taken in the same manner. Then we are equipped to accurately describe any parcel of land, giving its character, its influence on neighboring property and also indicating what influence neighboring property has on it. Such a description is absolutely essential where appreciation of value is shown over cost value.

It may be said that many roads have just such records. Fortunately are those that have anticipated this requisite. There is nothing that will convince the land appraisers of the merit of your valuations more quickly than preparedness by proper records.

There will be much litigation between the government and the railroads before it will be definitely settled just what land values will be allowed. It is because of possible litigation that I advise making up a complete history of each parcel, containing much that is not included in the form furnished by the commission.

It must be remembered that the land appraisers are human and subject to all the frailties of human kind. Some are competent and fair. Some are competent and biased. Some lack judgment and many lack perspicacity. It therefore behooves us to be in such a position, come as they may, as to establish our values beyond dispute. They must have more than a semblance of fairness. They must be backed by reasons that will justify our judgment and be convincing beyond cavil.

While the land appraisers may not have had the experience the right-of-way or railroad real estate agent may have had, it must not be forgotten that their appraisals will stand unless we can offset them in court. We must be prepared to furnish our attorneys with facts that will completely confute the contentions of their opponents and upset the appraisals made by the government. So be prepared.

The discussion on Mr. Cokeley's paper was opened by E. A. Whitman, valuation engineer, Minneapolis, St. Paul & Sault Ste. Marie.

COSTS OF REAL ESTATE

E. Holbrook, special engineer, Union Pacific and Southern Pacific systems, gave an informal address on "Compositions of Cost of Railway Estate," in which he urged the importance of making every effort to get at the composition of cost of right-of-way and terminal grounds on account of the necessity for proving these costs in connection with the valuation now being made by the Interstate Commerce Commission. In illustrating the importance of the subject he called attention to the fact that the railways in the United States own about \$5,000,000,000 worth of land, which is the largest item of property they have, constituting about one-third of the total. He discussed the relation of cost to values, and described the results of numerous investigations showing the large proportion of expense entering into the acquirement of railway land, in addition to the bare cost of the property, which can only be discovered in many cases by extensive research, while there are many such items of cost which cannot be traced now. Mr. Holbrook expressed the opinion that such obscure items will usually run from 10 to 15 per cent of the cost of land as shown by the vouchers.

He also outlined an interesting calculation he had made with reference to the unearned increment argument, to show the effect of railway location on the value of adjacent land. He had taken the assessed value of all property within 10 miles of a railroad for a distance of 40 miles, in a territory in which

there was no other road sufficiently near to influence the value of the land, and had computed the value of the entire property with relation to the value of the outside property. He found that in a total valuation of \$15,000,000 the excess value of the entire property as compared with the value of the property at the outside edges, was \$3,250,000, or more than what the entire railroad through the property cost. He also gave some interesting figures as to an investigation of the cost of property acquired by the railroads for the Kansas City terminal. His investigation had not been completed, but at the time of the investigation the railroads had spent \$10,500,000 for land, which represented 3.09 times its normal market value, and that other items which he had been able to locate, including a large amount of land donated to the city for a park, brought the total cost of land up to approximately \$14,000,000. The first land for the terminal was purchased in 1902, and the rest from 1906 on. He had figured the interest on each piece of land from the date of its purchase to November 1, 1914, when the terminal was opened, and it amounted to 31 per cent of the cost of the land, or about equal to its normal value. Eliminating the value of the land donated to the city the railroad received only about \$2,000,000 worth of property, figured at its normal market price.

Mr. Holbrook said that some railroads had ordered their land departments not to anticipate any expense on account of the valuation, and therefore that some of them had not done the work necessary to get their records in proper shape. He urged the members of the association to do everything in their power to induce their roads to begin the work of investigating the cost of their land, and to make every possible search for records of this kind, as it is work that requires a long time and can never be made complete. And in the future railroads should never buy a piece of land without making complete records of all items of cost connected with the purchase.

LEASING OF RAILWAY PROPERTY

Frank Taylor, right-of-way and lease agent of the Canadian Pacific, read a paper on "Leasing of Railway Property for Industrial Purposes," in which he said in part:

The promiscuous granting of sites on railway property at nominal rents, for shipping warehouses, etc., by local officers, a custom which prevailed pretty generally not many years ago, seems now, like many other old railway customs, to be yielding to the ever-widening demand for uniformity in practice, and for executive control by means of standard methods. While, however, some railways have a well-defined policy, and clearly-drawn instructions governing the handling of all such leases, on other railways we find either no general policy at all, or an indefinite one, subject to change to meet any and all conditions demanded by shippers who are looking for sites.

What we should first endeavor to accomplish is, the adoption of a schedule of rents bearing a fixed ratio to the value of property, and then undertake to adhere absolutely to such a schedule. Many railways have a schedule of rents and apply it in probably the majority of leases, but the exceptions are sometimes so numerous as to materially affect the revenue from this source, and to discourage effort to maintain the standard.

The principal obstacles to the rigid observance of a schedule are first, the precedent established years ago of granting leases at nominal rents, many of which leases are still in force, and second, the conditions arising at competitive points, due to lack of agreement between railways. With regard to old leases at nominal rents, the argument usually advanced when there is any talk of getting them up to schedule, is that lessees erected their warehouses under such leases, believing that the company did not seek revenue from this source, and that it now would be tantamount to a breach of good faith for them to charge a rent proportionate to the value of the site, and this is usually followed by a guarded intimation that a change in the rent would result in the removal of warehouse and loss of traffic to

the railway, and finally a "spiel" about what good friends they have been to the company all these years, and so on.

Then the freight traffic officer, for he usually gets into the deal about this stage, verifies the touching story of fidelity and affection, and between him and the operating department officials, the lease agent is finally routed with a mortifying conviction that he was caught in the act of stealing candy from a baby, and that he didn't even get away with the candy.

We are sometimes reminded that in our zeal for our special work, our horizon is too apt to become limited to the departmental scope, that the obtaining, handling and retaining of freight business is the major function of a railway company, and that where it is involved the question of rent for industrial sites must be relegated to its proper and insignificant niche.

This is a sort of a cold douche, but rather than get disgruntled about it, and seek solace in the reflection that a freight man would give away the whole road for a carload of competitive freight, it would be better to face the situation. The freight man is right about the relative importance of freight traffic, but it is just possible that he may have a departmental note in his own eye. The sources of revenue on the big transportation companies of our day are very varied, and not one of them in these days of competitive and legislative burdens can with prudence be ignored. If the industrial site is a handmaiden of the freight business, and can also be utilized as one of the sources of direct revenue without detriment to traffic returns, there can be no question regarding the wisdom of benefitting by it.

Until the old leases are brought up to the general schedule there will always be difficulty in getting new applicants to accept it, and this difficulty is greatly increased, when for traffic considerations exceptions to schedule rates in new leases are made in favor of certain shippers, or at competitive points. This latter condition can only be remedied by an agreement between railway companies.

Mr. Taylor then outlined the methods used by the Canadian Pacific. The paper was discussed by W. S. Bake, land and tax agent, Pere Marquette.

RAILWAY TAXATION

J. B. Jones, tax agent of the Louisville & Nashville, read a paper entitled, "Is Railway Taxation Approaching the Limit?" in which he outlined the methods of railway taxation in Alabama and Florida. He estimated that in Alabama the railroads pay, in state, county and municipal taxes and licenses, substantially more than one-sixth of their net operating revenues in the state; in other words, it takes over two months' earnings to pay the taxes, and that the assessed valuation of railroad property constitutes about 16 per cent of the aggregate assessed valuation of all property in the state. As to the rates of ad valorem taxation, he said, the constitutional limits of taxation have been generally reached, but the state apparently has not yet reached the limit of its power as to license taxes. In Florida the railroads pay about 15 per cent of the ad valorem state taxes, but probably a considerably larger proportion of local taxes. Discussing the general situation Mr. Jones showed that the taxes paid by the railroads of the United States per mile amounted in 1900 to \$255, in 1907 to \$367 and in 1915 to \$586, or about 16 per cent of the net operating revenues, but that there is an encouraging sign in the reduction from \$604 per mile in 1914.

OTHER PAPERS

Other papers were presented as follows:

"Subsidy Lands and Office Records," by B. A. McAllister, land commissioner, Southern Pacific. Discussion opened by John A. Dresser, until recently manager lands department, Algoma Central & Hudson Bay.

"Real Estate Features in Connection with Separation of Grade Crossings," by H. A. Howarth, real estate agent, Long Island Railroad. Discussion opened by E. E. Pettibone, real estate agent, New York Central Lines west of Buffalo.

"Uniform Contracts Covering the Occupation of Railway Lands," by H. H. Trabue, assistant chief engineer and assistant real estate agent, Nashville, Chattanooga & St. Louis. Discussion opened by C. H. Moran, assistant real estate agent, Baltimore & Ohio.

"Acquirement of Right-of-Way Land and the Preparation of Deeds Therefor," by Peter K. Soffel, real estate claim and tax agent, Wabash-Pittsburgh Terminal, and Wheeling & Lake Erie. Discussion opened by J. W. Marvin, right-of-way and tax agent, Duluth & Iron Range.

Pierce Butler, valuation counsel, Western Group Presidents' Conference Committee on Valuation, addressed the meeting on some features in connection with the valuation of railway land.

It was decided that the president should appoint committees for the ensuing year, as follows: A standing committee of five on standard forms for leases, a committee of five to investigate and report as information on methods of keeping office records and accounts, a committee of three to examine the constitution and by-laws with a view to their revision, and a membership council. It was also decided to extend an invitation to the Railway Tax Association to amalgamate with the Railway Real Estate Association. Officers for the ensuing year were elected as follows: President, B. A. McAllaster, land commissioner, Southern Pacific Company, San Francisco; first vice-president, James P. Nelson, valuation engineer, Chesapeake & Ohio, Richmond, Va.; second vice-president, Frank Taylor, right-of-way and lease agent, Canadian Pacific, Montreal, Que.; secretary, F. C. Irvine, special agent, Pennsylvania Lines, Pittsburgh, Pa.; treasurer, J. G. Armstrong, assistant real estate agent, Wabash-Pittsburgh Terminal and West Side Belt, Pittsburgh, Pa.; board of directors: F. A. Walter, general right-of-way and tax agent, San Pedro, Los Angeles & Salt Lake, Los Angeles, Cal.; H. D. Howe, general land and tax agent, New York Central Lines West, Chicago, Ill.

It was decided to hold the 1916 annual meeting in Chicago.

EFFECT OF RECENT FLOODS ON RAILWAYS

The public seldom realizes the extent to which the ordinary difficulties of railroad operation are frequently increased by extraordinary occurrences, such as floods and storms, nor the great pressure of emergency work suddenly thrust upon a railroad organization by the necessity of immediately repairing the damage thus caused in order to restore service as speedily as possible.

The great floods which put large sections of the railroads in Ohio, Indiana and Pennsylvania out of commission for considerable periods in the spring of 1913, causing damage which was estimated to have cost the railroads in Ohio alone approximately \$10,000,000, naturally attracted widespread attention, but the effects of more localized catastrophes, such as the floods at Galveston, Tex., and in the vicinity of St. Louis, Mo., which were described in the *Railway Age Gazette* of August 27, page 393, and the recent storm in the vicinity of New Orleans, La., are often scarcely appreciated outside of the territory involved.

One of the accompanying pages of illustrations showing some of the effects of the hurricane of August 16 on the property and equipment of the Sunset-Central Lines in the vicinity of Galveston, gives an idea of the unusual difficulties experienced by the railroads on such occasions. The losses of the Sunset-Central Lines on account of this storm were conservatively estimated at \$375,000.

Another page of illustrations presented herewith shows some of the effects on the railroads of the recent hurricane which passed over New Orleans and vicinity on September 29, causing the deaths of about 300 persons, and damage to property which has been roughly estimated at over \$1,000,000, a large proportion of which was railroad property.

A hurricane from the Gulf of Mexico struck New Orleans about 8:00 a. m., on the date mentioned, gaining in violence during the day until between 4:30 and 7:30 p. m., the wind

attained a velocity of from 80 to 120 miles an hour. The barometer fell to 28.11 in., said to be the lowest ever recorded in the United States. In addition to the damage to buildings in the city of New Orleans the country for many miles was devastated and railroads entering the city from every direction suffered damage as well as interruptions to their service.

The most serious consequences of the storm, as far as loss of both life and property is concerned, were the results of the flood. Besides bringing heavy rains the storm backed up the waters of Lake Pontchartrain, north of New Orleans and connecting with the Gulf of Mexico, forming a tidal wave nearly 12 ft. in height when it struck the western shore of the lake, and overflowing the low-lying surrounding country for miles. The line of the Louisville & Nashville, which crosses an arm of the gulf over a long bridge at Rigolets at the lower extremity of the lake was cut in two when several of the girder spans were washed away, in addition to damage done at many other places on the line between New Orleans and Ocean Springs, Miss.

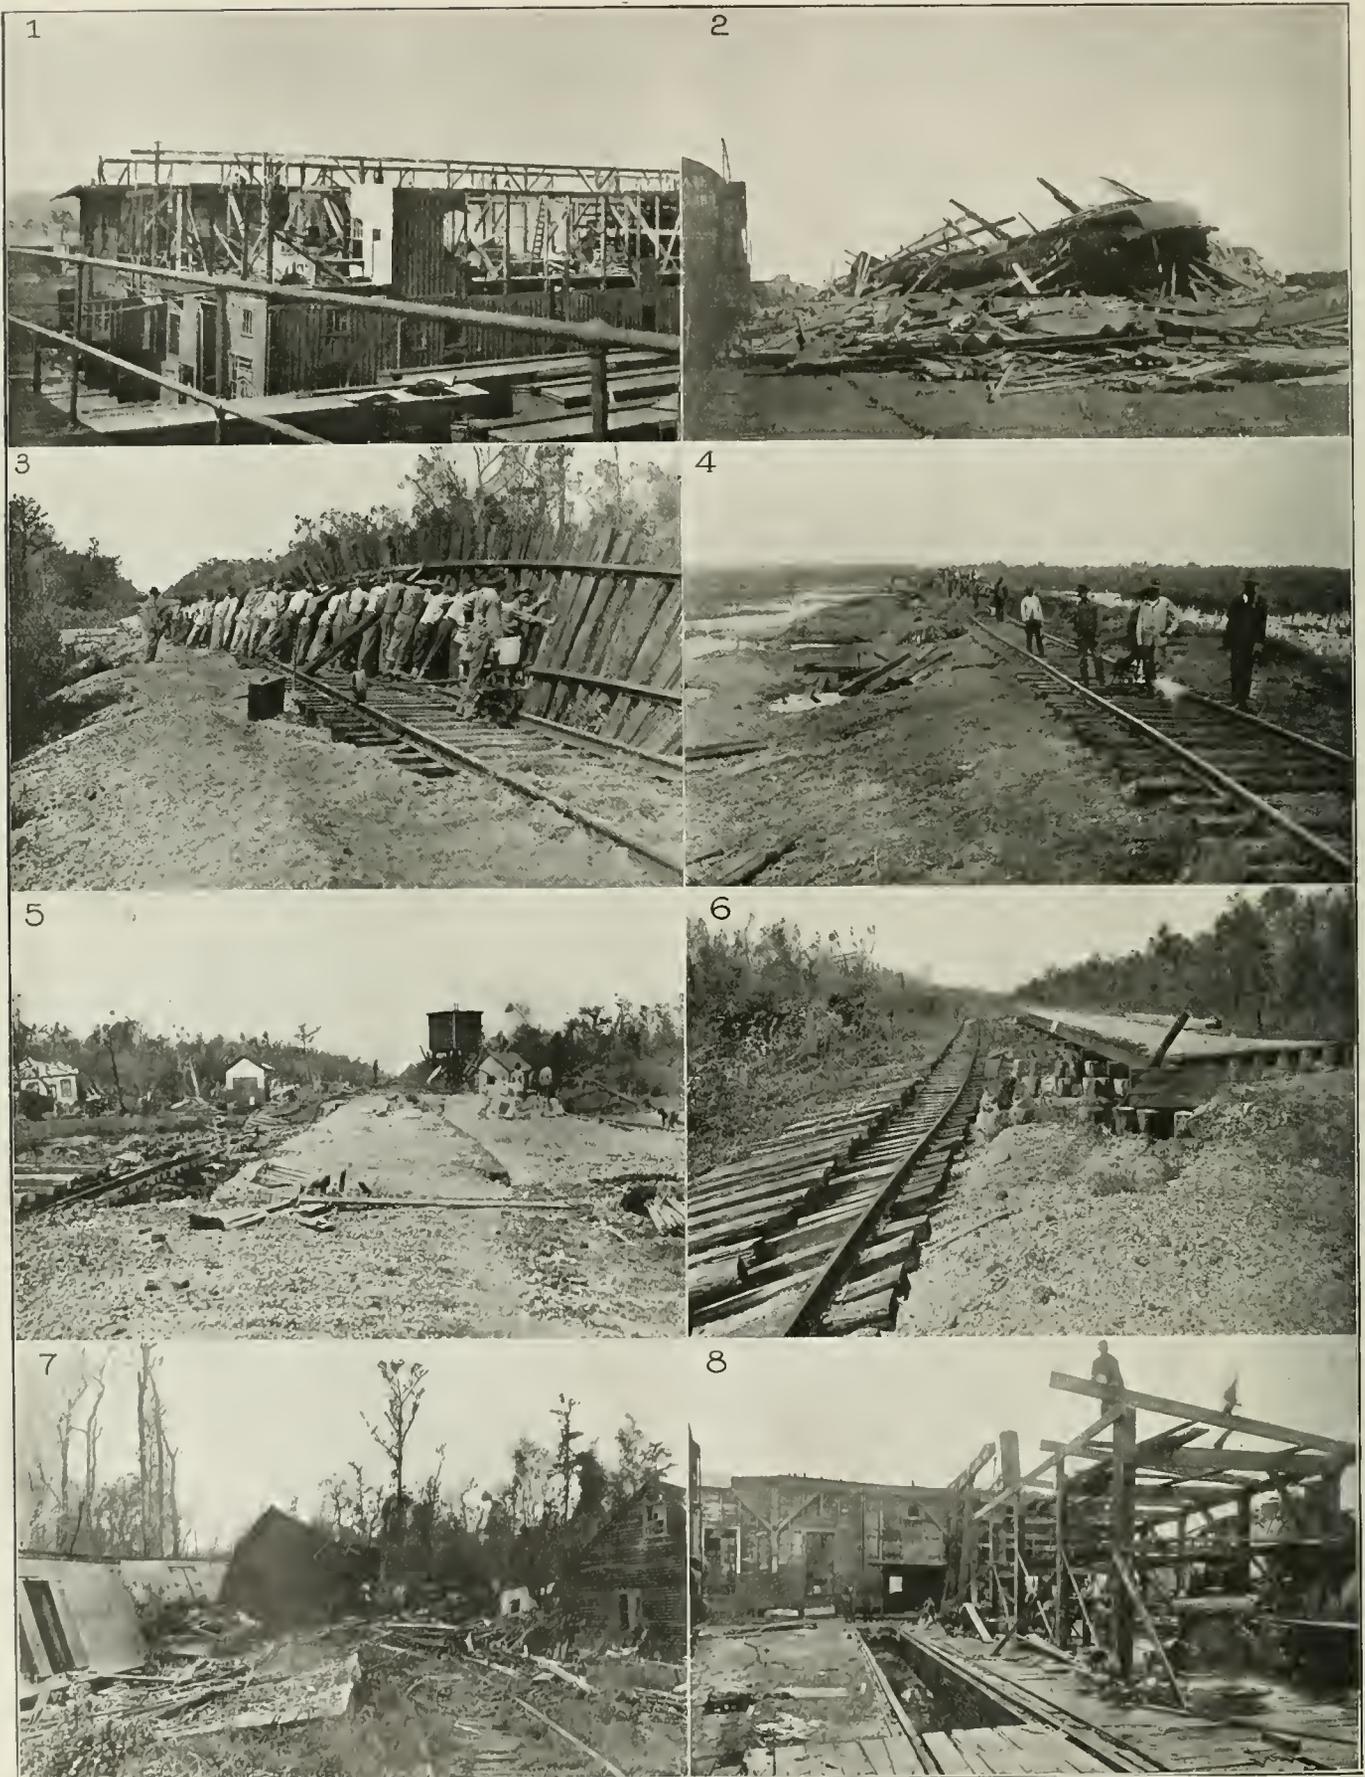

The Illinois Central main line to New Orleans extends along the western shore of the lake for several miles, crossing a narrow channel between Lake Pontchartrain and Lake Maurepas, and between New Orleans and Hammond 18 miles of double track was washed from the embankment, most of it between Kenner and Ruddock. Although cutting the main line, the storm did not interfere with the Illinois Central's through service, because the line of its controlled road, the Yazoo & Mississippi Valley, entering New Orleans from the west from Baton Rouge, was not damaged and trains were detoured over this line, and from Baton Rouge to Hammond. A single track was restored through the flooded part of the main line on October 8.

The property loss of the Sunset-Central Lines is estimated at \$150,000, consisting principally of damages to shop buildings in Algiers, La., the sinking of several barges and car floats used in transferring freight between New Orleans and Algiers, roofs and walls of freight houses and warehouses damaged, and damages to ferry inclines on the New Orleans side of the Mississippi river. Aside from obstructions caused by fallen telegraph poles, signal posts and trees, the line into New Orleans was not interrupted and trains leaving there the day following the storm reached Houston, Tex., practically on time. None of the destruction was of such a nature as to interfere with the prompt handling of business and repairs were rapidly under way. The views reproduced herewith were taken on the Sunset-Central Lines and on the Illinois Central.

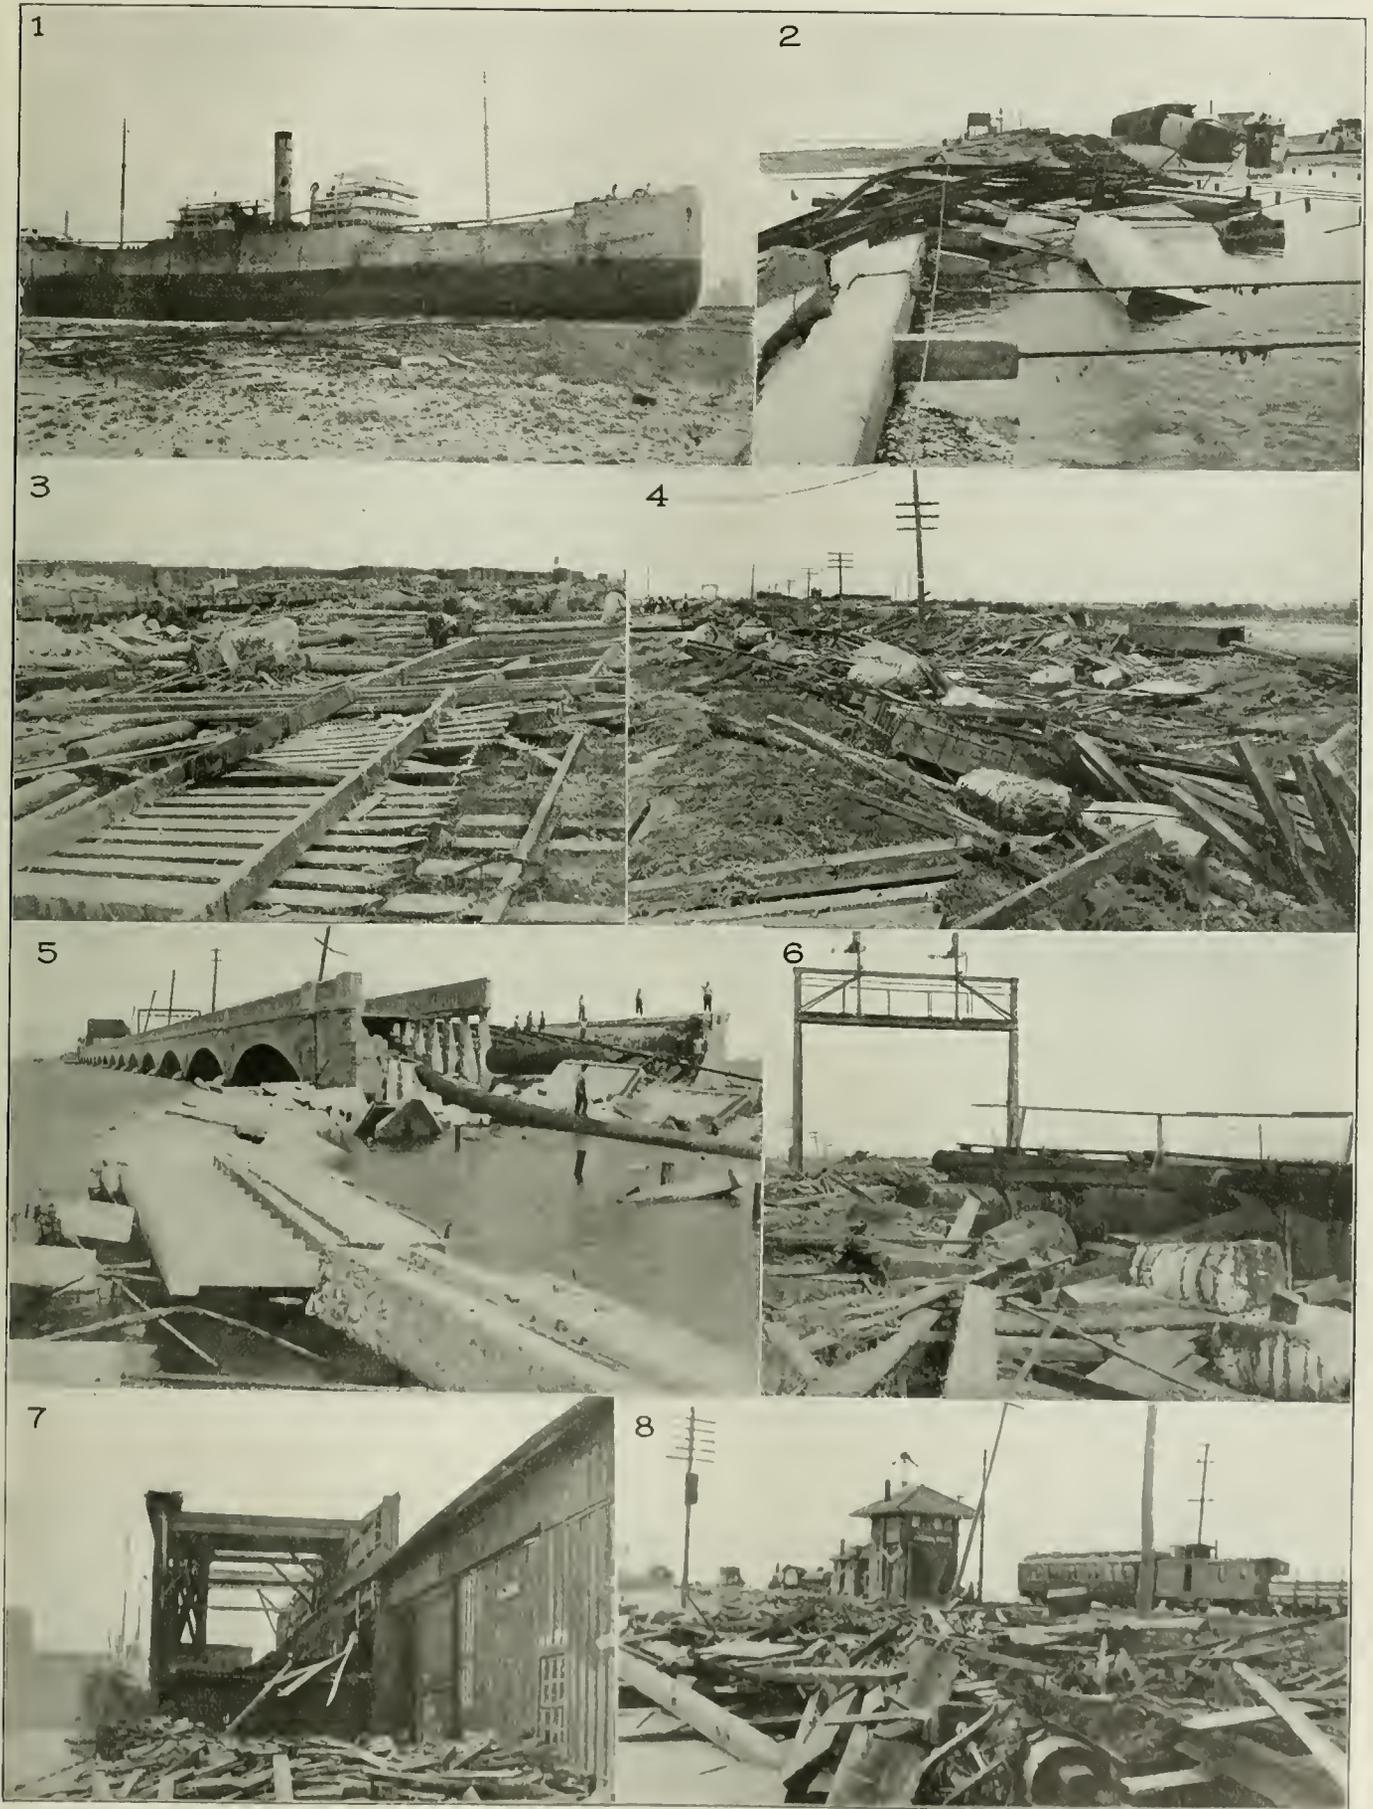

In the case of the latter road it will be noted that much of the track was washed to a considerable distance from the embankment. In other places one track was turned completely over onto the other track. Although most of the line is located at a considerable distance from the lake, the water in some places overflowed several miles of farm land to a depth of four to six feet on either side of the track, and the flood came so suddenly that at Frenier, La., 25 section men were drowned before they could escape. Roadmaster R. L. Hazlegrove and Peter Elardo, a section foreman, were drowned in the section house at Manchac.

Aside from the damage to the track the Illinois Central's property loss was estimated at \$30,000. This included the loss of the station at Manchac, damage to docks and several roofs, including that of the roadhouse at Harahan, La. There was comparatively little damage to the company's property in New Orleans. Over 14,000 lineal feet of bridge work in 67 double track bridges was damaged. About half of the decks were washed away, but most of the material was recoverable and the piling and caps were left intact. On the Yazoo & Mississippi Valley the only damage was to telegraph and signal wires and poles.

The storm subsided about 9 o'clock in the evening and much of the water flowed into the lake, making it possible to begin rebuilding operations at once on the following day. On the Illinois Central repair gangs were promptly organized and sent

to the scene of the washouts in motor boats, working from both ends of the washed out portion of the track. About 1,000 men were employed on the work in the day time and 600 at night. Much of the track it was possible to pick up and relay on the embankment intact, and much of the timber was recovered. Derricks and new materials required were brought in as fast as a track could be laid, while to some places material was brought in by boats, which were also used by the supervising officers. The president, vice-president in charge of the operation, general manager, chief engineer and other officers were on the scene as early as possible.

The railroad forces also were able to do a great deal of relief work in rescuing people who had been obliged to take refuge in trees. The extent to which railroad service was interfered with is indicated by the experience of a man who to get from Gulfport, Miss., to New Orleans, a distance of about 60 miles, on the Sunday following the storm, found it necessary to travel 360 miles by way of Jackson, Miss., and Baton Rouge, La., to get to his destination.

TRAIN ACCIDENTS IN SEPTEMBER*

The following is a list of the most notable train accidents that occurred on railways of the United States in the month of September, 1915:

COLLISIONS

Date	Road	Place	Kind of Accident	Kind of Train	Killed	Injured
1	Chicago, M. & St. P.	Racine	bc	F. & F.	1	0
1	Missouri, K. & T.	Smithville	bc	F. & F.	2	1
8	Denver & R. G.	Tennessee Pass	bc	P. & F.	1	64
24	Missouri Pac.	La Platte	bc	P. & F.	3	4
25	Balt. & Ohio	Willow	rc	F. & F.	1	2

DERAILMENTS

Date	Road	Place	Cause of Derailment	Kind of Train	Killed	Injured
4	San Pedro, L. A.	Galt, Nev.	Washout	P	0	3
4	Norfolk & W.	Starkey	Slide	F	4	4
5	Balt. & Ohio	Confluence	D. truck	P	0	13
10	Chicago & A.	Elwood	Unx	P	0	7
14	Wrightsville & T.	Alcorns, Ga.	Cow	P	1	1
18	Balt. & Ohio	Ripley, W. Va.	See below	F	0	9
20	C. B. & Quincy	W. Springs, Ill.	D. truck	F	1	16
23	Penn	Titusville	B. wheel	F	1	0
28	New York Central	Bryan, Ohio		F	1	1
30	Penn	Lancaster	Unx	F	1	3

The trains in collision at Racine, Wis., on the first, were an eastbound and a westbound freight, both running at moderate speed. Two engines and one car were badly damaged. The engineman of the eastbound train was killed. The collision was due to disregard of a meeting order by the men in charge of the eastbound train. The engineman forgot the order and the conductor started from the appointed meeting place on the assumption that the westbound had arrived.

The butting collision near Smithville, Tex., on the first, was between two heavy freight trains, both running at good speed; and ten cars were wrecked. The engineman and fireman of the northbound train were killed and a brakeman was slightly injured. The collision was due to neglect of the men in charge of the northbound train, who overlooked a dispatcher's order.

The trains in collision near Tennessee Pass, Colo., on the eighth, were eastbound passenger No. 20 and a westbound extra train, consisting of a light engine. Both engines were damaged. One fireman was killed and 11 employees and 53 passengers were injured, most of the injuries being slight. The collision was due to the negligence of the men in charge of the light engine.

The trains in collision near La Platte, Neb., on the morning of the 24th, were southbound passenger No. 104 and northbound

freight No. 153, both running at good speed. Three trainmen were killed and four were injured. The passengers escaped with minor injuries. The collision was due to forgetfulness on the part of the men in charge of the passenger train, who overlooked a dispatcher's order and a caution card and ran past the appointed meeting place—a non-telegraph station.

The trains in collision near Willow, Ohio, on the 25th, were both work trains, one running into the rear of the other, because the leading train was not properly protected by flag. One employee was killed, and seven others were slightly injured.

The train derailed near Galt, Nev., on the fourth, was a westbound express. Three passengers were injured. The cause of the derailment was a washout, due to a cloudburst.

The train derailed near Starkey, Va., on the fourth, was a southbound freight and the engine and five cars were wrecked. Two trainmen and two trespassers were killed and four trespassers were injured. The derailment was due to a landslide which struck the engine, sidewise, at the moment it reached the point.

The train derailed near Confluence, Va., on the fifth, was an excursion passenger train and two employees and 11 passengers were injured. The cause of the derailment was a defective engine truck.

The train derailed near Ellwood, Ill., on the evening of the 10th, was southbound passenger No. 9, and one coach was partly overturned. Seven passengers were slightly injured. The tender was the first vehicle to leave the track; cause not discovered.

The train derailed at Alcorns, Ga., on the 14th, was a passenger train No. 2 and the engine was overturned. The engineman was killed and the fireman injured. The derailment was caused by a cow, which ran upon the track immediately ahead of the train while it was moving at low speed.

The train derailed near Ripley, W. Va., on the 18th, was a wrecking train consisting of an engine and four cars, and the cause of the trouble was a loose wrecking crane which swung crosswise of the track and knocked down one truss of a bridge. The engine passed over the bridge in safety, but the cars fell to the bed of the creek 50 ft. below the track. Nine employees were injured.

The train derailed at Western Springs on the 20th was an eastbound freight and a derailed car fell in front of westbound passenger No. 55, which was running about 40 miles an hour. It overturned the engine. Fourteen passengers and two trainmen were injured, one of the trainmen fatally. The cause of the derailment was a brakebeam which became loose and fell to the track.

The train derailed near Titusville, Pa., on the night of the 23rd, was a fast freight and 17 cars were wrecked. One brakeman was killed. The derailment was due to the breaking of a wheel.

The accident at Bryan, Ohio, on the 28th, was the derailment of a work train, the tender of the locomotive being the first vehicle to jump the track. The fireman was killed and the engineman injured.

The train derailed at Lancaster, Pa., on the 30th, was a local freight, and the cause of the derailment was an open switch. One car was knocked off a trestle in the yard, and one brakeman was killed. Three other trainmen were injured.

Electric Car Accidents.—Only three serious accidents are reported in the newspapers as having occurred on electric roads in the month of September, but all three are on what may be called high speed roads. None of the accidents was attended by fatal injuries. On the fifth, near Huron, Ohio, there was a butting collision between a "limited" train and a local, in which about 35 passengers were injured. Near Norfolk, Va., on the sixth, an express car collided with a work car, injuring the motorman and slightly injuring a number of passengers. At Woodside, Ill., on the 20th, an interurban train, in which was a sleeping car, was derailed and the sleeper rolled down a 15-ft. embankment. Twenty persons were injured.

*Abbreviations and marks used in Accident List:
 rc, Rear collision—bc, Butting collision—xc, Other collisions—b, Broken—d, Defective—unf, Unforeseen obstruction—unx, Unexplained—derail, Open derailing switch—ms, Misplaced switch—acc, obst., Accidental obstruction—malice, Malicious obstruction of track, etc.—boiler, Explosion of locomotive on road—fire, Cars burned while running—P, or Pass., Passenger train—F, or Ft., Freight train (including empty engines, work trains, etc.)—Asterisk, Wreck wholly or partly destroyed by fire—Dagger, One or more passengers killed.

Passenger Train Cars for the Northern Pacific

All-Steel Equipment of Standard Construction for Service
Between St. Paul and Duluth and on the Pacific Coast

The Northern Pacific has recently received from the Pullman Company 47 coaches, 22 mail and express cars, 17 baggage cars and 6 dining cars of all-steel construction, 10 of the baggage cars and four of the mail and express cars being equipped with the head end generator sets of which two are of the axle machine train lighter type. The interesting feature of these cars is the marked similarity in their construction. The trucks are identical, the underframe practically so, and the framing only different in characteristic details, the coaches and diners

have a seating capacity of 84, and the diners 30. Vestibule ends are used on the coaches and diners, the side doors and steps being wider than usual. The other cars have stub ends.

The coaches have a natural Mexican mahogany finish from the window sills to the lower head lining and 7/16-in. fireproof Agasote below the windows to the baseboard. The ceiling is of the half empire style, with 3/16-in. fireproof Agasote head lining finished in pearl color with gold stripes. The diners are finished in Cuban mahogany with the exception of the kitchen, which is finished in plain oak. Agasote is used below the window sills and on the ceiling, which is of the full empire style. It is decorated in pearl color with gold stripes. Pressed prism plate glass embodying the Northern Pacific monad emblem

Interior of Northern Pacific Dining Cars

being designed to carry a live load of 20,000 lb. and 18,000 lb. respectively, and the other cars 50,000 lb. Many of the Northern Pacific standard parts were used and, where possible, steel castings were used in preference to forgings. The cars all have the same general dimensions, which are as follows:

Length over end sills (Dining Cars).....	72 ft. 10 in.
Length over end sills (Other Cars).....	70 ft. 10 in.
Width over side sills.....	10 ft. 1 3/8 in.
Rail to top of floor.....	4 ft. 5 3/8 in.
Truck wheels, number and diameter.....	.6—36 in.
Journals.....	.5 in. by 9 in.

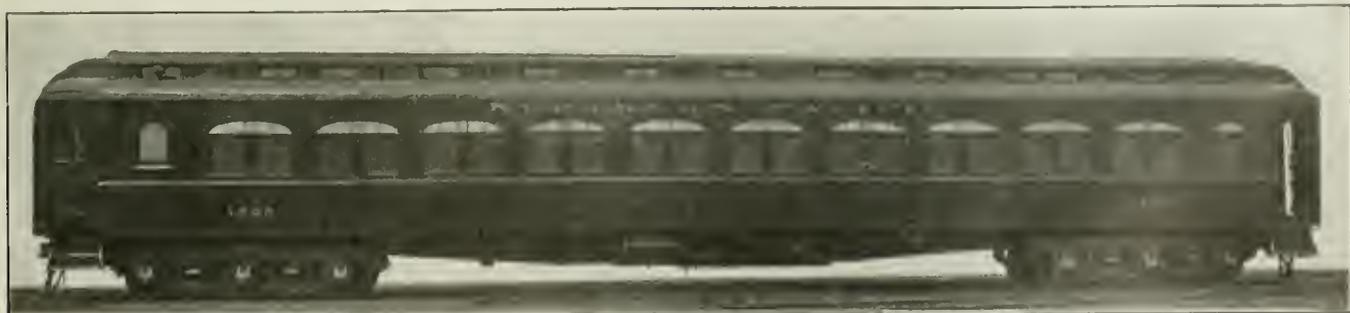

The weight of the coaches is 141,100 lb.; the mail and express

Interior of Coach Taken Under Its Own Illumination

design at the center is used for saloon, deck and gothic windows of the coaches and diners. On the coaches the prism glass was applied both inside and outside at the gothics, while in the dining-room of the diners the space usually taken up by the gothics was incorporated in the main window, making a clear glass 36 in. high by 47 in. wide. These large and extra high windows are particularly adapted to afford unobstructed views. The oval aspect of the windows, which is the Northern Pacific standard for wooden cars, has been maintained in these cars. The flooring in the coaches and the dining rooms of dining cars is of flexolith the color of which is natural gray in the dining cars and tinted red color in the coaches to harmonize with the inside finish.

The baggage and the mail and express cars have an inside

Northern Pacific All-Steel Passenger Coach

cars, 140,300 lb. without, and 146,200 lb. with, the lighting dynamo; the baggage cars, 127,800 lb., without the lighting dynamo, and 139,800 lb. with, and the dining cars, 160,100 lb. The coaches

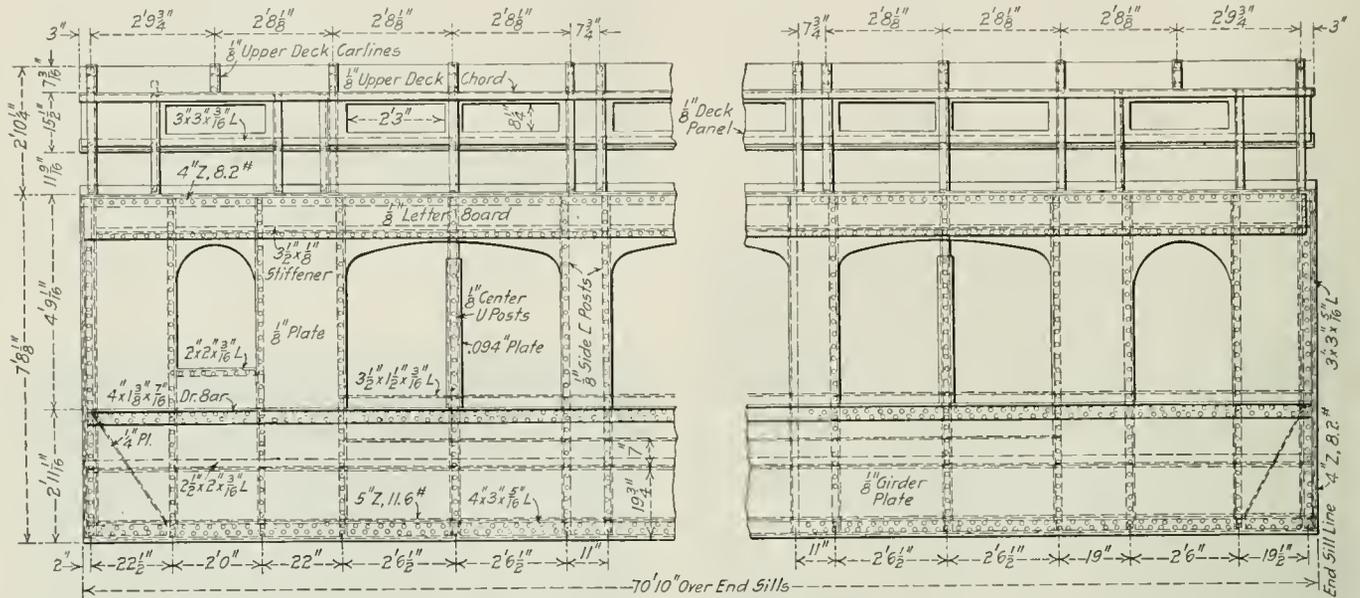

sheating of 13/16-in. by 5 1/8-in. poplar, with a ceiling of 3/16-in. Agasote. A 1 1/8-in. poplar partition separates the dynamo compartment from the rest of the car. All of the baggage and the

mail and express cars not equipped with dynamos were designed so that they may readily be so equipped. The mail and express cars were so constructed that the 30-ft. mail compartment can readily be converted into a 40-ft. compartment, and for that purpose a blind door was built in each side of these cars.

All the cars are equipped with Northern Pacific special buffing devices, which have a capacity of 350,000 lb., and also with three-

mechanism and at the center line of the draft gear, respectively. For this stress only the underframe members are considered, the superstructure being considered as supporting the underframe from buckling vertically.

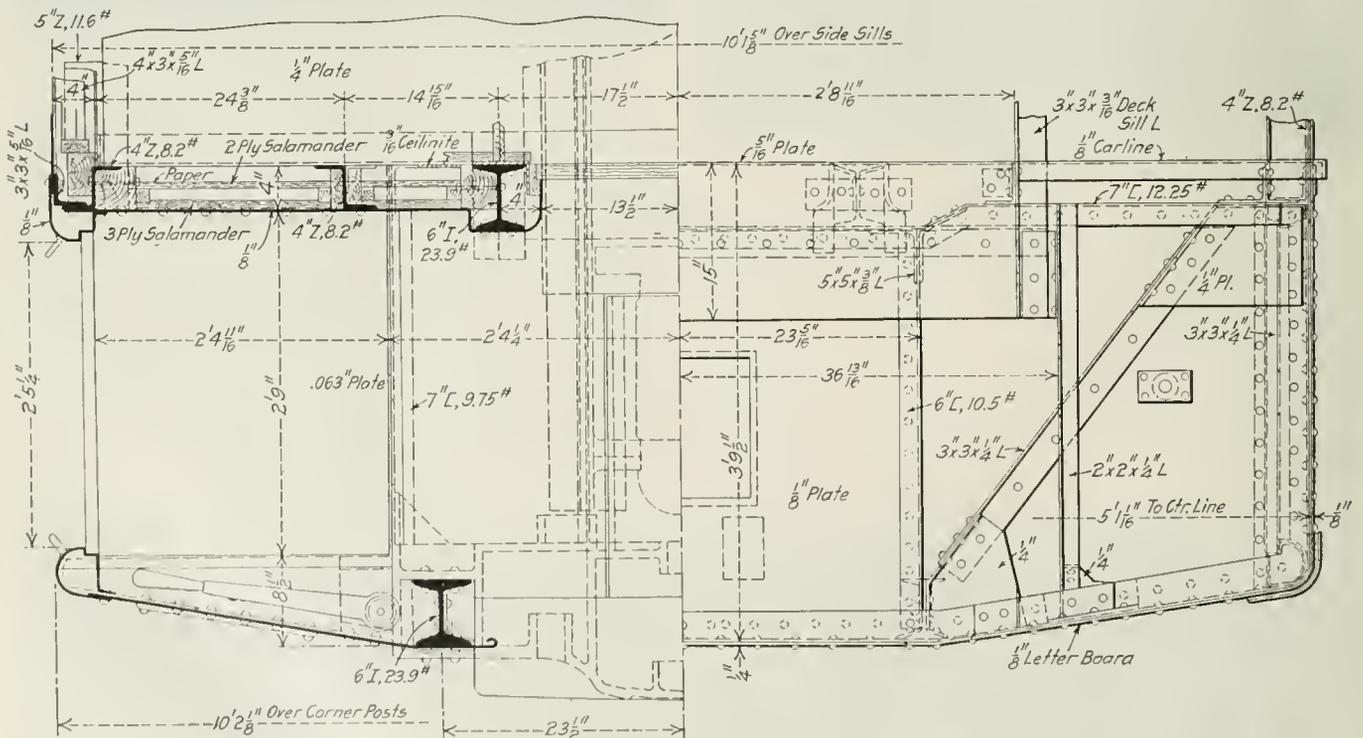

The underframe is made up entirely of plates and structural steel shapes and is, in general, used on all types of cars included in this article. The center sill is of the fish-belly box-girder

Side Frame of Northern Pacific Coaches

stem couplers having 8-in. tandem draft gear using one 8-in. plain and one 8-in. friction draft spring at each end of each car. The coaches, dining cars and combination mail and express cars are equipped with automatic deck ventilators with intake and

type with bottom cover plates only at the bolsters and cross-bearers. The body bolsters are of the double type, consisting of 5/16-in. pressed steel pans placed back to back. A cast-steel center plate is enclosed in the center sill girder and is designed

Section Through Vestibule Ends

exhaust working in conjunction. Eighteen of these ventilators are provided for each coach and seventeen for each dining car.

Underframe.—The longitudinal sills are designed to resist the maximum shock due to buffing, which is assumed to be the equivalent of a static load of 400,000 lb. applied horizontally at the resultant lines of force acting at the center line of the buffing

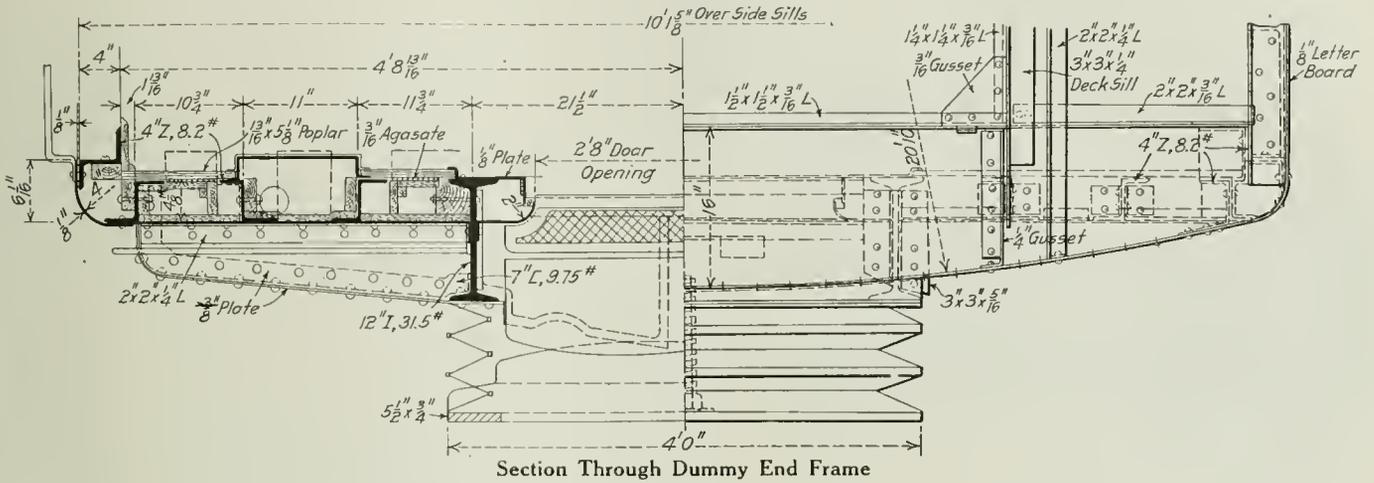

to receive the Coleman locking device. There are two cross-ties, one 9 ft. 3 in. each side of the middle of the car. The side sills are 5-in., 11.6-lb. Z-bars, extending in one piece from end sill to end sill. The end sills are 1/4-in. pressed steel pans, 12 in. deep, extending between the side and center sills.

Side Framing.—The general construction of the side framing in

all types of cars discussed in this article is similar, the clerestory type of construction being used. The side posts are 1/8-in. pressed steel channel sections 4 in. wide placed with the backs at right angles with the side of the car. The side plates are 4-in. 82-lb. Z-bars. The upper and lower deck carlines and the deck posts are made of one piece of 1/8-in. steel plate pressed in the form of a channel.

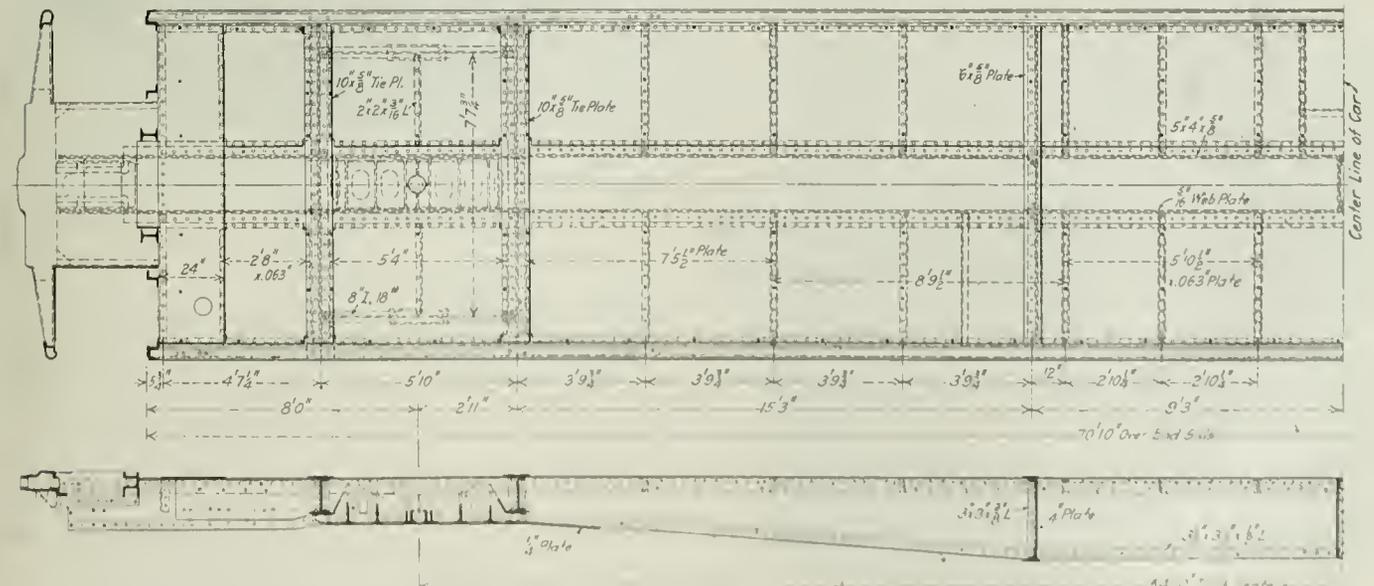

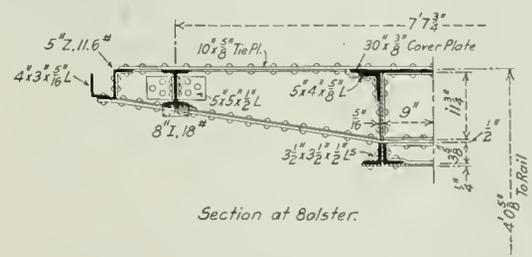

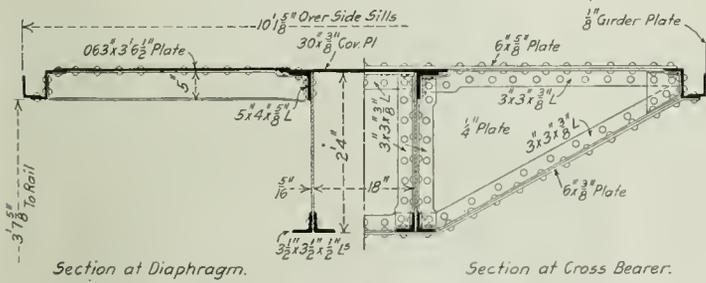

directly to the center sill. An anti-telescoping plate extends across all sills back of the end sill.

Insulation.—The insulation for the floors of the coaches and diners consists of a layer of 1/8-in. ceillinite cemented to the steel subfloor and passing under the six floor stringers, a layer of 3-ply salamander, an air space, a course of Neponset paper laid between the two courses of 13/16-in. fir flooring and a layer of

In the vestibule ends four 6-in., 23.9-lb. I-beams form the door and vestibule diaphragm posts and four 4-in., 82-lb. Z-bars the intermediate and corner posts. The cast-steel buffer is mounted directly on the center sill and is further reinforced by

1/2-in. flexolith with wire netting laid on the top course of wooden flooring. The insulation for the side and end walls consists of a layer of 3-ply salamander cemented to the inside of the steel sheathing, an air space, a course of 2-ply salamander,

Underframe Construction of Northern Pacific Passenger Cars

a 7-in., 9.75-lb. channel 2 ft. 4 1/4 in. each side of the center line of the car. In the stub end cars 12-in., 31.5-lb. I-beams are used for the door posts, and eight 4-in., 82 lb. Z bars form the intermediate and corner posts, there being two corner posts at each corner. As in the vestibule end the buffer casting is attached

a layer of wool felt, a layer of Neponset paper, an air space and a layer of 3/16 in. ceillinite cemented to the inside lining. The insulation for the roof, including both the upper and lower decks, consists of a layer of 3-ply salamander cemented to the roof sheets, an air space, 2-ply salamander, Neponset paper, wool

car. A heavy canvas webbing closes the opening in the car floor around the machine to keep the dust and cold air out. In service the machine and the opening in the floor are completely covered by a sheet iron casing.

An interesting feature in connection with the building of these cars is that the plans and specifications described the cars in such detail that the builders were able to place orders for material as soon as they received the contract (December 4, 1914) and where thereby enabled to turn out the first cars February 20, 1915. These cars have been made up into new steel trains running between St. Paul and Duluth, between Spokane and Seattle and between Seattle and Portland. In addition to these, the Pullman-Northern Pacific Association has supplied 21 new steel standard sleepers for use in these trains.

INDUSTRIAL TRUCKS ON THE PENNSYLVANIA*

By T. V. BUCKWALTER

The industrial electric motor truck as at present developed comprises baggage and mail trucks for use in passenger stations, warehouse trucks for freight stations and warehouses, shop trucks for railroad shops and general industrial purposes and electric tractors for propelling freight cars over street railway tracks.

There are no well-defined lines of demarcation between the first three classes. Baggage trucks are characterized by a height of about two-thirds the distance from the platform to the baggage-car floor, about 30 in. The length is controlled generally by existing elevator sizes and ranges from 9 to 12 ft. The width is generally 44 in. A modification of the baggage truck has a

Baggage Truck—Straight Frame Class

body only 9 in. high for use in depressed track stations where the car floor is but slightly higher than the station platform.

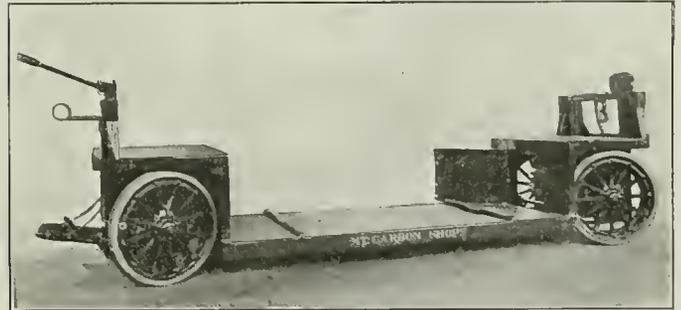

The electric warehouse trucks are characterized by a depressed portion at one end to facilitate loading, and delivery of the load into the end of a freight car. The restrictions limit the height to about 10 in., the width to about 40 in. and the over-all length to less than 9 ft. Shop trucks are subject to a variety of conditions as regards relative size and bulk of material handled. This has required a number of modifications in sizes. A distinct shop truck class has therefore not been developed but adaptation has been made of baggage and warehouse classes.

Railroad stations and shops are generally congested, and runways are narrow, therefore with the object of avoiding entirely the necessity of turning around, which would block other traffic, railroad industrial trucks have been constructed with double-end control. This feature permits of operation with equal facility in either direction, reducing congestion to a minimum. An

exception is the warehouse truck, which must have the low frame suitable to run into freight cars.

Space required to turn can be reduced still further by steering four wheels instead of two, and operation is made exactly identical in either direction. This eliminates the practice of running two-wheel steering trucks backward.

Sufficient traction for all ordinary work is available with two-wheel driving and therefore four-wheel driving complication is avoided. The voltage of industrial trucks has been selected after a careful study of the advantages of prevailing commercial truck standards and of much lower voltages, and was finally

Drop Frame Shop Truck with Transverse Rail for Carrying Mounted Wheels

adopted at 24 volts as the minimum at which efficient motors were obtainable, in consideration of the preponderant advantages of the low-voltage battery. The 24-volt battery has the minimum number of cells, and minimum number of connectors, and consequently the minimum possibility of jar and connector breakage, the minimum cost per unit of capacity and the minimum weight per unit of capacity.

The capacity of industrial trucks was worked out at 4,000 lb. as the maximum that could be handled within narrow and congested enclosures readily and safely, in consideration of the absolute necessity of quick stopping and positive and quick manipulation of control mechanism. Larger than 4,000-lb. trucks are too cumbersome, and smaller trucks will not carry enough to realize the full efficiency of the service. A 50-per cent overload factor has been found desirable, which makes a total weight as much as can be handled quickly.

Shop Truck—Warehouse Class

High-speed capacity has been found of little or no value, for the reason that the speed is limited by the amount of congestion of runways, and by the presence of other people who have other duties beside looking out for trucks. Therefore the

* Abstract of a paper read before the Electric Vehicle Association, at Cleveland, October 18.

speed has been reduced gradually as our experience has increased to the present standard of 6 to 7 miles an hour with the empty truck and 5 to 6 miles an hour loaded.

OPERATING RESULTS

The records of operation for the year 1914, including all labor and operating charges for a total of 212 trucks, show:

ELECTRIC TRUCKS; SUMMARY OF DATA, 1914

Shop	Shop trucks Average monthly data all trucks			Averages per truck month		
	No. of trucks	k.w.h. current	Total cost	Total cost	Saving	Percent age
Harrisburg	1	209	\$5.43	\$70.00	\$70.00	100
Verona	1	587	8.81	82.00	82.00	99.8
Trenton	1	792	9.90	67.00	67.00	87
Jumata	2	1,426	11.14	131.00	65.00	109.00
Altoona Car	3	1,251	8.57	190.00	63.00	96.00
Reno	2	1,168	18.05	136.00	68.00	93.00
Altoona Mach.	9	2,342	14.06	788.00	87.00	92.00
Pittsairn	4	789	4.05	312.00	67.00	89.00
Meadows Shop	1	734	29.40	34.00	34.00	21.00
Jersey City, Pier L.	3-5	1,340	45.77	173.00	51.90

Station	Baggage trucks Average monthly data all trucks			Averages per truck month		
	No. of trucks	k.w.h. current	Total cost	Total cost	Saving	Percent age
Baltimore	2	953	\$11.50	\$27.00	\$13.00	100
Philadelphia	34-35	6,821	88.66	421.00	16.00	81.2
Pittsburgh	17-28	6,731	34.96	503.00	17.00	76.5
New York	64-66	5,016	66.63	1,184.00	18.00	76.1
North Philadelphia	4-10	1,534	43.56	154.00	24.00	55.3
Washington	18	11,810	85.88	455.00	25.00	54.4
Jersey City	3-5	956	19.12	115.00	29.00	46.5
Harrisburg	1	588	12.01	66.00	66.00	20.6

For the shop trucks the total cost includes the wages of the driver, which, under differing circumstances, varies from \$32 to \$60 a month; repairs of trucks, repairs and renewal of bat-

The saving effected in baggage service is considerable but the figures are not sufficiently complete to be presented at this time. This saving is difficult of calculation. The character of the service has changed considerably since the introduction of electric trucks. The parcel post, formerly non-existent, is now a large and important part of the work. The labor force has not, generally speaking, been decreased, but, on the other hand, the business has increased. Rush periods can now be handled without borrowing untrained men from other departments, and a better class of men continue in service, as compared with the rapidly changing force in the old days. The operating officers consider that the most important advantage of electric baggage trucks is relief to terminal congestion and prompt despatch of trains resulting from avoidance of baggage detention. The saving effected is not stated on certain installations. This does not indicate an absence of a saving, but the failure of the operating people to ascertain the amount in time for this paper. The installations omitted would be near the top of the list. Under the heading "Number of Trucks" is indicated the number at the beginning and the end of the year, but the averages are based on actual truck months.

ELECTRIC TRACTOR

The electric tractor has now been in service 31 months and has proved entirely satisfactory. A description of this machine will be found in the *Railway Age Gazette*, January 9, 1914. It replaces horses for moving freight cars on tracks laid on paved streets. The tractor runs on the pavement like an automobile truck. Cars can be pulled or pushed by either end of the tractor. Steering, driving and braking is on four wheels. The size of tire is 60 in. by 6 in.; the weight 29,000 lb., and the drawbar capacity, 8,000 lb. at two miles an hour. The normal speed with one car on level tangent is six miles an hour. Brakes can be operated by hand or automatic air. Radial draft gear with standard couplers is provided at each end. Driving gears are 33 in. in diameter and 4 in. wide on each wheel.

During 1914 this tractor was in service an average of 7.6 hours a day, with 6.7 hours on a charge; an average discharge daily of 478 ampere hours, and an average of 11.5 miles daily. The average number of cars moved daily was 29.4 in addition to 20.5 "internal" movements. The total number of cars moved in the year was 8,562 in addition to 5,956 "internal" movements, and the total weight of these cars, in tons, was 219,382.

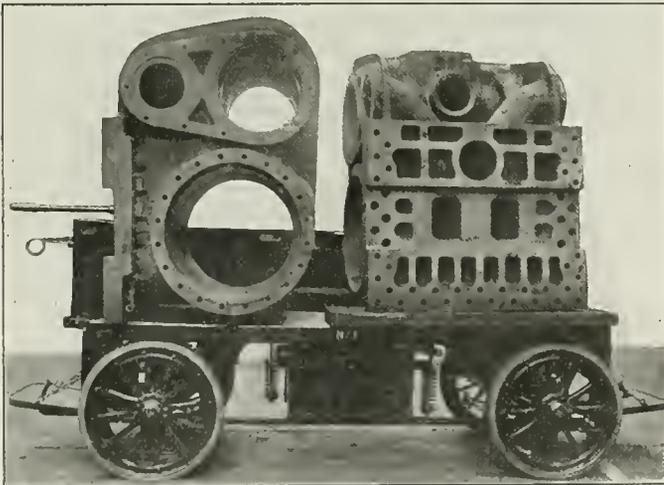

The record for the first seven months of 1915 shows the average hours in service daily to be 8.2; the average miles, 12.8, and the average number of cars moved 36.3, in addition to 25 internal movements.

"Internal movements" means cars moved from point to point within the track territory operated by the tractor. These movements are not included in total costs in service.

From the records of the 2½ years the following data may be derived:

Cost of tractor	\$13,400.00
Cost of maintenance and operation, 2½ years	\$13,145.67
Interest at 6% on \$13,400, 2½ years	2,010.00
Depreciation, less tires and battery, \$13,400 — \$4,200 = \$9,200 at 5 per cent, 2½ years	1,150.00
Depreciation battery \$3,200 at 25 per cent, 2½ years	2,000.00
	\$18,205.67
Total cost of service, 2½ years	\$18,205.67
Total number of cars (in and out) 2½ years	22,639
Total cost of service if horses had been used, 22,639 × \$1.86	\$42,108.54
Saving by electric tractor, 2½ years	23,902.87
Saving over investment, 2½ years	178.4%
Saving over investment, 1 year	71.4%
Total cost of service per car, 18,205.67 ÷ 22,639	\$0.805
Average weight per car	33,196 tons
Cost of service, per ton (in and out)	0.0243
Total miles operated	8,804.3 miles
Total number cars handled in internal movements	15,202 cars
Grand total cars (in, out and internal)	37,841
Cost of maintenance and operation per car (in, out and internal) 13,145.67 ÷ 37,841	0.347
Cost of maintenance and operation per ton (in, out and internal)	.0104
Cost of maintenance and operation per mile 13,145 ÷ 37,841	1.49
Cost of service per working day by tractor	24.67
Cost of service per working day by teams	57.06
Saving per day	32.39

There has been a gradual growth of service in number of cars moved per month from 690 to 920 cars, during a period when railroad business has been stationary. At the same time

Shop Truck—Straight Frame Class

teries, and new material for trucks, batteries, and tires. Of the shop trucks that at Harrisburg made the best record and is entered as 100 per cent; the ratio of the others is calculated on the Harrisburg record as standard.

The wide variation in some of the charges is due to difference in current cost ranging from 0.5 cents to 10 cents per k. w. h. to the number of trucks in the installation, and to the character of the work.

The figures for the baggage trucks do not include charges for drivers for the reason that the trucks are driven by the baggage porters.

The installations are given an efficiency standing based on the saving on shop trucks and on the cost of operation on baggage trucks. In the shops these trucks handle work formerly done by manual labor and the saving is readily computed. However, the figures do not represent the total saving, as, for instance, the increased efficiency of the shop due to having material handled on a regular and prompt schedule does not admit of calculation. The old practice of helping out the labor gang with machinists is largely done away with.

the cost per car has decreased from a maximum of 83 cents to 58 cents.

Mr. Buckwalter amplified the statement of cost with details by months, from which it appears that since September, 1914, the average expense per month for driver has been \$7,165, as compared with \$13,451 per month for the corresponding period prior to October, 1914, indicating that formerly a driver's mate was employed.

NATIONAL ASSOCIATION OF RAILWAY COMMISSIONERS

The annual meeting of the National Association of Railway Commissioners was held at San Francisco, Cal., on October 12, 13, 14 and 15. In his opening address as president of the association, Clifford Thorne, chairman of the Iowa Railroad Commission, vigorously defended state regulation as opposed to what he characterized as a tendency toward complete federal regulation. Mr. Thorne said in part:

"Too much 'nationalism' is just as wrong as too much 'states' rights. There is a happy medium. It is not this government as one nation, not the several states, but the combination in one federal plan that has rendered such a distinct contribution to the welfare of humanity. It is this federal plan that must be most jealously guarded. A tendency one way or the other, towards centralization or toward decentralization, is dangerous.

"For several years there has been gradually developing in this country a sentiment in favor of wiping out state lines. An agitation, partly spontaneous and partly inspired by interested persons, has been carried on to support a change in our judicial decisions relative to the powers of a state to regulate business. It is now vigorously claimed that the time has arrived for the practical abolition of all state regulation. Such a change in the American plan of government would be of stupendous importance. The issues of today concern vast property interests, and the future policies of state and nation on many grave questions of business are vitally concerned."

After reviewing the Minnesota rate case and the decision of the United States Supreme Court, Mr. Thorne said: "The court said that the question as to whether federal regulation of commerce shall supplant state regulation is not a question for the judiciary to determine; it is legislative and not judicial in character. It now becomes, not a question of precedent or of statute, but one of expediency, of wisdom.

"Within the next 25 years substantially all our commercial affairs will be carried on by companies doing both state and interstate business. What is good for railroads will be good for others. Shall we abandon our state governments, so far as the regulation of business is concerned? Here is an issue which strikes at fundamentals; which has to do with the method of government.

"In striving after the new, we frequently fail to realize the intrinsic value of the old. What is the fundamental characteristic of our government? It is the creation of a nation, large and strong enough to assert its independence among the world powers; at the same time combined with a form of government securing real tangible home rule to the various independent sovereignties making up that nation.

"If the national government is permitted to gradually absorb the functions formerly exercised by the states, it will only be a question of time until some great evil will demand some great remedy. Agitation will follow agitation. There will be no opportunity to try out the new proposal; the nation as a whole must adopt it or reject it. We believe the federal plan, as conceived by our fathers, is better than the new nationalism. We believe the states are a distinct factor in our scheme of government."

Judson C. Clements, of the Interstate Commerce Commission, addressed the meeting on the subject of federal regulation of railroad securities. Mr. Clements said that there must come a

time when some single tribunal will control this phase of railway operation. "It will be a long time," he said, "before effective legislation can be secured by the states, and public ownership should be resorted to only as the last resort." Mr. Clements said that politics would figure too largely in the management of government-owned roads.

It was decided to establish a bureau at Washington to represent the interests of the states and to assist the Interstate Commerce Commission in its work of making a valuation of railroad property, and the following committee was appointed to take charge of the new bureau: C. E. Elmquist of Minnesota, Clifford Thorne of Iowa, G. A. Henshaw of Oklahoma, Max Thelen of San Francisco, C. B. Aitchison of Oregon, J. L. Bristow of Kansas, and E. C. Niles of New Hampshire. A resolution was adopted advocating legislation to give railroad commissions power to eliminate grade crossings. The committee on railway service and accommodations submitted recommendations that every state be urged to enact laws against the use of liquor on trains. R. R. Prentiss of the Virginia commission was elected president of the association for the ensuing year.

ECONOMIC VALUE OF TERMINAL IMPROVEMENTS AT DETROIT

One of the important engineering works of the country completed within recent years is the double tube tunnel under the Detroit river, connecting the American and Canadian divisions of the Michigan Central.

Detailed descriptions of the work* and the numerous difficulties successfully overcome, from an engineering standpoint, were made public from time to time during construction. The tunnel was opened for traffic in 1910, and has entirely superseded the use of ferryboats for transferring Michigan Central freight and passenger traffic across the river. Sufficient time has now elapsed to fully test the estimates of the advocates of the plan as to the advantages it was believed would accrue from a materially reduced cost of handling traffic and time saved in transportation.

There are usually one or more points upon trunk lines with a fluctuating volume of traffic which tend to limit the amount of business that may be handled economically on the whole line. When the traffic load approaches the peak, congestion is found at these points, the whole line becomes affected and operating costs rise abnormally. Such a place was the Detroit river ferry over which all the through traffic of the Michigan Central had to pass, and as early as 1870 plans were made for relief from the limitations this method of transfer imposed. With the engineering facilities then available, a projected tunnel was found to be impracticable of construction because of the conditions which tests disclosed in the river bottom.

Various plans involving the erection of a bridge were discussed, but these were finally abandoned in 1904 for the reason that the clearances demanded for lake vessels would have required a structure of such height that it would have been necessary either to establish grades impossible of operation, or construct approaches of such great length that the cost would have been prohibitive.

The growing traffic and vexatious delays pressed for a solution of the problem, and in 1906, confronted with the necessity of making large additions to its ferry transfer equipment, the Michigan Central appointed a committee to study the situation. The committee reported that a tunnel could be built within reasonable limits of cost, and that in operation it would be economical enough to justify the investment. Plans were then adopted for the laying of twin tubes under the river, and, as a necessary adjunct thereto, provision was made for a new passenger

*For description of tunnel, see *Railway Age Gazette*, November 10, 1911, page 945; for description of tunnel yards, see August 18, 1911, page 334; for description of Detroit terminal passenger station, see January 9, 1914, page 73.

station in Detroit and for new yards and terminals required by the change in location.

In the construction of the tunnel, lying partly within the United States and partly within the Dominion of Canada, it was necessary to organize separate tunnel companies, one under the laws of Michigan and one under the laws of the Dominion of Canada. These companies were subsequently consolidated under the name of the Detroit River Tunnel Company, which was authorized to build and own the property, all of which has since been leased to the Michigan Central. Construction work was begun in 1906 and completed in 1910. The terminal building was opened for use in December, 1913, a short while before its completion, on account of the destruction by fire of the old station. The entire property—that is, the Detroit River Tunnel Company—was capitalized at \$21,000,000, of which \$3,000,000 was in capital stock, all owned by the Michigan Central, and \$18,000,000 in fifty-year first mortgage 4½ per cent bonds. The money was expended for the cost of building and equipping the tunnel, for rights-of-way, separation of grades at street crossings, and the construction of the new passenger station, yards and other terminal facilities.

Up to 1910, all Michigan Central trains were ferried across the Detroit river, requiring the breaking up of through trains and involving many switching movements and a delay of from three to eight hours per train in through freight service. On account of the swift current in the river, the frequent use of the channel by steamships, and the added difficulties of fogs in the summer and autumn, and ice in the winter, it was found impossible to maintain schedules or to regulate traffic in a satisfactory manner.

Since the opening of the tunnel for operation, the average time of passenger trains between Windsor and the new Detroit terminal, in either direction, is about nine minutes, or less time than it formerly required simply to place the trains on the transfer boats.

The average time required for moving a freight train through the tunnel is about twenty minutes, as compared with several hours required for breaking up, switching, reassembling and ferrying trains under the former method of operation, in addition to which they were frequently subject to more or less serious delays crossing the river because of weather conditions, ice, etc.

This saving of time has been particularly advantageous in the handling of traffic requiring expedited transit, such as perishable commodities. Thus, the railroad has been in a position to give better service because of the removal of the main cause of delay, but has been able to improve its operating efficiency on this division by greatly increasing the train loads since it has been possible to send solid trains through the tunnel.

The following statement indicates the growth in average monthly operating revenues which the Michigan Central has enjoyed since opening the tunnel:

	Three-Year Monthly Averages		
	1907-9	1912-14	Increase Per Cent
Monthly Passenger Earnings:			
Summer months	\$645,935	\$838,056	29.74
Winter months	470,209	634,164	34.87
Average throughout period....	\$558,072	\$736,111	31.90
Monthly Freight Earnings:			
Summer months	\$1,481,740	\$1,791,970	20.94
Winter months	1,494,737	1,830,530	22.47
Average throughout period...	\$1,488,238	\$1,811,250	21.70
Monthly Passenger and Freight:			
Summer months	\$2,127,675	\$2,630,028	23.61
Winter months	1,964,946	2,464,694	25.43
Average throughout period...	\$2,046,311	\$2,547,361	24.49

Just how much of the increased traffic represents a normal growth and how much comes from the better service which the road renders cannot be ascertained.

Important as are the benefits mentioned to the public and the railroad resulting from the construction of the tunnel, a feature

of equal importance, particularly from the railroad viewpoint, is the fact that the total cost of transfer is now considerably less per car than it was under the old method of ferrying across the river. Although the investment in the tunnel property and equipment is about eight times as large as that required for the transfer boats and slips, the cost of switching and operating the trains, and maintaining the property is so much lower that the higher interest charges and taxes are more than offset.

Statistics for the year 1914, as compared with the year 1908 when the transfer boats were in operation, show that there has been a large saving in the cost of switching service, although the number of cars transferred across the river in 1914 was greater than in 1908.

A material saving has also been obtained by the transferring to the new freight yards at Windsor, constructed for this purpose, of all the switching operations necessary on through freight trains, thus relieving the Detroit yards (which were rapidly becoming congested and overcrowded owing to the extraordinary industrial growth of Detroit) and increasing their capacity about 40 per cent. Another item, the exact amount of which cannot now be computed because of the loss of records by fire, is the saving in per diem charges on loaded and empty freight cars, particularly empty cars, many of which were formerly frequently held back on either side of the river as a matter of necessity in order that the forwarding of loaded cars might be expedited. Under present conditions, there being no congestion at this point, empties are forwarded without delay.

The traffic through the tunnel represents but a small percentage of its capacity. If it continues to increase in the next few years as it has in the past decade, the Michigan Central will find the tunnel to be an increasingly valuable asset, and one without which it would not be able to render the service that will be absolutely required of it if it is to maintain its standing as a trunk line.

It is not possible as yet to determine the decreased cost of handling passenger trains that will result from the use of the new station. A more convenient arrangement of the tracks has undoubtedly effected a reduction in cost. The better location of the station and the better service the tunnel affords have undoubtedly attracted to the line a larger number of passengers.

In planning the new station and terminal at Detroit, and following the scheme of development applied to the Grand Central Terminal in New York, the company has included its own offices in the building and has reserved for renting purposes certain parts of the property, the income from which, it is expected, will meet a large part of the interest charges on the terminal investment.

The improvements at Detroit afford an example of a relatively large investment concentrated at one point. Following the general policy of the New York Central Lines with regard to important changes, this improvement is not a temporary makeshift, but has been installed with liberal provision for present needs and ample capacity for growth in the future. In this case, the wisdom of the investment has already been demonstrated, not only from the standpoint of economy and consequent benefit to the owners of the property, but in greatly promoting the public service as well.

A BRITISH RAILWAY'S EQUIPMENT.—The North British Railway Company owns over 60,000 freight cars and the number awaiting repair is normally about 1,000. Owing to the various adverse conditions resulting from the war the number awaiting repair at the present time is about 5,000. Notwithstanding this the supply of cars to the ironmasters and coal mines was never so satisfactory to the trade as it is just now. This is due to the car supply on the North British being controlled from the train control office, which is at Portobello, a point not far from Edinburgh.

Maintenance of Way Section

The report on water tanks presented before the convention of the Bridge & Building Association this week, and abstracted on another page in this issue, calls to mind the changes which have been made within the last few years in the manner of storing water for locomotive use at outlying points. It is only a few years since water

Recent Developments of Water Tanks

was almost universally stored in wooden roadside tanks of 50,000 to 60,000 gal. capacity, located alongside the track and delivering directly to locomotives. Today the capacity has increased until the 100,000-gal. tank may be said to be standard; the steel tank has replaced the wooden tank on many roads, and frequently the tank is set back from the track and water is delivered to the locomotives through a standpipe. These and other developments make necessary the continued study of this problem by those having to do with water tank installations. It is especially important, in determining between wood and steel tanks, to study the relative merits of the two materials for use in particular locations, for the quality of both of these materials obtained has been changing rapidly. It is necessary to scrutinize carefully not only the materials entering into the tanks proper, but into their accessories as well, for a tank is serviceable only so long as all of its appliances are serviceable.

In 1897 the average freight traffic density of the railways of this country was approximately 482,396 ton-miles per mile of main track and the average passenger traffic density 62,144 passenger-miles per mile of main track. In 1913 these figures had increased to 1,095,000 and 126,300, respectively. Thus, in 16 years the

The Development of Special Steels

average amount of traffic passing over each mile of main track had doubled. These are necessarily average figures and do not indicate the amount of traffic passing over the points of greatest congestion. On portions of several roads the freight traffic movement alone over certain parts of the lines exceeds 20,000,000 ton-miles annually, and the movement over each track is proportionately large. Nevertheless, these figures denote in a general way the increased service required of the tracks all over the country. The unit of track construction most directly affected by the density of traffic is the rail; and especially is this true at the points subject to the most severe attacks, as in the case of the high rails on curves and special construction at frogs and crossings. With this large increase in the service demanded, it is not surprising that there have arisen many instances of rapid rail wear. This has led to efforts to secure some metal other than Bessemer or open-hearth steel which will give a greater life at these particular places, and has given rise to the experiments with special steels described by W. C. Cushing in another column. To be successful, any substitute metal must possess the valuable qualities of the present open-hearth steel, while at the same time affording a greater resistance to wear, and must yield itself to manufacture at a cost sufficiently low to enable it to be used with economy. These are rigid requirements and it is neither surprising nor discouraging to note that no entirely satisfactory substitute has yet been developed. Material progress is being made in the development of materials of the required physical characteristics and with increased use the cost of manufacture will decrease materially. It is important that these and other experiments be continued, even at heavy initial cost to the railroads as well as to the manufacturers, for it is certain that the traffic will continue to grow in the future as it has in the past, and that the demand for rail materials giving greater resistance

to wear will gather momentum from year to year. It is not beyond the range of possibility that the ultimate solution will be the development of several grades of rail material of varying resistances to wear and corresponding cost for use on lines of different traffic densities.

Competitive commercial enterprises are frequently hampered by the lack of proper standards for the control of quality, quantity, weight and sizes of the various products. A loose interpretation of inadequate standards or the entire absence of such standards always works to the disadvantage of the conscientious dealer in favor of his unscrupulous competitor. The purchaser also suffers. Fortunately these conditions no longer obtain in most well-established lines, because of the rules, specifications and standards adopted by the various manufacturers' associations. A recent example of this is the action taken by the National Association of Mixer Manufacturers for the standardization of the rating of batch concrete mixers. It is a well-known fact that the batch capacity of a mixer of unmixed sand, stone and cement is about 50 per cent greater than its capacity for mixed concrete, and up to the present some mixer manufacturers have been rating their machines by their capacity in mixed concrete, while others rate them by their capacity in loose, unmixed material. The action recently taken by the mixer manufacturers was in the form of a resolution which provided that the members of the association shall specify the capacity of their mixers as "size of wet mixed batch" in catalogues and circulars and not otherwise. It also provides that the dry, unmixed capacity of a mixer may be approximated as one and one-half times the wet mixed batch, on the basis of a stone concrete with 1½ in. crushed stone and 1¾ gal. of water per cubic foot of mixed concrete. The Association of Mixer Manufacturers is to be commended for this action.

THE DANGER POINT IN RETRENCHMENT

A GREAT deal of attention is being given to the "Safety First" agitation, and it is to the credit of the railways that they have led in this movement. Numerous more or less important measures have been adopted to increase the safety of travel, many of which have involved the expenditure of large sums of money. As an example, the extension of automatic block signals may be cited. In many cases such installations have been made for the economic purpose of increasing the capacity of the line, but in many other places, large expenditures have been authorized primarily for considerations of safety on lines where a congestion of traffic did not prevail.

The past few years have been years of declining railway revenues in the face of increasing expenses, a condition requiring strict retrenchment and the conservation of resources. In such times the problem is to distribute the limited funds available where they will go furthest toward accomplishing the desired result, there not being resources available sufficient to do all the work desired. Under these conditions, great care must be exercised to maintain all units of the property to the proper standards of safety.

In any period of retrenchment, the first and most drastic reductions in expenditures are ordinarily made in the maintenance of way department. During the year ending June 30, 1915, the average expenditure for maintenance of way and structures for the railways of the country decreased about \$210 per mile of

line, or 11 per cent. While the effects of restricted expenditures are not ordinarily reflected at once in the condition of the track and structures, this last reduction, coming after an extended period of retrenchment, has caused the condition of much track to deteriorate seriously and in many cases to the point of danger.

It is, of course, impossible for a railway to spend money which it does not earn or possess, and for the policy of slow starvation which is being carried out by the state and federal regulating authorities, they must accept their full measure of responsibility. But, regardless of the cause of present conditions railway officers must also accept responsibility for so distributing the funds at their disposal as to secure the greatest degree of safety for the traveling public. In this connection, those in charge of the maintenance of the track and structures should bring to the attention of those responsible for the distribution of funds the actual condition of the property, particularly at those points where travel is endangered. If the higher officer is then unwilling to make the proper expenditures, he must accept the responsibility.

In these days of labor agitation, great dependence is placed on the unorganized, poorly paid section foreman who is expected to maintain track safe for high speed trains 24 hours in the day, frequently with only two or three foreign speaking assistants, and with no 16-hour law to protect him in times of storm or wet weather. Furthermore, when retrenchment comes, the amount of ballast, rail and other materials furnished for maintenance purposes is reduced, and at the same time the foreman is given less labor, although his track requires more attention and the trains run at the same speeds. After all, the track is the first essential to safe railway operation and without good track the best equipment and the most elaborate signals are ineffective.

SELF-EDUCATION

It is a common complaint among all ranks of maintenance of way employees that few opportunities are presented for promotion to positions of more responsibility and correspondingly greater rewards. At the same time the executive officers of railways lament their inability to secure men properly prepared to fill vacancies in this department as they occur. If these two apparently contradictory conclusions are correct, and it must be admitted that there is merit in each, it is pertinent to inquire what measures are being taken to bring the men and the positions together.

All branches of maintenance of way work are changing rapidly and the standard methods and materials of only a few years ago are fast becoming obsolete. The introduction of special materials, such as heat treated bolts, and of devices such as rail anchors, the use of treated ties and the adoption of motor cars, illustrate recent developments in track work. The widespread use of concrete and measures for its proper preparation, the use of fuel oil engines in pumping stations and the construction of more scientifically designed track scales are of similar importance in other branches of this department. To serve his company best, as well as himself, a man must keep abreast of these developments and do his share in perfecting them. This requires that he must use all the available means for educating himself to greater efficiency.

A few years ago opportunities for education along the line of a man's work, but outside of his regular daily activities, were very limited. Fortunately this condition is rapidly disappearing and information is available today for men of all ranks. For the man who desires that his line of study be directed for him, courses of instruction have been prepared which will give him, step by step, a broad working knowledge of his duties. These courses are available for officers and employes in practically all ranks of the maintenance of way department. Realizing the merits of such courses, several railroads are now placing them

at the disposal of their men in the lower grades without expense to them.

For the man who prefers to select his own literature, the number of books on railway subjects is increasing constantly, while the railway journals present information concerning recent railway developments from week to week, and from month to month.

The universal demand for trained men and the means for self-education so generally accessible, should afford sufficient incentive for the wide-awake men to so prepare themselves. It is significant that some of the most prominent men in the railway field today are those who were denied the privileges of a college education and who have advanced to their present high positions by dint of hard study, and it is interesting to note that, having attained success, they retain their same studious habits. The same opportunities are presented, to a degree at least, in all ranks, even to the most humble. Within the past year one general manager went to the man in charge of educational work on his road for a list of track laborers whose educational work indicated they were fitted for foremen, and out of a list of 80 men so selected he secured practically his entire quota of section foremen for the year. There has never been a time in the history of our railways when trained men were in so much demand in all ranks as today. The man who properly equips himself for the work of the position he now holds and continually endeavors to fit himself for the position just above it will almost certainly secure recognition and advancement. What is true in this regard today will be true to an increasing extent from year to year.

THE RAPID DEVELOPMENT OF CONCRETE CONSTRUCTION METHODS

In a spirit of conjecture, perhaps not unalloyed with flippancy, the bridge engineer of a certain railroad recently suggested the following picture of the future of concrete construction on railroads: After the excavation has been completed, a gang of carpenters will build the forms complete to the last detail. When all is ready a "concrete train" will arrive on the ground and, in a manner comparing favorably with the operation of a modern fire department, a few active, skillful men will run out lines of hose or flexible pipe and proceed to "squirt" the forms full of concrete. It must be admitted that this sounds somewhat like the prophecy of a well-known American inventor which had to do with concrete houses built in a day in cast iron forms, with furniture and plumbing all in place, etc., but which unfortunately has not been fulfilled. On the other hand, the picture outlined above was a result of a close association with the concrete industry and was drawn in the light of the recent developments in the making and placing of concrete.

Reviewing the use of concrete during the last twenty years, the first ten were marked by the development and application of the theory of reinforced concrete design; the second ten by a wonderful advance in the making and placing of concrete. It is believed that this will account for a recently observed tendency toward a return to the use of mass concrete in place of reinforced concrete in certain classes of retaining walls where mass concrete can serve the same purpose. Where it can be handled in large quantities, concrete can now be made and placed so much more cheaply than formerly that the saving of concrete in the thin reinforced wall is largely neutralized by the greater cost of the reinforcement and form work.

Fifteen years ago a large portion of the concrete was hand-mixed, while now almost no job is too small to justify a mixer. Today we use the cement gun, the concrete atomizer and the pneumatic mixer and placer, collapsible steel forms and concrete mixer cars. Mechanical or gravity handling of mixed concrete is a firmly established practice, and manual labor is eliminated even for supplying the materials to the mixer. One of the lessons of the Panama Canal is taught by the illustration it afforded of the possibilities for plant development when large quantities of concrete are required.

A New Terminal for the Southern at Birmingham, Ala.

This Includes a Classification Yard and Engine Facilities with Provision for Future Enlargement

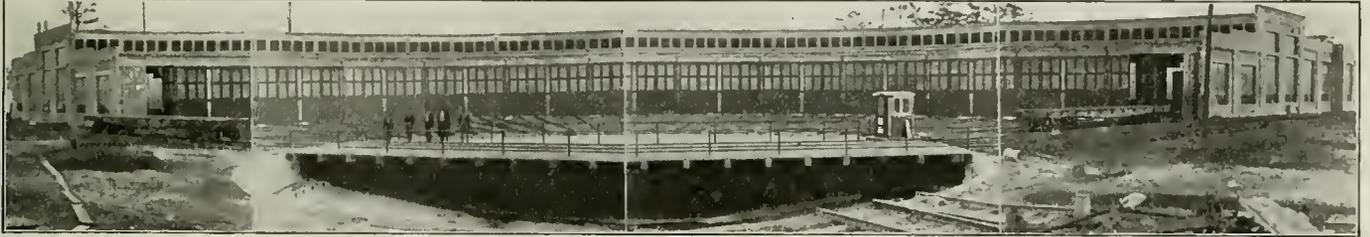

To keep abreast of the rapid growth of Birmingham, Ala., the railroads running through it have been obliged to increase their passenger and freight facilities. Among these, the Southern has recently built a freight yard and engine terminal representing an expenditure of \$661,000, which will be adequate to handle its business in the Birmingham district for some time to come.

The facilities of the Southern for handling freight, up to the

borrow, obtained from the location of the future extension of the yard. Drainage is taken care of by a system of catch basins, inlets and sewers of terra cotta, cast iron and reinforced concrete pipe, ranging from 12 in. to 48 in. in diameter.

YARD ARRANGEMENT

The receiving yard consists of 8 tracks, having a capacity of 45 cars each, and two running tracks; the yard tracks are

The Roundhouse and Turntable

time of this improvement, consisted of four yards scattered over a territory of approximately 10 miles, and such improvements as could have been made would have involved a large expenditure of money and would not have provided adequate facilities for any reasonable length of time. It was therefore decided to abandon all schemes for expansion of the old yards and to build a new yard on property owned by the railway at North

laid 12 ft. 6 in. and running tracks 15 ft. between centers. The grade of the receiving yard is level for about half its length, changing to a grade of 0.5 per cent ascending in the direction of the hump. The grades for the new hump as shown on the accompanying profile were adopted after careful observation of various humps in operation at other yards and actual tests during construction; that is, when the yard was practically com-

Looking East Over the Classification Yard

Birmingham, Ala., to be known as "Finley Yard," in honor of the late President Finley. Plans were accordingly developed for a yard layout, taking into consideration the probable needs for a period of 25 years, with the intention, however, of building only one unit of the yard at a time and adding to it as found necessary.

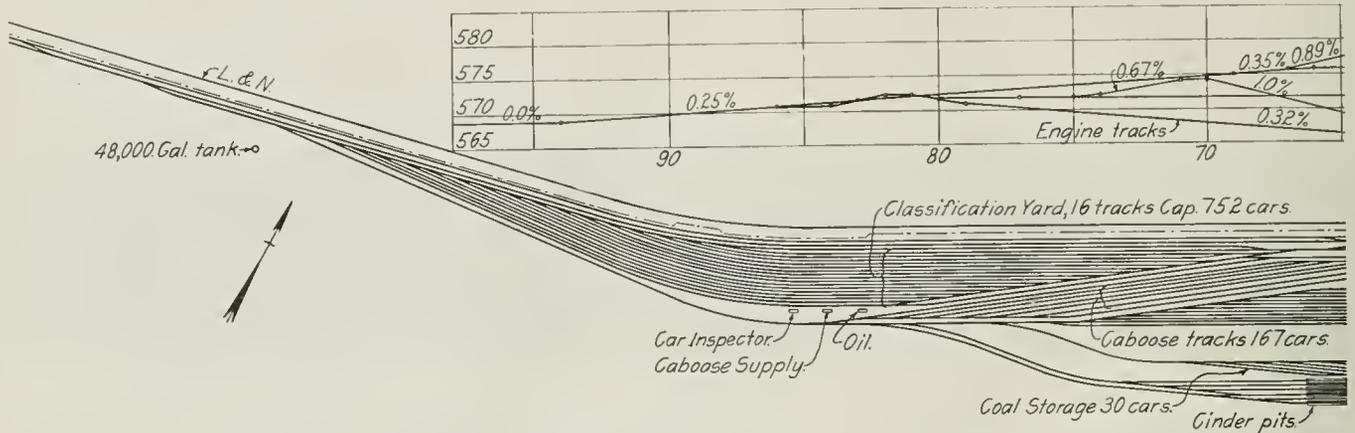

The first unit consists of a receiving yard, a gravity classification yard and a storage and repair yard, having a combined capacity of about 2,000 cars and a complete engine terminal.

The grading for the above consisted of about 105,000 cu. yd. of earth and 1,600 cu. yd. of solid rock excavation, the cuts and fills equalizing, with the exception of 20,000 cu. yd. of

pleted, and before it is put in operation, cars were run over the hump and the grades adjusted to meet local conditions. Commencing with the vertical curve at the apex the grade is 3.0 per cent, reducing to 0.6 per cent across the scales, a distance of 91 ft. The maximum beyond the scales is 3.8 per cent. Vertical curves were used at all grade intersections, their lengths ranging from 20 to 50 ft. There is a concrete underpass under the hump, eliminating the necessity of employees crossing the hump track while cars are being handled. A railing across the path just outside the subway at each end prevents direct passage from the subway onto the adjoining tracks, thus reducing the opportunity for accidents.

The classification yard consists of 16 tracks, having a capacity of 47 cars each, and two running tracks; the yard tracks are laid 12 ft. 6 in. and the running tracks 15 ft. center to center. The grade of the yard is 0.25 per cent throughout its entire length with the exception of a few hundred feet at the extreme west end which was made 0.8 per cent to coincide with the grade of the main tracks. There are 5 caboose tracks, providing for 173 cars, 2 repair tracks of 74 cars capacity, 10 local freight and storage tracks having a capacity of 530 cars each, and a 6-track coal storage yard of 35 cars capacity. The coal storage

A special feature in the operation of the scale is an interlocking device for the switch at the upper end of the scale, the purpose of which is to eliminate the possibility of leaving the switch open for the passage of an engine or unnecessary switching over the scale, to prevent cars being run on the scale before the weighmaster has had ample time to put it in proper adjustment for weighing, and to place responsibility for prevalent bad practices in weighing and care of scales with one person. The main and extension levers are of cast iron, the fifth lever is of cast steel and all pivots and bearing steels are of special alloy.

West Half of the Finley Yard

tracks are on a 1.0 per cent grade descending towards the coal hopper to permit gravity handling of the coal cars. The coal and cinder pit tracks are arranged to enable engines to take coal and water, and deposit cinders, with a minimum loss of time.

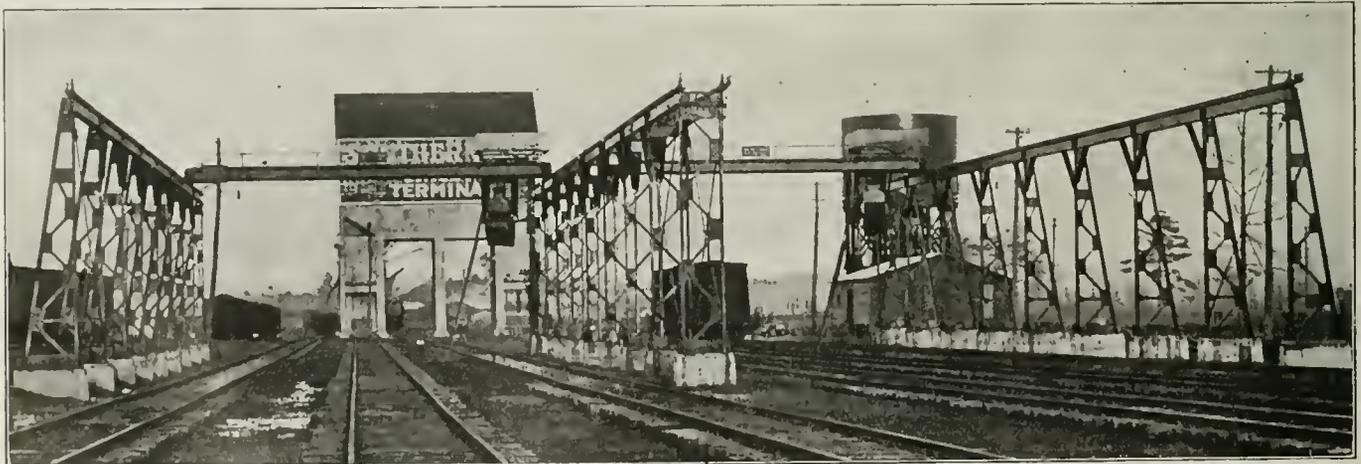

The ladders for the receiving, classification, caboose and storage yard have No. 8 manganese insert frogs. Main line and running track turnouts and crossovers and the turnouts for engine terminal tracks are nearly all equipped with No. 10 frogs.

TRACK SCALES

The track scale is of the 4-section suspension bearing type and of 150 tons capacity. It is 54 ft. long with a live weighing

The scale is installed in an open pit constructed with concrete approach abutments and two intermediate piers in each side of the scale for the support of the "dead platform." The grade over the scale is 0.6 per cent. Bethlehem steel I-beams were used in the construction of the weigh-bridge and the platform, the latter being made up of main side girders, sidewalk brackets, floor beams and stringers directly under and supporting the dead rails on malleable iron castings the thickness of the timber decking. The scale house is of special design, and, instead of the usual bay, a square front with ample window area is used which gives more satisfactory vision.

For night work the exterior lighting consists of two electric head lights so located that their rays intersect at a point 4 ft.

The Cinder Pits, with Craneways and Overhead Traveling Grab Buckets. Coaling Station in the Background

surface of 50 ft. and equipped with a full capacity 400-multiple beam with automatic weight recorder. The platform is designed for a dead load equal to the weight of the structure and a live load of one E-55 engine without allowance for impact, using 10,000 lb. per sq. in. unit stress in bending. The live and approach rails are connected by Bohannon-Dugger improved flexible easer joints, which prevent excessive impact and reduce the vibration of the scale mechanism. This mechanism is also protected from rain and dirt by splined and grooved timber decking and dirt shields.

above the rail and directly in front of the scale beams. General lighting of the scale and the upper part of the cars is furnished by a cluster of 40-watt lamps placed on the front of the scale house.

When trains having both weigh and non-weigh cars are switched over the hump to the classification tracks, the foreman of the crew notifies the weighmaster of the approach of a weigh car by means of a push button at the apex of the hump, which rings an electric bell in the scale house.

The yard office is a frame structure 25 ft. by 56 ft. with tile

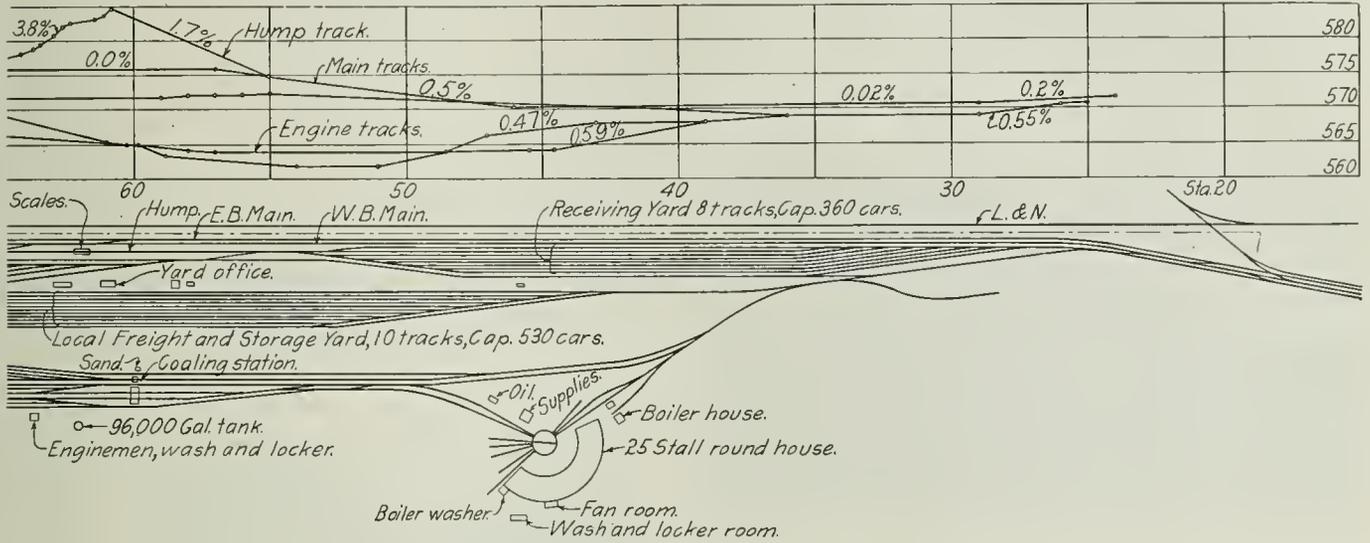

roof, the first floor providing for a telegraph office, conductors' room and clerks' office; the second floor for the yardmaster's office and a record storage room.

In connection with the toilet facilities, two sewage treating plants consisting of settling tanks and intermittent slow sand filter beds were installed, one near the roundhouse, the other near the yard office.

THE ENGINE TERMINAL

The roundhouse has 25 stalls, 92 ft. long and is constructed

with a concrete floor and a tar and gravel roof on a concrete slab; the rooms are equipped with lockers and other conveniences. Water for the yard and for fire protection purposes is supplied by the local water company. The railway furnished and installed all pipe lines on its right of way. Water storage sufficient for the fluctuating demand of the yard is provided by two wooden tanks, one of 96,000 gal. capacity on a 34-ft. frame and the other of 48,000 gal. capacity on a 16-ft. frame. A circulating fire protection, high pressure water main takes water directly from the local water company's pine line.

East Half of the Finley Yard

of reinforced concrete with a tar and gravel roof on a concrete and hollow tile slab. There are 25 engine pits and one truck wheel and one driving wheel drop pit. The windows are of wire glass and metal sash, each having an area of 284 sq. ft. (58 per cent of the panel area). The floor is laid with creosoted

There are four cinder pits, 160 ft. long, arranged in pairs, each pair being equipped with an electrically-operated overhead traveling crane running the entire length of the pits. The cranes have a span of 46 ft. 8 in. supported by steel runways on bents 20 ft. 6 in. center to center, have an under clearance of 16 ft.

Interior of the Roundhouse

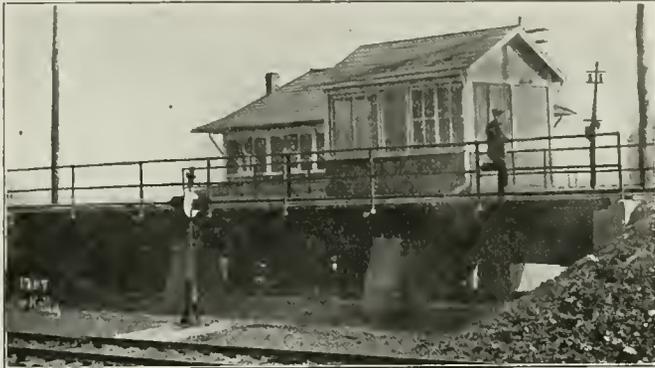

wood blocks on a 5-in. concrete base. The turntable is of the deck type, 90 ft. long, motor operated, and is installed in a concrete pit.

The wash and locker room is a brick building 23 ft. by 63 ft.

over all tracks and are provided with a Brown-Hoist grab bucket of 1.5 cu. yd. capacity. The pits are of plain concrete, 4 ft. deep and 4 ft. wide, with track rails fastened to channels secured to the top of the concrete walls by U-bolts. The bottoms of the

pits are sloped for drainage and are protected from damage by the grab buckets by means of two rails embedded at the surface of the concrete.

The coal and sand handling plant is located in the center of the yard between the cinder pits and the roundhouse. The coal handling and storage facilities consist of a reinforced concrete storage pocket having an overhead capacity of 1,000 tons, of which 60 tons are held in four 15-ton scale pockets. Coal is unloaded from hopper bottom cars into a track hopper and is elevated to the top of the pocket by a motor-driven chain and bucket type elevator, from which it is discharged into the overhead storage pocket. Coal is handled from cars into the overhead pocket at the rate of about 100 tons per hour. Locomotives on any of the four tracks are supplied with coal from the scale pockets which are filled by gravity from the overhead storage.

The Track Scale and House

The scales are fitted with type registering beams which enables the operator to determine accurately the amount of coal taken by each engine.

An independent reinforced concrete sand storage and drying building is located adjacent to the coaling station. It has a capacity of 100 cu. yd. of wet sand, which is unloaded from the cars direct into a hopper, from which it is elevated to the overhead storage pocket by a motor-driven belt and bucket elevator. Three stove driers located immediately under the storage pocket are supplied with wet sand by gravity. Dry sand from the driers is delivered to a steel drum from which it is conveyed by compressed air to a storage tank located in the monitor of the coaling station, from which it flows by gravity through an outlet fixture to each of the four coaling tracks: A motor-driven air compressor is located in the sand drying room. Sand is handled into the wet bin at the rate of 35 tons per hour and is dried at the rate of about one-ton per hour.

AUXILIARY INSTALLATIONS

Elaborate air brake testing facilities have been installed so that each train may be tested as made up. The plant consists of a duplex, 2-stage air compressor, with capacity of 1,000 cu. ft. of free air per minute. An air receiver 54 in. in diameter by 12 ft. long is located about 50 ft. from the compressor house. The main supply is a 2½-in. wrought iron pipe, from which 1¼-in. lines are laid to the center of each yard track, at about the clearance point, and connected to an angle cock and standard hose coupling inside a reinforced concrete service box installed flush with the top of cross ties. Condensation reservoirs, 24 in. in diameter by 3 ft. long, equipped with drain cocks, were placed in concrete pits at the lowest points in the main pipe line. In addition to furnishing air for the brake testing facilities, the compressor also supplies air to the roundhouse.

The entire yard is lighted by 400-cp. 6.6 ampere, series, nitrogen lamps, located to secure adequate light at all points of the yard. Electric lights were installed in all buildings in accordance with the best known practice, the lighting of the roundhouse having received particular attention, 100-watt mazda lamps with enameled steel reflectors are used, and about the engine pits receptacles

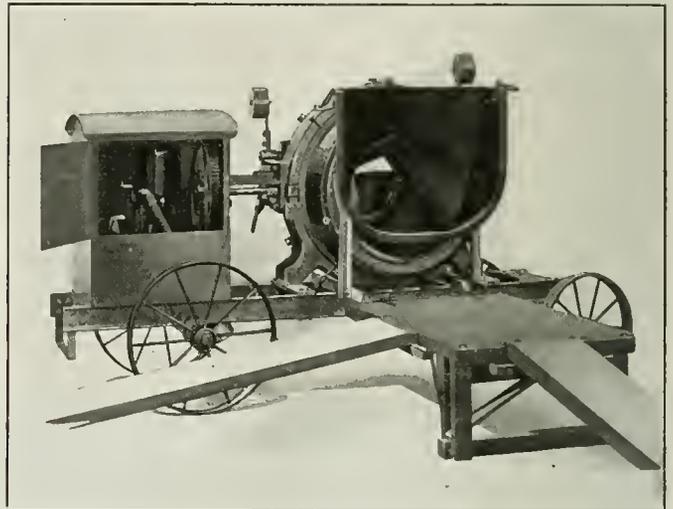

are provided for portable lights. To supply current conveniently, a brick substation was erected to house the switchboards and duplicate 75 kw. motor generator sets. Current is purchased from a local company.

The entire terminal was built under the direction of B. Herman, chief engineer maintenance of way and structures, and T. H. Gatlin, assistant chief engineer maintenance of way and structures, to whom we are indebted for the above information.

A LOW-CHARGING CONCRETE MIXER

The T. L. Smith Company, Milwaukee, Wis., is placing a new type of low charging concrete mixer on the market to meet the demand for a machine of this kind in cases where extensive plant development is not desirable. It is built in four sizes, the smallest being the 3-ft. Low Charging Mixerette, which requires a charging platform only 18 ft. high. The other three sizes—4-ft., 6-ft. and 9-ft. mixers—are provided along the line of the standard Smith-Chicago mixers with the addition of the low charging feature.

To afford rapid charging, the feed end of the drum is left almost entirely open. A narrow hopper is added to facilitate dumping a wheelbarrow by upending. Rapid discharge is afforded by means of a steep-angle discharge chute which extends far into

The Low-Charging Mixerette from the Charging Side

the drum so that it receives the full charge of each blade. These mixers are unusually simple in design and detail and are recommended by the manufacturers, especially for the use of men inexperienced in handling concrete work.

THE SOUTH AFRICAN RAILWAYS AND THE WAR.—The report of the general manager of the South African Railways and Harbors for the year ended December 31, 1914, recently issued, contains a statement to the effect that apart from the execution of work directly relating to the working of the lines, the railway workshops have undertaken work in connection with guns, armored trains and motors, ambulance trains and cars, transport motors, condensing plants, searchlights, X-ray appliances, pontoons and many other military appliances. In fact, the railway workshops have to a certain extent served as the Woolwich Arsenal of the Defense Force. Five "armored trains" have been constructed and manned by employees of the administration; these trains were found to be of great assistance, as, in addition to the duty of patrolling the railways in areas where movement of rebels was taking place, and repairing the line where it had been damaged, they were utilized in assisting the forces in their endeavors to get into touch with the enemy. The trains were commanded by officers of the department, whose knowledge of train-working operations proved of great assistance.—*Engineering, London.*

The Development of Special Steels for Track Work*

A Résumé of the Present Status of this Increasingly Important Study and a Summary of the Results Secured

By W. C. CUSHING

Chief Engineer, Maintenance of Way, Pennsylvania Lines, Southwest System

The following discussion of the present status of special alloy and special process steels was prepared originally for the International Railway Congress, which was to have been held in Berlin this year:

The different kinds of special steels in use, or undergoing trial,

1906) India, Brazil, Russia, Cuba, Germany, Japan, Belgium, United Kingdom and Canada. The proper chemical composition, therefore, compared with Bessemer and open-hearth rail steels, in order to impart the required characteristics, has been determined to be, in percentages, within the following limits:

Kind of Steel	Manganese	Carbon	Phosphorus	Silicon	Sulphur
Manganese steel.....	11-13	1.0-1.20	0.06-0.11	0.25-0.40	0.02-0.06
Bessemer steel.....	0.80-1.10	0.45-0.55	Not to exceed 0.10	Not to exceed 0.20	
Open-hearth steel.....	0.60-0.90	0.62-0.75	Not to exceed 0.04	Not to exceed 0.20	

may be divided under two heads: Special alloy steels, and special process steels. Under the first head are included manganese, nickel, nickel-chromium, high carbon (that is, steel containing 0.75 per cent of carbon or over), and high silicon. Two or more

The physical characteristics, compared with Bessemer and open-hearth rail steel, are about as follows, although it is extremely difficult to obtain specimens which are truly representative of the steel, as it cannot be cut or machined:

Kind of Steel	Tensile strength in lb. per sq. in.	Elastic limit in lb. per sq. in.	Elongation per cent in 2 in.	Reduction of area, percentage	Hardness by	
					Brinell	Scleroscope
Manganese steel.....	75,000-102,000	40,000-58,000	8-27	15-29	230	40-50
Bessemer steel.....	89,000-126,000	44,000-62,000	5-25	5-43	172-230	29-35
Open-hearth steel.....	115,000-156,000	54,000-80,000	9-16	10-30	230-300	32-43
Chilled cast iron.....						65-75

of these have been combined, in some instances, as, for instance, high carbon with nickel and chromium. Silicon is present in all carbon steel rails. By special process steels is meant the steel products derived from special heat treatment, or by the addition of metalloids which do not appear in the test analyses of the resulting product. Such are the so-called titanium-treated, aluminum, electric process and heat-treated steels. The object of their use has been in all cases to bring about additional safety, economy in maintenance by reducing the number of renewals, and smoother passage for trains at high speeds, over the gaps of frogs and at drawbridges.

SPECIAL ALLOY STEELS

Manganese Steel

The special steel which is now most extensively used in the United States and Canada for frogs, crossings and switch-points, outside of those built up from the usual Bessemer and open-hearth steel rails, is manganese. It is also being used experimentally in some South American countries, especially those where the railroads are under English management.

The prime characteristics of manganese steel are its very great strength, toughness and resistance to abrasive forces, and these qualities are imparted by the increase of the manganese and carbon contents in carbon steel to certain proportions which were first made known to the scientific world by the Hadfields. The manganese must lie between the limits of 8 per cent and 35 per cent. If between 7½ and 5½ per cent the alloys are extremely weak and brittle. The upper limit is partially determined by the cost of manganese metal, which is 50 cents per ton unit, when the addition is made by means of ferro-manganese. Also the high carbon content of ferro-manganese interferes with the physical properties induced by the manganese. When enough ferro- is added to make a steel with manganese 20 per cent, the carbon begins once more to dominate and a steel results which is stiff and brittle when cold, and unworkable when hot.

Ferro-manganese is a compound containing about 80 per cent of the element manganese, and is mined chiefly in Russia. It is imported into the United States from (in order of rank in

The above results are for cast manganese steel. The figures for rolled and for forged manganese steel are higher, as shown by the following, given by W. S. Potter, the originator in the United States of rolled manganese steel for rails, in the Journal of the Western Society of Engineers, Vol. 14, 1909:

Kind of Steel	Tensile strength in lb. per sq. in.	Elastic limit in lb. per sq. in.	Elongation, per cent in 2 in.
Cast metal.....	82,000	45,000	30
Rolled metal.....	135,000	60,000	35
Forged metal.....	142,000	55,000	38

To impart the above physical qualities to manganese steel, and especially the great resistance to abrasive forces, special heat treatment is necessary, and it is in this heat treatment in which one manufacturer claims superiority for his product over another. It is his trade secret and is jealously guarded.

Having finally recognized the valuable qualities of manganese steel for track work, the railways found they were coupled with high cost, and therefore instituted tests or experiments to determine the matter of economy in its use. In many locations in the United States, these economics have been well established, and manganese steel is in regular use, but there are also many other places where the first cost will overbalance the economics. In all places of extremely hard service, such frogs are economical, and even absolutely necessary under present conditions, in order to avoid renewals where the traffic is so frequent that it is difficult to find an opportunity for repair work. The more difficult the place, the more economical and indispensable is manganese steel. The Cleveland, Cincinnati, Chicago & St. Louis finds in general that where frogs, switches and crossings made of Bessemer or open-hearth rail require renewal within about 20 months, it is economical to use manganese instead, and the Pennsylvania Lines place the time at 18 months. These are not scientific ways of expressing relative wear so as to be of general service to others, but are suitable only for those special cases for which the rule was determined.

The Northern Pacific states that manganese frogs will outlast open-hearth steel frogs under the same conditions by 6 to 10 times, and the Norfolk & Western from 3 to 6 times. The Lehigh Valley reports that manganese steel frogs will outlast frogs made of Bessemer steel by at least three times, the Bessemer & Lake Erie by from 3 to 15 times, and the Pennsylvania

* Abstract from Bulletin No. 177 of the American Railway Engineering Association.

Railroad by 30 times, the cost being only three times as great. This information is of service also only to those who know the conditions of service, for it is necessary to be made aware of the annual cost or saving in each case of the frogs of different kinds in order to compare them accurately. This information is difficult to obtain, but some results of trials will now be presented, the results being preceded by a table showing the relative cost of frogs and switch-points made of manganese, Bessemer and open-hearth steels about the beginning of the year 1914.

This table gives the relative cost of two distinct types of manganese frogs: The built-up, or rail-bound, frog, and the solid cast manganese steel frog. The first consists of manganese steel for the point and those parts of the wings which receive the wheel treads surrounded by pieces of Bessemer or open-hearth rail, and all bound firmly together with bolts. The second is made of a solid manganese casting without any bolts, except those necessary to join the four ends with the track rails by splice bars.

The first type is the one most generally used by the railways, although for certain locations, where the speed of traffic is slow, the second type is preferred, though of greater primary cost than the first, because it does away with the bolts. There is a certain feeling of mistrust (which may be removed later with experience) in its value for general use, because such great care is required in making the castings that defective material occasionally creeps in, and should a fracture occur, there is sometimes nothing to hold the parts together. This has been remedied in some designs by riveting the frogs to a base plate. This distrust has been expressed by the Terminal Railroad Association of St. Louis. Many frogs and crossings have been in use for the past six years, and a large number of them were of the solid cast type, but on account of having had more or less trouble with breakage, the officers in charge rather favor the inset, rail-bound or built-up work, three terms of synonymous meaning. The manganese frogs last 3 or 4 times as long as those made of ordinary rail, under those conditions.

rolled manganese rail and are being tried on several railroads, report of such use, but with no data, having been made only by the Hocking Valley and the Pennsylvania railroads. They have not been generally used, owing to their high cost and the waste of manganese steel when the point is sufficiently worn away to cause the discard of the whole switch. For that reason the manganese-tipped switch-points are almost universally employed where manganese steel is desired. They can readily be repaired with economy. The short points are about 3 ft. long for 18-ft switches and 6 ft. long for 30-ft switches, while the long ones are 6½ ft. long for 18 ft. switches, and correspondingly longer for the long ones, reaching about as far as the planing on the head of the switch-point. A record of the comparative trials of manganese and Bessemer steel switch-points has been kept by the Pennsylvania Lines, which shows that in no case has the monthly cost of the Bessemer been less than that of the manganese. In a large number of the cases the economy of the manganese points is very great, the monthly cost of Bessemer points being as high as 13 times as large.

The first attempt to apply manganese steel to rails of curves was in 1895, in the shape of flat rails for street railways, by William Wharton, Jr., & Co., Inc., and subsequently in November, 1898, 7-in. high girder guard rails were cast in about 12-ft. lengths for the Philadelphia Traction Company. In the beginning of 1902, the Wharton Company had also been approached by the Boston Elevated Railway Company on the question of manufacturing manganese steel T rails for some of the curves of its system, where an unusual condition of rapid wear existed, and in April, 1902, the first manganese steel T rails cast in 20-ft. lengths and ground to section were furnished for a curve of 82 ft radius near the Park Street station of the Boston subway. The rails were cast straight and afterwards curved. The section was quite heavy, i. e., while the contour of the head corresponded to the 85 lb. per yd. A. S. C. E. design, the web and base were made 1½ in. thinning down at the ends, which were ground to a splice bar fit, and the top and side of the head were also ground smooth and true.

COST OF SWITCH POINTS MADE OF MANGANESE, BESSEMER AND OPEN HEARTH STEELS. RAILS 100 LB. PER YD.; SECTION ARA-B

Length of switch points	Manganese			Made of Bessemer steel rails		Made of open-hearth steel rails	
	Cost	Total weight of points and rails	Weight of manganese tips	Cost	Total weight of points and rails	Cost	Total weight of points and rails
15 ft.	\$79-103	1,450-2,330 lb.	100-170 lb.	\$46-68	1,935-2,300 lb.	\$48-69	1,935-3,300 lb.
39 ft.	\$114-156	2,300-3,580 lb.	142-260 lb.	\$78-104	3,100-3,775 lb.	\$81-105	3,100-3,775 lb.

The Pennsylvania Lines have for a long time been keeping a record of the cost of manganese frogs, and manganese tipped switch point, to determine their relative economy in comparison with frogs and switch points made from ordinary carbon steel, and to establish some rule or guide which would be of use to the officer in charge of maintenance, and enable him to decide in advance whether or not it would be economical to order a manganese frog or switch point for a given location. This proves that the manganese steel frogs are economical in many locations, principally where the service is severe.

In none of the cases reported are reduced dimensions attempted. It is rather the opposite. The thickness of the walls of the casting are made greater because it is difficult to make thin castings of manganese steel, and there must be no question of the strength of such costly material.

Switches are also made in the United States entirely from

Between 1905 and 1908, the successful rolling of manganese rail was accomplished by the Pennsylvania Steel Company of Steelton, Pa, and the Manganese Steel Rail Company of New York City, both of which rolled a quantity for the Boston Elevated Railway, and they were laid in the track November 4, 1908.

The price of the open-hearth rail was about \$30 per ton, and of the rolled manganese rail originally \$180 per ton, but now about \$90 per ton. Between 1903 and 1908 several other elevated railroad companies purchased manganese steel rail for sharp curves with heavy traffic. The steam railroads have been much slower than the elevated railroads in adopting manganese steel rails because of the high cost, while at the same time their curves are not so sharp. Nevertheless, trials have been made by some of them.

The use of manganese steel rail is not well established like

that of manganese steel frogs and switches, but it is still being tried in especially difficult locations, and will in all probability meet with greater favor among railway engineers when some of the objections have been removed. The principal faults found with it at the present time are:

(1) A number of breakages have been recorded, which is disquieting. The ordinary rolled carbon steel shapes are difficult to reproduce in manganese steel, on account of the trouble in quenching the metal without the formation of minute cracks, which may subsequently cause fracture.

(2) It is strong and tough, but the hardness is not superior to that of Bessemer steel, and consequently the resistance to battering at the ends of the rails is not altogether satisfactory. Measurements to show this have been made by the Atchison, Topeka & Santa Fe. The maximum joint depression or "set"

ceived back at \$19.60 per ton for the nickel plus whatever might be the market price for old steel rails at the time of return.

The outline or profile of the rail section was measured with a Sommer & Rauge instrument twice a year at set places in order to determine the rate of abrasion, and ultimately the comparative wear or life. At some points the nickel rail showed some slight superiority in life, but the average of all the tests pointed to the fact that the life of each, and hence the resistance to abrasion, was practically the same. The removals began in 1906, and were continued until 1911 when the last was removed, these differences being due to the differences in degree of curvature and amount of traffic. It is also necessary to compare the relative safety by keeping a record of the failures, and these are given in the table:

TABLE OF NICKEL AND BESSEMER STEEL RAIL FAILURES

Kind of Rail	System	Failures								Broken	Split heads	Crushed heads	Other defects	Total Failures	Ratio of rails laid to 1 failure
		1903	1904	1905	1906	1907	1908	1909	1910						
Nickel	Northwest	22	46	53	51	54	90	28	29	29	95	133	116	373	9
Bessemer	Northwest	16	34	32	40	30	22	14	2	29	53	37	71	190	18
Nickel	Southwest		6	19	16	1				4	19	19		42	86

recorded up to the present time seems to be 0.10 in., after three years and two months' service.

(3) The present primary cost, about \$90 per ton of 2,240 lb., is so high that, although the resistance to wheel flange abrasion on curves is greater than any other metal tried, the resulting economy is not sufficiently great to be attractive to the railways. It is hoped that additional knowledge and skill in manufacture will overcome this, because the price has already been reduced from \$180 per ton. The high price was, of course, partly due to the very small quantities produced, and the lack of suitable manufacturing facilities.

(4) It is impossible to drill or cut it in the field on account of its great toughness. It is beyond the reach of present tools.

The use of manganese steel for guard rails has been introduced within the last four or five years, because of the increasing severity of the service which must be performed by a guard rail in guiding the wheels of the modern extremely heavy equipment safely past the frog point. The wearing away of a guard rail made of Bessemer or open-hearth rail is very rapid, which causes a frequent adjustment or resetting in order to make it perform its work effectively. A more resistant material will reduce the number of resettings and save labor. The relative economy of the manganese steel one-piece guard rail is now fairly well determined, but additional trials are being made, and its use is already quite large.

Nickel Steel Rail

Between 1900 and 1902 some small lots of Bessemer rail with a percentage of nickel were rolled for trial by different roads, some of which were the Pennsylvania Lines, the Baltimore & Ohio, the Bessemer & Lake Erie, the Lehigh Valley, the New York Central Lines and the Pennsylvania Railroad.

Between March and June, 1903, the Pennsylvania Lines laid 3,248 tons, or 22 miles, of nickel rail, weighing 85 lb. per yd., in comparison with Bessemer rail in curved track, some of the curves of which were as sharp as 7 deg. The two kinds were laid in alternate stretches, the change from nickel to Bessemer being made at the centre of the curve so that one-half of the curve was laid with each kind, in order to have them under the same conditions of traffic.

The average chemical composition of the two kinds of rail was as follows:

	Kind of Steel	Car-bon	Phos-phorus	Manga-nese	Sili-con	Sul-phur	Nick-el
Pennsylvania Lines							
North West System..	Nickel	0.443	0.090	0.833	0.059	0.030	3.46
	Bessemer	0.498	0.093	0.850	0.105	0.039	
South West System..	Nickel	0.433	0.090	0.800	0.090	0.030	3.44
	Bessemer	0.430	0.095	0.910	0.106	0.037	

The price paid per ton for nickel rail was \$51.50, and for Bessemer rail was \$28, and the scrap nickel rail was to be re-

To test the strength and ductility of the nickel steel, 48 pieces struck by a weight of 2,240 lb., falling from a height of 17 ft. 10 in., the supports for the test pieces being spaced 3 ft. apart, gave a deflection of 1½ to 2¾ in., the average being 1 15/16 in. Only one piece broke. This series of tests shows that the nickel rail cost almost twice as much as the Bessemer, lasted only about the same length of time under similar conditions, and was less strong and safe, having a very small ratio of rails laid to one failure.

The Bessemer & Lake Erie Railroad reported that the nickel steel rails tried by that company did not give satisfactory results. On the New York Central & Hudson River, 200 tons of nickel rail, 80 lb. per yard, were laid in 1903, and 100 tons of 100 lb. per yard in 1905. Both lots were Bessemer steel with 0.40 to 0.50 carbon and 3½ per cent nickel. The 80-lb. rails after a short time of service commenced to flow laterally on the curves, and large flakes were detached from the heads, though the loss of metal did not take place quite so rapidly as in the case of the plain Bessemer rails laid with them for comparison. The flow from the heads of the 100-lb. rails was rapid, great slivers being detached on the curves after a few months' service.

Nickel-Chromium Steel Rail

The next step was to add chromium, a hardener, to the nickel steel rail. The nickel-chromium rail was of the usual open-hearth steel with 2½ per cent nickel and 0.50 to 0.90 per cent chromium, and the comparisons were made with ordinary open-hearth rails and with Bessemer steel rails in addition. The hardening effect of the chromium was clearly evident in the diagrams of all the tests, as well as the inferiority of the Bessemer rail to either of the others. In the case of the outside or high rails the abrasion of the open-hearth rail was 10, 13, 35, 38 and 55 per cent greater in the different tests than the nickel-chromium alloy; and in the case of the inside or low rails the abrasion of the open-hearth rails was 14, 22, 37, 58 and 62 per cent greater.

There were 20 rails of each kind in the test, on a 9-deg. 20-min. curve. Five nickel-chromium and no open-hearth rails broke, while 1 nickel-chromium and 4 open-hearth rails had crushed heads. This shows that the greater resistance to abrasion of the nickel-chromium rail is at the expense of greater brittleness. In another test with 16 rails of each kind, on a 7-deg. 32-min. curve, 5 of the nickel-chromium rails broke and one had a split head, while none of the open-hearth rails failed. All of the tests showed that for greater resistance to the forces of the abrasive action of wheels the addition of nickel and chromium to open-hearth steel rails in the quantities and in the manner used is very desirable, but is undesirable on the score of safety. Similar unsatisfactory service has been given by nickel-

chromium rail on the Central Railroad of New Jersey, where the breakages were 1 in 20 rails laid, and on the Erie, where they were 1 in 78 rails laid. On the Lehigh Valley the results of trials were the same in regard to failures, but the rate of abrasion was slower than for ordinary steel under the same conditions, the difference being as high as 70 per cent in some cases. The composition of the rails was carbon 0.50 to 0.60, phosphorus not over 0.04, manganese 0.60 to 0.90, nickel 2.0, chromium 0.4 to 0.75 per cent.

High Carbon Steel Rail

The only road which sent in any information about high-carbon steel rails was the Pennsylvania Lines. These rails have given excellent service from the standpoint of resistance to the abrasive action of wheels, lasting more than twice as long as ordinary Bessemer and open-hearth rail, under similar conditions of traffic, but have developed serious fault from the standpoint of safety, as the breakages have been numerous, 1 in 14 rails laid, and, most alarming of all, the silvery oval spot, called the "transverse fissure," has been found in the head. The carbon was very high for rail weighing 85 lb. per yard, from 0.80 to 0.88 per cent, and in addition nickel and chromium were present, making a very hard and brittle material, and it is not known what the effect might be in the case of rails of heavier section. It is customary to increase the percentage of carbon in the heavier rails. It is evident that the proportions used in the 85-lb. section were too high.

SPECIAL PROCESS STEELS

It has come to be fully recognized by American railway engineers that sound ingots are essential for the production of sound rails, and, although nearly all railways are opposed to interference in the processes of manufacture, believing instead in the principle of specifications for rails which set forth clearly and concisely the physical qualities which they must have, and the methods of conducting tests which will prove that the product offered for sale does or does not possess those qualities, nevertheless, it is the universal practice in the United States and Canada to specify the chemical constituents as well, and a few introduce other clauses relating to mill practice, such as holding in the ladle for a specified time, size of teeming nozzle, length of ingots, etc. While such requirements have generally been excluded from specifications, yet the subject of mill practice has been and is being widely studied by railway engineers.

Bradley Stoughton has admirably summed up our available information on ingot defects. These defects are phosphorus, which has been mastered in the open-hearth steel process, slag inclusions (sub-divided into solid oxidized enclosures and entrained sulphides), blowholes, combined gases, pipes and segregation. The purpose of the addition of aluminum, silicon, ferro-titanium, vanadium and other "physics" or "cleansers," is to remove as many of the defects enumerated as possible. In doing this, aluminum and titanium pass off with the impurities and leave no trace behind in the finished rail.

Titanium

The results of the trials of titanium-treated steel rails have been conflicting up to the present time, owing, perhaps, to the fact that the variables in the tests have been too numerous. In order to obtain accurate information, there should be but one variable, the treatment with ferro-titanium. The conditions in the cases of the Delaware & Hudson and the Lehigh Valley tests were not the same, and it is impossible to say to what extent the sharper curvature for the titanium-treated rail offsets the greater power of resistance to abrasion due to the higher carbon content in it. In the case of the Northern Pacific the results are reported not good on account of the higher percentage of piped rails which shows the necessity for an improved method of making sound ingots or an additional discard. The trials of the two kinds of rails are not exactly comparable, with reference to the titanium treatment, because titanium-treated Bes-

semer steel, with its lower carbon and high phosphorus, is compared with open-hearth steel with its higher carbon and low phosphorus. In the Rock Island trials, the advantage seems to lie with the titanium-treated Bessemer rail over open-hearth and electric-process rail during 17 months' service.

Neither the Maine Central, the Terminal Railroad Association of St. Louis, the Chicago Great Western nor the Delaware, Lackawanna & Western found any appreciable difference in resistance to abrasion by the use of ferro-titanium, but the results on the Boston & Maine were quite favorable to it. The Baltimore & Ohio tests exhibit superiority in resistance against the abrasive action of wheels of titanium-treated Bessemer rail over ordinary Bessemer rail of practically the same composition, but in the case of open-hearth rail, with its higher carbon, the superiority is lost. Of course, the comparison would be fairer if open-hearth steel of the same composition had been treated with titanium.

The principal value of ferro-titanium is in helping to produce solid ingot metal, and that is, of course, a splendid quality. Its tendency to produce a deeper pipe must be counteracted by a greater discard or an improved method for making the top of the ingot sound. It leaves no trace of itself in the resulting metal, and therefore does not make an alloy steel with any greater resistance to abrasion, or any greater strength, than is brought about by its less spongy condition and greater compactness.

Aluminum

Aluminum is used in their daily practice by many of the rail manufacturers at their mills, but its use has not been specifically requested by any railroad administrations for special tests, but, on the contrary, is entirely prohibited in the specifications of some railroad administrations.

High Silicon

Although trials have been made in limited quantities of steel rails high in silicon, that is, over 0.30 per cent, but little information has been furnished to the reporter. On an 8-deg. curve at Hoblitzell, on the Baltimore & Ohio, some rail with carbon 0.596, phosphorus 0.10, manganese 1.11 and silicon 0.69 was tried, but it was too brittle, as 7 out of 8 rails failed. Other tests are now being conducted by other roads.

Electric Process

A few railways are trying small quantities of rail manufactured by this process at the Heroult furnace of the Illinois Steel Company at South Chicago. The Terminal Railroad Association of St. Louis reports that limited experience indicates that it has better resistance to abrasion than ordinary Bessemer steel, and the Lake Shore & Michigan Southern reports that the Electric Process shows less abrasion than the Bessemer. The Rock Island Lines put 287 tons of 100-lb. rail in service and state that after 17 months' service the number of square inches worn off the head was less for the electric process than for the open-hearth, but greater than for the titanium-treated rail. There were no failures of the titanium-treated or of the electric process, while there was 1 failure in 1,008 rails laid of the open hearth.

Heat-Treated Rails

The Carnegie Steel Company is conducting an investigation into the performance of oil-quenched rails and is making service tests on the Union Railroad of Pittsburgh. A number of open-hearth rails of 100-lb. A. R. A. Type B (Fig. 14) section were rolled and treated in April, 1912, and were placed in track June 10 and 11, 1912, on the high and low sides of a 5-deg. curve, about 3½ miles from East Pittsburgh. As far as the profiles and inspections show up to July 1, 1913, the oil-quenched rails show an average improvement of 41 per cent over the untreated rails on the high side of curve, and about 37 per cent improvement on the low side of curve, or an average of 39 per cent for the oil-quenched rails over the untreated rails under exactly the same conditions of service.

Other steel companies are also making experiments with heat-treated rails in order to raise the elastic limit without sacrificing ductility, and the Pennsylvania Steel Company has recently rolled 16 rails of special section, approximating 121 lb. per yard, which are to be laid for service test in the tracks of the Pennsylvania Railroad, where the curvature is sharp and the traffic heavy. The Pennsylvania Steel Company manufactures rail from Cuban iron ore, known as Mayari ore, which naturally contains a small amount of nickel and chromium, and it has been found that this steel when heat-treated possesses the qualities of extreme hardness unaccompanied by brittleness, but it is difficult to heat-treat an unbalanced section like a rail without distorting it, and at a reasonable cost.

Conclusions

1. Cast manganese steel has been proved by long experience, under exacting conditions, to be a satisfactory and safe metal for the manufacture of frogs and switch-points.
2. The trials of rolled manganese steel for rails, and for the manufacture of frogs and switches have not been so extensive as with the cast product, but have been continued to a sufficient degree to enable us to conclude that it will ultimately be entirely suitable for those uses at locations where great strength, toughness and a maximum abrasive resistance are desirable.
3. The experiments with nickel, and nickel and chromium in certain proportions, in rail steel have not, up to the present time, been entirely satisfactory; but the accepted employment of nickel steel in bridge construction, and the trials of nickel and chromium in other proportions in rail steel, especially when incorporated as two of the natural elements of the iron ore, justify continued use.
4. The use of high carbon (over 0.80 per cent) in rails weighing 85 lb. per yard, in combination with 0.92 to 1.00 per cent of nickel, and 0.24 to 0.29 per cent of chromium, has not been satisfactory. The conditions with rail sections of greater weight might be entirely different.
5. Further study of the qualities possessed by high silicon rails, that is, steel with over 0.30 per cent of silicon, is advisable.
6. The value of the use of ferro-titanium in rail steel manufacture as a "physic" for improving the condition of solidity of the metal is conceded, but at the same time steps should be taken to overcome its injurious effect in deepening the "pipe" in the ingot.
7. Heat-treated rails, and those manufactured with the assistance of the electric process are at present in experimental use only, but the possibility of future value is promising, and the study should be continued.

ABSTRACT OF ENGINEERING ARTICLES

The following articles of special interest to engineers and maintenance of way men, to which readers of this section may wish to refer, have appeared in the *Railway Age Gazette* since September 17, 1915:

Grade Crossing Elimination in North Toronto, Ont.—The Canadian Pacific is completing the elevation of its tracks in North Toronto for a distance of 2½ miles, this work also involving the building of a new passenger station at North Toronto. This project was described in an illustrated article in the issue of September 24, page 555.

The First Bridge Built in War Time.—That construction activities have not entirely ceased in those European countries engaged in war is evidenced by the recent completion of a cantilever bridge across the Seine at Rouen, with a total length of 1,065 ft. This bridge was described in a short illustrated article in the issue of September 24, page 564.

Recent Progress in the Federal Valuation Work.—The field forces engaged in federal valuation work are now covering about 4,000 miles of line per month. Recent developments in the methods adopted by the government forces and by the carriers to secure the desired information, were described in an article in the issue of September 24, page 569.

International Engineering Congress at San Francisco.—Five sessions of the International Engineering Congress, held in San Francisco, September 20-25, were devoted to railway engineering and papers were presented by men prominent in the various branches of railway operation and maintenance in this and foreign countries. These papers were abstracted in the issue of October 1, page 599.

Grade Crossing Elimination.—An editorial describing the relation between

the expenditures for the elimination of grade crossings and the number of persons killed and injured in Chicago was published in the issue of October 8, page 634.

Interstate Commerce Commission Hearing on Valuation.—On September 30 and October 1 the Interstate Commerce Commission heard oral arguments by representatives of the railways on important considerations regarding the federal valuation. The arguments presented at this time were abstracted in the issue of October 8, page 651.

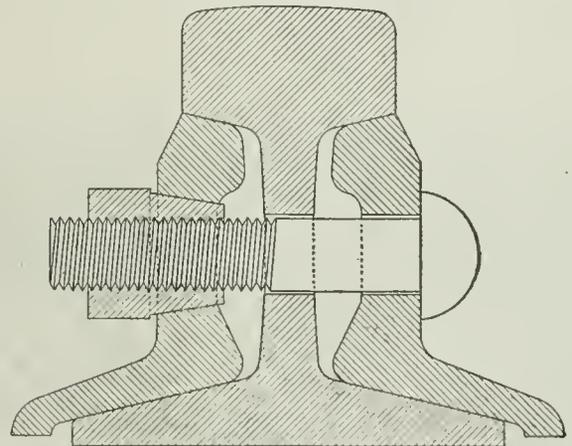

Pennsylvania Track Elevation Through Wilkinsburg, Pa.—The Pennsylvania is now completing the elevation of its main line through Wilkinsburg, a suburb of Pittsburgh. This work involves a number of interesting construction problems, which were described in the issue of October 8, page 654.

Electrification of 440.5 Miles of the St. Paul.—The Chicago, Milwaukee & St. Paul is now completing the electrification of the first of four engine districts between Harlowton, Mont., and Avery, Idaho, and is actively engaged on the remaining three. The details of this work were described in an illustrated article in the issue of October 15, page 683.

Valuation Methods on the Big Four.—To secure the information required by the federal valuation parties, the large roads now under valuation have organized special departments. The character of the organization developed on the Big Four, on which work has been under way for a year, was described in the issue of October 15, page 701.

A NEW BOLT NUT FOR RAIL JOINTS

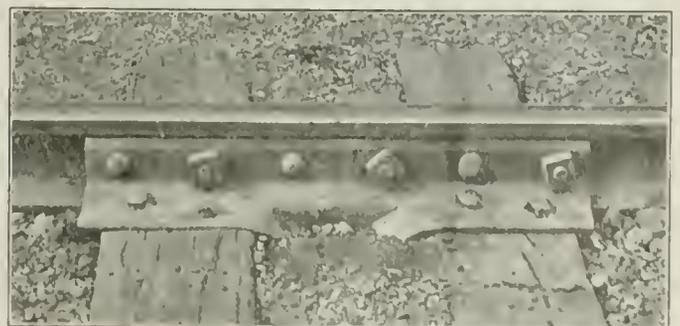

The Ballou safety rail bolt nut is the name of a new nut recently put on the market for use with rail joints. The nut is provided with a conical or tapered extension which fits into the bolt hole in the splice bar. This bolt hole is also given a

The Ballou Safety Rail Bolt Nut

conical taper of such size that when the bolt is drawn up the tapered shank of the bolt comes to a secure bearing in the tapered hole without allowing the shoulder of the nut to bear against the face of the splice bar.

Joints equipped with these nuts have been used experimentally on 27 railroads and several street car systems, in some cases

An Application of the Ballou Bolt Nuts to a Depending Flange Joint on the Norfolk & Western

for a period of two years or more. These tests have shown that the frictional resistance of the taper bearing is sufficient to prevent the loosening of the bolts by the ordinary vibration and movement of the tracks under traffic. The axial elongation of the nut serves to strengthen the threaded connection of the bolt to the nut, it shortens the length of the bolt between the

head and the nut and it protects the thread on the bolt from frictional wear and exposure to the weather.

A joint of the angle bar pattern designed for use with bolt nuts of this type is now on the market under the name Ballou safety rail joint, but bolts equipped with the Ballou nut may be applied to any form of joint. An accompanying photograph shows an example of such an application, which follows the ordinary practice of alternating the nuts on the inside and outside of the rail. There is no restriction upon the length of bolts with which these nuts may be used, and in consequence, the nuts are equally applicable to frogs and crossings. This joint is manufactured by the Ballou Safety Rail Joint Company, Roanoke, Va.

THE THOMAS RAIL ANCHOR TIE PLATE

As its name indicates, the Thomas rail anchor tie plate is a tie plate and rail anchor combined. It consists of a malleable iron tie plate with slight corrugations on the bottom and with shoulders on both sides. The plate can be made of any thickness and size desired to conform to the standards of any road. The special features of this design are the means by which it is locked to the rail, eliminating movement between the rail and tie plate. To accomplish this the shoulder on one side is extended up over the flange of the rail $\frac{3}{8}$ in. The lower surface of this extension is inclined to the same angle as the upper surface of the rail flange, providing a drive fit. A set screw of cast

An Installation of Thomas Rail Anchor Tie Plates at Kansas City, Mo.

hardened steel also extends through this extension, engaging the rail. This screw is inclined at right angles to the upper surface of the rail flange, giving it a full, firm contact. Two set screws have been provided on some patterns of this plate, although it is not believed that this is necessary in most cases. On the opposite side of the rail, lugs are provided behind the spike holes, forcing the spikes to their proper position against the rail, and holding them there, thus securing contact with the rail on both sides. With this device the track is anchored against movement in both directions without the use of any additional devices and by making the rail, tie plate and tie a unit, expansion is confined to each individual rail. By reversing the plates on alternate ties, the rail is given increased resistance against overturning.

These tie plates have been in service experimentally for periods up to two years under very severe conditions. One of the earliest installations was made on the Kansas City Terminal two years ago on a track on a heavy grade between the roundhouse and the station. While this track was not subjected to heavy trains, there is an almost continued movement of engines over it. Another test has been under observation since February 1, 1915, in the main tracks of the Chicago, Burlington & Quincy near Canal and Sixteenth Streets, Chicago. These tracks are on a heavy descending grade with about 300 movements per day over

them, the large majority of which are heavy passenger and switching trains. Although this track has been especially difficult to maintain previously, both with reference to creeping and to spreading, neither of these tendencies has been evident since the installation of these plates. A similar installation was made at the same time on the main tracks of the St. Paul at Western Avenue, Chicago, where these plates replaced tie bars, rail anchors, rail braces and tie plates and which has proved equally satisfactory. Other installations have been made on the

A Section of the Thomas Rail Anchor Tie Plate, Showing Its Relation to the Rail and Tie

Chicago Great Western and on the Chicago & North Western at points of heavy grades and soft embankments where the rail was inclined to run. In all of these installations this plate has been effective as an anchor as well as a tie plate.

The Thomas Rail Anchor Tie Plate is made by the Chicago Malleable Castings Company, West Pullman, Chicago, Ill.

EFFECT OF TREATMENT ON THE STRENGTH OF BRIDGE STRINGERS

The United States Department of Agriculture, Forest Service, has made public, in Bulletin No. 286, the results of a number of tests made in co-operation with the Illinois Central and one eastern and two western wood-preserving companies, to determine the effect of commercial creosote treatment on the strength of loblolly pine, long leaf pine and Douglas fir bridge stringers. The timbers were selected for test from stock furnished by the co-operators and they received the regular commercial treatment. The test specimens were 8 in. by 16 in. in section and from 28 to 32 ft. in length, each stick being cut into two stringers of equal length at the time of treatment. Based on these tests the following conclusions were drawn:

(1) Timber may be very materially weakened by preservative processes.

(2) Creosote in itself does not appear to weaken timber.

(3) A preservative process which will seriously injure one timber may have little or no effect on the strength of another.

(4) A comparison of the effect of a preservative process on the strength of different species should not be made, unless it is the common or best adapted process for all the species compared.

(5) The same treatment given to a timber of a particular species may have a different effect upon different pieces of that species, depending upon the form of the timber used, its size, and its condition when treated.

Convention of the Bridge & Building Association

Abstract of the Committee Reports and Discussions at the Twenty-Fifth Annual Meeting Held at Detroit

The twenty-fifth annual convention of the American Railway Bridge & Building Association was held at the Statler Hotel, Detroit, October 19-21, inclusive. About 175 members of the association were present, including a considerable number of the past-presidents and older members. A special feature of this convention, marking the twenty-fifth anniversary of its organization, was the attention paid to the earlier work of the association and to a review of its development.

This convention was the most successful in the history of the organization in point of attendance, character of committee reports and discussion. The officers for the past year were: president, L. D. Hadwen, Chicago, Milwaukee & St. Paul; first vice-president, G. Aldrich, New York, New Haven & Hartford; second vice-president, G. W. Rear, Southern Pacific; third vice-president, C. E. Smith, Missouri Pacific; fourth vice-president, E. B. Ashby, Lehigh Valley; secretary, C. A. Lichty, Chicago & Northwestern; and treasurer, F. E. Weise, Chicago, Milwaukee & St. Paul.

The convention was opened with prayer by Past President J. N. Penwell (L. E. & W.), Mayor Marx of Detroit, and J. C. Bills, assistant general solicitor of the Pere Marquette, welcomed the association. Vice-President G. W. Rear (S. P.) and Past President W. A. McGonagle (D. M. & N.) responded for the association. In his presidential address L. D. Hadwen traced the development of bridge design and maintenance during the 25 years since the association was founded, citing the change from Coopers E. 35 to Coopers E. 55 loading, or heavier; the replacement of wrought iron with steel, and more recently with alloy steels; the substitution of concrete for stone, etc.

The report of the secretary showed 95 new members received during the year and a total membership of 664. The treasurer's report showed a balance on hand of \$1,200.

Committee reports were presented on The Use of Locomotive Cranes; Pile and Timber Trestle Bridges; Railway Water Tanks; Costs of Structures; Warnings for Overhead and Side Obstructions; Reinforced Concrete Bridge Work; Concrete Culvert Pipe and Concrete Piles, and Street Crossing Gates, Towers, Bells, etc. Monographs were also presented on the subjects of Manila Rope by F. E. Weise, chief clerk, engineering department, Chicago, Milwaukee & St. Paul, and on Water Waste by C. R. Knowles, general foreman, water service, Illinois Central.

LOCOMOTIVE CRANES

The entire development of the locomotive crane has taken place within the last 25 years. It was designed to fill the demand for a portable crane that could be moved from place to place around an industrial plant. The first locomotive cranes were of two to five tons capacity with short booms of about 15-ft. radius. They were mounted on short car bodies supported by four small car wheels, and the propelling gear consisted of sprockets and chains. The first real improvement was the adoption of gearing for propulsion, and this feature has now been developed to such an extent that cranes have been built capable of hauling several cars at 20 miles per hour.

The four-wheel car was used exclusively for several years and cranes of 10 and 15 tons capacity were built. These cranes could not be hauled in trains, even at slow speeds, and the need of a crane that could be transported readily led to the adoption of the eight-wheel car about ten years ago, which has permitted increasing the capacity to a maximum of 60 tons. The greatest handicap in the development of cranes is the fixed width of gage, which makes it necessary to have a heavy car and sufficient counterweight to prevent overturning when loads are lifted at right angles to the track. Even with all the weight that can be applied conveniently, the cranes have their full capacity only at

short radius. The use of outriggers, which are provided on the larger cranes, increases the width of the base and adds to the stability at right angles to the track. They should be used on both sides of the crane when handling heavy loads on poor track, as the breaking of the hoisting cable or the slipping of the hitch may cause the crane to tip over backwards.

A modern locomotive crane in capable hands can be used for an endless variety of work. No railroad is so small that one or more can not be kept busy, nor is it necessary to use them every day to make them economical.

USES OF LOCOMOTIVE CRANES

In almost all cases a locomotive crane can switch the cars that it loads and unloads, doing away with the necessity of having the cars "spotted" with a locomotive. Within its capacity a crane will do all kinds of hoisting either with one or two lines, and with a long boom, or extension of a short boom, it can place loads high above it. As a crane can swing its boom through a complete circle and the radius can be varied, loads can be picked up and placed anywhere within its radius. A double-drum crane can operate any two-line clam-shell or orange-peel bucket. When a locomotive crane is equipped with an electric generator and magnet, it will handle all kinds of metal. A leader truss with regular pile driver leaders has been designed to take the place of the boom on the larger sizes of cranes. This arrangement makes a pile driver more capable of doing work than a regular driver. A locomotive crane will switch the cars, unload the material, drive the coffer-dam, make the excavation, drive the foundation piles, handle concrete material, tear out the old structure, erect the new one, and clean up and load the remaining material without the assistance of any other machine and with very few men. In a storage yard a locomotive crane will switch the cars, will load, unload and pile material of all kinds, and will pile it higher than is economical by hand. In a ballast pit it will make a good showing loading ballast, especially if the excavation is below the water line. On the road it is of great value picking up freight that may have fallen from cars. It will pick up and place rip-rap, and will load and unload lumber, rails or any other heavy material.

Cranes are built in sizes ranging from 3 to 60 tons capacity; the lightest ones being used chiefly around industrial plants and the larger ones for special purposes, such as bridge erection. The best crane for maintenance of way work is the eight-wheel crane of 20 to 30 tons capacity. Such a crane will cost from \$7,000 to \$8,000. The cost of operation depends on the number of days worked, the kind of work, etc., it being evident that a crane loading ballast will require more repairs than one doing light work in a storage yard. However, the average cost of operation will be about as follows:

Interest	\$2.00
Depreciation	2.00
Repairs	2.00
Fuel	2.50
Supplies50
Labor	6.00
Total	\$15.00

This is somewhat higher than is usually claimed, but is probably a fair estimate. Where fuel is cheap and wages low, it may be reduced somewhat, but it is usual to underestimate such items as depreciation and repairs. Depreciation and repairs have been figured on the basis of 20 years' service, but that in the meantime it will have been completely rebuilt once. The daily rate is based on 200 full service days during the year. It is when the use of a crane is compared with manual labor that its great saving is shown. Figures have been obtained from a large number of sources and while they show considerable variation in

general it may be claimed that a crane will save as against hand work as follows:

Handling scrap, etc., with a magnet	\$40 day
Handling coal, etc., with a clam shell bucket.....	40 "
Handling lumber and timber	30 "
General construction work including switching	40 "

A few comparative costs selected at random, follow:

Material Handled.	Unit.	By Hand.	With Crane.
Scrap	Ton	\$0.20 to \$0.25	\$0.02 to \$0.06
Coal	Ton		0.05 to 0.10
Timber	M. ft.	0.40 to 0.50	0.12 to 0.20
Lumber	S. ft.	0.40 to 0.50	0.25 to 0.35
Piling	Lin. ft.	0.004	0.002
C. I. Pipe (Loading).....	Cwt.	0.032	0.016
C. I. Pipe (Unloading).....	Cwt.	0.021	0.012

GENERAL CONSIDERATIONS

The wheels, axles, journals, boxes, brasses, etc., should be of the standard used by the railroad purchasing the crane, so that repairs to the running gear can be made quickly. The car should be built of steel and of such length that the boiler end of the crane will not extend beyond the end of the car, thus permitting the car to be coupled into the train without removing any parts of the crane, except the boom, which may be carried on an idler flat car. The car should also be long enough (about 24 ft.) to give it riding qualities necessary for handling in ordinary freight trains. At least one truck should be of the standard swivel 4-wheel type.

The propelling gear should be designed to propel the crane and whatever cars it will pull at the rate of four to six miles per hour. Provisions should be made to throw out of gear without the removal of collars or other fastenings under the car, and this feature should be handled entirely by levers or hand wheels at the side of the car or on top. The car should be provided with standard draft rigging and brakes. It is a great advantage to have an air pump and engineer's valve on the crane itself, but this feature is not absolutely essential.

The boom should not be too long except for special service, the ideal length being from 30 to 40 ft. The boom hoist should be of ample capacity and should be operated with a worm gear of such pitch as to require power to operate it in either direction. The A-frame should be of such design and material as to withstand shocks without cracking and should be rigid enough to keep the engine and gears in proper alinement. As far as possible the design of the engine and gears should be such as to permit the removal of any shaft, gear, etc., without having to remove other gears and shafts. The reversible engine is favored by all who use it. Experiences of 15 years with hundreds of machines have proven that there are no objections to a reversible engine and its advantages in lowering a heavy load are enough to overcome any disadvantage.

There should be two drums, so that two-line buckets can be operated. One of these drums should be the main hoist for heavy loads and the other may be an auxiliary drum of lighter capacity to operate the holding line of the bucket, but both should be power operated. An automatic tag-line or take-up device should be furnished to handle the tag-line of the bucket. The operating levers should be in such a position as to give the engineer the best view of what he is doing. The engineer should also have ready access to the boiler compartment, so that he can fire the crane when the class of service will permit without inconvenience.

The boiler is the real limiting feature of the machine. It should be of proper size, well insulated and designed for hard service. It should be a free steamer and economy of fuel should be sacrificed if necessary to provide the maximum amount of steam. Reference to the cost of operating tables will show that the cost of fuel is a small percentage of the total cost and the results obtained are so great that extreme economy is not of importance. Fuel and water should be carried in the greatest quantities for which space can be found.

Probably the most important feature is the fastening of the crane to the car. The up-lift on the center hold-down apparatus, or king pin, is great, and subject to shocks, and in case of breakage there is nothing to prevent the crane from overturning off the car. The sliding I-beam out-riggers are to be preferred over the bracket type on the side of the car. They should be located as low

as possible so as not to require much blocking. Jack-screws for the out-riggers are not necessary.

An efficient device should be provided to take the load off the truck springs. This should be of such design that the crane will ride properly if this device is not removed before the crane is put into a train.

The capacity of the crane at different radii should be plainly marked. An automatic indicator which will indicate the capacity at any position of the boom is simple and should be on every crane.

G. W. Rear, chairman, S. P.; A. T. Mercier, S. P.; D. E. Plank, Pac. Elec.; D. A. Shope, A. T. & S. F.; W. O. Eggleston, Erie; E. T. Howson, *Railway Age Gazette*; G. H. Stewart, B. R. & P.; E. B. Ashby, L. V., committee.

Discussion.—The versatility of locomotive cranes for railway work was emphasized. R. H. Reid (N. Y. C.) uses locomotive cranes in erecting bridge spans, for placing concrete culvert pipe and for similar work at a greatly reduced cost.

G. S. Robinson (C. & N. W.) has unloaded up to 20 cars of coal per day at a cost as low as six cents per ton. The crane was not so successful in unloading rubbish, and could only unload eight tons per day. W. O. Eggleston (Erie), has erected a number of overhead highway bridges with a locomotive crane at a saving of 50 per cent as compared with other methods. A. S. Markley (C. & E. I.) called attention to the demands of the labor organizations that train crews be employed whenever the cranes are used on the main track, stating that the Indiana law now requires this. Even with this added expense he has found locomotive cranes economical. G. W. Rear (S. P.) stated that rubbish can be handled more satisfactorily if the cars are dumped first and the material then picked up. A bucket which will pick this up readily will dig into the floor. He stated that the California law requires an engineer, conductor and one brakeman to accompany a locomotive crane when working over one-half mile from a side-track on any line with more than four trains daily. He defined a locomotive crane as a hoisting apparatus which can be taken anywhere and is ready to work at any time.

PILE AND TIMBER TRESTLE BRIDGES

The sizes of standard parts and the amount of timber used for carrying the same loads under apparently the same conditions appear to be different and a large part of the difference is apparently due to personal equation, and also to a certain extent to the financial conditions of the various roads. For example, standard pile bents vary from 4 to 6 piles under approximately the same conditions. Standard stringers vary from 3-ply 8 in. by 16 in. to 4-ply 10 in. by 18 in. for carrying approximately the same loads on spans of nearly the same length. While, of course, it will never be possible to eliminate entirely the effect of personal equation, a more uniform standard of practice would appear possible.

OPEN DECK TRESTLES

A width of 8 in. appears to be almost universal for bridge ties, the spaces between them varying from 4 to 6 in., placing the ties from 12 to 14 in. center to center. The depth varies from 6 in. to 11 in., the great majority of roads reporting the use of a tie 8 in. deep, which the committee feels is the proper depth to use. A great deal of labor expended in the past by all roads and at the present time by some roads for dapping ties to fit down over the stringers can be avoided entirely, either by purchasing the ties surfaced to the exact height (7¾ in. in the case of 8-in. ties), or by gaining them in the field to exact depth. The first method is recommended.

Lengths of 9 ft. and 10 ft. have been reported for bridge ties, but the committee feels that a length of 9 ft. is sufficient except in those cases where a very heavy chord is used for long panels or for unusually heavy loads.

The lateral stability formerly provided by the shoulders of dapped ties fitting down over the stringers is now secured in some cases by the use of lag screws or drift bolts fastening every fourth tie to the stringers; and in some cases by driving

dowel pins into bored holes in the under surfaces of each end of every fourth tie, the ends of the dowels projecting downward into the packing space between the bridge stringers. The latter method is of advantage in eliminating the damage to the stringers caused by the insertion of lag screws, which frequently start decay on the tops of the stringers.

The committee feels that the track rails should be held securely in place on bridges by the use of tie plates having a length equal to the full width of the face of the tie, that is—8 in. wide, but it does not recommend the use of tie plates with claws piercing into the fiber of the tie as such plates are found to reduce more rapid decay of the tie. This does not necessarily require the use of flat bottom plates, as slight corrugations on the bottoms of tie plates will provide sufficient lateral holding power without breaking the fiber of the wood.

Regardless of all that has been said and written with reference to the dapped guard timber, no more effective means of holding the ties in place has yet been perfected. The committee feels that the practice that now prevails to some extent, i. e., the laying of a flat timber on top of the ties near their ends and fastening that timber to each end of each tie by a lag screw will not prevent the ties from bunching in case of derailment as effectively as the old dapped guard timber. The committee feels that the only effective method of preventing the ties from bunching is to provide between them struts having shoulders at the ends, bearing against the sides of the ties. Such struts made of malleable iron castings have been devised and are being used to a slight extent experimentally. Their advantage rests in the elimination of the labor of framing guard timbers, a very expensive procedure. If their experimental use proves successful, they should be used in preference to a flat timber lag-screwed to the ties.

The committee feels that inside guard rails weighing about 60 lb. per yard spiked to every tie and fully and carefully bolted to eliminate any offsets at the joints, should be laid entirely across every trestle ultimately, and that, as a move in that direction, roads not using such guard rails, commence their installations on high bridges, long bridges and all bridges on curves, the exact length and height to depend upon local conditions and the length of time over which the road desires to extend the expense of this improvement. Such guard rails should extend approximately 30 ft. beyond each end of each bridge and there come to a point either by the use of a casting inclosing the ends of the rails or by the use of an old frog point.

Bridge stringers in use on various roads vary from 6 in. to 12 in. in width and from 15 in. to 20 in. in depth. The most universal sizes appears to be 8 in. by 16 in., of which 3-ply stringers are used most universally although 4-ply stringers are extensively used on the longer panels and under the heavier engines. The panel lengths run from 12 ft. to 16 ft., the heavier stringers being used on the longer panels. All roads report the use of stringers twice as long as the panel length, alternate stringers breaking joints at the alternate bents. Stringers are usually framed to exact depth at the bearings. In the past and to some extent at the present time, stringers have been framed at the packing points to exact dimensions, but the best practice indicates the desirability of using stringers just as they come from the mills as far as width is concerned, thereby eliminating the extra labor and weakening of the stringer caused by cutting into the side to preserve exact dimensions. While the practice of framing the sides of stringers so the chord would pack to exact dimensions was excusable in the past when dapped ties were used, thereby making possible a fit of the dapped tie over the chord, the use of the undapped tie renders the exact width of the chord immaterial and the side framing of stringers should be dispensed with.

The various stringers composing a chord should be packed with spaces not less than $\frac{3}{4}$ in. clear between them, two chord bolts being put through each end of each stringer, making four chord bolts over each bent.

Although in the past when narrow chords were used, it was quite customary to place the chords outside the rails to give greater stability by the greater width of bearing on the caps,

the increase in the width of the chords caused by more and heavier stringers has rendered this generally unnecessary, and, on account of the necessity of distributing the load on the rail equally among the various stringers in each chord with as little danger of over-straining or breaking the tie as possible, it seems desirable to place the center of the chord directly under the center of the rail.

To keep the caps and stringers from changing their relative locations at the bearings, many types of anchors are used, consisting of dapped corbels, packing blocks or boxes, drift bolts, through bolts, straps, etc. The tendency of the best practice today is toward the elimination of corbels, packing blocks or boxes and drift bolts, although drift bolts are still extensively used. Their use results in serious damage to stringers, as it frequently happens that, after they have been drifted down, they must be withdrawn in connection with relining or other work on the bridge and the pulling of such drift bolts is frequently a difficult operation, sometimes necessitating chopping into the stringers to get hold of them. The same result can be secured and the bolts made more accessible by boring entirely through the stringer and cap and placing at least one through bolt, not less than $\frac{7}{8}$ in., entirely through the stringer and cap at each bearing. Although it is desirable for stiffness to have nuts and washers on the lower ends of these bolts, this is not absolutely necessary, as the lower ends extending under the caps provide means of starting them out in case of work on the bridge.

The caps in use vary from 12 in. by 12 in. to 14 in. by 14 in., a few instances being reported of the use of caps composed of several timbers framed over the tops of the piles. The framing of the tops of piles to fit into two or more timbers forming a cap appears unnecessary and has almost disappeared. For ordinary conditions a 12 in. by 14 in. cap 14 ft. long should be sufficient, the 12 in. dimension being vertical and giving a 14 in. width of bearing. There should be one or more drift bolts through the cap into each pile.

Replies indicate the use of four to six piles per bent, some roads using six piles on very low bridges, while other roads use four piles on very high bridges. Most roads report the use of a 5-pile bent. The designs of 5-pile bents submitted almost invariably show the middle pile entirely relieved from load, and the four outer piles of such bents would usually carry the same load per pile if the middle pile were omitted.

A great advantage in the use of a 4-pile bent occurs especially in redriving old trestles when the use of a 5-pile bent would require shifting the chord out of place during the driving of two of the piles under the stringers, while the 4-pile bent can be so arranged that for ordinary conditions the four piles can be driven without interfering with the old chord. This advantage, of course, will not obtain where the largest 4-ply chords are in use on bridges to be redriven.

The same conditions as to the number of posts apply to frame bents as to pile bents, the added requirement being the necessity for a firm, unyielding foundation under the frame bent. This foundation is sometimes provided, especially in new construction, by concrete pedestals, where rock is close to the surface. For high bents footing piles in sufficient number are frequently driven.

Some roads make a practice of cutting off old pile bents and placing frame bents on top of the old pile stubs. While at first glance such construction gives a very rigid support there are many undesirable features. When frame bents are placed on top of the old piles cut off at low-water line and having a considerable unsupported length in the water there is danger of their buckling out of line. Also the sills and lower ends of the legs of such bents and also of frame bents having the sills at or just below the ground line decay very rapidly and introduce an element of weakness into the bridge. Reports have been received indicating that all the pile bents of long, low bridges are frequently cut off when ready for renewal and replaced by frame bents. In such cases adequate longitudinal bracing should be placed at proper intervals to prevent the bridge from

collapsing longitudinally. If floods or other conditions prevent the placing of such longitudinal bracing, a considerable percentage of all the bents should be renewed as pile bents.

The general practice seems to favor the use of 3 in. by 10 in. braces. On some roads the braces are bolted to the posts or piles, while other roads continue to use boat spikes. The committee recommends that the use of boat spikes for such purposes be discontinued, and that not less than 3 in. by 10 in. bracing be through bolted by $\frac{3}{4}$ in. or $\frac{7}{8}$ in. bolts to the caps and piles or posts, double-sash bracing and two sets of "X" bracing being used in bents over 24 ft. high.

All roads reporting use of two or more lines of longitudinal struts or ties, varying in sizes, on all frame or pile bents over 24 ft. in height; these being placed above and resting on the sash bracing, and being bolted or spiked to the posts or piles. The best practice would seem to be that of cutting longitudinals to fit between the posts or piles, obtaining continually by the use of blocks or splices at the post or piles, securely bolted to them.

BALLAST DECK TRETTLES

The committee feels that the use of ballast deck trestles of treated timber should be given further consideration, as it is believed that very considerable economies can be shown by the use of such structures. The best information indicates that the cost of construction of a ballast deck trestle of creosoted material will be approximately 50 per cent greater than the cost of a similar open deck, untreated trestle of standard construction. For ballast deck trestles standard track ties may be used. There should be at least 6 in. of ballast, preferably sandy gravel, between the bottom of the tie and the floor of the trestle. The floor of the trestle should be composed of 4 in. plank 13 or 14 ft. long. To prevent water from getting into the floor and timbers below, the floor should be covered with a built-up roofing of about 4-ply felt and pitch. The sandy gravel ballast will make a sufficient bond with this roofing so that other covering over the pith will be unnecessary. Drainage should be provided by leaving open spaces between the floor of the trestle and the guard timbers at the edges of the ballast by raising the guard timbers 2 in. off the floor and providing a washer at each point, approximately 4 ft. apart, where the guard timbers are bolted through the floor.

The committee recommend that the stringers on ballast deck trestles be not sawed off at the ends, but that they be lapped, the length of stringer to be one foot longer than twice the panel length to provide practically a full bearing at each end of each stringer. It is thought that the equivalent of 4-ply 8 in. by 16 in. stringers under each rail for 14 ft. panels and 5-ply 8 in. by 16 in. stringers for 16 ft. panels will give sufficient carrying strength for any loads now operating. There appears to be no reason for the use of outer guard timbers on ballast deck trestles as the ballast will prevent the ties from bunching on the trestles as well as that service is performed on solid ground. Inner guard rails should be furnished, however, as on open trestle bridges.

A. B. McVAY (chairman), L. & N.; C. E. SMITH; F. G. JONAH, St. L. & S. F.; S. T. COREY, C. R. I. & P.; J. J. TAYLOR, K. C. S.; E. J. AUGE, C. M. & St. P.; A. J. JAMES, A. T. & S. F.; S. C. TANNER, B. & O., committee.

Discussion.—R. H. Reid (New York Central) favored framing the ties over stringers and bolting the guard rails to every fourth tie. He has found the bolting of ties to stringers unsatisfactory, in that it prevents the bunching of ties under derailments and also when renewing ties. J. P. Wood (Pere Marquette) opposed framing the ties at the mill, as it is then impossible to place the best face of the tie up. He had had no bridges go out of line. R. C. Sattley (C. R. I. & P.) favored bolting the ties to the stringers, because the track can be lined up readily by partially pulling the bolts. G. W. Rear (Southern Pacific) has used ties, which were sized up in the mill, for a period of 10 years, in which time he has had experience with 480,000 lineal feet of trestles up to two miles long. Ten bolts

are used per panel for holding the ties to the stringers and two bolts for holding the stringers to the caps. No trouble has been experienced with these bridges going out of line. It is necessary to build bridges properly if they are to stay well built. F. J. Conn (Queen & Crescent) has used treated and dressed bridge ties with tie plates 31 in. long extending under the rail and inside the board rail. The rails are held by screw spikes and the outside wooden guard rail is bolted through every tie.

The paragraphs regarding guard rails caused considerable discussion. G. W. Rear (Southern Pacific) advocated the use of rerailing castings at the ends of high bridges and the spacing of inside guard rails with a 3-in. clearance from the main rails. Most derailments are caused by broken flanges and wheels with broken flanges cannot derail with this construction. I. O. Walker (Western & Atlantic) has eliminated the dapping of guard rails since using creosoted timber. The guard rails are bolted to the ties and the ties are held in place by two castings per tie on the tops of the girders or I-beams. In discussing stringers Mr. Rear thought that all bolts holding the stringers to the caps should have the bolts placed on top. A. S. Markley (C. & E. I.) thought that no span should be of a length to require the use of more than three stringers because of the increased difficulty in driving other piles. R. H. Reid (N. Y. C.) also opposed using more than three stringers, stating that the New York Central Lines are now considering the shortening of the panel length rather than adding more stringers to accommodate heavier locomotives. L. Jutton (C. & N. W.) opposed running the bolt through the stringer and cap and advocated the use of a drift bolt with a square head enabling it to be pulled readily. The remainder of the report was accepted without discussion because of lack of time.

WATER WASTE

By C. R. KNOWLES

General Foreman of Water Works, Illinois Central Railroad

As an example of what may be accomplished by a campaign against water waste, the Illinois Central has reduced the expense for city water alone from \$225,112.94, during the fiscal year 1913-14, to 190,438.50 during the fiscal year 1914-15, a reduction in the cost of city water of \$34,673.79. This is a net saving accomplished by the elimination of water waste. The expense for city water represents only about 40 per cent of the total cost for water, 60 per cent being for water pumped by company forces and not included in the savings which are given above.

Water is generally considered as free as the air we breathe, and much of the waste is due to carelessness on the part of employees who fail to realize its cost. It follows that careful instruction followed by disciplinary measures, where necessary, is the remedy in a campaign to reduce waste. This lack of co-operation, due to ignorance of the value of water, sometimes aided and abetted by departmental lines and jealousies, causes thousands of dollars' needless expense to the railroads of the country. American railroads consume daily approximately 1,950,000,000 gallons of water, at a daily expense of over \$100,000. These figures should be enough to convince almost anyone that water is not free, and that a saving in water is quite as important as a saving in coal, oil or other supplies. It is safe to say that 15 per cent of the water used by railroads is waste. By waste is meant that quantity of water drawn in excess of the amount actually required. An employee who has the interests of the company at heart will not deliberately destroy property or waste supplies, yet that same employee will often leave a valve or faucet open, allowing water to waste and causing a needless expense that could be easily avoided. The opportunities for water waste on railroads are many and it is within the power of every railway employee to effect a saving in this respect.

A few illustrations of the most common forms of waste will be given with the cost of such waste and suggested remedies.

Large quantities of water may be wasted in taking water at tanks and penstocks, unless care is exercised to properly spot the engine and avoid overflowing the tender. Not only does this cause a waste of water, but it causes an additional expense for removing ice from the track in winter months and repairs to soft track during the summer. A conservative estimate of the total cost of this waste per annum is \$60 per tank. With 30 tanks, the annual expense will be \$1,800, a sum equal to 5 per cent on \$36,000. This will pay the interest and depreciation on the cost of a new 100,000-gal. tank at each station in five years, or will build and maintain a locomotive each year. The remedy is to keep the tank spouts and the penstocks in proper repair and to compel due care in taking water on locomotives.

One of the most expensive sources of water waste is at engine houses, in connection with the use of boiler washout hose and valves. The water used for washing locomotives invariably has to be handled twice to secure the high pressure necessary to properly wash locomotive boilers. The average cost of such water is in excess of ten cents per 1,000 gal. A boiler washout hose with a 1-in. nozzle, at 100-lb. pressure, will easily

coaches, etc., causes a great waste of water that may easily be avoided.

Leaking or improperly adjusted valves in toilet flush tanks will waste from \$3 to \$50 per month for each battery, depending on the number of fixtures and the cost of water. A case was found recently where toilet facilities at a large terminal were causing a loss of over \$400 per month. In another instance the loss was over \$150 per month. The trouble was corrected by cutting down the waste of water and the saving at these two points alone amounts to \$10,000 per year.

Wash basins, slop sinks and other fixtures connected direct to

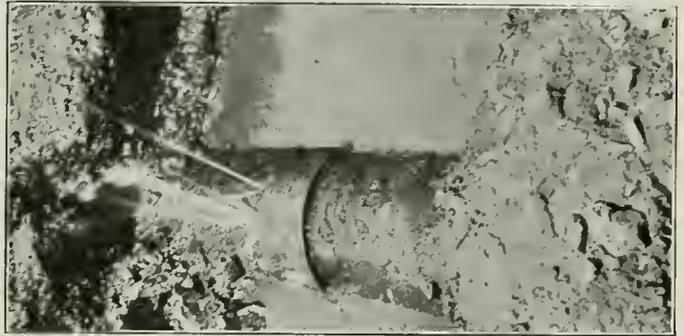

Wasting Water When Filling a Locomotive Tender

waste 12,000 gal. of water per hour at a cost of \$1.20 to \$1.50. This does not take into consideration the cost of heating water where hot water is used for washing. This is a very hard matter to control and results cannot be obtained except through the co-operation of the roundhouse force.

Laws prohibiting the use of public drinking cups have made the bubbling drinking fountains a necessity, but the makeshift affairs commonly constructed of 1/2-in. to 1 1/2-in. pipe, and flowing constantly, are an abuse to this system of providing drinking water, and will waste from \$150 to \$350 per year for each fountain. The actual amount of drinking water required by a man is about 1/2 gal. per day. A single bubbling fountain with a 1/4-in. opening will deliver 425 gal. per hour, at 25-lb. pressure, ample for 10,000 men, with 50 per cent waste. The only satisfactory way to control this waste is to restrict the size of opening and equip all fixtures of this kind with self-closing valves.

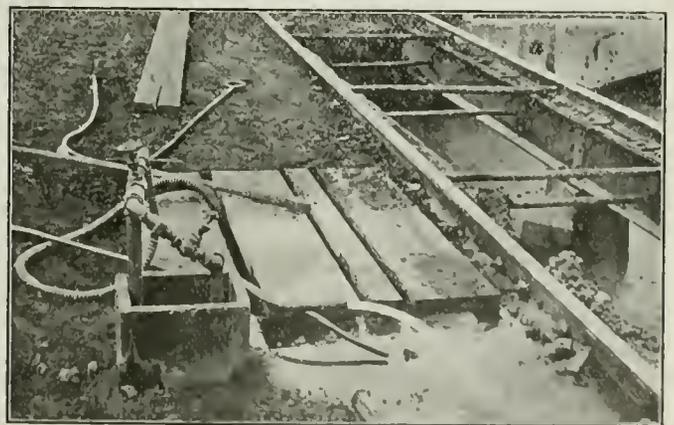

Yard hydrants for sprinkling, filling water jugs, and coach yard service also cause a heavy waste of water. A 1-in. hydrant of this type will waste from 20 to 30 cents' worth of water per hour, or \$5 to \$7 per day. Forty or 50 of these hydrants are often installed in a single coach yard and, as a number of them are nearly always open and running, the loss is enormous. The improper use of hose for sprinkling, washing

Leakage from a Buried Water Main

sewers and drains offer opportunity for heavy water losses and a saving can be made in almost every instance by giving attention to valves and faucets, keeping them in proper repair and making it a point to see that they are closed when not in use.

Another source of waste is through leaks in underground mains. These underground leaks are not always easy to detect, for there is nothing in the old saying that "leaks will always show at the surface," for if the pipe is laid in a porous formation or near sewers, the water finds a ready outlet without reaching the surface. The presence of leaks of this kind may sometimes be determined by use of the aquaphone or sonoscope, or by carefully comparing the consumption with the pumpage or meter readings. But locating and repairing the leak is often

Wasting Water at a Submerged Cinder Pit

such a difficult matter that one sometimes wonders whether it is cheaper to permit the pipe to leak or make repairs. However, this question is easily answered. It always pays to stop leaks.

The saving effected in handling cinders with modern cinder-pit facilities is often destroyed by the waste of water through hose connections. The photograph shows an actual condition where the waste is 10 gal. per minute, 600 gal. per hour, 14,400 gal. per day. The cost is \$1.44 per day, \$10.08 per week, or \$524.16 per year.

Fire hydrants are often used for drinking and other purposes with a resultant waste of water. One hundred gallons of water are being wasted to secure a pint of water. A man will require water from 4 to 8 times per day of 10 hours, or an average of

6 times per day, and 20 men will drink 120 times a day. By using this method of securing their drinking water, they waste 12,000 gal. while drinking 5 gal.

Discussion—J. S. Robinson (C. & N. W.), a member of the committee, stated that his road was studying water waste in the Chicago terminals. It has recommended close supervision and minor improvements in equipment, which it is estimated will result in an annual saving of \$24,000. I. O. Walker (W. & A.) told of an instance in which water used to cool an air compressor was recovered with a resulting saving of \$80 a month.

MANILA ROPE

By F. E. WEISE

Chief Clerk, Engineering Department, Chicago, Milwaukee & St. Paul

Possibly there is no article in the outfit of a railroad construction organization or of a contractor that suffers more neglect and abuse than manila rope. In nine cases out of ten, this condition is due more to a lack of knowledge than to wilful neglect. It is the general impression that the use of Manila rope is decreasing and that it is being replaced by wire rope, but this is true only along certain lines and, on the contrary, the field for its use is increasing.

Fibers from which ropes are made are termed by manufacturers as hard and soft. The hard fibers are of Manila, sisal and New Zealand hemp, and the soft fibers are of jute, American hemp and flax. Of the hard fibers, very little New Zealand hemp is used. The best rope for all purposes is made from Manila hemp, and very little rope over one inch in diameter is made from anything else. Sisal hemp is shorter and coarser than Manila, is not as strong and will not withstand water or the weather as well. Considerable rope less than one inch in diameter is made of sisal hemp. The soft fibers are used mainly for the manufacture of small rope and cord. This paper is to be limited to the best and larger ropes, and, therefore, deals entirely with Manila rope.

Until rather recently all rope was made by hand, but its manufacture has been revolutionized by the introduction of modern machinery. In a modern plant the bales of fiber are opened and graded as to quality by expert workmen, and are then passed to machines where the fibers are reduced to suitable size for rope making. After this operation the fiber is spun into yarn by twisting it in a right-hand direction. From 30 to 75 yarns, according to the size of the rope, are put together and twisted in the opposite, or left-hand direction, into a strand. Three or four of these strands are then twisted together in a right-hand direction into a rope. In the manufacture of a very large rope or cable, three hawers or three strand ropes are twisted together in a left-hand direction. It will be noted that each operation is in an opposite direction, and because of this, the rope keeps its form. The rope maker has learned by long experience how to make these twists so that the tendency of one part to untwist will cause another part to twist until an equilibrium is attained. If the twist is great, the rope will be hard and stiff, and will keep its form well, but will not be as strong as a rope with less twist. This is explained by the fact that in the latter case the fibers lie more nearly in the line of tension.

A good hemp rope is hard, but pliant, yellowish or greenish gray in color, with a certain silvery or pearly lustre. A dark or blackish color indicates that hemp suffered from fermentation in the process of curing, and brown spots show that the rope was spun while the fibers were damp, and is consequently weak and soft in those places. Sometimes a rope is made of inferior hemp on the inside, covered with yarn of good material. This may be detected by dissecting a portion of the rope. Other inferior ropes are made from short fibers, or with strands of unequal lengths or unevenly spun, the rope in the first place appearing woolly, on account of the ends of the fibers projecting; in the latter case the irregularity of manufacture is evident on inspection.

A test for ascertaining the purity of Manila hemp rope con-

sists in forming balls of loose fiber for the ropes to be tested and burning them completely to ashes; pure Manila burns to a dull grayish-black ash; sisal leaves a whitish-gray ash; a combination of Manila and sisal yields a mixed ash resembling the beard of a man turning from black to gray. Manila hemp is frequently adulterated with phormium (New Zealand flax) and Russian hemp, both of which are much inferior in strength.

It is not always true that the highest priced material is the best, and there are no doubt many cases where from lack of knowledge or time for investigation, a better grade of material is purchased and used than is necessary. The price of this material is governed largely by its quality, but the selection of the quality should be governed by its suitability to the work in hand.

Rope in service deteriorates in two ways: The wear on the outer surface that can readily be seen, and the stretching, bending, crushing and breaking of the inner fibers that cannot be discovered without a careful examination.

Should these conditions develop more rapidly than the service in which the rope is used seems to warrant, they may be due to the following causes: The first might be caused by chafing, resulting from ropes rubbing against each other or dragging across hard materials, or by running over sheaves having too small grooves. The latter may be due to overload or to running over sheaves or pulleys of too small diameter.

Ropes do not give out all at once, and therefore need much care and attention. The factors that determine the usefulness of a rope and its length of service or life are: the material of which it is made; the care and skill with which it is manufactured; the manner in which it is used or its application, and the care taken of it while in service and while being stored.

Manila hemp is a vegetable fiber and is susceptible to the action of water and air the same as an unprotected piece of wood. In fact, the hardest wear on a rope is exposure to all kinds of weather. This cannot be avoided in construction work; therefore, when a rope has become wet and muddy, it should be cleaned, dried and stored in a well ventilated place. Wet rope placed in a box or unventilated storeroom is likely to rot or ferment and will become worthless in a very short time. Ropes that must necessarily be constantly exposed to the weather are tarred frequently, but as the tar affects the tensile strength, it cannot be used on ropes that are subject to hard use on derricks and cranes. Tared ropes may be used for guy lines, the rigging of ships or similar work.

It is generally conceded that moisture will not injure a rope in storage, provided the storeroom is well ventilated, and in fact some dealers advocate a damp storeroom. On the other hand, a rope may be seriously injured by becoming too dry, because the fibers become brittle. A rope should not be allowed to freeze after becoming very wet, or if frozen, should not be used, because the frozen fibers will break and thus make it useless. Neither should rope be piled against radiators or steampipes for obvious reasons.

The failure of ropes is more likely to be due to overloading than to any other cause. Should a rope be submitted to an overload, it may be shown by the twist coming out of it, or by one of the strands slipping out of its proper place. In the handling of heavy loads with a derrick or crane, the load should never be applied suddenly or with a jerk, not only because the stress will be many times that of the weight to be lifted, but it will cause deformations in the rope that start deterioration. Should there be a kink in the rope, the damage may be serious enough to cause failure, and in any event the rope will have lost a good deal of its strength and value. Ropes used on derricks, cranes and pile drivers wear out very rapidly. It is said that a rope 1½ in. in diameter will wear out in handling from 7,000 to 10,000 tons of coal, while a transmission rope of the same size, running 5,000 ft. per min. and carrying 1,000 h.p. over sheaves 5 ft. and 17 ft. in diameter, will last for years.

The rapid wear of ropes used on derricks and pile drivers is

due to their passing over comparatively small sheaves under load. When passing over a sheave, the rope is subject to bending, which causes the fibers to slide slightly on each other, and, as they are somewhat rough, the friction ultimately causes the fibers to break. Frequently upon opening up ropes of this kind, it is found that some of the inner fibers have been ground to a fine powder. Manufacturers aim to overcome this difficulty by treating the fibers with tallow or graphite, or both, but there seems to be considerable difference of opinion as to the value of such treatment. Tallow-laid rope is not affected as much by weather conditions as rope not so treated. Should it be necessary for a rope to run over two sheaves, bending first in one direction and then in another, the difficulty last described is much exaggerated, and is much like bending a pliable wire first one way and then the other. It will soon break.

It is frequently necessary to splice the ends of two ropes together in order to make one long rope. Either a short splice or a long splice may be used. If properly made, the short splice will develop the full strength of the rope, but it cannot be used over a sheave because it is considerably thicker than the original rope. The long splice can be used over a sheave, but it cannot be expected to give as good service as an unspliced rope. The short splice is more quickly made.

Manila rope is usually supplied to the storekeeper in coils of 1,200 ft., and shipped out by him in lengths suitable for the work. The shorter pieces left over are used for making slings. After it is worn out, rope is returned to the storekeeper as scrap. The accumulation is disposed of from time to time by selling to scrap dealers at a price approximating \$50 per ton.

Slings made from Manila rope for handling and hoisting heavy materials do not always receive the care and attention that they should, largely because of a lack of knowledge of what a sling will stand. Many advocate the use of new rope, and this is without doubt the safe plan. A new rope, however, is too stiff and it is better, where possible, to use parts of a rope that have been limbered up by a day's service. There are others that advocate the use of old rope for this purpose. If this is done, care should be taken to select pieces that have not been overstressed or that have not been working over sheaves. An examination can easily be made by opening up the strands, and if the inner fibers show deterioration, the rope should not be used for slings. Slings are made by splicing the two ends of a rope together, using usually what is known as the short splice.

On construction work and during wet weather, slings are subject to severe usage. When muddy, they should be thoroughly cleaned, preferably with a hose, before the mud has been allowed to dry. They should then be allowed to dry under shelter, but never in the hot sun.

When slings are sent to the tool car or toolroom for storage, they should be inspected carefully and such as are not fit for continued use should be discarded. Those in good condition should be hung on suitable pegs. Slings are frequently called for in a hurry and under such conditions there is not always time to make an examination, or it may be overlooked. It is well to be on the safe side, because the failure of a sling may result in serious injury to the workmen and a fall of only a few feet may damage or utterly ruin a piece of machinery.

The method of attaching a sling to a load should always be delegated to a reliable and experienced man. Whether one or more slings are to be used will depend not only on the weight of the load to be lifted, but also on its shape. In placing a sling on a load, care should be used to see that the load is evenly distributed on the two sides of the hoisting hook and also that the turns of the sling do not overlap, thereby throwing an excessive stress upon one part of it.

The stresses that are thrown upon slings and ropes vary a great deal with conditions, and they are often influenced to a marked degree by circumstances, which the casual observer might consider trivial and unimportant. In particular, the inclination or obliquity of the sling, in those parts which lie between the

supporting hook and the points at which the sling first touches the load, must be carefully considered, as it is a highly important feature in connection with safety.

COALING STATIONS FOR THE ECONOMICAL HANDLING OF 25 TO 50 TONS PER DAY

There are four types of coaling stations of this class, a platform where the material is unloaded and delivered to the engines by hand shoveling; a stiff leg derrick with the necessary coal storage and operating platforms; a station where cars are pushed up an inclined trestle and the coal unloaded into small pockets and delivered to the engines by gravity; and mechanical coaling stations where the coal is dropped by gravity into hoppers and elevated into large pockets by means of buckets or conveyers operated by mechanical power.

The coal platform can hardly be called a coaling station, as it is only a makeshift.

The stiff leg derrick is probably the one most used at stations where a small amount of coal is handled. The construction of the derrick at this plant is much the same as for any stiff leg derrick. The boom, however, is generally rigid, being placed at a fixed angle and far enough out to properly reach the center of the track. It is, therefore, necessary to operate only the main hoist and the swing of the derrick. Adjoining such a derrick is a storage platform of proper size and length to store as much coal as is considered necessary at the plant. At one of these stations where the average amount of coal handled per day was 12 tons, the cost of handling per ton was 17.9 cents. This station was operated by one man, assisted by the train brakemen in coaling engines. At another such coaling station, where the average amount handled per day was 31.2 tons, the cost of handling per ton was 12.6 cents. Comparatively speaking, the first cost and maintenance of a derrick station is low; the third mentioned type of station is cheaper to operate than the derrick type, although for small amounts the derrick will compare favorably with it. It costs more than the derrick, and the maintenance is much more. For small amounts the derrick is better than the trestle type of chute, and for large amounts the mechanical type is the better.

The mechanical type of station is coming into use more and more and has many things to commend it for economy of operation. It is not the intent here to discuss the merits of the different types of mechanical coal chutes, but rather whether the mechanical chute is adaptable to small stations. At a certain coaling station where an average of 44.5 tons of coal is used the cost of handling is 8.2 cents per ton. One man is employed days and one man nights. If it were necessary this amount of coal could be increased 50 per cent without increasing the number of men employed. The mechanical plant is high in first cost, and the maintenance may be considerable after the plant gets old. Nevertheless, a good mechanical plant is cheap to operate and has many points in its favor even where a small amount of coal is used.

In general the cost of handling coal at small coaling stations is large, as a certain amount of labor is necessary, no matter how small the amount of coal handled. It seems advisable where small coaling stations are necessary that some other occupation should be found for the men employed in the coaling plant. Where conditions are right a water station can be operated advantageously in connection with the coaling station. If the two facilities are properly located with respect to each other and the most improved machinery is installed at both plants, one man working days and one man nights can operate the combined plant where the coal consumption amounts to about one car load per day and the water consumption amounts to about 40,000 gal. per day.

The report is signed by L. Jutton (chairman), C. & N. W.; W. T. Krausch, C. B. & Q.; B. F. Pickering, B. & M.; J. L. Talbott, A. T. & S. F.; A. W. Pauba, C. & S.; G. A. Manthey, M. St. P. & S. S. M.; Wm. Mahan, W. & L. E.

COST OF STRUCTURES

DETAILS TO BE KEPT IN TIME BOOK

The usual practice seems to be for the gang foreman to enter in a time book for each day the time and overtime allowed for each man and sufficient information for making up a distribution and the prescribed reports. Very few roads require any more detail than the title of the job and possibly a few subdivisions. The majority use a monthly or semi-monthly time book, except in a few states where weekly payments are required by law. These time books vary from the small stock book, which can be bought in stationery stores, to a monthly diary giving a complete record of labor and material, an outline of work done, a tool report and other general information required from the foreman.

It would seem desirable that a time book should be adopted of a size to be carried readily in the pocket and to be ruled properly to show one month's or one week's time as conditions require. On a large road it would not seem desirable, however, to combine all of the foreman's monthly reports in one book, as such a book would be cumbersome for the foreman and for the clerks who handle the accounts. The committee recommends a time book using one double page for the time and distribution for each man. The last page of this book should give a recapitulation, distributing the total time of the gang between the different Interstate Commerce Commission accounts, as these greatly facilitate the work of the time clerks in consolidating the distribution. A system of sub-accounts for similar work should be made up to suit local conditions and the structures on which the work is performed, such as excavation, foundation, concrete and masonry above the foundation, concrete forms, steel work, framing, painting, plumbing, lighting, etc.

REPORTS OF MATERIAL USED

The usual practice is for the foreman in charge of a gang to make some form of monthly material report, either in a monthly diary or on loose sheets. The committee considers that the material report should be sent in by itself, either in a special book or on loose sheets, the reports from the different foremen being consolidated in the division supervisor's office, and made up into one material report. If a printed book is furnished to the foreman it should have pages for the material received, used and shipped away, and a record of the cars received.

Material should be distributed to various subdivisions for each job the same as labor, and on the completion of each job a completion report should be made. In addition to the title of the job and the date of completion, this should show the number of units and the cost of each class of work, such as the number of yards of excavation, the cubic yards of concrete, the weight of steel erected, etc. It will, of course, be necessary to have several different forms of completion reports to cover the costs of different classes of work.

RECORDS TO BE KEPT IN DIVISION OFFICES

On most of the larger roads it is the custom to keep all detailed records in the division offices, collecting the information from the various gangs and making a complete cost record to the general offices. The systems in use are varied, some using blank forms or stock ruled books, and in a few cases a special loose leaf or card file. In many cases, so far as the keeping of unit costs or the cost of jobs is concerned, the system is left to be worked out by the individual supervisor so that there is very little uniformity even on different divisions of the same road.

In most cases, the cost records which are being kept at the present time simply cover the accounts required by the Interstate Commerce Commission and the total costs of structures or pieces of work. It would seem desirable that more extensive records be compiled not only to show the costs of all structures, but the costs of the various items going to make up the total, such as the number of cubic yards and the cost per yard for excavation, masonry and concrete work of various classes; also the cost per 1,000 feet for framing and erecting all of the

usual classes of timber work, etc. For keeping such records, a loose leaf ledger or card system would seem to give the best results, as it gives greater flexibility and opportunity for growth and also an opportunity for classifying similar kinds of work.

The complete cost of a piece of work should in all cases include not only the labor and material used, but the system should be such that all other items of expense, such as work train, teaming, board of men and other necessary expenses, should be included. The cost statement should also show any second-hand material used as well as an explanation of any unusual charge due to bad weather, accidents, time lost in traveling or other items which would affect the cost.

A completion report blank to cover all of this information would be so large and complicated as to be out of the question. It would therefore be necessary to make up a number of printed forms for the various classes of work.

With all of the detail records kept in the division offices, the only cost records to be sent forward to the general offices should be cost cards or sheets showing completed structures, cards showing unit costs and graphic tabulations or comparative statements. These records should be submitted in a form so that the cost of similar work on various divisions can be compared and filed with as little labor as possible. By using cards or blanks of a uniform size these can be filed very readily in card index system and comparison readily made. The costs of similar work on the various divisions should be tabulated; this showing which divisions are doing the work most efficiently. Various reports showing the distribution of labor and material to maintenance of way accounts must also be made to the auditing department to comply with the Interstate Commerce Commission regulations.

ANALYSIS OF COST

On many roads complete records are kept for large construction jobs, particularly on concrete construction, the costs being analyzed and unit cost data worked out. This scheme, however, does not seem to be followed very extensively on maintenance work. Cost records on all jobs should be so kept that statements can be made up showing the distribution to the different subdivisions and also worked out for unit costs as outlined under the previous subject.

It is very desirable that graphic tabulations and curves be made up to show both labor and material and the total charges to all of the maintenance accounts to compare with former years. Similar graphic tabulations and curves can be made up where a number of similar structures are built on different divisions or under somewhat similar conditions.

A system of cost records analyzed for unit costs is of immense value to any road, not only for future estimates, but especially in connection with the United States valuation of railroads. The committee recommends that costs of this kind be kept by each railroad, feeling that the expense involved will be more than offset by the benefits to be derived from their use after a few years.

G. A. Rodman (chairman), N. Y., N. H. & H.; F. E. Weise, C., M. & St. P.; J. H. Nuelle, N. Y., O. & W.; J. S. Robinson, C. & N. W.; R. S. Sattley, C., R. I. & P.; C. W. Wright, L. I.; W. A. Pettis, N. Y. C., committee.

WARNINGS FOR OVERHEAD AND SIDE OBSTRUCTIONS

The necessity and the value of giving proper warning to men on top or on the side of cars before passing overhead or side obstructions on railroads is evident. When a train passes some overhead or side structure, tunnel, etc., with less than the requisite overhead clearance to allow a man to stand erect on top of the highest box car, or the necessary side clearance to permit him to hang on the side of a car, his limb or life is jeopardized.

Only four states have enacted legislation regulating the requirements for side clearances and ten states regarding overhead clearances. The following is a tabulated summary of the

statutory requirements of the several states which enacted legislation as to railroad clearances:—

State	Overhead clearances above top of rail	Side clearances from center of nearest track
Connecticut	18 ft. 0 in.	
Ohio	21 ft. 0 in.	18 in. from locomotive cab
Indiana	21 ft. 0 in.	7 ft. 0 in.
North Dakota	21 ft. 0 in.	8 ft. 0 in.
Kentucky	22 ft. 0 in.	
Minnesota	21 ft. 0 in.	8 ft. 0 in.
Mississippi	23 ft. 0 in.	
New Hampshire	21 ft. 0 in.	8 ft. 0 in.
Rhode Island	18 ft. 0 in.	
Michigan	7 ft. above roof of freight cars passing over line.	
Width of bridges		
Vermont	Single track, 15 ft. 0 in.; double track, 27 ft. 0 in.	

There has been a tendency in the past few years to enlarge the side clearance diagrams for bridges, but, until the maximum size of motive power and equipment is established by legislation or other method, there seems little relief in sight by reason of the enlargement of the clearances. It is an acknowledged fact that, up to this time, the size of motive power and equipment has closely followed the available clearances, and this will, no doubt, continue until some restraint is placed on the enlargement of the motive power and equipment.

E. G. STORCK (chairman), P. & R.; F. E. SCHALL, L. V.; T. E. THOMAS, B. & O.; M. M. BARTON, P. R. R., committee.

REINFORCED CONCRETE BRIDGES

Three methods of procedure in placing slabs are common: (a) constructing slabs at a central point, hauling them to the bridge site on flat cars, and setting them in place with a derrick or wrecker; (b) Building slabs at the bridge site at the side of their permanent location, and skidding them into place; (c) Where there is sufficient head room, the slabs built at the bridge site are, of course, constructed in place. There is a decided preference for casting slabs at a central point and lifting them into place. Fourteen roads with a mileage of 64,700 follow this method, while 11 roads, with a mileage of 31,000, report building slab at the bridge site.

The conditions governing the use of the first method are (a) the renewal of a bridge on the same alinement, while maintaining traffic on all tracks. Where the span is not too long, a temporary trestle to carry traffic is built to clear the finished structure. The slab is then built under traffic. Where long spans of a new structure prohibit the construction of a trestle, the tracks are shifted temporarily beyond the limits of the structure. (b) The renewal of a bridge on the same alinement with traffic closed on one track: The slab is built on sections 13 ft. wide, under the closed track. This method obtains only on large construction, where the forces can be moved to some other part of the work during the time allowed for the concrete to set. When the concrete under the closed track has set, a different track is closed and its traffic diverted to the track on the finished slab. (c) The renewal of a bridge or new construction on a change of alinement: Such work is generally constructed by contract. Company forces are usually employed where the construction interferes with traffic. The conditions governing the use of the second method are where unit construction is used where traffic must be maintained on all tracks without interruption for any length of time without change of alinement. The methods of handling work trains depend largely on whether the work is being done by company forces or by contract. A large system that does the work by company forces necessarily has its work train service well systematized. When called out, the train is kept busy during the full day. In this class of work the train has little to do beside moving the materials. Wherever possible, material is allowed to accumulate at the nearest station until enough is on hand to make a full day's work for a train. Where this is not practicable, it is handled by the local freight. The material is handled by the men on the job, whether on company work or contract. Where the work train service is for contract work, it is quite a general practice to make a fixed charge for this service. Under this

arrangement the contractor can have all the train service he requests, but it will be to his interest to use it only when he actually needs it.

The differences in the work train service on the various roads appear to be due more to the difference in the amount of the service, and to the local conditions, than to any established practice in the handling of such trains.

The question of methods for concreting in cold weather and protection against frost is one on which the southern roads have little to say, but with the roads of the northern states and Canada the question is a live one. Wherever practicable, all concrete work is done during the warm months, but where the winter season is long, it becomes necessary to do considerable concreting in freezing weather. The necessity for heating the ingredients in freezing weather and keeping the concrete warm after it is placed, is generally acknowledged. The methods for accomplishing this vary considerably. The different methods of heating the sand and stone are steam pipes, steam jets and fires in pipes or under grillages laid under piles of material. The protection of the concrete in place is secured either by housing it in and warming with stoves, steam coils, etc., or by covering it with double forms with air spaces, sacks, tarpaulins, hay or anything that will prevent the circulation of air in contact with the forms. Salt is used under certain restrictions, in mass concrete, but, obviously, it cannot be permitted in reinforced concrete on account of the action of salt on the reinforcing steel. The preparation of test pieces during the progress of the work has been recommended frequently. In order to show the condition of the concrete the test pieces must be exposed to the same conditions as the concrete from which they are taken. This test is not recommended as a means for determining the quality of the cement, or other ingredients in the concrete; this must be determined before they are mixed. It has been suggested as a means for determining whether the concrete has hardened sufficiently for the removal of the forms and has been done more frequently perhaps, in connection with building work, than on bridges.

It is evident from the reports of the roads that the making of test pieces is not by any means general. The replies of 21 roads, with a total mileage of 53,500, is "no." Eight roads, with a mileage of 46,500, advise that they make test pieces on certain work, or under special conditions of construction.

The question of the spouting of concrete called for a great variety of answers. Three roads reported that spouting is not permitted on their work under any conditions. Ten roads permit spouting without any specific restrictions as to slope or distance, but subject to the general requirement that the concrete shall be delivered in good condition at the forms. Sixteen roads permit spouting under specific restrictions as to slope, distance, amount of water, etc.

Evidently there is a great deal of dissatisfaction with, or distrust of, this practice. The rules and restrictions under which spouting is permitted on most of the roads reporting indicate that the method will give satisfactory results, provided the work is properly conducted and carefully supervised. On those roads where it is prohibited, the belief evidently prevails that concrete can not be delivered in good condition by this method, or that the abuse of the method can not be wholly prevented by their inspection service.

The facility with which concrete can be delivered over a considerable range by spouting makes it desirable to permit the method, provided the work can be supervised so effectively that there will be no abuse of the method. That this is the most general view is shown by the number of roads, and the mileage represented by the roads permitting spouting under specific restrictions.

As to precautions to insure thorough mixing the belief is apparently quite general that if the mixture is left in the mixer long enough, no other precaution is necessary to secure good mixing. The inspector or supervising foreman is left largely to his own devices on hand mixing. If he is an experienced and

competent man he will get the desired results, but there will undoubtedly be many variations in the methods adopted by different men to obtain the same results.

Machine mixing is generally required on all work of sufficient magnitude to justify a mixer, and batch mixers are quite generally specified. Continuous mixers are apparently not in good standing among the engineers who write the specifications and prescribe the methods. When hand mixing is done, the manner of mixing is sometimes specified in detail, requiring the sand and cement to be mixed dry, then the stone added with some water and the mass shoveled until all of it has been turned a specified number of times, water being added during the mixing until the required consistency is obtained.

The cement gun (using compressed air) and the atomizer (using steam) have been developed within the last few years. They are not intended for use in placing concrete where the ordinary equipment will serve, and where concrete of the usual quality is wanted. The duty required of them is to place the material where it is not practicable to deposit it in forms, and to give a dense and impervious product. The deposited mixture is mortar. The cement gun uses no stone. The atomizer uses stone up to $\frac{3}{4}$ in. in the mixture, but the stone rebounds from the surface to which it is applied. Its only function is, apparently, to pack and tamp the mortar against the surface to which it is applied.

These machines can be used to good advantage when applied to the kinds of work to which they are adapted. It appears from the reports received, however, that these appliances are in use on only a very few roads, and the engineers in charge of concrete construction can not speak from personal experience. Twenty-six roads report not having used either kind, but the roads which have used them nearly all report satisfactory results. One road reports that in one instance, at least, the results were unsatisfactory. The kind of work or the nature of the defect was not stated.

It appears to be the common practice to leave it to the engineer in charge to determine the time when forms can be removed safely, without handicapping him with detailed instructions. The weather conditions and the kind of structure enter largely into the considerations. A few roads report tests, such as breaking off exposed portions of the work, or using test pieces that are made at the same time and exposed to the same conditions as the work.

There is a wide range in the time allowed for setting, even under the same weather conditions. This may be accounted for by assuming that structures of entirely different character were in mind when the different replies were written.

A general review leads to the conclusion that in summer weather, mass concrete, such as retaining walls, abutments and piers, should have two to three days, and a little more if the structure is high or massive. When weather is cold, but not freezing, the time should be from one to two weeks. Forms for slabs, arches and culverts should remain in place in warm weather, from one to two weeks, and the structure should not be loaded for 30 days. In cold weather, the time should be correspondingly longer.

O. F. Dalstrom (chairman), C. & N. W.; A. Montzheimer, E. J. & E.; I. L. Simmons, C. R. I. & P.; J. A. Bohland, G. N.; C. J. Scribner, C. B. & Q.; D. C. Zook, P. L. W.; T. J. Stuart, W. P., committee.

CONCRETE CULVERT PIPE AND CONCRETE PILES

Concrete piles are used by the railroads for a variety of purposes and particularly for reinforced concrete slab trestle bridges. This use is of particular interest in that the reinforced concrete pile slab trestle type of construction presents a seemingly perfectly satisfactory and economical solution of the pile and timber bridge replacement question in many instances, for those openings which are too large for small culverts of a permanent character. The Chicago, Burlington and Quincy, which was the pioneer road with this type of construction, has constructed about 20 miles of concrete pile trestles, some of which have been

in service eight years. The Chicago, Milwaukee & St. Paul started manufacturing and using concrete piles for concrete trestles in 1912 and since that time upwards of 30,000 lin. ft. have been made and driven. On account of the delay to trains that might be occasioned by driving on main lines of heavy traffic, this company has constructed most of its concrete pile trestles on a second track or on lines where the traffic is not very dense.

The Great Northern, the Illinois Central, the Minneapolis, St. Paul & Sault Ste. Marie, the Northern Pacific and the Wheeling & Lake Erie are among the roads that make considerable use of concrete piles for trestles. The Great Northern now prefers, however, in place of concrete pile bents, slim reinforced concrete piers extending one to two feet below the surface of the ground, and supported on piles, with longitudinal struts for heights about 20 ft.

Most of the railroads agree that the premoulded reinforced concrete pile is suitable for use in trestle bents, that they allow loads of from 20 to 35 tons per pile and that the penetration required under ordinary conditions varies from about $\frac{2}{5}$ to $\frac{2}{3}$ the length of the pile, while the maximum projection above the ground recommended varies from 10 ft. to 30 ft. Several roads agree on about 20 ft. for the maximum projection above ground unsupported, while some limit this height to about 14 or 16 ft. and build slim concrete piers for greater heights.

The premoulded type of pile seems to be preferred by the greater number of roads, which is due partly to the necessity of using this type for trestle work. The octagonal, straight-sided pile about 16 in. in diameter appears to be the most used shape. The steel reinforcement of concrete piles should be designed not only to take a portion of the load that may be placed upon the pile after it is driven, but also to take care of the bending stresses that occur when the pile is lifted either by the middle or by one end and to withstand the shocks caused in dragging it over rough ground to the loads and the jars occasioned in driving.

While a great many different makes and types of piles have been used, it is comforting to observe that there have been no failures reported and that very few piles have been broken in handling or in driving and none under load. On the strength of this record it would seem that there should be no need of hesitation on the part of railroad engineers and builders to use concrete piles where the conditions make this type of construction the most economical.

CONCRETE CULVERT PIPE

The use of concrete culvert pipe is much more general among the railroads than that of concrete piles. While some of the roads have used this pipe in special instances, or for experimental purposes only, quite a number use the pipe generally for sizes ranging from 24 in. to 48 in. internal diameter inclusive. A few make common use of sizes varying from 12 in. to 72 in. inclusive, while at least one uses as large as 84 in. x 89 in. oval pipe.

It is not the general practice to restrict the heights of embankments under which concrete pipe is used, other than to specify a certain minimum depth of cover over the pipe, which minimum varies from 8 in. between the bottom of tie and the top of the pipe to about 3 ft. from the base of rail to the top of the pipe. The road reporting the 8 in. minimum stated that its only reason for not placing pipe closer than 8 in. to the tie is that a less distance than this does not afford sufficient protection to the pipe from injury from tamping tools. There is involved in this discussion of the restriction of the heights of embankments, of course, the general question of the appropriateness of placing a rather small pipe under a very high fill, even though the drainage requirements are satisfied. Some roads do not place pipe culverts of small diameter under extremely high fills irrespective of the fact that their carrying capacity is ample to take care of the unexpected quantity of water.

It is not the usual practice to have two or more designs of concrete pipe of the same diameter with different amounts of reinforcement and thickness of the walls for use under different

heights of embankments. The Chicago, Rock Island and Pacific, however, does make such a distinction, having a design known as Class "B" for embankments up to 20 ft. in height and another known as Class "C" for embankments from 20 to 40 ft. high. The amount of reinforcement and the thickness of the walls are both increased in the class "C" design.

In 1906 Prof. Arthur N. Talbot of the University of Illinois tested to destruction several sections of 48 in. and 36 in. reinforced concrete culvert pipe. The results of these tests, which were made under laboratory conditions of bedding and loading, are recorded in bulletin No. 22 of the University of Illinois. This bulletin recommends certain formulae for the design of reinforced concrete pipe which are pretty generally accepted.

More roads use head walls on one or both ends of the concrete pipe culverts than do not use them. The bell and spigot continues to be the more popular type of joint, while the roads are pretty evenly divided on the question of cementing the joints. All of the joints, no matter of what type or whether cemented or not, seem to be pretty uniformly satisfactory.

The length of time the pipe should cure before shipping shows a very considerable variation ranging in air from 10 days to 60 days, while some roads do not install pipe that is less than 90 days old, although they ship after pipe has cured 60 days. While there have been a few failures of pipe in place and a considerable number have been broken in handling, many of these are due either to poor concrete or to the pipe being used too green. If a rich, dense concrete, which is allowed to cure a reasonable length of time, is provided in reinforced concrete pipe which are intelligently designed and installed, we believe that the railroads should feel perfectly safe in adopting this construction wherever it seems desirable to do so. H. Rettinghouse (chairman), C. S. & P., M. & O.; S. T. Corey, O. R. T. & P.; G. H. Stewart, B. R. & P.; C. F. Urbutt, C. M. & St. P., committee.

PROTECTION OF GRADE CROSSINGS

All public crossings should be marked by crossing signs placed as conspicuously as possible to indicate the proximity of tracks. This is essential even though flagmen may be on duty, a bell ringing, or other warning given to drivers of approaching vehicles. A whistling post should be placed on the engineer's side of the track a quarter of a mile from the crossing so that trains may give warning of their approach. To further indicate to drivers of vehicles and trainmen the locations of crossings, the cross fences should be painted white or whitewashed.

It is important that the roadway at railroad crossings be kept in good condition. Even in cases where it is only incumbent on the railroad to maintain the roadway between its rails and for two feet outside, the necessary steps should be taken to see that the approaches are maintained on easy and uniform grades, and free of ruts or rough spots which might possibly stall an automobile or otherwise contribute to hazard at the crossing. The area between the rails should be kept well filled, and if a smooth crossing can not be obtained otherwise, guard rails should be used.

Objects which obstruct the view of crossings either from approaching trains or vehicles should be removed as far as possible. Whatever protection may be provided at a crossing will be inefficient if the view from all directions is obscured by trees or other obstructions. Proper care in this respect may greatly reduce the hazard of accident.

The choice between the forms of protection in common use lies between gates, wigwag signals, or so-called automatic flagmen, and flagmen. There is no rule for determining the choice of protection, but the best device may be indicated by local conditions of topography, the widths and layouts of roads or streets, the angle of crossing, etc., or it may be chosen after experience and observation of a particular case.

Crossing gates are suitable for roadways crossing one or two tracks where the traffic is not greatly congested. Where the teams are very numerous, the time required to operate gates tends to block the traffic and create congestion. There is the further

possibility of vehicles being caught between the gates or of the gates being lowered on them. Where the roadway crosses a large number of tracks, gates are least satisfactory. There are cases of well improved highways in suburban or country districts where automobiles are run at high speed where gates are sometimes run through. In an article in the *Railway Age Gazette* of July 16, 1915, a crossing is described and illustrated where the ordinary light gate has been replaced by a spruce pole about 10 in. in diameter as an effective barrier against automobilists who approach the crossing at reckless speed. This gate is painted with spiral bands of black and white to attract attention at a considerable distance. The Southern Pacific has tried red paint and stripes on its crossing gates, but a subsequent canvass of automobile drivers indicates a preference for plain white gates as being easier to distinguish, especially at dusk or dawn. In the opinion of the committee white is the best color for gates.

There are various types of gates, wire-pull, electric and pneumatic, all having the same idea of placing a barrier across the roadway. Some have ticklers and others fence attachments, but these are but variations of the barrier idea. There is also in use an automatic gate which is operated in a manner similar to automatic signals. This has not been found satisfactory as yet. It is apt to lower on a vehicle, or if constructed too high to strike a wagon is too tempting for malicious persons to tamper with it.

A very good additional protection in connection with crossing gates is a red light hung on the gate at night, with blinders on the sides so that it will not be visible to the engineers of approaching trains. This light is replaced during the daytime by a red disk.

The Southern Pacific is conducting experiments with a form of warning signal consisting of a red disk 16 in. in diameter located 200 ft. from the crossing. As automobile associations are providing signs which serve the same purpose it is perhaps better for railroad men to look out for the immediate crossing only.

Where traffic conditions do not require gates or flagmen the best form of signal is the automatic flagman or wigwag, which consists of a red disk displaying a red light at the center, which is suspended from a bracket away from the line of poles. The disk and light swing through an arc in the lower quadrant and attract attention readily from the roadway for a considerable distance. In some respects this device is superior to a flagman. There is no variation in the signaling. The movement is always the same. When in motion it can indicate but one thing—that a train is approaching. A bell may be rung in connection with the visible signal, and this is advisable in certain districts; but in residential sections, where trains are numerous or where the signal may be operated for long periods on account of switching movements, the bell may be removed and the device used as a visible signal only. The cost of installation of the wigwag varies with the number of switches within the limits of the electric circuits, the presence of automatic signal circuits, etc. The minimum cost is approximately \$60 for labor and \$260 for material, or a total of \$320. On account of other circuits and switches within the operating limits of the signal the cost may reach as high as \$500.

No matter what the railroads may do in the way of eliminating danger at grade crossings their efforts are of little avail unless the public co-operates to the extent of observing warning signals set up for its protection. Pomona, Cal., causes the arrest of persons who disregard the city ordinances which require the drivers of vehicles to stop before crossing a railroad track. A personal way of checking up careless drivers is for gatemen or flagmen to note the vehicle numbers and write to owners and employers. It is our experience that employers are glad to be advised of instances where their employees show carelessness in crossing tracks.

CONCLUSIONS

1. Where feasible, grade crossings should be eliminated.
2. Obscure crossings should be opened up to the view as much as possible by the removal of trees, buildings, brush or other obstructions.

3. Roadways at track crossings should be maintained in the best possible condition.

4. An automatic flagman, gates or flagmen should be provided as local conditions may require.

5. All means possible should be used to induce the public to use caution at grade crossings.

E. C. Morrison (chairman), S. P.; A. T. Mercier, S. P.; F. M. Nelson, S. P.; A. Ridgway, D. & R. G.; J. B. Gaut, G. T.; J. H. Johnston, G. T.; C. E. Johnston, K. C. S.; J. B. Sheldon, N. Y., N. H. & H.; G. H. Jennings, E. J. & E.; F. O. Draper, I. C., committee.

OTHER REPORTS

An extended report on Railway Water Tanks was presented by C. R. Knowles, chairman. Because of lack of space it is necessary to hold it out of this issue, but it will appear in the November Maintenance of Way Section.

A report was presented on Efficient Methods of Handling Work and Men by G. W. Rear (S. P.). An abstract of this will also appear in the November Maintenance of Way Section.

OTHER BUSINESS

The following subjects were selected for consideration at next year's meeting:

Brick, Cement, Asphalt and Wood Block Floors for Shops, Roundhouses, Freight Houses, Highway Bridges, etc.

Paint and Its Application to Railway Structures.

Fireproofing Roofs of Wooden Buildings.

Water Supply Intakes and Intake Lines for Internal Combustion Engines.

Caring for and Handling Creosoted Material.

Blank Forms for Bridge and Building Department.

Modern Methods of Driving Piles.

Efficient Methods of Handling Work and Men.

Economical handling of Concrete on the Smaller Jobs.

Station Buildings for Passenger Service Only.

Small Coaling Stations.

On Tuesday evening about 315 members and supply men were guests of the Bridge and Building Supply Men's Association at a dinner and vaudeville entertainment given in the Hotel Statler.

Wednesday afternoon was spent in an inspection trip by special train through the Michigan Central tunnel and over the Windsor terminal. A trip was also made through the plant of the Ford Automobile Company.

On Wednesday evening about 200 members and guests attended a banquet at the Hotel Statler. Special emphasis was placed on the early history of the association. The speakers included Past President W. A. McGonagle, Secretary C. A. Lichty, Vice-President G. W. Rear, J. B. Sheldon, E. T. Howson and C. R. Knowles.

On Thursday afternoon the members and guests enjoyed a boat excursion on the Detroit river.

ELECTION OF OFFICERS

The election of officers on Thursday morning resulted as follows: President, G. W. Rear, general bridge inspector, Southern Pacific, San Francisco; first vice-president, C. E. Smith, consulting engineer, St. Louis, Mo.; second vice-president, E. B. Ashby, chief engineer, Lehigh Valley, New York; third vice-president, S. C. Tanner, master carpenter, Baltimore & Ohio, Baltimore, Md.; fourth vice-president, Lee Jutton, division engineer, Chicago & North Western, Madison, Wis.; secretary-treasurer, C. A. Lichty, general inspector, Chicago & North Western, Chicago. Members of the executive committee were chosen as follows: F. E. Weise, chief clerk, engineering department, Chicago, Milwaukee & St. Paul, Chicago; J. S. Robinson, division engineer, Chicago & North Western, Chicago, and J. P. Wood, supervisor bridges and building, Pere Marquette, Saginaw, Mich.

SUPPLY ASSOCIATION

The Bridge and Building Supply Men's Association held an exhibit in a room adjoining the one in which the meeting was

held, with about 25 firms represented. The exhibits consisted largely of models, samples, photographs and literature. The officers of this association for the past year were: President, J. A. Meaden, Paul Dickinson Company; vice-president, D. A. Bonitz, National Roofing Company; secretary, L. D. Mitchell, Detroit Graphite Company; treasurer, H. A. Neally, Joseph Dixon Crucible Company.

At the annual meeting held on Thursday morning the following officers were elected: President, D. A. Bonitz, National Roofing Company, Tonawanda, N. Y.; vice-president, H. A. Neally, Joseph Dixon Crucible Company, Jersey City, N. J.; treasurer, L. D. Mitchell, Detroit Graphite Company, Detroit, Mich.; secretary, P. O. Jacobs, H. W. Johns-Manville Company, Chicago. Members executive committee: H. H. Husted, Asphalt Ready Roofing Company, New York; M. J. Trees, Chicago Bridge & Iron Works, Chicago; and W. H. Pratt, Heath & Milligan Company, Chicago.

The following firms had exhibits:

American Hoist & Derrick Company, St. Paul, Minn. Represented by F. J. Johnson and W. O. Washburn.

Asphalt Ready Roofing Company, New York City. Represented by C. A. Sparrowhawk and H. H. Husted.

American Valve & Meter Company, Cincinnati, Ohio. Represented by J. T. McGarry.

Barrett Manufacturing Company, New York City. Represented by J. I. Holder, E. J. Caldwell, K. C. Barth and A. C. Wiles.

Philip Carey Company, Cincinnati, Ohio. Represented by C. L. Cockrell. Chicago Bridge & Iron Works, Chicago. Represented by M. J. Trees and C. S. Pillsbury.

Chicago Pneumatic Tool Company, Chicago. Represented by T. D. Slingman, C. E. Walker and F. McComber.

Joseph Dixon Crucible Company, Jersey City, N. J. Represented by H. A. Neally.

Detroit Graphite Company, Detroit, Mich. Represented by T. R. Wyles, J. J. Hogan, L. D. Mitchell, F. G. Hogan and E. Booth.

Paul Dickinson, Inc., Chicago. Represented by J. A. Meaden and A. J. Filkins.

Fairbanks, Morse & Co., Chicago. Represented by G. J. Akers, A. A. Taylor, F. M. Condit and K. P. Brown.

Heath & Milligan Company, Chicago. Represented by W. H. Pratt.

H. W. Johns-Manville Company, Chicago. Represented by P. C. Jacobs, W. H. Lawrence, C. E. Murphy, H. A. Waldron and J. C. Younglove.

The Lehon Company, Chicago. Represented by Thomas Lehon and D. B. Wright.

C. F. Massey Co., Chicago. Represented by C. F. Massey and Charles Gilman.

National Roofing Company, Tonawanda, N. Y. Represented by D. A. Bonitz.

George P. Nichols & Brother, Chicago. Represented by George P. Nichols.

The Patterson-Sargeant Company, Cleveland, Ohio. Represented by M. R. Stowell.

Pyrene Manufacturing Company, New York. Represented by W. H. Sherman and R. H. Neal.

Railway Age Gazette, Chicago. Represented by L. B. Sherman and E. T. Howson.

T. W. Snow Construction Company, Chicago. Represented by T. W. Snow.

Standard Asphalt & Rubber Company, Chicago. Represented by C. V. Eades and R. E. Kartack.

Toch Brothers, New York. Represented by A. H. Rhett.

United States Graphite Company, Saginaw, Mich. Represented by H. F. Gump, A. W. Walker and J. F. Lee.

U. S. Wind Engine & Pump Company, Batavia, Ill. Represented by C. E. Ward.

PENNSYLVANIA ANNUAL TRACK INSPECTION

The annual track inspection of the Pennsylvania Railroad east of Pittsburgh and Erie was made on October 5 and 6 by S. C. Long, general manager, and a party of about 350 operating officers. This inspection covered the main lines between New York and Pittsburgh and between Philadelphia and Washington. The first, or "Klondyke" prize of \$1,200, divided on the basis of \$800 for the supervisor and \$400 for the assistant, and awarded for the best maintained subdivision throughout the year, went to C. Z. Moore, supervisor, and L. R. R. Fleming, assistant supervisor, in charge of track between Dillerville, Pa., and Harrisburg. Premiums of \$800, \$600 for the supervisor and \$200 for the assistant supervisor, were awarded for the subdivision having the best line and surface on each of the four main line divisions. These prizes went to C. M. Wisman, supervisor, and H. M. Grimm, assistant supervisor, in charge of track between Tullytown, Pa., and Dean, N. J.; W. T. Hanly, supervisor, and J. B. Baker, assistant supervisor, in charge of track between Marysville, Pa., and Thompsontown; R. H. Pinkham, supervisor, and F. X. Bradley, assistant supervisor, in charge of track between New Florence and Donohoe, Pa., and to G. H. B. English, supervisor, and C. M. Hursh, assistant supervisor, in charge of

track between Wilmington, Delaware, and Perryville, Maryland.

A special improvement prize of \$1,000, divided \$700 to the supervisor and \$300 to the assistant supervisor, offered for the greatest improvement made in line and surface on a supervisor's subdivision, was awarded to W. G. Shaner, supervisor, and T. K. Minsker, assistant supervisor, in charge of track between Baltimore and Springfield, Md.

These awards were not based entirely upon the general manager's inspection, but frequent inspections were also made during the year by a special committee composed of W. G. Coughlin, engineer maintenance of way; A. B. Clark, assistant engineer maintenance of way; J. J. Rhoads, superintendent Media division, and E. J. Cleave, superintendent, Cresson division. The methods of conducting this inspection were described in detail in an article by Joseph T. Richards, consulting engineer maintenance of way, in the issue of January 22, 1915.

THE ADVANTAGE AND COST OF SPIRALING CURVES*

BY W. F. RENCH

Supervisor, Pennsylvania Railroad, Perryville, Md.

It was universally the practice in the early days of railroads, as it very generally is today, to locate a line as a succession of tangents and circular curves with no provision for present or future easements. Although operation is possible over such an alinement it must necessarily be at a very moderate speed and even then accidents are not infrequent occurrence. When locomotives were small and the greatest speed attainable was comparatively slow, the lack of easements for the lighter curves was not felt, but their absence from the sharper curves was always a source of trouble. Indeed, it is difficult to convey how operation was otherwise than precarious upon many such curves that were devoid of easements. The presence of superelevation presupposes curvature and the very fact of a tangent track being several inches out of level, whether at the approach to a curve or elsewhere,

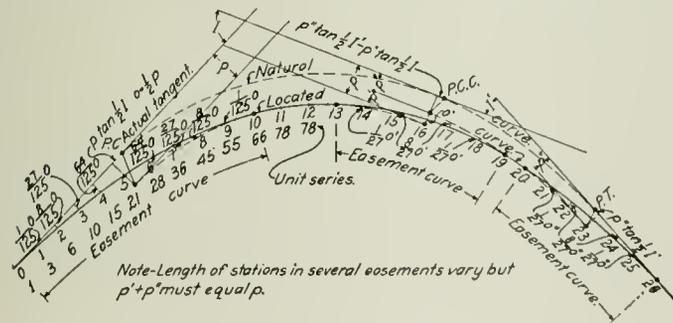

ing of curves the flat places developed by the outward throw of the ends were eliminated by lining the entire body of the curve inward, the throw being often as much as 6 in. Finally, when such methods, at first crude, were further improved, a complete adjustment was made on exact lines, the protrusions being removed, a more efficient easement provided and finer detail line of the curve attained. The last adjustment almost always consisted in making first an inward throw of the ends, both to remove the protrusions that makeshift correction or the natural movement with the traffic had produced and to flatten the curve for the easements, and then an outward throw through nearly the entire body of the curve, varying in amount from 2 in. to 6 in., to modify the sharp places which the previous throws had introduced at each extremity of the remaining arc. The net result of the several changes was a lengthening of the curve amounting to about 75 ft. on each end and a sharpening of the circular portion by about 3 per cent of the initial degree.

As affecting the question of introducing easements into the original location or at least of providing the means for such correction at a later time when the roadbed shall have settled, it will be instructive to study the cost of the relining necessary to attain this end when no such provisions has been made. It will no doubt be thought that the value of the labor thus spent is so indefinite as to be impossible of even approximate estimation. But the record of cost on a typical branch road of medium traffic and maintenance is offered as a suitable criterion. The road, which is cinder ballasted, is 44 miles long and the speed prescribed is 40 miles per hour. The alinement follows the shore of a river through all its points and bays and contains 185 curves, several as sharp as 8 deg., the average of all being 3 deg. 20 min. It is safe to say that each has had the three general lining adjustments referred to during the 20 years of the road's operation. The final correction of one-fourth of the curves was made quite recently and a measure of the expense is therefore readily obtainable.

For this last operation the average cost, including both the throwing and subsequent surfacing made necessary, was 3 1/3 cents per foot of curve. The throws were no greater than 6 in. and the average throw was 2 1/2 in. It is a conservative assumption that the total cost of the several adjustments was three times the cost of the one operation, or 10 cents per foot of curve. For the road in question on which the curves compose 57 per cent of the total length, the expense of adjustment was \$300 per mile of single track line. The labor necessary for spiraling the curves thus amounted to no less than \$13,000, a considerable sum, which would unquestionably have been largely saved if ultimate addition of easements had been provided for in the original alinement.

The type of easement that is most suitable for general use is the one that can be most readily designed for application with an instrument and that can be most easily maintained afterward by string lining. The cubic parabola, a curve whose deflection angles vary as the square of the distance and whose offsets vary as the cube of the distance, fulfills both requirements. The method of developing this curve in string lining was described in the *Railway Age Gazette* of May 15, 1914. The same relation between distance and deflection angles or offsets may be shown to apply to all spirals whose ordinates increase from a unit quantity by successive additions that are in an arithmetical progression with the difference equal to the unit quantity. Thus in the series of ordinates, 1 in., 3 in., 6 in., 10 in., 15 in., 21 in., in which the value of the unit is 1 in. and the maximum addition is 6 units, the curvature through each station would be represented by the mean of the adjacent ordinates or by the series 1/2 in., 2 in., 4 1/2 in., 8 in., 12 1/2 in., 18 in., in which it is seen that the ratios of the several members to the first are as the squares of successive numerals, 2 being 4 times 1/2, 4 1/2 being 9 times 1/2, etc.

The use of such a series extended as far as necessary, with the unit having the value suited to the individual case, will reduce to a minimum the labor of designing an easement.

A Study of a 10 and 6 Station Spiral with Offsets and Unit Series Ordinates

suggests the possibility of accident. The records of most branch roads contain the account of derailments occurring at the ends of curves, the causes of which were never satisfactorily ascertained. But the fact is pertinent that such accidents become noticeably fewer following the proper spiraling of the curves. With the increase of speed in both passenger and freight schedules the addition of easements has become not merely a refinement for comfort but a necessity for safety.

Various methods have been used in providing present easements on old lines. The first was usually to throw the ends of the curve outward, which served to remedy part of the defect. But the resulting protrusions beyond the tangents were both unsightly and to some extent uncomfortable. When adjoining curves turned in the same direction and the tangent between was short it readily appeared that a relining of the entire tangent would effect the necessary correction, although in most cases the protrusion was allowed to remain as the lesser of two evils. But as methods were evolved for the lin-

*Copyrighted by W. F. Rensch.

The value of the unit to be used with this series in any particular instance may be obtained by dividing the ordinate of the body of the curve by the highest number in the series that is required by the length of easement adopted and the ordinates of the easement by multiplying each number of the series by the value of the unit. For example, if it is desired to use an easement curve five stations long the sixth number in the series, 21, would represent the ordinate coinciding with the ordinate of the main curve. If this were 8 in., the value of the unit for that easement would be 8 in. divided by 21, or $\frac{3}{8}$ in. The ordinates of the easement would then be $\frac{3}{8}$ in., $1\frac{1}{8}$ in., $2\frac{1}{4}$ in., $3\frac{3}{8}$ in., and $5\frac{5}{8}$ in. The mean of the adjacent ordinates changed to degrees of arc would supply the mean curvature through each station and one-half of this would give the deflection angles needed for applying the curve in an original location. Such a curve has been found in many cases to approximate closely the spiral developed by the more expert track foreman in lining by eye, so that it has the sanction of practical experience.

The error of the system in which the ordinates are made proportional to the distance cannot be better shown than by an exhibit in parallel.

Middle ordinate by the cubic parabola	Degree	Super-elevation	Degree	Middle ordinate by regular proportion
$\frac{1}{8}$ in.	0 min.	0 in.
$\frac{3}{8}$ in.	11 min.	$\frac{1}{2}$ in.	23 min.	$\frac{1}{4}$ in.
$\frac{5}{8}$ in.	23 min.	$1\frac{1}{2}$ in.	45 min.	$1\frac{1}{2}$ in.
$1\frac{1}{8}$ in.	41 min.	2 in.	1 deg. 07 min.	$2\frac{1}{4}$ in.
2 in.	1 deg. 00 min.	$2\frac{3}{4}$ in.	1 deg. 30 min.	3 in.
$2\frac{3}{4}$ in.	1 deg. 22 min.	$3\frac{1}{2}$ in.	1 deg. 53 min.	$3\frac{3}{4}$ in.
$3\frac{1}{2}$ in.	1 deg. 49 min.	4 in.	2 deg. 15 min.	$4\frac{1}{2}$ in.
$4\frac{1}{4}$ in.	2 deg. 23 min.	$4\frac{3}{4}$ in.	2 deg. 38 min.	$5\frac{1}{4}$ in.
6 in.	3 deg.	$5\frac{1}{2}$ in.	3 deg.	6 in.
6 in.	3 deg.	6 in.	3 deg.	6 in.

It will be noted that by this scheme a superelevation of $\frac{3}{4}$ in. obtains where the degree of curve is 23 min. and $1\frac{1}{2}$ in. where it is 45 min., but that by the cubic parabola the superelevations for similar degrees are respectively $1\frac{1}{2}$ in., and $2\frac{1}{4}$ in., which have been found by experience to be the correct selection for a speed of 70 miles per hour, and indeed, agree substantially with the theoretical value by the well-known formula of mechanics. No one can doubt that the superelevations by the former method are wholly insufficient and it is this condition mainly which causes the deflection noticed in going on and off such a curve, even when it is newly adjusted. Through the strain introduced by this deficiency there is a tendency toward quick distortion and the defect increases until a lurch is the inevitable result.

A brief resume of the effect of the final correction upon the alinement of the curves through a typical mile on the branch line mentioned above is given below in tabular form. The adjustment also involved some change in the direction of the tangent.

Name of curve	Original degree	Present degree	Original length	*Present length	Length of easement
State Line	7	$7\frac{1}{4}$	468	681	155
Frazer	8	$8\frac{1}{4}$	771	961	155
4th No. M. P. 14....	$1\frac{1}{2}$	$1\frac{3}{4}$	364	496	93
3rd No. M. P. 14....	3	$3\frac{3}{8}$	302	434	124
2d No. M. P. 14....	3	$3\frac{3}{8}$	413	589	124
1st No. M. P. 14....	4	$4\frac{1}{4}$	707	868	124
M. P. 14.....	4	$4\frac{1}{4}$	411	558	124

*Includes length of easements.

While the locating engineer may reasonably claim that in general it is an unnecessary refinement to stake out the detailed spiral curve preliminary to new construction, it cannot be denied that provision ought to be afforded for such adjustment and a statement of the practical working limits from the maintenance standpoint should be of service. It is believed that the situation will be met satisfactorily by the use of the following plan. Stake out the circular curve between imaginary tangents parallel to and a selected distance within the actual tangents. Shorten the circular curve on each end by half the length of the easement and locate points on the actual tangents at the same distance in the opposite direction. Re-locate the stakes marking the original ends of the circular curve a distance outward equal to one-half the se-

lected offset distance. This location will enable the track-laying forces to adjust the curve by eye with sufficient precision for the purpose of the new construction and will allow the final detailed adjustment to be made later at nominal expense.

The amount of the offset will depend upon the length of easement desired and this in turn will be governed by feasibility and the service required. The least offset that is of practical utility is one whose length in tenths of a foot is equal to the figure representing the degree of curve. This will provide an easement curve with a half length of 60 ft. If a longer easement is desired and is not impracticable, the offset distance would be increased in proportion to the square of the half length. For a very satisfactory adjustment upon a branch of medium traffic such as the case described above, the half length of easement might be made 75 ft. and the offset distance would then be equal in tenths of a foot to $1\frac{1}{2}$ times the figure for the degree of curve.

If a run-off at no greater rate than $\frac{1}{2}$ in. to 30 ft. were desired for a 4 deg. curve to be operated at 40 miles per hour with the superelevation of 3 in. attained 60 ft. upon the circular curve the half length of 60 ft. would be proper and the offset distance would be 0.4 ft., but if the same curve were part of an important main line route to be operated at 55 miles per hour and the rate of the run-off for the 6 in. of superelevation necessary were desired to be as low as 1 in. to 100 ft., a half length of 250 ft. would be required and the offset distance would be 7 ft. In the latter case it would be necessary to stake out the entire easement curve, preferably by 50 ft. stations, and the above described methods would apply or, if preferred, the location might be made by offsets, for one-half the easement curve from the actual tangent and for the other half by similar offsets in inverse order from the located circular curve. With this method, equal stations could be used when the several offsets would be the proportion of that at the middle of the easement determined by the cube of their relative distance from the ends of the easement. Thus, in the case cited the first offset would be $1/125$ th of 3.5 ft. or 0.028 ft. and the several other offsets, respectively, 8, 27 and 64 times this, or 0.22 ft., 0.76 ft., and 1.79 ft.

The same methods would of course apply to the easement between two curves of considerably different curvature. The offset distance between the imaginary tangents at the P. C. C. would then be computed from the difference in the numbers representing the degree of the two curves and the several offsets would be measured from the two circular arcs. The unit middle ordinate would be obtained by dividing the difference between the ordinates of the two curves by the highest number of the series applicable and the spiral ordinates then obtained would each be increased by the amount of the ordinate of the lighter curve.

In fitting the spiral curve as determined by its middle ordinates to the same curve as determined by its offsets it must be noted that there necessarily is an ordinate at the beginning of the spiral and while by the geometric requirements of the curve this ordinate will be of the unit value, which should always be used in the design, the actual value when measured with the chord extended half upon the curve and half upon the tangent will be one-half the unit value. It should also be understood that the circular arc commences one station back of the first point of full ordinate and ends one station in advance of the last point of full ordinate.

GERMAN-MADE RAILWAY THROUGH BELGIUM.—It is reported that the construction of the new railway line between Aix-la-Chapelle and Brussels, via Vise, is being vigorously pushed forward. German workmen are busy day and night. The building of a new bridge near Lische will begin shortly. The railway through Belgium will be an almost straight line, without regard to private property or natural obstacles. It appears that the German authorities consider the railway of the greatest importance, not only for the present, but also for the future.

General News Department

The twenty-ninth annual convention of the Canadian Ticket Agents' Association was held at Denver, Colo., on October 18.

A Union Pacific combination passenger and baggage motor car fell off a bridge weakened by high waters into a creek near Randolph, Kan., on October 16, causing the deaths of 16 passengers, it is reported, and injuring a large number of others. A trailer remained on the track.

On Wednesday afternoon Charles S. Mellen, president of the New York, New Haven & Hartford from 1903 to 1913, took the witness stand in the criminal suit against the New Haven directors under the anti-trust law described in detail the traffic situation in New England previous to July 2, 1890.

The Employees' Relief department of the Baltimore & Ohio is now 35 years old and the aggregate amount of its payments, to June 30, 1915, is \$20,096,883. More than half this sum went to pay for sick benefits and death benefits having no connection with accidents. The relief department fund lends money to employees of the road, to assist them in buying homes, and in the last fiscal year the sum of \$1,440,000 was lent for this purpose.

Five men held up a freight train on the Erie Railroad in Bergen cut, near Glen Rock, N. J., on the night of October 20, and attempted to steal part of the contents of a freight car supposed to contain silk. It is thought that the train was stopped by tampering with the air brake hose and when the trainmen got down to make an examination they were held up by five men. While one of the men kept the trainmen covered the others broke into the freight car, but before the contents of the car could be unloaded two railroad detectives, who were riding on the train, came up and began firing into the car. The robbers returned the fire, but managed to get away to an automobile waiting nearby.

The Erie's Eightieth Anniversary

On Saturday, November 6, the Business Men's Association of Deposit, N. Y., will celebrate, with a parade and speeches, the eightieth anniversary of the Erie. On November 7, 1835, the first ground was broken for the Erie Railroad at Deposit, N. Y. At the time that this construction work was begun the president of the company, James G. King, made the prediction that fully 200,000 tons of freight would be transported over the railroad a year. Last year the Erie handled 42,874,315 tons of freight.

The Value of Motor Cars

At the meeting of the New York Railroad Club on Friday, October 15, a paper on "The Value of Motor Cars on Railroad Systems" was read by W. R. McKee, Jr., consulting engineer, motor cars, Union Pacific. Mr. McKee laid stress on the value of motor car service in stimulating passenger travel and stated that by this means an increase ranging from 50 to 100 per cent may easily be obtained in from 6 to 12 months. Among those taking part in the discussion were A. W. Jones, General Electric Company; R. B. Williams, Jr., president, Central New York Southern, and D. F. Crawford, general superintendent motive power, Pennsylvania Lines West of Pittsburgh.

Lehigh Valley Buys New Equipment

The Lehigh Valley has announced that it has ordered 10 new Mikado type freight locomotives from the Baldwin Locomotive Works, that it will have 20 other engines rebuilt and equipped with superheaters, Walschaert valve gear, etc., and that it has contracted for a considerable addition to its floating equipment in New York harbor. This will include: a new steel tug, 109 ft. over all, with 28 ft. 1 in. beam and 11 ft. 6 in. depth, with a towing capacity of 10,000 tons; four 12 car capacity

and three 8-car capacity steel car floats; two 120-ft. barges and six 90-ft. barges. The company has also bought a 500-ton capacity gasoline hoisting lighter.

Including the new freight locomotives, the 20 locomotives which are to be overhauled and improved, another 100 locomotives recently rebuilt and equipped with superheaters, and the 2,000 box cars rebuilt in outside shops, together with the harbor boats just ordered, the Lehigh Valley has spent over \$2,500,000 for equipment in the last few months.

Head-On Collision on the Rock Island

In a head-on collision on the Chicago, Rock Island & Pacific between a southbound passenger train, No. 11, and a northbound freight, No. 98, on a curve at Agawam, south of Chickasha, Okla., early Tuesday morning, two firemen, one brakeman and four tramps were killed, and 45 passengers were more or less injured and the two engineers were seriously injured. Both trains received a 31 order for train 11 to wait at Agawam until 1.15 and at Rush Springs until 1.25 for train 98. As the collision occurred half a mile west of Agawam at 1.08 or 1.09, the passenger engineer apparently must have failed to obey the order. On Wednesday he was still unconscious, so there has been no statement from him.

The freight engineer was late with a train of livestock and left Rush Springs at 12.55, with 20 minutes to go about seven miles and clear passenger train by 10 minutes. About one hundred head of cattle were killed and both engines and several cars were seriously damaged. The tramps were killed riding on the blind baggage car. There are no block signals in this territory.

I. C. C. Issues Circular on Car Shortage

The Interstate Commerce Commission has recently issued a circular giving warning of a possible car shortage and urging co-operation to obtain the greatest efficiency in the use of the car supply. The commission says:

"Informal complaints to the commission indicate that the annually recurring failure of transportation facilities known as 'car shortage' is again appearing. The commission urges on all shippers and all carriers that close attention to methods of loading, unloading, moving, and promptly returning to use the cars now available will go far toward making the present supply of cars sufficient for all purposes.

"In order that the business of the country may go forward without interruption, the commission urges shippers, both individually and through their associations, to co-operate to secure the prompt and full loading of cars and their prompt release. One of the chief causes of failure of car supply in past seasons has been the unnecessary detention of cars by careless shippers and by shippers using them for storage purposes. In the general public interest, shippers should endeavor to release cars at the earliest possible moment without regard to the free time given by the tariffs.

"All the efforts of the shippers will be unavailing, however, unless the carriers also use extraordinary measures to eliminate all delays chargeable to them. The failure of car supply is usually a failure of car movement. The congestion of terminals is the ever present feature at times of such failure. The commission therefore urges carriers to make every possible endeavor to improve their methods of operation of terminals in order that cars may move promptly. Also company material should be unloaded with the same despatch that is required of shippers.

"The commission is moved to make this appeal by its desire to save both shippers and carriers from the losses which are occasioned by failures of car supply, and by its knowledge that measures such as are here suggested to have operated in past seasons to save all concerned from heavy losses."

Howard Elliott, president of the New York, New Haven &

Hartford, has sent a copy of the circular to the newspaper editors, with the following letter asking the co-operation of its patrons:

"During the last few years, from various causes, the railroads of the country have been unable to make such additions to tracks, yards, equipment, and facilities as are now necessary to keep pace with the growth of business in the country. This is especially true in New England, and there is danger that there will not be transportation enough produced to meet the daily demands. The condition of the railroads in this respect is not different from many other large industrial plants that have more orders than they can fill.

"The danger of a shortage in transportation can be reduced if every user of it is very prompt and if he co-operates with the railroad in trying to make the best of a difficult situation. Shortage of trackage, oftentimes, causes us much, if not more, trouble than shortage of cars, and close co-operation between shippers and carriers will help prevent congestion, the result of which does harm not only at the particular point where it exists, but all along the line.

"The New Haven management is using every effort it can put forth to obtain the full use of all its facilities and to furnish all the transportation it can, and asks the help of its patrons at this time when facilities in many places are overtaxed."

Summary of Revenues and Expenses of Steam Roads

The Bureau of Railway Economics' summary of revenues and expenses of railways and comments thereon for July, 1915, are as follows:

Net operating income of the railways of the United States for July increased \$39 per mile, or 13.3 per cent, as compared with July, 1914. This increase was due in the main to reductions in expenses, which have been effected in all parts of the country. In July, 1914, net operating income per mile was 3.1 per cent less than in July, 1913.

Total operating revenues amounted to \$258,526,363, an increase from 1914 of \$2,567,724. Operating expenses were \$171,-

90 per cent of the steam railway mileage in the United States.

Operating revenues of the eastern railways per mile show an increase of 3.8 per cent as compared with July, 1914, operating expenses decreased 3.9 per cent, net operating revenue increased 22.5 per cent, taxes decreased 0.3 per cent and operating income increase 26.2 per cent.

Operating revenues of the southern railways per mile decreased 4.5 per cent, operating expenses decreased 9.2 per cent, net operating revenue increased 9.7 per cent, taxes increased 1.9 per cent and operating income increased 11.2 per cent.

Operating revenues of the western railways per mile show a decrease of 1.4 per cent, operating expenses decreased 3.1 per cent, net operating revenue increased 2.1 per cent, taxes increased 2.6 per cent and operating income increased 1.9 per cent.

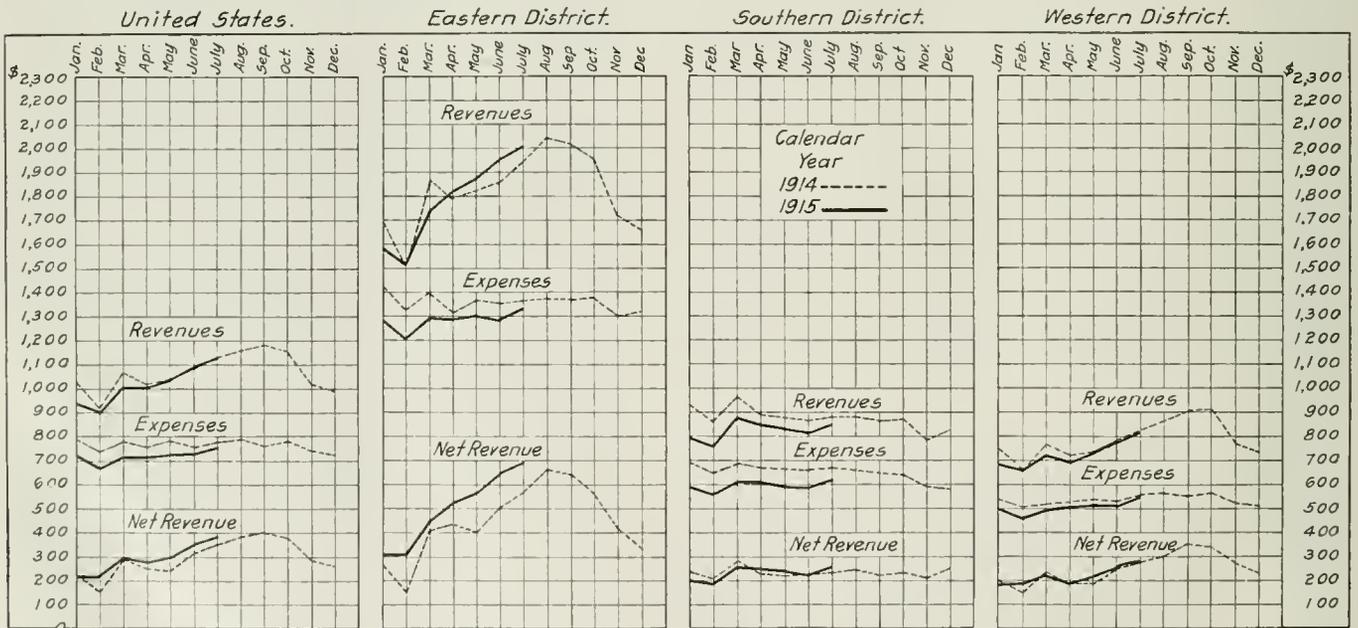

July net operating income per mile was 13.3 per cent greater in 1915 than in 1914, 10.4 per cent greater than in 1913, 7.2 per cent greater than in 1912 and 15.8 per cent greater than in 1911.

Transportation Club of Louisville

The first monthly meeting of the Transportation Club of Louisville, Ky., was held in the Seelbach Hotel in that city on October 19. The address of the evening was made by Samuel O. Dunn, editor of the *Railway Age Gazette*, on the subject of "Government and Business."

Chilled Car Wheel Manufacturers

At the annual meeting of the Association of Manufacturers of Chilled Car Wheels, held in New York on October 12, officers were re-elected as follows: President and treasurer, George W. Lyndon; vice-presidents, E. F. Carry and J. A. Kilpatrick; secretary George F. Griffin; consulting engineer, F. K. Vial. The board of directors consists of E. F. Carry, J. A. Kilpatrick, W. S. Atwood, Chas. A. Lindstrom, F. K. Vial, A. G. Wellington, W. C. Arthurs, J. D. Rhodes, F. B. Cooley, A. J. Miller and

Monthly Revenues and Expenses per Mile of Line in 1914 and 1915

526,861, a decrease of \$6,990,534. Net operating revenue amounted to \$86,999,502, an increase of \$9,558,258. Taxes amounted to \$11,574,582, an increase of \$217,588. This left \$75,377,176 for net operating income, available for rentals, interest on bonds, appropriations for improvements and new construction and dividends. Operating revenues per mile of line averaged \$1,130, an increase of 0.3 per cent; operating expenses averaged \$750, a decrease of 4.6 per cent; net operating revenue per mile averaged \$380, an increase of 11.5 per cent, while net operating income per mile was \$330, an increase of 13.3 per cent. Taxes per mile increased 1.2 per cent. Railways operating 228,713 miles of line are covered by this summary, or about

Wm. F. Cutler. An abstract of President Lyndon's address appeared in last week's issue, page 690.

Milwaukee Veterans' Association

A large number of employees and officers of the Chicago, Milwaukee & St. Paul, who had been in the service of the road for 25 years or more, held a meeting at Chicago on October 14, and organized the Milwaukee Veterans' Association. Among those present at the meeting were President A. J. Earling, who began work for the company 52 years ago as a telegraph operator; John C. Fox, of Janesville, Wis., who operated one of the three

locomotives first operated by the road, now a roundhouse foreman, and J. H. Flynn of Chicago, a conductor, who has been in the service of the road for 52 years.

Association of Passenger Traffic Officers

A special meeting of the American Association of Passenger Traffic Officers is to be held at French Lick Springs, Ind., October 26-27. Several suggested means of economy will be discussed and reports received from committees on printing and distribution of folders, on passenger train service, on economical operation of city ticket offices, and on checking of baggage.

General Baggage Agents' Association

The annual convention of the American Association of General Baggage Agents was held at Kansas City, Mo., on October 13 and 14. The meeting was devoted mainly to a discussion of baggage rules. The question of whether the Western roads should adopt the declaration of value as a protection against unlimited liability under the Cummins amendment was discussed but no action taken. Uniform symbols for recording the

June Mechanical Conventions

A joint meeting of the executive committees of the Master Car Builders' Association, the American Railway Master Mechanics' Association and the Railway Supply Manufacturers' Association will be held at the Hotel Statler, Cleveland, Ohio, Monday, November 15, at 10 a.m. The object of the meeting will be to decide upon the dates for the June conventions, as well as the place of the meetings, and also to discuss other details of the joint work of these three associations. It is planned also to hold separate meetings of the executive committees of each one of the associations after the joint meeting. The meeting is being held at Cleveland because of the illness of President MacBain, of the Master Car Builders' Association, who expects, however, to be sufficiently recovered by November 15 to participate.

Operating Revenues and Expenses of Express Companies for June, 1915

The following statement, which is subject to revision, has been compiled by the Interstate Commerce Commission from the monthly reports of operating revenues and expenses of the principal express companies for June, 1915:

A—FOR THE MONTH OF JUNE												
Item	Adams Express Co.		American Express Co.		Canadian Express Co.		Globe Express Co.*		Great Northern Express Co.		Total for All Companies Named†	
	1915	1914	1915	1914	1915	1914	1915	1914	1915	1914	1915	1914

* Discontinued operations April 30, 1915.

† Figures for 1914 include returns of United States Express Co., which ceased operations as of June 30, 1914.

description of and damage to baggage were adopted for the entire country. It was decided to appoint five standing committees to consider the subjects of standard baggage rules, arbitration, baggage checks; standard forms for office methods and accounting, and telegraph code to which matters pertaining to these subjects will be referred for report. The following officers were elected: President, John F. Dugan, general baggage agent, Baltimore & Ohio, Baltimore, Md.; secretary-treasurer, J. E. Quick, general baggage agent, Grand Trunk, Toronto, Ont. It was decided to hold the next annual meeting at Boston, Mass., on June 21, 1916.

American Association of Railway Surgeons

The twelfth annual meeting of the American Association of Railway Surgeons was held at the Hotel Sherman, Chicago, on October 13, 14 and 15. President George F. Beasley, surgeon of the Chicago, Indianapolis & Louisville and the Cleveland, Cincinnati, Chicago & St. Louis, at Lafayette, Ind., presided. In addition to a large number of papers and discussions on technical medical and surgical subjects, one session of the meeting was devoted to papers and discussions on "The Railway Surgeon and His Work," which included the following papers: "The Local

Surgeon and His Duties," by G. W. Pirtle, surgeon, Chicago & Eastern Illinois, Carlisle, Ind.; "Some Vexations of the Railway Surgeon," by E. T. Easley, surgeon of the Chicago, Indianapolis & Louisville at New Albany, Ind.; "Accidents and How to Prevent Them," by B. M. Hart, surgeon of the Chicago & North Western at Blunt, S. D.; "Railway Accidents in the Country and Care of the Injured," by W. J. Ragan, surgeon of the Chicago & North Western at Shawano, Wis., and "A Plea for Scientific First Aid," by John S. McAtee, surgeon of the Illinois Central at Council Bluffs, Iowa.

The following were elected officers for the ensuing year: F. T. Fort, surgeon Illinois Central, Louisville, Ky.; vice-presidents, J. M. Dodd, Minneapolis, St. Paul & Sault Ste. Marie, Ashland, Wis.; E. H. Griswold, Wabash, Peru, Ind.; C. P. Frantz, Chicago, Burlington & Quincy, Burlington, Iowa; treasurer, H. B. Jennings, Chicago, Rock Island & Pacific, Council Bluffs, Iowa; secretary-editor, Louis J. Mitchell, Chicago, Milwaukee & St. Paul, Chicago, Ill.

Association of Railway Electrical Engineers

The eighth annual convention of the Association of Railway Electrical Engineers was held at the La Salle Hotel, Chicago, October 19, 20, 21 and 22, H. C. Meloy, New York Central (West), presiding. The following is a list of the exhibitors at the Convention:

Adams & Westlake Company, Chicago—Straight and drop handle car brake, roundhouse headlight and lighting fixtures. Represented by W. J. Pierson, A. S. Anderson, G. L. Walters and J. F. Stender.

American Pulley Company, Philadelphia, Pa.—Axle pulleys. Represented by C. P. Englehart and J. F. Forrest.

Albert & J. M. Anderson Manufacturing Company, Boston, Mass.—Plugs and receptacles. Represented by W. W. Hincher.

Benjamin Electric Manufacturing Company, Chicago—Reflectors and lighting fixtures. Represented by H. E. Watson, J. B. Weher and A. Aelueck.

Central Electric Company, Chicago—Okonite wires and cables, Ralco receptacles and plugs, Maxolite reflectors, fans and other car lighting fixtures. Represented by J. M. Lorenz, L. G. Martin, D. Woodhead, E. C. Wilson, R. N. Baker and A. L. McNeil.

Consolidated Railway Electric Lighting & Equipment Company, New York—Regulator panels and dynamo.

Crouse-Hinds Company, Syracuse, N. Y.—Condolets, panel boards and roundhouse headlights. Represented by F. J. Hills, C. H. Bissell, E. G. Smith, M. J. Kiefer, F. F. Skell, Walter Fagan, C. Dubsky, E. C. Otto and C. N. Crowfoot.

Cutter Company, George, South Bend, Ind.—Switchboards and lighting fixtures. Represented by O. B. Duncan and F. L. Curl.

Darling-Henric Manufacturing Company, New York—Locomotive headlights. Represented by L. A. Darling and M. S. Jordan.

Edison Storage Battery Company, Orange, N. J.—Storage batteries. Represented by H. G. Thompson, W. F. Bauer, E. V. McGinness and C. A. Luckey.

Electric Storage Battery Company, Philadelphia, Pa.—E S B axle lighting outfit and panel switchboards. Represented by G. H. Atkin, J. Lester Woodbridge, H. M. Beck, H. E. Hunt and O. R. Shortall.

General Electric Company, Schenectady, N. Y.—Lighting cable, testing instruments and arc-welding sets. Represented by B. F. Bilsland, R. H. Parker, S. W. McCune, Jr., J. Scribner and C. C. Bailey.

Gould Coupler Company, New York—Regulating panel, generator and lead battery accessories. Represented by G. R. Berger and J. W. Jepson.

Harter Manufacturing Company, Chicago—Lighting fixtures. Represented by G. A. Harter, W. M. Soffe and D. E. Warrel.

Hart & Hegeman Manufacturing Company, Hartford, Conn.—Paiste switches and taplets. Represented by H. L. Everest, Jr., W. W. Winslip and F. C. Church.

Kerite Insulated Wire & Cable Company, New York—Wire and cables. Represented by B. L. Winchell, Jr., W. N. Feuley and J. A. Hamilton.

Krantz Mfg. Company, Brooklyn, N. Y.—Lighting and control panels with safety switches and automatic emergency relay switch. Represented by I. A. Bennett.

National Lamp Works of General Electric Company, Cleveland, Ohio.—Mazda lamps. Represented by A. M. Klingman and L. C. Kent.

National Metal Molding Company, Pittsburgh, Pa.—Metal molding, Sherardized conduit, Flex-steel conduit, outlet boxes and a complete line of fittings for these devices. Represented by H. C. Moran and J. A. Bennett.

Oneida Steel Pulley Company, Oneida, N. Y.—Corrugated bushing axle pulley. Represented by N. G. Stark.

Pyle National Electric Headlight Company, Chicago—Arc and incandescent headlights. Represented by W. Miller, Crawford P. McGinness, J. Will Johnson, and W. T. Bretherton.

Safety Car Heating & Lighting Company, New York—Underframe axle equipment, regulating devices and car lighting fixtures. Represented by C. A. Pinyard, A. C. Moore, H. E. Hulse, J. H. Rodger and W. I. Thompson.

Sangamo Electric Company, Springfield, Ill.—Recording amper hour meters and circuit breakers. Represented by C. H. Koehler, M. B. Southwick, J. T. Hartley and T. M. Torzillo.

Schroeder Headlight Company, Evansville, Ind.—Sunbeam headlights, 32-volt and 6-volt incandescent generators. Represented by J. Henry Schroeder and E. H. Wetzner.

Standard Underground Cable Company, Pittsburgh, Pa.—Cable and fittings. Represented by E. J. Pietzcker, W. M. Rogers, Elbert J. Norton and H. K. Weld.

United States Light & Heating Corporation, New York. Car lighting generators, panels, batteries and various parts of lighting apparatus. Represented by C. C. Bradford, R. C. Haley, John Roddell, H. A. Mathews, R. E. Stuntz and O. A. Schlesinger.

Western Electric Company, New York—Loud speaking telephone receiver, lamps and portable telephones. Represented by J. C. Benning and George H. Porter.

Westinghouse Lamp Company, New York—Mazda locomotive headlight lamps. Represented by W. H. Rolandson, A. N. Brown and J. G. Harvey.

Willard Storage Battery Company, Cleveland, Ohio.—No-wash type train lighting batteries and accessories. Represented by L. Sears, W. E. Ballantine, R. M. Newbold and E. L. Myers.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, date of next or regular meetings, and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

- AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York. Next meeting, October 26-27, 1915, French Lick Springs Hotel, French Lick Springs, Ind.
- AMERICAN RAILWAY ASSOCIATION.—W. F. Allen, 75 Church St., New York. Next meeting, November 17, 1915, Chicago.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.
- AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York. Annual meeting, December 7-10, 1915, New York.
- ASSOCIATION OF RAILWAY ELECTRIC ENGINEERS.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Annual meeting, October 18-24, 1915, Chicago.
- ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—G. P. Conard, 75 Church St., New York. Next meeting, December 14-15, 1915, St. Louis, Mo.
- BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meetings with American Railway Bridge and Building Association.
- CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.
- CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.
- CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.
- ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.
- GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.
- MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—T. I. Goodwin, C. R. I. & P., Eldon, Mo. Next meeting, October 19-21, 1915, St. Louis, Mo.
- NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.
- NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.
- NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—E. N. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.
- PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.
- RAILROAD CLUB OF KANSAS CITY.—Claude Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Saturday in month, Kansas City.
- RAILROAD MEN'S IMPROVEMENT SOCIETY.—J. B. Curran, Eric R. R., 50 Church St., New York. Meetings, alternate Thursdays, October to May, Assembly Rooms of Trunk Line Association, 143 Liberty St., New York.
- RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 30 Church St., New York. Annual meeting, December, 1915, Waldorf-Astoria Hotel, New York.
- RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.
- RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, 1063 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.
- RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.
- ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.
- SALT LAKE TRANSPORTATION CLUB.—R. E. Rowland, David Keith Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.
- SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Piedmont Hotel, Atlanta.
- TOLEDO TRANSPORTATION CLUB.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boody House, Toledo.
- TRAFFIC CLUB OF NEWARK.—John J. Kautzmann, P. O. Box 238, Newark, N. J. Regular meetings, 1st Monday in month, except July and August, The Washington, 559 Broad St., Newark.
- TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.
- TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Waldorf-Astoria Hotel, New York.
- TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Gen'l Agt., Eric R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings bi-monthly, Pittsburgh.
- TRAFFIC CLUB OF ST. LOUIS.—A. F. Versen, Mercantile Library Bldg., St. Louis, Mo. Annual meeting in November. Noonday meetings October to May.
- TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, Superintendent's office, N. Y. C. R. R., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.
- WESTERN CANADA RAILWAY CLUB.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.
- WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Building, Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.
- WESTERN SOCIETY OF ENGINEERS.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings. Annual meeting, 1st Wednesday after 1st Thursday in January, Chicago.
- UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, 1111 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF AUGUST, 1915

Main data table with columns: Name of Road, Average mileage operated during period, Operating revenues (Freight, Passenger, Total), Operating expenses (Traffic, Trans-shipment, Miscellane-ous, General, Total), Net from railway operation, Railway tax accruals, Operating income (or loss), Increase (or decrease) comp. with last year.

TWO MONTHS OF FISCAL YEAR, ENDING JUNE 30, 1916.

Summary table with columns: Name of road, Average mileage operated during period, Operating revenues (Freight, Passenger, Total), Operating expenses (Traffic, Trans-shipment, Miscellane-ous, General, Total), Net from railway operation, Railway tax accruals, Operating income (or loss), Increase (or decrease) comp. with last year.

Traffic News

The New York state canals are to be closed at midnight, November 30, unless sooner closed by ice.

The ocean-going ferry, Henry M. Flagler, carrying freight cars between Key West and Havana, is being worked to its full capacity and officers of the Florida East Coast say that the facilities will soon be increased by the addition of another boat. It is proposed to build a vessel with a capacity of 38 cars. The Henry M. Flagler carries 28 cars.

The Chicago, Milwaukee & St. Paul Railway has issued a booklet, entitled "New Towns and Business Opportunities," containing a list of the industrial, business and professional openings existing in the towns and cities along the St. Paul's line, together with valuable information concerning the population and the existing state of business development.

The annual meeting of the National Industrial Traffic League will be held at the Congress Hotel, Chicago, on November 17 and 18. The annual dinner is to be held on the evening of Wednesday, November 17. The speakers will be George T. Buckingham, president, Chicago branch, National Security League, and E. J. McVann, manager traffic bureau, Commercial Club of Omaha, Neb.

According to the Canal Record, on October 5, there were 83 vessels tied up in the Panama Canal on account of the slides at Culebra, awaiting passage. Of these 45 were on the Atlantic side with an aggregate of approximately 167,000 tons of cargo, and 38 were on the Pacific side with approximately 189,000 tons of cargo. A number of boats which had intended passing through the canal are taking their cargoes around via the Straights of Magellan.

The railroads terminating at Hampton Roads, Virginia,—the Norfolk & Western, the Chesapeake & Ohio and the Virginian—announce that after January 1, 1916, the freight rates on coal from the mines to tide water, when intended for use as fuel on vessels, will be advanced from \$1.40 a ton to \$1.50. The lower rate is that on export coal and the advance is in accordance with the Interstate Commerce Commission's ruling that coal to be used on the vessels must not be treated as export freight.

The results of the diversified farming campaign conducted by the St. Louis, Iron Mountain & Southern are now becoming manifest. Already this season 41 cars of wheat have been received from stations on the Arkansas, Memphis and Valley divisions which heretofore have shipped no wheat and where many thought it could not be successfully grown. In all about 225 cars of the grain have been shipped from the cotton territory of Arkansas, and millers pronounce it the equal of any for commercial milling. Four parishes alone along the Iron Mountain, in Northeast Louisiana, raised over 1,500,000 bushels of oats this year, and the farmers had little difficulty in selling their entire surplus for an average of about 42 cents a bushel. Twenty-seven cars of corn have been received from stations on the Arkansas, Louisiana and Valley divisions, which last year supplied only two cars. The United States Department of Agriculture estimates that the 1915 corn crop in Arkansas and Louisiana will be about 36,000,000 bushels in excess of that produced in 1914. D. C. Welty, commissioner of agriculture, has posted in waiting rooms a large placard on marketing corn. It gives valuable information as to gathering the grain, storing it on the farm, fumigating it for weevils, preparing it for market and grading it.

The Florida State Board of Health is having built, by the Pullman Company, three cars to be used for a traveling exhibition of the board throughout the state. Two of the cars will be used for models, photographs, exhibits, apparatus, moving picture outfit and everything connected with this line of work. It is the plan of the board to equip these cars, using the third for living purposes, and to traverse the state, giving exhibitions of first-aid to injured, prevention of disease, clean living methods, and everything pertaining to health operations for the benefit of the young.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

Rates on Salt from St. Clair, Mich.

Diamond Crystal Salt Company v. Michigan Central, et al. Opinion by Commissioner McChord.

The commission holds that a through rate of 67.4 cents per 100 lb. on salt in car loads from St. Clair, Mich., to California terminals is not unreasonable or discriminatory and dismisses the complaint. (36 I. C. C., 172.)

Switching Charges at South Omaha, Neb.

Opinion by Commissioner Daniels.

The commission finds that the railroad operated by the Union Stock Yards Company of Omaha, Neb., between the transfer tracks of the carriers and certain industries, etc., has justified an increase from \$1 to \$6 for switching livestock between connecting lines and private chutes of packing houses and an increase from \$2 to \$3 for switching dead freight between connecting lines and other departments of the stockyards company and for switching dead freight as an intermediate carrier between the connecting lines. A proposed increase from \$2 to \$3 for switching dead freight to non-proprietary interests on respondent's line.

Figures were offered to show that the carrier was not earning sufficient return on its investment, but these were not sufficiently accurate and the commission held that even in case the earnings on the railroad property were shown to afford an inadequate return on the investment, the question would arise whether the increase should be sought mainly from dead freight in which the respondent is interested only as a carrier or from livestock in which the respondent is interested not only as a carrier but as the proprietor of a stockyard. (36 I. C. C., 198.)

The Extension of Credit to Consignees

American Coal & Coke Company v. Michigan Central. Opinion by Commissioner Clements.

The complainant, a coal company in Detroit, alleges that it is discriminated against by the action of the carrier in refusing to extend credit to it for freight and demurrage charges on coal in carloads consigned to it at Detroit, while extending such credit to its competitors. The situation was somewhat complicated by the refusal of a number of dealers, including the complainant, to pay demurrage charges on coal consigned to Detroit and held at Windsor, Ont. The complainant, however, had also been delinquent in its payments on other charges than the demurrage in question and suit had been brought against it by the carrier, although no suits had been brought against other dealers who had refused to pay demurrage. The commission holds as follows: The complainant appears to have refused to pay any demurrage charges, whenever and however accruing. This put complainant in a different attitude from that of other patrons and left the defendant no other reasonable alternative but to demand payment of its lawful charges before delivery of the freight. The fact that suit was commenced against the complainant and not against its competitors, does not prove undue prejudice within the meaning of the act. The obligation, under penalties of the law, is upon the defendant to collect its established charges from all by such lawful methods as may be suitable and necessary for the purpose. (36 I. C. C., 195.)

Lateral Allowances on Shipments of Anthracite Coal

In re allowances on anthracite coal at Hauto and Nesquehoning, Pa. Opinion by Commissioner McChord.

The commission in this case orders the Central of New Jersey to cancel tariffs in issue proposing to pay to the Lehigh Coal & Navigation Company certain lateral allowances out of the rates on shipments of anthracite coal from Hauto and Nesquehoning, Pa. These allowances were considered in *Rates for transportation of anthracite coal* (35 I. C. C., 220), reported

in the *Railway Age Gazette* of August 20, 1915, page 314. The Lehigh Coal & Navigation Company leases to the Central of New Jersey the lines of the Lehigh & Susquehanna Railway, for which the New Jersey Central has paid upwards of 10 per cent yearly. The Central of New Jersey in addition has transported coal for the coal company at reductions of from 11 to 23 cents below tariff rates. These so-called lateral allowances result from the tenth covenant of the lease, in which it is provided that on coal delivered by the Navigation company on sidings at the northern end of the Nesquehoning tunnel the rates should not exceed the rates from Penn Haven. The carrier, however, has published in tariff form a higher basis of rates on this traffic and at the close of the month has paid back the allowances mentioned. In the anthracite case the commission held that "the payment of the allowances is an unlawful discrimination against competing shippers, who are charged the full tariff rates," and that "even if the amounts of these allowances were published, their payment is the payment of a rebate, and hence unlawful. But, since these allowances were not published, their payment is also clearly unlawful as being a departure from the published tariffs." These findings are now reaffirmed. (36 I. C. C., 166.)

Loss and Damage Claims on Eggs Delivered at New York City Piers

New York Mercantile Exchange, et al v. Baltimore & Ohio et al. Opinion by Commissioner Daniels.

Complaint is made against the reasonableness of the carriers' rules relating to the delivery of eggs in the metropolitan district of New York. The rules of the Baltimore & Ohio are typical and are as follows:

Where cases of eggs are received at shipping point and receipted for on other than order bills of lading as in apparent good order (contents and condition of contents of package unknown) and arrive at destination in the same apparent good condition and show no external evidence of damage, no inspection of the contents of such cases will be permitted before delivery thereof to the consignee, and the consignee will be required to accept and receipt for same subject to the same conditions under which the shipment was received for transportation, viz., as in apparent good order (contents and condition of contents of packages unknown).

Where cases show external evidence of damage, consignee shall have the privilege of inspecting the contents of such damaged cases, such inspection to be made jointly with carrier's representative and receipt taken in accordance with the actual ascertained condition of the property.

These rules were put in force largely as a result of abuse in the matter of loss and damage claims whereby some of the carriers were obliged to pay as much as from 20 to 60 per cent of their total revenue on this traffic in claims.

The commission holds: The rule in vogue delimits investigation at docks, piers and stations to cases showing external evidence of damage. The demand for investigation at docks, piers and stations of all cases is precluded by considerations of time, space and cost. The rule simply requires of consignees that where external evidence of damage is absent they receipt for the cases in the same terms as the carrier receipted for the cases when offered for shipment, and can not be said to be unjust or unreasonable.

The enforcement of the rules in issue is cared for by the inspection bureau of the Trunk Line Association. The commission finds no reason why the carriers at a common terminal may not intrust to a joint agent work allotted elsewhere to a carriers' immediate employees. (36 I. C. C., 156.)

STATE COMMISSIONS

The Texas Railroad Commission has issued a notice that it will hear arguments in the advance rate case on October 26.

Wells, Fargo & Co. have filed with the Railroad Commission of California a petition for a rehearing to set aside the order of the commission of September 10, denying its application to increase its rates in California for transportation of merchandise.

The Illinois Public Utilities Commission has announced a series of hearings on the tariffs filed by the railroads, advancing freight rates in the state five per cent, to correspond with the advances allowed by the Interstate Commerce Commission last December. The tariffs have been suspended several times by the state commissions. The first hearing will be held on November 9, and four days will be devoted to a general presentation of the case, including financial and accounting matters. Other days

will be devoted to evidence on specific commodities, the hearings to be concluded on January 13.

The California Railroad Commission has issued a circular to shippers, stating that during the next few months a great number of cars will be required to handle California traffic, and that transportation lines fear that the extremely heavy east-bound carload business to be handled will materially affect the number of cars which will be available for local traffic. The commission therefore urges that all shippers and receivers of freight in carload lots use every effort to load and unload cars in the shortest time possible, and wherever practicable to load cars to their full capacity, thereby reducing the number of cars required.

COURT NEWS

The California Supreme Court holds that a railroad employee who was killed while in a roundhouse repairing a switching engine which had been withdrawn from service in the operating department three days before the accident, and was not returned to service until three days afterwards, and which was one of many such engines used both for intrastate and interstate commerce, was engaged in interstate commerce within the act, and therefore the case was not within the jurisdiction of the state accident board.—*Southern Pacific v. Pillsbury* (Cal.), 151 Pac. 277.

Flooding Land—"Unprecedented Flood"

The Alabama Supreme Court holds that a railroad company, constructing and maintaining an embankment with a culvert of sufficient size to carry off the water from ordinary rainfall, is not liable for overflowing the land of another because of the insufficiency of the culvert to carry off water caused by an "unprecedented flood," which may be defined as such an unusual and extraordinary rainfall as has no example or parallel in the history of rainfall in the vicinity affected, or as affords no reasonable warning or expectation that it will likely occur again.—*Nashville, C. & St. L. v. Yarbrough* (Ala.), 69 So. 582.

Proportional Rates

The Circuit Court of Appeals for the Fourth circuit holds that a joint proportional rate of 97 cents on coal from the Kanawha district in West Virginia to Toledo, the coal being for lake shipment beyond, does not apply to coal which though originally intended for lake shipment, was sold and delivered at Toledo as bunker coal. The shipper was bound to pay the lawful rate then in force on coal consigned to Toledo, \$1.68, and the railroad had no option except to collect it. The reasonableness of that rate was a question for the commission, not for the courts.—*Hoeking Valley v. Lackawanna Coal & Lumber Co.*, C. C. A., 224 Fed. 930.

Preferential Rates—Unfavorable Locality—Switching Service—Terminal Facilities

The Louisiana Supreme Court holds that there is no rule of reason or of law which imposes on a railroad the burden of compensating, by preferential rates, the disadvantage resulting from unfavorable location under which either a community or a particular shipper may labor. An order of the Railroad Commission which throws on one railroad, out of several, the entire burden of putting an unfavorably situated place on a parity, as to freight rates, with a place that is favorably situated; which declares certain handling of freight cars between different stations, which is necessary to the delivery of the freight at its destination, to be "switch movements," and fixes a flat rate therefor, which is below the cost of the movement, the court holds to be unreasonable and properly annulled. Where freight is received for transportation, and delivered by the same carrier, or by a connecting carrier, who is a party to a through contract, the charge for transportation and delivery is largely regulated by the character of the commodity, and as some classes of goods are more valuable and some involve greater expense than others, the charge is determined accordingly, and includes the entire service. But there is no rational theory upon which

one of the carriers, in any such case, can be entitled to the highest rate and another be required to accept the lowest.

Switching service, as between railroad companies, is usually reciprocal, and it is inconceivable that when a particular company has hauled a carload of high class freight to the end of its road, it should have the right to require a connecting company to continue the haul and deliver the car at its ultimate destination as a switch movement, at a fixed price, without regard to the character of the contents of the car; and especially is that true where there is no possibility of its rendering a reciprocal service to such connecting carrier.

It is also held that it is unreasonable to suppose that a railroad company can afford to acquire extensive terminal facilities, build, maintain and operate a drawbridge, at an original cost of \$276,662 and an annual expense exceeding \$2,000, and charge no more for the use of such facilities, in the hauling, unloading and handling of cars, than for ordinary switching operations upon a track costing \$11,000 a mile.—Vicksburg, S. & P. v. Railroad Commission, La., 69 So. 161.

Where Shipper Accompanies Cattle

Shippers agreed to load, transship and unload horses at their own risk, and during the transportation thereof to unload them whenever necessary, and one of the shippers accompanied them to take care of them. The New York Appellate Division holds that the carrier was not liable under the rest, food and water act for injuries caused by confinement for more than 36 hours, whether or not it had any sufficient excuse to offer to the federal authorities, especially where the shipper accompanying the horses never requested or desired that they be unloaded.

Where the car was equipped with ventilators and windows, it was the duty of the shipper accompanying the horses to open the ventilators, or cause the carrier to do so, and where he made no effort in that direction the carrier could not be held liable for injuries to the horses from lack of ventilation.—Haner v. Fargo, 151 N. Y. Supp., 913.

Extra Fares—Interference by Courts

New York law provides for the filing of tariffs, together with regulations determining the aggregate of rates in each particular case. Section 49 confers upon the commission a supervisory control, and whenever it deems tariffs or regulations unreasonable, it may determine the just and reasonable rates. An interurban electric railway filed a schedule providing for an extra charge to the passenger of 10 cents where he had not purchased a ticket. The plaintiff was ejected from defendant's car for refusal to pay the extra charge, and brought action on the ground that, the regulation being unreasonable, he was justified in refusing to pay. The New York Appellate Division holds that he had no standing to bring the action, the attack being on the rule itself, and not on the manner of its enforcement, and the reasonableness thereof being for the initial determination of the Public Service Commission, and not for the court.—Metzger v. New York State Rys., 154 N. Y. Supp. 789.

"Location" of Farm Crossing

An owner of land crossed by a railroad conveyed land to the company needed in making changes in the railroad, the deed providing that the company at some convenient place should construct an overhead crossing for the landowner, the location to be selected by the latter. The landowner designated a site, on which the company built a bridge at right angles to the track. The landowner claimed that the bridge was useless to him unless built diagonally across the track. There was evidence that it was the uniform method to construct such bridges at right angles to the road, so as to prevent obstructing the view of the enginemen and weakening the bridge, and that, if the bridge had been built diagonally, the approaches would have encroached on the land of another owner. The Kentucky Court of Appeals held that the bridge as constructed was a substantial compliance with the contract, as to "locate" a thing means to place it and not to design or construct it, and neither party could be allowed to arbitrarily exercise his right under the contract to the manifest injury or detriment of the other party.—Chesapeake & Ohio, Ky., 176 S. W. 22.

Railway Officers

Executive, Financial, Legal and Accounting

Z. G. Hopkins has been appointed special representative in charge of publicity for the Missouri, Kansas & Texas, with office at St. Louis, Mo., effective October 12.

Robert J. Mills, assistant to the president of the Streets Company, of Chicago, has resigned, and his duties have been taken over by W. L. Marston, vice-president and treasurer.

W. A. McDowell, secretary and general manager of the Lexington & Eastern, has been appointed general agent of the executive department of the Louisville & Nashville, with headquarters at Lexington, Ky.

Operating

W. McAuley, general yardmaster of the Winnipeg Joint Terminals, at Winnipeg, Man., has been appointed trainmaster, vice H. J. Hunt, promoted.

David J. Hagerty, trainmaster of the Northern Pacific at Missoula, Mont., has resigned to enter the traffic department of the Canadian Pacific at Saskatoon, Saskatchewan.

F. E. Harvey has been appointed assistant trainmaster of the Beech Creek sub-division of the New York Central Pennsylvania division, with headquarters at Jersey Shore, Pa., vice G. W. Bullock.

W. E. Bell has been appointed acting chief assistant to manager of telegraphs of the Grand Trunk and the Grand Trunk Pacific with headquarters at Montreal, Que., during absence on leave of A. P. Linnell.

J. C. Sesser, division superintendent of the Great Northern at Whitefish, Mont., has been transferred to Superior, Wis. J. J. Dowling, superintendent of safety, with headquarters at St. Paul, Minn., has been appointed to succeed Mr. Sesser.

H. C. Grout, general superintendent of the Atlantic division of the Canadian Pacific, at St. John, N. B., having been given leave of absence, A. C. Mackenzie, engineer maintenance of way, at Montreal, Que., has been appointed acting general superintendent, Atlantic division.

G. Collins, superintendent of the Canadian Northern at Trenton, Ont., has been appointed superintendent of branch lines, Toronto district, with jurisdiction over Picton, Maynooth, Tweed, Irondale and Kingston subdivisions with headquarters at Trenton, Ont., and P. H. Fox, chief dispatcher at Trenton, Ont., has been appointed chief dispatcher of the Toronto district with office at Rosedale, Toronto.

W. R. Kelly, assistant superintendent of the Canadian Northern at Trenton, Ont., has been appointed superintendent of the Lake Superior district, with office at Capreol, Ont., and the jurisdiction of this superintendency is extended over the Nipigon subdivision to Current. W. J. Curle, superintendent at Toronto, has been transferred to the Toronto district as assistant superintendent, with office at Toronto, and R. J. Kelly has been appointed trainmaster of the Lake Superior district, with office at Hornepayne, vice A. J. Gayfer, transferred.

C. M. Dukes, general chairman of the Brotherhood of Railway Trainmen, has been appointed assistant to the general manager of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, Ill. He was born at Marion, Iowa, on November 17, 1868, and following a common school education entered the service of the St. Paul as a freight brakeman, in 1890. He was promoted to yardmaster of the same road, at Cedar Rapids, Iowa, and later became a freight conductor. In 1902, he was elected general chairman of the Brotherhood of Railway Trainmen, with headquarters in Milwaukee, Wis. He remained in this position until his recent appointment on October 15.

J. F. Murphy, general superintendent of the Missouri Pacific-St. Louis, Iron Mountain & Southern with headquarters at St. Louis, Mo., has been appointed general manager to succeed J. W. Higgins, resigned, to become chairman of the General Managers' Association of Chicago. John Cannon, superintendent of

the Eastern division, with headquarters at Jefferson City, Mo., has been appointed general superintendent of the Eastern district, vice J. F. Murphy. W. E. Brooks, superintendent of the Illinois division at Illmo, Mo., has been appointed superintendent of the Eastern division to succeed Mr. Cannon. H. H. Berry, trainmaster, has been promoted to the position vacated by Mr. Brooks. Effective November 1.

Traffic

Clarence E. Becker has been appointed district freight agent of the Canadian Pacific, with headquarters at Omaha, Neb.

J. D. Clardy has been appointed commercial agent of the Missouri, Oklahoma & Gulf, with headquarters at Ft. Worth, Tex., vice J. S. Smith, resigned.

H. G. Dowling has been appointed commercial agent of the Atlanta, Birmingham & Atlantic, with office at Waycross, Ga., vice O. M. Williams, resigned.

H. A. Johnson, general freight and passenger agent of the Colorado & Southern, with headquarters at Denver, Col., has been promoted to traffic manager.

P. D. Freer has been appointed division freight agent of the Cincinnati, Hamilton & Dayton and the Baltimore & Ohio Southwestern, at Chillicothe, Ohio, vice N. G. Spangler, resigned. H. E. Warburton has been appointed division freight agent of the Cincinnati, Hamilton & Dayton at Dayton, Ohio, vice P. D. Freer, promoted. Effective October 15.

Engineering and Rolling Stock

Victor R. Walling, first assistant engineer of the Chicago & Western Indiana, has been appointed principal assistant engineer, in charge of construction and maintenance, with office at

Chicago. Mr. Walling graduated from Kansas University in 1901, receiving the degree of Bachelor of Science, and in 1911 received the honorary degree of C. E. from the same school. From June, 1901, to December, 1901, he was with the Greene Cananea Copper Company as draftsman and transitman; in 1902 he was with the Southern Pacific on preliminary surveys and location, leaving to return to the Greene Cananea Copper Company, with which he remained until June, 1912, when he entered the service of the Chicago & Western Indiana. While with the Greene

Cananea Copper Company he held the positions of assistant engineer, first assistant engineer and superintendent in charge of railroad, mill and smelter construction and of superintendent in charge of maintenance and operation of the railroad. Since he has been with the Western Indiana he has had charge of the construction of clearing yard and shops, the track elevation on the Belt Railway between Belt Junction and the Pan Handle crossing along Seventy-fifth street and of the present track elevation work south of Seventy-first street on the Western Indiana main line, involving the elevation of over 40 miles of tracks.

J. Graham, assistant roadmaster of the Canadian Pacific, with headquarters at North Bend, B. C., has been appointed roadmaster, with office at Nelson, B. C.

C. R. Hening, roundhouse foreman of the Michigan Central at Kensington, Ill., has been appointed general foreman of the machine shop at Michigan City, Ind.

H. P. Thomas has been appointed supervisor of Division

No. 20 of the Pennsylvania Railroad, with office at Hollidaysburg, Pa., vice W. E. Brown, promoted.

W. E. Guignon, division engineer of the Pennsylvania Lines West at Zanesville, Ohio, has been transferred to Logansport, Ind., vice A. C. Watson, transferred to Cleveland, Ohio.

C. T. Delanere, acting engineer of construction of the Canadian Pacific, at Montreal, Que., has been appointed acting engineer maintenance of way, Eastern Lines, vice A. C. Mackenzie appointed acting general superintendent, Atlantic division.

E. Eley, division car foreman of the Canadian Pacific at North Bay, Ont., has been appointed master car builder, eastern lines, with office at Montreal, Que., vice F. B. Zercher, and Gordon Sproule has been appointed acting engineer of tests, with office at Montreal, vice E. B. Tilt, resigned.

W. C. Moore, master mechanic of the Ottawa division of the Canadian Northern at Trenton, Ont., has been appointed master mechanic of the Toronto district, with headquarters at Trenton, Ont. J. H. McAlpine, locomotive foreman at Winnipeg, Man., has been appointed master mechanic, Lake Superior district, with office at Parry Sound, Ont.

Samuel G. Thomson, superintendent of motive power and rolling equipment of the Philadelphia & Reading at Reading Pa., having resigned, Irwin A. Seiders, fuel inspector at Reading, has been appointed superintendent of motive power and rolling equipment, and Clyde C. Elmes, assistant engineer of motive power, at Reading, has been appointed assistant superintendent of motive power and rolling equipment.

Curtis C. Westfall, whose appointment as engineer of bridges of the Illinois Central has been announced, was born on July 14, 1886, at Bushnell, Ill. He graduated from the University of Illinois in 1907, and in June of the same year entered the employ of the Illinois Central. He remained with this road in the capacities of draftsman and assistant engineer in both the bridge and construction departments until August, 1911. From August, 1911, to January, 1913, he was assistant engineer in connection with the Grand Crossing track elevation work in Chicago, Ill. From January, 1913, to October, 1913, he was chief engineer in charge of the construction of 70 miles of railroad in North Dakota. From November, 1913, to October, 1915, he was assistant engineer in the bridge department of the Illinois Central.

G. P. MacLaren has been appointed division engineer of the Toronto district of the Canadian Northern, with office at Rosedale, Toronto, Ont.; A. J. Gayfer has been appointed division engineer of the Lake Superior district with office at Capreol, Ont.; J. D. Evans, division engineer at Trenton, Ont., has been appointed supervisor of bridges and buildings, with office at Trenton; F. McKay, supervisor of bridges and buildings at Toronto, has been appointed supervisor of bridges and buildings, with office at Capreol, Ont.; E. Myers, roadmaster at Trenton, Ont., has been appointed supervisor of track, with office at Rosedale, Toronto, Ont.; W. M. Jacklin, inspector of tracklaying on construction at Port Arthur, Ont., has been appointed supervisor of roadway, with office at Hornepayne, Ont.; J. MacDonald, supervisor of track, Central Ontario and Quinte districts, at Trenton, Ont., has been appointed supervisor of track with jurisdiction over Maynooth, Picton, Irondale and Tweed subdivisions, Toronto district, with office at Trenton; J. R. Audet has been appointed supervisor of roadway, Capreol to Oba, Lake Superior district, with office at Capreol, Ont., and E. Haystead, supervisor of track at Parry Sound, Ont., has been appointed supervisor of track, with office at Capreol.

OBITUARY

William Byrd King, vice-president and general manager of the Ft. Worth Belt until his resignation on account of ill health about a year ago, died in Ft. Worth, Tex., on October 11. He was born in Orange county, Va., on December 29, 1850, and entered railway service in 1869. Among the noteworthy positions he held were chief engineer of the Ft. Worth & Denver City, from 1889 to 1891; chief engineer, vice president and general manager of the Ft. Worth & Rio Grande, from 1891 to 1902; general manager of the stock yards at Ft. Worth, and his last office, with the Ft. Worth Belt, mentioned above.

V. R. Walling

John W. Logsdon, formerly superintendent of the Louisville & Nashville, died on October 8, at Pensacola, Fla., at the age of 59. Mr. Logsdon's entire railway service had been with the Louisville & Nashville. He began railway work in 1876 as agent's sistant agent, operator, agent, master of trains, general agent, clerk on that road, and subsequently served consecutively as as-superintendent of the Owensboro & Nashville division, assistant superintendent main stem (Second division) and Nashville & Decatur and Nashville, Florence & Sheffield divisions. From March, 1892, to August, 1900, he was superintendent of the Cumberland Valley division, and then was superintendent of the St. Louis and Henderson divisions, at Evansville, Ind., until December, 1914, when he retired from active duty on account of ill health.

James H. Foulds, Jr., formerly from February, 1910, to January, 1914, auditor of disbursements of the New York Central & Hudson River, died on October 4, at his home in White Plains, N. Y., after a long illness. Mr. Foulds was born at Salmon Falls, N. H., on September 26, 1862, and began railway work in the accounting department of the Boston & Albany at Springfield, Mass., in June, 1882. He was transferred to Boston in September, 1889, when the accounting department was moved to that city, and served as a clerk in the auditor's office until February, 1902, when he was transferred to the auditor's office of the New York Central & Hudson River, at New York city. In January, 1906, he was appointed chief clerk of the auditor's office, and on February 1, 1910, was appointed auditor of disbursements, from which position he retired on January 1, 1914, on account of ill health.

Robert H. Hill, formerly from January, 1895, to May, 1906, auditor of the Lake Shore & Michigan Southern, died on October 14, at West New Brighton, Staten Island, N. Y. He was born on February 25, 1832, at London, England, and began railway work in 1858, as a clerk on the Michigan Southern & Northern Indiana, subsequently merged in the Lake Shore & Michigan Southern. From 1863 to 1864 he was freight agent of the same road at West Detroit, Mich., and then for one year was freight agent at Detroit. He subsequently served for one year as contracting agent at Chicago, and from 1866 to 1869 was chief clerk in the freight department of the same road. In 1869 he was appointed chief clerk of freight accounts of the Lake Shore & Michigan Southern, remaining in that position until 1890, when he was appointed auditor of freight receipts. From June, 1894, to the following January he was acting auditor and then was appointed auditor of the same road, from which position he retired in May, 1906, after a service of 48 years on the Lake Shore & Michigan Southern, now a part of the New York Central.

J. H. Foulds, Jr.

R. H. Hill

Equipment and Supplies

LOCOMOTIVE BUILDING

THE ST. PAUL UNION DEPOT is reported to have ordered 2 switching locomotives.

THE INTERSTATE RAILROAD has ordered 2 locomotives from the Baldwin Locomotive Works.

THE BALTIMORE & OHIO has ordered one Mallet type locomotive from the Baldwin Locomotive Works.

THE RARITAN RIVER has ordered one Consolidation type locomotive from the Baldwin Locomotive Works.

THE CEMENT, TOLENAS & TIDEWATER is in the market for 1 Mikado type locomotive with 20½ by 28 in. cylinders.

THE ARTHUR IRON MINING COMPANY, F. A. Bushnell, purchasing agent, St. Paul, Minn., is in the market for 8 locomotives.

THE CENTRAL OF GEORGIA has ordered 8 Mikado type locomotives and 4 Pacific type locomotives from the Lima Locomotive Corporation.

THE MICHIGAN CENTRAL has ordered 7 Pacific type locomotives from the American Locomotive Company and is inquiring for 6 Mikado type locomotives.

THE ILLINOIS CENTRAL has ordered 47 Mikado type locomotives from the Lima Locomotive Corporation and 3 Santa Fe type locomotives from the American Locomotive Company.

THE LEHIGH VALLEY has ordered 10 Mikado type locomotives from the Baldwin Locomotive Works and has given the latter an order to repair 20 other engines and equip them with superheaters.

THE NEW ORLEANS & NORTH EASTERN has ordered 4 Mikado type locomotives from the Baldwin Locomotive Works to be used on the Vicksburg, Shreveport & Pacific. These locomotives will have 22 by 28 in. cylinders.

THE CHICAGO JUNCTION, reported in the *Railway Age Gazette* of October 8 as having ordered 2 superheater six-wheel switching locomotives from the American Locomotive Company, has increased this order to 3 locomotives.

THE CINCINNATI, INDIANAPOLIS & WESTERN, which was reported in the *Railway Age Gazette* of October 1 as inquiring for prices on 48 locomotives, has issued inquiries for 8 Mikado, 6 Pacific, 15 ten-wheel, 10 Consolidation and 7 six-wheel switching locomotives. This company was at one time a part of the Cincinnati, Hamilton & Dayton and owned that part of its system west of Hamilton, Ohio, including a line from that point to Springfield, Ill., with a branch from Sidell, Ill., to West Liberty, crossing the main line at Hume, and aggregating approximately 361 miles of line. In the latter part of September, 1915, it was bought at a foreclosure sale by the bondholders and has since been operated by them independently of the Cincinnati, Hamilton & Dayton and, hence, of the Baltimore & Ohio. B. A. Worthington is vice-president and general manager and John Simmons, general superintendent, both with offices at Indianapolis, Ind. See also item in *Financial News* under date of September 17, page 548.

CAR BUILDING

THE BALTIMORE & OHIO is inquiring for 500 box car bodies and is also said to be in the market for 1,000 hopper cars.

THE NORFOLK & WESTERN is in the market for 1,000 90-ton gondola cars.

PHELPS, DODGE & Co. have ordered 50 ore cars from the Pressed Steel Car Company.

CINCINNATI, INDIANAPOLIS & WESTERN.—See item above under Locomotive Building.

THE NASHVILLE, CHATTANOOGA & ST. LOUIS is in the market for 1,000 center constructions.

THE MINNEAPOLIS & ST. LOUIS is formally inquiring for 500 40-ton steel underframe box cars.

THE MISSOURI, KANSAS & TEXAS has ordered 200 ballast cars from the Roger Ballast Car Company.

THE CENTRAL OF NEW JERSEY is inquiring for 1,000 steel hopper cars, 1,000 box cars and 250 ice cars.

THE ILLINOIS CENTRAL has ordered 1,000 refrigerator cars from the American Car & Foundry Company.

THE MICHIGAN ALKALI COMPANY, Wyandotte, Mich., has ordered 50 50-ton hopper cars from the Pressed Steel Car Company.

THE CENTRAL OF GEORGIA has ordered 500 freight cars from the American Car & Foundry Company, and 500 box cars from the Pullman Company.

THE BOSTON & MAINE has ordered 6 70-ft. steel coaches and 2 70-ft. steel smoking cars from the Pullman Company and 6 baggage cars from the Laconia Car Company.

THE PHILADELPHIA & READING has ordered 1,000 box cars from the American Car & Foundry Company; 500 gondola cars from the Standard Steel Car Company, and 1,000 hopper cars from the Pressed Steel Car Company.

THE WESTERN MARYLAND, which has been inquiring for 1,000 70-ton steel hopper cars, recently changed its specifications to include the same number of 50-ton hopper cars. It is now further reported to have ordered 2,000 hopper cars from the Pullman Company, but the latter item has not been confirmed.

IRON AND STEEL

THE MISSOURI PACIFIC has ordered 15,000 tons of rails from the Illinois Steel Company.

THE ILLINOIS CENTRAL has ordered 15,000 tons of rails from the Illinois Steel Company.

THE PERE MARQUETTE has ordered 17,000 tons of rails from the Algoma Steel Corporation.

THE SOUTHERN has ordered 2,300 tons of bridge material from the American Bridge Company.

THE LONG ISLAND has ordered 3,500 tons of fabricating materials from the American Bridge Company.

THE NEW YORK CENTRAL is inquiring for 500 tons of steel for a bridge over the Erie barge canal near Rochester, N. Y.

THE CENTRAL OF NEW JERSEY is reported to have ordered 1,500 tons of steel from the American Bridge Company.

THE WABASH has ordered 7,500 tons of rails from the Lackawanna Steel Company and the United States Steel Corporation.

THE GREAT NORTHERN has ordered 15,000 tons of rails from the Illinois Steel Company and 5,000 tons from the Lackawanna Steel Company.

THE BALTIMORE & OHIO CHICAGO TERMINAL has ordered 252 tons of steel from the American Bridge Company for a freight house to be built at Twelfth street, Chicago.

MACHINERY AND TOOLS

THE ARTHUR IRON MINING COMPANY is in the market for 6 steam shovels and 1 locomotive crane.

AMUR RAILWAY, IN SIBERIA, APPROACHING COMPLETION.—The number of railways serving Russia's Pacific ports is increasing. In six months the through traffic on the new Amur Railway will be opened. The most important work still to be done is on the bridges at two points. When the traffic opens from Kuenga, where the line joins the Transbaikalian Railway, there will be a double-track line through all Siberia from the Pacific ports, Vladivostok and Nikolaieffsk. The difficulties overcome in the construction of the Amur Railway resemble those of the Transcaucasian Railway 20 years ago.—*Railway Gazette, London.*

Supply Trade News

The Hilles & Jones Company, Wilmington, Del., has moved its Pittsburgh office to larger quarters in the Oliver building, Room 235.

At the annual meeting of the American Locomotive Company, held in New York on October 19, Vice-President Leigh Best was elected a director to succeed William M. Barnum.

The American Steel Foundries is reported to have closed a contract with the British government for \$20,000,000 worth of war materials, including principally castings for shell work.

Stanley H. Smith has been appointed district sales manager of the Pennsylvania Steel Company and the Maryland Steel Company at Chicago, Ill., to succeed Robert E. Belknap, transferred to New York city.

Robert Allan, representative of the Burd High Compression Ring Company, Rockford, Ill., has been appointed district branch manager for northern California, with offices at 847 Phelan Building, San Francisco, Cal.

The George E. Molleson Company, sales agents for iron and steel products and railway supplies and New York representatives for the Tyler Tube & Pipe Company, Washington, Pa., has moved its offices from 50 Church street to 30 Church street, New York.

Arthur C. Everham, formerly assistant chief engineer of the Kansas City Terminal, is now engineer of construction for the Kansas City Bridge Company. He will have charge of all construction work of the company and will give particular attention to government and railroad construction.

The Chambers Valve Company, New York, announces that it has received orders for Chambers throttle valves to be installed on 45 locomotives for the Chicago & North Western; 33 for the Erie; 13 for the Texas & Pacific; 30 for the Norfolk & Western, and 2 for the Mobile & Ohio.

W. Hoyt Weber & Co., New York, have completed arrangements with the MacDonald Car Buffer, Limited, of Montreal and Pittsburgh, whereby they will represent the latter in the eastern part of the United States. The members of the firm are W. Hoyt Weber and Horatio S. Schroeder. The firm has offices in the Vanderbilt Concourse building.

The committee on arts and sciences of the Franklin Institute at Philadelphia has announced that it will recommend the award of the John Scott Legacy Medal and Premium to Clement F. Street, vice-president of the Locomotive Stoker Company, New York, for the Street locomotive stoker. This appliance has now been installed on over 700 locomotives, more Street stokers being in use than those of any other make.

The International Oxygen Company is erecting an oxygen and hydrogen generating plant at Verona, Pa., in charge of Phillip J. Kroll as branch manager, for the accommodation of its customers in the Pittsburgh district. The new factory will enable the company to make better deliveries in this district than were possible from its plant at Newark, N. J., and it will serve as a demonstrating installation of the I. O. C. system for inspection by officers of other companies who are considering installing generating apparatus in their own plants.

The Canadian Car & Foundry Company has sold to the Royal Securities Company of Montreal \$250,000 preferred stock, \$250,000 common stock and \$1,000,000 6 per cent debenture notes of the Canadian Steel Foundries, which it controls. The money received from the sale of the securities is to be used in financing the large war orders taken by the company. By the sale of the \$250,000 preferred stock the amount of this stock now outstanding is increased to \$7,250,000 out of a total authorized issue of \$7,500,000. The common stock outstanding is increased by the sale to \$1,225,000 out of \$5,000,000 authorized. War orders placed with the Canadian Car & Foundry Company by the Russian Government amount to \$142,000,000, including only business actually signed for.

Owing to the increase in the demand for the Thomas rail anchor tie plate and other track specialties made by the Chicago Malleable Castings Company, West Pullman, Chicago, that company has established a "Thomas specialty department," which will be in charge of J. W. Thomas, W. H. Kofmehl and Fred F. Bennett. Mr. Thomas, the inventor of these specialties, has had 30 years' practical experience with track work on the St. Paul, the Rock Island, the Burlington, the Missouri Pacific, the Santa Fe, the Ft. Worth & Denver City and other railroads. Mr. Kofmehl has been for 25 years roadmaster on the Chicago, Milwaukee & St. Paul. Mr. Bennett has been identified with the railway supply field for many years. At one time he was representative of the *Railroad Gazette* (now the *Railway Age Gazette*) west of Buffalo and Pittsburgh, and later sales agent of the American Steel Castings Company (now the American Steel Foundries).

Negotiations have practically been completed whereby the Pennsylvania Company will transfer to the Bethlehem Steel Corporation its controlling interest in the Pennsylvania Steel Company, all that is now needed being the assent of the Reading interests. On January 1, 1915, the Pennsylvania Steel Company's outstanding stock consisted of \$20,560,800 preferred and \$10,750,000 common, of which the Pennsylvania Company owned \$9,158,300 preferred and \$7,388,900 common, and the Pennsylvania Railroad \$584,700 preferred. The Reading Iron Company (a subsidiary of the Reading Coal & Iron Company) at present owns approximately \$4,000,000 preferred and \$3,000,000 common. Payment for the stock to be acquired by the Bethlehem Steel Corporation will be provided for through cash and bonds bearing 5 per cent interest. The preferred stock will be exchanged for bonds at par, and the common stock at about \$35 a share. The Pennsylvania Company, which, as noted above, now owns a majority of the Steel Company stock, will acquire the minority interest and the total amount of stock acquired will be turned over to the Bethlehem Company, which will retain the securities as a holding company. Dividends of 7 per cent were paid on the preferred stock of the Pennsylvania Steel Company from November 1, 1901, to November, 1912; no dividends have been paid on the common. The acquisition of the company by the Bethlehem interests will strengthen the latter greatly, more particularly as the Pennsylvania Steel Company controls the Maryland Steel Company, operating a large ship building plant and rail mill at Sparrows Point, Md., and the Spanish-American Iron Company, owning large ore deposits in Cuba. The Pennsylvania Steel Company is said to own the largest deposits of iron ore of any of the independent companies, and much of this is of very high grade.

Westinghouse Air Brake Company

This company's net earnings in the fiscal year ended July 31, 1915, were considerably below those of the preceding year, but as the company is now working on a large order for munitions, it was possible to continue the dividends at the usual rate. The net sales of the Wilmerding plant were approximately one-third less than those of 1914, and only 62 per cent of the average net sales for the past five fiscal years. The net profit for the year was \$1,575,839. This compares with \$3,482,994 in 1914, or \$5,255,259 (after deducting depreciation of \$809,519) in 1913. Charges for depreciation on buildings and machinery in 1915 totaled \$207,768.

During the year the electrical and brake business formerly carried on in France by the Societe Anonyme Westinghouse was divided and the brake business was taken over by a new company, the Compagnie des Freins Westinghouse, the ownership of which is vested in the Westinghouse Air Brake Company and the Westinghouse Brake Company, Limited, of London. This ownership was acquired by transferring to the British Westinghouse Electric & Manufacturing Company, Limited, holdings in the Societe Anonyme Westinghouse, in which the American company is no longer interested.

The report says that the subsidiary companies in England, Italy and Russia are doing well despite the war, although the English company has thought it best to reduce its annual dividend from 20 to 10 per cent.

The outlook for the company is good. The unfilled orders on August 1, 1915, were \$800,000 greater than on August 1, 1914. This total, however, did not include the order for munitions spoken of in the report as follows:

"During the month of April, 1915, your company accepted orders for 18-lb. shrapnel, complete, except propellant power, and additional cartridge cases amounting in total to \$17,930,000. While the terms are favorable, with ample guarantees against contingencies, these orders have necessitated a heavy expenditure for special machinery, and for its installation in temporary, though substantial, buildings, to the end that the maximum output of the company's regular product might not be affected in case of a sudden revival of the railway supply business. It is expected that when the value of this special machinery and the buildings not available for future use shall have been charged off, the net result will represent a substantial but not an unusual manufacturing profit on the amount involved.

"The factor that chiefly influenced the management in deciding to undertake this special line of work was the unfavorable outlook for the railway supply business in general and the desire to prevent, if possible, a repetition of the hardships endured by your working force last winter through lack of employment. There is, however, another consideration which should be mentioned, namely, the conviction arising from a study of the unexampled conflict now raging in Europe that the time has come for some of our larger manufacturing concerns to prepare themselves, by the installation of equipment and especially by the acquisition of technical and mechanical experience now so woefully lacking, to assist the United States government in the defense of our own country, should such a contingency arise."

There follows the general consolidated balance sheet for July 31, 1915. There has been a decrease of \$250,000 in contingent surplus representing the excess of par value of the stock of subsidiary companies over the amount at which they are carried on the books of the parent company. An increase of \$1,203,804 in inventory results from the large accumulation of material on hand for special contracts. The surplus shown of \$4,390,342, compares with \$5,648,865 on August 1, 1914, the dividends paid having slightly exceeded the net returns.

ASSETS

TRADE PUBLICATIONS

INSPECTION OF CREOSOTED TIMBER.—Robert W. Hunt & Co., engineers, Chicago, have issued a booklet describing the inspection of creosoted timber and including specifications for paving with creosote wood blocks, adopted by the Association for Standardizing Paving Specifications.

HIGHWAY BRIDGES.—Robert W. Hunt & Co., engineers Chicago, have prepared a booklet on the inspection and testing of materials for highway bridges, containing specifications for structural steel for bridges, billet-steel and rail-steel reinforcement bars, and for steel castings, adopted by the American Society for Testing Materials.

WATER SOFTENING.—The L. M. Booth Company, New York, has recently issued a bulletin relative to the company's type F water softeners. The booklet is attractively illustrated. It explains the operation of the softeners in detail, showing sectional views of the softeners at work. There are also given a number of views of typical installations.

Railway Construction

ATLANTIC COAST LINE.—Announcement has been made by this company, it is said, that an extension is to be built from the present southern terminus of the line now in operation to Sebring, Fla. The proposed route is southeast from Sebring to a point on the shore of Lake Okeechobee, about 60 miles.

CANADIAN PACIFIC.—Construction work is to be pushed on an additional 25 miles of track from Foremost, Alta., east to a point about 10 miles from Lake Pakowki. This will form part of the through line between Weyburn, Sask., and Lethbridge, Alta., and when this section is finished there will only be a gap of about 44 miles between the line now terminating at Altawan, Sask., and the east end of the Foremost extension.

HIWASSE VALLEY.—Grading work will be finished in about 30 days on the line building from Andrews, N. C., southwest via Peachtree to Hayesville, 25 miles. The maximum grades will be 2.5 per cent, and the maximum curvature 16 deg., and there will be two steel bridges on the line. The company expects to develop a traffic in lumber and forest products. The Wright-Johnston Company, Andrews, N. C., are the contractors. F. A. Cloud, chief engineer, Andrews. (May 7, p. 993.)

ILLINOIS CENTRAL.—The report of this company for the year ended June 30, 1915, shows that during the year new rail was laid on 262.23 miles of track; 99 new industrial tracks were built or extended, making a net addition of 7.46 miles; 401 new company sidings were built or extended, making a net addition for the year of 69.64 miles and second main track between Fulton, Ky., and Memphis, Tenn., under construction last year has been completed. A cut-off was built from Fredonia, Ill., on the Carbondale district to Reeds Junction on the Johnston City branch, 1.77 miles. This involves the abandonment as first main track of 6.64 miles of line between Fredonia and Carbondale Junction. The second main track at Parkway, Ill., was extended to Broadview, 2.46 miles, and additional side track was constructed, for handling passenger traffic to and from Speedway, Ill. At Paducah, Ky., the freight yard was added to by the construction of 6.28 miles of siding, and the freight yard at Fulton, Ky., was increased by 6.59 miles. The reduction of grades between Paducah and Princeton, and the enlargement of yard facilities at the latter point were continued and were about finished at the close of the year. The elevation of the tracks at Memphis, Tenn., also the construction of the new passenger facilities at that place, were also completed, and the raising of tracks and relocating of main line in connection with levee improvements, being made by the city authorities at North Memphis, were undertaken during the year and are about half finished. Grade crossing elimination work at Grand Crossing, Chicago, Ill., track elevation work between Seventy-ninth street and One Hundred and Sixteenth street, Chicago, and through Cicero, also grade revision at Mattoon, were still in progress at the close of the year. Work of strengthening the Cairo bridge to carry heavier rolling stock was completed during the year. To facilitate the handling of coal traffic a double track connection was installed between the junction of the Carbondale and Johnston City districts near Cambria, Ill., for 1.34 miles. A viaduct was completed over Nicholas street, Omaha, Neb., and an overhead bridge constructed at Monticello, Wis. Work was started and is still under way on subways at Prairie avenue, Decatur, Ill., and Phinney Park boulevard, Fort Dodge, Iowa.

KETTLE VALLEY LINES.—It is expected that work will be completed by December on the extension from Coquihalla summit to Hope, B. C., on the Fraser river. Track laying is now under way from the Hope end and has been completed, it is said, to Ladner creek, where a steel bridge is being built. (April 16, p. 871.)

NEWTON, KANSAS & NEBRASKA.—This company has awarded a contract for a railway from Newton, Kan., through Harvey, McPherson, Dickinson, Saline, Clay and Washington counties, to the Newton Construction Company. S. O. Waddell, Newton, Kan., chief engineer.

NEW YORK SUBWAYS.—The New York Public Service Com-

mission, First district, has submitted the proposed form of contract for the construction of Section No. 2, of Routes Nos. 19 and 22, being a part of the Southern boulevard and Westchester avenue branch of the Lexington avenue subway, to the Interborough Rapid Transit Company. This company is made a party to the contract, and will bear part of the construction cost. The underground portion of this line ends at Bancroft street, in the borough of the Bronx, and Section No. 2, which will be elevated, extends northerly from that point along Westchester avenue to Eastern boulevard, or Pelham Bay Park. The commission has completed negotiations with the government for the construction of the necessary fixed bridge across the Bronx river, the last obstacle to the construction of the line.

OREGON, CALIFORNIA & EASTERN.—This company has been incorporated to build a railway from Bend, Crook county, Oregon, to Lakeview, Lake county, with branch lines running from Silver Lake, Lake county, to Kirk, Klamath county, from Millican, Crook county, to Arden, Harney county, and from a point to be determined to Warner Valley, Lake county. The capitalization is \$100,000; the officers are P. B. Ellis, president, L. S. Ellis, vice-president, and William Muller, secretary and treasurer. The Oregon office will be at Portland.

PATTERSON & WESTERN.—This company has been incorporated to build a railway in Santa Clara and Stanislaus counties, Cal. R. J. Pratt, 3388 Clay St., San Francisco, Cal.

PENNSYLVANIA ROADS (ELECTRIC).—According to press reports the project to build a line from Milford, Pa., Pike county, northeast to Port Jervis, about eight miles, is being revived. Residents of Milford have guaranteed an amount of \$25,000, it is said, in aid of the project to build an electric line between these two places. Gifford Pinchot, Milford, may be addressed.

ROACH TIMBER COMPANY.—This company will do some additional grading on its rail line from Sutherlin, Ore., to its timber holdings, in the near future. W. L. Roach, president, Muscatine, Iowa.

SAN ANTONIO & AUSTIN INTERURBAN.—This company has revived its plans for building an interurban electric line between San Antonio, Tex., and Austin, about 80 miles, and negotiations for financing the project are now in progress. The proposed line will pass through the towns of New Braunfels, Hunter, San Marcos, Kyle, Buda and Manchaca. A survey for the route was made some time ago and much of the right of way has been secured.

SEABOARD AIR LINE.—On the section between Sanford, N. C., and Apex, 28 miles, this company is making some corrections and revisions in its grade lines, removing therefrom certain quick changes of gradients and improving the objectionable dips. This is a part of the general scheme of revision in that territory. There will be no change of alignment. Ballasting and the laying of new rail will follow as soon as the grade changes are accomplished.

SOUTHERN RAILWAY.—The report of this company for the year ended June 30, 1915, shows that the double track construction work on the main line north of Charlotte, N. C., including improved alignment and elimination of heavy grades, has been pushed on 100 miles of the 142 between Washington and Charlotte, which was operated as single track at the beginning of the past fiscal year. Of this mileage, 27 miles between Pelham, N. C., and Brown Summit, were in operation as double track at the close of the year, and it is expected that the remaining 73 miles on which work is now under way will be completed before April, 1916. At the close of the year there was 434.03 miles of double track in operation. Since the close of the fiscal year money has been made available for double track work and other improvements. The work in immediate contemplation consists of 56 miles between Spartanburg, S. C., and Central, and the 23 miles between New Holland, Ga., and Cornelia. On the section of 100 miles of main line on which double track work has been under construction, 54 out of 73 grade crossings were eliminated. In addition to the terminal yards at Richmond, Va., at Spencer, N. C., and Winston Salem, at Mobile, at Finlay, Ala., and at Forrest, Tenn., work was carried out on a new yard at Danverside, near East St. Louis, Ill., also on new facilities for both passenger and freight traffic at Spartanburg, S. C., and the separation of busy grade crossings in several cities. Since the close of the year the export coal terminal at Charles-

ton, S. C., has been put into operation. Arrangements have been made to provide a union passenger station at Macon, Ga., and new passing, side and spur tracks comprising 89.27 miles were constructed.

TEXAS ROADS (ELECTRIC).—The preliminary survey for a proposed interurban electric line to be built between Temple, Tex., and Marlin, about 40 miles, has just been made by S. D. Hanna, and the organization of a company to build the line is now in progress. Residents of Temple and Marlin are financing the project, it is said, and plans for building the line are well advanced. It is expected that the construction work will be started this year.

TORRINGTON & THOMASTON TRACTION.—An officer of this company which was recently organized writes that the prospects of building the proposed electric line from Torrington, Conn., south to Thomaston, 10 miles, are good, and that the cost will be about \$200,000. Work on the line, which calls for the construction of two short steel bridges, will be carried out next year. H. Mann, president; H. M. Guernsey, vice-president; G. B. Goodwin, treasurer, and E. T. Canfield, secretary. (October 8, page 670.)

RAILWAY STRUCTURES

BEAR CREEK, MINN.—The Chicago Great Western has ordered 55 tons of steel from the Chicago Bridge & Iron Works to be used in reinforcing a viaduct. Twenty truss spans and 38 tower posts will be strengthened. The steel was shipped early this week.

CHICAGO, ILL.—The engineering department of the Illinois Central is again preparing plans and specifications for a bridge on the St. Charles Air Line over the Chicago river.

EVANSVILLE, IND.—The contract for the new Illinois Central freight house and the extension of the old structure has been let to George P. Swift & Co., of Chicago.

HUNTINGDON, PA.—The state water supply commission of Pennsylvania has approved the plans submitted by the Pennsylvania Railroad to build a bridge over Dotter run, also a bridge over Mill Creek in Rockland township, Venango county; and a bridge over Catfish run in Madison township, Clarion county.

LYNCHBURG, VA.—A reinforced concrete bridge is to be built over the James river, and the tracks of the Norfolk & Western, the Chesapeake & Ohio and the Southern Railway. It is proposed to build a structure with 19 arch and arched girder spans, to cost \$250,000. The cost of the work is to be paid for jointly by the above railroads and the city of Lynchburg. Bids have not yet been asked for this improvement.

MIAMI, FLA.—An officer of the Florida East Coast writes, regarding the report that new car shops are to be built at Miami, that the company does not contemplate that any work will be done on this improvement in the immediate future.

NEW LONDON, CONN.—The New York, New Haven & Hartford will build a bridge over the Thames river between Groton and New London. The proposed structure is to have a concrete substructure with steel superstructure of three 330-ft. riveted truss spans, one 185-ft. fixed span and one 185-ft. bascule span. The total estimated cost of the bridge is \$2,000,000. Contracts for the work have not yet been let.

NONCONNAH, TENN.—The Federal Cement Tile Company, of Chicago, has the contract for the roofing for the Illinois Central repair shop. (October 8, p. 671.)

NORTH TORONTO, ONT.—Work is now under way on a new station at Yonge street to be used jointly by the Canadian Pacific and the Canadian Northern. The new station forms part of improvements being carried out to include the elevation of the railway tracks and the elimination of all grade crossings on about three miles.

OLYMPIA, WASH.—The E. D. Rounds Construction Company of Seattle, Wash., has been awarded a contract for erecting a depot for the Oregon-Washington Railroad & Navigation Company. The cost is estimated at \$25,000.

WINSTON-SALEM, N. C.—An officer of the Norfolk & Western writes, regarding the report that a new steel viaduct is to be built at Winston-Salem, that plans for the viaduct will not be completed for several months.

Railway Financial News

CHICAGO, MILWAUKEE & GARY.—The securities which were pledged as collateral for notes aggregating \$1,813,036 were bid in by a representative of the noteholders at a price equalling the par value and interest of the notes. The collateral consists of bonds with a face value of \$5,764,000 and stock with a par value of \$5,475,000.

CHICAGO, ROCK ISLAND & PACIFIC.—The seven directors agreed upon by various Chicago, Rock Island & Pacific interests were elected at a stockholders' meeting held on October 14. The new directors are: Edmund D. Hulbert, vice-president of the Merchants Loan & Trust Company, Chicago; Charles D. Dawes, president of the Central Trust Company of Illinois, Chicago; John G. Shedd, president of Marshall Field & Co., Chicago; Nathaniel French, Davenport, Iowa; William B. Thompson, director of the Federal Reserve Bank of New York; John R. Morron, president of the Atlas Portland Cement Company, New York, and Joel W. Burdick, Pittsburgh.

FT. SMITH & WESTERN.—This road, running from Ft. Smith, Ark., to Guthrie, Okla., 217 miles, has been placed in the hands of a receiver by the United States District Court on the application of the trustee of its outstanding \$6,240,000 bonds.

GREENVILLE NORTHWESTERN.—Application has been made for a receiver in the suit brought to foreclose a deed of trust for \$63,300.

MISSOURI, KANSAS & TEXAS.—A protective committee has been formed to represent the preferred and common stockholders. The committee consists of Alvin W. Krech, chairman; Frank H. Davis, Charles Hayden, J. J. Slocum, S. A. Mitchell and A. W. Smithers. The Stockholders have been asked to deposit their stock with the Equitable Trust Company, New York.

MISSOURI PACIFIC.—The reorganization committee which is acting with Kuhn, Loeb & Co., New York, has extended the time for deposits of stocks and bonds under the previously announced reorganization plan to December 15.

NEW JERSEY & PENNSYLVANIA.—This road was sold under foreclosure on October 18, following the refusal of Vice-Chancellor Howell, of New Jersey, to confirm a previous sale. The completed portion of the road was bid in by a representative of the bondholders for \$27,000 and the uncompleted portion by G. F. Fisher, of New York, for \$1,600. The sale is subject to confirmation.

NEW ORLEANS, MOBILE & CHICAGO.—The federal court at Mobile, Ala., has confirmed the sale of that property to a committee representing the bondholders.

SEABOARD AIR LINE.—A special stockholders' meeting has been called for November 15 to vote on the question of approving the merger of the Seaboard Air Line and the Carolina, Atlantic & Western (mentioned in these columns last week) and to authorize an issue of \$300,000,000 bonds. Upon the approval of the issue of \$25,644,000 of these bonds of which \$2,750,000 are to be held in the treasury of the consolidated company, approximately \$5,725,000 are to be used to retire an equal face amount or underlying first mortgage 6 per cent bonds of the Carolina, Atlantic & Western and \$17,168,500 have been sold to a syndicate headed by the Guaranty Trust Co., and the National City Bank.

The new company formed by the consolidation will be known as the Seaboard Air Line Railway Company, and will assume all the obligations of the consolidated companies, including the \$300,000,000 first and consolidated gold bonds. It is not proposed at this time that the new mortgage shall be a lien on any of the existing Air Line mileage, but there will be pledged under it approximately \$22,162,000 Seaboard refunding bonds now in the company's treasury or pledged to secure its notes.

The provisions for the issuance of stock of the new company were mentioned in these columns last week.

ANNUAL REPORTS

SOUTHERN RAILWAY COMPANY—TWENTY-FIRST ANNUAL REPORT

RICHMOND, VA., October 12, 1915.

To the Stockholders of Southern Railway Company:

The Board of Directors submits the following report of the affairs of the Company for the year ended June 30, 1915:

It has been a difficult year. After a period of unexampled prosperity throughout the South, attended by growth and expansion in all forms of industry, business had begun to slow up during the early months of 1914. Although for this reason railway revenues were less during the first six months of 1914 than they had been during the peak load of the corresponding six months of the previous year, nevertheless the Company entered upon the fiscal year now under review with an actually large traffic and a large turnover of revenue. The flame of war which burst forth all over Europe at the beginning of August, 1914, had a sudden and withering effect upon industry in the South. Preparing to market the largest crop in the history of cotton growing in the United States, the Southern people were looking forward to the profits from the sale of this their chief staple as a stimulus to their purchasing power and so of every form of industry in which they were engaged. When over night they were apparently shut out by the war from the European market, which has always consumed a large part of the American cotton crop, the people of the South were thrown back upon their own resources with a disturbingly large proportion of their chief money crop on their hands and an inadequate market price in prospect. Despite several futile plans of assistance from without, the South practically suspended for a time its industrial activities. The result was a fall, as vertiginous as that of the price of cotton, in the revenues of the railways at the South, and this lean diet was protracted, with the condition which caused it, throughout the year now under review. For this Company the suddenly changed industrial situation of the South meant a loss in revenues for the fiscal year of \$8,551,487.22, or 12.09 per cent. The development of the loss was precipitous. July showed a small increase in revenue, August a decrease of 1.20 per cent., September a decrease of 8.33 per cent., while in October, November, December and January the decreases in revenue were, respectively, 18.47 per cent., 20.06 per cent., 19.97 per cent. and 18.93 per cent., with gradually improving conditions during the remainder of the fiscal year, as the South again caught its breath.

It was a situation which demanded radical action on the part of management. When the first symptoms of the loss of revenues were felt, plans of retrenchment were made and were thereafter applied progressively. This action could not be brought into full effect for several months, but the effort became both evident and effective in March, 1915. The result for the year was a reduction of expenses amounting to \$5,585,938.68, and a balance of income over all charges of \$1,523,369.32, as compared with the similar balance (but in that case after provision for a dividend) of \$2,047,776.69 carried to the credit of profit and loss at the end of the previous fiscal year. These results and the financial condition of the Company at the close of the year will appear in greater detail by reference to the Income Statement (page 30) and the General Balance Sheet (pages 34 and 35), as well as the other tables which are part of this report.

DIVIDENDS

One of the unhappy results of the year has been the necessity, once again, of suspending dividends on the preferred stock. The regular dividend was amply earned for the six months ended June 30, 1914, but consideration of it, coming before the Board in September, was postponed until it should be apparent what was the tendency of the financial condition of the Company in the crisis which had then developed. Later the Board, being confident that the Company's affairs were well in hand, declared a reduced dividend of 2 per cent. (making 4½ per cent. for the year ended June 30, 1914), but conservatively made it payable in five year scrip bearing interest at the rate of 4 per cent. per annum. No dividend for the current fiscal year was declared, or could be justified during a period of convalescence.

OPERATING CONDITIONS

The characteristic of operating conditions during the year under review has been retrenchment, both by reducing service and by the practice of greater efficiency. What has been accomplished in both these respects will appear in detail in the subsequent pages of this report. It will suffice here to point out the parallel between the conditions of this year with those of the year ended June 30, 1908. That was the year of the financial panic or 1907. The revenues of the Company were at the high tide of its history up to that time until October, 1907, when they fell rapidly and dangerously throughout the remainder of that fiscal year. Then, as during this year, the problem of management was retrenchment, severe and sustained retrenchment, during several months. Attention was called in the annual report for 1908 to what was then done. What is perhaps as significant an illustration as can be made of the contemporary tendency of the railway industry, as well as of the increased strength of the Company today as compared with 1908, is found in a comparison of what had to be done and was done then and this year. In considering these comparisons it should be remembered that because of decreases of 1.74 per cent. in the average receipts per ton mile, 7.35 per cent. in the average receipts per passenger mile and 9.33 per cent. in mail revenues per mile of road, the 1915 revenues are \$2,145,093 less than they would have been had the 1908 averages been maintained on the revenue side of the account, while on the other hand operating expenses for 1915 carry an increase of approximately \$3,881,418 more than those for 1908, due to increased wage scales; therefore the operations for 1915 were burdened with unavoidable decreases in revenues and increases in expenses approximating together the large sum of \$6,026,511. In a comparison of actual results in the two years, 1915 has thus been handicapped to the extent of over six million dollars, which had to be overcome before increased efficiency could be observed. Under these conditions, the causes of which are too well known to all students of contemporary economics in the United States to require explanation here, the hope of the railway industry is that aggregate revenues may increase progressively in greater ratio than aggregate costs. Fortunately for this Company, the conditions making for a continued rapid development of the South, despite temporary setbacks as in this year and in 1908, have realized as well as promise such a result; while the intelligent expenditure of new capital for improvement of the plant in the interest of facility, and so of economy, of operation must in future, as in the past, be made to check, if it cannot altogether control, an abnormal increment of operating costs. A few statistics of 1915 compared with those of 1908 will serve to make the point, viz.:

SOME OPERATING COMPARISONS, 1915-1908

	Per Mile of Road.	Per Train Mile.
Gross Revenues	Increased 23.06%	24.54%
Net Revenues	Increased 29.58%	31.33%
Revenue Train Miles.....	Decreased 1.31%

Maintenance of Way and Structures	Increased 26.44%	27.48%
Maintenance of Equipment Expenses	Increased 25.05%	26.00%
Transportation Expenses	Increased 14.51%	16.03%
Ton Miles—All Freight.....	Increased 35.73%	67.59%
Ton Miles—Revenue Freight.....	Increased 28.35%	57.90%
Freight Train Revenue.....	Increased 18.08%
Freight Train Miles.....	Decreased 26.10%	55.85%
Passenger Train Revenue.....	Increased 16.15%
Passenger Train Miles.....	Increased 17.09%	.78%
Revenue from Passengers.....	Increased 20.34%	3.59%
Taxes	Increased 35.83%

Transportation costs per dollar of revenue were 36.59 cents, or 6.97 per cent. less than in 1908. Freight enginemen, trainmen and fuel costs per 100 ton miles decreased 27.29 per cent. Passenger enginemen, trainmen and fuel costs per 100 passenger miles increased 7.76 per cent.

Freight locomotive fuel costs per 100 ton miles decreased 37.19 per cent., and pounds of coal consumed per 100 ton miles were 36.93 per cent. less in 1915 than in 1908. While the average cost of coal at coaling stations was the same for both years, the average handling cost at stations was 35.71 per cent. less in 1915 than it was in 1908.

Overtime per dollar of wages was 5.20 cents in 1908; in 1915 it was 1.64 cents, an improvement of 68.46 per cent.

Adjusting the 1915 revenues and expenses to the average receipts per ton and per passenger mile, and mail revenue and wage costs to the averages and scales which prevailed in 1908, the following comparisons are found:

	1908	1915	Increase or Decrease
Cost to earn \$1.00 of Gross Revenue	65.73c.	75.53c.	Dec. 12.97%
Transportation Costs per \$1.00 of Revenue	31.60c.	39.33c.	Dec. 19.65%
Transportation Costs per Train Mile	66.28c.	63.93c.	Inc. 3.67%

The higher transportation costs per train mile this year are due to increased train loading, as illustrated by the following figures:
Enginemen, Trainmen and Fuel Costs—Freight:
Per Train Mile..... 30.12c. 33.37c. Dec. 9.74%
Per 100 Ton Miles..... 7.88c. 14.62c. Dec. 46.10%

MAINTENANCE:

The obvious and easy method of retrenchment on a railroad, in an emergency, is to reduce unduly the appropriations for upkeep of the property. During the past year the management has steadfastly sought to avoid this temptation. Public announcement was made that retrenchment was necessary and that it was the policy of the Company to reduce its expenses at the cost of the temporary convenience of the people of the South before reducing maintenance of the railroad to the point of endangering their safety. The public accepted this announcement in good part and it has been due to the co-operation of the State Railroad Commissions and of responsible and enlightened citizens everywhere that the Company was enabled to reduce its passenger service more nearly to the requirements of current passenger traffic than it had been for several years past. This large item of retrenchment made it possible to spend on upkeep all that was necessary for the preservation of the integrity of the property. When to this policy was added the splendid response to the emergency by the officers and men charged with maintenance, it resulted that it was possible to say at the close of the year, as it is to-day, that the physical condition of the roadway and structures is better than ever it has been; that the motive power and passenger equipment are in good condition and fully up to normal and that the only deferred maintenance has been in freight car equipment, where upkeep could economically be deferred, because without traffic freight cars must stand idle in any event.

An evidence of the justice of this claim as to the physical condition of the property, as well as of the skillful and careful service of the officers and men immediately charged with the movement of trains, is found in the marked reduction of the number of personal injuries during the year, and the interesting fact that the Company carried this year more than sixteen and a half million passengers, a number equal to the population of the territory served, without fatality in a train accident to more than a single passenger, and he would not have suffered had he not been riding on a car platform in contravention of the rules made for the protection of passengers.

There was, of course, a substantial reduction in maintenance costs, as in other costs, as part of the policy of retrenchment, but, considering only those items of such costs as are included in operating expenses, the total decrease of maintenance costs was 10.61 per cent. compared with a decrease of 12.09 per cent. in revenues. For each dollar of revenue earned there was spent in maintenance 30.78 cents in 1915 compared with 30.27 cents in 1914.

GENERAL EXPENSES:

There were substantial reductions during the year in all the normal items of general expenses, but by reason of a charge to this account during the year of \$98,191.32, representing the cost to this Company of the preparation prescribed to it for the pending Federal Valuation of its property, the total of general expenses is greater this year than last. This statement is made, not in criticism of the valuation expense, but in justice to the loyal officers who, by their sacrifice, made possible the reduction of one of the principal normal items of the account known as General Expenses.

CHARACTERISTICS OF TRAFFIC DURING A YEAR OF DEPRESSION.

FREIGHT:

The effect on the Company's freight business of the conditions which have obtained during the year is expressed in a decrease of 3,754,044 tons of commercial freight.

This decrease was chiefly in manufactures and in raw materials, the principal items being:

Bituminous coal and coke.....	1,463,480 tons.
Manufactures and miscellaneous.....	1,134,422 tons.
Forest products	939,687 tons.

These decreases reflect curtailment of industrial and building operations and economics practiced by the people of the South during a period of business depression.

The decrease in manufactures and miscellaneous includes approximately

500,000 tons of fertilizer and fertilizer material, and this decrease is directly attributable to the war.

The war in Europe, by narrowing the market for cotton while broadening the demand for many other farm products, has given great impetus to the movement which was already under way for the broader diversification of Southern agriculture. With relatively a small reduction in cotton acreage, the South is now producing a much larger proportion of the grains, forage crops, and meat and dairy products that it consumes. While one of the effects of this is to reduce the tonnage of agricultural products carried into the South, it is adding to the economic strength of the section, and the consequent increased purchasing power of its rural population may be expected, under normal business conditions, to result in the increased carriage of all classes of commodities except agricultural products; while the reduced movement of agricultural products into the South will be, in a measure, compensated for by an increased movement of these products between Southern points and from the South to outside markets. This change in the character of the Company's traffic is already noticeable. Thus during the year there was no decrease in the tonnage of agricultural products as a whole, viz.:

	1915, Tons	1914, Tons
Grain	655,513	756,215
Hay	150,662	165,902
Leaf Tobacco	169,126	158,919
Cotton	734,539	735,869
Cotton Seed	359,734	316,599
Melons	65,664	59,368
Citrus Fruits	60,557	53,686
Other Fruits and Vegetables.....	291,358	236,552
Peanuts	20,659	24,179
	<u>2,507,812</u>	<u>2,507,289</u>

The maximum grain tonnage handled by the Company in any one year was in 1906-1907, namely, 1,012,692 tons. The tonnage for the year just closed represent a shrinkage from this maximum of 35 per cent and reflects the effort of the Southern farmer to feed himself and emerge from a condition of dependence upon the grain fields of the West. Coincident with this economic change, the South is increasing other classes of agricultural products which find market largely outside the territory of production. Comparing the same years (1906-1907 with 1914-1915) the Company's tonnage of melons, fruits and vegetables increased more than 100 per cent. So that, while rapidly approaching the time when the South will produce grain sufficient to feed itself, and probably have some to sell, the South is now producing fruits and vegetables to feed many of its neighbors as well as itself.

The cotton crop was the largest on record, but there was a decrease in exports in excess of 800,000 bales, yet the Company's tonnage of cotton was not appreciably less than during the previous year, the difference being approximately 5,000 bales, and this was more than compensated for by an increase in tonnage of cotton seed and its products of 168,282 tons, due to a large crop and to a strengthened position with relation to the seed crushing industry. It is interesting to note that, compared with 1906-1907, the tonnage of cotton seed and its products for the year just closed represents an increase of 168 per cent.

The South has had but a small part in the business of supplying munitions of war for the armies in Europe, but in the latter months of the year the Company handled a substantial movement of horses from the west and southwest destined to the battlefields. In all some 20,000 horses were so transported for export. Special arrangements were made for the prompt and comfortable movement of these unfortunate animals, and, by preventing loss and damage in transit, this business was profitable to the Company.

The South enters the new year with a much more hopeful outlook, which, it is fairly expected, will be reflected in freight revenues.

PASSENGER:

For the past twenty years, up to the third week in July, 1914, the passenger revenues of the Company have shown increases, month after month, over corresponding periods of the previous years, except during the period December, 1907, to April, 1909, when decreased passenger revenues resulted from a passenger fare reduction in the States of Virginia, North Carolina, Georgia and Alabama, along with a general depression in business during the latter part of the year 1907 and the first part of the year 1908.

Since the third week in July, 1914, passenger revenues have shown decreases ranging from 2.05 per cent to 34.02 per cent, the greatest decrease occurring during the second week in May, 1915, since when the passenger revenues have improved.

The increased use of automobiles, especially for short distance travel, is the only permanent cause contributing to a reduction of railway passenger travel in the South. The use of automobiles has largely increased, owing to the great reduction in the cost of the automobiles and the material improvement of the highways throughout the Southern territory. The short distance travel is principally affected by the automobile competition, and while it costs more to travel by automobile than it does by train, the automobile affords a convenience of time to which no local railway schedules can be adjusted.

The travel on the Southern Railway is of two kinds, local and competitive. Approximately 70 per cent is local, short distance travel between non-competitive stations, and 30 per cent long distance travel between points where other lines compete.

The local travel, approximately 70 per cent of the total, will increase with the agricultural and manufacturing development of the country, but during times of business depression this short distance local travel is more affected than is the through travel. The farm laborer, as well as the factory employee, travels for the most part for pleasure, and as soon as his wages are affected he quits traveling. The farmer, particularly in the cotton sections, has discontinued during the past year his old-established custom of advancing money to laborers above their actual requirements for living necessities.

The long distance competitive travel in the Southern territory is susceptible of great development, and as train service improves, as the result of double track and other physical facilities, revenues from long distance passenger travel may be expected materially to increase. While the travel from the North and the East to Southern resorts during the winter seasons increases each year, the travel of the Southern people to the mountain resorts of the Carolinas and Virginia and to the resorts in the Northern States increases to a greater extent and will continue to increase with the prosperity of the Southern people. The mountain sections of Western North Carolina grow more popular and each year attract a larger number of people for their summer vacations. The importance of this is shown by the fact that the months of July, August and September yield the Company's largest passenger revenues. But the principal development and improvement in through long distance travel may be expected to come from increased travel of business men between the Southern business communities and the Eastern and Northern commercial and

banking centers. The people of the South are given to much traveling, and as their incomes, both from manufacturing industries and from farming developments, improve, that much more will they travel for business and for pleasure.

INDUSTRIAL AND AGRICULTURAL DEVELOPMENT OF THE TERRITORY SERVED

MANUFACTURING:

Although industrial development was restricted by the prevailing business depression, the ground swell of the prosperity prevailing in the South prior to the war in Europe carried over into this year a substantial addition to the manufacturing plants established on this Company's lines. While less than in former years, the record is an earnest of what may be expected in the future. The new industrial plants on the Company's lines completed during the year numbered 519 and may be classified as follows:

Brick, Tile, etc.....	19
Cotton Seed Products.....	47
Fertilizer	7
Flour and Feed.....	54
Furniture	12
Iron Products	17
Lumber	57
Stone (mineral)	38
Textile	24
Woodworking	47
Miscellaneous	197
Total	<u>519</u>

The capital involved in these new industries is \$17,492,850. During the year there were additions made to 219 manufacturing establishments at a reported cost of \$8,162,047. Industries reported under construction June 30, 1915, were 57 in number with a capital of \$15,456,250. New buildings of all kinds (except those used in manufacturing) and other general improvements represented an expenditure of \$66,422,856.

AGRICULTURE:

The September 1, 1915, estimates of the United States Department of Agriculture show increases this year over the 1914 yields of sundry crops, other than cotton, in the Southern States as follows:

Corn	100,341,000 bushels
Wheat	6,162,000 bushels
Oats	14,253,000 bushels
Irish Potatoes	13,344,000 bushels
Sweet Potatoes	6,705,000 bushels
Hay	1,227,000 tons
Tobacco	97,923,000 pounds

The South may, this year, well quote Virgil's verse: "Gargara is astonished at her own fertility."

In these figures, as well as in the development of the cattle industry, hereafter referred to, lies a promise of an enduring, because a self-contained, prosperity in the South; they indicate, as has already been suggested, that our section may expect in the future to provide the bulk of its own food supplies, with some surplus of such commodities for sale, while it will maintain its leading position as the source of one of the principal staples upon which civilized man depends to clothe himself.

The Company has continued active co-operation with the State and Federal governments, agricultural colleges and Southern farmers for the advancement of Southern agriculture. A preliminary report of the Agricultural Division of the Company's Industrial and Agricultural Department shows a total of 18,172 acres being cultivated in accordance with the advice of our Field Agents, embracing 7,882 acres in corn, 3,570 acres in cotton and 6,720 acres in miscellaneous crops. These figures do not by any means measure the work being done, as they embrace only those fields or parts of fields in which farmers agree to follow the advice of our agricultural field agents. Much larger areas are cultivated substantially in accordance with this advice, and the good results of the agricultural uplift work being done by the Company and, of course, by the State and Federal governments, as well as by other intelligent agencies, public and private, are noticeable in almost every agricultural community on the Company's lines. In 1914 the average yields of both cotton and corn per acre on fields in which the advice of the Company's agents was followed were more than double the average yields obtained on similar lands in the same localities where this advice was not followed, and as good results may be expected in 1915, when the figures are available.

The Agricultural Agent reports 313,000 fruit and nut trees planted during the year.

The live stock industry is making rapid progress in all of the territory contiguous to the Southern Railway. The numbers of beef and dairy cattle and hogs are rapidly increasing, and their quality is being improved through the introduction of pure-bred animals. The Live Stock Agent of the Company reports the location of 1,468 pure-bred cattle along the Company's lines during the year, the construction of 1,475 silos, and the organization of thirty live stock associations. The climate of the South and the large range of forage crops that can be produced are exceptionally favorable to all kinds of live stock, and the United States Department of Agriculture has demonstrated that beef and pork can be produced cheaper in the South than in other parts of the United States. The only obstacle to the development of the beef and dairy industries has been the cattle tick which carries the germ of Texas fever. The agricultural agents of the Company are co-operating with State and Federal agencies in the eradication of this insect. Large areas along the Company's lines have already been released from the cattle tick quarantine and large additional areas will be released in the autumn of this year.

GOOD ROADS:

Recognizing the importance of good country highways to the development of the territory traversed by its lines, the Company has, at all times, co-operated with the Office of Public Roads in the United States Department of Agriculture and other organizations engaged in the promotion of the good roads movement. The latest figures for road construction are those for the calendar year 1914, which show that during that year there were approximately 5,400 miles of improved roads built in counties traversed by Southern Railway lines, and that in the same year those counties issued bonds for road construction aggregating \$5,000,000. The total length of improved country highways in those counties at the end of the calendar year was approximately 50,000 miles.

LATIN-AMERICAN TRADE:

One of the interesting developments of the public service of a private corporation which looks forward, as does this Company, to its educational activities. Attention has been called to the notable work of this kind in behalf of better agriculture. Another work, germane to that in agriculture, has been the stimulation of the people of the South to take advantage of

current opportunities for a mutually profitable trade with Latin America. While this Company's South American Agency has been in operation only a short time, it has already laid the foundation of a foreign trade which is entirely new to many manufacturers in the South, and, while the beginnings are necessarily small, they contain the germ of what can become an important factor in the industrial activities of the South and so in the revenues of this Company. One interesting result of this movement is that fifteen thousand school children are now studying Spanish in the schools of the South as a direct result of recommendations to educational authorities by the South American Agency.

THE ADDITIONS TO CAPITAL ACCOUNT AND TO PROPERTY INVESTMENT

In the matter of additions and betterments the policy of the Company is better railroad, not more railroad. All suggestions of buying or building new railroads into new territory have been laid aside, and, in justice to the urgent demands of the existing property in the interest of economy of operation and convenience of the public served, cannot be properly considered at this time.

The Company has been fortunate in its ability to continue and to push forward, during this year of depression, the additions to its plant which will be necessary, before they can be completed, to handle the traffic of the industrial South. The capital for this work was provided during 1914, and its disbursements during the current year, when most other construction work had been suspended in the South, has not only enabled the Company to get more for a dollar invested than ever before, but has contributed substantially to the welfare of many Southern communities, which were refreshed, when they most needed refreshment, by the flow of our money through all the arteries of the commercial body. In this connection special attention is called to the table (page 45), included for the first time in this report, which sets forth the use and application of all the bonds issued by the Company since its organization.

During the year the investment in Road and Equipment increased \$11,021,684.56, of which \$9,004,934.79 was in Roadway and Structures and \$2,016,749.77 was in Equipment. This increase represents net additions made during the year. (See pages 36 and 37).

There was an increase of \$1,551,000 in Mortgage and Collateral Trust Bonds and Miscellaneous Obligations, and a decrease of \$3,193,000 in Equipment Trust Obligations. (See pages 42 and 43).

First Consolidated Mortgage Five per cent Bonds in the total amount of \$7,136,000 were sold and the proceeds applied as follows: On July 1, 1914, \$2,414,000 to redeem a like amount of matured Western North Carolina 6 per cent bonds; in December, 1914, \$4,722,000 to redeem a like amount of Richmond & Danville 6 per cent bonds. These transactions resulted in no increase in the funded debt, while the difference in the interest rates borne by the old bonds and the new means a reduction of \$71,360 in the annual interest charges.

There were drawn and taken into the treasury \$456,000. Development and General Mortgage Four per cent Bonds, representing in part the equipment trust obligations paid during the year and charged to Property Investment Account.

The total amount of Development and General Mortgage Four Per Cent Bonds available for disposition on June 30, 1915, was \$32,579,000, of which \$16,667,000 are pledged as collateral under Southern Railway Three-Year Five Per Cent Collateral Trust Indenture, dated March 2, 1914, leaving \$15,912,000 of such bonds in the treasury.

DOUBLE TRACK:

The double track construction work on the main line north of Charlotte, N. C., carrying with it improved alignment and elimination of heavy grades, has gone forward rapidly on 100 miles of the 142 miles of main line between Washington and Charlotte operated as single track at the beginning of the past fiscal year. Of this mileage, 27 miles, between Pelham and Brown Summit, N. C., were in operation as double track at the close of the year, and it is expected that all of the remaining 73 miles upon which work is now under way will be completed before April, 1916. There were 434.03 miles of double track in operation at the close of the year.

Since the close of the fiscal year there has been made available for the provision of double track and other improvements on the main line between Charlotte, N. C., and Atlanta, Ga., the sum of \$3,500,000 through the sale of First Mortgage Thirty-Year Five Per Cent (Series B) Gold Bonds of The Atlanta and Charlotte Air Line Railway Company. The work in immediate contemplation consists of the fifty-six miles between Spartanburg and Central, S. C., and the twenty-three miles between New Holland and Cornelia, Ga.

SEPARATION OF GRADE CROSSINGS:

One of the difficulties of modern railroading is the existence of grade crossings of highways with railroads. These crossings, which in some instances were actually required by the early charters, have become, with the growth of population, a menace to the public, and cause, in deplorable accidents for which those in charge of railroad trains are not always responsible, but are usually held responsible, a drain on the revenues of the Company. The increased use of automobiles in the South has accentuated this risk and this drain, and this Company is alive to the advantage of separating such grades wherever reasonably practicable. As, and when, the community recognizes its share in the responsibility and evinces a willingness to participate in the expense, much can be done, has been done and will continue to be done on our lines. Moreover, on all revision of line undertaken in connection with the policy of constructing double track, this Company has separated important and busy grade crossings wherever physically practicable and not prevented by selfish local interests. Thus, during the past year, on 100 miles of the main line on which double track has been under construction, 54 out of 73 dangerous grade crossings were eliminated, and this policy will be continued. The enormous investment required for perfection in this respect is, however, an unfortunate assurance that for many years more reliance must be placed, for the prevention of accidents at grade crossings, upon human care than upon physical elimination of risk. This is one of the most serious problems in the South, as in other parts of the United States.

YARDS AND TERMINALS:

In addition to the terminal yards at Richmond, Va., at Spencer and Winston-Salem, N. C., at Mobile and at Finley (near Birmingham), Ala., and at Forrest (near Memphis), Tenn., mentioned last year, work upon other important terminal improvements progressed during the past year, including a new yard at Denverside (near East St. Louis), Ill., new facilities for both passenger and freight traffic at Spartanburg, S. C., and the separation of busy grade crossings in several cities. Since the close of the year the modern export coal terminal at Charleston, S. C., has been put into operation. Arrangements have been made to provide a union passenger station at Macon, Ga., to meet the long continued and insistent demand for improved passenger traffic facilities in that city. New passing, side and spur tracks aggregating 89.27 miles were constructed.

AUTOMATIC ELECTRIC BLOCK SIGNALS:

These signals were placed in operation on the 190.3 miles of double track between Amherst and Whittle, Va., Danville, Va., and Pelham, N.

C., Atlanta and New Holland, Ga., Austell and Howell, Ga., Knoxville and Morristown, Tenn., and Ooltewah and Citico, Tenn. It is the policy to so equip all new double track as constructed. A total of 365.6 miles of such signals was in operation at the close of the year.

SERVICE OF EMPLOYEES

There has never been a year of the Company's history in which the stockholders have had as much reason for pride in and appreciation of the officers and employees, their work, their spirit, their loyal self-sacrifice. The manner in which a grave emergency was met and dealt with illustrates at its best that discipline which distinguishes a true organization from a mere co-operative society. Our organization, which has in recent years been built and cemented by a strict adherence to the principle of promotion for merit and reliance upon men made on the road, who have faithfully stood by during all our vicissitudes, has proven in this year of need the greatest of the Company's assets, for it has fought a losing fight and won.

ACCOUNTS AND STATISTICS

Statements of the accounts and statistics of the Company in detail will be found in the tables hereto annexed.

The accounts have been examined, as usual, by independent auditors and accountants, Messrs. Patterson, Teele & Dennis, and their certificate is made a part of this report.

Appended to this report is a minute of the resolution adopted by the Board upon being advised of the death of Alexander Boyd Andrews, for many years a Director and First Vice-President of the Company, who died at his home in Raleigh, North Carolina, on April 17, 1915.

Respectfully submitted, by order of the Board,
 FAIRFAX HARRISON,
 President.

ILLINOIS CENTRAL RAILROAD COMPANY—SIXTY-FIFTH ANNUAL REPORT

REPORT OF THE BOARD OF DIRECTORS

To the Stockholders of the Illinois Central Railroad Company:
 The Board of Directors submit herewith the following report of the operations and affairs of your Company for the year ended June 30, 1915: The number of miles of road operated on June 30, 1914, was.....4,769.27 Additions for year:

January 9, 1915—Fredonia and Reeds Railroad—Reeds Junction, Ill., to Fredonia, Ill.....	1.77
Mileage added account of trackage rights, revision of line, and remeasurements	3.16
	<u>4,774.20</u>

Less:

January 9, 1915—Reclassification of first main track, Carbondale Junction, Ill., to Fredonia, Ill., as other main track, due to construction of Fredonia and Reeds R. R....	6.64
May 26, 1915—Reduction due to construction of cut-off between Kuttawa, Ky., and Cumberland, Ky.....	.42 7.06

The number of miles operated on June 30, 1915, was..... 4,767.14
 The average number of miles of road operated during the year was..... 4,770.03

INCOME

The following is a statement of the Company's income for the year compared with the previous year:

	1915	1914	Increase + Decrease —
Average miles operated during year	4,770.03	4,768.51	+ 1.52
Railway operating revenues:			
Freight	\$41,212,270.70	\$43,871,271.70	— \$2,659,001.00
Bridge tolls and miscellaneous freight	3,263,246.00	3,464,624.56	— 201,378.56
Passenger	12,640,597.28	13,715,979.06	— 1,075,381.78
Bridge tolls and miscellaneous passenger.....	211,080.10	247,762.37	+ 36,682.27
Mail	1,050,706.59	1,042,042.96	+ 8,663.63
Express	1,589,501.31	1,770,646.75	— 181,145.44
Other passenger train....	457,177.96	475,668.53	— 18,490.57
Other transportation	753,786.52	804,580.88	— 50,794.36
Revenue from operations other than transportation	522,006.02	481,123.21	+ 40,882.81
Total railway operating revenues	61,700,372.48	65,873,700.02	— 4,173,327.54

Railway operating expenses:			
Maintenance of way and structures	8,839,472.06	9,205,946.38	— 366,474.32
Maintenance of equipment	13,892,443.73	14,510,079.49	— 617,635.76
Traffic expenses	1,238,439.64	1,290,777.98	— 52,338.34
Transportation expenses	22,299,815.12	24,150,039.98	— 1,850,224.86
General expenses	1,603,255.98	1,618,483.63	— 15,227.65
Transportation for investment—Cr.	303,278.88	— 303,278.88
Total railway operating expenses	47,570,147.65	50,775,327.46	— 3,205,179.81
Net revenue—rail operations	14,130,224.83	15,098,372.56	— 968,147.73
Outside operations:			
Revenues	411,179.77	499,802.61	— 88,622.84
Expenses	405,049.10	517,453.45	— 112,404.35
Net revenue—outside operations	6,130.67	*17,650.84	+ 23,781.51
Net railway operating revenue	14,136,355.50	15,080,721.72	— 944,366.22
Railway tax accruals	3,233,838.38	3,341,247.07	— 107,408.69
Uncollectible railway revenues	24,044.24	+ 24,044.24
Railway operating income	10,878,472.88	11,739,474.65	— 861,001.77
Other income	7,659,428.03	7,320,600.33	+ 338,827.70
Gross income	18,537,900.91	19,060,074.98	— 522,174.07
Deductions from gross income	11,678,739.25	10,921,250.55	+ 757,488.70
Net income	6,859,161.66	8,138,824.43	— 1,279,662.77
Disposition of net income:			
Applied to sinking and other reserve funds ..	107,875.00	+ 107,875.00
Appropriated for additions and betterments ..	46,027.77	41,642.66	+ 4,385.11
Balance transferred to credit of profit and loss ..	6,705,258.89	8,097,181.77	— 1,391,922.88

* Deficit.

REVENUES

For the current year the operating revenues amounted to \$61,700,372.48 as compared with \$65,873,700.02 in the previous year, a decrease of \$4,173,327.54, or 6.34 per cent.

Freight revenue amounted to \$41,212,270.70, a decrease of \$2,659,001.00, or 6.06 per cent. The principal portion of the decrease was on the southern lines, the northern lines showing a comparatively small decrease and the western lines an increase. The bituminous coal traffic showed a substantial increase both in tonnage and revenue over last year and there was also a heavy increase in the movement of grain through the port of New Orleans which added materially to the revenue for the year. These gains, however, were not sufficient to offset the loss in revenue due to the falling off in lumber traffic and the heavy shrinkage in merchandise and miscellaneous freight business.

The revenue from the transportation of passengers was \$12,640,597.28, a decrease as compared with last year of \$1,075,381.78, or 7.84 per cent. There was a substantial decrease in the revenue north of the Ohio River; but the greatest falling off in business was in the territory served by the southern lines.

Statistics as to freight and passenger traffic will be found by reference to Table No. 12.

EXPENSES

The operating expenses were \$47,570,147.65 this year as compared with \$50,775,327.46 last year, a decrease of \$3,205,179.81, or 6.31 per cent.

MAINTENANCE OF WAY AND STRUCTURES

Maintenance of way and structures expenditures amounted to \$8,839,472.06, being a decrease of \$366,474.32, or 3.98 per cent, as compared with the previous year. This decrease was due in part to the smaller quantity of new rail laid in renewals and partially by the fact that the previous year's expenses were increased by substantial charges on account of the construction of the new passenger terminal at Memphis and other additions and betterments work, while the operating expense portion of additions and betterments work was not so large this year.

Included in the renewals, the cost of which was charged to operating expenses, were the following:

2,087,531 cross ties were renewed, this being equivalent to 672.92 miles of continuous track, or 8.99% of all ties in track, including sidings.
10.21 miles of track were relaid with new steel rail and 5.65 miles with second-hand steel rail, replacing rail of the same weight.
7,428 lineal feet of timber and pile bridges were replaced by embankments.

1,504 lineal feet of iron and 4,136 lineal feet of concrete pipe culverts were put in.

486 miles of ballasted track were repaired or renewed to restore the track to its original standard.

As to work, the cost of which was charged wholly or in part to "Road and Equipment," comments will be found on page 10 of this report under "Physical Changes."

MAINTENANCE OF EQUIPMENT

The expenditures for maintenance of equipment were \$13,892,443.73, a decrease of \$617,635.76, or 4.26 per cent, as compared with last year. The decrease is accounted for by a reduction in repairs to freight equipment, both locomotives and cars. Considering the volume of business handled the equipment was well maintained during the year.

Depreciation charges amounted to \$2,076,094.24, being an increase over the preceding year of \$376,478.28.

246 locomotives received general repairs this year as against 306 in the preceding year, and 404 were given thorough repairs this year as compared with 398 last year.

561 passenger-train cars received medium repairs this year as compared with 459 last year, and 148 were given heavy repairs this year as against 165 last year.

The average mileage per serviceable locomotive for the year was 27,802.

The average age of locomotives was 12.27 years this year and 12.61 years last year, of revenue freight-train cars 8.93 and 9.49 years for the respective years, and passenger-train cars 14.67 years this year and 15.62 years last year.

TRAFFIC EXPENSES

Traffic expenses amounted to \$1,238,439.64 this year, a decrease of \$52,338.34, or 4.05 per cent, as compared with last year.

TRANSPORTATION EXPENSES

Transportation expenses were \$22,299,815.12 for the year, a decrease as compared with the previous year of \$1,850,224.86, or 7.66 per cent. The reduction in the volume of traffic was, in part, responsible for this decrease; but an important saving was occasioned by the substitution on portions of the main lines of superheater locomotives of greater tractive power, resulting in the movement of heavier trains with but slight increase in the expense. In the freight service the increase in the average tons moved per train mile, including Company's freight, was 7.16 per cent.

A special campaign was carried on in connection with fuel economy, resulting in a decrease of 10.16 per cent in the cost of fuel for locomotives, notwithstanding the larger locomotives in service on some parts of the line and a decrease of only 6.01 per cent in engine miles. Special attention was also given to the elimination, as far as possible, of the causes for loss and damage and other claims, the result being that there was a decrease of 27.48 per cent in the amounts paid for loss and damage to freight, and of 20.69 per cent in the sums paid for all claims and damages during the year as compared with last year.

GENERAL EXPENSES

General expenses amounted to \$1,603,255.98, a decrease of \$15,227.65, or .94 per cent.

TAXES

The amount of taxes for the year was \$3,233,838.38, a decrease of \$107,408.69, or 3.21 per cent less than the previous year.

There was a substantial decrease in the amount accruing to the State of Illinois on account of the charter tax owing to the decrease in the revenues on the charter lines during the year as compared with last year. There was also a material decrease in the amount of taxes paid on the non-charter lines in Illinois and on the lines in several of the other states due to reductions in the rates of taxation.

FINANCIAL

The financial condition of the Company at the close of the year as compared with the previous year is set forth in the general balance sheet, Table No. 4, which table, together with Table No. 7, "Long Term Debt and Interest," has been stated in somewhat different form from the previous year. These changes were made in accordance with the form of balance sheet prescribed by the Interstate Commerce Commission to take effect July 1, 1914.

CAPITAL STOCK AND FUNDED DEBT

There were no changes in the Capital Stock during the year.

\$1,980,000.00 of Illinois Central Equipment Trust Certificates, Series "C," were issued and sold in April, 1915.

Illinois Central Railroad Company Four and One-half Per Cent Secured Gold Notes, amounting to \$10,780,000.00, matured July 1, 1914, and were retired.

Under the terms of the mortgage \$2,000,000.00 Illinois Central Railroad Company First Lien Equipment Bonds were delivered to the Trustee and cancelled. An additional \$881,000.00 of the same issue of bonds were also turned over to the Trustee for cancellation in connection with the sale to The Yazoo & Mississippi Valley Railroad Company of 105 locomotives released under the mortgage and which were a part of a total of 134 locomotives sold to that Company.

There were retired and cancelled under the terms of the respective Trust Agreements \$800,000.00 of Illinois Central Equipment Trust Certificates, Series "A," and \$350,000.00 of Illinois Central Equipment Trust Certificates, Series "B."

SECURITIES OWNED

In December, 1914, the Chicago, St. Louis & New Orleans Railroad Company issued under the terms of the Trust Agreement \$5,700,000.00 of its Equipment Trust Certificates, Series "A." The Illinois Central Railroad Company purchased \$700,000.00 of this issue. Of the latter amount \$35,000.00 matured and were redeemed in May, 1915.

\$2,586,000.00 of The Yazoo & Mississippi Valley Railroad Company Five Per Cent Gold Improvement Bonds were acquired as follows: In July, 1914, from the Trustees of the Western Lines, Omaha Division and Chicago, St. Louis & New Orleans Railroad Sinking Funds, \$852,000.00; in September, 1914, from The Yazoo & Mississippi Valley Railroad Company for the purchase price of one hundred and thirty-four locomotives sold to that Company, \$912,000.00; and in the same month that Company also issued and turned over to the Illinois Central Railroad Company in liquidation of indebtedness for improvements made to its property \$822,000.00.

\$2,500.00 par value of the Dubuque & Sioux City Railroad Company capital stock was purchased in November, 1914.

\$10,000.00 par value of the Central Elevator and Warehouse Company stock was purchased in October, 1914.

In addition to the above the Company also acquired \$3,600.00 par value of miscellaneous stocks.

The Company sold during the year Illinois Central Railroad Company and Chicago, St. Louis & New Orleans Railroad Company Joint First Refunding Mortgage Bonds as follows: \$5,000,000.00 in February, 1915, \$1,750,000.00 in March, 1915, and \$3,250,000.00 in April, 1915.

There were delivered to the Trustees of the several sinking funds in exchange for The Yazoo & Mississippi Valley Railroad Company Five Per Cent Gold Improvement Bonds as above mentioned, \$944,000.00 of the Louisville Division and Terminal Three and One-half Per Cent Bonds of 1953.

The Peoria and Pekin Union Railway Company redeemed \$12,500.00 par value of its Five Per Cent Debenture Bonds, maturing August 1, 1914.

\$86,000.00 par value of The Yazoo & Mississippi Valley Railroad Company Five Per Cent Gold Improvement Bonds were transferred to the Insurance Fund, and \$30,000.00 par value were sold.

\$100,800.00 par value Cuban American Sugar Company preferred stock was sold during the year.

INSURANCE AND OTHER FUNDS

The changes in the Insurance Fund during the year and the condition of the fund at the close of the year are shown in the following table:

	Year Ending June 30, 1915	Year Ending June 30, 1914
Amount at credit of fund July 1	\$2,129,835.52	\$2,089,844.54
Added through monthly charges to operating expenses	60,000.00	60,000.00
Collected from lessees account of insurance	1,099.92	2,106.68
Interest received on investments of the fund	107,875.00	94,630.00
Fire losses collected	12,604.82	6,941.30
Total	\$2,311,415.26	\$2,253,522.52
Losses by fire	\$50,714.86	\$80,479.61
Premiums paid for reinsurance	45,327.84	43,207.39
Total	\$96,042.70	\$123,687.00
Amount of credit of fund June 30	\$2,215,372.56	\$2,129,835.52

The balances in the sinking funds as of June 30, 1915, and the increases during the year were as follows:
 The Farmers' Loan and Trust Company, Trustee—Cairo Bridge Contingent Fund, \$504,180.00.
 The Farmers' Loan and Trust Company, Trustee—Cairo Bridge Sinking Fund, \$344,580.24, an increase of \$32,412.97.
 United States Trust Company of New York, Trustee—Sinking Fund for Western Lines Bonds, \$1,417,887.73, an increase of \$100,294.21.
 United States Trust Company of New York, Trustee—Sinking Fund for Omaha Division Bonds, \$192,921.50, an increase of \$17,076.65.

ROAD AND EQUIPMENT

There was expended during the year for Road and Equipment (including improvements on subsidiary properties) \$10,323,622.76. The following is a classified statement of these expenditures:

	Advances for Additions and Betterments to Lines of on Owned Subsidiary Companies	Additions and Betterments to Lines of on Owned Subsidiary Companies	
ROAD:			
Engineering	\$32,033.80	\$72,392.91	
Land for transportation purposes	112,241.70	43,987.82	
Grading	395,845.74	773,502.14	
Tunnels and subways	356.93		
Bridges, trestles and culverts	434,984.44	819,451.44	
Ties	36,002.33	148,473.05	
Rails	174,526.95	347,765.16	
Other track material	243,346.17	348,520.74	
Ballast	19,326.48	149,360.12	
Track laying and surfacing	120,492.58	335,814.21	
Right of way fences	2,763.47	11,949.17	
Crossings and signs	112,596.08	20,200.14	
Station and office buildings	97,414.43	488,890.75	
Roadway buildings	2,314.39	5,212.32	
Water stations	5,613.72	56,602.84	
Fuel stations	14,854.20	10,431.65	
Shops and enginehouses	66,152.72	148,289.48	
Grain elevators	828.18	11,890.31	
Storage warehouses		46.31	
Wharves and docks	69.13	8,416.57	
Coal and ore wharves		26,275.88	
Telegraph and telephone lines	29,676.73	18,717.18	
Signals and interlockers	91,828.96	188,489.05	
Power plant buildings	2,714.30	5,543.24	
Power transmission systems		1,909.17	
Power line poles and fixtures		1,336.00	
Miscellaneous structures	5,084.25	812.74	
Paving	69,866.11	44,542.41	
Roadway machines		879.47	
Roadway small tools	25.23	6,394.02	
Assessments for public improvements		32,988.77	
Cost of road purchased	1,500.00	18,148.93	
Other expenditures—Road	154,126.43	193,016.35	
Shop machinery	33,384.13	23,765.48	
Power plant machinery	23,761.86	458.86	
	Covered by Equipment Trust Series "C"		
EQUIPMENT:			
Steam locomotives	\$1,256,065.82 Cr. 260,280.44	*1,749,341.90	
Freight-train cars	1,078,535.52 Cr. 39,316.03		
Passenger-train cars	168,250.14 Cr. 123,997.17		
Work equipment	452,213.15		
GENERAL:			
Organization expenses		291.04	
Taxes	1,053.62		
Interest during construction	4,619.82	10,618.81	
Other expenditures—General		55.00	
	\$2,502,851.48	\$2,350,839.01	\$6,093,901.80
Less amount transferred to "Miscellaneous physical property," due to change in classification		623,969.53	
	\$2,502,851.48	\$1,726,869.48	\$6,093,901.80

*Balance covered by outstanding C. St. L. & N. O. R. R. Equipment Trust Series "A."

The following shows the amount advanced during the year to each of the subsidiary Companies, these amounts being included in total advances shown in Table No. 6 of this report:

Chicago, St. Louis & New Orleans R. R.	\$5,676,567.14
Canton, Aberdeen & Nashville R. R.	50,862.26
South Chicago R. R.	Cr. 1,964.85
Blue Island R. R.	1,898.65
Dubuque & Sioux City R. R.	188,747.36
Kensington & Eastern R. R.	12,323.99
Batesville Southwestern R. R.	1,121.58
Bloomington Southern R. R.	1,589.95
Johnston City Southern R. R.	48,679.80
Benton Southern R. R.	72,500.33
Herrin Northern R. R.	1,358.76
Fredonia & Reeds R. R.	40,216.83
Total	\$6,093,901.80

PHYSICAL CHANGES

Substantial improvements were made in the physical condition of the Company's road and equipment during the year.
 Below is a statement as to the more important improvements, the cost of which was charged either wholly or in part to Road and Equipment.

ROADWAY AND STRUCTURES:

During the year 90 pound new steel rail was laid on 262.23 miles of track, and second-hand steel rail was relaid on 62.74 miles, all of which replaced rail of lighter pattern.
 Ninety-nine new industrial tracks were built or extended, making a net addition of 7.46 miles after allowing for industrial tracks taken up.
 Four hundred and one new Company sidings were built or extended; allowing for tracks taken up there was a net addition for the year of 69.54 miles.
 The second main track between Fulton, Ky., and Memphis, Tenn., which was referred to as being in the course of construction in last year's report, was completed.
 In order to facilitate the handling of coal traffic a double track connection was installed between the junction of the Carbondale and Johnston City Districts, near Cambria, Ill., the length of track constructed being 1.34 miles.

A cut-off was built from Fredonia, Ill., on the Carbondale District to Reeds Junction, Ill., on the Johnston City Branch, a distance of 1.77 miles. This involved the abandonment as first main track of 6.64 miles of line between Fredonia, Ill., and Carbondale Junction, Ill.
 The second main track at Parkway, Ill., was extended to Broadview, Ill., a distance of 2.46 miles, and additional side tracks were constructed for the purpose of handling passenger traffic to and from Speedway, Ill., the site of the new automobile race course a short distance east of Broadview, Ill.

At Paducah, Ky., the freight yard was added to by the construction of 6.28 miles of sidings. The freight yard at Fulton, Ky., was increased 6.59 miles.

The reduction of grades between Paducah, Ky., and Princeton, Ky., and the enlargement of yard facilities at the latter point were continued and were practically completed at the close of the year.

The elevation of the tracks at Memphis, Tenn., as also the construction of the new passenger facilities at that place, referred to in previous reports, were completed. The raising of tracks and relocating of main line in connection with levee improvements being made by the city authorities in North Memphis, Tenn., were undertaken during the year and are about half completed.

The grade crossing elimination work at Grand Crossing, Chicago, Ill., track elevation work between 79th Street and 116th Street, Chicago, Ill., and through Cicero, Ill., also grade revision at Mattoon, Ill., were still in progress at the close of the year.

The work of strengthening the Cairo Bridge so as to be able to operate heavy locomotives over it was performed during the year.
 An interlocking plant was installed at Aulon, Tenn.

New station buildings were erected at Grand Crossing, Chicago, Ill., Marion, Ill., Buckner, Ill., Toone, Tenn., and Masonville, Ia., and others are in course of construction at Storm Lake, Ia., and Millwood, Ky. A new freight house was erected at Starkville, Miss.

The freight and passenger station at Winona, Miss., was enlarged and improvements made to the station building at La Salle, Ill.

New water plants were installed at Obion, Tenn., and Dyersburg, Tenn. Water stations were improved at Storm Lake, Ia., Rock Rapids, Ia., Sioux City, Ia., De Koven, Ky., Cecilia, Ky., Fulton, Ky., McComb, Miss., and Crystal Springs, Miss. New steel water tanks of 100,000 gallon capacity, replacing wooden tanks, were installed at Dubuque, Ia., Central City, Ky., and Jackson, Miss.

New mechanical coaling plants were erected at Amboy, Ill., and Jackson, Miss. At Harahan, La., new coal handling facilities were installed for transferring coal from cars to barges.

New mechanical buildings, consisting of car repair shed, sand house, six stall roundhouse, power house, oil and store house, were erected at Princeton, Ky., and a five stall roundhouse and machine shop, store and oil house, sand house, and car repair shop and shelter were built at Jackson, Miss. The plant within the city limits at the latter place was abandoned.

New 85-ft. steel turntables were installed at Princeton, Ky., Dyersburg, Tenn., Noncannah Yard, Memphis, Tenn., and Jackson, Miss. A second-hand 66-ft. turntable was put in at Kenner, La.

One hundred and sixty-two miles of electric automatic block signals were constructed at various points and placed in operation. There were 1,262.4 miles of protected track at the close of the year.

Electric block signals are being installed between Branch Junction and Centralia, Ill., 4 miles; Marine to Glen Carbon, Ill., 13.7 miles; Coleman to Plato Center, Ill., 11.5 miles; and Mona to Benson, Ia., 10.7 miles; a total of 39.9 miles.

6,063 lineal feet of permanent bridges and trestles were constructed, replacing timber and pile bridges, trestles, and embankments.

1,501 lineal feet of permanent bridges and trestles were rebuilt or replaced by embankments.

29,402 lineal feet of timber and pile bridges or trestles were rebuilt or replaced by embankments.

EQUIPMENT:

Fifty Mikado type freight locomotives and twenty-five switching locomotives were added during the year, and sixty-eight locomotives were disposed of, resulting in an increase of seven locomotives, and an increase in tractive power of all locomotives as compared with the previous year of 1,181.65 tons.

One hundred and one passenger-train cars were acquired and thirteen were sold, destroyed or transferred to other service, making a net increase of eighty-eight cars.

Nine thousand three hundred and thirty-two freight-train cars were added during the year; six thousand four hundred and nineteen were new cars and two thousand nine hundred and thirteen were cars purchased from the Central Fruit Dispatch; four thousand nine hundred and sixteen cars were sold, destroyed or transferred to work service, leaving a net increase of four thousand four hundred and sixteen cars. The average capacity of cars owned at the close of the year was 41.46 tons as compared with 41.52 tons last year. The total capacity of cars was 2,647,730 tons this year and 2,467,995 tons last year.

GENERAL REMARKS

Your Company during the past year has suffered from the depression in business prevalent throughout the country, and this has been most pronounced on the lines south of the Ohio River.

The crops in the territory served by your Company's lines were generally good; but the practical discontinuance of lumber exports and the general depression in the building trades seriously affected the lumber business; this, together with the low price received by cotton growers for their product, not only affected the revenue your Company received from the transportation of lumber, but also, in connection with both commodities, had a depressing effect on the revenues from the transportation of general merchandise and on passenger travel.

The substantial amounts expended by your Company during the past few years in additional facilities, as well as in the upkeep of existing tracks and structures, together with the acquisition of a large number of new locomotives of increased tractive power and cars of greater capacity than those formerly in service, enabled your Company to curtail its expenses in line with the decrease in revenue. As a result, while the total railway operating revenues decreased 6.34 per cent, the ratio of railway operating expenses to railway operating revenues was 77.10 per cent this year as against 77.08 per cent the previous year.

Under date of December 1, 1914, an equipment trust, known as the "Chicago, St. Louis and New Orleans Equipment Trust, Series 'A,'" was made in the amount of \$5,700,000.00 with which to provide funds, in part, for the acquisition of 72 locomotives and 6,500 freight cars. The Illinois Central Railroad Company guaranteed the payment of the trust certificates and entered into an agreement with the Chicago, St. Louis and New Orleans Railroad Company under which your Company became the sub-lessee of the equipment covered by the lease. Under date of April 1, 1915, the Illinois Central Railroad Company issued \$1,980,000.00 of equipment trust certificates known as "Illinois Central Equipment Trust, Series 'C'" for the purpose of paying, in part, for 75 locomotives and 1,000 refrigerator cars. The equipment covered by both of these trusts was received and placed in service during the year.

The Board takes this opportunity of expressing its appreciation to the officers and employees for their loyal and efficient services during the past year.

By order of the Board of Directors.

C. H. MARKHAM President.

GENERAL NEWS SECTION..... 818

*Illustrated.

Many railroad officers other than those in the executive and accounting departments do not realize the scope of the Association of Railway Accounting Officers or the importance of the work which is being done by it. The association has 600 individual members, representing over 280,000 miles of railroad, some express companies and some steamship lines, and has members in the United States, Canada, Mexico, South America, Cuba, Porto Rico, Philippine Islands and South Africa. With the change that has been taking place in the attitude of railroad managements

toward the quantity and quality of the information which they give out about the company's affairs has come an opportunity for the association to make its work better understood and more fully appreciated by the layman. Two little leaflets have recently been published by the association, one setting forth concisely its objects and what it accomplishes, and the other containing abstracts from the comments of some of the members on the work of the association. One thought that runs through all of these comments is that an accounting officer must continually guard against losing touch with the other branches of the service and of the progress being made in the science of his own work. Frank Nay, controller of the Chicago, Rock Island & Pacific, puts this aptly:

Our work is done in offices in the top stories of buildings; rarely do we meet the patrons of the road, and only occasionally meet our own brother officers outside of the circle of a certain half dozen with whom we come in contact regularly; that very fact makes our work more difficult, and it is apt to appear to be drudgery. Without the constantly broadening influences of contact with people outside of our own department, and outside of railroad service, as is the case with nearly all other departments of railroad operations, it is no wonder that we do sometimes become narrow.

The work of the association deserves not only the support of its members but more attention than it is getting from a great many railroad officers in other branches of the service. On the other hand, the association itself can help, and apparently realizes the fact, in making a better understanding between accounting officers and other officers of the railroad possible.

No more complete statistical demonstration of the overwhelming superiority of the railways of the United States over those of the

The Superiority of Railways in United States

rest of the world has ever been made than that afforded by the bulletin just issued by the Bureau of Railway Economics, presenting comparative statistics for the United States and 38 foreign countries, covering 606,000 miles of line, or seven-eighths of the total railway mileage of the world. In the tables published elsewhere in this issue it is shown that with one exception the railways of the United States pay a higher average wage than prevails in any other country, yet with one exception, freight rates per ton per mile in the United States are lower than the rates in any other country. In most other countries freight rates are 50 per cent higher than in the United States, and average wages are 50 per cent less than in the United States. In capitalization per mile of its railways the United States is exceeded by every one of the principal countries of the world. The one important particular in which the railways of the United States are surpassed, from the viewpoint of the public, is in the rate per passenger per mile, and even in this respect, taking into account the accommodations furnished and the service performed, rates in the United States are lower than in any of the countries with which comparison is made. The low fares in many countries are shown to be due to the different character of the service, which is indicated very clearly by the figures showing the great density of low class passenger traffic, such as we do not have in this country, and the average number of passengers per train.

In only one country, Denmark, are so few passengers carried per train as in the United States, where the average is 53, although the trains have space accommodations for many more. In most European countries the number of passengers per train is from 30 to 60 per cent greater, and in India the average reaches 176. Just as the low freight rates in the United States are made possible by the fact that the freight density is greater than in any other country except Germany, and that in hauling 406.8 tons of freight per train the United States leads every other country by a long interval, the low passenger fares in some other countries are made possible by heavy loading—in other words, crowding—of passengers. In fact, in many of the countries where the prevailing fares are

Passenger Fares in the United States and Elsewhere

lower than in this country the passengers are handled very much like freight. Instead of crowding the passengers we crowd the freight. The fact that the freight rates in Germany or Russia more closely approximate our passenger fares than our freight rates, while their fares are nearly as low as our rates for freight, may indicate the relative degree of respect paid to people and to property in a country where the boys are raised to be targets. A Chicago newspaper recently printed a story that about one thousand college students are trying to make arrangements with the railroads to transport them to a football game in Minneapolis in cattle cars, so that the reduction in railroad fares thus obtained will enable the university to have a larger representation at the game and to make its "beef" count in the cheering section as well as in the scrimmage line. The rates which the railroads quote for such an occasion may give us something to compare with the low European fares. Such a proposition ought to appeal to the railroad rate-makers on the theory of charging what the traffic will bear, but the Cummins amendment, which imposes on the railroads full liability, presents a possible obstacle, unless it be held that a college student under such circumstances constitutes a shipment the value of which is concealed by the package, in which case the value could be declared to be "not over \$100." As this scheme is said to have originated at the University of Iowa, railroad men are liable to suspect in it a crafty inspiration on the part of Clifford Thorne, moving in this mysterious way to establish a precedent for lower passenger fares. With the rate once established it might not be impossible to persuade the Iowa legislature to impose some legal requirements as to the service and equipment, such as padding for the interior of the cars or springs for the trucks.

The total amount of time that might be devoted to a study of the big problems that are involved in government regulation of railroads and public utilities by members of the Interstate Commerce Commission and state commissions that is wasted through having to hear complaints that ought never to have been brought is astonishing. The "residents" of Port Ewen, Ulster county, N. Y., recently brought a complaint before the New York Public Service Commission, Second district, against the Western Union because it discontinued the use of a telegraph wire, about a mile long, to that village, and instead of a Morse operator at the village had an agent who transmitted the telegraph messages by telephone to a telegraph office about a mile distant. A local druggist, who was also a telegrapher, had been the company's telegraph operator at Fort Ewen, receiving half the amount taken in as compensation for his work as telegrapher. This amounted to considerably less than the regular wages of a telegrapher. Card—that was the local druggist's name—was so slow in getting his accounts in that the Western Union decided to make a change. Another man was hired to transmit telegraph messages by telephone to the nearest office. Card and other "residents" of Port Ewen brought a complaint before the Public Service Commission. Commissioner Emmet, in dismissing the complaint, calls it a fairly typical one. It is hardly believable, however, that there is not one touch of the unique in this case. When Card was notified that the commission would hold a hearing on his complaint at Albany on a certain date he informed the commission by letter that Albany was inconvenient as a place for a hearing and asked that further public hearings, if any were necessary, should be held at Port Ewen. There is no doubt that one of the important functions which the Interstate Commerce Commission and state commissions perform is to offer an open court where any one's grievance against a railroad or public utilities company can be thrashed out. Might it not be just possible, however, to divide some of the state commissions into two sections, one to hear complaints of the Port Ewen order and the other to study the somewhat broader problems of government regulation and pass on such questions as a two-cent rate for passengers?

A Typical Case

THE PANAMA CANAL AND RAILWAY RATES

THOSE who think of the railways as always demanding increases in rates and quarreling with their customers, the shippers, should take note of the fact that the transcontinental railways recently have been appearing, together with the shippers of the middle west, at a hearing before the Interstate Commerce Commission at Chicago for the second time within a year, asking permission to make further extensive reductions in their rates to the Pacific coast. The purpose of these is to meet water competition via the Panama Canal and to enable some of the middle western shippers, whom Uncle Sam's waterway has left high and dry, to retain some of their former business on the Pacific coast.

This is in spite of the fact that the railways of the middle west, including some of the same lines, are still seeking advances in rates by asking the commission for a rehearing of the western rate advance case. Of course, both the western and the transcontinental groups of roads are trying to increase their revenues, the western trunk lines by advancing rates which they consider unremunerative and the transcontinental lines by reducing rates to a point which will restore to them a part of the traffic they have been obliged to relinquish to the canal route during the past year.

Last fall the transcontinental roads asked the commission to approve reductions in the rates on a list of about 100 commodities which were not low enough to prevent the water lines through the canal from taking business away from them. These were to be made without corresponding reductions to intermediate points. The commission granted the authority asked with some modifications. Now the canal has been in operation for over a year and both the railways and the middle western shippers, as they testified at the hearing, have found that it is necessary to make reductions in the rates on several hundred more commodities, if they are to retain any considerable portion of the business. Ever since the canal was opened the Interstate Commerce Commission has been bombarded with petitions and letters from shippers in the middle west for some relief from a condition under which their competitors on the Atlantic seaboard have been given such low rates by water through the canal that they can undersell the shippers in the Mississippi valley who are dependent on the through rail routes to the coast. The railroads could not, without the permission of the commission, reduce their rates to the coast without at the same time reducing their rates and revenues on traffic to intermediate points not subject to the water competition. These petitions and letters the commission turned over to the railroads and from March 1 until September 1 a committee of representatives of the transcontinental lines was in session at Chicago hearing the stories of shippers whose business has been hurt by the canal.

The result has been the presentation of a petition for relief from the commission's fourth section orders, similar to that granted in connection with the application of last fall—relief which would allow reductions to the coast without proportionate reductions to interior points on a large number of additional commodities.

It was testified at the hearing that many commodities which have never before been considered subject to water competition are now moving almost entirely by water; that during the past four months 42 vessels have been operated through the canal westbound with general cargoes between the Atlantic and Pacific ports of the United States; and that in the first 11 months after the opening of the canal the tonnage of this class of traffic had amounted to 900,000 tons, substantiating the estimate made by the roads last fall that it would amount to 1,000,000 tons a year. A large number of shippers who appeared at the hearing described in detail how their business was being affected, and asked that the reductions be allowed, while the representatives of western intermountain cities were on hand to protest against any reductions in the rates to the coast, unless they are to be given similar concessions.

The controversy over transcontinental rates now presents very much the same features that it always has during the quarter of a century it has been before the commission. The interior cities always have been at a disadvantage as compared with the coast cities that have both rail and water transportation, and this disadvantage the government has increased by building the canal. Although the commission a few years ago reduced the difference between their rates and the coast rates, it has not yet been able to give the interior cities the advantages that the coast cities derive from their location on the water. So far as the present case is concerned, if the rail rates are not reduced the business will go to the coast by water, and while the intermountain cities would thus be spared the chagrin of seeing the freight pass by rail on its way to the coast they would be no better off than if reductions in the rail rates enabled some of the business to move by rail to the coast. In fact, it is better for the interior cities to have traffic move to the coast by rail than by water, because the railways do employ people, buy supplies and pay taxes in intermountain communities, while the water lines do not; and, therefore, whatever causes the water carriers to take business from the railways injures the intermountain communities by injuring the railways.

The Panama canal was built by the people of the United States, partly for benefit of the shippers of the United States. As it has turned out, the canal is benefiting only the shippers of the Atlantic and the Pacific coasts, and it is necessary for the railroads to come to the assistance of the remaining shippers to prevent them from being harmed while the shippers on the coasts are being benefited.

SOUTHERN PACIFIC

ABOUT as severe a test as is likely to be applied to a railroad company operating in eight states was applied to the Southern Pacific in the two years ended June 30, 1915. The law of chances would be strongly in favor of prosperity in some of these states—they include the Southwest, Pacific coast and mountain states—in at least one out of two successive years.

Operating revenues for the 10,311 miles of railroad operated by the Southern Pacific in 1913 amounted to \$142,775,000. In 1914, with 111 more miles in operation, operating revenues amounted to \$138,520,000, and in the fiscal year ended June 30, 1915, with 10,554 miles of line in operation, operating revenues amounted to \$129,866,000. Operating expenses and taxes in 1913 amounted to \$98,567,000; in 1914 to \$100,825,000, and in 1915 to \$94,125,115. In 1913 the Southern Pacific earned a surplus available for dividends of \$26,868,000, the equivalent of 9.85 per cent on its stock. In 1915, notwithstanding all the difficulties which it had to contend with in the two years, the company earned \$20,452,000 surplus available for dividends, or the equivalent of 7.50 per cent. The Southern Pacific is paying 6 per cent.

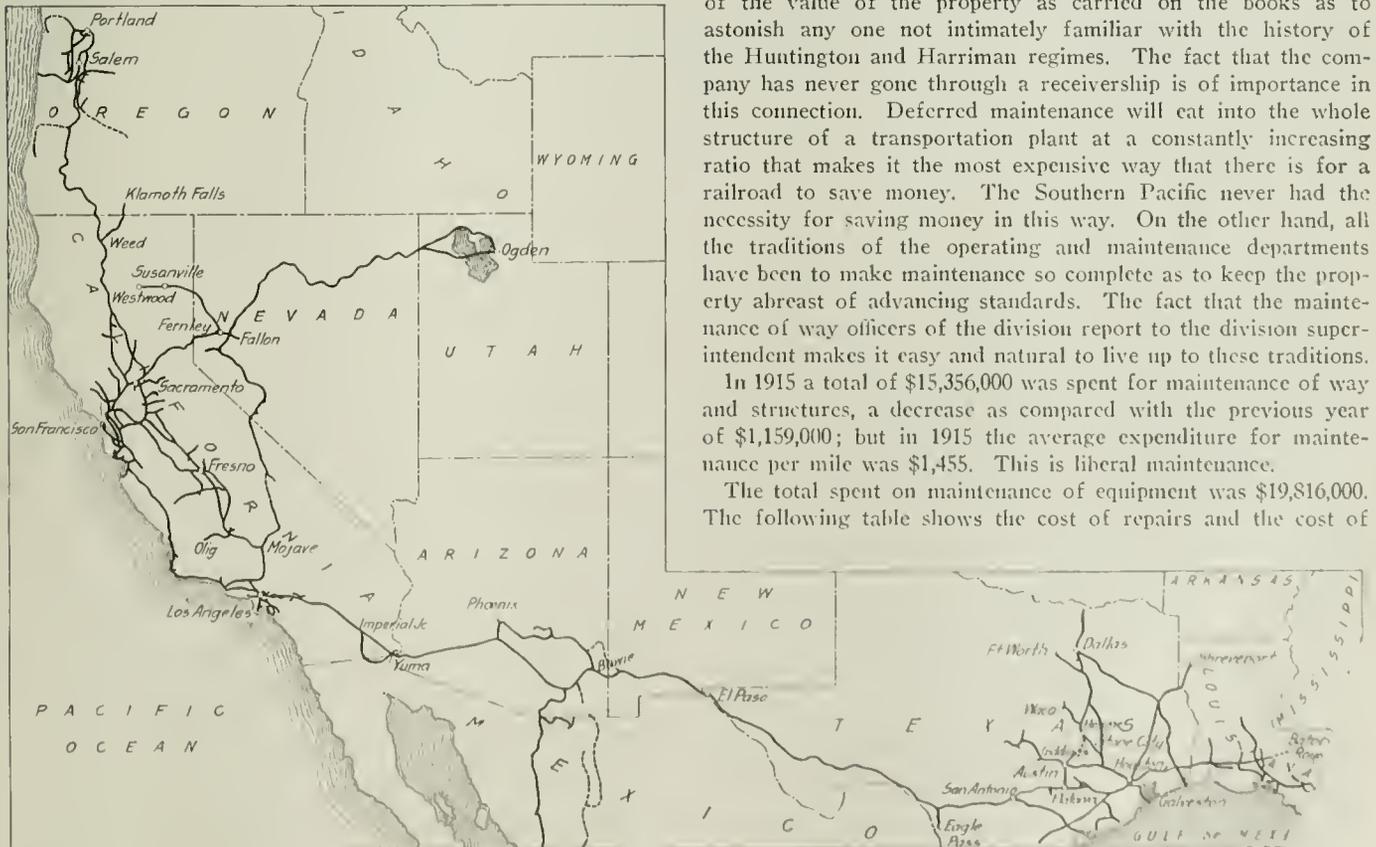

Two years previous to the floods and crop failures of 1914 the Southern Pacific had just finished going through a strike of machinists which would have tried the resources of the strongest of American railroads. In 1915 the prostration of industry, and with it the cessation of all but the most necessary purchases and of all but the most necessary railroad journeys, was a factor which all of the railroads serving the cotton producing states had to face, and while only a small proportion of the Southern Pacific's lines are in the cotton producing states, the loss was considerable. The lumber trade was in as bad a way as cotton. What increase there was in passenger business from the expositions at San Diego, Cal., and San Francisco was more than offset by the effect of the business depression on passenger traffic.

Passenger revenue in 1915 amounted to \$36,865,000, a loss of \$3,550,000, or 8.78 per cent, as compared with the previous year.

The real reasons which underlie the Southern Pacific's ability to get through such a long period of continuously and severely adverse conditions date back to the early history of the company. For years and year Collis P. Huntington poured money back into the Southern Pacific to an extent that it would be almost impossible to determine from the records. What is known of these records, however, leads one to suspect that when the valuation of the Southern Pacific is concluded the cost of reproduction new for that property will be so far in excess of the cost of the value of the property as carried on the books as to astonish any one not intimately familiar with the history of the Huntington and Harriman regimes. The fact that the company has never gone through a receivership is of importance in this connection. Deferred maintenance will eat into the whole structure of a transportation plant at a constantly increasing ratio that makes it the most expensive way that there is for a railroad to save money. The Southern Pacific never had the necessity for saving money in this way. On the other hand, all the traditions of the operating and maintenance departments have been to make maintenance so complete as to keep the property abreast of advancing standards. The fact that the maintenance of way officers of the division report to the division superintendent makes it easy and natural to live up to these traditions.

In 1915 a total of \$15,356,000 was spent for maintenance of way and structures, a decrease as compared with the previous year of \$1,159,000; but in 1915 the average expenditure for maintenance per mile was \$1,455. This is liberal maintenance.

The total spent on maintenance of equipment was \$19,816,000. The following table shows the cost of repairs and the cost of

The Southern Pacific

depreciation and retirements together for locomotives and cars:

	1915	1914
Per locomotive:		
Repairs	\$3,443	\$3,920
Depreciation and retirements	448	309
Per passenger-train car:		
Repairs	682	838
Depreciation and retirements	251	137
Per freight-train car:		
Repairs	81	93
Depreciation and retirements	33	21

The higher charges for depreciation and retirements are made in compliance with the orders of the Interstate Commerce Commission, which require a charge to operating expenses for the depreciation portion of rental paid on equipment, which in 1914 the Southern Pacific charged to income and not to expenses.

Transportation expenses in 1915 amounted to \$44,007,000, a saving as compared with the previous year of \$2,393,000, or 5.16 per cent. The average trainload of all freight was 464 tons in 1915, as against 471 tons in 1914. One reason for the smaller trainload was the greater proportion of unbalanced traffic on the lines east of El Paso. The percentage of loaded freight car miles to total car miles in 1915 on the lines east was 69.22, as against 70.91 in the previous year. There was an increase in the price of locomotive fuel, which resulted in a cost for the fuel used in 1915 \$765,000 greater than would have been the cost for the same quantity of fuel in 1914. To offset this there was a saving of \$450,000 made through the more economical use of fuel. The same amount of fuel in freight service moved 6.83 per cent more gross tonnage in 1915 than in 1914, and in passenger service, 2.85 per cent more gross tonnage.

The total tonnage of revenue freight in 1915 was 31,857,000. The tonnage of all classes of freight, except agricultural products, was less than in 1914, the total in 1914 being 31,960,000. The greatest falling off was in lumber and other forest products, which furnished 4,992,000 tons, or 15.80 per cent of the total tonnage in 1915, while in 1914 these classes of commodities furnished 5,717,000 tons, or 17.89 per cent of the total tonnage. In 1915 products of agriculture furnished 6,881,000 tons, or 21.78 per cent of the total tonnage, while in 1914 they furnished 5,803,000 tons, or 18.16 per cent of the total tonnage.

It will be recalled that in 1914 the United States Supreme Court decided that proven fraud alone could defeat the Southern Pacific's title to its oil lands. Since that decision the attorney general has brought suit to show that there was fraud in the Southern Pacific land case and that because of the fraudulent concealment of its acts by the railroad company the six-year period of limitation does not apply. The chairman of the executive committee says that the institution of these suits does not lessen the confidence expressed last year as to the ability of the company to sustain title to the lands in question. The Supreme Court during the past year decided the case that was brought by the government to compel the Southern Pacific to forfeit its title to unsold lands which had been granted to the Oregon & California Railroad, holding that an injunction should be granted against the disposition of these lands and the timber thereon until Congress should provide legislation for their disposition, "and at the same time secure for the defendants all the value the granting acts conferred upon the railroads."

During the year there was an increase in funded debt of the Southern Pacific and proprietary companies of \$3,832,000, and in non-negotiable debt to affiliated companies of \$4,425,000. There was \$6,080,000 spent for additions and betterments to road and equipment and an additional investment in affiliated companies' securities and in advances to these companies of \$20,559,000. The company had on hand at the end of the year \$16,308,000 cash and demand loans and deposits, which was \$2,863,000 less than at the beginning of the year, with no loans and bills payable and but \$7,693,000 audited accounts and wages payable. For a company doing a business of more than one hundred and a quarter millions this is a particularly good showing for accounts and wages payable.

Mention should be made of the Southern Pacific's safety record. With one exception, no passengers have been killed in

train accidents for six years and 11 months, and during this time 12,046,000,000 passengers were carried one mile. During the year six employees out of 8,664 employed in train service lost their lives in train accidents.

The following table shows the principal figures for operation in 1915, as compared with 1914:

	1915	1914
Average mileage operated	10,554	10,422
Freight revenue	\$80,020,751	\$85,864,379
Passenger revenue	36,864,998	40,414,932
Total operating revenues	129,885,675	138,520,259
Maintenance of way and structures	15,356,356	16,515,452
Maintenance of equipment	19,815,973	21,475,526
Traffic expenses	2,915,010	3,114,348
Transportation expenses	44,006,753	46,400,045
Miscellaneous expenses	2,031,857	2,292,153
General expenses	3,955,027	3,864,742
Transportation for investment—Cr.	327,133
Total operating expenses	87,753,842	93,662,267
Taxes	6,371,273	7,162,625
Operating income	35,689,614	37,695,367
Gross income	53,481,178	53,580,277
Net income	20,570,319	21,257,918
Applied to sinking funds	939,725	805,702
Dividends	16,360,464	16,361,088
Surplus	3,270,130	4,090,128

NEW YORK, NEW HAVEN & HARTFORD

THERE have been numerous instances in the history of American railroads where far too much emphasis has been laid either on the traffic problems of a road or on its financial exploitation to the eventual detriment of profitable operation of the property. In the testimony last week of Charles S. Mellen, former president of the New York, New Haven & Hartford, before the jury which is trying some of the former directors of the company under indictment for violation of the anti-trust law, there was ample evidence that the traffic problems of New England at the time of the formation of the present New York, New Haven & Hartford were complex and difficult enough to tax the resourcefulness of any group of railroad men or bankers. It was not a question of stifling competition but of organizing the transportation facilities of New England in such a way as to meet the competition of Canadian ports on the north, New York and the southern Atlantic ports on the south, and the varying interests of the trunk lines. With this attempt at organization went a series of financial problems of the first magnitude. The result was that these two large problems were allowed to overshadow the importance of the fundamental fact underlying all railroad operation, which is that the business of the railroad is to manufacture and sell transportation of the best quality at the lowest cost.

The financial problems of the New Haven in the last three years have been difficult beyond any conception of an earlier time. The underlying competitive conditions have been just as necessary to meet; but while never losing a grasp on these two factors in the situation, the management has applied itself to the task of more economical operation with results that must go far toward compensating for the almost heart-breaking strain of the last three years.

Total operating revenues in the fiscal year ended June 30, 1915, were \$65,379,000, a decrease as compared with the previous year of \$2,073,000. Operating expenses amounted to \$44,127,000, a saving of \$5,106,000. The New Haven, after paying all fixed charges and without including in its income account interest due it from subsidiary companies, except that which was actually paid, had a net income (profit belonging to the stockholders) of \$2,308,000. Needless to say, stockholders were called on by their directors to leave this net income in the property; but the fact that it was earned is something which should be a gratification to them. More especially is this so because the saving that was made in expenses was in large part in transportation expenses.

Maintenance expenditures were somewhat lower than in the year before, but apparently do not represent deferred maintenance, except in the case of repairs to freight cars. President Elliott frankly points out that the company is somewhat behind in repairs to freight cars and in varnishing and painting of passenger cars and locomotives. As a matter of fact, only 11.26 per cent of all freight cars were in need of repairs, either light

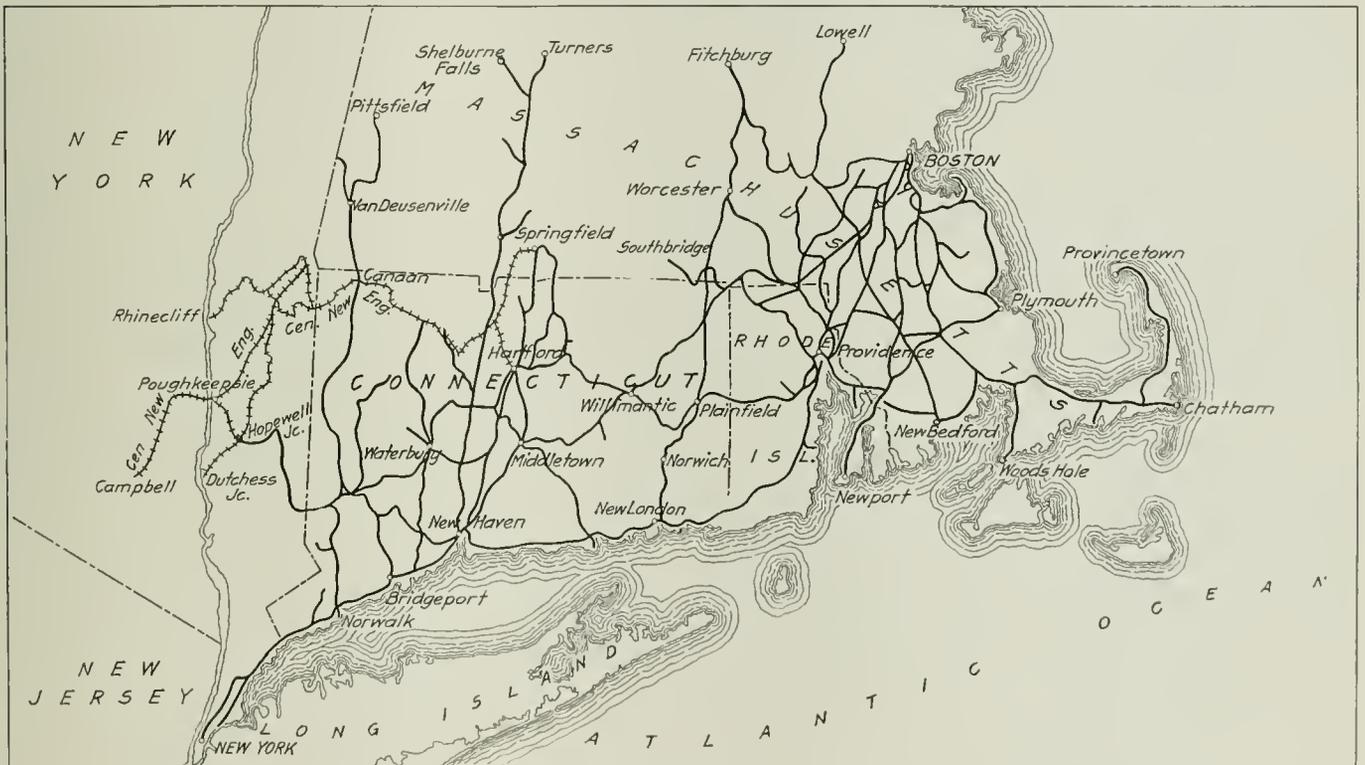

or heavy, at the end of the year, and although this is not as small a number of bad order cars as should be permitted in years of good business, it is not an unusually high one.

Maintenance of way and structures cost \$7,729,000, or \$1,102,000, (12.48 per cent) less than in the previous year. The item in which there was the largest reduction was in maintenance of signals and interlocking plants, which cost \$370,000 in 1915, or \$309,000 less than in the previous year. The fact was, probably, that in 1914 and in 1913 extraordinarily large amounts were spent for maintenance of signals and interlocking plants. The road had had a series of bad train accidents and the management probably felt that insofar as it was possible there would be safety first, cost what it might. There was also a reduction of \$101,000 in the amount spent for rails, the total in 1915 being \$400,000, and of \$156,000 in the amount spent for other track material, the total in 1915 being \$227,000.

Transportation expenses is where the New Haven has been weak for a number of years. It is argued, and correctly so, that

in fuel was due to less train mileage, which is also shown in a reduction in wages of trainmen of \$278,000, the total in 1915 for trainmen being \$2,818,000. Thus, the reduction in trainmen's wages is a little more than 9 per cent and if fuel were in the same proportion there would have been a saving of about \$400,000, leaving \$377,000 to be accounted for in some other way against a total increase in cost of power produced and purchased of \$176,000.

The average trainload in 1915 was 333 tons, an increase of 29 tons, or 9.61 per cent, over the previous year. The average number of freight cars, including caboose, per train was 31.78 as compared with 28.35. President Elliott says: "This is a step in the right direction, but there is much chance for further economies through the purchase of heavier locomotives, in lengthening side tracks, and the creation of better terminal facilities." In other words, the gains made in 1915 were through the more effective use of the old facilities. Other roads, through the introduction of heavier locomotives, have increased their average

The New York, New Haven & Hartford and Its Subsidiary the Central New England

a road with so large a proportion of its business made up of passenger transportation and so large a proportion of the freight business short haul, high class freight, necessarily has high transportation expenses; but that these transportation expenses are capable of reduction has at last been demonstrated. These expenses in 1915 amounted to \$23,959,000. This is a decrease as compared with the year before of \$3,020,000, or 11.19 per cent. The largest saving was made in fuel and in the payments for loss and damage and injuries to persons, and for clearing wrecks. The amount spent on loss and damage and injuries was \$1,413,000, a decrease of \$553,000. Fuel for train locomotives cost \$3,768,000 in 1915, a decrease of \$777,000 as compared with the previous year. The use of electric locomotives for hauling freight trains from New York has been gradually extended towards Stamford, Conn., and this quite surely has helped materially in the reduction in expenses for fuel. If this assumption is right the economies of electric operation are beginning to show themselves. Train power produced cost \$412,000 in 1915, an increase of \$155,000 over the previous year, and train power purchased cost \$190,000, or \$21,000 more than in the previous year. Part, of course, of the \$777,000 saving

trainload by 50 per cent or more. Whether or not the nature of the New Haven's traffic will permit of any such increased trainload as this is too much to say; but that there are large possibilities is evidenced by Mr. Elliott's remarks. As it is now, the New Haven has 1,165 locomotives, and of these, 343 are Moguls, with an average tractive power of 27,427 lb., and 367 are American type, with a tractive power of 17,115 lb. The New Haven has such a large volume of light passenger business, branch line trains, etc., that its American type locomotives can be used to advantage; but the opportunity for increased trainloading by the substitution of Mikados for Moguls and the equipment of more locomotives with superheaters—the New Haven now has 88 locomotives equipped with superheaters—is very large.

Since July 1, 1903, the New Haven has issued \$317,203,000 of its own securities, of which \$87,217,000 has been stock and the remainder interest bearing debt; and \$37,200,000 of bonds and notes of the New England Navigation Company, the New York, Westchester & Boston, and the New York Connecting, making a total of \$364,403,000 of securities, and for all of these securities the New Haven must be responsible, although the guarantee of the Connecting railroad's \$8,000,000 bonds is shared by the

Pennsylvania Railroad. The New Haven received \$388,049,000 for these securities and spent \$171,669,000 on additions and betterments to its own property and to its leased lines and on obtaining securities of leased lines. About \$39,000,000 was spent on the New York, Westchester & Boston; about \$9,500,000 on the New York Connecting, and about \$6,000,000 on the Grand Central terminal, making a total of \$225,971,000 spent on steam railroads and terminal properties. In addition there has been an investment of \$167,000,000 in outside property, including \$100,527,000 spent on trolley lines and their securities.

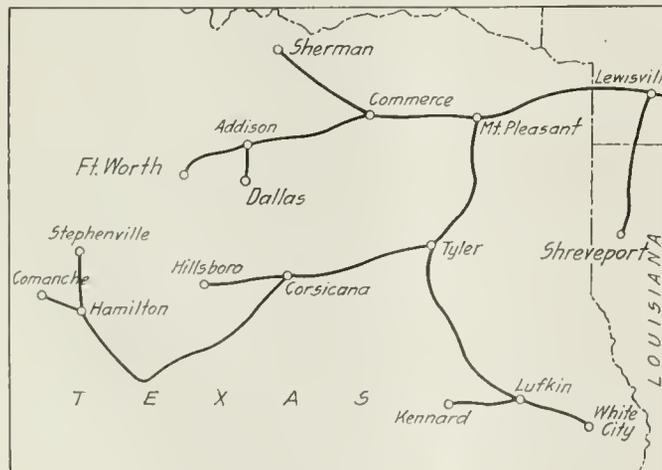

The balance sheet at the end of the year has a credit to profit and loss surplus of \$3,733,000; but as the annual report points out, if under the terms of the settlement of the government suit against the New Haven the company has to sell its trolley and steamship lines at a heavy loss, it may be forced to show a very considerable debit to profit and loss. On the other hand, a physical valuation of the property will pretty surely show very much higher cost of reproduction new than the cost of assets as shown by the books, and it may be that loss on securities which the company will have to sell will be offset, or even more than offset, by the appreciation in its property, as shown by valuation.

The following table shows the principal figures for operation in 1915 as compared with 1914:

	1915	1914
Average mileage operated.....	2,003	2,046
Freight revenue	\$31,179,310	\$32,476,640
Passenger revenue	27,010,799	27,643,836
Total operating revenues.....	65,379,264	67,452,594
Maint. of way and structures.....	7,729,241	8,831,064
Maintenance of equipment.....	9,780,330	10,392,278
Traffic expenses	473,368	502,020
Transportation expenses	23,958,702	26,978,871
Miscellaneous expenses	592,054	614,447
General expenses	1,611,243	1,924,120
Transportation for Investment—Cr.....	18,314	9,790
Total operating expenses.....	44,126,624	49,233,010
Taxes	2,743,921	3,578,444
Operating income	18,500,888	14,641,138
Gross income	24,357,133	22,471,648
Net income	2,307,971	268,662

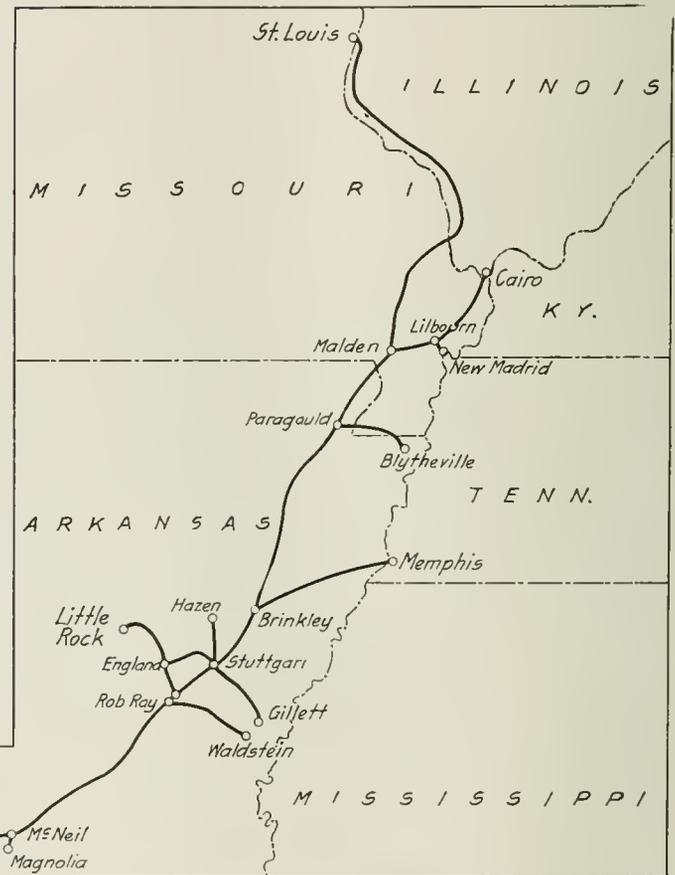

ST. LOUIS SOUTHWESTERN

OF the total tonnage carried by the St. Louis Southwestern only about 12 per cent is made up of cotton, cotton seed and cotton seed products. While there was a decrease in the fiscal year ended June 30, 1915, of 7 per cent in the tonnage of cotton and 9 per cent in the tonnage of cotton seed, there was a 16 per cent increase in the tonnage of cotton seed products, so that the total tonnage of these three commodities was about 297,000 tons in 1915, as compared with 309,000 tons

road, earned \$10,628,000. This is less by \$2,164,000 than the revenues in 1914, and amounts to a decrease of 16.92 per cent as compared with the year 1914. The number of passengers carried one mile totaled 88,411,000 in 1915, a decrease as compared with the previous year of 22.15 per cent, and the ton mileage of freight totaled 747,474,000, a decrease of 9.95 per cent. Furthermore, the receipts per passenger per mile averaged 2.29 cents in 1915, or 2.14 per cent less than in the previous year, and the receipts per ton per mile averaged 1.06 cents, a decrease of 5.36 per cent, as compared with the previous year. With this reduction in business to be handled the company's transportation expenses amounted to \$3,809,000, or 8.29 per cent less than in the previous year. The total saving made in expenses was \$1,473,000, of which \$344,000 was in transportation expenses. It will be seen, therefore, that the greater part of the cut in expenses was made in maintenance.

Maintenance of way and structures cost \$1,586,000 in 1915, or

The St. Louis Southwestern

\$351,000 (18.13 per cent) less than in the previous year, and maintenance of equipment \$2,076,000, or \$587,000 (22.03 per cent) less than in the previous year. President Britton states quite frankly that a considerable portion of the saving in maintenance of equipment expenses is due to deferred repairs of freight cars, which with the smaller traffic were not needed in service. The fact also that the company received 2,120 new freight cars early in the year made it easier to store bad order cars and allow their repairs to await better business.

The St. Louis Southwestern did not reduce its passenger service in anything like the proportion of the reduction in business. It is almost never possible for a railroad to cut off passenger service in full measure with the loss in passenger mileage, but the Southwestern runs only two passenger trains each way a day on most of its lines. Its service is highly competitive and to cut off one of these trains was considered to be out of the question. On branch lines the passenger service consists of a mixed train each way each day and this service cannot

in 1914. The direct loss, therefore, from an unprecedentedly bad year for the cotton growers of the territory served by the St. Louis Southwestern was not serious; but the indirect loss to the railroad, due to the loss of purchasing power of the cotton growers and the economies both in traveling and in purchases, hit the railroad hard.

In 1915 the St. Louis Southwestern, operating 1,754 miles of

very well be cut. There was a reduction of 6 per cent in passenger car miles and of 17 per cent in parlor and observation car miles, but a very large increase in the mileage of dining cars—from 314,000 miles in 1914 to 794,000, or one and a half times as many more. Competitive conditions through the Memphis gateway were such as to make it advisable, the management thought, to change from a buffet parlor car to a full dining car service.

For the first time the company began running motor cars and a total of 238,000 miles was made by these cars. Much of this service was necessary to forestall orders of the state commissions for putting on passenger trains, the service rendered by the motor cars being just as satisfactory and the saving, as compared with the cost of running steam trains, being quite considerable.

This decision not to reduce passenger service accounts pretty surely in large measure for the failure to reduce transportation expenses to a greater extent. President Britton also mentions some large judgments for personal injuries which were settled in 1915, although the accidents occurred in a previous year. The total payments for injuries to persons were \$243,000, an increase as compared with 1914 of \$54,000. This was in part offset by a reduction of \$43,000 in payments for loss and damage.

The tons of revenue freight per train-mile averaged 304 in 1915 as against 394 in the previous year, an increase of 3.32 per cent, and the total trainload, including company freight, averaged 345 tons in 1915, as against 338 tons in the previous year, an increase of 2.24 per cent.

The apparently low trainload is due very largely to competitive conditions. For probably three-quarters of the time at least the fast freights out of St. Louis at night could haul from half as much again to twice as much tonnage if the necessities of this service did not preclude waiting to fill out full rating. In connection with transportation economies, however, mention should be made of the results which were obtained in getting foreign cars off the line so as to avoid per diem payments. The miles run per car per day for foreign cars in 1915 was 44.63, as against 40.21 the year before, and the average number of days each foreign car was on line was five in both years, while the average number of days each home car was on foreign lines was 153 in 1915 and 203 in 1914.

The company spent a total of but \$2,783,000 on additions and betterments to its property, of which \$2,048,000 was for additional equipment. Nearly all the money for this additional equipment had been raised in the previous year and at the beginning of the year was deposited in the form of cash. At the end of the year the company had still on special deposit \$383,000 and had current cash on hand amounting to \$676,000, and during the year had borrowed and carried on its balance sheet as loans and bills payable \$1,622,000. The outstanding securities of the company were reduced through the payment of equipment trust certificates by \$350,000.

The prospects for the present year are much brighter. The Arkansas Railroad Commission has approved of rates which went into effect May 20, 1915, which will give the company approximately 7 per cent greater revenue on its Arkansas intrastate traffic than it had been getting under the old rates. The company has petitioned the Interstate Commerce Commission to increase its interstate passenger fares, which it had previously reduced to two cents a mile because of intrastate rates, to three cents a mile, and the Interstate Commerce Commission has permitted increases on hardwood lumber which will give the St. Louis Southwestern from two to five cents better rates per hundred pounds on this commodity. Cotton prices are, of course, much better than they were and the outlook in the Southwest as in the Southeast has been much improved by the restriction in acreage planted to cotton and by more diversified agriculture.

In regard to operating conditions President Britton says: "In order to handle the present volume of traffic more economically, there should be expended on the property, including the Texas lines, as soon as financial conditions justify, about \$1,100,000,

which includes the development of terminals at East St. Louis, Ill., extension of yards at Illmo and Malden, Mo., Pine Bluff, Ark., and other points; re-establishing incline at Birds Point, Mo., washed out by flood; completion of ballasting on the Texas lines from Lavon to Ft. Worth and Addison to Dallas, Tex., a distance of approximately 75 miles; also, the relaying of branch lines with second-hand 75-lb. rail secured from main line where necessary to remove it on account of worn condition. There should be provided at once, however, at least 20 miles of new 75-lb. rail to replace worn rail in the track, and in order to release 56-lb. rail from branch lines for use in industry and business tracks."

The following table shows the principal figures for operation in 1915 as compared with 1914:

	1915	1914
Average miles operated.....	1,754	1,735
Freight revenue	\$7,891,642	\$9,295,143
Passenger revenue	2,030,950	2,659,656
Total operating revenues.....	10,627,861	12,791,904
Maintenance of way and structures.....	1,585,884	1,937,045
Maintenance of equipment.....	2,076,048	2,662,760
Traffic expenses	450,245	505,820
Transportation expenses.....	3,808,827	4,152,925
Miscellaneous expenses	47,770	60,130
General expenses	521,878	515,091
Total operating expenses.....	8,361,154	9,833,801
Operating income	1,682,741	2,356,217
Taxes	581,278	601,883
Gross income	2,909,164	3,424,435
Net income	*280,993	335,771

* Deficit.

MISSOURI PACIFIC

THE Missouri Pacific's report for the fiscal year ended June 30, 1915, furnishes all the information which is available to the general public upon which to base any estimate of the chances for success of the present reorganization plan and is therefore of special interest. The road went into the hands of a receiver since June 30, so that the report for the 1915 fiscal year is made by Mr. Bush as president and chairman of the board and not as receiver.

The company* finished the year with a deficit, after paying interest and rental charges, of \$1,241,000. In 1914 it just broke even. There was a loss of \$1,295,000 in passenger revenue, the total being \$9,865,000 in 1915, and an increase in charges for maintenance of equipment of \$468,000, due to a charge made for the first time for depreciation, which two factors were not offset by a saving in transportation expenses of \$756,000, the total spent on this account in 1915 being \$20,576,000. The operating ratio in 1915 was 73.11 and in 1914, 72.33. If either through increased revenues or decreased expenses, or both, the Missouri Pacific cannot earn more than the \$13,054,000 operating income earned in 1915, the total capitalization on which it could earn 7 per cent would be but \$25,600 per mile on its 7,285 miles of road.

A lower operating ratio might be the result either of a higher average ton-mile rate or decreased expenses per unit of business handled, or both. The ton-mile rate in 1915 was 7.69 mills, comparing with 7.99 mills the year before. In 1915 operating revenues per mile of road amounted to \$7,990. The freight density (revenue ton-miles per mile of road) was 780,000, an increase as compared with the previous year of 3.16 per cent. The passenger density was 67.625, a decrease as compared with the previous year of 10.25. A single-track road with as low a density of freight and passengers as the Missouri Pacific has an opportunity for materially decreasing its expenses per unit of business handled if it can obtain an increase in traffic. This holds good, however, only if the road and equipment are in such shape as to permit of the use of modern methods of reducing transportation expenses. The physical condition of the Missouri Pacific has been very greatly improved under Mr. Bush's management, but any heavy increase in traffic could probably only be handled with the purchase of some new equipment and especially of heavy locomotives. Together with this would have to go further improvements of the roadway and the bridges,

* Except where otherwise specifically mentioned the figures are for the system including with the Missouri Pacific and the St. Louis, Iron Mountain & Southern.

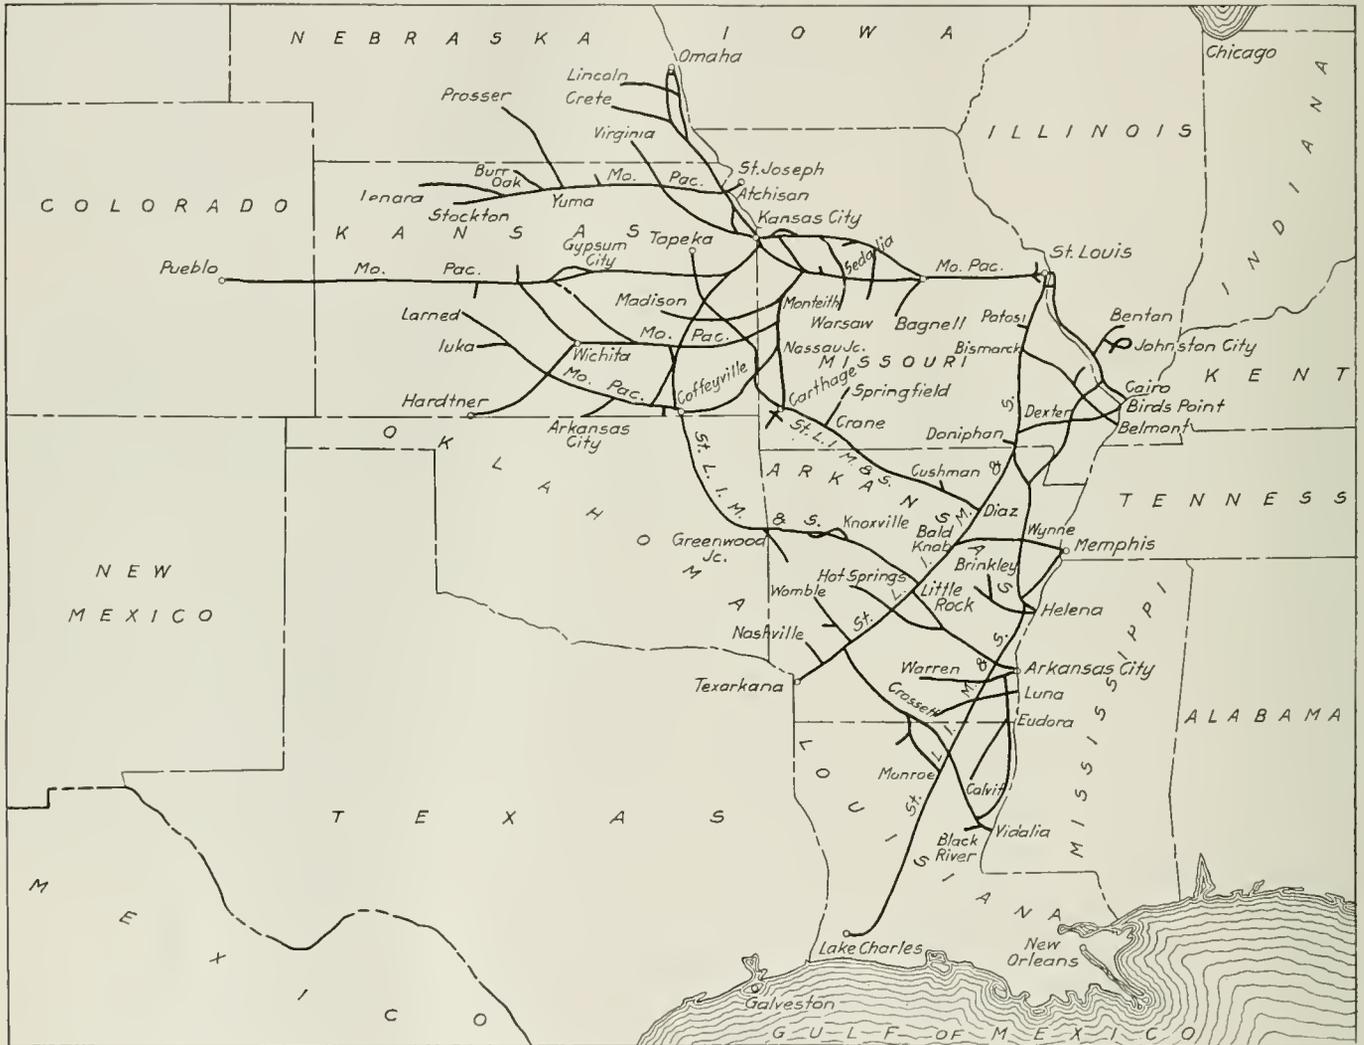

along the lines which have already been laid down by Mr. Bush.

To secure additional traffic, however, the Missouri Pacific has got to get it in competition with the other roads serving the same territory, and the only way that this can be done is through service. It is possible to greatly improve freight service and passenger service and still to reduce operating costs, as has been shown in the case of the Erie, but this means the expenditure of a large amount of additional capital. The Missouri Pacific has the backing of Kuhn, Loeb & Co., New York, which assures strong and adequate banking support, but additional capital expenditures can only be justified by a reasonably safe prospect of earning adequate returns on them.

Under normal conditions the total tonnage of freight for the Missouri Pacific is divided about as follows: Products of mines,

The Iron Mountain serves a territory which is either industrial or whose principal money-making crop is cotton. The Missouri Pacific's territory is agricultural, the chief crops being corn, wheat and oats. The Missouri Pacific's freight revenue in 1915 was \$21,256,000, or nine per cent greater than the revenue in the previous year. The Iron Mountain's freight revenue was \$22,438,000, or 8.43 per cent less than in the previous year. The total tonnage of freight carried by the system was 22,873,000 tons, or 1.75 per cent less tonnage than in 1914. Products of agriculture, however, furnished 4,846,000 tons, or 19.93 per cent more than in 1914. Products of forests furnished 4,411,000 tons, or 15.18 per cent less than in 1914.

Some years ago the criticism could properly be made that the Missouri Pacific was not being operated in such a way as to

The Missouri Pacific System

36 per cent; forest products, 22 per cent; agricultural products, 17 per cent; manufactures, 14 per cent; live stock and meat products, 4 per cent, the remainder being merchandise and miscellaneous. The year 1915 was, however, by no means normal. There was severe depression in the lumber trade and in all lines of business in the south, and, as more railroad annual reports come out, it is becoming more apparent that there was retrenchment and conservatism in buying even in the parts of the country that had unusually large crops. On the other hand, the Missouri Pacific exclusive of the Iron Mountain, serving Kansas, southeast Nebraska and northern Missouri, had the benefit of the traffic furnished by record crops in these states. If we take the income accounts of these two companies separately the adverse and favorable factors in 1915 are at once contrasted.

get the greatest net revenue year in and year out. By this is meant that often a short-sighted policy was pursued as to maintenance to the detriment of possible economies in transportation expenses. So far from this criticism being justified now, the Missouri Pacific is unusually well operated. In 1915 even with the big falling off in lumber, which loads heavily, and the big increase in agricultural products, which load comparatively lightly, the average revenue train load was 417 tons as against 389 tons in 1914, and 294 tons in 1910. With an increase of 3.12 per cent in the total ton mileage, including company freight, there was a decrease of 5.19 per cent in freight-train miles. The larger train load of revenue freight was shown notwithstanding an increase of 4.29 per cent in empty car mileage with almost no increase in loaded car mileage. The number of cars per train averaged

33.26, or 5.25 per cent more than in the previous year. The Missouri Pacific found it possible to cut down some passenger train mileage to meet the large loss in passenger revenue. The total number of passengers carried one mile in 1915 was 492,664,000, a decrease as compared with the previous year of 10.24 per cent. The total passenger train mileage was 11,156,000, or 6.77 per cent less than in 1914.

A study of these figures and of traffic conditions in the territory served by the Missouri Pacific, when taken in connection with the present feeling of investors and bankers toward railroad securities, leads to the conclusion that the Missouri Pacific's only salvation will be better intrastate rates for both passengers and freight and higher interstate rates on at least a considerable portion of its freight traffic, which in turn should lead to a renewal of confidence in the earning power of the property. With the restoration of its credit the company can command a large amount of new capital and put the plant in such shape as to give the most economical operating results.

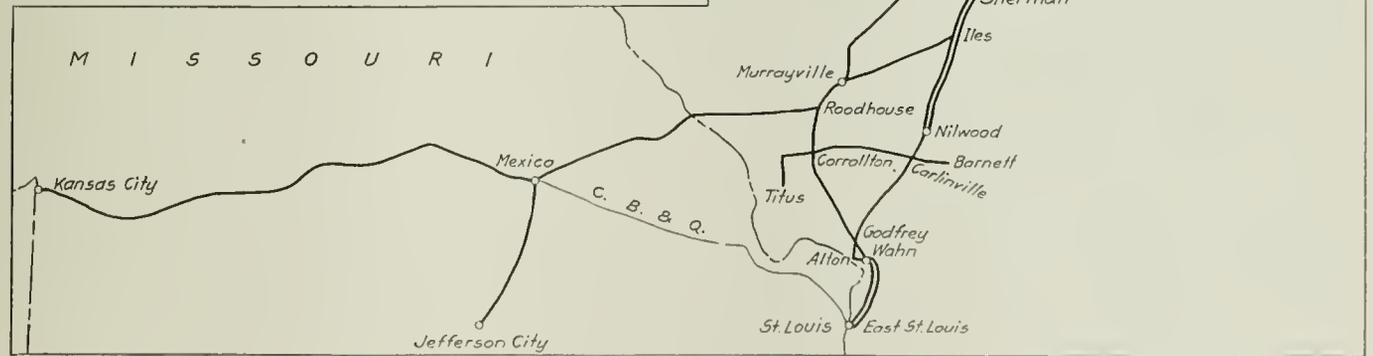

The following table shows the principal figures for 1915 as compared with 1914:

	1915	1914
Average mileage operated.....	7,285	7,285
Freight revenue.....	\$43,683,712	\$43,995,027
Passenger revenue.....	9,864,626	11,159,634
Total operating revenues.....	58,209,306	59,985,731
Maintenance of way and structures.....	8,141,892	8,593,601
Maintenance of equipment.....	10,769,047	10,301,335
Traffic.....	1,417,094	1,330,992
Transportation.....	20,576,420	21,332,567
Miscellaneous.....	192,890	265,195
General.....	1,484,807	1,563,877
Total operating expenses.....	42,559,670	43,387,567
Taxes.....	2,552,429	2,513,432
Operating income.....	13,053,640	14,084,731
Gross income.....	14,156,814	15,215,452
Net income.....	*1,240,546	74,692

* Deficit.

CHICAGO & ALTON

THE Chicago & Alton has made a most unusual showing in a reduction in the direct items of train expense of 12.38 per cent in the fiscal year ended June 30, 1915, as compared with the previous year, despite an increase of 3.20 per cent in freight train mileage, and a decrease of only 1.04 per cent in passenger train mileage. Since the new regulations of the Interstate Commerce Commission in regard to the division of freight

The Chicago & Alton

and passenger expenses were not in effect in 1915, it is not possible to allocate the economies as between these two classes of service. For a number of years very few roads have shown any decrease in transportation expenses per train mile; in fact, almost all of them have shown increases per train mile, due to higher wage schedules, and increased cost of fuel and train expenses, which were increased by the running of longer trains. In some cases the economies effected by heavier average trainloads have offset the increased costs per train mile; in many others they have failed to do so. The Alton shows a very considerable decrease in the transportation expenses per train mile, with, however, a somewhat smaller trainload, the saving in expenses per train mile more than offsetting the loss of tonnage per train, so that the expenses per ton-mile were lower in 1915 than in

1914. The trainload in 1915 was 454 tons, as compared with 479 tons the year before. The transportation expenses per train mile for all classes of service were 75.1 cents, in 1915, and 80.1 cents, in 1914, or a decrease of 7.17 per cent, with a decrease of but 5.22 per cent in the tonnage per freight train.*

The Chicago & Alton operates 1,050 miles of road. It has double track for most of the way between Chicago and St. Louis. On this line the business is highly competitive, and some of it, such as dressed meats and other packing house products, of which the Alton carried 344,000 tons in 1915, has to be carried on a very small margin of profit over and above actual out-of-pocket expense. The line between Kansas City and St. Louis is a single-track line, and is also in highly competitive territory. In the fiscal year ended June 30, 1915, total operating revenues amounted to \$14,246,000, a decrease as compared with the previous year of about \$14,000. The passenger business of the Alton, like other roads in its territory, was adversely affected by the business depression, and the freight business was better than the year before, because of the large tonnage of agricultural products resulting from extraordinarily good crops. Passenger rev-

enue amounted to \$3,840,000, in 1915, a decrease of \$290,000, and freight revenue to \$9,201,000, an increase of \$308,000.

Total operating expenses amounted to \$11,112,000, a decrease of \$1,195,000. This is before the subtraction from expenses of the income account prescribed by the Interstate Commerce Commission—Transportation for Investment—Cr. Incidentally it might be mentioned that the report of the Alton makes a distinction between total operating expenses and net operating expenses, making clear the fact that total operating expenses, in 1915 and 1914, are comparable, and the net figures are not com-

* These figures, of course, do not prove conclusively that transportation expenses per ton mile were reduced, since, as is mentioned above, the transportation expenses are not divided as between passengers and freight; but since the transportation expenses per train mile in passenger service are less susceptible of variation, the strong presumption is that the figures given above do indicate a reduction per ton mile.

parable. The decrease of \$1,195,000 in total operating expenses was the result of a reduction of \$321,000 in maintenance of way, \$355,000 in maintenance of equipment and \$377,000 in transportation expenses. The saving in transportation expenses has already been commented on. The amount spent for materials for renewals and repairs, as distinguished from track labor and the labor for applying these materials, was about the same for ties and rails in 1915 as in 1914. For bridges, trestles and culverts, however, it was very much smaller in 1915, the 1914 expenditures being abnormally high because of the elimination of previously deferred maintenance. There was an average of 285 tie renewals per mile of main track in the year 1915, as compared with 255 in 1914.

Maintenance of equipment cost \$3,335,000, in 1915. The cost of repairs per locomotive, in 1915, was \$3,129, and in 1914, \$3,505; of passenger cars, \$912, in 1915, and \$1,022, in 1914; of freight cars, \$67, in 1915, and \$87 in 1914.

Apparently the condition of locomotives in service was better at the end of the year than at the beginning. There were 93 locomotives out of service at the beginning of the year, in shop or waiting for repairs; at the end of the year there was a total of 73, which included 15 in outside roundhouses undergoing light repairs. At the end of the year the company had 34 locomotives stored, as compared with 28 at the beginning of the year. During the year 17 locomotives and 414 freight cars were scrapped. For heavy power the Alton has 50 Mikado locomotives, and there are two Mallets. There was no new equipment acquired during the year.

A total of \$767,000 was spent for additions and betterments to road, the two principal items of expenditure being \$224,000 for land for transportation purposes, and \$115,000 for shops and engine houses.

The company had on hand at the end of the year \$976,000 in cash, and \$466,000 cash in transit, with \$1,675,000 loans and bills payable. At the beginning of the year there was but \$145,000 loans and bills payable.

One cannot help asking what is going to happen to the Alton. The Union Pacific owns a controlling block of its stock, and if it is possible for good railroading and strong financial support to pull the company out of its difficulties the Alton will come out all right; but, as in the case of other roads in its territory, it is a real and very serious question as to whether, under present rates and present competitive conditions, it will be possible to so improve operating conditions as to make the operation of the property even pay the interest charges on its borrowed money without any immediate prospect of profit to the owners.

There is a cheerful note touched in the discussion of transportation expenses in the following paragraph:

"The increased expense in operation of joint facilities, \$32,508.15, is due principally to the inauguration of Kansas City Terminal on November 1, 1914, although at practically all points where joint facilities are used by this company an increased expense is apparent. This refers not only to transportation accounts but also to both maintenance and general expenses, and is due to a relatively greater share of traffic handled through such joint facilities."

The following table shows the principal figures for operation in 1915 as compared with 1914:

	1915	1914
Average mileage operated.....	1,050	1,046
Freight revenue	\$9,200,547	\$8,892,256
Passenger revenue.....	3,839,893	4,130,289
Total operating revenues.....	14,245,624	14,259,479
Maintenance of way and structures.....	1,647,541	1,968,047
Maintenance of equipment.....	3,334,943	3,689,709
Traffic expenses	436,498	512,128
Transportation expenses	5,216,447	5,593,546
Miscellaneous expenses	115,435	136,814
General expenses	361,520	407,500
Total operating expenses.....	11,112,384	12,307,744
Transportation for investment—Cr.....	39,677
Taxes	508,839	568,938
Operating income	2,660,584	1,382,797
Gross income	2,757,821	1,478,107
Net deficit	1,690,156	2,762,290

Letters to the Editor

IMPORTANCE OF CAB LIGHTS

PUEBLO, Colo.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

Every locomotive should be provided with a cab light in a convenient place to enable the engineman to read his train orders, instructions and time table by night, clearly and without strain, and the proper officer should see to it that such equipment is provided and kept up.

In these busy days, especially on single-track lines, train orders and messages play an important part in the movement of trains, and it is essential that an engineer may be able to read his orders quickly and easily, in order that his attention to the track ahead be not unduly diverted. This particularly where Form 19 is used extensively for orders and trains pick them up without stopping.

The majority of engines on western railways are now equipped with electric headlights, and an auxiliary cab light for the illumination of the steam gage, etc.; but in only a few cases have I found a mechanical department which takes interest in placing a light in a convenient position for the purpose which I now speak of. Too often an engineman has to hold his orders up to a gage light and let the light shine *through* them. In case of a dim carbon it is difficult to read an order in that way.

The proper place for a reading lamp is immediately over the engineman's seat box, with a switch by which it may be turned on or off at will. Some similar provision should be made for use on engines not equipped with electric lights. Such engines as are provided with acetylene lighting can be easily equipped; and where oil lights are used a lamp similar to a gage light can be placed in a convenient position for the engineman's use. The desideratum is a light in such a position that he can conveniently use both of his hands to hold the paper.

WILLIAM E. WATTS
Dispatcher, Denver & Rio Grande R. R.

OROVILLE SIGNALING CRITICIZED

NEW YORK CITY

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

In your editorial note, printed October 8, commenting on the installation, described in your columns, at Oroville, Cal., on the Western Pacific, comprising cab signals to be used without any visual roadside signals, and an automatic stop, you say that it is to be hoped that the world will be given the benefit of the experiments which are to be made with this installation. Well said! There is great need of full and impartial reports of experiments in this line, more thorough than anything that has yet been published. Is the American railroad world going to continue to witness the expenditure every year of good money by the thousands for experiments in automatic train stops which never get anywhere? Will anybody venture to say that the devices which you have noticed in your columns within the last two or three years have swallowed up less than half a million dollars? And what do these investors, who have put up this money, think of their investments?

The railway officers of the country are cautious in their expenditures in this line. But are they not justified in being so? What are the lessons of experience?

The other parts of your comments seem pretty mild. Why not describe the situation just as it is? One of the first requisites in the automatic field is that every device shall detect its own failures; but the National Safety Appliance Company's devices, both the signals and the automatic stopping device, are arranged on the open circuit plan. The apparatus on the engine is complicated and of such design that severe cold weather will probably interfere seriously with its operation. The line circuits required, except for the overlapping features, are practically

the same as for the control of a system of semaphore signals, but the devices installed to give the signal indications in the cab of a locomotive appear to be of such a character that this will cost more than semaphore signals.

The current consumption is apparently in excess of that required for semaphore signals, and there is little in this regard to recommend the National devices.

In the operation of the track transformer, 28, Figs. 1 and 3, on which dependence for applying the brakes on the engine is placed, current must flow through this magnet to induce a reverse current in the engine magnet, and a failure of contact 35 to close when it should, or a failure of relay 9 to pick up its armature through exhaustion of battery 26, or even a cross connection between certain wires of the engine equipment will result in a failure of the brakes to apply when they should. That this open circuit feature is a great and serious objection is obvious, as experience has often shown that it is just at the time protection is most needed that devices are apt to fail. Any one who has tried to get in at the front door late at night and found the bell did not ring on account of the breaking of a wire, or an exhausted battery, will know, without too much explanation, what the objections are, and what are the chances of an open circuit device failing.

Two magnetic devices of the general type of the National Safety Appliance Company's device have been given service applications by roads near New York, although with both of these there was not the chance of failure from the circuits used that there is with the installation on the Western Pacific. Two other devices, one promoted by a prominent Buffalonian and another by a resident of New York state, have been brought to the attention of the railroads and have been given very careful consideration and study; one from a model and the other from an installation approximating service conditions. That the magnetic induction type of apparatus seems to be the most promising is a growing belief of many signal engineers; but that they are prepared either to recommend or to use open circuit devices, which may so readily fail, is a step which does not seem to be warranted by the development and the working of any automatic stopping devices the design of which has been disclosed up to the present time.

The circuit arrangement in your description shows that the brakes are applied by the automatic stop at a point beyond that at which the stop signal is displayed in the engine cab and that an overlap is provided to insure a certain distance in which, it is assumed, there will be length of track sufficient for the train to be brought to a stop before meeting with an obstruction. While it may be satisfactory, from an operating standpoint, to use the overlap on a road having light traffic and one where there are no interlockings, the delay to traffic occasioned by the use of the overlap is such that Eastern roads and those which have a number of interlockings, particularly grade crossing and junction points, have decided that they can not afford the delay to trains that will result through the additional spacing required, and particularly where an automatic stopping device is depended on to enforce the keeping of the overlap distance free of trains.

A number of roads have given the overlap a fair trial and have been forced to give up its use owing to the impossibility of running the desired number of trains.

There is no road using the overlap as a complete installation. On all of those roads where it may be found there are one or two places which are not protected. Complete overlap protection, such as the protection which is provided against running over a misplaced or open switch, as well as where there is a train in the block ahead, may be said not to have been provided by any railroad up to the present time. If the protection is to be such that the stop would be applied at certain places and not at others, so that an engineman running by the signal at a point where the overlap was not provided could cause a collision, even though the stopping device were in use, it would undoubtedly be held by the public authorities that the road was at fault for not having provided complete protection everywhere.

The magnets on the engine clear those on the track three inches, while the track magnets stand one inch above the top of the rail. With most roads it is a requirement that no part of the track apparatus project above the top of the rail and a clearance of the parts on the locomotive of but four inches is not sufficient to insure against damage from contact with objects on the right of way.

Track circuits arranged as are those shown in Figs. 1, 2 and 3, where one rail is common to two circuits, will be found unreliable in operation and should not be depended on for such important service as the control of an automatic stop. It has been found, by extended experience with circuits so arranged, that currents will flow from one circuit through parts of the other under the varying conditions due to poor insulation, broken or loose connections, broken rails, etc., to such an extent as to occasionally cause wrong working of one or the other of the relays of the two connected track circuits.

The action of the dash-pots of relay 9, Fig. 5, may be exceedingly unreliable and irregular under the varying conditions of lubrication, humidity and temperature that will be experienced under general use. If the relay should not operate to close contact 35 no application of the brakes would be made. If a back contact were not made at contact 35 no application of the brakes would be made, although the block ahead might be occupied. It is within the range of possibility and probability that armature 14 of relay 9 may not be lifted at the time the engine magnet passes over track magnet 28. Should this occur no application of the brakes would be made. With but two magnets to be energized, as in this case, it has been found by a certain Western road that to permit enginemen to observe signals returned from the proceed to the stop position, before the engineman should pass the signal, it was necessary to place the signals 220 ft. in advance of the commencement of the track circuit, thus showing apparently that a longer time to operate than has been allowed for is probably desirable.

The use of time-limit relays, cutting off current from the track magnets, would seem to be economizing at the expense of reliable and safe working. The advisability of using the short track sections and slow releasing relays is surely questionable when the expense of installation and maintenance is considered, irrespective of the complications introduced by the use of such apparatus. Time-limit relays, of the pattern shown, do not appear to be nearly as reliable as those of the ordinary free-acting type.

The elimination of wayside signals and the use of cab signals only can not be recommended as good practice, as the engineman's attention is likely to be occupied in observing the signal in the cab and not looking ahead. Eliminating the wayside signals makes it practically impossible to check the display of signals made on the engine; so that in case of collision an engineman need only say the indication called for the action taken by him and there would be no means of ascertaining whether or not he told the truth.

As has been shown by the working of an automatic stopping device on a short section of an Eastern road, where road-side signals have not been installed, it is extremely difficult, if not impracticable, to get satisfactory maintenance, owing to the difficulty that the maintainers experience in locating trouble and determining whether or not the trouble, when apparently located, has been entirely removed.

Again, it seems unwise to place all of the signal indicating apparatus and the automatic stop on the engine where, in case of a failure of any of the essential parts, there would be no information by which the engineman might be governed while the engine was making its run to the end of the division or to a point where repairs might be made. It is a case very much of "putting all of the eggs in one basket," and is very different from that of the ordinary signal installation, where signals are placed along the track. With an installation of semaphore signals a failure generally results in but one or at most a few signals being affected, and the time lost at such places is comparatively short. The movement is readily protected by flagging or by

running at low speed. The results, however, with an installation like Oroville would be very different and would on single track call for sending a flagman ahead of the train for the entire distance to a point where orders for the movement of the train could be obtained or where the train could be run under its time table rights without block signal protection.

I believe I am justified in saying that the conservative signal engineers of the country hold imperatively that an automatic stopping device, in addition to being safe and reliable in its working, shall be operative between the distant and the home signal, and be so arranged that when the engineman is reducing the speed of the train to bring it to a stop at or before reaching the home signal, the brakes should not be applied or the action of the engineman interfered with; but that, however, should the engineman permit the speed of the train to be such, at any point between the distant and the home signal, that the home signal would be run by while it was indicating stop, the device should operate to stop the train. Should the brakes be applied by the stopping device it should not be possible for the engineman to effect their release until the train has been brought to a stop. This method is an essential requisite for practicable and successful operation, if the automatic stopping device is to be put in service on trains as at present run without requiring the use of the overlap. As before stated, complete overlapping protection can not be provided on the average steam surface railroad; and, even if this were practicable, the restrictions to traffic resulting would be such that it would not be possible to move, in a given time, the trains that are now being safely and satisfactorily run through important junction and crossing points.

M. TAINER.

FRENCH PASSENGER SERVICE

PARIS, France

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

The following tables show the make-up and schedule of the Havre-Paris express of the French State Railways, which it may be of interest to compare with similar data for American express trains.

This train runs usually with 19 cars, which are well filled. The cars are mostly of the steel underframe type, fitted with truss rods and are steel sheathed. They are steam heated and have Westinghouse air brakes, but no air signal system. Second class is equivalent to our day coach, the character of the third class being such that it would not be put up with in America.

For a while this train was hauled by ten-wheel locomotives, but it is now hauled by Pacific type locomotives, as before the completion of the bridge over the Seine at Rouen [described in the RAILWAY AGE GAZETTE of September 24, page 564] Pacific locomotives could not be operated to Havre.

RIPLEY, E. P.

An Ode to the President of the Santa Fe on the Occasion of His Seventieth Birthday

By FRANCIS W. LANE

Through desert and canyon and mountain and plain
 The Santa Fe follows the trail;
 Prunes and lemons it takes
 From Pacific to lakes,
 And thereby accumulates kale.
 But when Ripley, E. P.,
 Came up to the tee,
 Though he didn't play golf much—not yet—
 According to Poor,
 Four millions or more
 And big D, represented its "net."

When the line was first built from the lakes to the sea,
 Outgrowing Topeka and Kansas,
 South and West, wild and woolly,
 Liked the road; it was bully!
 And everyone dreamed of bonanzas.
 Its patrons had class,
 For each rode on a pass;
 Every greaser had one in his hat;
 If you offered a ticket
 That was bought through a wicket:—
 "Blast my eyes," said the con.; "What is that?"
 When Ripley, the wizard
 With brains and with gizzard,
 Took hold twenty winters ago,
 The whole of its stock
 Was just out of hock—
 For the road was quite busted, you know.

Now this is the course that Ripley pursues:—
 He is leary of those of the Street;
 When Wall Street beguiles
 This canny boy smiles
 And replies in a manner discreet:—
 "I'm busy with whacks
 On old Brass Tacks
 When the hammering seems to be good;
 And it's best for the health
 To accumulate wealth
 By industriously bisecting wood.

"It is not good when the railroad man
 Cahoots with those on the Street;
 When the railroader blows
 The whole Street knows
 And prepares itself for a treat;
 At the end of the score
 The Street's back door
 Has a heap of bones nearby;
 For the railroader's meat
 Has been pickled to eat
 And his hide hung up to dry."

So, at three-score and ten we congratulate him
 And the road whose Moses he's been;
 Since his drives are still strong
 May his course yet be long
 To the clubhouse over yon on the green;

May he stick to the game and keep up his form,
 For lo! these many more moons;
 May he gather much kale
 For the Santa Fe trail
 Out of lemons and livestock and prunes!

Elimination of the Tower Grove Crossings, St. Louis*

A Complicated Grade Separation Problem Was Solved Recently by the Missouri Pacific and the Frisco

By E. L. WONSON

Bridge Engineer, Missouri Pacific, St. Louis, Mo.

The tracks of the Missouri Pacific and the St. Louis & San Francisco lie closely adjacent from the St. Louis union station westward nearly to the city limits. Between Grand avenue and Kings Highway boulevard, a distance of 1½ miles, the only main thoroughfares for north and south traffic are Tower Grove and Vandeventer avenues, which intersect at an angle of 52 deg. at the point of crossing of the railways.

The general location of the railways and streets is shown on the accompanying map. At Tower Grove avenue the Oak Hill branch of the Missouri Pacific diverges from the main line. This is a double track belt line connecting with the main line of the St. Louis, Iron Mountain & Southern in South St. Louis and is used by all St. Louis passenger trains over the Iron Mountain, as well as by a considerable industrial switching service. This line crosses the Frisco at grade. Connecting with

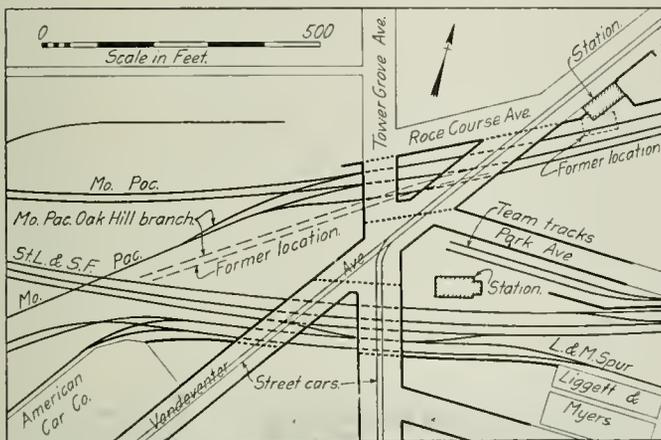

as by a long ascending grade on the Oak Hill branch, a short distance south.

The question of eliminating these crossings was first taken up by the city in 1905, on a basis of track depression. After further study, however, by the Board of Public Improvements of the city of St. Louis, and the engineering departments of the railways, an agreement was arrived at early in 1907 on the basis of street depression. Ordinances embodying this agreement were rejected by the Municipal Assembly in 1908, considerable popular opposition having developed to what was called the "tunnel plan."

New ordinances, requiring depression of tracks under the existing street levels, were passed in April, 1909, requiring an approximate expenditure of \$3,000,000, as compared with about \$500,000 for street depression. They were considered by the railways as unduly oppressive and by the industries as destructive of their railway connections, and it became necessary to determine the rights of the parties in court.

The ordinances were upheld by the St. Louis Circuit Court, and appealed to the Supreme Court of Missouri, which in a unanimous opinion, handed down in December, 1912, held in brief that, while the city had power to require elimination of the crossings and to prescribe the general method, as by track or street depression, the ordinances in question were void, both as being unreasonably burdensome in their requirements and as not having originated as prescribed by the city charter.

Meanwhile the present management of the Missouri Pacific had assumed charge of the property, and general plans and

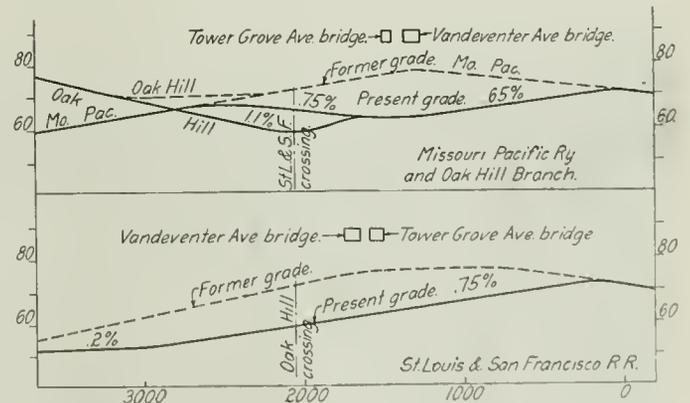

Location Plan at Tower Grove and Vandeventer Avenues

the Oak Hill branch, the Missouri Pacific also has a track crossing the streets south of the Frisco tracks and leading into the plant of the Liggett & Myers Tobacco Company, it in turn being crossed at grade by two Frisco connections to the plant of the American Car Company.

With the development of this section of St. Louis by industries, stores and residences, together with the rapid growth of a large residence territory to the south, served by Tower Grove and Vandeventer avenues as through thoroughfares, the street traffic over the crossings become continually heavier, amounting in 1909 to approximately 400 street cars, 2,400 vehicles and 6,000 pedestrians per 24 hours. Protection by gates and watchmen was afforded for some years prior to the elimination of the crossings. Both railways maintain passenger stations at Tower Grove at which practically all passenger trains stop; this, although contributing largely to freedom from serious accidents, increased the inconvenience and delay to street traffic by the necessity of occupying the crossings during stops. The total train movements over the crossings average 250 per 24 hours, of which 100 are passenger trains.

The main lines of both railways rise to a natural summit at Tower Grove, while the intersecting streets are practically level, indicating the possibility of a separation of the crossing, either by street depression as less costly, or by track depression as removing the summit in the railway profile. Actually the track depression is limited by considerations of economical adjustment and practical operation of important industry connections, as well

Profiles of the Missouri Pacific and the Frisco at Tower Grove

estimates were prepared for six different methods of elimination, of which one contemplated partial depression of tracks and elevation of streets, being the general method finally adopted.

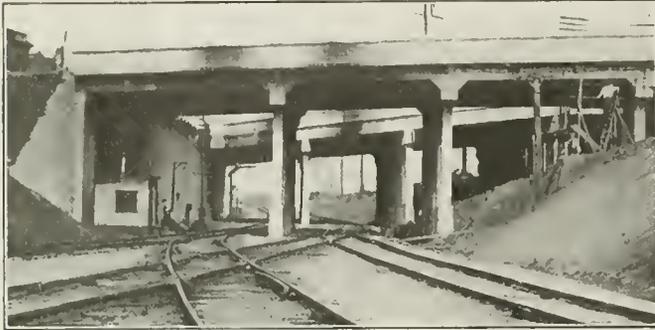

Immediately following the Supreme Court decision of December, 1912, the Board of Public Improvements called a conference with the railways, and announced a preference for partial track depression and street elevation as a basis of elimination. The details were worked out for a new ordinance rapidly, which was passed and approved in March, 1913, and formally accepted by the railways. Actual work was started on November 1, 1913.

ADOPTED PLANS

The streets were elevated 13 ft. over the tracks on reinforced concrete bridges, the tracks being depressed 13 ft. to afford a 22-ft. clearance above top of rail. The filled street approaches are on 3¼ per cent grades with retaining walls along the street lines, except where abutting property is raised to conformity with the new street grade.

* Abstract of a paper presented before the St. Louis Engineers' Club.

The railways endeavored to induce adjoining property owners to raise their buildings and lots, offering to provide the necessary filling, and pointing out that the expense of restoring the property to the street grade would constitute a definite and easily-adjusted claim for damages. Several owners proceeded along these lines, but the majority preferred to await a definite adjustment with the city, which, under the ordinance, assumed

West Elevation of Viaduct Over Missouri Pacific Tracks

the damages. The city officials were successful in making such an adjustment in a number of cases, and under waiver of damages, raised the buildings and built retaining walls at the rear of the lots, the railways providing the filling.

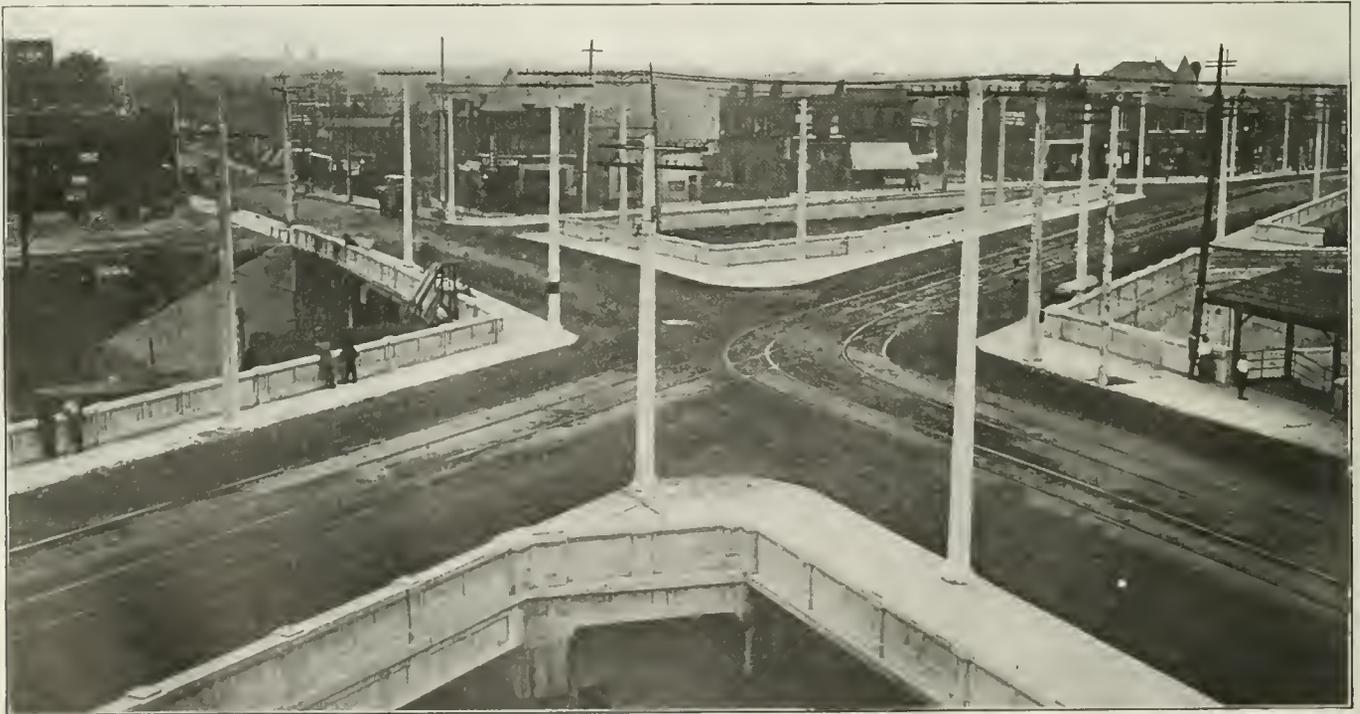

A profile shows the former and present railway main line grade lines with the summit lowered by the depression. The most unsatisfactory features as to gradient are found on the tracks leading into the Liggett & Myers Tobacco Company and American Car Company, upon which, although depressed as far as practicable into the plants, grades of from $2\frac{1}{2}$ to 3 per cent are required, which add materially to the expense of operating and maintaining these connections.

have rectangular columns and footings spaced about 12 ft. center to center. The columns are 18 in. by 24 in. and 20 in. by 24 in.; they are joined at the tops by cross girders supporting the deck beams, and at the bottoms by continuous diaphragms extending to 4 ft. above the top of rail, serving primarily as a guard against damage to the bridge from derailed equipment. The footings of bents and abutments are designed for a maximum pressure of $2\frac{1}{2}$ tons per sq. ft. on the firm yellow clay found at this point. At Vandevanter avenue the angle of intersection between street and railway is only about 27 deg. at the Missouri Pacific tracks, and $42\frac{1}{2}$ deg. at the Frisco tracks; consequently the deck beams are built normal to the bents, and are supported with the deck slab at the street lines by fascia girders from 26 to 72 ft. long, those over 35 ft. being steel plate girders encased in concrete. The abutments of the Frisco bridges are of gravity section, while for the abutments and connecting retaining walls of the Missouri Pacific bridges, a reinforced counterfort type is used on the north side, and a bent and slab design on the south side.

At Race Course avenue, requirements of street width at the elevated level and track room at the depressed grade, necessitated the use of cantilever brackets for supporting the sidewalk and concrete rail along the retaining wall, between the Tower Grove and Vandevanter bridge abutments. As the face of the retaining wall and the street line are not parallel, the overhang of the sidewalk slab is variable throughout.

With the exception of Park avenue, which is paved with granite blocks, the elimination ordinance required all streets affected by the work to have creosoted wood block paving on a concrete base, full width concrete sidewalks, steel curbs on the viaducts and granite curbs on the approaches.

Material changes were required in the brick station buildings of each railway. It was decided to relocate the Missouri Pacific station at the new street grade on a slightly different location. New foundations were built in trenches down to the depressed

Overhead View of the Viaduct Looking North

A photograph shows the finished street bridges, which, with their limiting abutments and retaining walls, form an X-shaped structure with a section of solid fill at the central portion between the railways. The construction, except the abutments of two bridges, is of reinforced concrete throughout, consisting of a beam and slab deck resting on abutments and intermediate bents and forming four and five spans as shown. The bents

track level and partly under the building, which was kept in service until the new foundation walls were brought up to the former street level. Station service was then transferred temporarily to two large box car bodies fitted up for the purpose, location and the foundations completed. The Frisco station has been maintained without change in level or position; it was underpinned with new foundation walls to the depressed

level and stairway connections to street and tracks were constructed.

DIVISION OF COST

The elimination ordinance provided that the construction cost, including the relocation of municipal sewers and water mains, should be assumed by the railways, and the damages to abutting property, by the city. The expense of rearranging utilities other than those municipally owned, such as street car tracks, gas mains, conduits, wires, etc., was assumed by the proprietary interests. Prior to starting work, an agreement was reached between the two roads whereby each should build the viaducts over its own tracks and the approaches thereto; this agreement also provided for a specified division of the work of raising Park avenue and those portions of Tower Grove and Vandeventer avenues between the tracks. There resulted a distinct division of the work on the basis of location, except as to the construction by the Missouri Pacific of two spans over its Liggett & Myers spur south of the Frisco tracks and of the retaining walls and building underpinning required by its depression. With the exception of these latter items and of the raising and moving of its station building, the Missouri Pacific handled all work with its own forces. The Frisco performed its track depression and rearrangement with its own forces and the remainder of its work by contract.

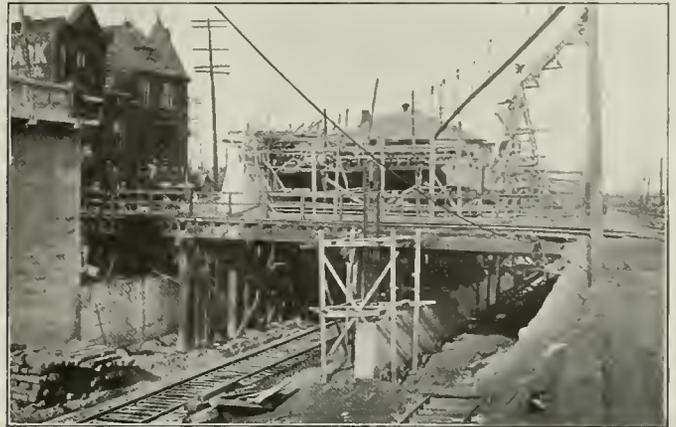

CONDUCT OF THE WORK

Owing to the considerable volume of street traffic and the absence of other crossings in the vicinity, it was necessary to provide for maintenance of street traffic throughout the construction. The plan carried out involved closing the two west legs of the "X," that is, Tower Grove north and Vandeventer avenue south of the intersection, the plan being to complete the elevation of these sections and turn street traffic over them, permitting in turn the closing and elevation of the other two legs of the "X."

In making the Missouri Pacific track depression, the two main tracks were first thrown over to the south side of the right of way, and a steam shovel cut was started as wide as practicable along the north side from the west end of the depression. In the vicinity of the streets the cut was widened to include

street, sufficient width could not be left between the operated surface tracks and the edge of the excavation for the proper accommodation of passengers and the handling of baggage and a temporary platform 500 ft. long was built along the tracks for this purpose, connection with the station being provided by a temporary foot bridge over the excavation.

A permanent track was then laid in the excavation, to which

Construction View. Temporary Crossing of Street Car Tracks Over Missouri Pacific Westbound Tracks and at Grade with Missouri Pacific Eastbound Track

westbound Missouri Pacific traffic was transferred, the temporary street bridge at Vandeventer avenue being raised about 4 ft. to provide overhead clearance. This permitted the removal of one of the two surface tracks, widening the excavation and the construction of the second permanent track at the depressed level. The depression of the Oak Hill branch was performed in a similar manner, except that for a distance of 1,000 ft. from the Frisco crossing south to McRee avenue only one track has been depressed, pending a possible relocation at this point.

The greater portion of the material for raising streets and private property was dumped from the dirt trains brought on

West Elevation. Frisco Tracks on the Right Crossing Missouri Pacific Oak Hill Branch in the Foreground

excavation for the bridge abutments and retaining walls along the north side of the tracks in order that the concrete work might be started. When the cut had been carried up to the street car tracks in Vandeventer avenue, a wooden bridge was built behind the shovel to carry the street traffic over the excavation by a slight detour. The cut was then continued through the street and to the east end of the depression. East of the

a temporary track from the west end of the depression into Tower Grove, Race Course and Vandeventer avenues. A considerable amount was also deposited directly on the ground by the steam shovel, when working near the streets and spread by teams. The balance of the excavation not required for filling, was disposed of at nearby points on the line.

The Frisco excavation was also made by steam shovel under somewhat less difficult operating conditions, as it was possible here to divert traffic on two temporary tracks largely clear of the excavated area. A portion of the cutting beneath and between the street bridges was handled successfully by a Thew shovel loading on cars or into wagons as conditions dictated.

It had been intended to change all railway traffic to the depressed level and the highway traffic to the elevated level on the same day, but unforeseen delays and complications made it impossible to abandon all the surface tracks at this time. A temporary bridge was therefore built to carry street traffic over the incomplete portion of Tower Grove avenue north, and Vandeventer avenue south of the street intersection. To provide for clearance over the surface track used by Oak Hill trains and the Frisco detour tracks, this bridge was raised about 4 ft. above the permanent street grade with runoffs on the completed concrete viaducts. After this change in street traffic, a comparatively free opportunity was afforded for the remaining steps

Construction View Showing Conditions Before Grades Were Separated

of the work. All railway traffic was removed from the surface in February, 1915, and on July 31 all streets were opened for travel.

To handle concrete the Missouri Pacific installed a tower plant with chutes at the corner of Park and Vandeventer avenues, served by a temporary spur track. Sand and gravel were unloaded by a derrick and clamshell bucket into a divided bin and drawn by gravity into a divided truck, which was moved to the mixer and dumped into the hopper by a cable attached to the hoisting engine. On the Frisco work, a small portable tower traveling with the mixer was used, and the material was hauled to it in wagons from the team tracks at Park avenue. The total cost of the construction work to the railways, the city and the public utility companies was \$830,000. It involved 220,000 cu. yd. of excavation, 60,000 cu. yd. of filling, 17,400 cu. yd. of concrete, 540 tons of reinforcing steel, 78 tons of structural steel and 23,300 sq. yd. of paving. Owing to the conditions imposed upon both design and construction, the work required attention out of proportion to its magnitude. More than 200 drawings covering the permanent work as constructed were prepared by the Missouri Pacific alone. The engineers in charge of the planning and execution of the work were F. G. Jonah, chief engineer, and Perry Topping, assistant engineer, for the St. Louis & San Francisco; C. E. Smith formerly assistant chief engineer; E. A. Hadley, chief engineer during the later stage of construction, and the writer, assisted by W. D. Hudson, L. H. Davis and S. M. Bate, assistant engineers, for the Missouri Pacific.

RAILWAY ELECTRICAL ENGINEERS' CONVENTION

The eighth annual convention of the Association of Railway Electrical Engineers was held at the Hotel La Salle, Chicago, October 18-22, H. C. Meloy, chief electrician, New York Central Lines West, presiding. Mr. Meloy spoke of the good work that had been done by the various committees in co-operating with other associations, such as the Master Car Builders', Illuminating Engineers', and the American Railway Engineering Associations. The secretary-treasurer reported a cash balance of \$1,357.29, and a membership of 507, of which 170 are senior active members, 95 junior active members, 20 honorary members and 222 associate members. Reports of progress were submitted by the committees on Reciprocal Relations, Loose Leaf Binders, Wire Crossings, Electric Headlights, Wireless Telephone and Telegraph, Industrial Trucks, Metal Conduit Specifications and Rating of Train Lighting Lamps.

The committee on Standards for Train Lighting Equipment presented as its report the standards adopted by the Master Car Builders' Association, with the exception of the design of the armature pulley. It was believed that by relocating the web of this pulley it will be possible to use the same patterns for the ball bearings and the sleeve pulley. The chairman was instructed to confer with the chairman of the Train Lighting Committee of the Master Car Builders' Association, with a view of having this matter again drawn to the attention of the M. C. B. Association.

The committee on Wire Specifications presented a revision of the former specifications to conform to the best engineering practice.

The committee on Car Wiring presented a set of specifications covering the complete installation of an electrical wiring system for the lighting of passenger cars to meet the requirements of the Board of Fire Underwriters' rules. These specifications are in considerable detail and were accepted by the association as recommended practice for car wiring.

DATA AND INFORMATION

The committee, reporting on this subject, stated that, as in previous years, it has been difficult to obtain the necessary information from the railroads, regarding their equipment. From that which was obtained it was found that there has been little or no change in the electric car lighting situation during the past year. There has been a great increase in the number of gas-filled Mazda lamps used and the number of Cooper-Hewitt lamps reported this year is considerably larger than last year. The number of electric arc headlights has increased from 12,432 to 16,446 and the number of incandescent headlights from 932 to 1,287. It was also shown that although the total number of shops reported this year is practically twice that of last year, the percentage of the shops at which the power is purchased remains the same, being 42 per cent in each case. The total horsepower of the connected load at the shops at which the power is purchased represented 30 per cent of the total last year and 29 per cent of the total this year.

The report was signed by Edward Wray, chairman, Railway Electrical Engineer; C. J. Causland, P. R. R.; G. W. Cravens, C. & C. Electric and Manufacturing Company; W. A. Del Mar, I. R. T.; A. J. Farrelly, C. & N. W.; J. E. Gardner, C. B. & Q., and W. M. Wiggins, Pullman Company.

ILLUMINATION

The committee stated that an investigation is to be made on the study of illumination for classification yards. Regarding the development of the incandescent lamp, it was stated that since 1907 the sale in this country of the Mazda lamp has been increased from 0.1 per cent to 71 per cent of the total lamps sold, while that of carbon lamps has decreased from 93 per cent to 7 per cent, the remainder being practically entirely Gem lamps. The only justifiable use of the Gem lamps is where mechanical break-

age is excessive, due to vibration of the courses. The Mazda C or gas-filled lamp bulbs are now commercially available in the multiple burning type from 1,000 watts down to and including the 100-watt size and in the 110-volt class. The development work in the Mazda C lamps for train lighting service has progressed to a point where they will soon be commercially available. In this connection there is an important question to be settled regarding the sizes that should be provided, as it is highly desirable to avoid the multiplicity of sizes that the railroads have been using in the vacuum type. In the Mazda B, or vacuum type lamp, the improvements made have been almost entirely in increasing the efficiency. These have amounted to approximately 6 to 9 per cent, and in a few sizes somewhat more.

The report is signed by L. S. Billau, chairman, B. & O.; C. W. Bender, National Lamp Works, General Electric Company; L. C. Doane, Holophane Works of the General Electric Company; H. C. Meloy, N. Y. C.; J. L. Minick, P. R. R., and G. O. Moores, B. & O.

Discussion.—Preston S. Millar, Electrical Testing Laboratories, New York, stated that the modern Mazda lamps have been found to be more rugged than the Gem lamps. He also believed that the gas-filled Mazda lamps of small wattages would be so expensive to make and the increase in efficiency so small that together with the increase in the intrinsic brilliancy of the filament which is objectionable to the eye, they would not be desirable in train lighting service. At the present stage of development of the gas-filled lamp the 100-watt sizes do not seem practical.

STANDARDIZATION OF CRANE MOTORS

The committee in making a study of the existing conditions of traveling crane equipment in railway shops has found that the present installations are in a rather chaotic condition, so far as any attempt at the standardization or uniformity of a motor size is concerned.

After making a careful analysis of the problem with a view to fully meeting the needs of the modern locomotive repair shops and at the same time reducing the number of different crane capacities to a minimum, the committee believed that the following nine crane sizes would suffice, these capacities being in tons, 2, 5, 10, 15, 30 (single and double trolley), 60, 75, 120 (double trolley), 150 (double trolley). The 30-ton, 120-ton and 50-ton cranes each having the double trolley hoist, will actually reduce the number of sizes to the following: 2, 5, 10, 15, 30, 60 and 75. The committee states: "There may be individual preferences on the part of many engineers for odd sizes of cranes, but it is no trade secret that odd crane sizes specified by railroad engineers usually are made up as a compromise equipment from a few standard sizes, and not always with the best results for either the crane manufacturer or the railroad company."

The great advantage of standardization in crane motors would be the reduction in the number of spare parts, armatures, etc., to be carried in stock, which would greatly facilitate the repairs or replacements. It was recommended that the committee be continued for another year. The report was signed by H. C. Meloy, chairman, N. Y. C.; T. V. Buckwalter, P. R. R.; J. E. Gardner, C. B. & Q.; A. J. Farrelly, C. & N. W.; Edward Wray, Railway Electrical Engineer; C. J. Causland, P. R. R.; P. L. Batty, Arnold Company; R. M. Gaston, George P. Nichols & Brother; B. F. Bilsland, General Electric Company.

AIR COMPRESSORS

The committee made a careful study of the motor-driven, oil engine-driven and steam-driven air compressors. It was reported that a well-designed motor-driven compressor would have an over-all efficiency of 72.5 per cent, while the efficiency of the same type of air compressor, steam-driven, would be 77.7 per cent, and 81.3 per cent when driven by an oil engine. It was believed that at a large railroad shop or terminal, which would require a 3,000-cu. ft. compressor and where live steam was to be supplied to other units, the steam-driven compressor

would be the most economical. A motor-driven compressor would be desirable where but little live steam is used in the operation of the plant for either power or heating, and where the electrical power may be purchased in the neighborhood of one cent per k. w. hour. The synchronous motor has proved satisfactory for motor-driven compressors. It has given excellent service on units from 200 cu. ft. to 1,200 cu. ft. per minute. The oil engine-driven compressor is the most suitable at isolated points, such as at large terminal yards, or at some small special shops where there is no demand for steam, and where the cost of electric current makes its use prohibitive. The best type of compressor to be driven by an electric motor or an oil engine is one designed to operate at a constant speed, with the proper form of valve gear and unloading device, as this prevents complication of electric motor speed variations and the oil engine speed variations. The report was signed by F. Wanamaker, chairman, C. R. I. & P.; H. R. Bucks, O. S. L.; L. C. Hensel, S. L. & S. F.; J. F. Gardner, C. B. & Q.; F. G. Baker, Frisco Line; H. C. Meloy, N. Y. C. West.

SHOP PRACTICE

The Committee on Shop Practice considered this year the subjects of crane magnets, magnetic chucks and the tempering of tools in electric furnaces. It showed how by the use of the locomotive crane and magnet the cost of handling material in scrap yards and large store yards would be materially reduced. One road handled with a locomotive crane and magnet 41 tons of old locomotive grates in 40 minutes, 56 tons of old track spikes in 33 minutes and 44 tons of miscellaneous scrap in 35 minutes. Another road is handling this class of material at a cost of less than 2 cents a ton, as compared with 25 to 35 cents by hand. Another road reports the cost of handling No. 1 wrought iron scrap with the electric crane as 4 cents, against 22 cents where it was done by hand. Busheling No. 2 wrought iron and malleable iron cost 2 cents as against 10 cents, handling cast iron and mixed steel cost 2 cents as against 9 cents, and handling sheet steel cost 20 cents as against 30 cents. The locomotive crane with a magnet can be used to good advantage for picking up scrap along the right of way on roads where the traffic is dense. The information obtained indicated that the cost of maintenance of a crane magnet is practically negligible, and consists in most cases simply in the renewal of the cable. Where power for operating the magnet is supplied by generating equipment mounted on the crane there will also be some slight maintenance expense for this apparatus.

Magnetic chucks are used in railroad shops to a very limited extent. They consist of two general types—the flat and the rotary type. The use of the magnetic chuck is principally in connection with grinding operations, either flat or cylindrical, although it is occasionally used for light machining operations. The greatest merit lies in the fact that light thin work may be supported rigidly without distortion of the material. The power required for a magnetic chuck is small, and if the shop lighting or power circuits are direct current the chucks can in most cases be connected directly to the shop lines.

In tempering tools by the electric furnace the temperature can be more accurately regulated and, by means of the pyrometer, accurately determined. The report was signed by D. C. Wilson, U. P., chairman; W. E. Heald, B. & O.; H. R. Bucks, O. S. L.; George H. Cravens, C. & C. Electrical Manufacturing Company; J. M. Craig, P. R. R.; J. L. Hayes, S. A. L.; L. R. Pomeroy, U. S. L. & H. Company; J. H. Bryan, West. Elec. & Mfg. Co., and A. L. Chapin, I. C.

CLOSING EXERCISES

H. D. Rohman, chief electrical engineer, Franklin Railway Supply Company, New York, gave an interesting talk during Wednesday's session on Electric Train Lighting in South Africa and Roumania. He stated that out of 2,000 passenger cars in South Africa 1,900 were electrically lighted. The individual train lighting equipment is not of as large capacity as is used

in the United States, nor are the passenger cars as well illuminated.

The following officers were elected for the ensuing year: President, E. W. Jansen, III, Cent.; senior vice-president, C. J. Causland, P. R. R.; junior vice-president, J. E. Gardner, C. B. & Q.; secretary-treasurer, Joseph A. Andreucetti, C. & N. W.; E. Wanamaker, C. R. I. & P., and E. S. M. MacNab, C. P. R., were elected to the executive committee.

It was voted to hold the semi-annual convention at the time and place of the convention of the Master Car Builders' Association, and to hold the next annual convention in Chicago.

THE RAILWAY AND THE AUTOMOBILE*

BY T. C. POWELL

Vice-President, Queen & Crescent Route

From the earliest time mankind has found it necessary to move from place to place, and the means of doing so which we enjoy to-day, are simply the responses to that demand. But simply to move from one locality to another has not satisfied the human race. Running all through the world's progress will be found the same desire for speed, the same admiration for the success resulting from the application of speed.

The substantial long-distance means of transportation in this country have been the steam railroad and the steamboat. The river steamboat service has been largely superseded by the railroad, not only because of cheaper rates and faster time, but because the railroad traffic and transportation organizations have been more efficient. Had the steamboat people recognized this in time, they would not have been eliminated to the extent that has come to pass. Their organization would have grown also, and they would have retained at least part of the through and they would have developed new local traffic.

With this example staring us in the face, the railroad fraternity in every department must lead in transportation methods and not simply follow. It must be remembered that the "steam propelled carriage," as it was first called, was not invented to run on rails, but on the public highways. It was put in competition with the stage coaches, and from the beginning, made better time than the coaches drawn by horses and very shortly made lower rates. The owners of the coach companies, many of whom were in Parliament, succeeded in having passed such restrictive laws against the "steam carriages" operated on the turnpikes, that they were driven off and compelled to provide their own roadways, and the automobile industry in England, as it is now known, was set back nearly two generations.

The automobile, both for freight as well as for passengers, is coming into its own again. Highways are being improved for its benefit, and part of the very taxes paid by the steam railroads is being used to provide smooth roads and streets for the benefit of a possible and very probable future competition.

My own experience in this country and abroad, that is, where the roads are good, shows that the average mileage made is 20 miles per hour, and this is confirmed by the experience of others. Short distances can be made in better time per hour. The same kind of service can be obtained on some freight, and when it is understood that this time applies from door to door, the serious nature of the competition can be realized. There are now nearly 2,000,000 motor cars in this country. In a year there will be at least 2,000,000 automobiles exclusive of auto trucks. Allow each automobile an average annual mileage of 5,000 miles—many travel 20,000—and you have a total mileage of 10,000,000,000 automobile miles. Allow an average of two passengers to each automobile and you have at total of 20,000,000,000 passenger miles. Not all of this is taken from the steam roads, but the proportion of people traveling by automobile who otherwise would travel in some direction by railroads, is very important.

"Touring" is not a Twentieth Century invention; on the contrary, a writer who has made a study of it and has written a

book called "Touring in 1600," says that he had the opportunity of consulting thousands of diaries, letters and other accounts of that period, descriptive of the various journeys throughout the world entered upon for reasons other than business. All the world likes to travel, and travel brings about an exchange of products. The point I want to emphasize is that this desire for travel is as strong now as it ever was, and is probably stronger. The facilities are better, but the serious feature for us to consider is whether these facilities are the ones which the steam railroads furnish or whether the public is turning to the automobile, the motorcycle, the motor boat, the electric traction line or perchance the aeroplane for a medium of transportation.

Travelers have the right to ask that the passenger stations shall be well arranged and clean; that the attendants shall be courteous and attentive, that the officers and all those in authority shall be intelligent and well fitted for their positions. They have the right to demand that upon paying the price they shall be provided with the accommodations for which they pay, and that they shall be transported to their respective destinations in comfort and safety.

The shipping public, upon paying the price, is justified in asking that its goods shall be handled with care at all times and delivered at the designated point promptly and without unnecessary detail or harassing regulations.

In short, the traveling and shipping public is becoming posted as to the relative merits of all forms of transportation, and to retain its patronage, the steam railroads must enhance the efficiency of their organizations, recognizing that the only reason for the existence of a common carrier is to transport from place to place passengers and merchandise, safely and expeditiously and without undue or unreasonable charges or regulations.

RESULT OF THE M. M. LETTER BALLOT

Fifty-four subjects were submitted to the members of the American Railway Master Mechanics' Association for action by letter ballot and of these only one was unfavorably acted on, that being the engineer's torch made of steel tubing and shown in the report of the Committee on Standardization of Tinware as Fig. 1. The entire 14 recommendations of the Committee on Standards and Recommended Practice were adopted, these including specifications for steel axles, fire-box steel, forgings, cylinder castings, etc., and steel castings. The changes made in the specifications for inspection and testing of locomotive boilers to have them conform to the Federal regulations were adopted, as were the regulations covering the operation of brakes on engines and tenders handled dead in trains and offered in interchange.

The methods of photometering locomotive headlights, as proposed by the Committee on Locomotive Headlights, and the rules for determining stresses in longitudinal barrel seams and patches, longitudinal gusset braces and flat surfaces, and staybolts, radial stays and crown bar bolts in locomotive boilers as presented by the Committee on Design, Construction and Inspection of Locomotive Boilers were also adopted.

Thirty-nine of the 40 examples of tinware presented by the Committee on Standardization of Tinware were adopted, which should prove of material assistance to the manufacturers and users of this material. The instructions in fuel economy on locomotives prepared by the Committee on Fuel Economy for the instruction of the enginemen and firemen were adopted, the vote lacking one of being unanimous. These instructions, it is understood, will be printed in pamphlet form and sold at a nominal cost by the association.

The three recommendations of the Committee on Forging Specifications covering the fiber stresses for heat treated and alloy-steel materials, and the specifications for quenched and tempered carbon steel axles and alloy-steel forgings (separate specifications) were adopted by a large majority. The rules outlined by the Committee on Boiler Washing for washing boilers were also adopted.

*From an address before the Cincinnati Railway Club, at Cincinnati, Ohio, on September 14, 1915.

Comparative Statistics of the World's Railways

Bureau of Railway Economics Compiles Data for United States and 38 Foreign Countries; 606,000 Miles of Line

In only one country in the world do railways haul freight so cheaply as the railways of the United States. That country is India, where the cost of labor is so little as to be almost negligible. On the other hand, wages of railway employees in the United States are higher than in any other country, except Western Australia, in which country average receipts per ton are almost twice as great as in the United States. In our own country the average annual wage of the railway employee in 1912 was \$730. Only in Australia, New Zealand and Canada does the average annual wage reach one-half that amount. In Japan it is \$114 per year. In capitalization per mile of its railways, the United States is exceeded by every one of the principal countries of the world. The list is headed by the United Kingdom, with a capitalization of \$277,147 per mile. Belgium comes next with \$216,143 per mile. Russia has an average of \$149,814; France, \$148,436; Switzerland, \$122,010; Austria, \$121,327; Germany, \$116,365. The average for the United States is \$63,535. In no country in the world has so much progress been made in efforts to perform railway service in a manner which shall best serve the business interests of its patrons. In none of them is the service performed so cheaply.

These are a few of the facts indicated in a bulletin just issued by the Bureau of Railway Economics on "Comparative Railway Statistics, United States and Foreign Countries." Numerous comparative statements have heretofore been compiled covering such statistics in a more or less fragmentary form; but no previous compilation has approached in completeness of vital statistics those contained in the present work.

The bulletin presents comparative data regarding the railways of the United States and of the principal foreign countries. In the list are included 38 countries or states for which are given in tabular form the principal information covered for the United States in the statistical reports of the Interstate Commerce Commission. The statistics cover for 1912, the latest year for which fairly complete comparable statistics are available, the principal facts concerning an aggregate mileage of 606,000 miles, or approximately seven-eighths of the world's total railway mileage. Figures for the railways of the United States for 1913 and 1914 also are given. The data are presented separately for each country and in comparative form relative to leading heads under financial condition and operating results. The eighth of the total mileage which is not included comprises that of insignificant or backward countries and the mileage of local, narrow-gauge or otherwise unimportant railways in the principal countries.

Inevitably the strict comparability of certain of the items for the different countries is affected by the inclusion or omission of items in the statistics of one country that are not included or omitted in all; but the slight error does not appear to be sufficient to impair the general usefulness of the data. Some points in which differences exist in the significance of certain items are pointed out under the various heads.

FREIGHT TRAFFIC

In average receipts per ton mile the railroads of the United States receive about 60 per cent of the average receipts in the principal European countries. The rate in the United States is lower than that of any other country except India. Brazil stands highest in the list, with receipts nearly 10 times the average amount for the United States. Several countries receive from two or three and even four times as much for hauling a ton of freight one mile as the railroads of the United States. The only country which has substantially the same rate is Canada. The average receipts per ton mile for 25 countries are shown in the accompanying table.

AVERAGE RECEIPTS PER TON-MILE.

	Cents.		Cents
United States.....	0.744	Holland	1.240
Algeria and Tunis (1911)....	1.691	Hungary	1.215

Denmark	2.113	Sweden	1.373
France (1911).....	1.181	Switzerland	2.640
Germany	1.244	Union of South Africa.....	1.834

In freight revenue per mile of line the average for the United States is \$7,962. This amount is exceeded in five European countries, viz., Belgium, \$14,440; Germany, \$13,898; the United Kingdom, \$13,295; Austria, \$11,237; and Switzerland, \$8,629. Yet in freight density, ton miles per mile of line, the United States is exceeded only by Germany. The effect of the difference in rate per ton per mile in Germany and in the United States is clearly brought out by a simple comparison based upon the two following tables, showing freight density and freight revenue per mile of line. Freight density is 3.6 per cent greater in Germany than in the United States. Freight revenue per mile of line is 75 per cent greater in Germany.

FREIGHT REVENUE PER MILE OF LINE

Cuba (1911)	108,154	Siam	67,088
Denmark	293,900	Spain (1909)	240,166
France (1911).....	631,736	Sweden	229,468
Germany	1,117,376	Switzerland	326,887
Holland	507,637	Union of South Africa.....	296,406

In average receipts per ton the comparative record for the United States appears somewhat better, but this is because of the longer haul. The more important European countries receive from 50 to 75 per cent of the amount received by the railways of the United States, but in none of the countries in this comparison is there a rail haul per ton comparable to the 256.9 miles average haul in the United States. Next to the United States in this respect stand Mexico, with 222 miles, and Canada, with 218. In important European countries the average haul per ton is from one-fourth to one-third the average for the United States.

It should be noted, however, that the figure above given for the United States is the average haul per ton when all railways are considered as one system. The average haul per ton on the individual railway in the United States in 1912 was 143.44 miles. This haul per ton is exceeded in five countries, in each of which, however, by reason of the extent of the country it is probable that conditions of transfer comparable with those customary in the United States prevail. Of the countries which have a longer average than the United States haul on the individual railway, the Union of South Africa and Mexico have nearly

three times the average receipts per ton of railways of the United States; India has 31 per cent more; and Canada has 55 per cent more. Figures for Russia are not given. The figures for each of the countries are given in the accompanying table:

AVERAGE HAUL PER TON

	Miles		Miles
United States.....	256.9	Germany	61.8
Algeria and Tunis (1911)...	73.8	Holland	55.2
Australia:		Hungary	71.8

France (1911).....	78.4	Switzerland	45.5
		Union of South Africa.....	171.2

PASSENGER TRAFFIC

In the consideration of passenger rates, the facts for the various countries are not at all comparable with those for the United States, unless full consideration is given to the distribution of passengers into classes. Such distribution prevails in every other country except Canada included in this compilation. It appears that while receipts per passenger per mile are higher in the United States than in most countries, in only 15 of the countries in the list have railways less passenger revenue per mile of line than those of the United States, and those in eight countries have less passenger density. Belgium has the greatest passenger density and naturally the highest passenger revenue per mile of line. The statistics are given in the accompanying table.

AVERAGE RECEIPTS PER PASSENGER-MILE

United States.....	1.987	Germany	0.908
Algeria and Tunis (1911)....	1.466	Holland	1.020

Egypt	6,059		

The apparent facts shown by the tables above are very greatly modified by the statement of the distribution of passengers. In the United States practically all passenger traffic is first-class. In nearly all of the countries with which comparison is made a very large proportion of the passenger traffic is second, third, or even fourth class. The percentage of passenger travel in the lower classes ranges from over 98 per cent for Siam, 96 per cent for the United Kingdom, 96 per cent for France, 95 per cent for Japan, 91 per cent for Germany, down to about 50 per cent in some of the Australian colonies. The average revenue per passenger mile is greatly reduced on account of this pre-

ponderance of low class traffic. No comparison of rates for this service that is at all accurate can be made without taking into consideration the averages for the different classes and considering them in connection with the class of accommodation furnished for each class. The cheaper accommodations in most countries are greatly inferior to the service of the day coaches in ordinary use in United States and Canada. The distribution of passengers by classes for the various countries is shown in the accompanying table.

The average receipts per passenger on the railways of the United States are considerably greater than those on the railways of the principal European countries for the reason that the average haul is much longer and because the traffic is substantially all first-class. Some indication of the difference in accommodations furnished in the different countries is afforded by the statement of the average number of passengers per train. Although the trains in the United States have space accommodation for very many more passengers than trains in any of the countries named, with the possible exception of Canada, yet only Denmark has so small an average number of passengers per train. The limit in the other direction is reached by India, which carries 176 as the average number of passengers per train. In most of the European countries the number of passengers per train is from 30 to 60 per cent greater than in the United States, notwithstanding the smaller amount of space accommodation afforded by smaller coaches and less number of coaches in the train.

The statistics for various countries are presented in the following table:

PASSENGERS PER TRAIN

United States.....	53	Germany	84
Australia:		Holland	63
New South Wales.....	109	Hungary	66
South Australia.....	82	India	176
Austria	73	Japan	111
Belgium	99	Mexico (National Railways).....	86
Canada	62	Roumania	76
Denmark	53	Switzerland	69
France (1911).....	69		

WAGES

One of the most important comparisons that can be made as to cost of operation between the railways of the United States

and those of other countries is in the average compensation of employees. With the exception of Western Australia, the United States pays a larger average yearly compensation than any other country. The country having the lowest average yearly compensation per employee of which the available figures can be placed on a comparable basis with the United States is Japan. The average yearly compensation in that country is \$113.88 as compared with \$729.64 for the United States (in 1912). It appears that the Australian colonies and New Zealand are, with the exception of Canada, the only countries in which the wages of employees stand on anywhere near an even basis with those of employees of the railways of the United States. In Germany the average yearly compensation is a little more than half that in the United States. In Holland, Italy, Switzerland, Austria and Hungary the compensation is less than one-half the average for the United States. The facts are shown in the accompanying table for all the countries of which data upon this subject can be reduced to a basis which is comparable with statistics for United States.

AVERAGE YEARLY COMPENSATION PER EMPLOYEE

Based on average number of employees during year:	Switzerland	\$366.96
Australia:	Based on number of employees at end of year:	
New South Wales.....	United States	\$729.64
Western Australia.....	Australia:	
Germany	Victoria	608.52
Holland	Austria	329.88
Italy	Canada	604.47
Japan	Hungary	300.41
New Zealand.....	Roumania	249.40
Sweden	Russia (1910)	211.40

OPERATING REVENUES AND EXPENSES

From the facts already stated and taking into consideration the density of both freight and passenger traffic, it is to be expected that the operating revenues per mile of line of the principal European countries should show amounts greatly in excess of those for the railways of the United States. In Germany and Belgium the operating revenue per mile of line is practically twice that in the United States; in the United Kingdom the operating revenue is about two and one-half times that per mile in the United States, while France, Austria, Denmark, Holland, Italy, Russia and Switzerland show operating revenues per mile considerably in excess of the figure for the United States. The figures for 38 countries are shown in the accompanying table.

OPERATING REVENUES PER MILE OF LINE

United States	\$11,482	France (1911).....	\$14,521
Algeria and Tunis (1911)...	4,681	Germany	22,026
Argentina	6,302	Holland	13,440
Australia	5,621	Hungary	8,599
New South Wales.....	8,315	India	5,971
Queensland	3,562	Italy	13,868
South Australia	6,964	Japan	10,495
Victoria	7,168	Mexico (National Railways) ..	5,099
Western Australia.....	3,713	New Zealand.....	6,813
Austria	16,049	Norway	3,841
Belgium	23,665	Portugal (1910).....	7,239
Brazil (1911).....	7,324	Roumania	9,830
Bulgaria (1911).....	4,505	Russia (1910).....	12,424
Canada	8,209	Siam	2,604
Chile (1913)	5,732	Spain	8,551
China (Peking-Mukden Line) ..	8,680	Sweden	4,975
Cuba (1911)	5,709	Switzerland	15,945
Denmark	12,141	Union of South Africa.....	7,996
Egypt	13,024	United Kingdom.....	26,689

Comparison of operating expenses per mile of line shows somewhat similar relation to that which obtains in respect to operating revenues. In this respect, however, Germany and Belgium show a larger excess of operating expense per mile of line over that of United States railways, while the relation for France, Holland, Switzerland and Austria is not materially different from the relation shown in regard to operating revenues. The United Kingdom stands highest in operating expenses as in operating revenue. However, in the United Kingdom operating expenses absorb only 63 per cent of operating revenue, this, with that of France, 62.6 per cent, being the lowest operating ratio of any important country. In the United States operating expenses absorb 69.3 per cent of operating revenue.

OPERATING EXPENSES PER MILE OF LINE

United States	\$7,968	Victoria	\$4,545
Algeria and Tunis (1911)...	2,949	Western Australia.....	2,647
Argentina	3,977	Austria	11,976
Australia	3,669	Belgium	16,406
New South Wales.....	5,341	Brazil (1911).....	6,352
Queensland	2,252	Bulgaria (1911).....	2,837
South Australia	4,312	Canada	5,639

Chile (1913)	\$5,092	Mexico (National Railways) ..	\$3,189
China (Peking-Mukden Line) ..	2,516	New Zealand	4,643
Cuba (1911)	3,430	Norway	2,900
Denmark	10,192	Portugal (1910).....	3,644
Egypt	7,619	Roumania	6,340
France (1911)	9,084	Russia (1910).....	8,348
Germany	14,860	Siam	989
Holland	9,332	Spain	4,099
Hungary	5,451	Sweden	3,489
India	2,922	Switzerland	10,575
Italy	11,644	Union of South Africa.....	5,193
Japan	4,859	United Kingdom.....	16,863

Results of operation as shown in the two preceding tables are more clearly reflected in net operating revenue. Under this head the United Kingdom leads the list with \$9,826 per mile; Belgium is second and Germany third. Chile, Norway and Brazil are at the foot of the list.

Net operating revenue per mile of line for 38 roads is represented in the accompanying table.

NET OPERATING REVENUE PER MILE OF LINE

United States	\$3,514	France (1911).....	\$5,437
Algeria and Tunis (1911)...	1,732	Germany	7,166
Argentina	2,325	Holland	4,107
Australia	1,951	Hungary	3,148
New South Wales.....	2,974	India	3,050
Queensland	1,310	Italy	2,224
South Australia	2,652	Japan	5,616
Victoria	2,623	Mexico (National Railways) ..	1,910
Western Australia.....	1,066	New Zealand	2,170
Austria	4,073	Norway	941
Belgium	7,259	Portugal (1910).....	3,595
Brazil (1911).....	972	Roumania	3,490
Bulgaria (1911).....	1,668	Russia (1910).....	4,076
Canada	2,570	Siam	1,615
Chile (1913)	639	Spain	4,452
China (Peking-Mukden Line) ..	6,165	Sweden	1,486
Cuba (1911)	2,278	Switzerland	5,370
Denmark	1,949	Union of South Africa.....	2,803
Egypt	5,405	United Kingdom.....	9,826

A summary of these series of comparisons of railway statistics between the United States and 38 foreign countries may be presented in a few words. With one exception, railways of the United States pay a higher average rate of wage than prevails in any other country. Also, with one exception, freight rates per ton-mile in the United States are lower than the rates per ton-mile in any other country. It is not an exaggeration to state that freight rates in most other countries are 50 per cent higher than in the United States; and that average wages are 50 per cent lower in other countries than in the United States is an understatement. Passenger rates, also, taking into account the accommodations furnished and the service performed as a part of the traffic, are lower than in any of the countries with which comparison is made. In other words, in no other country does the passenger receive so great a return for the value of his fare.

TRAIN LOADING, TRAIN DENSITY AND TRAIN REVENUES

How the railways of the United States have been able to conduct business under these difficult conditions, in some instances with marked success, is suggested by one or two other comparisons that are included in the bulletin from which these facts are taken. Passenger service in the United States is undoubtedly, though for causes that are apparently unavoidable, conducted upon an extravagant basis. Economics of operation must therefore be looked for in the freight branch of the railway service. It appears that the most conspicuous source of economical operation has been found in increasing the unit of transportation and in the consequent reduction in number of units relative to the volume of business carried on.

In number of tons of freight hauled per train, the United States leads every other country by a long interval. The average number of tons per train in 1912 was 406.8. Next in order is Canada with an average of 325.3. German trains carried an average of 240.3 tons and Mexican trains 224 tons. In all other countries the average trainload was less than 200 tons. The following table presents the facts:

TONS PER TRAIN

United States	406.8	Germany	240.3
Australia:		Holland	137.1
South Australia.....	109.6	India	184.4
Austria	180.5	Japan	110.7
Canada	325.3	Mexico (National Railways) ..	224.1
France (1911)	141.7	Roumania	143.7
		Switzerland	132.8

The effect of this heavy average train load, brought about by the universal provision of ample track facilities and the adop-

tion of large motive power units, cars of large capacity and numbers of cars per train limited only by the capacity of the locomotive, is reflected in train density, or train miles per mile of line. Train density in the United States is about 26 per cent of that in Belgium; less than 30 per cent of that in the United Kingdom; about 40 per cent of that in Germany and Holland; and approximately 50 per cent of that in France, Switzerland and Japan.

The corresponding result is also shown in a comparison of average receipts per train mile. Railways of the United States receive more per train mile than those of any other country except Mexico; and in Mexico the average rate per ton per mile is 82 per cent higher than in the United States.

The statistics as to train density and average receipts per train mile are presented in the two accompanying tables.

TRAIN-MILES PER MILE OF LINE
(Train Density)

United States	4,950	Germany	12,454
Algeria and Tunis (1911)	2,859	Holland	12,888
Australia	3,339	Hungary	6,100
New South Wales	4,875	India	4,562
Queensland	2,492	Italy	8,356
South Australia	4,127	Japan	10,523
Victoria	3,905	Mexico (National Railways)	1,859
Western Australia	2,115	New Zealand	3,175
Austria	8,492	Norway	3,655
Belgium	18,827	Roumania	5,901
Bulgaria (1911)	2,804	Siam	1,901
Canada	3,776	Spain (1909)	4,458
China (Peking-Mukden Line)	3,751	Sweden	4,010
Denmark	7,157	Switzerland	10,048
Egypt	7,004	Union of South Africa	3,707
France (1911)	9,764	United Kingdom	17,598

AVERAGE RECEIPTS PER TRAIN-MILE

United States	\$2.24	Germany	\$1.65
Algeria and Tunis (1911)	1.62	Holland	0.95
Australia	1.71	Hungary	1.37
New South Wales	1.68	India	1.27
Queensland	1.43	Italy	1.49
South Australia	1.65	Japan	0.96
Victoria	1.80	Mexico (National Railways)	2.64
Western Australia	1.66	New Zealand	2.07
Austria	1.80	Roumania	1.61
Belgium	1.25	Siam	1.34
Bulgaria (1911)	1.54	Spain (1909)	1.61
Canada	2.13	Sweden	1.21
China (Peking-Mukden Line)	2.13	Switzerland	1.52
Denmark	1.57	Union of South Africa	2.11
Egypt	1.83	United Kingdom	1.40
France (1911)	1.46		

CAPITALIZATION

A fitting conclusion to a series of comparisons of operating results of railways in various countries is afforded by a statement of the amount of capital involved in their operations. The opening paragraph of this article covers the most conspicuous facts. The data for the several countries are presented in the following table:

CAPITAL PER MILE OF LINE

United States	\$63,535	Germany	\$116,365
Algeria and Tunis (1911)	55,108	Hungary	71,226
Australia	46,130	India	45,051
New South Wales	67,970	Japan	89,102
Queensland	31,657	Mexico (National Railways)	59,579
South Australia	44,120	New Zealand	53,789
Victoria	61,586	Norway	43,187
Western Australia	26,060	Roumania	90,093
Austria	121,327	Russia (1910)	149,814
Belgium	216,143	Siam	40,074
Bulgaria (1911)	47,133	Spain (1909)	89,348
Canada	64,054	Sweden	33,940
Chile (1913)	48,265	Switzerland	122,010
China, Peking-Mukden Line	32,902	Union of South Africa	49,218
Denmark	61,839	United Kingdom	277,147
France (1911)	148,436		

Comparative statements of railway capital in different countries are apt to be misleading. This is particularly the case when a part or all of the mileage of a country is under government ownership. In the United States "capital" means outstanding stocks and bonds. In Canada and in the United Kingdom the term is used in the same sense. But statistics of railways under government ownership ordinarily report only the amounts expended in construction and equipment of the railway plant. The term "capital," therefore, as used in the table may not mean precisely the same thing for all countries. The result, however, of supplying any omission in the data would probably invariably be to add in the capitalization per mile of the average of all such countries as have railways under the ownership of the government. Railways are owned by the government in all the countries in the list except the United

States, the United Kingdom, Spain and China. In South Africa, Russia, India, Germany, Austria and Australia, government ownership predominates. Any allowance for increase in the stated amount of capitalization per mile would be, at best, indefinite and would vary according to the system of accounting prevailing in each country. Without any such allowance, however, as shown by the table, the capitalization per mile of railways in the United States is less than that of the railways in any other important country of the world.

RESULT OF M. C. B. LETTER BALLOT

Of the 91 propositions submitted to the members of the M. C. B. Association for adoption by letter ballot only five were rejected. Of those rejected the specification describing the door of wooden construction and the question as to whether or not standards should be established for limiting dimensions for the cast steel design of side frames with pedestal jaws and designs of journal boxes for them were the most notable. The Committee on Brake Beams succeeded this year in providing specifications for testing all classes of brake beams that was adopted by a large majority. The adoption of the recommendation of the Committee on Train Brake and Signal Equipment, that truck clasp brakes be applied to all four-wheel truck passenger cars weighing 96,000 lb. or over, and to all six-wheel truck passenger cars weighing over 136,000 lb. or over, is indicative of the success of this type of brake throughout the country and is surely a step in advance.

Another plan of considerable importance that was adopted by a large majority and which, if carefully followed, will be of material benefit to the railroads, is covered by the rules governing the minimum strength requirements for reinforcement of the draft gear of existing wooden cars, as formulated by the Committee on Car Construction. The recommendations of the Committee on Specifications and Tests for Materials were adopted. These include new specifications for structural steel, steel plate and steel sheets for passenger equipment cars and for freight equipment cars (separate specifications); for malleable iron castings; miscellaneous steel castings; mild steel bars; rivet steel and rivets, and galvanized sheets. They also include the revised specifications for journal bearings, chains, steam heat hose and air-brake hose.

The proposals of the Committee on Train Lighting were approved, with the exception of the recommendation regarding the use of emergency fuses between the dynamo and field on wooden cars equipped with the axle dynamos. The Committee on Car Trucks, acting on the suggestion of those roads which voted negatively on the subjects submitted to letter ballot at the 1914 convention, has succeeded in reconstructing its recommendations so that 17 of the 18 proposals presented this year were approved.

The following are, in brief, the results of the letter ballot by committees:

Committee	Number of Subjects*	Number Rejected	Rejected Subject
Standards and Recommended Practice	9	1	Height of platform buffer for passenger cars.
Train Brake and Signal Equipment	3	1	Conductors' valves
Brake Shoe and Brake Beam Equipment	1	..	
Loading Rules	15	..	
Car Construction	17	1	Specification for construction of wooden side doors.
Specifications and Tests for Materials	20	..	
Train Lighting	8	1	Emergency dynamo fuses on axle equipment on wooden cars.
Car Trucks	18	1	Desirability of having standards for limiting dimensions for truck sides with pedestal type jaw.
Totals	91	5	

*For an itemized record of the recommendations of the various committees that were submitted to letter ballot see the abstracts of the reports of those committees in the *Daily Railway Age Gazette* for June 10, 11 and 12, 1915.

Completing the Summit Cut-Off of the Lackawanna

The Last Concrete Has Just been Placed in the
Nicholson Viaduct. Other Work Practically Finished

On September 8 the last concrete was poured for the Tunkhannock viaduct, the largest structure on the new line of the Delaware, Lackawanna & Western, between Clarks' Summit, Pa., and Hallstead. All the other structures on this line have been completed and only a small amount of excavation remains to be removed from a large rock cut about four miles east of Nicholson. It is expected that the entire line will be completed and placed in service by November 1.

A section $3\frac{1}{2}$ miles long between New Milford and New Milford Summit was placed in operation last fall. The 5 miles between New Milford and the connection with the old line near Hallstead was turned over to traffic on June 5, 1915. Track has been laid from New Milford Summit up to Tunkhannock viaduct and from the east end of the cut-off to the rock cut, leaving only four miles still to be laid.

This project has been of unusual interest because of its magnitude as a whole, because of the size of the structures involved and because of the high standards adopted in its construction. This line, 39.6 miles long, saves 3.6 miles in distance, 327 ft. of rise and fall and 2,440 deg. of curvature. It reduces the maximum grade eastbound from 1.23 per cent

to a maximum of 1,600,000 yd. The methods of handling this earthwork were described in detail in the *Railway Age Gazette*, November 14, 1913, page 903.

All structures are of permanent construction, 35 bridges being of concrete and 6 of steel. All grade crossings with highways were eliminated. Likewise, with two exceptions, all farm crossings at grade were avoided, entire farms being purchased in some instances to make this possible.

The most noteworthy structure is the Tunkhannock viaduct, a 12-span concrete arch bridge with a total length of 2,375 ft. and a height from bed of stream to top of coping of 242 ft., making it the largest structure of its type ever built. This structure, which is built for double track, consists of ten 180-ft. and two 100-ft. arches. It involved 167,000 cu. yd. of concrete, requiring unusual construction methods. As much as 14,000 cu. yd. of concrete has been deposited in one month by two mixers; nine thousand cu. yd. being deposited in forms. The methods employed by the contractor in placing this concrete were described fully in the issue of the *Railway Age Gazette* of February 5, 1915, page 235.

The Completed Tunkhannock Viaduct at Nicholson, Pa.

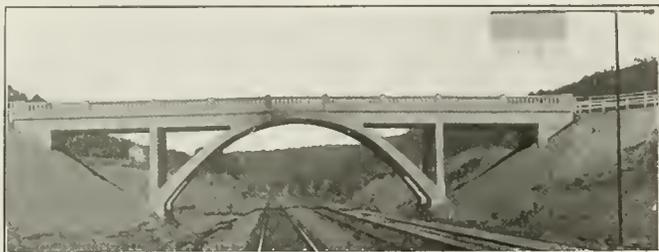

uncompensated to 0.68 per cent compensated, and westbound from 0.52 per cent uncompensated to 0.237 per cent compensated, while it reduces the maximum degree of curvature from 6 deg. 22 min. to 3 deg. Eastbound, the pusher service consisting of two pusher engines for tonnage trains between Hallstead and New Milford on the old line and three from Nicholson to Clarks' Summit will be reduced to one pusher engine at each point. The one pusher engine now required from Clarks' Summit west to New Milford on all tonnage trains will be eliminated. The importance of this saving will be realized from the statement that the tonnage moving over this line averages over 20,000,000 ton miles per mile of line annually.

This line cost approximately \$12,000,000. The grading amounted to over 13,318,000 cu. yd. or over 336,000 cu. yd. per mile of line. This was divided between 7,600,000 cu. yd. of rock, 5,100,000 cu. yd. of earth and 618,000 yd. of miscellaneous excavation.

Very careful attention has been paid to the waterproofing of this structure. The floor and sides up to the elevation of the base of rail are covered with 3-ply Minwax membrane covered with 1 ply of asbestos felt. Above this, $1\frac{1}{2}$ in. of Johns-Manville mastic concrete consisting of Johns-Manville asphalt and torpedo gravel was applied hot in two layers, each $\frac{3}{4}$ in. thick, with the joints lapped. An expansion joint was placed over each pier and over the quarter point of each span. These joints are flashed with copper sheeting covered with 3 ply waterproofing and the interstices are then filled with mastic. The total area being waterproofed on the viaduct is approximately 78,000 sq. ft. Ten down spouts lead to drains between the centers of the tracks on each span. Cast-iron drains extending to within 2 in. of the top of the tie are placed in recesses in the waterproofing directly above these down spouts, discharging freely between the arch rings.

The Martin's Creek viaduct was the next largest structure, containing 78,000 cu. yd. of concrete. The last concrete was poured in this structure on November 14, 1914.

With the exception of one double barrel 24-ft. arch culvert, 471 ft. long under an embankment 120 ft. high above the top of barrel, the remaining structures were nearly all for the purpose of carrying highways across the tracks. These struc-

Skeleton Arch Near New Milford, Pa.

tures show a considerable diversity of design, the result of a variation in local conditions. One of the most interesting is a reinforced concrete arch carrying a highway over the tracks, one mile east of New Milford, Pa. This structure consists of a skeleton arch with a span of 76 ft. 6 in. and a rise of 23 ft. 9 $\frac{3}{4}$ in. with vertical bents at the haunches and at the top of

carried to a depth capable of sustaining a load of 3 $\frac{1}{2}$ tons per sq. ft. and with a head room of 14 ft. it was necessary for the abutments to be about 28 ft. high. Mass abutments for this situation would have required large foundations and much

Church Street Subway at Hallstead, Pa.

concrete. For this reason a special design consisting of a face wall to the level of the sidewalk and counterforts of sufficient size to carry the load below were adopted. These counterforts were spaced 15 ft. between centers and extended forward to the piers on the curb line. This type of construction permitted the earth pressure to be transmitted through

A Closer View of the Tunkhannock Viaduct

slope. A design involving end spans and bents was more economical than one requiring abutments at the skew backs. This design not only gave an attractive structure but an economical one.

Another interesting structure of a different type was constructed to carry the tracks over Church street in Hallstead. This was on a skew of 50 deg. 21 min., giving a distance between abutments of 50 ft. With the excavation for the abutments

between the counterforts and very materially decreased the amount of concrete required in the wall. The fill was tamped carefully as it was laid up to the sidewalk level.

This entire cut-off has been built under the direction of George J. Ray, chief engineer, and F. L. Wheaton, engineer of construction. A. B. Cohen, concrete engineer, has been in charge of the design of the structures, and C. W. Simpson is resident engineer on the Tunkhannock viaduct.

THE RAILROAD SOLDIER AT THE FRONT

BY WALTER S. HIATT

Our Special European Correspondent

The victory of the French and English in Northern France, late in September (the first of any consequence since the battle of the Marne 13 months ago), revealed the existence of about 1,000 miles of new railroad tracks which had been built on the two sides of the trench front by the English, French and Germans. Mighty railroad construction jobs had been going on quietly for many months on both sides, and one of the big purposes of the Anglo-French advance was to destroy the new railroad lines of communication so carefully built by the Germans to the north of Reims, at Lens, and elsewhere.

That the work of the railroad and the railroad man in war time is not all behind the lines of the battling armies, safe from shot and shell, and that this work does not merely duplicate peace transportation under war conditions, was distinctly shown during this advance. It was the final touch that cleared the railroad men of the reproach that they constituted the only class of strong men not serving under arms. It showed that many thousands of them were enduring all the danger and hardship of the men in the trenches, and that they in fact were soldiers, too.

Despite the incomparable need for railroad men in France and Germany to keep up the transportation facilities of the civil populations, and despite their tireless efforts to handle the huge movements of troops, arms and ammunition quickly and safely, and to whirl the wounded of the battles back to the hospitals, for many months there was a popular prejudice against the railroad man who had to go about this task wearing his train uniform rather than that of the soldier of the nation. This prejudice crept up in France last June in connection with the Dalbiez law, aimed at the cowards who sought to evade military service at the front, and for a time it seemed that this prejudice would result in crippling the railroad services by taking sorely needed men from their posts and mobilizing them as soldiers for the trenches.

Dating from the present conception of war as a task not altogether done in the very trenches or by the baring of the naked breast to projectiles, but rather as an industrial task having for its purpose the manufacture of munitions, in abundant quantity, the role of the railroad man has come to be understood by the civil population. In England there are 500 factories turning out war materials, working 12 hours a day, and in France there are 200 factories working 21 hours a day. And one-third of the men in these factories are skilled workmen who have been taken out of the trenches because of their technical training and put in a place where they can serve the nation best.

"Every man at the war job he can do best," is now the slogan. While the majority of the railroad men must necessarily be behind the lines, there are a large number at the front, not 400,000 of them in Germany and France as has been loosely stated; yet enough to do the immense railroad war work required.

The work at the front in which the railroad men have taken their proud share certainly surpasses in both immensity and quality all other colossal construction jobs which history, past or present, has regarded with wonder. Though not so lasting, and the more difficult because it changes daily, the mere digging of trenches and mines would seem to have surpassed in immensity the excavation work of the Panama Canal, 41½ miles long and with a channel hundreds of feet deep and wide. On the two sides of the 500-mile front between the North Sea and Switzerland no less than 2,000 miles of excavation has been made, counting communication trenches and the second and third lines of defense trenches. It has been estimated that more than 100,000,000 tons of earth have so far been shifted, a modest estimate when it is considered that the 6½ million coal miners of the world annually dig out a billion and a half tons of coal. Much of this earth and debris must be cleared away by trains.

At 600 tons a train load, if all of it had to be moved, more than 100,000 trains would be needed.

The mere citation of this trench work, which is but a part of the whole war job, involving the transport by train or motor van of heavy machinery, of cannon and cannon foundations, conveys a conception of how railroad men are helping at the front.

According to the *Zeitung des Vereins*, the total number of German railroad men engaged in the war service is 125,000 (or 22 per cent of the total), of whom 58,000 are on the firing lines and 67,000 engaged on war trains. When the head of the German state railways was asked if he could furnish more men at the front, he replied that he could do so only by crippling the service of the interior of the country, and at the risk of costly accidents.

In France some 37,000 railroad men are enrolled as soldiers and some 16,000 are detailed for campaign railroad work at the front. The latter form a body known as the *sections de campagne*. They are an arm of the engineering corps and take part in destroying enemy tracks and trains, in operating and laying new lines and in helping build new bridges. In times of peace there was a special railroad regiment, practised in hasty railroading, which was constantly on duty and operated the portion of the State Railway connecting Orleans and Chartres in every detail.

From this nucleus has grown the special railroad army now on duty at the front, at Compeigne, at Longpont, at Cumieres, at Fismes, everywhere operating army trains, building new lines, repairing track destroyed by bombs or clearing away trains wrecked by enemy cannon. Every railroad department is represented—engineers, train dispatchers, even way bill clerks and bookkeepers. When men of this army are killed they are replaced by other men from some one of the ten sections of campaign railroaders or else by men taken from the regular commercial service. All of the men of this railroad army are engaged in active railroading. The work of guarding the tracks is left to the soldiers of the regular army at the front. Behind the lines, throughout France, where every foot of railroad track and every station is guarded by sentinels, day and night, this work is done by the reserve army composed of older men who, because of their age, are not sent to active trench fighting.

One of the big construction tasks in which this railroad army has been involved has been the laying and operation of connecting track just behind the front between the Eastern and Northern railroad lines. This was a task neglected before the war, and in order to get quick communication at all points of the front without doubling back to Paris, or even to the way stations between, many miles of new track were required. In the far north of France, where the English hold some 30 miles of the extreme end of the Allied front, the same situation forced the English into railroad building, and as early as last April 10,000 navvies were brought into France from England and put to work at building connecting lines along the front. Some of the English railroad work has extended back as far as Havre, the terminal port of the English army.

What the French army thinks of its railroad soldiers has been indicated by the numbers of them that have been decorated with the cross of the Legion of Honor or cited in the Order of the Day. Some of them fell too early to get either the cross or the *Medaille Militaire* that comes with such citation. One of these was M. Nigond, director of the Orleans system, who died almost at his desk November 2, 1914. The overwork that came with mobilization during the first two months of the war killed him.

Many of the men of the Southern Railway, serving at the front from the very beginning of the war, have been noticed. The Cross of Honor has been given to Charles Jufflet, operating manager, and to M. Vassal, station agent at Toulouse, and the military medal to Frederick Pailheres. The Director of the Railroads of the Army, in September, published a notice that the military medal had been given to the following members

of the Southern Railway's staff: Fireman Gassiot, "who during the bombardment of his station, refused to seek shelter and stayed on his engine to keep up steam despite the hail of bursting shell;" Charles Bibie, master workman, "who acting as switchman, during the bombardments of the 18th and 20th, did not leave his post, although shells of large calibre burst about him, covering him with earth, and to Louis de Peyralade, employee of the first class, who "serving as agent in a station which has been bombarded nearly every day, continued his service under fire, both night and day, undisturbed by his danger, and has given a splendid example of courage, coolness and attention to duty."

For such reasons as the above, just before the recent victory, General Joffre invited to his headquarters a delegation from the Union Nationale des Cheminots (National Union of Railway Men), and there complimented the railroad men through them for their patriotic valor, their calmness and perseverance, saying in part:

"With all Frenchmen united in the same firm determination to win, we will go to the end, and persevere to a last victory which will permit us to dictate peace."

THE PROSPECTS OF RAILWAY LEGISLATION

By W. L. STODDARD

WASHINGTON, D. C., October 26

In spite of the fact that the main attention of the Administration and of the country centers upon the program of preparedness, already announced in part, there are indications that Congress will seriously consider at least one measure of railroad legislation—the bill to regulate the issuance of railroad securities. This bill is an item of "unfinished business," left over from the Wilson trust program. It has long been advocated by the Interstate Commerce Commission, which will unquestionably renew its recommendation in its next annual report. It has the backing of many conservative and constructive thinkers in the railroad, financial and economic world. Lately the Brotherhoods of Locomotive Engineers and Firemen have issued statements endorsing this legislation on the ground that its enactment will guarantee to the roads a fair return on their actual investment, to the employees a wage commensurate with their service, and to the public "a square deal."

When the bill in question was brought before the House of Representatives on June 2, 1914, for debate and passage, Mr. Rayburn, of Texas, its nominal author, declared that it contained three provisions deemed necessary by a majority of the committee. The first of these was greater publicity in the financial transactions of railroad corporations; the second, making it illegal for railroad corporations to issue stocks and bonds "or other evidence of indebtedness" except for certain specified purposes to be approved in advance by the Interstate Commerce Commission; and the third, that within two years after the passage of the act, it should be illegal for one man to hold a Directorship or official position in more than one railroad, and for any official to "appropriate, pay or receive as salary or dividends any money resulting from the sale of stocks and bonds."

On June 5, 1914, after several days of desultory debating, the Rayburn bill passed in the form in which the Committee on Interstate and Foreign Commerce had prepared it. The vote was 325 in favor, 12 against, 2 answering "present," and 94 not voting. Going up to the Senate, the bill found its way to the committee on commerce, which reported it on July 23, cutting out, however, the interlocking directorate provision and making several amendments to the text, the nature of which it is not necessary to go into at this time. The session closed with the bill still on the Senate calendar. It was not revived at the winter session.

As Chairman Adamson, of the House committee, pointed out in his report on the bill, the investigations of the Railroad Securities Commission, appointed by President Taft, and headed by President Hadley, of Yale, were used as a basis for many

of the sections of the measure. Provision was made for the avoidance of friction or conflict of jurisdiction between the federal commission and the state authorities by requiring that notice of every application for approval of stock and bond issues should be given to the regulatory authority of the state concerned, so that the states might appear and be heard. "There is no doubt in our mind," said the report, "that that provision will rapidly lead up to a satisfactory working of the law and to absolute harmony and agreement between the two authorities." As to the interlocking directorate clause, the House committee declared:

"It has been represented to us that . . . railroad men are now no longer dishonest or incompetent, and that it is a matter of convenience for the same men to handle different enterprises without having to consult so many different people; but our observation is that there are good men enough in the world to fill every responsible position and then not have enough positions to go around, and we observe, in answer to the suggestion, that if the practice has ceased the provision in the law will not hurt anybody, for no man will be punished unless he is guilty."

It has already been intimated in newspaper despatches from Washington that the Rayburn bill will be reintroduced in December and pressed. This is to be expected, and does not necessarily mean that Congress will actually make any move in the matter. Everyone who is familiar with the present political machinery of the federal government knows that as Congress is now operated, the successful passage of legislation depends not upon the attitude of the membership of that body, but upon the desire and purpose of the President alone. Almost without exception, every important bill enacted by Congress during the last two years has been enacted because it was urged by the President; and, by the same token, practically no important bill was enacted during this period that failed to secure the President's support. The exceptions to this rule were measures such as the Seamen's bill, which had been for years before Congress, and which were supported by a large and powerful body of public opinion.

Railroad investors and officials, then, will await with interest any intimation from the White House of intention to recommend the Rayburn bill. No one close to the President at this time will give out any hint as to Mr. Wilson's attitude on this matter. The fact that he failed to secure its enactment when the trust program was before Congress over a year ago, would seem to indicate that the regulation of railroad securities was not a pressing subject in the executive's mind.

Of course, as has been indicated above, public sentiment may secure the passage of the railroad security bill, even without a sign of encouragement from the Administration. In view, however, of the great mass of appropriation bills which must be passed before the end of June, 1916, and in view, also, of the preoccupation of Congress with preparedness and the political campaign, the fate of any other legislation is not to be predicted with any confidence whatever.

A NOISY YARD ENGINE

The Toledo Terminal Railroad recently received the following expressive letter which we are permitted to reprint:

Is it absolutely necessary, in discharge of his duty day and night, that the engineer of your yard at the upper Terminal bridge should make it ding and dong and fizz and spit and clang and bang and buzz and hiss and bell and wail and pant and rant and yowl and howl and grate and grind and puff and bump and click and clank and chug and moan and hoot and toot and crash and grunt and gasp and groan and whistle and wheeze and squawk and blow and jar and perk and rasp and jingle and twang and clack and rumble and jangle and ring and clatter and yelp and croak and howl and hum and snarl and puff and growl and thump and boom and clash and jolt and jostle and shake and screech and snort and snarl and slam and shake and throb and crink and quiver and rumble and roar and rattle and yell and smoke and smell and shriek like hell?

Railroad Sessions of National Safety Congress

Enthusiastic Representatives from 35 Roads Report Instructive Experiences; Motion Pictures Becoming Popular

The National Safety Council held its annual congress at Philadelphia last week, and in connection therewith the railroad section, Marcus A. Dow (N. Y. C.), chairman, held well-attended and instructive sessions on Wednesday forenoon and afternoon and on Thursday morning. Nearly 100 railroad men were present, representing 35 roads; and in this number the New York Central Lines and the Pennsylvania Lines East of Pittsburgh are each counted as one. The New York Central sent 15 men, representing safety committees from all parts of the system, and the Pennsylvania, east of Pittsburgh, 14. The Lackawanna sent nine. Two men came from California and two from Canada.

The chairman, in his opening address, took occasion to emphasize the high degree of safety already attained by American railroads, quoting the statistics of 115 companies which during the fiscal year ending in 1914 had no passengers killed in train accidents. At the same time the harvest of death reaped among the trespassers, a field in which the railroads are helpless, continues large. Mr. Dow, called attention to the importance of the personnel as the most fruitful field in which safety-first work must be carried on. For many bodily injuries the victim himself is largely or wholly at fault and the problem is to make men think. A certain track repairer, seeing a shopman from an establishment near the road start to cross a deck bridge where he was in danger of being struck by a train, called the shopman to account, and very likely saved him from death or severe injury; that railroad man was engaged in true safety work. He is as much a hero as many who perform more spectacular services. Employees must be trained, and training implies a great amount of work on the part of safety committees and all who have a duty to see this work promoted.

The first discussion was on a paper by W. C. Wilson, (D. L. & W.) delivered before the general congress the day before. Mr. Wilson, in his paper, outlined what the railroads have been doing for safety during the past few years, and contrasted this with the inaction of public authorities. He cited a recent decision of the United States Circuit Court of Appeals in which the judge, at considerable length, pointed out the advantages which the driver of an automobile has, as compared with one driving horses, in avoiding danger at railroad crossings; he has better control of his machine than does any man over a horse, especially in circumstances where a horse may become frightened; and the courts should hold the automobile driver rigidly to account for reasonable care and precaution. Mr. Wilson alluded to the good work which has been done by some manufacturing establishments and said that the general public must be educated, in the same way, in knowledge of railroad conditions. The public really has a duty to co-operate with the railroads, not simply to wish them good luck in their tasks. To indulge in superficial talk about the need of abolishing grade crossings is a waste of energy, oftentimes. This problem is a big one, and such talk has about the same weight as to say that the way to stop a drought is to make it rain. The National Safety Council should be a powerful molder of public opinion.

THE TRESPASS EVIL

In the discussion of Mr. Wilson's paper, F. M. Metcalf, (Northern Pacific) told of a circular which he had issued to station agents to be distributed among school teachers, explaining the dangers of trespassing on tracks. This had been noticed and copied, in whole or in part, by local newspapers throughout the Northern Pacific lines, many notices of this kind filling a half column.

G. S. Locker (D. & I. R.) holds meetings for the enlightenment of the public, much of the time as often as once a month. These have been held in four important cities and in some

smaller places. He uses both the stereopticon and motion pictures. In each city he has made it a point to show pictures taken in that city; and in some cases children attending the exhibition saw themselves climbing on freight cars and doing other dangerous things. Some of these meetings have been held in the afternoon and with an attendance of more than a thousand children. A sentiment has been created in favor of the meetings by interviews with editors and with representative citizens.

G. C. Martin (Toronto, H. & B.) has been educating section foremen and crossing watchmen and also many employees of factories along the line. To accomplish results with this last class it is necessary to go personally to the manager of the establishment.

Mr. Dow, replying to questions, and to the suggestion that the education imparted to school children at meetings, however successful for the time being, will need to be repeated, said that the policy of his road was to keep up the agitation. A year ago, a man was employed to go to every important town on the line and carry on a little local campaign. In New York the law, if enforced, would be adequate; and this traveling agent of the road went to every local magistrate, also to local editors and made sure that they understood the situation. In both these classes many were found who were surprised at the records of casualties which to railroad men are so familiar. As a part of the campaign little notices giving a warning against trespassing were printed and distributed among manufacturers to be put by them in the pay envelopes of employees. Having disseminated information thoroughly, agents were sent out to make arrests; and from five to ten a day were made by each of these officers. The arrests were made first in the towns where the magistrates who had been interviewed were believed to be alive to the situation. A large number of convictions were secured and some fines imposed as high as \$25. Jail sentences varied from five days to three months.

E. F. McKenzie (Penn.): Why should the railroads have to drive off trespassers? Partly because, in many situations, the railroad right of way is the best path available; some of the roads adjacent to the tracks are mostly mud-holes. It is desirable to stir up the towns and counties to build better highways.

S. G. Watkins (B. & M.) had found very satisfactory results from getting school teachers to arouse the interest of pupils by asking them to write letters. In letters from pupils of all grades, from the high school down, a prominent expression is "I did not realize the danger." In the past year Mr. Watkins in his addresses to schools has reached the ears of 40,000 children, including hundreds of high school pupils. He secures the co-operation of the superintendent of schools, who goes around with the lecturer. Mr. Watkins has been a claim agent for twenty years and so has stories of real experience with which to illustrate his exhortations to the pupils. In his circulars, which he puts into each home, he keeps the legal end of the subject out of sight. There is no question about the attractiveness of this subject as it has been presented during the past few years; the problem is how to keep it up.

G. L. Wright (C., St. P., M. & O.): In Wisconsin there is a law requiring teachers to preach safety-first to the pupils 30 minutes a week. This has been found very beneficial. There is room for education of teachers, however; a certain principal of a large school, whose pupils were careless, was found to be ignorant of the law.

L. F. Shedd (Rock Island): Railroad employees (trainmen) neglect the duty of keeping trespassers off trains. They should be made to obey the rules.

AUTOMOBILE ACCIDENTS

The first paper before the railroad section was one on automobile accidents at grade crossings, by J. C. Rose, chief claim agent

of the Pennsylvania Railroad. Mr. Rose, briefly outlining what the railroads have done to secure safety at crossings, and noting the fact that the public has done nothing at all, declared that there must be legislation; and it must be national, not state. The education of school children is well enough in its place, but who can expect that this great task will continue to receive adequate attention? On a certain road in the Pennsylvania System the school propaganda has been carried out to some extent, but apparently this teaching has no more influence on the children than has the brief prayer at the opening of school. The magnitude of the problem, and the seriousness of its dangers are not appreciated. There are now in this country two million automobiles and speed regulations are not enforced adequately anywhere. Licenses are granted too freely and liquor drinkers get them without trouble. A person who uses any intoxicants whatever should never receive a license. Grade crossings cannot be abolished for years; on the Pennsylvania System alone there are 13,000 crossings and to abolish them would cost \$600,000,000. The only solution, therefore, is a drastic law; a federal law applying to all interstate railroads, requiring all persons approaching a grade crossing to stop, look and listen, not less than 10 or more than 40 feet before reaching the crossing. Punishment should be a fine of \$50, one-half to go to the informer.

After a brief discussion the meeting voted unanimously to endorse Mr. Rose's proposed law.

In the discussion on this paper G. C. Martin (T. H. & B.) spoke of the nuisance of automobilists running through gates, especially at night. His road has adopted a light, to be hung on gates, which shows red to the wayfarer. Red lights are also in use on the Lehigh Valley, the Southern Pacific and, to a limited extent, on the New York Central. At obscure crossings Mr. Martin would have a distant signal 100 ft. back from the track. The owner of an automobile, receiving a license, ought to be required to acknowledge in writing that he had read the conditions.

R. C. Richards (C. & N. W.) said that his road, sometime ago, had put up distant signals on the highway at many crossings, placing them from 100 ft. to 1,000 ft. from the tracks, according to conditions. He thought the National Safety Council might do much good by formulating a notice of warning for automobilists the council to use its endeavors and influence to have such notices sent out by the officers of the several states who issue the licenses for automobiles.

Mr. Rose called attention to the uncertain dependence to be placed on red lights. These lights are used so much to indicate places along the roadway, usually at one side, which are temporarily impassable, that drivers of automobiles become careless and do not treat the red light as a stop signal; they simply aim to run around it, and often without slackening speed. The Pennsylvania has put up distant signals for automobilists at some points in New Jersey. The railroads, however, have done their full duty, and more than their duty, in the matter of protecting crossings; there is something for the public to do.

F. V. Whiting (N. Y. C.) advocated more attention to the crossing watchman and to giving him adequate power and authority. All flags should be taken out of the watchman's hands. A disk is better. Disks are used on the Central of New Jersey. The New York Central has had some gates painted red; and proposes to make the red light standard for the night crossing light. Every large road should have an overseer of crossing attendants; this work is important enough to demand constant expert supervision.

PRIZES FOR COMMITTEEMEN

W. C. Wilson (D. L. & W.) gave a brief account of the action of his road in recognizing the best work of the committeemen by prizes. Last year, on each division, a watch charm was given to the committee which had made the most useful or the most numerous suggestions looking to better safety. On each division the division committee, by vote, selects that one of its members who is to receive the prize.

H. J. Bell (C. & N. W.): In four years our committees have received 21,000 recommendations and all but 678 have been adopted. The committee lets the men know that their suggestions are adopted. The North Western has a banner which is given to the division making the best record; and now, in addition to the banner, the members of the committee who have won it are allowed a week's vacation with pay.

Mr. Dow (N. Y. C.): From May, 1912, to the present time our committees have received about 20,000 recommendations. Of the faults pointed out by these recommendations about 89 per cent have been corrected, and of the balance a considerable number are still under consideration. It is important to acknowledge recommendations made by employees. On the New York Central members of safety-first committees are paid their time while attending meetings and also, when away from home, their expenses. Meetings are held usually every month.

C. H. Baltzell (St. L. & S. F.): On our road a prize for excellence in safety-first activities is given annually to the best division and the best shop. Our division has taken the prize three years in succession; and this was done by keeping up the interest by constantly bringing out new things. Mr. Baltzell told of his success in regulating boys who trespass his yards, with which the readers of the *Railway Age Gazette* are already familiar.

ELECTION OF OFFICERS

A brief discussion on Mr. Wilson's suggestion ended the morning session. At the afternoon session the meeting adopted a code of by-laws for the guidance of the railroad section of the National Council and elected officers for the ensuing year as follows: M. A. Dow, general safety agent, N. Y. C., chairman; J. M. Guild, superintendent of safety, Union Pacific, vice-chairman; H. J. Bell, safety inspector, C. & N. W., Chicago, secretary.

MAINTAINING INTEREST

The first paper in the afternoon was on how to create and maintain interest among the members of committees, by W. B. Spaulding (St. L. & S. F.). Mr. Spaulding outlined the most common criticisms of safety-first work. It has been charged that it is too one-sided; that the shortcomings of the railroad company are never mentioned. The method of choosing committeemen is often at fault and critics say that a committeeman always has to take the company's view of everything. When an employee makes a recommendation and hears nothing from it he feels neglected, and this leads to a silent unfriendly feeling, if nothing worse. The thing to do is to establish reciprocal and unwavering confidence between officers and the rank and file. The superintendent who acts as chairman of a committee should put aside all his ideas of authority. Where the superintendent does this the employees value membership on a committee. The employees should be leaders in this matter; the company should co-operate with them, not they with the company. Why should not each class of employees select its representative to serve on the committee?

HOW TO REACH FOREIGNERS

C. T. Banks, of the Erie, recently from the Northern Pacific, spoke informally on how to reach non-English speaking employees. One of the principal weaknesses is in not recognizing that many employees who do not speak English are, from a mental standpoint, not over 14 years old. With men of this kind, education in their work, which means education in safety, must be very elementary and very clear. Teaching a track laborer or a freight house man how to handle freight or materials without injuring himself must be done by example. Moreover, such teaching is a vehicle by which the foreman can make the laborer his friend, and this stimulates the man's pride in his work. There is danger that we may go too far in classing personal injuries as due to the negligence of the victim; often this negligence is a thing for which the boss, perhaps the trainmaster, is partly responsible; he has not done his best to educate the man.

A paper on this subject by Isaiah Hale (A. T. & S. F.) was read by chairman Dow, Mr. Hale being unable to be present. On the Sante Fe the foreigners are all Mexicans. Half of these are out of reach of the general office and Mr. Hale had made extensive trips throughout his territory to educate the men in safety, giving them ten-minute talks. He had an automobile fitted to run on the track and was able to reach practically every workman in the company's service. In most cases printed matter could not be used. A phonograph was used to spread the lectures to men who could not be otherwise reached, and this was used not only for direct instruction, but also for little talks on loyalty, which are believed to have been very profitable, both for employer and employee. The phonograph was also used to give musical entertainments, which the men warmly appreciated.

Following this paper there was a general discussion of the three addresses of Messrs. Spaulding, Banks and Hale.

Vincent Colelli: I am the instructor in Italian (and teacher of the English language for Italian employees) for the Pennsylvania Railroad. Beginning about three years ago I found that the men who were unable to speak English felt that they were substantially laid aside. I began by teaching them the English language. Contrary to the view expressed here today, I have to say that the foreigners in the service of American railroads are intellectual men. We have track laborers who have attended technical schools in Italy. The Pennsylvania has issued 13 pamphlets for the benefit of non-English speaking employees and will issue many more. These deal not only with the ordinary subjects embraced under the head of safety, but on how to use tools, how to save lives, etc. Over 3,000 Pennsylvania employees are now taking the correspondence course in English.

In dealing with foreigners it is important to get foremen who are not narrow-minded and who understand the importance of the humanities in dealing with workmen. We have safety-first meetings which are carried on in the Italian language, using also a lantern. Important permanent impressions are made. We listen carefully to all complaints.

T. H. Carroll (P. R. R.): The most important desideratum, especially in the work of the trackmen, is to make employees realize the hazard of their work. On the Pennsylvania the proportion of trackmen killed is no greater among the foreign born than among the native men. Too much confidence must not be placed in percentages. If business increases in 1916 it is not likely that the railroads will be able to continue the decided diminution in fatal and non-fatal injuries to persons which has been shown in the last year or two. Comparisons are of little value unless it is known what service the man was engaged in. In comparing percentages each occupation should be taken by itself. Our form for analysis contains 700 causes. A great majority of personal injuries may be classed as due to "misadventure"; that is, it is some little carelessness or thoughtlessness which even men classed as careful are liable to.

S. G. Watkins (B. & M), finding that foreign workmen on the track were struck by trains, because they did not understand the warning shouts of the foreman, issued a circular, printed in the Italian language, and there was a marked improvement. Mr. Watkins has used a lecture car, going to different points on the road. Besides lectures, men are invited to the car in the evening for conferences. These include the use of the stereopticon which not only shows safety-first pictures, but also, by way of variety, scenery and other interesting subjects. Conferences are held also at midnight to get to the night workers. At the small towns, the men are invited to bring their wives to the car. Sometimes an employee who is not much impressed by the lecture is brought to a realizing sense of the situation by a look from his wife sitting at his side. A drill has been adopted, something like a fire drill. The men are called upon, without notice, to step off the track, when no train is approaching.

E. F. McKenzie (P. R. R.): Mouth whistles are the proper thing to warn trackmen to get out of the way of trains. A shrill whistle should be used.

C. H. Blakemore (N. & W.): To get reliable figures of the

proportion of men injured or killed to the total number employed, we make comparisons, for each class, with the payroll.

Mr. Martin (T. H. & B.): We calculate percentages by taking the number of hours the men work, all the men in the class to which the casualties are to be charged.

Dr. R. I. Randolph (B. & O.): In all this discussion I notice little mention of discipline. It is a problem to get men to carry out the rules, for example the rule requiring workmen to wear goggles where there is danger of injury to eyes. Since January last there have been on the Baltimore & Ohio 200 injuries to eyes serious enough to be brought to the chief surgeon. It is important to get after the true reasons for neglect; for example, men will go without goggles from no other motive than vanity.

J. S. Rockwell (B. R. & P.) agreed that discipline should be more carefully attended to. The records of every injury should show whether or not the victim was himself careless. Strict discipline requires that a man shall be reprimanded or punished, even in the case of an injury to himself. There are cases, even, where a man should be discharged when he has injured himself. Speaking of foreigners, Mr. Rockwell said that his road had efficient Italian foremen.

Mr. Dow.—We make goggles compulsory in the shops.

THE NATIONAL SAFETY COUNCIL

R. C. Richards (C. & N. W.), who is a vice-president of the National Safety Council, spoke on the value of this national organization to the railroads. That people having common interests should cultivate each other's acquaintance for mutual benefit is a fundamental principle which has been frequently illustrated from the time of the Continental Congress, in Philadelphia, in 1776, to the present day. The railroads can learn from the other industries and in turn they can learn from the railroads. Mr. Wilson's paper before the general council on Tuesday will have far-reaching effects for good. With the backing of the council he will get a nation-wide hearing, whereas, if he had spoken only as a railroad man, he might have had from the daily papers only three-inch notices in obscure places.

MOTION PICTURES

C. H. Blakemore (N. & W.) read a brief paper on this subject. After trying all available methods he was satisfied that motion pictures constituted the one best means of securing the interest of employees. During the past five months he has been using a car equipped with a high-class machine, showing pictures as attractive as any of those displayed in the professional houses. Employees are entertained by a program that takes about one hour, of which one-third is occupied by lantern slides and 20 or 25 minutes by two reels of motion pictures. "Steve Hill's Awakening," is a forceful and comprehensive safety-first lecture. It has been shown to 8,000 employees during these five months and the effect is remarkable. There is no trouble in getting the men to attend; the difficulty is to keep them out so as to make room for others; and the most pleasing effect is on the older employees. It is important to have the "human interest" element. Unemotional pictures will not answer. Mr. Blakemore thought that one or another of the large producers of motion pictures would get up what the railroads want if enough roads would join to assure them of a reasonable price. Ten or fifteen roads, willing to pay \$300 each could get 2,000 ft. of films. That length is necessary for a satisfactory show.

C. T. Banks (Erie) has bought a motion picture machine, and intends to show "Steve Hill's Awakening." The Erie also has a machine for taking motion pictures.

M. A. Dow (N. Y. C.): The motion picture car on the New York Central has now been in use for about a year. Shopmen attend this exhibition on the company's time. About 75,000 employees have visited the car. It is the intention to produce another scenario.

AN EXPERIENCE MEETING

The second day of the meeting was given over to informal discussion. M. A. Dow (N. Y. C.), replying to a question as to

how best to awaken interest in committees, told of experiences on his road. After devoting attention pretty exclusively for a considerable time to physical conditions, it was decided to put more emphasis on the personnel; and he drew up a brief code of rules for the guidance of committees on all parts of the system. These rules were in substance as follows: (1) The superintendent to preside at all meetings. (2) If absent give the reason for the absence and have this go into the minutes of the meeting. (3) Detailed comparisons of the casualties on each division, and with the figures of other divisions, to be furnished by the general safety agent, and to be discussed at every meeting. (4) Meetings to discuss not only the tabular statements, but also the causes of selected typical cases, the reports of which are prepared by the general safety agent, and sent to all division committees, names of persons being omitted. (5) At each meeting, live topics, assigned by the general safety agent to be announced for discussion at the next following meeting. (6) Each of the 15 to 25 members of each committee requested to caution at least two employees in the matter of safety before the next meeting, and report the names of these employees and the subject on which they were cautioned. (7) A member who has no report to make must explain the reason; and must tell what safety work he has done, all to go into the minutes. (8) The committee must make a trip of inspection over the division at least once a year, sub-committees being appointed, on these trips, to attend to particular subjects. (9) In matters of importance members to send written reports to the superintendent at once, without waiting for the next regular meeting.

J. M. Guild (U. P.), referring to the omission of names from reports of accidents, said that when his road, a few years ago, began the investigation of train accidents in public, with outsiders on the investigating board, there was much discussion as to the possible harm of making public the names of employees at fault; but the fears were proved to have been groundless. On the other hand the legal department finds the public hearings a help. The officers of the road try to show the men that a square deal may be relied upon in all cases. The personal injury lawyers will get the information that they want, in spite of any amount of secrecy.

Mr. Dow said that the assignment of topics beforehand was one of the best moves that had been made on the New York Central. Division meetings now frequently sit all day, and longer, where formerly they sometimes were unable to occupy the time in a satisfactory manner. The safety-first committee should never ignore the foreman of any force of workmen. If he is a good leader, he is a great help; if he is a bad leader or is lukewarm on the subject of safety, good results cannot be secured. The general managers of the New York Central System sent out circulars to foremen, reminding them that any foreman, knowing of an unsafe practice, who should not make suitable efforts to stop that practice would be morally responsible for the results. This circular was approved by the legal department of the road. The wide-awake foreman is a safety committee in himself. One yardmaster on the New York Central established a sub-committee on safety; and his example has now been followed by many others.

E. F. McKenzie (P. R. R.): Why should we not more generally employ personal appeal? Let us adopt the methods of Billy Sunday. I have tried this with fellow employees on the booze question, with good results. This would be carrying out the Scriptural injunction to love your brother as yourself. As business picks up there will be many new men in the service, and only by personal efforts of the experienced can men be made to appreciate the dangers of the work.

T. H. Carroll (P. R. R.): How do your division superintendents feel on this subject? The superintendent is all important. All the good things on the division should originate in his office. Why should a safety committee have to take up matters which the superintendent ought to have attended to? It is important not to confuse the duties of the superintendent with those of the safety committee. On the Pennsylvania, inspectors

are going over the different divisions all the time; but safety committees cannot do the things that the superintendent ought to do.

H. J. Bell: On the Chicago & North Western we try to give the safety committee men the feeling that every employee is important. If a careless man is to be reprimanded or cautioned the letter is sent, not by the superintendent, but by the safety committee. We expressly agree that no one is to be disciplined for a first offense reported by a safety committee. The State Railway Commissioners, recently in convention, are to be commended for formulating a statute empowering station agents and section foremen to arrest trespassers, acting, in this matter, not as employees of the railroad but as deputy sheriffs. To further diminish trespassing by children, the North Western is getting out a postal card to be sent to parents.

E. R. Scoville (B. & O.): On the Baltimore & Ohio those members of safety committees who are not officers are rotated every three months, oftener than on many roads; this with a view to getting a large number of men interested. The dates of the meetings of the safety committee on the divisions are so arranged that members of the general safety committee can visit each division meeting. At the close of each committee meeting we post bulletins containing suggestions which have been made by employees, with the name of the employee. On the whole system, in the last fiscal year, the number of suggestions was 15,352 of which 93 per cent represented faults which were corrected. In the state of Ohio there is a specific statute relating to trespassing, and the road has a form letter which is sent to individuals, where occasion seems to demand, calling attention to the law and to the addressee's violation of it. This written notice does abate trespassing. Letters also are sent to owners of automobiles who disregard the flag signals given at crossings. In the company's shops a safety committee posts a bulletin each day, calling attention to matters of interest, good and bad. A foreman who has had three injuries in his department in one month due to the same cause is liable to have his name put on the bulletin; and this arouses him to activity.

THE VALUE OF MOTOR CARS*

By W. R. McKEEN

Consulting Engineer, Motor Cars, Union Pacific

A transcontinental railroad passenger department officer stated in my presence that his road did not receive any profit whatever from passenger train service until the earnings showed approximately one dollar per mile. A railroad director and financial representative stated that one road has 300 branches on which every passenger train operated loses money. While it is true that competent authorities are at times inconsistent in their expression of costs and profits of passenger train service, I think I am safe in saying that very few if any three-car passenger trains are operated at a profit, and branch line passenger trains and the passenger coaches on mixed trains are a source of financial loss every day, the whole year through. The heavy fixed expenses of passenger train operation are too high and too great to be offset by the limited and restricted passenger receipts; with mixed trains the situation is even worse.

At first thought, it seems that to place a passenger coach on the rear end of a freight train, thereby having the advantage of additional revenue to help offset the operating expense of the freight train, is good economy and indicates a thrifty management. As a matter of fact a mixed train as a rule is a source of trouble, and represents false economy with no visible benefits other than being, as it is, an expedient, and a poor one at that. A mixed train's schedule that suits the passengers as to leaving and arriving time, is as a rule disadvantageous to the freight and stock shippers; the passenger stops slow up the freight time, the freight stops make tedious delays to the passengers, the train crews run into overtime, the service becomes uncertain, unreliable

*From a paper read before the New York Railroad Club, October 15, 1915.

and is poor railroading at best, and never will be a source of profit and satisfaction.

The financial success and universal popularity of the trolley car is not entirely the result of its operating on the city streets, picking up passengers at street corners; on the most successful interurban electric systems the passengers are taken aboard at depots or central stations just the same as steam railroads take their passengers. The interurban cars stopping on city street corners is a detriment to electric car service, just the same as doing local work with 12 and 15 car steam through trains is bad railroad practice. The electric interurban cars with frequency of service, however, can be scheduled to suit the convenience of and please the public and in consequence they get the business. Thus I reach the subject, the gasolene motor car, a transportation unit which offers a means of earning profits on branch lines, where the present steam service loses money. It has a great value to railroads operating mixed trains; they can be divided, producing two services instead of one, it is true, but both on an acceptable as well as revenue earning basis. The motor car will stimulate increased passenger travel and a 50 to 100 per cent increase thereby is easily attained in six to twelve months, resulting in a handsome increase in passenger earnings and at the same time the freight train is scheduled to suit freight business, the cost of operation is reduced and the improved service always tends to better freight earnings.

The branch line passenger business responds most actively to motor car service. The motor car can make road crossing stops, pick up one or two passengers at a time, stop more often and maintain the same average speed as the steam train; the absence of cinders, smoke and jar are attractive features. Often on branch lines the public, having one passenger service a day, is much dissatisfied and demands two services per day. The single service loses money and the railroad cannot consider doubling or trebling its present losses by putting on double passenger train service; yet a disgruntled local public is not desirable. A motor car for the new or second service not only can operate at a profit, but frequently stimulates and increases the travel on the steam train. It is a constant complaint of motor cars that they are too small. Originally a 30-ft. car could handle the business, then a 55-ft. car was more than ample, next a 70-ft. car seating 105 people was thought to be more than ample. The motor car always increases and continues to stimulate travel. The 70-ft. car having stimulated and increased business beyond its capacity, we have recently inaugurated the gasolene double unit motor car service, the baggage, mail and express on the front or the power car and the passengers in the second car. However, where a 70-ft. car is loaded to capacity, I believe additional service is the economical and preferable practice—the additional service continues not only to stimulate travel, but the rate of increase is also stimulated.

While motor cars are more necessary to branch line service, they are also a source of much economy on main lines. One portion of a through line of a large railroad system was through a sparsely settled country and the fast through trains were doing the local work with the usual irregular arriving time and generally unsatisfactory service. A gasolene motor car service was inaugurated running about 40 minutes ahead of the through train; the express, mail, and passengers were collected from the small stations and deposited at the terminal where the through train picked them up. The motor car made reasonable profits and the local business increased about 60 per cent, but the improved time, the regularity of arriving at destination on time and the greater comfort and satisfaction to the through passenger service was of more real value than the increased profits. I have in mind one branch line operated for 30 years without any profit earning passenger business. There are now two motor car services daily with two coaches instead of one on the mixed train; besides the freight train is now scheduled to suit the freight and stock business and as a result the pleased freight shippers are a valuable asset, outside of the improved freight receipts. On another sixty-mile road where the passenger train

service showed a deficit since the road had been built, in thirty days after the gasolene motor car had been substituted for the steam train the passenger service showed a profit, the cost of operation had been cut over 60 per cent and the favorable showing has been maintained ever since, some eight years or so.

From annual reports I notice the average number of passengers per train was 33, 30, 31 and 34 for four successive years; in other words, one-third of a load; on another road with excellent local business the average for three and four car trains was 37 passengers; another road shows 40 passengers per train, including, however, ten and twelve car through trains. On most branch lines the averages will run down to 20 passengers and at times below. Manifestly, then it is uneconomic to operate a locomotive, three cars, full engine and train crew with all the inherent fixed expenses and only use them to one-third capacity; here is the explanation why a single unit motor car handling the same business can make money where the steam train loses.

Among the structural features of the gasolene motor car bodies the success of which is demonstrated by 10 years' practical service is the single steel center sill in place of the well established double center sill construction in wooden cars. A single steel center sill will develop all the strength necessary and therefore its simplicity, economy and desirability, backed by its successful operation in practice, shows the fallacy of using a two sill design where one will answer. The steel center sill in a motor car structure is three times as strong as two standard wooden draft sills. The gasolene motor cars were among the first all-steel passenger cars built, and notwithstanding their comparatively light weight have shown remarkable strength and safety characteristics. These cars are so constructed that the load is almost entirely carried by the sides of the car and not by the sills, and in ten years' experience I have never known one of them to sag; even after years of hard and fast service over the rough track of branch lines, the alignment of the side sills is as near as we can measure the same as when the car originally left the shop.

DISCUSSION

A. W. Jones, General Electric Company, gave some figures for motor car service which included one instance of an operating cost of 2.35 cents per train mile. This was for trains of one motor and one trailer car.

An example was given by another speaker of a 60-mile road which because of the high initial cost of motor cars found it advisable to purchase additional locomotive and passenger cars instead. He advocated a cheaper and lighter type of motor car which would be much easier on tracks than the present types and believed such a car could be built for \$1,800.

The Central New York Southern, which operates two McKeen cars on runs of about 40 miles each way, has found that the cars will run slightly over two miles per gallon of gasolene, while the maintenance costs average 3.1 cents per car mile. Stress was laid on the effect of the operator's training on the results obtained with motor cars; a man trained in steam service should not be expected to make the best job of running a motor car immediately as he is too used to the sounds and other characteristics of the steam locomotive. The Southern Pacific now has in service 42 motor cars and 9 trailers and obtains an average of 2.4 miles per gallon of gasolene.

LABELING EXPRESS AND FREIGHT PACKAGES IN ENGLAND.—The Railway Executive Committee has issued amended instructions, effective September 1, as to the labeling of parcels and goods. In order to meet the fears of traders that their competitors might know from the addresses on packages who their customers were, the companies have, in the case of a number of similar consignments to the same consignee, been content in the past to accept only a few labeled in each lot. With the depleted staff at their command, this has put an increased amount of work on the companies, and from September 1, when there are 10 or fewer packages, each must be labeled; where there are over 10 but less than 100, one in five and for over 100 one in 10.

General News Department

Jay A. Rossiter, office engineer of water pipe extension for the City of Chicago, Ill., has been appointed engineer of track elevation.

During one week recently the department having charge of lost and found articles at the Chicago & North Western passenger terminal, in Chicago, returned to owners 157 articles that had been left in suburban trains. Among the articles were 15 raincoats, 34 umbrellas, 3 traveling bags, 2 boxes of cigars and a purse.

Employees of the Missouri, Kansas & Texas have organized an athletic association, the purpose of which is to develop a closer relationship among the men as well as to promote athletics. The first annual field and track meet of the association will be held at Denison, Tex., on November 6, and employees from all branches of the service and from all districts of the road will participate. C. E. Schaff, president and receiver of the road, has given a cup, to be known as the "C. E. Schaff Trophy," which is to be contested for annually.

The American Association of Engineers is perfecting plans for a national convention to be held at Chicago on December 10 and 11. All engineering societies have been invited to send representatives. A national membership committee has been selected to push the organization of local chapters in various parts of the United States. The association maintains a service clearing house, engaged in putting the engineer in touch with the employer and the employer in touch with the men, without charge. The association has recently taken larger quarters at 29 South LaSalle street, Chicago.

The National Highways Protective Society, E. S. Cornell, secretary, New York City, has records showing that in the first nine months of the present year 142 automobiles killed persons in the streets of New York City, and that the drivers of these cars are today operating their vehicles unmolested and apparently having no fear of any legal action. This and other facts in this connection, printed in the New York Herald, are made the basis of a strong argument for more energetic action on the part of prosecuting officers. In the theatre and shopping districts of New York the street conditions are said to be absolutely intolerable. Of 170 persons killed in the streets by automobiles 68 were victims of trucks.

A southbound passenger train of the Missouri, Kansas & Texas was stopped by ten robbers near Onapa, Okla., on the morning of October 27, about 2 o'clock, and the express car robbed. They tied up the crew with ropes, placed a guard over the passengers and held the train two hours, going about their work with precision. They sent back a detachment which stopped a freight train coming up behind and placed the freight crew under guard to prevent interference. The robbers escaped into the woods and posses followed. Three safes proved impregnable and were abandoned. After five charges of nitroglycerine were exploded the fourth safe was opened. During this time probably a dozen shots were fired by the robbers.

The Boston papers continue each day to have news and discussions of the strike of freight house men in that city; but from the railroad standpoint the strike seems to have been settled. Large numbers of new men have been engaged and put at work, and the reports say that freight is moving nearly in a normal way. The strikers say that they are going to get longshoremen and other workmen to join them in sympathy, and the mayor of Boston writes to the railroads that the situation is threatening; also that the public will support the men in their demand for \$2.50 a day; but the activities of the mayor and of other city officers do not seem to have affected the final outcome.

Approximately 2,500 ft. of double-track snow sheds on the line of the Southern Pacific at Summit, Cal., where the railroad crosses the Sierras at an elevation of 7,018 ft., was burned out

on Sunday, October 17, by a fire which probably started from an explosion of a carboy of acid in a freight train on a siding. Fourteen loaded freight cars of this train, with a value estimated at \$100,000, were destroyed, with their contents. The company soon sent three fire fighting trains loaded with water to the scene of the fire, and the line was open to traffic by 8:30 in the evening. Only the heavy timber supports of the snow sheds were left standing, and snow has already begun to fall at that elevation. Material was immediately rushed to the place and the work of rebuilding was begun at once.

Cost of Running Jersey City Tractor

The results of the use of an electric automobile, running on the pavement, to move freight cars on tracks in the streets of Jersey City, were given in an article, by T. V. Buckwalter, in the *Railway Age Gazette* of October 22, page 737. The expenses for the driver (wages) during the past year have averaged \$71.65 a month, not \$7,165, as erroneously stated on page 739. The same error, the omission of a decimal point, is what is the matter with the other item, \$13,451, which appears in the same paragraph.

The Cost of Valuation

Charles A. Prouty, director of valuation of carriers' property for the Interstate Commerce Commission, is quoted as saying that he expects the task to be completed in four years from next January. "The engineering departments are now proceeding at a rate of 50,000 miles a year," he said. "We have about 1,500 men employed at an annual expense of about \$3,000,000; but the total bill for securing the information necessary to furnish a satisfactory basis upon which to predicate rates will not be more than the cost of one big dreadnought."

The Trial of the New Haven Directors

The trial of the criminal suit against the eleven New Haven directors under the anti-trust law was continued in the Federal Court at New York during the past week. Former President C. S. Mellen was the principal and practically the only witness on the stand during the week and his testimony as developed by letters and other evidence offered by the attorney general's special attorney, Frank M. Swacker, dealt only with the years prior to 1897. During this time the New Haven attempted to eliminate the New York & New England as a competitor.

Mr. Mellen on Thursday told how he became general manager of the New England in April, 1892, but how seven months later he was made second vice-president of the New Haven, because, as C. P. Clark, president of the New Haven, later said, he was "too much of a nuisance on the New England."

Mr. Mellen told how in his new position he helped to eliminate the competition of the New England. The New Haven refused at one time to pay advance charges on freight coming from the New England. The New Haven entered into agreements with a number of roads west of the Hudson River whereby it exclusively was to receive New England traffic from them. One of the New England's means of access to New York City was by the Wilson's Point route. The government in this connection brought up the Sound Lines agreement signed in 1881, which the New Haven accused the New England of breaking in 1891, when the latter attempted to establish a connection with New York via Wilson's Point and the Long Island Road. The New England was jointly interested with the Housatonic Road in this route, and the New England Terminal Company, which supplied an important part of the service. New Haven interests later bought control of the Housatonic line and an attempt was made to abolish the service of the Terminal Company almost entirely. The New England then tried to secure access to New York over the New York & Northern, which was about

this time acquired by the New York Central. Thereupon the New Haven tried to block the New England by the so-called tripartite agreement, which attempted among other things to hinder the New England's access to New York City over the Central. Negotiations were not entirely successful, but in May, 1895, the New Haven bought a controlling interest in the New England, following the latter's receivership.

Monday morning the proceedings were enlivened somewhat by the presence of John T. Johnson, the colored messenger in the president's office at New Haven under Presidents Hall, Clark and Mellen. Mr. Johnson was called upon to identify a large number of press copy letter books from the president's office.

On Tuesday Mr. Mellen was asked about certain friction arising between the New York Central and the New Haven, back in 1894, relative to a proposed readjustment of traffic relations. The New Haven, on Mr. Mellen's advice, tried to secure larger divisions and to effect changes in routing which would give it a longer haul, and it was partly because of this that the New York Central opened its terminals to the New England. The friction aroused the anger of the late J. P. Morgan, who was a director of both roads. Mr. Mellen, on hearing of this, went immediately to Mr. Morgan's office and explained the circumstances, whereupon Mr. Morgan exclaimed: "I never understood it before, Mr. Mellen; I have been misinformed. I have been used as a doormat. Good day!" The disputes were later covered by the so-called Corsair agreement.

Mr. Mellen was also on the stand on Wednesday, and discussed the secret methods followed by the New Haven in buying control of competing roads. The detail into which the government has thus far carried the case has not only been the subject of comment by counsel for the defence, but by Judge Hunt, who is conducting the trial. Mr. Lindabury, of the counsel for the defence, on Tuesday complained of the manner in which "ancient history" was being brought up and expressed the opinion that if things went on as in the first two weeks of the trial he expected to be in court until next July.

Chestnut Hill Electrification

The Pennsylvania Railroad has begun work between the Schuylkill river and North Philadelphia on the foundations for the posts which will be required for this portion of its line when electric propulsion is put in use. It is expected that the electrification work, which includes the branch to Chestnut Hill, 12 miles from the Broad street terminal, will be finished in the latter part of 1916. On the Chestnut Hill branch the elimination of grade crossings at Chelton avenue and Highland avenue, which is to be paid for jointly by the city of Philadelphia and the railroad company, will require about 12 months for completion, so that the introduction of electric traction will depend on the time when the grade crossing work is completed.

A Correction

On page 677 of the *Railway Age Gazette* of October 15 there was a map of the railroads in the hands of receivers. On this map the line from New Orleans, La., to Laurel, Miss., was shown as being in the hands of receivers. The New Orleans, Mobile & Chicago formerly had trackage rights over this line but it is owned by the New Orleans & Northeastern and the trackage right contract was canceled before the appointment of receivers for the New Orleans, Mobile & Chicago. The New Orleans & Northeastern is not, of course, in the hands of receivers, although the New Orleans, Mobile & Chicago is. The line from New Orleans to Laurel, therefore, should not have been shown as being in the hands of a receiver.

Highway Crossing Data

"The Partnership Interests of a Municipality and a Railroad, in the Matter of Eliminating Grade Crossings" is the title of a pamphlet which has been issued by Fairfax Harrison, president of the Southern Railway, apparently for circulation among the officers of cities and towns along the lines of that company's railways in the southern states; but it is of interest to students of this subject everywhere, being filled with facts concerning this problem gathered in several northern and central states and in a dozen prominent cities. This matter, showing how this difficult

subject has been dealt with under all sorts of conditions, is in the nature of a preface to a half-dozen pages giving details of the division of cost for improvements of this class in Atlanta, Birmingham, Chattanooga and other places on the Southern Railway's lines.

A New York View of the Mail Pay Question

The Merchants' Association of New York has made an investigation of the mail pay question, thorough and exhaustive, and finds that the railroads are being greatly underpaid; and the board of directors concludes that the plan embodied in the two measures now pending before Congress, the Bourne and Moon bills, would divert large quantities of merchandise from the freight traffic of the carriers.

The investigation was made by a committee of ten members, of which William Fellowes Morgan was chairman. After considering the report the directors adopted resolutions in part as follows:

"Whereas, It is shown by the analyses of the Interstate Commerce Commission

(a) That railroad revenues as a whole are insufficient and should be increased; and

(b) That the deficiency is mainly due to insufficient passenger service earnings; and

"Whereas, It is shown by the analyses of the Bourne committee that the earnings of the mail traffic branch of the passenger service are approximately 22½ per cent below the average earnings of the passenger service, which the Interstate Commerce Commission finds deficient as a whole; and

"Whereas, It is shown by the report of the Association's Committee on Postal Affairs that the average rate of compensation paid by the government to the railroads for mail carriage has been reduced approximately 50 per cent since 1902, and now produces little or no profit and possibly entails a loss; and

"Whereas, The space-rate proposed is equivalent in the case of fully loaded cars to a rate of 1¼ cents per ton-mile for freight carried for the government on passenger trains, while the same high-class freight, if carried for private shippers on freight trains, would pay from two to three times that rate per ton-mile.

"Resolved, That the public welfare requires that the country's transportation facilities be maintained in constantly efficient condition, and that we recommend

(a) Payment for the present, for weight, on the basis of the existing law, but with provision for annual instead of quadrennial weighings;

(b) Payment for apartment-car space, pro rata, upon the basis of payment now in effect for full postal cars;

(c) Payment for side and transfer services, or that the railroads be relieved of the performance of those services.

"Resolved, That no new and untried plan for determining railway mail pay should be adopted unless or until approved by the Interstate Commerce Commission, after thorough investigation, with especial reference to the effect of such plan upon the railroads' existing freight revenues, and the equity of rates proposed for the carriage of postal matter upon passenger trains in comparison with the rates charged for first class merchandise on freight trains; and we recommend that for not less than two years, all weighings and adjustments for determining railway mail pay be supervised by the Interstate Commerce Commission, which Commission shall obtain from the Post Office Department and the railroads reports covering all necessary information as to the service performed, and pending such report and recommendations by the Interstate Commerce Commission the existing law be continued, but with the modifications indicated by the preceding resolution.

"Resolved, That the plan of space-payment is excessively discriminatory in that it makes, for mail-freight carried on passenger trains, a rate only about one-third to one-half the rate paid for high-grade freight carried on freight trains, which condition will promote the diversion to the mails of large quantities of high-grade merchandise, on all of which the railroads will suffer a loss of two-thirds of their present freight revenues; and therefore that The Merchants' Association of New York oppose any and all bills for the readjustment of railway mail pay on the basis mainly of space or substantially as proposed by the Bourne and the Moon bills."

Western Society of Engineers

L. E. Johnson, president of the Norfolk & Western, will address the Western Society of Engineers at its meeting in Chicago on November 2, on "The Relations of the Railroads and the Public," giving a discussion of the railway situation, especially with reference to the policy of regulation, both as it is and as it ought to be.

Passenger Traffic Officers

A special meeting of the American Association of Passenger Traffic Officers was held at French Lick Springs, Ind., on Tuesday of this week, with about a hundred members present. A large docket of important subjects was discussed, including committee reports on a Universal Telegraph Code; Association Ticket Paper; Economical Distribution of Folders and Advertising Matter; An Additional Charge for Checking Baggage; Economy in the Operation of City Ticket Offices and Regulation of the Sale of Prepaid Ticket Orders.

Society of Railway Financial Officers

The annual meeting of the Society of Railway Financial Officers was held at Colorado Springs, Colo., on October 19, 20 and 21. President A. O. Wellman, assistant treasurer of the Atchison, Topeka & Santa Fe, presided. The meeting discussed committee reports on Uniform Form of Vouchers and Agents' Drafts, Semi-Annual Pay-Days, Railroad Collection Bureaus in Large Cities and Railway Clearing House. The subject of a railway clearing house was referred back to the committee for a further conference with a committee of the accounting officers' association during the year, the result of the conference of the joint committee to be referred back to the next annual meeting. Addresses were made by Senator Charles S. Thomas on "Some Features of the Federal Reserve Bank," Dr. William F. Slocum, president of Colorado College, and R. L. Holland, of Colorado Springs.

Officers for the ensuing year were elected as follows: President, T. H. B. McKnight, treasurer, Pennsylvania Lines, Pittsburgh, Pa.; first vice-president, H. E. Suckling, treasurer, Canadian Pacific, Montreal, Que.; second vice-president, D. K. Kellogg, treasurer, Richmond, Fredericksburg & Potomac, Richmond, Va.; secretary and treasurer, Carl Nyquist, assistant secretary, Chicago, Rock Island & Pacific, Chicago.

Railway Development Association

The Railway Development Association will hold its annual convention at the Hotel McAlpin, New York City, November 9, 10 and 11.

The program for Tuesday, November 9, includes an address on "General Railroad Business," by George A. Post, president of the Railway Business Association; on Immigration, by F. C. Howe, United States Commissioner of Immigration; Immigration Field Work, by John F. Fox, Immigration Agent of the Northern Pacific; Exports, by W. S. Kies, vice-president of the National City Bank, New York; Fruit Growing, by J. H. Hale; "What Made the Department Permanent," by W. W. Wood, General Industrial Agent of the Baltimore & Ohio; "Eliminating Competition by Locating Industries on Joint Tracks," by C. C. Dana, Industrial Commissioner of the Atchison, Topeka & Santa Fe.

On the second day there will be papers on Agriculture, by Professor Alva Agee, Dean of the New Jersey State College of Agriculture; Intensive Agriculture, by William H. Olin, Agricultural Commissioner of the Denver & Rio Grande; Co-operation of Railroads and Commercial Organizations, by R. C. O'Keefe, Secretary of the Buffalo Chamber of Commerce; Acquisition of Land for Locating Industries, by John C. Emig, Industrial Agent of the Cleveland, Cincinnati, Chicago & St. Louis; Horticulture and Agriculture in the South, by J. A. Hearne, Fruit and Vegetable Agent of the New Orleans & North-Eastern.

On Wednesday evening there will be a banquet, and the speakers will be Howard Elliott, President of the New York, New Haven & Hartford; Senator J. W. Weeks, of Massachusetts, and Ralph Peters, President of the Long Island Railroad.

On the third day the following addresses will be made: Do-

mestic and Foreign Immigration, by S. A. Hughes, General Immigration Agent of the St. Louis & San Francisco; Markets and Rural Organization, by C. C. White, of the United States Department of Agriculture; Industries, by W. W. Hartman, Industrial Agent of the Grand Rapids & Indiana; Harbor Development and Pier Extension, by Thomas O. McGill, Secretary of the Committee to Investigate Port Conditions in New York City.

The president of the Railway Development Association is J. C. Emig (C., C., C. & St. L.), Cincinnati, Ohio, and the secretary is H. O. Hartzell (B. & O.), Baltimore, Md.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, date of next or regular meetings, and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

- AMERICAN RAILWAY ASSOCIATION.—W. F. Allen, 75 Church St., New York. Next meeting, November 17, 1915, Chicago.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.
- AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York. Annual meeting, December 7-10, 1915, New York.
- ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—G. P. Conard, 75 Church St., New York. Next meeting, December 14-15, 1915, St. Louis, Mo.
- BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—L. D. Mitchell, Detroit Graphite Co., Chicago, Ill. Meetings with American Railway Bridge and Building Association.
- CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.
- CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.
- CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual meeting, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.
- ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 2511 Oliver Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh.
- GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.
- NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meetings, 2d Tuesday in month, except June, July, August and September, Boston.
- NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.
- NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—E. N. Frankenberger, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.
- PEORIA ASSOCIATION OF RAILROAD OFFICERS.—M. W. Rotchford, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.
- RAILROAD CLUB OF KANSAS CITY.—Claude Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Saturday in month, Kansas City.
- RAILROAD MEN'S IMPROVEMENT SOCIETY.—J. B. Curran, Eric R. R., 50 Church St., New York. Meetings, alternate Thursdays, October to May, Assembly Rooms of Trunk Line Association, 143 Liberty St., New York.
- RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 30 Church St., New York. Annual meeting, December, 1915, Waldorf-Astoria Hotel, New York.
- RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Monongahela House, Pittsburgh.
- RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.
- ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.
- SALT LAKE TRANSPORTATION CLUB.—R. E. Rowland, David Keith Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.
- SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 A. M., Piedmont Hotel, Atlanta.
- TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.
- TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Waldorf-Astoria Hotel, New York.
- TRANSPORTATION CLUB OF DETROIT.—W. R. Hurley, Superintendent's office, N. Y. C. R. R., Detroit, Mich. Meetings monthly, Normandie Hotel, Detroit.
- TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Gen'l Agt., Eric R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings bi-monthly, Pittsburgh.
- UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, 1111 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.
- WESTERN CANADA RAILWAY CLUB.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.
- WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Building, Chicago. Regular meetings, 3d Tuesday in month, except June, July and August, Karpen Bldg., Chicago.
- WESTERN SOCIETY OF ENGINEERS.—J. H. Warder, 1735 Monadnock Block, Chicago. Regular meetings, 1st Monday in month, except January, July and August, Chicago. Extra meetings, except in July and August, generally on other Monday evenings. Annual meeting, 1st Wednesday after 1st Thursday in January, Chicago.

REVENUES AND EXPENSES OF RAILWAYS
TWO MONTHS OF FISCAL YEAR ENDING JUNE 30, 1916.

Name of Road.	Average mileage operated during period.	Operating revenues			Maintenance of			Operating expenses			Net from railway operation.	Railway tax accruals.	Operating income (or loss).	Increase (or decr.) comp. with last year.

Traffic News

Offices are being established by the American Express Company in Manila and Hong Kong, which will also represent the traffic department of the Union Pacific System.

The Rutland Transit Company, operating freight steamers on the Great Lakes and to Ogdensburg, N. Y., has sold its last two vessels, the Rutland and the Ogdensburg. The purchaser is said to be the Pacific Alaska Navigation Company, of Seattle.

Train service was resumed on October 19 between Laredo and Mexico City. Temporarily, the train starts from New Laredo, just across the river from Laredo, Tex., but it is expected that within a short time the service will be extended to this side of the river.

Those railways which formerly maintained passenger or freight agencies in Mexico are considering arrangements for re-opening the offices. H. C. Dinkins, foreign freight agent of the International & Great Northern, is making a tour of Mexico, studying business conditions.

The Canadian Northern will begin running regular trains between Winnipeg and Toronto on November 1. Passenger trains will leave Winnipeg at 5:15 p. m. on Mondays, Wednesdays and Saturdays, arriving at Toronto at 2:45 p. m. on Wednesdays, Fridays and Mondays. Trains will leave Toronto at 10:45 p. m. Mondays, Wednesdays and Fridays.

"Baltimore Agricultural Transportation Club" is the name of an organization recently started in Baltimore for the purpose of promoting co-operation between the railroads and agricultural interests of all kinds, for the promotion of agriculture as related to traffic. Austin Gallagher, industrial commissioner of the Western Maryland, is president of the club.

The Northern Pacific has put in effect a low passenger rate for harvest hands of \$5 per capita for the round trip, from all points in Minnesota and from points in North Dakota east of and including Oakes and Valley City, as well as from Superior, Wis., to any point on its line in North Dakota, except that from St. Paul, Minneapolis, Duluth and Superior this rate will apply only for parties of five or more on one ticket.

The Canadian Express Company is now doing a large business in the transportation of fresh fish from the Pacific ocean to the eastern part of the country. An officer of the express company says that the average monthly receipts of fish at Prince Rupert, the western terminus of the Grand Trunk Pacific, amount to 1,723,000 lb., nearly all halibut. Most of the fish comes from Alaskan waters, nearly 1,000 miles from Prince Rupert. Monthly receipts at Seattle average 2,000,000 lb., and at Vancouver 1,099,000 lb.

A committee representing the Chicago Board of Trade and other shippers' organizations interested in traffic on the Great Lakes, appeared at the hearing before the Interstate Commerce Commission on October 23, on the application of the Lehigh Valley for a reconsideration of the commission's order requiring it to discontinue the operation of its boat lines on the lakes. The committee, which was appointed at a meeting at Chicago last week, appeared and asked the commission to postpone the effective date to give the shippers an opportunity for a further hearing. The petition filed by the Chicago Board of Trade, setting forth the fear of the shippers that the commission's order will practically destroy boat service on the Great Lakes, was reported in last week's issue.

The Department of Agriculture, Washington, has issued a bulletin, No. 315, giving results of a study of the cantaloupe industry. It is found that many receivers encourage the shipment of greater supplies than they can sell promptly. In August, 1914, melons from Texas were being sold in New York City in competition with those from New Jersey. At Chicago in one day melons were on the market from eight different states, including Delaware and California. Differences in the weather in different parts of the country, and the superiority of irrigated fields produce violent changes in the conditions affecting the competition between growers in the east and those

in the far west. In the study made by the department in 1914 statistics were gathered of 16,401 carloads of cantaloupes. In carload shipments California was the greatest producer, shipping 5,146 carloads.

The New England Industries Demurrage Committee held its annual meeting at Boston, October 20, with 31 members present. These representatives of shippers and receivers of freight express themselves well satisfied with the special arrangement in New England under which a demurrage commissioner, with an office at Boston, virtually arbitrates all demurrage disputes between the carriers and the shippers. A proposition to broaden the scope of the committee so as to have it deal with all sorts of traffic questions was voted down. It is estimated that demurrage charges in the six New England states amount to nearly a million dollars a year. The chairman of the executive committee of this body is W. A. Clark, president of the New England Coal Dealers' Association, Northampton, Mass.; vice-chairman, G. L. Graham, American Woolen Company, Boston; secretary, C. J. Hart, Old South Building, Boston; treasurer, C. H. Tiffany, New England Paper & Pulp Traffic Association, Boston. Other cities represented in the executive committee are Lynn, Holyoke, Worcester, Bridgeport, Lawrence, Providence, Bellows Falls, Berlin, N. H.; Plymouth, Mass., and New Britain, Conn.

Decrease in Loss and Damage Payments on the Santa Fe

At the recent semi-annual conference of the Atchison, Topeka & Santa Fe loss and damage committee figures were presented showing a still further reduction in payments for loss and damage to freight, in spite of an increase in the volume of freight as shown by the earnings, the payments for such claims amounting to .96 per cent of freight earnings as compared with 1.05 per cent the year before. The loss and damage payments by the Santa Fe in 1908, the year the campaign for reductions of loss and damage was started, were \$1,565,434, with freight earnings amounting to \$61,848,638, the payments being 2.53 per cent of the earnings. As a result of the campaign there has been a gradual decrease as shown below:

Year	Gross Freight Receipts	Payments for L. & D.	P.c. Fght. Receipts
1909	\$64,212,638	\$1,234,564	1.92
1910	71,194,055	1,141,014	1.60
1911	71,787,200	1,091,435	1.52
1912	71,529,574	939,676	1.31
1913	78,190,922	942,838	1.21
1914	73,638,388	772,300	1.05
1915	80,504,000	771,764	.96

Heavy Freight Movement

Serious congestion of freight is reported on all of the trunk lines centering in New York. The movement of export grain, and of many other articles for export, including war material, is very heavy; and, beginning with the delays occasioned early in the month by the strikes of laborers in New York City, the movement of all freight has been growing more and more difficult. The Central of New Jersey announced last week that it had been necessary to refuse all new shipments for a period of two weeks, but it was expected that most of the accumulated freight could be cleared out of the way by the middle of this week. The trunk lines have many miles of side tracks filled with delayed cars. The movement of grain from Lake Erie to the Atlantic Seaboard is the heaviest ever known. A competent observer in New York believes that there is now ready for export at New York harbor five times as much freight as the available vessels can take.

The vessels of the Southern Pacific and other lines have had to leave behind large quantities of freight at Galveston and New Orleans destined for New York and other Atlantic ports, these lines being crowded with freight because of the blockade of the Panama Canal.

The ship lines whose business is stopped or delayed by the closing of the canal are complaining loudly that the rates by the Panama Railroad across the isthmus are excessive. A flat rate of three dollars a ton has been announced by the Panama Railroad, which rate includes wharfage and cartage and the transfer charges on the docks. There were about 375,000 tons of freight in the vessels awaiting transit through the canal before any of them left to go by the longer routes. This is equal

to more than half the largest annual tonnage ever hauled by the Panama Railroad between the seaboard.

Texas Farmers' Attitude

[Statement by Henry N. Pope, President Texas Farmers' Union.]

"The weekly crash of railroad receiverships as they fall upon our courts forebodes the coming of government ownership, but if the people want government ownership, it should come through choice and not be thrust upon them by the financial failures of the railroads. The railroad problem in Texas is perhaps more acute than that of any other state in the Union. We lead all states in total railroad mileage and likewise we lead all states in receivership mileage, as 30 per cent of our mileage and 45 per cent of railroad investments are in the hands of receivers. We are more in need of additional mileage than any other state and construction is at a standstill.

"The public hearings before the Texas Railroad Commission so far indicate that almost every line of industry and almost every shipper who has appeared concede that the railroads are entitled to an increase in rates, but most of them want their own business exempt; yet the railroads cannot pay bills with moral support. Any shipper who wants his goods hauled for less than cost begs from his neighbors and asks of government a special privilege for which he gives nothing in return. Such conduct is feeble, vicious and un-American and unworthy of serious recognition by any tribunal of justice.

"The rate problem is too complicated for the layman to undertake to pass upon it in detail, and I have perhaps given the matter no more study than the average citizen and like all shippers have been opposed to increasing the rate on my own freight and had hoped an increase of any sort could be avoided; but it is time to meet the issue squarely and if an increase in rates is necessary to avoid honest receiverships and to provide sufficient revenue to maintain and improve railroad property wisely and honestly administered, then all shippers and all commodities should be willing to bear an equitable portion of the burden.

"The hearings have pretty well exploded the theory that 'the consumer pays the freight,' or at least that he feels every vibration in rates, for the consumer in some instances has invited an increase in rates and in no case has it been opposed by the consumer; but the dealer has kept a battery of attorneys and rate experts at Austin to battle against every suggestion of an increase. There have, no doubt, during the past quarter of a century, been many decreases made in freight rates that never reached the consumer and such rates ought first to be restored, as they are nothing more than legalized rebates to the shipper, and result in impoverishing the railroads without benefiting the people. The public gains nothing by a rate that confiscates the property of a railroad to increase the dividends of private corporations or that forces a railroad to make an unreasonable contribution toward building up a business, an industry or a city. Such conduct is immoral, for a business that must have its freight hauled for less than cost has no right to exist and a railroad should not be made to subsidize any line of industry. Such a procedure, when voluntarily engaged in by the railroads several years ago, was vigorously condemned by the courts and censured by public opinion, and ought not to be legalized now.

"Every effort should be made to give the railroads necessary relief by the equalization of rates and by making every pound of freight pay its own fare before taxing the products of the soil; and, likewise, all expenses should be reduced to the minimum. The Farmers' Union has always opposed the legislature burdening the railroads with unnecessary expenses and now is a good time to search the statute books for oppressive and extravagant laws which consume the revenues of the railroad and give the public inadequate returns, and for the inauguration of constructive legislation that protects and invites expansion of our transportation facilities."

RAILWAY EXTENSION IN AUSTRALIA.—A big scheme for extending the New South Wales government railways into Victoria and the Victoria government railways into New South Wales is in contemplation. The former government has consented to the appointment of a joint state commission to investigate the subject and formulate schemes, and reports say that the Victoria government is considering the question.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

Rates on Fertilizer from New Orleans

Opinion by Commissioner Harlan.

The commission finds that the carriers have justified proposed increased rates on domestic fertilizer and fertilizer materials from New Orleans and other Louisiana points to Ohio river crossings and beyond. (36 I. C. C., 247.)

Complaint Dismissed

Nebraska State Railway Commission v. Chicago, Burlington & Quincy. Opinion by Commissioner Daniels.

The commission finds that the rates on cattle, hogs and sheep from stations in Nebraska on the Holdredge-Cheyenne branch of the Chicago, Burlington & Quincy to St. Joseph, Mo., are not unreasonable nor discriminatory. (36 I. C. C., 219.)

Rates on Soap to Texas Points

Pect Brothers Manufacturing Company v. Atchison, Topeka & Santa Fe et al. Opinion by Commissioner Daniels.

The commission finds that the rates on soap from Kansas City to Texas points are not unreasonable nor discriminatory as compared with the rates from St. Louis or from Chicago or Cincinnati to the same or other destinations. Action on a fourth section application for authority to continue rates on soap and soap powder from Kansas City, Mo., to Beaumont, Houston and Galveston, Tex., lower than the rates to intermediate points is reserved because this matter is being taken up in connection with another case. (36 I. C. C., 208.)

Soap to Texas points. Opinion by Commissioner Daniels.

A proposed increase in commodity rates on soap from Kansas City, Mo., St. Louis, Mo., and points east of the Mississippi river to Beaumont, Houston, and Galveston, Tex., is found not justified, since a present discrimination against St. Louis from points beyond is increased thereby without the necessary fourth section relief. This denial of the proposed increase is, however, without prejudice to future action by the carriers. (36 I. C. C., 215.)

Rates on Pig Iron from Virginia Furnaces

Low Moor Iron Company et al. v. Chesapeake & Ohio et al. Opinion by Commissioner Daniels.

In the original report in this case, 30 I. C. C., 615, the rates on pig iron from Low Moor, Roanoke and Virginia furnaces on the Chesapeake & Ohio and Norfolk & Western to Baltimore, Philadelphia and New York, and points taking the same rates, were held unreasonable and new rates were prescribed not to exceed \$2.25 per gross ton to Baltimore, \$2.75 to Philadelphia, \$3 to New York and \$3.25 to Boston. The defendant carriers put in effect the rates prescribed as maxima to the cities specified, but not to related points. In a new order they are required to establish rates to these other points which will bear the same relationship to the rates prescribed above that was formerly in effect before the rates were changed. (36 I. C. C., 222.)

Rates on Scrap Iron to Galveston

Phoenix Iron & Steel Company v. Galveston, Houston & Henderson et al. Opinion by Commissioner Daniels.

Prior to September 1, 1911, the defendants absorbed the unloading charges at Galveston on all commodities exported through that port, with the exception of lumber, logs, staves and other articles taking the lumber rates, when from Texas, Louisiana, and California points, provided that the net revenue to them after the absorption was \$1.50 per net ton on traffic from all points except Houston, as to which point there was apparently no minimum net revenue required on carload shipments for export. On that date they refused to continue the absorption

of an unloading charge of 35 cents a net ton on scrap iron for export alleging that their rates on this commodity were too low to permit of absorption. The commission finds that the effective rates in question are reasonable and that the carriers are justified in refusing to absorb the unloading charges. (36 I. C. C., 175.)

Rates to the Teton Basin

Foster Lumber Company v. Clatskanie Transportation Company et al. Opinion by Commissioner Daniels.

In view of carriers' adjustment of rates subsequent to the filing of this complaint, and in view of their proffer of additional through routes with joint rates applicable thereto, rates from points in Oregon, Washington and Idaho to destinations on the Teton Basin branch of the Oregon Short Line are held not unreasonable.

The Teton Basin branch was opened for operation in 1912, and the defendants contend that in accordance with the general practice followed by them in connection with branch lines, the through rates were originally made by full combination upon the junction point, subject to reduction by substituting lower differentials for the locals as the development of traffic on the branch warranted, and that a readjustment of August 20, 1914, was made in pursuance of that practice. It is in evidence that the Teton Basin branch was costly to construct and that its volume of traffic, as also the complainant's lumber shipments thereon, are light. North of Ashton the line to the Yellowstone is operated only during the tourist season. (36 I. C. C., 190.)

Lumber Rates on the Gould Southwestern

E. P. Ladd Company v. Gould Southwestern et al. Opinion by Commissioner Daniels.

The rates on lumber from Furth, Ark., on the Gould Southwestern, 13 miles from Gould, Ark., its junction with the St. Louis, Iron Mountain & Southern, are 2 cents per 100 lb. higher than from Gould. The commission finds that these rates from Furth are unreasonable to the extent that they exceed the rates from Gould. The rate on hardwood from the latter point is blanketed in Arkansas from just north of Little Rock south to the Arkansas-Louisiana state line, and the rate on pine and cypress is similarly applied as a blanket rate from the Arkansas river south to the Gulf of Mexico and east to the Mississippi. Gould and Furth are near the northern boundary of these blanketed territories, and consequently nearer Cairo and other northern markets than most of the other stations within the groups. The complainants contended that the rates from Furth should not be higher than from points on many other short-line connections of the Iron Mountain like the Gould Southwestern in the same general territory as Furth, or higher than from main and branch line points in these groups on the Iron Mountain much farther distant from points of destination than Furth. Reparation awarded. (36 I. C. C., 179.)

Rates on Lumber from Michigan Points

Opinion by Commissioner McChord.

The Ann Arbor, the Grand Rapids & Indiana, the Grand Trunk, the Pere Marquette and the Michigan Central have proposed increases in the rates on lumber in carloads from producing points in Wisconsin and Michigan to points in the lower peninsula of Michigan and along the northern borders of Ohio, Indiana and Illinois. The rates on this traffic were increased following the decision in the *Five Per Cent Case*. On September 29, 1914, the Michigan Railroad Commission allowed the carriers to establish rates on lumber equal to 95 per cent of the sixth class mileage scale. When new rates in accordance with this order were put in effect it was found that the rates to certain intrastate points were higher than the interstate rates to border points in northern Ohio and Indiana. The Michigan Commission later modified its decision so as to permit only a five per cent increase in the intrastate rates, except that in order to eliminate discrimination alleged to exist against points in the western part of the state in favor of points in the eastern part, it provided that the rates to Detroit from all stations within a distance of 125 miles, thereof should be increased 1 cent net per 100 lb.

The interstate commission finds, therefore, that in order to

maintain the proper relationship in lumber rates between Detroit and Toledo the carriers may put in effect increased rates to Toledo but not to the other points in issue. (30 I. C. C., 184.)

Joint Rates from Canadian Points

Philip Carey Manufacturing Company et al. v. Grand Trunk Western et al. Opinion by Commissioner Clark.

Complaint is made that the rates on asbestos sand in carloads from Robertson, Thetford and Sherbrooke, Que., to Lockland and Rockdale are unreasonable.

The commission finds that the rates in question do not conform to the general adjustment of rates between the Canadian territory of origin and the group in which these destinations are located and that the rates on asbestos sand to Rockdale and Lockland are higher than from the same points of origin to Chicago and Milwaukee, while the rates on asbestos fiber from the same points of origin to Rockdale and Lockland are lower than from the same points of origin to Chicago and Milwaukee, the fiber being a lighter loading commodity and much more valuable than the sand. The rates attacked are therefore held to be discriminatory against complainants.

Following *International Paper Co. v. D. & H. Co.*, (33 I. C. C., 270), the commission cannot prescribe joint through rates from points in Canada to points in the United States, but it can control the rates which the lines in the United States charge for services rendered within the United States. Joint rates from and to points in Canada are a convenience to the public and the shippers and should be encouraged. It is therefore expected that the defendants will comply with the finding that the rates to Lockland and Rockdale are discriminatory to the extent that they exceed the rates to Chicago or Milwaukee by proper readjustment of the present joint through rates. If this is not done an order will be entered requiring the defendants that are subject to its jurisdiction to establish in lieu of the present rates joint or local rates from the ports of entry in the United States to Lockland and Rockdale which shall be no higher than those contemporaneously maintained to Chicago or Milwaukee. (36 I. C. C., 203.)

STATE COMMISSIONS

The railroad commissioners of South Dakota have notified the railways of the state that reports of accidents will be accepted on the forms prescribed by the Interstate Commerce Commission; though telegraphic reports must continue to be made of all accidents resulting in personal injury or death, this being required by statute. This adds one to the list of eight states, mentioned in the *Railway Age Gazette*, October 15, page 696, which accept the federal forms for monthly reports of accidents.

The New York State Public Service Commission, Second district, has prescribed a uniform blank for declaration of value by passengers having baggage checked, which form must be put in use by November 1, on all roads in the state where such a declaration is required. Where the value of a passenger's baggage is less than the limit of value for which the carrier makes no charge, the actual sum need not be named; the certificate simply says that it is less than \$100 (or, in the case of an intrastate movement, \$150).

The New York State Public Service Commission, Second district, following a hearing on the application of William B. Gray, of New Rochelle, for authority to operate "jitney buses" on six routes in New Rochelle, has approved four of the routes and has disapproved two. This refusal applies to routes which would run on the same streets with street cars, or closely parallel to them, thus introducing unnecessary competition. The opinion, by Commissioner Emmet, compliments the authorities of the city for imposing salutary regulations in granting the franchise for the operation of these omnibuses. It is required that each carriage shall seat from 10 to 17 persons, that they shall have pneumatic tires, shall be of the pay-as-you-enter type, and that trips must be made at least every 20 minutes from 6:30 a. m. to 1:30 a. m. Three per cent of the gross earnings is to be paid to the city, and the franchise expires in 10 years. A substantial bond will be required.

COURT NEWS

The Superior Court of Thurston county, Washington, has quashed the supersedeas writ previously issued against the order of the public service commission promulgated last August, requiring the railroads to discontinue the practice of requiring two full fare tickets as a requisite to engaging drawing room accommodation in sleeping cars, thus making the order effective immediately. It is understood that the railroads will continue their legal fight under a writ of review.

Judge Trieber, of the United States court at Little Rock, Ark., on October 20, on application of the Arkansas Railroad Commission, granted a continuance until April 1, 1917, on all the cases to enjoin the roads from charging three cents a mile passenger fare. The action was taken because the money appropriated by the legislature for rate litigation has been spent and the next general assembly does not meet until January, 1917. The state has therefore given up its fight for the time being.

Federal Judge Carpenter, at Chicago, on October 22, at the request of four brewing companies, issued a permanent injunction restraining the Chicago, Rock Island & Pacific from refusing to accept and deliver consignments of liquor to points in Iowa to agents of the consignees on the written order of the latter. It is provided in the order that the consignees must designate the drayman or other carrier who is to receive the liquor and that the shipment must be marked "for personal use and private consumption." An attorney representing the state of Iowa opposed the order on the ground that it would force the railroad to violate both the laws of the state and the Federal Webb-Kenyon law.

No Liability for Injuries to Trespassing Employee

The Supreme Court of Michigan holds that, where a railroad company posted a notice warning persons other than employees from using a bridge and trestle, it is not liable for the running down of one of its own section laborers using the bridge instead of a highway to go to work, though the engine which ran him down was not equipped with lights.—*Newell v. Detroit, G. H. & M.* (Mich.) 153 N. W. 1077.

Employer's Liability Act Held Not to Apply to Injuries on Ships Unconnected with Railroads

The New York Court of Appeals has affirmed the decision of the Appellate Division (152 N. Y. Supp. 1120) holding that the federal employer's liability act does not apply to a railroad which operates ships unconnected with the line, and in such case the state laws governing injuries to a servant apply though the ships are engaged in interstate commerce.—*Jensen v. Southern Pacific*, N. Y., 109 N. E. 600.

Rest, Food and Water Act—Connecting Carriers—Separate Penalties

A railroad unloaded a shipment of cattle, but reloaded them 3 hours later, and transported and delivered them to a connecting carrier more than 36 hours from the time of loading at the point of shipment, they not having been unloaded for 5 hours in the meantime. The connecting carrier, without unloading them, transported them to their destination. The federal district court, N. D. New York, holds that the initial and connecting carriers were guilty of separate violations of the act, and liable for separate penalties, though the time of confinement constituting the two violations overlapped.—*United States v. New York Central*, 221 Fed. 1000.

Assessments—Special Franchises

The New York Appellate Division holds that where land used by a railroad company for its tracks was acquired for a street, and the grade of the street was carried over the land and the company's tracks by a bridge, the railroad company, though it thereafter increased its trackage, had no special franchise subject to taxation, for a special franchise involves a grant from competent public authority, while in such case the railroad company retained the right to use the land for any purposes not inconsistent with its use as a street.—*People ex rel. New York Central v. Woodbury*, 153 N. Y. Supp. 537.

Railway Officers

Executive, Financial, Legal and Accounting

J. O. Talbott has been appointed assistant auditor of the Pere Marquette, with office at Detroit, Mich.

Thomas Y. Railey has been appointed assistant attorney for the Missouri Pacific-St. Louis, Iron Mountain & Southern, with headquarters at St. Louis, Mo., vice T. L. Philips, valuation attorney, resigned to engage in private practice.

Edward F. Kearney has been elected president, with office at St. Louis, and Winslow S. Pierce, chairman of the board of directors, with office at New York, of the newly organized Wabash Railway. Mr. Kearney was president and Mr. Pierce chairman of the board of the old company.

Operating

O. E. Smith has been appointed trainmaster of the Oregon Short Line, with headquarters at Salt Lake City, Utah.

N. Shaw, chief dispatcher of the Great Northern at White Fish, Mont., has been promoted to trainmaster, and W. A. Depew has been appointed chief dispatcher.

W. M. Jeffers, superintendent of the Nebraska division of the Union Pacific with headquarters at Omaha, Neb., has been appointed general superintendent with office at the same place. G. O. Brophy, superintendent of the Wyoming division with headquarters at Cheyenne, Wyo., has been appointed to succeed Mr. Jeffers as superintendent at Omaha. S. R. Toucey, assistant superintendent of the Colorado division, has been appointed superintendent of the Wyoming division, vice Mr. Brophy. Effective November 1.

Traffic

E. L. Bevington, secretary of the Transcontinental Passenger Association, with office at Chicago, has been appointed chairman of the association with headquarters at Chicago, succeeding the late James Charlton. Mr. Bevington was born on February 22, 1866, at New Lenox, Ill. He was educated in high school, business college and under private instruction, and entered railway service in March, 1883, holding various positions in the passenger department of the Chicago & Alton until 1900. From 1900 to 1901 he was general manager of the Denver, Boulder & Northern, with office at Denver, Colo., and in 1901 he was appointed secretary of the Transcontinental Passenger Association at Chicago, which office he had held ever since. Since the death of Mr. Charlton

E. L. Bevington

in November, 1913, he has assumed the duties of both offices.

C. M. Rollings has been appointed district passenger agent of the Union Pacific, with headquarters at St. Louis, Mo.

D. H. Street, traveling freight agent of the Baltimore & Ohio at Baltimore, Md., has been promoted to commercial freight agent, with office at Akron, Ohio.

Elmer H. Wood, freight traffic manager of the Union Pacific with headquarters at Omaha, Neb., has retired and his office has been abolished. He has been placed on a pension.

Engineering and Rolling Stock

Irwin Ashton Seiders, who has been appointed superintendent of motive power and rolling equipment of the Philadelphia &

Reading, with headquarters at Reading, Pa., as has been announced in these columns, was born on October 23, 1864, at Tamaqua, Pa., and was educated in the public schools. He began railway work on January 18, 1882, as a laborer on the Philadelphia & Reading, and the same year became machinist helper. He later served as station hand and then as brakeman until September, 1888, when he was appointed locomotive fireman, and two years later became an engineman. In April, 1907, he was promoted to road foreman of engines, remaining in that position until December, 1914, when he was appointed fuel inspector, and now becomes superintendent of motive power and rolling equipment on the same road, as above noted. Mr. Seiders' entire railway service has been with the Philadelphia & Reading.

Clyde C. Elmes, whose appointment as assistant superintendent of motive power and rolling equipment of the Philadelphia &

C. C. Elmes

Reading with headquarters at Reading, Pa., has already been announced in these columns, began railway work in 1903, at the Olean, N. Y., shops of the Pennsylvania Railroad, and after learning the machinists' trade he attended Purdue University. He subsequently returned to the Pennsylvania Railroad at Olean, as gang foreman, and later was promoted to roundhouse foreman. He then served as superintendent at Auburn, N. Y., of the New York, Auburn & Lansing, now the Central New York Southern, leaving that company to go to the Kansas City Southern

as superintendent of construction of new shops at Shreveport, La., and on the completion of that work was transferred to Pittsburgh, Kan., as roundhouse foreman. He was subsequently promoted to chief inspector of new locomotives being built for that road. He was then consecutively general foreman at Ennis, Texas, of the Houston & Texas Central, acting master mechanic of the general shops of the Southern Pacific at Houston and master mechanic of the same shops with the duties of master car builder until his appointment as assistant division superintendent of the Texas & New Orleans. He then went to the Philadelphia & Reading and served consecutively as motive power inspector, road foreman of engines and as assistant engineer of motive power until his recent appointment as assistant superintendent of motive power and rolling equipment of the same road, as above noted.

R. M. Kincaid, valuation engineer of maintenance of equipment of the Chicago & Eastern Illinois, has been appointed master mechanic of the Illinois and St. Louis divisions, with office at Villa Grove, Ill., vice F. Studer, resigned.

Hugh Sowa, roadmaster of the Marcus division of the Great Northern, has been transferred to the Superior and Messaba divisions, with headquarters at Superior, Wis. Thomas Beighton has been appointed to succeed Mr. Sowa with headquarters at Marcus, Wash.

OBITUARY

Walter E. Downing, general eastern agent of the Illinois Central, at New York, died in that city on October 25, at the age of 53.

Richard Fenby, formerly auditor of the Texas & Pacific, died at Dallas, Tex., on October 18, aged 70 years. Mr. Fenby retired from active service in 1912.

Lynde A. Catlin, who was secretary of the Illinois Central, previous to 1884, died suddenly on October 23, at his home in South Woodstock, Conn., at the age of 82.

Equipment and Supplies

LOCOMOTIVE BUILDING

THE CHESAPEAKE & OHIO has ordered 10 Mallet type locomotives from the American Locomotive Company.

THE MINNEAPOLIS & ST. LOUIS has ordered 5 Mikado type locomotives from the American Locomotive Company.

THE PENNSYLVANIA has ordered 75 Mikado (L-1-s) type locomotives from the Baldwin Locomotive Works.

THE ATCHISON, TOPEKA & SANTA FE has ordered 30 Mikado type locomotives from the Baldwin Locomotive Works.

THE ERIE has authorized the Baldwin Locomotive Works to proceed with the construction of 2 Centipede type locomotives.

THE PHILADELPHIA & READING has ordered 10 Mikado type locomotives from the Baldwin Locomotive Works in addition to the order for 20 Mikado type locomotives reported in the *Railway Age Gazette* of October 1.

THE TOLEDO TERMINAL has ordered one Consolidation type locomotive from the American Locomotive Company. This locomotive will have 22 by 28 in. cylinders, 51-in. driving wheels and a total weight in working order of 199,000 lb.

THE MAINE CENTRAL has ordered 2 six-wheel switching locomotives from the American Locomotive Company. These locomotives will have 21 by 28 in. cylinders, 51-in. driving wheels and a total weight in working order of 166,000 lbs.

THE CINCINNATI, INDIANAPOLIS & WESTERN has ordered 42 locomotives from the Lima Locomotive Corporation. In the item relative to the identity of this company which appeared in last week's issue, page 776, it was incorrectly stated that the Cincinnati, Indianapolis & Western was now being operated independently of the Cincinnati, Hamilton & Dayton. The general manager of the latter company has since advised that the owners of the C., I. & W. have not as yet taken over the operation of that property. It is still being operated by the C., H. & D., but it is expected that the new owners will take over the property in the near future, about December 1.

CAR BUILDING

THE CHESAPEAKE & OHIO is inquiring for 1,000 70-ton coal cars.

THE BINGHAM & GARFIELD is inquiring for prices on 25 gondola cars.

THE CHICAGO, ROCK ISLAND & PACIFIC is inquiring for 500 center constructions.

THE NEW YORK, CHICAGO & ST. LOUIS will repair a large number of freight cars.

THE ANACONDA COPPER MINING COMPANY has ordered 14 dump cars from the Pullman Company.

THE NEW YORK, NEW HAVEN & HARTFORD has ordered 2 dining cars from the Pullman Company.

THE DELAWARE, LACKAWANNA & WESTERN has issued inquiries for 500 50-ton steel hopper cars.

THE MISSOURI, KANSAS & TEXAS has ordered 50 steel underframes from the St. Louis Car Company.

THE ATLANTIC COAST LINE has ordered 200 flat cars from the American Car & Foundry Company.

THE GADSDEN CAR COMPANY is reported to have ordered 1,000 underframes from the American Car & Foundry Company.

THE PHILADELPHIA & READING is said to have ordered an additional 500 hopper cars from the Standard Steel Car Company.

THE LYON CYPRESS LUMBER COMPANY, Garyville, La., has ordered 75 50-ft. logging cars from the Bettendorf Company.

THE ERIE is said to have ordered 200 gondola cars from the Standard Steel Car Company. This item has not been confirmed.

THE CINCINNATI, NEW ORLEANS & TEXAS PACIFIC has ordered 1,000 center constructions from the American Car & Foundry Company.

THE BALTIMORE & OHIO is reported to have ordered 1000 hopper cars from the Cambria Steel Company. This item has not been confirmed.

THE MISSOURI PACIFIC is reported to have ordered 500 box cars from the American Car & Foundry Company. This item has not been confirmed.

THE NORFOLK & WESTERN, reported in the *Railway Age Gazette* of last week as being in the market for 1,000 gondola cars, will build these cars at its own shops.

THE LOUISVILLE & NASHVILLE is reported to have ordered 1000 steel underframe box cars from the Mount Vernon Car Manufacturing Company. This item has not been confirmed.

THE WESTERN MARYLAND was reported in an unconfirmed item in the *Railway Age Gazette* of October 22 as having ordered 2,000 hopper cars from the Pullman Company. This item has since been confirmed.

THE PENNSYLVANIA RAILROAD has authorized its Altoona shops to proceed with the construction of 100 all-steel caboose cars. It is rumored that this company is contemplating the purchase of possibly 25,000 freight cars.

THE CINCINNATI, HAMILTON & DAYTON has ordered 500 steel underframes from the Barney & Smith Car Company. The latter company will use the underframes to rebuild 500 box cars. It also has a contract to rebuild 300 gondolas.

THE RUSSIAN GOVERNMENT.—The Wall Street Journal published the following item in its morning edition of October 27: "Pittsburgh.—The Pressed Steel Car Co., having completed an order for 7,500 steel freight cars for Russia on Monday closed a contract for an additional 8,500."

THE NEW YORK CENTRAL has ordered 1,000 55-ton composite gondola cars from the Standard Steel Car Company for the Pittsburgh & Lake Erie, 2,000 box cars from the Haskell & Barker Car Company, 1,000 automobile cars from the Pullman Company for the Michigan Central and 1,500 steel box cars from the American Car & Foundry Company. It is also reported that 5,500 more cars (in addition to the 1,000 noted above) have been ordered from the Standard Steel Car Company, but this last item has not been confirmed. All these orders are in addition to orders previously reported.

IRON AND STEEL

THE SOUTHERN has ordered 2,300 tons of bridge material from the Virginia Bridge & Iron Works.

THE MAINE CENTRAL has ordered 2,000 tons of bridge material from the American Bridge Company.

THE DELAWARE & HUDSON has ordered 200 tons of bridge material from the American Bridge Company.

THE CENTRAL OF GEORGIA has ordered 5,000 tons of rails from the Tennessee Coal, Iron & Railroad Company.

THE ATCHISON, TOPEKA & SANTA FE has ordered 10,000 to 11,000 tons of 90-lb. rails from the Illinois Steel Company.

THE DELAWARE, LACKAWANNA & WESTERN has ordered 4,000 tons of fabricating material from the American Bridge Company.

THE GREAT NORTHERN has ordered 3,000 tons of steel from the American Bridge Company for plate girder spans and viaduct work.

THE NORFOLK & WESTERN has ordered 4,000 tons of rails from the Pennsylvania Steel Company, and 1,000 tons from the Cambria Steel Company.

THE MISSOURI, KANSAS & TEXAS received the approval of the federal district court of Dallas, Tex., on October 22, for the purchase of 15,000 tons of rails for replacement and improvement work in Texas.

THE ILLINOIS CENTRAL has ordered 5,000 tons of rails from the Illinois Steel Company in addition to the 15,000 reported in our issue of last week. It has also ordered 15,000 tons from the Tennessee Coal, Iron & Railroad Company.

Supply Trade News

J. R. McAllister has been elected a director of the Electric Storage Battery Company, Philadelphia, Pa., succeeding Rudolph Ellis, deceased.

The Sprague Electric Works of the General Electric Company has opened a sales office in the Provident Bank building, Cincinnati, Ohio, in charge of Frank H. Hill as manager.

The directors of the United States Steel Corporation at a meeting held in New York on October 26 declared the regular quarterly dividend of $1\frac{3}{4}$ per cent on the preferred stock, but took no action relative to a dividend on the common stock.

Reports are current that the Baldwin Locomotive Works will sell to the Midvale Steel & Ordnance Company the buildings and land at Eddystone, Pa., now under lease to the Remington Arms Company, which was recently acquired by the Midvale interests.

Stanley H. Smith has been appointed district sales manager of the Pennsylvania and Maryland Steel Companies at Chicago, to succeed Robert E. Belknap, transferred to New York City.

S. H. Smith

Mr. Smith was born at Toronto, Ont., on August 4, 1885. He entered the service of the Pennsylvania Steel Company in February, 1904, as a shop apprentice. After spending two and one-half years in various mills of the company, he served as an outside inspector for the frog and switch department. Later he joined the sales force of the company at Steelton, Pa., and from there was transferred to Cleveland, Ohio, where he represented the Pennsylvania and Maryland Steel Companies for two and one-half years. Next he took a position in Chicago, where he became first assistant to

Robert E. Belknap, recently transferred to New York.

The Industrial Works has opened an office in the Widener building, Philadelphia, Pa. Complete data and information can be obtained there regarding the company's line of locomotive, wrecking and freight handling cranes, pile drivers and grab buckets.

The Westinghouse Electric and Manufacturing Company has taken an additional order for shells for the British government. The order will total about \$12,000,000 and the work will consist of machining shells. This order is in connection with the one recently taken by the American Steel Foundries.

The Locomotive Stoker Company, New York, has received orders for Street stokers for the 10 new Mikado type locomotives recently ordered by the Lehigh Valley of the Baldwin Locomotive Works. Street stokers are also being applied to 30 Mikado type locomotives now in service on this road.

The Illinois Central has let contracts to the Railroad Water & Coal Handling Company, Chicago, for a complete water station at Gravel Switch, Ky., including a double-unit oil-engine pumping plant with pipeline one mile long and a 100,000-gal. steel tank. It has also let a contract to the same company for a double-unit oil engine with centrifugal pump and a 100,000-gal. steel tank at Rockford, Ill.

Negotiations for the transfer of a controlling interest in the Pennsylvania Steel Company from the Pennsylvania Railroad interests to the Bethlehem Steel Corporation, which were reported last week as having been practically completed, have since

been checked. Henry C. Frick, who holds an option on the railroad's holdings in Pennsylvania Steel, is understood to have held up the transaction. The situation is complicated further by negotiations which are under way for a possible merger of the Pennsylvania and Cambria Steel companies.

A. E. Ostrander has been appointed mechanical engineer of the American Car & Foundry Company and is succeeded as assistant mechanical engineer by H. C. Lunger, who was formerly chief estimator. W. H. Selden, formerly assistant chief estimator, succeeds Mr. Lunger. Mr. Ostrander, who succeeds John McE. Ames, who recently resigned as mechanical engineer to go into other business, began railway service on the New York, New Haven & Hartford, serving in several different capacities in various departments on that road. Later he was employed in the engineering office of Cornelius Vanderbilt, leaving there to accept a position with the Standard Steel Car Company. He entered the service of the American Car & Foundry Company in 1903 and has been with that company continuously since that time.

Canadian Car & Foundry Company

President Nathaniel Curry of the Canadian Car & Foundry Company has sent the following circular letter to all stockholders in regard to inquiries concerning the company's business in war munitions:

"It is the desire of the board that the stockholders shall have as clear a view of the situation as it is possible to give them, both regarding amount of war orders and the progress which has been taking place in the manufacture of the same, although for obvious reasons it is not considered wise to publish much detail regarding the orders received. The company's railway equipment business is less than in former years. Several of the plants, as well as those of the Canadian Steel Foundries, Ltd., have been equipped for the manufacture of parts of shells, the production of which is well under way. The plants are working 24 hours a day, and production is constantly increasing in a satisfactory manner. A large portion of this work is for the British government, on which substantial deliveries have already been made.

"Several months ago two contracts were made to supply the Russian government with a large number of complete shrapnel and high explosive shells, and recently a third order has been obtained, subject to the negotiation of minor details in connection with same. The transaction of this business has involved the negotiation of large contracts for parts of shells between this company and manufacturers in the United States, as well as Canada, greatly increasing the magnitude of the operations of this company. This work has now progressed to a point where the first shipments are about to be made, and from results obtained the management feels that they can make fairly reliable estimates both as to costs and net earnings.

"Your management knows that there is a reasonable profit in all the company's business, the amount of which business during the current fiscal year to September 30, 1916, should be in excess of \$150,000,000, as compared with about \$27,000,000 in the best previous year in the history of the company. While the directors do not feel at this time that they should make any definite announcement as to the disposition of the surplus earnings which will accrue from this business, they feel that the shareholder may look forward with confidence to an early resumption of dividends."

TRADE PUBLICATIONS

ROOFING MATERIAL.—More Light on Barrett Specification Roofs is the title of an attractive folder which has recently been issued by the Barrett Manufacturing Company, New York. The folder bears an appropriate title, for it contains a number of views of the plant of the National Lamp Works of the General Electric Company at Nela Park, near Cleveland, Ohio. Barrett roofs were used on the roofs of these buildings.

LOCOMOTIVE CRANES.—The Browning Company, Cleveland, Ohio, has recently issued two rather unusual folders relative to the use of the company's cranes in railway service. One is entitled, "How to be reasonable about handling scrap iron and other materials," and the other bears the name "Railroad construction with locomotive cranes." Each folder contains four illustrations showing Browning cranes at work.

Railway Construction

ALABAMA & MISSISSIPPI.—According to press reports, work is now under way on an extension of the Pascagoula-Moss Point Northern, which now operates a 43-mile line from Pascagoula, Miss., north to Evanston. The extension is under construction from Lucedale, north to a connection with the Alabama & Mississippi, and there only remains about seven miles yet to be built to complete the connection between these two roads.

CENTRAL POWER COMPANY, OF CHATTANOOGA.—Incorporated in Tennessee with \$50,000 capital, it is said, to build an interurban railway from Cleveland, Tenn., west to Chattanooga, about 25 miles. The incorporators include G. B. Adams, J. L. Foust and M. N. Whittaker.

CINCINNATI, HAMILTON & DAYTON.—This road will begin at once to lay seven miles of double track from South Dayton, Ohio, to Miamisburg, at a probable cost of \$175,000.

DALLAS NORTHWESTERN TRACTION.—A franchise for interurban trackage rights in Dallas, Tex., has just been granted to the Dallas Northwestern Traction and the Dallas Southwestern Traction, two corporations of the same ownership. Construction work on 20 miles of the proposed lines must be begun within six months and must be completed within 14 months. The Dallas Northwestern Traction plans to build from Dallas to Denton, about 30 miles, and the Dallas Southwestern Traction has arrangements well advanced for building from Dallas southwest via Cleburne and Glen Rosa to Stephenville, about 80 miles. E. P. Turner is president of both companies.

DALLAS SOUTHWESTERN.—See Dallas Northwestern.

DETROIT, PONTIAC & OWOSSO (ELECTRIC).—At a recent election residents of Pontiac, Mich., approved the 30-year franchise asked for by this company. The Michigan Railroad Commission had already authorized an issue of \$3,300,000 of bonds to provide for the construction of the projected electric line between Detroit and Owosso. The company was incorporated in Michigan last year with \$50,000 capital to build from Detroit, Mich., northwest through Pontiac, Drayton Plains, Waterford, Clarkston, Davisburg and Holly to Owosso. The incorporators include George H. Lau, R. G. St. John and G. W. Eyster, all of Detroit.

GRAHAM COUNTY RAILROAD.—According to press reports, Cheoah and Yellow Creek townships of Graham county have voted \$50,000 of bonds in aid of this proposed line. Surveys were started in 1911 for a line from Topton, N. C., north via Robbinsville and along the Cheoah river for 43 miles. E. Philbrick, chief engineer, Andrews, N. C.

LOUISBURG & ROCKY MOUNT.—See North Carolina Roads.

MARYLAND-WEST VIRGINIA ROADS ELECTRIC.—The right-of-way is being secured, it is said, for an electric line to be built from Hancock, Md., south to Berkeley Springs, W. Va., about 10 miles. L. F. Johnson, Baltimore, is said to be interested.

MIDLAND & NORTHWESTERN.—This railroad is projected from Midland, Tex., northwest through Andrews county to Seminole in Gaines county, a distance of about 65 miles. Approximately 5,000 cu. yd. of material will be handled per mile in grading the road. The maximum grade will be 1 per cent and the maximum curve, from one to two degrees. The contract for the grading has been let to J. A. Hunter, Strawn, Tex., and it is hoped that track laying can be begun by May 1, 1916. Fifty-six-pound relay rails will be used, and rolling stock will be obtained from the Texas & Pacific. The new company expects to obtain a charter before November 15. T. J. O'Donnell, president, Midland, Tex.; G. W. Thaxter, chief engineer. (Oct. 8, p. 670.)

NEW YORK SUBWAYS.—The New York Public Service Commission, First district, has obtained the necessary number of property owners' consents to legalize Route No. 61, the Sixtieth street, East river route. This line is to be a two-track underground railroad, from Fifty-ninth street west of Fifth avenue, in the borough of Manhattan, thence under Central Park and Fifth avenue into Sixtieth street, and through Sixtieth street
