The process through which the St. Louis Southwestern is now going is one of very thorough physical rehabilitation accompanied by a conservation of financial resources and a really remarkably successful effort to take full advantage of the present period of large railroad gross earnings through operating economies. Although the improvements made in operating methods during the process of rehabilitation and under conditions of extreme car shortage are more interesting to railroad men and are really more unusual than the financial and physical rehabilitation, it is necessary to fully understand the conditions under which the new management is working to appreciate the extent of the success in operation. For some time previous to 1916 the St. Louis Southwestern had not been fully maintained. This was especially true in regard to equipment. Like many other roads, the St. Louis Southwestern found it necessary to cut down appropriations for maintenance, but it was particularly unfortunate in that the expenditures which it did make were not as effective as they ought to have been. The consequence was that when the present great increase in traffic occurred it found the property threadbare in places. Luckily, possibly, the general railroad bond market was such as to preclude the possibility of a road like the St. Louis Southwestern selling a large issue of bonds. Had things gone on as they were apparently going before 1916 and had no large increase in traffic occurred, the road might well have suffered the same fate as so many other southwestern roads. With, however, the advent of a new executive and operating management and a marked change in policy toward maintenance there came also a great increase in earnings, and with this increase in gross a chance to rehabilitate the property, not through the issue of receiver's certificates, but through surplus earnings.

During the six months ended December 31, 1916, \$860,000 was spent for maintenance of way and structures, an increase of \$228,000, or 36 per cent, over the amount spent in same period of 1915, and \$1,360,000 was spent for maintenance of equipment, an increase of \$300,000, or 28 per cent, over same period of 1915; and despite high prices, the expenditures for maintenance, especially of equipment, were far more effective per dollar spent in 1916 than in the year 1915.

The equipment situation was the most serious one which confronted the new management. A program was laid out to cover three years. This called for the rebuilding of 4,650

box cars at the rate of 1,550 per year; heavy repairs to 829 other freight cars, and the scrapping or sale of 537 light freight cars of about an average of 20 tons capacity (the total number of box cars in service was about 9,700). This work, which was begun well along in 1916, had up to December 31 progressed remarkably well. Six hundred and sixteen box cars had been almost completely rebuilt and heavy repairs had been made to 343 cars and 71 cars of the light equipment had been scrapped. At the present writing, inquiry develops that, at the close of July, 1917, 1,952 box cars have been rebuilt; heavy repairs have been made to the 829 cars, at an actual cash outlay for labor and new material of \$760,000, all of which has been appropriated from current earnings; and 223 cars of the light equipment have been sold, or dismantled and written out of equipment account. It will thus be seen that their operations, under this general and comprehensive plan of rehabilitation of freight-car equipment, are considerably ahead of the schedule, and will probably be wholly completed and out of the way prior to December 31, 1918, instead of June 30, 1919, as originally contemplated. The company has ordered since the close of the year 125 steel underframe 40-ton box cars to replace 50-ton wooden cars under equipment trusts which have been destroyed. From now on cars will be built at the company's own shops to immediately replace cars destroyed under equipment trusts.

The locomotive situation was not as serious as the car situation, but since the close of the year eight 10-wheel passenger locomotives and 12 Consolidation freight locomotives were bought through the sale of equipment trusts.

Not only was the company's equipment in bad shape, however, but the difficulties of operation were greatly increased by the fact that the St. Louis Southwestern being an originating road felt the car shortage particularly severely. For a period of many months the company did not have on its own lines a supply of cars equal to more than 50 per cent of its ownership of cars.

business handled under conditions which were quite abnormal.

As throwing light on the prospects for the present year it is significant that although there was an actual large increase in freight business moved, much additional business was offered which could not be handled and which will presumably move in 1917. Much of the 1916 crop of cotton was withheld until after December 31. The rice crop of Arkansas was the largest in the history of the state, but a

The St. Louis Southwestern

very considerable part of this crop was not moved because of the car shortage, and lumber, which forms an important part of the traffic of the St. Louis Southwestern, while showing a largely increased tonnage moved partly because of better carloading, did not move in by any means the volume that it would have had more cars been available.

During the six months ended December 31, 1916, freight revenue amounted to \$5,839,000, an increase of \$1,187,000, or 25.51 per cent. To have moved the large increase in freight business which this increase in revenue represents is no small feat in itself. The increase in revenue was apparently* greater than the increase in ton mileage, due to the fact that the average ton-mile rate was higher, but not withstanding this there was a very large increase in actual freight

Transportation expenses (the out-of-pocket cost of moving the business) amounted to \$2,105,000, an increase of \$287,000, or 15.81 per cent, over the previous year. The average carload of freight in the last six months of 1916 was 18.30 tons, comparing with 17.95 tons in the fiscal year ended June 30, 1916, and 17.55 tons in the fiscal year ended June 30, 1915. The average trainload, including company freight, was 394 tons in the six months ended December 31, 1916, comparing with 386 tons in the fiscal year ended June 30, 1916, and 345 tons in the fiscal year ended June 30, 1915. Better carloading and better trainloading were the methods used in holding down transportation expenses so successfully in the face of the very adverse operating conditions above described. It is quite safe to say that the better trainloading was largely due to a renewal of enthusiasm on the part of officers and employees brought about by more direct and personal supervision on the part of the new vice-president in charge of the property.

The improvement in the financial condition of the com-

*Traffic statistics are not given in the company's annual report for the calendar years 1916 and 1915, comparisons being made only for the six months ended December 31, 1916, and the corresponding six months of 1915. The average ton-mile rate in the 1916 six months was 1.15 cents, and in the 1915 six months, 1.05. The increase in the 1916 six months over the corresponding period of the previous year in tons of freight carried one mile was 14.75 per cent.

pany is striking. At the end of the June 30, 1916, fiscal year there were \$785,000 loans and bills payable; at the end of the calendar year 1916 this entire amount has been paid off. Cash on hand had been increased by \$679,000, bringing the total up to \$1,299,000, and special deposits had been increased by \$535,000, bringing the total up to \$979,000. The working capital of the St. Louis Southwestern would be quite ample for a 1,754-mile road doing the amount of business that this road does under ordinary circumstances, but with the program laid out for rehabilitation through surplus earnings this working capital is certainly not large enough to justify any disbursement in the way of dividends.

The St. Louis Southwestern will undoubtedly need, some time in the comparatively near future, considerable expenditures for additions and betterments. In the last six months of the calendar year 1916 there was \$142,000 spent for additions and betterments, of which \$133,000 was appropriated from the income of that six months. As soon as railroad credit improves and the full results of the present operating methods and policy toward rehabilitation have become effective the St. Louis Southwestern ought to have an ample basis on which to do necessary financing. The company has spent \$517,000 on road equipment, against which no securities have been issued; it has \$1,111,000 bonds of affiliated companies which are not pledged, and has made construction advances amounting to \$268,000, besides having loaned the Valley Terminal Railway \$261,000 and has in its treasury \$4,114,000 of its own first terminal and unified mortgage bonds. The Valley Terminal Railway mentioned above is a subsidiary company formed to build a large interchange yard near East St. Louis. In all about 14 miles of track will be laid in this yard and when completed this yard will connect the Missouri Pacific-St. Louis Southwestern joint Illinois main line and the Terminal Railroad Association of St. Louis with the Alton & Southern and the Illinois Central.

The following table shows the operating figures for the six months ended December 31, 1916, and December 31, 1915:

	1916	1915
Average mileage operated.....	1,754	1,754
Freight revenue.....	\$5,838,628	\$4,651,869
Passenger revenue.....	1,594,466	1,222,176
Total operating revenue.....	7,906,460	6,280,779
Maintenance of way and structures.....	858,986	631,281
Maintenance of equipment.....	1,360,267	1,060,046
Traffic expenses.....	269,079	242,842
Transportation expenses.....	2,104,831	1,817,421
General expenses.....	273,295	257,466
Total operating expenses.....	4,884,094	3,972,574
Taxes.....	306,613	289,877
Operating income.....	2,714,428	2,016,048

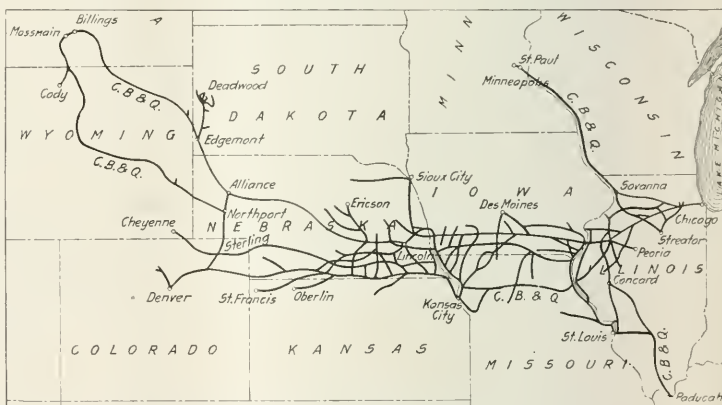

The following table shows the income account figures for the calendar year 1916 compared with the calendar year 1915:

	1916	1915
Operating revenues.....	\$13,850,130	\$11,275,024
Operating expenses.....	9,318,306	7,848,791
Taxes.....	615,814	598,793
Operating income.....	3,913,634	2,823,982
Gross income.....	5,442,631	3,951,776
Net income.....	2,222,165	736,012
Appropriated for additions and betterments.....	132,580	
Surplus.....	2,089,585	736,012

CHICAGO, BURLINGTON & QUINCY

THE Burlington has reduced its operating ratio to below 60 per cent. The ease with which this road, its management and its organization have handled a very great increase in business in the last year and a half is in striking contrast to the difficulties which the eastern trunk lines have experienced in taking care of their increased business. For one thing it illustrates graphically the contrast between a railroad plant with a large margin between business handled and capacity of facilities and a railroad plant being worked under normal conditions to within 10 or 15 per cent of its capacity. In the case of the Burlington, however, not only does the showing made in the calendar year ended December 31, 1916, give a basis for generalizations about railroad operation, but it also brings home with great force the remarkable foresight and combination of precision of judgment and imagination which has been exercised in the development of these 9,019 miles of railroad.

For the first time the Burlington earned over a hundred million dollars—\$109,191,000 in the calendar year 1916.

The Chicago, Burlington & Quincy

The average ton-mile rate was lower in 1916 than in 1915, being 7.08 mills last year and 7.21 mills the year before. The ratio of expenses to total revenues was 59.74 in 1916, as against 64.25 in 1915. The ratio of transportation expenses to total operating revenues in 1916 was 29.32; in 1915, 30.57.

After paying expenses, rentals and interest the Chicago, Burlington & Quincy had a surplus available for dividends of \$32,995,000, comparing with a surplus in 1915 of \$21,072,000. The 1916 surplus was equivalent to nearly 30 per cent on its stock. The Burlington has been for a number of years paying regular dividends of 8 per cent. During this last week the directors have declared in addition to the regular quarterly dividend an extra dividend of 10 per cent. Certainly this is amply justified by the showing made in the calendar year 1916. This extra dividend which the Burlington declared goes in equal parts to the Great Northern and the Northern Pacific, and unless an extra dividend is declared by one or both of these companies, is not in the nature of an extra cash distribution to investors.

Heavier trainloading was by far the most important item in the explanation of the Burlington's lower transportation ratio. The increased volume of traffic and the better balancing of traffic were important factors in helping the increase in trainload, but this fact detracts not at all from the credit which is due to the organization which, under

stress of an increase of 19 per cent. in the revenue freight carried and of 22.7 per cent. in ton mileage of revenue freight, held freight train mileage down to an increase of only 11.7 per cent. and freight train car mileage down to an increase of 10.8 per cent. The average revenue trainload on the Burlington in 1916 was 575 tons as against the average in 1915 of 519 tons, and the average trainload of all freight, including company, was 670 tons in 1916 and 617 tons in 1915. With a road operating 9,019 miles, of which more than half is branches and spurs, and having as large a proportion of grain and livestock as the Burlington and as small a proportion of coal—only 30 per cent. of the total tonnage even in 1916—a trainload of 670 tons is a record that the management may well be proud of.

The average number of loaded cars in freight trains, excluding mixed trains, in 1916 was 28.89, as against 27.75 in 1915, and of empty cars, 11.64 as against 13.14 the year before. The average tonnage of all freight per loaded car in 1916 was 23.94, and in 1915, 23.09. With a small proportion of coal tonnage this is remarkably good carloading.

The outstanding reasons for the Burlington's present great prosperity are its original comparatively low cost of building, its low capitalization per mile of road, the policy of keeping the road well ahead of the needs of a rapidly growing country by the expenditure of large sums from surplus earnings for additions and betterments, and the perfecting of an operating organization which, like the plant itself, has been kept far enough ahead of the requirements placed on it to be capable of meeting even an overload such as has developed in the last year and a half without breaking down under it.

When we talk about the Burlington's surplus and its great investment from earnings in additions and betterments it is essential to remember that during all these years the Burlington has been in active competition throughout its territory with other powerful railroads, and of necessity its rates have been no higher than those of other roads and its service has had to be at least equal to that of its competitors. There can be, therefore, no question of the company having charged unduly high rates to build up its great surplus. Its rates were reasonable, both as established by the test of competition and by court and state commission reviews. The huge surplus which has been put into the property represents the self denial of the owners of the stock of the company in not taking profits which under any test belong to them. The total surplus at the end of 1916 amounted to \$203,090,000 and is divided on the company's balance sheet as follows: \$40,527,000 additions to property since June 30, 1907; \$15,437,000 funded debt retired through income; \$24,080,000 sinking fund reserves; \$8,565,000 appropriated surplus not specifically invested (possibly some of this amount was drawn upon for the extra 10 per cent dividend), and \$114,481,547 profit and loss. The Burlington's cash on hand at the end of 1916 was nearly double its total current liabilities—cash amounting to \$19,848,000 and current liabilities to \$11,422,000. In addition to the cash on hand there was \$12,347,000 time deposits.

In 1916 the Burlington appropriated from income \$8,865,000, but this covered the 18 months ended December 31, 1916. The actual additional investment in road and equipment during the calendar year 1916 was \$8,616,000. The principal items of expenditure were \$1,125,000 for grading, \$1,064,000 for bridges and trestles, \$912,000 for shops and engine houses, \$417,000 for freight cars, and \$445,000 for passenger cars.

The following table shows the principal figures for operation in the calendar year 1916, compared with the calendar year 1915:

	1916	1915
Mileage operated	9,019	9,019
Freight revenue	\$77,310,516	\$64,211,845
Passenger revenue	21,833,534	20,838,622
Total operating revenues	109,191,204	93,598,722

Maintenance of way and structures	11,203,997	12,925,216
Maintenance of equipment	17,403,852	14,833,787
Traffic expenses	1,662,805	1,577,138
Transportation expenses	32,014,949	28,810,984
General expenses	2,203,308	2,033,345
Total operating expenses	65,235,705	60,127,079
Taxes	4,820,197	4,262,552
Operating income	39,098,988	29,175,934
Gross income	42,090,304	30,480,802
Net income	32,994,726	21,671,892
Sinking funds	1,864,287	1,783,800
Dividends	8,867,128	8,867,128
Additions and betterment	8,864,595	3,340,669
Fund for accrued taxes not yet due	2,400,000
Miscellaneous appropriations	6,000,000
Surplus to profit and loss	4,998,715	7,680,295

COLORADO & SOUTHERN

IT is interesting to note how the policies of the parent company, the Chicago, Burlington & Quincy—are being reflected in the showing made from year to year by its subsidiary, the Colorado & Southern. The Chicago, Burlington & Quincy bought the controlling interest in the Colorado & Southern in 1909. The road had been previously placed on a dividend paying basis—apparently a 4 per cent basis—for its preferred stock, of which there is \$17,000,000 out-

The Colorado & Southern

standing, but not long after the Burlington took possession, dividends were discontinued, and it was not until October, 1916, that they were resumed. In the calendar year 1916 the Colorado & Southern had available for dividends \$3,011,000, and payments for the year, representing a 2 per cent dividend on the preferred payable October 10, 1916, amounted to \$170,000.

The Colorado & Southern is one of those lines which may have to profit by traffic developed via the Panama Canal, but in 1916 practically none of this traffic was developed, and the very favorable showing made by the Colorado &

Southern as compared with its showing in 1915 was due entirely to the general prosperity of the territory served and increase in coal consumption and shipments of agricultural products. In 1916 the total ton mileage of revenue freight was 1,221,500,000, an increase as compared with 1915 of 143,800,000 ton-miles. Total freight revenue amounted to \$11,951,000, an increase of \$1,390,000 over 1915, and passenger revenue amounted to \$3,523,000, an increase of \$262,000 over the previous year.

The Colorado & Southern is a single track road connecting Colorado with the Gulf, using the Trinity & Brazos Valley as an outlet to Houston, Tex. With freight revenue in 1916 of \$6,489 per mile and passenger train revenue, including express, mail, etc., of \$2,174 per mile, the average ton-mile rate was 9.78 mills, a decrease of 0.02 mills as compared with 1915, and the revenue per passenger-mile was 2.626 cents in 1916, an increase of 0.057 cents.

Of the total tonnage amounting in 1916 to 7,873,000, 62.44 per cent originated on the Colorado & Southern lines and \$7.56 per cent was received from connecting carriers. Of the total tonnage, 55.78 per cent was products of mines, 19.16 per cent products of agriculture and 11.40 per cent manufactures. L. C. L., although furnishing only 2.85 per cent of the total tonnage, furnishes 11.39 per cent of the total freight revenue, and fruits and vegetables, which are included in the tonnage of products of agriculture and which represent only 1.62 per cent of the tonnage of all freight, furnished 4.65 per cent of the total freight revenue.

In 1916 the Colorado & Southern brought its operating ratio down from 68.30 to 61.24. Total operating expenses amounted to \$10,085,000 in 1916 as against a total of \$10,071,000 in 1915. Transportation expenses show up particularly well. These expenses amounted to \$4,611,000 in 1916, with 1,221,500,000 ton-miles of revenue freight carried and 134,150,000 passenger-miles handled, and in 1915 to \$4,604,000, with 1,077,800,000 ton-miles of revenue freight and 126,900,000 passenger-miles. Notwithstanding the larger freight business handled, total freight train mileage amounted to 2,856,000 in 1916 as against 2,914,000 in 1915. Passenger train mileage increased slightly, being 2,437,000 in 1916 and 2,404,000 in 1915.

Maintenance of way expenses were held down probably because of the difficulty of getting material and men. They amounted in 1916 to \$1,882,000 as against \$1,944,000 in 1915. The two principal items in which there was a saving were ties, with \$442,000 spent in 1916 and \$494,000 in 1915, and track laying and surfacing, with \$537,000 spent in 1916 and \$595,000 spent in 1915.

Maintenance of equipment costs increased only very slightly, amounting in 1916 to \$2,821,000, and in 1915 to \$2,769,000. The decrease in the cost of repairs of freight cars is little more than offset by an increase in the amount charged for depreciation of freight cars, and there were also small increases in the amounts charged for depreciation of passenger cars and of locomotives.

Burlington policies are in evidence in the 1916 balance sheet of the Colorado & Southern. Cash on hand amounted at the end of the year to \$2,682,000, and time drafts and deposits to \$2,970,000. There were no loans and bills payable, and total current liabilities amounted only to \$2,489,000. There was to the credit of profit and loss June 30, 1908, just prior to the purchase of the Colorado & Southern by the Burlington \$6,539,000. At the end of 1916 there was a total corporate surplus of \$13,652,000, and in the intervening years considerable amounts had been written off through profit and loss.

The following table shows the principal figures for operation in the calendar year 1916 compared with the calendar year 1915:

	1916	1915
Average mileage operated	1,842	1,829
Freight revenue	\$11,951,001	\$10,560,926
Passenger revenue	3,522,955	3,260,469

Total operating revenues	16,469,279	14,746,663
Maintenance of way and structures	1,881,738	1,944,311
Maintenance of equipment	2,821,367	2,769,214
Traffic expenses	213,672	202,160
Transportation expenses	4,611,103	4,604,377
General expenses	479,700	475,085
Total operating expenses	10,085,332	10,071,277
Taxes	737,611	666,184
Operating income	5,625,619	4,007,906
Gross income	6,347,780	4,575,976
Net income	3,011,227	1,108,150
Sinking funds	67,432	68,301
Dividends	170,000
Additions and betterments	280,220
Miscellaneous appropriations	500,000
Surplus	1,992,575	1,039,848

BROOKLYN RAPID TRANSIT

THE Brooklyn Rapid Transit earned its 6 per cent dividend in the fiscal year ended June 30, 1917, with only a comparatively small margin to spare; but, on the other hand, the company made a better showing in the second half of the year than in the first half. This is especially encouraging in view of the fact that prices of materials and labor have continued to rise, being considerably higher in the second half of the fiscal year than in the first half. There are two sources from which the Brooklyn Rapid Transit may expect to show increased gross and a corresponding increase in amount available for dividends. One is from its operation of rapid transit lines, in the earnings of which it has a prior joint interest with New York City, and the other from an operation of its surface lines.

The one hope of increased net available for dividends from the surface lines is that the New York Public Service Commission and public opinion generally will recognize the necessity for the maintenance of the credit of the company and grant its requests for a small charge for transfers. The increase in cost of doing business on the surface lines is, in-so-far as it affects materials, probably not permanent, but in-so-far as it affects labor—and a large part of the increase in the cost of operation of the surface lines was in increased wages—it will in all likelihood be permanent.

The transfer privilege in large cities is very much abused, and especially is this so in Brooklyn and in New York. The Brooklyn Rapid Transit in 1913 received an average of 3.41 cents per passenger per ride. This has been steadily decreasing, until in 1917 it was only 3.26 cents. While there may be a great deal of force in the argument that a nickel fare has been established so long and is so much more convenient than a six-cent fare that it will be almost impossible to get municipal governments and public service commissions to agree to change from this fare, these arguments do not apply to a charge for transfers. A charge is now made in New York for a transfer from the subway to surface lines and there is no complaint of inconvenience. The unscrupulous man or woman who gets a transfer, does a morning's shopping and then uses the transfer is getting a service which amounts to discrimination against the more scrupulous passenger who pays a second fare in accordance with the provisions on the face of the transfer.

As will be shown later, there is no prospect of an immediate increase in net revenue to the Brooklyn Rapid Transit from the operation of its rapid transit lines in partnership with the city, although in years to come the operation of this part of the system may prove very profitable. The company, however, needs a greater margin of safety above dividend requirements and needs it immediately.

The company spent for additions and improvements to its surface lines, exclusive of any construction expenditures under contract made with the city, \$1,249,000. As far as the balance sheet is concerned this expenditure was in part offset by a credit of \$957,000 for properties displaced, the largest single item being a credit for power plants abandoned or sold. The company spent on capital account, therefore, in

1917 about \$1,225,000, part of which should have been and was supplied from surplus and the rest will have to be, some time in the future supplied from the sale of securities. The company is now carrying a floating debt of \$4,450,000 secured by refunding bonds. It is obvious that this debt ought to be funded in the near future.

The people of Brooklyn are vitally interested in the proper maintenance and expansion of the Brooklyn Rapid Transit. The company in recent years has given indisputable evidences of good faith in its efforts to build up an organization which will give good service to its patrons. Good service on a city railway depends primarily on two things: type of equipment and caliber of conductors and trainmen. The Brooklyn Rapid Transit is adopting, as near as can be judged, modern types of equipment just as rapidly as its financial condition will permit. Operating conditions in Brooklyn are such as to preclude certain types of equipment that smaller and less congested cities are using.

A motorman or conductor's job, especially in winter, is a hard one. If low wages are paid and poor conditions of work are tolerated the class of men that will take such jobs are a very poor type and the average time which a man holds down his job is short. Recognizing this, the Brooklyn Rapid Transit has made special efforts to pay as fair a wage as operating revenues will permit and at the same time to create conditions which will attract a higher grade of men than would ordinarily become street railway conductors or motormen.

In commenting on the company's previous reports mention has been made of the employees' welfare work, which includes various activities in the interest of the health and social entertainment of employees and the company also provides life insurance for employees. The Brooklyn Rapid Transit spent \$133,000 on this work in 1917 and it is interesting to note that there are now 6,246 employees who are members of the group insurance plan. At Christmas the company gave its employees in the form of gratuities a little over \$29,000. The company also helped its employees to subscribe to the Liberty Loan, making it possible for them to make small monthly payments to be deducted from wages, and the total number of employees subscribing for Liberty bonds was 7,744, the amount subscribed for being \$579,000. It was, of course, necessary for the company to borrow the amount necessary to finance its employees' subscriptions and employees were allowed in some cases as much as two years to complete their payments.

In so far as the employees themselves are concerned, they showed an appreciation of what the company is doing for them by a refusal to join in with the outside agitators who created considerable trouble in Manhattan last winter. President Williams says that the sympathetic relations which have prevailed for years between men and management remained unbroken. Not only are the employees deriving benefit from this broad policy of the company, but the patrons also ought to appreciate that these efforts are of direct and vital interest to them. It is difficult enough to train even fairly high class men to give courteous, good service in surface street car work. It has been proved over and over again quite impossible to train a poor grade of men to perform this work at all efficiently. The conditions in rush hours on the Brooklyn Rapid Transit, as on other street railways in the large cities, can be bettered only through the provision of additional facilities, but conditions in non-rush hours vary directly with the efficiency of motormen and conductors. While the Brooklyn Rapid Transit has by no means reached its ideal in the training of its employees, the public and Public Service Commission both ought to recognize the farsightedness of the efforts which are being made in that direction and to co-operate with the company so as to permit the establishment of a credit which will insure adequate development of facilities and a continuation of payment of fair wages

and the provision of good working conditions for employees.

As was previously mentioned, the prospects for immediate increased net from the operation of the rapid transit lines in which the city has a partnership are not at all good. The Brooklyn Rapid Transit under the agreement made with the city in 1913 has spent \$11,149,000 toward the building of new city owned lines, \$8,373,000 for equipment of city owned lines, and \$30,459,000 for additions, extensions and improvements on existing lines; a total of \$49,981,000. The agreement with the city provides for a first preferential for the company of \$3,500,000 and a further preferential for interest on additional expenditures for equipment, new city owned lines, etc. Previous to June 30, 1917, fiscal year the earnings on the rapid transit lines had failed, after the payment of maintenance, taxes, depreciation, etc., to quite cover the total \$10,180,000 company's first preferential from August 4, 1913, to June 30, 1916. During the year ended June 30, 1917, however, earnings provided for the payment of \$3,500,000 first preferential due in that year in full, with a net of \$858,000 over. The amount due on the second preferential was \$1,109,000, so that there was a deficit of approximately \$250,000 in the company's preferential. This deficit is cumulative and the total amount now owing to the company out of future net earnings is \$1,037,000. As new lines are put into operation there is a very good prospect that the company will be able not only to earn its first and second preferentials but to earn enough to take up this deficit; but after the deficit has been taken up no further profits will accrue to the company except its preferentials until the interest paid by the city on its cost of construction is earned in full.

The city's deficit in the year ended June 30, 1917, was \$2,239,000, and presumably it will be some little time before net earnings are sufficient to pay both the company's preferentials and the city's interest charges. What the company needs, therefore, is to have the Public Service Commission grant it sufficiently increased revenues on the surface lines to strengthen its credit and make safe its dividend during the period which must elapse before a larger profit is earned on the new rapid transit lines.

The following table shows something of the magnitude of the business done by the Brooklyn Rapid Transit:

Fiscal Year Ended June 30, 1917.	
Total miles of first track of surface lines.....	129
Total miles of second track of surface lines.....	124
Miles of first track of surface lines leased.....	116
Miles of second track of surface lines leased.....	111
Total miles (all double track) of rapid transit lines.....	57
Grand total miles of all tracks (surface and rapid transit) leased and owned.....	743
Passenger earnings, surface lines.....	\$17,154,827
Passenger earnings, rapid transit lines.....	11,331,000
Total earnings, including mail and freight.....	29,931,833
Operating charges and betterments.....	16,741,417
Taxes.....	2,351,104
Interest and rentals.....	5,644,074
Net available for dividends.....	5,195,238
Dividends.....	4,467,318
Surplus (after deducting other appropriations).....	382,016
Passengers carried.....	760,519,397

NEW BOOKS

Eight-Hour Law Time-Mileage Computing Table. Copyright by C. F. Needham. Published by Fred. E. Murray, Battle Creek, Mich. Printed on celluloid card, in two colors. Vest pocket size 2½ in. by 3½ in., price 50 cents; and office size 4¾ in. by 7½ in., price \$1.

This table is designed for the purpose of reading at a glance the number of miles corresponding to any given period of time, in hours and minutes, from 1 minute to 24 hours; and conversely the time, in hours and minutes, corresponding to any given number of miles from 1 to 300 miles, at 12½ miles per hour. The small size is convenient for men in engine and train service; while the large size is for the use of timekeepers and others, or for posting on terminal bulletin boards.

How Railway Efficiency Helps Win the War.

Why Better Use of Existing Facilities May Save the
Lives of Hundreds of Thousands of Young Americans

By Daniel Willard

President, Baltimore & Ohio, Chairman Advisory Commission on National Defense.

ON the 6th of last April this country, by formal action of Congress, became a participant in the greatest war that has ever occurred in the history of mankind. Before the United States entered the war we were told on good authority that there were at that time 37,000,000 men in uniform and under arms on the various battlefields of Europe—not in the first line, it is true, but either at the front or in reserve—37,000,000 men in uniform and under arms before the United States went in! Estimates have been made which would indicate that at the present time the cost of this war to the total participants is approximately \$100,000,000 a day in money and 15,000 men in lives lost—not crippled or wounded, but lives actually lost every twenty-four hours. But terrible as that is, it is only a mild statement of the case. It is just the slightest possible measure of what is being done. That statement takes no note of property destroyed, of those crippled for life, of minds shattered, of eyesight lost.

The United States for a long time, longer than some thought should have been the case, kept out of the war. I tried, with many others, to be neutral. I had been in Germany many times. I had great admiration for the German people. I have a great admiration for the German people today. But developments took place, things happened (all of which were laid before you by the President in his various admirable messages, and all may know, if they desire to know, why it is that we are at war), and the day when our Congress decided that we should enter the war, no matter what might have been my previous views, that day I ceased to be a neutral. I am not a Democrat. I did not vote for President Wilson; but this is not a matter of politics, it is a question of national existence; and today a man can occupy only one of two possible positions on that question; he is either for his country or he is against it. There is no other possible choice.

One of the first problems requiring serious consideration after the declaration of war was the matter of transportation, and I feel that it is a great credit to the railroads of this country that in just five days after the Congress had declared war, men representing the 175 principal independent railroad companies in the United States assembled in Washington, and, after listening to a presentation of the situation, they voted unanimously then and there, and signed papers confirming their action before they left the city, giving to a small committee of five men, selected by these railroad representatives, full power to control the operation of all the railroads in the United States during the period of the war in order that the railroads might thereby be in a position to respond immediately and as a unit to any demand made upon them by the President in the interest of the general situation.

Nothing of the kind was ever done before by any industry, so far as I know, in this or any other country, and the railroads were the first to do it—and remember, only five days after war was declared. We went from a system of 175 separate and independent companies competing with each other into one nationalized system under the control of five of the ablest railway men in the country. Why? In order that we might best serve our country and so best help to win

the war. That is why it was done. No other reason in the world would have induced those executives to turn over their properties to be run as five men might dictate.

The committee of five men are sitting constantly in Washington, in effect with a map of the United States before them, on which is a railroad system 265,000 miles in length, with all ownership names wiped out. They are no longer thinking in terms of C. B. & Q., North Western, Pennsylvania, or anything of that kind. They realize that they are faced with the problem of seeing that the necessary transportation service of the United States is performed. They find, for instance, that unless unusual efforts are made to move coal to the Northwest there is likely to be a coal famine there next Winter, and, so far as they are able to prevent it, there will be no coal famine in the Northwest next Winter. Early in the Spring it became apparent that this nation would be expected to furnish much of the food stuffs required by our Allies, and with that in mind the Secretary of Agriculture urged the farmers all over the country to enlarge their crop areas as much as possible. In response to that request it is estimated that the amount of tilled land, the acreage plowed up this year, is at least 30 per cent greater than it was a year ago.

Now, in order that the program might be a success, that we might have more crops, that this additional tilled land might be productive, it was necessary to move quickly and in the Spring, not at some other time, the things necessary to increase the crop growth, such as seeds, fertilizers and agricultural machinery. That was one problem, I repeat, and the railroads met it, and I have heard no complaint from the Secretary of Agriculture or from any other source that the crop acreage or condition has been restricted or impaired in the slightest degree by the failure of the railroads to furnish proper transportation.

The importance of the railroads in a time of war is constantly illustrated. Marshal Joffre, when he was in Washington a short time ago, said something like this, as near as I can recall:—"The Battle of the Marne was won by the railroads. Without the railroads it would never have been possible to bring up the supplies, to provide the armies with the munitions, and all the things necessary to carry on the battle. The railroads won the Battle of the Marne." That was the statement made by the Hero of the Marne, one of the greatest soldiers of the present day.

RAILWAY SITUATION IN RUSSIA

Professor Lomonosoff, a high official of the Russian transportation system, is in this country now. A few days ago he also made the statement that unless they can have improved transportation facilities in Russia, it will be impossible for them to vigorously carry on the war. I am going to take time to tell you briefly just what he said about the railroad situation in Russia.

He pointed out for instance, that Petrograd—which is, we will say, the Pittsburgh of Russia—had formerly obtained its coal supply from England. Of course, they use a great deal of wood also in Russia, but at the same time they require a great deal of coal. Owing to the conditions on the ocean, the menace of the submarine and the shortage of boats, Petrograd is unable longer to get coal by ships via Archangel, on the North Sea, as was formerly the case; the same condition obtains at Moscow. Other interests are also af-

* From an address delivered to the officers of the Baltimore & Ohio at Deer Park, Md., June 29, 1917.

fectured by the reduced coal supply from the North. Russia is not so richly favored by Nature with coal deposits as is the United States, and the only deposit of any considerable size is in Southern Russia near the Caucasus, 1,400 miles from Petrograd. They are now obliged, because of that situation, to haul roundly 1,500 cars of coal north from the Caucasus each day, several times more than they had to haul in times of peace. That, in itself, was a pretty big transportation problem in a country so sparsely provided with railroads as Russia.

Furthermore, the blocking of the Archangel route virtually made Vladivostok the front door of Russia, and where formerly equipment and other things much needed came in by a much shorter haul, now those same materials, if they get there at all, must come via Vladivostok and be hauled by rail 6,000 miles before they reach Petrograd. Some of that railroad—considerable of it, in fact—is single track. I want you to know this because you gentlemen have got to play an important part in the winning of this war. I hope

From the St. Louis Globe-Democrat

Russia: Well, Now You Know What I Need

I will succeed in making that clear to everyone of you. I have no doubt that you have appreciated it from the first, but it will do no harm to repeat, that every man in this room has got to *help win this war*. Today Russia wants 2,500 locomotives just as soon as they can be obtained and 40,000 cars. Why should we be interested in that? For this reason, for this very, very good reason. It is estimated that the Germans have some two and a half millions of their troops on the Eastern front. If Russia should be forced to make a separate peace with Germany, and she might be compelled to do so—not because of the change of government, because it is believed that that change has helped the situation—but suppose Russia should be unable to get supplies, to get food, to get ammunition, to get guns, and all the other things necessary for her army—she might have to quit whether she wanted to or not, and if Russia should make a separate peace with Germany those two and one-half million Germans that are now facing the Russian Army would be released and would be moved to the western front facing France and England, and that is the exact number, I suppose, of additional men which we would have to send over to oppose

them. In other words, it may mean two million more of our young men to France if Russia is unable to meet her transportation problem satisfactorily.

It is because of the seriousness of that situation that it was felt, as soon as we got into the war, that one of the most important things to do was to find what, if anything, we ought to do to help in that connection. Fortunately, Major Washburn, who had been in Russia all during the war as correspondent for the London Times, happened to be in this country and he appeared before the Council of National Defense and explained the situation—told how important it was that Russia's railroad facilities be quickly improved so that she could carry on her operations. It was immediately decided to send a small committee of our best railroad men to Russia to find out what the situation was, and how we could be of assistance.

It took some three or four weeks to arrange the preliminaries for sending such a committee, because things were just then somewhat disturbed in Russia. A country cannot throw off an old government and take on a new one quite as easily as you can change your coat. It is a very serious undertaking, and we ought all to be glad that so far it has been carried on with such success that it promises to go through to a satisfactory conclusion. However, the committee was appointed, and comprises five of the best men who could be sent on a mission of that kind. John F. Stevens, chief engineer of the Panama Canal in its early stages, was made chairman of the Commission.

The Canadian Pacific Railroad, at our request, held the "Empress of Asia," one of their largest steamships, four days at Vancouver for the committee—they being unable to reach there sooner. They were met with a special train at Vladivostok, and taken through to Petrograd. The burden of all letters and cables that we get from them is "send cars and engines without limit; we must have cars and engines quickly, and we must also arrange to erect the cars and engines ourselves." Heretofore, because of there being no shops at Vladivostok, the engines have been hauled 400 miles to Harbin to be set up in the shops at that place. They have now asked us to erect them at Vladivostok, and that also we are going to do.

"BE CAREFUL OF YOUR POWER"

Now, why do I mention all this? For this reason: the combined output of the locomotive shops in this country is about 5,500 a year. Russia wants a thousand engines before the first of January, and at least 2,000 next year. England and France require from 1,000 up to as many as we can give each year. But suppose we give Russia 1,500 next year and England and France 1,000? That is nearly one-half of the average total locomotive output of this country. We also need more power on our railroads, but shall we sit down and hold on to everything we have and see Russia forced to a separate peace? Shall we, in order to make our own task somewhat easier, to meet a situation that is undoubtedly pressing here, hold on to all the new engines we can build, facing the possibility that because of such action we may have to send 2,000,000 more of our young men to the battle line? Or shall we say to the builders, "You send the engines that Russia wants, you send the engines that France and England want, and we by additional effort will undertake to carry the greatly increased burden put upon us, with what we already have"; that is why I ask you to be more careful of your power, to keep it in better shape, to get more out of it, to try constantly to do more with what you have. Not because we do not want to spend money, although that is a good reason, but because we want to send every available car and engine to our Allies so that on that account we will be called on to send fewer of our young men. I want you to think of that seriously. The railroad committee in Washington, which sits there constantly, is en-

deavoring to deal with the situation in such a way as to contribute most toward the winning of the war.

THE RAILROADS' PROBLEM

The railroads will not be able, no matter how hard they try, to carry all the freight that will be thrown upon them during the war, and this is why: They were measurably well equipped to perform the service of the country before the war began. As a matter of fact, for a period of some seven or eight years there was nearly always a surplus of anywhere from 50,000 to 350,000 freight cars. It cannot be said that the railroads were not fairly equipped to do the work required of them when the war began. Since then, and particularly within the last six months, we have done what I have already pointed out toward increasing the crop average. Our shops and factories were working feverishly day and night before we entered the war, making munitions for our Allies. Since then this government has appropriated two billions of dollars for the necessary supplies for its own army, superimposed on what we were already undertaking to do.

In addition to that, many boats on the Lakes which formerly carried a large volume of business east and west have been taken off, sent down through the Welland Canal and are now in Trans-Atlantic service. The boats that formerly ran up and down the Pacific Coast, carrying coal from Vancouver to southern points, have been taken off to be used as mine-sweepers, patrols and in transport service for the Navy. In the east a considerable number of boats that formerly were in our Atlantic coastwise service have been taken off. The business they formerly carried is now being done by the railroads. Not only have boats been taken off, but insurance rates on the water are so high, because of the submarine menace, that much of the business that might go by boats is now going by the railroads, and still further, the boats that formerly ran through the Panama Canal are now in other service. All that puts additional work upon the railroads, and that they have responded to the situation as well as they have I think is a great credit to everyone engaged in the railroad calling. Now, for the reasons given, the railroads will not be able to carry all the freight that may be offered. That is one of the things that I wish you gentlemen to understand, so that you will be able to help the public understand—that part of the public with which you come in contact.

The railroads will probably be able to carry all of the food stuffs necessary. They will carry the necessary coal and munitions, and they will carry the steel to make ships, *all of the things necessary from the standpoint of winning the war*, and this will not exhaust their capacity. But let us say that it will take 75 per cent of their capacity to perform service of the kind mentioned, leaving 25 per cent of the capacity for the ordinary business of the country. Probably the ordinary business of the country at the present time requires double that capacity, so that part of it cannot be carried, and we must exercise a judicious discrimination. Congress has been asked to pass a so-called priority bill, establishing a small committee of men who will decide questions of that kind—questions of priority of movement. Because of the fact that all things cannot go at the same time, they will endeavor to determine which particular thing ought to go first, from the standpoint of national defense.

There has been, for instance, much complaint from the road and structural builders in Ohio, because the railroads could not handle the sand, gravel and other things necessary in carrying on their work. They appealed to their members in Congress and it looked as if the situation would become serious. However, a small committee of representative men came to Washington, at the suggestion of Senator Pomerene, and the situation was explained to them as clearly as it could be. It was pointed out that we were at war—we were not at peace—that it was idle to say that things would or could go

on as usual while we are at war—idle—worse than that, criminal—because it was misleading, and any serious effort in that direction would tend to prolong the war rather than to shorten it. That was pointed out to them, and it was suggested that they go over the situation and find out what particular things were of most importance and then come back and tell us what they wanted. It was suggested, for instance, that if some among them were using sand at points located on the Pennsylvania, that they should also buy it on the Pennsylvania and not on the Baltimore & Ohio, and *vice versa*, so that the delay due to the transfer of cars between railroads could be cut out. They were delighted to have these and other suggestions. It was pointed out to them that the railroads had not broken down, as is sometimes said,—that never in their history were the railroads carrying as much business as today, but that we must carry those things first that are essential to the *winning of the war*; they said—“Of course, we understand it now; we will go back and co-operate with the local railroad officers and we will certainly try to make lighter your burden and to defer for the present those things that can be deferred without serious detriment.”

I mention that as an illustration; I know of many instances of the same kind. Now you men who come in contact with the public must explain the situation to them, you must say to them that there is *nothing* in this world so important to you, or to them, or to anyone interested in this country as the *winning of the war*. This is the only test we have: “*Will the thing under consideration help win the war?*” If so, it has our support; if not, so long as the war continues, we are not interested in it. I hope you men, because of what I say, will have a little better understanding of the situation when you leave here than have many who are living in the interior, and it is your duty, and your privilege, too, to tell them what the situation is as you understand it, so that they can co-operate and help in what we are all trying to do. My own experience makes me believe that they will accept your suggestions and you will find cooperation instead of complaint.

THE RAILROADS' WAR BOARD*

By Edgar E. Clark

Member Interstate Commerce Commission.

I am glad to take advantage of the opportunity of saying that I personally, and, through me, the other members of the Commission, have had, and still have, entire sympathy with the work of this Committee and with the principles upon which it is founded. We recognize the full effect of, and the principle that lies underneath, the response of the railroads of this country to the needs of the hour as presented to them by the Federal Government.

I think there is a weakness in the average American character in expecting to see the next day after a new plan is formulated, direct, immediate and visible results. And so when a movement of this kind is undertaken you find on the streets and in the newspapers the next morning criticisms that the machinery has been created or provided, but it has not been productive of any good results yet. A movement of this kind if it is to be successful must be undertaken, as this has been undertaken, by laying a foundation.

We have watched with a good deal of care at the Interstate Commerce Commission the results from day to day and from week to week and I can say without qualification or hesitation, in fact, I am glad to say, that within the past few weeks it has been apparent, both on the face of the returns and in the marked falling off of complaints that come to us,

* Remarks made at a conference of the Special Committee on National Defense of the American Railway Association, Washington, D. C., July 11, 1917. Mr. Clark, representing the Interstate Commerce Commission, sits with the Railroad War Board.

that the efforts of the railroads through this Committee are resulting in great good. A great deal has been done to relieve what was and still is a very serious situation.

We realize that this situation, the congestion on the railroads, the abnormal demand for transportation, came almost out of a clear sky. We realize, as the average person does not realize, that the demands for transportation probably exceed the possibilities even if the maximum of efficiency be worked out. It follows that somebody may have to go without transportation he desires to have.

The Committee and the railroads must get along as best they can, not only under the thoughtless criticism of those who do not take time to study the situation and think it over, but they must meet unfair criticism from people who are trying to direct attention to alleged faults of others in order to avoid having their own shortcomings and evil doings brought into the limelight. There are those, and they are heard through the newspapers and otherwise, who in my opinion are pursuing a studied course to make it appear that the shortcomings of the railroads are much worse than in fact they are, because they do not want the shortcomings of those whom they represent to become known or prominent. So I think it is due to yourselves that the facts should be known. Facts will speak for themselves among the thinking people of the country and the more of the facts that can be put out, the better in my judgment it will be for all concerned.

The principal thing that is complained of by most people is what is commonly called "car shortage." Congress has recently put upon the Interstate Commerce Commission the responsibility in a large measure for movement, distribution, interchange and exchange of cars. That legislation is responsive to a recommendation in the Commission's annual report submitted to Congress in December last at a time when it was difficult to find enough clerks to open the telegrams and letters received, complaining about these things. At that time there was no concerted or unified effort on the part of the railroads to deal with the situation and no apparent evidence of any such intention. The Commission felt that the situation would not grow better as long as the war continued unless there was some centralized general plan for dealing with the situation. If the plan that was later adopted and under which this Committee was created had been in existence at that time that recommendation would probably not have been made. But now that law comes into existence at a time when the railroads themselves are, in my judgment, dealing with this situation in a comprehensive, patriotic, able and fair manner.

It would be most unfortunate if because that law has cast upon the Commission the powers and duties which it does cast upon us, the railroads' officers should feel discouraged in their efforts, and I can say authoritatively that it is not the desire of the Commission that they should so feel, because in so far as our duties reach we hope to work the problems out in cordial cooperation with this Committee. We do not want to interfere with any well laid, well conceived plan that this Committee has formed. We are organizing to perform those duties with those purposes definitely in mind. We wish to establish the best possible means of contact with the Car Service Commission and to have thorough understandings with them. We will have no secrets from them and will consult freely with them on important matters.

It is not perhaps entirely unfortunate that this law was passed, because in any large movement for progress or reform we run against the recalcitrant that will not willingly get into line. So if it becomes necessary in dealing with recalcitrants or insurgents the Commission will have the power to require proper action and will not hesitate so to act. There are many good things in connection with transportation in times of peace and when there is plenty of

transportation and plenty of transportation facilities that seem consistent and proper which in times like these are troublesome and expensive and in a large measure perhaps ought to be modified or eliminated.

The question of reconsignment has been referred to. We are not insensible to the facts that under the rules that have been voluntarily established by the railroads there are many abuses of equipment, and that the carriers are put to the performance of expensive services without due and proper compensation therefor. I have no special authority to speak for the Commission, but I can speak for myself and I believe I speak the sense of the Commission in saying that in so far as our authority is necessary to that end, we are willing to exercise it in moderation in the direction of correcting evils, but we do not think that the right way to cure them is to immediately or at one stroke wipe out all such provisions and practices. There are situations in this country where reconsignment is essential to proper distribution of commodities, and, in many ways, is essential to the interests of the carriers. I have in mind the situation in regard to fuel coal at Detroit, where much trouble has been felt. The industries have grown in the last few years with marvelous rapidity and practically none of them is equipped with facilities for storing a supply of coal which would permit it to operate a month. If these industries are required to order their coal from a given mine consigned direct to their plants it follows that that coal must come with regularity day by day or the plant will find itself out of coal. And so there has grown up at Detroit a system under which the industries depend upon coal dealers who keep a supply coming from the mines all the time, but when it comes from the mines they have no idea who is going to use it. It comes to Detroit and is reconsigned under tariff provisions to the ones who need it, and in that way the city is supplied. We justified in the first instance the establishment of a reconsigning charge of so much per car for reconsignment, a service which the railroads had been performing free. It developed that most of this coal was moving through the Toledo Gateway and the railroads adopted the plan of giving a passing notice at Toledo so that they might get the reconsigning orders before the coal reached Detroit. However, as the congestion was relieved the coal reached Detroit before the reconsignments could be given and recently they have come to the Commission asking reparation in certain instances in which they paid the \$2 reconsigning charge. We said it was a proper charge, that the conditions justified it and that the railroads should not be required to pay it back. I simply recite that as an instance. The point I want to make is that the Commission is not against changing these things in moderation. It is not averse to going step by step, and by long steps in some instances, in the direction of appropriate rules and proper conditions. We do not want to do things too precipitately, and perhaps do as much harm as good.

The thoughts I want to bring to you are of encouragement in this effort, of appreciation of the response, patriotically made by the railroads to the demand upon them, and to convey, if I can, an understanding of them. The Interstate Commerce Commission may not agree in full with all that the railroads would like to have. You differ among yourselves about some things and it naturally follows that others will differ with you. It is impossible for a large number of intelligent men to think alike on all subjects. If they can think alike, they will act alike. We are in sympathy with your efforts, in full sympathy with the plan along which you are acting. I do not believe that the American people in general appreciate the gravity of the situation that confronts our Government. We are not in a war of a milk-white flag. We are in for a very serious and perhaps a very protracted situation and even if peace should come at an early date and hostilities should cease, there is an enormous work for

the United States Government to do to prepare itself for similar situations that may arise within the next few years. There is an enormous work for the railroads of the country to perform.

This Committee has adopted a policy, and in the exercise of our duties under the Esch Bill we are going to try to push it along and cooperate with it, to get the cooperation of shippers in increasing the carloading, decreasing the delay to cars and contributing each his little bit, which in the aggregate means an enormous amount. The figures which are contained in the reports of this Committee as to what has been accomplished along that line are very interesting and illuminating and they show great results. If somebody could write them in a readable story for the average newspaper reader it would be appreciated a good deal more than it will be by simply stating the figures.

AN OLD STONE ARCH BRIDGE

Repairs made recently on what is probably the oldest railroad bridge in service today disclosed some interesting construction details that indicated the skill and ingenuity of the

verse 12-in. brick walls resting in the arch rings. These walls are spaced 3 ft., center to center transversely, and 5 ft. longitudinally, and are covered with 12-in. granite slabs, which in turn hold the ballast under the tracks.

It was originally constructed for double track, and, although the equipment it was designed to carry undoubtedly weighed less than the present-day automobile truck, it has

The Arch

bridge masons of nearly a century ago. The structure is 297 ft. long with a central arch with an 80-ft. span and with the base of the rail 65 ft. 6 in. above the bed of the stream. It was constructed by James Lloyd in 1829, as stated on a marble stone set in the parapet wall, and it has, therefore, been in service for 88 years. It is of native granite cut to a true surface and set in lime mortar. Large pilasters were placed at the side walls and extend to about 4 ft. above the original elevation of the railroad tracks to form parapets. The spandrel spaces over the arches are not filled, but the track load is supported on a system of longitudinal and trans-

A Close View of the Abutment

remained in perfect condition under the continually increasing loads, until it is now carrying as heavy loads and traffic as any bridge in the country. No repairs would have been necessary at the present time had not the common practice of raising the track at intervals when applying new ballast brought the rails up to the level of the top of the parapet walls and placed a heavy lateral thrust upon them which they were not designed to carry. This has caused the spandrel walls to move to such an extent that it has been necessary to take them down to the elevation of the top of the arch, and in some places still lower, and to reset them, backing them up with concrete under the track a sufficient distance to take the thrust from the parapet walls. In handling this work special care was taken to replace the stones in their former position in order to preserve the originality of the old bridge as far as possible.

The structure was in serious danger of destruction during the Civil War, but by careful guarding it came through unharmed, and, judging from its present condition, it will continue to serve indefinitely. We are indebted for this information to S. C. Tanner, master carpenter on the Baltimore division of the Baltimore & Ohio, under whose direction repairs and alterations were made.

Constructive Suggestions on Car Interchange

Prize Winning and Three Other Papers Received in the Contest on This Subject. Ideas for Present Problems

TWENTY-THREE papers were received in the contest on car interchange which was undertaken by the *Railway Age Gazette* at the suggestion of a well-known railway man who has long been a student of this complicated problem. After the close of the contest on June 10, the papers were turned over to A. M. Schoyer, resident vice-president of the Pennsylvania Lines at Chicago, N. D. Ballantine, assistant to the operating vice-president of the Chicago, Rock Island & Pacific and E. H. DeGroot, Jr., superintendent of transportation of the Chicago & Eastern Illinois, until his recent appointment as chief of the division of car service of the Interstate Commerce Commission, who examined them carefully and unanimously awarded the first prize to O. C. Castle, superintendent of car service, Southern Pacific Lines, Houston, Tex. The second prize was awarded to J. W. Smith, superintendent of car service, Western Maryland, Baltimore, Md., on the decision of a majority of the judges, Mr. Schoyer dissenting because of his disapproval of the suggestions for an equipment company.

Other papers were contributed by E. E. Betts, superintendent of transportation, Chicago & North Western, Chicago, Ill.; J. R. Cavanagh, superintendent of car service, Cleveland, Cincinnati, Chicago & St. Louis, Indianapolis, Ind.; A. C. Hasey, Yonkers, N. Y.; S. W. Fisher, car accountant, Ft. Dodge, Des Moines & Southern, Boone, Iowa; D. W. Brantley, car accountant, Central of Georgia, Savannah, Ga.; J. M. Brickett, chief clerk to general manager, Kansas City Southern, Kansas City, Mo.; T. D. Simmons, car distributor, Seaboard Air Line, Hamlet, N. C.; M. M. McNeel, car interchange clerk, Houston & Texas Central, Hearne, Tex.; J. E. Campbell, Munhall, Pa.; Mark H. Reasoner, Minneapolis, Minn.; R. J. Barry, superintendent, Houston & Texas Central, Austin, Texas; K. V. Conrad, Norfolk & Western, Roanoke, Va.; T. H. Meeks, chief dispatcher, Southern Pacific Lines, Lafayette, La.; Chas. Burlingame, superintendent, Wiggins Ferry Co., St. Louis, Mo.; P. J. Bergeron, chief demurrage clerk, Southern Pacific, Houston, Tex.; H. E. Sanders, car distributor, Kentwood, La.; G. W. Segrest, agent, Galveston, Harrisburg & San Antonio, Markham, Tex.; C. E. Henry, agent, Warren & Ouachita Valley, Banks, Ark.; L. F. McNeill, agent, Houston, East & West Texas, Appleby, Tex.; E. T. Brady, agent, Atchison, Topeka & Santa Fe, Sweetwater, Tex.; and M. L. Reinhardt, agent, Galveston, Harrisburg & San Antonio, El Campo, Tex.

FIRST PRIZE—A WORKABLE SET OF CAR SERVICE RULES

By O. C. Castle

Superintendent of Car Service; Southern Pacific Lines, Houston, Texas.

The writer makes no claim to originality in the rules presented below, as the principles underlying them are almost as old as the history of car interchange. These principles have been advocated by prominent transportation and car accounting officers for more than 50 years, but it seems to have required a world war to give them an opportunity for a fair trial.

The method of car handling now being undertaken by the Commission on Car Service practically ignores the right of the car owner to the control of his individual car, and, in theory at least, recognizes the justness of the principle laid down by the American Railway Association that each road is entitled to the possession of cars equal to its ownership. It seems reasonable to suppose that if car handling methods based on this principle are practicable and desir-

able at a time like the present, they would certainly be practicable and desirable under normal conditions.

I might point out that, under the terms of the contest outlined by the *Railway Age Gazette* no rules which rely on an equalization of balance by the return of the individual car to the owning road can be given consideration, for it is obvious that without an absolute balance in the flow of traffic it is mathematically impossible for an originating road to maintain 100 per cent of ownership solely by means of rules which insure the return of the individual car when released from the original load. Such a road must either receive the empty cars of other carriers to offset its loaded deliveries, or content itself with less than 100 per cent until its own cars are released and returned to it. If the "individual car" method is relied on, originating roads must provide equipment sufficient to handle their traffic through to destination, in which event they do not hope for nor desire the use of their entire ownership.

CAR SERVICE RULES

Definition

"Excess" road—A road having in its possession more freight cars of railroad ownership than the total number of such cars owned by it.

"Deficit" road—A road having in its possession fewer freight cars of railroad ownership than the total number of such cars owned by it.

Organization

(1) The territory in the United States and Canada shall be divided into zones by the American Railway Association.

(2) An interchange supervisor shall be selected for each zone, and a general interchange supervisor for the entire territory. The supervisors shall be detached from the employ of any railroad.

(3) The zone supervisors shall have jurisdiction over car interchange in their respective zones, reporting to the general supervisor, who shall report to the Commission on Car Service of the American Railway Association.

(4) The general and zone supervisors shall be empowered to require such reports from railroads as are necessary in the administration of these rules.

(5) The expenses of the general and zone organizations shall be borne by the American Railway Association, and all fines and penalties collected shall be credited to the association.

(6) A penalty and compensation fund shall be created and maintained by the American Railway Association for the purpose of clearing the amounts received and disbursed through the administration of these rules.

Operation

(7) All railroad cars shall be considered as "common cars," except as follows:

(a) Special classes of cars assigned by their owners to a defined traffic. This assignment shall be limited to coal, ore, coke, stock, tank and ventilated box cars, and assignments shall be approved in each case by the zone supervisor, subject to review by the general supervisor and the Commission on Car Service.

(b) All cars below 40 tons capacity.

(c) All cars in mechanical condition which will prevent their acceptance in interchange under the provisions of M. C. B. rules.

NOTE: Cars in classes (b) and (c) shall be confined to the rails of their owners.

(8) Any railroad having on its line less than 100 per cent of its owned equipment may make demand for partial or complete equalization; such demand shall be filed with the zone interchange supervisor, and shall specify the class and number of cars required, and the situation with respect to interchange and ownership balance.

(9) On receipt of a demand for equalization, the zone supervisor shall call upon excess roads in the zone to deliver a given number of cars of the required class to the deficit road making the demand.

(10) In the event the zone as a whole shows a deficit the zone supervisor may make demand on the general supervisor for an equalization, giving the necessary data for the lines, with further details as to the preferred gateways through which equalization may be effected.

(11) On receipt of a demand from any zone supervisor the general supervisor shall call upon other zones to deliver a given number of cars of the required class to the zone making the demand. The order shall specify the road or roads to which delivery shall be made, and the period within which the order must be complied with.

(12) In order to apportion the cars received in equalization by zones, a zone supervisor may direct deliveries by deficit roads to other deficit roads, such deliveries in no case, however, to be in excess of the receipts from roads in other zones.

(13) The per diem rate of settlement between carriers shall be fixed at an amount agreed upon to cover the actual cost of owning a freight car, based on the cost of equipment, depreciation, repairs and interest on the investment. The rate shall be in effect throughout the year, and shall be changed only when a thorough investigation develops that the items making up the rate have changed materially.

(14) The Commission on Car Service, on recommendation of the general interchange supervisor, shall fix a *per diem penalty* rate applicable to all cars on the road of any carrier which has refused or failed to comply with instructions from supervisors with respect to equalization of equipment, this rate to apply from the time the equalization order becomes effective until it is fulfilled or cancelled by the interchange supervisor. The penalty per diem shall be in addition to the regular per diem rate, and shall be paid into the penalty and compensation fund of the American Railway Association.

(15) Any deficit road which has made a demand for equalization which is not satisfied within ten days from the date of such demand, shall make a claim against the Penalty and compensation fund of the American Railway Association for per diem penalty on the total car days represented by the unfulfilled demand. The reclaim shall be at a rate per car per day equal to 50 per cent of the average gross earnings per car per day of all cars on the line of the demand road for the six months immediately preceding.

(16) Common cars will be at home on the line where located, and will not be handled empty in interchange except in switch service without instructions from the zone or general interchange supervisor.

(17) An excess road desiring to relieve itself of per diem payments on cars not required for loading may report its condition to the zone supervisor and make tender of all, or a part of its excess. If the zone supervisor fails to give disposition within a period of five days from the date of the tender, the excess road making the tender may reclaim against the penalty and compensation fund for the per diem on its excess cars, such reclaim to cover the period during which the excess continues, or until such time as the zone supervisor shall accept the tender or make a demand for equalization.

(18) On receipt of a tender from an excess road, the zone supervisor will tender to deficit roads in his zone sufficient cars to reduce the excess on the line making the tender, and

failing to find disposition for such cars in his zone will make similar tender to the general supervisor. A deficit road which declines a tender of equipment offered by the zone supervisor will honor a reclaim from the penalty and compensation fund for the per diem on all or a part of the deficit for such period as the deficit may continue, or until the deficit road makes a demand for an equalization.

(19) A car owner desiring the return of some particular car or cars, for a special purpose, may have such car, or cars, moved empty to a junction point with his line on payment of a reciprocal mileage charge of $3\frac{1}{2}$ ct. per car mile, plus bridge and switching arbitraries.

(20) Roads making excess empty mileage through the movement of cars in equalization will be compensated by such payments as the Commission on Car Service may, after full investigation, find to be equitable.

SECOND PRIZE—JOINT OWNERSHIP OF FREIGHT CARS

By J. W. Smith

Superintendent of Car Service, Western Maryland,
Baltimore, Md.

The various interchange and car service rules for the handling of freight equipment which have been tried out in the past, have all failed at the most critical time, with the result that at present we have a pool of equipment, unregulated, except insofar as the recent orders of the Commission on Car Service of the Railroads' War Board are being made effective. These orders, however, are only emergency measures intended to take care of conditions during a period of war and will not meet the situation when these conditions have passed. The time is, therefore, opportune for developing and perfecting a permanent plan of operation that will meet the situation which will confront us at the close of the war. This plan should be such as will recognize the rights of ownership and assure to each road at all times its full quota of equipment of the particular class or classes it owns, or in which it is interested. To do this with the present diversity of ownership would entail all of the difficulties which have confronted the railroads under the various interchange and car service rules that have been in effect up to the present time. The proper and equitable distribution of equipment between the various lines of the country cannot be accomplished efficiently and economically until some comprehensive plan of ownership is adopted and enforced which will recognize the responsibility of each road to contribute to the equipment of the country its full quota of cars necessary to protect shipments while moving over its rails.

Under the present method of placing upon the originating road the responsibility for furnishing equipment in sufficient numbers to protect the business it originates, and to carry it to destination, many roads have contributed more cars of certain classes than should be required of them while others are grievously delinquent in their obligations to contribute their share. It follows that in times of car shortage, the roads which originate large volumes of business, and which have contributed cars in sufficient numbers to carry this business to destination over the rails of other roads, find themselves depleted of equipment, owing to their cars being diverted and detained on other roads which have not contributed their share of the equipment necessary to take care of the business they originate and handle.

This situation can be overcome and the proper and equitable distribution of cars between the various roads made possible by a readjustment of ownership of the equipment on the basis of what may be termed "A plan for the Joint Ownership of Freight Cars," which may be outlined briefly as follows:

(1) Organize an equipment company, the stock of which shall be owned only by railroad companies; this company to own and control all cars which it is desirable to have placed under joint ownership.

(2) Have this company under a separate and distinct organization with a board of directors elected by the stockholders, and an independent management appointed by the board of directors.

(3) Have the stock of this company issued in different series, representing the different classes of cars owned by the equipment company, and give each railroad the right to purchase stock of any series in amounts representing the number of cars of that particular class desired or necessary to handle its business.

(4) Equalize the balances of equipment company cars on each line on the basis of stock ownership, requiring roads in excess to give up cars within a reasonable fixed period to roads that are short on their proportion, assessing appropriate penalties for failure to do so, and awarding appropriate damages to the road which has suffered.

(5) In times of surplus, require each road to accept and hold on its line its full proportion of cars owned by the equipment company on the basis of stock ownership.

(6) Have an established per diem rate, which each road shall pay to the equipment company for all cars of the equipment company on its rails; this rate should be made sufficient to cover the cost of operation and ownership, including interest, maintenance and depreciation, with a sufficient margin to cover the fluctuations in prices of material.

(7) To enable the management to know at all times the balance of equipment company cars on each road, and properly to equalize these balances between the roads, arrange a system of daily reports to be made by each road to the equipment company showing the total number of cars of each class interchanged with connecting lines; these reports to be made on a basis similar to that provided for in the "Double Entry Daily Balance Plan," for per diem settlements as outlined in the minutes of the No. 10, meeting of the Association of Transportation and Car Accounting Officers, Cincinnati, O., December, 1908, pages 1,216 to 1,240, inclusive.

(8) Have the equipment company assume the obligations and rights of owners, under M. C. B. rules, with respect to repairs and the destruction of cars.

(9) Have the equipment company purchase from the railroad's stockholders any cars in good, serviceable condition which such railroads may desire to turn in under this plan, at a depreciated or appraised value, and have the equipment company purchase such new cars of each class, of standard design and construction, as its funds will permit, and as may be desirable or necessary to protect the business of its stockholders.

The above is only a brief outline of the joint ownership plan, but it covers such of the essential features as will serve to illustrate its value. There are a number of other points, which would have to be considered in working out the details of the plan, and in this connection the following suggestions are offered:

Stock should be sold to the railroad companies at par value only, and should not be transferable except with the consent of the board of directors of the equipment company.

The par value of each share of stock of each series should be sufficient to cover the cost of a new car of standard design of the particular series represented by such stock.

Cars covered by trust certificates, the title of which can not be transferred, and which it might be desirable to place under joint operation may be leased to the equipment company for an annual rental equal to 6 per cent of the depreciated value at the time such lease is executed; certificates of lease to be issued by the equipment company covering such cars which entitle the holders to the same privileges and obligations as stock except as to dividends and assessments.

Amounts accruing from the sale of stock should be ap-

plied to the purchase of old and new equipment, a sufficient amount therefrom being set aside for a renewal account to offset the difference between the price of the old equipment purchased and the par value of the stock representing such cars.

Amounts accruing from per diem should be applied to operating expenses, the payment of rentals on leased cars and the cost of repairs; a sufficient amount being set aside therefrom for renewal account to offset the depreciation of cars in service.

The surplus, if any, should be applied as dividends on stock, while deficits, if any, should be made up by assessment on stock.

The management should be given authority to assess proper penalties against delinquent lines for failure to give up excess cars on demand within a reasonable fixed period to roads that are short on their proportion and award them as damages to the line or lines suffering thereby. These penalties and awards for damages should be sufficient to cover the full amount of loss sustained. The management should be permitted to distribute cars to roads requiring them in excess of their proportion at times when such cars are not required on other lines.

These and other matters of detail, necessary to the working out and inauguration of this plan, should be given careful consideration. I am confident they can all be worked out on a fair and equitable basis.

While this plan is in effect a pooling scheme, and therefore has all the advantages of a car pool, it eliminates practically all of the objectionable features of the various pooling plans which have been suggested. I am submitting it in the hope that it will be given full and careful consideration by all interested in car efficiency, and particularly by those who have the authority to say what shall be done in matters of this kind.

A SUGGESTED SET OF RULES

By T. H. Meeks

Chief Dispatcher, Southern Pacific Lines, Lafayette, La.

PROPOSED CAR SERVICE RULES

1. (a) The distribution and equalization of railroad-owned or controlled cars between railroads will be directed by the Commission on Car Service.

(b) Railroads will make such reports to the Commission on Car Service as may be required for the purpose of accounting for cars in their possession.

(c) Embargoes will be placed by the Commission on Car Service as may be deemed necessary to maintain an equal distribution of cars according to ownership.

2. All railroad owned or controlled cars to be:

(a) Used irrespective of ownership.

(b) Delivered empty to the home road when belonging to a direct connection.

(c) Delivered empty to the home route at any junction that will make the empty haul shortest.

(d) Delivered to any road for loading.

3. (a) When practicable to do so without delay or additional empty haul, foreign cars must be loaded in the general direction of home and system cars used locally.

(b) Cars designed by the owner for special service shall be so recognized, receive special attention and be sent, either loaded or empty, to or in the direction of the home road.

(c) Private line cars shall be handled in accordance with instructions from owners or lessees.

4. (a) It is incumbent upon a railroad receiving the line haul rate to furnish cars for loading within the switching limits of another railroad when the railroad on which cars are loaded receives only a switching rate.

(b) An equal number of cars, of the same kind, must be returned promptly, loaded within the same switching dis-

trict, or empty, to the railroad from which cars are received in switching service.

5. (a) No railroad will be permitted to retain in its possession more cars than a number equal to its ownership of each kind, and will deliver surplus of cars above its quota of each kind to connecting railroads as may be directed.

(b) A railroad may assign for any period of time, a portion of its quota of cars to another railroad, in which case the number allowed it on an ownership basis will be reduced below the number of its ownership by the equivalent of the cars so assigned to another railroad.

(c) Cars may be short-hauled from one railroad to another through intermediate railroads at a reciprocal rate of $3\frac{1}{2}$ cents per mile, plus bridge and terminal arbitraries, with a minimum of 100 miles for each railroad handling the cars, the railroad requesting the movement to pay the charges. Intermediate railroads handling cars under this arrangement may load cars received and deliver others of the same kind, when, by so doing, it is possible to reduce the delay and empty haul.

DISCUSSION

I have felt the necessity in daily practice for a specific rule governing the handling of cars between different roads in switching movements, regardless of the general balance between the lines concerned, hence the inclusion of rule 4.

Under rule 1-b the Commission on Car Service can require of all railroads a daily report giving the number of car loads of each commodity originating on their lines and the names of the railroads to which they are destined, so that it will be possible to determine daily the total number of loads moving to each line, which movement can be regulated by embargo to the extent of the ability of the destination road to handle the cars promptly.

Under rule 5-b a railroad to which cars are assigned is entitled to retain on its line a number of cars equal to its ownership, plus the number assigned to it by another railroad. The object of this rule is to permit trunk lines to take care of small lines such as coal and lumber roads whose business is principally outbound.

Rule 5-c is intended to cover movements where the intermediate line is not interested in the equalization and should be compensated for the service performed. It has often been found convenient and more economical for a railroad performing the intermediate haul to load the cars so received and substitute for them cars of the same kind at the junction point where billed.

I would also recommend that a rule be added providing a penalty for the violation or non-compliance with these rules, or any instructions that may be issued by the Commission on Car Service.

A COMBINED OWNERSHIP AND POOLING PLAN

By S. W. Fisher

Car Accountant, Fort Dodge, Des Moines & Southern,
Boone, Iowa

To increase the efficiency of car interchange, we have two periods to take into consideration: (1) the normal period when cars are available, (2) the abnormal time when there is a shortage of equipment. The writer's recommendations are very briefly:

(1) To establish an impartial commission supported by the Interstate Commerce Commission. This commission should be composed of an equal number of transportation men representing the eastern, western, northern and southern roads, with one or more men to represent the smaller lines. This commission will have charge of per diem assessments, the preparation of car service rules, and the distribution of equipment when necessary. It should have full plenary powers, and its decisions should be final. Violations of its orders should be subject to fine.

(2) During normal times, the commission should issue such

instructions as will insure car owners getting their equipment. It would be impracticable to have all cars in a pool during such a period. This plan would enable the car owner to place his cars in first class serviceable condition, he alone having all the necessary material to do so. Rules similar to those issued by the Commission on Car Service on April 18, 1917, to take effect on May 1, 1917, eliminating the penalty feature, should be placed in force, fixing the per diem rate of 75 ct. per day for closed cars, and 40 ct. per day for open cars, except that where a car owner does not average 60 per cent (or any reasonable per cent as fixed by the Commission) of his equipment on his line for the month his cars should earn \$2 per day; i. e., where a car owner does not average 60 per cent of his equipment on his line during the month of January, the Commission will instruct all lines to pay such an owner \$2 per day per diem for the month of March. If in February the per cent on the line to the total ownership is 60 per cent or more, the per diem will automatically go to 75 ct. or 40 ct. per day for April. I recommend the short routing of equipment to owners and the interchanging of empty mileage.

(3) During an abnormal period, the writer recommends the pooling of all equipment. Car distributors should be stationed at certain points throughout the country, the roads reporting their situation by wire each day to the car distributor in charge of those roads. Distributors will take care of the distribution of equipment in their territories. Wire reports should be consolidated into one form and mailed promptly to the commission which should be centrally located. If car distributors cannot supply equipment within their territory, they will immediately wire the Commission. The distribution of equipment should be carried out along such lines as can be accomplished with the minimum empty mileage.

It is the writer's opinion that the unsatisfactory car interchange may be attributed to the very low per diem rate. There has been too much difference between the freight earnings and the per diem. It is essentially wrong for a road to build cars for its requirements, be deprived of their use, pay the car repair bills, the interest and the insurance, assume the depreciation, etc., and then go begging for equipment.

Considering past experiences, the writer firmly believes that the car owner should by all means be recognized during a normal period, while during abnormal times all equipment should be pooled, eliminating unnecessary mileage and the distribution being made according to ownership and requirements.

WORKING ON CAR BALANCES

By A. C. Hasey

No condition tends to destroy freight car efficiency as much as the empty car movement incidental to the obligatory return of freight equipment to the owning roads, with the cumulative delays at successive junction points for home route rights. This is an evil of disastrous effect, reducing the use of equipment to an enormous extent and entailing a dead loss in operating expenses. If, instead of computing per diem on each individual car and in the haste of relieving a road of per diem charges, sending a car on a journey of hundreds of miles empty, the basis of per diem was upon the excess of cars held on each road over the total owned, calculated upon a debit and credit system with rights and values on all cars regardless of ownership and with a per diem charge fixed at a figure large enough to produce the incentive to keep the quota on each road near its allotment, the result would be accomplished.

Regional offices could be established covering an area sufficiently limited to prevent too large a volume of reports, to which would be reported all cars interchanged between roads in that territory in classes and a debit and credit maintained with each road daily and in turn reported to a cen-

tral office, where accounts would be balanced and settlement made monthly. Each road should take a tally of all cars and ownership in classes on the line as of the date accounts were started in the regional and central offices, with an allowance of one or two months for the adjustment of discrepancies, when settlement would begin upon the basis thus established and each road be charged at the determined per diem rate for all cars in excess of its quota.

A road having a monthly aggregate of 425 cars on its line in excess of its quota would pay per diem at the prevailing rate to the central office and a road with a monthly aggregate of 225 cars less than its quota would receive per diem on that number, preferably settled in classes. Re-claims between respective roads would be settled by the roads direct as at present. This would be the only clerical force required by each road for per diem settlement, and would result in an appreciable reduction in clerical expenses from the present methods that would offset the expense of maintaining regional and central offices.

No obligation would exist to forward cars home or in a homeward direction empty and therefore empty car mileage and car haul expense would be unpleasant memories only. A road would have the right to use any car for loading in any direction, and could be obligated to make repairs at its expense on all cars on its line, except possibly owners' defects on cars which have left home rails within a certain established period.

Accumulations caused by abnormal conditions such as existed recently in the export trade could always be anticipated and met by embargoes, and when, conversely, there was a stagnation of business and a surplus of equipment, arrangements for storing a certain quota on each road, regardless of marks, could be made effective, upon which per diem would not be charged, an arbitrary number deducted, and per diem responsibility based upon a new quota for each road.

This method would undoubtedly save enormous expense in new equipment and empty haulage. The objection that may appeal to some of having a large number of foreign cars on lines would not have much force, as this evil would not be much greater than at present. Now one foreign car is hurried toward home empty to be replaced by another foreign car and this one likewise handled, whereas under the method proposed the one car might remain longer on one road, but the result would be the same.

This situation could be met by a "gentlemen's agreement" to load cars in the direction of home where, possible, and should actually accomplish such a purpose more than present rules, with the restrictions created by the present obligation to send cars home empty, which reduces the availability of cars for use, and produces more cars available for the protection of loading in all directions.

This plan may appear on the surface to be a radical change, but a remedy of present conditions must be radical, and national exigencies demand now or in the near future an eradication of the pernicious method so inimical to industrial economy and progress.

CHINESE RAILWAY INCOME IN 1916.—The total income derived from Chinese railways during 1916 amounted to \$30,997,471, an increase of \$2,415,800 compared with 1915. The total expenditure incurred was \$14,839,614, or \$265,140 less than the previous year.

RAILWAY CONSTRUCTION IN ARGENTINA.—The following six lines are under course of construction in Argentina: Pichinal to Oran, Province of Salta, 17.4 miles; Nare to San Javier, Province of Santa Fe, 45 miles; Catamarca to Tucuman, 115 miles; Talapampa to Alemania, Province of Salta, 6.8 miles; Metan (Province of Salta) to the east, 150 miles; and Milagro (La Rioja) to Quines (San Luis), 85.6 miles.

NEW YORK CENTRAL THRIFT SPECIAL

The thrift special of the New York Central ended a three weeks' run on August 11 after making its way through the heart of New York state bearing the latest message on canning and conservation to the housewives of that section. The car started its run at Pulaski and ended at Hudson, and was one of the most effective means of following up the patriotic

The Exhibition Car

planting movement, with practical suggestions for utilizing the large surplus of vegetables and fruits.

The car was run in co-operation with the Home Economics Department of the State College of Agriculture at Cornell and with the New York State Food Supply Commission. Two expert home economics workers were aboard to demon-

An Interested Audience Watches the Canning Demonstration

strate the best methods of preserving food, to distribute literature and to answer all questions asked by the women who flocked to the daily demonstrations. The train was made up of two cars, one a regular passenger coach equipped at one end for canning demonstrations, and another fitted out with an exhibition of home canned products, with the best equipment for canning and drying, and with suggested labor-sav-

ing devices for the home. It was, in fact, an itinerant school in home economics and bureau of information on all subjects pertaining to the present emergency food situation.

The schedule of the special was mapped out some time in advance and the country adjacent to each town was placarded with the announcement of its arrival. The car stayed one day in each town on the schedule and with its flying stars and stripes and signs bearing the words, "Thrift Campaign" and the slogans, "Waste Nothing," "Practice Patriotism," was a valuable object lesson in conservation. Each afternoon a two-hour demonstration was given in the canning of various products by the home economics experts.

The visitors to the car averaged 150 or 200 a day, in spite of the terrific heat which lasted through a good part of the run.

RAILROAD BUILDS COW BARN

Efforts to secure economy in the construction and operation of railroads as well as in the maintenance of the road and equipment, or in extending their commercial influence, have frequently led railroads into activities more or less remote from pure railway transportation. As an illustration of the diversity of such activities the Boston & Albany recently constructed a sales cow barn at Brighton Stock Yards, Boston. This building is the property of the railroad but is leased and operated by the Brighton Stock Yards Company of Boston.

The new barn is 215 ft. long and 138 ft. wide of reinforced concrete throughout with metal sash and standard fire doors. The floor is concrete and the stanchions are all metal, making the building as fireproof as possible. The

backs of the cattle and is so full that it will not be necessary to take them out of the stalls in order to make a full examination. This, it is expected, will reduce greatly the time required for inspections.

The building will accommodate 400 head of cattle. A complete drainage system is provided so that every part of the interior can be disinfected and washed down, hydrants being provided for that purpose. A small restaurant for use on sales days is provided at one corner of the building, adjoining which is an office and sleeping quarters for the cattle inspectors. These quarters are heated by steam and hot water is also provided.

Construction on the building was started on March 12, 1917, and it was opened for business July 9, 1917, 21 days ahead of the contract time allowed. The piers, foundation walls and walls were built of 1: 2: 4 concrete, the outside

A Portion of the Exterior

A View Along One of the Alleys

risk of a fire in the feed and bedding is provided for by the installation of nine hose lines distributed at convenient points in the service alleys, and also by the placing of fire extinguishers near each of the doors.

The federal cattle inspectors examine all cattle in this barn and therefore the distribution of light, both natural and artificial, required careful study. It was finally determined to eliminate all side lighting and secure natural lighting altogether from overhead, and artificial lighting by the distribution of a large number of small unit electric lights.

The elimination of all windows in the outside walls of the building was also to reduce maintenance costs for broken glass, which is found to be a very heavy item in buildings lighted from the sides. The lighting results are beyond expectations, and have worked out most satisfactorily, every part of the building being uniformly lighted. It was noted from the photographs that the light falls directly on

being given a rough surface and the inside a smooth surface. The granolithic floor was constructed of 1: 3: 6 concrete for the lower 4 inches, with a 1-in. finish of 1 to 2 mortar laid simultaneously with the concrete and finished with a wood float. At least 8 in. of engine cinder was laid under the concrete and thoroughly compacted before the floor work was started. The roof slabs were constructed of 1: 2: 4 concrete reinforced with Kahn bars. The total cost of the building and paving adjacent thereto was \$70,000.

The barn which this building replaces was of timber construction and required a constant force of six to eight carpenters to maintain it properly; it was destroyed by fire after having twice suffered damage from this cause. The new building was designed and constructed by the engineering department of the Boston & Albany, under the direction of F. B. Freeman, chief engineer, to whom we are indebted for the above information.

MILITARY TRANSPORTATION.—Speaking in the House recently as to the work done during the year by the Ministry of Munitions, Dr. Addison said: "The other day Sir Douglas Haig paid a high tribute to the work of military transportation. It has been the duty of the Ministry (of Munitions) to supply the goods, except that the transfer to France of a certain amount of existing railway stock was undertaken by the Railway Executive Committee. The quantity of locomotives, trucks and track required was so great that to manufacture all in time—even if there had been the raw material to spare, which there was not—would have been an impossibility. To meet the program track was pulled up at home. India, Australia and Canada sent their contributions. More than 2,000 miles of track have already been supplied in a complete condition, and nearly 1,000 locomotives of various kinds, apart from hundreds supplied by the Railway Executive Committee."

A 120-Ton Coal Car for the Virginian

One of Four Experimental Cars Built Without Drop Doors to Unload in the Car Dumper at Sewalls Point

By B. W. Kadel

ONE of the four experimental 120-ton gondola cars which are being constructed for the Virginian Railway by various builders, has recently been completed and delivered by the Virginia Bridge and Iron Company, Roanoke, Va. The design of this car demonstrates certain special features of construction of this class of equipment. It is built for use in bituminous coal carrying service between the West Virginia fields and the tide-water terminal of the Virginian

The ratio of stress to end strain for this sill is .057, a factor well within the recommendations of the M. C. B. Association. In addition to this there are no open holes or cuts of any description in the sill, it is well braced and stayed both in a vertical and a horizontal plane, and it is not called upon to carry any of the weight of the lading, thus eliminating vertical bending.

To prevent the center sill from receiving bending stresses

Virginian 120-Ton Flat Bottom Coal Car Built by the Virginia Bridge & Iron Company

at Sewalls Point, Va., there to be handled over the road's car dumper.

The principal dimensions of the car are as follows:

Length inside	50 ft.
Length coupled	53 ft. 7 in.
Distance between truck centers	37 ft. 4 3/4 in.
Width inside	9 ft. 8 1/2 in.
Width over all	10 ft. 3 1/2 in.
Height of sides above rail	11 ft. 1 1/2 in.
Height of sides inside at ends	7 ft. 3 3/4 in.
Volume level full	3,785 cu. ft.
Volume with 30-deg. heap	4,422 cu. ft.
Truck wheel base	9 ft.
Truck weight	16,350 lb.
Capacity	218,000 lb.
Weight	73,900 lb.
Ratio of revenue load to total load with 10 per cent overload	76.4 per cent

The car body is of plate and angle construction with Carnegie cross-tie sections for side stakes and end plate stiffeners. To provide for corrosion the minimum plate thickness is 3/4 in., and no angles of less than 1 1/4-in. stock have been used. Heavier stock is used wherever needed.

The principle of the design is that the weight of the lading actually be transferred to the sides of the car, the integrity of the center sill as a draft member being maintained. The center sill is a Bethlehem 12-in. 84.5-lb. H-section and extends not quite to the bolster at either end of the car. The ends of the center sill are milled and are attached to steel castings, which form a portion of the National Malleable Castings Company's radial draft gear, so that the buffing forces are delivered to the center sill, not through the rivets, but as direct loads upon the ends of the sills. The center plates are integral parts of these steel castings.

of any moment from the lading, three plate girder diaphragms are provided to carry the load out to the side plate girders. These have the compression members passing continuously over the center sill and the bottom or tension members passing under the sill. At the outer diaphragms the floor line of the car is dropped down to the plane of the lower face of the center sill, thus increasing the capacity of the car and lowering its center of gravity.

The sides are constructed of 1/4-in. plates with a bottom chord of angle section and a bulb angle for the upper chord. From the depressed portion of the floor to the ends of the car the size of the bottom chord angle is reduced, as its load is less nearer the bolsters. The side plates are also cut away here in line with the floor over the trucks, not only to eliminate unnecessary metal, but to give an unhindered view for the inspection of the trucks. No cross-ties are used, the sides being stiffened by means of wing plates which extend between the diaphragms and the inside side stakes. Between the diaphragms are located the stakes on the outside of the car so that they bear against the blocking on the cradle of the car dumper. The top angle, grab irons, etc., are thus protected, while the alternating inside stakes with their stiff wing plates support the car and prevent the sides from bending in when the cradle is rotated. The ends of the car are stayed against bulging by means of two Carnegie cross-tie sections extending from side to side. Because of the excessive depth of the car at the ends inside ladders are supplied.

The sides of the car are carried by the body bolsters which

are of novel construction. They are integral steel castings, located above the floor of the car within the coal space, and are shaped not only to give an economic and advantageous disposition of the metal for the various conditions of load applications, but at the same time to offer no obstruction to the coal in dumping. Wing plates extend upward from the outer ends of the bolsters to stay the sides of the car. The bolsters are a product of the American Steel Foundries.

The floor is stiffened between the diaphragms with angles. The diagonal angles for stiffening against poling are located above the floor to clear the brake rigging of the trucks.

Lewis Articulated Six Wheel Truck

Because of the great weight of the car it is necessary to provide definite jacking points specially designed to take care of this operation. Two jacking blocks are provided at each corner of the car, the one being under the end of, and in reality a part of, the cast-steel body bolster, the other being a part of the corner poling pocket. Either of these blocks will support the load of that corner of the car, so that the

Interior of the Virginian Coal Car Showing the Unique Steel Transom Castings

car can be jacked up at one of these points and stood off the other. The jacking face on the bottom of the push pole pocket bears directly against the bottom end of the corner angle of the car body, and serves to strengthen the push pole pocket and the corner of the car. The push pole pockets also have bracket portions which extend out and engage stops on the cradle of the dumper, should the overhead clamps for

any reason fail to hold the car when in inverted position. This feature is used on other equipment of the Virginian Railway. Wooden planks are set into the outline of the center-sill section to present a smooth face for the sliding of the coal and prevent its hanging up when dumping the car. These are held in place by means of removable stops upon the diaphragms, and are accessible from the outside. No open holes are left in the center sill for securing this planking.

The trucks for this car are of the Lewis Articulated* six-wheel type manufactured by the American Steel Foundries, and are equipped with McCord pressed-steel journal boxes of the Vulcan type and Davis cast-steel wheels. Each truck weighs 16,350 lb. The length of the wheel base is 9 ft. and the height of the center plate is $26\frac{1}{2}$ in. above the rail. The center plates are 16 in. in diameter, and are machine faced. The bolster springs are of extra large capacity. The bolsters are fitted with Stucki Frictionless side bearings of the two-roller type, the rollers being four inches in diameter and four inches long. The axles are M. C. B. Standard with 6-in. by 11-in. journals.

The car is equipped with the Westinghouse Air Brake Company's empty and load brake. A 16-in. by 12-in. load cylinder and 10-in. by 12-in. empty cylinder are used, the latter having a 4-in. preliminary slack take-up piston. The brake is designed to give a braking power of 40 per cent for the empty or loaded car. The trucks have clasp brakes, the arrangement of which has been worked out especially to prevent excessive reaction loads in the side frames. The foundation brake gear and the clasp brakes were furnished by the

The Stucki Two-Roller Type Side Bearing

American Brake Company. The Banty ratchet hand brake is used.

The car is equipped with the National Malleable Castings Company's radial draft gear, which is pivoted to the ends of the center-sill construction, and is swung with the truck through the medium of an arm connected with the truck bolster. The draft gears at all times stand approximately tangent to the track and in line with each other, so that in buffing the forces have little tendency to displace the couplers. The coupler heads are specially made with side abutments or stops which allow but a limited movement of the couplers out of line in buffing.

The volume of the car is 3,785 cu. ft. level full and 4,422 cu. ft. including a 30-deg. heap. Its light weight, including the specialties mentioned, is 73,900 lb., of which 32,700 lb. is in the trucks and 41,200 lb. is in the body.

While it is generally known as of 120 tons capacity, the car in reality is stenciled 218,000 lb. in order that the allowable loads for the 6-in. by 11-in. axles may not be exceeded

*For a description of this truck as originally designed, see the American Engineer for January, 1913, page 35.

when the car is given a 10 per cent overload. On this basis the load per pair of wheels with 10 per cent overload amounts to 52,283 lb., or a load of approximately 49,900 lb. on the M. C. B. 50,000-lb. axle.

The car represents the results of extensive experience and careful study and was worked out jointly by the builders and the motive power department of the Virginian Railway. The aim in the design has been to eliminate as far as possible all useless metal and to this end an especially careful analysis of the known forces and stresses was made. Under the most extreme conditions of loading, the extreme combined stresses have not been allowed to exceed those given in the table, based on 10 per cent overload in the car. As far as possible

STRESS LIMITATIONS OBSERVED IN DESIGN OF VIRGINIAN 120-TON COAL CAR
Stress, lb. per sq. in.

	Structural parts	Steel castings	Rivets
Tension	13,000	9,000
Compression	13,000	9,000
Shear	9,000	8,000	8,000
Bearing	16,000

the secondary stresses have been analyzed and allowed for, and it is hoped later to have available for publication the method of calculation for the various portions of this car.

MORE CARS ORDERED TO WEST AND SOUTH

To facilitate the prompt movement of grain and food products, as well as lumber and munitions, the Car Service Commission of the Railroads' War Board has ordered the immediate distribution of 20,790 additional empty cars among the lines operating in the South, the West and the Southwest, some of which will go from the East to the Pacific Coast.

This will make a total of 106,033 empty cars that have been ordered moved from one railroad to another, regardless of ownership, during the past three months, in order to mobilize in different sections of the country a sufficient number of cars to handle the abnormal government and commercial traffic that war conditions have produced.

Of the latest cars ordered by the War Board to be distributed where they will be most needed, 7,800 are to be placed in the grain-producing country. One thousand of these go to the Southern Pacific, and 500 to the Western Pacific, to insure the speedy movement of a huge shipment of barley. Other roads receiving cars to accelerate the movement of grain and farm products are the Missouri, Kansas & Texas, the Missouri & North Arkansas, the Kansas City, Mexico & Orient, the Atchison, Topeka & Santa Fe, the Missouri Pacific, the Wabash, the Nashville, Chattanooga & St. Louis, the Chicago, Rock Island & Pacific, the Illinois Central, and the St. Louis-San Francisco.

To protect the vegetable and Southern watermelon crops, more than 5,000 cars have been sent to the Atlanta, Birmingham & Atlantic, the Central of Georgia, the Seaboard Air Line, the Atlantic Coast Line and other roads operating in the Southeast.

Meanwhile, hundreds of cars are being rushed daily to the lumber states of the South to take care of the tremendous movement of lumber to the army cantonments and shipbuilding yards.

In addition to the demand for lumber, the war has practically doubled the orders for phosphate rock during the past three months. This product, which is essential to the operation of sulphuric acid plants and the manufacture of munitions, is also used as a foundation for fertilizer. In the past, the coastwise vessels carried a large volume of it, but with the reduction in the number of vessels used for freight purposes along the coast, practically all this traffic has been diverted to the Atlantic Coast railroads. As a result, it has been necessary to send thousands of cars into that district.

To protect the movement of sulphur for the munitions factories, hundreds of cars have been ordered to the Kansas

City Southern, the Southern Pacific and the Gulf Coast Lines.

More than a thousand stock cars have also been sent into Texas to enable the cattle raisers there to get their herds into the western pasture country.

The roads to which the latest order of 20,790 cars has been consigned, together with the number of cars consigned to each, are as follows: Central of Georgia, 1,300; Chicago, Peoria & St. Louis, 200; Mississippi Central, 135; Southern, 3,025; Atlantic Coast Line, 1,700; Illinois Central, 600; Georgia, Florida & Alabama, 30; Missouri Pacific, 600; Richmond, Fredericksburg & Potomac, 100; Georgia & Florida, 300; Tennessee Central, 100; Georgia, 200; Seaboard Air Line, 1,000; Louisville & Nashville, 1,700; Mobile & Ohio, 1,000; Louisiana Railway & Navigation Company, 500; Wabash, 1,000; Missouri, Kansas & Texas, 1,000; St. Louis Southwestern, 500; Carolina, Clinchfield & Ohio, 300; Chicago & Alton, 500; Louisiana & Arkansas, 200; Missouri & North Arkansas, 300; Kansas City, Mexico & Orient, 500; Chicago & North Western, 500; Atchison, Topeka & Santa Fe, 500; Nashville, Chattanooga & St. Louis, 500; Chicago, Rock Island & Pacific, 500; Southern Pacific, 1,000; Western Pacific, 500; St. Louis-San Francisco, 500.

Fourteen thousand seven hundred of these cars, or a little more than two-thirds of the entire order, are to be supplied by the Pennsylvania System. The other roads that have been ordered to supply empties include the Western Maryland, Philadelphia & Reading, Cleveland, Cincinnati, Chicago & St. Louis, Boston & Albany, Boston & Maine, Central Railroad of New Jersey, New York, Chicago & St. Louis, Chesapeake & Ohio and the Norfolk & Western.

WASHINGTON CORRESPONDENCE

WASHINGTON, D. C., Aug. 14, 1917.

REORGANIZATION OF THE INTERSTATE COMMERCE COMMISSION

President Wilson on August 9 signed the bill providing for the reorganization and enlargement of the Interstate Commerce Commission, which requires him to appoint three new members, including a successor to the late Judson C. Clements, to bring the number up to nine. As President Wilson appointed Commissioners Hall and Daniels, a majority of the reconstituted commission will, therefore, be his appointees. It is reported that the President will send his nominations to the Senate this week. The names of nearly 100 candidates for the position have been recommended to him.

It is assumed that shortly after the new members are chosen the commission will be able to announce its organization into divisions as provided by the law, as it has had this plan under consideration for a long time, while the bill has been progressing slowly through the various parliamentary stages for nearly two years, and because it was suggested by the commission itself in order to enable it to organize its work in a way to promote greater efficiency. Under the old law all acts of the commission were presumed to represent the combined judgment of all its members, and although the great mass of work imposed on the commission naturally required it to delegate much of its work to subordinates and in many cases opinions were written mainly by examiners or represented the work of one commissioner only, the fact that the entire commission was technically responsible for everything that was done naturally made each member feel it incumbent upon him to give at least some personal attention even to minor matters. Under the new plan the commission may place responsibility for various departments of its work on committees or divisions of its members who may act for the commission and have all the jurisdiction and powers now conferred by law upon the commission. This will relieve other members of the commission from the responsibility of keeping in close touch with the

work that is delegated to divisions except in cases of great importance. Provision is made for a rehearing by the entire commission as provided in the act.

A few years ago it was customary for members of the commission personally to travel about the country hearing rate cases. Of late years the volume of business handled by the commission has increased so greatly that this has not been possible. The commissioners are in Washington most of the time and hearings are usually held before examiners, or attorney-examiners, who not only take the testimony but review it and in the majority of cases prepare the opinions, under the supervision of a commissioner. The opinions as written are then passed upon by the commission in conference and either approved, modified or sent back to be rewritten. In important cases the opinions are written by commissioners with the assistance of the examiners and attorneys who heard the evidence.

Under the division plan the entire commission need not participate in the conferences in ordinary rate cases, but the work of the examiners will be reviewed by a division, which under the law must consist of at least three members. Ordinarily the decision of the division will be final except in cases of such importance that the entire commission will want to pass on it, or where a rehearing is asked.

Within the past year or so the commission has considerably expedited and simplified its work by the plan of serving on the parties in advance copies of the examiners' tentative report as the basis for the oral argument before the commission. In this way the argument may be confined to the findings and time need not be wasted in arguing points which have been accepted. In many cases oral argument is heard by the examiner at the conclusion of the testimony.

The plan of submitting the tentative report has worked very satisfactorily, in the opinion of those who practice before the commission, and has enabled the commission to issue its final decision in a much shorter time after the submission of the case, than was formerly required.

The commission has also issued the following notice to those who practice before it, making suggestions for further conservation of time in arguments before it:

"Increasing demands make it imperative that the time of the commission be conserved as far as possible. The principles applicable in tariff cases are fairly well known to all of us. There is relatively little controversy about the facts. The issue usually turns upon the significance of those facts, under the principles applicable, as determinative of the controversy.

"The commission feels justified in asking counsel to confine their attention in oral argument to those features which in their judgment are determinative. The detail is presented in the record, can be developed on brief, and is largely susceptible of check by comparison with tariffs or reports on file.

"The opportunity now afforded for argument before the attorney-examiner at the close of the hearing conducted by him and our present practice of putting out his statement of facts and proposed conclusions in advance of the argument tend to clarify and focus the issues for oral presentation before the commission.

"In such case the proposed report of the attorney-examiner and the exceptions thereto should be used as far as possible as the basis of the argument. The statement of facts as given in the proposed report, if accurate and adequate, need not be repeated unless in an expository way at the opening, and the argument should be directed as far as possible to the conclusions suggested by the attorney-examiner.

"Much expenditure of time and money will be obviated if the parties on the same side of a controversy agree in advance upon the person or persons who shall come to Washington and make the oral argument. Their interests can be more effectively presented in 60 minutes by one or two counsel than

by half a dozen speaking 10 minutes each. Hitherto it has not been customary to apportion the time among those desiring to be heard until after they presented themselves on the morning of the day set. Hereafter Frank C. Stratton, chief of the commission's docket division, should be advised at least 10 days before the day set of the selection of counsel and the time needed.

"From and after resumption of arguments in October, the time allotted will ordinarily not exceed one hour in minor cases and three hours in major cases, except as exceptional complexity or importance may in the judgment of the commission warrant exceptional treatment."

APPROVAL OF RATES BEFORE FILING

The new provision in the bill which became a law on August 9, that no increased rate shall be filed except after approval has been secured from the commission, will work a considerable change in the methods of filing tariffs. It was adopted by Congress, with very little consideration, although after the conferees appointed by the Senate and the House had discussed it with members of the commission and a representative of the railroads, as a substitute for the Senate amendment proposed by Senator Smith. The purpose of the Smith amendment was to prevent any increase in rates without suspension if any one in the United States filed a protest. The new provision is far less drastic and, as the commission already had the power to suspend rates, either on protest or on its own initiative, it would seem that about all it has accomplished is an increase in the amount of red-tape involved in getting tariffs made effective. Heretofore the railroads have simply filed their tariffs 30 days in advance of the effective date, the commission's tariff force has checked them over to see that they complied with the rules, and, ordinarily, unless there has been a protest, they have automatically gone into effect, the shippers having been given an opportunity to make any protest by the 30 days' public posting.

Now the commission will have to take some action before the tariffs can even be filed, but, according to the law, this approval may, in the discretion of the commission, be given without formal hearing, and in such case shall not affect any subsequent proceeding relative to the rate involved. In other words, approval of the filing of a rate in such circumstances does not carry any decision as to its reasonableness, and protests or complaints may be filed after the filing or after the effective date of the tariff, as before. The commission is given power to prevent even the filing of an increased rate if it desires to do so, but it is rather difficult to understand how this represents any real increase in the power it previously possessed to suspend a rate that had been filed or to declare it unlawful, although it might make it rather difficult to secure a review of the commission's action. The commission has issued a notice to all carriers to cover the tariffs that were in transit to the commission at the time of the signing of the bill.

The commission's notice states that the act means "that the approval of a proposed increased rate, fare, charge, or classification must be secured before the tariff containing it is forwarded to the commission for filing," and adds:

"As tariffs are at all times in transit to the commission for filing and in order to avoid unnecessary complications due to invalidation of such schedules, the commission approves, without hearing, such increased rates, fares, charges, or classifications as may be included in tariffs which are forwarded for filing prior to August 15, 1917.

"As to increased rates, fares, charges, or classifications contained in tariffs that are issued or forwarded for filing on or after August 15, 1917, the approval of the commission to the increased rate, fare, charge, or classification must be secured before the tariff is forwarded for filing, and as to all

such tariffs that are issued on or after August 25, 1917, the title page must bear reference to the serial number and date of the commission's approval."

PRIORITY BILL NOW LAW

The President also signed on August 10 the bill authorizing him to direct that such traffic or such shipments of commodities as, in his judgment, may be essential to the national defense and security, shall have preference or priority in transportation, but he has not yet designated the person or persons to issue such directions for him. In adopting the House substitute for the Senate bill Congress omitted the provision which would authorize carriers to enter into agreements for the division of earnings, and also the amendment to the Senate bill proposed by Senator Reed authorizing the Interstate Commerce Commission to order the railroads to acquire equipment.

UNLAWFUL TO LIMIT TRANSPORTATION FACILITIES

The food control bill, passed by Congress last week, in section 4 carries a provision making it unlawful "to conspire, combine, agree or arrange with any other person to limit the facilities for transporting, producing, harvesting, manufacturing, supplying, storing or dealing in any necessities." A number of senators, particularly Senator Hollis of New Hampshire, who often acts as spokesman for the railroad brotherhoods in Congress, opposed very vigorously the idea of including such a provision without some proviso to prevent it from operating against "peaceful" strikes. Senator Hollis wanted it qualified by an amendment stating that "nothing in this act shall be construed to repeal, modify or affect either section 6 or section 20 of the Clayton law," designed to prevent the prosecution of a strike conspiracy under the anti-trust law. Other senators who discussed this provision of the bill asserted that it could not be used to prosecute labor leaders who might order a strike, because the prevention of strikes was not included as one of the purposes of the bill in its preamble.

Just before the bill was passed Senator Husting told the Senate that he was authorized by the Secretary of Labor to say that the administration and the Department of Justice do not construe this provision of the bill as prohibiting strikes and peaceful picketing and will not so construe the bill. Senator Newlands expressed the opinion that a contention might well be made that section 4 does limit and restrain the power to call strikes, but he said that if that was its effect the result would have been secured by indirection because Congress had refused to meet the question squarely by supporting bills he had introduced to prevent strikes of railroad operators contingent upon the creation of a tribunal for the adjustment of differences between employers and employees. The priority bill as passed by Congress contains a provision to prohibit some of the effects of a strike, but the prohibition is directed rather against the obstruction of interstate commerce than against calling a strike, and Senator Hollis in this case secured the adoption of his amendment that nothing in the bill should be construed to modify the effect of sections 6 and 20 of the Clayton law.

BILL TO REGULATE PRICES

While the War Industries Board of the Council of National Defense and the various government departments are wrestling with the question of prices of materials for the government and for the allies, efforts are being made in some quarters to attempt to bring about a reduction in prices to consumers other than the government. Senator Pomerene of Ohio has introduced a bill to provide for regulating the production, sale and distribution of iron ore, iron, steel and other products. It would give the President authority to fix prices for these products not only for the government and the allies, but for the private consumer as well. If prices cannot be agreed upon the President would be given power

to take over the mills and operate them. The President now has power to commandeer such plants for war purposes only.

WAR TAX BILL

In the revised war revenue bill now under consideration in the Senate, which increases the proposed income tax on corporations from 4 per cent, as originally proposed, to 6 per cent, the title of the proposed "excess profits" tax is changed to "war profits" tax. The rates of taxation on the excess of net income over that received in the pre-war years 1911, 1912 and 1913, a graduated scale ranging from 12 to 50 per cent, remain the same as in the Senate bill reported on June 28, but there are several changes in the language. For instance, Section 201 now includes the following: "For the purposes of this title all the trades and business in which a corporation or partnership is engaged shall be deemed to be a single trade or business, and all its income from whatever source derived shall be deemed to be received from such trade or business."

The original bill included provision for an exemption of 6 per cent in the case of corporations whose income was less than that amount during the pre-war period. This is omitted in the revised bill. Instead it is provided in Section 205 that if the Secretary of the Treasury upon complaint finds either that during the pre-war period the net return of any domestic corporation was low as compared with the net return during such period of representative corporations, partnerships and individuals engaged in like or similar trade or business, or that during the pre-war period the ratio between the net and gross income was substantially less than the like ratio in case of representative corporations engaged in similar business, then the war profits shall be the same proportion of the net income received during the calendar year as that of representative corporations engaged in similar business, the proportion to be determined by the Commissioner of Internal Revenue in accordance with regulations prescribed with the approval of the Secretary of the Treasury.

The 10 per cent tax on undistributed surplus is made to apply to the amount remaining undistributed six months after the end of the calendar year, deducting the amount actually invested and employed in the business or retained for employment in the reasonable requirements of the business.

BELGIUM NEEDS RAILWAY SUPPLIES

The special Belgian mission in the United States is understood to have outlined in a tentative way to officials of the United States government plans for securing large quantities of railway supplies and equipment from this country for rehabilitating the railway lines of Belgium at the first opportunity.

NATIONAL ARMY TO MOVE IN SEPTEMBER

Regulations to govern the call to the colors of the 687,000 men that will compose the new national army have been issued by Provost Marshal General Crowder. These call for the transportation first of 30 per cent of the number, or about 200,000, to the various training camps beginning on September 5. The next 30 per cent are to begin entraining on September 15, another 30 per cent on September 30, and the remaining 10 per cent will be mobilized as soon after that date as possible.

LOW FARES FOR BRITISH MUNITION WORKERS.—The Ministry of Munitions announces that, in order to facilitate the transfer of labor to important work, arrangements have now been made whereby working people proceeding to work of national importance on which they have been placed through an employment exchange or the Ministry of Labor will be provided with a railway warrant to enable them to travel at the rate of five-eighths of the ordinary fare in operation before January 1, that is, considerably less than half the present full fares.

SEAMINESS AS A CAUSE OF RAIL FAILURES

H. W. Belnap, chief of the division of safety of the Interstate Commerce Commission, has issued a report of an investigation made by James E. Howard, engineer physicist, of the rail failure occurring on the Pennsylvania Railroad, Sodus Bay branch near Newark, N. Y., on February 16, 1917. The broken rail caused the derailment of a passenger train consisting of a locomotive and two cars traveling at the rate of 35 to 40 miles an hour. The rails were 60-lb. steel rails rolled by the Cambria Steel Company in 1887 and laid the same year. The ties were oak and pine 17 per panel, with tie plates on the pine ties. The broken rail was on the inside of a curve. There were no defects in the wheels

Assembled Fragments of the Broken Rail

or flanges of the derailed equipment to indicate any contributing cause for the accident. An abstract of Mr. Howard's report follows:

The type of fracture was a split head. Failure took place in the receiving half of its length. About three feet of the rail, at its immediate receiving end, remained intact. Beyond this part there was a broken section, 8 ft. 4 in. long, followed by an unbroken section, 18 ft. 8 in. long, completing the length of the rail, 30 ft. The unbroken section was locally bent at the time of the derailment. Forty-eight fragments of the broken section were recovered.

The appearance of some of the recovered fragments assembled in their relative places is shown in the drawing.

The top of the rail showed an increase in width of 0.18 in., as nearly as could be judged when the fragments were put together. This increased width corresponded substantially with the width of opening of the seam in the head, a relation generally found in splithead rails.

Lateral flow of the metal occurred in the shallow zone between the running surface of the head and the upper edge of the seam. The formation of a split head is attributed to the wedge action of the steel in this affected zone, reaching streaked metal, starting an incipient seam where the metal of the head in a crosswise direction is deficient in strength or in ductility, or both. The incipient seam gradually develops in length and in depth until there is complete separation of the head.

Seaminess of the steel was shown on polished and etched sections. Cross-sections of the rail showed these markings as dots and short lines; on a longitudinal section they appeared as streaks. Attention is called to the difference in the formation of these streaks in different parts of the rail. In the upper part of the head and the lower part of the base they are needle shaped, or acicular. In the web and at the junction of the web with the head and the base, these needlelike streaks are converted into seams of considerable width.

The longitudinal streaks are believed to have had a direct influence on the formation of the split head. Examples of split heads have been witnessed in different stages of development, and incipient seams have been found to coincide with and follow the paths of interior streaks. The quest for the primary cause of the presence of streaked metal leads back to the ingot. Efforts to introduce streaks by heat or mechanical means have been unsuccessful. Conversely, their removal by heat or mechanical means has not been accomplished. Sudden quenching of hot steel will cause the formation of thermal cracks, but such cracks are of a different order to the streaks

and seams under consideration. These are present in steel which has cooled slowly.

Mass segregation occurs in the cooling of ingots, shown in the chemical analysis of the metal. There are slag or other nonmetallic inclusions in different parts of the ingot and blowholes are also found. The large reduction in sectional area given the metal of the ingot orients these structural conditions and leads to the formation of longitudinal streaks in the rail. Lengthwise the rail this structural arrangement seldom affects its serviceability. In a crosswise direction, however, the character of the streak becomes an important factor, especially when service stresses approach the limit of endurance of the steel.

The streaks brought to view upon etching with tincture of iodine differ in their characteristics, each variety assuming greater or less importance, depending upon the severity of the service stresses. There are streaks which represent metal enriched in carbon; others in which ferrite predominates. In these streaks the continuity of the metal is not lost. The welding of blowholes may be partial, the efficiency of which in a degree depends upon the composition of the steel. The presence of slag is a barrier against welding and at such inclusions the continuity of the steel is interrupted.

Wheel pressures which cause lateral flow of the metal in the head of the rail differentiate the properties of these streaks. Whenever evidence is presented of permanent flow having taken place, the rail problem has evidently passed beyond the stage in which the elastic limit of the steel is a controlling factor. The rail is practically certain to fail in course of time, under a repetition of these overloads. The life of the rail may be prolonged or its type of failure changed by the elimination of streaks. It is highly desirable that structural soundness be attained as nearly as the art of steel making permits. A margin in strength should be maintained between working loads and the ultimate resistance of the rail in which structural soundness is an essential factor.

A number of rails of different weights and of more recent fabrication were examined in conjunction with the 60-lb. rail which caused the present derailment, and disclosed the prevalence of streakedness in some degree in all of them. A comparison of rails of early fabrication with those of current

Internal Strains in Different Kinds of Rails

manufacture is favorable for those which are being made at the present time.

Measurements were made of the internal strains in the rail which caused the present derailment, also those which were in other rails taken from the track. Service conditions introduce strains into all grades of steel, and of all weights and types of rails. The values of these strains amount to many thousand pounds per square inch, and they are permanently retained in the metal, in wrought iron as well as in steel. An old wrought-iron rail, which was examined, displayed the presence of strains which had probably been locked up in

the metal upward of 40 years. These internal strains may be modified by track conditions, and the state of internal strain of a rail, when properly interpreted, is a reliable index of what occurred in the track preceding the time of the examination.

The failure of the present rail was undoubtedly precipitated by the seamy state of the metal in the head. The steel was of medium hardness in respect to its chemical composition. Wheel loads had not distorted the general shape of the head except at the broken section.

Repeated impulses along different elements of the head, their paths varying according to the lines of contact made by wheels of different contours of treads, had effected a hardening of the surface metal covering a width of two inches.

Internal strains were introduced, amounting to many thousand pounds compression, measured in the direction of the length of the rail. Lateral flow had taken place in the metal next the top of the head, shown at the surface by a flattening of the grains, and necessarily exerting an effect on the interior metal. Under the influence of lateral flow, it is believed that an incipient crack was started in the interior of the head, this effect reaching some line of structural weakness, or place where the continuity was interrupted by a slag or other seam.

A measurable increase in the width of the head, in rails which have otherwise maintained their primitive shape, commonly signifies that a seam is in progress in the interior. Very soft rails may show increase in width without a split head necessarily being in process of development. The detection of a split head in the very earliest stage of its development does not appear feasible. In its more advanced stage the general increase in width of the head, or droop at the under side, or a discolored line along the running surface, are the recognized indications of the presence of a split head. By reason of the difficulties attending the detection of a split head before it has reached an advanced stage, and the possibility of error in judgment in interpreting the significance of the first visible indications, every effort should be made to eliminate the presence of streaks from the steel. The sequence of the passes in the rail mill, in the reduction of the bloom, is shown to be favorable in respect to the modification of the form of the streaks which are located in the different parts of the cross section of the finished rail.

A careful examination of the metal at different stages from the ingot to the finished rail is essential for a thorough exposition of the subject of streaks. Blowholes and shrinkage cavities disappear from view in the early passes of the blooming mill. Slag or other nonmetallic inclusions, found in globular form in the ingot, are drawn into acicular lines in the finished rail. These structural variations are frequently of such an order that the results of chemical analysis do not adequately indicate the state of the metal. Drillings for chemical analysis taken at a streak are so diluted by the surrounding metal that the characteristics of the streak are obscured. If the seaminess is due to an incompletely welded blowhole, structural rather than chemical manifestations should be looked for. Microscopic examination offers a promising method of test in this connection.

All rails are subjected to internal strains, which are not negligible factors, as the magnitude of their values indicates. If it were feasible to furnish rails initially free from internal strains they would not remain so. The cold rolling of the wheels in the track promptly introduces strains at the running surface of the head. No grade of steel has been examined which has resisted this action of the wheels.

In conclusion it appears: That the failure of the rail which led to the present derailment was caused by a split head;

That the split head resulted from a condition of streaked and seamy metal;

That ingot conditions were responsible for this streaky state;

That warning was given of the development of the fracture by a decided increase in the width of the head prior to the time of derailment; and that such warning called for the removal of the rail from the track.

A RAIL AND TIRE CONTOUR RECORDER

A new machine for reproducing an accurate full-size cross-section of a rail head, car wheel or locomotive tire on a card or metal plate has been perfected by B. F. Deuel, Yonkers, N. Y., under the name of the Deuel rail and tire contour recorder.

The device is being used for taking rail sections by the New York Central and is also being tried out for use on tires. It consists of a metal frame on the face of which is attached a hollow frame which slides longitudinally, on which in turn is mounted a plate which moves vertically, both sliding on roller bearings. A T-shaped frame with adjustable points is secured to the plate by pivots and a reproducing shaft, actuated by a spring so arranged that the spring can be removed easily to permit the resharping of the lead or the insertion of a metal point passes through the center of the T-frame. Immediately above this shaft is a device, also operated by a spring, which locks the T-

Front and Back Views of the Device

frame upon the plate to retain any of its arms in an operative position. A grooved slide with a stop at one end insures cards or plates for tires being replaced in the same position when used again. In this way one card can be used for the entire life of a wheel or tire.

The rail base is detachable and is held in place by two clamps supported by springs. No special adjustments are necessary for different weights of rails as the instrument is held in place perpendicular to the rail while in use by clamps supported by springs which engage the under side of the rail. This arrangement permits the instrument to be attached or detached in a very short time. For use on tires the rail base is replaced by an auxiliary base which has two legs, one of which will engage in two punch marks previously made in the tire and which are also used for subsequent sections taken on the same tire. The other leg has a thumb screw which is set in the wear groove or a punch mark and holds the instrument in position on the tire.

After the instrument is attached the card or plate is inserted in the groove and is kept from moving by tightening the thumb nut on the back of the card. One of the side arms of the T-frame is then brought in contact with the side of the rail or tire, first pulling out the locking pin above the reproducing shaft so as to rotate the T-frame to the desired position. The reproducing point is then released by a slight turn of the thumb nut which will permit the point to come in contact with the card or plate. The arm is then moved

downward, keeping it in contact with the rail or tire to the limit of the movement. After this the reproducing point is raised and, by giving it a slight turn, it is held away from the card which the T-frame is being revolved through 90 deg., bringing the center arm to the first point on the rail or tire. The reproducing point is then released as before and the arm moved across the top of the rail or tire. By revolving the T-frame 90 deg. more in the same direction the other side arm in the T-frame is brought into contact with the rail or tire and, after releasing the reproducing point, the instrument is again moved down to the limit, giving a full size reproduction of the rail head, car wheel or tire.

For rails a card or plate about $3\frac{3}{4}$ in. square is required and the record obtained can be transferred to a tracing showing the original section and the worn area can thus be noted. The instrument weighs 6 lb. complete and can be carried in a traveling bag or a 4-in. by 9-in. by 11-in. case.

A SAW FOR RAIL RECLAMATION

The advantage of sawing off the ends of rails released from tracks is becoming generally appreciated by railway officers. Several railroads have adopted the practice and others have the matter under consideration. More attention is being given to the reclamation of second-hand rails in order that the maximum service may be secured from them when relaid, because of the fact that rails on tangent tracks

The High Speed Friction Saw

are taken up largely on account of the characteristic battering of the heads near the ends of the rails and the wearing of the fishing surfaces. The economy of resawing is naturally dependent upon the efficiency with which it can be done.

The friction saw has been practically applied in some industries for about 10 years, but it is only within the last four years that it has been developed for the cutting of rails in reclamation work. In the friction saw the metal is melted or burned away by the heat generated through the friction of the rapidly moving saw blade against the metal of the piece being sawed. It has the advantage of extreme rapidity of action and economy in operation and maintenance. As the saw blades are without teeth they are much cheaper than the regular tooth saw and can be replaced at much smaller expense.

The saw machine shown in the illustration has a toothless blade 46 in. in diameter by $\frac{1}{4}$ in. thick, direct connected to a 45-hp. electric motor. The saw and motor are mounted on a carriage propelled by a second motor of 1 hp. capacity attached to the side of the machine base. Through the movement of this carriage the saw is brought into contact with the rail and caused to follow through as the metal is cut away. When the operation is completed the carriage motor

is reversed and the saw is withdrawn. The entire outfit weighs less than 13,000 lb.

Another advantage of the machine is that the rail can be cut without need of clamping it into fixed position. As shown in the photograph the center line of the saw blade is mounted slightly above the rail section. Consequently the blade itself answers as a sort of automatic clamping device, forcing the rails hard against the retaining clamp attached to the table.

Installations of these saws at railway reclaiming plants include one at the rail mill of the Chicago & North Western at Boone, Ia., and one at the reclaiming shop of the Chicago Great Western at Oelwein, Ia. The saw at the Boone plant has been operated at a cost of \$0.54 per gross ton of rails handled, including the cost of unloading, cutting, drilling, reloading, and removal of the scrap. Rails of 72 lb. section have been cut off in 20 sec. and as many as 354 rails have been sawed in 10 hours. This high speed friction saw is manufactured by Joseph T. Ryerson & Son, Chicago, Ill.

A HEAVY TIE PLATE

The drawing shows the details of a tie plate adopted by the Southern Pacific to secure the full advantage of larger size ties which were made standard on that road about two years ago. These ties are 7 in. by 10 in. by 8 ft. in size, it being the conclusion that this size would be more proportionate to the present day loads.

Prior to the change the standard tie for all service was 7 in. by 9 in. by 8 ft. With the adoption of the larger tie for main lines a 7-in. by 8-in. by 8-ft. tie was made standard for use on branch lines and sidings, these relative sizes conforming more nearly to the comparative service requirements. Eighteen ties are used per 33-ft. panel.

The new tie plate is $9\frac{1}{2}$ in. by 10 in., giving 95 sq. in. of bearing area on the timber as compared with 70 in. with

Details of the Tie Plate

the plate formerly used. This tie plate is $17\frac{1}{32}$ in. thick and has a $\frac{3}{8}$ -in. shoulder. It extends $2\frac{19}{32}$ in. beyond the base of the rail on the shoulder side and $2\frac{9}{32}$ in. beyond the base on the inside. It weighs 12.21 lb. The use of these larger plates has been found to decrease materially the tendency of the rail to "roll out" on curves.

Locomotive No. 1, the First of 680 Consolidations for Service in France. Was Built in 20 Days

U. S. A. War Locomotive Completed in 20 Days

This is the First Unit on Orders for 1064 Locomotives and 8997 Cars for U. S. Service in France

LAST Saturday, just 20 working days after the order was placed, the Baldwin Locomotive Works completed the first locomotive on its order from the United States Government for 150 engines for service with the American troops in France. The contract was received July 18 and was given preference over all other work, either foreign or domestic. Speedy construction was also considerably facilitated by the similarity between these locomotives and the Consolidation locomotives which the Baldwin Locomotive Works have been building for the British War Office, the two locomotives being almost alike except that the American locomotives will have superheaters and the British have not. The Baldwin Locomotive Works is continuing its speedy work on these locomotives and will turn them out at the rate of four a day.

The locomotives are of standard gage; they weigh 166,400 lb. and will have a tractive effort of 35,700 lb. Their cost is said to be about \$43,000 each. The general dimensions follow:

Gage	4 ft. 8½ in.
Cylinders	21 in. by 28 in.
Driving wheels, diameter	56 in.
Total wheel base	23 ft. 8 in.
Driving wheel base	15 ft. 6 in.
Weight, total engine	166,400 lb.
Weight on drivers	150,000 lb.
Tractive effort	35,700 lb.
Boiler, diameter	70 in.
Boiler pressure	190 lb. per sq. in.
Number and diameter of tubes	5¼ in., 26; 2 in., 165
Length of tubes	13 ft. 9 in.
Firebox	122 15/16 in. by 38½ in.
Heating surface, firebox	181 sq. ft.
Heating surface, tubes	1,681 sq. ft.
Heating surface, total	1,862 sq. ft.
Superheating surface	420 sq. ft.
Grate area	32.7 sq. ft.
Tank capacity	5,400 U. S. gal.

The speed with which this first locomotive has been built, however, is only one sign of the aggressiveness being shown relative to equipping the railroad lines which our regiments of railway engineers will build behind the sectors to be held by the American troops in France. The War Department has thus far distributed orders for 150,000 tons of rails. On July 18 it placed orders for 300 large locomotives; early in the present week it ordered no less than 764 more locomotives, this making 1,064 in all, and 6,000 30-ton standard gage and 2,997 narrow or 600 mm. (1 ft. 11½ in.) gage freight cars, all for service with the troops in France.

The standard gage freight car order, as noted elsewhere in this issue, was distributed among five companies as follows:

1,200 low side gondola cars—Pressed Steel Car Company,

1,000 box and 300 tank cars—American Car & Foundry Company.

900 high side gondola and 800 box cars—Standard Steel Car Company.

600 flat and 300 refrigerator cars—Haskell & Barker Car Company.

900 box cars—Pullman Company.

These cars are all two-truck cars of 30-ton capacity, whereas the cars in general use on the railways in France are four-wheel cars of not more than 20-ton capacity.

The narrow gage cars were distributed thus:

500 flat cars and 100 trucks—Pressed Steel Car Company.

166 tank and 700 low side gondola cars—American Car & Foundry Company.

400 low side gondola cars—Ralston Steel Car Company.

400 low side gondola cars—Magor Car Company, and

666 box and 165 gondola cars—Standard Steel Car Company.

The original locomotive order for 300 locomotives was for standard gage 80-ton Consolidation locomotives and was divided evenly between the American Locomotive Company and the Baldwin Locomotive Works. The new order for 764 locomotives placed this week has been given entirely to the Baldwin Locomotive Works, and is especially interesting other than as to its size, because it includes a large amount of narrow gage equipment. The order includes 380 additional standard gage Consolidation locomotives; 195 600-mm. (1 ft. 11½ in.) gage Prairie type locomotives, 126 50-h.p., 600-mm. gage gasoline locomotives, and 63 30-h.p., 600-mm. gage gasoline locomotives. These orders will, of course, have preference over all other business.

Some people are under the impression that the order placed July 18 was the first order for locomotives ever placed by the United States Government. This is not the case. During the Civil War, Brigadier General D. C. McCallum, general manager of the United States Military Railroads in the Military Division of the Mississippi, had to purchase a large number of locomotives and cars for the Federal railways south of Nashville, Tenn. He acted under orders from Secretary of War Stanton, and found the railway supply industry on the job then just as he would find it now. "It is proper and just to state," he wrote, "that the requisitions of this order were met by all in a spirit of zealous patriotism. The manufacturers at once placed all their available force at work upon the engines and cars ordered, which were all completed and delivered in an unprecedented short time."

WAR PRISONERS AS RAILROAD LABORERS

By Our Special European Correspondent.

When the armies of the United States in Europe begin to take prisoners in large numbers, it is not unlikely that they may be shipped to the United States and put to work there to lessen the labor problem created by the mobilization of the troops that captured them. At least this has been the method used so far by all the nations at war. The photograph is a typical picture that may be seen in Italy, in France, in England, or Russia, or any of the Central Empire countries. Here we see a handful of Austrian prisoners, some of the hundred and odd thousand taken by the Italians, at work near the new railroad which is to connect the port of Ostia, Rome's ancient seaport, with modern Rome.

Thanks to these prisoners, work is being done that has been contemplated many years but which is only this year under full headway, and the city of Rome, which for a couple of thousand and more years was connected with the sea, some eighteen miles distant, by a road of stone, will soon have a road of steel. This new railroad is being built for the purpose of converting Ostia into a summer resort for the great mass of Rome's population which is too poor to ride to the more expensive and distant sea resorts.

The handling of prisoners in the beginning of the war was

ALL IS NOT WELL WITH THE GERMAN RAILWAYS

"Germany's weak spots are . . . three—men, transport and Allies,"—the New York Times in a copyright cable despatch quotes a prominent Swiss manufacturer as saying: "The first two are intimately connected. Apart from the never-ending and gigantic drain of the armies, Germany has made colossal efforts to cope with the huge demand for war materials. By concentrating on a standardized pattern of their most useful weapon, the cannon, she has been able to reply to the allied artillery augmentation and still increase the output of other growing necessities, like grenades and machine guns. . . .

"But all this effort has been screwed up to the topmost notch. No further increase is possible, and even to attain that result sacrifices have been imperative. That is where the question of transport becomes important. Not only are the railroads—lines, sleepers, and roadbeds—in bad repair and short of men to operate them, but war material requirements have compelled the Germans to withdraw labor from the manufacture of new rolling stock. Men who have worked on the German railroads tell me they are often forced to put in 36 hours without relief, and with that be incessantly at grips with defective material. Of course, accidents are

Austrian Prisoners Building a Railroad at Ostia, Italy

a problem, at least for the Allies. The Germans and Austrians soon showed the way war prisoners should be handled by putting theirs to work. While the Allies have not resorted to the barbarous treatment of prisoners resorted to by the Central Empires, prisoners are now no longer treated as gentlemen of leisure. They are put to work, though given good food and a small wage to encourage them. Indeed, the majority of the prisoners prefer work to idleness. In Italy the prisoners are given work of the above description or in the fields.

In France prisoners have for two years been employed on the docks, on the repair of railroads, in the fields and in similar occupations.

The English have 58,000 prisoners in England and many more thousands employed with the army in France on railroad reconstruction work.

As many of these prisoners are only too glad to get free of the fighting and as many of them would be only too glad to get to the United States under any conditions, the prisoners of our armies will rejoice, as one might say, in an opportunity to lighten our labor problems.

common. They are increasing and there is no way out of the vicious circle.

"Just one illustration. Last winter Berlin had a coal famine, though Germany is one of the greatest coal producing nations, simply because it was impossible to rush coal trains to the city at the moment when water transport was blocked by ice."

FORMER UNITED STATES VICE CONSUL'S STORY

"Considerable disintegration has taken place in the material organization of Germany as well as in her spiritual organization," says A. Curtis Roth, former United States vice-consul at Plauen, Germany, in an article in the Saturday Evening Post. "The German railroad systems not only have been greatly disorganized by war but have suffered a significant deterioration. It has been impossible to keep the roadbeds in repair, to replace the worn rails and switches, and to renew the rolling stock. The result is, the railroads are no longer the efficient roads they were at the outbreak of the war. The trains now are invariably from one to three or four hours late, and it is impossible to move troops today

on the schedules that prevailed in the early part of the war. This, of course, is a very real factor in the reduction of Germany's military efficiency.

"It has been impossible, too, to keep the great state roads—the Landstrassen—in repair. Those roads, which in former days were the envy of motorists from all parts of the world, are now worn deep with ruts and fretted with hollows. Thousands of Russian and French prisoners have been kept at work upon these roads; but, so heavy have been the traffic requirements of the armies at the front, it has not been possible to keep pace with the amount of repair work necessary.

Superior means for communication has been a prime necessity in German strategy, and it is the deterioration of her state roads and railroads that has, to a great degree, lamed the striking power of her armies.

NEW EQUIPMENT HARD TO OBTAIN

Some extremely interesting figures regarding the operating difficulties of the Prussian railways were recently given in the Journal des Transports of Paris. It appears that at

SAFETY ON THE NORFOLK & WESTERN

The Norfolk & Western has had no train accident within five years in which any passenger was killed; and in this time the number of passengers carried has been about 34 millions. Since May, 1913, when the "safety-first" movement was begun on this road, there has also been a marked improvement in the record of safety of employees, and the progress in this respect is indicated by the diagram showing the increase, or decrease, month by month, in the total number of injuries to employees; and on the same diagram there is shown in the broken line the increase in the volume of freight traffic, measured in ton-miles, during the same time. The lines of the diagram, starting together in May, 1913, were, at the end of last December, 69 per cent apart.

Another record has been made up for the years 1912 to 1916, inclusive, showing the reduction in the number of employees killed on duty, as compared with the volume of freight traffic. Compared with 1912, the increases in traffic, year by year, were, in ton-miles, (1913) 10 per cent, (1914) 5 per cent, (1915) 22 per cent and (1916) 42 per cent; while the employees killed, all causes, as compared with

Injuries to Employees on the Norfolk & Western as Compared with Fluctuation of Business. Percentage Based on May, 1913

the end of 1915, out of 25,176 locomotives, as many as 4,300 were being employed either in allied or invaded territory, while at the same time 30 per cent of the total locomotive stock was undergoing repair. This is said to be due, not to the heavy traffic, but to the bad quality of the materials used, which are largely "substitutes" for those normally employed. New rolling-stock is also being built at a lower rate, due partly to higher prices, and while 27,728 cars were bought in 1915, the total for last year was only 22,267.

Compared with last year, the cost of locomotives has risen by 40 per cent and that of freight cars by 26 per cent, and on the authority of the Secretary of the Essen Chamber of Commerce there will be further increases of 25 and 20 per cent, respectively, on the locomotives and freight cars to be delivered this winter. The same person has also complained that too many railwaymen have been mobilized. The total number called now amounts to 200,000, and while 80,000 women and 20,000 prisoners have partially replaced them, these substitutes are too badly fed to be good employees, and three prisoners are said to do the work of only two ordinary men. Another difficulty is that the more territory occupied by Germany, the more she has been obliged to send her rolling-stock away for long distances, with the result that the increased mileage run decreases the stock available.

1912, decreased 23 per cent, 41 per cent, 41 per cent and 49 per cent. There was a somewhat smaller decrease in the number of employees injured.

A JUDGMENT OF SOLOMON.—A study of what the French call the "divers facts" recorded in the daily press reveals many little incidents and dramas of railway interest. For instance, there is the recent case of the Birmingham soldier's wife, who, when fined at Willesden for traveling on the London & North Western Railway with intent to defraud, informed the magistrate that she had never been in a train before. We can easily understand the magistrate's incredulity. However, he had an easier task than the judge who was lately asked to award \$2000 damages against the Bavarian State Railways in respect of "loss of beauty" by a 17-year-old governess. Plaintiff's face had suffered contact with a carriage door, causing the loss of several teeth and other blemishes, and she therefore sought to convince the court, not only that she was not pretty, but that her chances of marriage were diminished. After a lengthy hearing, and evidence by "three expert connoisseurs of female beauty," the young woman was awarded her \$2000, plus a monthly solatium of \$50 until she married, in which event her "diminished eligibility" would cease to have any but an academic interest.—*Railway Gazette, London.*

General News Department

The Santa Fe has addressed a circular letter to employees who have to do with the handling of freight traffic, urging them to put forth every effort to conserve freight equipment and prevent loss of and damage to freight shipments.

The Union Pacific has issued a booklet containing information of interest to those who have relatives who have been called to the colors. The booklet gives answers to more than a thousand questions regarding the location of the new army training camps and other matter concerning the various branches of the service.

The lumber committee of the Council of National Defense has reported that, with a slight improvement in the supply of empty cars being furnished to the sawmills getting out lumber for the cantonments and camps, a better movement resulted. Up to August 4, of the 12,220 cars originally ordered for the cantonments, 11,675 cars, or 95.45 per cent, had been shipped.

To facilitate the transportation of laborers employed at the Great Lakes Naval Training Station, Great Lakes, Ill., the Chicago & North Western is running three special trains to the camp each morning and three returning in the evening. The company transports approximately 3,000 skilled and unskilled laborers, bricklayers, carpenters, etc., to and from the station each day.

The Indiana committee on information for the Railroads' War Board has announced the following officers: H. F. Houghton, general agent of the Cleveland, Cincinnati, Chicago & St. Louis, chairman; Joseph F. Hall, general passenger agent of the Lake Erie & Western, and J. H. Baumgartner, publicity agent of the Baltimore & Ohio Southwestern, members of the executive committee.

The State Public Service Commission of Washington has adopted a resolution setting forth that in its opinion the erection of new stations and the elimination of grade crossings is work that can be deferred until after the war, or for some time at least. In the resolution the commission also favors the curtailment of passenger service so that the men and money may be used in other lines.

A section gang of women has just been put to work on the main line of the Lehigh Valley. Nine women, working under the direction of an experienced foreman, comprise the gang, which operates on the west end of the Buffalo division near this city. The women are performing all the regular duties of similar gangs of men, tightening bolts, putting in new ties, and tamping ballast. Pneumatic ballast tampers are used by the Lehigh Valley.

The American Defense Society has asked the railroads of the country to run "food instruction" trains to aid the movement for the conservation of food. Letters have also been sent to the mayors of various cities and the heads of the state councils of defense in various states urging them to take up the question with the railroads in their home territory. It is pointed out in the letter that extraordinary success has resulted from a similar movement by the Long Island. Each train, according to the plan, would be manned by speakers and demonstrators working under the state and local committees in co-operation with the railroads.

Officials of the Pennsylvania Lines West at Ft. Wayne, Ind., have felt that, due to the shortage of common labor, it might be necessary for them to endeavor to use women for light labor, and also on the light machine tools and such other work as they may be expected to handle. No facilities have been provided as yet to make possible the employment of women, but the road proposes to install the necessary toilets and rest-rooms at once, so that they will be ready should the emergency arise. No steps have been taken for the adoption of a standard uniform for women, such as the Pennsylvania Lines East of Pittsburgh are now supplying their women workers.

The Interstate Commerce Commission has issued a supplement to its rules governing the classification of steam railway

employees, providing that until further order, railways may be relieved from the requirement of recording and reporting the number of hours on duty of the following classes of employees: M. W. & S. foremen, section foremen, gang and other foremen—M. E. department, electricians, employees in outside agencies, other traffic employees, crossing flagmen and gatemen, draw-bridge operators, other transportation employees, and all other employees. Instead they may record and report the number of days served by these classes of employees.

Attorney General McGhee and the State Public Utilities Commission of Ohio have been investigating reports that the Toledo & Ohio Central and the Hocking Valley have been selling coal cars to the Canadian government. The Attorney General has stated that he is ready to take action to prevent any cars owned by Ohio railroads from being sold for use in another state or country, inasmuch as the railroads, in their demand to the Public Utilities Commission for authority to increase freight rates, have urged as a reason for such increases the need of getting more money with which to get additional rolling stock. The Hocking Valley has denied that the company sold any cars recently, and stated that the last sale of cars made was over three years ago.

The Missouri Pacific has sent out a card addressed to its patrons, officers and employees, thanking them for their co-operation in helping to reduce the car shortage by loading cars to capacity, and moving and releasing them promptly. An appeal is made for still greater co-operation, and it is pointed out that two tons more in each car would equal 200,000 more cars. The company asks any persons having suggestions on the subject to send them to the road's officers, who will be very glad to receive them. On the reverse side of the card there is an illustration of a freight car and a copy of a poem entitled "Who Am I," reproduced from the St. Louis Furniture News. The poem deals with the greatly increased importance of the freight car, and contains an appeal to speed up the handling of the cars.

President Earling of the Chicago, Milwaukee & St. Paul has issued an appeal to the loyalty and patriotism of the employees of the company to "do his or her utmost to render the maximum of service, in not only promoting operating efficiency, but also in promoting military efficiency and bringing nearer the dawn of peace." The appeal calls upon all men who are handling the trains to reduce the consumption of coal, fuel, oil or lubricating oil; to avoid delays in stations and promote the prompt and careful handling of passengers and baggage. It calls upon the yard crews to increase the number of cars handled, and to reduce the damage to cars; station agents are urged to reduce the detention of cars and secure increased loading thereof. Detailed suggestions as to the best means of accomplishing results will be put forth by the officers of the company in charge of the several departments.

Thirty-four Dead in Italian Wreck

Press despatches report that 34 persons were killed and 100 injured in the derailing of the Genoa-Milan express at Arquata on August 6.

Highway Crossing Gates Ordered Closed After Midnight

After August 22 the late returning automobilist will have to wake the crossing watchman before he can cross a railroad track inside the limits of New York City. The New York Public Service for the First district has adopted an order directing the New York Central, the Long Island and the Staten Island Rapid Transit to keep the gates at 145 highway crossings closed between midnight and 5 a. m. as a measure of protection to vehicle traffic. The order will take effect on August 22, and was favored by the railroads and the city police department. It was brought out at the hearings that it had been found extremely difficult to keep the crossing watchmen awake and on the job.

19 Killed and 50 Injured in Trolley Accident

Nineteen people were killed, including one who died the following day, and between 40 and 50 injured, when two electric cars collided head on, late the afternoon of August 13, at North Branford, twelve miles east of New Haven on the Shore Line Electric Railway. Both cars were crowded. The accident was probably caused by the crew of the westbound car which, according to orders, should have waited on a siding less than a half-mile from the spot where the accident occurred. Instead it kept on, the crew for some unexplained reason planning to reach the next switch. It later developed also that the dead man's handle on the westbound car had been fastened down so that it would be inoperative. The motorman and conductor of the westbound car escaped injury, but the motorman of the eastbound car was killed. Approaching a sharp curve the car crashed into the eastbound car from New Haven. The force of the impact telescoped the cars fully half their length.

Discontinue the Valuation!

There has long been a question in many minds as to the practical wisdom of the valuation of the railroads by the government. The task will require so long a time that values are certain to be materially altered before the great task is completed. . . . Now that nine regiments of railway engineers are to be sent to France, why not abandon the valuation of American railroads for the period of the war? Railway employees of the highest character, experience and skill have been commandeered, as it were, for the government valuation. These are just the type of men needed for the rehabilitation of the French railways. This nation can't afford to send tyros to do the work in our sister republic. We must send the best we have. Why not divert the amount appropriated by Congress for valuation to the equipment and maintenance of engineer regiments?—*Cincinnati Enquirer*.

New York Commission Will Originate Legislation

The New York Public Service Commission for the First district has announced a plan for "drafting legislation in the open." The law under which it was created explicitly authorizes the commission to recommend legislation as to corporations and matters within its jurisdiction, and provides that the commission may hold hearings and take testimony in respect to any matter of legislation. This method the commission proposes to apply to the formulation of future legislation amending the public service commission's law, the railroad law, the transportation corporation's law and other statutes affecting public service corporations and their rates and service. Corporations will be invited to submit their legislative proposals in advance for scrutiny. Individuals interested in the perfecting of legislation will be also invited to follow the same course. Every company under the jurisdiction of the commission has been invited to participate, and hearings will begin on Wednesday, August 15, 1917.

Privilege vs. Right as Applied to Passes

The Erie has joined those roads who are asking their employees traveling on passes not to hold their seats while paying passengers are standing. "An employee using a pass," says the notice to the Erie employees, "is enjoying a privilege of transportation. A passenger holding a ticket has paid for a right of transportation, which must be regarded as in every way superior.

"Under war conditions trains will, at times, unavoidably be crowded. It may not always be possible to give every passenger a seat, but certainly none should stand while railroad employees of either sex, holding passes, are seated. The obligation of an employee in such a case is plain and rests upon the principles of courtesy and right.

"The success of the railroads in coping with the great burdens which the war is laying upon them depends very largely upon their ability to retain the confidence and win the co-operation of the public.

"Every employee who shows courtesy and consideration helps toward this end; every one who fails in these respects hinders it.

"Here is a chance to help!"

The Pennsylvania's Frank Thomson Scholarships

John Morrow Daniels, of Freeport, Pa., and Eugene F. Dawson, of Columbus, Ohio, have been awarded the Frank Thomson scholarships for 1917.

Mr. Daniels, who was awarded the scholarship for the Lines East, is 20 years old, and has been a student at Kiskiminetas Springs School, Saltsburg, Pa. He will enter the University of Pennsylvania next fall, in the engineering department. He is the son of J. J. Daniels, assistant trainmaster, Conemaugh division, Freeport, Pa.

Mr. Dawson, the recipient of the Lines West scholarship, is 21 years old, and is a graduate of the North High School, Columbus, Ohio. He intends to enter the engineering department of the Ohio State University. He is the son of William E. Dawson, passenger car builder, Pennsylvania Lines' Shops, Columbus, Ohio.

The Frank Thomson scholarships were established in 1907 by the children of the late Frank Thomson, formerly president of the Pennsylvania Railroad, as a memorial to their father. The purpose of the scholarships is to enable sons of living or deceased employees of the Pennsylvania System to obtain technical educations, and so fit themselves for the service of the railroad. Two scholarships are awarded each year, upon competitive examinations; one goes to a son of an employee of the Lines West, and the other to a son of an employee of the Lines East of Pittsburgh.

Carry Home Your Purchases

Governor Whitman of New York has issued a proclamation to the people of that state in which he says:

"Men are needed for productive labor. They must be reserved for such work and not drawn therefrom to do non-essentials. If you will show due consideration, your dealer will be able to supply men for productive fields, instead of withdrawing them therefrom. The needless delivery work that you put upon stores means an unnecessary drain on the country's man power.

"At the request of the Editorial Conference, representing the leading business newspapers, I desire to point out that every shopper can be patriotic in five ways:

- "By carrying parcels home whenever possible;
- "Accept without complaint less prompt deliveries in war time;
- "Do not demand special deliveries;
- "Avoid having goods sent home unless you are sure you are going to keep them;
- "Bring back to the store such goods as are portable when return cannot be avoided.

"The stores will give you the best service in their power, but both the stores and the public must do their duty to the country.

"As governor of the state of New York, I ask the public to do these things for the welfare of our country during the war."

The *Railway Age Gazette* and the other papers published by the Simmons-Boardman Publishing Company are members of the Editorial Conference mentioned in the proclamation.

One Way to Save Meat

President Harrison, of the Southern Railway System, has issued a statement calling attention to the fact that one of the ways in which a very substantial saving of our meat resources may be made is through reducing the number of animals killed on railroad tracks. On the railroads of the United States many thousands of cattle and hogs are killed every year, and as those killed in this way are not used for food, this loss results in a correspondingly large decrease in our available meat supply.

"The responsibility for this loss rests primarily on the owner of the animals who allow them to stray on the railroad right of way," says Mr. Harrison. "When they are killed the law places the responsibility on the railroad and the owner suffers no direct pecuniary loss. There is, however, in addition to the serious reduction of the meat supply of the country, a further economic loss through the payment by the railroad of money, which is urgently needed at this time for increasing the transportation facilities of the country, the lack of which for the movement of his products to market may cause a loss to the farmer greater than the amount he received for the animals killed on the rail-

road. The extent of this loss may be indicated by the fact that the Southern Railway System alone paid out in the 12 months ended June 30, 1917, more than \$200,000 for animals killed on the right of way. This sum, even at the present high prices of equipment, would be sufficient to buy more than 100 standard box cars capable of handling at a single load more than 3,000 tons of freight, and the constant use of these many additional cars would tend to the relief of the present war-time congestion of traffic. Is it not the patriotic duty of every farmer to keep his live stock away from the railroad tracks?"

General Agent J. S. Rockwell, of the Buffalo, Rochester & Pittsburgh, speaking along the same line, says that, "In the face of a threatened food shortage, it becomes more than ever important that farmers along the railroad tracks should keep their gates closed to prevent live stock from straying out on the tracks and being struck by the first train that comes along. Cattle killed in this manner are usually rendered unfit for food, and the result is a total loss as far as helping feed the nation and winning the war is concerned. On a recent inspection, an officer of the Buffalo, Rochester & Pittsburgh observed that 33 out of 82 gates on the Buffalo & Rochester divisions had been left open. Carelessness in not closing gates renders useless all precautions and safeguards placed to keep animals off the tracks, and results in large numbers of them being killed yearly.

"It can be said without prejudice, if the fences maintained by the property owners were kept in as good a state of repair as are the right of way fences maintained by the railway companies, one of the frequent causes of cattle getting on the track would be eliminated to a considerable degree. It often happens that cattle placed in a field where a railroad company's fence is perfectly secure and the gate closed, will wander into the adjoining pasture through the poor fence between, and then, because the gate to that field has been left open, the animals finally get onto the tracks and frequently are killed."

Department of Commerce Urges Use of Waterways

Secretary Redfield of the Department of Commerce has issued a statement calling attention to the importance of making use of navigable waterways in every manner possible to the end of lessening the burden of traffic upon our railroads, because the latter are now carrying a volume of tonnage unparalleled in history, and further imperative demands are going to be made upon them.

"Not only is it patriotic in communities and individuals to endeavor to lessen pressure upon our railroads," the secretary said, "but it is economic common sense. Our waterways are a tremendous asset which each community can realize on largely. This can be done in the main, at small expense; and in this work the Department of Commerce and the Shipping Board stand ready to aid wherever possible. The wisdom of preparing now will be demonstrated later; and that municipality or district, foresighted enough to take steps to use these water highways, will reap abundant substantial benefits, aside from the merit of having co-operated with the efforts being made to lessen the burdens on the railroads. This latter is no less than a patriotic duty.

"According to a report by the Storage Committee of the General Munitions Board, in certain of the belligerent countries in Europe, the railroads are available for general commercial traffic only one day in seven. This is an indication of what may, in some measure, be expected here when we get into the full swing of this war work. By diverting all unnecessary burdens, in the utilization of our abundant waterways, we should be in vastly better position, and commerce generally should not feel the lack of transportation, inevitable if these waterways are not made use of. The government will thus be facilitated in its colossal task of moving enormous numbers of men, enormous amounts of necessary equipment, baggage, horses, stores, material, munitions, foodstuffs and freight for export.

"The Department of Commerce is endeavoring to help these waterside communities make use of the means at hand. Its work is handicapped to some extent at present by lack of force and facilities; however, Congress has been asked for a small appropriation in order that this assistance may be carried forward energetically. Doubtless the funds will be allowed, as no more important piece of interior development work of a creative nature can at this time be seen. Meanwhile, any community interested, or individuals or groups of individuals, with plans for

using inland waterways are requested to write the particulars to the Department of Commerce, and wherever possible, hearty and energetic co-operation and assistance will be rendered."

Increased Efficiency in Car Loading

A report made public by the Chicago, Burlington & Quincy shows that that system has effected an increase of 28 per cent in average tons per loaded car for the month of June, 1917, compared with June, 1916. The road handled an average of 29.38 tons per car in June, 1917, and 22.98 tons per car in June, 1916, an increase of 6.4 tons per car. This increase in average loading represents a saving of 46,622 cars for the month.

H. E. Byram, vice-president, in charge of operation, in commenting upon the figures says that "the increase in car efficiency has not been due entirely to the efforts of the Burlington's management and its employees, but a large part of the credit for the increased loading of cars is due to the co-operation on the part of the shippers along the line. To a remarkable degree our shippers have exhibited a sense of appreciation of what the Burlington, in common with other systems, is attempting to do in furnishing the greatest possible volume of transportation with the amount of equipment that is available. The practical effect of this co-operation is clearly shown by the large number of cars made available for other purposes as a result of loading cars more nearly to capacity."

This same spirit of co-operation appears to have developed generally in the last few months throughout the United States, though not always to the same extent as shown by the Burlington's record. Reports from roads having a mileage of 173,000 miles, and handling about 80 per cent of the total traffic, show an average of 25.8 tons per loaded car in May, 1916, and of 27.2 tons in May, 1917, an increase of 1.4 tons per car, or 5.4 per cent. In the eastern and southern districts the average increase for the same period was 1.5 tons, or 5.5 per cent, and in the western district there was the same increase in tons per car, but the per cent of increase was 6.4. Many individual roads in central territory have made good records in April, 1917, compared with April, 1916. The Chicago & Eastern Illinois increased its tonnage per loaded car from 25.5 tons to 31.4 tons, or 23.1 per cent; the Lake Erie & Western from 18.7 tons to 23.6 tons, or 26 per cent; the Chicago & Alton from 21.6 tons to 26.3 tons, or 21.8 per cent; the Chicago & Erie from 23.3 tons to 26.2 tons, or 12.4 per cent; the Atchison, Topeka & Santa Fe from 19 tons to 21.3 tons, or 12.1 per cent.

It is evident that the spirit of co-operation on the part of the railroads and shippers, which has been so strongly urged by the Railroad's War Board, is producing a beneficial effect in securing the loading of cars to capacity, and thereby accomplishing the same results that would follow the placing of many thousands of additional cars in service, without the additional congestion that more cars in service might produce.

Efforts to Increase Coal Shipments to Northwest

Representatives of coal operators, all dock companies on Lake Michigan and Lake Superior, the railroads, and the Interstate Commerce Commission held a conference at Washington on August 14, at the call of F. S. Peabody, chairman of the committee on coal production of the Council of National Defense, to consider ways of meeting the urgent necessity of increasing shipments of coal via the lakes to the northwest. It was estimated that it would be necessary to ship a total of 29,000,000 tons of soft coal from Lake Erie ports during the season of navigation, whereas only 12,000,000 tons had been moved up to August 11, leaving 17,000,000 tons to be shipped in the 16 weeks remaining before navigation closes, or an average of 1,062,000 tons a week. Shipments to date have averaged only 940,000 tons a week.

After an all day discussion as to the reasons for the condition, and as to how the situation could be remedied in order to avoid a fuel famine this winter, resolutions were adopted expressing the sense of the meeting that unless peremptory orders are issued from some authoritative source to all coal operators in the Pittsburgh, Fairmont and No. 8, Ohio, districts that they must ship 50 per cent of the cars (except cars for railroad fuel) furnished to their mines daily to Lake Erie ports for transshipment to the northwest until further notice, or until the present emergency is met, the situation in the northwest next winter will amount to a calamity. This resolution was referred to

Daniel Willard, chairman of the advisory commission of the Council of National Defense; the members of the Division of Car Service of the Interstate Commerce Commission, and C. M. Scheaffer, chairman of the Commission on Car Service, who were present, to attempt to secure the necessary authority. It was the thought of those present that a priority order to be issued under the authority given to the President in the priority bill, which has just become a law, would meet the situation. The resolution also suggested that the method of car distribution now applied to railroad fuel coal should be adopted.

There was considerable discussion as to whether the reason for the shortage of shipments to the northwest was caused by car shortage or by a preference on the part of coal operators to ship elsewhere. It was stated that railroad shipments placed in vessels on Lake Erie ports up to August 1 of this year had amounted to about 11,000,000 tons, as compared with 13,000,000 tons for the same period last year, the shortage being caused by the fact that the season of navigation began late this year. It was also shown that a considerable amount of coal had been shipped into Canada. The Railroads' War Board had recently requested the coal operators to use 50 per cent of their car supply for shipments to the lake ports, but this measure had proved ineffective because there was no authority to enforce the request on the shippers. It was declared that the situation in the northwest presents the most immediate pressing necessity, and should be given first consideration because other districts may be taken care of after the season of navigation by rail shipments. The New England situation was to be taken up at a similar meeting later.

Signal Appliance Association Meeting

It has been the practice for years to hold the annual meeting of the Signal Appliance Association at the same time and place as the annual meeting of the Railway Signal Association, but in order to co-operate fully with the latter body this year, the annual meeting was held at the Hotel McAlpin, New York, N. Y., on August 10. The R. S. A. annual meeting at Atlantic City next month will, on account of war conditions, be confined to a two days' business session, all forms of entertainment having been eliminated.

Secretary-Treasurer Edmunds reported an active membership of 52 companies; and that the association purchased last June a \$1,000 Liberty bond. Further action was taken authorizing the purchase of an additional \$500 bond in the next Liberty Loan.

At the meeting a resolution relating to official attendance was offered and unanimously adopted, to the effect that "this association shall have no official representation at Atlantic City during the time of the annual meeting of the Railway Signal Association, September 18 and 19, 1917."

While this resolution refers to "official representation" only, the spirit and practice of that resolution rightfully construed should prevent all attendance by railway supply men on their own individual responsibility. It is certain that none of the many representatives interviewed by this publication will attend the convention. The only justification for any representative is for those engineers who have been actively participating in committee discussions be on hand to discuss the subject when it is presented on the floor of the convention. The Signal Appliance Association expressly desired the full co-operation of its members in this respect.

The new officers of the association are: W. T. Kyle, Page Woven Wire Fence Company, chairman; George C. Isbester, Rail Joint Company, vice-chairman; F. W. Edmunds, Dressel Railway Lamp Works, secretary-treasurer. Mr. Isbester was continued as vice-chairman this year on account of his now being the paymaster in the United States Army. New members of the executive committee are: Sidney Johnson, General Railway Signal Company; H. G. Thompson, Edison Storage Battery Company; A. S. Anderson, Adams & Westlake Company; and C. F. Massey, C. F. Massey & Co.

Chairman Kyle has appointed the following arrangement committee: J. Warren Young, chairman, Kerite Insulated Wire & Cable Company; J. W. White, General Railway Signal Company; J. F. Lepreau, Thomas A. Edison, Inc.; A. S. Anderson, Adams & Westlake Company; W. R. Young, General Railway Signal Company. Place committee: Henry Lee, chairman, Railway Signal Engineer, and G. A. Blackmore, Union Switch & Signal Company.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings and places of meeting of those associations which will meet during the next three months. It is published only in the first issue of the Railway Age Gazette for each month.

- AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York. Next meeting, October 16-17, St. Louis.
- AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lighty, C. & N. W., Chicago. Next convention, October 16-18, 1917, Chicago.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.
- ASSOCIATION OF AMERICAN RAILWAY ACCOUNTING OFFICERS.—E. R. Woodson, Rooms 1116-8 Woodward Bldg., Washington, D. C. Next meeting, September 26, Congress Hotel, Chicago.
- ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—W. L. Connelly, Supt. of Telegraph, Indiana Harbor Belt, Gibson, Ind. Next annual meeting to have been held September 18, 1917, Washington, D. C., indefinitely postponed.
- CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.
- CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.
- CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual dinner, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.
- CHIEF INTERCHANGING CAR INSPECTORS AND CAR FOREMEN'S ASSOCIATION.—W. R. McDunn, New York Central, Albany, N. Y. Next convention, September, 1917, St. Louis.
- CINCINNATI RAILWAY CLUB.—H. Boutet, Chief Interchange Inspector, C'n'ty Rys., 101 Carey Bldg., Cincinnati. Regular meetings, 2d Tuesday, February, May, September and November, Hotel Sinton, Cincinnati.
- ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 568 Union Arcade Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh, Pa.
- GENERAL SUPERINTENDENTS OF CHICAGO.—A. M. Hanter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.
- INVESTMENT BANKERS' ASSOCIATION OF AMERICA.—Frederick R. Fenton, 11 W. Monroe St., Chicago. Annual convention, October 1-3, 1917, Baltimore, Md.
- MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—F. W. Harget, Fort Worth & Denver City, Fort Worth, Tex. Next convention, October 16-18, 1917, Cleveland, Ohio.
- MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—A. P. Dane, B. & M., Reading, Mass. Next annual meeting, September 11, Chicago.
- NATIONAL ASSOCIATION OF RAILWAY COMMISSIONERS.—Jas. B. Walker, 120 Broadway, New York City. Next annual convention, October 16, 1917, Washington, D. C.
- NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meeting, 2d Tuesday in month, except June, July, August, September, Boston.
- NEW YORK RAILROAD CLUB.—Hart D. Vought, 95 Liberty St., New York. Regular meeting, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.
- NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—Geo. A. J. Hochrehe, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.
- PACIFIC RAILWAY CLUB.—W. S. Wolfner, Assistant to Chief Engineer, Northwestern Pacific R. R., San Francisco, Cal.
- PEORIA ASSOCIATION OF RAILROAD OFFICERS.—C. Stewart, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.
- RAILROAD CLUB OF KANSAS CITY.—Claude Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Saturday in month, Kansas City.
- RAILWAY CLUB OF PITTSBURGH.—J. R. Anderson, Room 207, P. R. R. Bldg., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Pittsburgh Commercial Club Rooms, Colonial Annex Hotel, Pittsburgh.
- RAILWAY FIRE PROTECTION ASSOCIATION.—C. B. Edwards, office of the president's assistant, Seaboard Air Line, Norfolk, Va. Next meeting, October 2-4, 1917, St. Louis, Mo.
- RAILWAY REAL ESTATE ASSOCIATION.—R. H. Morrison, Assistant Engineer, C. & O., Richmond, Va. Next convention, October, 1917, Duluth, Minn.
- RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Myers Bldg., Bethlehem, Pa. Next annual convention, September 18-19, 1917, Hotel Traymore, Atlantic City, N. J.
- RICHMOND RAILROAD CLUB.—P. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.
- ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—P. J. McAndrews, C. & N. W., 400 Building, Ill. Next annual convention, September 18-21, 1917, Hotel Auditorium, Chicago.
- ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.
- SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.
- SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grand Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 m. Piedmont Hotel, Atlanta.
- TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.
- TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 201 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Waldorf-Astoria Hotel, New York.
- TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Gen'l Mgt. Erie R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings bi-monthly, Pittsburgh.
- UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, 1114 Newhouse Bldg., Salt Lake City. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.
- WESTERN CANADA RAILWAY CLUB.—I. Koo, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.
- WESTERN RAILROAD CLUB.—W. T. Wynn, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Monday in month, except June, July and August, Hotel Sherman, Chicago.

MONTHS OF CALENDAR YEAR, 1917

INCOMES AND EXPENSES OF RAILWAYS

Name of road.	Average mileage operated during period.	Operating revenues—			Maintenance of—		Operating expenses—			Net railway operation.	Railway tax accs.	Operating income (or loss).	Increase comp. with last year.
		Freight.	Passenger.	Total.	Way and structures.	Equip-ment.	Traffic.	Trans- portation.	Miscel- laneous.

Traffic News

In order to prevent a threatened fuel famine in Utah and Idaho, the railroads entering Utah have agreed to divert cars to the coal mines.

The receivers of the Tennessee Central announce that on request of the War Board they have discontinued the operation of four week-day passenger trains, making a reduction of 180 train miles per day.

A joint session of the public utilities boards of Ohio, Illinois and Indiana has been called for August 23, at Indianapolis, Ind., to consider the request of the railroads for an increase of 15 cents a ton in intrastate rates on coal and coke.

The New York Central has withdrawn passenger tariffs filed with the New York Public Service Commission, proposing increases in rates between points in New York state. As noted in last week's issue, the commission for the first district suspended the tariffs from September 1 to September 20, and had planned to hold hearings on August 15.

The State Railroad Commission of Iowa has announced that the hearing of the shippers' side of the railroad petition for a 15 per cent increase in the intrastate freight rate on coal and coal products will be held on Tuesday, August 14, at Des Moines, Iowa. The case of the railroads petitioning for the increase was heard by the commission on August 2. All roads operating in Iowa were represented at the hearing.

Bryan Snyder, receiver of the Marshall & East Texas, announces that after August 14 that road will accept no freight or passengers for transportation over that portion of the line from West Marshall, Tex., westward to Winnboro, 72 miles. This action is taken pursuant to a decree of the United States District Court issued July 17. This order leaves in operation that portion of the road from West Marshall, eastward, 19 miles, to Elysian Fields.

The State Railroad and Warehouse Commission of Minnesota has undertaken a special inquiry into the freight car situation, with a view to sending out a special appeal to railroads and shippers, and attempting to avert shortages as much as possible. The commission points out that there are indications that the federal officials will use the government authority to designate car preferences for the prompt movement of military equipment, grain and other similar shipments, and that such a condition will aggravate the present situation.

The Pere Marquette, in order to promote the conservation of cars and to expedite the handling of l. c. l. business, has adopted a "sailing-day" plan at Chicago, to go into effect on August 15. The schedule of the company is as follows: Mondays and Thursdays, Big Rapids, Mich.; Harbor Beach, Lake View, Midland, Manistee, Mt. Pleasant and Newaygo; Tuesdays and Fridays, Elkton, Freepoint, Ionia, Lake Odessa, Sparta, White Cloud and Laporte; Wednesdays and Saturdays, Belding, Toledo, Baldwin, Saginaw, Weidman, Portland and Alma. The road will continue daily l. c. l. service to Grand Rapids, Flint, North Flint and Detroit.

A conference between the Chicago sub-committee of the Railroads' War Board and the Chicago regional committee of the National Industrial Traffic League, was held at Chicago on August 10. H. E. Byram, vice-president of the Burlington, is chairman of the sub-committee, and C. I. Forsyth is vice-chairman. F. B. Montgomery, vice-president of the International Harvester Company, is chairman of the Chicago regional committee of the National Industrial Traffic League, and Robert C. Ross, traffic manager of the Ryerson Company, is vice-chairman. The league committee represents all the large shipping interests of the Chicago district. Plans were adopted at the meeting for complete co-operation between the railways and the shipping interests, and the committee aims to secure the utmost efficiency in the use of railway equipment moving within, into and out of the Chicago district.

The Chicago sub-committee of the War Board will meet every Tuesday morning, and an arrangement has been made under which the regional committee of the National Industrial Traffic League will always have representatives to meet with it. The

committee of the Industrial Traffic League will meet regularly probably once every fortnight, and these meetings will be attended by representatives of the railroads. The subjects discussed at the last meeting were those of earlier closing of freight houses; sailing-days for package freight cars; the pooling of box cars in the Chicago switching district and increases in the minimum weight of trap and ferry cars. No action was taken on any of these subjects, but they will be taken up for definite action at later conferences.

"Buy an Upper Berth—You'll Like It"

Western roads have adopted this slogan as a war measure intended to avoid the necessity of hauling two half loaded cars instead of one filled to capacity. The lines point out that necessity demands the full use of every bit of railroad equipment in the country, and that the upper berth is just as desirable; in fact more so than the lower. The arguments put forward in favor of using an upper, are that the upper berth is 20 per cent less expensive, the ventilation is excellent, the berth is further removed from the noise of the wheels, and he is out of the way of people moving up and down the aisles. The Pullman Company is supplying new upper steps and individual curtains, which are designed to make the upper berth more attractive.

Louisiana Roads Ordered to Increase Equipment

By an order of the Louisiana Railroad Commission dated July 26 the railroads of Louisiana must secure additional open top cars for shippers in that state.

On March 21, on account of numerous complaints, the commission declared that in its opinion, the railroads of the state were not furnishing sufficient freight equipment to handle the traffic properly and promptly at all seasons of the year, and decided to enter into an investigation. In accordance with the terms of the order a full investigation was made at a session at Baton Rouge, La., on July 16 and 19. It developed at this hearing that the shippers of the state were undergoing severe hardships, and that large industries were about to close on account of the failure to receive proper equipment for transporting their products. The commission decided that in its opinion arrangements can be made by the carriers to place in service more equipment in the shape of open top cars, and that this should be done without delay. By the order of the commission the Texas & Pacific, Morgan's Louisiana & Texas, the New Orleans, Texas & Mexico, the Missouri Pacific and the Louisiana Western, must each secure within 90 days from the date of the order 200 additional open top cars to be placed in service for the transportation of intrastate freight. The Chicago, Rock Island & Pacific, the Louisiana & Arkansas, and the Vicksburg, Shreveport & Pacific, must in the same period secure 100 additional open top cars each.

Car Shortage Again Reduced

Reports just received by the Railroads' War Board show that the railroads of the country, in their co-operative efforts to give to the country the greatest possible amount of freight service, have effected an extraordinary improvement in freight car supply. The excess of unfilled car requisitions over idle cars, or what is ordinarily but inaccurately termed "car shortage," was less than one-fourth as great on August 1, 1917, as on May 1, 1917. The excess of unfilled car requisitions on May 1 was 148,627; on June 1 it was 106,649; on July 1 it was 77,682, and on August 1 it had been reduced to 33,776.

This result has been accomplished at a time when the railroads are supplying from 15 to 20 per cent more freight service with the same number of cars than was being given this time last year, for the railroads handled in July a tremendous increase in both government and commercial traffic. The movement of cantonment supplies alone occupied the full services of more than 30,000 cars. There was also an extraordinarily heavy demand for cars to transport food products, as well as materials to and from munition factories.

"The result above achieved has been accomplished by co-operation with the railroads of shippers, regulating bodies and the public generally," says Chairman Harrison of the Railroad War Board. "This co-operation has made possible the intensive loading of freight cars, prompt unloading, the elimination of a large amount of unnecessary passenger train service, and an opportunity generally to utilize the railroad plant efficiently.

The aim of the railroads at the present time is to put each car to the greatest possible use, to have empty cars placed where they are most needed, to prevent over-lapping and unnecessary service—in other words, to make the entire railroad system of the United States the most effective possible transportation agency in winning this war."

New Haven Embargo Distinguishes Between Cars Loaded to Capacity

The New York, New Haven & Hartford on Friday last put into effect an extensive embargo on carload freight for New England from connecting railway carriers via all junction points, from coastwise steamship lines via Harlem river, New York, piers 31 to 70 East river, New York, Brooklyn terminals and lighter service, except the following freight when loaded to the "marked carrying or practical carrying capacity of the car" consigned to stations on its own lines:

"Perishable and live stock, foodstuffs for human consumption, food for live stock, news and book print paper, copper, spelter, zinc, lead, crucible, billets, insect repellents, vermin exterminators, fungicides, tree and other agricultural spray material, baskets, barrels and fruit containers for shipping fruit and produce, coal, coke, hemp, sisal, tin cans, glass containers, materials and supplies for the New York, New Haven & Hartford, Central New England and Boston & Maine."

Embargo is also placed on less than carload freight except perishables. The embargo also excepts shipments for the United States or the allied governments or for the Red Cross.

Roads in Central Department Plan Further Reduction in Passenger Service

Extensive reductions in passenger train service in addition to those already made are soon to go into effect in the Central territory. According to a report made by R. H. Aishton, president of the Chicago & North Western, and chairman of the Central Department Committee, the railroads in this territory have effected a saving at the rate of almost 7,000,000 passenger miles a year in passenger train service between March 1 and July 15. The total reductions already made, and those which will soon be put into effect in this territory amount to over 12,000,000 passenger miles. This is in addition to reductions of over 16,000,000 passenger miles previously reported in eastern territory. The states included in the Central Department are Illinois, Indiana, Iowa, Kansas, Kentucky, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, West Virginia, Wisconsin and Colorado. The reductions already made will effect the saving of approximately 500,000 tons of coal a year, which, by this reduction, is made available for other purposes, and the further reduction to be made will bring the amount of the saving up to about 840,000 tons.

Of the roads which, by reason of the extent of their service, have been enabled to contribute most largely to this result in the Central territory are the Pennsylvania, 835,756 passenger miles; Cleveland, Cincinnati, Chicago & St. Louis, 779,560; Chesapeake & Ohio, 725,510; Baltimore & Ohio, 601,987; Missouri, Kansas & Texas, 580,206; Pere Marquette, 574,629; Erie, 325,782; Chicago, St. Paul, Minneapolis & Omaha, 310,048; and Chicago, Rock Island & Pacific, 298,006. Several of the roads which have up to the present time made only small reductions in passenger service are contemplating larger reductions to take place in the immediate future. These include the Chicago, Burlington & Quincy, 1,800,000 passenger miles; the Chicago, Rock Island & Pacific, 886,456; the Missouri Pacific, 1,000,000; and the Missouri, Kansas & Texas, 598,822. The Chicago & Eastern Illinois, the Grand Rapids & Indiana, the Kansas City Southern, the Lake Erie & Western, the Michigan Central and the Minneapolis, St. Paul & Sault Ste. Marie, several of which have already made considerable reductions, are planning further reductions amounting to from 130,000 to 200,000 passenger miles each. The total amount of additional reduction already planned amount to 5,539,561 passenger miles, making a total of 12,227,963 passenger miles for the railways of the Central Department. The whole matter of curtailment of passenger train service has been carefully worked out by the committee and the railroads, and most of the further reductions are expected to be brought about by lengthening the schedule of transcontinental trains, and the effect will therefore be felt locally only to a small extent.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The commission has made public the tentative report of Attorney-Examiner Watkins in the case involving the adjustment of class rates in the southwest resulting from a general readjustment, including many advances made by the railroads in rates to bring them into conformity with the rates in Texas allowed by the Interstate Commerce Commission in the Shreveport rate case, in place of rates formerly made by the Texas Railroad Commission, which the carriers asserted had unduly reduced rates to points outside of Texas. The tentative report finds that the proposed increases in class rates between points in Texas and points in Oklahoma between Shreveport, La., and certain points in Oklahoma on interstate traffic between points in Oklahoma and between points in Kansas and the Panhandle of Texas are not justified. It is also recommended that the tariffs now under suspension until December 1 shall be ordered cancelled without prejudice to the filing of tariffs to conform with the findings of the report.

Conference Rulings

The commission has adopted the following conference rulings:

"That employees of common carriers who enter the military or naval service of the United States in the present war, and who are carried on the records of the carrier as furloughed employees, to be restored to the carrier's service at the termination of the war, are furloughed employees within the meaning of section 1 of the act to regulate commerce, and that the carriers may lawfully grant free passes to dependent members of their families."

"A carrier may not lawfully build a switch track inside the plant boundary of an industrial company without adequate compensation therefor. And an agreement by the industry to give the carrier all or a part of its traffic as compensation for the building of the track is not regarded as 'adequate compensation.'"

"That the act to regulate commerce, as amended, does not authorize an express company subject to the act to carry property either for its own officers or employees or for the officers and employees of other common carriers except at its legally published rates."

STATE COMMISSIONS

The New York Public Service Commission, First district, has refused permission to the Long Island to put into effect an increase in its mileage book rates from \$10 to \$11.25 for a 500-mile book, pending the decision of the commission upon a number of rate increases proposed by the company, and now under consideration by the commission. The new rate has been allowed by the commission for the Second district to apply outside of New York City, but the commission for the First district objected to the railroad's putting the new rate into effect in New York City. The railroad protested against having to sell separate mileage books for use wholly in New York City, and the present decision is not final.

COURT NEWS

Expense of Transportation

A trunk line railroad, the Illinois Central, entered into a contract with a tap line railroad, the Kentwood & Eastern, whereby the K. & E. should receive part of the freight rate paid on lumber made from logs brought over the tap line and transported by the trunk line into a designated territory. The trunk line entered into a contract for the purchase of lumber from a lumber company whose mill was situated at the point of intersection of the trunk line and the tap line. Logs out of which lumber was made were hauled over the tap line, and the trunk line, on carrying such lumber into the designated territory, made the required payment to the tap line company, which amounts were in turn paid to the lumber company. The lumber company sold the lumber f. o. b. at the intersection point. In an action by the

trunk line company against the lumber company and the tap line company, the Circuit Court of Appeals, Fifth Circuit, held that though the trunk line, by reason of the diversity of its business and multiplicity of departments, did not immediately discover the situation, it was (the lumber company having agreed to deliver the lumber *f. o. b.* at the point of intersection) entitled to repayment of the sums paid the tap line company, for otherwise the lumber company would escape payment of a large portion of the freight on the logs to the point of intersection.—*Illinois Central v. Brooks-Scanlon Co.*, 241 Fed., 445. Decided April 11, 1917.

Carriage of Alcohol

A druggist by an action of detinue sought to obtain from a railroad possession of a shipment of alcohol to carry it to his place of business, where he was engaged in the sale of beverages, to keep and use it there in the manufacture of extracts in violation of the Alabama statute. The Alabama Court of Appeals holds that the railroad could not deliver the alcohol to the plaintiff without violating the criminal law, nor could the plaintiff accept delivery without a like result, so that the plaintiff, not being entitled to immediate delivery, was not entitled to recover in detinue.—*L. & N. v. Parish (Ala.)*, 75 So., 638. Decided May 29, 1917.

Freight Rates—Routing

The Minnesota Supreme Court holds that a carrier, in the absence of shipping instructions, is not bound to route shipments on an intrastate line to secure a lower rate for a shipper, where an easier grade and a shorter distance call for an interstate route, though as to a car which by mistake was routed on an intrastate line, it would be required to refund under the Minnesota maximum freight rate statute of 1913. In this case, not only the easier grade and shorter distance called for the interstate route, but the intrastate route would have involved a back haul of 15 miles, which, it was held, could not in reason be demanded.—*Comstock F. El. Co. v. Great Northern (Minn.)*, 163 N. W., 280. Decided June 22, 1917.

Insufficient Evidence of Negligence in Handling Live Stock

In an action against a railroad for damages to horses and mules resulting from alleged negligence in handling a carload of them, the evidence showed that the animals were not physically injured, but were in apparently good condition when delivered to the consignee, that in stockyards from which the animals were shipped a contagious disease similar to that contracted by them was discovered before they were put there, that live stock shipped from North to South in that season frequently suffer from shipping cold, and that several days after the plaintiff received them several animals developed colds, followed by pneumonia and died; but it was not shown that this condition resulted from the railroad's negligence. The Mississippi Supreme Court holds that a verdict for the plaintiff was wrong, and judgment for the plaintiff was reversed and the case dismissed.—*Illinois Central v. Ainsworth (Miss.)*, 75 So., 755. Decided June 25, 1917.

Order to Construct New Station Held Unreasonable

The Missouri Supreme Court holds unreasonable and unlawful an order of the Public Service Commission requiring the Wabash to construct a new passenger station at Macon for the following reasons: The evidence did not tend to prove any defect or inadequacy which could not be corrected by repairs, improvements and enlargement of the existing depot. There was no evidence that it was physically impossible or even difficult to make the changes necessary to meet the objections made to the existing structure. It did not appear that there was any legal obstacle to the changes proposed. There was no evidence tending to show that the company's right of way was too narrow to accommodate the improvements desired and necessary, or that the enlargement of the building and widening of the platform would in any way infringe on any street or interfere with any other property.—*State ex rel. Wabash v. Public Service Commission (Mo.)*, 196 S. W., 369. Decided June 1, 1917.

Construction of Safety Appliance Acts

The Louisiana Supreme Court holds that the federal Safety Appliance Acts absolutely require handholds above footboards, and railroads will not be permitted to substitute for them uncoupling or operative levers. The acts embrace all locomotives, cars and similar vehicles used on any railroad which is a highway of interstate commerce.—*Lenree v. Texas & Pacific (La.)*, 73 So., 676. Decided June 11, 1917.

Assumption of Risk by Employees on Tracks

The Kentucky Court of Appeals holds that employees of a railroad in the habit of using the company's tracks in coming to and going from its offices in doing their work, assume the risk of injury from passing trains. One having intermittent employment as a flagman was injured when leaving an office in the railroad yards which were without a municipality. A small number of employees visited the office daily, but their numbers were not so great as to charge the company with knowledge of their presence. The court holds that such employee was at best a mere licensee in the technical sense of the term, and hence, as the company was under no duty to maintain a lookout for him, it was not liable.—*Illinois Central v. Pierce (Ky.)*, 194 S. W., 534. Decided May 8, 1917.

Invalids as Passengers

A regulation of a railroad company provided that sick or injured persons on cots or stretchers, accompanied by an attendant, might ride in the baggage car on orders from the superintendent. A paralytic, obliged to use an invalid's chair, bought a round trip ticket and rode in the baggage car in his chair to his destination without having obtained a permit from the superintendent. On his return he was not allowed to ride in the baggage car and sued for damages. He had made similar trips five or six times a year for ten years, but had obtained a permit only twice. The Court of Civil Appeals holds that the fact that he had been so allowed to ride was an accommodation merely which could be discontinued at any time, and to the continuation of which the plaintiff had no legal right.—*M. K. & T. v. Nelson (Tex.)*, 195 S. W., 1176. Decided June 15, 1917.

Carriage of Intoxicating Liquor

The Alabama Supreme Court holds that a carrier which has lawfully assumed the delivery of an interstate shipment of liquor, authorized by Ala. Act, January 27, 1915, may intervene in a seizure thereof under Act January 23, 1915, as a "person claiming any right, title or interest" therein. The provision of the former act, prohibiting possession at any one time of more than a certain quantity of liquor by any person or corporation, does not apply to an interstate carrier, the act permitting the importation of liquor in such quantity to every adult citizen. The latter act, declaring it unlawful to receive liquor for storage, distribution, or on consignment for another, or to maintain a warehouse therefor, does not apply to a carrier holding for delivery an interstate shipment of liquor authorized by the former act.—*State v. Pensacola, St. A. & Gulf S. S. Co. (Ala.)*, 75 So., 892. Decided May 31, 1917.

Passing Trains at Stations

A railroad had a rule reading: "Trains must use caution in passing a train receiving and discharging passengers at a station, and must not pass between it and the platform at which the passengers are being received or discharged." The Indiana Appellate Court holds, in an action for wrongful death of a person crossing tracks at a station, that the railroad's violation of the rule was not negligent *per se*, but proper as an item of evidence tending to show the degree of care recognized by the road as ordinary care under the conditions specified in the rule. It was held that the rule applied to a station having a station and platform on one side of double tracks and a cinder platform on the other with a walkway across the tracks. The tracks were curved to the east and west of the station, and passed through deep cuts, so that the view of approaching trains was obstructed. It was held to be the duty of the road's servants running a train to use reasonable care to ascertain if another train was at the station, discharging passengers, and if so, under the common law as well as the rule, to have used such reason-

able care as might be necessary for the protection of any person lawfully using the track at the station at the time. What constitutes reasonable care in such a case was held to depend on the circumstances, and may require constant lookout, after the place of possible danger is visible, the giving of warning signals, reduction of speed, or even stopping the train, in order to discharge the duty imposed.

The person killed was a farmer who had gone to the station to ship a case of eggs and remained to receive a milk can he was expecting. The train bringing the milk can was standing at the cinder platform side (on which the passengers alighted and crossed over around the end of the train). The deceased went on the other track, and was waiting for that train, which was about to pull out, to pass, when he was struck and killed. The trial court directed a verdict for the defendant; this was reversed on appeal. It was held that deceased was not a trespasser, though he was bound to exercise reasonable care for his own safety, commensurate with the dangers of which he had either actual or constructive notice, and that the question of his contributory negligence should have been submitted to the jury.—*Smith v. Cleveland, C. C. & St. L. (Ind.)*, 115 N. E., 603. Decided March 27, 1917.

Assumption of Risk by Passenger

A passenger is under no obligation to obey instructions of the railroad or its agents where obedience will subject passengers to great and obvious danger, and a passenger who obeys with knowledge of danger assumes the risk of injury. A passenger was seated in a safe place in a coach when a member of the train crew called out to the passengers to go into the car ahead. He picked up his traveling bag and some bundles, and went upon the platform. The train was then going so fast that, as he testified, he was afraid the car would jump the track or break its coupling. He was thrown from the platform as the train was rounding a curve. In an action for his injuries the New Jersey Supreme Court held he had assumed the risk of an obvious danger, and the railroad was not liable.—*McGrath v. D. L. & W. (N. J.)*, 100 Atl. 753.

"Intrastate Commerce"—Transportation of Circuses

The Arizona Supreme Court holds that, in a proceeding before the Arizona Corporation Commission to compel a railroad to transport the Campbell's United Shows from Tucson to Phoenix, the movement between these points was intrastate, subject to the jurisdiction of the commission, although the shows were engaged in a journey beginning in Texas and ending in California, the movement of the circus being a mere incident to the object of its existence.—*Cunningham, J.*, dissented, on the ground that, as it is the commencement and ending of the continuous journey in contemplation which fixes the character of interstate commerce upon the thing moved, the movement was interstate, and therefore the commission's order fixing a freight rate was void and incapable of placing a duty of transportation on the railroad company.—*Southern Pacific v. State (Ariz.)*, 165 Pac 303. Decided May 19, 1917.

Crossing Accident—Contributory Negligence

In an action for death of a motorcycle rider by being run over by a fast passenger train at a crossing, it appeared that the deceased approached the crossing without looking for trains, though an approaching train could have been seen had he looked. The Louisiana Supreme Court holds that the deceased's negligence continued to the moment of the accident so as to be a contemporaneous contributing cause, and the railroad was therefore not liable for the negligence of the engineer in failing to make an emergency stop upon seeing the deceased's danger. A man in full possession of his faculties, who goes upon a railroad track, must be held to know that he is upon such track, and that a train may be coming at any time, and must be held to the necessity of using his senses for his safety, and cannot absolve himself of negligence because of absent-mindedness.—*Barnett v. Louisiana Western (La.)*, 75 So., 649. Decided June 11, 1917.

Equipment and Supplies

LOCOMOTIVES

THE SOUTHERN PACIFIC is asking prices on 41 Santa Fe type and 10 six-wheel switching locomotives.

THE J. G. WHITE ENGINEERING COMPANY, New York, recently received a 300-hp. gasoline locomotive from the McKeen Motor Car Company, Omaha, Neb.

THE UNITED STATES GOVERNMENT has placed orders with the Baldwin Locomotive Works for 764 locomotives in addition to the 150 that company now has on order, and the 150 which will be built by the American Locomotive Company. The locomotives are for service with the forces in France, and will be given preference over all other work. The new order is as follows:

380	80 ton	Standard gage	Consolidation
195	60 c m gage*	2-6-2
126	50 hp.	60 c m gage	Gasoline
63	30 hp.	60 c m gage	Gasoline

* 60 c m equals 1 ft. 11½ in.

The previous order for 300 locomotives, as was reported in the *Railway Age Gazette* of July 20, includes 150 80-ton standard gage Consolidation locomotives ordered from the Baldwin Locomotive Works, and 150 from the American Locomotive Company. The Baldwin Locomotive Works completed the first locomotive on its order last Saturday, and is building the remainder at the rate of four a day.

FREIGHT CARS

THE MARK MANUFACTURING COMPANY, Chicago, has ordered 18 70-ton capacity steel gondola cars of special construction from the American Car & Foundry Company.

THE ILLINOIS CENTRAL recently received from the McKeen Motor Car Company, Omaha, Neb., a 50-hp. distillate weed burner.

THE UNITED STATES GOVERNMENT has distributed orders among a number of car building companies for 6,000 30-ton standard gage and 2,997 narrow gage freight cars for service with the American forces in France. The standard gage cars will have two trucks, and are distributed as follows:

1200	Low side gondola.....	Pressed Steel Car
1000	Box	} Am. Car & Fdy.
300	Tank	
900	High side gondola.....	} Standard Steel Car
800	Box	
600	Flat	} Haskell & Barker
800	Refrigerator	
900	Box	Pullman

The narrow gage cars are of 600 mm. gage, the order being distributed as follows:

500	Flat	} Pressed Steel Car
100	Trucks	
166	Tank	} Am. Car & Fdy.
700	Low side gondola.....	
400	Low side gondola.....	Ralston Steel Car
400	Low side gondola.....	Magor Car
666	Box	Standard Steel Car
165	Gondola	Standard Steel Car

IRON AND STEEL

THE UNITED STATES GOVERNMENT has issued an inquiry for 20,000 tons of 25-lb. rail for use in France.

THE MISSOURI PACIFIC has ordered 180 tons of steel from the American Bridge Company for a riveted truss span at Sweet Springs, Mo.

MISCELLANEOUS

THE PITTSBURGH & LAKE ERIE has awarded a contract to the Roberts & Schaefer Company, Chicago, for a complete tandem four-pit cinder handling plant for installation at Haselton, Ohio.

Supply Trade News

P. M. Kling, consulting engineer of the Laconia Car Company, Leconia, N. H., has resigned. Mr. Kling retires, after having spent 34 years in the car industry.

The Hazard Manufacturing Company, Wilkesbarre, Pa., announces the appointment of George B. North as general sales manager, with headquarters at New York.

A. T. Stewart, general freight agent of the Missouri Pacific at Kansas City, Mo., has resigned, effective August 15, to become general traffic manager of the Sinclair Refining Company and the Sinclair-Gulf Corporation, with headquarters at Chicago.

McCord & Co. have purchased three and one-half acres of land at West Pullman, Ill., from the Illinois Central. This property has been occupied by the purchasers for the last two years under a lease from the Illinois Central, with the option of purchase. A part of the property is improved with a plant which has been used as a steel foundry for the manufacture of journal boxes.

James K. Howard has been appointed assistant to the president of the A. G. A. Railway Light & Signal Company, Elizabeth, N. J., with headquarters at Elizabeth. Mr. Howard was born on August 8, 1871, at Zanesville, Ohio. He entered railway service on the New Haven & Derby as a rodman, leaving that road in 1890 to enter Rutgers College. He left this institution in 1893 to enter the employ of the Peoria & Pekin Union, serving successively as assistant engineer and engineer until 1899. In July, 1900, he went with the Wabash as division engineer, holding this position until July, 1905, when he entered the service of the Chicago, Peoria & St. Louis as engineer of maintenance of way. After serving in this capacity until January, 1907, he left the C. P. & St. L. to become engineer in charge of railway surveys in eastern Ohio and western Pennsylvania. In July, 1910, he was appointed engineer of maintenance of way on the Ann Arbor, leaving in January, 1913, to become assistant chief engineer for the Lorain, Ashland & Southern. In October, 1916, he was appointed northwestern representative of the A. G. A. Railway Light & Signal Company, with headquarters at Chicago, which position he held until his recent appointment as assistant to the president.

Unfilled Steel Orders Decrease

United States Steel Corporation reports that unfilled orders on hand July 31 amounted to 10,844,164 tons, a decrease of 539,123 tons, as compared with 11,383,287 tons on hand June 30.

Unfilled tonnage on May 31 amounted to 11,886,591 tons; on April 30, 12,183,083 tons; on March 31, 11,711,644 tons, and on July 31, 1916, 9,593,592 tons.

TRADE PUBLICATIONS

LATHES.—An attractive eight-page booklet recently issued by the Gisholt Machine Company, Madison, Wis., gives a number of illustrations of Gisholt lathes and time studies of work of various kinds of work turned out on them. The booklet contains a striking cover bearing the inscription: "Old Glory and the Allies," and showing the flags of all the nations now waging war on Germany.

PNEUMATIC PAINTING EQUIPMENT.—The Spray Engineering Company, 93 Federal street, Boston, Mass., has recently issued a folder describing its equipment for applying all kinds of liquid coatings with the Spraco paint gun. Particular attention is called to an extension pole attachment made up of a jointed fiber rod, which is used for covering surfaces beyond the reach of the operator, thus eliminating the necessity for staging or ladders.

ELECTRIC HOISTS.—The Lidgerwood Manufacturing Company, 96 Liberty street, New York, has recently issued bulletin No. 20, on Lidgerwood electric hoists. The bulletin contains 31 pages, each of which is devoted to a separate type of hoist, which is illustrated with a photograph. The special work for

which the hoist is designed is then described, as are the special features of the hoist. Finally a table of sizes is given containing all the necessary detailed information.

TIN PLATE.—The American Steel Export Company has recently published a 16-page illustrated booklet thoroughly describing in a concise way the practice of American makers of tin plate. The chief object of the booklet is the elimination of the confusion existing in the export trade because of the difference in the methods employed in the various countries where this commodity is manufactured. It deals first with a brief history, then the process of manufacturing. Numerous pages are devoted to the proper placing of orders, the exact method of figuring prices, and the usual method of packing for export.

EDISON STORAGE BATTERIES FOR USE IN STORAGE BATTERY LOCOMOTIVES is the title of bulletin 608 of the Edison Storage Battery Company, Orange, N. J. This bulletin, which is just off the press, describes the use of Edison storage battery locomotives in coal mining, metal mining and in general industrial service. The bulletin is full of photographs of locomotives in actual service, and there are two pages which contain complete general data and trade dimensions of Edison Type A storage batteries for storage battery locomotives. The last page describes the Edison electric safety mine lamp, which is more fully described in bulletin No. 300.

HOISTING MACHINERY FOR INDUSTRIAL TRUCKS is the title of a 115-page bulletin, No. 2,000, recently issued by the Shepherd Electric Crane & Hoist Company, Montour Falls, N. Y. The bulletin is loose-leaf and pocket size and contains complete and detailed specifications for the various types of hoists manufactured by the company. The class or frame size, capacity in pounds, hoisting speed feet per minute, number and size of hoisting rope, maximum lift in feet, catalogue number, shipping weight of each type of hoist are given in tabulated form, while on the opposite page the same type of hoist is shown in a line drawing where the clearance dimensions are given.

STORAGE BATTERIES FOR INDUSTRIAL TRUCKS.—The Edison Storage Battery Company, Orange, N. J., in bulletin No. 600, deals with Edison storage batteries for industrial transportation. The bulletin, which contains 32 pages, fully covers the use of electric tractors and trucks for use around factories, shops, freight houses, docks, terminal stations, etc. A special feature of the bulletin is the large number of photographs which illustrate the great variety of transportation work which electric trucks and tractors can do. The last few pages in the bulletin contain a general description of the Edison storage battery, how it is made and what it is made of, its operation, maintenance, etc. The last page is devoted to a table giving general data and tray dimensions of Edison storage batteries for industrial trucks, practice storage batteries, locomotives, etc.

COAL REQUIREMENTS OF INDIAN RAILWAYS.—It is estimated that the railways of India will require about 8,000,000 tons of coal during 1918, which represents about 20,000 tons of coal per day.

SPAIN MOBILIZES RAILROAD MEN.—Press despatches state that the Spanish government has decided to mobilize all railroad employees. They will remain at work, but will wear army uniforms. The Northern of Spain has issued a statement declaring there will be no strike as long as the government guarantees freedom to work. Although the Catalan railwaymen have handed the government a declaration of a general strike, conditions are still normal.

EUROPEAN RAILWAYS AND THE COAL FAMINE.—The shortage of fuel and its excessive cost are making themselves more and more felt in almost every country. The revenue is suffering greatly, and the service generally is much impeded. Both in Sweden and Denmark a number of trains, more especially fast trains, have been discontinued; in the latter country, for instance, the number of daily passenger trains has been reduced to less than half the normal, and fast or through trains are almost a thing of the past. As a result the trains are often overcrowded and unable to keep time. In Sweden the Board of the State Railways has just decided to propose a rise of at least 40 per cent in the present freight tariff, and a rise of 20 per cent to 25 per cent in the passenger tariff, to offset the great increase in operating expenses.—*Engineering, London.*

Railway Construction

GALESEBURG, ROCKFORD & NORTHERN.—The Illinois Public Utilities Commission has granted a certificate of convenience and necessity to this company for the purchase of the Hoopole, Yorktown and Tampico, and the extension of this line from Hoopole to a point on the Chicago, Rock Island & Pacific at Geneseo, a distance of approximately 12 miles.

NEW YORK, NEW HAVEN & HARTFORD.—This company is building with company forces a new yard between New Haven, Conn., and North Haven. In addition to the track work five steel bridges varying in length from 25 ft. to 200 ft. will be built, also general yard buildings. The grading work will be heavy.

PENNSYLVANIA RAILROAD.—This company has given a contract to Arthur McMullen, New York, for building the entire bridge line from Camden, N. J., to Petty's Island. (April 6, p. 765.)

ST. LOUIS-SAN FRANCISCO.—This company has completed plans for a railroad station at Oklahoma City, Okla. The building will be two stories high, 139 ft. wide and 146 ft. long, and will cost approximately \$300,000. It will be of reinforced concrete construction with cut stone and brick exterior. Bids for the work will be opened on September 15. Inquiries should be addressed to Lebenbaum, Marx & Vigeant, architects, Chicago.

TEXAS ROADS (ELECTRIC).—H. M. Gray, Las Cruces, N. Mex., and associates are promoting the construction of an electric line between Las Cruces and El Paso, Tex., about 44 miles.

TOLEDO, ST. LOUIS & WESTERN.—This road has completed plans for the construction of a freight house at Frankfort, Ind., and also for an extension to its office building at the same point. The specifications for the freight house call for a frame building 26 by 140 ft., the east 40 ft. of which will be two stories high and the balance one story high. The work includes the construction of an island platform 8 ft. by 150 ft., a house platform, and an incline for automobiles. The extension to the office building will be of brick construction two stories high, 20 ft. wide and 32 ft. long. In addition the company is planning improvements at Charleston, Ill., including an engine house and machine shop, a freight house and a reservoir. The engine and machine shop will be of timber and brick construction. The engine house will contain six stalls 96 ft. long. The machine shop will be 40 by 75 ft. The freight house plans provide for a one-story brick building 25 by 100 ft., with platforms, inclines, etc. The reservoir will have a capacity of 500,000 gal., and will be lined with concrete.

A VULNERABLE RAILWAY CENTER IN GERMANY.—Cologne has lately come in for considerable mention among advocates of air reprisals. This city is of such enormous importance as a railway center that it may without exaggeration be described as the key to the Western front. In fact it is unlikely that any other railway center has been such an important factor in the German plans of campaign ever since the beginning of the war. Study of a good railway map will show that Cologne focusses the whole railway network of Germany, forming, as it does, a junction for all the principal main lines from north and south and east. In fact, it is in some respects an even more important junction than Berlin, with which it is linked up with numerous main lines, and it is in addition the chief point in the system which runs along both banks of the Rhine, all the way from Frankfort-on-Main. In normal times, Cologne is the gateway to France and Belgium, and since August, 1914, this aspect of its importance has been enormously enhanced. Indeed, it is not too much to say that but for the network lines radiating from the Cathedral city, the whirlwind invasion of Belgium and northern France—the principal feature of the whole German plan of campaign—would have been impossible. When it is borne in mind that the only outlet to the West of all the railways entering Cologne is over a single bridge across the Rhine, which is very wide in this neighborhood, it will be realized how vulnerable is this railway center to attack from the air.—*Railway Gazette, London.*

Railway Financial News

BALTIMORE & OHIO.—See comments on the annual report for the calendar year 1916 elsewhere in this issue.

CHICAGO & WESTERN INDIANA.—The \$1,000,000 issue of 5 per cent notes due September 1, 1917, has been extended to September 1, 1918, at 5 per cent per annum.

CHICAGO, BURLINGTON & QUINCY.—This company has declared an extra dividend of 10 per cent, and the regular quarterly dividend of 2 per cent, both payable on stock of record date September 25. Books close September 19 and reopen September 25. The Chicago, Burlington & Quincy is controlled by the Great Northern and Northern Pacific Railroads, through joint ownership of practically all the \$110,839,100 stock outstanding, which is deposited behind the collateral 4's of the two controlling roads. The regular dividend rate of the Chicago, Burlington & Quincy is 8 per cent. The 10 per cent distribution by the Burlington amounts to \$11,083,910, of which about half, or \$5,500,000, will accrue to the Northern Pacific, and the same amount to the Great Northern. The Northern Pacific has outstanding \$248,000,000 capital stock, and the Great Northern \$249,476,850 preferred stock (there is no common stock), so that the Burlington distribution is equivalent to 2.2 per cent on both Northern Pacific and Great Northern preferred.

See also editorial comments elsewhere in this issue.

CINCINNATI, HAMILTON & DAYTON.—After protracted negotiation a settlement has been reached between the Baltimore & Ohio and the minority owners of Cincinnati, Hamilton & Dayton general mortgage bonds of 1939, which will complete the reorganization begun when the Baltimore & Ohio took over the operation and control of the Cincinnati, Hamilton & Dayton in 1909. Negotiations were principally carried on through Iselin & Co., and it is reported the minority bondholders will be allowed either \$1,000 in B. & O. Toledo Division 4 per cent bonds, plus \$140 in cash, for each \$1,000 C. H. & D. bond, or \$800 in Toledo Division bonds, plus \$280 in cash, the Baltimore & Ohio reserving an option to purchase the bonds for \$840 apiece in cash. The minority interest involved represents somewhat less than \$2,000,000 in face value of the bonds, out of \$17,529,000 issued, the bulk having been purchased by the Baltimore & Ohio at 70 and interest. The minority owners held out for the original offer of 85 with interest, or an exchange bond guaranteed by the Baltimore & Ohio.

GREAT NORTHERN.—This company has sold \$20,000,000 three-year 5 per cent notes to the First National Bank of New York. The notes were offered at 98 and interest, to yield 5¼ per cent. They are dated September 1, 1917, and are secured by \$25,000,000 of the company's first and refunding mortgage 4¼ per cent bonds which are due in 1961. The notes are redeemable at any time before September 1, 1918, at 101 and interest, and at any time thereafter before maturity at 100½ and interest. The purpose of the issue is to provide the Great Northern with funds to pay for improvements and equipment already purchased. The last previous important financing by the Great Northern was in 1911, when \$20,000,000 first and refunding 4¼ per cent bonds due 1961 were sold to J. P. Morgan & Co., the First National Bank and the National City Bank, who offered them at 102.

See also Chicago, Burlington & Quincy.

MISSOURI PACIFIC.—The syndicate which underwrote the \$46,000,000 cash requirements of the reorganization plan has been closed with the mailing of checks to syndicate members by Kuhn, Loeb & Co. The profit was 3 per cent, representing a distribution of \$1,380,000 to the subscribers who have been for more than a year liable for the cash requirements of the plan. This finally cleans up practically all matters pertaining to the Missouri Pacific reorganization, except that further opportunity will be given to a few stockholders, mostly residing abroad, to come in under the terms of the plan when the war situation permits them to deposit their securities.

NORTHERN PACIFIC.—See Chicago, Burlington & Quincy.

ANNUAL REPORTS

ST. LOUIS SOUTHWESTERN RAILWAY CO.—TWENTY-SIXTH ANNUAL REPORT "COTTON BELT ROUTE."

CHAIRMAN OF THE BOARD AND PRESIDENT,
New York, April 16, 1917.

To the Stockholders of the

St. Louis Southwestern Railway Company:

The Twenty-sixth annual report of your company, for the calendar year ended December 31, 1916, is herewith presented.

The report of Mr. J. M. Herbert, First Vice-President in Charge, which follows, exhibits full and complete details of operating revenues, expenses and other operating results, as well as the financial and physical condition of the property.

The amount of expenditures made on account of, and charged to, "Road and Equipment—Road" during the six months ended December 31, 1916, was \$142,005.64, of which there was appropriated from Income, \$132,579.61, representing expenditures made by the Company, and from Surplus, \$9,426.03, on account of "Donations" made by Individuals and Companies—like amounts being credited to "Corporate Surplus—Additions to Property through Income and Surplus."

It will be observed that the better earnings of the last fiscal year, while not in the judgment of the directors justifying any distribution to stockholders, have enabled the Company to improve its financial position and to liquidate floating liabilities of \$785,000 accumulated as a result of former operations.

Special attention is invited to Exhibit "R" containing a summary of Property Investments and Advances Unfunded, Cash Loans to Controlled and Affiliated Lines, and Unpledged Securities (not necessary for control) held in the Treasury as of December 31, 1916.

CAPITAL STOCK.

No change has been made in the Capital Stock during the period covered by this report. Exhibit "M" on page 39 shows the par value authorized and the par value outstanding as of December 31, 1916.

FUNDED DEBT.

The amount of Funded Debt, outstanding in hands of the public, was increased during the period under review in the sum of \$285,000, explained as follows:

Equipment Trust Obligations Issued:

Series "F"—Guaranty Trust Co. of New York, Trustee:

For Equipment:

12 Consolidation Freight Locomotives \$420,000.00
8 Ten-wheel Passenger Locomotives }

Deduct:

Equipment Trust Obligations Matured and Paid:

Special Equipment Trust—The Philadelphia

Trust Safe Deposit and Insurance Co.—

Trustee \$33,000.00

Series "D"—U. S. Trust Co. of New York—

Trustee 17,000.00

Series "E"—Guaranty Trust Co. of New

York—Trustee 85,000.00

135,000.00

Net Increase \$285,000.00

The Public Service Commission of the State of Missouri, after a full hearing, duly approved the issuance of the Equipment Trust Obligations as shown in the foregoing statement.

Detailed exhibits of Funded Debt as of December 31, 1916, will be found on pages 40 and 41.

The faithful and efficient services of the officers and employees of the Company are acknowledged, with pleasure.

For the Directors,

EDWIN T. GOULD,
Chairman of the Board
and President.

St. Louis, Mo., April 2, 1917.

MR. EDWIN GOULD,

Chairman of the Board and President,
New York City, N. Y.

DEAR SIR:

Pursuant to the order of the Interstate Commerce Commission, dated November 24, 1916, establishing the calendar year as the fiscal year for common carriers by rail, and the subsequent action of the Board of Directors, changing the fiscal year of this company accordingly, I present herewith a report upon the business and operations of the Company for the calendar year ended December 31, 1916, and its financial and physical condition as of that date.

The last report to the Stockholders was for the fiscal year ended June 30, 1916, and the report now submitted continues the operations and financial transactions for the period, July 1 to December 31, 1916 (thus preserving the continuity of records and statistics without duplication), and also contains Income and Profit and Loss statements for the full calendar years 1916 and 1915, for comparative purposes.

The financial results from operation for the calendar years 1916 and 1915 and for the six months periods, July 1 to December 31, 1916, and 1915, will be found in the condensed statements immediately following:

Inasmuch as the business for the fiscal year ended June 30, 1916, has been fully presented in the preceding annual report, the following com-

ments and statements (excepting statements of Income and Profit and Loss) for the calendar years 1916 and 1915) are confined to the operations for the six months period, July 1 to December 31, 1916, compared with the same period of 1915, and to the changes in the assets and liabilities as reflected in the general balance sheet as of December 31, 1916, compared with that of June 30, 1916.

OPERATING REVENUES.

The total operating revenues for the six months period amounted to \$7,906,459.74, an increase of \$1,625,681.14, or 28.38% compared with the same period of preceding year. In Exhibit "A" on page 28, will be found a statement showing separately the increases and decreases in each of the several classes of revenues.

Comparative exhibits containing interesting data of a statistical nature as to the freight and passenger operations, will be found on pages 46 and 47.

OPERATING EXPENSES.

During the six months period, the total operating expenses were \$4,884,093.94, an increase of \$911,519.88, or 22.95%, compared with the same period of preceding year.

Attention is called to Exhibit "A" on pages 28 and 29, in which is shown the increases and decreases in the several general operating expense accounts, and the ratios of each to total operating revenues, also to Exhibit "B" on pages 30 and 31, showing operating expenses by primary as well as by general accounts.

It will be noted that an increase of \$1,625,681.14 (or 28.38%) in operating revenues was accomplished with an increase of only \$287,409.80 (or 15.81%) in Transportation Expenses, and that of the increase in operating revenues only 17.68% was used to take care of the increase in Transportation Expenses.

The ratio of Transportation Expenses to Total Operating Revenues for the six months period was 26.62% for the System. For the St. Louis Southwestern Railway Company, proper, it was 22.10%.

Notwithstanding increases of \$304,200.76, or 38.32%, in Maintenance of Equipment and \$277,005.49, or 36.07%, in Maintenance of Way and Structures, the relatively small increase in Transportation Expenses resulted in a reduction in the ratio of Total Operating Expenses to Total Operating Revenues from 63.55% for the period of preceding year to 61.77% for the period under review.

CAR AND TRAIN LOADING.

Following will be found tables showing the average load, in tons, per loaded freight car mile, and per freight train mile, for the past eight and one-half years:

Average number of tons (including company material) per loaded car mile:		St. L. S. W. Ry. Co.		St. L. S. W. Ry. Co.	System.
Year ended		June 30,		of Texas,	
1909	17.84		16.67	17.49	
1910	18.58		16.89	18.14	
1911	18.78		17.30	18.32	
1912	18.02		16.44	17.55	
1913	18.36		16.44	17.78	
1914	18.22		16.19	17.62	
1915	17.95		16.57	17.55	
1916	18.18		17.40	17.95	
Six Months ended					
Dec. 31, 1916	18.72		17.23	18.30	
Average number of tons (including company material) per train mile:		St. L. S. W. Ry. Co.		St. L. S. W. Ry. Co.	System.
Year ended		June 30,		of Texas,	
1909	394.23		190.34	301.61	
1910	434.16		196.27	326.11	
1911	423.70		200.04	320.16	
1912	411.11		211.14	340.58	
1913	461.11		214.50	349.49	
1914	455.14		199.32	337.65	
1915	457.53		208.21	345.21	
1916	489.88		252.71	386.40	
Six Months ended					
Dec. 31, 1916	497.85		251.93	394.12	

The handling of freight, to and from connecting lines, during the six months period ended December 31, 1916, was seriously interfered with on account of the unprecedented congestion of freight traffic throughout the country, especially in the East, which resulted in numerous embargoes being placed from time to time by Eastern carriers. In consequence of this congestion, the shipment of much of the 1916 crop of cotton was necessarily withheld until after December 31, 1916.

SHORTAGE OF FREIGHT CARS.

During the latter part of July, 1916, the shortage of freight cars was quite apparent, and by September 1st had become extremely acute. The demand for cars increased from week to week, causing the greatest car shortage in the history of the Company.

On account of being an originating carrier, the greater part of this Company's cars were sent beyond its rails, and in spite of repeated efforts to secure a corresponding return of equipment from connecting lines, very little was accomplished in that direction. This condition reduced the supply of cars on this Company's lines to approximately fifty per cent of its ownership, which condition had a material effect on the Company's revenues. Late in the Fall of 1916 the Interstate Commerce Commission initiated a hearing at Louisville, Kentucky, with the object of forcing cars home to owners; various orders were issued to accomplish this, but practically no benefit was derived therefrom.

RATE SITUATION.

The financial results from operation for the period of six months covered by this report were adversely affected, in no small degree, by increases in wages and in cost of materials and supplies.

Since the close of the period ended December 31, 1916, the constantly advancing prices of materials and supplies of all kinds, including fuel, growing out of the European conflict and various other causes, have acquired a momentum which has carried them to figures unheard of heretofore. Added to these almost prohibitive costs, the railroads have been required to shoulder numerous additional burdens, such as: higher wages for trainmen and engineers, under provisions of the Adamson Law, effective January 1, 1917; necessary increases in the wages of other employees of all classes, higher rates of taxes and additional forms of taxation as well as other onerous increased expenses which have to be met.

These conditions, coupled with a lack of adequate facilities and available credit, have brought the railroads and the public face to face with a most critical situation, in which the railroads may be placed in a position to efficiently handle existing traffic and be prepared to meet the

necessities of the international situation, it is absolutely essential that they be granted higher rates.

Realizing the emergency now confronting them the railroads have made application to the Interstate Commerce Commission for a general advance in interstate freight rates and to the various state rate-making bodies for similar general advances in State rates.

It is hoped that both the Federal and State rate-making bodies, recognizing the acute predicament in which the railroads now find themselves, as well as the justice of their claims, will speedily grant the necessary relief in the way of the prayed-for advances in rates.

AGRICULTURAL AND INDUSTRIAL.

Agriculture is one of the most important industries of the Southwest and a proper appreciation of the many opportunities for improvement in agricultural methods should result in a corresponding increase in agricultural resources. This can best be accomplished through education and demonstration of proven principles of farm management, through encouragement of the live stock industry and conservation of soil fertility. Much educational work has been conducted along these lines by the Company's Agricultural and Industrial Department.

The six months period covered by this report includes the harvest time for the cotton crops. During this period, the territory served by this Company's lines has enjoyed unusual prosperity due to good crops, high price of cotton, its by-products, and grains, and because of the fact that the farmers have practiced crop diversification and have produced the greater part of their foodstuffs during their former period of adversity. It is hoped that this company is taking an active interest, to grow more feed and foodstuffs will, no doubt, be productive of good results during the 1917 crop season.

The rice crop of Arkansas was the largest and best in the history of the industry and highly profitable to the growers. However, the shipment of a large part of this crop was delayed beyond the period of this report, on account of the car shortage and other conditions.

The demand for lumber and other forest products has been good, and the movement during the six months period under review has been as heavy as the car supply would permit. The extreme car shortage which prevailed during all of the latter part of 1916, made it impossible to supply all of the cars required for the lumber industry, and while the tonnage was greater than during the corresponding period of the previous year, this increase was largely due to the heavier loading per car. The present demand for lumber is unprecedented and with a better car supply should show a greater tonnage for 1917.

Throughout the territory traversed by this company's lines, there has been a most commendable continuation of industrial development. Cities, towns, and rural communities have undergone substantial improvements, especially as to more and improved types of schools, construction of good roads, drainage ditches, etc.

The enactment of the Federal Farm Loan Law will have a tendency to stabilize farm credits in the South and to make it possible for the farmers to borrow money from usual sources at a reasonable rate of interest and under conditions whereby they can make more permanent improvements. In order to place the advantage of the Federal Farm Loan Act clearly before the farmers, the Agricultural and Industrial Department of these lines has distributed a large number of the Federal Farm Loan "primers" and have also given instructions in meetings and otherwise as to the proper methods to pursue in the formation of local Federal Farm Loan Associations. In several localities, local associations have already been formed in anticipation of the establishment of the Federal Farm Loan Banks, which will put the law into practical operation.

FEDERAL VALUATION.

The work of valuation of these lines, begun by the Interstate Commerce Commission late in the year of 1914, was continued during the six months under review. The field forces of the Government have completed their work on the line, and the data obtained taken to the Chicago Office of the Division of Valuation for pricing and final valuation.

The preparation of Land and Equipment data, which is being compiled by the Company in response to orders of the Commission, is under way and will probably be ready for submission in the Summer of 1917. The completion of the Division of Valuation work on the Federal Farm Loan Act, which has been on the Company's books since February 8, 1915, are still engaged, and it is expected, will complete their work in the Company's general offices by the middle of the Year 1917. As nearly as can be determined at this time, the Commission's "Tentative Valuation" of these lines was made in the latter part of 1917 and under the Valuation Act the Company will have thirty days within which to file its protest.

The amounts expended by these lines on account of Federal Valuation work to date are as follows:

Year ended June 30, 1915	\$14,812.81
Year ended June 30, 1916	30,639.66
Six months ended December 31, 1916	10,478.17
Total	\$55,930.64

During the latter part of 1916, the Commission served "Tentative Valuations" on four carriers, consisting of the Atlantic & Pacific Railroad Company, The Texas Midland Railroad Company, New Orleans, Texas & Mexico Railroad Company and The Kansas City Southern Railway Company. Each of these carriers filed vigorous protests against the methods employed and results obtained by the Commission and several hearings have since been held on the subject of these protests. These hearings have been attended by representatives of the Company.

INVESTMENT IN ROAD AND EQUIPMENT.

In Exhibit "H" on page 35, under heading "Investment in Road and Equipment" will be found a statement of expenditures made for additions and betterments during the six months period ended December 31, 1916.

EQUIPMENT.

On page 61 will be found a list of equipment owned as of December 31, 1916, compared with June 30, 1916, showing changes made during the six months period.

Eight ten-wheel passenger locomotives and twelve consolidation freight locomotives, acquired under the terms of an Agreement of Conditional Sale, and referred to in the preceding annual report, have been received and placed in operation since the close of the period ended December 31, 1916.

A program is now in effect which provides for the rehabilitation of freight equipment, extending over a period of three years. This program involves the dismantling and rebuilding of 4,650 box cars at the rate of 1,550 per annum, heavy maintenance repairs to 829 freight cars of various classes, the retirement (by scrapping or sale) and "writing out" of Road and Equipment—Equipment account, of 537 light capacity (40,000 pound) freight cars of various classes, which are no longer fit for service on account of light capacity, old age and decay, and the equipping of freight train cars owned with safety appliances. United States standard, all of which work is now being carried on at the Company's shops. At close of

the period ended December 31, 1916, 616 box cars have been dismantled and rebuilt, and heavy repairs have been made to 343 cars of various classes, and 71 of the obsolete light capacity cars, have been scrapped or sold and their original cost "written out" of the Equipment account. The program for equipping cars with safety appliances, United States standard, is well under way and it is now anticipated that all freight cars will meet the requirements of the Interstate Commerce Commission not later than March 1, 1918, the final date set by the Commission for compliance with the Safety Appliance Act.

Since the period covered by this report, contract has been let for the building of 125 steel underframe, 80,000 pound capacity, box cars to fill the vacancies caused by destruction of a similar number of 60,000 pound capacity wooden box cars, covered by Equipment Trust Agreements, and arrangements have been made to fill such vacancies in future by building the cars at Company shops.

VALLEY TERMINAL RAILWAY.

The Valley Terminal Railway has been organized for the purpose of constructing a complete freight terminal at Valley Junction, in St. Clair County, Illinois, adjoining East St. Louis. The capital stock of the Valley Terminal Railway is owned by this company. Property (consisting of about 126 acres of land) has been acquired, plans for the track layout, engine house, machine and car repair shops, and various other buildings have been made, and at the date of this report, work has been commenced, and if weather conditions permit, it is hoped the work may be completed during September or October of the present year.

This Terminal will connect with the Missouri Pacific—St. Louis Southwestern Joint Illinois main line, and The Terminal Railroad Association of St. Louis (through its subsidiary, the Illinois Transfer Railroad), at Valley Junction, Illinois, and with both the Alton & Southern and Illinois Central Railroads at the East end. At present it is the intention to lay out fourteen miles of track.

BROOKLYN RAPID TRANSIT CO.—REPORT OF THE BOARD OF DIRECTORS TO THE STOCKHOLDERS

FOR THE YEAR ENDING JUNE 30, 1917.

85 Clinton Street,
Brooklyn, N. Y., July 23, 1917.

The operations of the system for the year ending June 30, 1917, with comparison for the preceding fiscal year, are shown generally in the following table:

COMPARATIVE STATEMENT OF THE RESULTS OF THE OPERATIONS OF THE BROOKLYN RAPID TRANSIT SYSTEM FOR YEARS ENDED JUNE 30, 1917 AND 1916.

	1917	1916	Increase—Decrease—
Gross Earnings from Operation.	\$29,504,018.96	\$27,948,771.81	+\$1,555,247.15
Operating Expenses	16,741,417.19	15,693,907.81	+ 1,047,509.38
Net Earnings from Operation	12,762,601.77	12,254,864.00	+ 507,737.77
Income from Other Sources	427,814.75	438,705.88	- 10,891.13
Total Income	13,190,416.52	12,693,569.88	+ 496,846.64
Less Taxes and Fixed Charges	7,995,178.23	7,081,737.70	+ 913,440.53
Net Income	5,195,238.29	5,611,832.18	- 416,593.89
Surplus at Beginning of Year.	11,562,654.04	10,621,966.45	+ 940,687.59
Total	16,757,892.33	16,233,798.63	+ 524,093.70
Other Credits to Surplus during year	22,603.07	29,958.05	- 47,354.98
Total	16,780,495.40	16,303,756.68	+ 476,738.72
Of this amount there has been appropriated:			
Accounts written off.	5,515.97	6,330.75	- 814.78
Adjustment of Expenses prior year*	1,088.36	8,621.97	- 9,710.33
Supersession and Depreciation	289,022.50	66,247.94	+ 222,774.56
Loss from operation of Employees' Restaurant	5,631.86	2,338.35	+ 3,293.51
Adjustment of Special Franchise and Real Estate Taxes	135.37	183,970.44	- 183,835.07
Expenses in connection with Thompson Legislation Investigation of Public Service Commission		4,850.00	- 4,850.00
Allowance to Employees in Military Service	17,345.81	1,425.19	+ 15,920.62
Christmas Gratuities to Employees	29,341.29		+ 29,341.29
Dividend on B. R. T. Co.'s Stock outstanding	4,467,318.00	4,467,318.00	
Total Appropriations	4,813,222.44	4,741,102.64	+ 72,119.80
Balance Sheet Surplus	\$11,967,272.96	\$11,562,654.04	+ \$404,618.92

*Credit.

The year's surplus applicable for dividends was \$5,195,238.29—equivalent to 6.97 per cent on Brooklyn Rapid Transit Company's stock outstanding.

The gross revenue from operation was \$29,504,018.96, a gratifying increase of \$1,555,247.15, or 5.56 per cent.

The operating expenses were increased by the same influences which have prevailed generally throughout the country in cumulative force since

the breaking out of the European war, namely, the rising prices of labor and materials. These expenses aggregated \$16,741,417.19, an increase of \$1,047,509.38, or 6.67 per cent—most of which increase was represented by higher wages. The percentage of operating expense to transportation revenue was 56.74, as compared with 56.15 for the preceding year. The charges to maintenance of way and structure and equipment aggregated \$5,001,637.33, a slight increase over the charges for the preceding year. The amount expended, however, was less than the amount charged by \$120,376.02, which balance was carried to the credit or reserves. The large increase in the cost of power was due primarily to two factors, namely, the higher cost of coal, and the necessity for purchasing outside power because of delay on the part of the Public Service Commission in approving arrangements for the supply of power for rapid transit lines.

The burden of taxation continues to increase, the amount charged for the year being \$2,331,104.16, which is 27.94 per cent more than for the preceding year.

Deductions from operating income were swelled by the addition of \$442,863 to interest, on account of new rapid transit properties placed in operation. Other interest and rental deductions were somewhat less than for the preceding year, making the net deductions \$400,018.89 greater. The remaining surplus is \$416,593.89 less than for the preceding year. In other words, the addition of \$1,555,247.15 in gross operating revenue, while \$507,237.77 was saved in net revenue, the net operating revenue and interest absorbed all of this saving and considerably more. Nevertheless the company was able to maintain its dividend rate of 6 per cent, and add a substantial amount to the system's surplus.

It is gratifying to note that the operations of the company's rapid transit lines in conjunction with those provided by the city under the provisions of the contracts of March 19, 1913, resulted for the year ending June 30, 1917, in earnings not only the first preferential of \$3,500,000 (which accrues under the contracts to the operator and is applied to interest on obligations outstanding prior to the date of the contracts, and to dividends), but within \$250,371.77 of interest at the rate of 6 per cent on the cost of the properties placed in operation since March 19, 1913. This deficit is cumulative and becomes a charge against the earnings before the company receives interest on its investment. The total deficiency from the beginning of temporary operation on August 4, 1913, to June 30, 1917, is \$1,037,276.78. In other words, notwithstanding that it is subsequently to be made good, has been absorbed as it accrued in the respective annual statements of the system. These results have been attained before the completion of the combined system and without the addition of any new lines which contribute materially to net earnings. The showing is indicative of the possibilities of the completed system and justifies the previously expressed confidence that it will only be a short time after complete operation when all of the operator's preferentials will have been earned and the city will begin to get interest on its investment. The Broadway subway, which is expected to contribute largely to this result, will be partially opened for operation during the next few months, but unfortunately the completion of the entire line with its resulting benefits will be still longer deferred.

SPECIAL BURDENS ON SURFACE LINES.

The street surface railroad companies of the system have applied to the Public Service Commission for a modification of its order of March 17, 1914, establishing certain rules and regulations regarding the issuance of transfers.

This order was accepted under protest and without waiving any legal rights, and upon the understanding that in case the effects should be adverse the companies would apply to the Commission for relief. The Commission's order required the establishment of over three hundred additional transfer points, and became effective June 1, 1914. Under the new regulations the passenger receipts of these companies have remained practically stationary, while during the three years preceding the order the average increase in passenger revenue had been over \$600,000 per year. The number of transfer passengers carried, however, has increased from 146,000 in 1913, to nearly 173,000,000 in 1917, and the average fare per passenger has consequently decreased from 3.41 cents in 1913 to 3.26

EMPLOYEES' SUBSCRIPTIONS TO LIBERTY BONDS.

The participation of employees of the system in the Government Liberty Loan was particularly gratifying. The number of employees making subscriptions was 7,744, and the total number of bonds subscribed for was \$578,850. Of these bonds 10,775 were in \$50 denomination. Subscriptions came from every department, and were encouraged by the partial payment plan offered by the company, whereby to those who chose to avail themselves of this plan installments on account of subscriptions are deducted weekly or monthly from the pay rolls—the period of payment extending over one year or the term of certain employees over two years, in the case of other employees. By this method not only was the volume of subscriptions made large, but employees were encouraged to set aside a portion of their earnings in a thrift fund. In order to finance the transaction the company borrowed the amount necessary to pay for the bonds originally, with the privilege of reducing its loan from week to week as installments on the purchase price are received from subscribers.

EMPLOYEES' WELFARE WORK.

For various activities in the interest of the health, social entertainments, life insurance and welfare of its employees, the companies of the system expended during the year \$132,803.78, including the application to these items of \$13,487.36 received from the collection of fidelity bond premiums. Of this amount \$32,653.68 was for pensions, and \$35,559.50 was for life insurance.

On June 30, 1917, 6,245 employees were members of the Group Insurance Plan—a net increase of 497. During the fiscal year the beneficiaries of deceased employees were paid the sum of \$61,000 under the terms of the policies.

RELATIONS BETWEEN COMPANY AND EMPLOYEES.

Throughout the labor disturbances in the summer and autumn of 1916, which temporarily interfered with the operations of most of the transportation lines of the city, our employees gave renewed evidence of their loyalty and co-operation. They repelled the efforts of outside agitators to stir up discord and to paralyze service. The sympathetic relations which had prevailed for years between men and management remained unbroken. In order that it might be strengthened, a better opportunity given for mutual consultation, the functions of the Employees' Benefit Association (comprising practically all employees) were enlarged by provision for the election by secret ballot of trustees representing the various departments of the system, who will be the spokesmen of their fellow employees, respectively, in working out in conjunction with heads of departments the improvement of working conditions. These departmental trustees meet periodically and have already accomplished much towards the purposes for which they were elected.

FIRE INSURANCE.

The Insurance Reserve Fund was increased during the year by \$59,836.84, and amounted on June 30th last to \$898,934.02. The average amount of reinsurance in effect during the year was \$25,046,494.38, upon which the fire losses made during the year total of 23.8%. On account of certain adjustments this rate was somewhat sub-normal.

The fire losses during the year aggregated \$1,959.47, of which \$399.73 was paid out of the reserve fund, and the remainder through reinsurance. The protection for prevention of fire has been rigid and systematic, and this accounts for the very small percentage of loss.

FREIGHT OPERATION.

The South Brooklyn Railway Company has continued to conduct the freight operations of the system. These have been interfered with considerably during the past year by reconstruction work on lines and terminals, and by the competition of automobile trucks in the carriage of beer, ice and asphalt. The freight revenues were \$205,556.09, an increase of 12,386.04, and the operating expense was \$304,666.22.

Several new sidings at manufacturing plants have been installed, and this seems to be the tendency on the part of Brooklyn manufacturers to take further advantage of the facilities which are offered. This is particularly true in outlying territories where freight operation can be conducted without interference with the regular passenger business of the system.

MISCELLANEOUS IMPROVEMENTS, RENEWALS AND REPAIRS.

Additions, renewal and even ordinary maintenance work have been retarded and prevented by the prevailing conditions affecting the supply of labor and materials. Not only has the work been more expensively, but on account of the impossibility or delay of getting material, much desirable work has had to be postponed. This is particularly true in renewals of tracks, where only a part of the reconstruction program has been carried out because of the failure to get rail. This condition seems likely to continue for at least another year.

Among the various expenditures for maintenance and construction during the fiscal year (other than construction and equipment expenditures on rapid transit lines referred to in a preceding part of this report) are the following:

The 30,000 K.W. Turbo Unit and Condenser Outfit, contracted for in January, 1916, for the Williamsburg Power Station, which was to have been received in August, 1916, was not delivered until recently. The condenser has been installed and the turbo unit is being erected and is expected to be ready for service about the first of October.

Repairs have been made for a further increase in power facilities by a reconstruction of the East River Power Station. The 25,000 K.W. Turbo Units for this station have been contracted for, to be delivered during May and November of 1919.

During the year 18 Taylor stokers were installed in the Williamsburg Power Station, making 24 in all. In addition, 8 blower engines have been installed, 4 of which are now in service. Orders have been placed for 36 additional stokers and 4 blower equipments, making a total of 72 stokers for the station. In the same station the rebuilding of coal downtakes for 18 boilers, and the provision of ash downtakes for 11 boilers have been completed; the main steam header was rebuilt; the work of rebuilding the auxiliary steam piping in the boiler room on account of increase in the working steam pressure is about one-half completed; 42 feed water regulators have been ordered, and a boiler was installed to provide automatic regulation of the feed water, which will result in more efficient operation of the boilers and auxiliaries.

At the Central Power Station two coal bridges have been constructed, with a capacity of 125 tons of coal per hour, and two of these bridges is in operation and the second is under way. The slip on the north side of the station was rededicated to provide for the entrance of barges in connection with the proposed storage of coal on the north side of the slip.

At Richmond Hill, the new substation was completed. The 3,000 K.W., Essex Street Substation from 3,000 K.W. to 5,000 K.W.; the Parkville Substation from 4,000 K.W. to 6,000 K.W.; part of these increases in capacity being provided by the transfer of power from other stations.

Additional switchboard panels have been installed in the Tompkins and Myrtle Substations, and additional switchboard equipment has been ordered for the Coney Island Substation.

During the year the overhead lines removed from the system 49.71 miles of overhead direct current feeders, of which 11.02 miles were reinstalled in other parts of the system; 25.09 miles of underground feeders were removed, and 14.69 miles reinstalled in other parts of the system.

There were renewed 97.40 miles of trolley wire, and 1,309 feet of conduit line were constructed on Avenue H from the Brighton Beach line to Ocean Avenue.

There were 862 trolley poles installed during the year; 419 removed; 181 reset; 375 reinforced, and 2,450 repainted.

On May 4, 1917, the surface railroad operating headquarters at Ridge-wood were transferred to the new terminal at Fresh Pond Road, and the former property was put up for sale.

Various improvements and repairs were made in buildings and other structures.

Approximately 11½ miles of surface track were reconstructed, involving the entire removal of the old track structure and foundation, and its replacement with new 7-inch standard grooved girder rail, on wood ties, with cast welded joints and tie rods, and the installation of new pavement on concrete foundation.

The surface track overhauled and repaved amounted to 12,652 lineal feet of single track.

The new lines of surface track constructed during the year aggregated 56,465 feet measured as single track. This construction was at the following places:

Palmetto St., St. Nicholas Ave. to Myrtle Ave.	944 ft.
Flatbush Ave., Ave. N. to Ave. U	8,673 "
Eighth Ave., 39th St. to Jay Ridge Ave.	15,432 "
Fresh Pond Rd., Luthern Line to Metropolitan Ave.	3,652 "
Metropolitan Ave., Dry Harbor Rd. to Jamaica Ave.	18,041 "
Surf Ave., West 8th St. to West 5th St.	591 "
New 110th St., Brighton Beach	4,932 "
Line on Ralph, Fulton and Kemble Aves. to Atlantic Gulf and Pacific Co.'s plant.	4,200 "

With the exception of the new street at Brighton Beach and the line leading to the Atlantic Gulf and Pacific Company at Mill Island, the above construction was 7-inch grooved girder rail with sheet asphalt pavement on concrete foundation. Granite curb pavement with sand foundation on Flatbush Avenue, and standard 5-inch granite on concrete foundation on the remainder of the lines.

We reconverted car tracks to the extent of 122,111 square yards of pavement, divided as follows:

New granite on concrete	74,758 square yards
New granite on sand	4,903 "
Recut granite on concrete	12,589 "
Recut granite on sand	11,234 "
Wood block	11,234 "
Sheet asphalt	14,720 "
	122,111 "

Twenty-one pieces of surface track special work were installed; 75 renewed, and 33 repaired. Twelve electric switches were installed.

The single track on Adams Street, north of Front Street, comprising 230 lineal feet, was again improved by the laying of a single track from property conveyed to the Brighton-by-the-Sea at Brighton Beach.

A dump track for disposal of snow was installed at the dock at the foot of Fulton Street.

Surface storage tracks were removed from the storage yard at Ocean Avenue and Avenue Z, upon expiration of the lease of that property.

The new drawbridge over Coney Island Creek at Stillwell Avenue and the connecting tracks were placed in operation.

Of the 1,652 lineal feet of structure were repaired; 21,998 ties were renewed, besides 106,832 lineal feet of guard rail, and 58,170 lineal feet of footwalk.

The rail and special work renewals on the elevated lines consisted of renewing 41,426 feet of 80-rb running rail; 4,988 feet of 100-lb. running rail; 702 feet of guard rail, besides various frogs and switches.

The equipment of all surface passenger cars with air brakes required by order of the Public Service Commission was completed with the installation of 128 sets of air brakes on 116 cars. The equipment of all elevated passenger cars; there were also installed 24 geared hand brakes, completing this installation.

Whiting electrically driven cranes were installed on three cars, displacing derricks and pillar cranes.

Considerable work was done in the repainting, repainting and overhauling of equipment, the number of surface cars passing through the shops for this purpose, or for damage in operation, being 3,280, and number of elevated cars 1,184.

For experiments' purpose four sets of passenger cars were equipped with enclosed platforms, the doors of which are interlocked with the power control of the car.

Various machines were added to the shop equipment.

Three hundred pairs of Brill maximum traction trucks were equipped with inside hinge brake riggings, and 87 pairs of the same class of trucks on cars of the Coney Island & Brooklyn Railroad Company were equipped with fixed wheel guards.

INCREASE IN NUMBER OF STOCKHOLDERS.

The number of stockholders at the date of closing the books for dividends in June, 1917, was 9,187, an increase of 149 as compared with the similar date of 1916.

RESERVE ACCOUNTS.

Reserves have been added to during the year as follows:	
Insurance	\$59,836.84
Amortization of Capital, etc.	\$73,229.61
Employer's Liability	\$0,451.23

Total.....\$33,517.68

As against these additions, however, payments have been made on account of Employer's Liability amounting to \$20,522.55, and charges to amortization of Capital, etc., on account of property retired, aggregate \$474,802.12, thereby reducing the accumulated reserves, as shown in the balance sheet by \$171,811.99. The adjustments for property retired which are reflected both in this statement, in the direct charges to profit and loss, and in the capital accounts) are somewhat abnormal, being increased considerably by the discard of obsolete passenger house equipment, no longer required transmission lines and by the removal of car tenders.

CONSTRUCTION EXPENDITURES.

On account of the construction and equipment of rapid transit lines under contract with the City, the New York Municipal Railway Corporation has expended during the year an additional amount of \$9,146,736.03, making the total expended from June 1, 1917, to June 30, 1917, \$11,149,308.40.

On account of contribution to City-owned lines	\$11,149,308.40
On account of equipment of City-owned lines	8,371,379.79
On account of additions, extensions and improvements of existing railroads	30,458,760.53

Total.....\$49,981,311.32

Other economies of the system have expended during the year for track and roadway (including extensions), \$1,249,326.83, and for \$256,318.12 for power plant, \$174,657.27 for cars and electrical equipment, \$22,589.00 for buildings and fixtures, \$48,608.43 for real estate, and the remainder for other purposes. Against these charges, however, credits have been made for properties displaced aggregating in value

\$957,200.82, leaving a net addition to the property accounts of other companies \$292,125.71.

BROOKLYN RAPID TRANSIT REFUNDING MORTGAGE FOUR PER CENT. BONDS.

Authenticated to July 1, 1916..... \$55,705,000.00
Authenticated during year..... 223,000.00

Converted into stock..... \$55,928,000.00
29,619,000.00

Deposited with Trustee of The Nassau Electric Railroad Consolidated Mortgage..... 725,000.00
Guaranty Fund Brooklyn City Railroad Lease..... 250,000.00
\$22,850,000.00

* \$2,265,000 par value of these notes have been converted into New York Municipal Railway Corporation's five per cent. first mortgage bonds, as permitted, prior to January 1, 1916, by the terms of the trust agreement.

Detailed statements of operation, various statistics and consolidated balance sheet are appended hereto.

The Board of Directors desires to express its appreciation of the loyalty and efficiency of its employees during the past year, particularly in view of the trying conditions of the times through which we are passing.

In order of the Board,
T. S. WILLIAMS,
President.

CHICAGO, BURLINGTON & QUINCY RAILROAD COMPANY—SIXTY-THIRD ANNUAL REPORT

Chicago, January 1, 1917.

To the Stockholders of the Chicago, Burlington & Quincy Railroad Company:

As of July 1, 1916, there was issued the Sixty-Second Annual Report of your Company, covering the year ended June 30, 1916. Since then the Interstate Commerce Commission has changed its fiscal year for which carriers are required to make reports, to end December 31 instead of June 30 as heretofore. A similar change in the fiscal year has been made by most of the railroads of the country and your directors took similar action at meeting held January 24, 1917.

It has seemed best, for purpose of future comparisons, to make this report cover the fiscal year ended December 31, 1916, and the figures are so presented herein. There are included, however, for the six months period ended December 31, 1916, an Income Account Statement, and tables showing Changes in Equipment, Revenue Freight Carried and Investment in Road and Equipment.

COMPARATIVE INCOME STATEMENT, YEARS ENDED DECEMBER 31.

Wyoming	309,444.33	206,803.24	Inc. 102,641.09
Other States	199.51	280.55	Dec. 81.04
Total States	\$4,130,146.26	\$4,047,016.53	Inc. \$83,129.73
United States Government	\$690,051.11	\$215,535.03	Inc. \$474,516.08

Grand Total \$4,820,197.37
The large increase in the United States government tax was due principally to the change of rate from one per cent to two per cent of the net income.

STATISTICS OF OPERATIONS.

The large increase in Operating Revenues, and the increased efficiency of operation, resulted in reducing the operating ratio from 64.25 in 1915 to 60.58 in 1916. This operating ratio of 1916 was further reduced to 59.74 by the deduction from Operating Expenses of the credit for "Trans-

portation for Investment" as a recent requirement by the Interstate Commerce Commission.)

Increased efficiency of operation is shown by an increase of 22.7% in ton miles of revenue freight being carried with increases of only 11.7% in freight train miles and of 10.8% in freight train car miles.

There was an increase of 6,281,581 tons, 19.04%, in revenue freight carried of which 4,687,982 tons, an increase of 20.86%, was in freight originating on this road, and 1,593,599 tons, an increase of 15.14%, in freight received from connecting carriers.

The principal increases were in grain, live stock, bituminous coal and in petroleum and other oils. The increase in grain was 1,309,370 tons, 31.66%, of which 1,102,112 tons, an increase of 31.86%, originated on this road. The increase in live stock was 205,463 tons, 10.89%, of which 166,124 tons, an increase of 10.75%, originated on this road. The increase in bituminous coal was 1,935,469 tons, 20.30%, of which 1,854,056 tons, an increase of 23.80% originated on this road. The increase in petroleum and other oils was 386,011 tons, 51.22%, of which 340,166 tons, increase 92.91%, originated on this road.

The increase in bituminous coal was due to some extent to our reaching new mines, but principally to the fact that last year eastern coal found its market in the east to a much greater extent than in former years, due to increased demand from industries for coal; also increased export and transshipment movement. The car situation and serious congestion in the east also militated against free movement to western territory, resulting in greatly increased demands for western and Illinois coal.

The increase in petroleum and its products was due principally to increased oil demand in the Wyoming fields served by this Company. This tonnage has developed satisfactorily.

Grand Total.....	\$655,497.70	\$8,819,662.58	\$7,677,578.87	\$8,616,034.14

* Of this amount \$1,175,999.32 was charged to previously appropriated surplus. The total of appropriations made as of June 30, 1916, and December 31, 1916, was (vide pages 5 and 23) \$8,864,395.48, which covered Additions and Betterments for 6 months to December 31, 1915, \$2,363,515.92, for 12 months to December 31, 1916, \$6,501,579.56.

During the year there was a further expenditure of \$94,680 for land for Chicago Terminals, making the total expended \$51,120,634.

For the reconstruction of the Missouri River bridge at Kansas City, there was expended during the year, \$711,179, of which \$694,338 was charged to Operating Expenses and the balance to Additions and Betterments. This makes the total expended to date \$1,012,768. It is estimated that the charges subsequent to Jan. 14, 1917, will amount to \$402,000, making the total cost for the bridge \$1,414,768.

There has been expended during the year for track elevation at Aurora, Ill., \$222,993, most of which was chargeable to Additions and Betterments, the total charged to date being \$1,003,584. The estimated further cost is \$2,061,592, making the estimate for complete work \$3,065,176.

The building of the new Chicago Union Passenger Station requires a rebuilding of your Company's freight terminals at Chicago, and during the year there was expended on a temporary freight terminal \$161,860, and on the permanent work \$20,089.

During the year the work on new shops and additional tracks at West Burlington has been carried along at an expenditure of \$911,468, most of which was charged to Additions and Betterments. The estimated further cost is \$544,301, making the total estimated cost at completion, \$1,455,769.

Second track has been constructed during the year:

Steward Jet. to Flag Center, Ill.....	\$164,628
On Beardstown Division.....	525,740
On La Crosse Division.....	372,454
Forbes to Curzon.....	88,726

Making a total of..... \$1,351,548

and the estimated cost of completing these pieces of double track will bring the total to \$2,921,165.

Work has been continued on the Chalco-Yutan Cut-Off at an expenditure during the year of \$438,440, making the total expended to date \$638,216 and leaving an estimated further expenditure of \$130,000 to complete the work.

On New Line and necessary side tracks between Glenview and Thornspool, there has been expended \$335,874, making the total amount expended \$558,757, leaving an estimated expenditure of \$20,000 to complete the work.

As indicated, the operations reflected in the accompanying statements and report are those for the year ended December 31st, 1916, during part of which numerous items of expense have been affected by increased cost of materials and labor. These increases will affect the Operating Expenses throughout the whole of the year 1917; and there will be the large additional expenses now accruing through the increase in wages resulting from the "sacred" law. Effective Jan. 1st, 1917, and through increases in other wages which have been granted or are in process of negotiation. The 1917 figures will also reflect the more recent increases in cost of locomotive fuel and material and supplies, accruing on account of economic and other conditions affecting the country as a result of the European War and conditions relating thereto. Pending revenue measures likewise indicate a substantial increase in taxes payable during the coming year.

Following is the report of the General Auditor with statements prepared by him:

By Order of the Board of Directors, HALE HOF DEN,
President.

COLORADO & SOUTHERN RAILWAY COMPANY—EIGHTEENTH ANNUAL REPORT

CHICAGO, January 1, 1917.

To the Stockholders of The Colorado & Southern Railway Company:

Herewith is submitted the Eighteenth Annual Report of your Board of Directors for the year ended December 31, 1916. In order to conform with the orders of the Interstate Commerce Commission, your Board of Directors amended the By-Laws of the Company so that the fiscal year begins on January 1st and ends on December 31st each year.

The following report sets forth comparative statements for the newly adopted fiscal period and combines the operations and affairs of the Lines operated by the Company named on the preceding page and which are herein designated as the

"COLORADO & SOUTHERN LINES."

FISCAL YEAR JANUARY 1 TO DECEMBER 31.

Railway Officers

Executive, Financial, Legal and Accounting

F. A. Deverell, general auditor of the Cincinnati, Hamilton & Dayton at Cincinnati, Ohio, has been appointed assistant general auditor of the Baltimore & Ohio, reporting to the general auditor; W. E. Rittenhouse has been appointed assistant auditor merchandise receipts, reporting to the auditor of merchandise receipts, and J. G. Westbrook has been appointed special accountant, reporting to the general auditor. All with headquarters at Cincinnati, Ohio.

Morley Donaldson, vice-president and general manager of the Grand Trunk Pacific, at Winnipeg, Man., has resigned on account of ill health. He was born in Edinburgh, Scotland, on May 1, 1851, and was educated privately in France and Canada. He was for some time in the engine works of E. Gilbert & Co., Montreal, and later served under Walter and Frank Shanly during the construction of the Hoosac Tunnel, Massachusetts. In 1881 he entered the service of the Canada Atlantic as chief draughtsman, and later served successively as mechanical superintendent, superintendent of traffic and mechanical departments, and as general superintendent until the Canada Atlantic became merged with the Grand Trunk in 1905, when he became superintendent of the Ottawa division of the Grand Trunk. He was appointed vice-president and general manager of the Grand Trunk Pacific in 1912, and has been a member of the Canadian Society of Civil Engineers since 1889.

William Pittman Hinton, traffic manager of the Grand Trunk Pacific, at Winnipeg, Man., has been appointed vice-president and general manager, with headquarters at Winnipeg. He was

W. P. Hinton

born on August 30, 1871, at Ottawa, Ont., and was educated at Ottawa Collegiate Institute. On May 3, 1887, he began railway work in the auditor's department of the Canada Atlantic, and in September, 1891, became rate clerk in the traffic department. From March, 1896, to July, 1901, he was assistant general freight agent, and then was general freight agent, until his appointment in February, 1903, as general freight and passenger agent of the same road. In October, 1905, when the Grand Trunk absorbed the Canada Atlantic he became general agent in the passenger department of the Grand Trunk at Ottawa, Ont., in charge of immigration and transatlantic passenger traffic, remaining in that position until January 1, 1907, when he was appointed assistant general passenger agent of the Grand Trunk at Montreal. On May 1, 1909, he was appointed general passenger agent of the Grand Trunk Pacific at Winnipeg, Man., and in January, 1914, was promoted to assistant passenger traffic manager of the same road at Winnipeg. The following October he was promoted to assistant passenger traffic manager of the Grand Trunk and Grand Trunk Pacific lines, with headquarters at Montreal, Que. In November, 1915, he returned to Winnipeg as traffic manager of the Grand Trunk Pacific, having charge of both freight and passenger traffic; he was appointed at the same time to represent also the Canadian Government Railways with the title of western traffic manager, and now becomes vice-president and general manager of the Grand Trunk Pacific, also of the Grand Trunk Pacific Coast Steamship Company, Limited, with headquarters at Winnipeg.

Operating

R. King, assistant superintendent of the Canadian Government Railways at Winnipeg, Man., has been appointed acting superintendent, with headquarters at Fort William, Ont.; D. W. Steeper has been appointed acting assistant superintendent, with office at Graham, Ont.; J. H. Brassard has been appointed chief train dispatcher, with office at Levis, Que., and J. J. McLeod has been appointed chief train dispatcher at New Glasgow, N. S.

M. F. Leamy, trainmaster of the Delaware & Hudson at Albany, N. Y., has been appointed superintendent of the Saratoga division, with headquarters at Albany; L. A. Crounce succeeds Mr. Leamy; J. W. Nolan has been appointed assistant trainmaster, succeeding F. R. Griffin, assigned to other duties; H. S. Sloat has been appointed chief train dispatcher, succeeding Mr. Crounce, and C. E. Chubb has been appointed night chief train dispatcher, succeeding Mr. Sloat. All with headquarters at Albany.

C. R. Morrill, who has been appointed assistant general manager of the Southern Pacific at Houston, Tex., was born at St. Louis, Mo., on October 12, 1869, and entered railway service with the Southern Pacific in April, 1892, as a rodman, and served successively until 1897 as a chairman, draftsman and instrumentman. On the latter date he became roadmaster, and four years later was promoted to division engineer. In July, 1904, he became assistant superintendent, and in January, 1915, was appointed superintendent, with headquarters at Houston, which position he held until his appointment as assistant general manager.

Traffic

M. Walsh, traffic manager of the Georgia Coast & Piedmont at Brunswick, Ga., has resigned and the office of traffic manager, has been abolished. Effective August 8.

W. M. Hardin, whose appointment as general freight agent of the Minneapolis & St. Louis, with headquarters at Minneapolis, Minn., was announced in the *Railway Age Gazette* of

W. M. Hardin

August 10, was born at Independence, Mo., on May 3, 1878, and entered railway service in July, 1895, as a station helper on the Chicago & Alton. In the early part of 1898 he became telegraph operator with the Chicago, St. Paul, Minneapolis & Omaha, and in September of that year he went to the Minneapolis & St. Louis in the same capacity. Later he served successively as relief agent and traveling freight agent until January 1, 1909, when he was appointed commercial agent, with headquarters at Kansas City, Mo. On January

1, 1912, he was transferred to Minneapolis, and on November 1, 1915, was promoted to assistant general freight agent at Minneapolis, which position he held until his recent appointment as general freight agent, as already noted.

F. J. Parker, chief clerk to the general freight agent of the Michigan Central, at Detroit, Mich., has been appointed division freight agent, with the same headquarters.

Joseph W. Hickson has been appointed general Canadian freight agent of the New York Central, with headquarters at Toronto, Ont., in place of William A. Wilson, who has retired under the pension system.

S. G. Linderbeck, district passenger agent of the Seaboard Air Line, at Tampa, Fla., has been appointed division passenger agent, with headquarters at Jacksonville, and R. E. Camp has been appointed district passenger agent at Tampa, vice Mr. Linderbeck.

Lawrence Snapp, chief clerk in the passenger department of the Pittsburgh & Lake Erie, has been appointed assistant general passenger agent, with headquarters at Pittsburgh, Pa., succeeding W. B. Morris, resigned.

L. F. Vosburgh, general passenger agent of the New York Central at New York, has been appointed passenger traffic manager, and C. C. Howard, assistant general passenger agent at New York, has been appointed general passenger agent. Both with headquarters at New York.

F. La Bau, freight traffic manager of the New York Central at New York, has been appointed traffic manager; W. A. Newman, general freight agent at New York, has been appointed freight traffic manager, and G. C. Woodruff, division freight agent of the New York Central and the West Shore at Albany, N. Y., has been appointed general freight agent of both roads. All with offices at New York.

J. L. Amos, general agent of the freight department of the Missouri Pacific, with headquarters at St. Louis, Mo., has been appointed general freight agent, with headquarters at Kansas City, succeeding A. T. Stewart, resigned to become general traffic manager of the Sinclair Refining Company at Chicago; H. N. Atwood, general agent of the freight department at Milwaukee, Wis., has been transferred to St. Louis.

F. L. Jenkins, division passenger agent of the Southern Railway at Birmingham, Ala., has been appointed division passenger agent at Jacksonville, Fla.; G. R. Pettit, division passenger agent at Jacksonville, has been appointed district passenger agent at New York, N. Y., and T. J. Connell, division passenger agent at St. Louis, Mo., has been appointed special passenger representative at Atlanta, Ga.

The positions of New England freight agent, at Boston, Mass., and of commercial agent at Boston of the Seaboard Air Line, have been consolidated, and F. J. Cook, who was commercial agent at Boston, is now New England freight agent, with office at Boston; F. C. Cheney has been appointed commercial agent, at Greenville, S. C., vice N. M. Martin, resigned, and B. H. Hartley has been appointed commercial agent at Atlanta to succeed Mr. Cheney.

Bruce F. Moffatt, whose appointment as assistant freight traffic manager of the Minneapolis & St. Louis, was announced in the *Railway Age Gazette* of August 10, was born at Iola, Kan., on March 28, 1873, and entered railway service with the Iowa Central in 1893, in the local office at Marshalltown, Iowa. He served successively with that company in the auditor's office, the general freight department, and as traveling freight agent in Iowa. He later became commercial agent of the Minneapolis & St. Louis and the Iowa Central, at St. Paul, Minn., in which capacity he served until November 1, 1915, when he was appointed assistant general freight agent of the Minneapolis & St. Louis, with headquarters at Minneapolis, which position he held until his recent appointment as assistant freight traffic manager.

Engineering and Rolling Stock

H. A. Empie has been appointed general fuel agent of the Delaware & Hudson, with headquarters at Albany, N. Y.

T. L. Reed, master mechanic of the Seaboard Air Line at Hamlet, N. C., has been appointed master mechanic of the Georgia division, with headquarters at Howells, Ga.

Richard J. Vaughn, roadmaster on the Union Pacific at Evanston, Wyo., has been appointed general roadmaster, with headquarters at Omaha, Neb., succeeding Thomas Scott, resigned.

J. M. Grant has been appointed engineer maintenance of way on the Chicago, Peoria & St. Louis, with headquarters at Springfield, Ill., vice E. A. Froyd, who has been commissioned a captain in the United States Army.

A. L. Moler has been appointed master mechanic of the Saratoga and Champlain divisions of the Delaware & Hudson, with office at Colonie, N. Y., succeeding J. H. Stranahan, who has been transferred to the operating department.

W. Wells, division master mechanic on the Algoma district of the Canadian Pacific at Sudbury, Ont., has been appointed division master mechanic, with office at Schreiber, vice F. Grant transferred; T. Hambley, acting master mechanic at North Bay,

has been appointed division master mechanic, with office at Sudbury, vice Mr. Wells; and C. Gribbin has been appointed master mechanic, with office at North Bay, vice Mr. Hambley.

T. J. Skillman, division engineer of the Monongahela division of the Pennsylvania Railroad at Pittsburgh, Pa., has been appointed division engineer, office of the principal assistant engineer, New Jersey division, with headquarters at New York City, and W. F. Greene, division engineer of the Delaware division at Wilmington, Del., has been appointed division engineer, Monongahela division, with headquarters at Pittsburgh, Pa., succeeding Mr. Skillman.

H. S. Rogers, maintenance engineer of the Delaware & Hudson at Albany, N. Y., has been appointed division engineer in charge of maintenance of way forces on the Susquehanna division, with headquarters at Oneonta, N. Y.; F. C. Hohn has been appointed division engineer on the Pennsylvania division, with headquarters at Carbondale, Pa., and G. D. Hughey has been appointed division engineer on the Champlain division, with headquarters at Plattsburg, N. Y.

John J. Hanlin, whose appointment as assistant superintendent of motive power of the Seaboard Air Line with headquarters at Portsmouth, Va., has already been announced in these columns, was born on June 1, 1871, in Texas county, Missouri. He was educated in the common schools and in 1888 became an apprentice at the Birmingham Foundry & Machine Company, and four years later, on the completion of his apprenticeship, became a machinist on the Louisville & Nashville, remaining in that position until 1900. He was then appointed general foreman of the Birmingham Southern at Birmingham, Ala., and in 1904 became general foreman on the Seaboard Air Line at the same place. In 1907 he was appointed master mechanic at Atlanta, Ga., which position he held until his recent appointment as assistant superintendent of motive power of the same road, as above noted.

J. J. Hanlin

OBITUARY

Edward Dickinson, formerly receiver of the Kansas City, Mexico & Orient, died at his summer home at Miltons, Minn., on August 9. He was born at Cumberland, Md., on October 8, 1850, and entered railway service as a messenger in the freight office of the Cleveland & Toledo, at Cleveland, Ohio, in October, 1861. In 1865 he became telegraph operator on the Atlantic & Great Western, and in 1868 was promoted to assistant train dispatcher. For a short time in 1869 he was clerk and telegraph operator on the Union Pacific at Omaha, Neb., and in 1870 he became train baggage man and express messenger on the Atlantic & Great Western. In 1872 he was appointed train dispatcher on the Nebraska division of the Union Pacific, and served successively until July, 1890, as chief dispatcher of the Laramie division, superintendent of the same division, general superintendent of the Wyoming division, assistant general superintendent, general superintendent and general manager of the Missouri river division. On the latter date he became general superintendent of the trans-Ohio division of the Baltimore & Ohio, at Chicago, and one year later was appointed assistant general manager of the Union Pacific. In April, 1893, he was promoted to general manager, and in November, 1902, became vice-president and general manager of the Kansas City, Mexico & Orient, which position he held until March, 1912, when he was appointed receiver.

One of the fundamentals of the Y. M. C. A. organization is that the work and responsibility should be put squarely up to the members and boards of management by the employed officers. Too often the members discharge their responsibilities lightly and the brunt of the work is left to an overworked secretary and his staff. An emergency confronts the Railroad Y. M. C. A. of this country that will demand the very best service of every one of its members during the coming weeks; and it is fortunate indeed that the membership campaign that was carried on a year ago resulted in such large accessions to the membership of the various associations. The wartime activities of the R. R. Y. M. C. A. look not only to the needs of soldiers who may be engaged in guarding railroad property and to rendering service to groups of soldiers who may be camped in railroad centers where such associations are in operation, but also to looking to the comfort and convenience of soldiers in transit. With the movement of the National Guard into concentration camps and the gathering together during September of 687,000 men into the various cantonments, the extent of this work will be so great that if every member does not do his full duty, splendid opportunities for service will be neglected. The Y. M. C. A. has earned the admiration of the world because of the remarkable service that it has rendered to the soldiers during the war, and the railroad branch should take pride in the faithful discharge of the important assignment that has been made to it.

The Times (London) recently published a communication from a neutral observer who had returned from Germany, referring to the use of women workers on the railways of that country. In speaking of a group of women who were working at a railway junction as mechanics he said: "I must say that these women compelled my respect, for they seemed burly and healthy and not unhappy at finding themselves in the positions they now occupy." In commenting on the future of the women workers, however, this statement was made:

R. R. Y. M. C. A. Confronted with Big Task

"There is already much complaint about the moral conduct of women workers. I am told that in Westphalia, where prisoners of war and women work together in the mines, the most deplorable condition of things prevails." These matters are particularly deserving of attention at this time when so many women are entering railway service in this country. If these workers are surrounded by proper conditions there would seem to be little danger of the lowering of moral standards. The Canadian railways have employed women for comparatively heavy work in railway shops with excellent results. Undoubtedly they profited by a study of conditions abroad. For instance, it is very noticeable that they insisted from the very start on strict and high standards of conduct on the part of both the male and female employees in their relations to each other and that exceptional care was taken to provide in advance adequate and convenient rest rooms for the use of the women. In practically all cases these are in charge of what might be termed shop matrons, who assume not only the care of the premises but act in the capacity of matrons in looking after and keeping in touch with the women workers. England's experience has indicated that in order to secure the best results from women workers in shops and factories special care must be taken to avoid overwork and the rest periods should be maintained that are customary in times of peace.

No clearer statement of the necessity for American railroads to conserve and make full use of their locomotives and freight equipment could be made than that by Daniel Willard, president of the Baltimore & Ohio, in an address before the officers of that railroad, which was printed in our last week's issue. He showed that France and Russia will require about half the output of the locomotive builders in this country, and what transportation facilities mean to Russia in the prosecution of the war. If these facilities are not provided Russia may be forced to conclude a separate peace, thus releasing over two million German troops from the Eastern front for use on the Western front, and requiring

Women Workers on Railways

Increase the Efficiency of Cars and Locomotives

just that many more American troops at the Western front. The problem resolves itself, therefore, into one that affects our national existence. Russia must have locomotives and equipment if it is to do its part in the war, and we in this country must sacrifice, work harder and use what we have with greater efficiency in order that this equipment may be furnished that country. While engineers are planning and devising means of combating the submarine menace our railroad engineers and designers must plan and devise means of making locomotives and cars do more work. The cars must be kept in good condition and when repairs are made they should be done thoroughly so that the equipment will not spend an excessive time on the repair tracks. There are a large number of locomotives that can be made to do more work by the application of devices which will increase their power and hauling capacity and they can all be made to do their work efficiently if properly maintained. The mechanics in the shops, the inspectors in the yard and the repairmen on the repair track may play as important a part in the prosecution of the war as the men in the trenches. Each one must realize this and do his part unselfishly. With only fifty per cent of the output of our locomotive plants available for domestic use and with demands for transportation which cannot be met, the men at our "shop line front" have become important factors in the situation and no stone should be left unturned to have them thoroughly understand the responsibility that rests on their shoulders.

CONSERVE THE COAL SUPPLY

THERE is a great deal of talk about the need for conserving the food supply of the United States. There has not been so much talk about conserving the coal supply, but there is probably even more pressing need for doing so. The situation with respect to the coal supply which has developed since the United States entered the great war has become alarming. Attention has been called to one phase of it by a memorandum on the movement of coal to Lake Erie ports for trans-shipment by water to Duluth which Howard Elliott, a member of the Railroad's War Board, has made public, showing that the amount of coal which has been transported to the head of the lakes for consumption in the Northwest this fall and winter is much less than it was last year. As a result of representations made on behalf of the railways the government has ordered priority given to coal shipments to Lake Erie ports. This, however, is only one phase of a serious situation to which government officers, the railways, the coal operators and miners and the public should give immediate attention.

The railways within the four months April, May, June and July, moved much more coal in the country as a whole than ever before in any corresponding period. In April, 1917, they handled 20 per cent more anthracite and 22 per cent more bituminous coal than they did in April, 1916. In May they handled 24 per cent more anthracite and 27 per cent more bituminous coal than in May of last year. In June they handled 18 per cent more anthracite and 29 per cent more bituminous coal than in June of last year. In July they handled 19 per cent more anthracite and 34 per cent more bituminous coal than in July of last year. In April, May, June and July, 1916, they moved 2,297,290 carloads of coal, or approximately 115,000,000 tons. In the same months of this year they moved 2,951,054 carloads, or about 148,000,000 tons, an increase for the entire period over the same period of last year of 28 per cent. When it is considered that the amount of coal moved in 1916 was the greatest up to that time—in other words, that the railways have this year beaten their best previous record by 28 per cent—it will be seen that if the coal situation is not satisfactory this is not because the railways have not been exerting themselves to the utmost to make it so.

What, then, is the cause of the trouble? There are several causes. Two of the most important are the following: First, before the war a large amount of coal was transported by vessels on the Great Lakes and in coastwise service which have since been transferred to other service, with the result that there has been a very large increase in the part of the burden of carrying the country's fuel supply which has been thrown upon the railroads. Second, there has been an enormous increase in the demand for coal for carrying on the country's industrial and military activities. Another fact, which has especially affected the situation in the Northwest, has been that navigation on the Great Lakes began three weeks later this year than in 1916. This, based on 1916 figures, affected the coal movement from Lake Erie ports to the head of the lakes to the extent of 926,000 tons.

What are the remedies for the situation? To make sure that the great Northwest, for which the amount of coal loaded into boats at Lake Erie ports was 2,507,000 tons less during the first six months of the year than it was during the first six months of last year, will be provided with an adequate supply, Mr. Elliott, for the Railroads' War Board, has suggested that the federal government make use of some of the extraordinary powers recently vested in it, and the government has taken action accordingly.

In order, however, that the supply shall be made adequate to the needs of the entire country it is desirable not only that the production and transportation of coal shall be increased, but also that in all ways that are reasonable its consumption shall be curtailed. The railways themselves already have made a good beginning in this direction. They have reduced their passenger service at the rate of 20,000,000 passenger-train miles a year and have other reductions in contemplation which will make the total reduction about 30,000,000 a year. It is estimated that this will effect a saving of about 2,000,000 tons of coal a year. The railways are the largest consumers of coal, and perhaps they should and will have to go still farther in curtailing their passenger service as a patriotic measure for the saving of fuel.

Why should not other industries "do their bit" along this line by eliminating all unnecessary use of coal? Why should not also every family do a part of its "bit" by refraining from using any more coal than is necessary? As deficient as is the coal supply of the United States, the fuel shortage in European countries is far more acute. In every country which has entered the war and in every neutral country of Europe one of the most serious troubles to which the war has given rise has been the almost insuperable difficulty of getting enough coal to keep the railways and industries running and to keep the people from freezing. The best way for the people of the United States to secure partial immunity from coal shortage is to conserve the coal supply. The railways can do and are doing much to reduce the consumption and increase the movement of coal, but there is a limit to what they can do.

MINIMUM WEIGHTS, WAR NEEDS AND PATRIOTISM

IN our issue for August 3 we published an editorial entitled "State Regulation Interferes with Railroad Efficiency." It was based chiefly on a letter written by E. P. Ripley, president of the Atchison, Topeka & Santa Fe, to the Chicago Tribune, in which he criticised the state railroad commissions in the Middle West for, not permitting advances in the minimum carload weights on flour and other grain products to the basis allowed by the Interstate Commerce Commission—that is, 40,000 lb. In the present issue we publish a letter from Commissioner Dwight N. Lewis of the Iowa Railroad Commission, in which he criticises, not only Mr. Ripley's views on the subject of minimum carload weights, but also Mr. Ripley's attitude, or rather the attitude Mr. Lewis attributes to him, on railway regulation generally.

Mr. Ripley needs no defense from us, but we cannot let Mr. Lewis' criticism of him pass without saying that for many years he has stood forth as one of the ablest railway managers in the world, and that no railway manager in this country has been more public-spirited in operating his own railway or has done more to get railways generally operated in the interest of the public than he has. Furthermore, the charge that he has been "a most bitter opponent of railway regulation" is without foundation. He was one of the first among the heads of the large railways to recognize the fact that the Interstate Commerce Commission ought to be given the power to regulate rates, and, while he has been an opponent of certain kinds of regulation which have been especially prevalent in the Middle West, he has not been an opponent of regulation in itself.

Now, as to the specific subject discussed by Mr. Ripley and Mr. Lewis. It is well known—or ought to be well known—that the railways, owing to past unwise regulation and to conditions created by the war, are confronted by a traffic which has exceeded their capacity and which will soon be so large that they will be unable to handle it all unless they are able to move the maximum possible amount of freight with every freight locomotive and every freight car. In recognition of this fact, the railways, under the leadership of the Railroads' War Board, have been carrying on a nation-wide campaign to secure the maximum loading of cars and their prompt loading and unloading. A large part of the shippers of the country have responded to the appeals of the railways and are vigorously co-operating with them, but there are many shippers who are not doing so and who apparently will not do so unless they are forced to. The only way to force them to load heavier is to increase minimum carload weights.

Mr. Lewis, in his letter, refers to the opinion of the Iowa Railroad Commission rendered on July 23, 1917, in which the commission refused to permit an increase of the minimum carload weight on flour from 24,000 lb. to 40,000 lb. It was a matter of record in this case that the Interstate Commerce Commission had allowed a minimum weight of 40,000 lb. to be fixed on interstate shipments. It was also a matter of record, to quote from the opinion, that "there are practically no cars in active service on any of the larger systems of railways operating in Iowa of a capacity of less than 30,000 lb., and there are very few of less than 40,000 lb. to 80,000 lb. capacity." The commission found, however, that "the average local dealer in flour and other mill stuffs in the towns and villages of Iowa is running his business upon a very small capital, making it financially impossible for him to purchase a 40,000-lb. car of flour at the present abnormally high prices, also at the prices obtaining prior to the present application for an increase in the minimum weight; that a great many of said local dealers cannot now use the 24,000-lb. minimum except that a portion of a car may be made up of feed and other mill products." The commission decided that it would not allow an increase in the minimum because "we do not believe we would be justified in taking any action that would result in financial disaster to the mills now operating in Iowa, even though they are small and of limited capacity." It was shown that the larger shippers would not object to, but would even welcome, an increase in the minimum weight.

Commenting upon Mr. Ripley's criticism of the state commissions, Mr. Lewis says: "Because state railroad commissions are undertaking to save to the small shipper and to the consumer somewhat upon the cost of his living or the conduct of his business is no reason why such state commissioners should be considered less patriotic during this war period than the president of a railroad who, in the face of greatly increased earnings, insists upon higher rates and greater minimums. Working for his company, Mr. Ripley overlooks the fact that a railroad company is performing a public service and that there are times when the public in-

terest must be placed even above private ownership and large dividends."

These statements, coming from such a source, seem to express a want of understanding of the present railway situation that is little less than appalling. Mr. Ripley did not, in his letter from which we quote, argue in favor of an increase in minimum weights because it would tend to augment the earnings or reduce the expenses of his railroad. He did it upon the ground that the amount of traffic handled per car must be increased as a means of helping the nation in the present struggle. If the greatest possible utilization of railway equipment is not secured the railways will not be able to handle the country's business, and if they cannot handle the country's business the nation will be seriously hampered carrying on the war.

Mr. Lewis reminds Mr. Ripley that there are times "when the public interest must be placed even above private ownership and large dividends." True. But Mr. Lewis apparently overlooks the further fact that the welfare of the people of the United States must sometimes be put above the convenience and profits of a few small dealers in flour and mill stuffs in the state of Iowa. As a matter of fact, the railways in their efforts to secure the greatest utilization of equipment are trying to promote the interest, not only of the public in general, but also of the very shippers of flour and mill products in Iowa that the railroad commission of that state thinks it is protecting. If the railways do not secure the greatest utilization of equipment there will not be enough cars to go around, and, in consequence, these very dealers in flour and mill products in Iowa will not have enough cars in which to ship their commodities in carloads of 24,000 lb. or any other size.

It is a notable fact that the decision of the Iowa Railroad Commission denying an increase of minimum weights was rendered on July 23, 1917. This was over three months after the entrance of the United States into the great war. In other words, after three months of war, after three months of military preparation, after three months of explanation of the railway situation and of the reasons why it is what it is, it is still possible for the railroad commission of a great state to believe that it is acting in the "public interest" when it throws obstacles in the way of the railways in their efforts to secure the greatest efficiency in their operations.

Apparently, however, Mr. Lewis does not believe that increases in carloading are in the interest of efficiency. He says: "I recently talked with one of the high traffic officials of one of our western railroads and he stated as his opinion after several years' careful observation that the railroad companies, in their mad desire for larger cars, heavier locomotives and long trains, had become less efficient in the expeditious and economic handling of the traffic of the country." Either the "high traffic official," who expressed this opinion—whatever he may be—does not know the A B C of railway operating efficiency, or all the railway executives from James J. Hill down, who have made notable records in increasing operating efficiency have proceeded along wrong lines. If railway rates had been regulated as they have been by the Iowa and other commissions, and at the same time the great and to the promotion of the welfare, not of localities or of increases in carloads and trainloads had not occurred, every railway in the United States would have been bankrupt long before this. It is big carloads and trainloads that have made possible the present high wages and low rates. What is more important at this critical juncture, without the great increases in carloads and trainloads which have occurred the railroads could not possibly handle their present traffic with present facilities, and without still further great increases in carloads and trainloads within the next few months they will not be able to handle the vast additional traffic which will be offered to them.

By subordinating the efficiency of the railways, in this terrible crisis, to the supposed interests of a few of their local

constituents, the state railroad commissions of the Middle West are using their authority to help autocracy in the struggle against democracy, to aid the Kaiser to whip Uncle Sam. If that is not putting local selfishness, or politics, or something equally reprehensible above patriotism, we do not know how to describe it. The railway managements, by voluntarily subordinating the interests of their individual lines to the securing of the maximum efficiency of all lines states, but of the nation as a whole, are setting an example of disinterestedness and patriotism which many public officials seem unable to understand, much less to emulate.

NEW BOOKS

The Life of James J. Hill. By Joseph Gilpin Pyle. Two volumes. 958 pages, 8 illustrations, 6½ in. x 9½ in. Bound in cloth. Published by Doubleday, Page & Co., Garden City, N. Y.

A true estimate of the life of a great man cannot be conveyed through the medium of ornate and abstract eulogy. Fully cognizant of this fact, the author has recounted Mr. Hill's achievements in the many fields of activity which drew his attention, at the same time indicating the scope of his work, the catholicity of his interests and the genius he applied to every undertaking. The biography impresses the reader not only with the unremitting energy, rare foresight and consummate ability of the great railroad builder but with the fact that these qualities were translated into constructive results. Indeed, Mr. Hill was a great general of peace who mobilized large forces of men, materials and capital for the conquest of an empire from the wilderness. In fact, the history of the Northwest is in no small measure a chronicle of the work of James J. Hill.

How he first engaged in the transportation business when the rivers were the commercial highways of the Northwest, how he acquired the St. Paul & Pacific when it was nothing but two streaks of rust, extended it to Winnipeg and later by gradual stages to the Pacific coast, is related in detail. His important connection with the construction of the Canadian Pacific, his acquisition of the control of the Northern Pacific and the Chicago, Burlington & Quincy, the Northern Securities case, the crucial struggle with Harriman, and the Minnesota Rate Case are high points in his life to which a considerable portion of the biography is devoted.

Throughout his career, Mr. Hill displayed the qualities of an astute and sound economist. He thoroughly understood the relation between natural resources and transportation, and realized how necessary it was to foster the development of the agricultural, lumbering and mining industries in order to create railway traffic. He was foremost in introducing higher grades of seed, mixed farming, fertilization and improved farming methods in the Northwest. He was a pioneer in the conservation movement. Throughout his business career he showed a keen conception of sound financing and efficient management. Not a dollar of the capital of the Great Northern represents what is commonly termed "water." A few years before Mr. Hill's death he thoroughly reorganized the road's finances to insure it against all contingencies for half a century to come. He was often called upon to lend his assistance to corporations in which he had little or no interest. In this way he helped the Erie and the Baltimore & Ohio to shake off financial difficulties. Shortly before his death he established a great bank at St. Paul to emancipate the Northwest from dependence on Wall street during the crop moving season. In 1907, Mr. Hill saved thousands from financial ruin as well as privation by extending credit to farmers when banks generally had practically suspended operations.

He had an excellent grasp of issues confronting the country and was in constant demand as a speaker. When "trust busting" was the popular thing he summed up the real abuses of industrial combinations and their cure in an address before the Illinois Manufacturers' Association. He

said in part: "The valid objection to many concerns, especially some of those known as 'industrials,' is that they appear to have been created in the first place not so much for the purpose of manufacturing any particular commodity as for selling sheaves of printed securities which represent nothing more than the good will and prospective profits of the promoters. . . . Under the constitutional provision allowing Congress to regulate commerce between states, any company desiring to transact business outside of the state in which it is incorporated should be held to a uniform provision of federal law; namely, that all should satisfy a commission that their capital stock was actually paid up in cash or in property taken at a fair valuation, just as the capital of a national bank must be certified to be paid by the controller of the currency." The mere size of a corporation does not constitute a danger, he said, and may often result in distinct benefits to the workingman, consumer and capitalist in the shape of higher wages, lower prices and safer and more productive investments.

Mr. Hill was one of the first railroad men to realize the extent to which railroad development had been arrested by repressive legislation and regulation. In an address before the Merchants' Club in Chicago in 1906 he declared it the most important question confronting the country since the Civil War. In a letter to Governor Johnson of Minnesota in 1907, he pointed out the great disparity between the growth of traffic and the additions to railroad mileage and equipment. He showed that in the 10 years from 1895 to 1905 the total single track mileage of the country had increased but 21 per cent, locomotives 35 per cent, passenger cars 23 per cent and freight cars 45 per cent. In the same time passenger mileage increased 95 per cent and freight ton mileage 118 per cent. Improved facilities necessary to take care of the traffic of the country could only be built with more money, and more money could be obtained only if the railroads were permitted to earn the profits accruing from other forms of investment.

Mr. Hill was an individualist. He believed the functions of our national economy could be more efficiently discharged through private initiative than through government ownership or control. Government ownership of railroads, he maintained, would mean the death knell of democracy. An administration backed by the votes of 2,000,000 transportation employees would have unassailable power.

Proceedings of the American Railway Engineering Association. 1721 pages, illustrated, 6 in. by 9 in. Bound in half morocco, cloth or paper. Published by the American Railway Engineering Association, Karpen Bldg., Chicago. Price, half morocco, \$7; cloth, \$6.50; paper, \$6.

This is the largest volume of proceedings ever published by this association under one cover. The proceedings of 1911, published in three volumes, contain a few more pages. Of the total contents of the volume for 1917, 1,438 pages are devoted to committee reports, 141 to discussions on the floor of the convention and 142 to special papers and monographs. Following the general rule, the committee on rail presented the longest report which includes an extensive report on the quick bend test of rails as a substitute for the drop test, a paper on induced interior transverse fissures, and an account of tests of rail joints. The report on electricity comprises 182 pages, of which 152 are devoted to a preliminary report of the American Committee on Electrol-ysis. The Committee on Records and Accounts submitted a large number of forms for field and office use in valuation. Service records of cross ties occupied a considerable portion of the report of the committee on wood preservation. The miscellaneous papers included the full final report of the Joint Committee on Concrete and Reinforced Concrete, occupying 63 pages; a study of fuel consumption calculations; the electric power input on movable railroad bridges; and a reprint of a paper on the cost of railroad transportation, prepared in 1874 by Albert Fink.

Letters to the Editor

TWO ANSWERS TO "INITIATIVE—ORGANIZATION AND EDUCATION"

DETROIT, Mich.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

I am not in sympathy with the letter entitled "Initiative—Organization and Education" and signed by "Observer" published in your issue of August 10. Railroads of today are handled by rule. It is not expected of a junior officer to do what he knows to be good railroading, without the sanction of his superior officer, if the action is in conflict with the approved practice or system. It would not be possible to have system if junior officers were permitted to use their judgment in conflict with the general policy. Such a method, by which the judgment of inexperienced officers (as junior officers are usually), would result in chaos. It is only in recent years that railroads have become cognizant of this fact and have profited through efficiency measures and system.

What the writer says about nepotism might have been true under the old method of railroading, but it is not true today. With reference to the general superintendent who, over the heads of the superintendent, trainmaster and yardmaster, dismissed a couple of his engine foremen from one of his yards,—this might happen in one case out of a hundred. As to assigning to an agent authority to put on and take off help ad libitum this, in my judgment, would be unwise.

The greatest problem confronting railroad officers of today is to educate the old employees, rather than the new ones, into new methods. Safety in transportation is the first essential. If officers and employees make it their business to observe carefully the rules and regulations and devote their energies toward expediting the company's business along these lines, they will have done all that should be expected of them.

I consider this presentation unwise and harmful to young railroad men and junior officers. The facts are that it would not be possible for an officer of a railroad, under the old method, to "reach first base" today.

FRANK H. ALFRED,
President, Pere Marquette Railroad.

MONTREAL.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

I have read Observer's letter on "Initiative—Organization and Education," in the August 10 issue, and I would like to say to Observer, "Well done."

I do not believe he is the kind of man who will worry over what a few self-sufficient, all-sufficient men in the railway service will say about his letter and his views generally. These are the men who should read this letter many times, but unfortunately they won't. Men who practice the methods he condemns will not learn, but that is not Observer's fault. He could have gone further than he has in pointing out how the initiative is destroyed, for he has failed to mention the cases where the favorite is given the credit and money due to the man who has but his work to recommend him.

There is also the official whose personal office staff can do no wrong and who never learns the great harm these lick-spittles are doing his railway. Here is a case I have personal knowledge of, I know both the man and one or two of his clerks. The man was a district freight agent with a large number of local agents reporting to him. He would find that an agent was not following out instructions as per

circular No. 00, and would call on his staff to show that the agent had received the circular. They found that through their neglect the circular had not been sent to the agent. Knowing the man they had to deal with they simply forged a receipt of acknowledgement for the circular and handed it in. The agent, or perhaps a number of agents, would then receive one of those "stingers" for which the "old man" was noted. What a loyal lot of fellows they would be for the next six months, and by that time there would be more of the same thing from the same source. These men in the mass are more important to the railway than the district agent, and individually better men than the members of his office staff.

I say again, well done Observer, let us hear from you again, and while on the subject take a look at other lines of business to see if by any chance they are all free of the evils mentioned. It is poor human nature that Observer is gunning for. Why train his "75" on the poor railway? Try a shot at the other fellows and see what you bring down.

ANOTHER OBSERVER.

COMMISSIONER LEWIS REPLIES TO MR. RIPLEY

DES MOINES, Ia.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

I have long been a reader of your magazine and have always regarded it as one of the strongest, if not the strongest, railway magazine we have. Perhaps because I have always so highly regarded it, is the reason I now desire to take exception to a recent editorial.

In your issue of August 3, on page 176, is an editorial comment on the various minimum weights applying on flour and other mill products in carloads, as promulgated by a number of states therein named.

E. P. Ripley, president of the Atchison, Topeka & Santa Fe railway, whom you quote, has been a most bitter opponent of railway regulation. He is a good controversialist, and were it not for his persistent "anti" attitude his ability and long years of experience should give his opinion much weight with every one. It is true with him, however, as it is always true with those whose prejudices are permitted to color their argument, that his statements will not always bear close and careful scrutiny.

It is no argument for Mr. Ripley to cast aspersions upon the character of men who may be members of state commissions, however true his accusations might be, if those commissions, in the performance of their duties, have rendered decisions or made orders in accordance with the evidence submitted. Your editorial is occasioned by the action of the Kansas Commission in refusing to advance the minimum on flour beyond the 24,000 lb. limit, yet your comments are general. This Commission, too, has but recently declined to grant an increase in the minimum on flour, and it remains at 24,000 lb.

I do not desire to enter into any controversy with Mr. Ripley. If he believes he is best serving the public and the interests of his company by slandering state railroad commissions and continually objecting to regulation, then I leave the field to him. I do not, however, like to see so good a paper as yours accept the unsupported statements of Mr. Ripley as a basis for an assault upon state railway regulation. It may be you are right and that state regulation should be abolished; however, this will never be done upon anything Mr. Ripley may ever say upon the subject.

I but recently talked with one of the high traffic officials of one of our western railroads, and he stated as his opinion, after several years' careful observation, that the railroad companies, in their mad desire for larger cars, heavier locomotives and long trains, had become less efficient in the expeditious and economical handling of the traffic of the

country; that shorter trains, more frequent service and less insistence on enormous carloads, would move the traffic faster, cheaper and more satisfactorily. Of course, he did not mean going back to the small and inefficient cars or locomotives, but what he meant was, that loading and service should be based more largely upon the commercial needs of the country, rather than upon the possible ability of a carrier to handle immense trains and heavier carloads.

I note by the press despatches today the railroads of the United States have increased their net earnings in June, 1917, eight million dollars more than the figures show for June in 1916. Of course, you will remember 1916 was the best year the railroads ever had. The carriers are to be congratulated upon their splendid showing. But, because state railroad commissioners are undertaking to save to the small shipper and to the consumer somewhat upon the cost of his living or the conduct of his business, is no reason why such state commissioners should be considered less patriotic during this war period than the president of a railroad who, in the face of greatly increased earnings, insists upon higher rates and greater minimums. Working for his company, Mr. Ripley overlooks the fact that a railroad company is performing a public service, and that there are times when the public interest must be placed even above private ownership and large dividends.

I am enclosing you a copy of our decision in the minimum weight case. I ask as a favor that you read this opinion, as it not only gives our conclusions, but the evidence upon which such conclusions are based.

DWIGHT N. LEWIS,
Member, Iowa Railroad Commission.

GOVERNMENT OWNERSHIP AND RAILWAY RATES

TARRYTOWN, N. Y.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

The New Republic, in an editorial on government ownership of railways appearing some time ago, advocated the theory that it is impossible for the public and the government to co-operate sympathetically with the railroad managers, and that the failure of railroad credit will eventually force the issue. While the recent rate decision seems to give point to such a belief, there is the possibility of a complete reversal of attitude by the Interstate Commerce Commission after the appointment of three new members. Moreover, the intimate relations that are now being developed between the government and the railroads through the railroads' War Board should surely aid in bridging the chasm.

The New Republic's latest editorial in the issue of July 21, however, evolves the unique principle that rate-fixing, being inherently a form of taxation, is therefore easily adapted to exploitation by governmental agency for the purpose of stabilizing the operation of the whole industrial and financial system.

Such a theory has little of value, but the very novelty of the argument makes it of interest. It is said that rates based on what the traffic will bear include "a charge for service and an additional charge that is essentially . . . one of the least burdensome forms of taxation, resting mainly upon unearned increment." The idea of unearned increment cannot in any true sense be applied to railway traffic as a whole, probably not to more than a small portion of the traffic. Of course, it is true that half or more of the tonnage of the average road consists of coal, lumber, etc.—commodities subject to monopoly at the source. But it is also true, I believe, that the railroad rate, though it may in a sense be called a tax, is borne more largely by the consumer than by the producer. It is easily shifted except in cases where relocalization of industry is possible.

It is not true that the average rate now consists of "a charge for service and an additional charge that is essentially of the nature of taxation." Our whole rate system is honeycombed with inconsistencies—in fact, there is no system worthy of the name. There is no "charge for service" in the sense of a cost basis. The railroads do not know what the traffic costs to handle. When the Commission fully understands the scope of its duty it will, perhaps, inaugurate a national rate system based on the cost principle rather than the tax idea—with regard, however, to the present distribution of manufacturing. Our greatest industry would then be placed on a basis of efficient relation to other industries; but such a step will require many years to develop, and there is danger in too rapid a change from present bases.

The problem of cyclic changes—periodic booms and depressions—would not be solved, as the New Republic hopes, by a system whereby railroad rates would be placed on a sliding scale. This involves the assumption that the government should become a general clearinghouse of industry, which is hardly tenable except under war conditions or a socialistic regime. The issue of prosperity vs. depression is purely a problem of credit and finance (subject of course, to political and international factors), and must be regulated as such. Moreover, an attempt at control through exploitation of railroad rates would merely thrust us on another horn of our national dilemma—the high cost of living.

The idea of using the railroad rate in a dual function of "diverting to the public treasury part of the excess profits of boom times" and of "abating the evils of speculation and unmerited enrichment" is, indeed, too fanciful for serious consideration, and deserves attention only because it appears in a journal said to be the best exponent of modern politico-economic conditions. Taxation must be based on simple principles and applied at the source; and there are many ways of despoiling monopoly of its ill-gotten gains, if we will only courageously adopt them. To use the rate-tax principle would not only befog the issue as to the fair distribution of wealth, but would deprive industry of its only stable and dependable set of values.

The welfare of the railroads themselves must always be considered as the paramount issue. Of course, if rates are to remain stationary without respect to a steady decline in the purchasing power of the dollar, the government must ultimately (and perhaps not far in the future) use its superior credit to finance the needs of the railroads; but that does not necessarily imply government ownership, although it may be considered an unwise and dangerous step toward the adoption of that policy.

OWEN ELY.

HALF PORTIONS ON DINING CARS

INDIANAPOLIS, Ind.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

I notice in your publication of July 13 reference to the relative merits of a la carte and table d'hôte.

I have wondered many times, since war began and prices commenced to go up, why a similar arrangement did not work on dining cars as obtains in many of the restaurants where a la carte obtains and half portions are served so that parties can order according to their appetite.

Thus: If a whole portion of ham and eggs a la carte is 75 cents, would it not be economical to serve a half portion of ham and one egg at say 40 or 45 cents; one whole order of French fried potatoes, 25 cents and half portion, 15 cents.

Many times, while eating on the diners, a large portion of my dinner has gone back to the kitchen on account of the portions being too large.

FREQUENT TRAVELER.

New Line Along the North Side of the Canyon East of Castle Rock

Second Track Work on the Union Pacific

Heavy Grade Revision Was Made in Connection with the Improvement of a Dense Traffic Line in Eastern Utah

THE Union Pacific is now completing the construction of a section of second track in eastern Utah which is of unusual interest because of the difficult problems presented. This work comprises the last 16 miles of the 75-mile climb east from Ogden to the crossing of the Wahsatch mountains. The construction work is very heavy, involving an expenditure of more than \$3,000,000, or nearly \$200,000 per mile,

growing rapidly during the last few years and was unusually heavy during the last year, averaging 12,500 gross tons westbound and 13,500 tons eastbound daily for combined freight and passenger movement. However, in the fall of 1916 a maximum daily movement of 26,000 tons eastbound and 11,000 tons westbound was handled. This eastbound movement required 17 trains and the westbound 8 loaded trains,

Location of the Old and New Lines in the Echo Canyon

and was undertaken primarily because of the congestion resulting from the heavy traffic and the pusher engine movements down the hill.

Since the character of the country is such that the construction of a second track on the present location would commit the railway to so large an investment that subsequent grade revision or other improvement would necessarily be set very far into the future, it was decided to include the reduction in the ruling grade in the present work in spite of the fact that it required a total expenditure justified only on the basis of a traffic considerably in excess of that now

5 light extras and 21 light engine movements. In addition to this there were 6 passenger trains in each direction.

The new work involves the portion of the line between Emory, Utah, and Wahsatch, where the old line was located up the Echo Creek canyon in 1864 by Samuel B. Reed. The existing line occupies the original location and will continue in operation under the new plan as the westbound

1.11 per cent, while the climb for the remaining distance necessitates a maximum grade of 1.77 per cent.

The new track is parallel to and 14 ft. north of the old one for the first $2\frac{1}{2}$ miles east of Emory, but for the remaining distance it is on an independent location along the north side of the canyon, where it was possible to obtain support in the vicinity of Castle Rock at a sufficient elevation to secure a grade of 1.14 per cent compensated for the entire distance. The location along the north side of the canyon was also governed partially by the fact that this side receives much more sunlight and is therefore less subject to disadvantageous winter conditions.

The new line is an improvement over the old one in other respects than grades. It is 0.342 miles shorter, the curvature is less by 757 deg., and the total length of curves is 5.7 miles as compared with 7.65 miles on the old line. The maximum curve is 3 deg. as compared to 6 deg. The reduction in rise and fall is small, only 17.48 ft.

As seen on the profile, the situation at the summit is rather unusual. The physical features of the saddle in the mountains at Wahsatch are such that no material reduction in the elevation of the tracks could be accomplished. The improvement in the grade line was secured partially by moving the summit on the new tracks about 3,800 ft. east of that for the old one. Here the two tracks are practically at grade and while the old line remains on the surface for

The Summit Cut—Old Line on the Surface to the Right

almost a mile to the west, the new line descends into a cut which has a maximum depth of 65 ft. at the lower end where it terminates in a tunnel 1,500 ft. long. This tunnel has a maximum over burden of only 35 ft. and is crossed by the old line in a cut about 5 ft. deep.

The grading of the new line is largely in the nature of side hill cuts through cliffs, containing a variety of materials varying from hard sandstone to shale with relatively short high fills in the ravines between. Some of the cuts, particularly in the vicinity of Castle Rock and further west, are over 100 ft. deep, although they contain relatively small quantities of material. One exception to this is an embankment between Castle Rock and Curvo, which is 113 ft. high and contains nearly 1,000,000 cu. yd. of material in a length of less than 1,000 ft. Another exception is the summit cut referred to previously which required the removal of 275,000 cu. yd. of material. There are four tunnels, the longest being tunnel No. 1 near the summit and they form an interesting feature of the project.

EMBANKMENT WORK

Owing to the fact that the bottoms of the ravines contain earth that could be handled economically while the cuts were

largely in rock, the grade line was established with a considerable excess of material in the embankments so that, in general, material borrowed from the bottoms was used very largely in the bases of the embankments and the material from the cuts was used principally for the upper portions of the fills. In some cases the embankments were made almost entirely from borrow, one of 175,000 cu. yd. near Castle Rock taking only 25,000 cu. yd. from adjoining cuts. In nearly all cases the borrowed material was taken out with Fresno graders working over relatively large areas

Typical Embankment Work

with limited depths of pits. This work followed common practice as a rule, but in one or two cases wagons were used having a capacity of 4 cu. yd. The team outfits were an important factor in the work on this project and a number of good records were made. In one fill of 125,000 cu. yd. west of Tunnel No. 1, a record of 1,200 cu. yd. in 10 hours was made with one grader hauled by 16 horses and served by 12 two-horse wagons.

One advantage gained by borrowing a large part of the

125-ft. Cut—"Daylighted"

material in the hills from pits in the bottom was that the making of the lower lifts by teams reduced the height of trestle required for unloading the material coming from the cuts. Part of one side hill embankment was made by a steam shovel casting directly while excavating the roadway necessary for it to reach the required elevation for the first cut. The material in the fills is of a character that will

not roll to a $1\frac{1}{2}$ to 1 slope from a trestle or over the edge of the embankment but will gradually assume that slope through the action of wind and frost. On this account the contractors were not compelled to produce a fill of standard dimensions, but the top width was made sufficient to insure a full section after natural agencies had become effective. A shrinkage allowance was made only in the width of the roadbed, the embankment being allowed to stand over the winter and the grade then restored for any settlement by raising it in the spring.

The largest single feature in the earth work was the building of the 1,000,000 cu. yd. embankment near Curvo.

The Large Fill Near Curvo

This is nearly 500 ft. wide at the bottom and was made in three lifts, the first of 30 ft. or more and the second and third of 42 ft. each. Twenty-foot berms were provided between the lifts on each side. Three steam shovels were employed for a part of the time to make this embankment, but the program of the work as carried out was equivalent to the continual performance of the two 70-C Bucyrus shovels from April 20 to November 18, working two 10-hour shifts daily. In addition to the work done by the shovels a total of 100,000 cu. yd. was placed by two Fresno grading outfits working partially on the bottom lift but principally on the

to a considerable extent because there was a marked variation in the character of the material encountered in close proximity.

The side hill cuts were daylighted whenever this could be done with the removal of not over 10,000 cu. yd. of additional material. The contractors were required to trim the slopes to the neat section and were cautioned particularly to avoid over-cutting. This was done to eliminate irregularities that would eventually lead to slides, washes or rock falls. Other special measures were also taken to overcome this last danger. One of the illustrations shows a cut having a face 125 ft. high that was provided with a bench 15 ft. wide

40 ft. above grade, in addition to which the slope was carefully cleaned by hand while the lower portion was scraped by the steam shovel to remove all loose rock. The daylighting of this cut produced a shelf 90 ft. wide. The slopes of all cuts were made 1 to 1.

The summit cut contained 275,000 cu. yd. principally of rock, although 5 ft. of black soil was encountered near the upper end. Most of the material was wasted. As this cut was arranged to drain through the tunnel at its lower end and as excavation was in progress long before the tunnel was completed, it was necessary to install pumps to remove

The New (Right) and Old (Left) Tracks Near Castle Rock

west end of the top lift. The material for this team work was secured close at hand but it was necessary to go a mile from the fill to secure borrow pits containing suitable material in adequate quantities for the shovels. The shovels were served by 4-yd. dump cars handled in 12-car trains by 20-ton locomotives on 3-ft. gage track.

INTERESTING EXCAVATION METHODS

The excavation in the cuts was troublesome because of the difficulty experienced in drilling and shooting the harder classes of rock encountered. The work was also hampered

the water during construction. Notwithstanding this the steam shovels mired badly and resort was had to a drag line excavator working from the top of the slope. This machine was employed successfully to load 30,000 cu. yd. into 4-yd. dump cars that were used to haul the material away.

TUNNEL WORK

Tunnel No. 1 was driven through material of a character that required immediate timbering. Consequently a top heading was adopted, with a cross section that permitted

the erection of the full arch at once, down to the level of the wall plates on either side. Following the placing of this timbering, the benches were shot down and the muck from both the heading and the bench were loaded by an air-operated shovel into small cars handled by gasoline locomotives.

Jack hammers were employed throughout, using 16 holes 8 ft. deep in the heading which removed about 6 or 7 ft. of face to the shot. In some of the soft material it was possible to use augers in place of drill bits. Air for the tunneling operations was supplied by a plant containing three two-stage steam air compressors having a combined capacity of 1,440 cu. ft. of free air per minute to 100 lb. per sq. in., steam being supplied by four 100-hp. boilers.

Tunnel No. 2, which is 1,100 ft. long, pierces rock of sufficient stability to make a lining unnecessary at the start, but as the rock disintegrates on exposure the tunnel will be lined with concrete. As a measure of temporary safety a set of posts and segments were installed every 8 ft. The tunnel was driven with a bottom center heading 10 ft. wide by 12 ft. high with the bottom 4 ft. above subgrade. This was advanced by 25-ft. holes in the face, drilled with jack hammers with a crew of 10 men—two drillers, four muckers and four mule drivers—the average progress being about 17

New Line Crossing Under Old at Tunnel No. 2

ft. per day. The enlargement was made by drilling 20 radial holes at intervals of 5 ft. along the tunnel, the 7 upper ones being drilled by a stoep drill and the 13 lower ones with jack hammers. The bottom holes, which were drilled 6 in. below subgrade, were shot first about 75 ft. ahead of the upper holes, from 2 to 4 rings being shot at one time. The muck from the enlargement was taken out with an air-operated steam shovel that averaged about 20 ft. of advance per day. The air used in the tunnel work was supplied by a plant which also furnished air to the work on tunnel No. 3 only about a mile distant.

A peculiar situation obtains at tunnel No. 3, which is on a tangent parallel to and 81.5 ft. south of the tangent of the old Wahsatch tunnel of the original line with the new grade 41 ft. lower than the old one. This is shown in one of the illustrations. At the west portal the new line crosses under the old one on a flat skew, the old line being carried on a viaduct consisting of four 60-ft. deck girder spans supported on masonry abutments and two intermediate masonry piers, while the center support consists of a steel bent with a long cross girder placed astride of the new track passing underneath.

The site of this bridge is over a cut that had to be taken out before the structure could be built. The work was further complicated by a change in the alinement of the old track to replace a 5-deg. curve by one of 4 deg., a measure involving the shortening of the old tunnel by 80 ft. These tunnels are just east of Curvo which derives its name from a series of 10 reverse curves in a distance of two miles. As it has been suggested that some of these curves be eliminated by tangents on embankments between the adjacent

Tunnel No. 4

convex curves, the spoil from the new tunnel and its west approach cut was wasted where it would be applicable for this possible future purpose.

Tunnel No. 4 is 200 ft. long, extending through a short shoulder in the bluff near Castle Rock. It was driven entirely by hand work, using a center bottom heading into which the muck from the enlargement of the arch was trapped. The benches on either side of the heading were taken out last. The tunnel was lined with concrete throughout.

A LONG CULVERT WAS REQUIRED

With the exception of a viaduct at tunnel No. 3 all structures on this project are arch culverts. The largest of these

16-ft. Arch Culvert Under 1,000,000-cu. yd. Embankment

is a structure of 16 ft. span under the 1,000,000-cu. yd. embankment, having a length of 464 ft. Owing to the heavy load which was imposed by the high embankment, it was deemed desirable to put this culvert on rock foundation and to accomplish this in a location that would give

the culvert a minimum length of barrel, 50,000 cu. yd. of excavation was required. The culvert contains 4,200 cu. yd. of concrete and is reinforced with 60-lb. rails curved to the shape of the arch. The concrete materials were brought to the site on a spur track carried nearly a mile from the old main line. The materials were unloaded from cars to storage piles by a locomotive crane and were transported to two $\frac{3}{4}$ -cu. yd. Smith mixers in wheelbarrows. The concrete was delivered to the footings by chutes and to the neatwork by tram cars running on a trestle at a sufficient height to permit dumping directly into the forms. These cars were loaded by a bottom dump bucket lifted from the mixer to the level of the cars by a stiff leg derrick.

CONSTRUCTION ARRANGEMENTS

The general contract for construction work was awarded to Kilpatrick Bros. & Collins of Beatrice, Neb., who divided the work among 10 sub-contractors on a joint account basis under which the general contractor shared equally with each sub-contractor in the net profits of the work. In general, the basis of payments for the excavation and embankment work was a schedule of unit prices for earth and classified material with definite overhaul allowances, applicable both to excavation in embankment and in borrow pits. With

TRANSPORTATION OF NATIONAL ARMY TO TRAINING CAMPS

Plans for the largest movement of troops by railroad in the history of the country are now being perfected by the American Railway Association, at the request of the United States government. The citizens selected to form the National Army will begin to move to their respective training camps on September 5. The number to be selected stands at present at 687,000 men. The first movement will consist of approximately 30 per cent from each local concentration point, a total of about 200,000 men, and will begin on Wednesday, September 5, this date having been selected in place of an earlier date, at first considered, which would have brought the movement at the time of the rush of traffic incident to the Labor Day holiday. Entrainment is to be completed on Sunday, September 9. It is expected that a second movement of 30 per cent, or 200,000, will take place beginning on September 19, continuing for four days thereafter; and that a third movement of 30 per cent will begin on October 3, to continue for four days.

While plans for the National Army mobilization are being perfected the railroads are engaged in the movement of the National Guard to their training camps, which began

The Old and New Lines—Looking East Toward Wahsatch

these schedules as a guide the engineers determined where the material was to be obtained to secure the cheapest embankment, each situation demanding its individual solution. The large embankment referred to previously was paid for on a flat price per cubic yard of borrow pit measurement, independent of the haul. The tunneling was paid for at a flat price per cubic yard of neat section.

This construction work has been under the direction of R. L. Huntley, chief engineer of the Union Pacific, with W. S. Woodworth, engineer in charge, the resident engineers being W. G. Tinney, H. C. Mann and F. W. Newhart. The entire project has been under the general supervision of E. E. Adams, consulting engineer of the Union Pacific System, New York City.

FUEL SITUATION IN RUSSIA.—The Russian fuel crisis, which became marked in 1916, has grown more acute this year. It is aggravated by the deterioration of the railway locomotives, which causes them to require a constantly increasing share of the fuel available for industrial purposes. The railways and the navy now require 60 per cent, and this proportion is expected to be increased steadily until the railways are bettered.

last week and will continue in increasing volume until all have moved. This movement will include approximately 350,000 men and their impedimenta. The movement of troops and supplies to the seaboard for service abroad has also been in progress for some time but details regarding the transportation and as to the number of men involved must not be published.

A total of 4,531 points in the United States have been designated by the Provost Marshal General as points of local concentration for the draft army, at one of which each individual will be required to report at a stated time and from which the parties will proceed by railroad to the 16 cantonments to which they have been assigned. The Provost Marshal General, through the state authorities, will retain control of these men until they are placed upon the trains designated, and will designate a man in each party to be in charge of it from each local concentration point to destination.

The American Railway Association has been directed to prepare schedules for the movement of each of these parties. These schedules are being prepared by the passenger associations in conference with representatives of the operating departments. They will show the date and hour at which

trains, either regular or special, may be expected at each local concentration point to receive the men departing from such point, together with schedules through to destination in each case. When these schedules have been approved by the quartermaster-general they will be furnished from the Washington office of the Railroads' War Board to all railroads and others interested in the movement.

The individual in charge of each party will hold tickets for each member of the party and will also be furnished with meal tickets, each having a face value of 60 cents, sufficient in number to provide for the food of all the men under his charge.

In preparing schedules due regard will be paid to the necessity for providing for the feeding of these men at convenient points, either by use of eating houses, dining cars, or by furnishing box lunches on the train. The meal tickets are redeemable at their face value on presentation to the department quartermaster at the headquarters of the department in which they are used.

The American Railway Association will place a qualified official of the passenger department in the office either of the governor, or of the adjutant general, as may be deemed most suitable by the state authorities in each state. This official will keep in touch with the state authorities in any emergency which may arise and will assist them in carrying out the schedule. The schedules which are used for the first movement will also be used for the second and third movements with such modifications, to be decided later, as may be essential.

Railroads have been instructed that it is necessary that railway passenger train equipment used for the movements of the National Guard or the National Army be immediately emptied upon arrival at the camps, and immediately returned to the road from which it was received. Orders for the disposition of the Pullman equipment released will be waiting for the cars at destination. Movements of empty passenger equipment, railroad or Pullman, according to the instructions, must be made with utmost expedition that it may be available for further service at the earliest possible moment.

The movements of National Guard troops up to date have been principally of advance contingents sent to training camps for work in preparing them for the larger number of men to follow. They have been moved in day coaches where the journey did not involve more than a day and a night of travel and in tourist and standard sleeping cars where the journey was longer. Where sleeping cars are used three men are assigned to a section.

1,200 RAILROAD WAR GARDENS

Nearly 1,200 "war gardens" are being cultivated this summer on vacant land of the Pennsylvania Railroad and its Lines East of Pittsburgh by employees for the use of themselves and their families. The value of the crops raised will probably exceed \$250,000.

Altogether more than 1,000 acres have been planted, and are now producing crops of potatoes, peas, beans, tomatoes, corn, and various other garden vegetables. The average size of each plot of railroad land, tilled by an employee, falls just short of an acre.

Special arrangements were made this spring by the Pennsylvania Railroad to induce employees to take up unoccupied land belonging to the company, and plant it for the purpose of assisting in increasing the nation's food supply. Through the real estate department of the company, a plan was worked out whereby any employee could, without formality, obtain the use of as much land as he could properly cultivate, and upon a mere nominal rental. All that was necessary for an employee to do if he desired to raise a "war garden" was to apply to his superior officer and sign

a simple form of lease. The land would then be placed at his disposal.

To encourage proper and scientific methods of cultivation, every employee undertaking to plant such a tract was supplied with a copy of "The Garden Primer," issued by the National Emergency Food Commission, and also a copy of a booklet on Potato Culture, which was prepared by the Agricultural Department of the State of Pennsylvania especially for the use of the Pennsylvania Railroad.

Since March 1, 613 new leases have been made covering garden tracts cultivated by employees of the Pennsylvania Railroad. In addition, 569 other tracts of the railroad's land are being cultivated on leases dating from previous years.

Besides the land used for kitchen-garden purposes, under nominal rentals, the Pennsylvania Railroad has leased to employees and others 649 larger tracts of land, owned by the company but not at present utilized for railroad purposes.

These tracts are being cultivated as farms, or are used for cattle grazing and similar purposes. Of these tracts, 231 consist of improved farms, and 89 of unimproved farms. There are also 315 large tracts used for pasturage, and 14 tracts for miscellaneous agricultural purposes.

NEW YORK CENTRAL AGENT COUNTS ON 10 TO 15 BUSHELS OF BEANS

The illustration shows an employee's garden on the New York Central. The agent at Chaumont, near Watertown, N. Y., took a lease on a plot opposite his station, 1,500 ft.

A New York Central War Garden

long and 25 ft. wide. He reported to the manager of the road's farm bureau recently that this was the first time the land had ever been turned up by the plow and "heretofore was an ideal spot for all varieties of weeds." He planted one-quarter of his plot to white marrow beans and recently counted more than 32 full grown pods each on a number of the hills. He expects from 10 to 15 bushels of dry beans. He also reported that the further end of the garden was planted to Irish cobbler potatoes and that when he opened one hill 10 days ago he found one tuber "as large as your fist." Needless to say the garden is attracting more than passing attention from the summer tourists.

REPORT OF ENGLISH RAILWAY UNION.—The annual report of the National Union of Railwaymen of England shows that the number of branches has increased during the year from 1,240 to 1,270, and that the membership, inclusive of those at present absent from the country, has risen from 307,305 to 340,511.

What Is a "Fair Return" for Public Utilities?

To Be Well Served We Must Let Investors Earn as Much
as Men of Average Success Earn in Other Business

By William G. Raymond, C.E., LL.D.

Dean of the College of Applied Science, State University of Iowa.

SOME of you may wonder that an engineer, a man accustomed to deal with things rather than with ideals, to talk about tangibles rather than intangibles, to have visions of structures of wood, steel, stone, and mortar, rather than visions of social conditions; whose thought runs not in warm, musical, rhythmic measures, but rather finds expression in cold, hard statements of fact; some of you may wonder, I say, that such an one should be invited to address you, you a body of actual or potential teachers accustomed to deal with souls rather than things; to talk about intangibles rather than tangibles; to have visions of social conditions rather than visions of artificial structures; and whose training should tend to make the expression of your thought to flow in warm, measured periods rather than to burst explosively in cold, hard statements of dreary facts. And I wonder whether or not there is any significance in this, other than an indication of desperation on the part of the committee of arrangements, which has perchance found itself embarrassed in these times of business stress and activity. I wonder whether possibly it may be that we are coming nearer together in our thought and interest; whether possibly in this materialistic age, you of ideas and ideals, whose field of effort is the development of souls, and I of the field of steel and stone, may find it not without interest and possible profit to turn aside a little, each from his own field, to consider something that belongs in the area of no man's land, or rather everyman's land, that lies between us. I hope we may find it of interest and profit to consider for a little time a question that has puzzled lawyers and engineers, courts and commissions, and even those very positive people, economists and sociologists, namely: What is a fair return?

FROM THREE STANDPOINTS

All too briefly for adequate consideration we shall try to discuss this question from three standpoints:

1. The fair return in private business.
2. The fair return for privately owned and conducted public service.
3. The fair return for benefits received.

I should like to consider it from a fourth and perhaps the most important standpoint of all, namely, fair return for personal service. But this question asked and argued through volumes already written, yet never answered, I could not hope even to formulate fully in two or three whole addresses, to say nothing of trying to discuss the question in the fourth part of one very brief address.

Doubtless those of you who have done your major work in economics or sociology will recognize early in the discussion that I am groping in a field already well explored by experts; but I believe it is a fair statement, to make, that no person or body of authority has ever answered the question, "What is a fair return," with finality. With respect to pub-

lic utility corporations, those organizations that furnish us with water, light, heat, power, and transportation, the courts have said that the owner of a public utility property is entitled to a fair return on the fair value of his property used in the public service, but no generally accepted rule or method for determining fair value has been established, nor has an upper or lower limit of fair return been determined.

Everyone of us has contributed to the earnings of private businesses and public utility corporations. We have purchased various supplies from various tradesmen; we have paid railway and street car fares, bought electric power, gas and water, and we have somewhat arbitrarily and without much thought believed that we were paying too much, that the shop keepers and corporations were waxing fat at our expense. But how many of us have ever stopped to consider why men are in business and what they must earn to be called successful and be praised for their thrift, energy and foresight; and how many of us have considered with any care at all what we owe as fair return to those who have made it possible for us to prepare ourselves for service of a high order?

THE RIGHT TO EARN A PROFIT

Considering first a private commercial enterprise it is perhaps trite to say that the right to earn a profit over and above expenses is conceded to all men engaged in such enterprises. To the private business man the public concedes the right to include a salary for himself in his operating expense and when he does this he gets a living out of the expense of his business, and his profit may be saved and accumulated from year to year until he has secured a competence, or a large fortune. He is rated as a successful man if he accumulates a competence, as a particularly successful man if he accumulates a large fortune, and so long as his acts are considered honorable he is praised for his intelligence and business ability and his advice may be sought on public matters. There is no limit set to his rate of profit or the magnitude of his operations. Except rarely in times of greatest stress, as a time of war, the law will not attempt to regulate his earnings, for that would be interfering with his inalienable rights, and to reduce his earnings would be taking his property without just compensation, which results in a violation of the constitution of this country. How large are the profits earned?

One business man is contented with a small rate of profit if it is enough to give him a modest living, while another is ambitious and seeks a larger rate and makes a larger effort in order to secure those luxuries and that position that a large income makes possible.

THE RATE OF PROFIT

The profit rate of return is frequently spoken of in ordinary commercial business, not as a rate on the capital invested, but as a rate on the gross business done. A corner grocer in the suburbs charges a large profit rate on very small

Dean William G. Raymond

*An address delivered at the Mid-Summer Convocation of the State University of Iowa, Iowa City, Ia., on July 27.

sales that he may earn a modest living, while a Marshall Field, a Wanamaker, or a Woolworth collects a smaller profit rate on very large sales that he may earn for himself or his company a moderate rate of return on the invested capital, which moderate rate will yield a large annual income.

If on a capital of \$1,000 a small dealer does a business aggregating \$10,000 gross, he hopes to make say 10 per cent on the \$10,000, or 100 per cent on the capital actually invested, but this is not profit, it is only salary which some people count as profit. As the extent of his operations increases and he does a business of \$100,000 a year, he may hope for a net return of at least 5 per cent on his gross business over and above salary. As his business grows he invests more capital which he takes from his profits or borrows from the bank, and he does a business amounting to \$1,000,000. On this he hopes to earn from $2\frac{1}{2}$ to 3 per cent, or perhaps 10 to 20 per cent on his actually invested capital. When his business amounts to \$10,000,000 a year, he is content with perhaps 2 per cent profit, or even less, on the gross volume of the business, since this will yield from 10 to 20 per cent on his actually invested capital and this has gotten to be so large that a smaller rate of return enables him to live in the manner he chooses, and the business is established and safe.

He could probably incorporate the business and sell the stock on a 5 or 6 per cent return basis, pocket the resulting profit, invest it in safe securities yielding 4 or 5 per cent, and spend the remainder of his days in such activities as might please him. This is the successful man—the more than average successful man. It is a lamentable fact that the average man in business is a failure so far as his business results are concerned. He may not go into bankruptcy but he takes \$20 a week or \$100 a month out of the business as salary, thinks he is earning a profit but really makes no profit at all, not even interest on his actually invested capital. Such a result cannot be called success.

BANKING AS AN EXAMPLE

Men who invest their money in a new banking business, one of the more stable and certain kinds of business, expect that their money will earn not less than 10 per cent and they hope for and usually receive considerably more than 10 per cent, which is partly paid in dividends and partly by payments to the surplus fund which increases the market value of their stock. When the business is well established and is earning on the average 10 per cent on the par value of its stock, men will be willing to invest in this stock at such prices as to make their return less than 10 per cent and often as little as 5 per cent on the investment. One of the great banks of New York pays regular dividends of 25 per cent quarterly, or a return better than 100 per cent annually, and occasional extra dividends of 100 per cent, and its stock is quoted at more than 40 times its par value. This bank has established an enormous business with a relatively small capital. It charges for its service no more than its service is worth else it could not do the business in competition with other banks. There are numerous other banks whose stock is worth several times its par value because of the large returns on the originally invested capital, and the existence of a large surplus, which returns and surplus have been realized by doing a relatively large business on a small capital.

MANUFACTURING AND CONTRACTING

When one goes into any manufacturing business or into a contracting business involving considerable risks, he figures to receive a large return rate because of the risk of actual loss or very small or irregular return, which frequently results. He plans to make from 50 to 100 per cent if all conditions prove favorable and to make 10 per cent if conditions prove to be as unfavorable as he thinks at all possible. Not

infrequently conditions prove more unfavorable than he thought possible or he makes some mistake or oversight in his estimates and as a result he loses money; on the other hand occasionally conditions prove to be much more favorable than he had hoped for and he makes a large profit. The thinking public permits and expects such profits, and must pay them or it does not get its work done.

NO DEFINITE FAIR RATE

These considerations seem to indicate that in private business there is no rate of return that can be called in general a fair rate of return. Any business man or corporation seems to be permitted by common public consent to earn any rate of return on the actually invested capital that is possible by honorable dealing. In general business then there is no standard for determining a fair rate of return. The laborer is worthy of his hire and whether he makes his talents return an hundredfold or only tenfold, he has earned no more than a fair return if he has dealt honestly and has not defrauded or oppressed his neighbor. Indeed, a fair return in general business might be defined as any return a business is able to earn fairly through the use of honorable methods.

AS TO PUBLIC UTILITIES

Does the same definition hold for public utility properties? In considering this question it must be remembered that men go into the business of furnishing public service—service that is generally recognized to be a proper, if desirable, public function—for exactly the same reason that men go into any other business, namely: to make money. Perhaps this is not the most laudable ambition and it may be that it is not to be compared favorably with the ambition of the scholar in pure science, whose ambition is to discover something new and valuable to the world; but it is an ambition regarded as worthy by most men, possibly because it is the principal ambition of most men. And it seems fair to say that the business man, who has reached the point where he is satisfied with simple interest on his money has passed the period of greatest usefulness to his community and to the world unless he devotes his life to gratuitous public service; he has lost his ambition to create wealth; (I believe the successful distributor of wealth is almost certain to be also a creator of wealth) he has lost a human quality most essential to the material progress of the world. Let it be granted at once that material progress is not more important than spiritual progress if indeed it is as important, but, also, let it be recognized that material progress is essential whichever sort of progress may be deemed the more desirable.

If then we prefer to have men of ambition and courage undertake to serve us in certain ways rather than to serve ourselves, to provide our water supplies, our light, heat, and power, and our transportation facilities, must we not expect to permit them to earn at least as much as men of average success earn in other business of equal risk and magnitude? Of equal risk and magnitude is a simple and well sounding phrase, but close acquaintance will develop difficulties of determination. On the other hand if we give these men of ambition and courage the practically exclusive privilege of supplying us with certain necessities of life, may we not say to them: "You must deal fairly with us. You must charge us no more than the service is worth to us, and this must be determined by its cost to you, because its cost to you may be considered to be what it would cost us to serve ourselves. To this cost to you we shall expect to add a good profit to pay you for relieving us of the burden of serving ourselves, but we shall look to you to see that this profit is not more than successful men in private business of equal risk and investment expect to earn. Come, let us agree as to what this shall be and how we shall treat and share from time to time in the

beneficial results of advance in the art of furnishing the service you propose to furnish."

NECESSITIES AND LUXURIES

It may be that the fair return will depend on the nature of the business. The furnishing of an absolute necessity, like water, by a monopoly company should call for a less rate of return than the furnishing of a luxury like gas or electricity for two reasons:

1. A sociological reason—because absolute necessities should be supplied always at the lowest possible cost.

2. A business or economic reason—because there is less risk in developing a property to supply an absolute necessity, for which there is no practicable substitute, than in developing a property to supply gas or electricity, either of which is always in partial competition with the other and both in partial competition with oil.

To be sure as time goes on gas and electricity tend to become necessities, but there is always much more to be done to develop this condition than to develop the necessity for a pure water supply. The possibility in the development of demand for gas and electricity is much more unlimited than is that of developing a demand for water. Though the demand for water may be limited, yet water will always be needed; it will never go out of style or be superseded by something better. Gas properties have already suffered by the introduction of electricity, and the art of electric lighting and power development and transmission is advancing so rapidly that new machinery and appliances of today must be discarded tomorrow. Functional depreciation allowances must be large or great risk must be recognized as a reason for allowing a high rate of return.

CAPITAL AND INTEREST RATE

Again different businesses require differing ratios of capital to annual volume of business done. The successful private mercantile business has as a rule gross annual receipts far in excess of its invested capital, so that 2 per cent of the gross annual receipts may mean from 6 to 20 per cent of the invested capital, while in a railroad business one finds exactly the opposite condition. In this business the invested capital is always larger than the gross annual receipts, so that, as an average for the United States, perhaps it is fair to say that a profit of 20 per cent of the gross annual receipts will mean not more than 5 per cent and perhaps less on the honestly and reasonably invested capital. Thus a relatively large rate of return measured as a percentage of business done must be allowed such enterprises in order to make the return measured as a percentage of invested capital compare favorably with the returns in purely private enterprises.

The legal rate of interest in a given state or country may influence the conclusion as to fair rate of return. If the legal rate has been determined by the people to be 6 per cent and not more may be charged without involving the charge of usury, then it would seem to be clear that 6 per cent is not enough to warrant a company investing its money in a business which requires effort and the taking of certain risks from both of which the money lender is free, if he lends on good security.

IS 6 PER CENT ENOUGH?

The foregoing matters influence private business as well as privately owned public utilities; the two are unlike only in the greater degree of control exercised by government over public utilities, and the fact that these are as a rule more nearly monopolistic in character than private business, which though not always so, is more often entirely competitive. Because of the monopolistic feature of public utility service, a feature in some cases less existent than is often supposed, we are apt to feel that such enterprises should be subject to many more restrictions than private business, and that they should be limited to a very moderate rate of return on

their invested capital, some persons believing 6 per cent to be sufficient. The considerations thus far developed ought to indicate that no uniform rate of return can be fixed that will be fair to all utilities; that we cannot expect business men to go into public business with an expectation of earning less than they could earn with any success in other enterprises of like risk and magnitude, because they go into public business for the same reason that they go into private business—to make money—and until private business is limited by law there would seem to be no good reason to limit the earnings of privately owned public utilities to less than the return of the average successful private business of like risk and magnitude. No definite percentage can be fixed as measuring this return, but that it is more than the 5 or 6 per cent that some would fix as the limit, a glance at a purely hypothetical but entirely reasonable example will serve to show.

The banking business, while competitive and complex in its details is in general theory one of the simplest businesses to reason about, and being pretty well controlled by law furnishes a fairly good example from which to begin reasoning with respect to other business. It involves some risks but when well managed is perhaps reasonably free from most of the risks attending many other kinds of business. The banking company has capital invested, and generally the law makes it necessary that its capital shall be all actual; that if \$100,000 of capital stock is issued, \$100,000 of cash must be behind it actually paid into the treasury of the company. The banking company has operating expense consisting of rentals, stationery and printing, advertising, wages, and other incidentals, and interest paid to depositors. It performs service for its depositors, stores their money, furnishes them with books, checking blanks, etc., and pays out their money on their order, keeping track of receipts and payments. For the use of the depositor's money, the company pays this service and from nothing to perhaps, 4 per cent interest. The rate depends on the character of the deposits, whether savings or open account, and on their magnitude, very large open accounts receiving, perhaps, 2 per cent on the average daily balances, small accounts nothing.

The banking company lends its depositor's money to others and charges from 5 to 8 per cent or more depending on the size of the loan, the nature of the security furnished, the law fixing the maximum rate, the demand for money, and competition, although there is little variation in the rate due to competition. It also has a small amount of incidental charges for commissions, protests, etc. As a result of its charges and expenditures the company may clear from 1 to 2 per cent on the loans; that is to say, if the average interest charges are, say 6 per cent; then from $\frac{1}{10}$ to $\frac{1}{3}$ of its charges or gross business will be profit. If a banking company with \$100,000 capital has loans amounting to \$1,000,000, which is a not uncommon ratio, and its average interest charge is 6 per cent yielding \$60,000, and if $1\frac{1}{2}$ per cent on the loans, or a quarter of the charge is profit, the banking company earns net \$15,000, or 15 per cent on its invested capital.

This is not at all an unusual or peculiar result of the operation of a moderate banking business in a moderate sized community. It will be noted that as in the case of railroad property, the income is less than the capital. If the loans are two million dollars with the same ratio of expense and profit, the net earnings will be 50 per cent on the capital, while if the loans are only half, or \$500,000, the net earnings will be but $7\frac{1}{2}$ per cent on the capital. Of these two latter conditions the first is rare and represents unusually profitable business, and the second, though not to be called rare, represents somewhat less than an average success in banking. In the first case the income is more than the capital.

If the foregoing is fairly representative of the conserva-

tive business of banking—a business hedged by regulatory statutes—and such results are recognized as fair and reasonable, does it not appear that we should hesitate to limit any public utility to a 5 or 6 per cent return on the capital reasonably invested?

REASONABLE ATTITUDE

Now without question when business properties, any of them, purely private or privately owned public utilities, are firmly established and earning, say, 15 per cent on the outstanding capital, there will be those who will be glad to buy the securities on a 5 per cent basis, and the market price of the stock may be 300, or three times its par value. The stock may then be increased—watered as it is sometimes called—to three times the original amount, and the increase distributed gratis to the stockholders of record. Other things may be done that are less defensible. It has been not uncommon for public utility corporations to keep their evidences of capital, bonds and stocks, at such an amount that the return should appear to be not more than from 5 to 8 per cent, largely because of the fear that the public noting larger returns would take action to reduce the earnings.

This would be made unnecessary by a reasonable attitude of the public toward its service corporations; a realization that those engaged in public utility work are not public agents entitled to a wage only and guaranteed that wage, but that they are business men engaging in a business for the same reason that other men engage in other business, *with no guarantee against failure*, and that subject to certain limitations of fair dealing when supplying common necessities, they are entitled to make their talents earn other talents just as other business men, praised for their foresight, judgment, and ability, make their talents earn other talents.

Must not the conclusion of the matter be that the "fair return" on the "fair value" of a public utility property, that the courts have talked about so much and have judged to be the right of every public utility corporation to earn, means any return the corporation can earn by honorable methods when operating freely without rate regulation, so long as it does not exceed on the reasonable investment, the rate of return expected by the man or corporation of average success in other business of equal risk and magnitude; and may not the rate exceed this average successful rate if thereby incentive is given to develop economies in which the public may share?

PLEA FOR AN OPEN MIND

My plea is not for the corporation but for an open mind when considering great questions of public policy; for a spirit of fairness when considering private or corporate acts as they affect us; for freedom from hasty judgment without adequate evidence. You all have read of the plea of the railroads to the Interstate Commerce Commission to be allowed an advance in rates in this time of high prices and increased expense due to governmental action fixing the length of the working day. Many of the larger private businesses, some, to be sure, whose prosperity is closely linked with railroad prosperity, have seen the justice and need of an increase in transportation rates, but the farmers of the country have appeared by counsel before the Commission to try to prevent the increase in the rates. The farmers of the country are heavy shippers and feel the effects of changes in rates, but it is worth while to call attention to a fact brought out in a recent editorial in the *Railway Age Gazette*, that whereas farm products have increased in value tremendously in the past six years, railway rates have stood almost still. In 1910 the freight rate on wheat from Chicago to New York was 11 per cent of the farm value of the wheat; last year it was only 6.3 per cent of the farm value of the wheat. In 1910 the freight rate on corn from Chicago to New York was 18.6 per cent of the farm value of the corn; last year it was but 10½ per cent of that value. To increase

the rate by the amount asked by the railroads would advance the freight charge on grain but a very small amount measured as a percentage of the value of the grain, and would leave it still much less than it was a few years ago.

I am not arguing the case of the railroad. I do not say whether the increase demanded is necessary; there are other factors to be considered; but I call attention to this curious fact to emphasize my plea for an open mind in considering questions of public and private concern, and for fair dealing between men. The need must be evident from this example of the farmer and the railroads. It may be that in the years to come government will over-turn all the theories of supply and demand, of competition and combination, now held by economists, and will fix the reward for all public and private effort. I do not look for this time in the near future, and until it shall come, who shall say with justice that this man may make his talent earn ten talents, but this other man shall make his talent earn but one talent? Let us be fair.

HEAVIER CAR LOADING AND THE RAILWAY BUSINESS ASSOCIATION

Winning the war by making every freight car do all it can has now enlisted in cooperation with the Railway Business Association trade organizations having a total membership of 20,000. These are national, state and local bodies which have recommended to their members the performance record blanks through which the president of each company can measure from month to month the progress maintained by his shipping department. A vigorous effort is afoot to extend the number of the associations participating in this movement in order that the heavy traffic of coming months will find thousands more shippers conserving car supply by system.

George T. Smith, of Jersey City, chairman of the Association's Freight Car Thrift Committee, has made public the names of 40 bodies which have already responded. He issues a new appeal to the others. All the secretary of such an organization has to do is to multigraph a letter, ask the Railway Business Association for the requisite sets of blanks and drop in the mail.

Following are the organizations which have recommended performance record blanks to their members:

- American Face Brick Association.
- American Feed Manufacturers' Association.
- American Hardware Manufacturers' Association.
- American Iron, Steel & Heavy Hardware Association.
- Associated Industries of Massachusetts.
- California Redwood Association.
- Carriage Builders' National Association.
- Hardwood Manufacturers' Association.
- Hard Yarn Spinners' Association.
- Illinois Manufacturers' Association.
- Knit Goods Manufacturers of America.
- Manufacturing Chemists Association.
- Michigan Manufacturers' Association.
- National Association of Automobile Accessory Jobbers.
- National Association of Furniture Manufacturers.
- National Association of Garment Manufacturers.
- National Association of Glee and Gelatine Manufacturers.
- National Association of Stationers and Manufacturers.
- National Association of Stove Manufacturers.
- National Confectioners' Association.
- National Lumber Manufacturers' Association.
- National Machine Tool Builders' Association.
- National Paper Trade Association.
- National Petroleum Association.
- National Pipe and Supplies Association.
- National Varnish Manufacturers' Association.
- National Wholesale Grocers' Association.
- Ohio Manufacturers' Association.
- Richmond, Va., Chamber of Commerce.
- Rochester, N. Y., Chamber of Commerce.
- Rubber Association of America.
- St. Joseph, Mo., Commerce Club.
- Silk Association of America.
- Sioux City, Ia., Commercial Club.
- Southern Hardwood Traffic Association.
- Southern Pine Association.
- Southern Supply and Machinery Dealers' Association.
- Syracuse, N. Y., Chamber of Commerce.
- Toy Manufacturers of the U. S. A.
- United States Sugar Manufacturers' Association.

Possibilities of a Market-Train Service*

Primarily Designed to Aid Small Producers and City Consumers and to Operate Over Short Distances

By G. C. White and T. F. Powell

Transportation Specialists, Office of Markets and Rural Organization.

IF the statement be true that more than one-half of the industrial and commercial energy of the civilized world is expended in the provision and preparation of food, it becomes all the more important, as the density of population and the economic conditions of the United States approximate those of the Old World, that the producing areas in the vicinity of large consuming centers be utilized to their full capacity, and that the products of such areas be accorded an efficient and economical transportation service.

Conditions controlling the commerce of England have developed a railway freight service characterized by light trains of high speed and frequent movement, cars of small capacity and very low minimum weights. The settlement of the greater part of the United States and its industrial development followed the advent of the railroad. The long distances separating the sources of raw material from the mills and factories utilizing it, as well as the character of the raw material, have developed high minimum weights for large cars of great weight capacity drawn in heavy trains by powerful locomotives. The development of these features of the freight service of the railroads of this country has received relatively more attention than has been given to the improvement of facilities for short-distance local traffic.

The greater part of the trading at the principal live-stock markets of the United States is done on certain designated days each week, and special trains carrying nothing but live stock reach these markets in large numbers on those days. From a comparatively small area in the Imperial Valley of California approximately 5,000 cars of melons are shipped to market each year, the bulk of the crop being handled during four weeks in June. During the height of the shipping season special trains carrying nothing but melons move east across the desert. From certain of the Gulf ports special trains carrying only bananas run on frequent and fast schedules to northern cities. Solid trains of milk daily supply New York City with that commodity. All these may be termed "special market trains," and, for the most part, they are additional examples of the efficient handling of long-distance, high-speed traffic of large volume.

In that section of the United States lying north of the Ohio and Potomac rivers and east of the Mississippi, known in railroad parlance as official classification territory, has taken place the greatest industrial development of the country. Here is situated much agricultural land in small units, the individual farm yielding dairy products, poultry, small live stock, and fruits and vegetables, which mature at different seasons, and produce less than a carload quantity of any commodity at one time; here are our most populous cities, daily demanding a supply of perishable foodstuffs; and here density of population and economic conditions are beginning to approximate those of the Old World. In this section are presented many opportunities for developing the possibilities of a market-train service along the lines of the service now furnished by milk trains.

Steam and electricity in passenger transportation have relieved some of the congestion of the population of large cities, but the suburban development of residential districts has withdrawn a proportionately much larger area from tillage, until most of the market gardeners have been pushed back beyond wagon range of the city markets, and many of

them beyond the range of the autotruck. Coincident with this development has come the increasing demand for greater quantities of foodstuffs, and it becomes necessary, therefore, that the commutation passenger service of the large cities find its counterpart in a similar freight service. The relatively small number of postal cars as compared with freight cars, or even with express cars, makes improbable any considerable amount of relief by the parcel post at the present time, and express service has not fully met the need.

The limited market-train service maintained by certain of the roads serving New York City, and the somewhat more extensive service of the same kind maintained by roads serving Philadelphia, were foreshadowed in some of the marketing practices which developed with the construction of the first railroads in the United States. Following the analogy of turnpike operation, the first railroad companies furnished roadway only; horses were the only motive power; farmers furnished their own motive power, paid the necessary tolls for the use of the track, and hauled their produce to market in their own vehicles.

More than 50 years later, in 1888, the reports of the Interstate Commerce Commission disclose a special market-train service by four of the railroads leading to New York City, and doubtless there were other roads that offered a similar service. The service consisted in transporting on the daily milk trains, in the same cars with the milk, such commodities as fresh meat, berries, butter, and eggs, and in returning to the shippers the empty containers, such as meat baskets, berry and egg crates, and butter carriers.

The rapid increase in the milk business and other conditions peculiar to its transportation and marketing in the course of time made it necessary to restrict the milk cars almost exclusively to the transportation of milk. However, many, if not most, of the tariffs covering the transportation of milk to Boston and New York include pot cheese as a commodity which may be included in mixed carload lots of milk, cream, and buttermilk. A railroad in Vermont and another in Massachusetts permit the transportation of butter in milk cars, and a road in Maine includes eggs. One road serving sections of Pennsylvania and New York and participating in the New York City milk traffic handles in its milk cars practically every class of farm produce except fresh meat. Another road serving an extensive section of New York makes tariff provision for a similar service by its milk trains. One of the trunk lines serving New York City has had in operation since 1890 a produce train giving a carload service for farm products on one of its divisions; and on another division the same class of commodities is given a less-than-carload pick-up service by milk trains.

The examples given of special facilities and service, in the transportation of less-than-carload quantities of farm products, are merely some of the best-known examples and, of course, do not include all the cases throughout the country to which attention might be called. The most conspicuous examples are the market trains running to Philadelphia over the rails of two of the carriers serving that city.

The first road runs its market trains over the several divisions only once a week. The trains leave the most distant stations, some 60 miles from Philadelphia, about 7.30 a. m. and reach Philadelphia about 2 p. m. Some of the cars used are box cars fitted with adjustable ventilators in the

*Abstract of a bulletin issued by the Department of Agriculture.

doors and in the side walls. Some of the cars are equipped with hooks along the walls for hanging fresh meat, a fact which makes it easier to keep the meat both clean and cool. Some of them are combination stock-and-poultry cars, one end being slatted for small live stock and the other end of the solid, box type for the reception of coops of poultry. Refrigeration by means of ice bunkers built into the cars is unnecessary because of the short time of transit. Some of the cars are assigned to the more important stations and are lettered with the name of the station to which they are assigned.

The rates named are any-quantity rates, and range from 10.5 cents to 28.4 cents per 100 lb. They apply on "marketing," which is defined as including dairy products (except milk or cream); poultry-yard products; products of the orchard, garden, or farm; fresh or dried fruits or vegetables; and such small live stock as calves, sheep, lambs, pigs, and hogs. The charges must be prepaid or guaranteed; and the rates apply only on shipments handled on designated market trains.

The railroad disclaims responsibility for loss or damage resulting from neglect on the part of marketmen to comply with its instructions, which read as follows:

All marketing must be properly packed for safe transportation and protection against loss, theft, or damage to contents of packages, plainly marked with consignee's name, and promptly and properly claimed upon arrival of market train at destination.

The suggestion is made that, for obvious reasons, shipments should be accompanied by the owners, but the freight rate does not include the transportation of the owners; they have to pay passenger fare.

The facilities are excellent for handling and taking care of the shipments on the arrival of the market trains at Philadelphia. The terminal station for the market trains is centrally located, directly adjacent to a wholesale market, and is itself equipped with a cold-storage plant. Immediately on the arrival of the trains the shipments are unloaded. They can be transferred directly from the cars to the station cold-storage rooms, or to stores of dealers in the wholesale market. If it is desirable or necessary to take them to other parts of the city, it is possible to unload them directly from the cars into wagons backed up to the cars. Apparently the one thing lacking to make the facilities complete is a retail market or a row of farmers' stands along the sidewalk in front of the station. Under the plan of this railroad, the freight is handled and delivered in the same way as general merchandise.

The second road inaugurated its market-train service more than 25 years ago. The trains are run daily, except Sundays and holidays, and the speed is that of the average passenger train. The farthest point served is not more than 75 miles distant from Philadelphia; consequently there is no need for car-lot refrigeration, although some shippers at times do ice their own packages.

The rates charged the shippers are slightly higher than the first-class freight rate, ranging from 15.8 cents to 31.5 cents per 100 lb. and applying on "marketing" "carried on market or milk trains, when accompanied by shipper holding trip or excursion ticket." The tariff naming the rates is an intrastate tariff, and does not give a list of the articles or commodities included in the general term "marketing." The charges must be prepaid, and the rates include the return of empty containers.

The principal retail market of Philadelphia occupies the street-level floor of the passenger terminal of this company, but this is not the terminal for its market trains. Freight arriving by market trains is delivered at freight stations at other points. On the whole, the facilities at these stations are not so good as those of the other road whose service has been described. Shippers or their representatives must be on hand, on the arrival of the trains, to claim and unload the consignments, as the carrier does not perform this service.

The transportation is at owners' risk, the carrier disclaiming responsibility for count or condition of the packages on delivery.

RESULTS AND ADVANTAGES

It must be borne in mind that a market-train service, such as is discussed here, designed primarily for small producers and city consumers, is of equal advantage to the carriers, and is in fact an economic necessity. It is of no interest to growers whose production is sufficiently large to enable them to ship in carload lots; nor would it be of any advantage to those communities where co-operative associations have united to combine into carload shipments the output of many small farms devoted to the production of the same commodity. When the distance to market is so great as to make protection of perishable commodities by refrigeration necessary, shipping in carload lots is essential for that reason alone. Aside from the question of refrigeration, and regardless of distance, producers should combine their shipments into carload lots, whenever it is possible, for economy in transportation charges. But, for farmers living along a single operating division of some railroad, within a hundred miles of a large city, or along a branch line terminating at some large city, who can produce a variety of foodstuffs almost continuously the year round, a market-train service would be of the greatest advantage.

The fruits and vegetables on such farms mature at intervals throughout the summer; the dairy products, eggs, and poultry, to say nothing of such commodities as apples and potatoes, can be shipped throughout the year as they are ready for shipment or as the market demands. There is not enough of any one commodity on a single day along the entire division or branch line to make a carload, even if it were otherwise feasible to combine it into a carload; and there is not enough of all commodities at one station on a single day to combine into a carload, even if the great variety of products and containers did not make it impossible to load the usual minimum weight into a single car. Such are the products of farms of this kind, and the success or failure of the farmers is in proportion to their ability or inability to market their products at a profit.

Other things being equal, the market nearest to him is the best market for the small farmer who produces a great variety of commodities and does not specialize on one or two. As has been shown, distant producers can reach any market with car-lot shipments, while the small producer here described, unable to ship in carload lots, is confined to the near-by market. His nearness to the market enables him to keep in closer touch with market demands, and he can quickly adjust his supply to the demand. To a distant shipper, large quantities in transit may bring loss by reaching destination on a falling market. In comparison with the large producer, the small farmer is doing a retail business. With a retail market adjacent to or in the city terminal of the market train, he would be in a still better position to do a retail business in every sense of the word and to sell directly to consumers.

This is just what was done during a part of the summer of 1912 in the case of a market train run to East Pittsburgh, Pa., by one of the roads serving that point. The farmers shipping by the train were organized in a farmers' exchange association, and the association had a representative at East Pittsburgh, who disposed of the shipments. Some of them were sold to wholesale and retail dealers, but the greater part was sold to factory employees. While the usual facilities of a retail market were wholly lacking, the service quickly developed a retail market, as sales were made in the railroad yard directly from the car to the householder. So popular had the service become and so great a reputation had it attained at the time it was discontinued, that a more affluent class of people was beginning to take advantage of it, some

of them coming long distances by automobile to do their daily marketing there.

Apparently all classes of people who bought supplies of foodstuffs here found some advantages over previous methods. It is quite evident that those who came long distances to buy got either a better quality of goods or lower prices, if not both.

This particular service was given for only 46 days during the months of April and May, when it was discontinued. The reason given for its discontinuance was that the terminal facilities were not satisfactory to the health authorities from a sanitary standpoint. The season of the year and the short period during which the train was run did not give sufficient opportunity to make a correct estimate of its probable continued success. Apparently there was no lack of patronage.

FACTORS NECESSARY TO SUCCESS

Market-train service is not a panacea for all the ills that afflict the small farmer in the marketing of his products. Every item of labor performed by the farmer in serving the consuming public is from one point of view an element of his co-operation with others. From the standpoint of his returns for the service that he performs he alone is responsible for the efficient performance of many of the items of labor. Sometimes he fails to recognize fully his own responsibility in co-operative effort, and sometimes he is mistaken in the causes to which he attributes the failure to market his products at a profit. Again he alleges cheaper methods of production on the part of his competitor or a disadvantage against himself in the matter of freight rates.

Mention has been made of co-operative associations whose efforts are directed toward consolidating into carload shipments the output of many small farms producing the same commodity. A market-train service with adequate terminal facilities in the way of a retail market offers an ideal opportunity to the producing community served of forming a co-operative association for the sale of its products directly to city consumers. No better opportunity can be asked for restoring the custom of direct exchange between producer and consumer, as far as it is possible to restore it, in those sections where changing economic conditions coincidentally have brought about the abandonment of that custom and have developed the necessity for a market-train service. With a representative of the association at the terminal to dispose of products directly to householders, all questions of variation of price on account of quality and condition are determined at the time of the sale by an actual joint inspection of the commodities by the seller and purchaser; no vexatious correspondence is afterwards necessary in adjusting claims—correspondence which may terminate established business relations by arousing mutual suspicion of lack of good faith; and, what is by no means the least important advantage, it is a cash transaction and the purchaser avoids the annoyance of remittance by letter.

As a step-toward the successful marketing of his products, the farmer must be brought to a realization of the justice of many of the criticisms against some of his methods. He must produce the commodities that the consumer wants; and only their superior quality will command prices higher than are being paid for the same commodities shipped from remote sections. If his products are not graded as carefully nor packed in containers as attractive as those of the long-distance stuff, he will not get the prices that are paid for the long-distance stuff.

One of the roads furnishing a market-train service to Philadelphia states that if the service were not already established it is hardly likely that it would be established "in view of the very light yield of revenue therefrom." As the inauguration of the service in the beginning was the result of judgment based on careful estimates, no figures of actual

operation being in existence, the statement would seem to indicate a desire to withdraw the service. The road that served East Pittsburgh in 1912 rendered a similar service at two other cities, Butler and Allegheny, Pa., from 1907 to the close of 1914, when the service was discontinued. The service to East Pittsburgh was inaugurated under the jurisdiction of the passenger department, as it was intended at first to handle the shipments on passenger trains. Later it became necessary to transfer it to the freight-traffic department. This road handles a large volume of heavy traffic to and from the iron and steel mills in the Pittsburgh district. Eighty-eight per cent of its entire tonnage for the fiscal year 1915 consisted of products of mines, while its total tonnage of agricultural products and products of animals was less than four-tenths of 1 per cent of its entire tonnage. Under the circumstances it readily can be seen that a market-train service would be of little interest to its freight-traffic officials from the standpoint of either tonnage or revenue.

It is true that some producers have begun to utilize the parcel post to some extent and that the reduction in interstate express rates which became effective in the early part of 1914 has attracted some shipments by express. In some sections freight service by interurban electric lines has afforded a slight measure of relief, but the advantages of that kind of service are too frequently offset by the lack of adequate and centrally located city terminals and the restrictions imposed on the running of freight cars through city streets. In some cases the growth of intermediate towns has attracted a considerable portion of the commodities that formerly went to the large city terminal. City boards of health have imposed restrictions making it necessary to exclude other commodities from milk cars, which increases the cost of performing the transportation service on lines where one car would hold all the shipments. This competition is pointed out by roads now giving a market-train service; and roads that do not now give such a service offer these and other facts as objections to its inauguration.

The small farmer is dependent on either local freight-train service, which is too slow, or on express service, which relatively is too expensive. The slowness of local freight-train service was pointed out in the Report of the Mayor's Market Commission of New York City, submitted in December, 1913, where it was said that it took from ten days to two weeks to get freight from some places distant for passengers only two hours from New York. The same conditions that now prevail with reference to the transportation of small quantities of miscellaneous foodstuffs formerly prevailed with reference to the transportation of milk to the large cities. The problem was solved in the case of milk, and it would seem that it can be solved as readily in the case of the other commodities. To cut off a city's supply of milk produces a crisis quickly; attention is called sharply to the situation, and a remedy is devised promptly. Lack of marketing facilities for the small farmer affects the producer more vitally than the city consumer, but the bad effects, while they make themselves felt more slowly, are none the less sure and none the less harmful to the community at large.

A market-train service affords an excellent method of restoring, as far as it can be restored, where it has been abandoned, the custom of direct dealing between producer and consumer. It contemplates the shipper loading his products into the car at point of shipment and taking possession of them immediately on arrival of the train at destination. There should be a retail market, or at least a wholesale market, in or adjacent to the city terminal. The service is more valuable to the shipper than ordinary local freight-train service. The time in transit is practically that of trains carrying express matter, but collection and delivery is made by the shipper. Such a service, to be successful, depends on the organized effort of the producing community intelligently directed in sympathetic co-operation with the carrier.

Increased Utility of Modern Malleable Iron

Facts versus Current Fallacies Regarding the Manufacture and the Physical Characteristics of the Metal

By A. H. Weston

Sales Engineer, T. H. Symington Company

THERE are a number of fallacies, both in connection with the manufacture of malleable iron castings and with the physical characteristics of the metal itself, which are unfortunately still entertained as facts by many engineers. These fallacies, based largely on hearsay, and to some extent on experience with the product of manufacturers who have

Fig. 1—Malleable Iron Wedge Tested Under a Light Drop Hammer

not kept in touch with developments in this industry in the past few years, may be cited as follows:

(1) That the strength and ductility of malleable iron castings lie principally in the skin.

(2) That malleable iron castings with thickness of sections exceeding $\frac{1}{2}$ in. cannot be completely annealed.

(3) That malleable iron castings are frequently over annealed.

(4) That the ultimate tensile strength of malleable iron does not average much over 40,000 lb. per sq. in., and the average elongation does not exceed 6 per cent in 2 in.

(5) That malleable iron is frequently unreliable due to non-uniformity in methods of manufacture.

The outer skin of a malleable casting does not by any means supply the major part of its strength and ductility, as the core has both of these qualities. In fact, there is very little, if any, difference between the strength of the metal in the core and that in the skin.

A malleable iron wedge is shown in Fig. 1 which has been subjected to the wedge test adopted as one of the standard test practices of the Associated Manufacturers of Malleable Iron. For this test the wedges are cast 1 in. wide by 6 in. long and are $\frac{1}{2}$ in. thick at the base, tapering to $\frac{1}{16}$ in. at the top. They are held upright under a small drop hammer shown in Fig. 2, and are repeatedly struck by this hammer until fracture commences. Each blow delivers 70 ft.-lb. of energy. The number of blows required to start fracture and the shortness of the uncurled portion of the wedge are taken as one means of measuring the strength and ductility of the iron.

The record of the following test conclusively proves the ductility of the core of a malleable casting. Several of the wedges as above described were cast of the standard width and length, but were made five-eighths inch thick at the base and three-sixteenths inch thick at the top. These wedges then had one-sixteenth inch machine off the 1 in. by 6 in. faces, leaving a wedge of the same dimensions as the un-machined standard wedge. Since the skin of a malleable casting is only about one thirty-second inch thick, the removal of one-sixteenth inch insured the removal of the skin. After machining, these wedges were put under the drop-hammer and subjected to the standard test. Their appearance after test was as shown in Fig. 3.

These results compared with tests made at the same time of un-machined wedges from the same furnace and annealed in the same oven are tabulated below:

	Unmachined wedges, blows.	Machined wedges, blows.
Afternoon heat, June 3.....	18.5	13.20
Afternoon heat, June 4.....	29.75	26.30
Afternoon heat, June 6.....	19.75	21.20
Average	22.67	20.27

It will be noted that the average result of the three tests of un-machined wedges is but slightly above that of the three

Fig. 2—Wedge Method of Testing the Ductility of Malleable Iron

tests of machined wedges, and in one case a machined wedge actually stood more blows than an un-machined wedge. Assuming this one case to be unusual and considering only the other comparative results, it is evident that malleable iron, even with its skin removed, is both ductile and dependable.

All parts of a malleable iron casting, even if the sections are as thick as 2 in., can be completely, thoroughly and uniformly annealed. The micrographs shown in Fig. 4 are illustrative of this fact. These micrographs show the typical

structure of first class malleable iron after anneal, the white areas being ferrite (pure iron) and the dark spots temper carbon. The structures shown range from the extreme edge to the exact center of a 2-in. section. It will be noted that the structure is practically the same in every case.

Heavy malleable iron castings are readily annealed, and insofar as this last step in the production of malleable iron is concerned, the process with heavy section castings is not different from that used with castings of light section. All that is required to anneal malleable iron castings is to raise them to a temperature at which the cementite and pearlite in the hard iron break down into ferrite (carbonless iron) and carbon, to give the action time to be completed and to cool slowly. It is obvious that a heavy section casting can be heated to the annealing temperature as readily as one of light section; for no matter how heavy a mass may be it can be heated throughout to any desired temperature if surrounded by a medium at that temperature for a sufficient time. The annealing of malleable iron requires about seven days, more than enough time for a heavy section to reach the temperature of its surroundings.

The annealing process, however, is not the one which alone controls the successful production of heavy malleable iron castings. An equally important factor is the foundryman's close adherence to the somewhat different procedure required in the production in the "hard iron" of castings of heavy section from that required for castings of light section. Regardless of thickness of section the prerequisite in making good malleable iron is to have practically all the carbon in the "hard" or "white iron" castings in the "combined" state. If carbon to any extent occurs there in the uncombined state the iron will be bad. Several factors tend to cause this condition; notably excessive carbon or silicon in the molten metal at time of pouring, and rate of cooling.

The rate of cooling has a very sensible influence on the appearance of "uncombined" carbon in the "white iron" castings; the slower the iron cools in the mold the greater the tendency for graphite to separate out. Obviously a casting 2 in. thick will cool much slower than one of $\frac{3}{8}$ -in. section. Consequently, in the manufacture of heavy-section castings the carbon or silicon, or both, in the molten metal must be lower than when light-section castings are made. This is taken care of by the operation of different furnaces

Fig. 3—Machined Malleable Iron Wedges Tested Under the Drop Hammer to Show the Ductility of the Core Metal

with different charges, suitable for very light work, medium weight work, or for very heavy castings.

Malleable iron castings cannot be over-annealed. It has been determined by very exhaustive tests that no marked deterioration in quality results if a casting is exposed to the proper annealing temperature for even four or five times the normal length of time of the anneal. This fact is evident from the appearance of the fractures shown in Fig. 5, which illustrate malleable iron that had been annealed from one to eight times. The strength and ductility of the iron showed no noticeable change until after the fifth anneal, and even then the deterioration was very slight. The illustrations of the fractures, made from ordinary photographs of the

polished and etched sections indicate that after the second anneal a ring of pearlite appears, working steadily towards the center during each successive anneal. The structure on each side of this ring is still the free ferrite and carbon characteristic of superior malleable iron.

It is true that malleable iron castings can be burned, as can all iron and steel products if heated to too high a temperature, but in all malleable iron foundries deserving of the term "modern" the annealing ovens are equipped with an electric pyrometer with terminals at various points in the ovens. In this way the temperature throughout the ovens is accurately known at all times.

Malleable iron with a tensile strength of 38,000 lb. per sq. in. and an elongation of 5 per cent in 2 in. was considered satisfactory under the old methods. At the present time good malleable iron has an average tensile strength somewhat above 45,000 lb. per sq. in. and an average elongation of 8 per cent in 2 in., seldom falling below these values and frequently rising above them. That this statement is conservative and as indicative of what quality of malleable iron can be produced and is quite often produced

Fig. 4—Photo-Micrographs Showing the Structure, from the Edge to the Center, of a Malleable Iron Casting of Two-Inch Section

today, the following data, taken from a record book of one of the association's foundries, show 16 consecutive heats from one furnace:

Heat	Tensile strength, lb. per sq. in.	Per cent elongation in 2 in.
November 1, A. M.	53,800	10.91
November 1, P. M.	57,300	10.51
November 2, A. M.	56,100	11.71
November 2, P. M.	54,400	12.50
November 3, A. M.	55,800	12.50
November 3, P. M.	54,100	11.71
November 4, A. M.	54,100	11.73
November 4, P. M.	53,800	10.95
November 5, A. M.	56,100	14.09
November 5, P. M.	60,000	14.05
November 6, A. M.	52,100	7.89
November 6, P. M.	54,100	10.90
November 8, A. M.	55,400	9.37
November 8, P. M.	55,100	10.89
November 9, A. M.	57,700	9.42
November 9, P. M.	55,400	14.09
Average	55,300	11.45

The Associated Manufacturers of Malleable Iron have recently voluntarily adopted a specification for railroad malleable iron castings, applying to the product of some 30 member companies, embodying a minimum tensile strength of 45,000 lb. per sq. in. and a minimum elongation of 7½

per cent in 2 in. This specification they will offer to all purchasers of such castings and agree that their product shall be accepted or rejected on this basis.

Assertions are still frequently made that malleable iron is unreliable due to non-uniformity in methods of manufacture and other defects inherent in this metal. This was doubtless true of the product as a whole made some years ago, and may still be true of iron made by those manufacturers who have not kept abreast with recent developments, but it does not apply to malleable iron produced by the Associated Manufacturers of Malleable Iron. This association, comprising a large number of malleable iron manufacturers in this country, has had in its employ for some time metallurgical experts who have by patient research insured the production of an iron which is ductile, strong and uniform in quality. The three means of investigation made use of by these experts, and in continued use, are the chemical laboratory, the physical laboratory and photo microscopy. Standards of procedure adopted by and compulsory with members of this association may be briefly described as follows:

After the castings are poured an analysis is made to disclose any irregularity in furnace operation and to give assurance that the desired composition of the iron is obtained. At the same time necessary test bars are cast from each heat to be used to determine the tensile strength, transverse strength and ductility. These test bars are distributed at different points in the oven in which the castings from this

quality of malleable iron, are preventive of considerable economy in car and truck construction due to the unnecessary use in many cases of cast steel car members instead of the less expensive malleable iron parts.

With respect to the stated inferiority of malleable iron to cast iron "under loads subjecting it to pure compression," this reiteration of a well known fact is superfluous, as the comparison made applies with equal force to all ductile steel products, and further, with the exception of wheels the inability of cast iron to resist shocks should eliminate its use on freight cars.

It will be noted from the above quoted statement, that "malleable iron is greatly inferior to cast steel in strength and ductility," and further, "It should not be used subject to high tension or bending strains unless breakage will not involve danger or damage to other parts of the car." Comparing malleable iron as produced today with cast steel, the actual facts as proved by tests at once controvert this opinion and recommendation.

In testing a cast steel rod having an ultimate strength of 65,000 lb. per sq. in., the elastic limit was reached at 32,200 lb. per sq. in. A malleable iron bar, having an ultimate strength of 53,500 lb. per sq. in. under tensile test, showed an elastic limit of 38,500 lb. Thus the elastic limit of the malleable iron bar was 9.38 per cent higher than that of the cast steel bar. It would seem hardly necessary to emphasize the advantage of this particular characteristic of malleable iron when it is recalled that the elastic limit and

Fig. 5—Photographs of Polished and Etched Fractures Showing the Effect of Successive Annealings on Malleable Iron

heat are annealed. After the castings, test bars and wedges have been annealed the bars and wedges are tested. Each one must come up to a certain standard before the castings are considered fit for service. If any bar fails to meet this standard, sections are cut from the casting, examined under the microscope, and the cause of the failure thus ascertained.

The following statement appears on page 13 of the 1914 report of the M. C. B. Committee on Car Construction:

"Malleable iron varies greatly in quality and is generally inferior to cast iron under loads subjecting it to pure compression. It is ductile, and has ability to resist shocks without cracking, which makes it superior to cast iron for car details not subjected to high tension or bending strains. It is greatly inferior to cast steel in strength and ductility. It should not be used subject to high tension or bending strains, unless a breakage will not involve danger or damage to other parts of the car."

This statement, while without question made in good faith at the time of this report, if now reviewed by the same committee members would doubtless be considerably modified, but it unfortunately stands on record as part of the last published report of an M. C. B. Committee on Car Construction. The assertions made, with one exception, do not now apply, are misleading, and where seriously entertained by those not in touch with the great improvement in

not the ultimate strength is used by engineers as the proper basis in designing castings. Despite the high ratio of elastic limit to ultimate strength, the unquestionable ductility of malleable iron is proved by the wedge tests as above described and illustrated, and by the figures given for percentage of elongation.

The not infrequent failure of steel castings due to interior flaws which cannot be detected by surface inspection is a matter of common knowledge. Examination of steel castings which have failed in service will in almost every instance disclose flaws in the core of the casting which were not in any way apparent on the exterior surfaces.

Malleable iron shrinks and cracks less than cast steel, and very rarely contains blow holes. This is because malleable iron castings are poured at a lower temperature than steel castings. The higher the temperature to which a metal is heated the more gas it takes up, with resultant greater liability to blow holes. Likewise the higher the temperature of the molten metal the more rapid its rate of cooling in the mold, with resultant tendency to shrinkage, flaws and cracks.

Much of the adverse opinion concerning malleable iron is due to the misconception as to its adaptability to heavy as well as light-section castings and lack of co-operation between designer and manufacturer. An engineer, with the erroneous belief that it will not do to design a malleable iron

casting with sections in excess of $\frac{1}{2}$ in. in thickness, has his attention called to such castings in service failing in considerable number, and forthwith decides on the substitution of a steel casting of such increased thickness as to weigh 60 to 100 per cent more than the malleable iron casting which it replaces. Had only a part of this additional metal been put into a properly redesigned malleable iron casting, equal or better results would have been obtained with less dead weight and less expense. Again, an engineer without precise knowledge of the peculiarities of malleable iron designs a car casting in such a way as to cause hidden shrink cracks and internal strains sufficient to result in a large percentage of failure in service. Experience has demonstrated that by intelligent co-operation with the foundryman developments of this character are entirely avoidable. The malleable iron manufacturer knows his metal. With this knowledge he is well informed how best to design any given pattern so that unequal shrinkage in the component parts of the casting made from it will not occur; thus affording maximum strength for a given weight. While he may not be fully informed as to just what is required in service of a certain part, he knows that failure because of structural defects, at once apparent to the experienced malleable iron foundryman, can be avoided by making the casting a little thicker here, a little thinner there, bracketing at one place and altering at another.

Freight equipment draft gear and attachments are admittedly subjected to greater abuse in service than any other car members. Modern friction draft gears and many of the draft attachment parts have always been and are still made of malleable iron, and yet it is a matter of record that the percentage of failure of these malleable iron parts of friction draft gears and draft attachments is not greater than that of the steel couplers. As a matter of fact, malleable iron draft castings can be and are designed so as to make them proof against failure in the severest kind of service.

The writer submits that malleable iron as produced today by reputable manufacturers is on the whole just as dependable as cast steel, comparing the two metals in castings of the same thickness of sections and of length not over six feet. The truth of this statement, in view of the lower cost of the malleable iron casting, should merit the careful investigation of those engaged in the design and maintenance of freight cars.

GERMAN RAILWAY RESTRICTIONS.—References have recently appeared in our columns and those of the daily press relating to the growth of transport difficulties on the German railways. The latest official document on the subject available enumerates a series of drastic restrictions. To begin with, it is laid down that cars must be loaded and unloaded with all possible speed, and that work must proceed by day and night, including Sundays and all public holidays. The military authorities are given powers regarding the employment of soldiers and civilians when the railway staff is inadequate, and the necessity for quick unloading is especially urged on the owners of private sidings. Consignees are not to ask for cars unless they can be loaded in the time officially specified, and it is further provided that "no merchandise should be despatched unless the possibility of unloading is assured beforehand." Consignees handling large quantities of merchandise are required to give the railway authorities advance information of expected deliveries, and in order to avoid unnecessarily long journeys buyers of all commodities are requested to make their purchases at the nearest possible centre to the place of destination. Another regulation provides that "every despatch which is not indispensable should be avoided." These regulations followed on certain passenger traffic restrictions, which have since been added too.—*Railway Gazette, London.*

NEW HAVEN BUILDING LARGEST NEW ENGLAND FREIGHT YARD

The New York, New Haven and Hartford has started work on a new classification yard at Montwese, Conn., near New Haven, which, when completed, will be the largest and most complete in New England, and in comparison with the character and volume of business handled, it will rank with the great railroad yards of the country. The plans for the new yard have been drawn with the idea of increasing and improving the service of the New Haven and to provide the facilities for handling the peak load at all times without delay or congestion.

The new classification yard is to be located near New Haven because of the relative importance of that city to the whole New Haven system. It is similar to the hub of a wheel. Important lines radiate from New Haven to New York; to the west over the Poughkeepsie bridge route; to Waterbury and Winsted; via the canal line to Holyoke, Northampton and other points; to Hartford and Springfield; via the air line to Middletown, Willimantic and points in the northeast; and over the low grades of the shore line to New London, Providence and Boston, and other points in Rhode Island and eastern Massachusetts. The essential purpose of the classification yard will be to receive trains from all routes made up of cars for all destinations. In the yard the cars will be sorted out and made up into trains for their proper destination. All trains will leave the yard in station order for all the important destinations, many of them being straight made up trains for each of the more important commercial centres.

The yard will be of the hump type. There will be two distinct sections, one for eastbound and northbound traffic, and the other for south and westbound traffic. Each section will have three units. The first will be the receiving yard into which arriving trains pull in. The tracks in this yard will practically eliminate the standing of freight trains in the cuts and on the main line, both east and west of the New Haven station. It will also prevent delay to freight trains at other points in the vicinity of New Haven. The next unit is the classification yard. There will be about 25 tracks in the east and northbound unit and 15 in the west and southbound. They will be short tracks into which cars will be delivered by cutting them off at the hump and letting them drop into the various tracks by gravity. Each track in these two classification units will represent a single classification. The third unit is the departure yard. After being classified the cars are switched into this yard from the classification yard and are made up into trains.

A 16-stall roundhouse and a large merchandise transfer that will hold three or four hundred cars will be included in the layout. The plans for the new yard provide for the separation of grades at Air Line junction, where the westbound shore line passenger trains will be carried overhead all the tracks. The freight will pass underneath in the middle and the northbound passenger line will pass underneath and around the east side of the yard. Under this arrangement through passenger and through freight trains will not cross each other at any point at or in the vicinity of New Haven. In a similar manner, the freight tracks leaving the shore line east of the junction will be separated from the grade of the westbound passenger track.

The New Haven, in anticipation of this improvement, purchased nearly all the property required some time ago. At the present time five steam shovels are in operation and it is hoped to have a few of the tracks of the first unit completed within three months.

FRENCH LIGHT RAILWAYS.—France has a much greater mileage of light and secondary railways than is generally imagined, one company alone operating 1,366 miles.

Full Cars Are Essential for Train Loading

Five Discussions Which Point Out Some of the Basic Principles Underlying the Securing of Heavier Tonnage

THE first essential to a heavy train load is fully loaded cars. In the discussions of means of increasing the train load printed below several of the authors emphasize this and other primary factors which must be considered in a campaign of this kind.

SOME PRACTICAL ILLUSTRATIONS

By W. Wilson

Assistant Superintendent, Southern Pacific, Portland, Ore.

Train loading, engine efficiency and train miles are in the hands primarily of three men: the chief dispatcher, engineer and yardmaster. The average yardmaster is ambitious to keep his track clear and in doing so frequently overlooks the importance of a full train load. On a certain division the engine rating is 2,000 tons. Two trains are due to arrive a few hours apart. The first has 1,750 tons, the second 2,250 tons. In order to save a few minutes' work, the yardmaster runs the first train on arrival, 250 tons light, and the second train on arrival, reducing it 250 tons. If the first train had been made up and the 250 tons from the second train added, the delay would have been nominal and all tonnage would have been moved, securing 100 per cent engine efficiency with a full train load on both trains.

In figuring tonnage it often happens that to add one load to a train would make it ten tons over the engine rating. Instead of adding a 20 ton load, the yardmaster lets the train go out ten tons light. By doing this he has lost 20 tons, or one per cent on the train load and one-half of one per cent on engine efficiency or he has lost one train in 100 trains.

On a 700-mile division, of which the first 250 miles is on easy grades, two trains of fruit are moving; the first on time, the second three or four hours late. The first should be run with 90 per cent of the engine rating and be kept on time, and the second with 70 per cent of the engine rating to enable it to close up on the first at the end of the 250-mile run and be consolidated with it, filled to 90 per cent of the engine rating and so run for a distance of 250 miles, or over the various grades, furnishing the necessary helper engines that are adapted to such grades. This class of helper engines should be located at the different helper stations to handle the tonnage in the train, and at the same time correspond with the engine rating. With proper train despatching this train will have gained 30 min. to 1 hr., putting it that much ahead of time, leaving, say 200 miles of easy grade to be run, over which full tonnage and 100 per cent engine efficiency could be maintained.

On some divisions local freight trains make the division in six to eight hours, handling only a few cars. They should be filled to tonnage that will enable them to make the division in eight or ten hours.

In a large commercial center, several roads are competing for early morning delivery of merchandise at intermediate points. The time is very fast, making it necessary to handle a light train load. As a rule it is not essential to deliver Saturday's loading until Monday morning and Sunday's loading is very light, if any. On Saturday and Sunday these trains should be filled to full tonnage. A train including ten cars of bananas arriving at Chicago at 6 p. m., Saturday, for Monday morning delivery, would be time thrown away. Some of this time should be consumed on

the last 300 or 400 miles of the run for handling tonnage.

Chief dispatchers have been known to run several sections of fast freight trains a few minutes apart over long divisions, and in the prevailing direction of traffic, some of the sections gaining several hours and being delivered to the connection several hours ahead of time. By proper supervision on the part of the chief dispatcher, this time should have been used to haul full tonnage or to consolidate some of the sections, which would ultimately result in the saving of several trains.

Most engine ratings are made by the mechanical department, and the result is that our engines are underrated. While we make a good showing in engine efficiency we are losing in train load as against what our engine can actually handle.

It is not necessary to run test trains in order to arrive at what an engine can haul, or to figure engine ratings mathematically except to attain a fair rating. The proper way to test an engine to determine what it can haul is to add a load or two until you have gotten it where it will handle every pound possible of dead freight at a speed of 12 miles per hour over a freight district.

On a certain division the largest number of cars of perishable freight that had ever been handled in any one train was 50 cars. The connecting division delivered 60 cars of perishable freight on short notice. There was nothing to fill out with in order to run two trains. The chief dispatcher, knowing the engineer, instructed the yardmaster to let the 60 cars go in the one train, stating "Russell will handle them." He did and made the schedule, and from that time on, with the same class of engine, 60 cars of perishable freight has been the maximum. In fixing such schedules the chief dispatcher should take into consideration all conditions, including the number of trains to be met and passed, the weather, slow orders at the foot of short grades, whether the train consists of heavy or light loads, or mixed loads and empties.

LOADING TRAINS FOR THROUGH MOVEMENT

By H. S. Noble

Office of Division Superintendent, Pennsylvania Railroad, Erie, Pa.

On certain portions of a railroad there are usually a number of junction points where cars are interchanged, and also, on account of variable grades, numerous locomotive ratings have been established between local points. To operate such divisions by endeavoring to pick up and set off cars to suit the grades, will result almost invariably in a reduced train load. Theoretically it would appear that the maximum average train load is obtained by loading locomotives to their maximum rating between interchange points. In actual practice, however, a congestion will form at some outlying point where cars have been set off on account of encountering heavier grades, and it will become necessary to run an engine and crew light to the point of congestion to clear up the accumulation. The light locomotive mileage made in this operation increases the total mileage to the extent that the train load invariably falls off in proportion to the number of times the train master permits tonnage to accumulate at the outlying points. To overcome those difficulties through tonnage ratings with proper helping service on the grades will have the effect of increasing the average train load and incidentally reduce the coal consumption, overtime and draw-head failures.

On one division the writer found trains being operated

*Other papers received in the contest on Methods of Increasing the Train Load were published in the issues of June 22, page 1401; July 13, page 63, and August 3, page 201.

on the local tonnage basis, and owing to the heavy business and considerable overtime which was being made a heavier class of power of the superheater type was substituted in place of the smaller engines. Comparative records were kept to indicate the advantages of the heavier engines, during which time the old basis of setting off and picking up cars was practiced; this resulted in an increased train load of only 8.5 per cent. At the same time the overtime decreased 13.7 per cent and the coal consumption decreased 12.8 per cent. By the application of through tonnage ratings and the establishing of one regular pickup train each day, the train load was increased 21 per cent, the overtime decreased 68 per cent and the coal consumption reduced 27.4 per cent as compared with the corresponding period when the smaller power was used.

TEMPERATURE REDUCTION

On account of the fall in temperature during winter months, a reduction in the tonnage of freight trains must be made in order to produce a total resistance of the train equal to the power of the locomotive. No definite dynamometer car figures have been produced to show accurately the proper reduction to make in order to meet the various low temperatures. However, the following table indicates the percentage reductions that can be made for various grades, according to the amount of increased resistance due to fall in temperature.

TABLE SHOWING TEMPERATURE REDUCTIONS

Symbol	Pounds increment in resistance	Per Cent Reduction in Tonnage		
		0.3 Per Cent Grade	1 Per Cent Grade	1.5 Per Cent Grade
A	0	0	0	0
B	1	8.1	4.8	2.8
C	2	18.7	8.5	5.7
D	3	28.2	11.5	8.3
E	4	30.7	14.8	10.8
F	5	35.7	17.8	13.1
G	6	40.0	20.7	15.4
H	7	43.7	23.3	17.5
I	8	47.0	25.8	19.5
J	9	50.0	28.2	21.4

In applying the reductions on a division where at one terminal the grade is 0.3 per cent, and at the opposite terminal 1.5 per cent, it will be noticed that the reduction on the heavier grade is much less than that on the lighter grade. From observations noted on various railroads, the percentage reduction made for a given division is uniform and therefore no consideration is given to the smaller reductions necessary on heavy grades. In actual operation it has been found that where the temperature was about 15 deg. below zero, that 50 per cent reduction was found necessary on a 0.3 per cent grade, while on a 1.5 per cent grade only 25 per cent reduction was necessary for the same temperature. As the former ratings used on the division in question carried a flat reduction of 50 per cent for a temperature of 15 deg. below zero, it is evident that an increased trainload of 25 per cent is obtained through the use of the above table.

HOW THE ILLINOIS CENTRAL MADE PROGRESS

By O. O. Carr

Statistician, Office of General Superintendent of Transportation, Illinois Central, Chicago.

The revenue train load on the Illinois Central for 1916 was 550 tons, an increase of 182 tons over 1912, or 49 per cent in four years. About 6.4 per cent of this increase was accomplished by the greater tractive power of locomotives, about 1 per cent by grade reduction, and the balance by reducing the empty car mileage in the direction of the full train load, increasing the car load by heavier loading and increased car capacity, increasing the tonnage rating of locomotives by the equated method, rerouting fast freight trains to avoid three operating districts having unfavorable grade conditions, and by close supervision.

The supervision has been improved by a system of daily

tonnage reports compiled in the superintendent's office and distributed to the chief dispatcher, train masters, traveling engineers and others concerned, showing the per cent of the full engine rating handled by each train, the total for the trains run that day and the total for the month to date compared with previous periods. The data are taken from conductors' wheel reports. The work of compiling mileage and tonnage statistics from wheel reports has been transferred from the office of the car accountant to that of the superintendent in order to have the comparative train tonnage data available daily.

In addition to the daily check kept on each division, monthly graphic charts are distributed from the office of the general superintendent of transportation showing comparatively by months the gross and net train load in the direction of heavy traffic and in both directions, the car load, the percent of loaded cars to the total and the car miles in the direction of heavy traffic and in both directions.

The principal increase in train load was accomplished by adding tonnage to the trains handling the heavily loaded cars, as under the single rating for all lengths of trains, the short trains were underloaded.

KEEPING EVERLASTINGLY AT IT

By J. L. Coss

Dispatcher, Chicago, Rock Island & Pacific, Haileyville, Okla.

The problem of increasing the train load where the tonnage fluctuates rapidly and where many connections that interchange cars are located is a serious one. However, the fact that tonnage can be increased under these conditions has been demonstrated on the Indian Territory division of the Rock Island. There are 12 interchange stations on this division of 353 miles. These, in connection with local stock pick-up trains, long trains of empties in one direction and short trains of coal in the other, the bulk of the tonnage east-bound for a part of the month and westbound for the remainder, require a constant study of transportation matters to keep the train load normal, to say nothing of increasing it.

In the latter part of 1912 the average gross tons per freight train, which included three mixed runs on branch lines, was 1,025, while in August, 1916, it had reached 1,240, an increase of 215 tons per train, or 20.9 per cent. This was accomplished little by little during the intervening time with the same engines, with the exception of six which were converted into superheaters and delivered to this division at intervals of approximately 30 to 60 days. The superheater engines are capable of handling from 160 to 200 tons, or about 10 per cent more than the other engines.

From 12 to 18 engines, including the superheaters and small engines on the branches, are generally used on this division to handle the traffic. Local trains handle full tonnage in the direction of heavy traffic over the division.

Trains doubled over the line where the physical condition permitted and turn-around runs were handled in order to place tonnage for local trains that carry short cars for trains which were expected to pick up stock but which failed to load for various reasons and for trains that set out cars short of destination on account of their becoming bad order.

Agents have been cautioned repeatedly to see that cars are loaded to capacity and frequent checks are made with a view of correcting any errors in light loading. During the cotton loading season if an agent has 10 or 15 bales to load for the compress he loads them in a car and the car is then moved to some other station where a similar amount is loaded in the car, thereby avoiding light loading of cars in the direction of the compress. The mechanical department is pressed continually to keep the engines in good shape to handle the tonnage and the attention of the car department

frequently is called to the importance of seeing that boxes are well oiled and packed and brakes properly adjusted to prevent their sticking.

The roadmasters and bridge and section foremen are required to see that all bad track and bridges on which slow orders are placed temporarily are repaired as soon as possible and that no time is lost in reporting the repairs to the dispatchers' office in order that the restrictions can be taken off, thereby possibly preventing a train stalling and making the consequent reduction in the train load. The dispatchers take personal pride in seeing that the train is put on the side track that can get out of the siding most readily at meeting points and also to locate meeting and passing points with the least stopping of trains, all of which works to the advantage of the heavy trains. Agents are required to report to the chief dispatcher's office the moment loads are ready to move and when received from connecting lines in order that such cars can be figured on to fill trains that might have short or disabled cars.

The tonnage handled by conductors is frequently checked with the way bills at the end of trips to ascertain if they are handling the tonnage reported on their register slips and if the result reveals a light discrepancy the conductor is required to make an explanation.

When for any reason an engine fails to handle its rating, an immediate explanation is due from the engineer. The matter is not allowed to drag along until perhaps forgotten, but it must be investigated at once by the trainmaster and a representative of the mechanical department and a suitable explanation made.

In brief, the fundamental reason for this increase in train load is the diligent methods pursued day after day. The subject is not taken up one day and then allowed to lie dormant for a week or so, but it is pursued daily without any let up.

OTHER PRACTICAL SUGGESTIONS

Two Handicaps.—There are today entirely too many small classification yards in which a maximum train load cannot be approximated with a reasonable amount of switching. First of all, the territory to which heavy classification falls must be analyzed carefully. No classification yard is in a position to give a full train load unless it is sufficiently well junctioned, and its capacity great enough to accommodate the in-going and out-going movement of the maximum tonnage accruing to that territory.

During the days of active solicitation the railroads and shippers interested are inclined to establish specific train numbers or symbols, to protect the business of a certain district by exceptionally fast movement and prompt delivery. Many trains were operated in this way that were not necessary at the beginning or today. If a train was of a certain symbol it sometimes carried 25 cars or less, because there were no more ready at the scheduled time that contained the class commodity that this symbol or train was to carry, yet there were many cars for the same destination or classification that might have been despatched on the same schedule without delaying it, the only exception being that they carried another class commodity.—*A. E. Aumiller, Chief Clerk to Freight Agent, Pennsylvania Railroad, Harrisburg, Pa.*

Supervision.—Intelligent supervision and persistent action are necessary requisites in the successful prosecution of any scheme. The secret of increased train loading is nothing more nor less than the secret of concentration and intensified action. The responsibility for increasing the train load with existing facilities rests with the division superintendent and his subordinates. Enthusiasm, efficiency and activity should not begin with the dispatcher and go up to the superintendent, but should begin with the superintendent and permeate down through his organization. If the superintendent is not

personally efficient and active, he can not expect his subordinates to be. The superintendent should keep up enthusiasm by his constant activity; he should know from day to day the tonnage his trains are handling.—*H. E. McCier, Superintendent, Missouri, Kansas & Texas, Greenville, Tex.*

Avoid Car Delays.—In their zeal for increased tonnage, operating officers should not lose sight of the fact that the average car detention is increased. Holding a train for an hour or two in order to fill out may result in the failure to unload 50 more or less per diem days upon your neighbor, which is quite an item at the present time. In order to obtain maximum efficiency from the cars available, they should be given a maximum load promptly and then moved with despatch. An idle car should be viewed with alarm. The operating officer should keep before him the figures showing the average detention to foreign cars for each month and focus his energy on reducing them. It behooves all railroads at the present time to handle all cars with the least possible detention, to help alleviate the serious car shortage. Maximum tonnage is commendable as evidenced by the visible saving, but at the same time let us keep an eagle eye on the lookout for a possible invisible loss.—*H. S. Hanley, Superintendent of the New Orleans Great Northern, Bogalusa, La.*

Car Efficiency.—The present car shortage forces upon us the question of car efficiency. It has been said that if all cars used were fully loaded over a million cars could be released from service. This may exaggerate, but it is the firm belief of many that the present number of freight cars is sufficient provided they were kept busy, both as to movement and loading efficiency.

If fewer cars can be made to do the work, operating expenses will decrease. In moving grain from its lake port to the seaboard one railroad made an examination of the car axles on its 80,000 lb. capacity cars last year and found they would safely carry 94,000 lb. It loaded these cars with an average of 1,563 bushels, or 93,803 lb., and on a total movement of 17,769,391 bushels of wheat saved the use of 750 cars and a haulage of dead tare of over 9,000,000 ton miles. There was not a single accident due to the cars carrying the excess tonnage, although the total car miles plans for increasing railroad revenues. Whenever car earnings can be increased without increasing the rate per hundred was about 4,700,000.

Another way in which fewer cars may be made to do the same service is by increasing the minimum weights. To shippers this seems the least objectionable of the various pounds no one is injured and great economy is practiced. It is a fact today that minimum loads oftentimes do not fill one-half the cubical or weight capacities of a car. While it is true that the carriers in some instances might utilize the unused space in such cars for less carload freight, it is not ordinarily done, and there are many reasons why it is not a good thing to do. Roads with long hauls can doubtless use some of this space, but it is not a common practice.—*Geo. C. Conn, Freight Traffic Manager, Pere Marquette, Detroit, Mich.*

PIG IRON PRODUCTION IN 1917.—In the first half of 1917 the United States produced 19,258,235 tons of pig iron, comparing with 19,619,522 tons in the first half of 1916, and 19,815,275 tons in the second half of 1916.—*Bulletin of the American Iron and Steel Institute.*

CARS FOR PASSENGERS WITH BULKY PARCELS.—The 1916 report of the Metropolitan, the Paris underground railway, mentions that a number of second-class compartments without seats are now in use, for the special convenience of passengers with bulky parcels. The results of this experiment should be of interest in other large centers of population.

INCREASED LOADING OF FRUITS AND VEGE- TABLES

The Commission on Car Service has issued Car Utility Bulletin No. 2, addressed to shippers and receivers, pointing out ways in which the car loading of fruits and vegetables may be increased and showing that increased car loading will help eliminate the car shortage. The bulletin states that the ability of carriers to move the crops depends upon the co-operation of shippers in the full loading of cars and then gives plans illustrating how cars may be loaded to capacity with potatoes, cucumbers, tomatoes, onions, cabbages, beets, oranges, grape fruit, lemons, watermelons and apples, together with photographs showing how the contents of a car are frequently damaged when a car is not loaded full. One page of the bulletin gives suggestions for relieving freight congestion as follows:

"The demand for freight cars at the present time is far beyond that of any previous period in our history. When our troops are actually in the field this demand will be greatly increased. The following suggestions for relieving car shortage and freight congestions are recommended to the attention of shippers and receivers of merchandise:

- "1. Unload promptly all loaded cars received.
- "2. Load promptly all outgoing cars and release them immediately to the railroad.
- "3. Anticipate disposition of freight before its arrival.
- "4. Do not order specimen types of cars when ordinary types will serve.

"5. Eliminate use of railway equipment in trap or transfer service when tonnage can be handled by motor truck or wagon.

"6. Load all cars to their full carrying capacity, (110 per cent marked capacity) or cubical capacity, so that maximum use of each car will be obtained. This can be accomplished by:

- (a) more careful supervision of loading;
- (b) producers and buyers agreeing to disregard established trade units and increase the units as a war measure;
- (c) waiving rights in regard to minimum weights under tariff and traffic regulations;
- (d) buyers increasing their orders so as to fill the car, and producers disposing of their output on a basis of full carrying capacity of equipment furnished;
- (e) buyers who cannot handle larger quantities clubbing together with other buyers to make full capacity cars;
- (f) showing customers who desire, merely as a matter of convenience, smaller units than maximum how they can help the general situation by enduring inconvenience.

"(7) Load freight requiring refrigeration to the safe carrying capacity for the commodity loaded.

"(8) Load freight requiring ventilation to the safe carrying capacity for the commodity loaded, but understand that this class of freight can be loaded much heavier than freight requiring refrigeration, although not always to the full visible capacity.

"By more intensive loading, there will be a reduction in the number of cars under load, which will particularly relieve congested territory, where it is a question of track room rather than of equipment, so that business can and will be handled more promptly. Cars detained by congestion will thereby be relieved, and since congestion exists in the great consuming centers a reduction in the number of cars under load will result in better equalization of equipment throughout the country.

"In all cases keep the cars moving with a full load and settle differences of opinion afterwards.

"NOTE:—This Bulletin has the approval of the United

State Department of Agriculture, together with a number of leading railroads.

"Mr. Shipper, Mr. Wholesaler and Mr. Distributor, there is already an acute car shortage. This car shortage can be greatly reduced if you will make better use of car space.

"EFFICIENCY IS AS NECESSARY AS PATRIOTISM.

"WE ARE SURE OF YOUR PATRIOTISM.

"WE MUST HAVE YOUR EFFICIENCY."

USE AND ABUSE OF STATIONERY AND OFFICE SUPPLIES*

By M. K. Barnum

Assistant to Vice-president of Operation and Maintenance,
Baltimore & Ohio

The fact that the Baltimore & Ohio spent about \$410,000 for stationery and printing during 1916 shows the possibility of large savings in the ordering and use of stationery and small office supplies. The amount does not include typewriters, computing machines, tickets, passenger and freight tariffs, time-tables, etc.

As an illustration of the large cost of small items used in quantities, the stationer sent out 8,300 lb. of common pins, valued at \$5,677.65 during 1916.

Some of the other small articles which were furnished in large quantities, were the following:

611,159 pencils	498,264 pens
13,494 rubber stamps	11,500 sponges
18,537,620 envelopes	3,912,310 sheets of carbon
22,807,100 second sheets	10,104 pen holders
70,000 thumb tacks	2,615,600 file backs
421,000 blotters	3,924 message hooks
33,264 rubber erasers	10,620,730 rubber bands
2,487,000 McGill fasteners	900,720 clip fasteners

As an example of the lack of care used in some offices in making up stationery requisitions, one division superintendent's office recently ordered over 2,000 lead pencils for a 60 days' supply, although other offices on the division made separate requisitions for their own supply of pencils.

The following are among the bad practices in the use of stationery:

1. Cutting up printed blanks in current use for scribbling paper, instead of ordering pads.

2. Use of a large envelope where a small one will serve; also, not enclosing in one envelope as many communications as possible.

3. Discarding sponges instead of washing and re-using them.

4. Discarding carbon paper which is still serviceable.

5. Throwing rubber bands, pins, and fasteners into the waste basket which tends to reduce the value of the waste paper when sold, in addition to the loss of the bands, pins and fasteners.

6. Allowing the stationery to become scattered and soiled.

A few suggestions in the use of stationery are:

1. Carefully check supplies on hand before making requisition.

2. Have requisitions made up by some one with sufficient experience and responsibility to insure the correct amounts.

3. Return at intervals to the stationer at Baltimore, all surplus or obsolete forms on hand.

4. Save all waste paper and report accumulation.

5. Check over the records, correspondence, old catalogs, etc., and arrange for scrapping those which it is not necessary to keep.

It is estimated that from \$40,000 to \$50,000 a year can be saved by a general observance of the foregoing suggestions.

* Abstract of an article from the Baltimore & Ohio Employees' Magazine.

Judge Lovett Appointed Priority Director

Coal Given Preference for Northwest; Remarkable Operating Results in June; New Tariffs Filed in a Hurry

WASHINGTON, D. C., August 21, 1917.

ROBERT S. LOVETT, chairman of the executive committee of the Union Pacific and member of the War Industries Board of the Council of National Defense, in charge of priority, has been designated by the President as administrative officer under the provisions of the priority of shipments law, which authorizes the President, during the war, if he finds it necessary for the national defense and security, to direct that such traffic or such shipments of commodities as, in his judgment, may be essential to the national defense and security shall have preference or priority in transportation by any common carrier. Judge Lovett came to Washington shortly after the war was declared to offer his services and was appointed chairman of a committee of the Red Cross. Recently he was appointed a member of the new War Industries Board and given jurisdiction in particular over questions as to priority in manufacture. With his new appointment his function will be to determine the relative importance of various kinds of commodities to the work of winning the war, to the end that the articles and materials most essential shall be given precedence in both production and distribution over others less important to the national interest.

PRIORITY FOR COAL FOR NORTHWEST

The need for such an authority had been especially emphasized recently by the situation as to coal shipments across the lakes to the northwest and Judge Lovett's first official act after his appointment was the issuance of an order on Monday directed to 46 roads engaged in the transportation of bituminous coal to Lake Erie ports directing them until further order "daily to give preference and priority in the distribution of cars to coal mines served by them" and to transport the same so that bituminous coal for transshipment by vessel to ports on Lake Superior and Lake Michigan shall have preference and priority. The lake carriers were also ordered to accept and receive all cargoes of such coal tendered to them for shipment and to so load, transport and deliver them that it shall have preference and priority in transportation.

The order stated that "it has been made to appear, and the President through the undersigned finds, that under present conditions and volume of shipment, sufficient bituminous coal will not be transported via lake movement to Lake Superior and Lake Michigan ports before the close of navigation to supply the requirements of the territory contiguous thereto, which is necessarily dependent upon movement by lake for supply of bituminous coal, and that an adequate supply of bituminous coal in that territory is necessary to the

national defense and security, and that a condition exists requiring the exercise of the powers vested in the President" by the aforesaid act of Congress and conferred by the President upon Judge Lovett.

The fact that an adequate supply of coal has not been moving across the lakes, although it is said that ore boats loaded from the upper ports have in many cases returned empty, has been giving great concern for some time to the people of the northwest, the railroads, the Committee on Coal Production and the governmental authorities. Members of Congress from the northwestern states have been

agitating the question for some time both in Congress and at the White House and the Committee on Coal Production, the Commission on Car Service and the Interstate Commerce Commission have all given much attention to the situation. The consensus of opinion seems to be that the railroads have done everything in their power to move the coal but they have had no way of compelling shippers to use the cars furnished them to send the coal in the desired direction and many of the coal operators have preferred to ship elsewhere. It has also been said that the buyers in the northwest had delayed placing orders in the hope that coal prices would be further reduced.

At a meeting of representatives of the coal interests, the railroads and the Interstate Commerce Commission last week a resolution was adopted expressing the sense of the meeting that the situation could only be met by orders requiring coal operators

in the Pittsburgh, Fairmont and No. 8 Ohio districts to ship at least 50 per cent. of the cars furnished to their mines to the lake ports for transshipment. After this meeting further conferences were held with the Railroads' War Board and a committee composed of Daniel Willard, Howard Elliott, and G. L. Peck, F. S. Peabody, chairman to the Committee on Coal Production, and A. G. Gutheim, of the Division of Car Service of the Interstate Commerce Commission, was appointed to make a tentative draft of a priority order. The definite order was issued by Judge Lovett after a conference with the President on Monday.

STATEMENT BY HOWARD ELLIOTT

On Saturday the Railroads' War Board had issued a statement that in order to meet the exigencies of the situation in the northwest the roads had appealed to the national government to make use of the powers conferred by the priority law to force the movement of coal across the lakes before the closing of navigation. The entire situation was explained in

R. S. Lovett

a memorandum filed by Howard Elliott, which showed that the Railroads' War Board had been giving continuous attention to the subject since its organization, that on April 26 the roads were ordered to give preference to the movement of coal and iron ore and to confine the use of open top cars to this business so far as was reasonably practicable. As a result of this order, it was shown, the total number of cars of coal loaded and moved by the railroads in the United States has been as follows:

	1916	1917	Increase	Percent
May	692,316	876,591	184,275	26.6
June	899,378	1,146,334	246,956	27.5
July	658,200	862,026	203,826	30.9
Total	2,249,894	2,884,951	635,057	28.2

At 50 tons to the car, this represents 31,752,850 tons of coal loaded and handled in 1917 more than for the same period in 1916.

For reasons entirely beyond the control of the railroads, Mr. Elliott said, much of this very large increase in the movement of coal has sought markets other than those reached by Lake Erie ports and there had also been a reduction in the amount of coal loaded into boats at the ports because the season of navigation had been three weeks late this year, and in spite of the co-operative efforts of all there remained 17,110,000 tons of bituminous coal to be loaded and moved across the lakes in the 16 remaining weeks of lake navigation. Mr. Elliott said that as the fuel for domestic consumption in the northwest is largely supplied through Duluth and contiguous ports it was especially important to grant relief at once because it will be most difficult, if not impossible to obtain relief during the winter months by rail shipments because of the distance from the mines and weather conditions. He also pointed out that there are 18,000,000 tons of iron ore to be moved and that if coal is forwarded freely to Lake Erie ports empty cars are provided for iron ore going back, which will give a load in each direction and increase the total efficiency of the railroads, besides providing the necessary fuel and the iron ore needed for the furnaces up to June 1, 1918.

A somewhat similar shortage of coal shipments to New England has also been causing grave concern. A large part of the supply is customarily transported by water and the water shipments have been reduced because the government has commandeered so much of the boat capacity that would otherwise have been used for coal. A number of conferences have been held to discuss the situation but the northwestern situation has been dealt with first because it must be handled during the season of open lake navigation.

INCREASE IN COAL TRANSPORTED IN JULY

Reports received by the Railroads' War Board show that the railroads carried 129,721 more carloads of bituminous coal from the mines in July this year than during July, 1916. This increase, which amounts to 20.4 per cent, makes available for consumption 6,486,000 tons of coal in excess of the amount that would have been available had the railroads merely duplicated their July, 1916, performance. Through co-operative effort, however, and by giving preference to the movement of coal, the roads that handle the bituminous product loaded 764,965 cars last month as against 635,244 cars in July, 1916.

The railroads also achieved an increase in their average daily loading of bituminous coal in July this year over the average amount loaded in June this year, loading an average of 30,599 cars a day in July as compared with 30,059 cars in June. There was an increase in the average daily loading in all districts east of the Mississippi and an actual increase in the number of cars loaded in July this year compared with the month previous in the low volatile fields of Pennsylvania, Maryland, West Virginia and Eastern Kentucky and the high volatile coal fields of West Virginia.

The most notable increase in the total shipments in July this year as compared with July, 1916, occurred in Illinois,

Indiana and Western Kentucky. It amounted to 84 per cent.

The total increase in the amount of bituminous coal handled by the railroads for the months of April, May, June and July this year over the same months last year amounts to 578,536 cars or approximately 28,886,000 tons. This is 25.10 per cent more than the amount handled for these four months in 1916, and is indicative of the increased efficiency shown by the railroads since they voluntarily agreed to merge competitive activities and co-ordinate their operations in a single continental railway system in order to produce a maximum of national transportation efficiency during the period of the war.

INCREASED EFFICIENCY IN JUNE

Twenty-nine railroads, operating about half of the country's railway mileage and owning about half of the freight cars performed 25 per cent more freight service with only 3 per cent more cars in June, 1917, than in June, 1916, according to reports thus far submitted and compiled by the Commission on Car Service. This was accomplished not only through the co-operative efforts to bring about an increase in the loading of cars, thereby securing a greater utilization of their capacity, but also by a large increase in the trainloading and in the mileage per car per day, with a reduction in the empty car mileage. The comparison of the reports for June, 1917, with those for June, 1916, is as follows:

	June, 1917	June, 1916	Per Cent Increase
Mileage operated	125,488	125,338	0
Freight cars loaded	1,284,644	1,248,160	3
Revenue ton miles	19,676,463,348	15,650,194,737	25.7
Non-revenue ton miles	1,877,249,235	1,738,781,962	8.0
Total ton miles	21,553,712,583	17,388,976,699	24.0
Freight car miles	1,228,765,973	1,049,407,942	17.1
Tons per train	656	589	11.0
Tons per car	25.3	22.6	12.0
Average miles per car per day	31.8	28.0	13.6
Per cent empty car miles	30.8	30.2	0.6

EFFECT OF NEW LAW ON TARIFF FILING

Railroads apparently took advantage of the opportunity afforded them by the Interstate Commerce Commission's notice of August 10, that approval of a proposed advance rate must be secured from the commission before the tariff is forwarded for filing, but approving the filing of tariffs in transit or forwarded for filing prior to August 15, by rushing to Washington before midnight on August 14 as many tariffs as could be got together in the short time allowed, proposing advances in rates which were under consideration. Tariff clerks in the employ of the commission have estimated that the number of tariffs filed on August 14 and 15 suddenly jumped from an average of around 250 a day to nearly 3,000. Among those filed are a large number proposed by the eastern roads proposing advances in commodity rates which are based directly on class rates and which have usually fluctuated with them, for the purpose of bringing them up to the level of the increased class rates allowed by the commission in the fifteen per cent case. The commission has specifically ruled that such rates were not included in the meaning of its decision in that case but the roads had decided to make an effort to have them advanced correspondingly and therefore filed as many of the tariffs as possible to get them into the files before the taking effect of the new procedure caused by the amendment to the interstate commerce law requiring the approval of the commission before the filing of tariffs containing advanced rates until January 1, 1920. Among the articles on which advances are proposed in the new tariffs are livestock, dressed beef, iron and steel articles, and grain and grain products. Also many commodity rates are proposed to be advanced by the filing of supplements cancelling the commodity rates and referring to the class tariffs.

The filing of the new tariffs does not, of course, render

them immune from further proceedings in the way of protests or complaints leading to informal or formal proceedings, but avoids the formalities now made necessary before a tariff can even be filed. While no official notice has been made public it is understood that a tentative form of procedure has been adopted by which carriers wishing to file advanced rates will explain their purpose in advance to J. M. Jones, chief of the tariff division, and the members of the suspension board. In simple cases the filing will probably be allowed as a matter of course. In more important cases shippers would probably be notified and an informal hearing held similar to those now held where shippers ask the commission to suspend a tariff that has been filed but not yet become effective. In a case like the fifteen per cent case the commission might institute a formal ex parte proceeding as it did in the recent case.

TO REDUCE ACCOUNTING REQUIREMENTS

The Railroads' War Board has under consideration a plan for requesting the Interstate Commerce Commission to reduce during the war its requirements of the railways in the way of reports and statistics. The Committee on Corporate, Fiscal and General Accounts of the Association of American Railway Accounting Officers has been asked to study the question and consider a possible reduction in the accounting system now required by the commission.

WILL KEEP RECORDS OF PUBLIC'S CO-OPERATION

Admitting that public co-operation and helpfulness, inspired by patriotism, are chiefly responsible for the remarkable record of increased transportation service shown under pressure of heavy war demands, the eastern railroads will compile a record that will show just "when, where and how much" this friendly treatment has helped their efforts.

This unique contribution to war-time business literature—a "Chronicle of Co-operation" or "History of Helpfulness"—will be written in an effort to extend and perpetuate the new spirit which, the transportation chiefs aver, bids fair to be a most potent force in aiding them to fulfill their pledge to the government to "produce a maximum of national transportation efficiency" for the winning of the war. The record will be made up from day-to-day reports of specific acts of shippers, passengers, employees, public officials and others which definitely contribute to greater service, with an accurate accounting of the benefits of such helpful acts in mileage, cars, tonnage, fuel or dollars saved.

In an official request sent to railroad executives last Friday by L. F. Loree, president of the Delaware & Hudson and chairman of the Eastern Department of the Railroads' War Board, he said: "Co-operation of patrons and public, in many quarters where there has been indifference or hostility, it must be admitted is largely responsible for the splendid results thus far attained. A spirit of helpfulness on the part of persons dealing with the railroads, prompted by patriotism in face of actual war, has permitted economy and efficiency in operation previously not attainable. Fully to meet, on the part of the railroads, this friendly spirit, and to develop and extend such co-operation as a potent means toward gaining maximum service to win the war, it is deemed desirable that a record be kept showing just how the public attitude has helped."

A WAR LESSON OF LASTING BENEFIT

Chairman Loree in explaining the new move said: "Actual value of friendly co-operation by the public with the railroads—as measured by larger, better and more economical service—necessarily has been a matter of theory, subject to contradictory opinions, in the past. We now expect to be able to show by actual experience what a fair attitude toward

the railroads by the public means in the way of benefits to the public. This should furnish one of the many valuable lessons of the war, and it is our duty to make the most of it.

"The railroads have gone the limit to help the government in winning the war, surrendering their property and subordinating every personal advantage and profit to the nation's needs. The people have responded by greeting our efforts with appreciation and approval, in many quarters affording aid and co-operation that is invaluable and necessary to the best results.

"If we are able to extend and perpetuate this constructive, helpful spirit toward the railroads it will bring good results that are almost incalculable, and which will be permanent in their effect on American business, prosperity and progress.

"Railroad operators constantly are engaged in intensive studies for efficiency, economy and general improvement which the public hears nothing about. The theory that better public relations would yield improved service has been generally accepted, and we have sought earnestly to bring them about. In view of the accomplishments of the past hundred days, some have asked why the railroads have not reached such a height of service before this. Recent experiences have furnished the answer in striking fashion.

"The action of the Committee on Coal Production of the Council of National Defense in pooling their shipments alone has permitted the railroads to haul to Atlantic ports 6,640,000 tons more bituminous coal than they did last year, with an estimated saving of 153,000 freight cars. The coal producers have eliminated the great accumulation and the long delays of cars at the ports by patriotic action.

"Latest reports from about 60 per cent of the mileage of the country show that these lines rendered 16.1 per cent more freight service during May than last year, with practically the same number of cars and locomotives.

WAR REQUIREMENTS TO BE STILL GREATER

"The demands upon the carriers will be greater and greater as the war proceeds, and much remains to be accomplished in the way of improvement. The Nation's needs in transportation certainly will call for the utmost of patriotic co-operation from every citizen concerned, both in and out of the railroad service.

"Two items of co-operation, which lie with our public authorities should be afforded the railroads forthwith: First, the local, state and national government officials should not press for improvements and new construction that will not directly operate to increase the capacity of the lines for national service and contribute toward winning the war. With every man, machine and dollar available necessary to the war work, non-essential improvements such as new station buildings and grade-crossing changes should be deferred. Second, the so-called 'full-crew laws' still existing in some 20 states should be repealed or suspended for the war period, inasmuch as these statutes are compelling the railroads to transport an aggregate of over 20,000 trainmen in idleness, these able bodied and experienced employees being greatly needed to man additional freight trains and troop trains.

"Splendid progress is being made, and with a better public understanding of the benefits to be derived, still greater results may be hoped for."

MR. LOREE'S LETTER

Mr. Loree's letter to the presidents of all the railroads in the eastern department follows:

"The great increase in transportation service—particularly freight-carrying capacity—shown by the railroads since the special organization was formed to meet war demands, has occasioned considerable surprise and wonder, with some misunderstanding, on the part of the public. The question

has been asked, 'Why was not this greater efficiency attained before?'

"Co-operation of patrons and public, in many quarters where there has been indifference or hostility, it must be admitted is largely responsible for the splendid results thus far attained. A spirit of helpfulness on the part of persons dealing with the railroads, prompted by patriotism in face of actual war, has permitted economy and efficiency in operation previously not attainable.

"Fully to meet, on the part of the railroads, this friendly spirit, and to develop and extend such co-operation, as a potent means of gaining maximum service to win the war, it is deemed desirable that a record be kept showing just how the public attitude has helped.

"The savings effected in time, men, equipment and capital—with consequent increase in capacity of public service—by shippers' bettered practices, by more considerate and reasonable action of public officials, by care, energy and intelligence of employees, might be recorded, with credit bestowed where due, and the facts given to the public as the war work proceeds. The record should consist of definite, confirmed facts, with specific instances in point, and the benefits given in units of mileage, tonnage, cars, fuel or dollars added to capacity.

"The American public at home, and our citizens risking their lives abroad, alike will be interested to know what persons and forces have exerted every effort for national safety and for victory.

"Specific reports of gains and benefits might be noted in the following general branches: (1) Promptness in loading of freight cars; amount of former delay in idleness of equipment eliminated, and value thereof in number of cars added to service, and in use of warehouse, track and landing space. (2) Extent of loading cars to full capacity, or to desired 10 per cent in excess of marked capacity, with percentage of reduction of former 57 per cent of unfilled space in cars. (3) Reduction of premature ordering of cars, or ordering in excess of needs, through careless checking of cargo or unreadiness for loading. (4) Minimizing of damage and delay in transit and at destination by improved methods of packing cargoes. (5) Elimination of avoidable reconsignments, 'blind' shipping orders and kindred practices causing delays and extra handling. (6) Public authorities' and officials' actions toward reasonable and intelligent imposition of regulations and restrictions, tending to prevent unnecessary obstruction, inconvenience, loss and delay to the free flow of traffic. (7) Acts of employees of all ranks toward eliminating waste and lost motion; and also their conduct in meeting properly and supplementing the co-operative efforts of patrons. (8) Any and all specific instances wherein the action of a patron of your railroad has been the means by which greater service and efficiency has been attained.

"We deem it our duty to omit no effort to encourage and reward the 'win-the-war' spirit and believe that a general interchange of experiences and ideas on the subject, with full information given to the public, will be of lasting constructive benefit."

COAL DISTRIBUTION COMMITTEES IN ENGLAND.—The mayors of all the principal towns in Great Britain recently received a letter from the Controller of Coal Mines, asking them to organize a local committee for the distribution of coal during the coming winter. The suggested constitution of such a committee was as follows:—The mayor or deputy, the chief constable, two coal merchants, one representative of each railway, one representative of each canal, and a secretary. The railway and canal representatives were to act in an advisory capacity only. A letter suggesting labor representation was sent to each mayor or deputy at a subsequent date.

THE RUSSIAN RAILWAYS SITUATION

The following is taken from correspondence of the Associated Press in the (New York) Mail:

John F. Stevens and his associates on the American Railway Commission now in Russia to assist the administration of Russian railways to increase their efficiency, have discovered many ways in which transportation may be speeded up on all lines without additional equipment.

The commission has advised the United States government to supply Russia with 2,500 more locomotives and 40,000 more freight cars as soon as possible. However, it will be long before this rolling stock can be manufactured and shipped to Russia. The shortage of bottoms on both Atlantic and Pacific will delay delivery of the new rolling stock, and additional shops must be erected at Vladivostok before such great quantities of locomotives and cars can be put together speedily.

The Russian roadbeds are in excellent condition. Virtually all lines were well built and the tracks have been kept up, chiefly through work of peasant women, in spite of the shortage of labor created by the heavy war draft upon the male population.

After traveling the full length of the Trans-Siberian line and inspecting many important lines in central and southern and European Russia, the American engineers found that Russian railway men are working at great disadvantage in not having up-to-date equipment for coaling, watering and cleaning locomotives.

At nearly all stations in both European and Asiatic Russia, engines are watered by 8-in. pipes. From 12 to 20 minutes is required for work which is accomplished in the United States in four or five minutes.

By the Russian methods 24 hours is required to clean a locomotive, coal it and get up steam again. The Russian engine houses lack the hot water equipment. Engines are allowed to cool before they are washed.

Oil is used as fuel for locomotives in southern Russia, but in Siberia and northern European Russia coal and wood are fuel. The facilities for loading wood are bad and plans are under way to improve the system. Water is supplied to passenger cars by buckets at most stations. Few stations have the hose necessary to water cars in a hurry. These have not been required because engines took water so slowly and labor was so abundant that it was possible to supply the cars with water by hand while the locomotive was being cared for.

But now even the labor of women must be economized as much as possible. Women are required in the fields. They are the baggage handlers at most stations, and are even firing locomotives. Wages necessarily have risen with the increased cost of living and every possible labor saving device must be used.

Because of the lack of skilled labor, the inadequacy of repair shops and the scarcity of metals and other supplies many locomotives on the Russian railways are out of repair. The American engineers have advised an immediate extension of repair shops and employment of foreign mechanics if necessary to restore these locomotives to service immediately.

Pig iron is among the needs of Russia which officials have reported to the American experts. Worn rails and other iron and steel have been used prodigally by the railways in construction work. At nearly every railway station in Russia tons of old steel rails are in use as hand railings.

They are used at railway crossings for fences and are found in many other places on railway property where wood would serve as well. In the larger centers hundreds of tons of old steel and iron could be collected by the government from railway property on short notice. This material would meet the urgent demand for iron without placing further

burden upon overloaded ships, and it is not unlikely that the government will avail itself of this metal.

Railway administration in Russia is not centralized sufficiently to get the greatest possible service out of tracks. Trains are operated on local orders. By the employment of division superintendents and institution of a more general system of dispatching, the American engineers believe, greater service can be obtained from all lines.

Since the overthrow of the emperor, railway employees have chosen their own officials. The success of such a system is doubtful. But it was necessary, apparently, to throw off the domination of the old bureaucracy.

THE PRESIDENT FIXES THE PRICE OF COAL

President Wilson in accordance with authority granted by Congress has issued the following proclamation:

WHITE HOUSE,
Washington, Aug. 21, 1917.

The following scale of prices is prescribed for bituminous coal at the mine in the several coal-producing districts. It is provisional only. It is subject to reconsideration when the whole method of administering the fuel supplies of the country shall have been satisfactorily organized and put into operation. Subsequent measures will have as their object a fair and equitable control of the distribution of the supply and of the prices, not only at the mines but also in the hands of the middlemen and the retailers.

The prices provisionally fixed here are fixed by my authority under the provisions of the recent act of Congress regarding administration of the food supply of the country, which also conferred upon the Executive control of the fuel supply. They are based upon the actual cost of production and are deemed to be not only fair and just but liberal as well. Under them the industry should nowhere lack stimulation.

WOODROW WILSON.

Note.—Prices are on f. o. b. mine basis for tons of 2,000 pounds.

	Run of Mine	Prepared Sizes	Slack or Screenings
Pennsylvania	2.00	2.25	1.75
Maryland	2.00	2.25	1.75

ITALY EXTENDS AERIAL MAIL SERVICE.—In addition to the recent establishment of aerial mail service between Turin and Rome, Consul General David F. Wilbur, of Genoa, Italy, reports the successful inauguration of an aerial postal service between the Italian mainland and the island of Sardinia on June 27, and between Naples and Palermo (Sicily) on June 28.

DETERMINATION OF CAR REQUIREMENTS OF A RAILROAD*

During the course of a recent conversation with Mr. A. I was asked the question, "How many freight cars should the North & South Railroad Company own in order to meet the demands of commerce upon it?"

My answer to the question was in substance that freight cars owned by the North & South Railroad Company, considered without reference to classification were probably sufficient to meet satisfactorily a large percentage of what might be termed normal or average requirements, providing the cars be maintained properly, handled efficiently, and the carrying (or cubical) capacity utilized fully, but that the classified freight car requirements could be determined only by analyzing carefully those details of operations applicable to a series of months which reflect clearly the relationship of the supply of each class of freight cars to the demands for each class of freight cars, and that I would undertake to develop such facts as could be accepted as a reliable basis for a formal answer to his question.

Many theories and opinions have been advanced with reference to the true measure of a railroad's obligations from the standpoint of freight cars required to enable it to render reasonable service as a common carrier, these theories and

Statement Used by the Pennsylvania Lines West of Pittsburgh Showing the Percentage of Journal or Cubical Capacity of Freight Carrying Cars Utilized by Shippers of Various Commodities at "Car Load" Rates During March, 1917

opinions having crystallized into two quite distinct and logical conclusions, namely:

1. That on account of the diversity of traffic conditions, and the fact that to a large extent each individual carrier line serves territory which produces traffic not common to territories served by all other lines, forming parts of through routes over which traffic moves, the obligations of an originating carrier should be to provide a sufficient number of cars to accommodate traffic of shippers served by it regardless of what might be the destination of the traffic, this conclusion being especially significant in its relation to the products of certain industries in the Pittsburgh district, which are distributed throughout the United States, including Mexico and Canada, although cars conforming to a special design are required for the transportation of them; and

*Excerpt from letter written by a transportation officer of one of the larger railroads relative to the classified freight car requirements of that system.

2. That traffic which comes to a railroad irrespective of the character, or source of the traffic, constitutes the measure of that company's obligations in the nature of car supply as a common carrier, the measure of responsibility as between (or among) carriers which participate in earnings from the transportation of traffic via a joint through route being dependent upon different factors, the more prominent of which are:

(a) The *permanency* of traffic, i. e., the known ability of a carrier to prevent diversions of traffic to other roads;

(b) Ratio of mileage (road-haul) of each carrier forming part of a joint through route to the total mileage (length of the joint through route);

(c) Ratio of gross earnings of each carrier forming part of a joint through route to the total gross earnings of all interested carriers derived from the transportation of traffic;

(d) The general nature of service other than road service incident to the handling of traffic on each of the lines forming part of a joint through route;

(e) The average detention per car to cars engaged in through service; and

(f) The ratio of the empty mileage on each line forming part of a joint through route of cars engaged in the through service, to the total mileage made by such cars on the joint through route.

The correctness of the first conclusions could not be questioned if disposition of the majority of all classes of freight which represent the larger volume of traffic handled by carriers, conformed to spasmodic and irregular orders requiring distribution of the traffic among a great variety of destinations, but this is not true, the fact being that producers of practically all classes of traffic find permanent markets for it and establish permanent arrangements governing its movement, the exceptions to this customary or general order of things being:

First. The outgrowth of such extraordinary conditions as those which prevail at the present time;

Second. The natural consequences of inferior service on the part of certain carriers in comparison with service on the part of other carriers;

Third. The results of radical commercial developments in new localities; and

Fourth. Demands for cars of a peculiarly special type required for the transportation of traffic which will ordinarily seek markets where the most favorable prices obtain.

In support of the first conclusion, it seems proper to state that if the business conditions were to remain permanently on substantially the same basis as the basis which we consider extraordinary, and attributable to the war involving both the old and the new world, a common carrier could not afford to authorize large expenditures for the acquisition of new cars for the reason that its representatives would be without any means whatever of controlling the movement of traffic via a certain route, laws and decisions of the Interstate Commerce Commission prohibiting carriers from dictating as to the routing of traffic, but compelling them to permit of the movement of freight cars to any destination in North America covered by a joint route and through rate.

If history of the past may be accepted as a reliable guide for speculation pertaining to the future, it is reasonable to believe that carriers should not base their developments with reference to increasing the number of freight cars upon the extraordinary situation now prevailing, but upon the more substantial and normal business conditions which preceded and which will follow the present conditions; hence I feel that the second conclusion rests upon the correct principle, and my efforts to determine the classified car requirements of the North & South have been exerted in that direction.

From my standpoint, neither the kind of traffic which offers for movement via the lines of a common carrier, nor information with reference to its origin or destination, has

a direct bearing on the obligation of that carrier to furnish cars beyond the limits to which the volume of traffic varies from time to time, and that result is determinable by the consideration of three details, namely:

I. The average number of classified cars on the lines of a common carrier, daily;

II. The number of classified cars owned daily during a period to which the first detail applies; and

III. The ratio of classified cars furnished applying on orders to the total number of classified cars ordered during a period to which the first two details apply.

In other words, were all carriers to decide arbitrarily that not a single system car would be permitted to go beyond the limits of their lines, and that not a single foreign car would be accepted in interchange, the obligation of each carrier from a car supply point of view, would be represented by the number of cars required to take care of strictly internal business; through traffic from junction points with connecting lines to junction points with other connecting lines; traffic from junction points with connecting lines to local stations; and traffic from local stations to junction points with connecting lines.

We have, of course, grown beyond such a scheme, but the principle underlying it is perfectly sound in its application to the present arrangement, which contemplates the free interchange of cars among various parts of what the Interstate Commerce Commission has elected to term the "National Railway System." Under this (present) arrangement, there are a certain number of each of different classes of freight cars in the possession of the North & South each day, or an average number daily within each calendar month; and calendar year. Numerous conditions affect this detail, and it is therefore a variable one, the changes being influenced largely by variations in business conditions. These facts preclude the use of the detail, applicable to the operations of one period, as a measure for freight car requirements, but they lead logically to the conclusion that if the detail applicable to operations of each of a number of months when the car supply is slightly under the actual demands, considered in conjunction with the additional details, number of each class of cars owned, and the ratio of each class of cars furnished applying on orders to the number of each class of cars ordered, the results thus obtainable can not be other than the number of cars of each class required to handle the traffic. Example: the average number of box cars on a line daily, based on operations of several months, is represented by 6,000 cars. The number of box cars owned during the same period of several months is represented by 4,000 cars. The average number of cars required daily for loading at local stations during the period is represented by 2,000, of which 95 per cent are furnished. On this basis of the operations, 6,000 cars were used daily to meet the various demands; the average number of cars available daily for application to local orders was 100 cars short of the requirements and the average number of cars on the lines daily exceeded the ownership 2,000 cars, hence the cars owned were equal to about two-thirds of the cars required.

Unfortunately, records available did not embrace details which were essential to a satisfactory study of the operations of the North & South Railroad Company, in connection with the handling of cars during several years, but from information which I have obtained from special reports and statistics, the diagram was prepared and has been used as the basis for conclusions as to the classified freight car requirements of the North & South.

AGED MEN RUN BRITISH ENGINES.—Overcome by the heat, a London & North-Western engineer, aged 71, fell off the footplate of his engine at Birmingham and was killed. Owing to the war, the company, it developed, has many men over 70 years of age working local trains.

THERMOSTATIC METAL

The General Electric Company, Schenectady, N. Y., has perfected a new product designated as G-E Thermostatic Metal which takes a curve or regains its original straightness in accordance with well defined laws as the temperature rises or falls. As a result of this responsiveness to temperature change and the mechanical force developed, this metal is used to actuate various mechanisms which tend to neutralize either the temperature change or its effect upon devices.

The metal is made up of two strong non-corrosive metals possessing a wide difference in co-efficients of expansion, the widest difference possible for any known stable combination of metals. These two metals are firmly attached to each other throughout their entire length so that there is absolutely no slip of the one upon the other. Thermostatic metal can be cut, stamped or pressed into practically any desired shape, and when annealed will have all its original inherent qualities; moreover, it will not deteriorate nor take permanent set under applications of heat or force within definite practical limits. The metal is manufactured in various standard thicknesses ranging from 0.25 to 0.015 in.; the maximum width is 4 inches and the maximum length is 36 inches.

This metal can be used for temperatures as high as 500

The length or thickness of the metal alone affect the deflections of the metal, the width of the piece having no influence. From these curves it will be found that the deflection for any given temperature change varies directly as the square of the length of the piece of thermostatic metal and inversely as the thickness of the piece. As previously pointed out, the deflection of any piece of metal varies directly as the temperature change.

This metal is used in the products of many different industries owing to the fact that it can be successfully worked into different shapes and forms. In some of its applications it is used to actuate mechanisms directly by means of the force developed within itself when its tendency toward assuming a curved shape is restrained. In other applications it is used to close and open the contacts of electrical circuits by means of which various devices are operated.

STANDARD GAGE IN EUROPE.—The disadvantages of the variety of gages within this Empire has been keenly felt during the war. Had there been a universal gage rolling stock might have poured in from all parts to points where it was most wanted. But something more than a universal track-gage is wanted if the full benefits are to be obtained from it. When it was proposed to exhibit some of the French locomotives in England it was found that they could

Fig. 1.—Deflections Caused by a Temperature Change of 100 Deg. F.

Fig. 2.—Force Required to Give Permanent Set

Fig. 3.—Force Exerted by Metal Strip at 100 Deg. F.

deg. F. The deflection per degree temperature change besides being quite considerable as shown by Fig. 1 is a constant for any definite piece of the metal, and since a definite and considerable opposing force is necessary to cause the metal to take permanent set (see Fig. 2), the metal can be depended upon when used in devices where extreme accuracy is required.

If the curving of this thermostatic metal on heating or cooling is opposed, the metal will produce a mechanical force (see Fig. 3), which is limited only by the force required to produce permanent set. For example, Fig. 3 shows that a piece of thermostatic metal 0.1 in. thick, $\frac{5}{16}$ in. wide and 4 in. long will exert a force of 24 ounces ($1\frac{1}{2}$ lbs.) on being restrained from bending when subjected to a temperature change of 100 deg. F. This curve illustrates the laws that the force exerted by this metal varies as the square of the thickness, directly as the width and as the square of the temperature.

not be run over English lines to their destination owing to their rolling stock dimensions fouling our minimum fixed structures. This fact will tell heavily against the usefulness of the channel tunnel, as it will prevent that free interchange of rolling stock without which traffic will be greatly hampered. The world is shrinking so rapidly that the different gages in Africa, in India, in Russia, and even in Ireland are rapidly becoming an intolerable nuisance, and, in time, it will be found absolutely essential to bring them all to one standard, including the running and fixed dimensions; if the smallest of these, on the 4 ft. 8 $\frac{1}{2}$ in. gage, be selected as the standard, the conversion could be effected gradually at comparatively little cost. A difference in gage has been considered a safeguard against invasion, both in Russia and in India. As regards Russia's European and Eastern Asian boundaries the break of gage has not stopped invasion and has hampered the defenders as much as it has the offenders.

General News Department

The National Association of Railway Agents concluded its semi-annual meeting at Cedar Point, Ohio, on August 16.

The old stone arch bridge, which was described in the *Railway Age Gazette* of August 17, 1917, page 278, is located at Gwynn's Falls, on the Mt. Clare branch of the Baltimore & Ohio, near Baltimore.

Senator Owens has introduced a bill to authorize the Interstate Commerce Commission to determine when a car shortage exists on a railroad, and to order the road to provide sufficient and suitable cars.

According to the Southern Pacific Bulletin the Southern Pacific reports that the average carload on the Portland division has been increased to 26.5 tons in June, 1917, as compared with 22.3 tons for the same month in 1916, or an improvement of nearly 19 per cent.

The Atchison, Topeka & Santa Fe has announced an increase in wages, ranging from 11 to 15 per cent, to car and locomotive employees. This increase is in addition to the ten per cent bonus which will be paid at the end of December. The new scale will go into effect September 1.

Because of the increased value of scrap paper, the Southern Pacific has adopted a policy of retaining magazines, old records, newspapers, etc., for shipment to the stationery storekeeper at West Oakland, Cal. During the month of June the West Oakland collecting office disposed of nearly 16,000 lb. of waste paper that had been forwarded from all parts of the Pacific system.

Announcement is made in another column of the appointment of Elisha Lee, general manager of the Pennsylvania Railroad, as acting vice-president in charge of operation during a leave of absence granted to W. W. Atterbury. No official announcement has been made of the reasons for the leave of absence granted Mr. Atterbury, but it is understood that he will go to Europe, and be in charge of certain phases of the transportation system of the Allies.

The Southern Pacific has announced that nearly \$4,000 in bonuses will be paid to the 86 employees of the system who have left the service of the company to enter the army or navy. By leaving the employ of the road employees forfeit all claim to the second half of the ten per cent bonus which was payable on June 30 to employees in active service, but notice has been given that such breaks in the service as were occasioned by enlistment will be waived and the bonuses paid.

Heavier loading enabled the Baltimore & Ohio to save the use of 6,238 cars in the handling of less than carload freight in July, compared with the same month last year. At the same time the company handled 12,000 more tons of this class of freight in 4,000 less cars, according to the report of the transportation department which has just been compiled. Last month the Baltimore & Ohio handled 1,393,660 cars in freight trains, 928,684 of which were loaded. While the loaded car movement is indicative of the general business activity, hot weather interfered somewhat. It is expected that the company will handle more than 1,000,000 loaded cars monthly during the fall.

The Rock Island Lines have issued a colored map of the United States showing the locations of national guard mobilization training camps, national army cantonment camps, reserve officers' training camps and government aviation sites. The regular army departments are shown by solid dividing lines, and are also named. The 16 new national army divisions are shown in separate colors, each camp being indicated by a circle, name and number. The national guard camps are indicated by blue stars, with the name of each, together with the names of the state which will be represented at each camp. Reserve officers' training camps and aviation sites, as well as forts, are shown in a distinctive way.

R. J. Clancy, assistant to the general manager of the Southern Pacific, has pointed out that railroad transportation is probably the only product, relatively speaking, that has decreased in price. "As indicated by the purchasing value of commodities," says Mr. Clancy, "railroad transportation is now approximately 50 per cent cheaper than three years ago. A bushel or sack of wheat, corn or barley, a bale of cotton or wool, or a ton of copper, iron or steel will buy approximately double the amount of railroad transportation it would three years ago. This is regardless of the fact that during the last three years wages of railroad employees and the cost of capital have greatly increased along with an increase of 100 per cent in the cost of fuel oil for locomotives and an increase of from 50 to 500 per cent in the cost of railway supplies, equipment and material."

The Committee on the Safe Transportation of Explosives and Other Dangerous Articles, of the American Railway Association, recently issued a bulletin to members containing additional rules and recommendations prepared by the Bureau of Explosives, covering the handling of dangerous traffic, with special reference to conditions incident to war requirements. The rules provide that properly qualified railway representatives shall be put in charge at all points where explosives or dangerous articles are handled or held for any purpose, whose duty it shall be to see that all employees comply with safety regulations. The regulations also provide that authorized persons only shall be permitted on railroad property used for the storage, handling, loading or unloading of dangerous articles, and specify in detail who shall constitute "authorized" persons. Necessary safety precautions which must be enforced at points where dangerous freight is handled are enumerated.

Mileage Allowance on Refrigerator Cars Increased

The American Railway Association has issued a circular announcing an increase, effective on October 1, in the mileage allowance paid for the use of refrigerator cars from $\frac{3}{4}$ of a cent to one cent per mile in eastern and southern territory, where the $\frac{3}{4}$ -cent rate now applies. The rate in western territory has been one cent.

American Railroad Men Needed in Russia

J. F. Stevens, chairman of the railroad commission making an investigation of the railway situation in Russia, has telegraphed to Washington requesting that an American railway unit of 129 men, consisting of division superintendents, dispatchers, trainmasters, engineers, master mechanics and one telephone expert, be despatched to Russia to educate the Russian railway men in American operating methods. The request has been referred to S. M. Felton, director general of railways, in charge of the organization of railway forces for service abroad.

Railroads Help Potato Conservation

A pledge made by the representatives of the railroads of practical co-operation in handling this year's big potato crop will greatly help plans for potato conservation, according to a statement issued by the Food Administration.

Equitable distribution of the crop is a great problem concerning the grower, the government and the public at large. The harvest of late potatoes runs for about six weeks, and the railroads have stated that it will be possible for them to handle approximately one-third of the crop during this time if shippers will see to it that cars are loaded to a maximum capacity of from 46,000 to 50,000, instead of 40,000 pounds, and also see to it that they are unloaded within 24 to 36 hours of their arrival at destination. Under the recent ruling of the Federal Reserve Board another one-third of the crop may be stored, later to be distributed as market demands afford opportunity, the remaining third to be stored by owners.

The recent ruling of the Federal Reserve Board in favor of

the issue of warehouse receipts, negotiable at member banks, on potatoes when properly graded, sacked and stored, is said to assure ample money with which to handle the big reserve stock, and to a large extent eliminate the waste of former years, caused by poor market facilities or glutted market terminals.

War Convention of American Business Men

A war convention of American business men has been called by the Chamber of Commerce of the United States, to be held at Atlantic City, N. J., September 18 to 21, inclusive. The general subjects discussed will be: The duty that business owes the government in war; How may the business of the country render greater service in winning the war? Ways and means by which business may most readily adjust itself to the conditions produced by the war, and For what readjustments after the war must business prepare? Under the general subject of How business may render greater service in the war, will be discussed the question, How shall greater efficiency of land and water transportation be developed?

New York Port Commissions Organize

The two commissions appointed by Governor Edge, of New Jersey, and Governor Whitman, of New York, to investigate the port conditions at New York, organized Wednesday in New York by electing J. Spencer Smith and William R. Willcox, respectively, chairman of the two commissions. General George W. Goethals was appointed chief consulting engineer, and will confer frequently with the commissioners.

The work, Mr. Willcox explained after the meeting, will pertain to all matters which affect the development of the port, the Jersey Meadows and all territory contiguous to the port, and when completed, it is expected, will result in more harmonious relations between the two states. The railroads will be consulted in the working out of terminal plans, etc., as will storage, warehouse and steamship companies. The commissions, after they have concluded their investigations, will make reports to the New Jersey and New York legislatures.

On the New York commission are William R. Willcox, E. H. Outerbridge and Arthur Curtis James, while on the Jersey commission are J. Spencer Smith, De Witt Van Buskirk and Frank R. Ford. Offices will be established at 115 Broadway, New York.

Frankness as an Element in Efficiency

Under the title, "Some Facts to Remember," E. E. Loomis, president of the Lehigh Valley, has posted, for the benefit of the employees of that road, a placard on the hackneyed subject of efficiency, but the placard is not hackneyed; it is notable for its freshness, and also for its excellent typography. Extracts follow:

Real Service: When we sell a ticket we sell more than a ride. When we issue a bill of lading our obligation extends beyond the mere movement of freight. In each case our patrons are entitled to and must receive prompt, courteous and accurate information and attention.

Passenger Service: If a train is late, say so. If you don't know how late it is, find out. If you expect or can get a later report, state when it will be available. Give special attention to the comfort of women and children. Help passengers to work out their train connections. Do not tell passengers Pullman space is unavailable until you are sure other stations cannot release space to you.

Do not argue. Passengers have a right to criticize railroad service. Criticism is frequently the basis of improvement. Improvement is the everlasting mark at which we must aim.

Trainmen: You are the official hosts of the company. You can make every passenger's trip a pleasant one. Make the passengers feel they are at home on one trip, and they will be with you on their next. This is more than good business policy; it is a manly—a courteous policy. It is the only policy.

Freight Service: Accepting freight is but the beginning of our service to a shipper. When he asks for information about that freight he is exercising a right—not seeking a favor. When a car is delayed, say so, and try to expedite its movement. If a car is lost, start the machinery that will locate it. Don't promise a shipper to place a car today if you know it cannot be placed until tomorrow.

If a shipper needs reports to satisfy a consignee, see that he gets them promptly and accurately. Help the shipper to hold his customers, and you will help us to hold the shipper as a customer. Give the shipper a maximum of service, attention and courtesy if you wish him to give you a maximum of tonnage.

GIVE REAL SERVICE.

The Extra Crew Law in New Jersey

The State Board of Public Utility Commissioners of New Jersey will begin hearings on September 17 relative to the application of railroads operating in the state to reduce the crews of specified trains. The trains affected are mostly freight trains, but there are some passenger trains on the list.

The roads contend there are now more men carried in the train crews of these trains than are needed. Applications are made under the repealer of the Full Train Crew law which was passed last winter, and became effective July 4. The law puts the matter in the hands of the Public Utility Commission. Railroads making the applications are: Central of New Jersey, Lehigh Valley, Delaware, Lackawanna & Western, Pennsylvania, West Jersey & Seashore, Philadelphia & Reading, Atlantic City, Lehigh & New England, Lehigh & Hudson River, and the Baltimore & Ohio.

It is understood that the trainmen have refused to accede to the withdrawal of any men of any train crew as now constituted. The trainmen intend to make each company prove that each reduction proposed is one where a full crew is not needed.

Army Section for Embarkation Service

A new section of the army general staff has been created to handle all business pertaining to the shipment of troops and supplies to Europe. Brigadier General Francis J. Kernan, assistant chief of staff, has been detailed temporarily as chief of the embarkation service, with Col. Chauncey B. Baker of the Quartermaster's Corps as his chief assistant. The functions of the section are explained in the following general order issued by the War Department:

"To enable the Chief of Staff to exercise effectively his supervisory and co-ordinating powers in respect to overseas movements there is hereby created in the office of the Chief of Staff, for the period of the existing war, a section to take charge of the embarkation of troops and supplies for transatlantic transportation, and to exercise under the Secretary of War the direct control incident to this service.

"The officer in charge is designated as the Chief of the Embarkation Service, and he will be given such assistance, commissioned and civilian, as may be necessary, with office rooms in the War Department building.

"The function of this section is to co-ordinate all shipments of munitions and supplies of every kind, and all troop movements whose ultimate destination is Europe, and to advise and assist the Chief of Staff in reference thereto. It will have direct supervision, under the Chief of Staff, of all movements of supplies from points of origin to ports of embarkation; will supervise the operations of the latter; and will control the employment of all army transports engaged in the transatlantic service and such commercial shipping as may be used to supplement that service. It will arrange with the navy for convoy service.

"It is made the duty of all chiefs of supply bureaus to keep the Chief of the Embarkation Service informed fully of the condition of supplies in their several bureaus, and to this end they will correspond directly with that officer. Direct correspondence between the Chief of the Embarkation Service and the commanding officers of ports of embarkation is authorized. Copies of all requisitions, requests, and information of every character received from the commanding general of our forces in Europe, or his subordinates, which bear upon reinforcements or renewals of supplies will be transmitted to the Chief of the Embarkation Service; and, in general, under the supervision of the Chief of Staff, this officer is charged with the duty of arranging that all supplies for our forces in Europe shall be forwarded in the most expeditious and convenient manner, and to that end he is authorized to call upon all supply officers for information and to exercise control in matters of shipment, both within the territory of the United States and in the overseas haul."

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF JUNE, 1917

Name of road.	Average mileage operated during period.	Operating revenues			Operating expenses				Net from railway operation.	Railway tax accruals.	Operating income (or loss).	Increase (or decrease) last year.

Committee on Restoration and Employment

At the special meeting of the Association of Railway Claim Agents held at Chicago on August 10, the question was brought up of appointing a committee to consider ways and means of providing for those who are injured by reason of the war or from any other cause, and incapacitated for the work in which they were formerly employed.

After considerable discussion the following committee, to be known as the Committee on Restoration and Employment, was appointed: F. V. Whiting, chairman, general claims attorney, New York Central; John S. Rockwell, general agent, Buffalo, Rochester & Pittsburgh; S. J. Peterson, general claim agent, Union Pacific; H. B. Hull, general claim agent, Illinois Central; C. W. Egan, general claim agent, Baltimore & Ohio.

St. Louis-San Francisco Establishes School for Women

The St. Louis-San Francisco has undertaken the employment of women to fill such vacancies as occur from time to time where the work can be satisfactorily handled by women. In order to handle the work intelligently the company has organized a "bureau of employment for women," and G. E. Whitlam, inspector of transportation and maintenance, has been placed in charge, with headquarters at Springfield, Mo. The duties of the bureau will be: (1) To list every woman in the employ of the company as regards her present occupation, salary and ability, so that provision may be made for finding better positions for those in its employ and filling their positions with other women, which will result in the present women employees being given promotion according to their ability. (2) To canvass the entire railroad in order to ascertain what positions can be filled by women when vacancies occur. (3) To provide women for vacancies now existing, either by promoting those in the service or by new employees.

The company will give preference to members of families of employees, and to widows and female members of the families of men who were in its service at the time of their death. The object in giving preference to female members of families is: (1) It is thought that they are entitled to this consideration if they wish to work. (2) Having been raised in a railroad environment it is reasonable to assume that they will learn the work readily. (3) Unfortunately some of the employees' families do not have the opportunity to place their girls in desirable and remunerative positions in which the bureau will be in a position to assist. No applications will be considered where the applicant is less than 16 years of age or more than 40. Applicants will be required to fill out an application blank and, if accepted by the examiner, will be required to pass a modified physical examination to insure the fact that none but the physically fit are employed. A fee of one dollar will be charged for the examination, to be paid to the company physician, and an additional fee of one dollar will be charged for vaccination if required. If the applicant is successful in passing the examination, the bureau will list her as available for employment and will undertake to find employment for her in the order in which the application was received, except where previous experience, training and ability may qualify some in preference for the position taken.

The responsibility of the bureau will not end when a woman is placed in a position, but it will undertake to find her a respectable place to board and to see that she is properly instructed in the work to be performed. As a great many of the women desiring to enter railroad service cannot do so on account of lack of previous training, it is the purpose of the St. Louis-San Francisco to organize at Springfield, Mo., as soon as it can be done, a school where women who are selected for employment can secure proper training. The company will provide the tuition, instruction blanks, stationery, etc., free, and the only expense the student will be put to will be for board and room during the period of instruction, the duration of which depends upon the student and the position for which she undertakes to qualify. It is thought that three months' training will be sufficient. In some cases where women members of employees' families desire to enter school, but do not have the funds, the company will undertake to advance a sufficient sum of money to meet expenses, this to be repaid by the students on the installment plan after they have obtained positions, provided some responsible employee of the company will guarantee reimbursing

the company in the event the student fails or refuses to qualify or accept a position.

Illinois Roads Break Coal Traffic Records

In a hearing on the question of fixing coal prices in Illinois before Chief Justice Carter of the Illinois Supreme Court, at Chicago on August 17, R. H. Aishton, president of the Chicago & North Western, and Charles H. Markham, president of the Illinois Central, showed that the carriers of Illinois, as well as those of the other states, have moved more coal in recent months than ever before in their history.

Mr. Markham stated that one of the first orders issued by the Railroads' War Board provided that preference be given to the movement of coal and iron ore, and that every effort be made to secure increased car efficiency. The operation of the railroads of the United States by the board as a single system, eliminating individual and competitive activities, and the extraordinary efforts put forth by both carriers and shippers to increase car mileage and car loading, resulted in an increase of 16 per cent in freight traffic in May, the first full month following the organization of the board, with practically the same number of cars and locomotives as in the corresponding month in 1916. For the four months, April to July, inclusive, the coal-carrying roads of Illinois represented at the hearing (the Illinois Central, the Chicago & North Western, the Chicago & Eastern Illinois and the Chicago, Burlington & Quincy) loaded 7,173,746 tons more coal than in the corresponding period in 1916. Mr. Markham was of the opinion that even better records would be achieved if the State Public Utilities Commission made certain changes in demurrage and reconignment rules recommended in a report recently prepared by a committee representing the coal operators and railroads following conferences with the State Council of Defense.

Mr. Aishton stated that reports for April, May, June and July, 1917, indicated an abnormally large movement of both anthracite and bituminous coal by the railroads of the country. During that period 753,451 cars of anthracite coal were handled on nine roads, or an increase of 20 per cent over the previous year; and 3,448,699 cars of bituminous coal were handled on 110 railroads, an increase of 28 per cent over 1916. Coal movements, he said, had never before averaged so many miles per day, and through the co-operation of shippers the average load of coal per car has been increased nearly 10 per cent, which has been automatically reflected in an increase of 10 per cent in the supply of empty cars. The Chicago & North Western, for example, handled 249,996 tons of coal in average carloads of 40.6 tons in April, 1916, while in the same month of 1917 it handled 566,728 tons, with an average load per car of 43.3 tons. The increase in the amount of coal handled was approximately 100 per cent, and the increase in the average carload 9 per cent.

Railroads in general are and have been storing coal, although this practice increases the cost of coal on the locomotive practically 55 cents per ton—15 cents for unloading, 15 for loading and a deterioration of 25 cents a ton. In the case of the Chicago & North Western 800,000 tons are being stored at an estimated cost of \$400,000. The railroads are undergoing this sacrifice in order to make gondola cars available for commercial business next winter. The result has been accomplished by the carriers in the face of a very large increase in regular commercial traffic, in military traffic, and in special movements of material of all kinds for the building of ships, and for the construction of cantonment camps. In addition there has been a complete change in the natural flow of coal traffic. In ordinary years 31,500,000 tons of coal are shipped by lake from Ohio and West Virginia to the Northwest. This year a shortage of vessel tonnage will result in a decrease of from 10 to 15 million tons in the receipts from those fields, which has necessitated the movement of additional coal by rail from Illinois, Indiana and Kentucky fields.

MEETINGS AND CONVENTIONS

The following gives names of secretaries, dates of next or regular meetings and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the 100 issue of the Railway Age Gazette for each month.

AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hone, C. R. & R. of N. I., 143 Liberty St., New York. Next meeting, October 16-17, St. Louis.

AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 16-18, 1917, Chicago.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.

ASSOCIATION OF AMERICAN RAILWAY ACCOUNTING OFFICERS.—E. R. Woodson, Rooms 1116-8 Woodward Bldg., Washington, D. C. Next meeting, September 26, Congress Hotel, Chicago.

ASSOCIATION OF MANUFACTURERS OF CHILLED CAR WHEELS.—George W. Lyndon, 1214 McCormick Bldg., Chicago. Semi-annual meeting with Master Car Builders' Association.

ASSOCIATION OF RAILWAY CLAIM AGENTS.—Willis H. Failing, Terminal Station, Central of New Jersey, Jersey City, N. J.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal). One. Regular meetings, 3d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—W. L. Connelly, Supt. of Telegraph, Indiana Harbor Belt, Gibson, Ind. Next annual meeting to have been held September 18, 1917, Washington, D. C., indefinitely postponed.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual dinner, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S ASSOCIATION.—W. R. McMunn, New York Central, Albany, N. Y. Next convention, September, 1917, St. Louis.

CINCINNATI RAILWAY CLUB.—H. Boniet, Chief Interchange Inspector, Cin'ti Ry., 101 Carey Bldg., Cincinnati. Regular meetings, 2d Tuesday, February, May, September and November, Hotel Sinton, Cincinnati.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 568 Union Arcade Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh, Pa.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Huhner, 321 Grand Central Bldg., Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

INVESTMENT BANKERS' ASSOCIATION OF AMERICA.—Frederick R. Fenton, 11 W. Monroe St., Chicago. Annual convention, October 1-3, 1917, Baltimore, Md.

MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—F. W. Hager, Fort Worth & Denver City, Fort Worth, Tex. Next convention, October 16-18, 1917, Cleveland, Ohio.

MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—A. P. Dane, B. & M., Reading, Mass. Next annual meeting, September 11, Chicago.

NATIONAL ASSOCIATION OF RAILWAY COMMISSIONERS.—Jas. P. Walker, 120 Broadway, New York City. Next annual convention, October 16, 1917, Washington, D. C.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meeting, 2d Tuesday in month, except June, July, August and September, Boston.

NEW YORK RAILROAD CLUB.—Henry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—Geo. A. J. Hochgrebe, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.

PACIFIC RAILWAY CLUB.—W. S. Vollner, Assistant to Chief Engineer, Northwestern Pac., P. O. Box 1, San Francisco, Cal.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—F. C. Stewart, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.

RAILROAD CLUB OF KANSAS CITY.—Claude Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Saturday in month, Kansas City.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Pittsburgh Commercial Club Rooms, Colonial Annex Hotel, Pittsburgh.

RAILWAY FIRE PROTECTION ASSOCIATION.—C. R. Edwards, office of the president's assistant, Seaboard Air Line, Norfolk, Va. Next meeting, October 2-4, 1917, St. Louis, Mo.

RAILWAY REAL ESTATE ASSOCIATION.—R. H. Morrison, Assistant Engineer, C. & O., Richmond, Va. Next convention, October, 1917, Duluth, Minn.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Myers Bldg., Bethlehem, Pa. Next annual convention, September 18-19, 1917, Hotel Traymore, Atlantic City, N. J.

RICHMOND RAILROAD CLUB.—P. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—P. J. McAndrews, C. & N. W., Sterling, Ill. Next annual convention, September 18-21, 1917, Hotel Auditorium, Chicago, Ill.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grand Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, December, m., Piedmont Hotel, Atlanta.

TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Waldorf-Astoria Hotel, New York.

TRAFFIC CLUB OF PITTSBURGH.—J. L. Wells, Gen'l Apt., Erie R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings bi-monthly, Pittsburgh.

UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, 1111 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.

WESTERN CANADA RAILWAY CLUB.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—W. V. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Monday in month, except June, July and August, Hotel Sherman, Chicago.

Traffic News

The summer meeting of the National Industrial Traffic League was held at the Hotel Statler, Buffalo, N. Y., on August 23 and 24.

The National Shippers Conference will meet at Chicago, August 31, to consider what action to take if the railroads again ask for a rate increase.

The freight traffic department of the Baltimore & Ohio is working out a plan for "sailing days" for l. c. l. freight similar to the methods recently adopted by the Pennsylvania and the Pere Marquette.

The Railroad Commission of Louisiana will hold a hearing at Baton Rouge on September 5 to consider the application of the railroads of the state for an advance of 15 cents a ton on intrastate coal and coke rates.

The Southern Pacific has filed application with the Railway Commission of California for permission to increase one-way and monthly commutation fares on suburban passenger trains between San Francisco, Cal., and Alameda county points.

The dining car department of the Rock Island Lines announces the inauguration of tray service in passenger coaches. Under the arrangement a waiter will pass through the cars during meal hours with coffee, sandwiches, doughnuts and hard boiled eggs for sale to passengers at prices ranging from 5 to 10 cents each.

Illinois railroads on August 17 petitioned the State Public Utilities Commission of Illinois for a reduction in the free time to be permitted for the unloading and loading of open top cars from 48 hours to 24 hours. They also asked the abolition of the 24 hours' free time permitted in connection with the re-consignment of open top cars. The railroads took the action upon the recommendation of the State Council of Defense.

R. J. Clancy, assistant to the general manager of the Southern Pacific at San Francisco, recently issued a statement illustrating the inexpensiveness of transportation service. It costs more, he said, to send a letter through the mails from New York to San Francisco than to ship a \$5 hat the same distance by freight. Shoes are loaded into a car and hauled 3,000 miles to the Pacific Coast for one-third the cost of a shave. A pound of live beef from Nevada is hauled more than 300 miles to San Francisco over a mountain range a mile and one-half high for about a third of a cent. A 15 per cent increase in freight rates applied to the shipment of a \$35 suit of clothes, a \$5 hat, an \$8 pair of shoes, 30 dozen eggs and 7 pounds of live beef, from New York, Petaluma, Cal., and Wabaska, Nev., respectively, to San Francisco would amount to less than 5 cents.

Caution as to Shipper's Order on Grain, Hay and Feed

Shippers of grain, hay and feed have been advised by the Bureau of Markets, United States Department of Agriculture, to be on the lookout for what is known as "shipper's order bill of lading" transactions with unknown or irresponsible persons. Shipping carlots to such buyers under no obligation other than to pay for the shipment if they finally take it out of the cars tends to encourage speculation and is liable to increase freight congestion. Some of these buyers order products shipped in the hope that the price will go up in the meantime and enable them to sell locally to a local dealer who will pay cash. Unless they succeed in selling to others, many of these "shipper's order" consignees have insufficient capital to pay for the goods which sometimes fall back on the shipper.

In a case recently investigated by the department a man without financial standing, who posed as a commercial company, succeeded in purchasing large shipments of hay and mill feed. As there was no advance in price, and as he had no cash with which to meet the drafts, he held the goods for several weeks in the cars on the track. Some of the cars were on the track for over 20 days before unloading. When he succeeded in

selling a car, instead of paying his own cash for it, he sent his customer to the bank to release the draft. The day the department investigator was on the ground this man had 13 cars of hay and 9 cars of mill feed on the track, papers for 17 more cars en route, and a number more still to be shipped. It was stated locally that in the same kind of transaction in the past a severe decline in price rendered this individual unable to pay for 30 cars of produce, which the shipper was forced to sell at a material loss.

"94,839 Pounds of Catalogues in One Car"

Putting 94,839 pounds of catalogues into one box car is the way a New York shipper and officials of a railroad it used answered in concrete fashion the plea of the Railroads' War Board to make one freight car do the work of two.

The books—bulky affairs—made 16 truck-loads when they were carted to the Lehigh Valley Pier 34. They were catalogues of the National Cloak & Suit Company bound for a western distributing point, and ordinarily would have required two box cars.

The traffic manager decided it was possible to get them all into one car and secured that result through the co-operation of the Lehigh Valley.

Keeping Tab on Live Stock Shipments

On August 16 there were 3,115 carloads of live stock on the railroads of the United States destined to some 100 markets. Of these cars, 1,772 were loaded with cattle, 699 with hogs, 289 with sheep, 105 with horses and mules, and the rest with mixed stock. The greatest number of cars for any point were bound to Chicago, with Kansas City second, Fort Worth third, and St. Paul fourth.

These are the figures that are being compiled daily by the Bureau of Markets of the United States Department of Agriculture with the co-operation of 521 division superintendents of all railroads west of the Allegheny mountains, representing about 225,000 miles of line who nightly report these facts by telegraph. The Bureau receives nightly an average of 300 such wires from division superintendents. A night force of telegraph operators and statistical clerks receives and tabulates this information, so that it can be wired to market points at 7 a. m., eastern time.

A tabulated summary of the loadings is wired daily, including Sunday, to the local offices of the Bureau of Markets in Boston, New York, Philadelphia, Chicago, Kansas City, Omaha; Portland, Ore.; Fort Worth, Tex., and Washington, D. C., for immediate publication in the press. Thus producers of live stock and members of the live stock and meat trade at the markets have an early morning report, which will assist in gauging more accurately the receipts at all of the live stock markets. The information contained in these reports, those issuing them say, will help to avoid the present costly market glut, and should decrease the need for the divisions of live stock in transit.

INCREASED FREIGHT AND PASSENGER RATES IN RUSSIA.—The consulate general at Moscow, Russia, has reported under date of June 25 that the Provisional government has decided to increase passenger tariffs on the railroads 50 per cent, and freight tariffs 200 per cent.

INCREASED FREIGHT IN URUGUAY.—A decree of June 21, 1917, by which the Uruguayan government authorizes the Central Uruguay Railway Company to collect a special surcharge, has settled for the present a controversy of several months with respect to railway rates.

ELECTRIC MOTORS FOR RAILWAY IN PERU.—Sr. Benjamin La Torre, of Cuzco, Peru, has informed Commercial Attaché William F. Montavon, at Lima, that he desires to obtain information with regard to electric locomotives from the United States for possible use on the Cuzco-Santa Ana Railway, an extension out of Cuzco of the Southern Railway of Peru. He is interested in both the construction and operation of the road. Although it will open up a region of some importance, he expects light traffic at first, and suggests the possibility of using locomotives running on storage batteries.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The commission has suspended from August 20 until December 18 proposed increases in carload rates on wheat from Omaha and Kansas City to Jackson and Meridian, Miss.

The Interstate Commerce Commission has suspended from August 20 until December 18 the operation of a proposed increased charge via express companies, exclusive of Wells, Fargo & Co., for the transportation of empty fish cars in express service. The present charge is 10 cents per mile per car, and the charge proposed is 25 cents.

COURT NEWS

Off-the-Line Telegraph and Railroad Service

In a suit brought by the Postal Telegraph-Cable Company against the Chicago Great Western, Judge Evan Evans in the United States District Court at Chicago sustained the order of the Interstate Commerce Commission, declaring invalid contracts between railroads and telegraph companies by which free off-the-line service is given on both sides. In conformance with this decision the telegraph company must pay for its off-the-line railroad service, and the railroad company for its telegraph service off its lines, notwithstanding any contracts. The holding is in direct conflict with the decision of Judge Mayer in the United States District Court in New York in a suit brought by the Baltimore & Ohio against the Western Union Telegraph Company, which was later sustained by the United States Court of Appeals of the Second Circuit.

Injuries to Passenger by Others

A passenger sued a railroad for injuries received by her when, as she reached the center of a car platform in boarding the train, she was thrown against the brake wheel by a man emerging from the car. It did not appear that the car was crowded or that there was any commotion or disturbance. The Massachusetts Supreme Judicial Court held the railroad not liable, under the rule that a common carrier is not responsible for injuries to a passenger caused by the misconduct of others, which it could not have foreseen or guarded against.—*Eaton v. N. Y. N. H. & H. (Mass.)*, 116 New England, 815. Decided May 26, 1917.

Objection to Railroad Reorganization

The Circuit Court of Appeals, Fifth Circuit, holds that where the owners of 80 per cent of the bonds secured by a railroad mortgage had joined in a plan of reorganization, and it was still open to an objecting bondholder, who was acting purely in his own interests, and not for other minority bondholders, to join in such plan, a confirmation of a sale to a reorganization committee would not be denied, and a resale ordered merely for the purpose of coercing the committee, by repeated orders of resale, to pay such bondholders the par value of the bonds.—*Simon v. New Orleans, Texas & Mexico*, 242 Fed., 62. Decided April 28, 1917.

Construction of Safety Appliance Act

The Federal district court for the Eastern District of Kentucky holds that the Safety Appliance Act, sect. 4, which provides that a car properly equipped, which has become defective or insecure while in use, "may be hauled from the place where such equipment was first discovered to be defective or insecure to the nearest available point where such car can be repaired," without liability for the penalties imposed, does not permit a railroad company to move, without penalty, from one point to another, a defective car, not known to be defective, and which is not so moved for the purpose of repair, although in fact it

is hauled to the nearest available point for repair, and is there repaired.—*United States v. Chesapeake & Ohio*, 242 Fed., 161. Decided October 14, 1916.

Conflicting Freight Rates

The Interstate Commerce Commission prescribed maximum rates between Shreveport, La., and points in Texas, prohibited the charging of rates between such points higher than those applied for like distances between points in Texas, and ordered the railroad companies to cease applying the classification provisions then maintained to transportation between points in Texas. A compliance with this order by the railroad companies would subject them to a multiplicity of suits by the State Railroad Commission, and by shippers for failure to comply with the rates prescribed by the State Railroad Commission, while non-compliance therewith would also subject them to a multiplicity of suits with liability to large penalties. The Federal district court for the Western District of Texas holds that the companies are entitled to a temporary injunction restraining the State Railroad Commission and shippers who are threatening suit from instituting any suits pending an action for a permanent injunction based on the failure of the railroad companies to comply with the state rates so far as in conflict with the rates prescribed by the Interstate Commerce Commission.—*Eastern Texas v. Railroad Commission*, 242 Fed., 300. Decided April 20, 1917.

No Authority to Prescribe Unremunerative Rates

The district court for the Western District of Missouri holds that, assuming that Missouri Public Service Commission Law, sect. 35, providing that nothing therein, or in any other law, shall limit the power of the commission to order the sale of and prescribe reasonable and just maximum fares for commutation tickets, authorizes the commission to order the sale of suburban commutation tickets, and to prescribe rates therefor, where a carrier's earnings fall short of a fair return to any extent, the commission cannot prescribe commutation rates which will still further reduce such earnings, even though to a comparatively negligible extent, and such action is not authorized by reason of local public demand or interest, or by the commission's views of the possible beneficial effects of such rates on the company's business.—*Kansas City, C. C. & St. J. v. Barker*, 242 Fed., 310. Decided May 27, 1917.

Hours of Service Act—Available Excuses

The Circuit Court of Appeals, Sixth Circuit, holds that, under section 3 of the Hours of Service Act, where there is a delay from unavoidable accident, or a cause not known to the railroad's agents when a freight train leaves its terminal, and which could not have been foreseen, the railroad is entitled to add to the 16 hours permitted by statute all the delay, no more and no less, which thereafter occurred as the result of this cause, provided the following conditions existed: (a) That from the beginning of the trip, and even before it became apparent, or should have become apparent, to the train dispatcher that there was danger of not finishing the trip within the time, the railroad used reasonable diligence to avoid delays; (b) that as soon as it became apparent, or should have become apparent, that there was any danger of not getting through on time, the railroad used a very high degree of effort or extreme diligence to get the train through to the end of the run within the time limit; (c) that as soon as it became fairly probable that excess service would otherwise be necessary, the railroad used that same high diligence to prevent excess service either by laying up the train or by sending relief, or in any other practicable way; (d) that continually and until the service ended, the railroad used the same high diligence and by the same means, to the end that the excess service, if any, should be as short as possible.—*B. & O. v. United States*, 242 Fed., 1. Decided May 8, 1917.

BRITISH INVENTIONS DURING THE WAR.—During the year 1916, the report of the British comptroller general of patents states, applications were filed for 18,602 new patents. The number of applications during the preceding year was 18,191.

Equipment and Supplies

FREIGHT CARS

THE CHICAGO & ALTON has ordered 200 gondola car bodies from the Haskell & Barker Car Company.

THE SEMET-SOLVAY COMPANY, SYRACUSE, N. Y., has ordered 100 hopper cars from the Haskell & Barker Car Company.

THE UNITED STATES GOVERNMENT has increased its orders for standard gage cars for service in France from 6,000 to 9,000, each individual order having been increased 50 per cent. This now makes a total of 9,000 standard gage cars, and 2,997 narrow gage cars. There remain orders for 5,000 more cars to be placed.

MISCELLANEOUS

THE TEXAS & PACIFIC has awarded a contract to the Roberts & Schaefer Company, Chicago, for a 400-ton, 2 track coaling plant, for erection at Mingus, Tex.

THE ELGIN, JOLIET & EASTERN has awarded a contract to the Roberts & Schaefer Company, Chicago, for a 150-ton reinforced concrete, 2-track automatic electric coaling plant for installation at South Gate, Illinois Steel Works, Joliet, Ill.

THE OREGON SHORT LINE has awarded a contract to the Roberts & Schaefer Company, Chicago, for two 150-ton reinforced concrete, 3-track automatic electric coaling plants and sanding plants, for installation on its lines at Dillon and Melrose, Mont.

THE CHICAGO SHORT LINE has awarded a contract to the Roberts & Schaefer Company, Chicago, for a 100-ton coaling plant, equipped with a Duplex shallow pit loader and a "Rand S" measuring coal loader, for issuing and recording all coal passed to locomotives.

THE PENNSYLVANIA LINES WEST OF PITTSBURGH has awarded a contract to the Roberts & Schaefer Company, Chicago, for a 500-ton, 3-track reinforced concrete and steel counterbalanced bucket coaling plant of the automatic type, for installation at the New Harthorne Yards, Indianapolis, Ind.

THE MONONGAHELA RAILROAD has awarded a contract to the Roberts & Schaefer Company, Chicago, for the building of a combined 200-ton concrete, 3-track coaling plant, electric cinder handling plant, and a "Rand S" gravity and sand plant, all of concrete construction, to be erected immediately at Brownsville, Pa.

THE FIRST SUBMARINE.—The first submarine boat of which history makes any record was built by a Dutchman, named van Driemel, in 1640. The boat was built in England with money said to have been advanced by King James I. According to reports the vessel had a unique ballasting system. There was a number of goatskin bags placed under the deck between two large planks. These bags, when filled with water, caused the vessel to sink. To cause it to rise again the bags were pressed together again with a windless arrangement, forcing the water out, and thus giving the boat reserve buoyancy.—*The Engineer*.

ELECTRIC SOLDERING IRON.—A new type of soldering iron consists essentially of two high-resistance heating points, or electrodes, that become incandescent when the current passes through them. As the circuit is closed as soon as the points come into contact with the metal to be heated, the iron is said to become heated to the required degree the moment it touches the work. Besides, the heat is generated at the point of contact and at the spot where the heat is needed when soldering, brazing, or annealing. The iron operates at from six to sixteen volts and the points are made to carry current according to ratings of 150, 250 and 500 watts.—*Machinery*.

Supply Trade News

Howard C. Mull, sales representative of the Verona Tool Works in the Chicago office, has been appointed sales agent in charge of the Chicago territory.

R. G. Taylor, sales representative for the American Car & Foundry Company, has been commissioned captain of ordnance in the Officers' Reserve Corps, and has been assigned to duty at Rock Island, Ill.

Thomas H. Garland, president of the Garland Ventilation Company, Chicago, and inventor of the Garland car ventilator, died in Chicago August 20, following a protracted illness. Mr. Garland was 56 years old.

William L. Allison, vice-president of the American Arch Company, Chicago, who has been in training at the officers' training camp at Ft. Sheridan, Ill., has been commissioned a major in the Officers' Reserve Corps.

Arthur S. Lewis has resigned his position with the Chicago-Cleveland Car Roofing Company to join the sales force of Flint & Chester, Inc., New York, effective September 1. Mr. Lewis as assistant to the president will have charge of sales to railroads and other large corporations. He succeeds W. B. Wise, resigned to go into other business.

Adrian D. Joyce, general manager sales and distribution of the Sherwin-Williams Company, has been appointed by the Federal War Industries Board to membership on a special committee for the standardization of paints and varnishes in connection with war purchases. On the committee with Mr. Joyce are six other prominent paint manufacturers of the country.

TRADE PUBLICATIONS

BRINELL HARDNESS TESTING MACHINE.—The Scientific Materials Company, Pittsburgh, has issued a 12-page pamphlet discussing the hardness testing of materials with special reference to the advantage of measuring the depth of the indentation made by the testing ball rather than its diameter. A description is given of the improved American model of the Brinell machine, with the appliances for measuring the depth of the penetration as well as other apparatus used in testing of this kind. The pamphlet also contains tables of hardness values.

COST OF COAL ON SWISS RAILWAYS.—The quantity of coal used yearly by the Swiss Federal railways is as follows: In 1915, 636,298 short tons, or 33 pounds per kilometer of 0.621 mile; in 1916, 652,884 tons, or 34 pounds per kilometer. The average price per ton paid for coal by the Swiss Federal Railways during the past 5 years was as follows: In 1912, \$5.27 per ton of 2,204 pounds; in 1913, \$5.22; in 1914, \$5.17; in 1915, \$5.15; in 1916, \$6.17.

FREIGHT CONGESTION WORRIES JAPAN.—At the end of 1916 the total amount of freight at the Japanese government railway stations was returned at 285,420 tons, but since then the accumulation has continued, and on June 10, 1917, the total reached 463,130 tons. Lately the number of applications to the railway authorities for forwarding goods has greatly increased as the raw silk season and the time for the planting of rice shoots are approaching. The Japanese Railway Board is said to be endeavoring to devise means of meeting the requirements of the situation, though this is not easy, considering that the maximum transportation capacity of the government railways is not much more than 130,000 tons a month. Mr. Hasegawa, superintending engineer of the Railway Board, referring to this matter, remarks that the chief cause of the enormous increase in railway freight must be attributed to the scarcity of hold space and the consequent rise in freight, much of which has hitherto been carried on ships being now collected on the railways. The railway authorities are doing their best to build trucks and engines, so as to increase the transport capacity, but on account of the short supply of iron and other materials the building of equipment does not proceed as quickly as desired.—*N. Y. Tribune.*

Railway Construction

ATCHISON, TOPEKA & SANTA FE.—Plans have been completed by this company for the building of a second track between Floyd, Mo., and Camden, a distance of approximately 5 miles; between Braddock, Kan., and Walton, a distance of 6 miles; from Goff, Cal., to Bagdad, a distance of 30 miles, and from Glorieta, N. M., to Fox, a distance of about 4 miles. Work has already been started on the new track in California.

CHICAGO, ROCK ISLAND & PACIFIC.—This company has prepared preliminary plans for the construction of a subway under its tracks at Moline, Ill.

GRAND TRUNK.—A contract has been awarded by this company to James Stewart & Co., New York, for the construction of a car repair shop at Port Huron, Mich. The building will be 22 ft. high, 77 ft. wide and 300 ft. long, with brick walls, concrete foundation, and a tar and gravel roof.

KIRBY-BONNER LUMBER COMPANY.—Plans have been completed by this company for the construction of a road from Newton, Tex., to a point 24 miles northeast. The contract for the work will probably be let within the next 10 days, and construction will be started as soon as possible.

LEHIGH & NEW ENGLAND.—A contract has been given to F. H. Clement & Co., Philadelphia, Pa., to build a line from Bethlehem, Pa., 4.82 miles, in a generally westerly direction to Allentown and East Allentown, with an intermediate terminal at Rittersville, and a spur from Rittersville 0.61 miles long. The line is to be built through a rolling country, the approximate cut per mile will be 36,000 cu. yd., approximate fill 47,000 cu. yd., the maximum grade will be 1.5 per cent, and the maximum curvature 10 degrees. There will be 5 reinforced concrete bridges at highway crossings. The line is being built to carry coal and general merchandise.

MISSOURI, KANSAS & TEXAS.—This company has awarded a contract to the L. J. Smith Construction Company, Kansas City, Mo., for grading in connection with the extension of yards at Parsons, Kan. The work will involve the moving of approximately 275,000 cu. yd. of dirt.

PACIFIC ELECTRIC.—This company has been granted a franchise to extend its line from Santa Ana, Cal., to Tustin, a distance of approximately 6 miles. Work on the extension will be started in the near future.

PENNSYLVANIA LINES WEST. This company is building a new north-and-southbound yard at Orrville, Ohio, which involves the laying of about 30,000 yd. of track.

PHILADELPHIA & READING.—A contract has been awarded to C. P. Bower, Reading, Pa., for grading at Saucon Creek, south of South Bethlehem, Pa., for an extension to a freight yard north of Saucon Creek, providing for 385 more cars, and for a new yard south of Saucon Creek, with a capacity of 850 cars. The road will also build an engine house providing for six engines at the present time, but planned to ultimately take care of 29, and will construct a coaling station, water station and ash pit.

SAND SPRINGS.—This company has completed plans for the construction of a one-story brick car barn at Sand Springs, Okla. Work will be started on the structure in about two weeks, and will cost approximately \$10,000.

YAZOO & MISSISSIPPI VALLEY.—A contract has been awarded by this road to the George B. Swift Company, Chicago, for the construction of a passenger station and power house at Greenwood, Miss. The station will be one story high, 42 ft. wide and 161 ft. long, of brick construction, with concrete foundation and slate and composition roof. The power house will be 20 by 54 ft., and will also be of brick construction. The improvements necessitate the removal and remodeling of the freight house, which will be done by the company's forces.

Railway Financial News

CANADIAN NORTHERN.—This company has sold to Wm. A. Read & Co., \$10,000,000 one-year 6 per cent notes, which are being offered at 99.05, or on a 7 per cent basis. These notes are secured by \$15,333,000 Canadian Northern general mortgage 4 per cent bonds, guaranteed principal and interest by the Dominion of Canada. The notes are convertible into the bonds at 79.

DENVER & SALT LAKE.—Judge Class in the District Court at Brighton, Colo., has placed this company, which operates 255 miles of line between Denver, Colo., and Craig, in the hands of receivers. Charles Boettcher, president of the company, and William R. Freeman, tax agent for the Atchison, Topeka & Santa Fe, have been appointed receivers.

NEW YORK CENTRAL.—The New York Public Service Commission has authorized this company to guarantee \$1,000,000 25-year 5 per cent bonds to be issued by the Boston & Albany. The bonds are to be disposed of at par.

NEW YORK, NEW HAVEN & HARTFORD.—Marcus P. Knowlton and the other trustees appointed under the dissolution decree of October 17, 1914, in the government's Sherman law suit against the New Haven and other defendants, have petitioned the Federal District Court for a further extension of time in which to dispose of the aggregation of stock which they hold and control as a result of the litigation. They hold among other securities a block of 219,198 shares of stock of the Boston & Maine. The dissolution decree directed the trustees to dispose of the stock at private sale or public auction prior to January 1, 1918. Asking for the extension of the time of sale to January 1, 1920, the trustees in the position state that from the time of their appointment to the present time the financial situation of the Boston & Maine has been such as to make it impossible for them to sell the large block of stock without an enormous and unreasonable sacrifice. The other stocks in their possession, the trustees explain, are mainly those of railroads leased or operated by the Boston & Maine, and their market value is seriously affected by the same conditions which affect the stock of that road.

ST. LOUIS-SAN FRANCISCO.—J. W. Kendrick and Frederick H. Ecker have been elected directors, the stockholders having voted to increase the board from 15 to 17, and the executive committee from 7 to 9. Jesse Hirschman has been elected a director to succeed James Speyer, resigned. Mr. Kendrick and Mr. Hirschman have also been elected members of the executive committee. The directors have declared six months' interest (3 per cent) on the adjustment bonds and one year's interest (6 per cent) on the income mortgage bonds, payable October 1.

Authority has been obtained from the Missouri Public Service Commission to issue \$6,440,000 of 5 per cent prior lien bonds. The application states that \$4,578,900 will be used to reimburse the company for expenditures in acquiring property and improving the system, and \$1,862,000 for refunding obligations secured by lien.

INCREASED TRAVEL AT BOSTON TERMINALS.—In June the New Haven and the Boston & Albany handled 3,114,280 passengers in and out of the South Station, against 2,977,151 for the corresponding month last year. This represents an increase of 137,129, or 4.6 per cent. In the same month the Boston & Maine carried 2,320,828 passengers in and out of the North Station, against 2,246,086 last year, an increase of 74,742, or 3.3 per cent. In the six months ended June 30 the travel in and out of the big South terminal aggregated 19,171,063 passengers, against 18,074,601 for the corresponding period last year, an increase of 1,096,462, or 6 per cent. In and out of the North Station the travel was 14,193,405 passengers, against 13,351,703, an increase of 841,702, or 6.3 per cent. The South Station is the busiest in the country. The North Station is second and the busiest used by only one road.

Railway Officers

Executive, Financial, Legal and Accounting

Elisha Lee, general manager of the Pennsylvania, has been made acting vice-president in charge of operation during a leave of absence, which has been granted W. W. Atterbury. See also note in General News.

J. Tancy Willcox, assistant secretary of the Pennsylvania Railroad, and of 36 subsidiary corporations of the Pennsylvania System, will attend the officers' training camp, at Fort Oglethorpe, Ga., where he will report for duty on Wednesday, August 22. To fill the resulting vacancy, Harry T. Wilkins, who is at present special agent in the traffic department, and who managed the Pennsylvania Railroad's exhibit at the Panama-Pacific Exposition, has been appointed assistant secretary, effective August 20.

The officers of the Savannah & Atlanta, which has acquired all properties and franchises of the Savannah & Northwestern, are as follows: James Imbrie, chairman of the board, New York; Frank S. Gannon, president, New York; John H. Hunter, vice-president, Savannah, Ga.; C. E. Gay, Jr., vice-president and general manager, Savannah; Robert M. Hitch, secretary, Savannah; Ralph N. Scheffey, assistant secretary, New York; Thomas P. Goodbody, treasurer, Savannah, Ga.; J. E. Grainger, auditor; Hitch & Denmark, general counsel; Wilson Runnette, general freight agent, and J. S. Douglas, superintendent, with headquarters at Savannah.

Edgar S. McPherson, who has been elected vice-president of the Spokane International, with headquarters at Spokane, Wash., was born at Racine, Wis., on October 7, 1881, and entered railway service with the Wisconsin Central as an office boy on June 1, 1898. He was later promoted to secretary to the general superintendent of the same road, and on August 1, 1901, became chief clerk to the general superintendent. On January 15, 1902, he was promoted to secretary to the president, and on June 1, 1909, became associated with the Minneapolis, St. Paul & Sault Ste. Marie in a similar capacity. On February 1, 1910, he was appointed chief clerk to the general manager, and on June 1 of the same year became chief clerk to the president. On January 1, 1916, he was promoted to assistant secretary, and on May 1, 1917, he became assistant to the president of the Spokane International, which position he held until his election as vice-president.

Operating

James Berlingett, general manager of the Virginian Railway, has resigned from that position.

C. J. Adair has been appointed terminal trainmaster on the Chicago & Alton, with headquarters at Chicago.

T. S. Fox has been appointed trainmaster on the Grand Rapids & Indiana, with headquarters at Ft. Wayne, Ind., succeeding R. E. Casey, promoted.

George W. DeGraff, yardmaster of the Central of New Jersey at Cartaret, N. J., has been appointed assistant trainmaster, with headquarters at Jersey City.

J. P. Taylor has been appointed general agent of the Atlantic Coast Line, the Seaboard Air Line and the Southern Railway at Camp Jackson, near Columbia, S. C.

T. J. Hayden, yardmaster of the Southern Railway at Asheville, N. C., has been appointed trainmaster, with headquarters at Asheville, vice C. G. King, assigned to other duties.

John Goodfellow has been appointed trainmaster of the Los Angeles division of the Southern Pacific, with headquarters at Los Angeles, Cal., succeeding J. C. Muir, resigned, effective August 10.

J. P. Connolly, supervisor of mail traffic of the Philadelphia & Reading at Jersey City, N. J., has been appointed supervisor of mail and express traffic, with office at Reading Terminal, Philadelphia, Pa.

O. S. Johnson, chief clerk to the president and general manager of the Minneapolis & St. Louis at Minneapolis, Minn., has been appointed assistant to the general manager, with the same headquarters.

Joseph H. Gumbes, whose appointment as general superintendent of the Western Pennsylvania division of the Pennsylvania Railroad is announced elsewhere in these columns, was

born at Oaks Station, Montgomery county, Pa., November 27, 1866. He graduated from the engineering department of the University of Pennsylvania in 1888, and entered railway service as a rodman on the Middle division. In December, 1890, he was transferred to the maintenance of way department at Altoona, and on August 11, 1891, promoted to assistant supervisor at Freeport, Pa. He was transferred to a similar position at Mifflin, Pa., on the middle division, on April 30, 1893. On July 1, 1897, he was promoted to supervisor

at Millersburg, Pa. On October 30, 1899, he was transferred to the Monongahela division as supervisor at Dravosburg, and on January 1, 1900, he returned to Mifflin as supervisor. On December 10, 1901, he was transferred to the position of supervisor at New Florence, Pa., on the Pittsburgh division, and on June 1, 1903, was promoted to division engineer of the Monongahela division. On April 1, 1905, he was transferred to division engineer of the West Jersey & Seashore, and on April 1, 1907, to division engineer of the Pittsburgh division. He was promoted to assistant superintendent of the Pittsburgh division on March 3, 1911, and on December 1, 1913, he was made superintendent of the Renovo division, with headquarters at Renovo, Pa. He was promoted to superintendent of the Philadelphia Terminal division on May 1, 1916.

Arthur B. Clark, whose appointment as superintendent of the Philadelphia Terminal division of the Pennsylvania Railroad is announced elsewhere in these columns, was born at Green Village, Pa., October 1, 1867. He graduated from Lafayette College in 1891, receiving the degree of civil engineer. During his summer vacations in 1889 and 1890 he was employed on the Pennsylvania Railroad as rodman, first entering the service July 1, 1889. After graduation he was employed from September 14, 1891, as rodman on the Philadelphia division at Philadelphia. On July 2, 1896, he was promoted to assistant supervisor, and served in that position on the Altoona and Pittsburgh divisions. On July 1, 1900, he was promoted

to the position of supervisor on the Baltimore division of the Northern Central. On July 20, 1901, he was transferred to the Pittsburgh division and located at Pittsburgh, in charge of the track work of the Pittsburgh Yard, in connection with the construction of the new Pennsylvania station. On December 15, 1905, he was promoted to assistant engineer of the Middle and Western divisions of the Philadelphia & Erie. He was subsequently transferred to the same position on the West

Jersey & Seashore, thence to the Maryland division of the Philadelphia, Baltimore & Washington, as assistant engineer. On January 15, 1910, he was promoted to principal assistant engineer of the Philadelphia, Baltimore & Washington, and on June 16, 1913, he was made assistant engineer maintenance of way, in charge of roadway and track. On September 28, 1916, Mr. Clark was promoted to the position of superintendent of the Renovo division.

W. R. Parsons, trainmaster of the Atlanta, Birmingham & Atlantic at Fitzgerald, Ga., has been appointed superintendent of the Birmingham division, with headquarters at Manchester, Ga., vice F. M. Wooddall, resigned.

J. P. Kavanaugh, terminal trainmaster of the Baltimore & Ohio at Philadelphia, Pa., has been promoted to assistant superintendent in charge of the Baltimore (Md.) terminals, succeeding R. A. Grammes, who was recently given a commission as major in the army; W. H. Lynn, general yardmaster at Cumberland, succeeds Mr. Kavanaugh.

Richard L. O'Donnel, whose appointment as assistant general manager of the Pennsylvania Lines East of Pittsburgh is announced elsewhere in these columns, was born in Philadelphia,

November 5, 1860. He graduated from the Philadelphia high school in 1877, and from the Polytechnic College of Pennsylvania in 1882. He entered the service of the Pennsylvania Railroad in 1883, and was employed as rodman, levelman and transitman in the construction department until 1884; as draftsman at Blairsville in the assistant engineer's office of the West Penn division during 1884, 1885 and 1886. In November, 1886, he became assistant engineer in the principal assistant engineer's office at Altoona. He was

appointed assistant supervisor at Hollidaysburg in March, 1887, and was transferred in February, 1888, to the same position at Lancaster on the Philadelphia division. Following the flood at Johnstown, May 31, 1889, Mr. O'Donnel was assigned to temporary duty at that point in charge of a force of men. After six weeks' service at Johnstown he was transferred to the Pittsburgh division as assistant supervisor at New Florence. He was promoted in November, 1889, to supervisor in the Altoona yard, and in April, 1891, became assistant engineer of the Tyrone division. He was transferred to the Pittsburgh division as assistant engineer in December, 1894. In February, 1897, Mr. O'Donnel was promoted to assistant superintendent of the Pittsburgh division, and to superintendent of the same division on January 1, 1902. He was appointed general superintendent of the Buffalo & Allegheny Valley division on January 1, 1903, and on March 3, 1911, general superintendent of the Western Pennsylvania division.

C. E. Green, trainmaster on the Chicago, Rock Island & Pacific at Des Moines, Iowa, has been transferred to Bureau, Ill., succeeding B. H. Hagelbarger, resigned to enter military service; C. W. Lafer, trainmaster at Omaha, Neb., has been transferred to Des Moines; H. C. Higgins has been appointed trainmaster of the West Iowa division, with headquarters at Omaha.

To complete the organization of the general manager's department of the Pennsylvania Railroad, Richard L. O'Donnel has been appointed assistant general manager of the Lines East of Pittsburgh and Erie. This position has been vacant since April 1. Mr. O'Donnel has been general superintendent of the Western Pennsylvania division, at Pittsburgh, for the past six years. As assistant general manager, he will be located in the general offices at Broad Street station, Philadelphia. J. H. Gumbes, super-

J. H. Gumbes

R. L. O'Donnel

A. B. Clark

intendent of the Philadelphia Terminal division, has been appointed general superintendent of the Western Pennsylvania division, to succeed Mr. O'Donnel. A. B. Clark, superintendent of the Kenova division, will become superintendent of the Philadelphia Terminal division. He will be succeeded by E. B. John, superintendent of the Delaware division, and P. L. Grove, master mechanic of the West Philadelphia shops, will become superintendent of the Delaware division.

Traffic

Hugh Miller has been appointed commercial agent of the Delaware, Lackawanna & Western at New Haven, Conn., vice Robert H. Martin, resigned to engage in other business.

R. C. Wharton has been appointed general agent of the Georgia Railroad at Macon, Ga., vice W. E. Mobley, assigned to other duties. F. W. Boschert has been appointed commercial agent at Memphis, Tenn., succeeding Mr. Wharton.

N. H. Hall has been appointed commercial agent of the Gulf Coast Lines, with headquarters at San Francisco, Cal., succeeding C. F. Northrup, resigned; L. G. Wilson has been appointed commercial agent, with headquarters at Los Angeles.

F. H. Donahue, traveling passenger and freight agent of the Missouri Pacific at Milwaukee, Wis., has been appointed general agent of the passenger and freight departments, with the same headquarters, succeeding H. N. Atwood, transferred.

Sheldon A. Volkman, general agent on the Great Northern at St. Paul, Minn., has been appointed general agent, refrigerator service, succeeding O. W. Farrell, assigned to other duties; H. E. Kendree has been appointed general agent, with headquarters at St. Paul.

G. R. Piper, general agent of the Atchison, Topeka & Santa Fe at Atchison, Kan., has been appointed division freight agent at Wichita, succeeding E. E. Hook, resigned to enter other business; M. C. Burton, traveling freight agent, with headquarters at Hutchinson, has been promoted to general agent at Atchison.

B. Z. Ruff, commercial agent of the Southern Railway at Spartanburg, S. C., has been appointed commercial agent, with office at Savannah, Ga., succeeding G. S. Hinkins, who has accepted service with the American Railway Association, and C. J. Danehey, traveling freight agent at Columbus, S. C., has been appointed commercial agent at Spartanburg, vice Mr. Ruff.

C. A. Werlich, whose appointment as assistant general freight agent of the Minneapolis & St. Louis, with headquarters at Minneapolis, Minn., was announced in the *Railway Age Gazette* of August 10, entered railway service with the Iowa Central in 1888 as a clerk in the local freight office of Oskaloosa, Iowa. In 1890 he was promoted to the general auditing department at Marshalltown, and in 1892 became rate clerk in the general freight office, and later held various positions in that department, including that of chief tariff clerk, until January 1, 1905. On the latter date the general offices of the Iowa Central and the Minneapolis & St. Louis were consolidated at Minneapolis, and he was appointed chief clerk of both roads. On November 30, 1909, when the general freight offices of the Chicago & Alton, the Toledo, St. Louis & Western, the Minneapolis & St. Louis and the Iowa Central were consolidated at Chicago, he became chief clerk of the tariff department for all four roads. On December 15, 1910, he was promoted to chief clerk in the general freight office of the Minneapolis & St. Louis and the Iowa Central at Minneapolis, Minn., and on January 1, 1912, became chief of the tariff bureau of the Minneapolis & St. Louis, which position he held until his recent appointment, as already noted.

Engineering and Rolling Stock

W. F. Seemuth has been appointed signal inspector on the Chicago, Milwaukee & St. Paul, with headquarters at Milwaukee, Wis.

N. C. Van Natta, who has been appointed chief engineer of the Missouri, Oklahoma & Gulf, with headquarters at Muskogee, Okla., was born at Chicago, on May 8, 1868, and entered railway service with the Chicago, Burlington & Quincy in 1887. In 1909 he became associated with the Gallatin Valley as chief engineer, and in 1910 he went with the Chicago, Rock Island &

Pacific. In April, 1912, he became assistant engineer on the Chicago, Milwaukee & St. Paul. In the following year he went with the Chicago & Eastern Illinois in a similar capacity, and in 1916 he was promoted to locating engineer, and in 1917 he became valuation engineer for the Missouri, Oklahoma & Gulf, which position he held until his recent appointment as chief engineer.

Special

Frank A. O'Connell has been appointed editor of the Baltimore & Ohio Employees' Magazine at Baltimore, Md., succeeding R. M. Van Sant and A. W. Grahame, editor and associate editor respectively, who have entered military service.

Railway Officers in Military Service

R. M. Van Sant, editor of the Baltimore & Ohio Employees' Magazine, has been commissioned a lieutenant in the infantry branch at the Officers' Reserve Corps training camp, Fort Myer, Va., and A. W. Grahame, associate editor, will enter military service this month at the same camp.

Major R. Falshaw Morkill, formerly signal engineer of the Grand Trunk Railway System, and now serving overseas in the British Army, has been appointed by the director-general of transportation to take over all signaling work in the area occupied in France and Belgium by the British forces, and is now at general headquarters.

Colonel Charles D. Hine, formerly vice-president and general manager of the Southern Pacific of Mexico, and more recently special representative of the president of the Baltimore & Ohio, has been assigned to the command of the 165th Regiment, formerly the 69th of the New York National Guard. Colonel Hine is a graduate of West Point. He later entered railway service, but became a major of volunteers in the Spanish-American war.

OBITUARY

George S. Cheyney, general superintendent of water companies of the Pennsylvania Railroad since March, 1910, died suddenly on August 16, 1917, at his home in Cheyney, Pa., at the age of 54.

J. H. P. Hughart, president of the Grand Rapids & Indiana, who died at a Grand Rapids (Mich.) hospital on August 16 from injuries sustained from a fall, was born at Pittsburgh, Pa., on December 1, 1854, and entered railway service with the Pittsburgh & Connellsville on September 1, 1869. In 1874 he went with the Grand Rapids & Indiana, and served successively until January 1, 1892, as secretary to the president, purchasing agent, paymaster, secretary, assistant to the president and acting superintendent. On the latter date he was promoted to second vice-president and general manager, and on June 1, 1896, became general manager of the road when it was reorganized. On April 1, 1906, he was elected vice-president and general manager, and in April, 1914, became president.

MEXICO REDUCES RATES ON AMERICAN CORN.—The Mexican railways have reduced the freight rates throughout Mexico 30 per cent on American corn, according to a report from the American consul general at Mexico City.

GOOD TEAM WORK ON INADEQUATE RAILWAYS.—There had been serious strikes in Italy's railroad force only a few months before the declaration of war, and doubts could reasonably be entertained as to the efficiency of the railroad service, which, moreover, was said to be heavily sprinkled with anarchistic or socialistic theories, and disorganized on account of the recent disastrous earthquakes. But on the day when the army was mobilized, the nation showed what stuff she was really made of, and how the infection both of Germanism and of evil-minded socialism was only skin-deep. Military trains followed each other on the most congested and unmilitary tracks in the world, day and night for days and nights without a single casualty; the railroad force saw to it that everyone concerned did his duty. As a piece of team-work and organization in the face of technical odds (it is remarkable how the geography of Italy stands against her history at all times) it was unprecedented, and may be hard to beat.—*Amey A. Bernardy in the Boston Transcript.*

Increased Car Mileage on the El Paso & Southwestern.....	392

Many roads have an organized department for supervising the handling and performance of locomotives. Never before has a department of this kind had such an opportunity to show its worth. With the cost of fuel to the railroads as large as it now is no stone should be left unturned to have fuel used economically. It has been shown in the past that great results can be obtained by adequate supervision. The enginemen must be thoroughly trained in the matter of fuel economy. They must be shown how to get the most out of every pound of fuel fired and further, it must be seen that they follow instructions. The only proper way to do this is by supervision. The addition of a few more supervisors to the fuel organization will be money well spent when the advance in the cost of fuel is considered. More power must be gotten out of the locomotives. Enginemen must be taught how to use their power to the best advantage. This can only be accomplished by careful and proper instruction, together with adequate supervision. To be sure, the war has and will create a shortage of labor on the railways and it may be thought that men can not be spared for this work; but the conservation of the fuel and the greater reliability of the service must also be considered and men enlisted in this work may be of greater service to the railroads of the country, than in any other place. It is a problem which should be given the most careful consideration.

A note on another page tells of the excellent record of a New Orleans firm in unloading one-fourth of its cars on the same day that they came in; that is, before the railroad would begin to count the time. This note is a reminder that the smaller traders—those who load or unload from three to a dozen cars a week—present the most difficult problem in car conservation. The large establishments can employ an experienced traffic man to give his whole energy to the work, driving others, where necessary, and keeping everybody constantly alert. With operations of less magnitude, the station agent and the shipper or consignee have got to combine their

efforts and co-operate, else the necessary enthusiasm will be lacking. The trainmaster must spur the agents, if they need spurring, and the division freight agent must arouse any slow consignee. It is particularly important to make plain to the consignee that the good records of the large establishments are not due to any favoritism extended by the railroad. Neither should railroads ask the merchant to improve his service simply as a favor to the carrier. Every reasonable railroad man does surely appreciate favors in this field, and it is to be hoped that he never forgets to express his appreciation; but the main argument to be presented to the public is a lucid and forceful statement of the cold facts, frank, full and detailed. Car conservation helps all concerned; to tell this to all concerned is a never-ending job.

In the study of railroad accidents and their causes there is a constant necessity of remembering the comprehensive nature of the term "accident." Not the least of the accidental features of such casualties is the accident of time and of place. In the butting collision of trolley cars at North Branford, Conn., on August 13, seventeen persons were killed; and everybody who travels is justly indignant as he reads of the incredibly careless management which continues to use, with high-speed electric cars, the same old methods of operation which prevailed in the days of horse cars. But only seven days later, within 25 miles of North Branford (near Saybrook Junction), half as many persons lost their lives in a "railroad accident" for which the railroad management is in no sense responsible. Nine out of ten persons, riding in an automobile, were killed by a locomotive at a railroad crossing. A cynic might, very plausibly, ask why, if people will rush to their death voluntarily, at crossings, there should be so much outcry when they are killed in the cars! Neither of these "accidents" has any relation to the other, so far as the details of prevention are concerned. Yet their being so nearly in juxtaposition may well call attention once more to the need of getting down to actual causes and of patient attention to the real issues, in every case, uninfluenced by special interests or the clamor of shortsighted advocates.

Awaken the Small Shipper

The fact that within a given territory, within a given time, a hundred people are killed on railroad premises by their own fault, when only a half or a tenth of that number are killed by the fault of the railroad or its employees does not, indeed, afford any excuse for the railroad, or justify any relaxation of efforts at improvement; but it does show that a good deal of the activities of press and legislature are misdirected, and that much of the time of the courts is wasted. The operation of twenty thousand miles of busy railroad—in Great Britain or America—for a year or longer, with not a passenger killed except by his own fault, is a great achievement. This is one side of the shield. A statement of all casualties, great and small, on the steam railroads of the United States for a year—one hundred and eighty thousand, three hundred and seventy-five in the last report issued—shows the other side. Each figure has its own lessons; but each side of the shield is often shown in such a way as to lead the superficial observer to think that he is looking at the other side. If a clear distinction were always made between "railroad accidents" not due to the fault of either railways or their employees and railroad accidents actually due to them, it would be easier to secure intelligent regulation to reduce accidents.

A PRIZE FOR A STUDY OF THE RECONSIGNMENT PRIVILEGE

IS the reconsignment privilege as it is used and abused now a pernicious form of rebate or has it become so much a part of the commercial customs of the country that it would be economically wrong to make a substantial charge for this privilege? There can be no doubt that the reconsignment privilege puts a very heavy burden on the railroads. Just how heavy the *Railway Age Gazette* would like to demonstrate. Specific instances are occasionally made public where this reconsignment privilege is grossly abused not only to the detriment of the railroads but of the consumers. In some of the investigations made last winter at New York in regard to food speculation it was brought out that a carload of perishable foodstuff was sometimes sold a dozen times over, and nearly each time it was sold a reconsignment was made. A carload of potatoes was sold by a local jobber to a New York jobber and by him sold to a Chicago jobber and the car reconsigned to Chicago; the Chicago jobber sold it to a Cincinnati dealer and the car was reconsigned to Cincinnati; the Cincinnati dealer sold it to a Cleveland dealer and the car was reconsigned to Cleveland, and so the thing went on through half a dozen more transactions covering a period of more than thirty days. All this time the car itself was standing in the yards in one of the upstate cities of New York.

Yardmasters and station agents are the railroad men who have first-hand knowledge of the extent to which the reconsignment privilege is used, the kinds of commodities that are reconsigned, and the expense to which the railroad company is put. In order that this subject may be fully discussed and as much light thrown on it as possible, the *Railway Age Gazette* offers a first prize of \$50 for the best article dealing with this subject and a second prize of \$25, and will pay space rates for any other articles that are used. Discussions of this subject should be condensed as much as possible but no rigid limit will be placed on the length of articles. Contributions should be sent to the Woolworth Building, New York City, and must reach New York not later than September 29. The *Railway Age Gazette* reserves the privilege of condensing any statistics which are presented if such condensation can be done profitably.

Three judges will be selected and their names announced in the near future. What is especially desired is a statement of facts culled from experience. Such information in regard to reconsignment as this contest may bring forth

should be of value, especially at the present time. The names of roads will, if the author so desires, be held confidential, but we strongly urge competitors to name commodities and to give figures for length of time held, destinations to which reconsignments are made, etc., and to discuss the subject with the greatest possible frankness. It is through such a discussion as this, if participated in by a sufficiently great number of men with first-hand knowledge of the subject, that the *Railway Age Gazette* hopes to be able to make available the facts.

RECENT INCREASES IN RAILWAY EFFICIENCY

IT is becoming well understood that, second only to success in enlarging and training its army and navy, the thing most needful to enabling the United States to do its part in winning the war is to increase the efficiency of all the country's productive and distributive processes. Of all the concerns which have increased their efficiency in this good cause the railways probably stand foremost. They are today handling a much larger amount of traffic with each freight locomotive and each freight car than was ever done before in their history or in that of any other railway system in the world.

Those who like to snarl at the railways ask why it required a national crisis such as the present to cause their managers to introduce more efficient methods. It did not. They were constantly introducing more efficient methods long before we got into the war. The doctrinaire advocates of government ownership, such as Frederic C. Howe, say that the increases in efficiency are due to concentrated control and that therefore they are an argument for government management. But neither the premise nor the conclusion of this argument has any foundation. No government railways ever got such operating results as our railways are now getting; and our own railways would not be getting them if they were under government management. It is not merely the concentrated direction, but it is still more the brains and energy that are being put into the general direction of the roads, and into their operation that are getting the results. Such brains would not be put into their direction and operation under government ownership.

We said above that the efficiency of the railways was being constantly increased before our entrance into the war. The facts regarding the increases in efficiency which have occurred both since the country entered the war, and during the year preceding, make a remarkable story. We shall try to tell here only the part of it relating to the augmentation of the service rendered by the railways with each locomotive and each car.

The largest freight traffic handled by the railways in any fiscal year prior to 1916 was that for the fiscal year ended on June 30, 1913. In the years ended on June 30, 1914, and 1915 the traffic showed heavy reductions, there were many idle cars throughout both years, and therefore it was impossible to secure the maximum service from each engine and car. In fact, the traffic was so light and earnings were so small that purchases of new equipment became very small and there were actually 29,351 fewer freight cars and about 700 fewer locomotives in service on June 30, 1916, than there were on the same date in 1915, and 340 less cars than there were on June 30, 1914.

With this reduced number of cars and locomotives the railways had to handle in the fiscal year 1916 much the largest traffic they had ever had. With a slight increase in cars and locomotives they handled in the calendar year 1916 a still larger business, and with an increase of less than 1 per cent in locomotives and of perhaps 3 per cent in freight cars they are today handling a vastly larger business than they did in the calendar year 1916.

What do these facts indicate as to the increases which have occurred in the service being derived, on the average, from

each locomotive and each car? The following table throws light on that question:

TON-MILES HANDLED PER FREIGHT LOCOMOTIVE AND PER FREIGHT CAR

	Per Freight Locomotive	Per Freight Car
Fiscal year 1908.....	6,461,907	104,524
Fiscal year 1909.....	6,424,796	105,514
Fiscal year 1910.....	7,237,369	114,755
Fiscal year 1911.....	6,913,289	115,593
Fiscal year 1912.....	7,056,034	119,194
Fiscal year 1913.....	7,843,663	132,566
Fiscal year 1914.....	7,368,713	123,974
Fiscal year 1915.....	7,087,491	117,483
Fiscal year 1916.....	8,954,248	147,444
	Per Freight Locomotive	Per Freight Car
*Calendar year 1916.....	9,953,660	162,630
*Increase 1916 (fiscal) over 1908 (fiscal).....	38.6 per cent	41.1 per cent
*Increase 1916 (fiscal) over 1915 (fiscal).....	26.3 per cent	25.5 per cent
*Increase 1916 (fiscal) over 1913 (fiscal).....	14.2 per cent	11.2 per cent
*Increase 1917 (calendar) over 1916 (fiscal).....	28.4 per cent	27 per cent
*Increase 1917 (calendar) over 1915 (fiscal).....	62.2 per cent	59 per cent
*Increase 1917 (calendar) over 1913 (fiscal).....	46.6 per cent	41 per cent
*Increase 1917 (calendar) over 1908 (fiscal).....	77.4 per cent	78.9 per cent

* Estimated.

The statistics for the calendar year 1916, while estimated, are based upon the number of freight cars and locomotives known to have been in service and upon the actual freight earnings during the year. The estimates for the calendar year 1917 are based upon the assumption that each car and each locomotive will handle 15 per cent more freight in the year 1917 than it did in the calendar year 1916; and this is a perfectly safe estimate, in view of the records which are known actually to have been made in the movement of traffic during the three months of the year already past. The available statistics indicate an increase of 13 per cent in freight car efficiency in April, 14 per cent in May and 22 per cent in June. They indicate even greater increases in locomotive efficiency.

Going back to the period before we entered the war, the statistics show that in the fiscal year 1916 the railways handled 14 per cent more freight business with each freight locomotive and 11.2 per cent more freight business with each freight car than they did in the fiscal year 1913, which was the banner year before. In other words, they handled 7,843,663 ton miles with each engine and 132,566 with each car in 1913; and 8,954,248 with each engine and 147,444 with each car in 1916. The increase per locomotive in 1916 over 1915 (fiscal years) was 26.3 per cent and per freight car 25.5; while in 1916 over 1908 the increase per locomotive was 38.6 per cent and per freight car 41 per cent.

The calendar year 1916 showed a still further great increase in efficiency. As compared, for example, with 1913, the banner fiscal year prior to 1916, the increase in business handled per freight locomotive was 27 per cent, and per freight car 23 per cent. It will be noted that the foregoing increases in efficiency occurred before the United States entered the war and before the centralized direction of the railways by the Railroads' War Board was established, and that therefore all talk about the railways not having increased their efficiency until we got into the war is groundless.

The entrance of the country into the war, however, affording, as it did, the opportunity to operate the railways as a single system, and to appeal to the individual managements, the employees and the patrons of the railways, on patriotic grounds, to co-operate vigorously in increasing their efficiency, has enabled some remarkable improvements in the use of engines and cars to be made. As the table shows, if the railways handle relatively as much more freight traffic in each remaining month of the calendar year 1917 with each locomotive and car as the improvement in their performance in April, May and June indicates that they will, they will make a record far surpassing their best past performance. With each locomotive we estimate they will handle 28.4 per cent more business than in the fiscal year 1916; 62 per cent

more than in the fiscal year 1915; 46.6 per cent more than in the fiscal year 1913, and 77.4 per cent more than in the fiscal year 1908. With each freight car we estimate that they will handle 27 per cent more business than in the fiscal year 1916; 59 per cent more than in 1915; 41 per cent more than in 1913 and 79 per cent more than in 1908.

When it is considered that the remarkable increases in the efficiency of the use of equipment which have been made since the present organization under the Railroads' War Board was formed have followed directly on the heels of unprecedented increases in the efficiency of its use in the year or year and a half immediately preceding, the record becomes a very remarkable one.

The railways will never get credit for what they have done and are doing from the doctrinaire advocates of government ownership, or from those who consider it good business or good politics to snarl at them; but they will get full credit from the American public when the facts become as widely known as they should be.

ARREST THE DETERIORATION OF RAILWAY TRACK

THE track of most railroads is not being maintained to normal standards today. As a result it is deteriorating at a time when the country is demanding the maximum service from the railways. Such a situation would be serious at any time. It is doubly so now when it is vital that transportation facilities be kept in the best possible condition.

The roads of the United States are handling the heaviest traffic in their history. As noted on page 220 of our issue of August 10, statistics covering the operations of Class 1 roads—those earning over 1,000,000 gross annually—for the first five months of the present calendar year show operating revenues of \$1,548,348,314, an increase of \$348,000,000 or 29 per cent over the same months of 1913, the period of highest railway earnings previous to the war. During the same interval transportation expenses increased 30.3 per cent and maintenance of equipment expenditures 27.6 per cent. Charges for maintenance of way for these same roads for the first five months of 1917 were \$177,319,957, an increase of only \$15,000,000 or 9.3 per cent over 1913, while the percentage of these expenditures to total operating expenses fell from 18.3 per cent in 1913 to 15.9 per cent this year. Thus with an increase in business handled of 29 per cent the increase in the amount of money spent for the upkeep of the roadway and structures was only 9.3 per cent.

This tendency was most prominent in the eastern and southern districts. In the former an increase of 29.2 per cent in operating revenues was accompanied by an increase of only 4.2 per cent in maintenance of way charges. In southern territory a growth of 25.1 per cent in traffic led to only 4.1 per cent heavier maintenance of way expenditures. In the western district conditions were more nearly normal, the 30.4 per cent increase in operating revenues being accompanied by a rise of 16.8 per cent in expenditures for maintenance of way. A striking illustration of the situation on some of the eastern and southern roads is afforded by the statement of operations of an important road in this territory for July which shows an increase in traffic of 20 per cent accompanied by a decrease in maintenance of way expenditures of 22 per cent.

While a superficial analysis of these figures might suggest that this reduction in maintenance of way charges was gratifying, reflecting increased efficiency in this department, more careful consideration will show that this is not the case. The increases in maintenance charges indicated would be too small even in comparison with the growth of the business in normal times, and they are far too small under the present abnormal conditions. Railway rates have remained practically stationary in this period so that a comparison of oper-

ating revenues is a fairly accurate measure of the service performed. Unit costs of maintenance of way work, on the other hand, have been far from stationary. Four years ago the average wage rates for laborers in the maintenance of way department was not far from \$1.60; now it will probably average at least \$2.30, with many roads paying from \$2.50 up to \$3. As approximately 56 per cent of all maintenance of way expenditures are for labor, this increase of almost 45 per cent in unit rates of pay is alone equivalent to an increase of 25 per cent in the total maintenance of way expenses without taking into consideration the greatly decreased efficiency of labor which always follows rapid increases in wage rates in times such as this. Measured in terms of the service performed, the maintenance of way accounts probably have been increased well over 30 per cent by changes in the labor situation alone.

Materials have also risen rapidly in cost, few, if any, now being procured at the same or lower prices than prevailed in 1913. Rails have advanced \$10 per ton and other steel products have doubled in cost and more. While a wide variety of materials are used in maintenance of way work, each with its individual price tendencies, it is conservative to estimate that on the average their cost increased as much as that of labor. Therefore, if the traffic had been the same in 1917 as in 1913 the conditions in the labor and material markets alone would have led to a large increase in expenditures for maintenance of way to secure the same results. As the traffic has increased over 29 per cent in this period a still further increase in maintenance of way expenses should be expected if the wear and tear on the property caused by the movement of this additional traffic is to be overcome.

Instead of the increase in the charges to this account bearing some reasonable relation to the increase in the traffic handled and to the advances in unit costs of labor and materials, the statistics quoted at the beginning of this discussion show that it has been only 9.3 per cent. This demonstrates beyond question that the expenditures for the upkeep of the physical property are not keeping pace with the burden imposed on it by the traffic and by changing conditions. Various explanations, all more or less correct, may be offered for this condition. Labor may be scarce or even impossible to secure. Materials cost more than they did four years ago. These and other facts require no proof as they are of common knowledge to all. But they do not alter the fact that deterioration is taking place.

One of the most disquieting phases of this entire situation is the complacency with which many railway managements seem to be regarding this condition. As a writer states in a letter to the editor in another column, the officers riding over the track see that it is getting rough, realize that the roadmasters do not have a sufficient number of men at work and do little or nothing. Resignation to this state of affairs does not meet the problem, neither does it remove the danger of failure of our railways in the emergency through which they are passing. It is true that a large portion of the repairs on a well-maintained property may be postponed for a short time, but this cannot be done indefinitely. No one can tell the duration of the present emergency. The government is planning on a three years' war. The railways cannot stand the continuance of the present retrenchment in maintenance of way for such a period without disaster. They must meet this situation squarely, and plan at least upon as safe a basis as the government.

This problem is not one requiring the attention merely of those officers whose duties are limited to the maintenance of way department. More help is necessary from the general managers and higher officers. When the demands of the government for transportation are so extensive it is natural that these officers should give almost their entire attention to operating matters in order that troops and mili-

tary supplies may be moved promptly and with the minimum of interference with normal business. As a result of their concentration on the transportation problem they are giving less than the usual amount of attention to maintenance matters at a time when this attention is required even more than normally.

Help is needed and needed quickly. Three months from now, or even two months, will be too late, for the tracks will then be going into the winter. Unless relief is secured quickly and more work is done at once the tracks will be in bad shape this winter, while facing a heavier traffic than they have ever had to bear.

Even with the most active efforts it will be impossible for much of the ground already lost to be made up this year, and there is certain to be a large accumulation of deferred maintenance at the close of the year.

The normal net earnings of the roads are being swelled to the extent that this deferred maintenance is accumulating. Since such amounts are not real savings, but are only postponed expenditures, England has permitted the roads in that country (which are laboring under conditions similar to the railways in the United States), to put aside reasonable amounts to compensate for these postponed expenditures, and the amounts so set aside are included in operating expenses before net earnings are computed, just as if the expenditures had actually been made. The funds thus accumulated will be available for maintenance expenditures as soon as men and materials can be secured without drawing on the earnings of later years. Insofar as it is actually impossible to get men and materials for maintenance, this plan has much to commend it to the railway managements of the United States and to the Interstate Commerce Commission as a sound, business-like proceeding under present conditions.

NEW BOOKS

Railway Nationalization and the Average Citizen. By William H. Moore. 181 pages, 5 in. by 7 3/4 in. Bound in cloth. Published by McClelland, Goodchild & Stewart, Limited, Toronto, Ont. Price, \$1.35.

The Irresponsible Five: A New Family Compact. By William H. Moore. 67 pages. 7 1/4 in. by 5 in. Bound in cloth. Published by McClelland, Goodchild & Stewart, Limited, Toronto, Ont.

The question of government ownership and management of railways is of especial interest in Canada at the present time. There has been much discussion of the way in which the government-owned Intercolonial has been managed and the government-built National Transcontinental has been constructed. The Intercolonial has, on the whole, failed to earn even its operating expenses, much less interest on the investment in it, since it has been owned by the government. The National Transcontinental cost vastly more than the original estimates and the government commission which was created to investigate its construction rendered a report charging gross waste and incompetency in the building of it.

In spite of the fact that government ownership and management of railways in Canada has thus far been a colossal failure, owing chiefly to the operation of influences which it is especially difficult to prevent in democratic countries, the present government has committed itself to the acquisition of the Canadian Northern. This system now has 9,295 miles which, added to the present government railways, will make a state-owned mileage in Canada of over 13,000 miles. The main reason why the government has proposed the acquisition of the Canadian Northern is that the Dominion government has guaranteed the interest on the road's bonds, that it is unable to earn enough to pay its fixed charges and at the same time raise money for necessary improvements and extensions, and that if the government allows it to stay in the hands of its present owners the road will either have to go through bankruptcy or the government will have to continue to make it advances. The government does not wish to

let it go through bankruptcy and at the same time it takes the position that if the people of Canada are to make any more advances to the Canadian Northern they ought to own the road and get the benefit of future increases in the value of the property.

Mr. Moore's book "Railway Nationalization and the Average Citizen," was written before the government's proposal for the acquisition of the Canadian Northern was submitted to Parliament, but it constitutes an excellent answer to all the arguments in favor of this step. In a word, the answer is that government management almost certainly will be more costly and less enterprising than private management. If the road is turned over to government management the public will have to pay whatever deficit it may incur, and the deficit which it will have to pay will be larger than would be the deficit which would be incurred and which the public would have to pay if the railway were left under private management. In other words, under government management the road, because of its more expensive operation, will place a heavier burden on the shippers and taxpayers of Canada than it would under private ownership. It is true that under government ownership there will be no private stockholders to make money out of the property, but how does it hurt the public for private stockholders to make money out of a property if they afford such good management that the burden put upon the public is actually less than it would be if the public owned the property?

The contention that railway transportation actually costs the public, including those who pay the rates and those who pay the taxes, less under private ownership even when private stockholders make money out of it than it does under government ownership, is not merely a theory, but is a proposition demonstrable by the almost uniform experience of the entire world. Nowhere else has experience afforded more support to this proposition than in Canada. It is certainly remarkable that a country in which government ownership has thus far been an utter failure should be planning to extend this policy. The financial and commercial future of Canada would be much brighter if its politicians and people were influenced less by catch-words and more by actual facts.

The reasons why private ownership and management of railways are better for most countries, and especially for democratic countries, than government ownership are very interestingly and entertainingly, and at the same time forcefully, set forth in Mr. Moore's book, "Railway Nationalization and the Average Citizen." In its first two chapters which are entitled "The Platitudinarians" and "The Doctrinaire School," the author attacks those whose arguments for government ownership consist chiefly in the familiar platitudes such as "Trust and the public" and "Public ownership seeks only the welfare of the many; private ownership strives for the wealth of the few," and those who base their arguments in favor of it on "so-called fundamental principles," which on examination prove to be anything but fundamental. One of these latter, for example, is what Mr. Moore calls "the highway argument" and another is "the universal use argument."

Mr. Moore next examines the actual results of the operation of public utilities in Canada, and especially of government telephones in Manitoba, where the failure was as complete as it has been in the operation of the Intercolonial. He next examines the experience of other countries, especially those of Europe, showing that in Prussia, for example, where government management has been a comparative success, the political and other conditions are entirely different from what they are in Canada. He then proceeds to a somewhat detailed consideration of the railway situation in Canada and shows that the railways which have been designed, built and managed under the company system in that country have contributed far more to its prosperity and development than

those which have been designed, built and managed under public ownership.

Mr. Moore's book, "The Irresponsible Five," is a critique of the report made by the majority members of the Royal Commission to Inquire into Railways and Transportation in Canada. The majority was composed of Sir Henry Drayton and W. M. Acworth, and it recommended government acquisition of practically all the railways in Canada, except the Canadian Pacific, and their operation by five trustees who would be chosen by the government, but under the plan favored would be free from political influence. Mr. Moore severely criticises some of the statements of fact in the report and also the plan for acquiring and operating the railways which it recommends.

Both of these books are well worthy of careful perusal by all who are interested in the subject of government ownership of public utilities.

Poor's Manual of Industrials. Published by Poor's Manual Company, 80 Lafayette street, New York. Price \$10.

This 1917 issue of Poor's Manual of Industrials is corrected up to August 1. It contains income accounts and balance sheets of nearly all of the larger industrial companies and is compiled with the care, thoroughness and broad intelligence which Poor's Manual Company has put into its Railroad, Industrial and Public Utility Manuals for a great many years. With a large increase in interest of the investing public in industrials, Poor's Manual fills a real need. Prior to the requirements of the Interstate Commerce Commission in regard to railroad annual reports in 1907, Poor's Manual of Railroads was the one source from which uniform statistics of railroads could be obtained. Now with the Interstate Commerce Commission figures available, Poor's Manual of Railroads is still the most convenient form in which railroad statistics can be got at, but the Manual of Industrials is indispensable to any statistical library because much of this information is not available anywhere else.

Railroad Construction, Theory and Practice. By Walter Loring Webb. 4 in. by 7 in. 841 pages. Illustrated. Bound in morocco. Published by John Wiley & Sons, Inc., 432 Fourth avenue, New York City. Price \$4.

This is the sixth edition revised and enlarged of the well known treatise on railroad construction which is intended both as a text book for the use of students in college and technical schools and as a hand book for the practicing engineer. In the preface of this edition the author explains that the advance in the science of railroad construction made during the last few years has been so great as to make the extensive rewriting of the book necessary. Special credit is given to the American Railway Engineering Association for its work. The first 100 pages are devoted to field engineering—surveys, alignment, curves, etc. Earthwork occupies 84 pages; trestles, tunnels and minor structures cover an equivalent space. About 100 pages are devoted to the various elements of track construction and a smaller space to buildings, yards, terminals and signaling. The relation of train operation to the economics of railway location is discussed in detail as in the earlier editions. Nearly 200 pages are devoted to curve and earthwork tables.

INTERNATIONAL TRAFFIC OF THE SWISS RAILWAYS—In 1916 the passenger traffic of the Swiss Federal Railways with Italy was 38,461 journeys and the freight traffic 700,777 (metric) tons. Passenger traffic with France was 134,871 journeys and the freight traffic 27,859 tons. To and from Germany through passengers numbered 140,619, while the freight traffic was 2,639,817 tons, of which 2,216,138 tons went into Switzerland and 423,679 tons came out.

Letters to the Editor

OBJECTIONS TO UPPER BERTH

NEW YORK.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

At this time, when the railroads are making such strenuous efforts to load cars, including passenger equipment, to full capacity, it may not be amiss to consider the objections made to traveling in upper berths. Speaking from my own experience, and from that voiced by other travelers, here are some of the reasons why upper berths are objected to:

(1) Lack of facilities to care for clothing. The coat hanger and the little hammock are insufficient. Why not attach, in the upper berth, a *folding* shelf, either on the partition, or above or below the hammock?

(2) Lack of a window. Passengers like, especially when traveling through country new to them, to look out early in the morning. I also like to see where we are, so I may know whether the train is on time, and can calculate—when passing a station—how much longer I can stay in bed. Presumably the ingenuity of our car builders will some day provide windows for upper berths.

(3) If retiring early, the light is very objectionable. Perhaps here, too, the ingenuity of our car builders will devise ways and means of overcoming the difficulty.

If the above mentioned conditions are remedied, I don't believe I would care whether I have an upper or a lower berth, and I know other people feel the same about it.

TRAVELER.

SAVE THE TRACK

"Somewhere in America."

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

I have been doing considerable reading on war topics and war conditions lately and between the lines I have noticed with deep concern the tendency to let everything slip that does not have a direct bearing on the promotion of the war. This is true in every factory and every mine in the country. It is also true on every railroad. Under the spur of the necessity for preparedness to move troops and ammunition on a minute's notice, the railroads have bent every effort to prepare for the work which they may be called upon to do. They have their rolling stock ready and their engines are virtually under steam waiting for the soldiers to entrain. Everything is in readiness for the first dash, but what about the track?

The track is on the rapid road to ruin the same as the track in every belligerent country in Europe. We have sent some of the best railroad men to Russia because the track there had gone to smash and we are now sending regiments of railroad men, from chief engineers to track laborers, to France to rebuild the track that has been allowed to fail for lack of maintenance. In Germany not only the railroads, but even their wonderful highways have gradually fallen behind until the greatest danger that country now has to face is the total collapse of the one-time perfect system of railroads and highways.

Our railroads have not collapsed (I pray God they never shall), but the same danger is here, nevertheless; and the most significant thing is the attitude of our officers. The general manager is not thinking of the track, but of the train loads of soldiers that must be moved. He rides over my track and knows it is getting bad, but he realizes that I have not been getting the new material I should have and he can see the pitifully small force of track laborers. The division engineer will go over my district and get a rough ride,

but does he write me a note about it? Of course not. Instead he goes to his office and wonders where he can get men for me.

We have a National Defense Board on which there are traffic men, but no track men. There should be a man there who knows track and knows men, a man who could look over the newly established war routes as mapped out by the traffic men and then go over those routes and see the disease that is eating at the very foundation of our defense scheme. He would need to be a man who could see and meet trouble and then tell of it afterward, a man of resource who would have the nerve to demand an army of trackmen to be placed on a given road and to make the working and living conditions for those men such that they would be willing and anxious to do their part.

I know this sounds hysterical. It startled me when first I thought of it, but we have been used to sitting back in the shadow while someone else stood out in front in the spotlight and naturally think we must continue thus. Give us an entire year like the past two months and the railroads of this country will be running on the ties more often than on the rails. Men will not work for us at our wages and under our conditions, and our superiors will not or can not see where we are drifting.

PROMETHEUS.

THE OVERLAP AS SEEN FROM THE FIRING LINE

VAN BUREN, Ark.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

I have read with interest your article in the issue of August 10, discussing the merits and demerits of the overlap. This is very interesting reading, and it is refreshing to see so many vice-presidents speak their minds with freedom. Such evidence of a sincere desire on the part of these executives to arrive at a correct solution of such a vexatious operating problem, is, to say the least, an inspiration to the local officers; but in the last paragraph, the imaginary president of this imaginary meeting opines that there is nothing to be done about this matter. He surely meant to add "at this time." Quite likely he is right. It is not for me to dispute him, but what I should like to see would be some discussions of real facts and a continuation of the same until some actual information could be brought out. This being a vital matter, the discussion should be kept alive until a rational, and so far as it is possible, a uniform basis is reached, inasmuch as the blocking of trains is finally an integral part of the general scheme, pertaining to their operation.

I understand that the Pennsylvania Lines West of Pittsburgh operate hundreds of miles of line with automatic signals, where all trains are kept always *two blocks apart*. If this is so, what are the reasons for such a radical departure from ordinary practice? On the surface, it looks as though that road were getting about one-half as much out of its signaling investments as other roads. What reasons do the officers give for this? What do the officers of the Pennsylvania lines, east of Pittsburgh, think of this practice? What does the Government think of it?

These are questions that occur to the local officers, who are at the front, so to speak, in carrying out the details and in enforcing discipline and are therefore very naturally much interested, and discussions such as these tend to keep alive and even intensify their interest and are therefore certainly valuable. As I comprehend it, the problem under discussion is a fundamental one, which embraces the human equation. Human nature is the same everywhere, and we should, with all alacrity, find the fundamentals in the premises. We can not get anywhere with antinomies. We must be riveted generally to verities. Let us find the verity here and then engage assiduously in a campaign directed toward adjustment of the details in keeping with the fixed principle agreed upon.

W. C. MORSE,
Superintendent, Missouri Pacific.

A New Passenger Station at Danville, Ill.

The Chicago & Eastern Illinois Structure Presents a Pleasing Appearance and Embodies Novel Features

THE Chicago & Eastern Illinois has recently placed in service a new passenger station at Danville, Ill., which combines good architectural lines, convenience in operation and permanent construction. The structure also embodies a number of novel features that deserve special notice. In addition to the station building the project involved some track changes and a subway at Fairchild street, the total expenditure being about \$300,000. The station handles an average of about 360 outgoing passengers daily, but the facilities provided are adequate for a much greater traffic. The present train service consists of 10 through trains and 2 local trains on the Chicago-Evansville main line and 4 trains on the Danville-Villa Grove line.

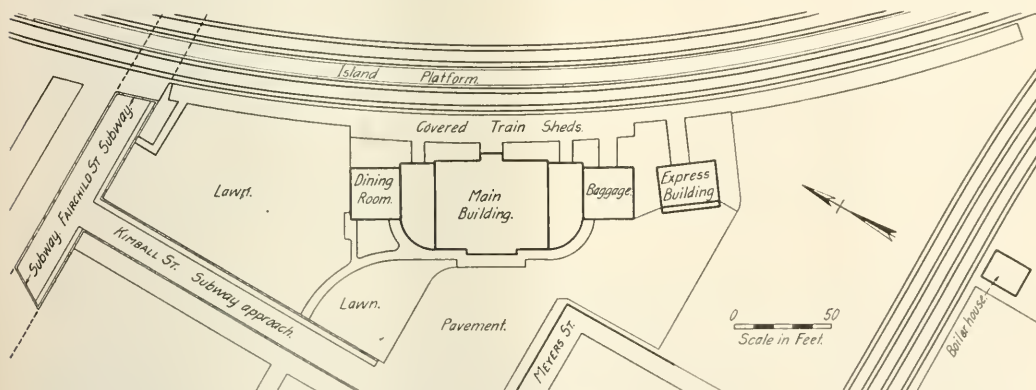

The station is served by three tracks, all of which are on a four-deg. curve. A fourth track on the far side of the layout is used for freight traffic. There are also four tracks along the south edge of the station grounds which are used as a coach yard, the outer track also being used to deliver coal to the station heating plant. The track in front of the station is served by a platform 995 ft. long. There is also

prominence in the central building, and it is emphasized still more over the main street entrance, which is located centrally in the middle of the street side. This entrance is also framed by a band of terra cotta extending to the floor line on each side and is divided into three openings by concrete columns. Further emphasis to this building entrance is afforded by a marquee with a wire glass roof which shelters the doorway, the three-step approach and the concrete carriage landing. The entrance is illuminated by a row of 11 8-in. spherical electric globes along the outer edge and by two ornamental lanterns surmounting pilasters on either side.

Secondary entrances to the station are afforded by the two covered passageways, each of which is embellished on the street side by a row of six concrete columns placed in a quarter circle curve.

CONVENIENTLY ARRANGED INTERIOR

Entering the main doorway the passenger traverses a passageway 25 ft. long and 19 ft. wide, set off as a vestibule

The Station Grounds

an island platform 953 ft. long between the second and third tracks.

PLEASING APPEARANCE

A main building 100 ft. by 78 ft. occupies the center of the layout, being flanked on one side by a baggage building and on the other by a dining room building. The side structures are separate from the central building, but are connected with it by roofs over the passageways between them. An express building similar in design to the baggage annex, but separated from it by a distance of 20 ft., occupies a position on the extreme south of the layout. Ample brick driveways are provided between the street and the main building and between the baggage and express buildings. There is a spacious lawn between the street and the station buildings and platforms.

The walls of the buildings are of a dark red, rough texture brick surmounted by a band or entablature of cream-colored terra cotta. This treatment is carried out with modifications in the covered passageways and the smaller buildings on either side, but an increased width gives it greater

by two sets of doors. This passageway leads directly into the main waiting room, which is 53 ft. wide and 82 ft. long, entirely unobstructed by columns. The walls are wainscoted with vitrified brick in soft variegated colors to the springing line of the arched ceiling. The ceiling is finished in plaster, relieved by a beam effect. Ample illumination is provided. Four ornamental indirect hanging fixtures are suspended from the ceiling, while a continuous line of invisible electric lamps placed in a recess at the top of the brick wainscot afford additional indirect illumination. The floors are finished in a mosaic tile furnished by the National Mosaic Tile Company. At the right or south end of the waiting room are a station master's room, in which is also a Western Union Telegraph office, and a ticket office, separated by a vestibule leading across the covered passageway to the baggage building. At the left end of the room is a similar vestibule leading across the other passageway to the door of the restaurant building. The track or platform door is directly opposite the street door and has a vestibule projecting out onto the platform. In the space to the right of the street entrance vestibule, with a door communicating with the main

waiting room, is a men's smoking room and toilet room. In the corresponding position on the left side is the women's rest room and toilet room. These are finished similar to the main waiting room except that the brick work comes only to the normal wainscoting height instead of extending to the ceiling.

The dining room is finished in plaster with an enameled tile wainscot. Seating accommodations are provided for 24 at the lunch counter and for 36 at 9 tables. Special attention has been given to the installation of only the most sanitary furnishings. In addition to the dining room and kitchen

One special feature of the station is the system of clocks, one being provided over the street entrance, one in the main waiting room and another in the restaurant. These are all controlled by a master clock in the station master's room, which is automatically regulated by Western Union Telegraph service.

STATION PLATFORMS AND SHEDS

The main station platform is protected by reinforced concrete butterfly sheds, 11 ft. wide, with the edges of the roof 12 ft. 8 in. above the base of rail and extending along

View of the Station From the Street

the dining room building contains a basement for the storage of supplies, lockers for employees, etc.

FIRE RESISTING CONSTRUCTION

The building has been designed with a view to securing a high grade of fire-resisting construction. The walls are brick in all cases and the floors are either tile or concrete, the tile being placed on concrete. In the main building the roof is carried on a system of steel trusses covered with a reinforced concrete one-way tile slab. The ceiling consists of plaster on metal lath carried on 8-in. channels suspended from the trusses at 4-ft. centers. The pitched portion of the roof is

the curved platform for a distance of 764 ft. Instead of attempting to cover the space between the standard sheds and the faces of the station buildings with a canopy, branch butterfly sheds are run from the main shed to the doorways of the main building, and to the baggage and express buildings and to the center of each of the covered passageways on either side of the main building. At the north end of the platform a branch of the shed extends down a stairway into the street subway. The portion of the train shed in front of the station involved considerable special work because of the branches to the various doorways, and was in consequence built in place. However, all sections of the shed

Looking South Along the Station Tracks

covered with red Ludowici tile, the flat portion being protected by composition roofing. The roofs of the express, baggage and dining room buildings are composed of concrete-tile slabs, carried on I-beams, the latter structure having a metal lath ceiling suspended as in the main building. The express and dining room buildings have reinforced concrete floors, while the baggage room has a concrete floor on an earth fill. A portion of the space in the baggage room is given for a raised platform 3 ft. high, which is similarly paved with concrete on an earth fill retained by a concrete wall. The express building, in addition to raised platform on the inside, has a raised platform on the outside extending the full length of the building along the driveway.

that were of uniform design were built by the pre-cast method.

The roof consists of a slab 16 ft. long and $4\frac{1}{2}$ in. thick, split at the center line of the shed. The columns, which are "T"-shaped, are 9 in. thick, the stem having a width of 18 in. at the bottom and 12 in. at the top. The base of the stem is secured to the footing pedestals by $4\frac{1}{2}$ -in. dowels. All of the pre-cast units were concreted in a yard located about two blocks from the station and were erected by a derrick car having a 35-ft. boom. A 3-in. stirrup was provided at each end of the slab to facilitate erection, and 1-in. dowels in the top of the column members held the slabs in place at each corner.

INTERESTING SUBWAY CONSTRUCTION

In connection with the building of the new station a subway was constructed under the tracks at Fairchild street. The interesting feature of this structure is the type of retaining wall used in the approaches. Owing to the fact that the subway is in two sections with 225 ft. of uncovered depressed passageway between them and the necessity of providing an

The Restaurant

approach to Kimball street, on which the station faces, the building of this subway involved the construction of about one-half mile of retaining walls. To accomplish a material saving in these walls a special design was adopted which permitted a material reduction in the amount of concrete as well as in the excavation required. By providing a series

Floor Plan of the Main Building

of concrete struts spanning the roadway, which are designed to take the earth thrust exerted against the upper portions of the walls, it was possible to reduce the retaining wall section to that of a reinforced concrete slab one foot thick with a footing at the bottom two feet in width. These walls are reinforced on the inside face with one-inch square rods placed vertically nine inches center to center. The struts are 1 ft. 4 in. deep by 1 ft. wide, spaced about 10 ft. apart. For the sake of appearance they are crowned 2 ft. at the center. The reinforcing consists of four 3-in. by 3-in. angles, placed near the edges of the strut and connected by bar lacing.

The covered portions of the subway under the track consist of three-centered arches of 34 ft. 8 in. span and 17 ft. 2 in. maximum clear height at the center line. One section of the covered subway has a length of 202 ft. and the other of 105½ ft. Grades of 6 per cent in the roadways were required for all three approaches, but stairways are provided at three points for the convenience of pedestrians. One of these leads to the station ground and another provides direct communication with the north end of the station platform.

Work on the station was started in the summer of 1916 and the station was placed in service in June, 1917. The design and construction of the station were under the general direction of L. C. Hartley, chief engineer of the Chicago &

A Section Through the Subway Approach

Eastern Illinois. Henry Raeder, of Chicago, was the architect for the station and also prepared the designs for the station grounds, the subway construction and the platform sheds, all the work being carried out under his general superintendence. The station and shed construction was under the immediate supervision of J. W. Hunter, division engineer for the railroad. The Clarke Construction Company of Danville, Ill., had the general contract for the station,

The Main Waiting Room

and the M. J. Hoffman Construction Company of Evansville, Ind., had the contract for the platform sheds. The subway was constructed under the immediate supervision of W. H. Martin, city engineer of Danville. The Carson-Payson Company of Danville had the general contract for the subway, the cost of which was borne by the railroad and the city.

WASHINGTON CORRESPONDENCE

WASHINGTON, D. C., August 28, 1917.

SHIPPERS CO-OPERATING ACTIVELY IN HEAVY LOADING CAMPAIGN

The Railroads' War Board, through the Commission on Car Service, is receiving most encouraging reports from all parts of the country indicating a nation-wide co-operation on the part of shippers in the campaign inaugurated by the railroads to bring about a more efficient use of existing freight cars, in order that they may be able the better to provide the increased amount of freight service made necessary by a war which has also made it difficult if not impossible for the railroads to considerably expand their existing facilities.

Reports have come to the board from railroads, shippers and shippers' associations showing that practically every commodity, from coal and steel to food products, is being loaded now in a way to eliminate the waste in freight car space and thereby increase the car capacity available to shippers.

During the month of July, it is estimated, the savings thus accomplished have been sufficient to represent the equivalent of an increase in the number of cars available for freight traffic by practically 120,000.

While the railroads deserve the credit for the initiative which inspired the movement for conservation of transportation by making one freight car do the work of two, because they foresaw its necessity and because they were in possession of the information which indicated to what an extent freight car capacity was being wasted, they are unhesitatingly giving full credit to the shippers, the government departments and to the Interstate Commerce Commission and some state commissions for the co-operation which is making the campaign effective. While railroad officers have been striving for years to do what they are just now beginning to accomplish on such a large scale that its results have become evident to all because they knew that the difficulty of increasing the minimum weights as provided in the tariffs has encouraged shippers in the habit of dealing in small carloads in spite of the steady increase in car capacity, they also realize that the gradually improving showing made during the past two or three months could not have been brought about by the railroads alone. They recognize that a most potent influence has been the new spirit of patriotism aroused by the war coupled with an understanding on the part of the shipping public that transportation capacity has become too scarce, relatively, to be wasted.

This, of course, is the answer to some of the misguided critics of the railroads that have asked "Why did they not do it before?" or who have described the efforts now being made by the roads and the shippers as "the mere exercise of ordinary business principles." The eastern roads have strongly emphasized their recognition of the fact that public co-operation and helpfulness are chiefly responsible for the remarkable record of increased transportation service, in the public notice they issued last week of their intention to compile a record of its results, and the War Board itself, in most of its public notices, does not fail to call attention to its appreciation of this co-operation.

Some conception of the efforts which the shippers are making to help the roads in their campaign to increase transportation efficiency and release cars that are essential to take care of the increased government and commercial traffic may be gleaned from the following facts taken from the reports sent to the Commission on Car Service from various parts of the country:

In New Orleans, sugar, which was formerly loaded to only 50 per cent of the capacity of the cars, is now being loaded from 100 to 113 per cent of marked capacity.

The loading of coffee has also increased in the New Or-

leans district from 50 per cent of the full capacity of the cars to as high as 86 per cent.

At Libby, Montana, a lumber company which in July, 1916, loaded on an average 22,268 ft. of lumber per car, in July this year increased the average loading to 26,383 ft., an increase of more than 15 per cent per car.

A rubber company in the middle west which averaged 16,000 lb. of tires to the car before the campaign for intensive loading began, is now loading 32,000 lb. of tires to the car.

A salt company in Kansas is now loading cars to 110 per cent of their marked capacity, an increase of more than 20 per cent over its performance last year.

An iron company in New York state that formerly loaded pig iron to 90 per cent of the marked capacity of its cars increased its loading to 107.2 per cent during the period July 15 to July 31 inclusive.

A recent check of bituminous coal on one of the eastern roads showed that out of 540 cars only 7 contained lading below the marked capacity of the cars. The total marked capacity of these cars was 27,593 net tons. The weight of the lading per car was 30,667 tons, or a loading of 111.14 per cent of the marked capacity.

In addition to co-operating by intensive loading, a number of shippers and manufacturers' associations have voluntarily agreed to the abolishment of reconsignment and diversion of cars in transit. An example for this action was set by the West Coast Lumbermen's Association on August 14, when it passed resolutions recommending that each and every common carrier in the United States be authorized by the Commission on Car Service to place embargoes against the diversion or reconsignment of all freight, except in cases where it can be satisfactorily shown that the additional haul is made necessary by the insolvency of the consignee or a bona fide refusal of the original consignee to accept the shipment.

POSSIBILITY OF REDUCTION IN ACCOUNTING REQUIREMENTS

The Committee on Corporate, Fiscal and General Accounts of the Association of American Railway Accounting Officers, which was requested by the Railroads' War Board to investigate the possibility of trying to bring about a reduction in the requirements of commissions and governmental authorities as to accounting and statistical reports during the period of the war, has considered the question and submitted a report. It was decided to forward copies of the report to the chairman of the Interstate Commerce Commission and to the president of the National Association of Railway Commissioners for their consideration, with a suggestion that they each appoint committees to meet with the committee of railroad accounting officers and report whether something can be accomplished along this line. The report will be called to the attention also of the Division of Valuation of the Interstate Commerce Commission.

WEIGHING BRITISH PASSENGER TRAINS—During the last three years there have been Board of Trade reports on accidents issued which go to show that the London & North-Western, Midland, Caledonian and North British companies now calculate the weight of their passenger trains by the actual weight of the coaches, and that the Great Western and the Great Northern by the number of wheels. Other companies may, of course, have followed either of these examples, but there has been no report issued that has revealed any such change. The former method, and that still in force on the minor lines, is to count the weight by the number of vehicles, a four-wheeled coach being reckoned as one, a six-wheeled coach as one and a half, and a bogie vehicle as two. Where the weights are used the weight is to be found on the buffer beam.—*The Engineer*, London.

The Film and the American Railroad

Interesting Review of the Extensive Use Made of the
"Movies" for Advertising, Instruction and Entertainment

By T. T. Maxey

Advertising Agent, Burlington Route, Chicago.

THE introduction of the term "moving picture" into the language of our everyday life a few years ago, gave the advertising agents of the big railroad systems a distinct thrill in a new place. "Moving picture" had a welcome sound, and they were not slow to sense its seemingly too-good-to-be-true possibilities. The advent of the moving picture film, provided it proved to be practical, offered a new field for the exploitation of the wares which a railroad has to sell so broad that it was almost entirely beyond conception.

Seeing is believing and actions speak louder than words. Therefore, to be able to photograph, in motion, the wondrous, varied and numerous beauty spots of America, so as to show the life that is there, and parade these pictures before the eyes of the world, would certainly awaken the public to a realization of the value, pleasure and benefit of traveling around a bit and getting acquainted with America, in a way never before possible and hardly dreamed of. Such direct and visual advertising was bound to "strike home" and give the public a desire to climb aboard the limited and go and see the real thing. It likewise meant the pulling away of any artificial props in the mind of the skeptic that the wonders of your scenery, or the benefits of your resort, were far over-estimated in your literature and only partly existed in reality.

The rapid development and perfection of the moving picture camera to a point where it occupies a front seat among the mediums in the publicity band wagon, have been among the wonders of modern times. Hand in hand with this came increased attention from the passenger traffic officers. They, too, began to believe there was something to "the movies" and the dreams of the advertising agents relating thereto; but it was only after their customary thorough investigation to ascertain that there was no Senegambian in the wood pile, that some of them became convinced that the film was entitled to consideration in connection with their advertising plans.

It is only by recounting a few of the many exploits along this line by the principal railroads that one can form an adequate idea of the extent to which the railroads have become users of films in connection with the exploitation of their wares.

Generally speaking, these films may be divided into four grand divisions—scenic, industrial, safety first and educational.

It is but fitting and proper that Yellowstone, the oldest and largest of our national parks, should have been filmed first. As near as can be determined from the records of the writer this actually took place. The antics of Old Faithful, the world's most famous geyser, the beauties of the Grand Canyon of the Yellowstone river and the great falls at the upper end of it, and the attractiveness and comforts of Old Faithful Inn, were successfully filmed for the Northern Pacific. The wide circulation of this film, through the company's lecture bureau and otherwise, has aroused the interest of tourists and travelers in the wonders of Wonderland by disclosing them in a manner not possible by still photographs or mere word description.

The heavy snow-fall of winter before last drove most of the wild animals (especially the deer, antelope, elk, mountain goats and Rocky Mountain sheep) resident in the Yellowstone region down into the Gardiner basin for food

and shelter. This presented an opportunity to secure a film of animal life at close range, the like of which might never again be obtainable in this country. The Northern Pacific was not slow to take advantage of the opportunity and secured what is beyond question the best film of this nature ever taken. The animals were protected by the government and given generous rations of alfalfa.

The Santa Fe was also one of the first railroads to try out the film in advertising. Its first film was used in the windows of its Pacific coast offices at night. Thousands of passersby stopped to see the wonders of the Grand Canyon of the Colorado river as the film reeled them off. The results encouraged the Santa Fe to continue this line of advertising endeavor until it now has completed films of the principal scenic features along its lines.

The Pennsylvania Railroad recognized the value of the film in advertising by making it a unique feature of its wonderful exhibit at the Panama Pacific Exposition at San Francisco. In a theatre which was constructed of two standard all-steel coaches, the Pennsylvania treated visitors to a moving-picture journey over the principal lines of the system, which presented an instructive panorama of the country through which the Pennsylvania runs.

Any one who visited the Washington State Building at the Panama Pacific Exposition and was fortunate enough to see the film which showed a spectacular race between a number of automobiles and a train enroute from Tacoma to Ashford, the entrance to Mount Rainier National Park, shown by the Chicago, Milwaukee & St. Paul, could hardly doubt the value of such publicity or escape having deeply implanted in his mind an intense desire to go to bogging down the old mountain and pick some of the gorgeously-hued wild flowers which blanket this sky-piercing cone below the snow line.

If a prize were offered for the place which has been filmed the greatest number of times, Glacier National Park would probably win in a walk. The rapid exploitation by the Great Northern of the greatness and strikingness of the sawtooth-like Alpine mountain scenery in this vacation paradise has attracted the attention of artists, painters, photographers and moving-picture producers alike from all sections of the world. The Blackfeet Indians likewise presented material for films of which the public would never tire. Their life in their native haunts, their picturesque raiment, the numerous and grotesque ceremonies of Not-Go-Out, Heavy Breast, Buffalo Body, Many Tail Feathers and others of the tribe, have delighted many Americans—both young and old. Those who saw the Lyman Howe travelogue for the 1915-1916 season will at once recall the wonderful pictures of Glacier Park and the Indians. A large amount of newspaper publicity, which could hardly have been purchased at any price, directly resulted therefrom. The Great Northern has also used films extensively, in connection with its lecture bureau, with telling effect.

The Union Pacific system, in connection with its lecture bureau, has also made considerable use of the film in exploiting the scenery in the west and along the Pacific coast.

The Southern Pacific has some splendid films picturing the beauties of the Yosemite valley and other sections of California.

The little one-day journey from Denver, which has be-

come familiarly known to so many tourists as "The Georgetown Loop and Mt. McClellan Trip," via the Colorado & Southern and Argentine & Gray's Peak Railways, was filmed this past summer.

The Denver & Rio Grande has likewise had the beauties of the world-renowned Royal Gorge recorded in film, as well as the wonderful archaeological remains in Mesa Verde National Park.

Some of the Canadian lines, particularly the Canadian Pacific, have produced considerable film. This road has filmed the beauties of the Canadian Rockies, Nova Scotia (Evangeline Land), and the winter sports of Quebec; and has also taken some film in Alaska.

The Burlington had the principal features of its various main lines covered by "movie" camera men last summer, and it plans to create a nation-wide desire to go and see the real wonders which these films portray. Experts have pronounced these to be the finest scenic films yet produced. In these films the Burlington has largely forsaken the old style, or black-and-white, film and enhanced both their beauty and attention value by the use of tints and tones—sepia, green, blue, yellow, pink—each section carrying that particular tone or tint which more nearly portrays the natural beauty of the subject. Several very attractive novelties in the way of titles have also been worked out.

The ceremonial exercises at the Fortieth Anniversary of the Custer Battlefield was the subject of the Burlington's first scenic film. This was followed by films of the Cody Road in Yellowstone Park; Rocky Mountain National-Estes Park, Colorado; Thermopolis Hot Springs, Wyoming; Central Wyoming, covering the new joint Burlington-Colorado & Southern Line between Billings, Montana and Denver, including the gigantic canyon of the Wind River, the great oil industry near Casper and the great cattle and sheep industries which center around Douglas; and the Vacation Ranch Resorts in the Big Horn Mountains of Wyoming, showing where men who do big things go to "let down" and become boys again for a time.

No doubt other roads have also produced films of various scenic regions and subjects of which the writer has no immediate knowledge.

Most of the above-referred-to roads have also used films more or less extensively in connection with the exploitation of their industrial, immigration or colonization work.

The Great Northern has films showing the Wenatchee Valley fruit industry and various other agricultural regions in "The Zone of Plenty." That the farmer-student amasses a sufficient fortune to become independent in a remarkably short time is so apparent to those who see these films that a strong urge to investigate is thereby aroused.

The Northern Pacific has films intended to convey in a forceful manner the great opportunities in "The Land of Fortune" that beckon the city-tired man who wants to better his condition.

The Soo Line has used so-called industrial or agricultural films quite extensively. Its films vividly portray the resources and opportunities existing along that line in North Dakota. The Soo has met with such success in this work that additional films have been taken recently.

The Canadian Pacific has films showing the asbestos industry of Quebec, the elevators and other facilities at Ft. William, the great grain shipping port at the head of the Great Lakes, and the lumbering and fishing industries in New Brunswick.

The Burlington uses a film titled "The Romance of Irrigation," which illustrates how a school teacher in the east who became dissatisfied, wrote to the U. S. Reclamation Service at Washington, D. C., and secured information which led her to take up an irrigated homestead on the Shoshone Project near Powell, Wyoming, and how she "made good." The Burlington also has a film which shows

strikingly how two farmers from the east, who had the nerve to back up their good judgment and buy raw \$10-an-acre prairie land in Northeastern Colorado a very few years ago, raised abundant crops, surrounded themselves with comforts which many city-men cannot afford to enjoy and became "well to do" in a remarkably short time.

A number of "safety first" films have made their appearance. The film which leads the procession in this line, is that entitled "The House That Jack Built," produced under the direction of M. A. Dow, general safety agent of the New York Central Lines. This well acted, effectively staged and very convincing photo play provides a most effective channel through which to convey lessons in safety to employees. Every scene in the film is true to life. It points out in an unmistakable manner the far reaching and unhappy effects of carelessness and the many sad and unfortunate accidents which have been the result thereof. "Steve Hill's Awakening," is the title of another safety first film produced by this road. The Burlington and many other roads have circulated copies of this film with beneficial results.

The Rock Island has also produced films showing views of men doing dangerous work and illustrating the right and wrong way of doing such work. It is needless to say that the circulation of such film has been instrumental in greatly reducing the number of accidents to employees.

The Chicago Railways Company (Surface Lines) have also produced some safety first films, for the education of the public as well as their employees. These films show the proper and improper way of getting aboard and alighting from a car; the dangers of permitting children to play on the car tracks, and other features which have a bearing on the operation of their cars in the streets of Chicago. These films have been widely circulated in churches, schools, etc., with splendid results.

When the Milwaukee's Puget Sound extension was being pushed through the Rockies and the Cascades some heavy construction, requiring unusual engineering skill, was encountered. In order that the public might form some conception of the almost insurmountable obstacles that are found in the path of a trans-continental railroad, the road filmed some of the most remarkable features of this work, which, with the scenery that naturally found its way into the picture, made a most favorable impression on its audiences.

The Burlington has also produced two out-of-the-ordinary films of an educational nature. One shows how this road helps to conserve the national timber supply and makes one tie do the work of four—being a trip through its immense timber preservation plant at Galesburg, Ill. One cannot view this film without getting aboard the idea of what happens to a tie there and why. The other film is the story of "How the Mississippi River was Harnessed by Man, at Keokuk." It shows the huge hydro-electric development of the Mississippi River Power Company—the ultimate capacity of which is to be 300,000 h. p.; it takes one out on to the gigantic dam which is said to contain sufficient concrete to build a sidewalk three feet wide and 1,500 miles long, and through the power house where approximately 8,000,000 lb. of machinery revolve once a minute; it shows how boats are put through a lock which has a lift higher than those in the Panama Canal, and how the entire plant, which cost about \$26,000,000, is operated—the natural inference being that the ample supply of cheap electrical power available in this region will force an industrial development of unusual importance and that countless opportunities will follow in its wake.

An over-dose of films that were neither pleasant, instructive or entertaining has brought about a demand for a different, better class of films from the majority of moving picture theatre patrons. The impetus of the "See America First" movement has had its effect. Many of these better-

class travel films will find their way into the best of moving picture houses, and receive a hearty welcome from the audiences because of their beauty, educational value and pleasant entertainment. There is also a great and continuously increasing demand for films from Y. M. C. A.'s, universities, schools, clubs and churches. Seven hundred and fifty-nine out of the 2,583 Y. M. C. A. buildings in the United States are now equipped with standard moving picture machines. Such apparatus is also fast becoming a part of the regular equipment of school buildings everywhere. In fact, the channels through which circulation for good films may be obtained are many and varied. To cite a concrete example of how far reaching they really are, however, let me say that it is estimated that one-tenth of the entire population of the United States will have had an opportunity to see the Burlington films before their circulation shall have been completed.

So much for what the film has done for the railroad. This article would not be complete, however, without some mention of the prominent part which the railroad has played in the production of modern "movie" dramas. In a large percentage of the films you see, there is a train or track or station scene—something to remind you of the railroad. The studios of many of the largest film-producing companies are located in Southern California along the lines of the Santa Fe, Southern Pacific and Salt Lake Route. Signal, a station on the latter road, for instance, is used almost exclusively by motion-picture people. "Get the proper effect—cost be hanged," must be the working motto of the directors; and special passenger and freight trains are frequently chartered in order to do this. The well known railroad photoplays "Whispering Smith," "The Lass of the Lumberlands," "The Girl and the Game" and "The Railroad Raiders" now running, are excellent examples of this. The Salt Lake Route's passenger locomotive No. 3708, which was shown with so much pride at the San Francisco exposition, has been used so frequently in the production of films that it has become almost a "prop" of the motion picture directors.

OIL-ELECTRIC MOTOR CAR

A new type of self-propelled car which is operated by a 150-hp. oil engine connected to a generator in connection with a storage battery having a rated capacity of 438 ampere hours at the five-hour rate, has been built for the Nashville, Chattanooga & St. Louis by the Electric Car & Locomotive Corporation, 165 Broadway, New York City. This car is the most powerful self-propelled car yet constructed, and

fifth of the present cost of steam operation. From tests it has been found that the car will run $2\frac{1}{2}$ miles per gallon of kerosene oil, and 50 miles per gallon of lubricating oil. Its rated speed is 45 m.p.h., and the rated acceleration is .8 m.p.h. per second. Its service is, therefore, not limited to branch line service, but it could be used to advantage in high speed interurban work and between divisional point-on railways. This car is to be used between Nashville and Lebanon, Tenn., a distance of 32 miles. On this run there

View of Passenger Compartment of the Oil-Electric Car

is a short grade of 2.25 per cent and a grade a mile long of 1.7 per cent. Three round trips will be made per day with the car.

The power plant in the car is of particular interest. A standard four-cycle, eight-cylinder, 150-hp. oil engine of the marine type is direct-connected to a 100-k.w. differential compound wound, 250-volt d.c. generator, running at a constant speed of 1,000 r.p.m. This engine will burn either kerosene or fuel oil, and is so arranged that no carburetors are necessary. The oil is fed to the cylinders in a gassified state. From the storage tank the oil passes to a gas generator, which converts the liquid fuel into a permanent fixed gas. This generator is located in the muffler of the exhaust, thus absorbing the waste heat from this source

Floor Plan of the Beach Oil-Electric Motor Car

with the combination of the generator and storage battery a large reserve of power for peak loads is obtained. The car was invented by Ralph H. Beach, and it is designed to take the place of steam train service on branch lines and small railways where such service is unprofitable. It is claimed that this car will operate at from one-third to one-

for gassifying the oil. From the generator the gas passes directly to the engine cylinders, being mixed with air in the proportion of one part of gas to six parts of air where the kerosene is used. This mixture burns in the cylinders without smoke or any carbon deposit on the walls of the cylinders. The gas generator has no moving parts and no deposits of

carbon, tar or by-products of the oil are found to remain in the generator.

The storage battery is suspended underneath the car body and operates in parallel with the generator. It is characteristic of a storage battery that as the load increases the voltage declines and as the load declines the voltage rises.

The generator is so constructed that it will automatically coincide as to voltage with the battery. In a generating plant constructed in this manner, the generator will deliver current up to its capacity, and at the same time will work in unison with a storage battery, which by itself will supply any excess of current that the load may require. This battery is capable of delivering 400 hp. for 5 minutes, 210 hp. for 15 minutes, 93 hp. for one hour and 30 hp. for 5 hours. This power in addition to the 150 hp. developed by the generator gives the car abundant amount of power for acceleration and for use in working over heavy grades.

With this arrangement the engine works at nearly full load constantly, therefore getting its maximum efficiency. All power required above the capacity of the engine is furnished by the battery, and all power generated by the engine, not required to drive the car, charges the battery. The battery furnishes convenient source of energy for starting the engine, lighting the car and driving the auxiliary apparatus. It also furnishes a complete and separate source of energy in case of failure of the engine to perform its work, having sufficient capacity to operate the car about 35 miles.

The body of the car is made of steel with the exception of the interior finish, sash and doors, which are mahogany. The car weighs 113,000 lb., is 59 ft. long and is divided into four compartments, as follows: Engine room 12 ft. 5 in. long; baggage room 5 ft. 5 in. long; smoking compartment 10 feet; main passenger compartment 25 ft. 6 in. The entrance to the car is between main passenger and smoking compartments. It is provided with folding doors and a trap door to cover the steps when the door is shut. In addition to the side entrances there is an emergency exit at the end of the car, a sliding door with a drop window at each side of the engine room and 4 ft. sliding doors in the baggage compartment. The car has a total seating capacity of 75 people, the baggage room being provided with folding seats

tains, incandescent lights and stationary seats. The car is fitted with an M.C.B. drawbar and incandescent headlight. It is heated with hot water from the engine, which is by-passed when it is not wanted.

The car is provided with two four-wheel trucks made by

Front End of the Oil-Electric Car

the Baldwin Locomotive Works, of the equalized high speed type. The trucks have a 7 ft. 3 in. wheel base and are provided with 33-in. M.C.B. rolled steel wheels. The journals

Beach Oil-Electric Motor Car

for four persons, the smoking compartment has a capacity of 18 persons and the main passenger compartment has a seating capacity of 53 persons. Each passenger compartment is fitted with a lavatory, basket racks, Pantasote cur-

are 5 in. by 9 in. The type of control used on this car is the standard Westinghouse H. L. series parallel type, used for single or train operation. Four standard 250-volt box frame railway motors, having a horse-power of 75 each, are

mounted one on each axle. They are inside hung and are equipped with standard gears and cases. The Westinghouse straight and automatic air brakes for single and trailer operation are used, as well as the hand brake. Multiple tube type radiators mounted on the roof with forced circulation are used to cool the water from the oil engine. There are two oil tanks having a capacity of 140 gallons each. Air operated whistles, single gong and sanders are furnished with the car.

The following are the estimated figures for the cost of operating this car. The amount, of course, will vary with the service required and upon the scheduled speed, distance between stops, grades, etc. These figures, however, are prepared covering average conditions.

	Per Mile
Wages	\$0.0745
Fuel and lubrication	0.0400
Repairs and supplies	0.0350
Depreciation	0.0385
Total cost	\$0.1880

THE TRAGEDY OF THE EMPTY CAR

By J. L. Payne

Comptroller of Statistics, Department of Railways and Canals of Canada.

The empty car attaches to the tragic side of railway operation. It is the obscure burden which every railway is compelled to bear without compensating consideration for any quarter. A callous public looks on with indifference. In fact, the casual critic of railway administration takes no account whatever of the empty car. He fancies that cars are always loaded when in transit, and loaded at highly profitable rates. Yet the empty car is ubiquitous, chokes terminals, blocks sidings and in a very large and comprehensive sense is the despair of the operating department. It intrudes very conspicuously into operating cost.

Biologists talk about the malignant part played in the human body by the so-called vagrant cell. The empty car is the railway analogue. It plays a double role, and in both parts finds a place in the adverse column. It gives trouble when it is tucked away in the yard and classified in the car association accounts as "surplus"; and it is no less an undesirable when in motion. In both cases it is directly unproductive. It cannot be got rid of by any sagacity on the part of the superintendent. It is both unavoidable and inevitable.

In a moment of inquisitiveness I undertook to investigate the life history of the empty car. This led to depressing discoveries. For my purposes I selected the experience of the Canadian Pacific Railway, for three reasons: First, because the records were immediately under my hand; second, because this is a large railway, probably the largest system in the world; and third, because the Canadian Pacific is an exceedingly well-administered road, prosperous in an exceptional degree, and therefore represents what might be regarded as favorable conditions. That is to say, the degree to which the Canadian Pacific finds the empty car a problem and a costly care might safely be taken as applying with equal force to every other large railway.

Here is a little table compiled from C. P. R. reports which tells its own sad story.

	Mileage of loaded cars.	Mileage of empty cars.
1907	338,742,798	101,363,491
1908	319,507,176	110,373,337
1909	354,798,284	106,472,294
1910	433,498,875	118,134,609
1911	460,739,921	139,455,186
1912	556,234,798	140,210,180
1913	581,397,285	165,637,992
1914	526,194,125	169,768,346
1915	404,249,594	144,408,327
1916	603,705,406	280,241,711

My first thought was to discover, if I could, some more or

less constant law governing the proportion of empty cars to loaded cars. I couldn't find it. The volume of traffic, for example, did not afford a clue. The facts were as follows:

	Tons of freight.	Percentage of empty car mileage.
1907	14,910,429	23.0
1908	14,232,306	25.7
1909	15,701,281	23.1
1910	20,551,368	21.4
1911	25,536,214	23.2
1912	25,940,238	20.1
1913	29,471,814	22.2
1914	27,801,217	24.4
1915	21,001,506	26.3
1916	29,276,872	31.7

Obviously the tonnage of traffic requiring to be moved did not have a direct bearing on the percentage of empty car mileage to total freight car mileage. For example, in 1911 the percentage was 23.2. In 1912 the movement of freight was on a larger scale, and yet in that year the percentage declined to 20.1. A glance at the figures for 1914 and 1915 will show the absolute reverse. But I found that there was revealed in the ten-year period a distinct tendency on the part of the percentages to rise. The two highest figures are found at the foot of the table. Moreover, while the average was 23.2 for the first five years, it was 24.9 for the second period.

My second suspicion was that this growth of the empty car ratio might be due to weakness in the trainload or carload. Again I was disappointed. The upward movement had taken place in spite of quite remarkable betterments in the average number of tons per train mile and the average number of tons per car mile. For example, the C. P. R. trainload was 303 tons in 1907, moved up to 372 tons in 1912, and reached the maximum of 503 tons in 1916. For the same three years the average carload was 17.13, 18.30 and 22.90 tons, respectively. Thus the capricious empty car refused to be answerable to any law that I could find.

I turned to the records of the Grand Trunk to see whether or not, by comparison with the Canadian Pacific, there could be found any facts which would suggest a curve common to both roads, even to the extent of time. It was my notion that perhaps certain years had developed an abnormal freight movement either eastward or westward which would be reflected in a higher proportion of empty cars on both railways at the same time. Once more I was baffled; for it transpired that there were years when one went up and the other went down. The Canadian Pacific had a variation all the way between 20.1 and 31.1 per cent; whereas the Grand Trunk figures ran between 25.9 and 32.9. The average for the Grand Trunk was 28.3 for the first five years, and 29.3 for the second five, showing that the Grand Trunk is more acutely affected by the empty car trouble than is the Canadian Pacific. The extreme fluctuation in the case of the Canadian Pacific during the ten years was 11.5 points, while in the case of the Grand Trunk it was 7 points. The two roads were alike only in showing an ascending scale; but the ups and downs in neither case followed the changing volume of freight movement.

It occurred to me that the distribution of cars over a long system might account in some degree for the high percentage of empty cars; but once more I landed in a blind alley. The Canadian Pacific had an average haul per ton of 472.13 in 1916, while the Grand Trunk average was but 197.72. If length of line were suspected of being a controlling factor in the matter, then it would follow that the Canadian Pacific would show a high ratio while the Grand Trunk would be relatively low. The facts all leaned the other way. On the whole, the Grand Trunk was a greater sufferer than was the Canadian Pacific. The empty car positively refused to give up the secret of its rise and progress.

The practical aspects of this matter go right down into the vitals of railway life. Most of them are obvious. It

would appal the outsider, especially the layman who can show anybody that freight rates are unreasonably high, to know that in every 100 cars moved over any big line of railway from 20 to 32 of them, according to conditions, are empty. I do not know what it costs to haul an empty car—nobody does—but the effect on operating expenses, I take it, is nearly the same as in the case of a loaded car. Since all the operations of a railway focus themselves in the running of trains, and the freight car is the basic unit of a freight train, it follows quite logically that the undemonstrative empty car—which is entirely omitted from the calculations of the average critic—really absorbs a tremendous proportion of the earnings of the loaded car. In other words, if it were not for the care demanded by the ever-present empty car freight rates could be materially lowered without affecting net results.

ELECTRIFICATION IN SOUTH AMERICA

The Bethlehem Chile Iron Mines Company is about to put into operation its electrified railroad, which is 15 miles in length, extending from the port of Cruz Grande, Chile (about 300 miles north of Valparaíso) to the mining village located about 4 miles inland at Tofo. The iron mine at this point is located about 2,200 ft. above sea level and consists of two hills of iron ore, which is removed somewhat after the manner of trap rock quarrying. It should be noted that, while the mines are only four miles inland, the railroad is 15 miles long; the circuitous route was necessary in order to limit the grades. The railroad is constructed in four loops and the grade is thus restricted to a maximum of 3 per cent which is 14 miles long. The loaded car movement is, of course, down the grade. The railroad is a single-track, standard gage line. The trains will consist of an electric

load of 1,500 tons the locomotive will return approximately 1,000 kw. to the line. The schedule will be so arranged that the empty train going up will take power from a loaded train coming down the hill. Excess power will be absorbed by switching operations at the mines and docks. The air brake equipment on these locomotives provides for either straight or automatic operation. The cars are provided with empty and load brakes.

A power plant has been installed capable of furnishing sufficient power for mining and transporting 5,000 tons of ore per day with provision for sufficient additional equipment to double the capacity. The present equipment consists of two 3,500-kw. Curtis steam turbines generating three-phase 60-cycle alternating current, and one 300-kw. 60-cycle turbine for lighting and small power service.

The railway substation equipment is located in the power house and consists of two 1,000-kw. 2,400-volt direct-current units operating directly from the 2,300-volt a. c. busses. On account of the circuitous route, a considerable saving in feeder copper is effected since a portion of the feeder takes a direct route from the mines to the docks.

At Cruz Grande there is a steam dock equipped with three tracks for delivering the ore to the boats and to the steel bins. On account of the traveling gantry crane which extends over these tracks, it was considered advisable to feed the locomotives on this section of the road from a 1,200-volt third rail. Power is supplied from either of the 1,200-volt generators of the 2,400-volt motor-generator set in the power house.

ECONOMICAL TONNAGE RATING FOR WAY FREIGHT TRAINS

By F. W. Green

The successful operation of a division depends largely upon the efficient handling of way freight services. The flow of local traffic, especially in those parts of the country where natural resources are but incompletely developed, is constantly changing both in magnitude and direction. A wise superintendent will, therefore, keep a watchful eye on the local service and adapt it to changed conditions. The re-arrangement of merchandise loading schedules at important stations from time to time frequently offers opportunity for large economies.

No hard and fast rule may be laid down as to what tonnage rating is most economical for way freight trains. A large number of variables enter into a consideration of the problem, among which are:

- a. Length of the district.
- b. Traffic density—i.e. number of trains to be met and passed.
- c. Time lost because of station switching.
- d. Time consumed in loading and unloading l. c. l. freight.
- e. Maximum speed permissible between stations.
- f. Character and quality of fuel burned.
- g. Physical characteristics—grades, rise and fall, etc.
- h. Traffic characteristics—number of loads to be picked up and set out.

When the district is so long as to preclude the handling of anything except way freight tonnage within reasonable hours of service for the crew, the rating should be that which will permit the crew to be released at the final terminal without exceeding what is considered the maximum economical time for the crew to be on duty.

As a general rule, but to which there are always to be found just grounds for exception, it is better economy to shorten local districts than to reduce tonnage ratings. Train miles are paid out in exchange for ton miles. The lighter the rating the fewer ton miles per train mile, and consequently the higher the operating cost per ton mile. It will

Electric Locomotive for a South American Industrial Line

locomotive and from twelve to twenty 50-ton ore cars. The motive power consists of three d. c. electric locomotives which take power from a 2,400-volt catenary trolley supported on concrete poles on the main line and from a 1,200-volt third-rail at the docks. The complete locomotive unit weighs 120 tons and is equipped with four GE-253, 1,500-3,000 volt motors having a normal one-hour rating of 240 hp. each on 2,400 volts. The locomotives are geared for a speed at a rated load of 12.2 m.p.h. and are capable of exerting a tractive effort of 42,000 lb. at the one-hour rating.

In order to provide for suitable control on heavy down grade work, the locomotives are provided with regenerative braking equipment similar to that used on the Chicago, Milwaukee & St. Paul electric locomotives. The trains will descend at about 12 m.p.h., at which speed with a trailing

never be possible to handle tonnage in way freight trains for as low a cost as when handled in through freight trains, because of the wage differentials and the additional fuel and other items required to accelerate and retard way freight trains because of the additional stops as compared with through freight trains. It will, nevertheless, be found that true economy will be had only when the largest practicable tonnage rating that the conditions will permit is hauled on way freight trains. The analysis following is intended to emphasize this latter point.

On the same district, the traffic originating at the same points and of the same volume and moving in the same direction in each case, it may be assumed that the train operating cost per ton moved consists of two items: (a) costs accruing for handling the rating with a way freight crew but moving as a through freight; (b) costs accruing from the additional stopping and starting which a way freight train incurs, but which a through freight does not.

It has already been shown in an approximate way what

Relation of Cost Per Ton Handled to Tons Handled

the cost of starting and stopping trains is. (Proceedings Am. Ry. Eng. Assn., Vol. 16, Part 2, p. 271 et seq.) The cost per stop may be written,

$$c = \frac{70V^2Tq}{495,000} + \frac{0.84(70V^2T)0.00015}{495,000} + 90w + \frac{1.3657Dw}{2V}$$

In which c = the cost per stop in dollars for stopping and starting.
 V = miles per hour from which stopped and to which accelerated.
 T = tons in train including engine, tender and caboose.
 q = cost of coal per lb. in dollars.
 w = rate per second of wages for train and engine crew in dollars.
 D = distance in feet in which tons T are accelerated to speed V .

In the above the following assumptions are made:

That 4 lb. of fuel are used per horsepower hour.
 That 7 lb. of water are evaporated per lb. of coal.
 That water costs 15 cents per 1,000 gallons.
 That the train loses 1.5 min. in coming to a stop and releasing brakes over and above the time that would be used if the speed had not slackened.
 That the fuel required to move the train from the point where deceleration begins, to the point where acceleration ends, at the regular through freight speed V , would be required if no stop were made; therefore it should properly be deducted and not charged to the cost of the stop.

Substituting values as follows in the above:

$V = 25$
 $q = \$0.0015$
 $w = \$0.0006$
 $D = 3,000$

We have, $c = \$0.00144T + \0.058915 , whence the cost per ton per stop will be

$$C = \frac{\$0.00144T + \$0.058915}{T} \quad (2)$$

And for n stops over the district, the cost per ton will be

$$E = \frac{n(\$0.00144T + \$0.058915)}{T} \quad (3)$$

The first term within the parenthesis varies with the ton-

nage handled, while the second term is constant, and greater in value than the first term when the tonnage is less than about 409 tons. The value of E varies directly with the number of stops n , and inversely as the tons handled T .

The cost per ton handled by a way freight crew running over the district as a through freight would, of course, be the amount of the cost divided by the tons. The total cost per ton would then consist of this item plus item E to cover the cost of the stopping and starting that the way freight must perform over and above that required for straight through freight operation. In other words, total operating cost for train service, P , will be

$$P = (\text{through freight cost} + E) \text{ divided by the tons.}$$

For purpose of illustration, assume through freight cost at \$60 per day, then,

$$P = \frac{\$60.00 + n(\$0.00144T + \$0.058915)}{T} \quad (4)$$

Assuming further for purposes of illustration that the stops n , are 20, we have after substituting in above, the following table:

Tons handled, T	Cost per ton for train service, P
100	\$0.614663
250	.247593
500	.125237
750	.084451
1000	.064058

The values in the above table are plotted in the diagram, which shows graphically how the cost per ton handled is a rapidly decreasing function of the tonnage handled.

The first item in the numerator on the right side of equation 4, shown as \$60 above merely for purposes of illustration, should not be understood as a constant quantity. In reality it is a constant plus a variable—the minimum day's pay for the crew and the fuel necessary to take locomotive and caboose over the road, together with water, lubricants, etc., making up those items of expense which are entirely independent of tonnage handled, being the constant; and the increased expense for wages, fuel, etc., which varies with the tonnage handled, being the variable. In any particular case the correct values for this item would have to be determined from the records, or preferably from actual tests. The above formulae are not to be understood as scientifically accurate; their degree of accuracy is no greater than the accuracy of the assumptions upon which they are based. They are merely intended to indicate one way through which the problem may be considered, and it is to be hoped that others who have given the problem any study, and who may be better qualified to discuss it, may be induced to submit their views.

It will be noted that no account is taken of the time, fuel and other costs in connection with station switching, unloading and loading merchandise, etc., coming under the general head of station work. In any case, these costs would be the same regardless of the tonnage handled. They are constant and need not enter into a consideration of the problem other than to be classified as constant expenses and entirely independent of the tonnage handled in way freight trains over the district or sub-division.

RUSSIAN RAILWAY EQUIPMENT SCARCE.—Chief Traffic Manager Shubersky, in charge of Russian railway transportation along the front, has made a report to the Committee of Engineers of the Department of Communications in which he cites figures to show that at the end of the present half year there were 700,000 freight cars less than in the same period a year ago. At the beginning of 1917, said Mr. Shubersky, there were 34,000 broken locomotives, or 16½ per cent. of the total. Today there are 52,000, or 25 per cent. Similarly the cars out of commission were 25,000, or 4.8 per cent. against a present number of 46,000, or eight per cent.

MEETING OF NATIONAL INDUSTRIAL TRAFFIC LEAGUE

The National Industrial Traffic League held its summer meeting at the Hotel Statler, Buffalo, N. Y., on August 23 and 24. The attendance was good and the annual meeting was set for November 15 and 16 at New York City. In his opening address, G. M. Freer, president of the League, called attention to the patriotic necessity of shippers extending every effort to conserve the car supply regardless of what the carriers do or fail to do in that direction.

H. C. Barlow, chairman of the executive committee and now advisory member of the Car Service Division of the Interstate Commerce Commission, addressed the convention at length on the work of the new division. He believed that he had succeeded in large measure in impressing the members of the Commission on Car Service of the American Railway Association with the importance of the shippers' point of view in connection with problems of car supply. The work of the Car Service Division, he stated, is discharged largely through the Commission on Car Service, and he asked that shippers, taking up matters with either committee, send a copy of this correspondence to the other committee. He recommended that shippers route freight in such a way as to permit its diversion through other gateways when the gateways through which it has been routed are congested or embargoed. He believes that some sort of billing notation should be provided whereby the shipper may authorize the railroad to change the route of a car when destined to pass through an embargoed gateway or junction point provided that such a change does not interfere with the through rate. He does not believe that the plan of sailing days for I. C. L. freight, recently put into operation at Philadelphia, will prove successful. He pointed to the fact that the plan has been tried by the New York Central at Cleveland and abandoned. He also stated that it is the imperative duty of shippers to work individually and collectively in the interests of expedited car movement.

The report of the executive committee included opinions on the various recommendations of the Interstate Commerce Commission in its annual report to Congress. The committee expressed itself in favor of the Commission's recommendation No. 1: "That unless the recommendation No. 4 in this summary be followed, Section 15 of the Act to Regulate Commerce be so amended as to provide one period, limited to one year, for suspension of a schedule stating a new rate, fare, charge, classification, regulation or practice; and, if so amended, that Section 6 be so amended so as to provide for 60 days' notice of proposed increased charges." The committee was opposed to recommendation No. 4, which is as follows: "That by statute the Congress fix the interstate rates, fares, charges, classifications, rules and regulations existing at a specific date prior to that of enactment, as just and reasonable for the past, and provide that no change therein, after that specified date be made, except upon order of the Commission, with provision that such statute shall not affect proceedings pending at the time of enactment."

The committee expressed itself in favor of recommendation No. 5 and recounted the action it had taken in the interest of the passage of suitable legislation in Congress. This recommendation is "that if jurisdiction to award reparation remains with the commission (in lieu of the uniform three-year period recommended in our last annual report for the beginning of all actions relating to transportation charges, subject to the Act) the Congress fix a limit of three years within which a carrier subject to the Act to Regulate Commerce may bring action for recovery of any part of its charges, and amend Section 16 of the Act so as to provide that if the carrier begins such action after the expiration of the two-year limit now prescribed in that section, or within 90 days before such expiration, complaint against the carrier

for recovery of damages may be filed with the Commission within 90 days after such action shall have been begun by the carriers, and not after."

The committee favored the Commission's recommendation No. 9, that legislation upon the subject of control over railway capitalization be passed. The committee did not believe, however, that any scheme of federal incorporation of common carriers and federal regulation of the issuance of securities, should be adopted, which might put any moral or financial obligation on the government.

The report of the executive committee was adopted in full with the exception of that section dealing with the Commission's recommendation No. 6, namely, "that without abdication of any federal authority to finally control questions affecting interstate and foreign commerce, the Commission be authorized to co-operate with state commissions in efforts to reconcile upon a single record, the conflicts between the state and interstate rates." The committee did not favor this recommendation on the grounds that such a change in the law might postpone or prevent exclusive federal control of railway regulation. A motion was finally adopted, however, which provided for the appointment of a special committee to consider the recommendation further.

The League adopted the report of the committee on car demurrage and storage which was largely a history of changes in demurrage rules within the last six months and the action taken by the League in connection with those changes. The League expressed its approval of certain changes in the demurrage rules governing private cars which were proposed by the special committee on private cars.

The report of the express committee, which was adopted in full, emphasized the importance of better packing and marking of express shipments in relation to increased efficiency by express companies as well as a reduction in the number of claims against express companies.

The League adopted the report of the freight claim committee which pointed to the failure of some carriers to keep records of l. c. l. freight at transfer points and recommended the appointment of a special committee to take the matter up with the railroads.

The report of the legislative committee included a discussion of the law recently passed increasing the membership of the Interstate Commerce Commission and authorizing the Commission to form itself into divisions. Considerable consideration was given to Section 4 of this act which amends the Act to Regulate Commerce to provide that no increased rate, fare, charge or classification shall be filed, except after approval thereof has been secured from the Commission, such approval to be given with or without formal hearing at the discretion of the Commission. It was the general consensus of opinion that Section 4 did not substantially change the provisions of the commerce act and that if the Commission gave merely a perfunctory hearing in any given case the shipper could later secure a suspension until a full hearing had been granted.

The report of the committee on transportation instrumentalities was adopted in toto. The report mentioned in particular the League's opposition of long standing to the car service rules requiring the return to each railroad of its own box cars and restricting the movement and routing of such equipment. It was pointed out that these rules had been materially altered by an order of the Railroads' War Board on April 30, 1917, and that considerably more freedom in the movement of box car equipment had obtained.

The special committee on railroad leases and side track agreements read a long report, which was adopted after some discussion. Attention was called to the general tendency of railroads to modify railroad leases and side track agreements to put all liability on the shipper. In view of this condition the committee urged the advantages of a uniform liability clause in all railroad leases and side track agreements.

Articulated Six-Wheel Freight Car Truck

Interesting Design Developed for Service Under an
Experimental 120-Ton Coal Car for the Virginian

A SIX-WHEEL truck design which contains a number of unusual features has been developed by the Buckeye Steel Castings Company, Columbus, Ohio, for use under one of the four 120-ton experimental steel cars recently placed in service on the Virginian Railway. Sample

Although these trucks possess a flexibility equal to that of equalized six-wheel passenger trucks, the design is such that the entire truck body is composed of parts which may be manufactured in large quantities by steel foundries, thereby facilitating the making of repairs with limited shop facilities.

The Buckeye Six-Wheel Articulated Truck

trucks of a similar design, but for cars of 90 tons capacity, have been in operation since 1914 on the Norfolk & Western, and have given excellent service during their more than 50,000 miles of travel.

The car to which these trucks were applied was built by

The wheel base is 9 ft. 2 in., a short wheel base being particularly desirable for coal car service, in which uneven mine tracks with curves of small radius and steep inclines to unloading machines must be safely negotiated.

Each side frame consists of an outside and an inside

Plan, Elevation and Sections of the Buckeye Articulated Truck

the Cambria Steel Company, and has a rated capacity of 218,000 lb., or 120 tons, with a 10 per cent overload, and 4,265 cu. ft. The light weight of the car is 83,300 lb., of which 48,650 lb. is in the car body and 34,650 in the trucks. The ratio of revenue load to total load, with a 10 per cent overload, is thus 74.2 per cent.

frame, each with a 6-in. by 11-in. journal box cast integral. The middle journal boxes are cast with equalizer arms on either side, the ends of which are provided with pockets in which the ends of the side frames rest.

The equalizing of the cross bolster loads is thus entirely performed by the articulated side frames. By providing the

frames with elongated holes through which the equalizer bolts pass, a limited amount of forward and backward movement of the frames is allowed, thereby affording flexibility to the sides of the truck and enabling it to take comparatively short curves with no appreciable binding of the wheels. The location of the bolsters in the side frames is such that the distance between the point of loading and the center of the end journal is one-half of that between the point of

of vertical movement to provide for passing up and down steep inclines to coal docks, or in case of derailment to insure against excessive strains which might otherwise be imposed upon the castings.

The cross bolsters are cast with openings through which pass the ends of the center bolster. Sufficient clearance is provided to allow a limited movement of the center bolster, thereby adding to the flexibility of the truck and greatly facilitating the ease with which the bolsters adjust themselves to inequalities of loading. The side bearing bridges are arranged on the inside of the frames and are supported directly by the cross bolsters. Rectangular shaped boxes on top of each end of the cross bolsters fit into recesses in the top members of the side frames and serve as column guides.

The side frames and equalizers are of channel section, including the brake brackets at the end of the frames. The two inside frame castings on each truck are interchangeable, as are also the outside frames.

The trucks are equipped with a clasp brake of extra heavy pattern designed by the American Brake Company. All beams are hung from brackets cast integral with the side frames. The weight of the clasp brake rigging per car is 4,100 lb., leaving for the weight of the trucks alone 30,550 lb. The steel castings account for 14,580 lb. of this weight.

End View of the Truck, Showing the Longitudinal and Cross Bolster Connection

loading and the bearing point in the equalizer pocket. Any unbalanced load on one of the frames which causes an upward or downward movement of the equalizer arm, is immediately counteracted by a shortening or lengthening of the moment arm between the point of loading and the bearing point in the equalizer pocket, the contour of which is designed to compensate in this manner for variations and inequalities in loading. The equalizer bolts serve only to hold the side frames and equalizers in place, the load being

STANDARD CODE RULES 17 AND 90

By Harry W. Forman.

17. The headlight will be displayed to the front of every train by night, but must be concealed when a train turns out to meet another and has stopped clear of main track, or is standing to meet trains at the end of double track or at junctions.

If trainmen and enginemen always had to depend upon uninterpreted rules to determine just how to operate their trains, confusion would sometimes result, as many code rules are so abridged that much must be left to their judg-

Clasp Brake Rigging Applied to Buckeye Trucks under Virginian 120-Ton Coal Car

transmitted directly through the bearing between the castings.

The bolster is made up of three parts, i. e., one longitudinal center bolster and two cross bolsters. In order to keep within the low limit of 27 in. for the center bearing height, a unique type of longitudinal center bolster was developed. The bolster itself is dropped below the center axle. The center plate is removable and spans the axle. Ample clearance is provided between the center plate and the bolster member below the axle to allow the axle the necessary freedom

ment. Rule 17 does not mean that the headlight must always be concealed while standing at the end of double track, or at junctions. Whether or not an engineman should do so depends upon the position of the switch in front of his train. It should be a well grounded principle in safe railroading that a headlight must never be covered while a switch is so lined up that an approaching opposing train might, should its engineman miscalculate distance or lose control of his train, strike the waiting train.

Code rules do not require the train which is standing on the main track at a meeting point to adjust the switch so that the opposing train will run in on the siding, but this should be done, provided, of course, the train which holds the main track arrives in time and stops near the switch. In this situation, after the switch has been opened, the standing train should dim its headlight, if it be an electric or any other kind which is exceptionally brilliant, because, if not done, the engineman of the train which must take siding will find it extremely difficult to determine the position of the switch, or see any hand signals necessary to be given.

Under this interpretation of the rule, every engineman should understand that the fact that some other crew may turn the switch for him, does not relieve him from being prepared to stop in time to allow one of his trainmen to open

Management of Headlights at Meeting Points

Trains Marked C Have Headlight Concealed.

it. The crew of the standing train must be instructed not to give a "Come ahead" signal if there are any cars or trains on the siding. In fact they should, in such cases, give a slow-down, or a stop-signal. The diagrams below may help to make the intent of the rule clear.

90. (Fourth paragraph.) The engineman will give signal 14 n at least one mile before reaching a schedule meeting point with a train of the same or superior class, or at a point where by train order the train is to meet or wait for an opposing train. Should the engineman fail to give signal 14 n as herein prescribed, the conductor must take immediate action to stop the train.

The gentlemen who formulated Rule 90 may have wished to be understood as meaning, "Engineman will give signal 14 n one mile before reaching the entrance switch at the point beyond which his train must not go until the expiration of the time named in his train orders, or until the opposing train, or trains, for which his train is restricted, either by time-table or train order, shall have arrived. Should he fail to so signal, then the conductor must take immediate action to stop the train in time to prevent collision." But there is a good deal left out. If it be thought best to require enginemen to sound the whistle in a way that will assure their trainmen that train orders or opposing trains are not being overlooked, certainly this precaution should be taken in every case where one train must wait for another, without regard to whether such meeting point be by time-table or train order. The schedule meeting point is no more

important than any other. In practice, I am inclined to think that many enginemen do so whistle, notwithstanding the rule does not cover every case wherein they ought to whistle. Should the field be canvassed, it is probable that a slight majority of officers would vote to continue whistling meeting points; but not every railroad man who has had an opportunity to observe its workings is willing to concede the necessity of this so-called safeguard. So much whistling is not only a nuisance, but we are drifting toward a condition of mind where we do not regard the whistle as vital, having so often been misled; and we are not taking proper action to prevent a possible collision when there is a failure to whistle. Every division has its enginemen who whistle incorrectly and unnecessarily, and also those who use judgment in this particular. Those who confine the use of the whistle to actual cases of need get along as well as, if not better, than the others; and have no more accidents or misunderstandings than those enginemen who make a plaything of the whistle lever. I never take a trip extending over several different roads without returning more fully convinced than ever that the rule for the public crossing whistle should be changed to two long, one short and one very long, gradually-dying-out blast, this being a signal often heard. It is so entertaining to hear an engineman string out his whistle about four times longer than necessary, when one is trying to sleep. It is not that enginemen have not the proper appliances, or have not been most fully instructed; some are just bullheaded, or too ignorant to appreciate the value and satisfaction of accurate whistling. Every engineman who lives near the railroad devotes much of his time while off duty to showering imprecations upon his brother enginemen who deliberately indulge in such damnable practices while passing his house. This condition may be expected to continue until actual suspension is applied for this kind of carelessness, the same as is administered for other violations of rules.

Assuming that Nos. 1 and 2 are of the same class, No. 1 superior by direction, and that they are scheduled to meet at G, it is clear that only No. 2 would sound the meeting point (or restriction) whistle. If directed by train order to meet each other, or No. 1 be ordered to wait for No. 2, or No. 2 be given right over No. 1 to G, then both enginemen must sound this whistle.

Should No. 1 be instructed to run late, or wait at given stations until certain times for No. 2, the engineman of No. 2 must sound this whistle about one mile short of the station beyond which he must not move against No. 1. But No. 1 is not required to thus whistle, unless it finds that it is going to arrive at such station in advance of the time named, in which event it would seem to be proper for the engineman of this train also to whistle as per 14 n. It may be contended, however, that the effect of such an order is merely to change the time-table time of No. 1 by that much, and that therefore it should not whistle. Probably this view of the matter will eventually obtain. There is at present a difference of opinion as to this.

Should No. 2 be one hour late, No. 1 on time, and No. 2 be allowed to go to any station which it can make for No. 1 without train order help, it is clear that provision is not made in the rule for No. 2 to sound this meeting point whistle; though it is just as important that it do so, the same as in approaching the schedule meeting point. Watches sometimes go wrong.

There is much complaint about this signal not being distinctive. Often it is taken for a public crossing whistle if there is a crossing nearby. I have found that when two full seconds are allowed to elapse between each two blasts of the whistle it more surely attracts attention. It can be heard much better by the trainmen concerned. Try it. It is true that an unfortunate combination was selected. One long, a short and a long would have been better; or one long and one short.

A. C. SIGNALS ON THE SOUTHERN RAILWAY

When present contracts are completed the entire line of the Southern from Washington, D. C., to Atlanta, Ga., 640 miles, will be equipped with automatic block signals. A very thorough study of this problem was made before the first work was undertaken, with the result that the standards then adopted have been maintained without important changes for all the later installations. This line will be one of the longest in the country under the protection of a. c. signals, and the high degree of satisfaction rendered by the installation is convincing proof of the value of this system. The use of alternating current, supplied by a power line from a central station not only makes possible much longer track circuits, with the lessened expense for relays, and reduces by one half, or more, the maintenance force that would be required with direct current, produced by primary batteries at each signal; it also makes available other economies, such as electric lighting of signals and of passenger stations and the use of power for small motors at isolated locations; so

principally on account of the installation of passing sidings. The need arose in several cases for a special signal indication for use on ruling grades to permit full tonnage freight trains to pass a stop signal without first being brought to a stop. The form of indication adopted is a 15-inch yellow disk mounted to the right of the signal mast, 7 ft. 9 in. below the blade, in the center of which is displayed a letter G which is illuminated, when the signal is in the stop position, by an electric lamp mounted behind the disk. A tonnage train is permitted to pass a stop signal having this marker, at not over eight miles an hour, expecting to find the block occupied, a switch open or the track broken or obstructed.

No switch indicators are provided except at the junction of single and double track. The rules provide that an interval of two minutes must elapse after a switch leading to the main lines is opened before a movement can be made past the fouling point. This has worked out very satisfactorily, thus far.

The G. R. S. 2A signal mechanism with steel semaphore blades and two 12-volt 5-watt Mazda lamps have been used

Typical Signal Location Showing A. C. Line at the Right

that the cost of generating stations, which is the largest item of expense, beyond that of a direct current installation, is far outweighed; and beyond all questions of immediate economy there is the additional safety due to the use of relays which cannot be dangerously energized by foreign currents.

The first signals were put in service between Denim, N. C., and Charlotte in February and March, 1913. Successive sections were equipped as the work of double tracking was completed. In three cases short sections of "A. P. B." signaling were installed on single track, but two of these have been changed over to double track signaling and the third soon will be.

Preliminary study showed that for the existing traffic of 40 to 50 trains daily it would be most economical to adopt a standard block length of two miles, with the thought that intermediate signals could be installed when traffic justified, without disturbing the existing installation. This block length has been adhered to throughout, although in several cases the intermediate signals have already been required,

for all of the new work. The signal motors are 110-volt and in the first installation were of the series commutator type. Later developments, however, soon led to the substitution of induction motors, which are now used throughout. While the induction motor requires somewhat greater power, it operates the signal arm from zero to 90 deg. in the same time required by the series motor, seven seconds, and eliminates the weekly or semi-weekly cleaning which the earlier type required.

The 8½-in. wrought iron numbers used to designate the signals have repeatedly demonstrated their advantages. These numbers are painted white on the face and black on the back and are bolted to a wrought iron supporting bar which is attached to the pole with clamps. The numbers are distinctive in appearance, are easily painted and do not chip off or break.

A six-strand aluminum cable on a steel core was chosen for the three-phase, 4,400-volt transmission line on account of its greater conductivity, increased strength, lighter weight, ease of erection, and cheaper first cost, as compared with

No. 6 hard drawn copper. The first cost is the only one of these advantages which has changed since the first installation, and in spite of increases in price this material is still being used for the transmission line. Its strength has been repeatedly demonstrated in service on this line. In some cases trees have blown over on the aluminum wire without breaking it, and when the trees were cut down the wire has sprung back into place. The steel gains which were originally used on all poles, to obviate the necessity for crossarm braces and to preserve the strength of the pole, have been eliminated on account of the high cost of steel. It has been found that under present conditions it is cheaper to provide crossarm braces and to cut gains in the poles. The original line was built with 1/2-in. steel pins on the crossarms for the high tension line, but it has been found that the standard 1 1/4-in. locust wood pins used for the low tension line are fully as good, or better, for this high tension line, and of course are much cheaper.

The transmission line is sectionalized at intervals of about 5 miles, the switches in the first installation being immersed in oil. It developed in service, however, that this line carried such a small amperage that the oil switches could be dispensed with, and hook switches used instead. These switches are of the Westinghouse Type M, consisting of a copper bar mounted on vitrified porcelain attached to a cast iron pedestal. The porcelain supports are designed to withstand the voltage of the circuit without breaking down or puncturing. The switches are operated by a hook mounted upon the pole which engages in a hole in the switch blade. This enables the switches to be opened even when the circuit is alive if necessary.

The most important single cause of trouble with signals on this line is lightning. This territory is particularly subject to electrical storms at certain seasons and it has proved a very difficult matter to entirely eliminate disturbances in the signal system from this cause. It is not uncommon to hear those familiar with the maintenance of these signals remark that if it were not for the lightning "they wouldn't know they had any signals." Three distinct types of protection have been provided from the beginning, one in all low voltage circuits, another for transformer protection on the transmission line, and the third for the protection of power house apparatus. The 1-in. galvanized rods used for arrester ground have been salted and every known precaution has been taken to improve the quality of lightning protection, but in spite of all such precautions the problem cannot yet be said to have been satisfactorily solved.

The construction and maintenance of the signal system is under the direction of W. J. Eck, signal and electrical engineer.

COLLEGE GETS A SLEEPER. A Pullman sleeping car will be used next year to supplement the dormitory of Highland College, Highland, Kansas. It is a ten-section observation car, accommodating forty persons if two sleep in each bed, and has a reading room and a vestibule. Dealing, as they do, with students working their way through college, the trustees of the institution were hard pressed this spring when it was announced an addition to the dormitory would be needed next year to accommodate the increasing enrollment. The college had just finished raising a \$50,000 endowment fund, and more money for building a dormitory could not be had. Then President W. Gilbert James learned the Pullman Company had presented a Pullman car to a "self-help" college in the East, and he made application for a sleeping car for Highland. The request was granted, and the car has been started on its way here. A wrecking car crew will be sent here to move the car to the college campus. The car is old, of course, but it promises to fill adequately the need for which it is intended. It will become a permanent part of the school's equipment.—*Kansas City Star.*

PURCHASE AND MAINTENANCE OF LABOR ON RAILROADS

By E. Wanamaker

Electrical Engineer, Rock Island Lines.

Much has been said and written regarding the accomplishments of specialists, efficiency engineers, etc., who have devoted their time to the economic purchase of all kinds of materials, machinery, etc., and the maintenance and operation of such equipment. On many railroads the subject of fuel has been given close attention by specialists, often resulting in a marked reduction in the fuel bill which amounts to from 7 to 15 per cent of the total operating expenses. To obtain supervision that will secure an economic use of the fuel, large salaries are paid and a large staff of men is employed. Likewise, large salaries are paid to men who are familiar with the different equipments in use on the railroads as well as to the men who secure the economic installation of many materials entering into railway construction.

These are all important and worthy of the attention that has been given them, but inasmuch as nearly 50 per cent of the railroad dollar is expended for labor, it would seem that if there is one particular item on the railroad that justifies the employment of expert supervisors, it is the hiring of employees, or the purchase of labor, together with the matter of educating and caring for the workers, which might be called the maintenance of labor. It is a vast subject and today by far the most important with which the railroads have to deal. As a general rule, it requires far more ability to handle the men, who in turn handle the equipment and materials, than to choose the proper equipment and materials.

When an important machine, as, for instance, a large air compressor, is to be purchased, the engineers make careful and minute investigation requiring the service of a number of men several days, when the total cost of the compressor installed will not exceed \$20,000, and oftentimes when the difference in economy of operation of the several compressors considered would not lose the company more than \$500 or \$600 per year were the poorer one purchased. On the other hand, consider the case of a foreman employing four men. Their total wages for the year will probably amount to \$5,000, but due to ignorance or inefficiency they may during the year easily cost the company more than \$5,000. The purchase and care of labor has not been given nearly the attention that it should have received.

Labor, or laboring men have too often been looked upon as cogs or spokes in the wheel, when it should have been borne in mind that each and every individual has his own personality, his own feeling, his own indifference, or his own ambition. In the employment of labor, much attention should be given to the examination and questioning of the prospective employee by a man who is thoroughly competent to judge men. The employment of labor on railroad systems should be placed in the hands of an employment department made up of specially trained men in order that the proper kind of men for the various occupations be chosen at the start. Then these men should be followed up by the labor department in order to see that they are properly educated in their work, and also in all general matters that affect them in their relation to the company by which they are employed. It should be seen that the square man does not get into a round hole; that the employee is protected, and that faithful and competent service is properly rewarded. It is evident that inefficient labor in any organization holds down the flat rate for all, and whether or not labor contracts exist, individual effort and efficiency should be rewarded financially over and above the flat rate, which would be only the minimum. When individual effort is substantially rewarded, we will again see hearty and efficient co-operation between

labor and capital, with its resultant success, such as largely existed prior to the advent of the large corporation. In this way, the personal element will again come to the front, making it worth any man's while to put forth his best efforts in his work.

The writer has been termed, at different times, a sort of efficiency engineer or crank; however, it would seem that a competent efficiency engineer is only a good business man, who takes sufficient time to sit back and thoroughly study and investigate all phases and conditions of his business in order that he may change any practice that does not secure efficient and economical results. Constant association from boyhood with many classes of labor, and a close study of men, have convinced me that the method of rewarding labor outlined above is both efficient and just.

A labor department is fully as necessary an adjunct to a railroad as is the department for testing materials. The function of the labor department is different however. It would test the men, but go further than the department for testing materials and follow the welfare of the men and their relations with the company as long as they are connected with the service. The statement "that no manager is greater than his organization" holds true. The loyal support of each employee is necessary; likewise, loyalty of the manager and the company to the employees, if substantial and lasting success is to be attained. In order to secure good service from the men, it will be necessary for the company on its part to insure good service to the men by guaranteeing a fair compensation for work well done, and the continuity of employment for the deserving. Undoubtedly the welfare of the employee should be directly connected and to some extent proportionate to the welfare of the company.

The system used need not be bonus or piece work; however, it is probable that a combination of a fair flat rate, together with piece work, for some classes of labor, and bonus for other classes, would be the best method of rewarding individual effort and providing the proper incentive to secure good work. It would be well if free insurance for all employees was carried by the company, for officials as well as the rank and file. However, this benefit should accrue only to those who render good service. Pensions for disabled or superannuated employees might also be taken care of in a similar manner, or it would probably be better still to proceed on the basis that only those be retained in service who are good, honest workers. This would mean that eventually practically all employees in the service would be first-class in every respect.

The retention of unfaithful employees should not be tolerated. Under no condition should any labor organization be permitted to force unfaithful employees on any employer. Fair play must be assured by and between the employer and each and every class of employee, and faithful, efficient service rewarded by each side doing its very best to assist the other. This is practical from the standpoint of business efficiency—indeed, it is not only possible, but it is absolutely necessary for the good of all concerned.

There have been factories in which the overhead was unusually high, due to the fact that the machinery used and the buildings in which it was installed were very expensive, yet the entire plant was only in use 10 hours out of 24 and the overhead expense was a large proportionate part of the total cost of production. Would it not then be wise to have, in such cases, two eight-hour shifts per day securing 16 actual working hours out of the 24 instead of 10? Take the case of a factory turning out 100 pieces of machinery per day and producing all that was possible in the 10-hour day. If it was desired to turn out 200 pieces per day, it would be necessary to double the size of the plant. Now, if instead of duplicating the expensive machinery and buildings, two shifts were employed, working from 7 a. m. to 3 p. m. and from 3 p. m. to 11 p. m., the output could probably be dou-

bled without increasing the plant size and yet the working hours would, no doubt, be quite as conducive to the well-being of the employees. A case of this kind would only apply on the railroad to large shops where heavy repairs are made to motive power and rolling stock.

An employment bureau might well be formed on all our large railroads to be composed of the heads of the different departments; for instance, the general manager, superintendent of motive power, chief engineer, traffic manager, superintendent of dining car service, electrical engineer, superintendent of telegraph, etc. This organization should carry on its work through the superintendent of an employment and educational bureau whose relation to these officers would be analogous to the relation existing between the purchasing agent and the testing department. It would, no doubt, be necessary to organize a trained staff to follow up the educational and record work.

Due to the lack on most railroads of a method or system for educating employees, it is now becoming a difficult matter to secure competent help. Take, for example, the problem of obtaining competent section foremen. The class of track labor now generally employed does not, as a rule, furnish suitable material for making foremen, and yet the maintenance of track is constantly becoming more important and requiring more skill. An educational system for this class should be started now in order that the old section foreman, now being rapidly retired, can be successfully replaced.

Hand in hand with the proper method of rewarding and educating employees should go the elimination of the departmental viewpoint in so far as possible, meaning by this that although the employees of each department specialize on the work of that department and become expert therein they should also have a fair understanding of the work done by the other departments in order that all may co-operate to advantage instead of hampering each other. The working of one department without regard to the effect of its policy on other departments has often caused an organization as a whole to trip on its own feet.

It is just as necessary for a railroad to have its employees interested in all its departments, say, for instance, the traffic department, which sells the passenger and freight transportation, as it is for any successful merchant to have the hearty co-operation of his employees.

Last but not least, if the use of intoxicating liquors were stopped labor troubles would be greatly decreased and efficiency substantially increased.

INCREASED CAR MILEAGE ON THE EL PASO & SOUTHWESTERN

One of the best examples of improvement in the handling of railway equipment is afforded by the recent performance of the El Paso & Southwestern. For the month of May, 1917, the average miles made per car per day for system cars was 36.90 as compared with 31.64 one year ago and 27.56 in May, 1915, while the combined average of system and foreign cars was 49.17 miles per car per day this year as compared with 45.24 for the same month last year and 37.75 two years ago. Similar improvement has been shown in other months of this year as seen in the table:

		System	Foreign	Both
January,	1915.....	18.72	58.64	30.09
	1916.....	27.41	62.64	38.51
	1917.....	33.50	56.07	43.51
February,	1915.....	20.87	57.98	30.69
	1916.....	30.25	66.82	42.23
	1917.....	35.82	47.60	41.66
March,	1915.....	18.30	63.75	29.95
	1916.....	28.98	66.53	41.88
	1917.....	32.24	70.76	47.50
April,	1915.....	20.54	58.36	30.18
	1916.....	30.64	70.07	44.03
	1917.....	34.95	64.02	47.97
May,	1915.....	27.56	64.82	37.75
	1916.....	31.64	67.09	45.24
	1917.....	36.90	66.56	49.17

In January of this year the average miles made per day by freight locomotives over the entire system was 116.50 and in May 128.40. The same figures for passenger locomotives were 170.3 for January, 1917, and 172.69 for May. The average mileage of locomotives in non-revenue freight service in January was 106.80 and in May 91.34, while the mileage of switch engines was 79.19 and 73.44 respectively. The total average mileage per day per engine for all classes of service was 117.52 in January and 122.16 in May, an increase of 4.64 miles per day in the latter month.

IF I WERE PRESIDENT OF A RAILROAD

By B. B. B.

The real reason why the young college man does not enter railroad service is because of the uninviting future which the railroad work offers to him. If I were president of a railroad I would so operate it that it would command the attention of the better class of young men who are casting about for their future work. Some of the things I would do are:

I.—I would have a thorough check made of all the positions on the road, and fix an equitable salary commensurate with the work to be performed and the responsibility attached to each position. I would then employ men to fill the positions who were worth the salary paid. By doing this there would be no reason for working the men more than eight to ten hours a day during normal times, because with the salary commensurate with the position, it would not be difficult to secure men who could perform in eight to ten hours a day the duties which the men with less training must take 12 to 15 hours a day to do. To perfect this arrangement would require the best of judgment on the part of the persons fixing the salaries, because in adapting the salaries to the positions the questions of skill to perform the duties, and the responsibilities attached to the position would have to be the determining factors, instead of the amount of actual technical work connected therewith.

There are a great number of positions paying from \$75 to \$100 a month which require no skill or training, and very little responsibility, but require from 12 to 15 hours' work a day, when two men at \$50 a month could do the work without half the drudgery. Efficiency would be the watchword, and the highest efficiency can never be attained when persons have a lot of detail drudgery work which keeps them on the job for long hours each day, and who never know what it is to be caught up with their work.

II.—I would have an employment department, and place a competent man in charge of it—a man who knew men. This department would keep a personal record of all employees of the road, from the messenger boys up to the general manager, which record would consist of such information as to enable the department to determine the capabilities of the persons so employed. Accurate information would be furnished this department by the heads of the different departments of the road. When a position was vacant the matter would be taken up with the employment department and the employee who was most deserving and most competent, regardless of what department the vacancy occurred in, or in what department such employee was working, would be given an opportunity for the position. No outside man would be employed to fill any position if such vacancy could be filled by promoting some person already in the employ of the company. In making such promotions, of course, the duties of the position, the capabilities of the person to be promoted, etc., would all have to be taken into consideration. By this plan, every person who entered the service of the road would feel that he was in line for promotion from the moment he became connected with it. When it was necessary to employ outside men, I would, where

possible, employ college men. If they could not be obtained, I would then employ men who were desirous of bettering themselves, with the idea in view of educating and training them to fill more responsible positions, and not just filling the present vacancy.

I would have it thoroughly and distinctly understood that no salaries would be increased, but that all increases in salaries would be attained by promotion. With the salaries fixed commensurate with the positions, there would be no necessity for raising salaries, especially with the above employment and promotion plan in effect.

III.—After all expense of operation had been paid each year, I would deduct a sufficient amount from the net earnings of the company to pay six per cent on the total amount of money invested in the property of the railroads; this six per cent to be set aside to the stockholders—the balance of the net earnings would be divided fifty-fifty between employees and stockholders; the amount so set aside to the employees to be paid them pro rata according to the amount of yearly salary each employee received. With this plan the employees would feel that they were a part of the company; that if the company made money, they would get their share; and that if the company lost money, they would be losers with it. This plan would enable the company to secure the services of a better class of employees; would cause the employees to be more diligent and work harder both to prevent losses to the company, and to secure revenue producing business for the company; this would have the effect of increasing the efficiency of the employees to a degree never yet attained on any railroad in the United States—or anywhere else. I firmly believe that if the above plan were adopted that a saving of from six to fifteen per cent in operating expenses—and in many instances a great deal more—could be effected; and that the operating revenue would be considerably increased.

I believe that if the above were put into effect, it would not be very long until all troubles with the labor organizations would end. The general standard of employees would be raised, because a higher class of men would be attracted to the work; efficiency would be increased, because the employees would have some incentive for taking interest in their work, because they would feel that they were a part of the "company," instead of being a part of the "machinery" to run the company; the ratio of operating expense to operating revenue would be smaller, due to stopping the leaks on the one hand, and securing more business through all classes of employees on the other hand.

As the "railroad game" now stands, what inducement is there for a college trained young man—or any ambitious young man with a fair amount of education, and fair ability—to enter the railroad work as a life business, when other industries offer more favorable working hours, more favorable salaries, better opportunities for rapid advancement, and better social standing? The railroads are the arteries of American industry, and are entitled to the very highest class of men in their service, but the managements of the railroads have not kept pace with the managements of the other industries of the United States in the way of making the railway service attractive enough to secure the best class of men in its service. Other industries school and train their employees for their special work, while about the only training a young man gets in the railroad work is a "halling out" because he cannot handle it like an "old head"; and a young man who has spent his life up to the age of 25 years, and spent approximately ten thousand dollars to secure a college education does not care to spend ten to twenty years longer "coming up through the ranks" in order to reach a point where he can command a salary of from \$200 to \$300 a month, when there are so many different avenues of business which will land him far above this mark in one third the time.

INCREASED RATES TO OFFSET INCREASED EXPENSES

By W. W. Atterbury

Vice-President in Charge of Operation, Pennsylvania Railroad.*

It is hard to realize how rapidly the demands upon our railroads increase. Roughly speaking, traffic doubles about every ten or twelve years. The facilities of the railroads must grow with the traffic, or industry must slacken its pace.

In 1903 there was a great congestion of freight in the Pittsburgh district—the most severe ever known up to that time. Following that experience, great improvements were made in the railroad facilities here. At the time we were severely criticised for our seeming extravagance, as many thought the extensions then made were in advance of all possible demands for a half century. Yet here we are, after the lapse of only 14 years, face to face with a still greater congestion and the need for still more extensive and costly additions.

No one at all familiar with our national history needs to be told that from the time when railroads were first constructed they have been the dominant factor in the commercial development of this country, and in the settlement and opening up to civilization of its vast areas. We are, in truth, a railroad-made nation.

If you stop to think, I am sure you will also realize that railroad building and expansion, throughout our periods of growth and development, have always preceded and not followed the processes of our commercial and agricultural development, and the outspreading of our population. The railroads, indeed, have been the pathfinders and pioneers.

This condition has held true until within a comparatively few years—let us say about a decade. In this latter period, railroad development, as the result of the causes to which I have referred, has been slowing down and today has practically ceased.

Meanwhile, however, our industries, under the spur of individual enterprise, untrammelled by artificial restraints, have pushed forward, until we have now reached the position in this country of producing faster than we can distribute and exchange. I do not see how it is possible to escape the conclusion that unless the way is soon opened to permit our railroads to resume a normal rate of growth, the commercial development of the United States must shortly also cease.

This is a serious situation. It carries the threat of idle mills, idle men and idle machinery; nevertheless we are face to face with it and we might just as well understand it.

Now, what has been the effect of inadequate revenue? What fundamental error has imposed this needless check upon our national growth and prosperity? It must, in the final analysis, be attributed to failure to appreciate a simple truth.

In physics and in chemistry we all know it is impossible to make something out of nothing. It is a pity that, as a people, we do not also realize that it is as impossible in the field of economics. In the realm of business this truth means that every desirable thing must be paid for, in some way. Let me say most emphatically that this applies in the highest degree to railroad service. If you want adequate, prompt and certain service, you must pay for it, and any one who tells you that it can be gotten without being paid for is imposing on your credulity.

The erroneous idea that shippers, passengers, labor, equipment makers and material dealers can go on indefinitely getting constantly more and more out of the railroads, without any one having to pay for it all, has found concrete expression in vicious regulation and legislation. Its object has

been to punish; its effect has been to maim and destroy. Constructive development of the transportation system has almost been lost sight of, and possibly it would still be hidden by fogs and obscurities of two-cent passenger fare laws, extra-crew acts, wage-increasing statutes, and other enactments and measures having for their purpose getting more and giving less, had not the events of the last two years, and particularly the international situation, awakened the country. The railroads have been compelled to obey these laws, every one of which adds to the cost of rendering railroad service, and have been expected to do so without adding anything to the price received for the service.

Pressure has been constant to force rates down still lower, in the face of rising costs. Surely it is a matter of common sense that this process cannot go on indefinitely. Unless I am much mistaken, the limit has now been reached, so far as the railroads, in general, are concerned.

Is it any wonder, then, in view of the narrowing margin between railroad receipts and expenses, that the New York Central Railroad, one of the great transportation properties of the country, recently failed in the effort to sell \$25,000,000 of stock at par, or that the Erie Railroad and Southern Railway failed in their attempts to work out comprehensive financing schemes?

In 1916, the only railroad stock issued on the New York Stock Exchange, for new construction, was \$351,145.65, issued by the Cleveland & Pittsburgh Railroad for a small amount of work done in 1915—and even that stock was guaranteed by the Pennsylvania Railroad.

Last year, in fact, was the first year in which not a single share of new railroad common stock was listed on the New York Stock Exchange, in which the public took the chance of the investment of money for new railroad building in the United States proving sound. These are not pleasant facts, but you cannot ignore them. They are of profound importance to the shippers of this country. You know what it means to be short of facilities. You appreciate now how intimately the normal processes of our national life are dependent upon adequate railroad facilities. The one thing staring you in the face whichever way you turned was, that the railroads are swamped with business which they haven't the facilities to handle properly. The lines haven't the terminal facilities; they haven't the power; many have not the cars to handle properly the business that has been forced upon them during the past year.

There is but one remedy for the problem of the railroads, and that is to allow them higher rates—rates commensurate with the cost of rendering service and with the added demands that are daily imposed upon the carriers.

It is to the best interests of shippers and the general public alike that railroad rates be advanced. What the public most needs, is adequate service.

Paradoxical as it may seem, an advance in freight rates would lower the cost of living, rather than raise it. Will one of you question the statement that the price of food products, fuel, supplies, etc., has been materially increased through the local shortage of equipment, or our inability to move? Had rates been high enough in the last few years to have permitted the additional railroad improvements that you all now recognize are so badly needed, foods, fuel and other necessities would now be moving to market freely, in greater quantity, and the normal law of supply and demand would not be upset by a failure of transportation.

In short, freight rates play such a small part in the cost of nearly all the daily necessities of life, that an advance would, if apparent at all, be offset by normal supply.

On the other hand, the efficiency of the railroads would be so greatly increased that the ultimate effect might well be a general lowering of prices as a result of the improved machinery of distribution and exchange that the country would possess.

*From an address delivered at the 15th annual dinner of The Traffic Club of Pittsburgh on March 29, 1917.

General News Department

The Interstate Commerce Commission, Division of Valuation, has issued specifications in pamphlet form for maps, charts and schedules of telegraph and telephone properties owned by railroads, telegraph, cable and telephone companies, effective August 1, 1917. These specifications describe in detail the character of the maps desired, the manner of their preparation and other requirements for guidance in their preparation for filing with the division of valuation.

The Senate has recently passed a bill, S. 2718, appropriating \$100,000, to be expended by the Postmaster General in conducting experiments in the operation of motor truck routes in the vicinity of such cities of the United States as he shall select, for the purpose of promoting the conservation of food products, and to facilitate the collection and delivery thereof from producer to consumer. The Postmaster General is to report the results of his experiments to Congress.

An agreement embodying the final details of the settlement of the wage controversy between the southeastern railways and their shop employees was signed on August 24. The principal terms of the settlement, which were published in the *Railway Age Gazette* of August 10, were decided by Secretary Wilson of the Department of Labor, and include an eight-hour day for most of the employees, together with increases in wages, which altogether, it is estimated, will cost the railways about \$8,000,000 a year.

Despite unusual operating conditions caused by the enormous movement of materials and supplies to the army camps, the Nashville, Chattanooga & St. Louis made an excellent record in the operation of freight trains during the month of July. The average daily running time of the principal freight schedules operated by the line were as follows: Southbound (Chicago connection), Martin, Tenn., to Atlanta, Ga., 24 hours, 55 minutes; southbound (St. Louis connection), Martin to Atlanta, 25 hours, 8 minutes; northbound (Atlanta to Martin), 25 hours, 19 minutes. The distance from Martin to Atlanta is 431 miles, and the average running time, including stops, was 17 miles an hour.

General Manager George W. Stevens, of the Chesapeake & Ohio, has issued to employees a circular calling attention to the curtailment of passenger train service and the attendant inconvenience to the traveling public and reminding them that every passenger is, in a sense, a guest of the company; and expressing the hope that "every employee will recognize the fact that he is a representative of the host, and when off duty traveling on free transportation, if he is seated, and paying passengers are compelled to stand, will recognize the obligation due from a courteous host to his guest, and will quietly arise without attracting undue attention to his action, and make room for the paying passenger."

The Order of Railway Telegraphers has agreed to arbitrate, under the Erdman act, a pending wage dispute with the Chicago, Rock Island & Pacific. The Rock Island has selected as its arbitrators E. S. Jonett, general attorney of the Louisville & Nashville, Louisville, Ky., and C. W. Jones, general manager of the Rock Island at Des Moines, Iowa. The union has selected two arbitrators to represent its interests, and it is now in conference with the management of the Rock Island for the purpose of selecting two neutral arbitrators. The men demanded a 20 per cent cash increase in pay, an eight-hour day, various adjustments in the rules and certain vacation privileges. If their demands were granted in full the yearly telegraph payroll of the Rock Island would be increased by about \$700,000.

At the recent annual meeting of the American Society for Testing Materials it was decided that the tentative standards shall be published in the proceedings as heretofore, and the executive committee was requested to take such action as it saw fit with regard to their separate publication. In accordance with this action the executive committee has decided that, in addition to the publication of the tentative standards as Part

1 of the proceedings, they will be reprinted in a separate pamphlet in a paper binding. Each of the standards will also be reprinted separately so that those who desire copies of individual standards can secure them in that form. The paper-bound book for 1917 will comprise about 325 pages, and in addition to the 60 tentative standards will contain the complete list of standards and tentative standards of the society, with a suitable index. The price of this publication has been fixed at \$2 for members and \$3 for non-members. The volume is expected to be available about October 15.

W. H. Chandler, manager of the Transportation Bureau of the Boston Chamber of Commerce, has written an article complaining that in the matter of freight car shortage the railroads take too little upon themselves and endeavor to throw too much burden upon shippers and consignees; and he says that the records of 664 cars received in New England show that the average time of these cars from western points to destination was 34.7 days. One car came through in six days, and one was in transit 95 days. The average time from Peoria was 48.2 days; from other Illinois points, 44 days; from Milwaukee, 50 days; from Mississippi River crossings, 64.9 days; from Minneapolis, 57.5 days.

French Railroads in Fine Trim

Secretary of War Baker in a recently issued statement has denied that there was any basis of fact for a published statement that the railroads in France had fallen into such a state of disrepair that it had become necessary for American engineers to be sent to France to take charge of their restoration. On the contrary, said Mr. Baker, all his information indicated that the commercial railroads of France were in astonishingly good condition. The nine American engineer regiments that have been sent to France, he said, were to be used in reconstruction and maintenance of military lines.

Judge Lovett Member of Purchasing Commission for Allies

W. G. McAdoo, Secretary of the Treasury, has announced the appointment of Bernard M. Baruch, Robert S. Lovett and Robert S. Brookings, members of the War Industries Board of the Council of National Defense, as members of a purchasing commission to handle all purchases for the allied British, French and Russian governments in the United States. It is expected that the other allied governments may also place their purchases in the hands of this commission. Judge Lovett is also the administrative officer, who, acting for the President, has power to give direction for priority in transportation of certain kinds or classes of freight, as may be made necessary by war conditions.

Delays in Repairing Freight Cars

Fairfax Harrison, chairman of the executive committee of the A. R. A. committee on national defense, has issued a circular, "Bulletin No. 27," calling the attention of railroad managers to the large amount of unnecessary delay in repairing foreign freight cars. When a railroad car shop repairs a freight car belonging to another road, and has to send to that other road for material, it has to bear not only the cost of the per diem charge on the car while it is waiting, but also the loss of the car in service; and in the present scarcity of cars this is a serious item. One large railroad found that there was an average delay of 14 days, from the date of its orders for material from owners, to be used on foreign cars, to the date the material was shipped; and a further delay of 31 days (average) from the time the material was shipped until it was received. These figures, very likely, may show the general average throughout the country.

Attention is called to the fact that the Master Car Builders'

rules permit the use of unstandard parts under certain conditions, provided the car can be made safe and serviceable; and the association has recommended and urged members to take advantage of this provision of the rules. Where it is necessary to use metal holsters, large castings or other parts for which non-standard material cannot be substituted, car owners should take care to ship material with the utmost promptness.

Nine Hundred Twenty Miles on the Wing

Captain Giulio Laureani, an aviator in the Italian army, on August 28 flew from Turin to Naples and return, a distance of about 920 miles, without a stop. He left Turin at 10.07 a. m., reached Naples, flew over that city, and was back in Turin at 8.40 p. m., making an average speed of about 87 miles an hour. The previous long-distance non-stop record was held by Antoine Marchal, a French aviator, 807 miles. Miss Ruth Law flew 590 miles from Chicago to Hornell, N. Y., on November 19, 1916.

Railway Engineers in Battle with Submarine

Letters from members of the Rock Island and Illinois Central companies of the Thirteenth Engineers (Railway) United States Army indicate that the vessel which carried them to Europe had a lively battle with a German submarine shortly after the war zone was entered. In a letter to A. C. Ridgway, vice-president of the Chicago, Rock Island & Pacific, V. H. Hagelbarger, captain of the Rock Island company, wrote in part:

"Our trip so far has been uneventful except yesterday morning when we had a brush with a German submarine, but succeeded in getting away unharmed, although the skirmish was rather lively while it lasted. The men all behaved with the best of order and we were afterwards patrolled by two British destroyers, finding ourselves this morning at anchor waiting for orders."

A letter received by a relative of another member of the Rock Island company described the battle in greater detail: "Sunday at 7 A. M. a 6-in. gun was fired, followed by a 4-in. gun. I did not think of the danger we were in until a shot hit the water about 20 ft. from the left side of the boat. It was a submarine firing at us from the rear. Some of the boys claim they saw the U-boat, but the submarine was too far for me to see with the naked eye. I did see the flash from her guns, but could not hear a report. You can imagine, she was pretty far away. One of the gunners claimed that three shots went over the ship between the funnels and the bridge. The captain sent out a wireless for help and telephoned to the engine room for more speed ahead. The fight lasted 34 minutes, and during that time our gunners fired 34 shots. The 'sub' evidently fired more, for the shots hit the water all around us. At 9 and 9.15 we passed two English ships with one gun each on the stern and signalled them of the danger ahead. Between 11.30 and 12 o'clock we picked up a wireless message that one ship was sunk, but the other got away from the submarine."

Report on Collision at Irving, W. Va.

The Interstate Commerce Commission has issued a report, dated July 6, on the collision which occurred May 22 on the Baltimore & Ohio, near Irving, W. Va., between Wallace and Dola, where one employee was killed and four were injured. The collision was between a wrecking train moving east (after having attended to a derailed car), and a freight train moving west, and was due to carelessness in giving or in executing an order about flagging. The conductor of the wrecking train had sent a flagman from Dola by a preceding train, with orders, he says, to hold the westbound freight at Irving; but the freight was not held and the flagman claims that the order which he carried did not require him to hold it. The flagman held a paper containing the conductor's second instructions; but the conductor claims that a third paper had been issued. This the flagman says he did not receive. The inspector is unable to settle the question of veracity between these two men.

None of the instructions prepared by the conductor were read aloud either by the conductor or the flagman, and in issuing new instructions the former ones were not destroyed. The engineman and the pilot of the wrecking train are censured for not taking an interest in what was going on; they might have prevented the error or errors that were made.

In connection with the investigation it was found that employees were engaged under very lax methods of examination and instruction. Men were employed for train service by a trainmaster's clerk, who had himself never been examined on the rules; and the examination was very perfunctory.

The Railroads, the Public, Legislatures and the Labor Unions

[From the New York Times]

There never was such a volume of railway business moved as is moving now. There never was such a low average rate charged for the business done, in the face of rising costs surpassing all comparisons. The railways' profit is not the smallest ever known, for there have been times when railways went into receiverships by the billion dollars, but the profit is moderate compared with other profits. The mobilization of the army will be accomplished without much disturbance of the public comfort. When similar efforts are made by the railways abroad, the railways are closed to the public, in some cases for six days in a week. That inconvenience is borne because it must be. The railways propose to keep a record of their extraordinary doings and of the co-operation of the public. It will be an interesting record, and as interesting for its omissions as for its inclusions. For example, nothing will be said of the railways' indebtedness to the Governor of Pennsylvania for his veto of the repeal of the full crew bill, nor of the services of the legislature of this state [New York] in not passing a similar repealer. Twenty states have laws compelling the useless employment of 20,000 men, but there are no signs of repeal. The opposition of the unions is already registered.

The purpose of these remarks is to call attention to the fact that there is general co-operation with the railways, except by the lawmakers and the unions. The lawmakers, state and federal, show no signs of having outgrown their hostility to the railways. The unions, of course, regard the railways' difficulty as their opportunity, and will not waive their advantage for any consideration of the public good. In that the unions of this country are not singular. The cable reports the selection of the present moment to strike for the eight-hour day in England.

Prevent Fire

A patriotic duty of every American is to prevent fire, says a bulletin recently issued with the approval of the National Board of Fire Underwriters, and endorsed by the Council of National Defense. The bulletin is of interest to railway men as well as those in other lines of industries. The bulletin follows:

America at war needs every ounce of her energy and resources. It is criminal to cause hazards; it is unpatriotic to neglect them.

Here are some of the ways in which you can help:

1. Learn the factory safety rules and observe them.
2. If you discover a fire, give the alarm promptly. Do you know how to do this? Ask to be shown.
3. Don't smoke where it is not permitted.
4. Never drop a lighted match, cigar or cigarette; be sure that it has no spark left before throwing it away.
5. Report suspicious strangers seen about the plant.
6. If you notice any unusual smoke, the overheating of any machine, or any other accident, notify the foreman at once.
7. Carry your precautions into your own home; keep your house and yard free from rubbish, and help others to do the same.

Where would your job be if this plant should burn?

Help Uncle Sam. BE CAREFUL.

Railroading in Time of War

The Atchison, Topeka & Santa Fe recently sent out 125,000 letters to employees and patrons outlining the Herculean task of taking care of the country's unprecedented transportation needs and the importance of energetic co-operation by all concerned to bring about the highest efficiency possible. The circular points out that the railways were the first forces in the United States to volunteer their services to the Government for the world war and early merged their individual and competitive activities, placing them under the control of a committee of five railway executives, designated the Railroad War Board. "The War Board, as a result of the unity of action on the part of the carriers, has brought into use every available freight car in the

United States. Once a week there is a redistribution of cars among the lines which need them the most, regardless of ownership, thus eliminating waste. This has helped materially in increasing the efficiency of the service. On May 1, the country was short 140,000 cars. On August 1, the shortage had been reduced to 33,776 cars. The Santa Fe on its own lines will contribute to a further reduction of the car shortage by the purchase of 3,900 new freight cars, 55 new passenger cars and 60 new locomotives at a cost of approximately \$12,000,000. Nearly all of this equipment should have been delivered, but the Santa Fe has subordinated its rights and the manufacturers are using the men and material on Government orders."

The letter commends the co-operation of shippers, making possible heavier loading of cars and a reduction in the time of loading and unloading, and concludes: "The volume of Government traffic is the heaviest ever offered, and the fact should be known that the carriers are required to handle it at about half the price paid by other patrons for the same class of service. As a public service corporation the Santa Fe has a two-fold duty to perform—to help win the war abroad, and to continue to help build up the country at home, for use after the war is over. If the exigencies of the Government require it, the entire facilities of the Santa Fe will be devoted to the service of the Government, even to the extent of cancelling all trains now serving the public; but the most resourceful prophet, looking into the future, can see no such situation. The transportation of more than 100,000 cars of material for army cantonnments and the national guard camps, now in progress over the several railways, without interfering with the regular movement of traffic, is the best evidence that the carriers can discharge the duty devolving upon them in any emergency by which they may be confronted."

President Fixes Anthracite Coal Prices

Government control of the coal industry, under the terms of the food and fuel control law, was further extended on August 23 when President Wilson appointed Dr. H. A. Garfield, president of Williams College, as fuel administrator, and also announced a schedule of prices for anthracite coal, at the mines; this in addition to the prices for bituminous coal announced on August 21, and given in the *Railway Age Gazette* last week, page 355. Regulations governing the distribution of coal, which may include a regulation of the profits of retailers, are to be issued later by the fuel administrator, and a licensing system may be adopted. The margin of profit for jobbers was fixed in the President's order. Under the law the government may take over and operate any mine failing to observe the prescribed regulations. The price-fixing order provides that, effective September 1, 1917, the maximum prices per ton of 2,240 lb. on board cars at the mines for the grades and sizes of anthracite coal specified shall not exceed the prices indicated, when such coal is produced and sold by the Philadelphia & Reading Coal & Iron Company, Lehigh Coal & Navigation Company, Lehigh & Wilkes-Barre Coal Company, Hudson Coal Company, Delaware & Hudson Company, Scranton Coal Company, Lehigh Valley Coal Company, Coxie Brothers & Co., Pennsylvania Coal Company, Hillside Coal & Iron Company; Delaware, Lackawanna & Western Railroad; Delaware, Lackawanna & Western Coal Company; Susquehanna Coal Company, Susquehanna Colliers Company, Lytle Coal Company, or the M. A. Hanna Coal Company.

The grades and sizes for which the maximum prices are specified are as follows:

WHITE ASH GRADE			
Broken	\$4.55	Chestnut	\$4.80
ERR	4.45	Pea	4.00
Stove	4.70		
RED ASH GRADE			
Broken	\$4.75	Chestnut	\$4.90
ERR	4.65	Pea	4.10
Stove	4.90		
LYKEN'S VALLEY GRADE			
Broken	\$5.00	Chestnut	\$5.30
ERR	4.90	Pea	4.35
Stove	5.30		

Producers of anthracite coal who are not specified shall not sell the various grades and sizes of anthracite coal at prices that exceed by more than 75 cents per ton of 2,240 pounds, free on board cars at the mines, the prices enumerated; provided, that any producer of anthracite coal who incurs the expense of

rescreening it at Atlantic or lake ports for shipment by water may increase the price thereof by not more than 5 cents per ton of 2,240 pounds.

Producers named shall not sell anthracite coal to producers of anthracite coal not specified.

Dealers and selling agents shall not sell coal produced by the producers named on the basis of the prices fixed at the mine for coal produced by the producers not specified.

The prices fixed are based on investigations as to the cost of production conducted by the Federal Trade Commission, which has also been conducting investigations as to the cost of iron and steel, lumber and other commodities, with a view to further regulations. They are approximately the same as have been charged by the companies after conferences with the trade commission.

Railway Signal Association

The business of the annual meeting of this association, to be held at Atlantic City, September 18 and 19, consists wholly of the discussion of reports of committees, which reports have already been tentatively presented at previous meetings, and most of which now contain recommendations for final action by letter ballot. The first committee to be heard is the special committee on harmonizing of specifications, and the others are to be heard in the following order: Committee No. 2, mechanical interlocking; No. 3, power interlocking; No. 6, standard design; No. 10, storage battery; No. 1, signaling practice; No. 7, direct current relays; No. 8, electric railways and alternating current signaling; special committee on electrical testing; No. 5, maintenance and operation; special committee on lightning protection.

Committee No. 1 does not recommend any definite action at the present time. Committee No. 2 reports on field construction of pipe lines, and on locking switches mechanically at interlocking plants. Committee No. 3 presents a specification for petroleum asphaltum. Committee No. 5 presents a set of instructions for maintenance of alkaline storage batteries. Committee No. 6 presents 26 drawings, 7 of which are new designs, and also a specification for hand lantern globes. Committee No. 7 will present matter concerning the resistance of track relays as set forth in the Journal for March and for May; also a table showing minimum safe resistance between battery and track. Committee No. 8 will present five unit specifications, which were discussed at the June meeting; also descriptions of a number of installations of alternating current signaling. Committee No. 10 will present a specification for lead type stationary storage battery for signaling; general specifications for switchboard, and a drawing of a thermometer. The committee on harmonizing specifications will present a revised statement of the matter which has been discussed at the previous meetings this year, and will propose that the harmonized sections and paragraphs be approved for reference to letter ballot. The committee on lightning protection will present a specification for made ground apparatus. The committee on electrical testing will present a specification for ranges and scales for direct current electrical instruments; a track circuit chart and a ballast and rail resistance test chart.

Association of American Railway Accounting Officers

The secretary of the Association of American Railway Accounting Officers has recently announced that the next meeting of the association will be held at the Congress hotel, Chicago, on September 26.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the *Railway Age Gazette* for each month.

- AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hope, C. 16-17, St. Louis.
- AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 16-18, 1917, Chicago.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 230 W. 57th St., New York.
- ASSOCIATION OF AMERICAN RAILWAY ACCOUNTING OFFICERS.—E. R. Woodson, Rooms 1116-8 Woodward Bldg., Washington, D. C. Next meeting, September 26, Congress Hotel, Chicago.

ASSOCIATION OF MANUFACTURERS OF CHILLED CAR WHEELS.—George W. Lyndon, 1214 McCormick Bldg., Chicago. Semi-annual meeting with Master Car Builders' Association.

ASSOCIATION OF RAILWAY CLAIM AGENTS.—Willis H. Failing, Terminal Station, Central of New Jersey, Jersey City, N. J.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—W. L. Connelly, Supt. of Telegraph, Indiana Harbor Belt, Gibson, Ind. Next annual meeting to have been held September 18, 1917, Washington, D. C., indefinitely postponed.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual dinner, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S ASSOCIATION.—W. R. McMunn, New York Central, Albany, N. Y. Next convention, September, 1917, St. Louis.

CINCINNATI RAILWAY CLUB.—H. Bonhet, Chief Interchange Inspector, Cin'ti Ry., 101 Carey Bldg., Cincinnati. Regular meetings, 2d Tuesday, February, May, September and November, Hotel Sinton, Cincinnati.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 568 Union Arcade Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh, Pa.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

INVESTMENT BANKERS' ASSOCIATION OF AMERICA.—Frederick R. Fenton, 11 W. Monroe St., Chicago. Annual convention, October 1-3, 1917, Baltimore, Md.

MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES OF CANADA.—F. W. Ilager, Fort Worth & Denver City, Fort Worth, Tex. Next convention, October 16-18, 1917, Cleveland, Ohio.

MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—A. P. Dabe, B. & M., Reading, Mass. Next annual meeting, September 11, Chicago.

NATIONAL ASSOCIATION OF RAILWAY COMMISSIONERS.—Jas. B. Walker, 120 Broadway, New York. Next annual convention, October 16, 1917, Washington, D. C.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meeting, 2d Tuesday in month, except June, July, August and September, Boston.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—Geo. A. J. Hochgrebe, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.

PACIFIC RAILWAY CLUB.—W. S. Wollner, Assistant to Chief Engineer, Northwestern Pacific R. R., San Francisco, Cal.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—F. C. Stewart, 410 Masonic Temple, Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.

RAILROAD CLUB OF KANSAS CITY.—Claude Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Saturday in month, Kansas City.

PAULWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Pittsburgh Commercial Club Rooms, Colonial-Annex Hotel, Pittsburgh.

RAILWAY FIRE PROTECTION ASSOCIATION.—C. B. Edwards, office of the president's assistant, Seaboard Air Line, Norfolk, Va. Next meeting, October 2-4, 1917, St. Louis, Mo.

RAILWAY REAL ESTATE ASSOCIATION.—R. H. Morrison, Assistant Engineer, C. & O., Richmond, Va. Next convention, October, 1917, Duluth, Minn.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Myers Bldg., Bethlehem, Pa. Next annual convention, September 18-19, 1917, Hotel Traymore, Atlantic City, N. J.

RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—P. J. McAndrews, C. & N. W., Sterling, Ill. Next annual convention, September 18-21, 1917, Hotel Auditorium, Chicago.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—J. J. Merrill, Grand Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 a. m., Piedmont Hotel, Atlanta.

TRAFFIC CLUB OF CHICAGO.—W. D. Wharton, La Salle Hotel, Chicago.

TRAFFIC CLUB OF NEW YORK.—A. C. Swope, 291 Broadway, New York. Regular meetings, 1st Tuesday in month, except June, July and August, Waldorf-Astoria Hotel, New York.

TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Gen'l Ag't, Erie R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings bi-monthly, Pittsburgh.

UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, 1111 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.

WESTERN CANADA RAILWAY CLUB.—L. Kon. Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Monday in month, except June, July and August, Hotel Shelman, Chicago.

WESTERN SOCIETY OF ENGINEERS.—Edgar S. Nethercut, Acting Secretary, 1735 Monadnock Block, Chicago, Ill. Regular meeting, first Monday in month, except January, July and August. Extra meetings generally on other Monday evenings except in July and August.

Traffic News

F. A. Lallier, hitherto connected with the Houston (Texas) Chamber of Commerce, has been appointed traffic manager of the Galveston Commercial Association.

The railroads of Wisconsin filed an application before the Railroad Commission of that state on August 16, asking for authority to make an increase of 15 cents a ton in coal and coke rates.

The New York, New Haven & Hartford has filed with the Public Utilities Commission of Rhode Island a proposal to increase local freight rates applying on shipments within that state 15 per cent.

The State Public Utilities Commission of Illinois will hold a hearing at Chicago on September 4 to consider the application of the railroads for a reduction of free time to be allowed for loading and unloading open top cars from 48 hours to 24 hours, and the abolition of free time in connection with the reconsignment of such cars.

The Public Service Commission of Indiana, the State Public Utilities Commission of Illinois and the Public Utilities Commission of Ohio, held a joint conference at Indianapolis, Ind., on August 23, to consider the application of the railroads for an increase of 15 cents a ton in freight rates on coal and coke. No joint action by these commissions will follow this conference, but each will issue separate orders on the basis of the evidence presented before each commission. It was also decided at the conference to appoint a committee composed of one member of each commission to discuss class and commodity rates, other than those covering coal and coke, where there appears to be discrimination as between the various states.

Car Conservation in the Concrete

Penick & Ford, of New Orleans, wholesale dealers in molasses, are reputed to be pioneers in double loading of freight cars, and in the month of May last their average carload was 9,706 lb., or 20 per cent, heavier than in May, 1916; and this means the average per shipment, not the average per car. "Double loading," as most of our readers know, means to make one actual carload out of two "carloads" as defined by the freight classification. For example, the tariff may say that the carload rate applies to any shipment of 20 tons or over; but if the car which is provided for the load will hold 40 tons, and if there are two shipments of 20 tons each, destined to the same point, the shipper can put the whole into a single car.

The increase above noted marks the culmination of a fine record in this respect at Penick & Ford's establishment since the beginning of this year. This concern also has made a marked improvement in the prompt loading and unloading of cars; and the firm's traffic manager has issued a circular, printed in red, white and blue, giving some of the figures. In January, 1917, 93 per cent of the cars loaded or unloaded were released before the expiration of free time; and one-sixth of these cars were released before the beginning of the free time. Similar good records were made in following months, and in April no less than 26 per cent of the cars were released before the beginning of the free time. For example, in the case of a car arriving on Monday at noon, and on which the demurrage record, including the free time, would not begin until 7 a. m. of Tuesday, the load was completely discharged on Monday afternoon.

This circular reports the average detention per car at the New Orleans plant of Penick & Ford as follows: January, one day; February, two-thirds of a day; March, one and one-fourth days; April, one-half day; May, one and one-fourth days. The circular says:

"This is not a boast, simply a statement of where we stand. We hope to improve the record. What is your record Messrs. Shipper and Railroad man?"

Commission and Court News

INTERSTATE COMMERCE COMMISSION

A hearing was held before the suspension board of the Interstate Commerce Commission at Washington on August 28, on protests of the livestock shippers and packers against the proposed advance of approximately 15 per cent in the rates on livestock and dressed meats east of the Mississippi river, which is the first to be considered of a considerable number of proposed advances in commodity rates filed by the roads just prior to August 15, under the blanket approval given by the commission for the filing of tariffs up to that date.

The commission has issued the tentative report of its examiner on the proposed tariff, reducing from five days to two the free time allowed for holding domestic freight at New York for unloading. This tentative report approves the reduction. The commission has not yet passed upon the report nor approved the findings. The proposal to increase storage charges on both export and domestic shipments not handled within the proposed two days free time limit also was tentatively approved in the report. The proposal to reduce the free time of 15 days allowed for handling export shipments at North Atlantic ports and the free time of 10 days allowed at Gulf ports to five days is not approved.

The commission is now making public, by placing copies on the press table in the secretary's office, notices giving approval for the filing of tariffs, as required by the amendment to section 15 of the act, which became effective on August 9. When a railroad or a tariff issuing agency now desires to file a tariff containing an increased rate, it is necessary to file with the commission an application giving an explanation of the proposed increase and the reasons for it. Of the first five applications filed the commission had approved two up to Tuesday of this week, the other three being still under consideration. The notices state that a petition for approval of the tariff having been filed, the tariff is approved for filing without formal hearing, which approval shall not affect any subsequent proceeding relative thereto.

COURT NEWS

Improper Use of Brake Beam by Switchman

The Texas Supreme Court holds that negligence cannot be predicated on a railroad's failure to make a brake beam safe for a switchman to step on as the car approaches him.—*Freeman v. Garretts* (Tex.), 196 S. W., 506. Decided June 30, 1917.

Passes to Employees

The Massachusetts Supreme Judicial Court has issued a decision on the rule that, where a pass is issued to an employee as one of the terms of his employment, the clause by which the recipient assumes the risk of accident is not binding. The rule is held to be not changed by the Massachusetts statute of 1913 as amended in 1914, prohibiting free transportation, but permitting free or reduced rate service to employees, etc.—*Palmer v. B. & M.* (Mass.), 116 N. E., 899. Decided June 28, 1917.

Setting Fires by Sparks—Evidence

In an action against a railroad for destruction of property by fire, the Alabama Supreme Court holds that the defendant's evidence showing that its engine was properly constructed and equipped, in good repair, and properly operated and managed, was a complete defense unless the showing was contradicted, as by evidence that the sparks emitted on the occasion were of unusual size or in unusual quantities, or were thrown to an unusual distance, in which case it would be for the jury to say whether the construction, equipment, repair and management were proper and sufficient. Where the engine was pulling a heavy load up grade, it was held that a witness' statement

that it emitted an unusual quantity of sparks, as compared with other engines, as observed by him, was not *prima facie* relevant, and should have been excluded.—*L. & N. v. Davis* (Ala.), 75 So., 977. Decided May 10, 1917.

Hiring at Will for Deed of Right of Way

The Arkansas Supreme Court holds that a railroad's contract, in consideration of a right of way deed, to give the grantor a position as brakeman at regular work and a named salary, being for an indefinite period, was terminable at the will of either party, and a hiring for any substantial length of time and refusal to give employment for a further time, did not constitute breach by the railroad.—*Ashley, Drew & Northern v. Cunningham* (Ark.), 196 S. W., 789. Decided June 11, 1917.

Rates for Disinfecting Stock Cars

In proceedings before the Illinois Public Utilities Commission to fix rates for cleaning live stock cars, it appeared that the disinfecting of cars as required by the state board of live stock commissioners necessitated a detention of the car for one day and a charge of 45 cents for one day's detention was reasonable and customary. The Illinois Supreme Court held that the commission should have included such charge in the rates fixed by it.—*Commission v. Atchison, T. & S. F.* (Ill.), 116 N. E., 696. Decided June 21, 1917.

Free Passes—Stipulation Against Liability for Accident

Following the decision in *Ft. Wayne & Wabash Valley Traction Co. v. Justus*, 115 N. E., 585, the Indiana Appellate Court holds that a pass issued by the defendant railroad to deceased, an officer of another railroad, in exchange for passes issued by his road to officers of the defendant, as authorized by the Indiana statute of 1914, is a free pass or gratuity, so that a provision therein that he should assume the risk of accident is binding, preventing recovery for his death while riding thereon, unless caused wilfully.—*Mitten v. Delano* (Ind.), 116 N. E., 744. Decided June 29, 1917.

Insufficient Evidence of Negligence

In an action for personal injuries it was alleged that while the plaintiff was walking on a well marked path alongside the track a train passed him at high speed, sucking him against or under the cars. The Georgia Court of Appeals held the railroad not liable. Either the happening was likely to occur, in which case a man of ordinary prudence would be bound to guard against it; or it was unusual and extraordinary, and the men in charge of the train could not be expected to anticipate it.—*Southern v. Young* (Ga.), 93 So., 51. Decided June 27, 1917.

Corporation Excise Tax—"Income"

The Circuit Court of Appeals, Sixth Circuit, holds that where a railroad company bought stock in another company prior to January 1, 1909, for investment, and not for sale, but sold such stock at a profit subsequent to January 1, 1909, such profit was not "income," within the Corporation Tax Law of 1909, except to the extent that the selling price exceeded the ascertained market value on January 1, 1909; but to that extent the selling price constituted income, it appearing that the stock had a well-understood stock market value. The word "income," in the Corporation Tax Law, imposing an excise tax measured by income, means the same as in prior laws imposing a tax on income.—*Cleveland C. C. & St. L.*, 242 Fed., 18. Decided May 8, 1917.

Liability of Railroad and Hospital Association for Refusal to Give Treatment

Suit was brought by a railroad employee against the railroad and a hospital association connected therewith for failure to furnish medical and surgical treatment for the plaintiff's thumb, injured in the railroad's machine shop. The railroad deducted from the plaintiff's wages a certain percentage as hospital fees, which it turned over to the hospital association, a separate and distinct corporation, from which the railroad received no profits. The deductions thus made entitled the employees to medical

treatment in the hospital. On the back of each check to the plaintiff for wages was an indorsement, below which he always signed, to the effect that deduction for hospital fees was made with the express understanding that the sole obligation of the railroad was to pay over the money to the association. The plaintiff applied to one of the surgeons for treatment, which was refused. The Texas Court of Civil Appeals held that the railroad was not liable for the damage resulting to the plaintiff.

The original contributors to the hospital fund agreed with each other that the fund should be used for the sole purpose of treating and caring for [contributors]; and the court held that the use of the funds to satisfy this claim would be in violation of the agreement.—*Davis v. G. C. & S. F. (Tex.)*, 196 S. W., 603. Decided May 12, 1917.

Crossing Accident—Contributory Negligence of Automobile Passenger

The Nebraska Supreme Court holds that one who by invitation rode in an automobile driven by another and remained in it, with knowledge that it was approaching a dangerous railroad crossing without requesting the driver to stop or to take other necessary precautions to avoid danger, though, if he had looked and listened, there was time to induce the driver to stop or to jump out of the car, was guilty of contributory negligence, and cannot recover for personal injuries sustained from colliding with a passing train, even though no signal by the locomotive bell or whistle was given.—*Morris v. C. B. & Q. (Neb.)*, 163 N. W., 799. Decided July 3, 1917.

Leaky Valve—Assumed Risk

The South Dakota Supreme Court holds that a plaintiff railroad employee's testimony that an engine valve was leaky and that he was scalded by hot water and steam suddenly escaping does not establish the defendant railroad's negligence, where the cause of the leak is unexplained. The plaintiff employee had the burden of showing the defendant employer's negligence proximately causing the injury. If injury from escaping steam could reasonably be anticipated from a leaky valve, the plaintiff employee assumed the risk incident to such defect when he used the engine knowing its condition and that it could not be remedied until the engine reached another point.—*Lee v. Great Northern (S. Dak.)*, 116 N. E., 560. Decided June 26, 1917.

FUEL CONSUMPTION OF CANADIAN RAILWAYS.—The consumption of fuel of all kinds by locomotives on Canadian railways increased from 5,608,954 tons in the year ended June 30, 1907, to 8,995,123 tons in the year ended June 30, 1916. The average cost per ton in the last statistical year was \$3.11, against \$3.02 for the immediate previous year.

GERMAN COAL YIELD CUT 1,000,000 TONS.—Strikes of miners in Silesia during the month of July reduced the German production of coal by more than 1,000,000 tons, according to statements made in the debate in the Reichstag Main Committee on the fuel problem. Vice-Chancellor Helfferich gave an urgent and earnest warning against further strikes.

BY WATER INSTEAD OF RAIL.—To further the government plan of conserving railroad rolling stock, the Keystone Steel & Wire Company, of Peoria, Ill., of which W. H. Sommer is president, has experimented with moving its product by water. It has transported 1,200 tons of pig iron over 681 miles from Sheffield, Ala., to Peoria, almost entirely by water. The officials believe that this is the longest inland movement of pig iron made by water by any single manufacturer. The government took a deep interest in the matter, loaning some necessary machinery for loading the iron. It has not been determined whether this is a cheaper way of transportation.

BRITISH RAILWAYMEN'S FIFTH BONUS.—It is announced that the railwaymen's war bonus of 15s. (\$3.60) per week for men and 7s. 6d. (\$1.80) for youths is in future to be reckoned as wages. This will be of benefit to the men in that payments for overtime and Sunday duty will be calculated at the higher rate that includes the bonus amount. It is expected that the same concession will be made to the shopmen. This is the fifth increase in pay made to the railway men since the war commenced, three years ago.—*The Engineer, London.*

Equipment and Supplies

LOCOMOTIVES

THE MINNEAPOLIS & ST. LOUIS is trying to secure space for 5 Pacific and 20 Mikado or Santa Fe locomotives.

THE NEW YORK, NEW HAVEN & HARTFORD has ordered five electric locomotives from the Westinghouse Electric & Manufacturing Company, and it is understood will soon buy 15 more.

THE AMERICAN RAILROAD OF PORTO RICO has ordered 3 compound Consolidation locomotives from the American Locomotive Company. These locomotives will have 14 and 20 by 20-in. cylinders, and a maximum tractive effort of 15,000 lb.

FREIGHT CARS

THE INLAND STEEL COMPANY has ordered 72 50-ton general service cars and 35 50-ton hopper cars from the Bettendorf Company, Bettendorf, Iowa.

SIGNALING

THE KANSAS CITY TERMINAL has given a contract to the Union Switch & Signal Company for a 15-lever frame electro-pneumatic interlocking machine at High Line Junction.

FOR THE PENNSYLVANIA LINES WEST the Union Switch & Signal Company will install a mechanical interlocking at Hawthorne, Ind.; 4 switch levers, 10 signal levers and 5 levers for facing point locks.

THE PHILADELPHIA, BALTIMORE & WASHINGTON has placed an order with the Union Switch & Signal Company for a 23-lever electro-mechanical interlocking machine at Harrington, on the Delaware division.

THE CENTRAL OF GEORGIA is to extend its automatic block signal territory in the vicinity of Macon, Ga. Seventeen 1-arm and one 2-arm Style "S," double case, low voltage, ground signals, and other necessary material have been ordered from the Union Switch & Signal Company.

THE NORFOLK & WESTERN has awarded a contract to the Union Switch & Signal Company for the extension of the signaling on the electrified division near Welch, Va. Thirteen 1-arm, 3-position, Style "S" bridge signals will be installed. Centrifugal relays of the 2-clement type will be furnished for the track circuits; and vane type line relays.

THE PENNSYLVANIA has ordered from the Union Switch & Signal Company two interlocking machines for the Philadelphia Terminal division; at Twenty-second street an 83-lever frame Model 14 electro-pneumatic, and at Delaware avenue and Vandalia street a 19-lever type "F" electric interlocking; also on the Pittsburgh division an electro-pneumatic machine at Bennington, Pa., with a 23-lever frame.

CHINESE RAILWAYS SEEK MOTOR CARS.—Consul N. T. Johnson, at Changsha, China, requests that catalogues describing and quoting prices on small motor-driven inspection cars, such as are used on railway lines by engineers for inspecting track or roadbed, be sent to the consulate. Information concerning small 1-passenger or 2-passenger cars is wanted. The cars should be driven by kerosene motors rather than gasoline, if possible.

AMALGAMATION OF SIAM'S STATE RAILWAYS.—The Siamese Northern and Southern Railways, which up to the present time have been under separate management, have now been placed under a commissioner general of State Railways, and at the same time Henry Gittins, controlling engineer of the Southern line, has been appointed adviser to the new office. The Prince of Kambeng Bcitra, who about two years ago made an extended visit to the United States, has been appointed commissioner general of the amalgamated railways.—*Commerce Report.*

Supply Trade News

The Railway Specialties Corporation has moved its office to larger quarters at 30 Church street, New York.

W. S. Spiehl has been appointed manager of the Davis wheel department of the American Steel Foundries, with office at Chicago, to succeed F. A. Lorenz, Jr., who has resigned to go into other business.

The Lipman Refrigerator-Car & Manufacturing Company, Beloit, Wis., has commenced the construction of a foundry, tank and welding shops and an office building in that city, and will soon commence work on car sheds and other buildings. The initial expenditure will be about \$50,000.

Edward C. Fisher, manager of the Cooke Works of the American Locomotive Company since September 26, 1916, has been transferred from Paterson, N. J., to become manager of the American Locomotive Company's plant at Pittsburgh, Pa. A sketch and photograph of Mr. Fisher appeared in the *Railway Age Gazette* of September 29, 1916, page 569.

The American Car & Foundry Company has leased for five years a half of the 17th floor of the Hudson Terminal building, 30 Church street, New York, and will consolidate its New York and St. Louis offices there. At present the company has New York offices at 165 Broadway, but could not obtain sufficient space in that building to provide for the departments that will be moved to New York from St. Louis.

The Walter A. Zelnicker Supply Company, St. Louis, Mo., has recently secured the service of J. C. Bryan, formerly with Manning, Maxwell & Moore, Inc., as that company's southwestern representative of the Ashcroft Manufacturing Company, the Consolidated Safety Valve Company, the Hayden & Derby Manufacturing Company, and the Hancock Inspirator Company. Mr. Bryan will be associated with the equipment department of the Zelnicker company.

American Locomotive Company

If there is one thing in the recently issued annual report of the American Locomotive Company that shows what has been going on in the equipment market in the last few months, it is the statement that the total unfilled orders on June 30, 1917, amounted to \$77,620,449, as compared with \$19,376,532 on June 30, 1916. The American Locomotive Company completed its munitions work, which was being done at its Richmond and Montreal plants, this month. The amount of munitions orders which were uncompleted on June 30, 1917, was only \$3,566,528.

The gross earnings of the company in the fiscal year ended June 30, 1917, were \$82,000,000, as against \$59,000,000 in 1916. The increased cost of operation, however, was such that the profits on the year's business were only \$7,000,000, as compared with nearly \$11,000,000 in 1916. Dividends were declared in 1917 amounting to \$3,350,000, including 7 per cent on the preferred stock, 5 per cent on the common stock, and the special Red Cross dividend of one per cent on the common stock. This left a surplus of \$4,000,000, as compared with \$9,000,000 in 1916. From this surplus there was deducted a reserve for additions and betterments amounting to \$2,000,000, whereby the net credit to profit and loss in the year's business was \$2,000,000, making the surplus at the close of the year \$16,000,000.

Chairman, Sylvanus L. Schoonmaker in his annual report to the stockholders of the company, says in part:

"During the year prices of materials of all kinds increased to an unprecedented degree; a great scarcity of both skilled and unskilled labor existed, notwithstanding that large increases in wages were made and the working time of the shops shortened. These abnormal operating conditions, which could not be fully anticipated, affected the profits on both locomotives and munitions.

"Both in Canada and the United States, the selling prices on munitions were reduced to lower levels than prevailed in the preceding year and the new contracts for shells admitted, even under normal conditions, of a much smaller margin of profit than previous contracts allowed. The new contracts were for larger shells than those previously made, and necessitated large

additions of equipment and extensive alterations to plants, for which the sum of \$3,760,561.49 has been included in the manufacturing cost and deducted from earnings.

"The munitions work at Richmond and Montreal will be completed in August, 1917. The work of restoring these plants to locomotive production uses has already been started, and when completed the entire capacity of all of the plants of the company will be devoted exclusively to the manufacture of locomotives, which are urgently needed abroad as a war necessity, and also by the railroads of this country.

"As a part of the plan of restoring the Richmond plant, and with the purpose of obtaining an immediate increase in the foundry capacity of that plant for locomotive work, the company purchased on June 25, 1917, the land and buildings of the Henrico Iron Works Corporation at Richmond, Va., suitable, with improvements which can be quickly installed, for making locomotive gray iron castings. As a part of the purchase price of the Henrico property, your company assumed an outstanding mortgage of \$25,000, represented by an issue of the Henrico Iron Works Corporation of first mortgage 6 per cent gold bonds maturing August 15, 1919, which cannot be retired prior to maturity.

"It is the purpose of the management to manufacture as much of the material entering in large quantities into the construction of locomotives, as can be produced by the company to economic advantage. In accordance with this policy, the company purchased on July 2, 1917, from the Penn Seaboard Steel Corporation, a modern steel casting plant at Chester, Pa., known as the Seaboard Works. As a part of the terms of purchase your company acquired the full working organization of the Seaboard plant, which has continued to operate without cessation, and its entire output is now being used for the company's locomotive work.

"The company subscribed for \$1,000,000 of the issue of United States Liberty Loan Bonds of 1917, of which \$500,000 was in anticipation of subscriptions to be made through the company by its employees. Because of the country-wide over-subscription of the loan, the company's final allotment was \$612,500. Out of this allotment 7,867 of the company's employees purchased \$535,850 of such bonds to be paid for in weekly and monthly installments over a period of 50 weeks. The remainder of the bonds, amounting to \$76,650, are carried by the company as an investment."

The general balance sheet follows:

ASSETS	
Cost of property (less depreciation reserves).....	\$47,138,127
Sundry securities owned.....	908,328
Current assets—

Railway Construction

CANADIAN PACIFIC.—This company is increasing the capacity of its West Toronto yards from 1,700 to 2,200 cars, and revising the layout so as to eliminate conflicting movements. The Runnymede Road subway through the center of the yard, which now has a six-track steel superstructure, is being extended for six additional tracks with a reinforced concrete superstructure. The subway was excavated, and the abutments and the retaining walls built for a total of 12 tracks when the subway was originally constructed. All grading and track work is being done by the company's forces, and the Runnymede Road subway superstructure is being built by Archibald & Holmes, Ltd., Toronto.

Work has also been started recently on double tracking the line between Leaside, on the North Toronto subdivision, and North Toronto, about two miles distant. The grading is comparatively light, and this, together with all track work, will be handled by the company's forces. In connection with this work the company is removing two single track steel viaducts, and replacing them with reinforced concrete construction. Each is about 400 ft. long, and has a maximum height of approximately 100 ft. from base of rail to ground line. The one at mileage 0.9 over the Belt Line Ravine will be replaced by a two-track, and that at mileage 1.8 over the reservoir Park Ravine by a three-track structure. It is hoped to have the work completed by the end of November in order that it may be ready to handle next winter's traffic. The contract for bridge 0.9 has been let to the Dominion Construction Company, Ltd., and for bridge 1.8 to Wells & Gray, Ltd., both of Toronto.

ILLINOIS CENTRAL.—This company has completed plans for the construction of a brick freight house at Grand Crossing (Chicago). The structure will be 30 ft. wide by 200 ft. long, with wood block floor and slate roof, and will cost approximately \$70,000.

Plans have also been completed for an addition to the passenger station at Paducah, Ky., which will be 56 ft. by 22 ft., of brick construction with a slate roof, and will contain a lunch room and kitchen. The plans also provide for the installation of toilets in the depot and the construction of a frame canopy, averaging about 30 ft. in width, around the building, which will be about 250 ft. long. The work will cost about \$10,000.

A contract has been awarded to George B. Swift & Co., Chicago, for the construction of a freight house at Kankakee, Ill., to cost about \$20,000. The building will be 37 ft. by 128 ft., 60 ft. of which will be two stories in height. The structure will have brick walls, a slate roof and wood block floors (July 6, page 43).

A contract has been awarded to T. S. Leake & Co., Chicago, for the enlargement of mechanical facilities at Clinton, Ill. (May 18, page 1076).

W. J. Zitterell, Webster City, Iowa, has been awarded the contract for the construction of a freight house at Ft. Dodge, Iowa, to cost about \$25,000 (June 15, page 1260).

A contract has been awarded to Kehn Bros., Chicago, for the installation of heating facilities at the Burnside (Chicago) shops, to cost about \$5,000.

MIDLAND & NORTHWESTERN.—This company is erecting a station at Midland, Tex., to cost about \$5,500, the work being done by C. K. Stark. The grading for the road, which will extend from Midland, Tex., to Seminole, 65 miles, has been completed, and 48 miles of track have been laid. It is the intention ultimately to extend the line from Seminole to Roswell, N. M., 130 miles further. T. J. O'Donnell, president, Midland, Tex. (February 23, page 337).

MISSOURI, KANSAS & TEXAS.—This company will construct a new main line approximately two miles in length around the east side of its present yard at Muskogee, Okla., and a 2,500-ft. second main line out of the station. It will also rearrange and extend yard tracks, with a total cost of all improvements of about \$80,000.

NEVADA-CALIFORNIA-OREGON.—This road is erecting an administration building, a roundhouse, a machine shop and other minor buildings at Alturas, Cal., the cost of which, including real estate and necessary trackage, will aggregate about \$75,000.

NEW MEXICO LINE.—New Mexican interests are contemplating the construction of a railroad from Holbrook, N. M., 70 miles south into a timber belt lying in the government forest preserve.

NEW YORK, NEW HAVEN & HARTFORD.—Company forces are now at work on a new 18-stall brick, concrete and hollow tile roundhouse at Cedar Hill yard just east of New Haven. The roundhouse will be about 98 ft. wide, 488 ft. long, and will cost about \$141,000.

PEARL RIVER VALLEY.—This company has been chartered to build a railroad from Picayune, Miss., to Columbia, approximately 55 miles, the entire distance being through virgin timber lands. J. E. Du Pont, Jr., traffic manager and superintendent, Picayune, Miss.

PENNSYLVANIA RAILROAD.—Work was recently started on a two-story brick and structural steel outboard freight house and bridges connecting with the present inbound house and the Louisiana street viaduct at Buffalo. The building will be 32 ft. wide and 420 ft. long, and will cost about \$150,000. The contract has been let to the Geo. H. Shickler & Sons Company, Erie, Pa.

TAMIAMI RAILWAY.—This company has in mind a project to construct and operate a railway between Homestead, Miami, Fort Myers and Chevalier Bay, Fla. The line will secure a business in timber, agricultural products, citrus fruit and stock. J. F. Jaudon is president, and F. K. Ashworth is engineer at Miami, Fla.

RAIL MOTORS IN WAR.—The war, which has led to the development of so many other peaceful appliances and inventions, has witnessed the utilization of the rail motor car on an extraordinarily large scale. We are not referring to the self-contained unit, usually steam propelled, which is so extensively used on branch lines in the United Kingdom, but to the small petrol-driven vehicle principally employed as an inspection car in normal times. Vehicles of this type have found a singularly wide scope of utility for military purposes, since their construction and operation render them as fitted for employment on narrow-gauge or temporary railways as on standard-gauge heavy lines. A French official publication has described a particularly neat type of rail motor used on light railways in the hilly Vosges country. This has a sprung framework of locomotive pattern, the conventional motor car "bonnet," cross seats like those of a tramcar, and a control handle, which also resembles tramway practice. Officers desirous of reaching their destination quickly find these cars very useful. This particular design is typical of many used on various fronts by Allies and enemies.—*Railway Gazette, London.*

SCRAP IRON AND STEEL OF WAR.—Considerable speculation has been going the rounds as to the amount of scrap iron and steel that is accumulating on the battlefields of Europe, and how it is to be disposed of. American companies which regularly deal in such old material have for some time been looking forward to the harvest to be reaped from these battlefields after the war. These hopes have been rather rudely shocked lately by observers recently returned from the front, who state that this matter is now being handled by the respective governments. According to the systems now established in modern warfare, it is stated that a salvage corps is daily going over all the ground near the battle front exposed to fire, and is gathering all the debris discarded by the contending armies. None of the scrap is neglected, with steel worth 2 to 3 cents per pound and copper and other metals in proportion. All the metals are taken to shops in the rear and there worked over to be cast into other various metal munitions that a modern army uses. All the lead that is fired is practically lost, as a bullet traveling at a velocity of 2,000 feet or more per second buries itself so deep into any object it hits as to be lost entirely. Other metals, however, such as tangled steel from wrecked motor cars, large pieces of shells, bits of copper, pieces of aluminum, etc., are carefully collected and later turned into usable conditions.—*Scientific American.*

Railway Financial News

CARTHAGE & COPENHAGEN.—See Deer River Railroad.

CHICAGO & EASTERN ILLINOIS.—The sale of this company, which had been set for September 4 at Danville, Ill., has been postponed indefinitely by Judge G. A. Carpenter, of the United States District Court at Chicago.

DEER RIVER RAILROAD.—A charter has been granted this company by Secretary of State Hugo to operate the 9-mile line formerly owned by the Carthage & Copenhagen Railroad Company, operating between Carthage, N. Y., and Copenhagen. The new company is capitalized at \$100,000 in shares of \$100 each. The directors are: James A. Outterson, W. B. Van Allen, David W. Balmat, Guy C. Jones, Arthur W. Mattison, of Carthage; Alfred C. Stewart, of Ogdensburg; William T. Twining, Robert A. Ross, Eugene B. Millard, William L. Sheldon and Harry L. Grant, of Copenhagen.

HOCKING VALLEY.—This company has authorized an issue of \$5,000,000 6 per cent notes, maturing November 1, 1918, to pay off \$4,000,000 note, maturing November 1, 1917, and for other capital required. The directors have issued the following statement: "Last week the Circuit Court of Appeals of Franklin County, Ohio, handed down a decision confirming the right of the Chesapeake & Ohio to own Hocking Valley stock, thereby concurring with a decree to similar effect rendered in 1914 by the United State Court of Cincinnati. Nearly all the other conditions of the decree of last week have been complied with before the decree was rendered, and the remainder are in process of being carried out."

PENNSYLVANIA RAILROAD.—Judge Dickinson in the United States District Court has handed down a decision under which bondholders of the Pennsylvania Canal Company, a subsidiary concern of the Pennsylvania Railroad, will share in a fund of \$1,379,941.28. After a long litigation the court held that the loss suffered by the bondholders when the canal company was unable to meet its bonds at maturity, was due to the failure of the railroad to maintain a sinking fund under the terms of a mortgage under which the bonds were issued in 1870. Since that time the railroad has used effort in an attempt to prevent the distribution of the entire fund. In the exceptions to the master's report it was contended by the railroad that it should share in the fund as the holder of detached interest coupons from the canal company's bonds to the amount of \$3,116,400, and also a claim for \$518,400, the face value of 17,280 interest coupons the railroad had purchased from canal bondholders, should be allowed. In deciding in favor of the bondholders and dismissing the railroad's claims, the court said in part: "Accepting as we do the ruling of the state court in the proceedings upon the mortgage, we are bound to conclude that under the terms of the mortgage the interest coupons have priority of payment in the distribution of the proceeds of the mortgaged premises sold as the property of the canal company, and as against the canal company. To hold, however, that the railroad company in an action against it arising under the collateral agreement is entitled as a purchaser of the coupons to a like priority of payment over the bondholders would be to deny the soundness of the reasoning upon which the ruling already made in the case proceeded. The master was, therefore, we think, entirely right in holding (whether the question was strictly *res adjudicata* or not) that the ruling already made, which resulted in the creation of this fund compels the ruling that the fund created for the payment of the bonds cannot be diverted to the payment of the coupons."

TROLLEY LINES TO REPLACE CHINESE WALLS.—Canton's noted walls, which have stood for centuries, are now being torn down in the interests of progress, and trolley lines are to be built that will completely encircle the city and give the visitor an inexpensive and pleasant means of "seeing Canton." A survey has already been completed and the contract signed. It is expected that work will be begun immediately.

Railway Officers

Executive, Financial, Legal and Accounting

Edson J. Chamberlin, president of the Grand Trunk Pacific and of the Grand Trunk, has resigned and has been succeeded in both positions by H. G. Kelley, formerly vice-president of the Grand Trunk.

Albert J. Gillingham, assistant to the comptroller of the Pennsylvania Railroad, reached 70 years of age on August 23, and will retire at the end of the month under the operation of the pension rules of the company. Mr. Gillingham has been with the Pennsylvania Railroad nearly 48 years. For more than 17 years he was auditor of passenger traffic, and was advanced to the position of assistant to the comptroller on January 1, 1917, in connection with the reorganization of the accounting department.

Operating

T. J. Clarken has been appointed manager of the lighterage department of the Lehigh Valley, with headquarters in New York.

P. L. McManus, general superintendent of the Chicago, Indianapolis & Louisville at Chicago, has resigned, effective August 29.

Hubbard W. Williams has been appointed trainmaster of the Cairo district of the Illinois Central, with headquarters at Fulton, Ky., succeeding H. B. Dexonia, assigned to other duties.

P. F. Gilhoulia has been appointed chief train dispatcher, fourth district, of the Saint Louis Southwestern of Texas and the Saint Louis Southwestern, with headquarters at Mt. Pleasant, Tex., vice W. A. Downs, resigned; effective August 21.

J. B. Silaz has been appointed acting trainmaster of the Arkansas division of the Chicago, Rock Island & Pacific, vice Kepler Johnson, temporarily assigned to other duties. Mr. Silaz has been succeeded as assigned chief dispatcher of the Arkansas division by T. R. Latham; effective August 16.

J. W. Smith, superintendent of car service of the Western Maryland, has been appointed superintendent transportation and has been detailed for special service with the Committee on National Defense at Washington, D. C. He has been succeeded by E. R. Rouzer, who will have headquarters at Baltimore, Md.; effective August 1.

John L. Beven, trainmaster of the Illinois Central at McComb, Miss., has been promoted to terminal superintendent at New Orleans, La., succeeding Frank T. Mooney, resigned. Thomas J. Quigley, roadmaster at McComb, has been promoted to trainmaster, succeeding Mr. Beven, with the same headquarters effective September 1.

A. A. Gist, trainmaster on the Atchison, Topeka & Santa Fe at Arkansas City, Kan., has been transferred to the Southern Kansas division, with headquarters at Chanute, succeeding T. Cunningham, deceased. Owing to the increase in traffic on this division A. S. Wilkins has also been appointed trainmaster of this district, taking over part of the territory formerly under the jurisdiction of Mr. Cunningham.

Elisha Barton John, whose appointment as superintendent of the Delaware division of the Pennsylvania Railroad was announced in last week's issue, was born at Mt. Carmel, Pa., October 1, 1873. He received his preliminary education at the Bloomsburg State Normal School and the Bethlehem Preparatory School. He was graduated as civil engineer from Lehigh University in 1895. Mr. John entered the Pennsylvania Railroad's service for the engineer corps at Philadelphia, June 24, 1895. He served in that capacity until January 1, 1900 on the Philadelphia, Tyne and Altoona divisions, when he was promoted to assistant supervisor, serving in that capacity on the Pittsburgh, Altoona and New York divisions, until April 24, 1902, when he was appointed supervisor, and held positions in that capacity on the Delaware, Central, Maryland and Middle

divisions. On December 1, 1908, he was appointed assistant engineer, Delaware division, Philadelphia, Baltimore & Washington Railroad. On March 24, 1909, he was advanced to principal assistant engineer on the Philadelphia, Baltimore & Washington Railroad, and on January 15, 1910, promoted to superintendent, Delaware division of the Philadelphia, Baltimore & Washington.

James A. Morrison, whose appointment as superintendent of the Kentucky division of the Louisville & Nashville, with headquarters at Paris, Ky., has already been announced in these columns, has been in the service of that road continuously since 1886. Mr. Morrison was born December 6, 1868, at Sonora, Ky., and received a common school education. He entered the railroad service in May, 1886. He served for a time as telegraph operator and entered the despatcher's office at Louisville in 1889. He was transferred to Birmingham, Ala., as despatcher in 1891, and subsequently served respectively as chief despatcher of the S. & N. A. division, until October, 1892; master of trains until 1902; assistant superintendent until August, 1907, becoming superintendent of the Kentucky division on August 1, 1917.

C. S. Christoffer, trainmaster of the Illinois and Racine-and-Southwestern divisions of the Chicago, Milwaukee & St. Paul, with headquarters at Savanna, Ill., has been promoted to assistant superintendent of the Milwaukee terminals, with headquarters at Milwaukee, Wis. D. E. Rossiter, trainmaster of the Milwaukee terminals, has been transferred to Savanna, succeeding Mr. Christoffer, and the office of trainmaster of Milwaukee terminals has been abolished. The territory of L. T. Johnston, trainmaster of the Iowa and Minnesota division and the River division, has been confined to the River division, with headquarters at Minneapolis, Minn., and O. N. Harstad has been appointed trainmaster of the Iowa & Minnesota division. W. M. Thurber has been appointed trainmaster of the Dubuque division, with headquarters at Dubuque, Iowa, effective September 1, a new position.

Traffic

Alfred R. Hall has been appointed general agent of the Union Pacific at Lincoln, Neb., effective September 1, succeeding E. B. Slosson, deceased.

F. F. Robins has been appointed commercial agent of the Georgia Southern & Florida at Miami, Fla., vice W. M. Brooks, resigned; effective September 1.

G. N. Snider has been appointed coal traffic manager of the New York Central, with headquarters at New York, effective September 1, vice F. E. Herriman, who is assuming duties on the president's staff.

F. E. Herriman, coal traffic manager of the New York Central, will after September 1 report to the president's office, and will assist in matters pertaining to the coal properties of the companies, and perform such other service as may be assigned.

J. C. O'Boyle, traveling freight agent of the Wabash at Cleveland, Ohio, has been promoted to commercial agent at that city, succeeding R. A. Brown, effective August 16. Mr. Brown resigned to accept an officer's commission in the National army.

Spencer Eakin has been appointed commercial agent of the Georgia Railroad at Nashville, Tenn., succeeding M. H. Lillard, resigned to engage in other business. T. H. Yeargin has been appointed commercial agent at Chattanooga, Tenn., succeeding Mr. Eakin, and B. H. Lumpkin succeeds Mr. Yeargin as commercial agent at Columbia, S. C.

F. L. Dalton, general agent in the freight department of the Chicago & Alton, with headquarters at Chicago, has resigned to become traffic manager of Montgomery, Ward & Co. The position of general agent in the freight department at Chicago has been abolished. J. F. Vosburgh, assistant general freight agent at Chicago, will have charge of solicitation in the Chicago territory. T. J. Shea, assistant general agent in the freight department at Chicago, has been appointed commercial agent, with the same headquarters.

Engineering and Rolling Stock

R. W. Burnett has been appointed master car builder of the Delaware & Hudson, with office at Albany, N. Y.; effective September 1.

J. R. Watt, roadmaster of the Louisville & Nashville at Nashville, Tenn., has been promoted to general roadmaster, with headquarters at Louisville, Ky., succeeding Thomas Maney, resigned.

H. B. Holmes, chief engineer of the Kansas City, Mexico & Orient, with headquarters at Kansas City, Mo., has resigned to become associated with Cloverdale & Colpitts, consulting engineers, with offices in New York.

I. M. Brown has been appointed acting engineer maintenance of way of the Indianapolis Terminal division of the Cleveland, Cincinnati, Chicago & St. Louis, with headquarters at Indianapolis, Ind., succeeding C. F. Hinchman, granted leave of absence; effective August 27.

Louis C. Frohman, whose appointment as principal assistant engineer of the Florida East Coast, with headquarters at St. Augustine, Fla., was recently announced in these columns, has been with that company since September 1, 1916. Mr. Frohman was born in Cincinnati, July 18, 1888. He attended the Ohio Northern University, and first entered railway service on November 15, 1909, on the Baltimore & Ohio South Western. He was appointed assistant engineer in the office of the engineer maintenance of way of the Baltimore & Ohio South Western and the Cincinnati, Hamilton & Dayton at Cincinnati, Ohio, January 1, 1913, upon the consolidation of the offices of these roads. He subsequently became assistant engineer in the office of the district engineer of maintenance of way of the Cincinnati, Hamilton & Dayton at Cincinnati, Ohio, on July 1, 1913, and was promoted to assistant division engineer of the Cincinnati-Toledo division at Dayton, Ohio, on January 1, 1914. He resigned September 1, 1916, to enter the service of the Florida East Coast as assistant engineer maintenance of way at St. Augustine, and it is this position which he is leaving to take up his new duties.

Railway Officers in Military Service

R. A. Brown, commercial agent of the Wabash at Cleveland, Ohio, has resigned to accept an officer's commission in the National army, effective August 16.

T. M. Ward, engineer of bridges and buildings of the Seward division of the Alaskan Government Railways, who has been commissioned captain in the engineering corps of the army, has been assigned to active duty at American Lake, Wash.

OBITUARY

William H. Arnold, terminal engineer of the Lehigh Valley at New York, died August 13 at the age of 53 years. Mr. Arnold came to the Lehigh Valley in January, 1914, and was terminal engineer at New York in charge of the new ore dock at Constable Hook, N. J., and the piers, pier sheds and dredging in New York harbor and at Perth Amboy, N. J.

A COMPLIMENT FROM THE PRESS.—A railwayman has been made First Lord of the Admiralty. This is not surprising. The railway business everywhere is associated with brains and capacity.—*Toronto Globe*.

RAILWAY BUILDING RECORD IN FRANCE.—Following is an extract from a letter from one of the officers of No. 2 Battalion, Canadian Railway troops, which is commanded by Lieut.-Col. F. F. Clarke, formerly a Canadian Northern Railway engineer: "We hold the record for railway building in France. We had a very difficult piece to build, because it was in full view of the German lines in daylight for about 1½ miles across a valley. On Tuesday night at 6:30 it started to rain and got very foggy and we got to work, and by midnight on Wednesday we had built 12,069 ft. of line, and ran a train over it. When the air cleared on Thursday the Germans saw the railway track from their observation balloon and started to shell it, and after sending over about 200 shells they broke a rail, which was repaired in a few minutes. This line can only be used at night, without light or noise. We have built 22 miles of light railway and 15 miles of standard gage, with 4 railway yards of about 3 miles of track in each. This makes about 49 miles of railway built and completed in 75 days."—*Canadian Railway and Marine World*.

GENERAL NEWS SECTION.....

In the State of Colorado, in an accident such as the injury of a tramp, struck by a train, or when a careless trackman gets in the way of a locomotive and has his arm broken, it is the duty of the conductor of the train to telegraph at once to the capitol, at Denver, giving the details of the accident and its cause. This is required by an order issued on August 18 by the Public Utilities Commission of the state. The order requires telegraphic reports of substantially all train accidents in which men are hurt, and all cases of injury of persons by moving trains, and may be considered the response of this commission to the recent request of the railways throughout the country that during the present stress they be relieved of the burden of making unnecessary reports. The makers of this order, however, have not only ignored this reasonable request of the railways; they have disregarded the lessons of experience. The office of the Interstate Commerce Commission could show a tremendous volume of unnecessary telegrams of this nature, and with a much more reasonable classification—that is, with a somewhat rational rule for the exclusion of the less important accidents. Not that any accident is not a proper subject of investigation; all useful investigation is to be encouraged; but to insist on such excessive promptness where 95 to 99 per cent of the telegrams will do no good, can only be classed as childish. But for the evidence of the formal order, with the names of three commissioners attached to it, one might suspect that the document had been prepared by the newest clerk, brother to that superintendent's clerk who ordered, in the name of his boss, that all cars on side tracks should be moved, occasionally, so as to prevent flat wheels.

Nearly every one will concede that the prices of all stocks on the New York Stock Exchange on July 30, 1914, the day before the Exchange was closed, reflected the desire or necessity of investors and speculators to convert securities into cash rather than any calm judgment of the intrinsic values which lay back of the securities. On the other hand, the present prices of railroad stocks reflect the judgment of the investing and speculating public as to the intrinsic values in the future. Industrial stocks may reflect fear of a tax on excess profits,

Railroad Stocks Now and in July, 1914

price-fixing, etc., but railroad stocks can reflect such fears only to a limited degree. The railways have already had their regulation. Notwithstanding this, notwithstanding the prosperity that was made so much of by the Interstate Commerce Commission when refusing to grant increases in rates, notwithstanding the present large earnings, Atchison, Topeka & Santa Fe common stock is selling at almost the same price today as on the panic day of July 30, 1914, when the Stock Exchange had to close. Notwithstanding the tremendous industrial activity of the country, Pennsylvania common stock is selling at about 104 per hundred dollars par value as compared with 105½, the price on July 30, 1914. Some of the presidents of the richer roads admitted on the witness stand that their roads were not themselves in need of higher rates although their neighbors were, apparently. The Stock Exchange disagrees with them. Chicago & North Western, one of the gilt-edged stocks, is selling at about 107 compared with 126 on July 30, 1914; Great Northern is selling at 104 as compared with 114 on July 30, 1914; Lehigh Valley is selling at the same price as on July 30, 1914; Louisville & Nashville is selling at 123 as compared with 127. There are, of course, railroad stocks that are selling much higher today than they were in July, 1914. Norfolk & Western is selling 20 points higher, and Union Pacific over 20 points higher, but the fact which deserves most serious consideration is that such stocks as Pennsylvania and Atchison are selling now at panic prices. The market may be wrong. The prices made on the Stock Exchange are the consensus of guesses as to future values, but in the long run they have proved accurate guesses and guesses that were founded on a more profound understanding of general conditions even than the Interstate Commerce Commission brought to bear on the rate case.

Before deciding to employ women more extensively in railway service great care should be taken to determine those classes of work on which they can be used to the best advantages. It may prove a serious mistake to rush in and hire them without thoroughly studying the situation in all its aspects. Railroads, as other industries, have not infrequently lowered their efficiency and lost money by adopting fads. This has been true not alone of small and comparatively unimportant details,

Go Slow in Hiring Women Workers

but of larger factors, such, for instance, as forms of organization, types of locomotives, inadequate car construction, station design, etc. There are many clerical positions on railroads now filled by boys or men that can, without question, be acceptably filled by girls or women, thus releasing the men for more active work for which they are better fitted. To secure real efficiency, however, the women must be carefully instructed and coached for the work; this in most cases will require a larger amount of supervision than is ordinarily provided, at least during the period that the change is being made. When it comes to the heavier and rougher work the roads should go slowly. Under no circumstances should women be employed for work in the shops, or where men only were previously employed, until special facilities have been provided for their comfort and convenience. As far as possible they should be segregated from the men, and arrangements should be made so that they will naturally find it convenient to lunch in a group by themselves. Capable women should be provided to maintain the rest rooms and look after the women. They should have their own first aid experts. If practicable, a forewoman should have charge of each group of women workers. Unless these things can be done and adequate facilities be provided to insure getting real efficiency from the women, it will be better to get along without them. "Fads and Their Cost" was the subject of a paper read before the New York Railroad Club many years ago. It is vitally important that both energy and money be conserved at this time, and that luxuries in the line of fads and fancies be rigidly guarded against.

"Sure, I'd buy a bond quick, but where will I keep the thing when I get it." That, they tell us, lost more subscrip-

Where to Keep the Bond

tions for Liberty Bonds than almost any other single argument; and those who had charge of recruiting subscribers have scratched their heads over the problem of how to answer it ever since. But, it will not come up when the next issue of the Liberty Loan is floated in one place, and that is on the Pennsylvania Railroad. That company has recently announced to its employees that it will make arrangements to take care of the bonds for its employees free of charge. The treasurer has been authorized by the board of directors to take over for safekeeping the bonds of any employees who may request it. The interest on the bonds will be collected as it falls due on June 15 and December 15 each year and will be added to the payrolls for the last half of the months of June and December respectively. This will solve a vexatious problem for those who will be called upon to sell Liberty Bonds in the future and also for employee subscribers. The Pennsylvania, presumably, is not the only road that has offered to hold the bonds for its employees in this wise. There is no doubt, however, that those railroads that have announced such plans are performing a national service quite in keeping with the many other things they are doing in the present crisis.

REGULATION IN AID OF THE ENEMY

THE transportation system was the first element in our national economy to recognize the heavy responsibilities which the war placed upon the country and to take prompt and united action to meet the emergency. In view of the energetic and patriotic manner in which the railroads have discharged their duty and the close relation between their efficiency and military effectiveness, it would not be unreasonable to expect that the hostile attitude of governmental agencies would cease in large measure until the conclusion of the war. Recent reports from Texas, however, indicate that public bodies are still pursuing the short-sighted and habitual policy of harassing common carriers.

At the instance of the Brotherhood of Railway Trainmen the city commission of Fort Worth, Tex., passed an ordi-

nance compelling the railroads to use a crew of four men on trains in switching service and to have the air hose coupled up on all switching trains of five or more cars which are moved over grade crossings. The provisions of the ordinance stipulate that the extra switchman must be stationed at the end of each switch train to warn persons who may be on or approaching a crossing and that the air hose must be coupled up so that a train may be brought to a stop more quickly. Apparently the measure is intended as a safety regulation, but its framers do not seem to comprehend the obvious unfairness of placing all responsibility for keeping crossings clear on the railroads and none on the public. The portion of the ordinance relating to the use of air brakes is especially vicious in that it would greatly impede switching in a city where 40,000 soldiers are now assembled in the face of the specific demands of the government that all military traffic be handled promptly and expeditiously in time of war. Any one with the slightest appreciation of transportation problems will appreciate that the addition of 40,000 men to the population of a city in itself would strain to the utmost the yard facilities serving that point. Under the guise of protecting citizens from injury, and incidentally of providing additional jobs for switchmen, the city commission would add to the difficulties of the carriers and make railroad efficiency in a time of need impossible.

Fortunately, a judiciary farther removed from political influence than the commission has granted the railroads a temporary injunction which prevents the enforcement of the ordinance pending the outcome of a suit for a permanent injunction set for trial in January. The action of the city commission of Ft. Worth and the wire-pulling of the B. of R. T. which prompted it are acts fully as reprehensible as those which have gained wide publicity as calculated to impede the prosecution of the war and thereby assist the enemies of the United States. It is to be hoped that the public will soon see these anti-American activities in their true light, and deal as they deserve with public officers who by placing politics above national welfare give aid and comfort to the national enemy.

A VICE-PRESIDENT IN CHARGE OF THE MECHANICAL DEPARTMENT

A PECULIAR significance attaches to the appointment of W. D. Robb as vice-president of the Grand Trunk in charge of motive power, car equipment and machinery. The trying times through which our railways are passing are demonstrating beyond question the importance of the equipment and maintenance problems. It is necessary on most roads that the head of the mechanical department be given greater authority and facilities in order properly to administer the work of that department. No one understands better than the mechanical superintendent the tremendous losses that the railroads of this country have suffered in past years by the policy of changing the mechanical department appropriations and forces with every fluctuation in earnings, and without regard to the condition of the equipment. This same policy has had much to do with the inadequate supervision in the mechanical department on many roads and the lack of preparedness on the part of that department in providing plans and specifications for new equipment. Indeed, instances are not unknown of managements ordering equipment without consulting the heads of the mechanical department. These things have discouraged not a few of the most promising mechanical department men in the past and they have been lost to the railways because of the wider opportunities and better conditions which they have found in the industrial field. The railways could ill afford to lose them and in many cases have indirectly continued to pay part, or all of their salaries in the buying of equipment. Surely the railroad companies could afford to pay competent mechanical department officers as well or better than manufacturing companies which make a business of supplying one, or at the best, a

few of the specialties required by the mechanical department.

In England the locomotive superintendents deal largely directly with the boards of directors and their authority is said to be beyond the reach of the stockholders when questions of safety and proper working condition of equipment are concerned. Chairman Smithers of the Grand Trunk is an Englishman; he has been spending several months in Canada studying railway conditions and quite possibly it may have been at his suggestion that the new vice-presidency was created. Mr. Robb's record as superintendent of motive power is such as to insure his success in handling the larger and broader responsibilities in the new position and the development will undoubtedly be followed with closest interest by American railroads generally. The tendency toward a larger recognition of the importance of the mechanical department is reflected to a certain extent in this country by the promotion last winter of D. F. Crawford to the general managership of the Pennsylvania Lines West and also by the promotion last week of George W. Wildin to the general managership of the New York, New Haven & Hartford.

SHALL THE GOVERNMENT MAKE A LOAN TO THE RAILWAYS?

NATHAN L. AMSTER, president of the Investors' Protective League of America, has issued a statement advocating a loan by the government to the railroads of \$300,000,000 or \$400,000,000 out of the receipts from the next issue of Liberty bonds to bear interest at 4 per cent. Mr. Amster says that the most critical and urgent problem facing the railroads is that of financing extensions and improvements and caring for maturing obligations during the war. They cannot, he declares, sell long term bonds in competition with the United States Government, which is issuing billions of dollars of tax-exempt bonds at high interest rates; yet they are called upon to render more and better service than ever. The making of such a loan, contends Mr. Amster, is "an essential war need. Furthermore, such action would tend toward emancipating the railroads from the unhealthy domination of certain Wall street powers."

There are many people, including some railway officers, who contend that as the government is fixing the maximum return which, on the average, railways are permitted to earn, it ought also to guarantee them a minimum return. Mr. Amster's proposition goes somewhat farther than this and contemplates not merely a guarantee to the railways, but a loan.

Government financial aid to the carriers when their financial situation is so largely attributable to regulation seems logical. If the government is going to persist in the policy of so restricting net returns as to render it impracticable for the companies to compete successfully for the capital which they require, doubtless the time will come when it will have to give many of them aid in the form of subsidies, guarantees or loans to prevent the arresting of their development from causing general industrial and commercial stagnation.

The *Railway Age Gazette* does not believe, however, that government aid at present is desirable. Mr. Amster refers not only to regulation as one of the causes of the present situation of the railways, but also to the "unhealthy domination of certain Wall street money powers" as another cause. If these are the causes why not attempt to remedy the situation by removing them? The adoption of the reforms in our system of regulation which the railways have been urging upon the Newlands committee would cause regulation to cease to be unduly restrictive and burdensome. The adoption of one of the proposed measures, that is, the giving to the Interstate Commerce Commission of reasonable authority to regulate the issuance of railway securities, would largely solve the problem of Wall street domination by rendering the abuse of the power of the banking interests difficult, if not impossible.

The money which does a man the most good is that which

he earns himself. In fact, it may perhaps be said with truth that in the cases of 99 men out of 100 the only money which ever did them any real good after they became men was that they earned themselves. The same general principle applies to railroads. In the long run we will not have efficiently and economically managed railways unless we give them an opportunity to earn reasonable profits and then let them go bankrupt, if they do not do it. The benefits that might be derived from direct government aid, whether in the form of guarantees, loans or subsidies, would be but temporary, while the injury done by them would be permanent. If a government loan were made to the railways to enable them to refund maturing obligations, the time would come when there would have to be another refunding of obligations. Would the railways be in any better position to refund them later on a satisfactory basis? Not unless they were regulated meantime in a less drastic manner than they are being now. But the very fact that the government had made them a loan would be used effectively as an argument for not regulating them any less drastically. Meantime, it is questionable if the railways, having already received advances from the government, and probably living in the expectation of having them renewed or of receiving others, would be operated as efficiently as they would be if their managers knew that they must operate them efficiently or take the consequences.

The railways of the world have had a large amount of experience with government guarantees and loans. With a few exceptions the governments have had to pay part or all of the interest which they have guaranteed or to forego part or all of the interest on the loans which they have made. The result usually, in cases where public aid has been given, has been that government concern about and interference with the management of the railways have grown until finally the railways have passed into the hands of the government as its property. This is what is occurring now under our eyes in the case of the Canadian Northern in Canada. The government guaranteed interest on the road's bonds; had to make advances in payment of part of the interest, and now a measure is being considered, and probably will be adopted by Parliament for government ownership and operation of the Canadian Northern. This is the way in which government ownership and operation of the Western Railway of France was brought about. It was an entangling alliance between the government and the railways which was different in form but similar in substance which caused the railways of Italy to be transferred to government ownership and management in 1905. Examples might be greatly multiplied.

Mr. Amster's is only one of many proposals which recently have been made to have the government of the United States intervene very directly in the financial affairs of our railways. One proposal which has been made is for the government to buy 100,000 freight cars and put them in service. Another has been for the government to acquire ownership of all the freight cars in service. The *Railway Age Gazette* opposes all plans of this kind because it believes that the adoption of any of them would create a situation which would lead inevitably to government ownership without the question of government ownership ever being considered squarely upon its merits.

There has not been a single case in history where government ownership of railways has been adopted because the public, after full consideration, has deliberately decided that it was desirable upon economic, political and social grounds. The people of the United States ought to refrain from creating conditions which would make it impossible to consider the question of government ownership upon its merits. If we are ever to have it let us adopt it, not because we shall have created conditions which make its avoidance impossible, but upon the ground that we believe it will contribute more to the welfare of the public than private ownership and government regulation.

Letters to the Editor

CARLOAD—MINIMUM WEIGHTS

JAMESTOWN, Cal.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

In your editorial on page 48 of your issue of July 13, you mention a very vital fact in regard to heavier loading of cars when you state that "the receiver of freight is even harder to reach than the shipper." This objection has been raised by shippers in asking for carload rates, and I believe this would be an opportune time to readjust that item in all tariffs.

All of the railroad commissions seem to be adverse to the raising of tariff rates, but I believe a concerted action to raise the minimum weight for carload rates would meet with only a moderate objection. If such an increase were made universally I believe the shippers would endorse rather than object to the change. There are very few commodities that cannot be loaded to exceed 30,000 lb. to the car and such items could remain as at present.

S. H. SMITH,

Traffic Manager, Sierra Railway of California.

PSYCHOLOGY AND EXPERIENCE

ALBANY, N. Y.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

Your correspondent who writes from California (Allen H. Babcock, July 20, page 96), about psychology and other things, proposes to change the whistle signal for highway crossings, so as to have a long blast come last; this to accommodate the rule to the idiosyncrasies of careless engineers. Believing it to be out of the question to reform the men, he would reform the rule. Is this the best way out of the difficulty? Look for a moment at past experience.

For half a century, more or less, the crossing signal consisted of only one blast; and everybody was happy. Is there any need for having this signal different from the signal signifying the approach to a station? If the way to improve our whistling is to make it easier for the engineman to adjust his mind to what is demanded, a change from four blasts to one blast would be a very simple way to go about it. I am informed that one prominent eastern road has—at least on some divisions—discontinued the use of the station-approach whistle-signal. Discontinuing it everywhere might not be an unprofitable experiment. The argument for moderation and common sense in whistling has been before the railroad world for years and yet does not make much progress; perhaps the easiest way to make such arguing effective would be to change it into a proposal to modify the whistling in this way—urge its abolition! Where crossings have an attendant the use of the crossing whistle, in numerous instances, has been discontinued at such crossings with satisfactory results.

It must be remembered that however simple or natural may be the requirement of the rule, there will still be the necessity for strict discipline. The hardest characters to deal with are not the men who blow a long blast because they believe it to be more suitable than that prescribed, but, rather, those whose mental operations are so unsystematic that they take no thought at all, except just enough to keep clear of censure. On the Boston & Albany, where the single "long" blast was in use at crossings for many years—and long after it was abandoned on most roads—the superintendents had to call enginemen to account frequently for annoying the residents along the line. The best of the runners complied with their instructions by reducing the single blast habitually to about one second. The writer

has noticed recently the whistle of a factory, which had been complained of as an illegal nuisance, because of its excessive noisiness. The court handed out a few sentences of common sense and that whistle now sounds regularly in only one second—and it seems to be satisfactorily effective.

One of the most pervasive facts to be remembered by American railroad men is the persistent conservatism of the American Railway Association, the code of which prescribes the "two long, two short" signal. Assuming that the signal ought to be changed, the committee of that association would probably demand that the proposition be supported by a good body of experience in favor of changing. Another fact is that many men in that association, as well as many other railroad officers, all over the country, are Morse telegraphers; and every one familiar with the Morse alphabet will agree that the present crossing signal, which means "7," is preferable to the reverse arrangement of the sounds which, from long experience, they have come to consider an unpleasant sound. The psychic theorists will tell you that there is a pleasing rhythm in — — — — ("7"), that is lacking in the opposite arrangement — — — — ("ut"). On one Eastern road, formerly, the crossing signal was one short, one long (letter *a*) and every telegrapher who ever heard it will say that it was a disagreeable sound.

I am not saying that telegraphers ought to rule our whistling or even that it is necessary, absolutely, that whistle signals should be pleasing to anybody; but it is only fair to take into account, in trying to adjust the code to the idiosyncrasies of the enginemen, that the rest of us have ears which ought to be considered. Mr. Babcock calls for discipline "along common sense lines," fearing unfavorable results from "arbitrary" discipline; but one of the most refreshing manifestations of common sense in whistling is that which is exemplified by the runner who constantly strives to please the public—a thing which all railroad men are being urged to do at the present time. The engineman who is thus striving cannot do better than to cut short his whistling. In studying how to shorten he will not fail to see other avenues of improvement.

THE POWER OF THE "LABOR VOTE"

CHICAGO.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

There has been a marked tendency in recent years to pass laws favorable to labor unions and it has been evident in many cases that the only excuse for their enactment has been to secure the favor of railroad organized labor because of its supposedly great voting strength. It is well to consider whether the facts justify this supposition.

An investigation will disclose that railroad brotherhoods vote but a small per cent of their total membership. The men are away from home so much of the time that many of them will be absent on the registration and election days unless they are willing to lose a trip or two and this is rarely the case because it would mean a loss of from \$10 to \$40. A certain proportion of the men are never interested in elections one way or the other and of the remainder many who were home on registration day are absent on election day or vice versa so that the number who are actually enabled to vote is very small. Of these a certain proportion vote against the wishes of the organization because of party affiliation.

Thus it is seen that the legislators have greatly overestimated the power of the railroad unions. But the fact remains that a great many laws have been passed which benefit a few labor leaders, while working an injury to the railroads, the shippers—in fact, all the rest of the community. For instance, the federal locomotive inspection law is costing the railroads millions of dollars without working

in any way to their advantage. It is also costing the government about \$3,000,000 a year without any corresponding benefit. The full crew laws passed in various states represent another instance of misguided legislation for which there is not the slightest gain to any one except the brotherhoods.

It is high time for the general public to open its eyes to the wasteful expenditure of public money and for it to realize that all money used in operating the railroads comes from the public's pocket and that the cheaper a railroad can be operated the less it will cost to transport freight and passengers from one place to another.

R. S. BARKER,

Machinist Helper, Chicago & North Western.

THE OSTRICH IN THE SUPERINTENDENT'S OFFICE

REDSTOCK, Ark.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

William Shakespeare, Mark Hanna, or some other eminent gentleman once asserted that truth is stranger than fiction. This party evidently had never perused any of the morning operation reports of a modern railroad. It is safe to say that the vivid imaginary powers displayed in compiling some of them would, if given proper publicity, make any strictly truthful contributor to modern literature sob in earnest with envy. Of course, there are exceptions and in some instances truth crushed to the right-of-way will rise again; but in the majority of cases a comparison of the reports of movements of trains and tonnage to the actual performance will reveal discrepancies that cannot by any stretch of politeness be called slight.

I once honored with my services a road upon which there was a particular abhorrence toward reporting any delays due to failure of engines to make steam on account of poor coal. Nearly every train that crossed the division had trouble of that nature but it was particularly impressed upon all concerned that it should never be reported. Whether or not this was due to a more than friendly interest in the welfare of the coal company on the part of some one connected with the railroad, I do not know; but the orders came from headquarters and they were obeyed. The methods used in covering up of the delays properly chargeable to poor coal, were left entirely to the discretion of the individual who compiled the reports, who in this case happened to be me. I was once confronted with a deficit of forty minutes in the movement of the pride and joy of the line, the limited, generally known as the "Spanker"; and there was absolutely nothing to fasten the delay onto. It was reported by the engineer as due to poor coal, and a personal inspection of the coal in the tender showed it to be a dirty mess, about as inflammable probably as wet asbestos. Orders are orders, however, and after much deliberation I resorted to the expedient of reporting forty minutes delay at Zanzibar, "account tree fallen across track and calling section men to remove same." No one was ever unkind enough to call my attention to the fact that there wasn't a tree growing within a hundred miles of Zanzibar.

In another case the superintendent of a division which included a considerable stretch of joint track, on which there was supposed to be no discrimination between the trains of the owning and renting lines, was very sensitive about the condition of his roadbed—I will admit that he had just cause for his tender feelings—and gave strict orders that no delays were to be reported as due to slow track. The delays had to be charged to something and a budding genius among the dispatchers devised the method of showing all delays to the trains of one road as being due to meeting trains of the same or superior class of the other road. This in spite of the fact that frequently the trains enumerated as causing the delays were not within the boundaries of our division

at the time mentioned. But the reports for each road went to different sets of officers and they seemed to be satisfactory.

What is the purpose of these reports anyway? If it is to portray the situation on a division or a grand division in as pleasing a manner as possible, so as to furnish some one with light fiction for the diversion of their minds, they succeed admirably. If it is to show what has actually happened during the preceding 12 or 24 hours and expose operating deficiencies, they are a dismal failure. Frequently a department or division head, who would not for a moment tolerate dishonesty on the part of a subordinate in dealing with himself, will not only encourage, but sometimes practically demand, dishonesty on the part of that same subordinate in dealings with the general offices.

Nor is this paradox confined to division offices. A suggestion of the same tactics may be frequently found higher up.

It is a poor policy at the best, and frequently the failure to report adverse conditions in their true light acts as a boomerang when an attempt is made to secure funds or permission to correct those conditions. Furthermore the desire to cover up some particular kind of detention results sooner or later in the juggling of reports between connecting divisions, and this sometimes results in a more serious reflection than to face the facts squarely.

One factor which has aided largely in bringing about this condition is, I believe, the practice in some general offices of delegating the first reading of these reports to some clerk who, by virtue of three months' experience as office boy and two months' opening envelopes, is classed as qualified to analyze difficult operating problems; and giving him carte blanche instructions to "follow up" all remediable delays. The results sometimes are ridiculous. I recall receiving once one of these general office "bullets" peremptorily demanding why No. 1 was delayed seven minutes at Bearskin, meeting No. 2. The logical answer was that eleven miles intervened between Bearskin and Wolfhide—the next siding—and that double track between the two points was painfully noticeable by its absence. But it was necessary to be more diplomatic and skillfully hint that No. 2 was seven minutes later at Bearskin than was anticipated. Such things burden division offices with unnecessary correspondence and cause a great deal of irritation among the men who are doing their level best to keep the railroad running smoothly. The doctoring of reports is a logical result. The way the general offices go off half-cocked about such things would indicate that a division officer isn't competent to solve his minor problems himself at all. I believe that if some persons at headquarters were not so conscientious about sending a couple of dozen biting telegrams every time they read one of these reports, and if they would manifest more confidence in the division officers, they would find that the railroad was being just as well taken care of and that for some reason, the reports told more about what was actually going on than they ever did before.

Another factor, and the main one, is the fact that sometimes there are events daily taking place on a railroad of which everybody is aware, but which no one wants to see detailed on paper. To nominally conceal these things seems to satisfy some people. An ostrich is satisfied to hide its head in the sand.

Nor is the practice confined to any one set of reports. Tonnage sheets, car reports, and a great many others, come in for their share of garbling. I have known of more than one railroad man who rose mainly through his skill with a rubber eraser.

Honesty should be the best policy in railroading the same as in any other business—but it is plain that in some features of the business it is not so considered.

HOMER PIGEON.

NEGLECTING THE DESPATCHER

LITTLE ROCK, Ark.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

Inspection trips made by officers constitute one of the worries of every despatcher. He knows he will receive little, if any, advance information as to their movements and he must handle the situation on a prophetic basis, trusting to luck. From a purely selfish standpoint an officer should make it a point to keep the despatcher posted on all anticipated movements, in order to give him an opportunity to figure with other trains. The writer has had some very trying experiences with official parties. One case in particular is recalled, where the superintendent was in charge, with a motor car, running under orders. The conductor reported for orders at 8:45 a. m., to leave at 9:30 a. m. He finally left at 1 p. m. and all the information I could get in the meantime was that they expected to move most any time. All this time I was fighting a road full of trains. Some trains were delayed by having to be stopped for orders at places where delays could not be avoided.

We are everlastingly after our conductors to keep us posted on their movements and our officers say they must keep us advised of when they will be ready at stations, etc.; why not the same rule for *all*? A despatcher does not feel like asking the superintendent every time he stops, what he is going to do; it becomes embarrassing. The conductors in charge could be of great assistance to the despatcher, but many of them think because they are with an official party all requirements are suspended, and they do not exert themselves in the least.

C.

"SWAT THE LETTER" CAMPAIGN

SAN BERNARDINO, Cal.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

Did it ever occur to you that we have rules and instructions concerning the duties of all our employees from the sectionman to the chief despatcher and that each is required to be sufficiently familiar with them to render a fair equivalent for value received? Contrast this condition with that of the newly appointed member of the official family. He finds no definite outline of duty laid down, with a possible exception of the number and kind of efficiency tests to be made, the number of days he is required to spend on the road and how to make out his expense account. He spends a few days looking over the new territory and learning to match up new names and faces. Those days will always be treasured up in his memory, standing out in bold relief against the background of future experience in official life, because they were days of freedom from investigations, freedom from the burden of unanswered correspondence and the delving into circumstances surrounding some event of more or less importance so long past that it has passed from the memory of the employees involved.

This new member of the official family gets back to his office and unless he is a rare specimen commences where his predecessor left off—writing or rather dictating letters. Unquestionably events detrimental to the service should be looked into with a view of preventing a repetition. If of sufficient importance an outline should be given to the next in command and with it the action taken for correction, or recommendations as to the remedy needful. But to what extent this thing has grown and what a handicap on efficient service it has become can only be determined by a careful examination of the evidence at hand.

Colonel Charles Hine introduced steps to reduce correspondence—a commendable project—but even his system did not eliminate the man who, with possibly good intention, will insist on returning you the file of correspondence for further investigation and additional statements concerning some trivial matter that perhaps should never have in-

curred the expense of one sheet of paper. Is there any one on your railroad writing letters to people in the same building as himself—possibly on the same floor, or in the same room? Who is it that requires all this information and what use is made of it? The investigation necessary to furnish an answer to this question must start from the top—obviously we on the borderland can do nothing. Personally, I doubt if many general officers are aware of how much correspondence, routine and otherwise, could be forever dispensed with and not only make a saving in paper and clerical force but not loosen the reins on discipline one iota.

Consider the case of a trainmaster on a district a hundred miles or so removed from the division headquarters, practically level and in the midst of double track work with eight or ten work trains working under the supervision of the engineering department, automatic block signals being interfered with by new work, sidings full of outfit cars to hamper the locals, both freight and passenger business abnormally heavy, getting a mixed assignment of power—really the leavings of the other divisions because this was a level district and it could make a better showing with weaker power—in fact, where the engines are sent them to finish out their mileage. Add to this an unusually cold winter with plenty of snow. This trainmaster put on storm clothes and went to the front. His chief clerk handled the bulk of his correspondence but sent the more important letters to him on the line all written up and ready for signature together with his copy of the morning report and a birdseye view of the railroad.

At one point trains were bunching on account of no water. He was there in the middle of the night and found the pumping was done by a gas engine looked after by a man who had two such plants to care for about 40 miles apart and he was at the other plant. He woke up the town marshal who knew how to operate the engine and paid him in advance for his services until the water service department could correct its mistake.

Here are the conditions he found at another point at the middle of the district: Cleaning the fire—crew gone to eat—headlight will not burn—engine leaking—fireman sick—grates down—16 hours got us, etc. Early in the evening this condition was made worse by the engineer of a westward freight moving ahead in the oiling process while the fireman was taking water, resulting in breaking off the penstock and filling the link belt chute cellar full of water which promptly froze and put the coal chute out of business. He arrived in time to find an engine still alive and a crew with a little time left under the federal law. Took this engine and crew 15 miles to a siding full of live outfits and brought the entire string back, in the meantime finding a foreman who could talk English. Then began coaling up from the cars.

Trains tied up under the federal law will also freeze up. He was along with the relief crew to break the train loose a few cars at a time. Leading, coaxing disheartened men to work against such odds, lending them money to eat with, he kept in touch with a loyal chief despatcher who moved things when there was a hole to move them through.

Look at the other side of the picture: Officer on the same staff at headquarters—bankers' hours—steam heat—comfortable chair—morning paper—also morning report—analyzes the morning report of the district above-mentioned with critical eye and detects a false note in it, an attempt to cover up some real bad condition. He turns to his trusty stenographer and dictates a scathing sarcastic letter to this trainmaster, and upon second thought sends a carbon to the superintendent. The first letter reaches the subordinate officer the morning after one of these strenuous nights, followed a day later by the other barrel from the superintendent's chief clerk.

Is there any question that supervision by retrospection is a deadener? A glance at present methods of handling OS&Ds and live stock claims demonstrates the fallacy of the methods, for when the file reaches the bottom of the ladder and starts back a rubber stamp could be made summing up the result in the following: "No rough handling while in my charge." Conductors and engine foremen have been known to reply to these claims without going to the trouble of looking at their record to see if the shipment was handled by them at all.

If a "swat the letter" campaign is to be started it should begin high enough in the official world so that all departments will be affected. This letter has been confined to the operating department, but there exists enough abuse in other departments to attract the attention of the rank outsider. An effort at reform started from the division office is useless. Why it is not started from the other end may in a measure be due to the higher officer becoming so interested in the duties of his new office that he forgets the wrong that needed righting in his former position. So it is to the man higher up this appeal must be made. We have specialists in everything nowadays. Why not choose a man of ability and experience and attach enough authority to him to take him through the files of all departments and add weight to his words of instruction and advice to departmental heads as well as their subordinate officers and clerks to the end that tons of valuable paper may be saved, type-writers stored away and clerical forces reduced, not to mention the precious liberty to the line officer of being able to do today's business while it is today, thus saving the dollar on this day's operation instead of spending this day explaining why the dollar was spent yesterday?

TRANSPORTATION.

STRONGER CONTAINERS—AN AID TO BETTER CARLOADING

NORFOLK DOWNS, MASS.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

The article appearing in your issue of July 13 entitled, "The Barrel Carries Its Own Running Gear," might lead the unthinking reader to believe that barrels could be substituted for all rectangular containers.

I agree in the main with the writer of this article that the barrel is one of the most desirable containers. Its use economizes in labor and loss and damage claims. While more space is required than with the rectangular package, the carriers receive compensation for this through the saving in damage and economy in labor.

But how can the barrel be used in these times for ordinary package goods? In the days of our forefathers, nearly all commodities were shipped to the corner grocery in bulk. The barrel or bag was the logical container for products in that form. Newer methods of living have created a demand for smaller units of merchandise. By the use of machines, the manufacturer reduces this cost of sub-dividing and insures to the consumer an absolutely sanitary package.

In a comparatively few years this packaging of goods has grown to a point where the container cost alone amounts to over 120 millions annually. Gradually, even articles like flour, salt and sugar have been going from the larger barrel units into the smaller sacks and cartons. In Minneapolis last year 94½ per cent of all the flour shipped out (19,000,000 barrels) was shipped in sacks. The greater percentage of salt and sugar used in the household is being shipped in carton form.

I believe you will agree that the barrel would not be practical as a container for cartons of any kind, and while it may be most desirable as a container, its field is limited. Customs have settled it that merchandise is to be shipped in rectangular containers.

The shipper, to economize on these containers, is seeking lighter and more fragile cases, with the result that the railroads, while paying at least \$15,000,000 in loss and damage claims, are also deprived of a large percentage of car space, thus increasing their operating expenses many millions. Both items of expense might well be considerably reduced by the use of pilfer-proof cases, sufficiently strong to withstand all shocks of traffic. If, as has been shown, eggs can be shipped from Russia to Pittsburgh, 9,000 miles, without one broken egg, there is no reason why the carriers should pay thousands of dollars annually in New York City on eggs that have been shipped less than 100 miles.

The figures tell us that 45 per cent of car space, as a whole, is unused. According to a statement by Grover G. Huebner, Professor of Transportation and Commerce at the University of Pennsylvania, it is costing the railroads not less than 209 millions to operate the 45 per cent of waste space.

"Now anything that can prevent this loss to the railroads, and at the same time will help shippers put money in their pockets, ought to be worth while. This is especially true, now that the purchase of new equipment to relieve congestion is made difficult because of the great demands on the steel mills and foundries.

"Poor packing cases are of themselves one of the worst drawbacks to efficiency in freight transportation and handling on all railroads in this country and, indirectly, they bear upon most of the other causes of underloading freight cars and on congestion at terminals. With a steel case that could be locked securely, which could be plainly marked, so that the destination always could be seen by the handler, and which would stand piling one on the other to the top of the car, millions of dollars paid annually in claims for thefts and for lost and damaged articles, as well as a part of the losses resulting from waste space, would be eliminated."

While fragile containers may be sufficient for a full carload of cereals to take one example, is it not true that when these same fragile containers are put in L. C. L. freight their weakness prevents the loading of the car much more than one tier deep?

It is the writer's belief that much of the congestion in terminals (where three cars are required when one should do the work) could be overcome; a large percentage of the annual payments for loss and damage could be eliminated, and a substantial amount of operating expenses could be saved to the roads were all merchandise offered for shipment in indestructible containers, sufficiently strong to allow of their being stacked to any height without fear of damage, regardless of contents. It is easy to see that the amount saved through this practice would mean far more to the roads than was ever saved by the tank car, and if the same consideration were given the shipper on containers of this type, his economy would be in the use of a container so strong that its life would be continued indefinitely. With no additional freight to pay, a strong case making 100 trips would be much cheaper for him than 100 cases for the same work.

Anything that we may do to discontinue the extravagant practice of throwing \$120,000,000 a year into the kindling-wood pile will work to the benefit of all. Barrel stock will be cheapened. The railroads will find that ties will be cheaper. Paper, which has gone up over 300 per cent certainly will be benefited if this is thrown back into paper pulp, as it represents practically one-half of the pulp industry.

We are being shown daily the importance of conservation in all lines. I believe this to be one of the most important changes possible, looking toward elimination of waste. The shippers, however, without concession from the carriers, are absolutely powerless to carry it into effect.

As I have before stated, if the carriers will recognize the benefits accruing to them by granting similar concessions as

were granted to the tank car, they at once add millions to their profits, save millions to the shippers, and by reason of the added material thrown back into the paper industry, relieve the public of an excessive burden being carried at this point.

W. H. DOBLE.

MISSIONARIES ON PUBLIC RELATIONS

BOSTON

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

Your editorial note of July 27 proposing to stimulate trainmen to be missionaries on public relations opens up a great field of possibilities. Any railroad employee who values his job and who aspires to be really efficient in the service of his employer ought to be glad to embrace the opportunity, as offered by the general manager of the Illinois Central and as described by you, to enlarge his usefulness and at the same time to make his place pleasanter. One cannot really enjoy his work—if it bear any relation whatever to the general public welfare—unless he has an outlook beyond his own narrow sphere.

But your scheme does not seem to contemplate much of any active propaganda, beyond a series of circulars; and circulars do not go far in settling such knotty problems as this one. The reader feels like Mr. Barnum, who was served (at regular rates) with a beefsteak which was so small that, classing it as a mere sample, he told the waiter to "bring on some." If conductors and enginemen—to say nothing of the other classes to which Mr. Foley appeals—are to do any missionary work worth counting they must be trained in polemics. The conductor who knows how to meet the critic who is saturated with anti-railroad notions such as are circulated in Congress and other legislative centers, and who, in addition has a brother-in-law who nurses an unsettled claim of \$100 against a railroad—that conductor is a rare bird. The average conductor not only is poorly equipped for sharp discussion—he has not even got up to the level of *desiring* to emulate that quick-witted Illinois Central man.

Some time ago, on the New Haven road, I noticed a passenger conductor who, in a brief conversation, knocked a lot of erroneous notions out of a passenger's head; and he did the job with a good deal of skill. But, it was evident that he needed a lot of information himself. Moreover, though he was a good advocate I am not sure that he was an AI conductor, for one of the brakemen was inefficient. To have a good conductor and a good speechifier in the same man, and be sure of it every time, systematic training will be necessary.

I would suggest that Prof. W. J. Cunningham, of Harvard University, be engaged to stir up interest in this subject. The art of argumentation is one requiring a good deal of study; and the "university extension" idea should be mobilized for the purpose of turning Mr. Foley's suggestion to really useful account. On his own road he may, perhaps, have all reasonable educational facilities provided; but if this propaganda of promotion is to be of any appreciable use it will have to be pushed simultaneously on a hundred other roads.

You say (1) that the more intelligent employees of the Illinois Central will accomplish something if they are sufficiently courteous; (2) that some of them are prejudiced against the road; (3) that neither of these two classes are trained debaters and (4) that the importance of fact should be impressed on all. Surely, there is a good deal of work to be done before the expected good results will appear above the surface. If Harvard or any other university undertakes to qualify these or any railroad men by "extension" the *measure* of the extension will resemble the trombone used in Billy Sunday's entertainment—that is to say, it will have to be extreme.

Professor Cunningham would probably begin with a debate. Why should not every railroad superintendent spend time and money liberally in training his conductors and enginemen to debate effectively? A debating society could be made to improve a conductor's ability, as a converter of farmers, by 100 per cent. Every ambitious man in the train service ought to welcome any means of education in this line—intimate knowledge of the relations of the railways to the public—if for no other reason than the improvement which it would work in his chances of promotion.

A debating society ought to be welcomed by railroad men everywhere. Even the higher officers often waste their energies, and make ineffective arguments in dealing with the public, because of incomplete acquaintance with the facts of their own case and insufficient appreciation of the position of the fellow on the other side; his feelings, his views, and his facts. An open debate is the only sure means of curing these weaknesses. To send a man to break down the prejudices of farmers and politicians against the railroads, without first giving him some actual practice in meeting such prejudices, is as shortsighted as to meet a damage suit in court without a lawyer; or to set a trolley-car motor-man to handle a 50-car freight train down a two per cent grade. Practice makes perfect; and in this matter there is no substitute for practice.

A debating society would be a valuable instrumentality, on most roads, to start some real, normal thinking in the minds of those conductors whose friendliness toward their employer is weak or qualified; conductors whom a brief letter from the superior would not touch. A railroad is such a large and complicated concern that feelings of unfriendliness, indifference, and even enmity, on the part of employees, are to be expected. Such feelings may be grounded in some detail or minor feature of the relations between employers and employees, and be a real drawback, while yet in the main the relation is actually friendly. Immense good would be done by clarifying the ideas of employees thus affected. Various schemes designed to overcome ill-feeling among employees have been tried; but we are still far from the ideal; why not try something different?

A debate develops little profit unless the sides are somewhere near evenly matched; and railroaders arguing for railroads ought to have as an opponent Clifford Thorne, or his equal, every time they intend to make and carry through any strong and important argument. The doughty Iowa advocate scarcely deserves this commendatory notice; but I refer to him simply to remind railroad men to beware of antagonists who are too reasonable! It is also important to find some one with staying power, dignity and serious purpose. Young men of this kind ought to be discoverable in every large city. It would pay well to compensate a few such men sufficiently to insure continued and persistent attention to the subject. Some reward ought to be offered for winners in debates; but not many railroad men have the technical ability as forensic specialists to argue effectively against their own side; hence this suggestion that the anti-railroad argument be always entrusted to persons who are not strongly pro-railroad.

Let us give "safety-first" and some of the other specialties a rest, for a time, and try something new! I heartily agree with Mr. Foley that trainmen ought to defend their employers; but, like the soldiers who are to defend us in France, they need a period of intensive training.

J. A. H.

RAPID GROWTH OF ELECTRICAL EXPORTS—American electrical apparatus is gaining rapidly in popularity the world over. A compilation by the National City Bank of New York shows that the value of electrical machinery, appliances and instruments exported from the United States in the fiscal year 1917 aggregated more than \$50,000,000 against \$30,000,000 in 1916 and \$6,000,000 in 1900.

The Exterior of the Test Car

Testing Rails by the Quick-Bend Method

A Description of the Apparatus Built Recently by the
Pennsylvania Railroad to Replace the Drop Test

THE Pennsylvania System first introduced the present drop test into its specifications for carbon steel rails in 1900, at which time the entire output of rail steel was produced by the Bessemer process, which, owing to the resulting high phosphorus content, imparted the predominant physical property of brittleness to the rails. Due to this fact some form of shock test was required to eliminate such rails as showed excessively brittle characteristics. The drop test proved the most adequate for this purpose. However, rails of open-hearth steel have come into general use since 1908, and at the present time practically all Pennsylvania orders for rails specify open-hearth steel, which, being low in phos-

phorus content, has the chief physical property of ductility and is much more tenacious for a corresponding hardness than Bessemer steel.

investigation should be conducted in order to determine the fitness of a transverse rapid bending test as an alternate or substitute for the present drop test of rails, with a view to obtaining more conclusive information relative to the physical properties, such as elasticity, ductility and hardness of the rail material. Accordingly, this investigation was made on the authority given for the test after a discussion of the subject at a meeting of the Pennsylvania System rail committee on April 9, 1915.

The sub-committee appointed to conduct this investigation submitted a report entitled "Rail Tests, Quick Bend Method," which was reviewed by the rail committee on November 10, 1916. Conformable to the recommendation of this committee an appropriation for the purchase of such a machine as proposed by the sub-committee and its installation on a suitable car for use in making parallel quick bend tests in conjunction with the standard drop test of rails rolled up on the 1917 schedule, was approved by the Pennsylvania Board of directors on November 22, 1916.

QUICK-BEND TEST MACHINE

The machine, which was built by the Southwark Foundry & Machine Company, Philadelphia, Pa., was delivered on April 16, 1917, and was placed in service immediately. Tests in accordance with a prescribed program have been conducted at several rail mills up to the present time.

The machine consists of a hydraulic press and intensifier, the design and operation of which were made to conform to specifications outlined under the supervision of J. T. Wallis, general superintendent motive power, Lines East of Pittsburgh.

The press is of the four-column inverted type, having a clear distance of 3 ft. 4 in. by 12 in. between columns. The main ram, 16 in. in diameter with a 12 in. stroke, is cast solid with the moving platen, which is guided on the four columns. The twin pull-back rams, 6 in. in diameter, are symmetrically located at the sides of the main ram, and are connected with the moving platen by 1 3/4 in. rods. The overall dimensions of the press are 5 ft. 6 in. by 3 ft. 1 in. at the

A Typical Diagram

base and 8 ft. 11½ in. in height. The maximum clearance between the moving platen and the base of the press is 2 ft. 2 in. The total weight complete with the loading head and two supports is approximately 22,000 lb.

The overall dimensions of the intensifier are 2 ft. 11 in. by 2 ft. 11 in. at the base by 9 ft. 6½ in. high. It is of the single pressure type with a total weight of approximately 11,000 lb. The ram which extends from the high pressure cylinder to the base pressure cylinder is integral with the base pressure piston, and has a total stroke of 36 in. The diameters of the ram and the base pressure piston are respectively 9 in. and 26 in., which give a step-up ratio of about 8.35 to 1. The high pressure intensifier cylinder is directly connected with the press ram cylinder through a 2 in. extra heavy pipe provided with a 2 in. check and stop valve.

The operation of the machine is controlled by a bronze three-way valve having a balanced exhaust. By admitting 450 lb. per sq. in. line pressure to the base cylinder of the intensifier, the pressure in the high pressure cylinder thereof, and consequently in the ram cylinder of the press, is raised to approximately 3,760 lb. per sq. in., developing a total capacity in the press of about 756,000 lb. (378 tons). The 36 in. stroke of the intensifier ram actuates the entire 12 in. travel of the main ram by intensified pressure alone, thus assuring a smooth, continuous curve on the indicator card. The machine was accurately calibrated in order to ascertain its actual effective working pressure.

The machine is so designed that no more than 60 per cent of its total capacity is necessary for the maximum test requirements in order to prevent all undue strain and wear on the parts. Safety guards are arranged around the machine, to prevent the broken pieces from flying when the rail specimens rupture under test.

A hydraulic indicator is used to register the pressure required for a relative deflection of the specimen, the indicator being in direct communication with the main ram chamber through a ½-in. pipe, the movement of the indicator drum being actuated by the stroke of the main ram. A general

loading head on the ram at the center of the rail until rupture of the specimen occurs. During this action, which re-

General Arrangement of the Testing Machine

quires approximately seven seconds, an indicator card showing increments of deflection and corresponding pressure is

Plan and Sections of the Testing Equipment and Car

arrangement of the indicating apparatus is shown in one of the photographs.

The rail test specimen, properly marked, is placed on the supports of the press and pressure is applied through the

taken. An accurate reproduction of such a card is shown in a photograph. The abscissae of the curve indicate deflections, whereas the ordinates obtained in each case represent the load in thousands of pounds. The elements taken from

the card are the deflection and load at the elastic limit and the ultimate strength. The work required to fracture the specimen is also obtained from the card.

It is obvious that the complete ranges of elasticity and ductility of the specimen are represented graphically on the card thus produced, which provides a means of making a precise study of the physical properties of the material in the rail.

The machine is installed on a modified class X-25 car, the general arrangement being shown on the drawing. This car is equipped for passenger train service.

It has been demonstrated from comparative drop and quick-bend tests that rails which have met the drop test requirements showed undesirable physical properties when subjected to the quick-bend test. The narrow limitations of the drop test when compared with the advantages of the quick-bend test in the determination of the ranges of elasticity and ductility of the steel would seem to warrant the adoption of the quick-bend method of testing rails, and the data obtained from the program of tests being conducted on this year's rolling is to be analyzed thoroughly with a view to establishing a specification adaptable to the quick-bend test.

WASHINGTON CORRESPONDENCE

WASHINGTON, D. C., September 4, 1917.

TRANSPORTATION OF THE NATIONAL ARMY

Practically all arrangements have been made by the railroads for beginning on Wednesday of this week the transportation of the 687,000 men who will constitute the first unit of the new National Army from the 4,531 points designated as concentration points to the 16 cantonment training camps to which they have been assigned. With the approximately 300,000 members of the National Guard, who have also begun the movement to their training camps, many of them preparatory for early departure abroad, this will place upon the railroads the task of moving nearly 1,000,000 men within the next few weeks.

The National Guard is being moved in military units with its equipment and impedimenta from the various local camps and armories. The men drafted for the National Army are moving practically as civilians, to be retained and furnished with equipment after their arrival.

The American Railway Association was directed to prepare schedules for the movement and the work has been done by the passenger associations in conference with representatives of the operating departments. The original plan was to move 30 per cent from each local concentration point at the first entrainment, but under the revised plans of the war department only 5 per cent of the men, or about 35,000, will be transported in the 5-day period, September 5-9. As they will be moved at the rate of 1 per cent, or 7,000 men a day, it is not anticipated that this military traffic will cause any disarrangement of regular passenger and freight schedules.

In the five-day period beginning September 19, the railroads must transport 40 per cent of the new army, or 274,800 men, at the rate of 34,700 a day. Another 40 per cent of the army will be carried to the cantonments from October 3 to October 7. During these two periods the passenger facilities of the roads will be fully utilized. The remaining 15 per cent of the men will begin entraining October 17. The number of recruits to be transported from the states to the various cantonments in the next six weeks follows:

To American Lake, Wash.—From Alaska, 696 men; Washington, 7,296; Oregon, 717; California, 23,060; Idaho, 2,287; Nevada, 1,051; Montana, 7,872; Wyoming, 805; Utah, 2,359; total, 46,143 men.

To San Antonio, Tex.—From Texas, 30,545 men; Oklahoma, 15,667; total, 46,212 men.

To Fort Riley, Kans.—From Kansas, 6,514 men; Mis-

souri, 18,660; South Dakota, 2,717; Nebraska, 8,185; Colorado, 4,753; New Mexico, 2,292; Arizona, 3,472; total, 46,593.

To Annapolis Junction, Md.—From District of Columbia, 929 men; Pennsylvania, 32,859; Maryland, 7,096; total, 40,884 men.

To Yaphank, N. Y.—From New York, 43,000 men.

To Des Moines, Iowa.—From North Dakota, 5,606 men; Minnesota, 17,854; Iowa, 12,749; Illinois, 9,366; total, 45,575 men.

To Louisville, Ky.—From Kentucky, 14,236 men; Indiana, 17,510; Illinois, 10,573; total, 42,319 men.

To Rockford, Ill.—From Wisconsin, 7,181 men; Illinois, 31,714; total, 38,895 men.

To Battle Creek, Mich.—From Michigan, 30,291; Wisconsin, 5,695; total, 36,486 men.

To Chillicothe, Ohio.—From Ohio, 38,773 men; Pennsylvania, 4,000; total, 42,773 men.

To Wrightstown, N. J.—From New Jersey, 20,665 men; Delaware, 1,202; New York, 20,241; total, 42,108 men.

To Little Rock, Ark.—From Arkansas, 10,267 men; Louisiana, 13,582; Mississippi, 10,801; Alabama, 8,016; total, 42,666 men.

To Atlanta, Ga.—From Tennessee, 14,528 men; Georgia, 18,337; Alabama, 7,920; total, 40,785 men.

To Columbia, S. C.—From South Carolina, 10,081 men; North Carolina, 15,974; Porto Rico, 12,833; Florida, 6,325; total, 45,213 men.

To Petersburg, Va.—From Virginia, 13,895; Pennsylvania, 24,000; West Virginia, 9,101; total, 46,896 men.

To Ayer, Mass.—From Maine, 1,821 men; New Hampshire, 1,204; Vermont, 1,049; Massachusetts, 20,586; Connecticut, 10,977; Rhode Island, 1,801; New York, 6,000; total, 43,438 men.

PRIORITY OF SHIPMENTS

According to present plans the power conferred upon the President by the priority law to direct that certain traffic or certain shipments of commodities shall have preference or priority in transportation during the war is not to be exercised except when there is especial occasion for it. Robert S. Lovett, chairman of the Union Pacific and now a member of the War Industries Board of the Council of National Defense, who was designated by the President as his agent to issue such priority orders, has thus far issued only the one intended to promote the shipment of an adequate supply of coal across the lakes to the Northwest during the season of navigation, and at present it is understood that no occasion has yet arisen to require immediate consideration of further orders. Many requests for priority in transportation have been addressed to the priority director both by individual shippers and by various departments of the government, but such cases are usually handled individually by investigation of the requirements and a request to the railroad involved or to the Commission on Car Service to furnish cars or to secure expedition in forwarding the shipment.

Under the priority law a finding that a priority order is necessary for the national defense and security is made a requisite and under the interstate commerce law railroads are required to give preference to the movement of government freight so that most requests for priority do not require the issuance of an order but merely the direction of attention to the facts and circumstances, after which the railroad, or if more than one railroad is involved, the Commission on Car Service, may see that the special service is given.

The law provides for the issuance of priority orders to a committee representing the roads as their agent and promptly after its passage the Railroads' War Board sent out to the various roads a form to be filled out designating the War Board as their agent, empowered to receive on behalf of all

notice and service of priority orders. The Commission on Car Service also issued the necessary circular giving the roads instructions as to carrying out the order of August 20 to give preference in the distribution of cars to coal mines served by them for shipments of bituminous coal for transshipment by vessel to ports on Lake Superior and Lake Michigan. The purpose of this order was to secure the shipment of a little over 1,000,000 tons of coal a week to the Northwest before navigation closes and it has been carried out by so distributing the cars that transportation facilities would be available for shipments to that amount without so exceeding that amount as to create a discrimination against other districts.

Judge Lovett has many other duties in addition to those under the priority of shipments law. As a member of the War Industries Board he was in charge of matters pertaining to priority in manufacture of materials and supplies needed for war purposes. The board as a whole is charged with many functions relating to the contracts for supplies for the government and Judge Lovett is also a member of the central board in charge of purchases for the Allies. In his organization priority matters in general are handled by a priority committee which was formerly a sub-committee of the General Munitions Board, headed by General Ayleshire. This organization keeps itself in touch particularly with the requirements of the Army and Navy.

To handle transportation matters Judge Lovett has appointed as his assistant George W. Kirtley, recently assistant to the vice-president and formerly general superintendent of transportation of the Erie. After his appointment by the President, Judge Lovett immediately established relations with the Railroads' War Board and the Interstate Commerce Commission and Mr. Kirtley works closely with the War Board's Commission on Car Service and with the Division of Car Service of the Interstate Commerce Commission. The Commission on Car Service has the organization and machinery for arranging for expedited service or for securing a distribution of cars to points where they are most needed and it also has the necessary data and information furnished by its system of reports from individual roads and its sub-committees in various parts of the country. Ordinarily the Commission on Car Service is in a position to deal with requests of shippers or of the government without any occasion for a request on the priority organization. The Division on Car Service maintains no extensive organization of its own and works in co-operation with the railroad committee, often backing it up with its authority as a governmental body and also representing, in a way, the interests of the public and of the shippers. E. H. De Groot, A. G. Gutheim and H. C. Barlow, of the commission's division on Car Service, regularly attend the meetings of the Commission on Car Service.

WAR TAXES

Important changes in the proposed plans for war taxation of corporations have been made during the debate in the Senate on the war revenue bill designed to raise a revenue of between two and three billion dollars during the coming year. The Senate Finance Committee agreed upon a further amendment to the war profits section of the bill in the effort to meet the approval of those who have been insisting on higher tax levies of this character and the amendment was reported to the Senate on August 29. Under this amendment it was proposed to levy more than one-third of the total revenues to be derived under the measure, or about \$1,286,000,000, from the tax on war profits. As originally reported to the Senate, the war profits taxes aggregated \$562,000,000. Another committee amendment provided a change in the method of computing the so-called excess profits of corporations that had sub-normal profits during the pre-war years of 1911, 1912 and 1913, providing that

the amount of war profits shall be determined by deducting from the net income of the trade or business received during the taxable year, the average amount of the net income of the trade or business during the pre-war period, but that such deduction shall not be an amount less than 6 or more than 10 per cent of the actual invested capital as of January 1 of the taxable year. In other words, a corporation that earns more than 10 per cent during the pre-war period would be taxed on more than the difference between its income in that period and its income during the taxable year, while the corporation that earns less than 6 per cent during the pre-war period would be allowed to deduct at least 6 per cent for the purpose of determining the taxable proportion of its income during the taxable year. As originally reported to the Senate the bill fixed a graduated scale of rates ranging up to 50 per cent on war profits over 250 per cent. This was increased by the adoption of an amendment providing for a tax of 60 per cent on profits over 300 per cent. It was estimated that the bill would take in taxes about 31 per cent of the so-called war profits on corporations. Various amendments proposed by Senator Johnson and Senator La Follette seeking to take in taxes up to 80 per cent of the net income were voted down by a large majority. A final vote on the war profits section of the bill was to be taken on Wednesday, with a final vote on the bill by Monday, September 10.

NEW RAILROAD LAWS

The legislature of Illinois has amended the act of June 30, 1913, regulating highway crossings, and it is now unlawful to construct a highway across a railroad, or a railroad across a highway, at grade, without the consent of the Public Service Commission. The commission may order the reconstruction or relocation of a crossing, after giving a hearing, and may apportion the expense of such change. By the same law railways are required to remove trees, etc., which may obstruct the view at a crossing and, by December 1, 1918, to put up standard signs at crossings, as directed by the commission. At crossings designated by the commission as extra hazardous, stop signs must be put up.

This law became effective June 29 without the governor's approval. Another law which became effective in the same way, on the same day, deals with the same general subject. On certification by the Public Utilities Commission to the highway commissioners, the latter must abolish, alter or relocate railway crossings at highways. The highway commissioners must remove trees, etc., for 300 ft. on each side of grade crossings, outside of cities and villages; and at extra hazardous crossings are required to erect signs 300 ft. from the crossings, in accordance with orders of the Utilities Commission. Automobiles must approach crossings at not more than 10 miles an hour; and if there is a stop sign, must be brought to a full stop; penalty for disobedience, not over \$10.

Illinois has amended the act of 1905 so as to exempt narrow-gauge railways from certain provisions of the law requiring automatic couplers, air brakes, etc.

Pennsylvania has authorized corporations to continue the salaries of employees who enroll in the military or naval service of the United States or of any state. Another Pennsylvania law authorizes railways to construct such branches as their directors may deem necessary.

FURTHER RAILWAY RESTRICTIONS IN ENGLAND—The English traveling public is threatened with a further reduction of railway facilities next month, for the exigencies of the military situation have compelled the railway authorities to adopt restricted services. The revision of the services is being delayed until September in order to afford facilities to the public to take a reasonable summer holiday.

HOWARD G. KELLEY

Howard G. Kelley, vice-president in charge of operation, maintenance and construction of the Grand Trunk System, has been elected president of the Grand Trunk and Grand Trunk Pacific, succeeding E. J. Chamberlain, retired. Mr. Kelley has been vice-president since 1911, prior to which he was chief engineer. In the account of Mr. Chamberlain's work on the Grand Trunk, which appears elsewhere in this issue, mention is made of the very difficult situation which now faces the Grand Trunk and Grand Trunk Pacific. Mr. Kelley has the reputation of being an indefatigable worker, very strong physically as well as strong in his opinions and in his actions. He brings to the difficult task that faces the president of the Grand Trunk and Grand Trunk Pacific, energy, determination and driving power.

There are various possibilities which have to be faced. The Canadian government may take over both the Canadian Northern and the Grand Trunk Pacific. In that case the responsibility for protecting the security holders of the Grand Trunk, while in theory resting on the board of directors, will largely, in fact, rest on the president, since many of the directors are residents of England. If, as has been rumored, the Canadian government were to take over the Canadian Northern, but not the Grand Trunk Pacific, then there would be the extremely difficult problem of operating the Grand Trunk Pacific and the Grand Trunk, separated as they are by the distance between Winnipeg and Chicago, in such a way as to make a profitable system. Such a problem would tax the ability of the best railroad men that either Canada or the States have produced.

Howard G. Kelley was born January 12, 1858, at Philadelphia, Pa. He graduated from the Polytechnic College of Pennsylvania and began railroad work in 1881 as assistant engineer on location and construction on the Northern Pacific. In 1884 he left the Northern Pacific, engaging in mining, and three years later went to the St. Louis Southwestern as resident engineer and superintendent of bridges and buildings. His jurisdiction extended over the St. Louis Southwestern in Texas and the Tyler Southeastern. Two years later he was made chief engineer. On March 1, 1898, he became consulting engineer of the St. Louis Southwestern and also chief engineer of the Minneapolis & St. Louis. On July 4, 1907, Mr. Kelley was appointed chief engineer of the Grand Trunk System and on October 1, 1911, was appointed vice-president in charge of construction, operation and maintenance. Mr. Kelley was president of the American Railway Engineering and Maintenance of Way Association from March, 1905, to March, 1907.

BRITISH UNION'S RAILWAY STOCK.—The railway stock held by the National Union of Railwaymen is officially valued at £36,702 (\$178,375).

RED CROSS REFRESHMENTS FOR TROOPS ON WAY TO CAMP

Secretary of War Baker has requested Henry P. Davison, chairman of the Red Cross War Council, to arrange that Red Cross chapters throughout the United States co-operate with the War Department in providing for the comfort of the troops while en route from their homes to camps and cantonments. The Red Cross immediately wired directions to its division managers to instruct chapters to take immediate steps to supply the necessary food, drinkables, and other refreshments.

The Secretary of War has directed that accredited representatives of the Red Cross be informed of the movement of troop trains, in order that at points where trains stop chapters may be able to see to it that comfort of the men is cared for; and also that in the event of accident or delay at any unusual point measures may be taken to provide food and refreshments

for the men. The Red Cross had already issued to its chapters a model plan for the organization of refreshment units. Chapters are thus prepared immediately to undertake the provision of the proper equipment.

The equipment for a single refreshment unit provides enough coffee, for instance, for 1,200 men. Meals suggested consist of coffee, sandwiches, sausages, and cold beef, with buns or pies. In the case of hot weather, ice tea is expected to take the place of coffee. Special preparations will be made for sick and wounded. It is expected that at every important junction point or place where men are to be transferred or detain the Red Cross will provide stationary canteens.

TRADE BETWEEN GREAT BRITAIN AND BELGIUM.—The British government has appointed a committee to investigate the means of promotion and advancement of trade and commerce between

the British Empire and Belgium. One of the members of the committee is Mr. Frank Potter, general manager of the Great Western Railway, who represents the Railway Executive Committee.

AN INDIAN RAILWAY ACCIDENT.—An unusual accident occurred last month to a mixed train on the Kohat Tail Railway between Doaba, India, and Kahi. The train, which consisted of seven third-class cars, one composite, and two brake vans, on going round a bend was struck by a very violent storm which upset the whole of it, the engine alone remaining on the metals. As soon as it was possible, the engine was cut off and it ran into Kahi for assistance. Two third-class passengers were killed and five injured. No great damage was done to stock or permanent way. The storm was reported to be extremely violent. The engineman was trying his best to get into a cutting for protection, but the train was blown over before he could reach it.—*The Engineer, London.*

H. G. Kelley

FUEL ECONOMY FROM AN OPERATING VIEW-POINT

By Mark H. Reasoner

Heretofore much stress has been placed by mechanical men on fuel supervision and fuel supervisors and regularly organized fuel departments. This is only reasonable, but without support from operating officers and a definitely outlined program of duties for the latter much may be lost that might otherwise be gained by co-operation.

Naturally the organization of a fuel department presupposes that it will act as a buffer and an intermediary between the operating, purchasing and mechanical departments without undue absorption of the energies of any one department. The fuel department's representative should be of sufficient importance in the affairs of the road to merit the confidence of the operating officers and should have education, address, poise and the ability to convince the most skeptical superintendent or purchasing agent that his methods and data are sound. This is particularly true in the matter of bringing the results of tests to the attention of these officials. Test bureaus, though often doubted, secure correct results and the cost of their maintenance, while large, is many times repaid in indirect savings.

The operating department, since it is the one that consumes the coal, should confer with the fuel bureau, or the purchasing bureau, and co-operate in a friendly way in confirming the results of tests and in advising as to the best fuel to purchase. It should also endeavor to analyze the car supply and facilities for moving the fuel to conform to the best interests of the fuel bureau. The superintendent who checks overtime freight handling and yard efficiency and then falls down on his fuel checks is indeed lax. But in order to do this he must depend on the aides on his staff—the trainmasters, chief dispatchers, master mechanic and fuel accountant.

HOW THE TRAINMASTER CAN HELP

The trainmaster by his personal contact with enginemen, firemen, hostlers and coalers is especially in a position to correct any bad conditions as they occur and at least make a report of them to his superior officer.

In the movement of trains the trainmaster has an especially wide responsibility in his relation to coal consumption, in that he is in a position to start trains and keep them moving. If more trainmasters realized just what this means to the fuel performance sheet they would be as keenly interested in it as in the overtime statement. A careful check on this feature and a check of the train lists to ascertain if trains are properly made up in order to avoid an undue number of set outs and switching movements would reduce delays and effect a subsequent marked fuel saving. In this the train dispatcher is equally guilty of negligence.

THE DESPATCHER'S RESPONSIBILITY

The dispatcher should watch his trains and can save fuel in the judicious calling of crews; saving 10 and 15 minutes on the calls of crews to work in the course of a month leaves much coal on the pile unburned. He too often starts tonnage drags on the road which meet and are held up frequently by locals switching and doing way work at stations. At least two hundred pounds of coal is consumed for every stop or slow down of these big trains. A dozen such stops will waste at least a ton of coal, all of which could have been saved had the dispatcher been on the alert. The location of some water tanks and stopping for crossings all tend to waste the coal supply.

The dispatcher in his choice of meeting points can be a fuel economist of no mean order, or on the other hand can be a rank waster. Local and through passenger trains had better be "put in the hole" than to force a 4,000-ton drag

to slow down, stop, or saw-bye. It saves coal, drawbars, overtime and temper. The dispatcher can pick his order points with care and put his orders out at regular stops, making delivery of them while regular station work is being done; much fuel may be saved thereby.

The dispatcher in his watching of yardmasters and agents can inoculate them with the germ of fuel economy.

The yardmaster can regulate the switch movement, especially in classification yards, and in the matter of doubling over with long cuts of cars when making up trains.

In the northwest, days come when a 70-mile wind and a 45 deg. below zero temperature absolutely preclude the handling of tonnage in a satisfactory manner over some of the prairie divisions. If such trains are set back and ordered for a start just after sun set and a night run is made behind the plows they can generally be moved in good shape with marked economy of handling.

THE MASTER MECHANIC

The master mechanic, the third of the superintendent's aides, can materially help the operating department and especially the ordering of power. The two departments should have a friendly and perfect understanding as to when such power is to be used, because the mechanical department should have all the time necessary to complete repairs. Much fuel may be wasted by getting up steam earlier than necessary.

In these days when overtime forms such an important factor in wages, trains are often ordered out later than intended due to some unforeseen minor repairs not being made by the mechanical department; an outgoing train may thus be blocked in the yard because of being on an opposing passenger train's time. This makes terminal delay, fuel waste and often overtime.

FUEL ACCOUNTANT

The last aide to the superintendent in fuel economy is a man who on most roads is out of the superintendent's jurisdiction. The fuel accountant is often practically an unknown personage in the operating affairs of the road as compared to his brother, the timekeeper. The fuel accountant has been more or less suppressed, but he is called upon to distribute and account for one of the largest bills in the road's expense account. In the past he has not been encouraged to participate in the staff proceedings and has in many cases fallen into a rut, living from one monthly balance sheet to the next. If he is alert and bright and abreast of his position, he should be able from the figures passing under his eyes daily to notice the locomotives and engineers that consume coal in excessively large amounts. He can note how and where the engines coal, the kinds of coal they take and the use or misuse of equipment in hauling it from the mines. The fuel accountant should take a week's trip over the division at least three times a year and become personally acquainted with the men and facilities. Nothing will broaden the office man so much and increase his value in the organization more than the personal touch and a knowledge of actual working conditions.

Most of our railroads are operating today under the divisional system and the superintendent who appreciates the saving of fuel and what it means, its direct bearing on operating cost, and its many possibilities can and will get results and a large saving, though if he does not insist on his subordinates doing the same, the chances are that his efforts will be a failure. The question of fuel economy is not entirely one for chemists, inspectors, scale men or fuel supervisors; real fuel economy to be effective must start first with the purchase of the proper fuel and then should be carefully followed by the operating department, personified by the division superintendent.

EDSON J. CHAMBERLIN

E. J. Chamberlin has retired from the presidency of the Grand Trunk and has been succeeded by Howard G. Kelley, vice-president. Mr. Chamberlin went to the Grand Trunk Pacific as vice-president and general manager in 1909 and when Charles M. Hays, president of the Grand Trunk, lost his life in the Titanic disaster in 1912, Mr. Chamberlin was made president both of the Grand Trunk and the Grand Trunk Pacific. During the entire five years of Mr. Chamberlin's presidency the Grand Trunk and its subsidiary have had, for reasons beyond the control of the management, very hard sledding. At the time of Mr. Hays' death, the Grand Trunk through its controlled line in the United States, the Central of Vermont, was building a line from Palmer, Mass., to Providence, R. I. This involved bitter opposition on the part of the New York, New Haven & Hartford. The late Charles M. Hays was a strong man and a fighter. His confidence in himself was great and he carried within himself the plans for continuing the fight and getting the Grand Trunk out of the difficulties in which it had become involved. His sudden death, therefore, made the position of his successor extremely difficult.

E. J. Chamberlin was a very different type of man than his predecessor and his view of the New England situation has been apparently quite different than that of Mr. Hays. His general attitude of co-operation and conciliation has been apparent both in the abandonment of the line to Providence and in his treatment of the difficult questions connected with the relationship between the government and the Grand Trunk Pacific. He showed firm determination, however, in the stand that he took in regard to the National Transcontinental. The Grand Trunk had agreed to take over the National Transcontinental, which is the eastern extension of the Grand Trunk Pacific, and to pay a certain percentage of the cost of building the line. The Canadian government built the National Transcontinental through contractors, but when the time came for the Grand Trunk to take over this line, the costs were so high that the Grand Trunk refused to pay its percentage of them. It is understood that Mr. Chamberlin offered to pay a percentage of what would have been a fair cost to build the line. This the government refused to accept.

Mr. Chamberlin's estimate of the extravagant cost of the National Transcontinental was strongly borne out by the report of A. H. Smith, president of the New York Central, in connection with the investigation made by Sir Henry Drayton, W. M. Acworth and Mr. Smith for the Canadian Parliament. The refusal of the Grand Trunk to take over the National Transcontinental left a very difficult situation. The Grand Trunk Pacific, extending west from Winnipeg to the coast, is not earning its fixed charges. The Grand Trunk, extending northeast from Chicago, is not earning

sufficient to make up the deficit of the Grand Trunk Pacific, and, furthermore, we have the problem of operating a line which was intended to be a trans-continental, competing with the Canadian Northern, a transcontinental, on the north and the tremendously strong Canadian Pacific on the south, with the middle link of the system missing, or at least operated by someone else.

Mr. Chamberlin has carried the Grand Trunk through a very difficult period and retires now with the friendship of those with whom he has had to deal during this trying time.

Edson J. Chamberlin was born at Lancaster, N. H., and was educated in the Montpelier Methodist Seminary. He began railroad work in 1871 as timekeeper in the car shops of the Central of Vermont at St. Albans, Vt. He worked as clerk in the paymaster's office and clerk in the office of the superintendent of transportation and in 1877 became private secretary to the general manager of the Central Vermont. In April, 1884, he was appointed superintendent of the Ogdensburg & Lake Champlain and the Central of Vermont Line steamers running between Chicago and Ogdensburg. Two years later he was made general manager of the Canada Atlantic, now a part of the Grand Trunk. In 1905 he resigned to do contracting work in Canada and later in South America and Mexico. In 1909 he became vice-president and general manager of the Grand Trunk Pacific and as previously mentioned succeeded Charles M. Hays as president of the Grand Trunk and Grand Trunk Pacific in 1912.

E. J. Chamberlin

SIR ERIC GEDDES ON RAILWAYS AT THE FRONT.—Sir Eric Geddes, First Lord of the Admiralty, recently made his maiden public speech at Cambridge before an assembly of his constituents. He said, in part: "The railwaymen of England I hold in the highest regard, and that regard

has been intensified by what I have seen of their work in France. The railwaymen out there have given movement to the army. Railways are now ahead of the guns everywhere—(cheers)—and the work of the railwaymen has saved thousands and thousands of lives at the sacrifice of many of their own. I have been asked to tell you about myself. There is not much to tell. What little politics I had I have forgotten in the munition factories, in France, in the dockyards, and with the fleets. Before the war I had done soldiering in India. At the beginning of the war, at Lord Kitchener's request, I raised and commanded one of the finest pioneer battalions that ever went to France. I went to the War Office and had a hand at most things there, except shell production. Then I went to France. It was what I saw in France that gave me my determination that nothing mattered but to go on with the war to the end. To one who has witnessed the wreckage of the most malicious retreat in the history of the world, the sole thing that matters is to go on with the war to destroy the German military power.

SLIDING SCALE OF PAY FOR SALARIED EMPLOYEES

By S. B. Pugh

Railroads frequently have vacancies in the ranks of stationmen, warehousemen, baggage-men and clerks for which, in many instances, they are unable to secure candidates possessing previous railroad experience. This makes it necessary for them to employ an inexperienced person and require the agent, together with some of the other employees at the station, to break him in.

The salaries of all regular positions at a station, of course, are based on the minimum wage for which the services of a man experienced in that particular branch of the business can be secured. When the company is obliged to engage the services of a man without previous railroad experience—who usually resides in the community adjacent to the station where the vacancy exists, and is usually a young man living at home with his parents—his services are invariably obtainable, to start with, at a rate of compensation below the recognized salary of the position. In order to obtain this inexperienced young man, however, at the decreased rate, he ought to be made acquainted with the fact that, as his services become valuable to the company, his salary will be increased on a sliding scale until the maximum salary for the position is attained.

In the interest of economy and efficiency division officers should be given blanket authority to fill such vacancies—when necessary to employ those who do not possess previous railroad experience—at a rate deemed by the employing officer commensurate with the applicant's capabilities. This should be done, however, with the unfaltering understanding that they may increase the salary from time to time as considered consistent, the rate not to, of course, at any time exceed the regularly authorized rate of pay for any specific position. It will be necessary that the employing officer have authority to promise and substantiate these periodical increases without either the necessity of submitting or the necessity of securing the approval of any customary form covering changes in payrolls.

By the inauguration of this sliding-scale system, considerable money can be saved to the company, and the employee taken into the service will be better satisfied, due to the systematic remunerative recognition which he has been promised as his experience and efficiency increases. Furthermore, this system will make the experienced employees realize that their services are appreciated much more than were an inexperienced employee taken into the service and placed along side of them at the same rate usually paid for an experienced man. It is incumbent upon the other employees at the station to educate the beginner, and assist him until he becomes capable of handling the work. As soon as the inexperienced employee is taken into the service at a lower scale of wages than his fellow workers received at the same task, the men already in the service are immediately encouraged, as it is evident to them that the company places a premium upon their experience. This encouragement will be reflected by the increased interest they take in the performance of their duties.

For illustrative purposes, let us take a specific station where the rate of pay for warehousemen is \$75 a month. The railroad on which this station is located is, the greater portion of the time, able to secure the services of an experienced warehouseman at that fixed rate of pay, but occasionally it is unable to do so and, not desiring to increase the salary of the position, it is considered advisable to employ a young man inexperienced in railroad work. This young man is furnished transportation to division headquarters for the purpose of an interview with the division officer delegated to employ station forces. The young man

is told during such interview that the company is willing to start him in the railroad business, but naturally could not afford to pay him the same as it would a man of several years' experience. The company is willing to start him in the position at a salary of \$50 a month, and if he proves satisfactory, he will be increased at the rate of \$5 every four or six months, until the rate of pay reaches \$75 a month, the amount the company can consistently pay for the services of an A-1 experienced man in the position. In some instances it may be necessary to shorten the period of time between such increases, but in no case would the eventual rate exceed the present fixed rate for the position (except, of course, by formal approval of the customary form covering changes in payrolls).

It is necessary that the employing officer shall have blanket authority to promise and substantiate the periodical increases as the applicant's services warrant, which obligation it is necessary to assume at the time of employment as an incentive for the candidate to accept the position at the low rate of pay, which in many instances would be a lower wage than he could earn elsewhere in a line of employment in which he has had previous experience. If the employing officer does not possess this blanket authority to incur these obligations, and is obliged to prepare and submit for approval the regular form to cover changes in payrolls, regardless of the nature of his understanding with his principals, his formal request for increase in salary at times may either be delayed or declined temporarily, owing to some unforeseen condition which may arise at any time, thereby establishing a reputation of insincerity for the company and the division officers in the community served by the line, and retarding, if not making impossible, further promulgation of the sliding-scale system.

Incidentally the same system should be applied in division offices. When the chief clerk of a division office is obliged to employ an inexperienced clerk, he should be in a position to place him under this same sliding-scale plan.

This sliding-scale system means a considerable reduction in the overhead expenses of the railroad, but in addition to this saving in expenses, the most redeeming feature of the system must not be lost sight of; namely, the fact that it enables the railroad to secure that efficient and loyal service which is only obtainable—almost regardless of supervision and scrutinization—from the employee who is furnished an incentive for the creation of ambition, and who is acquainted with the fact that an exertion of his best efforts will receive monetary recognition. The necessity of some such attractive system for the encouragement of unorganized salaried employees is more in evidence since a state of war exists in this country which has resulted in much more alluring and entertaining wages being offered by manufacturers and others, and the marked reduction in the material available for railroad office positions.

This sliding-scale system is in effect in the general offices of one of the large trans-continental railroads at the present time, with the exception that the money saved by the filling of a vacancy (whether by experienced or inexperienced person) at a lesser salary than previously paid, is distributed among such employees in the office force as merit warrants; it has been productive of the formation of one of the most faithful and efficiently organized office forces in the country.

TUNNELS ON THE NEW AFRICAN LINE.—There will be four long tunnels on the new railway deviation in Natal between Maritzburg and Durban. The Delville tunnel will be 970 yards in length, the Barrier tunnel 962 yards, the Eldorado tunnel 374 yards and the Manzine tunnel 400 yards. The new line will be 300 yards longer than the existing route, but great benefit will accrue as the result of improved gradients and curves.

A Study of the Design of Docks and Wharves*

A Discussion of the Considerations Involved in the Location and Construction of These Special Facilities

By W. H. Hoyt

Assistant Chief Engineer, Duluth, Missabe & Northern, Duluth, Minn.

IN conceiving the general plan or scheme of a dock, wharf or waterfront improvement, the character of the service to be rendered or the mission of the completed property is of first importance. A dock and wharf is a means to an end. Except as the means determines the operating cost, the choice of the means is of less importance than the accomplishment of the ends. That plan which accomplishes the end with the lowest cost per year is the most economical. We must include in the cost per year charges which will secure all original invested capital. Each kind of business or service has its own peculiar requirements which call for appropriate qualities in the character of the dock and wharf.

GENERAL CONDITIONS GOVERNING LOCATION

If the dock is considered as being the water basin adjacent to the wharf and serving the purpose of giving approach to the wharf for appropriate vessels, it partakes of the qualities of any sea road, that is, sufficient room to maneuver the boats with ease and dispatch, including boats of the present and future increased size and sufficient frontage on the wharf to accommodate the required number of vessels with a depth to float loaded vessels of the present draft and future design. Consideration must be given to allowing space enough for maintenance and dredging operations if the conditions are liable to cause changes in the depth of water. The vessels inside the dock should not be exposed unnecessarily to rough water, and if possible the plan should be such as to secure favorable conditions at the entrance for boats during rough weather and various phases of the tide.

In some cases the dock may be constructed on the line of two adjacent properties of different ownership, the dock area chosen being sufficient to serve both properties. The total area thus devoted to water surface may be less than the area required if both parties were to build separate docks. Dock property, which includes the land under the water, available for construction of both the dock and wharf, has risen in value in recent years and economy in the plan which will minimize the area wasted in waterway is greatly to be desired. Community developments of dock property are very important. The United States Government has spent large sums of money in developing harbors and approaches thereto and will continue to do so. This cost is borne indirectly by all and economy in the use of the frontages on these harbors will lessen the total amount required to be spent on harbor development, besides producing the greatest returns to each individual property. Sometimes the dock work is reduced to a minimum because the necessary service is secured by a pier run out into deep water.

The general scheme of a wharf will often be started with limitations of property available either because of prohibitive cost or the finished development of adjoining property by other owners. The shape of parcels of water front property is more liable to be irregular than regular, sometimes approaching the square, at other times a long strip between other strips. Sometimes when the shape is suitable, the approach is unsatisfactory because of developments of industries and surrounding communities. The facility of approach with railroad tracks, complications of manufactur-

ing and improved properties, and the general natural layout of the ground over which the approaching railroads are to operate, may alter the general conception materially. These predetermined conditions may force unsatisfactory arrangements, but care must be given to eliminate constrictions at any point on the approach which will develop neck-of-the-bottle effects and limit the full use of the property.

Changes in value of real estate and dock property should be considered. Property may become too valuable for use as originally intended and require a change to justify the interest charge which is always to be governed by present values.

CONSIDERATION OF TRAFFIC TO BE HANDLED

If the plant is to accommodate passenger service, its arrangement as to safety and convenience should be given careful attention. Ease of transferring passengers from trains or from land approaches to floating equipment and ample room for allowing rapid and safe movements, are factors which will largely control the general conception, as will also the passenger service, whether ocean-going, long voyages or short-voyage ferry service. The character and number of passengers handled influence the weight to be given to convenience and comfort. As passenger service comes in contact with human and psychological factors it requires a higher state of perfection, dependability and safety, especially so if in competition.

If the service is that of handling freight there are even more factors arising which will influence the arrangement. To handle miscellaneous package freight, its adaptability to the use of loading and unloading machinery and to the movements of freight from floating to rolling equipment, or vice versa, must be considered. To handle bulk freight such as coal and iron ore either from boats to docks or from stock piles, docks or cars to floating equipment requires an entirely different class of structures from that designed to handle package freight exclusively. The former may be exposed to the weather while the latter may require protection of warehouses. The character and weight of freight affect the storage and working areas required.

The character of the boats, whether ocean, lake, canal or river-going, whether they are standardized and whether they are equipped with freight-handling machinery, has a very important bearing on the wharf requirements. Great Lake boats for ore, grain and coal carrying are fairly well standardized. Canal service tends to standardization. Ocean-going vessels are more varied in character. Labor conditions and whether men are transient or stable influence the amount of machinery required for handling freight.

OTHER CONSIDERATIONS

At present the tendency toward government ownership and control may influence the amount of the expenditure to be made. In case of a transfer of ownership a permanent structure would bring a larger proportion of returns than one of temporary character. On the other hand, other conditions of public sentiment may tend to heavy taxation of the corporation and its property and thus the advantages to be gained by expending money in permanent construction would be offset by the additional taxes on such property. The fire hazard and insurance rate on property of this kind

* Abstracted from Bulletin 197 of the American Railway Engineering Association.

is very important. If located in the immediate vicinity of structures whose materials increase the fire hazard, fire resistant construction would be advisable. Rates of insurance in different localities should be considered carefully.

The height of the structure is often determined by its location on a shore line subject to rise and fall of the water due to tides, wind action or flood conditions of a river. The action of salt water upon different structural materials, the climatic and atmospheric conditions, decay and deterioration due to marine growths, the violence of wave action, the general prevalence of storm conditions, and ice accumulation will all have their influence on the choice of materials. The life of wood commonly used in each locality is a factor in the choice of timber or some more permanent form of structure.

The foundation details are variously affected by the character of the soil upon which the structure is to rest. A soft alluvial deposit or sand will often require very long piles, while if rock bottom may be reached without great expense, cribs or piers may be constructed economically. River or stream flow may wash out foundations or fill up adjacent docks. The season of the year when a wharf may be started might determine the character of construction chosen.

In most of our harbors conditions imposed by the general layout of the government harbor lines affect the general shape of the work. Where the government harbor lines are laid out far from the natural shore line, construction will develop into long and slender wharves, while if the harbor lines are close in shore, structures will develop into broad and probably filled docks. If the adjacent channels have not been developed to their final form by government decision, it might be unwise to adopt permanent construction. Sometimes riparian rights have not been settled by court decisions and permanence of legal rights should precede permanence of construction.

Business and economic conditions have a most important part in the design of a wharf. For instance, a lumber wharf built in a country where the timber business will last only 10 or 15 years will suggest a cheap first cost, while a structure to handle package or bulk freight serving ocean liners would naturally suggest permanent design. The volume of business to be handled at the dock, its rush times at certain seasons of the year, its possibility of increased growth or change of character of shipments may also develop a special design. The principle of obsolescence places limits on the investment even if no other limit comes in.

Many times judgment on general layouts will be made on the visible and self-evident factors, but the indirect and intangible things may be of greater value, as, for instance, the principle that the breakdown or loss of service of a part of the whole train or sequence of operation may entail loss of many times the cost of permanent construction in the loss of time of the rest of the machine, which may mean delay of all correlated transportation.

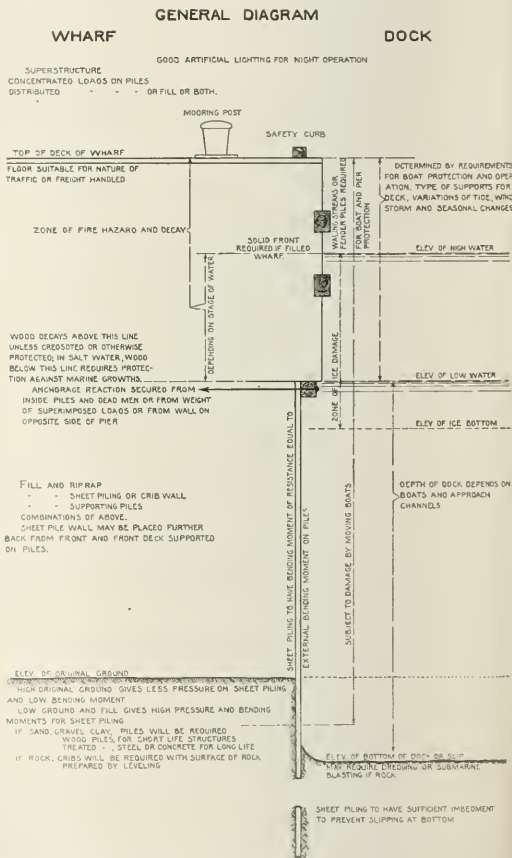

The item of maintenance cost is very important. Even at the present prices it may be the deciding factor, but with the upward tendency in the price of materials, repairs may run into larger sums than first contemplated and so balance the increased cost and interest on better structures. Maintenance costs vary through difference in the thoroughness of the system of maintenance, prompt repair oftentimes saving greater losses.

THE DESIGN OF THE SUBSTRUCTURE

Any substructure may be divided into elements as indicated by the diagram and notations thereon. The critical region where the greatest variation in design and construction occurs is that next to the dock basin or the part of the wharf which comes closest to the boats, for here we find a variety of forces and requirements. The vertical loads are carried by piling, sheet piling, crib walls and fills. The

horizontal pressures, where they exist, are carried by sheet piling or crib walls. Boat impact and mooring stresses are usually carried by the structure as a whole.

Of the faults in the foundation uneven settlement is worse than uniform settlement because it sets up destructive stresses in the superstructure. Therefore, if settlement seems unavoidable, attention should be given to keeping it as nearly uniform as possible. This can be attained by using a uniform system of support. One of the most common causes of failure, and perhaps the most common defect in dock foundation construction, is the improper spacing of the supporting piling. The tendency is to space piling more or less uniformly throughout the structure with utter disregard of the

Summary of General Considerations Which Govern Design of Docks and Wharves

unequal distribution of load. Often the parts of the dock carrying no load at all are supported by the same distribution of piling as the part of the structure carrying the maximum loads. Piles should be so placed as to receive uniform loading for each pile.

By far the greater number of all docks yet built or being built in this country are designed with wooden piling to carry their loads. In many cases they are being surmounted above water line by concrete piers either with or without timber grillage. It is becoming more and more the practice at the present time to use treated timber and treated

piling in all work subject to destruction by the teredo or other form of marine borers.

Where piling is driven in very deep water and future plans contemplate permanent filling of the dock, it is often good practice to fill in around the piling to a certain depth with rubble stone, thus stiffening the foundation and causing less damage to buildings and structures due to the shock of berthing boats. Some structures are surrounded by timber sheet piling well anchored back with steel rods and the wharf is then filled to the required height. A few have already used steel sheet piling for this purpose, thereby obtaining a very permanent foundation.

During the past a great many docks have been constructed of timber cribs sunk along the dock line without placing

The present depth of channel as well as the depth that may be required in the future should be given careful consideration. If the structure is one to be used a long time its future improvement by changing a timber foundation to one of more permanent design of concrete and steel must be considered.

Filling behind sheet piling or in cribs should be distributed uniformly and in horizontal layers. Sheet piling walls and cribs should be tight so as to retain all the fill permanently. Cribs should rest fairly on suitably prepared bottom. Ample allowance for strength in the foundation for all loads and forces which may come on the wharf and prevention of overloading later is the best way to minimize settlements.

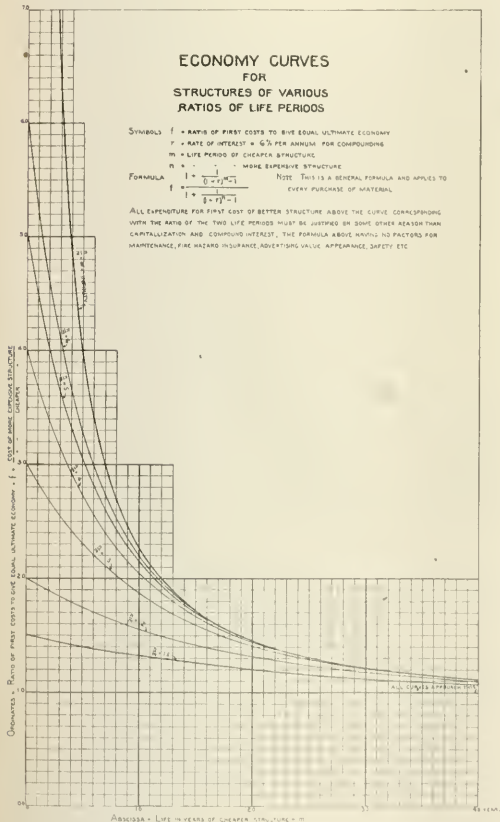

When a boat strikes a wharf or pier the damage done will depend on the size of the boat, its speed, its material, and on the mass of the pier, its fender system and its material. The designer must consider where he wishes to direct the damage or the cost of maintenance. There are two systems directly opposed in principle. The first is to build of materials of such elasticity and make up as will absorb the average service blows with very small damage. Usually this takes the form of elaborate timber framing with fender piles, sometimes backed with coil springs. The exposed points are usually protected with large groups of closely-driven piles. However, this protection fails with a square blow of a vessel under headway and usually results in expensive damage to the pier.

The other system is to build of simple concrete masses or reinforced concrete of such amount and rigidity that boats strike the pier at their own peril. Here a premium is put on solidity and mass. Vessels can and do much damage even to these structures, but greater damage is usually sustained by the boat. This tends to increase the skill and diligence of the captains, lessening the frequency of such accidents and usually leaving the structure in a shape to be easily repaired after a destructive blow. Such structures usually only have a rubbing waling strip of oak timber or fender pads of 12-in. by 12-in. timber hung over the side. Timber piers usually are not adapted to the second system because they are lacking in mass and rigidity, hence some form of the first system is used.

Where passenger service is rendered by the pier, the second system is not advisable because of the effect of a smashing blow of impact with the pier on a large crowd of people on the boat. Rightly here practice has developed elaborate systems of cushioning the blow and letting the damage be done to the dock.

The case of a submerged wall with water on both sides where filling is put in back may lead to a little confusion. If the water stands at the same level on both sides of the wall the hydrostatic pressures are balanced. The material filled in back of the wall usually weighs more than water, even after allowing for the buoyant effect of the water. This gives an added pressure on the side of the wall equal to the horizontal pressure of that material with its slope angle of repose under water and its reduced weight. The effect of the water is to decrease the angle of repose of the material and the effective weight. Decreasing the angle of repose increases the horizontal pressure and decreasing the effective weight lessens the horizontal pressure. If the material lies fair against the wall so that the hydrostatic pressure has no area to press against, the effective hydrostatic pressure on the inside of the wall will be zero, but in practice a film of water will lie next to the wall except at a few points which transmit the pressure of the filling itself.

Piling, piers and original ground which stands at greater heights than the bottom of the adjacent channel tend to reduce the pressure exerted against the inside of the wall. The amount of the reduction is a subject for careful judgment in each case. Because of this reduction, it is some-

times possible to leave out intermediate supports on sheet piling, using only secure anchorages at the top and a sufficient length of imbedment at the bottom.

In the early days of wharf building the driving of a strong pile sticking up through the deck three or four feet formed a satisfactory mooring post when boats were smaller and the attaching lines had a horizontal pull, but with the increase in the size and height of vessels which mean a high inclination of the rope with a tendency to slip off the old straight side posts, have come cast-iron posts with various shapes to overcome the slipping. All of these posts require suitable foundations with hold-down bolts to take care of the lift. With the addition of steam winches on the boats to warp them along the piers in loading, it has been found advantageous to have mooring posts at frequent intervals along the front of the pier. It is well also to have a few posts further back from the front to fasten mooring lines at less inclination for such work as pulling the boat closer to the piers. As a matter of safety, it is necessary that some form of curbing or foothold should be provided along the front of the pier for the men receiving the mooring ropes to prevent their slipping and being pulled into the water.

SUPERSTRUCTURES CONSTRUCTION

The superstructures of many wharves constructed during the past few years are of a composite character. Timber, concrete and steel are used in various combinations, and there seems to be great diversity of opinion as to the best practice. Timber structures are generally decked by cutting off the piling to the proper level, capping them with standard sized timbers and placing a plank floor, securely spiked to the caps. This form of deck is very satisfactory for wooden structures and, up to the present, on account of the low price of timber, has probably returned more on the investment than would have been produced by any permanent form of construction. In the past few years some designers have placed concrete decks on timber structures and others have used concrete with asphalt wearing surface. It would seem that either of these methods of construction were hardly satisfactory. Concrete or asphalt decks should be placed on filled or permanent structures so they will not deteriorate rapidly from the action of an unstable foundation.

The superstructure of many wharves is of very simple construction, being principally a more or less extensive roof supported upon posts from the foundation. Of late years many fine examples of steel and concrete buildings have been erected and the tendency in all the large shipping centers, at the present time, is to erect structures of this character. The danger of fires and the tremendous loss incident to the destruction of wharves and their contents, as well as the loss that may entail on shipping in the immediate vicinity, has been a very decided factor in producing a permanent form of construction. The constant rise in prices of timber in all forms and the lower prices of steel and concrete is making it more feasible to put up fireproof structures of permanent design.

ECONOMY CURVES

The formula for these curves is given with the curves. By assuming that n and m have a fixed ratio and using various life periods, it is possible to calculate values of f for each ratio of life periods and different lengths of life. By plotting these values of f and joining points calculated for the same ratio of life period, we get curves showing values of f for any life period within the limits of the curves. For convenience those of even life ratio were plotted. For any fractional ratio of life period values of f can be found approximately close by interpolation between the appropriate curves. The curves start at zero life and ratios of cost equal to the ratio of life period and approach the

ratio one as the life periods lengthen until at infinity $f =$ one, irrespective of the ratio of cost at the start. The curves are calculated with the interest rate at 6 per cent, but the principle would be the same whether we used 3 per cent, 4 per cent, 5 per cent, or 6 per cent except that the higher the rate the more rapidly do the curves fall to the ratio one.

By a study of the curves it will be seen that a larger ratio of first cost is justified for short life structures than for long life structures even if the ratios of life periods are the same. It will be seen that every additional year which we can add to the life of the lesser cost structure lowers the ratio of justified cost of a longer life structure, even though the longer life structure does last the same ratio of life. For example: Treated timber with a life of 25 years and steel of 50 years have a justified cost ratio of only 1.23 and even if we were to get infinite life from the steel a cost ratio of only 1.30 is allowable. This does not prove the steel should not be used, but indicates that where steel is used some other important factor such as maintenance of fire hazard must be the basis for spending a greater amount.

METAL ALLOYS USED IN LOCOMOTIVES*

By G. L. Hoyt

Assistant Professor of Metallurgy, University of Minnesota.

Every railroad man who is concerned with the design of a locomotive knows that heat-treated steel has better properties than annealed steel, for by heat treatment we are able to produce certain properties that can be produced in no other way. I have found, however, in talking with various railroad men, that the chief reason they are not ready to adopt heat-treated parts is that heat-treated steels do not stand up any better than ordinary carbon steels, and that in some cases special steels give more trouble than ordinary carbon steels. The reason given is that the producers of these parts are not in a position to heat-treat material of that quality on a commercial basis to sell for such a price that the railroads can effect an economy in buying. At present the practice is to merely anneal the various parts. A locomotive axle will be forged from an ordinarily good grade of open-hearth steel. After forging it is heated to the critical point and allowed to cool in the air slowly. The object, I take it, is to insure uniformity and to remove internal strains. Whether or not a satisfactory structure is produced is of entirely secondary importance. When I mention internal strains, I give the reason why heat-treated steels are not used generally in locomotive practice. There can be no doubt about the advantages which they possess over ordinary carbon steels, and if it is impossible at present to obtain heat-treated steels for locomotive construction, something should be done about it.

If I can read the signs of the times correctly, there is a necessity for all the economy possible in railroad operation, which is why the question of using heat-treated steels in locomotive construction is becoming more and more important. It is possible to produce steels that far surpass those now entering into locomotive construction. In gun construction the United States Government and the steel plants got together and are now successfully manufacturing heat-treated gun parts. Hadfield projectiles are probably the most difficult to produce satisfactorily of all materials made of steel, the internal strain serving to weaken the resistance of the material. What has been done in other cases can be done in regard to any part about a locomotive. I can see nothing inherently difficult about heat-treating locomotive parts. Whether or not the methods for doing this are developed depends upon the demand made upon the steel plants by the railroads to produce the desired material. If the roads feel that there would be an economy in using heat-treated parts, undoubtedly

*Abstract of a paper read at a meeting of the Minnesota Section of the A. S. M. E.

The saving effected by using special steels results chiefly

The advantages of a scheme of this kind are many. The voucher contains all the bills rendered during the month, and serves as a check at once upon all the invoices that may be outstanding. The account is complete and upon payment is cleaned up entirely. There is no fear of overlooking mislaid invoices, of forgetting invoices in process of being checked, or of invoices being too long delayed for payment. The railway, further, receives at the end of the month a complete record of its bills outstanding, and can easily determine where it stands at all times.

TRAIN HANDLING *

By G. H. Wood

General Air Brake Inspector, Atchison, Topeka & Santa Fe.

To prevent, as far as possible, damaging shocks in long trains, due to brake applications, it is necessary that the percentage of braking power be as nearly uniform as possible on all cars, and that loaded and empty cars be so distributed in trains that the greater part of each will not be at the head end or rear end. It is, of course, not practical generally to alternate loaded and empty cars throughout trains and the best that can be expected in this respect is to place part of the empties ahead and part of them at the rear, placing at least one third of the empties in the head end of the train, and the balance behind the loaded cars. This does not mean that in short trains, say 25 or 30 cars, and where there are only a few empties or loads that this procedure is necessary; but on long trains of 40 cars or more where about one half are loads, it is advisable to place the loads and empties as above suggested. This provides a means of distributing the braking power so that reasonably good handling of the train can be expected.

It is, of course, important that piston travel be properly adjusted on all cars in any train. This feature has been dwelt upon more or less by those concerned in brake maintenance. Long piston travel is preferable to short piston travel, that is, 7 in. standing travel will provide much better handling trains than 5 in. standing travel with the same brake pipe reduction, because in the former case the cylinder pressure will be built up more slowly and consequently any movement of slack in the train will take place proportionately slower, with a reduction in the velocity difference between cars and the stresses set up on account of such; and while there will be a considerable difference in the cylinder pressure between a 5-in. and 7-in. piston travel at the beginning of a brake application, the pressures will be nearly equal when the brake is fully applied. An idea of the shocks produced in trains may be gathered from the following statement:

"It is not infrequent that a velocity difference of one mile per hour is set up between cars at different points in a train, due to grade conditions or loaded and empty cars, during brake applications. With the present standard freight brake, the empty car tends to retard at about three or four times the rate of the fully loaded car, and if a heavy service reduction is made, if the loaded cars are toward the head end of the train, the ordinary slack between cars provides a means of stretching the train to such an extent that the stresses run around 300,000 to 400,000 lb.; hence it becomes plain why a draft gear yoke, capable of sustaining the weight of its own car, or even a number of such cars if suspended vertically, is so easily broken in service; also why so many damaging shocks, due to slack action, occur every day, with the great diversity in car loading, train make-up, grade conditions, brake conditions, etc. However, if a light brake pipe reduction be made the braking force will, of course, be reduced and the velocity difference between cars in the train will be reduced correspondingly, with a corresponding reduction in stresses set up between cars in the train."

You will note that the statement is made that if a light brake pipe reduction instead of a heavy one be made that the braking force will be reduced and the velocity difference between cars will be correspondingly reduced; however, it is assumed in the above case that the piston travel is near 8 in. standing travel, so that it is possible to produce a low cylinder pressure, since with 7 in. piston travel a 10 lb. brake pipe reduction produces 30 lb. cylinder pressure, and a 5-in. piston travel produces 45 lb. cylinder pressure, with

the same brake pipe reduction. Note that in the case of the short travel the brake is nearly fully applied, if 70 lb. brake pipe pressure is the standard carried. A 5-lb. brake pipe reduction produces about 7 lb. cylinder pressure with a 7-in. piston travel, and the same reduction with a 5-in. travel produces about 17.5 lb. cylinder pressure. The rate of retardation due to brake applications depending upon the rate at which the brake cylinder pressure can be built up, it will be seen that with short piston travel, say 5-in. or less, a high rate or retardation is possible, because a 10-lb. brake pipe reduction produces 45 lb., a high cylinder pressure. It is true that the longer brake pipe on long trains automatically increases the time in which it is possible to effect any given brake pipe reduction over that obtaining for a short train. At the same time the longer brake pipe increases the time between the beginning of brake application on the head end and rear end. Now if the piston travel is short, say 5 in., it is possible to develop a high brake cylinder pressure at the head end with a 10 lb. reduction before the beginning of brake application at the rear. This causes the slack to run in from the rear, sometimes with very damaging results if the speed is low, because it is possible to produce sufficient braking power on the head end of a long train to stop the head end before the brake application begins at the rear end. This results in a collision between the two ends of the train. However, if the piston travel be long, say 8 or 9-in. standing travel, it is possible to make the same reduction and only produce 20 to 25 lb. cylinder pressure, less than one-half the pressure produced with the short piston travel. This reduces the rate of retardation set up on the head end of the train, and consequently the severity of any slack action due to a run-in of the slack. Lighter brake pipe reductions still further reduce the cylinder pressure developed, until the train can be controlled without any noticeable slack action.

The above serves to show that it is possible for the man engaged in brake maintenance to provide a brake condition that is difficult to handle, and one that contributes to rough handling; or to provide conditions that are quite the reverse, so far as piston travel is concerned; also that the old idea that the piston travel should be very short, to provide a quick acting brake and more braking power for light reductions is entirely wrong for long train operation.

As indicated in the foregoing, the engineman should avoid heavy brake pipe reductions at any one time in handling long trains. He is in a measure at your mercy in this respect, since once the triple valves are moved to service position, any reduction of brake pipe pressure causes a further increase in brake cylinder pressure. The rate of brake pipe loss or reduction due to leakage should be kept as low as possible, and should not exceed 5 lb. per minute after a 15 or 20-lb. brake application from 70-lb. pressure.

Numerous cases of damage in handling trains are traceable to the manner in which the train is operated by train and enginemen; however, cases are recorded where damage occurs due to other influences, and in order that this association may lend its efforts to lessen such cases the car department should be notified promptly of any case of trains leaving the terminals coming uncoupled due to defective drawbars or appliances, or breaking-in-two due to weak or defective draft gear, in order that these matters may be taken up promptly with the head inspectors so that they will realize the importance of doing everything possible to prevent cars coming uncoupled due to mechanical defects. In making up trains, cars having weak or defective draft gear, if not repaired, should be handled toward the rear of trains, and it is important that yardmen be instructed to place cars in the rear of the train when so notified by inspectors or when the cars are properly carded by them.

Any efforts directed toward providing good brake conditions tends to reduce the rough or improper handling with

* From a paper presented before the Car Foremen's Association of Chicago.

a resultant reduction in shocks that contribute to loss and damage.

In order to assist in the inspection of draft gear and brake conditions, and also keep the slack in draft gear at its minimum, freight trains should be stretched on their arrival at all terminals. This requires the incoming brake test to be made as follows:

On stopping the train, where it is to be left in the terminal yard, the brakes should be released and fully charged, sufficient hand brakes should be applied at the rear so that the slack may be gently pulled out on the entire train, after which the air brakes should be applied with at least a 20 lb. service reduction. The brakeman should not close any angle cocks until such application is completed. Inspectors should, of course, be on hand to inspect for brake and draft gear defects as promptly as possible.

Representing a railroad which has some long and heavy grades, I am vitally interested in the question of maintenance of retaining valves on freight cars. Since it may be that some will question the suggestion with regard to avoiding piston travel shorter than 7 in., I wish to state that for grade work if the retaining valve and its connections are kept in proper condition, as they should be, there will be less difficulty in controlling trains on heavy grades than obtains with the short piston travel. Not only this, but with piston travel at 7 in., the roads operating in level territory will have much better handling trains with a consequent lessening of the damage occurring, less trouble due to stuck brakes, and also cracked and slid flat wheels. The question is one that is worthy of considerable thought and also one that should be given a great deal of consideration and attention by those who are directly concerned in the maintenance of brakes.

I understand that M. C. B. recommended practice with respect to piston travel is at present $5\frac{1}{2}$ to 7 in. This, however, should be changed, in my opinion, to, from 6 to 8 in., making 7 in. the standard adjustment. I do not wish it understood that I favor a brake condition that will lessen the safety of train operation. On the other hand I am thoroughly convinced that for the operation of long and heavy trains with the pneumatic brake, sooner or later a move in the direction of overcoming the time element inherent in pneumatic brakes will be made. This does not necessarily involve the operation of the brake by electrical means, but rather by timing the application of the brake in its initial stages, thus allowing time for the tremendous forces existing in heavy trains to adjust themselves gradually before a high rate of retardation is produced. This, I feel, is necessary for both the service and the emergency brake application. The nearest approach that can be made to such an installation with present equipment is to maintain the piston travel slightly longer than is the present practice throughout the country. I have for the past several years recommended such a change and understand that at the present time this suggestion is being tried out on various lines, particularly in passenger service, with very satisfactory results. It is much more necessary for freight service, where the trains are so much heavier and consist of a greater number of cars.

ECUADORIAN BONDHOLDERS LOSE SUIT.—Judge Augustus N. Hand, of the Federal District Court of New York, has dismissed the suit brought against Speyer & Company and the United States Mortgage & Trust Company by Erskine Hewitt on behalf of himself and all other bondholders of the Guayaquil & Quito Railway. The action, which was filed on January 2, 1899, was designed to impress a lien upon money in the possession of Speyer & Company. The litigation grew out of contracts made by the government of Ecuador in 1897 and 1898 for the construction of a railroad from the port of Guayaquil, in that country, to Quito.

MOTOR TRUCKS REPLACE TRAP CARS

For about three months the Cleveland, Cincinnati, Chicago & St. Louis has been handling less-than-car-load freight between its sub-stations at Front street, Sixth street, Brighton and Ivorydale and its main station at Central avenue, Cincinnati, by motor trucks in place of trap cars. These motor trucks have been installed to release the freight cars now in this service for main line use; to increase the present station rail facilities; to increase the capacity of the present freight house by securing a more continuous movement of freight at the main and sub-stations and to decrease the liability for loss and damage.

The equipment in this service which has been installed jointly by the Motor Terminals Company and the railroad consists of one 5-ton White motor truck chassis, nine removable truck bodies with a capacity of 5 tons each, 12 sets of lifting chain hoists and five overhead superstructures. The plan of operation is to distribute these movable truck bodies at each of the four sub-stations and the main station. In outbound service they are spotted on the floor of the freight house or left suspended under the super-structure in the drive way so that freight can be loaded directly on them by the shipper instead of being placed on the station floor. In this way the rehandling of the freight over the floor to the out-bound car is eliminated. With in-bound traffic the

Motor Truck Chassis With Removable Truck Body and Chain Hoists

freight is trucked directly from the car in which it arrives over the platform into the truck body for the proper sub-station. When these truck bodies are loaded they are ready for movement at once over the streets to the main or sub-stations.

After a truck body is loaded and ready for shipment, an average of only five minutes is required to transfer it to and from the motor truck chassis. With this arrangement the motor truck can be employed continuously in transferring these bodies with their contents from one freight house to another. In this way the single truck has handled as much as 84 tons of freight in one day. The average load of each truck body is 4.55 tons. Investigation showed that trap car movements require an average of $1\frac{1}{2}$ days while with this system of motor transportation the haul of a trap car load of 9 tons of freight within a $9\frac{1}{2}$ mile radius and with an average haul of 3 miles is made in 1 hour and 24 minutes.

The use of this system of freight transference has resulted in advancing trap car freight movement 24 hours, as 88.4 per cent of this trap car freight reaches the main station in time for loading into line cars the same day or is delivered to the sub-stations in time for delivery to the

consignee. It has also made available for other service eight trap cars daily and has eliminated the expense of switching these cars. It is estimated that the floor capacity of the stations has been increased 4,860 sq. ft. or 40.8 per cent. The rehandling of the freight passing through these stations has also been reduced over 50 per cent daily.

In estimating the cost of this service as compared with trap cars the contract price per ton of freight handled, the labor cost for truckers and operators and the interest and depreciation on the investment in the superstructure were compared with the charges for switching, per diem, labor and interest and depreciation on the box car equipment. In spite of the fact that one truck with its disproportionately heavy overhead charges has been compared with the pro rated operating cost of a large road, the results have convinced those in charge of this development that it is economical. It is now planned to present these figures to the other roads in Cincinnati with the idea of extending this service to the interchange of freight between roads.

COMING MAINTENANCE CONVENTIONS

The programs for the meetings of the three associations in the maintenance of way field, which will be held in September and October have been prepared and well attended and profitable conventions are anticipated. These associations are the Roadmasters' and Maintenance of Way Association, the American Railway Bridge and Building Association, and the Maintenance of Way Master Painters' Association. According to the programs, entertainment will form a minor feature of the various meetings, the subjects for discussion being selected for the most part with a view to their pertinence at the present time.

THE ROADMASTERS' CONVENTION

The convention of the Roadmasters' Association will be held at the Auditorium Hotel, Chicago, September 18-20, inclusive. The program for this meeting appeared in the *Railway Age Gazette* of July 20, page 102. Arrangements for the exhibit of the Track Supply Association to be held in connection with this convention are taking form, 47 firms having already arranged to present exhibits. A list of these companies is given elsewhere in this issue.

THE BRIDGE AND BUILDING CONVENTION

The American Railway Bridge and Building Association will hold a convention at the Hotel Sherman, Chicago, October 16-18, inclusive. The place of meeting was changed from St. Paul, previously selected, to Chicago because of the more central location. The program in detail is as follows:

TUESDAY MORNING, OCTOBER 16

- 10:00 a. m.—Convention called to order by president. Opening business and reports of officers.
- 11:00 a. m.—Committee report, Economical Delivery of Water to Locomotives.

AFTERNOON SESSION

Economical Methods of Handling Work Under Present Conditions

- 2:00 p. m.—Committee report—Erection of Plate Girder Spans with the Least Interruption to Traffic.
- 2:45 p. m.—Committee report—Repairing and Strengthening Old Masonry.
- 3:15 p. m.—Committee report—Paint and Its Application to the Exterior of Railway Buildings.
- 3:45 p. m.—Committee report—Fireproofing the Roofs of Wooden Buildings.
- 4:15 p. m.—Committee report—Encasing Girder Bridges in Concrete.
- 4:45 p. m.—A paper—Snow Sheds.

Tuesday evening has been set apart to pay tribute to the memory of Samuel F. Patterson, late secretary emeritus.

WEDNESDAY MORNING, OCTOBER 17

The Labor Problem

- 9:30 a. m.—Committee report—How to Secure and Hold Bridge and Building Men.
- 10:00 a. m.—Committee report—Housing and Feeding Bridge and Building Maintenance Crews.
- 10:30 a. m.—Committee report—Uniform Rates of Pay Versus Differential Rates for Experienced Men.
- 11:00 a. m.—Committee report—Small Versus Large Gangs for Maintenance Work.

- 11:30 a. m.—Committee report—Labor-saving Equipment, Including Hand-operated Devices for Lifting, Pulling and Hoisting.

WEDNESDAY AFTERNOON

The Material Problem

- 2:00 p. m.—Committee report—How Can We Best Meet the Present Bridge and Building Material Situation?
 - (a) With Reference to Bridge and Structural Steel, by Albert F. Reichman, Division Engineer, American Bridge Co., Chicago.
 - (b) With Reference to Building Materials.
 - (c) With Reference to Water Service Materials, by C. R. Knowles, Superintendent of Water Service, Illinois Central.
- 3:30 p. m.—Committee report—Conserving the Supply of Materials by Intelligent Reclamation.
- 4:00 p. m.—Committee report—Shipping Company Materials Economically by Loading Cars to Capacity and Unloading and Releasing Them Promptly, etc.
- 4:30 p. m.—Committee report—The Bridge and Building Material Yard.
 - (a) As a Separate Organization.
 - (b) As a Branch of the Stores Department.

THURSDAY MORNING, OCTOBER 18

- 9:30 a. m.—Call to order. Unfinished and new business. Election of officers and selection of meeting place for 1918. Adjournment.

THE MASTER PAINTERS' ASSOCIATION

The Maintenance of Way Master Painters' Association will hold its annual convention at Cleveland, Ohio, on October 16-18, inclusive. The program, covering subjects that are of special importance at this time, is given in part below:

TUESDAY, OCTOBER 16, 10:00 A. M.

Opening Exercises

2:00 P. M.

Painters and Painters, C. F. Loweth, chief engineer, C. M. & St. P., Chicago, Ill.

Opening of the Question Box

Interior Wall Coatings, C. H. Hall, general superintendent Patton Paint Company, Milwaukee, Wis.
Methods Employed in Protecting the Public from Paint During the Renovating Period, H. B. Wilson, master painter, B. & L. E., Greenville, Pa.

WEDNESDAY, OCTOBER 17, 9:00 A. M.

Committee report Painting of Water Tanks, Bert E. Darrow, master painter, A. T. & S. F., Kansas City, Mo.
Open discussion: Painting of Danger Lines on Station Platforms.
The Volume of Maintenance of Way Painting, W. S. Lacher, managing editor, Railway Maintenance Engineer, Chicago, Ill.

THURSDAY, OCTOBER 18, 9:00 A. M.

Committee report—Painting of Bridges, H. S. Bird, master painter, P. & R., Philadelphia, Pa.
Finishing of Floors, H. B. Wilson.
Efficiency, Economy and Safety First, H. F. Jones, master painter, Big Four, Wash., Ind.

2:00 P. M.

Metal Protection, Philip L. Maurey.

Committee report—Material and Labor Reports, W. J. French, master painter, N. Y. O. & W., Middletown, N. Y.
Answers and discussion of questions from question box.
Closing business.

MILITARY RAILWAY CONSTRUCTION.—It is common knowledge that the British army alone has constructed and is operating a very considerable mileage of standard and narrow gage railways behind the firing line in France, and brief particulars are occasionally made public in the course of ministerial speeches in the House of Commons. Under existing conditions, technical details of these lines are, naturally, not available, and it is to be hoped that after the war data as to construction, maintenance and operation will be placed at the disposal of railway men. The facts relating to operation should be of especial interest. As regards construction, it is to be noted that while quick track-laying is essential in the case of military railways in or near the actual fighting area, the lines must at the same time be built to accommodate heavy traffic, and the axle-loads are very considerable where big guns and high-calibre munitions have to be conveyed, so that much of the standard gage mileage is heavy. This is especially the case in the newest construction. Military railways often vary in details from those built for ordinary commercial traffic. For instance, on a military line "somewhere in England" keys are dispensed with, the rails are flat-bottomed and of T-section, and are secured to the sleepers by dog spikes.

THE FIRST RAILROAD IN ALBANIA

By Our Special European Correspondent

A pair of steel rails today marks the continuation in the Balkan peninsula of the Via Appia, Queen of Roads, the historic example of the lasting nature of the work of the great Roman Empire.

After 2,229 years, the Italians, geographical inheritors of the ancient empire, have taken up the lost thread of the Via Appia on its way to the orient and there built, in Albania, not of stone but of steel, a road which will connect Rome with Athens and Byzantium (Constantinople). The Italians have rebuilt so far from Vallona along the route once known as the Egnatian section of the Via Appia. In ancient times the Via Appia had its starting point at the Gate of Capenza, at the foot of the Palatine Hill, in Rome, and thence wound along to Capua, thence to the modern Brindisi, refound itself across the Adriatic at Durazzo, capital of Albania, and thence drove along the shore above Vallona. Today the Italians plan to have the road begin at Vallona, connecting directly by boat with Brindisi.

In this war the Italians have followed the example of the old Romans. Wherever they have gone, they have not destroyed but reconstructed, built for the future, built roads,

peninsula on their way to the Orient, whereas the other powers wished to maintain the peninsula as a territory thrown across the path of Central Empire progress. Despite her poverty in money, the dominant party in Italy wishes actually to re-establish the country as the ruler of the Mediterranean, and the Balkan policy is to form a federation of all the discordant racial elements and make the peninsula prosperous and powerful. This will take many, many years, and in the meanwhile Italy plans to rule the Adriatic, rather than let the Austrians do it. A part of this rule means the possession of the coasts of Albania. And while we are about it, say the Italians, why not make Albania prosperous, why not build roads and railroads? In the entire peninsula there are some 6,300 miles of railroad, mostly French built. But Albania, until the Italians came, had not a foot of railroad.

Some of the most interesting and difficult land and sea transportation the world has yet seen has taken place in the Mediterranean since the war began, first the movement of the English to the Dardanelles, then that of the French, chiefly, to Salonika, and more lately that of the Italians in Albania.

Albania, it must be understood, though fertile in soil in spots, has for centuries been well-nigh forsaken. Wild

The Dock in Albania From Which the Narrow Gage Line Started

bridges, railroads, model camps of steel and concrete buildings, all of which will last and be useful to peace long after the war has ended. This has been particularly true regarding the mountain country of the Alps which they have wrenched from the Austrians, and during their brief year in Albania they have continued the civilizing work begun on their principal battle front.

There is considerable business and politics behind this railroad and reconstruction work. The political and military story of Italy's reasons for being in Albania has been told since Minister of Foreign Affairs Sonnino surprised Europe this summer by formally announcing Italy's occupancy of Albania and its intention to continue a protectorate there. Those unfamiliar with the fine points of European politics can hardly see how the occupancy of 11,000 square miles of territory, about one-third the size of Iceland, and at present not as rich, except for a troublesome population of three-quarters of a million, can cause much excitement among nations. But it must be remembered that the cause of this huge war began in the Balkans, because of its unsettled partitions of land ownership, because, broadly, the Central Empires wished to overrun the whole

nature was here coupled with wilder bands of robbers. A few years ago, in 1913, the Austrians made a deal with the Turkish rulers and set up William Frederick as king. Then, possibly acting for the Italians, Essad Pasha in October, 1914, proclaimed a republic with himself as president. Latterly he simply picked up his scant baggage and departed towards Southern France, after the horrible mid-winter retreat of the Serb army down the Albanian mountains, together with their Austrian prisoners.

The transportation of this body of starving men from Albania to the island of Corfu marked the beginning of the actual Italian occupation. Considering the submarine danger and their other normal war difficulties, it was quite a notable transportation job, that of handling 150,000 sick and disabled men. Cholera broke out among them, and in February, 1916, while the transfer to the island of Corfu was fairly well begun, two Italian ships, the *Re Vittorio* and the *Cordova*, each lost 500 men of this disease in the brief journey. The organization of the ports had been so rapidly and securely improvised that on certain days, for instance February 6, 1916, no less than 9,700 men were taken away from Durazzo—and this in the face of frequent submarine

attacks. Now that we ourselves have to handle soldiers, we can better appreciate the feat.

The handling of these Serb troops is a small part of the land and sea transportation done by the Italians for their allies. Just how many hundred thousand English and French have been carried over the Italian railways down to Brindisi and thence either by sea or land to Salonika cannot be stated; but it must be set down to their credit that, with a railway system certainly not up to the American standard in normal times, during the war occupied with its own millions of men and their freight along its Alpine front, with a system approximately of the size of the Chicago & North Western, these Italians have done pretty well. It will be remembered that in northern France the railway situation was relieved by the English, who put on their own trains, their own railroad men, and rebuilt tracks. In Italy they have gone it alone.

The results obtained by the navy afloat in these transportation matters, of course, depended on the organizing of the port of Brindisi with new dock, modern methods of handling freight quickly, including building broad and narrow gage railways right down upon the docks, and also organizing the new port of Vallona in the same way.

When the Italians first went into Albania, with Vallona as their selected base, after having deserted Durazzo to the Austrians, their engineers realized that they must build a railway in order to penetrate into the interior in the direction of Monastir and eventually Salonika. When the land was not flat and swampy, it was made up of impossible hillsides, without roads other than the muddy paths traced by the horse-riding and dry weather Albanian carters.

So, before a stone road was built, a narrow gage line was laid, first operated by handcars and horses hitched to the cars. With this primitive railroading artillery and army baggage was distributed through Albania, stores, materials for building army camps, and all the other heavy freight that cannot be carried on the back of men was thus gotten forward. In the wake of this wobbly little line came the

the central station of Vallona and running to the Vojussa river which describes an arc up from Vallona. For the present, the great highway, now that it is completed, reaching from Santi Quaranti towards Delvina, Lerisovic, Erzeke, Koritza and Florima, appears the more important, permitting wagon and automobile communication between the Adriatic sea and the Orient.

But all the workers and visitors to Albania say that it is the narrow gage which has taken Albania out of the class of musical comedy countries, and given it a solid civilizing foundation. When the Italians came to the country there was nothing there, absolutely nothing but the ground upon which they walked. There was not even a sand road from

A "305" Gun En Route for Albania

the town of Vallona down to the sea. The town itself consisted mostly of a name attached to a few straw-thatched wooden houses and a few Turkish mosques. The coast was naked, the back-country was naked, and the people nearly so.

After a little dock had been built, a road hastily laid out to the town, the ships disembarked their sailors and soldiers who went to work on the narrow gage. Then it was roads, and roads, and more roads, always pushing up country. One of the Italians told me how the Albanians first acted about this road business. "They looked on the narrow gage as the machinery of the devil that the crazy Italians were putting up. The women and children took to the tall grass, and the men would have gotten their old muskets into play had they dared. When the roads began to be passable, the natives carefully avoided using them, keeping their little mules to the cross country paths, for a time, looking with complacent irony on this useless work of civilization, but finally the easy-going interested them and the bridges across the streams got them."

Today school children walk over these roads and ride on the narrow gage, since the Italians have established 120 schools. In the wake of the army have come not only aeroplanes and automobiles and heavy artillery but real food and real clothes, Red Cross outfits with gentle born Italian nurses, and all these things are applied for the benefit of the Albanians. American and English charity has for many years vainly occupied itself with the unfortunate Albanians, ruined by Turkish rule, and today their hopes have been realized by the civilizing influence of a well ordered army occupation, which itself had a tiny narrow gage as its backbone.

INDIA'S RAILROAD RESOURCES FOR WAR.—India has already supplied for purposes of the war 900 miles of permanent way and rolling-stock, including some 120 locomotives and 50,000 cars.

A Railroad and Telegraph Station in Albania

solid macadam road, permitting army carts and wagons to move, and troops to march with ease. Generally, it is the other way about. First comes the wagon road and then the railroad. As the country was gradually opened up by this first penetration line of tracks, more attention has been paid to the railroad and from a narrow gage, it is being turned into the so-called colonial gage used in the North African colony of Libia.

No less than 250 miles of good, solid road has been built to date in Albania, thanks to the first penetration narrow gage line, which itself is but 60 miles long, originating at

RIVET CUTTING GUN

An important factor in the repair and reconstruction of steel cars is the cutting of rivets. The inaccessibility of many of these rivets makes their removal more or less awkward when the work is done with a sledge and chisel. The Rivet Cutting Gun Company, 220 East Second street, Cincinnati, Ohio, has developed a device for cutting rivets that has been found serviceable in steel car work. With it is

Rivet Cutting Gun Being Used in Steel Car Repairs

provided a long cutting bar for use on the sides of cars and in inaccessible places underneath cars; in fact, the machine can be used wherever a rivet is to be removed. A punch is also provided to knock the rivets out after the heads have been cut off. The illustrations show how it is used for cutting rivets from the top of gondola cars, a 5-ft. bar be-

Removing Rivets from Drawbars with the Rivet Cutting Gun

ing used in this case. This eliminates the necessity of scaffolding and provides a quick means of removing the rivets. The second illustration shows the rivet gun being used for cutting 1¼-in. steel coupler yoke rivets. In this case the work is done in the yards, it being unnecessary to carry the

coupler to any machine. This machine is also used for straightening bent plates on steel cars and in punching holes for various purposes.

This device weighs 71 lb. and is usually handled by three men, as indicated in the illustrations. It has been in use on one railroad for over a year; it has been found that three men with this tool can cut off 4,000 rivets in nine hours; this with a sledge hammer and bar would require four men four times as long. It is also reported that in working on a high side steel hopper car, which was wrecked, and which involved the removal of the center sill and attachments, the coupler, the hopper doors and all air attachments, 1,143 rivets of from 5⁄8 in. to 7⁄8 in. in diameter were cut off and backed out in 7¼ hours. This rivet gun can be operated with an air pressure of 55 lb., but 75 to 100 lb. is recommended for heavy work.

DODDS' STORED LIGHT

A means of storing and conserving light has recently been discovered accidentally by Ethan I. Dodds, who is associated with the Flannery interests of Pittsburgh in an engineering capacity, while experimenting on an appliance to enable the blind to see shadow pictures through the use of radium. Mr. Dodds found that by coating the interior of a globe with a certain mixture and subjecting it to the light, the coating would absorb light, which, when the source of

Dodds' "Cold Stored" Light

light had been removed, would provide a certain amount of illumination. One interesting feature of this light is that it dissipates no heat.

The arrangement shown in the illustration is one of the experimental types of the "cold stored" light units made by Mr. Dodds. It consists of double glass globes, the inner surface of the outer globe being coated with the light retaining element. The secondary globe is sealed in the mouth of the outer one and is, of course, transparent. When light is flashed from any source whatever, it is absorbed by the inner surface of the outer globe. More effective results are obtained, however, when the light which is flashed is placed in the secondary globe as shown in the sketch. In this case it is a common incandescent lamp. With this arrangement enough light will be absorbed by the outer globe from five seconds' illumination of the incandescent bulb to provide a considerable amount of light for a period of 10 to 15 minutes. Although this light will not be strong enough to use for reading purposes, it will provide sufficient illumination to readily discern objects in a dark room.

The intensity of light, of course, will gradually reduce until about an hour after the light was first charged it will be invisible in a dark room. It is expected that further experiments will lead to a light which will provide greater intensity, but this may be overcome at the present time by the rapidity of the flashes and the number of the lights.

While the source of light in this particular instance is an incandescent bulb, any source of light can be used which will be strong enough to charge the coating on the inside of the outer globe. Marconi, the Italian inventor, has become much interested in the device and is developing a wireless sparker which can be used in place of the incandescent bulb which is illustrated. In this way, for instance, it might be possible to maintain these lights without any wiring apparatus for subsea lighting in order to enable ships to find their way safely through dangerous channels or it may be possible to use this arrangement in mines. In this case a dim light could be maintained underground by the wireless arrangement in case of explosion or when any defects occur in the regular lighting system.

It is quite possible that numerous applications may be found for this light in railway service when it has been completely developed. For instance, a dim light which did not throw off heat would prove most acceptable in the berths of sleeping cars during the summer months. It might also be used to good advantage in the subways or tunnels, where a strong light was not necessary. If the outer shell of the stored light globe were used in the same way as a frosted or sanded globe for ordinary lighting it would insure a dim light for 15 or 20 minutes if for any reason electric current was cut off.

The possibilities of this light are great where a light of high intensity is not required. When it is considered that a five seconds' flash of the incandescent light will provide illumination for possibly 15 minutes, a great saving in coal and other sources of energy supply can be realized. The fact that this light is given off with no generation of heat makes it very desirable. There are possibilities for its use in submarines, warships and other places where but a dim light is desired with the least possible amount of heat.

RAILROADING IN NO MAN'S LAND

"Building a military railway is not like constructing a transcontinental," says Major Royland Hill, writing to the Montreal Herald from the war correspondents' headquarters with the Canadian army in France. Major Hill continues:

You don't quite know what the route will be and your right-of-way has to be purchased with blood and shells. But you have to make a road bed and string rails just as swiftly, perhaps more so, for the penalty clause in the contract is defeat.

I couldn't find the colonel of the Canadian railway battalion I visited. He was somewhere out in front among the field ambulances where disgruntled German shells were still bursting, locating the grade for his next section, through the quagmire of a much-fought-over No Man's Land. But the adjutant was there, in a battered estaminet which had been, until yesterday, an advanced dressing station. His painter—they carry painters and divers, too—had changed the Red Cross symbol into the sign that means Canadian Railway Construction Corps, and which has a Canadian brigadier whose name is a textbook in railway construction at its head. The adjutant had his ear glued to the telephone and he was asking how his trains of material were coming along.

When you at home read that "the guns were being brought up satisfactorily," and that there "have been heavy rains all day," you picture struggling teams of horses dragging batteries into advanced positions.

There are some of the old pictures of war left, but they are few and far between. Sometimes the gun and ammunition have to take the muddy streaks, but if luck is the least with us now they go over well planked roads where hauling is fairly light, and by the time the roads are getting wearily worn of the traffic the railway is there. We learned the value of lumber and railways at the Somme.

On a huge stand, such as you might see at the draughtsman's office at railhead on construction at home, there was a large scale map of what was yesterday "Germany in Flanders." There are blue and red lines which begin behind our old trenches and end nowhere—perhaps on the Rhine. There are the standard gage and the light railways, and they are wanted quickly.

Already this particular two thousand yards of advance had been platted out with little stakes and tapes and the red-tabbed, keen staff captain of heavy artillery was putting the finishing touches to the plan. He had worked with the Canadian adjutant before they both knew what speed meant.

SOME MARVELOUS WORK

If it was easier to build a spur for a twelve-inch howitzer a few yards farther east, the gunner gave the builder the concession and phoned back to get his ranges corrected accordingly. If the gun had to go to that particular spot this Toronto captain would put on another hundred men for the job and build through the crater. There was no argument. Each knew the other knew his job.

Some of the material was already up. British labor parties under the direction of a Canadian major who had worked gangs on the prairies and in the western mountains were out in the shell-pocked area making the first thousand-yard grade.

The new railroad which had been advanced from yesterday was fast filling up with metals, fishplates, spikes and ties. There were just enough for the length to be built. Right and left-hand switches were labeled for the stations and gun spurs where they would be laid. The junctions and stations were sympathetically named after the places, big and little, in the Dominion, where they were torn up months ago and cast into this melting pot of the Empire's war. I am not giving the names that are on the map, but don't be surprised if tomorrow or this week you hear that new Regina, or Le Pas, or even Ottawa has been shelled. There will be a good eight or twelve, perhaps fifteen-inch howitzer to give an account of itself there.

SOME SUDDEN PROBLEMS

"I'll want 200 twelve-inch shells at Ottawa dump tomorrow night," said the gunner captain. "Mind you, the line isn't built yet, and the gun is somewhere back at Vancouver, which is an old, before-the-push station."

"All serene," answered the Canadian adjutant. "I can pick them up at Halifax dump and bring them with the train taking the eight-inch to Oshawa." (Dominion geography is a bit mixed up here.)

It is swift traveling for a newly-constructed line, but then when the combination of railway and artillery experts gets going, things do travel with celerity. If Hindenburg wants to keep away from the big guns he will have to fall back more than five thousand yards in two days.

Thanks to sacrifices by British and Canadian railways, we have plenty of material, and we have the blended brains and labor, too, in these men of modern war, who pave the way for the huge guns and clear the way for the fighting men who "go over."

And when the guns are satiated, among the same lines will come anything from tin huts to house those men in the line, to tin hats to shelter them from shrapnel and tinned bully beef to feed them. There's never any want for traffic on the military railway.

General News Department

A military map of the United States showing the location of every cantonment, camp and training station has just been issued by the Union Pacific.

By direction of the Railroads' War Board, the per diem interchange rate of 60 cents on freight cars is to be continued in force until December 31, an extension of three months.

The twelfth annual convention of the Smoke Prevention Association will be held at the Deshler Hotel, Columbus, Ohio, on September 25, 26 and 27. Practical ways of firing locomotives smokelessly will be demonstrated at that time.

George W. Kirtley, assistant to the operating vice-president of the Erie, and until recently general superintendent of transportation of that road, has been appointed assistant to Robert S. Lovett of the War Industries Board. Mr. Kirtley will assist Judge Lovett on questions relating to the priority of freight shipments, which is Judge Lovett's special duty by appointment of President Wilson.

The Interborough Rapid Transit Company, operating elevated and subway railroads in New York City, has agreed with the Brotherhood of Interborough Rapid Transit Company Employees to pay bonuses, at the end of each month, to employees who have worked at least 22 days in the month, the bonus to be sufficient to make their pay for the month average \$3 a day. This applies to all employees whose regular rate of pay is less than \$3 a day, and the maximum bonus will be \$3 a month.

Edward Chambers, vice-president in charge of traffic of the Atchison, Topeka & Santa Fe, with office at Chicago, who was recently appointed an assistant to Herbert Hoover, United States food administrator, has been given the title of chief of the division of transportation. Fred S. Brooks, vice-president of the Sioux City Terminal Railway, the St. Paul Bridge & Terminal Railway, and the St. Joseph Belt Railway, with office at Chicago, has been appointed chief assistant in the division of transportation.

The United States Civil Service Commission announces examinations, October 2, for the position of senior signal engineer, grade 1, for the Interstate Commerce Commission, for work in connection with the valuation of railway property; salary, \$3,000 to \$4,800. Appointments will be principally for duty in the field. The commission seeks men with thorough technical training and several years' responsible experience; also with a thorough acquaintance with the methods of appraisal and cost estimating of railway signals and interlocking apparatus. Applicants must be graduates of an approved school and have had five years' responsible experience; or, if not graduates, ten years' experience. They must be between 30 and 60 years old.

Zone System of Second-Class Mail Rates

In its consideration of the war revenue bill the United States Senate on August 29 rejected the proposed special tax of 5 per cent on the profits of publishers above \$4,000 yearly, and also the flat increase of 1/4 cent a pound in the second class mail rate. In place of this, as a substitute for the zone rates provided in the bill as it passed the House, the Senate adopted an amendment proposed by Senator McKellar providing for the following zone system of rates, the zones being the same as those prescribed for parcel post; one cent a pound for the first 300 miles, with an increase of one cent a pound for each additional zone up to the eighth, where the rate would be six cents.

Increase in Shopmen's Pay on the Missouri, Kansas & Texas

The Missouri, Kansas & Texas management recently came to an understanding with its shopmen with reference to wage increases. The terms of settlement with the men included a flat increase of 6 1/2 cents an hour to machinists, boilermakers, blacksmiths, sheet metal workers and electricians, and to the helpers in the different trades and helper apprentices. Regular apprentices were

granted an advance of 2 1/2 cents an hour. The increases make the standard rate of pay for machinists, boilermakers, blacksmiths, sheet metal workers and shop electricians for points north of Muskogee, Okla., 50 cents an hour; for Muskogee and points south, including Oklahoma City and McAlester and all points in Texas, 51 cents an hour, and on the Wichita Falls & Northwestern, 52 cents an hour. Machinists, steel metal worker and electrician helpers will receive 30 1/2 cents an hour at all points on the system and boilermaker and blacksmith helpers 33 cents an hour.

Trainmen Honor Former Railway Officer

As a tribute to the memory of Patrick H. Morrissey, formerly grand master of the Brotherhood of Railroad Trainmen, a monument was unveiled on Labor Day at Galesburg, Ill., where he is buried. The monolith, which is of granite, 15 ft. high, was purchased through popular subscription among members of the brotherhood. At the time of his death, last November, Mr. Morrissey was not a member of the B. of R. T., as his membership had ceased automatically when he became assistant to the vice-president in charge of operation of the Chicago, Burlington & Quincy in June, 1913. This is believed to be the first instance in which a railway labor organization has honored a former railroad officer.

Stop the Valuation!

It was about six years ago that the Government undertook what it called a "physical valuation" of the railroad properties in this country. The Observer did not hesitate to go on record as classifying this proceeding as the monumental folly of the age. It now develops that this valuation board has expended all its money and has called for another \$10,000,000. Now is a good time to stop the whole proceeding. It is better to let the money already expended go, with the blessing of a misnamed Government, than to provide additional appropriations to which there may be no end. Of what good has been the valuation so far accomplished at a cost to the Government of \$10,000,000? Congress should set its foot down hard on this proposition for another appropriation.—Charlotte (N. C.) Observer.

7,000 More Cars Distributed

More than 7,000 additional empty cars have been ordered into the South and Southwest to move grain and food products and lumber for the cantonments and shipyards. The orders which the Commission on Car Service of the Railroads' War Board have issued since the policy was adopted of moving empty cars from one railroad to another, regardless of ownership, have resulted in 113,420 cars being distributed where they were most needed.

All of this movement has taken place since May 1. As a result, despite the most terrific pressure ever known, millions of tons of Government supplies, munitions and materials have been transported without a hitch and without interfering to any great extent with the regular commercial traffic of the country which, too, has been increased to vast proportions by the war.

By this latest order, 2,450 cars are to be placed in the grain-producing country, 4,537 additional cars have been sent into the lumber states of the South, and 400 others sent to one of the Atlantic coast lines to provide for an unexpected increase in general freight traffic.

The lines to which cars have been consigned for grain, are as follows: Chicago & Eastern Illinois, 500; Cincinnati, Indianapolis & Western, 500; Wabash, 500; Chicago, Indianapolis & Louisville, 250; Toledo, St. Louis & Western, 300; Gulf Coast, 200. Cars for lumber have been sent to Central of Georgia, 100; Louisville & Nashville, 500; Mobile & Ohio, 350; Illinois Central, 350; Louisiana Railway & Navigation Company, 12; Gulf, Florida & Alabama, 275; Nashville, Chattanooga & St. Louis, 300; Toledo, Peoria & Western, 150; Georgia & Florida,

75; Southern, 500; Atlantic Coast Line, 1,250; Atlanta, Birmingham & Atlantic, 75; Seaboard Air Line, 400; Charleston & Western Carolina, 300.

"Service Stripes" on Santa Fe Cars

"Every railroad in the United States is enlisted in the work of helping to win the war, and hereafter every freight car of the Santa Fe system will wear its 'service stripes,'" President E. P. Ripley said in a recent interview. These "service stripes" will be of red, white and blue of equal width, printed horizontally on cardboard, 12 in. by 18 in. On the stripes is printed in black the freight car's patriotic appeal to its users:

LOAD ME QUICKLY
LOAD ME TO CAPACITY
UNLOAD ME PROMPTLY
AND
HELP WIN THE WAR!

"If anybody thinks the humble freight car is not one of the most important factors in war," continued Mr. Ripley, "let him imagine what would happen in a very short time to Germany, France, England or to this country if all freight cars stopped running for a month, or even a week. While the war lasts there will not be enough freight cars to supply the demand, hence the necessity of making every car perform its maximum service. . . ."

Employees May Keep Their Bonds in the Company's Treasury

Arrangements to provide for the safekeeping of Liberty Loan Bonds purchased by employees of the Pennsylvania Railroad and of its lines east of Pittsburgh, have been made by the treasury department of the company, according to the announcement made last week by James F. Fahnestock, treasurer, through the general superintendents of the various grand divisions and the heads of departments in the general offices.

Special authority to perform this service has been accorded to the treasurer by the board of directors. In the capacity of custodian, he will accept for safekeeping the Liberty Bonds purchased by employees who have no such facilities. The interest on such bonds will be collected as it falls due June 15 and December 15 of each year and will be added to the payrolls for the last half of the months of June and December, respectively.

No charge of any kind will be made to employees availing themselves of this privilege. All that is required is the deposit of the bond by the execution of a request to the treasurer of the Pennsylvania Railroad, asking him to hold the bond, collect the interest and add it to the employees' payroll.

Over 53,000 of the employees of the Pennsylvania Railroad lines east of Pittsburgh subscribed to the Liberty Loan, taking a total of \$3,500,000. About 10 per cent of these made payment in full and are entitled to receive their bonds as soon as the Government makes delivery, which will probably be some time after September 1. Such employees may deposit their bonds at once if they so desire. The remainder of the bonds were purchased under the special installment plan offered by the company, which called for ten equal monthly installments of 10 per cent each beginning July 15, 1917.

2,540 Pennsylvania Employees With the Colors

Thus far, 2,540 employees of the Pennsylvania Railroad, lines east of Pittsburgh, have entered the Army and Navy of the United States as volunteers, and have been granted furloughs from the railroad service. Of this number, 75 have been appointed commissioned officers and 30 are student officers in various officers' training camps. The remainder, numbering 2,442, are enlisted men in the Army and Navy.

The commissioned officers include one colonel, one lieutenant-colonel, two majors, 21 captains, 23 first lieutenants, 22 second lieutenants, three ensigns and one pay clerk.

In addition to the employees of the Pennsylvania Railroad who have entered the military and naval service, as volunteers, many more are certain to be taken for the National Army under the draft. The exact extent by which the working force of the railroad will be further reduced, in this manner, will not be definitely known until the work of the various examining boards has been completed. However, it has been ascertained that there are in the service of the Pennsylvania Railroad lines east of Pitts-

burgh, 60,000 men, who are liable to military service under the law, and based upon the average proportion of the eligible men who will be taken in the first draft, 3,000 of these will be called.

Proposed Modifications in Locomotive Inspection Requirements

A number of proposed modifications in the rules for locomotive boiler inspection, intended to give the railroads some relief from the requirements of the present rules during the period of the war on account of the shortage of labor for shop work and inspection, were agreed upon at a conference at Washington on Wednesday between the division of locomotive boiler inspection of the Interstate Commerce Commission and the mechanical sub-committee of the Special Committee on Relations of Railway Operation to Legislation.

The modifications were proposed by the railroad committee because of the difficulty of living up to the requirements of the rules on account of the shortage of labor and materials and because of the pressure to keep all available motive power in service on account of the unprecedented volume of traffic. The members of the committee, headed by C. E. Fuller, superintendent of motive power and machinery of the Union Pacific, explained the conditions which impelled them to ask for the modifications, and asked especially for a reduction of the requirements for work on engines that could be as well taken care of when they had to be sent to the shop at some other time. Representatives of the engineers' and firemen's brotherhoods opposed any modification of the rules, and a protesting letter was received from the Railroad Department of the American Federation of Labor.

Frank McManamy, chief inspector, said he appreciated the condition and that the inspectors had been instructed to be lenient. After a discussion of the rules proposed by the roads he agreed to seek the approval of the commission for certain changes which would give relief for the period of the war, in some cases proposing modifications from the form proposed by the committee and in other cases declining to approve any change, while some of the substitute proposals gave the roads more than they had asked.

One of the modifications suggested by Mr. McManamy would permit the retention in service of locomotives with a factor of safety of $\frac{3}{4}$, to be increased to $\frac{3}{2}$ within six months after the close of the war. It was shown that numerous roads are now operating locomotives with a factor of safety less than that provided by law. Other changes provide for an extension of time for the removal of boiler tubes from three to four years, an extension for the period of the war of the time for the removal and inspection of jacket and lagging and an extension of the time for the testing of flexible staybolts with caps.

Positions Open in the Ordnance Department

The United States Civil Service Commission announces the following open competitive examinations for positions in the several ordnance establishments of the War Department, or in or under the office of the Chief of Ordnance, War Department, Washington, D. C. The salaries named are for entrance:

Mechanical engineer, artillery ammunition, \$3,000 to \$3,600 year.
Mechanical engineer, experimental work, \$2,500 to \$3,000 year.
Mechanical draftsman, \$1,000 to \$1,400 year.
Apprentice draftsman, \$480 year.
Inspector of artillery ammunition, \$1,500 to \$2,400 year.
Inspector of field artillery ammunition steel, \$1,500 to \$2,400 year.
Assistant inspector of field artillery ammunition steel, \$3.50 to \$5 day.
Inspector of ammunition packing boxes, \$3.52 day to \$1,800 year.
Inspector and assistant inspector of powder and explosives, \$1,400 to \$2,400 year.
Inspector of ordnance equipment, \$1,500 to \$2,400 year.
Assistant inspector of cloth equipment, \$80 to \$125 month.
Assistant inspector of leather, \$100 to \$125 month.
Assistant inspector of small hardware, \$80 to \$125 month.
Assistant inspector of textiles, \$80 to \$125 month.
Assistant inspector of leather equipment, \$100 to \$125 month.
Clerk qualified in business administration, \$1,200 to \$1,500 year.
Index and catalogue clerk, \$1,000 to \$1,200 year.

The examination for index and catalogue clerk is open to both men and women; the other examinations are open only to men.

The government urgently needs men for the work above indicated, and qualified persons are urged, as a patriotic duty, to apply for examination. Until further notice applications for the positions named will be received at any time by the United States Civil Service Commission, Washington, D. C. Papers

will be rated promptly. Applicants will not be required to appear at any place for examination, but will be rated principally upon the elements of education, training and experience, as shown by their applications and by corroborative evidence.

Full information concerning examinations, application blanks, etc., may be obtained by calling in person upon the secretary of the local board of civil service examiners at the post office in any city in which city delivery of mail has been established, or by communicating with the United States Civil Service Commission, Washington, D. C.

Strike of B. & M. Shopmen

The machinists, blacksmiths and boiler makers of the Boston & Maine struck, on August 31, and all the locomotive repair shops, general and division, stopped work, about 3,000 men going out. Nearly half of these men were employed at the shops at Billerica, Mass. Conferences concerning the requests of the men for higher pay have been held a number of times since last April, when an increase of about two cents an hour was granted and was made retroactive from January 1, 1917. In July the men asked for a further increase of eight cents an hour. The New Haven road has recently granted an increase and the Receiver of the Boston & Maine offered to make the pay on the B. & M. equal to that on the New Haven, but this was refused. The increase on the New Haven, three cents an hour, brought the rates up to a point a little in excess of the rates on the Boston & Maine. On Monday of this week the receiver, James H. Hustis, issued a statement in which he said:

"There should be no misunderstanding on the part of the public or of the employees as to the seriousness of the situation. The officers of the railroad, and particularly the temporary receiver, are fully conscious of what it involves. There is no thought other than that the railroad must rely largely on these men who have quit work returning to it to enable the road to give the service that is so imperatively needed at this time. It would be extremely unfortunate if there should be any bitterness injected into the controversy.

"Regardless of any question as to where the responsibility rests for the men going out, it must be remembered that as yet there has been no attempt to determine finally whether the increases in rates of pay demanded by the men are warranted by changes in conditions arising since the last wage adjustment in April, or the adoption by the New Haven Railroad in June last of a lower agreed scale for similar work.

"The sole point upon which the question of the strike has heretofore turned was whether the receiver should of his own motion, and without opportunity to consult with the United States Court under whose jurisdiction he is acting, agree to an increase of wages for certain classes of employees much higher than those paid by any other railroad in the territory; and the immediate effect of which would be to increase the cost to the railroad of such labor by about \$900,000 per year.

"To appreciate the receiver's position it must be remembered that if he should do this it is not unlikely that he would be called upon very shortly to deal with similar demands from employees (not affected by the eight-hour law) in other departments and if he granted similar increases to them, and on the same basis, the aggregate increase would run up to nearly \$5,000,000 per annum. And this in spite of the fact that the increases in wages already granted during the past twelve or fourteen months amount to upward of \$2,500,000; nor is there any guarantee that the same body of employees would not six months hence make another demand. The situation is an impossible one.

"Between the absolute necessity of the railroad retaining the men, on the one hand, and the impossibility of still further exceeding the financial capacity of the road on the other, an adjustment such as is proposed would seem to be out of the question unless there be some tribunal which can determine what is a fair compromise.

"It was the hope that the Court might be of some assistance in this direction that led the receiver to ask for a delay until September 10, when he was informed Judge Morton would return from his vacation. Efforts were made to reach Judge Morton before the strike took place but it was found that he was on a sailing trip and away from communication. We are still trying to reach him.

"It is said that if the receiver had promised that he would recommend to the Court a six cents per hour increase the men

would have deferred the strike until the Court could be consulted. It must be apparent to anyone who takes into consideration the whole situation and its possible consequences that some method of dealing with it must be found which will be more effective and more permanent than that. The situation is one that should be dealt with in such a way that the larger aspects of the case will have consideration.

"The efforts of the State Board of Arbitration and Conciliation to bring about a settlement are fully appreciated and will be availed of to the extent that it is possible to do so, but it is felt that the probable consequences will reach far beyond this State and the matter will be one of pressing interest to the Federal authorities. How far reaching are the questions here involved becomes evident if one considers that if demands similar to these were granted in all classes of labor outside of those affected by the eight-hour law, the increases in transportation rates required to compensate the railroad for the loss would be so large as to require the most careful investigation.

"In the meantime the railroad's war board has been advised of the situation and requested to inform the Secretary of Labor as to the facts. It seems unfortunate that the railroad is without the services of a large number of its employees and that the employees are losing their wages, especially in view of the fact that any wage increase that may be hereafter granted would, undoubtedly, be made retroactive."

After a conference with Justice Norton on Wednesday of this week, Mr. Hustis wrote to Mr. Fechner, chairman of the general committee of the strikers, offering to submit the controversy to arbitration, the arbitrator or arbitrators to be named by the Chairman of the Council of National Defense, the award when made to be retroactive to September 5, and the men to return to work meanwhile.

American Gear Manufacturers' Association

The meeting of the American Gear Manufacturers' Association will be held at the Edgewater Beach Hotel, Chicago, September 14 and 15. Papers on the following subjects will be presented: Advertising Don'ts, Heat Treating and Hardening of Gears, Inspection of Gearing, Spur Gearing by the Rotary or Disk Cutting Process, Spur Gears by the Shaper Method.

National Safety Congress

The National Safety Council, W. H. Cameron, Chicago, secretary, will hold its sixth annual safety congress at Hotel Astor, Broadway and 44th street, New York City, on Tuesday, Wednesday, Thursday and Friday, September 11, 12, 13 and 14. The sessions each day will be from 9:30 to 12 in the forenoon, and from 2 to 5 in the afternoon. The principal general session will be on Wednesday forenoon, with L. R. Palmer, president of the council, presiding. Addresses will be given by Hon. William D. Wilson, secretary of labor; Dr. Charles P. Steinmetz, of the General Electric Company; and Marcus A. Dow, general safety agent of the New York Central. Mr. Dow's new motion picture, "The Rule of Reason," will be exhibited.

The first meeting of the Steam Railroad Section of the Council will be held on Wednesday afternoon and will be continued Thursday morning and afternoon, and also Friday morning. The chairman of this section is Isaiah Hale (A. T. & S. F.), and the secretary is H. J. Bell (C. & N. W.). The speakers before the Section, as announced, are C. M. Anderson (N. C. & St. L.); L. E. Abbott (O. S. L.); T. H. Carrow (Penn.); Howard Elliott (L. A. & S. L.); David Moore (U. P.); C. H. Blakemore (N. & W.); J. T. Broderick (B. & O.); C. B. Floyd (N. Y. C.); S. G. Watkins (B. & M.); F. N. Loughnan (L. V.); C. H. Ratzell (St. L. S. F.); H. J. Bell (C. & N. W.); S. S. Morris (I. C.); G. L. Wright (C. St. P., M. & O.); and C. A. Cochrane (G. N.).

The meeting on Friday morning will be devoted to new subjects brought up during the preceding sessions and to reviews, if reviews are called for; and Friday afternoon will be devoted to unfinished business and to the election of officers.

Among the directors of the National Safety Council, besides Messrs. Dow, Hale and Broderick, already mentioned, are J. M. Guild (C. P.); E. F. Carry, president of Haskell & Barker; L. A. Larson, American Locomotive Company; H. D. Sharpe, Brown & Sharpe; W. B. Spaulding (St. L. S. F.); R. C. Richards (C. & N. W.); E. C. Spring, Lehigh Valley Transit Co.;

and W. C. Wilson, formerly on the Delaware, Lackawanna & Western.

In connection with this congress there will be an elaborate "safety exposition" in the Grand Central Palace, 40th street and Lexington avenue, open each day, including Saturday, from 3 p. m. to 10.30 p. m. The director of exhibits is M. A. Dow (N. Y. C.), third vice-president of the Council, who also is chairman of the committee of arrangements for the congress.

War Convention of American Business Men

The Chamber of Commerce of the United States has called a War Convention of American Business Men, to be held at Atlantic City, September 18 to 21, inclusive.

As briefly noted in the *Railway Age Gazette* of August 24, the general subjects discussed will be:

- (1) The duty that business owes the Government in war;
- (2) How may the business of the country render greater service in winning the war? Under this subject will also be discussed the question: How shall greater efficiency of land and water transportation be developed?
- (3) Ways and means by which business may most readily adjust itself to the conditions produced by the war;
- (4) For what readjustments after the war must business prepare?

In calling the meeting the president of the Chamber of Commerce has stated:

"It is the patriotic duty of every live business man who can possibly arrange to do so to attend this convention, not only to show emphatically where the business men of the United States stand in the present crisis, but also that each may gain from such a meeting all possible knowledge as to how he can plan more intelligently to be of greater service in the common cause."

The Chamber of Commerce in its War Bulletin No. 17, adds that:

"This convention will give business men the opportunity to voice their support of the government in this time of national trial. It will give them the opportunity of expressing to the government what the experience of business men has been in problems similar to those which the government is now facing. They can learn from government representatives who will be at the meeting what the government expects of business. But above all, the meeting will bring business men in contact with the problems of this great industrial war, and give them the opportunity of thinking about these problems and of reaching conclusions."

Exhibitors at the Roadmasters' Convention

The convention of the Roadmasters' and Maintenance of Way Association will be held at the Auditorium Hotel, Chicago, September 18 to 20, inclusive. The program for this meeting will be found elsewhere in this issue. From the interest expressed and the progress made in the preparation of committee reports and papers the meeting promises to be one of the most valuable ever conducted by this organization.

Equally promising indications are evident relative to the exhibit of the Track Supply Association, although the letters asking for reservations of space were not sent out until July 26. Forty-seven firms have already arranged to present exhibits and only a few spaces remain to be allotted. Among the firms which have already arranged to present exhibits are the following:

Ajax Forge Company, Chicago.
Alexander Milburn & Co., Baltimore, Md.
American Steel & Wire Co., Chicago.
American Valve & Meter Co., Cincinnati, Ohio.
American Hoist & Derrick Co., St. Paul, Minn.
Anti-Creep Corporation, New York.
Barrett Co., New York.
Bethlehem Steel Co., South Bethlehem, Pa.
Carbic Mfg. Co., Duluth, Minn.
Carnegie Steel Co., Pittsburgh, Pa.
Chicago Railway Equipment Co., Chicago.
Chicago Malleable Castings Co., Chicago.
Cleveland Frog & Crossing Co., Cleveland, Ohio.
Crerar, Adams & Co., Chicago.
Duff Mfg. Co., Pittsburgh, Pa.
Fairbanks, Morse & Co., Chicago.
Fairmont Gas Engine & Railway Motor Car Co., Fairmont, Minn.
Hauck Manufacturing Company, New York.
Hayes Track Appliance Co., Richmond, Ind.
R. W. Hunt & Co., Chicago.
Ingersoll Rand Co., New York.

Indianapolis Brush & Broom Co., Indianapolis, Ind.

Lackawanna Steel Co., Buffalo, N. Y.

Madden Co., Chicago.

Mudge & Co., Chicago.

National Lock Washer Co., Newark, N. J.

National Malleable Castings Co., Cleveland, Ohio.

Pocket List of Railroad Officials, New York.

Positive Rail Anchor Co., Marion, Ind.

P. & M. Co., Chicago.

Q. & C. Co., New York.

Rail Joint Co., New York.

Railway Equipment & Publication Co., New York.

Railroad Supply Co., Chicago.

Ramapo Iron Works, Hillburn, N. Y.

Reading Specialties Co., Reading, Pa.

Henry Roos Foundry Co.

Sellers Mfg. Co., Chicago.

Simmons-Boardman Publishing Co., New York.

Simple Gas Engine Co.

Southern Railway Supply & Equipment Co., St. Louis, Mo.

Templeton-Kenly Co., Chicago.

Union Switch & Signal Co., Swissvale, Pa.

Verona Tool Works, Pittsburgh, Pa.

Walls Frogless Switch & Mfg. Co., Kansas City, Mo.

Wm. Wharton, Jr., & Co., Easton, Pa.

Wyoming Shovel Works, Wyoming, Pa.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings and places of meetings:

AIR BRAKE ASSOCIATION.—F. M. Nellis, Room 3014, 165 Broadway, New York City.
AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—F. A. Pontious, 455 Grand Central Station, Chicago.
AMERICAN ASSOCIATION OF DYING AR SUPERINTENDENTS.—H. C. Boardman, D. L. & W., Hoboken, N. J. Next convention, October, 1917, San Francisco, Cal.
AMERICAN ASSOCIATION OF FREIGHT AGENTS.—R. O. Wells, Illinois Central, Chicago, Ill.
AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York. Next meeting, October 16-17, St. Louis.
AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—E. H. Hartman, Room 101, Union Station, St. Louis, Mo.
AMERICAN ELECTRIC RAILWAY ASSOCIATION.—E. B. Burritt, 8 W. 40th St., New York. Convention for 1917 postponed.
AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOCIATION.—Fred C. J. Dell, 165 Broadway, New York.
AMERICAN RAILROAD MASTER TINNERS', COPPERSMITHS' AND PIPEFITTERS' ASSOCIATION.—W. E. Jones, C. & N. W., 3814 Fulton St., Chicago. Convention for 1917 postponed.
AMERICAN RAILWAY ASSOCIATION.—J. E. Fairbanks, general secretary, 75 Church St., New York.
AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 16-18, 1917, Chicago.
AMERICAN RAILWAY ENGINEERING ASSOCIATION.—E. H. Fritch, 900 S. Michigan Ave., Chicago.
AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—J. W. Taylor, 1112 Karpen Bldg., Chicago.
AMERICAN RAILWAY FOREMEN'S ASSOCIATION.—Owen D. Kinsey, Illinois Central, Chicago.
AMERICAN SOCIETY FOR TESTING MATERIALS.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.
AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.
AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 59th St., New York.
AMERICAN WORK PRESERVERS' ASSOCIATION.—F. J. Angier, Supl. Timber Preservation, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January, 1918, Chicago.
ASSOCIATION OF AMERICAN RAILWAY ACCOUNTING OFFICERS.—E. R. Woodson, Rooms 1116-8 Woodward Bldg., Washington, D. C. Next meeting, September 26, Congress Hotel, Chicago.
ASSOCIATION OF MANUFACTURERS OF CHILLED CAR WHEELS.—George W. Lyndon, 1214 McCormick Bldg., Chicago. Semi-annual meeting with Master Car Builders' Association.
ASSOCIATION OF RAILWAY CLAIM AGENTS.—Willis H. Failing, Terminal Station, Central of New Jersey, Jersey City, N. J.
ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreuccetti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Semi-annual and annual convention postponed indefinitely.
ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—W. L. Connelly, Superintendent of Telegraph, Indiana Harbor Belt, Gibson, Ind. Next annual meeting to have been held September 18, 1917, Washington, D. C., indefinitely postponed.
ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—G. P. Conard, 75 Church St., New York.
BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—Tom Lehon, The Lehon Company, Meetings with American Railway Bridge and Building Association.
CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June and August, Windsor Hotel, Montreal, Que.
CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.
CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Laylor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.
CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual dinner, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.
CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S ASSOCIATION.—W. R. McMunn, New York Central, Albany, N. Y. Next convention, September, 1917, St. Louis.
ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 568 Union Arcade Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh, Pa.

FREIGHT CLAIM ASSOCIATION. Warren P. Taylor, Traffic Manager, R. F. & P., Richmond, Va.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, C. H. & D., Lima, Ohio.

INTERNATIONAL RAILWAY FUEL ASSOCIATION.—J. G. Crawford, C. B. & O. R. R., 702 E. 51st St., Chicago. Next convention, May, 1918, Chicago.

INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 1126 W. Broadway, Winona, Minn. Annual meeting, to have been held September 4-7, 1917, Hotel Sherman, Chicago, indefinitely postponed.

INVESTMENT BANKERS' ASSOCIATION OF AMERICA. Frederick R. Fenton, 11 W. Madison St., Chicago. Annual convention, October 1-3, 1917, Baltimore, Md.

MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—F. W. Hager, Fort Worth & Denver City, Fort Worth, Tex. Next convention, October 16-18, 1917, Cleveland, Ohio.

MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 95 Liberty St., New York.

MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—A. P. Darte, B. & M., Reading, Mass. Next annual meeting, September 11, 1917, Chicago.

MASTER CAR BUILDERS' ASSOCIATION.—J. W. Taylor, 1112 Karpen Bldg., Chicago.

NATIONAL ASSOCIATION OF RAILWAY COMMISSIONERS.—Jas. B. Walker, 120 Broadway, New York City. Next annual convention, October 16, 1917, Washington, D. C.

NATIONAL RAILWAY APPLIANCE ASSOCIATION.—C. W. Kelly, 349 Peoples Gas Bldg., Chicago.

NEW ENGLAND RAILWAY CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meeting, 2d Tuesday in month, except June, July, August and September, Boston.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meeting, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—Geo. A. J. Hochgrebe, 623 Brisbane Bldg., Buffalo, N. Y. Meetings 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.

PACIFIC RAILWAY CLUB.—W. J. Wollner, Assistant to Chief Engineer, Northwestern Pacific R. R., San Francisco, Cal.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—F. C. Stewart, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria, Ill.

RAILWAY BUSINESS ASSOCIATION. Frank W. Naxon, 30 Church St., New York.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Pittsburgh Commercial Club Rooms, Colonial Annex Hotel, Pittsburgh.

RAILWAY DEVELOPMENT ASSOCIATION.—D. C. Welby, Commissioner of Agriculture, St. Louis, Mo. & So., 1047 Railway Exchange Bldg., St. Louis. Next annual convention, May, 1918, Houston, Tex.

RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—I. Scribner, 1063 Monandnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.

RAILWAY FIRE PROTECTION ASSOCIATION.—C. B. Edwards, Office of the President's Assistant, Seaboard Air Line, Norfolk, Va. Next meeting, October 24, 1917, St. Louis, Mo.

RAILWAY REAL ESTATE ASSOCIATION.—R. H. Morrison, Assistant Engineer, C. & O., Richmond, Va. Next convention, October, 1917, Duluth, Minn.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Myers Bldg., Bethlehem, Pa. Next annual convention, September 18-19, 1917, Hotel Traymore, Atlantic City, N. J.

RAILWAY STOKKERS' ASSOCIATION.—J. P. Murphy, N. Y. C. R. R., Box C, Collinwood, Ohio.

RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.—J. D. Conway, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with Master Car Builders' and Master Mechanics' Association.

RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph and Telephone Engineers.

RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—P. I. McAndrews, C. & N. W., St. Louis, Ill. Next annual convention, September 18-21, 1917, Hotel Auditorium, Chicago.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August.

SALT LAKE TRANSPORTATION CLUB.—R. E. Rowland, David Keith Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

SOCIETY OF RAILWAY FINANCIAL OFFICERS.—L. W. Cox, N. & W., Philadelphia, Pa. Next annual convention, October 16-18, St. Louis, Mo.

SOUTHERN ASSOCIATION OF RAILWAY SERVICE OFFICERS.—E. W. Sandwich, A. & W. P. R. R., Atlanta, Ga.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. I. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 n. m., Piedmont Hotel, Atlanta, Ga.

TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Rampart Iron Works, Tillburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.

TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.

TRAIN DISPATCHERS' ASSOCIATION OF AMERICA.—J. F. Mackie, 7122 Stewart Ave., Chicago. Next annual convention, June 18, 1918, Grand Rapids, Mich.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. R. R., Cleveland, Ohio. Next convention, to have been held September, 1917, Chicago, indefinitely postponed.

WESTERN ASSOCIATION OF SHORT LINE RAILROADS.—Clarence M. Oddie, Mills Bldg., San Francisco.

WESTERN CANADIAN RAILWAY CLUB.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Monday in month, except June, July and August, Hotel Sherman, Chicago.

WESTERN SOCIETY OF ENGINEERS.—Edgar S. Nethercut, Acting Secretary, 1735 Monandnock Block, Chicago, Ill. Regular meeting, first Monday in month, except January, July and August. Extra meetings generally on other Monday evenings except in July and August.

Traffic News

The Railroads' War Board has notified the war council of the Red Cross that Red Cross shipments to the seaboard for transportation abroad or elsewhere, will be exempted from any embargoes and will practically be given the right of way over everything except government freight.

The railroads have withdrawn their application to the State Public Utilities Commission of Illinois for a reduction of free time in the loading and unloading of open-top cars from 48 hours to 24 hours, and for the elimination of free time in connection with the reconsignment of open-top cars.

The Public Utilities Commission of Ohio recently announced that tariffs filed by the railroads of the state providing for a horizontal increase in coal and coke rates of 15 cents a ton would become effective on September 1, without affirmative action by the commission. The tariffs were suspended twice pending hearings before the commission.

Better housing conditions for potatoes will be the topic to be discussed in the next campaign of the Lehigh Valley Railroad's agricultural department. The railroad sent a "Potato Special" through its territory last spring, demonstrating modern methods of planting and spraying, and now the most improved methods for building pits and cold storage houses installed in a car which will be used for demonstration purposes. There will be lectures on the new Federal standards for grading potatoes and the new arrangements by which farmers can borrow money on their stored potatoes. To accomplish maximum loading of cars and at the same time prevent a great spoilage through congestion at the terminal markets, Mr. Stevens, the road's agriculturist, is urging better storage facilities on the farms. Mr. Hoover has approved the plan. An itinerary for the car is now being arranged.

E. P. DeHoyos, general agent of the Mexican Railway, 233 Broadway, New York City, advises that sleeping cars are now running regularly between Mexico City and Vera Cruz, and he declares untrue the recent report that the sleeping cars of this road have been scattered all over Mexico by the military authorities. The through night trains, No. 5 and No. 6, are not now in operation, because of scarcity of locomotives and the sleeping cars are run on trains No. 1 and No. 2. These trains run through in 14 hours 30 minutes. Mr. DeHoyos is general agent also for the Constitutionalist Railways, operating the National Railways (as well as for the Tehuantepec National Railway); and he says that arrangements have been completed and shortly will be put in effect for the resumption of regular Pullman sleeping car service between San Antonio, Texas, and the City of Mexico.

The passenger department of the Canadian Pacific announces that bona fide tourists who are citizens of the United States or allied or neutral countries do not require passports to enter or permits to leave Canada and are assured courteous treatment and a hearty welcome. Persons born in an enemy country, however, who claim to have been naturalized in the United States, should carry naturalization papers and those of evident enemy origin who claim to have been born in the United States or in some other allied or neutral country should carry birth certificates or some other evidence of their birthplace. To facilitate departure from Canada, males between 18 and 45 years of age entering Canada for temporary purposes may secure, on application to the Canadian immigration officer where they enter, a card showing that they are not residents of Canada. Women and children do not require any identification card.

Telegraphic Reports of All Accidents

The Public Utilities Commissioners of Colorado, George T. Bradley, M. H. Aylesworth and A. P. Anderson, have issued an order concerning notification of accidents, as follows:

"It is ordered, that when any wreck, or any collision of trains, or any collision of trains with vehicles or pedestrians, resulting in loss of life or injury to persons, occurs upon any line, . . . either steam or electric, the superior officer, agent or employee

of the carrier on the ground at the time of the accident shall immediately notify the Public Utilities Commission, Denver, by telegram, the details of such accident, stating the immediate location, the nature and cause of the accident, and the number of persons killed or injured. . . . Disobedience . . . punishable by fine of \$1,000, or by imprisonment for one year, or both. . . ."

Production of Bituminous Coal

According to the weekly report on the production of bituminous coal and the causes of loss of working time, compiled by the Geological Survey, Department of the Interior, the ratio of tonnage produced to full-time output continued to decline during the week ended August 11. Mines representing more than one-third of the output of the country produced 71.8 per cent of their combined full-time capacity as limited by the present labor force. The index not only fell below the level of the preceding week (73.0), but reached the lowest point attained since June 1, when the system of weekly reports was begun. Iowa, Illinois, Ohio, Kansas and Missouri declined; Alabama, southwestern Virginia and western Pennsylvania held their own, while eastern Kentucky and Tennessee recovered to some extent from the depression of the week before.

Orders Heavier Loading of Cotton

The Commission on Car Service has issued instructions prohibiting the shipping of cotton in quantities less than 65 bales in a car and requiring as many more to be loaded as the size of the car furnished will permit. Notice to this effect has just been sent to buyers of cotton, together with a request that they place orders for their requirements on a basis of not less than 65 bales or multiples thereof. In the Southwest and Mississippi delta districts, the average car will load 65 bales, and in the Southeast the average car will load 75 bales. Consequently buyers are asked to order in multiples of 65 from the Southwest and in multiples of 75 from the Southeast districts.

"The New England territory will be taxed to the maximum capacity of facilities this fall," says the notice, "and the acceptance of freight by the railroads serving the territory north of the Ohio and Potomac rivers will have to be carefully regulated."

Clifford Thorne Organizes Shippers' Association

At a meeting in Chicago, August 31, of members of the National Shippers' Conference, which was formed last spring to oppose the proposed 15 per cent increase in freight rates, a permanent organization of shippers and shippers' associations was effected. The new association will be known as the National Federation of Shippers, and proposes to protect the interests of its members in rate cases before the Interstate Commerce Commission and state commissions. A resolution was passed authorizing the appointment of a committee to present a protest to the Interstate Commerce Commission against the increases in commodity rates on grain, livestock, oil and lumber proposed by the carriers in Official Classification territory. Among the reasons given for the opposition of the association to these advances is that they will increase the cost of living during the duration of the war and increase the cost of the war to the Government. If the railroads persist in asking increased rates it is the purpose of the federation to recommend that the Act to Regulate Commerce be amended so as to provide that no rates shall be advanced except after all shippers concerned have been notified and have been given opportunity to secure a full hearing.

Among those who took a prominent part in the meeting were Clifford Thorne, formerly chairman of the Railroad Commission of Iowa; Luther M. Walter, a Chicago attorney specializing in interstate commerce cases; and Judge S. H. Cowan, of the Texas Industrial Traffic League and other Texas shipping organizations. Among the associations who had representatives at the meeting were the National Live Stock Shippers' Protective League, the National Petroleum Association, the National Council of Farmers' Co-operative Grain Dealers, the National Lumber Manufacturers' Association, the Western Oil Jobbers' Association, the Western Petroleum Refineries Association, the Natural Ice Association of America and the National Lime Manufacturers' Association.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The Interstate Commerce Commission has made public a tentative report by Attorney-Examiner G. N. Brown, recommending a finding that carriers have not justified their proposal to reduce free time on export freight from 10 to 5 days at gulf ports and from 15 to 5 days at North Atlantic ports. The report recommends that the carriers be allowed to make effective their proposed reduction from 10 to 5 days on bunker coal at New Orleans, Mobile and Pensacola. Attorney-Examiner La Rue, in a tentative report on the New York harbor storage case, recommends a finding that the carriers have shown that it will be reasonable for them to reduce from 5 days to 2 days the free time allowed for holding freight at railroad terminals consigned to the New York lighterage district. He also recommends that the proposed increased storage charges on both export and domestic freight be allowed to become effective. Arguments on these reports will be heard by the commission on October 4.

Southern Pacific May Retain Interest in Direct Navigation Company

Opinion by Commissioner Meyer:

The commission finds that the Southern Pacific and Morgan's Louisiana & Texas may continue to operate or have an interest in the Direct Navigation Company, owning three tugs, six barges, wharves at Houston, etc., and operating on Buffalo Bayou between Houston and Galveston. (46 I. C. C., 378.)

Rates to Iowa Points

Board of Railroad Commissioners of the State of Iowa v. Ann Arbor et al. Opinion by Commissioner Harlan:

This proceeding in a sense is supplementary to the Mississippi River Case, 28 I. C. C., 47, and 29 I. C. C., 530; it also is closely related to the Interior Iowa Cities Case, 28 I. C. C., 64, and 29 I. C. C., 536, which was reopened on petitions for rehearing, and is now pending before the commission. In the case first cited the class-rate adjustment between the territory east of the Indiana-Illinois state line and the cities in the state of Iowa on the Mississippi river was brought in issue. That same adjustment, to the extent that it affected the construction of through rates to and from the interior Iowa cities, also was dealt with in the case last cited. In respect of traffic to and from the central freight association territory the commission is asked, in the complaint here before it, to place the Iowa cities, located on the Mississippi river, upon a rate parity with St. Louis, Mo.

The commission holds that:

From points in central freight association territory, west of the Pittsburgh-Buffalo line and east of the Indiana-Illinois state line, there should be no difference in the rates to the upper group cities in Iowa on the Mississippi river and to St. Louis, when the distances to the upper group cities are equal to or less than the distances to St. Louis; but for each 25 miles or fraction thereof that the distances to the upper group cities exceed the distances to St. Louis, rates to the upper group cities may exceed the rates to St. Louis by one cent on the first two classes and one-half cent on the remaining four classes.

From Pittsburgh, Buffalo and points taking the same rates, to cities on the west bank of the Mississippi river from and including Dubuque on the north to and including St. Louis on the south, the class rates shall not exceed 64½ per cent of the rates contemporaneously maintained between New York City and St. Louis.

The basis herein found proper will apply both eastbound and westbound, and the carriers will be expected to adjust their commodity rates in conformity therewith. (46 I. C. C., 20.)

Interior Iowa Cases. Opinion by Commissioner Harlan:

The Mississippi-Missouri river proportional class scale, whatever its measure may be, shall for the future be equitably prorated across the state of Iowa in constructing reasonable maxi-

mum proportional class rates between the west bank of the Mississippi river and interior Iowa cities on traffic originating at or destined to points in official classification territory east of the Indiana-Illinois state line.

Upon that basis reasonable maximum class rates are herein prescribed, and it is expected that the carriers will adjust their commodity rates in conformity therewith.

This is the second supplemental report in this case. "In the original report," says the opinion, "we announced that the carriers would be expected to propose a system of single proportional rates, applicable west of the Mississippi river on through traffic moving in both directions, that would bear a reasonable relation to the Mississippi-Missouri river proportional scale of 55 cents; and although the proportional rates subsequently established had our approval, it becomes apparent that the interior Iowa cities were not given the relief which this broader record shows they are entitled to have. It is also clear that the rate changes since made have unquestionably enlarged the disadvantages of which the interior Iowa cities complained in the original proceeding." (46 I. C. C., 39.)

Board of Railroad Commissioners of the State of Iowa v. Atchison, Topeka & Santa Fe. Opinion by Commissioner McChord:

Ocean-and-rail and rail-lake-and-rail class rates from upper Mississippi river cities, Dubuque, Iowa, to Keokuk, Iowa, inclusive, to points in trunk line territory found to be unduly discriminatory and prejudicial when compared with corresponding rates from the lower Mississippi river cities, Quincy, Ill., to St. Louis, Mo., inclusive, to the same points.

STATE COMMISSIONS

The New York State Public Service Commission, First district, as a result of a shutdown in the service of the Interborough subway for several hours on the afternoon of Saturday, August 25, delaying many thousands of passengers, has issued an order directing the Interborough Rapid Transit Company to maintain a coal supply in the bunkers of its subway power station sufficient to operate the subway for several days. The shutdown was due to failure of the coal supply. The company is required to report to the commission whenever the reserve supply of coal falls below 2,500 tons. The commission has also issued orders to its own inspectors to see that the order is lived up to, and is also making observations of other public utility companies, with the view of seeing that they have a sufficient coal supply to provide a continuous and regular service.

PERSONNEL OF COMMISSIONS

Edgar J. Watkins, attorney-examiner of the Interstate Commerce Commission, has resigned to engage in private practice.

COURT NEWS

Permits to Ship Liquor

The Supreme Court of the State of Washington holds that since the Webb-Kenyon Law divests interstate shipments of liquor of their character as interstate shipments, the statute of 1915, requiring a permit, applies to a shipment originating in Kentucky consigned to Washington, and on failure to secure a permit the liquors are liable to seizure.—*State v. Great Northern* (Wash.), 165 Pac., 1073. Decided June 22, 1917.

Damages for Delay of Fire Engine at Crossing—Nonsuit

In an action against a railroad for damages for injury in consequence of its obstruction of a grade crossing by its trains so as to delay a fire engine in reaching the plaintiff's burning building, it did not appear that those in charge of the train knew or ought to have known of the fire when they were using or about to use the crossing, or that until the gates were raised, it was reasonably practicable for the railroad to have cleared the crossing and enabled the engine sooner to reach the fire. The Pennsylvania Supreme Court held that a compulsory nonsuit was properly ordered.—*Kirstein v. Philadelphia & Reading* (Pa.), 101 Atl., 338. Decided March 19, 1917.

Equipment and Supplies

LOCOMOTIVES

SOUTHERN PACIFIC.—According to an announcement by Wm. Sproule, president of the Southern Pacific, 65 new locomotives, costing over \$2,500,000 are on order for the Pacific System Lines. Ten of the locomotives are to be built at the company's shops. This latest order brings the total expenditures for new equipment by the Southern Pacific and the Pacific Fruit Express, of which it is half owner, to \$24,500,000.

"This great building program," said Mr. Sproule, "is evidence of what the Southern Pacific is doing to make its facilities equal to the unusual demand for equipment occasioned by the war situation and general business expansion. The total number of freight cars we have had built this year or are having built, reaches almost 10,000, and comprises 300 box cars, 1,000 flat cars, 900 stock cars, 600 oil cars, 1,000 automobile cars, 400 gondolas, 40 narrow-gage flat cars, 50 cabooses, and 2,700 modern refrigerator cars for the Pacific Fruit Express. One thousand of the P. F. E. refrigerators, as well as 10 locomotives are to be built on the coast. There have already been delivered to us under this program 3,450 freight cars, and five mail and baggage cars. The refrigerator cars will begin to arrive about September 1. We have now building in the East 300 oil tank cars, 11 locomotives, and 20 baggage and mail cars. We are about to start on the construction of the 3,240 freight cars announced some time ago, and this work will be done at home. It is very difficult during these times to make any predictions as to when equipment can be delivered, because the orders of our government and the government of the allies for cars and locomotives are being given preference. We are making this expenditure responsive to the needs of the present emergency, although the prices of labor and material are the highest in the history of the world."

FREIGHT CARS

THE SEABOARD AIR LINE is in the market for 500 flat cars.

THE SOUTHERN RAILWAY is asking prices on about 400 freight cars.

THE VIRGINIAN RAILWAY is reported as about to place orders for 1,000 55-ton steel hopper cars.

RUSSIAN GOVERNMENT.—The Canadian Car & Foundry Company is negotiating with the Russian authorities for a large portion of the big Russian order which will shortly be distributed to the Canadian companies, totalling, as was noted in the *Railway Age Gazette* of August 10, 10,000 four-wheel cars.

THE UNITED STATES GOVERNMENT has placed additional orders for 500 small push cars with the Pressed Steel Car Company and 500 convertible ballast cars with the American Car and Foundry Company. The Government authorities are also reported as about to place additional orders for cars. It is understood that orders for 10,000 or more cars are in contemplation.

SIGNALING

THE TEXAS & NEW ORLEANS has ordered from the General Railway Signal Company a 4-lever interlocking, to be installed at Connell, Tex.

THE LEHIGH VALLEY has ordered from the General Railway Signal Company a 6-lever interlocking for installation at Bridge 386.

THE YAZOO & MISSISSIPPI VALLEY is to install an 8-lever interlocking at New Basin Canal, New Orleans. The material is from the General Railway Signal Company.

THE ALABAMA GREAT SOUTHERN is to install automatic block signals between Russell, Miss., and Toomsaba, 24 Model 2A, one arm, 10 volt, top-of-mast signals. The material will be furnished by the General Railway Signal Company.

Supply Trade News

L. L. Holmes, formerly purchasing agent of the Cincinnati, Indianapolis & Western at Indianapolis, Ind., has been appointed railroad representative of the Barrett Company, New York, with headquarters at Boston, Mass.

The Acar Manufacturing Company, 30 Church street, New York, has opened a Chicago office, in charge of Leland T. Johnson at room 649, McCormick building. Mr. Johnson will handle matters for this company in the western territory.

E. F. Carry, president of the Haskell & Barker Car Company, has been appointed as a representative of the Emergency Fleet Corporation, United States Shipping Board, on a labor adjustment board to adjust labor and wage disputes in connection with the building of ships for the Government.

A. E. Heffelfinger, who for more than two years past has been chief draftsman of the National Steel Car Company, Ltd., Hamilton, Ont., has recently been appointed chief engineer of that company. Mr. Heffelfinger was born April 10, 1881, at Reading, Pa. Following his graduation from the Williamson Free School of Mechanical Trades in 1900 he entered railroad service as a special apprentice in the car shops of the Philadelphia & Reading, at Reading, Pa. On the completion of his apprenticeship he served at different times as draftsman, designer, checker, estimator, computer and principal assistant engineer with the Harlan & Hollingsworth Corporation, the Pressed Steel Car Company and the American Car & Foundry Company. He was with the latter company for over eight years, during which time his headquarters were in its New York office. Mr. Heffelfinger has had a wide experience in handling engineering problems in connection with the manufacture of railroad equipment for export, and he served as engineer to the Cuban representative of the American Car & Foundry Company in 1912 and 1913.

A. E. Heffelfinger

W. K. Palmer, president of the W. K. Palmer Company, Engineers, Kansas City, Mo., has received a commission as major in the engineers' corps of the United States Army. In consequence his practice and the business of the W. K. Palmer Company will be discontinued after September 1, for the period of the war.

The McCarthy Drill & Tool Corporation of Toledo, Ohio, with executive offices at 30 Church street, New York, has purchased the Toledo Drill & Tool Company of Toledo, which has just moved into a new and enlarged fireproof two-story structure, where it has arranged to turn out large quantities of high-speed drills, in addition to a full line of cutters and reamers.

The Titanium Alloy Manufacturing Company announces that the constantly increasing demand for superior bronze and brass castings has compelled it to enlarge its bronze department and make a distinct unit of it under the name of the Titanium Bronze Company, Inc. The company's works are at Niagara Falls, N. Y.; its sales offices at Buffalo, and its general offices at 165 Broadway, New York.

Frank W. Davis, manager of railroad sales of the Lake Erie Iron Company, Cleveland, Ohio, died very suddenly of heart disease at the Royal Muskoka hotel, Muskoka, Canada, August 8. Mr. Davis was born in Cleveland, January 1, 1857. He received his education in the Cleveland public schools and

Oberlin, and commenced his business career with Bingham & Phelps, who at that time conducted a retail hardware business on Ontario street. He afterward engaged as a commercial traveler, and while on one of his trips he became acquainted with C. W. Scofield, secretary and treasurer of the Lake Erie Iron Company, who eventually employed him as a salesman for that company. He remained in the service of the Lake Erie Iron Company for 27 years.

F. P. Huntley

F. P. Huntley, whose resignation from his position as vice-president and general manager of the Gould Coupler Company and vice-president of the Gould Storage Battery Company has recently been announced in these columns, leaves after having completed 28 years of continuous service with these interests. Mr. Huntley began his business career in 1888 when he became a stenographer to the superintendent of motive power of the New York, Lake Erie & Western (now part of the Erie) but very shortly afterwards he left to become associated with the Gould interests as a bookkeeper and stenographer in the Gould Steam Forge, which completed an axle plant at Buffalo, N. Y., early in 1889.

F. P. Huntley

It is interesting to know that 21 years later (in 1909) Mr. Huntley introduced the first quick-acting hydraulic press used in this country in this same forge plant, then located at Depew, N. Y.

The Gould Coupler Company started in business in 1889, but its manufacturing was done for some years under contract by outside plants. In 1892 the main office of the company was moved to New York City, and the malleable iron plant was built at Depew, N. Y. Mr. Huntley was made secretary and director of the Gould Coupler Company in 1892, this company having previously absorbed the Gould Steam Forge. Seven years later, in 1900, when the Gould Storage Battery Company was formed, he was elected also vice-president and a director of that company, holding that position continuously thereafter.

In 1903 the plant for the manufacture of larger steel castings was erected at Depew, in which bolsters, couplers, side frames, and miscellaneous railroad castings were made. Both the erection of this plant and its operation afterwards was under the direct charge of Mr. Huntley.

In 1905 Mr. Huntley resigned as secretary of the Coupler Company and was elected vice-president, general manager, and a director which position he now relinquishes. Mr. Huntley, still a young man, has had the opportunity of seeing and studying from their inception, the most of the modern devices now used in railroad service in this country, and to a certain extent abroad. It is quite probable he will continue to be identified with the railway supply industry, although he has as yet announced no plans.

TRADE PUBLICATIONS

THOR DRILLS.—The Independent Pneumatic Tool Company, Chicago, Ill., has issued a folder illustrating the various types of piston air drills, pneumatic hammers and electric drills manufactured by that company. A table is also included giving the detailed characteristics and suitable service for each type of equipment.

NO TRANSPORTATION FOR BRITISH SOLDIERS.—The parliamentary secretary to the British war office stated recently that it was considered that soldiers stationed in Great Britain should not, as a rule, be granted leave, other than draft leave, if it involves traveling by train.

Railway Construction

APACHE RAILWAY COMPANY.—This company is completing surveys for a line from Hollbrook, Ariz., to White River, by way of Snowflake, Shumway, Lakeside & Pinetop, a total distance of about 71 miles. The work involves about 13,000 cu. yd. of grading per mile. The road will have a maximum grade of 1½ per cent and a curvature of 6 deg. The line will top the White Mountain timber belt and the Apache Indian Reservation. Grading work will be started in about 30 days, and it is expected that the road will be opened for operation in about a year.

ILLINOIS CENTRAL.—This company has called for bids for the construction of a four-track, concrete bridge at Kankakee, Ill. The structure will be approximately 570 ft. long and will have six arches, five of which will be 90 ft. long and the other one 60 ft.

This company has also awarded a contract to T. S. Leake & Co., Chicago, for the enlarging of storehouses and roundhouse stalls at Clinton, Ky. The improvements involve the shifting of some tracks and a total expenditure of about \$100,000.

INDIANA HARBOR BELT.—This company has completed plans for the rebuilding of the I.C.I. transfer station at Gibson, Ind., which was recently destroyed by fire. The cost of the building will be approximately \$75,000, and the work will be completed about October 1.

NEW YORK CENTRAL.—A contract has been given to the Eastern Concrete Steel Company, Buffalo, N. Y., for the construction of a building two stories high, 60 ft. by 500 ft., to be used by the American Express Company as a transfer station, for the consolidation of car shipments and for local service, with offices on the second floor. The building is located at Curtis street, Buffalo, and will be of reinforced concrete construction, including platforms and canopies.

NORTHERN PACIFIC.—This company has awarded a contract to the E. J. Rounds Construction Company, Seattle, Wash., for the construction of a depot at American Lake. The building will be 300 ft. long, 30 ft. wide and one story high, with concrete foundation and frame construction, and will cost approximately \$12,000. The road has also completed a reclamation plant at South Tacoma at a cost of about \$60,000. The plant includes two scrap platforms, each 50 x 600 ft., and three working sheds, 50 ft. by 100 ft. each. The sheds are equipped with rolls for smaller sizes of round and square bars and machines for the manufacture of bolts, etc., from scrap material.

PACIFIC ELECTRIC.—This company has completed plans for the construction of 12 one and two story buildings of steel and concrete construction, at Torrance, Cal. The total cost of the project will approximate \$1,200,000.

TEXAS ELECTRIC.—This company is constructing two single-track extensions from Waco, Tex., to Camp McArthur, about five miles. The cost of the work will be approximately \$60,000, and the company expects to have the line completed by September 15.

UNION PACIFIC.—This company is building approximately 13 miles of side tracks and running tracks to reach various points on the military reservation at Ft. Riley, Kan. Other improvements including considerable yardage at Junction City have been authorized. Details of these improvements will be announced later.

WISCONSIN INTERURBAN.—This company has awarded a contract to J. T. Adams, Columbus, Ohio, for the construction of a line from Madison, Wis., to Janesville, a distance of 40 miles. The road will have a maximum grade of 1½ per cent and maximum curvature of 6 deg. The work will involve about 15,000 cu. yd. of grading per mile, and the construction of several pile bridges, sub-stations, car barns, freight and passenger stations. In addition to the Janesville branch the company is planning the construction of a line from Madison to Fond du Lac, and another from Madison to Prairie Du Sac and Portage. The aggregate mileage of the three lines will be about 207 miles.

Railway Financial News

MISSOURI, KANSAS & TEXAS.—An application for the appointment of an additional receiver to act with Charles E. Schaff, now the sole receiver, was filed August 30 in the U. S. District Court at St. Louis by Speyer & Co., of New York. A hearing on the petition will be held before Judge William C. Hook in New York City on September 7. Speyer & Co. filed the petition as holders of \$7,000,000 of two-year notes and a portion of the general mortgage bonds and of part of the first refunding bonds. The fixed charges and sinking fund charges now aggregate \$7,000,000 a year. It is stated that the reorganization plan of Hallgarten & Co. and J. & W. Seligman & Co., New York bankers, cut the fixed charges to \$3,800,000, while Speyer & Co. maintained that the fixed charges could be safely fixed at about \$4,500,000, in which case they would still amount to only 62½ per cent of the average net earnings for the years from 1911 to 1915. The bankers further state that the fixed charges of \$4,500,000 are justified by the past and present earnings capacity of the system, especially in view of the new money which is to be raised through the reorganization. Differences of opinion, the petition states, have arisen between the present receiver and the holders of the two-year notes and general mortgage bonds as to a number of questions of policy, such as prompt payment of the interest on \$40,000,000 of 4 per cent first mortgage and other underlying bonds. In view of these differences and of the fact that the interests of the junior security holders differ from the interests of prior lien holders, the petitioners claim that the junior security holders are entitled to a direct representation in the management of the road, "especially in view of the fact that the receiver has shown himself to be a partisan of the proposed plan, which favors the holders of prior liens." They also state that the receiver in a discussion upon the merits of a plan of reorganization should not aline himself with one set of security holders against another.

NEW YORK CENTRAL.—Application has been made to the New York Public Service Commission, Second district, for permission to issue \$10,000,000 Series A of refunding and improvement 4½ per cent bonds; and to issue and sell \$15,000,000 of its promissory notes, bearing interest at a rate not to exceed 5 per cent per annum. As security for the payment of these notes the company proposes to pledge the \$10,000,000 of Series A bonds, and also \$10,000,000 additional bonds, the issue of which was authorized by the commission on April 26, 1917. The proceeds of the sale of the notes are to be used for the following purposes: \$5,500,000 for additions and betterments, and \$9,500,000 for the discharge of outstanding obligations.

NEW YORK, NEW HAVEN & HARTFORD.—In answer to the \$165,000,000 restitution suit instituted in the Federal District Court at New York on August 30, 1916, by five stockholders, J. Pierpont Morgan, Herbert L. Satterlee, William P. Hamilton and Lewis Cass Ledyard as executors of the will of the late J. Pierpont Morgan, and William Rockefeller, Charles M. Pratt, and Mr. Ledyard as individual defendants have denied the charge in the complaint that the New Haven company or any of its subsidiary companies ever acquired any control of the Boston & Albany or the Metropolitan or Eastern Steamship companies. Continuing the answer, Mr. Rockefeller explained that prior to June 30, 1915, the then board of directors of the defendant company advised with counsel concerning the acts of former directors and whether an action for restitution should be begun against them. He said that it was decided not to begin such an action because the litigation was sure to be very expensive, complicated, and would probably be barren of any good result. This action, it was said, was thereafter indorsed by a vote representing 950,000 shares of stock out of a total of 1,571,000. Asa P. French, on behalf of the defendants, presented a resolution calling upon the directors to bring a suit for restitution, and this was defeated. Mr. Rockefeller said, by persons owning 925,124 shares of stock. Then the directors whose action had been indorsed by the stockholders, were re-elected. For these reasons the defendants ask that the suit be dismissed.

Railway Officers

Executive, Financial, Legal and Accounting

F. W. Schanck has been appointed auditor of the Georgia Coast & Piedmont, with office at Brunswick, Ga., vice R. E. Anderson.

Archibald G. Loomis who has been elected treasurer of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, succeeding F. G. Ranney, retired, was born at Hartford, Conn., on June 20, 1848. He began his business career as a clerk in a bank at Hartford and later served successively as discount clerk, teller, cashier, director and president. In 1899 he was elected vice-president of the National City Bank of New York, which position he held until 1906, when he was elected vice-president of the Union Trust Company at Providence, R. I. In the following year the bank was placed in the hands of the receiver and Mr. Loomis was given direct charge of its affairs. Several years later the bank was taken out of the receiver's hands and Mr. Loomis remained a vice-president until 1915, when he resigned.

A. G. Loomis

Clinton L. Bardo, general manager of the New York, New Haven & Hartford, has been appointed assistant to president. He will continue in general charge of the operating department, with headquarters at New Haven, as now. He was born on October 24, 1867, and began railway work in May, 1885, as a telegraph operator on the Philadelphia & Erie division of the Pennsylvania Railroad. He was in the service of the Pennsylvania about a year, and then worked for brief periods for the Philadelphia & Reading and the Tidewater Oil Company. In October, 1887, he went to the Lehigh Valley as telegraph operator, and was soon promoted to train despatcher. In 1892 he was assistant trainmaster, then trainmaster, and in 1901 was promoted to trainmaster of the New York division. In October, 1904, Mr. Bardo went to the New York, New Haven & Hartford as freight trainmaster at Harlem River, N. Y.; and he was made assistant superintendent of the division in 1905. In 1907 he was appointed superintendent of the Grand Central Terminal, New York City, and superintendent of the Electric division of the New York Central. He resigned this position in March, 1911, and returned to the Lehigh Valley as assistant to the general manager; but two years later, February 15, 1913, he resigned from the Lehigh Valley and was appointed general manager of the New Haven, which position he held until his appointment last week, as assistant to the president of the same road, as above noted.

C. L. Bardo

J. F. Maguire, former general manager of the Lehigh Valley, has been appointed assistant to vice-president in charge of operation, with headquarters at New York.

George C. Jones, vice-president of the Central Vermont at St. Albans, Vt., has been appointed assistant to president of the Grand Trunk with headquarters at Toronto, Ont.

W. D. Robb has been appointed vice-president of the Grand Trunk, in charge of motive power, car equipment and machinery, with headquarters at Montreal, Que. Mr. Robb was born at Longueville, Que., on September 23, 1857. He received his early education in Sherbrooke Academy and St. Francis College, Richmond, Que., entering the service of the Grand Trunk Railway System as an apprentice at Hadlow Cove, July 1, 1871. In 1873 he was transferred to Montreal, where he finished his apprenticeship as a machinist. In February, 1883, he was appointed night foreman at Point St. Charles shops, and in August of the same year he was promoted to the position of foreman at Belleville in charge of the motive power and car department. He became master mechanic of the Middle division, with headquarters at London, Ont., in January, 1897, and was appointed acting superintendent of motive power at Montreal in July, 1901. In May, 1902, he received his appointment as superintendent of motive power, which position he has since occupied continuously until his recent appointment as vice-president.

W. D. Robb

U. E. Gillen, general superintendent of the western lines of the Grand Trunk, at Chicago, Ill., has been appointed vice-president in charge of operation with headquarters at Montreal, Que. Mr. Gillen was born on February 27, 1867, at Brooklyn, Mo., and was educated in the public and private schools. He entered the service of the Chicago, Milwaukee & St. Paul in 1884, as a clerk at Canton, S. D. During the same year he learned telegraphy and served as telegraph operator and relief agent until April, 1885, when he went as telegraph operator to the Missouri Pacific, at Pacific, Mo. He was promoted in 1888 to operator in the train despatcher's office at St. Louis; in 1892 he was promoted to train despatcher and subsequently served as chief train despatcher until 1901 when he went to the Grand Trunk as trainmaster at Belleville, Ont. In 1902 he was promoted to assistant superintendent at Belleville. Two years later he was again promoted to assistant superintendent at London, Ont., and in 1907 became superintendent at Toronto. He was transferred in 1912 to Montreal as superintendent and the following year he was promoted to general superintendent at Chicago, which position he held until his recent appointment as vice-president in charge of operation of the same road, as above noted. In 1916 Mr. Gillen served as president of the Grand Trunk Railway Maintenance of Way Association and in 1917 he was elected president of the General Superintendents' Association of Chicago.

U. E. Gillen

James Russell, until recently vice-president and general manager of the Minneapolis & St. Louis, has been appointed general manager of the St. Louis Southwestern vice W. T. Tyler, who continues as first vice president of the Texas properties, both with headquarters at Tyler, Texas.

L. R. Watts, general counsel of the Seaboard Air Line, at Portsmouth, Va., has been appointed consulting counsel, and E. Marvin Underwood, assistant attorney general of the United States, of Atlanta, Ga., has been appointed general counsel, with headquarters at Norfolk, Va., to succeed Mr. Watts.

F. G. Ranney, treasurer of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, who has resigned, effective September 1, began his business career as a bookkeeper with the Western Union Telegraph Company on February 22, 1866. In September, 1874, he was promoted to secretary and treasurer, and in 1879 entered the service of the St. Paul as cashier. In 1882 he was promoted to assistant treasurer of the same road, and on February 23, 1887, became treasurer, which position he held until his retirement.

Operating

R. E. Hoard has been appointed inspector of transportation of the Delaware & Hudson, with headquarters at Albany, N. Y.

C. P. Stempel, superintendent of the Minneapolis & St. Louis, at Minneapolis, Minn., has been appointed general superintendent of the Virginian Railway, with headquarters at Norfolk, Va.

He was born on October 3, 1868, and graduated from Shattuck Military School at Faribault, Minn., in June, 1887. He began railway work in 1889, as a clerk in the office of the ticket auditor of the Chicago Great Western, and subsequently held consecutively various positions in the auditing department. From September, 1892, to September, 1894, he was traveling accountant, then for one year was chief clerk to the general superintendent. In September, 1895, he was appointed assistant to the general manager, and from September,

1899, to July, 1900, he was superintendent of terminals at Oelwein, Iowa. He was then to March, 1905, superintendent of the Southwestern division, and then to July, 1908, was superintendent of the Eastern division, all on the Chicago Great Western. On July 1, 1908, he was appointed assistant to vice-president of the Chicago Union Transfer Railway, and the following January he was appointed superintendent of the Minneapolis & St. Louis, which position he held at the time of his recent appointment as general superintendent of the Virginian Railway.

Frederick T. Gibbs has been appointed trainmaster of the Illinois Central, with headquarters at Centralia, Ill., succeeding Donald L. Carlyle, assigned to other duties.

John L. East has been appointed superintendent of freight service of the Illinois Central, and the Yazoo & Mississippi Valley, with headquarters at Chicago, effective September 1. This is a new office created with a view to increasing the efficiency of the loss and damage bureau.

W. R. Davidson, superintendent of the Grand Trunk at Detroit, Mich., has been appointed general superintendent of the western lines, with headquarters at Chicago, succeeding U. E. Gillen, promoted; and T. King has been appointed superintendent of the Detroit division, with headquarters at Detroit, succeeding Mr. Davidson.

H. E. McGee, formerly superintendent of the Missouri, Kansas & Texas, at Greenville, Tex., and recently transportation officer of the government training camp at Waco, has been ap-

pointed superintendent of the Oklahoma district of the M. K. & T., with headquarters at Oklahoma City, Okla., succeeding S. H. Charles, granted a leave of absence; H. B. May has been appointed trainmaster of the Osage division, including the Osage terminal, with headquarters at Parsons, Kan., succeeding F. W. Grace.

James Berlingett having resigned as general manager of the Virginian Railway, the duties of that office were taken over on September 1, by E. E. Kerwin, vice-president, at Norfolk, Va. E. D. Hanes has been appointed superintendent coal terminals, Sewalls Point, Va., vice W. A. Young, resigned to accept service with another company.

George W. Wildin, mechanical superintendent of the New York, New Haven & Hartford, has been promoted to the position of general manager of that company, succeeding C. L. Bardo

who has been promoted to the position of assistant to the president. Mr. Wildin has been in the service of the New Haven since July, 1907. He was born at Decatur, Ill., February 28, 1870, and graduated from the Kansas State Agricultural College with the degree of bachelor of science in June, 1892. He entered railway service shortly afterwards as a mechanical draftsman in the Topeka shops of the Atchison, Topeka & Santa Fe. He subsequently became a machinist and locomotive fireman on the Santa Fe and later an

engineman on the Mexican Central. Leaving railway service he was for a while superintendent of the Acme Motor Company, Chicago. He returned to railway service shortly, however, as an engineman on the Chicago & Alton and then went to the Plant System, now a part of the Atlantic Coast Line, where he served successively as a machinist, a locomotive and car inspector and as mechanical engineer. From April 1, 1901, to March 1, 1904, he was mechanical engineer of the Central of New Jersey. On March 1, 1904, he left that company to become assistant mechanical superintendent of the Erie, being promoted on April 1 of the same year to mechanical superintendent at Meadville. From January to July, 1907, he served as assistant superintendent of motive power of the Lehigh Valley and then left that road to accept a position as mechanical superintendent of the New Haven. In May, 1917, he was promoted to general mechanical superintendent, and it is this position he leaves to take up his new duties. Mr. Wildin was president of the American Railway Master Mechanics' Association in 1910.

Traffic

P. M. Havens, commercial agent of the Cincinnati, Indianapolis & Western, with headquarters at Indianapolis, Ind., has been appointed general agent, with the same headquarters, succeeding A. M. Waldo, deceased.

R. H. MacDonald, city passenger agent of the Missouri Pacific at New York, has been appointed general agent of the passenger department, with the same headquarters, succeeding R. T. G. Matthews, granted a leave of absence.

J. W. Stevenson, traveling freight and passenger agent of the Chicago, Milwaukee & St. Paul at Bellingham, Wash., has been appointed commercial agent, with headquarters at Vancouver, B. C., succeeding A. W. Nasc, who has been transferred to Bellingham, Wash.

Engineering and Rolling Stock

J. M. Brown, assistant engineer maintenance of way on the Cleveland, Cincinnati, Chicago & St. Louis at Springfield, Ohio, has been appointed acting engineer maintenance of way of the

C. P. Stempel

G. W. Wildin

Indianapolis terminal division, with headquarters at Indianapolis, Ind., succeeding C. F. Hinchman, granted a leave of absence.

G. O. Hammond, assistant general mechanical superintendent of the New York, New Haven & Hartford, at New Haven, Conn., has been appointed general mechanical superintendent.

H. B. Brown, general fuel inspector of the Illinois Central, at Chicago, has been appointed superintendent of the fuel department of the Lehigh Valley, with office at South Bethlehem, Pa.

W. H. Sample, master mechanic on the Grand Trunk at Montreal, Que., has been appointed superintendent of motive power, with the same headquarters; G. M. Wilson, assistant master mechanic at Montreal, has been appointed master mechanic of the Montreal shops, with the same headquarters, in place of A. A. Maver, retired.

R. W. Burnett has been appointed master car builder of the Delaware & Hudson, with office at Albany, N. Y. Mr. Burnett was born at Farmer City, Ill., in 1868, and in 1890 entered the service of the Union Pacific in the car department at Denver, Colo. In 1892 he was connected with the Pennsylvania Railroad at Chicago as a car inspector, and from August, 1892, to July, 1899, was with the Lake Shore & Michigan Southern at Chicago as a foreman and general foreman of the car department at Englewood. The early part of 1900 he spent as general foreman of the car department of the Long Island, going in the latter part of the year to the Central of New Jersey at Elizabethport, N. J., as general foreman of the car department. He remained with that road until 1904, and then went to the Erie, and served on that road in the capacities of assistant master car builder and master car builder, with headquarters at Meadville, Pa., until January, 1907. He left the service of the Erie to go with the Canadian Pacific as assistant master car builder, and in 1909 was promoted to general master car builder. In 1913 he was also elected vice-president of the Master Car Builders' Association. In November, 1915, he left the service of the Canadian Pacific and has since been vice-president of the National Car Equipment Company, Chicago.

E. R. Battley, general foreman motive power department of the Grand Trunk at Decatur, Me., has been appointed master mechanic of the eastern lines with headquarters at Montreal, Que., and A. McDonald, foreman of the erecting shop at Stratford, Ont., has been appointed assistant master mechanic, with headquarters at Montreal shops.

W. L. Bean, who has been acting as assistant to the president of the New York, New Haven & Hartford, has been appointed assistant to the general mechanical superintendent. He was born on January 3, 1878, at Stevens Points, Wis., and graduated from the University of Minnesota with the degree of mechanical engineer in 1902. The same year he began railway work with the Northern Pacific as special apprentice. In December, 1904, he went to the Atchison, Topeka & Santa Fe, serving successively as erecting shop foreman, locomotive inspector at the Baldwin Locomotive Works in Philadelphia, and machine shop foreman at La Junta, Colo. In January, 1909, he was appointed division foreman at Belen, N. M., and the following July was appointed motive power assistant at Topeka, Kan. On February 1, 1912, he became chief engineer for the Oswald Railroad Service Company, at Chicago, and on July 10, 1916, he entered the service of the New Haven, and since that time has been acting as assistant to the president.

Railway Officers in Military Service

J. de N. McComb, office engineer of the Atchison, Topeka & Santa Fe, at Chicago, has been commissioned captain in the

Engineer Officers' Reserve Corps, and has been assigned to duty at Ft. Leavenworth, Kan.

J. W. Reid, bridge engineer of the Chicago & Alton at Chicago, and R. A. Cook, valuation engineer, who were commissioned captains in the Engineer Officers' Reserve Corps, have been assigned to duty at Ft. Leavenworth, Kan.

Special

J. Hampton Baumgartner, publicity representative of the Baltimore & Ohio, has resigned, effective September 1, to become assistant to the president of the National Association of Owners of Railroad Securities.

He was born in Westminster, Md., in 1887, and prior to his appointment as publicity representative of the Baltimore & Ohio, was employed in the office of the vice-president. The organization with which he now becomes affiliated was founded recently at a meeting of bondholders and stockholders of the American railroads at Baltimore, Md., when steps were undertaken to insure the stability of securities, representing in the aggregate more than \$17,000,000,000 of capital. The initial conference

was attended by 500 financiers and individual investors. In addition to Mr. Baumgartner and S. D. Warfield, president of the association, there are five vice-presidents in different sections of the country, who make up the executive personnel of the organization. Mr. Baumgartner has been in charge of the publicity department of the Baltimore & Ohio since July, 1911, and has been identified with the various national publicity campaigns conducted by the railroads to educate the public concerning the problems facing the roads.

J. H. Baumgartner

R. W. Burnett

OBITUARY

Martin N. Todd, president of the Galt, Preston & Hespeler, and general manager of the Lake Erie & Northern, at Galt, Ont., died suddenly on August 29, at the age of 59.

P. H. Leonard, general western live stock agent of the Erie, with headquarters at Chicago, died at St. Luke's hospital, Chicago, on September 1, following an operation.

E. S. Koller, vice-president and general manager of the Colorado & Southern, with headquarters at Denver, Colo., died at his home at Denver on September 2 after a ten-day illness.

John F. Enright, superintendent of motive power and car department of the Denver & Rio Grande, died at his home in Denver, Colo., on September 4, after an illness of about one year.

Charles L. Crandall, professor emeritus at Cornell University, with which he was associated for nearly 50 years, died at his home at Ithaca, N. Y., on August 25. While active in many branches of civil engineering, he specialized in railway work and was well known among railway engineers as a teacher and as an author of several texts and handbooks treating on various railway engineering subjects, including transition curves, earth-work tables, railroad surveying and railroad construction. He was a member of the American Railway Engineering Association, taking an active part in the work, particularly that of the committee on Iron and Steel Structures. Professor Crandall was born at Bridgewater, N. Y., in July, 1850, and entered Cornell University when that institution was opened, graduating with the first regular class in 1872. After two years of engineering experience he returned to the institution and was made a member of the instructional force, with which he continued until his death, serving in turn as instructor, assistant professor, professor of railway engineering and for the last two years as professor emeritus.

GENERAL NEWS SECTION

476

There is only a little over two weeks left before the close of the contest which the *Railway Age Gazette* has announced for the best papers discussing the reconsignment privilege.

The Reconsignment Privilege Contest

officers whose duties are affected by the reconsignment of shipments and this, of course, includes both operating officers and traffic officers, yardmasters and station agents and many others, are urged to send in to the New York office of the *Railway Age Gazette* a paper discussing this subject. Papers should be sent in before September 29. As was stated in the first announcement, we are particularly anxious to get just as much material bearing on this subject, going into some detail and citing specific instances, as is possible. The prizes are \$50 for the best paper and \$25 for the second best paper. All material used in addition to the two prize articles will be paid for at our usual rates.

"The situation would thus appear to be that whilst such men, materials, and rails as may be found requisite for Sir Douglas Haig's requirements as further enemy areas are occupied may be supplied from the United States, the demands for engine power must necessarily be met from France and Great Britain."

The quotation is from the *Railway Gazette* (London) of August 17. The *Railway Gazette* is right in one respect; namely, that the American railways probably cannot be called upon to supply cars and engines for service on the French railways. "The difference in the dimensions of the structure gage prevents this," says the *Gazette*. "The maximum height for a locomotive in France is somewhere about 173.2 in., whereas the American locomotive demands a headway of 178.75 in. As to width, the French locomotive calls for a clearance of about 114.1 in. as against a width of 122 in. for the American locomotive. The difference in the height and width of the French and American freight cars is greater still." But the *Railway Gazette* misses the point; it forgets entirely the American railway supply field. The locomotive companies have already supplied numbers of standard gage locomotives for the British War Office and for the Paris-Lyons & Mediterranean Railway of France, and locomotives are being built for the Paris-Orleans and the French State Railways. The

car builders have supplied large numbers of cars for the French State Railways and the Canadian builders for the Paris-Orleans, the P. L. M., the Northern Railway and the State Railways. But most important of all, American builders are to build 680 standard gage Consolidations and 9,000 standard gage freight cars and a large amount of narrow gage equipment for our own forces overseas. We will agree with the *Railway Gazette* that perhaps the American railways cannot supply locomotives and cars for service in France as the railways in England have done. The *Railway Gazette* must agree with us that the American railway supply field will give a good account of itself when it comes to supplying equipment that the American railways may not be able to supply for the military and other railways behind the allies' lines in France.

The automobilist who risks his life on a railroad crossing without looking out for trains—like the tramp who steals a ride on the "blind baggage" and is crushed between the cars when a wreck occurs—forfeits everybody's sympathy by the very patent recklessness of his course. To avoid the danger is so obviously the simple and rational course that there are no two ways of looking at the question—though cunning lawyers do contrive to get it before the courts frequently. But the reckless automobilist often, perhaps usually, risks others' lives besides his own; so that the problem of preventing the horrible crossing slaughters, which are now so frequently reported, is far from simple. The Nebraska Supreme Court, in a decision reported in the *Railway Age Gazette* August 31, page 400, declares that persons riding in an automobile and knowing of the existence of danger on approaching a railroad, have a duty to warn the driver; or, at least, to do whatever is possible to save themselves. Neglecting this, they have no claim on the railroad. And no one, thinking what he himself would do, in such a situation if he realized its true gravity, will dispute the logic of the court. This is a phase of the matter on which railroad safety specialists, in the very commendable missionary circulars and lectures by which they endeavor to recall highway travelers to their senses, may well lay emphasis. This ignorance or thoughtlessness is particularly pathetic when all or most of the victims of their own unwise trust in a

Responsibility of Automobile Passengers

driver are young and innocent children, as was the case at Saybrook Junction, Conn., August 20. And the lesson has a wide application. Near Perryman, Md., August 30, seven farm laborers, riding to their work on a wagon drawn by mules, were killed on a crossing. The party approached the railroad through a cut five feet deep, with tall corn growing in the adjacent field, so that, in the words of the despatch, "their vision was obscured." Like thousands of other people, if we may believe innumerable stories told in the courts, these men took no thought of the fact that their hearing was not obscured, except as they voluntarily obscured it. Even dumb animals seem, in some respects, to be wiser than men. A cat, or a horse, approaching that crossing, having the knowledge that those men possessed, would have used its ears as well as its eyes.

On Wednesday of this week the Railway Business Association gave an informal luncheon at the New York Railroad

Australian Government Officials in America

Club at which the guests of honor were the Right Honorable W. A. Holman, Premier of New South Wales, and Honorable H. C. Hoyle, until recently minister of railways of New South Wales and now special representative of New South Wales in this country studying American railroad methods. Both the Premier and Mr. Hoyle spoke informally and frankly and the Railway Business Association may well be congratulated. There are in operation in New South Wales nearly 5,000 miles of railroad. This is government owned and operated. Neither Mr. Holman in his wonderfully interesting talk, nor the former minister of railways made any concealment of the somewhat sinister ring which government ownership has for American railroad men. The success which they claim for the government operated railways of New South Wales is based apparently in part on the very high standard of political life in that state, and in part on the fact that the commissioner of railways, who is, of course, a political appointee, has no control over the appointment of officers or employees of the railways, but deals only with the broader aspects of management, such as rates, service, extensions, and so on. It was particularly interesting to note the stress which was laid on the duty of the railroad to the pioneer settlements. No hesitation apparently is felt in reducing rates to a point far below cost of service where it is necessary to help the sheep raiser move his flock during a time of drought, and in general apparently a paternalistic rather than a strictly business point of view is adopted by the minister of railways in the administration of his duties. The visit of these two distinguished Australians to this country is of interest not only to railway supply men, but also to American railroad officers. Australia is giving freely to the cause of the Allies in the war. When the war is over not only will railway supplies be needed, but there is every prospect that there will be openings in that country for American settlers, including American railroad men.

"I've been seeing what you've been saying about courtesy," said one of our laymen friends the other day. "I will tell

The Courtesy Killer

you something that happened to me on Labor Day. 'Go ahead, boss,' I said to another fellow as he came up to the ticket window beside me. 'Thanks,' he said, 'I'm in a hurry and want to catch the——'. 'See here,' said a ticket agent, a courtesy killer on the inside of the ticket window; 'let me run this ticket office, will you?' I replied: 'Sell that fellow his ticket and let him get his train before they shut the gates, I came here to ask a question, not to pick a fight. What's the fare to Sweetwater Beach?' '\$1.85.' 'You run an excursion on holidays, don't you?' 'Yes, \$1.00.' 'Well, give me two tickets.' 'We don't sell 'em here. Get 'em

outside.' 'Outside! What do you mean by outside?' 'There will be somebody outside to sell them at \$1.20.' It was noon then and I was getting madder every second, but that ticket man just then stepped back out of sight behind his cases, so I couldn't get anything further out of him, or tell him what I thought of him. And not an intimation did he give me, mind you, that the excursion ticket was good only on the train returning at 10 p. m., about four hours later than I could wait for. I was the only person at the window. He wasn't the least bit rushed and I was as polite as I could be. This occurred only last Labor Day, and on a railroad that, judging from its other actions, realizes that we are at war and professes to understand that now as never before railways must do their utmost to keep the public's favorable impression. The best "courtesy-first" agent and favorable impression creator a railway can have is its ticket agent, and it is hard to believe that a railroad would allow such discourtesy as was evident in this agent, who was actually making enemies for his railroad right and left on one of the busiest days of the year when prospective friends were coming fastest. This would-be passenger and many others who must have suffered the same experience are voters. Are they going to impress upon their legislators that they do not believe in nagging railroads, when they themselves feel that they must be on their guard to keep from being insulted every time they go to a ticket office on that railroad?

A CASE OF RECIPROCAL DISCRIMINATION

THE United States Food Administration, in regulating the prices of wheat at the various markets, has been having some of the same experiences that have beset the railroads and the Interstate Commerce Commission in their efforts to adjust freight rates. The other day it gave out a laconic statement as follows: "The Food Administration has received complaint by wire from Chicago protesting that the announced differentials in wheat are plainly discriminatory against Chicago and in favor of St. Louis. From St. Louis the Food Administration has received by wire the complaint that the differentials in wheat as announced are plainly discriminatory in favor of Chicago as against St. Louis."

Apparently the Food Administration believes that this offsetting of the two complaints is pretty good evidence of its fairness and possibly the same idea is responsible for the fact that the perennial charges of shippers that their products or their communities are being discriminated against by the railroads in the adjustment of freight rates have for a long time aroused much less public interest than formerly. There was a time when the public was so little informed about railway affairs that the term "discrimination" was popularly considered almost tantamount to "rebate," but as regulation has progressed and rebates have become a matter of ancient history, the enterprising traffic managers of the shippers have so overworked their charges of discrimination that the word has lost somewhat of its former flavor. Of course, "discrimination" simply means "difference" and it is only "undue" discriminations that are unlawful, but it is a very unimaginative industrial or civic traffic manager who cannot find arguments to convince himself that a discrimination is "undue."

In the early days of the car shortage of last winter the Interstate Commerce Commission was flooded with complaints from shippers who were not being furnished with all the cars they could load and most of them included bitter charges that their state or city or commodity was being discriminated against, because obviously some shippers had cars. Under such circumstances, however, the more complaints that someone else was getting the cars, the better the evidence that they were being somewhat fairly distributed. When the facts became better understood and there was a more widespread realization that there was a general shortage of transportation facilities in comparison with the unprecedented volume of business to be moved, some of those who had been loudest in

their complaints discovered that they were all in the same boat and much of the indignation subsided into a sincere effort to co-operate in making the best of the situation.

RETURNS FOR JUNE AND THE HALF YEAR

THE returns of railway revenues and expenses for June and for the first six months of the year 1917 show that the railways of the United States are still breaking all previous records except in the vitally important item of operating income, which represents what is left, after expenses and taxes are paid, as a return on the capital invested and therefore determines the credit of the railways and their ability to finance improvements or additions to their facilities. They are, therefore, in much the same position as the man whose pay has been raised, but not quite enough to keep up with the increased cost of living. Total operating revenues for June were greater than for any previous month in history, the total of \$349,739,636 being about \$4,000,000 greater than for May, in which the highest earnings for a month were previously recorded, and \$49,720,256 greater than for June, 1916; this is an average increase of 16.3 per cent per mile. The figures for six months of the year show a decrease in operating income per mile of 4.2 per cent, as compared with the first six months of 1916. The total revenues for the six months were over \$201,000,000 greater than in 1916, but expenses were \$207,000,000 greater, taxes were \$12,500,000 more and the operating income was therefore over \$18,000,000 less. These facts explain clearly why the stocks of some of our best railroads are selling at prices less than when the exchanges closed in July, 1914, and why in the same week that the figures were issued by the Interstate Commerce Commission, Pennsylvania fell below par for the first time in 20 years.

For the month of June total operating revenues reached the record figure of \$1,514 per mile of line, as compared with \$1,301 in June, 1916, and \$1,498 in the month or May. This was an increase over June, 1916, of 16.3 per cent. Operating expenses, \$1,020 per mile, increased 19.8 per cent per mile over June, 1916, but were slightly less than for May, thereby reflecting the remarkable improvement in operating efficiency being obtained in the way of securing increased tonnage and mileage for each freight car and locomotive in service. The decrease in expenses in June, as compared with May, is largely accounted for by the expenditure of \$10 a mile less for maintenance of equipment.

Operating income for June was \$422 a mile, 8.1 per cent greater than for June, 1916. Taken by themselves the June figures make the best showing of any month this year, although for the roads in the eastern district operating income per mile decreased 1.4 per cent.

When the six months' figures are compared, however, the effect which the unprecedented increases in expenses of all kinds are having, in spite of the stupendous increase in the volume of business and in gross earnings, becomes plainly apparent. Total operating revenues were \$1,898,210,538, as compared with \$1,697,051,238 in the first six months of 1916, an increase per mile of line of 11.6 per cent. Operating expenses were \$1,354,295,938, as compared with \$1,147,093,778, an increase per mile of 17.7 per cent. Net operating revenue was \$543,914,600, as compared with \$549,957,460, a decrease per mile of 1.4 per cent, while taxes increased from \$76,241,598 to \$88,936,624, or 16.3 per cent, and the operating income was \$454,661,633, as compared with \$473,295,808, a decrease of 4.2 per cent.

The biggest increase in expenses is naturally found in the cost of conducting transportation, in which wages and the coal bill are the most important factors. This item shows an increase for the six months of \$147,000,000. Maintenance of way and structures expenses increased \$14,000,000; maintenance of equipment, \$35,000,000; traffic expenses, less than \$2,000,000; while miscellaneous and gen-

eral expenses account for an increase of about \$9,000,000. These items make up the total increase of \$207,000,000 in expenses, or from \$4,977 to \$5,861 per mile of line.

Formerly June 30 marked the close of the fiscal year. However, if the returns of the first half of this year be added to the last half of 1916, we get the following comparisons:

	Total Operating Revenues (millions)	Operating Expenses (millions)	Net Operating Revenues (millions)	Operating Income (millions)
Year ending June 30, 1917....	\$4,824	\$2,581	\$1,242	\$1,069
Year ending Dec. 31, 1916....	3,622	2,373	1,248	1,089
Year ending June 30, 1916....	3,396	2,220	1,176	1,079

In other words, with an increase in earnings of over \$200,000,000 over the calendar year and of over \$400,000,000 over the fiscal year 1916, operating income for the 12 months ending June 30, 1917, was \$20,000,000 less than in the calendar year and only \$40,000,000 greater than for the fiscal year, the increase in what is loosely termed profits being only one-tenth of the increase in earnings.

ANTI-RAILWAY STATESMEN WHO ARE ALSO ANTI-AMERICAN

ONE of the most interesting features of the discussions of the war and of war measures has been that almost every man in Congress who in past years has been notorious for attacking and misrepresenting the railways has turned up as an opponent of measures necessary for the vigorous prosecution of the war.

Of all men in public life, Senator La Follette of Wisconsin has been the most consistent and persistent in assailing and misrepresenting the railways. He has been just as anti-United States on questions affecting the conduct of the war as he has been anti-railroad on all questions affecting the railways, and has resorted in the one case to the same kinds of agitation and misrepresentation as in the other. He was the leader of that "little group of wilful men" whom President Wilson scarified in one of his public utterances for defeating war legislation. That entire group was composed, with one exception, of men who had made their way in public life by attacks on the railroads.

Consider the list of those who are most prominent now in anti-war and anti-American activities—Johnson of California, Gronna of North Dakota, Reed of Missouri, Gore of Oklahoma, Vardaman of Mississippi, Norris of Nebraska, and so on. There are some exceptions, but a complete list of the members of Congress, and especially of members of the Senate, who have been anti-American in the war would almost serve as a list of the habitual railway baiters in Congress.

Why is this the case? We have reflected on that subject a good deal, and we have reached the conclusion that the attitudes of these men toward the war and toward the railways are effects of the same cause, and that that cause is a disposition to promote their own political interests by any means that they believe will accomplish that object, regardless of the consequences to the nation as a whole.

Many men in public life criticized the railways when there were serious and notorious abuses to be corrected; but it was left to a few to continue these criticisms after regulation and improved management had corrected the abuses in question. If it be said that these few are inspired by intelligence and worthy motives, may we not suggest that it is a remarkable coincidence that almost exactly the same men are following a course in regard to war measures which public opinion generally condemns as based upon ignorance, or bad motives, or both?

At any rate, the railways are now in a position to suggest to the public that it ought to love them for the enemies they have made. They are also in a position to suggest to the public that possibly those who are so far wrong in their attitude toward the war may also be wrong in their attitude toward the railways. Finally, the railways may congratu-

late themselves on the fact that, by men such as those mentioned taking the course they are regarding the war, a lot of their worst enemies are rapidly preparing themselves for political burial.

Meantime, does the public grasp the significance of the difference between the course of these anti-railway agitators and that of the railway managers? La Follette, Reed, Johnson and that crowd are doing, in their own ways, all they can to help the country lose the war, while the railway managers are doing in their own way all they can to help the country win the war. The nation should take note of this fact now so it will remember it when the war is over.

THE M., K. & T. REORGANIZATION

THE Missouri, Kansas & Texas is in the process of financial reorganization. It has been in the hands of C. E. Schaff, its former president, as receiver since September, 1915. As is almost inevitable in any reorganization of a bankrupt railroad property, wide differences of opinion have developed among the many conflicting interests that must be eventually brought together as to what principles should be pursued. Divergent opinions are not only natural, but salutary. Seldom, however, has there been presented so clearly a joining of issue on the fundamental principles which shall guide in a reorganization. One group of bankers is planning a reorganization in which just as little sacrifice is to be asked from holders of securities as is possible, and to speak plainly, funds are to be raised for setting the property on its feet secured by the hopes and prospects of the future development of the property. This principle has been carried out in a number of reorganizations in American railroad history and it is not to be denied that some of them, because of the very rapid growth of the country in the period between 1895 and 1906, proved successful. On the other hand, many have ended simply in another receivership. Under this theory, security holders have received face value of new securities equal to their old securities, plus assessments.

Another group of bankers proposes actually to cut down not only fixed charges, but face value of many classes of securities, to call on holders of the old securities to make considerable sacrifices and to base the fixed charges of the new company not on what may be hoped to be the net income available for interest, but on the lowest amount that will under even adverse circumstances be available for interest.

There would be very little difficulty experienced in choosing between these two fundamentally opposite theories of reorganization as a matter of abstract economics, but the processes of putting through a reorganization is a very practical matter of dealing with human nature. The same officers of life insurance companies who would consider only buying securities of a property which had been reorganized strictly on the second theory and would refuse absolutely to consider securities of a company reorganized on the first principle, will fight tooth and nail for a mild reorganization of a property of which they own securities. It is rather curious to see what dependence even intelligent men dealing with large sums of money constantly place on the face value of securities regardless of how great or how little is the value back of the securities issued. In the reorganization of the Missouri, Kansas & Texas the potential, or rather actual earning power of the property will be the same under either reorganization. The income available for interest will be neither greater nor less, if the property is soundly managed in both cases, with a large volume of securities outstanding or a small volume.

The danger lies, however, in the fact that the property will not be managed in the same way if a large volume of securities is issued as it will be if a small volume is issued, and it is this very fact probably which makes security holders so anxious to enter a reorganization only if the face value of their holdings is to remain untouched. Most railroad men

who have been in the game for a considerable number of years have had the bitter experience of working for a property which was being systematically undermined in the attempt to meet the interest on securities which did not actually reflect the real earning power. Poor service to the public always follow from conditions such as these. There have been instances where an entirely extravagant service has been rendered by a road headed toward bankruptcy in an effort to increase gross earnings, but the property itself, its organization, and in the long run its value to the community as a whole suffers greatly under such a stress.

The Missouri, Kansas & Texas in the calendar year 1916 earned \$36,734,000 gross, an increase over the previous year of 13 per cent, but spent in operating expenses \$29,440,000, or 27 per cent more than in the previous year and had available for interest \$5,433,000, or 23 per cent less than in 1915. This amount would have been \$1,135,000 short of the accrued interest on the outstanding securities.

Since the receivership there have been various reports made on the property by experts, among others one by J. W. Kendrick, formerly vice-president of the Atchison, Topeka & Santa Fe. Mr. Kendrick's report carries a weight of authority given it by his high reputation. The publication of this report was followed by a letter from C. E. Schaff to some of the bankers working on the reorganization, agreeing in a large part with Mr. Kendrick's comments, but differing in certain details, and most important of all, pointing out that the estimated income account for 1920 was based on a hope for the most favorable conditions of operation and earnings. Mr. Schaff estimated, even allowing for average good conditions, an income available for interest in 1920 of \$8,108,000 as against Mr. Kendrick's estimate of \$11,250,000.

A letter has now been made public which is dated May 3, 1917, written by Mr. Kendrick to Speyer & Company of New York, which is one of the New York firms of bankers interested in the reorganization. The letter is somewhat unfortunately written in a rather controversial spirit, but the purport of it is that the estimate of \$11,250,000 income available for interest in 1920 is conservative and the implication of it is that if this figure is not realized, it will be in large part the fault of the management itself. Into this question it is not our intention to go. It should, however, be pointed out that from the security holders' point of view and from the point of view of the public and from the standpoint of all those who desire to see the credit of American railroads raised from its present poor state, it is not so important to allocate the blame for failure in 1920 between hard luck, floods, bad crops, adverse legislation and unenterprising management, as it is to so reorganize the property now that if such failures do occur they will not result in disaster in 1920, or in a few years following that time. That is the point that ought to be kept clearly in mind and separated from the details of controversial matters. Mr. Kendrick may be entirely right in his estimates, but his estimates are based on the best that can be hoped for and the last two sentences in his letter to Speyer & Company drive home this point. He says: "Increasing rates are necessary to the continued efficiency of the railroads and are expected by everyone. This letter is written with the belief that this expectation will be realized."

Increased rates were not granted on an extensive scale to the western roads; neither can anyone foresee what effect the demands for steel for government purposes will have on the possibility of adequate maintenance; neither can anyone foresee what effect the termination of the war will have on the prosperity of the country as a whole. Here is squarely presented a case where enlightened self-interest, if it is far-sighted enough, would dictate that a reorganization of the Missouri, Kansas & Texas be made on a basis of interest charges that will be amply met even if unforeseen circumstances prove Mr. Kendrick 50 per cent too high in his estimate of income in 1920.

Letters to the Editor

PRESIDENT MARKHAM ON THE PROBABILITY AND DESIRABILITY OF GOVERNMENT OWNERSHIP

CHICAGO.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

I have read recently a newspaper interview given by President E. P. Ripley of the Atchison, Topeka & Santa Fe in which he expresses the opinion that "government ownership of railways in the United States is not only a possibility, but a high probability." He has expressed this opinion before.

Mr. Ripley occupies deservedly a very prominent place among the railway executives of this country. Therefore, if his utterances on this subject are allowed to pass without challenge from railway sources, they may be accepted by the public as expressing the views of railway executives. I do not think most railway executives agree with him on this matter. Certainly I do not. On the contrary, I think we are moving away from government ownership, and that recent developments, especially since the United States entered the war, have made its adoption less probable. Among my reasons for thinking this are the following:

First, it has been contended by advocates of government ownership that the government could raise enough capital to acquire the railways at 3 per cent, or even less, and that, therefore, a large saving could be made by substituting the credit of the government, as the owner of the railways, for that of private companies. Experience during the present war has answered this argument. Our government is paying 3½ per cent on the Liberty Loan bonds, which are tax free, and yet they are selling at slightly below par. It is understood that it will pay 4 per cent on the next large issue of bonds. The leading governments of Europe are paying 6 per cent and even more. Experience indicates that, conditions as to taxation and other matters being the same, the difference in the rate of interest on capital which a strong government and a strong railroad have to pay is not more than one-half of one per cent.

Second, it has been argued that the consolidation of the railways under government ownership would make it possible to effect large economies. One reason why our railways have not in the past effected all the economies possible has been that the government, through the Sherman anti-trust law and the anti-pooling section of the Act to Regulate Commerce, has prohibited them from curtailing wasteful competition. When we entered the war the prohibition against concerted action and unified operation ceased to be enforced and with the helpful co-operation of shippers the managements of the railways have since then made increases in efficiency that are remarkable. In 1916 they handled much more freight with each mile of line, each car and each locomotive than ever before; but they are at present far exceeding the record made in 1916. For example, in June, 1917, they handled 23 per cent more freight traffic with each mile of line, 21 per cent more with each freight locomotive, and 20 per cent more with each freight car than they did in June, 1916. These results show what the railways can do under private management when they are given a fair chance, and they undoubtedly surpass anything that could be accomplished by a consolidated government system with all of the red tape, waste and incompetency which ordinarily characterize government management.

Third, it was formerly argued that the railways ought to be acquired by the government so that in case of war they could be used with the greatest effectiveness for national de-

fense. The course followed by the railway managements, since the United States entered the present war, has resulted in our railways being made a more potent instrumentality of national defense than they probably would be if owned by the government. Within five days after the declaration of war, the railways had voluntarily organized themselves for doing their part, and the government has never expressed a wish with which they have not immediately and efficiently complied.

Fourth, when we entered the war the national debt was only about one billion dollars. It will soon be many billions. The railways represent an investment of approximately twenty billion dollars. The proposition that the government should acquire the railways when its debt was so small was very different from the proposition that it should add an indebtedness representing the cost of acquiring the railways to the huge debt that will result from the war.

It may be said that such facts as the foregoing are good reasons why this country should not adopt government ownership, but that they do not make its adoption any less probable. I believe, however, that the more intelligent part of the public is familiar with such facts; that it is quite feasible to make the public generally familiar with them; and that when the public generally does know them, it will see that they show that from the standpoint of the public welfare, government ownership is not only unnecessary but highly undesirable.

Recognition of the fact that, from the standpoint of the public, government ownership is undesirable will tend to cause the public to make regulation more reasonable and fair, and therefore to make government ownership more and more improbable.

C. H. MARKHAM,
President, Illinois Central Railroad.

DETERIORATION OF RAILWAY TRACK

AMARILLO, Texas.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

Your editorial of August 31, "Arrest the Deterioration of Railway Track," was certainly a proper warning. With 29 per cent increase in traffic there is only about nine per cent increase in expenditures for maintenance, which is more than accounted for by increases in wages.

Travelers on all busy lines notice that track is getting rough in spots, that roads heretofore noted for smooth riding are not up to standard. While none are noticeably bad as yet, they are losing ground and deterioration will soon be evident to passengers and later will tend to cause accidents, reduce capacity and cripple commerce.

This condition is due mainly to a shortage of labor. Material and money will not help without labor. The roads have increased wages, but trackmen are not available. National defense demands that track and equipment be maintained at a high standard, and under present conditions it will soon be necessary to draft men to work on track unless they can be obtained by importation or immigration. Congress, at the instigation of short-sighted sentimental theorists and vote-hungry politicians, who posed as labor protectionists, passed the Burnett bill which, after the warring European nations had taken all the foreign men who would return to their colors, drove out the Mexican trackmen who had been the salvation of southwestern railroads for ten years. Congress should repeal the illiteracy act during the present session.

All ranks of labor, whether skilled or common, all industries, as well as the cause of national defense, depend on the capacity and efficiency of the railroads. The press of the country should wake up Congress now, because the railroads and farmers of the United States need half a million men to produce and transport the necessities of life and support our army.

AVERY TURNER,
Vice-President, Panhandle and Santa Fe Railway.

General Arrangement of Camp Funston at Ft. Riley, Ken.

Railroad Efficiency at Army Encampments

Problems Arising Out of Transportation of Material,
Supplies and Men Met Successfully by the Roads

THE scope of the transportation problem resulting from the creation of large army camps throughout the country is indicated by the rapidity with which these military cities have been completed. Of the 16 cantonments constructed this summer to house the 687,000 soldiers selected for service by the draft, seven were ready to receive their entire quota of officers and enlisted men on September 5, seven others were ready to receive all the officers and two-thirds or more of their entire quota of enlisted men, and the two remaining cantonments had received and were taking care of more than their full quota of officers and were ready to receive the number of enlisted men originally ordered there on September 5.

In the construction of cantonments to date over 50,000 carloads of material have been transported to and delivered at the sites—an enormous tax upon the already overburdened railroad facilities of the country. The railroads, however, have given splendid service. As all government orders have received precedence over other traffic, the lumber and other supplies needed have been rushed to the cantonments in record time.

In the East where it has been impossible to secure sites except at a considerable distance from the railroads and labor markets, the roads have often been put to severe tests. At Camp Upton, L. I., it was necessary for the Long Island to take up rails from sidings to build the required spur tracks. At Camp Meade, Md., which is some distance from an electric road and not on any steam road, it was necessary to rebuild the electric road to make it of sufficient strength for steam transportation. In addition, the Pennsylvania has built a spur several miles in length into the cantonment site.

At Camp Grant, Rockford, Ill., it was necessary to construct 6.5 miles of side tracks in the camp and at Camp Funston, Ft. Riley, Kans., 13.5 miles. The site of Camp Dodge, 11 miles northwest of Des Moines, Iowa, is on an electric line which had 65 lb. rails and correspondingly light bridges. The latter had to be strengthened to carry small switch engines to facilitate the delivery of cars from the steam roads entering Des Moines.

In addition to serving the needs of the cantonments the railroads handled a heavy traffic to and from other encampments. The 21 regular army and national guard mobilization and training camps located in the 15 states comprising the Central War Department had 2,016 officers and 89,348 men in camp on September 5. During the ten preceding days 495 officers and 22,050 men arrived in camp, 252 officers and 12,764 men departed, and 850 carloads of materials and supplies arrived. In no instance in the handling of this traffic has there been any complaint about handling troops or freight.

In the aviation section of the Central department the camp at Mt. Clemens, Mich., received 2,329 cars of materials up to September 5; the camp at Dayton, Ohio, received 628 cars; and the camps at Rantoul, Ill., and Belleville, 1,075 cars and 1,341 cars respectively, making a total of 5,373 cars. In these instances, also, the roads met the situation efficiently and there was no delay in furnishing cars for material or delay of cars enroute.

The six cantonment camps located at Rockford, Ill.; Chillicothe, Ohio; Ft. Riley, Kans.; Battle Creek, Mich.; Louisville, Ky., and Camp Dodge, Iowa, received 11,104 cars of material up to September 5. In only one case was any complaint made as to transportation service and this was due to delays in the movement of cars from the South to Camp Custer, Mich. The matter was taken up with the general manager of the road concerned and the trouble remedied. In only two cases was there any delay in unloading, one of which occurred at Camp Custer where an accumulation of 30 cars of material for the hospital resulted when the track to the hospital site was graded. At Camp Taylor, Ky., 97 cars of lumber and 25 cars of other material were on hand at one time, but the accumulation was reduced to normal within the following two days. At Rockford, Ill., one car was recently reported delayed over 48 hours on account of refusal of the freight. At Ft. Riley no accumulation has been reported, and only a few cars have been held over three days.

These statistics bear out the statement that the railroads have succeeded admirably in their efforts to supply cars and to move them expeditiously. Camp Funston at Ft. Riley, Kans., which is a typical cantonment layout, consists of approximately 1,500 separate buildings. The camp has a complete system of water supply and sewerage disposal with more than 15 miles of piping, an electric lighting system with 250 street lamps and 20,000 incandescent lamps in the men's quarters; two fully equipped fire houses and a complete system of telephones. Each building is two stories high and houses a company of men. Every house is a complete unit, with sleeping quarters on the upper floor and a kitchen, mess hall and recreation room on the lower floor. There will be 13 heating plants, each having four 150 hp. engines and 9,106 radiators, which will require a total of 60 miles of wrought iron pipe. In addition to these large plants there will be 25 individual plants for heating officers' quarters in outlying buildings, and in such buildings as cannot be heated from these systems there will be 375 room heaters and stoves. On July 1, there was not a stick of lumber at Camp Funston. Three days later two office buildings of the Fuller Construction Company were completed and since that date 2,848 carloads of construction material have been delivered and over

General Arrangement of Camp Funston at Ft. Riley, Kan.

a thousand buildings constructed. At each cantonment up to September 1, it was necessary to complete on an average of one building per hour or, for all the cantonments, an average of one building every four minutes.

To serve this camp the Union Pacific is building a second track from Manhattan, Kans., to Junction City, a distance of 20 miles at a cost of \$1,000,000; and has already completed 13.5 miles of side tracks and running tracks to reach the various points on the reservation, new stations, freight houses, miscellaneous buildings and additional terminal and yard facilities at Junction City. The company is now handling one train of 23 coaches, carrying 1,800 laborers daily between Junction City and Camp Funston and one train of 13 coaches carrying 800 laborers between the camp and Manhattan. This latter train is expected to be increased to 20 cars and will carry 1,600 workers. The road has been compelled largely to increase its own working force and to build living quarters and restaurants for them. At the same time the company has had to mobilize passenger equipment to move 46,000 officers and enlisted men to the camp. In addition to serving Camp Funston, the Union Pacific has transported 10,000 regulars, including artillery, and the members of the officers' training camp in and out of Ft. Riley, which is adjacent.

The largest single item of construction material at Camp Funston has been lumber, which, up to September 1, had amounted to 42,000,000 ft. b. m. All the lumber for the construction of camp buildings was handled from Arkansas and Louisiana, the nails from DeKalb, Ill., the roofing paper from Minneapolis, Minn., the cement from Iola, Kans., the coal from the Missouri coal fields, the telegraph poles from Minnesota, the radiators and heating plants from Kewanee, Ill., the heating pipes from Pittsburgh, Pa., the sewer pipe from Deep Water, Mo., the machinery from Birmingham, Ala., the steel rails from Pueblo, Colo., and Joliet, Ill., and the ties from Arkansas and Louisiana. It is estimated that the average car miles of each carload of building material was 500 or a total for all freight moved of 1,500,000 car miles, approximately 50 times the distance around the world.

The following list of supplies and the amounts which the camp will require each month are as follows:

Potatoes	1,300,000 lb.	Lard	287,000 lb.
Beef	1,300,000 lb.	Butter	36,000 lb.
Flour	2,000,000 lb.	Oil	23,200 lb.
Mutton	200,000 lb.	Canned salmon	200,000 cans
Corned beef	300,000 lb.	Tomatoes	90,000 cans
Onions	375,000 lb.	Raspberry jam	36,192 cans
Prunes	53,400 lb.	Guinea	720 cans
Apples (dried)	17,800 lb.	Beans	106,900 cans
Peaches (dried)	17,800 lb.	Milk (condensed)	96,000 large cans
Coffee	99,800 lb.	Cornmeal	8,000 sacks
Sugar	320,000 lb.	Vinegar	9,000 gal.
Tea	1,900 lb.	Pickles	3,915 gal.
Pepper	3,400 lb.	Syrup	14,256 gal.
Salt	57,000 lb.		

The transportation demands of the camp have not ceased with the hauling of construction materials. The problem of moving men to and from the cantonment and delivering food, fuel and supplies will prove by no means simple. The quartermaster's department, after careful investigation, has estimated that the supplies for men and horses will require transportation for 35 lb. per capita per day. This will mean

approximately 1,600,000 lb. of supplies per day when the full quota is received. On the basis of 20 tons per car the supplies for the entire camp quota will necessitate 40 carloads per day. In addition about 500 tons of coal per day will be needed, calling for 10 more carloads.

WASHINGTON CORRESPONDENCE

WASHINGTON, D. C., September 11, 1917.

EFFECT OF WAR REVENUE BILL ON RAILWAYS

The war revenue bill, estimated to raise \$2,400,000,000 in taxes for the fiscal year ending June 30, 1918, as passed by the Senate on September 10 is more lenient with the railways in some respects than in the form in which it was reported to the Senate by the finance committee, although some roads will be hit rather hard. It is impossible to make any reasonable estimate of its effect on the roads as a whole without an application of its provisions to an analysis of the finances of each company.

All roads are affected by the increase in the income tax on corporations from 2 per cent, as provided in the present law, and from 4 per cent in the bill as reported by the committee, to 6 per cent in the bill as it was passed and sent to conference with the House. However, changes made by the Senate in the war profits tax tend to relieve a number of roads that would have been penalized, under the bill as originally proposed by the committee, for their sub-normal earnings during the pre-war period of the years 1911, 1912 and 1913.

Railroads generally would have escaped the excess profits tax as passed by the House, based on the excess over 8 per cent, but in the Senate bill the war profits tax is based on the excess of net income in the taxable year above that for the pre-war period with an exemption of at least 6 per cent but not more than 10 per cent. The rates of taxation are in a graduated scale ranging from 12 to 60 per cent of a graduated scale of percentages, ranging from 15 to 300 per cent of the difference between the pre-war income and the "war profits." The "capital," on which the exemptions are figured, as defined in the bill, does not include money or other property borrowed, nor stocks, bonds, or other assets, the income from which is not subject to the war profits tax, but includes the "actual cash paid in," the "actual cash value of property paid in other than cash for stocks and shares," and "paid in or earned surplus and undivided profits used or employed in the business." Therefore the capital on which the 6 to 10 per cent exemption is allowed is not the same as the capitalization of a road as ordinarily understood and roads which have a large proportion of their capitalization in stocks will be allowed a greater exemption than roads which have a large part of their capitalization represented by bonds.

The bill also includes a tax of 10 per cent upon the amount of net income remaining undistributed six months after the close of the year, but an exemption is allowed as to that portion of the surplus "actually invested and employed in the business or retained for employment in the reasonable

requirements of the business." It is provided, however, that if the Secretary of the Treasury finds that any portion of the surplus so retained is not reasonably required in the business a tax of 15 per cent may be levied upon it. All provisions in the bill providing for an increase in second-class mail rates were stricken out in the final vote. The bill does include a tax of 3 per cent on freight bills, to be paid by the shipper, including motor truck shipments, a tax of 1 cent for each 25 cents paid for express or parcel post shipments, and a tax of 5 per cent on passenger and sleeping car tickets.

COAL SHIPMENTS

Almost everyone in Washington having anything to do with the matter has recently been deluged with complaints of actual or threatened shortage of coal. These have received the attention of the Interstate Commerce Commission, the Commission on Car Service, the Priority Director, the Committee on Coal Production and the Fuel Administration, and in many cases the Commission on Car Service has been able to give relief by directing shipments of coal to places where it was most needed. One source of criticism has been the efforts to comply with Priority Order No. 1, directing that preference be given to coal shipments for transportation across the lakes to the Northwest. As a result of the efforts to comply with this order and to ship a little over 1,000,000 tons a week to the Northwest during the season of navigation many communities have complained that they have been discriminated against and that coal has been taken away from a community where it was needed. Meanwhile the Northwest began to complain that it was receiving a lot of slack coal which it did not want. As a result the Commission on Car Service has notified the railroads affected by Priority Order No. 1 to suspend the shipment of slack coal across the lakes. This, it is believed, will give relief to the communities where that kind of coal is needed for manufacturing and public utilities, without requiring any modification of the priority order.

Numerous requests have been addressed to the priority director for preference as to particular shipments. It is not the intention, however, to issue priority orders except in cases of broad, general importance and in any event such orders can be issued only to the railroads; individual shipments cannot be ordered to ship according to directions.

Meanwhile the fuel administrator, H. A. Garfield, is working out plans for an apportionment of the coal supply and to regulate the retail sale of coal. The fuel administrator is to choose a representative in each state and also local committees of citizens who, with the representative, will assume direction of the regulation and sale of coal in each state. Committees will also be appointed in each county and each city of over 2,500 population. The state committees will at once ascertain the amount of coal in the state available for use during the coming winter and the amount needed to meet any deficiency in the supply, based on last year's consumption. A large proportion of the coal supply available is under contracts made prior to the President's proclamation fixing the prices, and the contracts are being allowed to stand for the present but it is the intention to see that a sufficient amount is put on the market to meet the needs of domestic consumers.

Mr. Garfield has issued a statement saying that although there is a shortage of cars and of labor, by co-operation between Judge Lovett of the priority board, the Interstate Commerce Commission, and others vested with powers over transportation, cars can be had, and that he himself has power to apportion and distribute the coal.

BILL FOR GOVERNMENT PURCHASE OF CARS

Representative Bland of Indiana thinks that in order to improve the transportation system the government ought to appropriate \$100,000,000 for the purchase of freight cars

for the railroads. He has introduced a bill, H. R. 5919, for that purpose and made a speech in support of it in the House on September 8. The bill provides:

"That the President of the United States is hereby authorized to expend \$100,000,000 out of the sums heretofore or hereafter appropriated for ships, or, in his discretion, out of any money in the treasury not otherwise appropriated, for the construction or acquirement of freight cars to be used in the transportation by the railroad companies of the United States of coal and other products and commodities, pursuant to the provisions of the act entitled 'An act to amend the act to regulate commerce, as amended, and for other purposes,' approved August 10, 1917; and in the execution of this authority for the acquirement and construction of said cars the President may exercise all the powers heretofore conferred upon him by law with reference to ships. The President may direct the Interstate Commerce Commission to exercise the power hereby vested in him, or he may designate such other person or persons as he sees fit to exercise said power and authority, subject to his approval; and the cars so acquired or constructed shall be used by the railroad companies under such terms and for such compensation as may be approved by the President, and, as far as possible, under agreements providing for the purchase of such cars by the railroad companies receiving them. The President shall cause to be made public monthly information as to the number of cars acquired and constructed, the names of contractors and the terms of contracts, and the disposition of the cars; and he shall submit a detailed report to Congress at its next regular session of each and all operations and expenditures pursuant to this act."

In his speech Representative Bland said there are nine shops of consequence turning out freight cars in this country, that their capacity is about 300,000 cars a year and that at present they are turning out probably a little less than 150,000 cars a year. He thought that, for \$100,000,000, 65,000 cars could be procured and quoted a letter from the president of "one of our large railroads" suggesting that the government undertake to purchase equipment bonds from the railroads, allowing the roads themselves to make the purchase of the equipment and giving the government some control over it until the debt is paid off.

MOBILIZATION OF THE NATIONAL ARMY

The transportation of the first five per cent of the 687,000 men drafted into the National Army, from their local concentration points to the cantonment training camps, was accomplished last week without difficulty, as it involved only about 30,000 men, without their equipment. A somewhat bigger problem will be presented by the movement of the second increment of 40 per cent on September 19 and the remainder early in October, but as these men are moving from over 4,000 local points they are divided among many roads. The movement of the National Guard from their states to the 16 National Guard camps, which is now under way, requires the handling of their tents and equipment, amounting to about 12,000 freight car loads in addition to the coaches and tourist sleepers.

In the construction of the cantonments to date over 50,000 carloads of material have been transported to and delivered at the sites—a considerable tax upon the already overburdened railroad facilities of the country. The railroads, however, have given splendid service. All government orders have been given precedence and lumber and other supplies have been rushed to cantonments in record time.

In addition to the cantonment camps work has been started on the construction of two large seaboard concentration camps, each to be capable of accommodating approximately 20,000 men and consisting of 800 to 1,000 buildings. One of these is at Tenafly, N. J., in the New York harbor district and one at Newport News, on Hampton Roads.

The Large Trusses Completed

Another Large Railroad Bridge Completed

Bold Design, Involving Longest Riveted Trusses in America, Used by Chesapeake & Ohio at Sciotoville

ON July 31, the Chesapeake & Ohio commenced running trains over the new Ohio river bridge at Sciotoville, Ohio, thereby marking the completion of a structure that is distinctive because of the boldness of the design and the novelty of the erection methods which this design demanded. The river is crossed by two spans of 775 ft. each, but the superstructure of the bridge is continuous over the middle pier, thus forming one full riveted structure for the entire distance of 1,500 ft. between the end piers. This required the longest and heaviest fully riveted trusses in America. The bridge forms a most important feature of the Chesapeake & Ohio Northern, a 32-mile line extending north from Edgington, Ky., on the main line of the Chesapeake & Ohio to Waverly, Ohio. A de-

side, while at high water the river traffic shifts over to the Ohio side. These circumstances made it necessary to have two large openings for river navigation which were fixed by the war department at 750 ft. clear width, necessitating two spans of 775 ft. between centers of piers. A comparison of various designs, consisting of successive simple spans, cantilever trusses and continuous trusses, showed a decided economy for the design adopted, with the further advantage of symmetrical appearance.

The concrete piers rest on solid rock, which was encountered about 10 ft. below the mean low water level at the middle of the river. The foundation work was, therefore, relatively easy and security against settlement is assured so definitely as to eliminate positively the objection which is

Diagram of the Trusses and Falsework

scription of this line and the reasons for its construction as a link in the route of the Chesapeake & Ohio from the coal fields of West Virginia to the Great Lakes, was given in an article in the *Railway Age Gazette* of March 3, 1916, page 397.

In addition to the river spans the bridge includes two approach viaducts, 823 ft. and 1,065 ft. long on the Ohio and Kentucky sides respectively, the former on a tangent and the latter on a 1-deg. 15-min. curve. The total length of the bridge and viaduct approaches is 3,436 ft. The viaducts consist of deck plate girder spans 67½ to 110 ft. in length, with a 152½-ft. deck truss span at each end of the bridge proper. The two river spans are complete for double track, but the steel work in the viaducts provides for single track only, although the substructure provides for the future addition of a second track.

At the site of the bridge there is a short curve in the river and at low water the channel is near the inner or Kentucky

commonly advanced against spans continuous over more than two supports.

The principal dimensions of the river crossing are as follows:

Total length, center to center of end piers.....	1,550 ft.
Length of span, center to center of piers.....	775 ft.
Clear height above low water.....	106½ ft.
Clear height above high water.....	40 ft.
Height of trusses at center pier.....	120 ft. 2 in.
Height of trusses at ends.....	77 ft. 6 in.
Width between centers of trusses.....	38 ft. 9 in.
Length of panels.....	38 ft. 9 in.

The design and details were worked out with a view to obtaining a strong, rigid structure which would meet the demands of the heaviest immediate and future traffic. The live load assumed in the design was Cooper's E-60 on each track with unit stresses that make the structure adequate for a much higher loading.

The total weight of steel in the entire structure is about 15,000 tons of which the river bridge contains 13,200 tons.

The great economy of the design, derived from the choice of continuous trusses may be judged from the fact that if the usual specifications and an independent truss system had been used, which had been the nearest in economy for the two spans of 775 ft. each, the weight of the steel would have been greater by 4,500 tons. Thus a saving of about \$400,000 was effected by getting away from routine practice.

The material is open hearth structural steel having an ultimate strength of 62,000 to 70,000 lb. per sq. in. Alloy steels at the current prices showed no economy over the carbon structural steel.

The top and bottom chord members are of a double I section, covered with a plate on top and having channel lacing on the bottom. The heaviest member was 4 ft. by 4½ ft. by 77½ ft. long, with a gross section of 596 sq. in. and weighed 114 tons. The main diagonals are also of a double I section, laced on both sides with 10-in. channels. The main center diagonals over the center pier are solid box sections, 4 ft. by 4½ ft., with a sectional area of 511 sq. in. A piece 75 ft. long weighed 83 tons. The heaviest casting weighed 22½ tons. The largest rivets were 1½

nary floor beams would not have been as rigid and would have weighed considerably more. One of the photographs shows the lower portions of one of these floor beams in the storage yard at the site of the bridge. An idea of the size is given by the two men standing in front of it. The upper portions or legs of the U were built integral with the vertical members of the trusses.

Solid plate girder portals were provided in the planes of the inclined posts at each end of the bridge and over the middle pier. Deep lattice girders were used for the trans-

Floor Beams in the Material Yard

verse bracing instead of the diagonal sway bracing ordinarily employed. One of the photographs shows the heavy portals over the center pier clearly. It also shows the upper portions of one of the U floor beams and the field splices by which they were connected to the lower part of the floor beam.

Another detail is the provision for a truss in the plane of the bottom lateral bracing to transmit the longitudinal

Heavy Portal Frames on Diagonals Over Middle Pier

in. in diameter with a grip of 7¾ in. A number of maximum-sized gusset plates were used, among the largest of which were some 15½ in. by 130 in. by 15 ft. 6 in. and others 13/16 in. by 138 in. by 17 ft. 6 in.

As most chord and web members are subjected to both tension and compression, it was decided to make them stiff throughout. All connections are riveted. No saving could have been effected by the use of eye-bars for the few members taking tension only. Pin connections were thus avoided and for members subject to a reversal of stress, riveted connections secure the greatest possible rigidity. All joints of members, whether in tension or compression, were fully spliced. The center bearing of each truss on the center pier carries a dead load of nearly 5,000 tons and a live load of 3,000 tons.

UNIQUE DETAILS OF THE DESIGN

A number of details of the design are unique and were adopted primarily to increase the rigidity of the structure. The floor beams consist of continuous U-frames, the vertical portions of which extend up to the bottom of the sway-bracing. On account of the shallow depth available, ordi-

The Falsework Did Not Obstruct the Flow

forces from traction and braking directly to the trusses without bending the floor beams. No expansion joints are provided in the floor system.

INGENIOUS ERECTION PLAN

The Ohio span of the bridge was erected on falsework, while the Kentucky span which had to be maintained open

for river traffic was erected by cantilevering out from the middle pier. However, to avoid provision in the design for the cantilevering of the entire distance, temporary steel bents on concrete pedestals were provided in the channel on the Kentucky side at panel points 8 and 4 as shown in the diagram. In general the erection plan was such as to secure at least a certain measure of balance over the center pier between the two halves of the bridge and thus relieve

Commencing the Erection of Trusses on the Ohio Side with the Gantry

the falsework of a large part of the dead weight of the bridge.

The falsework was unusual in character. At the main triangle points, L-4, L-8, L-12 and L-16 on the Ohio side, the trusses were supported on steel columns 100 ft. high, resting on concrete pedestals similar to the two intermediate supports provided on the Kentucky side. The bents formed by these columns were enclosed by towers consisting of two frame bents of 29 posts each, supported on the river bot-

tom, leaving only the steel posts under the main triangle points. As shown in one of the photographs this type of falsework offers a minimum obstruction to the stream flow.

As stated previously the approaches to the bridge are equipped with a superstructure for single track only, but to facilitate the handling of the erection equipment on both tracks of the main structure the 152½-ft. deck truss span for the Kentucky side was first erected temporarily along side the duplicate span for the Ohio side. This afforded a double track directly over the material yard, which was located alongside the main line of the Norfolk & Western on the Ohio bank of the river. The transfer of materials from the yard to the bridge deck was aided materially by this arrangement and was accomplished by a stiff leg derrick set on a steel tower, located alongside of the yard tracks.

Three types of erection equipment were used in assembling the spans. The falsework girders, floor system, bottom chords and the lower sections of the vertical posts on the Ohio side were erected by a bridge derrick car. The trusses were completed in this span by a steel gantry 160 ft. high standing astride of the structure on tracks provided for it on the falsework outside of the trusses. This same gantry had been used previously by the contractor to erect the inverted bow-string trusses of the Little Hell Gate spans on the New York Connecting Railway. For the cantilever erection of the Kentucky span, a creeper traveler which moved on the top chords of the structure was used.

ERECTION INVOLVED HEAVY JACKING OPERATIONS

The erection of the trusses on the Ohio and Kentucky sides proceeded simultaneously towards the two ends of the structure, the progress on the Ohio side being sufficiently in advance of that on the Kentucky side to maintain an adequate condition of overbalance toward the side supported on falsework.

In consequence of the condition of cantilever over the center pier, the ends of the partly-erected trusses deflected downward below the normal position of the completed structure. As the steel work on the Ohio side was completed as far as each of the steel falsework bents in turn, powerful jacks at the tops of these bents were used to lift the trusses and thereby partially correct this deflection. This

Ohio Span Completed, Kentucky Span Advanced by the Creeper Traveler While Carried on Two Temporary Bents

tom. These towers and similar ones at the intermediate panel points half way between them served as temporary supports for the deck girder spans ordered for the viaduct approaches. These girder spans served to carry the bridge floor and the track for the erection equipment. They also supported the bottom chords of the trusses until the latter were assembled, but as soon as the trusses on the Ohio side were completed the girders and timber falsework were re-

moved, leaving only the steel posts under the main triangle points. As shown in one of the photographs this type of falsework offers a minimum obstruction to the stream flow. When the trusses were completed to the Ohio side, the end bearings were about 8 in. low and upon jacking these up sufficiently to place the 16-in. roller bearings, the load was

released entirely from the falsework in the Ohio channel.

Similarly when the erection on the Kentucky side had progressed to the two intermediate supports and finally to the Kentucky pier, jacks were used in turn to reduce the deflections and take portions of the load at those points. The end of the span on the Kentucky side was about 16 in. low and required a jacking load of about 2,340,000 lb. to lift the span the required amount. The jacking loads on the intermediate supports varied from 400,000 lb. to 1,926,000 lb.

Because of the rigid gusset plate connections, secondary stresses received special investigation in the design, but one of the most interesting features of the erection was the means taken to reduce the secondary stresses arising from the distortion of the riveted joints through deflection under load. To overcome this the members were laid out to fit the true shape of the trusses as deflected under their own weight and one-half of the assumed live load so that each member would then be in a straight line condition. Because of this no joint could be assembled under the erection conditions without forcing the member into its proper position. In some cases this was accomplished by a line from

Creeper Traveler Standing on the Completed Kentucky Span

the erection equipment; in others special jacking rigs were necessary. The workmanship was excellent, the connections came together accurately and true without delay and to this may be ascribed the fact that no mishap of any kind took place during the progress of the work.

The location and construction of the Chesapeake & Ohio Northern including the Ohio river bridge were under the general supervision of M. J. Caples, vice-president of the Chesapeake & Ohio. The design and detail plans of the bridge and approaches were worked out by Gustav Lindenthal, consulting engineer, New York City, who also was in charge of the execution of the work. The substructure was built by the Dravo Contracting Company of Pittsburgh and the fabrication and erection of the steel superstructure by the McClintick Marshall Construction Company, also of Pittsburgh. The work on the foundation was started in November, 1914, and the bridge was completed and opened to traffic on July 31, 1917.

THE INFLUENCE OF HYDRATED LIME

A little over a year ago when the structures on the new Indianapolis & Frankfort Railroad extending from Ber Davis to Frankfort, Ind., were being designed by the Vandalia, the value of hydrated lime as an ingredient in the concrete was seriously considered with respect to its effect in producing greater plasticity and freedom of flow. It was decided to give it a thorough trial to demonstrate its effectiveness and economy. Over the entire distance of the new road, 41 miles, there is a total of 42 bridges of various types, each containing from 300 to 1,500 cu. yd. of concrete. The contractors, Dunn & McCarthy Company, Chicago, up to this time had placed all of the concrete by means of a tower. It is interesting to note here that about ten of the bridges are located at public highways when a good supply of water could not be obtained except at considerable expense.

The quantity of hydrated lime specified to be used was 10 per cent by weight of the cement content for each batch of concrete. To make the method of incorporating it as convenient as possible a box about 3 ft. square and 2 ft. 6 in. deep was kept alongside the mixer with sufficient hydrate in the box to meet immediate needs. As the proportions of cement, sand and gravel for a three-bag batch were placed in the loading hopper, two 12-qt. pailfuls of lime were placed in the hopper on top of the dry materials. This mixture was then emptied into the mixing drum and mixed in the usual manner.

The first fact noticeable from the use of hydrated lime was that the mixture flowed much more freely through the chutes, and this was accomplished with the use of considerably less water than is ordinarily required. In view of the present agitation to avoid an excess of water in concrete, the fact that the use of lime made it possible to reduce the quantity of water was recognized as a factor that would tend to increase the strength of the concrete.

The next noticeable effect was after the concrete mixture had been deposited in the forms. The increased plasticity which has been introduced into the mixture by the lime with less water was found to permit the concrete to be placed properly with a less amount of spading than that ordinarily required. Some of the flat top subways had complicated skew spans with corners that it was impossible to reach with a spade. The lime proved very successful in such places, as can be seen by the hardened concrete, preventing honeycombing and producing a smooth, uniform surface. The easier working of the concrete also resulted in a saving of about 50 per cent in the spading. The labor saved in cases where it was necessary to move the concrete some distance in the forms from the place where it had been deposited amounted to about 40 per cent.

Another noticeable effect of the lime was apparent upon removing the forms when it was found that it had been effective in eliminating segregation as was seen by the appearance of the surface, which was smooth and even and in which honeycombs and stone pockets were conspicuous by their absence. No extra labor after removing the forms was necessary for patching. The results where watertight concrete was desired have also been satisfactory.

At the time of beginning this construction an order for 280 tons of hydrated lime was placed to be shipped as desired by the engineer in charge. After noticing the effect on the chuting and spading of the concrete, the lesser amount of water required, the labor saved, and the appearance of the finished concrete, it was decided to use lime in other parts of the structures where it had not been specified originally, involving an additional purchase of 300 tons. It is stated that the cost of the 580 tons of hydrated lime used has been largely compensated by the labor saved. The work was under the direction of F. T. Hatch, chief engineer, and H. T. Whitney, engineer in charge.

Practical Ways of Increasing Train Loading*

Several Railway Men Point Out Simple Methods by Which the Economy of Operation May be Promoted

IN view of the increasing importance of the subject of train loading at the present time the articles which follow, which were received in the contest on Increasing the Train Load, are of particular interest. Fortunately the ability to increase the train load is not dependent solely on large expenditures for the reduction of grades and for the installation of more powerful locomotives, for some of the greatest improvements in this respect have been made without these expenditures, but primarily by the exercise of increased supervision and the adoption of simple methods within the reach of every railway.

MAKE THE DESPATCHER RESPONSIBLE

By T. H. Williams

Division Superintendent, Southern Pacific, Oakland Pier, Cal.

The train loading problem should be assigned to the chief despatcher, because he directs the movement of the crews and power, and owing to his knowledge of the schedules he is in a better position than any other officer on the division to know the tonnage that can be moved successfully and still maintain train schedules on various assigned and extra trains. In laying out a campaign of train loading all staff officers on each division should be made to understand that this work will be directed by the chief despatcher and that it is necessary that he be given the co-operation and assistance of the staff in order to accomplish the desired results. Where the responsibility is not placed upon the shoulders of the chief despatcher, but it divided among several officers, a situation is created which in the end will mean the disorganization of schedules.

On a heavy operating division where a large volume of carload traffic originates and particularly in territory where there is keen competition, it is necessary for all officers, both mechanical and operating, to give this subject daily attention in order to produce results. A system of statements is necessary in order that each officer may know the following day, and at the end of each week, the number of through trains moved in the direction of the preponderance of business, and the average tons hauled per engine. These statements may be obtained from the train sheets readily. On this division this is placed before each officer in the following form:

MOVEMENT OF THROUGH TRAINS AND CARS, FEBRUARY 28, 1917 (WESTWARD)

Between—	Trains	Loads	Empties	Average tons
Oakland and Sacramento	1	44	8	2,195
Oakland and Tracy (via Martinez) ..	2	76	26	2,070
Oakland and San Jose	1	40	8	2,003
Redwood and Tracy	5	194	7	1,775
Redwood and Oakland	3	72	92	1,700
Oakland and Port Costa	1	45	3	2,342
Total	13	471	144	2,181

In addition to the daily record this information is kept by the chief despatcher in book form; it requires very little time on the part of the despatcher or his forces to take it from the train sheets. By posting on the first of each month the record by days made during the previous year we are able to know our standing from day to day as compared with last year. This company furnishes its officers promptly adequate statistics to show train and engine loading, and train and car miles, but the operating officer should not wait for the auditor's figures to enable him to analyze the results. The daily and weekly statements as kept by the chief despatcher are found to harmonize and compare with the auditor's reports, as the auditor's reports are taken from the conductors' wheel reports, and the tonnage on the train sheets

is wired in the consist of the trains by the conductor to the chief despatcher, therefore we have an absolute check on the amount of tonnage handled.

On a large system, where there are many divisions involved, it is the writer's opinion that the divisions should be ranked in statement form according to the increases or decreases in engine load, and that this should be sent to the division superintendents each month, ranking the divisions in the order in which they stand, according to the percentage of their increase this year over last. This will necessarily produce a spirit of rivalry among the various divisions involved.

The following statement gives a reflection of the results that can be obtained in decreasing the train and locomotive miles by increasing the engine load, and in view of the fact that train and engine men are paid principally on a mileage basis, the decrease in mileage in the face of an increase in business, necessarily means greater net revenue. Train and engine loading accomplished, however, through tying up crews short of destination because of the sixteen-hour law, through the use of a large number of relief crews, and through the payment of excessive overtime, is not producing the results that increasing the train load should accomplish:

STATEMENT OF GROSS TONS MOVED ONE MILE ON THE MAIN LINE (THOUSANDS), IN THE DIRECTION OF THE PREPONDERANCE OF BUSINESS; AVERAGE ENGINE LOAD: TRAIN AND LOCOMOTIVE MILES—FOR SIX MONTH PERIOD, JULY TO DECEMBER, 1916, WITH COMPARISON FOR THE SAME PERIOD OF 1915

Month—	Gross tons one mile (Thousands)		Average tons per locomotive		Train miles		Locomotive miles	
	1916	1915	1916	1915	1916	1915	1916	1915

Incr. or Dec.	24,660				9,381		4,832	
Per cent Incr. or Dec.	9.5				4.6		2.0	

An increase of 9½ per cent in gross tons moved was accomplished with a decrease of 14,213 train and engine miles, by reason of the increase of 131 tons per locomotive.

For traffic reasons, pressure is often brought to bear to install additional train service, and in many cases this demand is for fast service that means light trains in order to accomplish an "on time" record. These demands are usually made to afford a quicker despatch of the freight involved, making earlier delivery in various cities, which business prior to the installation of the fast service was moving on regular trains. In the end this serves to increase train and engine mileage and is a material factor in decreasing the average train load. Demands of this character are discouraging features which operating officers meet in their endeavor to increase the train load. It is admitted, however, that requests for additional service are frequently far-reaching. It may mean the controlling of a large volume of through business that might be divided or thrown to the rails of a competitor.

"BUY A CARLOAD"

By E. H. Shaughnessy

Trainmaster, Chicago & North Western, Chicago, Ill.

There is one way to increase the train load without spending a lot of money for grade reduction, larger locomotives and increased facilities, all of which are a part of every railroad's future plans. That is, to increase the load in the car. Locomotives are (or should be) rated to haul tonnage based on the maximum theoretical tractive force. If it were pos-

*Other papers received in this contest were published in the issues of June 22, page 1401; July 13, page 63; August 3, page 201; and August 24, page 347.

sible to put the designated tonnage in one car, the efficiency of the locomotive could be fully utilized the year 'round in hauling real tonnage and a trifle less than 100 per cent utility obtained. The necessity for spreading the lading among a number of cars brings into play the factors of atmospheric resistance, wheel friction, slack action, etc., which do not decrease the efficiency of the locomotive in itself but waste it so that the utility is materially decreased.

The necessity for heavily loaded cars is therefore of the greatest importance, so that trains can be shortened in length without loss of tonnage. Especially is this true on most railroads where the practice is to run mixed trains of loads and empties, governed by more or less scientifically compiled, equated tonnage ratings, which automatically reduce the actual tonnage hauled as the length of the train is increased.

To those who have in any way analyzed the loading of freight it must be apparent that the railroads do not get anywhere near the capacity (meaning 10 per cent or 15 per cent above the marked capacity) in the cars loaded. This is notoriously true in connection with closed cars loaded with manufactured commodities which are so bulky that it is not possible to load to capacity, and surprisingly so in connection with both closed and open cars loaded with commodities wherein it is possible to load to capacity, but which are not so loaded.

It follows, therefore, that without additional expense and without waiting for much needed improvements, the trainload can be increased if the carload is increased. In my opinion the best angle of approach in solving the problem is through the buyer of the commodities. Much can be done with the shipper and a great deal has already been done. In fact it would seem that the efforts put forth to increase the carload have been directed almost exclusively toward the man who loads the cars, whereas the fellow who unloads them holds the key to the situation.

In every village there are one or more merchants who buy coal, coke, brick, lumber, tile, sand, gravel, etc., in sufficiently large quantities so that a car is used in filling the order, and these orders are repeated from time to time depending on the amount of business done. Investigation will show that a very large number of these merchants order a specific quantity of each of the different articles sold by them. When queried as to why this method is followed, the merchant generally has no very good reason to offer. Sometimes the question of storage room enters into it, but as a rule it is simply a habit formed years ago when the cars were smaller, and the situation relating to cars entirely different.

Bearing in mind that these car-at-a-time merchants handle the bulk of the real revenue producing business on most railroads, the thing to do is to get them to "BUY A CARLOAD." That should be the slogan for every railway department from top to bottom. What shipper can consistently refrain from loading a car to its full capacity in space or weight, if he has orders to that effect from the people who are buying his materials?

Good results can be obtained right from the start in a "BUY A CARLOAD" campaign even on a single division. The increase in the train load on that particular division may not be noticeable to the eye, but it is there nevertheless. If this item were given the attention it really deserves on all divisions of all railroads along the lines suggested, a very decided step toward increasing the train load would have been taken without costing a cent.

It is simply a matter of education. The small town merchant is easily approached, deeply interested in railroad problems (more so than is generally thought to be the case), and if appealed to tactfully, co-operative in the greatest degree. All that is necessary is to enthrone him with the railroad viewpoint and he will "BUY A CARLOAD" every time, and

the rest is easy. Any good operating man can increase the train load if he has the increased carloads to do it with.

BETTER STATISTICS NEEDED

By Mark H. Reasoner

American railroad men, and especially those in charge of operating trains, have in late years been divided by a distinct line of cleavage into two groups; they are either low tonnage or high tonnage men and they have been encouraged by the tendency of the higher officers to endorse one or the other of these policies. By far the greater number have believed in high tonnage, so much so that it has become an established practice upon the majority of roads.

Probably most large terminals are inefficiently operated because of the lack of the information and supervision which form the essence of operation; with such an organization a complete scheme of classification may be worked so that properly loaded cars may be selected and switched into trains for preference destinations and thus handled with decreased cost and increased efficiency.

A trainmaster should devote a large share of his time to watching the handling of tonnage trains. Trainmasters too often fall into the habit of attending to matters which do not concern them, instead of those duties which rightfully should claim their attention. A trainmaster should be what his title implies, a master of trains.

The fact that the greatest difficulty of our present system of operating statistics is that they generally become ancient history and records of past performances so old that they are useless for practical purposes of operation has been one of the greatest hindrances to operating men. The imperative need for a statistical system which will give a prompt, accurate and comprehensive history of each operating division is apparent. Proper, prompt, intelligent and adequate supervision is only possible through these channels and they should present knowledge of conditions which any management can act upon with a reasonable degree of promptness.

Such statistics should take form in performance statements concerning main line movements and it is important that the proper relation between the value of the locomotive and the tonnage which it hauls be maintained and made a matter of daily inspection by the operating officer in charge. Such reports can be compiled readily in the transportation offices and finally completed by the statistical divisions in time to be of practical value. Roads using the Hollerith system of assembling statistics are in an especially fortunate position as regards speedy delivery of such figures. These figures should be based primarily on the expenses of road engineers, trainmen and fuel in freight service only and should be separated as between tonnage and way freights. This will, of course, reduce matters to the common denominator of railway cost, the ton mile.

THE MECHANICAL DEPARTMENT A FACTOR IN TRAIN LOADING

By T. T. Ryan

Division Foreman, Atchison, Topeka & Santa Fe, Las Vegas, N. M.

The principal thing that operating officers can do to increase tonnage on single track roads is to so despatch that the freight trains will have the open door and then keep them moving. Engines and cars with bearings warmed up and lubricated will run free and pull easily, while if the same equipment is run in and out of a dozen side tracks over the division it will pull vastly harder and the cost of operation will increase. Also by their tact and methods of approach operating officers can create an esprit de corps that will automatically increase tonnage. The chief factor in increasing tonnage does not lie with the trainmaster, but with the master mechanic; we can trust the trainmaster to "hang 'em on" if

we are ready to "pull 'em." There are many ways to increase the efficiency of the engines. The boilers should be kept scrupulously clean and free from scale. The effect of dirty boilers and the action of scale as a non-conductor should be explained to the men. Next see that fireboxes, flues and front ends are kept free from leaks so that the draft will be unimpeded. This seems like unnecessary advice, but an examination of the 70,000 engines in the United States will disclose that it is needed.

If these things are done we will have free steaming engines. This in turn means that an engineer knows when he gets the "gate open" he can go; you cannot expect an engineer to watch a falling pointer and at the same time try to handle tonnage. The good effect of these features will be largely minimized if coal is not properly selected and sized, for there are few things more discouraging to engineers than poor coal and to shop men than engines which do not steam owing to irregularity in the quality of coal. Both are expensive to the railway.

If these and the minor things about the engines are done and done well when they should be, the engines in their turn will pull the maximum rating and do it every day. Then if the despatcher will use the zeal he should in getting men over the road and encourage them to make a good run instead of a poor run we will increase our tonnage 20 per cent without a dollar of capital outlay.

This does not, however, mean that we should not modernize old engines. First in this line come brick arches. The application of arches to all the old power would mean the equivalent of 4,000 engines added. The application of superheaters to engines not yet superheated means the equivalent of 20,000 more engines.

Did we ever hear the best engineer on our territory say the train he had last trip pulled like two trains and he could not get it going? What was the reason? Friction of course, caused by brakes sticking owing to foundation gear binding, too little shoe clearance, and dry bearings with improper area. What is the remedy? Inspect the gear and know it is right and kept so. Inspectors are supposed to get cars through the terminals with a test of about a minute per car; they get them through all right, but the road pays for it in loss of tons and in excess of coal consumption and overtime. The remedy is to see that the car is right from point of origin to destination.

LOADING CARS INTELLIGENTLY

By H. F. Reddig

Division Superintendent, Chicago, Rock Island & Pacific,
El Reno, Okla.

To increase the revenue tons per freight train mile where no reduction is to be made in the grade line or in the increased capacity of motive power or equipment it is necessary either to increase the gross tons handled per train or the net tons by decreasing the number of tons of tare weight hauled per train mile. On most railroads the locomotives now have a tonnage rating up to their maximum capacity. To increase the revenue tons per freight train mile it is necessary to decrease the tare tonnage.

To do this one must commence with the car, and load it to the maximum or visible capacity. Apply proper equipment for loading—where one can get cars loaded to their maximum capacity, equipment of the largest capacity should be applied. The proportion of tare weight to capacity decreases with the increased loading capacity of equipment, so that by not supplying equipment of larger capacity than necessary for the load, the tare weight can be decreased. There is a difference of from four to six tons in the tare weight of 60,000, 80,000 and 100,000 lb. capacity cars.

After the loading of the cars comes the elimination of empty car mileage. The distribution of equipment should

be studied so as to load equipment into such territory that it can be given a load out without unnecessary empty mileage. Difficulty is experienced by all lines in loading flat, coal, automobile, stock and refrigerator cars, especially the packers' cars, in the direction opposite to that in which the car moves when under load with the commodities usually handled. A careful study will enable most of this equipment to be loaded at least part way in the direction in which these cars ordinarily move empty.

The heaviest power available should be used on all runs to increase the gross tonnage per train. Engines should be tested over each entire engine district to ascertain the maximum tonnage they will handle between different stations. Cars for intermediate stations should be handled on local trains. Through trains in the direction of the heaviest traffic should be kept under full load. In many instances fast freight trains are run with decreased tonnage in order to overcome operating conditions that can be eliminated with little difficulty.

By keeping fast freight trains moving it is seldom that schedules cannot be maintained and at the same time handle the maximum tonnage rating. Local freight train runs should be of such distances that they can either handle a maximum loading out of the initial terminal or into the final terminal.

A "follow-up" campaign is necessary to get agents to see that all cars are loaded properly and to report promptly any car leaving or arriving at their stations not properly loaded. Weigh masters, bill clerks at terminals, yard masters and conductors should all be kept interested and should call attention to cars not properly loaded or cars moving empty that might be given loading. The chief despatcher and car distributor should keep a close check on empty cars moving, which information can be gotten from the train consists, and get these empty cars to points where they can be given load. The tonnage clerk must check the wheel reports closely and call attention to lightly loaded cars and cars moving empty that could have been given loading.

PROGRESS IN ACCIDENT PREVENTION*

By Marcus A. Dow

General Safety Agent, New York Central Lines.

It is but a little more than ten years since the United States Steel Corporation began its systematic accident prevention work and planted the seed which has brought forth a product of such great value to humanity that its development has been one of the biggest things in the history of American industry. Those pioneers who first promoted accident prevention work entered a strange and unexplored country. Their only compass was a vision—a vision of a better state of affairs wherein cripples and widows and fatherless children were to be no longer a by-product of industry.

There are no reliable statistics of accidents occurring in the United States as a whole; but estimates give conclusive proof that the waste of human material due to preventable accidents each year is nothing short of appalling. Dr. Frederick L. Hoffmann, statistician of the Prudential Insurance Company of America, estimates that in 1916 there were approximately 22,000 persons killed in industrial accidents and that at least half a million were so seriously injured that they lost more than four weeks from work. The lives of 220,000 industrial workers were snuffed out in 10 years! The hospital cots of those seriously injured in the ten years would cover a single track railroad from New York to San Francisco and back again.

* * * There have been some few employers who have not acquired great success because, even though they pretended to

*From an address delivered at the congress of the National Safety Council, New York, September 12.

inaugurate accident prevention work in their plants, they were not good safety men at heart. Successful safety work is not based on pretense. There have been those who believed that all that was necessary for them to do was to post a few safety bulletins in their plants and let it go at that. The spirit of safety did not pervade their establishments because they were not good leaders and did not make their employees feel that they were sincere. Experience has proved that success in safety springs from a service of the heart, and an ability and determination to concentrate every energy, every resource necessary, upon the obtaining of results. The spirit and the attitude of any employer—of any railroad officer—will be reflected in every corner of his plant and on every mile of his road. If he is a safety man at heart accidents are reduced—the majority of his employees are co-operating with him to that end—and yet his plant is working on the highest plane of productive efficiency. There has, perhaps, been no greater benefit derived from accident prevention work than through the getting together of employer and employee in intimate conferences in regard to a matter of common interest and concern.

Operating officers, with their manifold duties, cannot keep continually developing new ideas in accident prevention, and the safety engineer has become almost indispensable. Experience has shown his territory should be confined to an area which will permit him to come into frequent personal contact with a majority of the employees under his jurisdiction.

The New York Central Lines originally employed in their safety bureau several safety agents who covered a wide territory where close supervision and frequent contact with the men was impossible. A year ago we tried as an experiment the employment of a few division safety agents on certain main line divisions. After several months' trial it was found that the accident record on these divisions, compared with the same months the previous year, was from 20 per cent to 35 per cent lower than it was on similar divisions where there were no division safety agents. Therefore, commencing the first of July this year, the New York Central Lines took a new step in safety progress by appointing division safety agents on all of the main-line divisions of the system.

There is perhaps a no more striking example of what consistent safety work will accomplish than the record that has been made by the railroads of the United States in the past few years—a record that has been made in spite of increased traffic, labor disturbances, and numerous other intense operating conditions. On all the railroads of the country, during the seven years ended June 30, 1916, there has been a steady decrease in the number of railroad employees killed and injured while on duty. In the year 1910, on all of the railroads, 2,17 employees were killed out of every thousand men employed, while in 1916, only 1.17 were killed out of each thousand employed—a decrease of 47 per cent in the number of employees killed per thousand employed. In 1910, 47.1 employees were injured per thousand employed on the railroads, while in 1916, only 25.2 were injured per thousand employed, a decrease of 46 per cent. Pride in the accomplishment of those who have worked with me on the railroad I have the honor to represent prompts me to tell you that on the New York Central Railroad in the year 1916, as compared with 1913, there was a decrease of 35 per cent in the number of employees killed per million tons freight carried one mile, and of 20 per cent in the number injured. Actually, in the three years ended December 31, 1916, on this road 284 employees were saved from fatal injury and 6,211 from non-fatal injury, using the rate for 1913 as a basis for comparison. The Chicago & North Western, the first railroad to inaugurate a safety campaign, in 6½ years has saved the lives of 293 of its employees, through the humanitarian work of that grand old safety pioneer, Ralph C. Richards.

The record of the United States Steel Corporation stands

out like a beacon light. In the nine years ended 1915, its safety work has saved 14,967 of its employees from death or serious injury, the injury rate for 1906 being used as a basis for comparison. The long list of industrial concerns, with similar records of achievement, should have their names emblazoned on a roll of honor that would inspire and enlighten the world. There is the E. I. Dupont De Nemours Company, the Eastman Kodak Company, the American Smelting & Refining Company, Cadillac Motor, Commonwealth Edison, Commonwealth Steel, Corn Products Refining Company, Fairbanks-Morse, Harrison Brothers & Company, Illinois Steel Company, Inland Steel, International Harvester, Milwaukee Coke & Gas, Neenah Paper, Packard Motor Car, Pullman Company, and the Rochester Railway & Light Company. [These show reductions from 24 per cent to 88 per cent in the percentage of casualties to number of employees.]

Even to-day, with our country at war, must the cause of safety be upheld and its progress continued. I have no sympathy with the thought that because lives are necessarily sacrificed for a righteous cause on the battle front other lives must be unnecessarily sacrificed at home through neglect. Surely, the killing of 22,000 and the injuring of half a million industrial workers a year is a serious drain on the manpower of the nation at a time when every available man is needed for the work that is to be done. Our duty is clear. We must keep the workmen inspired. We must keep the machines going; keep the wheels moving; keep the industries up to their highest point of productive efficiency; keep from having accidents, or anything else that will lessen that efficiency.

So much for the progress of accident prevention. What of the future? There may be a temporary backward swing of the pendulum. Accidents this year are increasing, even where the best of records have been made in the past. This is but the natural result of the high tension under which industries and the railroads are now operating, many at double their usual capacity. This, together with greatly increased labor turn-over and similar influences due to the war, is affecting the accident record adversely. But this only emphasizes the need for greater effort and increased safety activity. As to the future, I believe that somewhere within, say, 10 years, the time will come when a workman who is employed will not only be expected to know how to operate a particular machine, but that his continuance in the employment will depend upon his observance of reasonably safe practices. When a workman is employed he will be examined, not only as to his physical fitness, but as to his personal habits and as to his attitude toward accident prevention. Systematic instruction of the workman as to how to do his work with the least possible risk of injury to himself and others will be an obligation firmly fixed on the shoulder of the employer, and the competence of a foreman will be measured in part by his ability to enforce safe practices on the part of his men. I believe that the time is not far distant when the great majority of American workmen will refuse to permit a man to work in their midst who is habitually careless. The drawings and specifications for every new building, whether it be for an industry, a church or a home, will be carefully scrutinized by safety engineers to make sure that every known precaution has been observed. I expect the day to come when the safety engineer, or safety agent, will be a permanent and fixed member of the official staff of every industrial plant and of every operating division of every railroad in the land. Every village, town and city will have an organized department to protect citizens from injury by accident. I believe, too, that the subject of accident prevention will become a part of the curriculum of colleges and technical schools, and that the degree of safety engineer will be as coveted as that of physician or doctor of laws. The children in the public schools will be taught safe habits. * * *

SALVAGING ROLLING STOCK ON THE SANTA FE

Washouts in January, 1916, completely isolated a portion of the 15-mile branch of the Atchison, Topeka & Santa Fe between Fallbrook, Calif., and Fallbrook Junction and marooned equipment valued at \$50,000. This line, which lay in the Temecula canyon, had been subject to repeated floods in the past, and for that reason, it was decided to re-build on higher ground. When the new branch was completed, it had no connection whatever with the old line and terminated in the town of Fallbrook, 377 ft. higher and $1\frac{1}{2}$ miles south of the old station in the canyon where the

Moving Cars up a 10 Per Cent Grade

rolling stock was situated. The unusual difficulties in the way of salvaging this equipment and the manner in which they were overcome are outlined in an article in the Santa Fe Magazine by J. P. O'Shea, inspector of the Santa Fe Lines at San Bernardino, Calif.

The equipment consisted of an 80-ton, 2-8-0 type locomotive, four refrigerator cars, two passenger coaches, two flat cars (one loaded with a 36-ton turntable), one tank car and one box car—in all, a train weighing 400 tons, including loads. Among the factors which complicated the problem of moving the equipment were the complete isolation of the old

The Equipment 335 ft. Above and 4,500 ft. Distant from Starting Point.

line, the elevation of the new line above the old, the distance between the two, and the rugged character of the intervening country. It was finally decided to move the train over a temporary track on an abandoned wagon road between the two lines. This highway had a maximum grade of 14 per cent, with curves varying from 15 to 50 deg., and for three-quarters of a mile it followed the side of a canyon, where any carelessness would have junked the rolling stock. The fact that the train weighed 400 tons and that it was planned

to raise it 436 ft. within a distance of 6,300 ft. caused four surety companies to refuse to bond the work. However, the contract for the salvaging was finally awarded to a firm of house-movers in Pasadena, who began operations on March 14, 1917, with a force of five men, four horses and "the usual outfit of the house mover—capstans, cables, chains and cussin'." Less than three months later, i.e., on June 10, 1917, the work was completed and the equipment was transferred from Fallbrook to the main line at Oceanside.

To safeguard the rolling stock on the unusual grades, ties were wired behind each pair of trucks and 12-in. by 12-in. chocks were carried behind each set of drivers on the engine. The equipment was chained to the track when not in motion and the rails were removed behind the engine, which had been switched to the back end of the train before work began. The capstans used had a 10-in. spool (well casing) and a "sweep" of 108 in. By using $\frac{1}{2}$ -in. cable, $\frac{3}{4}$ and 1-in. chains, and six single sheave blocks, this arrangement enabled four horses to pull the 80-ton locomotive on a 14 per cent grade. On lighter grades two cars were moved by the same method at an average speed of six feet a minute; on grades under 10 per cent two horses easily pulled loads up to 50 tons.

The engine was stripped to a 15-ft. rigid wheel base, so that it could be drawn around a 50-deg. curve without de-

Locomotive on an 11 Per Cent Grade

railing. It was also necessary to grease the inner rail on curves to keep the locomotive on the track and to maintain a maximum super-elevation at those points below 4 in. to prevent the rails from overturning.

Floods have repeatedly damaged the Fallbrook branch and especially that part of it which originally extended to Temecula, about eight miles northeast of Fallbrook. This section, which formed part of a through route from San Diego to trans-continental connections at San Bernardino, was destroyed by washouts in 1884 and again in 1891. It was rebuilt the first time but not the second, and the remaining portion of the line from Fallbrook to Oceanside, 20 miles, was acquired by the Santa Fe in 1906. San Diego commercial interests, which desired direct connections with the Santa Fe line to the East, agitated persistently for the reconstruction of the Fallbrook-Temecula link. Finally, in 1916, the Railroad Commission of California ordered the Santa Fe to rebuild and restore to operation a line from Fallbrook to Temecula, or to construct an alternative line from the latter point through Rainbow Valley to Oceanside, although it was shown that the potential traffic would not justify the heavy expenditures which the work would necessitate. The case was later taken into the courts by the railroad, where the decision of the California commissioners was overruled.

ACCIDENT BULLETIN NO. 62

The Interstate Commerce Commission has issued its accident bulletin No. 62 containing a record of railway accidents in the United States during October, November and December and during the calendar year 1916, which, under the commission's order, is now the fiscal year for reporting all railway statistics. Comparisons are shown with the last two twelve-month periods ending June 30. The annual summary shows that the total number of casualties to persons for the year was 206,723. The figures for the year are summarized in Table 1 as follows:

TABLE NO. 1.—Casualties to persons year ended December 31

Class	Passengers		Employees		Other persons		Total	
	Kil'd	Inj'd	Kil'd	Inj'd	Kil'd	Inj'd	Kil'd	Inj'd
Collisions.....	70	1,886	179	2,013	17	46	266	3,945
Deraillments.....	41	1,699	156	1,279	61	155	258	3,133
Miscellaneous train accidents.....	66	35	530	3	23	38	619	
Total.....	111	3,651	370	3,822	81	224	562	7,697
Train-service accidents.....	180	4,357	2,143	45,299	6,591	9,629	8,914	59,285
Total.....	291	8,008	2,513	49,121	6,672	9,853	9,476	66,982
Nontrain accidents.....			428	127,802	97	1,938	525	129,740
Grand total.....	291	8,008	2,941	176,923	6,769	11,791	10,001	196,722

From table 1c, which gives comparisons with preceding years, we copy the following:

TABLE NO. 1C.—Summary of casualties to persons for years named.

	Year ended Dec. 31, 1916		Year ended June 30, 1915	
	Killed	Injured	Killed	Injured

	Year ended Dec. 31, 1916		Year ended June 30, 1915	
	Killed	Injured	Killed	Injured
Total in accidents involving train operation.....	9,476	66,982	8,278	62,848
Nontrain accidents.....	525	129,740	343	99,192
Grand total.....	10,001	196,722	8,621	162,040

Table 1b in the report gives the usual classification of casualties by causes. Table No. 2, which is reproduced herewith, shows the total number of collisions (5,737) and of deraillments (8,253). The bulletin shows collisions and deraillments for four years back and also two tables analyzing deraillments due to defective roadway and defective equipment for 15 years.

The number of persons shown in the quarterly report (October, November, and December, 1916,) as killed and injured on steam railways was 2,401; 152 killed and 2,249 injured. Total killed in all classes of accidents, 2,627; injured, 50,467.

The number of persons killed in accidents at highway grade crossings during the year, 1916, is given in a separate statement, showing the number of victims in each state. Of the total killed, 1,652, it appears that 121 were classed as trespassers.

The investigations of accidents by the inspectors of the commission, which were completed during the last quarter of 1916, numbered 22, and the reports of these investigations fill 55 pages of the bulletin. These 22 accidents occurred as follows:

Galveston H. & S. A.—Isler, Tex.....	Jan. 31	Deraillment
Pennsylvania—Lewistown Junction, Pa.....	Oct. 5	Rear collision
Cinn., Ind. & Western—Maplewood, Ind.....	Oct. 7	Butting collision
Western Maryland—Knobmount, W. Va.....	Oct. 12	Butting collision
Chic., Burl. & Quincy—Smithfield, Nebr.....	Oct. 15	Rear collision
Phil., Balt. & Wash.—Perryman, Md.....	Oct. 23	Deraillment
Union Pacific—Bushnell, Nebr.....	Oct. 23	Butting collision
Georgia Railroad—Union Point, Ga.....	Oct. 27	Deraillment
Delaware & Hudson—East End, N. Y.....	Oct. 31	Butting collision
Pennsylvania—New Portage Junction, Pa.....	Nov. 6	Rear collision
Chic., Mil. & St. Paul—Hornick, Iowa.....	Nov. 9	Deraillment
Chicago, R. L. & Pac.—Marion, Kan.....	Nov. 22	Rear collision
St. Louis, S. F.—Una, Mo.....	Nov. 23	Butting collision
Greenville & Western—Altamont, S. C.....	Nov. 24	Deraillment
Texas & Pacific—Strawn, Tex.....	Nov. 26	Rear collision
N. Y. & N. H. & H.—Beacon Falls, Conn.....	Dec. 2	Rear collision
Denver & R. G.—Price, Utah.....	Dec. 1	Rear collision
Nor. Pacific—Fast Helena, Mont.....	Dec. 7	Butting collision
St. Louis Southwestern—Waldo, Ark.....	Dec. 15	Deraillment
Central New England—New Hartford, Conn.....	Dec. 22	Butting collision
Boston & Albany—W. Springfield, Mass.....	Dec. 22	Butting collision
St. Joseph Valley—Inverness, Ind.....	Dec. 30	Rear collision

A tabular summary is given showing the causes of those accidents which were investigated during the six months ending December 31, 1916.

Electric railways reporting to the commission (not included in the foregoing statistics) had a total of 518 persons killed during the year and 4,606 injured. These roads had 216 train accidents, including 139 collisions and 53 deraillments. Train accidents are charged with 16 fatalities and 791 injuries. The total number of passengers killed from all causes was 34 and of employees 44, while 135 trespassers were killed.

J. M. HERBERT

James M. Herbert, who has been vice-president of the St. Louis Southwestern since August 1, 1916, has been elected president, succeeding Edwin Gould, who remains as chairman of the board of directors. Mr. Herbert's election as president is recognition on the part of the board of directors of the success which has been attained under Mr. Herbert's management in rehabilitating the St. Louis Southwestern. Mr. Herbert came to the property shortly after the death of F. H. Britton, president, from the Laramie, Hahn's Peak & Pacific, now the Colorado, Wyoming & Eastern. Many of the neighbors of the road were in the hands of receivers; the St. Louis Southwestern itself had been pretty badly undermaintained, and in general there was a situation that needed a strong hand. Mr. Herbert was just the man for such a situation. One distinguishing characteristic is his ability to make decisions promptly. Mr. Herbert is a man who can and does say yes or no to a proposition and this is a great quality in railroad work. In settling operating questions, prompt decisions are almost as essential as correct decisions. In settling traffic matters and in dealing with large shippers this ability to give a yes or no earns the respect of the shippers and makes business friends for a road. Mr. Herbert is a man of great energy, both physically and mentally.

He is a man who shoulders responsibility, who wants and takes the reins of management into his own hands, and has the capacity to handle a vast amount of work. Having come up from the lowest round in the operating department he has a thorough grasp of the details and he knows the Southwest thoroughly.

The equipment situation on the St. Louis Southwestern was particularly bad when Mr. Herbert came there. He has put through a vigorous program of scrapping obsolete equipment and rebuilding or extensively repairing a very large proportion of the company's box cars, and he has apparently got his cars in good shape. Remarkable progress has been made under his management in getting better mileage per day out of cars. In June, 1917, the average mileage per car per day was 35.3 as against 25.1 in June, 1916. Thirty-five miles per car per day is a high figure of itself and the increase as compared with a year ago amounts to over 40 per cent. A considerable improvement has been made in car loading, the average per loaded car being 20.4 in June, 1917, as against 17.7 in the same month in 1916; and a very large gain has been made in trainloading, the average trainload in June, 1917, being 466 tons, as against 351 tons a year ago in that month.

James M. Herbert was born January 15, 1863, at Belmont, Pa. He received a public school and high school education and began railroad work in 1880 as night telegraph operator on the Wabash, St. Louis & Pacific, now the Wabash. He

became station agent, then a yard clerk, later a despatcher, then chief train despatcher and finally trainmaster. In 1897 Mr. Herbert went to the Grand Trunk as trainmaster of the eastern division at Island Point, Vt. In the following year he was transferred to Belleville, Ont., and after two months was made superintendent of the eastern division of the Grand Trunk, with office at Montreal. In October, 1900, he went to the Missouri Pacific as superintendent of the Kansas and Colorado divisions, with office at Osawatimie. In the following year he was made general superintendent of the St. Louis, Iron Mountain & Southern and then went for a short time to the Southern Pacific. In November, 1901, he became general manager of the Denver & Rio Grande and the Rio Grande Western. On January 1, 1903, Mr. Herbert was appointed vice-president and general manager of the Colorado & Southern. In March, 1906, he left railroad work but later returned to it as president of the Colorado, Wyoming & Eastern.

J. M. Herbert

EMBARKATION CAMP
STARTED

The construction of a camp for the accommodation of troops during the period they may be compelled to await transportation overseas after reaching the port of embarkation is under way near Tenafly, N. J., at the port of New York. This camp has been named after the late Major Gen. Wesley E. Merritt, who fought in both the Civil and Spanish-American Wars. When completed it will be able to house 30,000 men. Regulars, former guardsmen and, later National Army contingents, coming from the South, will enter the camp while transports are awaited. No training will be attempted at this site, except incidentally.

The men will be housed in two-story wooden barracks, each accommodating 66 persons. As far as possible, the oaks and other shade trees, which dot the site, and the lawns and orchards will be preserved. The camp is not being established on strictly geometrical lines. Because of the attractiveness of the site, which is on high land a couple of miles back of the Palisades, the creation of the camp has been considered partly in the light of a problem in modern city building. The camp is to be ready in November. Ten thousand workmen will be employed within the next fortnight.

A similar camp is being constructed at Newport News on Hampton Roads.

CHINESE RAILWAY RETURNS FOR 1916.—The railway line from Canton to Shiuchow, 139.28 miles, was in operation for nine months during 1916 and carried a daily average of 3,382 passengers and 614 tons of freight, from which it derived revenues of \$1,553 and \$2,188, respectively. This is a part of the Canton-Hankow Railway, which was not extended during the year owing to financial difficulties.

WHAT THE RAILROADS' WAR BOARD HAS ACCOMPLISHED

Fairfax Harrison, chairman of the Railroads' War Board, has authorized the following statement giving a summary of its accomplishments:

Information gathered by the Railroads' War Board during the first four months of its existence, indicates that the voluntary act of the 693 railroads of this country in merging their competitive activities for the period of the war and uniting in one continental system, has not only made the transportation problem presented by the war less cumbersome to handle, but surer of satisfactory solution.

In addition to welding into one loyal army each and every one of the 1,750,000 persons employed by the railroads—from engine wipers to presidents—the co-ordination of the nations' carriers has made possible the most intensive use of every locomotive, every freight car, every mile of track and every piece of railroad equipment in the country. It has also facilitated the securing of invaluable co-operation from the shippers and the general public.

Some concrete instances of what has been accomplished through this co-operation of the railroads, the shippers and the public since April 21, when the War Board was created, may be summarized as follows:

The excess of unfilled car requisitions over idle cars, or what is commonly called car shortage, has been reduced 70 per cent. On April 30 the so-called car shortage amounted to 148,627. On June 30 these figures had been cut to 77,144. On August 1 the excess of unfilled car requisitions over idle cars amounted to only 33,776.

In the month of May, freight transportation service rendered by about 75 per cent of Class 1 roads was 16.1 per cent in excess of the service rendered in 1916. In that year, which was one of unusual activity, the freight service rendered by the carriers was 24 per cent greater than in 1915, so the carriers achieved the astounding feat of adding to their freight service, in the short space of two years, an amount equal to the freight traffic of Great Britain, France, Russia, Germany and Austria combined.

Approximately, 20,000,000 miles of train service a year have been saved by the elimination of all passenger trains not essential to the most pressing needs of the country. This reduction of passenger service has released hundreds of locomotives and train crews and cleared thousand of miles of track that are absolutely needed in the freight service for the transportation of necessities.

Freight congestion at many important shipping points has been averted by promptly moving empty cars from one railroad to another, irrespective of ownership. By ordering the adoption of this policy, which is brand new to American railroad usage, the Railroads' War Board has moved 113,420 empty freight cars into districts where they have been more needed.

Through the pooling of lake coal and lake ore, a saving of 52,000 cars in moving those commodities alone has been achieved.

A further saving of 133,000 cars has been made possible by the pooling of tidewater coal. Both of these pooling projects were brought about by the Railroads' War Board in collaboration with the Committee on Coal Production of the Council of National Defense.

By regulating the movement of grain for export, the number of cars ordinarily required for this service has been reduced, despite an abnormal export increase this year, 75,-682,028 bushels of wheat, corn, barley and oats being shipped to the Allies from May 1 to July 14. This business was so handled that there were no delays and no blocking of facilities at either the grain elevators or the seaports.

Although the figures on the intensive loading of freight cars are not complete as yet, a sufficient number of reports

have been received from the 27 local committees of the War Board to show that commercial bodies and individual shippers in all parts of the country are giving hearty co-operation to the railroads' campaign "to make one car do the work of two." Checks made recently in Florida and Georgia on loaded potato cars show for instance that cars are carrying 200 bbl. this year against 125 bbl. last year. Checks made in Chicago show that cement cars are now carrying 77,000 lb. as against 70,000 lb. last year. In Pittsburgh, tin plate cars that carried 92 per cent of their marked capacity on June 27 last are now being loaded to carry 98.6 per cent. In Minnesota the average carload of flour in 1916 amounted to 46,250 lb.; this year the average carload is 61,923 lb. In New Orleans, sugar cars that were being loaded to carry only 40,000 lb. three months ago, now carry an average load of 80,000 lb. In other parts of the country, sugar refineries have voluntarily increased their minimum capacity 25 per cent, or from 40,000 lb. to 50,000 lb.

Some figures that throw a clear light on the efforts that both the shippers and the railroads are making to relieve the coal situation were supplied a few days ago by the Western Maryland. A check of 540 cars of coal loaded on its line showed only 7 cars that were loaded below marked capacity. The average lading of the 540 cars was 111.14 per cent, or 11.14 per cent above the marked capacity.

A summary of coal mine operations for the month of July showed that a total of 132 railroads handling anthracite, soft coal and lignite transported 207,429 more loaded cars from the mines than for the same month last year—an increase of 31.5 per cent, or 10,316,990 tons.

In their efforts to shoulder the abnormal burden thrust upon them by the entrance of this country into the war, the railroads have not confined themselves solely to the task of making one car do double work. Through their War Board they have also supplied the government with every facility possible for intelligent co-operation in the handling of every military problem involving the transportation of troops and supplies. Skilled and experienced railroad men have been sent to every cantonment to assist the constructing quartermasters there in the movement of all supplies necessary to the erection and maintenance of these military cities. A trained executive has also been stationed in the Washington headquarters of the supervising constructing quartermaster, so that every car used in the transportation of government supplies might be made available when needed. As a result of these co-operative activities the movement of thousands of carloads of lumber and other supplies to the cantonments has been accomplished practically without a hitch.

In addition, and at the request of the government, plans have been perfected whereby one million men are to be moved from nearly five thousand different points to the 32 training camps for the National Army and National Guard by October 20. About one-third of these men, the National Guard, are already under way and are carrying their tents and equipment with them. This means that in addition to the coaches and tourist sleepers occupied by them more than 12,000 freight cars must be transported.

No special difficulty would present itself in accomplishing these troop movements if they represented all that the railroads were being called upon to perform at this time. But the movement of these million soldiers to their training quarters must not be permitted to interfere with the general movement of freight and passenger traffic, if such interference can possibly be avoided. Right here it may be stated that freight of all kinds is now moving in unexampled volume. Practically every factory in the country is working to its capacity turning out supplies for the Allies, for this government and for the general use of the American people. The grain crop is also beginning to move. Soon cotton will be ready for shipment. Moreover, the transportation of fuel cannot be interrupted for a moment, although each month the railroads

are carrying from the mouths of the mines six million tons more than they ever carried before. All of this traffic must be taken care of, and at the same time the million men upon whom this government counts for the speedy and successful termination of the war must be brought to the places where they are to receive their training. Organization, much hard work and the faithful help of the 1,750,000 men who man and operate the railroads is making the accomplishment possible.

Among some of the other things accomplished by the board during the first four months of its existence, have been the designing of special equipment for hospital and troop train service, the standardization of settlements between the government and the railroads, eliminating a large volume of correspondence and red tape, and the creation of a Special Committee on Express Transportation, composed of the vice-presidents of the American, Wells-Fargo, Adams and Southern express companies, to co-operate the work of the companies with the general problem of transportation.

The War Board is divided into departmental committees, who work in conjunction with the military department of the government, and also sub-committees on car service, equipment standards, transportation accounting, passenger tariffs, freight tariffs, material and supplies, and express transportation.

It has stationed general agents at all military headquarters with the specific duty of co-operating with the military officers at these points. There are 112 of these places and approximately 250 trained railroad officers have been assigned to them.

In addition, the Board has 69 general employees and 18 inspectors, who are kept in the field constantly.

In order to keep a close watch on local conditions and to promptly meet whatever difficulties may arise in any part of the country, sub-committees have been formed at Chicago, New York, Atlanta, San Francisco, Seattle, New Orleans and similar big traffic centers. These committees are co-operating with the shipping and traveling public as well as with the military authorities.

The Washington organization of the railroads employs 27 experienced railroad officers, including the five executives on the War Board, practically all of whom are there all the time. It also includes trained experts for every phase of the work confronting the railroads.

The war has created a demand for so many new kinds of business and so many new sources of business that abnormal movements of freight are constantly taking place in unaccustomed directions. Under the directions of the War Board every effort is being made to meet these demands, but the railroads by themselves cannot be expected to solve the whole transportation problem which the war has produced.

If the maximum amount of transportation service is to be obtained, the shipping and traveling public and all railway employees will have to continue to co-operate in many ways, submit to many inconveniences and sometimes even bear losses due to changes in the transportation service. One of the most encouraging features of the situation noted by the War Board is that both shipper and the general public appear to be reaching a clear understanding to that effect. This is shown by the encouraging reports coming from all parts of the country in conjunction with the heavier loading of cars, and the reduction in complaints concerning the elimination of all passenger trains whose operation was not absolutely essential and which were being run for the benefit of the few rather than the benefit of the country at large.

NETHERLANDS REDUCED TRANSPORTATION.—A cablegram from the American Legation at The Hague says that restriction in train service throughout Holland 40 per cent is contemplated, effective September 24, owing to coal shortage.

REPORT OF O'DONNELL FULL-CREW-LAW COMMITTEE

The executive committee of the Associated Railroads of Pennsylvania and New Jersey, R. L. O'Donnell, chairman, which committee was created early in 1915 to carry on a campaign for the repeal of the full-crew laws of New Jersey and Pennsylvania, has made a report, recounting what has been done, and recommending that the railroads establish a permanent committee to deal with such problems as the one which has engaged the attention of this committee; namely, problems where it is for the interest of the railways to act in unison in enlightening the public.

Following is a full abstract of the report:

The committee has found its work broadened. To attack with reasonable show for success, entailed a large treatment of the relationships of the railroads with bodies of their employees, with owners of railroad securities, and, above all, with the public and its elected representatives. In far greater measure than can be made clear in any report of definite results, the campaign made has been productive of good. It has been greatly instrumental in establishing a right understanding between the railroads and the public, and in clearing away many false impressions, harmful alike to all concerned.

The full crew law of New Jersey has been changed so that now the excess man may be taken off trains when the railroads show the public utility commissioners that he is not needed for safe and efficient operation of the trains and authorizes his removal. Because of the urgent necessity that the man power of the country should be mobilized for essential services and it being felt to be highly important that some 2,000 trained men held in useless jobs should be immediately released to crew additional trains, a different form of bill was finally introduced into the Pennsylvania legislature. It was drawn so as to suspend the full crew law for the period of the war and for six months thereafter. It was passed by the Assembly of Pennsylvania by a vote of 113 to 84 and by the Senate by a vote of 32 to 13, after being amended to read one month after the close of the war instead of six months. Two years before, the previous legislature overwhelmingly passed a bill repealing the full crew law but empowering the public service commission to require railroads to properly man trains. Again withholding action until the last day given him under the Constitution, Governor Brumbaugh on July 28, 1917, vetoed this latest bill, as he did that passed by the legislature two years ago. [The veto message is reprinted in full.]

During the recent session of the Pennsylvania legislature there were introduced 143 bills inimical or harmful to the railroads, corporate interests in general and against the public weal. No bills were passed which adversely affected railroads; the public mind and the thought of legislators has been aroused. * * * In New Jersey there were introduced, during the legislative session of 1917, 52 bills of objectionable character. * * * Only three were enacted into laws which could be considered as unfavorable. These were laws increasing taxes, and even they were so amended as to be much less objectionable than they were in the form in which they were introduced.

The press has recognized and given enlightened and earnest support to the work of your committee, and is giving liberal and broad-minded attention to all matters and problems in which the railroads are concerned, because those problems also intimately affect the welfare of the American people, the progress of the nation.

The New Jersey State Chamber of Commerce made a very exhaustive investigation of the operation of the full crew laws in this country giving particular reference to Pennsylvania, New Jersey and New York; and, upon the basis of its inquiry determined to make the fight for a repeal of the then

existing full crew law one of its principal legislative planks. This report of the State Chamber was so important that your committee made arrangements to have it printed for general distribution. The high character of this investigation was brought out by the Governor of New Jersey when he said in public hearing, just before signing the bill, that the facts in the State Chamber report had not been questioned by the opposition. The State Chamber worked energetically. It arranged for and made 42 addresses in New Jersey and furnished a speaker to appear at the public hearing at Harrisburg, Pa. The Pennsylvania State Chamber of Commerce and its members also performed effective supporting work.

RECOMMENDATIONS

From such firm and broad foundations as have been laid your committee earnestly feels—more, is entirely convinced—that constructive action should now press forward. The whole situation urges it. Your committee feels that it would be negligent in its duty if it did not again urge its recommendations of two years ago.

* * * The railroads should, in the proper manner, actively identify themselves with matters of public interest and doing so freely exercise their citizen rights. Their course should be openly taken and so laid in all matters as to command the respect, if not the support, of an informed public. Experience confirms the conviction that the American people as a body think clearly, judge wisely, deal fairly and act justly. Their informed judgment can be trusted. The essential thing, therefore, is for the railroads to get the attention and to reach the understanding of the American people. This can be done in many ways, but in none so effectively as through the press of the country. Such agency must be utilized to get anywhere. * * * Your committee has found a virtually universal readiness on the part of the press to give publicity to news, and to statements of public interest. Railroad executives can do no service greater for the companies they manage, the stockholders they represent, and the public they seek to serve than to clearly and frankly meet the outside questions which constantly arise.

In greater part this can be done through the simple process of giving an interview or making a statement when something should be said. A statement from an executive or other officer of a company carries public interest, not only for what is said but in proportion to the importance of the position of the man making it.

But while the columns of the press are open to all proper statements and news, there is often a distinct advantage in presenting a matter exactly as you think will best place it before the court of public opinion. On such occasions a carefully prepared advertisement makes not only the proper but the best vehicle. The use of advertising space is perfectly legitimate. A statement made in such a way strikes home as a business proposition. It challenges attention.

A forward working organization is required. It should take permanent form and start with a public statement of the reasons for its establishment. It is recommended that there be created a central committee to represent all railroads in a certain territory—say Pennsylvania, New Jersey, Delaware and Maryland—such committee to act for them in all matters of general concern and of public policy, the great object being always constructive and as such to promote measures for the common good, while also moving to prevent ill considered legislation.

Such central committee should have its life from the various railroads and should supplement, without interfering with, the activities which it is strongly urged each company shall conduct through a Department of Public Policy and Relations. There is abundant, important and continuing work for such a department in the railroad organization. It could take up matters, no matter how big, in which the public is interested and both act and speak with authority.

Through such department each railroad could work with effect to establish and maintain cordial relations with the public and its patrons, and the communities it serves in particular. The direct intercourse and clear understanding of local conditions would enable such department, intelligently conducted, to perform valuable service for the railroads and the industries and people in their territory. The work would accomplish most, in the opinion of your committee, conducted with broad minded publicity; it would be rendered abortive by narrow press agent attempts.

The recommended central committee should be established forthwith, that the cumulative result of the present committee's activities be not lost. Your committee urges this with every possible earnestness. The expense of such a central committee would be small measured by what it could do.

The proposed organization obviously would have tremendous power and influence, which wrongly directed could do great harm before the might of public opinion would crush it out. But by being held firmly to a rigid responsibility for its acts, best assured by constant insistence upon fullest publicity concerning what it does, the organization would serve good purposes.

There is no reason why the railroads should not, and abundant cause why they should press forward for all that is fair and right. They should do it courageously and without apology, for none is necessary. They should be equally careful not to ask for what they are not fairly entitled to have. They should proceed in the open. Frank publicity is their greatest protection. So also is the public best protected. An honest proposition thrives through publicity. On the other hand, publicity destroys one that is crooked or unfair.

WORK OF COMMITTEE

Exercising citizen rights, your committee turned attention first to the primary and later to the general elections, and at each stage gave its support to those candidates who were regarded as best qualified to represent the public. In the legislative sessions, your committee again exercised the citizen right to discuss with senators and assemblymen the merits or demerits of proposed legislation. Nothing was said or done that calls for defense, apology or explanation. The total expenditure to August 31, was \$87,063 of which \$15,826 was the cost of advertisements published to ensure a correct understanding of the change proposed and accomplished in the New Jersey Law. [A financial statement is appended.]

Governor Brumbaugh waited the full time which the Constitution gave him, and then issued his veto message. By building up a case upon false premises, Governor Brumbaugh charged the railroads with misrepresentation and bad faith. Such charges are not warranted by the facts. * * * It seems regrettable, at least, that Governor Brumbaugh should have twice seen fit to be the one man to keep in operation a law which forces upon the railroads of Pennsylvania and indirectly upon the public an expense of about \$1,500,000 per annum and which wastes the services of some 2,000 experienced trainmen.

The report gives the names of the 21 railroad officers, representing 21 roads, who constituted the supervising committee, and is signed by the five members of the executive committee, namely: R. L. O'Donnell (Pennsylvania), J. S. Fisher (New York Central), J. E. Turk (Philadelphia & Reading), G. B. Minshull (Lehigh Valley), C. C. F. Bent (Baltimore & Ohio).

CANADIAN RAILS FOR FRANCE.—In connection with the removal of rails from portions of the Grand Trunk Pacific in the Rocky Mountain District, for shipment to France, the company says some of these rails will be replaced by steel taken from the adjacent Canadian Northern line, and in some cases the Grand Trunk Pacific trains will be operated over the Canadian Northern grade.

Large Capacity Tank Cars for the Santa Fe

Latest Revised M. C. B. Specifications Are Followed.
Several Novel Details Are Included in the Design

THE Santa Fe has ordered from the Pressed Steel Car Company, 500 tank cars of 12,000 gal. capacity which are to be used largely in the company's service for handling fuel oil. These cars were designed by the railroad in accordance with the M. C. B. specifications for class III tank cars as revised in 1916.

The barrel of the tank is of open hearth steel plate, the bot-

tom cover has the usual outlets just below the flange to allow any pressure confined in the tank to escape before the cover is removed. There is a special lead gasket provided on the lower side of the flange of the tank cover and four holes spaced at 90 deg. are cored in the top so that pipes may be inserted to facilitate the application and removal of the cover.

One of the unique features of the construction is the application of splash plates to prevent an unequal distribution of weight on the trucks during brake applications. Two of these splash plates are provided, one on each side of the center of the tank and 6 ft. 6 in. from the center. They consist of two sections of 5/16 in. plate, each 18 in. wide, the upper plate placed 3 in. from the inside of the top of the tank shell and with a 5 3/8 in. space between the upper and lower plates. They are secured to the shell by 5/16 in. gusset plates. The bottom outlet valve casing is of the usual type except that it has an internal thread above the valve seat into which a casting is fitted which serves as a valve rod guide and also prevents foreign substances from getting under the valve seat. The safety valves are two in number of the latest M. C. B. standard type attached to the top of the dome and set to open at a pressure of 25 lb. per sq. in.

An ingenious method of fastening has been used on the handholds at the ends of the tank. As the vapor given off by fuel oil is poisonous the cars must be steamed out before it is safe for a workman to enter them to make repairs. In order that the handholds may be replaced from the outside they are attached with a special stud which is illustrated. The section is such that breakage is most apt to occur outside the hexagonal portion of the stud, in which case it can be readily removed with a wrench. In case the stud is broken flush with the tank it can be drilled out and replaced from the outside.

In one end of the tank near the top a 4-in. pipe flange and plug are provided to facilitate washing out the tank. The heater pipes are arranged according to the Vapor Car Heating Company's system. Two flanged couplings are provided

tom being a continuous plate 1/2 in. thick and 83 in. wide. The upper part of the barrel is in five sections of 3/8 in. plate. The heads are 1/2 in. thick and are dished to a radius of

End View of the Santa Fe Tank Car

Santa Fe Tank Car Built in Accordance with the New M. C. B. Specifications

10 ft. The dome is 5 ft. in diameter inside and is made of 5/16 in. plate on the sides and 3/8 in. on the top. The dome cover is dished to a radius of 8 ft. The dome ring is of cast steel and the dome cover of malleable iron. The

at one end of the car. The main steampipes, 3 in. in diameter, are screwed into these castings and extend along the bottom of the tank for nearly the entire length, being closed at the end with a pipe cap. Inside each of the 3-in. pipes

is a 1-in. pipe held in position by star couplings. The end castings are joined by slip joints and the steam pipes lead to a trap under the tank.

The underframe is designed principally to resist buffing stresses since the tank is largely supported at the bolsters. The center sill is made up of two 12-in. 35-lb. ship channels spaced $14\frac{1}{4}$ in. back to back, reinforced on the top by a $\frac{3}{8}$ -in. cover plate 22 in. wide extending the full length of the car and at the bottom by two $3\frac{1}{2}$ in. by $2\frac{1}{2}$ in. by $\frac{1}{2}$

$2\frac{1}{2}$ in. by $\frac{5}{16}$ in. angles connected to the bottom flange of the center sill channel.

The tank is secured against end shifting by anchors 10 ft. long of $\frac{1}{2}$ in. pressed steel. These are secured to the bottom of the tank with $\frac{3}{4}$ in. rivets and are fastened with 1 in. bolts of double refined iron to anchor supporting plates $5\frac{1}{4}$ in. wide, $\frac{1}{2}$ in. thick and 10 ft. 4 in. long, riveted to the center sills.

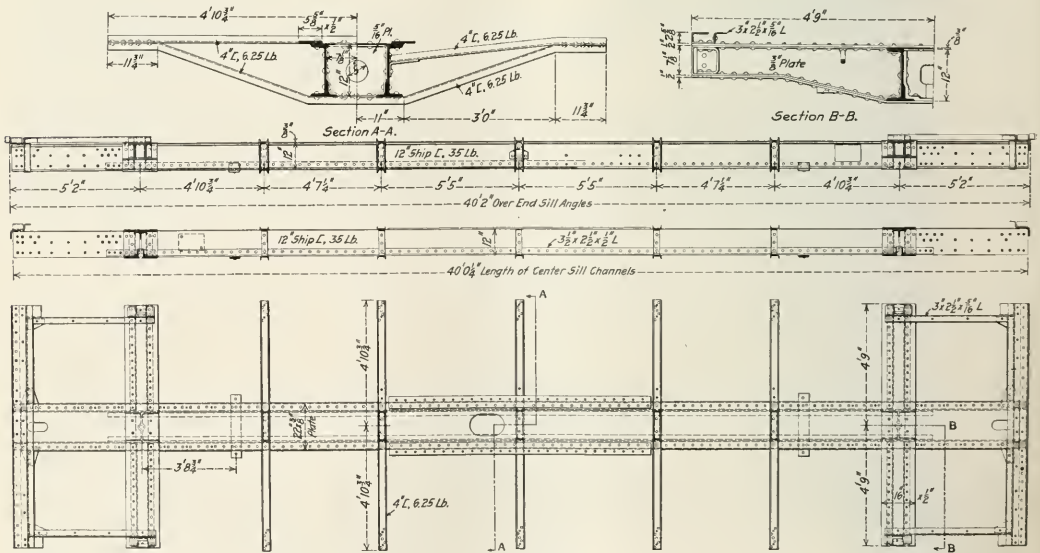

The end running boards are supported by the end sill cover

Plan View of the Santa Fe Tank Car

in. angles, extending 16 in. beyond the centers of the bolsters. Five stiffeners of pressed steel are located between the channels. The body bolsters are of built-up construction with a cast steel center filler and $\frac{3}{8}$ in. pressed steel side diaphragms spaced 5 in. back to back and reinforced on top and bottom by $\frac{1}{2}$ in. steel plates 16 in. wide. On top of the

plates by Z-shaped brackets of $\frac{1}{4}$ -in. plate. The side running boards are supported between the end sill and the body bolster by 3-in. by $2\frac{1}{2}$ -in. by $\frac{5}{16}$ -in. angles. Between the bolsters four supports are provided which are formed of 4-in., $6\frac{1}{4}$ -lb. channels placed back to back under the running board and riveted together, one running over the

Underframe of the Santa Fe Tank Car

bolsters are cradles built up of $\frac{5}{16}$ in. plate. Wooden blocks fitted into these cradles support the tank at each end. Push pole pockets are riveted to each end of the bolsters on the side nearest to the end of the car.

The end sills are built up of 4 in. by 4 in. by $\frac{1}{2}$ in. steel angles reinforced on top by a Z-shaped cover plate $\frac{5}{16}$ in. thick. The ends of the end sills are supported by 3 in. by

top and one under the bottom of the center sills, to which they are also riveted.

The draft gear is of the friction type Miner class A-18-R. The draft lugs are of cast steel, the front and rear lugs on each side forming an integral casting. The coupler yokes are of open hearth steel, $5\frac{1}{2}$ in. by $1\frac{1}{2}$ in., fastened to the couplers with rivets of double refined iron. The couplers

have 5-in. by 7-in. shanks and 9 1/8-in. butts. The coupler is supported by a carrier wearing casting placed on the carrier iron which furnishes a large bearing surface and reduces the wear on the coupler.

The trucks are of the Andrews cast steel side frame type with cast steel truck bolsters equipped with Barber roller lateral motion device. Cast iron wheels and malleable iron journal boxes are used. Among other specialties are Westinghouse brakes, Simplex couplers, Creco brake beams, National malleable journal boxes and the Imperial uncoupling arrangement.

RAILWAY ENGINEERS GETTING INTO THE FIGHT

A telegram from General Pershing last Monday night brought news of the first casualties in the American expeditionary forces in France.

The War Department's announcement said: "The department is advised that Sergeant M. G. Calderwood and Private W. F. Brannigan, Company F, Eleventh Railway Engineers, were slightly wounded by a bursting shell."

This announcement is the first official intimation that the railway engineers have arrived in France. The *Railway Age Gazette* has understood that the engineers had arrived in England, but it has not said as much in its columns, because of the request of the Committee on Public Information that secrecy be observed in all matters of "information tending to disclose the number or identity of troops in the expeditionary forces abroad."

The Eleventh Railway Engineers were formerly known as the First Reserve Engineers. They were recruited in New York and constituted the first of the nine railway engineer regiments. The American railway engineer regiments are not attached to Pershing's army, but are on duty behind the British and French fronts, aiding those nations in the operation of their supply lines.

Little information besides this has come across the ocean as yet relative to the work that the railway engineers are doing behind the lines. There are battalions of Canadian railway engineers overseas, however, and the work that they have done has been like that which the American railwaymen will have to do. What have these Canadian regiments been doing?

THE FIRST BATTALION OF CANADIAN RAILWAY TROOPS

The organization of this battalion, under the name of the 1st Canadian Overseas Railway Construction Battalion, says the Canadian Railway and Marine World, was started in Toronto, early in May, 1916; branch offices were opened at St. John, N. B., Montreal, Ottawa, Pembroke, Hamilton, London, North Bay, Sudbury, Cochrane and Fort William. Recruits were taken everywhere throughout the territory between Halifax and Winnipeg, a few men coming from Edmonton and other western centers to enlist. On July 28, 1916, after recruiting was completed, the battalion went into camp at Valcartier, Que., for training, sailing for England on Sept. 13, 1916. While it was expected that a sojourn of at least two months would be made in England, the battalion found itself actually engaged on railway work in France on Oct. 28, 1916. Probably no other battalion from Canada spent so short a time in getting its men, and its training; and in afterwards getting overseas and down to actual business in France. There have been a number of changes in the officers since the battalion went overseas, owing to promotions, but with one exception, all the original officers are still with the battalion. Capt. G. S. F. Grant has been invalided home to Canada. The organization is now as follows:

Headquarters Company: Officer commanding, Lt. Col. Blair Ripley. M.Can.Soc.C.E., M.Am.Soc.C.E., engineer of

grade separation, C. P. R., Toronto; 2nd in command, Major T. T. Loudon, professor civil engineering, Toronto University, and consulting engineer, Toronto; Chief Engineer, Major Wm. Monds, of Clarke and Monds, consulting engineers and contractors, Toronto; Capt. and Adj., E. D. Toye, storkeeper, Eastern Lines, Canadian Northern, Toronto; Quartermaster, Capt. E. P. Muntz, B.A.Sc., Welland Canal staff; Paymaster, Capt. H. G. Henson, B.A.Sc., McGill University; Medical Officer, Capt. C. P. Fenwick; Chaplain, Capt. E. F. Church; Transport Officer, Mechanical and Horse Transport, Lieut. G. O. Fleming, Toronto Ry.; Officer in Charge Technical Stores and Equipment, Lieut. L. McD. Fleming, formerly private secretary to Sir George Bury, Vice President, C. P. R.; Veterinary Officer, Capt. T. R. R. Hogan.

A Company.—Officer commanding, Major J. B. Heron, division engineer, Canadian Northern; 2nd in command, Capt. G. B. Little, contractor, Canadian Northern; Lieutenants, G. A. Butler, division engineer, National Transcontinental; C. P. VanNorman, engineer, Toronto and York Radial Ry.; F. G. Pusey, engineer and contractor; W. J. Wright, civil engineer.

B Company.—Officer commanding, Major A. R. Ketterson, assistant bridge engineer, C. P. R.; 2nd in command, Capt. H. B. Muckleston, assistant chief engineer, natural resources department, C. P. R., Calgary; Lieutenants, G. H. Pethick, engineer and contractor; F. A. R. McNair, superintendent, Toronto Works Department; J. A. Hamilton, bridge and building master, C. P. R.; H. J. Black, resident engineer, C. P. R.

C Company.—Officer commanding, Major Holland, division engineer, National Transcontinental; 2nd in command, Capt. L. B. Allan, assistant engineer, City Works Department, Toronto; Lieutenants, W. J. Norman, resident engineer, C. P. R.; R. F. Francis, structural contractor; E. H. Jupp, civil engineer and contractor; O. P. Hertzberg, engineering department, C. P. R.

D Company.—Officer commanding, Major F. G. Cross, inspecting engineer, natural resources dept., C. P. R.; 2nd in command, Capt. A. T. MacDonald, resident engineer, C. P. R.; Lieutenants, G. M. Saul, civil engineer; H. M. Jupp, engineer and contractor; H. R. McQueen, civil engineer; H. L. Gilmour, civil engineer; R. E. Lindsay, civil engineer.

The battalion includes 6 warrant officers, 52 staff sergeants and sergeants, 89 corporals, and 40 lance-corporals, making a total strength of 1,065 all told. The transport consists of 10 riding horses, 100 teams of mules, 2 motor cars, 8 light motor trucks, 9 heavy motor trucks, 4 field kitchens, 4 water carts, etc. The equipment consists of practically the same articles that would be used in Canada under peace conditions. Each company and headquarters is furnished with first-class engineering and surveying equipment, and each carries one surveyor with the regular survey party. Tools comprise practically everything that is necessary in building a roadbed, culverts, bridges and buildings and the tracklaying and ballasting of a railway, and the size of the outfit can be judged from the fact that it took three train loads, totalling 130 cars to move the battalion from its former location in France to its present one. The battalion's headquarters staff is quartered, and moves about in railway cars that have been fitted up specially for the purpose. These comprise an office car for the officer commanding and the second in command; orderly room car, in which the battalion's regular business, including preparation of plans and reports, etc., is carried on; tool car, messing car, cooking car, and two sleeping cars. The battalion also carries with it a pile driving apparatus, which was built in France, and occupies three cars. The majority of the men live in tents, but comfortable huts are being acquired to carry about with the battalion when conditions permit. They are collapsible and are easily taken down and set up again.

When the battalion first arrived in France it was put on

to double tracking of a then existing standard gage line, which it double tracked for eight miles, and station yards and terminals were doubled in capacity. In addition to the laying of track, putting in switches, ballasting, etc., the men moved 34,000 cu. yd. of earth, and the whole work was done in 28 days, which would probably compare favorably with similar work done in peace times in Canada. There was rather a novel experience on this work, in connection with putting in a water supply, which had been under consideration for months. Water was being hauled in in railway tanks and dumped into a reservoir, and on several occasions the consumption was such that the reservoir was nearly emptied before a further supply was brought in. A "push" was contemplated at the time, and it was deemed of the utmost importance that a safe and sufficient water supply be put in. Surveys were quickly made by members of the battalion, and it was found necessary to lay 30,000 ft. of 6 in. pipe line, and to pump the water against a head of nearly 300 ft. The pumps and other material were quickly secured and the excavation for the laying of the mains and the elevated water tanks was started at once. It was explained to the men that the work must be completed in less than two weeks' time, and notwithstanding the terrible weather encountered, the system was in operation on the tenth day. From the above mentioned work and location the battalion was suddenly moved on to light railways on a portion of the western front. Two weeks afterward it took over a portion of the French area, which was further augmented at a later date, and during last winter the battalion handled not only the maintenance of all the light railways in the Army, but did all the construction on the forward lines, some of which ran well in advance of the field guns. The light railway handled in the area referred to constituted more than half of the light railways on the western front at the time. Six light railway construction and maintenance companies of 250 men each, were organized and worked with the battalion, under its instructions on this work.

The importance of light railways and the difficulties of maintenance and construction, should not be underestimated. Some of them are built in summer when the ground is dry and when it is possible to operate them without ballast, and of course when winter comes on, the maintenance is a very big matter, the battalion's experience last winter being, that in some cases it took 20 men per mile, which is very large when it is considered that two or three men per mile will maintain standard gage railways in Canada. For ballast, brick from ruined towns and villages is hauled in and tamped underneath the steel ties, and where ballast is not obtainable, it is necessary to salvage boards, pieces of planks, sheets of galvanized iron, or whatever is available, to be laid longitudinally under the track to keep it from sinking into the mud, so that operations can be carried on and rations and munitions carried up to the men at the front. A good deal of not only construction but maintenance had to be done at times when weather conditions would not permit the enemy's viewing the battalion, otherwise heavy casualties would have resulted. This necessitated the doing of considerable work at night, and the choosing of dull and foggy days, which were not uncommon, for the rest. The lines, of course, were built as far as possible so as not to be under observation, but this could not always be done.

When lines were taken over from the French, in order to keep things going, it was necessary for the battalion not only to handle maintenance and construction, but operation also. The operation was very novel and pleasing to the men, and the locomotive men and firemen, fitters, etc., were brought into play. This was their work, and they were right at home again. The battalion was able to furnish 25 locomotive men immediately.

Last spring, when the German retreat began, the battalion was at once taken off the light railways and put on to stan-

dard gage ones. Surveys were made quickly and the first 11 miles connecting up with a well known city which had been blown to pieces by the Huns before retiring, was put in and operated on the fourteenth day. The battalion had a good many trains off the track during construction on account of the mud, shell holes, etc., but fortunately the line has been doing good service ever since. Four days after it was handed over for operation, it was munitioning and feeding 80,000 men. The battalion was very short of equipment on this work, and notwithstanding the fact that it had only six spike mauls of the regular pattern to put in the spikes, an average of a mile a day, including grading and track laying, was maintained. The rails and ties had to be man handled. The battalion had on this work, attached to it for labor, two brigades, consisting of the flower of the British army, including many titled officers. One of them, an Earl, was called by the rest of the officers "Lizzie," and as a matter of fact they all had nicknames. The spirit of these officers was splendid.

On standard gage work in that area last spring the battalion built altogether about 60 miles of track, the larger portion of which is double tracked, and the line was of such importance that it was ballasted with crushed rock. A large volume of traffic is being carried over it. It was blown up in one or two places by the enemy during construction, but quickly repaired without casualties. This line was carried so close to the Hindenburg line that the army command deemed it wise to discontinue the work, which the men of the battalion were only too anxious at the time to carry on.

The battalion is now in a new area, and on a very agreeable piece of work, where its experiences will not be quite so strenuous as they were at a previous location. Since spring the battalion's equipment has been brought up to what it should be, and it is now in a position to do good work. Without the use of an American track laying machine the battalion accomplished a mile and three-quarters of standard gage track laying in a single day.

ELECTRIFICATION OF THE GOTTHARD RAILWAY.—In view of the difficult conditions under which the Gotthardbahn has to work, the administration of the S. B. B. (Swiss Federal Railways) has resolved to apply for a credit of 2,030,000 francs for the construction of four trial electric locomotives, which are to be tested thoroughly before the final design is decided on. The locomotives are to be run on the Scherzlingen-Spiez-Brig section of the Lötschberg railway, which resembles the Gotthard railway in the general condition of the track. The experience already gained on the Lötschberg line is not considered sufficient therefore. The four trial locomotives are to be of three types, and to be supplied by Messrs. Brown, Boveri and Co., the Maschinenfabrik Oerlikon, and the Lokomotivfabrik Winterthur.—*Engineering, London.*

LABORATORY RAILROAD CARS.—The American Red Cross authorizes the following: The medical advisory committee of the Red Cross war council has decided to equip five laboratory railroad cars, which will be prepared for emergency work against possible outbreaks of epidemics in cantonment camps in this country. Each car will have a staff of five or more experts and will be so stationed at various cities that any cantonment can be reached with one of these laboratory cars within 24 hours on receipt of request from Federal or State authorities. The United States Public Health Service has such a mobile laboratory unit, and Surgeon General Rupert Blue said the Red Cross cars would prove of the greatest assistance in the control of civilian sanitary districts. The plan has also been commended by the Surgeons General of the United States Army and Navy.

Wooding's Automatic Train-Stop

A Spring-Supported Contact Rail, Made Movable to Break Ice; Interesting Experiments with Speed-Control

THE automatic train-stop devised by Dr. B. F. Wooding, of Denver, Colo., which has figured in the reports of the Interstate Commerce Commission for several years past, is the subject of a special report, by the Division of Safety, which has just been issued and which has been sent by the Commission to Congress. It is printed as House Document No. 251. The report covers tests made on the Delaware, Lackawanna & Western, near Newark, N. J., in the first four months of this year, including some experience with freezing weather.

This train-stop, which includes a speed-control apparatus, is of the intermittent electrical contact type, and the most prominent feature peculiar to the Wooding system is the ramp, which is illustrated in Figs. 2 and 4.

The report, as to the main features of the system, is fav-

ing intended to provide a comparatively gradual deflection of the locomotive contact shoe, while the deflection at a stop ramp, was designed to be quicker.

One locomotive, No. 967, was equipped. It was regularly assigned to passenger train service between Montclair and Hoboken, making three round trips daily. The locomotive equipment consisted of a normally closed electric circuit including a storage battery, a contact shoe and circuit breaker mounted on the right hand side of the forward tender truck, an electro-pneumatic valve installed in a branch of the brake pipe, provided with a cut-out cock, and a knife switch for cutting out the battery when tests were not being made; the speed-control feature of the system comprised a branch circuit, normally open at a push button installed in the cab as well as at speed-control contacts of the contact-shoe circuit breaker.

In normal operation, the local circuit on the locomotive is intended to be broken by lateral deflection of the contact shoe, caused by engaging a ramp; if the block section ahead is clear the ramp completes an electric circuit from the battery at the signal location to the valve magnet on the locomotive, the valve thereby being maintained closed. If the block section ahead is occupied, the polarity of the ramp circuit is reversed and therefore opposite to that of the engine circuit, and the valve magnet is de-energized, causing an application of the brakes.

The operation of the speed-control feature of the system is dependent upon the action of an unbalanced wheel or cam forming part of the contact-shoe circuit breaker. The cam carries a contact spring (115) which, upon deflection of

Fig. 1—Circuit Controller Box; Cover Removed Fig. 1a—Circuit-Control Apparatus

orable, although so far as concerns meeting the conditions of a severe winter climate, it is stated that the winter weather experienced with these tests was comparatively mild; but concerning the speed-control apparatus no positive opinion is given, the mechanical construction of this part having been crude and the records available being too meager to warrant any conclusion as to the practical utility of the device.

The track equipment of the installation which was tested included five contact rails or ramps, a stop ramp being installed in connection with signal M-66, and both a caution and a stop ramp being installed in connection with signals M-62 and M-56. The ramps were mounted on brackets attached to the right-hand track rail. The circuits were so arranged that both the caution and the stop ramps in one block were energized from a battery at the signal location when the block ahead was clear, and de-energized when the block ahead was occupied. Provision was also made in the circuits for the detection of the removal or displacement of a ramp. The difference between caution and stop ramps resided in the angle at the entering end, the caution ramp be-

Fig. 2—Contact Bar After a Snowstorm—Looking to the Rear

the contact shoe while passing through a ramp, engages another contact spring (113) mounted on an insulated block in the upper part of the housing, closing one of the open points in the speed-control branch of the locomotive circuits. If the rate of speed is below certain points (predetermined for both caution and stop ramps), say, 12 or 14 miles for caution ramps and 7 or 8 miles for stop ramps, the cam is not intended to complete its entire stroke but to be moved only into position to close the contacts (113 and 115), and maintain that point closed as long as the shoe is in engagement with the ramp. Under these conditions the branch circuit

may be completed by closing the engineer's push button in the cab, and the valve magnet is thereby maintained energized while passing a de-energized ramp. In case the speed is above the predetermined rate, however, the sharper and more abrupt deflection of the contact shoe, resulting from the higher rate of speed, is intended to impart sufficient momentum to the cam to throw it over its center, allowing it to complete its stroke. In this case the speed-control contact (113-115) is closed only momentarily and is broken again as the cam passes over its center and completes its stroke, the contact point being held open during practically the entire time the shoe is in engagement with the ramp and being restored to normal position again by the action of the shoe returning to normal position when it has passed out of engagement with the ramp. Under these conditions, the branch circuit being open at the speed-control contacts in the shoe circuit breaker, the engineman is unable to maintain the valve magnet energized by closing the push button, and he is, therefore, not able to pass a de-energized ramp above the predetermined rate of speed without receiving an automatic application of the train brakes.

The ramp is mounted in brackets clamped to the base of the track rail and held in normal position by coil springs forming a part of the rail clamps; the ramps are intended to

Fig. 2a—Contact Bar; Later Design—Looking Forward

be depressed by a snow plow, or other extra wide car and are then intended to be automatically restored to normal position by the coil springs. A circuit breaker is provided at each end of the ramp, through which the electrical connections are made, and the ramp circuit is broken whenever the ramp is depressed, not being restored until the ramp is returned to normal position.

In the circuit from the track relay to the ramp there are line relays to detect the removal or displacement of a ramp, and slow acting relays to prevent the track relays from opening when the direction of current flow in the ramp circuits is being reversed. In case a ramp should be torn out or displaced sufficiently to open one of the circuit breakers on either end, the circuit for the line relay at the location immediately in rear would be broken, and in consequence the line relay, the slow acting relay, and the track relay at that location would be de-energized, setting the signal at that location at stop and de-energizing the ramps controlled thereby.

The ramps are made of two overlapping angle-iron sections. At each end there is a throat about 5 in. in width and the engine shoe entering the ramp spreads apart the two overlapping sections which are normally held together by U-shaped springs, electrical contact being made on both

sides of the shoe with the edges of the angle iron sections. The engine shoe is deflected toward the track for a distance of 5 in.; the angle at the entering end of a caution ramp is such that this lateral movement of the shoe is accomplished when the shoe has traveled a distance of 60 in. from the point of initial engagement, and on a stop ramp about 32 in.

The speed-control branch of the engine circuits consists of wire 109, Fig. 3, leading from positive side of battery to engineer's push button, normally open; wire 111, contact 113, normally open, contact spring 115, which is permanently connected to the engine shoe, and thence through the shoe, wire 105, knife switch, wire 107, valve magnet, to ground.

Fig. 3—Circuits on Engine

When the contact shoe is deflected upon engagement with a ramp, the cam carrying contact strip 115 is rotated about the stud upon which it is mounted, closing contact 113-115; if the rate of speed is below the speed-control limit this contact is maintained closed as long as the engine shoe is in engagement with the ramp, and if the engineer's push button is held closed the valve magnet is maintained energized, even though the ramp is de-energized. If, however, the rate of speed is above the speed-control limit, on account of the inertia of the cam and the greater force resulting from the impact between contact shoe and ramp, the cam is thrown over its center and the contact finger 115 is carried past the segment 113; the contact is therefore closed only for the instant the cam is rotating, and it is immediately broken and

Fig. 4—Plan of Contact Bar

held open as long as the contact shoe is in engagement with the ramp. The speed-control branch of the engine circuits is therefore open at the shoe circuit breaker whenever the rate of speed of a train while passing a ramp is above the predetermined speed-control limit. The contact segment 113 is curved and so arranged that on the return movement of the cam the contact finger does not engage the face of the segment 113, but passes on the opposite side and does not make electrical contact except for a very brief instant when the engine shoe is being restored to normal position, at the last of the return stroke.

The contact shoe is made up of a bar of iron, 2 in. by 3/8 in. by 19 1/2 in. Pointed ends are provided to cut a path through ice or hard-packed snow. In its normal position the arm is inclined about 30 deg. from the vertical and its lower edge is about 20 in. from the gage side and about 3 1/2 in. above the top of the rail. When the arm passes through a ramp it is deflected toward the track and toward vertical

position, the movement of its lower edge being about 5 in. This apparatus is attached to the rear journal box on the right side of the forward tender truck and is insulated from it. When a ramp is engaged, the upper end of the arm is deflected toward the vertical, more or less violently, and the cam, by contact with the edge shown by dotted lines, Fig. 1a, is rotated to the left. Spring 127 breaks its contact, and contact is made between springs 115 and 113, to the latter of which wire 111 is attached. Spring 115 passes back of spring 113, being in contact with it for the whole distance. If the engagement with a ramp is at less than the predetermined limit of speed, the blow is not violent enough to give cam 124 sufficient momentum to carry spring 115 off from spring 113.

The magnet valve is an electro-pneumatic valve having a resistance of approximately 16 ohms. The connection with the brake pipe is made between the engineer's brake valve and the double-heading cock and consists of a $\frac{3}{4}$ -in. pipe, which leads directly to the magnet valve; in service an angle

Fig. 5—Shoe

cock in this pipe connection is intended to be sealed in open position.

The magnet armature consists of a circular metal disk, carrying a ball which fits into a valve seat in the end of the brake-pipe connection which leads through the magnet core; the ball also serves to hold the armature away from the coil, and its position is adjustable.

TESTS

In January the apparatus was tested 248 times, of which 158 tests were made with ramps de-energized. Of these last, five were failures. The cause of failure was obscure, but it is believed to have been due to a loose or defective stud in the circuit-breaker box. In February the apparatus was overhauled and adjusted and in March and April 632 tests were made, two-thirds of which were carried out with the ramps de-energized. Of these, four were classed as failures. Three of the four were non-dangerous, but the fourth, in which the magnet valve failed to open when it should have opened, is reported as unexplained. A number of tests were

carried out under sleet and snow conditions, and on two cold days water was sprinkled on the ramps to make a coating of ice. Proper electrical contact was made in all of these tests.

Three pages of the report are devoted to a discussion of the failures. The apparatus was rather crude and there was one block signal failure while the tests were being made; but the final conclusion is that, except as noted in connection with the speed control feature, the system operates well.

As to the speed control feature, Dr. Wooding had not made sufficiently detailed preliminary tests, and the government inspectors had to determine for themselves the speed limit which should be employed; and the tests with this particular feature were conducted near the end of the trial season and were not numerous. The report says that in all of these speed control tests, ranging from 12 miles an hour to 59 miles an hour, the brakes were applied properly and the train was brought to a stop without unduly severe shocks.

In all other tests the brake-applying apparatus was controlled so as not to go into operation, the trains on this section of the road being so frequent that no risk of delay could be tolerated.

The report, in conclusion, says:

"The design of the electric circuits is fundamentally sound. * * *

"The forms of contact shoe and ramp provide good electrical contact, which was not interfered with by snow and ice under the comparatively mild winter-weather conditions surrounding the tests, and there was a notable lack of shock or vibration upon engagement of contact shoe and ramps.

"If properly constructed and installed the automatic-stop apparatus could, no doubt, be developed to meet the needs of any railroad company desiring to employ an automatic train-stop system of the ramp type.

"The mechanical construction of the speed-control apparatus employed in the tests was so crude, and the records of its operation at the low, critical speeds are so meager, that no positive opinion can be arrived at concerning the practical utility of this form of speed-control device or the principles embodied therein."

CHINESE RAILROAD CONSTRUCTION.—The projected Chuchow-Chincow line, now being surveyed by American and Chinese engineers, will run in a southwesterly direction from Hengchow, in Hunan, tunneling the Hsiangfei Mountains east of Kiyang to reach Yungchow, Hingan, Lingchuan, Kweilin, Yungfu, Loyung, and Yanchow, a busy port 100 miles west of Pakhoi on the Gulf of Tongking. The estimated distance is 700 miles and the cost of construction \$50,000 per mile.

LORD NORTHCLIFFE ON GOVERNMENT OWNERSHIP.—"During the war, many types of industry in England have been partly or entirely socialized. Whether these will be restored to private control after peace comes is an interesting question," says a writer in *Printers' Ink* who was fortunate enough to secure an interview with Lord Northcliffe at his offices in New York. "In a good many cases, government control will undoubtedly be continued," his Lordship admitted, says the interviewer. "However, industries which were efficiently managed under private control before the war will doubtless go back to their owners. For instance, English railways were, on the whole, well and efficiently handled before the war by the railway companies, and will doubtless go back to them at the conclusion of hostilities. Their greatest weakness, in ante-bellum days, was in their handling of freight, and the government has taught them a lesson of expedition and foresight during the war conditions of complete government control, which they will not soon forget."

FURTHER DATA ON THE ROGERS PASS TUNNEL

Further light on the considerations effecting the use of a pioneer tunnel in driving the Rogers Pass, or what is now known as the Connaught tunnel of the Canadian Pacific, was given recently by J. G. Sullivan, chief engineer of the Canadian Pacific Lines West, in a written discussion of a paper describing this tunnel presented before the American Society of Civil Engineers by A. C. Dennis, who was associated with the contractor on this work. In answer to previous discussion in which questions were raised as to the economy of the pioneer tunnel, since it involves rock excavation that forms no part of the completed tunnel, Mr. Sullivan gave a comparison between the estimated economics upon which the pioneer tunnel scheme was adopted and the actual savings secured. In the estimates he assumed that the pioneer tunnel could be driven from 20 to 25 ft. per day at a cost of \$30 per lin. ft., as this was the only part of the work that would be done under high pressure, the heading in the tunnel proper could be taken out at least \$5 cheaper than if done at high speed, while the bench, containing 18 cu. yd. per foot, because of the absence of interruptions waiting for drilling or cleaning up to put in breast holes or knocking down material to get pipes into the heading, could be taken out for 75 cents per cu. yd. cheaper. On this basis, it was estimated that the tunnel section would be excavated for \$18.50 less, leaving \$11.50 to be taken care of in the interest saved, because of the shorter time required to complete the tunnel.

As actually carried out, the pioneer tunnels cost about \$28 per lineal foot, instead of \$30, while the saving in the enlargement of the tunnel section was much more than 75 cents per cu. yd. Summing up, the cost of driving this main tunnel through rock, including in this the cost of driving 19,610 lin. ft. of pioneer tunnel, 12 cross cuts, each about 40 ft. long, erecting the plant (including freight), the proportionate cost of building about five miles of temporary railway tracks and other overhead charges, plus 10 per cent on all expenditures, will amount to a little less than \$5 per cu. yd. of excavation in the tunnel proper.

In answer to statements that the method would not be applicable where there are soft spots in the rock, he expressed his confidence that the method would prove more economical than any other which has been tried where the soft rock encountered would not exceed 50 per cent of the total.

Mr. Sullivan also made some interesting comments on the selection of the location of the original line over Rogers pass in place of a line around the loop of the Columbia river from Beavermouth to Revelstoke, a location seriously considered when the Canadian Pacific was extended to the coast originally: "The distance around by the Columbia river, from Beavermouth to Revelstoke, is 163 miles, 96 miles longer than the line located by Major Rogers, and for the traffic carried in 1912 and 1913, when the question of double-tracking and revising the line was being studied, it was seriously proposed to abandon the Rogers pass route and build by way of the Columbia river, as almost enough could be saved in the cost of operation on this longer line to pay the interest on the construction of the new line, and a great deal more than the difference in the cost of the two lines, had the company been fortunate enough to build around there in the first place. Nevertheless, the company is now thankful to Major Rogers, for had it originally built the line around by way of the Columbia river, the writer is sure that it would never have been abandoned for the present line, which, with the tunnel and heavy business, is more economical, especially in time, than operating the longer distance by way of the Columbia river. The company should be especially thankful to Sammy Sykes, the locating engineer, who was responsible for the "loops" on the west slope of the Selkirk mountains, inasmuch as the original location ran straight down the

north bank of the Illicillewaet, where, to this day, signs of some abandoned construction work can be seen, but, in order to save money at the expense of distance, Mr. Sykes put in the "loops." The result of introducing these "loops" brought the constructed line into the valley of the Illicillewaet, very close to the west portal of the tunnel.

"These, the writer thinks, are two instances which illustrate the fact that it is never safe to be too sure in a criticism. Here are two cases which could be looked on as blunders, as the increased cost of operation, in the one case on account of the heavy grades and the large rise to be overcome, and in the other case operating over the longer distance of line without improvement in grades, with a reasonable volume of traffic would be greater than the interest on the money that was saved in construction, but which really turned out to be a benefit rather than otherwise."

NEW GUARD RAIL ATTACHMENTS

The cross section illustrates a new device for securing guard rails on curves. In this design the main and guard rails are supported on tie plates having shoulders at each end. By means of small malleable iron pedestals or shims placed under the far edge of the guard rail, together with toggles having

Cross Section Through the Main and Guard Rails

jaws to engage the adjoining flanges of the main and guard rails, a guard rail of lighter section than the main rail can be raised to any desired height. The toggles are placed in the spaces between the ties, and in addition to acting as supports for the guard rail, they serve to hold it against over-

The Guard Rail Fastenings Installed in Track

turning, as the turning moment is resisted by the weight carried on the main rail. In combination with the cast iron shims which are held in position by screw spikes, these toggles definitely fix the flangeway between the heads of the main and guard rails.

The device is simple of application and has the advantage that the guard rail may be changed at any time without disturbing the main rail or the tie plates, and rails of much lighter section than the main rails can be used as guard rails on curves. By using different size toggles and shims any combination of main and guard rails may be utilized and, if desired, a variation in the relative height of the shim block and of the vertical distance between the jaws of the toggles will permit changing the guard rail as much as may be deemed necessary.

The device has been in use in several places on the Louisville & Nashville. One installation on an 18½ deg. curve has been in service since February, 1916, on track subjected to a heavy transfer traffic handled by large locomotives. It is reported that no breakages have occurred in any of the parts, and that the track is free from noise and rattle, while the flangeway remains the same as when installed, except for such wear as has taken place in the head of the guard rail. The device has been patented by Thomas Maney, Louisville, Ky., until recently general roadmaster of the Louisville & Nashville.

SIMPLEX CLASP BRAKE

A clasp brake adapted for use on either four-wheel or six-wheel passenger car trucks is being manufactured by the American Steel Foundries. The design has been worked out with a view to providing a truck foundation brake gear

nected to one another through pull rods and to the brake beams through fulcrum jaws. The brake beams, which are suspended close to the horizontal center line of the wheels, are straight drop forged members of an I-section, with cylindrical brake head trunnions at both ends. Brake hangers pivoted to the truck frame on both sides support the brake beams at the heads. The brake beams have a third point of support at the center where a fulcrum jaw is fastened. This is connected to a swing hanger suspended from a spring steel bracket bolted to the truck frame. The brake beams in turn support the levers and thus all movement and support of the rigging is taken care of by swing hangers.

The adjustable brakeheads, which are mounted on the trunnions, are of a special design to give the maximum space for changing shoes, at the same time affording ample clearance between the brake beams and the flanges of the wheels. Bearings for the release springs are fastened to the brake beams to prevent chafing of the beams. Adjusting screws are provided at the outer ends of the truck and give sufficient movement to adjust the entire rigging, which is necessary only when variations are made in the diameter of the wheels. All moving connections are case-hardened to keep the lost motion in the rigging to a minimum.

The type of construction used in the Simplex clasp brake produces an even distribution of forces on all shoes. Inertia has been reduced by providing the most direct method of transmitting braking force and by keeping the weight of the parts as low as possible consistent with strength. Friction

Arrangement of the Simplex Clasp Brake

that would perform its function in the most efficient manner without sacrificing simplicity, strength and economy of maintenance.

The brake rigging as applied to the truck consists of a double system of vertical levers just inside the wheels, con-

has been minimized by the swing hanger method of support. Since the rods all pass over some part of the truck it is practically impossible for any parts of the rigging to fall to the track. The design has been thoroughly tested by the American Steel Foundries and is in extensive use.

General News Department

Traffic through the Panama Canal has now been uninterrupted by slides for one year, the last obstruction having been cleared September 7, 1916. The canal was opened for traffic on August 15, 1914.

The Boston & Albany, following protracted negotiations, has advanced the pay of track foremen 8 per cent, which is about half of what had been demanded. Laborers will have their pay advanced from \$2.10 a day to \$2.15.

The Alton & Jacksonville, a 21-mile road running out of Alton, Ill., has filed a petition with the Illinois State Public Utilities Commission asking permission to dismantle the line, dispose of its holdings and retire from business.

The United States Civil Service Commission announces examinations October 3 for the position of tariff clerk for the Interstate Commerce Commission; salary, \$1,200 a year. Applicants must be male and over 18 years of age.

Three railroads, the Southern, the Georgia, Florida & Alabama and the Gainesville & Midland, have applied to the Georgia Railroad Commission for authority to disregard those sections of the state law which prohibit the operation of freight trains on Sunday.

The Canadian Pacific, following protracted negotiations, has advanced the pay of the locomotive enginemen and firemen on its western lines, the increases to date from August 1. It is said that the men on passenger trains will receive an advance of about 9 per cent, and those on freight trains 5 per cent. The new agreement provides for the eight-hour day.

The New York Central has temporarily suspended the rule under which all employees reaching the age of 70 years are to be retired on pension, and those not physically unfit will be retained in the service. Former employees, now retired on pension, who are physically able and competent to perform some work, will be re-employed, temporarily, if they so desire.

A law was passed at the recent session of the Indiana legislature which requires that a township wagon or conveyance used for the purpose of carrying children to and from school shall be brought to a full stop at steam or electric railway crossings, and some responsible occupant of the vehicle must walk ahead and ascertain whether the tracks are clear before the vehicle may cross the tracks.

In court at Bluefield, W. Va., on September 6, G. A. Smith was awarded damages of \$15,921 against the Brotherhood of Locomotive Engineers for having expelled him from the brotherhood. Smith had sued for \$50,000, and the award is said to have been based on his expectation of life and on the amount of the insurance policy which he had held in the brotherhood. The brotherhood will appeal to a higher court.

Mrs. Ralph Peters, wife of the president of the Long Island Railroad is in charge of a plan whereby a group of Long Island women will erect and equip five "hostess houses" for the men at Camp Upton, the National army cantonment at Yaphank, L. I. One will be for officers and four for privates. The houses will be used as meeting places for officers, soldiers and their relatives who visit them. A restaurant will be installed in each house, and food will be served visitors at cost.

Employees of the Chicago, Milwaukee & St. Paul, drawn from its various offices in Chicago, were recently sworn into the Eleventh National Guard regiment of Illinois. The St. Paul men constitute a separate company under the leadership of J. Welch, captain, who is assistant general auditor of the road. The company is now in training at Springfield, Ill., and is one of many recently formed as home guard forces to take the place of militia regiments which are preparing to go to France. A. H. Davies, chief inspector of demurrage of the St. Paul at Chicago, is now organizing a supply company of St. Paul employees for the same regiment.

The New York Central has opened telegraph schools at Utica, N. Y., and Rochester, N. Y., for the instruction of students in telegraphy and in the operation of block signals. There have been approximately 80 applications for enrollment to date. An entrance fee of \$2 is charged, and thereafter a monthly tuition fee of \$1. The money is refunded to students who complete the course and who enter the service of the railroad company. A similar school has been operated at Albany, N. Y., for a number of years.

The State Corporation Commission of Virginia has imposed on the Southern Railway a fine of \$500 for having granted free passes to officers of the state. Such action is declared to be in violation of the constitution and laws of the state. The trial of the case brought out a copy of a letter in which the railway company had sent an annual pass, good over certain divisions, to a county sheriff, the terms of the accompanying letter constituting a contract by which the pass was to be deemed full payment for services performed by the sheriff for the railway or in connection with suits brought by or against the railway.

Western Railway Club Meeting

The Western Railway Club will hold the first meeting of the winter season on September 17, at the Hotel Sherman, Chicago. E. Vanamaker, electrical engineer of the Rock Island Lines, will present a paper on "War and Welding."

Railway Returns for September

The Interstate Commerce Commission's partial summary of railway revenues and expenses for September, covering the operations of 203,621 miles of road, shows an increase in operating revenues from \$1,300 to \$1,488 per mile of line, an increase in expenses from \$837 to \$1,013 and an increase in net operating revenues from \$463 to \$475. For the seven months of the year the report shows an increase in revenues from \$8,579 to \$9,585, an increase in expenses from \$5,732 to \$6,774, and a decrease in net revenue from \$2,847 to \$2,811.

Soft-Coal Output Lower

The Geological Survey, Department of the Interior, authorizes the following:

A direct measure of the serious effect of labor trouble is furnished by the statistics of bituminous coal production for the week ended August 18. In this week by reason of strikes in Illinois and the Southern Appalachians the ratio of tonnage produced to full-time capacity, as limited by present labor supply, was lowered for the country from 71.8 per cent to 62.5 per cent. In the districts directly affected the reductions were in Illinois from 70.3 per cent to 54.8 per cent and in eastern Kentucky and Tennessee from 74.2 to 10.8. Conditions in Iowa, Indiana and Ohio improved slightly, and the output percentage in western Pennsylvania declined from 78.2 to 69.4.

Seeks Data on Best Methods of Shipping Food Products

To determine the best ways of shipping, handling and transporting food products to avoid injury from unfavorable temperatures or other injurious weather conditions, the United States Weather Bureau recently has solicited the help of persons engaged in such work in compiling a manual of protective methods. Information is desired as to the best type of containers for various products; the methods of handling and packing; the most efficient types of cars for use during hot and cold weather; devices for cooling, heating and ventilating the same, and special precautions to be taken with particular classes of goods; housing of cars to secure additional protection en route or at terminals; railroad inspection of perishables and cars, and accuracy of thermometers used; kinds of heaters and advantages and disadvantages; icing requirements and regulations; protective value of wrapping paper; acceptance regulations as to low or high tem-

perature limits; best form of waybill to secure attention en route and at terminals; salvage or restoration processes; protective methods to and from depots or cars on track; and suggestions as to Weather Bureau service to meet the requirements of shipper, merchant and carrier.

Strike of Mechanics on Boston & Maine Ended

The strike of mechanics on the Boston & Maine was officially declared off Monday, and the 3,300 men involved are back in their places. An agreement was reached late Saturday night at a conference between the strikers, the railroad officers and the Massachusetts Committee on Public Safety.

Both the union and the railroad agreed that the wages be raised five cents an hour, provided the men return to work at once. The men asked for eight cents an hour, and the remaining three cents will be submitted to an arbitration for decision. Henry B. Endicott, executive manager of the Public Safety Committee, was chosen the sole arbitrator.

Freight Claim Record on Salt Lake Route

According to a recent announcement by H. C. Nutt, general manager of the Los Angeles & Salt Lake, that company has made substantial reductions in the ratio of loss and damage payments to gross freight revenues in the past decade. In the fiscal year 1909-1910, these payments constituted 2 per cent of the gross freight revenues, and in each subsequent year up to 1915 the ratio had been reduced to one per cent. In the fiscal year 1915-1916 it had been reduced to 0.64 per cent, in the last six months of 1916 to 0.46 per cent, and in the first six months of 1917 to 0.38 per cent; and this in face of the rising value of the commodities carried, which means higher claims for losses. This increased efficiency in stopping freight claim leaks has been due to the hearty co-operation of officers and employees to that end, working through the medium of safety and efficiency committees.

Liberty Bond Posters

Fairfax Harrison, chairman of the Railroads' War Board, has addressed a bulletin to the railroads stating that the Treasury Department of the United States has requested the railroads to permit the placing of a poster for the second Liberty loan in the waiting room of every railroad station in the United States, and a Liberty loan text book furnishing authoritative information regarding the loan in the hands of each station agent in the United States. The posters contemplated will be 36 in. by 48 in., lithographed in six colors, and are now in preparation. It is recommended to the railroads that the placing of the posters be permitted, and it is suggested that the proper officer on each railroad write direct to Oscar A. Price, director of publicity, Treasury Department, Washington, D. C., advising the number of posters necessary for its use and to whom they shall be sent.

Loss of Live Stock on Right of Way

The International & Great Northern has issued a general order under date of September 1 for distribution among officers, employees and patrons of the road, pointing to the economic loss in live stock killed on the right of way, and urging everybody to do all that can be done to reduce this waste. In the last fiscal year there were killed on the International & Great Northern 671 head of cattle, 474 hogs and sheep, and 153 horses and mules.

The general manager has also sent specific suggestions to the division superintendents, as follows: 1, owners of stock should keep their animals in fenced enclosures and should not permit their stock to roam at large on the railroad right of way; 2, superintendents, assistant superintendents, trainmasters, roadmasters, stock claim agents, station agents and section foremen should make personal appeals to the owners of stock to keep their animals in fenced enclosures; 3, enginemen should be impressed with the fact that it is very necessary that every precaution be taken within their power to avoid striking stock, and under no circumstances must they fail to report stock struck or seen on the right of way; 4, section foremen should keep stock off the right of way, farm gates closed and fences and cattle guards in good repair, giving preference to locations where the liability of stock getting on the track is greatest; 5, superintend-

ents should get in touch with newspaper editors to present this important matter to the public through the press.

Strike of Freight Handlers at Kansas City

A strike of the freight handlers called last week at Kansas City, Mo., has affected practically all of the lines entering that point. Three of the roads, the Atchafalaya, Topeka & Santa Fe, the Chicago, Burlington & Quincy and the St. Louis-San Francisco, are reported as having almost their entire forces at work again. The Chicago, Rock Island & Pacific was closed Monday and a small force was put to work Tuesday morning. Most of the other lines closed entirely and there have been no disturbances of any kind. The chief demand of the men is recognition of their union, an increase of from 25 to 35 per cent in wages, an eight-hour day, a six-day week and time and a half for overtime. Employees of packing houses at Kansas City are also out on a strike and indications are that men in other industries will join in a sort of general walkout. Authorities have not determined whether the conditions are due to German influences or to I. W. W. propaganda.

U. S. Chamber of Commerce Referendum on Railroad Regulation

The Chamber of Commerce of the United States has sent out to its members ballots for a referendum vote expressing the opinion of its members on four recommendations of the chamber's railroad committee on questions of railroad regulation, as follows:

1. That provision be made for federal regulation of the issuance of railroad securities.
2. That Congress pass a general railroad incorporation law under which all railroad carriers subject to the jurisdiction of the Interstate Commerce Commission may organize.
3. That if Congress passes a railroad incorporation law, all railroad carriers subject to the jurisdiction of the Interstate Commerce Commission, both those now existing and those hereafter to be created, be required to organize under this law.
4. In view of the fact that conflict has arisen with respect to the jurisdiction of the Interstate Commerce Commission over intrastate rates, even though such rates affect interstate commerce, the committee recommends that the commission be given authority by statute to regulate intrastate rates when those rates affect interstate commerce.

Railway Accidents in Great Britain in 1916

The British Board of Trade has issued its annual report on railway accidents for the last calendar year, and it is a pamphlet of only six pages, this reduction from the usual 60 or 70 pages having been made to economize printing and paper. And, besides this economy, the office records have been reduced in volume by an order relieving the railroads from reporting some of the less important accidents.

Three passengers, twelve employees and one other person were killed by train accidents during the year, and 350 passengers, 182 employees and 17 other persons were injured. In the preceding year the number of passengers killed in train accidents was 269, that record having included the disaster at Quintinshill, where 224 soldiers were killed. The average number of passengers killed in train accidents yearly during the ten years preceding 1915, was 21. Adding accidents due to other causes, mostly the victims' own fault, and including also those where no train movement was concerned, the totals for 1916 were 156 passengers, 441 employees and 453 other persons were killed and a total (all three classes) injured, of 5,589. The total killed, all classes, 1,066, was 88 less than the average total for the ten years preceding 1915. The total number of injuries reported last year, 5,589, is very far below all earlier records for the reason that in 1916 the railways were not required to report non-fatal accidents to employees, where the movement of trains was not concerned. In 1915 this class included 59 killed and 21,202 injured. This last number indicates the extent of the relief to the clerical staffs of the railway companies by the suspension, during 1916, of the usual reporting requirements. Of the employees killed in 1916 under this head, only four were trackmen. The number of trespassers killed in the United Kingdom last year, 310, is 54 less than in 1915 and 142 less than the average yearly number in the preceding ten years.

* Merged with Missouri Pacific, June 1, 1917.

Will Burn Coal Instead of Oil

According to advices received by the Texas Railroad Commission, there is such a shortage of expert mechanics that the Southern Pacific and the Santa Fe are meeting delay in changing the fuel equipment of their locomotives from oil burners to coal burners. The purpose of going back to the use of coal is in order to conserve the crude oil supply for war purposes. The demand for mechanics is said to be the greatest ever known in the history of Texas. Thousands of these skilled artisans have left the state during the last several months to take employment in industrial plants in the North and East. The railroad shops have been largely depleted of this class of employees, and there is no source open by which to fill the existing demand for them.

The equipment of the Texas railroads will be taxed to its limit during the next few weeks. In addition to the regular traffic of cotton and the usual heavy fall shipments of grain and other farm products, the railroads are now being called upon to handle an unprecedentedly large troop movement. Besides the transportation of the soldiers for the new army to the different military camps in the state, large numbers of cars and engines will be required to handle the supplies necessary for their maintenance. The diverting by order of the Federal government of export shipments through the ports of Galveston, Port Arthur and Beaumont will also bring into use much additional equipment of the railroads.

The drought in the cattle section of Texas is causing an unprecedented demand for freight cars for the transportation of starving cattle to sections where water and grass are available. In many cases the railroads are utterly unable to supply these cars, and the loss of thousands of head of cattle badly needed to augment the nation's food supply may result.

Railway Revenues and Expenses, June, 1917

The net operating income of the railways of the United States for June, 1917, was more than for June, 1916, by \$32 per mile, or 8.1 per cent, according to the monthly bulletin of the Bureau of Railway Economics.

Total operating revenues, \$349,739,636, exceeded those for June, 1916, by \$49,720,256. Operating expenses, \$235,590,773, were greater by \$39,363,926. Net operating revenue, \$114,148,863, increased \$10,356,330. Taxes, \$16,567,481, increased by \$2,912,302. Net operating income was \$97,516,514, which is an increase of \$7,506,833.

If spread over the mileage represented, operating revenues average \$1,514 per mile, an increase over June, 1916, of 16.3 per cent; operating expenses per mile, \$1,020, were greater by 19.8 per cent; net operating revenue per mile, \$494, shows an increase of 9.8 per cent, while the net operating income per mile, \$422, increased 8.1 per cent. Taxes per mile rose 21.1 per cent.

This summary covers 231,035 miles of operated line, or about 90 per cent of the steam railway mileage of the United States.

For the Eastern railways, operating revenues per mile were greater than those for June, 1916, by 14.1 per cent; operating expenses rose 21.0 per cent; net operating revenue increased 0.4 per cent; taxes increased 14.1 per cent. Operating income per mile decreased 1.4 per cent.

For the railways of the Southern district, operating revenues per mile exceeded those for June, 1916, by 19.9 per cent; operating expenses rose 26.9 per cent; net operating revenue increased 6.7 per cent; taxes increased 38.1 per cent. Operating income per mile increased 2.0 per cent.

For the Western railways, operating revenues per mile exceeded those for June, 1916, by 17.9 per cent; operating expenses rose 16.1 per cent; net operating revenue increased 21.1 per cent; taxes increased 22.1 per cent. Operating income per mile increased 21.1 per cent.

The six months of the current calendar year, compared with the corresponding period of the preceding year, show changes per mile of line as follows: Operating revenues increased 11.6 per cent, operating expenses increased 17.7 per cent, net operating revenue decreased 1.4 per cent, taxes increased 16.3 per cent, while operating income decreased 4.2 per cent.

Operating income per mile decreased 19.8 per cent in the East, increased 2.6 per cent in the South, and increased 11.2 per cent in the West.

REVENUES AND EXPENSES OF STEAM ROADS—JUNE, 1917.

Compiled from monthly returns of the railways to the Interstate Commerce Commission and covering roads of Class I, i. e., roads with annual operating revenues above \$1,000,000.

* Less than one dollar.

d Decrease.

June net operating income per mile was 8.1 per cent greater in 1917 than in 1916, 35.7 per cent greater than in 1915, 65.2 per cent greater than in 1914, and 48.6 per cent greater than in 1913.

War Convention of American Business Men

The keynote of the War Convention of American Business Men, to be held under the auspices of the Chamber of Commerce of the United States, at Atlantic City September 18 to 21, will be given by Secretary of War Baker, who will tell the business men from all parts of the country what the government expects of them in connection with the war. It is expected to be by far the most significant gathering of the kind since the beginning of the war.

Secretary Baker will bring out the underlying thought of the entire convention, which is the duty business owes the government in war. He will speak as president of the Council of National Defense, and will indicate to business men what services they can render the government in connection with its prosecution of the war.

The convention on later days will divide into groups of business men to consider the application to different lines of business of the broad principle as developed by the Secretary of War in his address. There will be a meeting of the National Council Monday, September 17. The regular sessions will begin Tuesday and last through the following Friday.

At the opening session on September 18 George M. Reynolds, president of the Continental Commercial National Bank, of Chicago, will make clear the call that is made upon every business man to sacrifice personal interest at this time for the national good.

Secretary Lane will open the second session on the first day and will take advantage of the gathering together of business men from all sections of the country to tell for the government, that in the conduct of the war every business man is relied upon to do his part.

Frank A. Scott, chairman of the War Industries Board, will also speak at the second session. Mr. Scott will explain the constitution of the recently created War Industries Board, and the manner in which this board works, and its relations to the industries of the country in providing munitions and supplies of all sorts for the army and navy.

The convention will not be confined to discussions of commercial problems. After the business session each day, there will be meetings in the evenings to hear distinguished men on various interesting aspects of the war, and its effect upon our allies, and our relations with our allies.

On one evening Boris Bakhmeteff, Ambassador from the New Russia to the United States, will discuss phases of the Russian situation which are of particular interest to business men of the United States, and will make suggestions to business men regarding the part which they can play in the development of New Russia.

At one of the early sessions, A. C. Bedford, president of the Standard Oil Company and chairman of the committee on oil of the Council of National Defense, will state for the benefit of business men, representing all lines of industry, the manner in which the oil industries have faced the problems of conservation of supplies and distribution of product.

At another session, Lord Northcliffe, chairman of the British Mission, will deliver an address on what American business men may do to aid our allies.

Giving Preference to Freight Shipments

Business men who may at some time apply for preferential shipment under the terms of the new law (administered by Judge Lovett) should bear in mind that preference can be granted only when essential to the national defense and security. When a manufacturer recently applied for preferential shipment of a material of which he was in need, inquiry was made of these branches of the government served by him, to develop how he stood on contract deliveries and what his attitude was toward supplying the government at fair prices. Business men should not forget the maxim of equity that those asking relief and assistance should come with clean hands.—U. S. Chamber of Commerce Committee Waddill Catchings, Chairman.

Foundrymen's Convention

The annual meeting of the American Foundrymen's Association and the American Institute of Metals will be held in the Mechanics' building, Boston, Mass., September 25 to 28, inclusive. The meeting will be accompanied with its usual extensive exhibits, many of which will be of direct interest to railway men. The following are some of the subjects that will be discussed during the convention:

"Fire Prevention in Large Industrial Establishments," by C. W. Johnson, Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa.
 "Co-Operative Shop Training," by W. B. Hunter, Fitchburg high school, Fitchburg, Mass.

"Improving the Relationship Between Employer and Employee," by J. F. Kent, American Cast Iron Pipe Company, Birmingham, Ala.

Report of A. F. A. committee on safety, sanitation and fire prevention, by Victor T. Noonan, chairman, Industrial Commission of Ohio, Columbus, Ohio.

Report of A. F. A. representatives on the conference board on training of apprentices, by Frank M. Leavitt, chairman, University of Illinois, Chicago.

"Application of Pulverized Coal to the Air Furnace," by W. R. Bean, Naugatuck Malleable Iron Works, Naugatuck, Conn.

"How Malleable Iron Has Improved," by Enrique Toaceda, Albany, N. Y.
 "Troubles Encountered in Machining Malleable Iron: Causes and Remedies," by A. T. Jeffery, Dayton Malleable Iron Company, Dayton, Ohio.

Report of A. F. A. committee on general specifications for gray iron castings, by W. F. Putnam, chairman, Detroit Testing Laboratory, Detroit, Mich.

"The Effect of High Sulphur in Gray Iron Castings," by T. Mauland, International Harvester Company, Chicago.

"A New System of Burning Crude Oil," by W. A. Janssen, Davenport, Iowa.

"The Use of Vanadium in Steel Castings," by J. Lloyd Uhler, Union Steel Castings Company, Pittsburgh, Pa.

"Melting Yellow Brass in New Form of Induction Furnace," by G. H. Clamer, Ajax Metal Company, Philadelphia, Pa.

"Casting Bearings in Sand and Metal Molds," by R. R. Clarke, Pennsylvania Lines West of Pittsburgh, Pittsburgh, Pa.

"The Present Status of Tin, Fusible Plug Manufacture and Properties," by Dr. George K. Burgess, bureau of standards, Washington, D. C.

"Stellite," by Elwood Haynes, Haynes Stellite Works, Kokomo, Ind.

"The Use of Bronzes in Railroad Turntables and Movable Bridges," by O. E. Selby, Big Four Railroad, Cincinnati, Ohio.

"Analysis of Rabbits and Brasses," by E. W. Hagmaier, Buffalo, N. Y.
 Address by Richard C. MacLaurin, president, League to Enforce Peace.

"The Flux and Cleaner Question of Brass," by E. D. Frohman, S. Obermayer Company, Pittsburgh, Pa.

"Pyrometers: Their Construction and Application," by John P. Goben, Brown Instrument Company, Philadelphia, Pa.

Among the supply companies exhibiting, the following are interested in the railway supply field:

Ajax Metal Company, Philadelphia, Pa.
 Armstrong Cork & Insulating Company, Pittsburgh, Pa.
 Atkins & Company, E. C., Indianapolis, Ind.
 Athol Machine Company, Athol, Mass.
 Ayer & Lord Tie Company, Chicago.
 Beaudry & Company, Inc., Boston, Mass.
 Besley & Company, Charles H., Chicago.
 Bullard Machine Tool Company, Bridgeport, Conn.
 Carborundum Company, Niagara Falls, N. Y.
 Chicago Pneumatic Tool Company, Chicago, Ill.
 Cleveland Pneumatic Tool Company, Cleveland, Ohio.
 Davis-Bournonville Company, Jersey City, N. J.
 Joseph Dixon Crucible Company, Jersey City, N. J.
 General Electric Company, Schenectady, N. Y.
 Goldschmidt Thermit Company, New York.
 Hauck Manufacturing Company, Brooklyn, N. Y.
 Monarch Engineering & Manufacturing Company, Baltimore, Md.
 Mahr Manufacturing Company, Minneapolis, Minn.
 Osborn Manufacturing Company, Cleveland, Ohio.
 Oswald Acetylene Company, Jersey City, N. J.
 Quigley Furnace Specialties Company, New York.
 Sullivan Machinery Company, Chicago.
 Titanium Alloy Manufacturing Company, Niagara Falls, N. Y.
 United States Graphite Company, Saginaw, Mich.
 United States Silica Company, Chicago.
 Warner & Swasey Company, Cleveland, Ohio.
 Whiting Foundry Equipment Company, Harvey, Ill.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meeting and the places of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hope, C. R. of N. J., 143 Liberty St., New York. Next meeting, October 16-17, St. Louis.

AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 16-18, 1917, Chicago.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 22 W. 57th St., New York.

ASSOCIATION OF AMERICAN RAILWAY ACCOUNTING OFFICERS.—E. R. Woodson, Rooms 1116-8 Woodward Bldg., Washington, D. C. Next meeting, September 26. Congress Hotel, Chicago.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—W. L. Connelly, Superintendent, Indiana Harbor Belt, Gibson, Ind. Next annual meeting to have been held September 18, 1917, Washington, D. C., indefinitely postponed.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual dinner, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S ASSOCIATION.—W. R. McMunn, New York Central, Albany, N. Y. Next convention to have been held September, 1917, St. Louis, indefinitely postponed.

CINCINNATI RAILWAY CLUB.—H. Boutet, Chief Interchange Inspector, Cincinnati, 101 Carew Bldg., Cincinnati. Regular meetings, 2d Tuesday, February, May, September and November, Hotel Simon, Cincinnati.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 568 Union Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh, Pa.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

INVESTMENT BANKERS' ASSOCIATION OF AMERICA.—Frederick R. Fenton, 11 W. Monroe St., Chicago. Annual convention, October 1-3, 1917, Baltimore, Md.

MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—F. W. Hager, Fort Worth & Denver City, Fort Worth, Tex. Next annual convention, October 16-18, 1917, Cleveland, Ohio.

NATIONAL ASSOCIATION OF RAILWAY COMMISSIONERS.—Jas. B. Walker, 120 Broadway, New York City. Next annual convention, October 16, 1917, Washington, D. C.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meeting, 2d Tuesday in month, except June, July, August and September, Boston.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meeting, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—Geo. A. J. Hochbrebe, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.

PACIFIC RAILWAY CLUB.—W. S. Wollner, Assistant to Chief Engineer, Northwestern Pacific R. R., San Francisco, Cal.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—F. C. Stewart, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Pittsburgh Commercial Club Rooms, Colonial-Annex Hotel, Pittsburgh.

RAILWAY FIRE PROTECTION ASSOCIATION.—C. B. Edwards, office of the president's assistant, Seaboard Air Line, Norfolk, Va. Next meeting, October 2-4, 1917, St. Louis, Mo.

RAILWAY REAL ESTATE ASSOCIATION.—R. H. Morrison, Assistant Engineer, C. & O., Richmond, Va. Next convention, October, 1917, Duluth, Minn.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Myers Bldg., Bethlehem, Pa. Next annual convention, September 18-19, 1917, Hotel Traymore, Atlantic City, N. J.

RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—P. J. McAndrews, C. & N. W., Sterling, Ill. Next annual convention, September 18-21, 1917, Hotel Auditorium, Chicago.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

SOCIETY OF RAILWAY FINANCIAL OFFICERS.—L. W. Cox, N. & W., Philadelphia, Pa. Next annual convention, October 16-18, St. Louis, Mo.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grand Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 a. m., Piedmont Hotel, Atlanta, Ga.

TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Waldorf-Astoria Hotel, New York.

TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Gen'l Ag't, Erie R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings bi-monthly, Pittsburgh.

UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, 1111 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.

WESTERN CANADA RAILWAY CLUB.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Monday in month, except June, July and August, Hotel Sherman, Chicago.

WESTERN SOCIETY OF ENGINEERS.—Edgar S. Nethercut, Acting Secretary, 1735 Monadnock Block, Chicago, Ill. Regular meeting, first Monday in month, except January, July and August. Extra meetings generally on other Monday evenings except in July and August.

Traffic News

The State Public Utilities Commission of Illinois has continued from September 7 to September 18 a hearing on the application of Illinois roads for a modification of the commission's recent order in a general 5 per cent advance in freight rates case.

The Southern Pacific recently added a freight-carrying steamship to its service between New York and Galveston. The new ship, "El Almirante," has a cubic cargo capacity of 398,490 ft., and a total dead-weight carrying capacity of 8,500 net tons. Its designed speed is 11 knots an hour.

The Delaware & Hudson Company, after a conference with the traffic commissioner of the Albany (N. Y.) Chamber of Commerce, has adopted a rule under which it is proposed to have "sailing days" for freight shipped from Albany, with a view to saving car space by sending cars to given destinations only every second or third day, instead of every day as at present.

The Maine Central has issued tariffs, effective September 1, increasing local passenger fares to the basis of 2.75 cents a mile, and mileage books to the basis of 2.50 cents a mile, an increase of one-fourth cent in each case. So far as intrastate rates are concerned the new tariff cannot go into effect as the Public Utilities Commission of Maine has suspended the tariff until December 1.

The State Public Utilities Commission of Illinois will hold a hearing at Chicago on September 12 to consider proposed additions and changes to the Illinois Commissioners' Classification. New ratings are asked on baskets, phonograph cabinets, cement mixing compounds, concrete slabs, corn oil, paper, envelopes, household goods, lime, live poultry, tubing, pipe fittings, stoves, ranges, furnaces, stone, self-propelling vehicles and other commodities. The commission has just issued Supplement No. 31 to Illinois Commissioners' Classification No. 10, effective October 1.

The Commission on Car Service has addressed a circular to the railroads announcing that in order to relieve congestion and resulting delays in shipments of raw cotton, the director of the Bureau of Export Licenses has been authorized by the Exports Administrative Board to waive, until October 1, the requirement of export licenses for raw cotton destined to Great Britain, France, Italy, Japan, or their colonies, possessions and protectorates, and also shipments direct to Russia. All shipments which are covered by railroad bills of lading or ocean bills of lading dated October 1 or later will require licenses.

The Commission on Car Service has issued a circular to the railroads stating that it has come to its notice that in some cases placards affixed to the outside of cars carrying government shipments are not removed at destination of the loading. The result is that cars subsequently move about the country in various directions with other loading or empty, thus destroying the effect which the placards are intended to accomplish, which is that government freight shall be given preference. The roads are asked to give instructions that will insure the removal of such placards in all cases as soon as the shipments to which they apply are unloaded.

An inquiry into the reasonableness of rates on cotton and woolen goods proposed by the New England railroads was begun at Boston Tuesday by Examiner Patterson, of the Interstate Commerce Commission. Last April the railroads filed tariffs which would increase the rates on cotton piece goods between New England points and New York about eight cents per 100 lb. and would also increase the rates on woolen piece goods and on manufactures from cotton and wool. These tariffs were suspended by the Commission on complaints by the various mills represented by the Arkwright Club, the American Woolen Company, and others.

Large quantities of freight will be moved by boat on the Mississippi river, in the near future, if a writer in the New York Sun may be believed. He says that boats which have been rotting at their wharves for years are now being refitted for

active service, and that "feverish activity" is observable at almost every important port on the river. The government is now making a canal through or around the Le Claire Rapids, the only remaining obstacle in the river to the use of boats throughout its length drawing six feet of water. The northern limit of navigation has been extended from St. Paul to Minneapolis. Large steamships navigate the river from the sea up to 40 miles above Baton Rouge. Looking at the other side of the picture, this writer says: "Outside New Orleans the most primitive methods of handling river traffic are still to be found at many large ports. Freight is being handled very much as it was in the days before the civil war. In many ports trucks cannot be used, and every package is taken aboard by manual labor. At one port freight being transhipped from the railroad to the river is carried by man power over four railroad tracks and down a mud river bank to the steamer."

Illinois Commission Makes Appeal for Car Economy

The State Public Utilities Commission of Illinois, on September 12, issued "An Appeal to the Patriotic Public," calling attention to the need of uninterrupted maintenance of railway transportation and pointing out that it is the duty of every American citizen and institution to co-operate with every agency which is helping win the war. "The plain truth," says the Commission, "is that the railroads have not, and will not have, during the war enough freight cars to meet the demand. They cannot get cars which were ordered many months ago. Load every car promptly and to the maximum marked capacity. Unload every car with the greatest possible despatch. Ask only for the cars needed, and when needed. . . . Buyers of many commodities can and should order by maximum carloads instead of by the customary trade units. . . ."

Progressive Farmers

The Association of State Farmers' Union Presidents, in session at Houston, Texas, September 5, adopted resolutions endorsing the federal food control act and commending the guaranteeing of prices; and the resolutions continued: We understand the food act as giving the federal government complete supervision of all transactions connected with all articles of trade between producer and consumer, except that of transportation; and . . . we look upon the future of our transportation industry with deep concern mingled with alarm. We consider the physical properties inadequate to meet traffic requirements, the public policy confusing and uncertain and the political conscience we believe hostile to a calm and dispassionate treatment of the subject. Farmers' unions have invariably asked for federal control either through regulation, operation or ownership. We venture the conclusion that the agricultural public favors exclusive federal authority over rates, securities and equipment through such a system as will bring about the greatest economy and efficiency in service.

Cincinnati Freight Houses Now Closing Earlier

Since September 1 freight houses at Cincinnati, Ohio; Covington, Ky.; Newport and Ludlow, have closed daily, except Saturday and Sunday, at 3:30 p. m., instead of at 4:30. The new closing hour was agreed upon by the Cincinnati committee of the Commission on Car Service and the local committee of the National Industrial Traffic League. The Merchants and Manufacturers Package Freight Bureau, Cincinnati, recommended closing at 2:30 p. m., and the action in adopting 3:30 p. m. as the closing time was a compromise between those who favored the early hour and those who opposed any change from the old hour. W. C. Farrington, vice-chairman of the Cincinnati committee of the Commission on Car Service, states that the new closing hour is essential on account of the application of the eight-hour day to train, engine, yard and other operating employees, which makes it necessary to make up locals and run connecting line transfers earlier. The earlier hour is also desirable because of the fact that in Cincinnati, as in most other railroad centers, the making up of locals and through freight trains takes place in the yards, which must also be used for switching passenger trains together, etc. Under former conditions locals and other trains handling cars from freight houses could not be made up until 7 or 7:30 p. m., or sometimes later, thus congesting the yards when they should be clear for incoming and outgoing pas-

senger service. The new plan enables bill and other local office clerks in freight houses to finish their work earlier than formerly, when they were generally held until 6:30 or 7 p. m. every night sorting, checking and typing the bills brought in by last-minute shippers. From the standpoint of the prompt handling of freight the new closing time is superior to the old, as many trucks formerly arrived at the houses just at 4:30 p. m., and had to stand in line possibly until 6 o'clock before they could get to the platforms and unload, a condition which inevitably resulted in congestion and delay.

Urges Early Shipment of Wheat

Fairfax Harrison, chairman of the Railroads' War Board, has issued a statement urging the early marketing of wheat. The statement says:

"We are assured that the price of wheat determined by the President will be maintained throughout the year by the Food Administration, and that there can be no objective in holding wheat. In fact the farmer saves interest and deterioration by marketing early.

"At the present time the railways can handle more wheat to storage points for ready distribution and to mills to be manufactured into flour for domestic consumption and exportation to our Allies, where it is much needed, and for which ships are available at ports. The railways wish to appeal to the farmers to bring their wheat to market now. Later in the fall the handling of many more products will cause congestion and delays.

"The railways are now being operated in common to serve the entire community. The demands for movements of military and supplies will be an increasing burden. Therefore, the railways must have the co-operation of the entire community."

Meeting of Chicago Car Service Committee

At the last meeting of the Chicago Committee of the Commission on Car Service it was decided that the plan of equalizing box cars used at freight houses and transfer platforms in the Chicago switching district, agreed upon June 11, cannot be successfully carried out without defeating the purpose of the Commission owing to the fact that cars are repeatedly ordered from eastern to western lines to take care of the movement of eastbound traffic. The plan was therefore abandoned. It was also announced that a committee of local freight agents of roads entering South Bend, Ind., had been formed to act in conjunction with and to assist the Chicago Committee.

D. I. Forsyth, vice-chairman of the Chicago Committee, presented a report on intensive loading activities. He stated that considerable difficulty is encountered in inducing shippers to load grain to the carrying capacity of cars because of the practice of buyers in eastern and New England territory of ordering minimum carload shipments, particularly of oats, which they will not accept in lots of more than 51,000 to 54,000 lb. per car. Investigation of a large number of cars has disclosed the fact that only 80 per cent of car capacity is utilized for oats, 89 per cent on wheat and 72 per cent on corn. The matter of prevailing upon eastern buyers to order full carloads has been taken up with the committees at Boston, New York and Philadelphia and the Commission on Car Service at Washington. To illustrate the possible improvement in loading, Mr. Forsyth cited one Chicago shipper, who recently forwarded 26 cars of export oats, which were loaded to 105 per cent of capacity. Had this shipment been loaded on the basis of domestic shipments, it would have required 30.65 cars. At the same time, five cars of domestic oats were loaded which, on the export basis, could have been taken care of in four cars. Reports from a brick company at Bernice, Ill., indicate that it is loading cars to 98 and 100 per cent of carrying capacity. Reports from the Forest Hill (Chicago) station of the Baltimore & Ohio Chicago Terminal show that the average trap car loading was 23,430 lb. for July, 1917, as against 21,518 lb. for July, 1916. Outbound loading of merchandise during the same period was 18,625 lb. as against 16,000 for July, 1916. According to advice from Sheboygan, Wis., the C. Reiss Coal Company, in July, 1917, loaded 327 cars of soft coal to 99.8 per cent of marked capacity and 509 cars of hard coal to 105.1 per cent of marked capacity.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The Interstate Commerce Commission has suspended until March 12 the proposed Central Freight Association class rate scale No. 2.

The Interstate Commerce Commission has announced a hearing for the taking of further testimony on the protest of the Kansas City Southern to the tentative valuation of its property made by the division of valuation, at Kansas City, Mo., on September 18 before Examiner-Attorney John H. Gray.

The Interstate Commerce Commission has approved for filing a tariff of the Pullman Company increasing the fares for accommodations between El Paso and Laredo, Texas, and destinations in Mexico on the Constitutionalist railway by changing the fare from Mexican currency to United States currency. The proposed fares are the same as those in force on the Constitutionalist railway and have the approval of the Mexican government. The commission allowed them to become effective on three days' notice.

An informal hearing was held before the suspension board of the Interstate Commerce Commission at Washington on September 10, at which shippers protested against the proposed increases in rates filed by the railroads on petroleum and petroleum products in Official Classification territory, and grain and grain products and by-products from western points to Trunk Line territory. Clifford Thorne and officers of the National Petroleum Association and the Western Petroleum and Refiners' Association presented a strenuous opposition to the proposed increases in petroleum rates on the ground that they would play into the hands of the Standard Oil interests, which transport their product largely by pipe lines, to the disadvantage of independent oil interests. These tariffs are among those filed by the eastern railroads in an effort to secure advances in a large number of commodity rates on which advances were denied in the decision of the commission in the 15 per cent case.

Grain and Grain Products from Cairo

Cairo Board of Trade v. Cleveland, Cincinnati, Chicago & St. Louis et al. Opinion by Commissioner Meyer:

Upon complaint that the rates on grain and grain products from Cairo, Ill., to points in trunk line and New England territories are unjust and unreasonable, and unduly prejudicial to Cairo and unjustly preferential of Chicago, Peoria, St. Louis and other points from which reshipping rates are published, held:

Such rates are not shown to be unjust and unreasonable on grain from Cairo proper.

The maintenance of reshipping rates from Chicago, Peoria and East St. Louis, Ill., and from St. Louis, Hannibal, and Louisiana, Mo., but not from Cairo, Ill., is unduly prejudicial to Cairo and unjustly preferential of competing markets. The unlawful prejudice and disadvantage required to be removed by the publication of reshipping rates from Cairo to the destinations involved not more than one cent higher than the reshipping rates contemporaneously maintained from St. Louis to the same destination. (46 I. C. C., 343.)

Class Rates on Southeastern Traffic at Indianapolis

Indianapolis Chamber of Commerce v. Cleveland, Cincinnati, Chicago & St. Louis et al. Opinion by Commissioner McChord:

Prior to October 15, 1914, defendants maintained proportional class rates from Indianapolis and Terre Haute, Ind., and Chicago, to Ohio River crossings applicable to southern traffic subject to the southern classification, and the local class rates northbound on similar traffic were subject to the southern classification. On that date the local rates were made effective on southbound traffic from Indianapolis and Terre Haute, and northbound and southbound traffic was made subject to the official classification. No change was made in the proportional rates from Chicago, or as to the application of the southern classification on southbound and northbound traffic. On April 1, 1915, the Indianapolis

and Terre Haute rates were increased 5 per cent, but no corresponding change was made in the Chicago proportional rates. Upon the facts of record; *Held*, That the carriers have shown that the present rates and charges are reasonable *per se*, but that the present adjustment results in undue prejudice to shippers and receivers of southeastern traffic at Indianapolis and Terre Haute. (46 I. C. C., 547.)

Buffalo Grain Cases

Buffalo Chamber of Commerce et al. v. Buffalo Creek et al. Opinion by Commissioner Harlan:

Ex lake rates on grain and grain products, domestic and export, from Buffalo to the Atlantic seaboard and interior points in the same general territory are not found to be either intrinsically unreasonable or unduly preferential of Chicago to the prejudice and disadvantage of Buffalo.

The maintenance of ex rail reshipping rates on domestic and export grain from Chicago to the Atlantic seaboard and interior points in the same general territory, when rates the same in kind are not contemporaneously maintained from Buffalo to the same territory, is, however, found to be unduly preferential of Chicago to the undue prejudice and disadvantage of Buffalo.

The defendants' refusal to accord transit service for the same charge at points east of Buffalo on grain moving from Buffalo as they accord at the same points on grain from Chicago, Toledo, Detroit, Cleveland and Sandusky, is found to be unduly prejudicial of Buffalo.

The defendants are required to submit for examination and approval a schedule of ex rail reshipping rates on domestic and export grain from Buffalo, and also a schedule of amended transit services and charges free from the inequalities herein found to exist. (46 I. C. C. 570.)

Eastern Commodity Rates Suspended

The Interstate Commerce Commission has suspended until December 30, with certain exceptions, tariffs filed by the eastern railroads in what has been designated as the eastern commodity rate case, in which the roads have endeavored to secure advances not allowed by the commission in the 15 per cent case in commodity rates which have a definite relation to the class rates, and which the roads claim would be discriminatory if not advanced when the class rates are increased. The tariffs which the commission has suspended were to become effective on September 15 and later dates. The commission's order named the tariffs involved and announced the suspension of all schedules in them insofar as they affect increases in rates all-rail, except for a long list of commodities, which included alcohol, aluminum, coal and coke, leather, grain and grain products, iron ore, iron and steel articles, live stock, lumber and hogs, fresh and dressed meats, oil, petroleum and its products, packing house products, stone and sugar. The proposed advances in the eastern rates on live stock and fresh meats which were included in the list of exceptions were, however, suspended by another order until January, 1918. These rates were the subject of an informal hearing before the suspension board on August 28. The grain and petroleum rates were the subject of similar hearings on September 10 and 11.

Second Duluth Case

Commercial Club of the City of Duluth et al. v. Pennsylvania Company et al. Opinion by Commissioner Harlan:

This proceeding is a renewal of the efforts the city of Duluth has been making for some years to secure a rate adjustment that properly accords with its location at the head of western extremity of the great lakes. By way of the lakes the route from Buffalo to Duluth is 985 miles in length; and there are various intervening lake ports through which traffic may move between Duluth and practically the whole of Official Classification territory lying east of the Indiana-Illinois state line, over rail-and-lake routes that do not differ greatly in length from the all-rail hauls between the same points. This practical parity in the length of the various routes is accompanied by a further condition that is favorable to Duluth, because of the fact that the movement of commerce by water is relatively less expensive than its carriage by rail. These advantages, as Duluth contends, were not reflected in the rates in effect when the complaint was filed.

The commission's findings are as follows:

The rail-and-lake class and commodity rates to Duluth from all points in trunk line territory and from all points in central freight association territory are not shown to have been or to be unjust and unreasonable.

Such rates from certain points in trunk line territory that are higher than the rates from the same points to Chicago are, however, found to be unduly prejudicial of Duluth and unjustly preferential to Chicago.

Class differentials in the rates to Duluth under rates to the twin cities of St. Paul and Minneapolis, heretofore found reasonable and now observed, are on the six classes in cents per 100 pounds 21, 18, 13, 8, 7 and 5. Commodity rail-and-lake rates to Duluth in excess of rates obtained by deducting the class differential of the classification of such commodity from the contemporaneously named rates to the twin cities are found to be unduly prejudicial of Duluth and preferential to the twin cities.

Applications for authority to continue to charge for the transportation of all freight from points of origin in official classification territory to Minneapolis, Minn., and St. Paul, Minn., and points taking the same rates, over rail-and-lake, lake-rail-and-lake, and lake-and-rail routes through Lake Superior or Lake Michigan ports, class and commodity rates which are lower than the rates contemporaneously maintained on like traffic to intermediate points over the same routes and through the same ports, granted in part, denied in part, and in part reserved for further consideration. (46 I. C. C. 585.)

STATE COMMISSIONS

The Public Service Commission of Indiana on September 11 granted an increase of 15 cents a ton on coal, where the rates exceeded 80 cents a ton, and 10 cents a ton where rates were below 80 cents.

COURT NEWS

Effect of Federal Employers' Liability Act on State Workmen's Compensation Acts

The Federal Employers' Liability Act, within its scope, viz., interstate commerce, deals with the same subject that is dealt with by the New Jersey Workmen's Compensation Act, under which the duty of an employer to make compensation to an employee for injuries arising out of the employment may exist independently of the negligence of the employer; whereas the federal statute makes such duty to depend upon such negligence, and excludes the existence of such duty in the absence of negligence. The federal act, being thus comprehensive, both of those cases in which it excludes liability and of those in which it imposes it, the New Jersey Court of Errors and Appeals holds that it ousts the courts of common pleas of the state of jurisdiction under the New Jersey Workmen's Compensation Act to award the compensation to be paid by a carrier to its employee for injuries received by the latter while both were engaged in interstate commerce. — *Ronsaville v. New Jersey Central (N. J.)*, 101 Atl. 182. Decided June 18, 1917.

Notice of Claims Recent Cases

The Kansas City Court of Appeals, considering an interstate shipment of live stock, holds that a provision that the shipper should give written notice of any claim for damages before the stock is removed and mingled with other stock, is enforceable; and the provision cannot be waived by the carrier. The fact that the carrier's local agent saw the live stock when it arrived and knew of its bad condition, or made "bad order" report to the company, did not dispense with the notice of damage required by the contract of shipment. — *O'Brien v. Pryor (Mo.)*, 195 S. W., 759. Decided May 21, 1917.

The Iowa Supreme Court holds that a bill of lading condition that claims for loss, etc., must be made in writing within four months, is reasonable and binding on a shipper in an action against a terminal carrier, although the condition was made by the initial carrier. In order to recover, the shipper must show by competent evidence not only that he delivered the statement, but the terms of the statement itself. The latter he cannot do by parol testimony. The only effect of the Carmack amendment, as applied to connecting or terminal carriers, is to give them the benefit of all lawful conditions or provisions in the contract made

by the shipper with the initial carrier.—*Erisman v. C. B. & Q. (Iowa)*, 163 N. W., 627. Decided June 26, 1917.

A bill of lading signed by the consignor and the carrier contained on its face a recital "that every service to be performed shall be subject to all the conditions, . . . (including conditions on back hereof)." On the back of the contract was the stipulation that claims for loss must be made in writing within four months. The claim was not filed until after the lapse of nearly a year. The Georgia Court of Appeals holds that the provision requiring notice within a certain time does not amount to an attempt to exempt the carrier from liability for negligence. Such a clause is not void on the ground that the carrier thereby seeks to limit liability, and does not give as a consideration therefor any extra service or special rate or other monetary consideration to the shipper, or that it is contrary to the public policy of the state. Judgment for the plaintiff was reversed.—*Southern v. Simpson (Ga.)*, 93 S. E., 47. Decided June 18, 1917.

The Mississippi Supreme Court holds that a live stock contract provision, requiring verified claim of loss or damage to be given to specified railroad employees within 10 days after the stock is removed, is valid as to interstate shipments; but that the stipulation may be waived by the acts and conduct of the proper agents of the railroad company. It is held to be waived where the shipper wrote the railroad's general claim agent regarding his claim within the 10 days, and the claim agent negotiated with him concerning its payment.—*Illinois Central v. Bauer (Miss.)*, 75 So., 376. Decided May 21, 1917.

The Oregon Supreme Court holds that in an action against a common carrier for damages due to failure to notify consignor of non-delivery of goods, failure to present a formal bill as a claim for damages within the time limited in the contract was not fatal, where the defendant was notified in writing that the consignor had a claim against it and insisted on its payment; the consignor's letters being so specific as to give the defendant the preliminary information necessary to a proper investigation of the facts.—*Stoddard Lumber Co. v. Oregon-Washington R. & N. Co. (Ore.)*, 165 Pac., 363. Decided May 29, 1917.

Statutory Exemption from Liability to Passenger Who Violates Rules

The New Jersey statute provides if a passenger be "injured by reason of his going . . . on the platform . . . in violation of the printed regulations" posted in a "conspicuous place inside of cars," said company shall not be liable for the injury. Defendant railroad conspicuously posted at each end of its cars a notice reading, "Passengers must keep off the platform until the train stops." Plaintiff, on defendant's train in New Jersey, after the station was called, but before the train stopped, went upon the platform, and was thrown to the ground in front of the station by a jerk of the train. The New York Appellate Division holds that defendant was not liable for plaintiff's injury. This plaintiff was injured while deliberately violating a rule which unmistakably forbade his going onto the platform "until the train stopped." If the statute means anything, it permits this notice, and exempts defendant from liability for accidents from its violation. If the prohibition in the notice means anything, it prohibits the very act of the plaintiff which resulted in his injury.—*Kettell v. Erie*, 163 N. Y. Supp., 640.

Recent Decisions Under the Federal Employers' Liability Act

The Kentucky Court of Appeals holds that a trackman of an interstate carrier killed just after "smoothing" the track, and while going to a place designated by the foreman to assist in unloading ties to be used in the track, was engaged in interstate commerce.—*L. & N. v. Williams (Ky.)*, 194 S. W., 920.

The Wisconsin Supreme Court holds that a track man, who was peeling ties intended for use in an interstate roadbed when injured was not engaged in interstate commerce.—*Karras v. Chicago & N. W.*, 162 N. W., 923.

The Vermont Supreme Court holds that where a railroad employee was injured while repairing a roundhouse wall of the railroad, a portion of which fell upon him, he was not engaged in interstate commerce.—*Castonguay v. Grand Trunk (Vt.)*, 100 Atl., 908.

Where an employee of an interstate carrier was not engaged in interstate commerce at the time of his death, the Georgia Court of Appeals holds that the fact that he was killed by an

interstate passenger train would not bring him within the operation of the act.—*Hardy v. Atlanta & West Point (Ga.)*, 93 S. E., 18.

A station employee was killed by a train carrying interstate passengers and mail while attempting to pass in front of it to secure mail from it intended for his station. The Massachusetts Supreme Judicial Court holds that he was engaged in interstate commerce.—*Lynch v. B. & M. (Mass.)*, 116 N. E., 401.

The Mississippi Supreme Court holds that a railroad laborer engaged in loading sand and gravel for use in repairing defendant railroad's interstate roadbed is not engaged in interstate commerce.—*Yazoo & M. V. v. Houston (Miss.)*, 75 So., 690.

The Alabama Supreme Court holds that a person employed by a railroad as a member of a posse to search for and apprehend bandits who had robbed an interstate train was not engaged in interstate commerce so as to fix liability on the road for his death under the act.—*Alabama Great Southern v. Bonner (Ala.)*, 75 So., 986.

The Texas Supreme Court holds that a brakeman who received a fatal injury from being thrown from the top of a car while engaged in switching cars destined for points without the state was engaged in interstate commerce.—*Geer v. St. Louis, S. F. & T. (Tex.)*, 194 S. W., 939.

The Colorado Supreme Court holds that where a trackman, when injured, was engaged in inspecting and repairing a track used in interstate commerce, he was engaged in interstate commerce.—*Denver & R. G. v. Da Vella (Colo.)*, 165 Pac., 254.

The Illinois Supreme Court holds that a switchman, who is fatally injured while engaged in moving cars from shops to storage tracks to be iced, the cars not having at that time been selected to participate in interstate shipments, is not engaged in interstate commerce, even though the cars, when afterward moved to a loading platform, are loaded with interstate goods.—*Chicago Junction v. Industrial Board (Ill.)*, 115 N. E., 647.

An employee was engaged in removing snow from tracks, both interstate and intrastate. The work was temporarily suspended, and the employee was going along the track to take refuge in a covered car from a storm, when he was struck by an overdue passenger train and killed. The New Jersey Court of Errors and Appeals holds that it was for the jury to say whether he was engaged in interstate commerce at the time, and judgment for the plaintiff was affirmed.—*Armbrecht v. D. L. & W. (N. J.)*, 101 Atl., 203.

The Texas Court of Civil Appeals holds that a trackman, injured while helping the assistant foreman to take ties unloaded on the right of way to a stack near the toolhouse for convenience, and to keep them in good shape for future use, was not injured in interstate commerce, though the branch of the railroad on which the ties were afterwards used was employed by the road in hauling interstate freight.—*M. K. & T. v. Watson (Tex.)*, 195 S. W., 1,176.

A rear brakeman on a freight train at the end of his run still had these duties to perform: Take down the markers, clean and fill eight lamps and lanterns, sweep out the caboose, register in, and, in this instance, get a supply of kerosene from the storehouse. As soon as the caboose was set on its proper track, the brakeman took in the markers and got the kerosene, and then sat down to read, and fell asleep for three hours. He then finished his duties and started on the usual route through the yard between two tracks. There was room enough by walking carefully to avoid injury, but he unconsciously swerved towards one of the tracks, and his foot was crushed by a locomotive coming up from behind. In an action under the act, alleging negligence through failure to ring the engine's bell, the Minnesota Supreme Court held that it was a question for the jury whether the unintentional delay of a few hours in the plaintiff's work removed him from the protection of the act.—*Davis v. Rock Island (Minn.)*, 158 N. W., 911.

The New York Appellate Division holds that a man in the employ of a railroad at its coal pockets at its yard, part of whose work was to coal the engines as required, and at other times to shovel coal from cars into chutes, and who, immediately before the contributory negligence of a fellow servant, a hostler in charge of a switching engine, resulting in his death, was engaged in coaling the switch engine used wholly within the yard in moving cars engaged both in interstate and intrastate commerce, and which on the day of the accident had moved only cars engaged in interstate commerce, was not himself "engaged in interstate commerce."—*Giovio v. N. Y. C.*, 162 N. Y. Supp., 1,026.

Equipment and Supplies

FREIGHT CARS

THE VERDE TUNNEL & SMELTER RAILROAD is in the market for 25 60-ton ore cars.

THE JAVA STATE RAILWAYS are reported as having ordered 172 box cars from the Standard Steel Car Company.

THE TEXAS COMPANY is buying specialties for 300 tank cars, which it will build in its own shops at Port Arthur, Tex.

THE PROCTER & GAMBLE TRANSPORTATION COMPANY has ordered 100 40-ton tank cars from the Pennsylvania Tank Car Corporation.

THE RUSSIAN GOVERNMENT is negotiating for the purchase of specialties and parts for about 10,000 cars, which will be assembled in Russia.

PASSENGER CARS

THE ERIE is in the market for 88 underframes for passenger cars.

THE GRAND TRUNK PACIFIC recently asked prices on 50 to 100 refrigerator cars for passenger train service.

THE CHICAGO, MILWAUKEE & ST. PAUL is asking prices on 50 refrigerator cars for passenger train service, reviving an inquiry first issued last February.

SIGNALING

THE MISSOURI, KANSAS & TEXAS has ordered from the General Railway Signal Company the materials for an interlocking plant at Muskogee, Okla.—24-lever machine, with 22 working levers.

THE NEW YORK CENTRAL has ordered from the General Railway Signal Company a 16-lever electric section for a Model 2C electro-mechanical interlocking machine, to be mounted on an existing Saxby & Farmer machine at Berea, Ohio.

THE UNION PACIFIC is to install a mechanical interlocking at Laramie, Wyo., a 32-lever Saxby & Farmer machine, with 24 working levers and eight spare spaces. The material will be furnished by the General Railway Signal Company.

THE SEABOARD AIR LINE is to install an interlocking plant at Bellaire, Fla., a 12-lever Saxby & Farmer machine, with 10 working levers. The contract has been let to the General Railway Signal Company, whose men will install the apparatus.

THE PENNSYLVANIA has ordered from the General Railway Signal Company three 8-lever interlocking machines, and three dwarf interlocking machines, to be installed at Wrightstown, N. J., where the government has established a military training camp.

THE ATCHISON, TOPEKA & SANTA FE has ordered from the General Railway Signal Company an electric interlocking plant for Bragdon, Colo.; a 32-lever, Model 2 unit lever type machine, with 23 working levers. The material will be installed by the railroad forces.

THE CINCINNATI, NEW ORLEANS & TEXAS PACIFIC has ordered the materials for alternating-current, automatic block signals between Science Hill, Ky., and King's Mountain, 14 miles. This installation will consist of 25 one arm, three position signals, with the necessary relays, switch indicators, transformers, lighting arresters, track impedances, relay boxes, etc. The materials will be furnished by the General Railway Signal Company.

\$14,550,000 FOR GOOD ROADS.—For the construction and maintenance of rural post roads the Secretary of Agriculture announced recently the apportionment of \$14,550,000 of federal funds to be used in the fiscal year ending June 30, 1919, by the several states.

Supply Trade News

Charles V. Eades, sales manager and engineer of the asphalt products department of the Sarco Petroleum Products Company, Chicago, for the past eight years, has left the service of that company.

Arthur C. Sullivan, formerly with the Hensley Trolley Manufacturing Company, of Detroit, Mich., has been appointed a sales representative of the National Railway Appliance Company, New York. Mr. Sullivan will be attached to the Chicago office of the company.

The Robinson Paint Company, Aurora, Ill., announces that it has purchased the plant, business and good will of the Akron Mining, Milling & Manufacturing Company. The business will be continued along the same general lines as heretofore, with the same organization.

The Standard Asphalt & Refining Company, 208 South La Salle street, Chicago, has purchased the plant, trade-mark and good will of the Sarco Petroleum Products Company. The Cities Service Company, 60 Wall street, New York, is behind this company, although the management will be essentially the same as heretofore. Charles Muller, who was an executive of the former company, has been appointed manager, and Robert S. Trumbull has been promoted to manager of the railway and building materials' department.

H. J. Richardson has been appointed works engineer for the Berger Manufacturing Company, Canton, Ohio. His new work includes the power plant, new constructions, maintenance and repair of manufacturing equipment and buildings. Mr. Richardson recently was connected with the New England Westinghouse Company, where he was manager of the gate department. Previous to this connection he was acting chief engineer of the ordnance department of the Crucible Steel Company, Harrison, N. J., and prior to that he was with the Commonwealth Edison Company of Chicago, the last seven years of this service having been in the engineering department.

Thomas H. Garland, president of the Garland Ventilator Company, Chicago, whose death was announced in the *Railway Age Gazette* on August 23, was born at Augusta, Me., on December 10, 1855. He entered railway service as a brakeman with the Chicago, Burlington & Quincy, at Quincy, Ill., in 1872, and several years later became baggage man at the same point. In 1882 he was promoted to clerk in the freight office at Chicago, and later was appointed chief clerk in the same department, which position he held until his appointment as superintendent of refrigerator car service. In 1908 he left the Burlington to engage in the railway supply business in which he was interested until his death.

Lewis S. Louer, western manager of Sweet's Catalogue Service, Chicago, has purchased a half interest in Engineering and Contracting, Chicago, and has assumed the business management of this publication, sharing the ownership with Halbert P. Gillette, who remains chief editor. Mr. Louer has been in the technical publication field since 1895, when he first became connected with the advertising service department of the Engineering and Mining Journal. He was advertising manager of Cassier's Magazine from 1896 to 1902, when he became western manager of Engineering Record. After ten years' service with that company he resigned to become western manager of Sweet's Catalogue Service.

The Austin Company, structural engineers, Cleveland, Ohio, announces the promotion of Edward Smith to chief draftsman in the Philadelphia office. Mr. Smith was born near Finleyville, Pa., on December 8, 1873, and graduated from Pennsylvania State College in 1893. He began his business career as a draftsman with the Keystone Bridge Works in 1896, and was later associated with the Fort Pitt Bridge Works and the American Bridge Company at Pittsburgh, Pa. In 1905, he became structural engineer of the Pittsburgh Railways Company.

in the construction of the Cannonsburg branch. Several years later he became associated with the Wheeling & Lake Erie as assistant engineer in the Cleveland office, which position he held until he went with the Austin Company.

James P. Beck, general manager of the Portland Cement Association, Chicago, died September 8 at that city. Mr. Beck was born at Odell, Ill., January 27, 1886, and graduated from the University of Illinois in 1907. He entered the employ of the Universal Portland Cement Company the same year, and two years later was made publicity manager. He was later prominent in connection with the conduct of shows of the Cement Products Exhibition Company. In the fall of 1915 he was chosen to prepare plans for broadening the scope of the work of the Association of American Portland Cement Manufacturers, and in December of that year, when his plan was adopted, he was made general manager of the association. This position he continued to hold up to his death.

The Sangamo Electric Company announces the opening of a Chicago district office in the Old Colony building, in charge of C. H. Hurtt as district manager. For several years past the Sangamo company has had a Chicago representative located with the Electric Appliance Company, for many years selling agents for the Sangamo Electric Company throughout the middle west. In establishing this new office, the Sangamo company has made no change in the selling arrangements, which it has had for many years with the Electric Appliance Company and the Federal Signal System (Electric) of Chicago, who will continue to handle Sangamo products exactly as in the past. The new office has been established with a view to giving a more complete service on Sangamo meters and other products than has heretofore been possible in Chicago and surrounding territory, this being necessary on account of the greatly increased demand for Sangamo products. A completely equipped repair department will be maintained as heretofore, under the management of the Chicago office.

Automatic Straight Air Brake Company

The Automatic Straight Air Brake Company has been incorporated under the laws of Delaware with a capital stock of \$5,000,000 preferred and \$20,000,000 common to manufacture and sell a new type of air brake, the invention of Spencer G. Neal, who is the designing engineer of the company.

The directors are A. B. Boardman, A. M. McCrea, K. B. Conger, H. I. Miller, C. R. Ganter, S. C. Holaday, A. M. Trueb and G. C. Pierce.

The officers will be H. I. Miller, chairman of the board and president; K. B. Conger, vice-president and treasurer; A. M. Trueb, secretary and auditor; and G. C. Pierce, chief engineer. The company will have offices at 14 Wall street, New York.

Good progress is being made in the preparations for a railroad officers' demonstration of the brake, which will take place in New York the early part of October.

Arrangements for manufacture are well under way. The company will not build its own plant until after the war.

Baldwin Locomotive Works

President Alba B. Johnson of the Baldwin Locomotive Works announces the following changes in the organization of that company and of the Standard Steel Works Company. In the Baldwin Locomotive Works no change has been made with respect to William L. Austin, chairman of the board, or Alba B. Johnson, president. Samuel L. Vauclain, hitherto vice-president, however, becomes senior vice-president; Grafton Greenough, sales manager, now becomes vice-president in charge of sales; J. P. Sykes, general superintendent, becomes vice-president in charge of manufacture, and James McNaughton, formerly vice-president of the American Locomotive Company, becomes consulting vice-president.

In the Standard Steel Works Company, William Burnham, heretofore president, has been elected chairman of the board, and other officers have been elected as follows: Alba B. Johnson, president; Samuel M. Vauclain, senior vice-president; Robert Radford, vice-president and treasurer; A. A. Stevenson, vice-president and engineer; Wm. H. Pugh, Jr., secretary; T. L. Rogers, assistant treasurer, and O. C. Skinner, works manager.

Railway Construction

ESSEX TERMINAL.—The Dominion parliament has authorized this company to build a branch from the existing line near Ojibway, Ont., to Pelton, seven miles.

GAULEY & EASTERN.—See Kanawha & Michigan.

KANAWHA & MICHIGAN.—The Gauley & Eastern is building from Gauley Bridge, W. Va., on the Kanawha & Michigan, along the west bank of Gauley river to Belya in Fayette county, on the Kanawha & West Virginia, 5.6 miles. The grading contract has been let to J. B. Lindsay, Littleport, Ohio, and involves handling 35,000 cu. yd. to the mile, three-quarters of which will be rock work. The track laying and bridge work will be carried out by company forces. The line is being built to carry coal and lumber.

NEW YORK, NEW HAVEN & HARTFORD.—This company has begun work with its own forces in preparation for the new brick station, which is to be built at New Haven, Conn. The building will be 90 ft. wide by 300 ft. long, and will face Union avenue. The main waiting room is to be 80 ft. wide and 136 ft. long. Part of the second story will be used as a dining room, and the rest of the second story for offices.

PACIFIC ELECTRIC.—This company is making several improvements at the Macy street yards, Los Angeles, Cal., which include the construction of a car inspection house, 246 ft. by 85 ft., with six through pit tracks; a car repair shop, 160 ft. by 150 ft.; a two-story trainmen's building, 32 ft. by 82 ft., containing instruction room, locker room, offices, etc., and a storehouse, 22 ft. by 25 ft. The total cost of the buildings will approximate \$151,000.

FROM SINGAPORE TO BANGKOK BY RAIL.—By the linking up of the Federated Malay States railways (which now extend northward to the Siamese border) with the southern railway system of Siam, through rail communication, has been established from Singapore to Bangkok, a distance of nearly 500 miles. The railway from Prai, opposite the island of Penang, to the Siamese border, has been built and will be operated by the Federated Malay States Railway Department, and is the property of the Federated Malay States Government. The railway from Perlis (one of the nonfederated Malay States) border to Bangkok has been built by the Siamese Government with funds loaned by the Federated Malay States Government, and will be operated by the Siamese Railway Department. It is intended, at the opening of the line for through traffic in April next, to commence with a weekly express service in either direction, the journey from Penang to Bangkok occupying 36 hours.

RAILWAY PROGRESS IN JAPAN.—The Imperial Railway Board of Japan is now contemplating the construction of 28 new railway lines, with an aggregate length of 1,135 miles, an increase of nearly 20 per cent in the present mileage under Government operation. The cost will be approximately 179,160,000 yen (£18,000,000 or \$87,500,000). A report of N. S. Marshall, manager of the Yokohama branch of the International Banking Corporation, states: "Last year an investigating committee was appointed by the Okuma Cabinet to study the possibility of converting the entire railway system of Japan from a 3 ft. 6 in. gage to the standard 4 ft. 8 in. This could be accomplished only with a huge outlay, as tunnels, bridges, stations, and practically the entire present equipment would have to be altered or replaced. Greater speed and carrying capacity are urgently needed, due to the requirements of new industries; for over a year there has been a great congestion of freight at the big commercial centers. On one of the regular lines a stretch of 4 ft. 8 in. track is being laid down on the same sleepers which bear the narrower gage. A special locomotive is being constructed and tests are to be made (with the cars now used) as to the increased speed and hauling capacity of the wider gaged engine, as well as to determine whether it will be possible to put down the 4 ft. 8 in. track without changing the 7 ft. sleepers."

Railway Financial News

CHICAGO & EASTERN ILLINOIS.—The sale of this company has again been postponed to take place at Danville, Ill., on November 4.

CHICAGO, ROCK ISLAND & PACIFIC.—Nathan L. Amster has sent out circulars to stockholders of the road announcing his intention of soliciting proxies for the election of directors at the annual meeting next month. The circular was in the form of a report on the progress made by the minority stockholders' committee. "We are arranging today," says the circular, "to send out about 1,400 checks to the Rock Island stockholders, returning to them the amount of their voluntary contributions which they sent my committee to help defray its expenses during the last two and a half years. In returning to the stockholders every cent that they sent the committee I will be out about \$9,000 in cash, which I incurred in out of pocket expenses during the two and a half years of the Rock Island campaign, but for which I have no way of procuring vouchers. One cannot ask for a receipt for every dollar he spends in connection with a work like this lasting nearly three years. It is interesting to point out in connection with this two things that have never been done before: That 1,400 stockholders should respond with voluntary contributions of from \$2 up, amounting to \$32,570. That every cent contributed by these stockholders should be returned to them in full. However, the Rock Island stockholders have accomplished in their fight quite a number of things that heretofore seemed impossible—as for instance: The forcing of the Wallace committee to distribute the shares pro rata to the collateral bondholders instead of selling the entire block of stock at auction and making a distribution of the cash resulting from such a sale, which everyone admits would have been very small, especially at a time in 1914 when the stock exchanges were closed, and when there was no market for even the most gilt edged security. Preventing the powerful Peabody committee from forcing a sale of the property under the refunding mortgage, etc. We have still, however, work on hand in the final contest at the coming annual election on October 11, to see that stockholders elect a board of directors representative of themselves, who will conduct the affairs of the company in their interest, and not, as in the past, in the interest of individuals with small, if any, holdings of stock."

GULF, MOBILE & NORTHERN.—See the Meridian & Memphis Railway below.

HOCKING VALLEY.—The Ohio Public Utilities Commission has approved this company's application for authority to issue \$5,000,000 of 6 per cent gold notes to run one year, maturing November 1, 1919, to be sold to pay and refund an issue of \$4,000,000 5 per cent notes, maturing November 1, 1917, and to pay for improvements made.

MERIDIAN & MEMPHIS.—This 33-mile line extending from Meridian, Miss., to Union, was recently sold to the Gulf, Mobile & Northern.

MISSOURI, KANSAS & TEXAS.—See editorial comments elsewhere in this issue.

NEW YORK, NEW HAVEN & HARTFORD.—Vice-president Edward G. Buckland has stated that a proposition for an issue of \$45,000,000 of 7 per cent preferred stock will be submitted to the stockholders at their annual meeting in October. The proposed stock issue is to meet the road's outstanding \$45,000,000 of 6 per cent short-term notes which fall due next May.

SEABOARD AIR LINE.—The National City Company and the Guaranty Trust Company are offering at 98 and interest, to yield slightly more than 7 per cent, the \$4,000,000 two-year 6 per cent notes of this company. The notes are secured by the deposit of \$5,334,000 of the company's first and consolidated bonds. They are dated September 15, 1917, and mature September 15, 1919.

Railway Officers

Executive, Financial, Legal and Accounting

C. G. Nelson has been elected secretary and treasurer, and appointed auditor of the Chicago, Milwaukee & Gary, with office at Rockford, Ill., vice W. F. McSwiney, resigned.

The election of J. M. Herbert, first vice-president in charge of the St. Louis Southwestern, at St. Louis, Mo., as president of that road to succeed Edwin Gould, is commented on elsewhere in this issue.

C. S. DuBelle, assistant treasurer of the Susquehanna & New York at Williamsport, Pa., has been elected treasurer of the Susquehanna & New York and the Tionesta Valley, with office at Williamsport, vice F. E. Bradley, and A. H. Bloomfield succeeds Mr. DuBelle.

Operating

L. V. R. Clum, chief clerk in the car record office of the Erie at New York, has been appointed assistant superintendent of transportation, with headquarters at New York.

W. C. Griffin, car accountant of the Georgia & Florida and the Augusta Southern, at Augusta, Ga., has been appointed superintendent of car service, and his former position has been discontinued.

H. R. Manby, acting superintendent and engineer of the Tennessee Central, at Nashville, Tenn., has been appointed superintendent and engineer; T. W. Burk has been appointed inspector of transportation. Both with offices at Nashville.

J. R. Stemm and D. J. Clark, trainmasters on the Chicago, Indianapolis & Louisville, have been appointed superintendents of the northern and southern divisions respectively, with headquarters at Lafayette, Ind., effective September 7. They succeed W. H. Fogg, promoted, who had jurisdiction over both divisions.

N. E. Stock has been appointed trainmaster on the Atchison, Topeka & Santa Fe at Needles, Cal., succeeding E. E. McCarty; W. E. Arntz has been appointed trainmaster of the San Francisco Bay Terminals, with headquarters at San Francisco; A. C. Haskell, trainmaster at Newton, Kan., has been transferred to the Oklahoma division, with headquarters at Arkansas City, Kan., succeeding A. A. Gist, transferred; A. T. Class has been appointed trainmaster, with headquarters at Newton.

J. C. Dobbie has been appointed acting general manager of the Guayaquil & Quito Railway, with headquarters at Huigra, Ecuador; and M. W. Jones has been appointed superintendent of traffic and transportation, with headquarters at Huigra. Mr. Jones entered the service of the Guayaquil & Quito in 1909 as secretary to the vice-president, and subsequently served consecutively as secretary to the president, chief train dispatcher, trainmaster, chief clerk to the general manager, acting paymaster, general freight and passenger agent, and superintendent of telegraph and telephone.

Traffic

Frank C. Keen, Jr., has been appointed commercial agent of the Georgia Coast & Piedmont, with office at Brunswick, Ga.

Howell Peoples, commercial agent of the Southern Railway at Baltimore, Md., has been appointed commercial agent at Washington, D. C., vice C. C. Baggett, assigned to other duties.

G. H. Ingalls, freight traffic manager of the New York Central, Lines West of Buffalo, is now traffic manager, and James Webster, assistant freight traffic manager, is now freight traffic manager. Both with headquarters at Chicago.

Carl Howe, manager of the New York Central Fast Freight Lines, has been appointed traffic manager of the Michigan Central; P. J. Findlay, assistant manager of New York Central Fast Freight Lines, has been appointed general freight agent of the Michigan Central, with office at Detroit, Mich., and F. O. Stafford, general west bound agent, has been appointed manager of the New York Central Fast Freight Lines, with headquarters at Chicago.

J. H. Reagan, agent of the Lehigh Valley, at St. Paul, Minn., has been promoted to commercial agent, with office at Minneapolis, Minn., succeeding M. P. Smith, who has resigned to go into other business. G. B. Peterson, representative of the Lehigh Valley-Nickel Plate Fast Freight Line, at Minneapolis, succeeds Mr. Reagan.

H. E. Everheart, agent at San Angelo, Tex., has been appointed division freight agent of the Atchison, Topeka & Santa Fe, with headquarters at Beaumont; Dwight V. Jones, freight and passenger agent at Washington, D. C., has been appointed general agent of the freight and passenger departments, with the same headquarters.

D. McNamara, district passenger agent of the Chicago & Alton at Indianapolis, Ind., has been appointed general agent of the passenger department with headquarters at New York, succeeding Frank Bowman, resigned to enter military service. T. M. Sommers, district passenger agent at Denver, Colo., has been transferred to Indianapolis. C. S. Brawner, special passenger agent at Kansas City, Mo., has been appointed district passenger agent, with headquarters at Denver.

Engineering and Rolling Stock

W. J. McLean, for the past five years master mechanic of the Kettle Valley at Penticton, B. C., has resigned.

G. O. Hammond, who has been appointed general mechanical superintendent of the New York, New Haven & Hartford with headquarters at New Haven, Conn., as has already been announced in these columns, was born on April 20, 1874, in New York City. He graduated from the New York public schools and from Stevens Institute of Technology, where he received the degree of mechanical engineer. In November, 1898, he began railway work as a special machinist at the Susquehanna shops of the Erie Railroad. He subsequently served as special apprentice until December, 1899; then as draftsman to 1901, and during the following year served as engineering clerk. He was general foreman of the Meadville shops until 1903, and later served as machinery inspector until 1905, and as chief draftsman from January to July, 1905, when he became mechanical engineer. He subsequently served as assistant mechanical superintendent and assistant to general mechanical superintendent until January, 1909, when he became mechanical engineer for the New York Air Brake Company. From February, to April, 1913, he acted as assistant superintendent on the New York, New Haven & Hartford. From May, 1913, to May, 1917, he was assistant mechanical superintendent and then was appointed assistant general mechanical superintendent, which position he held until his recent appointment as general mechanical superintendent of the same road.

O. B. Lackey, resident engineer of the Southern Railway System at Old Fort, N. C., has been promoted to supervising engineer, with headquarters at Washington, D. C., vice M. P. Northam, resigned to accept service elsewhere.

J. M. Salmon has been appointed bridge engineer of the Louisville & Nashville, with headquarters at Louisville, Ky., succeeding F. A. Busse, resigned to enter military service as a captain in the Engineer Officers' Reserve Corps, U. S. army.

A. B. Ogilvie has been appointed road foreman of engines of the Grand Trunk, with jurisdiction over Thirty-first and Thirty-second districts, including Ottawa terminal, vice W. M. Cooper, assigned to other duties, and E. S. McMillan has been appointed road foreman, Montreal terminals, vice F. H. Holland, assigned to other duties.

F. F. Gaines, superintendent of motive power of the Central of Georgia at Savannah, Ga., has been granted leave of absence on account of illness, effective September 8, and William H. Fetter, general master mechanic at Savannah, has been appointed acting superintendent of motive power.

Purchasing

John E. Byron has been appointed general storekeeper of the Boston & Maine, with office at Boston, Mass.

T. S. Edgell has been appointed division storekeeper of the Mobile & Ohio, with office at Tuscaloosa, Ala., vice W. O. Jamison, resigned.

J. A. Brackett, division storekeeper on the Atchison, Topeka & Santa Fe at Barstow, Cal., has been transferred to Calwa, succeeding O. H. Hansen, resigned to enter military service. Bayless McCain has been appointed division storekeeper at Barstow. H. R. Spann, division storekeeper at Riverbank, has been transferred to Gallup, N. Mex., succeeding G. O. Hixon, transferred to Winslow, Ariz., vice E. J. Burns, assigned to other duties. J. L. Diessl has been appointed division storekeeper at Riverbank.

Railway Officers in Military Service

F. A. Busse has resigned as bridge engineer of the Louisville & Nashville, with headquarters at Louisville, Ky., to enter military service as captain in the Engineer Officers' Reserve Corps, United States Army.

L. P. LeBron, assistant engineer of the Ft. Smith & Western at Ft. Smith, Ark., has been given an indefinite leave of absence to assume his duties in the Officers' Reserve Corps in which he has received a commission as captain.

C. W. Cochran, who resigned as engineer maintenance of way on the Cleveland division of the Cleveland, Cincinnati, Chicago & St. Louis last March, has received a commission as captain in the Engineer Officers' Reserve Corps, and is serving on the staff of the chief of engineers, Director General of Railways Department, U. S. Army, at Washington, D. C.

OBITUARY

Elliott T. Monett, general western passenger agent of the New York, Ontario & Western, with headquarters at Chicago, died at his home in Chicago on September 10.

J. F. Enright, superintendent of the motive power and car department of the Denver & Rio Grande, whose death on September 4 was announced in the *Railway Age Gazette* of September 7, was born at Savannah, Ga., in 1867. He entered railway service in 1885 as a machinist apprentice of the Savannah, Florida & Western, now a part of the Atlantic Coast Line, and remained in the Savannah (Ga.) shops of that road until 1895, when he was appointed general foreman of the shops at Montgomery, Ala. He was subsequently general foreman of shops of the same road at Waycross, Ga., and later master mechanic at Montgomery, Ala. From January, 1902, to January, 1907, he was master mechanic on the Mobile & Ohio at Whistler, Ala., and from the latter date to December, 1909, was superintendent of machinery of the International & Great Northern at Palestine, Texas. From the time he left the I. & G. N. up to the time of his death he was superintendent of the motive power and car departments of the Denver & Rio Grande, with headquarters at Denver, Colo., and during a portion of that period had jurisdiction also over the mechanical department of the Western Pacific.

GENERAL NEWS SECTION.....	533
---------------------------	-----

There is in the official family of every railroad a man the importance of whose duties has in a great many cases been overlooked. He is the road foreman of engines. Too often he is sidetracked from his work of educating and supervising the work of enginemen and assigned to special work which could be

done as well by others who have less important duties to perform. The demand for power and the extremely high prices for fuel, demand that both the engines and the fuel be made to produce the greatest possible amount of work. The place for the road foreman is on the road to see that this is done. He should not be given too large a territory; in fact, his territory should be reduced and new road foremen added so that the increased number of trains can be properly covered and the new men that are being placed on the locomotives can be properly instructed. With the demand for the more effective use of power the road foreman has become a more important member of the operating department. He is in a position to save considerable money for his road and to serve his country by increasing the efficiency of our great transportation system. His work is on the firing line and it is there he can do the most good.

"Cut out the elementary stuff!" This sharp admonition was addressed to the members of the National Safety Council at their meeting in New York last week, after some rather lengthy papers had been read. The words were noticeable because—not alone in this but in some other railroad associations—so many

members feel the need of such cutting but are too modest to suggest it. In this case the speaker was W. C. Wilson, formerly claims attorney of the Delaware, Lackawanna & Western, but now in private practice. Mr. Wilson always was plain spoken; but yet it is pertinent to observe in this place that the man who has left the railroad service often is the one who has a special mission (or at least a fine opportunity) to tell railroad people some things which they ought to be told but which, because of conventional modesty, tend to go forever unsaid. "You men are experts," said Mr. Wil-

son; "you cannot afford to spend your time on so many things already well known; concentrate on those difficult questions which cannot be settled at home, but on which light may be turned by specific discussion here." The report of the meeting, in this issue, will be found to cover a wide range of details. It is noticeable that "safety first" is not so common a phrase as it used to be. It is safety all the time. These specialists no longer deal so much in phrases. They act. For example, the motion-picture show on the New York Central is not a mere entertainment; attendance by employees is compulsory. That road believes it profitable to have a safety specialist (devoting his whole time to the work) on every division; and that is now the company's policy.

Some time ago Colonel Charles D. Hine wrote an article for the *Railway Age Gazette* advocating simplified station

accounting. It called forth some discussion from men in the accounting department, the principal objection to it being that under Colonel Hine's plan no adequate check was had on the

agent. The Boston & Maine has now adopted a method of auditing which actually in practice simplifies the work of the agent in making reports to the auditor of the freight revenue's office, and at the same time enables the auditor to have an actual daily balance with agents. Many roads have theoretically a daily balance with the agents, but in practice very often this is only a theoretical and not an actual daily balance. The Boston & Maine had been prior to March, 1917, on a monthly, manual basis of auditing freight revenue. It changed over to a daily basis, installing machines for doing much of the work that had heretofore been done by hand. The underlying principle adopted was to take away from the agent just as much of the audit office work as possible. Much of that which was taken away by the adoption of the new system had previously been done by the agent and then done over again in the audit office. At the larger stations it was in many cases possible to take off one man from the agent's force. At the smaller stations the agent, relieved of this work, properly

Safety all the Time

A Simplified Auditing Method

belonging to the audit office, has just that much more time for soliciting business, or for other duties which he had been in part neglecting. With the adoption of the new system it was possible to considerably reduce the number of persons employed in the auditor of freight revenue's office and the system has been in operation only since March 1. One of the great difficulties in having a reform adopted on a railroad, even when its advantages are obvious, is the reluctance felt by everyone affected to undergo the confusion and extra work of the transition period. It took a good deal of courage and a great deal of dogged persistence to get the new system in working order on the Boston & Maine and all the more credit, therefore, is due to those who actually went through the mill of making the change and to those who had the courage and foresight to authorize it.

RAILWAY OPERATING EFFICIENCY IN JUNE

OPERATING statistics for the month of June for railways having a total of 196,131 miles of line, which are just available, show a remarkable increase in operating efficiency as compared with June, 1916. The revenue freight ton mileage of these roads was 23 per cent greater than it was in June of last year; and they handled this largely increased tonnage with but one-tenth of 1 per cent more miles of line, 1.8 per cent more freight locomotives and 3.2 per cent more freight cars than they had last year. Perhaps what this really means can be best indicated by showing what were the increases in ton miles of freight per mile of line, per freight locomotive and per freight car. The following table gives these statistics for the United States as a whole, and for each of the three large territories—East, West and South:

	REVENUE TON MILES PER MILE OF LINE				
	United States	East	South	West	
June, 1917	165,600	315,500	151,800	98,300	
June, 1916	134,500	264,200	129,000	74,100	
Increase	31,100	51,300	22,800	24,200	
Per cent increase.....	23.1	19.4	17.6	32.7	

	REVENUE TON MILES PER FREIGHT LOCOMOTIVE			
	United States	East	South	West
June, 1917	1,182,000	1,326,000	1,091,000	1,048,000
June, 1916	977,000	1,129,000	944,000	807,000
Increase	205,000	197,000	147,000	241,000
Per cent increase.....	21.0	17.4	15.6	29.9

	REVENUE TON MILES PER FREIGHT CAR			
	United States	East	South	West
June, 1917	15,430	14,310	19,090	15,960
June, 1916	12,900	12,350	16,160	12,610
Increase	2,530	1,960	2,840	3,350
Per cent increase.....	19.6	15.9	17.5	26.6

It will be seen that the increase in freight traffic in the country as a whole per mile of line was 23 per cent; per freight locomotive, 21 per cent; and per freight car, 19.6 per cent. The increase in freight car efficiency was partly due to an increase in the average miles moved by each car daily from 27.3 to 29.1 miles; partly to an increase in the average load of loaded cars from 25.2 to 27.9 tons. The average miles made per locomotive per day increased from 65 to almost 78; the average tons per train from 642 to 715.

Relatively the largest increase in traffic took place in western territory, the total ton mileage exceeding that of June, 1916, by almost 33 per cent. This is reflected in the statistics of operating efficiency, the increase in traffic handled per mile of line in that territory being 32.7 per cent; per freight locomotive, 29.9 per cent, and per freight car, 26.6 per cent.

These increases in operating efficiency are truly extraordinary. They illustrate strikingly what American railways can do when they are allowed to work together without fool-

ish interference under the anti-trust law, and when they are able to get the cordial co-operation of most of their employees and of the shipping public.

Freight traffic continues to increase, the increase in June being the largest yet recorded in any single month, and in addition the passenger business now being handled probably is the largest ever known. How long can the railways continue to augment their efficiency enough to meet the demands upon them? The results they have secured already are greater than any but the most hopeful anticipated; and in view of what they have done already, there seems more ground for optimism regarding how they will get through the next fall, winter and spring than there ever was before.

MISSOURI, KANSAS & TEXAS AND ST. LOUIS-SAN FRANCISCO

THE St. Louis-San Francisco has been out of the hands of the receivers since November, 1916, and the Missouri, Kansas & Texas is now in the process of reorganization, the road being operated by a receiver. There has developed a rather wide difference of opinion as to what interest charges should be placed upon the Missouri, Kansas & Texas in the reorganization. Naturally comparisons with other roads have been used pro and con in the reorganization negotiations. There are hardly any two roads in the United States which are so nearly alike in operating conditions, traffic, etc., as to permit of a point to point comparison without qualifying analysis. Certainly the Missouri, Kansas & Texas and the St. Louis-San Francisco are not so much alike as to permit of such an unqualified comparison. On the other hand, it is interesting and not unprofitable to place the figures for one road against those of another even if it serves no other purpose than to call to each man's mind explanations of differences or similarities.

It may be said at once that the interest charges on the reorganized St. Louis-San Francisco are higher than any one interested in the Missouri, Kansas & Texas reorganization proposed to place on that property. They amount to \$1,618, whereas the higher figure which has been advocated for the Katy is \$1,159 per mile and the lower figure \$998 per mile.

It should be mentioned here that the St. Louis-San Francisco is making a very good showing indeed, having gross in the calendar year 1916 amounting to \$52,699,000, and after paying expenses, taxes and rentals it had \$14,638,000 available for interest, whereas the capitalization of the new company calls for \$8,506,000 fixed interest, \$2,322,000 cumulative interest and \$2,112,000 interest on income bonds. The company therefore earned \$1,698,000 above all three classes of interest charges.

The St. Louis-San Francisco operates 5,265 miles; the Missouri, Kansas & Texas 3,865 miles. The main north and south lines of the two systems serve the same territory, as will be seen from the map; but a list of mileage by states is illuminating:

State	St. L.-S. F.	M. K. & T.
Alabama	132	—
Arkansas	601	—
Louisiana	601	19
Kansas	630	494
Missouri	1,720	543
Mississippi	143	—
Oklahoma	1,408	1,036
Tennessee	18	—
Texas	505	1,273

It is apparent that the Katy has no line comparable to the Birmingham line of the Frisco, and this fact will be emphasized in a comparison of commodities carried. It will be noted that the Frisco has only about as much mileage in Texas as the Katy has in Missouri, while the Katy has as much mileage in Texas as the Frisco has in Missouri. This should be borne in mind especially when discussing comparative costs of injuries to persons and loss and damage payments. The Frisco has somewhat larger mileage in Okla-

homa and the Katy was comparatively a late comer in that state.

In 1916 the Frisco carried 21,270,000 tons of freight, and the Katy, 11,126,000 tons. The fact that there is no such contrast as this between gross operating revenues per mile (Frisco earned \$10,106 per mile in 1916 and the Katy \$9,504 per mile) is explained by the longer average haul of freight on the Katy—217 miles—as compared with the Frisco—174 miles. A contrast of the tonnage of the different commodities carried explains in part differences in average trainloading and resulting differences in transportation expenses:

Commodities	St. L. S. F.	M. K. & T.
Agricultural products	3,317,000	2,453,000
Animal and animal products	702,000	352,000
Products of mines	8,640,000	4,531,000
Lumber and forest products	3,067,000	842,000
Manufactures	4,137,000	1,938,000
Miscellaneous	353,000	211,000
L. C. L.	1,034,000	598,000

The Alabama line of the Frisco accounts in good part for the much larger coal and ore tonnage which permits of heavy

which can be used to fill out engine ratings and is therefore of great help in bringing up the average trainload. The Katy badly needs a northbound drag tonnage traffic. Both roads reach Kansas City and St. Louis; Oklahoma City, Okla.; Sherman, Tex.; Dallas, Tex., and both roads serve in general the territory between Kansas City and Dallas. The St. Louis-San Francisco serves Springfield, Mo.; Memphis, Tenn.; and Birmingham, Ala., a territory not reached in any part by the Missouri, Kansas and Texas. On the other hand, the Katy reaches Waco, Austin, San Antonio, Houston and Galveston and has a line from Dallas to Shreveport.

The Frisco's financial results for the year have been mentioned. The Missouri, Kansas & Texas earned \$36,734,000, an increase over the previous year of 13 per cent, and after paying expenses, rentals and taxes, had \$5,443,000 available for interest. The Frisco operated on a ratio of expenses to gross earnings of 67.11, while the Missouri, Kansas & Texas had an operating ratio of 80.14 per cent. A very considerable part of the difference in operating ratio is ex-

The Missouri, Kansas & Texas and the St. Louis-San Francisco

loading and is therefore a factor in favor of the Frisco in trainloading. The Frisco gets into the lumber country; the Missouri, Kansas & Texas, except its so-called orphan lines, does not get into the lumber country. This is an even more important factor in trainloading than the difference in tonnage of coal and ores. Much of the lumber is not only susceptible of heavy carloading but is drag freight northbound,

plained by the much heavier maintenance of way and maintenance of equipment expenditures of the Katy. That company spent \$7,630,000 on its 3,865 miles of line in 1916 for maintenance of way, while the Frisco spent \$7,403,000 on its 5,250 miles of line. The Katy spent \$7,274,000 for maintenance of equipment; the Frisco, \$9,703,000. There can be little doubt that during 1916 the receiver of the Katy

was taking up delayed maintenance. This was true for both maintenance of way and maintenance of equipment, and in addition there was \$2,286,000 spent on capital account, the largest items being for grading, bridges, rail and ballast. The Frisco went through its period of rehabilitation before it was taken out of the hands of the receiver. A list of improvements is included in the Frisco's annual report, but the amount charged to capital account for such improvements is not given.

In the estimates which have been made of the Missouri, Kansas & Texas future earning power a reduction in transportation costs per ton-mile figures prominently. The St. Louis-San Francisco's ratio of transportation expenses to gross earnings in 1916 was 31.48, comparing with 32.88, the ratio in the previous year. The Missouri, Kansas & Texas transportation ratio in 1916 was 33.74 as compared with 34.99 in 1915. Transportation expenses are not divided in the annual reports of either road as between freight and passengers, but it is interesting to make a rough comparison of transportation costs based on total train mileage because there are two distinct methods of approach in attempting to lower the transportation cost on the Katy. One is to increase the trainload, the other to decrease the costs per train-mile. Very roughly, the Katy had in 1916 15,000,000 train-miles, including both passenger and freight, and the Frisco, 22,000,000. There is some duplication of mixed train-miles in both figures. The Katy's transportation cost per train-mile averaged 82 cents; the Frisco's, 77 cents. The ratio of train-miles on the two roads is, roughly, as 3 is to 4.5.

Applying this ratio to the details of transportation expenses, most of the Katy's expenses are as low, and in some cases lower, than the Frisco's, with three notable exceptions: Fuel, loss and damage, and injuries to persons. Water also costs the Katy more than it does the Frisco. Injuries to persons cost the Katy \$634,000 in 1916 as contrasted with \$524,000, the cost on the Frisco. Loss and damage to freight cost the Katy \$393,000, and the Frisco very slightly less. The larger mileage in Texas in some part explains this contrast. Texas awards against railroads are notorious; but making full allowance for that fact, the Frisco is showing remarkably good results of its efforts to reduce loss and damage claims and claims on account of injuries to persons. It may be that the claims paid by the Katy in 1916 included not only the normal proportion of awards for accidents and losses in the immediate preceding years, but also a certain amount of taking up of delayed payments of awards. At any rate, the Katy is conducting a vigorous safety first campaign now and in a year or two it is not unfair to expect some betterment.

Very roughly, the fuel for train locomotives costs the Katy 17.7 cents per train-mile, and the Frisco, 12.9 cents. There are numerous points of difference between the two roads that would account for a variation in fuel costs. The Frisco has some very steep grades and, on the average, lighter locomotives, and there are many other things that could be mentioned, but as near as can be told from the available data, there is in general an indication that the Frisco is getting cheaper fuel as measured in train-miles than the Missouri, Kansas & Texas, and this actually bulks large in the final results as shown in the income account for the year. The St. Louis-San Francisco has for a number of years had a fuel department which has been given the authority and has taken the responsibility for conservation of fuel, and the results which were obtained in 1916 from almost any way of looking at it are a high compliment to the success of this department. J. W. Kendrick, one of the experts who made a report on the Missouri, Kansas & Texas for use in the reorganization, figured that \$500,000 could be saved on the Katy by a change in methods of handling fuel and the establishment of a fuel department. There is no method of judging the accuracy of Mr. Kendrick's figure, but it would appear

as if the Frisco, which had established such a department, was showing results that would appear to justify its existence. In comparing train-mile transportation costs it should be pointed out, of course, that the Frisco and the Missouri, Kansas & Texas do not have the same proportion of passenger train mileage to total train mileage. The Katy's passenger train mileage, including mixed train mileage, was 8,029,000, and the freight train mileage, also including mixed train mileage, was 7,144,000. The Frisco passenger train mileage, excluding mixed, was 10,065,000, and the freight, excluding mixed, was 10,551,000.

Stress is laid in the Kendrick report on the Katy on the possibilities of increasing the trainload. Ever since the present management took hold of the Katy, persistent and well thought out efforts have been made to increase the trainload. In 1916 the trainload of revenue freight averaged 338 tons; on the Frisco the average for revenue freight was 337 tons. Including company freight, the Katy's trainload was 409 tons and the Frisco's 396 tons. The total trainload of the Katy increased a little over 38 tons, or 10 per cent, as compared with the previous year, and the Frisco's trainload increased a little less than six tons, or between one and two per cent. The Frisco has considerably lighter engines on the average than the Missouri, Kansas & Texas. On the other hand, the older engines of the Missouri, Kansas & Texas are a pretty poor lot. The average weight on drivers for the Frisco engines was 69 tons, and the Katy's, 71 tons. The Katy has 105 comparatively new Mikados. It also has, however, in freight service 204 Moguls. The Frisco has in service 353 ten-wheel locomotives and 212 Consolidations. The company is now receiving, however, from the builders, 60 new Santa Fe locomotives for freight service and 10 Pacific locomotives for passenger service. When these engines have all been delivered the average weight on drivers for the Frisco's locomotives will be 73.7 tons.

It may be a considerable time before the Katy can get any large number of new modern locomotives to replace its Moguls. The increase in trainload in recent years has been in part due to better supervision and in part to the heavier locomotives. The increase which the road should show, however, in the next few years is in good part dependent on traffic developments. If the road can build or get a connection between its main lines and its two "orphan lines" there is the possibility of developing considerable lumber traffic. This would help the average trainload greatly, but it would mean the expenditure, presumably, of considerable capital amounts. Under the handicap of recent traffic conditions the Katy's showing, an increase in trainload from 266 tons in 1911 to 409 tons, is thoroughly creditable. The Frisco may hope to get a better trainload after its new locomotives have been broken in.

The following table shows the results of operation for the Katy in the calendar year 1916 and 1915, and for the Frisco for the calendar year 1916 with such comparisons for 1915 as are available:

	M. K. & T. 1916	Frisco 1916	M. K. & T. 1915	Frisco 1915
Mileage operated	3,865	5,256	3,865
Freight revenue	\$24,795,720	\$36,555,444	\$22,142,576
Passenger revenue	9,215,627	13,113,728	7,966,913
Taxes	36,733,682	51,199,999	32,453,462
Maintenance of way and structures	7,635,695	7,403,385	5,277,655	\$6,697,022
Maintenance of equip- ment	7,273,804	9,703,458	4,657,977	7,241,338
Traffic expenses	728,564	862,644	658,523	842,290
Transportation expenses	12,400,521	16,731,227	11,494,485	14,636,241
General expenses	1,169,910	1,671,426	1,047,282	1,221,665
Total operating expenses	29,439,701	35,646,779	23,223,816	30,372,891
Taxes	1,340,650	2,175,532	1,337,369
Operating income	5,747,322	15,280,127	7,692,277
Gross income	6,143,712	15,781,864	7,921,964
Net income	\$1,134,634	\$6,131,976	\$514,881
Surplus after payment of cumulative and income interest	1,698,443

The Fifteenth Engineers, Since in France, Pose in Front of Their Y. M. C. A. Tent at Camp Gaillard.

Y. M. C. A. Workers on 800 Trains to Cantonments

By This Step the Railroad Department Completes a
Y. M. C. A. Chain From Home to Front Line Trench

BY the time this is in print the movement will be under way of the second contingent of 40 per cent, or 194,800 men, of the National Army to the cantonments. These men will move in several hundred trains and on trips that will range from a matter of three or four hours to possibly 24 or 36 hours. On each and every train insofar as it is possible (and it is counting on accompanying 700 to 800 of them) the Railroad Y. M. C. A. will have a secretary or a member of his staff who will be of whatever service he can to the men. Through this important bit of work, the National Army men will first come in contact with the far reaching war work that is now being so energetically carried on by the Y. M. C. A. It is this link also that will complete the chain that will enable the Y. M. C. A. to keep in closest touch with the men who will go forth to uphold America's honor, from the time they leave their homes until they return victorious; or while they are on the train, in cantonment, or camp, on the train once more, in the embarkation port, on the transport, in London, in Paris and up to the fighting front.

The work which the Y. M. C. A. through its War Work Council, is now preparing to do for the men in olive drab, will therefore not by any means be confined to the National Army or National Guard cantonments or to camps for our forces overseas. There will be a lot to do between the time the men leave their homes and their arrival at the cantonments and at the time, when as trained men, they leave the camps to board the transports for their journey overseas. This particular part of the work is most important, and for the reason that it is a transportation matter, it is natural that it should have been placed in the hands of the Railroad Y. M. C. A.

In an article that appeared in the Patriotic War Number of the *Railway Age Gazette*, June 22, 1917, John F. Moore, general secretary of the Railroad Department of the International Committee of the Young Men's Christian Association outlined the part that the Railroad Department expected to take in the war work. Part of this program is already under way; other parts of it are now in preparation and await only the time of action.

The Railroad Department of the Y. M. C. A. did extremely good work among the National Guardsmen that were not so long since to be seen guarding railway bridges,

viaducts and tunnels. It filled a very important niche at the camps of the nine railway engineer regiments, and trained secretaries have since accompanied these railway regiments to France, where men and secretaries both are now getting into the swing of things. The Railroad Department also assisted materially and is continuing to assist considerably in the way of caring for the comfort of troops on their way to camp either as they pass through junction points or other important railway centers, or when they have to leave the trains and encamp for a time near a Railroad Y. M. C. A. The Railroad Department has representatives at important embarkation points to shake hands with the men and wish them *bon voyage*. As this is written, it is arranging to have secretaries on trains carrying men of the National Army to their respective cantonments, and by the time this is in print, no small amount of this work will have been done.

IN CAMP WITH THE RAILWAY ENGINEERS

When the nine railway engineer regiments were in camp near the several cities where they were recruited it was the Railroad Y. M. C. A. that supplied the men with writing paper, postage stamps, checkboards and other such conveniences. In cases where the regiments were not in buildings, a Y. M. C. A. tent was put up. A railroad secretary and his assistants at each camp attended to providing tables, chairs, a piano, and a phonograph. Classes in French were conducted. Many an otherwise tedious evening was sped quickly on its way by an entertainment arranged by this secretary, and many a Sunday afternoon was put to better uses by an interesting and well attended religious meeting.

Railroad officers keenly appreciated the work done by the Railroad Y. M. C. A. for the men in the engineer regiments from their railroads. "I was at the camp (of the Fourteenth Engineers at Rockingham Park, Salem, N. H.) many times," wrote President J. H. Hustis, of the Boston & Maine, "and saw what was being done. You can't overstate the benefits nor the results. The work of Secretary ———, loaned by the Railroad Association, is deserving of the highest praise. I am led to express on behalf of the executives of the railroads of New England,—and I think I can also speak for the men—their thanks for what was done."

The men in the engineer regiments can tell of many instances in which the Railroad Y. M. C. A. secretary helped

them over a rough spot. He sent money home for them; in a number of cases he helped men make their wills and in one of these latter cases, through the assistance of a railroad secretary in another city, he arranged also for an executor. These railwaymen are now in France, helping to construct, operate and repair railroads behind the lines. Trained secretaries have gone and more will go to continue the Y. M. C. A. work among them for the men will welcome the Railroad Y. M. C. A. there just as much and more than they welcomed it on their own home line. The first of the Railroad secretaries to go abroad was Frank G. Smith who is now in France. Mr. Smith has been with the Young Men's Christian Association for 12 years and served as railroad secretary at several New York points. He was later in charge of the Y. M. C. A.'s authorized by the government during the building of the Panama Canal and upon his return became social secretary at the New York Central Y. M. C. A. in New York City.

F. G. Smith

AT TERMINALS AND JUNCTION POINTS

The work that has been and is being done at terminals, junction points and other railroad centers consists principally of opening the association buildings to the men in uniform free of charge. They are granted the full use of tables, pens, ink and stationery, as also of the restaurant and baths. "Welcome, Soldier Boys. Everything We Have is Yours. Come in," said the big sign in front of the Y. M. C. A. across from the armory in one city, and, according to the reports, they certainly did.

This work of meeting the men at junction points will grow

Humphrey, general secretary of the Railroad Y. M. C. A. in that city. Dr. Humphrey has recently been made a member of the local committee of the Railroad's War Board at that point. Troop trains through St. Louis will probably not be passed through the Union Station but will be transferred from one railroad to another in some of the outlying railroad yards. Whenever it is possible, organizations and individuals will be afforded opportunity to distribute box lunches or other gifts among the soldiers and Dr. Humphrey will pay particular attention to looking after the welfare of the troops while the trains are being cleared through this gateway, and through him the work of the various organizations will be co-ordinated to the best advantage.

AT PORTS OF EMBARKATION

Perhaps one of the most interesting aspects of the work is that now being carried on at the ports of embarkation. The work of the Railroad Y. M. C. A. secretary on duty on the piers is uncertain to say the least, for he is very unlikely to know when the trains will arrive, or how many men they will bring until the trains are in; and then he must hustle with unseemly speed. On the other hand, he is just as unlikely to know when the boats will sail. Even with these handicaps, however, the secretary at the most important of the Atlantic Ports is making records every day. As soon as he hears that a train is in he immediately looks it up. If the men are likely to leave the train and wait at the station for a time, he will set up quarters, perhaps in the immigration room, for the railroads want to help him whenever they can. In some cases the men will move right

Dr. Rubens Humphrey

The Y. M. C. A. Encourages Outdoor Recreation

more important from day to day as the new contingents of National Army men go to their cantonments and as they and the members of the National Guard later leave the cantonments to go to the seacoast. The Railroad Y. M. C. A. is making extra efforts to see that the men are well taken care of. In St. Louis the work will be in charge of Dr. Rubens

on to the embarkation piers after a very short stopover. Perhaps they have not been fed for many hours. The secretary and his assistants promptly get on the job and secure sandwiches for them. In one case no less than 500 were served in 20 minutes, from the railroad station restaurant as it happened, and were sold to the men at cost price. This assist-

ance was certainly appreciated (by both the men and the regiment's commander) for the troops had not eaten for several hours and time was too short to allow them to leave.

A considerable part of this secretary's work comes when the men are at last on board the big transport. First, of course, he secures permission from the commanding officer to work among the men. Then armed with passes and permissions, and dressed in a field gray Y. M. C. A. uniform, designated by a red triangle inside a circle on the sleeves and

bye to some one. It is only a little thing, but a soldier going overseas feels much easier at heart for a last handshake, or the last "*bon voyage*."

FROM HOME TO CANTONMENT

The National Army will move to its cantonments, 5 per cent from September 5 to 9; 40 per cent from September 19 to 23; 40 per cent from October 3 to 7, and the remaining 15 per cent beginning October 17. The Railroad Y. M. C. A. is going to be on hand when these various contingents board their trains and a railroad secretary or a member of the secretary's staff will, if possible, accompany each and every train. He will be designated by an armband bearing the letters R. R. Y. M. C. A. and will have stamps and stationery, song sheets and magazines and little Protestant and Catholic Testaments, and possibly Hebrew prayer books.

In addition to supplying the prospective soldiers with these things, he will tell them something about the welfare work in the cantonments to which they are going and the name of the Y. M. C. A. secretary. The men will thus get their first introduction to the advantages of keeping in touch with the camp Y. M. C. A. work.

The pocket Testaments are not given out promiscuously, but only to interested men, who, seeing them, ask for one. They are well worth asking for, for they have been specially prepared for the soldier's use. The Y. M. C. A. at the camp in addition to its program of service to the men, will help to carry on the active religious work taking the place of that done by the churches at home; the Railroad Y. M. C. A. secretaries will therefore be the connecting link between the two. Both have a big work ahead of them, but any one who has come in contact with the enthusiasm that characterizes the Y. M. C. A. at the present time will have no doubt that its efforts will be highly successful and amply repaid.

RAILWAY STATION CAB TOLLS IN ENGLAND.—A long-standing difference between cabdrivers and the railway authorities came to a head recently when the London & Provincial Union of Licensed Vehicle Workers, acting on the instructions of their executive, issued a notice calling on all cabdrivers on and from August 1 to abstain from paying the penny cab toll demanded by railway companies from cabmen who ply for hire within London stations. On that date much inconvenience was caused to the traveling public, as the taxicab drivers refused to pay the penny toll demanded of them, and the ranks inside the stations were empty. Both the drivers and the railway companies express their intention not to give way. The latter say that the charge was fixed by the Home Secretary under an Act of Parliament in 1907, and was willingly agreed to by the cabmen of that day as a substitute for the old system of privileged cabs.

WAR SERVICE OF BRITISH RAILWAYS.—Apart from securing prompt and expeditious conveyance of traffic, the government has been assisted by the railways in a variety of other ways. Large numbers of railway-owned steamers have been taken by the simple expedient of commandeering; rolling-stock and permanent way have been sent overseas; railway workshops have been at the disposal of the state for the manufacture of munitions of war in great varieties; permanent way and other work in connection with munitions and other depots has been undertaken for the government by the railways. The services of various general managers and other officers have been placed at the disposal of the government for special duties (e. g. Sir Eric Geddes, K. C. B., Sir Guy Granet, Sir Sam Fay, Mr. Guy Calthrop, and others); over 150,000 railwaymen have been released for service with the colors, and generally every effort has been made to assist the government to the greatest possible extent.—*Engineering*, London.

Writing Letters and Catching Up With the News

the letters, R. R. Y. M. C. A., across the shoulder straps, he gets to work. He has specially printed stationery which is furnished to the men free of charge, post cards, stamps and writing materials. Very often when they are available he distributes magazines and books, and he does not have much of a job giving them away. When he puts them down on the deck, the scene that usually follows closely resembles a bunch of small street urchins scrambling for pennies. If the men are to be in the harbor for a time, he arranges an entertain-

The Y. M. C. A. Stages an Entertainment

ment and very often a religious meeting. He and his assistants help the men in many other ways.

One soldier wanted to send \$25 home to his wife. Still another soldier found out at the last minute that his mascot dog would be persona non grata in France; the secretary arranged to crate the animal and ship him home safely by express. The soldiers appreciate all these things, and most of all do they appreciate the chance to say good-

Byram to Succeed Earling as Head of St. Paul

His Will Be Great Task of Securing Hoped for Results From Pacific Coast Extension and Electrification

HARRY E. BYRAM, vice-president in charge of operation of the Chicago, Burlington & Quincy, will be elected president of the Chicago, Milwaukee & St. Paul at a meeting of the board of directors of that company the latter part of this month.

Mr. Byram will then have risen in eight years from the office of general superintendent of the Burlington lines West of the Missouri river to the position of chief executive officer of a great transcontinental system operating over 10,000 miles of line, and earning over \$100,000,000 a year.

While his rise has been rapid, there has been nothing adventitious about it. It has been partly due to the particular training and experience he has had, and partly to the ability and energy of the man himself. It was this combination which made him just the man that the controlling interests of the St. Paul road felt they needed when they decided that some change in management was desirable.

Mr. Byram's training and experience have been secured mainly on railways on which the policies and methods originated chiefly by James J. Hill have prevailed. Mr. Byram became a clerk in the office of the general manager of the Great Northern in 1898, and served in the operating department of that road until 1902, during which time he had risen to a superintendency. After spending two years on the Rock Island he went to the Burlington, which had then become a Hill property, and served first as general superintendent, and then as assistant to Daniel Willard, who was then vice-president in charge of operation. It was during this period that Mr. Hill was carrying out the reorganization and improvement of the Burlington system which was needed to enable it to operate in accordance with his ideas as to the way a railway should be operated.

Mr. Byram, since he became vice-president in charge of operation in 1910, has shown himself a worthy pupil of Mr. Hill and a fitting successor to Mr. Willard. Between 1901 and 1910 the Burlington's revenue ton miles had increased 92 per cent, while its average train load had been increased so much that its freight train mileage had increased but 1 per cent. Between 1910 and 1916 the average train load was increased from 381 tons to 575 tons, or over 50 per cent. In the same period the average tonnage per car was increased from 17 tons to 20.53 tons, or 21 per cent; and during the last year further large increases in carloads and trainloads have been achieved. In 1910, the ratio of operating expenses to earnings was 72 per cent. It has never reached that figure since, and in 1916 was only

60 per cent. The conducting transportation ratio in 1910 was 32 per cent; in 1916, only 29 per cent. The percentage earned on the common stock increased meantime from 13 per cent to 27 per cent; and surplus earnings in 1916 were almost three times as great as had ever been known before, being almost \$15,000,000. The showing made thus far in 1917 is even better than that for 1916.

These great advances in operating efficiency have been made possible by the exercise of great foresight in the development of the property and by the application of sound

principles in its general management by the two presidents under whom Mr. Byram has served since he has been vice-president — Darius Miller and Hale Holden. But they would not and could not have obtained without a strong man such as Mr. Byram at the head of the operating department. In fact, Mr. Byram has made himself recognized by the railroad fraternity during recent years as one of the most consummate masters of the entire art of railroad operation that the country has produced. His knowledge of the technique of railway operation is complete, and his ability to grasp and assimilate all the innumerable details of the business is extraordinary. He is physically strong, he takes good care of himself, and in consequence he is able to, and does, give to his work an amount of industry and energy that few men are capable of putting forth. An intense worker himself, he expects and receives somewhat similar

work from his subordinates all along the line. While Mr. Byram is so skilled as an operating man, he has taken a very keen and broad interest in all matters affecting railway management and the railway situation in general.

Mr. Byram not only knows how to operate a railway, but he has the vision and imagination necessary to see how a property should be developed in order that it may be successfully operated. In order to secure the good operating results which have been achieved on the Burlington, there was requisite not only careful supervision of carloading and trainloading, but even more reductions of grades, the construction of cut-offs, the development of sidetracks and terminal facilities, the acquisition of larger cars and more powerful locomotives, the maintenance of roadbed and equipment to high standards; and it has been largely due to the attention given to these matters that the Burlington has made a showing better than that made by the St. Paul, for example.

Meantime, Mr. Byram has taken great interest in all matters pertaining to the public relations of the railways.

H. E. Byram

He is a strong believer in giving the public good service at reasonable rates, and then tactfully but vigorously resisting all the attacks that are made upon them and answering all the misrepresentations that appear about them. While he has a great reputation as an operating officer, only those who have come into intimate contact with him realize the breadth of his knowledge of and interest in railway affairs of all kinds and also public affairs in general.

Mr. Byram is sometimes characterized as "cold," but the impression that he is so, insofar as it prevails, evidently is due to the fact that in his business relations he seems to act uniformly upon the principle that he is a trustee for his railroad, and that his main duty is to get the best bargains and the best results he can for its stockholders, consistent with fair treatment of others. As a matter of fact, he is personally extremely democratic, warm-hearted and companionable, and in consequence is very popular among the people who know him well.

The combination of training, experience, ability, energy, public spirit and personality which Mr. Byram possesses seems peculiarly to equip him for the presidency of the St. Paul at this time. The road offers him a great opportunity, and developments on it under his management will be watched with much interest. A man with his training, experience, and temperament is pretty sure to apply Hill methods of railroading and that seems to be what the St. Paul needs.

There is nothing fundamentally wrong with the road, with the strategic lines along which it has been developed, or with its operating organization. In fact, it has in its organization many very strong men. It does apparently need the application of certain principles and methods of development and operation which have been less in evidence in the St. Paul than on most of the more efficiently operated railroads in the territory; and Mr. Byram is the man to apply them.

Mr. Byram was born at Galesburg, Ill., on November 28, 1865, and entered railway service in 1881 as a call boy on the Chicago, Burlington & Quincy in the same city. He was later stenographer in the general superintendent's office and chief clerk to the superintendent of terminals of the same road at Chicago, Ill. From 1889 to 1894, he was out of railway service. From the latter date until March, 1898, he was with the Great Northern as clerk in the general manager's office and chief clerk in the vice-president's office at St. Paul, Minn., following which he was assistant general superintendent of the Montana Central at Great Falls, Mont., and from October, 1899, to October, 1902, superintendent of the Cascade division of the Great Northern at Everett, Wash. From Everett he went to Chicago to enter the service of the Rock Island. From October, 1902, to February, 1904, he was assistant to the first and fourth vice-presidents, of that road at Chicago, and from the latter date until July, 1904, was general superintendent of the southwestern district, with headquarters at Topeka, Kansas. He left the

Rock Island to become general superintendent of the Nebraska district of the Burlington, which position he held until May, 1909, when he was made assistant to the vice-president of operation. Since February, 1910, he has been vice-president.

ALBERT J. EARLING

Albert J. Earling, chief executive of the Chicago, Milwaukee & St. Paul for the past 18 years, who will retire from the presidency at a meeting of the directors of the road the latter part of this month, will be elected chairman of the board. Mr. Earling's entire railroad career of 51 years has been with the St. Paul—a record of continuous service with one road seldom equalled by American railroad executives. Beginning as a telegraph operator on the Milwaukee & St. Paul in 1866, he passed through practically every position in the operating department, becoming vice-president in charge of operation in December, 1895. His rise was steady but not rapid.

The fact that his entire railroad career has been with the St. Paul and that he became familiar, by virtue of experience, with the duties of each office in the operating department from the ground up, has proved of great advantage to him, giving him an unusually thorough knowledge of the property, the affairs of which he so long directed and a comprehensive grasp of the details of its operation. There is no department in which he has not taken a direct interest and there are few subordinate officers with whom he has not kept in close personal touch. He has pursued a policy of personal supervision seldom attempted by the president of so large a property.

The Milwaukee & St. Paul, as it was then known, was organized only three years before Mr. Earling entered the service. When it assumed its present name in

1874 it had about 1,400 miles of line. When Mr. Earling became president in 1899, it had 6,337 miles of line; and it now operates 10,510 miles.

Mr. Earling has launched two daring moves for the property since he has been president. The first, the construction of the Pacific coast extension, was undertaken in 1905 toward the end of a period of prosperity for the carriers and at a time when the epidemic of repressive railway regulation had not yet assumed appreciable proportions. The project was financed before the panic of 1907, and an ensuing period of low prices and low wages proved a favorable circumstance in carrying on the construction work.

The most spectacular undertaking of Mr. Earling's career probably has been the electrification of a large portion of the Puget Sound extension. This was begun in November, 1914, and although other roads had electrified small portions of their lines before that time, none had attempted a venture of such great magnitude. The first unit of 440 miles in the mountain country from Harlowton, Mont., to Avery, Idaho, was completed in February, 1917, and another unit is now in

A. J. Earling

progress of construction from Othello, Wash., to Seattle and Tacoma. It is unfortunate that most of the electrification work has been done in a period of rising prices, increasing wages and soaring interest rates.

When the Pacific coast extension was undertaken, trade in the Northwest was booming and an increasing business was being built up with the Orient and Alaska. The high expectations of traffic from these sources, entertained at that time, have not been realized. The extent to which readjustments in currents of trade at the conclusion of the world war will affect the situation is, of course, an uncertain matter; but while the result of the extension was the opening up of considerable areas of new territory for development, the long period of depression in the Pacific Northwest, which continued until recently, has had an unfavorable effect upon the St. Paul's results.

When Mr. Earling became president of the road in 1899 it was paying, and had been paying for nine years its fixed charges, dividends on its preferred stock, 5 per cent on its common and earning a good surplus. Its financial results so improved under his management that in 1901 the dividend on the common was advanced to 6 per cent, and in 1902 to 7 per cent. This rate was maintained to 1912. In the year 1906 and again in 1907, the surplus after dividends exceeded \$5,500,000.

From this time, however, it began to decline. In 1911 it had dropped to the negligible sum of \$127,000, and in 1912 there was a deficit after dividends of over \$5,000,000. In that year the dividend on common stock was reduced to 5 per cent, and it has been on that basis since. In 1913 a surplus exceeding \$4,000,000 was shown, and in 1914 there was a fair surplus, but again in 1915 there was a deficit after dividends of almost \$2,000,000. In 1916 the surplus exceeded \$3,300,000, but in the first six months of the calendar year 1917 the road's net operating income showed a decline compared with the same months of last year of almost \$1,400,000.

The increasingly unsatisfactory financial results have been due partly to conditions special to the St. Paul, partly to conditions affecting all railways in its territory. The increase in the road's fixed charges, due to the construction of its Pacific coast extension, to its investment in electrification, to grade revisions, and so on, has been large, the annual interest on its funded debt having advanced from \$5,800,000 in 1909 to \$8,500,000 in 1912 and to \$15,600,000 in 1916. While there has been a large increase, meantime, in total earnings, the advances in operating expenses and taxes have been so large that net operating income has not increased enough to offset the increase in fixed charges. The ratio of operating expenses to earnings in 1909 was 65 per cent. In 1912 it had increased to 75 per cent. In 1916, with the large earnings of that year, it was 65.43 per cent.

These general developments have given rise to increasing criticism of the St. Paul's management under Mr. Earling. The road's results have been compared unfavorably with those of other roads in its general territory, especially those of the Burlington. For example, in 1902 the average revenue trainload of the Burlington was 200 tons, that of the St. Paul, 237 tons. In 1915, however, the figure for the Burlington was 492 tons; that for the St. Paul, only 390; in 1916, Burlington, 558 tons; St. Paul, 425 tons. Transportation expenses of the St. Paul for the year were 36 per cent of its total earnings; for the Burlington, only 29 per cent. The total operating ratio of the St. Paul was 65.43; of the Burlington, only 60. The Burlington spent \$1,283 per mile for maintenance of way; the St. Paul, only \$1,133; the latter being a figure considerably below the average for the large granger roads.

The showing of the road and the criticisms it evoked caused the development of a sentiment among some of the strong interests in it, notably that represented by J. Ogden

Armour, that the road was not being satisfactorily managed. There was some question as to whether all the large investment made by it in improvements in recent years had been well adapted to securing the best operating and financial results, and there was a feeling that Mr. Earling ought to retire from the active administration of the property and give place to a younger and more energetic man, preferably one experienced and skilled in the Hill methods of railroad operation. Mr. Earling himself accepted this view, the result being the selection of H. E. Byram to succeed him.

The retiring president transformed a granger road of 6,000 miles into a transcontinental system of 10,000 miles; it is the task of his successor to develop the great possibilities of that system.

Mr. Earling was born at Richfield, Wis., on January 19, 1848, and entered railway service with the Milwaukee & St. Paul, now the C. M. & St. P., in 1866. For six years he was a telegraph operator, following which he was a train despatcher for five years, and assistant superintendent four years. From 1882 to 1884 he was division superintendent, and from the latter date until 1888 assistant general superintendent. During the ensuing two years he served as general superintendent and in 1890 he was promoted to general manager. He held this position for nine years and in December, 1895, was also made second vice-president. From September 23, 1899, until the present time he has been president.

WAR RECORD OF C. P. R. MEN.—In spite of the fact that the trains of the Canadian Pacific Railway, have been occupied in the transportation of soldiers and war materials, and that the huge workshops of the company have been turning out vast supplies of munitions of war instead of engines and rolling stock, no fewer than 8,000 men in the service of the company have gone to the front. In every theatre of war they are to be found—in France, Italy, Russia, the Balkans, Mesopotamia, Africa. Of these 8,000 men (apart from 100 who are serving in the Navy) 1,309 have been killed or wounded, among the killed being Capt. the Hon. A. T. Shaughnessy, son of Lord Shaughnessy, president of the C. P. R. The C. P. R. and Dominion Express staffs in Great Britain before the war numbered 213, of whom 179 were of military age, and of those 179 no fewer than 158 have joined the colors.

MIXED GAGES AT THE FRONT.—An interesting despatch, recently sent from the western front by H. Warner Allen, a British war correspondent, throws additional light on the German system of strategic railways close to the firing line. The underlying idea was the elimination of great accumulations of material in the immediate neighborhood of the lines, where they are exposed to the risk of bombardment, and it has been found possible to work on this principle as the result of utilizing an enormous amount of prisoners, mostly Russian. An adequate labor supply is essential, because such a system requires a very considerable labor force for transshipping in case of a sudden demand for a change from a standard to the narrow gage lines. Material is first brought up on standard gage lines, then transhipped to meter gage lines, and finally run on to the 60-cm. tracks (1 ft. 11½ in.) which feed the trenches. Huge junction stations have been laid out at centers where the different gages meet, and the finest of these is said to be at Ham, where there are two separate systems of standard and meter gage lines, capable of transshipping 3,000 tons a day. The Germans have made the greatest use of existing meter gage light railways, and to link these railway lines up with the standard gage main lines, mixed gage tracks have been provided. These are of two kinds; either a third rail has been laid on the standard gage lines or a meter track has been placed on the old roadbed.

System of Auditing on the Boston & Maine

Reports of Agents to the Freight Accounting Office Have Been Greatly Simplified. Daily Balances Obtained

AS the result of an investigation extending over a number of years, the Boston & Maine inaugurated, March 1, 1917, a simplified system of freight accounting on the daily report plan, which has resulted in a radical change in the methods heretofore in vogue on that road.

A review of freight accounting methods and a comparison of them with other accounting rules demonstrated that there was practically no relief to be obtained, either by the accounting department or at the station, from a revision of forms, it being shown very early in the investigation that freight accounting forms had been reduced to the lowest economical safety basis considering the purpose for which they were designed.

It was, therefore, decided to direct the entire energy of the investigation toward a satisfactory adaptation of current forms to a safe, economical plan of simplified accounting that

quirements of the station and the general office, were reduced to a carbon copy of the so-called cashiers' schedule.

Abstract of Interline Way Bills Received Printed by the Powers Tabulator from Cards Punched on Powers Machine

would avoid duplication of labor wherever possible. By a process of elimination, the reports to be made by the freight station to the accounting department, considering the re-

each day at the station in order to obtain an accurate record of the debits and credits to the station account.

It was found that all of the other forms in use could be

[illegible]

omitted and a good and sufficient reason assigned for such omission in each case, but no satisfactory substitute could be found for the cashiers' daily schedule.

Having arrived at this point the effort was then made to change the cashiers' daily schedule sufficiently to make a

Key Board of Powers Card Punching Machine

carbon copy of it, satisfy the accounting department requirements, and at the same time not changing it in any way that would affect its efficiency, both in economy of time, labor and material, at the station.

During recent years it has become more and more appar-

Powers Sorting Machine

ent that for statistical purposes the records of the accounting department must be used and, therefore, it has been increasingly evident that any statistics prepared at the station are a duplication, at least in part if not entirely, of records which are required for the same or other purposes in the accounting department.

With this in mind, it must be admitted that the station had very little interest in the tons, ton miles, commodity, or other statistical data. Therefore, if the station force is to accomplish the best results in the work properly assigned to it, relief must be given from reports of the above nature.

It is expected that the adoption of the daily report plan, detail of which follows, will accomplish that result and enable the station force to handle in a more satisfactory manner the duties required of it which, broadly speaking, are considered to be the solicitation, receipt and delivery of traffic, protection of the carriers' revenue and the proper consideration of the needs of the shipping public.

To accomplish the necessary results, machines such as manufactured by the Powers Accounting Machine Company, the Remington Typewriter Company and various calculating machine companies have been installed. The Powers system consists of three distinct types of machines, namely: The

Powers Tabulating Machine

punching or perforating machine; the sorting machine; and the tabulator-printer.

Tabulating cards $7\frac{3}{8}$ in. by $5\frac{1}{4}$ in. are used as a means of conveying information, such cards being specially designed to meet the requirements.

Waybills or copies of waybills are forwarded daily by the station freight agents to the office of auditor freight receipts. The data and information as shown on the waybills is perforated on the cards by the punching machine referred to. The perforated cards constitute the basis from which all subsequent operations are performed automatically on the sorting machines and tabulator-printers.

THE POWERS MACHINES

The blank, unpunched cards are placed in a magazine in the back of the machine and automatically fed after each punching by a raised edge about 0.005 in. high between the feeding rolls of the machine. The waybills or other data, from which it is desired to transfer the information thereon to the perforated cards, are placed on the rack above

and the operator sets the keys to the desired places indicating date, waybill number, station number, weight, freight charges, etc., presses a bar on side of machine, which trips the clutch, raises the dies and card holding mechanism against the punch and punches the entire number of holes desired at one stroke. After the die returns to the lower position the perforated card is automatically ejected into the front

moved forward in accordance with the position selected to its proper compartment. At the same time another card is fed from the magazine and the process repeated. The machine automatically stops when the last card has been selected and deposited in its proper compartment. Cards can be withdrawn from their respective compartments and additional cards placed in magazines without stopping the

magazine, and at the same time another unpunched card automatically feeds into proper position for cutting and all keys return to their normal position so as to be immediately available to operator for the resetting of same to correspond with the information as shown on the following waybill. All naughts are punched automatically.

The sorting machine distributes or separates the punched cards in accordance with requirements as to sub-divisions,

machine. Cards can be assorted at the rate of approximately 300 cards per minute.

The tabulator-printer tabulates totals and prints them in conjunction with the designations of station or other group numbers directly upon a report or record; or, if desirable, the listing in detail of all items represented by the holes punched in each individual card.

The machine is easily operated, and the principle of

lines in the row under the plungers passes under the guide plate, the corresponding plunger drops through the hole setting the guide bar beneath, which diverts the card to the correct pocket. As soon as the tripping levers underneath have been set, the plungers rise out of the card and it is

act as human fingers and, according to the holes perforated* in the various columns or fields of each card, make simultaneously the corresponding selection of all the items to be listed or added internally within the accumulative section of the machine. To operate, the perforated cards are placed

in the magazine in practically the same manner as they are in the sorting machine. Each card is fed automatically into the proper selective position, and the mechanical selection accomplished, in accordance with the perforated information as indicated on card, as above outlined. Card is then automatically ejected into a receiving magazine, and the process repeated. A "total card" is placed between the cards for each station or sub-division, which actuates the total mechanism and automatically prints the totals accumulated to that point before proceeding with the tabulation of the subsequent group of cards in the magazine.

The machines are equipped with from five to seven adding units, each of which has a printing or accumulating capacity of nine figures; the selection, printing and adding upon all units being performed simultaneously.

Under the daily system plan, agents are required to render to the audit office daily schedules. These daily schedules comprise the following:

(1) Daily received schedule showing debit to the station. Both local and interline received waybills are reported on the same schedule under the proper caption.

(2) Advances forwarded schedule. All interline and local waybills carrying advance charges are reported on this schedule, amounts being separately listed as to local or interline in the proper column.

(3) Prepaid forwarded schedules whereon the agents list all the waybills carrying prepaid charges, separating the local from the interline in the proper columns in the same manner as outlined in connection with schedules one and two.

(4) Miscellaneous schedules whereon are reported all

HANDLING OF WAYBILLS

Original waybills, both interline and local, copies of waybills, both interline and local, are separated from the schedules either received collect, forwarded advances or forwarded prepaid, and are placed in the hands of a force of clerks for purposes of coding, which by the use of numerals expresses the station from and to billing or receiving road, route, commodity, etc.

This having been done the local received waybills and such foreign waybills as are designated to be handled by the Powers machines, together with the copies of forwarded local waybills bearing expense and prepaid charges, together with copies of all interline waybills are then passed to what is known as the key-punch section to have the information put on the cards as previously described.

Interline waybills from certain designated roads are passed to the Remington-Wahl (adding typewriter) operators who make individual abstracts covering each billing station, from and to, road and route, using what is known as a carbon cut-off which allows a proof sheet to be tabulated carrying all the information on one sheet that appears on the individual abstracts and allowing the operator when completing the abstracting of a station to accumulate immediately the total weight, freight, expense, prepaid and collect of each station.

LOCAL RECEIVED

A card form as shown is used for local received waybills. All of the information as shown is punched directly from the original waybills.

Stop or total cards are placed in the magazine of the

Sample of Monthly Summary of Agents' Debits and Credits

miscellaneous charges which are not strictly chargeable to freight revenue account.

(5) Correction schedule whereon are reported all undercharge and overcharge corrections affecting waybills previously reported.

Schedules are prepared in skeleton form, showing date, waybill number, freight bill number, and total of waybill either collect, advances or prepaid, as the case may be. In addition to the above reports agents are required to forward to the audit office at the close of each month a monthly summary of debits and credits.

The following is a brief outline of the methods in force after receipt of the above described schedules in the audit office.

Original waybills are attached to the received collect schedules and carbon copies of waybills are attached to the advances and prepaid forwarded schedules, no report being made for waybills bearing freight charges only. These are enclosed in special envelopes and received intact at the audit office where a proper check is made to insure the prompt receipt of reports from all stations, and are uniformly stamped with the date received. The distribution of the various schedules, waybills and copies of waybills is then made to the various sections assigned to the performance of the work.

punching machines by the punch operators after each set of cards are cut from the waybills included on a schedule for each station. These cards then move to the tabulating machine operators and are tabulated showing all necessary information, such as station number, waybill number, commodity number, as well as weight, freight, advances and prepaid charges; the tabulator automatically printing the totals as represented by each station schedule. The tabulated sheets then move to a set of clerks designated as examiners, whose duty it is to audit the daily schedules against the figures as shown on tabulated sheets, and the necessary corrections are then made.

The tabulated sheets having been balanced against agents' schedules, the perforated cards are filed in station order in filing cabinets and remain in that order until the close of the month.

INTERLINE RECEIVED

Interline received waybills are handled by both the Powers machine and the Remington-Wahl typewriters.

The card form being used for such interline waybills as are handled by Powers machines is shown, and such waybills are handled in identically the same manner as local received waybills.

Waybills handled by the Remington-Wahl typewriters,

the proof sheet, as previously referred to, is key-punched on what is known as a master card, showing the receiving station, weight, freight, expense and prepaid charges, which represent the total of a day's business, and this master card is combined with the tabulations of the Powers machine covering any one station for the day, and the combined figures are used to balance the interline column of the schedule.

LOCAL FORWARDED

Only such local forwarded waybills as bear expense or prepaid charges are coded and key-punched.

It is not considered necessary to balance out daily or for any period of time the local forwarded charges as against received local charges. This system, however, permits the actual balancing daily or for a period of time, of the forwarded local expenses and prepaids against received local expenses and prepaids.

Cards having been key-punched are handled in identically the same manner as local received.

INTERLINE FORWARDED

Copies of all interline waybills after being coded and key-punched are handled in identically the same manner as local received.

RESULT OF OPERATION

The perforated cards and the tabulations made therefrom now represent by days the total local received, weight, freight, expense and prepaid charges, the total interline received, weight, freight, expense and prepaid charges, the total local forwarded expense and prepaid charges, the total interline, forwarded weight, freight, expense and prepaid charges and these cards filed in alphabetical order are held until the end of the month and the tabulations which represent the balance as between the machine operation and the agents' schedules are filed in station order and are held.

The various forms used to represent such miscellaneous charges as storage, switching, etc., are separated from the miscellaneous schedules and are handled in practically the same routine manner in the tabulating machine section.

At the close of audit month cards are sorted according to a miscellaneous charges classification and subsequent tabulations are made in conformity with established requirements.

CORRECTIONS

Under the new system instructions to agents provide that no corrections shall be included on daily schedules unless authorized by the audit office. The effect of this arrangement is to give the audit office complete control of the correction situation at all times. Waybills may be corrected before leaving the agent's office and reported on schedules on the basis of such corrected charges, attaching thereto copy of correction to sustain such corrected reporting; no subsequent reporting of corrections affecting waybills previously reported is permitted without the necessary authority from the audit office.

A card is cut for all corrections issued. These cards are listed in detail on the tabulator printers daily, and after proper checking of tabulated lists cards are assorted according to the station affected, they are also assorted as to undercharges and overcharges. A daily tabulation is then made on tabulator printers in duplicate. The original is sent to the agents together with a copy of correction with instructions to include total amount on his correction schedule of a certain date, duplicate statement being retained in the audit office to insure the agent's compliance with his instructions.

BALANCING

Recapitulation or master cards are cut daily for each station from printed tabulations of all detail cards, the

same card forms also being used for the punching of totals as shown on agent's schedules. A separate detail listing of these cards is made daily on the tabulator printer, the grand total of which must agree, thereby proving each day's work for the month.

Cards are separately filed in station order until the close of audit month and another listing is then made including the monthly balance which is also used as an audit of the agents' monthly summary of debits and credits.

This provides a very elastic method for balancing inasmuch as agents' accounts may be balanced by days, weeks, monthly, or for any period, and the agents' balance for any period of time must balance the combined local and interline account, both received and forwarded.

STATISTICS

All requirements as to daily and monthly statistics are for the most part obtained from the detail cards described.

The local received cards are taken from the file boxes, placed on the sorting machines, and are sorted in what is known as "station to station order," this giving a grand total as between each station on the line of the road, of the tonnage and freight charges, making it comparatively easy to insert the miles so as to arrive at the ton miles.

Interline received cards after being removed from the file cases are sorted in station order by junctions at which freight is received on the line of the road, in this way furnishing total tonnage and the freight charges via each junction to each station on the line of the road, and making it comparatively easy, after having inserted the miles, to arrive at the ton miles. The tons and ton miles of such abstracting as has been done by the Remington-Wahl typewriters is combined with this, and it has been found comparatively inexpensive to key punch cards from the Remington-Wahl tabulations covering this information as well as commodities and combine such tabulations with the Powers machines' tabulations.

Interline forwarded cards are sorted as from each Boston & Maine station in strictly numerical order of billing to all roads via any one junction, and after inserting the miles between that station and the junction it makes it comparatively simple to arrive at the ton miles.

Another sort of the cards is made through the sorting machines and cards are sorted out for each commodity by itself, and these cards put on the tabulator printer, a total weight of each commodity is arrived at, which combined, must agree with the total tonnage for the entire month.

The commodity tonnage, local received, interline received and interline forwarded can be kept entirely separate if necessary.

We are indebted to John F. Turner, general auditor, and to N. H. Ricker, auditor of freight receipts, for permission to study the Boston & Maine auditing system and to use the forms shown.

EXPORTS MAKE RECORD SINCE WAR WAS BEGUN.—Exports from the United States to the neutral world have doubled since the beginning of the European war, and to the belligerent world have trebled. A compilation made public recently by the National City Bank showed that exports to the neutral sections of the world other than those of Europe were, in the Government's fiscal year 1917, \$1,838,000,000 against \$877,000,000 in 1914. To neutral Europe the total for 1917 was \$414,000,000 against \$184,000,000 in 1914. This made the total exports to the entire neutral world, European and non-European, in 1917, \$2,252,000,000 compared with \$1,061,000,000 in 1914, and to belligerent Europe in 1917, \$4,042,000,000, against \$1,304,000,000 in 1914. The increase in exports to the entire neutral world 112 per cent, and to the belligerent countries of Europe 210 per cent.

Exclusive Federal Regulation Urged

U. S. Chamber of Commerce Committee Favors Federal Incorporation and Control of Securities and Rates

AS briefly noted in last week's issue, the United States Chamber of Commerce is taking a referendum vote of its membership on a report of its Railroad Committee recommending an extension of the authority of the federal government in matters of railroad regulation to avoid the present conflict between state and federal regulation. The referendum was ordered in accordance with a resolution adopted by the National Council of the chamber last November, recommending a referendum to ascertain the opinion of the business interests of the country respecting legislation designed to make certain that transportation facilities of the country may be stabilized, improved and extended to meet and keep pace with the needs of commerce and the entire public. The report of the committee is as follows:

PART I—RECOMMENDATIONS

The Railroad Committee has spent several months making a careful study of the present system of railroad regulation and reviewing the various plans for perfecting it that have been suggested by railroad executives, labor leaders, and commercial organizations in all parts of the country. The committee has also made a detailed analysis of all of the railroad bills introduced in the 63rd and 64th Congresses in order to learn what constructive plans have been proposed and what views have been expressed by the Congressional leaders on whom we must depend for any new railroad legislation. As a result of this study the committee has reached certain definite conclusions that are embodied in the four recommendations submitted in this report.

It has not been deemed necessary to include any recommendations having in view the provision of facilities for the transportation of men and materials during the present war, because the railway executives themselves are already doing very effective work along this line, thus giving positive assurance that in all cases of military necessity existing railroad facilities will be used to their maximum capacity.

The fact of overwhelming importance, however, is that as soon as the war is over the railroads will need greatly increased facilities in order to meet demands arising from the development of industries serving the home market, from the increasingly sharp commercial competition with foreign countries, and from the necessity for transporting to the seaboard enormous quantities of building materials, machinery, and other commodities needed for reconstruction in those parts of Europe that have been overrun during the war.

Undeveloped areas in our own country must be cultivated in order to supply the increasing demands for food at home and abroad. As transportation is an essential element in farm development, branch lines must be built and additional equipment provided to enable us to supply our own markets and those of our allies with the necessities of life.

The railroad question that is really of vital importance therefore is "What steps can we—the American people—take through our representatives in Congress to enable the railroads to secure the necessary capital for terminals, extensions, and equipment, and to provide such intelligent control and regulation as to insure efficient and uniform service?"

Unlike other business organizations the railroads are unable to control either their receipts or their expenditures.

Their receipts are limited by the Interstate Commerce Commission when it regulates the rates they are allowed to charge for transportation service which is the only thing they have to sell. At the same time their expenditures for labor and materials are increased by government authorities and labor organizations and by varying market conditions over which they have no control, and this is done without regard to whether the money needed to pay the increase arbitrarily imposed upon them is or is not available.

It is generally recognized that there are defects in the system of railroad regulation that have furthered the agitation in favor of government ownership. The committee believes, however, that it is entirely possible to perfect the present system of regulation under private ownership, and that if Congress will enact legislation based upon the recommendations made in this report it will go a long way toward accomplishing that purpose.

FEDERAL REGULATION OF RAILROAD SECURITIES

The issuance of railroad securities is now regulated by the states from which the railroads receive their charters. Since 1897 the legislatures of 23 states have enacted laws giving their regulatory commissions authority to regulate the issuance of railroad stocks and bonds; but these laws are so conflicting in character that they have had a disastrous effect on the financial condition of the railroads and have seriously interfered with necessary railroad development. Whatever the effect of the laws in these 23 states, there has been no attempt in the other states,—more than one-half,—to protect the public.

For reasons stated in Section I of Part II of this report the committee believes that the time has come for the federal government to assert its right to regulate security issues by placing them under the supervision of the Interstate Commerce Commission.

Therefore, the committee recommends that provision be made for federal regulation of the issuance of railroad securities.

RAILROAD INCORPORATION LAW

With few exceptions the railroads of the country are now operating under charters granted, not by the federal government, but by the individual states through which they run. For example, one trunk line running from Chicago to the Pacific Coast passes through seven different states and is obliged to operate under seven separate jurisdictions. The regulatory laws of each of these states define certain conditions that must be fulfilled by the carrier and impose certain obligations that may at any time be modified or extended by the state.

A study of the conflicting regulations adopted by the several states and of the confusion resulting from their enforcement has convinced the Railroad Committee that for reasons given in Section II of Part II of this report there is immediate need for the federal government to formulate a national transportation policy and to make possible the federal incorporation of interstate carriers.

The committee, therefore, recommends that Congress pass a general railroad incorporation law under which all railroad carriers subject to the jurisdiction of the Interstate Commerce Commission may organize.

FEDERAL INCORPORATION OF RAILROADS

There has been a great deal of discussion by shippers, carriers and government officials in regard to whether the

railroads should merely be given an opportunity to incorporate under federal authority or should be required to do so. Many constituent members of the Chamber of Commerce of the United States have made a careful study of this question and in resolutions forwarded to the chamber have declared themselves unmistakably in favor of compulsory federal incorporation. For reasons given in Section III of Part II of this report the Railroad Committee has reached a similar conclusion.

The committee, therefore, recommends that if Congress passes a railroad incorporation law, all railroad carriers subject to the jurisdiction of the Interstate Commerce Commission, both those now existing and those hereafter to be created, be required to organize under this law.

FEDERAL REGULATION OF RAILROAD RATES

The decisions of the United States Supreme Court in the Minnesota rate case, and in the Shreveport case, have established the authority of Congress to regulate intrastate rates whenever those rates throw an undue burden on interstate commerce. These cases recognize that when Congress passed the acts to regulate Commerce it did not exercise its full power of regulation; and that under these acts the Interstate Commerce Commission can regulate intrastate rates only to the extent of prohibiting discriminations found to exist between intrastate and interstate rates. For reasons given in Section IV of Part II of this report the committee believes that the control of the Interstate Commerce Commission should be extended and should be made complete over such intrastate rates when they affect interstate commerce.

Therefore, in view of the fact that conflict has arisen with respect to the jurisdiction of the Interstate Commerce Commission over intrastate rates, even though such rates affect interstate commerce, the committee recommends that the commission be given authority by statute to regulate intrastate rates when these rates affect interstate commerce.

PART II—SECTION I—FEDERAL REGULATION OF RAILROAD SECURITIES

Government regulation of railroad securities is necessary:

(a) *In the public interest.* Effective government regulation of railroad securities is necessary in the public interest. The fixed charges and other capital expenses of the carriers are in proportion to the volume of securities issued. The revenues to meet those expenses are necessarily derived from shippers and passengers. Those who make use of the railroads thus have a direct interest in the volume and character of the securities issued by carriers.

(b) *To protect investors.* As investors a large share of the public is affected by the amount and character of railroad securities issued. One railroad corporation has nearly 100,000 stockholders of whom about one-half are women; other corporations number their stockholders by the tens of thousands; while individual bond holders and persons who are indirectly so through insurance companies, trust companies and other fiduciary institutions holding these securities, total many millions.

(c) *To assure the provision of adequate transportation facilities.* The railroad companies also have need for government regulation of their securities. Without government regulation it is possible for a limited number of railway companies by speculative and irresponsible financing to bring all railroad securities under suspicion and thus to make it difficult for railroad companies generally to secure the funds needed to provide the public with adequate transportation facilities.

Federal regulation of railroad securities should be substituted for state regulation because:

(a) *Less than half of the states now regulate the issue*

of railroad securities. The present regulation is incomplete both because of the absence of regulation in a majority of the states and also because all of the important railroad systems in the United States have lines in several states. A large railroad company may have only a short mileage or even no mileage at all in the state from which the company's charter was derived. Under such conditions the corporation may escape regulation by the states that have the greatest interest in the financial operations and the service performances of the carriers. The railroad history of the last few years proves conclusively that state regulation does not prevent railway financing that is ruinous alike to the carriers and to the public.

(b) *The laws of the states vary greatly.* There are numerous instances of conflict between the laws of one state and those of another. This limits the effectiveness of the regulation of railroad securities while making the regulation unnecessarily expensive to the carriers. Government regulation of securities should be uniform throughout the country; it should be adequate for the accomplishment of the ends desired and should aim to be constructive and helpful to both the carriers and the public.

(c) *The federal government alone can make regulation uniform and effective.* The federal government acting through the Interstate Commerce Commission can make the regulation of railroad securities more effective than the several states can make it, however wisely they may act. The federal government can require regular and special reports of all railroad companies in the United States, it can obtain full information concerning the financial methods and operations of the carriers and concerning the capital needs of the corporation whose securities are subject to regulation. The federal government can also maintain adequate supervision over the financial operations of the carriers. It can enforce throughout the United States the requirements of the federal statutes and thus insure the observance by the carriers of the requirements contained in certificates authorizing the issuance and sale of securities.

Inasmuch as it is the United States government rather than the several states that can make uniform and adequate the regulation of railroad security issues and can maintain the supervision over the financial methods of the carriers that is needed to secure fully the aims of government regulation of railroad finances, legislation should be enacted substituting federal for state control and supervision of the financial operation of railroad companies.

Legislation for the federal regulation of railroad securities:

(a) Should define carefully the conditions to be complied with by the companies proposing to issue securities.

(b) Should give the Interstate Commerce Commission ample authority to obtain by investigation, and through regular and special reports of railroad companies, full information concerning the financial methods and operations of the carriers and the capital needs of the corporations whose securities are subject to regulation.

(c) Should enable the Interstate Commerce Commission to approve applications of carriers for authority to issue securities provided the Commission, after necessary investigation, finds that the petitioning carrier has fulfilled the requirements of the statute; and should also enable the Commission, if the provisions of the statute have not been fully observed, to require the carrier to make the necessary changes in its plans for the issuance of securities and to make appropriate amendments to its petition. The Commission should be authorized to approve a proposed issue of securities only when the financial plans and the petition of the carrier meet the requirements of the statute.

(d) Should require the Interstate Commerce Commission to maintain by means of an adequate force of inspectors such supervision over the financial operations of the

carriers as will enable the Commission to enforce the provisions of the statute and to insure the observance by the carriers of the requirements contained in the certificates authorizing the issuance and sale of the securities.

In November, 1916, the committee on capitalization and intercorporate relations of the National Association of Railway Commissioners reported as follows:

We reiterate the expression on this subject heretofore promulgated by your Association, and we unhesitatingly and emphatically declare our belief that the capitalization of the interstate carriers and the interstate public utilities should be subject to federal authority. To state the proposition is at once to answer it. It is not necessary to review the many cases so well known to the members of this Association, wherein several states have attempted to exercise jurisdiction over the identical issue of stocks and bonds by interstate carriers.

This report of the committee, to be sure, has not been formally approved by the association of railroad commissioners, having gone over for consideration until their next annual meeting. Nevertheless, the committee not only goes on record in favor of this proposition, but it calls attention to the fact that in 1913 the association approved the recommendation for the regulation of the stocks and bonds of interstate common carriers by the Interstate Commerce Commission; and that in 1915 a resolution in favor of vesting in the Interstate Commerce Commission control over the securities of railroads constructed across state lines was passed by the Association.

The report also calls attention to the fact that the Interstate Commerce Commission "have constantly urged with emphasis and detailed argument federal control of interstate capitalization." It is true that the report made some years ago by the commission of which President Hadley of Yale was chairman, did not favor vesting in the Interstate Commerce Commission control of the issuance of stocks and bonds by interstate carriers, but it is believed that subsequent developments (particularly the increased regulation of such stocks and bonds that has been vested by the legislatures of the different states in their state commissions) have altered the situation to such an extent that the conclusions of the Hadley commission are now inapplicable; and it is possible that if the question were again presented to that commission it would, in view of these subsequent developments, reach a conclusion in favor of federal control of such securities.

It is believed that the best results can be accomplished without disturbing the present outstanding obligations of the carriers. It seems quite possible under the decisions of the Supreme Court to reincorporate the existing corporations under a federal incorporation law without disturbing the outstanding securities. The reorganization would merely substitute a federal corporation in lieu of the existing state corporation. Such procedure would avoid serious legal questions as to the power of Congress to affect outstanding securities and the existing contracts. Under the decisions of the Supreme Court it is believed that the holders of the present securities would be held to have taken these securities subject to the paramount power of Congress over interstate commerce, and that therefore Congress could, in spite of these existing contracts, force the reincorporation of the railroads under a federal statute. But whether Congress could go further and provide, for instance, for the cutting down of outstanding securities to the present actual value of the properties they represent might be doubtful in law and would at any rate be questionable as a matter of practical procedure in view of the widespread opposition which would be felt to any move in that direction.

SECTION II—RAILROAD INCORPORATION LAW

Many of the leading commercial organizations in the country have declared in favor of federal incorporation of railroads. For example, the Philadelphia Board of Trade has submitted to the Chamber of Commerce of the United

States a program of remedial legislation in respect to government regulation of railroads which includes:

Legislation to provide for the grant of federal charters to all railroads engaged in interstate commerce without impairment on the one hand of the rights of the several states with regard to the fair proportionate taxation of railroad property within their borders and without surrender on the other hand of the rights granted to the roads by state charters except to the extent that such rights may be inconsistent with federal control; this legislation to be drafted with the end in view of placing all phases of railroad regulation in the exclusive control of the federal government.

The National Industrial Traffic League says in a report adopted November 10, 1916:

It appears to the majority of those present that federal incorporation of common carriers is desirable, provided that in bringing this about the government incur no moral and financial obligation in respect thereto.

The Railway Business Association says in a report on Congress and the railroads:

Incorporation and regulation of security issues should be federal.

The Illinois Manufacturers Association says in a report on railroad regulation:

The association approves the federal incorporation of common carriers and the federal regulation of the issue of securities of such carriers but only after providing proper safe-guards against increase and inflation of capitalization.

The Merchants Association of New York declared in a resolution passed in November, 1916:

That the public interest requires that all the railroads of the country shall effectively regulate their affairs by the sole authority of the federal government of the conditions under which railroad securities may be issued; and that as a means to that end federal incorporation of railroads should be provided for.

The Freight Traffic Committee of the Chicago Association of Commerce says in a report submitted in January, 1917, and afterwards adopted as the judgment of the Association of Commerce as a whole:

It seems to the Committee that the regulation of the issuance of securities and the expenditure of the money raised by the sale thereof should be placed by Congress in the exclusive control of the federal government; and that federal incorporation would be a proper means to the accomplishment of that end.

That Congress has power to enact a general railroad incorporation law must be conceded under the Pacific Railroad cases, 115 U. S. 1; The North River Bridge case, 153 U. S. 525, and the Metropolitan National Bank Case, 141 U. S. 520. The language of the recommendation is carefully selected to cover not only creation of railroad corporations but the nationalizing of corporations already existing under state charters. Indeed, the latter function is most important, since the need of new companies is not pressing.

The propriety of new legislation must rest on the existence of evils demanding remedy. The presence of evils in connection with the regulation of interstate commerce involved in railroad transportation is apparent to the most casual observer. A partial list of these evils includes conflict of jurisdiction between state and federal control resulting in confusion, inconsistency, useless expense, waste of energy and reduced efficiency of physical means at hand; apprehension of investors, frightened capital, and injured credit, resulting in reduced ability to augment physical equipment necessary to keep abreast of the expanding volume of business. From these basic evils there springs a host of lesser difficulties which will readily occur to the thoughtful mind.

In the process of delegating to the national government certain attributes of the sovereign states they divested themselves completely of certain powers, among which was the power to regulate interstate and foreign commerce. As to this power the relation of the two governmental jurisdictions was reversed, in that the states could exercise it only to the extent Congress chose to redelegate it, either directly or by implication from its own failure to exercise it. The present evils find their root in the failure, up to the present time, to crystallize this reversal of relation between the two governments into comprehensive legislation in respect

of interstate railroad transportation. The corporate creatures through which, almost exclusively, this transportation is conducted have with few exceptions derived their being from the states, and, in consequence, have owed allegiance to their creators in respect of all their activities except interstate commerce. The jurisdiction of the federal government is thereby limited to certain activities of these corporations while their general corporate existence is dominated by the states which created them.

This situation exactly reverses the relations between the two governments with respect to the greatest instrumentality of interstate commerce, viz., railroad transportation. Instead of the national government creating the fundamental instrumentalities of interstate commerce over which it has exclusive control, and delegating authority over such of the local activities as could be best exercised by the states, the states have hitherto created them, notwithstanding exclusive authority over their interstate operations has been delegated to the general government through the commerce clause of the federal constitution. As a consequence, under modern conditions the great bulk (at least four-fifths) of their activities is dominated by a power different from that which imparted life to them and holds dominion over the conditions of their continued existence. Needing additional capital to supply increased facilities, they must obtain it under conditions imposed by a jurisdiction directly interested in only a small portion of the service to be improved thereby. While the local demand for equipment is but a small fraction of the whole, the rule of its distribution is made exclusively by the local authorities.

The foregoing recommendation seeks to correct the fundamental conditions producing these evils by transferring the allegiance of carriers engaged in interstate commerce to the jurisdiction of that realm in which the great and ever increasing proportion of their activities is carried on. That such a change of legal status would be beneficial seems obvious because (a) through this means adequate and consistent regulation of the issuance of securities necessary to provide the capital demanded for the increased efficiency of these carriers can be best provided; (b) in this way alone can the inevitable conflict between the fixation of intrastate rates by the local commissions and interstate rates by the Interstate Commerce Commission be peacefully and intelligently reconciled; (c) thus alone can the multiplicity of masters be practically eliminated.

The railway executives represented by Mr. Alfred P. Thom are on record before the Newlands Committee as favoring such regulation. It was urged by Mr. Thom that while, according to his view, it would be permissible for Congress to regulate the issuance of securities by interstate carriers even without federal incorporation, such a procedure would involve nice legal questions which might result disastrously to the railroads and the public, and that in order to avoid those difficulties he is emphatically in favor of federal incorporation of interstate carriers, there being under those circumstances no question as to the power of Congress to control the issuance of their securities.

The recommendation does not contemplate any interference with the power of the states to tax the physical property of the carriers at the same *ad valorem* rates as apply to all taxable property in the respective states. Neither does it contemplate that Congress would withdraw from the states power to make reasonable police regulations. While some of the powers of the various state railroad commissions would necessarily be transferred to the Interstate Commerce Commission, the state commissions would still retain responsibility for the regulation of thousands of local public utilities, and their real usefulness would be undiminished by the elimination of evils flowing at present from joint control of the operations and credit of interstate carriers by both state and federal governments.

Legislation involving the principles of this recommendation would lay the foundation of a new structure for the rehabilitation of railroad credit and thus relieve a situation that is characterized by impractical control, impaired usefulness, and inadequate regulation of railroad securities.

SECTION III—FEDERAL INCORPORATION OF RAILROADS

If it be desirable to authorize the incorporation and nationalization of all interstate carriers under general laws of Congress it would seem to follow as a necessary corollary that compliance with such laws should be made compulsory rather than permissive. This is true for the reason that one of the fundamental objects to be obtained is uniformity throughout the entire railroad system of the United States, and this cannot be obtained if any substantial lines are permitted to retain their allegiance to state authorities.

In order to make a railroad incorporation law effective it would be necessary to require all interstate carriers to organize under the law. It is quite probable that some of the important lines in the United States would not of their own volition change their allegiance from the state to the national authorities because of certain special privileges claimed under their state charters. It would be a matter for Congress to consider, if the law so recommended compels their nationalization, whether or not these special privileges would be in whole or in part continued. Whether this is done or not the paramount interests of the public which would be subserved by complete uniformity would outweigh any special privilege now enjoyed by any particular line under the provisions of its state charter.

SECTION IV—FEDERAL REGULATION OF RAILROAD RATES

Intrastate rates are closely interwoven with interstate rates and that any regulation of the one must have some effect upon the other seems clear. Most of the railroads of the country cross state lines and handle both intrastate and interstate commerce over the same rails, by the same employees, and often in the same cars. The same commodities are handled in both intrastate and interstate commerce. Mr. Justice Hughes in the Minnesota rate case said:

The interblending of operations in the conduct of interstate and local business by interstate carriers is strongly pressed upon our attention. It is urged that the same right of way, terminals, rails, bridges and stations are provided for both classes of traffic; that the proportion of each sort of business varies from year to year and indeed from day to day; that no division of the plant, no apportionment of it between interstate and local traffic can be made, today which will hold tomorrow; that terminals, facilities, and connections in one state aid the carrier's entire business and are an element of value with respect to the whole property and the business in other states; that securities are issued against the entire line of the carrier and cannot be divided by states; that tariffs should be made with a view to all traffic of the road and should be fair as between through and short-haul business; and that, in substance, no regulation of rates can be just which does not take into consideration the whole field of the carriers' operations, irrespective of state lines.

It is to be observed that Mr. Justice Hughes does not in any way controvert the correctness of these contentions, but he goes on to say:

The force of these contentions is emphasized in these cases and in others of like nature by the extreme difficulty and intricacy of the calculations which must be made in the effort to establish a segregation of intrastate business for the purpose of determining the return to which the carrier is properly entitled therefrom * * *. But these considerations are for the practical judgment of Congress in determining the extent of the regulation necessary under existing conditions of transportation to conserve and promote the interests of interstate commerce. If the situation has become such by reason of the interblending of interstate and intrastate operations of interstate carriers and that adequate regulation of their interstate rates cannot be maintained without imposing requirements with respect to their intrastate rates which substantially affect the former, it is for Congress to determine within the limits of its constitutional authority over interstate commerce and its instruments, the measure of the regulation it should supply.

In both the Minnesota rate case and the Shreveport case the Supreme Court pointed out that Congress had not exercised the full jurisdiction vested in it by the Constitution over railroad rates, and that it was for Congress to determine how far federal regulation of any intrastate rates affecting interstate rates should go. The court did in the

Shreveport case, to be sure, hold that under the existing laws the Interstate Commerce Commission could by its orders indirectly affect intrastate rates when the Commission affirmatively found that actual discrimination resulted between existing intrastate and interstate rates. But under both of the above decisions the court emphasized the fact that Congress could lawfully exercise greater authority over intrastate rates than it had thus far vested in the Interstate Commerce Commission.

The committee believes that it is desirable that the regulation of all rates which affect interstate commerce, and so affect the people of more than one state, should be regulated by the Interstate Commerce Commission, the representative of the people of all the states. That only by vesting such power in the Interstate Commerce Commission can uniformity of regulation be brought about and all unfair discriminations abolished; that it is eminently unjust that intrastate rates should be regulated and controlled by state authority in such a manner as to give points within that state a preference over other competitive points situated in adjoining states; that this condition has already arisen on numerous occasions and is sure to arise again unless the Interstate Commerce Commission is given more complete jurisdiction over such discriminatory intrastate rates.

So long as there are two distinct regulatory bodies, the one the Interstate Commerce Commission and the other a state commission, exercising jurisdiction and control over rates for the transportation of the same commodities over the same rails and often in the same cars, the jurisdiction of the Interstate Commerce Commission depending on whether or not the transportation is interstate or affects interstate commerce, there is sure to be more or less conflict between these two regulatory bodies. The committee believes that such conflict should be reduced to a minimum and that it is to the interest both of the shippers and the carriers that in all matters affecting interstate commerce the supreme power of the federal authorities should be recognized and enforced. The committee therefore have made the above recommendation in favor of further legislation vesting in the Interstate Commerce Commission full jurisdiction over intrastate rates when they affect interstate commerce.

Undoubtedly a finding of fact by the Interstate Commerce Commission that a particular intrastate rate affects interstate commerce would be subject to review in the courts if the commission acted in a purely arbitrary manner and found that there was such a relation between the intrastate and interstate rates when there was no basis whatever for such conclusion; but if it was a matter upon which there could be an honest difference of opinion and there was some evidence in the record sustaining the conclusion of the commission, we believe that the finding of the commission in this as in other particulars would be treated as practically conclusive by the courts.

The members of the Railroad Committee are as follows: Harry A. Wheeler, chairman, banker, of Chicago; George W. Anderson, lawyer, of Boston, federal district attorney; F. C. Dillard, lawyer, of Sherman, Tex., formerly vice-president and general counsel of the Chicago, Rock Island & Pacific; R. H. Downman, of New Orleans, president of the National Lumber Manufacturers' Association; Dr. Thomas F. Gailor, chancellor and president of the board of trustees, University of the South; Stephen A. Foster, lawyer, of Chicago; Emory R. Johnson, professor of transportation and commerce, University of Pennsylvania; E. T. Meredith, editor and publisher of *Successful Farming*, Des Moines; George A. Post, president, Railway Business Association, New York City; William Z. Ripley, professor of political economy, Harvard University; G. W. Simmons, vice-president Simmons Hardware Company, St. Louis, Mo.; Alexander W. Smith, lawyer, of Atlanta, Ga.; and Charles R. Van Hise, president of the University of Wisconsin. Mr.

Anderson was unable to participate in the work of the committee and did not sign the report.

ARGUMENTS AGAINST THE COMMITTEE'S REPORT

To the report as submitted to the membership there is appended the following statement of arguments against the recommendations of the committee:

(a) The report recommends governmental control of securities, to be exercised by federal authority. Against these recommendations it may be argued that other methods for preventing abuses are possible and perhaps more desirable.

Legislation to prevent abuses in issue of securities can take the form of provision for greater responsibility on the part of the individual directors who participate, or who by virtue of their office should participate, in authorizing issues and on the part of the bankers who sell them to the public. Increase in responsibility in this way would not only prevent abuses but would in many cases lead to increased attention on the part of directors to the management of their corporations, which in the past has sometimes been left in large measure to an individual or a group of individuals, contrary to the principles which should govern use of the corporate form in business. In other words, it can be argued that legislation should take such form as to lead to increased efficiency in the direction of railways.

Governmental control of securities will have an opposite influence. The more authority the government—state or federal—exercises over such matters the less the responsibility to holders of securities that will lie with the men in charge of a corporation's affairs, and the less the incentive they will have to give the personal attention and effort that will make it a directly successful enterprise.

Moreover, a statute prescribing control of capitalization does not always afford protection against abuses; some of the state statutes regarding securities have not been vigorously enforced.

Government control, it may be argued, is also undesirable because it will directly or indirectly impose an obligation upon the government to adjust rates to the requirements for interest and dividends and in effect to guarantee that its regulation of rates will be of such a character as to insure returns upon the securities which are approved. Thus, a new element would be introduced into the question of rates, which is already very difficult. For the protection of the property actually invested this is not necessary, as regulation of rates cannot now be carried to a point where a fair return upon the property devoted to the public service is prevented. In order that the extent of this property may be determined Congress several years ago directed that it should be valued by the Interstate Commerce Commission, and much money and time have already been devoted to the task. If the element of providing for interest and dividends is introduced into consideration of rates, the present limitation upon the principle that a fair return upon property is to be allowed may be impaired; this limitation is that in any event the rates must be reasonable to the public.

In connection with the recommendation that regulation of securities should be undertaken by the federal government it may be argued that diversity in state legislation is not in itself an argument for federal action. This diversity exists with respect to legislation affecting many subjects other than railway securities. Regarding a number of subjects related to commerce—such as the law governing promissory notes, the law concerning the sale of personal property, and the law affecting warehouse receipts—uniformity has very largely been secured through the preparation of carefully drawn codes which could be authoritatively recommended to the states.

(b) The report indicates that approval should precede issue of securities. Against this recommendation it can be argued that such a procedure will not leave railways in a

position to take advantage of favorable situations in the market for money.

Changes in the money market are often rather sudden. If a corporation seeking new funds is to obtain them at low cost, it must act quickly in making its arrangements and take advantage of favorable opportunities. It cannot act quickly, however, if the securities to be sold have to receive approval in advance, since such approval can be given only after thorough investigation. Such an investigation by a government authority will require delay. The result may be that the cost of funds will be materially increased.

(c) Against the recommendation of the report that outstanding securities should remain as they are it might be urged that such a plan might contain an element of unfairness to the public.

Outstanding bonds will run for varying periods; some will not mature until the last decade of this century, and a few run to dates subsequent to the year 2000. These distant maturities indicate the dates to which any complete readjustment of securities to property values might be delayed.

Whatever the maturity, provision would eventually have to be made to retire these bonds. In order to make provision for retirement, and for interest in the interval, there would be, under a plan of governmental regulation of new issues, a degree of pressure upon the regulating authority to cause rates charged for service to yield the necessary funds. So far as this influence was operative, and caused rates which by present standards would be unreasonable to the public, the result would be detrimental. Receiverships growing out of past errors in management might be avoided, but at the cost of the public.

Likewise, if outstanding stock should remain in all cases, similar inequity might result, since the plan might fairly be said to tend to cause enhancement of such stocks. Stock by its nature has no date of maturity, except insofar as the life of the corporation is limited by statute, and outstanding stocks might consequently become a part of the capital upon which the regulating authority would have to seek to cause a return.

Under these circumstances, there might be a question which would be the more equitable and desirable course—an attempt to arrange for conversion of existing stocks and bonds into new securities issued upon a basis of present actual property values or a decision, because of the difficulties in the way of such a conversion, to continue the present capitalization of all railways under conditions which may cause rates to bear special charges in cases of erroneous capitalization.

(d) With respect to the recommendation of the report that there should be a general federal statute under which railways may incorporate it may be argued that, on the contrary, railways should continue as state corporations.

The proposal of the report would place railways in a situation different from the position of other corporations that engage in interstate commerce and different from the status of individuals. Except in so far as Congress might otherwise direct, they would not be subject to suit in state courts nor would they be subject to the taxing power of the states. In other words, they would largely cease to have dual relations, to state and federal authority, and become subject only to federal authority.

Such a result would in many ways be a reversal of the present situation. An individual is subject to the laws of the state in matters as to which states have jurisdiction under the Constitution, and to the laws of the United States as to subjects regarding which the Constitution confers power on the federal government. At present a corporation organized under the laws of a state is likewise under dual control, but the fact that it is organized under state law does not impair the extent in which it is subject to federal laws in those regards which under the Constitution belong to the United

States. In other words, it can be argued that a state railway corporation is subject to complete federal regulation with respect to its participation in interstate commerce, and that the degree of this possible regulation cannot be increased by federal incorporation.

Federal incorporation might, on the other hand, lead to impairment of the exercise of rights which belong to the states. Even though Congress made federal corporations subject to suit in state courts, and to local taxation as to tangible property, one Congress cannot bind another and, consequently, a succeeding Congress might alter the policy. In any event, state taxes on intangible property values which have been laid in many states, whether rightly or wrongly, might be made impossible.

The argument of the report that a railway line which operates in two or more states should be incorporated under federal law, and at least in some ways withdrawn from local control, may not recognize the differences in conditions, and the differences in local public opinion regarding policies, that are inevitable in so large a country as the United States. These differences are recognized in the combination of state and federal government which we have. It may be consistent with the fundamental principles which have generally left local questions to state authority that a railway operating in Oregon and Idaho should be subject to different taxes, and to different regulations as to protection of the public from physical injury, from the taxes and the regulations which are made applicable to a railway operating in Pennsylvania and Ohio, or in Georgia and Alabama. A circumstance that the roads might happen to belong to the same owner should have no bearing.

(e) Compulsory incorporation under a federal law, which is recommended by the report, might retard new construction.

Most of the railway systems of the country originated as small lines, undertaken in the first instance by local promoters, and to a degree new construction is still a matter of local initiative. When a small line is contemplated by local interests, the organizers of the enterprise may prefer to incorporate under state law; according to the recommendation of the report, however, they would have to obtain a federal charter as soon as their line began operation, since it would almost inevitably carry interstate shipments. Even if new construction tends to be undertaken more and more exclusively by railway systems, rather than by local enterprise, it may be unwise to take any action that will discourage the latter.

As to existing roads compulsory incorporation also raises legal questions. Since the present state corporations have special privilege in some instances, it is possible that they cannot be deprived of these privileges as a matter of regulation, unless the privileges are abuses which Congress can prohibit under its regulatory power. Stockholders and bondholders of state corporations might be upheld by the courts if they refused to exchange the obligations they held for obligations of new corporations.

Compulsory federal incorporation has not been used in other fields. For example, the national banking law did not compel state banks to convert into national banks.

WOOD FOR FUEL IN ARGENTINA.—The use of wood fuel to replace coal is assuming important proportions and is contributing a good share to the railway traffic of the Province of Santa Fe. It is reported that one railway transported 150,000 tons of wood in June, and that larger shipments are in prospect, inasmuch that the Santa Fe Railway has been compelled to warn shippers not to contract for larger quantities than the facilities of the railway can accommodate. It is reported from the Province of Santiago del Estero that many thousand tons of hardwood fuel are awaiting cars for transportation southward.

W. W. ATTERBURY APPOINTED DIRECTOR GENERAL OF TRANSPORTATION

Official announcement has been made that W. W. Atterbury, who was recently given a leave of absence as vice-president of the Pennsylvania Railroad, has been appointed director general of transportation of the United States expeditionary force now in France, a position corresponding to that of S. M. Felton as director general of railways in this country. The two officers will co-operate in securing railway and transportation equipment of all kinds and also the special units of railway men necessary for the transportation work in France. Mr. Atterbury is now in France in active charge of broad and narrow gage railways, docks and highways, in the immediate zone of operations.

Mr. Atterbury was born on January 31, 1866, at New Albany, Ind., and graduated from Yale University. He entered railway service in 1886 as an apprentice in the Altoona shops of the Pennsylvania Railroad. From 1889 to 1892 he was assistant road foreman of engines on various divisions and the Philadelphia, Wilmington & Baltimore; from 1892 to 1893 he was assistant engineer of motive power on the northwest system of the Pennsylvania Lines, and from 1893 to 1896 master mechanic at Fort Wayne, Ind. On October 26, 1896, he was appointed superintendent of motive power of the Pennsylvania Railroad at Altoona, and from 1901 to 1903 was general superintendent of motive power with the lines east of Pittsburgh and Erie. On January 1, 1903, Mr. Atterbury was appointed general manager, which position he held until March 24, 1909, when he was elected fifth vice-president.

He was later made fourth vice-president and on May 8, 1912, vice-president in charge of operation. Mr. Atterbury is president of the American Railway Association.

W. W. Atterbury

STOKER OPERATION ON THE BALTIMORE & OHIO*

By W. L. Robinson

Supervisor Fuel Consumption, Baltimore & Ohio

Locomotive stokers made their appearance on the Baltimore & Ohio in the latter half of 1912 and have been gradually added until there are now 373 locomotives stoker-fired. The installations under way will bring the total number of stoker locomotives up to 429. By the use of these stokers the manual labor of firemen in placing coal in the firebox has been very greatly reduced. They have eliminated the discussion as to the necessity of two firemen on locomotives, and it has not been necessary to have the coal shoveled forward on the engine tender at intermediate points. The

stoker has made it possible to increase the load hauled by a locomotive from 8 to 15 per cent. The principal advantage derived from the use of the locomotive stoker is that it has made it possible to use the full boiler capacity over extended periods and at points where the maximum tractive effort of the locomotive is required.

On the Baltimore & Ohio the stoker engines handle 58 per cent of the freight gross ton mileage of the system and consume 58.2 per cent of the total freight fuel, or 31 per cent of the total locomotive fuel. The installation of crushing plants at some fuel stations has been provided for, and these plants will be used for properly preparing the coal for these engines, thus permitting more economical use of the fuel.

Road tests have shown that the mechanical firing of the smaller sizes of coal is not as economical as manual firing of run-of-mine coal. This has been confirmed by recent laboratory tests at the University of Illinois, these tests showing

that the mechanical firing of 1¼-in. screenings is 15 to 18 per cent less efficient than when firing run-of-mine coal by hand, and that when 2-in. screenings are used on a stoker engine, there is a loss in efficiency of from 7 to 13 per cent as compared to hand firing with run-of-mine coal.

When hand firing run-of-mine coal at a rate of combustion slightly below the average (50 lb. per square foot of grate surface per hour) it has been found that the loss due to stack cinders was 3½ per cent, whereas with the 1¼-in. screenings from the same mine, used on a stoker-fired engine, the loss was 12 per cent. At the rate of combustion at which locomotives are operated a considerable portion of the time (110 lb. of coal per square foot of grate surface per hour) the losses were 9 and 16.1 per cent respectively.

To obtain maximum economy with stoker-fired engines, it is essential that

the coal be high in volatile matter, that it be as large as can be handled by the stoker (2½-in. screenings), that the exhaust nozzle be as large as the conditions will permit, that the brick arch be maintained in accordance with existing standards, and that the distributors and stoker apparatus be maintained and handled in accordance with instructions. If these items are followed carefully, the spark loss will be reduced materially and the capacity of the locomotive will be increased.

During the past fiscal year the fuel consumed on the Baltimore & Ohio was under 6,000,000 tons. Comparing the fiscal year of 1916 with the year before, systematic efforts were made to conserve fuel, there was 0.1 per cent less fuel used, 33.3 per cent more net tons hauled one mile, and 26.7 per cent greater revenue. For the first nine months of the 1916-17 fiscal year only 3.48 per cent more fuel was used, as compared with a similar period for the previous fiscal year, with an increase of 36.6 per cent in net tons hauled one mile and with an increase of 35 per cent in revenue.

*Presented at the Deer Park meeting of the Baltimore & Ohio officers.

INCREASE IN OPERATING EFFICIENCY IN JUNE

With an increase of only 10 per cent in train miles, the railroads of the United States in the month of June handled 23.2 per cent more revenue ton miles of freight than in June, 1916, according to the monthly report of freight operations compiled by the Bureau of Railway Economics for the Railroads' War Board. The returns included in the statement represent about 85 per cent of the total operated mileage of roads of Class 1 and about 88 per cent of their total traffic.

The revenue ton miles for the month amounted to 32,504,988,201, as compared with 26,379,460,986 in June, 1916. Freight locomotive miles increased 10.5 per cent, loaded freight car miles increased 10.7 per cent, while empty freight car miles increased only 8.7 per cent. This increased service was performed with an increase of only 1.8 per cent in the

in the efficiency of freight operation, which has also been shown in the reports for the months of May and April, are given in the table.

RAILWAYS IN CHINA.—An order has recently been placed with American mills, says The London and China Telegraph, for rails and fittings for the 20-mile extension of the Sunning Railway, which has been in contemplation for some time. The Sunning Railway is that constructed by Chinese-American capital, under the presidency and control of Mr. Chin Gee Hee. The company has constructed about 80 miles of road connecting Kongmun, a city on tidewater, with Sunning city, and on to the vicinity of Canton. The extension of 20 miles planned is to the west of Sunning city to Pak Sha, and eventually is to extend south to the seaboard at Yeung Kong. It is further planned to extend the road westward

d Decrease.

average number of freight locomotives in service and of 3.2 per cent in the number of freight cars in service. The number of tons per train was increased from 642 to 715, 73 more tons, or 11.4 per cent, while the tonnage per loaded car was increased by 2.7, or 10.7 per cent. The average miles per locomotive per day increased 5.6, and the average mileage per car per day increased 1.8. The percentage of empty car miles was reduced by 1 per cent. The percentage of freight locomotives and freight cars in shop or awaiting shop was also reduced. The details showing this remarkable increase

from Yeung Kong into Kwangsi Province, with the idea of tapping the Pak Hoi district and connecting that part of the province with Hong-Kong. For the present, however, construction is to be undertaken only to the sea. The railway is a good example of what may be accomplished by intelligent railway work in China. The concern was started with comparatively small capital, and most of its line and equipment have been paid for out of the earnings of the parts of the line already in service. This has been the case with the new extension.

Type of Locomotive on Which Firebox Temperature Tests Were Made

Oil Burning Locomotive Firebox Temperatures

Firebox Temperatures and Boiler Efficiency Increased,
and Smoke Reduced by the Use of the Gaines Wall

TO determine the effect on the temperature in the firebox of oil-burning 2-10-2 type locomotives which were equipped with the Gaines wall, the Texas & Pacific conducted a series of tests from which important data has been obtained. These locomotives are equipped with a Jacobs-Shupert firebox 176½ in. long and a combustion chamber of 42½ in. long. Between the two is located the Gaines wall with five 3-in. air ducts. The principal dimensions of the locomotive on which these tests were made are as follows:

Service	Freight
Fuel	Oil
Tractive effort	62,700 lb.
Weight in working order	324,600 lb.
Weight on drivers	262,100 lb.
Weight of engines and tender in working order	501,300 lb.
Cylinders, diameter and stroke	28 in. by 32 in.
Driving wheels, diameter over tires	63 in.
Working pressure	185 lb. per sq. in.
Boiler, outside diameter of first ring	84 in.
Firebox, length and width	176½ in. by 82 in.
Firebox, type	Jacobs-Shupert
Tubes, number and outside diameter	267—2 in.
Flues, number and outside diameter	41—5¾ in.
Tubes and flues, length	18 ft.
Heating surface, tubes and flues	3,539 sq. ft.
Heating surface, firebox	307 sq. ft.
Heating surface, total	3,846 sq. ft.
Superheater heating surface	886 sq. ft.
Grate area	70 sq. ft.

Contrary to previous practice, temperature readings were obtained at four points in the firebox by means of a platinum rhodium thermocouple in connection with a Leeds & Northrup potentiometer indicator, furnished by the railway department of the University of Illinois, and the readings were taken by Professor J. M. Snodgrass. Eight tests were made, four with the Gaines wall in place and four with the wall removed. The thermocouple locations are shown in Fig. 1. Locations A, B, C and D show points at which temperature determinations were made with the wall in place, while A', B', C' and D' show locations of thermocouple with the wall removed. The thermocouples were introduced into the firebox through holes in the combustion chamber floor and fire pan, the body of the thermocouple being protected from the flame by a water jacket.

As the type of instrument used in these tests was not of a sufficiently rugged character to withstand the jars and shocks incident to a road test, standing tests were conducted by removing the main valves and blowing all the steam generated through the valve chamber and out of the stack. In order to make the tests strictly comparable, an endeavor was made

to keep the oil fired during each test the same, by working the firing valve and the throttle in a constant position. As the results show, however, this did not accomplish the desired effect, as a little more oil was burned without the wall than

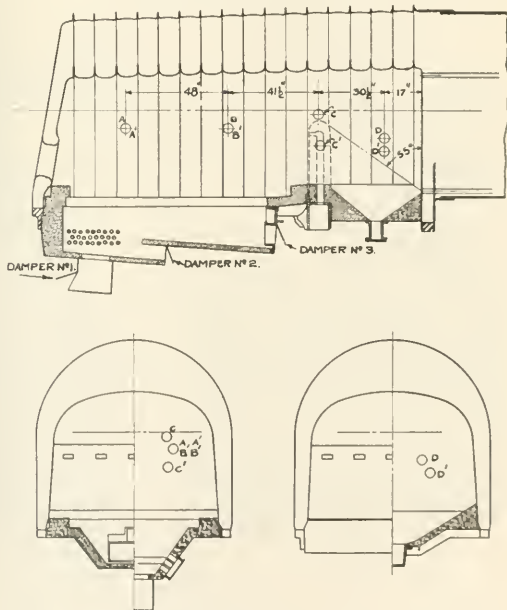

Fig. 1—Arrangement of Firebox Showing the Thermocouple Locations

with it. A Louisiana fuel oil with a gravity of 24 to 30 and heat value of 19,332 B. t. u. per pound was used. In order to compare the results obtained from the standing test with road service conditions two road tests were made, tem-

peratures being taken with a radiation pyrometer inserted through the door.

FIREBOX TEMPERATURE RESULTS

The firebox temperatures obtained during both the standing tests and the road tests are shown in Table I. Fig. 2 shows graphically the maximum temperature ranges, with

Fig. 2—Range of Temperatures in the Firebox of the Texas & Pacific Oil-Burning Locomotive

and without the Gaines wall, the average temperatures being 20 to 60 deg. lower than those indicated by the curves. It will be observed that with the wall in place, the highest temperatures were obtained in the back part of the firebox; and

* Pounds of oil burned on trip Longview to Marshall, Tex.

that there was a gradual drop in temperatures as the flames approached the tube sheet. With the wall removed, the temperatures in the rear and middle portion of the firebox were fairly uniform, with a decided drop in the combustion cham-

ing them back into the rear portion of the firebox where combustion is most intense; whereas with the wall removed there was no such baffling effect and there was a noticeable short-circuiting of the flames from the burner over into the combustion chamber.

The temperatures shown are probably lower than might be expected in burning fuel oil under these conditions, but with the large volume of the firebox (433 cu. ft.) the heat liberation per unit of volume is reduced and therefore the temperature is reduced.

BOILER PERFORMANCE

Advantage was taken of the opportunity to make some determinations of the evaporative efficiency of a boiler, with and without the Gaines wall. The results of the test are summarized in Table II. With the wall in place, an average of 3,675 lb. of oil per hour was fired, with an apparent evaporation of 47,968 lb. of water; this being equal to an evaporation of 13.05 lb. of water per pound of oil and 12.47 lb. of water per square foot of heating surface. With the wall removed and the same front end draft, the average amount of oil fired was 4,142 lb., with an apparent evaporation of 46,842 lb. of water per hour, or 11.3 lb. of water per pound of oil and 12.18 lb. of water per square foot of heating surface.

The boiler horsepower generated per cubic foot of firebox volume averaged 4.2; while the equivalent evaporation per pound of oil averaged 17.03 with the wall and 14.8 without the wall, the corresponding boiler efficiencies being 85.5 and 74.3, or a difference of 13½ per cent in efficiency, due to the Gaines wall.

The boiler efficiencies are high, considering the rate of firing; but it should be borne in mind that in burning oil there is no loss through the grates and ashpan and no discharge of fuel at the stack in the form of cinders. With the wall in place, combustion was perfect; there being no indication of CO (Carbon monoxide) in the flue gases, and no black smoke issuing from the stack at any time. Under these conditions, practically all the heat loss will be accounted for in the front end gases; and, as shown in Table I, the front end temperatures were uniformly low, considering the length (18 ft.) of the tubes. A tube of this length, used in conjunction with a firebox equipped with a combustion chamber of ample length and volume, will give as low front end temperatures as longer flues used in conjunction with a firebox without a combustion chamber.

With the wall in place, the average front end temperature was 585 deg.; without the wall, 615 deg.; a difference of 30 deg., which accounts for a part of the efficiency shown by the wall. The wall seems to have little or no effect on the superheat in steam, as these temperatures average from 225 to 230 deg. with the wall in place to 225 to 235 deg. with the wall removed.

With the wall removed, smoke emission was very notice-

ber space. At a point directly above the Gaines wall location, the temperatures were higher with the wall removed than when the wall was in place, this being due to the fact that the wall has the effect of baffling the flames and throw-

able; and there was considerable fuel wasted, due to the short-circuiting of the oil from the burner into the lower flues, partly unconsumed. Calculations based on the rate of flow of heat through fire brick and boiler lagging indicate

that less than 1 per cent of the fuel used was lost by radiation through the pan and through the boiler lagging.

Air used for combustion was drawn in through dampers 1 and 3, the pipe thimbles in the rear of the fire pan and the air ducts in the Gaines wall, as shown in Fig. 1. Damper 2 was kept closed during the tests, as it was found that air admitted at this point caused a violent drumming in the firebox. The total effective air opening was 540 sq. in., and this was found sufficient to burn 4,000 lb. of oil per hour without making smoke. The gas analysis indicated an air excess of about 40 per cent.

Firebox volume is a very important factor in burning oil. These tests indicate that not more than 9 to 10 lb. of oil per cubic foot of firebox can be completely burned per hour. This is equivalent to 4 to 4½ boiler horsepower per cubic foot of firebox volume.

WASHINGTON CORRESPONDENCE

WASHINGTON, D. C., Sept. 18, 1917.

CO-OPERATION VS. COERCION

On the principle that co-operation is more effective than coercion, which is sometimes expressed by saying that "molasses catches more flies than vinegar," the railroads have abandoned their plans for endeavoring to obtain general increases in the tariff provisions as to carload minimum weights, through approval of the federal and state commissions, and will rely instead on the voluntary co-operation of shippers in the campaign for heavier loading of cars, which is showing such satisfactory results.

In other words, it has been decided that the efforts to make one freight car perform the service formerly performed by

out ways in which the efficiency of existing transportation facilities might be increased in the emergency created by the war, and as one of the most important ways in which efficiency could be increased, it was pointed out that a gain of only two tons in the average load per car would be equivalent to adding over 200,000 cars to the number available for public use.

Railroads were urged to "enlist the co-operation of shippers in loading cars heavier as a war measure, using the services of local agents, superintendents and assistant superintendents, traffic officers, etc., to approach them, concentrating effort on a few friendly ones at first to lead the movement and set the example." It was also suggested that traffic officers be urged to make a strenuous and concerted effort to get the consent of the public to increase carload minima, thereby increasing the weight of commercial units.

In accordance with the first plan, an active campaign has been carried on under the direction of the Commission on Car Service, with the hearty co-operation of the National Industrial Traffic League, the Railway Business Association, and many other large organizations and companies that ship a large tonnage of commodities, together with very material assistance from the Interstate Commerce Commission, many of the state railway commissions and the government departments. The traffic officials also began a concerted movement to revive their efforts to secure increases in the tariff minima, which commercial conditions and commercial habits have prevented from keeping up with the increases in car capacity.

The Western Classification Committee had gone so far as to docket a long list of proposed increases in minimum weights to be submitted to the shippers and later to the com-

**YOUR NATION'S NEEDS
AND YOUR PART IN IT**

Your job during the war is to carry things where the country needs them

What good is a gun, unless you have it where it is needed? What good is a gun without shells—without food for the men who fire it?

Your services are absolutely vital to our country's success in war.

You are a **RAILROAD MAN**

THE NATION IS COUNTING ON YOU.

LOCOMOTIVES & SHRAPNEL

Our Nation needs locomotives as much as shrapnel.

Ordinarily, 15 percent of all the locomotives on our railroads are in the repair shops. By reducing that percentage to 10 we can add 3325 locomotives to the number available for use on our railroads. If we can keep more locomotives in good running order, we will help our country in the war with Germany.

THE NATION IS COUNTING ON YOU

PUT THE RAILROADS AHEAD OF THE GAME

Victory in the war is dependent upon efficient transportation. That's why railroad men must stay on their jobs and see that the railroads of the country do their part.

THE NATION IS COUNTING ON YOU

Posters Emphasizing the Importance of Railways to the Conduct of the War

two partly loaded cars can be made more effective by a campaign of education and by asking shippers as a patriotic duty, as well as for their own interests, to use the full capacity of the available cars when more cars cannot be had, than by seeking to force them to load the small additional tonnage that the interstate and state commissions might allow to be added to the present minimum weights, as provided by tariffs and classifications.

One of the first steps taken by the Railroads' War Board was the issuance of its Efficiency Circular No. 12, pointing

missions and the Official and Southern Classification Committees had planned similar action about the time the Commission on Car Service discovered that its co-operative campaign was producing such results in the way of increased loading that it might not be entirely wise to arouse the antagonism of shippers by an effort to force increased loading by tariff requirements. This view was urged upon traffic officials and the Railroads' War Board, backed up with such convincing evidence of the results of co-operation that after a thorough discussion and many conferences the plan

of the traffic department was discarded for that of the operating men.

It was believed that if approval for any considerable increase in carload minima should be obtained it would be only at the expense of such opposition that the proposed minimum weights might, as a practical matter, come to represent also somewhere near the maximum loading. It was not expected that commissions would allow the minima to be fixed at anywhere near the maximum capacity of the cars, whereas at present many large shippers have issued orders to load to as high as 10 per cent above the marked capacity.

The monthly reports of freight operations compiled for the Railroads' War Board have already shown a remarkable improvement in car loading, although the latest reports, for the month of June, were for a time when the campaign had been in progress for only a few weeks. In June the average car load was increased by 2.7 tons, or 10.7 per cent.

As an example of the results being obtained, it may be stated that in the case of one commodity, on which the classification committee proposed to increase the minimum from 33,000 to 35,000 lb., the principal shippers have voluntarily agreed to load 65,000 lb., and in many instances are placing as much as 100,000 lb. in a car.

THE CO-ORDINATING COMMITTEE ON EXPORTATION

At the instance of the Railroads' War Board, a committee of unusual importance has just been formed to co-ordinate the activities of the railroads, the war department, the shipping board, the food administration and the war commissions of the British and other allied governments that come here to purchase supplies. The committee will be known as the "Co-ordinating Committee on Exportation" and its purpose is to expedite the handling of export shipments by preventing congestion at American seaports and minimizing the danger of export traffic being accumulated and delayed in railroad yards and along the tracks of seaport lines.

Bearing in mind the danger of congestion this winter if effort should be made to ship everything ordered in this country through the North Atlantic ports, the members of the War Board decided that some immediate action should be taken for co-ordinating railroad with overseas transportation.

With the view of laying the foundation for this, representatives of the embarkation section of the general staff, U. S. A., the traffic executive of the Allied governments, the United States Shipping Board, the United States Food Administration, the Red Cross War Council and the Commission on Car Service, met with the War Board and formed the "Co-ordinating Committee on Exportation."

This committee will consist of a representative of each of the organizations named, together with a representative of the Railroads' War Board. Charles M. Sheaffer, chairman of the Commission on Car Service, has been made chairman of the co-ordinating committee. The other members of this committee appointed to date include E. Level, chairman, Traffic Committee of the Allied Governments; J. G. Rodgers, general agent, American Railway Association, military headquarters; R. B. Stevens, commissioner, or D. L. Ewing, director of traffic, U. S. Shipping Board; Col. Chauncey B. Baker, embarkation section, general staff, U. S. A.; C. B. Buxton, U. S. Food Administration, and D. W. Cooke, Red Cross War Board. It is hoped that a representative of the U. S. Navy and of the British Admiralty will also become members of the committee.

The committee will hold regular meetings and will exchange the information necessary to prevent freight congestion, and at the same time keep the tremendous amount of traffic designed for overseas use moving to the various ports and thence by ship to Europe.

RAILROAD WAR POSTERS

Reproductions are shown of part of a series of colored posters prepared at the direction of the Railroads' War

Board, which have been placed in railroad shops and other places where large numbers of employees congregate, for the purpose of emphasizing the important part played by the railroads in modern warfare and the duty of every railroad man to exert his utmost to increase railroad efficiency.

COAL MOVEMENT

The monthly report of the Geological Survey on coal and coke movements on 72 roads for the month of August shows an increase in the shipments of bituminous coal on these roads as compared with July of 16,857 cars, or 2.5 per cent.; and an increase compared with August, 1916, of 68,570 cars, or 10.8 per cent. There were, however, 27 working days in August and but 25 in July. The average daily loading in August was 5.1 per cent less than in July. Daily and weekly reports received by the Geological Survey show that the average daily rate was at its maximum in the first week of July, descended to a minimum by the middle of August and has been slowly gaining since that time.

Judge R. S. Lovett, priority director, has received numerous requests from all parts of the country for priority orders for the shipment of coal, but has issued none since the first, pending the announcement by Fuel Administrator Garfield of his plan of apportioning coal. Meanwhile the Commission on Car Service has been able to give temporary relief to communities and industries in acute need of coal by securing a supply of cars, by expediting shipments and by diverting shipments to places where they were most needed.

Fuel Administrator Garfield on September 14 requested the Export Administrative Board to allow no coal to be exported from the United States without specific licenses, and further that the Board authorize no such licenses before notifying him of the application. This step was taken in order that he might keep in close touch with both the quantity and the destination of coal exports and specifically for the purpose of protecting the Northwest part of the United States, which has been complaining that it has not been receiving its fair share of the coal sent to lake ports. An investigation by the Fuel Administration substantiated this complaint. It was found that plenty of coal was reaching the Lake ports, but it was not getting through to the northwest. In the period between August 24 and September 6, out of a total of 1,755,812 tons, 530,973 tons, or 30.2 per cent had been shipped into Canada. This is far in excess of the proportion of Canadian exports by lake boats in normal times.

The Fuel Administration announced that it does not intend to cut off Canadian exports, but with this supervision it will be able to equalize the distribution of coal, and see that the Northwest and Canada both get their fair shares.

In other parts of the country the situation, while not as serious as in the Northwest, is giving Dr. Garfield concern. New England states, which draw their coal supply from the West Virginia fields by barge transportation from Hampton Roads, have not thus far received as much coal as usual at this time of the year. Seizure of coastwise shipping by the government has made more difficult the problem of supplying these states.

INCREASED RATES IN NEW SOUTH WALES.—In order to meet increased operating costs the Railway Commissioners of New South Wales are now asking for 10 per cent increase in rates and fares.

ARGENTINE-PERUVIAN AUTO MAIL SERVICE.—An automobile service has been put in operation from La Quiaca to points in Bolivia connecting with mail service to Peru. The Post Office Department has given notice that correspondents should indicate upon the cover of mail whether it is desired that it be forwarded to Peru via Chile or via the new automobile route.

National Safety Council Annual Congress

Railway Safety in a Multitude of Phases; Perplexities of Getting Good Work Done by Inexperienced Men

THE sixth annual safety congress of the National Safety Council was held at Hotel Astor, New York City, September 11, 12, 13 and 14. Readers of the *Railway Age Gazette* are interested mainly in the doings of the Steam Railroad Section of the congress; but on this occasion the principal address at the general session, Wednesday, September 12, was made by Marcus A. Dow, general safety agent of the New York Central Lines; and a report of this address was given last week, page 459.

The first session of the railroad section was held on Wednesday afternoon, and the acting chairman was H. J. Bell (C. & N. W.); W. C. Wilson, formerly of the Delaware, Lackawanna & Western, who was elected chairman of the section a year ago, has now retired from railway service. C. M. Anderson (N. C. & St. L.), acted as secretary of the meeting. Eighty-seven railroads now hold membership in the section, an increase of 38 per cent in the number since the last annual meeting.

The first paper was by J. S. Rockwell (B. R. & P.), on the relation of the safety department to war problems.

Participation in the war obviously requires increased endeavor in numerous directions. Some roads have increased and almost doubled the number of safety inspectors during the past year. The necessity of employing inexperienced men, now felt everywhere, imposes grave responsibilities. The new man must be trained; and must be trained with speed; to impress him with the dangers of his work he must be actually "shown"; mere words will not answer. The employment of women in shop and outdoor work introduces new problems; but thus far it is believed that, generally speaking, women are less careless than men. They should, of course, be surrounded by all requisite safeguards. In all matters within his province the safety agent must watch the superintendent and the foreman and see that they do not let down the bars because of the stress of war conditions.

In the discussion on this paper, R. C. Richards (C. & N. W.), spoke of the vast numbers of new men now coming into the service. On his road there is a constant stream. In Chicago an examining class is held every day and new men are taken on by the dozen. The "House that Jack Built" (motion picture), is shown to these men and safety rules are displayed on the screen for their benefit. The screen is also used for showing the good results of the safety organization on that road, with statistics of accidents, showing the improvement that has been made.

B. H. Dayton (N. Y. C.):—We require new men in train service to make three trips over the road and then to fill out a written paper. The man is required to tell what he has learned; then the inspector can clear up his doubts. A special code of safety rules, 40 in number, is used in instructing new men. Of course, we do not get obedience to these 40 rules without persistent questioning. All men, old as well as new, are shown the educational motion pictures; and attendance on these displays is now compulsory.

C. L. Wright (C. St. P. M. & O.):—For new men in the train service we allow three days for study of rules before deciding to accept a man. Written replies are made to a series of questions; and it is found that men who have filled out these blanks make fewer dangerous blunders than were formerly made by men of the same grade.

Replying to questions, a number of inspectors said that the way to discover violations of the rules was for the inspector to be on the job frequently.

C. M. Anderson (N. C. & St. L.) read a paper on the cost

of personal injuries in the matter of time lost. He cited cases where a man in an important position, for example a section foreman, was injured, and the case imposed on the company considerable cost by the necessity of taking a man from some other important work to fill his place, and then perhaps the filling of this second man's place added further disturbance of important work somewhere. The cost to the railroads of the country for personal injuries to employees in one year, as reported to the government, aggregated \$27,000,000. "We all know that 85 per cent of the casualties on railroads are due to carelessness. Officers must personally interest themselves in the problem of reducing this loss, and we, members of the safety organization, must remember that actions speak louder than words."

"Safety, loyalty and efficiency" was the title of a paper by L. E. Abbott (O. S. L.). The problem of the superintendent is to make men contented. Examples were cited of engineers, and others earning large pay for light work, joining in strikes or threats of strikes, even after they had professed their loyalty to the company. Money will not buy contentment. The employee can be expected to be interested in the company only as he is convinced that the company is interested in him.

A central employment bureau is essential to satisfactory selection and appointment of men for the train service. This central bureau should have the final word in the selection of men and also in discharges. The local petty tyrant must be eliminated. Making promotions for causes which cannot be justified will always make trouble. Why do we not more carefully train railroad officers? The government trains its officers, why should not we?

In the discussion L. Boslooper (Mich. Cent.) said that on his road the officers were getting the brotherhoods interested in safety first. Questions are discussed in the lodge meetings and written suggestions from the lodge officers are sent to the superintendent. These suggestions are promptly acted on.

"We enforce the use of goggles, but we do it largely by persuasion. We give the men to understand that this is required because the employer sees the need, not because of any state law or any legal question about liability. Shopmen must be made to understand that they, like other employees, even up to the president, have a duty to each other and a privilege; the privilege of working for the safety of all concerned. We have reduced by 65 per cent the number of injuries to workmen's eyes."

NEW MEN AND THEIR LIABILITY TO INJURY

T. H. Carrow, safety inspector, Insurance Department, Pennsylvania Railroad, presented a study on this subject, an abstract of which follows:

In normal times between 80 and 90 per cent of railroad employees are men who have had at least two years' service and the vast majority of these have many years' experience. Nevertheless, the number of men hired yearly to take care of the labor turnover on some of the larger railroads, even in dull times, is equal to 30 per cent of the total number in the service; while during the present year some railroads, particularly those located in the munition manufacturing districts, are having a yearly turnover equal to the average number of men making full time. After making due allowances, it is assumed that the turnover in the United States at the present time is equal to at least 900,000 men yearly. On the basis of reports made to the Interstate Commerce Commission

and the experience of a large railroad an estimate is made as follows:

Occupation	Number in service	Annual turnover
Station men, except agents.....	175,279	171,000
Train service men.....	325,799	99,000
Shopmen.....	407,729	180,000
Trackmen.....	397,053	387,000
All other employees.....	490,140	63,000
Total	1,800,000	900,000

On some of the larger roads about 33 per cent of the total number of injuries to employees occurring at the present time involve men who have been in the service less than six months, while nearly one-half of these occur to men who have been in the service less than thirty days. On the basis of reports made to the Interstate Commerce Commission for three months ending with September, 1916, it is estimated that there will be 3,024 fatalities and 192,788 injuries to railroad employees during the present year; and using the above percentage 64,618 of the injuries and fatalities will involve men with less than six months' experience while more than 30,000 will involve men with less than one month's experience.

Trainmen's work, getting on and off cars, walking on top of trains, setting and releasing hand brakes, coupling and uncoupling, etc., involves hazards which experience alone can teach a man to ward against. In train service, 19 out of every 100 fatalities are recorded as "struck by trains"; and when it is remembered that even the old and experienced men occasionally walk in front of moving trains, it is easily understood why the young and inexperienced man becomes a victim of this menace. And no amount of instruction will take the place of actual experience. * * * As well as the railroads would like to eliminate all short clearances it is a physical and an economic impossibility to do so. However, this is a hazard that can be readily pointed out to the new man. He must not permit his body to extend beyond the line of the cars, except when he has a clear and unobstructed view. * * * Among maintenance of way employees "struck by trains" is the cause of 68 out of every 100 fatal injuries. Loading and unloading rails, frogs and timber is always more or less hazardous even to the experienced man, but with the new man it is doubly dangerous. * * *

Accidents to freight station employees are less serious but more numerous. At some of the larger stations the ratio of injuries among freight handlers, alone, amounts to as much as 75 per cent yearly. Nearly all of the larger freight stations throughout the United States have had a labor turnover during the present year many times greater than the average number of employees in the service. At many stations the entire platform force has quit in a body, their places having been filled by men who had never before had any experience in freight station work. One large station employing 500 men, whose experience corresponds with many others had a turnover in the first 6 months of the year amounting to 2,500 men or five times the number on the pay-roll at any given time.

In normal times the labor turnover among motive power department employees is made up largely of unskilled labor, but the present demand for skilled labor has resulted in the working forces being greatly depleted. Until men become familiar with the layout of the shops they are less likely to ward against natural hazards. * * * Many shops are now employing women, but sufficient time has not elapsed to determine the relation the employment of female help bears to accident frequency.

An excessive amount of property damage is attributable to the inefficiency of new men, particularly in connection with shifting cars in yards. Recent inspections have shown that the damage to equipment during the present year in some cases is 100 per cent greater than in previous years. There

is also a marked increase in loss and damage payments attributable to the same conditions. This point is of great importance, as from a financial standpoint it will justify remedial measures that might be too costly under other circumstances.

The railroads of the United States are doing more business than ever before; there is an unprecedented shortage of men in all departments; large numbers of men are constantly entering and leaving the service; the liability to injury among inexperienced men is much greater than among experienced men; and the railroads must expect a continuance of present conditions.

THE LABOR SHORTAGE

Howard Elliott (Los Angeles & Salt Lake) commented on Mr. Carrow's paper substantially as follows:

Mr. Carrow's excellent analysis of the causes of accidents is a most valuable contribution to safety literature. We see that a large proportion of personal injuries are suffered by new men who take the places of old men that leave because they are dissatisfied with working conditions or rates of pay. Railways cannot afford to pay the high wages that are being paid by outside industries, and our efforts must be confined almost altogether to improving the working and living conditions.

Railroading is a system of voluntary relationships. Our employees stay because the glamor of the transportation business appeals to them, and because they know the work is steady. They go because of the higher wages or easier work. The problem of the railway officer today is to maintain good discipline tempered with generous treatment. Men must be made to feel that we appreciate their staying with us, and that we are glad to have them submit suggestions for improving the service. It is possible for officers to fraternize with employees in close fellowship without breaking down the discipline or esprit de corps of the organization. Witness the efficiency and splendid morale of the French army, where that system prevails. Inspired men will suffer, bleed, and die for a principle. We must inspire our men with the thought that transportation is as necessary in winning this war as bayonet charges. * * *

We should pursue a policy of full and free publicity regarding the affairs of our companies. Our employees should be given information about the capitalization of companies, who the stockholders are, what our plans are, and all that sort of thing. Vice-President Foley of the Illinois Central has just started a campaign of that kind, and it embodies an idea which I have long held.

We should have on every road an employment bureau where each man's record is carefully kept, and where square pegs are assigned to square holes. We should abolish government by chief clerks, and have orders issued only by men who have been on the ground and are able to visualize the men and the conditions affected by the orders. The issuing of orders by clerks who never get out on the road is taking the starch out of some of the best railroad men in the country.

We should hold open meetings of officers and employees where each man can voice his opinion about the conduct of the company's affairs. We must tell employees the *why* of every move required of them, and if we have practices that cannot stand the acid test of reason, the sooner they are abolished the better.

We should shun red tape as a pestilence. We should give the man on the ground all the authority that he proves himself capable of shouldering. We should cut out 50 per cent of our letter writing. Is it a far cry from red tape to new men? New men are hired to take the places of old men who have become dissatisfied with conditions. Nothing creates dissatisfaction so quickly as a system of red tape which dwarfs the initiative of the individual.

We should provide places of amusement at terminals, a

Young Men's Christian Association, or club rooms where men can spend their time when off duty in wholesome pleasures. We should assist in every way practicable in the passage of laws promoting temperance. The saying is: "The Lord looks after drunken men and babies," but the records of personal injuries on our roads bear mute testimony to the falsity of that proverb.

We should build good houses for our section forces, and provide good accommodations for freight handlers, such as smooth floors in our warehouses, good trucks and adequate facilities for comfort. We should be liberal in the granting of passes. Instead of a rule requiring five years' service for a trip beyond Chicago, reduce it to two. We should have a system of increasing the pay of laborers the longer they stay and should grant bonuses to men who stand head and shoulders above their fellows in performance. We should encourage employees to subscribe for educational courses, and make it easy and inexpensive for them to do so.

Pressure should be brought to bear on Congress to waive the literacy test for track and shop laborers, the same as has been done with agricultural workers. A man doesn't need to know how to read in order to handle a pick or a shovel. The agreement about admitting Asiatics should be revised so as to permit 200,000 of them to come to this country under a bond providing for their return at such time after peace shall be declared as Congress shall prescribe. Japanese section foremen in the West are excellent workers, and they get along well with Mexican laborers. Chinese make good track men; they are quiet, of good disposition, and do not often get drunk.

There is a tremendous amount of needed improvement work on railways which has been authorized but not commenced because of no laborers. Allowing 200,000 Chinese to come into this country for the duration of the war may easily mean the sending of 200,000 fewer of our own beloved Americans to bleed and die on the fields of France.

DISCUSSION

S. G. Watkins (B. & M.): Accidents do not happen; they are manufactured. In nearly every case somebody fails to do what he knew should be done. The experienced foreman should be made to understand that he is responsible for the conduct, as regards their own safety, of inexperienced men. Let us put forth a mighty effort to improve our experienced men.

A number of members spoke of the perplexities incident to the present scarcity of good men. In freight houses and on track work some men who are hired will quit the same day, and many on the first pay day. Other large roads quoted figures concerning "turnover" as striking as those given by Mr. Carrow. In some yards the damage to freight cars has increased 100 per cent.

E. J. Birmingham (Erie): Among other measures to keep workmen contented on track work, we have a camp train with a good cook, a chef from the dining car department. Men without money are helped to get board and other accommodations until they can earn a little. Members of the safety committees on the Erie are allowed a bonus over and above their regular pay; this keeps them alert. The Erie now has employed in its shops 140 women, and during the three months that they have been in the service there have been 45 injuries to women. An improvement has been made in first aid kits by introducing smaller boxes; many such outfits have a larger number of articles than are needed.

In connection with this discussion, the New York Central's poster showing dangers at highway grade crossings was passed around among the members. W. H. Cameron, secretary of the National Safety Council, Chicago, has arranged to have copies of this poster printed in one color at five cents each for 6,000 copies and at lower prices for larger quantities. In three colors the prices would be higher.

ACCIDENTS IN GETTING ON AND OFF CARS

This was the title of a paper by C. H. Baltzell, superintendent of the St. Louis-San Francisco at Fort Smith, Ark. Few men habitually get on and off properly. The use of the oil box as a step should be forbidden. Men should be cautioned against catching the front end of the caboose. Every superintendent should make a strong crusade, as has been done by street railroads in cities, to instruct passengers how to get on and off.

Many personal injuries are due to what may be called a remote cause, namely, the neglect of men to rest properly when they are off duty. Men sometimes are tired out before they have half completed their trip. The railway officer must consider home conditions. Many times a careless man can be made more careful by having him bring his wife to the office for a conference. On the Frisco there is a woman's league for safety first. The division officer must take personal interest in safety; notice all disregard of rules and talk to the offender in a business-like and sincere way. The officer should discourage mischievous tattling. The officers themselves, if alert, will see violations of rules with sufficient frequency to be able to correct wrong practices.

Under the present war conditions the teaching of new men is an everyday duty. Go into the smallest details. The new man has the difficult task of learning in three months that which we learned in three years. Encourage athletic activities among employees. The athletic man is more careful and safe than one who is untrained; he learns to cultivate presence of mind, which is a main element in avoiding bodily injury to oneself.

Cultivate the young men; this will improve you as well as the young man. Encourage him to come to your office.

In the discussion on this paper H. J. Bell (C. & N. W.) explained the form for reporting personal injuries now in use on his road, based on that which was recommended at the congress last year in Detroit. Accidents which afford specially striking lessons, such as when an experienced conductor jumps off his train in front of one on another track, are made the subject of special safety bulletins, to be sent all over the system. The North Western has bulletin boards at 400 places. Besides posting on these boards, copies are sent to individual employees.

A desultory discussion on the right way to get off a moving train resulted in a good deal of difference in opinion and it was voted to have the secretary gather information on this point.

OTHER PAPERS

Accidents in Use of Tools and Machinery was the subject of a paper by David More (U. P.). Mr. More called attention to the great progress in the promotion of safety which has been made by the introduction of improved tools. For example, the electric overhead crane has done away with many injuries. The electric flue welder eliminates danger from flying sparks.

All tools are inspected monthly, and the inspector has to make a written report to the foreman. The Union Pacific has spent \$20,000 for guards on machines. The speaker invited all members to visit his shops and to criticize as severely as they could. Two kinds of men must be eliminated, the satisfied man and the dissatisfied man; the man who is wanted is the unsatisfied man. He is the man who is bigger than his job and who will progress.

Proper Handling of Track and Bridge Material was the subject of a paper by J. T. Broderick (B. & O.). Unskillful handling of rails and heavy timbers is a chief cause of accident to workmen in this department. An air hoist should be used, wherever possible, in unloading rails. Rails should always be loaded with heads up and with wooden strips between. In lifting rails from the ground tongs

should always be used. The speaker gave careful details of the right way to use rail laying machines and other appliances. The foreman who avoids hasty language is an important safety asset. Work should be discontinued when a train passes on any adjacent track. Tie tongs should be used in lifting ties, especially treated ties. Gloves must be used where necessary to avoid poisoning of the hands. Self-dumping ballast cars are a desideratum; men are injured in using old and unsuitable cars. In the discussion on this paper C. B. Floyd (N. Y. C.), emphasized the necessity of talking safety every day; the safety inspector should perform his duties before the eyes of the workmen. This inspector can make or break all our safety records.

Safe Operation of Hand and Motor Cars was the subject of a paper by S. G. Watkins (B. & M.). On the Boston & Maine the accident record has been reduced by abolishing iron handles on hand cars and using first quality hickory, the handles being made in the company's shops. Also, the foremen are directed to test handles occasionally. All motor cars have been fitted with a rail across the front, 18 inches high. Foremen should be instructed in the proper loading of motor cars; they must not be over loaded; men must not sit on the front end where a quick stop would throw them to the ground and they would be run over. Tools and other things carried on the cars should be made secure in their position. Always have the men seated before starting the car. Excessive speed must constantly be guarded against; foremen often run 30 or 40 miles an hour without realizing the speed. Foremen must inform themselves fully as to the right to the road before they start out; impatience because operators do not get information promptly is a fault to be guarded against. Bulletins telling of accidents which occur, and containing suitable admonitions are circulated frequently among the men.

In the discussion of this paper, F. N. Loughnan (L. V.) described experiences on his road under war conditions. Track foremen have difficulty nowadays in keeping competent flagmen in service. The supervisor has difficulty in finding foremen who are good leaders of men. Many times the explanation of ill-success in the case of a foreman is that he has a disagreeable personality. The Lehigh Valley limits the speed of motor cars rigidly to 20 miles an hour; and has had no trouble from excessive speed. The men in charge are required to have a knowledge of road rights as good as that of trainmen. There are fewer accidents in the use of motor cars than with lever cars. Every foreman has at hand a telephone, either at his car house or in the shape of a train telephone to carry on the road, so that he can communicate with the despatcher at any time.

A section should have a car of sufficient capacity for its work; use a trailer for tools if necessary. A foreman should be competent to inspect his car in detail and should do so every day. The motor cars on this road have two-inch blocks at the edges to prevent bars and other tools from falling or sliding off. Pick handles are taken out of the picks so that they will require less space and be carried more safely.

Protection of Men Working on Tracks was the subject of a paper by S. S. Morris (Ill. Central). Everything depends on the foreman. The first-class foreman has no scarcity of men and he makes very few reports of employees injured. One of his chief difficulties is handling men who are too young or too old; these constantly require his attention.

In the discussion on this paper R. C. Richards (C. & N. W.) said that on his road, when an employee is injured, a letter is sent to the victim and also to each man in his crew to impress that particular lesson at the right time.

S. G. Watkins (B. & M.): I make monthly studies of the accident records, taking a different class of men or of accidents each month; and give the results to the 150 members of safety committees.

F. W. Mitchell (N. Y., N. H. & H.): On our road every employee who is injured sufficiently to lose time, must, before again going to work, appear in person before the superintendent (or in the case of a shopman, before the shop foreman). The superintendents agree that these interviews are profitable.

INSPECTION OF CARS AND ENGINES

This was the subject of a paper by C. A. Cochrane, superintendent of safety of the Great Northern. The foreman of inspectors must be an enthusiast. All instructions must be in plain language; talk concrete things. Men should be instructed by rehearsing at length the procedure required in the inspection of cars. Inspectors should examine lading as well as cars, especially where the lading is on two cars. Look out for holes in the floors of stock cars, searching on the underside. The speaker presented a long and careful statement of the things to be attended to by the inspector of locomotives.

The election of officers of the steam railroad section resulted in the choice of H. J. Bell (C. & N. W.) as chairman; T. H. Carrow (Penn.), vice-chairman, and C. M. Anderson (N. C. & St. L.), Nashville, Tenn., secretary.

EXHIBITS

In connection with this congress, a display of safety devices was shown in the Grand Central Palace, Lexington avenue, the exposition being managed jointly with the American Museum of Safety, of New York City. Following are the names of the proprietors of some of the exhibits which are of special interest to railroad men:

Aear Mfg. Co., New York, N. Y. Blue flag signal.
American Abrasive Metal Co., New York, N. Y. Safety treads.
American Mason Safety Tread Co., Lowell, Mass. Safety treads.
Anti-Saloon League, New York.
Baltimore & Ohio Railroad.
Clipper Belt Lacer Co., Grand Rapids, Mich. Belt lacers.
Commonwealth Steel Co., St. Louis, Mo. Passenger car upright end-frame, etc.
Detroit Fuse & Mfg. Co., Detroit, Mich. Safety motor starting switches.
Durand Steel Locker Co., Chicago, Ill. Steel locker.
Edison Storage Battery Company, Orange, N. J.
Fire Gun Co., New York, N. Y. Fire extinguishers.
First Aid Equipment Company, New York.
Fyr Fyter Company, Dayton, Ohio. Fire extinguishers.
Hardy & Co., S. H., New York. Goggles.
Julius King Optical Co., New York, N. Y. Goggles.
Krantz Mfg. Co., Inc., Brooklyn, N. Y. Safety locked switches.
Merry Optical Co., Kansas City, Mo. Goggles.
Metropolitan Electric Mfg. Co., Long Island City. Panel switch boards.
Mine Safety Appliance Company, Pittsburgh, Pa. Assortment of danger signs.
New York Central Railroad.
New York Edison Company.
Norton Company, Worcester, Mass. Grinding wheels.
Palmer Electric & Mfg. Co., Boston, Mass. Electric switches.
Peelle Co., Brooklyn, N. Y. Fireproof self-opening freight doors.
Pyrene Mfg. Co., New York, N. Y. Fire extinguishers.
Southern Railway Company.
Standard Optical Company, Geneva, N. Y. Goggles.
Standard Pressed Steel Co., Philadelphia, Pa. Shaft hangers.
Strong-Kennard & Nutt Co., Cleveland, Ohio. Goggles.
Universal Safety Tread Co., Waltham, Mass. Safety treads.
West Disinfecting Co., New York, N. Y. Disinfectants.
Western Electric Co., New York, N. Y. Davis flood lights.
Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa. Shop safety appliances.
Wilson, T. A. & Co., Reading, Pa. Goggles.
Woolf Laboratories, Inc., New York, N. Y. Disinfectants.

Motion pictures were shown at the exposition in the afternoon and evening, among these being "The Rule of Reason," recently brought out by the New York Central, and another picture showing the welfare activities of the Baltimore & Ohio.

TRADE WITH RUSSIA GROWS.—Exports from this country to Russia increased from \$31,000,000 in 1914 to \$558,584,000 in 1917, according to a compilation by the National City Bank. This increase since 1914, while largely war material, included also railway supplies and material, automobiles, metal working machinery, leather, copper, steel rails, railway cars, wire, and miscellaneous manufactures of iron and steel.

RESULTS OF THE M. C. B. LETTER BALLOT

At a meeting of the Executive Committee of the Master Car Builders' Association, held in Chicago on June 14, 1917, a letter ballot containing 108 questions suggested by the various committees was formulated to be submitted to the members of the association. Of these 108 questions five were rejected by the members, as follows: Specifications for journal box packing, the need for specifications covering freight car lubricants, the revision of section 41 in the specifications for lumber, the advancement of journal bearings for passenger and freight equipment to standards, and the revision of M. C. B. sheet U-11 regarding the pulleys,

Sizes and dimensions for solid steel wheels. (It was also voted to change the name to wrought steel wheels.)
Truck side bearing clearance.

Limiting Dimensions for Pedestal Jaws for Cast Steel Truck Sides.—It was voted to change the limiting dimensions B for the 70-ton truck frame which are given on M. C. B. sheet 8 to the following:

Truck frame, maximum 5-15/16 in., minimum 5 7/8 in.
Journal box, maximum 6-1/16 in., minimum 6 in.

LOADING RULES

Rule 9.—Rule 9 has been changed to read: "Lading on single cars must never project over the end sill of the car unless such overhang is protected by an idler or carrying car forming part of a group of cars. See Fig. 1." Note.—Fig. 1 is to be revised to conform to this rule.

Rule 12.—The principal change in this rule was in the second sentence. It was changed to read: (B) "Hemlock or similar wood may be used only for the following loads: For single loads of stored lumber, rules 32, 33 and 34 (Figs. 5 and 6); for loading of tan bark, rules 60, 61, 62, 63 and 64 (Figs. 22 and 23); for loading of slab wood, rule 66; for lading of laths, rule 66a (Fig. 24) and for chocking and blocking for any load.

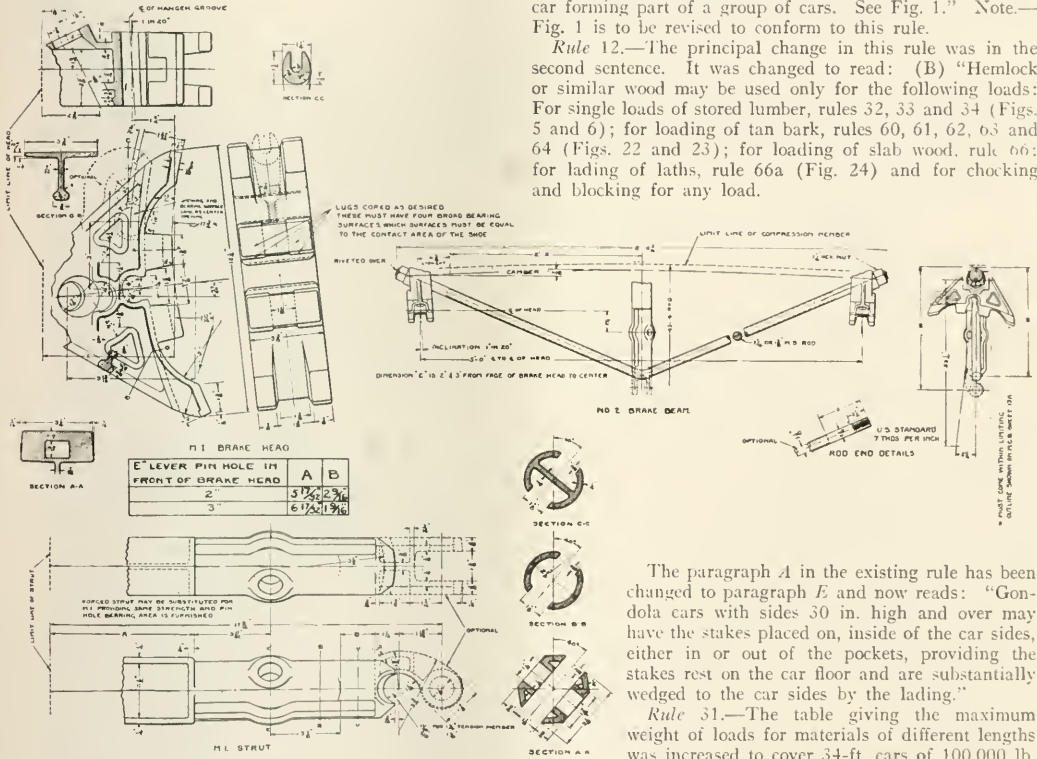

Fig. 1.—No. 2 Brake Beam Adopted as Recommended Practice by the M. C. B. Association

pulley seats and pulley keys for electric lighting equipment of passenger cars.

Following is an outline of the more important questions submitted to letter ballot which were accepted:

STANDARDS AND RECOMMENDED PRACTICES

The following items listed in the 1916 proceedings as recommended practices are advanced to standards:

Specifications covering dimensions and tolerances for solid wrought steel wheels for freight and passenger car service.

Minimum thickness for steel tires.

Wheel tread and flange for steel and steel tired wheels. (It was voted to have this measure cover steel, steel tired and cast wheels, thus eliminating the circumference measure for cast iron wheels shown on sheet M. C. B. 16-A.)

Roundness gage for solid steel wheels.

Plane gage for solid steel wheels.

Lining for outside-framed cars.

Rule 33.—In the first line after the word equal, change the word "width" to "thickness" and add after the word "side," in the eighth line, the following: "Provided that strips will not be required if load does not extend more than 30 in. above the top of car sides."

Rule 34.—Section D is changed to read as follows: "For loads of lumber lapped or stripped in accordance with rule 33, size of hardwood stakes must not be less than:"

Rule 58.—The second paragraph of this rule has been changed to read as follows: "When lading is in two piles on flat or gondola cars and ends of poles are interlaid at center of car as per Figs. 18, 19, 20 and 21, there must be not less than three pairs of stakes per pile, or six pairs of stakes for the total length of load." Figs. 18, 19, 20 and 21 are to be revised to conform to these changes.

Rule 67.—A note has been added to this rule reading

being put on beams developed the fact that they weigh all the way from 6½ lb. to 21 lb. apiece, with the result in the first case that the shoe cracks and works out, and in the second case an unnecessary amount of malleable iron is being purchased. In the design of the brake head, the pot-hook opening is shown at the center as the committee feels that the center hanging is correct. However, an optional location shown by dotted lines in Fig. 1 for the pot-hook opening at the upper end of the head is permitted. The specifications and tests of brake beams were also revised.

CAR WHEELS

The 33-in. cast iron wheel shown in Fig. 2 was adopted as recommended practice for cars of maximum gross weight not to exceed 210,000 lb.

The 33-in. 700-lb. cast iron wheel shown in Fig. 3 was adopted as recommended practice in place of the present 675-lb. wheel of the same diameter.

TRAIN LIGHTING AND EQUIPMENT

The following paragraphs of the specifications for electric lighting of passenger equipment cars, were advanced from recommended practice to standards:

- Paragraph 1. (System voltages.)
- Paragraph 5. (Mounting.)
- Paragraph 6. (Axle pulley and bushings.)
- Paragraph 9. (Size of ball bearings.)
- Paragraph 10. (Boxes, design.)
- Paragraph 12. (Dimensions of battery trays.)
- Paragraph 13. (Connections.)
- Paragraph 14. (Charging receptacles.)
- Paragraph 16. (Terminals.)
- Paragraph 19. (Switchboards.)
- Paragraph 20. (Fuses.)
- Paragraph 21. (Insulation of conduit and wire.)

It was voted to substitute an open end link fuse for the closed end link fuse now shown under these specifications.

TANK CARS

A number of changes were made in the specifications for tank cars, most of which are minor in character and as a rule do not change the substance of the present requirements. A new set of specifications called Class V Tank Car was adopted for the use of chlorine and sulphur dioxide.

115,000 FREIGHT CARS DISTRIBUTED

Fairfax Harrison, chairman of the Railroads' War Board, has authorized the following statement:

Some conception of the efforts which the railroads of this country are making to handle the tremendous increase in freight traffic which the war has produced may be gleaned from a report just compiled by the Commission on Car Service.

The report shows that during the four months' period between May 1 and August 31, this year, 115,152 empty freight cars were ordered into the South and Southwest to protect the movement of grain and other food products and assure the prompt delivery of the millions of feet of lumber needed by the government for the cantonments and shipyards. Several thousand of these cars were also used to facilitate the movement of phosphate rock and other materials needed in the manufacture of munitions. The cotton carrying railroads also received large consignments of "empties" to enable them to meet the beginning of the cotton and cotton seed movement. Most of the cars moved into the South and Southwest are owned by roads operating in other sections of the country. They were moved, however, regardless of ownership into the districts where they were most needed. The prompt compliance of the roads owning them with the orders of the Commission on Car Service averted what might easily have been one of the worst freight congestions in the history of the country, as the lines in the South and Southwest have been called upon to transport an unexampled volume of freight since the United States entered the war.

The movement of lumber for commercial purposes has been

unusually heavy and added to that has been the government's demand for the 64,000 carloads of timber needed in the construction of the training camps for the new national army and the thousands of other carloads that are being rushed from the Southern forests to the shipyards of the Atlantic coast.

Coincident with the lumber movement, grain, melons, vegetables and other food products have created a demand for cars that would have been impossible to meet if the railroads of the country had not voluntarily agreed to merge their competitive activities and operate as one system during the period of the war. This agreement made possible the shifting of empty cars into districts that would have been virtually buried under the abnormal amount of freight accumulated in them if the local lines had not received help from their competitors.

At the present time hundreds of empty cars are still being rushed into the South to assure the prompt movement of all government orders for lumber. Hundreds of other "empties" are going into the Central States to protect the grain crop, the transportation of which is now being complicated by the fact that during the next six weeks, when the grain movement will be at its height, the railroads will be obliged to run a large number of special passenger trains to carry the 687,000 citizen soldiers to the cantonments.

Long trains of stock cars are also moving into Western Texas, so that the thousands of heads of cattle that are threatened by the drought there may be moved into more fertile pasturage.

The railroads operating in Maine will soon receive an extra consignment of empty cars to enable them to handle the potato crop. A summary of the roads that receive consignments of empty cars from other roads during the four months' period ending August 31, together with the number of cars sent to each, is as follows:

Alabama & Vicksburg, 750; Alabama, Tennessee & Northern, 1,012; Atchison, Topeka & Santa Fe, 500; Atlanta, Birmingham & Atlantic, 1,275; Atlantic Coast Line, 8,500; Carolina, Clinchfield & Ohio, 800; Central of Georgia, 2,400; Charleston & Western Carolina, 250; Chicago Great Western, 1,500; Chicago & Alton, 1,225; Chicago, Findlay & Fort Wayne, 200; Chicago & Eastern Illinois, 1,395; Chicago & Northwestern, 500; Chicago, Indianapolis & Louisville, 250; Chicago, Peoria & St. Louis, 200; Chicago, Rock Island & Pacific, 3,600; Chicago, St. Paul, Minneapolis & Omaha, 1,500; Cincinnati, Bluffton & Chicago, 16; Cincinnati, Indianapolis & Western, 1,300; Delaware & Hudson, 48; Fort Worth & Denver City, 118; Georgia, 575; Georgia & Florida, 575; Georgia, Florida & Alabama, 30; Georgia Southern & Florida, 250; Gulf Coast Lines, 2,125; Gulf, Florida & Alabama, 275; Gulf, Mobile & Northern, 650; Gulf & Ship Island, 870; Illinois Central, 8,640; International Great Northern, 159; Kansas City, Mexico & Orient, 1,530; Kansas City Southern, 200; Lake Erie & Western, 300; Louisiana & Arkansas, 700; Louisville & Nashville, 10,497; Louisiana Ry. & Navigation Co., 1,212; Memphis & Meridian, 250; Minneapolis & St. Louis, 1,050; Missouri, Kansas & Texas, 2,200; Missouri & North Arkansas, 300; Missouri Pacific, 6,241; Mississippi Central, 685; Mobile & Ohio, 7,953; Nashville, Chattanooga & St. Louis, 4,350; New Orleans Great Northern, 700; Norfolk Southern, 1,909; Richmond, Fredericksburg & Potomac, 200; San Antonio & Aransas Pass, 250; San Antonio, Uvalde & Gulf, 183; Seaboard Air Line, 3,500; Southern, 8,277; Southern Pacific, 1,800; Soo Line, 1,400; St. Louis & San Francisco, 2,165; St. Louis Southwestern, 8,003; Sunset Central, 1,687; Tennessee Central, 100; Texas Mexican, 158; Texas & Pacific, 1,205; Toledo, Peoria & Western, 450; Toledo, St. Louis & Western, 450; Tremont & Gulf, 100; Union Pacific, 250; Vandalia, 200; Wabash, 2,500; Western Maryland, 200; Western Pacific, 500.

Roadmasters' Thirty-fifth Annual Convention

Abstracts of Committee Reports and Papers Presented
at the Meeting Which Was Held This Week in Chicago

THE thirty-fifth annual convention of the Roadmasters' and Maintenance of Way Association was held at the Auditorium Hotel, Chicago, on Tuesday, Wednesday and Thursday of this week. The meeting was characterized by unusual interest in the reports and papers presented. Because of the unusual conditions in the maintenance of way department which have arisen during the past year, the program for this convention was revised radically at a meeting of the executive committee held in July to concentrate attention upon those phases of the present situation which are of the greatest concern to track men.

The officers of the Association during the past year were: President, M. Burke, roadmaster, Chicago, Milwaukee & St. Paul, Chicago; first vice-president, A. Grills, general roadmaster, Grand Trunk, St. Thomas, Ont.; second vice-president, J. B. Oatman, roadmaster, Buffalo, Rochester & Pittsburgh, Du Bois, Pa.; secretary, P. J. McAndrews, roadmaster, Chicago & North Western, Sterling, Ill.; treasurer, W. H. Kofmehl, Elgin, Ill.

The convention was called to order at 9:30 Tuesday morning by President Burke and all addresses of welcome and similar formalities were eliminated. President Burke outlined the reasons for holding the meeting this year, describing the difficulties which confronted the roads and emphasizing the importance of the opportunity offered at the convention for thorough discussion. He emphasized the necessity of maintaining the track as well as possible under present adverse conditions with the acute labor shortage, lack of many materials and unusually heavy traffic.

R. H. AISHTON SPEAKS

R. H. Aishton, president of the Chicago and North Western and chairman of the Central Department of the Railroads War Board, outlined the manner in which the railways handled troops and materials to the Mexican border last year. He described the prompt action of the roads in organizing for the present war and described the manner in which they have co-operated in handling unusually heavy business without interference with the prompt movement of troops and military supplies. He emphasized particularly the excellent co-operation of the railway employees of all classes in helping to win the war. He predicted serious times ahead for all railway men, stating that precedents are worthless and that each problem must be solved on the basis of present-day conditions as it arises. American roads are taking up slack and are subordinating their interests to those of the country.

SECURING AND RETAINING TRACK LABORERS

It goes without saying that the first and best method of securing laborers to work on tracks is to offer them inducements equal or superior to those tendered by other companies or individuals employing similar help, while to retain them after we do secure them, we must accord them privileges and permanent employment consistent with the best interests of the employer and employed. On sections or other locations where labor headquarters are permanent every effort should be made to encourage trackmen, either laborers or foremen, to own their own homes. A foreman should be assured of the permanency of his position by his superiors and he, in turn, should impart such knowledge to the men under him to make them feel that they have an interest, not only in their work, but in their home town. The number of men should be the same in winter as in

summer. No more pernicious custom obtains than that of keeping the men in a section gang guessing during the summer months as to who will be retained and who will be laid off when the first snow begins to fly.

Section foremen should be permitted to hire their own men, and when there are laborers who cannot or will not rent or live in houses of their own, they should be provided with a bunk house at a location convenient to the work and where a certain amount of privacy is insured. This camp should be equipped with a cooking range and other necessary fixtures. A cook of the same nationality as the men should be secured who is able to cook good, wholesome meals.

When a foreman cannot secure his own laborers, they should be furnished by the railroad's authorized agent, but the labor agent's connection with the men should end there. The custom of having the labor agent furnish the victuals and wearing apparel of the men should be discouraged, as this system often results in charges and deductions against the laborer's wages that the men do not know of and in many cases do not owe, causing no end of trouble on pay day. Men for extra forces or floating gangs should be hired by the foreman of the gang when possible, but if he is unable to do so, they should be furnished by an accredited agent employed by the company on a salary, to preclude, as far as possible, the practice of charging men commissions for their jobs.

Bunk shanties or cars should be provided with double-deck steel bunks, good ventilation, wash basins, water coolers and other facilities. The dining car, or dining room should be well ventilated and sanitary and the cooking cars or compartments provided with all necessary utensils and ample storage for supplies. These camps should be conducted by a boarding contractor who will provide them with plenty of good, wholesome food and who will also see to the sleeping accommodations.

If Italian labor is used, the above arrangement may not apply, as these men do not care for cooked meals, preferring to handle their own food. In such cases, only good sleeping quarters are needed, with plenty of water and other sanitary arrangements, and a commissary where they can secure the necessary supplies.

To retain laborers after we do secure them is often easier said than done, and as long as other companies and individuals can offer better inducements than the railroads our men will leave us. With a perfectly clear knowledge of the cause of our shortage of men, our failure to take a firm stand in the matter, both in the men's behalf and our own, is to be deplored. The trouble is and has been that the importance of the track department is under-estimated, and no man comes to work in it who has any pride in himself or regard for those depending upon him because he will be looked down on by men in other branches of the service. The remedy is first, in the compensation we give our laborers and the manner in which we house and feed them; and second, in the treatment we and our foremen accord them and the opportunities offered for earning promotion. We should also furnish them motor cars to carry them to and from their work. All other mechanical tools consistent with the work should be used. As one of our most vital questions at this time, it should not be permitted to drop until relief is secured.

A. M. Clough (Chairman), supervisor New York Central, Batavia, N. Y.

DISCUSSION

The committee recommendation for uniform section forces throughout the year created much discussion. T. Hickey, Michigan Central, and D. O'Hern, Elgin, Joliet & Eastern, stated that much work such as gaging track and tightening bolts can be done satisfactorily during the winter keeping the men busy in constructive work. P. J. McAndrews, Chicago and North Western, pointed out the fact that the lengthening of the working season reduced the number of men required. The present practice of hiring men for a few months creates an abnormal demand during the summer, leading to excessive competition and abuses. He believes permanent forces are applicable to 80 per cent of the railway mileage. Coleman King, Long Island, described a plan in effect on his road for the last three years, whereby men are guaranteed permanent employment for the entire year and stated that over 90 per cent of the men now in service have been with the road over one year in spite of the present labor conditions. J. B. Oatman, Buffalo, Rochester & Pittsburgh, told of his inability to increase track forces appreciably above the winter basis, although authorized to put on many more men last spring.

The operation of boarding camps was also the subject of extended discussion. George Beckingham, Grand Trunk, strongly favored company operated labor bureaus and boarding camps, believing laborers would come to the company operated employment bureau first, and that more satisfactory results would be secured. Other members strongly condemned present conditions in boarding camps and urged that the companies take them over.

THE INSPECTION OF TIES IN TRACK FOR RENEWALS

1. To secure uniform practice and to prevent the removal of ties from track before their safe service life is exhausted and at the same time to distribute renewals properly in all tracks, ties for renewals should hereafter be marked by inspectors reporting directly to the supervising officers.

2. When the season arrives for the inspectors to start out, after conferring with their superior officers, they will inspect one mile of main track on each section in order to allow the section forces to begin tie renewals. They will then complete the inspection of all ties in main tracks and sidings on all sections. Inspectors will make a daily report to their superior officers on the proper form, showing the number of ties marked for renewals in the main track between each two mile posts and the number of cross-ties, switch ties and cross-over sets marked for renewals in each siding, giving the siding numbers.

3. Section foremen must in all cases accompany the inspector over their sections while the inspection is being made. For 1917 renewals one heavy white mark must be placed on the rail above each tie to be renewed, this mark to be placed on the west side of the west rail. Inspectors should keep a book record of all inspections, to be used from year to year for comparison.

4. There should be two standards for marking ties for renewals: (1) Where the track is not to be disturbed and (2) where the track is to be raised off the old bed. In the latter case, ties should be inserted while the track is being raised, thus placing them on the new bed. In the former case, ties should be dug in.

5. Inspectors should be provided with inspection picks, paint brushes and the necessary white lead paint.

6. Inspectors should be furnished with a statement showing the location of all track which is to be raised on each section, also the track where new steel is to be laid and re-ballasted.

7. Every tie which apparently is not good or which shows signs of decay or failure must be inspected with the pick.

8. In determining the necessity for replacing a tie, its condition as to decay and wear, the amount and character of the traffic carried, its position in track, the kind of timber, the condition of neighboring ties, the weight of rail and tie plates must all be considered.

9. Case 1—Ties should be inspected for the condition of timber by driving the pick into each side adjacent to the rail seats, near both the bottom and the top faces, below the sap line. The pick must be driven into the ties toward the center and must be drawn with as little prying as possible. Ties should not be tested on the top, with the exception of making tests for decay around tie plates and spikes. In making these tests, the ties should not be mutilated more than absolutely necessary. To test a tie for strength, one end of the pick should be inserted under the end of the tie and the pick used as a lever. If a tie is broken under the rail seat this method will usually determine it.

a. If two ties of only one year's safe service are together, one must be removed, and a group of ties of only one year's safe service, must be so removed as to leave each doubtful tie with one good neighbor.

b. Sap rot alone is not to condemn a tie for service.

c. A tie cut down by railwear is not to be removed unless the rail is cut into the face more than one inch. This applies to ties in tangents, as all ties should be full-plated and protected against rail wear on curves. On curvature where, through repeated rail renewals, ties are necessarily adzed more or less for the new plates, when a tie is so cut down as to weaken it for the service imposed, it should be removed and saved for side-track renewals if the timber is sound. On tangents where a good tie is cut down not more than one inch with rail wear or adzing, it should be protected against further cutting with tie plates.

d. In case ties are spaced too wide apart or where a large hewn tie is removed and replaced with a smaller tie, an extra spacer tie may be inserted, as the judgment of the inspector may decide.

e. Very careful attention must be given to the inspection of red oak and pin oak, also any other kind of timber that decays from the heart, as such ties usually rot from the center, leaving a hard shell, which can only be detected by careful inspection.

f. Where track is subject to heaving, and where shimming is necessary, care must be taken to insure enough good, sound timber for spiking and bracing, and careful attention must be given to the inspection of ties through road crossings, station platforms and other places where they are covered and liable to be overlooked by the section foremen.

10. Case 2—In track where new rail is to be laid or old rail is to be re-ballasted out of face, sufficient renewals should be made to last at least three years, depending upon the conditions, without being disturbed for renewals during that time. Inspectors will make a liberal inspection of such tracks, testing the ties for decay as in Case 1, but removing all ties that will not last more than three years. Where new steel is laid, no bad ties must be left under the joints. In making renewals in this case, some fairly good ties may be taken out, in which case they should be sorted and piled carefully, to be picked up and distributed for side-track renewals.

11. A lower standard of inspection should be used for mine lines and side tracks and especially for standing tracks in yards, where no tie must be taken out of track until its safe service life is exhausted.

12. In passing tracks care must be used to see that ties around turnout curves are in good condition.

13. In main tracks and sidings where the track is not to be lifted, foremen must renew only the ties that are spotted by the inspector, and in case they find ties which,

in their judgment, should be renewed, they will notify their superior officer and the inspector will be sent back to make a re-inspection. Where track is to be raised, the foremen should renew ties marked by the inspector and remove any unmarked ties which in their judgment should come out, such ties to be marked with a cross on the top face and laid aside for examination by the inspectors.

14. Inspection of ties by an independent inspector should not relieve the roadmasters, supervisors or foremen of the responsibility for the safety of their track.

15. Inspectors will inspect all switch ties in accordance with the above, except that in case a switch or cross-over set is more than one-half decayed, requiring renewals, a new set should be put in and any old ties taken out which are fit for use are to be saved and used for patching other sets.

16. After all tracks have been gone over and inspected, inspectors should spend their time checking renewals and marking ties which were missed by the first inspection. They should also carefully examine all ties taken out by foremen which were not marked originally and should see that all usable ties taken out of the track from any cause whatever are properly sorted and re-distributed for side-track renewals. Inspectors should give careful attention to all features of track work as they go over the line, especially in connection with tie renewals, and report promptly to their superior officer any defective practice coming to their attention, such as striking picks and other tools into new ties when drawing them into track, also adzing, spiking, tie-planting, etc.

DISCUSSION

D. O'Hern, Elgin, Joliet & Eastern, thought no further inspection was required than that given by roadmasters and foremen. He cited cases of incompetent inspectors that had been brought to his attention. Similar views were expressed by several others. J. B. Oatman said the track officers on his road were glad to have tie inspectors as these men saved them much time. The inspectors devote their entire time to this work, while the supervisors cannot give the necessary time and young foremen are frequently incompetent. J. F. Meir, New York, Ontario & Western, bore out this last point saying foremen would put in ties where it was easy or where little trucking was required. M. Donahue, Baltimore & Ohio, said it was his experience that roadmasters were glad to have the inspection done for them. He objected to the plan to inspect one mile of each section only on account of the time lost in riding to the next section. J. B. Kelley, Soo Line, favored inspectors as he believed the old system leads to much waste. Several others favored tie inspectors if under the direction of the roadmaster, while some preferred to have assistant roadmasters or shorter districts to permit the roadmaster to make the inspection. The report was adopted with minor revisions.

THE MATERIAL PROBLEM

By W. A. Summerhays,

Assistant Purchasing Agent, Illinois Central, Chicago.

The railroads are finding great difficulty, not only in maintaining their customary stocks of material, but in obtaining enough of the most necessary items to keep the road and equipment in safe operating condition. While deliveries have been greatly delayed, prices have climbed steadily. Track spikes that could be bought for \$3 a keg two years ago are now selling at \$8 a keg. During the same period track bolts have advanced from \$3.75 to \$11 a keg, angle bars from \$1.50 to \$3.25 a hundred weight, tie plates from \$36 to \$65 a ton, rail anchors from 16 cents to 31 cents each, steel rails from \$30 to \$40 a ton and other items proportionately. A very conservative estimate of the increases in prices of all items of material used in main-

tenance of way and structures places the figure at 30 per cent.

We have in our store departments complete records of each item of material in stock at the storehouses in addition to the quantities which are due on unfilled orders. On most railroads, however, it is the practice to carry small emergency stocks of track materials at designated points along the line as well as regular working stocks at each section foreman's toolhouse. In these times it becomes very necessary for each roadmaster and storekeeper to know exactly what is available at every point on the railroad. This is best accomplished by having for each division, whether in the office of division storekeeper or roadmaster, a complete tabulated list of every item of material on the division, showing its exact location. This statement should be kept up to date by adding each shipment of material received from the storehouse or supply car and deducting each item of material reported as used by the foremen. When emergencies arise requiring the immediate use of materials which can not be obtained readily through the customary sources, a record of this sort, showing the material on hand on the line of road is invaluable. The amount involved is no small matter, amounting to \$10,000 or more on any average operating division, and to \$20,000 or \$25,000 on the larger, busier railroads where rail, cross-tie and tie plate renewals are more frequent.

It is a natural tendency in maintaining line stocks of material to keep on hand more than the working conditions on the division justify. A record such as above described will show at a glance just how long each item has been on hand and whether it should be transferred to some other point where needed. No requisition should be passed to the purchasing agent until it has been checked carefully against the record of line stock as well as of storehouse stock and an effort made to supply the items needed from stock on hand.

Much of the material carried in line stock as a safeguard against possible emergencies remains on hand a long time before it is used. Unless given an occasional coating of heavy oil or thin paint the material soon becomes damaged by rust or action of the elements until it is little better than second-hand material.

It is extremely important to watch constantly the uses to which materials are put. Every dollar wasted in material means the expenditure of \$1.50 or \$2 to purchase the same quantity in replacement and nothing should be discarded until it is actually worn out.

While the prices of new material have advanced 30 per cent to 200 per cent, the price of scrap has risen to an even greater extent, and this has given rise on many railroads to a campaign toward cleaning up all scrap and putting it on the market. While it is desirable at all times to market all scrap as soon as it is available without permitting any accumulations, great care must be exercised to avoid selling as scrap a single item which can be put to further use. Even though the price of scrap is 300 or 400 per cent higher than at the start of the war, we must remember that the spread between scrap material and new material is much greater now than at that time.

Although all section foremen may be fully instructed relative to carefully inspecting scrap before loading for the market and holding out every usable article, it is a very human tendency to discard with the scrap all second-hand material of which the foreman has no immediate need. It, therefore, becomes necessary to have a competent inspector pass upon all scrap and set aside all material which is fit for further use or can be reworked. Where facilities are provided for reworking and assorting scrap at one point on a division or railroad system, a very decided saving can be effected by employing a blacksmith to rework certain materials.

All roadmasters are familiar with conditions in the rolling mills, due to giving preference to the government's requirements for new rail, the result being a decided shortage in new rails on many railroads. This condition has strongly affected the supply of frogs, switches and guard rails owing to inability of the frog manufacturers to procure new rail. Every roadmaster can help this situation by making careful inspection of every piece of track material removed from track. Many spring frogs and bolted rigid frogs can be made fit for further use, when removed from track because of having only one part broken, by removing a similar part from another scrap frog and making repairs. A great deal of this kind of work is being accomplished on various railroads, some railroads going to the expense of fitting up small shops where second-hand rail can be planed and fitted to supply the needed parts in repairing frogs. In view of the wide spread between the cost of new material and the value of scrap material, the present is an exceptionally favorable time for installing a plant of this nature.

DISCUSSION

P. J. McAndrews, Chicago & North Western, described in detail the methods used on the North Western to repair frogs in side tracks and yards by means of the oxygen acetylene welding process. The road has 50 outfits and plans to provide each roadmaster with one. The process has not been used on the main tracks but he believed it is practicable. The outfits are leased to the railroads by a manufacturer who sells the gases and metal used in welding, and also furnishes an instructor to teach the process. Bright young men taken from section gangs learn to do the work very quickly. The torches are also used for cutting rails and burning bolt holes as accurately as necessary for side track work. Old angle bars have been welded to part of the rail for rail anchors when new anchors could not be obtained.

THE ECONOMY OF OILING TRACK FASTENINGS

By E. T. Howson

Engineering Editor, the *Railway Age Gazette*

To have suggested that track fastenings should be oiled to protect them from corrosion would have subjected one to much ridicule only a few years ago. Yet today not one, but several large roads have made this a standard practice and others are awakening rapidly to the economy of this procedure, so that it is now a subject of live interest to track men.

THE DESTRUCTIVE EFFECTS OF CORROSION

The destructive agents attacking track materials may be divided into two general groups, (1) those resulting from wear created by service and (2) those resulting from atmospheric and other agencies producing corrosion. It is with the latter group that we are interested here. Corrosion is induced primarily by (1) the action of the atmosphere, (2) the action of salt water or spray on lines located along the seacoast, (3) by local conditions at tunnels, etc., and (4) by brine drippings from refrigerator cars.

Atmospheric corrosion is present everywhere, although in widely varying degree of activity. Its effects are most pronounced in humid climates, as in certain parts of the south, while its action is almost negligible in parts of the arid west. The most severe corrosion exists on those railroads over which large numbers of refrigerator cars are hauled.

The first effect of corrosion is a loss of material. This may be so small relative to the total area of the section as to be negligible, but with track fastenings this deterioration frequently continues to the extent that failure is brought about from weakness due to loss of section. One of the most severe examples of brine corrosion in this country is found on the tracks of the Chicago Junction Railway in

the Union Stock Yards, Chicago. On one of the main switching leads over which refrigerator cars are moving almost constantly the base of the rails, the tie plates and the fastenings are eaten away so quickly that they have to be renewed at intervals of not to exceed one year. This condition is more severe than that found on the average road. However, severe conditions are found frequently on lines out in the open. They are brought about primarily by the brine, but the atmospheric corrosion tends to the same result.

Another common and serious result of corrosion is the rusting of the nuts in place on track bolts. This condition prevents their being tightened readily, as they should be from time to time, and causes a heavy breakage and consequent loss of bolts when they are tightened. When relaying rail, the presence of corroded bolts not only slows down operations through the necessity of cutting them off, but this operation in itself is expensive.

APPLYING OIL ARRESTS CORROSION

The realization of the losses in track materials brought about by corrosion has led to the experimental application of oil on a number of roads during the last few years. To be effective in arresting corrosion, it is important that the proper grade of oil be selected. It must not be so thin that it will not remain on the fastenings, but will run off freely onto the ties and ballast, while it should not be so thick that it will not distribute itself over the metal readily. Where the proper grade of oil is secured it has been found possible to retain this coating on the fastenings for a year or more.

When experimenting in a limited way it has been the common practice to apply the oil by hand, giving a track walker or section man a bucket of oil and a small broom, brush or swab. This was the method used by the Chicago & North Western in oiling the joints on six miles of track in which new rail was being laid last year. Ordinarily crude oil was used for this work at a cost of about \$4 per single-track mile, 50 cents of which was for material and \$3.50 for labor.

The Union Pacific oiled the joints in one mile of track in each roadmaster's district on the Wyoming district last fall. The bolts were not tightened for two or three days after the oil had been applied, but after that interval it was found that they were tightened more easily and that the threads on the bolts and nuts were maintained in better condition, thereby securing a saving in both labor and material. To secure a direct comparison of results a number of joints which had been oiled and a similar number which had not been so treated were removed recently for examination, and it was found that while the bolts which had not been oiled showed evidence of corrosion and cutting of the threads, the others showed no such tendency.

The Chicago, Burlington & Quincy adopted the practice a year ago of oiling all the joints and bolts when laying new rail or when relaying second-hand 85-lb. rail or heavier on main lines. Bolts in main tracks which are to be relaid are also oiled about a month in advance of the removal of the rail and this practice has been found to permit a much larger percentage of the bolts to be reclaimed. Recent studies of this subject have also led to the decision to oil not only the joints, but also the base of the rail and other fastenings on certain lines of this road.

A little over two years ago the Illinois Central began to experiment with the oiling of track fastening on its Southern lines, the results of which have been so satisfactory that it has been extended over the entire system and all joints are now oiled twice a year. The oil is ordinarily applied by hand with an ordinary whitewash or paint brush. Approximately 10 gal. of low-grade fuel oil is required per mile. The total cost of this application

varies from \$2.50 to \$4.25 per mile, averaging somewhat over \$3.

One of the earliest roads to undertake the oiling of track fastenings was the Atchison, Topeka & Santa Fe, on which road it has been found that this practice has increased the life of the bolts 25 per cent. Careful records have also shown a saving of over 30 per cent in the number of bolts required for replacement purposes on the Eastern lines, while it has been estimated that the amount of labor required to tighten loose bolts has been reduced at least 40 per cent. About 75 gal. of fuel oil, costing about 5 cents per gallon, is required per mile, making a total cost for material of \$3.75 per mile and \$2.50 for labor. Where the bolts and joints are oiled alone the total cost is approximately \$2.50 per single-track mile.

THE LACKAWANNA HAS DEVELOPED AN OILING MACHINE

The Delaware, Lackawanna & Western has developed this practice further than any other road. This line has been a pioneer in the development of heavy track construction. Creosoted ties and screw spikes are used exclusively, while the tie plates are of a heavier section than commonly employed elsewhere. With treated ties costing \$1.30 each, tie plates between 30 cents and 50 cents, screw spikes 5 cents and track bolts from 5 to 11 cents each, and other track materials correspondingly expensive, this road began an investigation of means of protecting these materials early, which led to the oiling of track fastenings. Further study led to the development of a track-spraying device in 1914. The following year a flat car was equipped to distribute the oil and in 1916 an enclosed air-operated car was built in a remodeled caboose. One end was rebuilt to bring the operating table as far forward as possible and the car was equipped with air compressors, air supply tanks, sand boxes, rail wiper, oil strainer, air-operated oiling devices, an automatic device for clearing obstructions on the track and adjustable circular nozzles. The car was also equipped with a headlight, whistle, air brakes, speedometer and pressure gages, enabling the operator to control the train and to know the conditions under which he was working at all times.

Approximately 1,100 miles of track was oiled with this machine in the fall of 1916 at a cost of \$5.60 per mile, divided as follows:

10,400 gallons of oil at 5 cents.....	\$520
Engine and crew.....	30
Operator	5
Materials and supplies.....	5
Total cost per day.....	\$560

When the oil was first applied, in 1915, it was expected that it would loosen and remove the scale and corrosion on the rails and fastenings and a heavy application was made where corrosion from brine drippings or other causes was severe, the ordinary application being about 100 gal. per mile. The following year it was found that the oil had removed the heavy scale and exposed the solid metal where the corrosion had been severe and at other places subjected to ordinary attacks the oil was in first-class condition on the fastenings. After making a further application last year it is evident that this oil is now protecting the rails and fastenings satisfactorily. With the dust created by traffic it has formed a coat on the metal that is not affected by weather conditions. Based upon this experience, it is believed that a heavy coating of oil after the original application may be followed by lighter applications once a year where track is not subjected to excessively severe corrosion.

The practice of oiling track fastenings to protect them against corrosion has now been developed satisfactorily to demonstrate the fact that oil of the proper grade will protect the rails and fastenings from corrosion and thereby

extend their life materially. The economy of the oiling of the fastenings would appear to require no demonstration, particularly at the present time, when these materials are obtainable only with great difficulty and long delays.

DISCUSSION

C. H. Gruver, Chicago, Rock Island & Pacific, stated that on his road all joints were oiled twice a year and he finds the practice successful. It is done with a pail and brush and costs \$12 per section. J. H. Brown, Atchison, Topeka & Santa Fe, told of six years' experience with oil and stated that it was entirely successful. It eliminates rust and makes wrenching easy. Cattle guards are also oiled, thus greatly increasing their life.

LABOR SAVING EQUIPMENT FOR TRACK WORK

By E. J. Boland

Roadmaster, Illinois Central, Freeport, Ill.

It is the intention here to give an idea of the labor-saving devices in use on one of the large railroad systems of this country. There are two reasons for the installation of this large amount of the equipment mentioned below. (1) as a matter of progress, and (2) to offset the growing scarcity of all classes of labor.

Ditchers. The steam ditcher is one of the greatest labor savers in operation today. The company now has nine ditchers of the boom type. The saving with the operation of these machines is estimated at 10 cents per yard on 250 yd. per day over the next best method. Six months' operation per year will save about 50 per cent on the investment. In addition to operating as ditchers, these machines can be used in loading and unloading all kinds of materials, for other heavy lifting and for excavating work.

Dump Cars. Air dump cars in place of flat cars in ditcher service are of great value. The method is to operate two 20-yd. air dump cars with each ditcher, one ahead of the machine and one behind. By this method the cars are easily loaded and can be unloaded immediately. My experience has been that a saving of four cents per cubic yard can be made, based on 125 cu. yd. per day, which figures about 22 per cent on the investment, based on six months' operation per year. This also releases the 10 or 12 steel underframe flat cars for revenue service and the Lidgerwood for heavier work in unloading gravel ballast.

Lidgerwood Unloaders. The company now has 11 of these machines which are used in unloading gravel ballast, sand for track elevation, dirt, strippings for banking and any similar heavy work which is found necessary. A trainload of gravel from the Foreston, Ill., pit consisting of 35 Haskell & Barker cars of about 30 yd. each can be unloaded with one of these machines in about 30 min. provided the material is unloaded continuously. This operation would require 210 men for about 2½ hours without this equipment. These machines, when operated six months of the year, will save at least 50 per cent on the investment.

Track Supervisors' Motor Cars. The company has provided each roadmaster and track supervisor with an inspection car, which has increased the efficiency of these officers over 100 per cent. The track can be given much closer attention than by any other method.

Section Motor Cars. Until recently the company had only a few sections equipped with cars of company ownership. A great number of the men had realized the advantages that could be obtained from motor cars and had purchased engines themselves from various makers which were installed on their hand cars. The road has now purchased a sufficient number of cars to equip all of the gangs. Arrangements were also made to purchase the engines from the foremen, so that the company would be the sole owner of all of the motor-car equipment on its lines.

Bridge, Building and Extra Gang Motor Cars. The additional advantage obtained in this class of work is that the gangs often travel long distances. The men are carried to their work with the greatest despatch and are not worn out by the trip. It is not necessary to move the camp outfits nearly so often, which saves car mileage and switching.

Motor-Car Mowing Machines. After trying out a machine of this character for two years it was found so desirable that 13 more were purchased. These cars will mow a neat swath on each side of the track at the rate of about 30 miles per day. Each machine will save its cost every year.

Tracklaying Machines. The nine tracklaying machines which are now operated by the company have been of great service in offsetting the labor situation. They are a great relief to the men, as the machine does all of the heavy lifting. The gangs can be reduced or more rail laid than was possible with the same gang prior to operating the machine. The ordinary new rail program on this road includes between 50,000 and 60,000 tons per year and any reduction in the cost of laying this rail cuts down one of the largest items of expense.

Rail Loaders. Each division is now equipped with an approved air rail loader which can be operated with three or four men, whereas this work formerly required about 20. A saving of this kind is an absolute elimination of all of the useless work which was formerly done by hand.

Tool Grinders. This device relieved the most cumbersome tool that was carried on the hand or motor car. Grinders cost from \$12 to \$25, depending on the number of attachments provided with the machine. Tools can be kept in better shape and the machine saves its first cost in one season.

Weed Burners. These are of great value in the heavy semi-tropical country. These machines when operated over a district a second time, destroy all growth for a width of 18 ft. for an entire season. The labor of operating is almost nothing, compared with hand work in the same locality.

Rail Saws. The company is now operating one portable rail saw at Clinton, Ill., and authority has been granted for an elaborate permanent sawing plant to be located at Centuria. All second-hand No. 1 rail of the 85- and 90-lb. class is sawed and re-drilled before relaying in branch-line main track. The sawing process makes infinitely better riding track and adds greatly to the life of second-hand rail. It is figured that about \$2 per ton will take care of all of the expense of handling and sawing. The riding of track has improved 100 per cent by using sawed rail, in comparison with the old method.

Snow-Thawing Outfits. The greatest advantage in these outfits is that it is not necessary to reload snow and ice taken from switches and interlocking plants. In congested territory it was formerly necessary to cast snow out of the switches and in some cases it would have to be handled five or six times before it was finally disposed of. One man with one of these outfits can accomplish as much as three or four by the old method.

Cinder Cars. Each terminal should have a sufficient number of cinder cars to take care of all of the cinders handled without using cars in revenue service. The side dump car with the ridge bottom is the best class of car in service. It is proposed, however, to make these cars large enough to hold 50 tons of cinders, which would cut down the number of cars and greatly aid in the distribution.

There are many other small devices which are of great advantage to the trackman, some of which are—

- Lawn movers,
- Switch-point straighteners,
- Portable electric timber drills,
- Oxweld repair outfits,

- Ballast screening outfits,
- Rail benders,
- Snow plows and flangers,
- Electric trucks (for service in shipyards and docks),
- Cleaners for bridge steel (no satisfactory device is on the market at the present time, but a device for cleaning bridge steel preparatory to painting would be a labor- and money-saving device).

- Tie sizing and boring machines,
- Acid grass and weed killers (several of these patent weed killers have been tried out on this system, but the results obtained have not been satisfactory enough for the expense incurred to justify their use). I think that every device of this kind should be given fair trial, as the labor to remove weeds and grass by hand is tremendous.

INSPECTION OF RAILS AT THE MILL

By C. W. Gennert, Jr.,

Manager, Rail Inspection Department, Robert W. Hunt & Co., Chicago.

It is said that the earliest inspection of rails consisted chiefly of determining whether the size of the flaws in the flanges of the iron rails would permit of their concealment by dovetailing into them a piece of iron and afterward rubbing the patch with a mixture of scale and white lead. Later at the commencement of manufacturing Bessemer steel rails, which railroad officers were reluctant to adopt on account of their supposed brittleness, inspection became a more serious matter. Somewhat stringent specifications were required to be followed, and eventually chemists were employed to analyze the steel made. The new order of things came to stay, and manufacturers, as well as railroad officers, were brought to a keen realization of the fact that with so important a subject as rails, their careful and systematic inspection was not only warranted, but positively necessary.

STARTED IN 1912

It seems remarkable that for years the inspection consisted, apart from chemical and physical testing of the steel used, of merely examining the exterior or surface of the rails rolled; that is, (1) of insuring the proper fit of the template or gages; (2) of guarding against the shipment of rails containing flaws, seams and similar defects that can be seen on the surface, and (3) of assuring adherence to the desired mechanical finish of the rails with regard especially to the lengths, squareness of the ends, drilling of the bolt holes, etc. The idea never seemed to occur that steelmaking and the subsequent treatment that steel receives from the time it is made until it is finally rolled into rails is subject to all of the frailties to which either the misworking of the process or error of the human agency may contribute. But in 1912, when a very severe winter's record of rail failures had brought this subject to foremost attention, it was deemed advisable, by certain railroads, to inaugurate a system of greater or closer rail inspection. It is a system of inspection now recognized as essential by over 60 per cent of the railroad mileage of the United States and Canada.

Two important facts in connection with the manufacture of rails must be remembered; first, that all of the work is continuous for 24 hours a day and 6 days a week; and second, that the workmen are invariably paid on a tonnage basis, say, for 100 tons, with a bonus when this amount is exceeded in a stated time. Both of these conditions are almost a positive essential to the industry, as obviously and under most circumstances an increase of production must be invited from the men. But no other conditions possible could probably introduce the liability for error, or the exercise of poor judgment that might result in bad quality that these do, for the temptation among the workmen to

"speed up" some part of the process unnecessarily becomes quite irresistible at times and possibly to the detriment of the quality of the rails being made.

Special inspection provides a safeguard for the evils associated with the process of making rails. The system contemplates the employment of inspectors for duty day and night in each important department of the mill. These inspectors, employed in so far as possible because of their experience with the work of the department to which they are assigned, act as monitors in that department. Each man keeps an individual record of the work of his department, so made up that it is actually a historical record of each heat of steel made and the treatment it later receives in the rolling process. The men are instructed not to interfere with the operation of the mills in any way except by appealing to the moral responsibilities and obligations of those in charge. This they do by first reporting verbally to the foreman in charge of the work in each department any deviation from recognized good practice, and then by confirming that report in writing to the higher officers in charge. Immediate opportunity is therefore afforded the manufacturer to divert the metal affected by bad practice or workmanship to other uses or orders, and to take such action as will prevent shipment of the rails which might otherwise go forward. This feature alone has resulted in the greatest check imaginable on errors of mill practice and lack of judgment due to the employment of workmen on the tonnage basis. The workmen apparently realize that an inspector is watching every move with the interest of the final purchaser of the rails so much at heart that any evident carelessness or lack of good judgment may be promptly reported to the officers and consequent disciplining result. And this also has been the principal feature of special inspection that has so largely appealed to the officers of the manufacturing companies, for they, unquestionably desiring to make and ship only rails of the best quality and workmanship possible, have been quick to appreciate the advantage gained.

The reports of the special inspectors are accumulated eventually and made up to comprise a complete record of each heat rolled and this is furnished to the purchaser as desired. A splendid opportunity is thus afforded for keeping definite record of the data concerning the manufacture of each heat of rails and the later serviceability of those rails; in fact, a plan has been advanced whereby the linking together of the manufacturing record with the failed rail records might afford untold benefits in the solving of the ultimate problem of what constitutes good rails, but unfortunately this plan has not yet been taken advantage of except in isolated cases.

There is one remaining feature connected with the manufacture and inspection of rails which it seems not only fair to mention, but to impress you with it to the fullest extent. It is this: The best steel rails possible of making and the closest and most critical inspection will be of no avail whatsoever unless the rails are properly used by the railroads. You appreciate fully that the slightest nick in the right place can ruin the best of steel and its misuse in other ways frequently proves equally injurious.

OTHER PAPERS

C. J. Coon, engineer of track, Grand Central Terminal, New York, read a paper Wednesday morning on maintenance of track in large terminals in which he discussed track construction and maintenance methods applicable to intensive operation under adverse conditions.

J. S. Robinson, division engineer, Chicago & North Western, Chicago, read a paper on housing and feeding maintenance employees in which he described a design of portable frame house which could be built economically and also be dismantled readily and moved from place to place.

Coleman King, Long Island, presented a paper at the Tuesday evening session describing in detail the work involved in assembling materials and building tracks at the cantonments on Long Island.

The annual dinner of the Track Supply Association was held at the Auditorium Hotel Wednesday evening. There were 300 members and guests present. M. J. Gormley, assistant to the president, Chicago & North Western, and chief general agent of the central district of the American Railway Association at Chicago, spoke on the transportation problems incident to the war.

The report of the secretary showed 102 new members and a total membership of 964. The treasurer reported over \$1,300 in the treasury. The total registration of members at the convention was over 250.

On Thursday afternoon the party visited the Gary mill of the Illinois Steel Company, studying the manufacture of rails.

THE TRACK SUPPLY ASSOCIATION

The sixth annual exhibit of the Track Supply Association was held in a room adjoining the convention hall. About 50 firms exhibited their devices. Most of these had exhibited before, but there were also several new ones. The officers of the association for the past year were: President, R. A. Van Houten, Sellers Manufacturing Co., Chicago; vice-president, E. T. Howson, *Railway Age Gazette*, Chicago; secretary-treasurer, W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y.; past-president, F. A. Preston, The P. & M. Company, Chicago; director, J. J. Cozzens, Union Switch & Signal Company, New York, N. Y.; director, F. A. Barbey, Frictionless Rail, Boston, Mass. The names of the exhibitors, together with the products exhibited and the names of representatives in attendance follows:

Ajax Rail Anchor Co., Chicago. Rail anchors. H. G. Elfhorg, G. N. Holmberg, A. W. Holmberg.
American Hoist & Derrick Co., St. Paul, Minn. American railway ditcher. Edward Coleman, H. O. Washburn.
American Steel & Wire Co., Chicago. American steel fence posts. American fence. M. E. Evans, A. W. Froude, J. Alexander, L. P. Shanahan, J. L. Collins, C. Boone, B. Ryder.
American Valve & Meter Co., Cincinnati, Ohio. Economy switch stand, Anderson interlocker switch stand, Safety switch lock. J. T. McGarry, F. C. Anderson.
Anti-Creeper Corporation, New York. Rail anchors. O. Metcalf, C. H. Genscher, T. J. B. Bowman, E. L. Mills, P. B. Brown, A. J. Dinklage, E. T. Evans.
Barrett Co., New York. Tarvia, Barrett's shingle stain, Corbosa grade one liquid cresote oil, semaphore roofing, Multi-shingles, Everjet paint. E. J. Caldwell, J. E. McVay, John Ross, H. W. Fleming, Tom A. Warton, K. C. Barby, C. F. Ames.
Bethlehem Steel Co., South Bethlehem, Pa. New Century adjustable switch stand and "Steelton" positive switch stand. Robert E. Belknap, Neil E. Salsich, John F. Hennessy.
Carbic Mfg. Co., Duluth, Minn. Carbic lights. Gordon Paterson, H. N. Haberstroh.
Chicago Malleable Castings Co., Chicago. Thomas rail anchor tie plate. J. S. Llewellyn, W. M. Osborn, Ralph Schmidt.
Greer, Adams & Co., Chicago. Calumet track drill, Ureka bonding drill, Carbic lights, track jacks, journal jacks, car jacks and Calumet die starters. Russell Wallace, W. I. Clock, George Bassett, J. A. Martin, C. Clifford, C. Gregory, R. Bullard.
Duff Mfg. Co., Pittsburgh, Pa. Genuine Barrett track jacks, Duff standard and high speed ball bearings, screw jacks and journal jacks. C. M. Thulin, E. J. Johnson.
Fairbanks, Morse & Co., Chicago. No. 36 one-man inspection motor car. A. A. Taylor, E. C. Golladay, D. K. Lee, G. W. Lewis.
Fairmont Gas Engine & Railway Motor Car Co., Fairmont, Minn. Motor cars. D. G. Shephard.
The Frictionless Rail, Boston. Special section of rail for track curves. F. A. Barney, B. W. Simmonds, T. F. Dwyer, Jr.
Hauck Manufacturing Company, Brooklyn, N. Y. Thawing outfits, kerosene burning torches. G. A. Nelson, W. M. Squires, C. P. Cogswell.
Hayes Track Appliance Co., Richmond, Ind. Hayes derails. S. W. Hayes, R. W. Slantherhack.
R. W. Hunt & Co., engineers, Chicago. Inspection of materials. C. W. Gennet, Jr., J. J. Clark.
Indianapolis Brush & Broom Co., Indianapolis, Ind. Track brooms. F. R. Lay, George Lemaux.
Indianapolis Switch & Frog Co., Springfield, Ohio. Electric welder and manganese track worker. J. C. Jameson.
Ingersoll Rand Co., New York. Pneumatic tools and tie tampers. W. H. Armstrong, W. J. Warner, C. Dougherty.
Luckawanna Steel Co., Buffalo, N. Y. Hook shoulder tie plates, grooved head angle bars, Abbott rail joint plate, welded high T-rail joint. A. P. Van Schick, J. Hench, F. E. Abbott, A. H. Weston.
Alexander Milburn & Co., Baltimore, Md. Mithril carbide light and oxy-acetylene welding and cutting apparatus. E. C. McNutt.

Madden Company, Chicago. That labor saving devices. H. C. Holloway, T. D. Crowley.

Mudge & Co., Chicago. Motor cars. R. G. Sinclair, F. Posson, George W. Bender.

National Lock Washer Co., Newark, N. J. Nut locks. J. Howard Horn, R. L. Carneros, John T. Patterson, Alvin T. Thompson.

National Malleable Castings Company, Cleveland, Ohio. Rail anchors, rail braces and tie plates. J. J. Byers and T. W. Aishon.

Oxwell Railroad Service Company, Chicago. Welding by its oxygen and acetylene system. George Thompson, E. A. Woodworth, L. C. Ryan.

P. & M. Co., Chicago. P. & M. Vaughn and Ilenghi rail anchors. F. A. Preston, John Reagan, L. O. Henzgi, John E. Mahoney, S. M. Clancy, Alvar R. Sutter, P. E. Samelson.

Pocket List of Railroad Officials, New York. C. L. Dinsmore, J. Alexander Brown.

Q. & C. Co., New York. Rail clamps, derails, rail and step joints. J. L. Terry, R. B. Quincy, C. M. Brennan, A. R. Horn, A. Robertson.

Rail Joint Co., New York. Webber, Continuous, Troy, plain, insulated and step joints. B. Armstrong, G. H. Larson, A. C. Chapman, E. F. Schermerhorn, W. S. Boyce, G. T. Willard, I. N. Towne, H. C. Hickey, C. B. Griffin, J. P. Norton, Charles Jenkinson.

Railroad Supply Co., Chicago. Tie plate. H. H. Smith, H. C. Van Nostrand.

Railway Review. W. M. Camp, Elmer Gougeon, H. A. Smith.

Ramapo Iron Works, Hillburn, N. Y. Solid-rolled double-shoulder switch plates, Automatic safety switch stand. W. C. Kidd, Arthur Genander, Thomas E. Alers, Douglas E. Snow.

Reading Specialties Co., Reading, Pa. Rail bender, guard rail clamp, Compromise joint car replacer and fastener, tie spacer and Reversible rail bender. B. John Buell, J. J. O'Connell.

Henry Roos Foundry Co., Chicago. Hardieck locked and covered turnbuckle, Boltless Head Rod. William Hardieck, L. A. Ogden.

Sellers Mfg. Co., Chicago. Tie plates. J. M. Sellers, R. A. Van Houten, G. M. Hogan.

Simmons-Beardman Publishing Co., New York and Chicago. E. T. Howson, W. S. Lacher, J. H. Cross, H. A. Beardsley, J. H. Bryan.

Simple Gas Engine Co., Menasha, Wis. Gas engines. John P. Hrubesky, F. J. Oberweiser and John G. Walter.

Southern Railway Supply & Equipment Co., St. Louis, Mo. Saunders car stoker. W. D. Achuff, L. Boswell.

Templeton-Kenly & Co., Ltd., Chicago. Simplex jacks. A. C. Mills, J. H. Hummel, W. B. Templeton.

Track Specialties Co., New York. Superior mechanically operated derailler, Superior hand operated derailler, Trasco guard rail clamp, Superior compromise rail joint, Superior rail bender, Superior rail joint, Trasco guard rail brace, Trasco tie plate, Trasco padded tie plate, Trasco rail brace, Trasco foot guard, Trasco slide plate and brace. J. H. Bodkin.

Union Switch & Signal Co., Swissvale, Pa. Keystone insulated rail joint. J. Roett, J. J. Cozzens.

Vernon Tool Works, Pittsburgh, Pa. Track tools, gages, levels. H. C. Muil, E. Woodings, H. Fischer.

Walls Frogless Switch & Mfg. Co., Kansas City, Mo. Electric operated frogless switch. C. E. Ennis, C. M. Walker.

Wyoming Shovel Works, Wyoming, Pa. Chrome nickel steel, heat treated track shovels. H. T. Potter, G. E. Geer, H. C. Emery.

At the annual election of the Track Supply Association held Wednesday morning, the following officers were selected: President, E. T. Howsen, *Railway Age Gazette*, Chicago; vice-president, J. J. Cozzens, Union Switch & Signal Company, New York; secretary-treasurer, W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y.; directors, F. A. Darbey, Frictionless Rail Company, Boston; E. Coleman, American Hoist & Derrick Company, St. Paul, Minn.

PROGRESS OF THE ERECTION OF THE QUEBEC BRIDGE

QUEBEC, September 19, 1917.

With favorable weather conditions obtaining it now seems assured that the work of hoisting the central span of the Quebec bridge to its final elevation, one hundred and fifty feet above the level of the St. Lawrence river, will be completed before sun-down Thursday, September 20. The hoisting was begun on Monday, September 17, and at quitting time, 6 p. m. Wednesday, the span had been raised through one hundred and twenty feet of elevation, leaving only thirty feet to be negotiated before it reaches its final level.

The preliminary work having been completed previously it was intended originally to float the span to place on Saturday, September 15, but because of the unfavorable weather conditions action was deferred till Monday.

On Sunday night the conditions were considered favorable and the valves controlling the flow of the water in and out of the scows on which the span had been supported for some time were closed after the lowering tide had completely drained the scows of water; and with the rising tide of Monday morning the scows floated clear of their specially pre-

pared foundations and the three-mile towing trip to the site of the bridge was begun. The trip from the erection site to the site of the bridge consumed about two hours. Arriving at the bridge site the span was made fast and held in its proper position under the cantilever arms of the main structure by means of cables. The hanger lifting chains by which the span was raised were then attached to the supporting girders and the hoisting operations were begun shortly after 10 o'clock.

The hoisting is being done by eight hydraulic jacks placed two at each corner of the span and for each cycle of the jacks the lift is two feet. The work on Monday, which consisted of twelve lifts or twenty-four feet of elevation, was accomplished without a hitch.

On Tuesday when twenty-two lifts were made the work was held up for three hours in the early afternoon by the breaking of a bracket used in connection with the removal of the raised links of the hoisting chains. While this accident was minor it was necessary to hold up the work while a new bracket was made and installed.

On Wednesday before commencing the hoisting operations the brackets around all the chains were reinforced but in spite of this delay twenty-six lifts were made during the day.

RAILWAY SIGNAL ASSOCIATION

The Railway Signal Association held its twenty-second annual meeting at Atlantic City, N. J., on September 18 and 19, with about 100 members in attendance and President C. A. Dunham (G. N.), in the chair. The president, in his opening address referred to the stress of war conditions as affecting the signal departments of the railways and urged adherence to high standards in spite of the varied difficulties. Numbers of members have joined the army or the navy and the speaker uttered a patriotic Godspeed to them. The association looks forward to their safe return and keeps their names on the rolls of membership with all dues suspended. The work of the committees was commended and a warm tribute paid to the excellence of the work of the former committee which framed the present constitution of the association.

Secretary C. C. Rosenberg reported a membership on August 31 of 1,281, a net increase in 12 months of 13. He is unable to learn the names of all who have entered the military service and requests all interested to advise him of all such names. The 1,281 members include 703 senior, 226 junior and 344 associate, and representative votes (\$01) are cast by 70 railroads, operating about 173,000 miles of road and 186,000 signal blades. Receipts of the association for the year were: Balance, \$2,453; dues, \$3,469; sales of literature, \$3,536; miscellaneous, \$3,730; total, \$13,188. Expenses, printing, journal, etc., \$4,409; running expenses, \$5,774; balance, \$3,005.

The first report was that of the Harmonizing Committee, H. S. Balliet (N. Y. C.), chairman. This committee has reviewed all specifications adopted up to 1917 and all recent action taken by the association and submitted reports on 20 subjects. Some of these reports had not been concurred in by the committees most interested and there was a long discussion on the true functions of a harmonizing committee. The great bulk of the work of the committee was accepted, but the meeting buckled down to about three hours of committee work and directed that a number of subjects be referred back to the primary committees, mainly Committee No. 2, Mechanical Interlocking and No. 6, Standards.

Committee No. 3, F. B. Wiegand (N. Y. C.), chairman, presented a revised specification for petroleum asphaltum for protecting insulated wire in trunking, which after some amplification was adopted to be referred to letter ballot.

Committee No. 2, C. J. Kelloway (A. C. L.), chairman, presented a report on Field Construction of Pipe Lines, which

after brief discussion was accepted and ordered sent to letter ballot. A report by the same committee on Locking Switches Mechanically at Interlocking Plants was discussed at considerable length, the question whether the lugs for No. 1 switch rods should or should not have slotted holes developing decided differences of opinion. With first class road bed and large rails they are not used; but many members declared them a necessity. After a long discussion the report was accepted, not as a standard but in the nature of instructions to the Committee on Standards (Committee No. 6).

The Committee on Standards (No. 6), F. P. Patenall (B. & O.), chairman, presented eleven new designs and 15 revisions of designs, and a specification for lantern globes. These designs include the following:

Details and Assembly of Multiple Unit Bolt Lock; Mechanical Semaphore Bearing; Operating Connections for Mechanical Signals; Guide Clamps for Vertical Connections on Signals; Deflecting Bars; Cable Post Pinnacle and Cable Outlet; Relay Boxes; Cable Posts and Relay Boxes; Relay Box Inlet Bracket; Relay Box Linings and Terminal Boards; Horizontal Adjustable Deflecting Stands; Vertical Deflecting Stands, and Detector Bars. Also a revised compensation table and five pages of signal symbols, revised.

Also, two drawings, submitted for discussion only, covered an assembly of switch fittings for a double slip switch, and the same for movable point frogs. These represent designs already in satisfactory use on two roads. All of the foregoing, after some discussion, were accepted, and ordered sent to letter ballot, excluding the last two, but including the specifications for hand lantern globes. The matter concerning photometric tests of globes was criticized as incorrect in some details and was accepted subject to correction.

In line with an instruction to look into the specifications for signal roundels, lenses and glass slides, with a view to considering the high transmission convex glass, the committee made numerous field tests and visited various glass companies, with the result that it considers it advisable to adopt the high transmission, convex glass. This will give an increase in efficiency in the transmission of light. The convex roundel is to be recommended on account of its greater strength, eliminating to a certain extent the possibility of snow collecting on the face of the roundel and the absolute elimination of phantom lights. It was found that there are in use 16 different diameters in red roundels, 12 in yellow roundels, 17 in green roundels, 7 in purple roundels and 7 in blue roundels. The committee recommended the confining of new designs of apparatus requiring roundels to 3½ in. and 5½ in. in diameter for all colors.

In lenses, the committee found 9 diameters in red reported in use, 5 in purple, 6 in green, 4 in lunar white, 7 in white flint, 4 radius lenses, or a total of 40 different diameters in the various colors. The committee recommended the confining of new designs to the following in order to reduce the stock of various diameters: 4 in., 4½ in., 5 in., 5½ in., 6½ in., 8½ in., 10 in. and 10 in. doublet lens.

In the discussion on glasses the recommendations of the committee were warmly commended. It was suggested by a glass maker that the maintenance-of-way and the motive-power departments also should be brought into the movement to reduce the great variety of sizes. A. H. Rudd (Penn.), uses convex roundels of high transmission glass with great satisfaction.

Committee No. 10, R. B. Elsworth, (N. Y. C.) chairman, presented a specification for lead type stationary storage battery; general specifications for switchboards, including requisites, and a drawing of a proposed standard thermometer for storage battery. The committee brought up to date the specification for the battery now in the manual in order to harmonize the subject-matter wherever possible with specifications of similar character adopted in 1916. The switchboard specifications had been thoroughly gone over at a joint

manufacturers' meeting. The thermometer can be purchased economically in the open market.

The whole report was accepted and referred to letter ballot; but the switchboard specification was discussed at considerable length. There was a demand that all matter in the specification be written out in full instead of referring, as is done in some cases, to the specifications of the American Institute of Electrical Engineers; but this A. I. E. E. manual was said to be procurable at 25 cents a copy and the meeting sustained the present practice.

Committee No. 8 made a long report (presented by W. W. Morrison) 40 pages of which were filled with descriptions of alternating current signaling on 15 roads (including several electrically operated lines) as follows: The Philadelphia & Reading, the Cleveland, Southwestern & Columbus, the Norfolk & Western, the Boston Elevated, the New York, New Haven & Hartford, the Chicago, Milwaukee & St. Paul, the Chicago, Rock Island & Pacific, the Oakland, Antioch & Eastern, the San Francisco-Oakland Terminal, the Montreal & Southern Counties, the Atchison, Topeka & Santa Fe, the Lehigh Coal & Navigation Company, the Scranton & Binghamton, the Cumberland Valley and the Cincinnati, New Orleans & Texas Pacific.

The specifications cover impedance bonds, electric alternators, reactors, resistors, single-phase line transformers and other details. All were accepted and ordered to letter ballot, except the "general clauses to be used in unit specifications" (page 488, September Journal) which were referred back to the committee.

Committee No. 7, E. G. Stradling (C. I. & L.) chairman, reported on a proposed standard 2-ohm track relay, having made a study of resistances which has been discussed at previous meetings; but, after considerable discussion and much objection to displacing 4-ohm relays without further study of conditions on railroads in all parts of the country, the report was referred back.

The Committee on Electrical Testing, P. M. Gault (Ill. Cent.) chairman, recommended the adoption of the data published last March on Ranges and Scales for Electrical Instruments, and a form for recording results of tests. Both were accepted after brief discussion, and referred to letter ballot.

The report of Committee No. 5, presented by L. R. Mann, (Mo. Pac.) vice chairman, included a revised code of instructions for maintenance of alkaline storage batteries, which was accepted without discussion and ordered referred to letter ballot.

The special committee on Lightning Protection, E. G. Hawkins (N. Y. C.) chairman, presented a revised specification for ground apparatus for lightning arresters which, after brief discussion and one or two slight alterations, was accepted and ordered to letter ballot.

The Board of Direction reported that a committee had proposed three cities, Chicago, St. Paul and Cleveland, one of which should be selected as the place for the next annual meeting; but it recommended that, because of war conditions, no selection be made at this time; and the meeting left in the hands of the board all questions concerning next year's meetings (March, June and September).

The election of officers of the Association for the ensuing year resulted in the unanimous choice of the following: President, William H. Elliott (N. Y. C.); second vice-president, C. J. Kelloway (A. C. L.); secretary and treasurer, C. C. Rosenberg, Bethlehem, Pa.

THE PARIS NORTH-SOUTH RAILWAY.—Out of 962 employees on the Paris North-South Railway in 1916, 341 were women. The number of passenger tickets issued in that year was the highest on record, being 66,658,066, as against 54,630,529 in 1915 and 56,388,123 in 1913. At the St. Lazare station alone 7,000,405 tickets were sold.

General News Department

A roundhouse of the Delaware, Lackawanna & Western at Scranton, Pa., was damaged by fire September 13, and 14 locomotives were seriously damaged.

Settlement of a strike of approximately 1,500 clerical workers of the Seaboard Air Line was announced Tuesday to have been effected by the Department of Labor.

Station employees on the Boston & Maine Railroad met Monday and voted to demand an increase in pay. They want eight cents an hour more than they are receiving and a reduction in the amount of work required of them.

A fire started last Saturday night in the interior of the Winchester Bridge tunnel on the Georges Creek and Cumberland branch of the Western Maryland. Both ends of the tunnel were closed in the hope of smothering the fire.

Telegraphers on the Chicago, Burlington & Quincy have taken a strike vote. Their demands include a 25 per cent increase in wages, time and a half for overtime, extra pay on Sundays and certain vacation privileges. Strike agitation by telegraphers on the Illinois Central has resulted in the mediation of the differences between the men and the road.

The Brotherhood of Railroad Trainmen has presented demands to six middle-western roads for an increase of \$10 a month in the compensation of passenger brakemen and baggage men, dating from September 1. The roads affected are the Chicago & North Western, the Chicago, Burlington & Quincy, the Illinois Central, the Chicago Great Western, the Chicago & Alton, and the Chicago, Rock Island & Pacific.

At the time of writing the strike of freight handlers and freighthouse clerks at Kansas City had not yet been settled. The Atchison, Topeka & Santa Fe, and the Chicago, Burlington & Quincy had nearly full forces of men at their respective freight houses, while the Chicago, Rock Island & Pacific had about 10 per cent of the usual number of men at work, and the freighthouses of the other roads were closed. Switchmen and teamsters are threatening to call sympathetic strikes.

Cameron B. Buxton, former general agent of the Atchison, Topeka & Santa Fe at Philadelphia, and since last fall vice-president of H. L. Edwards & Co., cotton merchants of Dallas, Tex., has been appointed assistant director of the section of transportation of the United States Food Administration. This section is under the direction of Edward Chambers, vice-president of the Santa Fe, his services having been given free to the Food Administration by the railroad. Mr. Buxton's services have also been donated by his company.

A strike of shopmen of the Kansas City, Mexico & Orient was settled through mediation on September 14, following conferences between committees representing the shop crafts and officers of the road. The men had asked for a 10-cent increase in wages, and were offered an increase of two and one-half cents an hour by the company. The compromise agreement, which was reached on September 14, provides for an increase of from three to six cents an hour for mechanics, helpers and car-men, and two and one-half cents for apprentices. The men had been off work for nine days.

Press despatches from Petrograd dated September 18 said that David R. Francis, the American ambassador, had authorized the announcement that he has received a promise by the Russian government that the recommendation of the Stevens commission concerning transportation improvements will be carried out immediately. John F. Stevens and the others in his party are on a three weeks' tour of Siberia in company with Russian officials, who have been instructed to make the improvements suggested by the commission. The ambassador says that the carrying out of the commission's suggestions will improve the carrying capacity of the trans-Siberian Railroad 30 per cent.

Five More Engineer Regiments

Recruiting officers in several of the large cities of the country are advertising for recruits for five additional engineer regiments, one of which, the 21st Engineers, will be for constructing light railways. The remaining four include the 20th, forestry; the 23rd, highway; 25th, construction, and the 26th, supply and water supply. For the 21st, the light railway, men trained in the following trades are wanted: Timbermen, bridge carpenters, masons, pipe fitters, steam fitters, hoisting engineers, firemen, dinky runners, teamsters, track layers, construction foremen, pile drivers, concrete foremen, telegraph linemen, riggers, cooks, machinists, blacksmiths, transimen, surveyors, draftsmen, storekeepers, machine repairers, clerks, electricians, oilers, painters, rod drillers, powdermen, signal installers and bridgemen.

Seven Killed in Burlington Wreck

In a rear-end collision of two stock trains on the Chicago, Burlington & Quincy at 11:05 p. m., September 16, near Earlville, Ill., seven stock men were killed and six were injured. The men were riding in the first coach ahead of the way car of the foremost train when the train behind, which had run past a block signal and flagman, crashed into it. Five of the men were killed instantly, and two died later at a hospital in Aurora. When the engineer of the second train saw the crash was inevitable, he jumped from the engine, thereby sustaining slight injuries. Preliminary investigations by the company tend to show that the accident was caused by the fact that the engineer of the second train was asleep until his train was too close to the preceding one to prevent the accident. He, in fact, admitted that he was not fully awake at the time, and attributes his drowsiness to having taken some medicine to cure a cold. Traffic to Chicago was tied up for several hours following the wreck.

Loyal Union Men Protected by Court

Twenty-two members of the Chicago lodge of the Brotherhood of Railroad Trainmen have found it necessary to appeal to a court for protection of their membership rights because, they maintain, they remained faithful to a promise made by the brotherhoods to Congress in January. According to their contention, when the committee on interstate and foreign commerce of the House of Representatives was considering the advisability of giving the President the power to force trainmen to remain at their posts in the event of a strike, representatives of the brotherhoods agreed that if such authority was withheld, the men they represent would be found loyal to the government, and would do nothing to interrupt the operation of trains in case of threatened or actual warfare. Among those who, they assert, gave this guarantee to the government was W. G. Lee, president of the Brotherhood of Railroad Trainmen. About six months later, when he was dangerously ill, 2,500 Chicago switchmen, under the orders of James Murdock, vice-president of the B. of R. T., struck, thereby tying up movements of troops and government supplies. It is Murdock's contention that Thomas Dodge, acting president in place of Lee, gave him authority to order a strike. As a matter of fact, Dodge did give the order, but later rescinded it before the strike went into effect. In the face of the obvious illegality of the strike, 22 switchmen in the employ of the Illinois Central recently had charges preferred against them by the Chicago lodge of the B. of R. T., stating that by refusing to obey the strike order they made themselves liable to expulsion from the union. Upon application to the courts they secured an injunction preventing the Chicago lodge from taking any action to prejudice their membership rights on the grounds that only the grand lodge has the authority to expel members, and that the strike order which the men disobeyed was in itself a violation of the brotherhood's constitution, as it had been given in direct contravention of the order of the president of the union.

Stockholders Asked to Express Opinions

"The co-operation of the stockholders is earnestly invited to continue the successful practice established three years ago of making the annual meeting not merely a conventional routine, but a forum for the expression of the views of individual stockholders upon the policies and problems of the company." This statement is contained in a letter which has been forwarded to the stockholders of the Southern Railway by President Fairfax Harrison, giving notice of the annual meeting of stockholders to be held in Richmond, Va., on October 9. The letter states that the principal officers of the Southern will be in attendance to answer questions directed to the management, or to any detail of the company's business, and adds: "You are earnestly invited to attend in person; or, if that shall be impossible, to have your own personal representative in attendance in your behalf, or to address to the undersigned in writing what you might say if present."

Exemption Boards Praise Roads

The military exemption boards in northern Illinois districts have strongly commended the railroads for their "unselfish patriotism" in closely limiting claims of their employees for exemption from military service. R. H. Aishton, president of the Chicago & North Western, and chairman of the central department committee of the Railroads' War Board, promptly notified the exemption boards that the railroads would not ask for exemption for employees by classes, nor would requests be made for individual exemptions unless necessary for the successful operation of the roads. Each road designated one of its highest officers as exclusively authorized to approve claims of employees for exemption.

"This action of the railroads established a precedent, which has been followed by all other large employers of labor," said H. H. Merrick, chairman of the consolidated exemption boards of Illinois. "This policy assured the best results possible for the employer, the employee and the nation. . . . The railroads are deserving of full credit."

Tobacco for the Men in France

Every Pennsylvania Railroad man who goes to France with the army, who joins the marine corps, or enlists in the navy, will, from time to time—probably as often as once a month—receive from another Pennsylvania Railroad man, at home, a package of tobacco and cigarettes. Each package will contain a self-addressed post-card from the employee whose contribution provided the gift.

This arrangement has been made possible by the establishment of the Pennsylvania Railroad Tobacco Fund. More than 2,500 employees of the Lines East of Pittsburgh have already enlisted. Some of them are in France now; others are on their way; the remainder are preparing to go. The object of the fund is to maintain personal contact and the spirit of fellowship between those who go and those who stay.

Every contribution of 25 cents provides for a package of "smokes," which would cost 45 cents retail at any cigar store. For each 25-cent contribution the giver signs and addresses a post-card, which will be enclosed with one of the packages. The recipient is expected to put his own name on the card, perhaps write a brief message, and send it back by the next mail.

American Gear Manufacturers Meet

The American Gear Manufacturers' Association held its semi-annual session in Chicago, September 13, 14 and 15.

F. W. Sinram, of Van Dorn, Dutton & Co., Cleveland, O., president of the organization, opened sessions Friday morning. A paper on Advertising Don'ts was then read by J. C. McQuiston, advertising manager of the Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa. W. H. Phillips, of the R. D. Nuttall Company, Pittsburgh, followed it with a talk on the Heat Treating and Hardening of Gears.

In the afternoon the convention men were the guests of Chicago members. An automobile trip of about 75 miles through Chicago's park system was made.

On Saturday, a paper by B. S. Waterman, of the Brown & Sharpe Manufacturing Company, on Inspection of Gearing, was read; also another by H. E. Eberhardt, of the Newark Gear Cutting Machine Company, on Spur Gearing by the Rotary or

Disc Cutting Process; and another by F. Schneider, of Van Dorn, Dutton & Co., Cleveland, on Spur Gears by the Shaper Method.

The Bridge and Building Convention Exhibit

Although the exhibit of the Bridge and Building Supply Men's Association, held in connection with the annual convention of the American Railway Bridge and Building Association, is almost a month in the future, 15 firms have made reservations of space, a larger number than at this time in any previous year. An interesting feature of this year's exhibit is the fact that a number of the firms which have already reserved space have indicated their intention of making more elaborate exhibits than previously, and have asked for larger allotments. It is expected that at least 30 to 40 companies will present exhibits.

Among the firms which have already reserved space are the following:

American Hoist & Derrick Co., St. Paul, Minn.
American Valve & Meter Co., Cincinnati, Ohio.
Carbie Mfg. Co., Duluth, Minn.
Chicago Bridge & Iron Works, Chicago.
Detroit Graphite Co., Detroit, Mich.
Paul Dickinson, Inc., Chicago.
Fairbanks, Morse & Co., Chicago.
H. W. Johns-Manville Co., New York.
The Lehon Co., Chicago.
C. F. Massey Co., Chicago.
Mudge & Co., Chicago.
George P. Nichols & Brother, Chicago.
Patent Vulcanite Roofing Company, Chicago.
Standard Asphalt & Refining Co., Chicago.
Simmons-Boardman Publishing Co., New York.
Texas Co., Houston, Texas.
U. S. Wind Engine & Pump Co., Batavia, Ill.
Western Roofing & Supply Co., Chicago.

Railway Fire Protection Association

The fourth annual meeting of the Railway Fire Protection Association will be held at the Planters Hotel, St. Louis, Mo., October 2, 3 and 4.

The opening session will begin at 10 A. M. on October 2.

The afternoon session will be devoted to the presentation and discussion of the report on Statistics, E. B. Barry, of the Southern Railway, chairman, and to a discussion of a number of miscellaneous fire dangers and hazards.

At the morning session on October 3, reports will be presented by the following committees:

Handbook on Railroad Fire Prevention and Protection; C. N. Rambo, Norfolk & Western, chairman.

Fire Prevention and Protection in Terminal Classification and Storage Yards; F. A. Greene, Pennsylvania Railroad, chairman.

Electrical Hazards; T. S. Potts, Baltimore & Ohio, Chicago Terminal, chairman.

Locomotive Spark and Ash Pan Hazard; E. C. Sasser, Southern Railway, chairman.

At the afternoon session reports will be submitted by the following committees:

Wharves and Piers; W. F. Hickey, New York, New Haven & Hartford, chairman.

Fire Protection in Passenger Equipment; G. L. Ball, St. Louis-San Francisco, chairman.

Explosives and Other Dangerous Articles; W. S. Topping, Bureau of Explosives, chairman.

At the morning session on October 4, there will be presented a committee report on Hose and Hose Couplings; F. H. Elmore, Southern Railway, chairman. A paper will be read on Hazards in Connection with Storage of Pulverized Coal, by C. P. Beistle, chemist with the Bureau of Explosives; and motion pictures will be shown illustrating fire prevention on the Baltimore & Ohio.

Railway Club of Pittsburgh

At the first regular meeting of the Railway Club of Pittsburgh, after the summer vacation, to be held on September 28, at the Commercial Club Rooms of the Colonial Annex Hotel, Pittsburgh, A. L. Humphrey, vice-president and general manager of the Westinghouse Air Brake Company, will present a paper entitled Ammunition Problems in War Time. This paper will be illustrated by lantern slides and moving pictures, and is devoted to problems arising in the manufacture of ammunition in quantities necessary to equip and maintain a large army and the effective mobilization of our material and industrial resources for that purpose.

The Railway Real Estate Association

The 1917 convention of the Railway Real Estate Association, which was to have been held in Duluth, Minn., this coming October, has been postponed.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hope, C. R. K. of N. J., 143 Liberty St., New York. Next meeting, October 16-17, St. Louis.

AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 16-18, 1917, Chicago.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.

ASSOCIATION OF AMERICAN RAILWAY ACCOUNTING OFFICERS.—E. R. Woodson, Rooms 1116 Woodward Bldg., Washington, D. C. Next meeting, September 26, Congress Hotel, Chicago.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement B. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.

CENTRAL RAILWAY CLUB.—J. D. Younger, 35 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual dinner, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

CINCINNATI RAILWAY CLUB.—H. Bount, Chief Interchange Inspector, Cinti Ry., 101 Carey Bldg., Cincinnati. Regular meetings, 2d Tuesday, February, May, September and November, Hotel Statler, Cincinnati.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 568 Union Arcade Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh, Pa.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

INVESTMENT BANKERS' ASSOCIATION OF AMERICA.—Frederick R. Fepton, 11 W. Monroe St., Chicago. Annual convention, October 1-3, 1917, Baltimore, Md.

MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES.—Charles E. W. Hager, Post Worth 14, Denver City, Fort Worth, Tex. Next convention, October 16-18, 1917, Cleveland, Ohio.

NATIONAL ASSOCIATION OF RAILWAY COMMISSIONERS.—Jas. B. Walker, 120 Broadway, New York City. Next annual convention, October 16, 1917, Washington, D. C.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meeting, 2d Tuesday in month, except June, July, August and September, Boston.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meeting, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—Geo. A. J. Hochgrebe, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Hotel, Buffalo, N. Y.

PACIFIC RAILWAY CLUB.—W. S. Wollner, Assistant to Chief Engineer, Northwestern Pacific R. R., San Francisco, Cal.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—F. C. Stewart, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Pittsburgh Commercial Club Rooms, Colonial Annex Hotel, Pittsburgh.

RAILWAY FIRE PROTECTION ASSOCIATION.—C. R. Edwards, office of the president's assistant, Seaboard Air Line, Norfolk, Va. Next meeting, October 24, 1917, St. Louis, Mo.

RAILWAY REAL ESTATE ASSOCIATION.—R. H. Morrison, Assistant Engineer, C. & O., Richmond, Va. Next convention to have been held October, 1917, Duluth, Minn., indefinitely postponed.

RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—P. J. McAndrews, C. & N. W., St. Louis, Mo. Next annual convention, September 18-21, 1917, Hotel Auditorium, Chicago.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

SOCIETY OF RAILWAY FINANCIAL OFFICERS.—L. W. Cox, N. & W., Philadelphia, Pa. Next annual convention, October 16-18, St. Louis, Mo.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grand Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 a. m., Piedmont Hotel, Atlanta.

TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.

TRAFFIC CLUB OF NEW YORK.—C. A. Swenson, 291 Broadway, New York. Regular meetings, 1st Tuesday in month, except June, July and August, Waldorf-Astoria Hotel, New York.

TRAFFIC CLUB OF PITTSBURGH.—D. I. Wells, Gen'l Asst, Erie R. R., 1924 Greiner Bldg., Pittsburgh, Pa. Meetings bi-monthly, Pittsburgh.

UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, 1111 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.

WESTERN CANADIAN RAILWAY CLUB.—K. W. Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Monday in month, except June, July and August, Hotel Sherman, Chicago.

WESTERN SOCIETY OF ENGINEERS.—Edgar S. Nethercut, Acting Secretary, 1735 Monandnock Bldg., Chicago, Ill. Regular meeting, first Monday in month, except January, July and August. Extra meetings generally on other Monday evenings except in July and August.

Traffic News

The Railroad Commission of Louisiana issued an order on September 11, modifying the average demurrage agreement to conform with the average agreement in force on interstate commerce.

Under a decision handed down September 15 by the New Jersey Board of Public Utility Commissioners, the Pennsylvania, the West Jersey Seashore, the Philadelphia & Reading and the Atlantic City Railroads are allowed to make increases in commutation fares and excursion or round trip tickets applying on intrastate trips in southern New Jersey.

A revision of class rates and a 15 per cent increase in freight rates proposed by Ohio railroads were suspended on September 13 for 30 days by the Public Utilities Commission of Ohio. The railroads in Missouri recently filed a request with the Missouri Public Service Commission to have their application for a general 15 per cent increase in freight rates postponed indefinitely.

J. B. Jemison & Co., lumbermen of Thomasville, Ga., have issued to dealers a striking appeal for conservation of freight cars. Pointing out that the average capacity of box cars is 40 tons, and that the average load is only 17 tons or 43 per cent of capacity, everybody is urged to utilize the 57 per cent of facilities available, but not used. "It is, therefore, not only the patriotic duty of every lumberman, but it is to our own advantage, and a matter of plain, common, every-day, business sense, to load every car, every time, to full capacity, and load them quick. Put on every foot, every time, that every car will carry, and do it quick. . . ."

The Buffalo, Rochester & Pittsburgh and the New York, New Haven & Hartford have announced plans for "sailing days" on l. c. l. freight. On the Buffalo, Rochester & Pittsburgh, stations have been divided into five classes, according to the importance and the amount of traffic moving to them. The days on which freight will be received for certain stations and the leaving time of the train on which such freight will be sent forward are given in a pamphlet just issued to shippers. For certain points freight will be received daily, for others daily except Saturday, for a third class except Saturday and Monday, for a fourth class on Monday, Wednesday and Friday, and for a fifth class on Tuesday, Thursday and Saturday.

Adams Express Declares Two Days' Embargo to New England Points

The Adams Express Company announced Tuesday that it had declared an embargo, effective Thursday and Friday of this week, on express shipments in both directions between New York City, Brooklyn, Jersey City and Hoboken and all points on its lines in New England, except Government shipments and foodstuffs.

The reasons given are the unprecedented volume of matter offered for movement by express, rendered more acute by the heavy movement of Government shipments, as well as the restriction of express equipment, due to the handling of large troop movements and their accompanying impedimenta.

The Movement of Selected Men to Cantonments

It will take all of the 1,500 "tourist" sleeping cars available and 5,000 coaches to transport the 194,800 men, who constitute 40 per cent of the citizen-soldiers selected for military service, and who are being moved from their homes to the 16 cantonments of the government during a five-day period, which began on September 19. Publication of any routes or schedules of military movements is prohibited, but it can be said that the government and the railroads have co-operated in making every possible provision for the safe, comfortable and prompt transportation of the citizen-soldiers. Generally speaking, the "tourist" sleeping cars will be used by those located farthest from the cantonments, while the day coaches will be used for the shorter trips. All arrangements are made for stops for meals en route, wherever necessary.

Unlike movements of the "regulars" or national guards, the citizen-soldiers will not be accompanied by officers. The various examining boards throughout the country have notified each man the exact date he is to travel, where he is to take a train, the number of the train and its time of departure. These boards have also designated one man who will be in charge of each lot of men entraining at each place during the five-day period. The number of men to assemble daily at each place of entrainment ranges from two to several hundreds. The men from the smaller places will be carried on regular trains. Extra coaches will be added as more detachments are picked up. When the extra coaches reach a certain number they will be detached from the regular trains and made up into special trains. Each "tourist" sleeping car will carry 40 men, and the average in each day coach will be 50 men. From the larger cities the men will travel all the way in special trains, as a rule.

Navy to Help the Car Loading Campaign

The Bureau of Supplies and Accounts, Navy Department, has issued instructions to navy contractors concerning car supply and expeditious freight movements. Paymaster Gen. Samuel McGowan has called special attention to the fact that in the existing emergency it is necessary that there be no delay to matters in which the navy is interested, and advises contractors of the methods to be followed to hasten shipments for the navy. It is essential that contractors endeavor to have cars placed or consignments accepted and moved before requesting assistance from the government. If after reasonable effort on the part of the contractor it is impossible to secure car equipment, they are to advise the Bureau of Supplies and Accounts. It is important that cars be loaded to full capacity. Also that equipment be promptly unloaded and released. Effective co-operation on the part of all concerned will materially assist in relieving the car shortage situation and congested traffic conditions.

Aishton Points Out Great Increase in Freight Traffic

The magnitude of the increases which have taken place in the freight traffic of the railways of the United States within the last two years, and of the advances in efficiency which have had to be achieved in order to handle it, were shown in a striking manner by R. H. Aishton, president of the Chicago & Northwestern, in an address before the St. Louis Railway Club, at St. Louis, Mo., on September 14.

"At the present rate of movement," said Mr. Aishton, "the railways will handle 510,000,000, or 52 per cent, more tons of freight in 1917 than they did in the fiscal year ended on June 30, 1915. On the basis of the present number of tons handled per train, it would take 720,000 freight trains, containing 18,000,000 freight cars, merely to handle this increase in tonnage over 1915. If all the cars required to handle this increase in tonnage were made up in a single train, that train would be 136,363 miles long."

Mr. Aishton gave another striking illustration to drive home the same point: "The increase in the freight traffic of our railways in 1917 over the year ended on June 30, 1915," he said, "will amount, at the present rate, to as much as the total traffic handled before the war by all the railways of Germany, France, Russia, Spain, Sweden, Switzerland, Roumania, Holland, Canada, South Africa, Mexico, Japan, Brazil and South Wales. In other words, the total ton-miles of traffic handled annually in those 14 countries before the war was 141 billion ton-miles, and at the present rate the increase in this year over the fiscal year 1915, in the ton-miles handled by our railways, will be just about 141 billion ton-miles."

Marketing Grain at Country Points

The United States Department of Agriculture has issued Bulletin 558, on marketing grain at country points, which contains much information of interest to producers, shippers, dealers and consumers. The government investigators declare that the producer of high-quality grain often receives less than it is worth in order that the buyer may pay an equal price to a grower of grain of inferior quality. If the farmer would clean his grain he could not only demand top prices, but would thereby obtain screenings worth \$10 to \$25 a ton for feed. Many elevators are open only during the harvest season; but farmers should encourage elevators which remain

open and provide a local market throughout the year. To determine for or against storage of grain on the farm, it is necessary to consider the interest on the investment, interest on the grain in store, natural shrinkage and loss by rodents, convenience of marketing, condition of roads at time of delivery, price at harvest time, and the probable price at some future date.

Car Shortage Again Reduced

Reports to the American Railway Association show that on September 1 the excess of unfilled orders for cars in some parts of the country over surpluses of cars in other places was 31,591, a reduction of 14 per cent, as compared with the previous month.

In the latter part of April, when the Railroads' War Board was organized to co-operate with the government in all matters of the railroads affecting the conduct of the war, there was an excess of unfilled car requisitions over surpluses amounting to 148,627 cars.

As it was impossible to create cars over-night, not to mention locomotives, terminal facilities, tracks and other facilities just as badly needed, the War Board directed its first efforts at securing greater use of the facilities which existed, mainly freight cars. The object was to more nearly take care of all the orders of the government and shippers as well. Railroads were instructed to do things within their own province which would increase the efficiency of equipment and at the same time to secure the co-operation of shippers, consignees and commercial bodies.

The success of the combined efforts of state and federal regulating bodies, shippers, commercial organizations, the railroads and seasonable weather, may be seen from the fact that the railroads have, with practically no increase in facilities, handled the greatest amount of freight in their history in the past four months.

The excess of unfilled car orders has been cut down from 148,627 on May 1, to 106,649 on June 1, to 77,682 on July 1, to 37,062 on August 1, and to 31,591 on September 1, thus achieving an improvement in four months of 78 per cent.

President Holden Warns Public to Ship Now

A warning to buyers and shippers generally, but especially those of the central and western states, to ship all the freight they can now, was issued on September 15 by Hale Holden, president of the Chicago, Burlington & Quincy, and one of the five members of the Railroads' War Board. "The time to make hay is when the sun shines, and the best time to ship, under such conditions as those now existing, is when the railways have cars and the weather is good," he said. "The situation as to car supply is good now—better than at any time since the war began. In other years when there have been congestions of traffic they have usually begun about the middle of October, for that is when the movement of traffic normally becomes the heaviest. The same conditions, only intensified, may be expected this year. Hence, during the next few weeks, while the railroads have the cars and locomotives available, and while weather conditions are most favorable, every ton of freight that can be shipped should be."

"Fairfax Harrison, chairman of the Railroads' War Board, has just issued an appeal to farmers to send their wheat to market now, so that the railroads can transport it to storage points for ready distribution, and to mills to be made into flour for domestic use and for export to our allies, whose great needs can be supplied promptly because ships are available to our various ports. He points out that as the President has fixed the price of wheat for a year, the farmer can lose nothing now, while by holding his grain back he would lose interest on money and by deterioration of the grain."

"I would especially urge now the shipping not only of wheat, but of all commodities that can be shipped, and especially of coal. The railroads are now able to fill practically all orders for cars for coal. In fact in the past few weeks they have furnished more cars to mines in Illinois than have been loaded. There has been a marked reduction in the output of Illinois coal, due to labor troubles and other conditions for which the railroads are not responsible. They should not be blamed later for a coal shortage due to failure to ship coal at this time when the roads have enough engines and cars with which to move it."

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The hearing on the valuation of the Kansas City Southern announced for September 18 at Kansas City before Examiner John H. Gray was cancelled and a hearing assigned for October 8.

The Interstate Commerce Commission has suspended until December 30 a number of additional tariffs filed by the railroads in the eastern commodity rate case, together with some additional tariffs in the eastern live stock and fresh meat case. The tariffs were to become effective on September 15 and later dates.

The commission also suspended until January 13 proposed increases on commodities between trunk line territory and western points rates, on canned fish from New England points by rail and water to southern points, transcontinental rates on bottles westbound, and proposed increased charges for car float service in New York harbor.

H. C. Barlow, traffic director of the Chicago Association of Commerce, and chairman of the executive committee of the National Industrial Traffic League, who has been in Washington during the summer collaborating with the Division of Car Service of the Interstate Commerce Commission, has completed his work in Washington and returned to Chicago.

The commission has made public a tentative opinion in the western trunk line iron and steel case, holding that the proposal of the carriers to increase or cancel practically all commodity rates on iron and steel articles applying within western trunk line territory, and from points east of Chicago and the Mississippi river to points in western trunk line territory, are found generally not justified, but authority is given to publish somewhat higher rates than are at present maintained. The suspended schedules are required to be cancelled.

Reconsignment Case

The commission has made public the tentative opinion of Attorney-Examiner C. V. Burnside in the case involving changes in the regulations affecting the diversion or reconsignment of carload shipments proposed by practically all steam roads in the country. The proposed tariffs are upheld in many particulars, but many modifications are also ordered and the suspended tariffs are required to be cancelled. The findings in the tentative opinion are as follows:

1. The service of reconsignment is necessary, and should be provided for by the carriers at charges based upon cost, including a reasonable profit. Previous findings of the commission are reaffirmed. Undue detention of cars at point of reconsignment should be prevented by regulations which may include penalty charges.

2. The definitions of diversion or reconsignment should be clarified, and certain proposed rules should be so amended as to express the intent of the carriers, as shown by the record.

3. Proposed charges for change in the name of consignor not justified.

4. Proposed charge of \$2 per car for reconsignment in transit prior to arrival of shipment at original destination justified.

5. Proposed charge of \$2 per car for reconsignment at original destination on order received by the carrier in time to permit instructions to be given to yard employees prior to arrival of shipment not justified.

6. Proposed charge of \$2 per car for stopping carload shipments in transit to be held for orders prior to reaching original destination justified.

7. Proposed charge of \$5 per car for reconsignment at original destination on orders received by carrier after arrival or too late to permit instructions to be given yard employees before arrival justified; but carriers should give shippers advance notice of arrival at reconsigning points of shipments extraordinarily delayed.

8. Proposed charge of local tariff rates for movement of

carload shipments within switching limits after placement for unloading justified.

9. Proposed charge of \$2 per car for reconsignment within switching limits before placement for unloading on orders received within 24 hours after arrival justified.

10. Proposed charge of \$5 per car for reconsignment within switching limits before placement for unloading on orders received more than 24 hours after arrival justified.

11. Proposed application of charge for reconsignment service regardless of method of freight rate construction justified.

12. Proposed regulations prohibiting reconsignment to a point or points formerly under embargo, when the shipments are forwarded from point of origin prior to termination of embargo, justified.

13. Application of the proposed regulations to the reconsignment of shipments of coal not justified on the record.

14. Proposed regulations for reconsignment of grain at Pittsburgh disapproved as unduly prejudicial to Pittsburgh.

15. Proposed increases in charges for reconsignment by certain New England carriers not justified.

16. Respondent should provide by tariff for relief from reconsignment charges when reconsignments are necessitated by embargoes or by confiscation of coal.

17. Tariffs under suspension required to be cancelled, but without prejudice to the right of carriers to file new tariffs in conformity with the views expressed.

COURT NEWS

Crossing Accident—Contributory Negligence of Team Driver

The Kansas Supreme Court holds that the rule that contributory negligence is not to be ascribed as a matter of law to one who, through bewilderment, makes an injudicious choice of a means of escape from a sudden peril does not apply in an action against a railroad for injuries resulting from a crossing collision, where the railroad's only negligence was running the train at 16 miles an hour across a city street, and the plaintiff, while driving his team at an ordinary walk, could have seen the train when it was 300 feet away and he was 22 feet from the track, and there was nothing to prevent his turning to one side except his fear and excitement.—*Moler v. Rock Island (Kan.)*, 166 Pac., 488. Decided July 7, 1917.

Supplying Water From Streams to Locomotives

The Kansas Supreme Court holds that a railroad company, as a riparian owner, has the right to make reasonable use of the water of a stream for the purpose of supplying its engines and operating its road. Reasonable use means such use as is consistent with the equal rights of other riparian owners. Where water is abundant there is no occasion to dispute about its use. Only when the flow becomes scanty does necessity for adjustment arise. In this case matters were brought to a crisis by an unprecedented drought. The trial court found specifically that the railroad's dam did not back-water far enough to interfere with the operation of the plaintiff's up-stream mill, and that the quantity of water taken by the railroad did not in any appreciable degree affect the operation of the plaintiff's down-stream mill.—*Atchison, T. & S. F. v. Shriver (Kan.)*, 166 Pac., 519. Decided July 7, 1917.

Safety Appliances

The Montana Supreme Court holds that under section 2 of the Safety Appliance Act of 1910, requiring that all cars subject to the provisions of the act be equipped with sufficient hand brakes, the absolute duty was imposed on the defendant railroad to furnish a car with the several parts of the hand-braking appliances so securely connected that the brakes could be set with safety in the ordinary routine of a brakeman's duties, and it being necessary to that result that the chain be hooked over the end of a rod, the duty was imposed on the railroad to see that such connection was made in the first instance, and the same high standard of duty continued to see that the chain and rod were connected securely at all times, so that it was liable for injuries to a brakeman proximately resulting from the breaking of a wire which was used to connect the rod and chain.—*Armitage v. Chicago, M. & St. P. (Mont.)*, 166 Pac., 301. Decided June 28, 1917.

Equipment and Supplies

LOCOMOTIVES

THE NEW YORK CENTRAL has reserved space with the American Locomotive Company for about 250 additional locomotives.

THE NORFOLK & WESTERN is said to have reserved space with one of the locomotive builders for a number of large locomotives.

FREIGHT CARS

THE ANACONDA COPPER MINING COMPANY, Butte, Mont., is inquiring for 10 box cars.

THE SINCLAIR REFINING COMPANY, Coffeyville, Kan., is inquiring for 60 steel underframes.

THE TORONTO, HAMILTON & BUFFALO has ordered 5 caboose cars from the American Car & Foundry Company.

PASSENGER CARS

THE BROOKLYN RAPID TRANSIT is inquiring for prices on 250 street cars and 500 trucks.

IRON AND STEEL

THE PENNSYLVANIA has ordered 270 tons of structural steel from the Morava Construction Company, Chicago, for steel frames for four box-car unloading machines at the Northern Central elevator, Baltimore, Md.

THE JAPANESE IMPERIAL RAILWAYS.—An associated Press despatch from Seattle on September 19, said: Large quantities of old steel rails have been purchased in the Northwest by Japanese brokers and shipped to Japan, it was learned today. Twenty-three hundred tons of old rails have been shipped in the last few weeks, and additional shipments are being assembled. Brokers are paying \$70 a ton for the rails, which originally cost \$24 a ton. In turn they are selling them to the Japanese railroads for \$100 a ton.

CAPE TO CAIRO RAILWAY.—A special despatch from Elizabethville, Africa, to The African World announces the completion, in connection with the Cape to Cairo Railway, of the railroad to Bukama on the navigable Congo. The line now covers a distance of 2,700 miles direct from Cape Town via Rhodesia.

GREECE CONNECTED WITH CONTINENTAL EUROPE BY RAIL.—On May 8, 1916, the railway was completed between Gilda, on the Saloniki-Monastir line, and Pappapuli, on the Thessalian frontier, a section of 56 miles, linking Greece with the rest of Europe. After the war through trains will be run from Paris to Athens-Piraeus, shortening the time to some 60 hours.

REPORT OF SOUTH AFRICAN RAILWAYS FOR 1916.—The financial returns of the railways and harbors for 1916 show an increase in revenue of \$5,154,485 over 1915. Expenditures totaling \$15,335,670 were authorized for the railroads, of which \$6,377,388 was for capital, \$200,456 for betterment, \$8,388,619 for renewals, and \$330,275 for working purposes. Fifteen new locomotives—six standard and nine narrow gauge—costing \$324,036 were placed in service, and for new passenger coaches and freight cars \$2,920,611 was expended. During 1916 heavy shipments of agricultural products and other requirements severely taxed the available rolling stock; the abnormal traffic necessitated the ordering of more equipment. On December 31, 1916, there were being built or ordered locomotives valued at \$5,207,647; passenger coaches, \$2,207,143; and freight cars, \$4,107,476. The proposed electrification of South African railways again received consideration during 1916. On the recommendation of the railway board an English firm is to investigate and report upon the feasibility of electrifying certain sections of the system. This report is also to include the estimated cost of conversion, the benefits to be derived therefrom, and the effect upon operating costs.

Supply Trade News

George A. Turville, secretary and treasurer of the Crucible Steel Company, has also been elected a vice-president in addition. J. M. McComb, credit manager, has been made assistant treasurer.

Charles M. Terry, president of Charles M. Terry, Inc., has arrived in New York from Australia and will be temporarily located at the offices at 23-25 Beaver street. This company exports machinery and railway and engineering supplies.

The Hollow Tile Building Association, an organization composed of manufacturers representing 90 per cent of the total production of this burned clay product, has opened an office in the Conway building, Chicago. E. R. Sturtevant, who has been engaged in the manufacture of hollow tile, has been elected secretary and treasurer.

The Ransome Concrete Machinery Company, New York, has been reorganized and reincorporated as a new corporation with larger capitalization. It will enlarge and expand its business to include the entire line of building contractors' equipment, contractors' machinery, etc. Frank L. Brown is director and president, and John D. Givens, director and treasurer.

A. W. Ransome, who has been engaged for nearly 20 years in the development and manufacture of concrete machinery, has been appointed to the position of manager and chief engineer of the mixer department of the Blaw-Knox Company, Pittsburgh, Pa., which has taken up the manufacture of concrete machinery, developed during the past two years by Mr. Ransome.

The United States District Court for the Western District of New York has handed down its decision that the Gould "Simplex" system of electric car lighting is not an infringement of the Creveling patent, 747,686, owned by the Safety Car Heating & Lighting Company, and has directed that the suit be dismissed with costs to the Gould Coupler Company. This disposes of the last charge that the Gould "Simplex" system infringes any patent.

The Bradford-Ackermann Corporation, Forty-second Street Building, New York City, has been made the eastern sales office for the Young Brothers Company, Detroit, Mich. The sale of Young ovens, for jappanning and drying purposes, will in the future be handled by this eastern office for the New England states, New York, New Jersey, Maryland, Delaware and eastern Pennsylvania. An engineering department will likewise be available for manufacturers in the East who are interested in quick drying and baking processes, and special oven designs will be offered to meet various requirements.

W. G. Dunham, since 1907 in charge of the manufacture of McCord & Co. products in Canada, with headquarters at Brantford, Ont., died September 8 at the age of 62 years. Mr. Dunham was born in Canada, and came to this country as a young man. In 1884 he entered the employ of the Chicago, Burlington & Quincy, and was with that road as foreman of the old Sixteenth street passenger yards of that company in Chicago during the Debs strike in 1894, when he succeeded in keeping his department operating without damage to railroad property. He entered the employ of McCord & Co. in 1902, and prior to his going to Brantford was mechanical inspector.

H. E. Hiltz, district engineer at San Francisco for the Portland Cement Association of Chicago, has been elected general manager, with headquarters at Chicago, succeeding J. P. Beck, deceased. Mr. Hiltz was born in New York and received his engineering education at the University of Pennsylvania. He began his business career with the Mexican International as a rodman, and later became associated with the Philadelphia & Western. For two years he was instructor in the engineering department of the University of Pennsylvania, which position he left to enter the service of the New York Central, where he remained until 1913. On the latter date he became road engineer of the Portland Cement Association, and in 1915 was appointed district engineer at San Francisco, which position he held until his recent promotion.

Railway Construction

CHESAPEAKE & OHIO.—Work is now under way on additions to the Russell, Ky., yard, calling for about 800,000 cu. yd. of earth excavation. The contractors are the Langhorne & Langhorne Company, Richmond, Va.

CHICAGO GREAT WESTERN.—A contract has been awarded by this road to T. S. Leake & Co., Chicago, for the construction of an 11-stall roundhouse at Clarion, Iowa. The structure will replace a 14-stall building, which was destroyed by fire last April.

DELAWARE & HUDSON.—This company is now at work building a new line to be used as third track from Schenectady, N. Y., to Richmondville Summit, about 12.59 miles. This is located on a new right of way not adjacent to the present right of way, as the line is being constructed on a maximum of 0.5 per cent grade compensated, and maximum curvature of four degrees, to be used as a north bound freight line on the Susquehanna division.

GREAT NORTHERN.—This company is contemplating the construction of a cut-off from the Willmar (Minn.) line to the Fridley terminals. No work is being done on the project at present, and none will be done in the immediate future.

NEW YORK, NEW HAVEN & HARTFORD.—Contracts have been given by this company to the Central Construction Company, Roxbury, Mass., for foundations for bridges, and to the American Bridge Company, New York, for the steel superstructures of bridges, in connection with the work of widening the present two-track South Boston cut to accommodate four tracks. The cut is about one-half mile long, and the work is so involved with operation that the larger part of it will be carried out by company forces. The improvements call for 120,000 cu. yd. of excavation and the construction of 20,000 cu. yd. of masonry; the cost of the work will be about \$1,000,000.

Railway Financial News

BOSTON & MAINE.—James H. Hustis, receiver, has been granted authority by Federal Judge Morton to expend \$365,000 for necessary improvements on the Fitchburg road, a leased line. This expenditure will be borne by the Fitchburg road, whose directors approve it.

CENTRAL VERMONT.—Howard G. Kelley, who was recently elected president of the Grand Trunk, has been elected a director and chairman of the board of the Central Vermont to succeed Edson J. Chamberlin, resigned.

COLORADO & SOUTHERN.—Howard Elliott and O. M. Spencer were elected directors to succeed Harry Bronner and H. E. Byram, resigned.

The directors have declared out of surplus earnings dividends of 2 per cent each on the first and second preferred stocks, both payable October 1 to stock of record September 21.

FITCHBURG.—See Boston & Maine.

MINNEAPOLIS, ST. PAUL & SAULT STE. MARIE.—The directors were re-elected at the annual meeting September 18. The date of the annual meeting was changed from the third Tuesday in September to the third Tuesday in May, to correspond with the recent change in the fiscal year of the company.

MISSOURI, KANSAS & TEXAS.—See editorial comments elsewhere in this issue.

SOUTHERN RAILWAY.—A dividend of $2\frac{1}{2}$ per cent on the preferred stock has been declared, payable November 20 to stock of record October 31. This is the first dividend declared on this issue since October, 1914.

Railway Officers

Executive, Financial, Legal and Accounting

B. B. Greer, assistant to vice-president of the Chicago, Burlington & Quincy, at Chicago, has been elected vice-president and general manager of the Colorado & Southern, succeeding E. S. Koller, deceased.

William M. Doulin, assistant treasurer of the Pittsburgh & Lake Erie, at Pittsburgh, Pa., has been appointed treasurer, succeeding J. G. Robinson, deceased, and J. S. McKibbin succeeds Mr. Doulin.

Howard G. Kelley, president of the Grand Trunk and the Grand Trunk Pacific, has been elected also chairman of the board and member of the executive committee of the Central Vermont, vice Edson J. Chamberlin, resigned.

J. G. Rodgers, general superintendent of the Northern division of the Pennsylvania Railroad at Buffalo, N. Y., has been appointed assistant to the president, effective September 20. Until otherwise ordered, he will continue to discharge his present duties in Washington as general agent of transportation for the Railroads' War Board of the American Railway Association.

William H. Biggar, general counsel of the Grand Trunk, at Montreal, Que., has been appointed vice-president and general counsel in charge of all legal matters pertaining to the system.

W. H. Biggar

Mr. Biggar is also vice-president and director of the Grand Trunk Pacific and other associated companies. He was born on September 19, 1852, at Carrying Place, Ont., and was educated at Upper Canada College, Toronto. He entered the service of the Grand Trunk on February 1, 1881, and on December 31, 1902, was appointed assistant general counsel. About two years later he was appointed general solicitor of the same road, and on January 10, 1910, he was appointed general counsel of the Grand Trunk and the

Grand Trunk Pacific; in September, 1914, he was elected vice-president and general counsel of the Grand Trunk Pacific, with headquarters at Montreal, Que., and he also retained the position of general counsel of the Grand Trunk.

Operating

J. L. McKee has been appointed superintendent of the Buffalo division of the Delaware, Lackawanna & Western, with office at Buffalo, N. Y., vice F. M. Benning, resigned.

C. A. Hawkins has been appointed superintendent of the Nezperce division of the Nezperce & Idaho, with headquarters at Nezperce, Idaho. This division was recently acquired from the Lewiston, Nezperce & Eastern.

George A. Codling, assistant division superintendent of the New York Central lines west of Buffalo, at Elkhart, Ind., has been appointed assistant superintendent of freight transportation, with headquarters at Cleveland, Ohio.

W. E. Morse, general manager for the receivers of the Denver & Salt Lake, at Denver, Colo., has resigned, and the duties of that office have been assumed by W. R. Freeman, receiver. M. I. Phelps has been appointed superintendent, vice L. D. Blauvelt, resigned.

R. J. McArt, Jr., superintendent of the Delaware & Hudson at Oneonta, N. Y., has been appointed assistant to general super-

intendent of transportation, with headquarters at Albany, and J. K. McNeillie, general superintendent of the Canadian Government Railways at Moncton, N. B., has been appointed superintendent of the Susquehanna division of the Delaware & Hudson, with headquarters at Oneonta, vice Mr. McCarty.

A. J. Whitney, superintendent of the Maryland division of the Philadelphia, Baltimore & Washington at Wilmington, Del., has been appointed general superintendent of the Northern division of the Pennsylvania Railroad, with office at Buffalo, N. Y.; James Buckelew, superintendent of the Camden Terminal division and West Jersey & Seashore, at Camden, N. J., succeeds Mr. Whitney as superintendent of the Maryland division, and A. M. Parker, superintendent of the Allegheny division at Oil City, Pa., has been appointed superintendent of the Camden Terminal division and West Jersey & Seashore.

W. H. Fogg, superintendent of the northern and southern divisions of the Chicago, Indianapolis & Louisville, with office at Lafayette, Ind., has been promoted to general superintendent at Chicago, succeeding P. L. McManus, resigned, effective September 7. Mr. Fogg was born at Milwaukee, Wis., on May 25, 1868, and entered railway service as a messenger boy in the train despatcher's office of the Lake Erie & Western at Lafayette, Ind., on May 9, 1882. He was later promoted to train despatcher in the same office, and in the early part of 1889 went to Mt. Carmel, Ill., as despatcher of the Cairo, Vincennes & Chicago. From April, 1889, until September, 1889, he was despatcher on the Toledo, St. Louis & Kansas City, and from the latter date until January, 1890, was despatcher on the East Tennessee, Virginia & Georgia, now a part of the Southern Railway system, at Knoxville, Tenn. From January, 1890, to August, 1890, he was despatcher on the Pittsburgh Western at New Castle, Pa., following which he worked for a month as despatcher for the Chesapeake & Ohio at Clifton Forge, Va. He entered the service of the Monon as despatcher on September 1, 1890. In May, 1905, he was promoted to chief despatcher of the northern division, and in June, 1913, was appointed trainmaster of that division. He was promoted to superintendent of the northern division on January 1, 1914, and on January 1 of the following year had his jurisdiction extended over the southern division.

Traffic

J. G. Krener, chief clerk in the office of the general passenger agent of the Western Maryland, has been appointed assistant general passenger agent, with headquarters at Baltimore, Md.

W. E. Duperow, assistant general passenger agent of the Grand Trunk Pacific and the Canadian Government Railways, at Winnipeg, has been appointed general passenger agent of both roads, with headquarters at Winnipeg.

T. D. Geoghegan has been appointed traffic manager of the Gulf, Mobile & Northern, in charge of freight, passenger and industrial departments, with headquarters at Mobile, Ala., vice W. L. O'Dwyer, who has been appointed general freight and passenger agent, with office at Mobile.

G. L. Oliver, assistant general freight and passenger agent of the Ft. Smith & Western, at Ft. Smith, Ark., has been promoted to general freight and passenger agent, with the same headquarters. A. R. Christie, general agent at Oklahoma City, Okla., has been appointed assistant general freight and passenger agent at Ft. Smith. J. J. Gibson, general freight and passenger agent at Ft. Smith, has been appointed general agent to the receiver, with headquarters at Oklahoma City.

Engineering and Rolling Stock

H. A. Woods, assistant chief engineer of the Grand Trunk Pacific, with headquarters at Winnipeg, Man., recently resigned.

A. F. Stotter, supervisor of bridges and buildings of the Northern Pacific at Seattle, Wash., has been appointed division engineer of lines west of Ellensburg, Wash., with headquarters at Tacoma, Wash., vice B. L. Crosby, who has been granted an indefinite leave of absence on account of illness.

B. H. Davis, assistant master mechanic of the Delaware, Lackawanna & Western at Scranton, Pa., has been appointed master mechanic of Scranton, Syracuse & Utica and Bangor & Portland divisions, with jurisdiction over enginehouses and matters pertaining to road work, vice F. H. Reagan, resigned to accept service elsewhere; Charles W. McGuirk, general foreman in the motive power department at Scranton, has been appointed assistant master mechanic, succeeding Mr. Davis; and Joseph Greiser, general foreman in the motive power department at Scranton, has been appointed superintendent of shops, with jurisdiction over the Scranton locomotive shops.

Purchasing

C. N. Davids has been appointed purchasing agent of the Denver & Salt Lake, with headquarters at Denver, Colo., vice A. A. Dawley, assigned to other duties.

Special

Edgar S. Nethercut, who has been elected secretary of the Western Society of Engineers, Chicago, was born at Lake Geneva, Wis., on June 12, 1866, and graduated from the University of Wisconsin in 1889. From 1889 until 1893 he was employed as a draftsman by various companies, following which he was appointed chief engineer of the Paige Iron Works. In 1908 he became track expert in the valuation department, in charge of operation and sales, for the Public Service Commission, First district, New York, and three years later was engaged in the valuation of track for the Detroit United Railways. In the latter part of 1911 he opened offices in Chicago as a consulting engineer, and engaged in steam and electric railway valuation, reinforced concrete construction, sewer construction and building design. From 1914 to 1917 he was in charge of the valuation of track and rolling stock of the Washington Railway & Electric Company, Washington, D. C. On June 11, 1917, he was commissioned major in the Engineer Officers' Reserve Corps, from which position he resigned to become secretary of the Western Society of Engineers.

Railway Officers in Military Service

J. R. Jackson, assistant engineer of tests on the Archison, Topeka & Santa Fe at Chicago, has received a commission as captain of ordnance in the Officers' Reserve Corps, but has not yet been assigned to active duty.

C. F. Stewart, general passenger agent of the Western Maryland at Baltimore, Md., has been granted leave of absence to serve with the Railroads' War Board at Washington, D. C. He will be in charge of work of furnishing loading for all movements of troops over the United States.

Joseph V. Reaph, confidential stenographer to W. W. Atterbury, vice-president of the Pennsylvania Railroad since 1909, has gone to France as secretary to Mr. Atterbury, whose appointment as director general of transportation of the American Expeditionary Force in France is announced elsewhere in this issue.

F. T. Bowles, formerly superintendent of the Lake Erie & Western and the Chicago, Indiana & Southern, and recently assistant superintendent of transportation of the San Antonio & Aransas Pass, has been commissioned as a captain in the Engineer Officers' Reserve Corps, and assigned to the Twenty-first Engineers (railways).

P. Topping and E. Wells, assistant engineers of the St. Louis-San Francisco at St. Louis, Mo., have received commissions as captain and first lieutenant, respectively, in the Engineer Officers' Reserve Corps. Captain Topping has been assigned to the Fifth Engineers, United States Army, and Lieutenant Wells has been detailed to Ft. Leavenworth, Kan.

It is a matter of prime importance at the present time that locomotives be loaded to their full capacity. The larger

Tonnage Rating and the Road Foreman

the train units the more easily the tonnage can be handled, congestion will be relieved and more work will be obtained from the available power. The question has been raised as to whether or not the tonnage rating of locomotives is sufficiently high, especially where the rating is established by the mechanical department. The superintendent of the division can determine this for himself through his road foreman of engines. Here is a man, who from his extensive experience as a locomotive engineer, is in an excellent position to find out whether or not an engine is overloaded, underloaded, or is handling all that it is practicable to give it. The road foreman of engines has an important part to play in the transportation problem and this is particularly true under present conditions. He should be used where by virtue of his previous training he can do the most good. He should not be saddled with a mass of details and perfunctory work which may be done as well by others whose experience does not make them available for as important work.

The Interstate Commerce Commission has issued a new form for monthly reports of railroads to the Commission. One

Net Railway Operating Income

fundamental change which has been made is to make available figures for computing the return being earned on the investment after expenses, taxes and rentals have been paid. Heretofore railway operating income, which is the amount left from revenue after operating expenses, tax accruals and uncollectible revenue have been deducted was the figure used. The new form calls for equipment rents net, joint facility rent, leased road rent and miscellaneous rents to be shown and deducted from railway operating income to arrive at net railway operating income. In addition to giving the figure for investment in road and equipment at the beginning of the month each month, the railroads are also required to give the improvements of leased railway property at the beginning of the month. In other words, the Interstate Commerce Commission will have available for figuring return on investment the amount of investment in the company's owned

road and the amount invested in leased property, and on this total the Commission can figure the percentage of net railway operating income. This is a recognition by the Commission that rentals are a part of expenses analogous, apparently in the Commission's mind, to taxes and that they should properly be deducted before arriving at the amount available for return on total investment. This is obviously logical and proper accounting. There is, of course, the chance that some roads may be paying either too high or too low a rental as compared with the revenue which they are receiving from the operation of leased property. In the aggregate this would cause but a small error.

The completion of the Quebec bridge after two disasters marks a triumph in bridge engineering, yet the ultimate

The Quebec Bridge—A Sermon on Detail

success of this project has rested not so much on a spectacular struggle with well-nigh insurmountable difficulties, as in more or less prosaic effort to perfect the details of this great structure in all its parts. The story of this ill-fated project is a sermon on the importance of minute care in detail, since both of the disasters which befell it were brought about through oversight of seemingly minor features. In the first case it was carelessness in the revision of dead load calculations and in the proportioning of the lacing bars of the compression members. In the second case the design of the saddles by which the span was supported from the elevator hangers was at fault. Bridge engineering is essentially a matter of minute, painstaking detail. Imagination and vision play but a small part in the successful completion of even the most wonderful structure. One of the best illustrations of the importance of detail can be found in the field of movable bridges. In most of the types the fundamental principle is simplicity itself, but ultimate success involved years of experimentation. In one of the first types developed a period of 20 years elapsed after the first structure was built before a second one was attempted. The first one was a most indifferent success, while a greater perfection of working parts in the second led to the repeated use of this design in subsequent structures. Bridges of ordinary proportions built today are better than those of years gone by, not so much because new types or designs have been evolved, but because

greater care is taken in the proportioning of the details and closer attention is given to the perfection of the workmanship in the shop and in the field.

It is unfortunate that some mechanical department officers and foremen, who are hard pushed because of the difficulty of keeping the equipment in shape owing to the lack of material and shortage of labor, have become discouraged and have adopted an attitude of "what's the use." It is little wonder, therefore,

Explanations Will Not Solve the Problem

that one superintendent of motive power recently suggested to a subordinate that he "cut out the calamity howling, and get busy." This is no time to get discouraged and become fainthearted. The most difficult part of the task still lies before the railroads, and every possible effort must be made not only successfully to handle the heavy fall traffic, but to get the equipment into as good shape as possible for the winter. The railroads have accomplished wonders under the direction of their War Board, and the public is showing appreciation of this and is freely giving a large amount of co-operation. In spite of the shortage of men and material the mechanical department can make good in the months to come if it can be inspired and encouraged by the higher officers. There has possibly been too much of criticism and "please explain" and too little of friendly sympathy and encouragement—too little, indeed, of real appreciation for the importance and needs of the department. These are days of big things; men are successfully measuring up to bigger tasks than they ever dreamed of having to handle. The Railroad Y. M. C. A., as an example, had only a comparatively few days to organize its forces with a view to having a responsible representative with the necessary supplies on the great number of trains which took the men of the new National Army to the cantonments. Its leaders would hardly have been criticised if they had passed over this opportunity of serving the second contingent and had started their work on the third one. A representative of the *Railway Age Gazette*, when he returned from the meeting of the International Railroad Y. M. C. A. secretaries and their associates at which the final arrangements were made for this work, said: "I never saw such an enthusiastic bunch of fellows; nothing can stop them." Railway organizations must be thoroughly impregnated with this sort of spirit if they are successfully to overcome the stupendous task which confronts them. It is this spirit that dominates the railways of Canada and is responsible for the remarkable showing that they have made during the past few years in the face of almost insurmountable difficulties. This spirit cannot start from the ranks and work upward; it must start at the top and work down through the entire organization.

THE NEW MEMBERS OF THE COMMISSION

OWING to recent legislation authorizing the addition of two members to the Interstate Commerce Commission and to the death of Commissioner Clements, President Wilson has power to appoint three members of the Commission. The President has had this power for some time. The delay in exercising it may be due to the fact that he is making a special effort to find men who will not only be willing to accept appointment, but who possess the qualifications for membership on the Commission.

There never has been any difficulty in finding men who were willing to accept appointment to the Commission. During the time that the present three vacancies have existed, the politicians at Washington have brought to the President's notice a very large number of men who are quite willing to be appointed. Unfortunately very few of these have the special knowledge, the experience and the ability which members of the Interstate Commerce Commission ought to possess. Most of them are members of state commissions or men who

are or formerly were prominently identified with labor organizations.

The Commission is now composed of three lawyers, two former university professors and a former railway conductor who was a prominent labor leader. Those most directly concerned with the work of the Commission are the stockholders in railways, the business and agricultural interests and railway employees. While there is a former railway employee on the Commission, there are no former railway officers and no business men on it. Why should the banking interest have representation on the Federal Reserve Board, and the manufacturing and industrial interests representation on the Federal Trade Commission and the Tariff Commission, while the railways and the shippers and consignees of freight are left without representation on the Interstate Commerce Commission? The men who manage railways and those who produce and ship goods have to face payrolls and other business expenses. The problem of railway regulation is essentially a business problem. It seems obvious, therefore, that the Interstate Commerce Commission should be composed, to a large extent, of former railway officers and former business men.

Not only has President Wilson put business men on the Federal Reserve Board, on the Tariff Commission and on the Trade Commission, but he has drawn upon the best brains in business in the United States to help him in solving the problems presented to the government by the war. Let us hope that in appointing the three new members of the Interstate Commerce Commission he will follow the precedents which he himself has set in these other fields.

THE MARCH CONVENTION AND EXHIBIT

ALTHOUGH it is still six months before the time for the convention of the American Railway Engineering Association and the exhibit of the National Railway Appliances Association, the cancellation of meetings by a number of large railway associations has led some railway and supply men to question the advisability of holding this meeting and exhibit. Both of the associations are now proceeding on the assumption that their meetings will be held the same as in former years, but the fact that the question is being raised in both organizations indicates that a definite statement from the American Railway Engineering Association will clarify the situation and remove any ground for doubt. While at first thought it might perhaps be considered unnecessary for the American Railway Engineering Association to complete its arrangements for this convention at this early date, the National Railway Appliances Association is dependent upon the action of the Engineering Association for its guidance and it is important for the Appliances Association to know definitely where it stands in order that it may safely proceed with the negotiations for its exhibit space and incur other heavy expenditures. Many of the supply companies are also desirous of undertaking the preparation of their exhibits in the near future.

There would seem to be no reason why the American Railway Engineering Association should consider any plan other than the holding of its annual convention at the regular time and place. This society has been formed for the consideration of problems in the engineering and maintenance of way departments and the standing which it now has is an indication of the high character of the work it has done. The unusual conditions which the railways are now facing have created new and difficult problems for the members of this association, second in severity to those in no other department of railway service. These problems have arisen so quickly that time has not been available for detailed individual study and solution, and united effort is more necessary than ever before. There is, therefore, vastly more reason for the holding of the convention this year than at any previous period since the organization of the association.

An early decision on this matter is also essential, for to be of the maximum value to the membership, the program for the meeting should be changed radically. Under the organization in effect in the American Railway Engineering Association, the time of the convention is devoted almost entirely to the consideration of reports presented by standing and special committees on subjects assigned to them a year previous. In ordinary times this is an excellent method of procedure. This year, however, conditions have changed greatly since the subjects were assigned to the committees. Some of the topics selected are of engineering value at any time but have no particular application to present-day problems, while some of the most complicated questions are not covered in any way in the work now being done by the committees. The Board of Direction of this Association should give this situation serious consideration at the earliest possible opportunity, and should so alter the program that the members will be given that information which will be of the greatest value to them at present. This might require the postponing of entire reports of some committees and of portions of the reports of others. While this would be contrary to past practice, precedents are of little or no value in times such as the present. The railways themselves have made many revolutionary changes in their methods to meet the conditions which have arisen during the past year and the American Railway Engineering Association can do as much. Consideration of subjects such as methods of determining subsidence in embankments or secondary stresses and impact in steel bridges may well be deferred in favor of discussions of the labor problems, the reclamation and conservation of materials, the development of labor saving equipment and the conservation of cars in handling company materials. Elementary as subjects such as these may seem to some, they are the ones which are requiring the attention of railway men today to the exclusion of many more highly technical questions.

Owing to the cumbersome nature of committee work and the limited time before the convention, it may not be advisable to endeavor to secure committee reports on these timely subjects but to arrange for their presentation as individual papers by specialists in the respective lines. The important feature is to bring the desired information to the members either through committee reports or individual papers. Because of the intensity of the present problems the committee in charge of the annual dinner might also well consider the advisability of substituting addresses by railway men on current railway problems at the annual dinner for addresses on other than engineering subjects, as has been customary in the past.

With a large attendance assured by action of the Engineering Association (the Railway Signal Association having already provided for the holding of its stated meeting at the discretion of the Board of Direction) the National Railway Appliances Association will have an opportunity to present a more valuable exhibit than ever before. While the purpose of this exhibit is to display the products of the manufacturers before railway men and thereby to promote trade, the value of the exhibit to the manufacturers depends directly upon the extent to which the materials exhibited are of service to the railways. The situation in the supply field at present is very unusual. Some firms, particularly those handling products of steel, are so congested with orders that they are unable to accept further business except for long-delayed deliveries. Others are not so fortunate (or unfortunate) and are actively soliciting orders. There is no question but that the present labor situation will cause many railway men to study the exhibits more than ever before, searching for devices which will replace men and aid them to tide over the existing situation. The present, therefore, offers an exceptional opportunity to a large number of railway supply manufacturers to display their devices.

In brief the convention of the American Railway Engineering Association should be held as usual, but the program

should be revised to concentrate on the problems of today. The National Railway Appliances Association should proceed with its exhibit and the individual manufacturers should be encouraged to present those products which will aid the railways in meeting their present problems. The Associations should make a definite statement regarding the holding of the convention, and the exhibit, at once so that there may be no further uncertainty.

HOW THE FARMER TAKES REGULATION OF HIS BUSINESS

A LARGE part of the farmers of the country have long regarded railway stockholders and railway managers as very selfish and unreasonable, and as wanting in a proper public spirit, because they have resisted efforts to regulate railway rates in ways that the railway stockholders and managers have regarded as unfair. Persons purporting to speak for the farmers, especially those of the middle west, such as Senator LaFollette of Wisconsin, Clifford Thorne of Iowa, and so on, have also vigorously criticized the spokesmen of the railways and their witnesses in rate cases, on the ground that these representatives of the railways have "doctored" their statistics to make them show that the expenses of the railways were larger and their profits smaller than they really were.

It is an old saying that human nature is the same the world over, and the fact that human nature on the farms and in railway offices is very much the same is being amusingly and significantly exemplified by the attitude that many farmers and persons who volunteer to speak for them are assuming toward government regulation of the price of wheat, and by charges that are being made regarding the way spokesmen for the agriculturists are making up their statistics as to the cost of wheat-growing and the profits farmers are deriving from it.

The railway owners and managers frankly didn't like it when the government began fixing their rates. Neither do the farmers relish the action of the government in fixing the price of wheat. Furthermore, the farmers, like the railways, are trying to show that they can't live and prosper on what the government will let them have—the main difference between the situations of the two classes being that the railways are now receiving as low average rates as they ever did in their history, while the farmers are receiving prices for wheat that are unprecedentedly high.

The Kansas City wheat conference held a short time ago reckoned that to produce wheat this year cost \$2.71 a bushel. This is a startling figure, in view of the fact that the price fixed by the government is only \$2.20. How was this startling figure arrived at? We are told that "into the cost of wheat was figured interest on seed wheat, interest on the oats fed the horses, interest on investment, taxes, depreciation of farm machinery, and many other entirely proper items." But the Topeka Capital, published by Arthur Capper, governor of Kansas, intimates that the "costs" were padded. For example, the average production of wheat was assumed to be nine bushels to the acre. But the Statistical Abstract of the United States for 1916, page 123, shows that since 1866-75 the average production in this country per acre has never been less than 11.9 bushels; that in 1912 it was 15.9 bushels; in 1913, 15.2 bushels; in 1914, 16.6 bushels; in 1915, 16.9 bushels, and in 1916, 12 bushels. Governor Capper's paper says that "on the basis of a 15-bu. crop, the government has guaranteed a profit of 42 cents a bushel, or 27 per cent net profit over cost." Prof. G. E. Call, of the State Agricultural College of Kansas, is quoted as saying that on the average the American farmer is receiving \$1.21 profit when wheat sells for \$2, and \$1.41 profit when the government price of \$2.20 is obtained.

There are many farmers, and many men in public office, or who want to get into public office, who have been, and still

are, quite willing to assert that railway rates are high enough or even too high, in spite of the enormous advances in taxes, wages and other railway expenses which have occurred while rates have stood still or declined. They also presume to assert that if the railways with present rates aren't making enough money, it's the fault of their own managements; that all they need is to increase the efficiency of their operations—a thing which we are assured it would be very easy to do.

The *Railway Age Gazette* is much more modest than these people. We think we do know something about the railway business, but we would not venture to estimate what it costs to grow a bushel of wheat, or what price the government ought to allow to be charged for it. We do think, however, that the modest reserve we show in expressing opinions about agriculture might well be followed in future by farmers and their spokesmen who don't know a bit more about the railway business than we do about the farming business. Furthermore, we beg to call attention to the fact that in 1913, before the war began, with its consequent advances in wages and expenses of all kinds, the average railway rate per ton per mile in this country was 7.29 mills, while in 1916 it dropped to 7.06 mills, the lowest point ever known. On the other hand, in 1913 the average farm value of wheat in this country was 80 cents a bushel, in 1916 it was \$1.60, while the price fixed by the government is \$2.20. Would it be impertinent to suggest that, if the railways are to be required, with only a small increase in rates in eastern territory, and almost none at all in the rest of the country, to so increase their efficiency as to absorb all their increases in expenses, the farmers might also be asked to so increase their efficiency as to manage to worry along with a more than 100 per cent increase in the price of wheat?

The farmers have been mainly responsible for the unreasonable, unfair and drastic regulation to which the railways of the United States have been subjected during the last 10 years. They are now, in a great national emergency, being given just a little taste of the same medicine which they and the politicians they have chosen to represent them have been compelling the railways to swallow in large quantities for years. The regulation of railway rates, for which the farmers are mainly responsible, was bound to be used as a precedent for extending similar regulation into other fields. The *Railway Age Gazette* repeatedly has pointed this out, but persons in other lines of business, and especially the farmers, couldn't see it. Really, our farmer friends should accept price-fixing more gracefully, for it is merely the logical and natural application to their own business of a system which they have insisted on applying to the railway business. Furthermore, why shouldn't they be compelled to accept a price for their wheat which will barely yield them a "fair return on the fair value of their property," making no allowance in valuing it for the "unearned increment" in their land, or for investment in improvements that has been made from earnings? LaFollette, Thorne and all the rest of that crowd of politicians would confiscate all the investment from earnings and all the so-called "unearned increment" in the property of the railways. Now that we have got to regulating farm prices, we should, of course, proceed consistently and equitably, and do by the farmer as he would have the railway stockholder done by!

In view of the manifest dissatisfaction of the farmers with government regulation of wheat prices, perhaps they will be able in future to understand a little better and to sympathize a little more readily with the attitude of railway managers and stockholders toward government regulation of railway rates. The farmers are discovering that when government regulation reaches *them* it doesn't seem so entirely wise, and just, and beneficent, after all. Perhaps they will not be so keen for regulating other people's property to the point of confiscation when they discover that "curses are like young chickens, and still come home to roost."

Letters to the Editor

FROM A VEGETARIAN POINT OF VIEW

WASHINGTON, D. C.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

I have been impressed with your articles and editorials regarding food on dining cars, because in my travels principally on the Pennsylvania Railroad and the Southern Railway I have noticed what seems to me to be very small servings.

Perhaps my impressions are partially due to being a lacto-vegetarian. Meat eaters are more apt to slight the side dishes, giving particular attention to the main dish. Generally no two persons order the same, because appetites differ, but in the matter of essentials, such as bread and butter, toast, etc., the servings are niggardly. Breakfast foods, such as oatmeal, are served in unfairly small portions considering the cost of the material and the preparation of it. The Lackawanna plan of servings as shown by you recently affords opportunity for greater discrimination as to size of portions desired.

F. T. WHITTELEY.

UNNECESSARY TRANSFER OF LOADS

DENVER, Colo.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

The loads of approximately 25,000 cars are transferred during each month throughout the United States to facilitate the repairing of defective cars. There is no doubt but that about half of these cars could be run safely to their destination with their defects and unloaded. As the matter now stands the receiving line is the judge as to whether or not the lading in the cars is to be unloaded, and inasmuch as the cost of transferring and the payment of the damage claim is made by the delivering line, it is of course natural for the receiving line to transfer the load whenever there is the slightest difficulty in making repairs, delays to the equipment being entirely overlooked.

We may figure that a car is held out of service about five or six days when its load is transferred, a great deal of the time being lost in switching the car to and from the repair track. This means that the railways lose the service of the car for six days. It would be a good plan, owing to the scarcity of equipment at the present time for the railways to agree to haul the cars which are received in bad order and which could be handled safely to their destination, at the rear of the train. There is no question but that the car shortage would be reduced by about 12,000 cars a month if this practice were followed. This number of cars would take care of a great many shipments. Instances have been found where loaded cars have traveled 1,000 miles in bad order, which upon arrival at an interchange point, about 40 or 50 miles from their destination, were held by the receiving line, request being made for authority to transfer the load so the receiving line would not be obliged to make the repairs.

It would appear that while cars are so badly needed on all lines, that the railroads should get together on this proposition and agree to run such equipment as is reasonably safe to handle. It would not only help the receiving line, but also the delivering line. Furthermore, it would save the receiving line the labor of transferring, and labor at the present time is about as scarce as the equipment.

WILLIAM HANSEN,
Chief Joint Inspector.

How the Railways Are Helping Win the War*

The Record of Their Achievements and the Efficiency They Are Showing Under Difficult Conditions

By R. H. Aishton

President, Chicago & North Western; Chairman, Central Department Sub-Committee, Railroads' War Board.

DURING the closing months of 1916 and the first quarter of the present year, the railroads were engaged in a tremendous struggle in their efforts satisfactorily to transport a traffic larger than any that they had ever before handled; a traffic which was not running in the usual channels of trade, but which was complicated by numerous unusual movements, both of munitions and supplies, and of fuel, coupled with one of the worst winters known to the railroad fraternity.

I think that the executives of the railroads had generally recognized that sooner or later the United States would actively enter the war, and that when that time came it would not only increase the very large amount of traffic to be handled, but would also add to the complexity of the railroads' problem in handling it.

They knew that on the railroads must fall the burden of promptly and satisfactorily handling the military traffic of the nation, to enable it to perform effectively its part in the war, and that to satisfactorily handle the military traffic would require the greatest co-operation between the railroads and the military authorities; also that any failure on the part of the railroads to handle the great commercial traffic would be disastrous to the industries and commerce of the country and would interfere seriously with the prosperity of the country and necessarily impair their effectiveness as concerns the carrying on of the war.

PROMPT ORGANIZATION OF THE RAILWAYS

War was declared on Germany on April 6. Five days later, on April 11, at a meeting of the chief executive officers of most of the important railways, in Washington, and at the suggestion of the Council of National Defense, an agreement of historical interest was entered into, and when the history of this war is written, it is hoped that this agreement will be given the place of prominence that it deserves, for in this agreement the railroads of the United States, great and small, 631 in number, acting through their chief executive officers there assembled, and stirred by a high sense of their opportunity to be of the greatest service to their country in the present national crisis, pledged themselves to do certain things. They "pledged themselves with the government of the United States; with the governments of the several states; and with one another; that during the present war they will co-ordinate their operations in a continental railway system, merging during such period all their merely individual and competitive activities in the effort to produce a maximum national transportation efficiency." To this end they agreed "to create an organization which shall have general authority to formulate in detail and from time to time a policy of operation of all or any of the railways, which policy when and as announced by such temporary organization, shall be accepted and earnestly made effective by the several managements of the individual railroad companies here represented."

By another resolution adopted at the same meeting, the railways agreed "to the direction of the executive committee in all matters to which its authority extends, as expressed in the resolution heretofore adopted."

For two years prior to this meeting, a committee had existed known as the Special Committee on National Defense

of the American Railway Association, formed primarily to co-operate with the government in the mobilization of troops on the Mexican border, and also to consider the general problem that would be presented in case we should become involved in the great war; but the activities of this committee were confined to co-operation in military affairs. What more natural, than at this meeting of the executives in Washington they should create an Executive Committee of this Special Committee on National Defense?

This was done, and five railway executives were nominated and elected, and it is this committee which has since become known as the Railroads' War Board.

A REVOLUTIONARY STEP IN RAILWAY HISTORY

This was probably the most important and revolutionary step ever taken in the history of our railways. By placing the operation of all of their facilities under the direction of a single committee of five, it constituted them to all intents and purposes for the period of the war, a single railway system. At the same time it placed the service of this great railway system unreservedly at the disposal of the government.

The railways of this country have one-third of the total railway mileage of the globe. They have a greater mileage than all of the railways in the world that are now owned and operated by governments. They have about 260,000 miles of lines; about two and one-half million freight cars; 56,000 passenger cars; and over 65,000 locomotives. They have 1,750,000 employees.

Therefore, by this act, this great railway system with all its facilities, was made to serve the government in this crisis as completely as if it had owned them; and at the same time the government was spared the expense of buying the roads and the responsibility and labor of managing them.

Perhaps the most significant feature of the matter was that this act on the part of the railways was purely voluntary. No law required it. Another of its very significant features was that the step was taken without any prospect of special consideration or compensation having been held out by the government. In England the railways have been united for operating purposes during the war into a single system, but there this action was required by law, and each railway was guaranteed the same net return that it had earned before the war began.

The individual companies composing our railway system, through the organization formed by themselves, placed their facilities at the service of the government without any understanding or promise that if this resulted in loss to any individual line, this loss would ever be made good.

HOW MILITARY TRANSPORTATION HAS BEEN CONDUCTED

The two great purposes in forming this organization were to enable the railways to meet promptly and satisfactorily all the military transportation needs of the government, and at the same time to so increase their efficiency that in spite of the large amount of military business they would be called upon to handle, they would be able satisfactorily to move the commercial traffic of the country. What success have the railways had in accomplishing these purposes?

In connection with the movement of military traffic, I believe that it might be said, that up to the present time the railways have been able to render a satisfactory service. Six-

*From an address before the St. Louis Railway Club, September 14, 1917.

teen military cities or cantonments have been built by the government to house the 687,000 citizen-soldiers selected for service by the draft. Colonel I. W. Littell was in charge of the construction of these cantonments for the United States government, and on September 5, 1917, Colonel Littell issued a statement regarding this work in which he said:

"In the construction of the cantonments to date, over 50,000 carloads of material have been transported to and delivered at the sites, an enormous tax upon the already overburdened railroads' facilities of the country. The railroads, however, have given splendid service. All government orders have been given precedence and the lumber and other supplies needed have been rushed to the cantonments in record time."

Of the 16 cantonments, seven were ready on September 5 to receive their entire quota of officers and enlisted men; seven others were ready to receive all their officers and two-thirds or more of their quota of enlisted men, while the two remaining ones already had received and were taking care of their full quota of officers. A typical layout such as is used for accommodating the officers and men at a cantonment comprises in round numbers 1,500 separate buildings, requiring approximately thirty million feet of lumber. Each cantonment has a complete system of water supply and sewerage disposal, the piping alone for this amounting to more than fifty miles. Besides moving the material and men for the construction of these cantonments, the railways have been moving vast quantities of other materials for government military purposes and also large bodies of troops.

They are now moving the 350,000 members of the National Guard to the training camps and between September 5 and September 9 they moved 35,000, or approximately 5 per cent of the men selected in the first call for the new National army. They will be called upon to move about 275,000 of these men beginning about September 19; and another 275,000 beginning October third. Another 100,000 will have to be moved beginning October 17. The government has been put to no serious delays or trouble in the handling of these large bodies of troops and with the experience we already have had, there is no reason for believing that it will encounter any in the handling of those who are yet to be moved.

IMPROVEMENT IN COMMERCIAL TRANSPORTATION RESULTS

It should be borne in mind in considering what this indicates as regards railroad efficiency, that the railways of the country are today handling both the largest commercial passenger traffic and the largest commercial freight traffic that they ever did in their history.

Have they, in spite of this, been successful in accomplishing the second purpose for which their present organization was formed; viz., that of so increasing the efficiency with which their existing facilities are utilized as to enable them satisfactorily to handle the commercial business of the country? You will recall that on May 1, less than a month after the railways began to operate under the present arrangement, the excess of requisitions for freight cars over what the railways could supply—the so-called "car shortage"—was 148,627 cars. Since that time, the total freight traffic handled has shown large increases. The railways handled 16 per cent more freight traffic in May, 1917, than they did in May, 1916, and 23 per cent more in June, 1917, than they did in June, 1916. This occurred in spite of the fact that the traffic in the year 1916 far exceeded any ever moved before. In spite of this phenomenal increase in freight traffic, the railways had succeeded on September 1 of the current year, in reducing the unfilled requisitions for freight cars about 80 per cent, or down to 31,591 cars. This remarkable result was partly due to the exercise of the power vested in the Commission on Car Service to order freight cars sent from places where they had accumulated in undue numbers to sections of the country where they could be used to better advantage. Between May 1 and August 30, the Commission on Car Service ordered 113,420 freight cars sent from certain railways to others; chiefly from Eastern lines to lines in the

West, Southwest and Southeast, where they were needed to move the huge quantities of lumber required for the construction of the cantonments, for the handling of crops, and so on.

It is believed that the continued exercise by the Commission on Car Service of its large authority will prevent in future such accumulations of cars at ports and in terminals as caused the great congestion of traffic over a year ago.

The success which has been attained in handling the enormously increased traffic, while actually reducing the unfilled car requisitions, has been mainly due, however, to increased efficiency on the part of the railways all over the country, and to the remarkable co-operation they have received from shippers in loading cars more heavily and in loading and unloading them more promptly. Statistics which have been compiled for railways having a total mileage of 196,000 miles show that in June, 1917, the railways handled 23 per cent more freight traffic than they did in June, 1916, with only 1.8 per cent more freight locomotives in service, and only 3.2 per cent more freight cars. This indicates, without doubt, an increase in the efficiency with which locomotives and cars are being handled, which certainly is highly creditable both to the managements of the railways and to the shipping public, who have co-operated with them so patriotically and loyally.

THE TREMENDOUS INCREASE IN FREIGHT TRAFFIC

Extremely few people have any conception of the magnitude of the problem with which the railway managements have been confronted by the enormous increases in traffic within the last two years. If more people understood this, there would be less criticism because there have been shortages of cars and more appreciation of the remarkable increases in railway efficiency which have been made, and which have had to be made in order to prevent the congestions and car shortages from becoming very much more serious. Let me give an illustration of the most striking kind regarding both the increase in freight traffic and the increase in the efficiency of operation which have had to be made in order to handle this increased traffic.

Our railways have only a very small number more miles of line, track, locomotives and cars than they had in the fiscal year which ended on June 30, 1915, two years ago. In the calendar year 1916, however, before the present organization for operating the railways as a single system was formed, they handled 31 per cent more ton miles of freight traffic, according to the best estimate that can be made, than they did in the fiscal year ending June 30, 1915; and at the present rate of increase it appears probable that in the calendar year 1917, they will handle at least 15 per cent more ton miles of freight than they did in the calendar year 1916. This will make an increase in the freight traffic handled in the calendar year 1917, as compared with the fiscal year ending June 30, 1915, of 141,000,000,000 ton miles, or 52 per cent. Stated thus baldly in statistics, this increase may not appear to you as very significant, but I will state it in terms which will make it more significant.

If, during the rest of the calendar year 1917 the railways of the United States handle a traffic relatively as much larger than that of the fiscal year ended on June 30, 1915, as that which they have thus far handled during the current year, the increase in freight traffic handled by them over that handled by them in the fiscal year 1915 will be greater than the total freight traffic moved annually before the war by the combined railways of Germany, France, Russia, Spain, Sweden, Switzerland, Roumania, Holland, Canada, South Africa, Mexico, Japan, Brazil and New South Wales. In other words, the railways of the fourteen countries I have mentioned handled before the war a total of 141,000,000,000 ton miles of freight a year, while in the year 1917 the increase in the freight traffic of our railways alone over that of the fiscal year 1915, will be about 141,000,000,000 ton miles.

These figures give some idea of how much more vast is the railway system of the United States than that of any other country, as well as of the increase in freight traffic which has occurred within the last two years, and of the increase in the efficiency of the operation of the railways in this country; for as I have observed heretofore, this tremendous increase in traffic is being handled with a relatively small increase in facilities.

Stated in tons instead of ton miles, the increase in traffic in the calendar year 1917 over the fiscal year 1915 probably will be close to 510,000,000 tons. On the basis of the number of tons now being handled per train, it would take 720,000 trains, containing 18,000,000 cars, to hold this increase in tonnage. If all of these cars were made up into a single train it would be 136,363 miles in length.

Is it any wonder, in view of such facts, that there have been, and probably will continue to be, some congestions and delays?

There are some people who use the evidence of recent increases in railway efficiency as a basis for criticizing our railways. They say that such figures show that the railways were inefficiently operated before, and that a corresponding increase in efficiency ought to have been accomplished before we entered the war. Those who are really familiar with railway affairs in this country know how utterly without foundation such criticisms are. In the first place, it is easy to demonstrate that the railways have been steadily increasing the efficiency of their operations. If they had not been, the advancing wages, prices and taxes to which they have been subjected, together with the kind of regulation of rates which they have had to bear, would long since have bankrupted most of them.

In the second place, they never had such an opportunity to increase the efficiency with which they use their facilities as they have had since this country entered the war. They have been allowed since then, to operate, in so far as they have found it expedient, as a single system, while before we entered the war, the railways were prevented from doing this by the Sherman law.

They have also been able, since we entered the war, to secure an amount of effective co-operation from all shippers, large and small, in the country, that they never were able to obtain before; and in this same connection, the helpful and co-operative efforts of a number of the public service commissions in the various states, which early realized the situation confronting the railways and the necessity for increasing their efficiency, and which have used tremendous influence with the shippers and the public to bring about the elimination of delays to equipment; proper loading of equipment; and all of the various things of that kind that tend to increase the railways' efficiency; and by the weight of their influence they have been most helpful to us.

Within the past few days, the Public Utilities Commission of Illinois called a meeting of the railroads to find out in what manner they could be of the most help; and as a result of that meeting during the last 48 hours they have given publicity to some of the most helpful ideas on this subject.

It is certainly the irony of fate that the increase in the railways' efficiency, which they are making for the purpose of serving the country, should be adopted by certain persons as a ground for criticizing them.

RAILWAYS WILL SUCCESSFULLY PERFORM THEIR TASK

When we have briefly reviewed what has already been done by the railways in the war, our minds naturally turn to a consideration of what they probably will be able to do in the future. From present indications, it seems probable that the demands made upon them by both military and commercial traffic will continue to increase for a considerable time.

They probably will be called upon to handle a heavier

traffic during the next fall and winter than they ever have been before. In some respects the difficulty of handling this traffic will increase.

One serious problem with which the roads are confronted is the labor problem. They have raised nine regiments of railway men for the government, which are to be used in connection with military transportation in France. Not a few of their competent officers have gone into the service of the government. A considerable number of their employees have been selected for the new national army; and as more men are selected, the number of railway men who will leave the service of the railways to enter that of the government will probably increase.

As a concrete example, on the railroad with which I am connected (the Chicago & North Western), with a system of about 9,000 miles, already 820 of our men have voluntarily enlisted in some branch of the government military service. Out of a total of approximately 40,000 employees, 15,000 registered for the new selected national army, and while it is true that a great many of them have dependents, or secure exemption for some other reason, at the same time this will illustrate to you one of the phases under which the railways are struggling.

The labor problem was acute before we entered the war, and it is probable that it will grow more serious as the war progresses.

The problem presented by the situation as respects the securing of materials and equipment is also serious. Materials and equipment of all kinds have greatly advanced in price, and it is difficult to get many kinds at any price. The result is that not only is the problem of moving the freight a very difficult one, but also the problem of maintaining roadway and equipment is a very difficult one.

In spite of all of these circumstances, it is my confident belief that the splendid spirit of the officers and employees of the railways of this country, manifested in so many helpful ways; the helpful and co-operative attitude of the public, and of the various commissions, both state and federal; the support of the press; coupled with the effective organization of the railways themselves, will successfully meet any task that may be set before them to perform.

To accomplish this, however, we must be able to continue and to increase the co-operation of the shipping public in connection with the increased loading of cars; expediting their movement, etc.; and to continue to maintain the active interest of the various public authorities and commissions; and to have tendered to us by our employees willingly, the most energetic and efficient work that they are capable of doing. To secure all of these things and to retain them when once secured is your task and mine and the task as well, of every railway officer the whole length and breadth of the United States. The railways at this time need more than ever the forbearance and co-operation of the general public and of the regulating authorities.

For the purpose of saving coal and also making as many employees available for freight service as practicable, the railways already have made reductions in their passenger service at a rate exceeding twenty million passenger train miles annually, and they may have to make still further large reductions later on. The managements are as reluctant to do this as the public is to have them do it, and they hope that the public will recognize it as a war measure, and will bear patiently the inconveniences which may result.

With loyal and energetic service from their employees, with continued effective co-operation from the shipping public; and with a public sentiment which will be intelligently sympathetic with what they are trying to do; I repeat again, that there is no good reason for doubting that the railways will be able to accomplish the great task which they have set before themselves; although it will not be accomplished without great effort and without great sacrifices on the part of

those connected with the railways and those who use railway service.

The emergency confronting the government and the nation is greater than any emergency that can confront any private individual or corporation; and we, representing the transportation interests of this country, must stand together and co-ordinate all of our activities to one end; the *early and successful termination of the war*.

The vast transportation interests of this country are, for this purpose, standing together and laboring uniformly for this common end, and it requires a powerful guiding hand to secure uniformity of action where so many interests are involved; and this hand has been, and will continue to be, wielded by the Railroads' War Board, until the nation so loved by us all has definitely and triumphantly attained the end of the voyage on which we are now embarked, viz., the making of the world safe for Democracy.

RAILWAY RETURNS FOR THE CALENDAR YEAR 1916

The Bureau of Railway Economics has issued a bulletin, No. 114, giving a summary of the principal railway statistics of Class 1 roads for the calendar year 1916. This is the third in a series of publications for the purpose of presenting as soon as possible after the close of the year the significant statistics of the more important railways compiled from their annual reports to the Interstate Commerce Commission. This is the first annual compilation of the bureau under the commission's order changing the fiscal year.

The Class 1 roads, those having gross earnings of over \$1,000,000 for the year, include approximately 89 per cent of the railway mileage of the country and 97 per cent of the operating revenues. Emphasis is laid in the introduction to the bulletin upon the fact that the figures are preliminary and in some cases liable to correction and adjustment. Comparisons with the preceding year are attempted only in the case of the income account because of the change of the fiscal year. No account is taken of intercorporate duplications arising out of the relations between the operating roads of Class 1 and the smaller operating roads and non-operating companies. An effort is made, however, to present an approximate statement of the property investment of Class 1 roads, including the investment of all non-operating subsidiaries whose properties are operated by the roads of Class 1. Using this figure as a basis, the operating income for the year represents a return of 6.38 per cent upon the investment.

An average operated mileage of 230,486 miles of line is represented in the statistics. The income account, with comparisons for the previous year, is as follows:

Item	Year ended December 31		Increase 1916 over 1915
	1916	1915	
Railway operating revenues.....	\$3,592,591,023	\$3,061,621,651	\$530,969,372
Railway operating expenses.....	2,354,548,724	2,053,364,924	301,183,800
Net operating revenues.....	1,238,042,299	1,008,256,727	229,785,572
Railway tax accruals.....	156,875,396	137,398,653	19,476,743
Uncollectible railway revenues.....	795,359	792,163	3,196
Railway operating income.....	1,080,371,544	870,065,917	210,305,623
Miscellaneous operating income.....	3,039,951	1,566,871	1,473,134

d Decrease.

The total capital securities outstanding on December 31, 1916, not excluding duplications resulting from intercorpor-

ate relations, amounted to \$16,140,137,007, and the total property investment (estimated) amounted to \$16,974,809,871. The increase in the investment of Class 1 roads themselves during the year was \$365,468,359, of which \$39,939,000 was for new lines and extensions, \$322,394,000 for additions and betterments on owned lines and \$3,135,000 additions and betterments on leased lines. The equipment in service on June 30 included 60,945 steam locomotives, 322 other locomotives, 2,277,170 freight train cars, 52,145 passenger train cars, and 97,112 company service cars.

The number of general and division officers during the year was 17,366 and their total compensation was \$53,200,749. The total number of employees, excluding general and division officers, was 1,664,852 and their total compensation was \$1,348,773,274, an average of \$868.

In the following table are given some of the principal averages and ratios.

AVERAGES PER MILE OF LINE:

Operating revenues.....	\$15,587.00
Operating expenses.....	\$16,215.57
Net operating revenue.....	\$5,371.43
Taxes.....	\$686.01
Operating income.....	\$4,687.36

Average seating capacity per passenger car—coaches only.....	68

a On the individual railway.

USE OF BRITISH CANALS URGED.—In a letter to various local authorities the Canal Control Committee of England urges the use by manufacturers, merchants, exporters and importers of the inland waterways of the country for the conveyance of all kinds of traffic which can be so carried, in view of the fact that the railways are so severely taxed through depletions of staff for the army, while they have to deal with an increased volume of traffic. The committee states that the necessity of affording them relief by such diversion is urgent. To assist it the committee has appointed three sub-committees—the Northern, Midland and Southern—with offices at Leeds, Birmingham and London, respectively, which will each, with an independent chairman, be composed of representatives of canal companies and of carriers, in addition to official representatives of the War Office, Ministry of Munitions and Railway Executive Committee. These committees will exercise control over the canals in their districts.

A Successful Campaign on Claim Reduction

A Description of Methods Adopted by the Santa Fe to Decrease These Payments and of the Results Secured

By Charles E. Parks

Assistant Editor, The Santa Fe Magazine, Chicago.

Four Stages in the Proper Stowing of L. C. L. Freight

PREVIOUS to 1908, the Atchison, Topeka & Santa Fe, in common with most of the other railroads of the United States, had made no centralized or systematic effort to reduce the payment of claims growing out of loss and damage to freight. All attempts in this direction had been of a personal nature, depending upon the ambition of an officer to make a showing relative to the amount of the claim payments in his territory. When a reduction was brought about, this result could be traced to a number of reasons,

business; inadequate facilities, both terminals and rolling stock; increased hazards due to longer and heavier trains; the rapid deterioration of equipment, and the lack of co-operation on the part of shippers and connections in the work of prevention.

Freight claim payments had shown a steady and persistent growth year after year, the percentage of increase usually being in excess of the normal percentage of increase in freight revenue. In 1908 these payments reached the high total of \$1,565,434, or 2.53 per cent of the gross freight revenue of the company. This figure represented the high water mark of freight claim payments on the Santa Fe. However, it was no better or no worse than what other roads were paying in proportion to the amount of freight revenue earned. It was due to no extraordinary causes, but merely indicated the waste resulting from the hazards of transportation when no organized attempt was made to reduce these hazards to the lowest possible minimum.

Confronted with this large total and the indications of heavier future payments, the Santa Fe undertook to remedy conditions, and in 1909 made its first systematic study of the loss and damage problem. In September of that year a loss and damage committee was organized composed of representatives of every department of the road, whose duties were first, to locate the cause of the loss and damage, and second, to devise means of prevention.

Since its organization this committee has waged relentless warfare on loss and damage to freight, and its activities have gradually been extended to cover losses and damages of all kinds—personal injuries, loss and damage to baggage, damage to property and damage to stock on the right-of-way. As the prevention of loss and damage is the most important negative element in transportation efficiency and involves the discussion of practically every phase of railroad operation, the semi-annual meetings of the system loss and damage committee have come to be regarded as a sort of general system information meetings, where any question pertaining to the general efficiency of the road might be discussed, either formally or informally, among officials and employees.

How fruitful of results the work of this loss and damage committee has been may be judged from the following figures, showing the gross freight earnings, the payments for loss and

Freight Earnings, Loss and Damage Payments and Relations of Payments to Earnings

but the principal one was not always the attempts made to eliminate the real causes for loss and damage. These causes were numerous, but chief among them was the failure of officers and employees to take cognizance of the seriousness of the situation with the resultant lack of harmony and efficiency. Other contributing causes were the increase in

damage to freight and the percentage of freight claim payments to freight earnings for the past nine years:

Year	Gross Freight Earnings	Payments for Loss and Damage to Freight	Percentage of Freight Earnings
1908	\$61,848,638	\$1,565,434	2.53
1909	64,212,638	1,234,564	1.92
1910	71,194,055	1,141,014	1.60
1911	71,787,200	1,091,435	1.52
1912	71,529,574	939,676	1.31
1913	78,190,922	942,838	1.21
1914	73,638,388	772,300	1.05
1915	80,504,000	771,764	.96
1916	91,432,429	649,180	.71

Notwithstanding the great increase in gross freight earnings, the percentage of freight claim payments to freight revenue has shown a steady decline, while the total amount of claim payments has been reduced nearly two-thirds. For every dollar of freight revenue earned in 1908, the Santa Fe returned 2.58 cents to the shippers in payments for claims for loss and damage; last year the company returned but 0.71 cents, which is a remarkable showing in view of the great increase in freight business. The curves show graphically what this means.

The following table gives a comparison of the Santa Fe loss and damage payments and the ratio of claim payments to gross freight revenue with the claim payments of the other important roads operating in the same or similar territory for the year ending June 30, 1916:

	Freight Revenue	Freight Loss and Damage	Percentage of Freight Earnings
Santa Fe	\$91,432,429	\$649,180	.71
Foreign Line No. 1	32,287,854	302,223	.94
Foreign Line No. 2	48,370,000	525,134	1.15
Foreign Line No. 3	72,000,000	895,000	1.24
Foreign Line No. 4	60,353,399	864,988	1.40
Foreign Line No. 5	50,921,932	879,294	1.73
Foreign Line No. 6	21,697,723	377,406	1.60

The following table shows the decrease in claim payments for 1916, as compared with 1915, classified in respect to the commodities shipped:

Commodity	1916	1915	Decrease
Agricultural implements	\$5,026	\$5,446	\$420
Boots and shoes	11,452	11,019	*433
Batter	984	946	*38
Candy	2,135	2,157	.22
Castings	1,269	2,047	778
Canned goods	6,494	6,542	.48
Clothing	14,887	19,527	5,240
Coal	5,816	5,672	*144
Cotton	2,715	4,268	1,553
Cotton seed and products	1,733	2,492	759
Crackers	721	886	165
Crockery	4,154	3,682	*472
Dairy products	1,077	1,504	427
Eggs	9,532	10,069	537
Dry goods, notions, etc.	11,974	14,535	2,556
Cigars	1,196	1,885	689
Flour	10,970	14,075	3,105
Wheat	32,319	59,611	27,292
Corn	4,915	10,236	5,321
Other grain	8,959	8,175	*784
Mill products	5,093	6,844	1,751
Dried fruit	7,395	5,529	*1,866
Furniture	30,481	33,528	3,047
Glass and glassware	11,599	11,909	310
Plate glass	3,781	2,181	*1,600
Hardware	8,618	7,213	*1,405
Stoves	8,034	8,852	818
Household goods, etc.	25,180	26,538	1,358
Fruit jars	916	405	*511
Lumber	4,700	5,957	1,257
Machinery	13,847	13,662	*185
Oils	16,794	19,040	2,246
Paper	3,151	3,919	768
Sewer pipe	4,006	3,297	*709
Potatoes	15,161	11,931	*3,230
Citrus fruit	16,927	60,067	3,140
Deciduous fruit	27,464	24,321	*3,143
Packing house products	6,337	13,001	6,664
Fresh meat	2,414	3,263	849
Vegetables	11,166	11,896	730
Other perishable freight	15,630	18,460	2,830
Sugar	14,594	9,499	*5,095
Tobacco	3,276	4,205	476
Vehicles	15,340	13,156	*2,184
Other dead freight unclassified	92,162	124,586	32,424
Wines and liquors	10,430	17,957	7,527
Live stock	103,361	118,411	14,550
Total	\$656,543	\$764,401	\$107,858
Balance in fund established March, 1915, for settlement of wheat claims		7,363	
Credit for above amount used in 1916	7,363 Cr.		
Grand total	\$649,180	\$771,764	\$122,584

* Increase.

That this showing is due to the work of the loss and damage committee cannot be denied in view of the persistent and uniform rate of decline. As shown in the curve, there has been no fluctuation. As the ratio of loss and damage payments to freight earnings is well below the one per cent mark, it is realized that the reduction must cease and may even show a slight increase owing to conditions over which the company has very little control, particularly in respect to interline shipments, but it is the ambition of the committee to keep the ratio below the one per cent line.

When the committee first began its investigations it was not difficult to determine the various causes of loss and

Leaky Lard Bucket Caused by Carelessness of a Trucker

damage to freight, but it was not so easy to arrive at conclusions as to remedies and the most effective methods of their application. Some of the evils were of long standing and were not chargeable directly to the carriers. It was soon realized, however, that in order to reduce the waste it was necessary to secure the co-operation of the employees in order to improve (1), the checking and forwarding of freight at forwarding points and transfer stations; (2), the handling of freight in transit in trains; (3), the checking and delivering of freight at destination; (4), the preparation of cars for the transportation of certain commodities such as bulk grain, flour, sugar and perishable freight. It was also apparent that

An Outbound House with Systematic Arrangement of Freight

the co-operation of the shippers must be secured in furnishing a better grade of package and improved methods of marking and packing shipments, which would insure the articles arriving at destinations in good condition if handled properly by the carriers. As the work of the committee advanced, it also was found necessary to obtain the co-operation of the other roads in the proper handling of interline traffic. This is the plan of action which has been followed persistently from the beginning with the results above indicated.

Through its system of reporting loss and damage to freight the cause of such loss or damage is located with comparative ease immediately when it is discovered. At the end of each year a tabulated form of these causes is rendered with the amount of money expended for claims arising from the various causes distributed to each. With this table it is no difficult matter to trace and remedy as far as possible the conditions which cause the loss or damage.

The following table shows the causes of the loss and damage on the Santa Fe for 1916, with the amount expended for each cause and the increase or decrease over the preceding year:

Causes	DAMAGE		Decrease
	1916	1915	
Wrecks	\$29,235	\$30,555	\$1,320
Delays	44,337	51,289	6,952
Defective equipment—leaky roof, etc.	25,470	32,521	7,051
Freezing	33,826	30,706	*3,120
Transferring carload freight	1,258	3,320	2,062
Unit and nuclear cars	10,203	7,360	*2,843
Fires in excess of insurance collected	4,229	7,688	3,459
Improper refrigeration and ventilation	10,642	13,304	2,662
Concealed damage	36,072	35,768	*304
Other causes except carelessness	392,257	329,989	37,732
Total damage	\$487,529	\$542,500	\$54,971

Lading Well Broken Down Preparatory to Sealing Car

Loss			
Loss of entire package	\$51,112	\$62,379	\$11,267
Loss from package	13,366	14,826	1,460
Loss from bulk shipment	41,804	71,786	29,982
Concealed loss	13,415	15,743	2,328
Theft	10,998	15,200	4,202

Carelessness of employees	37,004	41,333	4,309
Total loss	\$169,014	\$221,901	\$52,887
Total loss and damage	\$656,543	\$764,401	\$107,858
Balance in fund established March, 1915, for settlement of wheat claims		7,363
Credit for above amount used in 1916	7,363	
Grand total	\$649,180	\$771,764	\$122,584

* Indicates increase.

To secure the co-operation of employees and accomplish the first four requisites in the campaign, it was necessary to make them realize the gravity of the situation and then remedy it. The efficiency of the work of handling freight must be increased. The necessary interest in the work was secured by a wide campaign of publicity among the employees. Posters, cartoons, bulletins and illustrated pamphlets showing all the phases of the loss and damage situation—the results of improper loading, packing, marking and stowing; the evils of carelessness, negligence and indifference, pointing out the remedy and appealing to the employees' sense of duty—were used.

The offices of transportation and switching inspector were created, whose duties are to supervise the loading and stowing of freight, the handling of cars, switching movements,

etc., and to educate employees along these lines. Much also was accomplished through local conferences. Every general superintendent has a local loss and damage committee for his territory which meets every six months between the regular semi-annual meetings of the system committee for the consideration of loss and damage matters. In addition to this, attention was given the subject at the monthly division and information meetings, which are held at each division point and are attended by all division officers and by many employees whose duties will permit.

By these means the seriousness of the loss and damage situation was brought home to every employee and each individual was made to realize his own responsibility and the value of working harmoniously with his associates. Once his interest was aroused the task of applying the remedies recommended by the committee was made easy.

The co-operation of shippers has been secured in different ways—by correspondence, by personal solicitation and by agitating the subject in shippers' organizations. This co-operation consists in the main in the proper marking and packing of freight, and in the case of carloads, the proper loading, storing and bracing. Before approaching the shippers a study was made of ways and means of interesting them in the matter. It was realized that the best results could not be obtained altogether through criticism of shippers' methods of packing, loading and storing freight, but that the company must show a disposition to meet them half way. It was also realized that the economy in the material used by them in packing their products must be considered. So, when a shipper was approached with a complaint, it was done in a friendly way, but with convincing evidence of the incompetency in hand, showing wherein both he and his customer were suffering loss because of loose methods of shipping freight. This method usually brought about a speedy remedy.

The company also approached some shippers from a different angle. Letters of commendation were written to those deserving of such recognition for their effort to load freight properly and use competent containers. The results of this method of approach have been most gratifying, so much so, that the operating department has incorporated this mode of procedure as a part of the every-day work in cause and prevention. However, special precaution is always taken to avoid the possible error of commending an unsafe package, in the same manner care is taken to avoid criticism for frail or improper package unless it is warranted. The committee also has taken up with manufacturers of containers the questions of their merits and defects. By evincing a spirit of fairness and helpfulness towards them, these manufacturers have indicated a willingness to consider any criticism that might be offered from time to time.

Reduction of loss and damage on interline traffic can be secured only through the co-operation of other roads. The Santa Fe undertook to secure this co-operation, first, by learning of the methods adopted by foreign lines with a view of appropriating such as were beneficial; second, by investigating their attitude towards the loss and damage movement and the extent to which their work had progressed, and third, by influencing those that neglected loss and damage prevention to do their part. With these ends in view the loss and damage committee made a thorough canvass of 119 of the leading railroads. The following summary shows the extent of the work of loss and damage prevention on the roads canvassed:

Roads active in claim prevention	72
Roads semi-active	31
Roads non-active	16
Total	119

While the Santa Fe was the pioneer in this work, this canvass developed many important means of lessening claims for loss and damage which theretofore had not been used by the

company. The Santa Fe promptly put into operation such practices as were found advisable.

As long as a large percentage of claims are prorated with foreign lines, maximum results in claim prevention cannot be attained unless the other roads are equally interested and take the same or similar precautions to prevent loss and damage. The further the Santa Fe has gone into the work, the truer this statement has been found to be and the more it feels the need for real and active co-operation on the part of every carrier. A large percentage of the Santa Fe claim payments are now on interline shipments and it is realized that if the ratio of claim payments to freight earnings is to be further reduced or even maintained at the present figure, much of the work of prevention must be done by foreign lines.

Individual cases too often carry the idea that there is no complete harmony of ideas on the work of claim prevention and unfortunately some lines have not been convinced that the Santa Fe loss and damage movement has not been undertaken at the expense of connections. Texas lines in recent years have been burdened with excessive claim payments and the lack of harmony among themselves often retarded the efforts of any one line towards a betterment. However, it is the aim of the Santa Fe loss and damage committee to complete its canvass of every railroad in the United States of any consequence with a view to influencing greater activity on the part of railroads that are semi-active or inactive in this work to "do their part."

At present gratifying progress is being made. If a similar canvass had been made three or four years ago a much larger percentage of the roads would have been included in the non-active column and each year witnesses the roll of delinquents gradually lessening. To these roads the Santa Fe appeals directly or through the various railroad organizations, confronting them with the duty they owe their connections as well as themselves. Formation of claim conferences, particularly in Texas and on the Pacific Coast, also has brought about some satisfactory results. So far as the loss and damage of freight is concerned, it is the opinion of the majority

important sub-committees for the past year is given below:

Loading, Stowing and Bracing Freight—A book of rules governing the loading, stowing and bracing of freight has been prepared by the sub-committee for the guidance of men who have in charge the direct handling of freight. This rule book is made up of drawings, illustrations and text relative to the subject and will soon be promulgated. The rules and regulations are in line with the recommended practices of the American Railway Association.

To determine the most practical methods of loading, stowing and bracing the various commodities classified as L. C. L. freight, special investigations and tests were made. All incoming cars received at representative large distributing

Using Condemned Grain Doors to Protect Freight

points were inspected during a period of 30 days. Present practices of stowing and bracing different commodities were studied and proved effective, or improved upon by a series of progressive impact tests under actual switching conditions. The commodities selected for the test were those most liable to damage themselves or to inflict damage to adjacent lading if shifted or overturned. They included barbed wire, jacketed cans, pianos, radiators, range boilers, rolls of wire and cable, safes, sewing machines, sheet iron roofing and tombstones.

The tests were conducted by switching the cars at varying speeds and under conditions subjecting the loaded commodities to the most severe conditions possible, the impacts at the higher speeds representing practically wreck conditions. After each impact the braced commodity under test was examined and changes made to overcome the weak points in the bracing. Photographic records were made of the various methods of bracing employed both before and after impact. The speed of the cars at the time of impact was determined by a stop-watch, recording the time necessary for the cars to travel a measured distance.

Loading, Stowing and Bracing Furniture—Furniture is one of the most troublesome commodities dealt with by the claim department, claim payments showing a tendency to increase each year. For the six months period ending December 31, 1916, the increase in payments for loss and damage to furniture in carload lots over the preceding six months was 0.3 per cent, while the L. C. L. shipments increased 30 per cent. A very careful analysis of the largest distributing and shipping points on the system was made in an attempt to arrive at causes and remedies, and it was found that a great many shipments were arriving at destination properly stowed but were found to be in a damaged condition either before or after delivery, indicating the possibility of damage at the time received or loaded. To prevent this inspectors were placed at the principal shipping points whose duties

Furniture Damaged by a Defective Platform

that the time has come to join forces in a nation-wide movement to prevent it.

The details of the work of the general system loss and damage committee of the Santa Fe is done by various standing and special committees charged with special duties. The system committee meets twice a year with an attendance of from 150 to 200 delegates for the purpose of reviewing the work of the sub-committees, advising them and promoting a general interest in the subject. As indicative of the manner in which the work is done and the results accomplished, a brief summary of the activities of a few of the most

were to inspect as many shipments as possible before accepting. At one station 1,200 shipments were inspected during a two-months' period with the following results:

Loaded O. K., and checking same at destination.....	921
Loaded damaged, checking same at destination.....	97
Loaded O. K., checked damaged.....	16
Loaded damaged with additional damage at destination.....	11
Loaded O. K., transferred in transit O. K., but checked damaged at destination.....	7
Shipments tendered but which inspector found to be damaged and refused to accept without damage notation which shipper would not accept and shipments were returned for repairs.....	64
Total.....	1,116

It was found that some of the shipments that had been refused had been repacked in a different manner and ten-

Floor of a Local Freight House Showing Indiscriminate Piling of Freight

dered again the following day or later. One damaged shipment was tendered by a very large firm on three different occasions.

Besides the employment of inspectors other remedies have been put in force, including a very thorough investigation of every furniture O. S. & D. claim. The results of these investigations are made known to the sub-committee, particularly if anything new is developed. Employees also have been urged to eliminate rough handling of cars containing furniture; to prevent unnecessary handling in break-bulk cars by loading the L. C. L. shipments in station order whenever practicable and to make a more rigid inspection at receiving stations as to the proper loading, stowing and general handling.

Making and Breaking Trains at Terminals.—Much of the work of the sub-committee covering this subject is carried on by correspondence with a view of eliminating the switching of all through cars at division terminals. To effect this, stress is laid on the proper makeup of trains—placing cars for various destination in certain locations in the train. Transportation inspectors see that no unnecessary or rough switching is being done.

Loss of Entire Package.—This is the largest single item of loss which the company has to contend with, being 7.9 per cent of the total payments made during 1916. While a considerable reduction has been made in the total amount of payments covering this item during the past five years, its percentage to the total claims paid has remained practically stationary, as the following figures will indicate:

Year	Payments	Per Cent of Total
1912.....	\$72,792	7.7
1913.....	87,678	9.3
1914.....	69,054	8.9
1915.....	62,379	8.1
1916.....	51,112	7.9

It is the prevailing opinion that the loss of entire packages is not due to theft by employees but to laxity on the part of check clerks in receipting, the company failing to receive the shipment receipted for. Surprise tests have been conducted from time to time in an attempt to locate the responsibility for the loss, but only a negligible number of the

packages failed to reach their destination, which indicated that check clerks were giving receipts for packages that were not delivered. Lack of proper supervision after the freight is delivered also is a contributing factor. On account of the large amount involved due to the loss of entire packages the loss and damage committee has investigated this subject very closely and has made numerous recommendations of the most minute details of handling L. C. L. shipments. Constant vigilance on the part of employees is especially urged.

Eggs.—Seventy-five per cent of the damage to eggs occurs in carload lots and such breakage as occurs in transit is due to improper bracing and the consequent shifting of the packages. The committee has recommended the closest practicable supervision to insure the use of standard packages, fillers and packing and the proper loading, stowing and bracing of carload as well as L. C. L. shipments. Several approved plans of loading are in use at nearly all shipping points, and these have the hearty approval of shippers.

Cooperage.—The general practice of stripping side doors of cars loaded with flour and similar commodities has been discontinued on the Santa Fe and such precautions are taken only in case the doors are not rain tight. During the year ending June 30, 1916, claim payments on flour and other mill products averaged only 29 cents per car. Claim payments on grain were considerably higher, being 70 cents per car. As the carriers main reliance must be on the adequacy of its inspection of the equipment both as to the quality of the car and the cooperage material, a rigid inspection of cars used to haul grain is being maintained by the company. This not only includes ordinary inspection before loading, but various special inspections at certain specified points. Acknowledgment from the consignee of the condition of the

Bracing Pianos in Place with Cleats and Wire

car is required at the time of delivery. Efficiency tests for discrepancies, particularly in weights, are often conducted and such tests have proved of considerable benefit.

Live Stock.—Loss and damage to live stock is the largest commodity item of loss and damage incurred by the Santa Fe, being approximately 16 per cent of the total payments. In 1916 the percentage of claim payments to live stock revenue was 2.2 per cent. Although this ratio is much larger than the average ratio of claim payments to freight revenue, it compares very favorably with the records of other live stock

carriers, being bettered by only one other road. The following table shows the amounts expended by the company for loss and damage to live stock during the past seven years:

Year	Live Stock Payments	Year	Live Stock Payments
1910.....	\$277,964.06	1914.....	\$137,503.34
1911.....	348,852.73	1915.....	118,411.14
1912.....	190,006.14	1916.....	103,860.66
1913.....	169,662.44	1917.....	110,535.00

This is an unusual showing, especially when it is considered that the average claim payment per car in 1917 was \$0.46, while in 1910 it was \$2.93, and that the company handled nearly twice as many cars of live stock in 1917 as in 1910.

The heaviest items of loss and damage are chargeable to delay and unlocated damage, 50 per cent of the claim payments being chargeable to the latter. This is the result principally of inherent weaknesses causing the stock to die in transit. The Santa Fe handles more of the weak, emaciated cattle of the South and Southwest than any other road. Claim payments on this account can only be avoided by the maintenance of proper records at the time of shipment as to the physical condition and treatment to which the stock was subjected prior to loading. A very close inspection of equipment before loading also is necessary. In reducing claims on live stock the co-operation of employees is the most essential factor and the great reduction the company has made can be attributed largely to the fact that this co-operation has been secured. The Santa Fe incurs law suits only when such course is necessary to avoid payment of improper claims.

In addition to the above matters other subjects were investigated by the sub-committees of the loss and damage committee during the past year. Chief among them were the following:

O. S. & D. reports.

Modernized plans of freight house construction.

Collection and distribution of data relative to loss and damage.

Mechanical matters which have any relation to the proper handling of freight—defective equipment, inspection, repairs, the different types of cars, their use and abuse, their advantages and disadvantages.

Handling of special commodities—explosives, newsprint paper, automobiles, cotton, etc. Transportation inspectors are required to specialize on certain commodities and submit their findings to the committee.

Freight Claim Association rules and regulations.

Pomeron bill of lading law.

Numbering agricultural implements.

Diversion failures.

Necessity of through billing on interline shipments.

Killing live stock on the right of way.

Increased car loading.

Baggage.

Personal injuries and safety matters.

The broad scope of the system loss and damage committee is evident, but the work of investigation and applying remedies is done by sub-committees. It is carried on energetically to a conclusion and the system committee merely advises and passes on the work accomplished. The efficiency of this mode of procedure is responsible largely for the excellent results in reducing loss and damage claims on the Santa Fe.

LOCOMOTIVE INSPECTION RULES MODIFIED DURING WAR

The Interstate Commerce Commission on September 20 issued an order at the request of the carriers, making modifications, for the period of the war, in certain of the rules and instructions for the inspection and testing of steam locomotives and tenders. The order is as follows:

"Whereas, at a conference held in the office of the chief inspector of locomotives on September 5 and 6, 1917, to consider modifications of the rules and instructions for the inspection and testing of locomotives and tenders and their appurtenances, which were prepared jointly by the mechanical advisory sub-committee of the American Railway Association's Special Committee on Relation of Railway Operation to Legislation and the sub-committee on military equipment

standards, Special Committee on National Defense, American Railway Association, and proposed by the committee representing the carriers, on account of the present international crisis, certain modifications were agreed upon by the representatives of the carriers, the representatives of the employees and the chief inspector; therefore,

"It is ordered, That effective at once and to continue in force during the period of the war, except where otherwise specifically stated, rules 2, 10, 16, 23, 110, 112 (b), 128 (d), 142 (c) and 150 (a) shall be modified as follows, except where conditions are such that the safety of operation is adversely affected thereby:

Rule 2.—The lowest factor of safety for locomotive boilers which were in service or under construction prior to January 1, 1912, shall be 3.25.

"Effective six months after the close of the war the lowest factor of safety shall be 3.5.

"The dates on which factors of safety from 3.5 to 4, as provided in rule 2, become effective, shall be advanced for a period equivalent to the duration of the war.

Rule 10: Flues to be removed.—All flues of boilers in service, except as otherwise provided, shall be removed at least once every four years, and a thorough examination shall be made of the entire interior of the boiler. After flues are taken out the inside of the boiler must have the scale removed and be thoroughly cleaned. This period for the removal of flues may be extended upon application if an investigation shows that conditions warrant it.

Rule 16.—The date for removal of lagging for the purpose of inspecting the exterior of locomotive boilers as provided by rule 16, except where indication of leaks exist, shall be advanced for a period equivalent to the duration of the war.

Rule 23.—Method of testing flexible staybolts with caps.—All flexible staybolts having caps over the outer ends shall have the caps removed at least once every two years and also whenever the United States inspector or the railroad company's inspector considers the removal desirable in order to thoroughly inspect the staybolts.

"The firebox sheets should be examined carefully at least once a month to detect any bulging or indications of broken staybolts. Each time a hydrostatic test is applied the hammer test required by rules 21 and 22 shall be made while the boiler is under hydrostatic pressure not less than the allowed working pressure, and proper notation of such test made on form No. 3.

Rule 110.—Time of cleaning.—Distributing or control valves, reducing valves, triple valves, straight-air double-check valves, and dirt collectors shall be cleaned as often as conditions require to maintain them in a safe and suitable condition for service, but not less frequently than once each six months.

Add to Rule 112.—On E. T. or similar equipment where the brake cylinder pressure is maintained regardless of piston travel the maximum piston travel for driving wheel brakes shall be 8 in.

Rule 128 (d).—Locomotives in road service.—The total amount of side motion of rods on crank pins shall not exceed $\frac{1}{4}$ in.

Locomotives in yard service.—The total amount of side motion of rods on crank pins shall not exceed $\frac{5}{16}$ in.

Rule 142 (c).—Top leaf broken or leaves in top half or any three leaves in spring broken. (The long side of spring to be considered the top).

Rule 150 (a).—The minimum height of flange for driving and trailing wheel tires, measured from tread, shall be 1 in. for locomotives used in road service, except that on locomotives where construction will not permit the full height of flange on all drivers the minimum height of flange on one pair of driving wheels may be $\frac{5}{8}$ in."

Factors in Locomotive Smoke Abatement*

How Smoke is Formed and How Brick Arches Reduce It; Ample Combustion Space and Flameway Needed

By J. T. Anthony

THE Master Mechanics' Association Proceedings for 1913 contain the report of the Smoke Committee appointed by the General Managers' Association of Chicago, which states that "while running, the brick arch is capable of making a 50 per cent reduction in smoke, irrespective of steam jets."

The tests upon which this statement was based were run with Penn gas coal of the following composition:

Fixed carbon	57.74 per cent
Volatile matter	34.07 per cent
Moisture	1.05 per cent
Ash	7.14 per cent
B.t.u. per pound of dry coal.....	14,539

The smoke reduction of 50 per cent was accompanied by an increase in evaporation of 8.6 per cent, due to the arch.

The Chicago Smoke Commission, of which Dean Goss was chief engineer, made extensive tests with and without the arch. They found that the brick arch decreases the average density of visible smoke emissions 33 per cent; decreases the total average quantity of cinders and fuel dust emitted in smoke 25 per cent; decreases the amount of carbon contained in cinders and fuel dust per ton of coal consumed 24 per cent; decreases the amount of ash contained in cinders and fuel dust per ton of coal consumed 28 per cent; decreases the volume of air intermingled with gases of combustion discharged through the stack 15 per cent; increases the volume of CO₂ discharged through the stack 6 per cent; decreases the volume of CO discharged through the stack 10 per cent, and increases the evaporation per pound of coal 7 per cent. These tests were run with coal from Macoupin County, Illinois, of the following composition:

Fixed carbon	37.47 per cent
Volatile matter	38.41 per cent
Moisture	9.89 per cent
Ash	12.23 per cent
B.t.u. per pound of dry coal.....	12,584

Both of the above tests were run with an 0-6-0 type switching locomotive, with a narrow firebox 40 in. wide by 106 in. long, with 29 sq. ft. of grate area. The air inlet through the ashpan was 5.7 sq. ft., or 20 per cent of the grate area. The arch was 66 in. long and was supported on two arch tubes.

The final conclusions of the above test report also stat that "the presence of the brick arch in the locomotive firebox increases efficiency and decreases fuel consumption, decreases the loss of heat units in smoke and ash discharged and reduces the visible smoke.

"The use of incorrect methods of firing, as indicated by the results of tests in which inexperienced firemen were employed, reduces efficiency, increases fuel consumption and fuel losses and increases smoke discharges."

Tests recently conducted on a Mikado type locomotive show smoke reductions varying from 50 per cent at low and medium rates of firing to 31 per cent at high rates, as shown by the curves in Fig. 1. The locomotive was hand-fired using high volatile Penn gas coal screened over a 1¼-in mesh screen, the coal having the following composition:

Fixed carbon	54.00 per cent
Volatile matter	31.00 per cent
Moisture	9.3 per cent
Ash	14.08 per cent
B.t.u. per pound of dry coal.....	13,088

This locomotive had 70 sq. ft. of grate area, a barrel combustion chamber 42 in. long, a 76-in. arch supported on

four 3-in. arch tubes, an air opening through the ashpan of 7.80 sq. ft.—11 per cent of the grate area—and air openings in the grate of 20.21 sq. ft.—28.8 per cent of the grate area,

In these tests the increase in evaporation, due to the arch, varied from 8½ per cent to 15½ per cent. These three tests are probably the most thorough and reliable that have ever been conducted for the specific purpose of determining the effect of a brick arch on locomotive smoke abatement, and the test results are corroborated by the practical experience of railroad men throughout the country. The principal measures taken by railroads today to meet smoke ordinances consist of issuing firing instructions and equipping locomotives with brick arches.

While it is generally recognized that the brick arch will reduce the smoke emission from a locomotive, the reason therefor may not be clear. The formation of smoke is due primarily to the decomposition of the volatile hydrocarbons contained in all bituminous, semi-bituminous and lignite coals, though the presence of coal dust that is fed into the firebox and whirled out through the tubes unburned, adds to the smoke emissions.

As the name indicates, the volatile hydrocarbons are com-

Fig. 1—The Effect of the Brick Arch on Smoke Reduction

pounds of carbon and hydrogen, and are of a very complex character. The heavier compounds are driven off in the form of tar in a semi-liquid or solid state, while the lighter hydrocarbons are driven off in a gaseous state. The distillation begins at a temperature around 400 deg. F., and is completed at a temperature of 1,600 deg. F. The decomposition of the volatile matter by the action of heat takes place very readily at temperatures above 1,400 deg. F.

The exact composition of the hydrocarbons when first distilled from the coal at the different temperatures is not known, as they break down so readily under the influence

*From a paper read before the annual convention of the Smoke Prevention Association.

of heat and are so unstable that it is impossible to collect samples for analysis. The indications are, however, that the heavy hydrocarbons when first driven off contain by weight about 85 per cent carbon, 10 per cent hydrogen and 5 per cent oxygen. Under the influence of heat, these hydrocarbons break down into carbon, hydrogen, oxygen, lighter hydrocarbons of the methane (CH_4) series, and lighter unsaturated hydrocarbons.

The hydrogen is highly inflammable and burns readily if there is an oxygen supply above the fuel bed. The lighter hydrocarbons also burn readily if the oxygen supply is sufficient. If it is insufficient the hydrocarbon is broken down by the heat into carbon and hydrogen, the hydrogen either combining with the oxygen that may be present to form water or escaping into the tubes unburned.

Carbon does not exist in a gaseous state at temperatures with which we are familiar in furnace practice. When the various hydrocarbons are decomposed, the carbon is precipitated as a solid particle in the form of soot and these incandescent particles, floating in the flame, give it the luminous color. We are apt to think of this carbon as being set free and deposited in the form of atoms, but such is not the case. We have no knowledge of the atom existing as a unit, separate and distinct. The small particles of soot with which we have to deal are probably made up of a large number of carbon molecules. The very smallest soot particle that exists is this molecule, which consists of a number of carbon atoms (probably 12), held together by a sort of bond or attractive force of an electrical nature.

As a result the soot particles, which are the primary source of all smoke, have a very tenacious structure and are extremely difficult to break down when once formed. In order to burn them completely, it is necessary to supply a number of oxygen molecules sufficient to combine with each carbon atom, to bring them into contact with the carbon atoms at a temperature high enough to sustain combustion and to provide time sufficient for the combustion to be completed.

These conditions are similar to those met with in burning the "fixed carbon" on the grate, but are more difficult to fulfil. A piece of coke, or carbon, burning on the grate is held more or less in place until it is consumed. Combustion is accelerated by the high temperature prevailing in the fuel bed and by the violent scrubbing action of the oxygen in the air rushing through the fuel bed.

The particle of soot resulting from the breaking down of the hydrocarbons is well on its way to the tubes at the instant of its formation. It is not brought into violent mechanical contact with a supply of oxygen, but floats along in an atmosphere that has been robbed of much of its oxygen in passing through the fuel bed. The temperatures prevailing in the upper part of the firebox are generally sufficiently high to insure ignition and combustion, but under ordinary conditions the time available for combustion varies from $\frac{1}{5}$ to $\frac{1}{10}$ of a second, and this is insufficient.

With the conditions that prevail in the locomotive firebox, it is easier to prevent the formation of soot than to burn it when once formed. The precipitation of soot can be prevented only by having an excess of heated air (or oxygen) above the fuel bed, and bringing this heated oxygen in intimate contact with the volatile hydrocarbons at the instant they are distilled off. Research work done by the United States Bureau of Mines indicates that the hydrocarbons are decomposed when they have travelled but a few inches from the top of the fuel bed, and if the precipitation of carbon is to be prevented the air must be introduced at the top of the fuel bed and intimately mixed with the issuing hydrocarbons.

The chief function of the brick arch in abating smoke is that of a gas mixer. By baffling and compelling all of the gases to pass through a relatively restricted area above the arch an intimate mixture of the volatile combustible with the

oxygen is insured. While the mixing of the gases at the end of the arch does not take place soon enough to eliminate smoke entirely, it has the effect of reducing the smoke emissions, as shown by the tests quoted.

In a firebox without an arch carrying a characteristic fire,—that is, with a bank of green coal under the fire door, the fire gradually becoming thinner toward the front end of the grate, where the draft has possibly pulled a hole in it,—the bank of green coal under the door is expelling large volumes of rich hydrocarbons. These, passing up along the top zone of the firebox, are decomposed by the heat, causing the formation of soot which either escapes at the front end as smoke or is deposited on the heating surfaces to retard the flow of heat.

Fig. 2—Type of Combustion Chamber in Successful Use in Oil Burning Service

At the same time a large excess of air is rushing through the thin portion of the fire on the front of the grate, and is passing directly into the lower tubes without in any way aiding the combustion of the hydrocarbons liberated in the back of the box and very often causing flue leaks or failures. Such conditions are not at all uncommon in locomotive fireboxes unequipped with the arch. Front end gas analyses often show a large excess of oxygen, due to the blast of air through the lower tubes, in combination with high carbon monoxide, hydrogen and hydrocarbon contents due to incomplete combustion of the volatile hydrocarbons arising from the bank under the door.

With the arch under similar conditions any excess air coming through the thin portion of the fire on the front of the grates is heated up, deflected and forced back over the end of the arch, where it is mixed with the gaseous combustibles arising from the green coal under the door. A heavy bank of green coal restricts the flow of air at the point where it is most needed and at the time when it is most needed,—with the result that most of the hydrocarbons are broken down and the carbon precipitated before being brought into contact with the oxygen entering through the front grates. With the ordinary type of firebox the combustion chamber space and the flamework are insufficient to give all the particles of soot and combustible gas time to burn before reaching the tube sheet, but such a mixing as the arch affords results in a material reduction of the smoke, and under moderate rates of firing will result in almost complete combustion of the combustible gases.

A light level fire should be carried, if smoke is to be reduced to the minimum. With the fuel bed maintained in this condition by a "scatter" type of firing, a uniform air supply is obtained throughout the fuel bed as well as a uniform distillation of the hydrocarbons. This facilitates the mixture of the oxygen and the hydrocarbons from the time

they leave the top of the fuel bed, the arch mechanically accelerating this mixture.

Some authorities state that the decomposition of the hydrocarbons is caused by heating them up with an insufficient air supply and then bringing them in contact with the cooler heating surfaces or a draft of cold air. While later evidence tends to prove that this decomposition is caused entirely by heat, shafts of cold air through the firebox are objection-

gases in the combustion space provided above the fuel bed.

For a specific example, take the second case shown in Table I, where $47\frac{1}{2}$ lb. of coal are burned per sq. ft. of grate per hour, with the fuel bed six inches thick.

Table II shows in lb. per cu. ft. of gas the weights of the different gases leaving the fuel bed, the heat value per pound and B. t. u. per cu. ft. of gas. The gas has a total heat value of 156.6 B. t. u. per cu. ft., of which 70.7 B. t. u., or 45

TABLE I—GAS SAMPLES TAKEN AT THE TOP OF THE FUEL BED
Wt. in grams per cu. ft. of total gases at 60 deg. F. and 30 in. mercury

Lb. coal fired per sq. ft. of grate per hour	Thickness of fuel bed	C in CO	CH ₄	H ₂	C ₂ H ₄	Total gaseous combustible	Tar	Soot	Total soot and tar	Total combustible	Soot and tar, per cent of total combustible
22.3	5	2.034	.628	.209	.732	3.603	.528	.482	1.010	4.613	21.9

185.0	12	1.634	.108	.072	.036	1.850	.123	.415	.538	2.388	6

able—both from the standpoint of combustion and of boiler maintenance.

It is evident from the foregoing that the arch is not in itself sufficient to prevent smoke. Intelligent firing is also necessary. Smokeless firing and intelligent firing are almost synonymous, although there are conditions under which smokeless firing is impossible, regardless of the care and intelligence exercised by the fireman.

In some quarters there has been prevalent an idea that smoke was mainly a nuisance, and that the emission of dark clouds of smoke did not signify any appreciable heat loss. As a matter of fact the emission of smoke not only indicates bad furnace conditions, but in many cases the soot and tar escaping as smoke may contain from 10 to 15 per cent of the heat value of the coal, and this will account for a considerable portion of our "unaccounted-for" heat losses.

Tests conducted by the United States Bureau of Mines (see Technical Paper 137) showed that when burning Penn gas coal as high as 32 per cent of the combustible arising

per cent, are developed in the fuel bed and 85.9 B. t. u., or 55 per cent of the total heat contained in the coal, are developed by the burning of the combustible gases above the fuel bed.

TABLE II—HEAT DEVELOPED IN FUEL BED, AND POTENTIAL HEAT IN GASES, SOOT AND TAR

Heat Developed in the Fuel Bed					
Constituent	Wt. grams per cu. ft.	Wt. lb. per cu. ft.	Heat value per lb.	B.t.u. per cu. ft. gas	
C in CO	2.136	.00471	4,500	21.2	
C in CO ₂	1.546	.00341	14,500	49.5	
Total					70.7
Potential Heat in Gases, Soot and Tar					
C in CO	2.136	.00471	10,000	47.1	
CH ₄	.142	.000313	24,000	7.5	
H ₂	.068	.000149	62,000	9.3	
C ₂ H ₄	.036	.000079	21,600	1.7	
Soot	.369	.000813	14,500	11.8	
Tar	.241	.000531	16,000	8.5	
Total					85.9

The tar and soot shown in the foregoing table contain 12 per cent of the heat in the coal. If one-half of this were to escape unburned as smoke the resulting heat loss would be six per cent; and such losses are constantly occurring.

The amount of heat developed by the gases burning above the fuel bed will serve to illustrate the importance of firebox volume and combustion chamber space, and will also explain why intelligent firing with the use of a brick arch is not always sufficient to prevent smoke. The ordinary firebox in service to-day has not volume and combustion chamber space sufficient to provide the time element that is essential for the complete combustion of volatile hydrocarbons and the total elimination of smoke. This deficiency has been recognized by some of our railroads and during the past few years many fireboxes have been provided with combustion chambers, particularly in locomotives of the 2-10-2 and Mallet types, but combustion-chamber engines are few, when compared with the total number of locomotives in service.

It is also probable that we have been too conservative as to the length of combustion chambers that have been installed. Tests indicate that an 18-ft. or 19-ft. tube is sufficient to reduce the front end temperatures to a normal figure. Tubes of this length, when used in conjunction with a firebox of ample grate area and long combustion chamber, result in a boiler design that gives both high efficiency and high capacity.

Fig. 2 shows a type of combustion chamber that is being used successfully in oil-burning service on some 2-10-2 type locomotives. This firebox has a combustion chamber $41\frac{1}{2}$ in. in length between tube sheet and bridge wall, firebox volume of 435 cu. ft., and an average flame path of 19 ft.

Fig. 3—Gaines Furnace Combined with Barrel Combustion Chamber

from the fuel bed is accounted for in the soot and tar which is the source of smoke.

Table I, which is taken from the bulletin mentioned above, shows the composition of gases arising from the fuel bed and the percentage of the soot and tar therein contained. It is evident from these figures that the fuel bed acts chiefly as a gas producer, and a large part of the latent heat contained in the coal is liberated by the burning of combustible

With a fuel oil containing 85 per cent carbon, nine per cent hydrogen and six per cent oxygen, weighing 7.43 lb. per gallon, having a heat value of 18,878 B. t. u. per pound, it was found that one square inch of air opening in the pan per gallon of oil burned per hour was sufficient to obtain complete and smokeless combustion, even when burning 4,000 lb. of oil per hour. At this rate of combustion, an indicated boiler efficiency of 85 per cent was obtained with the Gaines wall in place. With the wall removed the boiler efficiency was 74 per cent, or a difference of 13½ per cent in favor of the wall. With the wall removed, at a rate of combustion of 4,000 lb. of oil per hour, there was a very noticeable increase in the amount of smoke emitted. This serves to show the need of a baffle or some sort of mechanical mixing device that will insure the thorough mixture of the air with the combustible gases.

For coal-burning service, a modification of the above design is being used most successfully on several railroads. This combination of the bridge wall with air ducts through the wall admitting a secondary air supply above the fire is known as the Gaines Locomotive Furnace. Here an attempt has been made to increase the firebox volume and flameway by reducing the tube length and installing a combustion chamber between the bridge wall and the tube sheet. This firebox has obtained some of the results desired, but for high volatile coal burned at high rates of combustion the combustion chamber space is too limited.

Fig. 3 shows a Gaines furnace in combination with a barrel combustion chamber. Here additional firebox volume and flameway have been obtained by materially increasing the length of the combustion chamber and, as this particular

Fig. 4—Gaines Furnace with an Effective Volume of More Than 500 Cu. Ft.

design was used on Mallet engines, this result was obtained without unduly shortening the tubes.

Fig. 4 shows a Gaines furnace installation in the same size firebox, with the barrel combustion chamber eliminated. This firebox has a grate area of 90 sq. ft. and more than 400 sq. ft. of firebox heating surface, with an effective volume of more than 500 cu. ft. The average length of flameway or gas passage is 15 ft. and the over-all length of the firebox is 18 ft. 3½ in. This represents the latest endeavor to secure adequate firebox volume and flameway.

While the results obtained from this type of furnace have proved most satisfactory, there is still room for improvement in the matter of smokeless combustion. The scientific training of firemen, the use of brick arches and the installation of combustion chambers have all tended to reduce the visible emission of smoke, but the burning of high volatile coal at high rates of combustion with the total elimination of smoke has not yet been successfully accomplished; and the indications are that some radical changes in locomotive firebox design and methods of firing coal will be necessary for the accomplishment of this object.

WASHINGTON CORRESPONDENCE

WASHINGTON, D. C., September 25, 1917.

MORE RAILWAY REGIMENTS FOR FOREIGN SERVICE

Additional railway and engineer regiments, in addition to the nine regiments of railroad men organized earlier in the year and who are now understood to be in service abroad, have recently been authorized by the President and the war department and are now being recruited by the engineer corps of the army.

In General Order No. 108, just made public by the war department, the President directs that there be organized for the period of the existing emergency, the enlisted strength being raised and maintained by voluntary enlistment or draft, special and technical engineer troops, including six regiments, and additional smaller units of engineers for each army and 14 regiments for the line of communications, the organization of the latter being under the direction of S. M. Felton, director general of railways.

The authorization for the line of communications, which includes the nine railway regiments already organized, but also provides for an increase in the number of men in each company, from 180 to 250, is as follows:

1. A general construction service, consisting of the following: 1 regimental headquarters, 6 engineer companies (construction), 6 service battalions (4 companies each).
2. An engineer supply service, consisting of the following: 1 regimental headquarters, 2 battalions of engineers (supply) of 3 companies each, 2 battalions of engineers (workshop) of 3 companies each, 3 service battalions (4 companies each).
3. A forestry service, consisting of the following: 1 regimental headquarters, 10 battalions of engineers (forestry) of 3 companies each, 9 service battalions (4 companies each).
4. A quarry service, consisting of the following: 1 regimental headquarters, 2 battalions of engineers (quarry) of 3 companies each, 3 service battalions (4 companies each).
5. A light-railway service, consisting of the following: Construction department, 1 regimental headquarters, 5 battalions of engineers (railway) of 3 companies each, 3 service battalions (4 companies each); operation and mechanical department, 1 regimental headquarters, 4 battalions of engineers (railway) of 3 companies each, 3 service battalions (4 companies each).
6. A standard-gage railway service, consisting of the following: Construction departments, 5 regiments of engineers (railway) (the 11th, 15th, 16th, 17th and 18th engineers, railway, National Army), 8 service battalions (4 companies each); operation and maintenance department, 2 regimental headquarters, 6 battalions of engineers (railway) of 3 companies each, 3 service battalions (4 companies each); mechanical and supplies department, 1 regiment of engineers (shop) (19th engineers, railway, National Army), 1 battalion of engineers (railway) of 3 companies, 1 service battalion (4 companies).

Of these the regiments for the general construction service, the engineer supply service, the forestry service, and the light railway service are new. The 9 regiments already organized are the 11th to the 19th, inclusive. The 20th engineers (forestry) is being formed at American University, Washington, D. C. The 21st engineers, for construction of light railways, is being organized at Camp Grant, Rockford, Ill., under Col. Edward Peak, with H. J. Slifer, consulting engineer and formerly general manager of the Chicago Great Western, as lieutenant colonel.

The engineering organization for each army, in addition to that for the line of communications, will consist of a gas and flame service, a mining service, a water supply service, a general construction service, an engineer supply service, a surveying and printing service, a road service and an army pontoon park.

Service battalions will be transferred from one service to another as may be necessary. Engineer troops of a special service may be utilized in another engineer service in the discretion of the commanding general concerned.

A regimental headquarters will consist of: Commissioned, colonel, 1; lieutenant colonel, 1; captains, 3; total, 5, and enlisted, 38. A battalion of engineers will consist of: Battalion headquarters, commissioned, major, 1; captains, 2; first lieutenant, 1; total, 4, and enlisted, 24. An engineer company will consist of: Commissioned, captain, 1; first lieutenants, 3; second lieutenants, 2; total, 6, and enlisted, 250. An army pontoon park (material, 3 pontoon divisions and 1 supply division, complete) will consist of: Commissioned, first lieutenant, 1; second lieutenant, 1; total, 2, and enlisted, 181. A service battalion will consist of: Battalion headquarters: Commissioned, major, 1; first lieutenant, 1; second lieutenant, 1; total, 3, and enlisted, 6. Four service companies, each of the following personnel: Commissioned, captain, 1; first lieutenant, 1; second lieutenant, 1; total, 3, and enlisted, 250. Wagon companies and truck companies will also be organized of engineer personnel.

The general order also provides for medical assignments for each unit. Other provisions of the order are as follows:

Technical equipment and additional transportation therefor will be supplied by the engineer department.

Railway operating and shop troops, forestry troops, and service battalions will be equipped as infantry, but only 10 per cent will be armed, except during training, when all will be armed; noncommissioned officers of these organizations will be armed with pistols. All other special engineer troops will be armed as divisional engineer troops.

Under authority conferred by the first sentence of section 2 of the act of Congress approved May 18, 1917, enlisted men of the corps of engineers and members of the engineer enlisted reserve corps, selected for these organizations by the chief of engineers, will be transferred thereto under authority of this order. Notation of transfer, and in the case of non-commissioned officers of continuance of warrant, will be made on the individual records of all enlisted men transferred. This authority will not be construed to authorize any enlistments in the enlisted reserve corps in excess of those already authorized. The National Army cantonnments will be utilized for the organization of the units herein authorized. The cantonnement at which each unit is to be organized will be determined by the chief of engineers after consultation with the quartermaster general. When necessary for special engineer training, these organizations may be sent to one of the regular engineer training camps.

The selection of officers for these regiments is under the direction of Mr. Felton, Capt. E. N. Sanctuary of his staff being in charge of matters of personnel. Railway men who have been drawn under the terms of the selective service act may be transferred to the engineer regiments.

STEEL PRICES REDUCED

Reduction in the basic prices of iron, steel, ore and coke, ranging from 43 to 70 per cent, as a result of a more or less voluntary agreement of the steel producers with the War Industries Board and based on cost of production figures, as ascertained by the Federal Trade Commission, were announced with the approval of the President on Monday. The prices, which will apply alike to purchases by the government, the Allies and the public, which includes the railroads as large users of steel, becoming effective immediately, subject to revision on January 1, 1918, are as follows:

Commodity and Basis	Price agreed upon	Per cent of reduction
Iron ore, lower lake ports.....	\$8.05	...
Coke, Connellsville.....	6.00	...
Pig iron.....	33.00	43.1
Steel bars, Pittsburgh, Chicago.....	7.90	47.3
Shapes, Pittsburgh, Chicago.....	3.00	50.00
Plates, Pittsburgh, Chicago.....	3.25	70.5

* Gross tons. † Net ton. ‡ Hundredweight.

It is understood that these prices will not affect existing contracts, but that they will probably be of more immediate benefit to the railroads than the coal prices recently fixed, which applied only to the 20 to 25 per cent of the supply uncontracted for and which in many cases were higher than the prices named in long term contracts of large consumers.

The agreement stipulated that there should be no reduction in wages and the steel men pledged themselves to exert every effort to keep production up to the maximum.

One of the big problems encountered was similar to that so often discussed in consideration of railroad rates, involving the question of how to fix prices that would enable the smaller mills to produce without loss while preventing the larger plants from making too great a profit. It was settled by a plan which there has been great reluctance to apply to the railroad situation, of attempting to allow a fair price to the smaller producers, even if it does allow the larger producers a greater profit, but this decision was facilitated from the government standpoint by the fact that a large part of the profits may be taken by taxation.

Measures will be taken by the War Industries Board for placing orders and supervising the output of the steel mills in such a manner as to facilitate and expedite the requirements for war purposes and to supply the needs of the public in the best interests of all.

Coincident with the announcement of steel prices, the priorities committee of the War Industries Board made public its first general priority circular, giving instructions as to priority in orders and work for all individuals, firms, associations and corporations engaged in the production of iron and steel, and in the manufacture of their products. The committee is composed of Judge Robert S. Lovett, chairman, Major General J. B. Ayleshire, George Armsby, Rear Admiral M. E. Mason, Edwin B. Parker, J. Leonard Replogle and Rear Admiral A. V. Zane.

Under the regulations all orders and work are divided into three classes. Class A comprises war work, i. e., orders and work urgently necessary in carrying on the war. Class B comprises orders and work which, while not primarily designed for the prosecution of the war, yet are of public interest and essential to the national welfare, or otherwise of exceptional importance. Class C embraces all other orders and work. All orders will be classed as Class C unless covered by certificates to be issued by the committee. Orders and work in the other classes will have precedence and classes A and B will in turn be separated into subdivisions composed of orders regarded respectively as of greater moment and to be given precedence in accordance with serial number. Certificates will be issued upon application specifying the classification of the order or work. Certificates of a subsidiary nature will be issued upon request for the furnishing of material and articles required in manufacturing the article or prosecuting the work ordered. War orders of the Allies, as well as of the United States, will be placed in Class A in the case of those already contracted for. Orders previously placed by the War and Navy departments or the Shipping Board will be classed as subdivision A-1 of Class A unless otherwise ordered. Orders already placed by the Allies for war materials will be classed as subdivision A-2 of Class A unless otherwise ordered.

JUDGE ADAMSON TO LEAVE CONGRESS

William C. Adamson, of Georgia, who is chairman of the House Committee on Interstate and Foreign Commerce, who has had a potent influence on railroad legislation in Congress for several years, and who is chairman of the committee that has its name attached to some of the most important railroad laws that have been recently passed, including the eight-hour law for train service employees, has been appointed general appraiser of merchandise at the port of New York and is

to leave Congress shortly, after 20 years of service in that body. His successor as chairman on the Committee on Interstate and Foreign Commerce has not yet been announced, but the next ranking member is Representative Thetus W. Sims, of Tennessee. Judge Adamson's name had also been on the long list of candidates urged upon President Wilson for appointment to the Interstate Commerce Commission.

RAILWAY WAGES AND TAXES INCREASE, RATES DECLINE

The railways of the United States in the calendar year 1916 paid a higher average wage per employee, a greater amount per mile in taxes and handled freight at a lower rate per ton per mile than at any period in their history. These facts are disclosed by a compilation made by the Bureau of Railway Economics of the returns made to the Interstate Commerce Commission by the so-called Class I roads—those having annual operating revenues exceeding \$1,000,000. These returns for the first time are for the year ending on December 31, according to an order of the Commission making the fiscal year coincide with the calendar year, and they cover railways having 89 per cent of the mileage of the country and receiving 97 per cent of the total operating revenues.

Compared with a similar compilation of returns for the year ended on June 30, 1916, the average wage per employee of these roads shows an increase from \$840.62 to \$868.69, or \$28.07. This is exclusive of salaries to general and division officers.

In the same period taxes increased from \$631.29 per mile to \$680.63 per mile, or \$49.34; and the average freight rate per ton mile decreased from 7.07 mills in the year ended on June 30, 1916, to 7.06 mills in the year ended on December 31, 1916. Passenger rates increased slightly as between the two periods—from 1.995 cents in the year ended on June 30, to 2.042 in the year ended on December 31.

The mileage included in the two compilations is substantially the same, being 231,246 miles in the statement for the former fiscal year and 231,179 in the statement covering the new fiscal year.

The increase in the volume of service performed in the two periods under comparison was from 339,883,000,000 to 362,134,000,000, or 22,251,000,000 ton miles of revenue freight, and from 33,783,000,000 to 34,573,000,000 or 790,000,000 passenger miles.

The average number of employees of these roads, exclusive of general and division officers, increased from 1,563,928 to 1,626,103, or by 62,175; and their aggregate compensation increased from \$1,314,665,664 to \$1,412,579,190, or \$97,913,526. The increase in number of employees was 4 per cent and in their compensation 7.4 per cent.

Total operating revenues increased from \$3,381,945,764 to \$3,592,591,023, or \$210,645,259, equal to 6.2 per cent. Operating expenses increased from \$2,211,071,443 to \$2,354,548,724, or \$143,477,281, equal to 6.4 per cent. Taxes increased from \$145,536,535 to \$156,875,396, or 7.7 per cent.

Investment in road and equipment showed an increase for the year ended on December 31 as compared with the year ended on June 30, of \$198,658,088.

RED CROSS TRANSPORTATION SERVICE.—Major Murphy, head of the Red Cross Commission in France, has sent a cablegram to America asking for expert motor-truck drivers without delay. Owing to the congestion of the railroads in France, large quantities of Red Cross supplies are being transported by motor truck from seaports to Paris and other distribution centers.

AMERICAN RAILWAY REGIMENT NOW OPERATING MILITARY RAILROAD

"By day and by night the men of the American regiment of engineers which has taken over an important line of French strategic railways are hauling tons upon tons of ammunition and other supplies to the French army units operating against the Germans.

"The American regiment," continues an Associated Press despatch, "has been turned over as a unit to the French and is getting all its supplies except clothing from the French government. The officers and men entered upon the work with the greatest enthusiasm, and they have been under German bomb and machine-gun fire from airplanes.

"Within the last few nights a heavy train of supplies hurrying toward the front was attacked by several enemy planes. None of the bombs came dangerously close, but every time the fire-box of the engine was opened for stoking the planes swooped down upon the train and spattered it with steel-jacketed bullets.

"This fire got so hot that eventually the train was stopped, the crew taking refuge beneath the engine. Relating their experience afterward these trainmen rather 'swanked' about it over their inexperienced brothers.

"The spirit of adventure is strong throughout the American ranks and the engineers who so far have not been bombed are openly jealous of their more 'fortunate' comrades. So far none of the regiment has been under shell fire, but the men may yet have a taste of the noisy German 5.9s and the whistling 'Percys,' 'Woolly Bears' and 'Whiz-bangs.'

"There is a great spirit of comradeship among the officers and men, most of whom have worked together and have known each other for years. The regiment is known as an operating unit as opposed to the engineers enlisted as construction units.

"Before proceeding to the front the regiment was quartered in a little French town within the zone of the French army. The arrival of the Americans at this town was kept secret and they marched into the place late at night after all lights had been extinguished. The soldiers were not allowed to smoke, strike matches or say a word. Despite the stealthy entrance, however, the French townspeople knew quickly of the arrival and soon the streets were filled with a quiet throng which joined in among the Americans and paraded with them arm in arm.

"It was one of the strangest welcomes any troops probably ever received anywhere, but it was at the same time one of the most sincere."

AN ABLE LOOKING BODY OF MEN

Speaking also of this regiment, Lincoln Eyre, staff correspondent of the New York World, in a copyright despatch, said last Friday: "I accompanied the engineers to the front from the base town in which they had been spending a month for instructional purposes. Nowhere among the American troops in France have I seen a higher spirited or abler looking lot of men. Their hilarity as they entered the train which was to carry them to their corner in a famous battle region almost shocked the poilus watching them. After three years of it there is no laughter in a Frenchman's heart when he sets out for the front. With him it is just a grim job that has got to be done; with these railroaders it is adventure, romance, opportunity for glorious achievement. They are fired with enthusiasm for everything and everybody—for their country, for every reason one can imagine, for France for which they are to do their bit, for Great Britain where they landed and received a boisterous welcome, for themselves because they are picked men and know it. . . .

"From their spaciiously comfortable barracks, especially cleaned, white-washed and disinfected for *les Américains*, in which the engineers spent their first month in France, they

moved in troop trains, motor trucks and automobiles to villages in the region where they will pass the winter. Their headquarters is established at a point carefully chosen with a view of its proximity to the principal stations on the railroad they have already begun to operate.

"This line, which is of course military and one of the chief feeders of a French army, is manned by both French and American engineers. In a very short time, however—as soon, in fact, as they have mastered the details of the French methods of operation, which, being under the direction of the French, they will adopt in every particular—the regiment will run the road entirely by themselves from top to bottom. They will then form one of the engineering units of this French army.

"The French will supply them with rations and quarters. There is universal satisfaction, I found, with both. The engineers are housed in well built wooden huts, with plenty of light and air, and are fed so well they have almost forgotten to yearn for the flesh pots of home. At the officers' mess, at which I was a guest, the luncheon dished up by a French chef provoked comparisons with food at some of New York's high priced restaurants highly unfavorable to the latter."

FIVE AIR RAIDS IN FOUR DAYS

Many interesting letters have been received recently from members of railway regiments in France. The letter of which the following is a part was received from a member of the Thirteenth Engineers (Railways), the regiment which was quartered at Chicago before leaving for Europe:

"For interest and thrills this place (somewhere in France) beats anything I've ever struck in the short and varied career of my sweet young life. About an hour ago the alarm was sounded—German air raid! Everybody is supposed to duck into a bomb proof. I tried to get up on to a roof to see the big scrap and nearly landed in a cell as a result. They've apparently located our regiment, as we've had five air raids in four days.

"We spent two days in an English camp, crossed the channel in a cattle ship with a Chinese crew—no bunks—slept on deck. Obeying orders, I was completely surrounded by a life preserver until we landed. Then there was a long ride in a day coach, and we arrived at our present location at midnight. The entire population of the town and surrounding country was on hand to welcome us. No lights were permitted to be shown at night. Under the very dim light of a shaded lantern, the general in command of the French bade us welcome. Our colonel replied in a graceful speech and we marched three miles through inky darkness to barracks.

"There was no keeping the crowd back. White-haired men and women and little boys and girls crowded into the ranks as we marched. They hung on to our blouses, wrung our hands, laughed, cried, and sang. We were the first American regiment to get up within sound of the guns. Far off on the horizon the sky was illuminated at frequent intervals by the explosion of light bombs and the fire of the heavy artillery."

PARADE IN LONDON

Another member of the same regiment, Ernest J. Carr, writes that he was the first American who ever carried the American flag before the king of England. He wrote:

"We were in London for a day, and the whole regiment, together with other railway engineer regiments, paraded through the streets. We saw all the places of note—Buckingham palace, houses of parliament, river Thames, Wellington barracks, and several other places. King George of England reviewed our regiments in front of Buckingham palace. There was a long article about us in the London Mirror, as well as in several London daily papers.

"I carried the American flag past King George and he saluted. Ours were the first American troops, also the first armed troops of any foreign nation to pass through the streets of London and past the king of England. I am the first American in all history to bear the American flag before the king of England.

"The London Mirror carried a picture of me and the other color sergeant, and guards . . . The people of London turned out by the thousands. Everywhere we received a warm welcome. They cheered the troops and the flag all along the line."

A letter from Ralph C. Wirth, Company C, Thirteenth Engineers, states that following the review of the regiment by the king and queen of England, a light lunch was served the troops in Green Park, which is for the private use of the English royal family. He also states that following their arrival at Liverpool on August 12, the regiment engaged in gas drill at a training camp for five days. By "gas drill" is meant practice in the use of measures to protect the men from German gas bombs.

NEWSPAPER COMMENT ON PARADE

A London newspaper clipping received from an American engineer indicates what a holiday the English made of the parade of American soldiers:

"Very early in the morning people discovered their viewpoints and waited patiently watching the enormous crowds that joined us. Traffic was diverted or stopped altogether. Shops were shut and business suspended and later the meeting of the War Cabinet itself was adjourned so that the prime minister and his colleagues might become as the people of the streets making greeting to the men who 'mean to see it through.' . . . Londoners are not very ready to cheer. Theirs is the way of silent tribute. But yesterday they forgot the silly traditions of British reserve. They might have been Irish or Italian in their wild enthusiasm. For, as the first Americans were seen, cheers were raised such as have never been heard in London. . . . Louder and still louder rose the cries as the Stars and Stripes came in view. Soldiers in the crowd saluted; men raised their hats, and women threw their flowers and waved their handkerchiefs—and some of them sobbed happy tears of pride such as no man or woman need remember with shame."

Sergeant H. W. Hofmann of the Thirteenth Engineers writes of the difficulty encountered in speaking with the French: "Usually carry a French-English book containing common phrases and after searching through the book about an hour and going through two or three million motions, succeed in completing a sentence. When going to a restaurant in town to get something to eat I've found the best plan to go to a place where only table d'hôte meals are served. Had almost as much trouble understanding the lingo of those cockney Englishmen, while we were in England, as we do the French."

NEAR VERDUN
