Our road has a large number of locomotives equipped with stokers, which have proved so satisfactory that they are used on all new freight locomotives. After four or five years of service some parts wear out, and we have fitted out one shop for the reclamation of stoker material, where we can do almost any kind of work up to building a stoker complete.

The electric and gas welding processes have revolutionized a large amount of shop work which was formerly done by forging, riveting or in other ways, and I believe that there has been no one process introduced in the last ten years that has been of greater help to the railroads. The collars of worn car axles and sharp flanges on locomotive tires can be built up successfully; the latter operation is often done under the engine, thereby saving the cost of removing the wheels or tires. The building up of flat spots on tires and car wheels and of worn coupler locks and knuckles enables them to be retained in service, and a great variety of castings which break can be welded and made practically as good as new. One of the biggest savings that has been effected is by the welding of broken cylinders. One of our

*From a paper read before the New York Railway Club.

master mechanics told me, recently, that a saving of about \$4,000 had been made in one month by the welding of broken cylinders. The welding of firebox sheets, both for repairs and new work, is being done successfully, and in some railroad shops the entire firebox is welded up without the use of rivets except in the mudring.

Much track material is sent in as scrap which in the past had not been thought worth working over, but we have found that it pays to reclaim track spikes, nuts, washers, track bolts and anti-creeper, and much can be saved by building up worn switch points and frogs by the welding process.

The use of old ties has been studied by most railroads, and, in every case I believe, the conclusion has been that it does not pay to pick them up, bring them in to terminals and cut them up for firewood or similar purposes, because the expense of collecting and preparing them for use makes them cost as much, or more, than new wood. So the usual practice is to pile up old ties alongside the track and burn them.

Some of the larger roads have timber treating plants and there are several commercial plants which treat ties and timber. The fact that this treatment costs only about 25 cents a tie and doubles the life of the tie makes it an excellent proposition. The average railroad tie, in the middle and eastern United States, has a life of about 7 years, not treated, and, when treated, it runs to 14 years or more, the first price of the tie being the same in either case. In using treated ties it is customary to apply steel tie plates under the rails, to prevent the ties from being cut and spoiled by mechanical wear before they rot out.

One other very profitable department of reclamation work is the saving and repairing of grain doors. Some roads have a large grain business, and they have found that grain doors can be repaired for about 10 cents a piece, whereas, a new door will cost not less than 75 cents. The repairing of grain doors leaves a considerable amount of small pieces, which can be cut up and used for dunnage and powder strips, and also for making boxes for shipping nuts, bolts, etc.

The collection and baling of old paper for sale has recently been quite profitable, although for a time it was not worth while. One station on our road sold \$128 worth of old paper after a house cleaning, and another sold \$700 worth within a year. Those are some of the larger stations, but they show the desirability of saving all old papers for sale.

Another item which has not received much attention in the past, because it was not thought worth while, is the saving of coal and coke which becomes scattered along the tracks in switching yards. When coal could be bought for \$1 a ton at the mines, coal thus reclaimed hardly repaid the cost of picking it up, but at the present high prices it is worth saving.

I have said that the most important thing is to collect the old material so that it can be sorted out and the good separated from that which is only scrap. As an inducement to the section men to pick up material along the tracks, one of our superintendents has offered prizes to the section foremen who pick up the largest number of one inch nuts, and, on another occasion, the largest number of oil cup caps. The result was surprising and gratifying. One foreman turned in about 300 and another one about 200 nuts, most of them as good as new.

Many railroads are using box cars with either inside or outside metal roofing, and when they reach their limit of life much of the roofing is fit for further service. It can be used for making stove pipe, pails, cans, for roofing buildings and for many other purposes.

Some of the secondary results of the conservation of material and the cleaning up of scrap are the improved appearance of the property, the greater orderliness and a

stimulated interest on the part of the men in taking care of material.

Our company has studied the wastes in dining cars, and a great deal has been accomplished in reducing them. The prices of all supplies have gone up, but, by following the advice of the Federal Food Commission, the prices of meals have been kept down pretty nearly to what they were heretofore, while the quality has been kept up, and, at the same time, a considerable saving has resulted.

The use of stationery and office supplies has been watched, with some care on most roads, but the amount of it is so great on the average road that it is worthy of closer attention. We have one man who gives his entire attention to the study of requisitions and the inspection of stock on hand at various offices, with very profitable results.

Some reclamation operations that have been tried are of rather doubtful value, and it is a question whether they pay. Among these are the re-making of brooms, renovating caboose cushions and camp mattresses, retapping nuts and tinning lanterns. The question of painting brake beams and springs, after they have been repaired, is open to discussion but I believe it pays.

Another important item of conservation, which is worthy of more attention, is the protection of material from the weather, especially near the seacoast, where there is a good deal of wet and stormy weather. All finished work, such as threads of bolts, nuts and pipe, should be protected from dampness, or they will soon become rusted beyond any possible use. The same is true of steel plates and many of the finished parts for locomotives; dressed lumber for car work ought to be protected from rain, snow and sun. The ordinary rough castings stand exposure for several years, but if small they will be seriously damaged in a few months.

As an example of the value of scrap, I have obtained the figures for a large road, which show that in 1916 over \$3,000,000 worth of scrap was sold and for the first six months of 1917 over \$2,000,000 worth.

The motto which the railroads have adopted to guide them in their work is "What can we do to help win the war?" and this test should be applied to every problem that arises, because that is the biggest question now before us. Therefore, the conservation of material is more important now than ever before and it is one of the things that will be most helpful in winning the war.

DISCUSSION

E. J. McVeigh, general storekeeper, Grand Trunk System: Material is money, first, last and all the time. Unfortunately the railways have not learned that simple fact. They have never taught their employees to think of material as money. Due to the peculiar nature of railway operation, costly material is placed in the hands of many men totally untrained in the handling and value of the material. How many trainmen have been told that a journal bearing costs \$6 when new and is worth \$4.80 after it has served its purpose, if it is returned to the stores department; that a steam hose is worth \$4.80 new and \$3.80 after it has been worn out?

The railway "material man" buys, receives, cares for and delivers new material, but in addition to this he should educate the men handling the material as to its value, both new and old. When the material has fulfilled its function it once more becomes material and the material man does not let go of it until he knows that it has been conserved. The material man should have the proper facilities and organization for doing this. The old method of selling all used material as scrap has made the scrap dealers rich. Those roads which have developed central scrap and salvage yards have found that it pays. Average figures show a net increase of \$4.85 per ton in the price received for scrap that is examined for usable material and sorted. In addition to this

the reclaimed material is of great value to the car repair and shop men. It keeps them well supplied with material.

Neglecting the material for the convenience of the repair forces we have the \$4.85 net gain where a railroad handles its own scrap. A railroad will "make" three tons of miscellaneous scrap per year per mile of road operated. Thus a road of 4,000 miles will be able to save \$58,200 per year by handling its own scrap. In brass there is still a larger amount to be saved. The salvage in all hose is very large. What other department of a railroad on so small an investment can show so great a return?

W. F. Jones, general storekeeper, New York Central: If the materials throughout the world wasted today were saved and applied to proper uses, we would be confronted with an economic revolution tomorrow. When a man's hands are full, it is natural for him to be extravagant. It is born in him and nature has placed before him almost unlimited resources to be obtained at the expense of but little endeavor. He has been prodigal from his birth and only frugal when compelled by necessity.

To change this inherent characteristic has been the life-work of many men who have had the foresight to realize that, with our ever increasing population, the time will come when we will be confronted with a fight for existence.

In managing a business where men are employed, waste and extravagance will reduce the profits unless a watchful eye is placed on every detail of operation. This is not so difficult in a manufacturing plant where each individual workman is under the direct personal supervision of his foreman. Different conditions prevail in operating a railroad. While a large number of men are employed in buildings, under direct supervision, there is a vast army under indirect supervision, in the yards, along the road and on the water.

Conservation should begin with the quality of the material. It is not a paying proposition to use inferior material in a job that requires the best material than can be manufactured. A pair of wheels for a car may cost \$25.00 and the scrap value may be relatively high. The expense of that pair of wheels is not in the material, but in the delay to the car and contents, cost of switching, and labor of handling and of application and removal. If the life of a pair of wheels can be increased twelve months by using better material, even at increased price, would we not be conserving material?

Le Roy Cooley, general storekeeper, Central of New Jersey: Reclamation is so closely interwoven with conservation that I consider the two go hand in hand. If you can make the old material last a little longer or perform a further function you are conserving the new.

We have no elaborate scrap docks equipped with expensive machinery; we handle our reclamation work through our main locomotive and car shops, but not always with skilled labor, unless the class of work so demands. I will mention a few of the practices which we employ that might be of interest. No doubt all present have observed how the siding of box cars first becomes decayed at the sills and eaves, requiring renewal while the center portion is practically as good as new. Our practice is to cut off the decayed ends and use the siding as roofing.

A year or so ago all roads were obliged to re-build in a degree practically all of their equipment to meet the demands of the Interstate Commerce Commission, necessitating the removal of grab irons, brake wheels, brake staffs, cutting levers, etc. The old grab irons were used for the construction of bolts, as were also the brake staffs and cutting levers. The brake wheels which we were obliged to remove did not have sufficiently large brake staff fit to meet the requirements. We were able to reclaim practically all of these wheels by heating them and forcing the hole larger with a punch of proper size, with but little expense and little loss through breakage.

We have a rattler through which we pass all old or rusty nuts and washers. They are then sorted and those requiring re-threading are given such attention.

We found some time ago that it was possible in a large degree to reclaim our cast steel journal boxes through the electric welding process, by building them up in places where worn. This is also being done with front end coupler pockets, many of which require renewal on account of the pin holes becoming elongated. Our practice is to true up the hole by the electric welding process and return the pocket to service. Electric welding of bolsters and side frames is no doubt a common practice and the saving is enormous.

R. V. Wright of the *Railway Age Gazette* called attention to the moral effect the reclamation of material has on the men. Before the war there was plenty of material and at the prices that prevailed at that time it was not economical to reclaim material to the extent that it is at the present time. The fact that material is scarce and that the cost has risen materially should be impressed upon the men so that this matter will be given the proper attention. In addition to the material the conservation of labor is a very important problem and should be given consideration.

EDUCATION IN FREIGHT LOADING BY MEANS OF PHOTOGRAPHS

By Martin P. Kennedy

The Delaware, Lackawanna & Western has adopted a plan of photographing damaged freight in cars, and the idea has worked out so successfully in bringing the facts home to freight loaders that E. M. Rine, vice president, in charge of

Car of Raisins from California on Arrival at New York.
Damage Due to Frail Crating

the operating department, is receiving numerous requests from other roads for details and data concerning its operation.

The plan was first advocated by Major F. H. Schoeffel, of Scranton, a graduate of West Point, now back in the ser-

vice in the inspector general's department. The major is the chief special agent of the Lackawanna, and in the latter part of 1915 succeeded in convincing President William H. Truesdale that all the letters that the various freight agents might write about the dilapidated condition of freight frequently found in cars on arrival at stations would not have one-tenth the effect that a picture of the actual conditions would produce.

Authority to proceed was given and 25 No. 3 Auto-graphic Kodak cameras were distributed to freight agents at the principal points on the line, at transfer stations and piers.

Freight Robbed in a Car from a Connecting Line

Sufficient film of two exposures each was also furnished, together with instructions on how to take the pictures, and just what conditions to photograph. Naturally time exposures must be made, the time depending on the light conditions. Agents were told that when a car was opened at their station

A Bad Case of Improper Loading and Stowing

with freight strewn around and damaged, apparently due to improper stowing at the loading point, or exhibiting evidences of pilfering, they were to photograph the interior of the car, taking at least two views, and mail the film at once to the chief special agent's office in Scranton with a written report. A dark room was fitted out in the office at Scranton, and

here the films are developed, printed, distributed and filed.

The results have been exceedingly gratifying. A sort of friendly rivalry has sprung up among the agents in their efforts not to let the other fellow get anything on them in

Wagon Wheels Loaded on Smoked Meat in Glass Jars

the form of a picture showing freight improperly loaded from their stations, with the result that a remarkable improvement was at once noticed in the manner in which freight was loaded and stowed in cars, which brought about a decided reduction in the loss and damage account. Agents who heretofore were inclined to be indifferent as to how the freight was loaded, just so they got the doors sealed and car started on its way, now exercise the utmost care, for they know that copies of these pictures are sent to the general superintendent's office, with a report, which of course discloses the loading point, and it is only natural to assume that a rebuke is in store for Mr. Agent at fault.

Then again the agent who receives a car in bad condition

750 Cases of Condensed Milk Damaged Because of Improper Stowing, Making It Impossible to Get an Accurate Check of Car

and photographs it, feels that the agent responsible for the poor loading will surely await an opportunity to catch a car coming from the station that caught his car. What's the answer? The greatest care possible being exercised by all hands in loading and stowing their freight, with the result that there is considerably less damaged and broken shipments. The value of the cameras soon became apparent along more widely extended lines.

One of the principal improvements secured by these pictures were stronger containers for raisin shipments from

California to New York. Some of the pictures taken at New York piers of cars of raisins showed almost every box in the cars broken, and raisins piled on the floor, and these were sent to the originating line. The officers of that road presented the pictures to members of the California Raisin Association, who were astounded to see how their shipments were arriving at destination. No pen pictures could have

55 Sacks of Flour Damaged by Wet Due to Defective Roof and Side Boards

furnished such a forceful argument. The association immediately went on record as favoring more substantial crating, by which action it is hoped a great loss will be avoided in the future. This will not only save the shippers a great deal of expense, the railroad a great amount of work and expense, but will give the consignees much more satisfaction. These photographs furnish indisputable evidence to foreign

Codfish and Canned Goods Damaged by Shipment of Brass

lines. When a car is opened on arrival from a connecting line and freight is found in topsy-turvy condition, no letter can furnish such a convincing argument as these pictures carry. The true conditions are placed right before the officer's eyes, and they can't get away from it.

The officers of one connecting line recently disputed that a car was delivered in a pilfered condition, but when they saw a photograph showing all the cases in the car broken open, they threw up their hands and acknowledged the correctness of our contention. The responsibility for damage to a carload of flour in sacks by moisture, on account of defective roof and side-boards, was recently placed

when a picture showing all the damaged sacks was displayed.

One car from the West with 750 cases of cans of condensed milk had so many cases broken and the contents so scattered that it was impossible to obtain an accurate check of the car.

In addition to furnishing a copy of these pictures to the agent taking them, and to the responsible agent, sufficient copies of the worst cases are distributed at various agents' meetings, which are held monthly. They are taken home by the agents and shown to all their employees engaged in handling freight, and the necessity for careful handling is emphasized. They are warned against having a picture of one of

Mustard and Fire Clay Damaged by Heavy Freight Loaded On It

their cars come back to them, and the improvement in the service indicates that they are paying heed to the warnings.

Pictures of damaged freight, due to frail crating, are frequently presented to shippers, who are beginning to be convinced of the serious loss the railroads are put to on this

Whole Shipment of Wall Paper Damaged, Due to Poor Stowing

account, and are taking steps to remedy the evil. The railroad company is developing this feature of the camera, and it is bound to become increasingly effective in its results.

The camera is also used by the special agents in photographing unsafe conditions along the line, train wrecks, and various other irregularities, and is becoming an important adjunct to modern railroading. That it is here to stay is attested by the number of railroads adopting its use.

Proposed Eastern Freight-Rate Increase

Good Progress in First Day's Hearings. Strong Statements by Rea, Underwood, Hustis and A. H. Smith

THE Interstate Commerce Commission seems likely to make relatively short work of the resumed fifteen per cent case. The first hearing was held on November 5 and arguments to close it are to be made on November 17, one month from the time the eastern carriers reported that the fears expressed by them last May were being realized. The determination to expedite matters was announced at the conclusion of a day of general testimony by executives of Trunk line and New England territories, supported by exhibits prepared by George M. Shriver, vice president of the Baltimore & Ohio and W. J. Cunningham, professor of Transportation at Harvard. George S. Hobbs, vice-president of the Maine Central also submitted statistics. Commissioners Meyer, McChord and Anderson asked questions that may perhaps be taken as showing a determination on the part of the first mentioned to make an attack upon the increase in maintenance expenses shown in 1916 over 1915, because, as Mr. Meyer pointed out to President Willard, the heavy charges for maintenance are being kept up. Meyer wanted to know whether the B. & O. obtained as much efficiency out of the \$5,000 a mile spent on maintenance in 1916 as it did from the \$3,000 spent in 1915. Mr. Willard said he could not answer the question because he had not in mind the conditions in the years proposed to be contrasted.

Only the irreconcilables said they would oppose the increase. Clifford Thorne and Samuel H. Cowan were the only ones of that class giving tongue to their thoughts on the first day of the hearing. Ross D. Rynder, speaking for what are generally known as the big meat packers, Arthur B. B. Hayes for the smaller ones, represented in the American Meat Packers Association, and Walter C. McCornack for the interior Iowa packers said their clients would not oppose the advances, viewing them as war measures, unless their industry should be singled out to carry burdens heavier than proposed for other industries. As to the protests and complaints which they have pending before the commission now, they said they would not withdraw them but would hold them in abeyance. Mr. Hayes, speaking for the Indiana limestone interests, said that if the admission was not to be deemed as a bar to specific charges of unreasonableness and discrimination per se, the Indiana people will not oppose.

FIRST DAY'S HEARING

At the morning session of the hearing of November 5, Presidents Samuel Rea and Daniel Willard spoke in general terms as to the conditions of the railroads. Both emphasized their conviction that even if the Commission allows the benefits withheld in June, the necessities of the carriers will not be met. Mr. Rea said the roads would have to come back for more, because they cannot do the impossible. They also pointed to the prices fixed by the government on fuel and iron, to show that such prices, hailed by the newspapers as reliefs, are higher than the prices paid by the railroads in 1916. As a war expedient solely, Mr. Willard proposed that the Commission allow the collection of one cent per 100 lb. on all freight. That is a suggestion made by a shipper at the hearing last spring as being infinitely better than a horizontal increase of fifteen per cent.

At the end of the day's hearing, Chairman Hall announced that the taking of testimony in the investigation-and-suspension-docket cases, consolidated with the fifteen per cent case would begin on the next day before Examiner Disque. Disque is the man who handled the Central Freight Association case and had the nerve to tell the carriers that

they had not made their rates for short hauls high enough, and he would show them what they should have done; he would make a scale of his own. He did that and the commission, for once in its life, gave the railroads more than they had asked for. The hearings, as scheduled are: anthracite coal, November 6; general commodities and live stock and I & S numbers 1142 and 1134, (petroleum) on November 9; and lumber and cement on November 13.

It was arranged that the executives should return for cross examination on November 15 and that arguments on the whole case should be made on November 17. No objection was made by any interest to this departure from the usual deliberate processes. It will mean herculean efforts by the clerical staffs brought to Washington by the railroads.

At the morning session the witnesses were examined by George Stuart Patterson, as chairman of the committee of lawyers acting for the eastern carriers; and by Hugh F. Bond, for the Baltimore & Ohio. At the afternoon session, C. S. Pierce, counsel for the Boston & Maine, was leader. At the morning session the witnesses were Samuel Rea, (Penn.); A. H. Smith, (N. Y. C.); F. D. Underwood, (Erie); George M. Shriver, (B. & O.); John B. Kerr, (N. Y. O. & W.); and Daniel Willard, (B. & O.). At the afternoon session Messrs. Rea and Willard resumed the stand for a short time and were followed by J. H. Hustis, (B. & M.); Howard Elliott, (N. Y., N. H. & H.); George S. Hobbs, (M. C.); and Prof. W. J. Cunningham

STATEMENT OF GEORGE S. PATTERSON

In opening the case for the carriers, Mr. Patterson said that for the first nine months of the year gross earnings had risen \$123,789,000 but an increase of \$168,431,000 in expenses had left them \$57,291,000 worse off than in 1916. The three great eastern systems—Pennsylvania, New York Central and Baltimore & Ohio—were \$38,492,000 behind last year, notwithstanding they had done \$70,607,000 more business. For the year ending June 30, 1917, the net operating income of all eastern roads fell \$44,996,000, in spite of an increase in traffic of \$154,336,000 over the previous year. Net return on property investment for the year fell from 6.52 per cent to 5.71 per cent.

The effective prosecution of the war is the paramount duty of the nation, and the capacity of mobilized industry to supply men, munitions and foodstuffs to the war zone is limited by our transportation resources. It was, therefore, imperatively in the national interest that the government neglect no available means to insure the rapid development of railroad facilities, and the strengthening of imperilled railroad credit.

The eastern lines are achieving remarkable efficiency records with a plant several years behind the growth of the country. Eight billion more ton-miles were produced in the first four months of the war than in the same period last year. This gain of 15 per cent in service rendered the nation, with only a 1½ per cent increase in equipment, was almost entirely the result of the heavier trainloading. The average trainload was increased from 705 to 782 tons, a gain of 11 per cent. Two freight trains are now performing the work done by three trains in 1910, a year of "peak" traffic.

In May the eastern roads asked the commission for a fifteen per cent rate advance, and they estimated that the new level of costs would increase their operating charges \$235,000,000 a year. They now show that this was too conservative, as present figures indicate an increase of \$270,000,000

based on the 1916 volume of business. The advance in coal amounts to \$78,000,000; in wages to \$102,000,000, and in materials to \$90,000,000; total \$270,000,000.

The great rise in bituminous coal, of which the railroads consume a quarter of the entire mine output, has cut deep into revenues. The Pennsylvania System, for example, burned last year in its locomotives 18,335,000 tons at an average cost of \$1.23 a ton. The government price is now \$2.45, and the Pennsylvania, for the past six months, has supplied its needs at \$2.40. This means an increase of \$21,450,000 a year for this one company for the single item of coal.

The labor problem is becoming increasingly serious because of the inability of the railroads to hold their men against the competition of private industries offering better wages, and the consequent lowering of labor efficiency. The Adamson wage advance to the train brotherhoods is costing the eastern roads \$36,000,000 more a year for the same labor, while advances to other classes of employees have swelled the payrolls by \$66,000,000.

To maintain roadbed and equipment at the standard demanded in the public interest is becoming increasingly difficult. Not only does the great advance in the cost of labor and materials correspondingly contract the purchasing power of the railroad dollar, but the great volume of traffic moving under emergency conditions is wearing out roadbed and equipment at an unprecedented rate. While the eastern roads are spending more for upkeep than last year, they are actually getting much less work done, and this deferred maintenance will eventually have to be provided for. This is one of the most serious factors affecting the present critical position of the eastern lines.

Mr. Patterson made a comparison, on the same basis as in the 5 per cent and 15 per cent cases, of the revenues of the 38 railroad systems comprising the Eastern carriers. This comparison, made up from exhibits placed in the record at the hearing, showed the following between the calendar year of 1917 and 1916:

(a) That for the nine months ending October 1, 1917, the operating revenues of the 38 systems increased \$123,789,000; their operating expenses increased, \$168,431,000 and their net operating income declined \$57,291,000, notwithstanding an increase in the property investment up to July 1 of \$227,000,000.

(b) The corresponding figures for the Baltimore & Ohio, New York Central and Pennsylvania systems combined, show an increase in operating revenues of \$70,607,000 and a decrease of \$38,492,000 in net operating income, notwithstanding an increase in property investment up to July 1 of \$61,000,000.

(c) September showed (for the 38 systems) an increase of operating revenue of \$16,453,000 and a decrease of \$6,429,000 in net operating income, or 14.8 per cent and for the three systems, an increase in gross of \$9,967,000, and a decrease in net of \$3,699,000, or 15.4 per cent.

(d) Every month in 1917 shows both for the 38 systems and for the three systems, an increase in gross (except February) and a decrease in net, notwithstanding an increase in carloads and trainloads of 2.6 and 79 tons, respectively.

(e) Comparing with the same periods of the previous year, the three months January to April inclusive show an increase in gross of \$31,713,000 or 6.1 per cent, with a decrease in net operating income of \$37,134,000 or 29.8 per cent. The period May to September, inclusive, shows an increase in gross of \$92,076,000 or 12.6 per cent and a decrease in net of \$20,156,000 or 9.3 per cent.

A comparison of the fiscal year ending June 30, 1917, with the fiscal year ending June 30, 1916, shows that for the 38 systems, there was a decrease in net operating income of \$44,995,000 notwithstanding an increase of \$154,336,000 in gross and of \$200,000,000 in property investment; so that the return on property investment has fallen from 6.52 per cent in 1916 to 5.71 per cent in 1917.

The estimates of increased cost for 1917, and of revenues from increased rates on the basis of the increased costs of 1917 over 1916 was estimated as of the day of the hearing as follows:

Increased wages	\$102,070,229
Increased fuel cost	86,574,375
Increased material cost	89,084,214
Total	\$277,728,818

In addition to the above it is estimated that the taxes for 1917 will exceed those of 1916 by \$19,020,000.

Mr. Patterson estimated that the increases in rates granted since January 1, 1917, will yield an addition to the operating revenue of the eastern lines of \$97,000,000, on the basis of the 1916 traffic. A grant of the remainder of the 15 per cent program he estimated would add \$58,700,000 making a total of \$155,700,000. Subtracting that sum from the \$277,728,818 of increased cost of wages, fuel and materials would leave \$122,000,000 of increased cost not covered by the increase in revenues resulting from a grant of the whole of the 15 per cent program. This difference between increased revenue and increased cost is about equivalent to 10 per cent of the 1916 freight revenues.

"The wasting of the railroad machinery without adequate replacement cannot continue indefinitely. Due to the strong foundation on which some of these railroads were built they went into the war period able to stand some stripping of maintenance. But they cannot continue. . . . The situation is serious. This commission and these companies must assume the responsibility of making it clear to our people that these lines are necessary and that they must be kept in good condition and that they shall be able to expand in such degree as will enable them to take care of their peak load."

COAL STATISTICS

Mr. Shriver presented exhibits to support the extemporaneous remarks to be made later by President Willard. President Kerr, of the New York, Ontario & Western, presented statistics pertaining to the hard coal roads and their principal traffic and specifically asked that the unexpired order of the Commission in the big anthracite rate case, No. 4,914, be vacated and set aside so that the hard coal carriers may have the revenue to which they believe themselves entitled.

STATEMENT OF F. D. UNDERWOOD

"Agitation against increases in rates is largely manufactured for political or other selfish purposes," said Mr. Underwood. "The actual payer of rates is not here now and he never has been here. The question of rate increases is not one of law; neither does it demand extended oratorical efforts on the part of anyone. It narrows down to this: Are the railroads at this time to wither, and thereby fail to perform the physical functions demanded by inexorable conditions? Are the weaker ones to default on their interest payments, and the stronger ones to pass or cut their dividends, with the consequent effect on the financial fabric of the entire country?"

"The return on the property investment of the Erie Railroad was 2.88 per cent for the year ending June 30, 1917, as compared with 4.86 per cent in 1916. Upon that showing—which is the crux of all of it—it is vain to expect buyers for railroad securities. These results admit of no argument.

"The Erie Railroad asks an increase in rates sufficient to enable it to perform its duties to the public, pay the interest on its bonds, and have a proper surplus to meet emergencies. No percentage of rate increase that has been under consideration is adequate. If the railroads of the country are to continue to discharge their functions they can do it only through increased earnings, and the increase should not only deal with the present, but with the future, which holds unknown obstacles.

"The costs of materials, taxes, etc., are portrayed in our statement, but there is an element—the cost of unskilled transient labor to indispensable—which has to be met from day to day. The government contractors, private enterprises,

manufacturers, and even farmers have become competitors of the railways in the field of unskilled labor. Unskilled labor today is demanding and receiving wages in excess of those paid skilled labor two years ago.

"The railways must depend solely on unskilled labor for the care of locomotives and cars at terminals, for the handling of freight and materials, and for the removal of snow and ice in their season.

"It is not a healthy state of affairs for the Erie Railroad to earn \$83,900,000 in gross, and after exercising all possible economies—making parsimonious expenditures on the maintenance of the permanent roadway and equipment—to have a balance of only \$2,111,000 to apply to betterments and sinking funds. It is a dangerous thing from several standpoints for this small margin to continue. Statements showing the increased cost in maintenance of roadway and equipment are misleading. They show an increasing expenditure of dollars, but the dollar standard has been superseded for the reason that a dollar does not now buy its normal labor efficiency.

"There is no time to lose. The end of the next two months will be a trying period for many of the weaker lines. With the lessening and passing of dividends, and the probable defaults of interest, the investing public will set anew their face against railroad securities."

THE NEW ENGLAND ROADS

At the afternoon session J. H. Hustis and Howard Elliott made a general presentation for the New England carriers and in particular for the Boston & Maine and the New Haven. In summing up the case for the New Haven Mr. Elliott said:

"The New Haven is a great terminal yard for its many connections and promptness in handling cars will be of benefit not only to the New Haven but to all of its connections and to the railroad situation generally. With improved facilities and motive power, and with improved handling at terminals by railroad and shipper the present volume of business ought to be done with 5,000 less cars. This would make of greater use these cars, worth at present prices \$15,000,000.

"Railroad owners and managers should not be harassed during this war in attempting to curtail necessary expenditures for the purpose of keeping the property solvent but should be able to devote all of their time and energies to increasing efficiency. The rights of railroad security owners should also be protected so that they in turn will be relieved of anxiety on account of their investments and be able to devote their energies toward supporting the government both financially and in other ways.

"In the statement submitted May 7, 1917, we submitted estimates of increases in expenses, taxes and interest. In spite of some variations in particular items of expense, the total increase for the year will not vary much from the figures then submitted.

"The expenses of the New Haven company during the past nine months and its actual results compare with the estimates as follows: In arriving at the figures for 1917 the actual figures for the nine months are used and a close estimate for the remaining three months.

	Estimate of May 7	For year 1917
Adamson, law	\$1,400,000	\$1,353,000
Other wages	2,100,000	2,067,000
Fuel	4,000,000	2,580,000
Materials	4,000,000	3,600,000
Interest	500,000	219,000
Taxes	300,000	220,000
	\$12,300,000	\$10,039,000

Based on cumulative expenses due to further increases in wages and other costs, the comparison for 1918 with 1916 is estimated, as shown in the table in the next column, compared with maximum figures given in May.

"As against these increases the company has possible offsets as follows, if its petition for increased rates is granted

and if it can sustain its credit so that it can improve facilities and thus increase the volume of its business and at the same time continue to improve in its operating methods so as to

	Maximum estimates in May	Present estimates
Adamson law	\$1,600,000	\$1,353,000
Other wages	2,500,000	4,800,000
Coal	6,000,000	3,900,000
Materials	6,000,000	6,740,000
Interest	500,000	300,000
Taxes	400,000	575,000
	\$17,000,000	\$17,668,000

save more per unit of transportation than is possible with its present plant:

(1) Total additional revenue if full 15 per cent is granted.....	\$2,750,000
(2) Amended class rates.....	1,250,000
(3) Proposed increases in anthracite coal rates.....	300,000
(4) Proposed increases in passenger rates.....	3,700,000

Total estimated increase in revenue, provided business remains on or about the present volume..... \$8,000,000

"The total benefit from the increase in revenue as above plus the estimated savings for the calendar year 1917 due to better operation (estimated at \$4,000,000) is only \$1,961,000 more than the known increases in expenses for the year 1917. The same increased revenue as shown above and the benefit of these same economies for a full year (estimated at about \$5,000,000) would be \$4,668,000 less than the possible maximum increase in expenses in 1918.

"In conclusion the increases which we are asking for are intended for the following purposes:

"To meet increased expenses, to keep the road solvent, and prevent the danger of financial collapse involving as it will individuals, savings banks, insurance companies and other institutions. To keep the present plant up to a proper standard; to increase its capacity; to improve working conditions for employees and shippers and consignees in yards, stations, terminals and roundhouses, and thereby increase efficiency; to revive and restore the confidence of security holders, and to make a fair return on the fair value of the property devoted to the public use.

"The company if it can get this increased revenue must continue for some time to devote all income above its fixed charges and seven per cent on the proposed preferred stock (if the floating debt can be converted, to making the improvements so much needed for the welfare of the great population the company is serving. If the increased rates should result in a volume of net income greater than now seems possible and more than the commission thinks is just, they have the power to reduce the rates now suggested. Under war, transportation and financial conditions existing in New England and in the United States as a whole, the commission can well afford to lean in the direction of liberal treatment of this great transportation agency and grant all the increases in rates herein suggested."

STATEMENT OF RECEIVER HUSTIS

"A fifteen per cent advance in freight rates will not provide for the single item of increased payrolls on the Boston & Maine. Increased wages based on settlements already made and granted since January 1 will amount to about \$3,800,000 a year. There are now in course of arbitration wage demands which if granted will materially increase this amount.

"We are informed that the so-called 'Big Four' brotherhoods have also formulated demands, which if granted, would for that class of employees alone add at least \$1,500,000 additional to the pay roll expense. (From January 1 next.)

"While the action of the government in regulating the price of fuel, as well as the charter prices of the vessels that carry it, has performed a useful purpose, it has not materially relieved the New England situation.

"At government prices for coal and government prices for charter, and with fuel and vessels moving with despatch, the cost of fuel based on last year's consumption would be increased by at least \$4,700,000. In normal times fuel

makes up about 13 per cent of the operating expenses; for the present calendar year it will probably be as much as 20 per cent. . . . Steel bars, castings and plates are quoted at from 173 per cent to 400 per cent higher than last year. Lumber has increased 55 per cent. Material and supplies generally have been increased 64 per cent. Some of these prices are higher than those recently named by the government but it has been impossible thus far to obtain reasonable deliveries based on government prices.

"An inquiry recently made for the duplication of an order for sixty locomotives elicited the response that the tentative price would be in excess of 100 per cent over that of the locomotives delivered last winter. While deliveries of locomotives are not possible at the present time, yet they must soon be purchased and, if necessary, even at these high figures, if the present volume of business continues. . . . If the dictates of public opinion are to be followed; if the population and property of New England are to be protected from a foreign enemy in time of war; if the manufacturer, shipper, and consumer of New England and of the United States are to be furnished with proper railroad facilities, this increase now sought for is an absolute necessity."

STATEMENT OF SAMUEL REA

In only two previous years, 1903 and 1904, said Mr. Rea, was an increase in operating revenue followed by a decrease in the net. Such a condition, not corrected, would mean a collapse of the transportation facilities of the country in this hour of supreme National need. "We cannot afford to make any mistakes. It is not a time for panic, but neither is it a time for disregarding the facts of increasing expenses, of diminishing net operating income, of deferred maintenance, of lack of present facilities, and inability to provide future ones."

Mr. Rea thus summarized the salient factors:

"(a) Continuous increases in the cost of labor, fuel, supplies, taxes and of obtaining new capital;

"(b) Inability to secure and retain efficient labor;

"(c) Curtailment of maintenance expenses, which curtailment is due in part to inability to secure necessary labor and materials;

"(d) Decrease in net operating income, notwithstanding large increase in operating revenues, in property investment, in carload and in trainload;

"(e) Reduction in surplus with consequent effect upon the credit of the carriers;

"(f) Inability to secure new capital by the issue of stock, with the consequent weakening effect upon the financial structure;

"(g) Inability to provide improvements and facilities, not only essential for the traffic of today, but equally essential for the traffic of the future."

Declaring that the Pennsylvania Railroad system faces increased operating expenses of over \$74,000,000 a year, Mr. Rea attributed this to tremendous advances in the prices of labor, fuel and materials, as well as higher taxes. He presented the following summary of increased costs:—

Increased fuel costs.....	\$21,450,000
Increased materials costs.....	14,694,000
Increased wages under Adamson law.....	9,459,000
Increased wages to employees other than those affected by the Adamson Law.....	24,748,000
Increased taxes.....	3,870,000
Total	\$74,221,000

Mr. Rea reminded the commission that previous estimates of increased costs had proved far too low. He referred to the fact that his first estimate, presented to the commission on March 22, 1917, had placed the increased operating expenses of the Pennsylvania system at \$42,600,000 per year, whereas two months later it was necessary to revise this to \$51,892,000, and now, based on present conditions, this second estimate had been found too low by more than \$22,000,000.

Against the increased costs of \$74,221,000 per year now

confronting the Pennsylvania system, Mr. Rea estimated the increases in rates already granted at only \$30,000,000, and those pending in commodity rates at \$12,500,000 leaving an increase, unprovided for, of \$31,721,000 in the cost per annum of rendering transportation service.

That governmental price fixing on coal, in its present status, offers no prospect of lower fuel costs was indicated by Mr. Rea in his discussion of that subject.

"The railroads are going concerns," said Mr. Rea, "and must be operated and maintained upon a progressive basis. They are a vital factor in winning the war directly by the service rendered the government in the transportation of men and material and also by serving the shipper who is serving the government. If this transportation machine breaks down through inability to secure efficient labor by reason of inadequate wage rates it has a direct bearing upon the successful termination of the war."

"During the nine months ending September, 1917," he continued, "our total operating revenues have increased \$38,000,000 or 11.68 per cent, our operating expenses have increased \$47,000,000, or 20.53 per cent, while our net operating income has decreased \$13,380,000, or 17.09 per cent."

The government has recognized the increased cost of operation in manufacturing plants. The prices now fixed by the government give pig iron an advance of 105 per cent, bituminous coal 115 per cent, copper 68 per cent, and wheat 156 per cent.

"If this Commission takes the view of this situation which I hope it will, the result will be felt in the future financing of our improvements as it will give confidence to those furnishing such capital. If this Commission permits the rates of these carriers to be increased to such an extent as to return them adequate net operating income and maintains them upon such a basis the effect upon the financing of their needs will be very great and will tend to re-establish the confidence of investors."

STATEMENT OF A. H. SMITH

"We have been given five cents with which to pay an increase of 18 cents in expenses," said A. H. Smith, president of the New York Central. "It is of the utmost importance that these railroads be kept in good condition. They constitute the first line of communication with our armies. We may put ships on the ocean, construct railroads in Europe, and send our armies to the front, but we must not forget the great importance of maintaining in the very best of condition the first line of communication with our supplies and people."

"The financial strains put upon them through the rise in prices and wages are so great that they have been forced to do things which do not contribute to their strength and efficiency. The railroads cannot accomplish what the government itself has never been able to do—keep labor at pre-war wages and hold prices down to pre-war levels. A government may conscript capital and it may impress labor to carry on its work—an extreme measure to which we hope ours will not have to resort—but private corporations are powerless to do this and must compete in the markets for their capital, labor and supplies."

"We estimate that at the close of the current year the New York Central Lines will show that they have earned approximately \$93,000,000 more in gross revenues than they did in 1915; but the changes have been so great that they will have, after doing all this extra work, actually less net corporate income by several millions than they had in 1915."

"Our average train load and average car load has been increased greatly. We believe we have done all that we could with the means at hand. We have cut the service where that could be done; we have left undone things that should have been done, and we have taken on an extra heavy load without increasing the size of the plant. Obviously all of these resources have their limits."

Railway Regulation and Control

Joint Committee on Interstate Commerce Begins Hearing, Chairman Newlands Urges Constructive Policy

SAN FRANCISCO, Cal., November 6, 1917.

THE Congressional Joint Committee on Interstate Commerce, of which Senator Francis G. Newlands of Nevada is chairman, began a series of hearings at San Francisco on November 1, in its general inquiry into the problem of railway and public utility regulation, on which hearings were held at Washington last Winter and Spring.

Senator Newlands announced that the committee desired particularly to hear from state commissioners, representatives of shippers and others of the Pacific Coast and intermountain sections with reference either to the general problem or to local problems bearing on the subject of the inquiry. Max Thelen, president of the California Railway Commission and representing the legislative committee of the National Association of Railway and Utilities Commissioners, was the first witness, being recalled for cross-examination on his testimony at the Washington hearing.

CHAIRMAN NEWLANDS' ADDRESS

The problem confronting the committee was outlined by Chairman Newlands in an address at a luncheon for the committee given by the San Francisco Chamber of Commerce and the San Francisco Commercial Club in which he said in part:

"Transportation is the great economic question of the day, surpassing everything else in point of importance at this time, for adequate transportation stands at the base of a successful prosecution of this war and it will stand at the base of a proper development of commerce after the war has ended. We all know and believe that the United States has the best railway system in the world but few of us pause to realize the energy and the genius of the Americans who led in this great work and developed it to its present phenomenal standard. The work was entirely trusted to private enterprise. The public hardly claimed the right to interfere with it or in any way to endeavor to regulate it. Therefore, naturally, great abuses arose, which it was necessary to correct and the American people took hold of that question with the vigor which usually characterizes them. For years they have been engaged in corrective and punitive legislation and regulation of railways and have formed a habit of mind which is punitive and corrective.

"The President of the United States has now called our attention to the fact that it is important that we should again enter upon a constructive era, realizing that almost everything has been done that could have been done in the way of punitive and corrective legislation and that we have the administrative power which is necessary to correct any evils that may now exist or arise in the future.

"When this war broke out we realized for the first time that the railway facilities of this country, enormous as they were, were not adequate to the emergency which we had to encounter. They were, perhaps, adequate to the normal requirements of the country, but they were not adequate to the enormous and abnormal demands that were thrown upon them as the result of the war.

"As a result of the period of depression existing before the war the railways were in distress as to their income and they started to practice economies which, as experience has since shown, while entirely wise as far as the internal conditions of the railroads were concerned, were not wise as far as satisfying the demands of the country in general.

"That is why I am making an appeal to this entire country to stand by and sustain a constructive policy regarding the

railroads, not so much that the bondholders and stockholders may earn interest and dividends on their investments, but for the principal reason that the public interests absolutely require that these great public agencies should be fully developed and that we all should act in such a way as to encourage private capital in enlarging these facilities throughout the country.

"The war made such demands upon the transportation facilities of this country that car shortage and coal shortage and high prices have been the result. These skyrocket prices which have vastly increased the cost of living may be traced to a large degree to the enforced economies of the period before the war.

"We ought to have foreseen such conditions, but now, in order to accomplish anything, we have got to get out of the punitive and correctional habit of mind. Congress, I regret to say, is still in that habit of mind because the public is, for Congress doesn't lead public opinion; Congress follows public opinion. This does not mean at all an abandonment of the advantages which have been gained in the period through which we have passed. There is no danger of our lapsing into the old conditions, where such serious abuses existed as to arouse the resentment and indignation of the entire public. All I suggest is that the public should rid itself of the influence that these abuses have had upon its mind and help the railroads to regain the markets of the world for their loans and their securities; markets which are not open to them now, partly because railway securities are not the safest securities they once were and partly because the government is now monopolizing the financial markets.

"There are three ways of furnishing these railways with aid to bring them out of their deplorable state. One is a more liberal policy on the part of the government and the public that will satisfy the investing public. Another is national aid, furnishing from the public chest money to assist in meeting the public needs. A third way is to increase the rates of the railroads. I don't pretend to suggest the method, but I wish to call your attention to the need of meeting this question satisfactorily, and it will devolve upon this committee largely to suggest the method."

TESTIMONY

Among those who entered appearances to indicate their intention of testifying before the committee were: F. A. Jones, chairman of the Arizona Corporation Commission; W. S. McCarthy, of the Traffic Bureau of Utah; Seth Mann, of the San Francisco Chamber of Commerce; Fred P. Griggs, of the traffic department of the Associated Jobbers of Los Angeles; G. J. Bradley, representing commercial interests of Sacramento; F. M. Hill, of the Fresno Traffic Association; S. J. Wetrick, of Seattle; L. R. Bishop, of the Oakland Chamber of Commerce; J. C. Summers, of the Stockton Chamber of Commerce, and E. P. Troy, of the Public Ownership Association. Most of these said they wished to discuss the long and short haul clause in its relation to the rates to the Pacific Coast and the intermountain territory.

Mr. Thelen, questioned by Senator Cummins, said that his opposition to the plan of federal incorporation of railways was based on the fact that the plan is proposed by the railways merely as an agency for taking away from the states the power of taxation and the police power as well as the power to regulate rates. When a plan for federal

incorporation is presented to Congress, he said, it will be easier to take away these powers of the states by a few words in the law than it would be to do so by more direct methods.

Alfred P. Thom, counsel for the Railway Executives' Advisory Committee, entered a protest against this statement of the railroads' attitude, saying that they have no such idea; that they have proposed that the power of taxation and the police powers be reserved to the states under federal charters just as the power of taxation of national banks was left to the states.

Mr. Thelen's cross-examination was continued by Representative Sims and Senator Newlands on Friday. Representative Sims asked if the present system of taxation by states does not cause inequalities resulting in discrimination by a state against interstate commerce. Mr. Thelen admitted that there were inequalities but said they could be corrected by the federal government without federal incorporation.

Senator Newlands asked if the legislative committee of the National Association of Railway and Utilities Commissioners had reached any conclusion as to federal incorporation. Mr. Thelen replied that they are practically unanimous in opposing the plan proposed by the railroads but this does not necessarily apply to any other plan, such as a plan for turning over the property of the railroads to new corporations at a fair value. The railroad proposal contemplates an exchange of the present securities. He said that the majority of state commissioners are in favor of federal regulation of security issues. The states, he said, have gone into this field because the federal government has not, but he recognized that the states cannot adequately supervise the issue of securities of railroads chartered in other states and that embarrassments and delays result from the necessity of securing the consent of several states. It is important, he said, that such matters should be passed on promptly and the Interstate Commerce Commission should be provided with sufficient machinery to enable it to decide such cases promptly.

As to many of the functions exercised by the states, such as regulation of stations, crossings, investigations of accidents, etc., he thought that the state commissions can better protect the interests of the public than the federal government can, but there are many cases where the states can helpfully co-operate with the federal commission. He thought that the federal government might well establish a uniform method of taxation, to be followed by the states, while leaving the actual taxing power in the states. To this Senator Newlands assented. Mr. Thelen also said that the government should do something to prevent unnecessary duplication of facilities but the question of jurisdiction should depend on the character of the facilities involved.

There has been very little difficulty in California, he said, as a result of conflict between state and interstate rates, but he recognized that the existence of such situations as are involved in the Shreveport case are very unfortunate and that some steps should be taken to remedy them. With this change he thought the principal objection to the dual system would be eliminated and the national association had instructed the committee to confer with the Interstate Commerce Commission on a plan for reconciling conflicts of jurisdiction by joint hearings on a single record with an endeavor to reach a harmonious conclusion. The ultimate jurisdiction, he said, would be in the federal government.

Mr. Thelen gave some figures showing the percentage of state to interstate traffic on some of the principal roads of California. In the case of the Atchison, Topeka & Santa Fe, he said, 44.1 per cent of its California business is intrastate, while for other roads the percentages were: Southern Pacific, 56.9; Western Pacific, 27.6; and Los Angeles & Salt Lake, 24.4.

Questioned by Representative Esch regarding receiverships Mr. Thelen said that the federal charters of the Union Pacific and of the Texas & Pacific had not kept them from receiverships. He said it would be very desirable if the federal government would work out a constructive plan for dealing with receiverships and he was in favor of the Interstate Commerce Commission itself acting as a receiver. The stock and bond expert of the California commission has compiled an elaborate analysis of the causes of the receiverships of the principal roads that have become bankrupt, to be filed with the committee. Mr. Esch asked if a federal statute against trespassing would not be advisable in view of the fact that the states have not acted. Mr. Thelen assented to this and said the grade crossing committee of the national association had recommended such a statute although no action was taken on the report by the association. He said he would favor a modification of the anti-pooling and anti-trust laws to such an extent as to prevent wasteful duplication of facilities and thought the Interstate Commerce Commission might issue certificates of public necessity.

Senator Cummins led the witness into a discussion of the problem created by the existence of weak roads that cannot survive on rates which may be profitable to their stronger competitors. This, Mr. Thelen said, constituted the heart of the railroad problem and offered an opportunity for a constructive plan. He did not think the plan proposed by the railroads was a constructive one, but when Senator Cummins suggested that here was his opportunity to be constructive he had no plan to offer. He thought the plan of having the government subsidize the weak roads was impracticable but that there was some merit in the plan suggested by Senator Cummins for grouping the railroads in such a way that the strong roads should absorb the weaker lines.

A STATE COMMISSIONER WHO FAVORS FEDERAL REGULATION

A marked contrast to Mr. Thelen's ideas was presented by the testimony of E. O. Edgerton, of the California Commission, who followed him. Mr. Edgerton said he was in favor of complete and immediate federal control of railroads, starting with railroad service, because a situation in one state cannot be adequately considered except in its relation to other states and state commissions are concerned only with their own states. When the California commission ordered the Santa Fe to build a new line, although he believed their action was right, he said it had considered the case only from the standpoint of California without knowing what effect it would have on the ability of the road to serve other states, and when more cars are needed the state commission is naturally vigorous in trying to get them, perhaps at the expense of other states.

"Rates in one state are intimately connected with the rates in other states and also with the finances of the carrier," he said. "We can't fix rates in one state without to some extent affecting the ability of the roads to give service in another state and in interstate commerce. It is not right that one state should receive lower rates for like service than another state. The federal government not only should have the authority to regulate the issuance of securities but it should have control of the expenditure of the proceeds, and the authority that has the power to regulate the capitalization and finances should also have the power to say what the rates shall be."

"We have no national railway policy," Mr. Edgerton continued. "The railroads of the United States have been laid out without reference to the military needs of the country. One cabinet officer is pressing in the federal courts to tear apart a great railroad system, the Central Pacific and the Southern Pacific, that have always been operated as one system, while other cabinet officers are insisting on the rail-

roads being operated as a unit, to do the job we have in hand. The railroad system has broken down, at least to the extent that it cannot meet all the demands made upon it. For years past the railroads have been calling attention to the need for increased facilities to meet the needs of the country and now we see that they were right.

"To me the problem seems to be this: There is a national job to be done. The job is not being done. We have been proceeding with private ownership under regulation. Instead of overregulating the roads they have not been sufficiently regulated. The only chance for private ownership is affirmative and constructive regulation, not the exercise of veto power. Fixing rates in such a way as to get by the courts, just escaping the line of confiscation, is not intelligent regulation. We need the kind of regulation that compels the development of railroads to meet the national needs. Either private ownership under regulation must do the job we have before us or the government must. I suggest that we give over at once the discussion of the merits or demerits of government ownership, consider and formulate the needs of the country, put the job up to the railroads and ask their terms. If the terms are prohibitive let the government take the job itself."

Asked for his views as to the function of the state commissions under a plan of federal regulation, Mr. Edgerton said they would be left the vast field of public utility regulation but as to railroads they should serve in an advisory capacity only, appearing before the Interstate Commerce Commission frankly as partisans for their state instead of trying to act both as partisans and in a judicial capacity.

He did not believe effective results can be secured from the proposed plan for co-operation between state and federal commissions in cases involving conflicts of jurisdiction. "Co-operation is all right when the parties are agreed," he said, "but co-operation gets you nowhere in controversial matters unless one party has a club. Otherwise the only result can be a compromise. Situations like that in the Shreveport case should be settled by the Interstate Commerce Commission."

On Monday William Gardner, of the Reno Commercial Club, criticised the railroads and the Interstate Commerce Commission for discriminating against the intermountain country. He was followed by members of the Railroad Commission of Nevada and Spokane commercial interests.

On Tuesday W. F. McCarty, of the Utah Traffic Bureau, testified. H. M. Wade, of the Oakland Chamber of Commerce, defended the present system.

It is expected that the hearings will close this week.

DENVER TOURIST AND PUBLICITY BUREAU

In the past the railroads have had to depend largely on themselves for the creation of new tourist traffic. The Tourist and Publicity Bureau of the Denver (Colo.) Civic and Commercial Association is noteworthy in that it represents the organized and successful effort of a city to attract passenger travel. The bureau is supported by contributions from merchants and manufacturers of Denver. For the past two years it has achieved substantial results under the direction of its executive secretary, Harry N. Burhans, an experienced publicity man. Its work includes systematic advertising in newspapers and magazines likely to reach prospective tourists, the distribution of literature describing the scenic attractions of the territory tributary to Denver, the preparation of press stories on the natural wonders of the region and the operation of branch offices for the convenience and information of the public at other cities.

The publications which carry bureau advertisements were uniformly selected with the idea of achieving a maximum return. A school journal reaching thousands of the teaching profession, well known as more addicted to travel than any other class of our population, has been exceptionally productive of results. According to a railroad publicity

representative who is familiar with the work of the Denver organization, like advertisements by the bureau and the railroad in the same mediums bring twice as many inquiries to the bureau as to the carrier. He attributes this fact to the less evident pecuniary motive of the Denver organization in encouraging travel.

In a like manner the bureau has been able to "put over" press stories in national magazines which would not consider accepting similar articles from a railroad. By way of illustration, Mr. Burhans sometime ago engaged the services of a high-class Denver photographer and several professional posers for the purpose of securing scenic views with a little life in them. With some pictures taken in this way in Estes Park and a descriptive article on its natural beauties he approached the editor of one of the foremost American monthlies, to whom he offered the exclusive privilege to use them free of charge. The editor accepted the proposition and the bureau obtained the best publicity it had ever secured. In a similar manner the bureau has published a series of folders, copiously illustrated with photographs of Colorado scenes, some of which are in colors. These pamphlets have been placed in the lobbies of hotels and in the offices of many industries and commercial houses to which similar literature prepared by railroads cannot gain entree.

A folder, recently issued and entitled "Come Up to Colorado," contains a full-page map of the United States, showing the distances of the large cities of the East and Middle West to Denver and the distances from that city to the various points of interest to tourists in the West. The map is an ingenious argument for Denver's claim for recognition as the "gateway to 12 national parks and 32 national monuments." The last eight pages of the folder are devoted to detailed information concerning accommodations for visitors in Denver and Colorado resorts, suggestions as to how to "see Denver" either by trolley or automobile, instructions regarding the best highways for motorists to use to reach the city from the different directions, a detailed map of the Denver business district and a railway and road map of the state.

The bureau has three branch offices, the first of which was opened at Colorado Springs, Colo., the first stop of a large stream of tourists from Texas, Oklahoma and Kansas. The object of this office, obviously, was to encourage travelers to extend their itineraries to include Denver and other Colorado points. A second branch was established at Kansas City and a third at Chicago. The opening of each office has been accompanied by an aggressive advertising campaign in the newspapers for the purpose of securing an initial clientele. Those in charge of the branches have rapidly built up acquaintanceships among prospective tourists and supplied them with concrete information relative to the attractions of Denver and Colorado and the expense involved in taking various western tours. As no preference is urged for any of the railroads serving that territory the traveling public has not shown a disposition to discount the bureau's representations as designed to produce maximum passenger mileage.

The tourist offices have increased their usefulness and the effectiveness of their work by keeping constantly in touch with commercial, agricultural and trade opportunities in Denver and contiguous territory. From chambers of commerce and other sources in Colorado detailed advice concerning openings for merchants, manufacturers and farmers are received. Consequently, it is not infrequently the case that a visit to a bureau office brings a permanent resident to the Rocky Mountain state. Likewise, many on pleasure tours are so impressed with the desirability of Colorado as a place of residence that they take advantage of the business and agricultural opportunities concerning which the bureau is able to furnish them concrete data.

General News Department

The New York Central now maintains schools for teaching telegraphy and other station work at Albany, Utica, Rochester, Corning and Kingston.

By a fire of unknown origin the freight house of the Lehigh Valley at Phillipsburg, N. J., was destroyed on November 2, together with ten loaded freight cars and a flour warehouse adjacent; total estimated loss, \$200,000.

The Canadian Pacific, following the report of a Board of Conciliation, has advanced the pay of trackmen 30 cents a day on the western lines and 40 cents a day on the eastern lines. Foremen are advanced 15 cents a day to \$3.25, \$3.40 and \$3.60.

Carl Scholz, consulting mining engineer of the Chicago, Burlington & Quincy at Chicago, has been appointed a member of the Committee of Consulting Engineers on Coal Conservation and Publicity, for the Bureau of Mines, Washington, D. C.

The freight handlers of Chicago are demanding a twenty per cent increase in pay and have presented their claims to the Rock Island, the St. Paul, the Michigan Central, the Illinois Central, the Baltimore & Ohio Chicago Terminal, the Pere Marquette, the Chicago Great Western and the Chicago, Indianapolis & Louisville.

Most or all of the striking telegraphers on the northern division of the Pennsylvania Railroad have returned to work. It is said that they have the benefit of the general advance of 25 per cent in wages which has been granted by the road to its telegraphers; but the train dispatchers on the Northern division have not been taken back.

A compilation of state regulations regarding the housing of railroad employees, prepared by the Bureau of Railway Economics, shows that eight states—Arkansas, Kansas, Mississippi, North Carolina, Oklahoma, Oregon, South Carolina and Texas—have laws requiring railroads to maintain sheds over tracks where car repair work is regularly carried on.

On the Atchison, Topeka & Santa Fe lines east of Albuquerque, N. M., increases in pay have been granted to station employees, telegraph operators and clerical forces in the offices of superintendents, master mechanics, general superintendents and mechanical superintendents, effective October 15. The advances granted will add about \$410,000 per year to the company's payroll.

The Grand Trunk Railway of Canada has made a general advance in the pay of locomotive enginemen and firemen, following negotiations which have extended over two months. The eight-hour day is adopted, the same as in the United States. On engines of moderate size, the runners receive an advance of 10 cents a hundred miles; on the Pacific type, 20 cents a hundred miles. Firemen, on engines having 18-inch cylinders, are advanced 20 cents; on 19-inch cylinders, 15 cents, and on Pacific type, 15 cents, the latter from \$2.70 to \$2.85.

Passengers Killed by Mexican Bandits

A press despatch of November 6 reports that a northbound passenger train of the Mexican Central was dynamited and wrecked near Armendariz, 50 miles south of Chihuahua, on November 4. It is said that 40 federal train guards were killed, and that the passengers were robbed and some of them killed.

Alien Railway Employees Prove Loyalty

According to H. E. R. Wood, assistant secretary and assistant treasurer of the Chicago & Alton, 154 out of 160 men of foreign birth employed in the Chicago freight houses of the Alton bought Second Liberty Loan bonds to the amount of \$8,800. One Italian laborer mortgaged his home for \$1,000, on which he must pay 6 per cent interest, in order to buy a \$1,000 Liberty Loan bond. Greeks form the largest percentage of the alien employees who bought bonds, but the list also includes Germans, Austrians, Italians, Poles, Bohemians and other nationalities.

Reports to a committee of the Railroads' War Board show that on 21 railroads entering Chicago 63,000 employees subscribed \$5,341,000 to the First Liberty Loan. The subscriptions by railway employees to the Second Liberty Loan have not yet been compiled but it is estimated that they were more than three times as large as to the first loan.

Firemen to Demand Wage Raise

Locomotive firemen are preparing to launch a nation-wide campaign for higher wages. The eastern association, comprising employees of all roads east of Chicago and north of and including the Chesapeake & Ohio, held a meeting in Cleveland, Ohio, on November 5, to discuss the proposed demands, and the western and southern association will meet within a few weeks.

Railway Regiments' Smoke Fund

The railway supply companies have added \$60 a month more to the Railway Regiments & Tobacco Fund, subscriptions having been received since October 31 from the following companies:

Anti-Creeper Corporation, New York.....	\$10 a month
Carnegie Steel Company, Pittsburgh, Pa.....	10 a month
Crucible Steel Company of America, Chicago.....	10 a month
Damascus Bronze Company, Pittsburgh, Pa.....	10 a month
Waterbury Battery Company, Waterbury, Conn.....	10 a month
Western Railway Equipment Company, St. Louis, Mo.....	10 a month

The subscribers now total 58, the previous subscribers being given in the *Railway Age Gazette* of October 26, page 753, and November 2, page 810.

New York Port War Board

The secretary of war announces the appointment of a board, consisting of officers of the government acting with the commission recently appointed on the part of the states of New York and New Jersey, to co-ordinate all harbor and terminal facilities with special reference to the transportation of men and materials across the ocean. The chairman is the secretary of the treasury and the vice-chairman is William R. Wilcox, chairman of the New York-New Jersey Port Development Commission. Three other members of the cabinet and the mayor of New York City are members. The chief executive officer is Irving T. Bush, president of the Bush Terminal Company, operating extensive docks and warehouses in South Brooklyn, New York City. It is understood that Mr. Bush will have a free hand in the matter of controlling all storage and shipping facilities of the port of New York, and that railroad, terminal and lighterage interests will be able to co-operate with greatly increased efficiency in the relief of congestion.

\$19,000,000 in Liberty Bonds for the Pennsylvania System

Returns which have been compiled from all portions of the Pennsylvania Railroad System, including the Lines East and West of Pittsburgh, show that a total of 122,456 employees subscribed to the Second Liberty Loan, taking altogether \$9,051,700.

On the Lines East of Pittsburgh 77,273 individual subscriptions were recorded for a total of \$5,689,700. On the Lines West, 45,183 employees subscribed for \$3,362,000 worth of bonds.

As the Pennsylvania Railroad Company, the parent corporation of the system subscribed on its own account, for \$10,000,000 of the Second Liberty Loan, the total subscriptions for the company and for the employees of the system, amount to \$19,051,700.

An analysis of the subscriptions on the Lines East of Pittsburgh shows that the great bulk of the money was subscribed in small, or comparatively small amounts. Out of the total 77,273 subscriptions, only 88 were for more than \$1,000 each. Payment in full was made by 3,471 employees of the Lines East, while 71,802 subscribed under the installment plan, by which they

will save the price of the bonds out of their future wages, making payment in the ten-month period ending August 15 next.

The campaign for subscriptions among the employees of the entire Pennsylvania system was carried on with the greatest vigor and enthusiasm. Local Liberty Loan committees were organized on all divisions, and in all shops and departments. Nearly 2,000 men were actively engaged in the work of solicitation, and every one of the quarter-million employees of the system was personally urged to "buy a bond."

Christmas Boxes for France

Uncle Sam is determined that all his nephews fighting in France shall have as big Christmas boxes as relatives and friends here want to send them—up to 20 lb.—if mailed early enough. The French government, because of inadequate rail facilities, cannot carry parcel-post packages weighing over 7 lb.; but the United States War Department announces that it will take Christmas packages for the American expeditionary forces in France, and carry them over the lines there which have been built and are being operated by our nine railway regiments. The Post Office Department directs that Christmas packages (not over 20 lb. each) be sent in care of the Commanding General, at Pier J, Hoboken, N. J. Articles must be packed in a wooden box not more than two cubic feet in extent, well strapped, and with either a hinged or a screwed top. No perishable foodstuffs may be sent. The box should be marked to indicate it is a Christmas package, and should reach Hoboken not later than December 5. The rate of postage is 12 cents a pound.

Conductors and Trainmen to Ask Wage Increase

New wage scales for 200,000 members of the Brotherhood of Railroad Trainmen and the Order of Railway Conductors were agreed upon unanimously at a conference of the officers and committee chairmen of these two brotherhoods at Chicago, concluded on November 6. These demands will be presented to all railroads about December 1. On passenger runs of 155 miles or less per day they will ask for not less than \$5.43 per day or \$162.90 per month for conductors; \$4.65 per day or \$139.50 per month for ticket collectors; \$4.50 per day or \$135.00 per month for baggage electricians; \$3.88 per day or \$116.40 per month for baggage-men; \$3.61 per day or \$108.30 per month for flagmen and brakemen. Overtime is to be calculated at one-eighth of the day rate per hour. Passenger runs on short turn around, not to exceed 80 miles, shall be paid overtime for all time on duty or held for duty in excess of eight hours within ten consecutive hours. Passenger brakemen who do not lie off of their own accord shall receive a monthly guarantee.

Through and irregular freight, snow plow and circus trains: Conductors, \$5.30 per day; flagmen and brakemen, \$3.81 per day.

Local, way freight, mixed, pickup or drop, mine, roustabout, pusher or helper, wreck and construction service: Conductors, \$5.80 per day; flagmen, \$4.29 per day.

Yard service: Foremen, days, \$5.30; night, \$5.50; helpers, days, \$5.00; night, \$5.20.

All rates in freight and yard service are for eight hours or less, 100 miles or less; overtime pro rata.

It Is Never Too Late to Mend

John Skelton Williams, controller of the currency, has made the following statement: "When the railroads shall have laid frankly before the commission the facts and figures which will show so conclusively the extent to which the rates now in force are insufficient to maintain the credit of the roads and to enable them to perform efficiently their public functions under the present unusual and extraordinary conditions, we have no right to doubt that the decision which the commission will reach will be one which its superior knowledge and painstaking study of the whole situation will in every way justify, and that the relief needed will be promptly accorded.

"If a way cannot be found now to reduce promptly the prices of materials and the cost of labor to a normal basis, and this, for the present, is hopeless, it seems clear, on the facts before us, that a revision and modification of the fabric of rates to meet the new conditions have become imperative.

"If the relief which is manifestly required at this time is granted, I believe that confidence in our railroad securities will be revived and a basis established for new financing and for pro-

ceeding with new development and construction work, which is now so greatly needed. The beneficent influence and effect of such action would be felt instantly throughout the entire country."

National Railway Appliances Association Exhibit

The success of the exhibit of the National Railway Appliances Association, which will be held in the Coliseum and Annex, Chicago, on March 18 to 21, 1918, is now assured, applications for 225 spaces having been received up to November 1. The total number of spaces available at the exhibit last year was 234. By rearrangement of the floor plan to accommodate a larger number of exhibitors, 30 additional spaces have been provided this year, making a total of 264 spaces, which will be available.

Car Foremen's Association of Chicago

The next monthly meeting of the Car Foremen's Association of Chicago will be held at the Hotel Morrison on Monday, November 12. A paper on Wood and Steel Car Construction will be presented by H. S. Sackett, timber engineer of the Chicago, Milwaukee & St. Paul.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

- AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 20 W. 57th St., New York.
- AMERICAN WOOD PRESERVATION ASSOCIATION.—F. J. Angier, Supt. Timber Preservation, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January, 1918, Chicago.
- ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—W. L. Connelly, Superintendent of Telegraph, Ind. Harb. Belt, Gibson, Ind. Next meeting, November 22, La Salle Hotel, Chicago.
- CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal). One. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.
- CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 174 Mansfield St., Montreal, One. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Morrison Hotel, Chicago.
- CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual dinner, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.
- CINCINNATI RAILWAY CLUB.—H. Boutet, Chief Interchange Inspector, Cin'ti Rys., 101 Carey Bldg., Cincinnati. Regular meetings, 2d Tuesday, February, May, September and November, Hotel Sinton, Cincinnati.
- ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 568 Union Arcade Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh, Pa.
- GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month. Room 1856, Transportation Bldg., Chicago.
- INVESTMENT BANKERS' ASSOCIATION OF AMERICA.—Frederick R. Fenton, 11 W. Monroe St., Chicago. Next annual convention, November 12-14, Hotel Belvedere, Baltimore, Md.
- NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meeting, 2d Tuesday in month, except June, July, August and September, Boston.
- NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meeting, 3d Friday in month, except June, July and August, 29 W. 35th St., New York.
- NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—Geo. A. J. Hochgrebe, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.
- PACIFIC RAILWAY CLUB.—W. S. Wolfner, Assistant to Chief Engineer, Northwestern Pacific R. R., San Francisco, Cal.
- PEORIA ASSOCIATION OF RAILROAD OFFICERS.—F. C. Stewart, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.
- RAILWAY CLUB OF PITTSBURGH.—J. R. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Pittsburgh Commercial Club Rooms, Colonial Annex Hotel, Pittsburgh.
- RICHMOND RAILROAD CLUB.—O. Robinson, C. & O., Richmond, Va. Club has been suspended until after the war.
- ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.
- SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grand Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 a. m., Piedmont Hotel, Atlanta.
- TRAFFIC CLUB OF CHICAGO.—C. B. Singer, La Salle Hotel, Chicago.
- TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings, 1st Tuesday in month, except June, July and August, Waldorf-Astoria Hotel, New York.
- WESTERN CANADIAN CLUB.—L. Karl, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.
- WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpis Bldg., Chicago. Regular meetings, 1st Monday in month, except June, July and August, Hotel Sherman, Chicago.
- WESTERN SOCIETY OF ENGINEERS.—Edgar S. Nethercut, Secretary, 1735 Monadhuck Block, Chicago, Ill. Regular meeting, first Monday in month, except January, July and August. Extra meetings generally on third Monday evenings except in July and August.

Traffic News

The Public Utilities Commission of Ohio recently granted an application by the railroads for authority to continue until May 1, 1918, intrastate demurrage rates which expired on November 1.

The Railroad Commission of Louisiana in a decision rendered on October 23, denied the application of the railroads in that state for an advance of 15 cents a ton in coal and coke freight rates.

The Lehigh Valley and the New York, New Haven & Hartford have established a joint embargo committee, with headquarters at New Haven. Richard Hackett, assistant to the senior vice-president of the New Haven, is chairman.

The mayor of Providence, R. I., has asked Judge Lovett to suspend for 30 days his order forbidding the use of coal cars for the transportation of gravel and other road material, five important highway improvements in that city having been begun and being now unfinished.

According to estimates made at Columbus on October 31 the number of cars of coal shipped to Ohio points on the day fixed by the Priority Board, when that State was to have all of the shipments of all of the mines tributary to the state, was 3,000.

The Fruit and Vegetable Transportation Association of the South and East has issued a circular appealing to growers, shippers and receivers to do away with the great waste, everywhere evident, in getting fruits and vegetables to the markets. This waste is deplorable at any time, but it is more so at this time in the face of our patriotic duty. Everybody can help by using stronger containers, strong enough to carry the goods to destination safely; by carefully selecting and packing fruits and vegetables so that they will not deteriorate before reaching market, and by plainly marking each package l. c. l. shipments.

Large Coal Movement by Railroads

The Railroads' War Board has received reports indicating that the efforts of the railroads and coal shippers to prevent the threatened coal shortage in the Northwest during the coming winter have been more successful than seemed possible during the summer. With five weeks or more left before the close of navigation on the great lakes 23,348,100 of the 29,000,000 tons which it was estimated will be required, have already been sent to the Northwest.

The Commission on Car Service is now directing efforts to the work of insuring an adequate coal supply for domestic and industrial uses of coal in all other sections of the country. While a greater supply of coal has been mined and shipped than ever before the difficulty today is that the consumption all over the country is greater than ever before.

Priority for Coal from Mines in Wyoming and Utah

Robert S. Lovett, administrative officer under the provision of the priority shipments act, has issued priority order No. 3, directing railroads serving coal mines in the Utah and Wyoming coal fields to give priority rights on coal to the section of the country west and northwest of these fields. The order applies to the Denver & Rio Grande, the Los Angeles & Salt Lake, the Utah Railway, the Union Pacific, the Oregon Short Line, the Southern Pacific and the Western Pacific. These roads are directed to supply daily to the lines in the Utah and Wyoming coal fields all or so many of the empty box and single-deck stock cars moving west or northwest over their lines as may be required to transport coal ready for shipment west or northwest, according to the direction in which such cars are being moved. All cars of every kind loaded with commercial coal and destined to points west and northwest of point of shipment shall have preference in shipment, after transporting (a) railroad fuel supply; (b) live stock and perishable freight, including sugar beets; (c) Government shipments; and (d) commodities to and from smelting plants sufficient to keep same in operation.

In another order, designated Supplement B to priority order No. 1, Judge Lovett orders the cancellation of Priority Order No. 1 dealing with the transportation of bituminous coal for transshipment by vessel to ports on Lake Superior and Lake Michigan, effective November 1.

General Travel Conditions

All passenger transportation facilities report unusual business and a continuation of capacity passenger traffic is predicted; not alone on American railways, but on all available Transatlantic and Transpacific passenger carrying steamers. This business is almost altogether commercial and military; very little of it is tourist traffic. There is a general feeling, however, that with the second liberty loan out of the way and the new National Army settled in its routine of training and camp life, there will be at least a normal, if not an unusual tourist traffic to Florida, Gulf Points, and Southern California. California expects one of its biggest seasons. The hotels have made arrangements for better accommodation and more rooms. The national park tourist season which has just closed has been an unprecedented one, and the great increase in the number of visitors to the parks has not been a mere increase in local travel. There has been a marked increase in the number of eastern travelers in all of the great national play-grounds of the West. The Department of the Interior looks forward confidently to a still heavier travel in the season of 1918; and also, at present, is planning to entertain people in the parks where winter sports are being developed during the coming winter in larger numbers than ever before. Ski courses will be constructed in Rocky Mountain National Park, and perhaps in the Yosemite Valley. Both of these parks are accessible throughout the winter.—*American Express Co.'s Travel Bulletin.*

Council of National Defense Asks State Co-operation for Car Efficiency

The Council of National Defense, section of co-operation with states, has addressed a bulletin to the state councils of defense asking "Will you help increase the efficiency of the transportation agencies?"

The bulletin quotes the suggestions made by the Committee on Car Service relative to freight car efficiency and then continues:

"The state councils of defense can render a valuable and patriotic service by endeavoring to procure compliance with those suggested regulations on the part of all those who ship or receive freight. Your local organizations should be instructed concerning the importance of transportation of all kinds in the present emergency, and they should be asked to report to you cases which come to their attention and which they are unable to correct, where shippers fail to comply with the spirit of these regulations. If it should develop that any shipper or receiver of freight is delinquent, it is suggested that the matter be brought to his attention by means of a post card, urging his compliance as a patriotic duty, and if the matter can not be corrected in that manner that some member of your council or the local organization visit him personally and endeavor to explain the importance at this time of conserving all transportation agencies as much as possible. It should be kept in mind that the industrial activity of the country today exceeds that of any former period, and that conditions created by the war have resulted in the withdrawal of many transportation agencies from their normal and usual activities.

"This makes it necessary that the fullest possible use should be made of all transportation agencies, including not only the steam railroad, which is of course the most important, but such other agencies as the motor truck, the electric lines, and the waterways. Every possible effort should be made to obtain the maximum use of all of these agencies and in such way as will contribute most to the public good.

"The commission on car service of the railroads' special committee on national defense has created local committees in 80 cities. Your committees can doubtless work to best advantage in co-operation with such of the railroads' committees as are established in your State."

The bulletin is dated November 1 and is signed by W. S. Gifford, director, and George L. Porter, chief of section.

Commission and Court News

PERSONNEL OF COMMISSIONS

Oliver H. Hughes, chairman of the public utilities commission of Ohio, died at Columbus, on October 28, at the age of 52.

COURT NEWS

Railroad May Attack Interstate Commerce Commission's Awards as to Discrimination

The Circuit Court of Appeals, Third Circuit, holds that an award by the Interstate Commerce Commission in favor of a shipper on account of discrimination in furnishing cars is only prima facie evidence of the amount of the damages, and in an action thereon the railroad may attack the amount. If the evidence shows that the award is incorrect, the jury should follow the evidence and reject the award. The court stated that it did not decide the question whether a plaintiff can recover more than the commission awards, but undoubtedly the railroad may prove that the sum is too large.—*Pennsylvania vs. Minks*, 244 Fed. 53. Rehearing denied October 8, 1917.

Danger of Swaying Cars at Curves and Grades Assumed by Passengers

A female passenger was being shown to another seat by the conductor when she was thrown to the floor of the aisle by a sudden lurch of the car as it rounded a sharp curve. In an action for her injuries the Circuit Court of Appeals, Fourth Circuit, reversed a judgment of the district court for the Southern District of West Virginia in favor of the plaintiff, holding that swaying or lurching of cars necessarily incident to proper operation of fast passenger trains at curves in the track, necessary because of the nature of the [mountainous] country, whereby a passenger is injured, does not charge the railroad with negligence. The risk thereof is assumed by the passenger.—*Chesapeake & Ohio vs. Needham*, 244 Fed. 146. Decided July 5, 1917.

Contributory Negligence of Automobile Passenger

In an action against a railroad for personal injuries it appeared that the plaintiff and six others were taking a pleasure ride in an automobile, when it struck the side of a train at a grade crossing, killing some and injuring others of the riders. The plaintiff knew they were approaching a crossing, and was sitting on the knee of another of the party on the front seat beside the driver. The view of the track was obstructed by a building until they were within 15 feet of it, when it could be seen for 2,000 feet. The Circuit Court of Appeals, Third Circuit, held that it was as much the duty of the plaintiff as of the driver to look out for the train and give warning of its approach, and that under the undisputed facts she was chargeable with contributory negligence, which defeated a right of recovery.—*Bell vs. West Jersey & Seashore*, 244 Fed. 104. Decided July 30, 1917.

Hours of Service Act—Emergencies

A dispatcher intended to have carloads of live stock picked up by a certain train, but through inadvertence and oversight failed to give the necessary orders. To avoid holding the live stock until the next day, and causing loss and damage to the shipper and the company, he ordered the cars to be picked up by a train which, owing to unexpected and unforeseen delays, did not leave the station where they were picked up until the operator had been on duty more than the legal period—13 hours. The Circuit Court of Appeals, Eighth Circuit, holds that there was no emergency justifying the excess service under section 2 of the Hours of Service Act.

A train dispatcher was misinformed as to the time of arrival of a train load of silk to be delivered to his road by a connecting road. Wishing to move the train with promptness, he kept an operator on duty for more than the legal period—

9 hours—to hold another train and receive orders in reference thereto, and thus permit the prompt moving of the silk train. It is held there was no emergency justifying the operator's excess service.

A telegraph operator was kept on duty more than the legal period, 9 hours, because part of a freight train was derailed on account of a draw bar pulling out of one of the cars and falling on the track, thereby delaying a passenger train in reaching his station, and it was necessary to hold him on duty until such train arrived for the purpose of handling the mail and caring for passengers on its arrival. It is held the excess service was caused by an emergency, and was justified.

A train was delayed in leaving a station owing to broken packing rings in one of the cylinders of the engine, making it necessary to send for a relief engine. It is held that this was not such an emergency as justified keeping the operator at such station on duty more than the legal period, 9 hours, since while the word "emergency," as used in the act does not mean an extraordinary emergency as used in some statutes, it means more than ordinary mistakes and negligences, which happen in the practical operation of railroads.—*United States vs. Missouri Pacific*, 244 Fed. 38. Decided June 5, 1917.

Hours of Service—Computation

A telegraph operator was on duty regularly from 7 A. M. to 5 P. M. On one occasion he was excused from 1.30 P. M. to 3 P. M., when he returned to duty and remained on duty until 5.10 P. M. The Circuit Court of Appeals, Eighth Circuit, holds that the 24-hour period commenced at 7 A. M., and the fact that the operator was on duty for more than 9 hours in the 24-hour period commencing at 3 P. M. was not a violation of the Hours of Service statute. The railroad, being the party which must obey the law, the court said, "ought in all fairness to know before the employee is permitted to work just what is being done with reference to hours of service, so that the law may not be violated. It, therefore, by agreement with its employee fixes the time that the hours of service shall commence, and when they shall end. This being done, an inspector in the employ of the United States appears, and looking over the record of the hours of service, arbitrarily and contrary to the agreement between the railway company and the employee, establishes, after the service has been rendered, a different time for the commencement of the 24-hour period, and, by combining certain isolated hours of service performed on different days, seeks to show a violation of the law. We are of the opinion that the law or justice will not permit this to be done.

"It is claimed that any construction of the law which will permit the railway company to do that which is alleged to have been done would nullify the statute. To show that this is so, it is contended that a 9-hour operator might be required to work for 17 hours without rest. For instance, taking the employee described for illustration, it is claimed that he could be worked from 7 A. M. to 8 A. M. on September 6th, and then be excused from duty until 11 P. M. of the same day, and then be required to work through until 7 o'clock the next morning, when he again would be obliged to begin his regular day's work, and work through until 4 P. M. that day. In view of the fact that no instance of this kind is shown to have ever occurred, and the improbability that it will ever occur, we may say, in the language of the Supreme Court, in *United States vs. A. T. & S. F.*, 220 U. S. 37, 'This hardly is a practical suggestion.' If any such abuse of the law shall happen, Congress undoubtedly will regulate the matter by proper legislation. The employee mentioned had an unbroken rest between the time when he finally quit work on September 6th and the time when he resumed his duties on September 7th of 13 hours and 50 minutes, so that it appears that he was not overworked or deprived of a proper period of rest. In using the expression 'any twenty-four hour period' Congress did not intend to describe what should constitute in any one particular case a 24-hour period. The time when an employee should go to work and when he should be allowed to quit, provided the law was not violated, was left to the agreement between the employee and the employer. It would seem natural that an employer might on occasions, for the convenience of the employees, or to suit the exigencies of traffic, permit or require an operator to divide his usual hours of service."—*United States vs. Missouri Pacific*, 244 Fed. 38. Decided June 5, 1917.

Equipment and Supplies

LOCOMOTIVES

THE MISSOURI, KANSAS & TEXAS is inquiring for Mikado type locomotives.

THE ATLANTA & WEST POINT is inquiring for Santa Fé type locomotives.

THE WHEELING & LAKE ERIE is inquiring for eight-wheel switching locomotives.

THE RICHMOND, FREDERICKSBURG & POTOMAC is inquiring for 2 six-wheel switching locomotives.

THE EGYPTIAN STATE RAILWAYS have ordered 70 ten-wheel locomotives from the Baldwin Locomotive Works.

THE CHICAGO, MILWAUKEE & ST. PAUL's order for equipment for the Othello-Tacoma electrified section, reported in last week's issue, is divided as follows: 10 electric locomotives and 3 substations from the Westinghouse Electric & Manufacturing Company; 7 locomotives and 5 substations from the General Electric Company.

THE RUSSIAN GOVERNMENT's order for 1,500 locomotives reported in the *Railway Age Gazette* of October 5 and that for 30,000 freight cars mentioned in the *Railway Age Gazette* of October 26 have not yet been definitely signed, but it is understood that work will be begun on these contracts as soon as final arrangements have been made.

THE UNITED STATES WAR DEPARTMENT.—The French Government was incorrectly reported in the *Railway Age Gazette* of October 19 as having placed orders through the United States Government for 640 locomotives. This report was confused with orders placed by the United States Government for its own uses in France and included not 640 locomotives, but 920. Orders were placed by the War Department for our own uses overseas with the Baldwin Locomotive Works for 600 additional 50 hp. gasolene locomotives, 20 150 hp. gasolene locomotives, and for 300 additional 80-ton Consolidation locomotives which will follow the 680 now being built. The United States Government has also ordered 30 small saddle tank steam locomotives from the Vulcan Iron Works. It thus results that the War Department has placed orders, since the middle of July, for no less than 2,014 locomotives, a large number of which have already been built and shipped. Of this total number the Baldwin Locomotive Works received 1,834, the American Locomotive Company 150, and the Vulcan Iron Works 30.

FREIGHT CARS

THE CALUMET & ARIZONA MINING COMPANY, Warren, Ariz., is inquiring for 40 tank cars.

THE GARDENER EXTRACT COMPANY, Basic City, Va., is inquiring for 5 8,000-gal. capacity tank cars.

THE KANSAS OIL REFINING COMPANY, Coffeyville, Kan., is inquiring for 25 8,000-gal. tank cars.

THE WESTERN PACIFIC has ordered 1,500 box cars from the Mount Vernon Car Manufacturing Company and 400 general service cars from the Western Steel Car & Foundry Company.

The United States Government has placed orders for 4,975 additional freight cars for use of the American forces overseas. The division of the order is as follows:

No.	Type	Builder
400	Box	St. Louis Car.
400	Box	Central Car & Loco.
450	Box	Mt. Vernon.
500	Box (with guerite)	Am. Car & Fdy.
375	Box (with guerite)	Pullman.
350	High side gondola	Standard Steel.
350	High side gondola	Standard Steel.
500	Low side gondola	Pressed Steel.
500	Low side gondola	Cambridge.
125	Tank	Am. Car & Fdy.
125	Tank	Gen. Am.
250	Refrigerator	Haskell & Barker.
500	Flat	Southern.

Supply Trade News

Don L. Clement, eastern railway representative of Pratt & Lambert, Buffalo, N. Y., with offices in New York, has received a commission as first lieutenant of the 35th Regiment Railway Engineers, now stationed at Rockford, Ill.

The Balkwill Manganese Crossing Company, 1808 East 82nd street, Cleveland, Ohio, has been formed as a holding company to take over the Balkwill patents. The holding company will license crossing manufacturers to manufacture the Balkwill crossing under the Balkwill patents.

The National Railway Appliance Company, New York, has been made the eastern and southern representative of the Valley Steel Company of East St. Louis, Ill., and will handle its full line of axles, locomotive driving axles, piston rods, side rods, crank shafts, in normal or heat treated grades.

Chas. A. Carscadin, president of the National Car Equipment Company, Chicago, has been elected a vice-president of the Joliet Railway Supply Company, Chicago. James H. Slawson, vice-president of the Joliet Railway Supply Company, has been elected a vice-president of the National Car Equipment Company.

E. A. Hawks, of Detroit, has been appointed special representative for the Youngstown Steel Car Company, Youngstown, Ohio. Mr. Hawks will handle the selling of the products of this concern to certain railway companies, and also among the automobile companies. His office is Dime Bank building, Detroit, Mich.

The Consolidated Boarding & Supply Co., 1838 Transportation building, Chicago, has changed its name to the Mosher & Crawley Company. There are no changes in the financial end of the business. Geo. H. Mosher and M. D. Crawley, the partners in this firm, are both known to many railway men as they have been associated together in this work for the past 20 years.

In the announcement in last week's issue that Clement F. Street had opened an office as consulting mechanical engineer at 50 Church street, New York, the words "the present Locomotive Stoker Company of which Mr. Street was a vice-president" gave an incorrect impression. Mr. Street still is a vice-president and director of the Locomotive Stoker Company and any work that he may do as consulting mechanical engineer will be supplementary to his duties in these capacities.

Norman B. Hickox has been appointed sales and advertising manager of the National X-Ray Reflector Company, Chicago. E. H. Cameron, sales manager, has severed his connection with the company and is now located in Seattle, Wash. Hugh D. Butler, manager Chicago sales, has been promoted to assistant sales manager, and Guy R. Hastings, assistant manager Chicago sales, has been appointed manager Chicago sales. George D. Bryson has been appointed assistant advertising manager.

George A. Paff, formerly superintendent of the rod and wire mills at the Aliquippa works of the Jones & Laughlin Steel Company, Woodland, Pa., is now general superintendent at the Monessen works of the Page Steel & Wire Company. Mr. Paff served in the former capacity eight years, previous to which he was superintendent for five years in the rod and wire mills at the Sharon works of the American Steel & Wire Company, having been advanced to that position from master mechanic of the same works.

TRADE PUBLICATIONS

GRINDING WHEEL REFERENCE CARD.—The American Emery Wheel Works, Providence, R. I., has published a grinding wheel speed and reference card. One side of the card shows the kind of abrasive, grain and grade recommended for various classes of work, while the other side shows the revolutions per minute for speeds of 4,000, 5,000 and 6,000 ft. per minute for wheels ranging from 1 to 60 in. in diameter.

Railway Construction

OREGON-WASHINGTON RAILROAD & NAVIGATION COMPANY.—This road is building a roundhouse at Tacoma, Wash., which will cost about \$10,000. The building will contain three stalls, 97 ft. long. It will be a frame structure with concrete pits and concrete footings supported on piles. The contract for the work was let to the E. J. Rounds Construction Company, Seattle, Wash.

PHILADELPHIA & READING.—Contracts have been let for work aggregating in cost about \$350,000 in connection with the abolition of the grade crossing at Tulip street, Philadelphia, on the Port Richmond branch. The cost of this work is being borne jointly by the railroad company and the city of Philadelphia. The contract for the steel superstructure went to the McClintic-Marshall Company for \$164,000. It is said that the unit price for steel is about 5½ cents a pound and that, as compared with the prices prevailing before rates were established by the government, the cost of this bridge is about \$46,000 less than it would have been. The contract for concrete walls, piers and bridge floors went to C. P. Bowers, and that for waterproofing to the Benjamin Foster Company.

SANTA FE LINES.—The Atchison, Topeka & Santa Fe is building additional repair shops at Ottawa, Kan., at a cost of about \$60,000. Swanson Brothers Contracting Company, Topeka, Kan., has the contract for the work.

The Dodge City & Cimarron Valley, a Santa Fe subsidiary, will be built from Satanta, Kan., west to the Colorado line, about 62 miles. This work will involve moderately heavy grading.

RAILWAY FINANCIAL NEWS

GRAND TRUNK.—This company has paid off its \$4,000,000 5 per cent two-year notes due November 1, 1917, through Blair & Co., New York.

ILLINOIS CENTRAL.—The Illinois Public Utilities Commission has authorized this company to issue \$6,360,000 4 per cent refunding mortgage bonds, due 1955, to take up indebtedness incurred for improvements and additions north of the Ohio river; also \$8,206,100 Illinois Central-Chicago, St. Louis & New Orleans 5 per cent refunding bonds for improvements south of the Ohio river.

PITTSBURGH & WEST VIRGINIA.—This company has declared a dividend of 1½ per cent on the first preferred stock, payable December 1 to stock of record November 5. Three months ago the initial quarterly dividend of 1½ per cent was declared.

RIDGEFIELD & NEW YORK.—Judge Howard J. Curtis, in the Superior Court at Bridgeport, Conn., has appointed William B. Boardman, of that city, receiver. The action was brought by the New York, New Haven & Hartford to wind up the affairs of the Ridgefield & New York road. The Ridgefield & New York Railroad was incorporated in 1867 with a capital stock of about \$500,000, not all of which, however, it was said in court, had been paid in. No rails were laid. In 1897 the New Haven obtained a majority of the stock. The charter was renewed by the Connecticut legislature from time to time until 1909, when further renewal was refused and the charter expired.

RICHMOND & RAPPAHANNOCK RIVER.—President Thomas P. Love has been appointed receiver of this road, which operates between Richmond, Va., and Pamunkey, 16 miles.

THROUGH TRAINS—BERLIN TO RIGA.—Through trains are now running from Berlin to Riga, the trip consuming 24 hours. A person can travel from the Baltic seaport to Ostend, Belgium, with one change of cars at Berlin, in 45 hours.

FINANCING NEW CONSTRUCTION IN CHINA.—According to press despatches, negotiations are going on between the Chinese government and a Japanese company interested in China on a loan of about \$50,000,000 for the construction of a railway between Chaochow, in Kwangtung, and Nanchang, in Kiagsi.

Railway Officers

Executive, Financial, Legal and Accounting

R. S. Staten has been appointed claim agent of the Missouri & North Arkansas, with office at Harrison, Ark.

James F. Wright, assistant to general counsel of the Seaboard Air Line, has been appointed assistant general counsel, with headquarters at Norfolk, Va.

C. H. Dietrich, assistant freight claim agent of the Chicago, Milwaukee & St. Paul, has been promoted to freight claim agent, which position was held by H. P. Elliott, whose death was mentioned in these columns on November 2. C. W. Wilkinson was appointed assistant freight claim agent succeeding Mr. Dietrich.

W. A. Danforth, treasurer of the Bangor & Aroostook at Bangor, Me., having resigned to accept a position elsewhere. Wingate F. Cram has been elected treasurer, and F. A. W. Field has been appointed assistant treasurer. Mr. Cram, in addition to his new duties, will continue as clerk and as chairman of the valuation committee.

James Russell, general manager of the St. Louis Southwestern has been elected vice-president in charge of operation of the Denver & Rio Grande, with headquarters at Denver, Colo. Finley J. Shepard, vice-president of the Missouri Pacific at New York has been elected also vice-president of the Denver & Rio Grande to succeed Arthur Coppell. R. F. Watkins has been elected treasurer of the Denver & Rio Grande, with office at Denver, to succeed T. H. Marshall, who becomes assistant treasurer, with office at Denver. A portrait of Mr. Shepard and a sketch of his railway career were published in the *Railway Age Gazette* of June 8, 1917, page 1216.

Operating

J. L. Brown, car accountant of the Chicago, Milwaukee & St. Paul, has been promoted to assistant superintendent of transportation, with headquarters at Chicago.

A. P. Milliken, trainmaster of the Boston & Maine at Boston, Mass., has been appointed assistant superintendent of the Portland division, with headquarters at Boston.

F. E. Slack, assistant trainmaster of the Philadelphia & Reading, at Philadelphia, Pa., has resigned to enter the service of the American International Shipbuilding Corporation.

S. J. Hungerford, superintendent of rolling stock of the Canadian Northern at Toronto, Ont., has been appointed general manager of the Eastern Lines, with headquarters at Toronto.

Charles F. Heath has been appointed superintendent of steamers of the Southern Pacific Company, Pacific System, with jurisdiction over all floating equipment, vice John A. Carson, resigned.

F. H. Post, supervisor of stations and transfers of the Erie, has been appointed superintendent of stations and transfers of the Buffalo, Rochester & Pittsburgh, with headquarters at Rochester, N. Y.

F. W. Lyons has been appointed trainmaster of the Minnesota division of the Northern Pacific, with headquarters at East Grand Forks, Minn., succeeding F. M. Smith, granted leave of absence to enter military service.

James M. Giffand has been appointed inspector of transportation of the Philadelphia & Reading and subsidiary lines, with office at Reading, Pa., vice Agnew T. Dice, Jr., granted leave of absence to enter the government service.

Augustus E. Ruffer, superintendent of transportation of the Erie at New York, has been appointed general superintendent of transportation, with headquarters at New York. A sketch of Mr. Ruffer's railway career was published in the *Railway Age Gazette* of May 4, 1917, page 972.

J. J. Butler, trainmaster of the Chicago & Alton, at Bloomington, Ill., has been promoted to assistant to the general manager, with headquarters at Bloomington. R. J. McDonald, trainmaster at Roodhouse, has been transferred to Bloomington, succeeding

Mr. Butler. R. J. Burdett has been appointed trainmaster at Roodhouse.

A. G. Smart, whose appointment as general superintendent of the Nebraska district of the Chicago, Burlington & Quincy, with headquarters at Lincoln, Neb., was announced in the *Railway Age Gazette* of October 5, began railroad work

with the Burlington in 1885, being first employed in telegraph, station and yard service. Later he was consecutively train despatcher on the St. Joseph and Wymore divisions, and night chief despatcher and chief despatcher of the Wymore division. Subsequently he was successively superintendent of the Omaha, Aurora and Beardstown divisions. On October 1, 1917, he was promoted to general superintendent of the Nebraska district, with headquarters at Lincoln, Neb.

A. G. Smart

J. C. Kinton, trainmaster of the Coal & Coke Railway at Gassaway, W. Va., has been appointed acting assistant superintendent, vice J. W. Deneen, resigned, and J. D. Nicholas has been appointed trainmaster of the Southern district, and S. P. Burns has been appointed acting trainmaster of the Northern district.

H. B. Titcomb, whose appointment as superintendent of the Stockton division of the Southern Pacific, was mentioned in these columns on October 19, was born in Indianapolis, Ind., in December, 1871. He

graduated from Cogswell Polytechnical College in 1891, and on July 3 of the same year entered the service of the Southern Pacific as a draftsman. He was promoted to assistant engineer, construction division, in 1898; was appointed roadmaster of the western division in 1899; and was successively roadmaster of the Shasta and Sacramento divisions from 1900 to 1904. He was assistant resident engineer from 1904 to 1905, resident engineer at San Joaquin, Cal., 1905 to 1906, and at Los Angeles, 1906 to 1909. He was district

engineer, with headquarters at Los Angeles, from 1909 to 1914; and maintenance of way assistant to the assistant chief engineer, San Francisco, from 1914 to October 15, 1917, when he was promoted to superintendent of the Stockton division.

J. Irwin, superintendent of the Canadian Northern, at Rosedale, Ont., has been appointed superintendent of the third division, western district, with headquarters at Edmonton, Alta., vice G. A. Cunliffe, who has been appointed superintendent of the fourth division, central district, with headquarters at Brandon, Man., vice I. L. Boomer, transferred.

R. A. MacPherson, assistant to the general superintendent of the Grand Trunk Pacific, was appointed superintendent on October 29, with headquarters at Melville, Sask., succeeding H. McCall, promoted. Effective on the same date C. B. Mutchler was appointed assistant to the general superintendent at Winnipeg, Man., succeeding R. A. MacPherson and will continue in his position as signal engineer.

F. W. Urbans, assistant superintendent of the Minneapolis, St. Paul & Sault Ste. Marie, at Chicago, has been appointed acting superintendent of the southern district—Chicago division, with headquarters at Fond du Lac, Wis., a leave of absence having been granted C. M. Winter to enter military service. W. W. Wade, train master at Stevens Point, has been appointed acting assistant superintendent of the southern district, Chicago division, with headquarters at Chicago.

Robert E. Woodruff, superintendent of the Mahoning division of the Erie, at Youngstown, Ohio, has been appointed superintendent of transportation of the lines west of Salamanca; Carl Bucholtz, assistant superintendent at Youngstown, has been appointed superintendent of the Mahoning division, with office at Youngstown, succeeding Mr. Woodruff, and John M. Condon, trainmaster of the Kent division at Meadville, Pa., has been appointed assistant superintendent of the Mahoning division, with office at Youngstown.

R. W. Mitchener, whose appointment as general superintendent of the New York, Chicago & St. Louis, with headquarters at Cleveland, Ohio, was announced in the *Railway Age Gazette* of

November 2, was born on March 7, 1857, at New Philadelphia, Ohio. From April, 1877, to August, 1889, he was successively telegraph operator, station agent and train despatcher for the Cleveland, Lorain & Wheeling, now a part of the Baltimore & Ohio, and later was train despatcher on the Cleveland and St. Louis divisions of the Cleveland, Cincinnati, Chicago & St. Louis. He then entered the service of the New York, Chicago & St. Louis as chief train despatcher, and in April, 1894, became trainmaster. He was promoted to superintendent

R. W. Mitchener

of telegraph in September, 1906, and from February, 1908, to June, 1912, was a division superintendent. On the latter date he was made superintendent of transportation, which position he held until his recent appointment as general superintendent.

L. R. Huntley, superintendent of car service of the Evansville & Indianapolis, will assume the duties of supervisor of car service at Terre Haute, Ind., and will have charge of all matters pertaining to car efficiency, effective November 1. The position of superintendent of car service has been abolished and car accounting matters, wheel reports, interchange reports, car mileage, demurrage, shortage, weight and grain door records will be reported to the auditor or car accountant.

E. J. Hackenberg, who has been appointed division superintendent of the Northern Pacific, with headquarters at Staples, Minn., as was announced in these columns on October 26, was born at Carlisle, Pa., on November 26, 1863. He entered railway service in 1883 as a telegraph operator on the Cleveland and Marietta division of the Pennsylvania. He was train despatcher for the same company at Cambridge, Ohio, from 1884 to 1891; from 1891 to 1898 he was chief train despatcher of the Cleveland, Canton & Southern at Canton, Ohio, and from 1898 to 1900 night chief despatcher on the Northern Pacific at Staples, Minn. He was chief despatcher from 1900 to 1903, and trainmaster from 1903 to October 20, 1917, on which date he was promoted to superintendent at Staples, succeeding F. R. Bartles, transferred to superintendent of the Rocky Mountain division at Missoula, Mont.

Robert Edward Ryan, whose appointment as superintendent of the central and western divisions of the Minneapolis & St. Louis, with headquarters at Minneapolis, Minn., was announced in the *Railway Age Gazette* of October 19, was born at Newbern, N. C., on September 18, 1872. He began railway work in 1896 with the St. Louis, Iron Mountain & Southern, and re-

maintained with that road 14 years, filling successively the positions of operator, agent and trainmaster. He then went to the Minneapolis & St. Louis as trainmaster, and subsequently became assistant superintendent, holding the latter position at Watertown, S. D., until September 1, 1917, when he was promoted to division superintendent, as above noted.

Traffic

W. C. Douglas has been appointed division freight agent of the Michigan Central, with office at Detroit, Mich., vice F. J. Parker, promoted.

J. W. Switzer, chief clerk in the general passenger department, Michigan Central, Chicago, has been appointed assistant general passenger agent at Detroit. This position was formerly held by L. D. Heusner, who died on October 25.

B. T. Breckenridge, commercial agent of the Illinois Central at Evansville, Ind., has been appointed assistant general freight agent at Louisville, Ky., succeeding J. L. Durrett, relieved account of sickness. C. L. Netherland, assistant commercial agent at Chicago, has been promoted to commercial agent at Evansville, Ind., succeeding Mr. Breckenridge.

T. J. Cook, general freight agent of the Toledo & Ohio Central and the Zanesville & Western, was appointed general freight and passenger agent, Toledo, Ohio, with authority extending over the passenger traffic department, effective November 1. He takes over the duties of Moulton Houck, general passenger agent, resigned, the position of general passenger agent being abolished.

R. B. Kinkaid, whose appointment as assistant general freight agent of the Cincinnati, Indianapolis & Western, with headquarters at Indianapolis, Ind., was announced in the *Railway Age Gazette* of October 12, was born at Buelah, Kan., on April 26, 1884. He began railway work in 1900 as a clerk in the accounting department of the Indiana, Illinois & Iowa at Kankakee, Ill., and was subsequently employed in the accounting departments of that road, the Chicago, Rock Island & Pacific and the Gulf, Colorado & Santa Fe as a rate and interline clerk. In October, 1906, he went to the Chicago, Cincinnati & Louisville as rate clerk in the freight traffic department at Cincinnati, Ohio. Later he was employed on various railroads as rate and tariff clerk until November, 1910, when he became connected with the Lake Erie & Western. He was made chief clerk to the chief of tariff bureau of that road in February, 1911, and on December 1, 1915, he became chief of tariff bureau of the Cincinnati, Indianapolis & Western. On October 1, 1917, he was promoted to assistant general freight agent of the latter road, with jurisdiction over the Sidell & Olney.

Railway Officers in Military Service

C. M. Winter, superintendent of the Minneapolis, St. Paul & Sault Ste. Marie at Fond du Lac, Wis., has been granted leave of absence and has received a commission in the United States regular army for service with the Russian Railway Corps.

Engineering and Rolling Stock

S. E. Shoup has been appointed acting division engineer of the Kansas City terminal division, Kansas City Southern, effective November 1, succeeding A. Leckie, division engineer, temporarily assigned to other duties.

E. H. Nickerson, chief engineer of the Yosemite Valley, has resigned. His duties pertaining to track, bridges and buildings will be performed by George Dudley, appointed roadmaster, with headquarters at Merced, Cal.

F. B. Rowell, engineer of real estate of the Boston & Maine, has been appointed research engineer, and John B. Russell, chief draftsman of the valuation department, succeeds Mr. Rowell as real estate engineer. Both with headquarters at Boston, Mass.

H. W. Wagner, who has been promoted to chief engineer of the Atchison, Topeka & Santa Fe, eastern lines, with headquarters at Topeka, Kan., as was announced in these columns on October 26, was born at Boone, Ia. After graduating from the engineering school at Kansas University, he entered the service of the Santa Fe on May, 1897, as chairman in the maintenance department at Newton, Kan., and was promoted to rodman and later to transitman in May, 1900. He left the Santa Fe to go with the Union Pacific on relocation, change of line and new location work on that road and the Oregon Short Line, starting as levelman and later being promoted to transitman and then locating engineer. He returned to the Santa Fe in 1902 as division engineer at Arkansas City, Kans., being transferred later to Marceline, Mo., and La Junta, Colo.; from May, 1909, to January, 1910, he was division engineer on construction, and from June, 1910, to April, 1913, principal assistant engineer at Amarillo, Tex., on which latter date he was promoted to district engineer at La Junta, which position he held until his appointment as chief engineer, effective October 15, succeeding R. A. Rutledge, transferred to La Junta as engineer, northern district, on account of ill health.

Purchasing

R. E. Scott, whose appointment as purchasing agent of the Spokane, Portland & Seattle, with headquarters at Portland, Ore., was announced in these columns on October 19, was born July 17, 1887, at Barnesville, Minn., and graduated from the mechanical engineering department of Purdue University in 1911. The same year he entered the service of Fairbanks, Morse & Co., at Jacksonville, Fla., where he remained until August, 1914, when he became eastern representative of the Gurney Refrigerator Company at New York. On September 1, 1914, he was appointed roadmaster of the Oregon Electric, which position he held until September 30, 1917, when he was appointed purchasing agent of the Spokane, Portland & Seattle, with headquarters at Portland, Ore., succeeding S. M. Clark, resigned.

OBITUARY

R. H. Tate, division freight agent of the Southern Railway at New Orleans, La., died in that city on October 29.

Edward Dagle, formerly superintendent of terminals of the Chicago, St. Paul, Minneapolis & Omaha at St. Paul, Minn., died recently at Superior, Wis.

Experience with "Brown's Discipline" is not specially easy to describe, unless the history of the years to be reviewed has been put on record, year by year, and the responses to the *Railway Age Gazette's* prize offer, issued last July, have not been very numerous. Only two of the papers received are sufficiently comprehensive to be accepted for publication. Both of these have been written by chief clerks in superintendent's offices; not administrators of discipline, but keen and level-headed observers; and observers at close range. The prize goes to Sanford J. Keeler of Peoria, Ill. The next best paper is that of E. H. Heath of Herington, Kan. This paper appears in this issue, and the prize paper will be published later. Both writers record the same general conclusions, but the reader will profit by a perusal of both papers because of the different phases of "human interest" to be found in them. Both of these writers seem to assume that the marking of demerits—30, 60, etc., (as equivalent to 30 days' or 60 days' suspension) is the accepted and only scheme of recording punitive discipline; so that the very acceptable plan in operation on the Burlington and the Baltimore & Ohio, where no such mathematical measurement is attempted, is another branch of the subject in which further profitable discussion may be looked for.

"Are We Capable of Self Government?" This is the title of a recent book by Frank W. Noxon, who is well known to the readers of this paper as the secretary of the Railway Business Association. We publish in another column a review of the book, which has been written by Frank Trumbull, chairman of the Railway Executives' Advisory Committee. For some years before this country entered the great war the most important questions to which the public mind was devoting its attention concerned the relations between government and business. It was the way in which the public dealt with these questions rather than the way in which it dealt with purely political matters that made the title of Mr. Noxon's book highly pertinent. These questions concerning the relations between government and business have been made more rather than

less pressing by our entrance into the war. The government, since we entered the war, has been regulating the charges made for many things besides the services of public utility enterprises. Mr. Noxon devotes a large part of his book to the way in which the state and national governments have regulated the railways, but the book as a whole is a full review and a broad consideration of the manner in which they have dealt with industry generally. Mr. Noxon's conclusion from past experience is that we are capable of self government, and he indicates pretty clearly how he believes that the great problem of establishing satisfactory and beneficial relations between government and business is going to be solved. We are glad to publish Mr. Trumbull's review of the book because we believe it is one which those especially interested in railway problems will find worthy of careful reading.

The full-crew law decision of the New Jersey Public Utility Commissioners, reported in another column, gives the impression that the commissioners, like a more distinguished governmental body, in a decision affecting trainmen last year, has aimed at only one thing—to please the labor unions; and it settles nothing. It is the barren "Not Proven" of the Scotchmen. This unfavorable impression is unavoidable because the facts concerning the extreme wastefulness of a third trainman on through freight trains are so well recognized, by the public as well as by railroad men, and because the commissioners, so far as their report shows, made no effort to get at, or record, or consider the really significant facts in this particular case. The law requires them to consider and decide how many men are required on trains "to protect the public and the employees"; and all they have to say is that the railroad has not made out a case. If the railroad has failed to explain the matter fully, it is the commissioners' duty to call it to account. They are the servants of the public, and the public needs that useless brakeman for very necessary work on other trains or in other lines of effort. The public should not only allow but should require the railroad to use its men and money to more useful purpose. After the principal railroads all over the country for from 10 to 20 years

The New Jersey Full Crew Law

nothing. It is the barren "Not Proven" of the Scotchmen. This unfavorable impression is unavoidable because the facts concerning the extreme wastefulness of a third trainman on through freight trains are so well recognized, by the public as well as by railroad men, and because the commissioners, so far as their report shows, made no effort to get at, or record, or consider the really significant facts in this particular case. The law requires them to consider and decide how many men are required on trains "to protect the public and the employees"; and all they have to say is that the railroad has not made out a case. If the railroad has failed to explain the matter fully, it is the commissioners' duty to call it to account. They are the servants of the public, and the public needs that useless brakeman for very necessary work on other trains or in other lines of effort. The public should not only allow but should require the railroad to use its men and money to more useful purpose. After the principal railroads all over the country for from 10 to 20 years

have been running long freight trains with two brakemen, with no material sacrifice of safety, any intelligent and practical man who asserts the need of three, as a safety measure, simply stultifies himself. Legislators may salve their consciences, where consciences demand something to quiet them, by mixing ideas of convenience and ideas of safety; but this statute deals only with safety, and railroad commissioners cannot plead ignorance as legislators can. The specific issue in this case was the question, How can we decide whether the third brakeman can safely be dispensed with? The railroad asked for a general order covering all through freight trains; the commissioners, adopting the absurd position of the brakemen's lawyer, held, apparently, that they would have to be present in person at the railroad yard when each train started out! The railroads of the country—and of the world—have been obliged, from the first, to decide upon a regular number of brakemen to man a given class of trains, and to put on additional men only on very unusual occasions; but these commissioners assume that this problem of a standard crew is so difficult that they are unable to solve it, after holding hearings consuming many days. Judging by their statement of facts, the commissioners' minds became absorbed with details of operation affecting convenience and expediency and allowed the question of safety, the only point at issue, to drop out of sight!

MR. THELEN EXPLAINS HIS POSITION

IN our issue for October 19 we published an editorial entitled "Official Misrepresentation of the Railways." In that editorial we challenged certain statements made by Max Thelen in his presidential address at the annual meeting of the National Association of Railway and Public Utility Commissioners, and offered him our columns in which to reply to our animadversions upon his remarks. He has availed himself of our offer and we publish elsewhere a letter from him. We are gratified to learn from his letter that there is not so much difference between the views of this able railway commissioner and those of the *Railway Age Gazette* as we supposed when we read his address.

Mr. Thelen replies specifically to the criticisms which we passed upon three parts of his address, namely, those relating to railroad efficiency, to railroad valuation and to the duplication of facilities, service and operating expenses.

In his address he referred to the "waste and inefficiency (in railroad operation) which were pointed out by the Interstate Commerce Commission in the 5 per cent rate case." The *Railway Age Gazette* said in reply: "We have sought in vain for a single word in this opinion which pointed out such 'waste and inefficiency' as Mr. Thelen refers to," and added: "We boldly assert that there is no such word in it." Mr. Thelen in his letter expresses surprise that any one who has read the opinion should raise this point and attempts to defend himself against our criticism by making certain quotations from the opinion.

It is true that the commission indicated that there was room for the introduction of further economies in railroad operation, but, as the very language which Mr. Thelen himself quotes shows, it said that these opportunities for the introduction of further economies existed in railroading "as in other lines of business." Now, to assert that there is "waste and inefficiency" in the railroad business—language which the commission itself never used—sounds very different from saying there are opportunities in railroading, "as in other lines of business," for the introduction of economies. Mr. Thelen quotes statements made by the commission regarding the room which existed for improvement in the handling of freight cars. But just before the commission used the language which Mr. Thelen quotes, it had said: "In certain departments of railroading great advances have been made in efficiency in recent years; for instance, by increas-

ing the trainloading." The commission also referred to the possibilities of increased economy in the use of fuel, but it said: "Much has been done in recent years by means of mechanical devices and otherwise to reduce fuel costs. Thus the Baltimore & Ohio since 1910 reduced its coal consumption 9½ per cent per unit of freight traffic moved." Furthermore, the commission made this general statement regarding the efficiency of the railways: "We may justly feel proud of the developments of our transportation system. Despite occasional discreditable chapters, the history of our railroads has been marked by great achievements."

The foregoing quotations are from the majority opinion. In his dissenting opinion, Commissioner Daniels said: "As a necessary outcome of their declining ability to show profit, the attractiveness to investors of railroad securities has correspondingly grown less. In individual instances this reluctance to invest in such securities is traceable in part to careless or dishonest railroad management; but fortunately these instances of improper administration are the exception and not the rule. Offsetting them are demonstrations of exceptional progress in economy and efficiency of operation."

Does such language justify Mr. Thelen in attributing to the commission a general allegation of "waste and inefficiency"?

Mr. Thelen asserted in his address that "the carriers were at first largely in favor of the valuation" but "seem now to be generally opposed to" it. He says in his letter that he will not split hairs with us over the difference between "favoring" the valuation and "acquiescing" in it. But it is not a question of hair-splitting. He asserted that the carriers at first favored the valuation and we asserted in reply that they never did favor it. If they had favored it at first, and then, after it was under way, had tried to get it stopped, the plain implication of Mr. Thelen's statement, that they had become afraid to have the facts ascertained, would have been justified. But most railway men never believed in valuation as a basis for rates, and don't believe in it now. Mr. Thelen says that "it would be far wiser for the railroads to accept the situation than try to suspend or stop the valuation." The *Railway Age Gazette* agrees with that. If the people of the United States want to know a lot of facts about the railroads which it will cost the people a vast sum of money to ascertain and which will be useless for practical purposes after they are ascertained, the railways ought to acquiesce in the continuance of the valuation, just as they acquiesced in the passage of the legislation for it.

Mr. Thelen in his address referred to the duplications of railway facilities and services and, in consequence, of railway expenses, in language which seemed to us clearly to imply that the entire responsibility for these things lay with the railway managements. In our comments upon his address we contended that the responsibility lay with the government as well as with the railways. In his letter Mr. Thelen protests that his statement was not a "criticism" of the railroads and agrees with us that the government, as well as the railways, is responsible. He adds: "To the extent that legislation is responsible for existing waste and inefficiency in railroad operation, legislation must be changed. To the extent that the railroads are responsible, they must do their share of the work." That is a fair statement of the case.

Mr. Thelen adds that "it would be far wiser to stop trying to pick flaws and to work together, first, to ascertain the facts, and, second, to make such improvements in the existing order of things as the facts and the welfare of our people require." Let us hope this policy will be adopted, both by those who operate the railways and those who regulate them. There is at least as much need for a cessation of criticisms and attacks upon those who are devoting their experience, their energy and their ability to the operation of

the railways as for a cessation of criticisms and attacks upon those who are regulating them. The general policy of many railway regulating authorities has been to place heavy burdens and innumerable restrictions upon the management of railways and then to stand off and throw stones at them because they have not got as good results as the railway commissioners—most of them ignorant of practical railway matters—have imagined they ought to get. If the program adopted by the Association of Railway Commissioners, as outlined by Mr. Thelen, indicates that its members generally are going to begin to co-operate with the managements of the railways, instead of putting obstacles in the way of their efficient operation, the change is most gratifying. Both the railway managements and the regulating authorities have made serious errors. In the emergency created by the war they are afforded opportunities for co-operation in the public interest which would largely offset the effects of their past errors.

RECORD-BREAKING EARNINGS AND EXPENSES IN AUGUST

THAT the total earnings and the operating expenses and taxes of the railways in August broke all records for a single month is disclosed by the complete statistics of the Class 1 roads for August, which have just been made public by the Bureau of Railway Economics. The detailed statistics are published elsewhere in this issue.

The same statistics show that in spite of the fact that the roads in that month had the largest earnings ever known, the increases in their expenses and taxes were relatively so much greater than the increase in their total earnings that for the first time since March, 1917, the net operating income of the railways of all the three large territories of the country, east, south and west, showed a loss as compared with the same month of 1916.

The total earnings of the Class 1 roads in August, which include all the railways of any considerable size, were \$365,316,147. This was an increase of \$13,500,000 over the earnings of last June, which previously held the record. The increase per mile of line over August 1916, was 11.4 per cent.

Total operating expenses were \$246,341,511 or almost \$8,000,000 greater than those of May, 1917, which previously was the record month for expenses. The increase in operating expenses per mile as compared with August, 1916, was 20.8 per cent. The taxes charged up in August were \$16,999,686, which was a small increase over the previous high figure, which was reached in June, 1917, and was 24.6 per cent greater per mile than the taxes charged to August, 1916.

For several months the railways of the eastern district have been regularly showing losses of net operating income as compared with 1916, but during most months the railways of the southern and western districts have been able to hold their own. In August, however, the western lines with an increase of 7½ per cent in total earnings as compared with August, 1916, suffered a decline of 9.2 per cent in net operating income. The southern lines with an increase of 18.6 per cent in total earnings had a decline of 1 per cent in net operating income. The eastern lines with an increase of 13.3 per cent in total earnings had a decline of 7.2 per cent in net operating income. The Class 1 railways as a whole had an increase of 11.4 per cent in total earnings and a decline of 7½ per cent in net operating income.

Among the most remarkable and most unsatisfactory features of the August statistics are the large increases which they disclose in the ratio of operating expenses to total earnings. Comparing August, 1917, with the same month of 1916, the operating ratio of the western lines increased from 59 per cent to 64 per cent; that of the southern lines from

66 per cent to 69 per cent; that of the eastern lines from 64 per cent to 70 per cent, and that of the railways of the country as a whole from 62 per cent to 68 per cent.

Such large increases in the ratio of expenses to earnings in a month of record-breaking total earnings are almost without precedent. When the detailed statistics regarding the operating efficiency of the roads in August are available they will unquestionably show that in that month the railways handled more traffic per mile of line, per employee, per locomotive, per car, than in any previous month in their history. Maximum earnings, maximum operating efficiency and declining net operating income surely make a portentous combination to contemplate.

But what else could be expected with wages, taxes and prices of materials very much the highest ever known; in other words, on a war basis, and rates almost the same as before these great increases of wages and prices began? The railways, unlike every other industry, are on a war basis as to their expenses and on a peace basis as to their income. No other industry could stand such a combination. How long can the railways continue to stand it?

INTERMOUNTAIN RATE CONTROVERSY RENEWED

TESTIMONY presented before the Newlands committee last week at its hearing in San Francisco by state railroad commissioners and representatives of shippers from Arizona, Nevada, Utah, Idaho and Washington indicate that a strong fight is likely to be made at the coming session of Congress for a further amendment of the long and short haul clause, in the fourth section of the commerce law, to prohibit absolutely the charging of a higher rate for a shorter distance, the purpose being, of course, to secure as favorable freight rates from the east to the intermountain territory as are given to the Pacific coast terminals.

Great dissatisfaction was expressed with the results so far obtained from the Interstate Commerce Commission's various decisions with reference to transcontinental rates, because the commission has seen fit to agree with the intermountain contentions only in part; and the intermountain representatives made an urgent appeal to Congress, as represented by the Joint Committee on Interstate Commerce, to take from the commission all discretion in the matter and to enact a rigid long and short haul law. They also indicated that their representatives in Washington would press the fight in Congress with great earnestness.

Without entering at this time upon a discussion of the merits of the controversy, which have been thoroughly threshed out before the commission during the 25 or more years it has been dealing with the subject, it is pertinent to remark that even if the Newlands committee developed little information during its western hearing having a direct bearing on its inquiry into the general problem of railroad regulation, its members must have been strongly impressed with one fact which should be suggestive in their consideration of the question of government ownership. That is that the railroad question presents a large number of aspects which are a source of bitter sectional controversy which would certainly be much intensified if the government actually owned the roads and Congress were responsible for their management. The railroad question is as full of local issues as the tariff or the pork barrel, all of them having a vital effect on the business of the nation as a whole; and if a question involving the relation of terminal to intermediate rates, or the reasonableness of rates, is one to be decided by a political body, largely on the basis of sectional prejudice, Congress could easily find itself overwhelmed with similar demands.

Congress has twice attempted to settle the long and short haul controversy by establishing a general rule. On both

occasions it has decided that while on general principles a railroad should not be allowed to charge a higher rate for a shorter distance than for a longer one, a rigid application of the rule would be unwise. In the original law it left room for exceptions by inserting the qualification "under substantially similar circumstances and conditions." In 1910 it also recognized the necessity for some exceptions by providing that the Interstate Commerce Commission should have discretion to determine what departures might be allowed from the strict rule. In other words, it decided to place the determination of such technical questions in the hands of an expert body. Now, because that body with its technical knowledge of the subject and after 25 years of study of it does not entirely agree with the people of a considerable section of the country, Congress is asked to upset conditions in all other parts of the country by another rule, which, while general in its terms, is intended primarily for the benefit of that section.

It is not difficult to sympathize to a considerable extent with the people of the intermountain country, even though they seem to be blaming the railroads and the Interstate Commerce Commission for a condition which is the result of their natural situation; but after all the years that have been spent in working out a solution of the problem it would seem to be a poor time to renew the agitation in Congress so shortly after the Interstate Commerce Commission has rendered a decision which gives the intermountain region so large a degree of the relief for which it has contended, until opportunity shall have been afforded for testing out the commission's plan. While the intermountain interests have complained that their own rates were too high they have laid particular emphasis on the discriminatory features of the adjustment caused by the coast rates being lower. Now the commission has held that the discrepancy must be removed and although it was required to suspend its order as the result of the ill-considered change in the fifteenth section of the law recently passed by Congress, there is no reason to believe that any considerable further delay will result.

NEW BOOKS

Are We Capable of Self Government? By Frank W. Naxon. 329 pages. Size 5 in. by 8 in. Bound in cloth. Published by Harper & Brothers, New York. Price \$1.50.

In these perplexing times it is a pleasure to read so cheerful and cheering a book. Some of us, in considering the pointed and pertinent question indicated by the title, would be tempted to enumerate some of the conspicuous trials and temptations of the 138-year period during which our government has existed under the Constitution; thus bearing in mind that such a period in the life of a nation is after all not very long. It is much like asking—Is a ten-year-old boy a success?

During the comparatively brief period mentioned, our country has been tremendously enlarged in area, 35 populous self-governing and participating states have been carved out of what was before a wilderness; it has survived the strain of many panics; has freed millions of slaves; has prevented the severance of the Union, and thereby prevented the erection of two or more frontiers in three million square miles of territory; has gone right to the edge of the precipices of greenbackism and of free silver, but averted the plunge into such monetary experiments which, to put it mildly, would have been revolutionary; has survived severe political strains like the Hayes-Tilden electoral contest of 1876; has fought one of the most altruistic of wars ever waged by a nation—namely for the liberation of a neighbor, and then with perfect self-restraint helped set up for that neighbor (Cuba) a new experiment in self-government; and now, with larger vision, has voted conscription, and unprecedented appropriations, in the most altruistic performance of all—to wit, to

enable us to participate in a war to make the *world* safe for democracy, and to establish the new principle in international relations that a nation which violates its word must be punished.

Mr. Naxon's book, however, is useful because it summarizes events in this country commencing with the year 1900—a period with which all of the readers of the *Railway Age Gazette* are familiar through personal experience, and observation, and yet concerning which most of us are more or less forgetful.

Part three, entitled "Achievements," is a record of which American citizens need not be ashamed, and while we may feel that we have not yet "arrived" in the matter of railway regulation, it is encouraging to hope that the same government which has perfected our banking system—described by Mr. Naxon as "The Miracle in Bank Legislation"—will also rise to its opportunity and duty in the matter of stabilizing the credit of the railroads, so as to enable them to serve one hundred million people with a minimum of waste and loss of energy.

It is also encouraging to read Mr. Naxon's description of the new era in business, for which foundations have been so well and so conservatively laid by the organization of the Chamber of Commerce of the United States of America. Surely we need not be despondent, so long as we have men who had the vision and the courage, *before* the present war, to establish right in Washington the machinery for co-operative work between business organizations, and between such organizations on the one hand and the Federal Government on the other hand. In this connection we should not fail to note that the business men of the country have cause for congratulation that thus far all tendency towards price fixing is under federal jurisdiction without the conflicts of state regulation which afflict the railroads.

Mr. Naxon's book is full of happy epigrams and fascinating quotations, and I think I cannot do better than to quote the following paragraphs:

"Business men live in the hour. Their apprehension is not so much as to the long future, as to the ills which may befall them individually as business men next year, or next month, or next week, or which have already afflicted them."

But later on, in describing the work of the United States Chamber of Commerce, he says:

"The possibility of inducing busy men to serve in this fashion arose from the intensely practical bearing on the subjects dealt with. Once entered upon, such service held even men of the heaviest personal responsibilities. It introduced them to a social delight and a mental stimulus novel to many—that of sitting around a board with other live men in a non-competitive atmosphere, exchanging ideas, deferring to one another's suggestions, earnestly striving together for the broadest view and the fittest action. Some such men asserted that committee experience in a board of trade under the new conditions enabled them to do their own work so much better that they were more than repaid for the time and strength expended."

A part of the final appeal is this exhilarating paragraph:

"In your face I can read that you would like to give yourself to your country's problems, but you haven't any plan to grab hold. Maybe not, but if not who are you? If you are an employee there is an organization of such employees. If you are a merchant or manufacturer there is a local business organization and a national trade body. If you follow a profession it has its society. Do you believe your organization is giving itself to the problem of preserving what you are thankful for? Do you believe your organization is for America first and for its special class second, or America nowhere? Have you thought enough about the aims and performances of your organization to have a belief about its effect upon the preservation of America as a land of freedom and opportunity?"

It is a book that every patriotic citizen may read with profit as well as pleasure, and every railway official ought to have a copy.

FRANK TRUMBULL.

THE INDIAN EQUIPMENT MARKET.—During the year 1916 eleven of the thirteen principal railway systems of India used equipment and supplies to the value of over £6,000,000 (\$29,160,000), of which £3,500,000 (\$17,010,000) worth came from England.

Letters to the Editor

MR. THELEN REPLIES TO OUR CRITICISMS

SAN FRANCISCO, Calif.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

My attention has been directed to an editorial in your issue of October 19, 1917, in which you refer to the president's annual address delivered by myself before the National Association of Railway and Utilities Commissioners in Washington, on October 16, 1917. In this editorial, you question certain statements of fact in my address and invite my reply.

1. *Five Per Cent Case.*

You ask me to point out where in its decision in the Five Per Cent Case the Interstate Commerce Commission refers to waste and inefficiency in railroad operation.

I am surprised that any one who has read this decision should make this inquiry.

After referring to methods of increasing railroad revenues, the Interstate Commerce Commission (Vol. 31, I. C. C. Rep., p. 351), at page 409, says:

"There are, however, other fruitful courses which the carrier may pursue to increase net revenues which would not involve any increased burdens upon the shippers and the traveling public. We refer, of course, to the introduction of additional economies in operation and further advances in efficiency, opportunity for which obviously exists in every department of railroading, as in other lines of business."

The commission then draws attention to a number of "the most promising fields for such efforts," including, among others, increase in car efficiency, greater economy in the use of fuel and other economies in operation.

Referring specifically to increase in freight car efficiency, the commission, at page 411, says:

"It is, however, in the use and operation of cars that we must look for the most substantial economies. Mr. Daly, general superintendent of the Illinois Central, found that, even in the busy season, a freight car was moving in trains on the road only 3½ days out of every 30. Taking the average of all roads in official classification territory for the whole year, the time a car is moving in trains probably does not exceed 3 days out of 30, and the car is under load only 2 out of those 3 days. Furthermore, the cars under load are loaded on an average to only about 58 per cent of their capacity."

Continuing, on page 412, the Commission says:

"As pointed out by Mr. Daly, the economies which may be effected by greater car efficiency have only begun to be realized. The possibility of reducing the empty car movement should be examined. It is believed that by more careful management and through reasonable changes in regulations and practices carloadings can be increased, and that both shippers' and carriers' detention of cars can be materially reduced. At the same time the congestion at terminals, which is in large part both the cause and the result of such detention, can be greatly lessened. The greatest cause of car detention is perhaps the lack of regularity in the movement of freight. Much advance can undoubtedly be made in the way of developing freight train schedules, both in the terminals and between the stations."

As I pointed out in my address, this waste and inefficiency have been greatly reduced by action of the railroads in distributing empty cars into districts where needed, increasing the daily mileage of locomotives and freight cars, reducing the number of locomotives and freight cars awaiting repairs in shops, and other measures, and by co-operation of the shippers in prompt loading, loading to capacity and prompt unloading of freight cars. As I also say:

"What the railroads are now doing is being patriotically done, and deserves and is receiving the unstinted praise and commendation of all American citizens."

You say in your editorial that you have searched in vain in the decision of the Interstate Commerce Commission for a single word pointing out the waste and inefficiency to which I referred in my address and you "boldly assert that there is no such word in it."

I suggest that if you will read the decision at the pages herein indicated your search will be rewarded.

2. *Federal Railroad Valuation.*

You say in your editorial that the railroads have not "favored" the federal railroad valuation, but that they have "acquiesced" in it "because they believed that the valuation would show that the railways as a whole were not over-capitalized."

I do not propose to split hairs with you over the difference between "favoring" and "acquiescing." The outstanding facts are that the executive and financial officials of most of the railroads are opposed to the valuation and that leading railroad officials have recently made repeated efforts to suspend the valuation. These efforts, as is generally known, were blocked by President Wilson and Secretary of War Baker.

I regret that the railroads are taking this attitude. As a basis for a constructive solution of our railroad problems, the American people are entitled to have the facts promptly and officially determined. The sooner the facts are determined, the sooner may we look forward to real progress in solving our railroad problems. In my opinion, it would be far wiser for the railroads to accept the situation than to try to suspend or stop the valuation.

3. *Duplication of Facilities, Service and Operating Expenses.*

You agree with me that duplication of railroad facilities, service and operating expenses exists and that the same should be eliminated, but object to my statement of the facts as a "criticism" of the railroads.

While accepting your concurrence as to the facts, I must respectfully protest against your reference to my statement as a "criticism" of the railroads. What I said was not said in a spirit of criticism of either the government or the railroads, each of whom is partly responsible for the situation, but was a bare statement of existing, admitted facts, as is shown by the very next sentence of my address, which you do not quote, reading:

"I am not now speaking of causes, but only of the facts which are patent to all."

As I point out in another part of my address, the events of the world war and the necessities of the peaceful competition with other nations which will come after the war, will cause our people to insist on greater efficiency in both public and private affairs. Our transportation system will be no exception to this general demand. The conditions which I pointed out and with which you agree do exist, must be remedied if our transportation system is to measure up to the standard of increased national efficiency, which the American people will imperatively demand after the war.

To the extent that legislation is responsible for existing waste and inefficiency in railroad operation, legislation must be changed. To the extent that the railroads are responsible, they must do their share of the work. I am in favor of such legislation as will cure for the past, as far as that may reasonably be done, and prevent for the future, unreasonable and unnecessary duplication of railroad facilities, service and operating expenses.

It is foolish to close our eyes to the facts and to criticize and attack those who are seeking to ascertain and analyze the facts as a basis for constructive remedies. In my opinion, it would be far wiser to stop trying to pick flaws and to work together, first, to ascertain the facts and, second, to make such improvements in the existing order of things as the facts and the welfare of our people require.

The whole spirit of the convention of the National Association of Railway and Utilities Commissioners was a patriotic endeavor to be of service in every possible way to the states and the nation at this time.

The state commissioners have determined to do two things in connection with our railroad problems:

1. To give every possible assistance to help with the war.

2. To ascertain the facts with reference to our railroad problem in its entirety so that after the war we may do our part as public officials in assisting to secure a wise and constructive solution of the problem in the light of a quickened national efficiency and the best interests of our people as a whole.

The Association directed the appointment of a Special War Committee whose duty it shall be to confer with all appropriate state and federal officials and to advise with each state commission to the end that each commission shall be of the greatest possible service to its state and the nation.

I suggest that this is not a time for petty criticism or bickering. Rather should all men through whose veins there runs the blood of patriotism forget their erstwhile contentions and present a common front so that in harmonious, concerted action the nation can be most effective in the present contest.

MAX THELEN.

President, Railroad Commission of California.

LIMITATIONS OF THE THREE-CYLINDER LOCOMOTIVE

BOMBAY, India.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

I was much interested in E. Cecil Poultney's reference to the Pennsylvania Decapod type locomotive on page 1471 of the June 29 issue of the *Railway Age Gazette* and in his suggestion that three or four cylinders might have been substituted for two of the dimensions employed, particularly advocating the former arrangement.

I should be glad to think that the turning moment on the axles would be improved, and the chances of slip much reduced with three cylinders connected to cranks set 120 deg. apart. That is, of course, what one would set out to attain with three cylinders, but a little consideration will show its impossibility to any appreciable extent apart from the use of three coupling rods as well. Of course, three coupling rods (side rods) are impracticable, whether the third is placed between the frames and connected to a row of crank axles, or whether two couplings rods are placed outside the frames on one side, with two cylinders inside the frames and the third cylinder and coupling rod outside the frame at the other side.

Admitting that a more ideal arrangement for driving a single axle can hardly be desired than three cylinders, when it is attempted to transmit the even turning effort so obtained to a second axle it has to be performed by means of only two coupling rods. Those rods are set at an angle of 120 deg. and are therefore in a worse position for transmitting torque evenly than are the coupling rods of a two cylinder engine, which are set 90 deg. apart. The greater the number of coupled axles the greater the proportion of axles driven in this irregular manner. Even if the advantage gained in the driving axle be as much as 20 per cent over that possible with two cylinders, in a Decapod it forms only four per cent of the whole engine's tractive effort without making any allowance for the irregularity which applies to all the remaining coupled axles.

No doubt it is the appreciation of this point which has deterred designers from making greater use of three cylinders than is general. Conversely it follows, that the fewer the number of coupled axles the stronger the case for using three cylinders, until we come down to the single driver, for which a better arrangement need hardly be desired.

In a Decapod engine the inside cylinders must work on an incline something like one in four, leading to difficulties with the smoke-box apart from those introduced by this extreme angularity. I believe that any line having clearance for large enough cylinders would be well advised in

adhering to two cylinders until other considerations force the adoption of the three or four-cylinder arrangements.

But suppose that owing to a limiting axle load, as in England, a line should have to face the problem of deciding on an articulated express engine; having exceeded the capacity of their six-coupled passenger engines. The type which should develop for heavy passenger loads at high speeds to my mind could not be better than the six-cylinder double-ended articulated Garratt type having three cylinders at either end. Such an engine would possess good starting and accelerating ability; from the efficient use made of its adhesive weight by the three-cylinder arrangement it should equal in hauling and starting power a Decapod having the same diameter coupled wheels, were it practicable to build such a machine, and for speeds it would equal the Atlantic and absolutely surpass any other type having a greater number of coupled axles than two.

A. McBETH,

Assistant Locomotive Superintendent, Great Indian Peninsula Railway.

TYING-UP WITH THE MEN WITH THE COLORS

COLONIE, N. Y.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

I have noted with much interest the move made by the supply men to furnish "tobacco" to the men of the engineer regiments.

You will be interested in an organization we have formed in the Delaware & Hudson shops here at Colonie, N. Y.

We have given about 70 of our men to army or navy, some to the engineer regiments and many to other parts of the service. Realizing that we at home also have a duty to perform, after sounding the sentiment of the shop, at a noon hour meeting, an organization was formed comprising practically to a man the full shop quota.

Its purpose is:

(1.) To furnish periodically—approximately once each month—while the war lasts, to each fellow Colonie man enlisted in the nation's service, tobacco or some token of remembrance, together with a shop letter.

(2.) To keep in touch with those left at home who may be wholly or partially dependent on our fellow Colonie men at the front to the end that where a helping hand may be needed it will unobtrusively be extended.

(3.) By these means—to give to our men the encouragement had with the knowledge that we are back of them to a man, evidencing clearly our realization that the problem is a mutual one, and that we are ready manfully to do our bit to lighten the burden.

We have also placed an honor board in a conspicuous place in the shop, giving the location of the men in the service, so any employee who may care to so do can write from time to time.

Committees were formed as follows: Honor Roll, Purchasing, Reading, Home Letters, Helping Hand and Printing, the committee's title indicating its purpose.

Don't you think that if every shop in the United States did the same it would be a splendid thing. Personally I do and am calling it to your attention because it is working so well here.

G. S. EDMONDS.

TRAFFIC ON THE SWEDISH RAILWAYS.—The company-owned Swedish railways showed an increase in receipts for the first six months of the present year as compared with the same period last year, of 18.4 per cent on the freight traffic and 9.5 per cent on the passenger traffic. The increase in the freight traffic receipts is exclusively due to the higher tariff, temporarily adopted. The private railways are contemplating a material reduction in the number of trains during the winter, while the state railways mean to meet the shortage of fuel problem by reducing the speed.

Driving the Temporary Bridge

Bridge Work on the Hannibal Line Cut-off

Construction of a Reservoir Required the Relocation of a Part of the Chicago, St. Paul, Minneapolis & Omaha

THE construction of a reservoir by the Wisconsin-Minnesota Light & Power Company, at Chippewa Falls, Wis., caused the submergence of a part of the Hannibal branch of the Chicago, St. Paul, Minneapolis & Omaha and made it necessary for the railroad to abandon $9\frac{1}{2}$ miles of this line in favor of a cut-off built for it by the power company on a new location with the grade at a sufficient elevation to avoid inundation. The project involved

but involves a bridge across the Chippewa river, whereas the old location was entirely on the east side of the river.

The new line has a maximum grade of 0.5 per cent and offers no particular features of interest except the Chippewa river bridge which consists of eight 100-ft. deck plate girder spans on concrete piers and abutments, with an embankment approach 1,300 ft. long, averaging 40 ft. in height. The bridge and embankment have a level grade and are on a tangent, the base of the rail being 64 ft. above the bed of the river and 20 ft. above the water surface in the reservoir. This elevation allows a clearance of 8 ft. between the surface of the water and low iron of the spans.

Map Showing the New and Old Lines

the construction of a bridge across the Chippewa river, which embodied some interesting engineering and construction features.

The Hannibal branch of the Chicago, St. Paul, Minneapolis & Omaha joins the Eau Claire-Duluth main line $\frac{3}{4}$ mile north of the Chippewa Falls depot, the branch line continuing along the east side of the river, while the main line turns north, crosses the river and rises on a one per cent grade for a distance of $1\frac{1}{4}$ miles to attain the elevation of the flat country back from the river. Only $2\frac{1}{2}$ miles of the Hannibal line was subject to submersion by the water in the reservoir, but the selection of a new location to avoid the water necessitated the abandoning of the line to a point 9.9 miles from the Chippewa Falls station where it was possible to secure a junction with a cut-off. The distance by way of the new line is 1.65 miles shorter than over the old line

THE SUBSTRUCTURE

Careful consideration was given to the examination of the ground for the foundations of the piers and abutments. By the use of an ordinary well-drilling machine, 4-in. test holes were drilled for each pier and abutment. The results of these operations proved interesting, and are shown on

Profile Showing Results of Borings

the chart. Overlying the solid granite were found various strata of decomposed granite, red clay, soft white sandstone, sand and gravel. Owing to the extreme depth of the granite at the sites of piers 1, 6 and 7 and the north abutment, it was decided to resort to pile foundations. The south abutment was built on a soft white sandstone, while the footings of piers 2, 3, 4 and 5 were founded on solid granite.

No difficulty was experienced in excavating for the foundations. Ordinary sheet piling proved sufficient for the shore piers and abutments and double timber cribs filled

with clay were sunk for the foundations of the river piers. These were made large enough to allow the driving of short sheet piling next to the inside walls of the cribs, in order to shut off water coming in between the uneven river bed and the bottom of the cribs.

While grading south of the bridge an excellent quality of gravel was uncovered in unlimited quantities. A crusher and screening plant was erected and the concrete material was thus obtained in the immediate vicinity of the bridge site. The concrete mixer plant was located near the south abutment and concrete was placed by means of an aerial cableway operated by machinery located near the south abutment. A low temporary trestle, driven parallel to the new bridge, was used for moving machinery and pile drivers, and also to some extent for handling concrete in foundations. Work on the bridge proper started early in the spring of 1916 and the concrete work was entirely finished in the latter part of September of that year.

THE SUPERSTRUCTURE

The 100-ft. girder spans were designed for Cooper's E-55 loading. They were contracted for delivery September 1, 1916, but the bridge company subsequently extended this date to December 1. As there was no absolute certainty of delivery on the later date and as the power company was obliged, through contract conditions for the delivery of electric current, to commence filling the new reservoir and thereby submerging the old Hannibal line it became necessary to adopt heroic means to put the new cut-off into commission. Accordingly it was decided to put in a temporary bridge. Early in November two pile drivers were started at the north and south ends of the bridge driving a pile trestle which was completed on November 30. Girder spans began to arrive, however, before the temporary structure was completed, and the work of erection was started in January, 1917, and was completed on February 16.

GRADING

Material for the embankment at the north end of bridge was all handled by a steam shovel and trains. The em-

completed track work at the junction points was attended to.

All waterways and underground cattle passes were constructed of reinforced concrete pipe, except at locations where the headroom was not sufficient, in which cases cast iron pipe was used. The underground cattle passes have a diameter of 84 in. The reinforced concrete pipe was furnished by the C. F. Massey Company, Chicago.

The entire work of constructing the cut-off was done for the Chicago, St. Paul, Minneapolis & Omaha by the Wisconsin-Minnesota Light & Power Company. The grading and concrete work was done under a contract by A. Guthrie & Co., St. Paul. The superstructure of the Chippewa river bridge was fabricated by the Wisconsin Iron & Bridge Company, Milwaukee, and erected by Frankman Brothers Com-

Placing a 100-Ft. Girder

pany of Minneapolis. The tracklaying and ballasting were done by forces organized for that purpose by the power company.

The work was done according to the standards of the Chicago, St. Paul, Minneapolis & Omaha under the direction of H. Rettinghouse, chief engineer, and A. E. Winter, assistant engineer, in immediate charge. We are indebted to the former for the above information concerning the project.

THE LOCOMOTIVE OF YESTERDAY.—A considerable proportion of the locomotive work performed every day on the railways of this country is done by engines which have long since passed out of what we can rightly term a modern category. Nevertheless, it is work of a most useful character, achieved as a rule in an economical manner. Though secondary in importance when viewed in comparison with main line services of the first class, the work is indispensable, and the retention of locomotives which have long since passed out of the modern standard is fully justified by the results obtained. In a great number of cases the engines have been rebuilt, and some of them have, indeed, lost practically all resemblance to their former selves. The modernizing tendency resulting from the rebuilding processes has increased the capacity of the locomotive in a wonderful degree, and those who criticize the policy of thus retaining in service older locomotives and bringing them up to what is practically a present day standard by rebuilding should remember that the material and workmanship put into the British locomotive of yesterday were of a very high class indeed, and there is greater economy in keeping the engine going than in scrapping it. On the other hand, there are on most railways numbers of locomotives which retain practically all the features they originally possessed, and it has been found better and cheaper to keep these at work than to send them to the scrap heap. Not only in branch line but in main line service there is a place for these many year old engines which, all things considered, could hardly be so well filled by types built in accordance with the most modern ideas.—*Railway Gazette, London.*

Concreting Piers from an Aerial Tramway

bankment was made entirely of gravel from deposits obtained within $\frac{1}{2}$ mile of the work. As the embankments stand in the reservoir, the slopes of both the north and south approaches were made 1 to 3, and riprap 1 ft. thick was placed to a line 5 ft. above the surface of the water in the reservoir.

The grading of the entire line, outside of the high embankment referred to, was very light and was completed early in the summer of 1916. The track was completed up to the bridge from both ends by the time the temporary bridge was put in. Most of the line was ballasted at that time, but the work had to be suspended on account of cold weather. Ballasting was resumed early in 1917, when un-

Railroad Discipline Without Suspensions

Philosophical Observations of a Chief Clerk Long
Familiar with Brown System. The Ideal Superintendent

By E. H. Heath,

Chief Clerk to Superintendent, Kansas Division, Chicago, Rock Island & Pacific, Herington, Kans.

IN these days of highly specialized industrial effort the opportunity for spectacular individual performances is largely over, and large results are obtained in a large way only by united endeavor and co-ordination of forces. Team work, concerted endeavor, is the life blood of productive effort, and any system of discipline which discourages team work is inimical to the best interests of the industry itself. By this test actual suspension as a means of discipline has no place among railroaders or any other body of intelligent men, because it violates their sense of justice, breeds disloyalty, fosters discontent, engenders dislike and alienates the sympathy and fidelity of employees, their families and their friends. Any punishment that interferes with the employee's earning capacity results in impairing his ability to discharge the obligations of good citizenship and to protect and educate his family. Discontent is unconsciously contagious. Actual suspension cannot be successfully defended upon grounds of either justice or expediency, and as a matter of fact is not consistently enforced upon lines retaining that system. As in civil and criminal law, where unduly severe penalties make convictions difficult, so in disciplinary matters the severe penalty violates the disciplinarian's sense of justice and the offense is more or less condoned.

It is the same in railroad life. Sympathy for the misfortunes and miseries of associates, always felt by a man worthy of leadership, causes the sentence to be suspended or overlooked.

At present the demand for labor exceeds the supply, and men who are worth anything cannot always be spared to serve disciplinary sentences. During these days of high prices, when employees, for the most part, live from hand to mouth, enforced idleness for a period of ten or twenty days would often pauperize the employee and his family. He will not stand this, but goes into the service of a competing line; or he goes into some other business, and is lost to the railroad industry.

We are dealing with men whose training enables them quickly to discern injustice and unfairness; and their extensive brotherhoods enable them quickly to reverse questionable discipline. Such reversals are necessarily inimical to the prestige and influence of the supervising officer in the field. No man may hope to stalk through the industrial world like an avenging god, exacting an eye for an eye or a tooth for a tooth, and retain the loyalty or even the respect of the intelligent workmen. Intelligent discipline is the handmaiden of education, rightly presupposing proper instruction. Helpful discipline cannot be divorced from education. It looks forward not backward. It concerns itself with the future rather than with the past. It is more interested in the glories of the dawn than in the grandeur of the crimson sunset. It is the epilogue to a prologue whose precursor is rightly effective educational and teaching effort.

WEAKNESS FROM NEGLECT OF INSTRUCTION

It is a lamentable fact that railroad instructional methods are woefully weak, depending largely upon circulars and bulletins which reach a comparatively small proportion of the men employed; are read by a less number, are studied and understood by a comparative few. Instructions not

received, not read and not understood have no educational value. For the most part, training and efficacious teaching have been left to the employee himself or to the loud-mouthed agitator, who breeds discontent, and tears down, never building up. Few of us in our years of service can recall a conscious, continuous effort on the part of anybody to teach us the railroad business. Look at the younger men today. In studying claims for losses and other lapses from proper performance it is almost always found that the responsibility rests on the man who did not know, or, if he did know, did not understand. He bills shipments by the wrong route. He fails to attach certificates which are necessary to permit the shipment to go to destination. He fails to enclose the waybill in the stop-off envelope when it is required. He violates standard practices and injures himself or others. In defense, he explains that he did not know. Somebody failed to teach him, or taught poorly. So long as the railroad industry is content to ignore the fertile field of educative effort and is willing to await the overt act, the industry will pay the penalty in lack of competent effort and efficient team work. The way out is high class, continuous, persistent instruction to spur the latent ambition and utilize the dormant capacity, heretofore largely squandered.

Take two divisions of the same railroad. The observer will not fail to note the contrast in methods, and the consequent gain to the industry, in passing from one division to the other, where the first depends largely upon bulletins, circulars, and notices for the dissemination of information and an understanding of instructions, while the other supplements this method by personal instruction, and by explanation through wide-awake committees. Efficiency comes through persistent instructions by an efficient field staff, explaining the why as well as the how. The writer is happy to add that his association with operating officers in this territory during recent years has been a liberal education as to what may be accomplished by continuous personal effort to reach the man in the field and fully develop his mental powers.

A lack of proper educational effort is evidenced whenever by reason of a dearth of talent it becomes necessary to officer a railroad from other industries, or to call upon so-called efficiency experts, with little railroad experience, to improve railroad methods among men who have devoted a life-time to the business. "Education" includes, of course, not alone intellectual training, but also cultivation of the instinct to create and the stimulation of pride in that creation; the willingness of the toiler to accept the responsibility for his own acts, to understand his relation to his coworkers and to the industry in which he is engaged; to co-operate.

THE NECESSARY ELEMENTS

"Record discipline," commonly called the Brown System, is usually applied to all station and yard employees, to trainmen, enginemen, foremen in all departments, signalmen, and others working on a monthly basis. It should not be applied to officers nor the personal staff of the operating officer, nor to ordinary laborers. It must not be confused with personal records kept by a pension bureau or for other reasons. Proper and continuous effort being made to secure men with a promise of capacity and willingness to learn the

railway business, the system should be designed to educate the ignorant, to arouse interest, and to inculcate the pride of good workmanship. The system should without unnecessary delay eliminate the hopelessly incompetent and those not responsive to proper educational effort.

Discipline should be uniform over the whole road, and should be managed by operating divisions. One officer on each division should assess and equalize discipline. All personal records should be kept in that office, junior officers retaining only seniority lists and other data necessary for their own use. These records should always be consulted before discipline is assessed, to determine the standing of the employee; whether this is the first offense of this nature, and whether similar offenses may not have been previously overlooked by reason of the employee's good record. Records should always be available where the complete record may be consulted by all junior officers as well as by the employee; and the employee should be encouraged to keep himself fully informed. All papers or copies thereof giving useful information relative to the employee should be filed on his personal record papers. Such records for convenience may consist of a card index, application and supporting papers bearing a corresponding number and a loose leaf. Loose leaves may be kept in book form or on the personal record file, on which should be tabulated all entries.

Discipline letters should describe the exact offense. A letter notifying the employee of discipline assessed for "delaying a passenger train," when the real offense was failure to clear the time of a first-class train at a station in the rear, as required by rule, is grossly improper, featuring as it does the minor phase of the offense and ignoring the vital element. Failure to act, as well as improper action, must be noticed, and disciplinary notices should state in clear, concise language the exact offense. Such letters should always show the total balance of the entries, and should be followed up and an acknowledgment secured.

When the entries approach the final maximum the employee should be called in and cautioned, and a memorandum of that admonishment placed on his record. The record being correctly and impartially kept, tells the tale of the man's unfitness for the railway business, and he should be promptly removed; and unless there is a grave need by reason of shortage of men, should not be re-employed in any capacity on that road. Sufficiently close relations should be maintained with a central office in which is kept the record of applicants previously employed. At the end of each month an educational bulletin should be issued, correctly describing the offense, omitting names, places and dates, and showing all discipline assessed, as well as briefly outlining correct procedure.

In assessing discipline give consideration to the employee's previous record, his willingness to acknowledge the fault, and to concede correct conclusions; his determination to avoid repetition, readiness to promise betterment, to correctly analyze the occurrence and to lay the facts before his superior officer with frankness. A careful record should be made to show what consideration has been given to the man's history, to the end that undue credit may not be given a second time.

I am well aware of the argument that a given act merits the same discipline every time, regardless of the individual, and that the consideration here advocated is improper. But such consideration is actually given, consciously or unconsciously, whether we say so or not; and it is entirely right and proper. Otherwise the most potent reasons for co-operative effort would disappear.

PRECAUTIONS TO BE OBSERVED

The disciplinarian should properly be careful that the discipline assessed is proportionate to the seriousness of

the offense, the individuals involved and the circumstances surrounding the case. Manifestly, to assess ten demerit marks for violation of Rule 99 and thirty for failure to forward a certain report on time is so grotesque and unfair as to excite only rebellion and contempt; although it is conceivable that at times the continuation and repetition of small offenses may merit drastic action. A yard conductor, for example, in pushing cars into a yard track fails to send a field man to the farther end of the cut of cars already on that track, to insure against shoving out at the other end and colliding with a movement being made on the main or ladder track; or against part of the cut breaking off and running out on the main line. The first time this occurs an understanding is had with the offender and possibly minimum discipline is assessed. Clearly, the same discipline is inapplicable if the offense is repeated; for it is evident that it was ineffective; more drastic action must now be taken. Should the offense be repeated a third or a fourth time, the employee, presumably, lacks inclination or adaptability, or both, and should be removed. He cannot be retained without making careless, by example, those whose intentions are right.

To be effective, discipline must be certain and sure. The certainty that the employee will be called upon to explain improper operation will be found more of a deterrent than severe discipline occasionally applied. All discipline should be handled in a straightforward, open, aboveboard, manly way, impressing upon those concerned that the road is paying first-class wages, provides first-class working conditions, high class courteous treatment, and is entitled to high class service; and that nothing less will do. Effective team work implies that the division officer knows his men and is able to call them by name. He acts on the assumption that the man involved is worthy and is a satisfactory employee; meets him in a frank, candid and proper way, and explains that the railroad has spent much time and money for facilities to permit safe operation; has facilities equal to other lines and superior to many; has issued rules and instructions prescribing proper methods and performances; has spent time and money educating him, and has an investment in him. Dealing with an accident, he points out that, regardless of what caused it, whether haste or ignorance, the employee has violated this or that rule, or has failed to do this or that; that the road is paying first-class wages and expects first-class service, which, in this case, it did not receive; and he calls for adequate assurance for future performance. He takes time enough to impress this on the man's reason; does not try to stuff it down his throat. The employee acknowledges, promises and delivers. A capable, satisfied workman is retained, who will be an asset to the service.

In distressing contrast is the opposite handling. The employee explains the accident by saying, in substance, for example, "we were backing in over a bad turnout, which had been reported two or three times; the car that left the rails turned crossways; I couldn't get a signal to the engineer because of steam blowing bad, a difficulty which was reported the last three trips; there was no field man out, as I had two students who knew nothing, and I was alone; had been on duty over fifteen hours every trip for the last week." To all this the investigator replies, curtly, "You knew these conditions; they are the best we can do; you signed an application to do this work. I have nothing further for you." Here a bad condition is made infinitely worse by lack of frankness, candor and leadership. If the man is retained, he is dissatisfied, feels abused and is a liability. If he is not retained, the road loses its investment of time and money in his education.

Nor is it necessary or desirable that a decision unfavorable to the employee shall follow every interview or inves-

tigation; the opportunity to explain will, in many cases, be a sufficient deterrent; but the certainty that the explanation must be forthcoming will be found to have a far-reaching effect. Effective discipline is necessarily prompt. Immediate investigations, at the end of the trip or round trip or day, prompt decisions, immediately effective, give the action of the superintendent an impressive effect and businesslike character that is largely lost where the investigation, decision or action is drawn out through months or weeks. A delay of so little as three or four days, if unnecessary, has a bad effect. Every officer of experience knows that uncertainty as to what may be the final action will sometimes unfit a man for safe work.

OFFICER MUST BE FAIR AND PATIENT

Effective discipline moreover is fair and just. The discipline must appeal to the employee's American sense of fair play, otherwise it will excite his resentment and contempt. It must, however, be sufficiently drastic to impress upon him the necessity of "playing the game according to the rules," and to accept the responsibility for his own acts. It must demonstrate to the employee of right intentions that the management will be quick to distinguish real capability from the effort of the man whose ambition is so poor that he does just enough to "get by."

Generally speaking, discipline should never be assessed without a personal interview and an opportunity given to the employee to defend his position or explain his actions. The right to be heard in his own behalf is so fundamental and so ingrained in the American mind, resting as it does on the basic rights of man, that it cannot be ignored. The employee in that interview should be made to acknowledge his transgression and be told the superintendent's decision. The letter he later receives merely confirms what he has been told. There is no one thing that breeds disloyalty so quickly, that stings so venomously or that time erases so slowly as the receipt of a letter containing scathing criticism (or in fact, any adverse decision) without a previous opportunity for defense. It is a happy thing to the writer, however, that he has always been associated with men who investigate first, discipline afterwards. Long-distance mail order discipline is a sure indication of a lack of reasonable understanding of men. The failure to understand this basic and fundamental principle will be a fatal defect in what may otherwise be a fine and efficient organization.

THE IDEAL OFFICER

Fundamental in all discipline is the character of the man in the field who is responsible for the operation of the business. He must have the proper qualities of leadership, must secure proper co-operation, and weld his organization together to work as a unit. Such a leader must possess a thorough knowledge of the business he supervises and a wide knowledge of men, having an intimate personal knowledge of those who form his organization, and their condition of life. It is lamentably true and a serious loss to the business that our supervising officers as a rule have no intimate and personal touch with the lives of the men they supervise. The duties of junior officers are so many and so pressing that this intimate touch has largely been lost.

The vital element of team work is lacking when a division officer, happening to be at some small station, fails to recognize the section foreman who is surfacing track only a hundred feet away; or who as a matter of formality inquires after the health of the agent's wife only to learn that she died thirty days before. What can you say of a train master, accompanying the pay car, who finds himself embarrassed by being unable to identify the men he supervises? To create a really fine atmosphere of co-operation, the officer, in passing over the road and meeting those in the field, should be able to call the employee by name, and

to talk about his family in their respective walks of life; as to how the daughter is getting along teaching, or if the son is attending the university this year.

Let no one think, however, that these graces take the place of everyday business ability. The ideal leader is a suave diplomat, versed in finesse; but also he is acquainted fully with his work and ready at any time or place to issue proper instructions or to render decisions pertaining to matters within his jurisdiction. He is invaluable. His ideals must be high, but not unattainable; his methods correct, his intentions and motives exemplary and manifest; his life worthy and inspiring. He is master of men by right of education and personality. Always the courteous gentleman, he instructs without egotism, rules without malice, censures without sting, disciplines without personal feeling, commends where commendation is due. He sees that employees deliver value received; and that they, in turn, are accorded fair and honest treatment. Their working conditions are as near right as he can make them, and he sees that their contracts are observed. He is not a prosecuting attorney, nor is he attorney for the defense. He rules by reason and sometimes with an iron hand; but he never forgets the velvet glove. He performs many and varied duties, but always he teaches, teaches, teaches.

A SUBSTANTIAL DESIGN FOR A SMALL STATION

The Chicago, St. Paul, Minneapolis & Omaha, recently completed a passenger station at Marshfield, Wis., which illustrates a type of construction readily applicable to passenger stations of moderate size, that will insure long life,

Structural Details of the Building

high fire resistance and low maintenance costs. These results were secured without detracting from the interior or exterior appearance, but in reality adding to the effectiveness of the design.

The station is one story in height and follows the usual

floor layout of small passenger depots, with the agent's office in the center of the building, a baggage room, an express room and a trainmen's room at one end, and waiting rooms

The structure was designed under the direction of H. Rettinghouse, chief engineer, of the Chicago, St. Paul, Minneapolis & Omaha, by H. P. Padley, principal assistant engi-

Exterior View of the New Station

at the other end, the main waiting room being adjacent to the office, with separate accommodations for men and women at the extreme end. The roof of the building is flat but is broken up into three different levels. The roof over the agent's office is 22 ft. above the platform to give headroom for a record vault on the second floor; the main waiting room has a height of 16 ft. to permit the installation of windows above the level of the canopy roof on the track side, while the wings containing the baggage and express rooms and the women's room and smoking room have ceiling heights of 13 ft.

The foundation walls are concrete. In the baggage room end of the building the floors consist of concrete slabs 6 ft. square, placed on sand filling. In the remaining portions of the building the floors are of reinforced concrete, of one way tile construction as illustrated in the drawing. They consist of slabs 3 in. thick carried by girders 8 in. wide by 12 in. deep, spaced 20 in. center to center, the space between these girders being occupied by rows of 12-in. hollow tile blocks. The floors are covered with cement tile, finished at the walls by a terrazzo cove. The same form of construction is used for the roof, except that the girders and the hollow tiles are only 6 in. deep, so that the total depth of the roof slabs is only 9 in. as compared with 15 in. for the floor.

The roof is flat except for a slight pitch to gutters on the line of the inside faces of the walls, these gutters draining to down spouts carried down on the inside of the building. This insures that the down spouts will not freeze up, and as the gutters are kept away from the copings of the roof all danger of dripping or of icicles over the face of the coping is eliminated. The walls are of brick faced with a tapestry brick, trimmed with a coping of dark-colored terra cotta. A canopy is provided on the track side of the building for the length of the main waiting room portion which consists of a reinforced concrete slab supported on reinforced concrete brackets. The windows have steel sash with horizontally-pivoted ventilators.

The interior walls and ceilings are covered with plaster, a wainscot of Keen's cement plaster with ruled joints being provided in the waiting rooms. The only woodwork used is in the upper trim of the window openings and the doors and door trim.

neer and architect. The Charles W. Gindele Company of Chicago was the general contractor.

The Crater Zone in the West

The difficulty of accelerating a pursuit under modern war conditions is strikingly illustrated in this photograph, which shows a railroad station and a section of a railroad completely obliterated by shell fire. What once was an even and solid roadbed is now a shambles of debris and craters, which must be bridged before any attempt at pursuing the enemy can be made.

Railway Regulation and Control

Newlands Committee Hears Issue of Transcontinental Rates. Rigid Long and Short Haul Clause Urged

SAN FRANCISCO, Cal., November 10, 1917.

THE hearings at San Francisco before the Newlands Joint Committee on Interstate Commerce were concluded on Saturday, November 10. After the cross-examination of Max Thelen of the California commission had been completed and a number of other state commissioners had been heard on the problems which the committee is studying, relating to the method of railroad regulation, the hearing developed into a controversy between the representatives of the Pacific coast shippers and the representatives of the intermountain territory regarding the adjustment of transcontinental freight rates. As no other witnesses appeared to throw light on the problem of regulation or government ownership it was decided to adjourn and hold further hearings later in Washington. The time for the committee's report was extended for a year by Congress shortly before it adjourned.

The old issue as to transcontinental rates was raised by the representatives of the intermountain interests, who expressed extreme dissatisfaction with the results of the Interstate Commerce Commission's various decisions in the case since it was given discretion, under the amendment of the long and short haul clause in the fourth section of the commerce act in 1910, to determine the extent to which the roads might depart from a rigid observance of the long and short haul rule. They declared that they had received no relief at the hands of the commission and insisted that Congress should take the matter out of the commission's hands by making the fourth section an absolute prohibition against the charging of a higher rate for the shorter distance than for the longer distance. They were so bitter in their complaints against the railroads and the commission that the members of the committee were led for a time to believe that the commission had done nothing in the seven years since the amendment was passed, until the representatives of the coast shippers arose to defend the coast terminal rates based on water competition and explained that when an intermountain man talks about "relief" he means nothing less than a reduction of the intermountain rates to the level of the terminal rates. The commission has ordered some drastic reductions in the intermountain rates and in its decision of June 30 ordered a readjustment either by a reduction of the intermediate rates or by an increase of the coast rates during the period, while water competition is in abeyance during the war, but this order has been suspended and the case reopened because the railroads elected to raise the coast rates and the recent action of Congress prohibited the filing of increased tariffs without the approval of the commission. Hearings are now being held on the new rates.

INTERMOUNTAIN TESTIMONY

F. A. Jones, chairman of the Arizona Corporation Commission, began the argument for a rigid long and short haul clause on November 3. He said the intermountain country had hoped that when Congress amended the law in 1910 they would be relieved of the discrimination caused by the lower rates to the coast but that it had about come to the conclusion that it had little to hope for from the commission. He argued that any rate that would be compensatory from the east to the Pacific coast would be amply compensatory for the shorter haul to the intermediate country which does not involve the haul of 500 to 1,000 miles over the mountains. He declared that the discrimination has greatly retarded the development of the intermountain region and that the railroads have sacrificed millions in revenues which

they might have received from higher rates to the coast as well as from a greater traffic to and from the intermediate country. He thought that a solution of the problem might be afforded by giving the Interstate Commerce Commission jurisdiction over water as well as rail rates. He said that the intermountain people generally favored an absolute long and short haul clause, but, personally, he would not object to some exemption on account of water competition. Mr. Jones also took occasion to object to the federal commission's being given jurisdiction over state rates, and to any general curtailment of the power of the states. He said that 90 per cent of the work of the state commissions is handled informally and that the people secure better results than could be obtained if they had to go to the Interstate Commerce Commission. He favored a plan of co-operation between the federal and state commissions in matters involving a conflict of rates but thought that many matters of service, and such matters as the length of trains, hours of labor, safety appliances and securities might be better handled by the federal government.

He was followed by Edward P. Troy, of the Public Ownership Association, who said he wanted to "enlighten" the committee on the subject of government ownership. He entertained the committee for two or three hours with a violent tirade against the railroads and corporations generally.

The long and short haul controversy was renewed on November 5 by W. M. Gardner, vice-president of the Reno Commercial Club, who got both the committee and himself so tangled up in the mazes of the history of the transcontinental rate cases that it took most of the next day and several additional witnesses with less oratorical ability, but with a better knowledge of the subject, to straighten it out. Mr. Gardner got into difficulties by starting out with the claim that the Interstate Commerce Commission had given the intermountain country no relief and that it had delayed its decision for seven years and then postponed it again. When the members of the Congressional committee became curious as to what the commission had been doing all that time, he admitted that the rates had been somewhat reduced but asserted that they were still too high to enable the intermountain cities to do a legitimate business. He said they were discriminated against not only on traffic from the east but also in the eastbound distributing rates, which he said enabled San Francisco jobbers to put goods into Nevada at lower rates than Reno could. He insisted that the discrimination was intentional for the purpose of favoring the coast jobbers and declared that it is "time for Congress to dissolve the jobbing trust which is maintained by permission of the Interstate Commerce Commission." He did not include in the conspiracy the Providence that located Reno in a desert instead of on tidewater. He said that he was not unsympathetic with the railroads and that if it were necessary to help win the war the intermountain country would cheerfully pay double rates if the coast cities were required to pay the same, but that until the discrimination is removed the people of Nevada are prepared to "use every club that is available" against the railroads. He said that instead of suspending its order of June 30 the commission should have reduced the intermediate rates instead of giving the roads a chance to apply for higher coast rates.

Members of the committee cross-examined the witness at length in the effort to find out what the Interstate Commerce Commission had done with the case. Senator Cummins and Representative Adamson seemed to find difficulty in un-

derstanding why San Francisco was any more entitled to the benefits of a favorable location on the sea than the intermountain country to its advantage of a shorter distance from the eastern manufacturing points. Alfred P. Thom, counsel for the Railway Executives' Advisory Committee, asked if the real criticism of the witness was not against the administration of the existing law and if he was not driven to advocating an absolute law by disappointment as to the results obtained under the existing law. The witness replied that he objected both to the administration of the law and to the way the roads had delayed it.

W. S. McCarthy, representing the Traffic Bureau of Utah, took up the fight for the intermountain country on November 6. He also presented a telegram from the Idaho Public Utilities Commission asking him to represent it in opposing a curtailment of the powers of the state commissions and the extension of the authority of the federal government, and in urging an absolute long and short haul law. He declared that the exemptions authorized by the commission have resulted in gross abuses and that Congress never intended that an adjustment of rates covering one-third of the United States should be regarded as a special case in the meaning of the law. His contention was that either the present terminal rates are reasonable without regard in water competition or that they are so low as to place a burden on the traffic of the interior and that the rates now applied to the coast should be amply compensatory when applied to the shorter haul when the roads are relieved of the haul of 800 miles from Salt Lake to the coast over a summit of 7,000 feet. He said the carriers had voluntarily made rates to the coast on iron and steel articles as low as 1.77 and 3.54 mills per ton mile while the rates to the interior are 10.84 per ton mile, and that although a large part of the traffic of the Central Pacific is carried for what the roads call unremunerative rates, its net earnings per mile are greater than those of four lines between Chicago and Omaha combined. He said the railroads would have plenty of traffic if they abandoned the water competitive freight to the boats and confined themselves to natural rail traffic and the inland haul from the ports.

TESTIMONY OF COAST SHIPPERS

H. M. Wade, representing the Oakland Chamber of Commerce, defended the lower rates to the coast, saying that the rates were originally fixed by water and that the intermediate points had benefited by it because their rates were also fixed with reference to the water rates. He thought the coast was entitled to the benefit of water-compelled rates even while the water competition is in suspense, on the ground that investments have been made on the assumption of the old adjustment and he declared that the intermountain cities are trying to get something which it is not possible for them to have because of their location.

Seth Mann, attorney and manager of the traffic bureau of the San Francisco Chamber of Commerce, outlined the history of the transcontinental rate litigation and defended the water-competitive adjustment in a statement which Senator Cummins pronounced the most lucid he had ever heard on the subject. The coast shippers, he said, feel that the adjustment is primarily one for the railroads to defend; they have asserted no right or title to lower rates, but they are situated upon the unmonopolizable highway of the sea, and if the railroads desire their traffic it is for them to endeavor to secure permission to meet the water rates. The discrimination is not an unlawful one and the principles on which the roads have acted have been sustained by a line of decisions of the Interstate Commerce Commission for 25 years. He then outlined each of these decisions to show that the commission had not been entirely negligent during that time and to show that the discrimination had been gradually reduced. He declared that the situation can never be per-

manently settled because it is continually changing, although he did not expect that either the rail rates or the water rates would ever be as low as they were two years ago because of the increase in the cost of operation. He said that San Francisco felt no spirit of rivalry toward Reno, but regarded it as one of its best customers and hoped for its prosperity. San Francisco's real rivals are the great jobbing centers such as Chicago and St. Louis, but the great interest of the coast is in developing a manufacturing business and in securing a supply of raw materials on favorable terms. The intermountain country should not object to the rail carriers taking freight that would otherwise go by water and the existence of the water makes the intermountain rates lower than they otherwise would be.

EXCLUSIVE FEDERAL REGULATION ADVOCATED

Mr. Mann also advocated a plan of federal incorporation of interstate railroads and an extension of the jurisdiction of the Interstate Commerce Commission to cover the intrastate rates which have an effect on interstate commerce. He also favored federal supervision of railroad security issues and said that the San Francisco Chamber of Commerce had voted in favor of the federal regulation plan in the referendum conducted by the Chamber of Commerce of the United States. As much of his testimony was devoted to the rate controversy Mr. Mann said that possibly a representative of his organization would appear before the committee later to discuss the question of regulation. If the state railroad commissions of all states were of the same high type and character as the California commission, Mr. Mann said, he thought there would be little agitation for a change from the present system of regulation, but in many states the results secured from state regulation are not so good and the tendency of modern times is toward a unionizing of governmental authority. No question of state rights is involved in an extension of the authority of the federal government because its powers in that field are plenary. Representative Adamson asked the witness if other states did not believe that their commissions were as good as the California commission. To this Mr. Mann replied that if they did think so he would have to differ with them. A system of federal incorporation, he said, would clarify many questions arising from the differences in the provisions of railroad charters which cause confusion in regulation and while Congress could give the Interstate Commerce Commission jurisdiction over state rates without federal incorporation he thought that such a plan would present the simplest method and that if the commission were given such jurisdiction the rate situation would be much clarified. There is no question as to the power of Congress to legislate as to state rates which affect interstate traffic; the question is purely one of policy and he had come to the conclusion, after careful consideration, that in the interest of efficiency it would be the best policy for the federal government to have exclusive control of the rates of interstate carriers.

The 15 per cent rate advance case before the Interstate Commerce Commission, Mr. Mann said, illustrated the great possibilities for conflict between federal and state rate regulation. If the federal commission should find that the railroads were entitled to the advance while the state authorities decided differently as to the state rates a serious conflict would immediately arise, and as there were representatives of nine state commissions participating in the case to oppose the request of the roads it was probable that they would have denied an advance even if the Interstate Commission had allowed it. Traffic situations themselves are not affected by state lines, Mr. Mann said, and therefore the rate situation should not be so affected. The proposed plan of federal regulation would result in a great improvement. He also favored the plan of regional commissions but thought that they should each include representatives of each state with-

in their districts who should be intimately familiar with local conditions. Asked by Representative Sims whether he thought the states would willingly surrender their authority over rates to the federal government, Mr. Mann replied that he believed that when the people are educated to an understanding of the situation they would favor such a plan, although they might not be ready to do so now. He added that under a plan of government ownership the railroads would undoubtedly be managed entirely by the federal government and that the states would lose all jurisdiction over them.

Members of the committee displayed great interest in the rate controversy and questioned Mr. Mann as well as other witnesses very closely. Senator Cummins asked what he thought the government would do if it owned both the railroads and the waterlines operating through the canal. Mr. Mann replied that he thought that for the greatest good of the greatest number it would make no substantial change in the present methods of adjusting rates and that while the Interstate Commerce Commission has made many rate changes it has accepted substantially the principles applied by the roads. If the roads were required to cease meeting water competition, he said, so much of the coast traffic, in normal times, would move by water that the railroads would be reduced substantially to an express service and the effect on their revenues would be disastrous. It would be unwise for the government to impose any artificial restrictions. He opposed the idea that the government should also regulate water rates on the ground that while the railroads are inherently subject to regulation there is no monopoly principle in sea transportation.

Percy P. Powell, representing the Spokane Chamber of Commerce, testified from the Spokane point of view regarding the rate controversy and advocated an absolute long and short haul clause. He said that while the commission's latest decision would remove the discrimination Spokane would not be completely satisfied with an advance in the coast rates but wanted its own rates reduced. He made much of the fact, as other witnesses had, that the terminal lines receive, as their division of the rates, all of the excess to the intermediate points, none of it going to the lines east of St. Paul, and he contended that if the coast rate did not represent an actual loss the intermediate rate was certainly excessive.

H. F. Bartine, chairman of the Nevada commission, gave similar testimony in support of his argument for a rigid long and short haul clause. He said he was not contending that the Southern Pacific earns too much money but that it is getting too great a proportion of it from the state of Nevada, and that San Francisco was trying to keep Reno as "one of its customers" instead of allowing it to become a distributing center on its own account. He admitted water competition but insisted that it was not controlling and that the terminal rates would be sufficiently remunerative if applied to the intermediate points, citing an example of an 80-cent rate to the coast which the roads had declared to be unremunerative but which they had reduced after the canal was opened to 55 cents. He said that no one could tell when the water traffic would return to the canal and that the water competition now should be ignored.

In reply to questions by Chairman Newlands, Judge Bartine said that the railroads should be allowed to go just as far, in meeting water competition, as they can without discrimination against the people who do not have water competition, and he thought that in the end the Southern Pacific would profit more by trying to build up Nevada than by discriminating against it in favor of the coast.

Senator Newlands said he believed in the full development of water traffic and thought it had been a mistake to allow railroads to absorb water traffic to the impairment of the water carriers, but that he was anxious to promote water

traffic without any violent wrench of existing conditions. He thought conditions might now be improved without doing injury to any section and asked whether the latest order of the Interstate Commerce Commission, if put into effect, would not be sufficiently satisfactory to the intermountain people to obviate the need for legislation. Mr. Bartine replied that the order would be satisfactory if it were applied without delay and if it could be expected to be permanent, but that it left them at the mercy of the commission because it was liable to be changed upon the return of water competition. As long as the order is in effect, he said, it would be just as good as a rigid long and short haul clause.

S. J. Wetrick, attorney and manager of the transportation bureau of the Seattle Chamber of Commerce, and also representing the Tacoma Commercial Club, defended the present rate adjustment, emphasizing the fact that it had been sustained in principle by the Interstate Commerce Commission, an expert body, and by practically all economists and experts who have studied it. He said that if the railroads are able to handle water-competitive freight at anything above the direct out-of-pocket expense, the benefit reacts to the advantage of the intermountain country by diminishing the rate they would otherwise have to pay.

Those of the committee who attended the San Francisco hearing were Senators Newlands and Cummins and Representatives Adamson, Esch and Sims. A large number of railroad officials and shippers were present during most of the sessions.

On November 7 the committee members were the guests of the San Francisco Transportation Club at a luncheon. Alfred P. Thom, counsel for the Railway Executives' Advisory Committee, gave a short address on the need for a constructive policy of railway regulation. "The railroads must be regulated," he said. "Their influence is too great for the government not to control it. But, as the government has 'got over' us the time has come when it must 'get under' us with its protective care and assure to the man who puts his money into the railroad business justice and protection."

Numerous plans and suggestions have been filed with the committee without oral testimony. One of these is in the form of a pamphlet by W. W. Cook, general counsel of the Mackay Companies, outlining his plan for the creation of five regional operating and holding companies with directors to be appointed by a Federal Railroad Board to be appointed by the President. The plan contemplates that the holding companies shall gradually acquire the existing railroads, by exchange of stock or by condemnation, and that three per cent dividends shall be guaranteed on the stock of the federal railroad companies by the government, all earnings over six per cent to go to the government. This plan is advocated by Mr. Cook as a substitute for government ownership possessing its advantages without its disadvantages.

William McCrae, of Spokane, and also representing the Commercial Club of Boise, Idaho, advocated a rigid long and short haul clause, saying nine states in the union have such laws. He cited the case of a bank building in which the freight on the materials cost \$35,000 more than if it had been built on the Coast.

Fred P. Gregson, traffic manager of the Associated Jobbers of Los Angeles, said that if the roads were obliged to give up the terminal traffic to the boat lines the weaker roads, such as the Los Angeles & Salt Lake and the Western Pacific, could not live, because their earnings from local traffic would not permit the movement of one train a week, but that the lines were needed to give California an outlet for its products of the soil which must move principally by rail, because of their character.

Mr. Gregson said his organization was in favor of federal regulation of securities, but that it had secured such satisfactory results from the California commission that it did not believe in the plan of exclusive federal regulation of

rates. This, he said, would require the tearing down of the present machinery and the building up of new. He would prefer regional commissions to the present method of the Interstate Commerce Commission of delegating so much of its work to examiners unless the commission could secure more competent examiners.

G. J. Bradley, secretary of the Merchants' & Manufacturers' Association of Sacramento, although representing a city that now pays the higher intermediate rates, strongly defended the present adjustment and said that it is better for the intermountain country than the plan they seek. He thought it a mistake to agitate for a rigid long and short haul clause, because such a step would disturb rates and disrupt business in all parts of the country. He thought that the Interstate Commerce Commission, in passing on the thousands of applications of the railroads for relief from the fourth section, had established a scientific basis of rates and had permitted violations of the long and short haul principle only where it was to the best interest of the country to do so. Mr. Bradley said his organization was in favor of federal regulation of securities, but thought the Interstate Commerce Commission now had sufficient authority over rates.

J. N. Gillette, ex-governor of California, strongly advocated exclusive federal regulation and the elimination of the authority of state commissions over interstate carriers. He said the primary interest of the people is in adequate service and that this could only be brought about by a definite constructive policy of federal control which would enable the roads to know where they stand.

The railroads must have an adequate surplus, he declared, and this can only come from fair rates. The commission should have jurisdiction over the relations between employers and employees, he said, because Congress is charged with the regulation of commerce and "it is a helpless government indeed that cannot prevent an organization of men from interrupting commerce." The railroads should have the initiative as to new construction, but the commission should have some control over their expenditures.

R. N. Lynch, representing the San Francisco Chamber of Commerce, said the organization had voted in favor of exclusive federal regulation in the recent referendum of the Chamber of Commerce of the United States, and he thought that practically the entire rate-making power over interstate roads should be in the hands of the Interstate Commerce Commission.

Isador Jacobs, president of the California Canneries Company, said that the intermountain communities are taking a very narrow view of the rate situation, and that the development of trade must always proceed from the large centers, which are always established by water competition. He thought that the railroad service had broken down on account of the great demands now imposed upon it, and that it probably would be necessary for the government to take over the roads during the war, and that as for normal times it must do something to improve railroad credit in order to attract the investment of the necessary capital. Either the government must own the roads and operate them, or own them and leave their operation to private corporations, he said, or it must guarantee a reasonable return on the investment. He also suggested that the government loan the roads one or two billion dollars. He thought the roads were probably doing the best they can under the conditions.

James Keller, of the Pacific Portland Cement Company, which has plants both in the intermountain country and near the coast, said that a rigid long and short haul clause would work to the detriment of the intermountain country by closing up plants which his company is operating, and which could not operate unless it were given rates in violation of the strict long and short haul rule. The proposed leveling of the coast and interior rates, he said, will merely take business away from San Francisco and Sacramento and give it

to Chicago and St. Louis rather than help build up the interior.

The committee adjourned to meet in Washington at the call of the chairman.

DECAY RESISTANCE OF SOUTHERN PINE

The two chief requisites for the proper use of timber for construction purposes are strength and resistance to decay. The density rule, which has been adopted by the American Society for Testing Materials and the American Railway Engineering Association provides a means for indicating the strength of Southern pine timber, but very little has been known regarding the relative resistance to decay of the different species of this timber. Recognizing the importance of this subject, the Southern Pine Association established a technical scholarship at the Missouri Botanical Gardens for the purpose of making a careful investigation of the relation of the physical and chemical properties influencing resistance to decay. This investigation has been conducted by Sanford M. Zeller, who has outlined the experiments and the results which he has secured in bulletin No. 198, of the American Railway Engineering Association which has just been issued.

The conclusions indicate that in the selection of high grade bridge materials of Southern pine the density factor is not only a safe guide to strength but also to resistance to decay, provided sufficient restrictions as to sapwood are incorporated, and that the present rules of the American Railway Engineering Association regarding sapwood and heartwood fulfill this requirement.

The experiments were conducted with three species of yellow pine, for each of which special attention was given to the physical properties of the different samples as to resin content, specific gravity, percentage of summer wood, the width of the growth rings or the number of rings per inch, the sap and heartwood, and the distance of the sample from the pith. The following conclusions were drawn from this study. (1) Resin is no safe index of the durability of the three species of yellow pine investigated. (2) The specific gravity or density of the wood materially influences the resistance to decay of the heartwood—the more dense the wood being, the more durable it is. (3) Specific gravity, however, is a property which can not be determined from inspection, but it can be estimated by recourse to the proportion of summer wood to spring wood in the growth rings, which proves to be a safe criterion of the durability of heartwood; i. e., an increase in summer wood results in an increase in specific gravity. (4) The width of the growth rings furnishes a further index of durability, the narrower rings showing more resistance to fungous attack than broad, open rings. (5) The age, or distance from the pith of heartwood, shows no relation to durability at least up to 16 in. in diameter. (6) Sapwood decays irrespective of resin content, specific gravity, width of the annual rings, or species of pine. (7) Shortleaf heartwood or loblolly heartwood is as durable as longleaf heartwood, provided it has the same qualities as to specific gravity or density. (8) Specifications for durability of the three species of pine considered should be based on a judicious combination of the specific gravity, the number of rings per inch, and the percentage of sapwood. (9) The investigation showed that there are no toxic effects of resin but that it has other important relations to decay, including its waterproofing effect on the wood.

AERIAL MAIL FOR OUR MEN.—Aerial postal service between the American troops in France and their British and French comrades, with an extension to Algeria and Morocco, is planned by the municipal postal authorities at Lyons, France.

Second Prize in Reconsignment Privilege Contest

A Vivid Picture of the Actual Work Involved in Handling Reconsigned Cars Through a Busy Yard

THE first prize article in the reconsignment privilege contest was printed in last week's issue of the *Railway Age Gazette*. The following is the article that was awarded the second prize by the judges.

DIVERSIONS AND RECONSIGNMENTS—FROM A YARD STANDPOINT

By S. W. Wherry,

Assistant Yardmaster, Pennsylvania Railroad.

From experience in one of the largest railroad yards in the United States it is my opinion that the reconsignment privilege is being badly abused and is being used for speculative purposes instead of in a legitimate manner. One case which came to my notice during the coal shortage of last winter was where a broker had purchased between 75 and 100 cars of coal being loaded at various mines; then in order to get the cars away from the mines quickly, he had it consigned to tide water points. He then sold the coal at various points where coal was in great demand at a price considerable in advance of the tide water price and issued instructions to have it reconsigned. However, this form of speculation in coal has been done away with by putting into effect a tariff which prohibits the reconsignment of lading which is loaded in self-clearing cars.

There does not seem to be any question in regard to the diversion or reconsignment privilege being a desirable practice from an economic view, so far as it relates to the handling of perishable fruits, vegetables, etc., inasmuch as it permits of a better distribution of such products and prevents a glut of the market at one point while at another point the same product will be in demand. It is not practicable for every dealer handling these products to know what the other dealers have contracted for or what is being shipped to them on a commission basis, with the result that the market will be flooded with some commodity, resulting in not only a loss of money to the producer, but also a waste of a valuable food product, which could likely be used to advantage at some other city. In these cases the privilege of diverting or reconsigning the surplus cars should make it possible to make a more even distribution of the product, and while it no doubt enables the dealers to manipulate the supply so as to keep up the price, it also prevents loss to the producer and waste of the product.

Other than with perishable freight, the necessity for reconsignment or diversion, except in rare cases, would seem to cease to exist, and in the case of reconsignment of perishable freight the railroad company making the diversion or which has been requested to make a diversion, should be permitted to make a charge which will fully compensate them for the amount of work involved, as it means almost as much work to receive a request to divert a car as to actually accomplish the diversion.

In this yard we handle two kinds of diversions or reconsignments. First, those cars which are destined to some point beyond and which are to be reconsigned en route to some other point or are to be forwarded by some route other than the one via which they were originally billed. Second, those cars which are carded to this point with an "Order and Notify" consigne, for the express purpose of being reconsigned to some other destination after they reach here.

When a request is received to divert a car of the first description a message is issued from the office of the division superintendent giving the information in regard to the

original carding and the diversion to be made. When this message is received at the central yard office the clerk handling it must examine the car records to ascertain if the car has already passed this point, and if so, advise the forwarding record. If car has not passed, the instructions in regard to diverting it are telephoned to both the receiving and despatching offices of the yard. At these points the car number is placed on an indexed list and it is then the duty of the yard clerks to look for the car in every train received and every train despatched, until it is either located or advice is received that it has been caught at some other point.

If the car has arrived before the message is received and has been shifted to the classification yard, it is very probable that the diversion will be such as will place the car in another classification, and this means that before the car can be despatched it must be shifted out and placed in the proper classification. When it is considered that this shifting must be done on the tracks and switches over which all the trains made up for despatching in the direction in which car is moving must pass, it will be realized what it means to the yard operations at that point to have to cut out cars which have been diverted after having been classified and made up in trains ready for despatching. I know of nothing which will cause the assistant yard master at the despatching point to "lose his nerve" so completely as to have a train made up in the classification yard or placed on an "advance" track, all ready for the road crew and then to have the yard clerk inform him that he has just received instructions to divert one or more cars in the train so that they will go via another route and will have to be placed in another classification. This means that he will either have to put the yard crew back on the train and shift the cars out when the crew should be making up another train in order to keep the classification work going, or he will have to order the road crew to shift the cars out after it reports for the train, resulting in excessive terminal time and delay in clearing the advance track, which in all probability is needed for a train being made up by a yard crew, or in case the train is made up on a classification track it will mean delay to the classification crew waiting on room on that track.

After a car has been located and reconsigned it is necessary to make a telegraphic report through the office of the division superintendent and also to make a written report to the freight department.

It is hard to understand the necessity or the reason for the great number of orders which are being received daily to divert cars. During the last two weeks of August, 1917, instructions were received at this yard to divert 269 cars, an average of about 18 cars per day. These cars were loaded with almost every conceivable commodity, but it is interesting to note that there were proportionately few cars of perishable fruits or vegetables, there only being three cars of melons, one car of apples, one car of cantaloupes, five cars of bananas, five cars potatoes, six cars peaches, two cars fresh meat, and one car of tomatoes, while there were 20 cars of steel, 7 cars of cement, 33 cars of lumber, 29 cars of coke, 22 cars magnesite, five cars feed, nine cars of wire and one or two cars of almost everything else which is shipped by rail, so that it is evident that the principal use of the diversion privilege is not to secure a better distribution of perishable food stuffs. Our lists of numbers of cars to be diverted have contained as many as 76 numbers.

It is difficult to figure the cost of this class of diversion,

the principal item being the wages of the various clerks who handle the instructions and endeavor to locate the cars, this cost being governed by the length of time the instructions are held before the car is located; and it costs just as much to endeavor to locate a car which is caught at some other point as it does to locate one and make the desired diversion. We find that the average time for holding a re-consignment order before the car is located or the order cancelled is five days so that the approximate average cost of clerical labor in handling a diversion or reconsignment order for an eastbound car in this yard would be as follows:

Wages of clerk at central office, looking up record of car and relaying instructions to yard points; 10 minutes to each car.....	\$0.05
Wages of clerk at receiving yard examining manifests for all trains received in 5 days, at an average of 56 trains per day, 3 minutes to each train.....	2.45
Wages of clerk at despatching yard for same service for trains despatched.....	2.45
Total clerical cost.....	\$4.95

This cost does not include the stationery used or of the telephone or telegraph operators in transmitting the messages, and does not give any consideration to the cost of reshifting the car if it is located in the classification yard. This same expense evidently occurs at every yard to which the diversion order has been sent.

With the second class of reconsignment cars, which are those cars which are billed to this yard for the purpose of being reconsigned, an entirely different condition exists. These cars are loaded with flour, hay, wheat, corn, oats, other grains and grain products, and in the early spring with tomatoes from the south. With the cars of flour, grain, etc., I understand the lading is sold while the car is en route to this point or while it is being held here. When the lading is sold before the car arrives the reconsignment is also received before the car arrives and a new manifest is made out by the clerk who handles this work, so that when the car arrives in the receiving yard this clerk lifts the original manifest and places the new one with the car, so that it goes through the yard in the regular course of traffic and the only additional expense incurred is for the transmission of the messages and the clerical labor required.

When the reconsignment is not received before the arrival of the car, it is necessary to shift it to a track in the classification yard which has been set aside for this purpose, to be held until reconsignment orders are received. As reconsignment is being received for some of the cars on this track each day it is necessary to bring the cars back to the receiving yard and reclassify them once each 24 hours. This means that once each day during the time the car is held waiting on reconsignment it will be shifted from the receiving yard to the classification yard and returned to the receiving yard, this operation costing \$0.623 as follows:

Average cost of delivering cars to classification hump.....	\$0.032
Average cost of classifying a car over hump.....	0.286
Average cost of hauling a car from classification yard to receiving yard.....	0.245
Average cost of inspection of car each day.....	0.06

Now, when the yard is open and movement normal, the only question to this rehandling is the expense involved, but when the yards become congested and trains are being held out waiting on yard room we must consider that the time consumed in passing the reconsignment cars over the hump is lost and results in holding a train of active freight out of the yard just that much longer than if this time was used to shift a train which would pass directly through the yard, while the room made in the receiving yard by shifting the reconsignment cars is not available for receiving another train from the road, as it is usually the case that a train of reconsignment cars must be started from the classification yard to the receiving yard before there is room to classify the train which is in the receiving yard.

During the past several years the number of reconsignment cars handled at this point has fallen off to a considerable extent, possibly on account of the market conditions

and also on account of the higher demurrage charges. During the past year there were 5,070 of this class of cars handled through this yard, 3,180 of which were reconsigned upon arrival.

The cars which are held for reconsignment are in the yard from one day to several months, in fact some of the cars remain in the yard so long that they are almost considered as permanent fixtures. I have in mind the case of an Erie car which arrived on May 22 and was not reconsigned until June 25; this car was loaded with flour from Toledo, O. It was shifted over the classification hump and returned to the receiving yard a number of times at a total cost of approximately \$18.07, the charge for demurrage and reconsignment was, I believe, \$130.00, so that not counting any per diem charges for the foreign car, the net earnings were \$111.93 or \$3.29 per day. It would be interesting to compare these earnings with those of another car leaving Toledo at the same time but remaining in active service the 34 days this car was held.

The standard \$2 diversion charge will cover the cost of reconsignment where a car is billed to a certain point and reconsignment is at that point before the car arrives or within 24 hours after it arrives, but it does not cover the cost of holding a car for reconsignment more than 24 hours, or of picking a car out of general trade before it reaches its original destination.

WASHINGTON CORRESPONDENCE

WASHINGTON, November 13, 1917.

The western railroads will be heard on December 17 as to why they should be allowed to advance rates. The Commission connected the application with the old 15 per cent case and made it, like the application of the eastern railroads, a resumption of the case decided June 29 in advance of the Commission's being advised as to what the western railroads desire to say.

A clear definition of the wishes of the Official Classification railroads was made public by the Commission on November 8, when it gave out a copy of a petition signed on their behalf by George Stuart Patterson, George F. Brownell, Hugh L. Bond, J. L. Minnis and Clyde Brown of counsel. They set forth the desire of the eastern carriers to re-file all the percentage tariff supplements which the Commission suspended and ordered cancelled at the time it promulgated its Fifteen Per Cent decision at the end of June. They wish to file the supplements with the understanding that as soon as possible and in no event more than 90 days after they become effective, the carriers will file specific tariffs on the basis of advances of 15 per cent, preserving established rate groupings, relationships and differentials; that the order in the Anthracite case, docket No. 4914, be modified and the carriers be allowed to file tariffs increasing rates covered by that order, as requested in the petition filed at the hearing on May 9, 1917, on the Fifteen Per Cent case; that all applications filed since August 15, and not yet acted upon, and other applications now filed with the Commission but not cited by the Commission's order of October, 1917, be allowed and short time permission be given to file tariffs in accordance with the applications; that the commodity tariffs suspended and set down for hearing before Examiner Disque immediately after the hearing on November 5, be permitted to become effective, as published, on short notice. At the end of their petition the attorneys warn the Commission that "this outline of procedure is intended to complete the Fifteen Per Cent case and is not intended to relate to such further advances in class and commodity rates as may be proposed by the carriers."

Prior to the filing of that petition, Examiner Disque conducted the hearings assigned to him. Broadly speaking, Clifford Thorne and Graddy Cary, a new comer in practice

before the Commission, are the only opponents of the request. Their only clearly defined clients are the independent oil refiners. The traffic managers of these refiners, F. W. Boltz and W. E. MacEwen, testified the oil business is not on a war basis, gasoline selling now for only one cent per gallon more than when the price of crude was half what it is now. That declaration was made in answer to a query by Examiner Disque as to whether the independent industry could not live under the proposed increase in rates during the war. MacEwen said it could not stand even a 10 per cent advance without losing a large part of the market to the Standard and thereby reducing the production of the independent refiners.

COMPTROLLER WILLIAMS ON THE RAILWAY SITUATION

John Skelton Williams, comptroller of the currency, and Clifford Thorne, during the hearings on the resumed Fifteen Per Cent case, engaged in a controversy as to the duty of the Commission in view of the great shrinkage in railroad securities. Mr. Williams started it by giving out a statement expressing the belief that the Commission should and would allow an advance in rates, thereby increasing the credit of the carriers.

Before that he had advised the examiners of national banks to pay not a great deal of attention to the fact that there had been a big shrinkage in railroad securities. His object in doing that was to keep the banks from calling loans for which railroad securities had been deposited as collateral. The calling of such loans would cause, he argued, good securities to be needlessly sacrificed. He said that railroad securities had been leaders in the shrinkage.

That statement, appearing in the newspapers the day after the hearing at which the railroad executives testified, Thorne chose to regard as an attempt to exercise pressure on the Commission. In a letter, sent out to the newspapers and not received by Williams at the time it was released for publication, Thorne "challenged as untrue" the declarations of the comptroller that railroad "securities have sustained the heaviest shrinkages" and that "they have been the leaders in the downward movement of values." Thorne asserted that "the decline in security values is not due to inadequate railroad credit or inadequate railroad earnings; it is due to the war."

The part of the Williams statement that caused Thorne most anguish was the declaration that "if a way can not be found now to reduce the prices of materials and the cost of labor to a normal basis, and this for the present is hopeless, it seems clear on the facts before us that a revision and modification of the fabric of rates to meet these new conditions has become imperative."

Comptroller Williams was given an opportunity to answer Thorne at the same time the newspapers published the latter's letter. After explaining that his purpose was to prevent the sacrificing of good securities as a result of mistaken policy on the part of national banks carrying them as collateral, Mr. Williams said that it was only necessary to refer to the stock quotation list to see the "absurdity and error" of Mr. Thorne's claim that railroad securities as a class have declined at a less rate than government bonds. He compared the decline in government bonds, 2s, from 100½ to 97; 3s of 1918, from 102 to 99; 4s, from 112½ to 105, and 3s of 1961, from 103 to 85, with the following declines in railroad stocks during the past year: St. Paul, 102 to 37; B. & O., 96 to 50; New York Central, 114 to 65; Erie, 43 to 13; Pennsylvania, 120 to 94; New Haven, 77 to 21; Norfolk and Western, 147 to 100; Delaware and Hudson, 156 to 95, and Union Pacific, 153 to 108.

PRIORITY ORDERS REGARDING COAL SHIPMENTS

Judge Lovett, the government priority director, on November 10 issued orders releasing the Panhandle from the

obligation of sending coal originating at mines east of Steubenville, Ohio, to the ports for the lake cargo coal trade. The coal from mines on the rails of that carrier is more valuable for by-product coke ovens than for use in the heating stoves of the northwest. At the same time, Judge Lovett exempted all mines furnishing lake cargo coal from his first priority order for the 24 hours of November 19, so as to permit the operators to send their production to industries in Ohio. The supply of coal for the northwest has reached 26,000,000 tons and the lake cargo priority order will soon be rescinded in full because the demand for coal nearer the mines is as urgent as in the upper lake region. Twenty-six million tons was the supply upon which the northwest was able to live in the winter of 1916-17. It is now figured that if there is any shortage, it can be made up by all-rail shipments. Fred C. Baird, who has been in charge of lake cargo coal shipments, will probably be in charge all winter of the distribution of all-rail tonnage under the supervision of the Fuel Administrator.

HIGHWAY TRANSPORT COMMITTEE ORGANIZED

The Council of National Defense, acting through its advisory commission, on November 9 created a Highway Transport Committee to study the possibilities of motor truck transportation. It is composed of Roy D. Chapin, president of the Hudson Automobile Corporation, chairman; Logan Waller Page, the good roads expert of the department of agriculture; Henry G. Shirley, engineer for the Maryland State Roads Commission, and George H. Pride, president of the Heavy Haulage Company of New York.

The underlying idea seems to be that it may be possible to devise a scheme whereby the railroads may be relieved of the obligation to haul freight into the congested terminals by having deliveries made by motor trucks. Last winter, during the worst of the congestion, some shippers took delivery in the suburbs of Chicago, Cincinnati and other cities because they were more in need of the freight than they were of the money it cost them to have the lading of the cars hauled to the delivery points designated in the bills of lading. A considerable tonnage of package freight is also being handled by truck between New York and Philadelphia, and between other cities.

INDUSTRIES TO BE PUT ON FUEL ALLOWANCES

In a comparatively short time all industries probably will be placed upon fuel allowances. No industry will be wholly deprived of coal or coke. The full supplies needed for the war-essential industries will be procured through curtailment of the allowance for industries that are not essential to the prosecution of the war.

It is felt that no general rules can be applied without exception. It will be necessary, it is believed, for the fuel administrator to scrutinize the list of customers of each large coal dealer, find out what work each is doing, and then make his allotment in accordance with the relative importance of each establishment.

In an announcement by the fuel administration it is set forth that "the improvements in transportation which must be accomplished, together with the curtailment of shipments of coal to non-essential industries, to a limited extent, will provide sufficient coal for the railroads, munition plants, public utilities, and domestic requirements. The transportation problem can be relieved only by the reduction in the amount of freight the railroads shall be called upon to handle. The reduction of shipments of coal will accomplish this, in that it will remove from the rails the per cent of coal covered by such reduction, and will accomplish a proportionate reduction in the amount of products to be moved as a result of such curtailment.

"The government's war requirements have been provided.

and attention is now being given to the various steel plants and the plants manufacturing government munitions and other supplies. The requirements of public utilities are being arranged for on a permanent basis. Also the domestic requirements.

"Special arrangements have been made to provide coal for ship building plants, which will insure the operation of these plants on a 100 per cent basis, in so far as the supply of coal is concerned. The same applies also to the aeroplane program."

This rationing is to be accomplished by coal orders to the coal operators and coke producers issued by the fuel administrator, and priority orders to be issued to the railroads, wherever orders of the last mentioned kind are necessary. Priority orders are not necessary to persuade the carriers to perform their duties. They are necessary merely to protect them from suits for damages on account of the disregard of laws forbidding preferences and discriminations, during the continuance of the war. Thus far no carrier has failed to operate its property in accordance with plans for carrying on the war in the most efficient manner. Whatever trouble there has been has been made by shippers who have been unable to see why their business should be curtailed or destroyed so as to make room for more essential war operations.

PROPOSED INCREASES IN RATES IN NEW ENGLAND

The Interstate Commerce Commission has begun an investigation of its own, based on the applications of New England carriers for permission to increase passenger fares and advance class rates applying locally over one line or jointly over two. Commissioner Anderson is to hear testimony at Boston on November 21.

As to passenger fares, the Commission's announcement says, these applications propose an increase in the mileage book rates from $2\frac{3}{4}$ cents to $2\frac{1}{2}$ cents per mile and, an increase in one way fares from $2\frac{1}{2}$ cents to $2\frac{3}{4}$ cents per mile. It is also proposed to increase party fares from $2\frac{1}{4}$ to $2\frac{1}{2}$ cents per mile. This general statement applies to all the carriers except the Central Vermont, the Rutland and Grand Trunk. These three carriers propose only to increase the rate for 500 mile tickets from $2\frac{1}{4}$ to $2\frac{1}{2}$ cents per mile, no increases being proposed in the one-way fares. Certain changes are proposed by the Boston & Maine in its commutation fares and forms of commutation tickets.

The increases proposed in freight rates apply only to shipments moving under class rates either locally over one line or jointly over two or more lines. The proposed changes will result in materially increased charges for shipments moving under class rates, particularly for short hauls.

THE PRUSSIAN RAILWAY BUDGET.—The budget of the Prussian State railways for the financial year 1917-18 provides for very considerable expenditure. In addition to the appropriation of 105,000,000 marks (\$25,200,000) for locomotives and rolling stock and 151,000,000 marks (\$36,240,000) for new works and renewals, etc., over 312,500,000 marks (\$75,000,000) are to be spent under the provisions of the "Railway Loan Law." Of this sum, 259,000,000 marks (\$61,160,000) are to be allocated to locomotives and rolling stock and 15,250,000 marks (\$3,660,000) to new lines; 10,500,000 marks (\$2,520,000) are to be spent on track doubling, 5,000,000 marks (\$1,200,000) on light railways and just under 23,000,000 marks (\$5,520,000) on miscellaneous works. The budget also estimates an increase of 225,000,000 marks (\$54,000,000) in freight receipts and a decrease of 52,000,000 marks (\$12,480,000) in passenger traffic. These figures not to be taken at their face value, in view of the extent to which the German railway receipts are nominally increased by payments for military traffic, which merely represents sums handed over or credited by one government department to another.

MEETING OF RAILWAY DEVELOPMENT ASSOCIATION

The semi-annual meeting of the Railway Development Association took place at Chicago on November 8 and 9, with R. W. Cooke, president, in the chair. The convention was devoted largely to informal discussion by members on matters of interest to the organization. W. H. Manss, assistant to the vice-president of the Baltimore & Ohio, Baltimore, Md., outlined a plan he is preparing for the colonization of immigrants and returned soldiers and sailors after the termination of the war. His scheme includes the purchase of large tracts of land and the disposal of it on easy terms of payment. He favors the settlement of immigrants of the same nationality on adjoining plots and the erection of farm houses in villages centrally located with reference to the farms of the settlers, believing that this scheme will develop community spirit and a higher grade of agriculture. A similar plan of settlement is being worked out for veterans of the war.

J. C. Skinner, supervisor of state marketing agents, United States Bureau of Markets, Washington, D. C., urged members of the association to encourage the organization of co-operative shippers' marketing associations on the ground that these bodies insure the prosperity of the farmers and consequently the welfare of the communities which the railroads serve. He called attention to the federal law exempting such associations from prosecution under the Sherman anti-trust law and pointed to their advantages in increasing the agricultural yield, bettering the grade of farm products and improving methods of packing produce for shipment.

There was considerable discussion on the subject of whether there is a place for the railroad market bulletin now that state marketing agents issue such bulletins at regular intervals in many states. E. H. Anderson, agricultural agent of the New York Central, Rochester, N. Y., pointed out that government bulletins often reach the farmers too late to be of real service and that they contain information concerning large markets only. The railroad bulletins, he said, have the advantage of reaching the farmers more promptly and of containing information concerning the smaller as well as the larger markets. He explained how his road supplemented its bulletin service by sending the farmer advice concerning marketing conditions by telephone and telegraph. He also explained how his road had benefited the producer by diverting his shipments from glutted markets to points where his produce could be disposed of more advantageously.

The keynote of the discussion of railroad industrial development was that no further work should be undertaken except that which directly assisted in the winning of the war. The relative importance of agricultural work which shows immediate results and work the benefits of which extend over a long period were debated. It seemed to be the consensus of opinion, however, that agricultural agents should carry on neither kind of work exclusively. Various plans were suggested of compiling annual reports of agricultural accomplishments.

H. B. Fullerton, director of agricultural development of the Long Island, Medford, L. I., and chief grub scout of the Boy Scouts, described his work as director of fruit production by the Boy Scouts in Long Island. Mrs. H. B. Fullerton, assistant director of agricultural development of the Long Island, explained the advantages of a new dehydrator now used in this country. This process reduces the weight of fresh vegetables fourteen times.

A BAGHDAD RAILWAY RELIC.—Among the booty taken by the British at Baghdad was a sealed packet of tickets of the Baghdad railway. Each ticket had a round hole punched through the middle for the string (with a leaden seal) that ties the packets.

A Study of Friction Draft Gear Capacity*

A Travel of Four Inches or More is Recommended to Protect Properly the Car Structure and the Lading

By Louis E. Endsley

Professor, Railway Mechanical Engineering, University of Pittsburgh.

THERE are three things that draft gears may do in the handling of railway cars. These may be divided in general as follows:

1. Produce slack in starting trains.
2. Control slack in the movement of trains.
3. Reduce the impact force in the switching of cars.

In all of these the principle involved is the same, namely, producing the same speed in two cars that may be coming together or going apart because of differences of speed. The draft gear to be effective in doing this, must have a capacity that is relative to the difference in speed. What I mean by this is that for a difference of speed of, say, one mile per

will have to increase the slope of line AB to AD , in order to keep this pressure 300,000 lb. or below, and will only get an area represented by ADC , which is only twice that of ABC . The slope of line AD is much greater than line AB , and should it be desired to get four times as much area as that in ABC and still have the same travel, it will be necessary to increase the pressure to 600,000 lb., and then the area of AGC will be four times ABC , or area AGC will equal AEF , and the capacity of these two gears will be the same. The two-inch travel gear will have twice the final force that the one with the four-inch travel will have. This final force is what a great many people have called the capacity of a draft gear. The comparison shown in Fig. 1 is ideal. It would be almost impossible to construct a draft gear that has a slope equal to line AG . But this figure was merely given to illustrate the advantage of long travel gears.

If we have a draft gear that has a capacity equal to one-fourth the difference of the energy of two cars in impact, the cars will not receive a shock above the maximum force necessary to close the gear. That is, if a car is going 4 m.p.h. and strikes a car standing still, it will produce in the standing car approximately half of the speed of the moving car, or in other words, put into the standing car one-fourth of the energy that was originally in the rolling car. The rolling car will retain approximately one-fourth and coast down with the second car, but half the energy is gone and it must be absorbed in the draft gear or some part of the underframe. Of course, some of this energy may be absorbed, due to the shifting of the load, but it must be destroyed in some manner. If it is not done in the draft gear, it is bound to be done on the underframe or the coupler.

This shifting of the load amounts to considerable in some kinds of freight, such as coal and ore. Now, if the load should shift one inch, this would be equal to increasing the draft gear travel one inch; also, any give in the underframe would be equal to increasing the travel of the draft gear. Now there is considerable difference in the give of cars. Steel cars only give half as much as wooden cars below the elastic limit, assuming that both have the same ultimate strength. This fact is one thing that has been entering into wooden car construction. There has been considerable give in the bolt holes between the draft timbers and sills. Thus

Fig. 1—Graphic Representation of Draft Gear Capacity

hour, a draft gear of small capacity will suffice, but if the difference in speed is 4 m.p.h., it will take a draft gear 16 times as large to prevent a shock, for the energy of a moving body is proportional to the square of its velocity.

Draft gear capacity is the number of foot-pounds of work required to just close the draft gear. It can be represented by an area, as shown in Fig. 1. The lower line of this chart represents the travel of the draft gear and the upper distance represents the force exerted on the coupler to close the draft gear. If we assume a draft gear with a travel of 2 in., or from A to C in this figure, a final pressure of 150,000 lb., or from C to B , and that the pressure necessary to close the gear under discussion was directly proportional to the movement; the line of action of the gear would be a straight line and would be represented by AB . The capacity of the gear then would be represented by area ABC . Now, if we wish to increase the capacity without increasing the slope of the line AB , we must increase the travel, and if we should increase the travel to double that shown in the shaded area, we would have four times as much capacity as we had before. That is, if AC equal half of AF , the area ABC is one-fourth of AEF . While if we wish to increase the capacity of the gear and not the travel, we

TABLE I
Comparison of a Car, Total Weight 150,000 Pounds

Speed in miles per hour	Approximate energy in foot-pounds	Capacity of gear in foot-pounds to just close	Approximate height of drop of 9,000 hammer to shear nine 19/32 rivets
1	5,000	1,250	4.7 in.
2	20,000	5,000	9.7 in.
3	45,000	11,250	18.0 in.
4	80,000	20,000	28.7 in.
5	125,000	31,250	44.7 in.
6	180,000	45,000	63.0 in.

the car itself has been absorbing the shock and there has not been as much need for a draft gear of a large capacity. But when we are now using all steel cars with no give in the rivets, the draft gear must do the work of absorbing the difference in energy between the two cars coming together in impact or the coupler or some other part of the car will have to do it; if the coupler is stronger than the other part of the underframe, the underframe will have to do it.

*Abstract of a paper read before the Canadian Railway Club, November 13, 1917.

In order to illustrate what energy is necessary to be absorbed for different speeds of cars in switching service Table I is given. The first column of this table gives the speed in miles per hour; the next column gives the foot-pounds of energy in the moving car at the speed given in the first column; the third column gives the capacity of the draft gear that should be used in each car for the speed represented in the first column for two cars weighing loaded, 150,000 lb.; the last column gives the height of drop that the 9,000 lb. hammer should fall before it shears off 9 19/32 in. rivets to have the capacity given in the third column. This column was obtained by multiplying the values in the third column by 12 and dividing by 9,000 and adding 3. The first part of this deduction is to obtain the height of drop to close the draft gear. The 3 added at the end is the added height in inches that it will take to shear the rivets after the capacity of the draft gear is taken up.

Now, it will be seen that a very small capacity is necessary for one mile per hour, namely, a drop of 4.7 in. of the hammer, but a draft gear that is many times as large is required for a difference in speed of 6 m.p.h., or 63.0 in. This height should be the total fall of the hammer to just touch the dummy coupler used, plus the travel of the draft gear. That is, if the fall of the hammer was 15 in. before it started to close the gear and the travel of the gear was 3 in., the total capacity of the gear would be represented by 18 in. I, personally, think that we should take care of 4 m.p.h. switching speed in the draft gear design. If we should do this, that is, if the draft gear would just close under a speed of 4 m.p.h., it is certain that the coupler or

average pressure that I obtained on several sets of lugs.

Now, when the 9,000 lb. hammer drops vertically on a draft gear that is supported on these two lugs that rest on a solid base with these same rivets in the lugs, they will not shear off until an approximate pressure of 275,000 lb. is reached, and in a good many tests with the same draft gear and different sets of lugs, the variation is never more than 1 in. That is, if a given gear shears off at a 16-in. drop, it might go 15 in. at another test, or if it shears off at 24 in. one time, it might go to 25 in. on another set of lugs. In other words, the variation is very small. I have con-

Fig. 3—Deformation of Sills with the Center Line of Draft $3\frac{3}{4}$ in. Down from the Top of the Sills

Fig. 2—Deformation of Sills with the Center Line of Draft at the Center

any part of the car would never be damaged in an impact between two cars at this speed.

There is not a coupler on the market but that will stand a greater impact force than the force necessary to close any draft gear on the market today. I have given some heights of drop that a 9,000 lb. hammer should fall before it shears off one or both lugs with 9 rivets 19/32 in. in diameter. This method of testing draft gears was first used, I think, in September, 1908, at the Westinghouse Airbrake Company, but there 9/16 in. rivets were used. To my mind, this is the best method of determining the capacity of a draft gear. In this method of testing, the draft gear is mounted on two lugs that are riveted to two short pieces of channels and held upright between posts. Each lug has nine rivets, each 19/32 in. in diameter, each lug carries half of the load, and the test is made by dropping the 9,000 lb. hammer from 1 in., 2 in., 3 in., and so on, until one lug is sheared off. This occurs at about 275,000 lb., which is the

ductured a test of a certain draft gear of a given make that sheared off three sets of lugs at exactly the same height, which means that this method is bound to give very accurate comparison of the capacity of different draft gears.

Up to this point in the paper, I have been talking of draft gear capacity and have not mentioned the absorbing capacity. I wish to distinguish between these two at this point. Draft gear capacity is defined as the foot-pounds of work necessary to close the gear. The absorbing capacity is that which is not given back when the draft gear is released after being closed. This feature of a draft gear can be very easily obtained from the drop of 9,000-lb. hammer by putting a recording pencil on the hammer and causing it to mark on a revolving drum. If the hammer falls 20 in. and rebounds, say 10 in., it is evident that the absorption has been half the capacity. This feature of the draft gear comes into play in controlling the slack of a long train in going up and down grades and in the starting and stopping of trains. If the slack should run in, and is not absorbed by the draft gear, it would run out under almost the same speed minus only that absorbed in the journal and rail.

This brings me to a point that I have often made, and that is, that we can not expect a draft gear to last the life of the car any more than we can expect a brake-shoe to last the life of the car. No one has, as yet, discovered a metal that has any absorption of work by sliding on some other material that does not wear. Of course, some metals wear more than others under the same absorption. Some years ago I made some tests for the Brake Shoe Committee of the Master Car Builders' Association, and found some shoes with the same coefficient of friction that varied as much as 300 per cent in the loss of weight in doing a given amount of work. And this is a very good subject for study by the draft gear companies. It was found that the loss of metal increases very fast as the pressure increased and the coefficient of friction decreases as the pressure increases. We should keep the pressure between the wearing surface of the

draft gear as low as possible and this can be done by making it as large as possible.

Some time ago the M. C. B. committee on car construction made some recommendations with regard to the center line of draft. These recommendations when applied to most cars fixed the center line of draft within 2 in. or 3 in. of the center of the sill. In order to get some information on this subject six sets of channels were made up; photographic reproductions of two of them after the tests are shown in Figs. 2 and 3. The channels were each 15 in. high and weighed 40 lb. per ft. The center line of draft of one set was placed on the center of the channel or $7\frac{1}{2}$ in. from the edge and this distance from the edge was decreased by $1\frac{1}{4}$ in. until $2\frac{1}{2}$ in. was obtained. Two sets of channels with the center line of draft $6\frac{1}{4}$ in. from the edge were made, one set of which did not have any tie plate. The results obtained are given in Table II. It is evident from this table that the

TABLE II

Maximum pressure obtained in impact test made on 15-in. 40-lb. channel with 15,000-lb. pendulum hammer, with different center line of draft.	
Distance from edge of channel	Maximum pressure obtained before the channel failed
$7\frac{1}{2}$ in.	1,125,000 lb.
$6\frac{1}{4}$ in.	960,000 lb.
5 in.	725,000 lb.
$3\frac{3}{4}$ in.	662,000 lb.
$2\frac{1}{2}$ in.	744,000 lb.
$6\frac{1}{4}$ in. without tie plate.....	

center line of draft should be for maximum strength within 2 in. of the center line of the sills, and that the tie plates are of great value in strengthening the sills. By looking at Fig. 2 it will be seen that when the line of draft is on the center, both upper and lower flanges are bending, while with the line of draft $3\frac{3}{4}$ in. from the edge, as shown in Fig. 3, nearly all of the bending is at a place in the edge of the channel closest to the line of draft. This is nothing extraordinary, for you all know that if you eccentrically load any two pieces of steel, the one close to the load is going to take most of the work and the ultimate strength of the system is reduced.

SUMMARY

I have attempted in this paper to bring to your minds two or three very important things in the selection of draft gears and the design of freight cars. One of the most important things is—we will have to increase the travel of the draft gear above that thought sufficient some years ago. Some years ago it was felt that 2 in. or $2\frac{1}{4}$ in. was as much travel as we should have. But I am ready today to say that we should have at least 4 in. of travel, or possibly more, in any draft gear. It is evident that this is going to allow us to materially increase the capacity of the draft gear.

Another thing of importance to the railway men today is to know what capacity of draft gear they are getting. I am confident that the best method for them to use is the rivet-shearing test, as already described. The number of rivets does not enter into the subject. What they should have is a set of lugs that will shear just above the force which is necessary to close the gear under test. I can conceive how a gear can be designed for a final pressure of 350,000 lb., then a test of rivets shearing off at 275,000 lb. would not be fair. But in any design of a lug, the lug should be made much stronger than the rivets in order that the lugs will not bend down and the gear show a false capacity. I can see how a lug may be built and give false capacity of draft gear, but the lugs should be designed stronger than the rivets. I myself, have not found a draft gear today but that will close before it shears off 9 19/32 in. rivets. There may be some, however, on the market.

One thing that is important in the design of a freight car is that the underframe of the car should be made stronger than the coupler. It has been the coupler in the past that has been saving the car after the draft gear went solid. The men who repair cars appreciate the large num-

ber of couplers that fail. I am wondering if when we put on the new M. C. B. coupler it is not going to be the underframe of the car instead of the coupler that is going to fail when the draft gear goes solid. Especially is this true if we move the center line of draft out from the center of the sills or leave off the tie plate, as shown in the latter part of this paper, because then the pressure of only 662,000 lb. destroys the sills with the center line of draft $2\frac{1}{2}$ in. from the edge of the channel. The new coupler will stand this and more in compression, which means that it will not be the coupler but the underframe that fails, and it will cost considerably more for repairs than the coupler.

I assume that everybody here knows that a friction draft gear is superior to a spring gear, but I do not believe that all of you know how much this difference is. The highest capacity spring gear in use, made of two M. C. B. class G springs, will fully protect your 100,000 lb. car and lading at a switching speed of a little less than 2 m.p.h. There are friction draft gears in general use on thousands of cars that will protect this same car and lading at 4.5 m.p.h. Also, there are many gears on the market that will fall between these two extremes, and each of these gears has a definite speed at which it will protect the car. But if you should attempt to switch cars at 4 m.p.h. while equipped with a spring draft gear that only protects the car at a little less than 2 m.p.h., the coupler, underframe and lading are bound to suffer. Either the coupler or underframe will fail if this speed of switching is kept up. On the other hand, should this same car be equipped with the highest capacity gear, mentioned above, it could be switched at 4 m.p.h. without any damage to the underframe or to the coupler.

Unless we put on a car a draft gear of sufficient capacity to keep it from going solid, the force that car will stand is going to be limited by the strength of the weakest part. If this is the coupler it will be from 400,000 to 700,000 lb. on most couplers in service, or if the car be equipped with the new M. C. B. coupler type D, this force will be from 600,000 to 1,000,000 lb. Now, if it be the underframe that is weakest, and this may occur if the design is not correct, this pressure will be a little less than that given above for the strength of the coupler. But in any case, this force may be 600,000 lb. Now, if the impact force and shock is 600,000 lb. and the weight of the car is 150,000 lb., the end pressure per pound of car weight and lading will be 4 lb. per pound of weight, or will be equivalent to standing a car on end that has four times as much load in it as the car in question contained. This is what has been knocking out the ends of cars, damaging roofs, side walls, and racking the car in general and on account of insufficient draft gear protection. Now, if the travel and capacity of the draft gear is enough to keep this end force down to 300,000 lb., it would result in practically no damage to the car.

More care must be given the draft gear in the manner of inspection and repairs in order that it may do the work which it was put on for, and which it will do if kept in repair. It may mean new gears or parts of gears, and there will be some expense attached to this inspection and upkeep, but the saving in repairs to other parts of the car is bound to more than make up for this expense.

DISCUSSION

Mr. Endsley's paper was received with enthusiasm by the members of the club who considered it a valuable contribution to the study of the draft gear problem. Among those who discussed the paper were James Coleman, superintendent car department of the Grand Trunk, C. W. Van Buren, general master car builder, Canadian Pacific, R. W. Burnett, master car builder, Delaware & Hudson, and G. E. Smart, master car builder, Canadian Government Railways.

All who spoke were strongly in favor of high capacity friction draft gears. Mr. Coleman said that about 70 per cent of the claims for damage to lading which are of an indeter-

minate nature may safely be charged to inefficient draft gears. Attention was called to the necessity for the inspection and maintenance of draft gears both by C. W. Van Buren and R. W. Burnett. Several members spoke particularly of the need of some method for automatically taking up the slack in friction gears as the parts become worn. Mr. Burnett called attention to the necessity for giving the draft gear attachments careful study, especially the draft yoke. These are often responsible for failures of the draft gear. G. E. Smart particularly urged the extensive use of metal draft arms on the wooden equipment which is now being built so extensively because of the lack of steel. In closing the discussion, Mr. Endsley called attention to the question of the relative strength of the draft gear and center sills, stating that the center sill construction should be made stronger than the draft gear and the draft gear so designed that the parts which are more accessible for repairs will fail first.

The meeting was addressed by E. W. Beatty, vice-president of the Canadian Pacific, who spoke of the Canadian Victory Loan. Eighty new members were taken into the club.

REPORT ON NEW JERSEY FULL CREW LAW

The New Jersey Board of Public Utility Commissioners has issued a report, signed by R. W. E. Donges, president, on the petition of the Central Railroad of New Jersey for authority to withdraw the sixth man from certain passenger and freight train crews; and the petition is denied.

The full crew law of New Jersey, chapter 190, of 1913, requires that on freight trains of more than 30 cars there shall be two brakemen besides the flagman. By chapter 94 of the present year this law is superseded by one empowering the commissioners, on their own initiative, or on complaint, to direct any railroad to employ such number of employees on any train as would be necessary to afford safe, adequate and proper service for the protection of the public and the employees; and this law forbids any reduction in crews from the number required by the law of 1913, without the consent of the commissioners.

The railroads of the state, through a committee, have worked for the repeal or modification of the full-crew law, and the present action of the Central of New Jersey was understood to be preliminary to action by other roads. On the Central the number of extra brakemen affected by the law is only 32.

At the opening hearing the railroad company modified its petition and asked for action only concerning through freight trains—long trains making few or no stops. In the petition 26 of these trains had been mentioned by name, but, says the report, "the road at the opening hearing announced that relief was sought not in relation to any particular train enumerated in the petition, but the board was asked for an order broad enough to authorize the road to reduce the number of men employed in operating all through, fast and drag freight trains."

Continuing, and referring to the brief of C. E. Miller, attorney for the road, the report says, quoting Mr. Miller: "Because of the variance in the number of trains of these classes operating each day, the petitioner will be precluded from obtaining relief in this or any other like proceeding, unless the order of the Board is broad enough to authorize it to reduce the number of men employed in operating all through * * * freight trains. The question therefore to be determined, resolves itself as follows: Will the operation of any of these trains by a crew of less than six men afford safe, adequate and proper service for the protection of the public and the employees? * * * And if so, on what train or trains should the railroad be authorized to reduce the crew?"

Hearings were held consuming many days. The report gives what purports to be a summary of the evidence; but this summary is taken up largely with a narrative of the

everyday work of the trainmen, with little specific reference to points in relation to which a third brakeman would increase or decrease the safety of operation. For a single day, September 12, records were kept of all the trains under discussion, showing the number of stops and the number of cars taken or left at each stop. On most of these trains the number of cars usually is from 50 to 75, the smaller number being on the fast freights. General Superintendent J. W. Meredith presented the principal statement for the road. The report copies from this a description of the road-work done by the crews; but this deals with routine matters and throws no light on the question of safety.

The Brotherhood of Railroad Trainmen, represented by J. A. Matthews, a New Jersey lawyer, opposed the petition, claiming that no proof had been submitted to justify the contention that the trains enumerated in it should be classified, and had not shown that the relief sought should be granted. A number of trainmen were called to testify concerning their duties and their everyday habits of work. Testimony was offered of a general character as to the number of stops made by these trains, the number of cars picked up and set off and the emergencies encountered.

These witnesses said that trains are longer and heavier than they were prior to 1913. They told of the number of regular and emergency stops and enumerated the causes of emergency stops. The report says that "all of the testimony shows conclusive variations on all the trains. * * * In the main the witnesses for the railroad and for the brakemen agree in their statements of the principal facts;" but as to inspection of cars at the beginning of a trip, the railroad says that inspectors are employed, while the trainmen claim that their own inspection is necessary because of the inefficiency of the regular inspectors.

Continuing, the report says:

"The petitioner insists that the crew of three men excluding the engineer and fireman would be ample, and that there is no work at the terminals which requires the extra or 'full crew man.' The respondent, on the contrary, insists that said man is necessary. The work necessary to be done by the crew on the road varies with the number of stops to be made, number of cars picked up and set off, the number of cars set off for disability. * * * The railroad company did not ask in its petition to remove the extra man from all through, fast, and drag trains operated by it. Only a few of such trains are therein included. We are unable to discover from the testimony what distinguishes the trains mentioned in the petition from the other trains in the classification of the railroad company. If it is sought to deal with the trains by classes, the proof should be satisfactory that the characteristics of such classes are substantially uniform, and applicable to all trains within the class. Further, the classification should be related to, and serve as a guide regarding the size of the crew required to handle such trains.

"We are unable, on the proofs submitted, to conclude that all through freights, all fast freights and all drag freights do not require a sixth man. To make the order sought by the company would result in permitting the company to exercise its judgment as to the size of crew of all through, fast and drag freights, and thereby wholly nullify the provisions of the statute.

"We are unable to deal with the particular trains specified in the company's petition, because it offered no testimony to show that these individual trains do not require the sixth man. It relies entirely upon establishing the classification above mentioned, which would include the trains specified, as well as other trains.

"We conclude, therefore, that the Board cannot, under the proof submitted, authorize the withdrawal of the sixth man from all 'through, fast and drag freights' as petitioned by the petitioner, and that the petitioner should continue to operate such trains with crews of the size now required by law. The petition for such withdrawals will be denied."

Bankers Report on Railroad Securities

Unsatisfactory Condition of Railroad Credit, and Conditions Which Must Be Restored to Re-Establish It

THE following is the report of the committee on railroad securities to the board of governors and members of the Investment Bankers' Association of America at the sixth Annual Convention of the association held at Baltimore, Md., November 12 to 15.

The committee believes that expansion of facilities is the most important problem which the railroads will have to face during the next few years, and that expansion sufficient to meet the demands of the business of the country will be impossible until the present unwillingness of investors to provide new capital can be overcome.

Opinions differ materially as to the causes for the present unsatisfactory situation. Individual cases of mismanagement and the depreciation which has taken place in market values, due to unfavorable financial conditions incident to the war, are frequently referred to as the primary causes for loss of confidence in railroad securities. While the committee believes that both of these factors have added to the difficulties of financing, it is strongly of the opinion that the loss of confidence is due largely to the decline of credit brought about by decreasing margins of net earnings over fixed charges and dividends. The conclusions of the committee are based upon an examination and an analysis of the financial statements of a large majority of the railroad systems of the country. These statements clearly show that the margins over fixed charges and reasonable dividends have been steadily and almost universally declining for some years, and this condition applies for the most part to the well managed and conservatively capitalized systems as well as to the systems whose managements have been fair subjects of criticism.

That confidence was not restored and the attitude of investors was not changed by the more favorable results shown by the railroad statements for the year 1916 may well be attributed to lack of assurance of the permanency of the improvement, due to the difficulties which railroads have experienced in the past in their efforts to obtain increased rates to offset increased costs of operation, and the apparent failure of the regulating authorities to recognize the amount of margin over fixed charges and dividends which is necessary to maintain credit on a satisfactory basis.

ROADS DIVIDED INTO GROUPS

For the purpose of this report the principal railroads of the country have been divided into three groups, and an attempt has been made to account for the varying degrees of credit possessed by each group.

Group one includes roads which are generally considered conservatively capitalized, with physical and other assets approximating the total capitalization, stocks and bonds: Further, with a capitalization so divided between stocks and securities with a fixed charge as to make the financial organization well balanced.

Group two includes roads in financial difficulties, and, for the most part, in the hands of receivers.

Group three includes roads of which a large majority has too large a proportion of the capitalization (even though the total may not be excessive) made up of securities with fixed charges, resulting in a poorly balanced and unsound financial organization.

A careful analysis shows that a very large proportion of the business of the country is handled by a comparatively small number of roads. For the year 1915, the total railroad earnings of the country amounted to \$3,125,135,798, of which \$2,893,037,528, or over 92 per cent of the whole, was handled by 87 systems, which included all the railroads with gross earnings of over \$5,000,000 per annum. The remaining business, \$232,098,270, was handled by 215 systems, the

earnings of each one of these systems being less than \$5,000,000 per annum. It will be seen from this that while the number of companies is large, the number which needs to be studied in order to learn the tendency of financial operations affecting the greater part of the railroad interests is comparatively limited.

Dealing, first of all, with the railroads in group one, it may fairly be stated that these roads represent sound practice both in operation and finance. For the most part they have met the tests of credit established by the conservative savings bank laws of New York and Massachusetts. Included in this group will be found all the railroad systems, with few exceptions, which have financed any considerable part of their requirements by stock issues during the past ten years—a practice which is generally recognized as an indication of sound and satisfactory credit. Accepting such a financial policy as a fair test of credit, it may well be said that the increased amount of financing through bond issues by roads which formerly financed to a large extent by stock issues, strongly indicates that credit, in recent years, has been on a less satisfactory basis. The real situation in this respect is clearly shown by an examination of financial data relating to the greater part of the roads above referred to, for it appears that during the first half of a period which included the years 1907 to 1914, approximately 60 per cent of the financial requirements were met by the issue and sale of stock, while during the latter half of the period only 17 per cent of the requirements were met by stock issues and 83 per cent by securities with fixed charges. Business handled by these roads represented more than a majority of the railroad business of the country and an examination of the financial statements of these companies for the years 1907 to 1910, the first half of the period under consideration, when improvements were financed more largely by stock than by bond issues, indicates the standard of credit which apparently met the requirements of investors.

The committee believes it is fair to assume from information available that the average capitalization of the railroads in group one represents an amount which is less, rather than in excess of the investment in the properties, and that rates for service which provided a reasonable return on their property investment would, therefore, provide a reasonable return on their entire outstanding capitalization, both stocks and bonds.

ROADS WITH GOOD CREDIT

Taken individually or collectively, in the first half of the period 1907 to 1914, when, as stated above, the major part of the financing of these roads was by means of stock issues, these roads, with few exceptions, earned their fixed charges more than twice over; their capitalization was divided about evenly between stocks and bonds; their dividends were earned approximately one and one-half times over. In order to pay fixed charges and a fair return on stock they were not required to disburse more than 80 per cent of their net earnings, thus permitting a shrinkage of 20 per cent of net earnings before reaching the point where it would be necessary to reduce the dividend rate. The remaining 20 per cent of net earnings, representing the margin over interest and dividends, served to assure investors of the ability of these roads to meet expected payments of interest and dividends and enabled them to make improvements to their properties without additions to capital accounts, which, for the most part, did not contribute directly to increased gross

revenues, but made the systems more efficient and more economical to operate.

Operating under these conditions, and pursuing this policy, these roads were able to sell substantial amounts of their stock at 100 or better, and in this way a proper relation between stocks and bonds was maintained.

Rates appear to have been sufficient to enable these roads, for the most part, to maintain an operating ratio, including taxes, of between 65 and 70 per cent of the gross receipts, leaving 30 to 35 per cent of each dollar of earnings available for distribution to security holders. This amount apparently gave investors in these conservatively capitalized systems satisfactory compensation for the use of their capital, and satisfied them that the payments could be relied upon and that the properties would be properly maintained.

While gross revenues of these roads were about 20 per cent greater in the second half of the period, capital expenditures had increased in substantially the same proportion, so that the relation of capital obligations, stocks and bonds, to gross earnings was approximately the same in both periods. The average rate of dividends paid by these systems was also substantially the same, showing a variation of less than one-half of one per cent. From this it follows that the proportionate part of gross earnings required to pay fixed charges and the same rate of dividends was relatively the same for both periods and necessarily required a like operating ratio to pay a similar return on invested capital and provide a like margin over these payments. During the years 1910 to 1914, the second half of the period, operating expenses and taxes, however, increased very generally to an amount equal to from 4 to 5 per cent of gross receipts compared with the years 1907 to 1910, and the increase undoubtedly would have been much greater except for many economies in operation, evidence of which is found in train load and other operating statistics.

It should be noted that an increase of from 4 to 5 per cent in the operating ratio results in reducing net operating revenue 12 to 15 per cent., and it appears, therefore, that nearly three-fourths of the surplus—that is, the 20 per cent margin over fixed charges and dividends—which served as a protection to the investments in the first half, had disappeared in the second half of the period, due entirely to increased operating expenses which the managements were unable to offset by additional economies.

In general, the committee believes that the margin over fixed charges and dividends which characterized the first half of the period must at least be maintained if credit is to be kept on a sound basis and railroad investments are to continue to be safe and attractive. It seems hardly necessary to suggest that when the proportion of property values and capitalization to gross revenues remains unchanged, requiring similar payments for fixed charges and dividends, this margin cannot be maintained on the same basis of rates when operating expenses are continually increasing. Nor can it be expected that the investors will retain their confidence in railroad investments and furnish additional capital with the margin over fixed charges and dividends rapidly disappearing because rates cannot be obtained to offset the increased costs of operation.

The committee believes it can be safely stated that the railroads comprising group one, which handle approximately 60 per cent of the business of the country, are reasonably capitalized, and that their capitalization is represented by a proper relation of stock to securities bearing a fixed charge. With the assurance of rates for service sufficiently liberal to provide a proper margin over fixed charges and reasonable dividends, investments in these roads would again command the confidence of investors, and under normal conditions little difficulty would be found in financing requirements by the issuance of either stocks or bonds.

ROADS WITH POOR CREDIT

The remaining roads of the country must meet similar tests of credit if they are to be successful in raising the capital necessary to expand their facilities to meet their business requirements. If a fair return on the outstanding capitalization of these roads is to be expected, their capitalization must necessarily approximate their property values, for rates for service as determined by the Interstate Commerce Commission and other regulating bodies are based on property values rather than on outstanding capitalization. It is important also to note that even though capitalization may approximate property value and rates provide a fair return on a capitalization equal to property value, unless such capitalization is properly divided between securities with fixed charges and stock, credit will not be on a satisfactory basis.

The problem of the remaining roads whose business constitutes approximately 40 per cent of the railroad business of the country is, therefore, not only to obtain rates which will offer a satisfactory compensation on an amount equal to their property values, but to make such adjustment of outstanding capitalization as may be necessary to bring about a close relationship between property value and capitalization, and a proper division of the resulting capitalization between fixed obligations and stock.

In considering the problem of these remaining roads, which, as stated, handled approximately 40 per cent of the business of the country, it is necessary to make some analysis of their present circumstances, and for a clearer understanding of the situation these companies have been subdivided into three classes, as follows:

Roads in actual financial difficulties* which carried about 17 per cent of the business of the country.

Roads not in actual difficulties but which have seldom, if ever in recent years, had sufficient credit to enable them to finance any substantial part of their requirements by the proceeds of stock issues, and have been obliged to resort to expensive and less satisfactory methods of financing. The business carried by these roads amounted to about 15 per cent of the business of the country.

Roads with less than \$5,000,000 each of annual gross earnings whose business constituted about 8 per cent of the business of the country.

Leaving out of consideration the last class, which, if analyzed, would divide itself among the other classes named, it will be found that there were certain definite causes which affected the roads in both the 17 per cent and the 15 per cent classes, and led to credit inferior to that of the railroad of the 60 per cent class.

The roads of the 17 per cent and 15 per cent classes, taken as a whole and considered apart from their capitalization, both as to amount and as to division between stock and obligations, were not in themselves substantially different from those of the 60 per cent class. The character of their business, as a whole, was much the same, for it consisted of about the same proportion of passenger and freight traffic. The freight business was divided in substantially the same manner among the different classes of commodities. The distance that the freight was hauled and passengers were carried, the size of the train loads and other details of operation did not vary materially from many of the best roads of the 60 per cent class, except such differences as might be accounted for by differences in the physical condition of the properties, due to depreciation.

Briefly stated, similar business was handled in a similar manner, and the amount of property necessary for trans-

*The classification which is adopted above is based on an analysis of the situation as it existed in 1915. Some of the roads referred to as in financial difficulties at that time have since been reorganized, but as the conclusions to be drawn would not be materially affected, the changes which have taken place since that time have been disregarded.

acting the business could not have been very different in the various classes. As the roads of all the classes are not divided by any geographical characteristics, it will be found also that the same general scale of rates applied to each class.

With the same general amounts of property values involved and a similar scale of rates, such differences as existed between the 60 per cent class, which had in the past met the tests of good credit, and the 17 per cent and 15 per cent classes, which had no credit at all or poor credit, must have arisen from causes other than the character of the property required to handle the business and the compensation for the service.

The similarity of the business and operating conditions which surround the railroads which until recently had met the tests of good credit—the 60 per cent class—and those comprising a large part of the remaining roads of the country—the 17 per cent and 15 per cent classes—are clearly indicated by the statistics contained in the table below. The figures in column I are made up from averages compiled from the statements of the following roads:

Pennsylvania	New York Central
Baltimore & Ohio	Chicago, Milwaukee & St. Paul
Chicago & North Western	Illinois Central
Louisville & Nashville	Pitts., Cin., Chi. & St. Louis
Atlantic Coast Line	Chi., St. Paul, Minn. & Omaha
Nashville, Chatt. & St. Louis	

The figures in column II are made up from averages compiled from the statements of practically all the larger systems described as groups two and three, and which are now referred to as the 17 per cent and 15 per cent classes.

Tonnage classification:	Column I	Column II
	The 60 per cent class	The 17 per cent and 15 per cent classes
Product of mines.....	43.0 per cent	40.7 per cent
Products of agriculture.....	15.2	15.0
Products of forests.....	13.0	14.8
Manufactures.....	18.0	16.4
Products of animals.....	3.2	3.4
Merchandise and miscellaneous.....	7.6	9.7
	100.0 per cent	100.0 per cent
Operating conditions:		
Proportion passenger revenue to freight.....	41 per cent	43 per cent
Tons revenue freight per train.....	406	394
Average haul per ton.....	174 miles	177 miles
Revenue per ton-mile.....	76c	79c
Freight revenue per train-mile.....	\$2.83	\$2.89

Of the two groups of roads designated as the 17 per cent class and the 15 per cent class, the former contains the roads of the country which are financially embarrassed. This class includes practically all the systems which have called forth serious criticism, and the committee believes it fair to state that while their troubles have undoubtedly been intensified by inadequate rates for service, the real causes which have resulted in their receiverships or their utter inability to finance by either stock or bonds have arisen from overcapitalization; from the results of unwise reorganizations; from past operating or financial mismanagement, or in some few cases, from unfavorable conditions peculiar to the roads themselves. These causes have been so deep-seated and of so long standing as to have put these roads beyond the possibility of relief from any source unless accompanied

Operating conditions:	Based on data compiled from roads included in the	
	60 per cent class	The 15 per cent class
Proportion passenger revenue to freight revenue.....	41 per cent	39 per cent
Rate per ton per mile.....	76c	76c
Freight revenue per train-mile.....	\$2.83	\$3.07
Tons of freight per train-mile.....	406	459
Average haul per ton.....	174 miles	178 miles
Operating costs in percentage of gross receipts:		
Cost of operation, including taxes, but excluding maintenance.....	45.1 per cent	45.5 per cent
Maintenance.....	29.8	28.5
Total operating, including taxes and maintenance.....	74.9	74.0

by substantial changes in their financial organizations. Accordingly, the problem of this class is a problem of the separate companies, which can be restored to credit only

through the remedies necessary in each particular case.

With regard to the difficulties of financing encountered by roads of unsound credit, designated as the 15 per cent class, the committee believes that unsound financial organizations are in part responsible, and these difficulties have been increased and intensified by inadequate rates for service.

The similarity of the business and operating conditions of these roads compared with the selected roads of the 60 per cent class will be apparent from an examination of the preceding table.

The differences in their financial organizations, which largely determine their credit, other things being equal, is indicated by the proportionate amount of fixed charges and dividends to the total amount distributed to security holders. The following table shows the amount of such distribution and the surplus remaining, based on \$1,000,000 net earnings in each case:

	Column I	Column II
Net operating income.....	\$1,000,000	\$1,000,000
Fixed charges.....	477,000	707,000
Dividends.....	367,000	134,000
Total distribution.....	\$844,000	\$841,000
Surplus.....	156,000	159,000

It will be noted that substantially the same proportionate amount of net operating income is distributed to security holders in each case, but in column I only 56.5 per cent of the total amount distributed as fixed charges and dividends was distributed as fixed charges and 43.5 per cent in the form of dividends, while in column II, 84.2 per cent was distributed as fixed charges and but 15.8 per cent as dividends.

If the foregoing is a correct analysis of the situation it is fair to assume, because of the apparent similarity of their business and operating conditions, evidenced by data contained in the several sets of tables, that the railroads referred to in both the 17 per cent and 15 per cent classes are entitled to at least the same rates for similar service which it is found necessary for roads in the 60 per cent class to receive to maintain their credit.

If the credit of the roads in financial difficulties—the 17 per cent class—is to be re-established on a satisfactory basis, in addition to receiving rates for service which would provide a fair return on the investment value of their properties, plans for their reorganization must be worked out which will recognize that capitalization must be adjusted to approximate property values and, further, that this capitalization must be divided between obligations and stock in accordance with standards observed by the majority of the roads which have successfully met the tests of sound credit in the past.

As regards the 15 per cent class, rates for service which yield a fair return on property values would increase net earnings so as to supply a more liberal margin over fixed charges, and thus tend toward a better basis of credit. In some cases ability to pay dividends might be restored and this might re-establish a sufficiently satisfactory relationship between the amounts paid as fixed charges and as dividends without any adjustment of the capitalization. In other cases some readjustment of the proportions of fixed obligations and stock would be necessary if the highest credit standing were to be obtained. This might be brought about by the issue of preferred stock for future financing or for refunding, or perhaps by the issue of stock without par value, or at a discount under proper regulations.

AN INSUFFICIENT MARGIN OF SAFETY

The committee believes that, on the basis of the operating costs which have prevailed in recent years, rates have been insufficient to provide adequate margins over the amounts required to pay a reasonable and fair return on capital legitimately invested in railroad properties. It further believes, unless operating costs can be materially reduced, that more liberal rates for the future will be necessary if railroad in-

vestments are to be properly protected and new capital is to be made available for future requirements.

In stating the necessity for more liberal compensation the committee believes that no policy of regulation can succeed which gives the companies merely enough for their existence, without an ample margin for contingencies and for the fostering of confidence in their financial soundness; and that no policy can succeed which is not elastic enough to adjust the income of the railroads to meet the ever changing and fluctuating costs of labor and of capital.

The principle that capital legitimately invested is entitled to full protection and a reasonable return has time and again been clearly recognized by courts and commissions. The difficulty appears to have been in the application of this principle, through the failure to establish any fixed policy as to what constitutes capital legitimately invested and failure to recognize, or difference of opinion, as to what constitutes a return sufficiently liberal to be fair and reasonable.

A large proportion of the business of the railroads is interstate business. Railroads operating within certain prescribed territories are obliged by economic laws and by the mandates of the Interstate Commerce Commission to handle similar business at similar rates. Some railroads must necessarily be more prosperous than others, because more advantageously located or because of the greater ability of their managers.

The committee believes that the public interest would not be served by basing rates upon conditions surrounding the roads which are least advantageously located or operated with the least efficiency, nor would it be any better served by bas-

roads which handle approximately 60 per cent of the business of the country. It would encourage roads in financial difficulties to reorganize so as to place their credit on a permanently sound basis. It would assist all the railroads of the 15 per cent class in the fulfillment of their duties toward the public and would very probably result in the early restoration of the best of these to a position of sound credit.

A liberal policy as to rates appears to be the most feasible and most necessary step toward the permanent betterment of railroad conditions.

Without expressing at this time any further opinion as to the methods of regulation, the committee wishes to express its approval of such changes in the present system as may be necessary to reconcile the conflict of authority which now exists between national and state commissions in matters which vitally affect the prosperity of railroads.

TYPE "B" RAGONNET REVERSE GEAR

What is known as the "Type B" Ragonnet power reverse gear has recently been brought out by the Economy Devices Corporation, New York.

The most noticeable modification from the standard Ragonnet gear is the method by which the combination lever is connected to the slide valve, which materially decreases the length of the cross-head arm and raises the lower end of the combination lever so that there is practically no projection below the reverse gear cylinder. A slide valve, modified in detail from that used in the older gear, has been retained and

General Arrangement of the Type "B" Ragonnet Power Reverse Gear

ing rates upon conditions which surround those most advantageously located and most efficiently operated. Lack of foresight and inefficiency should be penalized, as foresight and efficiency should be rewarded.

Broadly speaking, the public will best be served by rates for service sufficiently liberal to allow the railroads operated under average conditions and with reasonable efficiency to maintain their credit and pay satisfactory returns to their security holders.

The committee believes that the adoption of such a policy toward railroad rates would make it possible within a reasonable time to place railroad credit generally on a satisfactory basis. It would automatically restore the credit of the rail-

the method of lapping the valve and maintaining air pressure in the cylinder is the same in principle as that previously employed. The mechanical connections, however, have been entirely changed and the gear possesses a number of operating features impossible of attainment with the older design.

Starting at the cab, it will be seen that the lower end of the reverse lever is connected to the top of the combination lever, while the crosshead arm and the lower end of the combination lever are joined by a connecting rod. The valve is operated by a rocker extending out through the valve chest gland 19, the end of the outside rocker arm being attached to an intermediate pin connection in the combination lever. For any position in which the reverse lever may be latched, it will be

seen that the valve is lapped when the piston has moved to a position in the cylinder corresponding to the position of the reverse lever. In this respect the operation of the "Type B" gear is the same as that of the previous type.

The construction of this gear is such, however, that the position of the reverse lever must always correspond within one or two notches to the position of the block in the link, irrespective of whether or not air pressure is available for the operation of the gear. This is brought about by extending the ends of the slide valve so that its movement in the valve chest is limited in either direction to the amount necessary to bring the cylinder port in line with the adjoining air admission port through the valve. A slight movement of the reverse lever causes the end of the valve to strike the end of the steam chest and prevents any further movement of the lever until the piston moves in the cylinder. The rocker arm connection 37 in effect becomes the fixed pivot, and the further movement of the reverse lever can only take place at a rate proportional to the movement of the piston in the cylinder. Should there be a tendency for the blocks to drop in the links when the engine is standing with the air pump shut off, excessive stresses might be set up in the parts of the gear if the valve and combination lever were depended upon to resist this movement. In order to protect the gear under such

Details of the Valve Rocker and Connections

conditions the reverse lever latch is so arranged that the force transmitted to the reverse lever lifts from the notches in the quadrant, thus permitting the lever to follow the movement of the link block to the corner. When the valve chest is again under pressure, no movement of the gear is possible beyond the slight amount necessary to lap the valve until the reverse lever is moved.

In the construction of the cylinder and valve, cored passages have been entirely avoided, thus eliminating any possibility of trouble from coarse sand or scale at the valve seat.

The increase in the length of the valve has materially added to the bearing surface and decreased the tendency toward uneven wear. Uniformity of wear is also insured by bringing the point of drive down close to the seat. The cylinder ports in the valve seat require an exhaust cavity in the valve but one-half inch in width and, therefore, the unbalanced area is so small that the valve always moves freely.

The parts inside the valve chest have been so arranged that there is nothing that can work loose or become displaced after they have once been assembled. The valve is moved by means of square blocks, which are placed on the inside of the jaws of the rocker, 22. These blocks work in vertical slots in the sides of the valve, and are pivoted about the ends of pins riveted in the rocker jaws. This construction will be made clear by reference to the drawing of the rocker. The rocker shaft is guided by the valve chest gland, 19, through

which it has a working fit. This gland is made steam tight by the use of a ball joint ring, 24, which seats against the end of the gland, the flat face bearing against a shoulder on the rocker. The joints are sealed by the pressure in the valve chest.

The piston is packed with a special type of packing which has been developed especially for that purpose. Each ring is made up of a special rubber core which will not vulcanize under the saturated steam temperatures met with in locomotive practice, and which is not affected by oil. Outside of this core the ring is made up of a duck fabric arranged in vertical layers, so that the edges of the material form the wearing surface. Three of these rings are placed in each piston and are held in place by a follower plate, the edge of which bears directly against the packing. The guides are of the bored type, and are cast integral with the front cylinder head, thus making them self-centering.

ACTIVITIES OF THE RAILROADS' WAR BOARD

Recently 1,500 flat cars have been rushed to lines operating in the Southeastern part of the country, in order to facilitate the transportation of the piling and heavy lumber needed for the new shipbuilding yards.

The Commission on Car Service has also ordered the prompt movement of more than 3,000 box cars into the West and Middle-west, to protect government orders of grain and hay.

In addition, large consignments of refrigerator cars have been sent into Colorado, Idaho, North Dakota and Minnesota, to handle the apple and potato crops. The potato growers of Colorado increased their production this year without making any provision for the storage of the extra crop. As a result the demand for refrigerator cars has been unusually heavy.

To safeguard the movement of all perishable crops the Commission on Car Service has issued a general order to the railroads, instructing them to exercise the strictest economy in the handling of refrigerator cars, the supply of which is unusually unequal to the demand. The order states that cars shall not only be moved with despatch and unloaded promptly but that all refrigerator cars must be returned at once to the owning road after they have been unloaded. It also urges more co-operation on the part of the shippers to load cars to full capacity, instead of wasting car efficiency through continued shipment of minimum carloads.

The Commission on Car Service has supplemented this order with the suggestion that the railroads save refrigerator cars by making a more liberal use of box cars in moving potatoes. These box cars, the commission states, will be suitable for the movement of potatoes if they are substantially lined and provided with stove protection.

On 77 of the principal railroads of the United States a saving of 114,109 cars was effected in one month this year, solely by increasing the average loading of less-than-carload freight, according to a statement by the Railroads' War Board.

The reports on which these figures are based cover the months of July of this year and July, 1916. They show that the average loading for that class of freight during July of this year was 13,927 lb., as compared with an average of 11,619 lb. during the same month of last year.

The 77 railroads from which reports have been received were able to move the total volume of less-than-carload freight last July in 579,180 cars. Had the average loading per car been at the same rate as during the month of July, 1916, they would have been compelled to use 693,289 cars.

TRAINMEN WANT MORE PAY

The brotherhoods of conductors and of brakemen are taking a vote, said to cover the whole United States, on the question of asking their employers for an increase of pay; and it is understood that the vote is expected to be canvassed by November 25 so that the demands can be submitted to the railroads on December 1 with the proposal that the increases take effect on January 1.

These two brotherhoods are said to include 32,000 passenger trainmen, 85,000 freight trainmen and 53,000 yardmen. The increases called for range from 20.6 per cent for passenger conductors, 28.9 per cent for freight conductors and 43 per cent for freight brakemen up to 51.5 per cent for passenger-train baggage-men.

The demands of the conductors and brakemen, if granted, would add to the payrolls of the eastern roads—not the roads of the whole country—about \$48,000,000. This sum is some \$17,000,000 or more greater than the advances which have already been granted under the so-called eight-hour law, and which went into effect on January 1, 1917. The conductors and trainmen receive about 55 per cent of the total expenditures for wages in the train service; that is to say, the enginemen and firemen receive 45 per cent. Therefore, if the men on the engine should ask to be favored in the same way that the men behind the tender are favored, and if both requests were to be granted, there would be a total increase in expenses on the eastern roads of \$87,000,000.

According to a report in a New York paper the brotherhood leaders were opposed to demanding an increase of pay at the present time, but found it necessary to give way to the more radical men among the subordinate leaders. Warren S. Stone, chief of the Brotherhood of Locomotive Engineers, is credited with having refused to consent to a demand by that brotherhood at the present time.

The foregoing appeared in the newspapers of Wednesday morning, November 14. On Wednesday afternoon a despatch from Washington said that W. L. Chambers, government conciliator, had already had conferences with railroad officers and brotherhood leaders looking to an amicable agreement to defer till after the war any disputes about wages, and that President Wilson, co-operating with Mr. Chambers, had arranged to meet the chiefs of the four principal railroad brotherhoods in conference at Washington on November 22.

The President's attitude on the subject of the threatened strike is revealed in the following letter to Judge Chambers:

"My Dear Judge Chambers: May I not express my very deep and serious interest in your efforts to bring the railroad executives and the brotherhoods engaged in train operation to an agreement that there shall be no interruption in their relations on either side until ample opportunity shall have been afforded the United States Board of Mediation and Conciliation to bring about if possible an amicable agreement, and that in the event of a failure to bring about such an agreement any controversy that may have arisen will be submitted to arbitration, in accordance with the provisions of the Newlands law?

"I take it for granted that your efforts will succeed, because it is inconceivable to me that patriotic men should now for a moment contemplate the interruption of the transportation which is so absolutely necessary to the safety of the nation and to its success in arms, as well as to its whole industrial life; but I wanted, nevertheless, to express my deep personal interest in the matter and to wish you god-speed.

"The last thing I should wish to contemplate would be the possibility of being obliged to take any unusual measures to operate the railways, and I have so much confidence that the men you are dealing with will appreciate the patri-

otic motives underlying your efforts that I shall look forward with assurance to your success.

"Cordially and sincerely yours,
"WOODROW WILSON."

ANTHRACITE SHIPMENTS IN OCTOBER ESTABLISHED A NEW RECORD

The shipments of anthracite for the month of October, 1917, as reported to the Anthracite Bureau of Information at Wilkes-Barre, Pa., amounted to 7,110,950 tons, establishing a new record for monthly shipments, and exceeding the shipments of June, 1917, which until now had been the greatest of any month in the history of the industry, by 61,913 tons.

The October shipments show an increase of 738,194 tons, or 11 per cent, over the preceding month, and are 1,240,746 tons, or 21 per cent, in excess of the shipments during the corresponding month last year.

The total shipments for the first ten months of 1917 have amounted to 64,889,047 tons, an increase over the same period in 1916 of 9,088,427 tons.

Distributed by carrier companies the shipments during October were as follows:

	October, 1917	October, 1916	Year, 1917	Year, 1916
P. & R. R. W.	1,435,265	1,206,570	12,479,062	10,601,274

*Deduction	152,364	73,127	1,165,604	401,934
	7,110,950	5,870,204	64,889,047	55,800,620

EQUIPMENT EXPORTS DURING SEPTEMBER.—The total exports from the port of New York during September, 1917, amounted to \$240,843,788, according to the foreign trade records of the National City Bank of New York. The value of steam locomotives exported in that month was \$3,170,273, railway cars \$1,719,818, and rails, \$1,045,400.

BRITISH CANALS RELIEVING FREIGHT CONGESTION.—Every effort is being made by the Canal Control Committee of England to divert coal and other heavy traffic to the canals so as to relieve the congestion on the railways. In the Midland district, in the case of one canal system alone, the amount of coal being transferred to the canal from the railways was equivalent to 150,000 tons per annum.

PROPOSED RAILWAY FOR COSTA RICA.—Philip W. Chamberlain, San Jose, Costa Rica, a member of the American Society of Civil Engineers, has a project for the construction of a railway from Alajuela to Grecia, Costa Rica, a distance of 25 kilometers (about 16 miles). There is one hitch in the concession, so far as the contract is concerned, with the Minister of Public Works. The proposition of Mr. Chamberlain is to put down a 30-inch gage track, making foundation on that basis, with an agreement to change to a 42-inch gage after 20 years. The government desires the foundation to be made at once for a 42-inch gage, although conceding the use of the narrow gage for 20 years. The concession is to be for 99 years. The government agrees to advance bonds for \$3,000 American gold per mile, or a total of \$75,000, secured by direct tax on the region benefited. The contract is subject to the approval of Congress, which does not meet again in regular session until May, 1918. The railroad will require equipment not now at hand as follows: Three 12-ton locomotives, twenty-five 8-ton freight cars, enough 20-pound rails for 15 kilometers (9 miles), telegraph and telephone equipment, and other necessary equipment.—*Commerce Report*.

General News Department

At the meeting of the Louisiana Engineering Society at New Orleans, La., on November 12, R. E. Hartman read a paper, entitled "Yellow Pine Industry in the South."

The Nashville, Chattanooga & St. Louis reports that 933 officers and employees of the road subscribed to the second Liberty Loan to the amount of \$93,400; this in addition to the million subscribed for by the company.

The Southern Railway now furnishes "coach lunch service" on trains which have dining cars. The dining cars have been provided with basket trays and the waiters pass through the coaches to sell sandwiches and coffee.

The Chicago & Alton has created the position of examiner in rules. Maynard M. Meatyard, a locomotive engineer, has been appointed to the new position. He will examine and instruct all train and enginemen in the operating rules and all enginemen in the rules for machinery.

A general increase in the pay of shopmen on the Pennsylvania Railroad east of Pittsburgh and Erie was announced this week, affecting, it is said, about 10,000 persons. Some clerks are also affected. The Lehigh Valley has advanced the pay of considerable numbers of station agents by from \$7 to \$10 a month.

According to report, Prof. E. C. Schmidt, head of the department of railway mechanical engineering at the University of Illinois and a recognized authority on train resistance, has received a commission as major in the ordnance department of the Officers' Reserve Corps and hereafter will have headquarters at Washington, D. C.

Three 300-foot spans of the Union Pacific bridge at St. Joseph, Mo., were moved 140 feet west at 11.30 on Wednesday morning to make room for a new draw span; this was completed in 13 minutes without accident. Traffic was interrupted for several hours on account of preliminary work and the restoration of track; new piers have been built to receive the spans.

The Mexican Railway, Mexico City to Vera Cruz, and the Tehuantepec National, extending across the Isthmus of Tehuantepec, are now under the same management, and Paulino Fontes, acting general manager of the Mexican, has been placed in charge of the entire system. This change took effect on November 10. R. Maury, general manager of the Tehuantepec National, has been transferred to another department. Traffic on both of these roads is said to be increasing.

Lord Shaughnessy, president of the Canadian Pacific, has subscribed on behalf of that company to the new Victory Loan of the Canadian Government the sum of \$5,000,000; and he says that if the amount called for should be increased from the present figure 150 millions to three hundred millions, the Canadian Pacific would subscribe ten millions. The Canadian Pacific already has lent to the British and Canadian Governments in connection with the war, cash and securities to the amount of nearly seventy millions.

At a banquet held by the Chicago chapter of the American Association of Engineers on November 10, Capt. Robert W. Hunt, president of R. W. Hunt & Co., Chicago, made a talk, entitled "Our War," in which he emphasized that this is an engineers' war. Others who spoke were Capt. Howard Scott, who served 28 months on the front and in the trenches in France, and Dr. F. H. Newell, of the University of Illinois. W. H. Finley, chief engineer of the Chicago & Northwestern and first vice-president of the association, presented a sabre to Garrison Babcock, formerly president of the association and now captain in the United States signal corps.

The Chicago & North Western and the Chicago, Burlington & Quincy have elected to operate under the provisions of the Wisconsin workmen's compensation act, and have filed certificates. This means that the law will apply to shop men, section hands and all other employees of these roads except those engaged in

interstate commerce, whose rights to recovery when injured are governed by the federal employers' liability law. Heretofore only the Minneapolis, St. Paul & Sault Ste. Marie and the Great Northern have been subject to the Wisconsin workmen's compensation act.

A. H. Plant, chairman of the Accounting Officers' Committee, announces that the internal revenue commissioner holds that the 8 per cent tax on passengers applies on the amount paid for extra baggage, dogs, etc. The tax will be due if the total amount paid by a passenger, including transportation and excess baggage, is more than 35 cents. A tax of at least one cent must be collected on each consignment of freight; for example, on a freight bill of 15 cents the figure would be less than 5 mills, but the tax will be 1 cent.

George H. Ingalls, traffic manager of the New York Central lines west of Buffalo suggests that the custom of sending Christmas cards by railroad officers be abolished this year and that the money ordinarily expended for that purpose be given to the Red Cross or some other war fund. Mr. Ingalls says that every Christmas railroad men send in the aggregate thousands of holiday greetings to their fellow officers, to shippers and others. The printing, postage and distribution of these cards involves large expenditures and the cards clog the mails at a time when the postal department needs space for more important matter.

Henry B. Endicott, manager of the Massachusetts Public Safety Committee, acting as arbitrator in the recent differences between the Boston & Maine Railroad and its shop and other employees, decides that the employees are not entitled to the additional three cents an hour in their pay which they asked for. Their threat to strike for an increase of 8 cents an hour was temporarily settled by the road paying an advance of five cents an hour and leaving the difference, three cents, to arbitration; and the result is now announced. The arbitrator says that he is absolutely clear in the view that the five cents advance has set the men on at least as high a basis as the average in the Eastern half of the country.

Railways Co-operate With U. S. Food Administration

Out of 66 railway dining car services in the country 47 have pledged themselves to work with the Food Administration in having meatless and wheatless days and urging the general plan of food saving on the public.

Philadelphia Bourse Urges Strike Prevention Legislation

Strike prevention legislation, affecting the operating employees of railroads, is urged by the Philadelphia Bourse in a statement recently made public, a part of which follows:

"Threatened demands by railroad employees for further increased wages and indications of trouble at a time when the safety of the nation requires the smoothest possible operation of the railroads, over-burdened as they are with war-traffic, will probably lead to renewed efforts by representative organizations of business men and shippers throughout the country to have Congress, when it convenes in December, put through legislation recognizing the railroad operatives as public servants, and as such not free to combine to leave employment simultaneously, and recognizing the interest of the public, as a third party, in disputes between the railroads, as public service corporations, and their employees.

"The men who are employed to operate these arteries of our national body are public servants, and have automatically assumed a public duty which cannot be lightly disregarded. This public duty is paramount to any personal claims. It was so before the war, and now the necessity is doubly increased. . . . There is no issue that can be raised between the roads and their employees that is not arbitrable, and Congress can make strike prevention legislation fair to the trainmen by requiring arbitration that is just and equitable."

REVENUES AND EXPENSES OF RAILWAYS

First Shipments of Tobacco to Railway Regiments

The Railway Regiments' Tobacco Fund has now become large enough for the commencement of shipments to the railway regiments in France, and the committee in charge of the fund, of which F. A. Poor is chairman, has ordered the first shipment to be made on December 1. The shipment on that date will consist of nine cases of tobacco, one for each of the railway regiments now in France. Each case will contain twelve 20 lb. packages of tobacco and each package will contain 15 pounds of Bull Durham in one ounce bags with the necessary cigarette papers and five pounds of Tuxedo smoking tobacco in one ounce bags. The tobacco will be delivered to the Quartermaster's Department of the United States army in New York City and the Quartermaster's Department will handle the shipments to Europe.

Additional contributions have been received for the Railway Regiments' Tobacco Fund from nine more railway supply companies. The following list brings the subscriptions to date to Tuesday noon, November 13:

Belle City Malleable Iron Co., Racine, Wis.....	\$10 a month
Hunt-Suiler Manufacturing Corporation, Boston, Mass.....	10 a month
H. C. Holloway, Chicago.....	10 a month
Locomotive Superheater Co., New York.....	10 a month
(to cover 1 year to Nov., 1918)	120
Milwaukee Coke & Gas Co., Milwaukee, Wis.....	10 a month
Pittsburgh Wood Preserving Co., (to cover 2 months)	20
Strobel Steel Construction Co., Chicago.....	10 a month
St. Louis Frog & Switch Co., St. Louis, Mo.....	10 a month
T. W. Snow Construction Co., Chicago.....(to cover 3 months)	30

Licenses to Use Explosives

Any person in the United States found with explosives in his possession after November 15, and who does not have a license issued by the Federal government showing the purpose for what the explosives are to be used, will be at once arrested and may be fined up to \$5,000 or sent to prison for one year, or both.

This law, passed by the last Congress, is now being put into effect by the Bureau of Mines, Department of the Interior. Francis S. Peabody, of Chicago, has been appointed to act as assistant to the director of the Bureau of Mines, Van H. Manning, in the enforcement of the law. Persons apprehended in plots to blow up factories and bridges will be turned over to the authorities for prosecution under Federal or state laws.

The law provides that everyone who handles explosives must have a license. The manufacturer, the importer and the exporter must have licenses issued by the Bureau of Mines in Washington. The seller of explosives and the purchaser of explosives must also have licenses, these to be issued generally by county clerks, or other local officers, who are authorized to administer oaths. There will be at least one licensing officer in each county. In each state there will be appointed a state explosives inspector, who will represent the Bureau of Mines in the administration of the law within the state. Contractors and others using large quantities of explosives may issue explosives to their employees only through those employees holding a license, called a foreman's license.

Railway Revenues and Expenses, August, 1917

The net operating income of the railways of the United States for August, 1917, was less than August, 1916, by \$35 per mile, or 7.5 per cent, according to the monthly bulletin of the Bureau of Railway Economics.

Total operating revenues, \$365,316,147, exceeded those for August, 1916, by \$38,116,778. Operating expenses, \$246,341,511, were greater by \$42,843,772. Net operating revenue, \$118,974,636, decreased \$4,726,994. Taxes, \$16,999,686, increased by \$3,383,173. Net operating income was \$101,917,702, which is a decrease of \$7,998,991.

If spread over the mileage represented, operating revenues averaged \$1,581 per mile, an increase over August, 1916, of 11.4 per cent; operating expenses per mile, \$1,066, were greater by 20.8 per cent; net operating revenue per mile, \$515, shows a decrease of 4.0 per cent; while net operating income per mile, \$441, decreased 7.5 per cent. Taxes per mile rose 24.6 per cent.

This summary covers 231,108 miles of operated line, or about 90 per cent of the steam railway mileage of the United States.

AUGUST RESULTS PER MILE OF LINE BY DISTRICTS

For the Eastern railways, operating revenues per mile were greater than those for August, 1916, by 13.3 per cent; operating expenses rose 23.5 per cent; net operating revenue decreased 5.1 per cent; taxes increased 16.3 per cent. Operating income per mile decreased 7.2 per cent.

REVENUES AND EXPENSES OF STEAM RAILROADS—AUGUST, 1917
Compiled from monthly returns of the railways to the Interstate Commerce Commission and covering roads of Class 1, i. e., roads with annual operating revenues above \$1,000,000.

* Less than one dollar.

For the railways of the Southern district, operating revenues per mile exceeded those for August, 1916, by 18.6 per cent; operating expenses rose 24.7 per cent; net operating revenue increased 6.9 per cent; taxes increased 63.6 per cent. Operating income per mile decreased 1.0 per cent.

For the Western railways operating revenues per mile exceeded those for August, 1916, by 7.5 per cent; operating expenses rose 16.7 per cent; net operating revenue decreased 5.7 per cent; taxes increased 20.4 per cent. Operating income per mile decreased 9.2 per cent.

EIGHT MONTHS OF THE CALENDAR YEAR 1917

The eight months of the current calendar year, compared with the corresponding period of the preceding year, show changes per mile of line as follows: Operating revenues increased 11.9 per cent, operating expenses increased 18.6 per cent, net operating revenue decreased 1.3 per cent, taxes increased 20.5 per cent, while operating income decreased 4.5 per cent.

Operating income per mile decreased 15.9 per cent in the East, increased 3.3 per cent in the South, and increased 5.5 per cent in the West.

COMPARATIVE AUGUST RESULTS PER MILE OF LINE, 1913 TO 1917

August net operating income per mile was 7.5 per cent less in 1917 than in 1916, 17.7 per cent greater than in 1915, 31.0 per cent greater than in 1914, and 30.4 per cent greater than in 1913.

Electric Railways to Have War Board

The pressing need of utilizing to its fullest extent every possible means of transportation within the United States, in order that the business of the country may be carried on under war conditions, has led to the appointment by the American Electric Railway Association of a War Board, which will be organized on similar lines to the War Board of the steam railroads, have headquarters in Washington, and work in close co-operation with the Council of National Defense. The Board will consist of the following: Arthur W. Brady, president, Union Traction Company of Indiana, Anderson, Ind.; Thomas N. McCarter, president, Public Service Railway Company, Newark, N. J.; Britton J. Budd, president, Chicago, North Shore & Milwaukee Electric Railroad, Chicago; L. S. Storrs, president, The Connecticut Company, New Haven, Conn., and P. H. Gadsden, president, Charleston Consolidated Railway & Lighting Company, Charleston, S. C.

The action of the association was taken at a meeting attended by a large number of the leaders of the industry, representing companies in 27 states. The need of utilizing every transportation facility now available for the movement of men and goods was emphasized. The possibility of co-ordinating the facilities of electric railways and developing them to an extent where they can supplement the steam railroads, or relieve the steam roads of some of the work which has been put aside for the government business was discussed. In many sections of the country, this is already being done and it was felt that the Government should be offered the direct co-operation of the electric lines, both urban and interurban.

Opposition to Federal Incorporation

S. Davies Warfield, president of the Continental Trust Company of Baltimore, in an address before the Investment Bankers' Association, said, in part:

"Federal incorporation is not only fraught with danger to the people generally, in that it takes five out of six steps towards Government ownership, but is a menace to the holders of all classes of securities, for it proposes the greatest autocracy in corporate management yet suggested and, if enacted into law, will not alone apply to railroad corporations, but sooner or later the same principle would likely be extended to all corporations engaged in interstate commerce. And aimed as it is at the public service commissions of the several states, it is an encroachment on the rights of the states to regulate their own affairs, when not inconsistent with public interest. It is revolutionary in its purposes and effects.

"The plan is, not that the carriers may have the right to incorporate under a federal act, giving up their state charters, but that the act will arbitrarily compel the carriers to take out charters under the federal act. To accomplish this, since no other means has been thus far shown for its accomplishment, it will be necessary for all existing interstate railroad companies,

organized under state charters, to sell all their properties to new corporations to be organized under a federal act—changing the very fundamentals incident to present railroad existence—a plan so sweeping as to demand the attention of every stockholder and bondholder of every railroad in the United States.

"Practically all lawyers, other than counsel for the particular companies who are advancing this legislation, are agreed that after the passage of any such bill as has been proposed, the legal status of existing railroad companies would be most uncertain, and pending a final decision by the various courts of the many questions which would arise, the situation would be chaotic.

"The power in Congress to amend or repeal the charters, subject only to a distribution of the property of the corporation whose charter is repealed, will furnish a club to Congress which can be used with most destructive effect."

Mr. Warfield points out that notwithstanding the executives of some of the railroads have testified before the Newlands Committee in favor of the federal incorporation of railroads, there was no evidence that this question had been submitted to the stockholders and directors of their companies.

Mr. Warfield then said: "The use of the term 'railway executives' rather implies unanimity. In point of fact I know a large number of railroad executives who do not favor federal incorporation. One of the railroad executives when testifying in favor thereof before the Newlands Committee admitted that there are many railroad companies that really would prefer to continue as they are."

Comforts for the Men in the 14th Railway Engineers

The railways in New England under the leadership of J. H. Hustis, president of the Boston & Maine and chairman of the Northeastern Department for the Railroads' War Board, have perfected an organization having for its purpose the collection of funds and the expenditure for comforts for the men from those railroads who compose the 14th Railway Engineers now operating railways behind the lines in France.

The 14th Railway Engineers are composed entirely of railway men from the New England railroads: two companies from the Boston & Maine, two from the New York, New Haven & Hartford, one from the Boston & Albany and one from the Maine Central, with men also from the Central Vermont, the Rutland, and the Bangor & Aroostook. Each railroad has established a committee, the work of these committees being co-ordinated through a central committee made up of one representative from each of the lines, one from the Traffic Club of New England and one from the New England Railroad Club, which acts to a very large extent on the advice of Colonel Wooten, commanding the regiment. The idea is that the funds collected from the employees of any one railroad are to be spent for the men from that railroad in the regiment. Thus the funds collected on the New Haven, and the knitting and other work done by the lady friends of the members of the two New Haven companies, E and F, are to be devoted to those two companies. The same will apply to the two companies recruited on the Boston & Maine, and one company each recruited on the Boston & Albany of the Maine Central. The Maine Central will take care of the Bangor & Aroostook men and the Boston & Maine will look out for those recruited from the Central Vermont and the Rutland. That is, these roads will pool their collections with those of the Maine Central in the first case and the Boston & Maine in the two last named cases.

In the Boston & Maine's scheme of carrying out the plan, local committees have been formed on each division, with one for the general offices and the Boston Terminal, to arrange for the collection of funds and to administer their distribution in co-ordination with a central committee, and to arrange for organizations of the ladies for knitting socks, sweaters and other wearing apparel. The superintendent of each division is authorized to receive contributions from employees and friends of the men in the railroad regiment, on their respective divisions, and to acknowledge receipt of such contributions, which are forwarded to the treasurer of the Boston & Maine, at Boston, who is treasurer of the Boston & Maine's Central Committee. That committee is composed of one representative from each division and from the general offices. The management has heartily indorsed the plan, and has suggested that individual subscriptions should not exceed \$1.

With this organization the Boston & Maine has raised \$6,157.84

in cash. With the money it is providing a Christmas box with pipe, pouch, tobacco, chocolate, socks and wristlets. It will also send a sweater to each of the road's 403 men now overseas and will send tobacco at least once a month.

Substantial sums have already been collected, and it is the intention not only to send generous Christmas gifts, but also to undertake a continuous work of providing some form of comfort for the boys.

The Traffic Club of New England and the New England Railroad Club acting jointly have already dispatched a box of candy and a flint and steel pipe lighter to each of the 1,200 men in the regiment.

Western Railway Club Meeting

The next meeting of the Western Railway Club will be held at the Hotel Sherman, Chicago, on Monday, November 19. W. T. Krausch, engineer of buildings of the Chicago, Burlington & Quincy, will present a paper on "Coaling Plants and Fuel." The subject will be considered with special reference to the conservation of fuel, in accordance with the policy which the club has followed this year of taking up problems having a particular bearing on the operation of the railroads during the war. E. P. Ripley, president of the Atchison, Topeka & Santa Fe, will give an informal address.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August. 220 W. 57th St., New York.

AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, Supt. Timber Preservation, R. & O. Mt. Royal Sta., Baltimore, Md. Next convention, January 22-24, 1918, Hotel Sherman, Chicago.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—W. L. Connelly, Superintendent of Telegraph, Indiana Harbor Belt, Gibson, Ind. Next meeting, November 22, La Salle Hotel, Chicago.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert, Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Astor Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Morrison Hotel, Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual dinner, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

CINCINNATI RAILWAY CLUB.—F. H. Boulet, Chief Interchange Inspector, Cin'tl Ry., 101 Carey Bldg., Cincinnati. Regular meetings, 2d Tuesday, February, May, September and November, Hotel Sinton, Cincinnati.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Miles, 568 Union Arcade Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh, Pa.

FABRICHT CLAIM ASSOCIATION.—Warren P. Taylor, Traffic Manager, R. F. & P., Richmond, Va. Next meeting, November 27, Vanderbilt Hotel, New York.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month. Room 1856, Transportation Bldg., Chicago.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meeting, 2d Tuesday in month, except June, July, August and September, Boston.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meeting, 2d Friday in month, except June, July and August, 29 W. 39th St., New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—Geo. A. J. Hochgrebe, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.

PACIFIC RAILWAY CLUB.—W. J. Wollmer, Assistant to Chief Engineer, Northwestern Pacific R. R., San Francisco, Cal.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—F. C. Stewart, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Pittsburgh Commercial Club Rooms, Colonial Annex Hotel, Pittsburgh, Pa.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

SOUTHERN & NORTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grand Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 a. m., Piedmont Hotel, Atlanta.

TRAFFIC CLUB OF CHICAGO.—C. R. Singer, La Salle Hotel, Chicago.

TRAFFIC CLUB OF NEW YORK.—C. A. Sager, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Waldorf-Astoria Hotel, New York.

WESTERN CANADA RAILWAY CLUB.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Monday in month, except June, July and August, Hotel Sherman, Chicago.

WESTERN SOCIETY OF ENGINEERS.—Edgar S. Nethercut, Secretary, 1735 Monadnock Block, Chicago, Ill. Regular meeting, first Monday in month, except January, July and August. Extra meetings generally on other Monday evenings except in July and August.

Traffic News

The coast-wise vessels of the Great Northern Pacific Steamship Company, plying between Portland, Ore., and San Francisco, Cal., were taken over by the government the latter part of September.

The Commission on Car Service estimates that the quantity of potatoes raised in this country this year will amount to 453 million bushels, 50 per cent more than in 1916; and to move these potatoes will require 75,000 cars.

Irving T. Bush, who has been appointed director of the Port of New York acting under a Port War Board, says that he expects that the storage and lighterage facilities of the port can be made 25 per cent more efficient than they are at present.

Judge Lovett has cancelled his order directing that priority be given to shipments of soft coal for ports on Lake Superior and Lake Michigan, in so far as it applies to points on the Pittsburgh, Cincinnati, Chicago & St. Louis east of Steubenville, Ohio.

Judge Lovett, acting at the request of the Fuel Administration, has suspended for one day, November 19, his order requiring priority to be given to shipments of coal for the Northwest; this for the purpose of allowing all coal to be sent to cities in Ohio and Michigan.

The Pennsylvania Railroad has announced a sweeping embargo on freight from all connecting lines with the exception of live stock, perishable freight, foodstuffs for human consumption, government shipments and other items, for the purpose of clearing up congestion.

The Baltimore & Ohio, acting on the suggestion of the government to discontinue the use of luxurious cars, which are run merely for entertainment of the passenger, has met the pressing requirements of the time to the extent of eliminating the observation sleeping cars on all of the trains running between New York and Chicago.

On 77 of the principal railroads of the United States a saving of 114,109 cars was effected in one month (July) this year, as compared with 1916 solely by increasing the average loading of 1 c. l. freight. The reports show that the average loading for that class of freight during July of this year was 13,927 lb., as compared with an average of 11,619 lb.

The Department of Agriculture of the State of Pennsylvania has made a special appeal to the Food Administration at Washington to limit the use of freight cars as storehouses; and the definite statement is made that on one day last week 250 carloads of potatoes were standing in Philadelphia and that the consignees were paying demurrage on them, at the regular rates, and making no efforts to sell the potatoes.

The Transportation Club of San Francisco on November 7 held a noon-day luncheon in honor of the members of the Newlands congressional committee which has been holding hearings in San Francisco: Senators F. G. Newlands and A. B. Cummins and Congressmen J. J. Esch and T. W. Sims. Hon. A. P. Thom, general counsel of the Railway Executives' Advisory Committee, Washington, D. C., was scheduled to deliver an address at the luncheon.

It is estimated that over 400,000,000 pounds of parcel post packages will be handled by the Post Office Department this month and next. The total number of parcel post packages mailed in the United States in the year ended June last was 1,024,362,744, weighing 1,926,932,904 lbs. In November, 1916, the number of packages was (in round numbers) 80,000,000, weighing 160,000,000 pounds, and in December 100,000,000 packages, weighing 200,000,000 pounds.

The three railroads entering Boston—the Boston & Maine, the New Haven and the Boston & Albany—have petitioned the Interstate Commerce Commission and the state commissions for authority to increase passenger fares. It is proposed to increase the rate for single tickets from 2 or 2½ cents to 2¾ cents a mile; to increase the mileage book rate from 2¼ to 2½ cents a mile; to make certain charges in trip tickets; to increase 25 per cent

the rate on 12 and 25 ride suburban tickets good within 15 miles of Boston, and to withdraw the so-called workmen's tickets.

The Baltimore & Ohio announces that henceforth the dining cars on that road will recognize Tuesday as a "meatless day" instead of a "beefless day." On these days none of the dining cars will serve meat in any form. Wednesday will be observed as a "wheatless day" and no breads or cakes or desserts will be served which are made from wheat. The announcement says that this is done at the direct request of the government food administration; the Baltimore & Ohio Railroad is a member of that administration and "all instructions from headquarters will be strictly observed."

Increasing its efforts to reduce the waste in the distribution of time-tables, the Northern Pacific has devised a plan which accomplishes that end and at the same time helps get new passenger business. The scheme was conceived by J. D. Zook, city passenger agent at St. Paul, Minn. It places the time-tables in the cashier's cage and posts conspicuous signs directing prospective travelers to ask the cashier for folders. The plan enables the cashier to speak to many potential patrons of the road, to set forth the advantages of the company's service and to help them plan their trips. In this way he learns the destination of many additional prospective passengers and often sells them tickets.

When a shipper, in sending an important consignment of freight, gives notice that prompt movement is important, because of some special reason, it behooves the station agent to take good care to carry out the shipper's wishes (or, in case of his inability to do so, to give good notice of the fact and advise his superior). The Southern Pacific Company, in its monthly circular to station agents, calls attention to this important feature of the freight agent's duties, taking as its text for the lecture an account of a suit which cost some railroad \$75,000 because a shipment of building material which was delayed and, because of the delay, retarded, by about 11 months, the completion of a government contract.

The Interborough Rapid Transit Company, operating elevated and subway lines in New York City, mainly in the boroughs of Manhattan and the Bronx, now carries about 1,350,000 passengers daily, or about 185,000 more than the average, two years ago. A considerable part of this increase is accounted for by extensions of the lines and by the addition of express tracks on the elevated lines. A circular which has been issued by the company says that of the 1,350,000 passengers carried daily, about 900,000 ride in the rush hours, three hours in the morning and three in the afternoon. About 15,000 are unloaded each afternoon at Times Square to go to matinees, and about 18,000 to attend theatres in the evening. Of this latter number about one-third remain in the theatrical district until 1 o'clock in the morning.

The discovery of a large dump of potatoes and other vegetables in railroad yards at West Chicago, Ill., last week, prompted an investigation by government authorities of what was apparently a great waste of food products. It was found, however, that an early and severe frost had damaged many shipments in cars not provided with heating facilities. In many cases potatoes had been shipped from points of origin in a frosted condition, and some of the railroads had protected themselves from claims by stationing inspectors at the larger shipping points to determine the condition of vegetables before they are loaded. Much farm produce has been damaged by holding cars too long in large terminals for reconsignment, and Harry A. Wheeler, Illinois state food administrator, has announced that beginning this week an inspection service will be put on in the principal yards in the state. The railroads have agreed to file with the Food Administration a daily report of all cars of vegetables received, thus making it possible to check up responsibility for carelessness and waste. Mr. Wheeler has also recommended that the privilege of reconsignment of cars loaded with vegetables be revoked.

Vice-President G. L. Peck, of the Pennsylvania Lines West, chairman of the Lake Coal and Ore Committee of the Railroads' War Board, reports that the task set the railroads, to haul 29,000,000 tons of coal from the mines to the Great Lakes ports, receiving return cargoes of ore for the interior furnaces, before ice closed navigation, has been well taken hold of. Up to No-

vember 4, there had been loaded 24,170,713 tons, which was an increase of 710,127 tons, or 3.03 per cent, as compared with the same date last year, leaving 4,829,287 tons of the original estimate to be transported during about 28 days of open lake navigation.

The week ended November 4, the latest reported, showed 822,613 tons of coal delivered to boats at Lake Erie, and 798,971 tons of ore carried back to the furnaces. He says that most of the furnaces are now pretty well supplied with ore, and some of the largest plants have already received their full allotment for the season. The pooling of Lake coal has saved car detention amounting to about 520,000 car-days. Great benefit has resulted from the harmonious working of all interests to a common end. This is growing more apparent among the employees every day.

Soldiers' Fares on the Boston & Maine

Camp Devens at Ayer, Mass., 36 miles from Boston, is now the daily destination of hundreds of thousands of passengers from all parts of New England; and the Boston & Maine has received numerous and persistent applications for a reduction in fares. In its last reply the road says:

"The only way in which lower fares can lawfully be given to the soldiers [on furlough] is by means of a special excursion rate to and from Ayer, open to soldiers and civilians alike. If this should be done between Boston and Ayer, it would have to be done also wherever like conditions arise; that is, wherever similar excursions of similar character offer themselves, whether soldiers or civilians.

"The rate between Boston and Ayer is now 2¼ cents a mile, or a one-way rate of 84 cents, making the round trip \$1.68. It has been spoken of as if it were \$1.82 for the round trip, but 14 cents of this is collected by the United States Government as a tax. The Boston & Maine gets only 2¼ cents a mile. This is only ⅓ of a cent higher than the round trip rate which the Long Island Railroad is giving to civilians, to which reference has been made."

"The Boston & Maine is earnestly endeavoring to get increases in its passenger and freight rates in order to properly and efficiently conduct its business for the benefit of the public, and it seems to the management that it ought not to decrease any passenger rates at this time."

Reconsignment Privileges and Intra-City Freight Movements Stopped in Philadelphia

The Philadelphia District Committee on Car Service, consisting of operating and traffic representatives of the three railroads which enter that city—the Pennsylvania, the Philadelphia & Reading and the Baltimore & Ohio—have placed an embargo on all shipments of less-than-carload freight between points within the corporate limits of the city. An embargo was also placed on all reconsignments of either carload or less-than-carload freight within the city limits. Both embargoes became effective on November 15. This action was taken as a further step in conserving the transportation facilities of Philadelphia and the surrounding region, and aiding the plants engaged in manufacturing war material and other necessities to keep in continuous operation.

The purpose of placing these embargoes is to relieve the railroads from the necessity of rendering, in the city of Philadelphia, what is virtually a teaming service, which seriously interferes with the performance of their proper duties as interstate carriers. The practice of shipping freight over the railroad lines from one station to another, within the city limits, has grown to very considerable dimensions, and it requires the use of a large number of cars which otherwise could be devoted to long-distance traffic. It also adds materially to the congestion of railroad tracks in the city, is a drain on labor facilities at freight stations and increases the congestion of teams waiting to load or unload at freight stations.

Owing to the arrangement of the railroad tracks in the city, which have been planned as terminals for long distance traffic, it is often necessary to send intra-city shipments over very circuitous routes in order to make delivery between points only a very short distance apart in an air line.

This involves an amount of shifting which is disproportionate to the character of the service actually rendered to the shipper.

While the embargo on shipments of freight between stations within the corporate limits of the city will apply only to l. c. l. lots, for the present, ultimately the restriction will be extended to carload freight also, and for the same reasons.

The practice of reconsigning freight, after its arrival at one of the railroad stations in the city, to another station within the corporate limits is similar, in its effect, to the making of direct shipments between intra-city points. For service of this kind the railroads receive certain rates which are governed by public tariffs, but it imposes a tax on the railroad facilities out of proportion to the service rendered. In its statement to the public the committee has not only forbidden intra-city shipments, but has placed embargoes on all shipments of freight between points less than 40 miles apart, thus compelling all traffic of that character to be hauled by teams or trucks, in order to relieve the railroad lines, as far as possible, and leave them free for troop movements and long distance freight.

Freight Congestion

Reports of extensive losses of fruit and vegetables in the Western states because of a lack of freight cars, published in New York last week led the New York Times to make inquiries concerning congestion of cars in Cleveland, Pittsburgh, Cincinnati, Memphis, St. Louis and Chicago. At Cleveland considerable congestion is found, caused not only by shortage of cars but inability to obtain help in terminals. However, it is said that there has been little loss or delay at that point thus far. At Pittsburgh there has been serious congestion of perishable freight and the report says that considerable food has actually begun to rot in the cars. It appears that these losses have been due in large measure to the well-known cause, heard of repeatedly in former years, the custom of consigning perishable freight to Pittsburgh before a buyer has been found for it.

At Cincinnati there has been a good deal of congestion, but no large losses of perishable provisions. At Memphis it is denied that there is any congestion of perishable traffic. At St. Louis it is said that fruits and vegetables are moving freely, and this notwithstanding the fact that in Colorado and other regions tributary to St. Louis the crops this year have been 64 per cent greater than last year.

At Chicago large quantities of potatoes, cabbages and other vegetables were refused by consignees because frozen. These shipments were taken to side tracks on the outskirts of the city and unloaded; and the Salvation Army has sorted the good potatoes from the frozen ones and has distributed them among the poor. Newspaper reports of losses by freezing or otherwise are declared to have been greatly exaggerated.

The placing of embargoes on ordinary freight in order to facilitate the movement of perishable goods and all commodities needed by the government is becoming more general. Receiving stations in New York City and Philadelphia are obliged to refuse many important commodities. One eastern railroad, not one of the largest, which carefully summarizes and reissues embargo notices received from its connections, issues several revisions every week; and on November 9 issued four letter-sheet pages of closely printed notices, the last notice in this series being Supplement No. 68 to the last regular embargo notice. How the local freight agent can sleep at night with these puzzles hanging over his head is a mystery to the uninitiated.

The regular weekly tariff bulletin of the New York State Public Service Commission, Second district, usually consisting of three or four large pages, is now devoted largely to embargoes. An example of one of the simplest embargoes, that of the Long Island Railroad, No. 3587, superseding No. 3512 appears in the last Commission Bulletin as follows. (It will be noted that special "shipping days" have been established at Brooklyn stations):

Long Island.—Embargo on less carload freight originating on the Long Island railroad is revised as follows: Effective November 7th, shipments of less carload freight destined to points on foreign lines may be accepted for forwarding on Mondays and Wednesdays only, except such shipments originating at Flatbush Avenue, Bushwick, and Long Island City. Shipments of 10,000 lbs. or more or loaded to cubic capacity of car and loaded by shippers in one car may be accepted and carded direct through to destination point or connecting line transfer. Effective November 8th, and each Tuesday and Thursday thereafter, embargo is placed on all less carload freight originating at Flatbush Avenue. Highly perishable shipments will not be accepted at Flatbush Avenue on Saturdays. Highly perishable l. c. l. freight will be accepted at Jamaica on Mondays, Wednesdays and Fridays only. Embargo continues on l. c. l. freight destined to or origin-

ating at Bushwick. Embargo continues on l. c. l. freight destined to Long Island City; l. c. l. freight originating at Long Island City and destined to local points will not be accepted on Wednesdays and Fridays. Embargo will not apply to freight consigned to or for use of the United States Government; freight for Long Island State Hospital, Kings Park; the Manhattan State Hospital, Central Islip; and material and supplies for the Long Island Railroad. Embargo 3587 (Supersedes Embargo 3512.)

Shipping Days at New York City

"The shipping day plan" for conserving freight cars and saving time of drays by accepting l. c. l. shipments for given destinations on only a part of the days of each week—usually Monday, Wednesday and Friday or Tuesday, Thursday and Saturday—is now in operation in New York City at the stations of three roads, the Pennsylvania, the New York Central and the New York, New Haven & Hartford. On the Pennsylvania the plan was put in use at the beginning of the present week and on the other two roads a week earlier. Each road has issued a convenient pocket manual containing lists of destination stations, large and small. The New Haven road has applied this rule thus far to only two New York City stations, piers 37 and 39. The New York Central book shows six loading stations and the list of destinations includes only those on the company's lines east of Buffalo; but there is a page given to connecting railroads without naming the stations. For most of these connections there are three shipping days a week.

The Pennsylvania's book consists of 113 pages and the stations are arranged both alphabetically and geographically. There is a separate list of the towns west of Pittsburgh. This book shows shipping days from a dozen loading stations, including several in Brooklyn. At some of the stations some of the cars are closed at 3 p. m. and 4:30 p. m. is the hour in most cases.

The New Haven road has issued revised shipping-day circulars at seven New England cities: Boston, Brockton, New Bedford, Fall River, Providence, Pawtucket and Worcester.

Freight will be shipped at the times and days advertised regardless of quantity; that is to say, even if partly filled cars have to be sent.

Illinois Manufacturers Favor Increase in Freight Rates

Substantial shipping interests the country over seem to recognize the justification of the railroads' plea for higher freight rates. A strong endorsement of the position of the carriers comes from the Illinois Manufacturers' Association (John M. Glenn, secretary) which sent the following telegram to the chairman of the Interstate Commerce Commission on November 10:

"The directors of the Illinois Manufacturers' Association * * * respectfully urge that the petition of the carriers in the official classification territory for an advance in freight rates be granted. It is almost the unanimous belief of shippers in the Middle West that in order to maintain the transportation service of the country more money must be paid for the carriage. Please act promptly. We feel the situation is critical."

Heavier Loading Up to Shippers

D. I. Forsyth, vice-chairman of the Chicago Car Service Committee, calls attention to the fact that maximum loading of freight cars is not affected by the Food Administration's rules governing the manufacture and distribution of food commodities. Those rules establish minimum trade units for buying and selling. They provide that carload shipments of certain commodities shall be made in lots of not less than a certain weight; but while the minimum carload weights, as fixed by the Administration, do require shippers to load cars heavier in order to secure carload rates, the carrying capacity of the cars in nearly all cases is much greater. Every freight car should be loaded to its maximum carrying capacity, not merely to the minimum necessary to secure a carload rate of freight. Some of the advances in minimum carload weights ordered by Food Administration are: flour, from 40,000 lb. to 60,000 lb.; syrup and molasses, from 36,000 to 60,000; rice, from 40,000 to 60,000; dried beans and peas, from 40,000 to 60,000; fresh meat and butter, from 20,000 to 24,000; canned vegetables, etc., from 36,000 to 60,000; wheat, oats, corn, rye and barley, to car capacity.

NEW RAILROAD PROJECTED IN MEXICO.—Construction will be begun early in January on a railroad line between Tapachula and San Benito in the state of Chiapas.—*Commerce Report*.

Commission and Court News

STATE COMMISSIONS

The Public Service Commission of West Virginia has authorized a general advance of 15 cents a ton in freight rates on coal.

The Railroad Commission of Kentucky has approved a tariff, agreed upon between the Louisville & Nashville and the coal producers, making considerable reductions in the freight rates on coal from mines in western Kentucky.

The Appellate Division of the New York Supreme Court, First Department, has sustained an order of the Public Service Commission, First District, issued last February, in which the surface railroad lines of the Brooklyn Rapid Transit system were directed to procure 250 new cars for winter use. This is the third court decision adverse to the railroad corporation.

Increased Allowance for Grain Doors

The New York State Public Service Commission, Second District, has issued an order requiring the principal railroads in the state to make an allowance of five mills per 100 lb. of lading for lumber used for grain doors and bulk heads when furnished by shippers of grain and produce in bulk. The opinion is by Commissioner Irvine. It is held that the former allowance of 50 cents a door with a maximum of two dollars a car was inadequate. The shippers declared that the former rate of allowance, reasonable when first made, has become insufficient owing to the rapidly increasing price of lumber. Commissioner Irvine says that evidence is not adequate to enable him to determine what would be a fair average maximum allowance at present prices. The rate of 5 mills per 100 lb. of lading, proposed by shippers, is the only basis at present available. "It may be that owing to very recent increases in prices it is too low; and the time may come when it is too high. . . . The flat allowance heretofore prevailing, inadequate under all circumstances, was an inducement to minimum loading. Moreover the amount of lumber used naturally varies with the load in the car, and the allowance should vary accordingly."

PERSONNEL OF COMMISSIONS

F. W. Putnam, of Red Wing, has been appointed a member of the Minnesota State Railroad & Warehouse Commission in place of E. Elmquist, resigned.

Charles P. Webster, state coal administrator of Iowa, has been appointed a member of the Iowa Board of Railroad Commissioners, succeeding E. D. Chassell, recently resigned to become secretary-treasurer of the Farm Mortgage Bankers' Association of America, at Chicago. Mr. Webster will continue to discharge the duties of coal administrator.

COURT NEWS

Safety Appliance Acts—Equipment of Trains

The Circuit Court of Appeals, Ninth Circuit, holds that the Safety Appliance Acts are mandatory in requiring that trains must not only be equipped to run, but must actually be run, without requiring brakemen to use the hand brakes in the ordinary movement of the trains. The case was before the court for the second time. Ross, C. J. dissented.—*Great Northern v. United States*, 244 Fed., 406. Decided June 25, 1917.

In a case just reported from the Eastern district of Michigan the doctrine of the above decision was followed. It was in a suit where, in certain specified instances, the speed of the trains was controlled by the use of the hand brakes, and not by the use of the power brakes. There was evidence tending to show that by reason of the steep grade the hand braking was safer, but this was held to be immaterial, the question of safety having been determined by Congress when the law was enacted.—*United States v. Grand Rapids & Indiana*, 244 Fed., 609. Decided October 5, 1916.

Reasonableness of Demurrage Charges

In an action by a railroad for demurrage charges of \$1 a day on cars delivered to a steel company, the defendant denied the reasonableness of the charges, but offered no evidence that they were unreasonable. Notwithstanding the railroad offered no proof of their reasonableness, the Pennsylvania Supreme Court held that it was not precluded from recovering, as the reasonableness of such charges was recognized by the Pennsylvania act of May 24, 1917.—*Pittsburgh & Lake Erie (Pa.)*, 101 Atl., 1048. Decided May 22, 1917.

Stop, Look and Listen Rule

The Pennsylvania Supreme Court holds that the duty of one about to cross a railroad track at grade is not always confined to stopping, looking and listening for the approach of a train. He must stop at a proper place, and when he proceeds he should continue to look and to observe the precautions which the dangers of the situation require. He should stop again if there is another place nearer the tracks from which he can better discern whether there is danger. One driving a buggy over a grade crossing was held guilty of contributory negligence when, after stopping, looking and listening when about 90 feet from the track, he did not stop before reaching the track, where he could have seen an approaching train for a distance of three-quarters of a mile.—*Reigner v. Pennsylvania (Pa.)*, 101 Atl., 995. Decided May 22, 1917.

Establishment of Rates by State Commission

The Michigan Supreme Court holds that, where the Railroad Commissioners, under the 1909 statute, determined that rates theretofore published were unreasonable, and established a new schedule of rates, its action, although liable to be set aside by the courts, fixed a legislative rate immediately in effect; and where a railroad company, while contesting the validity of such rates, exacted the old charges, it was liable to shippers therefor. But though the statute authorizes a shipper who has been compelled to pay illegal rates to recover double damages, the provision is one for a penalty, and it is held the penalty should not be assessed against a railroad company where, during the time that it made the illegal exactions, a rate fixed by the Michigan Railroad Commission was suspended by a court of competent jurisdiction.—*Fletcher Paper Co. v. Detroit & Mackinac (Mich.)*, 164 N. W., 528. Decided September 27, 1917.

Things Attractive to Children

In an action against a railroad for a child's death resulting from the rolling of logs left on its premises, a tract of uninclosed land with houses surrounding it, it appeared that some children were jumping from one to another of a pile of logs when one, on which a boy of about 7 years old was astride, began to roll, and killed him. The evidence did not show that children habitually played on the logs or on the tract of land, nor that the depositing of logs there was a new use of the land or that such use created a peril affecting any customary use of the premises by the public. It was held, on appeal from judgment for the plaintiff, that judgment should have been directed for the railroad.—*Sandstrom v. Minneapolis, St. P. & S. S. M. (Mich.)*, 164 N. W., 472. Decided September 27, 1917.

UNITED STATES SUPREME COURT

Powers of States to Regulate Commutation Rates

In a suit by the Pennsylvania, as lessee of the Northern Central, against the Maryland Public Service Commission for an injunction to restrain the commission from enforcing an order requiring the sale of commutation tickets at certain specified rates, the United States Supreme Court holds, affirming 126 Md. 59, that where a railroad company has recognized the propriety and necessity of rendering a peculiar service to suburban communities by establishing commutation rates, a state may, without violation of the Federal Constitution, regulate such rates within the limitation of reasonableness, and may fix rates for the special service rendered regular travelers ("commuters") different from those charged for the general service.—*Pennsylvania v. Towers*, 38 Sup. Ct. Rep. 2. Decided October 15, 1917.

Equipment and Supplies

LOCOMOTIVES

THE CENTRAL OF BRAZIL has ordered 2 Consolidation locomotives from the Baldwin Locomotive Works.

FREIGHT CARS

THE MAGNOLIA COTTON OIL COMPANY, Houston, Tex., is in the market for 10 tank cars.

THE BLISS OIL & REFINING CORP., Tulsa, Okla., is inquiring for 25 8,000-gal. capacity tank cars.

THE INDIANA REFINING COMPANY, Lawrenceville, Ill., is inquiring for 25 8,000-gal. capacity tank cars.

THE MILLER PETROLEUM REFINING COMPANY, Chanute, Kan., is in the market for 10 10,000-gal. capacity tank cars.

THE AMERICAN AGRICULTURAL CHEMICAL COMPANY is in the market for 5 50-ton tank cars for the transportation of sulphuric acid.

PASSENGER CARS

THE DULUTH & IRON RANGE is inquiring for 5 passenger cars.

IRON AND STEEL

THE SIOUX CITY TERMINAL has ordered 109 tons steel from the Frankman Brothers Bridge & Construction Company for a deck plate girder bridge across the Floyd River at Sioux City.

MISCELLANEOUS

THE CENTRAL OF NEW JERSEY recently retained Westinghouse Church Kerr & Co., New York, to design and construct a boiler plant at the railroad's coaling station in Communipaw, N. J. A transmission line will also be built from the railroad's power plant in Communipaw to this coaling terminal.

INCREASED RATES IN ARGENTINA.—Sir Henry Bell, presiding at the annual meeting of the Buenos Ayres Western, said the railways of Argentina had been permitted to increase their rates to cover the increase in wages granted after the recent strike, in addition to the 22 per cent increase in rates granted to cover the higher operating costs, the chief item in which was the cost of coal. The labor situation, however, he remarked, was still unsettled. The crops, he added, were excellent, but he expressed the fear that the roads would not benefit therefrom to any marked degree owing to the shortage of ocean tonnage.

AMERICAN LOCOMOTIVES RUSTING AWAY IN GREECE.—Press despatches from Athens state that ten monster American locomotives are standing on a side track at the Piræus, gradually rusting away for lack of use. They are evidence of the progressive modern methods which a recent government railway administration sought to put into practice without, however, making due calculations in advance. The engines were greatly admired when they arrived, but when they were put on the tracks it was discovered that the light rails almost flattened out with their weight, and the bridges along the main routes were not strong enough for them.

SAID TO BE AUTHENTIC.—Hundreds of women in track gangs are doing the hardest kind of work with pick and spade on the Pennsylvania lines east and west of Pittsburgh. The president of a steel company left his private car to watch the new section hands. "How do you get along with your new workers?" he asked the section foreman a rugged son of Erin. "Foine," confessed the foreman. "In this game you have to call a man every name in the calendar to get him working at top speed, but all I have to say to one of these gurrils is, 'That's great, dearie, keep it up,' and she'll wurk like the divvil. 'Dearie' fetches them."—*Wall Street Journal*.

Supply Trade News

The Combustion Engineering Corporation, Chicago, announces that six men in its drafting room have joined the colors.

J. M. Betton, maker of injector sand blast apparatus, formerly at 26 Park Place, has removed his office to 59 Pearl St., New York.

W. R. Toppan, who for 15 years was identified with the Kennicott Company, which recently discontinued business, is now manager of the railroad department of the William Graver Tank Works, Chicago, the new proprietor of the Kennicott type "K" water softener.

Joseph Sinkler has resigned as western representative of the Economy Devices Corporation to become special representative in Chicago and tributary territory for the Perolin Railway Service Company.

Mr. Sinkler was born at Scranton, Pa., on December 14, 1874, and began his mechanical career with the Dickson Locomotive Works in the same city. He remained with that company three years and later was employed on the New York, Susquehanna & Western two years and for the succeeding two years on the Delaware, Lackawanna & Western. He became associated with the Franklin Railway Supply Company commencing July 1, 1904, and continued with that company until January 1, 1916, when he was appointed western representative of the Economy Devices Corporation at Chicago. He assumed his duties as special representative of the Perolin Railway Service Company on November 15.

Joseph Sinkler

J. F. Sells, of the engineering staff of the National X-Ray Reflector Company, has been appointed consulting illuminating engineer for the new business departments of the Henry L. Doherty Company, central station. Mr. Sells is located at Mansfield, Ohio, at present.

The Badt-Westburg Electric Company, of Chicago, which handles the Ward Leonard Electric Company's line of electric controlling devices and vitreous enamel insulation resistance units, announces a change in the corporate name to Westburg Engineering Company. This involves no change in management.

Peter H. Murphy, president of the Standard Railway Equipment Company, New Kensington, Pa., died at Pittsburgh, Pa., on November 7. Mr. Murphy was born at Bennington, Vt., on March 16, 1846. He served as machinist apprentice and locomotive engineer on the Erie and was also an engineer on the Pennsylvania Railroad and on the Union Pacific, running the first night express west out of Omaha. He was later division master mechanic on the Baltimore & Ohio at Cumberland, Md., master mechanic of the Toledo, St. Louis & Western and general master mechanic of the Cairo Short Line. He left railroad work in 1888 to engage in the manufacture of car roofs.

TRADE PUBLICATIONS

DU PONT PRODUCTS.—There has just been issued a handy little booklet which contains a list of all the products manufactured by the E. I. du Pont de Nemours and Associated Companies, namely, Du Pont Chemical Works, Du Pont Fabrikoid Company, The Arlington Company, and Harrisons, Inc.

Railway Construction

CHICAGO, BURLINGTON & QUINCY.—This company is developing plans for a new freight terminal to be built on Canal street, between Harrison and Taylor streets, Chicago. A contract has been awarded to the General Wrecking & Lumber Company, Chicago, for the removal of two old freight houses, and a contract for grading has been given to Newman & Co., Chicago. Bids are now being asked on caisson work for the new structure.

The Chicago, Burlington & Quincy is building an addition to its inbound freight house at Omaha, Neb., 60 ft. by 368 ft., which, together with the equipment, will cost about \$60,000. The work is being done by T. S. Leake & Co., Chicago.

CHICAGO & NORTH WESTERN.—This company is building a spur from a point two miles south of Benld, Ill., three miles west to shaft No. 4 of the Superior Coal Company. About two-thirds of the line has been graded and part of the track has been laid.

GOLCONDA NORTHERN.—This company has filed an application with the State Public Utilities Commission of Illinois for a certificate of convenience and necessity to construct and operate a railroad from Golconda, Ill., in a northwesterly direction along the northwest bank of the Ohio river to a point at or near Elizabethtown in Hardin county.

LEHIGH VALLEY.—A contract has been given by this company to George W. Rogers & Co., New York, for building a boiler house at Perth Amboy, N. J. It is to be of brick construction, 40 ft. by 118 ft., and will replace the existing structure.

PACIFIC ELECTRIC.—This company is building car shops, 75 ft. by 220 ft., and one story high, at Torrance, Cal. The building will be a frame structure with concrete foundation and composition roof and will cost about \$10,000. The railroad company's forces are doing the work.

SIoux CITY TERMINAL.—This company is building a bridge across the Floyd river, Sioux City, Iowa, to cost about \$39,000. E. A. Whitney, Sioux City, Iowa, has the contract for the foundation work and Frankman Bros. Bridge & Construction Company has the contracts for fabricating and erecting the steel. The company also contemplates the rearrangement of tracks in the Sioux City stock yards, but has not yet completed plans for this improvement.

PERILS OF RAILROAD BUILDING IN ALASKA.—While the track laying crew was recently engaged in laying rails on the main line near Mile 195 a brown bear came out of the woods and attacked one of the laborers, chasing him down the right of way. Fortunately one of the men had a rifle near at hand and succeeded in killing the animal before any one was injured. The bear weighed about 800 pounds.—*Alaska Railroad Record.*

TRADE BETWEEN THE UNITED STATES AND SOUTH AMERICA is three times as great as in the year before the war. A compilation by The National City Bank of New York shows that the total exports to that continent in the eight months ending with August (the latest month for which figures are available) aggregated \$188,000,000 against \$65,000,000 in the same months of 1914; and the imports from South America were \$433,000,000 against \$157,000,000 in the same months of 1914. Thus the total trade with that continent in the eight months of 1917 was \$620,000,000 against \$222,000,000 in the corresponding months of 1914.

SOUTHERN PACIFIC ADOPTS CORN CAKES.—The extent to which Hoover's plea to save wheat by the substitution of corn is being practiced throughout the country is indicated by the appearance on the tables of all Southern Pacific dining cars of the following printed notice: "The government earnestly desires that wheat be used as sparingly as possible, and that corn be substituted. America was pioneering on corn; the Pilgrim Fathers almost lived on it. Corn was the first crop planted in all the virgin soil as it was settled, from the Atlantic out across the Alleghenies; upon the broad prairie and beyond. On our menu this morning, we have corn-meal cakes." The recipe for the cakes is also given.

Railway Financial News

CHICAGO, BURLINGTON & QUINCY.—At the annual meeting of the stockholders of this road on November 7, O. M. Spencer, general counsel, was elected a director. All retiring directors were re-elected. The date of the annual meeting of the stockholders has been changed from the first Wednesday in November to the first Wednesday in May.

CHICAGO & EASTERN ILLINOIS.—The date of the sale of this road has been postponed from November 7, 1917, to February 5, 1918.

CHICAGO, ROCK ISLAND & PACIFIC RAILROAD.—Justice Scott in the Appellate Division of the Supreme Court of New York has decided that the First National Bank of New York City must pay to Walter C. Noyes, as receiver of the Chicago, Rock Island & Pacific Railroad (one of the two old holding companies), all moneys of that company now on deposit in the bank. It was contended by the bank that as some of the money of the railroad company was deposited with it for specific purposes, such as the payment of interest on bonds maturing at different dates, the bank was holding it as a trustee, and should not turn it over except for the specific purpose for which it was intended. The Appellate Division decided that the naming of different funds was for convenience only, and that it was not in the province of the bank to regulate the use of any funds now lawfully at the disposition of the receiver of the railroad company.

ERIE.—Application has been made to the New York Public Service Commission for authority to issue \$15,000,000 of 6 per cent, series A bonds, under the refunding and improvement mortgage, dated December 1, 1916. The proceeds are to be used in re-imbursement the company's treasury in part for expenditures made from income within the past five years.

GRAND TRUNK WESTERN.—G. W. Dixon, Chicago, has been elected a director to succeed his father, Arthur Dixon, deceased.

KANSAS CITY TERMINAL.—This company has sold \$3,000,000 one-year 6 per cent notes to William A. Read & Co. and Lee, Higginson & Co. of New York, which are being offered at 99¼ to yield 6¼ per cent. The notes are secured by \$4,600,000 first mortgage 4 per cent bonds.

NEW YORK, NEW HAVEN & HARTFORD.—Application has been made to the Massachusetts Public Service Commission for permission to issue 450,000 shares of 7 per cent preferred stock, par \$100, to pay for the road's floating debt of \$45,000,000 now covered by promissory notes, secured by deposit of collateral and maturing April 15, 1918. The issue was recently authorized at a special stockholders' meeting.

PENNSYLVANIA.—See Philadelphia, Baltimore & Washington.

PHILADELPHIA, BALTIMORE & WASHINGTON.—The stockholders at a special meeting on November 7 approved the proposition to lease the company's properties for 599 years, beginning January 1, 1918, to the Pennsylvania Railroad, which owns practically all of the stock. The stockholders also approved the agreement to acquire the properties of the Pomeroy & Newark Railroad. Action on the lease of the Sparrows Point Railway was deferred pending the lease by the Pennsylvania of the Philadelphia, Baltimore & Washington.

YAZOO & MISSISSIPPI VALLEY.—An application has been filed at Memphis, Tenn., for authority to increase its authorized capital stock from \$15,000,000 to \$21,553,300. This company, which operates 1,382 miles of line, is controlled by the Illinois Central. A press despatch from Chicago dated November 9 says that the \$6,553,300 new stock of the Yazoo & Mississippi Valley, for the authority to issue which application has been made, will be substituted for a like amount of Louisville, New Orleans & Texas land grant, non-cumulative 6 per cent income bonds, which issue is owned by the Illinois Central and is pledged as security under the 4 per cent gold bonds of 1953. According to the latest records no interest has ever been paid on the income 6's. The substitution is to be made in order to equalize the funded debt and share capital of the Yazoo & Mississippi Valley.

Railway Officers

Executive, Financial, Legal and Accounting

John Duffy, advertising and publicity agent of the Lehigh Valley at New York, has been elected assistant secretary, with headquarters at New York.

W. S. Jones has been appointed auditor of the Prescott & Northwestern, with headquarters at Prescott, Ark., in place of L. P. Beidelman, assigned to other duties.

C. E. Denney, whose appointment as assistant to the president of the New York, Chicago & St. Louis, was announced in these columns on November 2, was born at Washington, D. C., on October 18, 1879. He attended the Pennsylvania State College from 1896 to 1899, leaving school that year to become an inspector for the Union Switch and Signal Company, with which company he remained until May 16, 1905, when he resigned the position of superintendent of construction to become assistant signal engineer on the Lake Shore & Michigan Southern. One year later, May 16, 1906, he was promoted to signal engineer and six years later his jurisdiction was extended over the Lake Erie & Western. On October 15, 1913, he was promoted to the position of special engineer in the office of J. J. Bernet, vice-president of the Lake Shore, which position he held until August 15, 1914, when he resigned to return to the Union Switch and Signal Company. His service with that company as assistant general sales manager, assistant general manager and assistant to the president, in the order named, was continuous from August 15, 1914, to November 15, 1916, on which date he was appointed special engineer to the president of the Nickel Plate. On November 1, 1917, he was appointed assistant to the president with headquarters at Cleveland.

C. E. Denney

W. G. Choate, superintendent of the Louisiana division of the Gulf Coast Lines at De Quincy, La., has been appointed assistant to the president, with office at Houston, Texas.

B. B. Greer, vice-president and general manager of the Colorado & Southern, has been elected also president of the Colorado Springs & Cripple Creek, with office at Denver, Colo.

W. E. Morse, having resigned the position of general manager for the receivers of the Denver & Salt Lake, the duties of that office have been assumed by W. R. Freeman, receiver. The offices of treasurer and assistant treasurer for the receivers have been abolished.

W. T. Tyler, vice-president of the St. Louis Southwestern of Texas, Tyler, Tex., has been appointed assistant to the first vice-president of the Northern Pacific, with headquarters at St. Paul, Minn., succeeding T. H. Lantry, who has been named a member of the Russian Railway Service Corps.

B. Newhouse, auditor of traffic accounts of the Minneapolis, St. Paul & Sault Sainte Marie at Minneapolis, Minn., has been appointed assistant comptroller, vice A. R. Marshall resigned, and R. A. Mueller has been appointed freight auditor. The position of auditor of traffic accounts has been abolished.

J. J. Turner, president of the Chicago Union Station Company and the Indianapolis Union, and vice-president of the Monon-

gahela Railway and the Pennsylvania Lines West, has been elected president of the Grand Rapids & Indiana, with headquarters at Pittsburgh, Pa., vice J. H. P. Hughart, deceased.

W. H. King, Jr., has been appointed president's assistant of the Seaboard Air Line, with headquarters at Norfolk, Va., vice E. C. Bagwell promoted, effective November 10. Mr. King succeeds Mr. Bagwell also as general manager of the Tampa Northern, the Raleigh & Charleston and the Chesterfield & Lancaster.

W. N. Neff, superintendent of the Northwestern Pacific, at Sausalito, Cal., was appointed vice-president and general manager of the St. Louis Southwestern of Texas, and general manager of the St. Louis Southwestern at Tyler, Tex., effective November 8, succeeding James Russell, resigned to become vice-president of the Denver & Rio Grande, Denver, Colo.

Robert McIntyre, whose appointment as assistant to vice-president and general manager of the Southern Pacific Company, Pacific System, was announced in the *Railway Age Gazette* of October 19, was born at Kouchibouguac, Kent county, N. B., and entered railway service on February 1, 1886, as brakeman on the Intercolonial at Moncton, N. B. He was subsequently until May, 1890, switchman on that road, and from June, 1890, to September, 1892, was employed as a switchman on the Old Colony at Boston, Mass. The following seven months he was with the Galveston, Harrisburg & San Antonio as switchman at El Paso, Tex., and from May, 1893, to March, 1900, was employed by the New York, New Haven & Hartford in a similar capacity at Boston. He then went to the Southern Pacific and until September, 1907, was successively brakeman and conductor on the Tucson division. From the latter date to July, 1909, he was salary chairman of the committee of the Brotherhood of Railroad Trainmen on the Southern Pacific, Pacific System. He was later made vice-president of the grand lodge of the Brotherhood of Railroad Trainmen, which position he held until his recent appointment, as noted above.

R. McIntyre

Operating

F. A. Winterson has been appointed assistant superintendent of the Laurentian division of the Canadian Pacific, with office at Montreal, Que., vice V. A. Harshaw, transferred.

A. W. McKay was appointed assistant superintendent of telegraph of the Great Northern, effective November 1, with headquarters at St. Paul, Minn., succeeding J. H. McGlogan, granted leave of absence.

W. H. Romoser, assistant superintendent of the Gulf Coast Lines at Kingsville, Texas, has been appointed superintendent of the Louisiana division, with office at DeQuincy, La., succeeding W. G. Choate, transferred.

W. C. Ascherast has been appointed trainmaster of the First Medicine Lodge and Kiowa districts, Panhandle division, Atchison, Topeka & Santa Fe, effective November 1, and will have headquarters at Wellington, Kan.

R. M. Leech, superintendent of transportation of the International Railways of Central America at Guatemala City, Guatemala, has been appointed general superintendent in charge of operation and maintenance in Guatemala.

H. McCall, superintendent of the Grand Trunk Pacific at Melville, Sask., has been appointed general superintendent rail lines west of, but not including Edmonton, Alta., with office at Prince Rupert, B. C., vice W. C. C. Mehan, granted leave of absence.

Andrew Keiser, superintendent of the Conemaugh Division of the Pennsylvania Railroad at Pittsburgh, Pa., has been granted a leave of absence, and during such absence the duties of the position will be performed by F. W. Smith, Jr., as acting superintendent; and A. B. Cuthbert, principal assistant engineer, Eastern Pennsylvania division, has been appointed acting superintendent of the Cresson division, with headquarters at Cresson, vice Mr. Smith.

F. E. Blaser, general superintendent of the Baltimore & Ohio at Baltimore, Md., has been promoted to assistant general manager; M. H. Cahill, general superintendent at Pittsburgh, has been transferred to Baltimore, succeeding Mr. Blaser; J. F. Keegan, general superintendent at Wheeling, W. Va., has been transferred to Pittsburgh, succeeding Mr. Cahill; J. M. Scott, superintendent at Grafton, W. Va., has been promoted to general superintendent, with office at Wheeling, and J. W. Deneen, assistant superintendent of the Coal & Coke Railway at Gassaway, has been appointed superintendent of the Baltimore & Ohio, at Grafton, succeeding Mr. Scott; effective November 1.

John Richard Savage, who has been appointed general manager of the Long Island Railroad, with headquarters at New York, as has already been announced in these columns, was born

on April 17, 1869, at Philadelphia, Pa. He graduated from the University of Pennsylvania in 1889, receiving the degrees of bachelor of science and civil engineer. In May, 1899, he entered the service of the Pennsylvania Railroad as a rodman and leveler, where he remained until October, 1890, when he resigned to become transitman with the United States engineering corps at Portland, Ore., and later served as assistant engineer in the United States engineering corps. In May, 1895, he was appointed engineer of the Seattle & Lake

J. R. Savage

Washington Company and from October, 1897, to October, 1900, served as assistant engineer on the Pennsylvania Railroad. He was then to July, 1901, engaged in making surveys for a proposed railroad through Lebanon valley, from Cornwall to Highspire. In August, 1901, he entered the service of the Lackawanna Iron & Steel Company, later known as the Lackawanna Steel Company, as assistant to the general manager, and was with that company during the construction of a new plant at Buffalo, N. Y. In April, 1904, he was appointed chief engineer of the Long Island Railroad and was recently appointed general manager of the same road, as above noted.

G. A. Hoag, assistant superintendent of the Canadian Northern at Trenton, Ont., has been appointed superintendent of the Superior district, including Nipigon, Long Lake and Oba subdivisions, with headquarters at Hornepayne, Ont.; W. R. Kelly is superintendent of the Nipissing district which now consists of the Ruel, Sudbury, North Bay and Pembroke subdivisions, including Foley, Sudbury and Parry Sound terminals, with headquarters at Capreol; George Collins has been appointed superintendent of the Quinte district which now consists of the Picton, Maynooth, Irondale, Tweed, Kingston and Brockville subdivisions, including Trenton terminals, with headquarters at Trenton, Ont.

The Seaboard Air Line announces that the operating organization was changed on November 10, as follows: The Virginia, North Carolina and Georgia divisions will constitute the Northern district, and the South Carolina, East Carolina, Alabama and Florida divisions will constitute the Southern district. R. S. Marshall, superintendent of the Virginia division at Raleigh, N. C., has been appointed general superintendent of the Northern district with headquarters at Hamlet, N. C.; H. B. Grimshaw,

general superintendent at Savannah, Ga., has been appointed general superintendent of the Southern district with headquarters at Savannah; O. R. Teague, superintendent of the Florida division at Tampa, Fla., has been appointed superintendent of the Virginia division, with headquarters at Raleigh, N. C., vice Mr. Marshall; D. N. Bacot, superintendent of the East Carolina division at Charleston, S. C., has been appointed superintendent of the Florida division, with headquarters at Tampa, Fla., vice Mr. Teague, and E. C. Bagwell, president's assistant at Norfolk, Va., has been appointed superintendent of the East Carolina division, with headquarters at Charleston, vice Mr. Bacot.

Traffic

H. L. Fell has been appointed assistant general passenger agent of the Central of Georgia, with office at Savannah, Ga.

C. Price-Green has been appointed industrial commissioner of the Canadian Northern, with headquarters at Toronto, Ont.

A. L. Ellet, assistant general passenger agent of the Chesapeake & Ohio, at Cincinnati, Ohio, has been transferred to Lexington, Ky., as southern passenger agent.

F. R. Stevens, agriculturist of the Lehigh Valley at Geneva, N. Y., has resigned to become agricultural secretary of the Pennsylvania State Chamber of Commerce.

Patrick Portel has been promoted to assistant general freight agent of the Chicago, Rock Island & Pacific, with headquarters at Oklahoma City, Okla., effective November 1.

T. H. Gurney, district passenger agent of the Chesapeake & Ohio, at Chicago, has been appointed assistant general passenger agent of the same road with headquarters at Cincinnati, Ohio.

P. L. Howard has been appointed commercial agent of the Missouri, Kansas & Texas at Tulsa, Okla., succeeding O. C. Thomas, resigned to engage in other business, effective November 1.

W. G. Knittle, traveling passenger agent of the New York Central, with headquarters at Youngstown, Ohio, has been promoted to general agent of the passenger department with the same headquarters.

W. H. Timberlake, commercial agent of the Southern at Cincinnati, Ohio, has been transferred to Minneapolis, Minn., in the same capacity. G. W. Benus, district freight agent, Cincinnati, will assume Mr. Timberlake's duties there.

W. J. Tremaine, commercial agent of the Alabama & Vicksburg and the Vicksburg, Shreveport & Pacific at Chicago, has been appointed assistant general freight agent, with office at Shreveport, La., and H. E. Freund succeeds Mr. Tremaine.

H. A. Jackson, general traffic manager of the Great Northern Pacific Steamship Company, San Francisco, Cal., has been appointed to the newly created position of export and import agent of the Great Northern, with headquarters at Seattle, Wash.

L. L. Fellows has been appointed general agent, freight department, of the Lake Erie & Western, the Ft. Wayne, Cincinnati & Louisville and the Northern Ohio, with office at Indianapolis, Ind., and the office of commercial agent at that point has been abolished.

Charles S. Cairns, general passenger and ticket agent of the Chicago & North Western, at Chicago, has been promoted to passenger traffic manager, and John L. Ferguson, assistant general passenger agent at Chicago, succeeds Mr. Cairns as general passenger and ticket agent, both with headquarters at Chicago; effective November 15.

E. B. Wilkerson has been appointed general agent, freight department, of the Missouri Pacific, with headquarters at Wichita, Kan., succeeding S. H. Kilgore, transferred. W. C. Dibblee has been appointed general agent, passenger and freight department, with headquarters at Seattle, Wash., succeeding W. S. Mitchel, transferred.

Alan W. Graves, traveling freight agent of the Merchants & Miners Transportation Company at Baltimore, Md., has been appointed commercial agent of the Merchants & Miners Transportation Company and the Central of Georgia (Central Savannah

Line), with headquarters at Baltimore, vice S. A. Tubman, furloughed to enter military service.

E. C. Meyer, commercial agent of the Chicago & Alton, at Birmingham, Ala., has been promoted to general agent, traffic department, with headquarters at Milwaukee, Wis., succeeding W. C. Mueller, resigned. H. A. Dowling, contracting freight agent, St. Louis, Mo., has been appointed commercial agent, Birmingham, succeeding Mr. Meyer; effective November 6.

Engineering and Rolling Stock

J. W. Coulter has been appointed master mechanic of the Alton & Southern, with headquarters at East St. Louis, Ill.

H. H. Temple has been appointed chief engineer of Pittsburgh & West Virginia and the West Side Belt, with headquarters at Pittsburgh, Pa.

J. A. Heaman, assistant to chief engineer of the Grand Trunk Pacific at Winnipeg, Man., has been appointed assistant chief engineer, and the position of assistant to chief engineer has been abolished.

E. C. Wright, district bridge inspector, Maryland district of the Baltimore & Ohio, has been promoted to division engineer, with office at Wheeling, W. Va., succeeding P. A. Beatty, resigned; effective November 1.

M. Turton has been promoted to mechanical superintendent of the International Railways of Central America, with office at Guatemala City, Guatemala, in place of R. Potts, who has resigned to go to another railroad company.

W. R. Harrison has been appointed master mechanic of the southern Arkansas division of the Atchison, Topeka & Santa Fe, with headquarters at Chanute, Kan., succeeding W. H. Hamilton, assigned to other duties, effective November 10.

L. L. Sparrow, engineer of roadway of the Atlantic Coast Line at Jacksonville, Fla., has been appointed office engineer, with office at Wilmington, N. C., and H. G. Laird, superintendent of timber preservation at Gainesville, Fla., succeeds Mr. Laird.

George H. Brown, division engineer of the Philadelphia division of the Pennsylvania Railroad at Harrisburg, Pa., has been appointed acting principal assistant engineer of the eastern Pennsylvania division, vice A. B. Cuthbert. (See Operating Officers.)

S. F. Shaw has been appointed chief engineer of the International Railways of Central America, with office at Guatemala City, Guatemala, in charge of engineering, additions and betterments and right-of-way in Guatemala, succeeding E. H. Stewart, resigned to go to another company. C. R. Chandler, assistant engineer at Guatemala City, has been appointed engineer of maintenance of way in Guatemala.

Charles Manley, whose appointment as superintendent of machinery of the Missouri & North Arkansas, with headquarters at Harrison, Ark., was announced in the *Railway Age Gazette* of October 19, was born on September 10, 1867, at Nashville, Tenn. He began railway work on May 1, 1883, with the Texas & Pacific at Big Springs, Tex., and after serving an apprenticeship of four years as machinist with that road, he was employed as machinist by various railroads in the Southwest and West, including the Mexican National, with which he was identified until May, 1910. While with the latter road he was employed successively as general foreman at Laredo, master mechanic at Mexico City, and superintendent of shops at Aguas Calientes. He left Mexico on account of the revolution, but returned in December, 1910, as master mechanic of the Vera Cruz Terminal Company at Vera Cruz, Mex. Subsequently he became superintendent of motive power of the Tehuantepec National. On August 1, 1912, he went to the Missouri & North Arkansas as terminal foreman, one month later he was promoted to master mechanic, and on July 1, 1916, was appointed superintendent at Harrison, Ark., which position he held until his recent appointment as superintendent of machinery.

Railway Officers in Military Service

Clyde E. Barnes, mechanical engineer of the Spokane, Portland & Seattle, has enlisted in the navy. He will take the Harvard or Columbia four-months' course in electrical or mechanical instruction for motor boat submarine chasing, after which he will be rated as a machinist's mate in the navy.

OBITUARY

W. R. Sykes

W. R. Sykes, inventor of the controlled manual system of block signaling is dead, in England, at the age of 78. He entered railway service on the London, Chatham & Dover in 1863 and continued to serve in the signal department until 1899, when that road was combined with the South Eastern; but he continued with the combined companies as consulting electrical engineer, and therefore had been continuously in the same service for 54 years.

Mr. Sykes began in the shops of the telegraph department, and, indeed, had worked for a telegraph company before coming to the railway; and in a very short time he made an improvement on the needle telegraphs which were used for manual block signaling. In 1872 he installed some electric signals in the Victoria station of the Metropolitan District Railway, London. He tried a track circuit as early as 1864, but the experiment seems not to have been followed up. The first controlled-manual apparatus was tried in 1874 and was patented in 1875. He called the scheme "a combined lock and block" and lock-and-block has continued to be the name by which the system is known in England. This invention was a truly fundamental innovation, for the control of the entering signal by the man at the outgoing end of the block section (and by the outgoing train) made a radical improvement in safety, though Tyer's single-track apparatus, which embodied the same electrical principle, was, we believe, of earlier date than Sykes' system.

Mr. Sykes installed what might be called an electro-mechanical system of interlocking at the Victoria station in 1883 where 50 signals were used, interlocked in some way with the mechanical interlocking. These appear to have been constructed on the same general principle as the enclosed disk signals which were then coming into use in this country.

Sykes was the author of numerous other inventions and improvement and his talents seem to have been availed of far beyond the limits of the London, Chatham & Dover. The lock-and-block system was soon introduced on the South Eastern, the London, Brighton & South Coast, the Great Eastern and the London & South Western.

The Sykes apparatus was introduced into the United States by the Union Switch & Signal Company. It was first used on the Harlem division of the New York Central, between Grand Central Terminal, Forty-second street, New York, and Woodlawn, in 1882, or 1883, about seven miles being completed in that year. The engineers of the Union Company made important modifications in the system and it was extended, about 1892, over the main line of the New York Central from New York to Buffalo, 440 miles, and it was installed extensively on the New York, New Haven & Hartford. On the Erie it was used on one division. J. P. Coleman, engineer of the Union Company devised many of the changes and improvements in the apparatus and in certain installations it was called the Coleman system.

Today, as everyone knows, the automatic block signal system is superseding the manual on busy lines all over the country and the controlled manual has gradually been displaced. The New York Central, by the last statistical report, had only 39 miles. The New Haven road had 175 miles. These installations are being slowly taken out, so that soon there will be none. In this connection it is to be noted that in England, where manual signaling still prevails, the primary principle of control of the entering end of a block section by the man at the outgoing end, has found increased favor within the last 10 years even on roads where Sykes did not find favor. And the root principle, it may be said, has been used on a considerable mileage in this country, on single track lines; but without the elaborate safeguards employed by Sykes and Coleman.

Personally, Mr. Sykes was of a very retiring disposition, and never took part in public discussions. A daughter of his is the wife of Arthur H. Johnson, at one time signal engineer of the Erie Railroad and now superintendent of telegraph and signals on the London & South Western; and a son, George Sykes, worked for the Johnson Railroad Signal Company at Rahway, N. J., for a few years in the early nineties.

NO SWISS SUNDAY TRAINS.—A Central News telegram from Zurich says that after October 15 no more passenger trains are to be run on Sundays in Switzerland.

As we go to press it seems to be generally expected that important if not decisive developments affecting the latest

A Big Job for President Wilson

demands of the railway train employees for higher wages will result from the conference between the brotherhood leaders and President Wilson to be held on Thursday of this week. Naturally there is considerable anxiety as to whether the President will be able to point the way to an adequate solution of the problem. The Railroads' War Board, while expressing a belief in the principle of arbitration, in view of the situation created by the war, has waived insistence on this method of settlement, and has agreed to place the interests of the railroads unreservedly in the hands of the President. The brotherhood chiefs are still unwilling to submit their demands to arbitration, but have agreed to mediation and that they will take no precipitate action until after hearing from the President. While no one apparently has any doubt that a settlement of some kind will be reached sooner or later, for a strike at this time would be unthinkable, the important question is as to what kind of a settlement can be reached. Manifestly the railroads cannot assume the added burden which this further increase in their payroll would involve without knowing where the money is coming from and without considering the great majority of their employees who do not belong to the brotherhoods. They have, therefore, gone about as far as could possibly be expected of them in placing themselves in the hands of the President, and their action should receive public recognition as being dictated by the most patriotic motives. If the President can devise a plan by which justice can be served without a surrender to the exigencies of the emergency, his action will merit the highest commendation, but the responsibility upon him is a heavy one.

The traffic commissioner of a Board of Trade or other merchants' organization has to spend a large part of his time and energy in getting justice from the railroads in behalf of complaining shippers; but sometimes shippers' grievances are not well founded and this traffic commissioner finds it his duty not to get justice, not to be an advocate, but to dispense justice, much as a judge or an arbitrator would do.

The National Industrial Traffic League

He stands between a large body of constituents and a smaller body of railroad officers. If any one thinks that these commissioners are partisans, always driving or fighting the railroads, he should attend a meeting of the National Industrial Traffic League, like that reported in another column of this issue. The high-minded, judicial, fair-dealing attitude of all of the principal participants in the discussions at this convention was constantly in evidence. Some of these men were formerly in railroad service, and they know all the weaknesses or wrongs or wickednesses that may be found in the railroads' practices; but the ex-railroader who, to please his new employer, is unreasonable or vindictive toward the carriers was conspicuous at this meeting by his absence. There was a time, years ago—we will not say how few years ago—when the Interstate Commerce Commission thought more of getting justice—from the railroads—than about placing itself in a strictly impartial attitude. If any member of that body feels in his breast a fear that this old spirit still persists, he could take lessons from some of these shippers' representatives. And there are railway traffic officers who could go to the same source for a number of lessons. Our suggestion of three weeks ago, that railway officers should perfect themselves in the art of presenting their ideas, might be amplified into an admonition also to study more assiduously the art of thinking straight. The most strenuous advocate often makes his strongest point when he makes clear to all observers that he has fairly considered both sides of his question.

The *Railway Age Gazette* recently referred to the fact that while railway gross earnings are the largest in history, net earnings are declining, and added: "These facts explain clearly why the stocks of some of our best railroads are selling at prices less than when the exchanges closed in July, 1914." The Topeka (Kans.) Capital, referring to this statement, says, "Half-truths always come from organs." The Topeka Capital is the organ of a clever politician, who owns it; who got himself elected governor of Kansas largely by the dissemination through it of half-truths about railroads; and who is now trying to get himself elected United States Senator by similar means. It is therefore an expert on organs and half-truths. The *Railway Age Gazette* is not consciously an or-

Half Truths and Whole Truths

gan of the railways, as the Capital implies. But suppose it is. With organs of politicians, such as the Capital, constantly telling half-truths about railways, why shouldn't the *Railway Age Gazette* be allowed to tell the other half, so that the whole may be known? However, in this case the Capital did not tell its half of the truth. It said: "There has been a corresponding shrinkage of all securities on all stock exchanges in the last six weeks." John Skelton Williams, comptroller of the currency, who is a much better expert on this subject than the Capital, issued a statement on November 5, in which he stated that the securities of the railroads "had sustained the heaviest shrinkages" and "had been the leaders in the downward movement of values." It is one of the duties of the comptroller of the currency to determine the basis of value on which national banks may carry securities as investments. When, therefore, the Topeka Capital says that "there has been a corresponding shrinkage of all the securities" and the comptroller of the currency says that railroad securities have sustained the heaviest shrinkage and have been the leaders in the downward movement of values, the public is more likely to accept the view of the comptroller. Why have railroad securities led in the decline? The comptroller of the currency also implies the answer to that question: "If a way cannot be found now to reduce the prices of materials and the cost of labor to a normal basis, and this for the present is hopeless, it seems clear on the facts before us that a revision and modification of the fabric of rates to meet these new conditions has become imperative." The plain implication of this is that railway securities have led the decline because railway expenses have increased so much as to impair the earning capacity of the roads.

FEDERAL INCORPORATION OF ALL RAILROADS

THE address made by S. Davies Warfield, president of the Continental Trust Company of Baltimore, before the Investment Bankers' Association convention, is crowded with material for sensational headlines, but nevertheless it deserves careful study rather than superficial display. After much study and consideration the Railway Executives Advisory Committee adopted the opinion that an act of Congress making compulsory federal incorporation of interstate railroads was one of the necessary steps in bringing order out of the present chaotic condition of railroad regulation. Stripped of its fireworks, Mr. Warfield's contention is that such an act of Congress would probably be unconstitutional and certainly would leave railroad credit in the most dangerous condition until its constitutionality had been passed upon by the Supreme Court; that it would make government ownership far easier of accomplishment and therefore more likely; that by shortening the present long drawn out and complicated process of appeal from inferior courts to higher courts, to still higher courts, and so on to the Supreme Court, the railroads would be depriving themselves of some safeguards which they now have; and finally that such an act would deprive states of their states' rights.

It is natural that Mr. Warfield should regard any step toward more centralized control of railroads as a possible invasion of states' rights. Loyal to the South, it is natural that Mr. Warfield should view political questions from a state's rights point of view. This quite possibly accounts for the brilliant coloring with which the dangers in the proposed act to provide for federal incorporation of railroads are painted. To the majority of those—railroad men, bankers, economists and statesmen—who are now struggling with the problems of railroad regulation, the sacredness of states' rights probably does not bulk as large as it does to Mr. Warfield. Considering the question of federal incorporation, therefore, simply on its merits as an expedient or in-

expedient measure for bringing order into the present hit and miss, haphazard and contradictory regulation of railroads by the Interstate Commerce Commission, state commissions and state legislatures, we must study critically the points which Mr. Warfield makes.

As to whether or not the act would be unconstitutional, only the Supreme Court can decide. Eminent lawyers would undoubtedly be of divided opinion. Mr. Warfield does not name the two legal authorities he quotes against federal incorporation; but it is pretty safe to assume that an eminent lawyer holding the views that Samuel Untermyer, for instance, holds might be prepared to argue that such an act would be unconstitutional. On the other hand, the Railway Executives Advisory Committee not only had the advice of its eminent counsel, Mr. Thom, but of many other distinguished lawyers. If, therefore, there is good reason to believe that the act might be held constitutional, it should, if it has merits, be placed before the Supreme Court for its ruling. It is probable that the Supreme Court would pass upon a question such as this very promptly. The interregnum period would therefore be quite short and as a matter of fact there would be very little more uncertainty in railroad security markets with the act passed and awaiting the Supreme Court's decision than there is right now, especially if other provisions of the proposed act cleared up other phases of this many sided question of railroad regulation.

It sounds rather startling to say that by procuring the exactment of a federal incorporation law the railroads would collectively be putting their various heads into a single noose for the convenience of the hangman of government ownership. If anyone will carefully study the acts of Congress and the President since the declaration of war by the United States and will use sound common sense in analyzing these acts as reflecting the attitude of the government and of the people, he will be pretty surely forced to the conclusion that if the people or the government really decide that government ownership is desirable, government ownership we will have in short order. The various little legal difficulties which would stand in the way because of the possession by the railroads of state granted charters would be brushed aside, as so many other apparent obstacles have been brushed aside since the beginning of the war, and the only thing that could really prevent government ownership would be a decision of the Supreme Court holding it unconstitutional. Is it not just a bit fanciful to say that government ownership would be constitutional if it were preceded by an act compelling federal incorporation, when that act itself would have been passed upon by the Supreme Court, but that if no such act had been passed the Supreme Court would hold government ownership unconstitutional?

As to taking away some of the advantages which a railroad now has in being able to raise one legal difficulty after another—to the railroad whose cause is just, such disposal of red tape would be a good clearance of useless rubbish and to the company whose cause is unjust, the deprivation of its present advantages will be for the good of the community as a whole.

There remains, then, the question of states' rights. The country happily is fast getting away from the old states' rights theories. The safety appliance act, the control of car distribution by the Interstate Commerce Commission, the child labor law, the Clayton bill, the income tax act, the valuation act, the white slave act, the national mediation and arbitration act, all vest in the federal government powers which under the old states' rights theories belong to the states exclusively. The Supreme Court has passed on nearly all of the acts such as those mentioned above. With the nation at war it is certainly inopportune to hark back to states' rights theories. Even before the supreme necessity for a compactly united nation to face the enemy had arisen,

the trend of legislation and the decisions of the Supreme Court had demonstrated that states' rights was an obsolete issue. The right of a state is to be protected against other states. Some states must not be permitted to burden all of the others.

THE RAILWAY WAR PROBLEM, AND ITS SOLUTION

IT was a highly significant piece of news which the Railroads' War Board gave to the public last week when it stated that it had handed to Judge Lovett, the government priority director, and Dr. Garfield, the government fuel administrator, a list of 525 commodities which were deemed sufficiently "non-essential" to be denied fuel for their manufacture and transportation for their movement in case need for such action should arise. The Railroads' War Board stated very precisely what its action was, and what it meant, but many of the reports regarding it have been inaccurate. For example, it has been said that the railways have "recommended" or even "demanded" that the articles in question be excluded from transportation.

This is incorrect. The truth is this: The course of developments has forced Judge Lovett and Dr. Garfield, representing the government, and the Railroads' War Board, representing the railways, to a recognition of the fact that it may, and probably will, become impossible for the coal mines to produce enough coal, and the railways to produce enough transportation, to furnish in this time of war fuel and transportation to all the industries to which they are furnished in time of peace. Since the railways have in the offices of their freight classification committees the most complete records in existence of all the commodities now being produced and transported in this country, the Railroads' War Board was asked to have prepared a list of commodities which, under war conditions, might be regarded as "non-essential." This work was assigned to the chairman of the Official (eastern), the Southern and the Western Classification committees, and the list in question was compiled by them. The railways do not even "recommend," much less "demand" that all or any of the producers and shippers of the commodities in question shall be denied fuel or transportation. It was their function to furnish the information for which they were asked, and they have performed that function. Any action which may be taken, based upon this information, will be a war measure; and it is strictly the function of the government to adopt war measures and to assume full responsibility for them. Until the government acts, the railways will continue to try to furnish transportation, and presumably the mine operators will continue to try to furnish fuel, to all classes of industries.

* * *

Meantime, however, the fact that there has been prepared a list of commodities to which it *may* be necessary to deny transportation is one of great moment. Just about eleven years ago James J. Hill wrote to Governor Johnson of Minnesota a famous letter in which he predicted that if the restrictive and destructive policy of regulation of railways then being generally adopted by the national and state governments were persisted in, the development of the facilities of the railways would be so arrested that they would become inadequate to the demands of the nation's commerce. The warning Mr. Hill then voiced has been repeated every day since by persons in close contact with the railway industry. But the policy they have deprecated has been continued and intensified. Meantime, the railway managers year after year, and especially within recent months, have performed prodigies in increasing the efficiency of the existing facilities.

The most striking illustration, perhaps, is afforded by the extent to which they have increased the amount of freight

traffic they have handled without any corresponding increase in train service. The Railroads' War Board has pointed out that in the five months from April to August, inclusive, the railways moved as much freight as they did in any entire year prior to 1904. The record of achievement is worth giving in more detail. In 1903—the largest year before 1904—the railways produced 173 billion ton-miles of freight transportation and did it by operating freight trains a total of 526 million miles. In the five months of this year ending with August the Class I roads alone produced 172 billion ton-miles of freight transportation by running freight trains a total of only 276 million miles. Of course, the saving in train-miles and the increased efficiency indicated were accomplished by almost doubling the average load of a freight train.

The railways are today handling twice as much freight as they were when Mr. Hill wrote his letter to Governor Johnson, and doing so with only about the same number of freight trains. In spite, however, of this tremendous increase in the amount of freight being moved, there are serious delays and congestions, and it is admitted that the time may soon arrive when it will become impossible to move some kinds of freight at all. And in spite of the increases of efficiency which have been achieved the railway managers are again before the Interstate Commerce Commission declaring that the net return of the railways has been and still is being so reduced that it has been impracticable, and is rapidly growing impossible, for most of them to make any substantial increases in their facilities, or even to maintain in good operating condition the existing facilities.

* * *

This general situation seems very puzzling to some people and entirely hopeless to others.

The former class can't understand why the railways, with the largest earnings and the most efficient operation ever known, are not making more money than they ever did and are not in a good position to increase their facilities and the amount of traffic they can handle.

The latter class can see no way out of the transportation muddle except some form of direct government assistance to the roads or government ownership.

We shall address ourselves to two phases of this general subject. First, have the railways reached or are they closely approaching the limit of their capacity with their present facilities? Second, if they have reached or are approaching their limit, what measures should be adopted by their managements, or by the government, or by both, to restrict the traffic piled upon them or to enable them to increase their facilities?

We have it upon the highest railway authority, that of the Railroads' War Board itself, that the railways as a whole have not reached the limit of the capacity of their present facilities, or the War Board, in the statement issued by it last week, which is published elsewhere in this issue, expressed this opinion. That opinion can be amply supported by evidence. The railways, as a whole, are still increasing the amount of traffic they are handling; and nobody can compare the statistics of car capacity with those of the tons actually being hauled per loaded car, or the statistics of locomotive tractive power with those of the tons being hauled per train, or the comparative statistics of different roads, showing, as they do, that some roads are handling much more business per mile of track and per mile of line than other roads under comparable conditions, without concluding that it is *possible* to handle a much greater traffic with existing facilities. But what is *possible* and what is *practicable* are commonly two very different things; and this is obviously the case as respects the matter under consideration. Doubtless it would have been *possible* to have handled freight in as large carloads two years ago as it is being

handled in now; but only a fool or an ignoramus would contend that it would have been *practicable*. Now, all the evidence indicates that, *under existing conditions* the railways are approaching the limit of what it is *practicable* for them to do.

The latest monthly statistics available regarding freight business handled are those for August. The number of unfilled orders placed by shippers for freight cars increased in that month, showing that the demand for freight transportation was still increasing. But the railways apparently handled little or no more freight than they did last June. The increase as compared with August, 1916, was only 8.4 per cent, which was the smallest increase over the corresponding month of 1916 recorded since this country entered the war. There are good reasons for believing that when complete statistics for the fall months are available they will show continued increases in the business handled, but nowhere near as large increases as those recorded from April to July. But the number of unfilled orders from shippers for cars had increased on November 1 to 140,000. The conclusion is obvious. The increases in traffic are again occurring faster than the increases in transportation efficiency. Under present conditions that means that the excess of the demand for transportation over the supply of it is growing.

When, on the entrance of the United States into the Great War, the same general condition existed, the managements of the railways, under government sanction, and entirely regardless of the Sherman Anti-trust law, took heroic action. They resolved to operate the railways as a single continental system, and created the Railroads' War Board to carry out the resolution. Marvels have been accomplished as a result of that action. *But experience has demonstrated that the resolution then adopted cannot be fully carried out; and the inability of the railways fully to carry it out is the main reason why the maximum possible amount of transportation cannot be provided with existing facilities.*

Why are the railways unable fully to carry out their resolution? Because the Sherman anti-trust law, the anti-pooling section of the Act to Regulate Commerce, the provision of the Act to Regulate Commerce empowering the shipper to route his freight any way he pleases, and various other existing laws—and also the want of some important laws—thwart at every turn those responsible for the operation of the railways.

* * *

It is agreed by the Interstate Commerce Commission and the Railroads' War Board that one of the main things needed to secure the greatest transportation efficiency under existing conditions is to route freight traffic over the lines of least resistance—in other words over those which are least congested. But how, under existing laws, is this to be accomplished? There are many parts of the country in which it would be beneficial for the Railroads' War Board, in the interest of the highest transportation efficiency, to order all the competing lines to pool their freight traffic, agreeing among themselves on some basis for the division of earnings. The result of the general pooling of freight traffic would be a large increase in the capacity of existing railway facilities. But any such action is entirely out of the question as long as federal laws both absolutely prohibit pooling of either freight traffic or earnings and in addition give every shipper absolute power to route his own freight. In other words, under existing law, the railways can pool and are pooling their equipment, but they cannot pool their trackage and other facilities, which would be far more important.

Again, a large further increase in efficiency could be secured by general increases in minimum carload weights and by reductions of delays to cars while in the hands of shippers. There are many thousands of shippers in the country

who have energetically and patriotically responded to the appeals of the railways for heavier loading and prompter loading and unloading of cars as means of winning the war. The railways have so cordially appreciated the way many shippers have co-operated with them that they have desisted from all efforts to get minimum weights increased. But the fact is, that while thousands of shippers are doing their duty in this matter, other thousands are not doing it, and that, largely owing to this condition, many classes of shippers are in danger of being denied transportation entirely. Is it not time for the railways and the regulating authorities to recognize the fact that the only people who will be hit by increased minimum weights are those who are not loading cars as the conditions demand, and that it is better that they should be forced to do their duty rather than that the entire nation, including shippers who are doing their full duty, should suffer? It seems very hard for many people to recognize the fact that this nation is engaged in a terrible war and that all of our commercial, industrial and transportation methods must be altered to meet the conditions created by war, or we shall be overwhelmed by a terrible disaster.

There is evident, also, a need for a new dedication of railway officers and employees to the great task to which they have set themselves. The organization of the Railroads' War Board last spring caused for a while a wonderful increase in the energy and the enthusiasm with which all classes of railway men did their work. It was largely this which produced the great results achieved for some months. While railway men may be working just as hard as ever, they are not working with the same enthusiasm and initiative that they were a few months ago. The cynical, cold-blooded and ignorant way in which their efforts and their problems have been regarded and dealt with by most of the regulating authorities, is largely responsible for this. But railway men have a high duty to perform in this war; and they ought to go on performing it with all the enthusiasm, energy and ability of which they are capable. That is the patriotic thing to do, and that in the long run will prove to be the most effective means of winning popular approval and support. There still remains much that railway officers and employees can do to increase the amount of traffic that can be handled if they will but renew, with a new baptism of energy and courage and optimism, their dedication to their country of the best service they have in them.

The most effective thing that could be done at this time to increase the capacity of the railways would be to repeal every law which interferes with their efforts to operate as a single national transportation system. If that were done the Interstate Commerce Commission would have plenty of power, under already existing laws, to control their rates and service in the public interest. If in addition to this, all those who are concerned with the operation of the railways and all those who use their facilities, would do all that they may reasonably be asked to do, to increase their efficiency, there could be secured from existing facilities a very largely augmented amount of service.

* * *

But would that solve the problem now presented to the railway managements and the railway regulating authorities? Unfortunately not. Anybody who will study the actual facts regarding the railway situation instead of forming mere impressions about it soon will see why this is the case. In the first place, there are certain to be still further large increases in traffic during the war. The government has only begun to spend the enormous sums, and to move the enormous quantities of materials, it will use in its war work, and there will be need for greater transportation facilities. In the second place, in order to get and keep on getting the greatest possible service from existing facilities

ties, it will be necessary fully to maintain them, and they are not now being fully maintained, and cannot, on present freight and passenger rates, be fully maintained.

There has been within recent years an enormous increase of operating efficiency and yet, except for short intervals of time, the general tendency of net return has been downward. Why? For the simple reason that wages and prices of materials and equipment have increased faster in proportion than efficiency of operation. If the number of ton-miles of freight transportation produced by a locomotive increases 20 per cent in a year, and other things remain equal, the amount of net money the locomotive will earn for the company that owns it will, obviously, increase. But suppose the cost of a locomotive increases 200 per cent, and the cost of the fuel used in it increases 100 per cent, and the wages of the engineer and fireman that run it increase 25 per cent. The necessary result will be a decrease in the net return earned by the locomotive unless there is an advance of the rates charged for the service it participates in rendering.

Now that is a rough but a perfectly just illustration of what is going on in the railway business and it suggests the only way in which under private ownership the problem of maintaining and increasing the capacity of the railways can be solved. There is no way in which, under private ownership, this problem can be solved except by giving the railways adequate increases of rates. What increases would be adequate? Nobody knows. That will depend entirely upon how large are the increases in traffic and the advances in wages, in the prices of materials and in the cost of capital.

* * *

One way which has been suggested to meet the situation is for the government to loan the railways several hundred million dollars; but that would be a mere palliative. The railways need not hundreds of millions, but billions to invest in new facilities. Mere hundreds of millions will do them no good except in the form of increases in their annual earnings to be used in paying their increasing expenses and the interest and dividends on the new investment of billions in them which should be made.

Some people continue to suggest that the government should buy one or two hundred thousand freight cars and put them into service. But an increase in the number of freight cars without a corresponding increase in the facilities for moving them would only aggravate the present condition. The railways need more locomotives and longer passing tracks and larger terminals much more than they need more freight cars. If they had more locomotives and larger terminals they could get much more service out of the freight cars they now have. Furthermore, as we have pointed out heretofore, if the government should loan them money, whether directly or in the form of an investment in freight cars, the railways would have to pay the interest on it; and how could they pay the interest on money borrowed from the government if they could not pay the interest and dividends on additional capital provided from private investors?

Finally we have the ever recurring suggestion that the only remedy for the situation is government ownership. But there never was a time when that suggestion was so inopportune and dangerous as it is now. For the government to attempt to finance the transfer of the railways from their present owners to itself would at this time cause a financial cataclysm. For it to undertake their management at this time, whether it actually acquired their ownership or left it in private hands and merely undertook their operation, would cause a demoralization in transportation by comparison with which the present conditions would look like the perfection of smooth running. No move the gov-

ernment could make at present would give more aid and comfort to the Kaiser and his allies in crime than an attempt on its part to take over the management of the railways. The government of the United States has before it already enough unsolved problems of unprecedented vastness, complexity and moment without having added to them a problem which in complexity and vastness would surpass any problem in connection with the war with which it is now confronted.

The problem of transportation during the war can be solved by the government by the adoption of the following measures:

1. Relieve the railways of the law-made restrictions which now interfere at every turn with their efforts to operate the existing facilities to their maximum capacity.

2. Give the present managements of the railways untinted encouragement and support in the efforts they are making to render to the government and the public the largest possible amount of useful transportation service.

3. Recognize the fact that as a war measure it is as necessary to let the railways of this country have all the labor, and all the materials and equipment they need, as it is to furnish materials and equipment to the railways of our European allies.

4. Grant the advances in rates which are necessary to enable our railways to meet their advancing expenses and taxes and also make such increases in their facilities as are requisite to enable them to support the rising flood of traffic which is being poured upon them by the government and the public.

The adoption of a less liberal, comprehensive and constructive program will result in national disaster.

The railways, ever since we entered the war, have been doing their part and doing it under difficulties, discouragements and hardships such as have been encountered by no other industrial or governmental agency. When will the government, in the interest of the industrial and military efficiency of America, remove these difficulties and discouragements and reduce these hardships?

RAILWAY MILEAGE AND THE SCRAP MARKET

THE present high prices of materials and the scarcity of certain materials at any price have brought about conditions which, while unique, are not without certain favorable aspects for the roads. Prominent among these is the high price of scrap which, while lower now than a few months ago, is still much above normal. The obvious and immediate result of this condition has been the collection and sale of all of the scrap accumulated on the property to secure the advantage of these high prices.

This has been carried even further on a number of roads where materials have been made available for sale which would not ordinarily have been released for a year or two. As an instance a number of roads have held in stock considerable quantities of second-hand rail released from main line service. In general this material has been used to relay branch lines according to a fixed program extending over a number of years. The rails and fastenings released on these branch lines are ordinarily too light for further use under the modern heavy equipment and they are, therefore, sold for scrap. One road which had a considerable tonnage of second hand rail in stock pushed its improvement program ahead and relaid practically all of this rail in its branch lines this year, finding that it was able to supply the new fastenings required and then to show a net profit of considerably over \$1,000 per mile, after deducting all labor and other charges directly incident to this work. This was made

possible through the high prices now being received for scrap rails and fastenings, the second hand rail having been charged out at the normal price at which it was being carried on the books.

Another development arising out of the condition of the scrap market has been the abandonment and sale of a number of small lines for the scrap materials they contained. Several bankrupt roads have recently secured the consent of the courts to abandon service and sell their properties to parties who purchased them solely for the track materials and equipment. So far as we have learned, this procedure has been followed only where the entire line has been insolvent and where little or no hope was held out for the future. However, the same lack of returns is to be found on many branch lines which form parts of systems, which as a whole are solvent. These branch lines constitute drains on the more prosperous portions of these systems and in many instances are of no more present necessity than the independent lines which are being taken up. It would seem a logical development of present conditions that these roads should endeavor to secure release from the necessity of continuing the operation of these more unremunerative branch lines. Fortunately conditions with respect to materials have not become so acute in this country as in Canada, where a considerable mileage of tracks has been taken up to secure the supplies needed elsewhere in Canada and on the French war front. If conditions should become such that similar action would be necessary in this country there is no question but that a considerable mileage of branch lines could be taken up and the materials diverted to better use, and that after the crisis had passed, the lines would never be rebuilt. Even though present conditions do not require such radical action it would be well to consider the advisability of eliminating waste of this character.

NEW BOOKS

Electric Railway Transportation. By Henry W. Blake, editor, "Electric Railway Journal," and Walter Jackson, business manager, formerly associate editor "Electric Railway Journal." First edition. 470 pages, 120 illustrations, 6½ by 9½ in. Bound in cloth. Published by McGraw-Hill Book Company, 239 West 39th Street, New York.

This is the first book on our knowledge devoted to the transportation methods and practices of electric railways. Most of the accounts of electric railway transportation practices which are mentioned in this book have appeared in the Transactions of the American Electric Railway Transportation and Traffic Association, or in the columns of electric railway press. The efforts of the authors of the present volume have been devoted to making this information more readily available in book form and adding such comment of their own as seemed to them of possible help to the operating man.

The book contains chapters on Organization and Definition; Adjustment of Service to Traffic; Accelerating Traffic Movement Along the Line; Accelerating Traffic Movement on the Car; Car Types in Relation to Traffic; City Timetables—Preliminaries; Interurban Schedules and and Despatching; Fare; Gas-Electric Practices and Devices; Public Relation; Promotion of Passenger Traffic; Traffic Signs for Car, Station and Road—Information for the Public; Competition; Freight and Express Business; Selection and Training of Men; Wages and Wage Agreements; Welfare Work; Discipline of Train Men; Forms of Extra Pay. All of these subjects are taken up in a thorough manner, and it is doubtful if there is anything that an operating man on an electric railway is interested in that is not discussed in this volume. The book is well illustrated, the various problems relating to the subjects just enumerated are thoroughly covered and the practice followed by certain electric railroads, or groups of roads, in regard to a given subject, is given.

Letters to the Editor

REDUCED FREIGHT RATES TO IMPROVE CAR LOADING

ROANOKE, Va.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

I have no doubt many students of conditions created by the entrance of the United States in the war, especially as they affect and are affected by railway transport, have been impressed by the extraordinary results apparent from the campaign for heavier car loading and have wondered into how hard straits ordinary business would have been forced by the sudden absorption of railway facilities for movement of war material, had there not been this waste of car space to fall back on.

At first thought it would seem that the lack of economy in railway operation incident to light loading of cars in the past, and the resultant loss to shippers who pay the freight, is simply chargeable to failure to advance the minimum carload ratings to keep pace with increasing car capacity. I feel, however, that this is not wholly true by any means, although there are doubtless many cases where an increased minimum for carload shipments would not be harmful. There are many shippers and many communities that could not bear an increase in the carload minima for certain commodities, and their inability to move traffic would inevitably result detrimentally to the general public, both producing and purchasing.

Viewed from a broad standpoint, therefore, it would appear that the room for economy in peace times, as well as in time of war, lies with the transport of traffic between communities and between those shippers and consignees that are able to handle capacity carloads or cars loaded above the minimum weights specified for carload ratings. At present the test of patriotism and business necessity on account of car shortage is being applied. In ordinary times there must be other inducement.

Carload freight is carried for lower freight rates than l. c. l. Why not apply the same principle, i. e., "cost of the service," and while continuing the minimum carload rating as a designation of the least weight for which a car can be furnished, to allow a percentage reduction in the freight rate per 100 pounds for each 10,000 pounds loaded in a car beyond the minimum specified. If this were done many shippers would be able to employ more labor necessary to load cars heavier, and many consignees would acquire greater storage facilities for their material. The railways would be relieved of a large economic loss now inequitably distributed among shippers, producers and purchasers; and in figuring this loss the large sums necessary for putting in service freight terminals and power must be considered along with the investment in freight car equipment.

Careful study of this proposition will, I believe, indicate that it would in no case work any injustice or unreasonable discrimination against any part of the public interested in rail transportation. It is a counter-proposition to that of raising the minimum carload ratings, which latter, if done, would strengthen the "middleman," and no thinking person wants to do that.

INVESTIGATION OF QUEENSTOWN RAILWAYS.—The Queenstown Government Railways are the latest to be the subject of an investigation. Messrs. M. Kirwan and Arthur Cooper have been appointed a commission for the purpose of inquiring into and reporting on the administration.—*The Engineer, London.*

The Employment of Women in Railroad Work *

Number Fast Growing in "Housekeeping" Departments
and Increase in Technical Departments is Accelerating

By Stuart Bready

Special Agent, Philadelphia, Baltimore & Washington, Wilmington, Del.

TODAY we are all thrilled with the desire to co-operate, to give of our energy, to sacrifice in any patriotic and democratic way that may help us in our purpose to put an end to the Imperial German Government. The women are playing no small part in this purpose, and the working out of the entire situation both here and abroad, during and after the war, will be well worth watching.

What is expected of all of us calls to mind a legend. It is the story of an artist who painted a picture. Other artists had painted pictures which were much more notable than his, but this had a particular red glow upon it, and as the people came and went, they admired the picture, they liked the glow. They said, "I wonder where he got his color from," and one day they asked and he said, "I cannot tell you." And ever the artist went on painting, and he became whiter and whiter, and his picture became redder and redder. One day they came in and found him dead before his easel, and they looked to see if they could discover the secret of this wonderful red color, but they found nothing which they did not already have. But when they took him up to put his grave-clothes upon him they found above his heart the marks of a wound, healed by death, which heals many things. And they buried him and he was soon forgotten, but his picture lived on forever. And still the people said, "I wonder where he got his color from." That is a legend. But it has a lesson for all who would paint a picture which will be enduring. We must put all our energy, our life's blood, into the thing we are doing. In this war, we cannot hope to paint a picture which shall endure for democracy in all ages without such whole-hearted sacrificial help on the part of the women as well as the men. And this they are willingly giving us, more and more.

The position of women before the war is difficult to define. The majority of women did not earn wage or salary, the minority did. The majority were married, the minority were not. The majority were economically dependent, the minority were, through inheritance or wage-earning, independent. The war has led to changes in conditions the ultimate outcome of which cannot definitely be foretold. In the last two years skilled labor has become scarcer and scarcer. Employers have been compelled to put women at work which in ordinary times they would have been thought incapable of performing. Pre-war conditions can never be re-established, and in many cases it would be unwise to desire them. Instead of clinging to the past we ought to plan boldly for better and more permanent ideals, where all shall have the liberty of assuming full responsibility for their own lives. The cry of "equal pay for equal work" raised by women to protect their interests is but an expression of consciousness of ability to render service. It expresses self-respect and a revulsion against under-valuation in the eyes of the stronger sex.

Europe has for a century been accustomed to seeing women as laborers in the fields, in vineyards, as tradespeople, at railroad crossings. It has today no feeling of pity for them. It simply sees results. Undoubtedly there was a time when the laboring man in France watched the woman laborer with jealousy, even as many men in this country are doing today, feeling that success for her meant lower wages and fewer opportunities for him, but today he feels not so. Instead he acknowledges the situation. A Frenchman who had traveled through his country during the recent harvest, observing the well-nurtured crops, said, "Would it not be a good thing to keep the men at war?"

However, we in America cannot hope immediately to succeed in what has taken a century of experimentation elsewhere

* Abstract of a paper read before the New York Railroad Club, November 16, 1917.

to develop. The problem for us is a new one. It is as yet in its infancy. We have still to learn what it may mean. To secure real efficiency the woman must be carefully studied, instructed and disciplined. Special facilities must be provided for her comfort and convenience, and all this requires a certain amount of supervision, time and expense. Processes may often need to be simplified, the result being an unusual subdivision of operations in order to enable several women to perform work heretofore done as a whole by one man.

Of primal and evident importance in the problem, is the fact that woman is fundamentally and constitutionally different from man. She speaks a language of her own, is mentally and physically differently endowed by nature. Recognizing this as an obvious fact, we may divide all railroad work so far as female labor is concerned, into two distinct classes:

First: In the departments which we will term railroad housekeeping, there seem no reasons why the service of women should not be generally acceptable, and of far-reaching importance, provided the traditions of the railroads (and may we say in passing, in some respects the railroads have been smothered in cobwebs of traditions), can be broken through. There is no reason why women should not be responsible for the whole domestic condition of the railroad including the cleaning of cars, selling of tickets, dispensing of information, marking of bulletin boards, performing of minor, semi-important and important clerical duties of all so-called indoor departments. The most notable instance of woman's progress in railroad work in this regard is that of Miss Oden of Davenport, Iowa, who entered the employ of

injury, due to the fact that a woman's mind does not grasp the mechanics of machinery easily, and another, the fact of the necessity of long sustained physical exertion, in many instances requiring her to stand all day. In England this question has been dealt with by shortening the hours of work in shops where women are employed.

England has spent much time and effort on the whole problem of women in mechanical labor, and as a matter of interest, I have inserted a partial list of processes, prepared by the Labor Supply Department of the Ministry of Munitions, London, in connection with tool room and precision work, upon which women are successfully employed:

Cutters:—Operating backing-off lathe; turning on turret lathe; all grinding operations; drilling; sand blasting, and annealing.

Dies and Punches:—Operating turret, capstan and centre lathes, pre-

Unloading Scrap Wood at Thompson Shop, Pennsylvania Railroad

the Western Union as a clerk, became an operator, and is now the Tri-City Passenger Agent of the Burlington in that State.

Second: On the technical, mechanical and working side there is quite another question. The "neat handed Phyllis" is by nature unfitted for all work that may present itself in such departments. It is on the technical side that most study will have to be made. If the parts to be handled are not too heavy, or the exertion of operating various mechanical appliances does not require too much physical strength, a woman can do the work as well as a man, and frequently her suppleness of hand will enable her to perform certain manual operations with greater ease and dexterity. There are, however, in the mechanical departments still other considerations that enter into the question, such as liability to

cision grinders and drilling machines; turning, boring, facing and reaming; turning in chucking lathe.

Drills:—Parting off, turning on centre lathe, grinding and fluting twist drills.

Fitting and Assemblies:—Tool room work and cutters of all kinds, e.g., fitting, facing cutters, milling cutters, filing split bolt for capstan lathes. Fitting and assembling cutter bars.

Gages:—Grinding, milling, fitting and engraving.

Marking-Off:—Marking off all parts not too heavy for women to handle.

Reamers:—Turning, milling, backing off, fluting, polishing and glazing all types of reamers.

Saws:—Milling, hardening, punching, setting, cleaning and packing back saw blades; hardening and tempering fret saws; sharpening band and circular saws.

Test-pieces:—Operating lathes, bending, shearing, planing, shaping and drilling machines, and precision grinding machines, upon test pieces of all kinds.

Testing:—Applying the bending and shearing test to steel test pieces.

Various Work:—Operating lathes on rough and finished turning; universal, plain and slot milling machines; shaping, planing and slotting machines; hardening with muffle furnace and color chart, cutting tools of various kinds; grinding work in lathe, on relieving cutter, and polishing to limit of 0.0005 in.; viewing, gaging and inspecting.

I also submit another list of processes in connection with structural engineering and the manufacture of boilers of all kinds, upon which women are successfully employed in England:

Angle Straightening Machine:—Steel girders, steel rails.

Boiler and Condenser Tubes:—Cutting, rounding, trimming, shaping and slotting; screwing, facing and finishing; bending, heating by gas and hydraulic testing; inserting and packing tubes in condensers and oil coolers.

Buffing and Grinding Machines:—Plates, angle and cover plates for structural steel work.

Drilling:—Drills for all parts of steel structural work from the smallest gusset plates to rolled steel joists up to 30 feet long; vertical drills; radial drills; plates for lattice girder for railroad bridge; steel girders for overhead travelling crane; steel work for run ways; holes in boiler end plates; battery drills; pneumatic drills.

Edge Plate Planing Machine:—Boiler plates, general work up to 24 x 5 feet x 3/4 inch; steel plates for railroad bridges, etc.

Operations Upon Ferrules.

Foundry Work.

Horizontal Boring Machines:—Boiler flues.

Hot Bending Machine.

Laboring.—Steel erectors' laborers; general laboring and assisting in engineering and blacksmith shops.

Unloading from Canal Barges, Trucks, Etc.

Oiling Railway Parts.

Cleaning Locomotives.

Plate Laying.—For light gage railroads in works and yards.

Milling.—Boiler parts of all kinds.

Punching Machine.—Wrought iron bars; steel girders; junction and tie plates.

Repair Shop, Boiler.—Taking various parts to pieces; marking off their own drilling work; drilling, turning, planing and shaping the parts and reassembling the job.

Shearing Machines.—Shearing small steel plates and acting as helper.

Surfacing Machine.—Boiler flue flanges.

Various Work.—Driving steel hammers; all engraving work on boilers; assembling bolts and nuts; oxy-acetylene cutting light plates; fire-barreling small steel parts; electro-galvanizing; all painting; maintenance work scraping, brushing and tarring; storekeeping; recording in-coming and out-going material; assisting in power house; driving crane in boiler shops, and structural engineering shops.

These lists show to what extent England has developed female labor, and while we have not, on the railroads of this country, reached anywhere near this wide diversity of labor, as the war goes on we are finding the number of different occupations increasing, most slowly of course in the technical lines, but undeniably increasing in all lines.

To indicate this gradual increase, I append a table showing by occupations the number of female employees on the lines of the Pennsylvania Railroad, east of Pittsburgh, for five months beginning May 1, 1917.

STATEMENT SHOWING BY OCCUPATIONS AND MONTHS NUMBER OF FEMALE EMPLOYEES ON THE PENNSYLVANIA RAILROAD.

Total	1494	1945	2525	3114	3730

It will be seen that while the greatest increases are noticeable in those departments which I have earlier designated as pertaining to the housekeeping of the railroad, it is also encouraging to notice a slow but distinct rise in the number of those engaged in the technical lines, such as shop hands, laborers, painters, warehousewomen, etc. It will also be seen from the tabulation that the total for September 1 is

more than twice that for May 1. While the figures for October 1 are not yet obtainable, the increase will be approximately 35 per cent in advance of the September 1 figures. For the present certainly, the Pennsylvania is proceeding in the employment of women at a careful and conservative rate, devoting a great deal of study to the problem. Under the direction of the superintendent of telegraph, a school of telegraphy has been established in Philadelphia. It is already well attended, and is producing most excellent results. In all departments, various matters of organization have been given much thought. On certain divisions where any considerable number of women have been employed, matrons are maintained, whose duties require them to look after the general welfare of the women. The general superintendent of the Philadelphia, Baltimore & Washington has issued instructions that a modest and suitable attire must be worn at all times. On the Maryland division the superintendent has issued orders that no women who are under the age of 25 shall be taken on. The reasons for this will doubtless suggest themselves to your own minds. The matter of apparel

Checking Counter, Pittsburgh Station Baggage Room

for those in the shops has, according to the job, assumed the utmost simplicity, and in many cases because of the liability of dresses catching in machinery, overalls have been adopted. A woman on the Baltimore & Ohio has designed a new jumper garment for women who work in the shops and has recommended that they wear the spiral puttees now so much in evidence on the soldiers.

After the war is ended will women continue to seek this kind of employment? Will greater wages be granted them than at present? Again, what will become of the multitude of men with families to support when they return from the war and find their places taken by women, mostly unmarried? The necessities of the present are laying foundations for future problems of a very serious, if not revolutionary character. In Canada, France, England, and also in Germany, the movement is largely on a patriotic basis. It is rapidly assuming the same proportions here. Certain railroads in the United States are encouraging the wives and daughters of employees who have "come across" to fill the places of the departed ones on the plea that any woman who by working releases a man, or equips a man for fighting, does national war service. A million women to take the

place of a million men soon to go to France, are to be card-indexed throughout the country by the National Defense Council Committee. Every woman over 16 years of age will be asked to register, to check from a list of 154 occupations those for which she has had training or those for which she wishes to be trained and to indicate whether she will serve for salary, expenses or as a volunteer.

However, all this is an emergency measure, and the officers of the railroads for the most part, have not and cannot formulate any definite plans for post-bellum days. To a casual onlooker, it would seem that some of the women at least will remain in their new places. Some have already been promoted. By the close of the war others will be still higher in rank. They may have become so important a part of the organization, that it will be difficult to remove them. Their effect on the morale of an office will in many instances be difficult to overlook. In work requiring patience—work which might be called monotonous—they will doubtless have proved more patient than men. They are proving so today. In dealings with the public on occasions where a man would terminate a situation in a wordy war, the female will more often have acted with despatch and diplomacy. She is at least willing, quick witted and as a rule always "on the job." Besides she is more often a "sticker" than a "floater," remaining ordinarily in one job a greater length of time than a man. The argument that women will work for less money and thus lower wages and crowd out the men is untrue. In certain classes of work the average woman today believes herself the equal, if not in many instances the superior in earning capacity. Two years ago in England women were admitted to the Railwaymen's Union and a considerable number have joined.

So far as the railroads are concerned, it is extremely un-

A Woman Attendant in the Pennsylvania Storehouse at Renova, Pa.

likely that they will be slow to see that there are certain fields of labor in which women are by nature peculiarly unfitted to enter, particularly certain technical lines; but it is just as certain that the railroads will be quick to discover their excellent qualities and their possibilities in the lines in which they have, and will continue to have, "made good."

DISCUSSION

The value of paying careful attention to the education of women employed in railroad work, for the performance of their specific duties, was referred to several times in the discussion. It was suggested that the benefits obtained from the instructions given women employees might have a far-reaching effect in drawing attention to what might be accom-

plished if similar methods were extended to all new employees.

The experiences of the Canadian railways and the munitions manufacturers in England were referred to. In Canada, where women are extensively employed in railroad shops, it has been found that the best results have been obtained where matrons are employed to exercise general supervision over the women and to look after their welfare. Special attention has also been given to the provision of adequate rest room facilities, so that the women may have a comfortable and attractive place to congregate by themselves during the noon hour.

In England, with a population of about 42,000,000 people,

Women Employed in the Tool Room at the Wilmington (Del.) Shops of the P. B. & W.

more than 1,000,000 women are employed in the manufacture of munitions of war alone. By a well developed policy of dilution of skilled labor, extraordinary results in increasing output have been accomplished in the face of a growing shortage of skilled mechanics. Women have been employed to replace men wherever the men can be used to perform more skilled operations. The number of operations requiring high skill have been reduced wherever possible by higher specialization.

POST-WAR RAILWAY PROBLEMS.—Few after-the-war problems are so fascinating as those connected with the rebuilding of railways destroyed or damaged in accordance with military plans. Detailed figures regarding the necessary reconstruction work are naturally not available, as the bulk of the mileage concerned is in territory occupied by the enemy, but, as a matter of fact, these data would be insufficient by themselves. First of all, while in France and Belgium the problem is mainly one of replacing and repairing systems quite adequate if they be restored to pre-war conditions, in Russia, Poland, Serbia and Roumania it will be necessary not only to repair the ravages of the war, but also to extend networks which before the war were not up to standard of twentieth century requirements. In all these countries, deficiencies in working stock will also require to be made good. Where the mileage of a country's railways is insufficient, the supply of locomotives, passenger and freight cars will have to be increased in proportion to new construction, while in France and Belgium—probably in Serbia and Poland as well—the problem is complicated by the German seizure of working stock, much of which is being operated far from its usual territory. The restoration of this loot, or the payment of indemnities in lieu thereof, will not be the least important question for international jurists to solve when peace terms are being discussed. Other post-war railway problems are the Russian gage question, the linking up of the railways of Greece with those of the rest of Europe, and the best methods of utilizing the Bagdad Railway as a through route to the East. As to the future of the Bagdad line, we may certainly hazard the prediction that it will not remain under German ownership or control.—*Railway Gazette, London.*

Non-Essential Transportation May Be Curtailed

Not an Admission of Failure—Traffic Still Growing—
Ways of Still Further Increasing Railroad Efficiency

WASHINGTON, D. C., November 3, 1917.

POINTING out that transportation conditions, unless more vigorously dealt with by all concerned, will grow more acute in the near future, the Railroads' War Board on November 15 issued a statement saying that the time may be almost here when it will be necessary to distinguish in railway transportation between things that are essential and things that are not essential. The statement also made public the fact that the war board has furnished to Judge Lovett, the administrative officer under the provisions of the priority of shipments act, and to Dr. Garfield, the government fuel administrator, at their request, a list compiled by a committee of railway traffic officers showing commodities, the transportation of which is regarded as non-essential under present conditions. One part of this list is made up of about 450 commodities whose transportation, it is believed, could be dispensed with without any serious inconvenience to the public. Another part contains about 75 commodities which it is believed the public could dispense with, but not without inconvenience. How many of these commodities shall be denied transportation, the statement said, is a matter for the priority director and the fuel administrator to determine. If the non-essential commodities are eliminated, the board has no doubt that the railways can transport all commodities required by the government in carrying on the war and by the people for their subsistence and comfort.

The list of commodities regarded as non-essential has not yet been made public and probably will not be until Judge Lovett and Dr. Garfield have given further consideration to the matter. Judge Lovett issued a statement on November 17, apparently designed to set at rest fears that any commodities would be denied transportation for the present, saying:

"While the situation may change, I am not at this time contemplating any further action with respect to transportation of non-essentials. Priority Order No. 2, with regard to open-top cars, went as far as it seemed wise to go in dealing with that problem by restricting the transportation of non-essentials. Conditions, however, will be constantly observed. Whether the coal shortage requires restriction of the coal supply of non-essential industries is a question for the fuel administrator, Dr. Garfield, to determine; and if any priority orders become necessary in the furtherance of his policy in that regard, they will be made only upon his request.

"As to the War Industries Board, apart from my action under the Priority Act with respect to transportation, I may say that the industries of the country would seem to be justified in assuming from the action of the board in the matter of copper and steel prices and its record generally to date, that it is the desire and policy of the board carefully and liberally to conserve the interest and welfare of industries. I feel safe in saying that the board will take no action designed to eliminate any non-essential industry without reasonable notice and an opportunity to be heard."

In making the announcement, the war board took occasion to make to the public a frank statement in explanation of the railway situation as it exists and the means which it believes should be used in dealing with the situation. This statement is in part as follows:

"The transportation situation is becoming the subject of growing public uneasiness and agitation. Those responsible for the operation of the railways realize that transportation conditions, unless more vigorously dealt with by all con-

cerned, will grow more acute. Both the public and the managements of the railways must courageously face the fact that under the trying conditions which will develop this winter it probably will become impossible for the carriers to handle all the traffic which the shipping public can offer. The number of unfilled requisitions for freight cars, after having largely declined between May 1 and Sept. 1, in spite of a vast augmentation of traffic, showed an increase on October 1 and a further increase on November 1. The main reason, of course, why the railways are having such great difficulty in handling all the traffic is that there has been an enormous increase in its volume, and that this still continues. Statistics which have just become available show that in the months of April-August, 1917, inclusive—those being the first five months after the entrance of the United States into the great war—our railways handled 16 per cent more freight traffic than in the same months of 1916, which year broke all records up to that time. The traffic handled in these five months of 1917 was 50 per cent greater than that moved in the same months of 1915; and, in fact, exceeded the total traffic moved in any entire year prior to 1904. When the statistics for September are available they will show that in the six months ending with that month the railways handled more freight traffic than in any entire year prior to 1907.

"Perhaps the most remarkable figures are those regarding the movement of coal. In the six months, May to October, inclusive, there were moved 150,000 more carloads of anthracite than in the same months of 1916, an increase of 18 per cent, and 751,000 more carloads of bituminous and lignite coal than in the same six months of 1916, also an increase of 18 per cent.

"A total of 116,000 carloads of freight have had to be hauled to the National Army and National Guard camps; and up to the time of the latest report over 17,000 carloads of freight had been handled for the shipping board.

"The railways are still moving a total freight traffic surpassing any ever known before, and it should be borne in mind that they are doing this with almost no greater facilities than they had two years ago and under conditions which prevent them from materially increasing their facilities. Another important phase of the situation to which attention should be called is that the railways this year have had to handle the largest passenger business ever known. This has been a serious obstacle to needed reductions in train service. In addition, between August 1 and November 12 they transported 1,200,000 soldiers to training camps, cantonments and points of embarkation. This troop movement involved the use of approximately 2,750 special trains.

"This large passenger traffic and the troop movement have complicated matters and increased the difficulty of moving the freight traffic. Large troop movements are still being made, and the railways are moving to the training camps and cantonments about 75,000 carloads of supplies a month.

"These facts are sufficient to explain the situation. The railways have secured much more service from every track, every car, every locomotive, than ever before, and the fact that the unfilled requisitions for freight cars amounted on November 1 to only 140,000 in spite of the tremendous increase in traffic reflects great credit upon their performance.

"Upon this record of actual achievement the railroads rely on the support of public opinion, despite much of what Commissioner Clark of the Interstate Commerce Commission has characterized as unfair criticism from the people

who are trying to direct attention to alleged faults of the others, in order to avoid having their own shortcomings and evil doings brought into the light.

"But the public naturally is not so much interested in what the railways have done as it is in what they probably will be able to do during the coming months. The course of developments is forcing those responsible for their operation to anticipate that probably they will become unable to provide transportation for all the classes of commodities which they have been moving.

"The situation is similar to that in other industries. The steel manufacturers cannot produce all the steel needed; the coal mines cannot produce all the coal needed, and the farmers have not produced all the wheat needed. Other industries, faced by similar conditions, under the sanction and direction of the government are reducing the amount of fuel and materials furnished to business concerns producing things not essential to carrying on the war."

Then follows the announcement regarding the proposed list of non-essential commodities. The statement adds that "those responsible for the operation of the railways do not wish to be understood as conceding that the transportation lines have reached the limit of their capacity. They are still increasing the amount of traffic they are handling, and with greater exercise of skill and energy by railway officers and employees and increased co-operation from the shipping public and government officials, including the regulation authorities, the freight service rendered can still be largely augmented.

"The Railroads' War Board is issuing to railway officers and employees, and to the public, detailed suggestions in addition to those already made as to methods by which this result can be accomplished, and we have no doubt that these will be received and acted upon as similar suggestions heretofore made have been.

"The difficulties with which the railways were confronted at the beginning of the war were very great. Some of these have been overcome. The increase during the first five months of the war of 16 per cent in freight traffic handled with practically no increase in locomotives or cars, was equivalent to the addition of 5,000 locomotives and 360,000 cars to the number in service.

"The difficulties now confronting the railways are even greater than those they faced at the beginning of the war. They cannot get anywhere near all the men they need. They have lost many of their most efficient officers and employees because of their enlistment in the service of the government and other reasons, and the new men, of course, are not as efficient as those we have lost. It is impossible for the carriers to get the materials and new equipment they need because it is thought by those in authority that the national welfare demands the output of the iron and steel mills and of the railway equipment concerns be devoted to other purposes.

"Great, however, as are the difficulties which the railways are encountering in their efforts to render adequate service, we believe that if the government and the public will be patient and will continue to give the managements of the railways their co-operation, most of these difficulties will be overcome."

NOT AN ADMISSION OF FAILURE

This statement from the Railroads' War Board is referred to by a writer in the Washington Post as an admission by railroad men "that the present state of affairs has continued long enough and that government control is the most feasible remedy now in sight." In a letter to the editor of the Washington Post in reply to this assertion, Fairfax Harrison, chairman of the Railroads' War Board, challenged it as without foundation. "We are in close conference constantly," he said, "with railroad men, business men and govern-

ment officers and none of them has ever expressed the opinion that the present state of affairs has continued long enough or that government control of the operation of railways is desirable. A statement exactly opposite would more accurately reflect the views expressed not only by railroad men but by members of the cabinet and other government officers."

The preparation of the list of non-essential commodities at the request of Judge Lovett and Dr. Garfield, Mr. Harrison said, cannot, except by most strained interpretation, be construed as an admission that transportation conditions demand any radical change in the organization and methods now being used in the operation of the roads.

"We are not advocating a 'let well enough alone' policy," he said, "and welcome any and all helpful suggestions. The Railroads' War Board and the managements of the individual railways are putting forth their utmost efforts to meet the transportation demands of the country, and we confidently believe, as we have indicated in previous statements, that under the present arrangement, the railways will be able to render all the transportation of essential articles necessary. If, however, more radical measures become necessary, the Railroads' War Board will not hesitate to recommend such changes. Therefore, the agitation of proposals for radical changes in the existing organization and methods without careful previous consideration is ill-timed and dangerous. Their adoption would result in a demoralization in the transportation field, greatly reduce the efficiency of the railways and be disastrous to the commercial and military interests of the country."

SUGGESTIONS FOR INCREASING THE EFFICIENCY OF THE RAILROADS

The detailed suggestions referred to in the statement regarding additional methods for increasing the efficiency of the railroads are contained in Bulletin No. 42 issued by the war board on November 15, addressed to all railroads, and are as follows:

"We are approaching the winter with apprehensions of possible congestion on our railroads, notwithstanding all that has been accomplished by the hearty co-operation with us of government agencies, shippers and the general public, in increasing their efficient operation. Our reports show that in the second quarter of 1917 each locomotive handled 16.1 per cent and each freight car 15.3 per cent more revenue ton miles than in the corresponding period in 1916, equivalent to the addition of 4,985 locomotives and 361,000 freight cars to the equipment of the latter year. While the committee gratefully accords credit for this showing to the co-operative efforts of the carriers and the public, it considers it necessary to direct attention to the extraordinary *additional* amount of transportation that the carriers will be called on to supply this winter, through the operation of conditions that have developed since our entry into war, the pressure from which is constantly and rapidly increasing in intensity.

"The commandeering of ships engaged in Atlantic and Pacific coastwise trade, and of seagoing tugs plying between Newport News and New England points, throws on the railroads the burden of transporting much of the New England coal and cotton supply that formerly moved by water. Many more troops, in addition to 1,200,000 already moved, will have to be transported, and at least 2,500 carloads of supplies for their use must be handled *DAILY* this winter. Proper response to these demands, and to the almost unlimited calls for fuel from all parts of our country, will require unremitting effort.

"It is evident, therefore, that however heartily the public has already responded to our requests for co-operation, additional and most strenuous endeavor must be made, both by us and by them, to overcome the stress of winter weather,

overworked plant, and depletion of forces through calls to the flag and resignations to accept employment in shipyards and munitions factories.

"Repeating and emphasizing the suggestions in our Bulletin No. 12 of May 4, 1917, to strive for increased efficiency, the following additional ones are offered:

"1. Study thoroughly all priority and other governmental orders issued to promote movement of traffic and use of equipment, comply cheerfully and promptly therewith, and

St. Louis Globe-Democrat

There Can Be but One Answer

adopt the same attitude towards the orders of the Commission on Car Service.

"2. Redouble effort to:

- (a) Increase the loads per car of bulk grain and other commodities, much of which still moves in light loads.
- (b) Expedite car movements through yards and terminals.
- (c) Check up and enforce demurrage rules rigidly.
- (d) Check up and eliminate cross-haul of commodities.

"3. Unload company material much more promptly.

"4. Increase lading in L. C. L. merchandise cars, by establishing 'sailing days,' a practice used with great success by some of our constituents.

"5. Increase fuel economy by closer inspection of firing practice, and by extending the use of superheated steam, feed-water heaters, etc.

"6. Review switching service at terminals, and prescribe special movements, so as to cut out all unnecessary detention of cars.

"7. Wherever transportation can be conserved, avoid the use of unreasonably circuitous routes, carefully avoiding, however, overloading direct routes.

"8. Lengthen passenger and fast freight train schedules during the winter, to promote punctuality, and avoid demoralization of traffic that invariably follows failure of regular trains to make their schedules.

"On single track, as most of our lines are, the number of meeting points and opportunities for collision decrease much more rapidly than the number of trains. For instance, 10 trains each way daily involve 100 possible meets, with the delays incident thereto, and offer equal opportunity for head-on collisions; by reducing the number of trains to 7, or 30 per cent, the possible meets, delays, and collisions fall to 49, or 51 per cent.

"The loss of equipment service resulting from a reduction of speed from 20 to 15 miles per hour, is suffered on the time it is moving only, and as this is but a small percentage of the total time consumed on a trip, the actual loss is very small, and is much more than offset by the GAIN of 15 per cent in tractive power of a typical freight locomotive at the lower speed.

"9. Wherever possible, arrange for common use of terminals and facilities, to tide over threatening emergencies.

"10. Curtail reconsignment privileges in every possible way.

"11. Encourage the use of motor trucks and co-operation with trolley lines for handling short-haul freight.

"12. Enlist the services of water transportation lines in all reasonable and practicable ways.

"13. Start a systematic, vigorous campaign to provide

From the Evening Mail, New York

Uncle Sam—"If Those Fellows Don't Quit Their Quarrelling, by Gum, I'll Run the Railroads Myself!"

universal interline waybilling, a study of the operation of which on one large system convinces us will result not only in a large money saving, but in saving 12 to 18 hours' time on cars and the continuous services of one switch engine, handling setbacks account 'no billing,' at each representative terminal.

"14. Keep seaports and regional gateways free of congestion, by prompt use of embargoes, which should be established immediately on signs of trouble, without waiting, as has frequently been done, until congestion has actually oc-

curred. An ounce of prevention is worth not one but many pounds of cure.

"The railroads generally are very short-handed, some of our constituents reporting a net shortage of 12½ per cent in the number and a much larger percentage of loss in the efficiency of its employees, because of the necessity of filling vacancies with unskilled and inexperienced men. We recognize that everyone is doing his best, in trying conditions, to help his country win the war, but if insuperable difficulties should arise to prevent us from giving the public as good service as we desire, we ask every railroad executive to make it clear why we failed, and to request the public to continue to exercise the patience and tolerance that they have heretofore shown."

STATISTICS SHOW INCREASED EFFICIENCY

The steadily increasing efficiency of freight operation is again reflected in the monthly report compiled for the Railroads' War Board by the Bureau of Railway Economics of statistics showing the results of freight operation during the month of August. The returns included in this statement represent about 97 per cent of the operated mileage of roads of Class 1, which during the month show an increase of 8.4

per cent in revenue ton miles transported with an increase of only 1.7 per cent in the number of freight locomotives and 2.5 per cent in the number of freight cars in service. The details are shown in the table. A statement has also been compiled showing the comparative results of freight operation for the five months, April to August, 1917, as compared with the same period of the previous year for certain selected features of the report. This shows an increase in revenue ton miles of 23,904,579,696, or 16.2 per cent, while the average number of freight locomotives in service increased only 1.4 per cent and the average number of freight cars in service increased 2.2 per cent. The average number of tons per train increased from 625 to 675, or 8 per cent. The tons per loaded car from 24.8 to 27, or 8.9 per cent, while the average mileage per locomotive per day increased from 65.3 to 68.7, or 5.2 per cent, and the average mileage per car per day increased from 27.3 to 28.1, or 2.9 per cent. The percentage of freight locomotives in shop or awaiting shop was reduced from 15.6 per cent to 14.1 per cent, and that of freight cars in shop or awaiting shop from 6.4 to 5.8 per cent. The revenue ton miles per locomotive increased 14.5 per cent in the five months operated, and the revenue ton miles per freight car increased 13.7 per cent. These statistics are for 225,349 miles of road.

National Industrial Traffic League

Constructive Discussions by Public-Spirited Commissioners of Demurrage, Bills of Lading, Express Rates

THE National Industrial Traffic League held its annual meeting at the Waldorf-Astoria Hotel, New York City, on November 15 and 16 with about 150 members present. G. M. Freer, manager of the Traffic Department of the Cincinnati Chamber of Commerce and president of the League, presided and, in the absence of Secretary O. F. Bell, that position was filled by E. F. Lacy, of Chicago, assistant secretary.

The first business was the election of officers for the ensuing year and the present incumbents were re-elected, namely, Messrs. Freer, Bell (traffic manager of the Crane Company, Chicago), Lacy, and W. H. Chandler, manager of the Transportation Department of the Boston (Mass.) Chamber of Commerce, vice-president. F. B. Montgomery was made chairman of the board of directors and H. C. Barlow chairman of the Executive Committee. The report of the secretary-treasurer showed \$4,016 on hand, of which \$3,000 is of the nature of an emergency fund, drawing interest. The membership dues were increased last year for the purpose of providing this fund; and the amount of dues collected, according to the report, was nearly \$12,000.

The Executive Committee presented a report recounting its activities since the last meeting (at Buffalo). In connection with the new rules of the Interstate Commerce Commission regarding the filing by railroads of applications for leave to issue new tariffs, the League has called to the commission's attention the importance of requiring the railroads, without exception, to confer, in advance, with representatives of the shipping public; and the commission has been asked to prescribe a form of application which shall show how and to what extent this duty of conferring with shippers has been carried out. The League also asked that all such applications for authority to issue tariffs should be filed at every place at which the railroads are required to maintain complete public files of tariffs. It is understood that the Commission proposes to issue a daily bulletin giving information about these applications.

In this discussion of the question of tariffs there was voiced a demand that every tariff should show, in summary form, on the first or second page, what changes have been made, especially advances on rates in former tariffs; but it was the consensus of opinion that in many cases such a rule could not reasonably be complied with.

DEMURRAGE

The Committee on Car Demurrage and Storage, F. B. Montgomery, chairman, presented an interpretation of demurrage rule No. 2, section A (allowing 48 hours' free time for unloading), as applied to a case where there are two minimum carload shipments in one car consigned to different consignees in the same town. It was held that each consignee should have 48 hours, free of interference, in which to unload his freight. The meeting adopted this interpretation.

The committee reported its interpretation of demurrage rule No. 2, section B, paragraph 3. The committee recommends that this rule (allowing 24 hours' free time) should apply to all cases where a car is delayed because a connection rightfully demands prepayment or the surrender of the bill of lading; and this the convention approved.

The committee made a number of suggestions in regard to changes in storage rules No. 1 and No. 5, and these were approved by the meeting.

The committee has had considerable discussion of demurrage rule 5, section A, covering constructive placement; and reported that further conferences were to be had with the American Railway Association's Committee on Relations. In regard to section B of rule 6, imposing a demurrage charge in case a car is placed for a shipper and he does not use it, the American Railway Association proposes to add to the demurrage charge the regular switching rate for each move. The committee has protested against this new rule, because of this switching charge addition and for other reasons. Shippers who have been consulted believe that no switching charge should be made, for any movement, except according to rates shown in regular published freight tariffs. In the discussion on the report it was pointed out that this rule, allowing a car thus unused to stand 48 hours, was liable to be wasteful; it does not cure the evil which is aimed at; it will not prevent interplant use of cars. The action of the committee in protesting against the rule was approved.

Reporting on the agitation by some railroad men to abrogate the average agreement and the complaints of some consignees that it ought to be more liberally applied to cars which are held en route to complete loading (and which are allowed one day for the purpose), the committee finds that the American Railway Association has disapproved the agitation for abolition of the agreement at the present time and has so notified its local committees; and no action is recommended.

Considering the question of the desirability or undesirability of demurrage bureaus (like that now in operation at Boston), the committee found much difference of opinion; and had done nothing except to appoint a subcommittee of three to discuss the matter, if found desirable, with the Interstate Commerce Commission. This action was approved by the meeting.

FREIGHT CLASSIFICATION

The report of the Classification Committee brought out a long discussion on the desirability of asking the railroads for more liberal rules to permit the combining of different commodities in a single carload at a carload rate. In some cases this practice has increased loading efficiency and in others, it is claimed, has not. Such clauses in the classification are abused by the mixing of commodities that have no legitimate relation to each other.

On the subject of uniform classification the committee reported that in the next revision of the Western Classification about 87 per cent of the descriptions will be in conformity with the descriptions adopted by the Uniform Classification Committee. This next revision, which will be No. 55, will contain 7,921 items, an increase of about 600 over the last one.

The railroads contemplate putting into the next Western Classification a rule stipulating that an article shall not be considered as knocked down unless it has been taken apart so as to reduce materially the space occupied. This has been objected to as not being sufficiently explicit, and the committee has been asked to recommend that the tariff shall set forth, in each case, just what must be done to an article to entitle it to the K. D. rating. The point was brought out that every shipper knows what is reasonable in this matter, and that all that is needed is competent and impartial inspectors on the part of the railroads; but the meeting finally

voted to instruct the committee to endeavor to secure explicit definitions, in the classifications, for each item.

In the revision of the Official Classification there is a proposal to take out carload ratings on about 75 commodities, and shippers objecting to this have already gone to the Interstate Commerce Commission with their complaints. These elisions are proposed on the ground that the commodities are never shipped in carloads; but the discussion brought out that some shippers want certain of these rates only to use them under rule 10, which permits mixed carloads.

FREIGHT CLAIMS

The committee on this subject proposed the addition of a line in the standard bill of lading for the street address of the consignee; and the meeting ordered the request to be laid before the Interstate Commerce Commission. The committee reported a need for a manual for the use of shipping clerks covering the marking, packing and handling of freight, but no action was taken. A strong argument was made for the enforcement of the rule requiring the marking of every package and the erasure of old marks. There is a great waste of time and energy in tracing for lost packages, which work would be saved if everything were properly marked. One member urged that the Car Service Commission be asked to order the rejection of shipments not properly marked.

Mention of the subject of tracing brought out a long discussion on the great amount of useless tracing and the difficulty in getting proper attention to tracers which really are necessary. One concern, shipping 300 cars a month, had boasted of sending out tracers after every shipment, within a day or two, and named the roads which cheerfully attended to such tracers, virtually furnishing to the shipper progress reports for every shipment. This abuse was condemned as impairing the railroads' ability to properly attend to legitimate tracing. This practice of indulging shippers in the habit of asking to have shipments traced before they have had time to reach destination was strongly condemned by a number of speakers; and one Chamber-of-Commerce commissioner moved to approve the use, by railroads, of a printed circular, declining to send tracers prematurely, this circular to be pinned to the application and to constitute the only reply to such applications. One New England road was cited as receiving 1,400 requests a week for these illegitimate tracers.

The speakers made a clear distinction between ordinary tracing and requests for special attention to shipments which must be expedited; and one of them said that if suitable junction records were kept, so that inquiries could be promptly answered, the matter of tracing would be greatly simplified. It was pointed out, however, that such records are not kept for l. c. l. shipments and probably could not be reasonably required.

BILLS OF LADING

The committee on this subject made a brief report on a proposed blank combining a bill of lading with a waybill, but after a very brief discussion the subject was laid on the table.

Certain railroads in the southwest have proposed to make a charge for issuing a bill of lading for a shipment to be billed "to order, notify," but the committee, after conferring with prominent railroad officers, concluded that there was no likelihood that such a charge would be actually put in effect. The motive for imposing a charge is to get rid of unnecessary application for such receipts.

There was a long discussion in regard to varied and inconsistent practices on the part of the railroads in determining the value of freight which has been lost or damaged. The present standard form of bill of lading stipulates that payment shall be based on the value of the freight at the time and place of shipment; but certain railroads try to reduce

their payments by insisting on the values named in the invoice, though the bill of lading now has no provision for the use of the invoice figures.

The Interstate Commerce Commission is now receiving two or three hundred complaints a month concerning shippers' difficulties in getting satisfactory treatment from the railroads in the matter of valuation of lost or damaged property. Many of these complaints have to do with what are called drop shipments; shipments where there are three parties concerned, the shipper, the jobber who has ordered the goods, and the consignee; the goods being shipped direct to the consignee and the jobber never seeing them. There are three possible bases for the valuation, namely, (a) the shipper's invoice, (b) the date and time of shipment, and (c) the jobber's invoice to the final buyer. Members reported much contention concerning claims on these shipments. It is expected that the new uniform bill of lading which the Interstate Commerce Commission hopes to decide upon and prescribe sometime within the next six months, will clarify this situation; but in the meantime the question is whether the League and the railroads cannot come to some temporary agreement. It was proposed to have a conference with a committee of the Freight Claim Association, but this was rejected as not meeting the situation. The freight claim agents deal only with questions between carriers, and have no authority as to questions between a carrier and a customer.

Many absurd transactions were cited. One railroad, to get at the value of goods at the place and time of shipment, requested the consignor to furnish the names of all of the farmers from which the goods had been bought, with a view to getting figures from each producer!

In the view of a number of members the Cummins amendment has had the effect of restoring the common law, so that the present provision in the bill of lading concerning values is illegal; the common law would require a railroad to pay the consignee's actual loss, regardless of technicalities.

A proposal to ask the Interstate Commerce Commission for a ruling interpreting the valuation clause in the present bill of lading was vigorously opposed, the claim being made that as the present bill of lading form is not in compliance with the law (as the Supreme Court is expected finally to decide) any expression by the commission, even of a temporary nature, may have a wrong influence in connection with the final action to be taken on a permanent bill-of-lading form; but it was finally voted to ask the commission for a conference.

EXPRESS BUSINESS

The committee on this subject reported the recent action of the express companies in asking authority for an increase of 10 per cent in their rates for the transportation of merchandise and expressed the opinion that probably such an increase, to be allowed only during the continuance of the war, would be justified. The express companies, no doubt, will agree to such a time limit and it is expected that there will be a hearing on the subject in December.

Shippers have complained that express companies will not consider a claim from a consignor until he gets a written release from the consignee. This is an annoyance because consignees in such cases frequently will refuse to comply. The committee was instructed to confer with the express companies; and to see that their rules were made public. Members who had gone to the highest officers of the express companies had succeeded in having subordinates soon brought to terms. A number of members narrated varied grievances. In the central west the express companies have returned the money on C. O. D. shipments 30 to 60 days behind time. All members were recommended to send their grievances to the chairman of the express committee, W. H. Chandler, Boston.

MISCELLANEOUS MATTERS

There was a brief discussion on the recent action of the Interstate Commerce Commission in relieving the railroads of some of the former requirements concerning statistical reports; and it was voted to request the commission to continue the requirements for statistics of ton miles, loaded car miles and some other data in relation to certain important commodities, the argument being that these statistics are still kept up by the railroads for their own use, and that therefore the data can be sent to Washington without imposing on the roads an unreasonable burden.

At the banquet of the League at the Waldorf-Astoria on Thursday evening an address was made by Hale Holden, president of the Chicago, Burlington & Quincy, which is reported in another column.

The membership committee reported an increase in the membership of the League during the past year from 360 to 430. Members from Cincinnati, Cleveland, Toledo, Milwaukee and other cities reported on the activities of regional committees and their work in co-operating with the district committees of the American Railway Association. Generally satisfactory conditions in this respect were reported, though in some cases the railroads had complained that the commercial interests were not active enough.

The question of a place for the next meeting was referred to the executive committee. There was a strong sentiment that the League ought to have at least three general meetings every year.

U. S. RAILROAD OFFICERS GOING TO RUSSIA

The personnel of the Russian Railway Service Corps, which has been recruited under the direction of S. M. Felton, director general of railroads, from railroad operating and mechanical officers of the United States, to assist in the operation of the Russian railway system, particularly the Trans-Siberian Railway, has been completed, and the prin-

cipal officers, with their railway and military titles, are as follows:

George H. Emerson, general manager, Great Northern; colonel; George S. Stewart, general superintendent, Great Northern, lieutenant-colonel; R. B. Hawkins, superintendent of motive power, Great Northern, lieutenant-colonel.

Majors: B. O. Johnson, division superintendent, Northern Pacific; Charles M. Winter, division superintendent, Minneapolis, St. Paul & Sault Ste. Marie; Frank R. Blunt, division superintendent; Collins Gravis, division superintendent; Andrew C. Peterson, division superintendent, Chicago, Milwaukee & St. Paul; Charles T. Spear, division superintendent; F. B. Irvine, division superintendent; George W. Tower, division superintendent, Chicago, St. Paul, Minneapolis & Omaha; M. F. McLaren, division superintendent; Samuel T. Cantrell, division superintendent; F. B. Parker, division superintendent; John H. McGlogan, assistant superintendent of telegraph, Great Northern.

Captains: J. C. Benson, master mechanic; John Delancy, master mechanic; James Casey, master mechanic; G. F. Egbers, master mechanic; Northern Pacific; H. A. Enochson, master mechanic, Chicago, St. Paul, Minneapolis & Omaha; Joseph B. Roach, master mechanic; P. G. Baker, master mechanic; W. C. Burel, master mechanic; Frank Buchanan, master mechanic, Chicago, Milwaukee & St. Paul; W. O. Williams, master mechanic; J. C. Climo, master mechanic, Chicago, Burlington, & Quincy, and A. R. McKabe, master mechanic.

The expedition also includes 24 traveling engineers, 24 trainmasters, 12 chief dispatchers, six boiler foremen and one secretary to general manager, all with the rank of first lieutenant; two secretaries to general superintendent, one secretary to superintendent of motive power, 69 train dispatchers, 3 line repairers, 1 lineman, 20 roundhouse foremen, 2 machine foremen, 3 engine erecting foremen, 4 boiler foremen and 1 foundry foreman, with the rank of second lieutenants.

Remarkable Photo Showing Destroyed Bridge Blown Up in Russian Retreat Buckling and About to Fall

This remarkable photograph is one of the very few made during the war showing a bridge actually being blown up. The span can be seen buckling under the strain of the explosion, just before it fell, dense clouds of smoke rolled over the structure and water spouts all about showing the effect of the mines planted in the river. Russian engineers mined the river and destroyed the bridge as part of the usual military tactics for delaying a pursuing enemy. They also blew up a neighboring village that had been used as a munition depot to prevent its falling into the hands of the Teutons.

Longitudinal Section of the Locomotive Showing the Arrangement of Apparatus in the Cab.

Pennsylvania Electric Freight Locomotive

Details of Notable Features of the Running Gear Construction and Description of Electrical Equipment

TESTS have recently been made on the Philadelphia-Paoli electrified section of the main line of the Pennsylvania Railroad, of the experimental electric locomotive which has been built for main line freight service by the Pennsylvania Railroad and the Westinghouse Electric & Manufacturing Company. A brief description of this locomotive, including the principal dimensions, was published in the June 8 issue of the *Railway Age Gazette*, page 1199. It is the largest electric locomotive which has so far been built, having a starting tractive effort of 130,000 lb. and a total weight of 240 tons, of which 198 tons is carried on the drivers.

The locomotive has a nominal one hour rating of 4,800 hp. at 20.8 miles an hour, which is equivalent to a tractive effort of approximately 87,000 lb. The continuous rating is 4,000 hp. or 72,000 lb. tractive effort at a speed of 20.85 miles an hour, with the motors connected in parallel. For starting and slow speed operation, "cascade" connection of the two motors on each truck unit is provided. When regenerating at continuous capacity, the locomotive is capable of returning to the trolley system 4,400 hp. at a speed of 21 miles an hour.

In service between Altoona and Johnstown, where it is the intention eventually to use locomotives of this type, it is proposed to operate trains with one locomotive at the head end and one pushing. The continuous capacity at a speed of 20.85 miles an hour enables a trailing load of 2,300 tons to be hauled up a one per cent grade, 4,100 tons up a .5 per cent grade, or 11,000 tons on level track. Two locomotives operating under the proposed plan are expected to handle 3,900 tons westbound, where the ruling grade is 2 per cent, and to handle 6,300 tons eastbound over a ruling grade of 1.33 per cent. The speed chosen is considered to be about the maximum desirable for the operation contemplated and is governed by the size of trains as well as the characteristics of profile and alignment.

In the previous article was given a general description of the construction of the locomotive, but there are a number of features of the locomotive, both mechanical and electrical, which are worthy of more detailed consideration.

The method of securing a rigidly maintained gear center distance may be seen in the illustration showing the flexible jack shaft gear and motor pinions with the casing removed. The jack shaft bearing brass consists of a solid bronze bushing pressed into an eye in the side frame. The removal of this brass involves the removal of the main gear center from the jack shaft. The armature bearings are contained in housings which are fitted into pockets 27 in. wide by 14½ in. deep in the top of the frame casting. These pockets depart from the rectangular in that the sides are tapered 1 in. in 16 in., the housing being forced into the pockets under a pressure sufficient to produce local stresses in excess

of any that will be imposed in service. The housings are then bolted in place both horizontally and vertically. The center distances between the gear and the motor pinions are, therefore, as securely fixed as if all three bearings were in an integral casting.

The active iron of both motor stators on each truck is mounted in a unit motor frame and locomotive cross-tie casting, which also surrounds the jack shaft. The armature bearings are arranged for oil ring lubrication, while the jack shaft is fitted with oil and waste lubrication, a large waste cavity being provided in the side frame casting above the jack shaft bearing.

The body of the jack shaft is 11⅞ in. in diameter with a long taper on each end to receive the gear center. The shaft is hollow, a hole 3 in. in diameter extending through from end to end. The gear center is of cast steel with a long hub which extends through the bearing brass and forms the running surface of the journal. The bore of the gear is tapered throughout its length and fits the taper on the end of the jack shaft. The gear center is pulled home to its seat on the shaft by a heavy nut on the end of the shaft, which is located in a counterbore in the outer face of the gear center. A heavy key in the taper fit insures the proper quarter of the crank pin. The crank pin is 8¼ in. in diameter and has a throw of 30 in. Opposite its center is a lead filled counterbalance with proper angular offset to compensate for transverse unbalance. A complete counterbalance is thus secured for all operating speeds.

The flexible gear is of the Westinghouse type which was developed for railroad service and has previously received wide application both on cars and locomotives. This, however, is the first commercial application in connection with rod drive and no other railroad application approaches it in the amount of power transmitted. The gear has a face 10 in. in width which is a radical departure from previous railroad practice with overhung gearing. This width is made practicable by dividing the gear rim at its midwidth into two rings, independent flexibility being provided for each ring relative to the gear center. The gear pinions are integral and each meshes with both rings, the independent flexibility of which insures an approximately equal division of the maximum load. The pinions and gear rims were manufactured by the R. D. Nuttall Company and are of heat treated steel.

The foundation of the cab structure consists of two built-up Z-shaped girders 26 in. deep, which are spaced 6 ft. 1½ in. apart. To the top of these girders is riveted a cover plate upon which the electrical apparatus is secured. At the mid-length of the cab is a built-in well 15 in. deep by about 3 ft. in width, containing the electrolyte supply from the liquid rheostat, the sides of which are supported from the center girder. To the bottom of this tank is secured the articulat-

ing device, which is of unique construction; in effect it is a link by means of which the inner bumper beams of the two truck units are held in contact, and by means of which all traction stresses are transmitted from the frames of one truck unit to those of the other through the bumper beams, without imposing any stresses upon the cab structure other than those due to its own inertia.

The inner bumper beam of each truck unit is a steel casting of box section, the vertical faces of which are circular arcs with radii equal to the distances from the center of the cab center pin bearing. The two castings are thus in rolling contact with each other as the angularity of the center lines of the two trucks changes, due to track curvature. Supported from the bottom of the electrolyte well by means of pressed steel channels are two steel castings, each of which forms one jaw of a longitudinal pedestal spanning the two bumper beams. This pedestal is closed by a binder generally similar to the usual type of locomotive driving box pedestal binder. The faces of the cast steel jaws are tapered and are covered by long vertical extensions on the binder to which are bolted steel wearing plates. When the locomotive is in operation the inner face of each bumper beam is in sliding contact

A series of taps is used on the main transformer partly to regulate the drop in the secondary voltage of the phase converter through its impedance when operating under heavy loads, and the rise in voltage when regenerating; also to correct the distortion of the phase of the secondary voltage under varying loads. Electro-pneumatically operated unit switches are used to change the various taps on the transformer in such a way as to enable the change to be made from one tap to another without disconnecting the phase converter from the secondary of the transformer, or momentarily short circuiting the transformer coils.

Three-phase power is supplied to each of the four motors through a set of five electro-pneumatically operated unit switches. These motor primary switches are also used as reversing switches. One is used commonly for both forward and reverse operation, and the other four switches are used in pairs to interchange the connection of two of the phases for obtaining forward or reverse rotation of the motors.

The motors are arranged for two-speed combinations, or normal regenerating positions, corresponding to approximately 10 and 20 miles per hour. On the low speed, each pair of motors is connected in cascade; on the high speed,

Pennsylvania Electric Locomotive Hauling an Idle Steam Locomotive and Freight Train

with one of these plates. Both the inner and outer surfaces of the steel bumper beams are protected by steel wearing plates one inch thick, and held in place by countersunk bolts.

The longitudinal cross section of the locomotive shows in detail the arrangement of the apparatus in the cab. Single-phase current at a potential of 11,000 volts is collected by a pantograph trolley, thence following a path through an oil circuit breaker to the primary of the transformer from which it is led to the framework of the locomotive, the circuit being completed through the rails to the substation. The secondary of the transformer supplies power to the phase converter, which may be considered as a combined motor generator, transposing a portion of the power to a phase displacement of 90 deg. from that of the transformer secondary voltage. This, together with the direct supply from the secondary of the transformer, forms a two-phase source of power which is combined by means of a Scott connection to give virtually three-phase energy.

A small single-phase motor which is mounted on the shaft of the phase converter is used in starting to bring the phase converter up to synchronous speed. It is then automatically cut out and used as a direct current generator to excite a winding on the rotor of the phase converter, to obtain a power factor of unity.

The motor primaries are connected to the three-phase supply in parallel, each secondary being connected to a regulating liquid rheostat. The control is arranged so that the change from one speed to another is made without losing more than half the accelerating or regenerating torque, this result being accomplished by effecting a progressive transition of the pairs of motors.

The liquid rheostats, which govern the acceleration of the driving motors, are located in two separate tanks, the castings of which are built as a part of the cab frame. Each tank contains two sets of electrodes. The liquid is circulated continuously through each of the tanks by centrifugal pumps. The level of the liquid in each tank may be varied independently by means of tubular overflow valves, which are controlled by differential air engines of the Westinghouse PK type. The rheostats are located in the center of the locomotive, one pair at each end of a cooling tower compartment containing two cooling towers. A small percentage of the liquid is by-passed to the top of the cooling towers and flows over the surface of the cooling trays back into the main tank. Air is blown over the trays in a direction opposite to that of the liquid. In this way the body of the electrolyte in the main supply tank is sufficiently cooled by the expenditure of a relatively small amount of energy for

pump operation, and the sacrifice of but a small quantity of electrolyte through evaporation.

When the liquid level in the rheostats has reached its maximum height, which occurs when the overflow valves occupy their uppermost position, a set of switches is automatically closed to short circuit the secondary motor winding and cut out the rheostats. A small motor generator set, the motor of which is of the three-phase induction type, provides a source of direct current for energizing the field of the phase-converter motor when it is operating as a direct-current generator to excite the phase converter motor winding. Power to operate the control circuits and marker lights is also obtained from this set.

One of the illustrations shows the master controller with the case removed. The upper handle, which is designated the "speed" handle, has three positions, one each for the 10 and 20 mile per hour combinations, and one midway between these two which is used as the transition position to enable one pair of motors to be changed over to a new combination without losing the accelerating or regenerating torque of the other pair. The center handle on the master controller controls the acceleration of the locomotive. It has three positions, marked "raise," "hold" and "lower." A movement of the handle to the "raise" position and then back to the "hold" position gives a positive increment of

The Motor and Jack Shaft Mounting

rise in the liquid level of the rheostats. Moving the lever to the lower position and then back to the hold position results in a lowering of the level of the liquid in the rheostats. In this way the speed of the locomotive is controlled during either the cascade or parallel connections.

Overload protection is obtained by a current limit relay. This has the advantage of not opening the circuit, but operates first to arrest the rise of the liquid level in the rheostats and then to lower the level if the accelerating current goes beyond a certain fixed maximum value.

The liquid rheostats may be operated independently of each other by means of levers located in an auxiliary controller. This provides a means of equalizing the load on the different pairs of motors and of reducing the current supply to one pair, without affecting the other pair. Other levers are provided in the auxiliary controller for raising and lowering the trolley, starting and cutting out the phase converter, and operating the phase converter voltage and phase balancing switches.

Due to the inherent characteristics of the induction motor regeneration requires no extra control equipment. Manipulation of the master controller is exactly the same for regeneration as it is for running. The manipulation of this type of locomotive is extremely simple for both running and braking, requiring no special knowledge other than the manipulation of the air brakes when handling heavy trains.

There are two compressor sets on the locomotive, each a four-cylinder, two-stage balanced compressor having a capacity of 150 cu. ft. These are manufactured by the Westinghouse Air Brake Company. The armature of the motor is fitted on the overhung shaft of the compressor. The motor is a Westinghouse four-pole commutator type for alternating current, and at 150 volts on each circuit develops 35 hp. continuous rating at 1,200 r. p. m. By making use of a single-phase commutator motor, the compressor set can be operated independently of the phase converter, the only other apparatus needed being the transformer. This motor has characteristics similar to a series motor and gives a high

The Auxiliary Controller

torque at starting. The compressor sets are controlled automatically by electro-pneumatic governors.

There are two sets of motor driven blowers on the locomotive. These blowers force air through ducts to the main motors, phase converter and main transformer. They are mounted one at each end of the cab. In the event of failure of one set, the air ducts and dampers are so arranged as to

The Master Controller with Case Removed

supply air to all the apparatus in the cab from the other set.

This feature also makes it possible to shut down one blower set while switching, and also to reduce stand-by losses. Although normally operating three-phase, the blower motor will run single-phase and act as a phase converter for the circulating pump motors. After a run, the phase converter may therefore be shut down and the blower motors will continue to run on single phase after having been brought up to speed on three-phase while the phase converter was in operation. This makes possible a further reduction in stand-by losses.

The American Railroads in War Time*

Comprehensive Review of War Board's Problems; Confidence in Ability of Roads to Carry Their Burden

By Hale Holden

President of the Chicago, Burlington & Quincy.

THIS League represents the energy and strength of the industry of the country; it visualizes the output of that industry *in motion* from producer to consumer. Your traffic is at once translated into terms of transportation; into the billions of ton-miles which the railroads of the country manufacture in the vital services they render to you. Modern war finds little by analogy in wars of the past; new terrors, born of the genius of diabolical invention have been met and endured and one by one are being surmounted. The practices of our commercial and industrial life of yesterday are being rapidly readjusted to meet the growing problems of this modern science of wholesale homicide and destruction and we must continue, as we have well begun, to bring our common effort into form best suited to the needs of the hour. Every month since April has added new momentum to this great machine of ours—the power of the American people—and willing co-operation, more than any other force, has brought this about. All of the great war measures, accomplished within a few months, were born of the sound morality of American citizenship, stirred from time to time by the great state papers of the President. . . .

At this point the speaker described the work of the Railroads' War Board in the organization of the railroads for the war. Speaking of the pooling of freight cars he said that approximately 160,000 empty cars had been moved from one line or part of the country to another to relieve shortage or distress, and that this probably had done more than anything else to increase the capacity of the railroad plant as a whole. In his judgment we shall not again return to former methods in this matter. Continuing, he said:

Empty mileage means added expense, and at a time when expenses are almost wholly out of control, it has been hard to incur; when cars for local needs have been scarce and hard to provide, it has been harder upon the individual road and upon the shippers on its line to let them go, but the larger needs of the country as given us by department or committee at Washington or as we have seen them, have governed, and cars ordered to competitor or connection have been delivered as directed without delay.

The Railroads' War Board felt that before calling upon the public to make sacrifices in its normal transportation rights and privileges, the railroads should prove that they had made the first response and as far as the means within their control would permit, had improved their own efficiency. Already, as comparative statistics demonstrate, the most efficient transportation machine in the world, and with lower rates and higher costs of operation, the increase in traffic handled gives ground to hope that thus far we have done our part. Without doubt, much more might have been done and the anxieties of the future point to much that must yet be done, but in passing judgment, you must remember that the life of this machine comes from the human hands that operate it and in the complex conditions about us, these hands sometimes fail us and at times they falter in the struggle with the overload of the plant; you must also remember that months ago, the intense industrial activity of the country, following the recall to Europe of thousands of able men, began to deplete our mechanical and repair forces, and now the problem of proper maintenance of track and equipment

and indeed, of the efficient operation of trains, has become one of the serious anxieties of every railroad officer in the country. . . .

Observing the general increase in efficiency, critics have harshly asked why these things were not done long ago. The answer is that some of these more important measures were adopted knowing that to do them would add instead of decrease expense but were necessary to manufacture more transportation; and the savings accomplished by others have been long since absorbed by the mounting costs of operation. The response of employees and officers under the patriotic cry of the hour, and the magnificent response of the shippers of the country to the same call have had their part; and also the disregard by both shipper and railroad, in the common good, of some of the restrictions which have, in the exercise of the arts of peace, been imposed upon this over-regulated industry.

FUTURE MEASURES

Cold weather is at hand with decreased efficiency of men and power and this, added to the growing scarcity of labor, gives much concern to the outlook for the winter. We have serious problems before us, but I think there is no reason for alarm nor indeed for doubt about the capacity of the railroads to meet the needs of the country. There are some things, however, which must be done to accomplish this and I base my judgment upon the faith that these things will be done.

In the first place, the remarkable results which have come from co-operation show that this co-operation must, at all hazards of differences of opinion or selfish interests, be continued. As difficulties multiply we must meet them by greater co-operation. Let us for the period of the war abolish and bring to an end the old spirit of complaint and criticism. We have in the past been too ready to criticize and to pass harsh judgment upon the motives and actions of each other. This is no time to rattle old skeletons; on the contrary, they ought now to be put well underground, and, if we do this, I think, they will permanently stay there. Organization such as this have done much in recent years toward a better understanding and, I think, the railroad men of the present day are striving earnestly and with unselfish purpose to render the service which the public is entitled to have.

The railroad plant today has definite limitations. It needs more power, but the output of the locomotive plants is going to supply the needs of the Government. We need more cars, but because of the needs of the Government and our allies not as much progress has been made as the traffic needs. We must remember, however, that it was only a little over two years ago that there were approximately 350,000 idle cars reported throughout the country. . . . It is unfair to say, as some have, that the railroads have broken down, because the truth is that they are doing more than ever before. . . . The Priority law accomplishes, legally, a necessary discrimination born of the emergencies of the war. More will have to be done in this direction and some traffic will in time have to be taken off the rails. Already we know that some forms of industrial activity will be curtailed. We can conserve the energies of the railroads, also, by not requiring them during the war to use men or mate-

*Abstract of an address delivered before the National Industrial Traffic League at the Waldorf-Astoria Hotel, New York City, November 15.

rial or train service for unnecessary improvements. The Secretary of War recently wrote to the chairman of the Indiana State Council of Defense, declaring that: "New enterprises which are not fundamental to the efficient operation of the country's necessary activities should not be undertaken." It seems plain that no substantial right nor interest can be seriously affected by the universal adoption at this time of this principle; if it is adopted it will take off the railroads a considerable volume of loading and release many men and cars for more essential work. The reduction of passenger service already has released a great many men for more important work and has accomplished a considerable saving in coal. The passenger travel of the country is heavier than it has ever been before and shows no signs of abatement, and the public may have patiently to submit to further curtailment of passenger service.

We must make greater use of waterways, electric lines and motor trucks, and no better time than the present can be found to make the experiment. There are some stubborn facts, growing out of the big American freight car and the low American freight rate and the industry and team tracks and freight houses located conveniently in every city and town, which, I think, have had more to do with the inactivity of traffic by river or canal in this country than anything else; but in this time of heavy traffic, let us take a new look at the problem and see if some valuable use cannot be made of these natural highways. The War Board has said that the railroads will welcome any practicable water transportation, and they are prepared to co-operate cordially with responsible persons or corporations who may provide such water transportation. This guarantees our interest, I think, in the subject.

In many parts of the country freight is interchanged in considerable volume between steam and electric lines. Locally, electric lines are handling an increasing tonnage. Motor trucks present an admirable means for effecting delivery of package freight to nearby points and as to all of these I am satisfied that the railroads are prepared to join in reasonable measures to develop the use of them.

FACILITIES MUST BE INCREASED AND KEPT IN REPAIR

But we must not stop here, when traffic is rapidly increasing and we see great plants and ship yards being constructed. The railroad facilities of the country must be increased and they must be kept in repair, otherwise they will embarrass and delay us. After a memorable interview with General Joffre, it was not difficult to surrender our space in American locomotive shops in order that the urgent needs of the French might be first supplied; and we did the same for Russia; and naturally the engines, cars and other railroad supplies needed by our own Government for its foreign operations have preceded ours. These things had to be done whether the American railroads could afford to do them or not. After learning from the great marshal the part played by the locomotives of France in the Battle of the Marne, there was but one answer.

We are building railroads in France and engines and cars to operate them, and we must not fail to build whatever is necessary here. To support our operations there, we must not fall behind here. We must have priority for materials and manufacture here, as may be necessary, and the benefit of prices fixed by the Government, and in these, the Government will, without doubt, lend us its aid. We must keep our shops running as now at full time, and competition of other industries must not be permitted to decrease our repair forces nor military service to take more of them than absolutely necessary, lest we may have, as others did, to call them back from the front to do this most important work at home.

Plainly, in these times, the railroads must have more revenues. Railroad expenses nowadays are an open book,

and the predictions made last spring in the effort to obtain timely relief failed only in that the increased cost has greatly exceeded the conservative estimates then made. These things seem to me, however, not difficult to do—and yet the doing of them adequately and in time will likely determine the success of the efforts the railroads are so earnestly putting forth to help win the war. I have faith that all of these things will be done, because the measure of success in this war-time service to the Government will be that we do for it now everything that patriotism and love of country can do.

IOWA COMMISSION APPROVES CURTAILMENT OF TRAIN SERVICE

The Board of Railroad Commissioners of Iowa has given its endorsement of the policy of the railroads in curtailing unnecessary passenger train service during the war, in an opinion reaching the conclusion that the Chicago Great Western should not be required to reinstate two passenger trains in each direction between Cedar Falls and Cedar Falls Junction, Ia., which were discontinued in April. The railroad had formerly operated four trains in each direction between the two points and a complaint regarding the reduction in service was filed by the Cedar Falls Commercial Club and the Iowa State Teachers' College. At the hearing it was shown that one of the trains discontinued during the year ending March 31, 1917, had carried an average of less than 10 passengers for each round trip and that the other had carried an average of about 12 passengers each round trip and that upon the whole service the earnings of the railroad did not equal the expense. There was also a showing that by reason of the discontinuance of the trains the International Harvester Company was unable to reach its patrons with express packages from its distributing plant at Cedar Falls with as much despatch as before and there was some showing that freight did not arrive at and was not taken away from Cedar Falls with the same promptness as before. It was also shown that service was available via the Illinois Central, the Chicago, Rock Island & Pacific, and the Waterloo, Cedar Falls & Northern. The commission says in its opinion:

"We recognize that the service given by the Chicago Great Western Railroad Company prior to the discontinuance of said trains was very convenient for the people of Cedar Falls. We think it would hardly be claimed that it was necessary, and the showing certainly is that the trains were not well patronized.

"In addition to these facts, this commission thinks it should so regulate and control the service to be furnished by railroad companies at this time as to avoid the expenditure of large sums of money either directly or indirectly simply for the convenience of a few people. This country is now at war and the railroads are absolutely necessary to the proper conduct of that war, and where the public safety and public necessity are not manifestly and eminently endangered, we cannot be expected to order the railroads to operate trains where their operation is a mere matter of convenience and not a matter of necessity. The railroads of this state must be permitted and encouraged to use their whole equipment, including their funds, to carry on what is now the supreme business of this country—the business of war—and to facilitate the distribution of food, fuel and other necessities of life. Mere matters of convenience, which are desirable in times of peace and for the purposes of peace, will have to wait until peace comes.

"The application is hereby dismissed."

THE G. T. R. PATRIOTIC ASSOCIATION contributed \$2,000 to the British Red Cross Fund, for which special contributions were raised throughout Canada during October.

The Work of the Army Engineer Corps

The Railway Section, an Important Part of the Corps,
Has Ordered \$70,000,000 Worth of Material to Date

THE Committee on Public Information has given out a statement outlining the work of the corps of engineers of the army during recent months which includes that of the railway section carried out under the direction of S. M. Felton, director general of railways.

The corps of engineers since April 6 has not only been supplying the engineer equipment for an army of a million men, but has undertaken the unprecedented task of furnishing railroads complete from the United States for operation in France. The engineers construct the free arteries through

have been raised as part of the National Army. Seventeen pioneer regiments have been authorized as part of the National Army and are rapidly organizing. National Guard units, equivalent to about 7 regiments, have been called into the federal service, and their reorganization into 17 pioneer engineer regiments for the 17 divisions of National Guard troops is well under way.

Engineer officers' training camps were established in each of the 16 training camp areas, the number of candidates for engineer commissions taken from each camp being 150.

This British Official Photograph Shows American Railway Engineers at Work on One of the Light Railways Behind the British Front

which flow great armies, reinforcements, supplies and ammunition to the extremities of the lines.

From March 1 to November 1 the corps of engineers increased its personnel from 256 officers on the active list to 394 officers and 14 retired officers on active duty and in addition has commissioned more than 5,000 reserve officers. The enlisted force has expanded from 2,100 to 95,000 and there has also been a heavy increase in civilian employees.

The enlisted strength of the corps on March 1 consisted of 3 engineer regiments of peace or minimum strength and 1 mounted company. On May 15, 4 remaining increments, authorized by the National Defense Act of June 3, 1916, increased the enlisted strength of the Corps of Engineers of the Regular Army to 7 regiments and 2 mounted battalions, all of which have been raised to war strength.

In addition, 9 railroad regiments and 1 forestry regiment

After a month's training in the same camps with candidates for commissions in other branches of the service, the engineer sections were transferred to three engineer training camps with special facilities for technical instruction, one in the vicinity of Washington, D. C., one at Fort Leavenworth, Kan., and one at Vancouver Barracks, Washington. Instruction was continued there for two months. In August, 1,900 candidates were graduated and now hold commissions. Large numbers of engineer graduates of training camps have been assigned to new regiments and special units are being organized and the training of enlisted men in the National Army will be largely under their supervision. A number are in France for special training.

On December 1 about 1,200 engineer reserve officers will be graduated from a second engineer officers' training camp.

A duty imposed upon the engineers has been the purchase of the necessary engineer equipment for more than one mil-

lion men. The Urgent Deficiencies Act, approved June 15, 1917, appropriated for the purpose amounts aggregating in excess of \$130,000,000, an amount comparable with the purchases of material, equipment and supplies for the Panama canal during the ten years of its construction. The Urgent Deficiencies Act, approved October 6, 1917, provides \$198,100,000 additional for engineer purposes, and it is expected that all of this will be expended during the present fiscal year.

In the work for the fiscal year 1916 one officer and 21 civilian employees were engaged in making purchases aggregating \$550,000. On November 1, 1917, the purchasing force had been increased over 1,000 per cent to 52 officers and 193 civilians. All but two of these officers were examined and commissioned in the Reserve Corps after the outbreak of the war.

Within 350 hours after the Engineer Corps, following the declaration of war, advertised for equipment, awards had been made covering the requirements of one million men, a total of 8,700,000 articles, which included among other items four miles of pontoon bridge. Approximately two months was the average time of delivery secured on all of this material.

On September 7, two weeks after receipt of instructions, equipment was en route to the various National Guard and National Army organizations at cantonments throughout the country. These shipments comprised a total of about 48,000,000 lb. in some 64,000 separate cases and packages.

By November 1 the outstanding obligations on orders placed for engineer material, equipment and supplies, aggregated \$130,000,000 and disbursements in payment for material delivered had reached the sum of \$15,000,000 per month. Another important task of the engineers has been to provide efficient methods for the receipt, storage and shipment abroad, with proper accounting system, for this mass of supplies as well as for the vast equipment for field operations and construction work.

This work comprehended the selection, in a short time, of appropriate sites in various cities, the leasing of land, storehouses, piers, railway tracks, and the purchase, when they could not be leased, of such material as locomotive cranes, electric trucks, and similar appliances for freight handling, together with the organization of competent personnel.

THE RAILWAY SECTION

The engineers of the Railway Section have undertaken to transport, and install and put into operation overseas, a complete railroad equipment. The railway problem in the theater of operations in France involves not only the organization, equipment and military training of railroad troops for the construction, maintenance and operation of standard and narrow gage roads necessary for the supply of our armies, but also the purchase, inspection and shipment of immense quantities of railroad equipment, rails, ties, locomotives, cars, shop tools, etc., necessary for the development of adequate port facilities, construction of new lines and their successful operation. The estimate of the situation in France was confirmed by the French Commission, headed by Marshal Joffre, and the means of meeting it have been carried on with intensity. The measures provided respond to the recommendations of the commission of expert railroad men which was sent abroad and reported in detail the transportation conditions that would confront our armies from the ports to the front.

Trained officials in various departments of American railroads were called upon for the officers, and experienced railroad employees for the enlisted men, of the nine railroad regiments, each of 33 officers and approximately 1,100 men. Three regiments were organized for operating rail-

roads, every class of operatives being provided; five regiments were organized for construction, officers being experienced railroad builders and the enlisted men being bridge-men, trackmen, etc., and one regiment was composed of men experienced in the departments of motive power and car repair.

The cost of materials ordered to date is approximately \$70,000,000, including some hundreds of locomotives, more than 100,000 tons of steel rails, more than 3,000 complete turnouts, 500,000 ties, 12,000 freight cars, 600 fill and ballast cars, 600 miles of telephone wire and apparatus, as well as vast quantities of construction and repair equipment.

An organization of engineers was prepared for the construction in France of piers, storehouses, terminal stations, hospitals, cantonments, roads, water supplies, sewage dis-

American Railway Engineers Preparing for Construction Work on a Light Railway System

posal plants, lighting plants and similar construction. A vast amount of timber and other supplies was purchased and shipping arrangements made. Within four days of the receipt of General Pershing's cablegram asking for certain steel buildings, designs had been prepared, competitive bids secured and orders placed for 30-day delivery. A construction company, contracted with to build wharf structures in France, sent abroad 225 men in August and the necessary material. Preferred attention was given to wharf and storehouse construction, at the request of General Pershing.

The engineers have also undertaken the work of organizing and equipping special troops for special services, such as lumber supply, road construction, sanitary construction, camouflage service, gas and flame service, mining work, mapping, etc.

Preferred attention has been given to the organization and equipment of the first forestry regiment, to be sent to France to produce lumber and timber from French forests. Three additional regiments are to be organized. The co-operation of the forestry service of the Department of Agriculture has been extended in the selection of personnel and equipment. About 80 per cent of the forestry regiment's equipment, value \$350,000, has been delivered for shipment, weighing over 2,000 tons, with 12 saw mills, truck and railway equipment and everything necessary to produce over four million board feet of finished lumber per month.

In addition to all of these duties the Engineer Corps has maintained its regular service in the preservation and improvement of navigable waters in the United States and construction of coast defenses. New batteries are being pushed to completion with energy.

Proposed Eastern Freight Rate Increase

Arguments Concluded and Case Submitted to Commission—Bankers Testify Regarding Railway Credit

WASHINGTON, November 19, 1917.

THE re-opened fifteen per cent rate case was submitted to the commission on November 19. At the same time George Stuart Patterson, counsel for the eastern roads, announced that as soon as possible the eastern carriers would file applications with the commission asking for another advance of 15 per cent in classes and commodities, except coal, coke and iron ore. As to them the request will be for specific advances of 10 cents a ton.

The hearing of the case took four days—a remarkable record in comparison with any other advanced rate case ever known. On November 15 the executives who had testified on November 5 returned for cross-examination, Messrs. Rea and Elliott being particularly selected for that ordeal at the hands of Clifford Thorne. On the next day the commission listened to Frank A. Vanderlip, president of the National City Bank and Paul Warburg, vice-governor of the Federal Reserve Board, who were called by the commission as experts to tell about the financial condition of the carriers. Their appearance made it necessary to put off the appearance of Clifford Thorne as a witness until the next day. His testimony was supplemented on behalf of the shippers by J. P. Norton, a stock and bond statistician. Thorne used the whole of Saturday and the arguments were put off until Monday, November 19.

The two sides were represented in the final arguments by George Stuart Patterson and Clifford Thorne. Commissioner Anderson, near the close of the arguments, asked them whether, disregarding the railroads' need of revenue to build up their credit with the investing public, the existing rates are high enough to enable the carriers to maintain themselves as going concerns capable of fulfilling their obligations as common carriers under the war strain.

"Absolutely, yes," said Thorne. "And you have no right to allow any advances for any purpose other than maintaining the properties of these carriers and paying the stockholders a reasonable return on their investment."

George Stuart Patterson was equally certain the present rates are not sufficient for that purpose.

"I am as absolutely certain as I am of my physical being, that the present rates are not high enough to maintain these properties," said he.

Throughout the hearing and argument ran the suggestion that the government should make loans to the railroads to buy equipment and extend their terminals. There was no enthusiasm on the part of either railroad men or shippers. The suggestion was made more often by a commissioner than by either party to the controversy. The only man who was strongly in favor of the plan was Benjamin C. Marsh who said he came from New York, as the representative of the American Committee on the High Cost of Living. He put forward government ownership as the panacea. If that could not be had he wanted the rate advances postponed until the valuation of the railroads is completed, so that, as he said, a proper basis for dividend paying and rates could be known.

President Rea admitted that the time had come for seriously considering some plan whereby the government would provide capital but he said that even if the government provided all the cars, locomotives and terminals needed to make an efficient plant the roads would still need more revenue for operations. He said the Pennsylvania is in exceptional financial condition but there are important roads in the eastern district that are in bad shape that are just as important to shippers as carriers in better position. He said the Altoona shops of the company are turning out 22 locomotives a month and in September they had made the record 30. Answering a question by Commissioner Clark, Mr. Rea said that 100,000 cars should be built. A government loan for that purpose would be favored by him if the cars were built on the car trust plan, but on more liberal terms than have yet been devised. Some railroad men, he said, believe that 100,000 cars "pitchforked" into the situation now would make it worse than it is, their contention being that the first need is locomotives.

Commissioner McChord wanted to know what could be done if the government provided the money for the equipment and terminals needed.

"Then the element of time would have to be considered," said Mr. Rea. Mr. Rea admitted the force of Mr. McChord's suggestion that money is not the only element and then followed with his declaration that even if the money was provided for all the additions usually charged to the

capital account, the carriers could not afford to forego their request for higher rates.

"How many cars would you buy if these advances were allowed?" asked Mr. Thorne.

"I can't tell," said Mr. Rea. He added that it is useless to place orders for cars or locomotives without first obtaining a priority of manufacture order because the builders are now working mostly on government account.

Answering a question by J. V. Norman, representing southern hardwood lumbermen, Mr. Rea said that the estimated increase in expenses of the Pennsylvania included war taxes. He thought the roads should be allowed to earn a fair return over war taxes but should not pass all the taxes on to the users of railroads.

Commissioner Clark raised a question as to the propriety of allowing an advance in rates to cover improvements, because, as he suggested, that would be equivalent to making a donation and then having the donors taxed to pay a fair return on the amount.

Howard Elliott was asked, when he took the stand, to point out what, if anything, is wrong in the commission's indictment of the financiering done by the former controllers of the New Haven. Mr. Elliott said that would be a long question and a long answer. He pointed out, however, that the capitalization of the road has been reduced \$12,000,000 since the report was written. Mr. Elliott gave a compilation of the figures showing the investment of the New Haven devoted to freight business to show that the existing rates do not pay the necessary return on investment.

MR. VANDERLIP'S TESTIMONY

"So long as railroads are regulated as to rates, they should have the advantages of the economies of combination," Frank A. Vanderlip, president of the National City Bank of New York, told the commission on November 16, responding to the invitation of the commission to address himself to the general financial situation as it affects railroads. Mr. Vanderlip said he believed regional consolidations of railroads should be permitted. The advance of 15 per cent in rates under consideration at present would, if granted, assist in restoring the willingness of the public to provide the carriers with new capital, said Mr. Vanderlip, but it will not be a cure for what he described as fundamental faults in the railroad situation.

"Before the situation is cured," said Mr. Vanderlip, "we will either go into the hands of the government or we will permit the railroads to consolidate. The railroads can learn something from the experience of the bankers. They have thought too much of their own problems and have not been thinking nationally. I should like to put representatives of the government on their boards of directors, representatives of labor and representatives of the public, after the fashion of the Federal Reserve Bank directorates."

Mr. Vanderlip said that the cure for the railroad problem should come from the commission, but that he had made his suggestions because the mere earnings of the roads do not appear to reflect accurately a situation the chief menace of which is the unwillingness of the public to purchase railroad stocks. He said that the railroads face government ownership unless the public can be convinced that railroad investment is desirable. None of the practical methods of obtaining money for the carriers is open, except at high rates of interest, he said. The roads need a billion dollars a year for improvements and extensions, in his opinion.

Mr. Vanderlip said the stocks of roads prudently constructed and managed should be slightly above par, as a reward for prudence. Commissioner McChord detailed the earnings of the carriers since 1912, indicating generally that these earnings have risen. Mr. Vanderlip said that while these earnings might indicate an increasing prosperity, market quotations of stocks indicated that the public is not satis-

fied with them and asserted that he preferred, as an index to value, the consensus exhibited in stock quotations to tables of expenses and earnings.

"The returns," said Mr. Vanderlip, "appear to indicate that roads are doing well, but investors do not think so."

Returning to fundamental changes which he believes are necessary, Mr. Vanderlip suggested the feasibility of a single corporation owning all the cars in the country. He said that fundamental changes must be made or government ownership lies ahead. He asserted that the railroads are not meeting demands for service and laid emphasis on the fact that service is more important than rates and that the public is willing, except an extremely selfish part of it, to pay for service when it is rendered.

Commissioner McChord asked if the decline of railroad stocks was due to a concerted assault by bankers.

"If you assume bankers have made a wholesale assault upon railroad securities, I deny it," said Mr. Vanderlip. Mr. McChord said that he had received messages at night concerning railroad stocks, but indicated that they had come from brokers. Mr. Vanderlip insisted upon a distinction between bankers and brokers and said that if banks were sending messages about the stock market to a member of the Interstate Commerce Commission at night the attention of the comptroller of the currency ought to be directed to them.

MR. WARBURG'S TESTIMONY

Paul Warburg, of the Federal Reserve Board, who also was invited by the commission to give its members his best judgment about the condition of railroad credit, said that every industry which contributes to the winning of the war should be encouraged and that foremost among those industries are the railroads. Index prices, he said, show an increase of about 100 per cent in wholesale prices since the beginning of the war. Higher interest rates and higher dividends are essential to attract the investing public. The investor is in doubt as to the future of railroads, the quantity of labor available and the price of material. Mr. Warburg said that the public was uncertain about whether the railroads would be dealt with generously.

In seeking an explanation of this statement, Commissioner Woolley said it seemed that the railroad situation was caught in a "vicious circle" if rates must be raised to meet higher wages and higher material prices and raised again as these quantities again advance. Mr. Warburg agreed that this "vicious circle" exists and suggested as a remedy that the government fix the wages of labor as it has fixed the price of materials.

Mr. Warburg said that the sale of railroad securities had become practically impossible and that he thought the roads should be permitted to obtain revenues which would enable them to keep their properties in as good condition as they were at the beginning of the war.

Discussing a suggestion that the railroads conserve their revenues by discontinuing the payment of dividends, Mr. Warburg asserted that such a policy would be fatal to railroad credit and that it would seriously affect the incomes of that large part of the public which owns railroad securities, and upon which the government depends for a large part of its war revenues. Railroad stocks have declined, on an average, about 20 per cent since the beginning of the war, said Mr. Warburg, and this decrease, together with the lessened value of railroad bonds, has brought about a shrinkage in values of about \$2,800,000,000. This is of serious interest to banks which hold about two billions of these securities as collateral for loans.

"Present conditions," said Mr. Warburg, "are such as to demand an increase in railroad revenues."

A desirable situation, he said, would be one in which the proportion of railroad stocks to bonds could be materially

increased, with the stocks quoted sufficiently above par to permit the flotation of new issues as rapidly as they might be required for extension and improvement of the roads. He pointed out that at present there are no new issues of railroad stocks and no market for them.

Mr. Warburg laid stress on the fact that these times are extraordinary, that many ordinary considerations have been waived in the fixing of prices by the government and that the principal consideration under war conditions is to attain results rather than to consider price. If, after the war, the commission finds that the revenues of the roads are too large, they can be reduced, said Mr. Warburg, who, in response to a question by Commissioner Meyer, said that he did not think the public is primarily interested in whether or not the railroads have built up from recent earnings a new equity on which dividends must be earned in the future.

At present, said Mr. Warburg, investors want to buy United States government bonds, exercising a preference that goes beyond the mere question of financial return. This makes more difficult the marketing of railroad securities. He expressed the opinion also that while the government is financing the war, industrial issues should be restricted as much as possible.

George W. Norris, of the federal Farm Loan Board, concluded the session by giving the commission the result of his experience in handling farm loan debentures and other securities, laying stress on the fact that many investors seek their investments because of considerations other than the promised financial return from them.

CLOSING ARGUMENTS

Arguments on November 19 were made in the following order: Mr. George Stuart Patterson for the railroads; C. H. Reynolds for the natural ice shippers of the Pocono hills; Graddy Cary of Louisville for the National Livestock Exchange; Walter E. McCormack for the interior Iowa packers; J. V. Norman for the southern hardwood lumber manufacturers; L. C. Boyle for the National Lumber Manufacturers' Association; C. D. Chamberlin for the independent petroleum refiners; Francis B. James for brick and tile manufacturers; Samuel H. Cowan for the Texas livestock growers; Clifford Thorne for the Iowa livestock men and farmers' grain elevators; B. C. Marsh for the cost of living committee, and Mr. Patterson in closing.

In the closing arguments the rate situation was overshadowed by the question of public policy raised by the suggestion of a government loan. In commenting on that phase the shippers suggested that Congress should deal with it. Chairman Hall asked Mr. Cowan whether he had spoken to Congress about the matter. Mr. Cowan said he had spoken with Senator Newlands and to shippers, and he found a considerable sentiment in favor of the proposal, if it could be shown that the railroads really need help. Mr. Thorne, naturally, both as a witness and as an attorney, said they do not need help; that the surplus accumulated in 1916 and 1917 should be used to meet the emergency. He filed a compilation showing that the surplus laid aside in the two years by the 38 eastern systems was \$147,000,000 in 1916, and \$145,000,000 in the year ended June 30 last. In the former year the dividend amounted to \$117,500,000, and last year to \$126,000,000.

ARGUMENT FOR THE CARRIERS

In concluding his argument for the carriers Mr. Patterson said that the relief granted by the commission earlier in the year amounted to \$97,000,000, and that the rates now under consideration would add \$58,000,000, or a total of \$155,000,000. This, however, would account for only a little more than half of the great rise in wages and materials, which had added \$278,000,000 to the operating costs. Mr. Patterson stated that, as a hearing would have to be had

on the further increases in rates necessary, application would be made by the Eastern carriers for permission to file tariffs making such further increases.

The essential facts of the situation, as recited by Mr. Patterson, were:

1. A continuous decline in net operating income, accompanied by a steadily increasing basis of cost of operation, and this in the face of increasing traffic, property investment, and in average car-load and train-load.

2. A decrease in both the supply and character of labor available for railroad operation, which is being daily intensified, and which will still further increase in the future the cost of operation.

3. The existence of deferred maintenance at a time when the highest standard known should be maintained, the further postponement of which will increase its cost, and decrease the operating efficiency of the railroads.

4. Inability to secure new capital by the issuance of stock, and the necessarily weakening effect upon the credit of the carriers.

5. Inability to make improvements imperatively demanded by the necessities of today and the traffic of the future.

Commenting on the rise in wages, which has already added more than \$100,000,000 to the payrolls of the Eastern carriers, Mr. Patterson said that these advances were still going on, the Pennsylvania Railroad alone having made increases in wages in the past month amounting to more than \$7,000,000 a year.

"As our armies increase into the millions," said Mr. Patterson, "and as the carriers are called upon to meet the competition of labor with industries whose prices are regulated or unregulated, or called upon to meet the competition of labor with the government itself, the available supply of labor will decrease, and its price will rise, and unless the government is prepared not only to conscript labor for the railroads, but also to limit its wage, we must assume that the present cost of labor, measured by wage and efficiency, will not decrease."

Mr. Patterson said that so far as it is humanly possible to look unto the future, there is no immediate prospect of any reduction in the cost of conducting transportation, and the cost of maintaining the railroad properties. He said that the increased cost of coal for locomotives is \$86,000,000 and that the price recently fixed by the government is higher than that now being paid by many of the carriers. The recent increase in wages to the miners would automatically increase the price to the carriers. The estimate of the carriers as to the average increase in the cost of materials other than coal is 42 per cent. Mr. Patterson cited the fact that the government price for pig iron, the products of which are largely consumed by the railroads, is 105 per cent above the average price paid in the five years before the war; that the government price of copper is 68 per cent higher, and the government price for coal 115 per cent above the pre-war level.

Particular emphasis was laid by Mr. Patterson upon the fact that the Eastern carriers are finding it increasingly difficult to provide for the upkeep of their properties. He stated that not only was the cost of labor and materials necessary for maintenance higher than ever before, but it was difficult to get the labor and materials, and this deferred maintenance was becoming a matter of very serious concern.

Mr. Patterson estimated that for the year 1917 the Eastern roads would show a loss of \$81,000,000 in net operating income, despite an increase of \$161,000,000 in total operating revenues. This would be a return on property investment of only 5.2 per cent, or less than the amount which the commission in 1914 found as being lower than demanded in the public interests. He said that the Baltimore & Ohio, without further relief in rates, would not earn its dividends; that the Pennsylvania would have a surplus for the year of only

1.6 per cent on its capital obligations; and that the New York Central would have a surplus of only 1.3 per cent after the payment of dividends.

Mr. Patterson said in conclusion:

"I have not said anything today as to the close and intimate relation which the question of increased rates bears to the successful prosecution of the war. That has been dealt with at length by Mr. Daniel Willard, of the Advisory Commission of the Council of National Defense, and by Mr. Paul Warburg, vice-governor of the Federal Reserve Board, who are far better able than I to speak on that question. They have told you in substance that increased railroad revenues are essential in aiding the government to the successful prosecution of the war. I may, however, say this in conclusion, and I desire to say it with all the earnestness that lies in my power, and to you who are so keen to do the right thing, the inadequacy of the revenues of the carriers has ceased to be a purely economic problem, and is today a vital question of the national defense."

MR. THORNE'S ARGUMENT

Mr. Thorne was very solemn in his argument. He invited the commissioners to consider the situation.

"The statement has been made that during the first year of the war the government will need twenty billions for war purposes," he said. "The income of the people of the United States is about forty billions, possibly more. Just think what that means. One half of every man's income, in one form or another, to be taken for war purposes.

"This is not the time for a combination of business men to come to Washington suggesting the imposition of still further burdens. They say this burden will be for the period of the war only. It is our bitter experience that rates go up but there is never a general reduction. In 1916, with a net \$100,000,000 greater than it had ever been were these railroads suggesting that they might reduce their rates?

"The United States government has already issued seven billions in securities. Last summer you gave these carriers \$100,000,000 additional revenue. Now they are asking for \$58,000,000 more. That is more than five per cent on a billion, in all the interest at five per cent on more than three billions.

"What is the limit of this never-ending cycle of higher costs and higher rates?

"Can these railroads be seriously and respectfully asking for advances because they cannot maintain their properties? Can the New York Central, which earned 15 per cent on its capital stock tell you that it cannot maintain its properties? Can the Pennsylvania be serious in making such an assertion in the face of its surplus of \$30,000,000 for the year ending last June? In the year ending June 30 last these carriers declared dividends amounting to \$126,095,909 and laid aside a surplus of \$145,009,363."

Thorne said there are several courses, other than raising rates, that could be followed, if the railroads were really in a serious condition. One of them is the loaning of money to buy equipment and terminals, to be repaid from earnings.

"Are present rates such as to keep the railroads in such a condition that their stocks would be good for prudent investors?" asked Commissioner Anderson, who had asked that Thorne disregard the question of credit. "Absolutely, yes," said Mr. Thorne. "You have no power to grant advances for anything other than a reasonable return and the proper maintenance of the property. You have no authority to give advances to create a surplus from which betterments and extensions are to be made. The surplus, in theory, is for non-revenue producing improvements, such as stations and grade eliminations."

Mr. Patterson's closing argument was a reiteration of his prior assertions on disputed points and the additional de-

claration that the advances asked in this case, even if granted, will not be enough, on account of the rising costs.

"Then the sky's the limit for rates," suggested Mr. McChord.

"They certainly must go up to meet rising costs," retorted Mr. Patterson.

WILLARD CHAIRMAN OF WAR INDUSTRIES BOARD

Daniel Willard, president of the Baltimore & Ohio, has been appointed by President Wilson as chairman of the War Industries Board of the Council of National Defense, succeeding Frank A. Scott, who resigned recently on account of ill-health. Mr. Willard has been chairman of the Advisory Commission of the Council of National Defense, which position he will retain. The War Industries Board was created to act as a clearing house for the war industry needs of the government, and has to deal with the important problems pertaining to the means and methods of increasing production, the sequence and relative urgency of the needs of the different government services, price factors and the general questions affecting the purchase of commodities, including the industrial and labor aspects of the problems involved. Since Mr. Scott's resignation, Judge Robert S. Lovett, who is a member of the War Industries Board, has been acting as chairman. In a statement regarding Mr. Willard's appointment, Secretary of War Baker, chairman of the Council of National Defense said:

"With the outbreak of the war, Mr. Willard was among the patriotic men who quickly volunteered their services to the government. Since that time he has unselfishly devoted his energies to the work of the Council of National Defense.

"In appointing Mr. Willard to the chairmanship of the War Industries Board the President brings to its activities the services of one who already has familiarized himself, to a large extent, with the task ahead of the board, and likewise has a general knowledge of the relations between industry and the war administration. He is an executive of well established reputation, and his selection was made in the interest of the continued efficiency and usefulness of the War Industries Board. Mr. Willard will enter upon his new duties immediately."

BIG JAPANESE PIER COMPLETED.—The reconstruction of the Yokohama Pier, which has been in progress for the past six years, has been completed. The pier is now 1,200 ft. long and 138 ft. wide, and the depth, alongside, which was formerly only 26 ft. at low water of spring tides, has been increased to 35 ft., providing adequate accommodation for the largest steamers engaged in the Pacific passenger trade. Two large double-storied sheds have been provided.

TRAVELING IN ENGLAND MUST BE ABSOLUTE NECESSITY.—Replying to a deputation from the United Kingdom Commercial Travelers' Association, on October 23, Mr. Wardle said that the difficulties of the railway companies were greater than they were at the beginning of the year. Many more than 500 locomotives had been sent abroad for the purposes of the war, and some thousands were awaiting repairs here, which could not be undertaken owing to scarcity of men and shortage of materials. There had been over 160,000 men released by the railway companies for military service. Although the train services had been considerably reduced a greatly-increased traffic is being dealt with by the companies. The government would be most reluctant to place any further restrictions on traveling by railway, but the ever increasing demands on the railways may make such a step necessary unless the public willingly refrain from using the railways except in cases of absolute necessity.—*The Engineer*, London.

Street Elevation of the Northern Pacific-Great Northern Station.

Terminal Developments at Vancouver, B. C.

New Great Northern-Northern Pacific Station Completed, Canadian Northern Facilities Under Construction

WITH the completion of the Canadian Northern passenger station, upon which work was started recently at Vancouver, B. C., that city will be unusually well supplied with modern passenger terminals. The Canadian Pacific occupies a terminal completed only four years ago, while the Great Northern and the Northern Pacific have only recently commenced running trains into their new station. The newly completed freight and passenger terminal of the Great Northern and the Northern Pacific and the proposed terminal of the Canadian Northern are entirely independent projects so far as ownership, construction or operation are concerned, although the sites are adjacent and the negotiations involved in their acquisition were more or less interdependent. The layouts also bear a striking resemblance.

The new facilities center about False creek, a shallow arm of the Strait of Georgia, in the southeastern part of the city of Vancouver. The original railroad to locate in this vicinity was the Vancouver, Westminster & Yukon, which acquired a right of way on the south side of False creek on which it built a line extending westward across Main street and thence north over a trestle to a terminal fronting on Pender street.

In 1911 the Great Northern as owner of the Vancouver, Victoria & Eastern Railway & Navigation Company, the successor to the Vancouver, Westminster & Yukon, concluded an agreement with the city of Vancouver by which it obtained the title to a U-shaped area around the edges of False creek, east of Main street, leaving a basin in the center about 1,600 ft. wide and 4,500 ft. long that was reserved as public property to be developed as a basin for dock purposes. To fulfill this agreement the railroad was compelled to spend \$2,500,000 for the acquisition of riparian rights from property owners around the basin, in addition it spent considerable sums in purchasing lots to secure the necessary street frontage for terminal development. The filling of the area to permit its use for railroad purposes also involved a large expenditure. Subsequent to the conclusion of this agreement the Great Northern sold a half interest in a portion of the property on the north side of False creek to the Northern Pacific and beginning January 1, 1918, the Northern Pacific will use the Great Northern (V. V. & E.) tracks from Sumas, about 60 miles southeast. The Canadian Northern also operates over these tracks under trackage rights from New Westminster to Vancouver, a distance of 12 miles.

In 1913, after the work on the Great Northern and the

Northern Pacific terminal was well under way, the Canadian Northern, seeking an adequate terminal for its Pacific Coast extension in Vancouver, entered into an agreement with the city whereby it secured title to the basin surrounded by the V. V. & E. property. This made an area of 162 acres of which 127 acres were available for terminal development, the remainder being reserved for a public street and for several small park sites. In addition to filling the area for its own and the city's use, the railroad was required to extend the fill 150 ft. west of Main street to a sea wall which it was also required to construct. This feature of the project entailed an expenditure of \$750,000 for the release of riparian rights. The agreement between the city and the Canadian Northern was founded on a plan of the Vancouver Harbor Commission, contemplating the future construction of a public railroad connecting the two new railway terminals with a public dock, to be located on the Kitsilano Indian Reservation. However, this project has not yet passed beyond the preliminary stages.

THE VANCOUVER, VICTORIA & EASTERN TERMINAL

The Vancouver, Victoria & Eastern terminal plan contemplates the ultimate development of the entire U-shaped area, but the improvements made thus far are restricted to the north side of the "U" with frontage on Park lane and Prior street, except for a locomotive terminal in the extreme southeast angle. The terminal as built provides a new union passenger station and coach yard, separate freight houses for the Great Northern and the Northern Pacific and a joint team yard. Each unit is designed to allow for material extension in the future and space is provided along the north side of the property for tracks to serve possible industries located along Prior street.

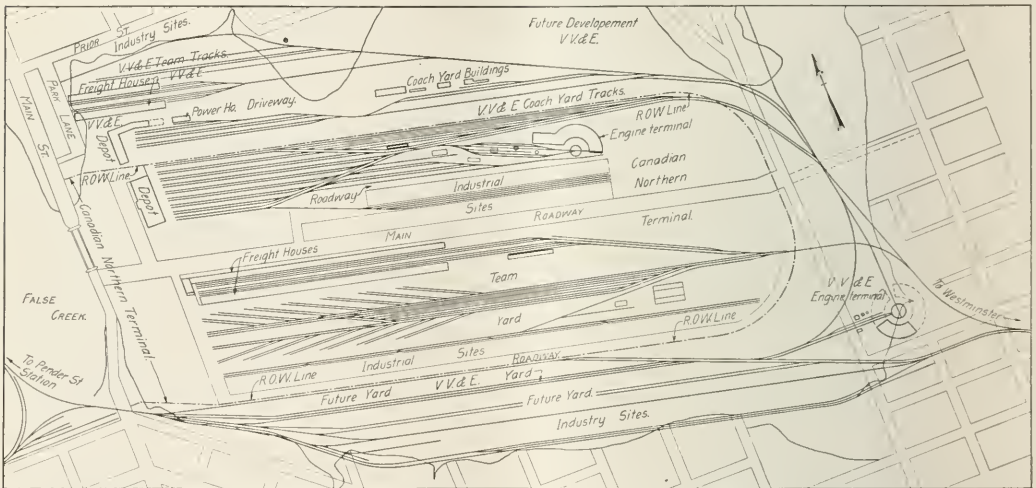

The passenger station occupies the south side of this portion of the property, with two main tracks leading to six station tracks and two coach cleaning and storage tracks. The future development contemplates moving the main tracks further to the south, thereby permitting the addition of five more station tracks and five additional coach yard tracks. The station tracks are arranged in pairs, spaced 12 ft. 6 in. center to center, with platform 20 ft. wide between each pair.

The station building is shaped like an L, the main building being located at the end of the station tracks, while the baggage, express and mail facilities are in a smaller wing alongside the northernmost track. The main building con-

sists of a central portion containing the waiting room 100 ft. by 60 ft., with the auxiliary facilities contained in symmetrical wings on either side. Entrance to the main waiting room is afforded by duplicate doors at each end of the street side, each of which is protected by a suitable marquis. Similar doors directly opposite, in the east wall of the waiting room, lead to the train concourse. The ticket office occupies the center of the east or track side of the waiting room. A woman's rest room and a smoking room together with toilet accommodations are located in the south wing of the building. Behind these is the immigrant waiting room, with a separate corridor leading to the train concourse and a separate street door in the south end of the building. The north wing contains a parcel and news stand, an exhibit room, a stationmaster's office and the checking counter for the baggage room. The main waiting room occupies the full height of the central portion of the building, but the two wings are arranged with second floors that are occupied as local offices by the Great Northern and the Northern Pacific.

The exterior treatment is a red brick above a granite base

minal. They are located on opposite sides of a grid of 6 house tracks, each house having its own driveway on the side opposite the tracks. These houses are 50 ft. wide and 600 ft. long but space is available for an ultimate extension to a maximum of 1,700 ft. A two-story portion at the west end of each of these buildings fronting on Park lane is used for office purposes. The remaining portions of the houses are divided equally into two sections by transverse fire walls, one section serving for bonded freight and the other for free goods. The storage portions of the freight houses have timber roof trusses spaced 22 ft. center to center and spanning the full 50 ft. The entire wall space between columns along the track sides of the storage portions of the freight houses is enclosed by steel roller doors; two to each 22-ft. bay, with windows and wooden sheathing in the space above the doors. The team side has one door 10 ft. wide and 9 ft. high in each bay. The freight house floors are of timber on earth filling, it being the intention to replace these floors with more permanent construction after the filling has had an opportunity to settle. The office portions of the freight houses are of ordinary brick construction with

The False Creek Improvements Showing Present Development of the Vancouver, Victoria & Eastern Terminals and the Ultimate Plan of the Canadian Northern

and a terra cotta dado. Extensive use is also made of terra cotta for the trim. The main waiting room is paneled in Alaskan marble and a cast plaster ceiling. All of the floors in the building are finished with terrazzo tile.

The wing north of the tracks has a width of 42 ft. and a length of 228 ft. Commencing at the west end it is occupied in turn by a baggage room 97 ft. long divided equally between general baggage and bonded baggage, a mail room 48 ft. 6 in. long and two express rooms having a combined length of 81 ft.

The main building has a reinforced concrete frame supporting reinforced concrete floors. The walls are of brick, terra cotta and hollow tile. The longitudinal wing is of ordinary brick wall construction. Owing to the fact that the structure stands on filled ground it was necessary to support it entirely on piles capped with concrete pedestals which carry the system of reinforced concrete girders that support the walls and floors.

THE FREIGHT HOUSES

Duplicate freight houses are provided for the Great Northern and the Northern Pacific, north of the passenger ter-

wooden floors. As in the case of the passenger station the freight houses are supported entirely on pile foundations.

A power plant for heating the terminal buildings is located east of the baggage building. It contains two 125-hp. return tubular boilers with space for a third boiler. The steam pipes for heating the passenger station are conducted through a 6-ft. by 6-ft. pipe tunnel.

As a large part of the area occupied by the terminals was submerged and most of the rest of it was only slightly above tide level, 2,600,000 cu. yd. of filling was required, most of which came from a pit at Sapperton, 10 miles away. A small portion of the material was secured in excavating the cut required to depress the tracks through Grand View, a section of Vancouver southeast of the terminal. The latter project involved eight street viaducts over the track, three of which were steel structures and five timber structures.

Except for a small portion done by the operating department of the Great Northern, the filling was done by A. Guthrie & Co., of St. Paul, Minn., and Portland, Ore., who used two Marion 80-ton steam shovels and 40 Kilbourne & Jacobs air-dump cars of 16-cu. yd. capacity which were operated in trains of 16 cars each. All of the terminal

buildings were built under contract by Grant Smith & Co., and McDonnell, Ltd. Fred L. Townley of Vancouver was the architect. The entire terminal project was under the direction of A. H. Hogeland, chief engineer of the Great

the area not far from the Great Northern station. The plans provide for a building 321 ft. in frontage with a depth of 105 ft. at the head of a group of 16 station tracks. The design of the building is symmetrical, with a waiting room

Train Sheds of the New Union Station

Northern, O. S. Bowen, principal assistant engineer at Seattle, and E. B. Ford, engineer in charge.

THE CANADIAN NORTHERN TERMINAL

The map shows the proposed ultimate development of the Canadian Northern terminal in the basin area of False creek. The filling of the submerged land involved over 5,000,000 cu. yd. of material a large portion of which has been completed. A large sewer has also been constructed

148 ft. by 48 ft. located in the center, supported by wings on either hand containing all the necessary auxiliary facilities. Two upper floors in the wings will accommodate general offices of the railroad, but the central waiting room will have a lofty ceiling extending the full height of the structure. A passenger concourse will occupy the space between the station building and the track platforms. The plans contemplate the use of high grade materials for both interior and exterior treatment, using material originating in

The Main Waiting Room, Northern Pacific-Great Northern Terminal

to drain the terminal property and intercept city sewers which hitherto drained into the basin. The sea wall west of Main street is nearly finished and the outbound freight house, 800 ft. long, has been completed. The contract for the passenger station has been awarded to the Northern Construction Company and Carter, Halls & Aldinger and will be completed early in 1918.

The passenger station is located in the northern half of

British Columbia as far as possible. The estimated cost of the passenger station is \$1,000,000. East of the station tracks the plan provides for a coach yard and passenger engine terminal.

The freight terminal occupies the center of the terminal area with a team yard in the southern portion. The freight house layout consists of an office building 100 ft. by 50 ft. and two freight warehouses,—an inbound freight house 50

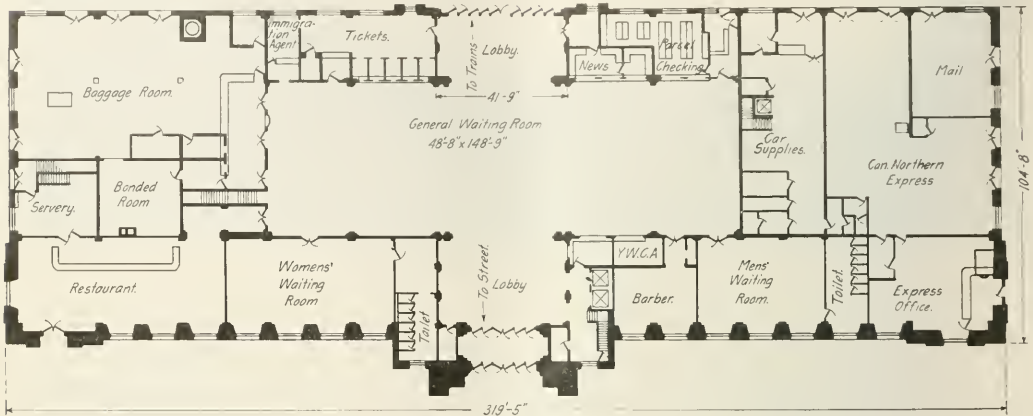

ft. wide and an outbound freight house 40 ft. wide,—with provision for an ultimate length of 1,600 ft. for each house. The freight houses are to be served by six house tracks, arranged in groups of three with a transfer platform in the center.

A section of the outbound freight house, 40 ft. by 800 ft.,

custom's office near the center and accommodations for the clerks and truckers at the west end of the building.

CONSTRUCTION DETAILS

The terminal area required filling to an average depth of 15 ft. The bed of the basin on which this filling was placed

Plan of the Canadian Northern Station

has been completed. This has a steel frame with steel roof trusses supporting wooden purlins which carry a 2 in. plank roof finished with tar and gravel roofing. The floors are of heavy timber construction. Along the track side of the building the doors are continuous, but on the team side they occur only in each alternate 16-ft. bay. Along the entire length of the building above the door head, continuous glazed

consists of a layer of mud and under this a layer of clay, sand and gravel, overlaying hardpan. The two strata varied in thickness but had an average combined depth of about 25 ft. The fill was placed by the hydraulic method with a dredge excavating in False creek west of Main street. The output averaged about 99,000 cu. yd. per month.

The sewer formed an important part of the preliminary

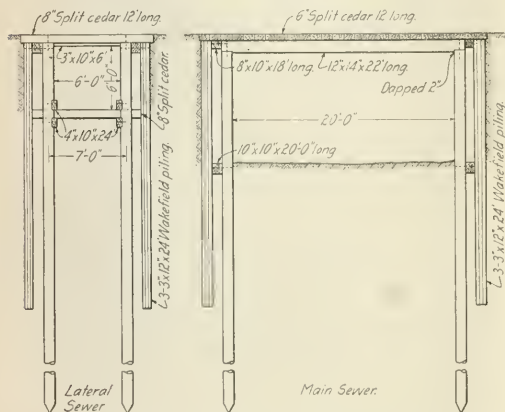

Plan of the New Union Station

transom lights are provided, while the wall portions consist of 7/8-in. sheathing on both sides of the studding, covered on the outside with corrugated iron. Three 13-in. brick fire walls divide the house into four compartments. A cold storage room is located at the east end of the building, a

work. It consists of a main sewer 20 ft. by 18 ft., 4,400 ft. long with laterals of smaller size having an aggregate length of 6,600 ft. Owing to the soft foundation and the presence of the fresh filling material, it was concluded to be unwise to use anything but timber construction for the

sewer, it being the intention to replace this with a more permanent form of construction when the timber sewer requires renewal because of the action of decay or marine borers. The details of the main and lateral sewers are shown in the sketch. The sides consist of Wakefield sheet piling composed of 3-ply, 3-in. by 12-in. timbers with a roof consisting of 6 in. split cedar spanning longitudinally across 12-in. by 14-in. beams supported at intervals of 6 ft. on two rows of piles driven just inside of the sheet piling. The construction of the lateral sewer is somewhat simpler. The roofs of the sewers were left off until they were completed so that they could be cleaned out by means of a clam shell bucket to remove sediment deposited by the return flow of the water from the hydraulic filling. All buildings constructed in the terminal area will be placed on pile foundations, 2,500 piles being required for the passenger station structure alone.

One of the most interesting features of the work is the sea wall west of Main street. This consists of a dock formed by a reinforced concrete slab having a total length of 1,045 ft. This slab is supported along the water side

Section of Canadian Northern Sewers

on a longitudinal concrete girder carried on a row of reinforced concrete piles. Along the land-side, the slab is supported on the top of a reinforced concrete retaining wall of the counterfort type. The wall is protected along the water edge by a fender consisting of a heavy timber supported on a row of creosoted piling. The counterfort retaining wall is on timber pile foundation. The construction of this wall entailed the use of 4,800 cu. yd. of concrete, 407,000 lb. of reinforcing steel, 535 concrete piles of a total length of 12,015 ft. and 13,200 lin. ft. of creosoted piles.

The Canadian Northern terminal work at Vancouver is under the general direction of M. H. MacLeod, general manager and chief engineer, Winnipeg, Man., with H. A. Dixon, division engineer, Vancouver, in direct charge. Pratt & Ross of Winnipeg and Vancouver are the architects for all of the buildings. McDonald, Nettleson & Bruce were the contractors for the freight house, A. G. Creelman was the contractor for the sea wall and the Pacific Dredging Company did the hydraulic filling. The sewer work was done by the Canadian Northern Construction Company.

SPECIAL WAR COURSES AT CORNELL.—The College of Civil Engineering of Cornell University is offering six special war courses, two of which are on Military Transportation and Military Construction.

A SECTIONAL MANGANESE CROSSING

Manganese construction has been used in crossings subjected to heavy traffic for a sufficient length of time to demonstrate the high resistance of this metal to wear and its economy under ordinary conditions. Where difficulty has been encountered it has in nearly all cases been from breakage which usually starts at the intersection of the flange-ways. This difficulty has been recognized in the development of a new design of crossing by Stephen Balkwill, of

Plan and Sections of an Articulated Crossing

the Balkwill Manganese Crossing Company, Cleveland, Ohio, which is manufactured under license by the Pettibone-Mulliken Company, Chicago. This type of crossing is built in eight sections with the joints along its lines of heaviest stress and ultimate breakage in the flange-ways. With this construction the sections are free to move slightly with reference to each other under traffic and the stresses encountered in crossings of solid construction are avoided.

The crossing consists of four side pieces each of which

Crossing of the Erie and Pennsylvania Lines at Cleveland

forms a tread, flange-way and guard rail of one of the four sides of the crossing as well as the guard rails of two of the exterior arms. There are also four corner pieces which form the tread portions of the exterior arms. These eight parts are held in place by bolts with the addition of knees to connect the side sections at the corners. The joints between the four side sections are mitred and terminate in the flange-

way at the groove intersections while the joint between the two parts forming each exterior arm is in the flange-way. The main advantage of this type of crossing is that it allows a certain amount of flexibility at the corners and that, since the joints occur at these points, opportunity for cracks is eliminated. Because of the smaller unit in which the manganese is cast it is possible to secure sounder and more thoroughly treated castings; and the wings are so designed that a rigid connection may be made with the running rails without need for a separate splice bar of any kind.

Crossings of this type have been in service at a number of points for intervals up to two and one half years. One of the earliest installations was in the crossing of the New York Central main line and a branch of the Baltimore & Ohio carrying heavy ore and coal traffic at Painesville, Ohio, which has been in the track for more than two years. Based upon the service of this original crossing another one was installed in the New York Central east bound high speed track at the same point about three months ago. A crossing of this type has been in track at the intersection of the Hocking Valley and the Baltimore & Ohio at Fostoria, Ohio, since November, 1916. Others are in service at crossings of the Erie and the Pennsylvania at Cleveland, the Illinois Central and the Chicago & Western Indiana at Chicago, the St. Charles Air Line with the Rock Island and the New York Central at Chicago, the Elgin, Joliet & Eastern and the Chicago, Milwaukee & St. Paul at Spaulding, Ill., and at crossings of the Rock Island with the Santa Fe and the Alton at Joliet.

TRUCK LEVER TYPE SLACK ADJUSTER FOR FREIGHT CARS

A description of an automatic slack adjuster for freight cars which was developed by the Gould Coupler Company, New York, appeared in the *Daily Railway Age Gazette* of June 14, 1916, page 1263. This slack adjuster replaced the push rod in the truck brake rigging, performing the functions of the latter, as well as that of the slack adjuster. The function of the push rod was performed by two members, one

members on the release of the brakes to maintain a constant clearance between the brake shoes and the wheels.

The drawing shows the application of the same principle in a device, since developed by the Gould Coupler Company, which has been materially altered and much simplified in construction. The slack adjuster proper is attached directly to the lower end of the live lever and through it passes the

Details of the Slack Adjuster

push rod which in this case is in one piece. The friction sleeve is mounted directly on the push rod and the adjusting rod employed in the original device has been replaced by an adjusting bracket attached to the live lever at the same location, but provided with a housing at the other end which slides on the push rod and contains the friction clamp.

The operation of the slack adjuster may be made clear by referring to the sectional drawing showing the arrangement of the details. It will be seen that the slack adjuster body A, containing four clamping dogs K is mounted on the push rod C, the lower end of the live lever G being connected directly to the body A. The spring L normally holds the dogs K in an oblique position in which they grip the push rod and prevent any movement of the adjuster along the rod toward the right. The friction clamp sleeve D may be moved along the push rod, but considerable pressure is required to move it.

Universal Truck Lever Type Automatic Slack Adjuster

of which telescoped within the other. In the barrel, or hollow member, was a pocket containing two friction grip dogs through which passed the solid, or push rod member, the normal position of the dogs at an angle of four or five degrees from a line at right angles to the center line of the push rod preventing the latter from telescoping, but permitting its movement freely in the other direction to lengthen the connection between the lower ends of the live and dead levers. An adjusting rod attached to the brake beam, fulcrum pin of the live lever, provided with a friction sleeve operating between two lugs on the side of the barrel member of the slack adjuster, automatically caused the lengthening of the push rod

The device as shown in the drawing is in release position. An application of the brake causes the upper end of live lever G to move to the left, carrying with it its brake beam and brake shoes until the latter bear against the wheel treads. Further movement then causes the push rod C to be moved to the right, applying the brake shoes to the other pair of wheels. The distance H between the friction clamp and the right hand shoulder of the adjusting bracket B is just sufficient to permit the angular movement of the live lever relative to the push rod required to take up the normal amount of clearance between the brake shoes and the wheel treads.

Any increase in this clearance due to brake shoe wear

causes the shoulder of the adjusting bracket to move the friction clamp along the push rod toward the left. On the release of the brake, the parts again assume the position shown in the drawing, the left hand shoulder of the adjusting bracket striking the friction clamp *D* and, if the latter has been moved to the left in the preceding brake application, causing the push rod *C* to move to the right through the slack adjuster jaw by the same amount. The slack will thus be taken up and only a normal amount of movement of the parts will take place at the next application of the air brake.

When the brake shoes are renewed it becomes necessary to let out the slack. To do this, the release handle *F* is first moved to the right, thus unlocking the dogs *K* and permitting the push rod *C* to move to the left. The friction clamp *D* is forced to the right until it strikes the right hand jaw of the adjusting bracket, this operation being repeated until the brake beams are far enough off the wheel to renew the brake shoes. The proper adjustment of brake shoe clearance will automatically be effected on the first application of the brake.

TRAIN ACCIDENTS IN OCTOBER

The following is a list of the most notable train accidents that occurred on the railways of the United States in the month of October, 1917:

Collisions					
Date	Road	Place	Kind of accident	Kind of train	Kil'd Inj'd
8.	N.Y.C. & St.L.	Dunkirk	xc	F. & F.	1 2
8.	Pennsylvania	New Galilee	bc	P. & F.	1 9
17.	Piedmont & N.	Spartanburg	rc	P. & P.	3 43
19.	Cumb. Valley	Winchester	bc	P. & F.	1 1
21.	Southern	Larmond	xc	P. & P.	2 0
28.	Balt. & Ohio	Elsmere	rc	F. & F.	2 0

Derailments					
Date	Road	Place	Cause of derailment	Kind of train	Kil'd Inj'd
3.	Wabash	Toledo	b. rail	P.	0 7
5.	Central Vermont	Williamstown	unx	F.	0 3
11.	Pennsylvania	Horseshoe Curve	d. eq.	F.	0 0
13.	Phil. & Reading	Joanna	unx	P.	1 1
23.	Central Ga.	Sidney	unx	P.	1 3
23.	Chicago & N. W.	Northfield	acc. obst.	P.	2 0
*27.	Kansas C. Sou.	Nederland	unx	F.	0 0
28.	St. Louis S. F.	Brush Creek	unx	F.	0 12
31.	Wabash	Ballou	b. rail	P.	0 17
31.	Central Ga.	Juniper	b. rail	P.	0 34

Other Accidents					
Date	Road	Place	Cause of accident	Kind of train	Kil'd Inj'd
16.	Atchison, T. & S. F.	Orsa, Col.	boiler fire	F.	3 1
*28.	Erie	Kathbone	fire	P.

The trains in collision at Dunkirk, N. Y., on the night of the 8th, were a northbound freight of the New York Central and an eastbound freight of the New York, Chicago & St.

Louis. The New York Central engine was ditched and the track of the Pennsylvania Railroad was obstructed. The engineman, fireman, and one brakeman were injured, the brakeman fatally. The New York Central train had approached the crossing at uncontrollable speed, the engineman having evidently misjudged the distance in which he could bring the train to a stop.

The trains in collision on the Pennsylvania Lines at New Galilee, Pa., on the 8th, were eastbound passenger No. 2, the Pennsylvania Limited, and a westbound freight. Both of the engines, the leading car in the passenger train and seven cars in the freight train were badly damaged. One trainman was fatally injured and six employees and three passengers were slightly injured. The freight train was moving westward on the eastbound freight track, under manual block-system regulations; but the signalman at the west end of the block neglected to protect the movement and erroneously set up the interlocking so as to divert the passenger train from the eastbound passenger track to the eastbound freight track.

The trains in collision on the Piedmont & Northern near Spartanburg, S. C., on the evening of the 17th, were a northbound passenger, consisting of three electric cars, and a following worktrain drawn by a steam locomotive. Both trains were crowded with passengers, mostly soldiers from Camp Wadsworth. The electric train had been stopped by reason of some trouble with or failure of the electric current, and, it is said, there were no tail lights displayed. Two civilians and one soldier were killed and 43 persons were injured. One of the killed was riding on the pilot of the engine of the worktrain, this because of the crowded condition of the cars. The engineman of the worktrain was arrested by the military police.

The trains in collision at Winchester, Va., on the night of the 19th, were a southbound passenger and a northbound freight which was switching and which fouled the main track. The locomotive of the passenger train was ditched and the fireman was killed. The engineman was slightly injured. The cause of the collision appears to have been the carelessness of the runner of the freight engine, who

*Abbreviations and marks used in Accident List:

re, Rear collision—bc, Butting collision—xc, Other collisions—b, Broken—d, Defective—unf, Unforeseen obstruction—unx, Unexplained—derail, Open derailing switch—ms, Misplaced switch—acc, obst., Accidental obstruction—malice, Malicious obstruction of track, etc.—boiler, Explosion of locomotive on road—fire, Cars burned while running—P, or Pass., Passenger train—F, or Fr., Freight train (including empty engines, work trains, etc.)—Asterisk, Wreck wholly or partly destroyed by fire—Dagger, One or more passengers killed.

Railroad Puts an End to Marching. It Used to Be "Fall In," and Then a Long Weary March to the Trenches. But Now It Is "At Ease" and the Tommies Tumble on the Trains and Are Carried to the Front Lines

said that he thought he was fouling, not the main track, but another one, parallel to it.

The trains in collision at Larmond, Va., on the 21st, were both southbound passenger, a local train on a side track moving toward the main line striking the side of an express train which was passing at full speed. The engineman and fireman of the express were fatally injured.

The train derailed near Toledo, Ohio, on the night of the third, was eastbound passenger No. 58. The engine and first three cars were ditched and 7 passengers were injured. The cause of the derailment was a broken rail.

The train derailed near Williamstown, Vt., on the 5th was a southbound local passenger. One car was overturned and two passengers and one trainman were injured.

The train derailed on the Pennsylvania Railroad at the Horseshoe Curve, near Gallitzin, Pa., on the 11th, was an eastbound freight. The locomotive and 14 loaded cars were wrecked and four main tracks were blocked. The derailment was caused by the spring equalizer between No. 1 and No. 2 driving wheels, right side of engine, interfering with guide yoke bolt.

The train derailed near Joanna, Pa., on the 13th, was a northbound passenger. The locomotive was overturned and the engineman was killed. The fireman was injured.

The train derailed near Sidney, Ga., on the 23rd, was northbound passenger No. 13. While running at about 25 miles an hour the locomotive ran off the track and was overturned, and the engineman was killed. The fireman and two other trainmen were injured.

The train derailed at Northfield, Ill., on the 23rd, was southbound passenger No. 102. The engine was overturned and the smoking car was ditched. The engineman and fireman were killed. The derailment was caused by something on the engine dropping down and catching a road

crossing plank, which plank was carried along to an adjacent switch, wedging in the point of the switch in such a manner as to cause the derailment of the engine and the six following cars.

The train derailed near Nederland, Tex., on the 27th, was southbound freight No. 51. Ten cars in the middle of the train were derailed; seven of them contained oil and the wreck took fire, presumably from friction of metals, and the derailed cars were ruined. The cause of the derailment was not determined; but the train is believed to have been running at excessive speed.

The train derailed at Brush Creek, Mo., on the 28th, was an eastbound special carrying soldiers. Five cars fell down a bank and twelve passengers were injured, none seriously.

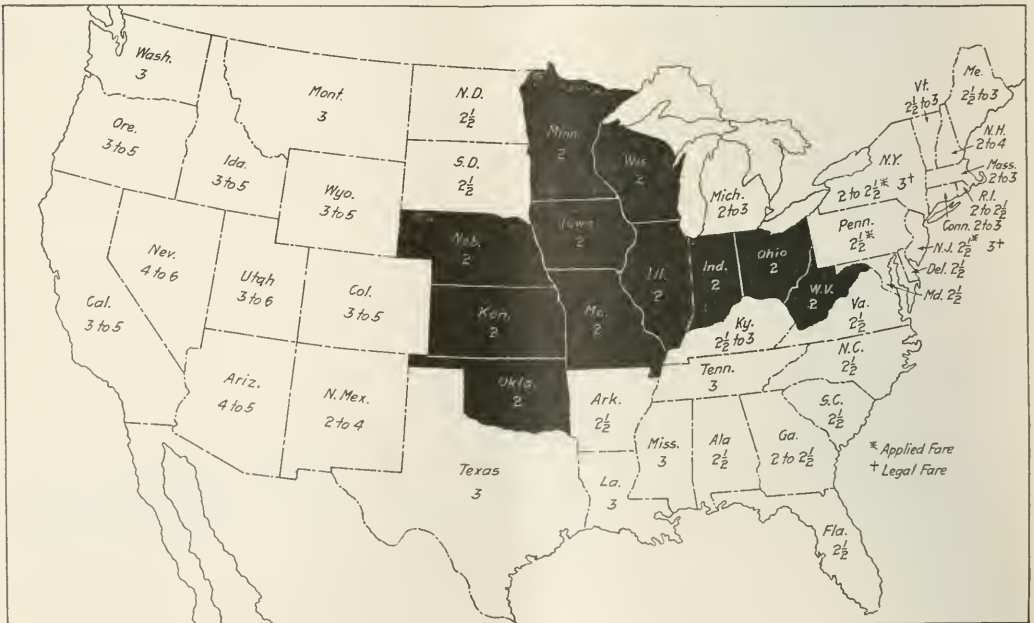

The train derailed near Ballou, Ill., on the 31st, was southbound passenger No. 11. Fifteen passengers and two trainmen were injured. The cause of the derailment was a broken rail.

The train derailed at Juniper, Ga., on the night of the 31st, was eastbound passenger No. 4. Three passenger cars were overturned and 34 passengers were injured. The cause of the derailment was a broken rail.

The train involved in the accident near Orsa, Col., on the 16th, was an eastbound freight. The locomotive was wrecked by the explosion of its boiler. Three employees were killed and one was injured. The cause of the explosion was low water.

The train involved in the accident near Rathbone, N. Y., on the 28th about 3 a. m., was an eastbound special passenger carrying troops. Fire, originating in a cook car, destroyed that car and one sleeping car together with some of the passengers' baggage. The flames spread rapidly and some of the passengers are said to have jumped out of the windows. The loss of property was estimated at \$60,000.

•• •• •• ••

Slacker States

This map, which was prepared by the American Association of Passenger Traffic Managers at the suggestion of Frank Trumbull, chairman of the Railway Executives Advisory Committee, shows the passenger fares per mile permitted by each state on intrastate business. We have called the area shown in black slacker states; they are putting the burden of unprofitable passenger service on the rest of the country.

General News Department

Employees of the Los Angeles & Salt Lake took second Liberty Loan bonds to the amount of \$146,550.

The Denver & Rio Grande has granted an increase in wages of three cents an hour to machinists, boilermakers, blacksmiths and sheet metal workers employed on its lines in Utah.

Judge Chambers, the government mediator, has been informed that wage differences which threatened a walkout of enginemen and firemen on the New York, New Haven & Hartford have just been referred to arbitration through an agreement reached by the two sides. The management of the St. Louis-San Francisco has notified the railroads' war board of its willingness to meet certain employees for a discussion of grievances over working conditions.

At the Sheephead Bay track, New York City, November 16, Ralph De Palma, driving a Packard automobile, fitted with a Liberty motor, traversed a distance of 633.12 miles in six hours, or at the rate of 105.6 miles an hour. The best preceding record was made at the Brooklands bowl-shaped track in England four years ago: 566 miles in the same time. De Palma traveled 113 miles in the first hour. The Brooklands record was made by three men driving alternately.

The Boston & Maine has made advances of 40 cents a day in the pay of station agents, freight-house men, clerks and other station employees, and of 30 cents a day in that of crossing tenders. These increases were fixed by Henry B. Endicott, arbitrator. The men had asked for 75 cents increase. On their request for an eight-hour day, Mr. Endicott says:

"It was agreed that in view of the present crisis in which this nation finds itself involved at the present time, it is unpatriotic to raise an issue at this time."

The United States Civil Service Commission announces an open competitive examination for telegraph rate experts, for men only. Vacancies in the office of the United States food administrator at \$117 a month and in positions requiring similar qualifications at this or higher, or lower salaries, will be filled from the examination. The duties of appointees will consist of the revision, preparation, audit and payment of telegraph cable accounts. Applicants should apply to the Civil Service Commission, Washington, D. C., at once, for Form 1312, stating the title of the examination desired. Applications must be properly executed, excluding the medical certificate and filed with the commission at Washington prior to the hour of closing business on December 4, 1917.

It is estimated that the saving of meat in dining cars and railroad restaurants by not serving meat on Tuesdays now equals an average of over 85,000 lb. annually or a money value of \$250,000. This estimate is based on reports made by 41 railroads, represented at a recent meeting at Chicago of the American Association of Dining Car Superintendents. "Meatless Tuesdays" and "Wheatless Wednesdays" are being strictly observed now on nearly every railroad. The only possible exception will be the serving of meat on Tuesday to troops in transit. The question of whether that shall be done has been referred by the dining car superintendents to the Federal Food Administration. Some railroads have eliminated roast beef from their bills of fare every day and are serving steaks or beef only at the evening meal. All lines reported that the traveling public has evinced hearty sympathy with the conservation policy.

The United States Civil Service Commission announces examinations for inspector of car equipment, for the valuation division of the Interstate Commerce Commission for duty in the eastern district at entrance salaries not exceeding \$1,500. Future vacancies requiring similar qualifications occurring in any district will be filled from this examination. Applicants must have at least three years' experience in the employ of a railroad in the department of equipment or with a car manufacturing company, or have graduated in mechanical engineer-

ing from a technical school of recognized standing and have had one year of such experience. Competitors will be rated on the following subjects, which will have the relative weight indicated on a scale of 100: Physical ability, 10; experience, 90. Applicants should apply at once to the United States Civil Service Commission, Washington, D. C., for Form 1312, stating the title of the examination desired. Applications, excluding medical certificates, must be filed with the Commission at Washington prior to December 11.

Census of Railroad Employees in Government Service

The Railroads' War Board, for the purpose of obtaining exact information as to the labor situation and of showing what contributions the railroads have made to the public service, has arranged for taking a census of railroad employees in the United States service or of draft age. A circular has been despatched to the railroads with blank forms prepared to show the number of employees who have entered the service of the government, by enlistment, as civilians, or by draft, and those at present in the railway employ who are of draft age. The forms are designed to indicate the character of service and the compilation will embrace all employees. The data which will thus be furnished by the railroads to the war board will not only show the extent of the contribution already made by the roads, but will also give an approximate idea of the extent to which railroad forces are likely to be further depleted and will lay a foundation for the designation of workers when the time arrives for this course to be taken.

Wage Question in Hands of President

The Railroads' War Board, following a conference with W. L. Chambers, chairman of the United States Board of Mediation and Conciliation, on Monday, November 19, regarding the situation created by the wage demands of the Order of Railway Conductors and the Brotherhood of Railroad Trainmen, agreed to place the interests of the railroads in the event of a crisis, unreservedly in the hands of the President for protection and for disposition as he may determine in the public interest. The entire situation was discussed by Judge Chambers and the members of the war board, who reiterated the position taken by the railroads during the eight-hour day controversy, that such matters should be settled by arbitration. They were willing, therefore, to place the entire matter in the hands of the President because of the unusual conditions created by the war, which make it more than ever imperative that there shall be no interruption of traffic. The President was to confer with the officers of the brotherhoods on Thursday. The position of the carriers was stated, after the conference, in a letter to Judge Chambers sent by Chairman Fairfax Harrison to be transmitted to the President. Mr. Harrison's letter is as follows:

"We confirm what we said to you this morning in reply to your inquiry as to what will be the attitude of the railroads with respect to the manner of settlement of any demands for increases in pay or changes in working conditions which during the war may be made upon them by employees.

"Speaking for the railroads today, we reiterate our belief in, and general acceptance of, the principle of arbitration. In the midst of war we are, however, prepared to go further. As no interruption of continual railroad operation can be tolerated under war conditions, we are ready, should any crisis now arise, unreservedly to place our interests in the hands of the President for protection, and for disposition as he may determine is necessary in the public interest."

Judge Chambers expressed the opinion that this action would remove the possibility of a strike, saying that while the brotherhood leaders have been unwilling to agree to arbitration, they have agreed that there shall be no definite action pending the consideration of all facts of the situation by the President and by the Board of Mediation and Conciliation.

National Railway Appliances Exhibit

At a meeting of the board of directors of the National Railway Appliances Association on November 12, spaces were awarded to members for the exhibition to be held at the Coliseum and Annex, Chicago, from March 18 to 21, inclusive, of the coming year. A total of 257 out of 267 spaces have been assigned as compared with 226 out of 236 assigned at the same time a year ago, or 31 more spaces. A list of the present members of the association follows:

Adams & Westlake Company, Chicago.
 Adams Motor & Manufacturing Company, Chicago.
 A. G. A. Railway Light & Signal Company, Elizabeth, N. J.
 Ajax Rail Anchor Company, Chicago.
 Alger Supply Company, Chicago
 American Hoist & Derrick Company, St. Paul, Minn.
 American Kron Scale Company, New York.
 American Steel & Wire Company, Chicago.
 American Vulcanized Fibre Company, Wilmington, Del.
 American Valve & Motor Company, Cincinnati, Ohio.
 Armo Iron Culvert & Flume Manufacturers' Ass'n, Middletown, Ohio.
 Associated Manufacturers of Malleable Iron, Cleveland, Ohio.
 Automatic Electric Company, Chicago.
 Ayer & Lord Tie Company, Chicago.
 Asbestos Protected Metal Company, Pittsburgh, Pa.
 Alexander Crossing Company, Clinton, Ill.
 American Auto Connector Company, Cleveland, Ohio.
 Alth-Prouty Company, Danville, Ill.
 Anti-Creep Corporation, New York.
 Barrett Company, The, New York.
 Bethlehem Steel Company, South Bethlehem, Pa.
 Bryant Zinc Company, Chicago.
 Brach Supply Company, Newark, N. J.
 Buda Company, Chicago.
 Baker, John, Jr., Chicago.
 Cambria Steel Company, Philadelphia, Pa.
 Chapman Chemical Engineering Company, New York.
 Chicago Steel Post Company, Chicago.
 Carbic Manufacturing Company, Duluth, Minn.
 Cast Iron Pipe Manufacturers' Ass'n, New York.
 Chicago Bridge & Iron Works, Chicago.
 Chicago Flag & Decorating Company, Chicago.
 Chicago Malleable Castings Company, Chicago.
 Chicago Pneumatic Tool Company, Chicago.
 Chicago Railway Signal & Supply Company, Chicago.
 Cleveland Frog & Crossing Company, Cleveland, Ohio.
 Crear-Adams & Co., Chicago.
 Corning Glass Works, Corning, N. Y.
 D. & A. Post Mold Company, Three Rivers, Mich.
 Detroit Graphite Company, Detroit, Mich.
 Dilworth Potter & Co., Inc., Pittsburgh, Pa.
 Dickinson, Paul, Inc., Chicago.
 Dixon Crucible Company, Jos., Jersey City, N. J.
 Duff Manufacturing Company, Pittsburgh, Pa.
 Dayton Malleable Iron Company, Dayton, Ohio.
 Edison, Inc., Thos. A., Bloomfield, N. J.
 Edison Storage Battery Company, Orange, N. J.
 Electric Railway Improvement Company, Cleveland, Ohio.
 Electric Storage Battery Company, Philadelphia, Pa.
 Elyria Iron & Steel Company, Cleveland, Ohio.
 Eymon Continuous Crossing Company, Marion, Ohio.
 Fairbanks, Morse & Co., Chicago, Ill.
 Fairmont Gas Engine & Railway Motor Car Company, Fairmont, Minn.
 Federal Signal Company, Albany, N. Y.
 Frictionless Rail Company, Boston, Mass.
 General Railway Signal Company, Rochester, N. Y.
 Gurley, W. & L. E., Troy, N. Y.
 General Electric Company, Schenectady, N. Y.
 Gould Storage Battery Company, New York.
 Grip Nut Company, Chicago.
 Graver Tank Works, East Chicago, Ind.
 Hatfield Rail Joint Company, Macon, Ga.
 Hazard Manufacturing Company, Chicago.
 Hayt Roller Bearing Company, Newark, N. J.
 Hall Switch & Signal Company, New York.
 Hayes Track Appliance Company, Richmond, Ind.
 Hoeschel Manufacturing Company, Omaha, Neb.
 Hubbard Manufacturing Company, Pittsburgh, Pa.
 Handlan-Buck Manufacturing Company, St. Louis, Mo.
 Hunt & Co., H. W., Chicago.
 Hagaman Castle Supply Company, New York.
 Ingersoll-Rand Company, New York.
 International Steel Tie Company, Cleveland, Ohio,
 Iowa Gate Company, Cedar Falls, Iowa.
 Johns-Manville Company, H. W., Chicago.
 Jonnison Wright Company, Toledo, Ohio.
 Joyce Cridland Company, Toledo, Ohio.
 Jordan Company, O. F., East Chicago, Ind.
 Julian Beggs Signal Company, Terre Haute, Ind.
 Kalamazoo Railway Supply Company, Kalamazoo, Mich.
 Kenneco Switchboard & Supply Company, Chicago.
 Keppler Glass Constructors Company, Inc., New York.
 Kerite Insulated Wire & Cable Company, New York.
 Keystone Grinder & Manufacturing Company, Pittsburgh, Pa.
 Kelly-Darby Company, Inc., Chicago.
 Kilbourn & Jacobs Manufacturing Company, Columbus, Ohio.
 Kettle River Company, Minneapolis, Minn.
 Kirby Frog & Switch Company, Birmingham, Ala.

Lackawanna Steel Company, Buffalo, N. Y.
 Lane & Bolder, Chicago.
 Lebon Company, The, Chicago.
 Lidgerwood Manufacturing Company, New York.
 Louisiana Red Cypress Company, New Orleans, La.
 Long, Chas. R., Company, Louisville, Ky.
 Lufkin Rule Company, Saginaw, Mich.
 M. W. Supply Company, Philadelphia, Pa.
 Madden Company, The, Chicago.
 MacRae's Blue Book Company, Chicago.
 Massey Company, C. F., Chicago.
 Miller Train Control Corp., Danville, Ill.
 Morden Frog & Crossing Works, Chicago.
 Mudge & Co., Chicago.
 McGraw Hill Publishing Company, New York.
 Marsh & Truman Lumber Company, Chicago.
 Monroe Calculating Machine Company, Chicago.
 Mercury Manufacturing Company, Chicago.
 McComber & Whyte Company, Kenosha, Wis.
 National Carbon Company, Cleveland, Ohio.
 National Lock Washer Company, Newark, N. J.
 National Indicator Company, Long Island, N. Y.
 National Concrete Machinery Company, Madison, Wis.
 National Lead Company, New York.
 National Malleable Castings Company, Cleveland, Ohio.
 Nichols & Bros., G. P., Chicago.
 Northwestern Motor Company, Eau Claire, Wis.
 National Surface Guard Company, Chicago, Ill.
 Ogle Construction Company, Chicago.
 Okronite Company, New York.
 O'Malley Beare Valve Company, Chicago.
 Otley Paint Manufacturing Company, Chicago.
 Post, G. A., New York.
 Patterson, W. W., Company, Pittsburgh, Pa.
 Positive Rail Anchor Company, Marion, Ind.
 Page Woven Wire Fence Company, Monessen, Pa.
 P. & M. Company, Chicago.
 Pocket List of Railway Officials, New York.
 Protective Signal Manufacturing Company, Denver, Colo.
 Pittsburgh-Des Moines Steel Company, Pittsburgh, Pa.
 Polk-Gentue-Polk Company, Chicago.
 Penton Publishing Company, Cleveland, Ohio.
 Q. & C. Company, New York.
 Rail Joint Company, New York.
 Railway Review, Chicago.
 Ramapo Iron Works, Hillburn, N. Y.
 Reading Specialties Company, Reading, Pa.
 R. E. & M. of W. Association, Sterling, Ill.
 Railway Motor Car Company of America, Chicago.
 Railroad Supply Company, The, Chicago.
 Railroad Water & Coal Handling Company, Chicago.
 Roberts & Schaefer Company, Chicago.
 Roos Foundry Company, Henry, Chicago.
 Simmons-Boardman Publishing Company, New York.
 Signal Accessories Company, New York.
 Safe Lock Switch Machine Company, Lexington, Ky.
 Sellers Manufacturing Company, Chicago.
 Snow Construction Company, T. W., Chicago.
 Squire-Cogswell Company, Chicago.
 Simmen Railway Automatic Signal Company, Buffalo, N. Y.
 Southern Pine Association, New Orleans, La.
 Standard Asphalt & Refining Company, Chicago.
 Standard Underground Cable Company, Pittsburgh, Pa.
 Simple Gas Engine Company, Menasha, Wis.
 Silver Steel Tie Company, New York.
 Sperry, H. M., New York.
 Tyler Underground Heating System, Pittsburgh, Pa.
 Templeton, Kenley Company, Chicago.
 Track Specialties Company, New York.
 Toledo Scale Company, Toledo, Ohio.
 Union Switch & Signal Company, Swissvale, Pa.
 U. S. Wind Engine & Pump Company, Batavia, Ill.
 Volkhardt Compn. The, Stapleton, N. Y.
 Verona Tool Works, Pittsburgh, Pa.
 Wayne Oil Tank & Pump Company, Fort Wayne, Ind.
 Wyoming Shovel Works, Wyoming, Pa.
 Waterbury Battery Company, Waterbury, Conn.
 Western Electric Company, New York.
 Wharton, Wm., Jr. & Co., Easton, Pa.
 Whall Company, C. H., Boston, Mass.
 Whittaker-Glossner Company, Portsmouth, Ohio.
 Yale & Towne Manufacturing Company, New York.

American Economic Association

The 30th annual meeting of the American Economic Association will be held with headquarters at the Hotel Adelphi, Philadelphia, Pa., December 27 to December 29. The general topic of the meeting will be War and Reconstruction. At the fourth session: to be held Friday, December 28, at 10 a. m., a paper will be presented on the "Present Valuation of Railroads by the Interstate Commerce Commission" by John Bauer of Princeton University. The paper will be discussed by: A. M. Sakolski, Albany, N. Y.; E. W. Bemis, Chicago; Milo R. Maltbie, New York City, and Charles A. Prouty, Director of Valuation of the Interstate Commerce Commission.

Railway Regiments' Tobacco Fund

Last week was a big week for the Tobacco Fund, subscriptions having been received from 24 supply companies or individuals. The following list brings the names of subscribers up to date at Tuesday noon, November 20:

Bettendorf Company, Bettendorf, Iowa.....	\$10 a month
Cleveland Frog & Crossing Company, Cleveland, Ohio.....	10 a month
Curtain Supply Company, Chicago.....	10 a month
Dearborn Chemical Company, Chicago.....	10 a month
Fairbanks, Morse & Co., Chicago.....	10 a month
Fowler Car Company, Chicago.....	(to cover 2 months) 20
Fort Pitt Malleable Iron Company, Pittsburgh, Pa.....	10 a month
Fort Pitt Spring & Manufacturing Company, Pittsburgh.....	10 a month
Franklin Railway Supply Company, New York.....	(to cover 6 months) 60
Illinois Car & Manufacturing Company, Hammond, Ind.,	(to cover 6 months) 60
Kelly Reamer Company, Cleveland, Ohio.....	(contribution) 10
Keylock Railway Equipment Company, Chicago.....	10 a month
J. E. Meek, New York.....	(to cover 6 months) 60
Miller Train Control Corporation, Staunton, Va.....	10 a month
Pilliod Company, New York.....	10 a month
Pickands, Brown & Co., Chicago.....	(to cover 15 months) 150
Clive Runkle and LeRoy Kramer, of the Pullman Company.....	10 a month
F. K. Shults, New York.....	(contribution) 25
Jos. B. Turbell, of American Brake Shoe & Foundry Company,	New York.....
Templeton, Kenly & Co., Chicago.....	(to cover 6 months) 60
Union Spring & Manufacturing Company, Pittsburgh, Pa.,	(to cover 6 months) 60
H. Vissering & Co., Chicago.....	10 a month
W. H. Woodin, of American Car & Foundry Company, New	York.....
	(to cover 6 months) 60

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings and places of meeting of those associations scheduled to meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.
AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. C. Angler, Supt. Timber Preservation, B. & O., Mt. Royal St., Baltimore, Md. Next convention, January 22-24, 1918, Hotel Sherman, Chicago.
CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.
CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.
CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Morrison Hotel, Chicago.
CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 4d Friday in January, May, September and November. Annual dinner, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.
CINCINNATI RAILWAY CLUB.—H. Boutet, Chief Interchange Inspector, Cin'ti Rys., 101 Carew Bldg., Cincinnati. Regular meetings, 2d Tuesday, February, May, September and November.
ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 568 Union Arcade Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh, Pa.
FREIGHT CLAIM ASSOCIATION.—Warren P. Taylor, Traffic Manager, R. F. & P., Richmond, Va. Next meeting, November 27, Vanderbilt Hotel, New York.
GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month. Room 1856, Transportation Bldg., Chicago.
NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meeting, 2d Tuesday in month, except June, July, August and September, Boston.
NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meeting, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.
NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—Geo. A. J. Hochberg, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.
PACIFIC RAILWAY CLUB.—W. S. Wollner, Assistant to Chief Engineer, Northwestern, 1000 R. St., St. Paul, Minn.
PEORIA ASSOCIATION OF RAILROAD OFFICERS.—F. C. Stewart, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.
RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Pittsburgh Commercial Club Rooms, Colonial Annex Hotel, Pittsburgh.
ST. LOUIS RAILWAY CLUB.—W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.
SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grand Bldg., Atlanta, Ga. Regular meetings, 2d Thursday, January, March, May, July, September, November, 10 a. m., Piedmont Hotel, Atlanta.
TRAFFIC CLUB OF CHICAGO.—C. B. Singer, La Salle Hotel, Chicago.
TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Waldorf-Astoria Hotel, New York.
WESTERN CANADA RAILWAY CLUB.—J. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.
WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Monday in month, except June, July and August, Hotel Sherman, Chicago.
WESTERN SOCIETY OF ENGINEERS.—Edgar S. Nethercut, Secretary, 1735 Monmouth Block, Chicago, Ill. Regular meeting, first Monday in month, except January, July and August. Extra meetings generally on other Monday evening except in July and August.

Traffic News

The railroads centering in Philadelphia have not embargoed freight "between all stations less than 40 miles apart" as was erroneously reported in our last issue.

B. G. Hinkley, of Boston, has been named to assist L. A. Sneed, of the United States Fuel Administration, in all matters relating to the supply of coal and coke for New England.

The Railroad Commission of Wisconsin recently authorized an advance of 15 cents a ton on hard coal and coke rates and varying advances for soft coal for different parts of the state. It held a hearing on November 21 to consider additional phases of the soft coal rate situation.

The Southern states can this year not only feed their own live stock but can furnish enormous quantities of feedstuffs to other sections. In addition to cottonseed meal, peanuts and peanut meal the states east of the Mississippi river have a surplus of velvet beans estimated at a million and a half tons. This is a protein feed of high value and particularly valuable as a dairy feed.

A committee of the New York Board of Trade & Transportation, 203 Broadway, New York City, is going to Washington to ask the Shipping Board to take action looking to the construction of boats for use on the enlarged Erie Canal, which will be in condition for use next spring. Members of the committee believe that the construction of boats can be started at once if the Washington authorities will give the necessary assistance.

The Boston & Albany has petitioned the Massachusetts Public Service Commission for authority to advance local passenger fares in that state from 250 cents a mile to 275 cents a mile except in the suburban zone, adjacent to Boston, where the rate is 2 cents a mile. The petition asks also for authority to increase the rate on mileage tickets from 2.25 cents to 2.50 cents; also an increase of 25 per cent on 12-ride and 25-ride tickets.

Among numerous freight embargoes announced this week was one by the Pennsylvania on shipments from any point on the lines east of Pittsburgh, as well as on all freight originating on connecting lines, destined for points on or by way of the Western Pennsylvania Division (the main line and branches from Altoona to Pittsburgh). The embargo will be lifted as soon as conditions warrant, but relief is not now in sight. Government freight, food, coal, etc., are excepted.

Coal to the amount of no less than 80,000 tons has been floated down the Ohio river on a single artificial flood, according to the last reports. This rise was started at Dam No. 7, Ohio river, and augmented by water from the Muskingum, Kanawha and Big Sandy rivers. The coal was taken to Cincinnati and other river cities. Every available towboat and barge was used, even small harbor boats. Fourteen tows of more than 200 craft were in the movement.

The Public Service Commission of Missouri on November 16 authorized a general advance in single trip passenger fares to 2½ cents a mile, from the present rate of 2 cents. The railroad had asked for authority to increase the rate to 3 cents. The rate now prescribed for round trip tickets is 2.4 cents a mile and for mileage books, good for 500 miles, 2.25 cents a mile. The commission allows these rates to go into effect on January 1 next. Commissioner E. J. Bean dissented and Chairman W. G. Busby did not sit in the case.

The New York, New Haven & Hartford has notified the New York Public Service Commission that it contemplates an increase in freight and passenger rates, and requests permission to file the new rates without the usual 30 days' notice. It is proposed to increase all local one way passenger fares from 2½ to 2¾ cents a mile and mileage books from 2¼ to 2½. The zone five-cent fares now prevailing on the Harlem River branch New York to New Rochelle are to be increased from five to six cents a zone. The freight increases (in New York State—no long distances) are from 2½ cents to 7 cents, according to the class.

The subcommittee on fertilizers of the committee on chemicals of the Council of National Defense, noting the embargoes of the Pennsylvania and other roads on the movement of fertilizers (included with other classes of freight quite as important as fertilizer) advises shippers and owners that the embargoes have been made absolutely necessary by the congested condition of the railroads; that all of them are likely to be removed at any time, as soon as the congestion is relieved, and urging that patience be exercised and that no attempt be made to interfere with the orderly working out of the embargoes; but if a given plant is placed in jeopardy of being shut down the facts should be reported to the committee.

The farm tractors which were bought by the Buffalo, Rochester & Pittsburgh last spring for the purpose of assisting the farmers along its line have been kept busy all summer and it is expected that they will continue hard at work until snow flies. These tractors have been furnished to the farmers at a rate of \$1.50 an acre for plowing and 75 cents an acre for harrowing, including the services of an operator and all materials used in operation. They have been of material assistance in helping to produce the million-acre increase in wheat sowed for next season. Many farmers, having witnessed the company's tractors in operation, have been encouraged to make the purchase of tractors of their own. No less than 25 tractors have been bought by farmers along the Buffalo and Rochester divisions since last spring.

The State Public Utilities Commission of Illinois has issued Supplement No. 32 to Illinois Commissioners' Classification No. 10, canceling Supplement No. 31, effective December 15. Additions, cancellations and changes in the classification of articles shown in the new supplement were made by orders of the commission at hearings held at Chicago on May 9, 1917, and September 12, 1917. The commission will meet on the Wednesday after the second Tuesday in the months of January, May and September, for the purpose of considering petitions for further changes in classification or the classification of new articles. All petitions, applications and suggestions of any character to be acted upon at the regular classification meetings must be filed with the secretary of the commission 30 days prior to the first day of such a meeting, and the classification docket will be printed and mailed to all interested parties at least ten days prior to the first day of a meeting.

In order to increase the available supply of gondolas during the winter, the Public Service Commission of Indiana, on its own motion, has modified the existing demurrage rules in so far as they apply to cars containing coal, as follows: On cars placed on public delivery tracks for unloading, 48 hours' free time will be allowed, computing from the time of notice of placement by telephone or messenger. On cars containing coal to be delivered at any other than public delivery tracks, 48 hours' free time will be allowed, computing from the time of actual placement, or from the time of notice by telephone or messenger of constructive placement. In computing free time, Sundays and legal holidays will be excluded and when a legal holiday falls on Sunday the following Monday will be excluded. The average agreement has been abolished as far as cars containing coal are concerned. The order took effect on November 20 and will remain in force for 100 days.

The Adams, American, Southern and Wells Fargo express companies have asked the Interstate Commerce Commission to authorize a general increase of 10 per cent in their rates for transportation of merchandise. They aver that they are carrying on greatly increased business under the most trying conditions, and that their facilities are taxed far beyond their normal capacity. It is increasingly difficult to obtain necessary labor, and because of the increasing demand for express and baggage cars for movement of troops and military supplies it has been impossible to obtain adequate equipment.

Frequent and substantial advances in wages have been necessary to retain the employees, and it has been necessary to hire large numbers of new men to fill the places of those drafted into the army or taken to other employment by higher wages. Present rates do not produce sufficient revenue to meet the actual operating expenses and taxes. Operating expenses and taxes of the four principal companies for the six months ended June 30, 1917, were \$99,653,848, and receipts were \$99,613,999. The deficit for July was estimated at more than \$250,000.

The Boston & Maine has adopted the shipping day plan. On the Boston & Maine the plan has been worked out carefully between the shippers and the management, so that co-operation to secure the maximum of efficiency and satisfaction has been assured in advance. Moreover, in the case of the Boston & Maine the shipping day plan will become effective at all the largest cities on its system.

The Pennsylvania Railroad has this week completed the revision of its method of handling less-than-carload freight, at all stations on its lines in Northern New Jersey. The shipping day plan, which has been already established in New York, Philadelphia, Buffalo and Baltimore, was on Monday put in effect at Trenton, Phillipsburg, Easton, Bristol, New Brunswick and a number of other stations on the New York and New Jersey divisions. Shipping day guides have been prepared for Trenton, Phillipsburg, Easton, Bristol and New Brunswick. For the other stations posters containing specific schedules for each individual station have been issued.

Commuters Show Patriotism

A year ago the State Public Utilities Commission of Illinois received 79 petitions bearing more than 3,000 signatures, requesting a 10-cent fare on the Illinois Central from West Pullman, Ill., to Randolph street, Chicago; also asking for complete electrification of the railroad's suburban lines and the use of modern steel coaches on suburban trains. When the case was called recently a communication from the representative of the petitioners was read as follows: "Because of the war and the expenses under which the railroads are operating, we ask that this case be indefinitely postponed." Accordingly, the case was struck from the docket of the commission.

Coal Production Increased

Not since early in July has the production of bituminous coal reached so high a point as during the week ended November 10, according to the weekly report of the United States Geological Survey. The total output, including coal made into coke, is estimated at 11,300,890 net tons, an average per working day of 1,883,482 tons. This was a gain of 4.7 per cent over the preceding week. Anthracite shipments were reported as 38,775 cars, a figure still far below the level maintained during October. During the week ended November 3, the ratio of tonnage produced to full time capacity was 75.4 per cent, as compared with 74.9 per cent during the preceding week. Losses due to car shortage amounted to 14.5 per cent of the present full time capacity, and labor shortage and mechanical breakdowns were responsible for losses of 5.7 and 3.6 per cent, respectively. A general improvement in car supply was reported in several districts.

County Officers to the Rescue

Governor Whitman, of New York, has notified the County Home Defense committees of the state to see that post-card notices are sent to shippers who are delinquent about obeying the national rules for conservation of transportation. If the delinquent shipper be visited personally by a member of the local committee and the importance of freeing cars as soon as possible made clear to him. It is necessary, says the governor, that the fullest possible use be made of all transportation agencies, including not only the steam railroads, but such other agencies as the motor truck, the electric lines and the waterways. He then quotes the Car Service Commission's suggestions, which include:

To the Receiver of Freight: Purchase in the nearest market. Be prepared to store the full contents of the largest freight car. Bunch your orders so as to make full car-load lots. If you can't order by carload, arrange with others to pool carload shipments.

To the Shipper: Have your shipments ready for immediate loading on receipt of cars. Arrange your shipment in car so as to permit prompt unloading at destination. See that packages are so loaded as to eliminate damage in transit.

Where you have been shipping less than carload freight daily and sending via a transfer point, hold your shipment two or three days to make up full carloads and bill to destination. Use drays or motor trucks instead of "trap-car service" and avoid the use of freight cars for moving freight from one point to another within the same city. Load in a single day, and time your loading to suit the schedule of departing trains. Furnish billing agent full

instructions that will permit the way bill being made up before loading is completed. Consign your shipment to final destination wherever possible, and discourage shipments that require changing destination in transit. Do not bill shipments by circuitous route in order to avoid the effect of embargoes.

Governors of other states have issued similar circulars.

Akron & Boston Express

Automobile trucks, described as "highway freight trains," are now running over country roads, from Akron, Ohio, to Boston, covering 1,510 miles in a week. This truck line is being operated by the Goodyear Tire & Rubber Company. It is called the "Akron & Boston Express." The present equipment consists of two White and two Packard trucks, of 1½, 3 and 5 ton capacity. It is planned to increase the equipment. A regular schedule is maintained, and the cars are said to be usually on time. The schedule calls for the round trip (1,510 miles) in less than one week. It is said that the express companies do not deliver as rapidly as that, and that the truck costs are competing with express rates. Tires are carried eastward and cotton fabrics and machinery on the return trip. Several trips have been made to Washington, D. C., with "war orders."

This service was started last April and the manager hopes to continue through the winter unless stopped by ice and snow. There is only 28 miles of unimproved road on the route. This bothers considerably in muddy weather. The poor condition of some of the old wooden and steel bridges is another handicap. Pneumatic tires are used exclusively.

Committee to Promote Use of Motor Trucks

The possibilities of co-operation with the railroads through greater use of motor trucks and horse-drawn vehicles, for relieving congestion in freight houses and releasing cars in the larger cities, was discussed at the first meeting, on November 17, at Washington, of the newly appointed Highways Transport Committee of the Council of National Defense. The great utility of motor trucks for carrying freight short distances, and keeping certain classes of freight out of the railroad terminals, will be a matter for recommendations by the committee. The committee will also act towards eliminating waiting time of trucks and drays at terminals. The committee will not operate any motor transportation, but, though co-operation with other transportation agencies, seek to develop the possibilities of the motor truck for carrying freight over distances where it can prove its economy and helpfulness in the present emergency. The committee appointed as secretary R. C. Hargreaves, who for some time past has been doing preliminary work on this subject under the Storage Committee of the Council of National Defense.

An example of the co-operation of manufacturers with the Washington committee is found in a large display advertisement printed in a New York paper and paid for by the Autocar Company, Ardmore, Pa., which reads, in part, as follows:

CLEAR THE WAY!

America's railroads are doing wonderful work, but they need help. Freight cars must be unloaded and terminals cleared. If it is your job, speed up loading and unloading of cars on private sidings. Do not be a slacker by trying to save expense of labor or space by using freight cars as storage houses. If your merchandise is congested at the terminals and you have not sufficient teams or motor trucks to move the goods at once, buy them or hire public ones. If you can't do this, do something else—ask your neighbor to help you. Why hesitate to hire your neighbors' trucking facilities? We must pull together. Shipping departments throughout the country demand the personal consideration of executives . . . Plan to reach nearby points by motor trucks, teams or waterways—save the railroad terminals. Twenty-five per cent of case, barrel and package merchandise can be delivered in this way. If the railroads decide to reserve certain terminals exclusively for Government materials, do not grumble, but go the extra distance and haul your goods to or from other terminals. It may be necessary to have a National terminal clearing day. If we have such a day, keep your teams and motor trucks going and keep your receiving departments open continuously 24 or 48 hours, if need be, and give the railroads a chance to catch up. Let everybody be prepared some way, somehow, to move their merchandise away from the terminals immediately.

Commission and Court News

STATE COMMISSIONS

Authority of a Commission to Raise Fares

The Public Service Commission of New York, second district, has authorized an advance of one cent—five cents to six cents—in the rate of fare on the Huntington Railroad Company, a street railroad running between Huntington Harbor and Amityville on Long Island. It was one of numerous six-cent fare cases, so called. No community through which the road runs objected to the applicant's case on the facts, nor did any of the inhabitants. The commission holds that subdivision 1 of section 49 of the public service commissions law (of 1907) has made it the duty of the commission, where it finds upon a sufficient showing that the maximum rates chargeable either under the railroad law or under the local franchise are insufficient to yield reasonable compensation, and are for that reason unjust and unreasonable, to authorize an increase. The opinion cites all of the decisions and all of the statutes of the State of New York having any bearing upon the question, and follows the Court of Appeals in the *Ulster & Delaware* case (218 N. Y., 643) and the Appellate Division for the Third Department in the *New York & North Shore* case (175 App. Div., 869).

COURT NEWS

The United States Bureau of Labor Statistics, Washington, has issued Bulletin No. 224, containing reports of important court decisions on labor questions issued since January 1, 1916. A number of the decisions of the Supreme Court of the United States, handed down since December, 1916, are included, but for the most part the decisions were made in the calendar year 1916. The most notable decisions are those sustaining the constitutionality of the Adamson eight-hour law, so-called; those deciding the constitutionality of workmen's compensation laws; and that sustaining the Oregon ten-hour day for factory employees without regard to sex or age. Besides these decisions of the Supreme Court there is the decision of the court of last resort of the state of Massachusetts in declaring unconstitutional an act of that state which undertook to limit the issue of injunctions in labor disputes, and numerous decisions and rulings by the state courts on questions of construction and constitutionality.

A large number of the decisions deal with the Federal liability law covering railroads in interstate commerce. Not only must the employing company be an interstate carrier, but the injured person must at the time of his injury have been employed in interstate commerce; for it is only when he is so employed that he can claim the benefits of the act, while, on the other hand, if so employed he is restricted to such recovery as that statute provides. With the wide extension of compensation legislation (now found in 37 states), there is constant conflict between the two classes of remedy, i. e., by compensation and by suits for damages; and it is frequently impossible to determine whether relief should be sought under the one law or under the other until the evidence has been submitted to a jury and a verdict rendered.

Evidence as to Notice of Flood

In an action for the destruction of a car of screens by fire from a car of unslaked lime fired in a railroad yard in Troy, N. Y., by an unprecedented flood, exceptions were taken to certain evidence introduced to show notice to the railroad of the coming of the flood. The Vermont Supreme Court held that parts of an article in a daily newspaper, published in a nearby city (Albany), to the effect that the river would rise nearly 16 feet (at Albany), and that it would continue to rise, and stating the weather observer's forecast, and the basis thereof, was inadmissible to show what information was accessible to the railroad as bearing on the question whether it ought to have known or to have inquired as to flood conditions in order to have protected the property, without a showing that the article had been seen and read by

some of the railroad's agents. Such an article did not in law have the effect of constructive notice, and at most could be only actual notice. Testimony of the weather forecaster concerning his daily weather maps mailed to public places, or his telephone messages to newspapers and to business houses, was held to afford no reasonable inference as to the railroad's negligence, and its admission was harmful error, especially in view of the railroad's custom of telephoning to the weather bureau for information as to flood probabilities. Judgment for the plaintiff was reversed and a new trial ordered.—*Porter Screen Mfg. Company v. Central Vermont (Vt.)*, 102 Atl., 44. Decided October 2, 1917.

In another action for the destruction of a carload of paper at the same time from the same cause the New York Appellate Division arrived at the same conclusion.—*International Paper Co. v. New York Central*, 166 N. Y. Supp., 751. Decided July 19, 1917.

Freight Classification

The South Carolina Supreme Court holds that under the rule of the Interstate Commerce Commission, making the rate on scrap iron apply only to scraps and pieces of iron and steel which cannot be again used for the purposes for which they were originally used, a shipper of partially burned gasoline engines to the factory for the purpose of rebuilding is not entitled to the scrap iron rate, though the engines cannot be profitably rebuilt.—*Gibbes Machinery Co. v. Southern (S. Car.)*, 93 S. E. Decided September 28, 1917.

Necessity for Physical Connection Between Crossing Tracks

Application was made by the Akron, Canton & Youngstown to the Ohio Public Utilities Commission for an order requiring that its tracks and those of the Cleveland, Akron & Cincinnati be connected at a certain point in Akron. The application was denied and the applicant appealed. The Ohio Supreme Court holds that the laws do not absolutely require such a physical connection. The test to be applied in every case is that of practicability of construction and reasonable necessity. Jurisdiction over such matters has been conferred upon the state Public Utilities Commission, and it is authorized to require such connection where, upon hearing, it finds it to be practicable and reasonably necessary. A charge of unjust discrimination is not made out by the mere fact of a previous connection with the tracks of one company and a refusal to another company. Reasonable public necessity for the proposed connection is the ultimate test in every case. In the present case the action of the commission in dismissing the application was sustained.—*Akron, C. & Y. v. Public Utilities Commission (Ohio)*, 117 N. E., 314. Decided June 26, 1917.

In another case application by the Wheeling & Lake Erie for physical connection with the tracks of the Lake Erie & Pittsburgh near Kent, where the two tracks crossed at different grades, was refused by the Public Utilities Commission, whose order was affirmed by the Ohio Supreme Court on the ground that the applicant had not shown whether the connection sought was reasonably required.—*W. & L. E. v. Public Utilities Commission (Ohio)*, 117 N. E., 317. Decided June 26, 1917.

Recent Claim Cases

A bill of lading for an interstate shipment stipulated that claims for damage should be made promptly in writing to the agent at the point of delivery within ten days. The South Carolina Supreme Court holds that the carrier's consideration, on the merits, of a claim not so filed does not operate as a waiver, and that question should not be submitted to the jury. There is no presumption of law that a shipper claiming damages for delay in transportation of goods gave the written notice of claim required by the bill of lading. Such a stipulation in a bill of lading was held to be reasonable, for the shipper might give notice of damage by his agents at the point of delivery, their knowledge of damage being imputable to the shipper, and no particular form of action being necessary.—*Murray v. Atlantic Coast Line (S. Car.)*, 93 S. E., 387. Decided September 6, 1917.

The North Dakota Supreme Court holds that the filing of a claim eight months after goods have been shipped from Devils Lake, N. D., to New York, is not a compliance with the require-

ment that "claims must be made within four months after a reasonable time for delivery has elapsed." It also holds that such a provision is not for the purpose of escaping liability, but to facilitate prompt investigation, and is sufficiently complied with when, prior to the expiration of the four-months' period, oral complaint was made to the company's shipping agent of its failure to deliver, and the company acted on such complaint, and not only promised the shipper to send tracers and to make an investigation, but complied with its promise, and a month after such complaint the shipper was advised by the agent to wait a little longer, as he understood that the goods had been sold.—*Shark v. Great Northern (N. D.)*, 164 N. W., 39. Decided July 28, 1917.

The North Carolina Supreme Court holds that a carrier's stipulation in the bill of lading of an interstate shipment of live stock requiring written notice of claim for damage to the shipment before the animals are removed from the place of delivery and before they are mingled with other animals is reasonable and valid; therefore a shipper's verbal notice to an agent of the delivering carrier was insufficient. The court held the decision in *St. Louis, I. M. & S. v. Starbird*, 243 U. S., 592, to be binding on it. *Bryan v. Louisville & Nashville (N. Car.)*, 93 S. E., 750. Decided October 3, 1917.

The same court also holds that a notation by a railroad agent on a freight bill as to injuries to a shipment was not a compliance with a bill of lading stipulation for written notice of loss required to be filed within a given time; and a shipper could not recover for injury to a furniture shipment where he failed to file the required written notice of loss within the specified time, although the agent had actual notice of the loss.—*Taft v. A. C. L. (N. Car.)*, 93 S. E., 752. Decided October 3, 1917.

The South Carolina Supreme Court holds that the provision of a bill of lading requiring, as a condition to liability of the carrier, the filing of claims for loss, damage, or delay, has no application in an action for conversion by the carrier, refusing tender of all charges and selling the goods.—*Dowling v. S. A. L. (S. Car.)*, 93 S. E., 863. Decided October 16, 1917.

UNITED STATES SUPREME COURT

The Supreme Court of the United States, in an opinion by Justice Brandeis on November 12, affirmed the action of the Federal Court for the Western district of Kentucky in refusing an injunction asked for by the St. Louis Southwestern and other carriers hauling pine from the southwest to Paducah and Cairo, to prevent the Interstate Commerce Commission enforcing its orders intended to put lumber rates to Paducah and Cairo on a parity. The carriers had asked for the injunction on the ground that the rates were confiscatory and beyond the power of the commission to make.

Reduction of Rates

The Supreme Court of the United States has upheld the order of the Interstate Commerce Commission (Paducah Board of Trade v. Illinois Central, 37 I. C. C., 719) directing 53 railroads to establish certain through routes and joint rates on logs and lumber from the "blanket territory" to Paducah, Kentucky, and reducing existing rates. (The blanket territory is west of the Mississippi and south of the Arkansas River, 300 miles wide by 400 miles long.) In the report on which it based its order the commission found: (1) That the 16-cent rate to Cairo was not unduly low; (2) that the 22-cent rate to Paducah was unreasonable to the extent that it exceeded the existing rate to Cairo; (3) that the existing disparity of rates gave to Cairo an undue preference and advantage over Paducah; (4) that the distances to Paducah via Cairo were so much greater than the distances via Memphis that the natural route is via Memphis rather than via Cairo; (5) that through routes and joint rates not higher than the Cairo rate should be established from the "blanket territory" to Paducah via either Memphis or Cairo.

The principal railroads serving the blanket territory are the St. Louis Southwestern, the St. Louis, I. M. & S. and the Rock Island. The 22-cent rate from the blanket territory to Paducah via Cairo was made by adding to the joint rate or local of 16 cents to Cairo, the local rate of 6 cents from Cairo to Paducah, Cairo being a rate-breaking point.—*St. Louis Southwestern v. United States*. Decided November 12, 1917.

Equipment and Supplies

LOCOMOTIVES

THE ALABAMA & VICKSBURG has ordered 2 Mikado locomotives from the Baldwin Locomotive Works.

THE PENNSYLVANIA EQUIPMENT COMPANY, 1420 Chestnut street, Philadelphia, is in the market for one second-hand, 65-ton, six-wheel switching locomotive.

FREIGHT CARS

THE RICHMOND, FREDERICKSBURG & POTOMAC is inquiring for 100 hopper cars.

MORRIS & Co. has ordered 400 refrigerator cars from the Haskell & Barker Car Company.

THE LEHIGH PORTLAND CEMENT COMPANY, Allentown, Pa., is inquiring for 50 50-ton hopper cars.

THE AMERICAN STEEL EXPORT COMPANY, New York, is inquiring for 120 20-ton flat cars and 200 tank cars.

THE ILLINOIS CENTRAL has recalled its bids on 1,000 70-ton hopper cars and has issued a new inquiry for 1,000 50-ton capacity hopper cars.

THE ITALIAN GOVERNMENT is receiving bids through the authorities at Washington for 6,000 to 9,000 four-wheel cars similar to those illustrated in the Patriotic War Number of the *Railway Age Gazette*, June 22, 1917, page 1462.

PASSENGER CARS

THE PENNSYLVANIA EQUIPMENT COMPANY, 1420 Chestnut street, Philadelphia, is in the market for 9 second-hand passenger coaches.

IRON AND STEEL

THE NORTHERN CENTRAL has ordered 144 tons of steel for a traveling gantry crane at Baltimore, Md.

THE PENNSYLVANIA RAILROAD has placed an order for 11,800 tons of foundry iron with a central Pennsylvania furnace at the prices fixed by the government. This tonnage represents the railroad's requirements over the first half of next year.

A RAILWAYMEN'S LIBRARY IN ENGLAND.—The importance of educational and recreation facilities for their employees has long been recognized by British railway companies, who have given practical encouragement to the movement in every possible way. Proof of this may be seen in the well-equipped institutions provided by the different companies. Prominent among these is the Great Western Railway Institution at Swindon, which now numbers over 11,000 subscribing members, and has been practically self-supporting since its foundation upwards of 70 years ago. Its success and influence, however, could not have been so far-reaching had it not been for the beneficent goodwill and direct encouragement of the directors and chief officers, from Sir Daniel Gooch, the founder of the institution, to the present day. One of its chief features is the library, which contains about 40,000 volumes, embracing standard works in all classes of literature, including natural and applied science, the fine and useful arts, travel, history and biography, philosophy, religion and sociology, music, fiction and books for the young. Being a railwaymen's library, it specializes in engineering and railway literature. For a graduated subscription, beginning as low as 6d. (\$12) a quarter, a member has the library and reading rooms at his constant service. Numbers of apprentices, journey-men and their families, draughtsmen and clerks, school teachers and other students are thus afforded unique opportunities which are not neglected. The officers and their staffs also utilize the resources of the library both in their official and private capacities. The library has thus made for itself an important place among the higher educational institutions of the town.—*Railway Gazette*, London.

Supply Trade News

Howard D. Taylor, of the Remington Arms Company, Eddystone, Pa., has been elected vice-president of McCord & Co., Chicago.

William S. Boyd, formerly assistant in the purchasing department of the Crucible Steel Company of America at Pittsburgh, is now purchasing agent of the Page Steel & Wire Company, Monessen, Pa.

R. L. Browne, who for the past 15 years has been identified with the electrical and mechanical engineering profession, has recently become associated with the sales department of the Goldschmidt Thermit Company, New York, in the capacity of commercial engineer, after having spent several months in the foundry of that company acquiring a practical knowledge of the Thermit process of welding.

W. J. Schlacks, general manager of McCord & Co., Chicago, was recently elected director and vice-president of that company, with headquarters at Chicago. Mr. Schlacks was born in Chicago on March 28, 1874.

His first railroad experience was as a machinist apprentice on the Illinois Central. Later he went with the Denver & Rio Grande, after which he entered Leland Stanford Jr., University. Following his graduation from college he was appointed assistant mechanical engineer on the Denver & Rio Grande. He was later appointed mechanical engineer on the Colorado & Midland, following which he was general foreman and superintendent of machinery on the same road. In September, 1906, Mr. Schlacks was appointed western sales agent of McCord & Co. and in October, 1914, was promoted to general manager with headquarters at Chicago. As vice-president he will continue to have headquarters at Chicago.

W. J. Schlacks

Charles H. Stoer and M. A. Sherritt, of the Sherritt & Stoer Company, Inc., machinery dealers of Philadelphia, who recently acquired the stock of the Betts Machine Company of Wilmington, Del., have disposed of the real estate buildings and equipment to E. J. DuPont de Nemours & Co. The business of the Betts Machine Company will be continued with improved facilities since the new owners retain the good will, patents, patterns, drawings, jigs, fixtures, etc. The new officers are: M. A. Sherritt, president; Geo. W. Moreton, vice-president, and C. H. Stoer, secretary-treasurer, and the general offices have been moved to the Finance building, Philadelphia.

The Glazier Manufacturing Company, Rochester, N. Y., one of the oldest manufacturers of headlights, cases and reflectors, has reorganized, and has elected Frank Ocumpaugh president and general manager and Fred Kimmel vice-president. Mr. Kimmel is also president of the Rochester Motors Company. Mr. Ocumpaugh was born in Rochester, New York, and after finishing a common and high school education entered business in 1890 as purchasing agent of the Vacuum Oil Company, Rochester, N. Y. He held that position for 27 consecutive years, during which time the size and business of the Vacuum Oil Company expanded tremendously. Two years ago he went into the real estate business, which he has now given up to devote his time to the manufacture of Glazier products. Oscar F. Ostby, who is manager of sales for the company, maintains headquarters at the Grand Central

Terminal, New York. A sketch of Mr. Ostby's life appeared in these columns October 26.

At a meeting of the board of directors of the Rail Joint Company, New York, on Wednesday, V. C. Armstrong, manager of sales, was elected president, succeeding E. Y. Weber, resigned, and Mr. Armstrong and D. P. Wollhaupter, of Washington, D. C., are elected members of the board of directors, succeeding Percy Holbrook and Frank P. Vanderlip, resigned. The other officers of the company remain as at present: G. G. Frelinghuysen, chairman of the board and of the executive committee; W. Paton Thomson, vice-president; Benjamin Wollhaupter, vice-president and secretary, and F. C. Runyon, treasurer. Mr. Weber, the former president, remains a member of the board of directors and of the executive committee. The other members of the executive committee are G. G. Frelinghuysen, V. C. Armstrong, Charles P. Wheeler and W. Paton Thomson.

TRADE PUBLICATIONS

ADJUSTABLE HUB PLATES.—A book has been published by the Smith Locomotive Adjustable Hub Plate Company, Chicago, which describes the application and maintenance of the adjustable hub plate, the use of which is licensed by this company.

AMERICA'S AIRPLANES.—An interesting booklet bearing this title has been published by the Gisholt Machine Company, Madison, Wis. It contains numerous illustrations showing the development of airplanes and dirigibles from the earliest types to those which are now being built for use in the war zone. There is also a section devoted to airplane engines and the manufacture of engine parts.

HEAT INSULATION.—The Magnesia Association of America, 702 Bulletin building, Philadelphia, Pa., has issued a leaflet of 40 pages called "85 per cent Magnesia" and Heat Insulation. The purpose of the book is to present the latest and best information on heat insulation. Particular stress is laid on "85 per cent Magnesia" and its development is described. The various types of insulation made with this product and the uses to which this material may be put are mentioned. Illustrations of many interesting installations are included.

AUSTIN STANDARD BUILDINGS.—The Austin Company, Cleveland, Ohio, has issued a 36-page book explaining the object, methods, results and advantages of the Austin system of standard buildings. The plan covers nine types of structures, in steel, timber and concrete, suitable for housing widely varying industries. The material for building them is kept in stock at various places in the country, so that with the help of an efficient organization, it is possible to complete large buildings at rates hitherto considered impossible. The book is illustrated by drawings of the various types, and halftones of completed structures.

THE DESIGN OF FORGING MACHINE DIES.—A paper on the "Laws Governing Forging Machine Die Design," by E. R. Frost, general manager of the National Machinery Company, which was read before the American Drop Forge Association, has been reprinted by the National Machinery Company, Tiffin, Ohio, as Forging Machine Talk No. 27. The principles governing the design of dies for forging machines have been reduced to simple rules, and numerous illustrations show the application of these rules in making various classes of forgings. The paper contains information that will be of value in shops where forging machines are used.

GEARED LOCOMOTIVES.—The Lima Locomotive Works, Lima, Ohio, has issued bulletin No. 2 describing Shay geared locomotives for industrial railways. These locomotives are designed particularly to operate on lines having sharp curves and turnouts on which rod connected engines can not operate. They are particularly suited for use in industrial plants as they will accelerate quickly and with them it is easier to spot loads more accurately than with rod connected engines. The bulletin gives an account of tests made with an 0-6-0 type engine and a Shay locomotive of equal tractive effort, to obtain comparative rates of acceleration when working under the same conditions and to determine the time required by the two engines to spot a given load at definite points. A brief description of the Shay locomotive truck is also included in the pamphlet.

Railway Construction

ATLANTIC COAST LINE.—This company is building, with company forces, a brick passenger station one story high, 32 ft. wide and 72 ft. long, at St. Cloud, Fla.

BUFFALO & NORTHWESTERN. Construction has been started on this road extending from Buffalo, Okla., to Waynoka, 52 miles, by Walker & Taylor, contractors, of Ft. Worth, Tex. Frank Adams, Oklahoma City, Okla., has a sub-contract. E. C. Johnson, Buffalo, is president, and L. E. Walker, of Waynoka, is general manager of the road.

CANADIAN NORTHERN PACIFIC.—This company has commenced the construction of train shed and a concourse for its new passenger terminal at Vancouver, B. C. The train shed will be 21 ft. in height, 90 ft. wide and 900 ft. long, of reinforced concrete construction on wooden piles, with platforms of wood. The concourse will be 21 ft. in height, 40 ft. wide and 310 ft. long, of reinforced concrete construction on wooden piles, with a floor of concrete. The work will cost about \$170,000 and is being done by the Northern Construction Company, Limited, and Carter, Halls & Aldinger, Limited, joint contractors, both of Vancouver, B. C. The plans were prepared by Pratt & Ross, architects, Vancouver, B. C.

GULF, COLORADO & SANTA FE.—This company is contemplating the construction of a freight station and a machine shop at Temple, Tex. The depot will be a two-story brick building, 32 ft. by 52 ft., with concrete foundations and a basement for a steam-heating plant. The structure will be covered with a tar and gravel roof. Adjoining the depot will be a freight warehouse, 32 ft. by 160 ft., on concrete foundations. It will be one story in height, with a tar and gravel roof, and will have metal rolling doors. Adjacent to the warehouse will be a covered platform, 32 ft. by 54 ft. The buildings will be electric lighted, steam heated and equipped with the necessary plumbing. The estimated cost of the freight house facilities is \$30,000. The proposed machine shop at Temple will be 60 ft. by 100 ft., with concrete foundations, brick walls, machinery foundations, electric light, steam heat and tar and gravel roof. The structure will cost \$15,000, exclusive of machinery.

NEW YORK CENTRAL.—A contract has been given to the Eastern Concrete Steel Company, Buffalo, N. Y., to build a concrete, brick and steel power station, 34 ft. high, 60 ft. wide and 67 ft. long, for the New York Central at Curtis street, Buffalo.

SAVANNAH & ATLANTA.—A contract has been given by this company to H. O. Young, Savannah, Ga., to build a brick warehouse 40 ft. by 250 ft. at Savannah, to cost \$11,000.

INDIA'S LOST RAILWAY EQUIPMENT.—Between April and December of the year 1916 the sum of £13,333 (\$64,800) had to be written off the books of the railways of India for material, rolling-stock, etc., supplied to Mesopotamia, which could not be traced.

INCREASED RATES IN AUSTRALIA.—On the recommendation of P. R. Johnson, an English railway expert, who has been investigating the cause of the unfavorable financial condition of the state railways, increased freight rates and passenger fares have been adopted.

AMERICAN-MADE BRIDGE TO SPAN COLOMBIAN RIVER.—A representative of an American company has recently arrived in Colombia to inspect the site for a bridge over the river Cello to Chicoral, Department of Tolima, which is to be erected in connection with the Tolima Railroad now under construction. The bridge will probably be delivered at Cartagena in November or December next. The contract price was \$15,900 on board at New York. In connection with this bridge it is interesting to note that the Minister for Public Works has recommended that, when possible, a long iron span be constructed over the Magdalena River to connect the Girardot and Tolima Railroads.—*Commerce Report.*

Railway Financial News

BALTIMORE & OHIO.—F. H. Goff, president of the Cleveland Trust Company, has been elected a director to succeed Oscar G. Murray, deceased.

CANADIAN NORTHERN.—Graham A. Bell, of Toronto, has been elected a director to succeed H. W. Richardson.

CHICAGO & EASTERN ILLINOIS.—Under an order of the court in the foreclosure suit brought by the Central Trust Company in behalf of owners of Chicago & Eastern Illinois 5 per cent purchase money first lien coal bonds, the trust company is applying \$1,022,500 received from Receiver Keller in reduction of the amount found due the bondholders by the court. Payment of \$200 per \$1,000 bond is to be made. These bonds are secured by a first lien upon 41,000 acres of coal lands in Indiana and Illinois, which are to be sold under foreclosure December 17 and 18. The committee, which represents \$4,935,000 of the \$5,094,000 bonds outstanding, announces that it will take such action at the sales as in its discretion will best meet the interests of the depositing bondholders.

GEORGIA COAST & PIEDMONT.—Judge Emory Speer in the Federal Court of Macon, Ga., has granted the application of the receivers to issue \$150,000 receivers' certificates.

HOCKING VALLEY.—A dividend of $3\frac{1}{2}$ per cent has been declared, payable December 31 to stock of record December 14. This compares with a dividend of 2 per cent in June, making the total dividends paid this year total $5\frac{1}{2}$ per cent as against 4 per cent in 1916.

KANSAS CITY, MEXICO & ORIENT.—W. F. Hall, of Kansas City, has been elected chairman of the board of directors to succeed Edward Dickinson, deceased.

PENNSYLVANIA RAILROAD.—Samuel Rea, president of the Pennsylvania Railroad Company, answering the published rumors of an amalgamation of the Eastern and Western Lines of the Pennsylvania System, Wednesday, said:

"The Board of Directors is considering the acquisition by the Pennsylvania Railroad Company of the lines comprised in the Northwest System, chiefly the Pittsburgh, Fort Wayne & Chicago Railway, the Cleveland & Pittsburgh Railroad, the Erie & Pittsburgh Railroad, and other roads now entirely owned and operated by the Pennsylvania Company. All the capital stock of the Pennsylvania Company is owned by the Pennsylvania Railroad Company. The acquisition of the Pennsylvania Company, which the directors are considering, is in line with our policy of eliminating unnecessary corporation and duplicate accounting and financing. Whether it is finally consummated or not, it will not disturb the experienced and efficient organization of the Pennsylvania System now at Pittsburgh, which has charge of the administration and operation of the Western Lines. Under the present pressure of traffic, and in order to assist most effectively in the prosecution of the war, we need more experienced officers instead of decreasing the number. The rumored creation of a Chairman of the Board, and other radical changes in our organization, have no foundation in fact."

PITTSBURGH & WEST VIRGINIA.—The following directors have been elected: Asa S. Wing and William R. Nicholson, of Philadelphia; Ernest Stauffen, Jr., of New York, and H. E. Farrell, of Pittsburgh.

WISCONSIN & MICHIGAN.—This road, operating between Peshtigo Harbor, Wis., and Mountain, Mich., a distance of 124 miles has been sold to John Marsch of Chicago, who owns a majority of the first mortgage bonds amounting to over \$1,300,000. The price paid for the road was not made public.

WOMEN POLICE ON THE GREAT EASTERN.—Nine young women were recently sworn in as special constables on the Great Eastern of England. They were dressed in blue coats and skirts, with brass buttons, and wore caps with white covers and the company's badge.—*Railway Gazette*, London.

Railway Officers

Executive, Financial, Legal and Accounting

H. L. Borden, secretary and assistant treasurer of the Atlantic Coast Line at New York, has been elected vice-president, with headquarters at New York.

G. E. Matt, assistant to the auditor and treasurer of the Miami Mineral Belt, has been appointed auditor and assistant treasurer, with headquarters at Miami, Okla.

F. R. Perkins, general freight and passenger agent of the Salina Northern at Salina, Kan., has been appointed also auditor, vice H. G. Strode resigned to accept service with another company.

George J. Adams, chief clerk to vice-president of the Pennsylvania Railroad, has been appointed assistant to the vice-president in charge of accounting, with office at Philadelphia, Pa.

Robert S. Parsons, assistant to president and chief engineer of the Erie at New York, has been appointed assistant to the president and general manager of the Erie and the New York, Susquehanna & Western, also of affiliated lines, and will remain in charge of maintenance and construction, with headquarters at New York. He was born at Hohokus, N. J., and was educated at Rutgers College. In 1895 he began railway work as a rodman on the Erie; the following year he was made assistant engineer, and, in 1899, became division engineer of the New York, Susquehanna & Western. In 1903, he was appointed engineer of maintenance of way of the Erie, and three years later became assistant general superintendent of the same road. He was appointed superintendent of the Susquehanna division in 1907, and three years later was transferred in the same capacity to the New York division. On January 1, 1913, he was appointed assistant general manager of the lines east of Buffalo, N. Y., and Salamanca, with headquarters at New York. One year later he was appointed general manager of the Ohio Grand division, now known as the Erie Lines West, with office at Cleveland, Ohio, and in January, 1916, he was appointed chief engineer; the following September he was made assistant to the president and chief engineer, and now becomes assistant to president and general manager of the Erie and the New York, Susquehanna & Western and affiliated lines, as above noted.

R. S. Parsons

John F. Morris has been appointed assistant general auditor of the Denver & Rio Grande, with headquarters at Denver, Colo., effective November 1. This is a newly created position.

F. G. Sprain has been appointed auditor of freight overcharge claims of the Great Northern, with office at St. Paul, Minn., vice J. A. Nelson, who has been appointed grain claim agent, with the same headquarters.

Operating

J. A. Cochrane, superintendent of safety of the Great Northern, was appointed assistant to the general manager, with headquarters at St. Paul, Minn., effective November 15.

H. E. Birkinshaw, superintendent of the Salina Northern at Salina, Kan., has been appointed general superintendent, and R. E. Greene has been appointed car accountant, both with offices at Salina.

W. J. Sullivan has been appointed assistant superintendent of the St. Louis-San Francisco at Sapulpa, Okla., succeeding F. R. Kennedy, assigned to other duties, effective November 15.

W. W. Scannel, assistant freight auditor of the Chicago Milwaukee & St. Paul, at Chicago, has been appointed car accountant, with the same headquarters, succeeding J. L. Brown, promoted.

J. C. Grisinger, trainmaster on the Chicago, Burlington & Quincy, at Lincoln, Neb., has been appointed inspector of transportation with headquarters at Chicago, succeeding W. E. Fuller, transferred.

M. J. Griffin, formerly with the Chicago, Rock Island & Pacific, has been appointed superintendent of the Chicago, Terre Haute & Southeastern, with headquarters at West Clinton, Ind., succeeding F. A. Leith, resigned; effective November 1.

Samuel J. Hungerford, whose appointment as general manager, Eastern lines, of the Canadian Northern, with headquarters at Toronto, Ont., has already been announced in these columns, was

born on July 16, 1872, near Bedford, Que. He was educated in the common and high schools and began railway work in May, 1886, as a machinist apprentice on the South Eastern and later served with its successor, the Canadian Pacific, at Farnham, Que. He was then machinist at various places in Quebec, Ontario and Vermont. From August, 1897, to February, 1903, he was consecutively assistant foreman at Farnham, Que., locomotive foreman at Megantic, general foreman at McAdam Junction, N. B.,

and locomotive foreman at Cranbrook, B. C., on the Canadian Pacific. In February, 1903, he was appointed master mechanic on the Western division at Calgary, Alta. The following January he became superintendent of locomotive shops at Winnipeg, Man., and four years later was appointed superintendent of shops at the same place. In March, 1910, he became superintendent of rolling stock of the Canadian Northern and the Duluth, Winnipeg & Pacific at Winnipeg, Man., and in May, 1915, was transferred in the same capacity to the Canadian Northern at Toronto, Ont., which position he held at the time of his recent appointment as general manager, Eastern lines, of the same road, as above noted.

H. J. Main, chief dispatcher on the Smiths Falls division of the Canadian Pacific, has been appointed assistant superintendent on the same division, and H. C. Taylor, has been appointed chief dispatcher on the Smiths Falls division, vice Mr. Main.

J. A. Frates, Jr., vice-president and general manager of the Miami Mineral Belt, has been appointed vice-president in charge of operation; H. B. Granlee, traffic manager and treasurer, has been appointed general manager and treasurer; both with headquarters at Miami, Okla.

L. T. Johnston, trainmaster of the River division of the Chicago, Milwaukee & St. Paul, with headquarters at Minneapolis, Minn., has been promoted to superintendent of the Prairie du Chien and Mineral Point divisions, succeeding A. C. Peterson, who has joined the Russian railway corps as a major, effective November 1.

T. F. Durkin, assistant superintendent of the Denver & Rio Grande at Helper, Utah, has been appointed assistant superintendent of the Salt Lake division, with headquarters at Salt Lake City, vice C. F. Seymour, assigned to other duties. E. F. Marshall has been appointed trainmaster of the Salt Lake division, with headquarters at Helper, Utah, vice G. W. Penwarden, assigned to other duties, and J. R. Loftis has been appointed trainmaster of the Salt Lake division, with headquarters at Thistle.

H. M. Eicholtz, whose appointment as assistant general superintendent of the Chicago & North Western, with headquarters at Chicago, was mentioned in these columns on October 26, was born at Mathusa, Ill., on February 18, 1873. His service with the North Western has been continuous since August, 1890, during which period he has served as station baggage man, telegraph operator, station agent, train dispatcher, trainmaster, assistant superintendent and division superintendent, which position he held at the time of his appointment, as noted above.

George Collins, whose appointment as superintendent of the Quinto district of the Canadian Northern, with headquarters at Trenton, Ont., has already been announced in these columns, was born on July 20, 1860, at Wellers Bay, near Trenton, and was educated in the Trenton public and high schools. He began railway work in June, 1882, with the Central Ontario and subsequently served on that road consecutively as agent and train dispatcher at Trenton. From 1892 to 1894 he was secretary-treasurer, then was general superintendent and secretary until October, 1902, when he became receiver and manager. From December, 1906, to August, 1914, he was general manager and secretary and from May, 1913, to August, 1914, a director of the same road. In September, 1914, he was appointed superintendent of the Ottawa division of its successor, the Canadian Northern; one year later he was made superintendent of branch lines and from September, 1916, until his recent appointment he was special representative.

Traffic

C. S. Connolly, general freight agent of the Miami Mineral Belt, has been appointed traffic manager at Miami, Okla.

M. A. Hood has been appointed general agent of the Las Vegas & Tonopah and the Bullfrog Goldfield, with office at Tonopah, Nev., succeeding R. J. Highland.

J. L. Ferguson, whose appointment as general passenger and ticket agent of the Chicago & North Western, was announced in these columns on November 16, was born in Henry county,

Ky., on August 23, 1853, and was educated in the common schools. He began railway work in 1868 as a telegraph operator on the St. Louis, Kansas City & Northern, where he remained until 1875 when he entered the service of the Chicago & North Western, serving successively as ticket agent at Milwaukee, Wis., city passenger agent at Milwaukee, city passenger agent at Chicago, assistant general passenger agent and assistant general passenger and ticket agent. He held the position of assistant general passenger and ticket

agent at the time of his recent promotion to general passenger and ticket agent with headquarters at Chicago, succeeding C. A. Cairns, promoted.

J. J. Clark, chief of the traffic bureau of the Chicago & Eastern Illinois, has been appointed assistant general freight agent; E. J. Schmidt has been appointed to succeed Mr. Clark as chief of the traffic bureau, both with headquarters at Chicago.

W. J. Keane, general traveling agent of the Blue Line (New York Central) with headquarters at St. Louis, Mo., has been appointed commercial agent of the New York Central East Freight Lines, with headquarters at Dallas, Tex., succeeding C. W. Smith, resigned, effective November 6.

J. B. Large, assistant general freight agent of the Pennsylvania Railroad at Philadelphia, Pa., has been appointed general freight agent in charge of through traffic, to succeed Walter Thayer. Walter S. Franklin, Jr., division freight agent at Baltimore, Md.,

S. J. Hungerford

J. L. Ferguson

has been appointed assistant general freight agent, with offices at Philadelphia, Pa., and S. T. Stackpole, acting division freight agent at Baltimore, has been appointed division freight agent at the same place. A portrait of Mr. Large and a sketch of his railway career were published in the *Railway Age Gazette* of October 19, 1917, page 727.

C. A. Cairns, whose appointment as passenger traffic manager of the Chicago & North Western was announced in these columns on November 16, was born at Cleveland, Ohio. He entered railway service in 1878 as messenger in the president and treasurer's office of the Cleveland, Columbus, Cincinnati & Indianapolis, from which date he served to March 1, 1879, as stock clerk in the passenger department. He later held various positions in the general passenger department of the combined Cleveland, Columbus, Cincinnati & Indianapolis, Indianapolis & St. Louis, and Dayton & Union, until April 15, 1889, when he resigned as chief clerk to become chief clerk in the passenger department of the Chicago, St. Paul & Kansas City. From January 1, 1890 to August 15, 1892, he was assistant general passenger and ticket agent on the same road, following which he held various positions in the general passenger department of the Chicago & North Western until January 1, 1895, when he was appointed assistant general passenger and ticket agent. From March 1, 1903, to November 15, 1917, he was general passenger and ticket agent, the position he held when promoted to passenger traffic manager, with headquarters at Chicago, as noted previously.

Walter Thayer, general freight agent of the Pennsylvania Railroad, at Philadelphia, Pa., has been appointed general coal freight agent, succeeding to the duties of the late Robert H. Large. Mr. Thayer was born on April 27, 1874, and received his early education at the Haverford, Pa., schools, and was graduated from the University of Pennsylvania in the class of 1897. He entered the service of the Pennsylvania Railroad in the fall of 1895, as a receiving clerk in the Thirtieth and market streets freight station, Philadelphia. In 1896 he was transferred to Dock street station as a clerk in the claim department, and in 1897 he was again transferred to the rate room at the Broad street station. He was then promoted to freight solicitor of the United Railroads of New Jersey. In the fall of 1901 he was made special agent in the freight department of the Buffalo & Allegheny Valley division, with headquarters at Pittsburgh. In 1903 he was appointed eastern manager and general freight agent of the Erie & Western Transportation Company—Anchor Line—with headquarters at Philadelphia. On June 1, 1910, he was appointed assistant general freight agent of the Pennsylvania Railroad, and in May, 1912, was promoted to general freight agent, which position he held until his recent appointment as general coal freight agent of the same road, as above noted.

C. A. Cairns

W. Thayer

Engineering and Rolling Stock

J. C. Pickens, assistant engineer of the Atlantic Coast Line, at Rocky Mount, N. C., has been appointed division engineer, construction department, with headquarters at Richmond, Va., succeeding M. S. McDanel, resigned.

C. H. Crawford, assistant engineer in the mechanical department of the Nashville, Chattanooga & St. Louis, has been loaned to the War Industries Board of the Council of National Defense for service on the storage committee.

Galen B. Owen, superintendent of maintenance of the Erie at New York, has been appointed chief engineer of the Erie and the New York, Susquehanna & Western, and Harold Knight, assistant superintendent of maintenance at New York, has been appointed superintendent of maintenance of way; both with headquarters at New York. A sketch of Mr. Knight's railway career was published in the *Railway Age Gazette* of April 27, 1917, page 915, and a portrait of Mr. Owen and a sketch of his railway career were published on May 18, 1917, page 1073.

H. H. Temple, whose appointment as chief engineer of the Pittsburgh & West Virginia and the West Side Belt, with headquarters at Pittsburgh, Pa., was announced in the *Railway Age Gazette* of November 16, 1917, entered the service of the Baltimore & Ohio Southwestern in February, 1899, as an assistant engineer. In December of the same year he was appointed resident engineer in charge of construction work on the Springfield division. From March, 1901, to March, 1902, he was signal engineer on the same road, and from the latter date to April 1, 1903, he was division engineer. On April 1, 1903, he was transferred to the Baltimore & Ohio, as division engineer of the Connellsville division, and in December, 1903, he was moved to the Pittsburgh division. In June, 1905, he was promoted to engineer maintenance of way of the Pittsburgh system, which position he held until January 1, 1907, when he became superintendent of the New Castle division. On March 1, 1914, he was appointed superintendent maintenance of way in charge of construction and maintenance of the San Antonio & Aransas Pass. His appointment as chief engineer of the Pittsburgh & West Virginia and the West Side Belt was effective October 22.

Railway Officers in Military Service

Fred. Jasperson, engineer of docks and construction of the Philadelphia & Reading at Port Richmond, Philadelphia, Pa., has been commissioned a lieutenant-colonel, and has left for Russia with the special force organized for the government by the Baldwin Locomotive Works, for repair and reconstruction work on the railways in Russia.

OBITUARY

G. E. King, assistant general passenger and ticket agent previous to 1905 of the Michigan Central, at Detroit, Mich., died on November 19.

G. H. Worcester, formerly superintendent of the Lake Shore & Michigan Southern and later superintendent of the Harlem division of the New York Central & Hudson River, previous to 1891, died at his home in New York on November 17.

George M. Miller, formerly from 1881 to 1887 president of the Denver, Utah & Pacific and later president of the Housatonic Railroad, vice-president of the New York, Providence & Boston and a director of the New York, New Haven & Hartford, died on November 14, at his home in New York, at the age of 87. He served as president of the Newport & Wickford Railroad and Steamship Company in 1871, and in 1879 was president of the Providence & Stonington Steamship Company, which is controlled by the New Haven.

Edward T. Postlethwaite, assistant to the president of the Pennsylvania Railroad, at Philadelphia, Pa., died on November 14, in a hospital in that city. He was born in July, 1850, and entered the service of the canal department of the Pennsylvania Railroad in April, 1863, as timekeeper, and in 1872 became shop clerk in the Northern Central shops at York. He later served in the office of the superintendent of motive power of the Pennsylvania Railroad at Altoona and then was successively chief clerk in the office of general manager, second, and first vice-president until February 10, 1897, when he was appointed assistant to the president.

To operating officers, the prize paper on discipline without suspension, printed in this issue, should offer a number of

Progress in Railroad Discipline

hints concerning the best way to perfect the discipline of a hundred or a thousand train- and station-men. It cannot be that there is much need of further argument on the bald primary question of suspensions versus the Brown system, for those officers who still continue the old practices are practically unanimous, so far as we have been able to discover, in speaking only words of praise for the new system and apology or explanation for the retention of the old. Therefore, it is proper in this place to concentrate attention on the task of perfecting what has already been well begun. And we address operating officers collectively, excepting none, because of the universal testimony to the imperfection of the present rules, regulations and practices everywhere. The difficulty of maintaining the ideals so clearly outlined by Messrs. Heath and Keeler is constantly recognized on the best managed roads. It might sound pleasanter to use a softer word than "imperfection"; but why dissemble? Everybody knows the never-ending perplexities of keeping a large force of trainmen keyed up to a high level of energy and vigilance. The road to perfection is a long one; but the goal is clearly recognized, nevertheless. There is no greater satisfaction in a superintendent's or a trainmaster's workday life than that to be found in a force of men whose intelligence, training, and character are so well settled that the officer's confidence in them can be based on knowledge as well as faith; and where the employees' capabilities and their confidence in their employer are settled on such a sound basis that their loyalty can be seen to be growing constantly firmer.

George W. Anderson, of Massachusetts, one of the new members of the Interstate Commerce Commission, held a hearing

Discrimination in Mileage Tickets

at Boston last week to consider general traffic conditions on the New England railroads; and in discussing passenger fares he said, according to the reports, that he "never could understand why there should be discrimination between a person who could afford to pay \$25 for a mileage book and one who could buy only a single ticket"; he thought that it might be a good

thing to "do away with mileage books and charge a flat rate to everyone." The reporters might have added that no one else ever could understand that point, either, without bolstering up his reasoning by arguments both illegitimate and unscientific. To say that the "wholesale principle" warrants a discount to the buyer of \$25 worth of rides makes a big point out of a very little one. Mileage tickets have been justified on the ground that they accommodate the commercial traveler; but the only material ground for giving him a lower rate is to secure his freight shipments; and freight discounts or commissions ought to be charged to freight accounts, not passenger accounts. It used to be said that mileage tickets were very convenient for use by dishonest conductors and dishonest drummers in combining to cheat the road; and it is still said that they are traded in by storekeepers who sell parts of tickets, at a small advance, to persons who wish to save a few cents in that way. However, the popularity of the mileage ticket rests, not on arguments about economy or honesty but on the views of thousands of people who feel that they have saved a great deal of money by using them; and it may be that Mr. Anderson's frankness is due mainly to his newness. The public and the railroads will await with interest the views of the other eight commissioners on this question of justice to the poor.

The Railroads' War Board, in bulletin 42, suggested that in order to increase the efficiency of the railroads they "en-

Highways Helpful to Railways

courage the use of motor trucks and co-operation with the trolley lines for handling short haul freight." To make use of motor trucks, it is, of course, necessary to operate them over properly constructed highways and to keep up the maintenance of these highways. Priority order No. 2, issued by the Priorities Committee of the War Industries Board of the Council of National Defense on October 27, denies the use of open top cars for the transportation of materials and supplies "for the construction, maintenance or repair of public or private highways, roadways, streets or sidewalks." This order, if it is not modified during the winter, will, of course, stop work on all highways so far as it depends on the haulage of material in open top cars. Meanwhile a Highway Transport Committee has been appointed by the Council of National Defense, as noted in the *Railway Age Gazette* of

November 16, 1917, to study the possibilities of motor truck transportation; it is quite probable that this committee will investigate the possibility of relieving the railroads by motor truck haulage at congested terminals. It is exceedingly important that railway officers co-operate with state highway commissioners and public authorities to determine just what roads will be of the greatest value from this standpoint so that all of the available money and material may be expended on the strategic points. These must be determined upon in the very near future in order that the plans may be made and the material provided so that work may be started at the opening of the season. If the strategic value of these stretches of roadway is placed before the Highway Transport Committee and is clearly understood, the Priorities Committee will doubtless co-operate in seeing that arrangements are made for transporting the necessary materials.

THE VALUATION DEPARTMENT AND EXEMPTIONS

IN proportion to the number of its employees, probably no branch of railway service has furnished as many men for the various classes of government work in this war as the engineering department. Not only has it contributed its full quota by conscription but it furnished three of the nine regiments of railway men sent to France in addition to representation in the five operating regiments. Many engineers have been called to assist in the building of the cantonments and other construction activities of the government while others have enlisted in the engineering corps of the army for foreign service. As a result the engineering forces are seriously depleted on many roads, even to the point of seriously delaying the progress of improvements.

One branch of the engineering department which is particularly hard pressed is that engaged in valuation. Here the forces have been recruited almost entirely in the last three or four years, and are composed to a large extent of young, unmarried men. As a result the number leaving for military service has been unusually large. At the same time the federal division of valuation has been urging the roads to make greater progress in the completion of maps and the collection of data. In spite of this pressure the roads have generally followed the policy here as elsewhere in the engineering department of refusing to claim exemption for their men, believing that the war-time needs of the government were at least equal to their own. Because of the position taken by the roads in this respect there has been much criticism of the government valuation forces because of rumors that exemption is being claimed generally for the men in at least one district in an effort to avoid the depletion of forces suffered by the roads. It is encouraging to learn from official sources that this reported attitude of at least the one district does not reflect the position of the Division of Valuation. We are advised that the division has encouraged the enlistment of its men in military service, and particularly the entry of its engineers into the Engineers Reserve Corps, and that many employees of the Division of Valuation have enlisted in that branch of the service. Likewise leave without pay has been granted employees desiring to attend the training camps, the law preventing the continuance of the salary of government employees whose names go on the pay roll in another branch of the service. Likewise we are advised that the officers in the valuation department have been instructed not to send in claims for exemption for approval to headquarters unless in their opinion it would be practically impossible to fill the men's places at the present time. Acting under these instructions 52 applications for exemption have been received, only 31 of which have been approved by the commission.

The total number of men in the employ of the Division of Valuation is about 1,575.

The fact that the Division of Valuation is taking this broad view with reference to exemption in spite of the plea of certain men in the division that universal exemption should be claimed is to be commended. At the same time the fact that claims for exemptions are being urged by anyone indicates the drain on the railway engineering talent of the country which the valuation work is creating. This gives added weight to the suggestion that the work be discontinued at this time in order to further the solution of the one big problem of this country at the present time—winning the war. We believe this to be particularly desirable because of the recent statement by the director that he has been forced to reach the conclusion that the present law does not require the determination of final values of the properties of the railroads, and that this will not be done at the present time, so that the work when completed will be far from conclusive.

THE COAL SITUATION—A NATIONAL MENACE

THE coal situation is becoming a menace to the prosperity of the country and to the success of its military preparations. The total production of bituminous coal in the United States in 1916 was 502,520,000 tons, and the total production of Pennsylvania anthracite was 87,578,500 tons, making a grand total of 590,100,000 tons. This was the largest output ever known, being an increase over that for 1915 of about 58,400,000 tons. It was estimated after the United States entered the war that in order to meet the industrial and military needs of this country the production in 1917 should show an increase over that of 1916 of 100,000,000 tons, or about 17 per cent.

The increased production which it was estimated would be needed is not being attained. At the end of October the production of bituminous coal was less than 10 per cent ahead of that in the corresponding year of 1916.

In consequence of the failure to produce the required amount of coal, there is a general shortage of it for domestic, for industrial and for other purposes. The concerns engaged in the manufacture of munitions complain that maximum output by them is prevented by inability to get sufficient coal. The railroads are in danger of not being able to get enough. The householders in communities all over the country are being rationed by their dealers and live in constant dread lest they will be unable to keep themselves warm this winter.

Why does this condition exist? It exists mainly because the coal producers of the United States have displayed sordid selfishness, a want of business capacity and a lack of patriotism. The railways, foreseeing the course of developments, organized themselves to meet the country's transportation needs during the war within five days after war was declared. The coal producers have not yet properly organized themselves to meet the country's needs for fuel. The railways, in spite of the seriousness of their labor situation, have succeeded in keeping their employees sufficiently satisfied to avoid interruption of their operations, except in a few sporadic cases. The coal producers have shown such want of diplomacy and capacity in dealing with their labor that month after month the reports of the United States Geological Survey have shown that mines all over the country have been working to much less than their capacity because of labor troubles. The railways have been obliged to go on rendering their service for the same rates as before the war, although they have had greater increases in expenses of operation than the coal producers; and yet during the five months ending with August they handled 16 per cent more freight than in the same months of last year, and in the

months from May to October, inclusive, they transported 18 per cent more coal than in the same months of last year. They have moved this year's increased output of coal, and also the vast quantities of it which in former years would have moved by water. The coal producers, on the other hand, succeeded in getting the government to fix prices for coal vastly higher than any ever known before the conditions created by the present war; but in spite of these high prices they have exerted themselves sufficiently to increase their production by only about 10 per cent.

While these facts are obvious, the government Fuel Administration at Washington does not seem to have discovered them. Instead of adopting measures to secure greater production of coal, it is largely engaged in paying compliments to the producers for having secured the relatively small increase of production they have obtained and in joining with them in "passing the buck" to other agencies. The coal producers are practical men. The Fuel Administration seems to be composed chiefly of theorists. To all appearances, the practical men are manipulating the theorists to suit their own purposes. It looks as if the Fuel Administration which was created largely to control and promote the production of coal, has fallen under the control of those it was created to regulate.

Having failed through avarice, incapacity and want of patriotism to meet the requirements of the situation, the coal producers are engaged in the familiar practice of crying "stop thief." The National Coal Association, an organization formed apparently to increase the output of misinformation regarding the fuel situation rather than the output of coal, is issuing frequent statements intended to put the responsibility for the failure to secure adequate production of coal upon the railroads. On October 8 the National Coal Association announced that "bituminous coal production in the United States was reduced approximately 2,000,000 tons last week by car shortage and railroad congestion." Again, on November 23, the coal operators issued a statement saying, "It has been impossible for the railroads expeditiously to handle even the most vital necessities of the country, including fuel."

But the coal producers give reports to the United States Geological Survey as well as to the general public regarding their activities. Doubtless under present conditions they do not make their reports to the Geological Survey any less favorable to themselves than is entirely justifiable. Nevertheless, their reports to the Geological Survey, taken at their face value, indicate a very different situation from the statements being given out for public consumption by the National Coal Association.

In a letter published in the Washington Post on November 22 Fairfax Harrison, chairman of the Railroads' War Board, called attention to the actual situation as disclosed by the weekly reports of the Geological Survey. He said:

"The statistics indicate that 'full time output' of the bituminous mines would be at the rate of approximately 14,300,000 tons a week. During the seven weeks ended with November 3 production amounted to 10,600,000 tons per week, or about 4,000,000 tons a week less than 'full time output.' We find that the part of the weekly deficiency as compared with 'full time output,' which was attributed by the Geological Survey to 'car shortage,' was 1,717,000 tons, but this accounts for only 45 per cent of the failure to secure 'full time output.' It leaves 2,209,000 tons, or 55 per cent, of the weekly deficiency to be accounted for on other grounds. After allowing for all the shortage of production attributed by the Geological Survey to the railroads, there still remains a much larger additional shortage of 2,209,000 tons a week, or 13,500,000 tons in seven weeks, which it was entirely within the power of the National Coal Association to produce and deliver to the public."

During the eight months since the United States entered the war, the railroads have not only handled a vastly larger coal traffic, but a vastly larger traffic of every kind than they ever did before; and yet during at least three-fourths of this period reports of the Geological Survey have shown that most of the failure of the mines to secure their theoretical

"full time output" has been due to causes other than "car shortage." The Geological Survey classifies the causes of failure to secure "full time output" under the headings, "Car Shortage," "Labor Shortage and Strikes," "Mine Disability," "No Market," "All Other Causes," and "No Cause Given." The combination of causes resulting from conditions under the control of the coal producers themselves during 12 weeks out of the 18 ending with November 3, had more effect in limiting the total output of the mines than did car shortage.

It goes without saying that the prime requisite to the maximum transportation of coal is the loading of cars as fast as they are set at the mines. When the mines are prepared to produce to full capacity, but the railroads do not furnish enough cars, the limitation of output is due to car shortage. When the railroads furnish enough cars, but the mines are unable to load them all, the limitation of output is due to shortcomings in the operation of the mines. Since the reports of the Geological Survey show that shortcomings in the operation of the mines have had much more effect in preventing full time output than car shortage and railroad congestion, it seems to be about time that the coal producers should begin to do their part in securing full time output instead of inspiring attacks upon the railroads for their relatively small failure to do their part.

There is a tradition that the streets of ancient Jerusalem were kept clean by every man sweeping in front of his own door. Consideration of the advantages of this practice is commended to the producers of coal. The *Railway Age Gazette* does not believe in government operation of industries. If, however, there is any industry in America which, since this country entered the war, has justified serious consideration of government seizure and operation of it, that industry is the coal industry. If the coal producers persist in following the course that they have thus far been following, they will be the first of the large industries to provoke the natural public resentment which will land them in the hands of the government.

THE POOL OF THE EASTERN LINES

THE *Railway Age Gazette* in an editorial in its issue for November 23 entitled, "The Railway War Problem and Its Solution," emphasized the point that the main thing needed to enable the railroads to handle more traffic was to pool their facilities. We also indicated that before this could be done, the anti-pooling section of the interstate commerce act and other federal laws restricting the freedom of action of the managers of the railroads must be repealed.

We were right as to the former point. The Railroads' War Board, by action taken last Saturday, has supported the contention as to the need for complete pooling. We were wrong as to the necessity for legislation. The War Board created a pool of the railroads east of Chicago without waiting for the slow processes of legislation to authorize it.

The statement issued by the Railroads' War Board outlining the measures adopted referred to them as "revolutionary." This was no exaggeration. Under the plan adopted the operating vice-presidents of the eastern lines are authorized and instructed to work all of the facilities of the railroads in the territory east of Chicago as if they were all owned by a single company. If a single company owned them and if it were well operated, it would move every passenger and ton of freight over that line which at any given time was in the best shape to handle it; and this is what the War Board has directed the committee of operating vice-presidents to do, and what it has begun to do. Just how extensive will be the changes in routing and in the methods of handling passengers and freight required to accomplish the desired result, only experience can show, but

whatever methods are necessary will be adopted, regardless of the interests of the individual railway companies.

The situation on the eastern lines is the key to the entire transportation situation of the country. On them is being concentrated a vast traffic originating throughout the United States. In consequence, there has developed on them a congestion which is largely responsible for the shortages of cars being reported from other sections. The pool of facilities which has been created in the east is, therefore, adapted not merely to relieve the situation in that section, but also to improve it throughout the country. One important part of the plan is the transfer of as many men, locomotives and machine tools as practicable from the western and southern lines to the eastern lines and the use of the repair shops of the western and southern lines to some extent in maintaining the equipment of the eastern lines.

The creation of this pool of the eastern lines is the most important step which has been taken by the Railroads' War Board in carrying out the resolution adopted by the railway presidents in Washington on April 11 to operate all the railways of the country as a single continental system. The first important step taken in carrying out that resolution was the creation of the box car pool. The next was the adoption of measures, which have proved highly successful, for securing a greater utilization of locomotives and cars. The next was the pooling of all military freight and passenger transportation. This last mentioned is a measure concerning which not much has been said, but which has been of great importance. In co-operation with the government military authorities, the Railroads' War Board and its subsidiary committees have regularly routed military freight and passenger business over the lines of least resistance. It has been chiefly due to this that there have been practically no congestions or delays in the transportation of materials for the construction of the cantonments or in the movement of troops, or of supplies for the troops. In addition, the transportation of supplies for this country's European allies has been practically pooled.

In spite, however, of all these measures and especially of the great increases which have been secured in the amount of traffic moved by every locomotive, every car and every train, a very serious congestion developed on the railways in the eastern territory and especially upon certain lines in that territory. The main cause of the congestion has been the enormous increase of business, but another important cause has been the failure of the government to adopt adequate measures for controlling the movement of materials being used in its military preparations. Judge Lovett, the government priority director, has not issued enough priority orders to cause any trouble, but the different government departments have had preference given to such a large volume of shipments that last week it was reported that on certain of the main eastern trunk lines two-thirds of all the freight being handled was moving under preference requirements. The railways have asked the representatives of the government to help relieve the situation by such means as the diversion of traffic from the North Atlantic to the South Atlantic ports, by the reduction of preference orders and by the reduction of the cross-hauling of coal.

The pool of the eastern lines which has been created is primarily a pool of physical facilities. The duty of the government in the premises is not doubtful. Its officials were cognizant before the railways took this important step that they were going to take it and the reasons for it. Therefore at the earliest practicable time the government should adopt all measures necessary to enable the roads to do with unquestioned legality all the things they are now doing or that they ought to do in future to promote the public welfare, and at the same time to prevent any of them from suffering serious losses as a result of the patriotic course they are following.

NEW BOOKS

Ingeniería de Ferrocarriles. By Verne Leroy Havens. First Edition, 357 pages, 4½ in. by 7 in. Illustrated. Bound in leatherette. Published by John Wiley & Sons, New York. Price \$3.50.

This book is written in the Spanish language and is intended for the use of the railroad builder of Central and South America and his assistants. The sub-title, "The Theory and Practice of Railways from the Conception of the Idea to the Completion of the Project," expresses the purpose of the book, namely, to condense within the space of 356 pages, the fundamental principles of economic railway location, the methods of making railroad surveys, the management of field parties, and the principles of railway surveying. The last 100 pages are devoted to the usual tables found in a field book on railroad engineering, using the metric system. The book contains chapters on Commercial Considerations, Railway Estimates, Reconnaissance, Field Party Organization and Equipment, Preliminary Surveys, Topography, Railway Economics, Railway Surveying and the Adjustment and Care of Surveying Instruments.

Shape Book. 352 pages. 5 in. by 8 in. Bound in Flexible leather. Published by the Carnegie Steel Company, Pittsburgh, Pa. Price \$1.

This is the sixth edition of the Carnegie Shape Book and, with few unimportant exceptions, contains profiles of all of the sections rolled in the structural plate, bar and rail mills of the Carnegie Steel Company. Compared with the fifth edition issued only two years ago, there are 265 pages in the new volume in place of 227 pages in the earlier one devoted exclusively to the profiles of sections. This increase in the number of sections has been made necessary by the remarkable expansion in ship building and the extensive use of steel frames for windows, doors and skylights in industrial building construction. In addition to sections for these purposes and the usual structural steel sections, dimensions are given for the standard A. S. C. E., and A. R. A. rails and a considerable number of special rail sections, as well as the sections of angle bars and other forms of rail joints. Four pages are devoted to sections of steel ties. The last 85 pages comprise tables of weights and areas and an index to the section numbers.

Wood and Other Organic Structural Materials. By Charles Henry Snow, dean of the School of Applied Sciences, New York University. 478 pages, illustrated, 6 in. by 9 in. Bound in cloth. Published by McGraw-Hill Book Co., 239 West 39th St., New York. Price, \$5.

Wood, unless treated alone, is usually associated in texts with the other common structural materials, steel, iron and masonry. In this book it is associated with certain other organic materials used in structures, namely, oils, paints, varnishes, glues and India rubber. The subject of wood covers 376 out of the 478 pages and the treatment may be said to comprise a general account of its physical properties. Strength, elasticity and other characteristics of special importance in the structural use of wood receive only minor treatment, a policy which the author justifies in the preface. The first 44 pages are given to an exposition of the physical makeup of wood. Following this, nearly 200 pages are devoted to a cataloging of the various species and their characteristics. Thirty-three pages cover the common structural properties, and following these is a chapter on decay. Fire hazards with respect to the use of wood in structures are also covered at some length. Marine wood borers and other wood destroying insects are given a much more full and complete treatment than is usually found in most books on wood. Fifty pages are devoted to the protection of wood against decay and animal life by the well known methods. The last 100 pages of the book cover the physical properties and uses of the other organic materials mentioned above. The treatment is interesting and combines in one volume much information that is not often found outside of the more extended encyclopedias.

Letters to the Editor

ARE LOCOMOTIVES SLACKING?

NEW YORK

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

Why should all the recent remarkable improvement of railroad operation be secured by heavier car loading? In opening the rate case for the railroads George S. Patterson, railroad counsel, is quoted in the November 9 issue of the *Railway Age Gazette* as making this significant statement:

"The Eastern lines are achieving remarkable efficiency records with a plant several years behind the growth of the country. Eight billions more ton-miles were produced in the first four months of the war than in the same period last year. This gain of 15 per cent in service rendered the nation, with only 1½ per cent in equipment, was almost entirely the result of the heavier trainloading."

Is the present locomotive equipment already hauling up to the limit of its weight? Certainly a study of some of the annual reports would indicate otherwise.

The Southern Railway and the Illinois Central have approximately the same class of traffic. The Southern owns 1,660 locomotives against 1,437 for Illinois Central. But while the Illinois Central increased the number of freight ton-miles 17 per cent with only 3.3 per cent increase in freight locomotive miles, the Southern increased its revenue ton-miles 14.6 per cent and took 12 per cent more freight locomotive miles to do it. Why this difference? Heavier engine loading is the answer. What has been done by one road can be duplicated by others. The pressure for more transportation is coming stronger and stronger. It is only a matter of time till all managements will be awake to the opportunity for increased efficiency that lies in heavier engine loading. It is reported that the Southern is increasing the hauling capacity of its existing locomotives by modernizing them at a rapid rate. When this work is complete and if the re-rating is made on new basis of a heavier loaded and therefore easier hauling train, the Southern will undoubtedly show a fine increase in ton-miles per freight locomotive miles.

A. N. OPERATOR.

REDUCING THE NUMBER OF TELEGRAMS

RATON, N. M.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

The article appearing in your issue of September 7, entitled "Swat the Letter Campaign," leads the writer to observe that the paring down of some telegrams and the entire elimination of others would make an appreciable saving.

How many of us, when dictating or writing a telegram, make a mental calculation of what the telegram would cost the company if sent at commercial rates and what would be saved out of our own pocket in case we were to pay for it by cutting out an extra word or two?

Such phrases as "Please advise" or "Advise quick," have no place in a telegram. The mere fact that we are sending a telegram should indicate to the recipient that prompt action is required. We get into a habit of sending the conductor and engineer a certain form of message, when through some fault or other the train is not making the time expected, or the engine has a mechanical failure. In these progressive days of telephones, better and more concise information can usually be had by talking to either on the telephone. The engineer should make a report or send a message stating the engine's disability and not have to be asked for it by wire.

Almost every railroad in the country has passenger train service that leaves general and division offices after the

closing hour, and passes stations during the night, which could carry messages enclosed in a certain colored envelope requiring preferred attention over ordinary mail. Yet every day we see messages originating from general and division offices that could be efficiently handled by mail. Some roads have adopted this "Train-gram" system, but there is still big room for improvement in reducing the number of telegrams handled and eliminating unnecessary words.

In order to bring about a reduction in the number of telegrams handled, the manager of the telegraph office, for instance, should make a copy of a few messages that appear unnecessary or contain unnecessary words, and send copies to superintendent of telegraph, or to the division superintendent, to be handled with party at fault. I do not mean to imply that the manager of the telegraph office should be dictator or censor of telegrams passing through his office, but once it is generally known that useless and lengthy telegrams were being watched, a big reduction will be noticed.

T. C. LOONEY.

WHAT IS A FULL CREW?

ELIZABETH, N. J.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

Judging by the report printed in your paper, November 16, the hearings held by the State Railroad Commissioners on the Central of New Jersey "full crew" application did not bring out much of anything that would really enlighten anybody on what the law requires or what it ought to require; or whether it is of any use at all. If you have quoted all that was in the report concerning the "protection of passengers and employees," which is said to be the object and purpose of the law, it must be a pretty poor report; for the question of safety was not wholly ignored. At several points the witnesses were questioned as to whether a certain piece of work could be done any more safely by three brakemen than by two, and in every instance, I believe, the answer was that there was no difference. One witness summed up by saying that the sixth man (the third brakeman) was as necessary on a freight train as a spare tire on an automobile; but nobody seems to have cared to inquire how the fifth tire makes an automobile run any more safely or in what way it "protects" the occupants of the car or of any other car on the street, except as it protects them from the annoyance of a long delay in case a tire has to be renewed while on the road.

If you had been in the lobby outside of the hearing room on one of the days of the investigation you might have heard some facts concerning this question of freight train operation, more enlightening than those brought out by the commissioners. It is not an unheard of thing for more light to be shed on knotty questions in the lobbies than in the court room, and your readers will be interested in the following scraps of a dialogue between a yardmaster, who may be called Frank Elston, and a venerable looking lounge, who may have been a yardmaster (or a reporter or a clergyman) forty years ago, but whose only present occupation seems to be to sit around looking like Judge Chambers. I cannot tell you his name, but we may call him I. Newton. Approaching the yardmaster, whom he seemed to know, he said:

"Rather dreary chin music in there" [in the hearing room].

Elston: "I believe you! Lawyers never seem to get anywhere until they get up to make their own speeches. As to the witnesses most every lawyer seems either to think they are too tender to be abroad except when packed in cotton, or else they are enemies who ought to be put in jail for their stupidity or their dishonesty. Why don't they get somebody on the witness stand who can tell that bunch [the commissioners] what's what?"

Newton: "That ain't the way they do things in courts!

But is there really anything in this claim of the trainmen that they have such a hard job getting over the road with these heavy trains?"

Elston: "Yes; there is something in it; but what makes me mad is their darned laziness. Those difficulties which their lawyer makes so much of are real enough, but what do they amount to? When a drawbar pulls out in the middle of a fifty-car train there is no fun in dragging a heavy chain from the caboose, especially if it is a dark night and you stumble over a tie and fall and scratch your hands; but what has that to do with protecting the passengers and employees which the commissioners say is the purpose of this law? Everybody knows that a fifty-car train of today is a slow coach compared with railroading years ago, but what if it is? Does the fact that a train loses an hour on the road because of a delay which could have been reduced to half an hour if another man had been there warrant the legislature in increasing our expenses for brakemen? I am constantly watched by my boss to see if I am wasting the company's money in any detail of my work; and here these lazy brakemen are doing their best to waste the company's money by putting on a man who does about five minutes' work on a trip—five minutes of necessary work, I mean."

Newton: "But how about those terrible long trains when they have to stop in a cut, on a curve, where it is impossible to see from one end of the train to the other? They claim it is dangerous handling trains in such conditions."

Elston: "Shucks! The 'danger' is all in the lawyer's eye. The brakemen know better. They wouldn't try to stuff that down the throat of a commissioner who knew anything about railroading. If you can't give a signal because of a curve you've got to run forward a few cars; that's all. It may delay you as much as five minutes, but what has that got to do with the safety that they are always harping on? And, did you notice that fat fellow who was asked about where the 'full crew man' rode? Always in the caboose! If he is needed anywhere it is on the middle of the train, where he can watch for hot boxes and where he can pass the hand signals when they stop in that Phillipsburg cut; but the twentieth century brakeman is not putting himself to any such inconvenience as riding out on top when he knows that it is not necessary. The more men they have in a crew, the less attention they pay to the little things. They don't even inspect the running gear at tank stops as they pretend to do. Why, on the Pennsy a year or two ago, down below Trenton, they had a wreck, killing several men riding in a car with some race horses and costing the company \$100,000, all due to a hot box which had been blazing for 10 miles, and not a man in the crew had seen it! If the extra man would ride on top; in the middle of the train; and if he would watch out as he ought to, he would, once in a while, discover a hot box, or a brake beam down, which would not be seen from the engine or from the hind end; but those occasions are so rare that they are not worth counting."

Newton: "I suppose that in taking and leaving cars at way stations, the additional man is a real help. They have to flag trains in all directions, don't they? I should suppose it would take a half dozen men instead of two."

Elston: "Not much! That is one of their principal fads, but there is not anything in it. Many times they can save perhaps five minutes by having the extra man, but that five minutes' saving costs somewhere from ten to a hundred dollars; for the stops of the through trains, in which this supposed saving is made, do not happen very often. There isn't any question of safety about it. As to flagging, the block signals protect them both ways. If there is any danger that some extra freight may come along and run into them, the thing to do is to jack up the engineers of those extras so that they will obey the block signals."

"This 'full crew' nonsense is tiresome. What is a full crew? Why, one consisting of enough men to do the work. On a long local passenger train they might need four or five

men, to assist passengers. On a local freight train they can economize time—not increase safety—by having a half a dozen men. But on a long freight train, every movement of which is controlled by the engineer with his throttle and his brake valve, the crew of a conductor and two brakemen have nothing at all to do for about nine-tenths of the time. The committees, who simply want to make more jobs (they will ask the legislature for a second extra man as soon as they dare to) talk loudly about safety; but all the real purpose they have in their minds is the safety of their pockets; or, rather the fattening of their bank accounts. They get away with their fake arguments because the lawmakers are constantly tumbling over each other to curry favor with the brotherhood. These lawmakers don't ask themselves whether the trainmen's statements are sound; but only whether they will hold water long enough to get the governor to sign any old bill they choose to put before him. The trainmen put it over the superintendent not because he does not know better, but because he thinks it best not to start a fight with such an ugly bunch, who are mean enough, any time, to knock him when they go to the general manager—if it happens to suit their purpose to do so.

"I wish they would get some real safety into their legislative grinding machines. They keep on doing everything to please the union, but a bill to promote good railroading in a rational way usually dies from neglect. As to handling freight trains, the question of safety is one for the civil engineers and the accountants to deal with. In theory an efficient crew of six men can sometimes carry out some particular safeguard in a way to make the protection against accidents a hair's breadth more satisfactory than it could be done with a smaller crew; but they can't prove it in practice and any increase or decrease in safety that can be measured, even in your mind, is never discoverable."

Mr. Editor, I forbear to take more of your space; most of your readers know these things already, but I thought perhaps you were not repeating them often enough. How can we get some of these illuminating informal dialogues which may be heard in any state capitol when occasion arises—how can we get them into the printed proceedings? How can the talk of the lobbies be transferred to the halls of justice where the judge and the reporters can have the benefit of hearing them? N. M. JAMES.

NEW LIGHTING ARRANGEMENT IN SLEEPING CARS

CHICAGO, Ill.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

I have been interested by the letter signed "Traveler," and those which have followed it, regarding the objections to the upper berths in sleeping cars. I agree with the letter published in the issue of October 19, that the greatest objection to the upper berth is that of light.

It is encouraging to those who spend much time in sleeping cars to know that the Pullman Company is devising methods that will remove the disadvantages of the present lighting system. In my travels I have noticed a new lighting arrangement which has apparently been installed to provide illumination for the floor of the car after the ceiling lights have been extinguished. Some of the installations which have come to my notice have been open to the objection that the floor light was noticeable in the lower berth. In one of the new lighting systems the illumination of the floor has been accomplished by fixtures placed below the end of the seat and this arrangement, in my opinion, is entirely satisfactory. It provides all the light that is required yet would not be noticed by any one inside the berths. The time is probably not far distant when those who prefer the upper berths will no longer be annoyed by the glare of the cluster lights in the car ceiling after they have retired.

OBSERVER.

Eastern Railroads to Be Pooled

To Be Operated Under Committee of Vice-Presidents— Revolutionary Measures Adopted to Relieve Congestion

THE Railroads' War Board on November 24 adopted the most revolutionary measures it has undertaken since its organization in order to relieve the congestion of traffic on the eastern railways. It directed "that all available facilities on all railroads east of Chicago be pooled to the extent necessary to furnish maximum freight movement." The effect of the plan adopted will be that to the full extent that conditions render it desirable these railways will be operated as a unit, entirely regardless of their ownership and individual interests. The operating vice-presidents of the eastern lines have been appointed a committee to operate as a unit all the lines involved and have been given instructions and authority to adopt all measures which in their judgment may be necessary to relieve the present situation and assure the maximum amount of transportation.

An important part of the plan adopted for the operation of the eastern lines is that of placing at their disposal the facilities of railways in other territories to such extent as may be necessary.

The special action taken with reference to the eastern lines is in recognition of the fact that the situation on those lines is more critical than in any other part of the country because upon them is being concentrated the bulk of the fuel and raw materials being used in the manufacture of munitions and also the vast quantities of supplies and food stuffs which are being transported to Europe. Therefore, locomotives, employees and machine tools will be transferred from other railways to the eastern lines, and the repair shops of other lines such as those of the western roads in Chicago, will be utilized for making repairs on the equipment of the eastern lines.

The measures adopted were the result of a series of conferences with government authorities and officers of the eastern lines which the Railroads' War Board initiated on Monday, November 19. The vice-presidents of the eastern railways were called to Washington on Thursday and received from the War Board their instructions for immediate action. On Saturday a meeting was held which was attended by Dr. H. A. Garfield, the government Fuel Administrator; E. N. Hurley, chairman of the United States Shipping Board; Robert S. Lovett, the government priority director, and Commissioner Edgar E. Clark, of the Interstate Commerce Commission, and the Railroads' War Board. At this conference the situation was fully discussed with the representatives of the government, who concurred in the importance of adopting the drastic measures decided upon as the result of the recommendations of the vice-presidents.

The measures the Railroads' War Board and the committee of operating vice-presidents will put into effect at once are as follows:

MEASURES TO BE PUT IN EFFECT AT ONCE

All available facilities on all railroads east of Chicago will be pooled to the extent necessary to furnish maximum freight movement.

All open top cars of all eastern roads and similar cars of private ownership which are at home on eastern lines will be pooled on an equitable plan, distribution under the pool to be made pro rata on the basis of the tonnage carrying capacity of the equipment in the pool. The car pool is to be administered under the direction of the Commission on Car Service.

The Commission on Car Service will divert from those lines where the congestion is most acute all freight that can

be handled by any open route until the congestion is relieved. The pooling of coal will be further extended wherever practicable.

The National Fuel Administration is asked to arrange for supplying the various coal markets from the nearest coal mines in order to avoid waste of car efficiency.

The committee reported that any order that preference be given to any class of cars or freight results in a slowing down of the operation of the transportation machine and that a constant flow of all traffic concurrently produces the best transportation results. The War Board, therefore, emphasizes the desirability of reducing the great volume of government preference orders which, by placing a substantial majority of the freight moved on the same plane, without attempt to classify as to urgency, defeats its own object.

The eastern railways are in serious need of more men and special measures may be necessary to provide them. Some specific illustrations of the way in which the trackage of the various lines is to be pooled are given in the report of the vice-presidents. For example, the Western Maryland will allow its line to be used as an eastbound track in connection with the Baltimore & Ohio from Connellsville, Pa. to Jerome, Md., 125 miles, thus making three tracks between those points. The Erie Railroad is to be used to its full capacity in transporting lake ore and coal between Cleveland and Youngstown, and power and equipment will be provided from other lines for its use as required. It is anticipated that under the new arrangement large amounts of freight traffic will be diverted from the railroads which are now most congested to those which still have some unused capacity.

The Railroads' War Board has been studying with concern the increasing congestion on the eastern lines. It has recognized the fact that the roads in that territory have been becoming overburdened in consequence of the growing industrial activity, of the condition of the labor market, and of other conditions. As part of the programme for relieving these conditions it has addressed a letter to the government Fuel Administration in which it has made the following recommendations:

RECOMMENDATIONS TO FUEL ADMINISTRATION

That a survey be made by the Fuel Administration of present contracts and methods of purchase and shipment of coal so as to shorten the rail haul from mine to consumer and to eliminate as far as possible all cross hauls of coal.

"Pooling of coal within reasonable limits," the War Board said, "will without doubt produce additional large savings, and the railroads are prepared to co-operate in any measures pursued by the Fuel Administration to that end."

That immediate measures be adopted to transfer movement of foodstuffs and other export material to southern and gulf ports to as large a degree as compatible with public interest, in order to relieve the eastern congested territory of an equivalent amount of train service.

That immediate survey be made of all government requirements now involving the movement of raw materials in and manufactured product out of centers of industry, so that accumulations on cars and line and in terminals will not occur as now, while product is awaiting use here or ocean transportation for foreign use.

As the concentration in certain parts of eastern territory of vast government and industrial activities has overtaxed the capacity of rail lines in that territory, considering the heavy movement of coal and other heavy commodities, which

formerly moved on coastwise vessels, but has now been thrown upon the railroads, the heavy military and civilian passenger travel, etc., it is recommended that further enterprises involving large operations in the use of coal and other heavy commodities should not be established in that territory, except after full consideration of these conditions.

In a statement announcing the principal features of the plan, the War Board said: "The measures adopted are calculated to enable the eastern railroads to transport the maximum amount of freight traffic which it would be physically possible, under any organization or by any methods, for them to move with their present facilities."

One of the effects of the congested condition of the eastern lines was explained by Fairfax Harrison, chairman of the Railroads' War Board, in the following statement regarding the car situation:

"Reports to the American Railway Association from all the railroads of the country show that on November first this year the excess of unfilled car orders amounted to 140,012 cars, an increase of 25,104 cars over the same day last year. Of this number, 97,000 cars are called for in other parts of the country than the congested region east of Chicago and north of the Potomac river where the abnormal war business is heaviest. Many of these orders for cars could be filled if the cars now delayed in the congested regions could be released. The Railroads' War Board is now applying extraordinary remedies in the endeavor to accomplish this."

The operating officers of the eastern lines met on Monday at the headquarters of the Railroads' War Board in Washington and created a committee which will be in full charge of the operation of the railway pool. A. W. Thompson, vice-president of the Baltimore & Ohio, was made chairman. The other members of the committee are C. R. Gray, president of the Western Maryland; A. T. Dice, president of the Philadelphia & Reading; P. E. Crowley, vice-president of the New York Central; Elisha Lee, acting vice-president of the Pennsylvania Lines East; G. L. Peck, vice-president of the Pennsylvania Lines West, and A. J. Stone, vice-president of the Erie.

The committee will establish headquarters in Pittsburgh at once and will sit continuously until the entire traffic problem produced by the abnormal war business in the district east of the Mississippi and north of the Potomac and Ohio rivers has been solved.

THE PENNSYLVANIA'S INVESTMENT IN NEW YORK CITY

Samuel Rea, president of the Pennsylvania Railroad, replying to criticisms in a New York daily paper, gives some data connected with the reasons why the road saw fit to build so grand and extensive a passenger station in the heart of New York. He says:

The Pennsylvania station, instead of being a monument to inefficiency and waste, and a white elephant, is a monument to foresight and the necessities of New York City and the whole country with which it does business, and more especially so for the Pennsylvania Railroad system, whose passenger revenues are about 20 per cent greater than the next largest railroad system of the country. Its revenue passenger mileage is about $13\frac{1}{2}$ per cent of the whole country, notwithstanding it constitutes only about $4\frac{1}{2}$ per cent of the country's mileage. Its ton mileage is also larger than any other and is nearly 13 per cent of the entire ton mileage of the nation's railroad systems; and that ton mileage doubles every twelve years, necessitating the construction of separate passenger lines and passenger facilities.

The station was constructed for the future and primarily for the long-distance passenger travel to and from New York,

New England and the Southern and Western States, the local and suburban traffic to New Jersey being accommodated through the joint service so successfully inaugurated between Newark and New York through the Hudson Tunnels. This line is handling about 200 per cent more passengers than in its first year of operation. Pennsylvania station was opened seven years ago and in the first year's operation 9,862,434 passengers arrived and departed from it, whereas in the last year this has grown to 18,135,311 passengers.

You say that not for years will its handling capacity be completely utilized. What would the public say of a management with an actively expanding business which built for the present only? That station is built for the present and for the years to come, and is so adapted as to handle the increasing traffic of the Pennsylvania and its Long Island railroads and also such traffic as the New Haven will put into and through it; and when justified, more tunnels may be built, the station and yard facilities being adequate therefore. Does the public realize that Broad Street station, Philadelphia, which is served by several double-track railroad lines, running in every direction, has been opened for 36 years, and Pennsylvania station only seven years, and that the latter handles about as many passengers, and has larger revenue from passengers?

Did you stop to inquire why this terminal was built alone by the Pennsylvania Railroad system, or why that system had to determine, at the time it did, to extend into and through New York or forever terminate on the west bank of the Hudson? The building of this great work now would, by reason of its cost, be prohibitory. Until electric traction for steam roads was developed, no responsible railroad would approve of tunnels under the Hudson (for steam traction). Between 1890 and 1900 when the North River bridge was projected, a federal charter was procured to have it open to all railroads, and the Pennsylvania actively worked for its realization. In 1900 its directors agreed to use the bridge when built and guaranteed its share of traffic at an agreed rate, provided the other railroads would join. None of the other railroads did join, and while the matter was pending, electric traction on the Orleans railroad tunnel extension in Paris was inaugurated, whereupon the Pennsylvania turned its attention to tunnels. It incorporated its tunnel railroad system, purchased a majority of stock of the Long Island Railroad, constructed the extension and erected the Pennsylvania station; and since then has built the New York Connecting Railroad jointly with the New Haven. The whole project, outlined sixteen years ago, including vast improvements, passenger and freight, and also those of the Long Island Railroad, has been carried out and devoted to public use. The Seventh Avenue subway, long projected and which we had hoped would be completed when our station was opened, is now nearing completion and will be opened soon to accommodate our passengers.

How would this great improvement have been secured otherwise? Would the city of New York have obligated itself for the cost, and the interest thereon, for a station for all the railroads, on the possibility that they would use it? Let me express the opinion here that a union station could not be built in that huge city that could conveniently accommodate all the rail traffic. If attempted, the cost, and the congestion around it, and on the approach streets, would make its useful operation impracticable.

As to co-operation in the development of the facilities of the port of New York, notwithstanding our railroads have in the past been reared on competition, and for most of the time unreasonable competition, and that they have fairly been compelled by state and federal laws to compete, if such compulsion be possible, they are today, in time of stress, co-operating to a degree never dreamed of and second to no other industry, and serving their government nobly. * * *

Track Work for United States Army in France

Special Designs of Frogs, Switches and Crossings Prepared to Meet Special Conditions in That Country

A COMPLETE set of standards for special track work including frogs, switches, crossings and cross-overs has been developed for use on the railways which the United States forces in France have taken over. The magnitude of the requirements of this character is indicated by the fact that 5,000 turnouts alone were specified in the first order. The designs for this work were prepared under the direction of S. M. Felton, director general of railways

better proportioned. The "B" section was selected because of its very heavy base, the government desiring to avoid chances of breakage on account of the rough handling the rail would be subjected to. The rails are laid to the French gage of 4 ft. 8 11/16 in. (144 cm.) and the narrow gage military railways use 25-lb., A. S. C. E. rails laid to a gage of 1 ft. 11 3/8 in. (60 cm.). The first standard determined upon was a No. 8 turnout having a 16-ft. 6-in. switch, a No. 8 rigid frog and an 11-ft. guard rail, the No. 8 turnout being adopted because it is not contemplated that any of these tracks will be used for high speed movements. As the work progressed a ground-throw switch stand was determined upon and also No. 8 single and double-slip switches, with the alignment according to the American Railway Engineering Association typical layout, as given in Vol. 17 of the Proceedings for 1916. The government

Full Lines Show A. R. A., 80 lb. Rail, Type B, Adopted for Use in France. Dotted Lines Show Rail Used by North-eastern Railway of France and State Railroads of Belgium

16-ft. 6-in. Split Switch

also called for additional turnouts for No. 12 and No. 6 frogs and also for a number of crossings of angles of 45, 60, 75 and 90 deg.

TURNOUTS INVOLVE NEW FEATURES

One of the drawings shows a standard 16 ft. 6 in. switch in which the switch and stock rails are supported on pressed steel slide plates, 5/8 in. thick by 6 in. wide, with pressed risers and with shoulders to hold a pressed steel rail brace. (The manufacturers were given the alternative of providing

for the United States Army. He was assisted in the preparation of the plans by A. H. Mulliken, president, and other members of the Manganese Track Society.

DETERMINATION OF THE DESIGNS

The main considerations which influenced the designs were: (1) Safety for standard railroad traffic based on American railroad practice; (2) Economy and simplicity in design to admit of quick production in large quantities for any emergency that might arise; (3) Standard sizes of materials that are carried generally in stock or are most readily procurable, and (4) American Railway Engineering Association standard layouts, with switches and frog details developed to meet the above conditions. An effort was also made to eliminate unnecessary cutting of rail in the manufacture of this special work.

It was necessary to proceed with the work before any really tangible information was available concerning the actual requirements or the nature of the track standards. Some information was obtained regarding materials which the French railways had obtained in this country previously which served as an approximate index. The 80-lb., A. R. A., type "B" section of rail was adopted rather than the French type, being of the same height as the French rail but

$\frac{1}{2}$ -in. slide plates with solid braces of malleable iron.) Two $\frac{3}{4}$ -in. by $2\frac{1}{2}$ -in. connecting rods are attached to the switch rails with pressed steel open side pockets. The switch rail is braced by $\frac{3}{8}$ -in. reinforcing bars, 13 ft. 5 in. long. The throw is 5 in. and the heel distance $6\frac{1}{4}$ in.

The frog embodies a number of interesting features. It is built of standard 80-lb. rail with cast iron throat blocks, rolled steel fillers and a heel riser made of a rail with the head and base pressed to the desired shape. The design of the point is a special feature. The web and base of the point rail extend 4 in. beyond the actual point, the head being cut away on a curve of 15-in. radius. This arrangement has the advantage that an additional bolt can be passed through the point rail and the fillers and it eliminates the notches in the fillers at the point of frog. Another effective

Details of the 11-ft. Guard Rail

detail is the planing of the flares in the heads of the wing rails in place of producing the flare by bending the entire rail. The advantages of this are that the standard rolled fillers can extend to the end of the wing, thereby eliminating the foot guard and that additional strength is secured by the use of bolts near the extreme end of the wings. The length of the frog is 13 ft. 6 in.; the bolts are of $1\frac{1}{8}$ in. open hearth steel; the throat distance is $1\frac{1}{8}$ in. to $2\frac{3}{4}$ in. and the flangeway is $1\frac{3}{4}$ in. wide.

The guard rail was made 11 ft. long to secure three of them from a 33-ft. rail. It has a compound flare, the main flare being $\frac{1}{2}$ in. in two feet and the end flare $1\frac{1}{2}$ in. in

plete with bolts and fillers in place and there is no opportunity for the loss of any parts.

Drawings were also prepared for a standard No. 8 turnout and a No. 8 crossover. These correspond very closely to the standard plans given in the Manual of the American Railway Engineering Association. The lead, tie spacing and other principal dimensions are identical, but in general the ties of the government turnout and crossover are 6 in. shorter than those shown on the American Railway En-

Compromise Joint for 25-lb. A. S. C. E. and 80-lb. A. R. A. Type B Rails

gineering Association plans. The standard switch stand is of the dwarf, parallel, ground-throw, Mansfield type, without provision for switch locks. The cover casting bears the marking 1917, U. S. A.

THE CROSSINGS ARE INTERCHANGEABLE

In connection with the crossings an intricate problem arose from the fact that the government engineers could

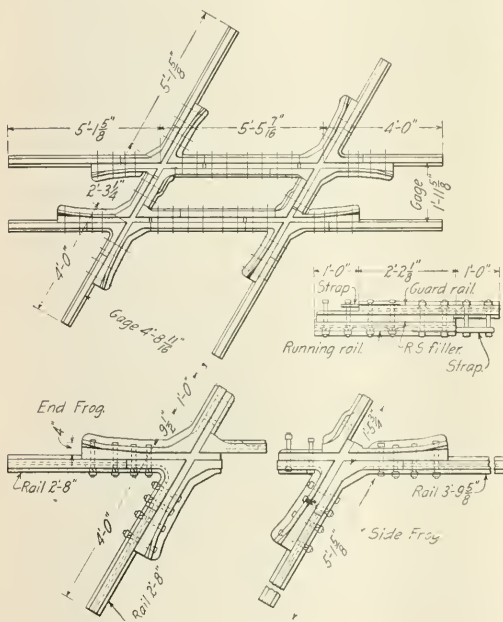

No. 8 Rigid Frog

one foot. The guard rail is secured to the running rail by four $1\frac{1}{8}$ -in. bolts with cast iron flare blocks at the end and rolled steel fillers 4 in. long for the intermediate bolts. The use of guard railclamps was considered when the design was being made but it was decided that it would be unwise to employ them for the service imposed because of the difficulty that might arise from the loss of loose parts of clamps. With the type selected, the guard rail can be shipped com-

not definitely determine the number which should be right hand or left hand, the principal crossing requirements being for the passage of narrow gage tracks over those of standard gage. In consequence of this situation it was deemed highly desirable to work out some scheme by which the crossings could be made reversible, that is, designed in such a way that they could be changed from right to left hand by a reassembling of the pieces. After a study of the

problem, the conclusion was reached that this could only be solved in a practical way by making the angular crossings of cast manganese steel. In general it was the idea in connection with this track work that the conditions imposed by the service did not demand the use of manganese steel, but owing to the peculiar problem imposed in the crossings an exception was made in that case.

One of the drawings shows the details of the 60-deg. crossing and illustrates how the special requirements were secured. Each crossing consists of two manganese steel end frogs and two manganese steel side frogs. The interior arms of these frogs are of such length that, when directly connected, they produce a complete crossing of one narrow gage (60 cm.) track over another. However, two sets of connecting rails are provided with each crossing, each connecting rail consisting of a running rail, guard rail and filler. When these are inserted between the frogs on the

Reversible Manganese Crossing

rails of one track, the crossing becomes standard gage for the opposing track. The crossing can be made right hand or left hand, depending upon which pair of the rails these connecting rails are inserted in. By procuring two more sets of connecting rails the crossing can be made standard gage for both tracks.

It is expected that most of the narrow gage track used in France will be of the portable type fabricated in sections with steel ties, each section of track having square ends. To facilitate the connection of such tracks to the crossings the exterior arms of the crossings are fitted with short sections of rail of such length that square ends are secured, when either or both tracks are for narrow gage.

The crossings were detailed to correspond to 80-lb. A. R. A., type B rail and as connections must be made in the narrow gage track to 25-lb. A. S. C. E. rail, four sets of compromise joints were provided with each crossing. This unusual jump in the sizes of rail called for the design of a compromise joint that is rather out of the ordinary and it is shown in one of the drawings.

SLIP SWITCHES

In the single and double slip switch designs, the frogs and switches are duplicates of those for the standard No. 8 turnout. The plan also provides that the joint in the stock rails coincide with the heel of the switch rail so that the two joints can be made with the use of a common 22-in. cast iron heel block. Provision against rail creeping is made by means of a 1/2-in. by 2-in. by 4-ft. 4-in. anti-creeper attached to this joint and extending over three ties. The knuckle rails and movable points are reinforced with easier rails. Both the double and single slip switches are provided with double hand throw devices interlocked to insure that the movable points will be in proper position for the routing given by the position of the switch point.

THE RECONSIGNMENT PRIVILEGE*

By H. W. Johnson

Superintendent Freight Loss and Damage Claims, St. Louis-San Francisco

That the reconsignment privilege granted by carriers in their tariffs is a pernicious form of rebate is a statement which is hardly justifiable—that it has become a part of the commercial customs of the country or rather a commercial necessity, is well taken. That the reconsignment privilege is abused very frequently and, in fact, so often that it is a distinct detriment to the shipping public and the railroads throughout the country is a fact which anyone dealing with the various phases of this subject during the past few years will not deny. In order to set forth the abuses to which this privilege has been subjected, it is first necessary to outline what may reasonably be considered the intent and legitimate purpose of the privilege, which I believe is fairly stated in the following:

(1) Time consumed in transit is saved to the shipper. Under the reconsignment privilege, shipments may be forwarded in the general direction of the market, billed to the shipper or his agent as the consignee, thus the shipper, instead of holding his product at the point of origin, has it at or en route to the market where the prospective purchaser may inspect it, thus facilitating sale, having shipments at point where delivery may be made promptly and incidentally relieving the shipper's warehouse or storage facilities.

(2) Through the reconsignment privilege, shippers are enabled to dispose to a good advantage of shipments that are refused at destination through no fault of the shipper or carriers.

(3) By the privilege of reconsignment, in the issuing of exchange bills of lading, shippers and consignees are enabled to conceal the name of either the shipper or the consignee as well as the source of supply or the location of the demand.

It follows, therefore, that all practices contrary to these are abuses of the reconsignment privilege, such as:

(1) Holding shipments in cars an unreasonable length of time after arrival at destination for purpose of speculation on rising markets.

(2) The intention of the application of certain rates may be defeated and a monetary advantage may be realized in some instances, which was not contemplated when the reconsignment privilege was published and the rates were made, in the following manner:

Where tariffs allow certain commodities the privilege of intermediate markets, for instance, live stock, which unloads at a given stock yards ostensibly for feed and rest and for the privilege of the market, are forwarded to destination by change of waybill heading and on through rate. The abuse

*This is one of the papers submitted in the Reconsignment Privilege Contest. The two prize winning papers have previously been published.

may consist of live stock having actually been sold and no record thereof given to the railroad company, or substituting other live stock in place of the original shipments.

A broker at a given concentrating point purchases a shipment for a client in another city and reconsigns the shipment that has arrived at the concentrating point to the final purchaser, on basis of the through rate, which in many instances is the same rate as that which has already accrued up to the point of reconsignment; the broker can thus make a profit on what would have been the local rate to the ultimate destination, provided shipment had actually been purchased at the reconsigning point, and reshipped under new contract to final destination. This occurs on such commodities as grain and hay.

(3) Under the reconsignment privilege on shipper's order shipments, a broker may do business on capital invested in shipments that are in transit and have not been actually sold to the consignee by drawing draft upon a prospective purchaser and in case original purchaser does not accept shipment, the reconsignment privilege permits the broker to draw another draft upon another prospect.

(4) During the past few years, since the carriers have undertaken to enforce rules and regulations between themselves governing the use of cars in accordance with the ownership of the equipment, permitting them to be loaded only in the direction of the car owners, the reconsignment privilege has enabled shippers to defeat these regulations in a great many instances by billing shipments to a point to which they are allowed to be loaded, then change the final destination, contrary to the regulations referred to, which privilege cannot be denied to shippers under reconsignment tariffs.

A specific instance that has come to my attention recently of what might be termed an abuse or at any rate a very excessive use of the reconsigning privilege is a carload of potatoes billed from A, a point in the far West on road A, February 15, arrived at B, first destination on road B, February 23; reconsigned February 26, arrived at C, second destination on road C, March 1; reconsigned March 7, arrived at D, third destination on road C, March 9; reconsigned March 10, arrived at E, fourth destination on road C, March 11; reconsigned March 14, arrived at F, fifth destination on road D, March 16; unloaded March 23. This shipment occupied the car 36 days, during which time, it was held for reconsignment an aggregate of 20 days. I believe it is safe to say that not more than \$10 demurrage was assessed during the entire time, allowing for free time and time to transmit notice to the shipper and secure disposition in each case. It is my understanding that the tariffs of none of the railroads in question provided for a reconsigning charge.

The result of abuses of reconsigning privilege as stated are obvious, and consist principally of the following:

Holding cars out of service unduly, for which only a nominal charge for demurrage or car service can be made. Even the demurrage charges are defeated by the abuses of reconsigning privilege in that the shipper may, in order to prolong the time in transit, name several destinations, and have car set out at each destination. The shipper is released from any payment of any car demurrage charges by giving another destination within 24 hours after he is notified that shipment has reached last named destination. This is particularly noticeable in connection with the handling of fruit and vegetables on which there is no reconsigning charge. Delay is also accomplished after car reaches destination by simply having car re-switched a number of times, paying a nominal charge for the switching service, which is far less than the advantage accruing through delay necessary to switching cars across and through terminals, which are sometimes congested, requiring considerable time. This is especially true on rising markets. In this connection,

the Interstate Commerce Commission holds the view that, without specific qualification, the term "Reconsignment" includes changes in destination, routing or consignee (Administrative Rule 7). Thus consignees are allowed additional free time under the demurrage rules when cars are held for any of these purposes.

This result is naturally accompanied by the further far-reaching and expensive detriment of unduly occupying railroad tracks and terminal facilities which should instead be used for the purpose for which they were built. Another result of these abuses is the extra handling of cars in switching out of and into trains at reconsigning points and shifting to and from designated tracks in terminals, including the expense incident thereto.

The final result of these abuses is to occupy railroad facilities unduly, thus limiting them for service for which they were intended, and causing inconvenience to the shipping public and loss to the railroads.

I am of the opinion that the cause of these abuses is twofold, first the construction of the rules and regulations governing, which, however, is not necessarily faulty, but impracticable of application to all conditions; second, the small amount charged or the absence of charge for reconsignment, for switching, and car handling incident thereto as well as for demurrage and track rental while cars are held for reconsignment.

In connection with the former, every condition should be set forth (some of which are not now covered) in the rules and regulations, in order that an adequate charge may be published to cover.

In connection with the latter, there is no charge for reconsignment of fruit and vegetables over a large part of the country; there is no reconsignment charge for coal and certain other commodities when reconsigning orders are given before shipments reach destination, or within a specified time thereafter.

Reconsignment charges that are made are entirely inadequate to cover the expense, to say nothing of a penalty that should in my opinion be imposed upon practices that are apparently unjustified. Switching charges at terminals are generally so low that it is very often profitable for the consignee to have his shipment re-switched a number of times in order to gain the time necessary to handle the car through terminals. The time allowed under car demurrage rules free of charge, on cars held for reconsignment or re-switching, is very often too great, especially when connected with other free time. The demurrage charge itself on cars held for reconsignment is entirely too low.

The remedy necessary to reduce the reconsigning privilege to a point where it will best serve the shipping public is an adequate charge for services rendered in connection therewith, including reconsigning charge, switching charge, car demurrage charge, etc. Such charges, in order to prevent or at least discourage some of the abuses to which the reconsigning privilege is subject, should be so constructed as to place a heavy penalty upon those abuses, as for instance, a charge equal to twice the ordinary charge should be made for a second reconsigning; demurrage rates on cars held for reconsigning should be much higher than the rates applicable to cars held for loading and unloading, especially after the first 24 hours, and should be graduated to a higher scale each day thereafter, until cars are released; each abuse, where possible, should be taken care of in a like manner.

TIES BOUGHT IN CANADA IN 1916.—A total of 7,572,878 ties were bought by Canadian railways in 1916, according to a bulletin of the Interior Department's Forestry Branch, based on reports received from 34 companies. The average value was 42 cents a tie as compared with 7,399,753 ties bought in 1915 at an average of 44 cents a tie.

The Railway Situation in Russia

Henry Miller, of the Railway Advisory Commission,
Describes Conditions and Gives Recommendations

A MUCH more optimistic view of the Russian railway situation than that which has become prevalent in the United States has been brought to this country by Henry Miller, formerly operating vice-president of the Wabash, who went to Russia in June as a member of the United States Railway Advisory Commission, and has just returned with a report. The commission, of which John F. Stevens is chairman, was accredited by the State Department and was sent to Russia to advise with and assist in every practicable way in the handling of the grave transportation problems which the war had thrust upon the Russian railway system. It has made a thorough investigation of the situation, made many suggestions for improved methods which have been adopted by the Russian railway authorities and has arranged for the despatch of railway materials and supplies from this country to Russia. At its recommendation, the Russian Railway Service Corps, consisting of 350 experienced railway operating and mechanical officials, has been recruited in this country under the direction of S. M. Felton, director general of railways, and sent to Russia to assist in the operation of the railroads and to act as instructors to Russian railway men for the purpose of building up a more efficient operating organization.

Some interesting information regarding the present condition of the Russian lines and the commission's recommendations were given by Mr. Miller in an interview with the *Railway Age Gazette* while he was in Washington last week making his reports to the railway and governmental authorities.

PHYSICAL PROPERTY EXCELLENT

"Russia is blessed with abundant crops and ample live stock and other foods and has resources beyond conception," said Mr. Miller. "The fear that the railways will fail to keep the army and civil population supplied is unfounded and has been dispelled by the American Railway Commission, who, after full investigation, during which the track, locomotives, cars and other facilities of the main trunk lines were examined, became convinced that by supplementing and reinforcing the operating department, together with the additional locomotives, cars and spare-parts now arriving from America, the transportation system of Russia will fulfill all reasonable requirements. The condition of the railways has been grossly exaggerated. Like our own, they are at present overtaxed with unusual traffic, but in many respects they are quite all right and their physical property and terminals are excellent.

"For instance, Moscow, the 'Hub' of the nation, has a well constructed belt line that has no superior anywhere, encircling the whole city connecting the nine railways radiating from there like spokes in a wheel, with commodious interchange yards at all intersections and no congestion of traffic of any consequence to interfere with the free movement of trains.

"The reports showing 25 per cent to 30 per cent of the locomotives 'sick' on the Russian railways is a fiction of the statistics largely, caused by the order to classify as 'sick' those needing repairs requiring withdrawal from service 12 hours or more, thus including mere running repairs. A rational analysis of the situation on the Trans-Siberian Railway reveals not exceeding 15 per cent of the locomotives 'sick' under a proper classification based on the practice of American railways."

The commission arrived in Petrograd on June 13 after a

ride of 6,000 miles over the Trans-Siberian Railway from Vladivostok and its members were then taken on a trip over the railway lines in the heart of European Russia, from Petrograd to Moscow, south into the coal fields and back by way of Kiev, this circuit taking them into the territory just back of the fighting front. The first problem undertaken was to work out a plan for expediting the transportation of supplies into Petrograd and to the army, and the next task was to arrange for the movement of coal into the city of Moscow, a great traffic center served by nine railroads, and Warsaw.

OPERATING METHODS REORGANIZED

"As far as the railways are concerned," said Mr. Miller "we found the great problem to be a question of operation. The physical properties are all right. As one of the first steps, we arranged to divide the railroads into divisions of approximately 300 miles, each in charge of a superintendent and a staff of 13 assistants, including trainmasters, train despatches, master mechanics, traveling engineers, etc., in order to provide the close supervision necessary to promote efficiency. We found that their practice was to operate their engines and crews on short turn-around trips. The men were assigned to their engines, which practice resulted in a very small mileage for each locomotive, because when the men needed rest or laid off on account of sickness or for other causes the engine was also taken out of service. By a plan of pooling the men and their engines the locomotive mileage was immediately doubled and the capacity for handling traffic was largely increased, so that it became possible with the existing power and facilities to clear up most of the congestion by the end of August. The railways are now clear and effective operations have been established over the whole system.

EQUIPMENT

"Russia has approximately 50,000 miles of railroad, of which about 60 per cent is owned by the government and about 40 per cent privately owned. The railroads have about 20,000 locomotives, whose average age is 24 years, most of them being compounds. About 10 per cent are wood-burning, 5 per cent oil-burning and the balance coal-burning. They have an average tractive force of 18,000 lb. We found about 15 per cent of the locomotives in bad order. They also have 580,000 freight cars of an average capacity of about 16 tons, of which we found about 8 per cent in bad order. The freight cars, both on the government lines and the privately-owned lines, are pooled and handled by a central car distributing office at Petrograd. The practice is to apportion a certain number of cars monthly to each of the lines based upon their traffic requirements as determined by previous experience.

"About 20 per cent of their freight cars have brakes and only the 13,000 American-built cars are equipped with air-brakes. Braking is done by hand, the practice being to use a brake van for every fifth car in a train and to station a brakeman at each brake.

"The Trans-Siberian line, including a detour line just constructed via the Amur river, is practically all double-tracked from Vladivostok to Omsk, a distance of about 4,000 miles. At Omsk the line divides in the form of a Y with branches extending to Petrograd and Moscow and the traffic is correspondingly divided, so the Trans-Siberian line is practically equivalent to a complete double track line.

"The Russian railroads are operated after the German

system, which differs from the American system in that train movements are not governed by time tables or train schedules, but trains are classified and their rights on the road are governed by the conductors and engineers. Time tables are only for the information of the public. There are no train rules or other operating rules corresponding to the American code of train rules and no train orders are issued except for slow orders. Trains are operated by the staff system on single track and by the telegraph manual block system on double track. The absolute block system is used in spacing trains.

"There is almost an entire absence of what in America is termed the operating department, and it is this void that the American commission has attempted to fill in order to increase the efficiency of the railways. It is for this purpose that the corps of 350 experienced railroad men from the United States has been sent to Russia to carry out the recommendations made by the commission and to act as instructors to the Russian railway men in American railway operating methods. It is hoped that by this means it will be possible to build up an efficient organization from among the Russian railway men themselves."

RAILWAY AGE GAZETTE PATRIOTIC WAR NUMBER USED AS HANDBOOK

Mr. Miller took occasion to make some flattering comments upon the Patriotic War Number of the *Railway Age Gazette*, which was issued on June 22. "The *Railway Age Gazette* War Number was used as a handbook by the American Railway Commission," Mr. Miller said. "Many of the things that were set out as being necessary to increase the efficiency of American railways were similar to those advocated by the commission for the Russian railways. Special Commissioner Oustrougoff, who was appointed by the Provisional Government to put our recommendations into effect, read it with the greatest interest, and requested that he be permitted to keep the copy for his information and guidance, his intention being to have some of the articles translated for distribution and use on the Russian railways."

Many of the recommendations and findings of the commission are set forth in a "Fourth of July proclamation" issued by the commission at Petrograd for the purpose of conveying to the Russian people a message regarding its purpose and the desire of the people of the United States to co-operate.

This statement was as follows:

THE COMMISSION'S PROCLAMATION TO THE RUSSIAN PEOPLE

"The United States Railway Advisory Commission is accredited by the State Department of the United States to its ally Russia. The object of the commission is, as has been stated, to advise with and to assist in every practicable way in the handling of the grave transportation problems which the war against a common enemy has thrust upon the railways of Russia.

"It seems fitting that upon this, the anniversary of our natal day of Independence, this commission should convey to the people of Russia a message declaring not only its purpose but also something as to what it has accomplished and which it is believed will cheer the nation and convince it that the United States stands shoulder to shoulder with its great ally in the prosecution to a successful conclusion of the war against the venomous enemy of democratic freedom.

"The commission has been in Russia about five weeks. During this time it has met with the officials of the Russian railways and has discussed fully and freely the various problems confronting the railways. It has been met everywhere and at all times with the utmost spirit of cordiality

and co-operation on the part of those officials. It has found, what was no surprise to it, that as masters of technique the Russian railway officials have no superiors in the world. It has found that in many ways their practices are among the best and that from a basic standpoint the Russian railways are intrinsically sound—backed as they are by the enormous latent resources and the vast population of this wonderful country.

"At the same time, it believes that a judicious mingling of the best Russian and American railway practices will be of great benefit to the railways of Russia, and in this belief your officials are in hearty accord and have given their approval to the following suggestions made by this commission:

"An improved system of train operation, a better divisional organization, whereby closer supervision can be maintained, and a revision of engine runs whereby a greater capacity of each engine and car can be obtained, resulting in an improvement in the movement of traffic.

"The construction of locomotive erecting shops at Vladivostok where the immense number of locomotives coming from the United States can be erected and put into service much more speedily than has been the practice heretofore.

"The working day and night of all locomotive repair shops so that the great number of out of repair locomotives may be reduced and that they may be put into service where they are so urgently needed.

"That the 'per diem' rate, or charges of one railway against another for the use of cars, be doubled, and that also the charge for holding cars for loading or unloading be doubled. This to insure prompt handling and release of cars in a reasonable time.

"That a supply department under a general storekeeper be installed, who shall be responsible for the maintenance and distribution of the vast amount of material and supplies needed for the operation and maintenance of the roads, the duties of such officer to include the reclamation of worn material and the reissuing of such as may be found serviceable.

"But the great imperative immediate necessity which confronts the railways of Russia to enable them to not only maintain its armies at the front, but also to support in comfort its civil population, who equally with its soldiers are fighting the great battle for freedom, is a great increase in the number of locomotives and freight cars. On this point the commission are entirely in accord with the railway officials and with the Russian people. To the end that this absolutely necessary want shall be supplied as quickly as can be done, this commission has cabled the Administration at Washington advising the immediate construction of 2,500 locomotives and 40,000 freight cars to be added to the equipment of the Russian railways.

"This means, of course, an extension of credit by the United States to Russia of some 750 million roubles. This matter has no commercial aspect for the commission has pledged what to it is dearer than family or life itself, the good faith and honor of its country.

"The commission has under further consideration the furnishing of raw material, tools and shop machinery to any extent that may be found advisable after careful consideration with the Russian officials, and stands ready to aid with its advice and counsel in any and all matters wherein it may be requested.

"In closing, it desires to express its hearty appreciation of the aid given it by the efficient Minister of Ways of Communication and his staff of able assistants. It knows that in their hands the future of the Russian railways is secure and it believes with the aid and material assistance which the United States is giving to its great Ally, that Russia will continue to sustain its part in the desperate struggle for freedom which is now convulsing the world."

Refrigerator Cars for the Baltimore & Ohio

The Insulation Applied Without Intervening Air Spaces;
A Free Circulation of Air Permitted Around the Ice

THE Baltimore & Ohio has recently constructed in its own shops some refrigerator cars that contain many interesting and new features of design. Contrary to the customary practice the insulation throughout the car is applied without any air space between the different layers. The purpose of this arrangement is to eliminate the so-called dead-air space and to better support the insulation. It has been found that it is difficult to maintain a tight car with the layers of insulation separated, because of the constant weaving of the car and further that the only *real* dead-air space is in the insulation itself. By applying the various layers of the insulation directly on themselves the construc-

tion of the car is less complicated and the insulation can be better supported and it will not deteriorate as rapidly. A careful study of refrigerator car design has also shown that the material in a car will be better refrigerated if the air in the car has a direct and positive circulation. To obtain this the bulkhead of the ice chamber was made solid with ample openings at the top and bottom and the load is held above the floor on racks. To obtain greater effectiveness from the ice, a wire netting is provided to hold it which permits a free circulation of the air around it. With the ice thus held away from the sides and end of the car, less

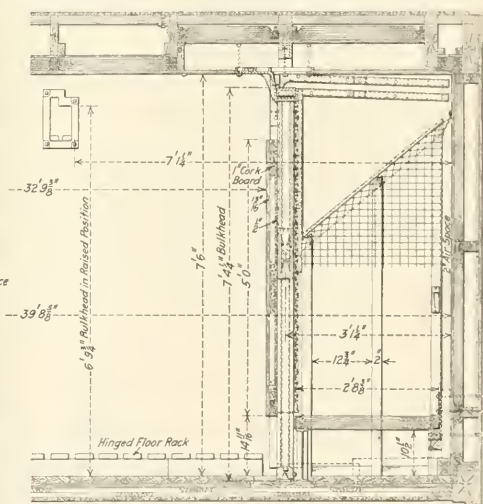

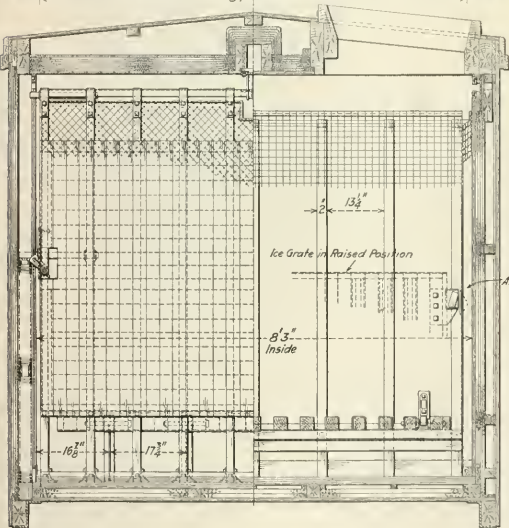

heat is absorbed through the car walls. The bulkhead is insulated so that it too will not transmit heat to the ice, but instead will guide the cold air down to the bottom of the car for circulation. The insulated bulkhead is of further benefit in that it prevents to a large extent, the condensation of moisture on the car side of the bulkhead which is liable to spoil the material placed against it.

These refrigerator cars are of 70,000 lb. capacity and weigh 54,800 lb. They have the following general dimensions:

Length inside	39 ft.	8 $\frac{3}{4}$ in.
Length between ice boxes	33 ft.	7 $\frac{1}{2}$ in.
Length of outside over body	40 ft.	10 $\frac{3}{8}$ in.
Width over siding	9 ft.	3 $\frac{3}{4}$ in.
Width inside	8 ft.	3 in.
Width at eaves	9 ft.	5 $\frac{1}{2}$ in.
Maximum width over side ladders	9 ft.	9 $\frac{1}{2}$ in.
Height inside, floor to ceiling	7 ft.	6 in.
Height from rail to top of brake shaft	13 ft.	10 $\frac{1}{2}$ in.
Distance from center to center of trucks	31 ft.	8 $\frac{1}{4}$ in.
Wheel base of truck	5 ft.	4 in.
Size of journals	5 in.	by 9 in.
Height from rail to top of floor	4 ft.	11 in.
Width of side door opening	4 ft.	0 in.
Length over end sill channels	41 ft.	11 $\frac{1}{2}$ in.
Length over striking casting	42 ft.	8 $\frac{1}{4}$ in.

CAR FRAMING

The underframe was furnished by the Ralston Steel Car Company. It is made entirely of steel, consisting of pressed and rolled shapes. The center sill is a fish-belly girder 2

tion of the car is less complicated and the insulation can be better supported and it will not deteriorate as rapidly.

A careful study of refrigerator car design has also shown that the material in a car will be better refrigerated if the air in the car has a direct and positive circulation. To obtain this the bulkhead of the ice chamber was made solid with ample openings at the top and bottom and the load is held above the floor on racks. To obtain greater effectiveness from the ice, a wire netting is provided to hold it which permits a free circulation of the air around it. With the ice thus held away from the sides and end of the car, less

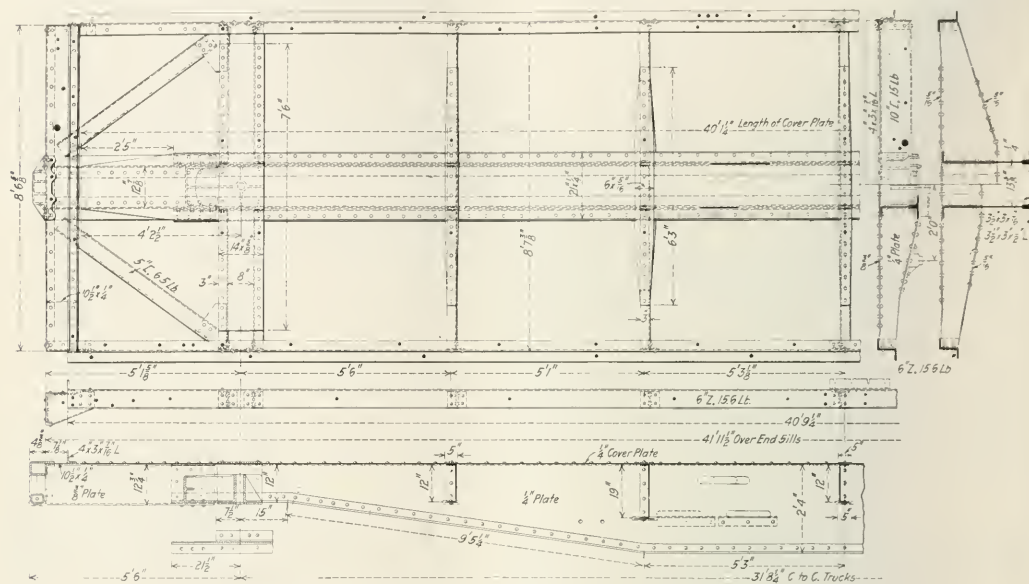

ft. 4 in. deep at the center and 12 $\frac{3}{4}$ in. deep at the ends. The webs are of $\frac{1}{4}$ in. plate, flanged outward at the top to receive the coverplate. They extend a short distance back of the body bolsters where they are riveted to the $\frac{3}{8}$ -in. draft sills. The coverplate is 21 in. wide by $\frac{1}{4}$ in. thick and extends between the end sills. The bottoms of the center sill webs are reinforced by 3 $\frac{1}{2}$ -in. by 3-in. by $\frac{1}{2}$ -in. angles on the outside and 3 $\frac{1}{2}$ -in. by 3-in. by 7/16-in. angles on the inside. The body bolsters are $\frac{1}{4}$ -in. pressed steel pans shaped to fit into the center and side sills. They have 14-in. by $\frac{3}{8}$ -in. top coverplates and 14-in. by $\frac{1}{2}$ -in. bottom

coverplates. The crossbearers are $\frac{1}{4}$ -in. pressed steel pans with 5/16-in. top and bottom coverplates. The side bearings are located on 48-in. centers.

The end sills are 10-in., 15-lb. channels, reinforced at the top by 4-in. by 3-in. by 7/16-in. angles set $7\frac{1}{8}$ in. back of the face of the channels. The end sills are braced at the center by 5-in., 6.5-lb., channels extending back to

tempt has been made to provide dead-air space between the successive layers of insulation and greater care has been taken in its application.

The cross sections show that below the $1\frac{3}{4}$ -in. flooring there is a 1-in. air space with 1-in. by 1-in. floor strips. A layer of felt paper is applied on top of two thicknesses of 1-in. corkboard. Before the felt paper is applied the top

Steel Underframe of the Baltimore & Ohio Refrigerator Cars

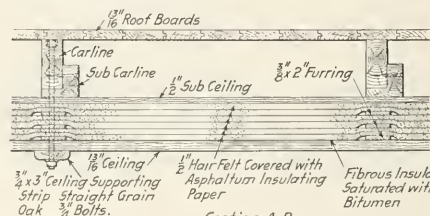

the ends of the body bolsters. The side sills are 6-in., 15.6-lb. Z-bars.

The side posts and braces are 5-in. by 2-in. Oregon fir, being set into malleable iron pockets doweled into the side and end framing. A tie rod is located at each post, extending through the side plate and side sill. The carlines are white oak, $1\frac{3}{4}$ in. thick. The ridge pole is secured to alternate carlines by $\frac{1}{4}$ -in. pressed knees bolted to both the carlines and the ridge pole. The flooring, lining, sheath-

surface of the corkboard is coated with hot odorless asphaltum to tightly seal all joints. Beneath the two 1-in. thicknesses of corkboard there is a $13/16$ -in. sub-floor.

The $1\frac{3}{4}$ -in. flooring is supported on 3-in. by 3-in. nailing strips which are bolted directly to the sub-floor and the crossbearers of the underframe. The felt paper extends in one piece from side to side of the car, the ends extending up between the corkboard insulation on the sides.

The lower part of the siding is insulated with four layers

Section A-B.

Method of Applying the Insulation to the Baltimore & Ohio Refrigerator Cars

ing and ceiling are Oregon fir. The flooring is $1\frac{3}{4}$ in. thick, and the lining, sheathing and the ceiling are $13/16$ in. thick. The roofing boards are of the same material and are covered with the Murphy XLA outside metal roof. The end plates are 3 in. by 9 in. and the side plates are 3 in. by 8 in.

INSULATION

The method of insulating these cars, as stated above, is novel in contrast to the general practice followed. No at-

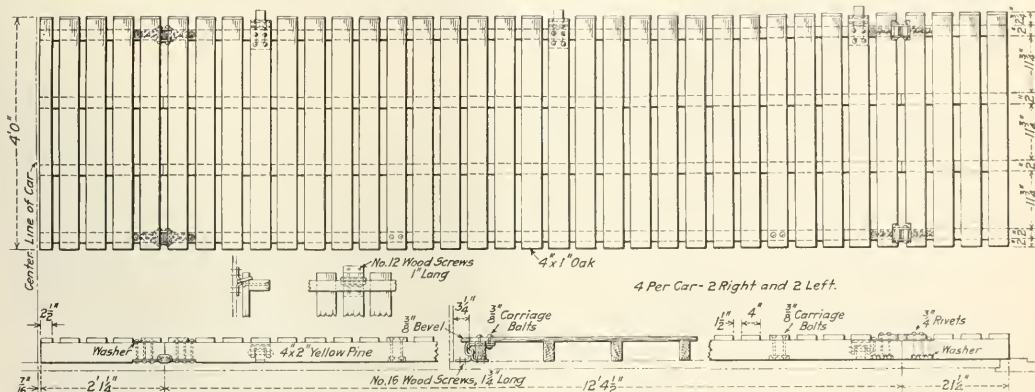

tempt has been made to provide dead-air space between the successive layers of insulation and greater care has been taken in its application. The cross sections show that below the $1\frac{3}{4}$ -in. flooring there is a 1-in. air space with 1-in. by 1-in. floor strips. A layer of felt paper is applied on top of two thicknesses of 1-in. corkboard. Before the felt paper is applied the top

the illustrations. The insulation passes around the corners of the car in continuous pieces to better provide a tight insulated joint. At the top the outside layer of insulation is lapped up into the ceiling insulation around the side plate.

The insulation in the ceiling is heavier than that on the

ICE BOXES

The ice boxes are of particular interest, being so constructed that a 2-in. air space completely surrounds the ice. The ice is contained in a heavy wire netting which exposes it to the air circulating through the car. The ice boxes are provided with a Bohn insulated collapsible bulkhead, which

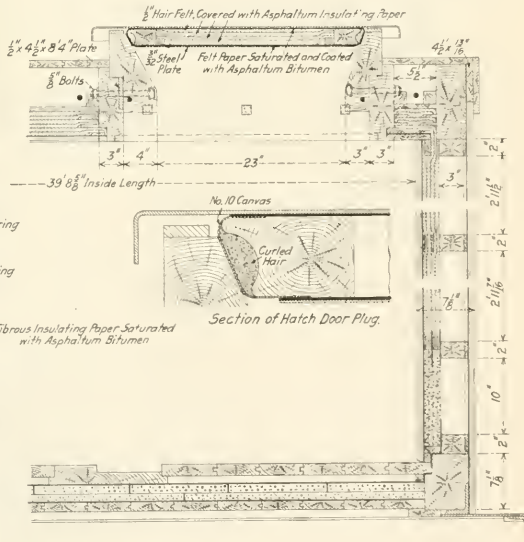

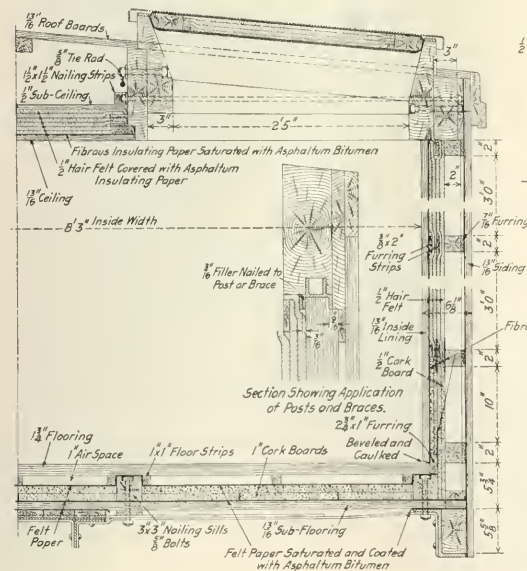

Details of the Hinged Floor Rack Used in the Baltimore & Ohio Refrigerator Cars

sides, as it has been found that the absorption of heat is greater at top of the car than on the sides. Six layers of $\frac{1}{2}$ -in. hairfelt are used here. These are placed directly on top of the 13/16-in. ceiling without any air spaces between them. On top of the insulation is placed a $\frac{1}{2}$ -in. subceiling which is nailed to the carlines. The weight of the ceiling

is 7 ft. $4\frac{1}{4}$ in. high, having an opening at the top and bottom for the circulation of air through the ice box. The insulated portion of the bulkhead is 5 ft. in height and this consists of a 13/16-in. lining, a 1-in. layer of corkboard and a $\frac{1}{2}$ -in. lining.

The purpose of insulating the bulkhead is to insure that

Sections Showing the Ice Hatch Insulation

with the insulation is too great for it to be substantially held by nails, therefore, $\frac{3}{4}$ -in. by 3-in. ceiling support strips are placed at every third carline and are bolted to the carlines by $\frac{3}{8}$ -in. bolts countersunk into the carlines.

the ice bunker will not cool the perishable freight piled up against it to a lower degree of temperature than obtains in other parts of the car. This feature is an exceptionally important one, as bananas and other fruit, as well as eggs,

have been known to freeze when piled up against the bulkhead of ice bunkers that were not insulated. The insulated bulkhead also effects a more positive circulation through the car.

The wire netting which holds the ice is cut away at the top to allow swinging the collapsible bulkhead into place at the top of the car. Without this bulkhead the netting would ordinarily extend up to the top of the ice box.

To further assist in the positive circulation of the air, a floor rack made up of 1-in. by 4-in. boards, spaced $1\frac{1}{2}$ in. apart, is hinged to the sides of the car and when in the lowered position it is 4 in. above the floor of the car. This allows the cold air to work up through the load equally throughout all parts of the car and better refrigerates the material carried.

Considerable care has been taken to properly insulate the walls surrounding the ice box. The illustration shows how thoroughly this has been done. The runway for the collapsible bulkhead at the center of the car is insulated by six

The Ice Hatch Door

layers of insulation which extend around it. The spaces between this runway and the hatchway, and between the hatchway and the end of the car are as thoroughly protected.

The ice hatch and door are particularly well constructed. A $\frac{1}{2}$ -in. plate, $4\frac{1}{2}$ in. by 8 ft. 4 in., extends across the car in the hatch frame at the inner side to give it strength. In addition to this a bar $\frac{3}{8}$ in. thick by $1\frac{3}{8}$ in. wide extends around the top of the hatch frame for reinforcement. The hatch door is made with a $3/32$ -in. steel plate on the underside and a $\frac{1}{8}$ -in. pressed steel plate on top; these are bolted to the door frame by $\frac{3}{8}$ -in. carriage bolts. The upper plate is ribbed to give it additional strength and is flanged downward on all four edges to protect the joints from rain. Between the steel plates four layers of $\frac{1}{2}$ -in. hairfelt with felt paper above and below are applied for insulation. The lock bar is so designed that the hatch door must be tightly closed before the door can be locked. A series of holes are

provided in the lock bar to mesh with a hole in a bracket attached to the top coverplate of the door, to permit holding the hatch door open at desired heights when the car is used in ventilator service.

These cars are equipped with the Westinghouse type K brakes. The trucks used were taken from dismantled steel hopper cars and have 5-in. by 9-in. journals. The capacity of the trucks is 80,000 lb. The ice bunkers have a capacity of 15,000 lb. of ice.

"SHIPPING DAYS" ON THE B., R. & P.

The Buffalo, Rochester & Pittsburgh was probably the first road to inaugurate "shipping days" on which l.c.l. freight would be received for various destinations, placing this plan in effect on the Pittsburgh district and on lines as far north as Punxsutawney and Du Bois, Pa., on July 6. The plan was later extended to cover the entire system on September 10. It differs from the methods in effect on some of the other lines in that the road has been successful in getting the shippers to refrain from offering their freight except on the days on which the cars are forwarded and in this way avoiding holding cars under partial load until the day for their departure.

This co-operation on the part of the shippers was the result of the care with which the detailed sailing schedules were prepared. Before definite "shipping days" were announced, the assistant to the general manager went directly to the wholesale and retail merchants shipping over the line, explaining the proposed plan to them in detail and asking them regarding their actual requirements. In some instances merchants were located from five to seven miles from the railroad, but they, as well as those located immediately on the line, were visited. Conferences in some communities were completed in an hour, while others required several days.

Some merchants stated that it was not necessary for them to receive merchandise more than once a week, but that they preferred to get it on Friday as they desired to have the goods on their shelves for Saturday, and they did not have time that day to haul them from the station to their stores. Others, and they were in the majority, thought that shipments twice a week would take care of their requirements in a reasonable manner.

After visiting all of the shippers along the line, it was found that it was possible to reduce the local train service to one-half and at the same time provide the schedules which were desired. This made it possible to transfer 8 to 10 locomotives, cabooses and crews to through service and resulted in a number of important economies in addition to the immediate savings in wages and wear and tear on equipment.

This plan has also enabled the loading of cars to be increased materially. In August of this year over 3,770 tons more merchandise were handled on the road than during the same month of the year previous, while 2,530 less cars were required to haul it than would have been necessary with the average loading secured in August, 1916. At East Salamanca, where 2,893 tons more freight were loaded in 624 less cars with an increase in the average load of 6,925 lb. in through cars and 725 lb. for peddler cars, the average load in through cars this year being 34,275 lb. and in the peddler cars 13,450 lb. At Punxsutawney the average load for through cars was raised from 6,695 lb. to 15,724 lb., and in the peddler cars from 5,867 lb. to 11,622 lb. with a saving of 528 cars. Similar improvement was made at other stations along the line. It is stated that this road now leads the country in intensive loading, with a decrease of 42 per cent in the number of cars and an increase in tonnage of 91.7 per cent. We are indebted for this information to J. W. James, assistant to the general manager, who has been in charge of this work.

The Brown System of Discipline—Prize Article

Intimate Studies Reported by an Employee of Fifteen
Years' Experience on Both Large and Small Roads

By Sidney J. Keeler

Chief Clerk to Superintendent, Peoria & Pekin Union Railway, Peoria, Illinois.*

IN my varied experience on the road and in the yard, and as chief clerk to the superintendent, I have served on roads where both systems of discipline obtained, and on one road where the practice of assessing actual suspensions was changed and the Brown system substituted while I was there; and I unhesitatingly say the Brown system has proved far superior to that of causing employees to serve time.

First, and above all, it promotes a spirit of loyalty. It is a system which can be applied at any time, and it applies to the little things as well as the larger ones. The enforcement of actual suspension cripples the railroad. At times it is utterly impossible to dispense with the services of an employee for any length of time without detriment to the service. This is especially so under the recent stringent laws, limiting the hours of service, length of trains, etc., at a time when the supply of experienced men is necessarily limited. Quite often the suspension of one man would necessitate tying up an entire crew, or at best would handicap a district or yard. In such a situation the officer must either overlook a serious infraction of the rules and permit it to pass unnoticed, or must limit the suspension to a minimum not in keeping with the offense.

That the employees, as well as the officers, understand this is illustrated by the reply of a switchman on one of our larger railroads. Upon meeting him recently I inquired what system of discipline they were using now on the road where he was working. The answer was: "They haven't any system. They lay a man off for anything, when they have lots of men; but now they are short of men and a fellow can do anything, and hear nothing of it." The railroad referred to was among the pioneers in the use of the Brown system; but under new management it had reverted to the actual suspension system. It is noteworthy that that same road has had several serious collisions of late, to passenger as well as freight trains; cars left standing foul of main tracks, misplaced switches, short flagging, and many other evidences of carelessness and neglect. These mishaps do not occur where everything of the kind is properly dealt with when it comes to the attention of the officer. Without doubt the men in charge felt that such cases of seeming slight importance were not of sufficient consequence to cause a man to lose a day's time, or possibly a round trip, and at the same time cripple the service, at a time when the guilty ones could not be spared.

I daresay there is not one superintendent or trainmaster who has worked under the actual suspension system who cannot recall numerous cases in which employees should have been suspended for infractions of the rules, but which were permitted to pass unnoticed because to have suspended the man would have compelled the company to replace him with one not nearly so good. By application of the Brown system such cases could have been properly dealt with at the time they occurred.

IMPORTANCE OF UNINTERRUPTED TEAM WORK

The value of the record system of discipline is often noticed where it makes it possible to keep a crew intact. It

weakens a crew to have to replace any member by a younger or extra man, be it an engine crew, a train crew, or a yard crew. Regardless of the question of experience, the extra man is not entirely familiar with the methods of the different crews and they are not acquainted with his work; and until such time as they do become thoroughly organized, the crew is weakened, and the company suffers in proportion. A check of accidents occurring on one railroad during the past four years shows that 78 per cent of those which were avoidable were chargeable to men who had been in the service less than six months, and were filling extra positions. I believe this to be a fair average, and one which will be found to exist on the majority of railroads, this especially as the road mentioned always hired experienced men where it was practicable to do so.

Not only are the services of the employee lost to the company during the period of actual suspension, but I have known old and faithful employees to become so dissatisfied through continually serving time for minor infractions of the rules where a good intention went wrong, or where a conductor, foreman or responsible head has been compelled to serve time through the carelessness or neglect of some subordinate—in many cases an extra man with whose capabilities he was not entirely familiar—that they sought employment elsewhere, under the Brown system, where they could be assured of uninterrupted service. In other cases, I have known where men found it necessary to seek employment in the service of other roads while "serving time," in order to keep their families provided with the necessities of life. These became attached to their new positions and valuable men were lost to the company.

DISCIPLINE AND DOMESTIC RELATIONS

Consider, also, the man's family. Most men of the caliber we desire to have for our employees are paying for a home, or have planned their financial affairs ahead, so that the loss of time by suspension interferes with their plans, and results in dissatisfaction on that account. Furthermore, the railroad man of to-day realizes that he must take a vacation or rest periodically in order to retain his health, and he figures his financial affairs accordingly; so that he can be absent at the time when business is slack and he can be spared from the service. He is able to do this under the Brown system, for he knows that so long as he remains in the service of the company he is privileged to work steadily; whereas, under the actual suspension system, if he is compelled to serve time when he does not need the rest, or when for other reasons he cannot leave his place of residence; when slack business rolls around and he could be spared, and he would like to take a rest, he cannot afford to do so, because he must work to make up for the time he has lost. The company suffers by the failure of a wornout machine, not physically fit to give one hundred per cent service.

REASONABLENESS OF THE BROWN SYSTEM

The brotherhoods have now reached the point where they are sufficiently strong to protect their members and insist upon their receiving the proper consideration at the hands of officers. The general run of railroad officers are capable and fair, but I have known cases where they were so unreasonable that the employees were compelled to serve actual

*Mr. Keeler has served on the Missouri Pacific, the Rock Island, the Union Pacific and other roads, mostly in clerical positions; but he has had some little experience in train work. His father has been in the train service all of his life and has worked under both Brown's discipline and the old fashioned kind.—EDITOR.

suspension where they were not at fault; and through their organizations, the employing officers have been compelled to reinstate the men and reimburse them for the time lost. How much easier it would have been under the Brown system; the officer could have reversed his decision when new facts developed, and he found the discipline was unjust, and the cancellation of the demerits would have closed the case.

It is contended by some that the only way to reach a man is through his pocketbook. But the number of these is decreasing and the time when that was the accepted rule in the railroad service is history; the successful officer to-day is the one who deals kindly yet firmly with his men, one who will reason with them, and is broad enough to see the employee's side as well as the company's. Employees will go much further to serve the interests of the company out of regard for the individual officer than they will out of fear of discipline.

Others say that an employee does not mind receiving demerits. My observation is that this statement is not borne out by the facts. There is no man so devoid of manhood that there is not some spark of good in him which can be brought to the surface by proper consideration; while many good men have had their future ruined through misuse of the power intrusted to a railroad officer. The men do take an interest in their personal record under the Brown system; anyone of contrary opinion has only to assess demerits wrongfully and see how quickly the employee will call at the office to present his side of the case and get justice. Moreover, the men make a practice of calling at the office at frequent intervals to look over their account and see how they stand with the company; and they have benefited by their wrongs and worked just as hard to atone for their wrongs, where the discipline was by record, as though they were compelled to serve the time. This is not merely a supposition on my part; it is information gained from conversation with railway officers who have risen from the ranks. They will tell you that while serving in the ranks they have tried as hard to retain a clear record under the Brown system as they did to avoid suspension. The general run of employees take as much pride in an untarnished record as any average intelligent man would in a duty well performed.

UNIFORM ADMINISTRATION DESTRAIBLE

At the present time there appears to be no standard measure of discipline on the railroads of this country. Some consider one demerit equal to thirty days' suspension, with a limit of ten demerits resulting in dismissal. I believe the better plan is where demerits are placed in multiples of five, with a limit of ninety or one hundred resulting in dismissal; not more than thirty demerits being assessed for any offense, and a clear record for stated periods canceling a specified number of demerits. Under this arrangement, any man dismissed from the service and later reinstated would return with sixty demerits still standing against his record. The accumulation of ninety (or one hundred) demerits should not be limited to any definite space of time. I have never known a really desirable employee to be dropped from the service through accumulation of demerits so long as demerits are canceled by clear records for stated periods. The use of the reprimand is an important element; to be used where the offense is not of sufficient consequence to require demerits, but which at the same time should not be permitted to pass unnoticed.

Some companies use the actual suspension system in conjunction with the record system. In my opinion it is preferable to use one system; else the discipline cannot be uniform.

So universal has the practice become of considering a demerit equal to a day's pay that the term "days record suspension" is considered preferable to "demerits."

Many of the larger roads compile periodical statements showing the actual amount of money saved employees through

use of the Brown system, which figures are taken from the payroll records showing the pay the employee received during the time he would have been serving actual suspension were the other system in use. It is needless to say that the saving represents a considerable amount of money to the employees and their families. But I dare say it would represent even a greater amount to the company were it possible to make a comparison with the results which would have been attained under the system of causing employees to serve the time. Unfortunately such a comparison is not possible; if it were possible to place a monetary value on loyalty and efficiency, and on the benefits of an uninterrupted organization, the actual suspension system would be a thing of the past on every railroad in America.

AMENITIES MUST NOT BE FORGOTTEN

Some railroads do not make a practice of recognizing meritorious acts, while others recognize them by letter, but make no favorable entry on the man's record. If we are going to keep a record of an employee, it is only just that we record and give him credit for his good acts as well as the bad. It is contended that the men are simply obeying the rules when they stop to extinguish a fire, remove a dangerous object from the track, make light repairs to a car of important freight which will permit it to go forward without delay, notice a dangerous condition of a car in a train of another crew or company, or perform many acts of seeming little importance; but I know that the men place greater than a monetary value on letters of recognition of a meritorious act. It should be made incumbent on employees to report any creditable act of themselves or their fellow-men the same as they are required to report accidents or infractions of the rules. It is a very easy matter for an employee to overlook material left carelessly beside tracks jeopardizing the lives of employees, or a fire burning in or near company property which might cause much greater damage if not promptly controlled; but by letting the men know that such acts are noted and appreciated there will be stimulated an alert disposition to watch out and to promptly remedy or report dangerous conditions. The results attained are far in excess of the effort required to write a letter thanking the man for the thoughtfulness and interest shown.

Regular monthly or semi-monthly bulletins, omitting names, but showing the credits and the record suspensions, are an important feature. Bulletins should go sufficiently into detail to show employees wherein the guilty ones err, or what rules were violated; and in the case of credits should show wherein some thoughtful act saved the possibility of injury to others, or damage to property. On the road I mentioned where the actual suspension system was replaced by the Brown system, it was a noticeable fact that the first educational bulletin took several sheets to record the demerits, with but few cases worthy of creditable mention; but there was a noticeable improvement from the first, and in a short time one sheet would cover the demerits, with the credits far in excess. There was a distinct change in the men; they took pride in their records and they worked together and perfected an organization which reached the highest point of efficiency. I can think of no stronger argument in favor of the Brown system than the change which was effected on that road; it was a revival of intelligent interest and loyalty that would convince the most skeptical.

Many of our railroads have advanced in their power, their roadbed, and their rolling stock, but have stood still in their organization and discipline. The character of the employees has advanced; the men of to-day cannot be compared to those of twenty or thirty years ago, who entered the railroad service because they had the strength of body, while they lacked the education to enable them to hold higher positions. There is no class of employees that has improved so rapidly as the railroad man. The railroad employee of

today must be a man of intellect. Our system of discipline must keep up with the times. I know of no class or occupation which cannot be properly reached through the use of the Brown system; it will cover every department of the service as well as the trains, yards and stations, and I believe it should be universal.

It seems to me that any railroad officer who has not become fully convinced of the wisdom of abolishing suspensions needs only to work under both systems and see both sides of the question. He would then appreciate the value of an organization composed of loyal and faithful employees who are ready at all times to go out and "do their bit" for the railroad company because they know their employers appreciate their desire to do right at all times. He would know how the men value a system which does not take the bread out of the mouths of their wives and children because of some slight fault of omission or commission. As the merits of the system become better known and the lessons of experience multiply, it must be that the wisdom of abolishing suspensions will come to be that acknowledged by railroad officers everywhere.

CONVENTION OF RAILWAY TELEGRAPH SUPERINTENDENTS

A special meeting of the Association of Railway Telegraph Superintendents was held in the Hotel La Salle, Chicago, on Thursday, November 22. The 1917 annual convention, which was to have been held in Washington, D. C., September 18 to 21, inclusive, was postponed on account of the war. The meeting was called to order at 9:30 a. m. by M. H. Clapp, superintendent of telegraph of the Northern Pacific, St. Paul, Minn., president of the association, with 59 members and 19 guests in attendance.

In a short opening address Mr. Clapp stated that the discussions at this special meeting would be on war topics and added that the annual convention would probably be held next year but the place of meeting would be decided later. The first speaker was Colonel Leonard D. Wildman, chief signal officer, central district, signal corps, U. S. army, who described the growth of that branch of the service in the present war and told of the methods used for training men to be telegraph and radio operators in the several schools recently started by the government in different parts of the country. In view of the urgent need for men, he expressed his approval of the recent suggestions that the roads employ women operators and also use the telephone wherever possible for the transmission of commercial and railway messages, thereby releasing experienced telegraph operators for government service.

A service flag with seven stars representing seven absent members hung over the speakers' platform. The following eight members are in government service; one having entered since the flag was ordered: C. D. Beard (P. & L. E.), F. E. Camp (C. P. R.), Claude Mitchell (G. C. L.), F. T. Caldwell (G. T. P.), J. H. McGlogan (G. N.), D. O. Van Der Vort (M. C.), I. D. Hoagh (E. P. & S. W.), P. H. Chapman (N. E. S. Co.). A motion was unanimously carried that the names of these eight members, and all others that may join the colors, be placed on the Association's Roll of Honor and all dues be annulled for the duration of the war.

The first report was read by J. F. Caskey (L. V.), chairman of the Membership Committee, who reported that there were 131 active, 77 associate and 45 honorary members, a total of 253.

Though the report of the subcommittee of Committee No. 1 on Wire Crossings was not presented in full by G. A. Cellar (P. L. W.), chairman, he outlined its plan for future investigation which is considered necessary before presenting the report for final action. The acting chairman of a subcommittee of Committee No. 1 on Transposition, G. A.

Dornberg (P. L. W.) recommended the adoption of the Western Union specifications. No action was taken.

R. F. Finley (N. Y. C.), chairman of special Committee No. 2 on Construction and Maintenance of Inside Plant, discussed the gathering of specifications and additional data which the committee had been working on but stated that his report was not complete. E. A. Chenery (Mo. Pac.), chairman of special committee No. 3, Wire Chief's Equipment and Routine, stated that as the report to be made by his committee depended directly in some cases upon that of Committee No. 2, it was necessary for them to work together and therefore report together.

Committee No. 5 on Protection Against Lightning and High Tension (Circuits, of which J. F. Caskey (L. V.) is chairman, reported having held five meetings since the last convention. Mr. Caskey discussed briefly some of the recommendations the committee would submit at the next meeting, among which was the advisability of using for the present an air gap and a vacuum arrester in multiple.

The report of Committee No. 6, on Telephone and Telegraph Development, was made by E. C. Keenan (N. Y. C.), chairman. Mr. Keenan said that only six replies had been received in answer to a circular letter, explaining the purpose and duties of this committee and asking for suggestions and information concerning new devices and equipment, which he had sent out to all members of the Association. Four new devices were recommended.

SCHOOLS FOR TELEGRAPHY

Committee No. 7, on Railroad Message Traffic, F. T. Wilbur (I. C.) chairman, had been assigned the special duty of considering the shortage of, and plans for, schools to teach telegraph operators. As this subject is of vital importance to practically all the railroads in the country, a general discussion was entered into. Mr. Keenan (N. Y. C.) stated that the New York Central has operated a school at Albany, N. Y., for a number of years and has recently opened telegraph schools at Utica, N. Y., and Rochester, for the instruction of students in telegraphy and in the operation of block signals. He has more applicants than he is able to enroll in either of these schools. An entrance fee of \$2 is charged and thereafter a monthly tuition fee of \$1. The money is refunded to the students who complete the course and who enter the service of the railroad company. The majority of students have been girls and on completing the course he finds them willing to go to way stations. Mr. Finley (N. Y. C.) stated that there were 12 women operators on duty on the Lines West and that he had received no complaints relative to their employment from the Order of Railroad Telegraphers. A point was then brought up by some of the members as to laws regarding the working of women more than a certain number of hours. One member emphasized the desirability of training clerks to be operators as they were familiar with the railroad operating routine and could grasp the work more quickly than a person who had had no experience along those lines.

G. M. Dodge of the Dodge Institute gave a talk outlining the purposes and course of study at his school. This was followed by a general discussion in which H. D. Teed (St. L.-S. F.) stated that employees of the Frisco in the various offices who expressed a willingness to learn telegraphy were excused from their regular duties for 1½ hours each day to receive instruction and were expected in return to devote the same length of time at the school in the evening. Practically all of the students who are receiving instruction in this way, about 100, are applying themselves very earnestly. After completing this part of the course, the prospective operators are given experience in the handling of tickets which proves of much assistance to them after being assigned to an office, and it is also found that an agent is usually glad to have an operator in the office

who has had this kind of experience. The personal interests of the girl operator, who has been assigned to an office, such as the handling of her baggage, assisting her in locating comfortable quarters, etc., are looked after by some one assigned to this work by the telegraph superintendent and who remains with her in the new office for two or three days, when possible, to see that conditions are made agreeable.

Mr. Wilbur offered suggestions relative to the conducting of schools, offering a bonus to employees who will teach a student telegraphy who afterwards accepts employment on the road; and soliciting the co-operation of the Order of Railway Telegraphers.

Among the members present, 8 reported that they are operating schools, 12 have no school and 4 are contemplating the opening of schools. The members operating schools reported as follows: N. E. Smith (N. Y., N. H. & H.), 100 students in two schools; E. C. Keenan (N. Y. C.), 194 students in seven schools; F. T. Wilbur, (I. C.), ten students in one school; Stanley Rhoads (C., C., C. & St. L.), 15 students in one school; W. H. Hall (M. K. & T.), 50 students; J. J. Rounds (D. & H.), 42 students in one school; H. D. Teed (St. L.-S. F.), 100 students.

A general summary of the discussion on schools showed that with a few exceptions no difficulty was being experienced in enrolling in the larger cities all the student operators that the school could train but the same success had not been met in the smaller towns, especially in the west.

CONSERVING TELEGRAPH AND TELEPHONE FACILITIES

A special committee consisting of Messrs. Cellar, Chenery and Keenan had been appointed by the president to consider and report on the conservation of telegraphing and telephoning in connection with both commercial and railroad wires. The committee reported that it had communicated with the entire membership of the Association and found that the service was being threatened with demoralization due to the enlistment of telegraphers in the army and navy and added that, with the calling of another draft quota and with the increased requirements of the railroads on account of the extraordinary government and commercial transportation, the condition would be made more acute.

It is estimated that about 50 per cent of the burden of tracing freight by telegraph, which is now imposed upon the railroads, is unnecessary and further, this use of the wires is rapidly increasing. Also, a large number of such messages are unnecessary and by concerted action could be abolished or largely curtailed. Also a large number of the messages contain superfluous words. It was further stated that a great deal of the information now being communicated in telegraph messages could be sent either by letter or by train-gram. The railway companies' telephone facilities are being greatly abused on account of conversations that are unnecessary or unnecessarily long, or of a social nature. The committee recommended the following in order to save in the use of telegraph and telephone facilities and to expedite necessary telegraphic and telephonic traffic:

(a) That concerted action be taken by the different railroads to greatly curtail, if not altogether abolish, telegraphic tracing of freight at the request of the consignor or consignee. In the opinion of the committee this concerted action can only be secured through the American Railway Association. That like action be taken in connection with any other system of telegraphic reports that are in use at present on the different railroads and are not necessary for efficient operation.

(b) That steps should be taken to eliminate all superfluous words from messages.

(c) That train or United States mail shall be used in forwarding all communications where it is not absolutely necessary to communicate the information by wire. The

carrying out of this recommendation contemplates special surveillance of communications to be forwarded late in the afternoons, or on Saturday afternoons and Sundays, or holidays, the idea being that no communication shall be sent by telegraph that can be forwarded by mail and still serve its purpose. It is expected that the train mail service can be made more reliable and expeditious by the use of special pouches for traingrams, delivered direct to the train baggageman just before the train is due to depart, the train baggageman to deliver the pouches directly to a messenger who will meet the train at the destination point.

(d) That adequate code and symbol systems and other methods for cutting down the number of words actually used in messages be generally adopted by the different railroads.

(e) That surveillance of the use of telephone facilities, both railroad and commercial, be instituted with the view of doing away with the present abuse of these important facilities.

(f) That an adequate and effective system of censoring telegraphic and telephonic communications be adopted by all the railroads. In order to carry out this recommendation, the following plan is recommended:

1. The issuing of special instructions over the signature of the highest officer of each railroad, appointing the superintendent of telegraph, or any other designated officer as official censor of all telegraphic messages of the officers and employees of the railroad.

2. The formulating and issuing by the official censor of the instructions necessary to put into effect and carry out the plans and recommendations contained in the preceding paragraph.

3. In view of the fact that for many years it has been the practice to scrutinize the telegraph office files and call attention to the unnecessary and improperly worded telegrams after they have been transmitted, and that this practice has been demonstrated to be not entirely adequate in the present emergency, it is recognized that it be made a fundamental of the censorship systems which may be adopted by individual railroads that telegrams must be censored *before they are sent* by a regularly appointed and responsible person in each department or departmental office. This person should receive detailed instructions from the official censor and be held for all violations occurring under his jurisdiction, which should be clearly defined.

(g) That the construction of additional telephone circuits for dispatching trains and for local message work should not be stopped or deferred on account of the war, but, on the contrary, should be prosecuted with greater vigor, to the end that as the shortage of telegraphers becomes more acute, they can be replaced without the delay incident to the long training required to master the art of telegraphy.

To this report was added a resolution recommending its adoption and the sending of copies at once to each member of the association and to the president or general manager of each railroad in the United States and Canada, and further, its submission later to the American Railway Association.

The president then introduced J. E. Dempsey, who spoke on the adoption of a code by railroads to be used for all telegraphic communications. The code which Mr. Dempsey compiled has been adopted by the Committee on National Defense and is used in handling government messages now. Mr. Dempsey is preparing a train sheet, which he will submit to the Committee on National Defense, whereby the movement of all troop and supply trains can be followed and recorded. Their routing and progress can be handled over the wire in one word.

In the absence of E. T. Griffith (Erie), chairman of Committee No. 8 on Commercial Telegraph Service, the report was read by F. L. Van Akin, Jr. (N. Y. C.).

The Employment of Women in Railroad Shops

Roads Relieve Serious Labor Shortage by Hiring Women; Notes on the Results at Some of the Shops

THE depletion of the forces in the railroad shops of this country, which during the past year has been very serious, seems now to have reached a point where any further reduction will inevitably result in a loss of efficiency in that department of the railroad organization. It was thought by many that after the men who were chosen for the national army were called there would be few changes in the force, but this has not been the case. The railway regiments now being formed for the purpose of rehabilitating the Trans-Siberian railroad will of course take their quota from

plane that would draw men from other industries, many would be taken from shops whose work is essential at this time, and the nation's productivity would not be increased by the shifting of workers. Labor-saving machinery might help the situation in some cases, but it is almost impossible to secure tools at the present time owing to the unprecedented demand. The logical way out of the difficulty seems to be to employ women in greater numbers for doing work in the shops.

Many roads have introduced women workers in the mechanical department, among them being the Baltimore & Ohio, the Erie, the New York Central lines, the Minneapolis, St. Paul & Sault Ste. Marie, the Chicago, Burlington & Quincy, the Northern Pacific, the Union Pacific, the Oregon Short Line and the Chicago, Milwaukee & St. Paul. On most of these roads the employment of women has passed the experimental stage and sufficient data are now available to make it possible to judge the value of women in shop work. Some observations made in shops where women have been employed for some time will show the progress that has been made in this direction.

The difficulties encountered in introducing women work-

An Expert Machine Operator Who Was Formerly a School-teacher

the railroad shops, and the increasing requirements of other branches of the government service will result in the withdrawal of considerable numbers. Of greater consequence, however, is the readjustment of labor, which will proceed slowly for a considerable period. Many of the war industries have lost men through the selective draft, and a part of the positions thus made vacant will surely be filled from the ranks of the railroad shopmen, some of whom place the higher wages to be secured elsewhere above the permanence of employment which the railroads provide.

It is quite unnecessary to state that no curtailing of the output of the railroad shops can be permitted at this time. In spite of all that the railroads can do cars and locomotives will deteriorate faster than they can be repaired. Daniel Willard, in his address, "How Railway Efficiency Helps Win the War,"* made it clear that the efficiency of the railroads will play an important part in winning the struggle. To keep the equipment of the railroads of this country in condition has now become a patriotic duty.

How is the labor situation to be met? In spite of the numerous wage increases which the roads have put into effect since the beginning of the war, it is impossible for them to compete in the labor market with plants manufacturing war supplies. Even if it were possible to put wages on a

Women Employees Grinding Tools, Havelock Shops, C. B. & Q.

ers in the shops have not proved serious. Rooms in which women can change from street to shop clothes, rest rooms and toilet facilities are, however, essential. Where women are employed around shops, skirts are in most cases a hindrance and sometimes a source of danger. It is, as a rule, unnecessary to urge the adoption of more suitable attire, the women workers being quite willing to don loose overalls. Women who work around power-driven machines should wear caps to preclude the possibility of injury by loose strands of hair catching in shafting or belting. In many states the hours of labor of women workers are limited by statute and special

*See *Railway Age Gazette*, August 17, 1917, page 274.

reports are sometimes required, but these are of such a character as to require but little clerical work.

On many railroads women have heretofore been excluded from the shops to such an extent that it is an easy matter to find positions for which women are quite as well fitted, now filled by men. For example, there are a great many male clerks employed in places where women after a short period of training could handle the work with little difficulty. At the Havelock, Neb., shops of the Chicago, Burlington & Quincy a woman is employed in distributing blueprints with entire success, although the work requires some knowledge of locomotive parts in addition to an understanding of the filing system. At Havelock women are also doing work which requires considerable skill, such as operating lathes, milling machines, gear cutters and shapers. Their work has been found highly satisfactory, and though a trifle slower

rience, and she is now holding a responsible position in the office of the general superintendent of motive power.

At the Pocatello, Idaho, shops of the Oregon Short Line women are now handling a large part of the work in the machine shop and car department on which male help was previously used. Women are probably employed to a greater

A Woman Operator Milling the Ports in a Valve Chamber Bushing, Pocatello Shops, Oregon Short Line

than men, they seldom make mistakes and do very accurate work.

An instance which shows the natural adaptability for machine work that some women display will serve to indicate the possibilities for women in railroad shop work. A young woman who, after graduating from a university, had been teaching the sciences in a Nebraska high-school, secured a position in the Havelock shops of the C., B. & Q., thinking the experience she could gain during the summer would be of value to her in teaching. She became so proficient that she was assigned to lathe work in the tool room and the work proved so fascinating that she resigned from her teaching position. Although the lady in question had intended to remain in the shops indefinitely, her stay there was limited to three months. At the end of that time a vacancy occurred in the general offices of the mechanical department, for which she was particularly qualified by reason of her shop experience,

Colored Women Working on Bolt Cutters at Pocatello Prove as Efficient as Men

extent in this shop than at any other place in this country. The effort to relieve the labor situation in the shops in this way has been so successful that if it were possible to get more women for shop work, it is probable that they would be employed in even greater numbers. No special training was provided for the women workers except such as is usually given to apprentices. The instructor who directed the work

Women at the Pocatello Roundhouse, Oregon Short Line, Cleaning Locomotive Cabs

of the apprentices also instructed the women. All the women at Pocatello are under the supervision of men, but at Salt Lake on the same road, where a great many women are employed as coach cleaners, a woman is in charge, who reports to the foreman of the coach department.

In the machine shop women are employed in the operation of engine lathes, boring mills, milling machines, planers, brass lathes, drill presses, cutting-off machines and nut tap-

ping machines. Most of the women are kept on specialized work. Those who show special adaptability, however, are trained on machines of all kinds, and some are capable of running almost any machine in the shop. It is the opinion of those in charge that a considerable proportion of the women workers could readily be developed into skilled machine operators.

The reclaiming and repairing of cab cocks, globe valves, boiler checks and miscellaneous valves is now done largely by women. In the tin shop they are repairing lanterns, oil cans, etc., as well as doing general tinsmith work. A woman is employed to run the motor-driven transfer table. Staybolts are finished in the boiler shop by two women, who are doing as good work as the men who formerly ran the machines. All parts of locomotives are now painted by women.

In the coach shop women are doing the upholstering work, cleaning coaches and preparing them for painting. Two colored women work almost entirely at painting and varnishing coach sash. While men are still employed on engine wiping, the cabs and the cab windows are cleaned by colored women.

It has been found that the output of the women workers employed at Pocatello compares very favorably with the output of male help and with efficient supervision the quality of the work is equally good.

At other shops women are employed on various classes of work which have not been mentioned, acting as helpers for machinists, blacksmiths and car repairers, operating steam hammers, building grain doors, packing journal boxes, reclaiming waste, sorting scrap and cleaning yards and shops.

At least one road has employed women as tracers in the drafting room, which suggests a method for relieving to some extent the serious shortage of draftsmen. In general, the experience which the railroads have had with the employment of women in the shops seems to indicate that it offers in many cases the only satisfactory solution of the labor problem of the mechanical department.

WASHINGTON CORRESPONDENCE

WASHINGTON, D. C., November 27, 1917.

BROTHERHOOD CHIEFS CONFER WITH PRESIDENT

The situation created by the new demands of the brotherhoods of train service employees for higher wages was not appreciably clarified as the result of the conference between the executives of the four brotherhoods and President Wilson on November 22, at least in so far as the results of the conference have been made public in statements issued by the brotherhoods and by the White House. The President confirmed the brotherhoods' statement and said he had received the impression that they were willing "in case any critical situation or controversy should arise, to consider any proposed solution in a spirit of accommodation and a patriotic purpose," while the statement itself declared that they "would be more than willing to discuss and consider any solution of the difficulty which presented itself, doing so in the spirit of patriotic co-operation."

While these expressions contain no threat of an attempt to interrupt transportation service and offer an opportunity for the President to propose a plan of settlement, they contain no promise that the threat will not be used later, and there is a marked difference between the attitude expressed by the brotherhoods and that of the Railroads' War Board. Speaking for the railroads, Chairman Fairfax Harrison had placed the interests of the railroads "unreservedly in the hands of the President for protection, and for disposition as he may determine is necessary in the public interest."

The brotherhoods merely told the President they wanted more money and would consider any peaceable method that might be proposed for giving it to them, and, at least so far

as the statements indicate, they have not committed themselves to anything more definite.

The two-hour conference with the President was attended by W. G. Lee, president of the Brotherhood of Railroad Trainmen; Warren S. Stone, grand chief of the Brotherhood of Locomotive Engineers; A. B. Garrettson, president of the Order of Railway Conductors; W. S. Carter, president of the Brotherhood of Locomotive Firemen and Enginemen, and also by W. L. Chambers and Judge Martin A. Knapp of the Board of Mediation and Conciliation.

Afterward Judge Chambers told newspaper men that matters looked "favorable." The brotherhoods gave out a signed statement as follows:

"The men who comprise the railway brotherhoods are thorough Americans, therefore they believe in American standards of living, and in consequence of this realize that standards of pay that were established in 1912 and 1913 are inadequate to meet present-day prices for commodities, and for that reason are demanding an increase in present rates that will meet half at least of the increase in cost of those things which they are compelled to purchase.

"They want to co-operate in every way that is at all possible in the successful prosecution of the war, and they fully realize that the most serious thing that could occur during the conduct of war would be any interruption of railway transportation, and they, in common with the great body of the people, are determined to do everything within the bounds of reason to avoid such interruption.

"Being fully conversant with their attitude and desire in this matter, we are in a position to give the assurance that, if a situation should arise which would threaten the interruption of transportation, the men whom we represent would be more than willing to discuss and consider any solution of the difficulty which presented itself, doing so in the spirit of patriotic co-operation, and would undoubtedly co-operate with the Government to the utmost extent in arriving at a just, equitable, as well as patriotic conclusion."

This was followed by a statement from the President authorizing the representatives of the press to say, "that he had got from the interview exactly the impression conveyed by the statement of the heads of the brotherhoods, namely, that the men whom they represented were not inclined to contend for anything which they did not deem necessary to their own maintenance and the maintenance of their families, and that they would be willing in case any critical situation of controversy should arise to consider any proposed solution in a spirit of accommodation and of patriotic purpose."

The rather vague character of these utterances may possibly be ascribed to the fact that the brotherhoods have not yet completely formulated their demands and it is, therefore, somewhat uncertain how great a problem is involved as to the ability of the railroads to pay the higher wages.

The fact remains that the brotherhoods are insistent that the wages of their members shall be increased and that they do not intend to let go of the club they possess in their ability to call a strike, which would be disastrous at such a time. Apparently also they decline to recognize the effect of the Adamson law in increasing their wages for the purpose of persuading them not to strike last year.

Thus far only the conductors and trainmen have formulated their demands. These are now being submitted to a referendum vote of the membership. Demands from the engineers and firemen, if they have been decided upon, have not yet been announced.

The circumstances attending the passage of the Adamson "eight-hour" law were recalled, on the same day that the brotherhood leaders saw the President, by a brief filed in the Supreme Court by the government supporting a decision of a federal court in Arkansas that the Adamson act applied to all railroads, regardless of whether they had a wage dispute pending at the time the law was enacted. The Fort

Smith & Western Railway Company had appealed from the decision.

"Congress did not undertake to investigate the conditions surrounding different roads," said the Government's brief. "It merely faced the fact that the commerce of the country was about to be tied up and endeavored to adopt a general measure to give relief. If it had known, as it probably did not, that there were some roads whose men would not join in the strike, it doubtless would still have passed an act applying to all alike. But slight knowledge of human nature is necessary to make it apparent that if relief had been granted to some and withheld from others, the result would have been new dissatisfaction which would speedily have brought about another emergency of the same kind to be dealt with."

COMMISSION REDUCES ACCOUNTING REQUIREMENTS

As a measure of war time economy the Interstate Commerce Commission has issued an order providing that the observance of the requirements of paragraphs 2 and 3 of its order of June 15, 1915, prescribing the rules governing the separation of operating expenses between freight service and passenger service on large steam railways may be suspended until otherwise ordered. The railroads, through the accounting officers' association, recently proposed both to the Interstate Commerce Commission and to the state commissioners a curtailment of the accounting requirements during the war, in order to conserve clerical forces, and while the whole program has not yet been acted upon, the commission has reduced many of its usual requirements of this kind.

WILLARD RESIGNS FROM WAR BOARD

Daniel Willard, president of the Baltimore & Ohio, has resigned as ex-officio member of the Railroads' War Board because of his appointment as chairman of the War Industries Board of the Council of National Defense. As chairman of the Advisory Commission of the Council of National Defense and chairman of its committee on transportation and communication Mr. Willard called the meeting of railway executives held at Washington in April which resulted in the organization of the Railroads' War Board and the agreement to operate the railroads of the country as a national system under its direction.

STATE COMMISSIONS APPOINT WASHINGTON REPRESENTATIVE

Charles E. Elmquist, for several years a member of the Minnesota Railroad and Warehouse Commission, has been appointed solicitor for the valuation committee of the National Association of Railway & Utilities Commissioners, with office at Washington, D. C., succeeding Clyde B. Aitchison, who was recently appointed a member of the Interstate Commerce Commission. Mr. Elmquist has also been appointed representative at Washington of the Special War Committee of the association and has been in conference with the Interstate Commerce Commission and the Railroads' War Board to express the desire of the state commissioners to co-operate in the work of winning the war and to establish a co-operative working basis.

NEWLANDS COMMITTEE TO RESUME HEARINGS

The Congressional Joint Committee on Interstate Commerce, of which Senator Newlands is chairman, will resume hearings in connection with its general inquiry into questions of railway regulation and control, at Washington, on December 4. It is probable that the first testimony will be that of officers of the transcontinental lines regarding the transcontinental rate situation as a reply to some of the testimony presented by state commissioners and shippers of the intermountain territory at the recent hearings in San Francisco.

COAL PRODUCTION AND DISTRIBUTION

Production of bituminous coal during the week ended November 17 continued at a rate of 1,890,590 net tons per working day, an increase of 2 per cent over the previous week, according to the weekly report of the Geological Survey. If the present rate of production is continued, the report stated, November should prove the best month in the history of bituminous mining in the United States. The total production, including coal made into coke, is estimated at 11,343,538 net tons. Shipments of anthracite, as reported by the nine principal carriers, amounted to 42,199 cars; this is below the level maintained during October. For the country as a whole, the ratio of tonnage produced to the full time capacity for the week ended November 10 was 77.8 per cent as compared with 75.4 per cent during the previous week. The improvement was attributable to reduction in the losses due to labor shortage, strikes and mine disability. Losses due to car shortage increased from 14.5 per cent to 15.3 per cent.

October production of bituminous coal is estimated to have been 47,429,780 net tons, an increase over October, 1916, and the total production from January 1 to October 31 is estimated as 454,326,059 net tons. This is an increase of 40,833,075 tons over the production in the corresponding months of 1916, or 9.9 per cent.

Fuel Administrator Garfield has decided to request Director of Priority R. S. Lovett to cancel priority order No. 1, which gave preference to coal shipments bound to the Northwest by way of the Great Lakes. Under this order a vast coal supply has been built up in the Northwest in advance of the closing of lake navigation.

The Fuel Administrator's recommendation would provide that the lifting of the priority order would begin at the mines on November 30. Cars at the mines at that date could be loaded, and would be given priority until they arrive at their lake port destinations.

The cancellation of the lake priority order, it is stated, will allow the coal produced in the central coal fields to find its way to its natural markets, and will do much to relieve present conditions in the central and eastern parts of the country.

The Fuel Administration believes that the supply secured for the Northwest under the lake priority order will place that section on a parity with the rest of the country for the winter. If further coal is needed in the Northwest before spring, steps will be taken to insure all-rail shipments from nearby fields to complete the requirements. With the lifting of the priority order arrangements have been made to insure immediate relief for New England, where the enormous industrial demands for coal threaten to outstrip the supply.

The way was cleared for an increase in coal shipments by water to New England ports by an order directing all mines under contract to supply New England consumers with coal by water carriers, to deliver their maximum monthly requirements, effective December 1.

The order directs mines holding New England contracts to ship the maximum amount of coal called for by the contracts for consumption in the states of Maine, New Hampshire, Vermont, Massachusetts, Rhode Island and Connecticut, where such coal is to be transhipped from rail to water carriers at Hampton Roads and at Baltimore. New England shipments are given preference over all shipments except coal requisitioned for railroad use and use of the government.

All coal producers holding New England contracts subject to the order are directed to file data as to their contracts with the United States Fuel Administration within ten days from the date of the order. The order gives New England Fuel Administrator James J. Storrow authority to supervise the distribution of this coal supply received by water after it reaches New England ports.

Western Railway Club Has Two Addresses

R. H. Aishton on Good Work Done by the Railroads

W. T. Krausch on Coaling Plants and Fuel Economy

At the meeting of the Western Railway Club, held at the Hotel Sherman, Chicago, on November 19, R. H. Aishton, president of the Chicago & North Western, gave an informal address, after which a paper on coaling plants and fuel was presented by W. T. Krausch, engineer of buildings of the Chicago, Burlington & Quincy. An abstract of Mr. Aishton's address and also of the paper by Mr. Krausch are given below.

RAILROADS ARE NOT BREAKING DOWN

Mr. Aishton spoke, in part, as follows: At this time we hear a great deal about the breaking down of the railroads. Their ability to handle the coal supply has been questioned and some have suggested that the government take a hand in operating the roads. The transportation system of this country could not be operated as efficiently as it is now if it were under government control. In the last 10 months 9,000,000 tons more coal was mined and moved than in 1916, amounting to 150,000 cars. The total traffic handled in this period was 751,000 carloads more than in 1916, or over 39,000,000 tons. This is a notable accomplishment and one of which the roads can justly be proud. The Chicago & North Western alone has moved 116,000 carloads of materials for the army camps, yet commercial traffic has gone on just the same, although this business is not on a normal basis but in most cases 150 per cent of the normal figure. Between August 1 and November 12, the railroads transported 1,200,000 soldiers, the movement requiring 2,750 extra passenger trains, but the usual business of the roads was carried on.

One of the things that makes the problem of handling the traffic a difficult one is the inability of the railroads to secure more equipment. The cars that have been received in the last 10 months have not made up for those destroyed in the same period and this statement will apply to locomotives as well. This is not due to lack of foresight by the railroads. They had ordered the equipment but the government needed it and the emergency confronting the nation was so much more serious that the railroads gave up the equipment and they held that by doing so they could help win the war.

When we hear criticisms of the railroads let us take into consideration just what they have accomplished. With no more facilities than in 1916, the roads have handled this year a traffic that is 16 per cent greater. This record is due to the brains and energy of the men working for the railroads, together with the assistance of the shippers. The shippers have played a big part in bringing about the increase in the tonnage handled. The Chicago & North Western is hauling an average load three and one-half tons greater this year than last year, which means a saving of 300,000 carloads for that road alone.

Deferred maintenance is slowly creeping into the railroad property. The roads have received this year less than half the rails they needed and the same statement applies to ties and ballast. Deterioration is going on just the same and some day we will have to make up for the deferred maintenance. People who read railroad reports and see that maintenance expenses are increasing think the properties are being kept up to the standard, but they are not. I do not believe in dire forebodings, however. I for one think that no matter what burden is placed on the transportation system of this country it is going to be found equal to it.

At this time the railroads are seeking more revenue. The case of the eastern carriers is being considered now and the

western roads will have a hearing later. I believe that the Interstate Commerce Commission will consider what the railroads have done and deal them justice. As to the future no man can predict, but in the words of John Paul Jones, I will say for the railroads, "We have not yet started to fight."

COALING PLANTS AND FUEL

By W. T. Krausch,

Engineer Buildings, Chicago, Burlington & Quincy

COALING PLANTS

The subject of coaling plants is without question one of the most important to be considered in railroad operation, and it is receiving most careful consideration. Each particular plant is a study in itself, requiring careful design to meet the conditions under which it is to be constructed and operated. The main features controlling the design are, in general, as follows:

1. Capacity of plant.
2. Kinds of coal handled.
3. Daily consumption.
4. Type of cars used (gondola, box or self-cleaning).
5. Length of receiving hopper.
6. Number of tracks served with coal.
7. Whether or not weighing or measuring apparatus is to be considered.
8. Track clearances.
9. Whether or not coal is to be crushed or broken.
10. Kind of power required or available.
11. Whether or not coal is mixed.
12. Kind of construction (whether frame, steel or reinforced concrete).
13. Whether or not ground storage is to be considered.
14. Whether or not sand storage and drying are to be considered.
15. Whether or not cinder plants and pits are to be considered.
16. Fire regulations and protection.
17. Whether a terminal or isolated plant.
18. Location of plant.
19. Release of cars.
20. Switching.

These features are simply general and give an idea of the varied conditions which control the design. After having carefully studied the conditions under which the plant is to be constructed, we can decide on the type of structure to be used, and this, at times, is most difficult. The conditions just given, however, govern the type to a large degree. In this connection the following considerations play a most important part—namely:

1. The capacity of the plant.
2. The ground area covered by the structure.
3. Land value.
4. Number of tracks coaled.
5. Kind of cars used.
6. Kind of coal handled.
7. Whether or not weighing or measuring pockets are to be considered.

The cost of operation and maintenance of these plants is a vital subject. This cost varies to a great extent and is dependent on the following conditions:

1. Kind of cars used.
2. Simplicity of design.
3. Daily consumption.
4. Kind of care of machinery and power.
5. Kind of coal handled.
6. Labor operating plant.
7. Supervision.

The actual cost of operation and maintenance varies greatly and actual costs are only secured by keeping close record of the particular plant in question.

As an illustration relative to the cost per ton of handling coal, one man can unload a self-dumping or self-cleaning coal car of 40 to 50 tons capacity in about 30 minutes. On the other hand, one man can shovel out of a gondola car at an average of, say, 25 tons per day of 10 hours, based on fair run-of-mine bituminous coal. This simply illustrates the great variation in the cost of handling coal from self-cleaning cars and gondolas.

The types of plants now in general use may be classified

as follows, starting with the oldest type (eliminating, however, the old bucket and jib crane type and platform type):

1. Incline trestle type, with, say, maximum grade on incline of 5 per cent. 2. Steep incline trestle type, with grade from 20 per cent to 25 per cent. 3. Locomotive crane types. 4. Clamshell bucket type with trolleys. 5. Small bucket conveyor type (commonly known as the "mechanical" type). 6. Continuous belt type. 7. Large bucket type (in which buckets of a large unit capacity are used, from 1 to 2½ tons capacity, as, for instance, the Holmen or Krausch bucket type).

(1) *Incline Trestle Type*: This is one of the older types in use, and is designed to deliver coal to one or two tracks. It may be divided into three classes, as follows:

"A." A plant having measuring pockets of given capacity of from two to six tons on one or both sides, and of any desired number.

Coal cars are pushed up the 5 per cent incline by a locomotive, and coal is shoveled directly into the measuring pockets, the sides of the car being about on the level or preferably a little higher than the measuring pockets. In this type of plant, coal is handled in gondola and occasionally in box cars.

"B." A plant having storage bin or bins of any given capacity or number. Coal cars are pushed up the incline and placed directly over the storage bin. In this type of plant, all kinds of cars can be used, but the self-cleaning cars to great advantage. If the coal used is of such a nature as to require breaking, steel bars about ¾ in. by 4 in. in size are placed over the bin or bins and spaced the required distance apart, say 5 inches or more. Coal is dropped or shoveled directly on these bars and broken through and over them by means of large sledges.

"C." A plant having storage bin or bins of any given capacity with scale or measuring pockets, located directly under the bins. Coal is handled in this case precisely the same as in the second case, except that coal is fed into the scale or measuring pockets from the storage bin above, by means of controlling gates operated from below.

In the fixed charges for operating these plants, the cost of switching and placing cars on the trestle by a locomotive is not ordinarily included. This method is dangerous and great care must be used by the engineer in handling cars up and down the incline.

(2) *Steep Incline Trestle Plants, with Incline Grades of 20 Per Cent to 25 Per Cent*: In this type of plant, cars are pulled up the incline by means of an engine and hoist—usually located on top of and in the rear of the coal stations. The power may be either steam, gasoline, or electric. A general description would be the same as just given for the incline trestle type under "B" and "C," except for the steep incline. This type of station requires a much shorter incline, does away with a great deal of switching, and is much safer. It also increases the possibilities of providing storage room, and for plants of large storage capacity, is much cheaper than the low trestle type. Preferably the design is made for one or two tracks.

(3) *Locomotive Crane Type*: This type can be used to advantage under certain conditions; namely, at terminals. It requires from six to twenty minutes to coal an engine with a locomotive crane, depending on the amount and kind of coal handled. Coal can be handled directly from the car to the tender or from a pile to the tender. To avoid delay to engine service, cranes are operated to handle coal direct from the cars to the coal storage bin.

At terminals, the use of the crane has many advantages besides the direct handling of coal—namely, transferring coal from cars, handling cinders, handling sand, etc. Its value is great in emergency cases. In handling coal for fuel storage, it gives very satisfactory results.

(4) *Clam Shell and Large Bucket Type Operating on Trolleys*: These types are flexible, the clam shell type handling the coal directly from the car to the storage or bin. With the large bucket type, coal is handled from the cars directly to the hopper and fed by automatic gates into large capacity buckets. These buckets are arranged to insure full loading. They are hoisted in the elevator leg to the required height, then automatically locked into the trolley, which travels on a slightly inclined track, directly over the storage bins. The buckets are tipped automatically and coal is discharged at any desired point. These plants are designed with counter-balanced buckets. The clam shell type is used chiefly in commercial and power plant work.

(5) *Small Bucket Conveyor Type (commonly known as Mechanical Plants)*: This type has great flexibility to suit different conditions, and can be practically used for any location or situation.

These plants, if well cared for and equipped with proper machinery throughout, give excellent service. A general description of this type is as follows:

Coal is unloaded into the receiving hopper from any type of car, from there is fed by an automatic loader directly into the elevator boot, from there raised by the elevator directly to the storage bin above. There are several types of elevator—namely, the continuous and overlapping bucket type, and the pivoted type. These two types of elevators must run slowly, at a speed not to exceed, say, 50 ft. per minute. The pivoted bucket must run at slow speed on account of the method of loading and dumping the buckets. The continuous elevator necessarily runs slowly on account of its great handling capacity.

The rigid bucket is designed to run at a speed of about 100 ft. per minute, the buckets spaced to suit the capacity required.

Those plants may be equipped with scales, measuring pockets, crushers, overhead or below, with breaker bars over receiving hopper and, in fact, are most flexible and can practically meet any desired condition.

When these plants were first put into service, the chain for the elevators was commonly made of malleable iron. This, however, gave unsatisfactory results. The practice now is to use steel chain entirely, with most satisfactory results.

(6) *Continuous Belt Type*: A great many plants of this type have been erected in past years. This raises the coal to the storage bin or bins on a continuous belt of rubber or cotton, on an incline of about 30 degs. as a maximum. This type is not as flexible as the small bucket type or mechanical stations. Under good conditions, with a fair quality of coal and careful attendance, very favorable results have been obtained. The coal is unloaded into a receiving hopper from any type of car, and from there by loader onto the belt and is then elevated to the storage bins.

(7) *Large Bucket Elevator Type*: This type is one of the most recent and is gradually coming into use, due to its simplicity of design and low maintenance cost. The description is briefly as follows: Coal is unloaded from any kind of car directly into a receiving hopper and from there fed into buckets of one or more tons capacity. These are raised by means of a hoisting engine to the storage bin above and the coal is dumped automatically into the bin. These plants may be equipped with scales or measuring pockets, or breaker bars over the receiving hopper, and are economical as to first cost and operation. These plants may also be operated with one bucket and increased in units as desired, depending on the capacity of the plants. Buckets may also be placed on one side or on both sides, depending on the conditions. In using the two bucket scheme, the weight of one is counter-balanced by the weight of the other, one ascending while the other descends.

In order to reduce the cost of handling coal and mainte-

nance to a minimum, the following important factors must be considered:

1. The proper type of station to be selected to meet all the conditions. It must be understood that each station considered is a distinct and separate problem.

2. The use of self-cleaning cars is a most important factor.

3. Emergency storage.

4. Plants must be reliable, using the best type of machinery and appliances throughout with ample power; at important stations, where delays are serious, the feasibility of duplicate machinery must be considered.

5. Fireproof construction—steel or reinforced concrete or combination.

6. Where frame structures are erected, fire protection should be provided, the power house being built some distance from the coal station.

7. Switching reduced to a minimum—car puller can be installed at any ordinary plant.

8. Breakage of coal must be reduced to a minimum.

9. Good labor must be employed and proper care given all machinery and appliances.

10. A most important factor is supervision.

This briefly describes railroad coal handling plants. Their design and construction are being given most careful consideration so as to create the greatest fuel efficiency. The men operating the plants are selected so that we may get the best results. The power plants and mechanical installations are given proper inspection and the operations, supervision. Then, finally, it resolves itself into the effort to keep the plant doing good work and getting results.

I am bringing this to your particular attention to show that the railroads are, and have been, working most consistently along the line of fuel economy in their plants, not only in operation, but also in the design. The present cost of steel has played a most important part in the total cost of so-called fireproof plants. Consequently we decided on a substitute, and this is the result: A combination structure built of wood and reinforced concrete slabs, the posts, girts, beams and braces being of wood. The storage pocket walls and floors are of thin, reinforced concrete slab construction. The upper or lighter structure above the bin is of 2 in. concrete walls on heavy metal lath. Two of these plants are now under construction.

STATIONARY PLANTS

Now let us consider the stationary plant for a moment. Efficiency here means:

1. A properly designed modern power plant equipped with high class boilers, burning the right kind of coal, with efficient engines and equipment, handled by a competent engineer and fireman, and the necessary help under proper supervision.

How many plants are there like this and what is their total efficiency? Experts tell us that with a good steam engine, a good furnace, and a good boiler, a horsepower hour can be produced from one pound to a pound and a half of coal. We find, however, that the ordinary steam engine uses from three pounds to as high as twenty pounds. This gives us an opportunity to increase our efficiency in a great many ways. The engineer in charge of operating the plant must be competent, the fireman must be competent, and they must have proper supervision. The boiler settings must be tight, and the draft regulated for the best results. The fire bed must be kept the right depth to suit the work. Further, the engineer and fireman should learn a little chemistry.

I firmly believe the way to get results is to take the plant you have and examine it most carefully. Get after the air leaks, steam leaks, and water leaks, get proper firing, the right kind of coal, proper draft and regulation, get rid of the soot and scale. Install proper grates and stokers. See that

the engines, generators, pumps and other equipment are in good order, working without leaks or waste. Use the proper lubricants and packing. Insist on performance and maintenance records, get the right man on the job and, above all, give the plant constant and proper supervision.

THE LOCOMOTIVE

The condition under which the locomotive operates is entirely different from other types of power, operating at high and low speeds, over grades, under maximum and minimum loads, in all kinds of weather, and under the most severe strains. Modern locomotives are now usually equipped with superheaters, which will save 20 per cent of the coal, with a superheat of 200 deg. F. If the engines are careless and carry the water too high or allow the boiler to foam, much of the possible saving is lost, due to the reduced temperature of the superheated steam. In winter, a locomotive will burn as much as 25 per cent more coal than in summer to haul the same tonnage.

The railroads, by using larger types of power, are constantly creating higher efficiency, as they are more efficient and there is a considerable saving in coal because they reduce the number of trains (which means less delay at meeting points), which increases the fuel consumption.

Railroads have organizations specially fitted to cope with the problem of fuel economy, which means that individual supervision and instruction are given to each and every engineer and fireman.

DISCUSSION

L. R. Pyle (Soo Line) brought out the fact that there was a considerable waste of transportation facilities and fuel at this time, due to the fact that coal is not being properly cleaned. He recommended that the railroads give more attention to fuel at the mines and also urged the centralization of authority in matters pertaining to the handling and use of fuel on every railroad. W. E. Dunham (C. & N. W.) expressed the opinion that much more could be done by the railroads to save fuel. Under the prevailing prices a small saving justifies a relatively greater expenditure than heretofore. Other speakers mentioned the savings to be secured by designing tenders to prevent the loss of fuel and by equipping stationary plants with superheaters and feed water heaters.

OIL GAS FOR TRAIN LIGHTING.—Those railway companies who use gas for their train lighting have every probability of being hit shortly by a scarcity of the oil from which the gas is compressed. Already some of these companies are experimenting with mixtures of oil and coal gas, but the results are not satisfactory; even the addition of only 25 per cent of coal gas makes a very indifferent light, while, of course, a mixture of half oil gas and half coal gas would be considerably worse. In this connection it may be remarked that it was long ago recognized that could trains be lighted satisfactorily by coal gas there would be many advantages. The gas could be obtained from the gas mains and there would be no need for compressing plants nor for the traveling gas containers. Experiments were made by some companies, e. g., the London & North-Western and Great Western, but it was not seen how the difficulties could be overcome. The matter was not, however, seriously pressed because of the gradual greater use of the electric light for train lighting. This, though, cannot be accepted as the available remedy for the shortage of oil at this time. On account of the scarcity of labor and the difficulty that would be experienced in getting the material—as it has to be obtained from sources that are very busy at the present time with war work—it is out of the question installing vast equipments of electric train lighting just now.—*Railway Gazette, London.*

A Study of Transverse Fissures in Steel Rails*

A Discussion of the Conditions Leading to This Type of Failure; Consideration of the Protective Measures

By James E. Howard

Engineer Physicist, Interstate Commerce Commission, Washington, D. C.

ON August 25, 1911, a rail failed on the Lehigh Valley, causing a disastrous wreck. The surface of the fracture was in a plane at right angles to the length of the rail. There was a dark-colored, oval spot on this surface, located on the gage side of the head, representing the part of the rail which was the first to fracture. The nucleus of this spot showed that the fracture had an interior origin. Other fractures of this kind, the peripheries of which had not reached the surface of the rail, presented surfaces having a silvery luster. The darkened surface of the present fracture was caused, doubtless, by the air having had access to it.

This fracture was recognized as a fatigue fracture of a modified type, its interior origin having been due to a component in the rail which is not usually present in cases of fatigue fractures. The metal next the running surface of the head of the rail was in a state of internal compression, this being the component not commonly met with in other cases, and which caused the fracture to have its interior origin. For the purpose of giving this modified type of fatigue fracture a specific name for identification, the term "transverse fissure" was applied.

No mystery was thought to attach to its formation, or to its development. The explanation of its occurrence seemed obvious in the light of common knowledge upon the behavior of steel under repeated alternate stresses. By reason of the state of internal compression at the running surface, the maximum tensile stresses in the head, under bending loads, were along an interior element. Here the tensile strains were higher than in the fibers more remote from the neutral axis. Under such conditions the fracture of the rail would be expected to have an interior origin. A discussion of the subject of transverse fissures essentially becomes a discussion of fatigue fractures, since they are believed to be identical.

The descriptive term, employed merely for the identification of this type of fatigue fracture, had the appearance of creating alarm. Apprehensions arose that a new phenomenon in the physical properties of steel had presented itself, the explanation of which was sought in every detail in the manufacture of the rail, omitting consideration, however, of the effects of service conditions, where the explanation really lay. Under this illusory search the subject soon took on a nebulous state; the distinguishing characteristics of a transverse fissure were lost sight of, and quite dissimilar fractures were reported under the same general terminology.

Brittleness of fracture in all grades of steel is characteristic of fatigue tests. Brittleness under repeated stresses, therefore, does not constitute evidence of defective or inferior metal. Primitive toughness is of value to meet occasional overloads at certain stages, but its value in prolonging the life of steel under repeated alternate stresses of moderate degree, if it has an influence, is not known. There are certain zones for each grade of steel within which its endurance is practically unlimited, and above which repeated stresses soon result in rupture. A fatigue fracture may be made in any piece of steel. It is only necessary that a given load shall be repeated a sufficient number of times, when rupture will ensue.

FIBER STRESSES SHOULD BE RESTRICTED

It would be prudent to restrict the fiber stresses in rails to less than 40,000 lb. per sq. in. It is ignoring general engineering practice and precedent to apply loads to a structure having no residual strength above the working loads. The occasional application of stresses in excess of this limit constitutes a menace to the integrity of the steel, although the working loads, in general, do not reach this maximum. If it shall appear that rails are subjected to stresses in service which approach or exceed the above-mentioned fiber stress, then their failure by fatigue will present no novel feature.

Steel rails in the track are subjected to bending stresses, the magnitude of which depends primarily upon the amount of the wheel loads; the number of repetitions within a given interval of time depending upon the density of traffic. The values of the static wheel loads admit of accurate determination. It is known that such loads are greatly exceeded when the trains are in motion.

Concerning the fiber stresses in the track under slowly moving locomotives, observations were made by the writer in 1893 and 1894, the results of which were published in the reports entitled "Tests of Metals." Even under the lighter equipment then in use, it was found "that rails were often strained higher than material is supposed to be in the case of bridges and other permanent structures." It was then brought out that wheel spacing influenced the results; that the leading pilot wheel caused much higher stresses per ton of wheel load than other wheels of the locomotive; that tie spacing did not afford the basis for computation of the fiber stresses, the wheel load and the moment of resistance of the rail being known; and that different kinds of ballast influenced the results.

At that time a rail was selected, representing good track conditions, and measured on frozen gravel ballast. It showed a variation in measured strains in different parts of its length of over 100 per cent, referring to the effect of one of the driving wheels. The aggregate longitudinal tension from eight wheels, at one place on the rail, was nearly three times that at another place along its length, while the compressive stresses displayed at one place were 10 times those measured at another place. The measured strains, although taken in the track 22 years ago, should effectually dispel any illusions that rails are uniformly strained, even under static conditions of loading.

In these early tests, the fiber stresses ranged from 10,000 to 18,000 lb. per sq. in. under the heavier wheels of the locomotives. There are more recently published accounts of fiber stresses, measured under trains traveling at moderately high rates of speed, the values of which range from 25,000 to 30,000 lb. per sq. in. with higher maxima in occasional observations in tension, the stresses being greatest in the base.

Rails in service not infrequently show appreciable local bends, acquired after they have been in the track. These bends represent permanent sets given the rails by loads which have exceeded the elastic limit of the steel. Some rails are bent downward at their ends, others are bent at regular intervals corresponding to the length of the peripheries of driving wheels of locomotives which have been over the

*Abstracted from a paper to be presented before the New York meeting of the American Institute of Mining Engineers, February, 1918.

rails, the latter permanent bends being due to the dynamic augment of the drivers.

There are internal strains in rails which result from conditions attending their manufacture, and those which are acquired after the rails have reached the track. During fabrication, cooling strains are acquired. The shape of a rail is such that it is peculiarly susceptible to the acquiring of strains under ordinary conditions of cooling. The stage at which these cooling strains are chiefly acquired is after the rail has left the last pass of the rail mill, and has become a finished rail.

Normally, the parts first to cool are temporarily put into a state of internal tension, which is reversed to a state of compression when the entire mass has reached atmospheric temperature. When the rail is cold, it is common to find the flanges in a state of internal compression, with the metal along the middle of the base in a state of tension. At the junction of the web with the head and the base, a state of tension is common. The peripheral metal of the head is left in compression, with the interior of the head in tension. The cooling strains are usually much greater in the base than in the head of the rail. Cooling strains in the flanges of thin-flange rails have been found as high as 18,000 lb. per sq. in. compression, with metal in close proximity at the middle of the base in a state of tension. Longitudinal strains are referred to in these remarks. It is obvious that shearing strains will be set up by these contiguous internal strains of tension and compression.

The usual initial state of compression in the flanges may be reversed to tension by cold-bending the rail, accomplished by an overload of compression on the base. Gaggling is merely applying an overload, causing a permanent set in the rail, and setting up new internal strains for the purpose of initially straightening it. It disturbs the primitive state of strain left by cooling, leaving the rail in a state of critical equilibrium from which it is again easily disturbed by track conditions.

When the rail reaches the track, cold-rolling of the running surface of the head takes place under the action of the wheel pressures. The top of the head then acquires a higher state of internal compression than left by normal cooling, the strains in the head acquiring an ascendancy over those of the base. Internal strains of compression next the running surface have been found in rails from the track corresponding to over 20,000 lb. per sq. in. stress.

INTERNAL STRESSES FROM WHEEL LOADS

Internal strains from wheel loads are unavoidable. The hardest rails are not exempt from this action of the wheels, nor do the lower wheel loads fail to introduce internal strains. An experimental inquiry into the effects of wheel pressures showed that a wheel load of 15,000 lb. introduced strains that were higher, superficially, than those resulting from the higher wheel loads of 25,000 and 35,000 lb. It was also noted that rerolling with 35,000 lb., after lower wheel pressures had been used, resulted in diminished internal strains over those due to the lower pressure. Furthermore, peining the surface with a light hand hammer introduced internal strains of greater magnitude than witnessed in either the experimental rails or those from the track.

In this connection, it is necessary to take into account the volume of the metal directly affected by the cold-rolling, and also the effect of repeated alternate stresses on the physical properties of the steel. The depth of penetration was found to be greater with the higher wheel loads than with the lighter loads or with the peining. The ratio of the volume of metal directly affected by the cold-rolling to that of the reacting metal is also a matter for consideration. The interior of the head is put into a state of tension to balance the volume of metal which is in a state of compression. Tensile stresses in the interior of the head equivalent to the measured strains have reached values of 8,000 to 9,000 lb. per sq. in.

COMPONENTS WHICH CAUSE FATIGUE FRACTURES

Of the two components which tend to cause fatigue fractures in steel rails, it will be borne in mind that one of them, namely, the state of internal compression at the running surface of the head, and the concomitant state of longitudinal tension in the interior of the head, will be introduced by the lighter wheel loads as well as by the heavier ones. These internal strains act upon the entire length of the rail. The direct bending stresses, the other component, will depend upon the wheel loads. If not strictly proportional to the wheel loads, still the bending stresses will be greater as the wheel loads are increased. Again stated, the two components which tend to cause fatigue fractures are the direct bending stresses from the wheel loads and the internal strains introduced by the cold-rolling of the wheels on the head of the rail. The latter are responsible for a disturbance in the physical properties in addition to the introduction of internal strains.

It is of importance to acquire data upon the relative effect of these two components in an endeavor to ameliorate conditions and prolong the life of the rail. Interest centers upon that influence which causes the maximum longitudinal tension, since a fatigue fracture is one of tension. The prompt display of transverse fissures in rails of 125-lb. weight leads to the inference that the cold-rolling component is of grave importance, which may be greater relatively than the direct bending stresses. There have been examples of rails sustaining traffic after the head had been practically separated by the development of a transverse fissure. The web and base of the rail, for the time, resisted the bending stresses, illustrating the ability of the steel to endure very high fiber stresses for a limited number of repetitions.

Primarily, it is desirable to ascertain, by means of direct experimental inquiry, the ability of steel rails to endure repeated alternate stresses, acquiring this information upon the rail in the condition in which it comes from the rail mill, and before any cold-rolling by wheels in the track has taken place. The section of the rail is such that opposing cooling strains are necessarily present in the finished rail. There is no assurance that a rail in full cross-section will display the endurance under repeated alternate stresses which carefully prepared bars of the laboratory have shown. Tests of this general nature on rails of full cross-section have yielded results which emphasize the need of this information.

Next, it is important to ascertain the limit of endurance of rails which have been in the track and have acquired a state of internal strain. There is no apparent reason why this barrenness of fundamental data upon steel rails should longer continue. In the use of materials of construction, two features should be known: The ability of the material to endure stresses, in the form in which it is used; and knowledge of the magnitude of the stresses which are to be endured. The steel-rail problem presents an example in which neither of these basic considerations has been definitely known. This dearth of relevant information is mentioned since its absence has led to many unsupported conjectures as to the causes of rail failures.

Transverse fissures occur in the head, and not in the web or the base. They commonly make their appearance on the gage side of the head, or central over the web. In a lot of 663 transverse fissures, 535 were located on the gage side of the head, 128 over the web, and none on the outside of the head. The preponderance of transverse fissures on the gage side of the head is significant, of course. Conditions of loading commonly reach a maximum on the gage side of the head.

It has been found that transverse fissures made by progressive gaggling of new rails can be located at will on the right or the left side of the head or central, according to the manner of applying the load. It is only necessary to apply the load to the side of the head on which it is chosen to

locate the fissure, to accomplish that result. Twenty-four transverse fissures were experimentally made in new rails by progressive gagging. By progressive gagging is meant that the rail was gagged at close intervals along its entire length, first on the head and then on the base, repeating the process until rupture ensued. The number of blows required to be struck at any one place ranged from 800 to 4,000. The total number per rail length of 33 ft. was from 50,000 to 250,000 blows.

The bending stresses given the rails in these tests were in excess of those experienced in the track, a circumstance which led to their rupture before the usual burnishing effect was accomplished which the opposite faces have upon each other in producing a silvery luster; rupture also being completed before the nuclei of the fissures had extended and covered a large part of the cross-section of the head. Efforts to produce transverse fissures by repeated gagging in one plane only were unsuccessful. Such rails displayed the common type of fatigue fracture; that is, the fractures had exterior origins in each case. Progressive gagging has an effect akin to the cold-rolling of the wheels.

In rails from the track, transverse fissures have been found along the same element of the head, in different stages of development. This manifestation corresponds to the shattering effect of repeated alternate stresses witnessed in laboratory test bars which have been exposed to a uniform bending stress over a part of their length.

Critical examinations have shown transverse fissures to have their origins in metal microscopically sound and normal in structure. Diligent research has failed to reveal micro-defects to which the origins of the fractures could be attributed. The composition of the steel at and in the vicinity of the fissures has shown no chemical reason why the fissures should have their origins at the places where they were found.

There has been no example of a transverse fissure in a rail which has not been in service, excepting experimental fissures. Rolling conditions would preclude the presence of a transverse fissure in an advanced stage of development in a new rail. The reduction of the metal in the rolls orients slag and other inclusions, arranging them in a direction parallel to the length of the rail, and not crosswise.

It is well known that slag inclusions are present in some degree in most steels. Slag filaments are drawn out and may be detected in the cross-section of the rail. In longitudinal sections they are at times prominently shown; but such longitudinal seaminess, when it exists, has no connection with the formation of transverse fissures. Composite sketches showing longitudinal seaminess in parts of the head remote from the places occupied by the nuclei of transverse fissures necessarily have no bearing upon the question of the development of transverse fissures.

It not infrequently happens, however, that longitudinal seams of another kind are developed in conjunction with transverse fissures, wheel pressures being the common cause for each. Shearing strains are set up in the head of the rail by the wheel pressures. When an acicular streak is reached, which may represent a slag inclusion, opportunity is afforded for the starting of a longitudinal seam. Shearing fractures which develop in vertical planes are designated as split heads. In other cases, the separation takes place in horizontal or oblique planes, and these latter may be developed independently or associated with transverse fissures. Each of these types of rupture was represented in the rail which failed on the Lehigh Valley.

EFFECT OF GAGGING

The effect of gagging has been referred to in respect to introducing internal strains or in modifying those which preexisted. Rail sections were subjected to normal and excessive gagging, also to the more severe ordeal of being

struck with the tup of a drop-testing machine. Microscopic examination directed to ascertain the effect, if perceptible, did not show any appreciable distortion of structure either at the places directly acted upon or in other parts of the cross-sections of the rails. Microscopically, the mill scale on the surface of the rail was disturbed in the vicinity of the place gagged or struck with the tup of the drop-testing machine. Surface indications comprised all that was visible resulting from this treatment.

Attention has so generally centered upon the results of the drop test, the bending test, or the tensile test, in respect to the display of primitive ductility, that the phases through which rupture is reached by repeated stresses have not received adequate consideration. Specifications governing the acceptance of the metal rigorously demand that a certain elongation shall be displayed. The elongation called for may be only a few hundredths of an inch per inch of length of sample, but such display is made the decisive measure for the acceptance of the steel. It would not be incompatible with experimental results for the steel which was deficient one-hundredth of an inch in its primitive display of elongation to show under repeated stresses an aggregate elastic extension of several miles, so radically different may be its primitive behavior and its behavior under long-continued alternate stresses.

In like manner, chemical requirements are frequently made the object of exact fulfillment. Without advancing other reasons, the cause of the failure of materials under service conditions has been attributed to some slender deficiency in fulfilling the specifications on which the material was supposed to be made. It is not always clear that the most suitable steel for the purpose is asked for in specifications.

Attributing the cause of failure of a rail to the use of one deoxidizer or another, or to an excess of some non-metallic constituent above prescribed limits, can hardly carry conviction in the absence of information which connects them as cause and effect, if they stand to each other in that relation.

It is desired to emphasize the fact that the durability of a rail consists of its ability to retain its integrity under repeated deformations. A direct test consists of subjecting the rail to repeated deformations, conducted upon the shape and dimensions in which it is used. The results of other tests may be accepted as indexical of the properties desired, provided the relations between the two are established. In general, however, direct methods are preferred to indirect ones.

TRANSVERSE FRACTURES ARE FATIGUE FRACTURES

In conclusion, a quotation will be presented from a recent report issued by the Interstate Commerce Commission, Division of Safety, embodying remarks by the writer on the investigation of a rail which failed in the track, displaying a number of transverse fissures:

"Neither chemical analysis nor microscopic examinations have shown a definite cause for the development of transverse fissures. They have occurred in rails of different weights; in those of different ingot positions; in the product of each of the two great methods of steel making, Bessemer and open-hearth; in direct-rolled rails and in those from reheated blooms; over ties and between them; they have made their appearance in the different seasons of the year, and in rails rolled in the different seasons; they occur where, according to chance, the rails may have been gagged and from the number and proximity of the fissures, where they probably were not gagged, they have displayed themselves singly, and independent of other types of rupture, and also associated with shearing fractures or seams which have developed in planes at right angles to the fissures; they are found in the head and not the base of the rail; they appear in rails which show very little wear; they are not confined to any one railmill, nor to northern or southern mills, nor to any one year's rolling, but have been displayed by rails rolled at periods of time separated by not less than two decades. The latter fact should remove doubts concerning any peculiar

conditions having found their way into modern mill practice influencing this type of failure.

"On the other hand, traffic has increased, wheel loads have increased, and speeds have increased; and transverse fissures are in general found where these conditions are well advanced. The girder strength of the rails has been increased, while the impinging pressures of the wheels still remain without amelioration. It is a disquieting matter that rails of the heavier sections recently laid have displayed transverse fissures. Mere increase in weight of section has not brought with it immunity from failure in this manner. It gives emphasis to the need of acquiring further data upon the features which have been discussed in this report.

"The conclusion seems well founded, the transverse fissures are fatigue fractures, and that they develop in rails which are structurally free from any known defect. It is a modified type of fatigue fracture in which there is a compressive component in the rail next the running surface of the head. The presence of this compressive component accounts for the interior origin of the transverse fissure. It constitutes the difference which the introduction of the term 'transverse fissure' was intended to emphasize over the common type of fatigue fracture in which this component is absent and which in consequence thereof has an exterior origin."

INCREASED EFFICIENCY IN USE OF EQUIPMENT

The accompanying chart was prepared for the officers of the Southern Pacific for the purpose of showing the remarkable increase in efficiency in the use of motive power and equipment, especially during the last two years. This is the result both of the great increase in traffic and of the heavier loading per car and per train as well as of unusual efforts

Revenue Freight Traffic Per Unit of Equipment Southern Pacific Co. and All Railroads of United States

to increase the mileage of each car and locomotive per day. It will be noted that the revenue ton miles per car on line on the Southern Pacific increased from something over 8,500 in January, 1915, to over 22,500 in August, 1917, while the revenue ton miles per locomotive in freight service increased from about 450,000 in January, 1915, to 1,150,000 in August, 1917. The chart shows the almost steady increase, in comparison with the average for all roads.

RAILWAY REGIMENTS AT CAMP GRANT

In addition to the nine regiments of railway engineers now in France two additional regiments composed mainly of railway men are now being organized at Camp Grant, Rockford, Ill., and will soon be ready for service. These are the Twenty-First Engineers, for light railway construction and operation, commanded by Col. Ernest D. Peck, and the Thirty-Fifth Engineers, a shop regiment, commanded by Col. A. E. Waldron. The roster of officers of the Twenty-First Engineers is as follows:

Regimental Headquarters: Colonel Ernest D. Peck, commanding officer, regular army; Lieutenant Colonel Hiram J. Slifer, formerly general manager, Chicago Great Western; Major Lunsford E. Oliver, supply officer, regular army; Captain David P. Banks, superintendent terminals, Louisville & Nashville, Evansville, Ind.; First Lieutenant George E. Miville, adjutant, regular army.

Headquarters First Battalion: Major Marshall R. Pugh, commanding, consulting engineer, Philadelphia, Pa.; Captain Arthur J. Minor, assistant engineer, Southern Railway; First Lieutenant Paul V. Brown, exchange officer, assistant engineer, Chicago & Alton.

Headquarters Second Battalion: Major Thomas R. Ryan, commanding, general manager, Brazil Railway, Paulo, Brazil; Captain Harry R. Gabriel, assistant chief engineer, Argentine Railway.

Company A: Captain Robert R. McGregor, commanding, assistant engineer, Southern Pacific; First Lieutenant Lewis G. Waterbury, assistant superintendent, Ponce & Guyana R. R., Porto Rico; First Lieutenant Charles R. Woods, land agent, Elgin, Joliet & Eastern Ry.; Second Lieutenant Harry E. Comfort, civil engineer; Second Lieutenant Matthew S. Butler, division engineer, Minneapolis, St. Paul & Sault Ste. Marie; Second Lieutenant Chester H. Plimpton, mess officer, mechanical department draftsman, Pennsylvania Railroad.

Company B: Captain Earl W. Evans, commanding, superintendent construction, New Orleans Terminal Company; First Lieutenant William N. Briscoe, draftsman, Baltimore & Ohio; First Lieutenant Charles T. Butler, engineer, Pennsylvania Railroad; First Lieutenant Morris B. Pumphrey, assistant engineer maintenance, Chicago, Ottawa & Peoria; Second Lieutenant Richard S. McCabe, timekeeper, Baltimore & Ohio; Second Lieutenant Scott D. Christopher, assistant engineer, Illinois Central.

Company C: Captain Michael M. Sheedy, commanding, safety inspector, Pennsylvania Railroad; First Lieutenant Otis T. Gregg, secretary, Gregg Company, Ltd., Hackensack, N. J.; First Lieutenant Hudson D. Dravo, road foreman of engines, Philadelphia, Baltimore & Washington; Second Lieutenant Charles M. Greeley, special mechanical apprentice, Pennsylvania Railroad; Second Lieutenant Arthur B. Helwig, mechanical inspector, Pennsylvania Railroad.

Company D: Captain James P. Nash, commanding superintendent terminals, El Paso Southwestern; First Lieutenant John M. Kimmel, Jr., assistant engineer, El Paso & Southwestern; First Lieutenant John S. Kiesel, assistant foreman, Pennsylvania Railroad; Second Lieutenant Edward P. Walsh, superintendent construction, Walsh Construction Co.

Company E: Captain William R. Scott, commanding, secretary, Joint Car Association, El Paso, Texas; First Lieutenant John C. Rill, trainmaster, Pennsylvania Railroad; First Lieutenant Robert A. Radford, assistant engineer, Lehigh Valley; First Lieutenant George C. Lightner, assistant engineer, Canadian Government Railways; Second Lieutenant Clarence J. Derrick, special engineer, Cleveland, Cincinnati, Chicago & St. Louis; Second Lieutenant Ray L. Hufford, concrete construction engineer.

Company F: Captain Frank T. Bowles, commanding, assistant superintendent transportation, San Antonio & Aran-

sas Pass; First Lieutenant Raymond H. O'Brien, electrical engineer, Pennsylvania Railroad; First Lieutenant Philemon S. Lewis, trainmaster, Philadelphia & Reading; First Lieutenant Harry E. Gabriel, assistant superintendent, St. Louis-San Francisco; Second Lieutenant Harry W. Dun, Jr., resident engineer, Atchison, Topeka & Santa Fe.

Attached: Captain Alfred B. Lewis, casual officer, locating engineer, Alaska Northern; Captain Clarence Roberts, road foreman engines, Pennsylvania Railroad; Captain Jesse G. Lorton, superintendent, Illinois Central; First Lieutenant Harvey W. Bell, general manager, Bell Locomotive Works; First Lieutenant Alfred D. Chandler, mechanical engineer, Baldwin Locomotive Works; Second Lieutenant Charles S. Hechner, mechanic, Philadelphia & Reading; Second Lieutenant Maurice E. Vermillion, regular army; Captain Hector Mansfield, assistant trainmaster, Philadelphia & Reading; Second Lieutenant James F. Ross, regular army; First Lieutenant R. L. Mock, assistant superintendent, Atlanta Joint Terminals; First Lieutenant A. O. Spurr, general yardmaster, Baltimore & Ohio.

Medical Department: Major James B. Hastings, surgeon; First Lieutenant Carl H. Bartling, assistant surgeon; First Lieutenant James H. Ross, dental surgeon.

THIRTY-FIFTH ENGINEERS

Regimental headquarters: Col. A. E. Waldron, commanding officer, regular army; Lieut.-col. G. H. Vincett, manager of plant, Standard Steel Car Company; Capt.-adj. Herman C. Huffer, Jr., of Huffer Campbell & Company, bankers, New York, and vice-president Augusta Southern Railway, president, Atlantic & Western and director Georgia & Florida Railway; Capt. James T. Blackstock, manager of shop, Standard Steel Car Co., and Captain W. C. Cole.

Headquarters First Battalion: Maj. Joseph F. Surridge, superintendent, Canadian Car & Foundry Co., and Capt. William E. Abbot, retired army officer; Capt. Robert Tinsley, formerly superintendent at Pullman Company's shops, Pullman, Ill.; First Lieut. Paul E. Carter, sales department, General Railway Signal Co., New York.

Headquarters Second Battalion: Maj. John S. Douglas, superintendent, Eastern Car Company; Capt. Herlof Amble, foreman erecting shop, Standard Steel Car Co.; Capt. William C. Lindner, assistant general foreman, mechanical department, Pennsylvania Railroad; First Lieut. F. W. Hausmann, electrical and consulting engineer, Allis-Chalmers Co., Milwaukee.

Headquarters Third Battalion: Maj. Thomas A. Dooley, Jr., Capt. W. L. Tedford, supervisor, Pullman Company; Capt. Charles F. King, First Lieut. Earl J. Zinck.

Company A: Capt. Hill P. Wilson, junior assistant valuation engineer, Texas & Pacific; First Lieuts. James M. Morse and Fletcher J. Snow; Second Lieuts. James C. Lamb and N. C. Raabe, machinist and electrician, Standard Steel Car Co.

Company B: Capt. Joseph W. Moore, assistant engineer, valuation department, Illinois Central; First Lieuts. Russell M. Smith, assistant road foreman of engines, Pennsylvania Railroad, Wilbur Oglesby, superintendent, South Georgia Railway, and A. W. Holbrook; Second Lieuts. Adam C. Warfel, safety engineer, Hartford Accident and Indemnity Company, and Robert M. Totten, draftsman, Standard Steel Car Co.

Company C: Capt. William R. Pearson, assistant valuation engineer, Nashville, Chattanooga & St. Louis; First Lieuts. John E. Brown, O. S. Dickson, motive power inspector, Pennsylvania Railroad, and Don L. Clements, foreman, New York Central; Second Lieuts. Ralph F. Getz, Benjamin G. Helsel, clerk, Standard Steel Car Co.

Company D: Capt. E. Burton Hocker; First Lieuts. Fred C. McFarland, civil engineer, Pennsylvania Lines West, John S. Wetherill and Howard Dyke, foreman, Standard

Steel Car Co.; Second Lieuts. Frederick W. Ford, junior draftsman, Boston & Maine, and Robert J. Byron, shop foreman, Pennsylvania.

Company E: Capt. Frederick N. Hatch; First Lieuts. Richard E. Trippe, assistant engineer, Atlanta & Anderson Construction Company, Walter Budwell, roundhouse foreman, Norfolk & Western, and James L. Blair, inspector, Standard Steel Car Co.; Second Lieuts. Roland G. Stafford, structural draftsman, Boston & Maine, and Harry Darling-ton, Pittsburgh Forge & Iron Company.

Company F: Capt. H. Fueller, night superintendent, Ralston Steel Car Company; First Lieuts. Merle V. Holmes, office engineer maintenance department, Atchison, Topeka & Santa Fe; Walter S. Mack, David Halderman, foreman, Standard Steel Car Co.; Second Lieuts. E. B. Wilkinson, James W. Ryan, assistant erecting shop foreman, New York Central.

Company G: Capt. William G. Vincett, Standard Steel Car Co.; First Lieuts. L. T. M. Ralston, Pennsylvania State highway department, Arthur F. Ainslie, assistant engineer, maintenance of way, Northern Pacific, William J. O'Brien, order foreman, Standard Steel Car Co.; Second Lieuts. Leo J. Stein and William E. Doll.

Company H: Capt. Wilke Woodard, consulting engineer; First Lieuts. William F. Philbrick, assistant yardmaster, Norfolk & Western; Horace M. Fetterolf and H. B. Gaither, inspector of locomotives, Baltimore & Ohio; Second Lieuts. Reginald V. Offutt, machinist, Baltimore & Ohio.

Company I: Capt. Reuben L. Rockwell, engineering department, Illinois Steel Company; First Lieuts. John F. Weiss; William S. Mussenden, field engineer of construction of steel plant for Mark Mfg. Co., South Chicago; Second Lieuts. C. C. Manchester, R. C. Montgomery, assistant purchasing agent, Philadelphia & Reading.

ENGLISH YACHTS BECOME FREIGHT CARRIERS.—Second-hand steam yachts are being turned into cargo carrying boats in England and they are finding ready purchasers at good prices. The royal yacht of Siam, the "Maha Chakrri," has been sold for conversion into a trader. The steam yacht Dotterell, which sold four months ago for £3,800 (\$18,470) has been resold for £10,000 (\$48,600) and has been altered into a cargo carrier.

THE PRESENT IMPORTANCE OF THE SCRAP HEAP.—In present circumstances the scrap heap in a locomotive shop assumes an importance which has never been accorded to it hitherto. Owing to the unusual demand for iron and steel products of all kinds, much difficulty is being experienced, and this condition of things must necessarily continue for some time. There is a natural shortage of material in locomotive and railway car shops as elsewhere, and this is not confined to new work alone, but extends to the repair department likewise. Wherever material can be reclaimed from the scrap heap its use may be of considerable advantage in assuring a continuous and adequate supply at all events of certain classes of material. The ever-increasing cost of metal and other requirements places upon those concerned the obligation of utilizing to the utmost all available supplies, and if recourse to the scrap heap makes it possible to complete work which otherwise would have to stand over for a considerable period, that plan would have every justification. It is necessary in reclaiming material previously scrapped to exercise considerable care in selection, and at best only a percentage is fit for re-employment in the shops. No matter how extensively reclaimed material may be used there are always large quantities which cannot be employed for building or repairing work in locomotive shops, and this, in the ordinary course, must be sold; but it may, however, serve a highly useful purpose when diverted to other channels.—*Railway Gazette, London.*

General News Department

The machine shop and blacksmith shop of the Grand Trunk at Brockville, Ont., were destroyed by fire on November 24.

The fourteenth annual convention of the National Rivers and Harbors Congress, which was scheduled to meet in Washington, December 5, 6 and 7, has been postponed until further notice.

Subscriptions to the second Liberty Loan by officers and employees of the Southern Pacific (Pacific system) and affiliated electric lines amounted to \$1,445,950, as compared with \$1,463,800 for the first Liberty Loan.

T. C. Powell, of Cincinnati, Ohio, vice-president of the Southern Railway, has been appointed by Judge Lovett as a member of the Priorities Committee of the War Industries Board of the Council of National Defense.

An agreement recently reached between the Illinois Central and its telegraphers provides for a readjustment of working hours and an increase in pay of \$9.75 a month. The settlement was effected through the efforts of G. W. Hanger of the Federal Board of Mediation and Conciliation.

The Texas & Pacific at the beginning of the crop season this year instructed section foremen each to plant and cultivate not less than three-quarters of an acre of ground upon the right of way. The men were allowed time to work these gardens, and they planted and harvested bountiful crops on about 400 acres of the company's land.

The highway department of the State of Pennsylvania has bought 15 snowploughs, to be used in keeping the highways open during the coming winter for heavy motor-truck traffic across the state. It is estimated that at present 200 automobiles are being sent eastward through Pennsylvania every day from the large manufacturing centers west of there.

In Toronto, Ont., this week, an exemption board, examining men drafted for the army under the Canadian conscription law, exempted, for a period of one year, Omer Lewis, a ticket seller of the Grand Trunk; indicating that this man's occupation is a war necessity. On the application of a yard foreman, 23 trainmen of the Grand Trunk were exempted, the railroad company promising to give prompt notice if any one of these 23 should leave the railroad service.

The Interborough Rapid Transit Company, New York City, operating subway and elevated railroads, is employing women in station service, giving preference to dependent women of the families of employees who are in the military or naval service. (In the ticket offices of elevated railway stations in Brooklyn women have been employed for many years.) The New York Railways Company, controlled in the interest of the Interborough, is to employ women as conductors on surface street cars.

The Association of American Railway Accounting Officers is to issue a book containing a synopsis of its recommendations and decisions affecting freight and passenger accounts, including the association's standard freight and passenger forms. The freight synopsis and the passenger synopsis will be under one cover, but separate each from the other. One copy of the Synopsis will be furnished to each member free. Additional copies may be obtained at one dollar each (if ordered soon) from E. R. Woodson, secretary, Washington, D. C.

In the County Court at Buffalo, N. Y., November 16, Paul Vogel, 29 years old, a yard clerk of the Lehigh Valley, was sentenced to imprisonment for from four years to eight years for grand larceny. He had been on duty nights and had ordered loaded cars transferred to a track of the Lackawanna road where they were robbed. The court proceedings showed that on one occasion Vogel had been responsible for the theft of a carload of aluminum valued at \$26,000; and the total of the thefts involved is said to have been \$50,000. Two accomplices, having given evidence for the state, were let off with light punishments.

The last span of the new bridge over the Ohio river at Metropolis, Ill., was swung clear of the falsework on November 10. With the laying of track and other finishing touches it is expected that this bridge will be placed in operation about the first of January. This great structure, which is notable as containing the longest simple span (720 ft.) in the world, is being built jointly by the Chicago, Burlington & Quincy and the Nashville, Chattanooga & St. Louis. The completion of this bridge opens a new all-rail route for traffic from the Northwest to the Southeast.

Representative T. W. Sims, of Tennessee, who is a member of the Newlands Committee, and who is expected to be the next chairman of the House Committee on Interstate and Foreign Commerce, in a newspaper statement, expresses doubt as to whether it will be advisable at the coming session of Congress to attempt any permanent railway legislation of importance because of the abnormal conditions created by the war. He suggested, however, that it might be wise to pass legislation by which the Government would guarantee loans to the railroads at $3\frac{1}{2}$ to 4 per cent for short terms.

Striking clerks of the Atlantic Coast Line and the Southern Railway at Norfolk, Va., decided, on November 25, to return to work; and this action appears to be the sequel to an order from J. J. Forrester, president of a clerks' union which appears to have a considerable membership on all of the principal roads of Virginia, North Carolina and South Carolina. Fragmentary newspaper reports of strikes of clerks on the roads in that region have appeared for the last three weeks. The last reports indicate that on the Chesapeake & Ohio, the Norfolk Southern and the Virginia roads the striking clerks are still out.

The New York State Safety Congress is to be held in Syracuse on December 3, 4, 5 and 6 under the auspices of the New York State Industrial Commission. War problems as related to industry in general and New York State in particular will be chief features of the program. There will be addresses on the first day by Charles B. Barnes, Dr. Royal Meeker, Carlton A. Chase and James P. Holland. On Monday evening there will be given a motion picture showing the salutary effect upon industrial safety by educating the alien population. Tuesday there will be addresses by R. M. Little, James A. Smith, Arthur E. Holder and Miss Mary Dreier.

The United States Civil Service Commission announces examinations for inspector of waybills, for both men and women, to fill vacancies in the office of the chief of ordnance, war department, at salaries ranging from \$1,200 to \$1,500 a year. The duties of appointees will consist of the inspection of waybills, card manifests and railroad terminal records. Competitors will not be required to report for examination at any place, but will be rated: Education and preliminary experience, 30; experience in the class of work specified, 70. Until further notice and on account of the urgent needs of the service, applications will be received at any time, and papers will be rated promptly.

Food Administration and Railways Co-operate at Chicago

A far-reaching plan designed by the railroads and the Food Administration to conserve cars and foodstuffs went into effect in Chicago on November 26. Hereafter every railroad entering Chicago will make a daily report to the food administration of every car of vegetables and other perishable foodstuffs which has been delayed three days or over, awaiting unloading or re-consignment or other disposition. This report will show the car initial and number, point of shipment, date shipped, name of shipper, contents, date of arrival, yard or track where held, name of consignee, destination for delivery and why car is held.

In all cases reported by the railroads of undue detention of cars so loaded the Food Administration and other government agencies will first definitely fix the responsibility for the detention

creased 8.6 per cent; taxes increased 79.7 per cent. Operating income per mile decreased 1.7 per cent.

For the Western railways, operating revenues per mile exceeded those for September, 1916, by 6.0 per cent; operating expenses rose 17.1 per cent; net operating revenue decreased 9.4 per cent; taxes increased 120.0 per cent. Operating income per mile decreased 25.5 per cent.

The nine months of the current calendar year, compared with the corresponding period of the preceding year, show changes per mile of line as follows: Operating revenues increased 11.6 per cent, operating expenses increased 18.7 per cent, net operating revenue decreased 2.0 per cent, taxes increased 29.7 per cent, while operating income decreased 6.6 per cent.

Operating income per mile decreased 15.9 per cent in the East, increased 1.4 per cent in the South, and increased 0.6 per cent in the West.

September net operating income per mile was 17.8 per cent less in 1917 than in 1916, 9.5 per cent less than in 1915, 9.2 per cent greater than in 1914, and 8.1 per cent greater than in 1913.

Valuation Arguments December 10

The Interstate Commerce Commission has announced that oral arguments will be held at Washington on December 10 in the cases involving the reports of the Bureau of Valuation on the valuation of the Atlanta, Birmingham & Atlantic, the Texas Midland and the Winston-Salem Southbound.

Association of American Railway Accounting Officers

A circular just issued by the president of the Association of American Railway Accounting Officers says in part:

It is inevitable, especially under the extraordinary conditions now prevailing, that railway accounting officers will evolve new, improved, or simplified methods, forms, etc., and if we may have the benefit of each other's ideas and experience in this connection, this would aid in solving those problems and difficulties that are confronting us all.

The association will welcome and will be glad to consider any suggestions or any ideas, methods, forms, etc., that might be helpful to others. Any communications along this line, if addressed to the president, J. A. Taylor, comptroller of the Central of New Jersey, will be placed in proper channels.

Minimum Facilities

The Railroad Commission of a prominent western state, reporting recently on a complaint that the station facilities at a certain place were inadequate, gives the following description of the station as it was found:

"X is a non-agency station 6.3 miles north of A and 2.6 miles south of G, by rail, these being the nearest open stations. The station facilities consist of a box-car shelter divided into separate compartments for passengers and freight. The compartment designed for the use of passengers has a door and three small windows. It is equipped with a coal stove and seats for five persons. The freight room has two doors, and is conveniently arranged for loading freight into wagons. The door of the waiting room is in poor repair and the walls are disfigured. A farmer living about 40 rods from the station is employed to attend the fire in the station, and for this purpose he or his fourteen-year-old son visit the station twice daily from November 1 to April 15. A single compartment earth closet is provided.

The village is located about one-half mile east and there are no houses in the immediate vicinity of the station. The village contains a number of business places and has a population of between 50 and 100; but it was estimated that approximately 500 families are naturally tributary to this station. The wagon road to G, is in fair condition and is approximately four miles in length.

"Witnesses complained that the passenger waiting room is insufficient and not properly cared for. A number of instances were cited where it was not heated at train time and was in an unsanitary condition. As many as fifteen people occasionally wait for a single train. The trains are often late, especially in severe weather. The freight room doors are never locked and the merchandise is pilfered if it is not immediately removed by the consignee. A number of such occurrences were described. The team-way leading to the rear door of the freight room was

said to be too narrow for convenience. A conductor's count of passengers on and off trains from April 5 to May 4, 1917, shows an average of 4 passengers a day boarding trains and 5 passengers leaving trains at this point. The greatest number boarding any single train was 6. The total freight receipts during the calendar year 1916 were \$2,144, of which \$1,250 were for freight received and \$894 for freight forwarded."

The commission, in its decision, denied the need of a new station or the employment of a regular agent, but ordered certain improvements, including the employment of a competent caretaker—whether or not the farmer and his fourteen-year-old son would be acceptable does not appear—and the provision of two toilets.

Transportation and Car Accounting Officers

J. W. Nowers, president of the Association of Transportation and Car Accounting Officers, announces that, on account of the present international situation, the executive committee has postponed indefinitely the Winter meeting of the Association. A Year Book is being prepared, which will be issued December 31, containing a resume of the work accomplished by the committees in response to requests of the Commission on Car Service of the Special Committee on National Defense. This will be prepared in form similar to the regular proceedings.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Watten Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.

AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, Supt. Timber Preservation, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 22-24, 1918, Hotel Sherman, Chicago.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Morrison Hotel, Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual dinner, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

CINCINNATI RAILWAY CLUB.—H. Boutet, Chief Interchange Inspector, Cincinnati, 101 Carew Bldg., Cincinnati. Regular meetings, 2d Tuesday, February, May, September and November, Hotel Sinton, Cincinnati.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hilles, 568 Union Arcade Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh, Pa.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month. Room 1856, Transportation Bldg., Chicago.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meeting, 2d Tuesday in month, except June, July, August and September, Boston.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meeting, 3d Friday in month, except June, July and August, 29 W. 59th St., New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—Geo. A. J. Hecherbe, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.

PACIFIC RAILWAY CLUB.—V. S. Winters, Assistant to Chief Engineer, Northwestern Pacific R. R., San Francisco, Cal.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—F. C. Stewart, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria, Ill.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Pittsburgh Commercial Club Rooms, Colonial Annex Hotel, Pittsburgh.

ST. LOUIS RAILWAY CLUB.—W. W. Frayenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grand Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 a. m., Piedmont Hotel, Atlanta.

TRAFFIC CLUB OF CHICAGO.—C. R. Singer, La Salle Hotel, Chicago.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 201 Broadway, New York. Regular meetings, 1st, 3d, 5th, 7th, 9th, 11th, 13th, 15th, 17th, 19th, 21st, 23rd, 25th, 27th, 29th, except June, July and August, Waldorf-Astoria Hotel, New York.

WESTERN CANADA RAILWAY CLUB.—I. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, 1117 Karpen Bldg., Chicago. Regular meetings, 3d Monday in month, except June, July and August, Hotel Sherman, Chicago.

WESTERN SOCIETY OF ENGINEERS.—Edward S. Nethercut, Secretary, 1735 Monadnock Block, Chicago, Ill. Regular meeting, first Monday in month, except January, July and August. Extra meetings generally on other Monday evening except in July and August.

Traffic News

R. S. Lovett, director of priority in transportation, has issued Priority Order No. 4 providing for priority in car supply and transportation for cottonseed cake and cottonseed meal to points in Texas and New Mexico over all other traffic, with five exceptions.

The interurban railway companies of Texas have advanced their freight and express rates; and the State railroad commission has issued an order assuming jurisdiction over all these roads. The commission proposes to make a thorough investigation and has ordered the interurban companies to file all their passenger, freight and express tariffs.

The Ann Arbor announces that car ferry service from Kraftort, Mich., to Menominee, Mich., and Marinette, Wis., will be suspended for the season on January 1. While the route is closed freight for Menominee and Marinette will be carried via Manitowoc, Wis., and the Chicago & North Western or via Kewaunee, Wis., and the Kewaunee, Green Bay & Western and the Chicago, Milwaukee & St. Paul.

Representatives of electric lines in Illinois and Indiana met in Chicago on November 22 for the purpose of organizing to assist the steam roads in handling freight. The meeting resulted in the appointment of a committee to establish through routes and to work out rates to achieve this end. The committee consists of H. G. Faithorn, vice-president of the Chicago Lake Shore & South Bend; F. W. Shappert, traffic and industrial agent of the Chicago, North Shore & Milwaukee; Richard Breckenridge, general freight and passenger agent of the Aurora, Elgin & Chicago; J. R. Blackhall, general manager of the Chicago & Joliet, and F. E. Fisher, general superintendent of the Chicago, Ottawa & Peoria. Further meetings will be held and it is planned to organize all the electric lines in Wisconsin, Illinois, Indiana, Ohio and Michigan for freight traffic purposes. This step is not being taken with the idea of competing with the steam roads, but at the suggestion of the latter in order to assist in handling the unprecedented freight business now flooding the railroads of the country.

Hearing on Proposed Increase in Express Rates

The Interstate Commerce Commission has announced that it will take up the application of the 14 express companies for a general increase of 10 per cent in express rates at a hearing at Washington, December 7. On the same day as its announcement the Commission had given out its usual monthly bulletin of express earnings and expenses which showed for seven months of 1917 an increase in operating revenues of the principal express companies from \$54,400,330 to \$64,520,781, while the operating income, as the result of increased expenses and taxes, had fallen from \$5,161,428 to \$1,192,340.

Fertilizer Association Works for Heavier Loading

The soil improvement committee of the National Fertilizer Association, Chicago, Ill., has issued a pamphlet, entitled "Fertilizers in War Time," explaining how war conditions have increased the difficulty in securing fertilizers and how the commandeering of coastwise vessels by the government forced fertilizers to move almost exclusively over the already overburdened railroads. Special emphasis is placed on the importance of ordering spring fertilizers early and in full carloads.

The pamphlet will be given nation-wide distribution in connection with a campaign to be conducted by the fertilizer industry through the winter and spring months. The association's campaign, in advance of the spring and fall shipping seasons of 1917, is credited with having doubled the efficiency of the cars used for fertilizers and stopping a long-standing trade custom in many sections, i. e., minimum carloading. The work of the association will be supported by liberal advertisements in the farm papers and agricultural journals during December, January, February and March. In addition, the manufacturers themselves are bringing special pressure to bear on all dealers and buyers of fer-

tilizers to order their supplies early. A part of the pamphlet distributed by the association follows:

"The railway transportation situation remains as acute as at any time during the past year. Most of the phosphate rock from Florida to be used in the north must move through the Potomac gateway, which is now so congested as to make shipments most uncertain and erratic. Two million tons of phosphate rock must be moved by one means or another, if the normal demands are to be met. It is only by ordering *now* that the farmer can be assured of deliveries when he wants the goods.

"Order *now*, and order *full* carloads."

Million and a Half Soldiers Moved by Railroads

Figures compiled by the Railroads' War Board indicate that the railroads of this country have safely transported approximately 1,500,000 soldiers to training camps and embarkation points since August 1. One-third of these men have made journeys necessitating overnight travel and have been moved in tourist or standard sleepers.

On one of the long hauls 8,000 men were moved from a training camp on the western coast to a point on the eastern coast—a distance of 3,700 miles—in a little less than a week. The men traveled in 16 sections, each section comprising 12 tourist cars and 2 baggage cars.

In order to centralize the furnishing of sleeping cars and to utilize these cars to the best advantage, the Pullman Company changed the supervision of the supply and movement of these cars from the headquarters of the company at Chicago to Washington, where C. W. Henry, assistant to the superintendent of car service, was stationed. Mr. Henry, in his headquarters at the offices of the Railroads' War Board, has been in daily touch with the office of the quartermaster general, and on receipt of requests from military authorities for sleeping-car equipment has seen that the cars were rushed at once to the points needed.

As a result of this co-operation between the government, the railroads, and the Pullman Company, 500,000 soldiers have been spared the discomforts of making long trips in day coaches. To assure the safety of the men in transit, the railroads have adopted an average speed of 25 miles an hour for all troop trains except when freight cars are included in the trains. The speed is then reduced to 20 miles an hour.

Federal and State Commissioners at Boston

George W. Anderson, Interstate Commerce Commissioner, began in Boston last week a hearing on the applications of the principal New England roads for authority to make increases in rates; and with Mr. Anderson sat members or representatives of the Public Service Commissions of all of the New England states and of New York (second district). The railroads have presented petitions both to the Federal and to the State Commissions. Henry B. Endicott, of the Massachusetts Council of Defense, who has acted as arbitrator in matters of railroad employees' wages, appeared and spoke in favor of the proposed increase of 15 per cent in freight rates. R. O. Lamb, president of the John Hancock Life Insurance Company, speaking for investors, recommended the increase. His company has bought no railroad securities for more than a year. The president of the Boston Chamber of Commerce said that the Chamber was in favor of the increase. Professor W. J. Cunningham, of Harvard University, gave statistics showing the great decreases in net earnings of the railroads. Howard Elliott, of the New Haven road, and a member of the War Board, gave general information about increases in cost of operation and in taxes.

Frederick H. Prince, a railroad capitalist of long experience, presented an argument in favor of increasing the prices for carrying small shipments of freight. He reported an investigation which had been made on the Pere Marquette which showed that local freight in small lots was constantly carried at a loss. The most profitable local freight train on the Pere Marquette cost, to run, an average of \$81, daily, more than its earnings. The losses of that road on that class of freight would amount to approximately fifty times this sum, that being the number of regular local freight trains. This would amount to \$1,500,000 annually. Mr. Prince said that of the freight traffic of the Boston & Maine, 37 per cent was of this unprofitable character. He would have all the railroads make a special charge for loading and unloading freight, with a minimum charge per package.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The Interstate Commerce Commission on November 23 issued an order discontinuing the investigation ordered some time ago in the matter of embargoes.

In the case of Pollak Steel Company of Cincinnati versus Baltimore & Ohio et al., Attorney-Examiner Charles F. Gerry has recommended that the commission require the railroads to remove a discrimination on iron and steel articles from Cincinnati and Chicago to Atlantic ports. He finds an undue preference for Pittsburgh, Cleveland and other points. Rates from Pittsburgh are about 37.5 per cent of the Chicago-New York scale, while a strict adherence to mileage would make them 60 per cent. Cincinnati's rates are strictly on the percentage basis, 87 per cent of the Chicago rates.

Minor Tariff Changes Authorized by Blanket Order

Division 2 of the Interstate Commerce Commission, consisting of Commissioners Clark, Daniels and Woolley, has taken action to enable the railroads to make changes in tariff publications which are in the nature of notices of changes in lists of stations, etc., and in physical facilities for the information of shippers and other carriers, rather than changes in rates, without the necessity of securing the approval of the commission under the fifteenth section of the act, as is required in the case of tariffs containing an increased rate. Fifteenth Section Order No. 125 was issued on November 20, which says:

"Changes in facilities for the physical handling of freight or express matter at stations or express offices throughout the country, such as the addition of or abandonment thereof on old lines, the installation or removal of facilities for handling c. l. or l. c. l. freight, the opening and closing of 'Summer' stations, instructions to agents concerning the waybilling of shipments, and changes in the list of restricted and prohibited commodities published by water and rail carriers, are of almost daily occurrence.

The shipping public and the carriers should be informed of such physical changes and restrictions as promptly as possible to the end that both shippers and carriers may be spared the inconvenience or actual loss which may be caused by delay to freight or express matter resulting from shipments being billed and forwarded upon improper and inaccurate information respecting facilities at destination points and the detention of shipment or cars at interchange points or at ports awaiting amended instructions from shipper or agent at point of origin."

Therefore, the carriers were authorized, to make changes in their tariffs, provided a notation referring to the order is placed on the title page, in such provisions as the following:

1. Additions of stations, landings or express offices on old lines.
2. Cancellation or withdrawal of stations, landings or express offices on old or abandoned lines.
3. Withdrawal or elimination of facilities for handling carload freight or express matter.
4. Withdrawal or elimination of facilities for handling l.c.l. freight or express matter.
5. Withdrawal or elimination of facilities for handling live stock.
6. Withdrawal or elimination of all facilities for handling freight or express matter.
7. Opening and closing of stations, landings or express offices at which business is transacted only during certain seasons of the year.
8. Provisions restricting the handling of inbound or outbound freight or express matter.
9. Provisions restricting the delivery of freight or express matter on private sidings.
10. Provisions restricting the handling of traffic interchanged with connections.
11. Designation of stations as junction points, passenger stations, passing tracks, or towers, at which no freight or express matter will be handled.
12. Limitations upon the quantity, weight or dimensions of shipments that can be handled at a specified station, landing or express office.
13. Limitations upon the handling of specified commodities at a station, landing or express office.
14. Waybilling instructions.
15. Additions to and eliminations from water carriers' lists of restricted and prohibited commodities shown in tariffs of the water carriers and joint tariffs of rail and water carriers.

Free Time at Ports Reduced

The Interstate Commerce Commission on Monday issued its decisions in the export freight free time and New York Harbor storage and free time cases. The commission finds the reduction proposed by the railroads from 5 days to 2 days in the free time allowed for holding at terminals at the Port of New York, domestic freight consigned to New York lighterage points, justified. Proposed increases in storage charges applicable on both export and domestic shipments were also found to be reasonable. In the export freight case the commission finds that the roads have failed to justify the proposed reduction from 15 to 5 days in the free time allowed on export traffic at the North Atlantic ports and from 10 to 5 days at the Gulf ports. The schedules under suspension, therefore, are required to be cancelled without prejudice to the filing of new schedules providing for not less than 10 days free time at the North Atlantic ports and not less than 7 days at the Gulf ports, which periods are found to be reasonable under existing conditions. The proposed reduction from 10 to 5 days in the free time applicable to bunker coal at the ports of New Orleans, Mobile and Pensacola are found to have been justified.

The report says that the only objectors to a reduction of the free storage time at New York were the flour dealers; and it adds:

"The New York flour dealers may not properly demand a total free time of seven days on their shipments when dealers at other ports have but two days; nor is it an adequate answer to this statement to say that the conditions at the port of New York are unusual. However unusual they may be, it would clearly be unjust to the carriers to rule that it is incumbent upon them to hold flour on their valuable piers for five days without charge, solely because the flour dealers find it convenient to use the carriers' facilities for storage purposes. The extent to which the flour merchants would use the terminal facilities for storage, if permitted to do so, is indicated by their contention that in addition to a reasonable period of free time they should be allowed to store domestic flour on the piers for thirty days and export flour for sixty days, at reasonable rates, as distinguished from penalty charges. There is merit in the railroads' contention that some remedy must be found for a condition that entails the holding on piers of 36.8 per cent of total flour shipments on hand (on piers) on typical days in October, 1916, for longer than thirty days."

STATE COMMISSIONS

The New York Public Service Commission, First District, has ordered the reduction of the rates chargeable by the Westcott Express Company, New York City, for taxicab service from railroad terminals to hotels, steamship piers, etc., and vice versa, to the level of the rates charged for taxicab service under city licenses. The Westcott Express Company has accepted the order of the commission and put the reduced rates into effect.

The Railroad Commissioners of Louisiana, on November 22, imposed a fine of \$5,000 on the Texas & Pacific and the receivers in charge of the road, for an "arbitrary, wilful, deliberate and flagrant" violation of the rule of the commission which forbids the discontinuance of a passenger train without the consent of the commission. It was further ordered that the fine shall be increased by \$5,000 for every day that the violation of the rule continues. It appears that the receivers had taken off nine branch line passenger trains in order to conserve the coal supply, and to insure the regular movement of freight traffic, especially sugar. On the following day, on application of the receivers, the Federal Court issued a temporary injunction restraining the commissioners from interfering with the operation of the road.

COURT NEWS

Weeds on Right of Way—Safe Place to Work

A section hand, while placing a hand car on the rails had his limbs pricked with burs and thistles, causing blood poisoning, for which he sued the company, alleging that it had failed to furnish a reasonably safe place to work. The Iowa Supreme Court holds that the presence of noxious weeds on a right of way is not a breach of the railroad's duty to furnish a safe place

to work to section hands whose duties involve the care and maintenance of the right of way, though an Iowa statute requires the railroads to destroy such weeds or pay the expense of their destruction by the public authorities.—*McCutcheon v. Chicago, M. & St. P. (Iowa)*, 164 N. W., 774. Decided October 27, 1917.

Liability for Injury to Pullman Employees

The Federal District Court for the Southern District of Florida holds that the validity of a contract made in Florida by a Pullman company employee, exempting any railroad company over whose line he might run from liability on account of any personal injury to him, when brought in question in an action in a Federal Court in Florida, is to be determined by the law of that state, although the injury sued for happened in another state. The Florida statute, providing that a railroad company shall be liable for any damage done to persons by the running of its trains, or by its employees, unless absence of negligence is shown, does not declare a public policy of the state, which renders void such a contract provision, and in the absence of statute, or a decision of the Supreme Court of the state establishing such a public policy, such a contract is valid.—*Eulbanks v. Southern*, 244 Fed., 891. Decided August 21, 1917.

Hours of Service Decisions—Diligence Alter Unforeseen Delay—Switch Tenders Receiving Telephone Orders

In an action for violating the Hours of Service Act by keeping train employees on duty for more than 16 hours it appeared that the crew of five men in charge of a freight train running from Blue Island to Chicago and return, a distance of 63 miles, was in continuous service for a period varying from 17 hours 5 minutes to 17 hours 35 minutes. In justification the railroad showed that, because of a derailment of a car in a train ahead, there was a delay of 2 hours and 20 minutes. The railroad contended, first, that delay of such origin comes within the exception of section 3 of the act, and the maximum period of 16 hours was thereby automatically extended 2 hours and 20 minutes. This contention the Circuit Court of Appeals, Seventh Circuit, rejected on the authority of prior decisions. It held that the railroad was required to show, in addition to the cause of delay, that it exercised a high degree of diligence to overcome the effect of the delay and relieve its employees from continuous service over 16 hours. "It was admitted on the trial that no effort was made by the train dispatcher or any other representative of the railroad to relieve the crew after knowing of the accident and resulting delay. The train dispatcher labored under the impression that the 16-hour limit was extended for a period of 2 hours and 20 minutes, due to excusable delay, and that no violation of the law would occur until the crew had been in continuous service for 18 hours and 20 minutes, and such misapprehension of the law explains, at least in part, the failure of the carrier to take any steps to relieve the crew." It was held that this evidence supported the finding of the trial judge that the railroad had violated the statute.—*Indiana Harbor Belt Ry. Co. v. United States*, 244 Fed., 943. Decided July 24, 1917.

The Circuit Court of Appeals, Seventh Circuit, holds that switch tenders, who regularly conduct the movements of the trains in and through a yard, receiving the yardmaster's telephone orders in their shanties, and executing them by transmitting them verbally or by signal to the engine or train men, and by manipulating switches, are within the proviso of Hours of Service Act, Section 2, limiting to nine hours the service of an employee who by use of the telephone receives orders pertaining to or affecting train movements.—*Chicago & Alton v. United States*, 244 Fed., 945. Decided July 12, 1917.

UNITED STATES SUPREME COURT

The case of the appeal of the Reading Company et al, from the decision of the lower court in the government's suit against them under the Sherman anti-trust law was reargued in the United States Supreme Court on November 20 and 21. Arguments were made by G. C. Todd, assistant to the attorney general, for the United States; by Jackson E. Reynolds for the Reading Company and by R. W. DeForrest for the Central of New Jersey.

Equipment and Supplies

LOCOMOTIVES

THE ST. PAUL UNION DEPOT COMPANY has ordered one six-wheel switching locomotive from the Lima Locomotive Works.

THE ILLINOIS CENTRAL has ordered 50 Mikado locomotives from the Lima Locomotive Works, Inc., and 25 switching locomotives from the American Locomotive Company.

FREIGHT CARS

THE UNITED STATES WAR DEPARTMENT, Equipment Division, is inquiring for prices on 78 50-ton flat cars.

THE ZIMMERMAN ALDERSON CARR COMMERCIAL COMPANY is inquiring for prices on 25 8,000-gal. capacity tank cars.

THE AMERICAN INTERNATIONAL STEEL CORPORATION, New York, has issued inquiries for 300 4,000-gal. tank cars and 80 mine cars for export to industrial interests.

THE UNITED STATES NAVY has ordered 4 50-ton box cars from the American Car & Foundry Company for the Great Lakes Naval Training Station and has issued an inquiry for 10 40-ton box cars for the Bureau of Docks and 16 40-ton gondola cars.

THE UNION PACIFIC has placed orders for 3,350 freight cars as follows: 1,000 stock cars, American Car & Foundry Company; 1,000 hopper bottom coal cars; 50 caboose cars, Mount Vernon Car Manufacturing Company, and 500 flat and 1,000 drop bottom gondola cars, Bettendorf Company.

PENNSYLVANIA HOLDS FAST TRAIN FOR SICK WATCHMAN.—The Pennsylvania Railroad company showed the human side of the big corporation one morning recently when it held up one of its through passenger trains running as an extra with first class privileges for half an hour to get a doctor on board who would carry relief to a lone watchman in a little box six miles west of Lewistown Junction, Pa., suffering from an acute attack of cramps. After the doctor had administered first aid to the sick watchman, both were brought to a local hospital in the caboose of a freight train.

ITALIAN RAILWAYS IN HANDS OF ENEMY.—Press despatches, dated November 9, report that the Austro-German armies are in possession of more than sixty miles of Italian railroads, controlling more than thirty miles of the line from Grado, on the Adriatic, toward Venice, and about an equal amount of the trackage of railroad in the north, with Udine as its center. Control of these facilities, together with a large part of the extensive system of canals in Northeastern Italy, supply the enemy with advantageous means of communication, of which the invaders already are making use.

THE CONSTITUTIONAL RAILWAYS OF MEXICO are gradually restoring their regular train service, says a correspondent, to divisions that have been out of commission during most of the protracted revolutionary period. It is announced that passenger and freight trains are now being operated between Torreon and Durango and upon several short branch lines that have been unused for a long time. The new railroad that connects the City of Durango with the division of the Constitutionalist Railways at a point near Zacatecas is finished and will be placed in regular operation as soon as it can be equipped with the necessary rolling stock. The railroad that runs between Saltillo and Torreon, formerly known as the Coahuila & Pacific, now a part of the Constitutionalist Railways, is again performing a regular freight and passenger service between those two cities. Bands of brigands are still operating along the line of the railroad that connects San Luis Potosi with Tampico, and occasional attacks are made upon trains between Saltillo and Catorce. The government, however, seems to be gradually gaining the upper hand over these outlaws and travel is becoming safer all the time.

Supply Trade News

Allen R. Miller, of the B. F. Goodrich Company, railroad sales department, at Akron, Ohio, has been transferred to the B. F. Goodrich Rubber Company, 1780 Broadway, New York, as eastern representative.

J. W. White has been appointed manager of the power and railway division of the Detroit office of the Westinghouse Electric & Manufacturing Company. Mr. White was formerly connected with the Pittsburgh office of the company, subsequently becoming associated with the Allis Chalmers Company, and has now returned to the Westinghouse Company, assuming the position above noted.

L. F. Hamilton, manager of the advertising and specialty department of the National Tube Company, Pittsburgh, Pa., will, on December 1, become associated with the Walworth Manufacturing Company, Boston, Mass., and will be succeeded by W. L. Schaeffer, his assistant. The Walworth Manufacturing Company recently purchased the Kewanee works and the Kewanee line of products from the National Tube Company. Mr. Hamilton will take up approximately the same duties with the company that he had with the National Tube Company, more particularly the training of specialty students, the supervision of specialty and sales promotion work, etc.

Fuel Orders for Lehigh Valley and the C. & O.

Orders intended to insure an adequate supply of coal to the Lehigh Valley and the Chesapeake & Ohio have been issued by the United States Fuel Administration. The orders will distribute equitably among the mines adjacent to the roads the burden of furnishing the roads' fuel supply. Both orders took effect on November 19. Mines now under contract to supply the railroads with coal will be required to supply their quota at their contract prices. Other mines will be required to furnish a pro rata supply, and at prices fixed by the government. The railroads will be required to file with the Fuel Administration each week a schedule of the tonnage which must be requisitioned for the next week's supply. The requisition order will be given priority over all contracts for other parties. The Lehigh Valley draws its supply from mines which are not located on its own lines. These mines are ordered to give priority to the demands of the Lehigh Valley, even over requisitions for coal to supply the railroads upon which they are located.

On Monday of this week, similar orders were issued in favor of the New York, New Haven & Hartford and the Central New England. The order directs all mines under contract with these railroads to give preference to the contract requirements over other shipments, except where coal is diverted by direct requisition of the Fuel Administration.

HYDRO-ELECTRIC STATION OF ITALIAN STATE RAILWAYS.—Permission has recently been granted to the Italian State Railways by the Ministry of Public Works for the erection of a hydro-electric station at Bardonecchia (Susa), a town in the Cottian Alps, 5 miles from the French frontier on the Modane line. The cost of this plant will be about 20,000,000 lire (approximately \$4,000,000).—*Commerce Report.*

CAPTURED ZEP UP 8 MILES.—A staff correspondent of the Philadelphia Evening Ledger sent a despatch, dated October 23, from American Field Headquarters in France describing the Zeppelin L-49, brought down near Bourbome-les-Bains. It says it is 600 feet long, with a diameter of 90 feet, has an aluminum frame, with longitudinal and horizontal ribs, covered with stout interlaced cord, over which is the outside cover of linen, painted black. The shape is that of an exaggerated fat cigar. Two silk balloons fill the interior, holding the hydrogen gas, which gives the lifting power. Slatted runways, nine inches wide, with guide rails, extend the length of the airship, giving access to sleeping quarters, an electric kitchen, and the five great steel engines. The Zeppelin's instrument for calculating altitude, says the correspondent, showed she had ascended a distance of 42,000 feet.

Railway Financial News

CANADIAN NORTHERN.—The Wall Street Journal says that the Canadian government has decreed that the most that shall be paid by arbitration for the 600,000 shares of common stock of the Canadian Northern shall be \$10,000,000. The road is now in its final stage of transfer to the government of Canada, which for the past year has owned 400,000 shares of the company's stock, taken as collateral for loans. Arbitration proceedings will commence at once and must be concluded by March 1, 1918.

The par value of the 600,000 shares at present held by the Canadian Northern is \$60,000,000, and Sir William Mackenzie, president of the road, says that the par value is not a penny above actual worth. However, the new government order marks down the stock at about 16 cents on the dollar. Nothing prohibits the arbitrators from placing a valuation higher than the arbitrary maximum of ten millions, but nothing more than that may be paid from the public treasury.

If the value is found to be less than \$10,000,000, then the less sum will be paid. It is understood that Mackenzie, Mann & Company, Limited, own approximately five-sixths of these shares. Consequently, the maximum that can be paid to them will be something over \$8,000,000. These shares are pledged to their bankers as part security for loans, which presumably constitute a claim against the property.

The duty of the arbitrators is to take evidence such as may be offered on behalf of the Dominion and of the company. Both parties will be heard in the usual way.

The agreement does not call upon the arbitrators to adopt any particular method. They may inquire what the stock could be sold for; they may ascertain the value of the assets and deduct the liabilities. They may take into consideration earning power. They are not restrained in any way, but simply required to get at the fair value in the best way possible. It is further specifically provided that if the arbitrators should see fit to take into consideration the reproduction cost of the system, then they must not include therein the increase in value, due to the war, of labor, material, equipment, or of any property whatever.

The company will be required to disclose all liabilities of every kind to the arbitrators. Should it be found later that liabilities exist that were not disclosed, or in excess of those disclosed, then a corresponding deduction will be made from any award given.

DENVER, BOULDER & WESTERN.—This company, which operates 49 miles of line between Denver, Colo., and Boulder, has notified the Colorado Public Utilities Commission that commencing with December 27, it intends to abandon operations, dismantle and sell its equipment.

ERIE.—Although this company recently received authority from the New Jersey Public Utilities Commission to issue \$15,000,000 20-year 6 per cent refunding and improvement bonds, series A, it is stated authoritatively that no public financing is contemplated at this time. It is understood, however, that the company may borrow some money privately and use the new bonds as collateral to secure the loan.

LAKE ERIE & EASTERN.—The Ohio Public Utilities Commission has authorized the issuance of \$7,750,000 common stock to sell at not less than par. The proceeds will be used in paying indebtedness to its controlling companies, the Pittsburgh & Lake Erie and the Mahoning Coal Railroad Company, amounting to \$6,687,415 for equipment and the construction of its line; also to pay for additions and improvements estimated to cost \$1,102,584.

SWISS TRANSPORTATION DIFFICULTIES.—Stage coaches may be seen again running between towns in Switzerland, according to press despatches. Owing to the ever-decreasing amount of coal arriving from Germany the Swiss Government has been forced to suppress half the number of passenger trains in Switzerland, while those trains in service will not be heated.

Railway Officers

Executive, Financial, Legal and Accounting

L. J. Masson has been appointed auditor of the San Diego & Arizona and the Tijuana & Tecate, with office at San Diego, Cal., vice H. I. Kittlesby, resigned to accept service elsewhere.

L. O. Heintz has been appointed auditor of freight and passenger accounts of the Missouri & North Arkansas and John P. Doughty has been appointed auditor of disbursements, both with headquarters at Harrison, Ark.

George J. Adams, who has been appointed assistant to vice-president in charge of accounting, of the Pennsylvania Railroad, with office at Philadelphia, Pa., as has been announced in these columns, was born on November 22, 1881, at Philadelphia. He was educated in the public schools and in Pierce's Business College of his native town. On April 1, 1897, he entered the service of the Pennsylvania Railroad as a clerk in the secretary's department. He was transferred in January, 1899, to the treasury department, where he served until August, 1900, when he returned to the secretary's department. In June, 1906, he served in the office of Samuel Rea, then vice-president, and in December, 1910, Mr. Adams was appointed chief clerk. He later was chief clerk to A. J. County, then special assistant to the president, who later became vice-president in charge of accounting. On November 1, 1917, Mr. Adams was appointed assistant to vice-president in charge of accounting of the same road, as above noted.

G. J. Adams

R. F. Watkins, whose appointment as treasurer of the Denver & Rio Grande was mentioned in these columns on November 9, was born at Davenport, Iowa, on October 13, 1870. Mr. Watkins received his education in the public schools of Davenport and the State University of Iowa at Iowa City. He entered railway service on February 26, 1894, in the office of the auditor of the Union Pacific, Denver & Gulf, afterwards the Colorado & Southern, and was chief clerk to the general auditor when he left that company on September 11, 1903, to become assistant secretary and trust officer of the International Trust Company, Denver, Colo. On January 1, 1906, he left the trust company to become assistant treasurer of the Denver & Rio Grande, and, after the death of the treasurer, J. W. Gilluly, was promoted to that position on August 19, 1913, resigning in 1915. He was again elected to the same position on November 1, 1917.

Operating

H. F. Sutherland has been appointed superintendent of the Kentucky & Indiana Terminal Railroad Company, with office at Louisville, Ky.

J. A. Shepherd has been appointed assistant superintendent of the Green River division of the Denver & Rio Grande, with office at Helper, Utah, vice T. F. Durkin, transferred.

P. J. Welsh has been appointed night trainmaster of the Kentucky & Indiana Terminal Railroad, with office at Louisville, Ky., vice F. I. Loyd, who has been assigned to other duties.

W. J. Haylow, assistant superintendent of transportation of the Louisville & Nashville at Louisville, Ky., has been appointed superintendent of transportation, vice C. B. Phelps, who has been called to Washington to serve as a member of the American

Railway Association's Commission on Car Service. T. B. Turner, assistant superintendent at Mobile, Ala., has been appointed assistant superintendent of transportation.

R. M. MacMillan has been appointed acting division superintendent of telegraphs of the Grand Trunk Pacific lines in Ontario, Manitoba and Saskatchewan, with office at Winnipeg, Man., vice F. T. Caldwell, granted extended leave of absence to enter military service.

H. L. Reed, superintendent of the Chicago, Rock Island & Pacific at Herrington, Kan., has been promoted to acting assistant general manager, second district, with headquarters at El Reno, Okla., succeeding G. W. Rourke, granted indefinite leave of absence on account of ill health; H. F. Reddig, division superintendent at El Reno, succeeds Mr. Reed; C. B. Pratt, terminal superintendent at Chicago, succeeds Mr. Reddig, and C. T. Ames, chief clerk to vice-president, succeeds Mr. Pratt, effective December 1.

James M. Scott, whose appointment as general superintendent, West Virginia district of the Baltimore & Ohio, with office at Wheeling, W. Va., has already been announced, was born on November 1, 1871, at Charleston, W. Va., and was educated in the high schools. He began railway work on September 10, 1890, with the Chesapeake & Ohio as telegraph operator and subsequently served on the Cincinnati, Hamilton & Dayton as operator; in November, 1895, was appointed despatcher, and subsequently served as trainmaster until November, 1904, when he was appointed superintendent. He remained in that position until May, 1910, and then went to the Kansas City Southern as trainmaster at Mena, Ark. The following January he entered the service of the Public Service Commission of Indiana in charge of the inspection department, and in September, 1912, went to the Baltimore & Ohio as supervisor of transportation. On January 1, 1913, he was appointed assistant superintendent of the Cumberland division and the following May became superintendent of the Monongah division, with headquarters at Grafton, W. Va., which position he held until his recent appointment as general superintendent, West Virginia district, of the same road, with headquarters at Wheeling, as above noted.

J. M. Scott

M. C. Selden, trainmaster of the Chesapeake & Ohio at Richmond, Va., has been appointed assistant superintendent, Newport News Terminal division, with headquarters at Newport News, Va.; P. P. Crawford, chief train despatcher at Richmond, has been appointed trainmaster of the Rivanna district, with headquarters at Richmond, vice Mr. Selden, and during the absence of C. S. Wright, trainmaster at Richmond, Mr. Crawford's jurisdiction is extended over the Peninsula district; E. W. Lacy has been appointed chief train despatcher of the Richmond division, with headquarters at Richmond, vice Mr. Crawford.

G. A. Hoag, who has been appointed superintendent of the Canadian Northern, eastern lines, with headquarters at Hornepayne, Ont., as has already been announced in these columns, was born on May 31, 1866, at Walters Falls. He began railway work on June 8, 1884, with the Grand Trunk and served as switchman until May, 1886. He subsequently served as night operator until January, 1888, and then as day operator and agent at different places until August, 1901, when he was appointed yardmaster at Belleville. He remained in that position until March, 1903, when he became agent at Trenton, and in October, 1905, resigned from the Grand Trunk service. He later served as trainmaster on the Central Ontario until 1908, and then to July, 1914, was superintendent on the same road. He subsequently became assistant

superintendent of the Canadian Northern at Trenton, Ont., which position he held at the time of his recent appointment as superintendent of the same road, as above noted.

F. E. Blaser, whose appointment as assistant general manager of the Baltimore & Ohio, with headquarters at Baltimore, Md., has already been announced in these columns, was born on

December 14, 1858, at Tomah, Wis., and was educated in the common schools. He began railway work in 1871, with the Western Wisconsin Railway, now a part of the Chicago, St. Paul, Minneapolis & Omaha, and served consecutively with that road as water carrier, telegraph operator, agent, brakeman, conductor, train despatcher and trainmaster. In 1900 he was appointed superintendent of the Ohio River Railroad and remained in the same position when that road was taken over by the Baltimore & Ohio. He then served as superintendent of the

Wheeling division of the Baltimore & Ohio and later was transferred as superintendent to the Cumberland division. In April, 1910, he was promoted to general superintendent at Baltimore, Md., which position he held at the time of his recent appointment as assistant general manager of the same road, as above noted.

William B. McCaleb, who has been appointed general superintendent of water companies of the Pennsylvania Railroad, with headquarters at Philadelphia, Pa., as has already been announced

in these columns, was born on May 18, 1862, at Mount Pleasant, Westmoreland county, Pa., and was educated in the public schools and at the Mount Pleasant Institute. He entered the service of the Pennsylvania Railroad in March, 1880, as chairman with an engineer corps at Connellsville, Pa. He subsequently was transferred to the assistant engineer's office on the Pittsburgh division as rodman, and later to the principal assistant engineer's office at Altoona. In April, 1883, he was appointed assistant supervisor at New Flor-

ence on the Pittsburgh division, and subsequently served in the same capacity at Harrisburg and at Greensburg. He was promoted in October, 1886, to supervisor of the Tyrone division, and a few months later was transferred to Middletown in the same capacity. In May, 1889, he was transferred to Downingtown as supervisor and the following December he was promoted to assistant engineer of the West Pennsylvania division at Allegheny City. He subsequently served in the same capacity on the Middle division at Harrisburg, and in October, 1895, was promoted to superintendent of the Bedford division. On December 10, 1896, he was made superintendent of the Sunbury and Shamokin division; in May, 1902, he was promoted to superintendent of the Middle division, at Harrisburg and upon a transfer of headquarters was made superintendent of the Philadelphia division in June, 1903, remaining at Harrisburg, and now becomes general superintendent of the Pennsylvania Railroad water companies, as above noted.

F. E. Blaser

W. B. McCaleb

J. W. Deneen, whose appointment as superintendent of the Monongah division of the Baltimore & Ohio, with headquarters at Grafton, W. Va., has already been announced in these columns, was born on July 8, 1875, at Cumberland, Md., and was educated in High School. He began railroad work in July, 1890, as a messenger on the Baltimore & Ohio; the following year he became an operator on the Cumberland division. From 1902 to 1915 he served consecutively as copy operator, train despatcher, chief despatcher and trainmaster. He was then appointed assistant superintendent, which position he held until his recent appointment as superintendent of the Monongah division of the same road, as above noted.

W. N. Neff, whose appointment as general manager of the St. Louis Southwestern and vice-president and general manager of the St. Louis Southwestern of Texas, with office at Tyler, Tex.,

was announced in these columns on November 10, was born at Lawrence, Kan., on August 11, 1874. His railway career started with the Missouri Pacific in June, 1889, and he remained with that road until September, 1895, serving as station baggageman, telegraph operator, station agent, roadmaster's clerk and clerk to the division superintendent. From September, 1895, to April, 1899, he was employed by the Montana Central and Great Northern, on the former as telegraph operator and maintenance of way clerk and on the latter as maintenance of way clerk, chief clerk to the superintendent and chief clerk to the general superintendent. In April, 1899, he went with the St. Louis Southwestern as assistant superintendent and in March, 1900, was promoted to superintendent, in which capacity he served until May, 1911, with the exception of one year when he was chief clerk to the president. From this date until January 1, 1915, he was general superintendent of the St. Louis Southwestern and vice-president and general superintendent of the St. Louis Southwestern of Texas. From January, 1915, to November 1, 1917, he was superintendent of the Northwestern Pacific at Sausalito, Cal. His appointment, as stated above, was effective November 8, 1917.

W. N. Neff

Traffic

H. W. Warren, city ticket agent of the Chicago, Milwaukee & St. Paul at Des Moines, Iowa, has been appointed to the recently created position of district passenger agent, with the same headquarters.

P. B. Doddridge, commercial agent of the Texas & Pacific at Kansas City, Mo., has been transferred to Pittsburgh, Pa., succeeding T. B. Moss, resigned. C. R. Krause succeeds Mr. Doddridge as commercial agent at Kansas City.

Paul Wadsworth, freight traffic manager of the Delaware & Hudson at Albany, N. Y., has been appointed assistant to the general traffic manager with duties to be assigned, and his former position has been abolished; Charles E. Rolfe, general freight agent at Albany, has been appointed general agent, traffic department, in charge of freight solicitation; William G. Story has been appointed general freight agent, and Walter C. Harden has been appointed assistant general passenger agent; all with offices at Albany.

Harvey Lewis Fell, who has been appointed assistant general passenger agent of the Central of Georgia with headquarters at Savannah, Ga., as has already been announced in these columns, was born on November 15, 1872, at Talbotton, Ga., and was educated in the public and commercial schools. He began railway work in October, 1892, with the Central of Georgia and has been in the continuous service of that road ever since. He first served in the passenger department as stenographer to the general passenger agent, and subsequently held positions in the same depart-

ment as voucher clerk, ticket stock clerk, rate clerk, chief rate clerk and chief clerk. On November 1, 1917, he was appointed assistant general passenger agent of the same road, as above noted.

E. H. Hoops, general agent in the freight department of the Chicago & North Western at Chicago, has been promoted to assistant general freight agent, with the same headquarters. A. R. Gould, general agent at Cleveland, Ohio, has been promoted to general agent in the freight department at Chicago, succeeding Mr. Hoops. A. W. Bower, general agent at Indianapolis, Ind., has been transferred to Cleveland to succeed Mr. Gould. John Mellen, general agent at Omaha, Neb., has been transferred to Indianapolis to succeed Mr. Bower and R. D. Miller, assistant general agent at Omaha, has been promoted to general agent, succeeding Mr. Mellen.

Walter S. Franklin, Jr., whose appointment as assistant general freight agent of the Pennsylvania Railroad, with headquarters at Philadelphia, Pa., has already been announced in these columns, was born on May 24, 1884, at Ashland, Baltimore county, Md. He graduated in 1906 from Harvard College with the degree of bachelor of arts, and in October of the same year entered the service of the Pennsylvania Railroad as platform clerk at Dock street freight station, Philadelphia. The following January he was made overcharge claim clerk in the general office, and in October of the same year was promoted to rate clerk. In October, 1908, he was transferred to the transportation department of the Northern Central Railway at York, Pa., as assistant to the agent. The following July he was appointed freight solicitor at Baltimore, and subsequently held the same positions in New Haven, Conn.; Toronto, Ont., and Pittsburgh, Pa. On January 1, 1914, he was appointed southern freight agent at Atlanta, Ga., with general supervision over the soliciting agencies of the Pennsylvania System in the southern states, and in December, 1915, was made division freight agent of the Philadelphia, Baltimore & Washington, at Baltimore, Md., which position he held until his recent appointment as assistant general freight agent of the Pennsylvania Railroad, lines east of Pittsburgh, as above noted.

W. S. Franklin, Jr.

Thomas Henry Gurney, who has been appointed assistant general passenger agent of the Chesapeake & Ohio, with headquarters at Cincinnati, Ohio, as has already been announced in these columns, was born on February 3, 1875, at Covington, Ky., and was educated in the high school. He began railway work in December, 1893, and served as a clerk and stenographer in the general passenger department of the Cleveland, Cincinnati, Chicago & St. Louis until August, 1895. He was then to August, 1903, consecutively stenographer and clerk, chief division clerk, and chief rate clerk in the general passenger department of the Cincinnati, Hamilton & Dayton at Cincinnati. From August, 1903, to the fall of 1904, he was chief clerk to the general passenger agent of the Chicago, Cincinnati & Louisville. In January, 1906, he was appointed general passenger agent of the same road, which later became part of the Chesapeake & Ohio, and from August, 1910, he was district passenger agent of the Chesapeake & Ohio lines until his recent appointment as assistant general passenger agent, as above noted.

Engineering and Rolling Stock

C. E. Peck, general foreman for the Southern Pacific at Roseville, Cal., has been promoted to master mechanic of the Portland division, with headquarters at Portland, Ore., succeeding George Wild, resigned.

A. C. MacKenzie, engineer maintenance of way of the Canadian Pacific, with headquarters at Montreal, Que., has been transferred in the same capacity to Winnipeg, Man., succeeding Frank Lee, transferred to Montreal in place of Mr. MacKenzie.

D. G. Cunningham has been appointed assistant superintendent motive power and car departments of the Denver & Rio Grande, with headquarters at Salt Lake, Utah; E. J. Harris having resigned, the duties of master mechanic will be also assumed by Mr. Cunningham.

William H. Fetner, acting superintendent motive power of the Central of Georgia at Savannah, Ga., has been appointed superintendent of motive power; Frederick F. Gaines, superintendent of motive power, who was granted leave of absence in September on account of continued ill health, has been assigned to other duties.

L. L. Allen, general foreman of the St. Louis, Brownsville & Mexico at Kingsville, Texas, has been appointed master mechanic of the Gulf Coast Lines, with headquarters at De Quincy, La., and J. L. Lavalie, master mechanic of the New Orleans, Texas & Mexico at De Quincy, has been appointed assistant superintendent with office at De Quincy.

Purchasing

R. L. Agner has been appointed division storekeeper of the Southern Railway, with office at Alexandria, Va., vice A. B. Lackey, resigned to enter service of United States Army.

E. J. Shields has been appointed general storekeeper of the Kansas City, Mexico & Orient, with headquarters at West Wichita, Kan., vice C. A. Keller resigned to accept service with the United States Government.

W. W. Eldridge has been appointed storekeeper of the Chicago, Burlington & Quincy at Sheridan, Wyo., succeeding M. Josselyn, assigned to other duties. I. G. Morrison, store inspector, succeeds Mr. Eldridge as storekeeper at Havelock, Neb.

Railway Officers in Military Service

F. T. Caldwell, superintendent of telegraphs of the Grand Trunk Pacific at Winnipeg, Man., has been granted an extended leave of absence to enter military service.

C. V. Link, was erroneously reported as being appointed assistant superintendent of the Chicago, Terre Haute & South-eastern at Bedford, Ind., in the *Railway Age Gazette* of October 19. Mr. Link was granted leave of absence from his position as assistant superintendent at Bedford on September 1, and is now a freight traffic expert in the ordnance department of the army with the commission of captain in the Ordnance Officers' Reserve Corps.

OBITUARY

Thomas P. Barry, formerly from 1891 to 1899 general passenger agent of the Iowa Central, died at the home of his son in St. Louis, Mo., on November 16, at the age of 75. Mr. Barry was for many years the general passenger and ticket agent of the old Marietta & Cincinnati, later acting in the same capacity on the Cincinnati, Washington & Baltimore.

Amos S. Crane, freight traffic manager of the Boston & Maine, with headquarters at Boston, Mass., died on November 22, at his home in Weston. He was born in 1848, at Washington, Berkshire county, Mass., and was educated in the public schools and at the Connecticut Literary Institute, Suffield, Conn. In 1877 he began railway work with the Erie Railroad at Chicago as contracting freight agent. Three years later he was transferred to Boston, as New England agent of the South Shore Line and Great Western Despatch which operated over the Erie. In 1883 he became general freight and passenger agent of the Boston, Hoosac Tunnel & Western, at Mechanicville, N. Y., and the following year he returned to Chicago as general freight agent of the Chicago & Atlantic. In 1890 he was appointed general freight agent of the Fitchburg Railroad, at Boston, Mass.; he was promoted in June, 1898 to general traffic manager and when that road was consolidated with the Boston & Maine in July, 1900, he was appointed export freight traffic manager of the Boston & Maine system. In 1907 he was appointed assistant freight traffic manager and since 1909 was freight traffic manager of the same road.

The nine regiments of railway engineers that represent the American railways behind the lines in France are now less than six months old, but they are already making history and tradition for their organization. We quote from a despatch from Washington dated Monday last. "High tribute to the gallant conduct of the American army engineers in France who were caught in the German encircling attack on the British lines near Cambrai, is paid in an official communication from the French government received here tonight by cable. The communication follows:

Our Engineers Win Praise at Cambrai

"We must remark upon the conduct of certain American soldiers, pioneers and workmen on the military railroad in the sector of the German attack west of Cambrai on November 30. They exchanged their picks and shovels for rifles and cartridges and fought with the English. Many died thus bravely, arms in hand, before the invader. All helped to repulse the enemy. There is not a single person who saw them at work who does not render warm praise to the coolness, discipline, and courage of these improvised combatants."

The president of the Association of American Railway Accounting Officers has issued a circular to members of the association urging each member to make a study of the unnecessary costs involved in the present system of intermediate inter-road rebilling. In addition to the unnecessary labor involved in this system there is also a delay to freight cars. Railway executives should not only carefully consider the facts which their accounting officers will present to them if the recommendations contained in this circular of the Accounting Officers' Association are carried out, but they should themselves direct their accounting officers to make such an investigation immediately. There is a great waste in intermediate inter-road rebilling and this system of billing is a survival of competitive practices which are rapidly being abolished. It is a waste which there can be no real excuse

Interline Waybilling Urged

for even on an individual road as distinguished from all the railroads. Tradition and inertia are the explanation of the continuance of the practice. The executives and accounting officers should override this prejudice.

The Pennsylvania Railroad, which owns all of the capital stock of the Pennsylvania Company, is now to assume the obligations of the Pennsylvania Company and to take over the actual operation of the Northwest system of the Pennsylvania Lines West and dissolve the holding company—the Pennsylvania Company—which now operates these lines. The vice-presidents of the Pennsylvania Company will become vice-presidents of the Pennsylvania Railroad, and while the organization will in a sense remain intact, it will actually become a part of the Pennsylvania Railroad organization and in time will presumably be as integral a part as one of the five grand divisions is now. Purely from an operating point of view this has distinct advantages. From a financial point of view the change made is at first sight one rather of form than of substance. All of the bonds and trust certificates of the Pennsylvania Company which are outstanding in the hands of the public are guaranteed by the Pennsylvania Railroad and are secured by the deposit of various forms of collateral. The elimination of the holding company would be of no importance except to substitute the credit of the Pennsylvania Railroad direct for this credit now one step removed by the interposition of the Pennsylvania Company. It would moreover bring the Pennsylvania Railroad one step nearer to the Pittsburgh, Fort Wayne & Chicago, which company owns the main line of the Northwest system from Pittsburgh to Chicago. This line is leased to the Pennsylvania Company and the lease is deposited under the Pennsylvania Company's first mortgage. There is no mortgage on the Pittsburgh, Fort Wayne & Chicago. The Pennsylvania Railroad's income account will be considerably benefited because the surplus of the Pennsylvania Company, after the payment of dividends to the Penn-

sylvania Railroad, has heretofore remained in the Pennsylvania Company's treasury and has therefore formed an equity only for the parent company. It will now go directly into the parent company's treasury as a part of operating income. This is a step toward simplification of the Pennsylvania system which should work out to the future benefit both of operation of the property and financing it.

Fifty per cent of the enormous number of freight-tracing telegrams now burdening the railroad telegraph and telephone wires all over the country are unnecessary; nearly 100 per cent of these messages are useless, so far as expediting the movement of freight is concerned; and this wasteful use of the

Wasteful Use of the Wires

wires is rapidly increasing. This is the substance of one of the significant paragraphs in the report of the convention of the Telegraph Superintendents' Association, published in the *Railway Age Gazette* last week, page 987. Sending letters by wire is a very old form of extravagance. Freight tracers are not the only abuse. The censoring that has been tried, here and there, during the last 20 years has worked temporary improvement, but no manager seems to have accomplished any sweeping or radical reform; or, if any has been accomplished, it is now swallowed up in the sea of war-conditions. We speak specially of the manager, for it seems quite plain that, to cut down the volume of telegraphing with appreciable and lasting effect, each general manager has got to stand, personally, very close to the man who actually uses the knife or the blue pencil. The committee has been instructed to send the association's resolution to the American Railway Association; which means, presumably, to the Railroads' War Board at Washington, as that body is in position to get immediate action on cutting out this unnecessary waste.

Some people are not satisfied with patriotism that is represented merely by service. They require a more violent manifestation of it. The Washington Times publishes a daily column of paragraphic comment which is rather bright and interesting, but which shows a cheerful disregard of logic. The other

Patriotism Not Sufficiently Violent

day this column included an item on the action of the general operating committee of the eastern roads in ordering a discontinuance of the Pennsylvania's Broadway Limited train to enable the road to handle more freight. Asserting that the train "for some strange reason was not well patronized and did not pay very well," and that the New York Central's Twentieth Century Limited "runs crowded and pays well," the writer applauded "the patriotic withdrawal of a train that doesn't pay and the business-like continuation of a train that does pay." All of which was "spoke sarcastic." What the Washington Times meant to imply, we assume, was that true patriotism would take off the trains that pay best, and leave on those which don't pay at all. But it happens that those which pay best are the ones on which the most people ride. That is why they pay best; and the better a train pays, the more people would be inconvenienced by cancelling it. It follows, according to the logic of the Washington Times, that the patriotic duty of the railways requires them to inconvenience as many people as possible. The Washington Times also advocates government ownership, doubtless considering it the most effective means available for accomplishing the purpose of inconveniencing the public. Ever since the railroads announced they would give up their competitive activities during the war many people have raised, as a sort of test of good faith, the question whether the Pennsylvania would give up its

Broadway Limited. We have not heard that the Pennsylvania management has applied for a medal for its action, but possibly it could best demonstrate its patriotism in the eyes of its critics by abandoning service altogether. This would accomplish its patriotic duty, as the Washington Times sees it, very completely.

THE NEW ENGLAND RATE HEARING

THE plan followed in the conduct of the recent hearing at Boston in the New England rate advance case has made a very favorable impression upon railroad officers and others who were present. One reason for favorable comment was the fact that the commission sent a New England man, the recently appointed commissioner, George W. Anderson, to take the testimony on the ground, instead of sending an examiner or instead of requiring the witnesses to go to Washington. Another was that the railroad or public utility commissioners of the six New England states were not only invited but urged to be present at the hearing and sit jointly with Commissioner Anderson.

Still another source of gratification was the attitude of the commissioner himself, who refused to allow the proceedings to be delayed or encumbered by attorneys representing organizations or individuals who had no direct interest in the matter involved. For example, he told the representative of the minority stockholders of the Boston & Maine that they had had their day in court and that a rate hearing was no place for them to appear. We understand that he also kept out several of the kind of "cranks" that frequently appear at hearings of this kind and who have frequently been treated with too great forbearance by the commission. The commission has often allowed its time to be wasted by witnesses who represented nothing but a desire to advertise their own ignorance.

Now that the commission has been increased in membership and allowed to organize itself more efficiently it is to be hoped that it will be able to return to its former practice of having important hearings more often conducted by commissioners.

The plan of holding joint hearings with the state commissioners is also a good one, especially in the absence of sufficient authority in the federal commission to prevent its decisions being to an extent nullified by state action. In his testimony in the recent supplemental fifteen per cent case before the commission President Willard of the Baltimore & Ohio said his company had not yet received the full benefit of the advance allowed by the decision of June 27 because two of the states through which it operates had refused to allow the advance in intrastate rates. Similarly the value of any decision the federal commission might make in New England could be greatly reduced by the various state commissions. Commissioner Anderson apparently made a special effort to emphasize this point during the hearing at Boston.

The plan of co-operation with the state commissions has been strongly advocated by the Interstate Commerce Commission as a means of avoiding the frequent conflicts of authority, and in its annual report it repeats its recommendation that without abdication of any federal authority finally to control questions affecting interstate and foreign commerce the commission be expressly authorized to co-operate with state commissions in the effort to reconcile upon single record the conflicts between state and interstate rates.

The commission has adopted the plan of holding joint hearings with state commissions in half a dozen cases during the past year and in its report it expresses the hope that the plan will prove effective. We believe the only really effective way to accomplish the desired result would be to give

the federal commission exclusive jurisdiction over the rates of carriers subject to its authority, but until this has been done, the commission's plan represents a desirable attempt toward a compromise.

TWO THINGS THE GOVERNMENT SHOULD DO

[The following editorial was written and put in type before the Railway Age Gazette had the slightest intimation that the Interstate Commerce Commission was going to make its special report to Congress recommending the principal action by the Government below advocated, viz.: the suspension during the war of the Sherman anti-trust law and the anti-pooling law. The Commission mentions as an alternative plan operation of the railways by the President, but as Commissioner McChord says in his minority report, the majority report takes the position, at least by implication, that this unification may be effected by the carriers and it is clearly apparent from what the majority of the Commission says that it favors leaving the operation of the railroads in the hands of their own managers rather than operation by the President.]

THERE are two things which it is extremely desirable the government should do as soon as practicable in order to enable the railways, and especially those in eastern territory, to better meet the enormous and increasing demands which are being made upon them.

First, it should appoint a government traffic manager. The government is today the largest shipper in the country. Every large industrial concern has a traffic manager in whose hands it places the work of dealing with the carriers in the handling of the shipments of all the departments and all the branches of its business. The government should have a man or men to do similar work for it.

At the present time all the departments of the government directly concerned with carrying on the war, and thousands of concerns which are working on government contracts, are permitted to put markings upon their shipments requiring that they be given preference in movement. The result is that a vast tonnage is moving under these preference orders; and this is one of the main causes of the congestion of the lines and terminals of the eastern railroads. When a railway, which is working close to the limit of its capacity, tries to give preferred movement to the bulk of its traffic it soon gets blocked and unable to give satisfactory movement to anything. Instead of some traffic being speeded up, all traffic is slowed down.

The government, having appointed its traffic manager, should give him complete authority to determine the order in which preference should be given to the movement of every kind of freight being handled for all government departments and all government contractors. The volume of the shipments made directly or indirectly on government account will steadily increase as the war goes on, and unless authority to control their movement is concentrated somewhere the present confusion, delays and congestion will be aggravated. Not all the freight that is being shipped directly or indirectly on government account is equally preferred. Some of it is "first preferred," some "second preferred," and so on; and it is for the government through its own representatives, not for the railroads, to determine the order in which preference should be given.

The second thing referred to, which the government ought to do at once as a necessary means of enabling the railways to handle the maximum possible traffic, is to repeal, or at least to suspend for the period of the war, the Sherman anti-trust act as it applies to the railways; the law giving the shipper the right to route his freight; and the anti-pooling section of the Act to Regulate Commerce.

It has been repeatedly asserted in the press that the plan adopted by the Railroads' War Board to relieve the freight congestion on the eastern lines is illegal, being especially in violation of the anti-pooling section of the Act to Regulate Commerce. Chairman Harrison of the Railroads' War Board issued a statement in the latter part of last week, denying this charge. The anti-pooling section prohibits the pooling of freight traffic or earnings. Mr. Harrison pointed out that if the word "pool" is applicable, what the War Board is pooling is merely the physical facilities, as what it is doing is to cause such common and joint use of the facilities of different lines, and such diversion of freight from the more congested to the less congested lines, as is necessary to enable them all to handle the maximum amount of traffic practicable.

This is all true enough. But it calls attention forcefully to a situation which, for the welfare of the nation, Congress ought at once to change. Much can doubtless be accomplished by the measures which the War Board is now adopting. But before the war is over, pooling, not merely of physical facilities, but of traffic and earnings, may and probably will be necessary to enable the eastern lines, and perhaps those of other territories, to render all the service the government and the public will need.

In order to handle the maximum traffic possible it is necessary that the railways should be free to route any or all kinds of it over the lines and through the gateways which, at any particular time, are most able to handle it. But to do that they must be able freely to divide the traffic among themselves; to divide the traffic, and at the same time reasonably protect the interests of all the individual lines. They must be able to arrange, and freely to change arrangements, for securing to each line the part of the total earnings to which it is entitled for the services which it renders to railway patrons and to other railways. With the existing laws standing in the way, the railways cannot legally make the arrangements necessary to enable them to move the maximum traffic which is practicable.

What would the public lose by suspending the laws mentioned for the period of the war, or even repealing them altogether in so far as they affect railways? Absolutely nothing. The Sherman act and the anti-pooling laws were intended principally to prevent combinations between railways which would result in the fixing or the maintenance of unreasonable rates. Under legislation since passed by Congress, neither a single railway nor any number of railways can advance a single interstate rate without the express consent of the Interstate Commerce Commission; and similar legislation also has been passed in most of the states regarding advances in state rates. Since the laws in question have no effect on rates, the only influence they exert is on service. The influence they exert on service only intensifies competition; and under present conditions the more competition in service there is, the worse the situation grows. Competition in service results in traffic being routed over indirect routes when it should be routed over direct ones; in trains being kept on which should be cancelled; in some roads getting more business than they are able to handle and in others getting less than they are able to handle; all of which reduce the amount of business which the railways as a whole can handle.

Competition in service may or may not be desirable under normal conditions. But the existing conditions are entirely abnormal. There is only one transportation question which is worth while considering during the war. That is, how may the railways be enabled to handle the government's and the public's business? One of the most important steps which could be taken toward enabling them to do this would be to remove all the obstacles legislation has placed in the way of their working together as a single system.

A WORLD-WIDE TENDENCY TOWARD HIGHER RATES

THE suggestions by Clifford Thorne and others that an increase of freight rates might be avoided by having the government take over the railroads are rather amusing in view of the increases in rates which have been put into effect or are under serious consideration in other countries where the governments either own the railroads or have practically taken them over during the war.

We publish in this issue a translation of an article from the *Economiste Français*, which describes the plan recently proposed by the French government itself for a general 15 per cent increase in rates on the larger systems of France to meet the deficits, for which the government has assumed responsibility, caused by increases in wages, prices of fuel and materials and expenses of all kinds. The article shows that these unprecedented rises in operating costs are by no means confined to the United States or even to the United States and France, but that they are the result of conditions in effect in all parts of the world. It also shows that in every case the remedy for this condition proposed or adopted has been the same. In many countries increases in rates were found to be necessary even before the war and since then, the article says, "the terrible conflict which has overturned economic life not only in the belligerent countries, but in the neutral as well," has forced an increase in rates in nearly every country which has any considerable railway system.

In Italy the rates, increased in 1911 and in July, 1914, were raised twice in 1916. In Switzerland passenger fares have been increased and now preparations are being made to follow the same course as to freight rates. In Russia rates have been undergoing increases since 1902 and since the war the government has placed taxes on transportation in such a form as practically to increase the rates. In Holland passenger rates were increased in 1909 and freight rates in 1916. In Norway rates were increased in 1913, 1915 and 1916 and a similar plan has been followed during the last three years. In Austria-Hungary freight rates were recently increased 30 per cent and even in Prussia the minister of railways has submitted to the Railway Council a proposal for a 10 per cent increase in passenger fares. Canada, Argentina and Denmark are also mentioned as countries where rates have been advanced to offset the increases in expenses.

The efforts of the railroads of the United States to increase their revenues by a higher scale of charges cannot be ascribed solely to an inordinate greed for profits. They are subject to a condition which is world-wide in its effect and they are seeking to meet that condition in the only way which is open to them, that of seeking permission to do what other kinds of business have done without requiring any permission.

BOSTON & MAINE

JAMES H. HUSTIS, receiver of the Boston & Maine, in his statement before the Interstate Commerce Commission in the bearing on the 15 per cent rate case, drew a remarkably vivid and convincing picture of railroad conditions in New England, and more especially conditions on the Boston & Maine. He estimated that for the 1917 calendar year there would be an increase over 1916 in expenses of approximately \$10,100,000, of which \$4,100,000 would be in fuel cost and \$2,900,000 in wages, the remainder representing the higher costs of materials and the higher payments for car hire. He also dwelt briefly, but none the less impressively, on the need for the expansion of facilities of the Boston & Maine.

It is well known that during the years that Mr. Hustis was on the Boston & Albany he not only added immensely to the capacity of the plant through improved organization

and methods, but he carried out a very comprehensive plan of rehabilitation. During most of the years that Mr. Hustis was on the Boston & Albany the Boston & Maine was almost standing still. After the New Haven got control, considerable sums of money were spent for additions and betterments, but there is much that needs to be done now. If Mr. Hustis could have the necessary money, and supplies were obtainable at anything like reasonable prices, he could solve the transportation problem of the New England territory served by the Boston & Maine; and just as the Boston & Albany was immensely increased in value, but at the same time itself added an incalculable amount to the wealth of the territory it served, so if the Boston & Maine could be comprehensively developed it would add immensely to the wealth of the community served.

In the fiscal year ended June 30, 1917, total operating revenues of the Boston & Maine amounted to \$56,992,000, an increase over the previous year of \$4,917,000. Operating expenses amounted to \$42,448,000, an increase of \$6,250,000. After allowing for interest charges, rentals, etc., there was only \$1,880,000 left in 1917 as against \$4,066,000 in the fiscal year 1916. The immediate hopes of a financial

The Boston & Maine

reorganization of the Boston & Maine without sacrifice on the part of security holders, either of the parent company or leased companies, have been knocked into a cocked hat through no failure on the part of the Boston & Maine organization to work to the full for economies; and this work has been successful if measured in terms other than dollars and cents.

The tons of freight carried totaled 30,925,000, an increase over the previous year of 6.49 per cent. The average revenue trainload was 374 tons, an increase of 3.22 per cent, and the average loading per loaded car was 18.23 tons, an increase of 7.30 per cent. The Boston & Maine is more like the New Haven than like most other roads in the relation between passenger business and freight business. Out of a total operating revenue of nearly \$57,000,000, passenger service and service incidental thereto furnished about \$23,000,000. Economies in passenger service, therefore, bulk larger in proportion to total expenses on the Boston & Maine than they do on most roads. The total number of passengers carried in 1917 was 47,377,000, an increase over the previous year of 11.43 per cent, the average length

of journey remaining about the same—18.81 miles. The number of passengers per train-mile was 75.56, an increase of 8.66, and the number of passengers per car-mile was 21, an increase of 7.69.

These figures showing what is being accomplished under very extraordinary labor conditions are in striking contrast to figures showing expenses. The average cost of coal per gross ton on the tenders was \$4.47 in 1917, an increase of 36.70 per cent; and it must be remembered that the first half of the fiscal year showed comparatively small increases in coal cost per ton. Maintenance of way cost \$6,415,000, an increase of 7.15 per cent; maintenance of equipment, \$7,881,000, an increase of 19.63 per cent, and transportation, \$26,075,000, an increase of 19.93 per cent. The following table shows the percentage of each class of operating expenses to total operating revenues in 1917 and 1916:

	1917	1916
Maintenance of way and structures.....	11.3	11.5
Maintenance of equipment.....	13.8	12.6
Traffic expenses.....	7	8
Transportation expenses.....	45.8	41.8
Miscellaneous operations.....	5	4
General expenses.....	2.4	2.4
Total.....	74.5	69.5

The Boston & Maine is making such additions and betterments as are most immediately essential. In 1917 there was \$3,113,000 net spent for additions and betterments, which included \$1,821,000 for equipment, less \$575,000 for equipment retired. The Boston & Maine badly needs new equipment, but how difficult the situation is is indicated by the fact that when the company made inquiries as to the duplication of an order of 60 locomotives the tentative price was fixed at just twice what had been paid when the original order was delivered in the previous winter.

The Boston & Maine had cash on hand, time deposits, etc., of \$7,964,000, which included overdue interest, etc., of \$2,088,000. Loans and bills payable amounted to \$18,306,000.

Mr. Hustis has the reputation of being able to build up a fine organization with a high esprit de corps both among officers and employees. The tone of the following, which is the concluding paragraph in his annual report for the 1917 fiscal year, gives some indication of why possibly he has that reputation:

"The disturbed labor conditions, heretofore referred to, that have existed throughout the year do not make for the kind of loyalty and esprit de corps that will produce the best results for the railroad or for the public. It is proper, however, that the thanks of the management should be extended to those officers and men who, by their faithful performance of duty throughout the year, made possible the safe running of millions of train and engine miles. It means constant watchfulness and intelligent co-operation on the part of those who man the trains, care for the tracks, repair the locomotives and the cars, and operate the signal towers. The men and women at the stations and in the offices, whose duties are exacting and laborious, are also deserving of recognition. Thanks are expressed to all who have contributed to the results that have been achieved during the year."

The following table shows the principal figures for operation in the fiscal year ended June 30, 1917, compared with the fiscal year 1916:

	1917	1916
Average mileage operated.....	2,305	2,305
Freight revenue.....	\$33,909,489	\$31,963,489
Passenger revenue.....	16,878,757	15,028,317
Total operating revenues.....	\$6,414,842	\$2,075,428
Maintenance of way and structures.....	6,414,842	5,986,603
Maintenance of equipment.....	7,881,110	6,588,044
Traffic expenses.....	426,841	421,797
Transportation expenses.....	26,076,407	21,742,534
General expenses.....	1,363,339	1,238,292
Total operating expenses.....	42,448,077	36,197,958
Operating income.....	1,123,477	1,986,267
Tax.....	12,419,251	12,889,578
Gross income.....	13,585,106	15,059,293
*Net income.....	1,880,449	4,065,691

*After making deductions for interest, some of which was not actually paid.

Letters to the Editor

RECOMMENDS CREATION OF SERVICE DEPARTMENT ON RAILWAYS

NORFOLK, VA.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

For some time I have considered suggesting the creation of a new department on railways, to be known as the "department of service." Service is of paramount importance in an organization and my past experience leads me to believe that if the railways made it the business of some one department to see that service of the highest order was rendered, much criticism directed against the carriers would disappear.

The present organization on most lines does not provide a clearing house where important matters can be sifted and reduced to concrete form for the information of the president and the board of directors. A department with a competent, responsible head, therefore, would fill this need and result in a saving in expense and in added efficiency in service to the public, which cannot be overestimated. After 30 years' experience in railroad work I am firmly convinced of the need of the further application of business principles to the operation of our railways, and to this end I suggest the creation of a business department the organization and duties of which are outlined as follows:

DEPARTMENT OF SERVICE

Executives—	Organization	Statistical Bureau—
1 Vice-president.		1 Statistician.
1 Assistant to vice-president.		1 Assistant statistician.
1 Chief clerk.		4 Clerks.
1 Assistant chief clerk.		3 Stenographers.
6 Clerks.		1 File clerk.
3 Stenographers.		—
1 File clerk.		10
1 Assistant file clerk		<i>Labor Bureau—</i>
1 Messenger.		1 Negotiator.
—		1 Assistant negotiator.
16		1 Clerk.
<i>Inspection Bureau—</i>		1 Stenographer.
1 Chief inspector.		4
1 Inspector, maintenance of way.		<i>Summary—</i>
1 Inspector, maintenance of equipment.		16 Executives.
1 Inspector of transportation.		13 Inspection bureau.
1 Chief clerk.		10 Statistical bureau.
3 Clerks.		4 Labor bureau.
3 Stenographers.		43 Total number of officers
1 File clerk.		and employees.
1 Messenger.		—
13		

OUTLINE OF WORK

- Expenditure Supervision—*
 - Allotments to departments and sub-departments on monthly expenditure.
 - Supervision over all new-work expenditures.
 - Audit of vouchers and payrolls.
- Efficiency Methods—*
 - Analysis of present practices and methods.
 - Improvements in methods and practices.
 - Reduction in waste and non-essential methods and operations.
- Vital Statistics—*
 - Elimination of all except important statistics.
 - Issue of vital set of statistics to each department and sub-departments.
 - Comparative statistics of other roads.
- Organization Outlines—*
 - Establishment of organization and lines in various departments and sub-departments.
 - Co-ordination of organizations in various departments.
 - Co-ordination in all departments.
- Reports and Records—*
 - Establishment of standard reports and records.
 - Elimination of unnecessary reports and records.
 - Use of reports and records.
- Labor Adjustments—*
 - Analysis of schedules and comparison with other lines.
 - Grievance adjustments.
 - New schedule matters.
- Analysis of Results—*
 - Concrete analysis of operating results.
 - Comparative analysis with other lines.
 - Fixed standard to be attained in operation.

8. *Foreign Relations*—

- (a) Cultivation of friendly relations with connecting lines in all departments.
- (b) Analysis of methods used on foreign lines.
- (c) Co-ordination of operation at common points with other lines to eliminate waste.

9. *Publicity Matters*—

- (a) Determination of extent of advertising and its results.
- (b) Co-operation with federal, state, municipal and other officers to create friendly relations.
- (c) Education of the public on railway matters.

10. *Recommendations*—

- (a) Résumé of past month's operations with comments and explanation.
- (b) Monthly reports for all departments on program for succeeding month with recommendations on important operating matters.
- (c) Monthly meetings of heads of departments and sub-departments for general discussion of vital matters relating to company's interests.

L. C. FRITCH,

General Manager, Seaboard Air Line.

GIVE THE EXPERT A SHOW

CHICAGO, ILL.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

Discussions on the opportunities afforded by railroads for the man who would succeed always seem to arrive at the same point—that a fellow should get a job with the road that will give him a chance to be a division superintendent, no matter with what department he may receive his preliminary training. This conclusion is founded on the proposition that, to become a general manager or executive officer, one must have attributes that befit a division superintendent. As a result a man whose bent is scientific rather than executive, who is better suited to be a specialist than a generalist, will find himself in a blind alley in a short time. Thus the mechanical engineer, the bridge engineer, the signal engineer, the engineer of tests, the engineer of design, the fuel engineer, the engineer of wood preservation and others, no matter how expert in their individual fields, are doomed always to remain such with emoluments measured entirely by the importance of their positions on the particular roads which employ them, save in the remote case where in addition to attributes making them valuable in their present position, they are executives of such exceptional merit that they may aspire to such positions as chief engineer or superintendent of motive power. However, their chances for this line of promotion are small because the division engineer and the division master mechanic are receiving training much better suited to develop them for the executive positions of the departments.

A lack of opportunities for the boss naturally holds down his subordinates and in consequence the sub-department of the specialist frequently suffers the stagnation under which poor men hang on and the good ones rot unless they have sense enough to quit or are fortunate enough to get fired, or, except for the opportunities which occur only at rare intervals when a vacancy actually appears at the head of the department itself.

The writer is familiar with the bridge department of a large road which we will say is in the southwest because it is not. For the last 15 years this road has undergone extensive growth and has built many more new bridges and other structures than would be built by a road merely making the current renewals. In consequence its drafting room force has been large. It has also enjoyed a reputation for high grade work, has been a leader in the development of modern construction practice based on scientific methods and has recruited its men from the best of the technical graduates or from men experienced in the drafting rooms of bridge companies. In view of this the personnel of its drawing room has ranked as high as any similar organization in the country. Obviously this railroad has had little opportunity to advance these men, with the inevitable result that the better ones quit when they perceive that they have reached the limit of advancement. Many of these men have subsequently achieved success in other lines.

Selecting from this group at random we find that two of them are now contracting engineers for large bridge companies; three are structural engineers in private practice; three are efficiency experts; two are civil service administrators and three are consulting public utility experts. These men have made their way and are at present in positions which in most cases pay as much or more than the salaries paid by railroads to bridge engineers. Thus we see that the service of a group of able men was lost not only to the road that trained them but to all other railroads as well, for, to the best of my knowledge, only two men who were employed in responsible positions in this bridge office are now serving as bridge engineers of other railroads and in each of these cases the man secured his position through an acquaintance antedating his employment with the road in question.

The example cited above is not entirely a peculiar one. Other large railroads are also training men for positions not only in the bridge department but in other technical departments as well. Technical work on railroads naturally attracts good men. It is interesting and the training is valuable but almost invariably the man finds he must look elsewhere for promotion. In the case of the small road the situation is somewhat different. The work is on a much smaller scale and in less variety and in consequence does not afford as broad a training, while, as the department is small, it offers less of a selection from which to pick a department head than on the large railroad.

This suggests a solution—a freer exchange of men between railroads or, to put it more specifically,—the recruiting of bridge engineers, engineers of tests, etc., for the smaller roads from subordinate positions on the larger ones and also the advance of the expert from one road to another as his work demonstrates his capacity for the position on the road of larger activities.

To a certain extent this practice is being carried out at the present time but only in a more or less haphazard fashion, limited by the extent to which the technical men on one road become known to those on another and almost entirely without any attempt at co-operation between the railroads. Development of this idea is also restricted by the fact that its objections receive greater notice than its advantages. The bringing of a man from another road has a tendency to discourage the subordinates who may have had reason to believe that they were in line for promotion. This objection is valid where the road in question has had an opportunity to build up an efficient organization in the particular department. The objection, however, is not nearly so clear in the case of a small road where the staff of the expert consists of only one or two men. For their own good the subordinates in such a case owe it to themselves to seek a broader experience elsewhere, for the small road, with its limited organization and direct contact between the minor subordinates and executive officers, is much better suited to the development of the all-around executive than the expert. In conclusion, and with reservation for such limitations as have been mentioned, the suggested exchange of men would have the advantage for the large road that its organizations would be kept alive through the more rapid advance of the men, while the smaller roads would secure men who have had a broader and more diversified experience. In general, an advantage would arise from the free exchange of ideas, practices and methods which such a system would bring about.

TECHNICAL.

SCRAP METAL IN 1916.—A report of the United States Geological Survey shows that in 1916 the total quantity of scrap metal of various kinds recovered in the United States was valued at \$265,377,856. This was more than double the value, and represented nearly double the quantity of scrap metal recovered in 1915.

The Commerce Commission's Annual Report

A Review of Its Activities During the Year and Those of Its Bureaus and Divisions. No New Recommendations

NO new recommendations are contained in the 31st annual report of the Interstate Commerce Commission to Congress, covering the year ended October 31, 1917. The commission repeats several recommendations made and explained in previous reports, including those for legislation to give it authority to co-operate with state commissions in rate matters, to provide control over railway capitalization, to require the standardization of operating rules and to prohibit trespassing, but the greater part of the report is devoted to the routine record of the work of the commission and its various bureaus and divisions. It also includes a general discussion of transportation conditions, particularly as they have been affected by the war, in which it says, in part:

TRANSPORTATION CONDITIONS

Since 1907 there were few times when the number of freight cars available did not exceed the number required for the transportation of the country's commerce. It is true that, owing to the uneven distribution of cars over the various roads, there were occasional periods when the needs of one locality or another were in excess of the cars immediately available, but throughout this period the total number of freight cars available as a rule considerably exceeded the number required. As a result of this condition there was slight incentive to acquire additional equipment, and on many lines the idle cars were allowed to deteriorate.

These conditions continued for some time after war began in the summer of 1914, and while there was great congestion at the Atlantic ports during 1915 the number of cars available in that year exceeded the demand. The number of idle cars was, however, steadily declining, and by the fall of 1916 car shortage had become acute.

Through the railroads' Commission on Car Service efforts have been made to relieve the difficulties resulting from car shortage and congestion. It has co-operated with the various governmental agencies, and through those efforts substantial increase in efficiency of available transportation facilities has been secured, and car shortage conditions in different localities have been improved by requiring railroads to haul thereto empty cars which were not so badly needed elsewhere.

Without attempting to detail the activities on the part of the railroads through this organization it will suffice here to say that they have responded to and supported the executive committee, which in an earnest way has attempted to deal with the vexatious and troublesome questions and to meet the unprecedented demands upon the railroads.

The commission has since undertaken to regulate car service throughout the United States through its Bureau of Car Service. Where occasion requires, orders or directions will issue under the car service act and directly to the carrier or carriers concerned. Subject to this fundamental principle, the commission is availing itself, and will continue to avail itself, of co-operative effort on the part of the carriers' commission on car service. The latter has a large force of assistants under its control both in Washington and in the field. The present is peculiarly a time for the avoidance of unnecessary expense and duplication of work, and it has seemed to this commission desirable to utilize to the fullest extent all means for insuring maximum efficiency in the handling of cars. The work of the bureau is steadily growing in volume, and its organization is being built up as demands require.

Transportation conditions have been abnormal throughout the entire country during the past year. A condition of extreme congestion has obtained in the territory north of the Ohio and Potomac rivers and east of the Indiana-Illinois state line, the workshop of the country, to which the raw materials of the south and west, together with the food products of those sections, naturally gravitate.

Even before our country was drawn into the war the railroads were handling an extraordinarily heavy traffic, heavier by far than at any time in their previous history. This was greatly increased by the war, and as that began in the spring, when the fuel and crop movement is normally light, transportation conditions during the past summer have probably been better than if our war activity had been thrust upon the carriers during the height of the fall or winter traffic movement.

The adoption by the carriers of new rules regulating the distribution of cars as between themselves and the enactment of the Esch car service act have already been mentioned. In this way equipment has been taken from sections where it was less needed to other sections, where military and commercial needs required more equipment than was available, and such stupendous movements as those of the cantonment construction material and the troop transfers have been made without seriously interfering with the commercial business of the country.

While conditions have been extraordinary and while traffic has not always moved as carriers and shippers would have had it moved, the essential needs of the country have to date been cared for. Much was said during the past winter as to the danger of freezing and famine on account of failure adequately to transport fuel and foods, but history will record no such calamity.

Conditions have now reached the point where it has become imperative under the power of the transportation priority act, approved on August 10, 1917, to effect priority in transportation for certain traffic necessary to the national security and defense. The first step taken in this direction was to insure to the upper lake states an adequate supply of coal for the coming winter. More recently the use of open-top cars suitable for the transportation of coal and commodities necessary in the metal, sugar, and fertilizer industries has been denied for the transportation of other commodities not essential in the nation's present emergency. It is to be expected that similar and broader action of this sort will be necessary in the near future.

In the work of distributing empty cars to producing sections of the country, taking care of emergencies arising on particular lines or in particular sections, the Bureau of Car Service is working with the Commission on Car Service, as before indicated.

The co-operation of the shippers and carriers is worthy of especial note. The volume of business being offered to the carriers for transportation materially exceeds the assimilating ability of the transportation instrumentalities. Owing to the demand upon car and locomotive building plants for equipment for use abroad, both by our own forces and by our allies, and to the unprecedented difficulty of securing labor and material, it is impossible at the present time for these plants to do much more than replace the equipment worn out in service in the United States. It is apparent that the solution of the car service problem until such time as additional equipment and facilities can be provided lies in securing the maximum use of those already existing. This

commission is co-operating with the transportation priority director, the food administrator, and the fuel administrator, agencies appointed by the President to assist in carrying forward the conduct of the war.

OPERATING INCOME OF RAILWAYS

The accompanying table gives a statistical review of railway operations since 1891. Notwithstanding the unreliability of book values as a statement of investment, especially in the earlier years, and the changes in accounting requirements which affect the comparability of statistics, the

6.35. For 1917 the table this year gives an estimate of 6.5 per cent.

A condensed abstract of the report, outlining the principal activities for the year, follows:

ABSTRACT OF REPORT

The number of formal complaints filed during the year was 651, a decrease of 203 as compared with the previous year; 746 cases have been decided and 106 have been dismissed by stipulations or on complainant's request, making a total of 852, as against 806 during the previous year.

ANALYSIS OF OPERATING INCOME OF RAILWAYS IN THE UNITED STATES, JULY 1, 1890, TO JUNE 30, 1917, INCLUSIVE, AND COMPARISON OF SUCH INCOME PER MILE OF ROAD, ETC., WITH BOOK COST PER MILE OF ROAD, ETC.

Year ended June 30.	Results of operation.										Ratio of mileage operated under trackage rights to mileage with trackage figures omitted.	Average income per mile operated (trackage be included in divisor).	Average income per mile operated, adjusted to eliminate effect due to duplication on account of trackage.	Book cost of road and equipment.	Number of miles of road represented.	Average book cost of road and equipment per mile of road.	Ratio of column (j) to column (m).	Average freight revenue per ton-mile.
	Operating revenues.	Operating expenses.	Operating ratio.	Taxes.	Income from operation.	Number of miles operated (including trackage rights).	Per cent.	Per cent.	Per cent.	Per cent.

¹ Mileage returns for balance sheet figures not stated in the annual statistical report of the Commission.

² Does not include figures for 1891, as no mileage is stated for that year.

³ Returns do not include data for switching and terminal companies.

⁴ The averages shown for 1908 to 1912 are not fully comparable with those for previous years, chiefly for the reason that the figures upon which they are based do not include returns for switching and terminal companies.

⁵ Represents returns for Class I and Class II roads and their nonoperating subsidiaries.

⁶ Represents returns for Class I and Class II roads and their nonoperating subsidiaries. Figures are taken from the 1913 statistical report.

⁷ Returns for operations, columns (b) to (j), inclusive, are based on figures which exclude returns for so-called small roads and switching and terminal companies.

⁸ Returns for Class I and Class II carriers.

⁹ Figures in columns (b) to (g), inclusive, and (i) are from monthly reports of revenues and expenses of Class I roads, excluding switching and terminal companies.

¹⁰ Based on estimated figures.

commission says such a statement has value in showing the general trend of railway development in the United States.

It will be noted that the average freight revenue per ton per mile in 1916 shown in this table is lower than for any other year. The rate of return on property investment, shown in column *m*, is given as 5.8 for 1916, based on the property account of roads of Class I and Class II and their non-operating subsidiaries. In a corresponding table published last year the percentage of return was estimated at

A total of 1,228 hearings were conducted and approximately 210,133 pages of testimony taken, as compared with 1,485 hearings and 154,488 pages during the preceding year.

The number of proceedings instituted under the investigation and suspension docket was 196, a decrease of 27, and 223 such proceedings have been disposed of, an increase of 17. In addition, many new schedules were added to pending investigations by supplementary orders and a large

number were suspended by order of June 27 in The Fifteen Per Cent Case. Suspension was refused in 236 cases, a decrease of 76 as compared with the previous year. Informal complaints numbering 5,300 were received, an increase of 361.

The matter of greatest interest and importance coming under the fourth section of the act has been the question of the proper adjustment of transcontinental rates. This was discussed at some length in the last annual report, and it was shown that the fourth section applications protecting this adjustment had been reopened for further hearing. Since that time a decision has been rendered. Owing to protests against the tariffs offered for filing by the carriers purporting to comply with the order, informal hearings have been set on these protests in New York, N. Y.; Chicago, Ill., and Portland, Ore.

A hearing has been had respecting approximately 500 applications of all carriers in the country, relating to class and commodity rates, which are higher as a through route than the aggregate of the intermediate rates. This matter is now pending, and when a decision thereupon is reached all of the fourth section applications of every carrier which sought relief from the aggregate of the intermediates provision of the fourth section will have been passed upon.

RATE SCHEDULES

Tariff publications numbering 166,810 and containing freight and express rates, passenger fares, and classification ratings were received. The figures stated include more than 35,000 schedules naming proposed increases in rates which were suspended and also a like number of suspension supplements, none of which resulted in the establishment of rates, so that, in fact, the number of rates becoming effective during the period named did not exceed that of previous years. During this period 2,196 schedules that were tendered for filing were rejected. Reference by shippers and the public in general to the tariff files has increased to such extent as to seriously interfere with the regular work of the bureau of tariffs, and to meet this situation a duplicate tariff file has been established and equipped for the use of the public.

Since the fifteenth section amendment of August 9, 1917, carriers have filed 1,400 applications for authority to file tariffs making increases in rates. Prior to November 1, 1917, 59 applications were approved and 4 denied. The approved applications were for the most part for the purpose of correcting errors in tariffs. It required some time to perfect an organization for the handling of matters arising under this amendment, and this accounts for the small number of applications passed upon. While arrangements for administering this law were being perfected a large number of applications accumulated. All those difficulties will gradually be removed under a definite and uniform mode of procedure, and it is believed that experience will show that the amendment is capable of administration and enforcement in its full spirit without any hardship, and that, while the commission's power to suspend schedules has not been abridged, eventually these matters can in the main be more satisfactorily handled in this way than under suspension proceedings.

During the year the Southern Classification Committee has been reorganized along the lines previously adopted by the Official and Western Classification committees, and it now consists of a permanent committee of three, which will sit in practically continuous session dealing with classification matters. Some progress has been made in the direction of uniformity in the three classifications, although, as heretofore, it has been slow. Including about 830 items which are in accordance with the recommendations of the Uniform Classification Committee, except that no carload rating is assigned, the Southern Classification Committee has accepted

about 72 per cent of the Uniform Classification Committee's recommendations, and the southern classification is now about 73 per cent uniform. This is lower than the percentage of uniformity in the western and official classifications. The Western Classification Committee has accepted without change 91 per cent of the recommendations reported by the uniform committee, and 87 per cent of the current western classification is in accordance with uniform recommendations. The Official Classification Committee has accepted about 87 per cent of the recommendations of the Uniform Classification Committee and the official classification is uniform to the extent of 81.81 per cent.

Early in the present year the Uniform Classification Committee, which was organized about 10 years ago and which previously consisted of nine members, three from each classification territory, was reduced to one representative from each classification territory and a chairman. The commission is assured that this reduction is not indicative of indifference with respect to uniformity in classification, but is in line with the reorganization of the several territorial classification committees. Increased activity in the direction of uniformity is promised as a result of these changes. The work performed by the Uniform Classification Committee has been carefully done.

The block system of stating express rates, which has proven to be generally satisfactory, has, during the year, been adopted for intra-state traffic in one additional state and is now effective in 43 states and parts of Canada. Negotiations are in progress looking to its adoption in the remaining states.

BUREAU OF INQUIRY

Fifty-six indictments were returned for violations of the act to regulate commerce and acts supplementary thereto. Twenty-four of these indictments were against carriers or carriers' agents and 32 against shippers, passengers, or interested parties other than carriers.

During the year 37 cases were concluded. In these cases pleas of guilty were offered by 17 defendants and pleas of *nolo contendere* by 3 defendants. In 9 cases verdicts of guilty were rendered, in 3 cases verdicts of not guilty were rendered, and in 1 case the jury disagreed. In 3 cases demurrers to indictments were sustained. In 3 other cases indictments were dismissed upon motion of the government, but in each case pleas of guilty were offered on other indictments returned in the same cases.

There has been a notable decrease in the number of prosecutions against shippers for abuses of transit regulations, for falsely billing shipments, and for filing false claims for the purpose of obtaining unlawful allowances out of the rates applicable for the transportation of property. When the carriers exercise reasonable diligence in properly inspecting property offered to them for carriage their care results in protecting their revenues, and in eliminating discriminations, and in transportation for shippers at known published rates.

Rigid enforcement of the demurrage rules will do much to aid in the relief of car shortage, the commission says. Several indictments for alleged failure to impose demurrage charges are now pending trial in the district courts.

BUREAU OF LAW

On October 31, 1916, there were 32 cases involving orders or requirements of the commission pending in the courts, of which 11 have been concluded. Of the remaining 21 cases, 6 have been argued, submitted, and taken under advisement by the Supreme Court, and 3 are pending argument and submission to that court. Eleven are under advisement or pending hearing or final hearing and submission in the district courts, and 1 is pending dismissal or reargument in a district court. Since October 31, 1916, 10 cases have been in-

stituted in the courts, 2 of which have been concluded. One has been argued, submitted, and taken under advisement by the Supreme Court and the remaining 7 are under advisement or pending argument and submission or dismissal in the district courts. As a result of the foregoing proceedings, there are now 10 cases pending in the Supreme Court and 19 cases pending in the district courts.

Six cases to which the commission was a party have been decided by the Supreme Court of the United States. In four of these, the Terminal Cities Case, the Lake Line Case, the Sheldon Rebate Case, and the Vulcan Coal Case the position taken by the commission was sustained, while the decisions in the Nashville Switching Case and the Paraffine Tank Car Cases were adverse.

BUREAU OF CARRIERS' ACCOUNTS

In the last annual report reference was made to the improved methods which had been instituted in the conduct of examinations of the accounts of carriers in the field. A creditable number of field examinations has been conducted during the past year, resulting in the discovery, and consequent discontinuance by the carriers, of various erroneous accounting practices. These examinations have proven to be essential and effectively useful, not only in securing uniform accounting but also in the prosecution of our work as a whole. One result of this feature of contact with the carriers' accounts is that any unwholesome finance, artificial returns of income and outgo, and unlawful rate manipulations, which must of necessity be carried into and be shown on its books or other records, become more difficult of accomplishment.

Recent accounting examinations indicate a noticeable and encouraging activity by the carriers during the last two or three years along constructive and economic lines, and this is particularly true since our own country became a belligerent in the war. Such information becomes accessible under the established accounting system and will be of value in looking toward permanent improvements in the carriers' methods and practices.

In August, 1917, the commission was asked by the Special Committee on National Defense of the American Railway Association to give consideration to the possibility of reducing the amount of statistical work required of carriers during the period of the war. A conference was held with representatives of the carriers and of the state commissions, and this matter was also considered by the National Association of Railway Commissioners at its annual meeting. As a result, the annual report forms prescribed for the year 1917 will be considerably simplified by the omission of certain schedules and the modification of others.

BUREAU OF SAFETY

The work of the bureau of safety has been substantially similar in character to the work of that bureau in previous years. A detailed report of its work is published separately.

During the calendar year ended December 31, 1916, 136 employees were killed and 2,440 injured in coupling and uncoupling cars; casualties resulting from employees coming in contact with overhead and side obstructions and from falling from and getting on and off cars occasioned 564 deaths and 15,937 injuries. This represents an increase of 13 in the number killed and 246 in the number injured in the former class of accidents, and 59 in the number of killed and 2,126 in the number injured in the latter class of accidents, as compared with the fiscal year ended June 30, 1916.

During that fiscal year, 187 cases, involving an aggregate of 542 violations of the law, were transmitted to the several United States district attorneys for prosecution. Cases comprising 127 counts were tried, of which 88 counts were decided in favor of and 37 counts adversely to the govern-

ment; 2 counts are still pending decision. Cases involving 478 counts were confessed, and 10 counts were dismissed.

During the past fiscal year there were transmitted to the several United States district attorneys for prosecution 113 cases, involving 1,197 counts, of violations of the hours of service act. Cases involving 811 counts were confessed and 444 counts were tried, of which 125 were decided in favor of the government and 198 in favor of the carriers. The remaining 121 counts are still pending decision. Cases involving 878 counts were dismissed, 841 of which were based upon the carriers' failure to report all instances of excess service, as required by an order of the commission. Two cases were decided by the Supreme Court, one against and one in favor of the government. In the circuit courts of appeal 8 cases, involving 44 counts, were decided in favor of the government, and 3 cases, involving 14 counts, were decided in favor of the carriers. Cases involving 185 counts are still pending in the circuit courts of appeal.

INVESTIGATION OF ACCIDENTS

During the year ended June 30, 1917, 80 train accidents, comprising 54 collisions and 26 derailments, were investigated. In these accidents 174 persons were killed and 827 persons were injured; the collisions caused the death of 132 persons and the injury of 638 persons, while in the derailments 42 persons were killed and 189 were injured. Twenty-one of the collisions investigated occurred on block signaled lines, 11 in automatic block signal territory, and 10 in non-automatic block signal territory, while 33 of the collisions occurred on lines operated by the train order and time interval system.

Of the 11 collisions investigated which occurred in automatic block signal territory, 8 were due to failure of enginemen to obey signal indications. This comparatively large number of accidents of that character emphasizes the necessity for the development and use of some form of automatic train control device to supplement existing block signal apparatus.

The investigation of the collisions in nonautomatic block signal territory has almost without exception disclosed lax observance or enforcement of rules. Nearly all of these accidents which were investigated during the past year could have been averted by proper observance of the rules which were in effect.

More than half of the collisions investigated occurred on lines operated by the train order and time interval system. In some of these cases inadequate operating rules were found, and in other instances it was found that practices not sanctioned by the rules were being followed. Many of these accidents were due to inherent weaknesses of the time interval method of operation, and a large proportion of them could have been prevented by a proper application of block signal principles.

In previous reports the commission has recommended legislation requiring the standardization of railroad operating rules. It is essential to the safety of train operation that rules be explicit and uniform, capable of being easily understood and applied, and not liable to be misinterpreted. Such standardization of rules can be accomplished only by federal legislation, which the commission again recommends.

The commission's accident statistics demonstrate that a large percentage of the derailments occurring from year to year are due to two causes, namely, defects of equipment and defects of roadway.

BUREAU OF LOCOMOTIVE INSPECTION

The work of the bureau of locomotive inspection during the year ended June 30, 1917, although covering a wider field, due to the extension of the law, has been substantially similar in character to its work in previous years, and is

shown in detail in the report of the chief inspector, which will be published in next week's issue.

Of 616 accidents, 389 in which 52 persons were killed and 469 injured were due to failure of locomotive boilers or some part or appurtenance thereof. Two hundred and twenty-seven of the accidents, in which 10 persons were killed and 252 injured, were caused by failure of some part of the locomotive or tender other than the boiler and its appurtenances and were investigated under the amended law.

Much of the increase in the number of defective locomotives and the accidents and casualties resulting from failure thereof has, perhaps, been brought about by unprecedented operating conditions, which, together with the shortage of labor and material, may have made difficult the proper maintenance of locomotives.

This, however, is not a justification for the operation by any carrier of locomotives that are in an improper condition for service, and the fact that some carriers by diligent efforts and careful supervision of repairs have not only maintained the condition of locomotives but have improved it during the past year, thereby increasing operating efficiency, is evidence that locomotives can be properly maintained even under the present exacting operating conditions. This can be accomplished by more careful inspection of locomotives by the carriers and closer supervision by those in charge to see that defects reported are properly repaired before the locomotive is returned to service.

The importance during the war of maintaining locomotives to the highest degree of efficiency and of avoiding unnecessary delay has been constantly kept in view, and every privilege consistent with the purpose of the law has been allowed.

In general, rules which promote safety in the operation of locomotives also promote efficiency; therefore, both in the preparation and in the enforcement of the locomotive inspection rules, efficiency in the operation of locomotives has been considered as second only to safety, and their enforcement has been so directed as to promote both.

BUREAU OF VALUATION

The road and track parties of the engineering section inventoried between October 1, 1916, and September 30, 1917, 52,946.65 miles of main line and 81,444.39 miles of all tracks. This was in excess of the previous year and in excess of the estimate for the current year. By January 1 next more than 150,000 miles of main line will have been covered by the road and track parties and about 100,000 miles will remain. While war conditions have interfered with the progress of this work, it is still believed that our estimated date for the completion of the work as given in the last report should stand. The engineering forces should substantially complete their field work during the year 1919 and should clean up the balance of their field work and finish their office work during the year 1920.

It is believed that the work of the land and accounting sections is in step with that of the engineers and that their work should be completed within the above time limit, provided the necessary information can be obtained from the carriers.

Arrangements had been made to begin an inventory of the long-distance telephone lines of the American Telephone & Telegraph Company last spring, but the breaking out of the war laid upon that company such unusual demands from the War Department that it was felt to be unreasonable to ask it to take up this valuation work, which was accordingly postponed upon its properties for the present.

It would be highly desirable in the prosecution of this work to finish each property before proceeding to the next, but this has been found impracticable in actual experience. The carriers are required to furnish certain information, and the work of the commission upon a particular property

can not be completed until that information has been furnished. The inability of the carriers to promptly give this information has rendered it impossible to complete reports upon their properties. For example, each carrier is required to file a schedule of its equipment, stating, among other things, the original cost of each piece of equipment as shown by its books. It is required to file another schedule showing its lands and the cost of each parcel when disclosed by its records. While this looks simple in the statement it is a very extended process in fact. The number of men who can be employed upon the records of the carrier in searching out these facts is limited so that in case of systems of considerable size a great deal of time is required. And yet no final report can be prepared by either the engineering, land, or accounting sections until these returns have been received.

This has made it necessary to pass on to other carriers before completing work on those first undertaken and the actual situation today is that the commission is engaged in the valuation of nearly every railroad system of any importance in the entire country, although scarcely any of those systems have been completed. This does not mean that the completion of the work as a whole will be delayed, for it seems probable that these returns will all be made within the time limit above named, but simply that the valuation of individual carriers can not be finished in proportion as the entire work progresses.

CO-OPERATION WITH STATE COMMISSIONS

In the last annual report the commission made certain suggestions and recommendations with the view of reducing and eliminating, to the greatest extent possible, the conflicts between intrastate rates prescribed by state commissions and interstate rates prescribed by this commission. It there recommended legislation to provide a legal basis for the co-operation thought desirable as being in the interest of uniform and efficient regulation from the point of view of the carriers and the public. With the view of promoting this kind of co-operative action hearings have been held in a half dozen different states, which were in fact, although not in law, joint hearings of the interstate and the respective state commissions. In one instance these hearings extended through many weeks, and while the controversies in question have not yet been disposed of, the commission believes that what has already been accomplished has been distinctly in the interest of all the affected parties, and that a proper basis has been laid for final disposition of questions which have vexed the citizens and authorities of the respective states as well as the carriers operating under these conditions, so that it will be possible to carry these proceedings to a final conclusion with substantial harmony of action on the part of the respective authorities.

The suggestion for legislation received the unanimous endorsement of the National Association of Railway Commissioners at its last annual convention. By resolution a committee was "directed to confer and co-operate with members of the Interstate Commerce Commission in bringing said matter before the federal Congress, with the view of securing the necessary statutory authority for effective co-operation between the Interstate Commerce Commission and the regulatory commissions of the several states." The committee representing state commissions is co-operating with a similar committee representing the Interstate Commerce Commission in the preparation of a draft of a proposed bill.

ENLARGEMENT AND SUBDIVISION OF THE COMMISSION

Since the last annual report the membership of the commission has been increased from seven to nine, and it has been authorized by law to act through subdivisions.

It is now working under this plan, by which rate cases, except such as have been reserved for consideration by the commission as a whole, are assigned, considered, and dis-

posed of by these respective divisions in monthly rotation. While one division is sitting in arguments, the other two divisions are occupied in finally disposing of submitted cases and in performing the other duties which daily come before it. By means of a series of rules relating to internal organization the commission has provided for the fullest possible co-operation among all the members of the commission and the respective divisions. Each member is kept informed with respect to the action of each division as well as of the whole commission. Conferences of the entire commission will continue to be held periodically, and in the entire reorganization it is keeping constantly before it the desirability and necessity of harmony and uniformity in all its activities. It believes that the relief which this statute was intended to afford to the commission will be realized without sacrifice of uniformity and with an increase in efficiency and gain in speed of action.

The larger subdivisions of the organization have heretofore been known as divisions, such as the division of tariffs, division of accounts, etc. Because of the statutory designation of "divisions" of the commission the name of the respective subordinate units has been changed from division to bureau.

RECAPITULATION OF RECOMMENDATIONS PREVIOUSLY MADE

For the reasons stated in previous reports the commission renews its recommendations to the effect—

That appropriate provision be made for punishment of any attempt, by intimidation, threats, inducements, or otherwise, to influence the testimony of any witness before the commission or to deter him from testifying; as also for punishment of misbehavior, disorderly conduct, or contumacy, in or about any proceeding before the commission.

That the Congress fix a limit of three years within which a carrier may bring action for recovery of any part of its charges, and amend section 16 of the act so as to provide that if the carrier begins such action after expiration of the two-year limit now prescribed in that section, or within 90 days before such expiration, complaint against the carrier for the recovery of damages may be filed with the commission within 90 days after such action shall have been begun by the carrier, and not after.

That without abdication of any federal authority to finally control questions affecting interstate and foreign commerce, the commission be expressly authorized to co-operate with state commissions in efforts to reconcile upon a single record the conflicts between the state and the interstate rates.

That the portion of section 20 of the act which accords the commission right of access to the accounts, records, and memoranda kept by carriers be amended so as to also accord right of access to the carriers' correspondence files.

That there should be appropriate and adequate legislation upon the subject of control over railway capitalization.

That the use of steel cars in passenger-train service be required, and that the use in passenger trains of wooden cars between or in front of steel cars be prohibited.

That under the Panama canal act the commission be empowered to permit, subject to further order of the commission, continued operation by a railway or under railway control of water lines or vessels where it will be in the interest of the people and of convenience to the public, even though such operation may reduce competition on the route by water.

The legislation requiring standardization of railroad operating rules be enacted.

That Congress consider the advisability of prohibiting by statute, under appropriate penalty, trespasses on the trains and on tracks of interstate carriers at places where there are two or more tracks, or within the limits of incorporated towns, or at places where the carrier by appropriate sign or warning gives notice that trespassing on its tracks is prohibited, providing that nothing therein is to be considered as making lawful any trespass which would be unlawful under state laws; and further consider the advisability of conferring concurrent jurisdiction upon federal and state courts for the enforcement of such statute.

From appropriations amounting to \$5,400,000 for the fiscal year ending June 30, 1917, the commission expended the following amounts:

As salaries to commissioners and secretary.....	\$73,916.66
All other authorized expenditures.....	1,087,614.91
Examination of accounts, act approved June 29, 1906.....	297,125.33
Locomotive inspection, act approved February 17, 1911.....	213,954.59
Safety appliance, block signal, and hours of service.....	235,674.30
Valuation	3,289,833.91
	<hr/>
	\$5,182,169.70

Reopening Railroads in Wake of German Retreat. The Tommies Are Clearing Away a Barrier the Retreating Germans Had Thrown Across the Railroad

Eastern Operating Committee Issues Its First Orders

**Traffic Diverted from Pittsburgh Gateway—Broadway
Limited Discontinued—Embargo on Export Steel**

THE General Operating Committee for the eastern railroads, of which A. W. Thompson, vice-president of the Baltimore & Ohio, is chairman, and which was appointed to deal with the problems created by the congestion of the eastern lines under the plan of pooling their facilities, lost no time in taking vigorous action to effect an improvement in the situation. Its first meeting at its Pittsburgh headquarters was held on November 28. As a result of this meeting, the committee issued the following orders:

That all lines reaching the eastern Atlantic seaboard issue an embargo, effective immediately, on all export steel, billets, bars, plates, or scrap and pig iron, except for the United States Government, and that all existing permits be cancelled; no permits to be issued for these articles except by specific authority of the committee.

That all freight, including livestock and perishable, from Chicago and St. Louis and points west thereof, eastbound, and from Boston, New York, Philadelphia and Baltimore westbound, passing through the Pittsburgh gateway be embargoed and diverted to lines north and south.

That the Pennsylvania 20-hour train known as the Broadway Limited be discontinued effective on December 1 until further notice in order to give greater opportunity for the use of existing facilities for freight traffic through Pittsburgh territory.

That in order to conserve power and transportation capacity required for war essentials, the movement of freight traffic on fast or reduced tonnage rating be suspended and that all such freight be hereafter operated on full tonnage continuous movement schedules.

That only box and stock cars may be furnished for team track loading of coal.

PLANS FOR CO-OPERATION WITH ALLIES

The reason for the export embargo was given in a resolution adopted by the committee, stating that there was stored on the ground and in cars at northern Atlantic ports 1,325,000 tons of steel and iron immediately available for movement overseas; that it is vitally essential that there be thorough co-operation in the handling of traffic for overseas shipment so that the railway equipment which would otherwise be available for coal or coke shall not be used in moving traffic which cannot be promptly trans-shipped when it reaches tidewater, and that a representative of the committee be named with headquarters in New York for co-operation with the representatives of the Allies to the end that rail transportation be limited to that traffic for which overseas transportation is available.

The committee also held a session on Thanksgiving Day and arranged for a committee on overseas traffic consisting of one representative each for Boston, New York, Philadelphia, Baltimore and Norfolk. This committee is called the "Export Division of the General Operating Committee of the Eastern Railroads" and it will sit regularly at New York city (165 Broadway). It will at once exercise control over the entire export traffic in iron and steel (unmanufactured), including billets, bars, plates, scrap and pig iron (except for the United States Government). Ultimately it will direct all overseas traffic of the eastern railroads, not only in iron and steel, but of all other descriptions, including that of the United States Government (with the approval of the Federal authorities). George D. Ogden, freight traffic manager of the Pennsylvania, is chairman, and the other members are: R. Van Ummersen, general freight agent of the Boston &

Albany; F. La Bau, traffic manager of the New York Central; Robert L. Russell, general freight agent of the Philadelphia & Reading; Archibald Fries, freight traffic manager of the Baltimore & Ohio; E. D. Hotchkiss, freight traffic manager of the Chesapeake & Ohio, and J. R. Ruffin, freight traffic manager, of the Norfolk & Western. All these will be relieved from their ordinary duties. The export division will co-operate with the agents of the Allied powers and the United States Government.

REGULATIONS IN DETAIL

On account of the fundamental importance of the free movement of traffic for and through Pittsburgh, the order to divert traffic through that gateway was amplified to provide that all freight westbound from New England, New York, Philadelphia, Baltimore, Harrisburg and intermediate points be embargoed and diverted to northern routes.

The committee also began a thorough study of the situation confronting it and requested the presidents of all eastern roads to advise promptly by wire of any serious congestion or accumulation which results in or threatens a reduction in efficiency or capacity of the transportation plan.

Each railroad in eastern territory was also called upon to make an immediate study of the possibility of securing greater efficiency by a rearrangement of engine and train crew runs by the utilization jointly of the track and terminal facilities of two or more companies, and that, wherever found practicable, an effort be made to secure the inauguration of this plan. An order was issued that each railroad take immediate action to eliminate any existing cross haul or indirect routing of freight traffic and that a report be made to the committee of any such cross haul or indirect routing which cannot be and is not connected by individual railroad action.

SPECIAL ATTENTION TO PITTSBURGH DISTRICT

On November 30, for the purpose of conserving transportation facilities in the Pittsburgh switching district, and aiding iron and steel industries manufacturing war materials to keep in continuous operation, the Pittsburgh district committee of the Commission on Car Service was instructed to place an embargo on all carload freight originating and terminating within the Pittsburgh switching limits, as well as on less than carload freight between points within its limits. The Pittsburgh district committee was authorized to issue permits for carload freight consisting of raw material or semi-finished products used in the manufacture of commodities for war purposes.

Owing to the shortage of labor and the urgent necessity of conserving railroad equipment and track facilities, the Pittsburgh committee was also directed to place an embargo on all shipments of slag and refuse from iron and steel industries non-self-contained. The committee was authorized to issue permits itself for the modification of this embargo.

Finding that United States troops had in some instances been routed over railroads where freight congestion exists, the committee requested the Railroads' War Board to require its representatives in charge of routing troops to keep in close touch with the General Operating Committee and to co-operate with it to avoid such congestion.

In order to prevent the cross-hauling of coal, the commissioner of the Lake Erie Bituminous Coal Exchange was directed to formulate plans for shipping and locating pools to facilitate the all-rail transportation and distribution of coal

to the west and north, all local organizations to become a part of such general pooling arrangements under the direction of the commissioner of the lake coal and ore traffic.

SUB-COMMITTEE AT CUMBERLAND

For conducting the work of the committee on lines east of Pittsburgh and Parkersburg, a sub-committee was appointed to meet immediately at Cumberland, Md., to secure information covering the exact transportation situation throughout its territory and to put into effect measures for immediate relief of congested points, keeping the general operating committee constantly advised and paying particular attention to government freight and the movement of raw materials for blast furnaces. F. E. Blaser, assistant general manager of the Baltimore & Ohio, was appointed chairman of this sub-committee. C. R. Gray, president of the Western Maryland, a member of the General Operating Committee, was assigned to this sub-division.

On account of the large accumulation of coal at Cumbo and Cherry Run and on account of the unusually heavy deliveries by the Norfolk & Western to both the Cumberland Valley and the Western Maryland at Hagerstown, the Baltimore & Ohio was ordered to deliver to the Western Maryland and Cumberland Valley three large freight engines each and the Norfolk & Western was instructed to deliver them two large freight engines each to be held until the congestion of freight via the Harrisburg gateway is relieved, or until further notice.

The embargo order on traffic through the Pittsburgh gateway was further modified to provide that it shall not apply to livestock, perishable freight and foodstuffs for human, animal and poultry consumption for destinations which cannot be reached except by lines operating through the Pittsburgh gateway.

THE STRIKE OF A. C. L. CLERKS

The Atlantic Coast Line, to settle the controversy with its striking clerks, decided on Wednesday, November 28, to take them all back notwithstanding the grave injustice which this would work on loyal men who had come to the aid of the company; this at the request of President Wilson. President J. R. Kenly has issued a circular recounting the negotiations with the government at Washington. He says that only 23 per cent of the clerks employed by the company left the service, and that the positions vacated were rapidly and satisfactorily filled.

The circular says that the movement to form the clerks of the company into a union followed the dismissal of a clerk at a Richmond freight office on October 16 on account of unsatisfactory service. Of the clerks at that agency, 36 struck; and during the 30 days following approximately 445 clerks altogether left their work, most of them without notice; and this affected 30 stations. The federal Department of Labor sent a conciliator to the company and, after conferences at Washington with L. F. Post, assistant secretary of labor, and with W. B. Hale, member of one of the committees of the Council of National Defense, a form of agreement was drawn up which, it appears, satisfied the representatives of the government and the railroad, but it seems that it did not satisfy the strikers. After a day or two the government officers reopened the question.

The principal feature of the proposed agreement was that, for the period of the war, the road should abandon its policy of employing no clerks belonging to a union, and that the strikers would be taken back so far as their places had not been filled in a satisfactory manner by new employees. This last was modified to an offer to take back 75 per cent of the men. The agreement with the Department of Labor was drawn up on November 17; there was a conference between the government, the railroads and the strikers in Wilming-

ton, November 22 and 23, and the road again laid the matter before the Department of Labor in a long letter. This letter called attention to the highly incensed state of mind of the loyal clerks, 1,500 or more, who had endured insults and annoyances during the early period of the strike, and who objected to the restoration of the 400 strikers.

The only response, according to the circular, to this statement of November 23 was a telegram from the White House, November 24, asking that as a means of strengthening the confidence of the wage earners of the United States in the good will of employers the company take back all of the strikers who wished to return to their former positions. Mr. Kenly replied to President Wilson that he would yield, if the request were insisted on, but that he felt that the President's suggestion would entail unfortunate results. To take back all of the strikers would impose a grave injustice on the loyal men who had enabled the road to continue its operation uninterruptedly. He asked for opportunity to present the situation to President Wilson in person. On the 27th, the President renewed his request saying, in substance, that his familiarity with the general labor situation in the country was such as to warrant him in placing the special circumstances of the Atlantic Coast Line secondary. President Kenly, then, in deference to the President of the United States, complied with his request.

OBDUKATE STATES.—How could the Government help the railways more than by letting the States know, for instance, that they could impose "full crews" upon State commerce, but they could not do so to the detriment of national trade? That is a small but heinous and recent example, which shows the obduracy of the States regarding national welfare of the railways.—*New York Times.*

THE VOLUNTARY RELIEF DEPARTMENT of the Pennsylvania Lines West of Pittsburgh, in its 28th annual report, shows the following disbursements for the year ended June 30, 1917: Benefits for accidental deaths, \$78,750; natural deaths, \$273,789; disability through accidents, \$237,482; disability through sickness, \$453,011; operating expenses, \$140,836. The number of accidental deaths was 101; natural deaths, 420; disablement through accidents, 11,363; disablement through sickness, 12,420; total cases of death and disablement, 24,304.

Locomotives of the 2-10-2 Type for the Wabash

Haul 5,000 Tons Over 0.4 Per Cent Grades; Large Boilers Make Possible High Sustained Capacity

THE Wabash has recently received 25 large 2-10-2 type locomotives from the American Locomotive Company. These engines have replaced others of the Mikado type on the Decatur division between St. Louis, Mo., and Chicago. On this division the heaviest traffic is in the north-bound direction, against which the ruling grade is .4 per cent, with the longest single grade four miles in length. The average train load for the 2-10-2 type locomotives north-bound is 5,000 tons, as compared with 3,500 tons for the Mikado type locomotives previously in service in the same territory. This is an increase for the 2-10-2 type of 42.8

per cent has been obtained and the train load has been increased 42.8 per cent.

As a rule, an increase in weight results in a proportionately greater increase in tractive effort. In this case, however, the percentage increase in weight and tractive effort are approximately the same because of the particular attention which has been given to the proportioning of the boiler. It is of the extended wagon top type with an outside diameter at the first barrel course of 87 9/16 in. The largest barrel course has an outside diameter of 98 in. The boiler is fitted with 253 tubes, 2 1/4 in. in diameter, and 48 superheater flues,

Longitudinal Section of the Wabash 2-10-2 Type Boiler

per cent in tonnage and a decrease of 30 per cent in train mileage has thereby been effected. These locomotives have been used on troop trains with very satisfactory results, hauling as many as 30 cars at speeds of 35 miles an hour. The exceptionally large boilers and the mechanical stokers with which the locomotives are equipped have made this high sustained capacity possible of attainment.

The new locomotives have cylinders 29 in. by 32 in. and

5 1/2 in. in diameter. The length between tube sheets is 23 ft.

The firebox has a grate area of 80.2 sq. ft. and is fired by the Street Duplex stoker. It is 120 1/8 in. long and 96 1/4 in. wide and is fitted with a Security brick arch carried on five arch tubes.

The heating surface of the firebox and arch tubes is 379 sq. ft. and the total evaporative heating surface of the boiler

Large 2-10-2 Type Locomotive for the Wabash

a tractive effort of 69,700 lb., with driving wheels 64 in. in diameter. The total weight of the engine and tender is 591,900 lb. The Mikado type locomotives displaced by the new engines, have cylinders 26 in. in diameter by 30 in. stroke and a tractive effort of 50,360 lb. The total weight of engine and tender is 423,800 lb. With an increase in total weight of 39.6 per cent, an increase in tractive effort

is 5,370 sq. ft. The superheater has 48 elements and a heating surface of 1,129 sq. ft.

According to Cole's ratios, a superheater locomotive having 29-in. cylinders and operating with 195 lb. boiler pressure produces a maximum cylinder horsepower of 2,954 at a piston speed of about 1,000 ft. per minute. On the assumption that each horsepower requires 20.8 lb. of super-

General Drawing of the Wabash 2-10-2 Type Locomotive

heated steam per hour, this locomotive working at maximum capacity requires 61,443 lb. of steam per hour. In accordance with the equated values of heating surface used in Cole's ratios, the firebox, combustion chamber and firebox

Tube Sheet and Cross-Section Through the Firebox

water tubes are rated at 55 lb. of steam per square foot of heating surface per hour. Tubes $2\frac{1}{4}$ in. in diameter and 23 ft. long with $\frac{3}{4}$ -in. clear spacing will evaporate 8.03 lb., and the flues $5\frac{1}{2}$ in. in diameter, having the same clear

The cylinders are of cast iron and both the cylinders and valve chambers are bushed. The back cylinder heads are of cast steel, while the front heads are of cast iron. Steam is distributed by piston valves 14 in. in diameter which are controlled by the Walschaert valve gear.

The power reverse gear is the latest type of Mellin reverse gear, furnished by the American Locomotive Company. This gear is provided with a friction clamp locking device which is actuated by a spring. One of the illustrations shows the gear as it is applied to the Wabash locomotive. The reverse lever connecting rod is attached to the lower end of the rocker arm shown at the left end of the cylinder, while the reach rod is coupled to the crosshead. The gear is operated by means of a rotary valve located below the middle portion of the cylinder; the lapping of the valve is accomplished in the usual manner by a combination lever connected at the upper end with the crosshead of the reverse gear cylinder. At the left end of the cylinder is a rack and pinion device for moving the gear when air pressure is not available.

It will be seen that the crosshead operates on a single bar guide attached to the top of the cylinder. Below the crosshead is a hinged bar connected at the outer end to the fixed guidebar by means of a bell crank and link. The locking of the gear is effected by a spring which, acting through the medium of the bell crank, causes the crosshead to be tightly gripped between the guidebar above and the hinged bar below. The clamping device is so designed that the pressure gripping the crosshead is about eight times the working capacity of the crosshead. When the reverse lever is moved, the clamp is released by means of a small pressure cylinder located in the rear of the spring cage. Through an automatic shifting valve pressure is admitted to this cylinder whenever air is admitted to either end of the operating cylinder. At the completion of the desired motion of the piston in the cylinder, the crosshead is again clamped in position by the release of the air pressure acting against the clamping spring.

The locomotives are fitted with the Woodard engine truck

The Mellin Power Reverse Gear

spacing will evaporate 9.18 lb. of steam per square foot of heating surface per hour. Using these values for the various evaporating heating surfaces, the maximum evaporation is estimated at 62,791 lb. of steam per hour, or 102 per cent of the actual maximum requirement.

and the Cole trailing truck, under a Commonwealth Steel Company's cradle casting. This casting combines the two rear frame slabs, footplate, trailing truck spring yoke brackets, and the trailing truck radius bar fulcrum.

The leading driving axle is fitted with lateral motion driv-

ing boxes and the main axle with long main driving boxes. Among other specialties with which the locomotives are fitted, are the Woodard throttle valve, Radial buffers and Fouldler solid back end main rods.

The principal data and dimensions are as follows:

General Data

Looking Down from an Aeroplane on the 400 Millimeter French Railway Guns

Huge 400 millimeter guns mounted on specially constructed cars, just arriving at the front. These guns, of long distance ranges, are used to destroy the German entrenchments and forces in the rear lines, while the smaller calibred guns, such as the famous 75s, are used on the front-line trenches of the enemy. These giant guns are operated from the cars on which they are mounted, running on strategic railway lines behind the first-line trenches.

Railwaymen Get Into Fight at Cambrai

American Engineers Caught Between the Lines Take Up Arms and Win Praise of British Commanders

"THE courageous conduct of a number of American soldiers attracted much attention. They were pioneers and specialists engaged in construction and working on field railroads. When the enemy appeared Friday morning, they exchanged their shovels for rifles and cartridges and fought alongside the Tommies. Several fell gloriously with arms in their hands facing the foe. No man who saw them at work but praises glowingly the coolness, discipline and courage of these improvised fighters." Thus the Havas correspondent at the British front, describing the formidable German attacks before Cambrai on Friday, speaks of the way the American railway engineers behind the British front before Cambrai jumped in to help against the Germans' terrific counter attacks beginning Friday last.

The Associated Press despatches on Saturday, Sunday and Monday featured the work of the American engineers. The first despatch on Saturday told how the engineers were caught between the British and German lines:

"Large numbers of American army engineers working on the British railways in the region of Gouzeaucourt, caught in the German turning movement, escaped by lying in shell holes and prone upon the ground while the British fired over them.

"There they remained until the British were near enough to enable the Americans to join the ranks, when they fought valiantly and played an important part in replying to the enemy.

"The British commanders refer to their gallant behavior with the greatest enthusiasm.

"Americans elsewhere took a busy hand in the fighting and were under hot German shell fire. Numbers of them volunteered for patrol work in the danger zone, and all acquitted themselves finely.

"A British general told the correspondent that he could not praise them too highly. It is reported that several

Americans were captured, but escaped after a few hours and rejoined the British.

"The crew of a train had a narrow escape. The engine driver, who hails from St. Louis, was standing beside his engine talking with a British soldier when the attack started. A shell struck nearby and killed the Briton, but the American escaped.

"Two more shells exploded on either side of the locomotive, and he and the crew 'dug themselves in' in shell holes, and after many hours made their escape. The railway was blown up by the Germans shortly after the Americans hid themselves.

"The engineers were mainly from New York."

An Associated Press correspondent also cabled that he could "recall no previous time when army engineers have undergone such varied and thrilling experiences as yesterday. The latest reports say that several Americans who were actually captured by the Germans escaped after a few hours and made their way back to the British line.

"How many of them spent agonizing hours lying in shell holes with the enemy all about it is impossible to state, but there were a large number."

PROBABLY MEN OF THE 11TH ENGINEERS

The railways engineers who were in the battle were probably members of the 11th Railway Engineers recruited in New York. Their colonel is G. M. Hoffman, a regular army engineer and William Barclay Parsons, a noted New York public service engineer, is now lieutenant colonel. When the regiment was organized, Charles H. McKinstry, a regular army officer, was its colonel, but he has since been promoted to the rank of brigadier-general.

ENGINEERS HELPED IN BRITISH DRIVE AT CAMBRAI

The American railway engineers have been at work behind the British front for sometime. An Associated Press

despatch from the American Army Headquarters in France dated November 28 said:

"American troops have played an important part in General Byng's drive before Cambrai. It is now possible to tell the people of the United States for the first time that American army engineers have had a large hand in the marvelous work which has been accomplished in the way of pushing the vital railways up to the front. The engineers have been laboring on the roads, behind the British lines for nearly four months, and two of the men who were wounded were the first American casualties announced from Washington. The military requirements have made it impossible to mention their presence here before this time.

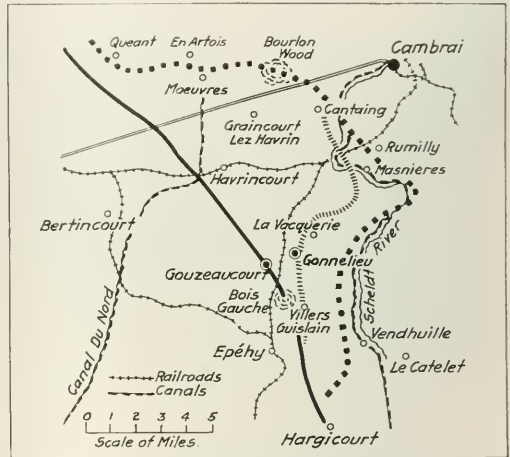

"The speed with which the lines have been laid up through the broken Hindenburg defences during the past week has called forth the highest praise from the British authorities. The Americans have been working in shifts twenty-four hours a day, and no such amount of track has been laid in this region in so short a time before. The manner in which they stood up under the strain has led to their being dubbed the 'force of American athletes,' for these untiring soldiers today are as fit and as willing as they were before the battle began.

"The Americans have for a long time been working under the range of enemy artillery and more than once they have come under heavy shell fire. One of the most striking sights along the front has been that of the engineers laboring coolly at their tracks while great shells were bursting a hundred yards away.

"At one time the Germans cut loose with their guns on a section of the tracks and tore up three miles of rails which had been laid with much labor but they scarcely had finished this bombardment when the twin lines of steel began to creep forward once more. After the engineers had reached a point where they were exposed on the skyline, it was necessary to work at night or on foggy days in order to avoid enemy observation.

"There have been three forces of Americans employed in this region since about August 1. Two of them have been

"The correspondent was talking with three officers today and the only anxiety they expressed about the future was the fear that they might later be compelled to work far back of the lines out of the fighting zone. The engineers love to hear the guns and to get so close to the firing line as military or-

occupied with the operation and maintenance of light railways and the other has been constructing narrow gage lines, over which food, ammunition and material of all sorts are poured to lend support to the fighting forces.

"The correspondent has visited many of these engineers since their arrival and has found them as fit as possible and eager for work. Most of them undoubtedly look forward to the time when they will be able to join the American forces, but just now they are content to do their bit here and to learn valuable lessons in military railroading.

called for volunteer stretcher bearers to go forward to the battlefield and bring in wounded British and Germans, and a large number of the engineers offered their services, which were accepted. They just had finished a hard day's work on the railway, but they gladly undertook the new, arduous and dangerous task and labored through the night getting injured soldiers back to the dressing stations. They were highly complimented by the British for their efficiency in this line of service which was rather a far reach from building railroads."

Railway Problem Viewed From Washington

Government Operation Is Not Desirable; Congestion Is Confined to the East; Question of Priority Shipments

WASHINGTON, December 4, 1917.

THE announcement by the Railroads' War Board of the plan for pooling the facilities of the eastern railroads to the extent necessary to secure a maximum of transportation has aroused a flood of discussion in Washington as to whether it will prove sufficiently effective to prevent a more direct control of railway operations by the government. While much of the prominence given to the idea of government operation may be ascribed to the fact that any possibility of such a radical step is a better newspaper story than any action to be carried out by the railroads themselves, it is also evident that the idea has been persistently cultivated in certain quarters in Washington.

As far as can be learned, there is no great desire on the part of responsible officers of the administration to assume the enormous burden of responsibility that would be involved in the operation of the railroads in addition to the many tasks with which it is now confronted. After the cabinet meeting last week it was reported that the railroad plan had been discussed but that the sentiment was that the government should not attempt to interfere unless it should appear certain that the railroads could not solve the problem themselves. It is not at all difficult, however, for a newspaper correspondent to obtain during a brief call at the office of the Fuel Administration sufficient authority for a statement that the question of the necessity for the government taking over the railroads "is being considered in government circles." Moreover, it is much easier for the Fuel Administration to explain to newspaper men that there would be plenty of coal if the railroads would only furnish enough cars and handle it promptly than it is to explain *all* of the reasons why more coal has not been produced.

The prevailing peculiar psychology as to the powers and capacity of a government seems to lead the same people who criticize almost everything the government has done to assume that any new undertaking of the government in the future will function like clock-work. Under this kind of reasoning, as soon as the railroads admitted that they might not be able to meet all the demands for transportation this winter, there came a general renewal of the suggestion that the government should operate them.

Railroad executives have expressed the opinion that under the plan adopted they can serve the government as well as if they were wearing uniforms, but the opinion has been expressed in some quarters that they would succeed much better if directed by a government transportation director "who knows no more about railroading than Dr. Garfield knows about coal," as one writer put it. The same correspondent said that Dr. Garfield's "success" has been attributed to the fact that he knows no more about coal than the average man who occasionally tends his own furnace; that he glories in the fact and that the President had appointed him for that reason.

If the country would be satisfied with the kind of success in transportation that Dr. Garfield has demonstrated in increasing the supply of coal, it would not be difficult to find a man in Washington who would fully measure up to these specifications.

PLAN NOT IN VIOLATION OF LAW

The answer to the question frequently raised, as to why the railroads had not adopted a pooling plan before, became evident when Fairfax Harrison, chairman of the Railroads'

War Board, felt called upon to issue a statement on November 29 to explain that the railroads are not contemplating a violation of the anti-pooling section of the commerce law. Mr. Harrison said:

"Various statements have been published to the effect that the plan which the railways have adopted to relieve congestion involves a system of pooling which is in violation of the act to regulate commerce. These statements are incorrect. The law forbids the pooling of freight traffic or earnings by competing railways. Our plan does not involve or contemplate the pooling of either traffic or earnings. We have merely arranged for the use of physical facilities in common at places and to the extent necessary to enlarge sufficiently the capacity of the eastern railroads. If the word 'pool' is applicable, what we have partially pooled are the physical facilities.

"The condition we are dealing with is analogous to the flood situation at Dayton, Ohio, a few years ago. It was impossible for certain railways to handle all the traffic which normally came to them. Therefore, they diverted large amounts to railways which were still open. Similarly at the present time certain railways have become so congested that they cannot handle all of the business which is coming to them, and we are utilizing other railway lines to relieve the situation.

"There is no similarity between these measures and the agreements for the pooling of traffic and earnings which are forbidden by the interstate commerce act."

While numerous government officials have told newspaper men that the laws must be disregarded in times of emergency and that they admired the railroads for having nerve enough to disregard them it is apparent that railroad officers do not feel that they can safely depend on such flimsy assurances of immunity.

CONGESTION CONFINED TO THE EAST

Mr. Harrison has also authorized a statement to explain why unusual methods were necessary for the eastern lines.

"The measures adopted in eastern territory apparently have given many persons an erroneous impression regarding the transportation situation in the country as a whole," he said.

"In the west there is no serious congestion, and the railroads are handling the traffic in as satisfactory a manner as could be expected in view of its very large volume. They are not able to furnish all the cars for which shippers ask, but this is largely due to the detention of cars in eastern territory owing to the congestion there which special measures have been adopted to relieve.

"In the Southeast the railways, without serious trouble or delays, are handling the heaviest business ever known in that territory. They could handle a still larger business and our committee anticipates that the government authorities will adopt the recommendation it has made for immediate measures to transfer movement of foodstuffs and other export material to south Atlantic ports." The Board finds that the congestion in the east has been to a great extent brought about by the excessive use of preference orders for Government freight. This is not due to priority orders issued by Judge Lovett, but to routine preference orders issued by many representatives of the various government departments. The number of these routine preference orders has become so large that on some roads they cover the greater part of the freight. This has increased congestion

in yards by causing a large increase in switching movements. Continuing, Mr. Harrison says:

"A constant flow of traffic concurrently produces the best transportation results. We are therefore emphasizing the desirability of reducing the number of preference orders, which, by causing attempts to give expedited movement to so large a volume of traffic, are slowing down the movement of all traffic and thereby defeating the very object sought. We are assured of the co-operation of representatives of the government as respects this matter."

FOOD AND FUEL ADMINISTRATIONS BOTH ASK PRIORITY

What appeared for a time like a disagreement between the government food and fuel administrations as to the relative importance of food and fuel as entitling them to priority in transportation has since been explained to mean that both want priority only over general freight, but so far Judge Lovett has declined to issue a general order. After a conference with representatives of the National Coal Association on November 28, Dr. H. A. Garfield, the fuel administrator, requested Judge Lovett, priority director, to issue an order giving priority in transportation to all railway movements of coal and coke and empty coal and coke cars over general freight. The coal operators had been importuning him to make this request for some time. On November 30, however, Herbert Hoover, the food administrator, entered a vigorous protest with Judge Lovett against the adoption of any policy that would put any commodity, even coal, ahead of the nation's essential foodstuffs, which, in the opinion of the Food Administration, are first in importance as a national necessity. After Mr. Hoover and Mr. Garfield had lunched together on Saturday it was explained that there was no conflict between them.

The request of the Fuel Administration was made after the coal operators had asserted that the country is facing a fuel famine and that shortage of cars is the most important factor in the situation. They were able to refer to the report of the Geological Survey for the week ended November 17 that the mines had produced only 77.2 per cent of their full time capacity and that 15.3 per cent of the deficiency was attributable to car shortage. In a statement regarding the situation the coal operators said:

"The National Coal Association recognizes that the railroads are congested and crowded with freight far beyond anything ever before experienced by them, but this does not change the fact so far as concerns the fuel conditions. The fact remains that we are face to face with a fuel famine. There is relief in sight only through additional supply of cars to run the mines at full capacity and preferential movement of the coal from the mines to the consumers. Bituminous coal operators will certainly run their mines to the limit of production if they are given the opportunity."

Coal has already received greater consideration both by the government authorities and by the railroad than any other single commodity, although without a government order the railroads have been unable to give it absolute priority. The first order issued by the Railroads' War Board after its organization was a direction to give preference in transportation to coal, coke and iron ore, and three out of the four priority orders issued by Judge Lovett have been for the purpose of promoting the movement of coal.

The requests for priority of food and fuel, as well as the general question of priority, were discussed at a conference between Judge Lovett and other government representatives and the Railroads' War Board on December 1, at which the railroad men objected to any more general priority orders. The question was then discussed by the government's interdepartmental war council on Monday, which referred it back to Judge Lovett, and Judge Lovett decided to consider the matter further before issuing an order. On Tuesday Judge Lovett held a conference with the President and is reported to have told him that general priority orders would only complicate the situation and should not be issued, at

least until the railroads have had further opportunity to demonstrate the results of their new plan.

In priority order No. 2 the use of open-top cars for a considerable list of commodities was prohibited, but no order has been issued confining the cars entirely to coal.

Judge Lovett on November 28 cancelled priority order No. 1, which was issued on August 20 to give preference to the movement of coal via the Great Lakes to the Northwest. At that time it was estimated that the requirements for trans-lake bituminous coal would be over a million tons a week during the remainder of the season of navigation, and special efforts have been devoted to keeping up an average movement that would meet that estimate. It is now believed that the requirement has been met and that any additional coal needed in that territory can be furnished by all-rail shipments. The cancellation order was made effective on November 30 and it will result in making many cars available for shipments to the central industrial section and to New England.

Pending action by Judge Lovett, Dr. Garfield telegraphed to Chairman A. W. Thompson of the operating committee for the eastern lines, asking the committee to consider the advisability of giving preference to fuel shipments without waiting for a general priority order. Mr. Thompson replied expressing entire sympathy with the principle and later telegraphed that the committee had advised all interested lines that preference must be given to coal and coke and empty open cars returning to mines to the fullest possible extent consistent with the relief of terminals and junction points. Upon learning of this, Mr. Hoover filed his protest asserting that the necessity of moving livestock and perishables and corn, oats and animal feed-stuffs must be considered as pre-eminent or large amounts of food would be lost. He also stated that the car shortage is a matter for extreme anxiety, especially with reference to coarse grains.

PREFERRED LIST FOR COAL SHIPMENTS

Instead of establishing a list of non-essential industries for the purpose of shutting off their coal supply, the Fuel Administration has sent to coal producers throughout the country a preferred list of consumers to serve as a guide in filling orders, which definitely requests them to give preference to shipments of coal for government orders, railway fuel, household requirements, public utilities, steel plants, coke ovens and munition plants, for a period of 30 days. Operators in Ohio, Michigan, Kentucky, Illinois, Indiana, Alabama, Tennessee, Colorado, and Oklahoma were requested to give preference to government orders, railway fuel, domestic requirements, public utilities and munitions plants, while those in Pennsylvania and Kentucky were requested to give preference also to steel plants and by-product coke ovens. All those in Virginia and West Virginia were asked to give preference to government orders, railway fuel, tidewater shipments for New England, domestic requirements, public utilities and munition plants. The request was not put in the form of a direct order, but the Fuel Administration expects it to be carried out. A communication was also addressed to state fuel administrators suggesting that attention be directed to opportunities for economy in the use of fuel on electric railways, particularly in the reduction of unnecessary heating.

PRESIDENT POSTPONES RECOMMENDATIONS FOR TRANSPORTATION LEGISLATION

No recommendations regarding the transportation situation were made by President Wilson in his message to Congress on Tuesday, as had been expected in some quarters. "Additional legislation," he said, "may become necessary before the present Congress again adjourns, in order to effect the most efficient co-ordination and operation of the railway and other transportation systems of the country; but to that, I shall, if circumstances should demand, call the attention of the Congress upon another occasion."

A New and Novel System of Vessel Unloading

B. & O. Installs Automatic Car Loading Machine
With Electric Weighing Devices on an Open Pier

A NEW and novel system for transferring bulk materials from vessels to cars whereby the usual procedure is reversed and the load is conveyed to the cars instead of requiring the constant attendance of an engine to spot the cars in position to receive the load has recently been installed by the Baltimore & Ohio on pier No. 5 at its Locust Point terminal in the Baltimore harbor. In this way the switching is reduced to a minimum with an appreciable saving in the time of engine crews in addition to releasing the locomotives for other service. The system, which involves an electrically-operated car loader with its belt conveyor and receiving hoppers, was installed to unload ores, sulphur, clays, coal and other bulk materials from the vessels and load them into cars automatically. It loads box or open cars with equal facility. This feature of design is particularly important now because of the acute car shortage as it permits a loaded westbound movement of box cars which previously have been sent light in that direction.

While a pier built to provide three tracks is all that is re-

quired on the center track. The conveyor belt runs through this machine which is motor driven and travels the entire length of the pier. The machine is fitted with a loading arm and an intermediate conveyor between the machine and the arm. The intermediate conveyor is movable in a horizontal plane, having a swing of 270 deg. The loading arm has a horizontal movement through 270 deg. in addition to a vertical movement sufficient to clear the side of the largest open car. With the horizontal movement of the intermediate conveyor it is possible to get the loading arm inside the box car door, and the two movements of the arm permit the load to be placed in any position in the car.

In operation the load may be transferred from the vessel to the hoppers by a gantry, locomotive or ship's crane. The hoppers have a capacity of 20 cu. yd. of materials and each hopper is fitted with a two-speed feeder or conveyor which delivers the materials to the main conveyor which carries them along the pier to the loading machine. By means of this two-speed feeder and an adjustable gate the amount of

Perspective Drawing of the Dock

quired for an installation of this system, there are four tracks on the Locust Point pier. This pier is the open type and is 800 ft. long. It is entirely open to the water on the north and for about 400 ft. on the south. The north, or No. 1 track on the pier is used by cars in loading or unloading materials not suitable for handling through the loading machines and the three remaining tracks are utilized in connection with the conveying system.

The apparatus for this transfer system consists of a receiving hopper, the car loading machine and the conveyor. These are all placed on the center track, leaving the two outside ones on which to place cars the entire length of the pier. The pier affords capacity for 38 cars.

One or more receiving hoppers, mounted on standard trucks and traveling on the center track, can be used with this system. These are so placed as to permit unloading from a number of hatches at one time. The hoppers are motor-driven to allow ready movement from one hatch to the other as may be necessary for unloading the vessels.

The main conveyor, which is a 30-in. belt, extends the entire length of the pier. It is driven by a motor located in a drive house at the land end of the pier. A positive take-up is provided at the water end of the pier to provide for the slack in the belt.

The loading machine is also mounted on trucks and runs

material delivered to the main conveyor is controlled. This feature permits a capacity load to be delivered to the main belt at all times irrespective of the nature of the material and prevents overloading when handling free-flowing materials. From the main belt the materials are delivered to the cars through the loading machine by 20-in. belt conveyors on both the intermediate conveyor and the loading arm.

The operation of the system is electrical and with the exception of the hopper traverse and the speed of the hopper conveyor which must be set at the hopper, it is entirely under the control of one operator in a cabin located on the loading machine. The power is supplied to the system by three wires strung along timber bulkheads which separate the middle track and the conveying apparatus from the outside tracks. A fourth wire interlocks the main belt control and the control on the hoppers. This feature permits starting and shutting down the whole equipment from the operator's cab on the machine.

The loader is placed in motion by the closing of a switch in the cabin. By means of a centrifugal control the belts must start in their proper sequence. Those from the intermediate conveyor and the loading machines start first and must reach a certain speed before the main belt can move. The operation can be stopped from any point along the system in case of accident or for any other reason, by wire ropes

which are provided on the bulkheads on either side of the conveyor and which are connected to the main circuit breaker in the drive house. To start again it is necessary to go to the drive house and reset the circuit breaker.

A drum control is provided on the hopper for the traverse and two drum controls on the loading machine, one for the traverse and the other to control the horizontal movement of the intermediate conveyor. The drum control of the hopper is not under the control of the attendant on the machine and must be operated from the hopper itself.

The loading arm is moved to its various positions by hand, the work being done by the man directing the loading of the cars. The horizontal motion is secured by pushing or pulling the arm to the desired position and the vertical movement by a worm, operated through a hand ratchet. The arm is so constructed that the movements are easily made by one man. By this system box cars have been loaded in ten minutes; open or gondola cars may be loaded in less time, governed by the capacity of the unloading facilities.

By means of an electric weighing device which automatically weighs the material moving over the machine, the operator is in absolute control of the car loading. Before loading, the tonnage which shall be delivered to each car is

Head-on View of the Car-Loading Machine Showing the Intermediate Conveyor and the Loading Arm

determined; the register is set for one-half this amount by the operator and the loading arm is swung into position to load one end of the car. The conveyors are then set in motion and when the predetermined amount has passed over the machine, a bell is rung automatically as a signal to the operator to stop the operation. The arm is then swung to position to load the other end of the car and the operation proceeds as before. This feature prevents under or overloading of cars and insures a proper distribution of the load over trucks. In addition to this device there is another register which records the total tonnage handled over the system, so that an absolute record of the tonnage is obtained. This weighing device is guaranteed for accuracy to within one-half of one per cent.

The loading capacity of this system is governed by the capacity of the cranes used to unload the ship. The labor saving feature is evinced by the fact that the entire loading operation on the pier can be carried on by two operators.

There was designed as a part of this improvement (but not yet installed) a shuttling-type boom gantry crane for handling not only bulk material, but miscellaneous merchandise freight as well. This gantry is provided with a traverse along the length of the pier with a shuttling movement of the boom, sufficient to allow reaching the off-side of the vessel's hatch, making possible the unloading of boats on either side of the pier.

To unload bulk material a clam shell type of bucket would be used, the motor for closing it being built in the head of the bucket, permitting the bucket to be removed, and allow the hoist to be used for the unloading of merchandise or miscellaneous freight. The present unloading operation is carried on by locomotive and ship's cranes.

An important feature of the system is the readiness with

The Receiving Hopper

which it may be installed on existing structures, as any pier of sufficient size and of sufficient strength to carry the locomotives and cars may be utilized. In the installation described above, which is the first of its kind, an existing pier was used and yards already in service provided the storage capacity for the loaded and empty equipment. The main advantages are a reduction in the cost of operation by the replacement of men by mechanical contrivances and entire

Side View of the Car Loader. The Automatic Weighing Device Is Contained Within the Steel Shelter Back of the Operator's Cabin

elimination of the cost of switching engines for spotting cars.

The system was designed and patented by Francis Lee Stuart, president, International Conveyor Corporation, New York, and formerly chief engineer of the Baltimore & Ohio. The Baltimore & Ohio constructed the improvement under the direction of H. A. Lane, chief engineer; M. A. Long, assistant to the chief engineer; W. S. Bouton, engineer of bridges; J. S. Davis, electrical engineer; J. T. Wilson, district engineer, and F. C. Thornley, consulting engineer.

The Depreciation of Railroad Property*

A Clear Exposition on Value and Depreciation, Including a Number of Interesting Original Suggestions

By G. C. Hand

Secretary, Kansas City Southern.

DEPRECIATION and value are facts inseparably related. Depreciation is the subsidence of value. The amount of depreciation is the change which a declining value undergoes in a given interval of time. Intelligent consideration of the subject, or its fruitful discussion, is postponed to a decision of the controversy with respect to value.

VALUATION

Physical value is affirmed by one party and denied by another; commercial value is alleged by the second and disputed by the first: and thus the issue is joined.

Whatever the angle of approach, and whatever the argument advanced, the conclusion is inevitable that value is either physical or commercial, or in part physical and in part commercial. It is necessary to differentiate between the thing valued, which is substantive, and the value assigned, which is attributive.

The commercial and the physical standards of valuation are distinct—the one economic and the other uneconomic. They are quantitatively and qualitatively opposed, and therefore in mutual contradiction.

Of two contradictories, one is true and the other false. No intermediate between them can be true. From the falsity of one, the truth of the other follows. From the truth of either, the falsity of the other may be inferred.

The doctrines of equitable election and of legal estoppel preclude the assertion of claim by or on behalf of a party both under and against the same state of fact, principle of equity, or rule of law.

Value is the measure of wealth, the degree in which property exists, expressed in terms of wealth subsisting in a different form. It proceeds from utility, and is the resultant of the algebraic sum of the forces of demand and supply. In form, it is a statement of equivalence; but, since equivalence cannot properly be affirmed of things essentially unlike, and because the content of wealth is the only attribute usually or necessarily common, value is in substance an equation.

The import of value is that the terms of the equation—the thing valued and the concrete thing employed to express value—are mutually convertible without deficit or remainder. When this is not feasible, the affirmation of value is untrue. Predicated of property, but employed in another significance, value is a misnomer. The fallacy of ambiguity is to be avoided.

The value of a railroad is the present worth of the annuity created by the periodic returns of net revenue, in enjoyment or expectancy, funded at the prevailing rate of commercial profit. The elements of utility and appropriation, demand and supply, together with resulting price, are here present.

Although there may be as many potential values as there are distinct uses and separate demands, there can be but one value effective in the same place and at a given time. Value is unique.

The suggestion of "other values and elements of value" is unscientific and unintellectual. Going-concern value, for example, is not the difference between commercial value and cost of reproduction, but the divergence between value re-

sulting from the primary demand and that consequent upon the highest subordinate demand: between transportation value and scrap or dismantlement value.

The proof is conclusive. A railroad in operation and producing net revenue has a value greater than if in a static condition, neither used nor useful. A property yielding 2 per cent. on cost of reproduction when capital commands 6 per cent, is worth less than reproduction cost. According to hypothesis, going-concern value is then a negative quantity. But value is either zero or a positive quantity, never negative.

Physical value is a meaningless collocation of terms. If value were a physical fact, the track-mile, with a fixed quota of equipment and appurtenances, would be its appropriate unit. But the track-mile is merely quantitative, and not accurately expressive of magnitude, while value expresses both quantity and quality.

Stated in terms of itself, it conveys no intelligence. In order to bring it into relation to an extraneous standard, the constituent elements and the standard itself must first be reduced to a common denominator. When equivalence to other property is asserted, economic quality is introduced, and value assumes a distinctively commercial character.

Physical value, as its proponents understand and intend to be understood, is the commercial value of physical property, ascertained in such manner as wholly or in some part to exclude commercial factors of determining effect.

It adopts the principles of economic science, but denies their reasonable application and legitimate force. It yields reluctant cognizance to the forces of demand and supply, but it ignores effective demand consequent upon the transportation use, and proceeds upon the premise of demands which ceased to be influential upon the conversion of materials to such use, and which are thereafter in suspense. It proclaims financial equivalence, but disclaims the mutual convertibility of things declared in substance and effect to be equal.

When the forces and nomenclature of economics are admitted to the terms of the problem, they must be accepted in their positive, as well as in their negative, consequences and implications.

There is no logical escape from the conclusion that a railroad is either an end or a means to an end. It cannot be both. Nothing finite is a means to itself. If an end, it depreciates in the ratio of physical exhaustion, but not otherwise, and is not normally liable to appreciation. Function must be totally ignored. As a means, it appreciates or depreciates according to the manner and degree in which it accomplishes the end whereunto it is appointed.

The value of property must be ascertained with reference to the capacity for and performance of a productive service, or in total disregard of those considerations. Physical value cannot be impeached upon functional grounds, nor can a commercial value be impugned for physical reasons, unless upon the failure of a material agency in the discharge of its office.

It is judicially decided that the constituents of value are at least four in number, including: original cost, and cost of reproduction; revenues and expenses, and the amount and market value of outstanding stocks and bonds.

The concept of physical value is realized in original cost or cost of reproduction. As constituting a test of value,

original cost, or actual investment, is rejected by the courts upon the ground that the expenditure of capital may have been wasteful or extravagant. It has no determining effect, and is at most accorded a discretionary consideration.

Waste and extravagance occur, if at all, in the adaptation of means to an end, and must be understood in their relation to the object of railroad construction. Investment is wasteful or extravagant when it fails to produce an instrumentality capable of meeting the competition of rivals, of rendering a service in request for a reward not in excess of its reasonable value, and of yielding a profit to the owner; that is, by reason of an insufficient demand for service, or an excessive supply of it, and the consequent inadequacy of price. The qualification is economic, and irrelevant to physical value.

Revenues and expenses constitute the subject-matter of operating income, credit and debit, leading to a balance which represents the net operating revenue or a net operating deficit.

Net revenue is the cause, of which the aggregate market value of outstanding stocks and bonds is the effect, and is properly to be regarded in conjunction with it. The value of securities outstanding is the base, whereof net revenue is the percentage, and the ratio of return is the rate. It is value resulting from the use of property, and varying with the profitability of that use.

Present value is not necessarily co-extensive with legitimate value. After half a century of limitation in disregard of value, or with regard to a false concept of value, present value is probably a remainder.

With original cost eliminated, and net revenue merged into security value, the issue is so narrowed as only to include cost of reproduction and the amount and market value of stock and credit obligations.

Both the statute and decisions limit the application of fair value to such property as is devoted to the public convenience; that is, to property used and useful. The law ignores mere physical existence. Instrumentality is affirmed, function is asserted, and the emanation of value from productive service clearly implied. Thus physical value is excluded by antecedent condition.

Cost of reproduction derives a verbal but negative plausibility from the economic truth that price (pecuniary value) tends towards such cost. But price seldom reaches that level, and its coincidence with reproduction cost is accidental and temporary. Before that stage is reached, the marginal producer is eliminated, supply is curtailed, and the tendency of price is to advance. The intervening margin is variable, and the relation of price to cost of production inconstant.

The importance of reproduction cost consists in the indication which it affords concerning the liability to competitive construction, in its effect upon the course and duration of returns.

Again the argument is economic in character, and not germane to physical value.

A new competitor will not enter the field with an old and depreciated plant. Cost of reproduction *less depreciation* is not responsive to the question of value. Cost of reproduction is an empirical finding, incapable of exact proof or scientific demonstration, and concerning which rational minds equally well informed may and do differ radically. It is not an ascertained fact, but usually a disputed opinion, advanced in advocacy of the cause of a party. The opportunity which it affords for an abuse of discretion is virtually unlimited.

Cost of reproduction is alleged in avoidance of commercial value, and must in the nature of the case differ from it in a substantial manner and to a material degree. It is a non-commercial value, not definitely related to commerce, and unadapted to serve as the basis for its reasonable regulation.

Cost of reproduction is nowhere else recognized as the criterion of value, and it is therefore discriminatory. Fairness does not consist with discrimination.

Cost of reproduction is an intermediate between contradictions, barred by the law of excluded middle.

Actual investment and cost of reproduction are alike in kind, and differ only in degree according to the lapse of time. Actual investment is cost of reproduction in the past tense. Reproduction cost is actual investment assumed as of the present time. Both are values resting upon demands no longer effective. The reasoning which warrants the rejection of either, precludes the acceptance of the other.

A new line of railroad, pending the establishment of commercial relations, is not lawfully entitled to allege cost of reproduction as the test of value. But at that time actual investment is identical with reproduction cost, as nearly as the latter can be ascertained.

When the event demonstrates that a line of road has been unwisely located, cost of reproduction is accorded no greater respect than actual investment. Indeed, reproduction cost may well exceed actual investment, quite apart from the question of depreciation.

The title of reproduction cost to rank as value is actually challenged by reason of the rarity of population, the insufficiency of traffic, the presence of competition, and the inefficiency of operation. Population is insignificant except as it is translated into traffic. Traffic is demand for service in visible manifestation. The service which a particular carrier is capable of providing is its contribution to supply. Service offered by other agencies is competitive supply. Efficiency affects the quantity and quality of supply.

Each fact alleged, every law invoked, is both approbated and rebated.

The demand for and supply of transportation service, now renounced in order to justify physical value, are now weapons employed in the furtherance of an assault upon its integrity.

Cost of reproduction, as already observed, is a pseudo-value, dependent upon arrested demands. It is asserted, denied when greater than value resulting from effective demand, and reasserted with damaging qualification when less than value consequent upon efficient demand.

Before exhaustion occurs, it is affirmed that useful life is the test of value, and denied that value is in the ratio of physical existence to reproduction cost.

After exhaustion takes place, it is denied that useful life is the criterion of value, although indefinitely prolonged, and affirmed that value is in the proportion which unexpired physical existence sustains to reproduction cost: subject, however, to adequate traffic, immunity from injurious competition, and to a suitable degree of efficiency; that is, to the forces of effective demand and supply.

Efficiency and inefficiency, the sufficiency and the insufficiency of traffic, are what might be termed continuing functions. They are opposite aspects of the same fact, lying respectively above and below zero, and differing solely in degree. The location of zero is relegated to the discretion. When negative, they are properly alleged in derogation of value. When positive, and abundant in extent, their efficacy to produce an augmentation of value is wrongfully denied.

Contrary to reason, and in antagonism to law, the advocate of physical value asserts claim to the benefits of both the physical and the commercial standards, but disavows the pains and penalties of either; and he does so in the ascertainment of reasonable value pursuant to law.

But the value of property results from the use to which it is put and varies with the profitability of that use, present and prospective, actual and anticipated. There is no pecuniary value outside of that which results from such use.—Cleveland, Cincinnati, Chicago & St. Louis Ry. Co. v. Baekus, 154 U. S. 459, 445.

In the absence of a fixed standard of value, rate regulation is arbitrary, and private property is exposed to predatory invasion. The recognition of two or more standards marks a departure from standard. The effect and presumptive purpose of a plurality of standards is to discriminate. An act of confiscation is not mitigated, and not divested of its pernicious character, because it is evasively accomplished by fiat of special and destructive definition.

DEPRECIATION

Value fluctuates directly as appreciation, and inversely as depreciation. Value expired, during the term of its existence, is one in origin and substance with value remaining unexpired. An accepted standard of value is obligatory as a basis upon which to reckon depreciation.

Original value is equal to depreciated value plus depreciation. The sum of unlike quantities is nondescript. Depreciated value is original value minus depreciation. The difference between unlike quantities is alien to either.

In view of commercial value, or of physical value modified by "other values and elements of value," neither original cost nor cost of reproduction affords a tenable basis of depreciation. In contemplation of reproduction cost, original cost is similarly disqualified.

Original cost is not co-extensive with value. Depreciation is a change in value. Therefore original cost does not afford a rational basis for the ascertainment of depreciation.

Cost of reproduction relies for support upon the considerations underlying original cost. Because of this, and inasmuch as reproduction cost is challenged by reason of economic disability, depreciation is not the proportion of such cost corresponding to physical depletion; nor, to state a distinct fact, is it equal to the present cost of necessary repairs and renewals.

Value is not proportionate to physical existence, nor is its variation commensurate with any change in physical extent or duration. Property used and useful, although in a state of depletion, possesses value, or at all events is capable of possessing it. A plant not used nor useful, although greater in physical extent and superior in physical quality, is destitute even of physical value. A positive quantity is greater than zero. It follows that depreciation—that is, the expiration of value—is not in the ratio of expired physical existence to any principal sum. Still less does it sustain a fixed relation to physical existence expiring, but never permitted to expire.

The contribution to value made by repairs and renewals will be less than, equal to, or greater than, their current cost. If less than cost, the conversion of liquid assets into fixed property has the effect, not of neutralizing depreciation of the property in its entirety, but of producing it. When equal to cost, they neither produce appreciation nor prevent depreciation, and their postponement involves no dereliction. Unless greater than cost, repairs and renewals will not normally be made.

The cost of deferred maintenance is the sum necessary to overcome depreciation resulting from physical exhaustion; but such cost does not necessarily reflect its extent as a function of value. Depreciation is equal to the current cost of postponed repairs and renewals, plus the loss in productive efficiency during inactivity.

Presuming the average life of ties to be 10 years, for example, the combined life remaining unexpired in each series of that number will, upon the lapse of a few years, be the quotient of 9 plus 1, or of 10 plus 0, divided by 2; and depreciation will amount to 50 per cent of cost, less the value of scrap material recovered. The salvage of ties is a negative quantity.

After a period of adjustment more or less prolonged, this will be broadly true of all elements of property other than land.

In the orderly course of events, this alleged depreciation occurs during the period of development; when it is held that the carrier is entitled to reimbursement, but when, upon failure for any reason to exercise it, the right lapses; when title to a fair return is in suspense, and when reimbursement is probably impossible; when cost of reproduction does not constitute the test of value, and when depreciation is disproportionate to it.

This is the highest state of physical excellence possible to

attain without a waste of capital, in the form of labor and materials, so flagrant as to defeat title to fair remuneration, and to vacate the claim of reproduction cost to represent value. Neither upon the performance of its conditions, nor upon a failure to perform them, is the equivalence of reproduction cost to value acknowledged. Thus the theory of physical value is self-destructive.

At the present time locomotives, cars, and certain classes of materials, are quoted at advances of from 100 to 300 per cent within three years. When these conditions prevail, it is possible for so-called depreciation to exceed original cost, or cost of reproduction as of an antecedent date, notwithstanding a residuum of useful life; while salvage may well reach a sum equal to or in excess of either cost.

The decisions give express recognition to the potentiality of appreciation. But in the circumstances here described appreciation cannot occur until, within the life of the least durable material, advances in the wages of labor and the prices of supplies approximate 100 per cent, and never in normal conditions. As renewals are made at increased cost, the supposed appreciation diminishes to a corresponding extent.

Appreciation and depreciation cannot both be ascribed to the same property, or any component part of it, at a given time. Appreciation or depreciation is the difference between two values. Present value cannot be at once greater and less than value at a focal date in the past.

It is the province of capital to provide plant and equipment in a condition for operation. It is the function of expenses to wield the instrumentality and maintain it in a condition for continuous operation. It is not incumbent upon, nor is it permitted to, the expense account to perpetuate a condition of newness.

At the time when repairs and renewals are necessary and economically possible, depreciation is said to be matured. Previous to that time, it is popularly described as accrued. Depreciation is an item of operating expense, antecedent to the question of profit. Upon maturity, the operation which neutralizes it and restores the original condition, occasions a charge to operating expenses, and it is actually so made, without effect upon accounts representing the cost or value of fixed property.

In its credit relation, it affects working capital through the media of vouchers, pay rolls, and the material account, subject to reimbursement from revenues in excess of operating expenses, including depreciation as a part thereof.

At an inchoate stage, and pending maturity, depreciation cannot be so charged as to involve a credit in diminution of property value.

Anticipated charges to the income account, such as accrued interest and taxes, might with equal reason be deducted from the value of property.

A railroad is a means to an end. While efficiency is maintained, an instrumentality suffers impairment, not from inherent causes or defects, but from the lapse of the office or its performance by other agencies; that is, from lack of traffic, the inferior quality of traffic, or the pressure of competition.

When repairs are punctual and adequate, and renewals are in proportion to the average life of materials, operating expenses have fully discharged their obligation to the property, there is no failure on the part of a material agency in the performance of its function, a condition of undiminished capacity is perpetually maintained, and existing depreciation, if any, results from causes other than physical exhaustion.

The depreciation here alleged is of the accrued variety. The distinction between accrued depreciation and matured depreciation is purely fictitious, and without foundation in fact. Depreciation is the difference between two values, let it be repeated, and its maturity is in the same ratio as its accrual. The fallacy of ambiguous terms is plainly evident.

Accrued depreciation, falsely so called, merely points the time when depreciation will occur, in the contingency that operating expenses fail in the discharge of the obligation devolving upon them. Inasmuch as depreciation is an element of expenses, it is necessary to conclude that upon the performance of such obligation depreciation is neutralized. Neither reason nor law admits the imposition of impossible conditions.

The effect and legitimate purpose of recording accrued depreciation is to equalize operating expenses, the occasion for which seldom arises in railroad accountancy.

Accrued physical depreciation rests upon the incomplete exhaustion of material elements, and is independent of the perpetuity of useful life. Functional depreciation, that is, obsolescence and approaching inadequacy, predicated upon the expiration of useful life, is independent of physical existence, extent or duration. They are mutually incompatible, and not at once capable of rational justification.

It is important to differentiate between an element of property and a unit of property. The element is related to the unit as the atom to the molecule. The unit is an integral part, capable in itself of performing a transportation service, and of possessing a transportation value. Although the element may be indispensably necessary, the contribution which it makes to value is undetermined and indeterminate.

Neither value, appreciation nor depreciation, can be allocated to constituent elements, any more than it is possible to decide which leg of a tripod is most essential to its stability. Each must be ascertained with reference to an integral part. Rails and ties, locomotives and cars, are not integral parts.

A line of railroad otherwise complete, but without locomotives, or having but one rail, or lacking one length of rail in each mile of track, is neither used nor capable of use, and not admitted to the inventory of property which is the subject of fair value. The locomotive and the rail, or length of rail, are under a like disability. Value other than for purposes of dismantlement is not attributable to either set of elements apart from the other. Whether physical or commercial, value is in abeyance until the component elements are combined into a unit, complete in itself, capable of producing service, and of response to demand.

The franchise is a condition precedent to use or usefulness. But certainly the advocate of physical valuation can ill afford to assume an attitude which would impute all or any part of value to an intangible right.

Depreciation, in its application to fair and reasonable value, raises no embarrassing question. It is ascertainable in its entirety by a simple and direct mathematical process. The problem derives its origin from physical value, in relation to which it is insoluble.

A single problem involving two or more unknown quantities is incapable of solution. The question of depreciation introduces three quantities, of which two being known, the third can be deduced. It presents itself in two aspects, viz.:

First, given original value and depreciation, to find depreciated value.

The analysis of depreciation is directed towards the end of synthesis. The purpose is to determine the aggregate amount of depreciation, which in turn has for its object the ascertainment of depreciated value by subtraction. But since value is not proportionate to physical existence, because depreciation is not in proportion to physical exhaustion, and inasmuch as depreciation cannot be allocated to constituent elements, analysis and synthesis are alike impossible. The proposition presumes the conclusion in the process of reaching it, and admits of no solution.

Second, given original value and depreciated value, to find depreciation.

The terms of the proposition furnish the desired result, to which depreciation is merely corollary, and not a matter of direct concern.

PRACTICAL PATRIOTISM AND TRANSPORTATION*

By Howard Elliott

Inspector of Transportation, Los Angeles and Salt Lake, Los Angeles, Cal.

Co-operation, like patriotism, is something more than a state of mind. The girl who says, "I love you, Mother," and then sits down to read the latest novel while mother does the dishes and scrubs the floors, is minus the divine spark of love which is active rather than latent. And the man who preaches patriotism from the housetops, uncovers at the sight of Old Glory, is the first to rise at the sound of the "Star Spangled Banner," but who fails to buy a Liberty Bond, declines to unload his freight cars quickly, refuses to economize on food and fuel, or to do anything affirmatively to help his country in time of need, is but a shade superior to the traitor who gives aid and comfort to the enemy.

Here are a few ways in which the citizen can help the railway, and by so doing, help the country, in these perilous times:

1. Load and unload cars the day they are spotted. If you regard demurrage as a get-rich-quick scheme of the carriers, cheat them out of some of their riches by handling your cars within the free time. The agents will rise up and call you blessed.

2. The upper berth of a freight car is used only part of the time. Please fill your cars top and bottom. Encourage your customers to buy in carloads instead of less than carload lots. This makes heavier car and train loading, reduces the car shortage, and saves fuel on the locomotives.

3. Purchase upper berths in sleeping cars. They are 20 per cent cheaper, the ventilation is better, there is less noise, less jarring, less chance to have your toes stepped on, the springs are better, there is more privacy, more room to stretch, more evenness of temperature, and you are performing an act of patriotism by helping the railway make every sleeper do double duty. A lady who had been almost persuaded to take an upper said to the ticket agent, "But I'll have to get up before I go to bed." "Very true, madam," replied the resourceful agent, "but the advantage is that the porter takes steps to put you to bed."

4. When you make a shipment by freight or express, pack it as securely as though it were destined to a foreign port, write the address as though it were to be read by a one-eyed man in candle light. See that tags are fastened securely. Erase all old marks. A shipment can't talk, and in case of two addresses, someone will have to guess which is right. Often the guess is wrong. If there are two stations of the same name in the same state, show the county. Help "make shipments expressly safe," a slogan I have just invented and which I am going to donate to some of my express company friends if they want it. The Salt Lake Route's ratio of loss and damage payments to gross freight revenue is less than four mills. This is as good as any road's anywhere, but railways nowadays are not trying for individual records. We want to win a war, not a skirmish, and for that reason we have pooled our resources and our ideas so that we may be able to "do more with less."

5. When the next legislature convenes, say to your senator or representative, "This is no time to pass restrictive railway legislation. If you must introduce some measures affecting common carriers, put in some repealers on the senseless car limit, extra crew and valuation bills. Try to put through an anti-trackwalking law and an act requiring drivers of vehicles to stop before crossing railroad tracks at grade. Such a program will conserve man power and resources."

*Abstract from an address before the Commercial Board of Los Angeles, Cal., on October 24.

Handling Freight Faster With Fewer Men

By Using Electric Trucks One Road Moved 60 Per Cent More Freight With 42 Per Cent Less Labor

By F. C. Myers

The Society for Electrical Development, Inc.

ONE day in July, 165 men were busily engaged in handling the LCL freight at one of the larger freight transfers. The men were so numerous they got in each other's way. On the next day, when electric truck service was started, 48 men were discharged. At the same time the freight was handled faster and with less congestion. Since the introduction of electric trucks the tonnage handled through this shed has increased 500 tons a month and the force has not been enlarged.

At another terminal one afternoon in August 30 team trucks were waiting to unload at 4 P. M. At 4:30 there were 32 trucks still waiting. The last truck backed up at 6:19 and it was 6:30 P. M. before all were unloaded. During this time only 3,875 packages were handled. One week later, when electric power had replaced the hand trucks, 19 trucks were waiting to unload at 4:00 P. M. At 4:30 the number had increased to 22 trucks. All trucks were backed up at 5:15 and the last one unloaded at 5:45. Forty-five minutes were saved and 5,350 packages were handled. The results given are from actual observation by the writer. It should not be understood that power trucking apparatus is recommended for every terminal or transfer point. Each case must be considered on its merits as conditions will determine what equipment best meets the requirements. There is no one remedy for all freight hauling problems any more than there is one medicine that will cure all the ills of the human family.

To talk about labor shortage seems futile, but the indications are that the real shortage has not yet arrived. Millions of men may be called into the government service before

the end of the war. The men left at home to do the work will be the defectives, the old and the young. This means inefficient workmen and more and more dependence must be placed on mechanical aid. The men that are left will be in great demand so that wages, which are high now, will go still higher. Where the end will be no man is bold enough to prophesy.

At the same time manufacturers are constantly increasing their output, which is another way of saying that shipments are steadily increasing. The 100,000,000 people of the United States will continue to live and require the necessities of life. Our allies and our army across the sea and in the training camps must be fed, clothed and housed. The burden that is falling on the railroads is enormous and will increase. How are they to handle the situation, limited as they are, in labor, in equipment and space for expansion?

This problem will not end with the war. The enormous wastage of men and material that is going on cannot be replaced in a day or a year. Cities, yes, countries, must be rebuilt and the burden of transportation will be heavy for many years.

Wonderful results are being obtained by heavier loading of cars and by urging shippers not to delay in loading and unloading shipments. Locomotives are being operated to the limit and trains are moving as rapidly as coal and trackage will permit. There is still room for heavier loading. But there is greater room for improvement in loading and unloading methods and in handling freight quickly and economically at transfer points and terminals.

The efficiency of human labor depends primarily on two

things. The physical condition of the labor and the mental attitude with which the work is tackled. Men of the class obtainable for truckers and freight handlers do not usually take the best care of their physical condition. Their mental attitude is one of absolute non-interest. They do the work because they must and only do as much as is necessary to hold their jobs, or to make a "stake."

Much of this trouble can be overcome and freight movement facilitated. Making the work easier is one method and to make the work easier machinery and power must be used for lifting and moving freight. Some development has taken place along these lines and some of the railroads have made great improvements, but much is yet to be done, as at many terminals freight is still handled just as it was when the railroads were first built.

FUNDAMENTALS OF PROBLEM

The fundamentals of the freight handling problem are few and simple. Freight is moved either horizontally or vertically. The hauls are either short or long. The package either

Fig. 2. Portable Electric Conveyors Pile to the Roof and May Be Placed at the Most Convenient Point

vary greatly in size and weight or they are uniform in size and weight. When considering the solution of freight handling problems these fundamentals should always be borne in mind.

Lifting and lowering freight from one level to another is increasing in importance because of the increasing number of double decked freight houses. Ramps have been used from time immemorial. It is not uncommon to see four or five men struggling to push a truck up a ramp, then walking to the lower level for the next truck load. With reasonably good floors one man can move a truck horizontally where several men are required to lift it up the ramp. In order to increase the number of men on trucks going up ramps extra men must be employed or they must be taken away from regular trucking work. Ramps usually increase the labor cost out of proportion to the material being moved or else delay the regular work.

The old two-wheeled hand truck, with its "husky" on the handles is the most familiar figure wherever freight is to be loaded or unloaded or transferred from one carrier to another. This method is slow and unreliable. Wherever lifts are necessary mechanical means are available for doing the work and should be employed. Inclined elevators or escalators, (Fig. 1) can be used. These machines are electrically operated, so that power is consumed only when they are being used. They have a large capacity, because of the steady stream of trucks that can be kept moving upward. They travel at a uniform speed and thus act as a "speed boss" for the truckers. They can be designed to travel in either di-

rection or the direction of travel can be reversed so that they can help truckers to bring freight down as well as to lift it up.

Under ordinary conditions, a 10 or 15 horsepower electric motor will provide all the power necessary to operate the inclined elevators or escalators. The current consumption will therefore be approximately 11 kilowatts an hour when working to full capacity. With a power rate of 5 cents per kilowatt hour, the maximum cost of current will be 55 cents an hour. As full load conditions will seldom maintain except for a few minutes at a time, the cost will be materially less than this. Also there is no cost for power when the elevator is not in use. Under present labor conditions the wages of two men for an hour will about equal the cost of electric current, but the difference in the amount of freight that two men can lift as against the amount that one of these elevators can lift is beyond statement.

LEVELING DEVICE FOR ELEVATORS

Vertical elevators are well known and largely used. There has recently been a development in this equipment that is worthy of note. A micro-leveling device has been produced that automatically maintains the floor of the elevator level with the floor from which the freight is being taken or onto which the freight is being placed. The time required for properly stopping the elevator and adjusting it as the load becomes heavier or lighter to facilitate truck movement out of the door is eliminated as is also the need of struggling to move trucks when the height of the elevator floor changes. Elevators are now proportioned to suit the style of trucks to be used and with capacities suited to the loads to be handled.

Fig. 3. Electric Trucks May Be Operated by Cheap Labor

Portable inclined elevators (Fig. 2) will be found economical in some locations, for instance, where quantities of material are to be lifted from one level to another at different points in a freight house, but where the quantities are not sufficiently large at any one point to warrant the expense of a permanent installation. Another case would be where freight is to be lifted or lowered from cars into boats at different points, or where large quantities of material must be handled from teams directly into cars which cannot be placed on team tracks or boats. These portable elevators consume approximately the same amount of electricity as the stationary equipment, depending on the kind and amount of material to be handled.

The horizontal movement of freight offers a big opportunity to save time, money and man power. Each time packages have to be lifted on or off a truck, time and human energy is consumed. Time is lost each time that a truck has to wait to unload. Congestion on platforms is caused by the man handling of freight and the inability to move it as fast as

it arrives. This condition applies also to car unloading. Every time that a car has to wait for truckers a delay is experienced that increases the cost of freight movement and ties up investment that should be working.

ELECTRIC TRUCKS

A man with a two-wheel truck is usually a liability these days. Even though wages are high, men are difficult to get and they cannot work fast enough or long enough to do the work required. Machinery can work continuously if properly attended. Electric trucks are "fool proof." They can be operated by the most ignorant labor (as shown by Fig. 3), and almost the only way they can be wrecked is by deliberate intent. They can be operated in approximately the same space as the old two-wheel truck. Their capacity can be made anything desired.

Two types of electric trucks are available. Carrier trucks, Fig. 3, and tractor trucks, Fig. 4. Carrier trucks carry the load just as the usual automobile truck carries its load. The tractor trucks draw the load just as the locomotive draws a train of cars. Both of these types have their applications and neither of them will be found economical under all freight transfer conditions.

Carrier trucks are especially adapted to work where they must be driven, loaded and unloaded by the same man,

Fig. 4. One Man With an Electric Tractor Truck Can Haul Half a Dozen Loaded Trailers

or wherever material is to be moved to scattered locations in such small quantities that it would not pay to have gangs of men to load and unload it. Carrier trucks can be run directly into cars for loading and unloading. They can be used economically where the loads can be handled quickly. It has been found that the use of one of these trucks for only a few hours a day may save more than liberal interest charges on the investment. For example, carrier trucks are being economically used for handling baggage, express and mail at passenger stations. The driver loads and unloads them and the loads are delivered to and received from trains standing at any of the platforms. More baggage is moved in one load than several men could move on the old style hand truck and the trip is made at the rate of from 5 to 8 miles an hour, where men pushing a loaded truck would hardly average $2\frac{1}{2}$ miles an hour even for a comparatively short distance.

Ordinarily, a carrier truck will either release for other work or eliminate from the payroll five or six men. Instances have been known where the force of truckers has been reduced 40 per cent and where the investment paid for itself in four months. If one truck will eliminate four men drawing \$3 a day the payroll will be reduced \$12 a day. Counting 300 working days in the year, the reduction on the payroll will be \$3,600, which is 6 per cent on \$60,000, an attractive saving when it is remembered that the truck costs approxi-

mately \$2,000 and that it can be operated for about \$1 a day of 10 hours.

Tractor trucks have their special field of utility. A tractor can draw a heavier tonnage than a carrier truck of equal battery capacity can carry, other conditions remaining equal. Tractors are useful where freight can be collected at some central point in the freight house and then delivered to the cars or teams. They can be used wherever loading and unloading gangs can be employed. The tractors are usually operated by two young men or boys, one to do the driving and the other to attend to the coupling and uncoupling of the trailers. The more continuously the electric trucks are operated the greater will be the saving because this part of the system represents the major investment. This is important because the overhead charge operates continuously.

OPERATING DATA

The following data has been taken from the files of a large railroad. On a short haul 24 men with hand trucks handled 49,881 lb. of freight in two hours. At the same place, under the same conditions and with the same class of freight, a tractor and trailer, with 10 men, handled 73,097 lb. of freight in $2\frac{1}{4}$ hours. The amount of freight handled was increased 68 per cent. The number of men were decreased from 24 to 10 and the length of time in handling the freight was only increased one-quarter hour. The labor charge in the first case, at 30 cents an hour, was \$14.40. In the second case it was \$6.75. The net saving in labor alone was \$7.65, but 23,216 lb. more freight were moved. At this rate for an eight-hour day with the truck, 259,904 lb. of freight will be handled by 10 men, against 199,520 lb. with 24 men, providing the 24 men could keep up the pace throughout the entire day, which is not likely. Actually under the old system each man handled 1,049 lb. of freight an hour. With the trucks each man handled 3,248 lb. of freight an hour. As the length of haul increases, the advantages of the electric truck increase, due to its greater speed.

The writer recently saw a tractor perform. A large piece of machinery, which on skids would just slip through the door of a car, was to be loaded. Of course, a truck of any kind was impossible. Eight men with pinch bars were trying to pinch the machine along the platform with the usual delays and slow movement. It was suggested that the platform ahead of the skids and the skids themselves be greased and the machine pushed into the car. Under these conditions a tractor did the work in a few minutes, and all the men but two were released for other work. The time saved cannot be computed in this case, but it would not take many such operations for the truck to pay for itself.

Other means of handling freight are available and each has its peculiar application. A movable loop has recently been developed for moving freight from loading platforms into storage or to team stands. The special claim made for this system is that the overhead trolleys travel from a suspended track, which occupies no floor space. Aisles are reduced to the minimum and goods can be piled up close to the ceiling. The carriers travel in one direction only and by means of the movable ends of the track the distance of travel can be made as short as is consistent with the length of travel necessary. Also by moving the loops the entire floor space is covered and available for storage.

Gantry cranes, traveling cranes and traveling hoists can all be used advantageously under certain conditions, especially where the freight to be handled is heavy and bulky. Conveyors are especially economical where the packages are uniform or so nearly so that one type of conveyor can be used advantageously for a large proportion of the work. These conveyors are, however, usually specially designed so that unless large amounts of similar freight are to be transferred the investment will not be warranted.

For general application the industrial truck of either the

carrier or tractor type will be found to have the widest application. They can be operated anywhere, up or down grades, do not require trackage, low class labor can be employed to drive them, the batteries may be charged during the idle hours of the truck or reserve batteries may be installed and the discharged batteries charged while the truck is operating, so that 24-hour operation is possible. The labor charge connected with freight handling is greatly reduced when handled electrically on account of the fewer men required and the larger amount of freight handled without a corresponding increase in time.

IMPROVED SANITATION AT OUTLYING POINTS

One problem of railway operation which has received little attention is that of sanitation at railway stations, round-houses, shops and other buildings housing railway employees, where no local sewerage system is available. In most such cases the requirements are so limited that the expense of a sewerage system would be unjustified even if the problems of water supply and outfall could be solved readily. The primitive substitutes for sanitary plumbing

is on a basis of 15 persons to each unit, with a tank having a capacity of 125 gal.

A number of railroads have installations of this system, particularly in the east. The Albany Southern, the Buffalo, Rochester & Pittsburgh, the Baltimore & Ohio, the Boston & Maine, the Lehigh & New England, the Maine Central, the Mobile & Ohio, the New York Central and the Philadelphia & Reading, are using this type of toilet in stations, signal towers, crossing watchmen's houses and other buildings that cannot be connected with a sewer. The Lehigh & New England has applied the system to its shops at Pen Argyl, while the Pennsylvania Railroad, the Lehigh Valley, the Delaware & Hudson and the Baltimore & Ohio have installed it in various maintenance camps, the first named road alone having 750 units in use in its camps.

The photograph shows a Kaustine toilet arrangement for a crossing watchman on the Philadelphia & Reading in a case where the watch house is not large enough to accommodate the installation. A better plan, where the size of

Kaustine Installation in a Separate Building for a Crossing Watchman

and sewerage in common use are unsatisfactory and apparently incapable of proper maintenance. The same conditions apply to railway labor camps except that the situation is usually more aggravated because of the larger number of men to be provided for.

In view of this situation considerable interest is attached to a sanitary system now on the market known as the Kaustine waterless toilet system, which provides for the chemical sterilization of the sewage matter by a chemical known as Kaustine, accompanied by a system of ventilation. The Kaustine toilet has the general appearance of a water toilet with a white china bowl, seat and cover. The bowl is attached to an Armco iron antiseptic tank, containing the active chemical which is designed to dissolve the solid matter and act as a thorough germicide. The contents of the tank is rendered harmless and drained off into the ground without fear of any contaminating effects.

The systems can be made to accommodate the requirements of the particular situation, whether large or small passenger stations, signal tower, shop, camp, etc., modifying the installation according to the number of persons to be accommodated. The antiseptic tanks are generally buried in the ground to prevent freezing. Each tank is equipped with an internal valve for emptying; this valve is commonly connected with a four-inch tile. A large disposal bed is unnecessary and under usual operating conditions the tank requires emptying and recharging about twice a year. This

Diagram for a Small Installation

the building permits, is to partition off part of the shanty for a toilet room.

An installation of this system consists of a relatively small number of parts and is said to be simple in application. The equipment is manufactured by the Kaustine Company, Inc., Buffalo, N. Y.

GERMAN RAILWAY OPERATIONS IN OCCUPIED TERRITORY is the subject of an article in a recent issue of the London Daily Mail, which says that at the beginning of September, 4,000 locomotives and 155,000 cars were employed in Belgium, Serbia, Roumania and Courland.

EMPLOYEES' INSURANCE BENEFITS ON THE B. R. T.—The second year of the Group Insurance Contract, made by the Brooklyn Rapid Transit Company with the Travelers Insurance Company for the benefit of the employees of the system, ended September 15 with a total of 6,010 employees insured. The premium contributed by the employees during the year amounted to \$34,965.85, while the benefits derived by the beneficiaries of deceased employees amounted to \$66,000 or within \$2,430.98 of the total premium received by the Travelers Insurance Company. Beneficiaries of deceased employees therefore received \$31,034.14 more than the amount of premium contributed by the employees.

French Railroads Must Have Higher Freight Rates

War Conditions Cause Enormous Increases in Expenses;
Serious Deficits; Fifteen Per Cent Advances Proposed

From *Economiste Français*, September 15, 1917

AMONG all the industries railroad operation is the only one in which the net cost has not stopped increasing while transportation rates have remained the same. And this state of affairs is not entirely due to war conditions. In the years preceding the war the prices of coal and metallurgical products, of which the railroads consume vast quantities, had already been raised to a very noticeable degree. According to the index numbers fixed by the Statistical Office of France (*Statistique Générale de la France*), which cover over 25 materials used in industry, if the average basal index number calculated on the years from 1901 to 1910, and assumed to be equal to 100 is compared with the index number of the same materials for the first half year of 1914, the index number is 113.3, that is to say, the average increase is more than 13 per cent in four years.

In spite of the fact that these averages are only approximately correct it may be assumed that the price of coal and products of the metal industries, among the 25 products which served as a basis for this calculation, have increased to a still higher figure. The price of coal, indeed, has increased at a much higher rate. The statistics of the mineral industry for 1914 give the average price per ton of coal at the mouth of the mine. After having fluctuated between 10 and 11 francs in the years 1890 to 1898 it began to increase and after some fluctuations it went beyond 15.50 francs in 1912, continuing its rise in the following years.

Railroads consume vast quantities of coal. Before the war their consumption of that commodity was nearly 10 million tons, that is, 15 per cent of the total coal consumption of France, which had mounted at that time to nearly 61 million tons. And all this can give only an approximate idea of the rise in the cost of coal, for the prices paid by the railroads were much greater than these average prices, since they were obliged to import foreign coal for their use.

INCREASES DURING THE WAR

Since the war these prices, as everyone knows, have increased enormously, as have the prices of metallurgical products, engines, rails and hoisting apparatus. The Paris-Lyons-Mediterranean Company, which spent in 1913 a little more than 55 million francs for its fuel, has seen that expense pass 170 millions in 1916, an increase of more than 200 per cent. The Paris-Orléans Company, which in 1913 spent 34 million francs for its coal, spent 91 million francs in 1916 for this one item. The amounts expended for coal in the two years compared, 1913 and 1916, have been for the other companies respectively: from 11 millions to 30 millions for the *Compagnie du Midi* and from 30 million francs to 100 millions for the State Lines. And during the present year this expense will be increased at least 30 per cent.

In the case of metallurgical products the increase in cost is also great. The price of rails has gone from 180 francs per ton before the war to 560 francs per ton in 1916; that of screws from 310 francs in 1913 to 1,225 francs in 1917, and bolts have risen in the same proportion. Even ties have doubled in cost and today cost 10 francs instead of five. A locomotive that cost 35,000 francs in 1913 now costs 145,000; a freight car with brake costs 17,300 francs instead of 5,000 francs.

As in the case of coal we must expect a still greater increase in the prices of all these products in 1917,

an increase that we know must be very great indeed.

To these expenses for supplies must be added the increases in salaries and wages of employees beyond those received before the war; expenditures for pensions since the passage of the law establishing them; and also the losses resulting to the railroads from the weekly rest day, the stricter regulation of working conditions and other improvements in the service for the benefit of the personnel. Since the war these expenses have advanced greatly because of increased difficulties in operation.

DEFICITS SHOWN BY THE RAILROADS

All this is indicated by the figures which show the operating deficits. Figures, which were issued from the office of the Minister of Public Works on July 16, show these results in the following table:

DEFICITS RESULTING FROM THE OPERATION OF THE LARGE RAILROAD LINES IN 1916 AND THE PROBABLE DEFICITS IN THE YEAR 1917

Railroad	Deficits in millions of francs			
	In 1916	In the 1st 4 months of 1917	Evaluation for 1917	Increase for 1917
État	150.5	234	234	83
Nord	97	51	138	41
Est	49	27	73	24
P. L. M.	33	45	100	77
Paris-Orléans	24	..	46	22
Total	353.5	123	591	247

From 353½ millions in 1916 the deficits will increase, according to estimates made by taking the first four months of the year as a base, to 591 million francs in 1917, that is, 247 millions more than in 1916.

The only remedy, the economical remedy, to apply to this state of affairs was an increase in rates for transportation. When a manufacturer finds that his cost of production is increasing and finally exceeds the selling price of the articles he manufactures, he raises the selling price. Railroad companies are not to be classed under the ordinary heads; they have not the liberty of making their rates. The concessionary companies work under a monopoly law and it seems very difficult for them to make any changes. This law of monopoly provides that rates shall be fixed by agreement with the State lines, the State lines having the deciding voice in the matter.

In view of the financial results shown by the operation of our railroads, especially since the war, results that we have just summed up in the table, the government proposed a measure having for its object an increase in the rates of transportation on the large systems. It is none too soon. One could even think that the government might have instituted this reform, which was known to be necessary even during 1916. From May 22 of this last year the companies and the management of the State Lines have begged for an increase in rates. The deficits resulting from railway operation must be provided for in the budget as the government is responsible for deficits and it is certainly not the proper time to allow the expenses of the budget to increase when they can be provided for in a normal way.

GENERAL ADVANCES IN RATES IN EUROPE

We are the very last of all countries to come to this reform. It has been forced upon nearly all the European countries and even in the United States by reason of a general rise in prices. Many of them came to it before the war. Since then, the terrible conflict which has overturned economic life, not only in the belligerent countries but in the

neutral as well, has forced an increase in rates in every country. In Italy the rates increased twice in 1911 and another time, shortly before the war, in July, 1914, have been raised twice in 1916. Since 1912 Switzerland has been proceeding with increases in passenger tariffs; she continued it in 1914, 1916 and 1917, and at this time she is preparing to do the same with freight rates.

In Russia rates have been undergoing increases since 1902. In 1915 receipts from taxes on railroads produced 50 million rubles and in 1916 75 million rubles. A new increase of 15 per cent went into effect on January 1, 1917. At that time it was decided that the war tax should cease at the end of 1917. Now they are not only retaining this tax but the Minister of Finances recently proposed to the provisional government a tax on travelers and their baggage. It seems that the tax placed upon travelers before this one did not bring forth any serious complaints. It is now proposed to raise the present tax by 50 per cent, from which increase a supplementary yield of 75 million rubles is expected. The minister even asks for an increase in the tax on freight. In 1916 that tax yielded 143 million rubles and the proposed increase will bring, according to his estimate, 70 millions more.

In Holland certain passenger rates were increased in 1909 and freight rates in 1916. In Norway the same thing took place in 1913, 1915 and 1916. Sweden followed her neighbor during the last three years. In Germany the policy of exceptional tariffs was abolished and they are now about to raise the rates on the Prussian state railroads. According to the *Vossische Zeitung*, Herr von Breitenbach, minister of railroads, submitted to the Railway Council a project for increasing passenger rates 10 per cent. This famous system, which the advocates of government operation of railroads boast of as having made such great financial yields, has thus at last become a charge on the Prussian treasury. In Austria-Hungary freight rates were recently increased 30 per cent. England has also vastly increased her passenger rates. Finally, in the United States, freight rates began to increase in 1914 and continued upward in 1915; passenger rates were treated in the same way in 1916 and it is now announced that over there they are working out new increases. This series of examples might be continued by adding to the list Canada and Argentina in America and Denmark in Europe.

Let us recall briefly that in 1892 the government abolished the supplementary taxes placed on the payments for seats, on account of the necessities of the budget, as a result of the war of 1870-71 and did entirely away with the proportional taxes on fast freight shipments of packages, perishable foods and live stock. A clause in the agreements of 1883 had obliged the companies, in case the state should reduce the taxes on railroads, to put into effect on their side a proportional reduction in the cost of passenger transportation; but no agreement was entered into with respect to freight rates. Nevertheless, in 1892 the companies consented to notable reductions in freight rates. In fact, and especially in the case of fast freight, the transportation charge was reduced in France to an extremely low point, a point which could not be lowered much further. Altogether, railroad rates in France may be considered as very advantageous in comparison with those in the majority of countries, even in industrial countries where a denser movement of trains gives more traffic and higher receipts per mile. In France the railroads are operated by their companies in the most economical manner possible, as is shown by their operating ratios.

An increase would have taken place even if the war had not broken out and for this very great reason it is today impossible to avoid it. The rise in prices before the war, as we have said, would have brought on this reform for the good of the state, for two reasons: On account of the payments which it must make to guarantee the interest and on account of the needs of its own lines, whose working is so very expensive. So there could have been no opposition from

the government to the project which the government has just proposed. It is true that the syndicates of agents have been protesting against an increase in rates. They are afraid that the public will not see cause for such increases in the improvements in service and in the advantages which have been accorded to them for several years. It cannot be denied that expenses of this kind contribute heavily to the expenses of operation. Nevertheless, it must be admitted that in numerous cases increases in salaries have raised the cost of production and obliged the employer to raise the selling prices. To argue the contrary would be a sophism of the kind that one can read into the professions of political candidates who have recently been promising increases in the salaries of officeholders and reductions of taxes to the taxpayers, all at the same time.

ADVANCE OF 15 PER CENT PROPOSED

Let us now look at the government bill for raising rates and see what it consists of. The fundamental feature is very simple. An increase of 15 per cent would be made in transportation rates on the main lines and on the two Paris belt lines, under the following conditions: The increased rates can exceed the maximum rates provided for in the contracts and in the special agreements; they will go into effect on each line five days after the modification has been published by means of posters. Packages sent by post within the country are also subject to the increase. The additional charges on private branch lines can exceed the maximum charges fixed by the contracts with the public.

What will be the effect of this increase of 15 per cent? M. Henry Roy in his report on the subject presents a graphic demonstration. As for the actual price of commodities the increase of 15 per cent will hardly be felt. If 100 kilograms be taken as a unit of weight the increased charge for coal would amount to .095 francs, for steel bars .165 francs, for rails .168 francs, for superphosphates .107, for beef .58 (100 kilos net), for cereals .15 francs. Thus, on a hundred-weight of wheat at 50 francs the increase in the rate would be .003 francs, or 3 millimes the franc.

Other calculations show that the surcharge for coal per ton would be only .92 francs and for commodities coming from Provence to Paris by fast freight the increase would be from 1.5 to 2 centimes per kilogram. In short, if a general average be taken it is evident that if the average rate per kilometer ton in 1912 was 4.20 centimes, the addition of 15 per cent brings it to 4.83 centimes. Up to 1886 the charge was hardly ever below 6 centimes, and in 1897 the rate was at the point to which we are returning by the present reform.

But this is not all. In respect to the relations of the companies toward the state there are additional conditions concerning the increased rate in the agreement which is appended to the proposed law.

Naturally, this agreement repeats that arrangement of the first article of the project which has to do with the 15 per cent increase. The proceeds of the increase ought to permit the state lines to meet their financial obligations as determined by the law of July 13, 1911. The same will be true for the concessionary lines as regards, first, the matter of interest on bonds, dividends on stock, amortization, and second, the payment of their debt.

While hostilities are going on and in the year which follows their cessation a fund will be made of the total increase in the income of the companies which accept the agreement. This fund will be distributed according to the following plan: The operating ratio of each company in 1913, the latest normal year, will be taken as a base. The excess of expenses for each year above the ratio of 1913 will be ascertained for each company and the capital fund will be distributed proportionately to that excess for each one of them.

This system of mutuality will cease after the period of

time indicated above. Each line will then retain the proceeds of the increase which it collects and these proceeds will serve to cover the deficits of the line and to pay off, if they are sufficient, the debt to the state owed by each line through the guaranty of interest. This debt once entirely paid off, the line will keep only three-tenths of the excess produced by the increase and the other seven-tenths will be distributed among the others according to their receipts. The Northern Railway and the Belt lines will not participate in this distribution, which is already known in railway history under the name of "déversoir." These two lines will retain the proceeds of the increase; they will not turn them into the common fund.

PROVISION FOR FUTURE REDUCTIONS OF RATES

Provision has been made for lowering the increased rates. They will be lowered to 10 per cent on all the lines when, after three consecutive years, two lines other than the Belt lines shall have had a surplus to divert to other lines, and the actual increase will be reduced to 5 per cent if two lines have had surpluses to divert two other years in like manner. Finally, they will be abolished if the same condition presents itself in two other successive years.

There is a modification in the clauses concerning the sharing of benefits in the agreements of 1883. According to these agreements the revenues of a system remain with the company up to a certain figure if the debts, in which are included the payments on capital interest and liquidation, are paid off. If this figure is exceeded the state shares with the company. There is no such provision in the new agreement. As soon as there is a surplus, after all debts are paid, it is to be divided between the state and the company. We

must remember that the Northern Railway Company is not in this agreement.

What will be the effect of this increase of 15 per cent? From the point of view of the cost of commodities transported we saw above that it will not have a perceptible influence on their prices, being so small in comparison. Let us note here that in making a uniform increase of rates without changing the bases on which they were fixed, the operation of these rates on prices remains the same as before, no exceptional nor special tariffication being introduced.

As regards the effects of the increase on the receipts of the lines, it has been estimated that they would amount to 300 million francs. Now we have seen above that the deficits in receipts reached 591 millions in 1917, or 600 millions in round numbers. This increase of 15 per cent is then absolutely insufficient during the war. It has not even been suggested that it could cover the deficits of these exceptional years. But in our opinion it is not enough to attain the desired result after the war is over. Surely there will be, let us hope, a redoubling of economic activity, which will increase business and traffic on our railways. Nevertheless, we can not ignore the fact that operating expenses increase with the increase of traffic and operating expenses will continue to increase for many years after the cessation of hostilities. So one must be somewhat sceptical of the optimistic views of the results of this increase of rates. In the previous agreements too much has been expected from future developments, and here again in the present circumstances it seems that too much confidence is being felt. However, it will be necessary to take up the question of railroads on larger grounds after the war, for too many financial problems will then force us to do so.

Immediate Relief Recommended for the Railroads

Interstate Commerce Commission Sends Special Message to Congress. Commissioner McChord for Radical Action

DECLARING that absolute unification in the operation of the railroads during the war is indispensable to their fullest utilization for the national defense and welfare, and that the act to regulate commerce was not designed to meet such an abnormal situation as now exists, the Interstate Commerce Commission on Wednesday made public a special report to Congress recommending that unification of the American railway systems be effected, either by the carriers themselves, with the assistance of the government, or by their operation by the President as a unit during the war, with a guarantee of an adequate annual return. The railroads' proposal that their rates be increased the commission regards as an impracticable solution of the difficulty.

"If the unification is to be effected by the carriers," says the commission, "they should be enabled to effect it in a lawful way by the suspension, during the period of the war, of the operation of the anti-trust laws, except in respect of consolidations or mergers, and of the anti-pool provision of the commerce act. In addition, they should be provided from the government treasury with financial assistance in the form of loans, or advances for capital purposes, in such amounts, on such conditions and under such supervision of expenditure as may be determined by appropriate authority.

"If the other alternative be adopted," says the report, "and the president operates the railroads as a unit during the period of the war, there should be suitable guaranty to each carrier of an adequate annual return for use of the property, as well as of its upkeep and maintenance during operation; with provision for fair terms on which improvements and betterments, made by the president during the period of his operation, could be paid for by the carrier upon

return to it of the property after expiration of that period."

Commissioner McChord filed a separate report, disagreeing with the position of the majority that unification may be effected by the carriers themselves, and declaring that "the supreme arm of governmental authority is essential," either by exercise of the president's authority to operate the roads or by the creation of a single governmental administration control.

In the majority report the commission says: "The act to regulate commerce requires the commission to transmit to the Congress such recommendations as to additional legislation relating to regulation of commerce as the commission may deem necessary. Under this mandate the commission submits the following special report, supplementing its annual report, with reference to transportation conditions as affecting and affected by the war. . . . The railroads of the country came into being under the stimulus of competition; from the outset their operation and development have been responsive to a competition which has grown with the growth of population and industry. This competitive influence has been jealously guarded and fostered by state laws and constitutions, as well as by the federal law. The keenness of rivalry naturally drew to the front those who were quick to seize and resolute to retain every point of vantage for their respective roads. Terminals, if confined to the owner's exclusive use, were not only of strategic importance but profit-yielding assets. Out of competition grew rate wars, pooling, mergers, and consolidation into systems; as well as rebating and other preferential treatment of shippers, which the act to regulate commerce was primarily framed to prevent.

"In that act the congress, accepting the competitive prin-

ciple as salutary, has thrown about it prohibitions against compacts for the pooling of freights or divisions of earnings of different and competing railroads and, while the original act is but the nucleus of the act we now administer, that prohibition has remained unchanged. The original act and the successive amendments were alike framed in times of peace and for times of peace. They looked to protection of the shipper and the public against unjust or unfair treatment by the carrier, and not to protection of the nation and its commerce in time of war by utilization of all the forces and resources of its transportation systems to their fullest extent.

"Since the outbreak of the war in Europe, and especially since this country was drawn into that war, it has become increasingly clear that unification in the operation of our railroads during the period of conflict is indispensable to their fullest utilization for the national defense and welfare. They must be drawn, like the individual, from the pursuits of peace and mobilized to win the war. This unification can be effected in one of two ways, and we see but two. The first is operation as a unit by the carriers themselves. In the effort along this line initiated early in this year they are restricted by state and federal law; and the idea is the antithesis of that which heretofore has controlled their activities. Their past operations have been competitive, although since the Hepburn act, and especially since the Mann-Elkins act, the prescription by this commission of reasonable maximum rates and charges for rail carriers subject to the act and the exercise of its power to require abatement of unjust discrimination or undue prejudice have in great degree restricted that competition to the field of service; but whether or not perpetuation of the competitive influence is desirable under a system of governmental regulation, it is apparent that operation of our railroads as a unit involves the surrender, by each of them, of exclusive use of terminal facilities; surrender, at times, of profitable traffic to other carriers, and acceptance of less profitable traffic with resultant loss of revenue, wherever economy of movement or greater freedom from congestion would dictate that course if the various carriers were in fact one system. The alternative is operation as a unit by the president during the period of the war, as a war measure, under the war powers vested in him by the constitution and those powers which have been or may be conferred by the congress.

"As bearing upon the alternatives thus stated it will be recalled that since the beginning of the war, in 1914, the traffic offered to and moved by the railroads has increased enormously. Prior thereto there had been occasional periods of car shortage, usually restricted in territory; but it may be said that from 1907 down to 1916 the number of cars in the country exceeded the demand. This subject is treated in our annual report. The sudden, unforeseen and unprecedented demand for transportation occasioned by the war placed a strain upon the facilities and equipments of the railroads which they were not and are not prepared to meet. There was created a need for immediate and extensive additions to existing facilities and equipment. This need is coincident with demands upon capital, as well as upon labor, manufacturers and natural resources, such as we have never before known. Important additions and betterments will require new capital.

"The railroads propose essentially that we allow increases in freight rates of such magnitude that their increased earnings will attract investors, by dividends declared or by the prospect of dividends, in competition with securities issued by federal, state, and municipal governments, public utility corporations, and industries organized and operating primarily for gain as distinguished from public service. Some of the latter have yielded large profits since the outbreak of the war.

"An attempt to secure new capital would come at a time when the rising cost of living has made it difficult for those dependent for support upon their earnings to meet their cur-

rent expenses; after the absorption by American capital of two-thirds of the American securities owned abroad prior to August 1, 1914, the railroad securities returned to this country alone amounting to from \$1,700,000,000 to \$2,000,000,000; after financing in this country of loans to our present Allies, and after subscriptions for almost \$6,000,000,000 for Liberty Loan bonds. Even if the railroads have more money, the immediate construction of necessary facilities and equipment could not readily be effected.

"Labor is scarce and the cost of labor and supplies is mounting. Car and locomotive builders are largely engaged in producing equipment needed abroad, both by our Allies and by our own forces. The steel and other materials needed for such construction, as well as the labor, are also needed in other phases of the conflict. Under such conditions and pending the acquisition of such additional facilities and equipment it is indispensable that those now in existence should be used to their fullest capacity; primarily for the uses which are most vitally needed for the country's defense and welfare, but without unnecessary hindrance to the industry and commerce of our people, upon which their ability to contribute toward the success of the war so largely depends.

"The act to regulate commerce was not enacted to meet such a situation. The carriers have the right to demand at our hands, and it is our duty to approve, just and reasonable rates sufficient to yield fair returns upon the value of the property devoted to public use after necessary expenditures for wages, fuel and supplies, reasonable expenditures for maintenance, renewals and betterments properly chargeable to operating expenses, and appropriate depreciation. Measured in dollars, the gross revenues of the carriers during the past and current fiscal years exceed any in their history, but what the dollar will buy in labor, material, and supplies is substantially less.

"We are sensible of the vital and imperative need of the hour that our railroads shall not be permitted to become less efficient or less sufficient. We realize the gravity of a serious breakdown of our transportation facilities. It is unthinkable that this breakdown would be permitted if it could be prevented. Increased charges for carriage, if found necessary to take care of unavoidable increases in operating expenses, would not at this time bring new capital on reasonable terms in important sums. In our opinion the situation does not permit of temporizing. All energies must be devoted to bringing the war to a successful conclusion, and to that end it is necessary that our transportation systems be placed and kept on the plane of highest efficiency. This is only assured through unification of their operation during the period of the war.

"The regulation of security issues of common carriers engaged in interstate commerce should be vested in some appropriate body, as has been recommended in our annual reports. The rights of shippers for reasonable rates and non-discriminatory service under the present jurisdiction of the commission need not be seriously interfered with by such unified control. Some elastic provisions for establishment of through routes would probably be needed."

Commissioner McChord, in his separate report, says that the railroads' war board is the fifth committee which the railroads have had in Washington to deal with the transportation situation since November, 1916. He does not wish to be understood as saying that the carriers' committee has not accomplished results, but he is led to the belief that no voluntary committee can accomplish what the situation demands. The unification needed, he says, is the unification of the present diversified governmental control. If the president does not elect to take over the roads, the authority now vested in the several governmental agencies should be centralized by act of congress.

Commissioner McChord's minority report will be published in full next week.

General News Department

The members and employees of the Interstate Commerce Commission have subscribed funds to present two ambulances to the Red Cross.

The telegraphers of the Philadelphia & Reading have had their pay raised about 6 per cent. It is said that 1,000 employees share in this increase.

W. G. Brantley, counsel for the Southern group, Presidents' Conference Committee on Valuation, has filed a brief and argument of 737 pages in support of the protest of the Atlanta, Birmingham & Atlantic against the tentative valuation of its property made by the Bureau of Valuation of the Interstate Commerce Commission.

The Great Northern has purchased from the Western Union Telegraph Company all telegraph lines along its right-of-way which it had not already owned, amounting to about 3,385 miles of pole lines. The Western Union has made a new contract with the railroad under which it will continue to operate over the Great Northern lines.

The Interstate Commerce Commission has announced a hearing at Washington on January 4 on the application of certain companies for a further extension of the period within which railroads shall be required to comply with the provision of section 3 of the safety appliance act of April 14, 1910, with respect to the equipment of freight cars.

Gold medals bearing the Southern Pacific safety emblem and suitably engraved were awarded recently to the six employees of each division and in each general shop of the Pacific system who, during the year ended June 30, 1917, did the most in furtherance of safety work. C. H. Rippon, piecework inspector of the Sacramento general shops, carried off the first prize for the second successive time.

So far, 193 employees of the Nashville, Chattanooga & St. Louis have enlisted in the army or navy, while 1,449 others are subject to draft. Of the enlisted men, there is one each from the executive, the legal and the purchasing department; five from the traffic, 12 from the accounting and 170 from the operating department; two from the agricultural department and one from the department of safety.

The Southern Pacific Company has recently made extensive additions to its telegraph lines, including a copper wire circuit from Houston, Tex., to El Paso; but in connection with the announcement of this improvement, the company's monthly circular to station agents reiterates the injunction that telegrams should be made as short as possible, and that the wires should not be used for communications which can be sent by letter.

The Erie Railroad Magazine, with its December number, issues a 22-page supplement containing the names of all of the 974 employees of the company now in the army or the navy, or other war service. With each name is given the man's residence, his railroad occupation and whether he is serving in the army or the navy. The cover of the supplement is in three colors, red, white and blue, and bears a representation of a service flag containing 974 stars.

The Commission on Car Service, with the approval of the Railroads' War Board, has directed that the rate of 60 cents a day on interchanged freight cars, which would expire by limitation on January 1, be extended to February 28. The commission has also ordered the cancellation of car service rule 4, which provides that an empty car, at a junction point with its home road, must be delivered to that road, at that point, either loaded or empty.

Action was taken by the United States Fuel Administration on December 3 to provide an increased supply of coal cars and an increased supply of bituminous coal for the Southern Railway and its operated lines. The order provides that coal operators under contract to the Southern and its operated companies shall

fill the fuel contract requirements, in so far as possible, in equal daily quantities. Orders of this character in favor of the Lehigh Valley, the Chesapeake & Ohio and the New York, New Haven & Hartford were noted last week, page 1007.

Newlands Hearing Postponed

The hearing before the Newlands Joint Committee on Interstate Commerce, announced to be held at Washington on December 4, has been postponed at least until December 10.

Southern Pacific Starts Fire Protection Campaign

The Southern Pacific is launching a vigorous campaign of fire protection throughout its system, and the 45,000 employees are being asked to spread the gospel among shippers, warehousemen and others. General Manager W. R. Scott in a circular says: "The responsibility of *feeding* not only ourselves, but our allies, rests largely upon this nation. As all the materials, supplies and food-stuffs necessary for our domestic use, the use of our armies and our navy must be transported over our railways, the necessity for fire protection becomes a patriotic duty. No amount of insurance can replace food and materials that are destroyed."

Industrial Unrest in Great Britain

The Bureau of Labor Statistics, Washington, has issued a bulletin, No. 237, giving a reprint of the report of the British Commission of Inquiry Into Industrial Unrest. The report is presented in eight sections, showing the results of inquiries in eight separate districts of Great Britain. The reports for all the districts emphasize as the leading cause of industrial unrest the fact that the cost of living has increased disproportionately to the advance in wages and that food distribution is unequal. Another cause regarded as particularly serious is the restriction of personal freedom under the Munitions of War Acts, by which workmen have been tied up to particular factories and have been unable to obtain wages in proportion to their skill; in many cases the skilled man's wages were less than those of the unskilled. Dilution of labor and lack of confidence in the Government, growing out of the surrender of trade-union customs and the fear that promises regarding the restoration of pre-war conditions will not be kept, are mentioned. All the reports refer to the lack of co-ordination between Government departments in dealing with labor. Mention is also made of lack of proper organization among the unions, inconsiderate treatment of women as regards wages, delay in granting pensions to soldiers, and inadequacy of compensation under the Workmen's Compensation Act.

Optimism at Ottawa

The Railroads' War Board of Canada, otherwise known as the Canadian Railway Association, is quoted as declaring that the Canadian railways have made a reduction of over 10,000,000 passenger train miles (per annum), which is a greater proportionate reduction than has been made in the United States.

The association further states that "Canada is today getting the best and cheapest railway service in the western world; in spite of car shortage created by the abnormal balance of south-bound over north-bound traffic, in spite of war requirements, higher labor charges, the necessity of importing coal for engines and the lower efficiency of the coal due to lower winter temperatures in Canada, there is a greater degree of efficiency reached in the operation of the Canadian railways than anywhere else in the New World.

"Car shortage is being reduced day by day. The percentage of freight cars out of service for repairs in Canada is lower than the percentage on United States roads and the average cost to the Canadian traveler or shipper is less.

"For the year ending June 13, 1916, the charge for moving an average ton of freight one mile in the United States was 7.16 mills. In Canada it was 6.53 mills. In the United States the

average passenger mile cost the passenger 2.06 cents and in Canada it cost him 1.954 cents. At the same time the Canadian railroads paid more for labor than any of the other roads on this continent."

Railway Regiments' Tobacco Fund

Fifteen more supply companies have made contributions to the tobacco fund for the American railway engineers who have been making history for themselves this last week in France. The following list brings the total to date on Tuesday noon:

American Arch Co., New York (to cover 15 months).....	\$150.00
Chambers Valve Co., New York.....	\$5 a month
Elliott Frog & Switch Co., East St. Louis, Ill.....	10 a month
Fairbanks, Morse & Co., Chicago.....	10 a month
Joliet Railway Supply Co., Chicago.....	10 a month
Kerite Insulated Wire & Cable Co., New York.....	10 a month
Keystone Grinder & Mfg. Co., Pittsburgh, Pa.....	10 a month
Laas & Sponenburg Co., Chicago.....	10 a month
Laconia Car Co., Laconia, N. H.....	10 a month
C. F. Massey Co., Chicago.....	10 a month
Ottensmeyer & Co., Chicago.....	10 a month
Republic Rubber Co., New York.....	10 a month
Steel Car Forge Co., Pittsburgh, Pa.....	10 a month
Union Draft Gear Co., Chicago (to cover 6 months).....	\$60.00
Westinghouse Air Brake Co., Pittsburgh, Pa.....	10 a month

Public Ownership Conference at Chicago

Resolutions demanding the immediate public ownership and control by the federal government of the railroads, the coal mining industry and the telegraph and telephone systems of the nation were passed at the conclusion of the National Public Ownership Conference held at Hotel LaSalle, Chicago, last week. The members of the committee on resolutions included David J. Lewis of the federal tariff commission, J. W. Brown of the United Mine Workers of America, Frank C. Perkins of Buffalo, John C. Kennedy, socialist alderman, Chicago, and Homer Talbot, secretary of the League of Kansas Municipalities. Prof. Charles Zueblin was the chief speaker in favor of government ownership of railways, although he said that existing conditions make it undesirable even to discuss the question of government ownership at this time. He spoke of the necessity of organization and unification to win the war for democracy, at the same time criticizing all concerned for not having made the railroads public property long since.

Railroad Telegraph and Telephone Men Organize for Service in France

Two battalions are now being organized at the Consumers' building, Chicago, for service in the telephone and telegraph departments of the railroads now being operated by American railway regiments in France. The recruiting is being carried on under the supervision of Colonel Leonard B. Wildman, of the signal corps of the regular army. Each battalion will have the following organization: (1) One major (superintendent of telegraph); first lieutenant, adjutant (assistant superintendent and chairman of discipline board); first sergeant, acting sergeant major (chief clerk of office); three privates, attached to headquarters as orderlies and drivers (junior clerks and messengers). (2) Supply detachment—one first lieutenant, supply officer (electrical engineer in charge of supplies); one sergeant, battalion supply sergeant (supplies accountant); four privates, first class, clerks and drivers. (3) Two telegraph companies, each of which will be organized as follows: One captain (division operator); two first lieutenants (assistant division operators); two master signal electricians (one wire chief and one supervisor of signals); seven sergeants, first class (four train dispatchers, one foreman telegraph and telephone linemen and maintainers, one foreman of signals, one instructor and examiner of train rules); 11 sergeants (seven in charge of more important towers and offices; two assistant foremen telegraph and telephone linemen and maintainers; two assistant foremen of signals); 17 corporals (nine towermen and operators, three telegraph and telephone maintainers, five signal maintainers); two cooks; one horseshoer (mechanic); 48 privates, first class (33 telegraphers, six telegraph linemen and maintainers, eight signal maintainers, one barber); 12 privates (five telegraphers, four telegraph linemen and maintainers, three signal maintainers).

The two battalions now being organized in Chicago are headed by Major Frank W. Sherwood, for 19 years in military service, and at one time manager and wire chief on the Western Union

Telegraph Company and an operator on the Chicago & North Western, and by Major P. Kirk Pierce, of Grand Rapids, Mich., superintendent of telegraph of the Pere Marquette. The roster of the officers of the 415th railway telegraph battalion, which is under Major Sherwood's command, is as follows: First lieutenant, E. M. Harding, adjutant, banker at Chicago and formerly agent of the Texas Company at St. Louis, Mo.; first lieutenant, A. E. Manheimer, supply officer; captain, William H. Mann, for the past nine years with Ware & Leland, grain and stock brokers, Chicago and New York, and with previous telegraph experience with the Western Union, the Louisville & Nashville and other roads; first lieutenant, Charles H. Martin, electrician and general wire chief, Chicago & North Western; first lieutenant, Charles S. Pack, train dispatcher, Illinois Central; captain, M. A. Loosley, electrical engineer, with 19 years' army experience; first lieutenant, G. Z. Flanders, trainmaster on the Wisconsin division on the Chicago & North Western; first lieutenant, Robert M. Phinney, assistant engineer, signal department, Chicago & North Western.

The complement of officers of the 416th railway telegraph battalion, under the command of Major Pierce, has not yet been filled. Two similar battalions are now being organized in New York.

Trainmen's Demand for Higher Wages

The brotherhoods of conductors and of brakemen on December 1 presented their request for a general increase of wages to all of the railroads throughout the country in accordance with the previous announcement in the newspapers. The proposed rates for passenger trainmen are as follows:

On runs of 155 miles or less per day: Conductors, not less than 3.5 cents a mile, \$5.43 a day, or \$162.90 a month. Ticket collectors, not less than 3 cents a mile, \$4.65 a day, or \$139.50 a month. Baggage electricians, not less than 2.9 cents a mile, \$4.50 a day, or \$135 a month. Baggage men, not less than 2.5 cents a mile, \$3.88 a day, or \$116.40 a month. Flagmen and brakemen, not less than 2.33 cents a mile, \$3.61 a day, or \$108.30 a month.

The schedule contains the usual provisions for short runs, overtime, etc., overtime in all passenger service to be not less per hour than one-eighth of the daily rate.

The proposed rates for freight service are as follows:

"Through and irregular freight, snow plough and circus trains: Conductors, .053 a mile; flagmen and brakemen, .0381 a mile. For yard crews, the rates contain the usual differences for night work, and are: Conductors or foremen, \$5.30 a day and \$5.50 a night. Brakemen or helpers, \$5 a day and \$5.20 a night. Eight hours or less to constitute a day's work; overtime pro rata; actual minutes to be counted."

Electric Roads Organize to Handle Freight

At the suggestion of Daniel Willard of the Council of National Defense urging the complete co-operation of all transportation agencies during the continuance of the war, the American Electric Railway War Board, recently organized, is planning to assist the steam railroads in the movement of freight. It is believed that the existing facilities of the 40,000 miles of electric roads in the country can be used advantageously as auxiliaries to the steam lines.

A sub-committee on traffic and transportation has been appointed, with a member representing each state, to investigate the possibilities of the electric lines as freight carriers. B. I. Budd, president of the Chicago, North Shore & Milwaukee and the Chicago Elevated Railways and chairman of this committee, states that the electric roads will be of service (1) in moving light merchandise and foodstuffs in and out of large cities for distances of from 50 to 100 miles; (2) in moving freight around congested terminals either in combination with steam roads or with other electric lines; (3) by relieving the steam lines of more short haul passenger traffic, thereby releasing engines and cars for the movement of freight on the steam lines. Electric roads in Ohio, Indiana, Illinois, Wisconsin and Michigan have already federated into a Central Electric Freight Association which is assembling statistics with reference to connections, clearances, rolling stock, rates and routes, to facilitate the movement of freight from one line to another. The American Electric Railways' War Board will have a joint meeting with the Railroads' War Board in the near future to determine how the two classes of carriers shall co-operate in handling freight traffic.

At the present time the Chicago, North Shore & Milwaukee is interchanging freight daily with the Elgin, Joliet & Eastern at Rondout, Ill. The Chicago, Lake Shore & South Bend is handling through freight business between Chicago and South Bend, Ind., daily, a distance of about 85 miles. Arrangements have recently been perfected for the movement of freight from Chicago to Rockford, Ill., about 100 miles, over the Aurora, Elgin & Chicago, the Elgin & Belvidere and the Rockford & Interurban. Illustrative of the service which the electric lines are able to give, freight loaded at Chicago in the evening arrives at Indianapolis the next morning at 9 o'clock. Through freight and passenger services are now in operation between Detroit, Mich., and Columbus, Ohio, about 235 miles; between Detroit and Dayton, Ohio, about 220 miles; between Cleveland, Ohio, and Lima, about 150 miles; and between Toledo, Ohio, and Cincinnati, about 250 miles. The longest through freight and passenger line in this territory is between Terre Haute, Ind., and Zanesville, Ohio, about 325 miles, which the passenger trains cover in 11 hours.

The rates for freight on the electric roads are generally higher than those on the steam roads because the electric lines are not built or equipped to handle freight as economically as are the steam roads.

Shop Crafts Federate to Press Demands

The various shop crafts on the railroads north, south and west of Chicago, including the Chicago & Eastern Illinois, the Illinois Central, the Chicago & Alton and the Wabash, have federated into one body and have distributed ballots among the members to determine what action shall be taken on the following proposed demands: (1) \$5 for a day of 8 hours for machinists, blacksmiths, boilermakers, sheet metal workers and electricians; (2) \$4.50 per day of 8 hours for car men, including pattern makers, cabinet makers, coach and locomotive carpenters, upholsterers, painters, varnishers, letterers and mill machine operators in planing mills; (3) \$3.50 per day of 8 hours for the first 6 months and \$4 thereafter for all other car men; (4) \$3.50 per day of 8 hours for helpers in all crafts; (5) for regular apprentices, 20 cents an hour for the first six months and an increase of 2½ cents per hour for each six months thereafter for the first three years, a 5-cent an hour increase for the first 6 months of the fourth year and 7½ cents for the last six months of the fourth year; (6) helper apprentices to start at the minimum wage for helpers for the first 6 months and to receive an increase of 2½ cents per hour for each six months until the time of apprenticeship has been served; (7) foremen and men employed by the month to receive a minimum increase of \$20 a month.

No member of a shop craft is to receive an increase of less than 10 cents an hour except apprentices. The ballots are returnable by December 10 and a general meeting of the federation will be held on January 4, 1918.

N. Y. C. Freight Tracks in New York City

The New York State Public Service Commission, first district, has begun the preparation of plans for the reconstruction of the line of the New York Central on the west side of New York City from Spuyten Duyvil southward to Canal street, about 12 miles, with a view to ordering the elevation or depression of the tracks at all points where necessary to secure the safety of street traffic.

Certain powers of the New York City government in connection with the regulation of these tracks ceased on December 1 by virtue of an act passed by the last legislature; and the elaborate plan for carrying out the proposed changes, involving many millions of dollars, which was agreed upon between the city government and the railroad company, after several years' costly studies and negotiations, is now, by this action of the legislature, virtually rejected.

In this rejection the legislature carries out the wishes of certain interests in the city, opposed to the city government, whose aim it is to deprive the railroad company of certain rights in its roadbed which it has possessed for seventy years; and to so limit any grants which the city may make, in connection with the proposed changes, that no right of way on or over public property shall be held by the railroad company except on condition that the rate of compensation shall be subject to readjustment every 25 years.

The railroad company, which, at great expense, had made prop-

arations for the proposed changes and which, by the agreement that was made with the city, was to increase its investments in property in the city by some fifty millions of dollars, is expected to oppose, in the courts, the attempt of the state authorities to modify what has been understood to be a perpetual franchise.

Interline Way Billing

The president of the Association of American Railway Accounting Officers has issued a circular dated December 4 in part as follows:

This association, through its appropriate committees and through the individual efforts of some of its members, has for years past strenuously advocated the general adoption of through interline waybilling.

That the action taken by you at the last meeting of the association has borne fruit is evidenced in bulletin No. 42 issued by that executive committee [the War Board] in which an appeal to increase the efficiency of the railroads is made. From it I quote the following:

"Start a systematic, vigorous campaign to provide universal interline waybilling, a study of the operation of which on one large system convinces us will result not only in a large money saving, but in saving 12 to 18 hours' time on cars and the continuous services of one switch engine, handling setbacks account 'no billing,' at each representative terminal."

The part the accounting officer can and should take in this campaign is of prime importance and I am quite sure if we will carefully prepare, based on data obtainable from division superintendents and other officers as well as that available in our own offices, estimates of the possible advantages to be gained from the proposed innovation, the results would go a long way in making universal interline waybilling a possibility.

Let me suggest that we, each of us, endeavor to ascertain estimates of what results would follow if all intermediate inter-road rebilling were abolished. Such estimates should show:

- (1) Clerical costs saved at agencies.
- (2) Approximate saving in car days, because of ability to move cars in continuous movements.
- (3) Approximate saving in switching costs by reason of discontinuance of double movement of cars awaiting revenue way-billing.
- (4) Overcharges are generally reclaimed. If they occur can we not assume that there are an equal amount of undetermined undercharges and would not universal interline waybilling avoid many such? If yes,
 - (a) What saving would be effected by eliminated undetermined undercharges?
 - (b) Could you reduce freight agency cost? If so, how much?
 - (c) What effect would such waybilling have on loss and damage claims? Are not losses occasioned by errors made in rebilling?

The foregoing are some of the things we can look into; there may be others.

After making your estimates, advise your chief executive and your traffic officer of them.

Railroads Not Only Industry Pressed by War Demands

In an address before the Peoria (Ill.) Transportation Club on December 5, R. H. Ashton, president of the Chicago & North Western and chairman of the Central Department Committee of the Railroads' War Board, reminded his hearers that the freight situation is just as unsatisfactory to the railroads as to the shippers. During 60 per cent of the time between the years 1907 and 1916 there were surpluses of freight cars ranging as high as 400,000 cars, and as late as August, 1915, the surplus was 250,000 cars. When our own country became involved in war the railroad managers immediately realized that there would be thrust upon them a gigantic task and they took heroic steps to meet the issue by forming the Railroads' War Board and co-ordinating their efforts, with what wonderful results is well known. Continuing, he said:

"Some people think the results accomplished by the railroads under this one directing body an argument for government ownership, but the vast transportation interests of this country could have done no more nor accomplished any more efficient results if they were owned by the government, or by anybody else. Furthermore, our government at this time has plenty of

vast problems to solve without adding the transportation system to its burden.

"The railroads are not the only industry in the country that cannot meet the demands on it. The farmer cannot produce all the grain and livestock needed to feed our people and our allies. The mines are not producing all the coal required. The steel industry's output is not equal to the demand from the government and private concerns; the railroads are obliged to get along without rails, cars and locomotives which they greatly need. . . ."

A Railroad President's Experiences

The New York American prints a column interview with Charles S. Mellen, former president of the New York, New Haven & Hartford, in which Mr. Mellen gives his views on government ownership of railroads and other things. He says that the managers of roads, the employees, the public and the stockholders are all dissatisfied. All have just grievances, and there is no possible solution except government ownership. Continuing, he said:

"Railroad employees are entitled to more pay. Advances in wages have not kept pace with the increases in the cost of necessities. It is going to take something like the strong arm of the Government to deal with the army of railroad employees. Under Government ownership there will be no more strikes on the railroads than there are in the army and navy, or post office. In fairness to the railroads, let it be said that, while they are restricted as to the amount they can charge for service, there is apparently no roof to the prices they must pay.

"The great government which trains men at West Point and Annapolis for the Army and the Navy can train men to run the railroads. Five years ago I thought the public altogether too impatient. Today I wonder at its patience!

"Why is it that when a man becomes rich in the grocery or banking business nothing else will do but he must become a director in a railroad? . . . I believe the government will make a success of railroading. The Naval Academy at Annapolis and the Military Academy at West Point will continue to turn out men trained in the handling of men. A good place to keep these men busy in times of peace will be the government-owned railroads. I understand very well that one of the stock objections to government ownership is that there will be too much graft. There will be no more in the government service than there is today. Is that a strong statement? Get a list of the railroad directors of America. See how many of them have their friends, and their sons, and their friends' sons, or other relatives, in good positions on the railroads. Many of them have been railroad directors for no other purpose!

"Moreover, the banker who sits on the board of directors of a railroad, who participates in any syndicate controlling the new securities of that road, should be compelled to buy the securities on the terms offered to all other bankers. The terms should never be secret. As it is today, one set of bankers refuses to interfere with the graft of another set of bankers. It is all secret and everything is done under a gentlemen's agreement. I have seen the terms of a certain proposed loan discussed by the board of directors of a railroad, even before the loan itself was authorized. There must be radical revision in our requirements of railroad directors. The director must not be permitted to dodge his responsibility by the plea, when things go wrong, that he depended upon this man or that man; that he employed an expert and trusted him implicitly.

"Two-thirds of the plans and schemes of railroad boards never originate with railroad presidents at all. They originate in the board, and if they are apparently proposed by the president it is because some director with power has asked him to do so.

"Will big railroad men be glad to work for Uncle Sam? Why not? It will be infinitely better than working for a coterie of bankers. Under government ownership there will not be so much politics in the conduct of our railroads as there is today. There will be no more nepotism. There will not be any more graft. I do not apprehend any great difficulty, although it is likely that many railroad presidents will have their salaries reduced. The people will hardly stand for paying their railroad presidents a salary larger than that of the President of the United States. But lower salaries for railroad presidents will not be an unmitigated evil.

"Those who oppose government ownership say the managers of the roads would be susceptible to influence by members of

Congress, or members of the Cabinet. That there will be some influence of this sort is likely true, but it will not be a flea bite to the influence exerted today by railroad directors—directors who do not direct but who, because of their great wealth and the great wealth they represent, have the power to get things through.

"Under government ownership I believe the railroads of the United States will be run with more of an eye to efficiency and with a smaller degree of subservency to one thousand and one masters than is the case today. . . ."

Western Railway Club

The Western Railway Club will hold a meeting on December 17 at the Hotel Sherman, Chicago. W. J. Bohan, mechanical engineer on the Northern Pacific, will present a paper on "The Box Car," and A. M. Schoyer, resident vice-president of the Pennsylvania Lines at Chicago, will speak informally.

American Society of Civil Engineers

The sixty-fifth annual meeting of the American Society of Civil Engineers will be held at the new headquarters of the society, 33 West 39th street, New York, on January 16-17, 1918. Annual reports will be read, officers will be elected for the ensuing year and other business will be transacted.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings and places of meetings:

- AIR BRAKE ASSOCIATION.—F. M. Nellis, Room 3014, 165 Broadway, New York City.
- AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—F. A. Pontious, 455 Grand Central Station, Chicago.
- AMERICAN ASSOCIATION OF DRIVING CAR SUPERINTENDENTS.—H. C. Boardman, D. L. & W. Hoboken, N. J.
- AMERICAN ASSOCIATION OF FREIGHT AGENTS.—R. O. Wells, Illinois Central, Chicago, Ill.
- AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York.
- AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—E. H. Hartman, Room 101, Union Station, St. Louis, Mo.
- AMERICAN ELECTRIC RAILWAY ASSOCIATION.—E. B. Burritt, 8 W. 40th St., New York.
- AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOCIATION.—Fred C. J. Dell, 165 Broadway, New York.
- AMERICAN RAILROAD MASTER TINNERS', COFFERSMITHS' AND PIPEFITTERS' ASSOCIATION.—W. E. Jones, C. & N. W., 3814 Fulton St., Chicago. Convention for 1917 postponed.
- AMERICAN RAILWAY ASSOCIATION.—J. E. Fairbanks, general secretary, 75 Church St., New York.
- AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Next annual meeting, October, 1918, New York.
- AMERICAN RAILWAY ENGINEERING ASSOCIATION.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next annual meeting, March 20-22, 1918, Chicago, Ill.
- AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—J. W. Taylor, 1112 Krider Bldg., Chicago.
- AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—Owen D. Kinsey, Illinois Central, Chicago.
- AMERICAN SOCIETY FOR TESTING MATERIALS.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st Monday and Wednesday in month, except July and August, 220 W. 57th St., New York.
- AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York.
- AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Ancier, Supt. Timber Preservation, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 22-24, 1918, Hotel Sherman, Chicago.
- ASSOCIATION OF AMERICAN RAILWAY ACCOUNTING OFFICERS.—E. R. Woodson, Room 1116-B, Woodward Bldg., Washington, D. C. Next annual meeting, St. Louis, May, 1918.
- ASSOCIATION OF MANUFACTURERS OF CHILLED CAR WHEELS.—George W. Lyndon, 1214 McCormick Bldg., Chicago. Semi-annual meeting with Master Car Builders' Association.
- ASSOCIATION OF RAILROAD CLAIM AGENTS.—Willis H. Failing, Terminal Station, Central of New Jersey, Jersey City, N. J.
- ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreucetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago.
- ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—W. L. Connelly, Superintendent of Telegraph, Indiana Harbor Belt, Gibson, Ind.
- ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—G. P. Conard, 75 Church St., New York.
- BRIDGE AND BUILDING SOCIETY.—Association.—C. E. Ward, U. S. Wind & Pump Company, Batavia, Ill. Meetings with American Railway Bridge and Building Association.
- CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert, Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.
- CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, 1115 W. 31st St., Chicago.
- CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual dinner, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.
- CHIEF INTERCHANGER CAR INSPECTORS' AND CAR FOREMEN'S ASSOCIATION.—W. R. McMunn, New York Central, Albany, N. Y.
- CINCINNATI RAILWAY CLUB.—H. Boutet, Chief Interchange Inspector, Cincinnati, 101 Carew Bldg., Cincinnati. Regular meetings, 2d Tuesday, February, May, September and November, Hotel Sinton, Cincinnati.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 568 Union Arcade Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh, Pa.

FREIGHT CLAIM ASSOCIATION.—Warren P. Taylor, Traffic Manager, R. F. & P. Richmond Va.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, C. H. & D. Lima, Ohio.

INTERNATIONAL RAILWAY FUEL ASSOCIATION.—J. G. Crawford, C. B. & O. R. R., 702 E. 51st St., Chicago. Next convention, May, 1918, Chicago.

INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 1126 W. Broadway, Winona, Minn.

INVESTMENT BANKERS' ASSOCIATION OF AMERICA.—Frederick R. Fenton, 11 W. Montrose St., Chicago.

MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—F. W. Hager, Fort Worth & Denver City, Fort Worth, Tex. Next convention, October 15-17, 1918, Chicago.

MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 95 Liberty St., New York.

MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—A. P. Dane, R. & M., Reading, Mass.

MASTER CAR BUILDERS' ASSOCIATION.—J. W. Taylor, 1112 Karpen Bldg., Chicago.

PEORIA RAILROAD OFFICERS.—F. C. Stewart, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.

RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 30 Church St., New York.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Pittsburgh Commercial Club Rooms, Colonial Annex Hotel, Pittsburgh.

RAILWAY DEVELOPERS' ASSOCIATION.—D. C. Welty, Commissioner of Agriculture, St. L., Iron Mt. & So., 1047 Railway Exchange Bldg., St. Louis. Next annual convention, May, 1918, Houston, Tex.

RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, 1063 Monahan Block, Chicago. Meetings with Association of Railway Electrical Engineers.

RAILWAY FIRE PROTECTION ASSOCIATION.—C. B. Edwards, Office of the President's Assistant, Seaboard Air Line, Norfolk, Va.

RAILWAY REAL ESTATE ASSOCIATION.—R. H. Morrison, Assistant Engineer, C. & O., Richmond, Va.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Myers Bldg., Bethlehem, Pa.

RAILWAY STOREKEEPERS' ASSOCIATION.—J. P. Murphy, N. Y. C. R. R., Box C, Collinwood, Ohio.

RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.—J. D. Conway, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with Master Car Builders' and Master Mechanic's Association.

RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph Superintendents.

RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Club has been suspended until after the war.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—P. J. McAndrews, C. & N. W., Sterling, Ill. Next annual convention, September 17-19, 1918, Auditorium Hotel, Chicago.

ST. LOUIS RAILWAY CLUB.—B. W. Fruenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

SALT LAKE TRANSPORTATION CLUB.—R. E. Rowland, David Keith Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

SOCIETY OF RAILWAY FINANCIAL OFFICERS.—L. W. Cox, N. Y. & W., Philadelphia, Pa.

SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, A. & W. P. R. R., Atlanta, Ga.

SOUTHERN & SEABOARD RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 a. m., Piedmont Hotel, Atlanta.

TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.

TRAFFIC CLUB OF CHICAGO.—C. B. Signer, La Salle Hotel, Chicago.

TRAIN DESPATCHERS' ASSOCIATION OF AMERICA.—J. F. Mackie, 7122 Stewart Ave., Chicago. Next annual convention, June 18, 1918, Grand Rapids, Mich.

TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Gen'l Ag't, Erie R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings bi-monthly, Pittsburgh.

TRAVELLING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. R. R., Cleveland, Ohio.

UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, 1111 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.

WESTERN ASSOCIATION OF SHORT LINE RAILROADS.—Clarence M. Oddie, Mills Bldg., San Francisco.

WESTERN CANADA RAILWAY CLUB.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Monday in month, except June, July and August, Hotel Sherman, Chicago.

WESTERN SOCIETY OF ENGINEERS.—Edgar S. Nethercut, Secretary, 1735 Monadnock Block, Chicago, Ill. Regular meeting, first Monday in month, except January, July and August. Extra meetings generally on other Monday evenings except in July and August.

Traffic News

A total of 1,845,689 troops had been moved by the railroads up to December 2, according to reports received by the Railroads' War Board.

R. S. Lovett, director of priority in transportation, has denied a report that he is contemplating an order shutting off a supply of cars from the automobile industry.

In its first year of operation the Panama Limited, the Illinois Central's 23-hour train between Chicago and New Orleans, was 99 per cent on time. Out of 365 trips ending on November 14, 1917, the train was late only four times. Continuously, for a period of 3½ months it was on time.

Shortage of cars is said to have produced serious congestion in the rice belt of Texas, Louisiana and Arkansas, especially in the latter state. Shippers in Arkansas are said to have still in their warehouses 400 carloads of rice which has been sold, but which the railroads cannot take away.

The Great Lakes Transit Corporation and the Northwestern Steamship Company, acting on the request of the Food Administration, have agreed to operate their vessels until December 12 and longer if the weather conditions permit. A new vessel, just completed at a dock on the lakes, is to carry a cargo of flour direct from Duluth, by way of the St. Lawrence River, to New York City.

In Philadelphia, last week, at a conference of railroad men and merchants, called because of serious complaints of shortage of coal, it was said that that city would need 23,000 tons of coal a day for the next 40 days. The representative of the Pennsylvania Railroad said that 2,245 carloads of freight, some domestic and some for export, consigned to the government, had been unloaded on the ground in and near Philadelphia because of lack of vessels for water transportation.

The governor of Ohio, appealing last week to the Fuel Administration at Washington for transportation relief, reported that three-fourths of the state institutions in Ohio were out of coal; that the manufacturer of airplanes in Dayton had 100 cars of coal stalled on side tracks between West Virginia mines and Dayton; that carloads of coal were detained on nearly every railroad side track in the state, and that at Hobson, Meigs county, such cars had been standing since October 1. The governor further gave specific locations of about six thousand cars of coal said to be stalled on various railroads.

Gradual improvement in the transportation difficulties involving shipments of coal by rail to Detroit and other points in the northern middle west is reported by the United States Fuel Administration. This movement was halted by embargoes placed on western shipments at Cincinnati and other Ohio gateways. The Fuel Administration called the attention of the operating committee of the eastern railroads to this accumulation of coal and the embargo on all coal over the Cincinnati division of the Big Four was at once lifted. The embargo on shipments over the Cincinnati, Hamilton & Dayton was lifted on December 4.

R. S. Lovett, director of transportation priority, on November 29 amended and extended priority order No. 4, issued on November 22, to provide that until further order railroads in Texas, New Mexico, Louisiana, Oklahoma, Arkansas, Kansas and Missouri shall give preference and priority in transportation to all shipments of cottonseed cake, cottonseed meal, hay, rice, straw, hulls and forage for all points in Texas and New Mexico from Texas, Louisiana, Oklahoma, Arkansas, Kansas and Missouri over all other traffic, except livestock and perishables, human foodstuffs, railroad supplies and material, coal and shipments for the government.

According to the reports of the Geological Survey, a slight decrease marked the production of bituminous coal during the week ended November 24. The total production is estimated at 11,260,490 net tons. This was .6 per cent less than the output during the preceding week, but the production for the month remains higher than at any time since early July. Anthracite

shipments amounted to 42,936 cars, the largest mark attained since the week of September 1. During the week ended November 17 representative operators produced 75.5 per cent of their combined full time capacity as limited by the labor forces at present available. Of the 24.5 per cent of what may be termed potential production which they failed to realize, 19.2 per cent was reported as lost for lack of cars. Inadequate transportation, the report says, thus remains the great limiting factor in the bituminous industry.

Food Administration Orders Preferential Movement of All Grain

Through the efforts of the Chicago Car Service Committee of the Railroads' War Board, the Chicago Board of Trade and other organizations, the federal food administration has modified its order requiring preferential movement of wheat, so as to include all grains. A large share of this year's corn crop contains an unusual amount of moisture and is in danger of spoiling unless promptly shipped to the large elevators having facilities for drying the corn. So long as the "priority order" gave preference to wheat shipments, the transportation of corn was necessarily delayed, and an immense amount of corn was in danger of spoiling. In anticipation of a very heavy movement of corn the Chicago Car Service Committee has now appealed to the War Board to order box cars sent West.

Consolidation of European Government Export Functions

France, Italy, England and Russia have established an office at 165 Broadway, New York, to centralize their requests for modification of embargo permits. It is called the "Traffic Executive." This step has been taken, at the request of the railroads' war board, to relieve the railroad embargo offices from the needless congestion resulting from thousands of requests for modification permits, the majority of which are duplications. When permits are desired for traffic consigned to Comptroller Johannet for account of the French government, General Tozzi for account of the Italian government, Connop Guthrie for account of the British government or C. G. Medzikovsky for account of the Russian government, the modification will now be made direct to the "Traffic Executive," who in turn will make application to the railroad company. It is expected that this centralization of authority will tend to relieve the over-burdened railroad and commercial telegraph lines.

Thanksgiving Traffic at Camp Devens

At Camp Devens, Ayer, Mass., for the Thanksgiving vacation, about 20,000 soldiers were granted leave of absence, and the Boston & Maine ran 18 special trains for their accommodation. The furloughs extended from 6 o'clock Wednesday evening until 6 o'clock Friday morning, but in view of the probable scarcity of passenger cars for some of the Thanksgiving traffic, the military authorities consented to let some of the men off earlier; and the special trains from the camp started at different hours from 11 a. m. to 6 p. m. The total number of passengers carried by the road from Ayer station and from the camp for the holiday was 18,117; and of these 14,774 were taken on the special trains within the hours named. Trains were run to Boston; to Troy, N. Y.; Concord, N. H.; Pittsfield, Mass.; Portland, Me.; Providence, R. I.; New Bedford, Mass.; Stamford, Conn., and Bellows Falls, Vt.

Counting now only the mileage on Boston & Maine rails, nine specials were run to Boston, 36 miles; four to Worcester, 28 miles; four to Concord, N. H., 57 miles; one to Salem, Mass., 40 miles; one to Portland, Me., 116 miles; one to Concord Junction, 14 miles, and one to Troy, N. Y., 154 miles. Practically all of the cars for use in these trains had to be run to Ayer from Boston, so that for the engines and for the men it meant 72 miles added to each run. For points on the New Haven and the Boston & Albany the cars were run through—some of them as far as Stamford, Conn. For the longest trip, that to Troy, N. Y., the special left Ayer at 12:45 p. m., arriving at Troy at 5:45 p. m.

The special trains started on their return trips Thursday evening; from Boston between 5:55 p. m. and 3:20 a. m. (Friday); from Concord, N. H., Thursday at 9 p. m.; from Pittsfield, Mass., at 7; Portland, Me., at 8:15; Providence, R. I., at 10:50; Stamford, Conn., at 7:40; Troy, N. Y., at 10 o'clock. The trains from the more distant points were scheduled to arrive at Ayer between 11 p. m. and 3 a. m.

Of all the passengers leaving the camp about 9,000 were carried to Boston, whence a large percentage made use of regular trains to points on other divisions of the Boston & Maine. The entire movement was made without serious delay and without accident.

Railroads Urged to Move Fertilizers Promptly

"Fertilizer isn't usually recognized as a factor in war, but it may prove an important one, nevertheless," says R. H. Aishton, chairman of the Central Department of the Railroads' War Board. "Our own fighting men and those of our allies are looking to this country for food supplies, and so is the civilian population of this and our allied countries. We must produce more food than ever; must plant a larger acreage and should aim to increase the average yield per acre. This means the use of more fertilizer; and notice has been sent to every railroad to provide for the prompt transportation of fertilizer and for the ingredients of manufactured fertilizer, such as phosphate rock, ground limestone, potash, gypsum, certain acids and other commodities. Notice has also been sent to all railroads that, on account of the shortage of leather, where animals are killed on railroads the hides should be saved. Some roads have made a practice of doing this but others have not."

Curtailement of Passenger Service

The Broadway Limited, the twenty-hour passenger train between New York and Chicago over the Pennsylvania, has been discontinued; this at the request of the Pittsburgh operating committee of the eastern roads, to facilitate the better movement of freight traffic.

The New York Central and the Pennsylvania have discontinued the observation cars on all New York-Chicago limited expresses. The same is true of the Empire State express of the New York Central and the "St. Louisan" of the Pennsylvania.

The Pennsylvania announces that on all trains between New York and Philadelphia, which have a Pullman smoking car (hitherto run for the accommodation of passengers holding seats in parlor cars) seats in such cars will henceforth be charged for; that is to say, the passenger paying for a single seat must elect whether he will ride in the parlor car or in the smoking car.

Heavy Passenger Traffic on the Pennsylvania

Except as limitations may be placed on the traffic as a war measure the Pennsylvania does not contemplate any general reductions in passenger service, said President Rea in a statement issued just before the General Operating Committee for the eastern roads ordered the discontinuance of the Broadway Limited.

"Less passenger train service on the eastern railroads, and especially on the Pennsylvania system, would be very desirable," he said, but "the Pennsylvania has about the largest passenger traffic of any railroad in the country. The year 1916 was the heaviest in its history, and passenger revenue for the first nine months of 1917 has increased 18 per cent over 1916, while later returns show that it is increasing at the rate of 30 per cent over 1916.

"Any traveler on this system can see for himself on day and night trains the extraordinary increase in passenger travel, including the heavy family travel to and from camps and to and from Washington on government business. I doubt whether slower and longer trains carrying full loads would materially relieve the tracks and terminals. Therefore, at this time I can see no other course than to continue meeting the abnormal demand for passenger transportation to the best of our ability."

The Philadelphia, Baltimore & Washington, the main line of the Pennsylvania System between Philadelphia and Washington, 137 miles, now earns about one-fifth of the entire passenger earnings of the whole Pennsylvania system. For the month of October its passenger revenues amounted to \$1,384,001; while the total passenger receipts on the whole system for that month were \$5,991,240. For the ten months ending with October, passenger receipts were on the P., B. & W. \$11,038,944, and on the whole Pennsylvania system, 12,000 miles, \$55,031,756. Twelve or fifteen extra sleeping cars are used on the trains from New York to Washington almost every night; and, altogether, the sleeping car service between these two cities requires about 150 cars, not counting those which start from Philadelphia.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The Interstate Commerce Commission has suspended until April 4 tariffs containing proposed increases in rail and lake class and commodity rates.

Procedure Under Fifteenth Section

The Interstate Commerce Commission on December 4 issued a notice to all carriers saying that since the fifteenth section amendment became effective carriers have in some instances filed tariffs containing rates issued in compliance with an order of the commission and also including increased rates or charges not authorized by and having no connection with the commission's order. If such a tariff were accepted by the commission the terms of the amended fifteenth section would not have been complied with. If the tariff were rejected by the commission the order of the commission would not have been complied with.

Aside from the question of orderly procedure important questions of law are involved when a carrier tenders for filing such a schedule, the commission says. It may therefore be doubted if an increased rate or charge filed without approval of the commission would be "in effect." If it would not, the old rate would still be in effect and any departure therefrom would be a violation of section 6 and subject the offender to the penalty fixed therein for violation thereof.

The notice also says that if an increased rate or charge filed without approval of the commission does not lawfully change the previously existing rate or charge, willful failure on part of the carrier to observe the previously existing rate or charge "until changed according to law" would be a violation of the Elkins Act. It is important that the provisions of the amended fifteenth section be strictly observed and complied with, and the commission hopes that neither further admonition nor resort to more drastic action will be necessary in any instance.

Suspension Docket Almost Discontinued

The amendment of the fifteenth section of the commerce law, requiring carriers to secure approval in advance from the Interstate Commerce Commission before they can file a tariff containing an increased rate, appears likely to result in a practical abolition of the suspension docket because proceedings involving increased rates are being settled before, instead of after the filing of tariffs. Since the amendment became effective carriers had filed up to December 1 a total of 2,005 applications for permission to file tariffs containing an increased charge, a very large proportion of them being of a minor character, such as changes to correct errors. The commission had issued orders approving or rejecting the applications bearing numbers up to 146, although, as they are not strictly consecutive, the number of orders that has actually appeared is somewhat less, probably in the neighborhood of 125. Many of these orders, however, covered a large number of applications and many of the applications were made a part of the supplemental advanced rate case. A suspension order was issued on December 4, but before that the last suspension order issued was on November 14, and the latest before that were on October 27 and October 9, whereas formerly there used to be an average of nearly one a day.

STATE COMMISSIONS

The New York State Public Service Commission, first district, has authorized the Long Island Railroad to advance from 2 cents a mile to 2.25 cents a mile its price for mileage tickets; and has disapproved applications for a number of increases in the rates on single trip tickets. The commission declares that the railroad has not shown in sufficient detail the reasonableness of the proposed advances. Commissioner Hervey, who wrote the opinion, says that there will be an increase in revenues in the near future, which the company had underestimated, and that the increase in cost of service may not be so great as is claimed.

PERSONNEL OF COMMISSIONS

Fred W. Putnam, whose appointment as a member of the Minnesota Railroad & Warehouse Commission was announced in the *Railway Age Gazette* of November 16, was born at Red

F. W. Putnam

Wing, Minn., on November 15, 1883. He graduated from the University of Minnesota and completed a course in law at the University of Michigan. Following his graduation from the latter school he returned to Minnesota to enter the office of the state attorney-general. He was later associated with the law firm of Keith, Evans, Thompson & Fairchild, and at the time of his appointment was a member of the law firm of Green & Putnam, of Red Wing, Minn. He was appointed a member of the commission to succeed Charles E. Elm-

quist, who resigned after a service of nine years to become a solicitor of the valuation committee of the National Association of Railway and Utility Commissioners with headquarters at Washington, D. C.

Charles Webster, whose appointment as a member of the Iowa State Board of Railroad Commissioners was announced in the *Railway Age Gazette* of November 16, was born at Waucoma,

C. Webster

Ia., on May 18, 1859. He was first employed as a station agent and telegraph operator at Waucoma, and then engaged in farming and stock-raising. He was for a number of years interested in the construction and financing of telephone companies and also in public utilities in Arizona. At the present time he is president of four chains of lumber yards operating in Iowa, North Dakota, South Dakota and Montana, and is a member of the firm of Webster Brothers, dealing in lumber, grain and a wholesale egg business in Waucoma.

He is also president of the Northwestern Lumbermen's Association, with headquarters at Minneapolis, which has members in the states of Iowa, North Dakota, South Dakota and Minnesota. Mr. Webster is a member of the State Council of Defense of Iowa and was appointed federal fuel administrator before assuming the position of railroad commissioner. He will continue to discharge his duties as fuel administrator as well as those of railroad commissioner.

COURT NEWS

Derailment by Sand on Crossing

A locomotive became derailed at a highway crossing by striking a pile of sand and gravel, and the fireman was injured. In an action against the railroad the evidence failed to show how the sand and gravel came to be there any length of time before the accident. The Minnesota Court held that the rule of *res ipsa loquitur* had no application, as the crossing was not in the exclusive possession or control of the railroad. The evidence did not justify an inference of negligence on the part of the railroad.

—McGillivray v. Great Northern (Minn.), 164 N. W., 922. De- (Pa.), 102 Atl., 141. Decided June 30, 1917.

Contributory Negligence of Pedestrian at Crossing

In an action for personal injury from falling on ice accumulating on a sidewalk at a grade crossing, it appeared that the ice was the only ice in the locality and could be seen for over six feet. Plaintiff could have seen it had she looked, but she failed to do so. The Pennsylvania Supreme Court held that a nonsuit was properly entered on the ground of her contributory negligence. One walking along a traveled highway must observe where and how he is going so as to avoid dangers which ordinary prudence would disclose.—Kleckner v. New Jersey Central (Pa.), 102 Atl., 141. Decided June 30, 1917.

Tort of Intoxicated Railroad Employee

The Vermont statute, P. S. 4506, makes railroads liable for damages which are sustained by reason of an operator, etc., who uses intoxicating liquors as a beverage to the knowledge of any of the officers of the road. The Vermont Supreme Court, in an action for damages due to the defendant railroad's agent shooting the plaintiff holds that as the evidence failed to show that either the defendant's president, superintendent, or one of its directors knew that the agent used intoxicating liquors as a beverage, a verdict was properly directed for the defendant.—Staten v. Central Vermont (Vt.), 102 Atl., 97. Decided October 2, 1917.

"Transportation" of Interstate Shipments of Live Stock

The Texas Court of Civil Appeals holds that, in view of section 1 of the Interstate Commerce Act, defining "transportation" to include services in connection with the receipt and delivery of the shipment, etc., the duty to deliver an interstate shipment of live stock to the commission company to which it was consigned was nondelegable, and where delivery could not be made in the pens of the consignee the duty of transportation was not fulfilled by delivery at the chutes of the stockyard company, which placed them in inaccessible pens having no facilities for feed or water.—Panhandle & Santa Fé v. Phillips (Tex.), 197 S. W., 1031. Decided October 17, 1917.

Directors' Power as to Receiverships

The federal district court in Massachusetts holds that the board of directors of a railroad, with the approval of the majority of the stockholders, has power to initiate proceedings looking to a receivership, by procuring the filing of a bill by a bona fide creditor, the allegations of which are admitted for the company, and there is no impropriety in such proceeding, where the directors act in good faith, solely for the interests of the company, and in view of its duty to the public as a common carrier. The court, however, is not absolutely bound to appoint a receiver. It might refuse to do so if confident that there was no real necessity for such action and that the application was improvidently made. The facts in the present instance indicated that this was not such a case.—Intercontinental Rubber Co. v. Boston & Maine, 245 Fed., 122. Decided February 26, 1917.

Limitation of Two Years for Action Under Federal Liability Act

The federal employers' liability act prescribes a limitation of two years from the time the cause of action arises for bringing action. In an action by an employee brought a few months after the injury the complaint stated a cause of action under the common law and statutes of the state of New York, and stated no fact bringing the action under the federal statute. After two trials had been had, and the case had been carried to the appellate courts by several appeals, and remanded for a new trial, the plaintiff moved for permission to amend his complaint, setting up the claim that at the time of the accident the plaintiff was engaged in interstate commerce and therefore entitled to the benefit of the federal act. This was not done until eight years after the happening of the accident. The New York Supreme Court, Special Term, Erie County, holds that the limitation of two years prescribed by the federal act applied, and a new trial would not be allowed on the amended complaint, as it would state a new cause of action under the federal act.—Kinney v. New York Central, 166 N. Y. Supp., 868. Decided July 1, 1917.

Equipment and Supplies

FREIGHT CARS

THE MOTOR FUEL COMPANY, Sapulpa, Okla., is inquiring for 10 8,000-gal. capacity tank cars.

THE LOUISVILLE & NASHVILLE is inquiring for 300 steel underframes for 50-ton gondola cars.

THE UNITED STATES NAVY has ordered 10 40-ton gondola cars from the American Car & Foundry Company.

THE JOHNSON OIL REFINING COMPANY, Chicago, is in the market for 10 to 50 8,000 to 10,000-gal. capacity tank cars.

THE PENNSYLVANIA EQUIPMENT COMPANY, 1420 Chestnut street, Philadelphia, is in the market for 100 8,000-gal. capacity tank cars for lease.

THE ROMA WINE COMPANY, San Francisco, Cal., has purchased 4 10,000-gal. capacity tank cars from the Pennsylvania Tank Car Company.

THE GENERAL PETROLEUM COMPANY, Los Angeles, Cal., has purchased 4 10,000-gal. capacity tank cars from the Pennsylvania Tank Car Company.

THE POWER GASOLINE COMPANY, Bradford, Pa., has ordered one 8,000-gal. capacity all steel tank car from the Pennsylvania Tank Car Company.

THE UNION PACIFIC order for freight cars as given in last week's issue was incorrect. The company's 3,550 cars were distributed as follows: 1,000 stock cars, American Car & Foundry Company; 1,000 hopper bottom coal cars, Pullman Company; 50 caboose cars, Mount Vernon Car Manufacturing Company; 500 flat cars, Bettendorf Company, and 1,000 drop bottom gondola cars, Cambria Steel Company.

SIGNALING

THE WABASH has ordered from the General Railway Signal Company material for an interlocking plant of 35 levers at Illes, Ill.

THE PENNSYLVANIA has ordered from the General Railway Signal Company a Saxby & Farmer interlocking, 12 levers, for Lalor street, Trenton, N. J.

THE UNION PACIFIC is to install a mechanical interlocking plant at Republican River Bridge; Saxby & Farmer machine, six levers. The material has been ordered from the General Railway Signal Company.

THE MISSOURI, KANSAS & TEXAS has ordered from the Union Switch & Signal Company, to be installed by the railroad forces, a mechanical interlocking for the crossing of the St. Louis-San Francisco at Clinton, Mo.

THE ATCHISON, TOPEKA & SANTA FE has ordered from the Union Switch & Signal Company, to be installed by the railroad forces, a twenty-lever mechanical interlocking for Morris, Kan. The levers will have a c. electric locks.

THE LOUISVILLE & NASHVILLE has ordered from the General Railway Signal Company, to be installed by the railroad company's forces, the material for automatic block signals on its line (single track) from Jackson, Ky., to Oakdale, Ky., 9 miles.

THE GREAT NORTHERN proposes next Spring to erect automatic block signals on its line (single track) from Blackfoot, Mont., to Summit, 34 miles; from Essex, Mont., to Columbia Falls, 42 miles and from Troy, Mont., to Bonner's Ferry, 31 miles, a total of 107 miles. The signals and material for this installation were ordered from the General Railway Signal Company, as noted in the *Railway Age Gazette* of November 2, page 821. The signals are one-arm, upper quadrant, 10-volt direct-current, with the mechanism at the top of the mast. This installation will require about 700 relays, 1,500 lightning arresters, and other materials in proportion.

Supply Trade News

Lewis A. Larsen, assistant comptroller of the American Locomotive Company, has resigned to accept the position of assistant to the president of the Lima Locomotive Works, Inc., effective

L. A. Larsen

December 1, 1917, with headquarters at Lima, Ohio. Mr. Larsen was born at Ridgeway, Ia., in 1875. He received his early education in the public schools of Ridgeway and Decorah, Ia., and Upper Iowa University, Northwestern University and St. Paul College of Law. In November, 1897, he entered the service of the Chicago Great Western as clerk to the master mechanic. He held successively the positions of chief clerk to the superintendent of motive power and chief clerk to the assistant general manager. In 1904 he resigned to accept the position of chief clerk to the superintendent of motive power of the Northern Pacific at St. Paul. In November, 1906, he became associated with W. H. S. Wright, railway supplies, representing the Railway Steel Spring Company, the Pittsburgh Forge & Iron Company and other companies, and in 1907 entered the service of the American locomotive Company. In 1909 he was appointed assistant to the vice president in charge of manufacturing, and July, 1917, was appointed assistant comptroller. For several years past Mr. Larsen has been a special lecturer in the Alexander Hamilton Institute, New York. He has also contributed a number of papers to the railroad magazines.

A Locomotive an Hour

Production records at the Baldwin Locomotive Works are being broken weekly. It is reported that in a recent week about 100 locomotives of various sizes were turned out, and President Alba B. Johnson is authority for the statement that the plant is completing a locomotive an hour.

President Johnson at the recent directors' meeting also said: "During 1916, 1,960 locomotives were made, an average of 160 a month. Large contracts for machining shells were executed and a considerable portion of the force, which ranged from 12,000 to 18,500 men, was diverted to shell manufacturing. All of these contracts except one, for the French Government, were run out during the spring of 1916. The French contract was completed in November. In 1917 the working force was increased approximately to 20,000 men. Locomotive production was largely increased and for ten months ending October 31, 1917, 2,254 were shipped, at the rate of 225 a month. This increase of production will be continued during November, December and the months of 1918.

"While our earnings have been satisfactory, the increase in production and increased cost of materials and labor have demanded a large increase in the amount of working capital as the conditions have been unfavorable for any financing. There has been no alternative but to provide the increased working capital by borrowing.

"Continued increasing activity is likely to require a continuation of all the capital at present employed. The directors have wisely decided that it is inexpedient to increase the loans in order to provide means for dividends on the common stock. At no time in the history of the works has there been so large an amount of business upon the books. All shell business has been transferred to the Eddystone Munitions Company. The work under contract should prove profitable and gives promise of satisfactory earnings during the succeeding year."

Economies Devices Corporation and Franklin Railway Supply Company Merged

With a view to concentrating into one organization two groups of men who have been working along parallel lines in the development of increased efficiency of the steam locomotive, the Economies Devices Corporation and the Franklin Railway Supply Company have been merged into a new corporation, namely, the Franklin Railway Supply Company, Inc.

The officers of the new company will be as follows: J. S. Coffin, chairman of the board of directors; S. G. Allen, vice-

J. S. Coffin

chairman; H. F. Ball, president; Walter H. Coyle, senior vice-president; J. L. Randolph, vice-president in charge of western territory; C. W. Floyd Coffin, vice-president in charge of Eastern and Southern territory; C. L. Winey, secretary and treasurer; Harry M. Evans, Eastern sales manager; C. J. Burkholder, Western sales manager; Hal R. Stafford, chief engineer, and William T. Lane, mechanical engineer.

Joel S. Coffin, chairman of the board of directors of the new company, brings to the new company a wide and

varied knowledge gained from 14 years of railroad work and 26 years in the railroad supply field. He began as a machinist's apprentice and became fireman, engineer and road foreman of engines. Most of this experience was on the Wisconsin Central. He left the railroad to enter the mechanical department of the Galena Signal Oil Company as mechanical expert, was promoted to manager of that department and several years later was elected vice-president. After serving as vice-president for two years, he resigned to accept the vice-presidency of the American Brake Shoe & Foundry Company, which position he held until 1911. In 1902 he organized the Franklin Railway Supply Company, of which he was president up to 1916, when he was elected chair-

S. G. Allen

man of the board. In addition to being chairman of the board of directors of the Franklin Railway Supply Company, Inc., Mr. Coffin is a director in a large number of other corporations. Samuel G. Allen, vice-chairman of the Franklin Railway Supply Company, Inc., is both a lawyer and a business man. He was plunged into business responsibilities immediately after leaving college, and studied law in his spare time. He was admitted to the bar in Warren County, Pa., and practiced for nine years in the oil districts of Pennsylvania. When the

Franklin Railway Supply Company was formed in 1902, Mr. Allen was elected secretary and treasurer, and later became vice-president, and in 1916 was elected president. H. F. Ball, president of the Franklin Railway Supply Company, Inc., has spent his entire business life in intimate contact with locomotive operation and construction. After serving his time in the locomotive and car departments of the Pennsylvania Railroad at Altoona, he entered the drafting room, and two years later entered the service of the Lake Shore & Michigan Southern as chief draftsman. He held successively the posi-

tions of general foreman car shops, general car inspector, mechanical engineer and superintendent of motive power. He resigned from the Lake Shore to become vice-president in charge of engineering of the American Locomotive Company, which position he occupied until 1913, when he left the company to become president of the Economy Devices Corporation.

Walter H. Coyle, senior vice-president of the Franklin Railway Supply Company, Inc., brings to his new position experience gained by many years in both railroad work and the railroad supply field. Mr. Coyle was for 11 years in the service of the Erie Railroad in the mechanical and traffic departments. Upon leaving the railroad he became identified with the Kent Manufacturing Company, and later entered the mechanical department of the Franklin Railway Supply Company. He spent six years in this department, when he was called to New York as assistant to the vice-president and placed in charge of the sales department of the central territory. He was elected second vice-president shortly after, and then vice-president, which position he held up to his election as senior vice-president of the new organization.

J. L. Randolph, vice-president of the Franklin Railway Supply Company, Inc., takes charge of the western territory, with office in Chicago. Mr. Randolph began as a machinist apprentice in the Concord, N. H., shops of the Northern Railroad, now a part of the Boston & Maine. Subsequently he served this road in the capacity of machinist, gang foreman, general foreman, master mechanic and superintendent of shops. He left the railroad to accept a position in the mechanical department of the Franklin Railway Supply Company. Three years later he was appointed sales manager of the Economy Devices Corporation, and in 1916 was elected vice-president.

C. W. Floyd Coffin, vice-president of the Franklin Railway Supply Company, Inc., takes charge of the eastern-southern territory, with office in New York. Mr. Coffin's entire business experience has been in the railroad supply field. After leaving Cornell University he spent five years in the treasury, sales and service departments of the Franklin Railway Supply Company. He was then transferred to Chicago as assistant western sales manager, and

later promoted to western sales manager, which position he held up to the time of his appointment as vice-president of the Franklin Railway Supply Company, Inc.

C. L. Winey, secretary and treasurer of the Franklin Railway Supply Company, Inc., is a man of extended experience both in railroad work and in the railroad supply field. Starting his career on the Pennsylvania Railroad, he spent three years in the motive power department, one year in the maintenance of way and signal department, and two years in the transportation department. He left railroad work to enter the service of the Gal-na Signal Oil Company, and five years later accepted the position of secretary and works manager of the Kent Manufacturing Company. In 1908 he was elected secretary and treasurer of the Franklin Railway Supply Company, which position he held until he was elected secretary and treasurer of the Franklin Railway Supply Co., Inc.

Harry M. Evans has been appointed eastern sales manager of the Franklin Railway Supply Company, Inc., with office in New York. Mr. Evans began railroad work as a call boy on the Erie, and served in various positions in the mechanical, transportation and traffic departments of that road. Upon leaving the Erie he entered the mechanical department of the Franklin Railway Supply Company, as traveling representative. He was promoted to assistant western sales manager, and shortly after was made eastern sales manager, which position he held at the time of his recent appointment as eastern sales manager of the Franklin Railway Supply Company, Inc.

C. J. Burkholder has been appointed western sales manager of the Franklin Railway Supply Company, Inc., with office in Chicago. Up to 1916 Mr. Burkholder's business experience had been entirely in railroad work. He was employed in the round-house of the Pennsylvania Railroad at Tyrone, Pa.; and later was a locomotive fireman. Leaving the Pennsylvania R. R., he became a locomotive engineer on the Union Pacific, and later on the Kansas City Southern. He was in turn promoted to traveling engineer, trainmaster, general road foreman of engines and division superintendent. In 1916 he accepted a position with the Economy Devices Corporation as mechanical representative in the western territory, which position he occupied up to his present appointment.

Hal R. Stafford, chief engineer of the Franklin Railway Supply Company, Inc., has for the past 17 years been active in locomotive development. On leaving college he started as a special machinist with the Schenectady Locomotive Works, shortly afterward was transferred to the drawing room. A year later he took charge of the cylinder and valve division. Eight years later he was made assistant to the consulting engineer in charge of Compound Locomotives. While in this position he helped develop the first Mallet locomotive, the Cole balanced compound and the Cole-Stafford balanced simple locomotive. For some years he represented the American Locomotive Company, conducting road tests jointly with various railroads. When the

H. F. Ball

C. W. F. Coffin

W. H. Coyle

J. L. Randolph

C. L. Winey

Economy Devices Corporation was formed he was appointed mechanical engineer of that company.

William T. Lane, mechanical engineer of the Franklin Railway Supply Company, Inc., has spent his entire business career in the railway supply field. For the past six years he has been constantly in touch with locomotive development. On leaving college he went as an apprentice with the Franklin Portable Crane & Hoist Company. His next position was as draftsman. In the Franklin Railway Supply Company, then Chief Draftsman. In 1915 he was made mechanical engineer.

Axil A. Storm, vice-president of the Pettibone, Mulliken Company, and president of the U. S. Ball Bearing Co., Chicago, died in New York November 29.

L. B. Moses, since 1911 sales manager of the Kettle River Company, Minneapolis, Minn., has been elected second vice-president of the Walter A. Zelnicker Supply Company, and will be in charge of the rail department of the company at its main offices in St. Louis, Mo.

TRADE PUBLICATIONS

OXY-PINTSCH METAL CUTTING.—An attractive eight-page booklet has been issued by the Pintsch Compressing Company, 2 Rector street, New York, describing the model "C" Oxy-Pintsch cutting equipment furnished by this company. This booklet sets forth the advantages of Pintsch gas for metal cutting and contains a brief description with illustrations of the various parts of its complete outfit. This includes an oxygen pressure regulator, high and low pressure Pintsch gas regulators, the use of which depends upon whether the gas is drawn from flasks or from low pressure service pipe lines, and the cutting torch.

DOWN AND BACK—A RAILROAD STORY.—A book of 52 pages, 5½ in. by 8 in. in size with 7 illustrations. In this book, issued by the Pneumatic Scale Corporation, Ltd., Norfolk Downs, Mass., in the interest of its pilferproof collapsible steel container, Sam tells of his and Bob's departure into the express business, very successful at first, of their unsuccessful experience with weak containers and of their deep seated desire for a stronger package as exemplified in the container made by the Pneumatic Scale Corporation. Bob and Sam, in the interesting story that Sam tells, entered upon the express business because they realized the waste of having to go to town for Old Man Sanborn's general store, that is going with an empty wagon and returning with Sanborn's supplies, while the nail-mill truck went with a load of nails into town and came back empty. Then, as time went on they had to figure out classifications for charges, and finally got up against a rule prohibiting the return of empty containers free of charge and against the weaker containers that as a result were made so weak that they barely lasted out the trip, let alone a return. It got so, says Sam that "It don't take much of a sneeze to make the average shippin' case collapse, anyway." Previous to that almost the only trouble they had had was with oil. As the new grocer said the day they delivered him a couple of barrels of sugar, "He didn't object to the sugar tastin' of oil, it kind of gave it a new flavor, but he did object to findin' that barrel of oil we brought had soaked up so much sugar." The story is interspersed with many other such touches and its author finds opportunity to bring up many of the other difficulties resulting from frail containers, theft, loss and damage, difficulty of loading cars to capacity with goods in frail containers, etc. References from articles in some of the technical magazines, from court cases and decisions, etc., inserted in the pages show Sam's bases in serious fact. On the whole, the book is well gotten up and takes an honorable position among trade publications of this character.

ITALY NEEDS 800,000 TONS OF COAL to run its railroads, munition factories and war industries. Italy's coal supply is so short that during the past summer more than one thousand square miles of forests were cut for use as firewood and in the preparation of charcoal. More than 500,000 tons of lignite was mined, both wood and lignite being used at present industrially, also on slow trains and switch locomotives. It is impossible to use such material for passenger trains, which have been under great pressure for months due to military movements.

Railway Construction

FRANKFORT & SHELBYVILLE ELECTRIC.—Surveys are now being made to build an electric line from Frankfort, Ky., west to Shelbyville, 19.7 miles. The headquarters of the company are at Louisville Trust building, Louisville, Ky.

HOUSTON, RICHMOND & SAN ANTONIO INTERURBAN.—This company was organized to build from Houston, Texas, west to San Antonio, 186 miles, surveys have been made from San Antonio east via Gonzales for 100 miles and from Houston west to Brazos river, 30 miles, and grading work has been completed on 30 miles. E. Kennedy, president, Houston.

KETTLE VALLEY.—This company will build a line from Princeton, B. C., south along the Similkameen river to Copper mountain, about 14 miles. The line will serve copper mines owned by the Canada Copper Corporation. Contracts for grading and bridge work will be let the early part of this month. The work involves about 50,000 cu. yd. of grading per mile, of which 40 per cent will be solid rock; it will have a maximum grade of 2.2 per cent and maximum curvature of 14 deg. One bridge will be built over the Similkameen river, a number of trestles will be constructed, and four tunnels will be bored totaling in length about 1,200 ft. The construction of the bridges and trestles will involve the use of 2,000,000 ft. b. m., of timber. A. McCulloch, chief engineer, Penticton, B. C.

LEHIGH VALLEY.—The Lehigh Valley, the Pennsylvania and City of Newark, N. J., are jointly building a steel and timber temporary bridge over the Lehigh Valley and Pennsylvania tracks at Bay avenue, Newark, to eliminate a grade crossing. The Lehigh Valley carried out part of the work with company forces and Henry Steers has the contract for the Pennsylvania's share of the work. The total cost of about \$75,000 is to be paid jointly by the railroads and the City of Newark.

NASHVILLE, CHATTANOOGA & ST. LOUIS.—This company is building with its own forces the extension from Coalmont, Tenn., to new mines of the Tennessee Consolidated Coal Company at the head of Mill creek. The grading is about 80 per cent completed and six miles of track has been laid. The work involves handling about 28,000 cu. yd. to the mile 80 per cent of which is rock work. There will be two stations on the line which is being built to carry coal. (January 19, p. 124.)

INCREASED PASSENGER RATES ON MEXICAN RAILWAY.—The Secretary of Communications and Public Works has authorized the manager of the Mexican Railway, in compliance with the petition made by the company, to put into effect, beginning on November 1, 1917, the 25 per cent increase in the passenger rates. The proceeds of this increase, as in the case of the one granted to the Mexican Electric Tramway Company, is destined for the benefit of the Federal Treasury.—*Commerce Report.*

FRENCH PLANS PROGRESSING TO MAKE PARIS A SEAPORT.—Consul General Thackara at Paris reports: Periodical agitation has arisen since the seventeenth century in favor of uniting Paris with the sea in a way so as to render the connecting river or canal navigable to ships of large size. Since the flood of 1910 the problem has acquired a fresh interest. But the outbreak of the present war has caused the scheme to present itself to municipal and national authorities as one of capital importance, inasmuch as the inadequate port facilities and means of communication have militated strongly against the revictualing of the Paris region on reasonably favorable terms. On December 30, 1916, the city council invited the prefect of the Seine to prepare "a technical, administrative, and financial prospectus for the realization of the port of Paris," at the same time requesting the Provincial Government to "constitute a committee with the object of studying the organization and the financial régime to be applied to the port of Paris." The prefect of the Seine on March 23, 1917, reported progress along these lines. Preliminary studies were made by government commissions appointed on February 9, 1910, and January 14, 1911, respectively. On the basis of these the investigation is continuing.

Railway Financial News

CANADIAN PACIFIC.—Preliminary returns of gross earnings for November show that a new high record for any month in the company's history has been established. The weekly statements for November give a gross of \$14,942,000, and it is probable, when the usual adjustments are carried, the monthly statement will top \$15,000,000 by a good margin. The previous high record for a month was \$14,733,774.

CHICAGO & ALTON.—See Missouri Pacific.

MICHIGAN CENTRAL.—The Illinois Public Utilities Commission has summoned the Michigan Central management to appear before it, December 11, in Chicago, to show cause why it issued \$4,000,000 notes and other securities without the commission's authority.

MISSOURI PACIFIC.—Negotiations are under way between the managements of the Chicago & Alton and Missouri Pacific for the rental of ninety miles of track of the latter road by the former. The stretch of track desired is that between Kansas City, Mo., and Norton.

NEW YORK & PENNSYLVANIA.—This road, which operates between Canisteo, N. Y., and Ceres, 56 miles, has been sold to Gustave Benjamin, of the Benjamin Iron & Steel Company, Buffalo, N. Y., for a price in the neighborhood of \$350,000. The road will be junked unless people who live along the line raise sufficient money to buy it from the new owner.

OKLAHAWKA VALLEY.—The Florida Railroad Commission is conducting hearings at Ocala, Fla., on the petition of this company to cease operations and discontinue the line. The road extends from Ocala, Fla., to Palatka, 54 miles. Officials of the company showed that the road is operating at a great loss, the deficit this year being over \$18,000.

PENNSYLVANIA RAILROAD.—The directors of the Pennsylvania Railroad Company and of the Pennsylvania Company have agreed, subject to the consent required from some of the state commissions, to transfer the leases and other operating agreements of the western lines, now held by the Pennsylvania Company, to the Pennsylvania Railroad Company. The latter company will then directly operate the lines now operated by the Pennsylvania Company, and the present experienced organization west of Pittsburgh, will continue to conduct the operations of the western lines, in the name of the Pennsylvania Railroad Company. The Pittsburgh, Cincinnati, Chicago & St. Louis Railroad Company is not included in the foregoing arrangement. All of the capital stock of the Pennsylvania Company is owned by the Pennsylvania Railroad Company, and all of its bonds are guaranteed by the latter company. Under the plan suggested, the capital stock of the Pennsylvania Company will ultimately be surrendered and cancelled, excepting such amount as may be deemed essential to preserve the charter of the Pennsylvania Company, until it is decided to dissolve it.

The Pennsylvania Company was incorporated under the laws of Pennsylvania in 1870, with the powers of a holding company as well as a railroad company, to take charge of the management and development for the Pennsylvania Railroad Company of the several lines west of Pittsburgh leased or owned by the latter company, notably the Pittsburgh, Ft. Wayne & Chicago, the Erie & Pittsburgh, the Cleveland & Pittsburgh and various other lines. Following the policy pursued by the Pennsylvania Railroad Company, the Pennsylvania Company is now to be taken over by the former company, to eliminate unnecessary duplication and to give its lines the additional strength and credit of the parent company, i. e., the Pennsylvania Railroad Company.

See also editorial elsewhere in this issue.

WASHINGTON, POTOMAC & CHESAPEAKE.—A petition has been filed in the Circuit Court at Hyattsville, Md., for the dissolution of the charter of this company, whose tracks extend from Brandywine, Md., to Mechanicsville, a distance of 21 miles.

Railway Officers

Executive, Financial, Legal and Accounting

J. P. Pelham has been appointed acting auditor of the Alabama Northern with office at Atlanta, Ga., vice W. E. Hix, resigned.

Charles H. Ewing, general manager of the Philadelphia & Reading, has been appointed vice-president, with headquarters at Philadelphia, Pa.

Announcement is made by the Pennsylvania Railroad that in connection with the change in the status of the lines of the northwest system (see Financial News) the vice-presidents, officers and employees of the Pennsylvania Company have been appointed to similar positions with the Pennsylvania Railroad Company, effective January 1, 1918, and will discharge the same duties as those now performed for the Pennsylvania Company in the management and operation of these western lines. The titles of the new vice-presidents are now as follows: J. J. Turner, senior vice-president, with general supervision over all departments of the western lines; E. B. Taylor, vice-president in charge of finance and accounting; D. T. McCabe, vice-president in charge of traffic; G. L. Peck, vice-president in charge of operation; Benjamin McKee, vice-president in charge of real estate and purchases. They will continue to be located in the company's general office at Pittsburgh.

Operating

J. B. Hutchinson, Jr., who has been appointed superintendent of the Tyrone division of the Pennsylvania Railroad, with headquarters at Tyrone, Pa., as has already been announced in these columns, was born on March 3, 1876, at Bristol, Pa., and was educated in Princeton University. While attending college he worked for the Pennsylvania Railroad during his summer vacations, and on January 1, 1898, was appointed rodman. In April, 1899, he was transferred to the office of the principal assistant engineer at Altoona, Pa., the following November he was made assistant supervisor on the West Penn division, and in 1900 he was transferred to the Pittsburgh division. He was promoted to supervisor on the West Penn division in 1901, and in 1905 was transferred to the Middle division in the same capacity. In January, 1910, he was appointed division engineer of the West Jersey & Seashore Railroad and three years later was transferred to the Williamsport and Susquehanna divisions of the Pennsylvania. He was appointed division engineer of the Monongahela division on February 11, 1914, and in September, 1916, was transferred to the Pittsburgh division in the same capacity. In April, 1917, he was promoted to assistant superintendent of the Pittsburgh division and on October 25 was made superintendent of the Tyrone division, as above noted.

W. T. Peyton has been appointed assistant general superintendent of the Fort Worth & Denver City and the Wichita Valley Railway, with office at Fort Worth, Texas.

E. L. Hill, an assistant in the engineering department of the Erie Railroad at New York, has been appointed assistant to general manager, with headquarters at New York.

J. C. Clark has been appointed assistant to the general manager of the Oregon Short Line, in charge of safety first work, with headquarters at Salt Lake City, Utah, effective November 26.

J. B. Hutchinson, Jr.

Homer Whitlock, train despatcher on the Peoria & Eastern division of the Cleveland, Cincinnati, Chicago & St. Louis, has been promoted to assistant trainmaster at Springfield, Ohio, succeeding H. B. Perry, who has enlisted in the army.

P. N. Place, superintendent of the Scranton division of the Delaware, Lackawanna & Western, with office at Scranton, Pa., has resigned, and F. J. Lawrence, trainmaster at Scranton, has been appointed acting superintendent, with headquarters at Scranton.

F. M. Falck, assistant general manager of the Philadelphia & Reading, has been appointed general manager, with headquarters at Philadelphia, Pa. A portrait of Mr. Falck and a sketch of his railway career were published in the *Railway Age Gazette* of April 20, 1917, page 857.

John Sesser, whose appointment as assistant general superintendent of the Great Northern, with headquarters at Great Falls, Mont. was mentioned in these columns on October 26, was born

J. Sesser

at Plantation, Hilo, Hawaii; 1901 to 1902, resident engineer on the Chicago, Milwaukee & St. Paul, and for a short time during the latter part of this period chief engineer of the Iowa & St. Louis; 1902 to 1907, he was resident and locating engineer with the Chicago, Burlington & Quincy, locating and constructing a 60-mile extension from Centralia, Ill., to Herrin, and as engineer maintenance of way of the Missouri district. From 1907 to 1908 he was vice-president of the W. A. Kenly Company, Chicago. In December, 1909, he entered the service of the Great Northern as trainmaster, and in April, 1910, was promoted to assistant engineer maintenance of way of the system. In July, 1913, he was promoted to superintendent of the Kalispell division, with headquarters at Whitefish, Mont. In October, 1915, he was transferred to the Missabe-Superior division, with headquarters at Superior, Wis., which position he held until his appointment as assistant general superintendent, central district, effective October 20.

M. B. Lamb, assistant superintendent of the Chicago, Burlington & Quincy, with headquarters at Dayton's Bluff, Minn., has been promoted to superintendent, with headquarters at Hannibal, Mo., succeeding J. H. Aydelott, who has been transferred to Omaha, Neb., as superintendent of the Omaha division. G. L. Griggs, division superintendent at Omaha, Neb., has been transferred to the Alliance division, with headquarters at Alliance, Neb., succeeding W. M. Weidenhamer, resigned. O. C. Hibbs, trainmaster at Galesburg, Ill., has been promoted to assistant superintendent, with headquarters at Dayton's Bluff. The above changes were effective December 1.

Traffic

J. L. Bacon has been appointed commercial agent of the Central of Georgia, with office at Albany, Ga., vice W. F. Brown, promoted.

John S. Talbot has resigned as general traffic manager of the Evansville & Indianapolis and the office of general traffic manager has been discontinued.

F. A. Adams, chief clerk in the freight department of the Rock Island Lines at Fort Worth, Texas., has been appointed assistant general freight agent, with headquarters at Chicago.

E. J. Dowie, special agent in the industrial department of the New York Central, has been appointed industrial agent, with headquarters at Cleveland, Ohio, effective November 22.

W. E. Lowes, assistant general passenger agent of the Baltimore & Ohio, has been appointed general passenger agent of the system with headquarters at Baltimore, Md. He began railway

W. E. Lowes

work as a call boy and messenger in the superintendent's office of the Indianapolis & Vincennes, now a part of the Pittsburgh, Cincinnati, Chicago & St. Louis. He later served as telegraph operator and station agent of the Indianapolis, Cincinnati & Lafayette, now a part of the Cleveland, Cincinnati, Chicago & St. Louis. He was subsequently freight claim clerk and chief clerk of the freight department of the Pittsburgh, Cincinnati, Chicago & St. Louis at Indianapolis, Ind., and then became advertising agent of the Cleveland,

Cincinnati, Chicago & St. Louis, at Cincinnati, Ohio. In 1897 he went to the Baltimore & Ohio as advertising manager and in 1910 he was made assistant general passenger agent, from which position he is now appointed general passenger agent of the Baltimore & Ohio system, as above noted.

W. T. LaMoure, general freight agent of the Boston & Maine, has been appointed freight traffic manager, with office at Boston, Mass., to succeed the late A. S. Crane. Mr. LaMoure was born

W. T. LaMoure

at Worcester, N. Y., and was educated in the public school of his native town. He began railroad work in 1882, as a telegraph operator on the Boston, Hoosac Tunnel & Western, now a part of the Boston & Maine. In 1885 he was appointed station agent at Petersburg Junction, N. Y. One year later he was transferred to Valley Falls, and then became agent at Johnsonville, when the Boston, Hoosac Tunnel & Western was consolidated with the Fitchburg Railroad. In 1892 he was appointed freight agent of the Fitchburg Railroad, at

Troy, N. Y.; three years later he was transferred to Boston as chief clerk of the local freight office, and two years later became local freight agent in charge of the Boston freight terminals of the Fitchburg Railroad, and continued in that position after the Fitchburg was leased to the Boston & Maine. In 1907 he was appointed foreign freight agent, and in January, 1914, was appointed assistant general freight agent of the Boston & Maine. In July, 1915, he became general freight agent, which position he held at the time of his appointment as freight traffic manager of the same road, as above noted.

R. S. Clark, commercial agent of the Tennessee Central, has been appointed assistant general freight agent, with office at Nashville, Tenn., and A. E. Yardley, commercial agent at St. Louis, Mo., has been appointed assistant general freight agent,

with office at Nashville, Tenn. The commercial agencies at Chicago, St. Louis, Mo., Atlanta, Ga., and Knoxville, Tenn., have been abolished.

Archibald Fries, freight traffic manager, eastern lines, of the Baltimore & Ohio, with headquarters at Baltimore, Md., has been appointed assistant general freight manager in charge of freight traffic of the system. He was born on February 27, 1864, and was educated in the public schools at Cincinnati, Ohio. He began railway work in 1880 as an entry clerk on the Ohio & Mississippi now a part of the Baltimore & Ohio System in the transfer station at Storr's, Ohio, and subsequently served consecutively as cashier and chief clerk at the same place. From January, 1890, to November, 1897, he was successively chief clerk, rate and claim clerk, accountant, chief clerk and acting manager of the Continental Fast Freight Line; then to October, 1898, he was chief clerk in the general freight department of the Baltimore & Ohio Southwestern. In October, 1898, he was appointed general agent at Cincinnati, and in January, 1899, he became assistant general freight agent of the same road. From March, 1911, to January, 1913, he was also assistant general freight agent of the Cincinnati, Hamilton & Dayton. In January, 1913, he was appointed general freight agent of the Sharpsville Railroad; the same year he was appointed general freight agent of the Baltimore & Ohio at Pittsburgh, Pa., and on October 15, 1916, was appointed freight traffic manager of the eastern lines, with headquarters at Baltimore, and now becomes assistant general freight manager, as above noted.

Walter B. Calloway, general passenger agent, eastern lines, of the Baltimore & Ohio, with office at Baltimore, Md., has been appointed passenger traffic manager. He was born on December 28, 1873, at Harrison, Ohio, and was educated in the public schools at Home City, Ohio, also at Wabash College, Crawfordsville, Ind. He began railway work in September, 1891, as office boy in the freight claim department of the Cleveland, Cincinnati, Chicago & St. Louis, and subsequently served consecutively in various positions in the passenger department of the same road. He was then division clerk in the general passenger department of the Cincinnati, Hamilton & Dayton and later was chief rate clerk in the general passenger department of the same road. In January, 1901, he was appointed advertising manager of the same department and from June, 1902, to August of the following year, was assistant general passenger agent of the Cincinnati, Richmond & Muncie. He later served as general passenger agent of the Chicago, Cincinnati & Louisville, and from November, 1904, to December, 1905, he was assistant general passenger agent of the same road and the Cincinnati, Hamilton & Dayton. He was then to March, 1911, general passenger agent of the C., H. & D., and later served as assistant general passenger agent of the Baltimore & Ohio

A. Fries

W. B. Calloway

Southwestern and the C., H. & D. until September 1, 1911, when he was appointed general passenger agent of the same roads. In the fall of 1916 he was appointed general passenger agent of the Baltimore & Ohio, eastern lines, with headquarters at Baltimore, Md., and now becomes passenger traffic manager, as above noted.

O. P. McCarty, passenger traffic manager of the Baltimore & Ohio, with headquarters at Baltimore, Md., has been appointed general passenger representative, and Golden Shumate, assistant general freight agent, with headquarters at Baltimore, has been appointed general freight agent. A portrait of Mr. Shumate and a sketch of his railway career were published in the *Railway Age Gazette* of March 16, 1917, page 470.

Engineering and Rolling Stock

E. S. Pearce has been appointed mechanical engineer of the Cleveland, Cincinnati, Chicago & St. Louis, with headquarters at Beech Grove, Ind., succeeding W. E. Ricketson, promoted.

T. S. Davey, shop superintendent of the Erie at Buffalo (N. Y.) car shops, has been appointed master mechanic in charge of engine terminals at Croton, N. J., and L. C. Fitzgerald, car foreman, succeeds Mr. Davey.

W. W. Lemen has been appointed superintendent of the motive power and car departments of the Denver & Rio Grande, with headquarters at Denver, Colo., vice W. J. Bennett, resigned, and W. O. Cook, general road foreman, has been appointed assistant superintendent motive power and car departments, with headquarters at Denver, Colo. (Burnham station). The office of general road foreman has been abolished, but the duties of the position have been assumed by Mr. Cook.

J. A. Delaney, master mechanic of the Rio Grande division of the Texas & Pacific, with headquarters at Alexandria, La., has been transferred to Big Spring, Tex. W. H. Keller, master mechanic at Big Spring, has been transferred to the Ft. Worth Division, with headquarters at Ft. Worth, Tex., relieving G. W. Deats, who has been appointed traveling supervisor of fuel and oil. W. L. McMurry, an engineer on the Ft. Worth division, has been appointed supervisor of fuel on the Rio Grande division, with headquarters at Big Spring, Tex.

R. E. Lee, acting manager of the mining and fuel department of the Chicago, Rock Island & Pacific, has been appointed manager of the mining department with jurisdiction over mines and mining operations, with headquarters at Chicago. The purchase, inspection and distribution of the company fuel will be under the jurisdiction of F. D. Reed, general purchasing agent. C. T. Winkless, superintendent of fuel, is transferred to the purchasing department, reporting to Mr. Reed. The conservation of fuel used in locomotives, stationary plants and pumping stations will be under the supervision of the mechanical department. The operation and maintenance of coal chutes will be under the jurisdiction of the transportation department and directly in charge of the division superintendent. The above reorganization became effective December 1.

Purchasing

H. M. Dewart has been appointed assistant purchasing agent of the Central Vermont, with office at St. Albans, Vt.

Railway Officers in Military Service

H. B. Perry, assistant trainmaster of the Cleveland, Cincinnati, Chicago & St. Louis at Springfield, Ohio, has enlisted in the army.

OBITUARY

David L. Middleton, commercial agent of the Lehigh Valley died from heart disease in his office in New York City on November 30.

Alexander S. Thweatt, general eastern passenger agent of the Southern Railway system, died on December 4, at his home in New York, at the age of 56.

Clinton White, former railroad commissioner of Massachusetts, died at his home in Melrose, Mass., November 25, at the age of 73. Mr. White was appointed a member of the railroad commission in 1901 and continued on that board, and its successor, the Public Service Commission, until 1915.

Slacker "is a useful expression designed to describe a person or institution derelict or negligent in the discharge of certain duties toward his government or country," says C. M. Larson, engineer of the Railroad Commission of Wisconsin, in a letter printed elsewhere in this issue. Mr. Larson objects strongly to applying it to states that, prescribing by law a two-cent passenger rate on intrastate business, place the burden of unprofitable passenger service rendered to its citizens on the citizens of other states. It is the merest quibble to say that Wisconsin permits charging a higher passenger rate for roads earning less than \$3,500 gross per mile. The Illinois Central, which heads Mr. Larson's list, operates about 100 miles in Wisconsin and runs two passenger trains each way each day over this mileage. The out-of-pocket cost of operating these trains, together with maintenance of way expenses and maintenance of passenger equipment expenses, would amount to over \$2,000 per mile, leaving less than \$1,500, even with three-cent passenger fares, for operation and maintenance of freight trains and equipment and interest charges. Even Wisconsin cannot get blood out of a turnip and need take no credit to herself for that fact. One of the vital needs that is being brought home by the war to every thinking man in the country is the necessity of an adequate and evenly developed transportation system. Two-cent-passenger-fare state legislation has done much to render this impossible, but past selfishness does not make a state a slacker; it is continuance in this attitude in the face of a national crisis that makes an "institution derelict . . . in the discharge of . . . duties towards its . . . country."

Derelict in the Discharge of Its Duties

Slacker "is a useful expression designed to describe a person or institution derelict or negligent in the discharge of certain duties toward his government or country," says C. M. Larson, engineer of the Railroad Commission of Wisconsin, in a letter printed elsewhere in this issue. Mr. Larson objects strongly to applying it to states that, prescribing by law a two-cent passenger rate on intrastate business, place the burden of unprofitable passenger service rendered to its citizens on the citizens of other states. It is the merest quibble to say that Wisconsin permits charging a higher passenger rate for roads earning less than \$3,500 gross per mile. The Illinois Central, which heads Mr. Larson's list, operates about 100 miles in Wisconsin and runs two passenger trains each way each day over this mileage. The out-of-pocket cost of operating these trains, together with maintenance of way expenses and maintenance of passenger equipment expenses, would amount to over \$2,000 per mile, leaving less than \$1,500, even with three-cent passenger fares, for operation and maintenance of freight trains and equipment and interest charges. Even Wisconsin cannot get blood out of a turnip and need take no credit to herself for that fact. One of the vital needs that is being brought home by the war to every thinking man in the country is the necessity of an adequate and evenly developed transportation system. Two-cent-passenger-fare state legislation has done much to render this impossible, but past selfishness does not make a state a slacker; it is continuance in this attitude in the face of a national crisis that makes an "institution derelict . . . in the discharge of . . . duties towards its . . . country."

Fairfax Harrison, chairman of the Railroads' War Board, has issued a bulletin to the railroads suggesting that during the period of heavy passenger traffic the use of official and private passenger cars should be limited in order to relieve overburdened passenger trains and that no such cars be handled, either in free or pay service, except for the accommodation of railroad officers when traveling on necessary railroad business. This is a matter which ought not to require sug-

gesting more than once. The Interstate Commerce Commission in its decision in the five per cent rate case made a similar suggestion to the railroads as a measure of economy. It is especially pertinent at this time when not only passenger traffic is heavier than ever before, but the railroads are overtaxed in almost every direction and are straining every nerve to handle the necessary traffic of the country. After the roads have done everything they have felt possible in the way of reducing unnecessary passenger service, particularly branch line and local service, it does not help them in the eyes of the public to handle any more private cars than necessary. Of course, there is a sharp distinction, which the public does not usually appreciate, between the official car which is the railroad officer's traveling office, and which is indispensable on many occasions, and the private cars used by various persons who can afford to pay for them or who are allowed free transportation, including the families of directors and officers, and who use them for the sake of luxury and exclusiveness rather than for business reasons. Everyone who has accompanied railroad officers on important trips, for example, knows that their cars are in no sense "private" but are as much a workshop as the office at headquarters and not only enable the railroad man to keep up his office work while on the road but are often occupied by a dozen or more people who ride a short distance with him for conference. Such cars are just as necessary in these times as in any others, if not more so; but the same facts do not apply to the private cars whose use by the occasional parasites on the railroad organization are responsible for the public criticism of all so-called "private" cars.

If our freight trains could be run at 12½ miles an hour where now they are run at 10 miles an hour, the cars would be one-fifth less time on the road and "there would be one-fourth more cars available for service at all times." This remarkable bit of economic wisdom comes from the Honorable William C. Adamson, representative in Congress, and putative author of the "eight-hour law" for trainmen. It is found in an interview in the New York Tribune of December 2. Mr. Adamson has resigned his seat in Congress and is to take a government position in New York City to which President

Mr. Adamson and His Law

Adamson, representative in Congress, and putative author of the "eight-hour law" for trainmen. It is found in an interview in the New York Tribune of December 2. Mr. Adamson has resigned his seat in Congress and is to take a government position in New York City to which President

Use of Private Cars In War Time

Fairfax Harrison, chairman of the Railroads' War Board, has issued a bulletin to the railroads suggesting that during the period of heavy passenger traffic the use of official and private passenger cars should be limited in order to relieve overburdened passenger trains and that no such cars be handled, either in free or pay service, except for the accommodation of railroad officers when traveling on necessary railroad business. This is a matter which ought not to require sug-

Wilson has appointed him; and this interview may perhaps be intended as his farewell address to the people of the country. The fact that freight cars average only about two hours a day on the road (spending the other 22 hours in yards or shops) reduces his calculated increase in car supply about 90 per cent, and makes in his pleasing picture a slight dent which, evidently, he had not thought of. That an increase in speed of trains would reduce the income seriously, because of the necessary lightening of the load, is another fact; and this would neutralize the remaining ten per cent of the supposed savings. This, also, the congressman may have forgotten, though he has been told it often enough. Mr. Adamson's interview indicates that he is a victim of misplaced confidence. He got his law passed (ostensibly) to aid the trainmen in getting shorter hours, but he finds now that "the railroads, every one of them, have agreed with the employees to run the same hours as before. . . . They seem to forget that the operating officers and the employees are compounding a felony." It must be truly depressing to find that the trainmen are as wicked as the capitalists whom they work for. In one little item of the interview there is a bit of light; Mr. Adamson has told President Wilson that there is no need of an investigation by the Goethals committee concerning the operation of the "eight-hour" law. The facts are well enough known already. This ought to mean a saving of government money. Mr. Adamson has varied troubles. He says "In San Francisco I found myself sitting next to a railroad president at a banquet, and he began sniping at me with complaints about the eight-hour law. I asked him if his road had ever paid any attention to it, other than paying the men overtime, and he admitted it had not." Sniping is, indeed, an underhanded method of calling a congressman to account. Such tactics are in marked contrast to the above-board methods of the trainmen when they sat in the Congressional galleries with their stop watches in their hands, on the occasion of the passage of the Adamson law.

The report of the Committee on Railroad Securities of the Investment Bankers' Association of America contained a suggested form for a standard railroad annual report to stockholders. The form combines the good features to be found now in various companies' reports and contains some suggestions for information to be given to stockholders which so far as we know no company is now including in its annual report. In one particular at least, however, the information called for is not as complete as it should be. This is in regard to depreciation. The form suggested for annual reports calls for a statement of the rules and rates which the company used to determine the amounts charged to operating expenses for depreciation, which is good so far as it goes. A specific statement should also be included showing the percentage of the original cost which has been written off through depreciation for each class of equipment. It is, of course, now possible to make a rough estimate by comparing the total credit through depreciation with the book value of the equipment as shown on the balance sheet, but a statement showing specifically the percentage of cost of locomotives, of freight cars, of passenger cars, etc., which has been written off would be of great value. The practice of different roads in regard to the method of figuring depreciation of equipment when partial renewals are made, etc., is in many instances very complicated, and while the companies have to stand ready to justify whatever system they use before the Interstate Commerce Commission, this does not help the layman stockholder to form an opinion as to how ample depreciation charges are. Furthermore, a company ought to state in its annual report specifically whether the amounts charged for depreciation are set aside or are used in the purchase of bonds for sinking fund or of

new equipment, or as is now generally the case, simply a part of general assets, no more readily available for use in buying new equipment than are any of the other general assets. If a board of directors had to state specifically that the average years in service of all their locomotives was 20, and that only 25 per cent of the original cost of these locomotives had been written off through depreciation, and that this depreciation was a book charge only and that if new equipment had to be bought next year funds would have to be borrowed to pay for it, it would have a salutary effect in preventing such a condition from existing.

THE IMPENDING GOVERNMENT CONTROL OF RAILROADS

AT the time this editorial is being written the railroads of the United States are passing through the most important crisis in their history. The determination as to whether they shall continue to be operated under the direction of the Railroads' War Board or their management shall be delegated to some government officer or board is entirely in the hands of President Wilson. The indications are that control of operation through some government board or official will be undertaken.

It is worth while at this time when the fate of the railroads during the war is hanging in the balance to inquire, first, why serious consideration is being given to government operation and, second, what results, if any, probably can be secured under government operation which could not be obtained under private operation directed by the Railroads' War Board.

* * *

If the government assumes control it will not be because the railroads have "broken down" or because the War Board has failed. The railroads have handled this year 15 per cent more freight business than they did last year, and during the first six months after our country entered the war they handled 50 per cent more business than in the same months of 1915. That does not indicate any "break down." The same facts which show that they have not broken down also demonstrate that the Railroads' War Board has not failed. It was appointed to operate the railways as a single system in order to enable them to handle the maximum practicable business.

Commissioner McChord, in his dissent from the special report on the railroad situation which the majority of the Interstate Commerce Commission sent to Congress last week, tried to show that the Railroads' War Board had not succeeded in operating the railways as a single system and that no voluntary railroad committee could do so. The evidence he cited in the case of the War Board is the measures adopted to relieve the congestion in eastern territory. But this was trying to prove that the War Board was not doing the very thing the evidence he cited showed it was. Nobody, we suppose, assumed last April when the railways agreed to operate as a single system, that all the measures necessary to carry out this plan would be adopted instantly. It was to be expected that needed measures would be adopted as conditions showed the need of them. This is what has been done. First, box cars were pooled. Next all freight handled in connection with the construction of the cantonments was divided between the different railways and moved over the lines of least resistance. Next, the same principles were applied in the handling of troops and of supplies for the troops. Finally, when the congestion developed in eastern territory further measures were adopted to apply the same general principles. The effort of the War Board has been to pool railway equipment and service, *in so far as necessary*, to move the maximum traffic.

In order to handle more traffic it will be necessary to secure still greater co-ordination in the operation of the

facilities of the various railways, and this, sooner or later, will make desirable and even necessary the use of methods not conforming to existing laws. For this reason, as the *Railway Age Gazette* began pointing out editorially some weeks ago, and as the Interstate Commerce Commission pointed out in its special report to Congress last week, the suspension of the Sherman anti-trust law and the anti-pooling law is extremely desirable. Furthermore, railway equipment is being worn out, and if efficiency is to be maintained and increased, the least that must be done is to let the roads get enough new facilities to replace those being worn out. But because the War Board has not done everything at once—because to enable it to secure the greatest efficiency it is desirable that certain laws be suspended, and that means be provided for enabling the railways to maintain and enlarge their facilities—it does not follow that the Railroads' War Board has failed. On the contrary, it has done wonders.

The government has created various agencies in Washington to deal with new conditions resulting from the war. The *Railway Age Gazette* asserts, as a result of careful observation both in Washington and elsewhere, that the Railroads' War Board, up to the present, has accomplished far more in the direction of helping win the war than any agency which the government itself has created since this country entered the war. And yet it is now proposed to set aside the Railroads' War Board, or at least subordinate it.

* * *

Why is this step probably going to be taken? The reasoning which has prevailed in Washington runs as follows: The operation of the railways should, in the interest of the highest efficiency, be left in the hands of their present managers. But the laws which interfere with securing their greatest efficiency should be suspended or repealed and the government should in some way help the railways to provide the facilities which they require for replacements and to increase their capacity, and should give them its support in one form or another in securing the earnings and the new capital required for this purpose. Now,—so this reasoning runs—as long as the railways are left to the management of their own officers Congress will refuse to suspend restrictive laws or to enact any legislation for the purpose of giving them loans or guarantees of any kind. Therefore, the government, in order to get Congress to do its duty in the matter, must assume control of operation.

The Railroads' War Board has met this argument by saying, in a statement to Senator Newlands, that the railroads do not at present ask a suspension of the Sherman anti-trust law or the anti-pooling law, and that they will not need government loans or guarantees if the Secretary of the Treasury and the Federal Reserve Board will co-operate with them in raising new capital on the railways' own credit. The railways would welcome suspension of restrictive laws and the aid of government loans or guarantees if these things could be secured without throwing the whole railroad question into the maelstrom of politics; but their managers feel that they can work out the problem of securing maximum efficiency without the suspension of the laws or government loans, and that it would be better for the country to let them do this than either to throw the whole railroad question into Congress or to appoint a government railway administrator.

Why does the belief prevail that Congress, in spite of the fact that the Interstate Commerce Commission has practically recommended it, will refuse to suspend restrictive laws or give the railways any financial aid, direct or indirect, so long as the railways are left in the hands of their own managers? We have asked that question in Washington within the last few days of many people, and a great majority have made the same answer. That answer has been "politics." We have made the interesting discovery that business men, government people and newspaper correspondents in Washington have the poorest opinion of Congress which obtains

in any part of the United States. Down there they always assume that under any and all conditions, in dealing with any and all questions, Congress will be governed, not by public considerations but solely by political considerations. The reasoning there about the railway situation is that Congress would not think it good politics to leave the railways in the hands of their own managers and at the same time give them any assistance by the suspension of restrictive laws, by loans or otherwise. But, it is argued, the railways must be given some kind of government help. Therefore, there must be created some government authority to supervise their operations so that Congress can be induced to give them the necessary aid. All of which is not very complimentary to Congress; but, as already said, it is the reasoning that is prevailing in Washington.

Of course, the doctrinaire advocates of government ownership do not reason thus. They believe that the adoption of government operation would result in an increase of efficiency and thus bring government ownership nearer. But the number of persons who reason thus in Washington seems to be small. It is generally understood that President Wilson himself is opposed to government ownership; and that even though he should decide in favor of government operation he would regard it merely as a war measure, to be abandoned at the end of the war.

* * *

Since some form of government operation or at least of government supervision of operation seems probable, the question naturally arises as to what will be gained and what will be lost by it. The Railroads' War Board has publicly gone on record with the opinion that government operation could not result in any increase in the efficiency of the use of existing railway facilities which could not be secured without it. The ablest railway managers in the country have for months devoted all their energy and ability to operating the existing facilities with the greatest practicable efficiency. To assume that any railway officer, merely because he was clothed with governmental authority, could accomplish more than they have is absurd, and to suppose that any man without experience in railroad management, even though clothed with governmental authority, could accomplish as much as they have, is equally absurd.

There is very great danger that the adoption of government operation will result in a serious reduction, rather than in any increase, of railroad efficiency. Railway officers, no matter how patriotic, are likely to feel disappointment and chagrin if the government takes control. It tells them, in effect, that they have failed and that the government does not trust them. The effect may be to impair, and even seriously impair, the official morale. A government railway administrator, if free from restrictive laws and enabled to raise and spend money where the railway managements have been unable to raise and spend it, might be able to do some important things which the railway managements have not been able to do. But any advantages which might result from these things would not be secured for months, while the effects of the impairment of the official morale would be felt at once and might easily continue to be so serious as to more than nullify the effects of all that a government administrator could do.

If the government should assume control of operation, it might limit or perhaps even prevent the impairment of official morale by adopting one or the other of two alternatives. It might appoint as the government railroad administrator an eminent railway executive whose ability and experience would inspire the confidence of railway men. Or it might appoint a railway administrator who was not a railway man, but with the understanding that, while he would exercise the authority of the government in so far as might be necessary, he would leave the actual operation of the railroads in the hands of the existing organizations. If the government

should appoint as the railway administrator a man without great experience and demonstrated ability in railroad affairs, and he should attempt to supplant the existing organization in the management of the railways, there would result a serious demoralization.

Unfortunately, our experience with government regulation has not been such as to encourage the hope that a government administrator, unless he were an experienced railway officer, would show the needed self-restraint and good judgment. The present railroad situation is due ten times as much to faults of railroad regulation as to faults of railroad management; and the effects which have been produced by the wrong kind of railroad regulation should serve as a warning which would prevent the adoption of government railroad management of the same misguided and destructive kind.

* * *

However, no matter how unwise railway executives and other railway officers may think that the adoption of government management may be at this time, no matter how unwise they may think the kind of government management adopted is, their duty will be clear. The country is involved in the greatest war ever known. Its future is at stake, and the outcome of the war will depend largely upon how railway executives and railway officers generally continue to do their work. The responsibility and burden of carrying on the war so far as this country is concerned rest chiefly upon one man. President Wilson, in carrying this responsibility and burden, ought to have, and if he is to bear them successfully, must have, the loyal and energetic support of every American citizen. He has done his best to settle the question of railroad management in that way which will most effectively promote the interests of the country. Once he has decided the matter, "Ours not to reason why, ours but to do and die," should be the motto of all railway men.

It was all right before the United States entered the war for people to discuss whether it ought to enter the war. Once it had entered, the first duty of every citizen became that of helping to make its participation in the war a success. So it is all right to discuss the desirability of government operation until it has been adopted. Once it is adopted, however, it will become immediately the first duty of every railway man to do all that is possible to make government operation a success. Nine railway men out of ten believe that the adoption of government operation is unnecessary and a mistake. But it is as much the duty of citizens to help prevent mistakes on the part of the government from having bad effects, as to help prevent the mistakes from being made. The one great object of all at present should be to help win the war; and whether the railways are under private management or government management the one way in which railway men can contribute most toward helping win the war is by contributing all they can toward efficient railroad operation.

FEDERAL LOCOMOTIVE INSPECTOR'S REPORT

THE report of the chief inspector of locomotive boilers to the Interstate Commerce Commission reflects to some extent the condition of the power on the railways in this country. While the percentage of locomotives found defective has increased from 47 per cent in 1916 to 54.5 per cent in 1917, the power throughout the country is believed to be in as good condition as it was at the end of the last fiscal year. The increase in number of defective locomotives shown is largely due to the fact that many roads have placed in service a considerable number of old locomotives which, under ordinary conditions, would have been scrapped and replaced, and they have done this without paying sufficient attention to their condition. The number of classified defects relating to the boiler and its appurtenances is found to have increased over last year a much greater amount than

the defects to the other parts of the locomotive and tender. This also is due primarily to the fact that old locomotives have been placed in service without proper inspection.

A careful examination of the detailed report of defective locomotives found on the individual roads shows that many roads have materially improved the condition of their power over last year, while some have not as good a record as last year. This is evidence that, as the chief inspector says in his report, the power can be properly maintained even under the present exacting operating conditions. He calls attention to the necessity for careful supervision of repairs made to locomotives, and this cannot be emphasized too strongly, for it is practically the only way by which a road may be sure of its power. An engine failure under the present traffic conditions is far more costly than under ordinary conditions, and it is far better to hold a train for a good locomotive than to send it out with one that is liable to fail and cause delays to many other trains. The running repairs must be carefully made and all repairs should be thoroughly inspected to see that they have been made properly.

The number of locomotives inspected this year was less than last year, owing to the fact that the inspectors in this department have at times been used on Interstate Commerce Commission business other than locomotive inspection. An abstract of the chief inspector's report to the Commission is published elsewhere in this issue.

BUY IN HASTE AND REPENT IN LEISURE

WITH a condition confronting the railroads under which performance is of much greater importance than economy, at a time when there is an extreme shortage of labor, great impetus has been given to the demand for labor-saving equipment of all kinds. Under normal conditions machinery designed to save man power is installed only after investigation clearly demonstrates the economy of the installation, but at present the prime condition imposed is that the equipment will bring about an increased production per man. Under such circumstances it is to be expected that the lack of careful study of the possibilities of such equipment which has retarded its application during normal times is now almost sure to result in its unwise and therefore disastrous use in certain cases unless preventive measures are taken before the damage has been done.

Take the case of the freight house truck. The relative merits of the two-wheel and the four-wheel truck commonly used in handling freight have been discussed so frequently that further mention seems almost superfluous. The advantages of the four-wheel truck in saving man power and reducing freight house costs under the usual conditions, whether used with tractors or without them, have been demonstrated repeatedly where care has been taken to secure equipment suited to the local situation and to modify the operating methods to meet the limitations of the new equipment. Notwithstanding this, trials with the four-wheel truck in certain cases have resulted in their subsequent abandonment for one of two reasons; either the situation was one to which the trucks were not suited or their trial use was not conducted intelligently.

Personnel is important. The right man should direct an investigation of this kind and in the right way. Before the work is taken up, this man should be fully convinced of the merits of the plan himself, and unless he is entirely in sympathy with it he cannot or will not overcome the obstacles to success. Selection of the equipment is also important; a duplication of the trucks used successfully in some other house will not necessarily be the proper solution in the case in hand. Other features that endanger or may prevent the success of the new installation include failure to redistribute the labor to secure the best results under the new conditions. Success may demand an entire change in the method of

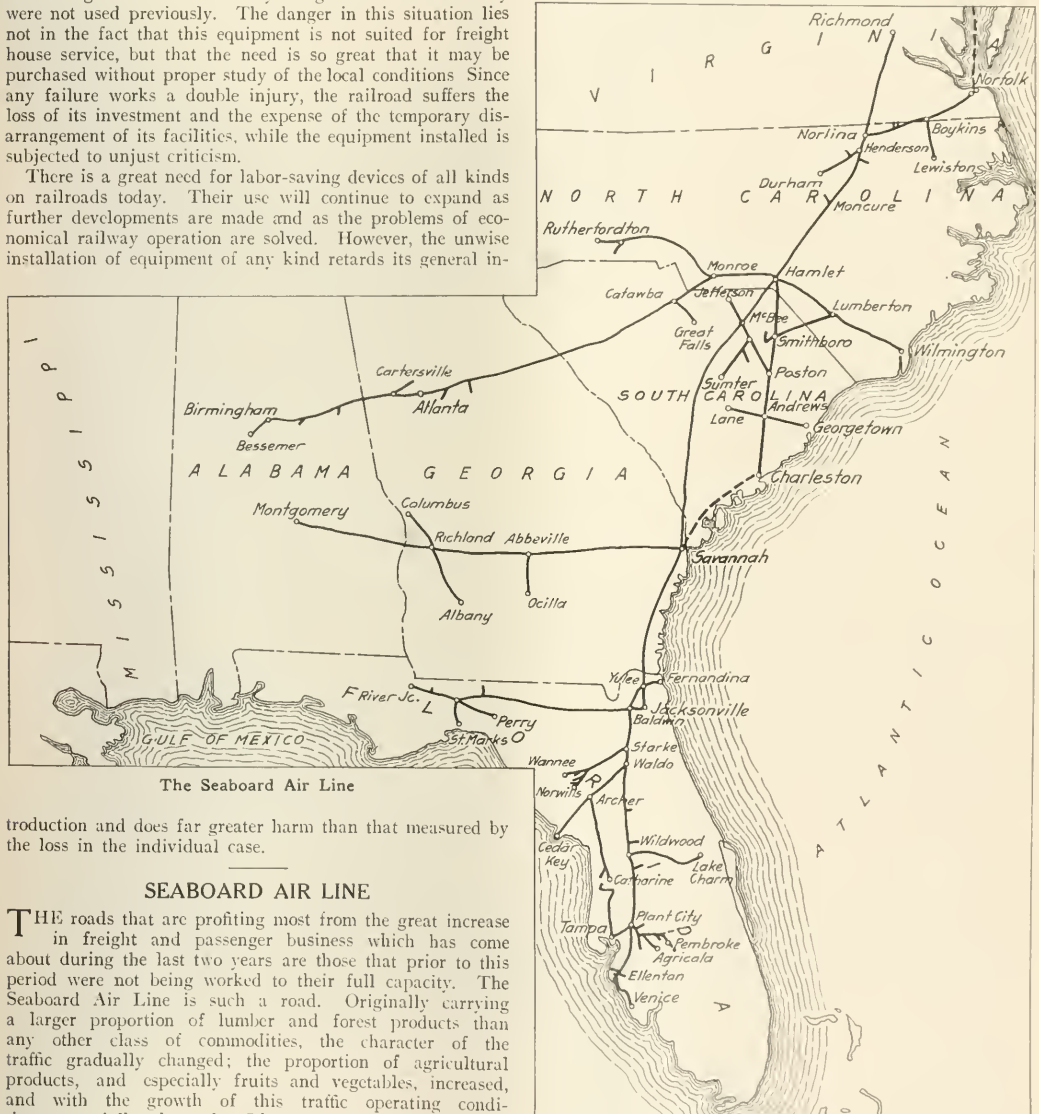

checking or routing the freight through the house. In more than one case failure has resulted from the reluctance of some individual to depart from long-established standards. These and other difficulties, usually surmountable if properly studied, have, in certain instances, prevented the installation of new equipment in the past.

Under press of the prevailing need for reducing the congestion in terminals, the four-wheel truck and the tractor are now being introduced in many freight houses where they were not used previously. The danger in this situation lies not in the fact that this equipment is not suited for freight house service, but that the need is so great that it may be purchased without proper study of the local conditions. Since any failure works a double injury, the railroad suffers the loss of its investment and the expense of the temporary disarrangement of its facilities, while the equipment installed is subjected to unjust criticism.

There is a great need for labor-saving devices of all kinds on railroads today. Their use will continue to expand as further developments are made and as the problems of economical railway operation are solved. However, the unwise installation of equipment of any kind retards its general in-

In the calendar year 1915 the total tonnage of freight carried by the Seaboard was 8,920,000 and the freight density (ton-miles per mile of road) 434,000. In the calendar year 1916 the total tonnage carried was 10,496,000 and the density 543,000.

Of the total tonnage carried in 1916 over 35 per cent was manufactures, comparing with less than 34 per cent manufactures in 1915. In 1916 the products of agriculture were

The Seaboard Air Line

roduction and does far greater harm than that measured by the loss in the individual case.

SEABOARD AIR LINE

THE roads that are profiting most from the great increase in freight and passenger business which has come about during the last two years are those that prior to this period were not being worked to their full capacity. The Seaboard Air Line is such a road. Originally carrying a larger proportion of lumber and forest products than any other class of commodities, the character of the traffic gradually changed; the proportion of agricultural products, and especially fruits and vegetables, increased, and with the growth of this traffic operating conditions materially changed. The plant, however, with the exception of equipment, was at no time being worked to anywhere near capacity. Within the last few years a further change has taken place in the character of the traffic handled by the Seaboard. The proportion of manufactures carried has been increasing and a larger traffic in heavy loading commodities, such as stone, sand, etc., has developed.

12.89 per cent of the total tonnage, and 1915, 16.72 per cent. Products of mines furnished 24.65 per cent of the total tonnage in 1916 and 23.26 per cent in 1915. With the change in character of traffic in recent years there has taken place a change in operating methods. Competition and the character of traffic had led to the use of high speed, compara-

tively light locomotives for freight service, with fast schedules for freight trains and, of course, high ton-mile costs. Within the last few years, however, heavier locomotives have been put into freight service, the average trainload greatly increased, and what are generally understood to be modern scientific methods of railroading have been applied. In 1911 the average freight trainload of all freight, including company, was 251 tons; in 1916 it was 400 tons. There was a big increase in 1916 over 1915, the average trainload of all freight in 1915 being 337 tons.

The management has replaced Pacific type locomotives in freight service with Mikados and has now ordered 26 locomotives divided between Mallets and Santa Fe type. Difficult as it has been to get deliveries of equipment, the Seaboard expects to receive these heavy locomotives within the next few months.

In 1916 the Seaboard earned \$26,184,000, an increase of \$3,544,000 over 1915. Expenses and taxes amounted to \$18,743,000, an increase of \$2,137,000, leaving an increase of \$1,402,000 in operating income, the total operating income in 1916 being \$7,429,000. A part of this increased income was offset by a debit of \$144,000 for hire of equipment as against a slight credit in 1915 on this account and an increase of \$290,000 in interest charges. The amount available for interest on the income bonds was \$2,862,000 in 1916 and \$1,805,000 in 1915. The full 5 per cent on these bonds calls for \$1,250,000, which amount was paid in both years, leaving a surplus in 1916 of \$1,612,000 as against \$555,000 in 1915.

In 1916 the Seaboard had not yet begun to feel the full force of the increase in operating costs which has since hit all railroads so hard. In the nine months of the present calendar year total operating revenues amounted to \$21,940,000, and since the winter months are the busiest ones for the Seaboard, this will mean between one and two million dollars increase in gross over 1916 for the year. Total operating expenses for the nine months were \$15,579,000. The increase in expenses has been large but had not up to the end of September entirely offset the increase in gross, operating income being \$5,361,000 for the nine months ended September 30, an increase over the corresponding nine months of the previous year of \$242,000.

Besides the economies that may be expected to follow the placing in service of Mallet and Santa Fe locomotives, the opening of the new line which the Seaboard has built from Charleston, S. C., along the edge of the sea coast to Savannah, Ga., will permit of very considerable economies in operation. A glance at the map will show that this new line, which it is expected will be completed during the present calendar year, will give the Seaboard two lines from Hamlet, N. C., to Savannah, Ga. Grade revision work has been done on the line from Hamlet to Charleston so that the new through line to Savannah will have a maximum 0.5 per cent grade and a maximum curvature of 3 deg. This maximum grade and curvature hold good for the entire line from Hamlet, via Charleston, to Jacksonville, Fla. The new line will permit of an increase in trainloading between Hamlet and Savannah of over 127 per cent.

Considerable other grade revision work is being done, and that between Raleigh, N. C., and Sanford will permit of considerable economies. When the work now in progress is completed on the line from Sanford, N. C., to Hamlet, two pusher grades will have been eliminated and a maximum .5 per cent northbound and .8 per cent southbound grade will have been established. In 1916 a total of \$2,027,000 was spent for additions, betterments and extensions to road and a net of \$172,000 to additions to equipment. At the end of the calendar year the Seaboard had \$2,385,000 cash, exclusive of special deposits with fiscal agencies and trustees, and no loans and bills payable except a nominal amount—

\$44,000—coming under this classification. The Seaboard is carrying on its balance sheet \$5,234,000 discount on funded debt, comparing with \$10,878,000 carried on the balance sheet as of June 30, 1916. During the six months June 30 to December 31, \$5,273,000 discount on bonds sold in previous years was charged off through profit and loss, leaving a surplus to profit and loss at the end of the calendar year of \$5,796,000, comparing with a profit and loss surplus of \$8,057,000 as of June 30, 1916.

The Seaboard depends entirely on colored labor for maintenance of way gangs, and the movement of negroes into the North has caused a shortage of section labor comparable to the shortage due to the lack of newly landed immigrants and the demand for industrial labor in the East, and the demand for farm and industrial labor in the West. During 1916 \$3,188,000 was spent for maintenance of way, an increase of \$557,000 over the previous year. Maintenance of equipment cost \$3,910,000, an increase of \$635,000 over the previous year. The following table shows the percentage of each class of expenditures to total operating revenues:

	1916	1915
Maintenance of way.....	12.17	11.62
Maintenance of equipment.....	14.93	14.46
Traffic expenses.....	3.47	3.47
Transportation expenses.....	33.07	35.02
General expenses.....	2.90	3.32
Total, including miscellaneous.....	66.96	68.44

The following table shows the principal figures for operation in the calendar year 1916 compared with the calendar year 1915:

	1916	1915
Average mileage operated.....	3,452	3,409
Freight revenue.....	\$18,211,895	\$15,434,241
Passenger revenue.....	5,348,979	4,781,523
Total operating revenues.....	26,184,487	22,640,876
Maintenance of way and structures.....	3,187,544	2,630,459
Maintenance of equipment.....	3,909,974	3,275,144
Traffic expenses.....	907,086	785,581
Transportation expenses.....	8,660,088	7,928,829
General expenses.....	758,373	750,915
Total operating expenses.....	17,531,907	15,494,595
Taxes.....	1,210,691	1,111,381
Operating income.....	7,428,999	6,026,677
Gross income.....	7,889,431	6,429,784
Net income.....	2,862,011	1,804,802
Interest on adjustment (income) bonds.....	1,250,000	1,250,000
Surplus.....	1,612,011	554,802

NEW BOOKS

Street Railway Fares. By Dugald D. Jackson, professor of electrical engineering and David J. McGrath, research assistant in electrical engineering at the Massachusetts Institute of Technology. 155 pages, 58 illustrations, 6½ in. by 9½ in., bound in cloth. Published by McGraw-Hill Book Company, Inc., 239 West 39th street, New York.

The contents of this book comprise data collected and conclusions reached in a research on electric railway traffic and fares, which research has been performed at the Massachusetts Institute of Technology. The data on street railway traffic and fares were broadly investigated for many years back, and were carried up to the present. The subdivisions of the main problem taken up comprise the major factors of street railway traffic, which influence the cost of carrying the average passengers and the manner in which these factors affect the practicability of making long hauls for five cents in ordinary street railway service. The data points strongly to certain limitations in regard to fares and hauls, which are intimately associated with the density of traffic, measured either in revenue passengers carried per car-mile run or passengers carried per year per mile of main track. The more important subdivisions of the subject dealt with have been treated in separate chapters, and it is believed that this subdivision of the chapters will make the book more valuable to students of street railway problems.

Letters to the Editor

MOTOR FREIGHT TRUCKS ON HIGHWAYS

AMARILLO, TEXAS.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

Referring to your editorial on "Highways Helpful to Railways," November 30, page 967.

In the Southwest it is questionable if motor freight trucks are helpful for following reasons: Many improved highways have been built parallel to railways to serve the larger towns. The work is financed by bonds, ultimately paid for by taxing property in the district, largely paid for by the farmers and railways. The carriers for hire on these good roads do not participate in either cost of construction or maintenance; in fact, very often no provision is made for maintenance.

When good roads are built, traffic is concentrated on them and they are soon cut up and become as bad as before and additional taxes are needed for maintenance from property owners. Jitney passenger lines and motor truck freight lines have not paid any taxes in many cases, though the last session of the Texas legislature passed a law taxing them about one million dollars. This is not enough, because taxes on other property have been increased about 50 per cent. The expense of finishing most highways in this district with a surface that will bear heavy trucking is prohibitive.

However, motor trucks can help railways by short hauls to relieve cars for long hauls, especially in intra-city switching movements; the main point to consider is that all motor carriers for hire should be properly taxed to bear their share of maintenance of highways by a special tax.

AVERY TURNER.

ELIMINATE UNNECESSARY VALUATION DETAILS

RICHMOND, VA.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

In the *Railway Age Gazette* of November 30 I read with much interest the editorial on "The Valuation Department and Exemptions." From my own organization 14 men have entered military service. With one exception, all are from my engineering force, and all are fine fellows—men whom I wanted to keep. Only two were drafted. One is now with one of our engineering regiments somewhere in France. The majority of the rest are holding commissions in the infantry and artillery. They should all be attached to our engineering forces. This depletion of my force leaves me short-handed with vacancies that are hard to fill, especially engineers and draftsmen.

The editorial referred to makes the depletion of valuation forces a plea for the discontinuance of the work of Federal valuation, and in that plea there may be reason. But to me there is in addition a strong plea for a revision of the methods now followed in this work, probably necessary under the Valuation Act, so as to get away from a lot of useless, burdensome and costly details that have no relation whatever to the great and sole object in view in this work—the ascertainment of "Value," of "Final Value." It may be that the ascertainment of "Final Value" is solely a judicial procedure. I leave that question to the lawyers.

I might say much on this phase of Valuation work, but it may be best to "let sleeping lions lie," because if I were to start to talk about a revision of this whole matter, I would begin with the very Act itself, an act that has loaded the Interstate Commerce Commission, as well as the carriers,

with a heap of useless, costly work. An Act lacking in constructive statesmanship, burdensome with irrelevancy, and distractingly indefinite.

It may be that the work must go on as it is going on, because of the mandate of the Act. But, while this great work of valuation is important, yet, if it is interfering with the great, paramount duty of our Nation today, then it should be stopped. I leave that question open, although there need be no interference.

I would not plead for the cessation of the work. There are good reasons why it should not stop. But I do plead for common sense in doing the work. Is it too late?

JAMES P. NELSON,
Valuation Engineer.

A QUIBBLE OVER A QUESTION OF DUTY

MADISON, WIS.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

On page 952 of your issue of November 23, 1917, you have published a map which purports to show the rates which each state permits the railroads to charge for passenger fares. A certain area on the map covering eleven states is colored black and these states have been designated "slack-rate states."

Before considering the fundamental fault that inheres in this analysis due to drawing conclusions from insufficient data, we are constrained to pause to consider the taste displayed by the use of this term as employed in this case. The word "slack-rate" has come to have a well defined and opprobrious meaning in the English language. It is a useful expression designed to describe a person or institution derelict or negligent in the discharge of certain duties toward his government or country. Phrase makers who attempt to enlarge the meaning of the term so that it may cover any person, establishment or institution against which they desire to inveigh, do much to rob the term of its usefulness in the particular emergency in which our country is involved. A specific term capable of nice use may become a general and meaningless expression through popular attempt to use it to cover situations to which it was not intended to apply. More particularly is the word robbed of its effectiveness when it can be shown that it was employed through no desire to make use of its descriptive force, but was maliciously used to secure the impeaching effect of the opprobrium it was originally designed to convey.

Though no explanation is given on or in connection with the map as to the basis for the figures indicating fares permitted in each state, the actual facts with respect to the state of Wisconsin, at least, dispute the correctness of the data shown thereon.

Under the laws of Wisconsin a railroad whose gross receipts amount to \$3,500 per mile per annum is not permitted to charge more than two cents per mile for passenger fares. Railroads whose gross earnings are less than \$3,500 per mile per annum may charge higher fares. Schedules of passenger fares on file with the railroad commission of Wisconsin show that many railroads in this state charge three, four and even five cents per mile for passenger fares.

The following list shows the rates of fares charged by certain of these railroads:

Illinois Central	3 cents per mile
Duluth, South Shore & Atlantic	3 cents per mile
Green Bay & Western	3 cents per mile
Wisconsin & Michigan	3 cents per mile
Stadley, Merrill & Phillips	3 cents per mile
Wisconsin & Northern	3 cents per mile
La Crosse & Southeastern	3 cents per mile
Fairchild & Northeastern	4 cents per mile
Mineral Point & Northern	5 cents per mile
Hillsboro & Northwestern	5 cents per mile
Other small railroads	5 cents per mile

It is true that the railroads which operate a large proportion of the mileage in the state are affected directly or indirectly by the so-called two-cent-fare law, but the above

figures show that any statement that all passenger fares are on a two-cent per mile basis in Wisconsin is erroneous.

C. M. LARSON.
Engineer, Railroad Commission of Wisconsin.

FRICION DRAFT GEAR IN SERVICE

CHICAGO, Ill.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

I have read with interest the article on friction draft gear by Professor Louis E. Endsley, which appeared in the *Railway Age Gazette* of November 16. The author states that there are three things that draft gears may do.

1—Produce slack in starting trains. 2—Control slack in the movement of trains. 3—Reduce the impact force in the switching of cars.

The author dwells on the third item extensively, considering principally the results shown by testing machines. This is very interesting and instructive, but I desire to present a few observations dealing with the first two items.

In determining what is the best draft gear in train service we should not be governed entirely by laboratory tests, as they do not represent service conditions. With the individual gear a high resistance with a low recoil shows the best results. In train service a high resistance and a high recoil are absolutely necessary to prevent slack action. The stored energy from the draft gear should be sufficient to release the gears throughout the train. Slack action caused by the non-release of the draft gear must be eliminated to avoid shocks in train service. In the report of a committee of the Air Brake Association appointed to investigate slack action in long passenger trains the following statement is made:

"From 1½ to 8 in. of slack between cars has been noted in handling trains, the average being about 2 in. per draft gear. It is evident from the investigation that draft gear generally is inadequate for present heavy passenger service. Draft gear failures occur universally in starting and stopping trains."

An investigation of freight trains should be made along similar lines. It is my opinion that friction draft gear with its increased travel and low recoil increases slack action because it has not sufficient stored energy to return to normal position after being closed by sudden jerks or thrusts or after creeping under the tractive force of the locomotive. After the gears have been in service for some time the parts wear and lose their resistance. To satisfy yourself of the fact go out in any yard when tonnage trains are pulling out and you will find 90 per cent of the draft gears stretched to the limit of their travel by locomotives with tractive efforts of less than 70,000 lb. If we were to increase the draft gear travel to 4 in. we would have more slack than ever before. The increased movement of 2 in. over the spring gear would add 8 in. between each two cars, half of which would be slack.

The conclusions which I have reached after numerous tests and observations of draft gears are as follows: No draft gear, spring or friction, has sufficient stored energy when closed to return to its normal position in a tonnage train, when the engine is working at its full capacity; any draft gear that remains closed from the tractive effort of an ordinary locomotive is useless as far as train operation is concerned. A 4-in. travel is no better than a 2-in. travel if the spring remains closed. A friction draft gear with a long travel and a low recoil does not have time to return to normal position before a reaction takes place. Such gears increase slack and shocks, as the distance between the closed position and the normal position of the gear in train service is lost motion or slack. Due to the factors of time and travel the reverse action is different in train service from that shown in the drop testing machine. In the testing machine the gear has but one action, namely, closing when force is applied, while in train service there is a double action. Any draft

gear, spring or friction, should have at least 100,000 lb. stored energy when closed, in order to release half way under the strain of an engine with a tractive effort of 50,000 lb. This would reduce slack action.

I agree with the author that cars should not be thrown together in yard service at speed exceeding four miles an hour. Switching service is, however, a secondary issue, since it can be controlled. The operation of cars in road service must be made as nearly fool-proof as possible. Under present conditions it is not a question of having sufficient coupler travel to start trains, but it is a question of having an engineer who can start without shock or breaking the train in two, due to excessive travel. The whole matter resolves itself into two questions, namely, Shall we increase the travel and also the shock? or Shall we increase the recoil, thus reducing the slack that produces the shock? The present Master Car Builders' standards of coupler travel are sufficient and should not be changed or departed from.

H. C. PRIEBE.

WHY NOT REGULATE THE COST OF PRODUCTION

RIVERSIDE, Cal.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

Being very much concerned about the labor situation in general, and filled with a desire to give my views some publicity, I am writing you and while I am not anxious that you publish my letter, I would like to see some expression given covering the ideas, as I feel there is a public need of fairness in regulation.

While I understand from the press reports that the federal government is beginning to fix maximum prices on commodities, wheat and coal in particular, nothing appears to have been done towards regulating the maximum cost of production. Assuming that the maximum prices that may be asked for wheat and coal are based on the present cost of production, what is going to be the result when the farmer or the miner is obliged to increase the wages of the employees? How can these producers be expected to continue production at a loss? In our business, the maximum selling price of transportation is substantially fixed while the price of labor is not fixed and the result is that we are forced to lose money on many properties. The losses of a railroad are widely distributed and, the corporation being large, the burden can be borne for some time, but what of the farmer and the miner and perhaps others; will they not curtail service under such conditions and, as a result inflict hardship on the country at large?

Since the draft law has become operative whereby the young men of our country are forced into the service of the government at a maximum wage fixed by the government, and in view of the fact that industrial success is necessary in carrying on the war, it seems to me that the government could well provide by statute that the wages effective as of a given date in any line of industry should not be increased without governmental consent during the period of the war, or something to that effect. There is no reason, and I am thinking of the constitution of the United States, why one class of American citizens, of draft age, should have their work and wages fixed by the government, and on the other hand and, at the same time, allow other American citizens to stay at home and dictate what they shall get or even whether they shall work so long, particularly, as their work is in any way of interest to the public at large. In other words, it seems to me that in all fairness maximum pay in industrial lines must be fixed, or an army of industrial workers formed. Surely this government is big enough and strong enough at this time to protect the public interest by preventing extortionate wages being demanded.

Another Day With the Railwaymen in France

The Engineers Continue to Be Headliners in the Day's News. Eleven Suffer Serious Wounds at Cambrai

AS if not to be outdone by the railways at home in the way of getting feature headlines in the public press, the railwaymen abroad are doing their best to make feature news for the cables from overseas.

FIRST LOCOMOTIVE FROM HOME

"It was welcomed with open arms" is the expression the New York Evening Sun's staff correspondent uses in a copyright despatch to tell of the arrival of the first American locomotive in France. Cabling on Monday from his station with the American Army in France, he says:

"Immense American hogback engines, the joy of the Yankee railroadman, are now drawing trains of ammunition, also supplies and wounded soldiers back to the French front.

"The railroad engineers who took over the French strategic railroad during September received their first locomotive from home recently. It was welcomed by them with open arms.

"It was a sort of personal victory for the locomotive. Cheering Americans lined the tracks along which the big machine had a kind of triumphant progress. One engineer, describing the scene, said:

"The greatest thing of all was that bell. I never paid much attention to engine bells at home, but this one sounded like music when that chu-chu came down the track!"

"French locomotives do not use bells, so the American machines must be shorn of that musical adornment, for at the French front the bell is the signal of a gas attack. If French soldiers heard that engine bell they would all don gas masks.

"Our engineers have been under fire again. German artillery is dropping shells all around the barracks of one detachment. No damage has been suffered.

"The Americans have been picking up the shell fragments for souvenirs. Engineers report that they are handling without a hitch more traffic than ever passed over these railroads before."

BELGIUM GIVES PERSHING 600 LOCOMOTIVES

As a mark of its appreciation of what the United States has done for Belgium, says an Associated Press despatch, dated December 8, the Belgian Government has turned over to the American expeditionary force 600 locomotives, all that remains of the Belgian motive power. Gen. Pershing has been authorized to make such disposition of them as he deems advisable.

To a Belgian representative Gen. Pershing expressed the appreciation which, he said, he knew would be felt by the people of the United States, especially as the Belgian government's act would result in a large saving of cargo space on American ships.

Early in the war Belgium had in France about 1,700 locomotives. Since then the government has turned over for the use of the Allies about 1,100 of these. The remaining 600 the Belgian government had retained up to this time as a nucleus for the rehabilitation of the commerce of the prostrated nation after the war.

When it was found that the American expeditionary force could use a considerable supply of motive power on the lines from the base ports to the army zone the Belgian government made haste to offer the use of the locomotives, realizing that to ship as many from the United States as were needed would require a large amount of cargo space which might be used for other supplies.

Many of the locomotives will be speedily put into use and will be operated under the direction of the transportation department.

MORE ABOUT THE BATTLE OF CAMBRAI

How American railway engineers gallantly fought and died with their British comrades in arms on the front before Cambrai was told December 7 in a semi-official statement forwarded by the Associated Press.

"Two and one-half companies of railway engineers," the statement says, "with a strength of eight officers and 365

men, were encamped at Fins on November 30, having completed their work in the neighborhood. At 6:30 four officers and 280 men went to Gouzeaucourt, arriving at 7 and starting to work with Canadian engineers. The entire contingent was under a Canadian major and an American captain. The area was three miles in the rear of the line and none of the troops was armed.

"At 7:15 German barrage fire moved on Gouzeaucourt after heavy shelling to the east. At 7:30 a general retirement was ordered, and it was effected with some difficulty, due to the artillery, machine-gun and airplane fire.

"A number of losses were sustained at this time, and also among the men who, cut off by the German advance, had taken refuge in dugouts. Some of these men who had been cut off succeeded in joining British combatant units and fought with them during the day. Meantime there was active shelling against Fins, and the men there were ordered to scatter in the fields.

"As the men returned to camp they assembled under arms and instructions were asked from British headquarters. At 3 o'clock they were instructed to dig and hold the trenches, and the men moved up and started work shortly afterward.

"At 6 the trenches were finished sufficiently for the entire

fighting line. The recommendation, which is certain to be adopted, was made as a result of the predicament in which the engineers found themselves when they became involved in a German attack on the British front last week. At that time they were forced to take up guns abandoned by dead and wounded soldiers."

THE CASUALTIES

That the railway engineers suffered severely is shown by the list of casualties forwarded to the War Department from General Pershing. The list gives the names of 12 of the engineers severely wounded and two slightly wounded; including one second lieutenant, two sergeants, three corporals and eight privates. The second lieutenant mentioned was Allie L. Cone of Company D of the 11th Engineers, the regiment that was recruited in New York.

ASSOCIATION OF 11TH U. S. ENGINEERS

About 800 relatives and friends attended the meeting of the Association of the 11th U. S. Engineers Sunday afternoon in the Engineering Societies building, New York, President Frederick L. Cranford, a prominent New York public service contractor, presiding. The 11th Engineers is

Officers of the Thirty-Fifth Engineers (Shop Regiment), Now at Camp Grant, Rockford, Ill.

Lieut. R. C. Montgomery, Lieut. Smith (M.D.), Lieut. John F. Weiss, Lieut. John S. Wetherill, Lieut. Lee, Chaplain.

Last row: Capt. F. N. Hatch, Sec. Lieut. E. B. Wilkinson, Capt. Wm. E. Abbott, Capt. E. B. Hocker, Lieut. Morris, Sec. Lieut. R. J. Offutt, Capt. W. C. Lindner, Capt. H. P. Wilson, Jr., Lieut. H. M. Fetterolf, Sec. Lieut. H. Darlington, Lieut. K. J. Zinck, Lieut. J. L. Blair, Lieut. W. S. Mussenden.

command and division headquarters directed a withdrawal to camp and that the men be held in readiness to man the trenches. Two small details were sent out to repair a distant break in the new track and to assist in transferring ammunition to another point.

"The list of casualties is relatively small and will be issued tomorrow. It is stated by British officers that the conduct of the regiment was most satisfactory. They praise its coolness under fire, and the ability of the men to work without interruption is regarded as most commendable.

"Engineer organizations in the American Army hereafter, it was recommended today, shall be armed and ready for battle on all occasions when they are anywhere near the

the regiment that was in the midst of the fighting around Cambrai and was mainly recruited in New York. The association consists of the relatives and friends of the 11th Engineers and was formed soon after the regiment sailed for France, with the purpose of acting as a clearing house for information concerning the regiment, providing for the physical comfort and well being of the regiment as far as possible, and giving help and comfort to dependents.

The association reported the sending of Christmas boxes containing tobacco, bouillon cubes, candy and concentrated coffee to all the 1,300 men. The boxes were paid for with voluntary contributions made to the treasurer, R. L. Cox. At the meeting \$700 more was added to the fund.

The most interesting feature of the meeting was the reading of about 20 letters from members of the regiment and the contribution of late bits of news from the front. Anxiety as to the casualties in the recent engagement with the Germans, for which members of the regiment were praised by a British General, made a background of intense feeling.

Plans were made to print and distribute among the members of the association a composite letter, containing all items of general interest received in letters from the front. Members were urged to forward their letters or excerpts from them promptly to the committee.

ENGINEER CAPTAIN CONFIRMS ATROCITIES

One of the most striking letters read at the meeting was from a captain of the regiment:

"I never before believed the stories we got in America of the boche outrages. I have to believe them now, and they are many times worse than the stories that I heard at home," said the letter.

"Canadian and Scottish battalions take no prisoners," the captain said. "They give and ask no quarter. The reason is that the boches have several times crucified Cana-

The Colors of the 35th Engineers, Now in Camp at Rockford, Ill., Were the Gift of American Car Construction Companies

dian and Scottish prisoners and held them above the trenches in view of the battalion. In one such case a Canadian battalion went right over the top to the boche trenches without orders. Very few of them returned.

"The thing that makes our blood boil is the absolutely unnecessary and wanton destruction wrought by the retiring Hun. His usual wonderful, systematic methods have been applied to this destruction. Whole towns that have hardly been touched by shell fire have been destroyed by dynamiting.

"So much of it has absolutely no military value. Isolated homes, beautiful chateaux, garden walls, little summer houses are all blown up. Shade trees, flower trees are cut down or the bark cut so the trees will die. Cemeteries have been ransacked.

"I have seen three cemeteries that are awful sights, one body dragged half out of the casket, caskets broken open and the bones from several dumped into one. Evidently the boche was looking for jewelry, or was simply malicious or both.

"Those things could not be done without the knowledge and permission of the officers; and the thing is so complete

that it looks as though it was all a part of an official systematic programme. I never did believe the stories we got in America of the boche outrages. I have to believe them now; and they are many times worse than the stories we heard at home."

Then follows a story of the crucifixion of prisoners and the violation of a convent.

"I cannot understand what the mental operations or processes of the Hun can be," the letter ends. "It must be the wrathful spite of a disappointed, degenerate mind."

A letter from a younger engineer, written in a lighter vein, speaks of the employment of women. "Everything here seems to be run by the women. The trolley car I rode on had women for motorman and conductor. The former was very robust and quite pretty, with considerable rouge on her face. I rode to the end of the line, and when she came through the car she chucked me under the chin and said I was 'a fine American.' It is a pretty nice country where the motorman loves you, isn't it?"

That two American engineers acting as stretcher bearers were shot in cold blood by German soldiers in the recent attack on the British lines at Cambrai is the report received at American army headquarters in France by a New York surgeon attached to the force of American railway engineers who fought at Cambrai, says the New York Sun's staff correspondent in a copyrighted despatch to his paper dated Tuesday.

"These two men," the despatch continues, "were unarmed, like the rest of their comrades, when the attack came, and for some time they hid in a dugout. When they came out they found the trenches deserted. They did not know the Germans had passed and started toward the rear. On their way they found a wounded British officer on the ground and making a stretcher out of a blanket started to carry him into a ruined village which they supposed was still occupied by the British.

"Suddenly some Germans appeared and despite the fact that the Americans had no weapons and were engaged in a work of mercy they shot and killed both of the stretcher bearers without giving them a chance to resist. They then dragged the wounded officer to their headquarters, where he was questioned in an endeavor to gain information as to the British strength.

"The British officer refused absolutely to answer questions, and so was dragged out and left on the ground again, though weak from loss of blood. Soon afterward there was a furious counter attack by a handful of men from the Royal Irish Rifles, who recaptured the ruined village and saved the officer.

"Another incident in the same battle drove home the truth of the British stories in regard to the German methods of fighting. This concerned an engineer sergeant, a big Irishman from New York, whose wit and good nature had been the life of the company. The Irish sergeant was badly wounded in the Cambrai fighting and was being taken to the rear in an ambulance when a German Taube, flying low, poured the contents of a machine gun into the ambulance. At the time the vehicle was plainly marked by the Red Cross and must have been recognized by the German airmen. One of the bullets slashed the sergeant's face.

"As more details become known as to how the Americans acted in the Cambrai surprise attack the greater becomes the pride of their comrades in their achievements. One engineer, unable to get hold of a rifle, went at the Germans hand to hand, armed only with his spade. Swinging this implement with which just before then he had been digging he felled two Germans before he himself was dropped.

"He was badly wounded in the head, but insisted on walking back to the dressing station. Asked by an officer how he felt, the wounded engineer replied: 'Oh, I'm all right except those damned shoes the quartermaster served out to me are so tight I can hardly walk.'"

EASTERN OPERATING COMMITTEE MAKES PROGRESS

Reports to the Railroads' War Board indicate that the General Operating Committee of the Eastern Railroads has already been able to effect results in relieving the congestion on the eastern lines which has been especially noticeable in the Pittsburgh district. On December 4 the committee adopted a resolution stating that whereas the situation through the Pittsburgh gateway is easing up on certain routes, the chairmen of the sub-committees at Chicago and St. Louis were authorized to issue permits for movement through the Pittsburgh gateway of such cars as the operating officers of the interested lines will approve, sending to the committee at Pittsburgh copies of such permits.

The first action of the committee, which established its office at Pittsburgh on November 28, was outlined in last week's issue. After making a preliminary study of the situation and issuing a few orders deemed most essential to effect an immediate improvement, the committee appointed sub-committees at the principal cities in its territory to report to the General Operating Committee. The instructions of the sub-committees are:

(a) To secure information covering the exact transportation situation throughout their respective territories; to agree upon and put into effect, measures for immediate relief of congested points, keeping the General Operating Committee constantly advised, and to pay particular attention to government freight, fuel, foodstuffs, and raw materials for blast furnaces.

(b) To agree upon and make recommendations to the General Operating Committee when the situation is of such magnitude that it cannot be reached by local treatment.

Various members of the General Operating Committee were assigned to the sub-committees to have special supervision over their work. The location of the various sub-committees and their chairmen are as follows:

Boston: C. L. Bardo, assistant to president, New York, New Haven & Hartford; New York: W. J. Frupp, general manager, New York Central; Philadelphia: R. L. O'Donnell, assistant general manager, Pennsylvania Railroad; Norfolk, Va.: A. C. Needles, general manager, Norfolk & Western; Cumberland, Md.: S. Ennes, general manager, Western Maryland; Pittsburgh: D. F. Crawford, general manager, Pennsylvania Lines West of Pittsburgh; Buffalo, N. Y.: D. W. Dinan, general superintendent, New York Central; Cleveland, O.: A. S. Ingalls, general manager, Lake Erie & Pittsburgh; Detroit, Mich.: E. D. Bronner, vice-president and general manager, Michigan Central; Chicago, Ill.: A. M. Schoyer, vice-president, Pennsylvania Lines West of Pittsburgh; Columbus, O.: I. W. Geer, general superintendent, Pennsylvania Lines, Southwest System; Cincinnati, O.: W. J. Jenks, general superintendent, Norfolk & Western; Indianapolis, Ind.: J. W. Coney, superintendent, Pennsylvania Lines, Southwest System; St. Louis, Mo.: T. B. Hamilton, vice-president, Pennsylvania Lines, St. Louis System.

Sub-committee chairmen were also instructed to make a report by wire at 12 o'clock noon daily to the General Operating Committee of the traffic conditions in their assigned territory and that this be made an imperative order of business. The chairman of the Pittsburgh sub-committee was instructed to meet with the General Operating Committee at the same time and report especially upon Pittsburgh terminal territory conditions.

One of the first subjects taken up by the General Operating Committee was consideration of the question of an open top car pool for the purpose of reducing switching and empty car mileage, with especial regard to certain situations where special types of equipment are essential to coke supply for blast furnaces. The committee adopted a resolu-

tion favoring an open top coal car pool on lines in Official Classification territory with the Norfolk & Western, Chesapeake & Ohio and Virginian railways included, and that flat, low-side, flat bottom gondola and coke cars should be excluded. It was also resolved that in determining the proportion which each line has contributed to the pool and which is the basis upon which distribution of available cars will be made, the tonnage capacity of the cars shall be considered and that cars of private ownership be included in order to realize the full benefit of the coal car pool.

On December 5, the coal car pool question was further considered and a resolution adopted stating that about 80 per cent of the coal mined in the United States originates on the roads represented by the committee and that an enormous amount of shifting can be eliminated and transportation efficiency increased by pooling coal-carrying cars and using them interchangeably. The committee, therefore, created, effective at once, a pool of all coal-carrying cars upon the roads represented by it, with F. G. Minnick, superintendent of freight transportation of the Pittsburgh & Lake Erie, as manager, with office at Pittsburgh. He was instructed to prepare and submit rules for the operation of such a pool which will insure distribution of pooled equipment in accordance with orders of the government as to priority of transportation and supply the current needs of shippers in accordance with existing regulations of the Interstate Commerce Commission, as well as preserving equities as between car owners.

The Railroads' War Board was requested to secure immediate authority from the proper government representative to pool those coal cars of private owners which are at home on the lines of the railroads represented and that a rate of compensation therefor be established. The Commission on Car Service and E. H. De Groot, Jr., chief of the Bureau of Car Service of the Interstate Commerce Commission, were requested to assist Mr. Minnick in the preparation of suitable rules and regulations to govern the pool.

When information reached the committee that a large number of loaded cars were detained at junction points short of destination awaiting revenue way bills, it requested the roads to move cars being held and make such arrangements as may be necessary to comply thereafter with Order No. 5 of the Commission on Car Service.

On December 5, in order to relieve terminal railroad congestion, as well as to release freight cars for the longer haul east, the interested lines were ordered to place embargoes within the ports of Boston, New York, Philadelphia, Baltimore and Newport News, effective on December 10 against all less than carload intracity freight and against any intracity reconsigning privilege after an incoming freight car has been placed in accordance with original billing instructions, and effective on December 24 against all carload intracity freight.

The committee has also urged all lines to act promptly on the suggestion in bulletin 42 of the Railroads' War Board toward the general adoption of interline billing for the purpose of decreasing detention to traffic and equipment. The Master Car Builders' Association has been called upon to formulate a modification of its present rules that will enable car repairs to be made immediately without sending for material from car owners, so far as is consistent with safety, and to take immediate action through its appropriate committee to make effective this modification as affecting the interchange of equipment in these two territories.

TRAFFIC AT SAULT STE. MARIE CANAL IN OCTOBER.—The vessels which passed through the canals at Sault Ste. Marie, Michigan and Ontario, during the month of October numbered 3,147. They carried eastbound freight amounting to 9,522,244 tons and westbound, 3,123,822 tons, making the total freight carried 12,646,066 tons.

Government Operation of Railways Imminent

President Wilson Expected to Announce Shortly Plan
for Taking Over Railroads for Period of the War

GOVERNMENT control of railroad operations for the duration of the war, probably under the direction of a government railroad administrator with a guaranty of earnings, is understood to be the policy decided upon by President Wilson as a result of his consideration of the recommendation made by the Interstate Commerce Commission in its special report to Congress last week. The President already has the authority of law to take possession of the railroads as a war measure but he is expected to go before Congress shortly with a special message recommending more specific legislation as to the terms of the plan.

Railroad executives from all sections of the country are in Washington conferring with the Railroads' War Board on the expected developments, and the members of the War Board discussed the proposal at a conference with the President on Wednesday afternoon. The question whether the railroads should continue to be controlled by their own managements or whether they should be taken over and operated by the government has been carefully considered by the President for several days but it has come to be regarded as a foregone conclusion that the latter plan will be adopted and that a government railroad administrator will be appointed, the security holders of the roads being guaranteed an adequate return, based on the pre-war earnings, in accordance with some plan patterned after that adopted in Great Britain.

In a last effort to show that government operation would be unnecessary the Railroads' War Board, at a conference on Monday with Chairman Newlands of the Senate Committee on Interstate Commerce, laid before him a plan by which they declared they would be able to furnish all the transportation which the existing plant can produce under any form of management. It is understood, however, that the President, while opposed to the idea of government ownership, feels that government authority is essential to the complete unification of the country's transportation system which the Interstate Commerce Commission declared "indispensable to their fullest utilization for the national defense and welfare."

The railroads pointed out that their principal difficulty is an operating problem and that with active government co-operation, an increase in rates for the eastern lines, and some assistance from the government to enable them to secure capital on their own credit, the unification of the railways now being carried out by the Railroads' War Board could be further perfected sufficiently to enable them to cope with the situation.

This plan, which was the result of a general conference of railroad executives in New York on Sunday, was submitted to Senator Newlands in the form of a letter from Fairfax Harrison which the Senator later placed before the President at a conference in which the alternative recommendations of the Interstate Commerce Commission were fully discussed. The Senator also conferred with the legislative committee of the Interstate Commerce Commission. After his conference with the President it was learned that the President intended to address Congress very shortly and it was understood he had imparted to Senator Newlands his intention of taking over the operation of the railroads.

Mr. Harrison said in the letter:

PROPOSAL OF THE RAILROADS' WAR BOARD

"The American railroad system has not broken down. On the contrary, it has, in recent months, handled 50 per cent more business than in 1915 without material enlargement of plant.

"Some misconception seems to exist as to the immediate

requirements of the railroads in their present situation. Their operating troubles are a volume of traffic greater than the capacity of the plant in certain limited territories, aggravated by excessive use of preference orders, and their now serious malady of 'dilution' of labor, which is general throughout the country and common to all industry. Nevertheless, the railroads under present management are prepared to furnish all the transportation which the existing plant can produce under any form of management.

WHAT THE RAILROADS DO NOT ASK

"1. They do not ask one billion dollars from the government or anybody else at the moment. They could not immediately invest it in plant and equipment if they had it, because of the difficulty in getting materials and labor. That figure represents, in round figures, what ought to be spent in every year for several years to bring the American railroad plant up to capacity to handle efficiently the growing traffic. About \$600,000,000 per annum on the average has been spent for a number of years for road and equipment, which, at present prices, would be equivalent to about one billion dollars for road and equipment.

"2. They do not at this time ask for repeal of the anti-trust and anti-pooling laws as relating to them, for they do not consider such relief immediately necessary to increase unified operations.

"The co-operative use of facilities will be continued in such way as to obtain maximum efficiency.

"The present system of voluntary unification is adequate for this. No interest has declined, or will decline, for selfish or other reasons to respond to the requirements of the present co-operative organization.

WHAT THE RAILROADS DO ASK

"3. The immediate appointment of a traffic officer to represent all important government departments in transportation matters, with whom the railroads can deal, to secure active government co-operation, the prompt and orderly transportation of government traffic, and avoid the excessive use of preference orders, which congest traffic instead of facilitating it.

"4. Most of the railroads need more locomotives immediately and enough new cars to replace those worn out. There are approximately 3,800 locomotives and 33,000 cars still on order undelivered for American railroads. The railroads expect to provide the capital. Priority orders are essential for prompt delivery of such equipment.

"5. Approximately 2,000 locomotives and 150,000 cars, in addition to those now on order, are necessary for early construction to meet the requirements of next year. This is no more than the railroads usually require every year, and at present prices represent a cost of approximately \$500,000,000. While a number of the railroads are able to purchase their quotas of such equipment without aid, it is apparent that because the United States has necessarily occupied the investment market for war loans, as evidenced by the recent request of the Secretary of the Treasury that no new private financing shall be undertaken without conference with him, the railroads cannot next year provide through their usual channels for the capital requirements for the acquisition of equipment and other possible additions to plant. They invoke, therefore, the co-operation and aid of the government through the Treasury Department and the Federal Reserve Board to secure for them, on their own individual credit, the new capital found by the government to be necessary not only

for enlargement of plant but for renewing maturing obligations.

"6. Immediate increases in rates as defined by the Interstate Commerce Commission's special report to meet increasing operating expenses and strengthen credit are necessary in eastern territory, and may become necessary in other territories.

"7. Railroad men drafted to be enrolled and assigned to railroad service until actually needed for military service."

The President has been giving the railroad question a large share of his attention during the past week and while the best information as to his intentions for a time seemed to indicate that his own inclination was against adding direct responsibility for railroad operation to the long list of important tasks which the government is now struggling with, it came to be generally believed by Saturday, even among railway executives in Washington, that he had about come to the conclusion that government operation presents the only feasible solution. It is also understood that one of the most important factors which led to this decision was the assurance that Congress would never stand for a loan to the railroads in an amount which would be sufficient to have any appreciable effect. Numerous members of Congress, with a great show of liberality, have talked about lending the railroads \$100,000,000, but it was apparent that most of them were rather staggered when they were informed of the railroads' estimate that \$1,000,000,000 would be needed. Whether Congress is in favor of government operation of the roads is perhaps a doubtful question but there is no doubt that it would accept a recommendation of the President on this point and a majority of the members of the Cabinet are understood to have advised that the roads be taken over.

PRESIDENT NOW HAS AUTHORITY

The authority of the President to take over the operation of the roads, to which the Interstate Commerce Commission referred in its report, is conferred by a brief clause which was inserted in the army appropriation bill approved August 29, 1916, without attracting general attention because the country was then engrossed with the possibility of a nation wide railroad strike. The clause merely provides that "The President in time of war is empowered, through the Secretary of War, to take possession and assume control of any system or systems of transportation, or any part thereof, and to utilize the same, to the exclusion as far as may be necessary of all other traffic thereon, for the transfer or transportation of troops, war material and equipment, or for such other purposes connected with the emergency as may be necessary or desirable."

This is merely an emergency provision, passed at a time when Congress was taking a few precautionary measures but not seriously considering the possibility of a war. It makes no provision for compensation either of railroad officers and employees or of the security holders, such as is contemplated in the commission's alternative recommendation. While under its authority the President could seize the railroads with a stroke of the pen, it is apparent that he would consider more legislation necessary because, immediately after war was declared, Chairman Adamson of the House Committee, following a conference with the President, introduced a bill in Congress to authorize the President in case of actual or threatened war or any emergency, to take possession in whole or in part of the railroads and prescribe rules and regulations for their operation, drafting into the military service of the United States any or all officers, agents and employees, provided that the operation of the lines should be conducted under the control and supervision of such officers as the President might designate and that whenever, in his opinion, the public safety no longer requires their possession by the United States they should be restored to the owners and the damages suffered or the compensation to which

the companies might be entitled should be determined by the Interstate Commerce Commission. During the time that the United States is in possession, the bill provided: "the officers, agents or employees shall receive for their service such compensation as they were theretofore accustomed to receive for similar services." The bill also contained a provision authorizing the President without taking possession of any of the lines to issue orders either direct or through such persons as he might designate for the purpose, to any officers of the lines or to operate any or all of the lines temporarily.

The President also referred to the probable necessity for additional railroad legislation, "in order to effect the most efficient co-ordination and operation of the railway and other transportation systems," in his message to Congress last Tuesday. Under the present law he could act first and then ask Congress to pass any law necessary to round out the plan.

The commission's report aroused intense interest among members of Congress. Discussion of the idea of a government loan to the railroads had already been started. Senator Newlands announced his advocacy of a large loan. Representative Adamson said he was opposed to the proposed suspension of the pooling law and that he was in favor of loaning money only to the weaker roads. The President held a long conference on the subject on December 6 with Chairman Hall and Commissioners Clark and Meyer of the Interstate Commerce Commission, after which he conferred with Secretary of the Treasury McAdoo.

On the same day the members of the Railroads' War Board and Mr. Willard held a conference with Senator Newlands at which they told him that if any plan of a government loan to the railroads were to be really effective in helping the situation the amount should not be less than \$1,000,000,000. They promised to submit to Senator Newlands a more detailed estimate on Monday before his conference with the President. Contrary to the impression created by many newspaper accounts, the railroads did not ask that the government make them a loan, but emphasized the point that if there is a loan it must be made large enough to be effective, as they feared the psychological effect if they should accept a small loan, such as \$100,000,000, which would not produce perceptible results.

The railroad situation was again discussed at the Cabinet meeting on Friday, after which it was generally reported that, while the President still held an open mind, he had been rather strongly advised by the Cabinet members to exercise his authority to commandeer the roads.

RAILROADS PREPARED TO FURNISH ALL NECESSARY TRANSPORTATION

The attitude of the railroads toward the Interstate Commerce Commission's report was discussed at a meeting which the Railroad's War Board held on Friday afternoon with the Washington correspondents, for the purpose of giving them an opportunity to ask any questions regarding the railroad situation. All of the members were in attendance and some 50 or 40 newspaper men, who asked questions freely and were answered promptly and frankly by Chairman Harrison and the other members. Mr. Harrison also read a general statement of the railroads' position as follows:

"The American railroads under present management are prepared to furnish all the transportation which the existing plant can produce under any form of management.

"They have already made common use of box cars and of many facilities for more intensive operation. The recent action combining facilities of eastern roads and providing for common use of coal cars in that territory is already reducing congestion. The American railroads under the direction of the Railroads' War Board are prepared without reservation to make common use of facilities, power and equipment to accomplish the highest measure of success in the transportation effort of the country.

"They point out, however, that in order to secure complete results, certain action not within their power is essential, viz.:

"(1) Co-operation of important military and industrial agencies of the government to avoid unnecessary congestion upon important lines serving territory of intense industrial activity and occasioned chiefly by extravagant use of preference orders for shipment.

"(2) Reasonable additions to power and cars to replace equipment wearing out and to provide for recent increase in traffic.

"Co-operation with government departments and agencies is already well organized and promises success. Opportunities through priority orders to secure completion and delivery of engines and cars now on order will furnish much immediate relief under the second head.

"The point of the whole matter is that the American railroads have, since our entrance into the war, been operated with the highest efficiency, and have until now transported without substantial complaint the greatest volume of traffic in the history of the country. Responsibility for recent congestions, which it must be remembered are only in a limited but highly important territory, cannot be charged to lack of efficiency or earnest effort to prevent them. From the beginning, the authority of the Railroads' War Board has not been questioned by any railroad, nor has there been any hesitation or avoidable delay in obeying its orders and directions."

URGE APPOINTMENT OF GOVERNMENT TRAFFIC MANAGER

Mr. Harrison pointed out that the General Operating Committee of the eastern railroads had already been able to effect an improvement by diverting freight from the most congested lines. He also said the roads had been advised that the government was about ready to act on the repeated recommendations of the War Board that the government should appoint a traffic executive to decide what shipments were most urgently required and thus avoid congesting the railroads as they have been congested by a multiplicity of preference orders, issued by numerous government authorities and their subordinates, each intent on having shipments in which he was interested handled as rush orders.

The Railroads' War Board has been trying to emphasize in every possible way for the past two or three weeks the necessity for some such action on the part of the government. When the arrangement was made during the summer for the plan under which the various government departments could have their shipments expedited by the use of the blue preference waybill envelopes, according to the plan outlined in the War Board's Bulletin No. 22, it was assumed that they would be used with some discretion. Instructions were issued to the railroads, in case of doubt as to the propriety of the use of the waybill envelope, to accomplish the movement as ordered and then take the matter up for investigation, "inasmuch as these forms are only furnished by responsible officers of the Army, Navy and the Shipping Board, who will undertake to prevent abuse thereof." But it has turned out that the preference orders have been used indiscriminately for all kinds of freight in which the government or the Allies were interested, either without any reference to whether one class of freight was more important than another, or because the man using the order considered that his particular business was more important than any other, with the result that the bulk of the freight moving on some of the eastern roads has been under rush orders.

One of the most conspicuous examples was a "rush" shipment of anchors to a ship yard to be used on ships to be built when the yard is built, using cars and track room in the congested district which are needed for something more important now. The War Board has urged upon every representative of a government department that it has conferred with the necessity of some co-ordinating authority in the gov-

ernment to decide what requirements are most important and to speak for the government to the roads in the same way that the traffic manager of a steel company does. The matter was finally put up to the Secretary of War, with an urgent request for the immediate appointment of an executive to determine the necessary routing and priority of shipments from the standpoint of all departments of the government interested in transportation, and when the members of the War Board were advised that such a plan would be adopted they considered that an important step had been taken toward relieving congestion. In fact the agitation they had conducted against the indiscriminate use of preference orders has already shown an effect.

NEED FOR EQUIPMENT

As to the need for additional equipment, Mr. Harrison said that merely a large number of new cars, without additional power and terminal facilities, would hardly improve the situation; that the roads have nearly enough cars now but ought to have enough new ones for replacements. Out of approximately 100,000 on order nearly 40,000 are still undelivered and 5,364 locomotives on order have not been delivered because the orders of the War Department for the military railroads in France, and of the Russian and French governments, have been given priority. Of 5,140 locomotives under order on June 30, exclusive of those being built in railway shops 1,049 have been delivered. Mr. Harrison said the roads were not criticising this policy of the government but thought the time had almost arrived when the needs of the American roads should be given greater consideration. Even if the government should be able to provide for increased capital for the roads, the eastern lines at least would still need the increase in freight rates they have asked to meet the higher level of operating expenses, Mr. Harrison said in reply to a question, but, because the government has practically monopolized the investment market it is impossible for the railroads to secure new capital in the usual way.

Asked why the plan of pooling the facilities of the eastern lines had not been adopted sooner, Mr. Harrison said that the necessity for it had not appeared until very recently. The principal congestion, he said, was on the Pennsylvania and Baltimore & Ohio and the primary object of the Pittsburgh committee is to relieve the congestion in the Pittsburgh district by diverting traffic to less congested lines. On the Pittsburgh division of the Pennsylvania 85 per cent of the freight recently has been moving under government preference orders. Efforts are also being made to route as much traffic as possible via Gulf and South Atlantic ports. While it was not stated at the meeting, it was learned from other sources that the Pittsburgh committee had already diverted 20,000 carloads of freight from the Pennsylvania to other lines and that 100 locomotives have been ordered from the western lines to the eastern lines, 50 to be delivered through the Chicago gateway and 50 through St. Louis.

Mr. Harrison said that the roads had by no means reached the limit of their possibilities and mentioned the possibility of increasing the movement of essential traffic by reducing passenger service and non-essential freight traffic. Mr. Kruttschnitt also called attention to the fact that in England when heavy troop movements were in progress both passenger and ordinary freight traffic had been suspended, whereas in this country the roads have thus far endeavored to handle both military and commercial traffic at the same time. In reply to questions, Mr. Harrison expressed the opinion that government operation of the railroads would prove less efficient than operation by the roads themselves because the railroad men were doing their best under present conditions and straining every nerve to produce the best results, while if they were told they had failed and asked to work under a government boss they could not work with the same spirit they now possess. He added that the authority of the government was not necessary because the authority of the War Board has

never been questioned by any railroad. The security holders, he said, might be better off under a plan by which the government would guarantee the earnings.

He said the roads had not yet given any detailed consideration to extending the pool of facilities to a pool of traffic or earnings which would run counter to the anti-pooling or anti-trust laws, but had thus far only attempted to handle the operating problem involved, postponing the question of the effect on earnings.

RAILWAY MAIL SERVICE

The reorganization of the Railway Mail Service and the adjustment of rates on the "space" basis is now practically accomplished after a thorough investigation by the department as to unreasonable and uneconomic methods, says the Postmaster General in his annual report to Congress, and although it has not been in operation sufficient time to work at its best, it is already bringing marked improvement to the service notwithstanding the irregularity of train movements, due to the heavy demands on the railroads because of war conditions.

On June 30, 1917, the length of lines on which railway post-office service was in operation was 231,501.39 miles, with annual miles of service of 308,018,777, and the length of lines on which closed pouch service was in operation was 71,268.32 miles, and annual miles of service of 281,499,859.

To date 1,824 railroad mail routes have been stated on the space basis of payment at the maximum rates stipulated in the act, such restatements being effective on November 1, 1916. This restatement embraced practically all routes having full railway post-office and apartment-car service, with storage and closed-pouch service incident thereto. The remainder of the routes, 1,157, were continued on the weight basis.

Although the rate of compensation on the space basis is higher than on the weight basis, the report says, the space basis of pay lends itself to such rational adjustment to the needs of the service that by the close of the fiscal year it was possible to eliminate duplication and other unnecessary

transportation to the extent of approximately \$7,000,000 per annum. Through economy in space the department was enabled to care for a large quantity of "blue-tag" mail, formerly sent by freight, and to handle postal supplies, which made a saving of \$500,000 in freight charges.

The cost of the entire railroad transportation service under the weight basis was at the annual rate of \$62,242,000. The cost of the same service under the space basis was at the annual rate of \$65,492,000, an increase of \$3,250,000 over the weight rate. Under the space basis of pay, however, it was possible to increase or decrease the amount of transportation to be purchased to the actual needs of the service, with the result that at the close of June 30, 1917, the regular authorized service was at the annual rate of \$58,518,478.

Thus the operation of the space basis is resulting, the report says, in the direct saving of millions of dollars to the government by reducing the car-mile service required of the railroads, and has released to the roads a large amount of car equipment and car space on trains.

The financial statement and reports upon operations of various branches of the service in detail discloses the introduction of economic methods, labor-saving devices, an improvement in efficiency through a strict adherence to the merit system, and a saving of expenses in the transportation and method of handling the mail. The statistical statements show an extension of the service—city, suburban, and rural.

NAMES OF BATTLES FOR C. P. R. STATIONS.—The Canadian Pacific has taken the step of renaming certain stations with the view to commemorate the glorious fields in which Canadian troops won renown. A beginning has been made in this direction. Milleta, on the Sherbrooke Division, has been changed to "Vimy," while the town of Enterprise, located on the Belleville Subdivision of the Ontario District, is to be called "Lens." All the fields in which the Canadians have won or shall win laurels will be commemorated in name by the C. P. R. in the christening of stations.

Siberian Railroad Bridge Blown Up Before the W. B. Thompson Red Cross Commission Train

Federal Locomotive Inspector's Report

Increase in Supervision and Inspection Believed to Be Necessary to Reduce the Number of Defects

THE sixth annual report of the chief inspector of locomotive boilers to the Interstate Commerce Commission has recently been made public and the following is an abstract of it:

The tables given below show in concrete form the number of locomotives inspected, the number and percentage found defective, and the number ordered out of service on account of not meeting the requirements of the law.

They also show the total number of accidents due to failure from any cause of locomotives or tenders and all parts and appurtenances thereof, and the number of persons killed or injured thereby.

The amendment to the locomotive boiler inspection law did not become effective until September 4, 1915; therefore, the record for 1916 includes accidents and casualties investi-

Roundhouse and shop employees:			
Boiler makers	11	1	11
Machinists	8	1	11
Foremen	1	1	3
Inspectors	3	3	3
Watchmen	5	8	8
Boiler washers	7	10	10
Hostlers	6	6	6
Other roundhouse and shop employees	19	1	21
Other employees	5	22	7
Non-employees	1	23	3
Total	62	721	38
			599

Briefly summarizing, for the purpose of comparison, the record of accidents caused by failure of locomotives or tenders, or any part thereof, which were investigated by this bureau, as required by the law as amended, shows a total of 616 accidents, with 62 killed and 721 injured thereby. Of these accidents, 389, in which 52 persons were

Relation of Defective Locomotives to Accidents and Casualties Resulting from Locomotive Failures

gated under the amended law for 9 months and 26 days only.

LOCOMOTIVES INSPECTED, NUMBER FOUND DEFECTIVE AND NUMBER ORDERED OUT OF SERVICE

	1917	1916
Number of locomotives inspected.....	47,542	52,650
Number found defective.....	25,909	24,685
Percentage found defective.....	54.5	47
Number ordered out of service.....	3,294	1,943

NUMBER OF ACCIDENTS, NUMBER KILLED AND NUMBER INJURED

	1917	1916
Number of accidents.....	616	537
Number killed	62	38
Number injured	721	599

The following table shows the total number of persons killed and injured by failure of locomotives or tenders, or any part or appurtenance thereof, during the year ended June 30, 1917, classified according to occupations:

	Year ended June 30—			
	1917		1916	
Members of train crews:	Killed.	Injured.	Killed.	Injured.
Engineers	16	230	11	205
Firemen	21	304	12	225
Brakemen	13	60	9	74
Conductors	3	14	1	6
Switchmen	1	8	..	6

killed and 469 injured, were due to failure of locomotive boilers or some part or appurtenance thereof, and this may properly be compared with the record of accidents and casualties investigated by this bureau under the locomotive boiler inspection law, as shown in former annual reports. Two hundred and twenty-seven of the accidents shown in this report, in which 10 persons were killed and 252 injured, were caused by failure of some part of the locomotive or tender other than the boiler and its appurtenances, and were investigated under the amended law.

Much of the increase in the number of defective locomotives and the accidents and casualties resulting from failure thereof has, no doubt, been brought about by unprecedented operating conditions, which, together with the shortage of labor and material, has made difficult the proper maintenance of locomotives.

This, however, is not a justification for the operation by any carrier of locomotives that are in an improper condition for service, and the fact that some carriers by diligent efforts and careful supervision of repairs have not only maintained the condition of their locomotives, but have actually improved it during the past year, thereby increasing

operative efficiency, is evidence that it can be done even under the present exacting operating conditions.

The problems which have confronted this bureau in the matter of withholding locomotives from service when defective and in violation of the law, under the operating conditions which have existed since the declaration of war and during the months immediately preceding it, have been unusually difficult and have required the most careful consideration. The importance of the prompt, as well as safe, movement of trains has been constantly in mind, and every privilege consistent with the purpose of the law has been granted.

It is to be regretted that some carriers appear to consider a congestion of traffic as a legitimate excuse for operating locomotives that are known to be in an improper condition for service and in violation of the law, and this is done to an extent that, I believe, fully justifies the statement that on such roads running repairs are neglected to an extent which, if continued, will cause serious interference to traffic during the coming winter in spite of the most diligent efforts of the limited force of Federal inspectors to enforce maintenance of locomotives as required by the law.

Six hundred and sixteen accidents caused by failure of locomotives or tenders or some part or appurtenance thereof, including the boiler, have been investigated during the past year.

Accident investigation is only of value when the knowl-

position while engaged in firing such locomotive. Locomotives now in service should be equipped with a mechanically operated fire door, as above described, the first time they are shopped for general or heavy repairs, and all locomotives should be so equipped within a reasonable time; provided, that the above recommendation should not apply to locomotives equipped with mechanical stokers nor to locomotives using oil for fuel.

Second.—Air operated power reversing gear should also have a steam connection, with an operating valve conveniently located in the cab, and so arranged that in case of air failure steam may be quickly used to operate the reversing gear.

Third.—Holes for plugs or studs in boiler sheets should have a good thread the full thickness of the sheet in which they are applied, and all plugs and studs and other fittings should be screwed through the sheet. Plugs, studs, or other boiler fittings should not be repaired by calking, and

The first recommendation is based on the result of hun-

A Locomotive Held Out of Service on Account of Steam Leaks

under no circumstances should an attempt be made to tighten them while there is steam pressure on the boiler.

dreds of investigations of boiler failures of a character which permits the steam and water contained in the boiler to be discharged into the fire box. With the swing type door, which is at present largely used, such a failure invariably results in blowing the fire door open and discharging steam and boiling water, together with the contents of the fire box, into the cab of the locomotive, seriously or fatally burning persons therein. The automatic fire door

Steam Leaks Due to a Cracked Cylinder Found by the Government Inspectors

will remain closed if the failure occurs while it is closed; and if the failure occurs while it is open, it will automatically close the instant the fireman's foot is removed from the operating device, thus preventing the direct discharge of steam and scalding water into the cab of the locomotive.

The second recommendation is made because defects to certain types of brake equipment, which results in the loss of main reservoir pressure, not only renders the brake inoperative, but renders the air operated reversing gear also inoperative. When this occurs on a locomotive being op-

A Crown Sheet After an Explosion Due to Low Water

This crown sheet was welded by the oxy-acetylene process to the side, tube and door sheets. The arrow shows where it tore a piece out of the left side sheet and the cross shows how a small patch welded to the tube sheet was pulled off with the crown sheet.

edge gained thereby is used to prevent similar accidents. The result of a single investigation may not be sufficiently conclusive to base a change in methods or equipment thereon, but where investigations cover numerous accidents extending over a period of years, changes can be recommended which can reasonably be expected to be of substantial value in preventing accidents of a similar character.

The similarity of the effect of accidents of certain types clearly points to improvements in construction or in methods which will promote safety in the operation of locomotives.

The advisability of recommending additional rules at this time has been given careful consideration, with a view to avoiding, as far as consistent with the purpose of the law, regulations which would require additional equipment or labor during the war, except where it has been demonstrated that both safety and efficiency will be increased thereby.

In accordance with the above the following recommendations with the reasons therefor are made:

First.—New locomotives placed in service should have a mechanically operated fire door, so constructed that it may be operated by pressure of the foot on a pedal or push button, or other suitable appliance, located in the deck or floor of the cab or tender at a suitable distance from the fire door, so that it may be conveniently operated by the fireman from his

erated light, it results in the complete loss of control of the locomotive.

The third recommendation is based on an investigation of more than 200 accidents, due to plugs, studs, or other boiler fittings blowing out. In a large percentage of the cases it was due to improper application, as the plug, stud, or fitting had only been screwed part way through the sheet, while in some cases not more than two or three threads were holding in the sheet.

No formal appeal from the decision of any inspector has been filed during the year.

The accompanying chart shows the relation between the percentage of locomotives found defective and the number of accidents and casualties resulting from failure thereof and illustrates the result of operating defective locomotives. It does not accurately represent the results of the law, because prior to September 4, 1915, the law only applied to locomotive boilers and their appurtenances, while since that date it includes the entire locomotive and tender and all their parts and appurtenances; therefore, the increase in the percentage of locomotives found defective, also in the accidents and casualties since that date is largely due to the extension of the law to include the entire locomotive and tender.

It should be noted that the record of accidents and casualties at the close of the fiscal year ended June 30, 1917, is well below the record for 1912, although the record for 1917 includes 227 accidents and 262 casualties, due to failure of parts of the locomotive and tender which were not covered by the original boiler inspection law and therefore not included in the 1912 report.

COMMISSIONER MCHORD ADVOCATES UNIFIED GOVERNMENT CONTROL

The special report of the Interstate Commerce Commission to Congress, recommending unification of railroad operation, was published in last week's issue. Commissioner McChord filed a minority report, opposing the suggestion that the unification be allowed to be effected by the carriers themselves. In full his report was as follows:

The special report of the majority of the commission leaves unsaid some things which should be plainly stated, if prompt and sure relief is to be brought to the present transportation situation. That the lack of adequate railroad service, particularly in eastern territory, is serious at the present time and is a cause of grave concern for the coming winter months needs no demonstration. Every one knows it who knows anything about present business conditions. That the industries of the country engaged in making war materials as well as those not so occupied require the very best service which can be given by the railroads is also clear. I fully concur in the statement of the majority report that "it is necessary that our transportation systems be placed and kept on the plane of highest efficiency," and also that "this can only be secured through unification of their operation during the period of war." But the majority report takes the position, at least by implication, that this unification may "be effected by the carriers" themselves. With that judgment I wholly disagree.

The carriers' co-operative effort at the present time is in charge of the "Executive Committee of the Special Committee on National Defense of the American Railway Association." This committee in its public announcements calls itself the Railroad War Board. It is the fifth committee that the railroads have had in Washington to deal with the transportation situation since November, 1916. The first two of those committees were given no real authority, although the commission was advised by the executives that they had been given full power, or as it was expressed in the case of the first committee, "all the power of the execu-

tives." These committees, therefore, were unable to cope with the situation, despite earnest and praiseworthy efforts of their individual members who were hampered by the unwillingness of certain railroads, acting under the restraint of executive influence, to carry out their instructions. These facts have been reported by the commission, *Car Supply Investigation*, 42 I. C. C. 657. In that report both the majority and the minority expressed the view that the situation could be improved by a committee of railroad officers to act in co-operation with this commission if the committee were given plenary power by all the railroads. In apparent response to that suggestion a third committee was sent to Washington in January, 1917, but it also had not been given the promised power and was therefore not received. In February, a fourth committee was sent to Washington to enforce certain car service rules. Not all of the railroads believed that these rules were workable and hence the agreement giving power to this committee was incomplete and inadequate. With this experience behind it the American Railway Association, on April 11, 1917, formed its special committee on national defense, and centered the chief authority in its executive committee. The resolution by which this committee was formed recites that the railroads of the United States pledged themselves, with the government of the United States, with the governments of the several states, and with one another, that during the present war they would:

"co-ordinate their operations in a continental railway system, merging during such period all their merely individual and competitive activities in the effort to produce a maximum of national transportation efficiency."

It was understood that the co-ordination of railway operations in a continental railway system meant that cars would be used interchangeably and sent where they were most needed, that track and terminal facilities would be opened up to all railroads, so as to relieve congestion, and that locomotives would be at once requisitioned from some of the strong and less burdened railroads for use on the important lines which have been unable to give efficient service largely because they were badly in need of motive power. Yet as late as November 24 the carriers' committee made an announcement from which the following is quoted:

"The Railroads' War Board today adopted revolutionary measures in order to relieve the congestion of traffic on the eastern railways. It directed that all available facilities on all railroads east of Chicago be mobilized to the extent necessary to furnish maximum freight movement. The effect will be that to the full extent that conditions render it desirable these railways will be operated as a unit, entirely regardless of their ownership and individual interests."

"The operating vice-presidents of the eastern lines have been appointed a committee to operate as a unit all the lines involved, and have been given instructions and authority to adopt all measures which in their judgment may be necessary to relieve the present situation and assure the maximum amount of transportation." * * * "An important part of the plan adopted for the operation of the eastern lines is that of placing at their disposal the facilities of railways in other territories to such extent as may be necessary."

These measures—the pooling of cars, the operation of railways as a unit, the placing of facilities at the disposal of railways in other territories as needed—are essential steps in the co-ordination of railway operations "in a continental railway system," using the phrase of the resolution of April 11, but were not taken until November 24.

I do not wish to be understood as saying that the carriers' committee has not accomplished results; nor that the shippers have not co-operated with the carriers to get greater service from the available equipment, for the heavier car-loading has been a very material factor of improvement. But our experience with railroad committees during the past year makes me believe that no voluntary committee can accomplish what the situation demands. One of the principal reasons is that the element of self-interest, the traffic influence, is a persistent factor in postponing and resisting measures that seek to disregard individual rights in the effort to secure transportation results as a whole. The

"merely individual and competitive activities" and the established operating practices have their effect, despite directions or recommendations that have no sanction to enforce them except a voluntary agreement which is very general in character. There runs also in the activities of these committees the self-evident purpose to do whatever appears to be necessary to prevent the governmental authority from acting. For these and other reasons, which it is not necessary to state, I cannot concur in a report to the Congress which apparently acquiesces in a continuation of control over the transportation situation by a committee appointed by the carriers themselves. The suggestions with reference to the anti-trust laws, the anti-pooling provision of section 5 of the act, the desirability of government loans for capital purposes, and the regulation of security issues, undoubtedly have merit, but in my judgment their enactment into law will not make it possible for any committee appointed by the carriers to secure the full measure of transportation service which the present conditions demand.

The "unification" needed if our transportation systems are to be "placed and kept on the plane of highest efficiency," is the unification of the present diversified governmental control. At the present time there are several federal agencies authorized by law to issue orders or directions with respect to transportation. This commission, by the car service act, approved May 29, 1917, was given very broad powers to issue summary directions with respect to the movement, distribution, exchange, interchange, and return of cars. The priority director, designated by the President for that purpose under the act approved August 10, 1917, is authorized to direct that traffic essential to the national defense shall be given priority in transportation, and he has made certain orders of that character. The transportation of troops and material of war, under the amendment to the act to regulate commerce, approved August 29, 1916, is required upon the demand of the President to be given preference over all other traffic in time of war, and by direction of the army and navy departments and the United States Shipping Board preference orders have been given for the transportation of a very large tonnage of war materials and supplies of all kinds. The administrations controlling fuel and

food, to which adequate transportation is of course vital, have taken an active interest in the movement of those commodities through their appointed agents. Under this diversified control the carriers are not able to meet the requirements of the increasingly heavy tonnage which must be moved. In consequence the industries devoted to war purposes and those engaged in their normal business are suffering. There is no institution in which regularity of operation is more requisite than in transportation, but railroad operation is approaching a chaotic condition. A coherent plan must be worked out which shall provide for both the needs of the government in the energetic prosecution of the war and the needs of general commerce. It is imperative that war material be given preference in transportation but the financial sinews of war depend in large measure upon the successful operation of our manufacturing plants and business establishments.

I concur in the view that "the situation does not permit of temporizing," but I am convinced that the strong arm of governmental authority is essential if the transportation situation is to be radically improved. That authority must be unified to make possible action that is both vigorous and consistent. If the President elects to exercise the power given him, under the act approved August 29, 1916, to take possession and assume control of the transportation systems, I believe that vastly improved transportation conditions can be promptly secured. For this course legislation assuring the carriers a fair return may be appropriate. If the President does not so elect, it is my judgment that the authority over the regulation of railroad operations now vested in the several agencies referred to, with such amplification as may be necessary, should be promptly centralized by act of Congress. All of the forces now at work upon the problem, including the carriers' executive committee and its numerous sub-committees, could be at once utilized, under a single governmental administrative control.

THE TOTAL OF MANUFACTURES EXPORTED in nine months of 1917 is \$3,020,000,000 against \$728,000,000 in the same months of 1914, according to an analysis of The National City Bank of New York.

Pooling Railroad Equipment and Facilities

Discussion of the Physical Problems of Pooling Equipment and the Needlessness of Government Control

By Samuel G. Thomson

MUCH confusion is rampant in many minds concerning the pooling of the physical facilities of our railroads. Such questions are being asked as: How will it affect the financial return? How quickly and to what extent should physical results be obtained? As a consequence, government ownership and government operation are now advanced on every side as a remedy for the present financial and physical conditions of our railroads. Mr. Vanderlip foresees government ownership as a financial necessity, "Unless something radical is done to convince the public that railroad shares and bonds are good securities." He regards it not as a choice of method, but rather as a tragic alternative. The way things are now drifting, we may well agree with Mr. Vanderlip; since, where except in the government shall we find any other purchaser or source of credit, unless the American people have a change of heart?

EXPECTATIONS TOO HIGH

We hear much "half-baked" theory expressed at commission hearings and before various investigating committees; and there is also a lot of loose talk going the rounds in Washington and elsewhere concerning the breaking down of our transportation system, including extraordinary opinions as to what ought to be accomplished by the railroads in order to meet the present emergency. The expectations even in high government circles seem to be very much over-developed in regard to what should be accomplished with present facilities in relieving the congestion this winter, and considerable disappointment is already shown because the railroads are not making two cars grow up where one already has been performing 15 per cent more service than ever before.

The railroads *have been* almost performing miracles, in expanding the service-capacity of their cars by co-operation with the shippers, and by the thousand-and-one other services which they have been rendering without additional compensation. But yet we hear this talk that the railroads will be given a last chance to see what pooling will accomplish, and that if this does not bring the necessary result, the railroads then will have to be taken over and be operated by the government.

Our present danger then is, the running wild of expectations which are not limited by proper conception of the practical difficulties to be overcome and of the intricate ramifications of the railroad business. Much serious damage may be done to the transportation industry of the country unless governmental agencies are willing to work closer to the ground in placing reasonable limitations on what they consider will be an adequate performance by the railroads. But can we expect government agency and rule by commissions to determine what is a good performance in lines which are entirely out of their specialized activity? Perhaps we can arouse a public sentiment which will say, "Well Done!" before the lawmakers have another chance to add to the "garbage division" of our present regulatory statutes, and before another cry of "failure" has a chance to crowd the government into the railroad business.

It is granted that the railroads, in their capacity as public utilities, must have some regulation by representatives of the public, and we admit that part of our regulatory statutes are good and fair; but commission rulers, bureau-heads and legislators will do well in the present emergency to forget their radical ideas of progress, and to focus on the many ways

in which these agencies might help in the *relaxation* of past over-zealous expectations and restrictions which are already enacted into federal and state laws. To meet this situation the railroad officials are rightfully and patiently saying: "Tell us what you want done and we will be able to do it better than anyone else."

There is no better corps of executives and employees to be found in the world today for meeting emergencies than is now in charge of our American railroads from the presidents down to the crossing watchmen. Would it not be doing our part to accept the best that can be done by these men who *already are* our transportation representatives, rather than to consider new laws and to talk government operation; and thus to advocate "jumping out of the frying pan into the fire"? Let us then by public sentiment try to place limitations on what is to be considered a well performed task, so as to minimize the business mistakes of the war-business, and, incidentally, to preserve some future for our railroads.

It will be easy during the next few months to aggravate matters by expecting too much from a general pooling of railroad facilities and equipment. This co-operative operation will accomplish much in speeding up the car movement, and possibly in increasing the financial return to some railroads; but railroad men will not have time to talk for publication about their troubles, nor will they have the opportunity to present to government officials even a small part of the difficulties involved. It may, therefore, be all the easier for those unfamiliar with the details and routine of railroad operation to think that all there is to do is to start to use all of the equipment in a given section of the country on a completely unified system of the railroads throughout that section, and then to expect the results to be multiplied in proportion to the magnitude of the consolidation. It is surprising how many there are outside of the immediate railroad circle who have this idea, and who are willing to make a public expression of their railroad knowledge.

PRACTICAL DIFFICULTIES

With curtailed service and congestion ahead of us for this winter, regardless of the best that the railroads can do, it may be fitting to touch upon a few of the practical difficulties that will dampen the enthusiasm of those who expect too much from pooling operation and the relaxation of laws. It is unnecessary to dwell on the most vital drawback of all—the total available terminal facilities in a given congested district. The best the railroads can do in this is to keep surplus business away so that cars can be kept moving up to the capacity of the terminals.

Those who are unfamiliar may also think that it will be fine for the railroads to call on each other for locomotives. They may not stop to consider that all locomotives which "can turn a wheel" are now in use, even to the extent of robbing the passenger service to help the freight; nor may they be aware of the large proportion of time that a locomotive stands in the engine-house or shop waiting for material and supplies, even when at home on their own divisions. These delays are part of the practical operation of a railroad and apply particularly at points where the stores' department has neglected or has been unable to keep up the supplies and spare parts of the particular locomotives which are standard to their division. What will happen when these locomotives suddenly turn up on a strange railroad and make request

for the customary running repairs, or report to a strange shop as a cripple? These same locomotives will wait until the shop nearest to the breakdown makes the specialized broken part, or sends the proper size of packing, or orders a casting "from home"; and in this connection we might stop to reflect that a locomotive which can haul a hundred cars and which costs \$100,000 might be held up for a day or a week because the threads have stripped on a nut of the injector pipe, or on account of some even less serious ailment, if proper material could not be obtained.

A locomotive is not much good to a foreign road, or even to an outlying division of its own road, without a stock of standard repair parts in the storehouse at both ends of its regular run. It will not be necessary to relate the experience of a "tramp locomotive" which on any railroad finds it necessary to work in a freight pool over a number of scattered divisions—any more than to say that it gets "a lick and a promise," "a trip on three legs," "leaking steam: cannot see ahead," "tied up the whole division," "sent home light to main shop for repairs."

"Mr. Government Operator" may say that the railroads will have to keep necessary material on hand, as well as competent men to handle and to order this material and to make proper repairs. He may forget, however, that most kinds of railroad materials are now very hard to get, and that many of the railroad's former expert workers are in the trenches or training camps, or in a neighboring shipbuilding plant getting double the wages that a railroad can afford to pay. He may also forget that in the enginehouse they are now doing the best they can with many men who hardly know the difference between a monkey-wrench and a fire-hook. What practical remedies will a change in railroad management accomplish?

Some may expect that large consignments of locomotives will be brought quickly from the West and started to work in hauling trains through the districts where the railroads do not have enough motive power for present business. They may not stop to think that the shop and locomotive terminal facilities of these eastern roads are already overtaxed in taking care of their own equipment. "Mr. Government Operator" may say that these shops and locomotive terminal facilities will have to be made adequate for these additional locomotives by the transfer of machine tools and employees from Western lines, in order that results may be obtained this Winter. He, of course, does not appreciate how much the time element is a factor in such operations, and that if anything is attempted in making transfers of this kind, it would be a matter of many months before substantial results could be shown and the new organizations working smoothly.

The mere matter of planning just what transfers of shop facilities can and should be made is a stupendous expert task which would be thrown upon the railroad mechanical organizations at a time when they can hardly keep the wheels turning with their present facilities and equipment. It would, therefore, seem that transferred mechanical assistance in any large proportion will be out of the question for this Winter in relieving the congestion and in reducing the lack of cars and power which is almost inevitable. This time element, therefore, is food for thought for those who will be inclined to say that the railroads are breaking down and have failed in their latest pooling project; and again we may inquire what practical means these critics would bring to bear in order to get quicker results under government operation.

Likewise, the advocate of nationalization, if in his liberality he should depart so far from the teachings of his cult as to advocate that the Government should assume responsibility for its acts in trying to obtain net returns from its operation, would do well to ponder that an effective shifting of locomotives with their standard extra-parts and supplies, as well as a transfer of machinery and men, would be very

costly for the railroads. This extra adjustment burden would have to be absorbed in the operating expense of his Ideal System, as is now probably expected of the railroads involved in the pooling plans, and he might find that this, with other unexpected costs of operation, might transform his "net earnings" into an additional federal tax from the people for the benefit of transportation.

In the pooling of freight cars, we may fare a little better than with locomotives, since it has been the business of the freight car to travel around the country and to carry its load to its destination without much transfer of lading. However, there are also many classes of cars which are quite domesticated in their activities. They might be classed with the locomotive which only likes to travel a hundred miles at a time, and that, too, on its own home road. These specialized cars are particularly adapted for local service in certain districts and have not become accustomed to the "Cooks Tour" circuit. They represent the largest part of the car equipment of the country, since it is the box car principally which has become a familiar visitor to shops away from home, as well as a vulnerable subject for the foreign road-repair billing clerk and a liberal contributor to the other "Customs charges" of the freight car pool.

We cannot then hope that all equipment of the various railroads can be thrown together satisfactorily and economically for general utility, as even in the "traveled" box car class we all remember when yards and shops were congested with foreign cars waiting for material from home; and we also recall the increased time and cost for repairs, on account of their repair parts not being standard and not carried in stock on the foreign roads. And to appreciate our troubles still further, we may well consider how much mileage we would get in a country-wide pool from the specialized home varieties of equipment, which forms a large part of the total.

Our railroads must come to an enlargement of the "Traveler Division" of their equipment. They must at least add to it hopper coal cars and gondolas; and it may be that the present emergency pool may serve to hasten the adoption on the various railroads of the same designs for these several types of cars in this "traveler" division. But this is not a matter to be accomplished this winter; and it is enough to say in pointing out this defect, that there are probably a thousand different railroads in the country with a corresponding thousand different designs of box cars of 60,000 capacity, which have a thousand different designs of center sills no one of which can be substituted for the other. We may understand how difficult this lack of standardization makes our repair and car service problem when we multiply this number of designs by the number of different capacities of box cars—not to mention the many different kinds of specialized cars which have heretofore been operating in their home districts. Our immediate car pool operation will save much empty mileage and will improve car service; but it also presents many difficulties, and the remedy is not a very rosy one to solve by commission rule. We are not yet ready for *economic* pooling of railroad car equipment. The situation however is not hopeless; but a discussion of a practical solution which can be developed gradually by the railroads themselves to greatly help future operation is hardly within the scope of this article.

CONCLUSIONS

The advocates of Government operation who expect big things from this momentous pooling departure will see, therefore, that even with car equipment—the most flexible and adaptable agent for pooling—there are "many bugs in the ointment," which may interfere with rapid progress and with the accomplishment of the ideal which they think ought to be obtained by working the railroads as one united national system. So let us conclude that the best that can be done will be by the co-operative effort of our railroad operat-

ing executives now assembled; that whatever is accomplished by pooling probably will be much more costly than normal operation—as far as the use of equipment and mechanical facilities is concerned; that our expectations for relieving the congestion and for the decrease of car shortage should not be distorted; that government operation cannot be more than a costly and roundabout attempt to accomplish results by means of the railroad executives who are *already at work*; that there is rough sledding ahead for the railroads even after the war; and that not all of the way will be made smooth by the raising of rates.

For our friends who argue that the railroads do not need an increase in rates on account of the many savings that will be realized from a united and concentrated railroad operation, we may add that they should consider how far these various physical and mechanical difficulties will offset the advantages of rerouting, redistribution and other benefits of co-operative pooling. And for the attention of our lawmakers and commissioners; let them become substitute when they speak of "taking over the railroads." Have they anything constructive to suggest in meeting the very practical difficulties mentioned above? "Anyone can tear down a house, but it takes a carpenter to build one." May we not warn, that the house cleaning which they suggest will but resolve itself into a "stir-up" for a protracted period which, if it does not break up some of the furniture, will only result in putting the bed where the bureau was, and in changing the railroads from the credit to the debit side of the ledger; and then we would proceed along as before, in having some bureau-agent of the government ask our railroads' experts to go ahead and do the best they can.

What particular results and what practical remedies have these same advocates in mind when they say that the President will have to operate the railroads as a military necessity? Let us answer quickly, that the military necessity of the country today is to keep the many thousands of mines and manufacturing plants running to capacity and to get their product on the boats. There is no one in America today who knows as well how to do this as the expert operating and traffic officials of the railroads; and let us venture to suggest that, with the supervision of their own War Board and with a few general necessities indicated by the governmental departments, it might even be left to the judgment of our railroad experts, who are in daily contact with the industrial world, to use discrimination as to which plant was the most important. Our priority troubles might then melt away and no longer be a hindrance to transportation. It might be well for the country if we could "let our railroad officers in on" this managing of the war business. We greatly need this army of expert help, and at its highest efficiency.

Is *pool operation* the misleading element in all this confusion of generalities? If it is, let us not be deceived in thinking that all we have to do is for the Congress to cancel some of their anti-pooling mistakes and then throw the railroads together for one grand "clean up" under bureaucratic operation. Pooling has its bad points as well as its good ones, and a few of the former are cited above in *only one department* of the railroad business. Our railroad officers and committees will understand best how to get the most out of pool co-operation during the war, both as to physical and financial results. Enforced pooling into undesirable channels would be a catastrophe, and might result, with reference to car equipment, in our finding on our hands a surprisingly increased proportion of it out of service for repairs at a time when it was most needed. This enforced pooling is probably what many have in mind when they think of government control and a country wide transportation system.

We dare not "swap horses in the middle of the stream"; and—except for a temporary and reasonable relaxation of

restriction on co-operation—we cannot, by annulling or by making laws, expect to create new methods and new conditions to help the railroad during the war which would not at the same time be just as efficient and just as profitable after the war. For the present emergency, the railroads could agree among themselves to share their terminals and routes, and perhaps some of their earnings, if laws are adjusted accordingly; but that is about as far as it should go; and in going this far, let us bear in mind that the railroad executives should be allowed to use their own pooling methods.

Co-operative competition with less regulation among privately owned railroads, should be our plan now and for the future. A little perusal of some of the troublesome and practical details of railroading may sober the judgment of those who are advancing large general theories for the revolution of the transportation business of our country. Let us discard the pet phrases: "Take over the railroads," "Government Ownership," "Unity of Railroads," "Country-Wide Pool"; and let us think more about co-operation under a plan which will not transform the railroads into absolute utilities but rather will allow them for the present and in the future to remain partially in the field of private business under reasonable business competition and co-operation. Our railroad executives are anxious to pool for war service their terminals and their various other facilities in which they have an advantage over their competitors; but after the war, they should have the exclusive benefit of these facilities to be used in reasonable business competition, if our railroad systems are to be developed and are to keep step with the needs of the country. Some people cannot understand how we could have competition and co-operation at the same time; but if they were willing to get a little closer to the greatest business men which the country has produced and many of whom are now donating much of their time to the Government for service and for consultation, they would soon learn that this joining of hands of competition and co-operation is the principle which will have to be relied upon to work out the salvation of our railroads.

HOSPITAL CAR FOR THE ERIE

To meet the demands of the Government for appropriate cars in which to transport sick or wounded soldiers, the Erie has remodeled a 70-ft. steel underframe parlor car, as

Erie Hospital Car

shown in the illustrations, providing it with 28 adjustable cots placed in two tiers. The car is provided with a receiving and supply room 10 ft. 8½ in. long, with a sliding door

at each side, at one end of the car. At the other end is a small rest room for the nurses, provided with a sofa and lavatory. The main portion of the car is about 50 ft. 6 in. long and contains seven two-story cots on each side.

The two-story cots are of a new design furnished by Frank A. Hall & Sons, New York. The springs of these cots are adjustable to any desired position for a patient's back or legs. This is clearly shown by a sketch on the floor plan of the car. The cots are finished in white enamel.

The supply room contains a fireless cooker, drinking water

Floor Plan of Erie Hospital Car

tank, wash basin and supply locker. The annunciator on which calls from any part of the car are indicated is also located here. It is separated from the main compartment by heavy rubber curtains.

The car is equipped with electric lights, the lighting fix-

Interior View of the Erie Hospital Car

tures being located on the side decks. Emergency lights are provided by Pintsch gas lamps located in the center of the upper deck. The interior finish of the car is a light gray, which is easy to the eyes.

TWENTY MEN IN GAS MASKS IN AIR-TIGHT CAR.—An abandoned freight car was recently used as a gas house at Camp Meade, Md., and twenty chaps of the 27th Engineers for two hours battled against the deadly fumes similar to those which the Huns unloose on the troops overseas. The car had been prepared for several days for the test and had been hermetically sealed. The men were cautioned to adjust the masks before they ventured into the danger zone, and the moment the car door was slammed the gas was turned on full force; every man came out apparently without a single handicap other than the weight of his mask.

WASHINGTON CORRESPONDENCE

WASHINGTON, D. C., December 11, 1917.

FOOD, FUEL AND MILITARY SUPPLIES GIVEN PRIORITY

A general priority order to the railroads to give preference in car supply and movement to fuel, food and military supplies was issued by Judge R. S. Lovett, priority director, on December 7. The question of what such an order should provide had been the subject of numerous conferences with railroad and government officers for several days. Both the

food and the fuel administrations had asked for general orders but the railroads had opposed the idea of too sweeping an order unless some plan were put into effect which would provide for a co-ordination of the requirements of the government. The Railroads' War Board expressed approval of the form in which the order was issued but urged that its success would depend upon the co-ordination of the traffic management of government business and relations with the railroads. The order provides for preference in the following order:

First—Steam railroad fuel for current use.

Second—Live stock, perishable freight, food and feed.

Third—(a) Shipments of military supplies when consigned direct to the United States government or the authorized officers of the United States army, navy or shipping board, or to the Allies or the proper representatives thereof, destined to any cantonment, post or encampment, to any point of export for movement thence to Europe, to any arsenal or navy yard, or material to any shipbuilding plant under contract to the United States shipping board for the sole purpose of constructing vessels for that board.

(b) Other shipments for the United States government, as the same may be authorized from time to time as necessary in particular cases, but only upon request of the United States army, United States navy and United States shipping board, through a designated officer or representative of the respective departments, located in Washington.

Fourth—Coal to and for by-product coking plants, and not subject to reconsignment.

Fifth—Preference and priority in movement only to coal for current use, but not for storage, consigned direct (and not subject to reconsignment) to hospitals, schools and other public institutions, retailers of coal for use in supplying domestic consumers only; and to coal, coke and raw materials for current use, but not for storage, consigned direct (and not subject to reconsignment) to blast furnaces, foundries, iron and steel mills, smelters, manufacturers engaged in work for the United States government or its Allies, public utilities (including street and interurban railways, electric power and lighting plants, gas plants, water and sewer works), flour mills, sugar factories, fertilizer factories and shipbuilders; also shipments of paper, petroleum and petroleum products.

ROUTING EXPORTS VIA SOUTHERN PORTS

The desirability of routing as much as possible of the export freight via Gulf and South Atlantic ports instead of North Atlantic ports, in order to keep it out of the congested

eastern district, has received a great deal of attention at the hands of railroad and government officers in the past two weeks and although no general plan has been adopted a great deal has already been accomplished. Edward Chambers, vice-president of the Santa Fe and head of the transportation division of the Food Administration, has devoted special attention to the subject and has arranged for routing much of the exported food supplies for the Allies via Southern ports. Following a meeting of the Export Co-ordinating Committee on Wednesday, it was announced that instructions had been issued by the Traffic Executive representing the Allies that all grain for the Allies originating west of the Indiana-Illinois line will be shipped through the Gulf ports. Orders were also issued to divert to the Southern ports over 100,000 tons of billets and bars.

To relieve the congestion on eastern lines and enable the return of box cars to western lines for use in handling grain,

ing to the western lines to be returned to that section for use, and at the same time allow more prompt handling of the freight in the eastern section of the country by lessening the number of cars to be handled by the eastern railroads.

The embargo will stop movement of corn and oats into the already badly congested eastern section of the country, and a supply of corn and oats for domestic consumption within the embargoed territory will be secured at points of production within that territory.

The western lines are considerably short of the number of box cars they own, and need these cars very badly for grain movement at this time. The Car Service Commission a short time ago issued an order requiring eastern lines to deliver to western lines approximately ten thousand box cars to relieve conditions the present embargo is designed to overcome, but the returns to date show rather light deliveries to the western lines.

STATE COMMISSIONER TESTIFIES BEFORE NEWLANDS COMMITTEE

The Newlands Joint Committee on Interstate Commerce on Tuesday resumed its hearings on the subject of railroad regulation for the purpose of hearing from state railway commissioners, members of the legislative committee of the National Association of Railway and Utilities Commissioners. Carl D. Jackson, chairman of the Wisconsin Railroad Commission, opposed the proposal of the railroads that regulation be centralized in the hands of the federal government, saying that before destroying the power of the states Congress should make a study of what is wrong in state regulation that should be corrected. Mr. Jackson was in favor, however, of federal regulation of issues of stocks and bonds.

Mr. Jackson described the work of the Wisconsin commissions to show that it is not open to some of the criticisms that the railroads have made of state regulation in general. "Utilities are regulated in Wisconsin," he said, "on the theory that regulated monopoly is desirable and that competition is undesirable. It is cheaper for the people to have one company do the work than to have two competing companies. In the end the public pays the cost of competition."

"We allow no duplication of facilities and require each company to obtain a certificate of public necessity. Some utilities have been taken over by municipalities but I believe the tendency in Wisconsin is against public ownership. Most of those that have been taken over are water companies because the electric light companies that are owned by municipalities are not doing well."

Mr. Jackson said that intrastate rates in Wisconsin are not in conflict with interstate rates because the commission has always taken the interstate rates into consideration in fixing them and that they are in general slightly higher per mile than the interstate rates because of the shorter haul over which the terminal expense is distributed. He said there had never been any conflict between the state rates and the interstate rates or between the state authorities and the Interstate Commerce Commission.

He opposed the centralization of regulating authority, saying: "In my opinion such a consummation is not sound, not founded on good public policy and in the long run would not be beneficial to the carriers themselves. The functions now performed by the state commissions have got to be performed by some one and if they are to be performed by the federal government its powers should be as complete and thorough as that now exercised by the states."

There was some discussion by members of the committee of discontinuing the investigation for a time, because the President was expected shortly to take over the operation of the railroads, which would postpone questions of railroad

The New York Tribune.

Interrupting an Emergency Case

the Commission on Car Service at the request of the United States Food Administration on December 6 declared a zonal embargo, effective on December 8, against the loading, re-consignment or movement of carload corn and oats into territory south of the Canadian boundary, east of the line separating Wisconsin and Michigan, Indiana and Illinois, and north of the Ohio and Potomac rivers from points outside. No exceptions to this embargo will be made except as authorized by Commission on Car Service. It is understood that a supply of corn and oats for domestic consumption within the embargo territory may be secured within the same territory.

For some time the congestion on eastern lines has been absorbing and holding cars properly belonging to the western section of the country. It is expected that this embargo, in addition to the diversion of a large volume of traffic by shipments of grain and other supplies for the Allies to the Gulf and South Atlantic ports, will allow the cars belong-

regulation. It was decided, however, to hear some of the state commissioners who had appeared.

WESTERN RATE HEARING POSTPONED

The hearing before the Interstate Commerce Commission set for December 17 for the purpose of considering the application of the western railroads for increases in freight rates has been indefinitely postponed at the request of the special executive committee representing the western lines.

E. S. Keeley, vice-president of the Chicago, Milwaukee & St. Paul, and chairman of the committee, wrote to the commission saying that the recommendations in its special report to Congress and the uncertainty as to the action to be taken

A PATENTED PASS FORM

What is believed to be the only patented pass form now in use was recently devised by Charles S. Sweet, Jr., chief clerk in the president's office of the Pullman Company, Chicago. The patented feature, which is applicable to round trip passes only, provides for a uniform wording on the going and return coupons of the pass, with the result that the only difference between the two coupons is that the positions of the starting and destination points are reversed with reference to the prepositions used to indicate the extent of the trips authorized. To illustrate, if the going portion of the pass reads "from Chicago to New York" the return por-

by Congress upon them, as well as the uncertainty as to the disposition to be made of the demands of employees for wage increases prompt the western carriers to ask for a postponement. A further consideration moving them to make this request, he said, is that by the early part of 1918 when the above uncertainties will probably have been cleared up, the carriers will be in a position to submit figures covering operations for the entire year 1917 and showing the extent to which the maintenance of road and equipment has been deferred.

LEGISLATION

The Senate and House judiciary committees both held hearings on December 6 on the resolutions introduced at the

tion reads "from New York to Chicago," and not "to Chicago from New York." Consequently, on every pass coupon presented to a conductor, the starting point of the train is the first entry and is preceded by the preposition "from," while the destination of the train is the second entry, and follows the preposition "to."

The pass is in triplicate-fold form so that the stub and two coupons may all be filled in at one time. The marked simplicity of the form not only reduces to a minimum the chance of error in collection, but saves clerical expense necessitated when the wrong coupon is lifted because of the unusual wording of the printed matter on the pass or the color of the coupons, conserves time lost in filling out more

last session of Congress at the request of the railroads to suspend until January 1, 1919, the provisions of Section 10 of the Clayton anti-trust law applying to the purchase of materials. These provisions have already been suspended twice since the law was passed. The Senate committee voted to recommend the passage of the resolution with an amendment providing that the postponement shall apply only to existing companies, and it was passed by the Senate on December 7. Representative Sabath, on December 5, introduced a joint resolution. H. J. Res. 172, providing for the taking over by the government during the period of the war of the railways and coal mines. The resolution was referred to the Committee on Interstate and Foreign Commerce.

complex forms; reduces the chance of error in issuance; and relieves conductors of the duty of filling in forms, obtaining passengers' signatures when but one coupon for the going and return trip is provided, and performing other essentially clerical work which should properly be done in the pass department. The pass has the additional advantage of being valid with but one countersignature, instead of two as required by some companies. It is now being used by the Pullman Company, the Chicago, St. Paul, Minneapolis & Omaha and the Minneapolis, St. Paul & Sault Ste. Marie.

RAILWAYS AND AERIAL ATTACKS.—On the whole, railways are singularly immune from aerial bombs, says Major Redway, the military critic of the London Globe, due to the fact that correct aim is practically impossible from aircraft, while even a four-track road offers a very narrow target to an aeroplane at a height of anything between 2 and 4 miles.

Timber Shed Construction

Snow Shed Construction in the Cascades

The Great Northern Has Added 17,360 Ft. of New Protection, 6.7 Miles of Line Out of 9 Now Under Cover

DURING 1916 the Great Northern built 14,560 ft. of snow sheds, and 281 ft. of concrete arch, and drove 2,519 ft. of tunnels in the Cascade mountains, to extend the protection against the snow slides prevailing in this territory during the late winter and spring months. Added to the work previously done the total length of snow sheds or tunnels built for this purpose in this vicinity is now 8.4 miles. Of this total 6.4 miles is west of the Cascade tunnel and, adding to this the length of the spiral tunnel at Martin creek, a total of 6.7 miles of track is now under cover in a distance of 9 miles. The longest continuous section of snow shed in this distance is 9,790 ft.

The construction of the snow sheds has extended over a number of years, previous work having been described in the *Railway Age Gazette* of January 13, 1911, and April 17, 1914. The snow slides on the west slope of the Cascade mountains are the result of the extremely heavy snow fall of this region, which has totaled as much as 55 ft. in a single winter and the Chinook winds which cause sudden thaws of the heavy snow beds. In recent years the more severe troubles have occurred in cycles of three years; thus the early months of 1907, 1910, 1913 and 1916 caused relatively more trouble than the corresponding periods of other years. Naturally the protection work has been most active in the construction seasons following these bad winters.

The initial protection was provided at situations where the slides had actually occurred, while later work comprised the extension of these sheds over other portions of the track subsequently suffering from slides as well as the repair of portions built previously. As the result of this policy snow sheds have been gradually extended over larger proportions of the tracks within the limits of snow slide action.

THREE TYPES OF SHEDS WERE TRIED

The early snow sheds were all of timber construction, but in 1910 and 1911 a total of 2,462 ft. of double track reinforced concrete sheds was constructed. This type has not

been used in subsequent work because of its expense. In 1913, 14,594 ft. of snow sheds was built, of which 10,094 ft. was of all-timber design and 4,500 ft. was of a composite design, with a timber roof over the tracks and a retaining wall of plain or reinforced concrete on the uphill side to take the place of the extensive timber work required in that position in the all-timber design. In 1916, when a total of 14,560 ft. of sheds was built, 12,309 ft. was of the all-timber design, while only 1,970 ft. was of the combination type. Besides these a total of 281 ft. consisted of reinforced concrete arches serving as extensions for three tunnels built for protection purposes.

Thus it is seen that there has been an almost complete return to the original form of construction. The prime reason for this is the high cost of reinforced concrete as compared with timber at a point located in the heart of the Douglas fir region. The investment in concrete snow sheds can be justified only if providing for the double track which must unquestionably be built before the life of reinforced concrete construction would be completed. At the same time it has not been deemed advisable to go to as large an investment as the reinforced concrete sheds would require, because of the degree to which it would commit the railway to the present location of the line. Also the old timber snow sheds can be built in less time than either the all-concrete or the combination sheds, a factor that was of no little importance in planning the completion of the construction program in the short working season.

WHERE THE SHEDS ARE LOCATED

As stated previously the bulk of the snow shed construction has been west of the Cascade tunnel. The location of the line between the tunnel and Scenic has been described previously in detail and is shown in the map. For this entire distance the line occupies a mountain side that has been swept almost bare by repeated slides. Between Windy Point and Scenic the two higher legs of a double loop are located

on benches in the same slope, one above the other so that the line is twice exposed to the same slide. East of the summit tunnel until last season very little snow shed construction was done, only 2,701 ft. of protection having been built, and this was scattered in sections not exceeding 500 ft. in length over the 33 miles between the east portal of the tunnel and Leavenworth.

West of the summit the work for 1916 consisted partially in the repair of old sheds but primarily in the construction of additional protection. The repair work was entirely between Tye and Embro, where 1,970 ft. of combination sheds and 526 ft. of all-timber sheds were constructed to replace old timber sheds built at different times between 1907 and 1915. West of Embro the work consisted entirely of additional timber sheds and two tunnels driven through shoulders in the mountain side to eliminate dangerous sections of track skirting the face. East of the summit, 7,358 ft. of new timber protection was added to the 2,701 ft. previously built, but as this was scattered over 33 miles of line it does not give the spectacular effect of the work on the west slope.

DESIGN

The design of the timber sheds differs but little from that developed in the past, through years of continued observation of the effect of the snow slides. The structural details of the snow sheds were discussed in detail in the article appearing in the *Railway Age Gazette* of April 17, 1914. The structure serves essentially as a chute for conducting the masses of snow, ice and debris from the hillside above the track to the slope below. It must serve to resist the impact of a rapidly moving mass that remains on the roof only momentarily and it must be able to carry the dead weight of a slow-traveling bank of snow that may concentrate on the roof and remain there until the summer sun melts it. Of great importance in the design is the resistance to the sliding action, which in the all-timber sheds necessitates the use of ample sway bracing and a set of batter posts on the down hill side, acting in conjunction with knee braces in the openings over the tracks. In the combination shed the friction is resisted by tying the roof timbers to the top of the retaining wall on the upper side.

This feature was improved in the design used in the last work. Resistance to sliding was provided in the earlier design by a row of dowels passing through the roof timbers and embedded in the top of the wall. This was replaced in the 1916 design by an improved connection, which is shown in one of the drawings. The 16-in. deck timbers are notched on the under side to engage the upstanding leg of a 4-in. by

This parapet is equipped with a 6-in. channel to take the bearing of the bolts and is reinforced adequately to resist the horizontal thrust.

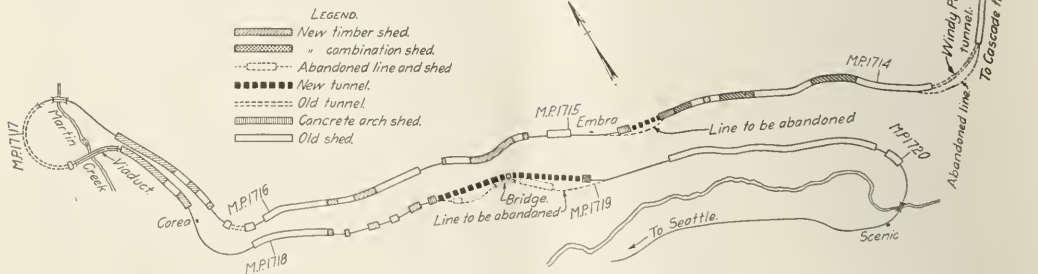

To form an effective chute for the snow the shed construction must be extended up the hill until the plane of the new roof intersects the mountain slope. If the slope is steep this is accomplished readily, but when it is flat the wide extension of the structure required in the all-timber design entails the use of large quantities of lumber. The combination shed overcomes this by introducing the retaining wall of either mass or reinforced concrete, the space behind the wall being filled to the desired slope with earth.

One feature requiring special treatment is the drainage of the mountain side to carry away the water from the melting snows. Where the discharge is small this can be accomplished readily in the all-timber design by building a flume on the roof of the shed, but the demands of permanent construction in keeping with the design of the combination sheds require something more substantial. One solution is the use of a concrete box culvert passing underneath the shed as shown in one of the drawings.

LARGE AMOUNT OF LUMBER REQUIRED

Some idea of the magnitude of the project can be obtained from the fact that 37,550,000 ft. b.m. of lumber was required to complete last season's work. Of this amount 18,800,000 ft. b.m. was used for the timber sheds on the east slope, while 18,255,000 was used on the west slope. Of the latter 16,128,000 was in the all-timber sheds and 2,127,000 in the combination sheds.

The progress in the shed construction on the west slope was about 24 track feet per day, which, with an average of 2,000 ft. b.m. of lumber per track foot of shed was equal to a daily consumption of 48,000 ft. b.m. of lumber. The site of the work did not afford any storage space, as

Location of Snow Sheds West of Cascade Tunnel

5-in. T-bar securely fastened to the masonry bearing. To the upper sides of these timbers are attached $\frac{7}{8}$ -in. by 12-in. plates, extending longitudinally for the entire length of the shed. At intervals of 5 ft. along these plates cast-iron lugs are secured which serve as stirrups to receive $1\frac{1}{2}$ -in. bolts passed through a parapet at the rear of the retaining wall.

all lumber received from the mills had to be sorted in a yard at Goldbar, 40 miles west. On the east slope the situation was much more favorable as a storage yard could be located at Merritt, situated about centrally in the construction territory. The concentration of lumber at these two storage points was commenced some time before the construction started in order

to insure a supply that would preclude any delays to the work.

From the storage yards the cars were loaded with pieces substantially in the quantity and order used daily in the construction of the sheds, and as the erection crews were working simultaneously at a number of sheds and had to be served almost constantly, a large amount of work train service was

the inspector as fast as the material was erected or was secured by means of a survey of the completed work.

West of the summit about 200 men were employed on the timber sheds, 130 on the combination sheds, 200 on the lower tunnels and 30 on the upper tunnel, just east of Embro station. The timber was erected by stiff leg derricks mounted on skids on the roof of the completed shed, so that they could

Retaining Walls for Combination Sheds

Snow Sheds on Two Levels

required. On the west slope this was equal to an average of four work trains daily in addition to a train supplying concrete materials. About 1,000 cars of sand and gravel were required for the concrete work, and about 2,500 cars of timber.

All of the work was done by contract. The railroads furnished the lumber and paid the contractors on the basis of

be moved forward as the work progressed. Only a small amount of framing was required and this was done on the ground just previous to erection. Holes were drilled with power-driven tools.

CONCRETE WORK

The plant for the construction of the concrete walls for the

Sheds on Two Levels Near Martin Creek Loop

the amount of lumber erected. The railroad engineering force made up a complete bill of all lumber, showing the actual feet b.m. of all the lumber placed as well as the commercial feet b.m. delivered. This billing was made up by

combination sheds is shown in one of the photographs. It consisted of two bins, one for sand and one for gravel, standing on a framework of sufficient height so that a mixer receiving materials by gravity from the bottoms of the bins

could discharge concrete directly into cars standing on a track well above the top of the wall. These bins were filled from cars by a clam-shell bucket hoisted by a stiff-leg derrick standing on a platform spanning the main track. The cement was elevated from a storehouse alongside the track by means of a chain conveyor.

Concrete was delivered to the forms in small narrow-gage dump cars operated on a trestle supported over the wall by frame bents that were placed astride of the forms. The cars were moved back and forth by a hoisting engine and cables. The location of the plant was generally made central with

A Culvert Passing Under the Snow Shed

respect to the length of the shed so that the concrete cars moved both ways from the mixer, thus reducing the length of haul to a minimum.

The forms for the wall were made in sections that could be taken down and re-used repeatedly. To facilitate the moving of the forms a gantry was built to travel on the trestle on two rails laid as far apart as possible so that the

Reinforced Concrete Wall Used with Combination Sheds

concrete cars could pass underneath the gantry without interference.

THE TUNNEL WORK

Between Corea and Scenic on the lower leg of the loop 2,057 ft. of tunnel was driven through two shoulders in the hill, thereby eliminating some crooked alinement and a via-

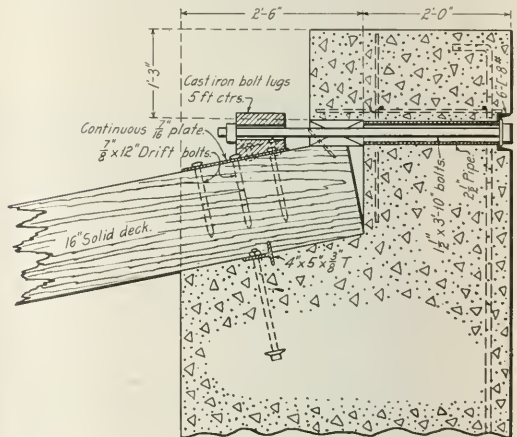

duct over a gully so situated as to constitute a serious hazard. There are really two tunnels, one each side of the gully under the bridge, there being a gap of 68 ft. in the rock, which was closed by building a single track timber shed. The tunnels were built for single track, and being

Typical Cross-Section of the Combination Shed

only partially lined with timber, can be enlarged readily to provide for double tracks during any summer season by operating trains around the old track since this involves no hazard in the summer months.

The tunnel work was conducted from six headings, one from each portal, two from the gap at the gully and two from an adit driven from the face of the hill. Several tunneling methods were used. One method was to drive a bottom heading to a full width and a height of 10 ft. and then

Details of Roof Anchorage Used on the Combination Shed

stope down the full section in four layers, two with 6-ft. holes and two with 4-ft. holes. Another method was to drive a top heading to the full arch width and later shoot down the bench. A steam-operated Marion 40 shovel was used to take out the muck, loading 4-cu. yd. Western air dump cars running on a 3-ft. 6-in. gage track. Lyner water drills were used for the heading work with jap drills for the benches. The air was supplied by two air compressors, one furnishing 1,300 cu. ft. and the other 1,700 cu. ft. of free air per minute. Steam was supplied by three boilers fired with fuel oil.

The tunnel on the upper line near Embro is 462 ft. long and has 193 ft. of arch construction at the west end and 40

ft. at the east end. The tunneling was done almost entirely by hand. A top full arch heading was driven, timbering as the work progressed, the bench being shot down later in two lifts. Drilling was all done by hand except for a small amount done with air supplied from a small compressor operated by steam from the boiler of the dinky locomotive. The muck was loaded by hand into small cars hauled by horses. For the heading 6-ft. holes were drilled that were sprung two or three times with 40-per cent. dynamite, this being also used for firing the holes.

All of the snow shed work was conducted under the general direction of A. H. Högeland, chief engineer of the Great

Interior View of the Timber Sheds

Northern, and O. S. Bowen, principal assistant engineer at Seattle. I. C. Otis was resident engineer in charge of the work west of the Cascade tunnel and G. A. Hensel was resident engineer east of the summit. The contractor for the work east of the summit was W. J. Hoy & Company, St. Paul, Minn., while west of the summit, Grant Smith & Co., of Spokane, Wash., had the contract for all of the timber sheds and the lower tunnel, while Henry & McFee, of Seattle, Wash., had the contract for the combination snow sheds and the upper tunnel.

ENGLAND'S LIMITED MAIL IN 1860.—A very interesting story is told in the September issue of the *London & North-Western Railway Gazette* by George P. Neele, the former superintendent, who is now in his 92nd year. The article in question relates to the Limited Mail and traffic by the West Coast route to and from Scotland and says that the train in question took its name from the fact that while furnished with a complete set of mail cars, fitted with apparatus for picking up and depositing letter bags en route, it was limited in the passenger accommodation to three cars only—one for Perth, one for Glasgow and one for Edinburgh. These cars were restricted to first- and second-class passengers holding single journey tickets. Those with return tickets were not, until August, 1860, allowed to use the Limited Mail. Directors with gold passes were even excluded, and any officers of the company who found it necessary to journey thereby had to book like ordinary passengers. Traffic conditions often made it necessary for appeals to be made to the Postmaster-General for permission to attach a fourth passenger car, and this concession was always readily granted on the condition that the punctuality of the train was not impaired. In 1864, however, the Post Office consented to the permanent addition of the fourth coach.

ELECTRIC TRUCKS IN STOREHOUSE SERVICE

Power trucks for hauling materials are installed to save manual effort and if the labor saved is sufficient to justify the investment in the equipment the results are considered satisfactory. However, when the installation of the trucks not only accomplishes this, but leads to a revision of other operations in the plant that bring about material economies, entirely aside from the mere hauling of material, the results become especially gratifying. This has been the case with the use of an electric storage battery truck in the general stores department of the New York Central at Collinwood (Cleveland) Ohio. It must be said in justice that the benefits gained have resulted not alone from the merits of the truck used but were derived in a measure from the skill with which the storehouse methods have been revised to secure the maximum benefit from the installation.

The truck used at Collinwood is an Elwell-Parker electric truck of the self-loading platform type; that is, the platform of the truck is supported on rocking links attached to an electric motor through worm gearing so that the platform can be raised or lowered about four inches while carrying a load of two tons. This function is utilized to good advantage in picking up loads placed on trays or skids and is one of the most important features in developing operating economies with the use of the truck.

To keep the truck moving has been the prime consideration in the Collinwood installation and in working out the details of operation to accomplish this in the largest measure, economies have been secured in the handling of the stores

Truck Carrying Basket of Packages Mounted on a Tray

materials which are entirely supplementary to the savings in labor effected in the moving of the articles from place to place. Specifically the plan provides that the truck is not standing idle during the time of loading and unloading, since a system of trays or platforms is provided on which the loading is done while the truck is otherwise engaged. The load ready, the truck comes up, its platform is rolled under the tray and then elevated to lift the tray clear of the floor. The load can then be moved to any point and the tray again lowered to a bearing on the floor. This system is by no means new, but its adaptation to the conditions imposed by storehouse operation has led to the introduction of a number of new features.

The storehouse problem includes the receipt of materials from the manufacturer or dealer in cars, the delivery of such portions of these materials to the shop as require finishing or assembling, the return of the completed or assembled

parts to the house for storage and lastly the loading of the materials from the storehouse onto cars for shipment to the division storehouses or other outlying points. Heretofore this has involved the loading of hand trucks, their manual transportation to the point of delivery and their subsequent unloading. This system has been modified materially under the new arrangement.

Suppose a car of miscellaneous material is received from the manufacturer. The electric truck delivers trays to the car where they are loaded while the truck is engaged in other service. When the loads are ready, the truck returns and carries the trays into the house, where they are unloaded for storage or are delivered to one of the shops. For instance, a tray of new air hose is taken to the fitting shop where the truck picks up another tray loaded with hose to which the fittings have been applied; or it goes to the foundry for a load of castings which are left at a lathe in the machine shop where a second tray is picked up which the lathe operator has loaded with turned castings as fast as he finished them. In these cases the loading and unloading is eliminated entirely and the machine operator or fitter ex-

second one being divided into six compartments. This has been of particular convenience in the filling of requisitions for miscellaneous articles, since the various sizes and styles can readily be kept separate and transported intact between storehouses having elevating platform trucks in operation.

The tiered trays when removed by the consignee are taken directly to the place where the particular material is stored; this has led to the elimination of regular fixed shelving to a certain extent. For example, brass fittings are made at the brass foundry at Collinwood. The practice has been to transport brass for use in the locomotive shop at Elkhart to the Elkhart storehouse. The first development of tiered trays was to load the brass at the foundry at Collinwood directly into the pockets in the tray and move the tray, entire, with the contents intact, direct to the storehouse at Elkhart. At that point the various pieces of brass were taken from the pockets in the tray and placed on shelves. It is now expected to utilize this tiered tray by simply lowering it into place at the brass section at Elkhart and avoid the handling of the brass from the tray into the stationary pockets. As the trays will be nearly empty before a new lot is received on a subsequent order, the few pieces remaining in the first tray will be tossed into the pockets containing the new shipment. This feature not only eliminates the cost of one entire handling operation but it insures (where it can be worked out) the turning over of the old material first, a very essential feature in storekeeping practice since it avoids the placing of new material upon the old.

Another development in this direction is the use of metal baskets for the handling of package materials. Much of this material such as stationery is delivered from upper floors of the storehouse to the shipping floor by means of a chute, the baskets being placed on trays at the lower end of the chute to receive them.

Another class of work in which the truck has been a big help is in the handling of heavy articles, such as locomotive side rods, air compressors, etc. The gain here has been principally in the transportation of the articles since the operation of the two-wheel trucks formerly used for this heavy service frequently entailed the use of two to four men in place of the one man who now operates the truck. Here again the use of the trays is a help since they can be left within the operating radius of a crane without holding the truck until the crane is ready to remove or place the load.

The truck is 36 in. wide and 104 in. long. It steers on all four wheels and turns on a 7-ft. radius. The load pick-up platform is 26 in. wide by 54 in. long and is used with trays 36 in. by 54 in. The propelling and elevating motors both receive current from the same battery carried in an enclosed compartment on the deck over 2½-in. by 3½-in. drive wheels. The controller is immediately behind the battery and the controller drum always returns to off-position, when the handle is released. The handle may also be removed from the truck when not in use. A special interlocked circuit-breaker and controller makes it impossible to start the truck unless the driver is standing on the truck in position to operate. The brake is applied by lifting one foot. Thus if the truck is traveling at full speed and the operator jumps off the truck it will stop within its length.

The brake will hold a loaded truck on an incline and speed may be picked up on an incline with the brake partially set, making it safe to handle on grades. The truck is steered by an adjustable handle provided with a sole-leather grip and an electric bell push button in the end.

The truck is normally operated for a 10-hour day, but 12 or 13-hour service is not uncommon. The charging is done each night although more recently it has been found practicable to do the charging only on alternate nights. An automatic rheostat, manufactured by the Electric Products Company of Cleveland, has been installed for this purpose. After testing the batteries of the truck, the rheostat is set for

Using a Tiered Tray to Transport Castings

pend no more labor in handling the pieces than if they had been placed on the floor.

The loading of materials of various kinds into cars is one of the important features of storehouse operation, and while the use of the trays for delivering supplies to the cars releases the truck immediately for other uses, there still remained the work of unloading the trays. However, even this operation has been eliminated in a measure, since another truck of the elevating platform type has been placed in service at Elkhart, Ind., where one of the most important division storehouses is located. Instead of unloading the trays in cars destined for Elkhart, they are left in the cars with their loads so that the truck at Elkhart can pick them up again without the trouble of reloading.

TRAYS BUILT IN TIERS

To put this plan on a really practicable basis and to insure the loading of the car to as near its capacity as possible, it has been necessary to use something more than the simple platform tray. The needs of this situation led to the development of trays built up in tiers, as shown in the photographs. One of these shows a tray of three tiers, the

the required charge and loaded up and will shut off automatically when the truck has been charged.

The installation of the truck and the adjustment of operating methods, through which the economies secured were made possible, have been developed under the direction of the stores' department of the New York Central lines west of Buffalo.

SUGGESTIONS FOR FIRE PROTECTION OF RAILROAD PROPERTIES

For the information of the railroads the Railroads' War Board has addressed to them a bulletin containing the following recommendations of the Railway Fire Protection Association, which is composed of officers having charge of fire protection and insurance matters of the railroads:

"(1) Wherever practicable the terminals should be enclosed in close board fences, at least six feet high with at least three strands of barbed wire above and projecting outward at an angle so as to prevent scaling the fence. Some property can be fenced in whole or in part while on others it may not be practicable. There should be as few entrances as possible, preferably not more than one to each pier or unit. In the case of some buildings, such as elevators and power houses, it may be necessary to also erect individual fences.

"(2) The buildings and premises should be effectively lighted so as to make it possible to detect any one approaching from any direction. Searchlights are not generally recommended but rather devices which will flood or distribute the light.

"(3) There should be sufficient watchmen, active, honest and intelligent night men, equipped with small fire extinguishers of the one-quart type and portable clocks, to properly patrol the property. There should also be a chief night watchman or roundsman to generally check up the other men. He should also be equipped with extinguisher and clock. In case of an effective central registering system it will be unnecessary for these men to carry clocks. According to the individual properties these watchmen may be confined to the inside or may be needed both inside and outside, but in the latter case separate men should be detailed.

"(4) The watchmen should be drilled in the handling of fire protection and should be required when they come on for night duty to lay out hose and have other protection ready for instant use in case of fire. Fire alarm signal system should be tested every night.

"(5) Telephones should be installed at entrances and other points convenient for watchmen so that immediate communication can be had to all parts of the terminals. This will do away with the necessity of identification cards for parties applying for entrance. Record of parties passed should be kept.

"(6) At each entrance there should be an armed guard with government authority for identification and search of persons, entering and leaving.

"(7) A patrol on the water front by a power boat is very necessary and probably one of the best safeguards that can be adopted, but will not be advisable in all cases. A boat not less than twenty feet in length, preferably longer, equipped with searchlight and manned by at least two armed guards, should be used.

"(8) The most important protection that can be given is an efficient military guard thrown completely around property, guarding all approaches both from the water and land.

"(9) No boats should be allowed to tie up to wharves and piers at night other than those regularly docked.

"(10) Rigid instructions should be issued and enforced to prohibit smoking on or around any water front property.

"(11) It is suggested that the arrangement at terminals

be subject to the supervision and constant inspection of the insurance or fire prevention representatives of the roads."

WAR TAXES PUSH SEPTEMBER INCOME BELOW 1915 LEVEL

War taxes, which finally have taken their place among other soaring costs of railway operation, were responsible for one of the most disastrous months of the year for railway net income in September. Only in February, according to comparisons by the Bureau of Railway News & Statistics, Chicago, covering the entire operated mileage, was the loss in net income greater than in the latest month reported. Though the sixth month this year to show a loss in net income as compared with last year, September was the first month to show a loss as compared with two years ago. The month's net income was \$9,500,000 under two years ago, though the month's gross was nearly \$75,000,000 greater than in September, 1915.

For February, the Bureau's comparisons show a loss of \$23,000,000 in net income after a gain of nearly \$5,000,000 in gross. In September, after a gain in gross of nearly \$34,000,000, there was a loss in net income of \$20,000,000, within \$3,000,000 of the loss suffered in February, although the gain in traffic was nearly \$30,000,000 greater and the almost impossible winter operating conditions of February were replaced by summer. Of the former month the Commission in rejecting the plea for a 15 per cent increase said: "If the unfavorable results of February had continued our conclusions must have been different." The unfavorable results of September were due entirely to added costs of operation arising from increased wages and prices, congestion of railway facilities and above all to the totally abnormal leap in taxes.

Whereas taxes for the entire nine months have risen \$33,884,000 the increase for September alone was almost \$12,000,000,—nearly four times as great as the largest previous monthly increase in history. Total taxes for the month reached above \$26,000,000, compared with \$17,936,000 in August, the previous record. Taxes in September were at the rate of over \$316,000,000 per year, against the high record of \$180,000,000 for the year ending June 30, 1917. The marked increase is attributable to the fact that the roads in September began to figure war taxes. The September total is somewhat too high, probably, since one or two roads have charged to that month the estimated war taxes accrued for the year to the end of that month. Yet even before taxes were deducted net revenues for September were more than \$8,000,000 below last year despite a gain in gross of \$34,000,000.

How the progressive aggravation of railway operating conditions has played havoc with all improvement in traffic is best shown by the following statement giving the increases or decreases compared with last year in the various items, by months:

	Gross Revenue	Expenses	Net Revenue	Taxes	Net Income
January ..	\$43,559,000	\$34,489,000	\$9,070,000	\$1,817,000	\$7,253,000
February ..	4,912,000	26,307,000	*21,395,000	1,822,000	*23,217,000
March ...	30,519,000	37,996,000	*7,477,000	2,360,000	*9,837,000
April	41,498,000	40,509,000	989,000	2,773,000	*1,784,000
May	47,377,000	43,672,000	3,705,000	2,609,000	1,096,000
June	52,768,000	41,781,000	10,927,000	3,329,000	7,598,000
July	47,200,000	44,203,000	2,997,000	3,621,000	*624,000
August ...	39,891,000	44,857,000	*4,966,000	3,585,000	*8,551,000
September..	33,987,000	42,031,000	*9,044,000	11,968,000	*20,012,000
Total ..	\$341,651,000	\$355,845,000	*\$14,194,000	\$33,884,000	*\$48,078,000

*Decrease.

In the last line, totalling the accumulated changes of the nine months, is told the disastrous part played by soaring expenses and taxes in current railway operations. After rendering an additional service to the country measured by a gain of over \$340,000,000 in gross revenues the railways had

\$14,000,000 less remaining after meeting their added costs of material and labor. After the expansion of almost \$34,000,000 in taxes had been added to this burden they were actually worse off by \$48,000,000 than when they rendered a third-billion rollars less service.

MAKE EVERY FREIGHT CAR DO ITS BIT

By O. O. Carr.

Much has been said and done with reference to the distribution of freight cars for loading with freight for territories from which they can be loaded back again. While many conditions interfere with this plan, everything should be done to develop ways to overcome these handicaps wherever possible in order to take up the slack in distribution and conserve the car supply. A combination drop bottom box and coal car or a combination drop bottom stock and coal car will do much to overcome part of this difficulty on roads which have a number of coal mines located on their lines, as such cars can be loaded with coal to territories where they can be loaded in the opposite direction with another class of freight. The saving in empty car days and in the expense of hauling empty cars in the direction of heavy traffic, and the decrease in the cost of owning and maintaining the cars of the two classes, will show some interesting figures.

Aside from the extensive distribution of gondola cars to mines, flat cars to lumber mills, and box cars to grain elevators, the cars which are distributed under the direct supervision of the division car distributor represent only about 20 per cent of the number loaded on a division each day. A good car distributor, fully posted concerning the kind of freight loaded at each station on his division and on connecting divisions, will, as far as possible, select cars to fill orders in such a way as to supply a car that will also serve the second station's loading and thereby save the car from being moved out of that station empty.

Cars that are made empty at stations or those supplied from the yards are ordinarily loaded by the agents as best suits their convenience, which is perfectly natural since they are not familiar with the loading other stations have for cars. One has to distribute cars and to see the number hauled out of local stations empty on account of their being of a wrong class or in unfit condition to serve their loading to realize the extent to which this waste takes place. To better illustrate this slack movement, consider a few stations with the kind of cars required and the approximate destinations or territories loaded to as follows:

Stoveton—Loads stoves for stations southwest. Rough-freight box cars or those with poor-linings required.

Flourboro—Loads flour for Southport export, also local stations in Southern states. Requires extra good box cars.

Woodbury—Loads cord wood and mine props for local stations on the division. Rough-freight box, stock or gondola cars required.

Coalville—Loads coal for points north—gondola cars.

Grainfield—Loads grain for points south—good box cars.

Nurseryville—Loads nursery stock for points on foreign lines west—large box cars.

Autobon—Loads autos for various points west—auto and furniture cars.

A check of the large freight loading and distributing points where from 50 to 75 cars of merchandise and other freight are loaded each day into empties supplied from cars made empty or reshipped at the station and empties from the terminal yard will show many cases such as noted below:

A good grain car will be loaded to Stoveton when one with poor linings would have served the purpose as well, and would also have guaranteed reloading at destination.

A stock car is loaded with sewer pipe to Flourboro when a good box suitable for flour loading should have been selected.

A furniture car is loaded to Woodbury when a car of another class and in poor condition would have served the purpose.

Box cars are loaded with iron rails for the coal mines at Coalville when gondola cars should have been loaded.

A small box car is loaded to Autobon when a large car or an automobile car should have been used.

While each of the 75 cars would not be loaded wrong, there would not be as many loaded improperly if agents had something to show what the needs of all stations are. A very simple way to enable them to load cars to the best interests of the company would be to print a booklet showing the name of every local way station on the system, the freight each loads regularly, the kind of cars needed and the approximate destinations of the freight and to place these booklets in the hands of all agents, yardmasters, local conductors and shipping clerks of large industries, thereby giving them the opportunity of making a selection of cars as between stations when loading them. If cars made empty at each station received this consideration, it would be possible to work out a scheme to keep a car in continuous loading for weeks without a single empty move. The plan would automatically make a silent system car distributor of every agent, yardmaster and local conductor on the railroad.

This booklet could be revised to cover shipping seasons or supplements could be issued to make it a reliable working guide. Local stations which do not have regular daily loadings for cars could be listed as having use for, the kind of cars their next station neighbor has daily use for.

In order to secure as close adherence to the plan as possible, receiving agents could make a report showing the cars they received loaded, which had to be hauled out empty on account of having no outbound loading for cars of their class, or in the condition of the cars loaded to them. Inquiry could then be made of the loading points to ascertain whether proper consideration had been given to the selection of the cars.

Carrying out this same idea in another way, roads which have a large number of coal mines on their lines should if possible prepare a list of all coal dealers receiving coal from mines on their road, showing who have bins or unloading conditions under which coal cars with dumping appliances can be handled better and more promptly than flat bottom gondolas and likewise the names of dealers who can use flat bottom cars to better advantage. This list should be placed in the hands of the mine superintendents, who will be glad to cooperate in filling their orders by loading cars that best fit the unloading conditions of their customers, and thereby help conserve the gondola car supply.

OPERATORS OF NEW ZEALAND GOVERNMENT RAILWAYS.—According to a late report of the Minister for Railways, the total earnings of the 2,970 miles of main lines of the New Zealand Government railways amounted to \$23,363,142 for the fiscal year ended March 31, 1917, an increase of \$1,228,567 over the previous year. During the year the expenditure amounted to \$14,243,584, leaving a net profit of \$9,119,558, which represents a return of 5.3 per cent on the capital invested in these lines by the Government, which to date amounts to about \$190,000,000. There were 14,173,115 passengers carried, as compared with 14,201,506 for the previous year; and 5,826,265 tons of freight were handled, as compared with 5,960,562 tons, with 412,908 tons of live stock, as compared with 410,383 tons. The greater receipts were due to the increased passenger and freight rates charged, since the aggregate business done was less during the 1916-17 period than for 1915-16.

General News Department

A Board of Conciliation at St. Thomas, Ont., has recommended increases of 18 and 20 per cent in the pay of brakemen and baggagemen on the lines of the Michigan Central in Canada.

The Senate passed on December 11 a resolution introduced by Senator Lodge providing for an inquiry by the Senate Committee on Manufactures into the causes for the shortage of sugar and coal.

The Chicago, Burlington & Quincy has granted an increase in pay to employees in its car department, effective December 1. Those paid on a straight hourly basis were granted an advance of two cents an hour and men on piece work were given a 5 per cent increase.

Forty-two submarine chasers and other small government vessels have recently been taken through the New York State Barge Canal from Lake Erie to the Hudson River. These boats were built at western yards and have been moved to New York under their own power.

On the lines of the Southern Pacific in Texas, New Mexico and Arizona orders have been issued that all cattle and other edible animals killed upon the track shall be saved and the meat disposed of to butchers. The pelts of all killed animals must also be saved and sold.

Station employees of the New York, New Haven & Hartford have asked for an increase of 75 cents a day in their pay and for the abolition of all rates based on piece work or tonnage; also the abolition of bonuses, and the adoption of the eight-hour day and a minimum day rate of \$2.50.

The Post Office Department is advertising at Hartford, Conn., for bids, to be received until February 1, for running a postal route daily, by motor vehicle, over the highways from Hartford to New York City by way of Waterbury and Danbury, Conn., and White Plains, N. Y. The distance is 105 miles.

According to the New York Tribune, the government of Switzerland has paid \$90,000 demurrage charges on a vessel which has been held at an Atlantic port since September waiting for a load of wheat, bought in Chicago before the ship was chartered. This instance is said to be only one of many.

Miss Katherine Stinson, on Tuesday, December 11, made a flight from San Diego, Cal., to San Francisco, 610 miles, in 9 hours, 10 minutes; and without a stop. This distance is about 58 miles greater than that made by Miss Ruth Law, November 19, 1916, from Chicago, Ill., to Hornell, N. Y. Miss Stinson, in crossing the Tehachapi Mountains, rose to a height of about 9,000 ft. above the sea.

The car repair shed of the Baltimore & Ohio at Storrs Station, Cincinnati, Ohio, was destroyed by fire on November 27, together with 21 freight cars, eight of them loaded. The structure was of frame construction, 48 ft. by 445 ft., open on the sides and with three tracks running the length of the shed. The fire was discovered in the vicinity of the lockers where the men kept their tools and working clothes. Estimated loss on structure, cars, tools and supplies, \$37,000.

In the Grand Central Terminal, New York City, service flags are now displayed showing the number of employees of the New York Central lines, the New York, New Haven & Hartford, and the Grand Central Terminal who are serving in the army or the navy, a flag for each of these three organizations. The New York Central flag shows the figures 4 9 7 6 (the lines of the figures being composed of small stars), indicating the number of men representing the Central companies; the New Haven's flag reads 1 4 1 2, and the Grand Central Terminal flag 1 0 4.

The Department of Commerce has issued a statement to the effect that through the negligence of live-stock owners food animals valued at \$20,000 were killed on the tracks of the Central of Georgia during the first nine months of this year; 1,862 head, including fine dairy cows and beef cattle as well as hogs and

sheep. This is equal to one animal for every mile of track; and if that figure can be accepted as a basis for estimating the loss for the entire country, the destruction of food animals on the railway tracks of the United States during the first nine months of this year can be put at \$2,760,000, or \$3,680,000 for the whole year. The lesson is obvious.

In the dispatchers' offices of the New York Central at the Union Station, Albany, N. Y., a complete new equipment of telegraph instruments is being installed; and in connection with this improvement numerous lines are to be equipped with selector bells and lights, so that the office can be called by the selector apparatus. This arrangement, which also is in use at a number of other large offices on the New York Central, provides against tedious delays when there may be only one operator on duty. In whatever part of the office he may happen to be he can be depended on to answer promptly on any wire even though the relay or sounder of that wire is not within his hearing.

Railroads in the southern and western as well as the eastern district show decreases in operating income per mile for the month of October, 1917, as compared with October, 1916, according to a preliminary bulletin for 128 roads issued by the Interstate Commerce Commission. For the 10 months ended with October the southern roads were still ahead of 1916, while the western lines had a decrease. For October the total revenues per mile were \$1,601 as compared with \$1,429. Expenses increased from \$888 to \$1,097 and operating income fell from \$481 to \$407. For 10 months the operating income of all the roads was \$3,511 per mile as compared with \$3,780 per mile. For the eastern lines it was \$5,559 as against \$6,441; for the southern lines \$3,323 against \$3,319, and for the western lines \$2,763 against \$3,884.

One of the first questions which came to the attention of the Chicago subcommittee of the General Operating Committee of the eastern lines was why approximately 2,000 carloads of live stock are shipped monthly through the Chicago gateway to New York in preference shipments. This condition seemed strange in view of the fact that Chicago facilities for slaughtering are the best in the country. When packers were called into conference for the purpose of determining whether this traffic might not be reduced considerably to relieve the congested districts in the east, it was learned that cattle are shipped to New York City for slaughter to supply the needs of the million of orthodox Jews in that territory. The Jews, it was pointed out, are forbidden by their religion to eat meat which has been slaughtered more than 24 hours before.

Mediation and Conciliation

A controversy between the Baltimore & Ohio and its telegraph operators has been settled through the efforts of the United States Board of Mediation and Conciliation. The settlement provides for a basic eight-hour day and increased pay for overtime. The question of increased rates of pay will be submitted to arbitration.

Patriotic Duty to Reduce Freight Damages

W. J. Jackson, receiver of the Chicago & Eastern Illinois, has sent to employees a letter reminding them that all avoidable waste or damage to property constitutes actual aid to the enemy. He says: "Our loss and damage to freight is running between \$15,000 and \$20,000 per month. This is a total waste and loss. Much of it can be avoided with only reasonable care. In August last our payments included \$1,124, on account of the destruction of products of agriculture; \$1,252 for destruction of animal products; \$3,600 for the manufactured articles, etc., including a total record of food destruction of nearly \$9,000 for this one month, or at the rate of over \$100,000 per year. Surely, in fairness to our boys, our families and our country, we can do better than this! Be just a little more careful and try a little harder to avoid losses."

REVENUES AND EXPENSES OF RAILWAYS

* Resources shown are for period June 1 to October 31

Railway Regiments' Tobacco Fund

Two more supply companies have made contributions to the Railway Regiments' Tobacco Fund since last week. They are as follows:

Marion Malleable Iron Works, Marion, Ind. \$10 a month
Rodger Ballast Car Company, Chicago. \$10 a month

The Machinery Club of New York City at its last board meeting approved a resolution that appropriated one-third the profits of the cigar department for the month of December for soldiers' smokes. One-half of this amount will be sent to the New York Sun Tobacco Fund and the other half to the Railway Regiments' Tobacco Fund.

Railway Officers in Military Service

In the *Railway Age Gazette* of November 23, page 933, there was published a list of railroad officers sent to Russia to assist in the operation of the Russian railways. By an oversight there was omitted from this list the name of T. H. Lantry, assistant to the vice-president of the Northern Pacific, who is one of the officers of the Russian Railway Service Corps with the rank of lieutenant colonel.

Limitation of Use of Official and Private Cars

The Railroads' War Board, through Fairfax Harrison, its chairman, has addressed to the railroads a bulletin expressing its opinion that the use of official and private passenger cars should be limited in order to relieve overburdened passenger trains. It is suggested that "no such cars be handled, either in free or pay service, except for the accommodation of railroad officers when traveling on necessary railroad business."

Pennsylvania to Sell War Savings Stamps

The Pennsylvania Railroad has completed arrangements for placing on sale the new war savings stamps and thrift stamps at ticket offices and in its shops, freight stations and in the various departments on the Lines East and West of Pittsburgh.

Every ticket agent on the entire system, except those in the immediate vicinity of a post-office, will have the stamps for sale.

As in the case of the campaign for the two Liberty Loans, special efforts will be made to encourage investment in the savings and thrift stamps on the part of employees. It having been found impracticable to place the stamps on sale directly in the pay cars, arrangements will be made wherever possible to have them on sale near the pay cars when employees are being paid.

Japanese Occupy Vladivostok Terminal

According to press despatches, authentic information was received at Washington, Tuesday night, that Japanese troops have occupied the great railroad works at Vladivostok, the Pacific terminal of the Trans-Siberian Railway.

The railroad works which the Japanese have occupied have been the place where all the imported railroad cars and locomotives shipped from the United States and purchased under the Russian credit in this country have been assembled. There are also at Vladivostok great supplies of other kinds of stores, including ammunition. The possession of the railway yards and the railway equipment at the Vladivostok terminals will make it absolutely impossible for the Bolshevik Government to move these cars and stores without the consent of the Entente powers.

Valuation Arguments Presented Before I. C. C.

Arguments in support of the protests of the Texas Midland, the Atlanta, Birmingham & Atlantic and the Winston-Salem southbound against the tentative valuations of their property made by the Bureau of Valuation of the Interstate Commerce Commission were presented before the full membership of the commission at Washington beginning on Monday, December 10, by Pierce Butler and W. G. Brantley, counsel for the roads. Arguments were also made on behalf of the state railway commissions by Charles E. Elmquist, on behalf of the railway brotherhoods by Glen E. Plumb, and on behalf of the Bureau of Valuation by Solicitor P. J. Farrell. The arguments of the railroad counsel followed the briefs they had previously filed, one of 1027 pages in the case of the Texas Midland and one of 737 pages in the case of the Atlanta, Birmingham & Atlantic.

Pierce Butler and Leslie Craven also filed a special reply in the form of notes and comments upon the memorandum recently filed by Director Prouty in the Texas Midland case, with a note stating that it had not been submitted to or considered by the Presidents' Conference Committee and was not filed in its behalf. A similar note was appended to the briefs.

Government Operation of Railways Imminent

The following facts were received by wire from Washington after the first part of this issue containing the article on "Government Operation of Railways Imminent," page 1073, was printed.

Legislative agents of the four railway brotherhoods went to Washington Wednesday at the request of Daniel Willard and conferred with the President after he had seen the railway officers. Representative Sims, the next chairman of the House Committee on Interstate Commerce, also conferred with the President.

The statement is made near the bottom of the second column on page 1075 that 100 locomotives have been ordered from the western to the eastern lines. The Western lines arranged to furnish these locomotives at the request of the War Board at a recent meeting in Chicago at which a pro rata plan for providing them was decided upon. They will be delivered to various Eastern lines at convenient junction points and will be furnished as follows: By the Santa Fe, nine; Northwestern, seven; Burlington, seven; Great Western, one; Chicago, Milwaukee & St. Paul, eight; Rock Island, six; Chicago, St. Paul, Minneapolis & Omaha, two; Duluth & Iron Range, ten; Duluth, Missabe & Northern, twelve; Great Northern, five; Illinois Central, six; Kansas City Southern, one; Minneapolis & St. Louis, one; Minneapolis, St. Paul & Sault Ste. Marie, two; Missouri, Kansas & Texas, two; Missouri Pacific, four; Northern Pacific, five; St. Louis-San Francisco, three; Cotton Belt, one; Southern Pacific, six; Union Pacific, four.

North Western Provides Free Recreation Rooms at Chicago for Soldiers

The Chicago & North Western will soon open spacious club rooms in its Chicago passenger station where soldiers and sailors may make themselves at home while in the city. The new club rooms will be on the street level and will be supplied with comfortable chairs, settees, couches, writing desks and stationery, books, newspapers and magazines, victrolas and pianos, shower and porcelain-tub baths, sanitary bubbling drinking fountains, toilet rooms, wash stands and towels. The Chicago & North Western will also establish an information bureau in charge of a secretary. At this bureau a register will be maintained for the interchange of information between the enlisted men and the public regarding entertainment at homes for weekends and meals, for the registration of gifts, including tickets for entertainments, and interchange of the donors' and receivers' names. Various societies in Chicago, co-operating with the railroad, have undertaken to provide suitable and frequent entertainments in the club rooms. The use of all these comforts is free to the enlisted men of the army and navy.

Report of Board of Mediation and Conciliation

The Federal Board of Mediation and Conciliation reports that during its life of four years interruption of interstate railway service by labor disputes has been almost negligible. The law does not require the board to make annually or otherwise an official report, but in view of the extreme gravity of the present railway situation a special report has been sent to the President.

In four and a half years there has been a total of 84 disputes, which threatened all classes of employees, but in less than half a dozen instances has there been cessation of train movement. In these cases the disputes broke out suddenly, before the board knew they were impending, and in each case a settlement was effected quickly. In no instance has a strike followed the intervention of the board.

Fifty-seven cases have been settled by mediation. Seven have been solved by combined mediation and arbitration, eight by arbitration, one by congressional action, three by the parties themselves, three are under arbitration, four in mediation and one remains unsettled.

Agreements effected by mediation have been found to be more

satisfactory to all sides. There is no decision against either party and neither of them suffers defeat.

"The present law," says the report, "may not be adequate for dealing with controversies of nation-wide extent, or even those which affect large sections of the country under abnormal conditions, but it seems to be the best plan yet devised. . . ."

The Halifax Catastrophe

In the disastrous explosion of a shipload of munitions in the harbor of Halifax, N. S., on Thursday, December 6, in which twelve hundred or more persons were killed and the city was devastated over a territory of 2½ square miles, the railroads suffered severely. The central passenger station was wrecked, and in it many lives were lost. Practically all buildings in the freight yards were demolished, and about 400 freight cars were destroyed, many of them being burned in the fires which followed the explosion. One statement says that, for a distance of two miles, freight cars were lifted off the track and thrown into the ditches or the adjacent fields. Seventy or more passenger cars were badly damaged. At the Richmond station every employee was killed and many were killed and injured in the freight yards. Of 70 trainmen making their headquarters at that station, only 10 had reported for duty on the Monday morning following the disaster.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings and places of meetings of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

- AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.
- AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, Supt. Timber Preservation, B. & O. Mt. Royal Sta., Baltimore, Md. Next convention, January 22-24, 1918, Hotel Sherman, Chicago.
- CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.
- CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Morrison Hotel, Chicago.
- CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual dinner, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.
- CINCINNATI RAILWAY CLUB.—H. Buet, Chief Interchange Inspector, Cin. Ry., 101 Carew Bldg., Cincinnati. Regular meetings, 2d Tuesday, February, May, September and November, Hotel Sinton, Cincinnati.
- ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 568 Union Arcade Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh, Pa.
- GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month. Room 1856, Transportation Bldg., Chicago.
- NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meeting, 2d Tuesday in month, except June, July, August and September, Boston.
- NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meeting, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.
- Niagara Frontier Car Men's Association.—Geo. A. J. Hochgrebe, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month. New York Telephone Bldg., Buffalo, N. Y.
- PACIFIC RAILWAY CLUB.—N. V. Walker, Assistant to Chief Engineer, Northwestern Pacific R. R., San Francisco, Cal.
- PEORIA ASSOCIATION OF RAILROAD OFFICERS.—F. C. Stewart, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.
- RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Pittsburgh Commercial Club Rooms, Colonial Annex Hotel, Pittsburgh.
- St. Louis Railway Club.—E. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.
- SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. I. Merrill, Grand Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 a. m., Piedmont Hotel, Atlanta.
- TRAFFIC CLUB OF CHICAGO.—C. B. Sinsler, La Salle Hotel, Chicago.
- TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Waldorf-Astoria Hotel, New York.
- WESTERN CANADA RAILWAY CLUB.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.
- WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Monday in month, except June, July and August, Hotel Sherman, Chicago.
- WESTERN SOCIETY OF ENGINEERS.—Edgar S. Nethercut, Secretary, 1735 Monmouth Bldg., Chicago, Ill. Regular meeting, first Monday in month, except January, July and August. Extra meetings generally on other Monday evening except in July and August.

Traffic News

The Pennsylvania Lines West will establish the sailing day plan of handling 1. c. 1. freight at Cincinnati on January 2, and at Pittsburgh some time in the same month.

According to the Altoona Tribune, express trains of 26 cars are now to be seen on the Pennsylvania Railroad. However, these are not sleeping cars or coaches; they are filled with the Adams Express Company's merchandise.

The cotton crop of this year is now estimated at 10,949,000 bales, smaller than the crop in any other year since 1909. The present estimate is more than a million bales below that made by the Department of Agriculture in October. Prices are now higher than before for many years.

The Transportation Committee of the National Lumber Manufacturers' Association, at a meeting held in Chicago, has adopted resolutions calling on the railroads' war board to prohibit the reconsignment of cars put in transit unsold, after such cars have arrived at the original billed destination.

The quantity of vegetables raised in Florida for the northern market this year is said to have been 26,000 carloads, or about 9,000 carloads more than last year; and the growers say that the lack of railroad facilities is now hampering them seriously. It takes eight days, or twice the normal length of time, to get freight from Florida to New York.

The Chamber of Commerce of Hartford, Conn., has an improvised clearing house to economize the work of automobile trucks. A Hartford manufacturer, sending a truckload of freight to Willimantic, 32 miles, got in touch with the secretary of the Chamber of Commerce and through arrangements then made, the truck driver, on arriving at Willimantic, was informed by telephone where a return load of freight could be found.

One of the greatest difficulties confronting shippers and railroad officers alike during the last year and a half has been an everchanging multiplicity of embargoes. L. J. Brinkman, general agent of the operating department of the Michigan Central at Detroit, Mich., has simplified his embargo problem by issuing every day a concise mimeographed statement indicating which roads are open or closed to c. l. and l. c. 1. freight from Detroit, with a brief summary of exceptions on each road. The statement also includes a summary of general embargoes and a list of embargoes against industries on the Michigan Central.

At a recent conference in St. Louis, Mo., with representatives of the Missouri and Illinois Fuel Administrations and the St. Louis Fuel Committee representatives of the railroads and coal operators agreed to a plan for limiting the reconsignment of coal and providing for confiscation of coal by the United States Fuel Administration under certain conditions. Under the plan agreed to, unless a bill of lading showing the final destination of coal is received at either the St. Louis or East St. Louis yards before a car arrives, the coal may be taken over by the Fuel Administration and reconsigned to points where it is most needed.

The Chicago, Burlington & Quincy recently issued a list of "don'ts" and "dos" for shippers for the purpose of preventing congestion during the winter months. The circular reads in part as follows: "Don't fail to consult agent before offering shipments for embargoed territory. Ascertain from agent before placing order for car if the route you wish to use is open. Don't ship via indirect lines to avoid embargoed routes, as it has the effect of plugging up quickly the only avenue the railroads have for relieving congestion. Don't think we want you to do it all. We are endeavoring to do our bit. Let us know if we have overlooked anything."

H. C. Bixler, superintendent of stations and transfers of the Pennsylvania Railroad, announces that at a conference of railroad men and shippers, an agreement has been reached for the use of standard containers for fruits and vegetables shipped by freight, the shippers being represented in the conference by the Fruit & Vegetable Transportation Association of the South and East. At this conference, held in New York City last Tuesday,

about 150 persons were in attendance, including representatives of the Department of Agriculture and of the New York City Government, steamship men and makers of boxes, crates and barrels. To insure satisfactory transportation and to avoid losses and waste, the Fruit & Vegetable Transportation Association has been working for some time toward the adoption of standard containers for each kind of vegetable; and at this conference a large number of sample boxes and crates were exhibited. Fourteen types were approved and recommended for adoption by all shippers of perishable freight. Among the designs approved are a lettuce crate, an orange box, a celery crate, two kinds of crates for cantaloupes, and numerous others. For each design there is a specification, naming every bit of material and prescribing every process of manufacture.

New Elevator at Erie

Overcoming the greatest difficulties in obtaining materials and labor the Pennsylvania Railroad has finished its new grain elevator at Erie, Pa., in time to render material assistance in moving the final grain shipments from the northwest, before the closing of navigation. The new elevator, a steel and concrete structure, replaces the old wooden plant which was destroyed in two successive fires. The first cargo, which has just been elevated and transferred to cars, consisted of 101,000 bushels of wheat from the steamer John Owen. It will be shipped abroad from Philadelphia. The lake trip to Erie is considerably shorter than to Buffalo, and may enable some steamers to make one more round trip, prior to the coming of heavy ice. The new elevator consists of 30 reinforced circular tanks, 18 interstice tanks and 22 side and pocket bins, having a total capacity of 1,156,400 bushels. It has track room for more than 150 cars, and is capable of unloading grain at the rate of 25,000 bushels an hour. The plant is complete in all respects, including powerful car pulling machinery for placing cars, and is absolutely fireproof. All machinery is operated electrically, and electric lights are used throughout.

Reductions in Passenger Service

The Pennsylvania has discontinued the express train leaving Pittsburgh, Pa., for New York City at 1 p. m.; and beginning with next week will discontinue, between New York and Washington, all of the through sleeping cars to and from points in the southern states, except on two trains. It is said that these withdrawals of sleeping cars will be equivalent to three full trains. The southward trains on which sleepers will continue are those leaving New York at 9:30 p. m., and midnight (12:30 a. m.). The Southern Railway express, leaving New York at 11:08 a. m., will be taken off, as will four northbound expresses; those leaving Washington at 7:30 a. m., 9:05 a. m. (two sections) and 11:15 a. m. The Florida Limited and the Florida Special, winter resort trains, will not be run north of Washington this winter. The foregoing changes aggregate about 3,000 passenger-train miles daily.

The Pennsylvania Railroad advises that there is no foundation for the report as circulated by the press that the company proposes to discontinue any of its regular two-hour express trains between Philadelphia and New York, or that it has reached an agreement with the Philadelphia & Reading to divide the passenger business between those two cities, either in equal shares or in any other manner.

The demand for transportation between New York City and Philadelphia, over the Pennsylvania, exceeds the capacity of the trains now operated and as a large proportion of this traffic is for business purposes of the highest importance—much of it relating to the conduct of the war—the question of curtailing the service presents a very difficult problem.

Livestock Shipments Regulated

Beginning Monday, December 10, all shipments of live stock into the Chicago market will be stabilized in accordance with a plan recently suggested by the Railroads' War Board. This plan, which also tends to stabilize prices, was adopted at a conference of representatives of the Chicago Car Service Committee of the Railroads' War Board, the Federal Food Administration, growers and shippers of livestock, commission men and the packing interests.

Under the old plan, which allowed unrestricted shipments of livestock, heavy consignments of cattle would arrive in Chicago

on one or two days of the week and light consignments during the remainder. To avoid all the undesirable results of this custom, what is called the zone system of regulating shipments was evolved and will govern all shipments on and after December 10.

Under this plan, within a zone of approximately 300 miles of Chicago, livestock will be received for shipment to reach the Chicago market only on Tuesday, Thursday, Friday or Saturday. Within the second zone, beyond 300 miles from Chicago and up to the 36-hour limit for shipments of live stock, shipments will be received to reach the Chicago market on Monday, Wednesday, Friday or Saturday. The third zone embraces all territory outside of the 36-hour limit from Chicago and from this zone shipments of live stock may be made at any time to reach the Chicago market on any week day.

It is probable that this system of stabilizing shipments and prices of live stock will be extended with necessary modifications to all the big live stock markets of the country.

New York State Waterways

Governor Charles S. Whitman, of New York, speaking before the Atlantic Deeper Waterways Association, at Miami, Fla., November 29, presented arguments in favor of deepening the Hudson River, between New York and Albany, so that ocean vessels could sail to Albany and thus relieve the congestion in New York harbor. He said that ample land, conveniently situated, could be made into a terminal, near Albany, where freight could be transferred from canal boats to larger vessels and vice versa. The governor said that the foreign commerce passing through Albany by rail amounts to more than 14,000,000 tons yearly. The completion of the new barge canal, next spring, should increase this volume of freight. The Hudson River is deep enough already for ocean-going vessels from New York up to a point about 40 miles south of Albany. The governor thinks that motor trucks will make the barge canal available to many shippers who, without them, could not expect to share in its benefits.

Representatives of the New York State Waterways Association propose to call upon the National Council of Defense for an appropriation of \$5,000,000 for the construction of barges for service on the new canal next year. This appropriation is urged as a military necessity and as "a means of benefiting the entire nation."

The Chamber of Commerce, at its regular monthly meeting in New York City, December 6, adopted resolutions requesting the governor of New York to direct the proper state officers to take the steps necessary, including co-operation with the appropriate Federal Department, to provide suitable and sufficient equipment to enable the barge canal and other waterways to be made use of to the fullest possible extent. On Monday, December 10, about 300 men, representing the Federal and State governments and commercial interests, met at the Chamber of Commerce, endorsed the resolutions which had been passed, and listened to addresses on the prospects of the canal and the need of additional transportation by General W. W. Wotherspoon, superintendent of Public Works of the State of New York, and Major-General William W. Black, chief of engineers of the United States Army. General Black said that many corporations were building barges for the transportation of freight on the Mississippi, Missouri and the Ohio rivers. He regarded the Erie Canal as of the highest importance in developing the powers and resources of the country for the winning of the war. He does not believe in government ownership of transportation lines.

Facilitating Export Freight

The export division (sitting at New York) of the eastern carriers' operative committee now has authority over the issuance of railroad shipping permits embracing all commodities for export via Boston, New York, Philadelphia, Baltimore, Norfolk and Newport News, excepting United States Government freight. This extension of authority was put in effect on December 12. In connection with this centralization of export permits at New York, the general operating committee (Pittsburgh) ordered that all lines reaching North Atlantic seaboard ports embargo at once all export freight through those ports, except for the United States Government, and that any existing permits be canceled. This drastic action is declared to be vitally essential, and the committee calls for thorough co-operation in the handling of traffic for overseas shipment, so that cars which would otherwise be available for fuel, foodstuffs and Government

freight shall not be used in moving traffic which cannot be promptly re-shipped when it reaches tidewater.

In an endeavor to enlist the aid of the commercial steamship lines, Chairman George D. Ogden, of the export division, has asked the Trans-Atlantic Associated Freight Conference and the steamship committee of the New York Produce Exchange to co-operate in relieving the congestion at the seaboard. He requests that in contracting cargo they give marked preference to the traffic now at the seaboard, rather than to book new business from the interior. He also asks for help in cases where cargo booked for specific sailing fails to arrive in time, thus involving a second engagement. "In event it were practicable for the steamship lines, in such instances, to create a co-operative plan for the purpose of turning such belated shipments to other steamship lines that might have available space for the same foreign destination," much relief would be accomplished.

Notes on the Coal Situation

More coal was forwarded from ports of the great lakes up to December 2 than during the entire season of 1916. It was estimated that 26,000,000 tons of coal would be required this year by consumers, but that estimate has now been exceeded by 1,072,290 tons, or 1,446,020 tons more than the total lake shipments of coal last season. Also, the Northwest has received, all-rail, from the fields of Illinois and Indiana this year nearly three times as much coal as last year.

Fuel Administrator Garfield has approved plans of the Coal Shippers' Terminal Pool Association for establishing terminal coal pools in the central west to facilitate handling of the coal supply. The plan contemplates uniform pooling arrangements under the Central Executive and Advisory Committee of the pool association wherever pools are established with the approval of the Fuel Administration.

Shipments of anthracite coal in November amounted to 6,545,313 tons, or about a half million tons more than in November of last year. For the 11 months ending with November the total shipments aggregated 71,434,360 tons, or 4,057,990 tons greater than the total shipments for the 12 months last year. To date this year the shipments exceed those of the same period in 1916 by 9,640,743 tons.

The pool committee, which represents coal operators in the central territory, will meet at Cleveland on Friday with F. C. Baird, who has been authorized to represent the General Operating Committee of the Eastern Railroads. Mr. Baird has also been designated to act as the official representative of the Fuel Administration in clearing up the congestion of coal shipments on the Chesapeake & Ohio, which has delayed the coal supply of Michigan and other central western points. He will combine the authority to control the transportation conditions with the authority conferred by Mr. Garfield in order to effectively deal with the emergency.

According to the weekly report of the Geological Survey for the week ending December 8, the total production of bituminous coal was 10,273,014 net tons, a decrease of 10.8 per cent, as compared with the production of the preceding week. Shipments of anthracite as reported by the nine principal carriers decreased 12.8 per cent. For the week ending November 24 lack of cars was responsible for 20.2 per cent of the deficiency from full time operation and, the report says, inadequate transportation facilities thus remain overwhelmingly the dominant factor limiting the output of soft coal.

Governor James H. Cox went over the heads of Federal Fuel Administration officials on December 12, and took the Ohio coal shortage problem in his own hands. His first move was to order solid train loads of coal assembled and sent immediately to points in the state most seriously in need of fuel. The order was directly contrary to instructions of F. C. Baird, Federal Fuel Administrator in charge of the lakes coal pool. Cleveland, who refused by long-distance telephone Wednesday to sanction such action. Subsequently word came that Mr. Baird had decided to send a representative to Columbus in accordance with the Governor's wish to keep in close touch with the distribution. He said by telephone that he would co-operate with the state. The changed attitude of the Fuel Administration representative, it is believed, will work to practically a complete distribution of all lakes coal, which means that no fewer than 5,000 cars in Ohio and more than 10,000 cars held in Kentucky, near Cincinnati, will be moving to consumers without further delay.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

Express Companies Ask Higher Rates

Representatives of the principal express companies testified before the Interstate Commerce Commission on December 7 in support of their application for a general 10 per cent increase in express rates on interstate traffic. It was announced that they proposed to ask the state commissions for a similar increase if their application is granted by the federal commission. T. B. Harrison, counsel for the express companies, stated that since the Interstate Commerce Commission allowed an increase on September 1, 1915, the expenses of the express companies had increased much faster than their revenues, but that the increases during the present year have been abnormal. In addition to the general rise in prices for labor and materials, Mr. Harrison said that the increase in expenses was largely due to the abnormal increase in traffic, and results from overloaded equipment, congestion of terminals, and the shortage of equipment caused by the use of so many express cars for military traffic, which has made it necessary for them to use box cars on some of the eastern roads in place of express cars. He also spoke of the large increase in the amount of loss and damage claims due to congestion, poor packing by the shippers, shortage of labor, and especially to the increased value of the commodities transported. As a result, he said, it has come about that the operating receipts of the express companies are less than enough to pay their expenses. If an increase is allowed and the abnormal conditions shall change, the companies will be willing to co-operate with the commission in reducing the rates.

J. H. Henderson, counsel of the Iowa Railroad Commission, appeared as chairman of a committee representing various western state railroad commissions. Hugh La Master, counsel of the Nebraska Commission, and a member of this committee, said the state commissions would desire an opportunity to examine the exhibits of the express companies before announcing their position, but that the American Express Company had charged the cost of the retirement of a large building in New York to expenses and had charged it to only four years' operations, making the annual charge more than the amount of the deficit. He thought the charge should have been made to surplus.

J. W. Newlean, vice-president of Wells, Fargo & Co., introduced an exhibit giving the composite statements of the Adams, American, Southern and Wells Fargo companies, which showed that for the seven months ending July 31, 1917, while the revenues from domestic express transportation were \$115,662,604, as compared with \$96,083,108 in the corresponding period of 1916, the operating expenses had increased from \$43,411,080 to \$56,261,522. Taxes had also increased, with the result that whereas the operating income in the corresponding seven months of 1916 was \$3,675,694, or 3.82 per cent of the gross receipts, in 1917 there was a deficit of \$508,527, or .44 per cent of the gross receipts. The exhibit contained numerous financial statements and also a table showing an increase in wages during the period from August, 1916, to October, 1917, equivalent to over \$6,000,000 a year. Another exhibit gave a detailed statement of the increases in the prices paid for articles of supply and equipment essential to express operations.

The Interstate Commerce Commission has announced a further hearing on the application of the express companies for increases in rates, at Washington, on December 18.

STATE COMMISSIONS

The Public Service Commission of New York, Second district, has been appealed to by the railroads to stiffen its rules for the marking of packages or loose pieces of l. c. l. freight; and a hearing is to be held at Albany December 18. They ask for the revocation of the orders of the Commission issued in 1908, so that carriers may demand that each package be marked with the name and address of the consignor. The present rule prescribes that only two packages in a shipment need be fully marked.

COURT NEWS

State Statute as to Handholds—Contributory Negligence

The Circuit Court of Appeals, Sixth Circuit, holds that under Gen. Code, Ohio, Sec. 8951, forbidding common carriers to move a locomotive not provided with grabirons or handholds in the sides and ends thereof, a railroad company is guilty of negligence where it operated an engine on the pilot of which a turtleback or iron bar had been placed, which rendered it impossible to use the handholds. The suit was one for injury to a track repairer, who, for the purpose of riding to dinner at the railroad's camp, attempted to step on the footboard on the pilot end of the engine, which was moving, tender foremost, at a speed of 8 to 12 miles an hour and hauling six empty cars; he missed either his footing or his handhold, fell under the cars, and lost a leg. Under the Ohio statute contributory negligence does not bar recovery where that is slight and the employer's negligence great. The questions whether the railroad employee's negligence was slight as compared with that of the company, as well as the comparative degrees of negligence, were held jury questions. There was evidence that the employees were warned not to board moving trains, but that their superiors acquiesced in their doing so. It was held that the plaintiff, in violating a mere warning, which did not amount to a prohibition, was guilty of only contributory negligence, and judgment for the defendant was reversed and a new trial ordered because of an instruction to the jury that might have led them to believe that recovery was absolutely barred because of such verbal warnings.—Heskett v. Pennsylvania, 245 Fed. 326. Decided October 2, 1917.

Recent Decisions Under the Federal Employees' Liability Act

The Illinois Supreme Court holds that a carpenter employed by an interstate and intrastate railroad in building forms on the margins of a right of way into which concrete was to be poured to form retaining walls for concrete for the elevation of the tracks, injured by sawdust flying into his eye, was not engaged in interstate commerce.—Dickinson v. Industrial Board (Ill.), 117 N. E., 438.

The North Carolina Supreme Court holds that an employee who, on the specific orders of the foreman, was carrying cross-ties to a repair track used by the railroad in interstate commerce, and which track was to be used by a waiting train immediately on being repaired, was engaged in interstate commerce.—Cherry v. Atlantic Coast Line (N. Car.), 93 S. E., 783.

Cars billed from another state were placed in the yards at the place to which they were billed. The Kentucky Court of Appeals holds that a member of the switching crew was not engaged in interstate commerce when injured the next day after their arrival while changing them to another track, solely for convenience in taking them to another place in the state.—Louisville & Nashville v. Meadors (Ky.), 197 S. W., 440.

The Michigan Supreme Court holds that a servant employed to provide coal and water for locomotives and to aid in moving them about the yards while on their way from Ohio to Michigan or from Michigan to Ohio was employed in interstate commerce, though sometimes the engines came in from one state at night and did not go out until the next morning. Gay v. Cincinnati Northern (Mich.), 164 N. W., 454.

The federal district court, N. D. Dakota, holds that an employee of an interstate railway company engaged in operating a pumping station furnishing water indiscriminately and contemporaneously to locomotives engaged in interstate and intrastate commerce is within the act.—Roush v. B. & O., 243 Fed., 712.

The Circuit Court of Appeals, Sixth Circuit, holds that an employee engaged in repairing a bridge used by an interstate carrier on its main line is engaged in interstate commerce.—Cincinnati, N. O., & T. P., 243 Fed., 76.

The North Carolina Supreme Court holds that a crossing flagman required to give signals to an interstate train and injured while assisting the engineer in its operation over the crossing is engaged in interstate commerce within the act.—West v. Atlantic Coast Line (N. Car.), 93 S. E., 479.

The New York Supreme Court, Trial Term, Saratoga County, holds that a brakeman injured while assisting in staking an empty freight car out on a siding in New York City for attachment to an interstate train, the car being billed to a foreign railroad's terminal in New York was injured in interstate commerce within the act; his train having come from Vermont to New York.—Daley v. Boston & Maine, 166 N. Y. Supp., 840.

Equipment and Supplies

LOCOMOTIVES

THE AMERICAN & FOREIGN SALES CORPORATION, Munsey building, Washington, D. C., advises that it desires to buy 2 second-hand standard gauge locomotives, weighing 35 or 40 tons and in good running condition.

RUSSIAN GOVERNMENT. According to reports, the orders outstanding for cars and locomotives placed last May on behalf of the Russian Government have not been canceled, but work on them has been held up. The orders outstanding call for about 500 large locomotives and 10,000 four-wheel freight cars. The orders for 1,500 locomotives and 30,000 cars which were in contemplation and which were distributed in October and November were not definitely signed and no work has been done on them.

FREIGHT CARS

THE NATIONAL TUBE COMPANY is inquiring for 30 50-ton ore cars.

J. S. MULLEN, Kansas City, Mo., is inquiring for 8 to 10 tank cars.

THE BALTIMORE & OHIO is inquiring for 2 to 10 8,000 to 10,000-gal. tank cars.

J. EDWARD CRUSEL, New Orleans, La., is inquiring for 30 to 50 8,000-gal. to 10,000-gal. tank cars.

THE UNITED STATES ARMY has ordered one spreader car from the Central Locomotive & Car Works.

THE ESSEX TERMINAL RAILWAY has ordered 50 gondola cars from the Canadian Car & Foundry Company.

THE VIRGINIA-CAROLINA RAILWAY has ordered 8 80-ton flat cars from the Central Locomotive & Car Works.

THE LOUISVILLE & NASHVILLE has ordered 300 steel underframes from the Western Steel Car & Foundry Company.

THE FLORA AMERICAN PLYWOOD COMPANY, Macon, Ga., has ordered 20 flat cars from the Central Locomotive & Car Works.

THE AMERICAN SMELTING & REFINING COMPANY is inquiring for 30 20 to 30-ton steel hopper cars and 30 30-ton dump cars.

THE VULCAN STEEL PRODUCTS COMPANY, New York is inquiring for prices on 100 flat, 150 box and 70 stock cars for South America.

THE GLEN NINA TANK LINE, N. M. Pierce, owner, Buffalo, N. Y., has ordered 50 8,000-gal. capacity tank cars from the Pennsylvania Tank Car Company.

IRON AND STEEL

THE GREAT NORTHERN has ordered 1138 tons of steel from the American Bridge Company for the renewal of 160 inner pockets at ore dock No. 3, Allouez, Wis.

THE CHICAGO, ROCK ISLAND & PACIFIC has ordered 2 77-ft. 8-in. deck plate girders from the American Bridge Company for a bridge at Romeo, Tex., 110 tons.

SIGNALING

THE INTERURBAN RAILWAY has ordered from the Union Switch & Signal Company materials for automatic block signals on three pieces of single track on its line between Des Moines, Iowa, and Camp Dodge.

THE SOUTHERN RAILWAY has awarded to the General Railway Signal Company a contract for the construction and installation of automatic block signals between Charlotte, N. C., and Spartanburg, S. C., 76 miles, double track. With the completion of this work, the Southern will be equipped with automatic block signals from Washington, D. C., to Atlanta, Ga., 649 miles; and alternat ing current is used throughout.

Supply Trade News

H. G. Doran & Co., Chicago, has been appointed agent for the Rivet Cutting Gun Company, Cincinnati, Ohio.

Henry Gaul, a forging machine expert connected for many years with the Ajax Manufacturing Company, Cleveland, Ohio, died recently.

The Union Railway Equipment Company, Chicago, has purchased the exclusive rights to manufacture and sell the Bourell brine valve or retainer formerly handled by the Western Sales Company, Chicago.

G. A. Schneider, formerly of the San Francisco sales organization of the Western Electric Company, has been appointed manager at the Buffalo house, succeeding J. W. Tabb, who has been transferred to New York.

New Glidden Company Formed

One of the most important transactions in the annals of the paint and varnish trade of this country has just been concluded by the outright purchase of the Glidden Varnish Company, of

Cleveland, Ohio, and its subsidiary, the Glidden Varnish Company, Ltd., of Toronto, Canada, by a newly formed corporation headed by Adrian D. Joyce, who was until recently director and general manager of sales and distribution of the Sherwin-Williams Company. The new company will be known as the Glidden Company, and is capitalized at \$2,500,000, fully paid in.

Associated with Mr. Joyce are O. A. Hasse, formerly manager of paint and varnish sales for the Sherwin-Williams Company, and R. H. Horsburgh, controller of the same company. They will vice-president and secretary-treasurer, respectively, in the new corporation. All three have resigned their connections with the Sherwin-Williams Company, and it is positively stated that the new company is not in any way connected with other paint and varnish interests.

Members of the Glidden family, including F. A. Glidden, heretofore president of the company, will retire from the new corporation, but the balance of the organization will remain intact and will be enlarged as necessity demands.

The present Glidden plant, occupying nearly 17 acres, is a model in completeness of equipment and modern arrangement.

With present extension plans completed the company will be the largest varnish plant in the country.

The Glidden Varnish Company has been in business nearly 50 years. Railroad and steamship companies are among the largest Glidden customers. Many large Government contracts will be executed by the new company.

Adrian D. Joyce has been 20 years in the paint and varnish business, mostly with the Sherwin-Williams Company. He was

for several years a traveling salesman, later special representative for the Industrial Trade, then sales manager of the Kansas City district and finally assistant sales manager of the company in Cleveland. He was then advanced to general manager of sales and distribution. He has had a broad sales and executive experience, and had charge of all sales and warehouse direction. He has been closely identified with national and international affairs in the paint and varnish trade, and is experienced in manufacturing. He has paid particular attention to raw materials and studied specially the new uses of paint and varnish materials. He was a director of the Sherwin-Williams Company.

O. A. Hasse's entire experience has been in the paint and varnish business. He started in the advertising department, then served as secretary and finally was transferred to sales department in charge of sales, serving consecutively in the following departments: insecticides, insulating varnish, railroad, street railroad and marine finishes, also general manufacturing sales, and then for several years he was manager of paint and varnish sales. He has had experience as a traveling salesman, and is familiar with the sales and manufacturing problems, having had at one time entire charge of the development of railway sales. He has also made a deep study of raw materials.

R. H. Horsburgh was with the Sherwin-Williams Company for 18 years, starting as office boy and working up to controller. In this latter position he was in charge of credits, accounts, taxes and insurance. He was in close touch with the financing of the company, was a credit specialist and has spent his entire career in this industry.

E. M. Baylies, eastern manager of the P. & M. Company at New York, has been appointed general sales agent with offices at 30 Church street, New York, and Railway Exchange building Chicago. He was born at Des Moines, Iowa, on March 14, 1878. After graduating from high school he was for two years with the Metropolitan West Side Elevated, Chicago, as a student apprentice, following which he was with the Rockford & Interurban as assistant to the general manager. He was later associated with the Aluminum Company of America as assistant sales agent at Chicago, and on December 1, 1914, was elected eastern manager of the P. & M. Company. He has been a stockholder and director of the P. & M. Company, since its organization.

R. H. Horsburgh

A. D. Joyce

ler of the same company. They will vice-president and secretary-treasurer, corporation. All three have resigned

O. A. Hasse

E. M. Baylies

A. A. Strom, vice-president of the Pettibone-Mulliken Company and president of the U. S. Ball Bearing Company, whose death was mentioned in these columns, on December 9, was born in Sweden in 1855. He came to this country at the age of 14 and worked in the foundries of N. S. Bouton & Co. at Chicago. He started a small forge shop in Chicago in 1880 with P. A. Godey, at first working at the forge himself. The business increased rapidly and in 1885 it was incorporated under the name of the Strom Manufacturing Company. This business was later incorporated with Pettibone-Mulliken Company, with which Mr. Strom had been associated ever since. At his death he was a director and vice-president of that corporation and also president of the U. S. Ball Bearing Manufacturing Company.

A. A. Strom

TRADE PUBLICATIONS

MILLING CUTTERS.—The Cleveland Milling Machine Company, Cleveland, Ohio, is issuing a stock list of milling cutters on the fifteenth of each month. In this stock list each type of milling cutter is illustrated and the number of each size and quality of material which are available for immediate shipment are tabulated. Copies will be furnished on request.

A. G. A. GRADE CROSSING SIGNALS.—This is the title of a pamphlet of 20 pages, illustrated in colors, which has been issued by the A. G. A. Railway Light & Signal Company, Elizabeth, N. J., to describe its flashlight signal for highway grade crossings. Detailed illustrations and descriptions are given of the signal, including the construction of the flashing apparatus, together with illustrations of the acetylene containers; also a view of a crossing at Richland, N. J., protected both by the A. G. A. light and by gates.

HOISTING MACHINERY FOR INDUSTRIAL WORKS.—Under this title the Shepard Electric Crane & Hoist Company, Montour Falls, N. Y., has issued a loose-leaf catalogue bound in a heavy manila cover. The catalogue refers in detail to the construction and specifications for the Shepard hoists, gives a complete outline of the terms and conditions of purchase, including prices and discounts. It gives all the information necessary for selecting and specifying the various types and sizes of hoists. Clearance drawings for each type are given.

UNIVERSAL VERTICAL AND HORIZONTAL BORER.—The Oliver Machinery Company, Grand Rapids, Mich., has issued a four-page folder containing illustrations and specifications of its No. 74 Universal vertical and horizontal wood boring machine. This machine has a single spindle each in the horizontal and vertical positions, which have a capacity of boring holes up to three inches in diameter. The folder also contains illustrations of the Oliver "Little Pattern Makers," which are boring machine cutting tools for use in profiling and core box work, fillet cutting, etc., operations which the pattern maker is often compelled to do by hand.

"HYDRO" PRESSURE AND DRAFT RECORDERS.—Catalogue "D" of the Bacharach Industrial Instrument Company, Pittsburgh, Pa., is an eight-page pamphlet in which is described in detail the design and construction of the "Hydro" recording instruments. The moving element of these recorders is a ball floating in water, to which is attached a recording pen. The position of the pen is determined by the differential pressure between the inside and outside of the bell. The instruments are made in several types, both recording and indicating, for a variety of uses where draft vacuum, low pressures and differential gas pressures are to be measured.

Financial and Construction

FINANCIAL NEWS

COLORADO, KANSAS & OKLAHOMA.—This 51-mile road, operating between Scott City, Kan., and Winona, is to be sold for junk at Scott City on December 15.

MINNEAPOLIS & ST. LOUIS.—Newman Erb, who for several years following the death of Edwin Hawley was president of this company but who subsequently resigned as both a director and president, has been elected a director again.

NEW YORK, NEW HAVEN & HARTFORD.—Eli Whitney has resigned as a director.

SOUTHWESTERN RAILWAY.—A. C. Parks announces that he was appointed receiver of this company on November 12 by the United States District Court for the Northern District of Texas. The road extends from Henrietta, Tex., to Archer City, a distance of 29 miles.

UTAH RAILWAY.—This company began operation under its own management on November 30, on which date its contract with the Denver & Rio Grande expired.

RAILWAY CONSTRUCTION

COLUMBIA RAILWAY & NAVIGATION COMPANY (ELECTRIC).—Surveys have been made for an electric line to be built from Columbia, S. C., west to Greenwood, 76 miles. On account of unsettled business conditions construction work is indefinitely postponed. F. H. Haskell, chief engineer, Columbia.

ELECTRIC SHORT LINE.—Surveys are being made for a line to be built from Hutchinson, Minn., to Lake Lillian, 25 miles. R. C. Jones, traffic manager, Minneapolis, Minn.

ILLINOIS CENTRAL.—This company has purchased property on the west side of its right of way at Fifty-third street (Hyde Park), Chicago, upon which it plans to construct a new passenger station.

INTERNATIONAL RAILWAY (ELECTRIC).—A contract has been given to the Buffalo Dredging Company to build an electric line from Buffalo, N. Y., to Niagara Falls, 16.5 miles.

MISSOURI, KANSAS & TEXAS OF TEXAS.—This company has awarded a contract to the List & Gifford Construction Company, Kansas City, Mo., for the elimination of three grade crossings and the improvement of three under grade crossings at Dallas, Tex. The work involves the use of 55,000 lb. of steel, 5,400 cu. yd. of concrete, the excavation of 50,000 cu. yd. of earth and the construction of a fill of 135,000 cu. yd. The cost of the work is estimated at \$350,000.

USE WOOD INSTEAD OF COAL.—To help meet the shortage of 50,000,000 tons in the country's coal supply the Fuel Administration, in co-operation with the Department of Agriculture, has inaugurated an intensive campaign for the substitution of wood for coal. "One cord of hard wood is equal to a ton of coal," said an announcement by the Fuel Administration. "One ton of coal is released for use in war work for every cord of wood substituted. Statistics show that there is a vast amount of dead wood in many sections of the country and that the supply of wood in many communities is sufficient for domestic purposes in those parts." Much of the wood in communities is destroyed as waste, it was pointed out, and its conservation not only would conserve coal, but would prove a measure of economy to the users. New England and the South, the statement said, have an abundance of wood and in the latter section activities already are under way looking to an intensive campaign for the substitution of wood. In this connection it was announced that the Department of Agriculture would provide the services of expert foresters without charge to supervise the cutting of wood so that no damage would be done to growing timber and that the largest use might be obtained of the wood supply.

ANNUAL REPORT

SEABOARD AIR LINE RAILWAY COMPANY

REPORT OF THE DIRECTORS FOR THE FISCAL YEAR ENDED
DECEMBER 31, 1916.

PORTSMOUTH, VA., OCTOBER 18th, 1917.

To the Stockholders of the Seaboard Air Line Railway Company:

The Board of Directors submits the following report of the operations of your properties for the year ended December 31, 1916:

The Interstate Commerce Commission issued an Order on November 24, 1916, requiring railway companies to furnish Annual Reports of their operations for the calendar year instead of the former fiscal year ending June 30th, the first report to be made as of December 31, 1916. In order that the Annual Report of this Company shall cover the same period, this report is submitted for the twelve months period ended December 31, 1916, and future annual reports will be made for the calendar year, which now becomes the fiscal year, instead of the fiscal year ending June 30th.

INCOME ACCOUNT

FOR YEAR ENDED DECEMBER 31, 1916, COMPARED WITH YEAR ENDED
DECEMBER 31, 1915.

	1916	1915	Increase
Gross Revenue	\$26,184,487.25	\$22,640,876.44	\$3,543,610.81
Operating Expenses and Taxes	18,742,598.01	16,605,976.09	2,136,621.92
Net Operating Revenue (after Taxes)	7,441,889.24	6,034,900.35	1,406,988.89
Uncollectible Railway Revenue	12,890.34	8,223.22	4,667.12
Operating Income	7,428,998.90	6,026,677.13	1,402,321.77
Other Income	460,431.79	403,106.39	57,325.40
Gross Income	7,889,430.69	6,429,783.52	1,459,647.17
Rents and Other Charges	210,135.81	245,035.27	34,899.46†
Hire of Equipment	143,991.87	(Cr.) 3,674.57	147,666.44
Applicable to Interest	7,535,303.01	6,188,422.82	1,346,880.19
Fixed Interest Charges	4,673,392.39	4,383,620.97	289,771.42
Balance	2,862,010.62	1,804,801.85	1,057,208.77
Full 5% Interest on Adjustment (Income) Bonds	1,250,000.00	1,250,000.00	
Net Income	\$1,612,010.62	\$554,801.85	\$1,057,208.77

†Decrease.

The Gross Revenue increased 15.65 per cent. Operating Expenses increased 13.15 per cent. Taxes increased 8.94 per cent. Operating Income increased 23.27 per cent. Operating Expenses, exclusive of Taxes, were 66.96 per cent. of the Gross Revenue, as compared with 68.44 per cent. of the previous year; and including Taxes, 71.58 per cent. of Gross Revenue as compared with 73.35 per cent. for the preceding year.

MILEAGE OPERATED.

The mileage of the Seaboard Air Line Railway Company in operation on December 31, 1915, was	3,449.29
Extension constructed during the year	10.00
Less spur tracks taken up	.37
Additional trackage acquired during the year	2.58
Less trackage discontinued	.16
Mileage in operation December 31, 1916	3,461.34
Made up as follows:	

MILEAGE OWNED.

The owned mileage of the Seaboard Air Line Railway Company on December 31, 1915, was	3,373.57
Extension constructed during the year	10.00
Less spur tracks taken up	.37
Mileage owned December 31, 1916	3,383.20

LEASED LINES.

Meldrim, Ga., to Lyons, Ga.	\$7.65
-----------------------------	--------

TRACKAGE.

Howells, Ga., to Terminal Station, Atlanta, Ga.	2.58
Howells, Ga., to Freight Depot, Atlanta, Ga.	2.84
Hilton, N. C., to Navassa, N. C.	2.40
At Birmingham, Ala.	.07
Freight Yard Jet, Birmingham, Ala., to Birmingham, Ala.	14.88
At Bessemer, Ala.	.16
Near Mulberry, Fla.	1.46
	82.04
	3,465.24

DEDUCT.

Amelia Beach branch, leased to City of Fernandina, Fla.	2.00
Silver Springs, Fla., branch, leased to Ocklawaha Valley Railroad Company	1.90
	3.90

Total mileage operated December 31, 1916	3,461.34
Average miles of road operated during the year	3,451.54
Average miles of road operated shows an increase over previous year, of	1.26%
Sidings (including 23.94 miles on Leased Lines and Trackage)	948.00

SECOND TRACK.

Between Raleigh, N. C., and Cary, N. C.	7.59
Hamlet, N. C., Northwardly	9.61
At Atlanta, Ga.	2.30
At Birmingham, Ala.	3.05
At Tampa, Fla.	1.32
Total	23.87

CHANGES IN OPERATED MILEAGE.

An extension to the Company's lines in Florida, known as the "Kissimmee Valley Ten Mile Extension" was built eastwardly from the end of the Lake Wales line	10.00 Miles.
Trackage rights acquired over the Southern Railway from Howells, Ga., into the Terminal Station at Atlanta, Ga.	2.58 Miles.
	12.58 Miles.

Spur tracks at Dunnellon, Fla., removed during the year.	.37
Trackage discontinued over the Western and Atlantic Railroad from Freight Depot to Union Station at Atlanta, Ga.	.16
	.53 Miles.

Net Increase 12.05 Miles.

In addition to the above, a spur about one mile long, near Mulberry, Fla., known as the "Christina Spur" has been practically completed. The Operated Second Track Mileage has been increased during the year by acquiring Trackage Rights over 2.30 miles of track owned by the Southern Railway at Atlanta, Ga.

FUNDED DEBT.

Of the \$3,184,500 First and Consolidated Mortgage, Series "A," Six Per Cent. treasury bonds as of June 30, 1916, \$2,750,000 were sold, of which \$2,062,000 were delivered up to December 31, 1916, leaving \$688,000 for later delivery.

\$2,306,000 Seaboard Air Line Railway Refunding Mortgage Four Per Cent. Bonds were during the year refunded under the provisions of the First and Consolidated Mortgage by the issue in exchange of \$1,700,000 First and Consolidated Mortgage, Series "A," Six Per Cent. Bonds; the bonds so refunded were deposited with the Trustee of the First and Consolidated Mortgage as provided in said Mortgage.

The total amount of First and Consolidated Mortgage, Series "A," Six Per Cent. Bonds outstanding in the hands of the public on December 31, 1916, was \$26,221,500.

The \$285,000 outstanding Seaboard and Roanoke Railroad Company Registered Six Per Cent. Certificates of Indebtedness maturing August 1, 1916, were refunded at maturity by the issue of First and Consolidated Mortgage, Series "A," Six Per Cent. Bonds in accordance with the provisions of the First and Consolidated Mortgage. The holders of the Seaboard and Roanoke Certificates were paid in cash and the First and Consolidated Mortgage Bonds received in this transaction were placed in the Treasury of the Company.

There were redeemed and cancelled during the year \$53,000 Florida Central & Peninsular Railroad Company Land Grant Extension Five Per Cent. Bonds, including \$5,060 of these bonds mentioned in the last annual report. For further details of the Funded Debt, see Table No. 4.

EQUIPMENT.

An equipment agreement, Series "R," was entered into on July 1st, 1916, for the purchase of

- 5 Mountain Type Passenger Locomotives.
- 2 Gas Electric Motor Cars.
- 15 All-steel Express Cars.
- 3 All-steel Dining Cars.
- 4 All-steel Observation Dining Cars.
- 50 Steel Under and Upper Frame Caboose Cars.

Under said agreement the cash payment of \$99,890.45 was represented by a deferred certificate which was received into the treasury of the Company and pledged under its First and Consolidated Mortgage in accordance with the provisions thereof, and the remainder of the purchase price was represented by Equipment Trust obligations aggregating \$510,000, bearing interest at the rate of 4½% per annum, payable in twenty semi-annual installments of \$25,000 and \$26,000, alternating on the first day of January and the first day of July in each year, commencing January 1, 1917, and ending July 1, 1926.

Of this equipment there was received during the fiscal year:

- 15 All-steel Express Cars
- In addition to the equipment named above, the following were purchased and placed in service during the year:
- 3 Ballast Spreaders
- 6 Air Dump Cars.

MAINTENANCE OF WAY AND STRUCTURES.

ROADWAY TRACK AND STRUCTURES.

Roadway, track and structures of the company have been properly maintained at a cost of \$3,187,544.10, which represents an expenditure per mile of \$923.51.

SIDE TRACKS.

42.16 miles of new sidings and extensions of existing sidings were constructed, and there were deducted by removal and changes of old sidings, 8.77 miles, making a net increase over previous year of 33.39 miles.

There were also constructed 2.40 miles of new sidings on leased lines, and there was deducted by removal .24 mile, making a net increase of 2.16 miles over previous year.

TIE RENEWALS.

Tie renewals were 1,632,264 cross ties and 1085 sets of switch ties, and the cost, \$749,604.76, was charged to Operating Expenses.

RAIL.

89.95 miles of new 85-lb. and 20.24 miles of new 90-lb. steel rail, making a total of 109.19 miles, were laid in the main line, replacing therefrom lighter worn rail. There was charged net to Operating Expenses therefor, \$126,024.56, and to Capital Account \$132,680.03.

In addition, 45.51 miles of released 68, 75 and 85-lb. steel rail were laid on branch lines, 70-lb. and lighter rail, and there was charged to Operating Expenses therefor, \$18,987.36, and to Capital Account, \$47,568.14.

BALLAST.

226,990 cubic yards of gravel and slag ballast were put under main line track during the year, and of the total cost thereof, \$357,861.97 was charged to Capital Account.

TRESTLES FILLED.

2,442 lineal feet of wooden trestles were filled in during the year and of the total cost thereof, including culverts, \$15,008.40, was charged to Operating Expenses.

TRESTLES REBUILT AND BALLAST DECKED.

There were built during the year out of creosoted timber 4,695 lineal feet of ballast decked trestles, replacing old open deck trestles, and of the total cost thereof, \$60,503.35, was charged to Operating Expenses.

BRIDGES.

Work has been done on five bridges, providing fenders, replacing with steel or concrete, or strengthening them for heavy traffic.

Four of these bridges were authorized during the year and all of them have been completed, the principal one being a reinforced concrete highway overpass, A. feet by 111 feet, at Hlanding Street, Columbia, S. C.

The total cost of the above bridge work during the year was \$22,581.94, of which \$19,720.73 was charged to Capital Account and \$2,861.71 to Operating Expenses.

In addition to the above, work is now in progress replacing the structures destroyed by the high water of July, 1916. This work will be completed during the coming year and consists of the following:

Catawba River, near Mount Holly, N. C., three through truss spans, each 165 feet long, and one deck girder span 50 feet long.

Catawba River, near Van Wyck, S. C., four through truss spans, each 147 feet long.

Waterlee River, near Camden, S. C., one through truss span 260 feet long.

Also, the above does not include the new Strauss Bascule lift bridge and the two new deck girder spans at Hilton Bridge, near Wilmington, N. C., which have been completed.

This bridge, as mentioned in previous report, is owned by the Wilmington Railway Bridge Company, which Company is owned and operated jointly by the Seaboard Air Line Railway Company and the Atlantic Coast Line Railroad Company.

RAIL IN MAIN LINE.

The total operated main line single track mileage of the system, 3,461.34 miles, is laid with steel rails of the following weights:

Miles.	Weight.
0.50	91 lb. rail.
53.87	90 " "
53.61	85 " "
97.42	80 " "
1,220.20	75 " "
256.48	70 " "
200.03	68 " "
18.87	65 " "
60.48	63.5 " "
3.95	60 " "
557.20	58 " "
215.40	56 " "
260.33	and lighter.

Total 3,461.34

The above does not include:

SECOND TRACK.

Raleigh, N. C., to Cary, N. C.: 7.59 Miles	85 lb. rail.
Northward from Hamlet, N. C.: 9.09 Miles	90 " "
52 "	75 " "
At Atlanta, Ga.: 2.30 Miles	85 " "
At Birmingham, Ala.: 1.43 Miles	75 " "
1.62 "	60 " "
At Tampa, Fla.: 1.32 Miles	75 " "

LINE OWNED BUT NOT OPERATED—LEASED.

Silver Springs Branch: 1.20 Miles	60 lb. rail.
70 "	56 " "
Amelia Beach Branch: 2.00 Miles	50 " "

MAINTENANCE OF EQUIPMENT.

The equipment of the Company was fully maintained during the year at a cost of \$3,909,973.00.

Included in the cost of maintenance is \$71,183.65, representing value of equipment destroyed or retired from service during the year and credited to the cost of equipment.

There was also included in the Cost of Maintenance \$435,649.96 for depreciation which was credited to Reserve for Accrued Depreciation.

The cost of maintenance per unit of equipment owned is as follows:

Average cost per annum per Locomotive owned.....\$2,642.25

Average cost per annum per Passenger car owned.....758.40

Average cost per annum per Freight car owned.....63.21

The extension from Charleston, S. C., to Savannah, Ga., mentioned in Annual Report for year ended June 30, 1916, is still in process of construction, but will be completed during 1917. This will provide two distinct and separate main lines between Hamlet, N. C., and Savannah, Ga., both serving different thriving sections. The completion of this line, in extension and the grade revision between Hamlet and Charleston, now in progress, will give a line with a maximum five-tenths percent compensated grade and a maximum curvature of three degrees between Hamlet, N. C., and Jacksonville, Fla., with the exception of three curves of four degrees. The new portion of the line from Charleston to Savannah will have a maximum three-tenths percent grade and two degree curves, and will effect a large saving in handling traffic between Hamlet and Savannah, as it will allow an increase of 127.5 percent in tonnage per train as compared with the tonnage which can be handled via the present Columbia route.

The grade revision which is now in progress between Hamlet, N. C., and Charleston, S. C., will be completed during the coming year and, as noted above, will give a maximum five-tenths percent grade line in both directions over these points.

During the year work has been completed between Raleigh, N. C., and Sanford, N. C., correcting the short and irregular grades in this line, thus facilitating train operation through this district and making a large saving in operating costs. Grade revision work is now in progress on certain sections of the line between Sanford, N. C., and Hamlet, N. C., which will eliminate two rusher grades, and provide a five-tenths percent grade against Northbound traffic and an eight-tenths percent grade against the train loading, and equalize the drawbar pull, thereby facilitating operation and reducing hazard and making a saving in operating cost. This grade revision work between Raleigh and Sanford and between Sanford and Hamlet is all located on one engine district.

A modern fireproof machine and erecting shop and blacksmith shop have been completed during the year at Portsmouth, Va., to replace buildings destroyed by fire. In addition, there has been provided a new power and house, fuel shop, engine, carpenter and paint shop, two wash and locker rooms, and one engine drop pit. A 50,000 gallon steel water tank was built in connection with the present fire protection facilities. New and modern machinery has been provided for the additional facilities including heavier power cranes for handling locomotives.

New shop facilities and additions to present facilities to serve both the Car and Locomotive Departments are now under construction at Howell, Ga. These facilities will be completed during the coming year. The additional facilities at Raleigh, N. C., and Hamlet, N. C., mentioned in previous report, have been practically completed and are now in operation.

New facilities for the Mechanical Department are also in course of construction at Andrews, S. C.

The coach shop at Jacksonville, Fla., has been completed by the addition of a concrete transfer table. New machinery has also been installed, thus providing modern facilities for repairing coaches at the south end of the Company's line. The use of these facilities for heavy repairs to passenger coaches at this point will avoid the long haul which was formerly made in moving the cars to Portsmouth.

Team tracks and paved driveways have been practically completed on the additional property which has been acquired during the year at Plant City, Fla. This provides facilities to care for a large and increasing business at this point, and also gives an additional frontage of 420 feet on adjacent property owned by outside parties and suitable for industrial locations.

The joint industrial track with the Central of Georgia Railway at Savannah, Ga., mentioned in the Annual Report for year ended June 30, 1916, has been completed. This track serves the cotton storage warehouses of the Savannah Warehouse and Compress Company, and also affords opportunity for other large industrial development.

An important industrial track has been constructed at Timmonsville, S. C., to serve the present and future development located off the Company's Right of Way.

Trucks have been provided at Jacksonville, Fla., to reach the industries located on the development of the Commodore Point Terminal Company's property on which are to be located wharves and terminal warehouses.

The train yard at Raleigh, N. C., is now being rearranged and extended to give an increased capacity of approximately 625 cars, and also, to provide tracks of sufficient length to accommodate a large car lot. Extensions to this yard at Monroe, N. C., Howells, Ga., and Charleston, S. C., are also under construction and will be completed during the coming year.

Second main track is being provided from the south end of Raleigh train yard in connection with the present Raleigh-Cary double tracks, thus constituting a continuous double track from the train yard to Cary.

New passenger stations are now in process of construction at Florence, S. C., and Manatee, Fla., and the present station at Charlotte, N. C., is being completely remodeled and extended. All of this work will be completed during the coming year.

Construction is also in progress on Union Passenger Stations at Cary, N. C., Rochelle, Ga., and Ocala, Fla., all of which will be finished during the coming year.

The present umbrella shed at Henderson, N. C., has been extended during the year, and a new shed has been provided at Catawba Junction, S. C.

A new combined passenger and freight station has been completed at Ailey, Ga., and one is now under construction at Bee Ridge, Fla.

A freight depot has been provided at Palmetto, Fla., and one is now being built at Helena, Ga.

Additional fire protection facilities are now being installed at the Shops, Savannah, Ga.

Important paving and street work has been done at Greenwood, S. C., Savannah, Ga., Orlando, Fla., Tampa, Fla., Bradenton, Fla., Manatee, Fla., Sarasota, Fla., and through several other points on the system to comply with municipal requirements.

Necessary dredging has been done during the year to maintain the required depths of water at the following terminals: Tampa, Fla., Hutchinson Island, Savannah, Ga., and Charleston, S. C.

6 track scales were rebuilt with concrete foundations and steel "I" beams, replacing wood.

4 old water tanks were replaced with new 50,000 gallon tanks and suitable pumping facilities provided.

113 industrial sidings and extensions to industrial sidings already existing have been constructed or are in process of construction.

15 depots and freight stations have been constructed or substantially added to during the year.

20 passing tracks have been constructed or extended or are in process of construction.

The heavy rains which prevailed in the Carolinas during July washed out and destroyed a section of steel bridge, total length of which aggregated 1,242 feet, also about 1 1/2 miles of trestle, and in addition thereto the roadbed was overflowed and impassable at several other points. During this period, through main line service was interrupted.

The work of the Federal Act to Regulate Commerce was continued during the year at a cost of \$56,983.55, which was charged to General Expenses.

The Territory served by the Seaboard is unsurpassed in the United States for traffic producing potentialities by reason of the mineral resources, water powers, port facilities, lumber reserves, fertile lands, long growing seasons, and the capacity for varied production at all seasons. It is the policy of the road to build and broaden the foundation for permanent success through systematic development by colonization and immigration activities, the stimulation of agricultural and horticultural pursuits, and the location of industrial enterprises.

The time and money expended as a result of the passage of the Federal Act to Regulate Commerce was continued during the year at a cost of \$56,983.55, which was charged to General Expenses.

The Territory served by the Seaboard is unsurpassed in the United States for traffic producing potentialities by reason of the mineral resources, water powers, port facilities, lumber reserves, fertile lands, long growing seasons, and the capacity for varied production at all seasons. It is the policy of the road to build and broaden the foundation for permanent success through systematic development by colonization and immigration activities, the stimulation of agricultural and horticultural pursuits, and the location of industrial enterprises.

The time and money expended as a result of the passage of the Federal Act to Regulate Commerce was continued during the year at a cost of \$56,983.55, which was charged to General Expenses.

CHANGES IN ORGANIZATION.

Mr. G. S. Rains was appointed Freight Traffic Manager on July 1, 1916, succeeding Mr. L. E. Chaloner, resigned to become Chairman of the South-eastern Freight Association.

Mr. W. Stanley was appointed Assistant to President, with offices at Atlanta, Ga., effective November 1st, 1916, being a new position created to provide for efficient dealing with the public and Railroad Commissions.

Effective November 1st, 1916, the office of General Claim Agent was abolished. Mr. W. G. Lavine was appointed Attorney in Charge of Personal Injuries and Mr. W. C. Moore was appointed Freight Claim Agent. These are new positions, embodying the work formerly handled by the General Claim Agent.

Effective September 1st, 1917, Judge Lech R. Watts at his request, was relieved from the office of General Counsel, and appointed Consulting Counsel. Mr. E. Marvin Underwood was appointed General Counsel.

Effective June 15th, 1917, Mr. L. C. Fritch was appointed General Manager.

The Board records its thanks and appreciation to the officers and employees for the faithful discharge of their duties during the year.

By order of the Board: W. J. HARAHAH, President.

CAPITAL EXPENDITURES FOR ROAD AND EQUIPMENT.

YEAR ENDED DECEMBER 31, 1916.

SUMMARY OF EXPENDITURES:

Additions and Betterments on Existing Mileage	\$2,005,848.17
Equipment Acquired	172,315.26
Expenditures for Extensions	21,094.27

TOTAL AS ABOVE

[Adv.]

Railway Officers

Executive, Financial, Legal and Accounting

C. M. Ball has been appointed assistant to the vice-president and general manager of the Oregon Short Line, with headquarters at Salt Lake City, Utah, succeeding E. L. Hickey, promoted.

W. T. Kemper, receiver, has been elected president of the Kansas City, Mexico & Orient. Herbert F. Hall was elected chairman of the board of directors and A. De Bernardi, Clifford Histed and H. S. Garret have been elected vice-presidents, and M. L. Mertz, a member of the board.

A. M. Penney, vice-president and general traffic manager of the Waupaca-Green Bay, Waupaca, Wis., has been elected president to succeed John Gordon, deceased. Irving P. Lord, secretary and general consul, has been elected vice-president to succeed Mr. Penney. H. G. Breit was elected secretary to succeed Mr. Lord, who still retains the general consulship of the company.

Charles Henry Ewing, who has been appointed vice-president of the Philadelphia & Reading, with headquarters at Philadelphia, Pa., was born on May 28, 1866, and began railway work on

August 1, 1883, in the engineering department of the Philadelphia & Reading. He was appointed supervisor in December, 1891, of the same road and from 1893 to July, 1902, was chief engineer of the Central New England Railway. He was then, to June, 1905, division engineer of the Reading and Lebanon divisions of the Philadelphia & Reading. In June, 1905, he was appointed engineer maintenance of way of the same road, remaining in that position until 1910, when he became superintendent of the Atlantic City Railroad.

On January 1, 1913, he was appointed general superintendent of the Philadelphia & Reading, and in March, 1916, was appointed general manager, which position he held at the time of his recent appointment as vice-president of the same road, as above noted.

Operating

J. C. Austin, trainmaster of the Southern Railway at Wilton, Ala., has been appointed trainmaster, with office at Birmingham, vice T. O. Crane, transferred.

W. M. Weidenhamer, division superintendent of the Chicago, Burlington & Quincy at Alliance, Neb., has been appointed inspector of transportation of the Chicago, Milwaukee & St. Paul.

W. H. Kirkbride, division engineer of the Sacramento division of the Southern Pacific, with office at Sacramento, Cal., has been appointed assistant superintendent of the same division with headquarters at Sacramento, succeeding J. T. Bell, who has been transferred to the Salt Lake division.

W. T. Wolff, special agent in the operating department of the Pennsylvania Lines West at Pittsburgh, has been appointed superintendent of freight station service, with headquarters in the same city. The position is a new one and its duties are to direct as to classifications for the loading of l. c. l. freight; to have general supervision over all service incident to the intensive loading of c. l. freight (including coal) and of l. c. l. freight; to keep in touch with details of all operations at freight stations, including the weighing of l. c. l. freight and the use of mechanical devices, and to make appropriate recommendations to division superintendents in the interest of efficiency and uniformity of

practice. Mr. Wolff will work under the direction of the superintendent of freight transportation.

O. C. Hibbs, whose appointment as assistant superintendent of the Chicago, Burlington & Quincy, with headquarters at Dayton Bluff, Minn., was announced in these columns on December 7, was born at Fontanelle, Iowa, on July 3, 1882. He entered the service of the Burlington on June 10, 1899, serving as operator and train dispatcher on the Ottumwa division until December 1, 1906. From December 1, 1906, to October 25, 1912, he was night chief dispatcher, and from October 25, 1912, to July 1, 1916, he was chief dispatcher at Galesburg, Ill. On July 1, 1916, he was promoted to trainmaster at Galesburg, Ill., which position he held until the time of his appointment, as noted above, effective December 1.

Traffic

John A. Groves, commercial agent of the Atlanta, Birmingham & Atlantic, has been transferred from Kansas City office to New York office.

R. M. Calkins, traffic manager of the Chicago, Milwaukee & St. Paul at Seattle, Wash., has been promoted to vice-president in charge of traffic for the entire system, including subsidiary

lines, with headquarters at Chicago, effective December 15. Mr. Calkins succeeds J. H. Highland, vice-president in charge of passenger traffic, and E. S. Keeley, vice-president in charge of freight traffic, both of whom have resigned. Mr. Calkins was born at Ogdensburg, N. Y., on August 12, 1863. He entered railway service in 1879 as a clerk and telegraph operator on the Chicago, Milwaukee & St. Paul at Monticello, Iowa. Subsequently he was local agent at various points, including Oxford Junction, Iowa, Sigourney and Ottumwa,

between December, 1881, and June 15, 1892. For four years he was agent at Kansas City, Mo., and on June 30, 1896, he was appointed division freight and passenger agent at Mason City, Iowa. On June 25, 1898, he left the St. Paul to become general freight and passenger agent of the Des Moines Northern & Western at Des Moines, Iowa. He returned to the St. Paul as assistant general freight agent with headquarters at Chicago on February 10, 1899. Ten years later he was appointed general freight and passenger agent of the Chicago, Milwaukee & Puget Sound and the Montana Railroad, with headquarters at Butte, Mont. From June 26, 1910, to January 1, 1913, he was traffic manager of the Chicago, Milwaukee & Puget Sound, and from the latter date until December 15, 1917, he has been traffic manager of the Puget Sound lines of the Chicago, Milwaukee & St. Paul, with headquarters at Seattle, Wash.

G. C. Henderson, traveling freight and passenger agent of the Denver & Rio Grande, with headquarters at Kansas City, Mo., has been promoted to general agent, with headquarters at Ft. Worth, Tex., succeeding J. E. Woodfin, resigned. H. I. Scofield, traveling freight and passenger agent, with headquarters at Detroit, Mich., has been promoted to general agent with the same headquarters, succeeding A. E. Brown, resigned, effective December 1.

C. C. Clark, general agent in the passenger department of the Michigan Central, with headquarters at Chicago, has been promoted to assistant general passenger agent with the same headquarters, effective December 1. He was born at Loveland, Ohio, and entered the service of the Cincinnati, New Orleans & Texas Pacific in 1889. In 1895 he was appointed soliciting passenger agent of the Cleveland, Cincinnati, Chicago & St. Louis at Cincinnati, Ohio, following which he was assistant ticket agent, traveling passenger agent and city passenger agent on the same

C. H. Ewing

R. M. Calkins

road. In 1905 he was appointed general agent in the passenger department with headquarters at Columbus, Ohio, and subsequently he served as general agent at Indianapolis, Ind., and Cincinnati, Ohio. On January 22, 1911, he was appointed general agent of the passenger department of the Big Four and Michigan Central in Chicago. On the separation of these two roads Mr. Clark remained with the latter road in the same capacity, which position he held at the time of his appointment, as noted above.

A. E. Brown, general agent of the Denver & Rio Grande, with headquarters at Detroit, Mich., has been appointed general agent in the traffic department of the Chicago & Alton, with headquarters at Detroit, succeeding Arthur Maedel, transferred in the same capacity to Peoria, Ill., succeeding S. A. Williams, whose promotion to general agent in charge of operation and traffic at St. Louis, Mo., was mentioned in these columns on October 5.

Engineering and Rolling Stock

W. D. Hitchcock has been appointed master mechanic of the Albuquerque division of the Atchison, Topeka & Santa Fe, with headquarters at Winslow, Ariz., succeeding M. Weber, transferred, effective December 1.

H. R. Warnock, superintendent of motive power of the Western Maryland at Hagerstown, Md., has been appointed general superintendent of motive power of the Chicago, Milwaukee & St. Paul, with headquarters at Milwaukee, Wis., succeeding A. E. Manchester, deceased.

C. A. Wirth, road foreman of engines of the Northern Pacific, with headquarters at Pasco, Wash., has been appointed master mechanic on the Pasco division, with the same headquarters, succeeding G. F. Egbers, granted leave of absence to enter the Russian Railway Service Corps, effective October 13. E. P. Smith has been appointed road foreman of engines on the Minnesota division, with headquarters at East Grand Forks, Minn., succeeding L. L. Moebeck, transferred, effective November 12.

W. E. Ricketson, mechanical engineer of the Cleveland, Cincinnati, Chicago & St. Louis, with headquarters at Beech Grove, Ind., has been appointed chief of the equipment division, valuation department of the New York Central Lines, with headquarters at New York, taking the place made vacant by the death of Mr. Buchanan last February. Mr. Ricketson was graduated from Cornell University in 1907, with degree of M. E. and began railway work in 1903 with the Delaware & Hudson Company, for which company he worked during his summer vacations while attending college. From 1907 to 1910 he was special apprentice with the Lake Shore & Michigan Southern, and the following two years successively was roundhouse foreman of the Lake Erie, Alliance & Wheeling at Alliance, Ohio, and the Lake Shore & Michigan Southern at Ashtabula. He was then general foreman of the latter road at Youngstown, Ohio, until September, 1913, when he was appointed assistant mechanical engineer of the Cleveland, Cincinnati, Chicago & St. Louis. On March 1, 1914, he was promoted to mechanical engineer, which position he held until his recent appointment as chief of the equipment division, valuation department, of the New York Central Lines, as above noted.

The following additional changes have been made as a result of the reorganization of the mining and fuel department of the Chicago, Rock Island & Pacific, noted in the issue of December 7, page 1060. The supervision of the use of fuel, formerly under the direction of the mining and fuel department, will henceforth be handled by the mechanical department. H. Clewer, master mechanic at Trenton, Mo., has been appointed superintendent of fuel economy, with headquarters at Chicago. His duties in this position include the supervision of the use of fuel, locomotive supplies, lubricating materials and general features in connection with the efficiency of locomotive operation. John Benzies, road foreman of equipment at Trenton, Mo., has been appointed supervisor of fuel economy of the Chicago Terminal, Illinois, and Missouri divisions, with headquarters at Rock Island, Ill. F. Meredith, road foreman of equipment at Silvis, Ill., has been appointed supervisor of fuel economy of the Iowa, Nebraska and Colorado divisions, with headquarters at Fairbury, Neb. P. Smith, assistant engineer of fuel economy, has been appointed supervisor of fuel economy on the Cedar Rapids, Minnesota, Dakota and Des Moines divisions, with headquarters at Cedar Rapids, Iowa. F. Connolly, road foreman of equipment,

at Herington, Kan., has been appointed supervisor of fuel economy of the St. Louis, the Kansas City Terminal, the Kansas and the El Paso divisions, with headquarters at Herington, Kan. W. H. Booth, road foreman of equipment, at El Dorado, Ark., has been appointed supervisor of fuel of the Louisiana, Arkansas and Indian Territory divisions, with headquarters at Little Rock, Ark. J. L. Curry, road foreman of equipment, at El Reno, Okla., has been appointed supervisor of fuel economy on the Oklahoma and Pan Handle divisions of the C., R. I. & P., and also of the Southern and Amarillo divisions of the Chicago, Rock Island & Gulf Railway, with headquarters at El Reno, Okla. J. H. Edwards, electrical foreman at Silvis, Ill., has been appointed supervisor of stationary plants, with headquarters at Chicago, with supervision over stationary plants and pumping stations. F. W. Wilson, engineer of fuel economy, has been appointed chief fuel inspector, reporting to the fuel agent. W. J. Eddy, superintendent of fuel economy, has been appointed master mechanic at El Dorado, Ark.

William T. Covert, who has been appointed principal assistant engineer of the Western Pennsylvania division of the Pennsylvania Railroad, with office at Pittsburgh, Pa., as has already been

announced in these columns, was born on January 4, 1873, at Philadelphia, Pa., and was educated in the public schools and in 1890 graduated from the Peirce School of Business of his native town. In May of the same year he entered the service of the Pennsylvania Railroad as a clerk in the accounting department at Philadelphia. The following September he was transferred to the maintenance of way department as a rodman and later served in various positions in connection with construction work being carried out in New Jersey and the city of New York by the engineer of maintenance of the United Railroads of New Jersey. During this time he attended Cooper Institute, New York, and graduated with the degree of B. of S. On October 3, 1895, he was transferred to the office of the principal assistant engineer, of the Pennsylvania Railroad, at Altoona, Pa., and in June, 1897, was appointed assistant supervisor of the Philadelphia division at Paoli. He was promoted to supervisor of the Renova division at Johnsonburg, Pa., in July, 1900, and subsequently served consecutively as supervisor at Philadelphia yard, assistant engineer of the Chautauqua division, assistant engineer of the Eastern and Susquehanna division and as division engineer of the Philadelphia Terminal division, from which position he was promoted on October 25 to principal assistant engineer of the Western Pennsylvania division of the same road, with headquarters at Pittsburgh, as above noted.

W. T. Covert

Purchasing

F. W. Taylor, general purchasing agent of the Pacific Electric with headquarters at Los Angeles, Cal., has been appointed general purchasing agent of the Southern Pacific to succeed I. O. Rhoades, retired, with headquarters at San Francisco, Cal., effective December 1.

OBITUARY

W. H. Knight, former traffic manager of the Union Pacific, died at Hinsdale, Ill., on December 10.

E. A. Dawson, who retired as manager of the Star Union Line, Pennsylvania System, at Chicago on December 1, 1915, died in Evanston, Ill., on December 7.

Thomas A. Ayres, assistant purchasing agent of the Erie with office at New York, died on December 9, at his home in Ridgewood, N. J., at the age of 38.

“On earth peace, good will toward men”

At no time since the birth of Christ have these words possessed more solemnity or more truly expressed the real sentiment of all true Christians than now. Would that we could chant them this Christmas Day as heralding a new-born world freedom!

But Prussianism, forgetting ancient Bethlehem and the “Stille Nacht, heilige Nacht,” unsheathed its sword and set the world aflame. Thus today we find the Caucasian, the Mongolian, the Ethiopian, the American Indian, and the Malayan fighting side by side that the earth may be made safe for their children and their childrens’ children.

To America has fallen the lot of striking the final blow which shall crush that awful Thing with its venomous sack and thirst for blood and rape. May God grant to us that certainty of aim and strength of arm so that on the next anniversary of the birth of our Savior we may shout with a full heart, “Peace, peace to him that is far off, and to him that is near.”

GENERAL NEWS SECTION.....

Unprecedented war-time traffic has produced a crisis which calls for the intensive utilization and co-ordination of all

The Co-ordination of All Transporta- tion Agencies

existing transportation facilities, as well as the conscientious and intelligent co-operation of the public and the carriers. The organization of the Railroads' War Board, the pooling of box cars, the substantial results achieved by shippers and railroads alike in effecting heavier car-loading and in diminishing delays in car movement, the release of locomotives and fuel for freight traffic by reductions in passenger service, and the pooling of facilities on lines in Official Classification territory are important steps which have already been taken to increase the carrying capacity of the railways. In addition, plans are under way for the more extensive use of electric roads, highways and waterways for the movement of freight. A Highway Transportation Committee, recently appointed by the Council of National Defense, is studying the possibilities of motor truck transportation as an auxiliary to the railroads. As the success of the motor vehicle as a freight carrier depends on the condition of our highways some modification of the recent priority order denying the use of open top cars for materials needed for highway construction may be desirable. The formation of the Electric Railways War Board was recently noted in the *Railway Age Gazette* and the steps taken under the direction of that body to organize electric railway facilities for freight transportation were outlined in the *Railway Age Gazette* of December 7, page 1048. It is worthy of note that the electric lines, which have a total operated length of about 40,000 miles, do not intend to undertake freight movement separately from the steam lines but will endeavor to co-operate with them to the end that traffic may be moved most expeditiously and with the least danger of congestion. Through the influence of the United States Food Administration shipping on the Great Lakes, which usually stops on December 1, will continue, in part, as long as weather conditions permit. All these developments are in the direction of maximum transportation efficiency and greater co-ordination of different kinds of carriers, at the same time pointing to further possibilities of

improvement in the future. It is patent that war conditions will not brook competition between carriers of the same kind or of different kinds, but they call for the operation of all transportation agencies as parts of a great whole, laboring under a tremendous burden which must be borne successfully until the war is won.

By a little deft cross-examination of J. F. Shaughnessy, of the Nevada Railroad Commission, on his testimony before

A Rule That Works Both Ways

the Newlands Committee this week, Senator Cummins punctured rather effectively the argument of the intermountain interests that Congress should pass a law containing a rigid long and short haul prohibition. Mr. Shaughnessy and other representatives of the intermountain section are asking Congress to enact a general rule, which would upset commercial conditions in all parts of the country, for the benefit of their own section. They ask that the railroads be prohibited from charging a higher rate for the short haul from the east to the interior than they charge to the Pacific coast to meet water competition. Senator Cummins asked the witness, as he had asked several other intermountain witnesses at the San Francisco hearing, why he had stopped at asking a prohibition of a higher charge, and why he had not asked that as high a charge for a short haul as for a long haul be forbidden. Mr. Shaughnessy, as had several of the other witnesses, replied that the intermountain country could "get along very nicely on equal rates" westbound, and that it wanted a continuance of the blanket rate system eastbound. Senator Cummins then pointed out that the argument for a rigid long and short haul clause, carried to its logical conclusion, would condemn all blanket rates, and that Congress could not pass special legislation but must act according to a general principle, such as a declaration that rates should be based on cost of service, or be made on a mileage basis. Mr. Shaughnessy did not care to go that far because the extension of his argument to its logical conclusion, while conferring one advantage on his section would take away another! No section or community ever finds fault with disregard of distance in rate-making

when the result is to favor it at the expense of competing sections and communities; but how wrong and downright vicious is disregard of distance when it helps competitors at the expense of the very same section or community!

Fuel economy in its broadest sense is an operating problem of direct interest to the transportation department. The

A Noteworthy System of Fuel Records

cost for fuel is a matter that every operating officer and particularly the division superintendent should watch closely, especially at this time; adequate records are necessary for this purpose. The division superintendent who seeks to lower the cost of operation must have available fuel statistics in sufficient detail to permit the consideration of this expense, as well as that of labor or any other expense, whenever he has any changes in operation in mind. An exceptionally good method of doing this was described in a paper by W. L. Robinson, supervisor of fuel consumption of the Baltimore & Ohio at a recent meeting of the New England Railroad Club, an abstract of which appears elsewhere in this issue. At a cost of 0.45 cents per ton of coal information is provided which may be considered as a barometer of the mechanical operating conditions on the road and which keeps the operating officers in close touch with the cost of fuel—the largest single item of operating expense. Among other things, a poor fuel performance is indicative of improperly maintained power, improper handling of trains, a poor quality of coal, or a lack of proper instruction of engine crews. This is what an operating officer should know and it gives him the opportunity of detecting the weak places in his organization. At the same time this system of fuel records shows the men on the locomotives that their work is being constantly watched; it shows the road foremen of engines which men need special supervision and instruction; and it brings out the mechanical defects of locomotives which affect fuel consumption for the benefit of the repair forces. The work on the Baltimore & Ohio is under the direction of a staff officer who reports directly to the operating vice-president. This brings the fuel problems before the operating staff in their true light and makes this question an operating problem instead of purely a mechanical department one.

AN UNPRECEDENTED SIX MONTHS' RECORD

APPROXIMATELY complete statistics of freight movement during the first six months after the United States entered the war—that is, April to September, inclusive—which have been compiled by the Bureau of Railway Economics for the Railroads' War Board, disclose that in that period the railways not only handled far more traffic than in any earlier six months of their history, but also as much as in any entire year prior to 1907.

It will be recalled that the years 1906 and 1907 marked the climax of a long period of rapid increase of railroad business which resulted in the longest and most acute congestion of traffic and "shortage" of cars ever known until recent months. It is, therefore, not without significance that in the first six months of 1917 after the country entered the war the railways handled as much freight as they did in the entire year 1906.

In 1915 the railways handled only 30 per cent more freight than in 1906, while in 1917 they are handling approximately 100 per cent more than they did in 1906. These facts illustrate not only the enormous increase which has occurred in railway freight business during the past eleven years but also how swiftly the bulk of the increase has come within the last two years.

The total number of tons of freight handled one mile in the six months April to September by Class I roads han-

dling about 95 per cent of the freight traffic of roads of that class was 204,702,861,865. This is an increase of 14 per cent over the freight business handled by the same roads in the same months of 1916. The increase in the average tons hauled per car was from 24.8 to 27 tons, or 9 per cent, and the increase in the average tons hauled per train was from 626 tons to 675 tons, or 7.8 per cent.

It is interesting, as indicating the increase in the efficiency of railroad operation which has occurred since 1906, to note that in that year the average freight train load was only 344 tons, as compared with the record of 675 tons per train made in the months, April to September. If the railroads had moved the traffic of these six months of 1917 in the same average trainload as they handled the freight of 1906, they would have had to render in these six months about 96 per cent more freight train service than they actually did render. They ran freight trains 330,000,000 miles in that six months. On the basis of the trainload of 1906 they would have had to run them about 645,000,000 miles.

The economy effected by this increase of the average trainload and the resulting saving of freight train service is the only thing which has enabled the railway system of the country to remain solvent in the face of almost stationary freight and passenger rates, and enormously increasing expenses of all kinds. Of course, economies have been effected by other means than increases of the trainload, but it is by this means that the really big saving has been made.

The labor brotherhoods are opposed to the big trains. The government apparently is soon going to take control of the operation of the railroads. In view of the attitude of the brotherhoods it will be highly interesting to see what policy the government railroad controller, if one is appointed, will adopt with reference to increases in trainloads.

THE TRUTH ABOUT THE COAL SITUATION

THE National Coal Association by its secretary, J. D. A. Morrow, has written the *Railway Age Gazette* a letter which appears elsewhere in this issue. It is in reply to the editorial, entitled "The Coal Situation—A National Menace," which was published in our issue for November 30.

The impression which many persons have been given by what has been said in the newspapers is that there has been an actual reduction this year in the amount of coal mined and transported. No impression could be more erroneous. The coal production of 1916 was the largest up to that time. Data regarding the amount of coal moved by the railways are available for the months, April to November, 1917, inclusive. In those eight months 175,986 more carloads, or about 10,000,000 more tons, of anthracite were moved than in the same months of 1916, an increase of 15 per cent. In the same months 925,691 more carloads, or about 51,000 more tons, of bituminous coal were moved than in the same months of 1916, an increase of 18 per cent.

Formerly large amounts of coal were carried by vessels on the Great Lakes, in the coastwise service, and running between the Atlantic and Pacific coasts through the Panama canal. Most of these vessels have been diverted to transoceanic service. In consequence, not only have the railways had to meet an increase in the output of coal, but they also have had to carry vast amounts of coal which formerly were carried by water. It is an illustration of the unfairness of Dr. Garfield, the government fuel administrator, and other persons who attribute the present coal situation to the shortage of transportation facilities, that they always talk about the alleged "car shortage" but never about the vessel shortage. The reduction in the amount of coal being carried by water has not only made it necessary for the railways to carry more tons of coal than formerly, but has also made it necessary for them to carry it a greater average distance: for the sections to which the boats carried the most coal—

the Pacific coast, the Northwest, and New England—are all relatively remote from coal mines. This increase in the tonnage to be moved and in the distance it has had to be moved have imposed a double burden on the car supply.

And, unfortunately, neither the government Fuel Administration nor the coal producers have shown the inclination or constructive ability which they should have shown in lightening the burden on the railways. There is a great deal of "cross hauling" of coal. Instead of coal being consumed almost entirely in the territories adjacent to the mines in which it is produced it wanders all over the country seeking its markets. West Virginia coal often passes almost directly through the great Illinois and Indiana field to the Northwest, and Illinois and Indiana coal coming eastward meets it on the way. Coal from the Pittsburgh field passes directly through the great coal mining districts farther east on its way to New England, and meets coal from those eastern fields going west.

This cross hauling of coal was not intolerable, or perhaps even undesirable, before the war. It has become intolerable since we entered the war because of the enormous waste of transportation which it involves. The remedy for it is to restrict the movement and consumption of all coal, except special kinds needed for special purposes, to the immediate zones within which it is produced. A large saving of transportation and increase of coal production could be secured in this way; and the adoption of some such scheme repeatedly has been suggested; but those who should have adopted it have been so busy "passing the buck" to the railroads that they have not had left any time, energy or initiative for the adoption of needed constructive measures.

In addition, the abuse of cars by coal shippers and consignees, which always has prevailed widely, has continued. Senator Pomerene of Ohio recently cited an example which he said came under his personal observation. This was the case of a coal dealer in Ohio who held loaded coal cars until they accumulated \$400 in demurrage, in order that he might increase by \$1600 his profit on the coal. The abuse of the reconsignment privilege has continued to be flagrant. And yet in the face of all such facts the Fuel Administration and the coal producers have the effrontery to continue to issue statements and make speeches charging the railroads with almost entire responsibility for the coal situation!

The line of argument adopted by Secretary Morrow in his letter which we publish elsewhere is typical of that which has been taken by the spokesmen of the National Coal Association and by the Fuel Administration. Mr. Morrow says: "The reports of the Federal Trade Commission and the United States Geological Survey show that the coal operators have furnished the nation with men and equipment at the mines to produce 700,000,000 tons of bituminous coal annually. The output this year will be some 540,000,000 tons. It is true that fires, floods, accidents, breakages and labor difficulties have caused the loss of some coal that might have been mined, but the official figures indicate that nearly 100,000,000 tons were not produced because of transportation difficulties."

Now, let us turn to the reports of the United States Geological Survey and find what they actually do show. They are compiled, it should be borne in mind, from reports made by the mine operators themselves. The weekly reports of the Geological Survey give the total amount of coal produced; the percentage which this production is of "full time output"; the percentage of failure to secure "full time output" due to "car shortage" and the percentages of failure to secure "full time output" due to "labor trouble and shortage," "mine disability," and all other causes. We have prepared a table based upon these reports of the Geological Survey for twenty-two consecutive weeks which is given here-with.

This table shows that in ten of these twenty-two weeks

a larger part of the failure to secure full time output was attributed to other causes than to transportation conditions. The mines reporting fell short of full time output during these twenty-two weeks by 60,500,000 tons; and the coal producers themselves attributed 52 per cent of this failure to transportation conditions, and 48 per cent of it to causes under the control of themselves, if of anybody!

"Under such conditions," Mr. Morrow concludes, "doesn't it seem rather futile and absurd to talk of the operators' failure to produce some millions of tons of coal? What could have been done with it, when the roads couldn't transport what actually was mined?" The answer is afforded by the statistics given in our table which demonstrate that at least 48 per cent of the failure to secure "full time output" has been due, according to the reports of the mine operators themselves, to their own failure to furnish coal for transportation when the railways were ready and able to move it.

One of the significant facts disclosed by our table is the tendency of coal production for some months after the government fixed coal prices. Secretary Baker's letter repudiating the agreement regarding prices made by Secretary Lane

TABLE I

Statement of Bituminous Coal Produced and Percentage of Full Time Capacity Output Lost Through Causes Within Control of Producers and Carriers Respectively. Weekly Figures, July 7 to November 24, Inclusive, 1917

Week ended	Tons produced	Per cent full time output produced	Full time output (100%)	Per cent full time output except car shortage	Tons lost, all causes, in control producers	Tons lost from R. R. causes
July 7	2,466,000	77.4	3,200,000	12.6	403,200	320,000
14	3,049,000	76.3	4,000,000	8.5	351,000	600,000

					29,252,931	32,263,649

*Carloads of coal multiplied by 58.

and the coal operators was made public on July 4. At that time the production of coal was running at the rate of 77.4 per cent of "full time output." The percentage of "full time output" being produced immediately began to decline and continued to do so for six weeks, until in the week ending August 18 it was only 67.2 per cent. Meantime the failure to secure "full time output" due to causes other than lack of transportation facilities increased from 12.6 per cent to over 22 per cent. The railways during this time could have handled millions of tons more coal than was produced. Again, in the week ending October 20 the output secured dropped to 65.8 per cent of "full time output," and the output lost due to causes in no way related to transportation conditions increased to almost 23 per cent. In this period, again, the railways could have hauled millions of tons more than were produced. If the mine operators at all times had been as well prepared to produce coal as they contend, by implication, that the railways should have been to transport it, the amount of coal produced and transported would have been many millions of tons greater than it has been.

Whether, under all the conditions, the mines could have produced and the railways could have transported enough coal to meet all demands is very questionable. The increase

in the demand has been very great; and it will continue to be so. The railways and the coal producers will not increase the output by continuing to "pass the buck" to each other; but they can increase it by co-operating in an effort to remove the various formidable obstacles to larger production which now exist.

THE WAR AND ENGINEERING STUDENTS

THE instructions issued by Provost Marshal General Crowder on last Saturday, deferring the calling of students in engineering colleges under the provisions of the draft and permitting them to enter the engineer enlisted reserve corps and to complete their education, will do much to remove a situation which was rapidly threatening to become serious to the government as well as to the railways and other agencies on which the government is dependent for service. Not only have large numbers of recent graduates left industrial work to enter various branches of military or naval service through voluntary enlistment or conscription but the present senior classes in the engineering colleges have been depleted to such an extent that only a fraction of the normal number of men will be graduated next spring. This same condition is already being reflected to an almost equal extent in the junior or 1919 class, and is also being felt in lower classes. A recent survey of the enrollment in about 60 of the leading engineering schools of this country showed a reduction of 45 per cent in the number of seniors and of 30 per cent in juniors as compared with a year ago. Within the last few weeks there has been a further and particularly heavy exodus of members of these classes, while the calling of additional men under the provisions of the selective draft would have again reduced the number remaining in the colleges. Even excluding the further draft, the number of graduates available for the government and for the industries of the country next spring will only be a small proportion of the normal number and the same condition may be expected in 1919. This is occurring at a time when the demand for engineers is greater than ever before.

Becoming alarmed at the results which would inevitably follow a continuance of this tendency, several of the leading national engineering societies called this condition to the attention of the government a few days ago with the result indicated above. In harmony with the spirit of the selective draft law to place every man where he will be of the most value to the country, similar action had already been taken by the government, with reference to dental and medical students, the basis for action in these cases being that these men are more valuable to the country in their professional capacities after completing their education than they would be as privates in the ranks if taken before the completion of their college courses.

This same argument applies to engineers. In no previous war have engineers played as important a part. They are being employed in professional capacities in larger numbers than in any previous conflict. The same tendency is present in the industries working on government business, while the unusual demands now being made upon the railways and other industries are further increasing the need for men with engineering training. It is evident that both during the continuance of the present conflict and in the period of reconstruction which must necessarily follow the conclusion of the war, engineers will be greatly in demand. With the heavy wastage which must inevitably occur in Europe and with the shutting off of the supply of engineers from the colleges, this country was threatening to deprive itself of the services of a class of men which it will sorely need.

The railways have suffered acutely from the shortage of engineers during the past year. On a number of roads contractors have been delayed and work held up pending the completion of plans and the staking out of the projects. On

many roads supervision of improvement work has been greatly curtailed with all the detrimental results which necessarily follow. Conditions have been aggravated during the last few weeks by the enlistment of registered men who wished to get into various branches of the service now closed to them. As a result the engineering department on many roads and particularly in the valuation work has been threatened with serious disorganization. While the action of Provost Marshal General Crowder will have only partial effect this year, the precedent thus established will tend to conserve the engineering resources of the country and will make available for the railways and for other industries, as well as for the government itself, the services of a class of men seriously needed.

NEW BOOKS

Proceedings of the American Society for Testing Materials. Edited by Edgar Marburg, secretary-treasurer, University of Pennsylvania, Philadelphia, Pa. Two volumes. Illustrated, 6 in. by 9 in. Part 1, 875 pages, Part 2, 675 pages. Bound in paper, cloth and half leather. Published by the Society, Philadelphia, Pa. Price per volume, paper \$5, cloth \$5.50, half leather \$6.

These two volumes contain the proceedings of the twentieth annual meeting which was held at Atlantic City, N. J., June 26-29, 1917. In Part 1, 451 pages are devoted to the reports of committees and to the discussion of these reports. The next 305 pages contain the tentative standards of the Society for a wide variety of materials used in engineering work. Part 2 contains the technical papers, 29 in number, which were presented at this meeting and the discussion of them.

The proceedings of this Society are unusually well bound and printed and contain a large amount of authentic information regarding materials used by the railways and other industries.

Encyclopedia of Latin America. Edited by Marrion Wilcox and George Edwin Rines. Size 7 in. x 10 in. 887 pages, illustrated and with maps. Bound in buckram. Published by the Encyclopedia Americana Corporation, 27 William street, New York. Price \$10.

In this book the editors, assisted by a number of other authorities and members of the Encyclopedia of Americana staff, have gathered together seemingly nearly all of the important and interesting information concerning the countries of Latin America.

In the first place the fact that the Latin American countries have so many characteristics in common has enabled them to devote 160 pages to the general characteristics of the Central and South American nations, under such heads as the Latin-American Civilization, Education, Labor, Property Rights, Commercial Regulations, Industrial and Commercial Expansion, etc., including also 32 well-written pages by Otto Wilson, chief of the Latin American division of the Bureau of Foreign and Domestic Commerce on railway and other transportation. The major part of the book, namely, over 500 pages, is devoted to the various Latin American countries in detail. To take one example, the articles on Argentina which cover over 70 pages go into detail concerning its physiography, its population, its history, its government and its salient industrial and commercial characteristics, this including 3 pages which enlarge upon the general article on transportation mentioned above. There is also another important section of the book which deals with the leading industries of the Latin American countries and contains special information relative to the commerce of these industries in general and in detail. To take one or two examples, the section on cattle and meat, classified by countries, covers 20 pages, that on tobacco 13 pages, etc. The book is of special interest and value to any person interested in South and Central America, or to any one having to do in any way with the commerce and trade with the nations to which it relates.

Letters to the Editor

MR. WARFIELD REPLIES TO AN EDITORIAL

BALTIMORE, Md.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

In the issue of your paper of November 23 there was an editorial of apparent slight to Samuel Untermeyer, myself, or both. In your criticism of remarks made by me before the convention of the Investment Bankers' Association recently held in Baltimore your editorial attributes to Mr. Untermeyer the authorship of one of the legal opinions quoted by me in reference to the unconstitutionality of federal incorporation of the railroads without the unanimous vote of all of the stockholders of the railroads. As a matter of fact I never consulted Mr. Untermeyer on this subject, nor have I seen directly or indirectly any opinion from that gentleman in this matter, or even an expression of opinion by him. So far as I know Mr. Untermeyer had no knowledge whatsoever that I proposed making the address in question, nor did he know my views on the subject.

Therefore, your statement was a gratuitous misrepresentation of the facts, all of which you could have ascertained had you taken the trouble to do so. The legal opinions from which I quoted had been obtained by sources for their own purposes, and when it was heard that I intended taking the position I did in the address mentioned they were voluntarily sent to me. However, I was requested not to disclose the names of the lawyers giving such opinions. But let me say that I would consider any legal opinion given by Mr. Untermeyer on any subject as having great weight, for I entertain a high opinion of the legal ability of that gentleman.

S. DAVIES WARFIELD.

President National Association
of Owners of Railroad Securities.

[The *Railway Age Gazette* did not say that Mr. Untermeyer had given Mr. Warfield one of the opinions referred to. It merely said an eminent lawyer holding his views might give such an opinion. It did not intend "slight" to either Mr. Untermeyer or Mr. Warfield. It has high regard for both of them. But it always has been possible for us to respect men and at the same time dissent from the views expressed by them.—EDITOR.]

THE COAL SITUATION—A NATIONAL MENACE

WASHINGTON, D. C.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

In your edition of November 30 you published an editorial entitled "The Coal Situation—A National Menace," which merits a word in reply. The editorial is an attack on the Fuel Administration, the coal producers of the United States and on the National Coal Association. We feel certain that your sense of fairness would hardly have let you make some of the categorical charges you do make had you first informed yourself of the true conditions. Kindly permit us to call your attention to a few facts that we think should have been before you.

In the first place you say that we have attacked the railroads. Not at all. The nation finds itself short of coal in time of war. Official records show that the lack of railroad cars is the principal cause of the shortage. We have merely called attention publicly to this condition. We are convinced that this is the quickest way to remedy the shortage, and that, knowing the facts, the people will insist that effective measures be taken immediately to relieve an intolerable situation.

In reciting the facts we have carefully avoided "attacking" the railroads. In our statement of November 28, to which

you have referred, we said that the "National Coal Association recognizes that the railroads are congested and crowded with freight far beyond anything ever before experienced by them. * * * Only orders establishing the preferential movement of coal by the railroads, issued at once, can correct the situation. The public must recognize that such orders are for its benefit, and, therefore, must support the railroads in carrying them out."

In our statement of November 23 relating to the New England situation, we said: "The National Coal Association realizes the plight of the railroads under the enormous burden they have been called upon to bear and is co-operating sympathetically with railway officials in an effort to find a solution to their troubles so far as the movement of fuel is concerned."

In our statement of November 19 stating that bituminous coal production had been reduced approximately 2,000,000 tons during the preceding week by car shortage and congestion, we said: "Curtailed production is due almost wholly to the inability of the railroads in their present congested condition to supply the mines with an adequate number of cars for loading. The National Coal Association is endeavoring to co-operate with railway officials, the Fuel Administration and the Priorities Committee in finding a remedy for the situation."

In announcing the appointment of our traffic manager, November 13, we said: "The task of co-operating with the railroads to provide sufficient cars for the loading of 500,000,000 tons of bituminous coal annually has been delegated by the National Coal Association to John Callahan," * * * and "In carrying out this work Mr. Callahan will endeavor to assist the various governmental agencies involved, and the railroad companies in meeting the transportation demands of the coal industry."

It is the intention of the National Coal Association to continue to state facts of interest to the public in connection with coal supply and reduction from time to time. It is also our intention to continue to the utmost the work we have already begun of co-operating with the railroads in meeting transportation problems relating to fuel.

You charge the National Coal Association with being founded to "produce misinformation." You appear to have based this verdict on the circumstance that the Association stated that the loss of coal production on account of transportation deficiencies in the week ending November 17 was 2,000,000 tons. We admit that our statement was based on incomplete reports, but the conservatism of our estimate is clearly shown by the announcement of the United States Geological Survey that the correct figure was over 2,800,000 tons.

We have been equally conservative in other statements. Hence we have uniformly been more than fair to the railroads whenever we have had to speak of them in connection with the coal shortage. Moreover, if we influenced the Fuel Administrator to ask for priority and preference for coal shipments, it was only because the facts we presented clearly indicated the need of just such action. Since the chairman of the Priorities Committee has made an ineffectual attempt to grant such a preference, we wonder if even you may not have at least a suspicion that the National Coal Association has been giving out facts instead of "misinformation."

You accuse the coal operators of "want of diplomacy and capacity in dealing with their labor," etc. What of the railroads? We wonder if you have forgotten in so short a time the Adamson Law and the events that led up to its passage.

You attempt to lay upon the coal operators the blame for the coal shortage. Here again we wish to refer you to the official records which are open to the public. The reports of the Federal Trade Commission and the United States Geological Survey indicate that the coal operators have furnished the nation with men and equipment at the mines to produce 700,000,000 tons of bituminous coal annually. The

output this year will be some 540,000,000 tons. It is true that fires, floods, accidents, breakages and labor difficulties have caused the loss of some coal that might have been mined, but the official figures indicate that very nearly 100,000,000 tons were not produced because of transportation deficiencies. Under such conditions doesn't it seem rather futile and absurd to talk of the operators' "failure to produce some millions of tons of coal"? What could have been done with it, when the roads couldn't transport what actually was mined?

NATIONAL COAL ASSOCIATION,
J. D. A. MORROW, *General Secretary*.

MR. KRUTTSCHNITT ON THE RATE OF DEPRECIATION

WASHINGTON, D. C.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

On page 1037 of your number of December 7, the following paragraph appears, in an article on "Depreciation" written by Mr. G. C. Hand:

"Presuming the average life of ties to be 10 years, for example, the combined life remaining unexpired in each series of that number will, upon the lapse of a few years, be the quotient of 9 plus 1, or of 10 plus 0, divided by 2; and depreciation will amount to 50 per cent of cost, less the value of scrap material recovered. The salvage of ties is a negative quantity."

The theory implied in the above, as we understand it, is that of the Division of Valuation of the Interstate Commerce Commission, is erroneous, and would result, if not refuted, in unjustly depriving shareholders of \$552,795,200 of capital invested in the railroads of the United States, being half the estimated present reproduction cost of the ties in 394,944 miles of tracks of all kinds. The error lies in confusing the maximum life of a single tie with the average life of a number of ties, and in ignoring the effect of replacements. If one tie has a maximum life of ten years—not an average life, as one tie cannot have an average life—the average life in an aggregation of such ties, of various ages, ranging from ten to zero, as assumed in the example, is 10 plus 0 or 9 plus 1, divided by 2, or 5; but if the average life of an aggregation of ties is ten years, the lives of the individual ties will range from zero to perhaps as much as 20 years, because the meaning of average implies various lengths of life bound together by the law that the sum of the lives of all individuals divided by the number shall equal ten. A picture of the life-expectancies of a group of ten ties will resemble this series:

Life Expectancy

Condition per cent of each tie in terms of *Average Life*—10 years—thus:
5 30 50 70 90 110 130 150 170 195 per cent of ten. Aggregate = 1000

Average condition per cent of group:
 $\frac{1000}{10} = 100$ per cent of 10, or 10 years

Condition per cent of each tie in terms of *Maximum Life*—20 years—thus:
2.5 15 25 35 45 55 65 75 85 97.5 per cent of 20. Aggregate = 500

Average condition per cent of group:
 $\frac{500}{10} = 50$ per cent of 20, or 10 years

In other words, we reach the conclusion that 100 per cent of 10 is equal to 50 per cent of 20, as it should be. The paragraph quoted should therefore read:

"Presuming the average life of ties to be ten years, for example, the combined life remaining unexpired in each series of that number will, upon the lapse of a few years, be the quotient of 19 plus 1, or 20 plus 0 divided by 2, and depreciation will be zero."

In other words, the average life of a number of ties of various ages can be ten, only if the lives of individual ties range from 0 to 20, and the lives can range from 0 to 20 only if

ties are currently renewed as their lives end, for otherwise the ages of all would be the same. The answers to the following two questions should make the matter clear:

Question 1. What kind of ties are used in construction and repairs by the ——— R. R.? Answer: Ties whose lives range from zero to as much as 20 years, but which under our traffic and climatic conditions will last on the average 10 years.

Question 2. What kind of ties will be found in the track of the ——— R. R., which makes renewals currently as the necessity therefor becomes apparent? Answer: Ties whose lives range from zero to 20 years, but which under our traffic and climatic conditions last on the average 10 years.

As the answers are identical, the average life of ties as found at any time in a properly maintained track is the average life of the class of ties used.

J. KRUTTSCHNITT,
Chairman Southern Pacific Company.

PERISHABLE TERMINALS

WASHINGTON, D. C.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

Time was when demurrage officers asked the question, "What is the test of a car shortage—the shipper's demands or the market's needs?" In so far as concerns the perishable products of the country it is neither the one nor the other. Perishables must move to market when they are ready to harvest. Not always is the market prepared to absorb them on arrival. They must be stored pending the readiness of the market to absorb them; else there will be financial loss to the producer, and possibly waste of food-stuffs.

Cars are not the places where they should be stored. But they will have to continue to be stored in cars until other storage space is available. It has for some time been evident to close students of the problems of intra-city distribution of foodstuffs that other storage space ought to be provided in each city in connection with joint wholesale perishable terminals to which all the rail carriers serving a given city shall have access on equal terms. The leading part which the railroads are called upon to take in bringing about conditions of this kind is to merge their competitive activities with respect to terminal delivery, and to agree to use a common neutral terminal.

Until that point is reached in the provisioning of our large cities, little headway will be made in securing by moral suasion the co-operation of shippers and receivers in the more efficient use of cars by releasing them promptly at terminal markets. A perishable terminal equipped with ample storage space, common and cold, will permit cars to be unloaded as soon as they reach the market, and to be returned to points of production.

It is idle to assert that present conditions will disappear with the close of the war. The war has merely accentuated and made very general difficulties hitherto sporadic, but for some time clearly on the increase. It has brought suddenly to the attention of the entire country the urgent need of changing some of our transportation and marketing practices to conform to changed economic conditions.

Transportation men seek higher demurrage rates to force the release of cars, but proper distinction is not made between perishable and nonperishable commodities. The arguments against increased demurrage charges by shippers of nonperishable commodities have not been very convincing, nor, in the long run, would any demurrage charge, however drastic, be a serious handicap to nonperishable traffic.

Perishable commodities, on the other hand, especially those moving under refrigeration, present a case quite different, especially in view of the necessity for their concen-

tration at one central point for the purpose of wholesale marketing. Instances are not wanting of concessions in the matter of free time and use of cars granted in the past by individual railroads in an effort to monopolize the perishable traffic of certain cities. Criticism now of practices not then improper is neither in order nor helpful. Doubtless, had transportation officials then been able to foresee the results now of their concessions, the present problem would be different and less difficult.

It does not appear that present demurrage rates, considering the country as a whole, are a handicap to perishable commerce. Nor do they force the release of refrigerator cars. To impose a rate that in all cases would force the immediate release of cars without providing other storage space would be uneconomical.

The United States Department of Agriculture has co-operated with the Commission on Car Service the past year by continually urging receivers of perishable commodities to unload and release cars promptly. As cold weather approached, shippers in the West pleaded for refrigerator cars to save apples and potatoes from freezing. The railroads, unable to fill orders for cars, at the same time begged the department to use its influence to secure the release of thousands of cars held in eastern markets under load. Slow progress was made, and the department's marketing experts at that particular time could detect no indication that receivers were holding cars under load for the purpose of manipulating prices.

The markets simply were saturated and lacking in temporary storage space. To have forced the accumulated products on the market would have meant loss to producers and distributors and waste of foodstuffs.

The department, through the columns of the *Railway Age Gazette*, desires to present this problem to the transportation officers of the entire country and to solicit their co-operation in making an early beginning of its solution.

G. C. WHITE,

Specialist in Charge of Transportation, Bureau of Markets,
U. S. Department of Agriculture.

A REPRESENTATIVE COMMISSION

NEW ALBANY, IND.

EDITOR OF THE RAILWAY AGE GAZETTE:

In view of the recent utterances of Frank A. Vanderlip relative to the need of a reorganization of the present methods of controlling transportation companies and the national interest which his remarks have apparently occasioned, I am sending you herewith a copy of a letter, which, with one or two minor changes and additions, is the same as one mailed you early this year, and which you published under Letters to the Editor in the issue of March 2, 1917.

In that letter I suggested that the President should appoint to the Interstate Commerce Commission one representative of the people from each of five districts, and that the transportation companies should select another representative from each district, the 10 members thus chosen to select a chairman, all to be subject to confirmation by the Senate. It was also suggested that the powers of this body should be almost plenary over all common carriers of any kind that originate freight or passenger traffic in interstate business, whether they operate wholly or partly in any one state, and that their decisions should be subject only to adverse decisions of the Supreme Court. In order to eliminate the confusion and injustice that now exist on account of the acts of various state and civic bodies, they should be eliminated or made entirely within the jurisdiction of the interstate body. But, in order that each state may have its individual needs taken care of, the governor of each state should appoint a representative of his state before the interstate body, such appointment being subjected to ratification

by the governing or legislative body of that state, and such appointees forming, perhaps, a lower body of the interstate body.

Referring to Mr. Vanderlip's statement, he says in part, "Upon the central board I would put representatives of the government, members of the Interstate Commerce Commission, representatives of labor, and representatives of the public, the investor." The representation of labor on such a board is an excellent idea, but would it be fair not to include representation of the transportation companies themselves; since, as the Chicago Tribune points out, the public, or investor, as used in Mr. Vanderlip's suggestion includes the direct and indirect interest of half of the nation; and therefore could not be easily considered as having direct reference to the incorporated bodies actually operating transportation facilities. Such corporations would naturally have more knowledge of their needs and requirements than any one not directly interested.

And may I ask, why it appears necessary to distinguish between the government, which is the servant of the public, and the public; or between the government and the Interstate Commerce Commission, which is apparently a part of the government?

And does it not appear that the addition of another governing body would prove superfluous and burdensome, and that it would be better to accomplish the desired end by simplifying instead of adding to the methods now used to attain that end?

Would you not, therefore, consider that the solution of the problem lies somewhere between the plan suggested by Mr. Vanderlip and the plan outlined in the letter above referred to?

C. E. NEWELL.

THE UPPER BERTH PROBLEM

SAN FRANCISCO, CAL.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

May I say a word for the Pullman Company in connection with the letter reproduced on page 679 of your issue of October 19, 1917? I, too, have been traveling in Pullman cars for a great many years, and therefore am quite familiar with the accommodations provided in upper and lower berths and compartments and drawing rooms. As I see it, the Pullman Company is improving its accommodations for the traveling public, the same as railway equipment, motor cars, building operations, and all other things in this human existence improve as time goes by. If this is a fact, then "a Pullman friend" surely must have noticed that in all late pattern Pullman cars a small electric light partly concealed is provided at both ends of the aisles in open cars, but in such way that passengers will not be annoyed by these lights after they retire.

Another point is the fact that the Pullman Company undoubtedly has issued instructions to its conductors and porters regarding the switching off of lights after specified hours. Of course, it is very difficult to satisfy all passengers who travel in Pullman cars, since many of them wish to retire early, while others desire to remain up more than half the night. In view of this I think most observing travelers will admit that the Pullman Company and its representatives do everything they possibly can to satisfy the greatest number of passengers.

It seems to me that the fact that upper berths are now sold for less than is charged for lower berths is a clear indication that they are not regarded as desirable as the lower berths, although we all admit that the beds of the upper berths are more comfortable than in the lower berths when once you get undressed and under the covers.

G. H. CORSE, JR.

Foreign Passenger Agent, Union Pacific System.

The British Railways Under Government Control

Many of the Railway Problems Great Britain Has Solved
Were Like Those We Are Now Trying to Solve

By F. A. McKenzie

THE following account of the operation of the British railways under the control of the government during war times is especially interesting at this time when President Wilson has recommended a similar policy for the operation of the railways of the United States:

British railways have played a great and splendid part in the war. Working with depleted staffs under war conditions, they have enabled England to move millions of men and millions of tons of munitions with the utmost rapidity and with an entire absence of confusion. They have met to the full every demand. They have sent their trained workers to the colors by the many score of thousands. They have torn up their lines and given their locomotives and rolling stock for the service of the army in France. Sinking ancient rivalries, they have come together, working as one for the common good. The government took control of the lines when hostilities began, but government control merely provided the agency through which the railway men themselves rallied to employ their resources as an effective instrument of war.

COMMERCIAL VS. WAR RAILROADS

The British and German railway organizations before the war presented a striking contrast. German railways were almost wholly state owned. Many of them were built primarily for purposes not of commerce, but of strategy.

The British railways were privately owned and were built solely for commercial purposes. The control of the principal lines was divided among forty companies. These maintained only a minimum of co-operation among themselves, and wherever they ran through the same territory there was keen rivalry. British lines were laid, the size of railway carriages and goods trucks decided and the staffs selected solely for the ordinary work of peace time.

One thing, however, had been done, a thing that was to prove of vital importance when war broke out. In 1871, following the Franco-Prussian conflict, the British government took power by act of Parliament to acquire by royal proclamation any or all of the railways of the United Kingdom in time of war. A committee of railway managers was already in existence to deal with such a situation. This body, known first as the War Railway Council and afterward as the Railway Executive Committee, was to act as a central organization, to give instructions and to co-ordinate the activities of the different railways in war time. Working in co-operation with it was the Engineer and Railway Staff Corps—a volunteer organization of railway workers whose purpose was to develop schemes, methods and personnel for the War Railway Service. It was composed of general managers of the leading railways, leading contractors, engineers and other railway men.

Month by month and year by year the Staff Corps worked out schemes for the utilization of our lines under any contingency. It planned how to carry out great movements of troops from one part to the other. Few, if any, then contemplated more than handling bodies of men running into a total figure of from four to five hundred thousand. When, later, the needs of the war raised the total to ten times the old maximum the plans proved to have been so soundly laid that the greater demands were easily met.

THE MANNING OF GOVERNMENT CONTROL

The Railway Executive Committee and the Railway Staff Corps, working in conjunction with the Director General of

Military Transport, gradually completed, during the years preceding the war, their plans of operation. These covered more especially the movements of a British expeditionary force to its embarkation port, the quick concentration of men at any point to repel an invading army, and the evacuation of invaded districts. By 1912 all was in readiness. Every railway manager had in his safe a confidential, sealed, unopened document, detailing a scheme of mobilization. In it he was told exactly what to do, the trains to be moved, their starting points and destinations, and the entire schedule of running, if war came. So far as the operation of our railways was concerned England was prepared.

On the same day that war was declared (August 4, 1914) the railways of England, Wales and Scotland—not Ireland—were taken over by the government. The managers opened their sealed instructions and proceeded to carry them out. It had been provided in the act of 1871 that full compensation should be paid to the owners for any loss incurred. The government, however, did not at the beginning announce any terms with the companies. This was left for a later date. Government control, it is important to note, did not mean government ownership. The lines remained the property of the companies. They retained the management of their own concerns, subject to the instructions of the executive committee, and the whole machinery of administration went on as before. The sole purpose at the beginning was to facilitate the movements of troops. But as the war developed, as economy became more and more essential, the scope of the Railway Executive Committee, now in supreme control, became greatly extended.

The official chairman of the Railway Executive Committee was the President of the Board of Trade, but the real presiding chief was the acting chairman. Working in co-operation with the acting chairman were 12 general managers of leading British lines. Under the central body were groups of committees, each made up of railway experts. The War Office and the Director General of Transport were in touch with the Central Committee. There was a constant interchange of ideas, but from the beginning there was no attempt to supersede the railway men in carrying out their work.

The main plans of the war policy of the railways had, of course, to be approved by the government, and announcements were made in the name of the President of the Board of Trade. But the plan uniformly adopted was for the authorities to tell the Railway Executive Committee what had to be done and then to leave it to plan the details of how the work should be completed. In other words, the experts were allowed to carry out their own work in their own way, so far as was possible, under war time conditions. And they got the thing done.

SEVENTY-THREE TRAINS IN FOURTEEN HOURS

The first task before the committee was one calculated to tax its resources to the full. The Territorials—the volunteer forces of the United Kingdom—had been called to the colors and had to be distributed to their training grounds and their defence areas all over the country. Simultaneously the Expeditionary Force, numbering 120,000 men, with a vast amount of material of war, had to be transported in a minimum of time to Southampton—the port of embarkation for France.

The government gave the railways a time limit of 60 hours to make ready for despatch to Southampton 350 trains of

about 30 vehicles each. In addition, close on 1,200 other trains were necessary for conveying the equipment, munitions and food supplies of the forces. There were about 60,000 horses to be carried—seven to a truck; there were 5,000 tons of baggage and 6,000 vehicles. Sir Herbert Walker, over whose system—the London & Southwestern Railway—the trains had to travel to Southampton, described what was done in a speech shortly afterward at the American Luncheon Club in London. He told of the government time limit of 60 hours:

We "delivered the goods," as you Americans would say, in 48 hours. At Southampton, for practically every day of the first three weeks of the war, we handled during a period of 14 hours no fewer than 73 of these trains, including the running of them to the boat side and the unloading of the full equipment of guns, ammunition and horses.

The trains arrived at intervals averaging 12 minutes. It was a matter of special pride to all the railway men concerned—and we general managers give credit for the feat to the efficiency of our disciplined staffs—that practically every train without exception came in on scheduled time. Some of them came from remote parts of the kingdom—Wales and the north of Scotland.

Among the audience on that occasion was Mr. (afterward Lieutenant Colonel) H. W. Thornton, general manager of the Great Eastern Railway, a distinguished American railway organizer, who had come to England from the United States. He said that so far as his knowledge of great transportation achievements went there was no event in railway history to compare with what the British lines had accomplished in that month of August, 1914. Certainly in America, the land of "big stunts," there had never been anything like it. It may be added that this rapid transportation of the troops to Southampton was only possible because the docks there had been carefully planned by the railway company for the handling of large masses of men and quantities of material. The trains conveying the troops and freight were run right down to one of the berthing stations; they were emptied there with the greatest expedition and at once sent back. Each train had a permanently displayed index number on it, by which it was known throughout its journeys; its exact time of arrival and departure at each place was scheduled, and the schedule had to be kept.

Under the terms on which the railways were taken over for the period of the war the government guaranteed to the proprietors of the railways that their net revenue should be the same as in 1913, except when the net receipts for the first half of 1914 were less than the first half of 1913; in that case the sum payable was to be reduced in the same proportion. The entire government traffic—men and freight—was to be carried without any direct charge being made for it or any accounts rendered. This plan was considered satisfactory by both sides. In the majority of cases there had been a reduction of earnings in the first half of 1914 over the previous half year, and companies were contemplating a still further reduction. The interests of their shareholders being assured, they were able to devote themselves to the work of economical and efficient distribution, quite apart from the usual financial problems. The one weak side of this agreement was that it made no allowance to cover increased interest payments on account of new investments and new capital expenditure since the war began. This point was afterward met by an arrangement that the government should pay interest at 4 per cent. on all new capital invested by the railways since August 4, 1914, on new lines, branches, terminals, equipment or other facilities put into use since January 1, 1913.

The conclusion of the financial agreement between the government and the companies automatically brought about a great economy in the system of railway accounts. Hundreds of clerks had been employed at the Railway Clearing House

at Euston, London, in dissecting payments covering different lines, so that each line should have its proper share. This work was no longer required. The vast amount of competition maintained before the war for traffic at once ceased. British railways, particularly those competing with others for the business of particular towns, had maintained staffs of canvassers not only for freight but even for passenger traffic. All the great companies had extensive publicity departments, which by posters, pamphlets and newspaper articles sought to bring home to people generally the attractions of their lines. In the years before the war this publicity had tended to grow more and more elaborate and more and more costly. Now it was swept away at a stroke. The weekly traffic returns of the different lines were no longer required and so ceased to be published.

The reports of the companies were cut down to a bare minimum, and in many cases even these reduced reports were not sent to the shareholders unless they specially asked for them. The tickets issued by various companies for the same points were made for a time available by the trains of any railway running between the points to which the tickets were issued. This concession was shortly afterward withdrawn.

The great strain of the despatch of the first expeditionary force passed, but it soon became clear that the railways would be faced by a double problem. They would all the time have a vast amount of military traffic to handle—the transference of troops, the carriage of munitions, the assembling of different sections of war material. Simultaneously with this great increase of work, they had a very serious reduction of staff. A number of railway men had been called up at once as army reservists and territorials, while many others volunteered to join the colors. It was estimated a few months after the outbreak of war that 66,000 men, out of a total of 643,135, had joined the army. This figure rapidly grew, until at the end of 1916 nearly 150,000 men had been released by the railways for war duty—close on to 50 per cent. of the men of military age. This shortage of labor quickly grew into one of the most serious issues. The companies had no desire to keep back recruits from the army, but they realized that it was essential for the welfare of the nation that the railways should be maintained in an efficient manner and be prepared to meet any military demands which might be placed on them. The King, in a message to the skilled workers in the shipbuilding and armament firms, emphasized this latter point in words that applied equally to railway workers: "His Majesty greatly admires that spirit of patriotism which arouses in them (the skilled workmen) the desire to enlist and fight at the front, but His Majesty wishes to remind them that by work that they alone can most successfully carry out they are assisting in the prosecution of the war equally with their comrades serving by land or sea."

At the time of the outbreak of war the railway companies and the men's unions—the National Union of Railwaymen and the Associated Society of Locomotive Engineers and Firemen—were engaged in a controversy on the question of wages. A railway conciliation scheme drafted by a Royal Commission had come into operation early in 1912. This was to continue until November 6, 1914, but either side could terminate it on or after that date by twelve months' notice. The men had given notice in November, 1913, to withdraw; they wanted the conditions revised. When war broke out the negotiations between both sides were in a very forward state. A temporary arrangement was arrived at in October, 1914, by which the conciliation scheme was to be continued, but to be terminable by either side at six weeks' notice. Many railway employees were convinced that since the government was now virtually in control of their lines their demands for increased wages should be met. The rapid rise in the cost of living had made it obvious, after a time, that something must be done. The railway companies felt that, from their point of view, any rise in wages, even though wholly or mainly

made by the government, might have the serious result of putting on them a heavy burden to be borne after the war and after private ownership was resumed. It is always difficult to reduce wages, whatever the conditions may have been under which they are raised.

On February 13, 1915, terms of settlement were arranged. A weekly bonus was to be paid to all wage-earning employees of eighteen years old and upward engaged in the manipulation of traffic; all whose standard rate of wages was under 30s. a week were to receive a weekly bonus of 3s., and those earning 30s. or more were to be paid 2s. The cost of this bonus was divided, one-quarter being paid by the companies and three-quarters by the government. Modifications of the original agreement between the government and the railway companies were made in order that this might be done. This agreement was revised afterward in 1915, and in its final form all employees of 18 years or upward were given a bonus of 5s. per week, those under 18 of 2s. 6d. The understanding at the time was that this arrangement was finally to settle the wage question until the end of the war. A definite undertaking was given on that point by the men's organizations: the National Union of Railway Men and the Associated Society of Locomotive Engineers and Firemen undertake that during the pendency of this agreement they will not present to the railway companies any fresh demands for increased bonus or wages, or general alterations in conditions of service, and that they will not give countenance or support either to a demand on the part of any of their members to reopen the settlement now made or any strike that might be entered upon in furtherance of such demand.

FURTHER WAGE INCREASES MADE

Here, however, war conditions proved a stronger factor than formal agreements. The cost of living generally, and particularly the cost of food, continued to mount up. A second war bonus of 5 shillings was added to the first, coming into force in September, 1916, and in April, 1917, a further agreement was come to between the Railway Executive Committee and the various trade unions of the men by which the war bonus was increased to 15 shillings per week for all employees over 18 and 7 shillings 6 pence per week for those below that age. It was estimated that the total additional expenditure on account of the war bonus would be £23,000,000. The whole of these latter increases were borne by the government.

These rapid rises in the wages paid to the men came in for much criticism. It was pointed out that the increase of 1916 was nearly equal to wiping out the dividends on the ordinary stock. The Railway Magazine declared: "Under no other system but state control would a war bonus be paid on an all-around basis alike to lads of 18 years of age and the oldest employee, and single and married men placed on the same plane, no matter what may be their financial responsibilities or comparative wages." But here certain considerations have to be borne in mind. This rise in wages was not peculiar to the railways, but was general in industry. The railway men under the war labor regulations were not to leave their employment for other work. It was felt that they could not reasonably be expected to continue under far lower wages than other men in allied industries in the same districts. Above all, there was the outstanding fact that the old scale of wages was inadequate under war prices. The average cost of food of the kind mainly purchased by working men had doubled; clothing was much dearer; all the incidental expenses of living, except rent and rates had gone up; and men could not maintain their families decently on the old wage scale. The idea of making the rise the same for all ranks was to benefit most those who needed it most—the lowest paid men.

No statements have been issued showing the final balance sheet of the railways under government administration, and any such statement would be very difficult to make out, since

a vast quantity of government traffic not credited under the war arrangements would have to be charged up in attempting to make any fair balance sheet.

In December, 1916, Mr. Bonar Law, speaking officially in the House of Commons, said that the government agreement with the railway companies, notwithstanding the grant of the war bonus to railway employees, had "involved no financial loss, but probably some gain." When we contrast the working of the railways under government supervision with the working of the British shipping independently, the gains of the government control become evident. The railways under government direction kept freights even, directed their operations on an organized plan, gave undue profits to no man, and were worked for the sole purpose of benefiting the country. The merchant shipping trade, left largely under private control, was used in many directions for the accumulation of individual fortunes—fortunes earned out of the necessities of the community.

The era of economy in administration extended. At first the railway companies, believing that the war would possibly be short, attempted to carry on as usual, to maintain as many of their ordinary services as they could, and to give the public all the facilities to which they had been accustomed in days of peace. After a time it became evident that this course was impossible. Step by step restrictions came in force. Restaurant and sleeping car services were cut down or suspended altogether. Excursion and week-end tickets, formerly a very prominent feature in British railways, ceased. The service of passenger trains was reduced. Minor stations were closed and some branch lines were abandoned. The "luggage in advance" system, by which passengers could send their luggage on a small payment before they themselves left and have it delivered by the railway company to their destination, was ended, and passengers were asked to take as little baggage as possible. Later on passenger baggage was definitely limited to 100 lb. per head.

FURTHER BENEFITS OF THE "POOL"

Among the most important economies in handling traffic was, first, the establishment of the common user of railway companies' open goods wagons. Under the old system the wagon received loaded by one company from another had to be promptly returned to the owning line, even though there was no freight for it on its return. Under the common user arrangement it became available for loading in any direction, thus reducing the haulage of empty vehicles to a minimum. This system of pooling luggage cars came into force on January 2, 1917. The pool did not include the very large number of privately owned wagons, estimated from 600,000 to 700,000, which are a distinct feature of British railways; but the benefits of the pool were soon seen to be so real that steps were pushed forward to take over the control of the private wagons also.

A minor economy introduced early in the war was an agreement by the railways to accept each other's "paid" and "to pay" stamps and labels on parcel traffic. This saved very much labor, and it led to a further development in January, 1917, when the Railway Executive Committee announced that from a given date "the carriage charges for all descriptions of traffic for conveyance by passenger train or other similar service must be paid by the sender at the forwarding station." The whole system of bills and accounts for passenger goods traffic was swept away. Some reformers even proposed that the railways should go further and insist upon the prepayment of all small traffic by goods trains. Still another step was a decision that claimants for the loss or damage of goods traffic should be dealt with by the company on which the claim was made without any division, such as had formerly taken place, of the amount paid between the companies concerned in the route over which the traffic had been conveyed.

The saving in printed matter was so extensive that at least one large company was able to turn out many tons of paper which had been stored for office use, and to put this on the market at a time when paper was scarcest.

In January, 1917, in addition to the changes already described, passenger rates were raised 50 per cent, and Irish railways, which had formerly been outside the government control, were taken into it. The rise in passenger rates was instituted not to increase revenue, but to reduce the amount of traveling. The British authorities openly appealed to the people not to travel except when necessary. It was urged on the public in every way possible that pleasure traveling under existing conditions was unpatriotic. The railway men were wanted for other work.

TRANSPORTING STOCK TO THE WAR ZONE

Late in 1916 a fresh consideration came to the fore. In the early stages of the war the British had relied mainly for the transport of their goods in France on the service of large numbers of powerful motor wagons. Experience proved that while a motor service might answer as a temporary measure for a comparatively small body of men, it was impossible to provide for very large armies by road traffic. It was particularly impossible to bring forward with sufficient rapidity the enormous quantities of shells required and the numerous heavy guns without the use of properly built railroads. The companies could not well manufacture afresh the rails, locomotives and rolling stock necessary, or educate outside men to operate them in France. To meet this situation large sections of line were torn up in England and sent over to France, and every spare locomotive and spare bit of rolling stock was also sent over. These rails were quickly laid down by the Railroad Construction Corps, drawn largely from railroad builders from the Dominion of Canada. The new lines were operated by the Railroad Corps, recruited from practical British railway men. This of necessity still further reduced traveling facilities in England.

Still further economies were necessary. The men organizing the railway services of the country ever kept in mind the purpose of effecting these economies with the minimum of inconvenience to the public. In July, 1917, an important scheme, going far beyond anything yet attempted, was announced for the coal trade. The carriage of coal was one of the big problems of the railways, for it involved much labor. In the winter of 1916-17, owing partly to delays in railway transit and partly to difficulties in local delivery, considerable numbers of people—particularly the poor—had been unable to obtain supplies of coal with any regularity. It was feared that conditions might be still worse in the approaching winter. This the authorities planned to prevent.

The Controller of Coal Mines published a scheme, dated July 4, 1917, for the purpose of reorganizing the transport of coal by railway for inland consumption. Under this scheme England, Wales and Scotland were divided out into twenty areas and each area had to take its supplies from certain fixed districts of production. It was estimated that the plan would effect a saving in railway transport of not less than 700 million ton miles annually. The scheme was based on four main issues.

(1) That consumption of coal should take place as near the producing point as possible.

(2) That in view of the superior facilities offered by the main traffic lines, the movement of traffic should follow these routes wherever possible.

(3) That the movement of coal should, as far as possible, be in well defined directions—north to south, north to south-east, north to southwest, east to west.

(4) That an area producing less coal than suffices for its own need should not send any portion of its output to other areas. That an area producing more coal than it requires for consumption within the area itself should only distribute

to adjacent or convenient areas. This scheme did not affect waterborne coal, anthracite or coke of any description.

It was the precursor of other schemes which were to reduce unnecessary traffic in goods to the minimum.

PROBLEMS TO COME AFTER THE WAR

The responsible men on our railways recognize that the problems in railway management and control raised by the war will not altogether come to an end when the war is over. A new era has begun in railway management, and it will be impossible to go back completely to pre-war conditions. Even if it were possible, it would be highly undesirable. While no definite schemes have yet been arranged, it can safely be foretold that there will be greater unity of administration when peace returns than in the old days before war came. Co-operation has proved to be better than cut-throat competition. In the old days the Railway Clearing House at Euston provided the machinery for a limited amount of co-operation, but one dissident could often hold up great reforms. The Railway Executive Committee of to-day is almost certain to develop into a permanent central body, which will act as the coherer, the organizer and the Supreme Court of Appeal among railways themselves when rival schemes threaten conflict. This central body will promote economy of effort. It will prevent extravagant and excessive competition, and it will, if wisely guided, hold the scales evenly between the triple claims of the railway proprietors, the railway employes and the general public.

The second problem is that of wages. Practical railway men maintain that under normal conditions it will be impossible to pay, when the companies emerge once more from government control, anything like the war bonus of 15 shillings per week per man now received. Any attempt to revert to the pre-war wages would probably plunge us into a labor war. What will be a fair and practical wage for the men after the war is over? How can it be paid? If a substantial increase on the pre-war rates is found necessary—as many think it will be—how are the companies to meet it? Are they to be allowed to maintain higher passenger rates or to increase freight charges? If so, will these higher charges mean increased revenue? It is an axiom of management that low fares mean heavy traffic. Here is a matter which will demand the most careful consideration of both railway managements and the men's leaders.

The third problem is that of the future of women's labor on the railways. The companies have promised that men who have left them to serve with the colors will be reinstated on their return in positions equal to those they left. That promise must be kept, and kept to the full. But, unfortunately, many of the men will never return. Women have been found such efficient railway servants that they are certain to be retained. Many branches of railway employment before the war exclusively held by men will, a few years hence, be wholly or almost wholly in women's hands. How can the change which has already taken place be made permanent without strife?

The changed conditions after the war may, of course, provide in themselves a solution for all these possible problems. In the great rush of work to be done when the world is to be repaired, when ruined countrysides are to be rebuilt, great cities re-equipped and the waste of war made good, there will be for a time at least a demand for labor greater even than the supply afforded by a gradually demobilized army. It has been the experience of other generations that a successful nation emerging triumphantly from a hard-fought war has in itself such springs of hope, enthusiasm and inspiration that the impossibilities of other days are tackled and overcome. The British railways may at least hope that, having solved the problems of war traffic and employment in unequalled fashion, they will master the lesser problems of the coming days of peace.

FREIGHT OPERATIONS FOR SIX MONTHS

The monthly report of freight operations of steam railways compiled by the Bureau of Railway Economics for the Railroads' War Board, shows an increase of 14 per cent in revenue ton miles for the six months April to September, inclusive, as compared with the corresponding six months of 1916. The total revenue ton miles handled amounted to 204,702,861,865, as compared with 179,586,351,511. This increase in traffic was handled with an increase of only 2.3 per cent in the number of freight cars in service and 13.9 per cent in the number of freight locomotives in service. Freight train miles increased 5.5 per cent, loaded freight car miles 4.4 per cent, and empty freight car miles 4.9 per cent. The tonnage per train was increased from 626 to 675, or 7.8 per cent, and the tonnage per loaded car from 24.8 to 27, an increase of 8.9 per cent. The average miles per locomotive per day increased from 65.8 to 68.7 and the average miles per car per day from 27.3 to 27.9. The percentage of empty car miles was nearly the same, 30.6 as compared with 30.4. The percentage of freight locomotives in shop or awaiting shop was reduced by 9.1 per

cent, and the percentage of freight cars in shop or awaiting shop was reduced by 7.8 per cent. These figures are for an operated mileage of 225,852.

During the month of September revenue ton miles increased 2.9 per cent, while the average number of freight cars in service increased 3.1 per cent and the average number of freight locomotives in service increased .9 per cent. The number of freight train miles during the month increased .1 per cent and the number of loaded freight car miles decreased 2.9 per cent, while the empty freight car mileage increased 3.8 per cent. The revenue ton miles amounted to 31,500,299,936 as compared with 30,604,074,564 in September, 1916.

SPECIAL COUNCIL FOR IRISH RAILWAYMEN.—At the present time all the Irish business of the National Union of Railwaymen is dealt with from the headquarters in London, assisted by an organizer in Dublin. To meet the disadvantages of this arrangement the executive of the union has decided to establish an Irish council, which will have authority to deal with all applications for increased wages and improved conditions of service on the railways of Ireland.

Railroad Views on the Valuation Act

Roads Reply to Director Prouty's Memorandum. Contend Act Requires Ascertainment of Final Value

PIERCE BUTLER and Leslie Craven, counsel for the Texas Midland, have filed with the Interstate Commerce Commission a special reply, in the form of notes and comments, to the memorandum recently filed by Director Prouty in the Texas Midland valuation case, with a note stating that it had not been submitted to or considered by the President's Conference Committee and was not filed in its behalf. An abstract of the director's memorandum was published in the *Railway Age Gazette* of October 5, page 599. An abstract of the reply, which discussed some of the principal questions raised in connection with the valuation proceedings, is as follows:

SHALL VALUE BE FOUND?

The director's memorandum, while professing to rely upon the contention in the solicitor's brief that the act does not require the commission to ascertain or report value at all and that it is impossible to fix ultimate value except for a particular purpose, strongly supports our contention to the contrary. The director there says that he, as a member of this commission, several times joined in recommending to the Congress that it should provide for a valuation of railroad property and that in so doing he understood that a valuation in dollars of the property as a whole was called for; that there can be little doubt that a majority of the members of the Congress which enacted this measure understood that it provided for a statement of the value of the properties dealt with in money, and that the act was so accepted by the country at large. No one can reasonably contend that the language of the act is not plain upon the point. The director suggests that ultimate value for rate making purposes should be stated, and that the full benefit of this valuation cannot be realized unless this be done; that uncertainty is the vice of the railroad situation today; that, if the present system of providing public service by private capital is to be continued, some way must be found to assure that capital of the treatment it will receive, and that he does not know how this can be done until the value of the property now devoted to that service has been determined.

Particular purposes, among others, for which the valuations required to be made by this act are by the act specifically declared. The solicitor's contention that it is impossible to find value, except for a particular purpose, ignores the fact that by the plain language of the act it is contemplated that the valuations may be used in numerous cases and for many purposes.

The adoption of the solicitor's views would deprive the railroads and the public of the advantages which the commission by various recommendations from 1888 to 1912 intended to secure, which the Congress plainly granted, which the public understood would result from the passage of this act, and it would continue the great vice of uncertainty mentioned by the director.

The director's memorandum in substance agrees with the contention of the Texas Midland that its property is not typical of the railroads of the country and that it should not be taken as a test case. As far as we know, the same may be said of the Norfolk Southern, Atlanta, Birmingham & Atlantic, New Orleans, Texas & Mexico, and Los Angeles & Salt Lake. The important principles involved should not be settled upon the facts included in the tentative valuation in this case. We have so contended from the first, and are gratified to find that the director in substance agrees.

Without citation of authority it is said:

"* * * It (value) has been described by the courts and is that sum upon which under all the circumstances and upon a fair consideration of all the facts and elements to be taken into account a fair return should be permitted."

The failure of the director to cite the language of the courts or the cases from which his description of value is derived is regretted. Is this description sufficiently definite to mean anything? What facts are to be considered? Would not this description apply as well in a condemnation case as in a confiscation case? How, if at all, is the value here described to be distinguished from value in its true economic sense? The director cannot mean that any sum that happens to be so fixed by any commission as a rate base is therefore the value. Does not "fair return" as used in his description mean "just compensation" as used in the fifth amendment to the federal constitution? Is not that clause, so far as federal action is concerned, and the equal protection and due process clauses of the fourteenth amendment, so far as state action is concerned, the source of power of the courts to restrain and set aside laws and orders prescribing confiscatory rates, i. e., rates which take property of the carriers without "just compensation"? Is not "just compensation" for property taken for public purposes the value thereof? Is not a reasonable return upon that value "just compensation" in rate fixing or other price fixing cases? As stated by Mr. Justice Lamar (233 U. S., 389): "The fixing of the price for the use of private property is as much a taking as though the fee itself had been condemned for a lump sum * * *." That contemporaneously the value of the same railroad property is the same in a rate confiscation case as in a condemnation case is clearly established by the decisions of the United States Supreme Court.

CLEARING AND GRUBBING

It is reasonable to assume that, in the ascertainment of the cost of reproduction, the existing property should be the basis, and that grading quantities in reproduction should be the actual quantities involved in the construction of the property as it exists; that excavations and embankments should not be assumed to have been made in whole or in part in advance of the commencement of the work which forms the basis of reproduction; that stumps,—like stones and other formation,—which were in fact removed in order to make the excavations and embankments should be included at proper prices.

In ascertaining clearing and grubbing quantities, present conditions of adjacent and adjoining lands are assumed and thereby a part of the work which was actually done to build the railroad is eliminated. The present condition of adjacent and adjoining lands discloses thereon crops, fences, drains, buildings, etc. If these conditions be adopted, then cost of reproduction new must include the amounts of money which on valuation date would have to be paid by the carrier to cover damages sustained by the owner by reason of the taking of his crops, buildings, etc., in the acquisition of its lands, rights of way and terminals. It is not reasonable to assume as the basis of ascertaining cost of reproduction new that the lands, rights of way and terminals of the carrier would be unused and naked of planting, fences, drains, buildings, other improvements, etc. Yet, it appears to be so assumed, and the tentative valuation does not in any account contain a dollar to cover such damages or the cost of clearing and removing the same

from the right of way and lands of the carrier to make the same ready for railroad construction, use and maintenance.

The director's method is unjust. On the basis of *present conditions*, it excludes clearing and grubbing which was actually done. On the basis of *original conditions*, it excludes the present cost of crops, buildings and other improvements for which the carrier must pay to secure its right of way and terminal lands. *Ignoring both original and present conditions*, it excludes the cost of buildings which were in fact upon the land when acquired, or which, on the basis of present condition of adjacent and adjoining land, would on valuation date be upon the right of way and terminal lands.

If the tentative valuation includes anything whatever directly or indirectly for removing buildings from the right of way or terminal land either upon the basis of original conditions or upon the basis of present conditions, we have been unable to discover the same, and we doubt whether anyone in the division can point out the same, or indicate the amount thereof.

The methods suggested in the director's memorandum and which, so far as we can learn, were employed to make the tentative valuation in this case would exclude from the cost of reproduction of terminal facilities,—like the Pennsylvania and New York Central stations in New York, the Kansas City terminal, the Northwestern station in Chicago and the Union Depot in Chicago now being constructed—the sums actually paid for buildings on sites when acquired and the cost of destroying and removing the same. Present and original conditions are ignored. Contrary to fact and contrary to reasonable hypothesis, the ascertainment of reproduction cost is made upon the assumption that the lands, rights of way and terminals would be vacant, unused and cleared off in advance, all ready for construction.

INDUSTRY TRACKS

The tentative valuation in this case omits from the cost of reproduction new and cost of reproduction less depreciation many items of property which are owned or used by the carrier for its purposes as a common carrier. For example, there are omitted 14 miles of main line used by the Texas Midland jointly with the Cotton Belt under an agreement with that company which is the owner thereof subject to the right of the Texas Midland to use the same; passenger facilities at Paris; passenger facilities at Ennis; freight facilities at North Ennis. All of these are used by the Texas Midland in the service of the public under arrangement with other companies, the owners thereof, subject to the rights of the Texas Midland. There are omitted the lands upon which are located practically all of the industry tracks used by the Texas Midland in the service of the public; all telegraph property along the line of the railroad used by the company; materials and supplies; working capital, etc.

That these industrial tracks are *used* by the Texas Midland for railroad purposes cannot be denied. The fact that the railroad company does not own an indefeasible title to these lands, or, if it be a fact, that the owners of the land may terminate the use, is immaterial so far as the inclusion of the same in the inventory required by the valuation act is concerned. Absolute title is not acquired by eminent domain, but that makes no difference in value.

The suggestion to the effect that industrial track right of way land and improvements thereon should be excluded from reproduction cost upon the hypothesis that in reproduction the land will be furnished and the track constructed exactly as they were originally is without foundation and a violation of the act. The act requires that there shall be ascertained the cost of reproduction new in detail of each piece of property owned or used. It does not make any difference who paid for it or whether it was paid for at all.

There is no ground for excluding from the inventory donated right of way or terminal land, or grading, buildings or other improvements donated to the carrier by the public or by individuals as an inducement for the completion and operation of the railroad. The original cost and financial history report will disclose the facts as to the original expenditure. There must be reported the original cost, the cost of reproduction new and the cost of reproduction less depreciation of *the thing*, i. e., in detail as to each item of property, that is *owned or used* by the carrier for its purposes as such.

The suggestion that the *carrier* has not devoted such property to public use is without foundation. It is used by the carrier in the public service. The fact, if it be a fact, that some or all of the elements have been donated by individuals, municipalities, the state, or the nation cuts no figure. The act expressly provides for the inclusion of donated items together with the value thereof at the time of the gift and at the present time. This commission held in the *Car Spotting Case* that these tracks are terminals of the carrier. The carrier is bound to use them in the public service.

The rules laid down by the director are plainly in violation of the valuation act. This act requires the inventory to include in detail each piece of property *owned or used* by the carrier for its purposes as such. The director makes ownership the test. He reads the phrase "owned or used" as if it read "owned *and* used." Attempt is made to excuse or justify this disregard of the plain language of the act by the suggestion that the carrier has no such interest in the land as to make that the basis of a *claim for earnings*. But the basis of rates is not involved. Non-carrier property is required to be included in the valuation.

The director is inconsistent. He holds that the act does not require value to be found. He holds that the exact terms of the act as to inventory, reproduction cost, etc., must be followed. He then disregards the plain language of the act which requires each piece of *owned or used* property in detail to be included in the inventory and the reproduction cost thereof to be shown, and which provides that the present value in detail of all of the owned or used lands, *rights of way* and terminals must be ascertained and included.

All the attempted justifications or reasons for omitting industrial tracks rest upon the assumption that the sole purpose of the valuation act is to produce a figure called value for rate making. This assumption is contrary to the fact.

The director described value for a rate base to be "that sum upon which * * * a fair return should be permitted" He denies that this is the *value* of the property as value has always been understood by economists. He says that, as a member of the Interstate Commerce Commission in recommending that Congress provide for a valuation of railroad property, he understood "that a valuation in dollars of the property as a whole was called for"; that Congress "understood that it provided for a statement of the value of the properties dealt with in money," and that the act "was so accepted by the country at large." He now appears to distinguish between the value of the railroad property of the carrier as a whole and "an ultimate value for rate-making purposes." But the reports and recommendations of the commission in which he joined, set forth the reasons why the commission wanted the valuation which it recommended the Congress to provide for:

- (a) To obtain a trustworthy estimate of the relation existing between the present worth of railroad property and its cost to its proprietors;
- (b) In determining whether rates as fixed by the government are confiscatory;
- (c) In connection with railway taxation;
- (d) In the ascertainment of a proper depreciation reserve;

(e) In testing the accuracy of the balance sheets of the carriers;

(f) To the organization of railway statistics in general;

(g) In determining whether the railroads are under or over-capitalized.

The language of the act and its legislative history show that the purpose of valuation is not limited to rates. Value in rate confiscation cases is the same as in condemnation cases. There is no foundation for the assumption that value depends upon the purpose of the appraisal. Any such assumption would leave us without guide. It would substitute the personal conceptions of the appraiser as to right and wrong in each particular case for the well settled principles of law which guide the judicial determination of value.

Even if the sole purpose of the act were to produce a figure for rate making purposes, industrial tracks would have to be included. Governmental authority cannot compel a carrier to use property for the service of the public, and withhold just compensation because the utility has less than the full title or no title.

PROPERTY USED JOINTLY WITH OWNER

As to property used *jointly with the owner* the positions indicated by the director's memorandum may briefly be stated as follows:

(1) While holding that *value* is not required to be found, it is conceded that the proceedings under the valuation act are for the purposes of valuation, and that sometime this commission or some other tribunal may or can use the facts found and reported for the purposes of ascertaining the value of the property owned or used by every common carrier. "The purpose has been to *value* all common carrier railroad property once and but once."

(2) Property jointly owned by two or more railroad companies is inventoried in the valuation of each.

(3) Property owned by one railroad company and exclusively used by another is inventoried to the owner but it also appears in the inventory of the user.

(4) Property owned and used by one railroad company which by lease or other contract arrangement grants joint use to another is inventoried to the owner and classified as owned and used by the owner. Reference is made to the fact that it is used by the lessee but the valuation of the latter omits all consideration of the same.

Under the above stated rule (2), certain railroad facilities jointly owned and used by the Texas Midland and one or more other railroad companies is included in the inventory and the cost of reproduction new and cost of reproduction less depreciation is shown and ownership is shown. The cost figures are divided by the number of owners. The same facilities will in the same way be included in the inventories of each of the other owners. *The director does not claim that this involves any duplication.*

Under the last mentioned rule there have been excluded from the valuation of the Texas Midland 13.97 miles of the main line, a passenger station at Paris, a passenger station at Ennis, and certain freight terminals at Ennis. Each of these jointly used properties is covered by a lease from the owner to the Texas Midland, and that company has property rights to and ownership in each of the same and uses the same in the service of the public for its purposes as a common carrier.

The valuation act requires the commission to investigate, ascertain and report the value of all the property owned or used by every common carrier. It requires the commission to make an inventory which shall list the same in detail according to the prescribed classification of accounts. It requires as to each piece of property owned or used for carrier purposes that there shall be reported in detail the original cost to date, the cost of reproduction new and the

cost of reproduction less depreciation. It requires that there shall be reported the present value of the lands, *rights of way* and terminals owned or used by every common carrier for its purposes as a common carrier.

Each of the jointly used properties in question is admittedly used by the Texas Midland for carrier purposes and under the plain language of the law must be included in detail, in the inventory and valuation. When details are stated in one inventory inclusion in the other inventory or inventories may be made by reference.

We insist that a *reporting of the facts* involves no duplication. There is no more ground for claiming that the report we here insist upon would be a duplication than there is for claiming that the director's methods for the handling of jointly owned property and property owned by a railroad company but used exclusively by another involves duplication.

We insist that there is no reason why property used jointly with the owner should not in valuation be shown in the inventory in the same manner as the director indicates for the treatment of jointly owned property and property owned by one railroad company and used exclusively by another. *No duplication is, or would be, involved.* The extent of the use of each railroad jointly using such a facility can easily be determined. The extent of the use of the Texas Midland is admitted by written stipulation in this case as to each of these joint items. The director's point to the effect that it is not possible to define the extent of the use in such cases has no application here, and we think is without merit in any case. No additional expense will be involved. The property in question must be listed in detail, the cost figures must be shown. When this has been done and the figures have been included in one inventory reference thereto is all that is necessary in the inventories of other joint users.

APPRECIATION

Appreciation comes with the lapse of time and use. It is an increase in worth due to an intrinsic physical improvement over and above what the same property item or element would be if new. It may be produced by labor, or it may result from the work of nature, or both. It is found in the roadbed, embankments, slopes or other parts of the property. As we understand the director's memorandum on this subject he agrees with us. It is a part of his platform, reiterated in different forms and places, that the act requires a statement in some form of every fact which might have a bearing upon the final value of these properties.

The Texas Midland Railroad has at all times been properly maintained, and on valuation date it was in proper condition for the service it is required to perform. The evidence establishes the fact that appreciation existed on valuation date in a large amount. Upon the undisputed testimony of all witnesses it could not be less than \$61,000 and the evidence justifies a much higher amount. As it is admitted that appreciation exists and should be included, and, as there is no contradiction of this testimony, we insist that the same should be allowed.

Some of the causes from which appreciation results are set forth in the director's memorandum. For a long time after the construction of a railroad the grading and other items of the way are worth much less than the same would be in the solidified and stable condition which results by use, lapse of time and proper maintenance. During this period the cost of maintenance is excessive in comparison with what the same would be if appreciation had matured. Some of the appreciation results from the expenditure of money for labor, and some results from other causes. The excess work necessarily performed during the initial period is properly *deferred construction work* and the expense thereof properly should be charged to cost of road. But so

far as the ascertainment of the value of the property is concerned, it is immaterial to what account the charges for such labor have been made, or ought properly to be made; it makes no difference whether the improved condition and the enhancement of value result from the performance of labor or by the mere lapse of time and use. Every element of value must be included. It makes no difference whether the same was paid for at excessive, moderate or too low prices or at all; the source of the fund from which the payments were made is immaterial. If an element of value exists, it belongs to the carrier and must be included and reported. As stated by the director, the Congress intended " * * * to provide for the statement in some form of every fact which might have a bearing upon the final value of these properties." At the time of the passage of this act it had long been settled in valuation practice that the replacement method involved the ascertainment of the cost of reproduction plus appreciation, if any, and less depreciation, if any. As shown by the director the Supreme Court of the United States has said that appreciation should be added.

The director suggests that appreciation is due to the action of nature, not to any extent to what the carrier has done; that the efforts of the carrier have only replaced the depreciation, so to speak, upon the outside; that they have simply kept good the form of the property without having increased or improved it. It is suggested that under the present rules of the commission these expenditures are chargeable to operation and that they do not represent any addition to the property itself which is a capital charge. It is suggested that appreciation has not been produced by any act of the carrier and that it has not involved any expenditure of money upon the part of the carrier. It is suggested that the cost of appreciation, which was paid for, is contributed by the public.

We do not understand that the director makes the foregoing and other like suggestions in support of a contention that appreciation when found to exist should not be allowed. We do not understand that he claims that in this valuation a foundation should be laid for the omission of any property or element of value, either in rate cases or in condemnation cases. It is true that some elements of appreciation result from the action of nature and from the use of the railroad and that other elements of appreciation result from the expenditure of money in properly maintaining the railroad. The accounting rules of the commission do not relate to value. They merely prescribe the manner and form of keeping certain parts of the cost of railroad property, and cost (not value) is recorded whether such cost exceeds or is less than value. If, in order to obey the valuation act, it shall become necessary to modify the accounting or other rules of the commission, then they must be changed. If there shall be found any inconsistency between these rules and the act of Congress, the latter must prevail. Even if all the appreciation on an entire railroad system was paid for out of the earnings of a carrier, it belongs to the carrier and must be included in the valuation.

The testimony of the carriers introduced on the general subject of appreciation not only demonstrated—as is now conceded—that appreciation exists but it also points to a method which properly may be used as a guide to ascertain the amount thereof. The evidence showed a comparison of the labor cost of maintenance of a new line before the property had appreciated with the corresponding cost of lines of varying ages, some of which were forty years old. The nature of the problem does not permit determination with mathematical exactness. Doubtless, it is true that the value of such comparisons will vary as the lines compared differ in characteristics affecting the matter. The director's criticism is *verbally* true to the extent that the figures introduced by the carrier's witnesses do not measure with mathematical exactness the amount of existing depreciation,

but, if it be intended thereby to suggest that proof of that kind is not pertinent and may not be used as a guide to arrive at the truth, the criticism is without foundation and violates common sense and rules usually employed to ascertain value and other facts which are not capable of determination with arithmetical exactness, as pointed out by the language of the Supreme Court above quoted.

We agree with the statement of the director to the effect that it was the evident intention of the framers of this act to provide for the *statement in some form of every fact which might have a bearing upon the final value of these properties*, and that it was the plain intent that the condition of the property at the date of the valuation be shown. We insist that the reservation by the commission of the analysis of methods, required by paragraph "Second" of the act to be made and reported, until after conclusion of the final hearing on the carrier's protest is contrary to the plain provisions and intent of the act, and is without any justification whatsoever. In the absence of protest, the tentative valuation becomes final by the mere lapse of time. It follows that the tentative valuation should be in form and substance the same as the final valuation. No one has ever suggested a reason founded upon justice or convenience for withholding from the carrier the methods employed to ascertain the "costs" of its property. An orderly compliance with the act requires that methods be first adopted. They necessarily affect the result. The tentative report should be in such form as to furnish an opportunity for the carrier at final hearing to discuss the propriety of the methods employed by the commission in making the tentative valuation. The ultimate value conclusion depends upon evidentiary facts and findings which must be disclosed in detail. The final value required to be reported is not like a verdict of a jury concerning the manner of reaching which no inquiry is permitted; the act specifically requires full disclosure of facts, methods and reasons involved in reaching final value, and this is to furnish to the carrier and others the means by which the final conclusion may be tested.

We contend that the evidence which is uncontradicted abundantly sustains the claim of the Texas Midland that at least \$61,000 should be included on account of appreciation. If for any reason the commission shall be of opinion that the evidence, though uncontradicted, is not sufficiently specific and certain to enable the commission to find a definite sum, then there should be further investigation. This, as we understand, is in harmony with the suggestion of the director.

DEPRECIATION

In dealing with "Depreciation" in his memorandum, the director of valuation reaches the conclusion that such parts of the property as rails, ties and the like, even when maintained by proper renewals in a state of 100 per cent efficiency, must be regarded as being depreciated 50 per cent. Hence, in determining the capital invested as represented by the cost of reproduction less depreciation, one-half of the capital expended for such parts of a railroad property as the rails, ties, etc., must be deducted, leaving as the value of the property thus determined, that is, the amount upon which a fair return may be earned or the amount which must be paid in case the government takes the property, a sum equal to only one-half of the capital outlay for such rails, ties, etc. This means the loss to investors in railroad property of millions upon millions, admittedly a part of the capital actually and necessarily expended in the production of the property, and would have to be expended in its reproduction. The obvious injustice of such a result is sought to be justified or palliated on the assumption that at some time in the early history of the railroad, before this 50 per cent of the amount expended for these so-called perishable items had disappeared, the railroad received in earnings from the

shippers of this early period, not only enough to pay a return on the investment in such items and the expenses, including necessary replacements or renewals, but in addition enough to reimburse it for one-half of the capital outlay for such items. In other words, although these early shippers have properly been charged enough to make all necessary repairs and replacements, it is assumed that they also unjustly have been charged enough to return half the original investment in these items and consequently that present shippers should be required to pay a return on only one-half of this portion of the original investment. It would be interesting to know upon what reasoning the director reached the conclusion that it was necessary or proper for a railroad to compel past shippers to purchase, as it were, one-half of the slowly perishable portions of the property for the benefit of future shippers.

CONTINGENCIES

The conclusion of the director is that no general overhead charge should be made on account of contingencies, but that any allowance of that kind which ought to be made should be taken care of in connection with particular items. The particular items referred to in the memorandum apply: To buildings on account of contingencies or contractor's profit, or both; to cover that element of uncertainty which exists in every estimate; to work in connection with grading not embraced in the contract price; to changes of highway and construction of a ditch off the right of way, etc.; to damaged embankments after completion by the contractor and acceptance by the railroad.

The memorandum says, " * * * No allowance has been made for contingencies, as such, * * * in the tentative valuation of the Texas Midland * * *." The tentative valuation does not state that any allowance whatever has been made for contingencies. The methods employed are not disclosed by the tentative valuation in this respect. It does not appear from the tentative valuation or the evidence offered by the division how much, if anything, has been included in unit prices, or any item, to cover the element of contingencies. General statements have been made to the effect that while contingencies *as such* have not been allowed the same have been taken into account in unit prices. We insist,—and we understand the director has agreed with us upon this point,—that proper practice requires that it should be made plainly to appear whether or not anything whatever is allowed in any account to cover contingencies, and, if any allowance is made, the amount thereof should be disclosed. The methods employed must be reported. They should not now be withheld. Mr. Worley testified, that it is the valuation practice in estimating reproduction cost to allow for contingencies, and that the amounts so allowed range from 5 to 10 or even greater percentages. The director's memorandum in substance so admits. But, contrary to the established practice and the proof, the director recommends that no allowance for contingencies be made, excepting in the instances above referred to.

The Texas Midland,—as is the case with a majority of the railroads,—was constructed a number of years ago and the records of the construction work are incomplete. Because of this, as we understand, a survey and a re-measurement was decided to be necessary by the commission in order to ascertain reproduction cost. The question here involved is whether, as a practical matter, the quantities and character of the work involved in the roadbed and other important elements of the property can be determined with such accuracy that no allowances are necessary to cover the elements of uncertainty necessarily attending the work. A reproduction estimate based upon complete maps, profiles, original cross-sections, and construction records presents a case quite different from such an estimate based upon present inspection and a survey of the roadbed without the aid

of such records. The original ground surface cannot be determined with accuracy by mere field work, nor can the amount of subsidence of such surface or shrinkage of materials. The dimensions of masonry under ground are often unknown and the foundation features hidden. Concealed drainage and *many items of work* will be overlooked or not recognized as being a necessary part of the cost of building the railroad.

The director's conclusion rests upon mere assertion that government valuation engineers are able to find and do find 100 per cent of existing quantities, and can foresee and do in fact take into account, 100 per cent of the unknowable facts, conditions, difficulties, accidents, disasters, delays, and lack of co-ordination which necessarily attend the construction of every railroad. This is contrary to experience and established practice. State commissions, valuation engineers and appraisers of the greatest ability make appropriate overhead allowances to cover contingencies.

ENGINEERING

The director does not claim that the original cost of engineering of this property has been or can be shown. The tentative valuation reports that original cost to date cannot be found. When the railroad was built there was no prescribed classification of accounts. As we understand the director, he holds that the original cost to date of engineering, even if that could be shown with accuracy, should not control or measure the cost of engineering to be included in the cost of reproduction. The tentative valuation allows \$54,926 to cover engineering. This is about 2½ per cent of the road accounts excepting engineering and land. The railroad is relatively simple and cheap. It is generally conceded as true that in cases where construction is relatively inexpensive the *percentage* of engineering cost to the total of the road accounts, excepting engineering and land, should be relatively high. The amount fixed in this tentative valuation is approximately the lowest per cent that the member of the engineering board in charge of the work is authorized to apply without specific authority from Washington. No reason is given why the general rule that the lower the cost the higher the engineering *per cent* does not apply here.

The director defines two methods of arriving at the amount properly allowable to cover the cost of engineering. These are defined as the *synthetical* and the *historical*. The *synthetical* method is similar to the reproduction method of estimating costs of construction. When based upon exact knowledge of the work required and practical experience in doing similar work, it is reliable. The estimate made by Mr. Newton was of this character.

The opinion or percentage method, with certain qualifications, is the method now employed by the division of valuation. Although the director refers to this method as the "*historical method*," or one in which the cost of reproduction is based upon the experience of the past as shown by construction records, an examination of this method makes manifest the impropriety of that designation.

The percentage used by the division of valuation is only slightly above what the records of the carrier show. These records undoubtedly are not complete. The extension was built in a year when the financial conditions in Texas were worse than at any time in its history, and the costs of work at that time are no criterion of reproduction costs. Nothing is known as to the accuracy of the costs shown by the Texas Central records.

GENERAL EXPENDITURES

It is quite apparent that the group of accounts included under the head of "General expenditures" did not receive proper attention. The director's memorandum says, "The member of the engineering board in preparing his report upon the Texas Midland has distributed general expendi-

tures over the different accounts, allowing a certain amount for each account." The director concedes that "it does not appear upon what basis the allowances were made by the member of the engineering board, * * *." The indefinite—and so far as appears the arbitrary—method of fixing these figures is illustrated by the language of the engineering report. For example, as to Account 71—Organization expenses, it is said: "Under this account was included a charter fee, as required by the statutes of the state of Texas, and a few other incidental expenses."

As to Account 72—General officers and clerks, it is said: "An estimate was made of the necessary executive and general officials, clerks and their expenses, necessary to the construction of the property."

As to Account 73—Law, it is said: "Under this account has been included the necessary legal expense, including clerks, stenographers, office rent, and other expenses incidental thereto. Nothing has been included in this account covering the expense of the acquisition of lands or right of way."

As to Account 75—Taxes, there was allowed an amount "equal to one-fourth of the total amount of taxes paid by the Texas Midland during the year 1914." Mr. Worley, member of the engineering board, did not depreciate organization expenses, general officers and clerks, or law, but does depreciate taxes. The director does not appear to support the tentative valuation in this respect as in the memorandum it appears that he favors depreciating the whole group. This group of accounts in the tentative valuation in this case well illustrates the disregard of that provision of the valuation act which provides that there shall be "an analysis of the methods by which these several costs are obtained, * * *."

The language of the act upon this point is plain. No one denies that the methods employed are required to be stated in detail, *i. e.*, "an analysis" of methods must be made. If methods were considered and settled in advance, they are not disclosed in the tentative valuation. The Texas Midland claims that the tentative valuation should report the methods employed in the valuation of its property and that it has a right at the final hearing to test the reported figures by the principles adopted and methods employed. We have never heard any reason why the tentative valuation and report should omit a statement of the methods employed to make it.

COST OF OBTAINING MONEY

It will be observed that the discussion in this chapter of the director's memorandum is not confined to interest during construction as that account is defined in the classification. It is the cost of obtaining the money which includes not only the items of expenditure specified in the definition of the account "interest during construction," but also includes the cost of obtaining the money, such as syndicating, banking and other expenditures not included in the interest account. It does not appear to be claimed by the director that *any facts in the Texas Midland case* would justify the suggestion contained in paragraph 2 that one-half of one per cent., or that one per cent., would cover the brokerage charge or the cost of commissions, syndicating, banking, etc.

The assumption that the credit of the Texas Midland is or would be good enough to enable it to borrow money to build its railroad or to extend its existing road upon a six per cent basis is without foundation in fact.

But even assuming as a basis for the estimate that the credit of all companies is *good and the same*, six per cent is too low a rate of interest to cover not only interest but the entire "cost of obtaining the money" including commissions, syndicating, banking and other expenses.

The Texas Midland claims that the rate of interest on any reasonable assumption of facts *applicable to its situation* should not be less than eight per cent and that in addition

thereto it would have to pay commissions covering syndicating, banking and other expenses of at least one per cent.

CONSTRUCTION PERIOD

The question of what should be the length of the assumed construction period is entirely a question of engineering fact. Its decision depends upon the peculiar facts of the particular case. The record discloses no detailed study on the part of government engineers. The testimony of Mr. Worley shows that he had given no study to the determination of the program of construction, and that he had no definite idea of any necessity of investigation of the problem or of its influences upon interest, other general expenditures, unit prices, etc. He showed a lack of familiarity with practical questions which are determinative of the period which should be assumed.

The carrier called two witnesses who had studied this question from the practical standpoint of Texas Midland conditions. Mr. Holbrook's testimony shows a very careful analysis based upon intimate knowledge of local conditions and proves very conclusively that the length of the assumed construction period has an important influence upon unit prices. This is true because rush jobs cost more and haste increases the risk. If time is short bids will be higher. Mr. Holbrook was of the opinion that 24 months would be required for the actual construction of the property. This study is based upon a personal reconnaissance and survey of several lines in Texas, three of which either crossed the Texas Midland or were in the immediate vicinity.

An analysis of the same problem was made by Mr. Newton. His analysis developed the necessity of a construction program contemplating a construction period of 28 months preceded by a four months' period for preliminary surveys and contemplated that 75 per cent, of the ballasting would be done subsequently. The testimony of Mr. Holbrook and Mr. Newton is harmonious. It is based upon the same sort of analysis and experience and is not contradicted. The record shows conclusively that the particular facts involved in the problem on the Texas Midland was not studied by the government engineers. As there is no supported opinion in opposition to the reasonable and well sustained testimony of Messrs. Holbrook and Newton, their views should be adopted and the tentative valuation should be changed accordingly.

INTEREST DURING CONSTRUCTION

The director's memorandum in substance admits that the valuation act requires that the present cost of procuring the right of way be ascertained and reported as part of the reproduction cost of the railroad. This has not been done or attempted in the Texas Midland case. As shown by exhibit introduced in connection with the testimony of Mr. Newton by far the largest part of the expenditure for lands, rights of way and terminals will be made in advance of the commencement of actual construction. It follows as a matter of course that the moneys so expended must be in readiness in advance of the need therefor, and that the same will bear interest during a relatively long period of time. The exhibits introduced in connection with the testimony of Mr. Brown, the commission's accountant, bearing upon the rate of expenditure of money in railroad construction, omitted land costs from consideration. As the amount of such expenditures is sometimes as high as 20 or more per cent of the total, this omission renders the Brown exhibits of little, if any, importance so far as interest during construction is concerned.

The director's suggestion that the allowance in the Texas Midland case of \$144,691 be increased to \$166,728 excludes all allowance of interest on account of expenditures for land. The cost of reproduction must include the present cost of acquisition of lands. Interest thereon must be included.

After further consideration by the division it is concluded

that interest at six per cent for one-half the period produces too low an amount. As we understand it, the director's memorandum suggests that an additional three months be allowed.

Heretofore we pointed out that the testimony of Messrs. Holbrook and Newton in this case shows that the construction period allowed by Mr. Worley—4 months for preliminary work and 14 months for construction—is too short; that the period supported by Messrs. Newton and Holbrook is sustained; that the testimony of Mr. Newton as to the percentage of the total amount which would be expended in each period is uncontradicted; that the same shows—as now appears to be admitted by the director—that one-half of the construction period is too short to be used as a basis for calculating interest at six per cent on the entire sum, and that the amount properly allowable therefor is in excess of interest on the entire sum for two-thirds of the construction period. In the light of these facts we contend that, if any rule for general application is now to be stated, it should be that interest on the entire sum at an appropriate rate should be calculated for at least two-thirds of the entire construction period.

The original cost of the Texas Midland lands as reported in the tentative valuation is incomplete. The land was acquired long ago. Since then the lands along the line of the Texas Midland have greatly increased in value. In this case, original cost at time of construction is so much less than present value that it is not an important indication or item of evidence. It is now quite impossible, we think, to divide the total original cost so as to show separately the so-called "acreage value" at the time of acquisition, or the cost in excess of the same. The suggestion of the director to the effect that the multiplier disclosed by actual purchase at time of construction would be applicable now is without foundation. Conditions have changed.

In the tentative valuation no attempt was made to show the cost of acquiring the lands, rights of way and terminals of the Texas Midland at the present time. The carrier's proof in the case establishes it. There is no conflict in the evidence as to the proper ratio or multiple. There is conflict in the evidence bearing upon the naked land value of adjacent and adjoining lands—the basic figure. If a multiple of 2.23 be applied to the basic figure reported in the tentative valuation for the lands classified by the division as used for transportation purposes there will be produced \$527,816. If applied to the figures which the carrier's testimony supports there will be produced \$628,474.

Present value is at least as much as such present cost of acquisition.

OTHER VALUES AND ELEMENTS OF VALUE

As to other values and elements of value the tentative valuation fails to comply with the law. The commission is directed,

"* * * The commission shall in like manner ascertain and report separately other values, and elements of value, if any, of the property of such common carrier, and an analysis of the methods of valuation employed, and of the reasons for any differences between any such value, and each of the foregoing cost values."

This important matter is treated in the tentative valuation in the following words: "No other values or elements of value were found to exist." We do not know what meaning that statement is intended to convey. It is plain that the law requires these "intangibles" to be ascertained and reported. They must be considered in the ascertainment of final value.

The director suggests that no evidence was offered by the carrier upon this point. We are sure that he will agree that as to these other values and elements of value it is as much the duty of the commission to investigate and ascertain the facts as it is to inventory the physical property in detail and show the several costs thereof as required.

The commission has before it all of the facts referred to in the tentative valuation. These include the inventory, the cost figures, the land figures, the financial history, the traffic statistics, the net and gross earnings in detail, the expenditure of moneys, etc. The gradients, the station facilities, its connections, its sources of traffic, together with the growth thereof as shown by the regular reports of the company are known or are available. The amount of intangible value fixed by Texas for the purpose of taxation is shown. This great mass of information furnishes a sufficient basis of fact for the determination of the value of the properties of the Texas Midland as a whole. The commission has quite as complete information as usually is furnished to the courts in confiscation cases involving the value of railroad properties.

The Texas Midland is a small and simple property. It has no valuation department. It would have been proper for it to call witnesses experienced and expert in the ascertainment of the value of railroads. The commission also had the right to avail itself of the services of like experts or to determine the fact without such aid. It cannot be said that the value of the Texas Midland property cannot be ascertained on the facts now in the possession of the commission, without the aid of expert witnesses. That value, while a unit and single in substance, may, for the purposes of thought and discussion, be divided between that which is attributable to the tangible or physical property and that which is attributable to the intangible or non-physical property, i. e., other values and elements of value. There is no denying that the act requires other values and elements of value to be found. This may be done by first ascertaining the value of the property as a whole and by deducting therefrom the amount which the commission finds should be attributed to the tangible or physical elements thereof.

The commission is now engaged under the act in ascertaining the value of all the railroads in the country. The Texas Midland is of minor importance. The difficulties of the problem before the commission are great. We have always contended,—as said by the director,—that neither this railroad nor any of the other railroads whose tentative valuations are on hearing before the commission present the phases of the subject of valuation which should be before the commission before it lays down any rule for the determination of a final value. Under the circumstances the commission should defer the determination of the other values and elements of value in this case until right principles shall have been found upon a full consideration of a sufficient number of typical railroads.

COAL MINE PRODUCTION SHOWS A NET DECREASE

In discussing the general need of fuel conservation in the boiler rooms, Van H. Manning, director of the Bureau of Mines, Department of the Interior, has issued the following statement:

There is one phase of the present coal situation which may put an entirely different light on the supposed increased production of coal of the present year. In round numbers, there was produced 600,000,000 tons of fuel last year. The statement has been made that 50,000,000 more tons will be mined this year. The preparation of this increased quantity of coal has not been as good as in times past. Analyses of samples show in many cases a greatly increased quantity of ash. Repeated cases are brought to the attention of the Bureau of Mines where coal which would run from 6 to 8 per cent ash in normal times is running from 12 to 18 per cent of ash in these abnormal times. Complaint about the preparation of coal is very general and it is not at all improbable that 5 per cent more ash is included in this year's coal than in previous years. If such a figure is true, it

means that 32,500,000 tons of the estimated output of 650,000,000 tons is nothing but increased ash.

If we can imagine over 600,000 car loads of ash being added to the present burden of transportation, the evident effect on car supply and transportation troubles would be seen. If this were the end of the matter, it would not be so bad, but there is another factor well known to engineers which is apt to be overlooked by the non-technical user. The extensive experiments carried on by the Government at the St. Louis Exposition showed that with the coals used, there was a decrease of about $1\frac{1}{2}$ per cent in efficiency for each 1 per cent addition to the ash content of the coal—that is to say, the inclusion of more ash with the coal decreases the value of the fuel not only the amount equal to the useless ash, but it makes the remaining good coal less effective to the extent of $1\frac{1}{2}$ per cent for each 1 per cent of ash. The inclusion of 5 per cent more ash in the fuel, therefore, means a reduction in efficiency of the remaining good coal of about $7\frac{1}{2}$ per cent, which, added to the 5 per cent useless ash, makes a total reduction in effectiveness of $12\frac{1}{2}$ per cent.

According to this point of view, although 650,000,000 tons may be produced in 1917, its effectiveness as compared with previous years is probably about seven-eighths of this, and equivalent to a production of normally prepared coal of about 570,000,000 tons. We have, then, instead of an increased production as compared with last year, an actual decrease of effective coal of about 30,000,000 tons. If this is added to the estimated increased needs, due to our accelerated activities, of 100,000,000 tons, we have a deficiency of the equivalent of 130,000,000 tons, instead of 50,000,000 tons to make up by good engineering and true fuel conservation in the boiler room.

SUPPLIES FOR AN ARMY OF ONE MILLION

The amount of freight transportation involved in furnishing supplies to an army of 1,000,000 men is described in a paper read before the war class of Columbia University

recently by Major Robert E. Shannon of the United States Army Quartermaster's Corps.

"For an army of one million men," he stated, "based on the regular United States garrison ration, it will be necessary to transport 26,700,000 lb. of beef or its equivalent in substitutive articles of the ration, per month; 6,750,000 lb. of bacon, 26,700,000 lb. of flour, 37,500,000 lb. of potatoes, 4,500,000 lb. of beans, 2,093,000 lb. of coffee and 6,000,000 lb. of sugar, or if we consider all the articles that go to make up the ration, to transport food alone for an army of 1,000,000 men, for one month, will require tonnage for 146,000,000 lb.—and to feed the horses and mules of this army of 1,000,000 will require the transportation of nearly 260,000,000 lb. of forage per month. When we consider the matter of clothing, to keep this army properly clothed, will require in round figures, per month, 300,000 pairs of breeches, 300,000 overalls, 300,000 shirts, 400,000 pairs of shoes, and 250,000 suits of underwear, to say nothing of the coats, overcoats, rubber boots, blankets, socks, hats and other articles that go to make the clothing allowance of the soldier."

EXPORTS OF RAILROAD EQUIPMENT IN OCTOBER.—The principal articles of railroad equipment exported from the port of New York during October, 1917, according to a bulletin of the National City Bank of New York, were steam locomotives valued at \$3,463,336; steel rails, at \$1,278,021; freight cars at \$785,783; and railroad spikes, at \$227,592.

ENGLAND ENCOURAGES TRUCK TRANSPORTATION.—In view of the shortage of petrol and the necessity of relieving the traffic on railways, it has become necessary that all privately owned lorries and steam trucks should be utilized to their fullest carrying capacity, and accordingly the transport section of the Ministry of Munitions has arranged a scheme of mechanical transport control to cover the West Riding of Yorkshire, which began operation on November 12. The object of the scheme is to provide loads for empty journeys that lorries are at present running and loads for lorries not fully employed within a radius of 20 miles of loading point.

Fuel Records on the Baltimore & Ohio

Methods for Following the Individual Performance of
Locomotives on a Road Having a Divisional Organization

By W. L. Robinson

Supervisor Fuel Consumption, Baltimore & Ohio

FUEL economy has now assumed an even greater degree of importance than it has ordinarily held. The United States Chamber of Commerce, co-operating with the Council of National Defense, he said: "Coal is the sinew of war, and he who unnecessarily reduces the country's available stock of coal may curtail the nation's energies in the great industrial conflict." A successful war implies supremacy in the industries on which it is based, and coal is the very root and foundation of war-time industry. Every pound that can be obtained is urgently needed for domestic and manufacturing purposes, for making munitions, for steam vessels and for railways; all directly or indirectly necessary to carry on and win the war.

Fuel economy has long been considered a mechanical problem and little supervision has been given the subject on many roads by officers other than those of this department. Recently, however, a more general recognition of this as a transportation problem has been noted, particularly in the meetings of the International Railway Fuel Association. The sooner all departments of a railway recognize their relation to fuel consumption, the sooner will progress be made in reducing admitted wastage, for fuel losses occur at all stages from purchase, inspection, distribution and utilization, right down to cleaning fire on the ash track. The largest losses, however, occur under the jurisdiction of the mechanical and transportation departments.

The human element is a large factor in fuel economy. A man will react to his environment, and where a commodity like coal is handled as if it were sand, ballast or dirt, and in such large quantities, he will come to consider economy of small importance. This is very well illustrated by the difference in handling wage and fuel accounts; every care and check is thrown around wage accounting, while on most roads the basis of fuel accounting originates with the lowly coal dock man, and fuel accounting finally becomes a matter of adjustments. Any scheme for fuel economy must aim to overcome this condition, to bring about a realization of the actual dollars and cents value of coal, both by the men and by the officers.

For the purpose of familiarizing and educating all concerned regarding the value of fuel, the Baltimore & Ohio distributes monthly statements, both in tabulated and graphic form, showing the total consumption and consumption on an amount-of-work basis. This information is sent to all executive and operating, and to division staff officers.

These statements show the performance of locomotives in freight and passenger service by months and by divisions, with totals for the entire road; the amount of fuel used on the entire system by months; the total cost of the fuel distributed by months; and the average cost of fuel per ton by months. On the fuel performance statement each division is rated according to the percentage increase in gross ton-miles per ton of coal over the same month of last year, in freight service, and the percentage decrease in pounds of coal per car-miles over the same month last year, in passenger service. These statements also show cost of the fuel saved or lost for each division. The chart showing the average cost of fuel per ton by months is particularly interesting. There has been a gradual increase in this cost from a little less than one

dollar per ton in June, 1916, to \$2.40 per ton in August, 1917, or an increase of 140 per cent.

Active interest shown by supervision and an intelligent use of reports is an unfailing method for securing co-operation in matters affecting fuel economy. This is illustrated in the case of a superintendent who reduced his percentage of locomotives with leaking packings, valves out of tram, and poor steaming qualities to an almost negligible amount, by the simple procedure of giving his master mechanic periodically a list of defective locomotives taken from regular reports and asking to be informed as soon as the repairs were made.

Standardized methods of firing and operating locomotives with systematic instructions are necessary accompaniments of fuel economy. The Baltimore & Ohio has issued a text book for engineers and firemen on locomotive management, called "Good Firing." This book contains instructions which will help the fireman in properly firing the locomotives. Enough of the scientific theory of good firing is given so that the fireman may have a rudimentary idea of what he is trying to accomplish and what it means. In addition to this there are instructions to engineers, fuel standards, instructions for the operation of locomotives equipped with superheaters, brick arches and stokers.

The use of the wrong kind of coal, improper preparation and sizing, have a very detrimental effect on fuel economy, as was clearly demonstrated by recent laboratory tests made at the University of Illinois.[†] The effect of proper sizing is not fully appreciated, or if so, is not given the consideration its importance demands. In the tests just referred to a variation in sizing from 1¼-in. screenings to 2-in. lump resulted in an increase in evaporation of 17½ per cent. The same consideration should be given to physical characteristics as to B. t. u. value and length of haul, by those to whom the purchase of railway fuel is intrusted, to obtain the maximum efficiency from the use of coal on grates. The full realization of extended application of apparatus for burning fuel in pulverized form, now so promising, should, however, remove eventually any necessity for considering the sizing.

Poor coal is a formula used to cover a multitude of real sources of inefficiency, but no matter how much it is abused, the fact remains that we do have poor coal which results in a waste of transportation facilities, a waste of fuel, time and money; it causes delays and failures. At present above all others, poor coal is a crying indictment against the coal producers, as it can only have one result—a slackening in the intensive manufacturing production demanded by war necessities. Coal producers can largely remove this industrial impediment by pooling their interests, and then concentrating the labor and energies during the war on mines producing satisfactory fuel. By concentrating for the period of the war on the mines capable of producing the best coal, greater efficiency should be forthcoming due to ability to haul more heat units per cubic foot of coal car carrying capacity, lessened amount of mine labor required and lessened amount of switching.

FUEL ECONOMY RECORDS

It is obvious that before any systematic improvement can be made in reducing fuel consumption, the particular sources

[†]Abstract of a paper presented at the December meeting of the New England Railroad Club.

[‡]See *Railway Age Gazette*, July 13, 1917, page 51.

of waste must be known. Before a general saving can be made, individual economy must be practiced, and the man on the locomotive offers the best opportunity for results in this field. His co-operation is essential for the success of any plan.

The Baltimore & Ohio has in operation a method for reporting daily the amount of fuel used by each engineer, each fireman, and also by each locomotive for every trip made. The fundamental idea consists in giving the supervising officers, particularly the master mechanic and road foreman of engines, positive information regarding specific men or

formance has been made, but if, at the same time, it were known exactly what should have been used on that particular trip the efficiency of the fuel performance would be apparent at once. For the purpose of making such comparisons, fuel standards were established on each division, showing for any trip the amount of fuel which should be used. These fuel standards vary with the class of service, type of power, direction and tonnage. They are not based on any theoretical calculations but on averages of consumptions actually made over a period of six or more months. The reason they are based on averages instead of the best performances, or on

Fig. 1—This Form Is Filled Out on Each Division Every Twenty-four Hours

locomotives where their supervision may be profitably employed. This information reaches the hands of the supervising officers promptly—say one to three days after the completion of the trip—so that while the incidents are fresh in the mind of everyone concerned, the development of bad conditions may be checked and any corrective measures applied. On each division there is a fuel clerk whose sole concern is fuel data. His duties consist in obtaining correct fuel reports, making proper individual charges, and compiling all regular and special reports in an intelligible manner, to be used by the supervising officers.

Form 2520 (Fig. 1) is filled out on each division for the 24-hour period. This form furnishes detail information regarding the fuel consumption for each trip, but since it is also the base of much other statistical data as well as fuel, the information is necessarily profuse, and a busy man is liable to miss the significance of any particular fuel item thereon among the mass of other irrelevant data. For this reason the fuel clerk compiles from this form a résumé of the various items which is a guide to the man in a supervising capacity, and he also makes a study of the individual trips which show the poorest fuel performance and gives detailed information of such trips to the road foreman or the party responsible for fuel economy.

The actual amount of fuel consumed is obtained from daily reports of coal disbursements, Form 2347 (Fig. 2), sent in from each coaling station and engine terminal to the fuel clerk. On the form is listed separately each engine receiving coal, the time and amount for a 24-hour period. The total actual coal used by any locomotive can be quickly determined by totaling the amounts received at each coaling station, this amount then being filled in its proper column on Form 2520 (Fig. 1). It is assumed that each tender is full on leaving its initial terminal, for which reason the amount required to again fill the tender at the final terminal, plus that received at any intermediate stations, will give the total amount used. In case the tender is not filled at either terminal, this is reported on Form 2347 (Fig. 2), giving the amount which would have been required to fill the tender, and necessary corrections are then made by fuel clerk. The inauguration of individual fuel records and standards has required no additional reports or work other than the reports compiled by the fuel clerk himself. The same reports used by the accounting department are used for this work.

A mere knowledge of the actual amount of fuel used is no indication in itself whether a good, average or poor per-

formance has been made, but if, at the same time, it were known exactly what should have been used on that particular trip the efficiency of the fuel performance would be apparent at once. For the purpose of making such comparisons, fuel standards were established on each division, showing for any trip the amount of fuel which should be used. These fuel standards vary with the class of service, type of power, direction and tonnage. They are not based on any theoretical calculations but on averages of consumptions actually made over a period of six or more months. ing up the matter with any crew persistently exceeding the standard. Constant care is exercised to have these fuel standards just, and revisions are made whenever necessary. This because an appeal is made to the competitive spirit

among the men to attain a good fuel performance by publishing their average standing monthly.

With the total fuel consumption, both actual and standard, known and placed on Form 2520 (Fig. 1), the remaining fuel data for each trip (total costs, pounds of coal per 100-ton-mile, cost per 100-ton-mile and fuel performance) are quickly obtained by use of the slide rule. This completes the work on Form 2520, and a summary is next made on Form 1598 (Fig. 3) showing the total fuel costs by the day by classes of service, or such other headings as may be desired for general statistical purposes, and for making divi-

fuel waste appears to have been due to mechanical defects, he ascertains if it has been shown on the work reports and if the repairs have been made. This is beneficial because the crews soon learn that constant supervision is exercised and that every poor fuel performance is noted, and further, because during every month each road foreman has instructed anywhere from 15 to 30 crews in matters affecting fuel economy. It is the slow, conscientious, individual work of this character that achieves beneficial results which are lasting.

Superintendents are busy men, and are more vitally inter-

and Gives Detailed Information Regarding Fuel Consumption for Each Trip

sional and period comparisons. This form also shows the total transportation wage costs for the same headings, and is a daily unobtrusive visitor to the desk of each superintendent, reminding him where any efforts to reduce transportation costs will be most amply rewarded.

A study is next made by the fuel clerk of the individual runs on Form 2520 (Fig. 1), and men with the poorest performance are selected as meriting the attention of the road foreman of engines. It was felt that a road foreman of en-

gested in the kind of a fuel performance their division is making than in what any particular men are making, and for their benefit Form 1509-F (Fig. 4) is next compiled by the fuel clerk from Form 2520 (Fig. 1). Fig. 4 shows the total fuel cost and consumption, both actual and standard, for the day, also the unit consumption actual and standard for the day, accumulative average for the month and for the same period one year previous. This form shows at a glance the divisional fuel performance for the day, whether

gines could not well handle more than one such case, on an average, per day, hence one card, is filled out for each road foreman of engines, showing in detail all information regarding the worst runs made during the day. The cards are small—3 in. by 5 in.—and easily carried in the pocket. The practice is not to call in any man or to cause any antagonism by censure or discipline; but in his daily trips about the division, as he gets on an engine, the road foreman, if he has received a card regarding that particular crew, refreshes his memory from it, and questions or instructs them with a view of correcting the causes of their poor fuel performance. Or he may make it a special point to ride with and instruct the crews so reported. In any event, where the cause of the

it is good or bad, and whether it is getting better or worse. If unsatisfactory, Form 2520 (Fig. 1) will show all the details as to cause and where corrective measures may be applied.

BULLETIN BOARDS

The other feature employed by the use of the fuel standards to attain economy in the use of fuel is the normal desire of the average man to lead in any sport or work involving competition. This is accomplished by publishing on the bulletin boards every month a list of all engineers and firemen on the division ranked in the order of their average fuel performance for that month. This is obtained by keeping

No attempt has been made in inaugurating these fuel standards to separate the fuel consumed at the terminals from that consumed on the road. The error involved in charging the record with the terminal fuel consumption is negligible because the error is practically a constant one, applying to all crews alike, and will not affect the relative standing on which their ratings are based. The ton-mile unit was used in preference to the car-mile unit, on account of the variations existing in car weights.

Fuel standards were originally expressed in pounds of coal per hundred-ton-miles, but these were soon discarded in favor of pounds of coal per trip. Practical use quickly developed the fact that for any given run the total coal used on a trip did not vary greatly, regardless of the tonnage, while, due to the same reason, the pounds of coal per ton mile varied almost directly as the tonnage; thus, to avoid having an excessive number of fuel standards for each run, the standard was made total pounds per trip. Otherwise the engineer was penalized each time he hauled lighter tonnage than average, and it is a measure of his efficiency we are after rather than that of train loading.

The general scheme of fuel records as described covers

that they can be used at the current time, is of more importance in connection with the latter than any fine degree of accuracy.

The success of the methods followed is evidenced by a decreasing or nearly stationary total fuel consumption, against a continually increasing total tonnage handled, as shown in the table. With the tonnage increasing 40.7 per cent the fuel consumption increased only 7.3 per cent. The comparisons are made against the fiscal year ending June 30, 1911, due to the fact that the present organized effort to effect fuel economy was not instituted until the latter part of that fiscal year. The increased size of locomotives, the use of superheaters, changed conditions of fuel and firing by introduction of stoker locomotives, as well as the following up of fuel consumption, have had a bearing on holding down or increasing the consumption, and it is probably not possible to determine definitely the relative values of the various causes.

DISCUSSION.

Henry Bartlett, chief mechanical engineer of the Boston & Maine, called attention to the necessity for everybody co-

for the future; the other, that giving information which can be promptly used in correcting specific irregularities as they develop. The problem of getting these records available, so

operating in the matter of saving fuel. As chairman of a committee appointed to investigate the fuel situation on the Boston & Maine, he found that the engine crews were not the only ones to be educated in the matter of fuel economy. Much depends upon the way the fuel is handled at the coaling stations, on the maintenance of the power, and in the handling of trains by the transportation department.

J. T. Anthony, assistant to the president of the American Arch Company, called particular attention to the necessity of proper supervision in the matter of fuel economy. Fuel-saving devices can be applied to locomotives, but unless the men are instructed properly regarding their use and maintenance, these devices will not fully serve their purpose. Considerable benefit will be obtained by giving the men reading matter on the subject of fuel consumption, with instructions as to how to use it. In view of the general fuel situation it is no longer a question of saving money, but of saving coal.

S. Bisbee, fuel supervisor of the Boston & Albany, favored the competitive method of handling the locomotive fuel problem. In order to obtain the best results from the individual performance sheets, it is very desirable to issue the information promptly. The engine crews should be thoroughly instructed in the principles of proper fuel combustion, and

State Commissioners Before Newlands Committee

Hearings Begun at Washington December 11
Continued This Week; State Authority Defended

CARL D. JACKSON, chairman of the Wisconsin Railroad Commission, on December 12 continued his testimony, reported in part in last week's issue, describing the work of the Wisconsin Commission for the purpose of showing that exclusive federal regulation, as proposed by the railroad, is unnecessary: "If state regulation is to be done away with," he said, "something just as effective must be substituted for it," and he doubted whether the plan of regional federal commissions would be as beneficial to the public and to the railroads as effective state regulation because he thought they would not be so familiar with local conditions.

He admitted that deplorable conflicts between state and interstate rates have arisen, although not in Wisconsin, he said, and that they should not be permitted, but he thought that the courts and the Interstate Commerce Commission have sufficient authority to correct them. For the purpose of avoiding such conflicts he favored the plan recommended by the Interstate Commerce Commission in its annual report, and endorsed at the recent convention of the National Association of Railway and Utilities Commissioners, that the federal commission, without any abdication of federal authority, be expressly authorized by law to co-operate with state commissions in efforts to reconcile upon a single record the conflicts between the state and interstate rates. A proposed bill to carry out the provisions of this recommendation is being prepared by a committee representing the Interstate Commerce Commission and the state commissioners.

In reply to questions asked by Representative Sims, Mr. Jackson said that the policy of forcing railroads to compete, which Congress has followed for 30 years, has been a mistaken one. "I do not think the competitive system is a success," he said, "but that co-operation and co-ordination should be encouraged, and I am not speaking with reference only to war conditions. The competitive system has not brought about good results. It has resulted in unnecessary duplication of facilities and has caused unnecessary expenses. The Interstate Commerce Commission should have power to prevent needless duplication."

Major S. W. Brookhart, of Washington, Iowa, an advocate of government ownership of railroads, testified on December 14, continuing a statement he had begun at a hearing on December 9, last year. Major Brookhart said he had formerly urged government ownership as a policy for peace times on the ground that it would save \$500,000,000 a year because the government can borrow capital at lower interest rates than private corporations, \$300,000,000 in increased value of real estate each year and \$400,000,000 by eliminating the waste of competition, a total of \$1,200,000,000 a year. In time of war, he thought this saving would be increased on the ground that the government can still borrow more cheaply than others, and because the increase in real estate values and in the amount of waste is greater during time of war. "In addition," he said, "war has brought about a crisis which private ownership can never meet. I believe the government will take over the operation of the railroads before the grass grows green, if not before the new year, and that they will never again be surrendered to their owners."

Major Brookhart said he thought a fair way to determine the value of the roads would be to take the average market price of their securities over a period of years, which would probably amount to about \$15,000,000,000.

As an argument for government ownership, Major Brook-

hart contended that both freight rates and passenger rates in this country are the highest in the world. He also said that the government could borrow capital at an interest rate about 1.75 per cent less than what private corporations would have to pay. He described the plan adopted in Great Britain upon its entrance into the war, by which the government took over the control of the roads and guaranteed the net earnings of 1913, but pays no freight rates. The expenses of the railroads are paid from their receipts from commercial traffic, and if a railroad earns more than during the pre-war year it is ordered to pay over the surplus to some railroad whose earnings have been reduced. This plan has been successful, he said, and instead of politics having entered into the railroad management it has been left entirely in the hands of railroad officers.

Charles E. Elmquist, formerly a member of the Minnesota commission and now Washington representative of the National Association of Railway and Utilities Commissioners, indicated that the state commissions are opposed to any plan of government control of railroad operations which would deprive the state commissions of their powers.

"If the state commissions are legislated out of existence," he said, "the only representative the public would have would be the counsel for large corporations, unless some authority were created for the purpose. The state commissions perform important functions as the agents of the shippers of interstate commerce as well as their regulatory functions. If the government takes over the railroads during the war it should only be done by utilizing the organization and experience of the state commissions."

Asked whether the public would be as well served by the creation of regional commissions, subordinate to the Interstate commission, as proposed by the railroads, Mr. Elmquist said that would depend upon the extent of their territorial jurisdiction and whether the commissioners were appointed from the territory or from outside. It would be possible to select commissioners from the territory who would be familiar with local conditions, but if the territory were made too large the plan would defeat its purpose, he said.

Ira B. Mills, chairman of the Minnesota Railroad and Warehouse Commission, described its work to show that it keeps in close touch with local conditions and is able to handle local matters more promptly and informally than would be possible for a commission at Washington. At one time, he said, he had advocated a centralized plan such as that now favored by the roads, but he had come to the conclusion that the state commissions are almost indispensable. He thought the Interstate Commerce Commission would be more successful if local matters could be handled locally with the right of appeal to the commission at Washington.

J. F. Shaughnessy, of the Nevada Railroad Commission, read a long statement criticising the attitude of the railroads and of the Interstate Commerce Commission in their handling of the transcontinental freight rate controversy, and he urged that Congress take the matter out of the hands of the Interstate Commerce Commission by enacting a rigid long and short haul clause to prevent railroads making lower rates to points where water competition exists than to the intermediate points. Mr. Mills had previously told the committee that a rigid long and short haul rule would not work as applied to interstate traffic.

Senator Cummins asked Mr. Shaughnessy whether he would have Congress follow the idea to its logical conclusion

and adopt the principle that all rates should be made on a mileage basis. Mr. Shaughnessy said he would not, because such a plan would interfere with other rates in which the intermountain country is interested, such as the blanket rates to points east of Denver on products of the soil.

Mr. Shaughnessy also criticised decisions of the Interstate Commerce Commission fixing passenger rates which had taken into consideration increases in the weight and cost of passenger trains. Railroad passenger service is conducted in this country in a too extravagant way, he said. "The railroads have followed the policy of using their passenger service as an advertising medium, and have therefore furnished a service superior to what has been needed. They are using heavy all-steel cars which require heavy track and heavy engines for their interstate travel which are only incidentally of benefit to the local traveler, and they are hauling around 10 tons of dead weight for each passenger. This is not necessary, and will drive the local passenger to using electric railways or automobiles. The weight of trains should be cut in two by using wood instead of steel, and the traveling public should be given the benefit of the reduction in fares."

Mr. Shaughnessy was using this as an argument against giving the Interstate Commerce Commission exclusive jurisdiction over rate regulation because he said the commission had fixed passenger fares with reference to interstate traffic conditions. Representative Esch pointed out that the Interstate Commerce Commission had repeatedly recommended legislation to require the use of steel cars on the ground of safety.

ENGINEERS PRAISED BY FIELD MARSHAL HAIG

Field Marshal Haig, commander of the British forces in France, has expressed to Gen. Pershing in a letter his thanks for the assistance given by men of the Eleventh Engineers around Gouzeaucourt on November 30. The Field Marshal's letter follows:

"General Headquarters British Armies in France, Dec. 6, 1917.—My Dear General Pershing: I have much pleasure in forwarding herewith for your information a copy of a report submitted to me by General Byng, commanding the Third British Army, on the gallant conduct of companies of railway engineers of the United States Army in and near Gouzeaucourt on the 30th of November.

"I desire to express to you my thanks and those of the British forces engaged for the prompt and valuable assistance rendered, and I trust that you will be good enough to convey to these gallant men how much we all appreciate their prompt and soldierly readiness to assist in what was for a time a difficult situation.

"I much regret the losses suffered by these companies."

17 ENGINEERS KILLED OR CAPTURED

General Pershing on Sunday sent to the War Department a casualty list in which appeared the names of 17 American army engineers recorded as missing as a result of the action of November 30 last. The report did not say whether these men were killed or whether they had been taken prisoners by the Germans. Nor did it say where they were "missed," but in view of the known fact that it was on November 30 that a large number of army engineers got into the action at Cambrai in the German counter attack on General Byng's army, it is reasonably certain that it was there these men were taken or killed.

Fifteen days having elapsed without any of the missing engineers reporting for duty, General Pershing has listed them as missing in action. Previously he had reported fifteen engineers of the same unit, mostly New York men, as having been severely wounded in the same action.

The casualty list of 17 "missing in action" is made up entirely of engineers. It includes one sergeant, one corporal and 15 privates, nearly all of whom were from New York or the neighborhood of that city.

SOME LETTERS FROM THE 13TH ENGINEERS

A number of interesting letters have recently been received from members of the 13th Engineers Railways, United States army, who are now in active service in France. The following excerpts were taken from a letter written by First Lieutenant G. C. Kennedy, now in charge of Company F, "somewhere in France":

"Where our camp now is was two years ago a peaceful farm, but it is now a large terminal yard, feeding the greatest of fronts in the present war. * * * Of the war, I must say that we have it always with us in the hundreds of trains we handle loaded with war supplies, etc., as well as the roar of the big guns in the not so far distance—all the time calling us to hurry.

"To our right, not half a block away, is one of the largest French base hospitals, where all the time are hundreds of suffering patients. And here daily many wonderful operations are performed. Men with half their faces shot away are given new faces and in a few weeks are again sent away to fight for France—very wonderful skill, that of the French surgeons.

"Right at our back door we have a beautiful and quiet resting place, where are buried men of every nation, even to our own. John E. Newlin, an American ambulance man, and a former Princeton student, is buried here, and on his cross is written 'Died for France.'

"We have been having the regular rainy season now for over a month. It is sure becoming very cold, and, even worse, it has caused our bombproof caves to fall in. Heaven only knows what we will do when the all too friendly Mr. Boche comes over again."

"THIS LIFE IS SURE EXCITING"

E. P. Dudley, formerly a despatcher on the Atchison, Topeka & Santa Fe at La Junta, Colo., and now a member of Company F of the Thirteenth Engineers, wrote in part as follows:

"We have 48 carded trains each way every day. About 7 miles is double track, and the balance of the 65 miles is single track. We are living in barracks here, in a little valley hidden between large hills. I have not yet found out that we are hidden any, as the Germans seem to know all about us—judging from the way they treat us. We have a large terminal here with many engines.

"We have beautified the countryside with long deep trenches, built at a convenient distance to our quarters. It is very necessary that we can make our way there in the dark, as we hunt them many times during the night, especially during the past two weeks when the moon has been full. Heinie comes over every night and throws apples at us, and the apples burst all over you if you are not in a trench. We get the signal from the lookout balloons on the hill that he is coming, and then we make a marathon for the ditch. I did not have my clothes off for four days last week, but I am an artist now at dodging the apples. They sure muss up the country.

"This life is sure exciting. I was on the road doing special work, and was at a certain town on the road when they shelled it. I lay on my stomach in a ditch for five hours. It was sure fun, with duck hunting as nothing in comparison."

ALMOST NEVER A "BAD ORDER"

Sergeant L. L. Trager, in a letter written on October 15, gives some interesting details concerning French railroad equipment and operating methods:

"The stations are close together and the track is in the very best condition, with never an engine failure. The

trains always reach their destinations on time. This is made possible by small trains, easy schedules and careful trainmen. There being no competition, it is not necessary to burn the wind to make the trip quicker than the other fellow. Munitions, etc., are started in plenty of time, so that there need be no cause to rush. Small trains and plenty of them, 35 to 50 (sometimes 60) cars—but not American cars. The gross tonnage per car will average about 20. Cars weigh 7 to 10 tons and generally load about 8 to 15 tons. Some of them have a load limit of 10 tons. They are queer-looking cracker boxes, with one pair of trucks under each end, and the wheels are not solid. They have spokes, so to speak. With only four wheels they look like a buckboard. We all had a good laugh at them at first—chain and hook couplers, great large bumpers at each corner of the car. I say we laughed at them at first, but since working with them we have more respect for them. They always fulfill their mission. Almost never a 'bad order.' No hot boxes or draw-bar trouble.

"The engines are about the size of Prairie types and are real up-to-date looking. Brass bands around the boiler jackets make them look real classy, and they are kept in the pink of condition. Some of them have left-hand drives, some right. As you probably know, on double track in England and France the trains move on the left rail instead of the right. I understand there is American equipment on French soil, but I have seen none. The track in this country is in fine shape, well ballasted, heavy rail—about 85 pounds—so speaking summarily, we have a whole lot better outfit to work with than I expected."

LOCOMOTIVES BUILT IN 1861

Captain V. H. Hagelberger, of Company B, compliments the French on the condition of their locomotives, track and roadbed:

"Two weeks ago we took charge of the military railroad supplying the front lines on one of the important battle fronts in France. This is a busy line and a great many difficulties in operation that we have to familiarize ourselves with. Our track and roadbed is fine and in good condition, and we are using engines that were built as far back as 1861 which are in remarkably good condition considering their age. However, they are much better built than the locomotives in the States, as a great many of them have copper fireboxes and brass linings in the machinery. There was evidently plenty of this kind of material when these locomotives were built and it didn't cost very much. At some places we have metal ties and in nearly every instance we have screw spikes. Most of the business is carried on at night here owing to the advantages darkness would have in a locality of this kind. We are getting along first rate, working in the dark, but such is war and I am sure that we will make a go of it. In fact, the people whom we relieved consider we are doing remarkably well in the short time we have had it."

A UNIQUE COALING PLANT

The problem of the economical handling of coal at branch lines or junction points where only one or two locomotives are coaled daily is often difficult to solve. The expenditure necessary to install a modern coaling plant at such points is not warranted and often no special facilities are provided. Where locomotives are coaled directly from the cars it is not an unusual sight to see a train crew stand for half an hour or more while a gang of laborers shovels coal on the tender. At such points not only are trains delayed but the coal cars are held and a considerable number of laborers is required to handle the fuel.

An interesting installation of a small coaling station designed to overcome these objections has recently been constructed by the Georgia & Florida, Nashville, Ga. Nashville is the junction point with a branch line on which there

are two trains a day and it is also the turning point for a local freight train. Prior to the installation of the present facilities, these trains were coaled by hand directly from the cars. This made it necessary to have one or two coal cars always on hand. In designing the new plant the object was to avoid the necessity of keeping cars standing under load at the junction, to eliminate the loss of time by locomotives and crews and to reduce the labor required to a minimum. While the installation is simple and of a type that can be employed only where the amount of coal handled is small, it has given very good results at this point.

The plant at Nashville consists of an inclined spur track 300 ft. long, parallel with the main line and 32 ft. from it. At the end of the spur is a trestle 6 ft. high and 70 ft. long. The space under the trestle is floored. Near the end of the trestle is an elevator of the hand power carriage type, with a platform 6 ft. by 14 ft. The elevator has a capacity of 3,000 lb. and can be raised to the height of the coal platform beside the tracks, which is 14 ft. above the rail, 16 ft. wide and 32 ft. long.

Only one man is employed in operating this coaling sta-

Coaling Station at Nashville, Ga., Operated by One Man

tion. The coal is received in hopper bottom cars and after the cars are placed on the trestle it is dumped directly on the floor beneath. It is then loaded by hand into coal buggies which have a capacity of one ton. After the buggies are filled they are rolled onto the elevator and hoisted by hand to the level of the elevated platform. They are then placed in a position from which they can readily be dumped on the tender of the locomotive. Eight tons of coal can be placed on the platform at one time. As the coal is loaded in the buggies and in position for dumping when the train arrives, the tender can be filled by the fireman and the coal handler in three minutes.

From 18 to 20 tons of coal are handled daily at this plant. By releasing the coal cars promptly, the per diem on two cars is saved. The delays to locomotives have also been eliminated and the cost of labor has been reduced considerably. The cost of the installation including the trestle, platform and elevator, but not the coal buggies, was about \$1,600. We are indebted to E. B. Eppes, chief engineer of the Georgia & Florida Railway, for the details of this plant.

RAILROAD SHELTERS PUBLIC FROM AIR RAIDS.—The London & North Western Railway has placed at the disposal of the authorities, for use by the public at times of air raids, the twin tunnels under Primrose Hill, built, but not yet opened, for the electric railway between Chalk Farm and Queen's Park. The tunnels are about a mile in length, and will accommodate thousands of people.

Settlement of Railroad Problem Delayed

No Action on Part of President; Congress Takes Holiday Recess; Coal Situation a Troublesome Question

WASHINGTON, D. C., December 18, 1917.

APPARENTLY President Wilson is either still trying to make up his mind as to what to do with the railroad problem and intends to leave it up in the air over the holidays, or he has decided to take over the roads for operation under the direction of a government controller under the authority conferred by the law of August 29, 1916. Without any definite knowledge it had been assumed by almost everyone in Washington in touch with the question that the President had decided to take over the railroads, and that he would make the announcement in a message to Congress recommending the necessary legislation; but Congress took a holiday recess on December 18 until January 3 without having received any word on the subject from the White House.

This has caused the railroad men whom the President has kept "watchfully waiting" to fear that he may soon exercise the emergency authority he already possesses to put the roads under the control of a government controller or "transportation dictator", leaving the complicated problems involved in the question as to how the companies are to be compensated for Congress to amuse itself with during the long winter afternoons. While the spectacle of Congress wrestling with the question of guaranteeing railway net earnings for the period of the dictatorship may also promise some entertainment for the spectator who has only an extraneous interest in the subject, it holds forth no pleasing prospect for the railway security holder or executive.

They recall very well that a so-called "eight-hour" law was passed, obligating them to pay out some millions of dollars a year in additional wages, and that some recommendations were made as to ways of assisting them to raise the necessary millions and as to making a recurrence of the circumstance impossible. They are reminded of the law with the recurrence of each monthly or semi-monthly pay-day, but they hear no more of the recommendations for compensating them for the expense, or for making a recurrence of the strike threat impossible.

Until Congress recessed for its holidays it had been the hope and expectation that if the President had decided to take over the roads he would ask Congress for a new law prescribing to some extent the conditions under which they should be taken and that the bargain would be made at least by the time the goods were delivered. Doubtless, the President could if he chose take over the roads under the law of August, 1916, but it was never understood that that law, comprising a single paragraph, inserted almost as an afterthought at the end of an appropriation for the National Guard, was intended for the purpose of taking over the entire railroad system of the United States. It has always been supposed, and the wording of the brief paragraph itself suggests, that it contemplated merely a commandeering of a railroad here or there for purely military purposes, for it contains not a word about compensation either of the employees or of the owners, nor does it prescribe their status in any way.

The alternative recommendation of the Interstate Commerce Commission specifically assumed, and the President is supposed to have recognized its justice, that if the government should take control of railroad operations the security holders should be guaranteed an adequate annual return while their interests were being subjected to the process of unification. Any other terms would amount to confiscation, particularly as the only reason advanced for the exercise of government control is the theory that the

railroads themselves are too greatly fettered by the constant reminder of private individual interests to be expected to succeed in unifying themselves. Unless it is proposed to do something with the railroads which would seriously affect the interests of the owners of different lines for the purpose of increasing the efficiency of the transportation system as a whole, railroad men cannot understand just what they can be expected to accomplish under the orders of a government administrator that they cannot do under the direction of the organization whose orders they have already agreed to comply with, that of the Railroads' War Board.

They have heard suggestions that with the magic wand of the President's delegated authority in one hand, while the other is occupied with printing, selling and collecting for billions of Liberty Bonds, a Cabinet officer may be expected to create 125 per cent transportation efficiency almost overnight. Fuel Administrator Garfield has allowed the impression to percolate into the public prints that with almost any kind of a government administrator for the railroads the entire problem of coal production, transportation and even unloading, cartage, distribution and prices might be solved so easily that he, too, would have an extra hand free to place at the disposal of, perhaps, the Food Administration.

Practical railroad men have heard these suggestions and are still rather curious to know how all of these simple little miracles are to be accomplished without more cars, tracks or locomotives and how the aforesaid appurtenances which they have been educated to believe are almost indispensable to the speedy transportation of freight are to be procured without some form either of cash or of credit.

After nearly two weeks of rather continuous reflection, many of them have attained a state of mind in which they are not so reluctant to be shown as they have sometimes been accused of being, but they cherish a lively curiosity as to when the demonstration is to begin and they are hoping for more action at the outset than can reasonably be anticipated from a Congressional debate. With a guarantee of net earnings patterned after the plan adopted in Great Britain, particularly if it should be based on the earnings of 1916, and with some assistance from the government in the way of priority orders for cars, locomotives and materials, it is believed that many roads would be able to finance on their own credit all of the expenditures that could reasonably be expected to be made at such a time, but if the President should seize the roads now and leave the terms for settlement by Congress at some later time, the effect on those who have thus far put up the capital to produce the transportation plant would be discouraging indeed.

It has been suggested that possibly the failure of the President to act as promptly as had been expected may be due to a growing doubt as to the desirability of such a drastic step as it has been assumed he was about to take, at least until the present plan has had a further trial, and that he may come to the conclusion that with a long, hard winter ahead, the present organization will be able to attain as near complete success as can reasonably be expected. One of the important causes to which railroad men have attributed the congestion of some of the eastern lines, the indiscriminate use of preference orders for all government freight, has recently been brought under control as the result of the agitation about it.

The watchful waiters at Washington received somewhat

of a surprise last week as to the attitude of the railroad brotherhoods toward the idea of government control. It had been rather generally assumed that because of their opposition to government ownership they would oppose the plan. It was given out that the heads of the four organizations were to call on the President last Wednesday, and the result was awaited with interest. Instead of coming themselves, however, they sent their four legislative agents who are stationed in Washington, H. E. Wills, representing the engineers; P. J. McNamara, the firemen; W. M. Clark, the conductors, and W. N. Doak, the trainmen. Their visit was brief and no announcement was made, but on the following day, A. B. Garretson, president of the Order of Railway Conductors, called at the White House and it was announced that he had stated that the brotherhoods would have no objection to make. One opinion advanced at the time was that this announcement would remove the last trace of hesitation in the President's mind as an important obstacle eliminated.

In view of the demands of the brotherhoods for higher

be sufficient inducement for them to accept the control of even a government administrator with a good grace.

Such a settlement would leave open only the question as to whether the government should pay the increased wages, through the medium of guaranteed net earnings, or whether they should be met currently by higher rates. In the former case the higher wages might easily survive to present another problem after the war and after the expiration of the guarantee, a contingency which the railroads would prefer to avoid. The other alternative would follow the policy of pay-as-you-go, which is distasteful to many people.

Senator Borah of Idaho made a vigorous protest in the Senate on Monday against an adjournment without taking some action on the railroad situation. He said that at least Congress should remain in session to give the President a chance to deliver his message. There is much speculation as to who the prospective railroad administrator will be and the Washington correspondents have compiled a long list of candidates. The two most frequently mentioned are W. G. McAdoo, Secretary of the Treasury, and Franklin K. Lane, Secretary of the Interior and former Interstate Commerce Commissioner. Daniel Willard and Judge R. S. Lovett have also been mentioned because they are railroad men who are taking an active part in the government's war work, but it has been stated rather positively that no railroad man would be chosen. Others have been mentioned for the reason that they have happened to call at the White House recently and there has also been a rumor that Justice Brandeis had declined with thanks. The name of Dr. Arthur T. Hadley has also been suggested.

The Senate on December 18 adopted a resolution by Senator Cummins providing for an investigation by the Committee on Interstate Commerce for the purpose of considering the recommendations of the Interstate Commerce Commission in its special report. The committee was instructed to report legislative recommendations as soon as possible.

Senator Newlands made no objection to this resolution, saying that the President is still engaged in investigation of the question. Senator Sterling introduced a resolution, which was referred to the committee on interstate commerce, providing for the appointment of a general railroad traffic director to exercise general supervision and direction over the handling and movement of all freight trains engaged in transportation of products essential to the public welfare. In the house Representative Lenroot introduced a bill providing for the creation of the United States Equipment Corporation to acquire railroad equipment and lease it to the railroads.

COAL OPERATORS STILL AFTER PRIORITY

Not satisfied with the position accorded coal in the latest government priority order, which gives livestock, perishable freight, foodstuffs, and in some cases military supplies, precedence over coal, the National Coal Association, representing bituminous coal operators, have been trying to persuade Fuel Administrator Garfield to secure a preference order as to coal from President Wilson.

Resolutions by the directors of the association, which have been presented to Mr. Garfield, assert that in practically all coal regions there is enough labor to produce much more coal than the railroads are now moving, and that the coal operators are powerless to produce more coal until greater transportation facilities are provided.

The latest priority order, No. 5, they say, gives no additional preference in car supply to coal mines and no special priority over most other commodities, sufficient to relieve the immediate coal shortage.

The Fuel Administrator was urged to secure from the President "an order to the effect that such an immediate priority be given the movement of coal now under load as will relieve the present emergency, and that further, for the

Stuck!

New York Tribune

wages, which their officers had already discussed with the President, and in connection with which the railroads had placed their own interests unreservedly in the hands of the President, an interesting solution of the entire wage question immediately presented itself. Aside from the interests of the railroads, already beyond their control, the idea of a tacit understanding between the brotherhoods and the President appeared quite feasible. The idea of this understanding contemplated an agreement for arbitration which might be entirely acceptable to the brotherhoods. In spite of their well-known disinclination to arbitrate they have never flatly rejected the entire principle of arbitration, and it was suggested that an arbitration as to what the recent cost of living has amounted to, following an agreement that wages should be increased by that amount when determined, might

next 30 days preference be given coal mines in the distribution of cars to the extent that may be necessary to operate all mines continuously at full capacity for the next 30 days, so as to supply at all points the amount of coal necessary to preserve the life and health of the people of this nation, and to rush with all possible speed the powder mills, cartridge mills, steel mills, and all other mills and manufacturing plants that are producing ships, guns, ammunition, food and clothing for our soldiers, and all the other supplies and equipment that are vitally essential to drive this war through to a victorious conclusion."

In an address at the Editorial Conference of the Associated Business Press last week Dr. Garfield asserted that with a government transportation administrator in office it would be a simple matter to secure such an order, but no announcement has been made that he has been able to convince the President that it should be issued.

Dr. Garfield continues to endeavor to place the blame for failure to secure the needed increase in coal production upon the railroads, asserting that the coal supply of the country is ample "if we could but solve the question of transportation."

According to the weekly report of the Geological Survey the output of bituminous coal for the week ended December 8 was 11,133,220 tons, and the nine anthracite roads originated 40,566 cars. A general easing up in the shortage of cars was reported from Illinois, Indiana, Ohio, Pennsylvania and Kentucky. In West Virginia, on the other hand, losses due to inadequate transportation were even more severe than during the preceding week. Car shortage was responsible, according to the report, for a loss of 19.6 per cent of the full time capacity.

The railroad situation in the country with particular reference to coal transportation was the subject of a conference on December 15 between United States Fuel Administrator Harry A. Garfield and A. W. Thompson, chairman of the General Operating Committee of the eastern railroads. One result of the presence in Washington of Chairman Thompson and of his recommendations was announcement of the appointment by the fuel administration of C. R. Moriarty of Cleveland as the fuel administration's representative to exercise such powers and authority as may be necessary to enable him to perform all of the duties of general director of the coal shippers' terminal pool association. Mr. Thompson reported that while the railroad committee which is working to relieve railroad congestion in the Pittsburgh terminal territory has made great progress the full effects and benefit of this will not be entirely apparent for some days.

RAILROADS NOT RESPONSIBLE FOR COAL SHORTAGE.

Fairfax Harrison, chairman of the Railroads' War Board, has authorized a statement saying that shortage of coal is due chiefly to the enormous increase in the demand for coal and to other causes, but it cannot fairly be attributed altogether to lack of transportation.

"The railroads appeal from the general statements being made upon this subject to the incontrovertible facts," he said. "The records of the railroads show not only that the coal operators have produced more coal than ever before, but that in the eight months, April to November, inclusive, the railroads have hauled and delivered 175,986 more carloads, or about 10,000,000 more tons of anthracite than in the same months of 1916. This was an increase of 15 per cent over the best record ever previously made. The records show that in the same months the railroads hauled 925,691 more carloads, or about 51,000,000 more tons of bituminous coal, than in the corresponding period of 1916. This was an increase of 18 per cent over the best record ever previously made.

"The railroads have not been able at all times to carry all the coal that could be offered to them for movement. But

has any other industry responded more efficiently to the demands created by the war than these statistics regarding coal transportation show the railroads have? And the railroads have accomplished what they have under the greatest difficulties—difficulties resulting principally from their inability to increase their plant and the excessive use of preference orders in government transportation.

"The charge has been made that the inability of the railroads promptly to move all the freight offered to them has been largely due to failure of the various railway lines to work together harmoniously and unitedly in this war crisis. We challenge those who make this allegation to cite any evidence in support of it. They cannot do so. The allegation is without foundation. The railways, under the organization they voluntarily formed to direct the operation of their properties during the war, have without exception acted on every suggestion the Railroads' War Board has made to increase the amount of traffic moved.

"The present coal problem is not, as has been represented, altogether a problem of transportation. It is primarily a problem of distribution, for which the public must share the responsibility. The railroads cannot, with their existing facilities, handle a much larger tonnage of coal so long as the present system of distribution prevails. The present system of distribution involves a great amount of cross-hauling of coal, and a resulting large waste of transportation. The remedy doubtless requires surrender of convenience and old habits, but it is clear. It is to cause coal to be supplied to every section from the mines nearest to that section. No one unacquainted with the facts can conceive the unnecessary long hauls of coal which have grown up under the right of the shipper to route his traffic as he pleases. Whatever may be its justification in normal times, this practice effectively reduces the efficiency of the transportation machine in the time of heaviest traffic ever experienced."

SIMS CHAIRMAN OF HOUSE COMMITTEE

W. C. Adamson, for several years chairman of the House Committee on Interstate Commerce, has resigned from Congress to become a member of the board of appraisers of the port of New York, and Thetus W. Sims, of Tennessee, has been elected chairman of the committee and also vice-chairman of the Joint Committee on Interstate Commerce to succeed him. Dan V. Stephens of Nebraska succeeds Mr. Adamson as a member of the two committees.

A CHANNEL FERRY between Newhaven, England, and Dieppe, France, is the subject of an article by Colonel Barry in the Railway Gazette of London, issue of November 16, 1917. He urges the installation of such a train ferry at once, for even though the proposed tunnel from Dover will be constructed after the war, a train-ferry as suggested would have the same stimulating effect on international trade as is expected of the tunnel, while the ferry could be constructed in twelve months whereas it would take more than ten years to build the tunnel.

SALES OF NATIONAL FOREST TIMBER in the fiscal year 1917 were more than double those of 1916, according to the annual report of the Forest Service of the U. S. Department of Agriculture. The total amount sold exceeded two billion feet and is valued at more than \$3,715,000. During the same period about 727 million feet were cut and removed, for which the purchasers paid \$1,507,303 into the Federal Treasury. The largest sales were made in Oregon, where about 688 million board feet were disposed of. In addition to the timber sold, approximately 113 million board feet valued at almost \$150,000 was cut under free use permit by more than 41,000 settlers living near the national forests and depending on the forests for firewood and building material to improve their homesteads.

General News Department

Following the severe winter weather of last week, the Pennsylvania Railroad sent from its shops at Altoona, to different division points on the road, about 300 men, to repair locomotives.

The Pullman Company has granted a bonus of 10 per cent of their pay for the past six months to office employees who receive less than \$2,500 a year and to Pullman conductors and porters.

The Interborough Rapid Transit Company, New York City, will pay a Christmas bonus of \$5 to each employee who has been in the service one year and whose regular pay is less than \$150 a month.

Thirty locomotives built at the Baldwin Locomotive Works, Philadelphia, for military railroads in France have been ordered by the Government to be put in use on the Philadelphia & Reading, the Pennsylvania, the Baltimore & Ohio, and the Lehigh Valley.

The Erie Employees' Relief Association, a benevolent association composed of the employees of the Erie Railroad, appears to be insolvent. Application was made to the court at Buffalo, N. Y., December 18, for the appointment of a receiver. This association was formed in 1911, and the report indicates that pensions have been paid to retired employees on a basis more liberal than was justified by the receipts and assets of the association.

It is announced that a large share of the Christmas presents sent to soldiers have been safely landed in France and are being distributed through the various military postoffices. Over 600,000 separate parcels, weighing approximately 1,000,000 lb., were shipped from one Atlantic port before December 5. Large shipments were made from other eastern ports; and the Christmas parcels for soldiers and sailors at the various camps or cantonments in this country probably weighed over 2,500,000 lb.

The 416th Battalion, of the United States Signal Corps is being recruited at Grand Rapids, Mich. The battalion is one of several which are being organized to take over the telephone and telegraph departments of the railroads now being operated by American railway units in France. During the illness of Major P. Kirk Pierce the recruiting work at Grand Rapids is being carried on under the direction of Major N. D. Ballantine, who recently left his position as assistant to the vice-president of the Chicago, Rock Island & Pacific at Chicago to relieve Major Pierce until his recovery.

Students from the department of transportation of the University of Illinois made a railway inspection trip in Chicago from December 18-21. The itinerary included visits to the passenger department of the Chicago, Burlington & Quincy, the Western Passenger Association, the Pullman Company, the freight tariff bureau and the development department of the Illinois Central, the freight claim and general freight departments of the Chicago, Burlington & Quincy, the Central Freight Association and the offices of the general auditor and controller of the Chicago, Rock Island & Pacific.

The Firemen's Wage Demands

Representatives of the Brotherhood of Locomotive Firemen and Enginemen held conferences at Chicago on December 15, 17 and 18, to prepare wage scales and working rules to present to the railroads.

The schedules were completed on Tuesday. The increases asked for range from 10 per cent for the higher-paid men to 40 per cent for those receiving \$2.50 for eight hours or 100 miles or less. All receiving more than the guarantees decided on want 10 per cent additional guarantees as follows: Firemen in passenger service per 100 miles, \$3; passenger firemen, not paid on a mileage basis, \$3.50 for eight hours; all classes except those in passenger and switching service, \$3.50 for 100 miles or less; those in switching service, \$3.50 for eight hours; helpers in electric service, \$3 for eight hours; inside hostlers, \$3.50 for eight hours;

outside hostlers, \$3.75 for eight hours, and their assistants, \$3.50. In all classes of road service, except passenger, they will ask time and one-half when runs are 100 miles or less. Time and one-half is also to be asked in switching service for all time above eight hours in each twenty-four.

St. Paul Union Station

The sinking of the foundation piles for the head house of the St. Paul (Minn.) Union station is now under way. The head house will be 150 ft. by 300 ft. and two stories in height, except over the main entrance, where the height of the building will be three stories. In addition, a waiting room, 375 ft. by 65 ft., will extend over the tracks. The exterior of the building will be of Bedford stone. The contract for the construction of the head house, for the grading for the elevation of the tracks, the building of retaining walls and the relocating of tracks, etc., is held jointly by the George J. Grant Construction Company and Morris, Sheppard & Dougherty, both of St. Paul. The estimated cost of the entire project is about \$15,000,000.

"Stop, Look and Loosen"

This was the legend on the front of the float of the Canadian Pacific Railway in the Victory loan parade in Montreal on Monday, November 19. The float, as shown in a picture published in the company's passenger bulletin, looks like a large passenger engine, with a tender; but in reality it is an effigy, made at the Angus shops in about 2½ days. Large banners, urging the purchase of bonds, covered the lower part of the "locomotive," so that the designers and artisans had to make the similitude of an engine only for those parts above the level of the tops of the driving wheels. In the parade the engine was manned by an engineman and a fireman, and also by "three of the prettiest lady workers at the shops, dressed in overalls."

Printing Telegraphs on Railroad Wires

The Telegraph & Telephone Age, in its issue of December 16, reports data from 70 prominent railroads of the United States and Canada showing the mileage of line, on each road, on which telephones are used for train despatching; and also the mileage of circuits on which printing telegraphs are used. The total length of road on which the telephone is used is 94,625, and of circuits on which printing telegraphs are used, 12,499. This last mentioned figure is made up as follows:

Name of Road	Name of System	Miles
Canadian Pacific	Morkrum	7,154
Chicago, Burlington & Quincy	Morkrum	659
Delaware, Lackawanna & Western	Am. Telegraph & Tel. Co.	150
Missouri, Kansas & Texas	Morkrum	381
N. Y. Central, E. of Buffalo	Am. and Morkrum	570
N. Y. Central, W. of Buffalo	Morkrum	113
Pennsylvania	Morkrum	585
Pennsylvania, W. of Pittsburgh	Morkrum	1,129
Southern Pacific	Morkrum	1,266
Union Pacific	Morkrum	492

On the Pennsylvania the Wright printer is in operation between Philadelphia & Pittsburgh, 350 miles; and the Morkrum between Philadelphia & Altoona, 235 miles. Several other printing circuits are to be put in service on this road in the near future.

Axioms—For Railroad Men and Others

Unnecessary work is unnecessary expense.

An unnecessary job increases the work of every other job.

Unnecessary work shortens the time that should be devoted to necessary work.

The handling of unnecessary correspondence reduces the time that should be devoted to necessary supervision.

To answer a foolish question takes the time that may be devoted to asking a sensible one.

Information required that is not used is the worst form of inefficiency.

Authority decreases as it is divided and is weakened every time it is transmitted.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF OCTOBER, 1917

Name of road.	Average mileage operated per period.	Operating revenues.			Maintenance of way and structures.			Operating expenses.			Operating ratio.	Net from operation.	Railway accruals.	Operating (or loss).	Increase (or decrease) last year.

Figures shown are for period April 1 to October 31.

Car Shortage Reduced

Reports to the Railroads' War Board show that on December 1 the excess of unfilled car orders amounted to 117,132 cars, a decrease of 22,880 compared with November 1, and an increase of only 10,000 cars compared with December 1 a year ago; although the railroads are handling currently at least 20 per cent more passenger and freight business than a year ago.

Illinois Manufacturers' Association Urges Appointment of Transportation Director

The directors of the Illinois Manufacturers' Association have addressed the following telegram to President Wilson:

"We suggest in order to secure more positive control of the transportation situation and as means of securing the operation of all the railroads of the country as a single unit with an obliteration so far as transportation problems are concerned, of all property lines, that the President of the United States appoint a director of transportation who shall select as his operating staff a committee of five railroad officials who shall have immediate charge of the operation of the complete transportation system; that the railroads carry both soldiers and all government war supplies free of charge during the duration of the war, and that in consideration thereof a fair return to the stockholders of the railroads' properties be guaranteed by the government."

Reductions In Passenger Service

Reports just compiled show that since the beginning of the war the railroads in the 15 states of the central military department have made reductions in passenger service aggregating 10,657,637 train miles per annum, equal to a saving of 1,176,085 tons of coal, 369 locomotives, 1,941 men and 203,839 barrels of fuel oil.

The Baltimore & Ohio proposes to take off two express trains each way, daily, between New York and Washington. The Pennsylvania and the Philadelphia & Reading will take off one train each way daily between Philadelphia and Cape May. By the new timetable the Reading will run an express to Cape May in the morning and the Pennsylvania will run one in the afternoon, and a corresponding arrangement will be made for the return trips.

The Louisiana Railroad Commission has authorized the Texas & Pacific to discontinue the operation of nine local passenger trains because of the scarcity of coal. It appears that these are the same nine trains which the road discontinued without the consent of the commission in November and which were restored on December 3.

Fuel Administration Calls for Reduction of Suburban Train Service

The United States Fuel Administration suggests the possibility of saving coal by cutting down suburban steam railroad passenger service during the non-rush hours. On many lines numerous trains are operated at non-rush hours which require only three or four cars for the small traffic handled. Many of these trains are run merely to afford a maximum of convenience through frequency of service. Competent railroad men have informed the Fuel Administration that, on the average, two of these non-rush hour trains could well be made to do the work of three by simply making an interval between trains. One important railroad as an experiment recently decreased its non-rush hour service, or made changes which proved economical without serious inconvenience to the public. This road has announced a further withdrawal of about 10 per cent of the total number of its suburban trains, whereby it will be able to release more than 1,000 tons of coal per month. It is suggested that the railroads do what they can and that the suburban communities, through community action, acquiesce where no great hardship is involved.

Contribution to the Railway Regiments' Tobacco Fund

Three contributions to the Railway Regiments' Tobacco Fund have been received in the week ending with Tuesday noon, December 18:

Dayton Malleable Iron Company, Dayton, Ohio... \$10 a month
Signal Alliance Association, contribution..... 17
J. Alexander Brown, New York..... 10 a month

Webb Bill Passed

The Webb bill, to legalize combinations of American exporters for the purpose of promoting foreign commerce, was passed by the Senate on December 11. It had already been passed by the House, but there were differences and it was sent to conference.

"Your Part"

This is the title of a circular decorated in red, white and blue, which has been issued to the employees of the Norfolk & Western by W. S. Battle, Jr., general claim agent of the road. It says, in part:

"Do you fully realize what this War means? Have you begun to do your duty toward your country? . . . If each one will handle freight as though it were *his own*, waste will practically disappear. It is believed that this company has not a single employee who would willingly cause loss or waste in the present time—*yet waste is still going on*. Do you not think that each one should *bestir himself* and 'deliver the goods'?"

"Do not think your efforts will *not do any good*. Suppose each one decided that his help was too small to count, what would happen? Consider what results could be accomplished if we all pull together.

"Talk over such matters with each other. Get the *habit* of trying to impress someone else with the importance of *protecting the freight of today*. Do this today and tomorrow and keep at it. Do not slack up, but keep trying to obtain better results, and you will soon learn that your efforts are of mutual benefit to your nation and yourself.

"Remember you are either *for* this country or *against* it; and you are against it, regardless of what you may say, unless you clearly show by your work and results that you are helping the nation to conserve its resources."

Mississippi Roads Fight Heavy Tax Assessment

The Illinois Central, the Yazoo & Mississippi Valley and other railroads in Mississippi were granted restraining orders on December 11 by Judge A. C. Niles, of the federal district court at Jackson, Miss., forbidding the Mississippi Railroad Commission to enforce tax assessments against the roads for 1917. With the creation of a new equalizing body in that state, taxes on general property were increased about 43 per cent. The assessment of railroad property, which, the carriers claim, was 100 per cent of its true value in 1916, was increased from \$64,000,000 to \$98,000,000. The increases for the Illinois Central and the Yazoo & Mississippi were alone \$10,000,000 and \$7,500,000, respectively, or about 66 per cent. The increase in the assessment of the property of the St. Louis-San Francisco amounted to about 50 per cent, and the increases in the assessments of other roads were likewise very large. The carriers maintain that the increase in the assessment of general property only brings it up to about 57 per cent of its value, whereas the increase in the assessment of railroad property puts it considerably above 100 per cent of its value, and in the cases of the Illinois Central and the Yazoo & Mississippi Valley as high as 166 per cent. The railroads contend that their property should be assessed on the same basis as that of other property, and on January 4, will appear in the United States District Court at Jackson to apply for a temporary injunction. If this is secured steps will be taken to obtain a permanent injunction against the railroad commission. Pending the outcome of the litigation the carriers have agreed to pay the same taxes that they paid in 1916.

Rock Island Announces New Pass Rules

The Chicago, Rock Island & Pacific will on January 1 put in effect new regulations covering the issuance of complimentary annual passes to employees and their wives. Under the new rules some employees will be given complimentary annuals on appointment and others after one year in the service; or five years, 10 years, 15 years, 20 years, or 25 years. When a position requires traveling, an employee will be furnished such transportation as is necessary upon appointment. System passes will be issued to officers and officers' wives upon appointment. Pensioned employees and their wives will be furnished with the same class of annual pass as they had at the time pensioned. Wives of employees holding what are termed "traveling positions" under general or district officers will be given system

annual passes upon appointment. Among employees coming under this provision are service inspectors, district car inspectors, claim adjusters, demurrage inspectors, pilot engineers, special agents, traveling auditors, fuel inspectors, tie inspectors, bridge inspectors and traveling car agents.

Under the provisions of the schedule governing the issuance of complimentary passes to employees who do not come under the class of traveling positions, station agents at larger terminal stations, freight and passenger department agents, chief clerks to system, district and division officers, assistant chief clerks to general officers, telegraph managers and wire chiefs, are granted system annual passes for themselves and wives on appointment. Train service employees are granted division annual passes at the end of one year's service and their wives are granted division annuals at the end of five years' service. Both are permitted district passes at the end of ten years' service and system passes at the end of 15 years. Agents at the smaller stations, telegraphers, chief clerks to local division officers, yardmasters, switchmen, shop and roundhouse foremen, machinists, blacksmiths, boilermakers and their helpers, signal foremen and maintainers and like employees, will receive annual division passes at the end of five years, district passes at the end of 10 years and system passes at the end of 15 years. Laborers and janitors will receive annual passes for themselves and wives for the system at the end of 25 years' service.

Thirty Army Trucks on 600 Mile Run

The latest plan for helping to relieve the railway congestion was put into effect this week when a train of 30 Packard army trucks left Detroit for a port on the Atlantic seaboard, 600 miles distant. It is hoped that this fleet will be the first of a number totaling 30,000 trucks of various makes. The plan if carried out successfully will release 17,250 cars, says the Quartermaster-General, and it will also be the means of training hundreds of drivers for their duties later in France. Twenty-eight of the 30 cars are carrying freight. Two are loaded with gasoline, oil and repair materials. In some of the cars berths for drivers have been built so that if necessary the trucks can be run night and day with relief drivers.

The Quartermaster-General estimates that if the plan proves successful, the total relief given to the railroads, through the shipment to the coast under their own power of the 30,000 war trucks the Army has under construction, will amount to 690,000 tons. The trucks have an average capacity of three tons and only two of them can be shipped by rail in a 40-ton freight car. The new plan will, therefore, relieve fifteen thousand 40-ton freight cars, and will also permit the transportation of 90,000 tons of Government materials to the coast from the interior storage depots. The actual number of freight cars which the plan will relieve, therefore, if successful, will be 17,250 forty-ton cars.

The plan will serve also another urgent need, that of providing adequate opportunity for the training of an effective corps of transport drivers and officers.

The training which our men will receive in driving loaded Army trucks from factory to seaport under the trying conditions which will be encountered this winter will, as nearly as possible, reproduce the actual service conditions abroad. Under the plans worked out the transport companies will negotiate drives of varying distances up to 800 miles over various types of highways, and our men will have met and solved actual problems which will be invaluable to their efficient service behind the lines.

"Dementia Pullmaniana"

Springfield, Mass., has the distinction of being one of the most interesting junctions of the three principal railroads of New England; and like all important junctions is blessed with more or less noise. The following letter from The Springfield Republican of recent date, signed Frank A. Waugh, tells of one of the days when it was more. A New York-White River Junction car enjoys the hospitality of all of the three railroads at Springfield, so that, as regards the criticisms of this writer, all three, very likely, are entitled to share the honors. Beginning with an allusion to the general reputation of the city for hospitality, Mr. Waugh continues:

Yet possibly the entertainment committee might do something

further for the regular Pullman guests. The night train between the two great metropolises of New York and White River Junction is a special case in point. We leave New York at 11:15 and reach Springfield at 3:38 in the dull morning. There we are scheduled to wait until 6:55. For the first three-quarters of an hour our sleeper is used in breaking up and making up trains. We are shunted wildly up and down the yards. First the driver will yank us all up to one end of the berths; then he will butt us back to the other end.

He then sets us out on a siding to cool off. We need it. But we don't need so much of it. There being no heat attached to our car we get busy conserving coal. We soon save up enough to run the road for a month. While we are shivering on our shelves we are soothed with music—the music of passing freight trains and of impetuous switch engines, each one madly ringing its bell and running with the muffler cutout wide open.

Then the Springfield Republican appears on the scene. The young Caruso who shouts it under our windows also announces the "Murkan." He is assisted at his abode [an open-air morning serenade] by an enemy alien who, having escaped the draft, now smashes baggage on the platform beside us, meanwhile carrying on a "konversation" with a "kamerad" over by the American express office or down by the bridge.

The call of The Republican seems to be irresistible with the Springfieldians in our car. Their heads are exerted between the curtains and their sweetly modulated voices call up and down the aisle for the porter. The next hour is occupied with their matutinal toilets, while we listen to such gossip as: "Hello, George! Didn't know you were on this car!" "Yes; got on at N' York." "Fine morn—whose got my—Say, port', mileage book, upper seven!" etc.

Then, just before we freeze to death or are consumed with dementia pullmaniana, the train pulls out. The porter brushes the last Springfield passenger off the car and turns to rouse the Northampton ticket-holders. He finds us already pretty well aroused, yet sad in our politeness to think that we cannot pass before the Springfield entertainment committee with the high handshake ceremony and tell them how greatly we have enjoyed our call in their city.

Hospitality for the Soldiers

The Soldiers' Welfare Committee organized by the St. Louis sub-committee of the Commission on Car Service in connection with the railroad department of the St. Louis Y. M. C. A. has been doing an important work in extending hospitality to the soldiers passing through St. Louis. Last month the committee, of which Rubens Humphrey, executive secretary of the Y. M. C. A., is chairman, met troop trains or groups of soldiers almost daily. Forty troop trains or groups of soldiers, comprising 6,522 men, received the hospitality of the committee during November. On one day the committee met six different groups or trains of men. Soldiers passing through from points in the east, west and southwest were given the opportunity of stopping over at the Railroad Y. M. C. A. building and the privilege of bathing and writing letters. Postal cards, note paper, envelopes and stamps were provided free. The ladies on the committee had furnished supplies of apples, figs, raisins and candy, besides arranging for a social time while the soldiers were in the city.

The committee comprised 70 men and women divided into 14 sub-committees, each of which had charge of the arrangements for one day at a time. The chairman of the committee received direct information from the railroad companies as to the movement of troop trains and directed the movements of the sub-committees without advising them as to the destination of the trains. Many of the committee members, in addition to contributing their time, gave money and turned over their automobiles for the use of the committee.

In one instance the attention of the committee was called to the fact that a barber doing business near the Union Station had charged a soldier \$3 for a shave. The co-operation of the chief of detectives of the city police was immediately secured and the man was arrested. At another time the committee was informed that Canadian soldiers passing through were being charged approximately 20 per cent discount for changing Canadian money to American money. The committee secured from the Railroad Y. M. C. A. over \$500 in American money which was exchanged for the Canadian money on an even basis. A large number of the Canadian soldiers passing through told the committee that

St. Louis was the only place en route from Toronto where any one had met them at stations or provided them with little comforts and writing materials.

The June Conventions

The executive committees of the Master Car Builders and the American Railway Master Mechanics' Associations held a meeting at the Hotel Biltmore, New York, Thursday, for the purpose of deciding whether or not a convention be held in June, 1918. The result of the deliberations will be published in next week's issue.

Portland Cement Association

B. F. Affleck, Chicago, was re-elected president of the Portland Cement Association at its annual meeting at Hotel Biltmore, New York, on December 12. Mr. Affleck is president of the Universal Portland Cement Company. F. W. Kelley, President of the Helderberg Cement Company, Albany, N. Y., was elected first vice-president, and Richard Hardy, president of the Dixie Portland Cement Company, Chattanooga, Tenn., second vice-president. G. S. Brown, president of the Alpha Portland Cement Company, Easton, Pa., was elected treasurer.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings and places of meetings of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

AMERICAN RAILWAY ENGINEERING ASSOCIATION.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next annual meeting, March 20-22, 1918, Chicago.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.

AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, Supt. Timber Preservation, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January 22-24, 1918, Hotel Sherman, Chicago.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Morrison Hotel, Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual dinner, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

CINCINNATI RAILWAY CLUB.—H. J. Cade, Jr., Chief Interchange Inspector, C. & N. Y., 101 Carey Bldg., Cincinnati. Regular meetings, 2d Tuesday, February, May, September and November, Hotel Sinton, Cincinnati.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 568 Union Arcade Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh, Pa.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month. Room 1856, Transportation Bldg., Chicago.

NATIONAL RAILWAY APPLIANCES ASSOCIATION.—C. W. Kelly, 149 Peoples Gas Bldg., Chicago. Annual exhibition, March 18-21, 1918, Coliseum and Annex, Chicago.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meeting, 2d Tuesday in month, except June, July, August and September, Boston.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meeting, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

Niagara Frontier Car Men's Association.—Geo. A. J. Hochgrebe, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Hotel, Buffalo, N. Y.

PACIFIC RAILWAY CLUB.—W. S. Wollner, Assistant to Chief Engineer, Northwestern Pacific R. R., San Francisco, Cal.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—F. C. Stewart, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Pittsburgh Commercial Club Rooms, Colonial Annex Hotel, Pittsburgh.

St. Louis Railway Club.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis Hotel, St. Louis.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grand Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 a. m., Piedmont Hotel, Atlanta.

TRAFFIC CLUB OF CHICAGO.—C. B. Singer, La Salle Hotel, Chicago.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Waldorf-Astoria Hotel, New York.

WESTERN CANADA RAILWAY CLUB.—L. Kon, Immigration Agent, Grand Trunk P. Ace, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Monday in month, except June, July and August, Hotel Sherman, Chicago.

WESTERN SOCIETY OF ENGINEERS.—Edgar S. Nethercut, Secretary, 1735 Monadnock Block, Chicago, Ill. Regular meeting, first Monday in month, except January, July and August. Extra meetings generally on other Monday evening except in July and August.

Traffic News

In the United States Court at Newark, N. J., December 18, fines amounting to \$6,000 were imposed on the Delaware, Lackawanna & Western for violation of the law forbidding carriers to keep animals in cars more than 28 hours. The Central of New Jersey was fined \$100 on a similar charge.

The freight traffic passing through the Sault Ste. Marie canals in the month of November amounted to 11,154,508 short tons, of which 8,753,843 tons were eastbound and 2,400,665 westbound. Of the westbound movement 1,885,586 tons were soft coal and 332,210 tons hard coal. Nearly 38,000,000 bu. of wheat and over 7,000,000 bu. of other grain passed through the canals to eastern destinations.

The Commission on Car Service has cancelled its general orders C S 3 and C S 3A, issued in June, directing the railroads to return hopper and self-clearing cars immediately to the home road when released from original road. Any existing restrictions prohibiting the use or interchange of interchangeable open cars are ordered cancelled so that unrestricted interchange of such cars may be permitted.

The Post Office Department announces that it has established coastwise parcel post water routes to relieve the railroad congestion. Steamer routes for parcel post have been established from Boston to Norfolk, Boston to Savannah, New York to Norfolk, New York to Charleston, New York to Jacksonville, New York to Savannah, New York to New Orleans, New York to Galveston, Philadelphia to Savannah, Philadelphia to Jacksonville, Baltimore to Savannah, and Baltimore to Jacksonville. Special delivery, insured and perishable parcels, and those too large for inclusion in sacks will not be carried on these routes. At present about four carloads of parcels are handled daily. The Post Office department has effected some saving of cars by routing through cars for long distances where it has been the practice to transfer.

In a recent telegram to John L. Nagle, manager of the California Fruit Exchange at Los Angeles, Cal., Edward Chambers, chairman of the transportation committee of the United States Food Administration, announced that beginning December 1, shippers of oranges and lemons would be required to load refrigerator cars seven boxes wide and two high the entire inside length of the car, either under ventilation or refrigeration. He also asked shippers of vegetables and deciduous fruits to advise him of the limit of safety to which they could increase the carload above the minimum, so that proper regulations might be issued at once. He stated that a careful survey of transportation conditions led him to believe that with the maximum co-operation of all shippers the railroads would be able to handle perishable freight this winter without serious delay.

Louisville, Ky., reported on Monday 17 inches of snow and temperatures down to seven below zero. Transportation was temporarily paralyzed throughout a larger part of Kentucky. The Ohio River was frozen over at many places, and all river transportation was stopped. Congestion of railroads at the Louisville and Cincinnati gateways increased. The National Fuel Administration on December 15 instructed W. B. Bryan, Kentucky Fuel Administrator, to seize approximately 3,000 cars of coal between the eastern Kentucky fields and Cincinnati and distribute the coal through Kentucky, where the public was in bad shape due to the diminution of the West Virginia natural gas supply. This coal was waiting entry into the north and east through Cincinnati, but the carriers north of the river had been unable to accept the cars, some of which had been held for two weeks.

Foresight

The Forest Service, United States Department of Agriculture, reports that by the use of a three-deck barge capable of carrying 2,700 sheep at a time, a hitherto unused grazing range for approximately 75,000 sheep, at the head of Lake Chelan, in the Chelan National Forest, Washington, has been made available for

use. Lake Chelan is a beautiful body of water, 52 miles long. The head of the lake is practically inaccessible by land, but the lower end is convenient to a railroad and also to the bunchgrass ranges of eastern Washington upon which the sheep men of that region have for many years wintered large numbers of sheep. They lacked summer range, however; while the summer range at the head of the lake is particularly good.

Officers of the Forest Service suggested the construction of a barge to be towed by a small steamer. This was done, and 37,000 sheep were carried to the head of the lake the first season. Thus the National Forest land is utilized, and the boat makes accessible a large adjoining area in British Columbia inaccessible from the Canadian side. The stockmen intend to build another and larger barge for use next season.

Rules for Putting Two "Car-Loads" in One Car

J. W. Roberts, superintendent of freight transportation of the Pennsylvania Lines West of Pittsburgh, in a circular to agents, recommending the loading of two "car-load lots" in a single car, where practicable, gives detailed instructions for the loading and billing of such shipments.

Shipments may be consigned to one or not more than two destinations, provided the first destination is intermediate to the second by available routes. Two shipments will not be accepted if the first destination is a prepay station. Shipment for the first destination must be for delivery on public team track or private siding of the railroad that performs the road-haul service to or from the first destination (not on the tracks of a switching line). The shipment for the second destination will be delivered under regulations published by the delivering line, the same as though the car had contained no other shipment. The carload rate at the actual weight, subject to minimums prescribed in the Official Classification or tariffs lawfully on file, will apply on each consignment. The two shipments should be so loaded as to permit unloading without re-handling. Separate bills of lading will be issued, and a separate revenue way-bill made for each consignment, the same as though each shipment were loaded in a separate car.

Waste of Using Flimsy Boxes

At the hearing held by the Interstate Commerce Commission in Boston on December 12 W. H. Doble, of the Pneumatic Scale Corporation, presented a statement concerning economical packing and loading, in which he said:

In considering increase of railroad rates necessary to properly meet advanced costs in labor and material, any possible savings to be secured by more efficient methods should be taken into account. The package freight car is responsible for the greater part of the wasteful short loading. Containers in which merchandise is offered for shipment are so weak and fragile that they cannot be stacked more than two tiers deep without crushing, owing to the indiscriminate nature of the freight. Grindstones and silk hats don't mix well. Until a substantial container is universally adopted, this short loading of cars is bound to prevail. Representatives of two roads have stated confidentially that the clerical expense involved in handling loss and damage claims is increasing and at present costing these two roads \$500,000 each per year. Of the \$500,000 annual loss and damage payments \$15,000,000 is lost through "rough or careless handling"; \$7,500,000 results from the loss of package freight through its going astray because of effaced or improper marking; \$1,000,000 yearly is attributed to concealed loss; \$3,000,000 is attributed to wrecks; \$5,000,000 is attributed to leaky car roofs, oil-soaked cars, etc., and the remaining 37 per cent consists of miscellaneous losses and those upon shipments other than in package form.

The speaker then went on to describe the collapsible metal carrier, with which our readers are well acquainted. He quoted from the American Railway Association's committee report to the effect that this carrier is many times stronger than a wooden box and practically indestructible in the ordinary wear and tear of freight handling. An automatic lock prevents it from being opened without clear evidence of robbery. It therefore prevents concealed losses, prevents damage, does not absorb moisture, and can be used over and over again indefinitely.

Continuing, he said: Investigation of the past four years proves that full efficiency of labor and space in the handling of

package goods can only be attained by the adoption of containers of such strength that no ordinary shock of traffic will change their inside contour. The one-trip, fragile container now in use represents an annual waste of \$120,000,000. The Government during the past 12 months has paid millions for one-trip containers, which might have been saved. This same \$120,000,000 by its drain on the pulp industry, has increased the price of paper to an unwarranted degree. Roads are urging the shipper to use stronger containers and the logical solution of this problem is in the use of a many-trip container. The economy is based on the strength of container, the shipper to secure maximum number of trips, the railroads to secure immunity from loss and damage, as well as increased loading efficiency. Over 800 prominent shippers throughout the United States have signed petitions asking that the roads make it possible to use a many-trip container on a mutually reasonable basis of cost.

A Plain Tale from the Hills

[From the Boston Transcript]

Bangor & Aroostook Railroad affairs were ventilated at the rate hearing (December 14) before the Interstate Commerce Commission examiner, Wilbur La Roe. Percy R. Todd, president of the road, testified that for a period of years it has shown a decreasing operating ratio. Examiner La Roe commented upon the comparatively good showing of the road; that it can put money out of its earnings into the maintenance of the property to such an extent that it need not carry any depreciation fund and at the same time can pay a dividend of 4 per cent; and he could not understand why the company should appear now and ask for an increase in rates.

To this President Todd replied that the increase asked for will amount to only \$20,000 a year to the company, a sum which the road needs to cover losses that are almost certain to come in the future. There is almost certain to be a drop in revenue. There are not so many potatoes to move. For about eleven years Mr. Todd has been trying to find out how many potatoes are raised and what the farmers are doing with them, and Mr. Hoover has been trying for some months to obtain the same information, but they have not been able to find out. The farmers will not tell. It is evident, however, that the potato crop this year was between 30 and 40 per cent short. There is storage capacity for about 7,000,000 barrels along the railroad and there are not more than 1,000,000 barrels stored today. The farmers have built their own storehouses this year, however, and how much they have in them it is impossible to find out. But the railroad has handled 5,000 cars less, so far, than it handled last year up to the same time.

And the lumber movement will be smaller than usual. The lumber men have difficulties in getting labor, and declare that they will not be able to cut more than 25 per cent of the normal crop. Mr. Todd said that it was 22 degrees below zero on his line last night, which is not an unusual temperature; and the freight capacity shrinks by 40 per cent. Snow plows with two engines have to run almost constantly from December 15 to March 15, and passenger trains have to use two locomotives on the grades. Track laying is suspended from November until June, and when the frost comes out of the ground it is likely to come out from under one rail before it gets out from under the other, making operation dangerous.

The company needs more cars. It started to buy new cars, but the Government requests the roads not to buy new cars now. Then it bought 200 old freight cars out West, to be strengthened before they were delivered. After the work of repair had been started at one factory the Government notified the railroad that the factory was needed for war work, and the cars had to be sent to another place. Unable to get enough cars that way, the railroad started to build 150 at its own yards and bought all the material and carried it to its own plants to be assembled. Although it secured more men than it had before, it could not get more than 75 per cent efficiency out of the labor, and had to abandon the idea of assembling the cars with its own men. Then the material was collected and shipped away again to Laconia, N. H., to be assembled there by a car-building company.

OCTOBER A RECORD MONTH IN CANADA.—The Canadian railways handled the greatest volume of traffic in their history during the month of October. The total gross earnings amounted to \$34,379,125.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The Interstate Commerce Commission has announced an informal hearing before its Fifteenth Section Board at Washington on December 19 on the application of the Southeastern Passenger Association for approval of a proposed increase in charges for interchangeable mileage books in the Southeast.

STATE COMMISSIONS

Proposed Reduction of Freight Rates in Georgia

The State Railroad Commission of Georgia, in a tentative report on its consideration of the request, presented many months ago by all of the railroads of the state for authority to make an increase in freight rates, has issued a circular outlining the principles on which it proposes to authorize certain changes; and a hearing has been appointed for January 22, when criticisms or suggestions will be received. The order proposes some reductions in rates, but there will be no final approval of reductions until after the proposed tariffs have been tried for a time and the records have been compared with records of movement under the old rates. The commission's order is summarized as follows:

First. The commission declined to adopt the Southern classification with Georgia exceptions, in lieu of the present Georgia classification, but retained the present Georgia classification with certain amendments and eliminations which will produce a more nearly complete uniformity in classification ratings and descriptions. Southern classification was declined largely on the ground that it would produce an unwarranted increase in freight rates.

Second. The commission revised its freight classification of railroads in Georgia, eliminating the present four grand classes and reclassifying the carriers of Georgia in two grand divisions, class A and class B, the former including all so-called trunk line railways and their subsidiary branches, while the latter class takes in the small roads.

Third. The commission proposes to eliminate its present joint freight rate rule, and to prescribe the mileage scale for the combined mileage of joint hauls, plus a scale of arbitrariness, ranging from 8 cents, first class, down to 2 cents per 100 lb., class C.

Fourth. The commission proposes to eliminate the present "basing point" system of rate construction in Georgia and apply the long-and-short-haul principle, a change of great importance to Atlanta, Macon, Augusta, Savannah and others of the larger centers which now operate as basing points. The effect of this change is to increase rates between present basing points where such present rates are lower than to intermediate points.

Fifth. The commission has prescribed a maximum of 95 cents per 100 lb. (470 miles) on intrastate first-class traffic, and a minimum of 16 cents (5 miles), and prescribes a percentage relationship of all classes to first class.

PERSONNEL OF COMMISSIONS

B. H. Meyer has been nominated by President Wilson for reappointment as a member of the Interstate Commerce Commission for seven years; and the Senate has confirmed the nomination.

COURT NEWS

Trackage Agreement Construed

Under a trackage agreement between two railroad companies, the object of which as expressed in the agreement was to enable one of the companies to connect disconnected portions of its railroad to form a continuous line, and to operate trains to and from points on its own road, the other company granted the right to use in connection with it a part of the railroad owned and operated by it, "including the main tracks, sidings, passenger and freight stations, Y's, inclines and other appurtenances and terminal and station facilities connected therewith." The Ohio

Supreme Court holds that the grantee company has no right to the use of a track built by the owning company on the right of way and connecting its main track with the mine tracks of a coal company, which track was not built for the general use of the railroad companies, but for the convenience of the coal company. The question was raised in a complaint to the Public Utilities Commission against the grantee railroad requiring it to furnish complainant cars for hauling its product. The commission's order in favor of the coal company was reversed. The court holds that the rights acquired by the grantee were contract rights, subject to the limitations and restrictions contained in the agreement, and the duties of that company to the public were not the general duties of a common carrier operating on its own road. That company could not be required to furnish cars to a coal company whose mine was situated on the part of the railroad over which the railroad was operating under the traffic agreement, if in the rendition of such service there would be a violation of a restriction contained in the agreement.—*Kanawha & M. v. Public Utilities Commission (Ohio) 117 N. E., 353. Decided May 29, 1917.*

UNITED STATES SUPREME COURT

Records of Shipments of Intoxicating Liquors

The Supreme Court of the United States has affirmed the judgment of the North Carolina Supreme Court (169 N. C., 295) adjudging the Seaboard Air Line guilty of violating section 5 of the North Carolina statute of 1913, requiring railroad companies to keep a separate book in which shall be entered the name of every person to whom intoxicating liquor is shipped, together with amount, kind, date of receipt, etc., to be followed by the consignee's signature, acknowledging delivery; providing that the book shall be open to inspection by any officer or citizen, and making failure so to do a misdemeanor. The company refused to permit a citizen to inspect its record of liquors transported from Virginia into Wake county, N. C. The railroad contended that the section was void as an attempt by the state to regulate interstate commerce, and also that, to comply, the carrier would violate the law which prohibits the disclosure of such information regarding shipments to third persons except under specified circumstances; and that the Webb-Kenyon Law of 1913 could not affect the application of these principles to shipments destined to points in Wake county, because it relates to liquors intended to be received, possessed, sold or used in violation of state law, and to receive or possess liquor in any quantity in that county is not unlawful. The Supreme Court said, by Justice McReynolds: "Since our decision in *Clark Distilling Co. v. Western Maryland Ry. Co.*, 242 U. S., 311, 320, 324, it has not been open to serious question that the Webb-Kenyon Law is a valid enactment; that its purpose was to prevent the immunity characteristic of interstate commerce from being used to permit the receipt of liquor through such commerce in states contrary to their laws, and thus in effect afford a means by subterfuge and indirection to set such laws at naught; and that under it a state may inhibit shipments therein of intoxicating liquors from another by a common carrier although intended for the consignee's personal use where such use is not actually forbidden. Plainly, therefore, after that enactment nothing in the laws or Constitution of the United States restricted North Carolina's power to make shipments of intoxicants into Wake county a penal offense irrespective of any personal right in a consignee there to have and consume liquor of that character. "The challenged act instead of interposing an absolute bar against all such shipments, as it was within the power of the state to do, in effect permitted them upon conditions intended to secure publicity, to the end that public policy might not be set at naught by subterfuge and indirection. The greater power includes the less.

"The provisions of section 15, Act to Regulate Commerce, here relied on, were intended to apply to matters within the exclusive control of the Federal Government; and when by a subsequent act Congress rendered interstate shipments of intoxicating liquors subject to state legislation, these provisions necessarily ceased to be paramount in respect of them." Justice Van Devanter dissented. Decided December 10, 1917. (The court has sustained the Idaho law which is truly "bone-dry." "Under it no person, without a permit, may possess liquor for medicinal, religious or industrial purposes)."

Equipment and Supplies

FREIGHT CARS

THE UTAH COPPER COMPANY is inquiring for 200 60-ton hopper ore cars.

THE ANACONDA COPPER MINING COMPANY is inquiring for 10 40-ton box cars.

THE REPUBLIC CREAMERY COMPANY, Indianapolis, Ind., is inquiring for five 10,000-gal. tank cars.

T. E. HAMMAN, Milmine, Ill., has ordered 5 box cars from the Central Locomotive & Car Works.

JOSEPH E. GRANVILLE, St. Louis, Mo., has ordered 4 box cars from the Central Locomotive & Car Works.

THE UNITED STATES GOVERNMENT has ordered 65 gun cars from the American Car & Foundry Company.

THE PETROLEUM PRODUCING & REFINING COMPANY, Tulsa, Okla., is inquiring for from 30 to 50 tank cars.

THE OREANA GRAIN COMPANY, Oreana, Ill., has ordered one box car from the Central Locomotive & Car Works.

THE FRENCH GOVERNMENT has ordered 1,000 steel underframe flat and 850 steel underframe gondola cars of 60 cm. (1 ft. 11½ in.) gage from the American Car & Foundry Company.

THE UNION PACIFIC's order for 50 caboose cars, reported in a recent issue of the *Railway Age Gazette* as given to the Mount Vernon Car Manufacturing Company has been transferred to the American Car & Foundry Company instead.

SIGNALING

THE NORFOLK & WESTERN has ordered from the Union Switch & Signal Company 15 signals, style S, for use on the Big Sandy division, near Kenova, W. Va.

THE JACKSONVILLE (FLA.) TERMINAL COMPANY has ordered from the Union Switch & Signal Company the material for two interlocking plants, towers 1 and 3, at the new Jacksonville passenger terminal. These machines will have mechanical levers for switching and electric power for signals.

THE PHILADELPHIA & READING has contracted with the Union Switch & Signal Company for the complete installation of an alternating current system of automatic block signals between the Delaware River Bridge and Skillman, N. J., 13 miles, three track and four track. The signals will be style T2 and the track relays Union Model No. 15, vane type. The work will also embrace the installation of a Type F electric interlocking at Trenton Junction, 11 levers. Changes will be made also at other interlockings and there will be two new twelve-lever mechanical machines, one at Hopewell and the other at Trenton Junction.

NEW YORK STATE HIGHWAY MILEAGE.—The designated mileage of state and county highway systems in New York State is 11,988, of which 5,926 miles had been completed and accepted on January 1, while contracts in force at that time covered 1,185 miles. This, with the contracts awarded during the year 1916, leaves a balance of designated mileage not yet cared for of 4,210. Highway construction during the past two years has been greatly hindered by shortage of labor.

INCREASED RATES IN NORWAY.—A substantial temporary increase in the rates on the Norwegian State Railways, both for passenger and freight traffic, has been decided upon owing to the very material increase in the cost of operating the railways. Including previous temporary increases in the railway rates, the rise amounts to 80 per cent for first and second-class passengers, 60 per cent for third-class passengers, 100 per cent on passengers' baggage, and 100 per cent on express and ordinary freight traffic, except articles of food and fuel, for which commodities the increase amounts to 70 per cent, and milk, for which it is 50 per cent.

Supply Trade News

The Greaves-Klusman Tool Company, Cincinnati, Ohio, has purchased the plant of the Champion Tool Works and will use it as an erecting plant in addition to its present works.

L. S. Love has resigned as sales manager of the Sherritt & Stoer Company, Philadelphia, to become general manager of the Machine Tool Engineering Company, Singer building, New York.

N. B. Payne has opened an office in the Havemeyer building, 25 Church street, New York, as an electric crane specialist dealing in new and used traveling cranes. Mr. Payne was formerly associated with Manning, Maxwell & Moore, Inc., New York, and has an extensive experience in this kind of work.

James K. Howard has been appointed general manager and elected a director of the A. G. A. Railway Light & Signal Company with headquarters at the company's main office, Elizabeth,

J. K. Howard

N. J. Mr. Howard was born on August 8, 1871, at Zanesville, Ohio. He entered railway service on the New Haven & Derby as a rodman, but left in 1890 to enter Rutgers College where he studied until 1893. He then entered the employ of the Peoria & Pekin Union, serving successively as assistant engineer and engineer until 1899. In July, 1900, he went with the Wabash as division engineer, leaving in July, 1905, when he entered the service of the Chicago, Peoria & St. Louis as engineer of maintenance of way. After serving

in this capacity until January, 1907, he left the road to become engineer in charge of railway surveys in eastern Ohio and western Pennsylvania. In July, 1910, he was appointed engineer of maintenance of way on the Ann Arbor, leaving in January, 1913, to become assistant chief engineer for the Lorain, Ashland & Southern, which position he held until October, 1916, when he became connected with the A. G. A. Company. He has held the position of northwestern representative of the company at Chicago since last February.

TRADE PUBLICATIONS

LONG LEAF STRUCTURAL TIMBER.—The Crowell & Spencer Lumber Company, Long Leaf, La., has issued a 24-page handbook for the use of engineers. In addition to a description of Calcasieu long leaf pine and an exposition of the trade-mark containing that word as applied to yellow pine lumber, the book contains specifications for yellow pine, tables of working stresses for beams and columns and a copy of the table of allowable stresses in structural timbers used in wooden bridges and trestles adopted by the American Railway Engineering Association in 1909.

CUTTING AND THREADING TOOLS FOR PIPE.—This is the title of catalog No. 12 of the Borden Company, Warren, Ohio, a neatly gotten up 32-page booklet covering the "Beaver" line of pipe tools. The line includes a number of types and sizes of die stocks and square-end pipe cutters. In the "Beaver" die stocks, the dies themselves are without taper, the taper thread being cut by automatically moving the dies away from the pipe as the threading operation progresses. Since the dies are straight but few teeth are required, and the range of adaptability is materially increased. The catalogue explains the principle on which these dies operate and contains a complete illustrated list of repair parts.

Financial and Construction

FINANCIAL NEWS

BALTIMORE & OHIO.—Following the meeting, on December 19, of the board of directors which was held a week earlier than usual, it was announced that action on the dividend was deferred until the next meeting, which it is expected will be held on January 16. Commenting on the situation, President Daniel Willard stated "that action was postponed because of the present unfavorable conditions, that the board naturally desired to make as large a distribution to the shareholders as was justifiable and it was hoped that there might be some favorable developments within the next few weeks which would support a more liberal action than would now be possible. Notwithstanding the company will have handled the greatest business in its history and will have realized the largest gross earnings, it was evident that the operations of the year would show earnings applicable to the common stock of less than 5 per cent. This possibility was foreseen and emphasized in my statement before the Interstate Commerce Commission on November 5. The gross earnings of the property will exceed those of the previous year by \$12,500,000, but the expenses will be over \$16,000,000 greater—transportation expenses alone being over \$14,000,000 in excess of the year 1916. The increased expenses are due in part to the severe weather conditions which prevailed in February, March and December of the current year, but are chiefly due to the increases in rates of pay, and in the price of fuel and material, which have, so far, been offset only in part by increase in rates."

NEW YORK, ONTARIO & WESTERN.—This company has declared a dividend of 2 per cent on the common stock, payable January 14 to stock of record December 31. The last previous dividend was 1 per cent, on July 24, 1916. In 1909, 1910 and 1911, dividends were paid at the rate of 2 per cent per annum. No dividend was paid in 1912, and in 1913 2 per cent was paid. The New York, New Haven & Hartford owns \$29,160,000 of the \$58,113,983 common stock of the New York, Ontario & Western, having acquired this majority interest in October, 1914, at a cost of \$45 per share. A dividend of \$2 a share on the common stock of the New York, Ontario & Western means \$583,200 additional revenue for the New Haven.

TEHUANTEPEC NATIONAL.—The Mexican Government is negotiating with S. Pearson & Son, Ltd., of London, for the dissolution of this railway, which extends from Puerto Mexico to Salina Cruz, Mex., 188 miles. The road had been operated under a contract extending for 50 years from July 1, 1903, between the Federal Government of Mexico and the firm of S. Pearson & Son. This contract provided that S. Pearson & Son should operate and manage the railway as managing partners for and on account of the partnership, with a working capital of \$5,000,000, one-half of which was to be furnished by each partner. The agreement now concluded contemplates that the government shall acquire the road and also the docks and harbor works now under construction at Puerto Mexico, the contract with the company being cancelled.

RAILWAY CONSTRUCTION

PENNSYLVANIA LINES WEST.—Plans have been made and bids will be asked for soon for improvements to be carried out at Cincinnati, Ohio, on the Cincinnati, Lebanon & Northern. The work will include new inbound and outbound freight stations, office building, team track yards, etc., to cost \$250,000.

PENNSYLVANIA RAILROAD.—Construction work is now under way on the Chester & Philadelphia branch of the Philadelphia, Baltimore & Washington. This branch leaves the South Chester branch near Central and Delaware avenues, Chester, Pa., and is located over private property to Front street. From the latter point it will be constructed through the city of Chester to Ridley Creek, thence via North Essington to a connection with the Pennsylvania Railroad at Girard Point. The general contract has been given to the James McGraw Company.

Railway Officers

Executive, Financial, Legal and Accounting

C. A. Trimble has been appointed assistant general auditor of the Colorado & Southern, with office at Denver, Colo.

H. G. Jenkins has been appointed assistant to the president of the Northwestern Pacific, with office at San Francisco, Cal.

T. A. Hamilton, special representative in the president's office of the St. Louis-San Francisco at St. Louis, Mo., has been appointed controller.

H. A. Toland has been appointed assistant auditor of the Oregon Short Line with headquarters at Salt Lake City, Utah, succeeding T. A. Martin, resigned, effective December 1.

G. W. Thompson has been appointed assistant to the president and purchasing agent of the Detroit, Toledo & Ironton, with headquarters at Detroit, Mich., succeeding A. H. Jones, transferred.

The officers of the Delphos branch of the Cincinnati, Hamilton & Dayton, the sale of which to John Ringling was noted in these columns on November 2, are as follows: John Ringling, president, with office at New York City; C. C. Wilson, vice-president, with office at Chicago; W. J. Bohan, general manager, O. C. VanZandt, secretary and J. M. Kelley, general attorney, with offices at Dayton, Ohio.

Operating

John Fritz has been appointed terminal superintendent of the Southern Railway, with headquarters at East St. Louis, Ill.

P. J. Coleman, trainmaster of the Northern Pacific at Jamestown, N. D., has been appointed assistant superintendent of transportation with headquarters at St. Paul, Minn.

A. Pardoe, car accountant of the Colorado & Southern, has been appointed acting superintendent of transportation, with headquarters at Denver, Colo., succeeding G. C. Randall.

E. D. Moore has been appointed superintendent of the Lansing division of the New York Central, with headquarters at Hillsdale, Mich., succeeding M. L. Reynolds, effective November 15.

F. J. Easley, until recently general manager of the Denver & Rio Grande, has been appointed general manager of the Peoria Railway Terminal Company, with headquarters at Peoria, Ill., succeeding George Walliser, resigned.

A. H. Jones, assistant to the president and purchasing agent of the Detroit, Toledo & Ironton, has been appointed general superintendent in charge of transportation and car service matters, succeeding G. W. Thompson, transferred.

E. H. Harman has been appointed superintendent of the Wiggins Ferry Company, with headquarters at St. Louis, Mo., succeeding Charles Burlingame, who has been appointed superintendent of the Terminal Railroad Association, with headquarters at the same city.

A. A. Freiberger has been appointed assistant superintendent of the Memphis subdivision and the Memphis (Tenn.) terminals of the St. Louis-San Francisco, succeeding E. L. Magers, who has been appointed superintendent of the Western division, succeeding E. C. Lilley resigned.

W. J. McGarry, superintendent of car service of the Lehigh Valley, with headquarters at South Bethlehem, Pa., has been appointed superintendent of transportation, a newly created position, and his former position has been abolished. V. D. Thayer, chief clerk in the car record office at South Bethlehem, has been appointed car accountant.

C. C. Holtorf, assistant superintendent of the Chicago, Burlington & Quincy, with headquarters at Deadwood, S. D., has been transferred to the Casper division, with headquarters at Greybull, Wyo. W. G. Dungan, trainmaster and roadmaster at Orleans, Neb., has been promoted to assistant superintendent of the Alliance division to succeed Mr. Holtorf. These changes were effective December 5.

A. S. Johnson, superintendent of the Terminal Railroad Association of St. Louis, has been promoted to assistant general manager, a newly created position, with headquarters at St. Louis, Mo. Charles Burlingame, superintendent of the Wiggins Ferry Company, St. Louis, has been appointed superintendent of the Terminal Railroad Association, with the same headquarters, succeeding Mr. Johnson.

J. L. Kendall has been appointed superintendent of the Valley division of the Missouri Pacific with headquarters at McGehee, Ark., succeeding D. O. Ouellet, transferred to Osawatimie, Kan., as superintendent of the Central Kansas and Colorado division. W. F. Kirk, assistant superintendent at Atchison, Kan., has been appointed acting superintendent of the Wichita division, with headquarters at Wichita, Kan. The above changes were effective December 15.

W. T. Wolff, whose appointment as superintendent of freight station service of the Pennsylvania Lines West of Pittsburgh, with headquarters at Pittsburgh, Pa., was announced in the

W. T. Wolff

Railway Age Gazette of December 14, first entered railway service with the Pennsylvania Lines on December 1, 1879, as a clerk in the superintendent's office at Cincinnati, Ohio. On May 1, 1880, he was transferred to the trainmaster's office at Xenia, Ohio, and on October 1, 1881, returned to the superintendent's office at Cincinnati. From April, 1886, to February 1, 1900, he was chief clerk in the superintendent's office at Cincinnati, and from the latter date to August 1, 1902, he was assistant trainmaster of the eastern division of

the Pennsylvania Lines. After six months as chief clerk to the general manager of the Chicago, Rock Island & Pacific at Chicago, he returned to the Pennsylvania Lines on February 1, 1903, as assistant trainmaster on the Indianapolis-Vincennes division. On April 1, 1903, he was transferred to the office of the general superintendent of freight transportation at Pittsburgh as special agent. On April 1, 1905, he assumed charge of the car record office for the Pennsylvania Lines West at Pittsburgh. He resumed miscellaneous work as special agent in the office of the general superintendent of freight transportation on April 1, 1912, and on December 15, 1917, was appointed superintendent of freight station service, with headquarters at Pittsburgh.

Mott Sawyer, superintendent of the Chicago, Milwaukee & St. Paul at Mason City, Iowa, has been appointed superintendent of the Columbia and Idaho division, with headquarters at Spokane, Wash., vice Ezra Clemmons, assigned to other duties. F. G. Hill has been appointed superintendent of the Musselshell division, with office at Miles City, Mont., succeeding Hugh Spencer, assigned to other duties. A. E. Campbell succeeds Mr. Hill as superintendent of the Trans-Missouri division, with office at Mobridge, S. D., and H. L. Wiltrout succeeds Mr. Campbell as trainmaster, with office at St. Maries, Idaho.

C. S. Christoffer, assistant superintendent of the Milwaukee terminal of the Chicago, Milwaukee & St. Paul, has been promoted to superintendent of the Chicago terminal, succeeding P. L. Rupp, transferred. C. A. Bush has been appointed assistant superintendent of the Milwaukee terminals, succeeding Mr. Christoffer. P. L. Rupp, superintendent of the Chicago terminal division, has been appointed superintendent of the Chicago & Milwaukee division, succeeding E. G. Atkins, who has been transferred to Mason City, Iowa, as superintendent of the Iowa & Dakota division, in place of M. Sawyer, transferred. The above changes took effect December 15.

R. E. Woodruff, whose appointment as superintendent of transportation of the Erie, with headquarters at Youngstown, Ohio, was announced in these columns on November 9, was born

at Green Bay, Wis. He graduated from Purdue university in 1905 and in the same year began his railroad career with the Erie as a track laborer. He later served as foreman, transitman, assistant division engineer, division engineer and trainmaster at various points on the Lines West. From March, 1909, to November, 1910, he was general agent at the Chicago terminal; from November, 1910, to May, 1912, he was division superintendent at Rochester, N. Y.; from May, 1912, to November 1, 1916, he was superintendent at Marion, Ohio. On November 1, 1916, he was promoted to superintendent of the Mahoning division with headquarters at Youngstown, Ohio, which position he held at the time of his appointment, as noted above.

C. T. Ames, whose appointment as terminal superintendent at Chicago of the Chicago, Rock Island & Pacific was announced in these columns on November 30, was born at Boston, Mass. He entered the service of the Fitchburg in the general freight department in October, 1892. He served in various clerical capacities, including secretary to the general freight agent, until February 1, 1898, when he was appointed traveling freight agent, with headquarters at Troy, N. Y., where he remained until February, 1899, when he returned to Boston as eastbound freight agent. He left this position on the consolidation of the Fitchburg and the Boston & Maine in the fall of 1900 to become traffic manager of the Hudson Valley, with headquarters at Troy, N. Y. He entered the service of the Chicago, Rock Island & Pacific in January, 1903, in the office of the superintendent of the Illinois division at Chicago and after seven months was promoted to chief clerk, remaining in that capacity until 1907, when he was transferred to the general manager's office as service inspector. In October, 1908, he was assigned to special duties at Little Rock, Ark., by the general superintendent. He returned to Chicago in the summer of 1909 and entered the general manager's office, where he remained until February 1, 1911, when he was appointed chief clerk to the second vice-president, which position he held up to December 1, when he was appointed terminal superintendent, as noted above.

Traffic

S. A. Eddy has been appointed commercial agent of the Chicago, Milwaukee & St. Paul at Winnipeg, Man.

Walter C. Harden, whose appointment as assistant general passenger agent of the Delaware & Hudson, with headquarters

W. C. Harden

at Albany, N. Y., has already been announced in these columns, was born on May 20, 1890, at Troy, N. Y. He was educated in the public schools of Troy, and in 1909 graduated from Lansingburg high school. In June, 1910, he began railroad work in the passenger department of the Delaware & Hudson, and to the following November served as office boy. From November, 1910, to January, 1914, he was rate clerk. On January 1, 1914, he was appointed chief rate clerk, which position he held until his appointment on December 1, 1917, as

assistant general passenger agent of the same road, as above noted.

E. L. Hickman has been appointed general agent of the Michigan Central at South Bend, Ind., effective December 1.

G. V. Omohundro has been appointed commercial agent of the Colorado & Southern at Cheyenne, Wyo., succeeding A. L. Moore.

L. P. Hichman has been appointed commercial agent of the Cleveland, Cincinnati & St. Louis at East St. Louis, Ill., succeeding E. J. Zschirpe.

C. H. Morrill, director of development of the St. Louis-San Francisco, with office at St. Louis, Mo., has been appointed assistant freight traffic manager.

G. W. Vetter was appointed general agent of the Atchison, Topeka & Santa Fe at Tulsa, Okla., succeeding P. T. McKirahan, resigned, effective December 1.

G. F. Scheer, traveling passenger agent of the Baltimore & Ohio, with headquarters at St. Louis, Mo., has been promoted to general agent, with headquarters at Toledo, Ohio.

F. E. Hammann, assistant general passenger agent of the Lehigh Valley, with office at New York, has been promoted to manager of mail traffic and general baggage agent, with headquarters at New York, and on January 1, the general baggage and railway mail departments will be combined. Mr. Hammann began railway work with the Lehigh Valley as a clerk in the passenger department at Mauch Chunk, Pa. He subsequently served as chief rate clerk at South Bethlehem and then as chief clerk to the general passenger agent at Philadelphia, Pa. On April 17, 1905, he was appointed assistant general passenger agent with office at New York, and now becomes manager of mail traffic and general baggage agent of the same road as above noted. Mr. Hammann's entire railway service has been with the Lehigh Valley.

F. E. Lewis, commercial agent of the New York Central at Detroit, Mich., has been appointed division freight agent, with the same headquarters, effective November 15. The office of commercial agent has been abolished.

Norman W. Pringle, division passenger agent of the Lehigh Valley with office at Ithaca, N. Y., has been appointed assistant general passenger agent, with headquarters at New York. He was born at Huntingdon, Que. and began railway work with the Rutland Railroad in the freight house at Rutland, Vt. Six months later he entered the passenger department and served as traveling passenger agent with office at Rutland, on the same road. In 1909 he went to the Lehigh Valley, and served as New England agent at New Haven, Conn., until 1914, when he was appointed division passenger agent, with office at Buffalo, N. Y. In 1916 he was transferred in the same capacity to Ithaca, from which position he is now promoted to assistant general passenger agent of the same road as above noted.

W. M. Orr, of the Queen & Crescent Despatch fast freight line, with headquarters at Cincinnati, has been appointed division freight agent of the Southern at New Orleans, La., succeeding R. H. Tate, whose death was mentioned in the issue of November 9.

The titles of M. R. Leahy and R. Thomson, assistant general passenger and ticket agents of the Chicago & North Western, with headquarters at Chicago, Ill., have been changed to assistant general passenger agents, with the same offices. The title of G.

Bronnell has been changed from industrial and immigration agent to industrial agent, with office as before at Chicago.

A. P. Bean, general baggage agent of the Lehigh Valley with office at South Bethlehem, Pa. and W. T. Heeran, supervisor of mail traffic, with office at New York, have resigned to enter other business. H. J. Bills, district passenger agent with office at Minneapolis, Minn. has been appointed division passenger agent with headquarters at Ithaca, N. Y. succeeding N. W. Pringle promoted.

D. H. Hoops, whose appointment as assistant general freight agent of the Chicago & North Western, with headquarters at Chicago, was announced in these columns on November 30, was born at Chicago in 1869. He entered the service of the Chicago & North Western in 1887 as an office boy and has been with that company continuously since that date, serving as chief rate clerk in the general freight department; chief clerk to the general freight agent, Des Moines, Iowa; assistant general agent, freight department, Chicago; general agent, passenger department, Chicago; general agent, freight and passenger department, Denver, Colo.; and general agent, freight department, Chicago. He held the last named position at the time of his promotion as noted above, effective November 15.

Engineering and Rolling Stock

C. F. Ludington, superintendent of the fuel department of the Missouri, Kansas & Texas, has been appointed fuel supervisor of the Chicago, Milwaukee & St. Paul with office in Chicago, effective December 15.

G. F. Wieseckel, master mechanic of the Western Maryland, with office at Hagerstown, Md., has been appointed superintendent of motive power, with headquarters at Hagerstown, succeeding H. R. Warnock, resigned to go to another company.

L. Clapper, assistant engineer on the Duluth & Iron Range, has been appointed engineer of bridges and buildings. His duties will include those previously performed by B. T. McIver, general foreman of bridges and buildings, resigned, and such other duties as may be assigned him.

R. H. Nicholas, general foreman of the Central of New Jersey at Communipaw (N. J.) engine terminal, has been appointed assistant master mechanic, and W. E. Hardy, foreman at East Twenty-second street, has been promoted to general foreman at Communipaw engine terminal, vice Mr. Nicholas.

L. E. Dix, master mechanic of the Trans-Mississippi terminal, a subsidiary of the Texas & Pacific, has had his jurisdiction extended over the Louisiana division of the Texas & Pacific, from New Orleans, La., to Boyce, with headquarters at Gouldboro, La. J. A. Delaney, whose transfer to Big Springs, Tex., was mentioned in these columns on December 7, was master mechanic of this division.

Special

E. Moore has been appointed insurance commissioner of the Canadian Pacific.

Railway Officers in Military Service

Major N. D. Ballantine, assistant to the vice-president of the Chicago, Rock Island & Pacific at Chicago, has assumed charge of the recruiting of the 416th Battalion of the United States Signal Corps at Grand Rapids, Mich., during the illness of the major of that battalion.

OBITUARY

G. M. Anderton, first lieutenant in the Engineer Corps of the Army, and formerly an assistant engineer on the Illinois Central, died on December 9, on board a United States transport bound for Europe.

GO ROUND GLOBE TO GET HOME.—Traveling from Asia and Africa by way of the United States, in order to reach England and the Continent has become necessary for many since discontinuance of direct steamship traffic. A British steamship which arrived recently at New York brought several mining engineers and others on their way to their homes in England from Cape Town, South Africa, to spend the Christmas holidays.

GENERAL NEWS SECTION

PRESIDENT WILSON TAKES OVER THE RAILWAYS

ON Wednesday night, after this edition of the *Railway Age Gazette* was ready for the press, President Wilson issued a proclamation taking over control of the railways and appointing Secretary of the Treasury McAdoo the director general of railroads. The plans suggested by the President for compensating the railways are not as good as railway managers hoped for, but they are as good as could reasonably be expected, and the duty of all railway men is to now turn in and help Mr. McAdoo make a complete success of his big task. The President's proclamation will be found on page 1170.

Both the gross and net earnings of the railroads in 1916 were so large that when measured in billions and millions they seemed to give evidence of astounding prosperity and it is only when expressed in terms of the percentage earned on the investment that their true character is seen. So many glowing accounts have

The Rate of Return on Railway Investment

been published of the results of railway operation in 1916 that, even at the risk of adding to the confusion of figures, we cannot refrain from calling attention to the fact that the Interstate Commerce Commission in a table published in its annual report to Congress last week, states the percentage of operating income to property investment for the fiscal year 1916 as only 5.8 for roads of Class I and Class II and their non-operating subsidiaries. In its annual report for 1916 it published an estimated figure of 6.35 per cent. In the *Railway Age Gazette* of September 29, 1916, there was published an estimate that the rate of return for that year would hardly exceed 5.6 per cent and on January 12, 1917, we published another estimate of 5.9 per cent for the calendar year 1916. The commission's report now gives a new estimate of 6.5 per cent for the 12 months ending June 30, 1917. With the idea that possibly the commission's method of estimating may have again produced a result as much more favorable

than the revised figures will show as it did in 1916, we have had another analysis of the available statistics for 1917 made by the Bureau of Railway Economics and get a result of approximately 5.7 per cent. In the course of time, when the Interstate Commerce Commission's official statistical reports finally emerge from the congestion of the government printing office, we shall accept the result there stated, but while estimates are being made we feel at liberty to call attention to the fact that the commission's method of estimating from the Class I roads alone produces a higher average rate of return than is obtained by using the operating income of the million dollar roads and making an estimate for the roads of Class I and Class III. This produces an operating income for the 12 months ending June 30, 1917, of \$1,090,000,000. After deducting an estimate for the taxes of lessor companies, and hire of equipment, joint facilities and miscellaneous rents, on the basis of the 1916 figures, we get a net operating income of \$1,050,000,000 or \$4,237 per mile, which on the basis of \$74,000 per mile investment produces an average return of 5.72 per cent. The Interstate Commerce Commission in its estimate apparently does not make the deductions referred to but uses a figure of \$1,069,750,000 for operating income, instead of calculating the net operating income. As the commission has reduced its estimate for 1916 from over 6 per cent to 5.8 per cent it is not impossible that, when its official statistics are issued, the result for 1917 will be found to be less favorable than has been generally assumed.

In carrying out the recommendations of the Special Committee of the Association of American Railway Accounting Officers,

Co-operation With Accounting Department

which are printed elsewhere in this issue, accounting officers will need the co-operation of the executives and of the heads of other departments especially in regard to the installation of mechanical devices and the elimination of unnecessary statistics. Appropriations for anything in the nature of a capital expenditure are particularly hard to get now, but it would be penny wisdom of the worst kind to fail to substitute, wherever expedient, mechanical devices for man power. The recommendation that unnecessary statistics be eliminated affects all departments, but the operating more than any other, perhaps. Probably steps have already been taken to do away

with unnecessary statistics on many roads but it is safe to say that there is still a great mass of figures being compiled which is pretty nearly useless, arriving at the general manager's desk, as it does, forty-five to sixty days after the events recorded. Supervision by means of statistics is more than ever essential under present circumstances but a few logical and searching reports made up within a few hours of the events recorded are more effective for purposes of supervision than an armful of reports completed "the fifteenth of the following month." Operating officers and executives especially ought to read every word of the accounting officers' committee report.

THE FAILURE, NOT OF RAILROAD ADMINISTRATION, BUT OF RAILROAD REGULATION

THE government is going to take direct supervision of the railroad management during the war. It is going to do this because our present system of railroad regulation has broken down. The Interstate Commerce Commission recently has made two important reports which bear directly on this subject. One is its annual report for 1917; the other, the special report regarding the need for unification of railroad facilities which it sent to Congress on December 5. The former is a vindication of the operation of the railways since the United States entered the war; the latter, as we view it, a condemnation of much of our past government regulation of railroads.

Those who say the need for government supervision of operation during the war is due to a break-down of railroad management should read these two reports and ponder their significance when taken together.

In its annual report the Commission said: "Transportation conditions have been abnormal throughout the entire country during the past year. * * * Even before our country was drawn into the war the railroads were handling an extremely heavy traffic, heavier by far than at any time in their previous history. This was greatly increased by the war. * * * Since 1907 there were few times when the number of freight cars available did not exceed the number required for the transportation of the country's commerce. * * * As a result of this condition, there was slight incentive to secure additional equipment, and on many lines the idle cars were allowed to deteriorate."

The recent enormous increase in traffic, as the Commission points out, rapidly wiped out the car surplus. "Through the railroads' Commission on Car Service efforts have been made to relieve the difficulties resulting in car shortage and congestion. * * * Without attempting to detail the activities on the part of the railways through this organization, it will suffice to say that they have responded to and supported the executive committee (i. e., the Railroads' War Board), which in an earnest way has attempted to deal with the vexatious and troublesome questions and to meet the unprecedented demands upon the railroads. * * * While conditions have been extraordinary and while traffic is not always moved as carriers and shippers would have it moved, the essential needs of the country have to date been cared for. Much was said during the past winter as to the danger of freezing and famine on account of failure adequately to transport fuel and foods, but history will record no such calamity."

In the entire report there is not a word of criticism of the railroads for what they have done or not done since the country entered the war. The conditions have been abnormal and the railroads, with the co-operation of the Commission itself and the shipping public, have done the best they could in the circumstances. This, in substance, is the Commission's report.

Fully as significant as what the Commission says in its annual report, and even more forcefully worded, are the views

expressed by Secretary of War Baker in his annual report for 1917 (pages 39-40) regarding the way in which the railroads have co-operated with the War Department. He says:

"In this general connection it seems appropriate to refer to the effective co-operation between the department and the transportation agencies of the country. For a number of years the Quartermaster General's Department has maintained close relations with the executives of the great railway systems of the country. In February, 1917, a special committee of the American Railway Association was appointed to deal with questions of national defense, and the co-operation between this committee and the department has been most cordial and effective, and but for some such arrangement the great transportation problem would have been insoluble. I am happy, therefore, to join the Quartermaster General in pointing out the extraordinary service rendered by the transportation agencies of the country, and I concur also in his statement that 'of those who are now serving the Nation in this time of stress, there are none who are doing so more whole-heartedly, unselfishly and efficiently than the railroad officials who are engaged in this patriotic work.'"

Contrast this with what the Commission says in its special report of December 5 to Congress. Complete unification of the operation of the railroads is necessary, it declares. "If the unification is to be effected by the carriers," it continues, "they should be enabled to effect it in a lawful way by the suspension during the period of the war of the operation of the anti-trust laws, except in respect of consolidations or mergers, and of the anti-pooling section of the Commerce Act." The only alternative is the appointment of a government railroad controller who would be able to disregard these laws.

Why must the railroads in one way or another be freed from the anti-trust and the anti-pooling laws? Because, as the Commission points out, those laws were passed to compel the roads to compete, and they cannot secure the greatest efficiency in the utilization of existing facilities without eliminating competition and working as a single system. In other words, the great obstacles to securing maximum transportation efficiency in this crisis are law-made obstacles and not railroad-made obstacles. As a matter of fact, the Sherman anti-trust law and the anti-pooling law, as has been pointed out by the *Railway Age Gazette* and by other students of railway problems, with "damnable iteration" for many years, always have been obstacles to efficient railroad operation and regulation.

In its special report the Commission says: "The sudden, unforeseen and unprecedented demand for transportation occasioned by the war placed a strain upon the facilities and equipment of the railways which they were not and are not prepared to meet. There was created a need for immediate and extensive additions to existing facilities and equipment. The need is coincident with demands upon capital as well as upon labor, manufactures and natural resources such as we have never before known. Important additions and betterments will require new capital." The Commission recognizes it as its duty to grant rates to cover all necessary expenses and a fair return upon the value of the properties, but takes the view that no rates it could grant would enable the railways to compete successfully against the government in the open market for the new capital they require. Therefore, it suggests a direct government loan or guarantee to enable the railways to raise the needed capital.

It is true, as the Commission indicates, that nobody foresaw that a great war would cause such a large increase in the demand for transportation. But it has been foreseen and predicted for over ten years that some cause or combination of causes would sooner or later result in an enormous increase in business, and that then if the policy of regulation being followed was persisted in the transportation facilities of the country would prove to be inadequate. Rail-

way facilities have now become inadequate for the very reason that students of the situation foresaw they would, viz., because the various regulating bodies have refused to let the railways earn enough return to raise the capital required to make facilities adequate. Regulation so restricted the earnings of the railways that in the years 1914 and 1915 the percentages of return earned were the lowest since 1899. The period of enormous increase in traffic followed directly on the heels of this period when railroad net earnings, owing to unwise regulation, reached the lowest point in fifteen years. There you have the explanation of present transportation conditions—conditions which were clearly foreseen, which were repeatedly predicted, and which the kind of regulation we have had made inevitable.

Since the "break-down" is not a break-down of railroad management, but of railroad regulation, why did President Wilson consider it necessary to appoint a government controller for the railways? Apparently because he thought only a government controller could remove the obstacles to efficient operation and to needed increases in facilities which have been created by government regulation. If the President is right in this matter, it is quite evident that much of past regulation has been wrong.

TWO TYPES OF SNOW SHEDS

ON another page of this issue an account is given of a novel form of construction for the protection of railway tracks against drifting snow. The snow sheds there described are in marked contrast to the extensive improvements made by the Great Northern in the Cascade mountains which were described in last week's issue. This difference results from the fact that snow sheds are classified in two distinct groups designed to protect against entirely different troubles. The sheds on the Canadian Pacific in Rogers Pass and those on the Chicago, Milwaukee & St. Paul on the Great Northern in the Cascade mountains have been built to protect the railways from avalanches, heavy masses of snow and debris which sweep down the mountain sides and produce formidable obstructions to a railway occupying a bench in the slope. Here the construction takes the form of an apron or chute, built in the hillside over the track of sufficient strength to withstand the weight of the sliding mass as it passes over on its way to the bottom of the canyon. The sheds of the Southern Pacific in the Sierra Nevada mountains and the recently completed sheds of the Union Pacific belong to an entirely different class, the former being located on mountain sides of moderate slope and the latter in flat or rolling country. These sheds afford protection against drifting snow carried by never-ending winds of high velocity.

The snow sheds are confined to limited districts where the unusual conditions prevail. The westward slopes of the Pacific Coast ranges offer an unusual condition in an extremely heavy snowfall. The average annual fall in the vicinity of the Southern Pacific sheds is 35 ft. and a maximum of 65 ft. has been attained twice in 10 years. In the mountains of western Washington, annual snowfalls of 50 ft. are not uncommon. Unusual conditions of an entirely different nature demanded the construction of snow sheds on the Union Pacific and are described in the article referred to above.

These snow troubles introduce an enormous liability in railway operation. The construction and maintenance of the required protection represent investments of millions of dollars for which there is no compensation in the form of decreased operating expenses. The work described in this issue covers a form of permanent construction that has been carried to a degree of perfection which has justified its application on a large scale. In the case of the protection against snow slides, the use of permanent construction can hardly be said to have been solved satisfactorily. Reinforced

concrete has had only trial applications, while most of the recent construction has been entirely of heavy timber. As a result the expense for maintenance and renewals is great as can well be expected in any structure containing as much as 2,000 ft. b. m. of untreated timber per running foot. Even on the lighter construction used by the Southern Pacific the annual maintenance expenditure amounts to \$100,000.

GOVERNMENT CONTROL AND RAILROAD EFFICIENCY

THE public should understand just what the assumption by the government of control of railroad operation means. It will mean that the government will take control of an organization which has rendered to it and to the public more efficient service since this country entered the war than any organization which the government itself has formed especially to deal with war conditions.

What governmental department or organization will anybody attempt to show has done any better than the railroads? The record of the railroads repeatedly has been made public. It speaks for itself, and it speaks eloquently. But, it is said, the railroads have "broken down." With almost no additional facilities they have so increased their efficiency that they are handling 50 per cent more business than they were two years ago; and yet it is said, "they have broken down"; and the remedy is increased government control.

But where is the evidence that they could do any better under increased government control? Certainly it is not to be found in the storm of accusations of inefficiency which is now being poured upon the various government departments and bureaus. Almost every organization which the government itself has formed to help carry on the activities incidental to the war is under fire. The principal organizations of this kind are the Shipping Board, the Food Administration and the Fuel Administration. The Shipping Board is under attack in Congress because it has not made enough progress with the shipbuilding program. The Fuel Administration is under attack because it has not handled the coal situation efficiently. The Food Administration is under attack mainly because there is a shortage of sugar.

Likewise, some branches of the war and navy departments are under fire. The Surgeon-General of the army has alleged that many soldiers are suffering from cold and are sick of pneumonia because they have not been provided with proper clothing. The Ordnance Department is being denounced for various and sundry short-comings, including its failure to adopt the Lewis gun promptly or to provide General Pershing's army with enough arms.

The *Railway Age Gazette* does not pretend to know the merits of the controversies which have arisen regarding these and other matters pertaining to the government's handling of the situation. We believe the present chairman of the Shipping Board and his associates are men of great ability and are doing their best. But everybody knows that the work of shipbuilding has been terribly delayed by the protracted wrangling and constant succession of changes in personnel which have occurred in the shipbuilding organization. We believe the head of the Fuel Administration has done his best; but can anybody be found who believes his work has been constructive and successful in the big way the conditions have demanded? Most people whose opinion is of value think Mr. Hoover is a very able man, and that he has dealt with the difficult problem with great energy and effectiveness; and yet the Food Administration is receiving bitter criticism on various grounds and from various sources. It is true there has been a serious congestion on the eastern railroads; but that congestion itself was due largely to failure on the part of the government departments to exercise proper control over the issuance of orders for preference in the movement of freight.

There is grave uncertainty as to whether the government

has proceeded along all or, indeed, along most lines, with real efficiency. And yet it is soberly contended that it should take over the operation of the railways in order to increase their efficiency; and some of the very people who most savagely criticise the alleged inefficiency of the present government departments and organizations are the most energetic in contending that the railways, under government control, would be operated more efficiently! Their logic is remarkable. The government does other things badly; therefore, it would operate railways well.

THE PRESENT IMPORTANCE OF WATER TREATMENT

ONE of the essential requirements of steam railway operation is an adequate quantity of water for locomotive use. Second only in importance to quantity is quality. While the results of an insufficient supply of water are evident at once the detrimental effects of a poor character of water are not so readily observed though they are just as real. As a result the quality of railway water supplies frequently does not receive the consideration which it deserves.

The effect of an unsatisfactory water supply is reflected in locomotive performance. The *economy* of keeping an engine out of the shops and at work at all times is generally understood. The *necessity* for so employing it under present conditions should be realized by all railway men. At a time when the roads are overwhelmed with traffic, when they do not have enough engines to handle the business and when new ones cannot be obtained, every influence which tends to increase the amount of time that engines stand idle in the shops should be studied carefully and eliminated if practicable.

Poor water is one of the factors effecting locomotive performance adversely. Not only does it increase the consumption of fuel and shorten the interval between trips to the shop but it increases the number of engine failures on the line. If these conditions were not preventable, there would not be room for criticism but sufficient progress has been made to demonstrate that the quality of the water can be improved to the extent that these conditions can be removed in large measure if not eliminated entirely.

The lack of attention to water treatment has resulted largely from the failure of railway men to realize the full economies which can be effected. This has followed the division of responsibility for water service between the engineering department which procures and delivers the water to the engine, the mechanical department which uses it and the operating department which is dependent on its use for the hauling of traffic. No one department, therefore, sees the entire problem through. Another cause for this condition is the fact that on many roads the detrimental effects of bad water have existed so long that the managements have come to take them as a matter of course. They are not, therefore, giving the subject the consideration which it deserves. Other officers think only of the importance of treating the supplies at those points where extremely bad water is found and lose sight of the fact that large quantities of water with smaller amounts of scale-forming ingredients are also serious. Consideration of the condition at such points will also show the opportunities for vast improvement in many instances.

There has never been a time when the treatment of water has assumed the importance which it now bears to railway operation. The expense for the improvement of the water supply is so small in comparison with the benefits to be derived, particularly under present conditions, that the subject warrants the most careful consideration. The removal of solids from bad water is economical at any time. It is doubly so now when the roads are straining every nerve to furnish the transportation demanded by the country.

Letters to the Editor

WHY THESE UNNECESSARY STOPS?

ST. PAUL, Minn.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

On a certain single-track railroad equipped with the "A.P. B." automatic block system, there is a piece of maximum grade, adverse from X to Y. Between these points are three intermediate "stop and proceed" signals which we may designate as a, b and c. If the train, having passed a clear home signal at X finds one of the intermediate signals, say b, at stop, it must be brought to a full stop before proceeding, at reduced speed, to c, although there may be 4,000 tons behind the engine, to start which on the maximum grade is something of an undertaking, consuming much valuable time and occasionally resulting in a draw-bar pulled out and a double to Y. The stop indication may have meant one of many things, sometimes nothing more serious than a broken wire.

The object sought to be attained is the assurance that the train will be moved from b to c with such caution as would be indicated as necessary to the mind of a reasonable man trained in the business of railroading; but the method used to accomplish this end is an extremely unreasonable one.

I wish to submit the following, based to some extent on an experience of thirteen years as trainmaster and superintendent, directly responsible for the discipline of many men:

1. A rule requiring a train to be brought to a full stop at a signal under conditions such as described above is unreasonable and unnecessary [whether on ascending or descending grades or on a level], as all the requirements of safety can be met by reducing its speed to ten miles an hour.

2. To bring any train to a full stop at a signal in the expectation that the stop will have any effect on its being run carefully through the block is unreasonable, except that the stop, if it can be enforced, will limit the speed to that which can be attained thereafter.

3. An unreasonable rule is practically unenforceable, and, by comparison, a reasonable rule is easy to enforce.

4. A rule that is not enforced is subversive of discipline.

5. It is a waste of money to make unnecessary stops at any time and with any train, but especially so on heavy adverse grades.

6. Enginemen, in the main, are conscientious; take a pride in doing their work well, and do considerable thinking. These are human attributes for which they do not always get credit. They have no heart for an unreasonable rule, but can very readily see the necessity for a reasonable one.

7. Road foremen and trainmasters chronically wink at infractions of unreasonable rules.

Therefore, the "stop and proceed" indication should be put in the scrap heap, and in its place there should be a permissive indication. Under such a plan the three aspects of a permissive signal would be "clear," "caution," and "extreme caution." No changes in present signals would be necessary.

Under such a plan surprise tests could be made as readily as now, and probably would be made more conscientiously. Discipline could be enforced as well as now, probably better, and business would be expedited.

The efforts that have been made to pull the teeth of the "stop and proceed" signal by using "grade" or "tonnage" permissive signals does not go far enough. The "stop and proceed" signal should be done away with altogether, except possibly in some very unusual locations.

A. M. BURT,

Chief Engineer of Maintenance of Way, Northern Pacific.

Handling Units with a Locomotive Crane. Driving Concrete Piles. Erecting the Shed at Rock River with the Special Traveler.

Concrete Snow Sheds on the Union Pacific

A New Form of Construction Has Been Provided to Protect This Transcontinental Line Against Drifting Snow

SIXTY-MILE gales, continuing for weeks, swept snow across the wide stretches of rolling plateau west of Laramie, Wyo., last winter and caused repeated interruptions to the heavy transcontinental traffic of the Union Pacific in spite of the tireless efforts of the operating and maintenance departments. Trains were blocked so often by drifting snow while taking coal and water at Rock River, Wyo., that 1,200 ft. of timber snow sheds were built in the midst of the stormy weather under very trying circumstances to alleviate the conditions at that point. Altogether the experience of the winter surpassed anything previously encountered within the memory of the oldest employees and

experienced last winter were at no time caused alone by the depth of the snow. Instead they were brought about by the almost incessant west and northwest winds which kept bringing fresh supplies of snow across the many miles of open country. The initial trouble occurred in the 18 miles between Rock River, Wyo., and Medicine Bow, and as the severity of the winter increased it was extended westward 20 miles to Hanna, and eastward 20 miles to Bosler. At one time snow troubles were experienced as far west as Tipton.

The condition encountered may be described as an almost steady stream of snow-filled air, traveling at velocities as high as 60 miles an hour, which formed deposits against any obstruction placed in its path. The snow in the air was all within about 60 ft. of the ground so that the sun was often seen shining in a clear sky overhead when conditions were at their worst. Under such circumstances the railroad cuts were the source of much trouble for even a standing train would stop so much snow that drifts would form around the wheels to a sufficient extent to block the train in the space of time occupied in taking water and coal. There were times when the track would become impassable three minutes after the passage of a snow plow.

Another peculiar phenomenon was the blowing of sand. At one time during the month of February six inches of sand, containing no small quantity of alfalfa hay, roots and all, was deposited on top of the snow drifts in White Rock cut, five miles east of Rock River.

RAILROAD MAKES A HARD FIGHT

The fight to keep the line open began after the snowfall in December and although no general tie-up of traffic occurred, it was necessary to continue the struggle for three weeks. Some additional snowfall with a renewal of the wind late in January called for renewed efforts, and with the gradual filling up of the cuts and the repeated passage of the snow plows, the difficulties were greatly increased so that the month of February was one long struggle. Portions of the line were blocked repeatedly for short intervals but there were only two general blockades, one of two days and another of three. However, it required increasing efforts with an ever-

Map of the Affected District

it is entirely possible that a like situation may not occur again in years. Nevertheless the management of the Union Pacific concluded that the demands for the uninterrupted movement of its trains are so great as to justify enormous expenditure for a permanent protection against these winter troubles. This decision led to the design and construction of reinforced concrete snow sheds, an entirely new form of protection against drifting snow.

THE WINTER OF 1916-17

The trouble started about December 20, 1916, with the fall of 12 to 14 in. of snow. This was the heaviest snowfall of the winter and is a relatively moderate fall as compared with some portions of the country, but the conditions

increasing organization to keep the trains running, until finally over 800 men, including the section crews, were employed in the 50 miles between Lookout and Hanna.

Ten snow plows were used, including four rotaries, one Gull plow, two Russell plows and three wedge plows. The extra gangs were assembled from the various divisions, 200 bunk cars being used to house them. Included in the boarding outfit were two standard dining cars and their regular crews.

The difficulties of the work were aggravated by cold weather. A minimum temperature of 21 deg. below zero was attained and for six weeks the temperature did not go

tailed the rapid accumulation of special material was the fire protection system, consisting of a 4-in. wrought-iron pipe line with hydrants and 150 ft. of 2½-in. hose at intervals of 150 ft.

PERMANENT CONSTRUCTION AUTHORIZED

The experience of the winter, the expense of maintaining large forces of men to keep the track open, the interference with traffic and the danger of serious blockades led to the authorization of the construction of 8,270 ft. of permanent snow sheds. Subsequent study indicated the advantage of reinforced concrete, pre-cast in units and erected. Of the total amount of shed the largest single section is at Rock River, where there is a length of 4,441 ft. All of the timber shed constructed during the winter is retained in service except that the south 700 ft. was taken up and moved to the north end and it was further extended to make a total of 1,779 ft. The new concrete shed at this point extends south from the south end of the wooden shed as now located. In addition to this installation, there are three other sections of concrete sheds. One section of 500 ft. is on a 4-deg. curve at Sulphur Lake cut, between Allen and Komo, Wyo. Another section is 1½ miles west of Wilcox, Wyo., involving 1,500 ft. on a 1-deg. 6-min. curve. Another 1,800 ft. was installed on tangent track 1½ miles east of Medicine Bow.

In the last three named sections the shed covers only two main tracks, but at Rock River the shed 500 ft. covers a center passing track in addition to the two main tracks, while east of this point the two main tracks are spaced wider than 13 ft. for a distance of 200 ft. in making the spread for the passing track. The situation is further complicated by the need of provision for a siding, branching off from the main track east of Rock River.

Part of the Timber Snow Shed

above zero. The troubles with the standing trains at Rock River became so severe that it was concluded to commence the immediate construction of a timber snow shed covering the tracks each way from the coaling station.

QUICK WORK ON TIMBER SNOW SHEDS

The character of the frame snow sheds is shown in one of the drawings, from which it will be observed that they are intended purely for protection against blowing snow. The roof trusses and the 8-in. by 8-in. posts which support them are spaced 12 ft. center to center along the track and are covered on top and on the windward side by No. 12 black corrugated iron, secured to 3-in. by 6-in. purlins. The winds causing the snow trouble were westerly (the line at Rock River runs north and south) so that it was not necessary to provide any protection on the east side. The structure was braced against collapse by a batter brace; but more dependence was placed on lines of ½-in. wire cable extending from every alternate bent to dead-men buried 50 ft. west of the west wall of the shelter. The shed covers three tracks, two main lines and a central passing track. The trusses directly above each track are protected from cinder blast by a strip of corrugated iron 6 ft. wide.

Twelve hundred feet of this form of shed was built during the severe weather in February. To as large a measure as possible, the material was prepared for ready erection before arrival at the work. The columns and bases and the trusses were framed at Cheyenne, 100 men being employed on this work, in addition to 100 men used on the erection. The sheds are supported on pile foundations, the piles being driven a sufficient time in advance to keep ahead of the erection work.

The construction of these sheds in this emergency required the accumulation of a large amount of material from all sources. This included lumber, hardware and corrugated iron, considerable quantities of the latter being shipped from the east in baggage cars. One feature of the shed that en-

THE DESIGN

One of the drawings shows the standard design for two tracks, which is in reality a simple structure, consisting primarily of a succession of concrete bents or frames erected along the track every 15 ft. Each bent consists of two unsymmetrical A-frames, supporting a reinforced concrete girder spanning across the track. The space between the verti-

Section of the Timber Snow Shed

cal legs of the A-frame and between the tops of the girders is enclosed by reinforced concrete slabs. The clearance provided by this structure is ample, as indicated in the drawing.

The structure is designed to withstand a working load of 50 lb. per sq. ft. of wind pressure on the side wall and 50 lb. per sq. ft. of live load on the roof in addition to the dead load. Under a condition of no wind, the load of the structure is practically all carried on the vertical legs of the A-frames. The batter legs come into play under the condition of lateral wind pressure. The designing unit stresses for the concrete were 650 lb. per sq. in. maximum

compression in flexure, 540 lb. per sq. in. compression under axial load and 40 lb. per sq. in. in diagonal tension. The working stresses in the steel were 16,000 lb. per sq. in. in tension and 9,750 lb. per sq. in. in compression.

Responsibility for the success of the design is due in a considerable measure to the details of the connection between the units, which afford adequate load-carrying capacity while permitting ready erection. The footings were fitted with pockets to receive the bottoms of the A-frame legs. Anchorage against overturning is provided by 1¼-in. bolts,

The sides of the A-frame columns perpendicular to the tracks are equipped with grooves to receive the ends of the side slabs as they were slid down into position from the top. The top slabs rest on the top surfaces of the girders and are prevented from sliding off by raised stops formed in the concrete of the girders.

SOME STRUCTURAL STEEL REQUIRED

The additional tracks and the special track spacing covering part of the site of the shed at Rock River entailed the

set in the outside pockets and passing through a 2-in. pipe sleeve in a toe extension on the outside legs. Similarly two ¾-in. bars projecting from the top of the A-frame passed into 2-in. pipe sleeves in the ends of the girders as the latter were lowered into place. The joints between the uprights and the girders were further protected by lugs cast on the underside of the girders on both sides of girder bearings.

use of a large amount of special construction. Where the main tracks are spread a sufficient amount to secure the desired clearance, a row of columns was placed along the center line between tracks, but where the passing track occurs this was not permissible and a clear span of 48 ft. was required. The turnout for the side track east of the station required a maximum span of 41 ft. 4 in. Designs in reinforced con-

plants. All parts of the forms were cut to templets and put together on assembling tables, thus eliminating all measuring after the pattern form had been made for each style of concrete unit. The forms were oiled preparatory to each pouring of the concrete with a paraffin base oil.

The reinforcement consisted of No. 27 triangular mesh in 54- and 56-in. widths, $\frac{1}{4}$ -in. plain rods and corrugated bars of various sizes. A set of tinsmith's rolls were used to flatten out the rolls of wire mesh. A line from a hoisting engine served to pull the mesh through the rolls and onto a long table, where it was cut into the desired lengths with hand shears, cleats nailed to the top of the table serving as guides for the cutting.

Although the unit character of the work called for the use of a great many bars of equal length, the conditions of the steel market made it imperative to order the bars, of which 1,500 tons were required, as soon as the plans were at a stage to give an approximate idea of the requirements. Obviously the exact bills of bars were not ready at that time and in consequence stock lengths were ordered, thus requiring the bars to be cut to special lengths in the field. The reinforcement for the various units was assembled into complete "cages" before placing in the forms. They were supported clear of the bottom forms by means of small blocks of concrete prepared for the purpose. For the larger units it was necessary to handle the assembled reinforcement with locomotive cranes.

AN ACCURATE RECORD OF THE UNITS WAS KEPT

The manufacture of a large number of units of various kinds, their storage for a sufficient time to insure proper curing,

the class mark of the unit in any given section of the yard was noted on a sign board nailed to the side of the hopper car trestles for identification. As fast as the units were cast they were marked with the class number and the date of pouring.

Three separate records of the units were kept in the superintendent's house in the cement storage building close to

South Portal of the Concrete Shed at Rock River, Wyo.

the mixer. Blueprints of the erection diagram, showing the position of each unit in the four sections of shed, were marked up as each piece was concreted. A large chart mounted on the wall served as a record of the number of units cast each day, the total number concreted to date and the amount of material used. In addition to this there was a storage yard diagram containing a record of the date on which the units were cast and the date they were shipped for erection.

The wall and roof slabs were removed from the forms and placed in the storage yard after three days and the girders and columns after seven days. All units were cured in the storage yard at least two weeks before removal for erection, and were kept moist by sprinkling during the entire period. Five locomotive cranes were used for the various lifting operations in the concreting and curing yards. The spacing of the tracks and the hopper car trestles was such that the cranes could readily pick up loads placed anywhere within the yards. Two switch engines were in service daily, handling material and hauling the units to storage or to the point of erection.

TWO ERECTION METHODS USED

The general methods of erection were adopted. At Rock river the erection equipment consisted of a special stiff-leg-derrick with a 96-ft. steel boom on a triangular steel frame equipped with rollers. The machine was rolled on blocking on the north side of the tracks at a sufficient distance to clear the tracks and structure. A temporary track was built in the path of this derrick for the delivery of the units on cars. A photograph shows this derrick in the operation of setting one of the roof slabs. The length of the boom was sufficient to permit the erection of 60 lin. ft. of shed from a single set-up and the speed of erection was such that the derrick was shifted about once each day.

At the three other snow sheds, all of which are located in cuts, the erection was carried on by the use of locomotive cranes. One crane operation on a track over the side ditch in the cut and clear of the main track erected the A-frames and wall slabs for one side, backing away as the work progressed. A larger crane with a 70-ft. boom operating on a "high line" on the natural ground on the opposite side of the cut erected the A-frames on the opposite side of the shed as well as the cross girders. The first crane was then trans-

An Exterior View

ing, the delivery of the units as needed for erection, the delivery of the units broken in handling and other contingencies arising requires the formulation of an efficient system of accounts covering all operations on the units from the time that they were cast until they were erected. The concreting yard was divided into sections containing a definite number of forms of the various classes and this number together with

ferred to the "high line" and erected the remaining side wall slabs and the roof slabs. The smaller crane erected about 300 ft. of A-frames and side walls per day.

The joints between all units of the structures were treated with cement mortar or asphalt or a combination of the two. The beds of the A-frames in the footing, of the girders on the columns and of the roof slabs on the girders were covered with a layer of cement mortar before the units were placed. The longitudinal joints between the roof slabs were closed with mortar but the transverse joints in the slabs over the tops of the girders were filled with asphalt. This material was also used in the joints of the side wall slabs in the grooves of the columns. To facilitate the placing of this filler the slabs were held in exact position in the grooves by means of wedges until the edges of the joints on both sides were closed up with cement mortar to form a dam that would hold the asphalt poured in from the top. All of the mortar

Houghton Construction Company of San Francisco was the contractor.

HOW CAN WE DO THE SAME AMOUNT OF YARD WORK WITH FEWER MEN?

By S. W. Wherry

Yardmaster, Pennsylvania Railroad, Altoona, Pa.

The indications are that the railroads as well as the other industries are going to face a shortage of men this winter, which with reference to the men in train service, is going to interfere seriously with commerce. This being so it would seem that the only thing to be done is to get more service out of the men we have. While this can possibly be done to some degree with men in road service, it is in the yards that it can be carried out to the fullest extent, this being

Interior of the Shed at Rock River

used was tempered with hydrated lime to make it work better on the trowel.

The work on the reinforced concrete sheds was commenced on May 20, when the contractor moved in his equipment; by August 6 the plant had been completed and forms had been built so that the concreting could be commenced. The erection of sheds was started on August 20. From 350 to 400 men were employed on the work. Eighty men on the forms; 30 on each mixer and 20 for each erection gang comprised the principal units of the force. One rather unusual arrangement of the contract was that the railroad company boarded the contractor's men.

The reconstruction of the wooden sheds was carried on by company forces. Besides shifting the sheds further north and the construction of about 500 ft. in addition, this work included fire protective measures, that is, the covering of all of the truss members with cement mortar placed on expanded metal lath.

The entire project has been carried on under the direction of W. R. Armstrong, engineer maintenance of way of the Union Pacific. The designs were developed and the plans prepared under the direction of W. L. Brayton, bridge engineer of the Union Pacific, and the construction was under the supervision of L. W. Althol, resident engineer. The

especially true with men engaged in classification work—usually the major portion of the yard forces.

It is generally the case that where car riders are averaging two and one-half cuts per hour, or twenty cuts in eight hours, and they see that they can benefit by riding more runs in order to finish a train in time to get an "early quit," or the last train in the yard is being shifted and there are prospects of a "flat," they will speed up to three or three and one-half cuts per hour, but to do this requires every man connected with the operation to keep hustling and under present methods it cannot be done all the time regardless of the efficiency of the supervision, unless the men have some object in view for which to work. It is evident that the only way to get a man to do all he can, instead of all he has to, is to give him some incentive to work for and to reduce the amount of energy he is required to expend doing things which bring no return.

A number of methods of increasing the number of cuts handled per man per day at the classification humps have been tried out in almost every yard in the country without any great amount of success. Probably the most satisfactory is that of having a check clerk stationed at the hump keep a record of the time each man leaves the hump and returns to it, imposing discipline for consuming unnecessary time,

but this method, like many others only provides for the punishment of the men who do not do the average amount of work and does not provide for rewarding the men who do more than the average. If a man is dropping a car into a classification yard and he sees that by holding the car up just a little he can arrive in time to miss the pick-up on the return trip, it would not be human nature for him not to do so in nine cases out of ten, unless it is to his advantage to catch that pick-up.

Under present conditions the suspension of a man is more of a penalty to the railroad company than it is to the man, and it is my experience that the only reliable incentive for a better effort in a man is the effect it will have on his pocket book, so that under the present labor conditions the best way to get the car dropper to increase his average work is to pay the established rate for a day's work and then pay a bonus for all cuts over a predetermined number ridden by a man in a day. This bonus should be the average amount paid per cut for the predetermined number. It should be arrived at by taking the average number of cuts per man at that point for a six months' summer period from May until November, and a six months' winter period from November until May, the averages to be used as bonus bases during these periods.

One of the objections to this scheme is that the men assigned to classification crews would likely object to doing necessary work other than riding runs, but this could be overcome by giving credit for cuts for the time he was engaged in other work in proportion to the average time required to drop a car into the yard and return to the hump at that particular point.

Another objection might be that the men would not drop their cars against the other cars on the classification tracks in order to get back to the hump quickly, but as this would be such a disadvantage to the men on account of the delay while cars were being backed down, I do not think it need be considered.

Of course it might result in reckless car riding and resultant damage to equipment; this would have to be overcome, possibly cutting the men who are responsible for damage out of the bonus privilege for a stated period, thus taking the incentive away from reckless riders.

The greatest benefit to be derived from the system would be that the car riders would likely raise very strenuous objections to any unnecessary delay which would cut down their bonus earnings and would tend to keep other employees working in connection with hump operations "on their toes."

When I refer to energy expended by car droppers for which no return is received by the railroad company I mean that which is used by the men in crawling across cars standing on the classification tracks to reach the pick-up track, in walking to the hump where there is no pick-up service or where the pick-up does not run the entire distance to the hump, and by reshifting cars which have been improperly classified.

It requires considerable more time and effort for a man to return to the hump after having ridden a car into the classification yard, than it does to ride the car down, as it is necessary to get up and down off the cars on from one to a score of tracks, depending on the size of the yard and the positions of cars on the various tracks. To overcome this useless expenditure of energy a better pick-up service must be installed. Unfortunately, it appears that when a majority of classification yards were laid out the main thought was in getting the cars down into the yard and very inadequate facilities were provided for getting the men back. About 50 per cent of the yards have the pick-up track on the first track leading off the ladder track instead of on the last, so that if a man takes a car on to any track he must cross cars to get to the pick-up track, whereas if the pick-

up track ran along the ladder track the men taking a considerable number of the cuts into the yard could cross the upper ends of the tracks to the pick-up track. If I had the designing of new classification yards I would provide subways under the yard to reach from one side to the other, about fifteen or twenty car lengths apart and with openings between every other track, so that a man would never have to crawl over a car to get to the pick-up and would not have more than eight or ten car lengths to walk to get to the subway.

However there is no time now to rebuild yards but I believe that a better arrangement of pick-up facilities could be made in a number of yards, and where the size of the classification yard warrants, two pick-ups could be used to advantage. This would perhaps be an expensive arrangement if locomotives were used for both pick-ups but by substituting gasoline, or electric storage battery motor cars the expense would be reduced. There does not seem to be any doubt but that the gasoline motor car should make an efficient, economical pick-up car, but the cars which I have seen used at various points for this work are small two-cylinder affairs which were built for entirely different service. When it is figured that in the average yard a pick-up makes an average of eight one-mile trips each hour with a load of about 12 men and keeps this up for 24 hours a day it would seem that a specially designed car would be required, with an engine of about the same capacity as a 3000-pound commercial truck.

In my estimation one of the good features about a gasoline motor pick-up car is that the assistant yardmaster or conductor in charge of the hump operations cannot use it for other purposes as he can a locomotive. The use of the pick-up engine for other work, unless it is absolutely necessary, is one of the most expensive things which can be done at a classification hump.

Overcoming the reshifting of cars improperly classified is a considerable task and there seems to be no efficient remedy for it, as it is almost impossible to keep all the cuts far enough apart on the ladder track to throw the proper switches and the levermen are very apt to make mistakes or lose cars on the ladder. However a little better co-operation between scale forces and yard forces at classification yards situated at scales would doubtless avoid some of this work, while a campaign of education should be conducted with the minor officers in charge of yard work so that judgment would be used in deciding whether it is not better to leave the car in the wrong classification and notify the man in charge of the despatching work to have a make-up crew shift the car out at the despatching end, which would probably take a crew consisting of one engine and three trainmen 20 minutes, rather than hold up a classification crew, consisting of two or more engines and from 15 to 20 men, 8 or 10 minutes.

If blocked receiving yards are to be avoided this winter it is time something was done to secure more efficient service from the men we have; and as the bonus system would not increase the cost of handling cars over the humps, although it would increase the individual earnings of the men, I believe that it is one solution of the problem. Under present conditions a man can easily get another position if he loses the one he has, and the old system of discipline reacts to the disadvantage of the railroad company. Strict supervision and penalizing have lost their effect, and we must try something different.

RAILWAYMEN AND AIR RAIDS.—Delegates from the National Union of Railwaymen in the London district have recommended legislation to place railwaymen who are killed or injured during air raids on the same footing in the matter of pensions as sailors and soldiers.

NEWLANDS COMMITTEE HEARING

The Newlands Joint Committee on Interstate Commerce on December 20 concluded its series of hearings begun on December 10 for the purpose of receiving the testimony of state railroad commissions, and adjourned subject to the call of the chairman.

A substitute both for government ownership or operation of railways and for the present system of private ownership of competing corporations was proposed as a solution of the railway problem by Ex-Senator Joseph L. Bristow, the concluding witness before the committee. Mr. Bristow is chairman of the Kansas Public Utilities Commission and chairman of the legislative committee of the National Association of Railway and Utilities Commissioners, but explained that this proposal represented only his personal views.

Mr. Bristow proposed, as a method of eliminating the evils resulting from private competition, a merger of all the railroads of the country under government supervision by the organization of a national bureau or corporation with directors appointed by the President, to acquire the railroads as a trustee by issuing stock, and that the Interstate Commerce Commission should be directed by law to prescribe rates sufficient to guarantee a dividend of from 4 to 6 per cent on the stock after payment of operating expenses. The separate organizations of the railways under his plan would thus be gradually eliminated so that the strong roads would sustain the weak roads. The operating officers would be appointed by the government directors, but there would be no necessity for taxation, he said, either to pay for the roads or for their operation, and the government guarantee would take nothing out of the treasury because it would be provided for in the rates.

"This stock should have no voting power," Mr. Bristow said, "and would not be a government obligation but an obligation on the railroad property itself. I don't think there could be any greater security. There would be none of the evils of competition and the strong roads which now do not need any increase in rates would sustain the weaker roads which now cannot be given rates that would give them an adequate return without swelling the earnings of the roads already earning a fair return. I don't think you can remedy the defects of the existing system without changing the system. The operation of the railways is all right now. The difficulty comes when the revenues are not enough to satisfy the bankers that control them. This would give us common ownership. I am not in favor of government ownership. I do not believe the government ought to buy the railroads and pay for them by taxation nor do I believe in taxation to pay for their operation. It would be too easy to levy a tax in case there should be a deficit from government operation."

As a basis for determining the value of the railroads under this plan, Mr. Bristow suggested taking the average market value of their stocks and bonds for a period of five years. This, he said, represents what the investor has considered the railroads' worth. As an alternative plan, he said, the valuation can be determined by waiting until the Interstate Commerce Commission has completed its valuation.

"I would not have the railroads operated by government officers," he said. "I am afraid government ownership and operation would be disastrous. Under my plan the political power of employees might be increased, but I doubt if it would be as great as it is now because their interests would be balanced against those of the shippers and the public. I think the public would always be willing to pay rates sufficient to pay good wages." He suggested that there is now rather a strong tendency on the part of the public to be indifferent to the merits of a wage controversy because

it assumes that the higher wages would come out of the pockets of a few rich men.

Mr. Bristow began his testimony by introducing a table prepared by J. P. Norton, a bond expert, giving the market prices and yields of the stocks and bonds of 20 railroads since 1890. This showed, he said, that the credit of the railroads has been good and if it has recently declined it has been rather due to the campaign of publicity conducted by the railroads depreciating their own financial condition rather than to any action of the state commissions.

Mr. Bristow said he would favor federal regulation of security issues provided the states should have the right to be heard and heard effectively in matters in which the people of a state are more interested than the nation at large. He objected to exclusive federal regulation of rates, saying that the state commissions can adjust many minor local complaints promptly and with knowledge of local conditions, which it would be too expensive to take before the Interstate Commerce Commission.

Federal officers, he said, would not be so close to the people and would not enjoy the confidence of the people to the same extent as state officers. Regional commissions having jurisdiction only over interstate matters he thought would be desirable.

In reply to questions by Representative Sims, Mr. Bristow said he would not change the present system of railroad taxation by the states, but he did not think railroad property should be taxed twice, once as property and again in the form of a tax on securities. He thought comparatively few states had that form of taxation.

Senator Newlands remarked that another senator had told him that there was almost no investment in railroad securities by people in his state because they are subject to taxation at such a rate that only tax-dodgers can afford to own them.

Mr. Bristow also said that state commissioners have been made "the targets for railroad press agents" and that they have been "much embarrassed" by railroad publicity. The Kansas commission has no publicity agent, he said, but has recently adopted the plan of issuing a bulletin which is sent to newspapers, for the purpose of showing what the commission is doing. He presented a copy of this bulletin which contained a reply to a magazine article which it declared misleading and also contained articles commenting on the "prosperity" of the railroads.

While Mr. Bristow said this bulletin is published for the purpose of informing the people of the activities of the commission, the copy he presented contained one page devoted to a list of hearings and orders issued by the commission, while the remaining three pages were principally devoted to other matters. One article was devoted to showing that 1917 was a good year for western railroads by comparing the 1917 figures with those of 1915. There was another long article on "Industry Suffering From Lack of Cars." One page was devoted to the editorial referred to and an article to show that the Missouri Pacific "is prospering now."

IMPROVING PORT FACILITIES IN EAST AFRICA.—The port of Lourenço Marques, one of the best in southern and eastern Africa in its wharf accommodations, is being made better able to serve a greater number of steamers than formerly. Arrangements have been made by agreements between the Portuguese Railway administration and the South African Railways whereby the facilities for transporting coal from the Transvaal collieries to Lourenço Marques will be increased about double the amount of present tonnage. This will be brought about by pooling the engine power of the two railway systems and by reserving certain trucks for coal traffic only. The Lourenço Marques Railways have recently added three new American locomotives of the Santa Fé type to its engine power.—*Commerce Report.*

New York Central 4-8-2 Type Locomotives

First of This Type for Freight Service; Requirements
Are High Sustained Capacity on Low Grade Line

ABOUT one year ago the New York Central received from the American Locomotive Company an order of 30 locomotives of the 4-8-2 type, which in several respects are the most notable locomotives of this type yet to be built.

Heretofore locomotives of this wheel arrangement invariably have been built to handle heavy passenger trains over mountain grades under conditions making difficult the maintenance of schedules with Pacific type locomotives. Locomotives of this wheel arrangement have therefore come to be known as the Mountain type. On the New York Central, however, the 4-8-2 type locomotives have been built for freight service on a line with comparatively few grades, on which, to an unusual extent, car limits determined by operating con-

Tractive efforts developed at the various speeds and the corresponding drawbar horsepowers are exhibited by the drawbar pull-speed chart, plotted from results obtained in dynamometer car tests with a steam pressure of 200 lb. per sq. in. It will be noted that the tractive effort of the locomotive is well sustained at the higher speeds.

On the basis of Cole's ratios, these locomotives should develop a maximum cylinder horsepower of 2,683 at a piston speed of 1,000 ft. per minute. In determining the ratio of boiler capacity to maximum cylinder demand, Cole's ratios are based on a steam consumption of 20.8 lb. per indicated horsepower-hour for superheater engines, and the grate is proportioned to burn four pounds of coal per indicated horsepower-hour at a rate not to exceed 120 lb. per square foot of grate area per hour. On this basis of comparison, the evaporative capacity of the boiler is equal to 98 per cent of the maximum cylinder demand, while the grate area is proportionately slightly smaller.

The boiler is of the conical type with an outside diameter of 81 7/16 in. at the first ring. The engines as originally built carried 185 lb. but the boilers were designed to carry a working pressure of 200 lb. and the pressure has been raised to 190 lb. per square inch since the engines went into service.

It will be seen that instead of the usual type of rod braces at the front and back heads, the heads of the boiler of the "Mohawk" type locomotives are braced with gusset sheets, the ends of which are bolted between angle bars forming the flanges for attachment to the boiler head. Where attached to the roof sheet the back head braces are flanged to conform to the curve of the sheet, while each front gusset sheet is bolted to the radial leg of an angle bar which forms the flange for securing the brace to the boiler shell. The longitudinal seam of the dome course is on the top center line, directly under the dome. It is of the butt joint type with inside and outside welt strips and the butt joint is welded throughout the length of the seam. The dome is of pressed steel formed in one piece and the flanges are extended in strips 13½ in. and 14 in. wide respectively, in front of and back of the dome, to form the outside welt strip of the barrel seam. The inside welt strip is bifurcated at the dome and forms the reinforcing pad under the dome flange.

There are no unusual features in the firebox construction. It is fitted with a Security brick arch carried on four tubes three inches in diameter and has a barrel combustion chamber which extends forward into the barrel of the boiler 40 7/8 in. beyond the firebox throat sheet. The tubes and flues are 21 ft. 6 in. long, measured over the tube sheets. As built, the

ditions and facilities other than motive power are the determining factors in the length of trains. The type name generally applied to these locomotives is obviously a misnomer in this case and these locomotives have therefore been styled the "Mohawk" type on the New York Central, after the name of the division upon which they were first placed in service.

It will be noted that the average load per pair of driving wheels in the case of the 4-8-2 engines has been kept well within 60,000 lb., and they have been designed to take curves up to 19 deg. With their well designed reciprocating parts they should cause little difficulty in the maintenance of track.

locomotives are hand-fired through two firedoor openings which are closed with air-operated firedoors.

The front end arrangement includes a 6¾-in. exhaust nozzle and a 19-in. stack extension which extends down to a point 3¾ in. above the center line of the smokebox.

The main frames and the single front rails under the cylinders are cast in one piece on each side. The top rail over the pedestals has a section 6 in. wide by 7 in. deep. The lower rails are 4½ in. deep at the smallest section, increasing to a depth of 5¼ in. over the ends of the pedestal binders. The rear frame and back deck plate are an integral steel casting, the forward ends of which are bolted to the rear ends of the main frames. The radius bar fulcrum, the pockets for the rear ends of the trailer springs and the trailer equalizer bar fulcrums are all an integral part of this casting.

With the exception of those for the main pair of drivers,

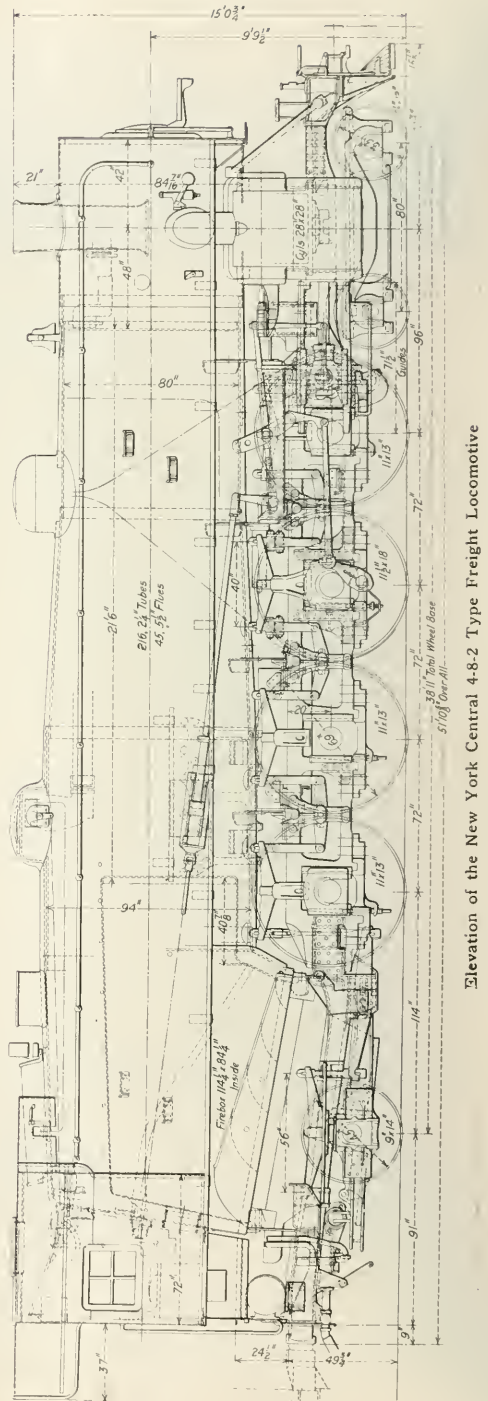

The Tube Sheet Layout and Section Through the Firebox

the driving journals are 11 in. in diameter by 13 in. long. The journals of the main drivers are 11½ in. in diameter and 18 in. long. Except for their length, the driving boxes used on this axle are similar in construction to those ordinarily used where the center line of the driving box and the center line of the frame coincide. The main jaws are widened by the use of steel castings which are bolted against the inside face of the pedestals. These castings also perform the function of frame cross ties. By the introduction of offset cross equalizers in the spring hanger system at either end of the main driving springs, the position of the main springs has been moved in so that they are located directly over the longitudinal center line of the driving boxes. Each spring rests in a saddle of the usual type designed to clear the offset position of the frame rail relative to the center line of the box.

Steam is admitted to the valve chambers through an outside dome connection type of throttle valve and distributed by 14-in. piston valves having a travel of 7 in. The valves are operated by the Walschaert valve gear, fitted with the Ragonet power reverse gear.

The engines are fitted with Woodward engine trucks and Cole radial trailing trucks. The engine truck has a swing of 4¼ in. on each side, and the swing of the trailing truck is 5¼ in. on each side.

Elevation of the New York Central 4-8-2 Type Freight Locomotive

It is evident that the development of the full capacity of a locomotive capable of delivering 2,600 indicated horsepower with a coal consumption of approximately three pounds per horsepower-hour, thus requiring the combustion of about 7,800 lb. of coal per hour, is beyond the possibility of attainment by hand firing. As the locomotives are hand fired, they have never developed their full capacity in regular road service. They have been able to decrease the time required to

President Wilson Takes Over Railroads

Wm. G. McAdoo, Secretary of Treasury, Becomes Director General of Railroads But Retains Present Office

WASHINGTON, D. C., December 26, 1917 (By wire).

PRESIDENT WILSON on Wednesday evening issued a proclamation taking over the possession and operation of the railways of the United States under the authority of the act of August 29, 1916, effective at noon Friday, December 28, and appointing William G. McAdoo, secretary of the treasury, as Director General of Railroads. He also announced that he would recommend to Congress that the roads be guaranteed a net income equal in each case to the average of three years preceding June 30, 1917.

"I have exercised the powers over the transportation system of the country which were granted me by the act of Congress of last August because it has become imperatively necessary for me to do so. This is a war of resources no less than of men, perhaps even more than of men, and it is necessary for the complete mobilization of our resources that the transportation systems of the country should be organized and employed under a single authority and a simplified method of co-ordination which have not proved possible under private management and control. The committee of railway executives who have been co-operating with the government in this all-important matter have done the utmost that it was possible for them to do; have done it with patriotic zeal and with great ability, but there were difficulties that they could neither escape nor neutralize. Complete unity of administration in the present circumstances involves upon occasion and at many points a serious dislocation of earnings, and the committee was, of course, without power or authority to rearrange charges or effect proper compensations and adjustment of earnings. Several roads which were willingly and with admirable public spirit accepting the orders of the committee have already suffered from these circumstances and should not be required to suffer further. In mere fairness to them the full authority of the government must be substituted. The government itself will thereby gain an immense increase of efficiency in the conduct of the war and of the innumerable activities upon which its successful conduct depends.

"The public interest must be first served and, in addition, the financial interests of the government and the financial interests of the railways must be brought under a common direction. The financial operations of the railways need not then interfere with the borrowings of the government and they themselves can be conducted to a greater advantage. Investors in railway securities may rest assured that their rights and interest will be as scrupulously looked after by the government as they could be by the directors of the several railway systems.

"Immediately upon the assembling of Congress I shall recommend that these definite guarantees be given:

"First, of course, that the railway properties will be main-

tained during the period of federal control in as good repair and as complete equipment as when taken over by the government, and second that the railroads shall receive a net operating income equal in each case to the average net income of the three years preceding June 30, 1917; and I am entirely confident that the Congress will be disposed in this case, as in others, to see that justice is done and full security assured to the owners and creditors of the great systems which the government must now use under its own direction or else suffer serious embarrassment.

"The Secretary of War and I are agreed that, all the circumstances being taken into consideration, the best results can be obtained under the immediate executive direction of the Honorable William G. McAdoo, whose practical experience peculiarly fits him for the service and whose authority as Secretary of the Treasury will enable him to co-ordinate as no other man could the many financial interests which will be involved and which might, unless systematically directed, suffer very embarrassing entanglements.

"The government of the United States is the only great government now engaged in the war which has not already assumed control of this sort.

"It was thought to be in the spirit of American institutions to attempt to do everything that was necessary through private management and if zeal and ability and patriotic motive could have accomplished the necessary unification of the administration, it certainly would have been accomplished, but no zeal or ability could overcome insuperable obstacles and I have deemed it my duty to recognize that fact in all candor now that it is demonstrated and to use without reserve the great authority reposed in me. A great national necessity dictated the action, and I was, therefore, not at liberty to abstain from it."

The proclamation directs that the possession, control, operation and utilization of the transportation systems shall be exercised by and through William G. McAdoo, who is appointed and designated Director General of Railroads. And the "said director may perform the duties imposed upon him, so long and to such extent as he shall determine, through the boards of directors, receivers, officers and employees of said systems of transportation. Until and except so far as said director shall from time to time by general or special orders otherwise provide, the boards of directors, receivers, officers and employees of the various transportation systems shall continue the operation thereof in the usual and ordinary course of the business of common carriers, in the names of their respective companies.

"Until and except so far as said director shall from time to time otherwise by general or special orders determine, such system of transportation shall remain subject to all

existing statutes and orders of the Interstate Commerce Commission and to all statutes and orders of regulating commissions of the various states in which said systems or any part thereof may be situated. But any orders general or special, hereafter made by said director, shall have paramount authority and be obeyed as such."

The order does not affect the possession, operation and control of street electric passenger railways, including railways commonly called interurbans, whether such railways be or be not owned or controlled by such railroad companies or systems. By subsequent order and proclamation, if any, when it shall be found necessary or desirable, possession, control, or operation may be taken of all or any part of such street railway systems, including subways and tunnels, and by subsequent order and proclamation possession, control and operation in whole or in part may also be relinquished to the owners thereof of any part of the railroad systems or rail and water systems, possession and control of which are hereby assumed.

It is further provided that "the director shall as soon as may be after having assumed such possession and control enter upon negotiations with the several companies looking to agreements for just and reasonable compensation for the possession, use and control of their respective properties on the basis of an annual guaranteed compensation, above accruing depreciation and maintenance of their properties, equivalent, as nearly as may be, to the average of the net operating income thereof for the three-year period ending June 30, 1917, the results of such negotiations to be reported to me for such action as may be appropriate and lawful.

"But nothing herein contained, expressed or implied or hereafter done or suffered hereunder, shall be deemed in any way to impair the rights of the stockholders, bondholders, creditors and other persons having interests in said systems of transportation or in the profits thereof, to receive just and adequate compensation for the use and control and operation of their property hereby assumed.

"Regular dividends hitherto declared, and maturing interest upon bonds, debentures and other obligations, may be paid in due course, and such regular dividends and interest may continue to be paid until and unless the said director shall from time to time otherwise by general or special orders determine; and, subject to the approval of the director, the various carriers may agree upon and arrange for the renewal and extension of maturing obligations.

"Except with the prior written assent of said director, no attachment by mesne process or on execution shall be levied on or against any of the property used by any of said transportation systems in the conduct of their business as common carriers, but suits may be brought by and against said carriers and judgments rendered as hitherto until and except so far as said director may, by general or special orders, otherwise determine.

"From and after twelve o'clock on said twenty-eighth day of December, 1917, all transportation systems included in this order and proclamation shall conclusively be deemed within the possession and control of said director without further act or notice. But for the purpose of accounting said possession and control shall date from twelve o'clock midnight on December 31, 1917."

In accordance with the provision of the law possession of the roads is taken in the name of the secretary of war, the proclamation reciting that it is necessary in the national defense. The order applies to "each and every system of transportation and the appurtenances thereof located wholly or in part within the boundaries of the continental United States and consisting of railroads and owned or controlled systems of coastwise and inland transportation engaged in general transportation, whether operated by steam or electric power, including also terminals, terminal companies and terminal associations, sleeping and parlor cars, private cars and private

car lines, elevators, warehouses, telegraph and telephone lines, and all other equipment and appurtenances, commonly used upon or operated as a part of such rail or combined rail and water systems of transportation—to the end such systems of transportation be utilized for the transfer and transportation of troops, war material and equipment to the exclusion so far as may be necessary of all other traffic thereon; and that so far as such exclusive use be not necessary or desirable, such system of transportation be operated and utilized in the performance of such other services as the national interest may require and of the usual and ordinary business and duties of common carriers."

The President in his statement indicates that Secretary McAdoo will retain his present office in addition to his new duties. The net income of the railways of the United States for the past three years, which the President says he will recommend be guaranteed to them, according to the latest annual report of the Interstate Commerce Commission was as follows:

In percentages of the book cost of road and equipment: 1915, 4.09 per cent; 1916, 5.8 per cent; 1917, 6.5 per cent (estimated).

REPORT ON LARMOND COLLISION

The Interstate Commerce Commission has issued a report, dated November 6, and signed by H. W. Belnap, chief of the Bureau of Safety, giving the nature and causes of the collision on the Southern Railway at Larmond, Va., near Orange, on October 21, when an engineman and a fireman were killed and six passengers, five postal clerks and 1 employee were injured. Northbound local passenger train No. 16, having taken the side track to wait for northbound passenger No. 42, started out of the siding immediately after the passage of the through train and was run into at the side by a second through passenger train, No. 38. The engine of No. 38 was overturned and its engineman and fireman were fatally injured. The line was straight and the weather was clear; and the inspector concludes that if any member of the crew of train No. 16 had looked back immediately before starting out of the side track, the collision might have been avoided.

The line is equipped with automatic block signals. There are no indicators at the switches but the rule requires that after the switch is set for a train to leave the siding, two minutes shall be allowed to elapse before moving the train forward. The inspector finds that the men in charge of No. 16 did not wait the two minutes; and No. 38 therefore, had entered the block section in which the siding is situated while the automatic signal (No. 834) indicated either stop or caution. The engineman, who died a few hours afterwards, said that it was "white"; but all the evidence contradicts this. By comparing the times and speeds of train 42 and train 38, the inspector is convinced that the testimony concerning the length of time waited by No. 16 is not true. The inspector cannot decide with certainty whether signal 834, when No. 38 approached it, was at stop or at caution. If train No. 42 had not gone far enough to clear the second block, and if therefore signal 834 indicated caution, the engineman, says the inspector, cannot be blamed; for under the rule, he would treat the indication only as a distant indication; an indication directing him to be prepared to stop at the next signal, but not to come under control at once. The engineman of No. 38 had had a clear record as engineman for 37 years, and all the employees involved were experienced men, with good records; but the inspector does not accept the testimony of the men in charge of No. 16 to the effect that they were on the siding four minutes or longer. The conclusion is positive that the turning of the switch, which would set signal 834 at stop, was not done until the engine of No. 38 had passed that signal; and as soon as it was turned No. 16 started out.

CORRELATING THE MILITIA AND THE RAILWAYS

By Brigadier-General Charles H. Sherrill
Adjutant General, State of New York.

Thanks to the preparation for war which is now going forward under the lead of the administration in Washington, energetic steps are being taken to send to the fighting front in Europe our regular army, our federalized national guard army, and all those who are taken into the military service through the operation of the federal draft law. It is, of course, difficult to conjecture how many months it will take to transfer all these men to the other side of the water, but the time is coming when that task will have been completed. When it is completed, and all the fighting men have been sent out of the country, how will there be safeguarded the lives of those who remain in the United States, and the property, including manufacturing and the munition plants which will then be working to their full capacity? This is a problem which deserves the best thought of the best minds in all parts of the country.

In New York State we have done our best to go forward to meet the problem without waiting for it to arrive, because preparedness in advance is the best form of preparedness. Believing in the militia we have used them as a basis upon which to build our structure of defense, and in that building we have sought the advice of the railways. In the spring of 1916 the "militia idea" of this country blossomed out into preparedness parades in 92 cities, with the impressive total of 2,850,000 marchers, led by the New York City parade of 140,139. Properly encouraged this same "militia idea" can, if wisely correlated with the railways, yield even greater results for the safeguarding of our land.

The New York plan of handling the guarding of our country, after our regular army, national guard army, and conscript army have all gone abroad, is that the two great factors available for that defense are the railways of the country, plus the militia, and that neither of those factors is anything like so valuable considered separately as the two together can be made to be if intelligently correlated. This combination of these two factors was described in detail by me, when, with the approval of the war department, I counselled recently in Washington with the Railway War Board upon the problem of railway guarding.

The reorganization of the New York Guard has been mapped out after careful study of the possibilities of railway transportation in this state, and after consultation with the best available railroad authorities. A large portion of any success which the New York Guard will have in the discharge of its duties will be due to the valuable co-operation which we already have received and are continuously receiving from the patriotic men who are at the head of the railway systems which form the arteries of communication of this state. We believe that too much stress cannot be laid upon the value to this country of the correlated efforts of the railways and the militia. Both of them deserve increased consideration by the public and by the government.

In the duty now being conducted by volunteer units from the New York Guard of protecting 95 miles of New York City's aqueduct, 420 miles of New York State's canals, and many important railway bridges and public buildings, we believe that our local militia, acquainted as they are with the geography of and the conditions surrounding the points they are guarding, can perform that work more efficiently than troops lacking that special information. We believe that the new battalion of the New York Guard, whose units stretch out along the southerly shore of Long Island, made up as they are from men who know well every inch of that coast line, can perform coast guard duty there more efficiently than could troops who are strangers to that coast. The efficiency of those local guards is more than doubled by their

being posted according to a plan based upon careful study of the possibilities of rapid interchange or strengthening of their units by means of railway transportation.

By instruction of Governor Whitman, there has been recruited into the New York Guard twelve thousand men, who are now receiving a full equipment of uniforms and have already received their rifles and an adequate supply of ball cartridges. All of these military supplies have been paid for by the State of New York.

The old policy of having the units of the Guard confined to a few localities in the state has been reversed, and since September first we have placed New York Guard units in over a hundred localities, which is double the number formerly covered by the armed forces of this state. There are now units in almost every county of the state, so that our military protection is more widely distributed than ever before. The reorganization of the Guard has been published in General Orders No. 58, which shows where every unit is located and also its brigade and the names of the regimental commanders.

All of these brigade and regimental commanding officers were trained in the New York National Guard, and with but one exception, have served with the units to which they are now assigned. In their selection no political influence has been considered, and no friendships observed. No officers are commissioned except upon the recommendation of their commanding officers, and approved by their brigade headquarters. We have determined that there shall be preserved under officers of their own training and in their own armories, the fine traditions of each of our splendid National Guard units which entered the Federal service and lost their old numbering.

It is but natural that a governor like Charles S. Whitman, who is a proved friend of the budget system of government, and who was so farsighted as to insist on putting through in the face of much public misunderstanding the New York state military census, now approved and copied on all sides, and being utilized by the American and the British governments, should insist upon rigid economy in the matter of military expenditures. To carry out that idea, I have arranged that all military supplies in this state shall be purchased through my Quartermaster General, Major Michael Friedsam, who as president of B. Altman & Company has had a wide business experience in the matter of purchases of supplies in large quantities. This system of purchasing not only guarantees that New York secures the best possible value for its money, but also that the state's funds are being honestly and intelligently disbursed.

Under the able leadership of E. G. Miner, of Rochester, there has been organized in the Adjutant General's office, in Albany, a Division of Chambers of Commerce, and all over this state we are utilizing those efficient non-partisan combinations of our best business minds to aid in each and every administrative problem which confronts my department.

The New York Chamber of Commerce has already aided us by its careful examination of Camp Whitman and Camp Peekskill, and so has the Citizens' Preparedness Association with its careful scrutiny of the arsenal, and similar valuable results will soon follow in other localities.

The war disbursements of New York State are so great, and the purposes of their expenditure so important that we need the best business minds to advise us thereon, and that advice is being accorded to us in most generous measure.

Based on the sure foundation of skillful non-partisan business supervision of the financial administration of our military department, and forearmed with a carefully studied plan of correlating the militia with the railways, New York State should possess a reasonable confidence in conformity with its problems of safeguarding the lives and property of its citizens.

Monthly Meeting of Western Railway Club

An Informal Address on Co-operation by A. M. Schoyer
and a Paper on the Business Box Car by W. J. Bohan

TWO addresses were delivered at the meeting of the Western Railway Club which took place at the Hotel Sherman, Chicago, on December 17. An informal talk was given by A. M. Schoyer, resident vice-president of the Pennsylvania Lines, following which the paper of the evening was read by W. J. Bohan, mechanical engineer of the Northern Pacific.

CO-OPERATION

Mr. Schoyer spoke in part as follows: The railroads have come to the point where they realize that if they are to have strength they must have union. They are now working together and while there is more business than ever before, there is less competition. There is still some competition on the western railroads, but there is very little between those in the East. On our own road we have turned all our traffic solicitors over to other work; some are in the transportation department, some in the accounting department, and others are serving on embargo committees.

The railroads have realized that they must get together to handle the present enormous business. The United States will spend in the next 126 weeks as many billions of dollars as it spent in the 126 years preceding. All of us will be called on to handle more government business in the next two years than in the 126 years before. Consider that in addition to this, we are supplying the armies of Europe and the people of this continent and it becomes evident that the railroads must combine their resources. By joining their forces and co-operating, by using the locomotives and all other facilities together they will get more business over the rails than was ever considered possible.

If the men now running the railroads cannot meet the railroad problem, no one in the world can do it. I know that we have the best railroad men in the world and lawyers, administrators, or college professors could not get 25 per cent as much traffic over the roads as the men now operating them can. For that reason we must co-operate; we must play the game together. Any railroad man at his regular work is doing more for the United States now than he could in any other place. We are needed here, for if the railroads can't go on, we can't win the war. In my judgment the duty of every man in railroad service is to press with might and main to make the railroads more efficient than ever before.

Any improper spirit of rivalry should be laid aside at this time. The carriers' function of keeping the government supplied is so tremendous they can't for a moment think of the interests of the individual roads as opposed to the interests of the nation. We must even subordinate the interest of the owners of the railroads to the interests of the country at large.

The western railroads are furnishing 102 locomotives to the eastern roads. These engines cannot well be spared from the western roads, but they have been turned over to the eastern lines where the need is greatest. This has been done because it is realized that that section of the country needs transportation and can only get it if the eastern roads have the locomotives.

There is great need of co-operation between employer and employee at this time, but there is little prospect of it unless the men come to realize that the United States must have its transportation lines in the best of condition to win the war. If we could make the laboring man realize this, we would get better transportation. The laboring men are organized and are now using the power of the unions with more force

than ever before. They have an opportunity for doing loyal service to the country by making the transportation system operate at its maximum efficiency. If labor conditions continue to grow worse, I do not know how we will get men enough to run the railroads. Whether we have government control or government operation, the railroad men must continue to operate the roads. Let us all remember that our part is to do our best for our country in the place where we have been put.

THE BUSINESS BOX CAR

By W. J. Bohan,

Mechanical Engineer, Northern Pacific

It is my intention to offer a few remarks on the business of a box car and the relation of its construction thereto. I am taking the box car, as that type appears most frequently in interchange, and is probably receiving the greatest attention at the present time. An impression of the importance of box cars as they affect dividends can be gained from the following facts:

A total of 261,100 box cars were owned and operated by eight leading western and northwestern railroads during the last year, or an average per road of approximately 32,600. The total number of box cars represents 50.7 per cent of the total freight cars owned by these roads. These box cars may fairly be said to represent an original investment of \$210,000,000.

The average total cost of repairs per road per year for a four-year period for all classes of cars was \$3,481,000. The average cost of repairs per car per year was \$64. The minimum cost per car per year for one of the roads was \$41. The maximum cost per car per year was \$110, a difference between minimum and maximum cost per car per year of \$69, or \$5 more than the average cost of repairs per car per year for all the roads mentioned.

The character of transportation on each of these roads is the same and the ratio of the number of box cars to the total number of freight cars of all classes is very nearly the same. It is fair to assume for the purpose of this paper that the above repair cost ratios for the different roads would obtain for box cars.

The claims paid for losses due to grain leakage by a large grain carrying line of the same group of roads for four years ending in 1917, averaged \$80,000 per year, grain being carried in both owned and foreign cars. The average damage claims paid per year on account of defective equipment on all commodities other than grain for the same period was \$17,000.

A stockholder of an inquiring turn of mind, or the president of one of these railroads, in view of the high loss and damage costs and wide difference in repair figures, would be justified in asking, "What is the matter?" Several things are the matter, and one of them is undoubtedly lack of business balance in car construction—box car construction—that being the type of car under consideration.

IMPROVED BOX CAR DESIGN NEEDED

For years mental and physical energy have been spent on box car design by the best and most loyal of men both technical and practical, and a generally satisfactory box car is not yet with us.

Have we kept it back by a flux of figures on stresses and strains lacking the leaven of sound engineering judgment?

Have we delayed its coming by building upon too narrow conceptions of the problem? Have we co-operated with each other sufficiently in treating a large subject in a large way, by exerting our energies toward a broad and careful analysis of the subject, with a full realization that box cars are business agents of the railroads that own them, and that their dividend earning capacity depends upon their commercial efficiency as well as upon their mechanical details, and have we realized that the two qualifications are correlated? The fact that we haven't the generally satisfactory box car indicates at least that the progress of its development has been slow. The time has arrived when we must develop an efficient box car in its fullest sense. The unusual volume of business, the shortage of equipment, the scarcity of labor and material with the constantly upward trend in the prices of both, demand it. What have we got to offer in the way of a business box car?

The business box car must be free from leakage of lading, it must be weather-proof and practically fire-proof, it must have a so-called non-sweating interior free from projections and pockets, it must have properly dimensioned door openings and substantial free positive functioning doors and fastenings, and be so constructed as to lend itself to diversified lading with the incidental supplementary doors, blocking, etc. In short, it must be a car popular with the shipper—a dividend earning unit having a maximum demand.

It must, in addition to these qualities, have a minimum light weight, a maximum utility and carrying capacity per unit of weight, reasonable first cost, and freedom from mechanical defects. Two principal elements enter into the design and construction of such a car. First, accurate technical engineering information, and second sound, practical business judgment based upon experience, the latter largely predominating for the reason that evidence is lacking that anyone ever reduced the things that happen to a box car to conclusive figures.

In a recent article in one of the railway magazines a statement was made that in train service the car body has three movements, all of which absorb a part of the force applied at the couplers. This is true as far as it goes, and if this were all, figuring would be comparatively easy. It, however, stops where the real trouble begins. The fact of the matter is that the box car is subject not only to these three forces, but the resultant of their combined action and many others of such varying direction, intensity and rapidity, of occurrence that their accurate mathematical determination is out of the question. Among these forces may be mentioned those due to poorly balanced design, unevenness of track, curvature, centrifugal force, train handling, draft action, irregular lading, shifting of lading, atmospheric conditions, etc.

Briefly, all of these forces combine in what may be called "team work" against the life of the box car. Close observation and experience with a large number of different types of box cars indicates that the general and greatest result of this team work manifests itself in twisting the car. Such being the case, team work in an opposite direction by the various members of the car must be the natural antidote.

I believe the most economically efficient box car to be one in which every detail, even the grab iron, is made to do its fair share in assisting the natural functions of the car and resisting the stress and abuse to which it is exposed. The body of such a car should not be built around any one member, but all of its members should form a unit having maximum inherent strength and resilience and acting as a unit in dissipating all reasonable strain action. It should have the fewest possible primary and special parts in that joints, gussets, rivets, bolts and fastenings which work and wear to the detriment of the car, increase its cost of upkeep and loss of time on repair tracks, may be reduced to a minimum.

GENERAL SPECIFICATIONS

A general specification for a car that would meet the requirements outlined would be briefly as follows:

The weight for a 40-ft. 40-ton box car should be between 45 and 50 per cent of the stenciled capacity. I should say it should not exceed 48 per cent. This weight can be obtained without sacrifice of strength.

The body should be steel framed throughout, preferably of pressed steel of resilient quality. The underframe, sides, ends and roof should be diagonally braced throughout. There is no question about the efficiency of diagonal bracing. Its value has been many times demonstrated in the reclamation of thousands of old cars. As the diagonal bracing of the entire construction will distribute the strains due to the live load and shocks to all members of the car, the fish belly type of center construction is not necessary. Ten-inch center sills of ordinary cross section are sufficient.

The side and end posts and braces, at the points of attachment with sills and plates, underframe bracing at the points of attachment with center and side sills, and roof bracing at the points of attachment with ridge pole and plates, should be directly connected, that is, the usual construction using gusset plates or other secondary members should be eliminated as the strength and efficiency of the car can be materially increased by so doing, and unnecessary parts eliminated. Autogenous welding may be used to material advantage in such a construction.

The diagonal underframe bracing at the ends should be securely tied to both the center and end sills at their junction, and extend continuously around the ends of the body bolster the cross ties, with alternate connections to the center and side sills. The same general construction may be followed in the roof for the attachments of the diagonal bracing and plates, ridge pole and door carlines. At the door openings the underframe should be substantially reinforced by supplementary diagonal bracing. The plate may be similarly reinforced above the door, or the door track constructed to form the reinforcement. The roof reinforcement at the door openings may be made by the use of carlines at the door posts. The end construction with its attachment to end sills and plates should be similar to the side construction.

The corner posts should be formed by directly connecting the end side post and side end post members throughout their entire length. This will not only tie the car together securely but it materially assists in forming an integral construction. The corners may be further reinforced by continuous corner and end grab irons. The side and end sheathing should be constructed of two sections of sheet steel, their junction reinforced by plates, and all securely riveted together forming side and end girths, the girth reinforcing plate extending continuously from side door post to side door post around the end of the car. The end and side lining should be of matched lumber, the sides $\frac{3}{4}$ in. or $1\frac{1}{2}$ in. thick, the ends $1\frac{1}{2}$ in. thick, the lining extending from floor to plates. The floor may be of the usual $1\frac{1}{2}$ in. matched stock secured to furring strips on the underframe, using standard grain strips at the intersections of the floor and the sheathing.

The roof should be of the circular type and may be constructed of two sheets of No. 16 steel running lengthwise of the car, with a joint at the ridge pole, the two roof sheets being securely riveted between the ridge-pole and a weather proof ridge-pole cap. The roof sheets should also be securely riveted to the diagonal braces, end and side plates, thus forming an integral member of the car capable of sustaining its share of the load. It is necessary that the inside of the roof be what is commonly called "non-sweating." This can be taken care of by the application of a heavy coat of ground cork and red lead or mineral paint applied to the exposed metal surfaces.

The door should be of steel, framed and sheathed similar to the body of the car, and mounted with weather-proof shields at the posts and plates.

The truck should, like the body, have as few parts as possible and be preferably of the cast steel type. Particular attention should be given the brake beam mounting to insure even brake shoe wear and proper alignment of levers and rods. All of these points are of extreme importance not only in that they may perform their special functions properly, but that irregular transmission of stresses to the car itself be avoided as far as possible. Brake equipment of standard makes is quite satisfactory. Special attention, usually lacking, to secure proper application and alignment of parts, is absolutely necessary to obtain safe and efficient results.

The draft gear should be of the friction type having a minimum recoil action, which should be just sufficient to readjust the parts in release. The travel should be approximately four inches. The shock dissipating capacity should be the maximum obtainable with prescribed travel and standard clearance conditions. The draft lug fastenings should approach strength sufficient to resist the maximum shocks regardless of draft gear capacity.

The holes in the framing should be die punched to templates. All rivets and bolts should be of the best quality obtainable and of full cross section. Bolts should have properly proportioned heads and clean cut and accurate threads to provide for wrench fit of nuts. Nuts should also be of the best quality and manufacture. The application of both rivets and bolts should be made without drifting, rivets having full and concentric heads and driven at the proper temperature.

Double nuts, lock nuts, cotters and split keys where used should be given special attention. I consider a good design of nut lock superior to a cotter or split key on account of the extreme difficulty in getting proper application of cotters or split keys. No one little thing is a source of more trouble on a car than loose nuts.

Too much stress cannot be placed upon the importance of more careful practical engineering study of both general and detail design to secure a well balanced, resilient car unit. Some manufacturers have done a great deal of excellent work in this direction on underframes, but have not in my opinion extended the resilient features far enough, as there is no reason why it should not extend to the entire superstructure. Particular attention should also be given to the selection and assembly of the best material obtainable.

In conclusion, it must always be borne in mind that the most efficient business box car is one so constructed and assembled that it will afford a maximum resistance to the development of chronic conditions arising from general and not maximum service stress. Such a car, reasonably maintained, will have the physical strength to take care of reasonable maximum stresses and at the same time represent a minimum first cost and up-keep, and be commercially efficient.

DISCUSSION

In the discussion the necessity for a greater side clearance for couplers to facilitate coupling on curves and to eliminate unnecessary stresses on striking castings was brought out. Several members spoke on side bearing location and clearance and brought out the fact that there is little agreement regarding the most desirable practice. In discussing the efficiency of diagonal bracing, one of the members told of some 50-ft. steel automobile cars which were diagonally braced and figured in numerous derailments on curves. The side bearing location and clearance were changed but the trouble was not overcome until the diagonal bracing was removed. The opinion was expressed that extra weight is often necessary in cars as it reduces maintenance. Since corrosion weakens the cars the parts must be designed

with excess strength. It was pointed out that the cost of maintenance of freight cars varies widely with the character of the service, the amount of switching and the topography of the road on which they are operated.

POOLING THE FACILITIES OF THE EASTERN RAILROADS

The eastern railroads' car pool, authorized on December 5 by the General Operating Committee of the Eastern Railroads, with F. G. Minnick as chairman with office at Pittsburgh, has issued General Order No. 1 containing regulations to govern the pool. The purpose is to pool all railroad coal-carrying cars upon the railroads coming under the jurisdiction of the committee, to the end that maximum efficiency may obtain in the handling of coal car equipment and the various railroads have been asked to instruct their transportation officers to give their full support and earnest co-operation in carrying out the work.

The organization consists of the manager and office and field assistants under the jurisdiction of the General Operating Committee. The expenses are to be apportioned in accordance with direction of the committee. The cars subject to the pool regulations include all open top cars owned or otherwise controlled by the eastern railroads or private cars at home on such railroads, if authority is secured to include them, except flat cars and coke cars and assigned coke cars. The basis for the apportionment of cars is to be the current situation represented by the percentage of cars furnished or available to cars ordered and actual requirements for the transportation of designated commodities, provided the number of pooled cars on each member line currently is equal to the average number of cars now controlled by the pool that were on each principal line daily during the period of 90 days immediately prior to December 1, 1917; further provided that such percentage does not exceed the actual requirements of each member. Cars which belong to a non-member line consigned to a particular mine for loading railroad fuel coal are not to be counted in the daily report of cars furnished or available and the mine rating must be reduced accordingly. Daily telegraphic reports are to be furnished by each member line to the manager giving information as to the number of cars required for the loading of coal, limestone, ore, iron and steel, and miscellaneous loading, also the number and percentage of cars furnished or available for each of these commodities. A weekly report is also to be furnished on form C S 11 and a monthly location statement, showing all equipment on line by classes. The manager will maintain a permanent record of daily telegraphic reports.

The regulations provide: Self-clearing steel hopper cars and single, double or triple hopper bottom steel or wood gondola cars originally built and intended for the handling of coal and limestone or other similar products must not be utilized for the handling of shipments of iron or steel or other similar products except that they may be loaded in the direction of coal mines, limestone quarries or ore docks in order to avoid empty mileage. Gondola cars having flat or drop bottoms, tight or drop ends, measuring 36 ft. to 46 ft. in length, which were originally built for the handling of iron and steel, must not be placed at coal mines for coal loading except when the lading will be destined to points in iron and steel producing territory in order to avoid empty mileage. Pooled equipment must, as far as practicable, be placed for loading to destinations on railroads which are members of the pool to the end that such equipment may be, as far as possible, governed by pool regulations.

It is the obligation of the Commission on Car Service to issue such instructions and enforce their provisions to railroads coming under their jurisdiction who are not members of the pool as will insure the immediate return, loaded or

empty, as soon as released from the original load, to railroads who are members of the pool, of all pool equipment loaded to points beyond the jurisdiction of the pool.

Railroads must equalize the interchange of pooled equipment currently. When the equalizing of pooled equipment is not accomplished by members of the pool it must be adjusted by the manager at suitable periods. The manager is to order the apportionment of cars among member lines based upon the situation as indicated by reports and records of cars required and cars available. The distribution of equipment by the manager among member railroads must be accomplished with a minimum empty movement of cars in all cases.

The pool is effective as of December 5, 1917, and will continue during the period in which extraordinary operating and traffic conditions obtain on account of the war.

Under date of December 17, the general operating committee issued a circular urging all roads, in order to assist in making the car pool immediately effective and to relieve the manager during the period of its installation as much as possible until the organization and working machinery can be perfected, to demonstrate co-operation by individually carrying out the regulation regarding the equalization of the interchange of pooled equipment currently with their connections, and also, so far as possible, to keep cars on the home road. It was stated that there are numerous interchange conditions where in the ordinary course of business cars can be sent back to the home road with no material increase in switching and thereby be kept in the hands of the owners, not only facilitating the distribution, but assisting in their maintenance. It was felt that no hard and fast rules can be formulated to cover this point and the co-operative spirit of roads concerned is therefore relied upon.

The sub-committee on military transportation accounting of the Railroads' War Board has created an accounting organization to confer and co-operate with the General Operating Committee in respect to all matters in which the revenues of the railroads are involved. The organization consists of an accountant, J. E. Merion, assistant comptroller of the Pennsylvania Lines, with office at Pittsburgh, and field accountants appointed by him to be stationed at the headquarters of, and to co-operate with, the chairmen of the several sub-committees of the general committee, together with field accountants appointed at or transferred to terminals which may be used in common by two or more railroads, as may be directed by the General Operating Committee for the purpose of directing and aiding in the keeping of proper records of the use of such terminals. The accountant is a representative of the sub-committee on accounting, to which he will report. He will also, however, keep in close touch with the operating committee to the end that maximum results may be obtained through practical co-operation. The accounting committee assumed that a large proportion of the traffic will move via its way-billed route and that it will be only necessary to provide machinery to take care of freight diverted. Its conclusion was that this could be best done by the use of rubber stamps properly worded, the impress of which is to be placed upon each way-bill at each junction or interchange point at and through which diverted freight moves. The stamps are to be applied by the agent or other representative of the railroad first receiving the freight from its way-billed route and by the agent or other representative at each succeeding junction or interchange point in the diverted route. The stamp thus indicates the route traveled by diverted freight and forms a guide in the apportionment of revenues by the accounting office of the destination railroad.

As to common use of terminals, it was assumed that such use would be under varying conditions, including in some cases only fixed facilities and in other cases both power and facilities. Mr. Merion is to keep in touch with the committee on this question and to produce suggestions for each condition as it arises.

As to detours, it is the understanding that compensation for ordinary detouring will be settled for under the rates and rules of the American Railway Association, but there may be extraordinary detours, the compensation for which will have to be specifically arranged.

Mr. Merion has issued a circular giving instructions as to the accounting methods to be followed in connection with diverted freight, to the end that accounting officers of destination lines may apportion the revenue to the line performing the service. These regulations provide in detail for the use of the diverted freight stamp referred to.

The General Operating Committee has also issued a circular on the same subject, ordering that a revenue way-bill must accompany each and every car of freight diverted from its way-bill route. In event of accident or any unforeseen emergency, if a car diverted from its way-bill route should be delivered at point of interchange on a card way-bill the delivering road is instructed to issue therefor an astray freight way-bill under which the car will be delivered to the diverted railroad and travel to its final destination in lieu of a card way-bill. General instructions are also given for the use of the rubber stamps.

C. R. Gray, president of the Western Maryland, has been elected vice-chairman of the General Operating Committee to act for the chairman in his absence. Albert S. Ingalls, general manager of the New York Central, has been appointed a member of the committee to succeed P. E. Crowley. J. J. Bernet, president and general manager of the New York, Chicago & St. Louis, has been appointed chairman of the Cleveland sub-committee, vice A. S. Ingalls. R. E. McCarty, resident vice-president of the Pennsylvania Lines West, has been appointed chairman of the Pittsburgh sub-committee, succeeding D. F. Crawford.

On December 18 the General Operating Committee issued a modification of its embargoes on carload freight within the Pittsburgh switching limits to permit the movement of fuel, oil and tank cars from refineries located within the switching limits directly to points of consumption within the same district.

Having been informed of the organization of the Coal Shippers' Terminal Pool Association, for the expeditious handling and distribution of coal at Cleveland, Toledo, Akron, Columbus, Detroit, Canton and Youngstown and other points to be determined later, the General Operating Committee has requested the various railroads to co-operate heartily and thoroughly with the organization. Primary pools are to be put in operation as quickly as possible at scales for the purpose of eliminating switching and relieving intermediate terminals.

Some of the sub-committees of the General Operating Committee have found it advantageous for railroads in their territories to exchange locally repair parts and materials for repair of foreign railroad cars, the railroad having such cars for repair requisitioning and securing necessary repair parts for adjacent or connecting lines on which a surplus of such material exists. The committee has issued a circular expressing its desire that this practice be carried out wherever possible or expedient to do so.

Arrangements have been made by the Railroads' War Board for the lease from the government of 100 U. S. A. locomotives, ordered by the War Department for service in France, to eastern railroads in this country for the purpose of enabling them to reduce congestion. It was noted in last week's issue that 30 of these locomotives built by the Baldwin Locomotive Works had been delivered to four eastern lines. Effort is being made to obtain permission to lease 50 more. It is probable that some of the locomotives on order for the Russian government will also be devoted to the use of American roads. Although no definite announcement has yet been made, it is understood that further shipments of railway supplies to Russia have been held up on account of the political situation in that country.

Annual Report of the Bureau of Safety

Decrease in Defective Cars Found; Suggestions for Improvement Resulting from Accident Investigations

H. W. BELNAP, chief of the Bureau of Safety of the Interstate Commerce Commission, has submitted his annual report to the commission, presenting a series of statistical tables showing the results of the inspection of safety appliances on railroad equipment for the fiscal year ended June 30, 1917, and also a review of the year's work. An abstract of the report follows:

Table No. 1 shows the number of cars and locomotives inspected, the number found defective, the percentage defective, the number of defects, number per thousand cars, etc.

Table No. 2 presents the number of defects reported for each of the 16 classifications on individual railroads on which 500 or more cars were inspected. Table No. 3 is a report of terminal or standing tests of power brakes.

Table No. 4 contains statistical summaries for the past five years with comparisons of the condition of safety appliance maintenance on the part of certain representative railroads. The results of inspections of the years ended June 30, 1914, 1915, 1916, and 1917 are shown as follows:

	1914	1915	1916	1917
Freight cars inspected.....	790,822	1,000,210	908,566	1,100,164
Per cent defective.....	5.79	1.77	3.72	3.64
Passenger cars inspected.....	26,746	33,427	27,220	29,456
Per cent defective.....	1.04	3.85	1.87	.85
Locomotives inspected.....	33,761	38,784	31,721	37,199
Per cent defective.....	4.98	4.06	3.66	2.69
Number of defects per 1,000 inspected	67.48	57.23	45.56	41.16

A marked decrease is shown in the percentage of defects found in equipment inspected during the year, the percentage of defective freight cars, passenger cars, and locomotives all having reached the lowest point in the history of safety-appliance inspection. It is significant that this decrease has been attained by the carriers during a period not only of the greatest increase in volume of traffic ever handled by the railroads but also marked by a scarcity of labor and an inadequate supply of cars.

At a hearing on March 13, 1917, it was shown that 296,033 cars were not fully equipped in conformity to the prescribed standards of January 1, 1917. It also appeared that the carriers were confronted with practical difficulties, such as car shortage, insufficient labor, inability to obtain new equipment, and congested traffic conditions. Upon consideration the commission on April 12, 1917, granted a further extension of eight months from July 1, 1917, within which to comply with paragraphs (b), (c), (e), and (f) of the order of March 13, 1911.

Thus the order will become effective March 1, 1918, and the combined efforts of all carriers should be directed to the equipment of cars on each of their lines of road regardless of ownership, the owning carrier to be billed for the expense.

Attention is directed to the number of defects per 1,000 cars inspected, respecting the visible parts of air brakes. This number of defects—19.01—is out of proportion to the number of defects to other safety appliances; in fact, 46 per cent of all safety-appliance defects reported are due to defective air brakes. Thus a situation obtains which can not be too strongly condemned. The maintenance of the air brake to the point of maximum efficiency is a consummation to be striven for by all carriers regardless of whether the grades on a particular line of road demand such efficiency in the ordinary movement of trains. Level roads should maintain their air-brake equipment to the same degree as those having steep mountain grades. The impression is too prevalent that the order of the commission of June 6, 1910, is complied with when 85 per cent of the cars in a train have their power brakes

used and operated, and this, no doubt, accounts in part for laxity in maintenance.

The standing tests of air brakes provide the only adequate means of ascertaining the true condition of braking power and as an element of safety is of inestimable value. It is encouraging to note that an increasing number of yards are being equipped with compressors and air lines for the testing of air-brake equipment, thus enabling proper adjustments and repairs to be made. However, there are too many terminals and yards where the only air-brake tests made consist merely of ascertaining whether or not the air is working throughout the train line. Such tests are inadequate, for the reason that the efficiency of individual brakes can not thus be determined. A system of careful inspection and tests at terminals by experienced and competent inspectors is therefore urged as a means of insuring adequate braking power on all trains.

Table No. 3 presents the condition of air-brake equipment in its most favorable aspect for the carriers, as it indicates the final result of inspections by our inspectors accompanied by the carriers' inspectors. In such inspections, in many instances, the first test develops that not even the minimum of 85 per cent of the brakes are operative, whereupon adjustments and further tests are made before the train leaves the terminal. The figures represent the condition disclosed by the final test; that is, the condition of the brakes when the train departed. These cases are not rare or isolated, and the very fact that when the commission's inspectors conduct terminal tests it is frequently found necessary to make repairs before even the minimum percentage of operative brakes required by law is available in trains discloses not only the need of better maintenance of air-brake equipment but also the absolute necessity for terminal tests and greater care and thoroughness in making them.

During the past fiscal year our inspectors not only inspected a greater number of cars and engines but in addition they investigated 80 accidents and conducted numerous special investigations respecting car shortage, and assisted in a number of tests of appliances relating to safety in railway operation. In their numerous activities they have shown marked ability and fidelity to duty.

HOURS OF SERVICE

During the year ended June 30, 1917, hours-of-service reports were filed by 1,189 roads. Of the roads that rendered reports, 448 reported a total of 135,513 instances of all classes of excess service, an increase of 37,201 as compared with the previous year. The remaining 746 roads filed reports showing that no excess service was performed by their employees.

Of the 135,513 instances of excess service reported, 112,341 were employees remaining on duty longer than 16 consecutive hours, 3,432 were employees continued on duty after having been on duty 16 hours in the aggregate in a 24-hour period, 723 were employees who, having been on duty 16 consecutive hours, were returned to duty with less than 10 consecutive hours off duty, 184 were employees who, having been on duty longer than 16 hours in the aggregate in a 24-hour period, were returned to duty with less than 8 consecutive hours off duty, 25,820 were employees at continuously operated offices remaining on duty longer than 9 hours, and 3,455 were employees at offices operated only during the daytime, who remained on duty longer than 15 hours.

The causes of instances in which train service employees remained on duty longer than 16 consecutive hours on roads

reporting more than 25 instances of excess service, for the past five fiscal years, have been arranged in the following table for the purpose of comparison.

Causes	1913	1914	1915	1916	1917
Collisions	9,910	5,099	1,703	3,414	3,421
Deraillments	88,317	53,481	25,209	25,013	30,395
Track defects and obstructions	10,620	5,712	2,567	4,696	3,982
Landslides, high water, fire	17,985	2,852	2,407	2,983	3,064
Adverse weather conditions	6,243	15,135	2,929	9,532	10,616
Congestion of traffic	13,812	3,992	1,059	1,769	16,250
Station work, waiting for orders and meeting trains	8,279	4,353	2,256	2,822	5,057
Conductor and drawbar defects	33,360	10,252	5,117	5,113	6,292
Miscellaneous car defects	17,753	10,914	7,509	9,386	10,246
Hot boxes	3,869	895	296	232	491
Air troubles	5,834	1,476	884	1,054	854
Taking or running for water	2,953	1,085	608	466	1,010
Clearing fires	519	138	40	45	181
Low steam:					
Poor coal	485	269	95	30	671
Bad water	423	105	49	46	28
Leaking	5,585	1,818	882	607	656
Miscellaneous locomotive mechanical defects	15,507	6,810	3,779	3,616	4,738
Wire troubles	2,072	689	119	168	206
Sickness, death, personal injury	923	381	156	131	173
Miscellaneous	16,883	5,879	1,709	1,932	2,905
Total	261,332	131,332	59,373	73,055	101,242

The foregoing table shows an increase of 28,187 instances in which employees remained on duty longer than 16 consecutive hours over the number reported for the preceding year. More than 50 per cent of this increase is chargeable to one road. The enormous increase in business incident to the extraordinary demands upon the carriers led to congestion of traffic and to this cause alone one road attributed 12,032 more instances of excess service than were reported by it for the previous year. In addition to the figures shown under the heading "congestion of traffic," the increased number of instances of excess service shown under "derailments" and "station work, waiting for orders, and meeting trains" were undoubtedly largely attributable to the business increase of the carriers. Comparing these three classifications for 1917 and 1916 there was an increase of 22,098 cases of excess service of employees engaged in train service in 1917 caused by increased business, or more than 78 per cent of the total increase shown by the table.

A very gratifying decrease has been noted in the number of instances in which employees were compelled to return to duty without having had the required statutory periods off duty.

The number of instances in which telegraphers remained on duty longer than the periods permitted by law increased more than 57 per cent, probably due largely to the increased business which is reflected in congestion of traffic, and to the difficulty experienced by the carriers in securing and keeping competent employees.

It is suggested that in order to remove the diversity of court opinion, Congress should enact legislation that will make certain the intent of the law regarding the limitation of the hours of service, of the period within which such service may be permitted, and of the circumstances, if any, under which an employee may lawfully be released in such manner as to extend his period of duty beyond the 16-hour limit prescribed by law.

MEDALS OF HONOR

The investigation of applications for medals of honor under the act of February 23, 1905, has been continued, and two such medals have been awarded during the past fiscal year. The act authorizes the President to bestow bronze medals of honor upon persons who by extreme daring endanger their own lives in saving, or endeavoring to save, lives from any wreck, disaster, or grave accident, or in preventing, or endeavoring to prevent, such wreck, disaster, or grave accident upon any railroad within the United States engaged in interstate commerce. Since the passage of this act, 31 applications for medals have been filed, 22 of which have been approved and medals awarded, and 9 have been denied.

INVESTIGATION OF ACCIDENTS

During the year ended June 30, 1917, this bureau investigated 80 train accidents, comprising 54 collisions and 26 derailments; 174 persons killed and 827 persons injured. Twenty-one of the collisions occurred on block-signalized lines, 11 being on lines where automatic block signals were in use and 10 on lines using some form of manual block system. Thirty-three of the collisions occurred on lines where the train order and time interval system of train operation was in force. Eight of the 11 collisions which occurred in automatic block signal territory were due to the failure of engineers to obey signal indications. In these eight collisions 30 persons were killed and 77 were injured.

Disobedience of signal indications on block-signalized railroads presents one of the most serious problems. Some of the most disastrous accidents are due to this cause and occur on roads equipped with modern systems of automatic block signals where trains are operated by trusted employees of long experience. The investigation of probably the most serious accident which occurred during the past year disclosed that the signal system in use was of comparatively recent installation and represented the highest development of automatic block signaling practice. The apparatus was surrounded with all safeguards necessary to insure its proper operation, and thorough inspection and tests of the signals at the point of accident demonstrated that they were in normal, operative condition. However, a collision, resulting in the death of 20 persons and the injury of 5 persons, was caused primarily by the failure of an experienced and competent engineer properly to observe and to obey block-signal indications partially obscured by a dense fog. In a very large percentage of accidents due to this cause which have been investigated, a contributing factor has been dense fog or stormy weather. In previous reports it has been pointed out that the practice of permitting fast trains to run at normal speed under such conditions constitutes a grave menace to the traveling public, and it has been recommended that during foggy or stormy weather, when signal indications can be seen but a short distance, unless some form of automatic train control system is used, positive and definite instructions should be given prohibiting the running of trains at high speed.

Of the 10 collisions investigated which occurred in non-automatic block-signal territory, 4 were due primarily to the failure of engineers to have their trains under proper control when approaching meeting points or in yards, 1 was caused by failure of a train crew to obey an order fixing a meeting point, 1 was caused by failure to protect by flag and another by the failure of a flagman to close a passing track switch, 1 was caused by failure of an engineer properly to manipulate the brakes for the control of a train on a mountain grade, 1 was due to the failure of an engineer to obey a stop indication of a dwarf signal, and 1 was due to cars fouling the main track.

The investigation of the collisions noted which occurred in non-automatic block-signal territory indicated that in certain instances little if any additional protection, as compared with the train-order and time-interval system, was afforded under the methods of operation employed. As was pointed out in the report for last year, on certain roads where the manual block system is used the investigation of accidents has disclosed that the benefits of the block system have been practically nullified by inexcusably bad operating practices, and even the most common and essential safeguards provided for the operation of trains have been disregarded. Nearly all of these accidents could have been averted by proper observance of the rules which were in effect. More than half of the collisions investigated during the past year occurred on lines operated by the train-order and time-interval system, and many of them were rendered possible by the inherent weaknesses of the method of operation employed.

In some of these cases inadequate operating rules were found, and in some instances it was found that practices were being followed which had grown up in the service, but which were not sanctioned by the rules. In one or two instances the employees involved failed to avail themselves of the facilities and safeguards for governing and protecting train movements provided for in the rules and resorted to methods and practices which could not in any manner be warranted or justified. It is a striking fact that the primary cause of each of the accidents investigated which occurred on lines operated by this method was the failure of one or more employees properly to perform some part of their duties; or, in other words, a so-called man failure. Many of these accidents could have been prevented by a proper application of block-signal principles. In comparison with the train-order and time-interval system, the block-signal system affords not only fewer opportunities for men to make mistakes likely to result in disaster, but it provides means for checking up and detecting such errors as do occur. It is true that accidents happen on lines operated by the block system, but it must be borne in mind that in general the lines carrying the densest and fastest traffic are operated by the block system, while the train-order and time-interval system is employed on lines of lighter and thinner traffic. It can not be questioned that there would be a very marked increase in accidents if an attempt were made to operate the block-signal lines by the train-order and time-interval system; and it is equally certain that the adoption of the block system, together with adequate rules and proper operating practices, on lines now operated by the train-order and time-interval system, would avert numerous accidents on those lines. Since 1903 it has been repeatedly recommended that railroad companies be required by law to adopt the block system on lines not already so operated, and it is again urged as one of the most important measures for the prevention of railroad accidents that the use of the block system be made compulsory.

In previous reports the Commission has recommended legislation requiring the standardization of operating rules. It is obviously essential to the safety of train operation that rules be explicit and uniform, capable of being easily understood and applied, and not liable to be misinterpreted. Such standardization of rules can be accomplished only by Federal legislation. Cases have frequently been found in connection with the investigation of accidents where employees in responsible positions had not been properly instructed or examined on the rules; and any legislation which may be enacted upon this subject should provide for proper supervision to insure that railroad employees are properly instructed and examined, as well as that the rules are properly enforced and obeyed.

The commission's annual bulletin containing statistics for the calendar year 1916 shows that during that year there were on steam railways 5,737 collisions and 8,253 derailments, the total number of both collisions and derailments having increased but continuing in approximately the same proportion as compared with the two preceding fiscal years. Approximately 83 per cent of the derailments which occurred during the calendar year 1916 were due to two causes, 4,185 being attributed to defects of equipment and 1,664 being caused by defects of roadway. Twelve of the derailments investigated during the past fiscal year were caused by defective condition of track and track equipment.

Speed was a direct cause or a contributing factor in 9 of the 26 derailments investigated, 2 of them being due to excessive speed on sharp curves, 1 being due to a locomotive running backward at excessive speed over uneven track, another being caused by excessive speed with one side of locomotive disconnected, and another probably being caused by freight cars being run at excessive speed.

While defective equipment is apparently the most common

and prolific cause of derailments, it is manifest that the most favorable result that can be attained by even the most rigid and thorough inspections which it is practicable to make is merely a reduction in some degree of the accidents due to this cause, for the reason that a derailment may occur at the time the equipment becomes defective. But it is believed that the cases in which the track or roadway becomes defective under a passing train and precipitates a derailment immediately form a very small percentage of the total number of derailments due to defects of roadway. As has been pointed out in former reports, existing federal law does not give the commission any supervision or jurisdiction over the condition of railroad track, and the commission is without authority to require its proper maintenance, although in many cases disclosed by investigation of accidents and in connection with regular inspection work performed by the commission's inspectors railroad tracks have been found so poorly maintained as to constitute a grave menace to the traveling public. It is beyond question that the existing condition of such tracks is responsible for a large proportion of the number of accidents due to defects of roadway. These matters have been pointed out in previous annual reports, and in various accident reports attention has been called specifically to certain roads and localities where better track maintenance was imperatively demanded by the requirements of safety. It is again recommended that the commission be given authority to conduct independent investigations with respect to physical conditions and operating practices on railroads, and to require the improvement or correction of unsafe conditions or practices which may be found to exist.

Investigations relative to failed material of both track and equipment have been continued during the past year. As was stated in the report for last year, there are some accidents due to failure of materials used in track and equipment which may be prevented by more careful inspection, while others can not be prevented by any sort of inspection, as the defects are hidden and do not disclose themselves until the material has failed. Several reports have been issued during the past year containing the results of investigations of failed material.

INVESTIGATION OF SAFETY DEVICES

During the year plans of 94 devices were presented for consideration; 111 devices were examined and opinions thereon transmitted to the proprietors. Of the number examined, 99 were so impracticable or crude that they were considered worthless; 2 possessed meritorious features, but as a whole required further development before being entitled to serious consideration; 8 were devices which were not intended primarily to promote safety and which would not affect the safety of railway operation sufficiently to warrant further consideration, and 2 were considered to possess merit but were no better than similar devices now in use.

Supplemental tests of the Wooding train-control system on the Delaware, Lackawanna & Western Railroad, near Newark, N. J., referred to in the last annual report, were conducted during the months of January, February, March and April, 1917. The device had been redesigned in many respects and parts of the apparatus rebuilt since the previous tests were made. A report upon this system, dated May 10, 1917, was transmitted to the Congress by the commission.

During the month of February, 1917, the operation of the Julian Beggs train-control system, which, as stated in the last annual report, was installed on the Queen & Crescent Route near Cincinnati, was observed preparatory to conducting official tests. It was found, however, that under the cold-weather conditions existing, the locomotive equipped with this apparatus was too small to haul the full train to which it was assigned; and as the company owning this device was not able to equip a larger locomotive and conduct proper preliminary tests of the apparatus before the season

had so far advanced as to preclude possibility of conducting the proposed official tests under the severe weather conditions of winter season, it was decided to postpone the proposed tests of this system until the coming winter season.

The revision of the automatic train-control system of the National Safety Appliance Co., San Francisco, Cal., mentioned in the last annual report, was not completed during the past fiscal year and the apparatus had not been developed sufficiently to require further inspection or trials.

The automatic straight air-brake system submitted by the Automatic Straight Air Brake Company, and mentioned in the last annual reports under the name of the California Valve & Air Brake Company, has been revised as a result of tests made by this bureau on the Atchison, Topeka & Santa Fe in November, 1915. Arrangements are being made by the proprietors to install the revised apparatus on the Virginian Railway for tests under the direction of this Bureau.

The annual statistical report for January 1, 1917, covering block-signal and train-order mileage, was compiled by this bureau and published by the commission. As shown by

this tabulation, the total length of railroad in the United States operated by the block system on January 1, 1917, was 98,407.9 miles, of which 32,954.6 miles were automatic and 65,453.3 miles were nonautomatic. Comparing these figures with the corresponding record contained in the bulletin of January 1, 1916, there was an increase of 2,012.1 miles of road operated by the automatic block system and a decrease of 179.8 miles of road operated by nonautomatic block system. The tabulation indicates a net increase during the year in mileage of road operated by the block system of 1,832.3 miles.

RAILROADS TO ASSIST AVIATORS.—Among the rules adopted by the aircraft board, to be followed by the public in its treatment of army aeroplanes which may be forced down by accident, is one requesting railroads to ask all employees to keep watch for aviators landing in isolated regions and to furnish assistance. All trains or steamships are requested to stop to take on stranded aviators and also at whatever point the aviator may desire to leave the train or boat.

The Halifax Explosion Did Not Leave Much of the Richmond Railroad Yards

THE NEED FOR STORAGE FACILITIES*

By Francis Lee Stuart
Consulting Engineer

The first problem of the United States government in the present war is to marshal the resources of the country to produce, distribute and use such military supplies as may be necessary to win the war—and its second problem is to carry through such aims with the least possible disruption of economic conditions so that our people may have recuperative power to meet and cope with the more serious period of readjustment after the close of the war.

It seems logical that in the fourth year of the war the effort of the United States in order to be effective should be so ponderous that it will be irresistible, and to accomplish that end the production of material and men must accordingly be planned. The distribution of necessary men and supplies must depend on applied simplicity for the success of its large continuous movement. The use of men and materials of war as far as this discussion is concerned, may be left to the field of operations.

The resources of the country will produce the needed military supplies, and it is therefore absolutely essential that such supplies should be so distributed that they will finally be under actual military control in order that there may be a dependable quantity for use when and as needed.

With the above essentials in mind, the Terminal Port Facilities Committee and the Storage Committee of the War Industries Board have recommended to the Depot Board of the War Department that—

(a) Storage areas and port facilities be created abroad for holding several months' supplies.

(b) That storage areas under military control be created at Atlantic ports to hold in storage several months' supplies, and that a number of ports be used instead of two or three.

(c) That interior storage areas be provided near the source of production for the collection of carload or train-load shipments to the terminal ports.

In operation, as the storage reserve abroad is drawn on for use at the front, it is replenished by requisition from Atlantic terminal ports, which in turn are kept up to a fixed reserve by moving up supplies in an orderly manner from the source of production.

With the full realization that the winning of the war is the largest undertaking embarked upon by this nation, the various committees have felt that methods or principles of doubtful effectiveness were unwise, and were unanimous in recommending the safe and simple methods outlined.

Speaking as an individual, as an engineer, and not as a member of any committee, I wish to explain some of the logic involved in such an obviously simple recommendation and the bearing that it has on present transportation congestion. The ports selected were selected because the export and import shipment business of the United States for the last 20 years has built up interior transportation facilities in proportion to the business of the various ports, and in this emergency there is neither time nor man-power to create greater railroad road facilities than now exist, and the entire country's rails, North, East, South and West should be used to an economical advantage.

Engineering students of transportation know that the present methods of export transportation which rely on cars meeting ships or holding cars to load direct to ships should be abandoned as it is inefficient and uncertain. Preferential orders which command are in effect, priority orders and such orders cannot be depended upon for any continuous effort, as they will disrupt and break down any organization whether designed for transportation or for commercial purposes, so that storage areas are essential at the ports for the

unloading of cars into them immediately upon the arrival of the cars and these areas are to be capable of holding several months' supplies available by lighters, truck or car for loading quickly any ship offered without delay.

The storage areas require sufficient size for expansion, as the uncertainties of the war are such that no man can foresee whether we shall have to furnish military material for two million or four million men or even a greater number. It is wise in planning for such a movement that the areas selected should be large enough to easily take care of a storage which can be expanded as required to meet the varying emergencies which may arise, without having to create new organizations or educate large forces in new methods.

It is necessary to build storage areas as there are no suitable storage areas available which are unoccupied by industries. The necessities of war will have a disastrous enough effect on the economic health of the country even with well thought-out endeavors to conserve the earning power and effort of the community and prevent the tearing down or disrupting of going concerns which in their indirect way, if not in a direct way, are necessary for our continuing strength.

Warehouses and layouts of the storage areas have been designed with due consideration of safety from fire or other risks. Quickness of despatch to ships, efficiency and simplicity of operation are other important and contributing conditions in the development plans, and while the storage areas are close enough to rail facilities which serve the ports they are segregated and their operation should not greatly interfere with the other efforts of the country.

Piers and berthing spaces for ships are available at every port, and it is recommended that we conserve man-power and materials by using such facilities as loading places for ships with materials from the nearby storage areas.

In 1913 had the business of the country been normally progressive the railroads would have been unable to avoid congestion as their improvements were not abreast with their needs; without the addition of new facilities the congestion of today was a certainty from every angle. Such congestion has been greatly augmented by abuses in use of cars for storage.

What can we do to avoid such congestion? In my opinion the greatest useful relief that can come in this crisis is the physical co-ordination of the railroads and a formidable public demand which will dictate a change in our business methods and coerce an immediate unloading and release of a car. This will require re-adjustment of business sites in the end, but the methods most intensively used to accomplish such result will be a storage area as a part of a business policy in every plant and a greater use of the already prepared roads, such as a city street for distribution by trucks or other means which do not require special tracks.

As to the railroad question per se, as long as republics require and encourage private capital to take the business risk of their early development and growth, there will be a desire as the country grows older and new generations control, to repudiate the cost of such agency in spite of the fact that such help has made them great; but regardless of the merits of the case this is not an opportune time for either party to force the issue.

The railroads' financial structure and credit have been crippled—how or why we have no time to consider now—Their full usefulness must be conserved at all cost, but it seems to me unwise to further jeopardize their efficiency by government experimentation with their working organization. The railroads today are manned by an organization that has taken years to create and train. Their ability is unquestioned. The Railroads' War Board has its records behind it and only business effort ahead and is the survival of thousands of able men who have been seeking the same recognition. In my opinion, there is nothing in the accomplishment of any other business body today and certainly

*Address at the annual meeting of the Academy of Political Science New York City, December 14, 1917.

not in the record of any government supervision that seems to me justifies any expectation that they could so efficiently guide the railroads' efforts as such a Railroads' War Board working with and for the President of the United States.

The congestion of today will be at its height in February and March. There will be attacks, criticisms, and what-not, and the usual scattering of ideas. The danger is that the country will try some cure-all, which will cause added confusion which will take months of efforts to overcome.

Let us hope it will be possible to get decisions and co-ordinate the many unrelated efforts of the government, and in spite of slow progress for the next few months, hold steadfast to tried methods of simplicity.

THE ACCOUNTING DEPARTMENT WAR PROBLEMS

In accordance with a resolution adopted at the meeting of the Association of American Railway Accounting Officers, held at Chicago, Ill., September 26, 1917, the president appointed a special committee of five to prepare recommendations as to how accounting officers may best meet the conditions confronting them with respect to clerical labor and the compilation of statistical data, particularly with respect to the use of mechanical devices as a means of solving the shortage in experienced clerical labor. The committee consisted of Mr. J. B. Duke, assistant comptroller, Southern Railway; C. E. Hildum, auditor of freight accounts, Erie; W. T. McCulloch, auditor of revenue, New York Central; J. S. Donaldson, assistant comptroller, Pennsylvania (chairman); and J. J. Ekin, general auditor of the Baltimore & Ohio.

After very careful and thorough consideration of the matter, the committee reported as follows:

It follows naturally that the answer to this phase of the situation depends largely upon the ability of the railroad to offer to clerical labor such compensation as would invite the acceptance of employment. On the assumption that each carrier is meeting the situation from the standpoint of offer of the highest compensation, which they are in a position to tender applicants for employment, consideration has been given, first: as to how to procure clerical labor. The present practices generally followed are: by awaiting applications from those seeking employment; advertisements in newspapers; notifying local agents of the desire of the general office to procure help; as well as through the various employees already engaged in the offices; and by application to business schools and colleges; and by the establishment of preliminary schools for the development of students to a point where it would be determined whether employment in the railroad offices would be tendered to such students.

The following suggestions are made:

In centers where it can be accomplished, co-operative schools, conveniently located, be established by the accounting officers of the carriers, through which students at such schools will receive sufficient development to determine whether or not they are qualified for positions in the accounting department of any of the carriers. The course of training in such school to be of such a character that the experience would be valuable to the carriers.

RETAINING AND DEVELOPING THE FORCES EMPLOYED

It is found that the practice prevails today of establishing night schools at which the employees of the accounting department are invited to attend, in order that they may receive instructions and education along particular lines, such as the application of rates and tariff classifications and divisions, the use of mechanical devices, shorthand and typewriting; and it is suggested that these be also extended so as to include instruction along other particular lines where there is necessity for help in such branches of the accounting departments and where vacancies are likely to occur.

The matter of office supervision is considered a very important feature in the development of efficient clerks and particularly so at this time when there is such a large proportion of such clerks who by lack of experience fail accurately to perform the work assigned, and it is recommended that those charged with the duty of overseeing the work should give very careful scrutiny to this, in order that unnecessary work may be avoided, which naturally follows inaccurate or imperfect production, with the thought that correct and proper handling of work in the first instance would eliminate much unnecessary work involved in the subsequent correction of the inaccuracies.

The assignment of certain picked employees to this feature of office practice as a special proposition seems highly desirable and has produced beneficial results where carried out.

COMPILED OF ACCOUNTING AND STATISTICAL DATA

It has been found that practices are in effect in the accounting departments of careful scrutinizing statistics or accounting department data which is furnished, to the extent that in every case the necessity for the data is being carefully inquired into and the cost of preparing it submitted at the same time, with the result that it has been developed that the data sought for involved an unwarranted expense as compared with the use to be made of such data, and this practice has resulted in the curtailment of such information, or the elimination of it entirely.

It is recommended that the accounting officers take the initiative by asking the co-operation of the traffic, operating and other departments in a canvass of the situation, respecting statements and statistical data prepared, with the idea in view of determining what, if any, real practical use is made of the information furnished, or if the company's interests would be in any way injured if such statements or statistical data would be discontinued. It is recommended that consideration be given to the question of estimated earnings and expenses during the war period, as it is felt that a saving in clerical labor can be effected in this way. It is also recommended that very careful consideration be given to the elimination of furnishing copies of billing to traffic officers, or to connecting lines, as it is very probable that to a very great extent no adequate use is being made of such copies, or where use is being made, it is questionable whether the service obtained from such copies justifies the expense involved in preparing and mailing it.

Too much consideration cannot be given to the establishment of through billing when through rates are provided and simplified per cents are provided for apportionment of the revenue. This matter is now receiving attention of the highest executive officers and accounting officers should take an active interest in preparing data for consideration of such executives, which will demonstrate to them the increased cost and the delay to traffic which results from junction billing, and should, also, show the burdens which are transferred from agencies to audit offices by the inauguration of interline billing, when percentages are not provided. This association has been active for years in its endeavor to secure through rates and simplified divisions and every advantage should be taken of the present opportunity, as economies of operation and conservation of man-power are sure to result from the extension of interline billing when percentage basis of division can be used. It is the thought of this committee that through billing arrangements should not be extended, except when through rates and percentage divisions are provided, unless, it may be found desirable by interested lines to arrange for two line through billing even when the arbitrary method of apportionment must be used.

In the agencies, much labor can be eliminated by the abolishment of detailed forwarded reports and reducing such reports to merely a record of waybills made, by num-

bers, and giving the auditor sufficient record to check the reporting of the waybill by the receiving agent.

In the matter of collection of charges from accommodation parties, by having the waybills pass through a revision bureau before the freight bills are tendered to the accommodation patrons and having all the collections made through a central bureau representing the treasurer, much detailed clerical labor can be saved in the local freight stations.

In the matter of billing, the committee would strongly recommend the use of a separate waybill for each shipment as being the means whereby, when desired, all the documents necessary for the transportation, accounting and collection of charges for a particular shipment can be prepared in one operation, as well as facilitating the movement of freight with the billing and making waybills more legible by reason of having only one shipment on each waybill. Consideration should also be given to the elimination of duplicate auditing of interline accounts, two or more roads accepting the audit of one carrier, covering both passenger and freight business, so that the audit of one carrier will be sufficient to protect the interests of both.

ACCOUNTING MECHANICAL DEVICES

It is suggested that each of the standing committees make a supplemental report to those already existing in the proceedings of the Association of American Railway Accounting Officers on June 26 and 27, 1912, at Quebec, with regard to the use of mechanical devices.

Under present conditions, every effort should be made to strengthen our forces—both in the general offices and at local stations—by the use of mechanical devices. It is not

practicable for this committee to go into details with respect to the merits of the various kinds of machines, as the adaptability of such machines can best be determined by study of local conditions. The principle governing the installation should be kept clearly in mind—that mechanical devices which may be operated by female clerks, without extensive experience, should be used wherever practicable, to release experienced men to take care of the more technical part of the work with which they are familiar. As examples—computing machines may be used for figuring extensions and footings on waybills—permitting revision clerks to devote their entire time to the revision of rates. Such machines may also be used for making extensions on shipping orders, and waybilling machines for preparing waybills, reducing to a considerable extent the work performed by experienced rate clerks.

Mechanical devices when installed should be accompanied by expert operators and their use should be carefully supervised. No economy is effected by the purchase of costly machines to be used under any other conditions.

NORTHWESTERN OPENS SOCIAL SERVICE BUREAU FOR SOLDIERS

With lines running both to Camp Grant, Ill., and the Great Lakes Naval Training Station, the Chicago & North Western carries more sailors and soldiers in and out of Chicago than any other road. Recognizing that the Chicago terminal of the North Western is an exceptionally large gathering point for these men, the executives of the road decided that it was the logical location for recreation rooms and a social service bureau for them.

Many of the soldiers and sailors are strangers in the city and exposed to the dangers growing out of chance acquaintances and unfortunate environments encountered in the quest for entertainment. It was with this idea of furnish-

Photograph by Central News Photo Service.

View Through a Shell Hole in a Damaged House on the Cambrai Front, Showing Tommies Loading a Light Railway Car with Bombs

Social Service Secretary at Work

ing them with wholesome recreation and suitable companions that a social service bureau was opened in the station for the registration of soldiers and sailors. Each man who desires to do so may leave his name with the social service attendant, stating the time he will be in Chicago and the length of his stay, even though it be for only an hour. Citizens of the city, on the other hand, who desire to extend their friendship to the enlisted men are asked to notify the bureau when they can entertain a soldier or sailor and leave. Both parties are brought together in this manner and in this

way enlisted men are provided with wholesome entertainment, whether it be a dinner, a dance or a theatre party.

For the entertainment and comfort of the men while waiting for trains at the terminal the North Western has provided recreation rooms containing comfortable chairs, reading and writing materials, music in the shape of a victrola

View of Recreation Room

and piano, bathing facilities in the way of porcelain tubs and shower baths, and a modern lunch counter where lunches can be procured at the lowest prevailing prices. In addition, cigarettes, cigars and candies are sold at cost.

LEWIS POWER REVERSE GEAR

The Lewis power reverse gear, which is shown in the illustration, is characterized by simplicity of construction and a high degree of adaptability so far as its location on the locomotive is concerned. These qualities have been obtained by the location of the control valve in the cab, where it is

The Lewis Power Reverse Gear

directly connected to the reverse lever, and by dispensing with the crosshead and guidebar for the piston rod. This gear is the development of the Commonwealth Supply Company, Richmond, Va.

The attachment of the gear to the locomotive is effected by means of brackets cast integral with the cylinder. Because of the absence of attachments for a guidebar or other parts of the gear, it is thus possible to bolt the gear directly

to the under side of the running board, to brackets attached to the boiler or to the frame of the locomotive, as the requirements of each particular case may make most desirable. The cylinder is merely turned to bring the faces of the brackets in the desired plane, the cylinder and heads being assembled with the brackets at the top, sides or bottom, as the case may be. The drain cocks have been placed in the cylinder heads in order that there may be no need of drilling special holes in the cylinder for each method of attaching the gear to the locomotive.

The control valve is of the rotary type with the seat in a vertical plane. Air is admitted to the top of the valve in the valve housing *A* and is admitted to the cylinder ports by means of a port through the valve. The exhaust cavity in the face of the valve is always in communication with a port in the valve housing leading directly to the atmosphere. The valve is operated by means of a stem or port *C*, in the end of which is a slot fitting over a rectangular lug on the top of the valve, thus relieving the valve of any tendency to tilt due to improper alinement of the operating post. To the outer end of the post is keyed a short arm, in the upper end of which is a slot working over a hardened block on the reverse lever.

The reverse lever has no fixed pivot. The initial movement of the lever is pivoted about its lower end, where it is

The Quadrant and Valve Housing with the Rotary Valve Removed

pinned to the back end of the reach rod. The extent of this movement is limited by a special tap bolt in the valve seat, the head of which extends up into the admission port in the valve and permits the valve to move in either direction only sufficiently to register with the admission ports in the valve seat. If the movement of the lever is forward, air is admitted to the rear end of the cylinder and immediately causes a forward movement of the piston. This is communicated to the lower end of the lever through the stroke lever *F* and the reach rod, and permits the continued movement of the upper end of the lever in a forward direction. During this part of the motion the lever is pivoted about the control valve connection and is retained in its proper location relative to the quadrant by means of the reverse lever guide *E*. This guide is a sleeve mounted on the valve housing, about which it is free to revolve. When the desired movement of the reverse lever is completed and the lever latched, the latch on the quadrant becomes the fixed point in the further movement of the lever necessary to lap the valve.

The quadrant is notched for 30 cut-off positions each in forward and back motion, a very fine adjustment thus being provided. There is a spring latch *D* on the reverse lever

which operates underneath the quadrant to indicate when the lever is in central position. This assists the hostler in locating the exact center of the motion with certainty.

When there is no air pressure on the reverse gear, the lever can be moved only slightly; it is impossible for it to be thrown into one of the corner positions until air pressure is available to effect the movement of the link blocks to a corresponding position. This is the result of the limited movement of the rotary valve. After the side of the valve admission port comes in contact with the head of the tap bolt projecting up from the seat of the valve the further movement of the reverse lever is dependent entirely upon the movement of the piston.

One of the unique features of this reverse gear is the ease with which the length of the piston stroke may be adjusted without blocking off the corners of the quadrant. There is a vertical slot in the stroke lever *F* where it is pivoted to the front cylinder head. The end of the pivot pin extends through this slot, in which it is secured by two nuts, one on either side of the lever. An adjusting screw, the length of which is equal to that of the slot in the stroke lever, is threaded through the pivot pin, and by means of this screw the position of the pivot pin in the slot is determined. It is possible with this arrangement to vary the relative lengths of the two arms of the stroke lever by an amount sufficient to change the length of the stroke from 18 in., which is its maximum, to 15 in., without affecting the movement of the reverse lever on the quadrant.

A crosshead and guide having been dispensed with, the piston rod is guided by means of long sleeve glands in both cylinder heads. These glands are bored to a running fit for the piston rod and are of sufficient length to provide the necessary bearing area. The glands are adjusted against the packing in the usual manner. The cylinder heads are cast with large oil pockets which communicate with gutters milled in the piston rod glands for lubricating the piston rod packing and gland bearings. The lubrication of the control valve and the cylinder is cared for in the cab, the lubricator being attached directly to the valve housing *A*.

DEATH OF SENATOR NEWLANDS

Senator Francis G. Newlands of Nevada, chairman of the Senate Committee on Interstate Commerce and of the Joint Committee on Interstate Commerce which is conducting a general inquiry of subjects pertaining to railway regulation, died suddenly at his home in Washington on December 24. As chairman of the Senate committee he had been expected to take charge in the Senate of the railroad legislative program to be recommended by President Wilson and he had held several conferences with him on the subject.

Senator Newlands had been chairman of the Senate Committee for several years and has therefore had an important influence on all transportation legislation in Congress and under President Wilson he has been regarded to a considerable extent as the administration spokesman on railroad matters. Personally he has taken a great interest in transportation matters and he has generally been friendly to the railroad cause in his efforts to place railway regulation on a sound basis which would promote railroad development. For years he has been an advocate of federal incorporation for railroads. He has also taken a great interest in waterway and irrigation legislation and recently had succeeded in having passed a bill providing for a comprehensive study by a special commission of waterways both in their relation to transportation and in their relation to irrigation and flood control.

Senator Newlands was in his seventieth year. He was born near Natchez, Miss., August 28, 1848, and entered the Class of 1867 at Yale, which he left in the middle of his junior year. He studied law at the Columbian College Law

School at Washington, and before he was graduated was admitted to the bar of the Supreme Court of the District of Columbia. He went to San Francisco in 1870, and became there a prominent member of the bar. In 1888 he became a resident of the State of Nevada, from which he was shortly after elected to the Fifty-third Congress. He served several terms in the House of Representatives before being elected to the Senate in 1905.

DISASTROUS COLLISION AT SHEPHERDSVILLE, KENTUCKY

In a rear collision of southbound passenger trains on the Louisville & Nashville at Shepherdsville, Ky., 18 miles south of Louisville, at about 6 p. m. on December 20 (Thursday), 45 passengers and two employees were killed and 40 or more passengers were injured. The employees killed were the conductor and the flagman of the leading train, and these two men, in the accounts given by the road to the newspapers, are named first as those responsible for causing the collision.

The leading train was a local passenger, No. 9, which had just started forward from the station and was to be set off on the side track to wait for the following train, an express. This train, No. 7, was about two hours late. It appears to have come on at full speed, and the rear car of the local train and the one next to it, both wooden coaches, were split open and completely wrecked. The express train consisted of one of the heaviest locomotives and nine steel cars, and there were no serious casualties in that train.

The statement issued by the company says that the men in charge of No. 9 were blameworthy, not only at the station, but also before reaching Shepherdsville, for not protecting their train at the rear while they were losing time. It says also that No. 7 should have approached under control; this because the train-order signal, which was in the proceed position for the local train, was motionless, whereas the rule requires the engineman to refuse to pass such a signal unless he sees it change from the stop indication to the proceed indication. There was a clear view for two miles. The space-interval system was not in use, though this section of the road was reported, a year ago, as having the manual block system.

On Saturday, December 22, President Milton H. Smith issued a statement to the public proposing arbitration of claims against the railroad, on behalf of persons killed or injured, to save legal expenses. This statement said, in part:

"Standing in the presence of the gravest catastrophe in the company's history, I feel, speaking for my associates and myself, utterly unable to adequately express how deeply we deplore the deaths and injuries and how profoundly we sympathize with those to whom have come these sufferings and bereavements. They and the general public are entitled to know just how the calamity came about, and this they shall know to the fullest. . . . The Louisville & Nashville has never knowingly contested a just claim. . . . and I desire hereby to definitely acknowledge legal liability in the case of the death or injury of all passengers; and I propose and request that the Hon. A. O. Stanley, the Governor of Kentucky, appoint a committee of three men of integrity and high standing, one each from the counties of Bullitt, Nelson and Washington, to whom shall be submitted all claims, settlement of which the company and the claimants cannot agree upon, their decision to be final.

"This will save the claimants the delay and expense of litigation, will insure a certain and just determination of their rights, and will guarantee their receiving the full amount awarded instead of dividing it with others. This proposition is not dependent upon acceptance by all claimants, but is open for three months to all who may desire to avail themselves of it."

TRAIN ACCIDENTS IN NOVEMBER

The following is a list of the most notable train accidents that occurred on the railways of the United States in the month of November, 1917:

Collisions					
Date	Road	Place	Kind of accident	Kind of train	Kil'd Inj'd
11.	Western Md.	Garrett.	bc	P. & F.	1 4
12.	Denver & R. G.	Cotopaxi.	rc	P. & P.	3 16
24.	Union Pac. A. T. & Santa Fe	Topeka.	xc	P. & P.	0 6

Derailments					
Date	Road	Place	Cause of derailment	Kind of train	Kil'd Inj'd
5.	Central N. J.	Jersey City.	exc. speed	P.	0 1
11.	Great Northern	Minneapolis.	d. eq.	P.	0 2
21.	Seaboard	Millbrook.	P.	0 1
22.	Norfolk & W.	Rippon.	d. eq.	P.	0 0
25.	St. Louis-S. F.	Weleetka.	acc. obst.	P.	2 3

The trains in collision near Garrett, Pa., on the 11th were through freights. Both engines and ten cars were badly damaged. One trainman was killed and four were injured.

The trains in collision near Cotopaxi, Col., on the 12th were eastbound passenger trains carrying troops. The leading train, moving at very low speed because of a freight train ahead, which had been delayed, was run into at the rear by a following train moving at about 25 miles an hour. Three soldiers were killed and sixteen were injured. Responsibility for the collision is charged against the men in charge of the leading train, who failed properly to protect the rear end of the train by flag.

The trains in collision at Topeka, Kans., on the 24th were a passenger train of the Union Pacific, No. 102, third section, carrying soldiers, and passenger train No. 105 of the Atchison, Topeka & Santa Fe. The U. P. train ran into the other at the crossing of the two roads. The U. P. train had stopped 300 ft. from the crossing. Three trainmen were injured.

The train derailed near Jersey City, N. J., on the 5th was an eastbound passenger. The locomotive left the rails and was overturned and one coach was derailed. One passenger

cars were ditched, three of them being overturned. The cause of the derailment was the failure of some part of the car first derailed, causing an obstruction on the track.

The train derailed at Millbrook, N. C., on the 21st was northbound passenger No. 4. The locomotive was overturned and one employee was injured.

The train derailed near Rippon, W. Va., on the 22nd was northbound passenger No. 28. All of the injuries to passengers and employees were reported as slight. The cause of the derailment was a loose tire.

The train derailed on the St. Louis-San Francisco, near Weleetka, Okla., on the 25th was a westbound through passenger. Traveling at full speed the engine was thrown off the track by a piece of iron wedged in a frog, and was overturned. The engineman and one other trainman were killed and three passengers were injured. The iron had been placed on the track by mischievous boys.

Electric Car Accidents—Serious accidents to electric cars occurred at Angola, N. Y., November 9; near Lorain, Ohio, November 8; near Youngstown, Ohio, November 12; and near North Lima, Ohio, November 4. Ten or more persons were injured in each accident and at Angola one of the injuries resulted fatally. Angola and North Lima were butting collisions; the Youngstown case was a rear collision in a fog and at Lorain a passenger train of the Lorain, Ashland & Southern ran into a street car at a grade crossing.

BURLINGTON CONSERVES FOODSTUFFS AND PREVENTS CLAIMS

An exceptionally early frost resulted in heavy shipments of damaged perishables this fall. To prevent a flood of damage claims and at the same time to conserve car space and save sound perishables from contamination by frosted vegetables, the Chicago, Burlington & Quincy inaugurated an inspection of perishable freight at points of origin. In the potato growing section of western Nebraska it has four inspectors who examine and make a record of each car of

Car Well Loaded for Bulk Shipment

Carelessly Loaded Car Containing Trash and Straw

Frozen Potatoes Sorted From Car

was slightly injured. The cause of the derailment was excessive speed at a crossover.

The train derailed near Minneapolis, Minn., on the 11th was an eastbound special passenger, carrying troops. Two trainmen were injured and several soldiers were slightly hurt. The train was traveling at about 40 miles an hour. Four

vegetables loaded for shipment. The railroad, of course, is bound to accept any shipment which it may receive, but the knowledge that a record is kept of the condition of the lading at the time of loading has been a sufficient inducement to shippers to sort out damaged perishables and send forward only those which are sound.

The right-hand photograph shows a pile of frosted potatoes which were sorted from a car at Alliance, Neb., because the inspector of the Burlington refused to give it a clear billing until the damaged potatoes were removed. The center illustration shows a car of Red Triumph potato seed stock which was loaded at Hemingford, Neb., and contained so

Abbreviations and marks used in Accident List:
 bc, Rear collision; —bc, Butting collision; xc, Other collisions; —b, Broken; —d, Defective; —unf, Unforeseen obstruction; —uns, Unexplained; —derail, Open derailing switch; —ms, Misplaced switch; —acc, Accident; —obstruction, —malice, Malicious obstruction of track, etc.; —boiler, Explosion of locomotive on road; —fire, Cars burned while running; —P, or Pass, Passenger train; —F, or Ft, Freight train (including empty engines, work trains, etc.); —A, Asterisk, Wreck wholly or partly destroyed by fire; —Dagger, One or more passengers killed.

much frost that it had to be resorted. The photograph, which was taken before the frozen potatoes were removed, also shows the careless manner in which the car was loaded. No effort was made to load the car to anywhere near capacity, and no pains were taken to sort the potatoes as to quality or size or to keep them free from straw and refuse. The view on the left shows a car well loaded for bulk shipment. This car was loaded practically to the roof at the ends and contained well-graded potatoes.

At the request of the railroads in Illinois, the State Food Administrator has agreed to provide inspection of perishables at points of origin to prevent damage to food in transit. It is expected that similar action will be taken by the food administrators in other states.

Because of the large percentage of wet corn this year, various agencies are taking steps to prevent unnecessary loss on this account. At some points artificial driers have been provided, but this method of saving the grain is too expensive for general use. The Burlington recently sent out a bulletin to bankers, county newspapers and county agents in the territory it serves, urging the wet corn to be treated with salt at the rate of one barrel of salt to a thousand bushels of corn. This practice has been tried out in other years, and the results have proved satisfactory in every way. The Burlington also gives preference to cars loaded with corn, to reduce damage to the crop while it is waiting for shipment.

AUSTRALIAN TRANSCONTINENTAL LINE COMPLETED

The first east-and-west transcontinental railway in Australia was recently completed when a new line was opened from Port Augusta, South Australia, to Kalgoorlie, West Australia, 1,053 miles. At the latter point the new road connects with the West Australian line from Perth on the Indian Ocean coast and at Port Augusta it joins the South Australian railway to Adelaide. A recent article in the "Railway Gazette," London, contains a description of the new road based upon a letter from Perth, giving an account

only, and the intervening unconstructed gaps being covered by motor car (90 miles) and by carriage (24 miles).

Mr. Lynch was of the opinion that by the time the line was properly ballasted and brought up to the high speed standard the cost would reach £7,000,000 sterling (\$34,000,000), or more, as against an original estimate of about £4,000,000 (\$19,000,000.) From Kalgoorlie the line runs through a fine belt of timber for 70 miles, after which it passes through a lighter timber belt and enters a large area of limestone plains, 450 miles in width. In that stretch there is 309 miles of straight line running through a tremendous sweep of open country with nothing to relieve the eye but blue bush, salt bush and other native shrubs.

The minister expressed satisfaction with the rate of progress, but believed that if ordinary foresight had been exercised at the outset the railway would long since have been completed. Although the line traverses practically 1,000 miles of dry country and it was essential that an adequate water supply be secured, this all important provision was neglected and 90 per cent of the delays which occurred later were due to this cause. At present condensers are being employed to obviate this difficulty, but steps are being taken to secure a reliable water supply throughout the entire line.

The transcontinental road is designed for high speed traffic with the expectation that it will prove practicable to make the journey between Port Augusta and Kalgoorlie in about 24 hours, or at an average speed, including stops, of 44 miles per hour. The line will not, however, be fully ballasted for some time, and consequently it is estimated that the average speed cannot exceed 30 miles an hour, permitting an average time of 35 hours for the trip between Port Augusta and Kalgoorlie. The rails weigh 80 lb. per yd. and are 40 ft. in length. The original intention was to use 70-lb. rails 33 ft. long, but the weight was changed in order to permit higher speeds, while the length was altered to save joints.

Owing to war conditions it has been impossible to secure the requisite material to build equipment suitable for the country traversed by the new line, which is warm in summer and cold in the winter months. For immediate purposes wooden bodies of the best design practicable will be built on such car underframes as are available in the Commonwealth. This equipment will consist of first and second-class sleeping cars, dining cars, day coaches and mail and baggage cars.

There will be 20 intermediate stations on the new road where postal, money order, savings bank and telegraphic business will be done. The line will be worked by the electrical staff, divided into 38 sections.

Location of the New Line

of an official journey made over the Australian Trans-Continental Railway when all but 114 miles had been completed. This trip was undertaken by a large party of members of the federal and Western Australian parliaments and government officers, including Hon. P. J. Lynch, Federal Minister of Works and Railways, and J. J. Poynton, Director of Transport. The through trip from Perth to Port Augusta took five days, the party travelling by daylight

TRAIN RESTRICTIONS ON ITALIAN RAILWAYS.—Owing to scarcity of coal on the Italian State Railways, it was decided to cancel 173 trains commencing with November 25.

NEW TYPE OF LOCOMOTIVE IN NEW ZEALAND.—A new type of locomotive has been employed on the Woodville-Taihape section of the Main Trunk Railway of New Zealand during the past three months. The first of the class was constructed at the government workshops at Dunedin for service on the Canterbury Plains some two years ago. When tried over the level country between Christchurch and Oamaru the new engine gave such excellent results that it was decided to try it over the sharply graded section between Oamaru and Dunedin, and there again it satisfied all tests. Four of the new engines were sent to North Island some months ago and have been employed on the Wellington-Taihape section with good results. It appears that this engine can travel farther than the compound engine without taking in water, and that it has a greater hauling capacity.

—Commerce Report

HEAVY LOADING OF COTTON

The Southern Pacific, Texas lines, is securing maximum carloads of cotton by the use of a small derrick and horse in loading. The flat car shown in the photographs which was originally fitted for the hauling of lumber, was loaded

Car Loaded with 86 Bales of Cotton

in this instance with 86 bales of flat cotton. The pictures were taken at Mabank, Tex., on November 28, 1917. In another instance a 50-ft. flat car was loaded with 110 bales

Carload of Cotton Bales in Process of Loading

of uncompressed cotton without the aid of derrick and horse.

We are indebted to F. M. Lucore, assistant general manager of the Southern Pacific, Texas lines, for these two photographs.

RAILWAYMEN AT THE FRONT.—There are leagues of narrow-gage railways serving the British armies in Flanders and France. These are largely in the hands of Canadian and American railwaymen who have had special training. These railways are helping to beat the Germans, who never expected that the Allies would bring field transportation to such a high pitch of efficiency. The adaptability of the North American has made him invaluable as a railway pioneer at the front. In some sections the railways abandoned by the retreating Germans have been turned to good use against the enemy after suitable changes in gage. The "Sammies" on the firing line, under General Pershing, are not the first draft to reach the front. For more than two years American railwaymen have been running the risks of war, repairing and constructing railways under fire. So risky is this work that some of them have volunteered for the front trenches, preferring fighting risks to the fortunes of war on a railway section. Men from Ontario, Northwest Canada, and the United States have done a magnificent work as railway men.—*Toronto Globe*.

MORELAND AUTO-RAIL TRUCK

The automobile has become such an important factor in the trucking business in the Imperial valley of California that the Holton Interurban Railroad found that its business was falling off. The fact that the automobile would take material directly from the ranches to the market made it much more desirable for the farmers to use this service, as it eliminated the haul from the ranch to the freight station on the railroad. To meet this situation, W. F. Holt, who controls the Holton Interurban equipped a standard 2½-ton Moreland distillate truck with a motor truck wheel,

The Truck Leaving the Highway for the Railroad

designed by himself, which has steel flanges on the inner side and a solid rubber truck tire of larger diameter than the metal flanged portion, on the outer side in order that the truck can be used on rails as well as on the road, as the illustrations indicate. It is a simple matter for the car to mount the rails at any road crossing.

After the truck wheels are in place on the steel rails they

Auto-Rail Truck Mounted on the Rails

are locked rigidly by a special brace, a patent for which has been applied for by Mr. Holt. The truck operates on regular schedule time and maintains a speed of about 40 m.p.h. The difficulty of crossing switches and frogs has been overcome by still another device which is being patented.

WAR HONORS FOR BRITISH RAILWAYMEN.—Thirty-three men employed by the London, Brighton & South Coast Railway have been awarded war honors and decorations on active service.

General News Department

The Delaware, Lackawanna & Western has made an increase of 10 per cent in the pay of clerks in the auditing and car record departments. The Pennsylvania has made an advance in the pay of telegraphers, said to be of benefit to more than 1,000 men.

On the Buffalo, Rochester & Pittsburgh during Christmas week all agents, conductors and station and train baggagemen were instructed to accept U. S. Mail presented by the post office department at any station, on any train, and carry it to destination or junction point regardless of space or territory authorized.

Near Ruston, La., on December 23, a man named Causey flagged a passenger train of the Vicksburg, Shreveport & Pacific, brought it to a stop, and at once went into a coach and killed a passenger, against whom he had some grievance; and seriously wounded another man. At the next station Causey got off and surrendered to the sheriff.

William A. Christian, senior civil engineer, and T. E. Laist, senior architect, of the Division of Valuation, of the Interstate Commerce Commission, Central district, Chicago, have received commissions as majors in the engineering corps of the United States army. J. M. Kemmerer, office engineer at Chicago, has also received a commission as captain in the engineers corps.

At Magnolia, Md., on the Philadelphia, Baltimore & Washington, on the evening of December 22, six men waiting for a train were pushed by the crowd from the station platform on to the track and were killed by an express train. The crowd, a large one, consisted of contractors' employees who had been working for the government near Aberdeen and were waiting for a local train.

Of the 102 locomotives recently ordered sent from western lines to eastern roads to relieve the districts congested with freight, 39 were delivered at Chicago and 7 at St. Louis by December 21, 26 were en route at that time and 30 had not yet started for their destination. The expectations were that all of the engines would be delivered by December 25, except a few which are being transformed from coal to oil burners.

The Grand Trunk Literary and Scientific Institute is now 60 years old, and recently celebrated its anniversary. It was organized by F. H. Trevelthick, a member of the distinguished family which included Richard Trevelthick, who made the first high pressure steam locomotive. F. H. Trevelthick, when he founded the institute, in 1857, was locomotive superintendent of the Grand Trunk. This movement led to the establishment of Grand Trunk Railway libraries at London, Stratford, Belleville, Lindsay and Battle Creek. The libraries are supported in part by a fund given to the railway company for that purpose, in 1860, by the Prince of Wales (King Edward).

Agnew T. Dice, president of the Philadelphia & Reading, has issued a call to employees of that road to stand by and do their share to the utmost. It speaks of the vital importance and urgent need of operating the road with the greatest possible efficiency and continues: "This result can be gained only through the giving by each man of the most efficient service of which he is capable. Railroad men may naturally be expected to set an example for other workers, and I am sure that each and every one of you will feel it to be a patriotic duty to lose no time from work and to give his best service of head, hand and heart. . . . Let every man feel that it is his patriotic duty to work and to co-operate with his fellows to the limit of his ability. Let us all face our difficulties with the determination to overcome them. . . ."

Officers of the Southern Pacific, testifying at an inquiry held by the California State railroad commission, recently said that the company had done its utmost to provide for the transportation needs of the public. Ten new locomotives have recently been delivered; ten more are being built in the company's shops, and others have been leased and borrowed. The company is

building 3,200 cars in its California shops and has had 10,481 skilled workmen employed in maintenance of equipment work. It could use 500 more men if they could be found. F. E. Bator, general passenger agent, said as war broke out the company called meetings on all its divisions to see if any unnecessary passenger service could be eliminated, and it had been found that all of its trains were needed by the public, that the expeditious moving of the country's man power in time of war was as necessary as the prompt handling of freight, and that any attempt to lengthen the schedules of fast overland trains, such as the Overland Limited, would be interfering with the expeditious handling of Government mail, and a delay to business men.

The United States Fuel Administration has announced that it will not permit local officers to confiscate coal to meet local needs. The authority to commandeer and divert coal will be retained entirely in the hands of officers of the Fuel Administration. Director of Charities William Krusen, of Philadelphia, who used four cars of coal for local distribution without consulting the state fuel administration has been notified that further confiscations will not be permitted; and that they are unnecessary, provided he will advise the Washington office. At Toledo, Ohio, Judge John M. Killits, in the United States District, took similar action in a similar case. It was a suit of the Baltimore & Ohio against the Mayor of Lima. The temperature at Lima fell to 10 deg. below zero and the city took some cars from trains passing through. Judge Killits said: "Such officials ought to be taught to respect the law. They should come down off their high pedestals. They should try to cultivate amiable relations with the railroads. Their acts impede efforts to solve the coal distribution problem and thwart the railroads in their work of contributing coal where it is most urgently needed."

At Macon, Ga., recently a board of arbitrators decided in favor of the reinstatement of a locomotive engineer of the Georgia, Florida & Alabama who had been dismissed and whom the brotherhood demanded should be taken back, and a few days later the railroad company filed in the United States District Court a bill, taking exceptions to the findings of the board. The bill of exceptions avers that the arbitrators were without jurisdiction to hear and determine the issues and that the federal district court in which the bill is filed is without jurisdiction to render any judgment based on the award because the act of July 15, 1913, which authorizes mediation between railroads and their employees, does not cover the case in question. Strickland was not an employee of the road at the time of arbitration and even had he been, it is contended, the mediation act would not have applied in the case since this act is designed to cover only cases where matters of wages, hours of work and conditions of employment are concerned. Strickland, it is alleged, was discharged for infractions of the rules of the road and so the case in question is not among those provided for in the mediation act. Strickland was discharged by the road on August 5, 1914. The unions demanded his reinstatement, and in October an arbitration agreement was signed. Stanton J. Pelle, F. A. Burgess and J. C. Hale were the arbitrators.

Trolley Car Disaster at Pittsburgh

In the derailment of a street car at Pittsburgh, Pa., December 24, at the foot of a steep descending grade, 19 passengers were killed and 80 or more were injured. The car became uncontrollable just after entering the tunnel, about a mile long, leading from the South Side at the center of the city, and ran uncontrolled to a curve at Carson street at the lower end of the tunnel.

Hearing on Railway Situation

The Senate Committee on Interstate Commerce has announced a hearing on Saturday on the railroad situation. The members of the Interstate Commerce Commission are expected to be the first witnesses.

Engineers Wanted for the National Army

The War Department announces that volunteers are now being accepted for a provisional reinforcement railway regiment, for the National army, which is being organized at Camp Grant, Rockford, Ill. Men are wanted who have qualifications in railway construction, operation and maintenance; shop work and transportation. Applications are received at all of the principal recruiting stations.

Freight by Automobile from Detroit to Newport News

The train of 33 automobile freight trucks which is being run by the War Department from Detroit, Mich., to Newport News, Va., to facilitate the movement of government freight, delayed by the congestion on the railroads, and also as a means of training soldiers in the management of this kind of transportation, has made thus far about 50 miles a day; in other words, has accomplished about the speeds that were planned. The best day's run was 65 miles. In northwestern Ohio much snow was encountered. Near Warren, Ohio, on December 19, about 1 a. m., one of the trucks was wrecked at a crossing of the Erie Railroad, being struck by a passenger train and one of the two men in charge was killed. The other was badly injured.

Curtailment of Use of Private Cars

In compliance with the request recently made by the Railroads' War Board that the use of private and official cars be curtailed as much as possible during the war, Henry C. Frick, one of the largest railroad stockholders and a director of the Pennsylvania and the Atchison, Topeka & Santa Fe, has ordered his private car, the "Westmoreland," dismantled and laid up for the duration of the war. The War Board has since requested the presidents of the Trunk Line roads to withdraw the tariffs covering the movement of private passenger cars.

\$250 for the Railway Regiments' Tobacco Fund

The Railway Regiments' Tobacco Fund received another big boost last week when the New York Railroad Club, on the motion of Daniel M. Brady, voted to give \$250 to the fund, \$250 to the Y. M. C. A., \$250 to the Knights of Columbus and \$250 to the Red Cross.

Other contributions were received last week as follows:

American Car & Foundry Company, New York, \$50; Damascus Brake Beam Company, Cleveland, \$25.

Iowa Defense Council Praises Railways

The Iowa State Council of National Defense has issued to shippers and receivers of freight a circular commending the patriotism of the officers of the railroads who have released many of their best employees to go to France and Russia and have also organized from their employees companies of engineers for service abroad. The circular says: "They have co-operated in every way with each other, diverting business from the companies which could obtain it to the companies which could handle it most efficiently. They have sought to attain the greatest degree of efficiency in transportation for the benefit of the country, regardless of the effect upon the individual companies. Their credit has been so greatly impaired that they cannot borrow money except at ruinous rates, but they have nevertheless greatly increased the amount of their transportation of passengers and freight. . . ."

Christmas on the N. C. & St. L.

President John Howe Peyton of the Nashville, Chattanooga & St. Louis, has issued a Christmas greeting to the employees in which he says:

"The joyous Christmas-tide is again at hand, and we should all remember that it is the annual reminder to all the earth that Christ, the Son of God, chose at this season to be born in the form of humanity, in order that He might work out the salvation of our race. With the whole earth at war this is no time for merriment, but I can and I do wish you all a 'happy' Christmas. Happiness is only possible to those who try to do their duty to God and men. . . . The future of our nation, and of the whole human family, is threatened with great suffering

and privation. We will meet the emergencies like true men, and we will do our duty at any cost. We must, each and all, volunteer for the war. Some of us must become soldiers and offer our lives to preserve liberty upon the earth. Some of us must sacrifice our leisure to produce more food, and all of us must economize by consuming less food. All of us must sacrifice our pleasures in order to save money to loan to the government. Let us rejoice because Christ was born in Bethlehem nineteen hundred years ago, and let us imitate Him by sacrificing ourselves for the cause of liberty, justice and righteousness upon the earth."

Cresosote Oil Imports

The imports of cresosote oil in the United States during the fiscal years ending June 30, 1916, and 1917, as compiled by the Bureau of Foreign and Domestic Commerce, were as follows:

Source	1916		1917	
	Gallons	Value	Gallons	Value
England	34,616,238	\$2,763,078	25,782,272	\$1,920,446
Scotland	505,346	62,285	206,012	30,270
Canada	3,746,192	272,273	3,089,754	233,853
Japan	1,630,616	109,144
	40,498,392	\$3,206,780	29,078,038	\$2,184,569

From these figures there is shown a decrease of 11,420,354 gal., the larger part of which results from the heavy falling off in importations from England and the suspension of shipments from Japan. The average invoiced value of all cresosote importations last year was 7.2 cents per gal. as compared with 7.9 cents in 1916.

Grand Trunk Safety Bulletin

The Safety Engineer of the Grand Trunk issues his December bulletin (No. 15) with decorations of holly and other embellishments; and illustrates one of his chief points by a picture of a barrel tipping over the brink of Niagara Falls. In this connection he says:

"Would you go over Niagara Falls in a barrel? *I should say not.* That's a funny question to put into a Safety Bulletin. What are you driving at anyway? *Just this.* Scores of you men every day are taking chances that are just as unnecessary, just as foolish and just about as risky as going over Niagara Falls in a barrel; and if you could read the reports in my office showing how Grand Trunk men get injured and killed, you would agree with me."

The introduction to the bulletin reads

You fellows who have never been hurt—and who probably think you never will be—go to look on this "safety first dope" as good stuff for the other fellow—you are the individuals this Bulletin is aimed at. I want you to quit flirting with Carelessness and get into the Safety Corral before your name comes floating into my office on one of those long pink sheets.

The safety engineer finds that three causes alone are responsible for more deaths to Grand Trunk men than all other causes combined: (1) Run over by cars or engines; (2) Falling from cars or engines; (3) Train or yard men working on cars which are moved by another engine working on same track.

Individual Christmas Boxes Sent to Railway Men in France

With contributions by employees of the Illinois Central, the Yazoo & Mississippi Valley and the Chicago & North Western individual Christmas boxes were sent to former employees of those roads now in active military service in France. Charles H. Markham, president of the Illinois Central system, addressed a personal letter to each Illinois Central soldier in France, sending it with the box. Every box contained the following articles: One box of cigars, 20 packages of cigarettes, 20 packages of cigarette papers, 20 boxes of smoking tobacco, one pound of chewing tobacco, one automatic cigar or cigarette lighter, one pipe, one package of pipe cleaners, two tooth brushes, two packages of tooth paste, five pounds of candy, three bars of soap, 10 packages of chewing gum, three pairs of woolen hose and one woolen vest.

The North Western Christmas boxes were purchased, packed and sent at an expense of \$1,247. There still remains a balance of \$3,895 of the fund contributed by employees and officers of the company. Each box which was sent to members of Company F of the Thirteenth Engineers, the North Western unit in France, contained one pound of assorted candy, one package of mints, three packages of gum, six packages of licorice, one pipe.

200 cigarette papers, 12 pipe cleaners, 20 packages of smoking tobacco, one pound chewing tobacco, 10 packages of cigarettes, 25 cigars, one indelible pencil, one cigar lighter and a set of writing tablets and envelopes. In addition, a box for general distribution was sent to the company containing baseball equipment, 40 decks of cards, 48 puzzles, 12 mouth organs, four yearly subscriptions to the *Railway Age Gazette* and a miscellaneous assortment of magazines.

Mr. Markham's letter expressed the pride felt by the men at home in their co-workers' response to the call of their country, and confidence that "any task which may be assigned to Illinois Central and Vazoo & Mississippi Valley men will be promptly and efficiently performed."

Appeal to Lehigh Valley Employees

E. E. Loomis, president of the Lehigh Valley, has issued a letter to employees suggesting that possibly they do not realize what a necessary factor the railroads are in the winning of the war. "They are literally the backbone of the men in the American camps and the French trenches. Without their faithful service, the courage and endurance of the bravest troops become useless. This is so true that railroad men unwilling at this time to give to their work the best that is in them, are actually slackers. . . . *There must be no slackers among us. Every man must stick to his job in these troublesome days. It is a time for self-sacrifice. This means working thirty days a month, if necessary, regardless of weather conditions; losing no time after pay day; assisting, each in his place, in running this railroad at the highest point of efficiency. . . . I call upon you all to enlist heart and soul in this patriotic service.*"

Coal Production

According to the weekly bulletin of the Geological Survey, zero weather and a heavy fall of snow impeding railroad traffic and surface operations at the mines caused coal production during the week ended December 15 to drop to the lowest point recorded since the weekly bulletins were begun. The average daily production was 1,402,594 tons. The lowest mark reached before since June 1 was 1,638,513 tons, in the week ended August 18, at the time of the coal strikes in Illinois and the southern Appalachians. Anthracite shipments fell off 22 per cent. Bituminous shipments originated on 114 roads amounted to 147,590 carloads. The percentage of full time output produced during the week ended December 8 was 73.6 and 19.3 per cent of the loss was attributed to car shortage. The bulletin says:

"Illinois and Indiana exhibited little change. In Ohio, losses due to no cars increased from 25.2 to 31.7 per cent of the full-time capacity. Conditions in western Pennsylvania, on the other hand, improved greatly. In central Pennsylvania, losses due to inadequate transportation increased. On the West Virginia fields, the Panhandle, Fairmont, and Cumberland-Piedmont experienced relief from the shortage of the week before. In the remaining fields, losses due to car shortage were even more severe than during the preceding week; in the high-volatile field of southern West Virginia, particularly, they amounted to 56.9 per cent of the full-time output.

"A study of these bulletins will reveal that the dominant factor limiting production is lack of transportation. As long as the soft coal mines of the country are idle from one-seventh to one-fifth of the time because there are no cars at the tipple, more laborers could add but little to the output. It should, however, be remembered that the railroads are already carrying more coal than ever before in the history of the country. The production of bituminous coal during the month of November was, with one exception, the largest in any one month in the history of bituminous coal mining in America."

The monthly bulletin of the Geological Survey for November gives a preliminary estimate of the output for that month of 47,747,000 net tons. The average production per working day during the month was 1,872,432 tons, as compared with 1,757,336 tons in October. The November rate has been exceeded only once in the last two years, when in February, 1916, the average production per working day rose to 1,882,771 tons.

The cumulative production from January 1 to November 30, 1917, came within 427,000 tons of equalling the entire 1916 output. Up to November 30, 1917, the country is estimated to have pro-

duced 502,691,000 tons. The entire output of the year 1916 was 502,519,000 tons. The country may thus be said to be one month ahead of its 1916 performance. If the present rate of production be maintained, the total output for 1917 will better the record of 1916 by 9 per cent.

A. W. Thompson, chairman of the General Operating Committee of the Eastern Railroads has been co-operating actively with the Fuel Administration to promote an increased movement of coal and recent reports have indicated a marked improvement in some districts.

Railway Returns for October

The Interstate Commerce Commission has issued its monthly bulletin of railway earnings and returns for October. Railway operating revenues for the month amounted to \$380,951,970 as compared with \$338,666,230 in October, 1916. Operating expenses increased from \$210,295,841 to \$259,017,248. Taxes increased from \$13,898,678 to \$21,910,588, so that the railway operating income was only \$99,526,889 as compared with \$114,431,497 in October, 1916, a reduction from \$495 to \$432 per mile of line. The operating ratio was 67.59 in October, 1917, as compared with 62.10 in October, 1916. The railroads in eastern, southern and western districts all show increases in operating revenues for the month and decreases in the operating income. In the case of the eastern roads, the reduction in the latter item amounted to nearly \$7,000,000, and in the case of the western lines to over \$7,000,000, while for the southern lines it was about \$100,000.

For the ten months ended with October, railway operating revenues amounted to \$3,350,721,651 as compared with \$2,991,462,057. Railway operating income was \$835,377,303 as compared with \$899,792,922, a reduction of nearly \$300 per mile. The operating ratio was 69.87 as against 65.52. For the 10 months the eastern roads show a reduction of \$62,000,000 in operating income, the southern roads show a gain of nearly \$2,000,000 and the western roads show a loss of over \$4,000,000.

A notable feature of the report is the increase in passenger revenues, which for October was \$15,000,000 or nearly 20 per cent. For the 10 months passenger revenues increased approximately \$90,000,000 or 15 per cent, while the freight revenues increased about 10 per cent.

Inefficient Watchmen

From an address by General Manager Mallahan, of the National Board of Fire Underwriters at a recent convention in New Orleans we take the following observations on the danger of retaining superannuated employees.

The custom among manufacturers, warehousemen and others is that of engaging as night watchman some superannuated employee who is no longer physically able to earn a workman's pay. The amount of real protection which he furnishes, especially in war time, is very small. Generally he can be avoided with ridiculous ease by any one who is in the place with hostile intent. In a recent test in a large grain elevator, six inspectors were sent into the plant at night time, without the knowledge of the aged watchman, and they spent six hours within the plant and made drawings of many of its important features, but their presence was never once detected. As a consequence the owners were given the alternative of engaging a sufficient number of young and vigorous guards or of having their plant taken over by the state authorities.

The big Baltimore fire of October 30 is a striking example of insufficient watchman service. Here was a pier, 900 feet long, containing a valuable accumulation of freight, left in the sole charge of a single watchman! To make the safeguarding of our production of war supplies depend upon those who can furnish only nominal safety, during the hours when darkness brings the greatest dangers, would be ludicrous if it were not so grave. It is equivalent to locking the windows and leaving the front door open. Watchmen should be picked men, not derelicts. They should be intelligent, courageous and physically active. They should be sufficient in number to furnish real protection. They should be armed. They should be trained in knowledge of fire alarms, fire prevention and fire protection. They should never be engaged except upon unmistakable evidence of character, and they should be paid the salaries that will command such qualifications.

The Wood Preservers' Convention

At a meeting of the executive committee of the American Wood Preservers' Association in Chicago on December 17, it was decided to proceed with the original plans for the fourteenth annual meeting of that association, which will be held at Chicago on January 22 to 24, inclusive. The advisability of postponing this convention or of omitting it entirely this year was given careful consideration, but it was decided that the importance of the conservation of timber and the unusual character of the new problems presented to this industry by the war made the exchange of information more than usually desirable. It was decided to limit entertainment to an informal dinner on Wednesday evening, which will be patriotic in character.

The tentative program so far as has been arranged is as follows:

TUESDAY MORNING.

Convention called to order at 10 a. m.

President's address.

Reports of committees.

Report of secretary-treasurer.

Communications.

TUESDAY AFTERNOON.

Report of Conference Committee.

Report of Committee on Publicity, Promotion and Education.

Report of Committee on the Purchase and Preservation of Treatable Timber.

WEDNESDAY MORNING.

Report of Committee on Service Tests.

(a) Ties and Structural Timber.

(b) Flooring and Paving.

Report of Committee on Plant Operation.

Report of Committee on Preservatives.

WEDNESDAY AFTERNOON.

Report of Committee on Wood-Block Flooring and Paving.

Report of Committee on Non-Pressure Treatments.

Motion Picture Exhibit of the Manufacturing of Iron Pipe.

WEDNESDAY EVENING.

Annual Dinner.

THURSDAY MORNING.

Report of Committee on Terminology.

Report of Committee on Publications.

Closing Business.

Election of Officers.

In addition to the reports of committees arrangements are being made for a number of prominent men in the field of timber preservation to present individual papers upon important problems in this industry which are now of special interest.

A. R. E. A. Nominations

The nominating committee of the American Railway Engineering Association has nominated the following candidates for officers in that association for the ensuing year:

President, C. A. Morse, chief engineer, Chicago, Rock Island & Pacific, Chicago.

Vice-president, H. R. Safford, chief engineer, Grand Trunk, Montreal, Canada.

Treasurer, Geo. H. Bremner, district engineer, Division of Valuation, Interstate Commerce Commission, Chicago.

Secretary, E. H. Fritch, Chicago.

Directors (three to be elected): J. L. Campbell, engineer maintenance of way, El Paso & Northwestern, El Paso, Tex.; J. E. Crawford, chief engineer, Norfolk & Western, Roanoke, Va.; J. M. R. Bairbairn, assistant chief engineer, Eastern Lines, Canadian Pacific, Montreal, Canada; E. A. Frink, principal assistant engineer, Seaboard Air Line, Norfolk, Va.; John V. Hanna, chief engineer, Kansas City Terminal, Kansas City, Mo.; E. H. Lee, vice-president and chief engineer, Chicago & Western Indiana, Chicago, Ill.; H. T. Porter, chief engineer, Bessemer & Lake Erie, Greenville, Pa.; E. B. Temple, assistant chief engineer, Pennsylvania Railroad, Philadelphia, Pa.; F. E. Turncaure, dean, College of Engineering, University of Wisconsin, Madison, Wis.

Members of nominating committee (five to be elected): J. E. Crawford, chief engineer, Norfolk & Western, Roanoke, Va.; Arthur Crumpton, assistant valuation engineer, Grand Trunk, Montreal, Can.; B. J. Dalton, chairman valuation committee, Missouri, Kansas & Texas, Parsons, Kan.; H. T. Douglas, Jr., chief engineer, Chicago & Alton, Chicago; John V. Hanna, chief engineer, Kansas City Terminal, Kansas City, Mo.; A. J. Himes, valuation engineer, New York, Chicago & St. Louis, Cleveland, Ohio; J. B. Jenkins, valuation engineer, Baltimore & Ohio,

Baltimore, Md.; J. A. Peabody, signal engineer, Chicago & North Western, Chicago; A. R. Raymer, assistant chief engineer, Pittsburgh & Lake Erie, Pittsburgh, Pa.; J. E. Willoughby, chief engineer, Atlantic Coast Line, Wilmington, N. C.

Association of American Railway Accounting Officers

The Standing Committee on Freight Accounts, in view of the shortage of man power on account of the war, and as a means of relieving the congestion in local agencies and in audit office settlements among carriers, has recommended the establishment of a \$1 minimum; in other words the committee recommended that the association's 25-cent correction minimum be changed to read items of less than \$1.

No June Mechanical Conventions

At the meeting of the executive committees of the Master Car Builders and the American Railway Master Mechanics' Associations in New York December 20, it was decided in view of the present state of affairs to hold no convention in June, 1918. If conditions warrant, however, a business meeting may be held in Chicago sometime during the year.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings and places of meetings of those associations which will meet during the next three months. The full list of meetings of associations published only in the first issue of the Railway Age Gazette for each month.

AMERICAN RAILWAY ENGINEERING ASSOCIATION.—E. H. Fritch, 900 S. Michigan Ave., Chicago. Next annual meeting, March 20-22, 1918, Chicago.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.

AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, Supt. Timber Preservation, B. & O. Mt. Royal Sta., Baltimore, Md. Next convention, January 22-24, 1918, Hotel Sherman, Chicago.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Morrison Hotel, Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual dinner, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

CINCINNATI RAILWAY CLUB.—H. Boulet, Chief Interchange Inspector, Cincinnati, 101 Carew Bldg., Cincinnati. Regular meetings, 2d Tuesday, February, May, September and November, Hotel Sinton, Cincinnati.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 568 Union Arcade Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh, Pa.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month. Room 1856, Transportation Bldg., Chicago.

NATIONAL RAILWAY APPLIANCES ASSOCIATION.—C. W. Kelly, 149 Peoples Gas Bldg., Chicago. Annual exhibition, March 18-21, 1918, Coliseum and Annex, Chicago.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meeting, 2d Tuesday in month, except June, July and August and September, Boston.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meeting, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—Geo. A. J. Hochgrebe, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.

PACIFIC RAILWAY CLUB.—J. S. Woolver, Assistant to Chief Engineer, Northwestern Pacific R. R., San Francisco, Cal.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—F. C. Stewart, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria, Ill.

RAILWAY CLUB OF PITTSBURGH.—J. R. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Pittsburgh Commercial Club Rooms, Colonial Annex Hotel, Pittsburgh.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Myers Bldg., Bethlehem, Pa. Next meeting, March 18, Chicago.

ST. LOUIS RAILWAY CLUB.—B. W. Fraenkel, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grand Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 a. m., Piedmont Hotel, Atlanta.

TRAFFIC CLUB OF CHICAGO.—C. B. Singer, La Salle Hotel, Chicago.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Waldorf-Astoria Hotel, New York.

WESTERN CANADA RAILWAY CLUB.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 1st Monday in month, except June, July and August, Hotel Sherman, Chicago.

WESTERN SOCIETY OF ENGINEERS.—Edgar S. Nethercut, Secretary, 1735 Monadnock Block, Chicago, Ill. Regular meeting, first Monday in month, except January, July and August. Extra meetings generally on other Monday evening except in July and August.

Traffic News

The Central Passenger Association roads will discontinue deliveries of passenger and sleeping car tickets to patrons, beginning January 1.

The embargo which was placed on the movement of corn, oats, kaffir corn and milo maize into and east of Chicago on December 5, was canceled on December 20.

The Wabash will on December 30 discontinue its passenger train leaving St. Louis for Chicago at 9:01 a. m. and the train leaving Chicago for St. Louis at 9 a. m.

The Chamber of Commerce of Houston, Tex., has established a bureau, in charge of F. A. Leffingwell, to aid shippers and consignees in securing prompt adjustment of overcharges and other claims against railroads.

The Delaware, Lackawanna & Western has filed with the Interstate Commerce Commission a tariff making an increase of 10 cents a ton in the freight rate on small sizes of anthracite coal from the mines to Tidewater.

The Delaware, Lackawanna & Western announces in New York City that some of the suburban passenger trains in the non-rush hours will be discontinued December 31, and the consequent saving in coal is estimated at 1,000 tons a month.

Union Pacific has announced that hereafter it will pay refunds to passengers on its extra fare train between Chicago and San Francisco at the rate of a dollar for each hour the train is late when the train is two hours or more behind schedule. No refund will be paid exceeding 50 per cent of the extra fare.

The New York, New Haven & Hartford, during the eleven months ended November 30, moved 390,505 tons more of commercial coal over its lines than in the same period of 1916. Of this increase the larger part was anthracite. Total movements for eleven months were 6,437,974 gross tons, compared with 6,046,469 gross tons in 1916.

The United States Food Administration announces that Lester Brothers, wholesale food handlers of Newport News, Va., have been deprived of their license, and ordered to close their doors on December 31. They had refused consignments of potatoes, allowing them to deteriorate in the freight yards and incidentally to add to railroad congestion.

The Southern Railway early in January will send its live stock and dairy instruction cars for a tour over the line in Georgia between Macon and Brunswick. Agricultural agents of the road's development service will be assisted by representatives of the state department of agriculture. The subjects to be treated will include horticulture, methods for the control and extermination of the boll weevil, and information on the growing of fruits and vegetables and forage and pasture crops.

The Secretary of War, in a public statement announcing that camp commanders had been told to discourage the granting of unusual numbers of furloughs to the soldiers at holiday time, says that the principal reason is that the transportation facilities of the country were taxed to their utmost for weeks in bringing to the mobilization points the hundreds of thousands of men now there and in making the necessary transfers of men and materials between those points. "To add to the burden of carrying great numbers of these men to their homes from the camps and back again to the camps would be a burden insupportable," he said. "The relieving of the railroads from this burden will enable us by so much to concentrate our energies and capacities for the transportation of our resources to the seaboard and to the battlefield in France."

At the suggestion of the traffic officers of the southeastern lines at a recent conference, the Railroads' War Board has appointed a committee, to be known as the South Atlantic and Gulf Export Committee, for the purpose of co-operation with the authorities of the United States and allied governments in the movement of traffic exported directly or indirectly via South Atlantic and Gulf ports. The committee consists of C. T. Airy,

Central of Georgia, chairman; R. A. Brand, Atlantic Coast Line; F. B. Bowes, Illinois Central; C. R. Capps, Seaboard Air Line; Lincoln Green, Southern; A. K. Smith, Louisville & Nashville, and W. A. Winburn, Central of Georgia. The chairman is to act as traffic manager, with headquarters at Washington, to make such distribution of the freight as will prevent congestion. The organization of a similar committee for the management of freight through Texas ports has been suggested.

Embargo on Corn and Oats Lifted

United States Food Administrator Hoover has notified corn and oats millers in the central and eastern states—east of Wisconsin and Indiana and north of the Potomac and Ohio rivers—that the zonal embargo on the shipment of corn and oats into or through that territory, which went into effect on December 8, is being taken off. Corn and oats users are urged not to buy or ship more corn or oats than they can at once discharge and not more than requirements from week to week until congestion is relieved. Otherwise railways may be forced to place special embargoes on plants at fault in this particular.

The Example of the Dining Cars

The railway dining car services of the country have reported to the United States Food Administration that during the months of October and November they saved, of

Meats	234 tons
Wheat flour	1,214 bbls
Sugar	12½ tons

These savings were made despite an increase of twenty per cent in the number of persons fed, as compared with the corresponding two months of the previous year.

Railroads Urge Curtailment of Christmas Travel

The Pennsylvania and the Southern last week advertised in the daily papers appealing to people not to travel during the Christmas holidays, except there be urgent necessity. "To the end that the soldiers on furlough and persons who must travel may do so with a minimum of inconvenience." The advertisement says:

"Every year the normal travel is greatly increased during the holiday season. This year it will be swelled by the return to their homes for Christmas of a large number of the troops now in camp. Furthermore, an extraordinary current traffic in military supplies, fuel and necessary commercial freight may be expected, during the holidays, to limit our ability to provide comfortable passenger transportation."

The Southern has also announced the curtailment of New York sleeping car service, noticed on December 14, page 1102, and says that some of its through trains will not be held at Washington for connections from the east, but will depart on time, and will be limited to their present capacity.

KEEPING TRAINS FROM BEING BLOWN OFF TRACKS.—There is a stretch of railway along the west coast of Ireland where it was formerly not an uncommon occurrence for the trains to be blown from the rails by the winds from the ocean, says the Popular Science Monthly for December. These disasters are now prevented by the use of an ingenious form of anemometer which rings an alarm bell when the velocity of the wind reaches sixty-five miles an hour. Each station on the line keeps on hand a stock of movable ballast, a ton of which is placed aboard every car arriving at the station after the bell sounds.

RAILWAY FACILITIES AND INCOME.—Increased railway facilities are a personal necessity to many of us; they are a national necessity. We need both tracks and equipment vastly in excess of the present supply. This is not a time to debate as to the best source of money for supplying railway needs, the return on the investment, etc. We know that the railway should be in a position to pay the same rate of interest on the money it requires as would any business of equal safety or risk, no matter from what source it borrows. The railways are not paying that interest now and can only and should only get capital when they can vouch for an adequate return. An increase of income is the *sine qua non* of the present railway situation. *Engineering and Mining Journal.*

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The Commission, Division No. 2, has issued an order providing that railroads may file tariff publications covering changes in the dimensions, capacity and number of cars, substitution of new cars for old and corrections in the number, capacity or dimensions of cars without formal hearing. The commission says that these changes are of almost daily occurrence and it is important that shippers be advised of them promptly.

The commission, on December 20, announced the suspension until June 30, 1918, of the tariffs involved in the eastern commodity rate case. These rates were suspended on August 28 until December 30, and have since been consolidated with the supplemental 15 per cent case, in which the decision has not yet been rendered. The further suspension of the rates would seem to indicate that the commission does not expect to issue a decision in the 15 per cent case before December 30.

Private Car Investigation Reopened

The Interstate Commerce Commission has announced the reopening of its investigation of the relations between railroads and shippers and private car lines, which was begun in 1913, but in which no report was made. The commission says that conditions have undergone material changes, and it is advisable that the evidence and statistical data heretofore submitted be brought down to date. It is proposed also to secure such further evidence as may be necessary to show the relation between private car companies and rail carriers; to determine whether it is proper, where special equipment is supplied by carriers, that a service charge, in addition to the rate of transportation, be assessed; and the amount of such charge if one is to be made; and to ascertain in case a carrier has no equipment of the kind demanded by a shipper, whether it should secure the same, or whether the shipper should be permitted to make his own arrangement.

The inquiry will further consider (a) whether if private car owners are to be permitted to continue to furnish cars and make charges direct to the shipper, a tariff should be filed.

(b) What compensation should be paid by carriers to the car owner.

(c) What relation investment in private cars, cost of operation, maintenance and depreciation, and loaded and empty per car-mile freight earnings, should bear to the rental to be paid by the carrier.

(d) Whether charges for refrigeration should be a stated sum for the service, in cents per 100 lb. of freight hauled, or be based on the cost of service.

(e) Rules and practices respecting icing and re-icing.

(f) Rules and practices of defendants as to mixtures, minimum weights and charges, part-lot shipments, return of empty containers, etc.

(g) Demurrage charges on private cars.

(h) Whether the M. C. B. rules with respect to private cars should be filed with the commission.

The case is set for hearing before Examiner George N. Brown at the Sherman Hotel, Chicago, February 4.

STATE COMMISSIONS

The Public Utilities Commission of Colorado, in view of the added demands which the war has made upon the railroads, has reduced its annual report requirements for the calendar year 1917 and now orders that carriers may discontinue the rendering of monthly passenger train movement reports. The last report to be filed will be that for the month of December.

The Public Utilities Commission of Colorado, reporting a case which was decided October 27, announces that it has permitted the Crystal River & San Juan Railroad to discontinue operation of trains on its line, seven miles long, until April 1 next. This road, about 30 miles south of Glenwood Springs, served the

Colorado Yule Marble Company; that company has apparently failed and a large portion of the population has moved away. The order of the commission forbids the railroad company to carry off its railroad, or any part thereof.

COURT NEWS

Consignee's Liability for Freight Charges

The Pennsylvania Superior Court holds that a consignee of lumber who refuses to accept delivery because the lumber was not of the kind he ordered will not be relieved from the transportation charges. He must look to the consignor to recover for any loss sustained because of any defect in the goods consigned.—*P. & R. v. Parry*, 66 Pa. Superior Ct. 49. Decided March 13, 1917.

Contributory Negligence of Trackman

A trackman, after seeing an express approaching at 50 or 60 miles an hour, decided he could strike a few more licks at his work and then avoid injury, and attempted to do so. He was struck by the pilot beam of the locomotive and killed. The Arkansas Supreme Court holds that he was guilty of contributory negligence as matter of law, barring recovery for his death.—*Tyler v. St. Louis, I. M. & S. (Ark.)*, 198 S. W., 128. Decided October 29, 1917.

Remedy for Refusal of Through Bill-of-Lading

The Circuit Court of Appeals, Eighth Circuit, holds that a bill to compel a railroad company to issue a bill of lading requiring it to carry and deliver at a place on the line of another road a single carload of wheat owned by the complainant, does not state a cause of action within the jurisdiction of a federal court of equity, there being an adequate remedy at law by an action for damages, which were easily ascertainable.—*Northern Pacific v. V. D. Harrington Co.*, 245 Fed., 454. Decided July 2, 1917.

Crossing Accidents—Contributory Negligence

The Oregon Supreme Court holds that safety to the public and travelers on trains requires that a person driving an automobile over a crossing should look carefully upon the track itself where a train may be expected, if there be opportunity so to inspect the situation; and the motorist who neglects this duty is negligent as a matter of law. The driver of a motor truck approaching a crossing, whose hearing was interfered with by the ringing of the bell on a standing locomotive, went forward experimentally and collided with a switch engine on the next track. It was held that he was negligent and judgment for the plaintiff was reversed and the cause remanded with directions to enter judgment of nonsuit for the defendant.—*Cathcart v. Oregon-Washington R. & Nav. Co. (Ore.)*, 168 Pac., 308. Decided November 6, 1917.

Prohibitive Rates Not Necessarily Unlawful

The Pennsylvania Superior Court holds that the fact that a rate is prohibitive does not make it *per se* unlawful. There are many elements which may enter into the fixing of a rate, such as the factor of distance, ton-mile revenue, car-mile revenue, earnings per car, and a comparison of the rates on other commodities of equal or higher value, the volume of movement, the value of the service to the shipper or consignee, and the cost of service. When all or some of these matters, and possibly others, are taken into consideration it does not follow that they will always result in the fixing of rates that will make it profitable for every shipper to use the means of transportation. His need may be a factor to be considered, but it is not a determining one. The fact that traffic does not move is not conclusive that the rates are not reasonable.

It was also held, on appeal from an order of the Pennsylvania Public Service Commission adopting the rates suggested by the complainant, a shipper of building sand, in a proceeding against a railroad company, that it was not proper for the commission to fix a rate for a route of a mileage of thirteen miles on a basis of what the rate should be on a route of 7.6 miles, when it did not appear that the shorter route was available, or that the carrier whose road comprised part of the shorter route was

a party to the proceedings.—*McCrary Bros. Co. v. P. & L. E., 66 Pa. Superior Ct., 307. Decided March 16, 1917.*

Provision in Bill of Lading as to Measure of Damages

The Kansas Supreme Court holds that a provision in a bill of lading that the amount of any loss or damage for which the carrier was liable shall be computed on the basis of the value of the property (being the bona fide invoice price, if any, to the consignee, including the freight charges, if prepaid) at the place and time of shipment, is reasonable and valid, and intended merely to establish a rule for determining the value of the property in case of loss, and not to limit or diminish the carrier's liability. In an action for damages for failure to deliver a shipment of wheat it was held that such a provision in the bill of lading precluded the recovery of the shipper for the difference between the market value of wheat at the place of delivery and the contract price at which the shipper had sold it after the original purchaser had declined to receive it. The measure of damages was held to be the difference between the price which the wheat sold for at the place where it was delivered and the invoice price or fair market value at the point and time of shipment.—*Wallingford v. Atchison, T. & S. F. (Kan.), 167 Pac., 1136. Decided October 6, 1917.*

Employees' Authority to Hire Physician

In an action by a physician against a railroad for services rendered to an employee of the defendant, who had been severely injured, but not in the course of his employment, having lain off for the day from his duties on grading work, it appeared that the plaintiff had been employed by an assistant engineer of the defendant. The Iowa Supreme Court holds that an assistant engineer, in charge of grades and bridges, with power to hire and discharge men, and hire physicians, in the absence of company physicians, to care for injuries, has no implied authority to employ a physician to treat or operate on an employee injured while not engaged in the line of his duty or service and within the scope of his employment. The duties of an assistant ordinarily are circumscribed, and the circumstance of being "assistant" puts all on inquiry as to the scope of his activity in helping another or others. It has been held that authority to employ a physician is not to be inferred from the mere fact that an employee is roadmaster, or a conductor, or a foreman, or a yardmaster, or a general surgeon.—*Carson v. Chicago, M. & St. P. (Iowa), 164 N. W., 747. Decided October 20, 1917.*

Assault and Robbery in Crowded Car

The North Carolina Supreme Court holds that a railroad is not liable to a passenger assaulted and robbed on its train, although the cars were without light and badly overcrowded, where there was no causal connection between the road's supposed negligent act in overcrowding and failing to light its cars and the injury caused to have resulted therefrom. The court quoted Lord Selborne, then Lord Chancellor (1894) in the English case of *Cobb v. Railroad Co.*, App. Cases 424, an action to recover damages from a railroad company for a sum of money which the plaintiff alleged had been taken from his person by robbery as a consequence of the company's negligence in allowing the carriage to be overcrowded, as follows: "I do not think it necessary to say more than that, on the plaintiff's pleading, it is not shown that the overcrowding of the carriage did in fact conduce in any way directly or indirectly to the robbery; and on the assumption that, under some possible circumstances, this might have been actionable negligence, it would, in my judgment, be indispensable, for that purpose, to state and prove some actual connection between the overcrowding and the loss. It is not, in my opinion, enough to suggest (as the plaintiff does) that to suffer such overcrowding was to 'facilitate the hustling and robbing of the plaintiff.' As the case is stated by him, nothing turns upon the fact that the robbery was committed by a gang of more than nine persons." In the present case the court said that the assault was not described with any particularity so that the court could understand how it came about, and seemed to be only the pleader's conclusion as to its character and not a statement of the facts. For this reason it held the case should have been dismissed, and reversed a judgment for the plaintiff.—*Chancey v. Norfolk & Western (N. Car.), 93 S. E., 834. Decided October 17, 1917.*

Equipment and Supplies

FREIGHT CARS

THE LESH OIL COMPANY, Kansas City, Kan. is inquiring for 10 8,000-gal. capacity tank cars.

THE PRODUCERS AND REFINERS CORPORATION Tulsa, Okla., is inquiring for 20 8,000-gal. capacity tank cars.

THE PRUDENTIAL OIL CORPORATION has ordered 50 tank cars from the Standard Car Construction Company.

THE GREAT WESTERN CONTRACTING COMPANY has issued inquiries for 30 8,000 and 10,000-gal. tank cars.

THE PENNSYLVANIA SALT MANUFACTURING COMPANY Philadelphia, has issued an inquiry for 5 acid tank cars.

THE MIDLAND REFINING COMPANY, Eldorado, Kan., is inquiring for 15 to 40 8,000-gal. to 10,000-gal. capacity tank cars.

THE OIL, GAS & LEASE COMPANY, Ardmore, Okla., is inquiring for 20 8,000-gal. and 10 10,000-gal. capacity tank cars.

THE EASTERN REFINING COMPANY, Oil City, Pa., has ordered 20 8,050-gal. capacity tank cars from the Pennsylvania Tank Car Company.

SIGNALING

THE PIEDMONT & NORTHERN has ordered from the Union Switch & Signal Company the materials for two small temporary interlockings at the entrances to the national cantonment at Camp Greene, Charlotte, N. C. Each plant includes a three-lever dwarf machine, and the signal indications will be controlled primarily by knife switches and selected over circuit controllers on the levers of the machine.

THE ATCHISON, TOPEKA & SANTA FE has ordered from the Union Switch & Signal Company the signals to be used on the Richmond-Fresno, Cal. section; 50 style "S," three-position, low voltage, D. C. double case ground signals, and 50 single case bridge signals of the same type. The Union company has also received a contract to furnish 49 style "S" ground signals for the Goffs-Bagdad division of the Santa Fe.

THE PENNSYLVANIA is to install three electro-pneumatic push-button machines at Hackensack Meadows, between Jersey City, N. J., and Newark; at "MV" cabin a 48-unit machine for the western receiving yard; at "CA" cabin, a 36-unit machine; and at "MW" cabin, located at the eastern limits of Hackensack Meadows, a 12-unit machine. All of these yards are laid out on a new fill, built over the old freight and passenger main tracks. There will be humps with an elevation of 21 ft. and a 4 per cent grade. Direct current for the detector locking will be supplied by the Edison storage batteries, charged in series-discharged in multiple duplicate motor generator sets being used for charging. The installation will be made by the railroad's own forces, with the materials to be supplied by the Union Switch & Signal Company.

THE BOSTON & MAINE has ordered from the Union Switch & Signal Company the materials for an electro-pneumatic interlocking at Tower "C," East Somerville, Mass., a 71-lever frame with 66 working levers and a total of 147 operation units. The new plant will extend the electro-pneumatic system now in service, viz.: North Station (A), 123 working levers, and Tower B, 69 working levers, there being one block between Tower B and C. Speed signaling has been adopted for this interlocking, and provision is also made to reverse traffic on the four main line tracks between Towers B and C. The plant also comprises a single-track crossing of the four tracks of the Boston & Maine by the Grand Junction line of the Boston & Albany. Alternating current track circuits will be used throughout, with electric section and section route locking. The electro-pneumatic high signals are semi-automatic with section control and lower arms.

Supply Trade News

J. H. Sharp has been appointed western representative of the Glazier Manufacturing Company, with headquarters at the McCormick building, Chicago.

F. H. Bird, traveling engineer of the American Steel Foundries, Chicago, has received a commission as first lieutenant in the ordnance department of the United States army and is now stationed at Dayton, Ohio.

N. M. Stineman, until recently chief engineer of the LaSalle Engineering Company, Chicago, and formerly office engineer of the Chicago, Milwaukee & St. Paul, Chicago, has been commissioned a captain in the engineering corps of the United States army.

Oscar F. Ostby, 2736 Grand Central Terminal, New York, has been appointed sales representative for the White American Locomotive Sander Company, Roanoke, Va., for territory from Baltimore north to the Canadian border and west as far as Pittsburgh and Cleveland.

Effective January 1, Mr. J. E. Buckingham, at present Northwestern representative of the Standard Steel Works Company with offices in the Northwest Bank building, Portland, Oregon, will become assistant general manager of the Hofius Steel & Equipment Company, Seattle.

A BACTERIOLOGICAL MOTOR CAR.—It is stated in the Indian and Eastern Engineer that a bacteriological car laboratory has been presented to the French Army. This remarkable motor car—the first of its kind—carries a complete bacteriological laboratory, 18 ft. by 12 ft., which can be erected in the space of an hour and a half. The laboratory is fitted with bacteriological incubators, microscopes and autoclave and all other accessories. These parts are fitted into specially designed cantens, so that nothing can be smashed, and everything is ready for use instantly and in the order required. The car and the portable laboratory are fitted with electricity and water is laid on.

CONSTRUCTION WORK IN MALAY STATES.—The linking up of the Siamese Southern Railway with that of the British Federated Malay States has finally been accomplished, railway officers of both systems having recently traversed the new road connecting Bangkok with Singapore. However, the track on either side is not yet completed, a number of bridges and other masonry work remaining to be done, and owing to the difficulty of obtaining ironwork from abroad, the line may not be ready for passenger traffic until April of next year. The completion of the northern line has also been hindered because of delay in obtaining rails and other construction material. A proposal is therefore under consideration to complete the railway only as far as Pang Choompo, and from this place to build a road suitable for motor traffic to Chiengmai.—*Commerce Report.*

AUTOMATIC SIGNALS FAVORED IN AUSTRALIA.—Automatic block signaling is approved on the New South Wales Government Railways, and is being introduced under two distinct conditions. On suburban lines it is used in order to shorten the headway between trains, and thus increase the traffic capacity. On country lines in districts that are thinly settled but have considerable through traffic it is found that automatic signals between stations afford improved facilities for dealing with through trains without requiring an increased force. The cost of installation and maintenance is greater than with manual signals, but there is a net saving in cost and an increase in safety due to the elimination of manual operation. Thus the 108 block sections equipped in 1916 would have required 46 signal towers, with a staff of 138 men whose wages would amount to not less than \$120,000 per year. A cab-signal and train-control system is being tried experimentally on the Richmond Branch. An audible signal is given in the cab and must be acknowledged by the engineman. If he fails to stop within a given distance after receiving a "stop" signal, a partial application of the brakes is made automatically.—*Engineering News-Record.*

Railway Financial News

BALTIMORE & OHIO.—Negotiations are being conducted by this company for the purchase of the Little Kanawha Railroad, which extends from Parkersburg, W. Va., to Owensport, a distance of 29 miles.

DELAWARE & HUDSON.—At a meeting of the directors on December 26, a quarterly dividend of $\frac{3}{4}$ per cent was declared, an official announcement being issued as follows:

The practice of the Delaware & Hudson Company for recent years has differed from that of other railway corporations in that it has been customary to take final action upon the dividend for the ensuing calendar year during December.

For ten years the board of managers has in each December declared a dividend of 9 per cent, payable during the next year in four quarterly installments of $\frac{3}{4}$ per cent, all such payments to be made out of surplus accumulative prior to the meeting at which the dividend action was taken.

The accumulative surplus of the present time as well as the earnings of the calendar year, 1917, now available for dividends, would fully warrant the declaration of a 9 per cent dividend payable in the same manner during 1918.

The board of managers feel that the present time is one of great uncertainty as to all the elements which will determine cash resources and cash requirements during the ensuing year. Under these conditions it is plain, without anticipating any future action, that it would be wise not to commit the company irrevocably to large cash disbursements, to be made so far in the future, but rather to follow the general practice of making dividend declaration quarterly.

GULF, MOBILE & NORTHERN.—Negotiations have been completed by this company for purchase and control of the Meridian & Memphis Railway, which extends from Meridian, Miss., to Union, a distance of 33 miles. Formal transfer will take place as soon as the debts of the Meridian & Memphis are liquidated.

LITTLE KANAWHA.—See Baltimore & Ohio.

MARSHALL & EAST TEXAS.—Hearings on the petition of the St. Louis Trust Company for court permission to sell this road as junk, have been postponed until January 14, 1918.

MERIDIAN & MEMPHIS.—See Gulf, Mobile & Northern.

MOHAWK RAILROAD.—This company's line from Calumet, Mich., to Gay, which has been operated by the Mineral Range, was taken over by the Copper Range, effective December 15. Passenger service on the Copper Range between Houghton and Gay was established on December 17.

PENNSYLVANIA COMPANY.—This company, which operates the Pennsylvania Lines West of Pittsburgh, has declared a dividend of 3 per cent. The dividend is payable December 31 to stock of record December 25. All the stock is owned by the Pennsylvania Railroad. This makes 6 per cent declared this year, 3 per cent having been paid six months ago. In 1916, a total of 8 per cent was declared, and in 1915, 6 per cent.

PENNSYLVANIA RAILROAD.—Comparing the number of this company's stockholders, on November 1, with a year ago, there was an increase of 7,174 to a total of 96,995. The average holdings were 102.95 shares, an increase of 8.22 per cent. The number of foreign holders was 1,857, a decrease of 1,633; and they held 2.13 per cent of the total 9,985,314 shares outstanding, a decrease of 1.58 per cent. The average holding abroad was 114 shares, an increase of 8.

In Pennsylvania there were 41,856 holders, an increase of 5,707, representing 33.81 per cent of the total stock outstanding; in New York, 17,723 holders, an increase of 858, representing 36.04 per cent of the total stock. Women stockholders numbered 48,327, or nearly half the stockholders, an increase of 3,791, and holding 28.49 per cent of the total share capital.

THE EXPORTS FROM GREAT BRITAIN of railway cars for the first nine months of 1917 were valued at \$1,606,003 as compared with \$2,535,402 for the corresponding period of 1916.

Railway Officers

Executive, Financial, Legal and Accounting

P. L. McManus has been appointed assistant to the president of the Coal & Coke Railway, with office at Elkins, W. Va.

V. J. Bradley, general supervisor of mail traffic of the Pennsylvania Railroad system, with office at Philadelphia, Pa., has been appointed vice-president's assistant in general charge of the mail traffic of the Pennsylvania Railroad, and the relations of the railroad with the government, in connection with the transportation of the United States mails.

C. M. Ball, whose appointment as assistant to the vice-president and general manager of the Oregon Short Line and assistant to the first vice-president of the Los Angeles & Salt Lake, with headquarters at Salt Lake City, Utah, was announced in these columns on December 14, was born at Osceola, Iowa. He entered the service of the Oregon Short Line in 1898 in a local freight office. In 1900 he resigned to engage in other business but returned to the road in 1902. In 1903 he was transferred to the superintendent's office as time keeper where he remained until 1905 when he resigned and entered the service of the Southern Pacific at Los Angeles, Cal., as chief clerk in the local freight office. In 1908 he was promoted to assistant chief clerk to the general superintendent where he remained until 1915 when he was again promoted to chief clerk to the assistant general manager which position he held until his appointment as mentioned above.

Operating

Maurice Daily has been appointed general superintendent of the Missouri, Oklahoma & Gulf, with headquarters at Muskogee, Okla., succeeding W. G. Humphrey.

E. C. Wills, superintendent of the Missouri Pacific at Wichita, Kan., has been appointed assistant general manager, with office at St. Louis, Mo., effective December 19.

A. S. Johnson, superintendent of the Terminal Railroad Association of St. Louis, who has been promoted to assistant general manager, a newly created position, with headquarters at St. Louis, Mo., as has already been announced in these columns, was born at Seymour, Ind., on July 21, 1871. He first entered railway service with the Terminal Railroad Association of St. Louis on November 8, 1889, and has been with that company ever since. He was appointed freight agent on October 13, 1903, and superintendent with headquarters at St. Louis on April 23, 1913. He was promoted to assistant general manager, with headquarters at St. Louis on December 13, 1917.

A. S. Johnson

J. H. Fraser, former general manager of the Detroit, Toledo & Ironton of Detroit, Mich., has been appointed general manager of the Gulf, Florida & Alabama, with headquarters at Pensacola, Fla.

F. M. Doar, superintendent of transportation of the Charleston & Western Carolina, with office at Augusta, Ga., has been appointed general superintendent, and the office of superintendent of transportation has been abolished.

G. L. Hickey, assistant to the vice-president and general manager of the Oregon Short Line, has been promoted to superintendent of transportation for the Union Pacific system, with head-

quarters at Omaha, succeeding L. C. Marston, resigned. Mr. Hickey was succeeded by C. M. Ball, mentioned in these columns on December 14.

E. A. O'Donnell, assistant superintendent of the Southern Pacific Texas Lines, with office at El Paso, Tex., has been appointed superintendent Houston terminals, vice T. C. Worthington, resigned to accept service with another company.

W. H. Carter, trainmaster of the Cincinnati division of the Cleveland, Cincinnati, Chicago & St. Louis, with headquarters at Springfield, O., has been appointed assistant superintendent, with office at the same point, E. M. Kelly, trainmaster of the Sandusky division, with headquarters at Bellefontaine, O., has been transferred to the Cincinnati division, succeeding Mr. Carter; J. J. Schreck, trainmaster at Wabash, Ind., was appointed trainmaster of the Sandusky division, succeeding Mr. Kelly, and O. P. Whitlock was appointed assistant trainmaster of the Cincinnati division, succeeding H. E. Perry, who resigned to enlist in the army effective December 1.

Edward Henry Harman, who has been appointed superintendent of the Wiggins Ferry Company, the St. Louis Transfer Railway and the East St. Louis Connecting Railway, with head-

E. H. Harman

quarters at St. Louis, Mo., as has already been announced in these columns, was born at Vernon, Mo., on August 25, 1876. He first entered railway service with the Vandalia in March, 1894. For two years he was employed in clerical capacities in the mechanical, operating and engineering departments at St. Louis, Mo., and Terre Haute, Ind., following which he was employed for two years in the mechanical department of the Terminal Railroad Association of St. Louis, at St. Louis. He then returned to the Vandalia at Terre Haute, where he was clerk and later chief clerk to the division freight agent. Two years later he went to Houston, Tex., to become private secretary to the chief engineer of the Southern Pacific Lines. He returned to the Terminal Railroad Association about 1901 and has been with that road ever since in the offices of the master mechanic, general superintendent and superintendent. For the past 10 years he has been chief clerk to the superintendent. Mr. Harman has been prominently identified with the American Association of Railroad Superintendents for a number of years, more recently as secretary. During which time membership increased from 75 to approximately 800. On his appointment as superintendent at St. Louis he was elected secretary of that association.

Leonard F. Johnston, whose appointment as superintendent of the Prairie du Chien and Mineral Point divisions of the Chicago, Milwaukee & St. Paul with headquarters at Milwaukee, Wis., was announced in these columns November 23, was born at Dakota, Minn., on November 29, 1878. He entered the service of the Chicago, Milwaukee & St. Paul on October 31, 1904, and has been in the employ of that company continuously from that date, serving as telegraph operator until July, 1909, when he was promoted to train despatcher. On March 20, 1907, he was again promoted to chief despatcher, which position he held until August 26, 1912, on which date he was promoted to train master. He remained in that capacity until November 5, 1917, on which date his appointment as mentioned above became effective.

W. M. Weidenhimer, whose appointment as inspector of transportation of the Chicago, Milwaukee & St. Paul was announced in these columns December 14, was born in Schuyler county, Ill., on June 23, 1863. He entered the service of the Chicago, Burlington & Quincy on January 2, 1880, as a brakeman and was promoted to conductor on February 12, 1885. On May 4, 1904, he

was assigned to special duties by the operating vice-president. He was appointed trainmaster of the Galesburg division, with headquarters at Galesburg, Ill., on November 1, 1904, and on October 15, 1905, he was transferred in the same capacity to the McCook division with headquarters at McCook, Neb. He was promoted to superintendent of the Sterling division on December 15, 1908, with headquarters at Sterling, Colo., and on December 1, 1909, was transferred in the same capacity to the Alliance division with headquarters at Alliance, Neb., which position he held until December 1, when he resigned to accept service with the St. Paul, as noted above.

M. B. Lamb, whose appointment as superintendent of the Chicago, Burlington & Quincy at Hannibal, Mo., was announced in these columns on December 7, was born in Hannibal on November 12, 1872. He entered the service of the Burlington on September 1, 1886, as a caller at Burlington, Ia. From October 1, 1889, to March 1, 1894, he was telegraph operator on the Ottumwa division; from March 1, 1894, to May 1, 1895, telegraph operator at Hannibal, Mo.; from May 1, 1895, to December 30, 1899, telegraph operator, bill clerk and chief clerk, freight department, Keokuk, Iowa; from December 30, 1899, to May 12, 1903, wire chief, car distributor and despatcher at Hannibal, Mo.; May 12, 1903, to February 15, 1907, despatcher at Brookfield, Mo.; from February 15, 1907, to January 1, 1911, night chief despatcher at Brookfield, Mo.; from January 1, 1911, to June 12, 1912, terminal trainmaster at Beardstown, Ill.; and from January 12, 1912, to June 20, 1917, trainmaster of the Beardstown division. On June 20, 1917, he was promoted to assistant superintendent of the La Crosse division, with headquarters at St. Paul, Minn., which position he held at the time of his appointment as superintendent of the Hannibal division, effective December 1.

Traffic

G. A. Blair, assistant freight traffic manager of the Chicago, Milwaukee & St. Paul at Chicago, has resigned, effective December 31.

C. H. Guion has been appointed commercial agent of the Missouri, Kansas & Texas at Galveston, Tex., succeeding C. P. Norman, acting commercial agent, transferred, effective December 1.

Engineering and Rolling Stock

J. A. Heaman, whose appointment as assistant chief engineer of the Grand Trunk Pacific, with headquarters at Winnipeg, Man., was announced in these columns on November 16, was born at Memphis, Tenn., on June 3, 1874. He attended the public schools and Collegiate Institute at London, Ont., and graduated from McGill University at Montreal, Que., in 1902. He was also an articled pupil to Moore & Henry, engineers and surveyors at London, Ont., from 1893 to 1898 and holds a diploma for the Ontario and Dominion Land Surveyors. He entered railway service as an instrument man on the Grand Trunk at St. Catharines and Port Union, Ont., in April, 1901. He was resident engineer at Oshawa, Ont., from April, 1902,

J. A. Heaman

to November, 1902; from November, 1902, to November, 1903, he was assistant resident engineer at Toronto, Ont. He entered the service of the Grand Trunk Pacific as an assistant engineer in charge of a location party east of Winnipeg in November, 1903. From May, 1905, to November, 1906, he was division engineer in charge of location and construction east of Winnipeg, and from November, 1906, to October, 1908, he was assistant district engineer at Kenora, Ont. From October, 1908, to June, 1910, he was assistant district engineer of the Grand Trunk Pacific at Kenora

and Winnipeg, and in April, 1911, was promoted to district engineer with office at Winnipeg, in which position he remained until March, 1912, when he was appointed office engineer at Winnipeg. From March, 1912, until August, he was division engineer at Jasper, Alta. On the latter date he was promoted to assistant to the chief engineer at Winnipeg, which position he held at the time of his appointment as mentioned above, effective November 1.

Edward S. Pearce, whose appointment as mechanical engineer of the Cleveland, Cincinnati, Chicago & St. Louis, with office at Beech Grove, Ind., was announced in the issue of December 7, graduated from the mechanical engineering course at Purdue University and was first employed in the maintenance of way and mechanical departments of the Norfolk & Western. From June, 1913, to January, 1914, he was employed in the machinery department of Jos. T. Ryerson & Sons, Chicago. On the latter date he entered the service of the New York Central Lines West as a special engineer in the office of the chief mechanical engineer at Chicago, where he remained until June, 1914, when he was transferred in the same capacity to the office of the superintendent of motive power of the Cleveland, Cincinnati, Chicago & St. Louis. In April, 1916, he was promoted to assistant mechanical engineer and in January, 1917, he was again promoted to special engineer in the office of the general superintendent, transportation department which position he held at the time of his appointment, as noted above, effective December 1.

H. R. Warnock, whose appointment as general superintendent of motive power of the Chicago, Milwaukee & St. Paul, was mentioned in these columns December 14, was born at Newcastle, Pa., on July 16, 1870. He began railway work as a freight brakeman with the Pennsylvania Lines West of Pittsburgh in June, 1889, and later in the same year went to the Pittsburgh & Lake Erie as a brakeman. In September, 1891, he was promoted to locomotive fireman and later was locomotive engineer, which position he held until May, 1900. From that date until July, 1904, he served consecutively as engine despatcher, roundhouse foreman, and general foreman, resigning on the latter date to become master mechanic of the West Side Belt, Pittsburgh, Pa., where he remained until October, 1905, when he became master mechanic of the Monongahela Railroad. He remained in this position until September, 1913, when he was appointed superintendent of motive power of the Western Maryland, which position he held until his appointment as noted above, effective December 15. As general superintendent of motive power of the St. Paul, he will have headquarters at Chicago.

H. R. Warnock

Railway Officers in Military Service

F. G. Robbins, general superintendent of the Erie at Chicago, has been commissioned a major in the Engineers Officers' Reserve Corps.

J. R. Jackson, assistant engineer of tests of the Atchison, Topeka & Santa Fe, Chicago, has received a commission as captain in the ordnance department of the United States army.

C. W. Haupt, assistant engineer in the valuation department of the Illinois Central, Chicago, has received a commission as second lieutenant in the engineering corps of the United States army.

SOUTH AFRICAN TRAFFIC RESTRICTED.—A cable to the African World states that in consequence of a shortage of locomotive power on the South African railways, coupled with the movement of maize coastwards, the coal and passenger traffic is restricted.
