SIXTY-SECOND YEAR

1917

SECOND HALF

INDEX

Sixty-third Quarto Volume—July 1, 1917, to December 31, 1917.

AUTHORS

- Acworth, W. M., 50
Aishton, R. H., 526, 547, 993, 1049
Alfred, Frank H., 327
Anthony, J. T., 557
Atterbury, W. W., 394
- Babcock, Allen H., 96
Barker, R. S., 408
Barlow, H. C., 155
Barnum, M. K., 350, 853
Bentley, H. T., 749
Beyer, O. S. Jr., 64
Dixler, H. C., 57
Bohan, W. J., 1173
Bohon, W. J., 1068
Boland, E. J., 530
Bready, Stuart, 923
Bristow, Joseph L., 1166
Brown, Stephen H., 67
Burke, M. E., 63
Burt, A. M., 1158
Butler, Pierce, 1123
- Campbell, J. E., 153
Carr, O. O., 348, 1094
Carrow, T. H., 518
Carty, F. J., 235
Castle, O. C., 279
Clark, Edgar E., 276
Corrigan, G. W., 830
Corse, G. H. Jr., 1117
Coss, J. L., 348
Craven, Leslie, 1123
- Dean, J. A., 636
De Groot, E. H. Jr., 658
Doble, W. H., 411
Dow, Marcus A., 459
Dunn, Samuel O., 155, 750
- Edgerton, E. O., 863
Edmonds, G. S., 878
Edwards, L. N., 14
Elliott, Howard, 31, 520, 662, 860, 1033
Fly, Owen, 328
Endsley, Louis E., 893
- Fisher, S. W., 282
Foley, T. J., 154, 798
Ferman, Harry W., 388
Fritch, L. C., 1015
- Gardner, H. A., 15
Gennert, C. W. Jr., 531
Givin, E. F., 178
Glass, J. J., 66
Goto, Sukehiko, 646, 791
Green, F. W., 384
- Hand, G. C., 1035
Hansen, William, 546
Harrison, Fairfax, 139, 158, 525, 662, 928, 1031, 1073, 1142
Hasey, A. C., 282
Hauser, W. H., 799
Heath, E. H., 881
Hershey, Q. M., 178
- Hill, Major Royland, 432
Hirsch, Herman D., 635
Holden, Hale, 937
Howard, James E., 996
Howson, E. T., 529, 705
Hoyt, G. L., 424
Hoyt, W. H., 421
Hustis, J. H., 860
- Irwin, A. C., 177, 635
- Jackson, Carl D., 1085, 1137
James N. M., 971
Johnson, H. W., 977
- Kadel, B. W., 285
Katzenbach, L. E., 739
Kean, John W., 591
Keeler, Sidney J., 985
Kennedy, Martin P., 856
Knowles, C. R., 706
Krausch, W. T., 993
Kruttschnitt, J., 1116
- Larson, C. M., 1067
Lemmerich, Gustave E., 50
Lewis, Dwight N., 328
Linn, John H., 245
Lonsdale, John G., 740
Looney, T. C., 971
Lore, L. F., 353
Lovett, Robert S., 927
Lyndon, George W., 157
- McBeth, A., 878
McChord, Commissioner C. C., 1045, 1079
McDonald, C. J., 26
McFilber, H. H., 224
McKenzie, F. A., 1118
Mann, Seth, 886
Manning, Van H., 1129
Merkham, C. H., 449
Maurer, W. R., 141
Maxey, T. T., 379
Meeks, T. H., 281
Meyers, A. J., 569
Miller, Henry, 979
Morrison, R. W., 741
Morrow, J. D. A., 1115
Morse, W. C., 374
Munholland, R. C., 837
Myers, F. C., 1039
- Nelson, James P., 1067
Newell, C. E., 1117
Newlands, Francis G., 862
Noble, H. S., 347
- Parks, Charles E., 551
Patterson, George S., 858, 943
Patton, F. E., 223
Payne, J. L., 383
Pearce, H. C., 707
Pigeon, Homer, 409
Porterfield, J. F., 156
Powell, T. F., 339
- Priebe, H. C., 1068
Prouty, C. A., 599
Tugh, S. B., 420
- Randolph, George F., 691
Raymond, William G., 335
Rea, Samuel, 680, 861, 974
Reasoner, Mark H., 418, 458
Reddig, H. F., 459
Redfield, William C., 813
Robinson, W. L., 513*, 1131
Ryan, T. T., 458
- Schaff, Charles E., 99
Schoyer, A. M., 1173
Selby, Grant, 224
Shackell, L. F., 801
Shaughnessy, E. H., 457
Sherrill, Brig.-Gen. C. H., 1172
Smith, A. H., 861
Smith, C. E., 23, 734
Smith, George T., 27
Smith, J. W., 280
Smith, S. H., 408
Sperry, Henry M., 743
Storey, W. B., 685
Stuart, Francis Lee, 1181
Sullivan, J. G., 474
Summerhays, W. A., 528
- Teesdale, C. H., 801
Thielen, Max, 693, 862, 877
Thomson, Samuel G., 109, 785, 1081
Thorne, Clifford, 944
Trumbull, Frank, 876
Turner, Avery, 449, 1067
- Underwood, F. D., 859
- Vanderlip, Frank A., 942
Van Keuren, H. L., 112
Vial, F. K., 157
Von Schrenk, Dr. Hermann, 657
- Vanamaker, E., 391, 753
Warburg, Paul, 942
Warfield, S. Davies, 1115
Weaver, C. R., 564
Weise, F. E., 707
Weston, A. H., 343

White, G. C., 339, 1117
Whitte, J. Lowell, 201
Whittelsey, F. T., 546
Wickhorst, M. H., 811
Wildman, C. B., 65
Willard, Daniel, 102, 274
Williams, John Skelton, 891
Williams, Lacey Y., 50
Williams, T. H., 457
Wilson, W., 347
Winterrowd, W. H., 683
Wishart, J. G., 229
Wollner, William S., 178
Wood, G. H., 426
Wooding, B. F., 835
Worden, E. J., 68

GENERAL INDEX

[Illustrated articles are indicated thus *; Editorials thus †; Letters to Editor thus ‡.]

A

Academy of Political Science: Need for Storage Facilities, 181
 Accident (See also Safety First):
 Baltimore & Ohio near Irving, 396
 British Report for 1916, 477
 Chicago of Safety's Investigations, 1178
 Chicago, Burlington & Quincy near Earlville, 535
 Chicago, Rock Island & Pacific at Midlothian, Ill., Grade Crossing, 471, 56
 Glasgow Subway, 132†, 140
 Halifax Catastrophe, 1101, 1180*
 I. C. C. Bulletin No. 62, 462
 Monthly Summaries: May, 108; June, 342; July, 700; August, 706; September, 849; October, 951; November, 1186
 North Branford, Conn., Trolley Cars, 299, 369†, 656, 780†, 784†
 Prevention Work, Progress in, 459
 Responsibility of Automobile Passengers, 445†
 St. Louis-San Francisco at Kellyville, 620
 Southern Railway, Laramie, 117†
 Telegraphic Reports in Colorado, 405†, 437
 Trespassing, State Laws on, 804
 Trolley Cars, 77, 1189
 What Are Railway Accidents, 369†
 Accounting (See also Association of American Railway Accounting Officers):
 Auditing System: B. & M., 491†, 501*
 Central Bureau Great, 99
 Depreciation, G. C. Hand and J. Kruttschnitt on, 1035, 1116†
 Depreciation Factors in Annual Reports, 1062†
 Reports, Unpublished in War Time, 378, 405†, 992, 1155†, 1183
 Vouchers Used on the L. & N., 425*
 Waybilling, Interline, 588†, 609*, 1011†, 1049
 Adamson, William C.:
 Eight-Hour Law Results, 255, 1061†
 Government Ownership Condemned, 817
 Resignation from Congress, 561, 1142
 Advertising:
 Eight-Hour Law Results, 255, 1061†
 Film, Use of the, 379
 Liberty Loan, 477, 652
 Western Railway Club Drops Advertising, 49†, 178†
 Woolley, Edward Mott, on, 2†
 Agriculture (See also Railway Development Association):
 Cars for Farm Products, 28
 Farmer and Railroad as Partners in Industry, 685
 Farms, Wheat Prices and Freight Rates, 93†, 545†
 Gardens, War, on the Pennsylvania and New York Central, 334*
 Illinois Central, Wildwood Farm, 186*
 Market-Train Service Discussed, 339
 Peach Shipments; N. Y. C., 772
 Aishon, R. H.:
 Railroads Not Only Industry Pressed by War Demands, 1049
 Record Traffic Handled, 993
 Aitchison, Clyde B., Appointed to Interstate Commerce Commission, 597*
 Alabama Great Southern: How Safety Medal Was Won, 160
 Alaska Northern, Progress on, 161, 575
 Albania, The First Railroad in, 429*
 American Association of Lining Car Superintendents:
 Meat, Savings in, 953
 Rules for Conservation of Food on Dining Cars, 121
 American Association of Passenger Traffic Managers: Slacker States, Map of, 952*, 106†, 1067†
 American Car and Foundry Company: Annual Report, 86
 American Electric Railway Association: War Record, 907
 American Foundrymen's Association: Annual Convention, 482
 American Institute of Mining Engineers: Transverse Fissures in Steel Rails, 996
 American Library Association: Reading Matter for Soldiers, 68
 American Locomotive Company:
 Annual Report, 401
 Denver & Rio Grande Santa Fe Type, 189*
 Illinois Central, 2-10-2 Type, 107*
 New York Central 4-8-2 Type, 1167*
 Wabash, 2-10-2 Type, 1025*
 American Railway Association:
 Car Surpluses and Shortages, 117, 133†, 103, 538, 769, 1146
 Military Allowance on Refrigerator Cars, 358
 Transportation of National Army to Training Camps, 333, 415
 American Railway Bridge and Building Association: Annual Convention, 703
 American Railway Engineering Association:
 Convention, March, 544†, 730†
 Docks and Wharves, Design of, 421*
 Impact Formula for Bridge Design, 177*, 635†

American Railway Engineering Association (Continued):
 Nominations for Officers, 1192
 Rail Failure Statistics for 1916, 811
 Southern Pine, Decay Resistance of, 888
 American Society of Mechanical Engineers: Metal Alloys Used in Locomotives, 424
 American Society for Testing Materials: Annual Meeting, 13*
 American Steel Foundries: Simplex Clasp Brake, 620
 American Wood Preservers' Association: Statistics for 1916, 110
 Amster, Nathan L.: Government Loan to the Railways, 407†
 Anderson, George W., Appointed to Interstate Commerce Commission, 597*
 Annual Report (See also names of companies; also Interstate Commerce Commission):
 Standard Form Suggested, 182*
 Anthracite Shipments in October, 902
 Apprentice (See Education)
 Appropriation Bill, Deficiency, 566, 619, 666
 Army (See War)
 Ash Pan, Commonwealth Cast Steel, 709*
 Aspinall, Sir John A. F., a Knight, 76
 Associated Business Papers: Aishon, R. H., 1189
 Associated Railroads of Pennsylvania and New Jersey: Report of O'Donnell Full-Crew-Load Committee, 465
 Association of American Railway Accounting Officers:
 Accounting Requirements During the War, 378
 Annual Meeting, 587†, 588†, 609*
 Mechanical Devices and Statistical Data, 1155†, 1182
 War Tax, Instructions for Applying, 761
 Waybilling, Interline, 588†, 609*, 1011†, 1049
 Association of Manufacturers of Chilled Car Wheels:
 Annual Meeting, 770
 Mechanics of Chilled Iron Wheel, 157
 Association of Railway Claim Agents: Committee on Restoration and Employment, 361
 Association of Railway Telegraph Superintendents: Annual Convention, 987, 1012†
 Association of the 11th U. S. Engineers, 1070
 Atchison, Topeka & Santa Fe:
 Annual Report, 782†, 824
 Apprenticeship System, By-Products of the, 245, 263†
 Bonus for Employees, 76
 Car Tank, 467†
 Freight Claim Payments, Campaign to Reduce, 551*
 Railroad in Time of War, 396
 Ripley, E. P., on Minimum Carload Weights in Illinois, 1261, 324†, 327†
 Salvaging Rolling Stock on Fallbrook Branch, 461*
 "Service Stripes" on Freight Cars, 434
 Atlantic Coast Line:
 Strike of Clerks, 1001, 1024
 Train Load, Increasing the, 201*
 Atterbury, W. W., Appointed Director General of Transportation, 513*, 619
 Auditing (See Accounting)
 Australian Government Officials in America, 446†, 620
 Australian Transcontinental Line Completed, 1187*
 Automatic Air Dump Car, 234*
 Automatic Stop (See Signaling)
 Automatic Straight Air Brake Company:
 Brake System, New, 697*
 Incorporation, 488
 Automobile:
 Crossing Accident and Responsibility of Passengers, 400, 445†
 Fords on the C. B. & O., 852*
 Freight by Trucks from Detroit, 1147, 1190
 Loading and Shipping, 166
 Montreal and Rock, Truck, 1188*
 Record Runs, 251, 953
 Aviation:
 Mail Routes Proposed, 574
 Record Flights, 575, 769, 1002, 1095

B

Baldwin Locomotive Works:
 Johnson, A. B., on Production, 1055
 U. S. A. War Locomotives, 295*, 645*
 Balkwill Mangano, Crossing Company: Crossing, Sectional Mangano, 949*
 Baltimore & Ohio:
 Accident near Irving, W. Va., 396
 Annual Meeting of Officers, 24
 Annual Report, 265†*
 Bridge, Old Stone Arch, 278*
 Car for Medical Examiners, 256*
 Car Loading Machine at Locust Point Pier, 1033*
 Cars, Refrigerator, 981*
 Chief Clerks' Association, 120
 Chief of Locust Point, 815
 Fuel Records, 1112†, 1131*
 Power Plant Supervision, 663*

Baltimore & Ohio (Continued):
 Stationery, Savings in Use of, 350
 Stoker Operation, 513
 Bangor & Aruostook: Rate Hearing, 1149
 Bankers' Railway Bulletin: September Issue, 620
 Barge (See Water Service)
 Barnes, C. W. B. & A., 284*
 Barrell (See Freight)
 Belgium: Locomotives Given to General Pershing, 1069*
 Belton, H. E.: Report of James E. Howard on Rail Failure on the Pennsylvania, 292*
 Belt Railway of Chicago: Pneumatic Tubes at Clearing Yard, 192*
 Bethlehem Chile Iron Mines Company: Electric Line, 384*
 Bill (See Legislation)
 Bill of Lading (See Freight)
 Block Signal (See Signaling)
 Bolster (See Truck)
 Bonney Supply Company: Loader, Rapid, 812*
 Bonus (See Employee)
 Book Umbrella, Dayton, 702*
 Boston:
 Cow Barns at Brighton Stock Yards, Boston, 284*
 Locomotives, Consolidation Type, Converted Into Light Wheel Switchers, 235*
 Pensions in 1895, 375
 Boston & Maine:
 Annual Report, 1014†*
 Auditing System, 491†, 501*
 Comforts for Men in the 14th Railway Engineers, 907
 Safety Appliance Act—Government Suit, 733, 831†
 Soldiers' Fares, 909
 Transportation to Camp Devens, 759*, 1052
 Strike of Shopmen and Others, 435, 477, 814, 903, 953
 Brake:
 Automatic Air Brake System, 697*
 Leakage, Train, Tested, 564*
 Simplex Clasp, 475*
 Brazil: Pulverized Coal, Tests, 767*
 Bridges and Buildings (See also American Railway Bridge and Building Association; also Construction, New; also Station; also Yards and Terminals):
 Arch Bridge at Gwynn's Falls; B. & O., 278*, 358
 Barnes, C. W. B. & A., 284*
 Chesapeake & Ohio Bridge at Sciotoville, 453†
 Chicago, St. Paul, Minneapolis & Omaha Bridge Across Chippewa River, 879*
 Delaware, Lackawanna & Western Viaduct at Clark's Summit, 25*
 Elevator at Erie; Penn., 1102
 Impact Formula, New, 177*, 635†
 Locomotive Weight and Bridge Stress, 264†
 Pitts., Cin., Chic. & St. Louis Freight House at Indianapolis, 69*
 Platte River Bridge, C. B. & O., 183*
 Quebec Bridge Completed, 533, 543†, 560*
 St. Joseph, Mo., Bridge Reconstructed, 74*
 Bristow, Joseph L.: Testimony Before New Lands Committee, 1166
 British Board of Trade:
 Accidents in 1916, 477
 Glasgow Subway Accident, 132†, 140
 British Railways (See England)
 Brooklyn Rapid Transit: Annual Report, 872†
 Brotherhood of Railroad Trainmen:
 Members of Chicago Lodge Appeal for Protection of Membership Rights, 535
 Ordinance Passed in St. Worth, Tex., 406†
 Strike of Yardmen in Chicago, 175†, 198, 219†, 832†
 Wage Demands, 832†, 865, 866, 902, 917†, 953, 991, 1048, 1885*, 1143
 Brown, Edward L., 689*
 Brown System of Discipline, 4†, 19, 873†, 881, 967†, 985
 Buckeye Steel Castings Company: Truck, Six-Wheel Articulated, 387†
 Buffalo, Rochester & Pittsburgh: "Shipping Days," 984
 Bureau of Foreign and Domestic Commerce:
 Creosote Oil Imports, 1190
 Bureau of Markets of the Department of Agriculture: Cars for Farm Products, 28
 Bureau of Mines: Coal Mine Production, 1129
 Bureau of Railway Economics:
 Freight Operations During April, 48†, 99; May, 241†; June, 492†, 514; July, 676†, 696; August, 931; September, and for Six Months, 1121†, 1122
 French Railroads Must Have Higher Freight Rates, 1014†, 1043
 Libraries for Soldiers, 68
 Returns for Calendar Year 1916, 550
 Revenues and Expenses for May, 206, 230†; June, 447†, 480; July, 816; August, 875†, 906; September, 1002
 Wages and Taxes in 1916, 562
 Bureau of Railway News and Statistics:
 Government Ownership in South America, 75
 September Income Below 1915, 1003
 Bureau of Safety, Annual Report of, 1177
 Byram, H. E., 498*

GENERAL NEWS SECTION.....	34

A few days ago an officer of a large railroad remarked that he was sitting back and letting other roads do the experimenting with a certain device, although he was closely interested in the results secured. While making this statement he admitted frankly that his position was open to criticism, but that he was following the practice of most other roads. He also admitted that if all other officers followed this same practice progress would cease. It is to the credit of American railway men that they have done as much pioneer work as they have in the development of methods, materials and devices. At the same time they have not gone as far as they might and progress has been retarded to that extent. It is not possible for every road to undertake experiments as elaborate as those conducted by the Pennsylvania Railroad at its locomotive testing plant at Altoona, but each road can do valuable work in some line. At present the need is particularly urgent for the development of methods leading to the conservation of labor and of materials such as fuel. While many of the ideas for appliances of this class originate with men in railway service they usually require much development and experimental work to make them successful. In the perfection of these devices the manufacturer is dependent on the co-operation of the roads for the opportunity to test the device out in actual service and for their sympathetic, constructive suggestions. Unfortunately it is here that the manufacturers frequently meet the spirit presented by the officer above quoted. In co-operating with the manufacturers a road must necessarily spend some time and money before the details of a device can be perfected and the device be made entirely practical. A railway may remain inactive and allow another road to assume this expense, knowing that it can share ultimately in the use of the device. However, such an attitude is unfair to the roads which are progressive enough to undertake work of this character, and if followed universally would stop further development. The greatest progress will only come when railway men take the broad attitude that time and money spent by them in developing one device will be returned to them through the benefit they receive from similar work on the part of other roads.

Developing New Appliances and Methods

Without missing sight of the fact for an instant that the railway companies themselves are the ones who must do the work of the educational campaign to get heavier carloading, nevertheless if the shippers and shippers' organizations were to fail to co-operate, it would be like putting the burden of a team of horses all on the nigh horse. It is especially encouraging, therefore, to have the Railway Business Association, which numbers among its members many of the very large shippers in the United States, come forward with a plan which, if adopted by all of its members, would be a long step toward furnishing the co-operation which is so necessary. The blanks which the Association asks its members to use in keeping records of carloading are shown elsewhere in this issue. In brief, the executives of the companies which are members of the association are asked to have a record made by individual cars of every carload shipment, the record showing car capacity or cubical capacity—when that is the limiting capacity; loading and reasons why full capacity was not obtained. It is safe to say that if such a system were adopted by almost any large company the improvement in loading would be a most substantial per cent. As it is now, there is little day by day check on carloading by employees of shipping companies. Occasionally there is an inspection made by the railroad or by some of the higher officers of the shipping company and for a time there is an improvement, but there is nothing systematic, nothing that will give assurance to an employee who carelessly loads a car to only a fraction of its capacity, that he will be caught and reprimanded. If, however, the blanks which the Railway Business Association has designed were used continuously and a responsible man was given authority to check these blanks every day and to report individual shipments which were inexcusably underloaded into cars, careless car loading by employees would be stopped to a great extent almost automatically. One thing more should be said about these blanks. They are a really constructive measure and therefore are in a rather different class than a simple circular or appeal to members of the association to get better

Railway Business Association Helps

carloading. Helpful as such appeals are, they do not hold forth a possibility of anywhere near as much actual improvement in conditions as does such a suggestion as this, which not only urges heavier carloading but gives a simple, feasible means by which better carloading can be obtained.

RAILWAY ADVERTISING

ADVERTISING has become one of the greatest constructive forces in American commerce and industry. An extremely interesting article on this general subject, of which Edward Mott Woolley is the author, appears in Scribner's Magazine for June. Mr. Woolley calls advertising "The Silent Voice," and he gives numerous specific examples of how by its use small and unprofitable concerns have been built up into big and highly profitable ones, and how other concerns by "public" policy advertising have changed popular hostility into its opposite.

The railways do not cut a very good figure in Mr. Woolley's article. He says: "Most people have no conception of the problems of the railroads and know little about the arguments from the railroad's standpoint. They are actuated chiefly by the conceptions they get from contact with trainmen and by reports of wrecks and claim suits. * * * Railroad advertising is in its infancy and the good-will publicity now being conducted is mostly of the eleventh hour variety. Railroad managers are just beginning to realize that they have long neglected to put their purposes before Congress and the people in that most logical of all publicity, paid advertising."

There is much truth in this. There has been a good deal of railway advertising which has been well handled and which has been effective in accomplishing its purposes. But its objects often have not been wisely chosen and, as Mr. Woolley shows, the aggregate amount of advertising which has been done by the railways is very small relatively to the investment they represent, the business they transact and the important part which they play in our national life.

The two most important kinds of advertising are that done directly to sell goods or services, and that done to give the public information and to secure its good will. The selling advertising of the railways has been directed almost entirely to the development and securing of passenger traffic. The amount of it they have done to develop and secure freight traffic has been negligible. They have engaged in "good will" advertising to a very limited extent. The most extensive campaign of that kind ever carried on in this country was conducted by them last year when they used advertising in over 17,000 newspapers to present to the public their side of their controversy with the railway brotherhoods. Some individual lines have done effective good-will advertising, but their number is few. Among those which are doing notable work along this line now are the New York Central, the Union Pacific, and, on a smaller scale, the Missouri, Kansas & Texas. The Pullman Company is carrying on an excellent campaign of this kind.

The most conclusive evidence in support of Mr. Woolley's statement that "railroad advertising is in its infancy" is afforded by statistics regarding the total amount spent for advertising in the country annually, and the part of this that is laid out by the railroads. Estimates of the total annual expenditure for advertising in the United States vary from \$375,000,000 to \$650,000,000. The railways represent about one-ninth of the national wealth, and yet their total expenditure for advertising in a year never has exceeded \$10,000,000. In 1913 the outlay of the Class I roads—those earning more than \$1,000,000 a year—was \$9,275,698. This is the largest figure ever reached, and yet it was only .44 of 1 per cent of total operating expenses. During the next three years railway expenditures for advertising declined, and in 1915 for Class I roads they were only \$7,141,908, or one-third of one per cent of total operating expenses. These

figures include the direct expense of printing advertising matter, folders, etc.; the outlay for space in newspapers, on billboards, and in show windows; the cost of distributing and posting such matter; the expense of any incidental plant or fixtures devoted to such use, as bulletin boards, racks, photographs, photographic outfits, etc.; and the salaries and office, personal and rental expenses of the advertising managers and their staffs.

Mr. Woolley estimates that the annual expenditure for the advertising of passenger automobiles amounts to \$25,000,000 and for motor trucks to \$2,500,000, or a total for motor-driven vehicles almost three times as great for all the railways. The manufacturer of a certain chewing gum and the manufacturer of a certain talking machine spend \$2,000,000 a year each. And yet there are people who talk about the railways "subsidizing" the press by large expenditures for advertising!

There are two ways of reaching the public through the press. One is through the reading columns; the other through the advertising columns. Publicity for a vast amount of railway information can be secured in the reading pages of newspapers and magazines, but only when it has the elements of timeliness and public interest, which make it to the direct interest of the journals themselves to publish it. Contrary to an opinion prevalent among railway men, there never has been and never will be any peculiar difficulty about getting information about railways published; but it must be what the editors want to publish at the particular time, not merely what the railways may think they ought to want to publish.

There are, however, many facts and fundamental principles regarding transportation which the railways want to familiarize the public with, but which editors generally, from their own point of view, have no special reason for wishing to publish. It is to familiarize the public with facts and principles of this kind that the railways ought to do much more "public policy" advertising than they ever have done. A good example of this kind of advertising is that which has been used by the American Telegraph & Telephone Company. This company found itself menaced a few years ago by a rapidly developing movement for government ownership. It has practically killed this by the use of intelligent advertising and publicity. A striking example of the kind of information it has disseminated through these channels is afforded by one of its recent advertisements entitled "20,000,000 Miles of Telephone Wire." This advertisement, which occupied a page in magazines throughout the country, shows that the Bell system has twice as many miles of telephone wire in the United States as there are in all Europe; that more than 500,000 new telephones are being added to it yearly—almost as many as the total number of telephones in England; that in twelve months the Bell system adds enough telephones to duplicate the entire systems of France, Italy and Switzerland combined; and that in proportion to population its extension in the United States is equal in two years to the "total telephone progress in Europe since the telephone was invented, a period of 40 years."

There are innumerable equally important and instructive facts about railways which ought to be told to the entire 100,000,000 people of this country, and which could be more effectively told by public policy advertising than by any other means. The total expenditure required would be relatively small; and even if as a whole the railways should increase their advertising expenditure 50 per cent it would then amount to but two-thirds of one per cent of their operating expenses. Of course, if the railways should conduct a public policy advertising campaign on a large scale they would be probably accused of subsidizing the press; but the good results obtained if the campaign was intelligently conducted would completely overshadow any bad effects which it might incidentally produce.

THE DECISION IN THE FIFTEEN PER CENT RATE CASE

THE *Railway Age Gazette* is disappointed but not surprised by the decision of the Interstate Commerce Commission in the 15 per cent rate case. This is the third time the carriers have appealed to the commission for general advances in freight rates. On all these occasions the main issue involved has been whether the controlling tendencies in the transportation field made it desirable from the standpoint of the public welfare for the railroads to be granted higher rates. On both previous occasions the commission showed want of comprehension of the situation, lack of foresight and disinclination or inability to predicate its findings on business principles. In its decisions in 1911 it based its findings largely on the good financial results of the fiscal year 1910 and hazarded the prediction that the results in 1911 would be better. But in all of the succeeding five years the carriers earned relatively less and in four of them very much less than in 1910. Again in 1914 the commission granted some increases but these were insufficient to be of any considerable value. The complete returns for the fiscal year 1914 show the smallest percentage of net return for 15 years. Then came the war, and six months later the commission granted some further small advances; but within a little more than a year from the time it rendered its first decision in the 5 per cent rate case there were more miles of railroad in receivers' hands than ever before and there had been made the lowest annual record of new construction in time of peace since 1848.

In other words, the commission went wrong in deciding the rate advance cases in 1911, and it went wrong again in deciding the rate advance cases in 1914. Therefore, this paper never was able to share in the optimism expressed in some quarters regarding the decision which it probably would render in the 15 per cent rate case. The commission up to this time usually has looked backward instead of forward. It has not correctly appraised the ruling tendencies in the railroad business or foreseen the results which the operation of those tendencies would produce. One of its fundamental troubles as at present constituted is that it has too many professors and lawyers on it and no business men at all. The business man who always looks backward soon becomes bankrupt. Foresight is the successful business man's qualification. The railway situation in the United States is what it is today mainly because for over ten years the earnings of the roads have been controlled chiefly by a regulating body whose members have not been able to tell what was going to happen in the railroad business until it had happened.

The opinion of the majority of the commission in the 15 per cent case lays much stress upon the fact that the gross and net earnings of the railways in both the fiscal and the calendar year 1916 were larger than ever before. It concedes that the present tendency of net operating income is downward, but it anticipates that it will be relatively larger in 1917 than in the years preceding 1916. It says that if the conditions should grow as bad as railway officers anticipate they may apply for further relief.

One of the first questions which all this raises is as to why the commission apparently thinks that if the net operating income of the railways to any extent exceeds that of the years prior to 1916 it will be sufficient. As everybody knows it was so insufficient during the years preceding 1916 that there was a steady and rapid decline in the development of railway facilities and the recent severe congestion of traffic and record breaking car shortage have been due to this. If it is desirable that the country should have sufficient transportation facilities; it necessarily follows that it is desirable that the net operating income of the carriers should be substantially larger than it was before 1916.

Another question which the opinion of the commission at once raises is as to why it believes that the net operating income of the carriers may be expected to be maintained on

the basis which it has been on since January 1. The fact is, that for about four years the railways have not spent enough for maintenance of way and maintenance of equipment. The commission says: "We have carefully considered the expenditures made by the carriers in 1916 for maintenance of way and structures and for maintenance of equipment. These indicate that no undue or disproportionate outlay was made in 1916 for these purposes."

The truth is that the expenditures for maintenance have been too small ever since 1913; that they were too small in both the fiscal and the calendar year 1916, and that this is one of the reasons why the net operating income shown in 1916 was so large. The great increases in prices of materials and equipment which have occurred are bound to affect net return much more in future than they have in the past if the railways can hire enough labor and buy enough materials and equipment properly to maintain their properties. If they do not do these things the properties will continue to be under-maintained. If they do these things there will be a very great increase in expenses and a sharp reduction under net operating income.

Suppose, however, that net operating income should be maintained not only on the present basis but should even be restored to the basis on which it was in 1916, would it be sufficient even then? One of the most vital needs of the country at the present time—a vital need which will continue to exist throughout the war and after it is ended—is for a large expansion of railway facilities. Now it requires twice as much earnings to add a locomotive or a car to railway equipment as it did two years ago. It costs 30 to 50 per cent more than it did then to provide almost any other additional facility that railways may require. All additional facilities must be provided either directly out of net operating income or out of new capital on which net operating income must be used to pay a return. It follows that if the railways are not to be allowed to earn relatively a larger percentage of net revenue than they were allowed to earn prior to 1916 they will be disabled from providing as large an amount of additional facilities as they did then, and the amount of new facilities provided for the last ten years has been utterly inadequate. The only member of the commission who apparently realizes that the prevailing tendencies of railway earnings and expenses prior to 1916 caused the slowing down of railway development and thereby made unavoidable the recent car shortage and congestion of traffic is Commissioner Harlan. Commissioner Meyer, apparently lost in a fog of academic theories, is blind to the fact that we are in the midst of a serious crisis in our transportation affairs and dissents even from the decision which grants the railways less than one-third of what they ask for. Commissioner McChord, who also dissents, makes the suggestion, which savors of politics, that instead of granting the railways increases in rates the government should regulate the prices which they have to pay for fuel and supplies. Commissioner Harlan, on the other hand, who concurs in the majority opinion in so far as it grants increases in rates, renders a separate opinion in which he contends the relief granted is not adequate. He goes to the heart of the matter when he says, "While the strains of the war have much to do with the present transportation conditions the one outstanding fact during the hearing as to which there was no disagreement was that our transportation system is lacking in the capacity to meet the demands of the shippers and that the resulting loss to the general public has been very large. This condition is one of present danger with a possibility that it may even become disastrous during the war period. But aside from this military influence the record leaves no doubt that our transportation system as a whole must be promptly enlarged and expanded."

His statement of the remedy is as explicit as his diagnosis. He adds:

"The record, in my judgment, demonstrates a proposition

that has long been clear to me, namely, that a rate is a public question, and that the existing rates, aside from any interest that the owners of our railways may have in the matter, could well be advanced in the public interest in order that assurance may thus be given for the early enlargement of our transportation facilities. So long as we look to private interests to furnish a transportation service for the country we must see to it that the rewards are sufficient to attract capital for its further development. Under present conditions this appears not to be the case."

This accurately sums up the situation. For almost ten years the railway managers have been telling the commission that they must have substantial advances in rates or they would be unable adequately to develop their facilities. The commission has declined to grant anywhere near as large advances as have been sought, and in consequence adequate facilities have not been provided. The commission has been conscientious in the course it has taken. It has meant to be fair. This is illustrated by the advance in interstate passenger and freight rates it had previously granted. It is illustrated by the fact that in the present case it has granted advances amounting to as much as all those asked for in both eastern and western territory three years ago. But the commission apparently does not appreciate how rapidly changes have been occurring. If it had granted three years ago the advances it has granted now the railway situation would be far better now and the present need for increases in rates would be far less acute. As the existing shortage of transportation facilities is due mainly to the past failures of the regulating authorities to understand current and foresee future developments, so it is to be feared that a serious aggravation of the present transportation situation will result from the Interstate Commerce Commission's failure to act courageously and vigorously in the present emergency. If this should be the case, the responsibility should be placed where it belongs.

BROWN'S DISCIPLINE; A PRIZE OFFER

THE abolition of suspensions is a reform in discipline which has made progress on American railroads during the past 30 years with rather slow and halting steps; but it is a real reform, in spite of doubts and lukewarmness and a good deal of neglect. The large success of the movement is indicated by the data, gathered from a hundred prominent roads, summarized in an article printed on another page of this issue. This subject, in its essential nature, is an elusive one, but for that very reason deserves study. On certain prominent roads the conviction that suspensions were undesirable, if not absolutely unjust, was fully settled twenty years ago, and long experience has confirmed that conviction. On other important roads the officers either denied this or treated the matter with indifference; and to make a broad survey of conditions has been difficult. On any large railroad system the mere collection of the facts concerning its discipline, the methods and the results, is a somewhat complicated problem; and this and other hindrances have left the whole matter so much obscured that a really satisfactory report on it is yet to be made.

This being the case, the *Railway Age Gazette* offers a prize of fifty dollars for the most readable and illuminating account of real, extended and instructive experience with the Brown system, the paper to reach the editor at New York before October 1 next. No conditions are attached to this offer; but there are some conditions in the nature of the case. As the desideratum is an account of experience it seems probable that the successful author must be a superintendent, or a trainmaster; an ex-superintendent or ex-trainmaster; or some other person who is or has been so close to the man actually managing the discipline that his (the manager's) acts, motives and spirit are thoroughly understood. Some one who has been intimate with a half dozen superintendents

may be best fitted for this kind of a task. Another condition is that the article must deal with a railroad of considerable size; for the officers who most want instruction in this matter are those whose divisions are too large for the chief executive to deal directly and in detail with all cases of discipline.

NEW BOOKS

The Story of the Pullman Car. By Joseph Husband. 161 pages, 56 illustrations, 5½ in. by 8 in. Bound in cloth. Published by A. C. McClurg & Co., Chicago. Price \$1.50.

This book contains a history of the sleeping car from its origin to the present day, giving particular attention to the life and work of the late George M. Pullman and the growth of the Pullman Company from an insignificant beginning to a great corporation. "The hotel desk," he says, "corresponds to the ticket office of the Pullman Company." The magnitude of Pullman service is indicated by its 260,000 beds and 2,950 office desks and its total registration of 26,000,000 people each year. He devotes separate chapters to the town of Pullman, Ill., where the Pullman cars are manufactured, to inventions and improvements which have added to the comforts and safety of passengers, to the manufacture of the cars and to the operating organization which makes Pullman service available in every part of the country.

Proceedings of the American Wood Preservers' Association. 538 pages, 6 in. by 9 in., illustrated. Bound in cloth. Published by the American Wood Preservers' Association, F. J. Angier, secretary-treasurer, Mt. Royal Station, Baltimore, Md. Price, cloth \$3.50; paper \$2.50.

This book comprises a complete account of the thirteenth annual convention of the American Wood Preservers' Association, which was held in New York on January 23 to 25 inclusive, 1917. As in previous editions it contains also statistics regarding the treating plants in operation, the quantity of wood treated and the preservatives used in the United States during the preceding year. A large part of the proceedings is devoted to statistics of service tests of cross-ties compiled by P. R. Hicks, engineer, Forest Products Laboratory, at Madison, Wis., and presented before the convention. Other subjects covered include plant operation, preservatives, the handling of wood, the grouping of ties for treatment, the purchase and preservation of timber, and service tests on wood blocks.

The Salton Sea. An account of Harriman's fight with the Colorado river. By George Kennan. Published by the Macmillan Company. 106 pages. Price \$1.

A rather exciting novel has been written based on the overflow of the Colorado river into the Imperial valley, Cal., and the fight which was made to save the valley by turning the river back into its own channel. The accurate account which Mr. Kennan now publishes of this episode in the history of the Southwest is as intensely interesting as any novel. The bed of the Colorado river, where it lies along the southwestern slope of the Imperial valley, is much higher than is the floor of the valley. The Imperial valley had been exploited by men entirely unconnected with the Southern Pacific who had built a large irrigation system and had colonized the valley. Water for irrigation was taken from the Colorado river. One of the irrigation ditches was so placed that floods in the Colorado ate back into it until the whole river flowed down through this widened ditch instead of in its own channel. In desperation the irrigation company appealed to Mr. Harriman personally. He lent the money on condition that Southern Pacific interests could see that the money was wisely spent. Before he got through with it Mr. Harriman had to advance more than three million dollars, which the government never reimbursed him for, although President Roosevelt had implied in a telegram that he would see that reimbursement was made. The book is so well written and the story it has to tell so dramatic that it ought to have a very wide circulation.

General Rate Advance Refused By Commission

Finds No Need for Heroic Treatment. Increases in Eastern Class Rates, Rail-and-Water Rates and on Coal

THE Interstate Commerce Commission on June 29 gave out its decision denying the general 15 per cent advance in freight rates asked by the railroads of the country, but permitting increases on coal, coke and ore, in class rates in Official Classification territory and in water and rail rates.

The order of the commission suspends until October 28 the tariffs and special supplements filed by the roads except those applying to bituminous coal, coke and iron ore in and between the eastern and southern districts. A separate order also suspends until October 29 proposed increases on anthracite coal.

As to the western and southern carriers, the commission expressed the conclusion that no condition of emergency exists which would justify permitting a general increase in their rates, but as to the eastern roads the commission found that they are entitled to increased revenue beyond that which they are securing and will secure from the increased rates on bituminous coal, coke and iron ore. It, therefore, announced that they would be permitted to increase class rates in Official Classification territory on not less than five days' notice, observing established relationships between ports and localities, based on the following scale between New York and Chicago:

Class	1	2	3	4	5	6
Proposed Rate	90	79	60	42	36	30
Present Rate	78.8	68.3	52.5	36.8	31.5	26.3

Carriers in the eastern, western and southern districts are given permission to increase joint rates between rail and water carriers to a level not higher than the all-rail rates and the western lines are allowed to file tariffs increasing rates on coal and coke not to exceed 15 cents per ton.

The commission says that the carriers were clearly within their rights in bringing the matter to its attention when they did and that "their action is an added evidence of the foresightedness and sense of responsibility in the performance of their duties toward the public with which so many of their officials are managing and administering the affairs of their respective properties," and that if there had been a continuation of the unfavorable results of February which were before the roads when the application was made, its conclusion must have been different, but that conditions have been improved since that time and that the record does not disclose the existence of a situation requiring so heroic a remedy as a large percentage increase.

Benefit is expressed that it would not be in the interests of any one now to resume hearings in detail as to the suspended tariffs and it is suggested that the carriers cancel them. Meanwhile, the commission promises to keep in close touch with the operating results for the future, and "if it shall develop that the fears which have prompted the carriers are realized or that their realization is imminent," that it will be ready to meet that situation by such modification or amplification of its conclusions and orders as are shown to be justified.

Commissioner Harlan filed a concurring opinion, but expressed the opinion that the relief granted is not adequate and that more general increases should have been allowed. Commissioner Meyer dissented from the conclusion that the eastern carriers require an increase in class rates. Commissioner McChord concurred in the dissent by Commissioner Meyer on the ground that the issue presented is largely one of governmental policy, and that the facts should be presented to Congress for determination as to whether prices for fuel and supplies should not be regulated rather than that rates should be increased. The following is an abstract of the opinion by the commission and of the other opinions. The statistical tables

referred to were not printed when the report was issued but are included in a separate supplement.

MAJORITY OPINION

On March 22, 1917, carriers in official classification territory, represented to the commission in a public conference that an emergency had arisen in their operation which required prompt remedial measures. Similar representations were made on March 27 by the carriers in western classification territory, and on April 10 by carriers in southern classification territory. In all of these conferences we were urged to act promptly, because, it was asserted, the situation had become critical and delay would detract from the beneficial effects of the remedial measures proposed.

The operating results for the month of February, 1917, may well have startled the railway executives because, generally speaking, they were, for the eastern district especially, extremely unfavorable. Severe weather, relatively heavy movement of empty cars, and increased wages, together with increases in the cost of materials and supplies, and to some extent of fuel, made the operating results of the eastern carriers for February alarmingly unfavorable. Under stress of these conditions the railway executives made their first appeals for relief in the emergency in which they believed they found themselves. If these unfavorable tendencies had continued and the operating results for the succeeding months had perpetuated tendencies of the month of February, a problem very different from that which now confronts us would have been presented. That carriers have been obliged to pay increased prices for materials and supplies can not be questioned. It is difficult to characterize with moderation the increases in the prices of metals as well as the prices which have been demanded in various localities for fuel.

The emergency which the carriers believed existed when these proceedings were initiated was attributed by some primarily to the war in Europe. While a number of witnesses referred to the burdens to the carriers of the war, viewing the record as a whole no such burdens have been shown to exist nor has the probability of their development been demonstrated. It was not shown that military transportation had been in the past, or is likely to be in the future, a financial burden to the carriers. On the contrary, certain facts were referred to which indicated that the transportation of troops had been more remunerative during certain mobilizations in the past than ordinary passenger transportation. In so far as anything that is here asked of us might contribute to the success of the war we should respond unhesitatingly to the fullest extent of our lawful authority. We are not unmindful of the fundamental and immensely valuable service which the carriers perform in times of peace and even more in times of war. No one will deny that the successful operation of the railways is vital to our national welfare. We fully appreciate the services which the railways are performing, and the unusual efforts they are making to secure a maximum of efficiency. But this record does not convince us that the suspending or refusing to suspend the proposed rates, or the granting or refusing to grant increased rates, will facilitate or retard the successful prosecution of the war.

An examination of the results of operation during 1916 shows that that year was as a whole more profitable for the carriers than any preceding year, and it may be assumed that they might suffer some abatement of the prosperity of that year without being crippled or in any way incapacitated. In the appendix are shown monthly averages per mile of

road for operating revenues and operating income for all class I roads in the United States and for those in the several districts. The relation of the figures for operating revenues for each calendar year to those for the first four months, January to April, inclusive, is seen to be rather remarkably uniform, enabling one to expect with considerable confidence that the operating revenues for the calendar year 1917 will be in excess of those of any preceding calendar year covered by the series of reports. An estimate of operating income for the year is also shown, but, owing to the fact that a considerable number of increased costs that may reasonably be expected had not become effective prior to April 30, this estimate is not entitled to so much confidence as that of operating revenues.

FAVORABLE PROSPECTS FOR 1917

A study of the figures suggests that, barring unforeseen contingencies and unusual disruptions of commercial affairs during the remainder of the year 1917, we shall find as results of the year's operations of class I roads figures about as follows:

	United States	Eastern district	Southern district	Western district
Average operating revenues per mile of road	\$17,104	\$29,432	\$13,610	\$12,597
Average operating income ¹ per mile of road	4,334	5,802	3,872	3,813

¹ Based on costs represented in accounts to April 30, 1917. Anticipated increased costs, if realized, will operate to reduce somewhat the estimated figures for operating income per mile.

The figures for operating income per mile of road for calendar years when compared with those for book value of investment in road and equipment per mile of road at June 30, give for class I carriers for the United States as a whole the following ratios, using the estimated figures for 1917:

	Per cent									
	1917.	1916.	1915.	1914.	1913.	1912.	1911.	1910.	1909.	1908.
Ratio of operating income to investment ¹	5.817	6.400	5.240	4.091	4.683	5.300	5.070	5.519	5.866	4.941

¹ Based on an estimate of \$4,334 operating income per mile of road and book investment of \$74,500 per mile of road. Increasing costs subsequent to April 30, 1917, will probably operate to diminish this figure somewhat.

The estimate of operating income for 1917 may be considerably diminished and still exceed the average for any three consecutive preceding years.

The consideration of a general increased rate case is necessarily a study of tendencies. The trend of the curves shown in the different diagrams for the respective periods of time is unmistakably in a certain direction. It will be observed that there have been numerous ups and downs, but the general tendency has been favorable, including, for the country as a whole, the first four months of 1917. These figures and diagrams do not suggest a country-wide emergency. Emergencies of greater or less intensity may have existed with respect to individual carriers during various limited periods, but the direction of the curves shows recovery in each instance before the lapse of extended periods of time. The general trend has been distinctly favorable.

MAJORITY OF ROADS IN HEALTHY CONDITION

An examination of the operating results of individual carriers shows that certain of them have lacked prosperity while others have been affluent. The reasons for lack of prosperity on the part of some of them are well known. The great majority of them show a healthy condition from financial and operating standpoints. We must consider not only the successful and strong but also the unsuccessful and the weak. The needs of certain weak lines, however, can not justify a course of action that is unwarranted by the condition of the larger number of strong and successful lines. This record shows that many of the carriers are in a most prosperous condition. They have been managed by men of conspicuous ability and integrity, in whose achievement the whole nation may well take pride. It is certainly desirable

that successes of this character which mean efficient service shall continue.

All the carriers expressed their willingness to begin immediately upon a revision of the horizontally increased rates with a view to re-establishing existing relationships between competitive localities, commodities, and territories, thus recognizing the commercial disturbances which would certainly follow the proposed increases. It was generally admitted that a percentage increase would destroy existing rate relations, and in all cases where the amount of the charge is appreciably large and where the differences in distance between competitive localities are relatively great a 15 per cent increase would seriously affect competitors in a common market. It is probably due to this fact that with respect to certain important commodities the protests came from persons located at the greater distances from the markets.

Only a most urgent and extraordinary situation would justify permitting tariffs carrying a large percentage increase to become effective. This record does not disclose the existence of a situation requiring so heroic a remedy.

The absence of protests against the proposed rates from many interests and localities affected received some attention upon the record. The relative absence of protests from certain large traffic areas was likewise brought to our attention. These facts are not without significance in so far as they indicate an existing state of the public mind. They are quite without significance as a basis for determining the propriety and reasonableness of the proposed rates. The statute does not authorize us to arrive at a decision with respect to the reasonableness of rates on the basis of preponderating views. It may be admitted that facts of this character reflected in the record indicate a somewhat different state of public opinion from that which has heretofore prevailed in connection with similar issues before us. Representatives of insurance companies and bankers appeared to favor permitting the rates to become effective as a means of stabilizing their investments in railroad securities and stocks.

As we have said, if the unfavorable results of February had continued our conclusion must have been different. Those unfavorable tendencies, however, did not continue. The general operating results, looked at in the large through a series of years, show on the whole substantial improvement, general prosperity, and, by comparison with former years, ample financial resources with which to conduct transportation.

Increased prices of materials and supplies, the increased cost of fuel, and increased wages are all significant and extremely important factors in the situation which we are here considering. Some of the symptoms are unquestionably unfavorable. Much or all of what some of the railway officials believe will occur may occur in the future. No one can know in advance. Higher prices are being paid today, and still higher prices may have to be paid in the future, but that these higher prices will have that unfavorable effect on the general operating results which some believe they will have is by no means certain.

RECENT TENDENCY OF REVENUES

The carriers in the eastern district down through September, 1916, showed an increase in net revenue and in operating income over the corresponding month of the previous year. Beginning, however, with October, 1916, and continuing through April, 1917, this tendency is reversed for the eastern carriers, whereas with few exceptions the southern and western carriers continued to show comparative increases in these items for each successive month. Thus, in October, 1916, the eastern carriers showed a decline in net revenue per mile of road from \$840 to \$821, and in operating income from \$760 to \$726. For November, 1916, the eastern carriers showed a decline in these two items from \$800 to \$720 in net revenue, and from \$721 to \$623 in operating income.

For December, 1916, the same tendency persisted, showing a decline in net revenue from \$706 to \$630 and a decline in operating income from \$625 to \$532.

The increasing tendency in these items for the months of July, August and September, 1916, sufficed for the last six months of the calendar year 1916 to make a slightly better aggregate showing as contrasted with the last six months of the previous calendar year. But so far as the eastern carriers are concerned, the decline for the last quarter of 1916 was continued for the first four months of 1917 and in increasing ratio.

Thus, in January, 1917, net revenue per mile of road operated declined from \$608 to \$531, and operating income from \$520 to 434.

For February, 1917, exceptional operating conditions exaggerated the decline and rendered it more pronounced. The February returns show a decline in net revenue from \$576 to \$271, and in operating income from \$489 to \$176.

March showed the same comparative decline, although upon a less intensified scale than in February. Net revenue declined from \$666 to \$557, and operating income from \$578 to 460. The returns for April indicated the same tendency, net revenue declining from \$686 to \$611, and operating income from \$599 to \$512.

Summarizing the four months ended with April, 1917, the decline in net revenue per mile of road was from \$2,536 to \$1,970, and in operating income from \$2,185 to \$1,581. If we compare the relative decline in the last quarter of 1916 when this tendency became noticeable, we find that the falling off in operating income from the operating income of the last quarter of the previous year was approximately 19 per cent, whereas for the first four months of the current calendar year the decline in operating income as compared with the first four months of the previous calendar year amounts to about 27.5 per cent.

In interpreting these figures it must be borne in mind that the gross revenue in each of the three districts showed for each month from July, 1916, to April, 1917, a comparative increase, except only for the month of February in the eastern district. In the southern and western districts the results, so far as net revenue and operating income are concerned, show an almost unbroken contrast to the results for the eastern district.

If on the basis of the first four months of the current calendar year we estimate the total gross revenue in the eastern district for the entire year, we find indicated an average operating revenue per mile of road of \$29,432, as against an average operating revenue for the preceding year of \$27,688. Despite this increase in the gross operating revenue the average operating income per mile of road estimated for 1917, on the basis on the first four months of the calendar year, amounts to but \$1,582, as against \$2,188 for 1916. This indicates that the ratio of operating income to average investment in the eastern district will be but 4.893 per cent, as against 6.662 per cent for 1916.

In other words, using the actual figures for the first four months of the present calendar year, it would appear that although the gross revenue for the carriers in the eastern district would exceed that for the calendar year 1916 by approximately 7 per cent the operating income per mile of road will be but \$5,802, as against \$7,782 in 1916. This is only 75 per cent as much net income per mile of road in 1917 for performing about 107 per cent of the service performed in 1916.

The returns for the first four months of the calendar year 1917 for the roads in the southern district and in the western district disclose a different tendency and outlook. Common alike to the three districts is the probable increase in gross operating revenues. Thus, the first four months disclose average operating revenues per mile of \$4,388 in the southern district as against \$3,960 for the corresponding period

in 1916, and \$3,705 as against \$3,288 in the western district. But in both the southern and western districts the first four months of the current calendar year presage not only an increase in the average operating income per mile of road, \$1,222 as against \$1,181 for the first four months of 1916 in the southern district and \$930 as against \$877 for the roads in the western district, but in both an increase in the ratio of operating income to average investment is indicated, rising in the case of the southern district from 6.390 per cent to 6.453 per cent and in the western district from 5.953 per cent to 6.217 per cent.

It may very pertinently be asked how it results that with the carriers in all three districts confronting increased expenditure for labor, fuel and supplies, the prospective effect upon their respective net income is so markedly different. To this inquiry it is probably too early to make a completely satisfactory answer. Among the factors the following may be suggested as highly probable contributory causes. The ratio of increased wages may have been greater for the eastern carriers. The eastern carriers have encountered earlier and to a more complete degree the increase in prices of materials and supplies. The volume of traffic which has congested certain of the roads and terminals in the eastern district would seem to indicate that with their present facilities they can perhaps take on additional traffic only at an increasing cost per unit. In this respect they present a somewhat sharp contrast to roads in the southern and western districts. Congestion at eastern ports and terminals has led to the diversion of some traffic to Gulf and south Atlantic ports.

In the western district the transcontinental roads, particularly the Southern Pacific and the Santa Fe, are now carrying a large volume of traffic which would normally move via the Panama Canal. This they are apparently able to handle without great difficulty. Whatever may be the other contributing causes to the divergent tendencies manifested in the three districts, the existence of agencies making for radically diverse results in the eastern district from those likely to appear in the southern and western districts would seem to be substantiated by the following table, which gives the ratio of net operating income to property investment in the three districts from 1900, with the probable results indicated for 1917.

NET OPERATING INCOME PER CENT OF PROPERTY INVESTMENT

Fiscal years ending June 30 —	Eastern district.	Southern district.	Western district.
1900.....	5.27
1901.....	5.49	4.46	4.84
1902.....	5.69	4.77	5.29
1903.....	5.77	5.01	5.30
1904.....	5.44	4.87	5.03
1905.....	5.70	5.15	5.25
1906.....	6.21	5.26	5.90
1907.....	6.14	4.67	6.19
1908.....	5.14	3.87	4.87
1909.....	5.43	4.72	5.34
1910.....	6.16	5.19	5.06
1911.....	5.13	6.22	4.68
1912.....	5.10	4.40	4.24
1913.....	5.28	4.55	4.91
1914.....	3.95	4.25	4.23
1915.....	4.42	3.41	4.14
1916.....	6.64	5.26	5.43
1916.....	1 6.42	5.27	5.29
1917 (estimated).....	2 6.61	5.45
1917 (estimated).....	4.89	6.45	6.21

¹ Average based on gross property investment.

² Average based on property investment less reserves for depreciation.

Without in any wise impugning the estimates of the carriers or criticisms thereof offered by the protestants, we prefer to confine our forecast to the basis of actual experience for the 10 months from July 1, 1916, including the first four months of the present calendar year.

RATES THAT MAY BE ADVANCED

For these reasons, necessarily stated in somewhat general terms, we are led to the conclusion that no condition of emergency exists as to the western and southern carriers which would justify permitting a general increase in their

rates to become effective. In the eastern district increased rates have recently been permitted to become effective generally on bituminous coal, coke and iron ore. We think that similar increases may properly be permitted in the southern district on coal, coke and iron ore, and in the western district on coal and coke. This will preserve rate relationships between the several districts. In the southern district the proposed increased rates on coal are on the basis of 15 per cent, with a maximum of 15 cents per ton. These tariffs we shall permit to become effective. In the western district the increases are based upon 15 per cent, with a minimum of 15 cents per ton. These tariffs will be suspended, but the western carriers may, if they so elect, file new tariffs carrying increases in rates on coal and coke not exceeding in any case 15 cents per ton. All of the tariffs included in this proceeding of the western lines will be suspended. All of the tariffs included in this proceeding of the southern carriers will be suspended, excepting those applying on coal, coke and iron ore.

EASTERN ROADS NEED MORE REVENUE

For reasons indicated in this report, we shall suspend all of the tariffs before us in this proceeding of the eastern carriers, excepting those applying on iron ore. As has been indicated, however, the conditions confronting the eastern carriers are substantially different from those confronting the southern and western carriers, and we are persuaded that they are entitled to increased revenue beyond and above that which they are securing and will secure from the increased rates on bituminous coal, coke and iron ore. By recent act of Congress we have been given jurisdiction over the movement, distribution, exchange, interchange and return of freight cars. The obvious intent of this legislation is that cars shall be so used by the carriers as to secure the performance of the largest possible amount of transportation in needed and equitable ways. Shortly following the outbreak of the European war an unprecedentedly heavy movement of freight to the eastern district began, and that district in large part has been badly congested ever since. Hopeless congestion has been avoided only by practically continuous condition of operating under embargoes. The result has been that while roads in other sections have generally been short of cars and in possession of less cars than they owned, the carriers in the eastern district have been in possession of substantially more than their ownership of cars. The hauling of empty cars is expensive and productive of no revenue. Railroad operating officials naturally and properly endeavor to avoid all unnecessary hauling of empties. There has been reason to believe that this disinclination to haul empties has caused the detention on the eastern roads of many cars that were badly needed in the west or south. It is probable, if not certain, that in administering the duties laid upon us by the legislation referred to we shall find occasion to require a very unusual haul of empty cars by the eastern carriers for the purpose of getting them promptly to western or southern localities where they are needed. In this way important additional expenses will probably fall upon the eastern carriers.

As we have indicated, percentage increases, especially where the percentage is substantial, can not fail to disrupt competitive commercial relationship. A general increase in class rates, which preserves existing relationships, distributes itself more generally and more equitably than would general increases on commodity rates. It also affords relatively equal benefits to all of the carriers parties thereto. Among the eastern carriers those located in New England appear to present the most serious condition. They are not carriers of large volumes of heavy loading commodities that move under commodity rates. It is not possible to estimate with confidence and accuracy the amount of additional revenue that will accrue from increased class rates, but from the

best information at hand we conclude that the eastern carriers should be permitted to increase their class rates between New York and Chicago to the following scale, and to correspondingly increase their other class rates applying intra-territorially between points in official classification territory, observing the established relationships between ports and localities:

1	2	3	4	5	6
90	79	60	42	36	30

Such tariffs may be made effective upon not less than five days' notice, given in the usual way.

Special emphasis has been laid upon the unusually heavy increased expenses that have been laid upon the carriers by water, which, because of arrangements for through carriage with rail carriers, are subject, as to part or all of their rates, to our jurisdiction. Ordinarily rates via rail-and-water routes are maintained at a lower level than via all-rail routes.

Largely increased costs of operation, the diversion of traffic to other channels because of war conditions, and the attendant increased marine insurance have laid upon such rail-and-water routes unusual burdens. We think that existing conditions justify the maintenance of rates via such routes on a level not higher than the all-rail rates between the same points. Carriers in the eastern, southern, and western districts parties thereto may, if they so elect, file and make effective, upon not less than five days' notice, tariffs increasing existing joint rates between rail-and-water carriers to a level not higher than the all-rail rates between the same points.

CARRIERS WITHIN THEIR RIGHTS

The carriers were clearly within their rights in bringing these matters to our attention when they did. We do not question their good faith in anything they have done in this connection. Their action is an added evidence of the far-sightedness and sense of responsibility in the performance of their duties toward the public with which so many of their officials are managing and administering the affairs of their respective properties. The things which they believed several months ago would happen have not happened. None of us know what the future may develop. We do not believe that it would be in the interests of anyone to now resume hearings in detail as to the suspended tariffs. As stated, we believe that the facts which have been developed constitute a full and sufficient basis for arriving at a just conclusion with respect to the proposed increased rates. We shall, through the medium of the monthly reports of the carriers, keep in close touch with the operating results for the future, and if it shall develop that the fears which have prompted the carriers are realized or that their realization is imminent, we shall be ready to meet that situation by such modification or amplification of the conclusions and orders herein reached and entered as are shown to be justified. If it shall develop that what has been accorded herein is more than is appropriate or that the increased rates are no longer warranted, we shall depend upon the pledges of the carriers to respond promptly to an announcement by us of a conclusion to that effect. Inasmuch as a general percentage increase is so undesirable because of its serious effect upon commercial conditions and established relationships, it would seem to be appropriate for the carriers to cancel the tariffs which we suspend herein, and permission is hereby accorded them so to do. The record will be available for consideration in any further proceedings that may be necessary or appropriate in this connection in the future, and any substantially changed conditions which may develop can be promptly, adequately, and fairly dealt with. The foundation for any such action can doubtless best be laid in conferences between the commission and representatives of the carriers and of the shippers. The existing public sentiment to

which we have referred and the manner in which, the proposals of the carriers have been presented and handled by them indicate a feeling of mutual confidence, which at many times in the past has been regrettably absent.

COMMISSIONER HARLAN'S OPINION

Under the law, this commission may act only upon a concurring vote of at least four of its members, and in view of the recent death of Commissioner Clements and of the varying conclusions entertained among my colleagues on the important questions presented by the record, it became necessary, in order that some affirmative results might follow from this extended and laborious investigation, that I should concur in the course outlined in the commission's report. I did this, however, because its findings are in the direction of what the record seems to me to justify and require and not because I regard the relief granted as adequate.

From the mass of statistics offered in evidence on both sides it is not difficult, as the commission's report indicates, to compile figures to illustrate almost any theory respecting the troubles of the carriers of the country. Laying some stress upon the figures for the last four months, the commission's finding upon the whole record is that the fears of the railroad officials, when they laid their request for increased rates before us, have not been realized. The report, then, indicates the purpose of the commission to follow the developments through the medium of the monthly reports of the carriers, and should their earnings make it appear that the dangers feared by the carriers are imminent, the commission will then meet the situation by promptly amplifying the limited relief now permitted to them.

MONTH-TO-MONTH VIEW INADEQUATE

This month-to-month and purely statistical view of the matter seems to me to be wholly inadequate. Nor do I regard that course as altogether safe. We are facing a much larger problem, and it must be approached in a much broader way if we are to reach a sound solution. The report of the commission states that some of the symptoms disclosed of record are unquestionably unfavorable. As I read the record, that is undoubtedly the case and, being so, the wisdom of deferring full relief is not apparent to me. What the country as a whole needs, as all participating in the hearings seemed to agree, is much larger terminals, more tracks, more cars, and more locomotives. This enlargement of our facilities is not required merely to meet the exigencies growing out of the war, but to keep our transportation facilities up to the measure of the country's growing volume of business. We are now a creditor nation, and it may reasonably be expected that the trade balance in our favor will continue at least for some years. With the aid of our new merchant marine, this may become a more or less permanent condition. With such a prospect before us, a foundation should be laid without delay for a definite plan for the development and building up of our transportation system. For seven or eight years, competent railroad officials have been warning us that the carriers are not keeping abreast of the requirements of the country. It is true that there are periods when a substantial part of the carriers' equipment is lying idle. On the other hand, the carriers can not prudently undertake to meet extreme and extraordinary demands. But a rough estimate of a billion dollars has been suggested as the yearly expenditure necessary to enable them to open up new territory and to enlarge and extend their present facilities in order to meet the rapidly growing volume of the general commerce of the country. No such investment, however, has been or is being made in our railroads. On the contrary an exhibit of record shows that beginning with 1895 the new construction increased year by year until 1910, while from the latter date it has steadily diminished. In other words, our population and commerce have largely expanded, but

there has been no expansion, relatively speaking, in our transportation facilities.

INDUSTRIES HAVE BEEN EMBARRASSED

For two years the commerce of the country has been moving under intermittent embargoes, an experience, as must be observed, that we have had in the past not only while we were at peace, but while the world at large was also at peace. Great losses have resulted to the whole country. The producer and manufacturer, with ample supplies which the public was demanding, have been unable to make deliveries. The coal operator, with no shortage of coal at the mine, has not been able to deliver it promptly to those needing it. Prices for the necessities of life have increased, partly at least because existing supplies could not be brought to the consumer; and the speculator has been enabled to demand unreasonable prices because inadequate facilities have prevented the competition in the consuming markets of those who were prepared to furnish the same commodities at lower prices. Large industries have been greatly embarrassed. It will suffice to say that, while the strains of the war have much to do with the present transportation conditions, the one outstanding fact during the hearing, as to which there was no disagreement, was that our transportation system is lacking in the capacity to meet the demands of the shippers and that the resulting loss to the general public has been very large. This condition is one of present danger, with a possibility that it may even become disastrous during the war period. But aside from this military influence, the record leaves no doubt that our transportation system, as a whole, must be promptly enlarged and expanded.

RATE ADVANCE IN PUBLIC INTEREST

The shippers of the country recognize the danger and have given expression to this apprehension upon the record. They regard a prompt and sound cure of the trouble as being as vital to them as to the carriers. Representatives of some of the largest industrial centers, officers of some of the largest traffic organizations, and officials of some of the most important shippers of the country, availed themselves at the hearing of the opportunity to refer to the situation, and to point out that in their own interest as shippers, and in the interest of the general shipping public, the rates of the carriers might well be increased in order that they may be put in a position to increase their terminals and facilities. Many earnest objections were of course made to any increase. Other shipping interests were ready to acquiesce in an increase provided no discriminations against them were involved. But the whole discussion, unusually free from selfish contentions on the part of the shippers, and approached by the carriers, as I understand the record, in no selfish spirit, leaves me with the conviction that the shippers at large are ready for a substantial increase in their rates, provided it will result in an early betterment of their transportation service and in a rate structure free from discriminations. The record in my judgment demonstrates a proposition that has long been clear to me, namely, that a rate is a public question and that the existing rates, aside from any interest that the owners of our railroads may have in the matter, could well be advanced in the public interest, in order that assurance may thus be given for the early enlargement of our transportation facilities.

I express the thought in that way because it is clear that so long as we look to private interests to furnish a transportation service for the country we must see to it that the rewards are sufficient to attract capital for its further development. Under present conditions this appears not to be the case. Executives of great insurance companies and of great savings institutions testified during the hearings that the volume of their holdings in railroad securities has been steadily diminishing and that they and other large investors

are looking with decreasing favor on railroad securities. Possibly this may result to some extent from an impression, which I think is very erroneous, that this commission takes too narrow a view of such questions as are before us here. But, in any event, we must not overlook the fact that at this time, and apparently for the next few years, new capital must be sought by the carriers in competition with the demands of many governments for war loans and in competition with the very large returns of industrial companies. Nor must we overlook the fact that the returns on property investment in railroads, even under the unusually prosperous year 1916, were not such as to give any preference to the railway investor, and for the last 16 years this average return has been, using the principal and representative roads, for the eastern district 5.48, the southern 4.69, and the western 5.04 per cent.

From the whole record it is clear to me that the 15 per cent increase proposed by the eastern carriers which in its actual results would probably not exceed 10 per cent should be permitted to become effective. The record shows that conditions with the western and southern lines are somewhat better than with the eastern carriers. Nevertheless, in my judgment, they also should be permitted some increase in their rates on the general grounds that I have attempted briefly to outline. In view, however, of the findings of the commission's report, it will not be necessary to discuss the extent of the increase that they should have.

In the light of the refusal by the commission of what, in my judgment, is sufficient additional revenues to the carriers, it seems appropriate again to call attention to the economies that may be and should be effected through the co-ordination of terminals, the elimination of unhealthy competition, the waste in service through the light loading of cars, and the performance of special services for particular shippers without charge. Much of the service at the larger industrial centers and ports is special in character and the heavy terminal cost encountered by the carriers in performing them is spread over the rate structure instead of being compensated under a special charge. The smaller communities grouped with the larger centers thus bear burdens that should be borne by others. Sooner or later matters of this kind must have serious attention by the commission, and they will open sources of substantial additional revenues to the carriers.

COMMISSIONER MEYER'S OPINION

Meyer, Commissioner, dissenting in part:

I concur in the conclusions with respect to carriers in western and southern territories. I dissent from the conclusion of the majority that an emergency exists in regard to carriers in the eastern district of such a character as to make it imperative to authorize at this time the increased class rates sanctioned by the majority.

I recognize freely that the results of operation for eastern carriers during recent months have been less favorable than for the western and the southern. Certain tendencies are unmistakably unfavorable. It is difficult to characterize with moderation many of the prices of materials and supplies and fuel which these carriers have paid and which apparently they will pay for some time to come. These together with higher wages tend with certainty toward more unfavorable operating results. We have authorized increases in the rates on bituminous coal, coke and ore which will add to the operating incomes of these carriers many millions of dollars and which will bring the estimated return on the book cost of the carriers up to a level which in my judgment disproves the theory of an acute contemporary emergency demanding drastic action at this moment. In spite of increased and increasing expenses, there is nothing before us to prove conclusively that the net returns of carriers in the eastern district for the calendar year 1917 may not be more

favorable than the net returns for all but a very small number of years during their entire history. But even if the contrary could be demonstrated, it does not necessarily follow that the increases authorized by the majority should be authorized at this time. Whenever the time may come, if it should come, that a real emergency can be shown to exist, we can then do promptly what justice and the law may demand. Before important action like this is taken the most conclusive proof of its necessity should be before the commission. If I apply to the facts now before us the same test which I applied to the facts before the commission in the great advanced rate cases that have preceded this one I am forced to a different conclusion regarding eastern carriers than that reached by the majority. In this connection I refer to Tables 13 to 21, which reflect operating results through the entire period embracing all of the important increased rate proceedings. They are the tables used in our reports of July, 1914, and December, 1914, brought down to date. I direct especial attention to Tables 13, 14, 15 and 16, which clearly indicate the improvement in operating results following December, 1914, and likewise reflecting the decline since the fall of 1916.

In the instant case we have before us once more the now familiar aggregation of basic factors. Again we have considered them by themselves and in their relationship to one another, and we have assessed them in the light of the attendant facts and circumstances of record. Applying the same kind of reasoning and the same methods which have prevailed in the earlier proceedings to the facts upon the present record, I have reached the conclusion that the proposed increased rates have not been justified. The majority holds that the eastern carriers have justified certain increased rates. My convictions are to the contrary.

The year 1916 is admitted by all to have been an abnormally prosperous year for the class I railways of the eastern district, as well as for those of the entire country. The banner year prior to 1916 was 1913. In 1913 the operating revenues in the eastern district amounted, for the four months January to April, inclusive, to \$7,241 per mile of road; the next best year prior to 1916 was 1915, in the corresponding four months of which this item was \$6,653, although for these four months it was surpassed by 1914, in which the item amounted to \$6,850. For the like period of 1916 the item had risen to \$8,528, an increase of 17 per cent over 1913, and for the like period of 1917 it had further risen to \$9,056, an increase of more than 6 per cent over the figure for 1916.

It is argued, however, that expenses are rising much faster than revenues and that the outlook is so unfavorable that in the opinion of the majority it is necessary at once to authorize an increased class scale of rates.

The carriers are primarily interested not in operating revenues nor in operating expenses, but in the margin between them, in what remains of operating revenues after operating expenses and taxes have been deducted, or operating income. The operating income per mile of road in the eastern district for the first four months of 1916 was far in advance of that of any prior year for which the figures have been compiled from our monthly reports, being \$2,188 as against \$1,394 for the like period of 1911. The largest figure for this period for any of the intermediate years was \$1,340 for 1913. The corresponding figure for the like period of 1917, within which the flood of increasing costs was expected to be upon us, was \$1,582, an amount more than 13 per cent better than for that period of any of the preceding six years except the abnormal year of 1916.

It is too early for most of the May reports of the large carriers to have reached us, and at the time of writing only two of the principal carriers have filed their reports for May. While it probably would be incorrect to say that these two are typical, it is not without significance to point out

that the operating income of the Southern Pacific Company for May, 1917, is more than 30 per cent greater than for May, 1916, and that while that of the Delaware, Lackawanna & Western, the only large eastern carrier whose last monthly report has been received, shows a falling off, it is yet substantially greater than for any May in the four years preceding 1916.

In our reports relating to advanced rate cases which have preceded this one more or less has been said about operating ratios. I fully appreciate the limitations inherent in the use of operating ratios. However, they have been among the more prominent factors which appear upon the respective records and in our reports. The table below states the operating ratios for all class I carriers in the eastern district for the first four months of each of the last 10 years:

TABLE OF OPERATING RATIOS FOR CLASS I STEAM RAILWAYS,
EASTERN DISTRICT

Month.	1917.	1916.	1915.	1914.	1913.	1912.	1911.	1910.	1909.	1908.
January	76.37	70.66	80.68	83.91	76.44	79.16	77.34	72.44	74.71	79.75
February	86.15	71.78	79.77	88.97	78.01	77.10	77.97	73.12	75.01	80.82
March	77.04	69.98	74.04	78.31	78.87	71.94	71.47	68.47	68.88	73.99
April	74.79	68.73	70.97	76.47	78.06	77.61	69.23	70.30	68.52	71.85

An examination of this table shows conclusively that so far as operating ratios may be used as a barometer, the first four months of 1917 do not necessarily predict unfavorable results for the entire year. In fact, it will be observed that for the banner year 1913, three out of the four operating ratios were more unfavorable than the corresponding ratios for 1917. I would be unwilling to state that this necessarily indicates that 1917 will result in larger net incomes than 1913, but I am equally unwilling to agree that the ratios for 1917 and the relatively unfavorable indications of certain other factors together support the conclusion that an emergency now exists which requires an immediate increase in the scale of class rates. Future events may justify this increase. Events up to the present have not done so.

COMMISSIONER MCHORD'S OPINION

McChord, Commissioner, dissenting:

Upon the facts before us, I concur in the dissent by Commissioner Meyer. The issue presented is in reality one largely of governmental policy, rather than a question whether the rates sought to be made effective July 1 are reasonable for the service of transportation. The nation is at war, costs of fuel and other commodities are abnormal, the conditions affecting the volume and movement of traffic are without precedent. The future of these conditions, immediate or remote, can not be predicted with even a fair degree of certainty. Thus the situation before us is not sufficiently normal or stable in character to make possible an intelligent inquiry into the reasonableness of rates. That the operating costs of certain carriers, particularly in eastern territory, have been substantially increased by the increased costs of fuel and supplies is apparent.

Should this commission upon the showing here made approve an increase of rates predicated in a large measure upon prophecies for the future, to strengthen the credit of the carriers, or should the prices of fuel and supplies be supervised by governmental authority? It is argued with much force that this is a question for the Congress to determine and that until it is clear that such control will not be exercised and that the carriers' fears as to what may happen in the future have been realized, this commission can not be justified in placing the burden upon the general public in the form of increased rates, especially in view of the showing made by the carriers as to their earnings. At the present moment it appears probable that the Congress will act in the matter. The Committee on Interstate and Foreign Commerce of the Senate is now holding hearings on the general subject of the control of prices. Coal operators have been in conference with the Federal Trade Commission and other government officers on the same subject. It appears that

a special committee representing coal operators in all sections of the country has proposed that prices of coal during the war be fixed by a joint governmental commission. Congress has now before it the report and recommendations of the Federal Trade Commission on the bituminous coal situation. No report has yet been made to the Congress by the commission appointed by the President to observe the operation and effects of the so-called Adamson law. It may be fairly said that the matter of the governmental control of prices of various important commodities affecting these carriers is now before the Congress.

With reference to the assertion that prices of certain commodities are affected by car supply it should be remembered that by the car service act, approved May 29, 1917, the Congress has given this commission full authority over the movement, distribution, exchange, interchange and return of cars, and I do not doubt that through a vigorous exercise of that authority substantially better transportation conditions and additional revenue can be secured.

It is my judgment, therefore, that this commission should report to the Congress the essential facts disclosed by this record. If it should be determined by that body that the prices demanded of the carriers for fuel and supplies are reasonable under present conditions, or are not such as to warrant control by the government, and it should hereafter appear that the apprehensions expressed by the carriers have been realized, then I am prepared to sanction such rate increases as will permit the carriers to so equip themselves as to enable them to perform, in the most efficient manner, the transportation required of them.

Operating revenues sufficient to enable the carriers to perform their full duties are unquestionably required. In the event that the apprehensions expressed by the carriers are realized and increased charges for transportation become necessary, I would not limit those increases to certain classes of traffic, nor, in the absence of very clear proof of differences in conditions, to particular sections of the country. Rate increases, made necessary by war conditions, should be borne by all sections of the country and all classes of traffic, in so far as influences of those conditions are national in scope.

It is admitted by the carriers that they do not seek the increase in freight rates for the purpose of purchasing additional equipment, motive power, or extension of terminals, but for the sole purpose of paying increased cost of wages, material, fuel and supplies.

AIR COMMERCE AFTER THE WAR.—At a recent meeting of the Aeronautical Society of Great Britain a paper on "Commercial Aeronautics" was read by G. Holt Thomas, one of the pioneers of aviation in that country. Mr. Thomas said that in his opinion aeronautics would revolutionize the world not only from a commercial point, but also from a humanitarian point much more than it had revolutionized war. He said he was not one of those who thought commercial aeronautics were going to beat out of existence the railroads and other forms of transport, but rather that flying would act as an adjunct to present modes of transport. From a business point of view speed was everything. The airplane would enable a business man to leave London in the morning, go to business in Paris and be home again to dinner. It would take him to Bagdad in a day and a half or to New York in two days. Ceylon would become 2½ days from London, Tokio 4½, Sydney five, Cape Town 3½, and Vancouver 3. As for the question of cost it would be possible to run a profitable air service between London and Paris at \$25 a passenger, a cent an ounce for mail and 50 cents each for parcels of three pounds. A Constantinople or Moscow journey of twenty-four hours might involve a cost of \$125 a ticket.

WORK OF THE RAILROADS' WAR BOARD

The Railroads' War Board has received the first installment of replies to its request for information to be reported by the roads monthly for the purpose of ascertaining what results are being obtained by the American railroads in increasing their operating efficiency.

Fairfax Harrison, chairman of the War Board, has authorized the following statement regarding the results for April: "The Railroads' War Board has received so far reports of the service performed for the public in April last by 51 per cent of the mileage of the railroads of the United States. It shows the astonishing fact that the railroads produced and delivered to the public more than three billion ton-miles of freight transportation in excess of their performance in April, 1916, when also business was at high tide.

"This result was accomplished with the movement of but 4.3 per cent more locomotive miles and 5 per cent more freight car miles, resulting in an increase of 66 tons or 10.4 per cent per train, and 2.4 tons or 10 per cent per lading of cars—equivalent to the addition of 126,000 cars to the equipment of the roads reporting.

"To form some conception of the increase of 16 per cent, or 3,354,000,000 ton miles, in one month, on the mileage covered by the report, it is equivalent to adding 35,000 miles of railroad to the roads of the United States, with a density of freight traffic on each mile equal to the average density for all railroads of the United States for 1915. This addition to the fixed plant of the railroads exceeds the total mileage of the railroads of Great Britain in 1914 of 24,000 miles, and nearly equals the total mileage of the railroads of Germany in 1913 of 38,154 miles."

Mr. Harrison also authorizes the statement that the drive the Railroads' War Board is making to get railroads and shippers of the United States, as an imperative step in national defense, to make every freight car do the work that two did before the war, is having telling effect. Reports received by the board indicate prompt acceptance of its suggestion that loading freight cars 10 per cent in excess of their marked capacity would be equivalent to adding immediately to the supply of available equipment approximately 200,000 cars.

The report of the Commission on Car Service shows that one railroad in the month of April hauled 2.92 tons more per car than in April of last year, thus saving on this one road the use of 58,473 cars. In the month of May the same railroad hauled 1,414 pounds more of less-than-carload freight per car than in May, 1916. This saved 6,319 cars.

Three thousand cars of cement, coal, slate, and limestone on one railroad were checked to see what progress was being made in the campaign for heavier loading of cars carrying these commodities. The result showed that practically every car was hauling more than its marked capacity.

Inspectors sent out by the Commission on Car Service are watching the loading of cars in all parts of the country to insure the full use of all equipment. Last week 12 copper companies, and a number of lumber carrying roads, were informed that they were not loading cars to the full capacity and they were asked to make better use of cars from patriotic motives alone.

To help those producing communities, and shippers, and those railroads, which by reason of their economic situation are suffering from a shortage of freight cars, the Commission on Car Service has ordered those railroads, on which cars accumulate in congested territories, to turn over to roads on which shortage exists cars to the number of 34,245. These cars are being sent in train load lots direct to the points where they are most needed. Reports up to June 28 showed that more than 19,000 of these cars had already been delivered.

The French, Italian and British governments have appointed a traffic executive to co-ordinate rail and water

transportation of supplies and materials purchased by those governments in this country. D. W. Cooke, vice-president in charge of traffic of the Erie, has been appointed to act as the representative of the traffic executive in charge of railroad transportation in this country and arrangements have been concluded to provide for co-operation in all possible ways between the traffic executive and the Commission on Car Service.

In the interest of freight car efficiency, the Master Car Builders' Association has been directed to modify its rules for the period of the war so as to make possible the use of any material that is on hand which will enable cars being held for repairs to be put into service without waiting for material from the owning road.

The Sub-Committee on Materials and Supplies has been instrumental in arranging for meetings between representatives of the steel and car building companies for the purpose of co-ordinating the material and supply situation. It has also held conferences with the priority committee of the general munitions board of the Council of National Defense regarding the needs for railway materials and has been informally advised that all material necessary for the continuous and safe operation of railways should be classed as necessities ranking with the requirements of the government.

The Sub-Committee on Military Transportation Accounting has compiled and issued way-billing and accounting regulations for the prompt transportation of material for cantonments and has been working on similar regulations for material for the aviation camps. Accounting officers are located at the army camps in 41 States, keeping in close touch with all accounting and government requirements. They appoint, supervise and direct accountants or field representatives at concentration camps wherever needed.

The Sub-Committee on Military Passenger Traffic, after extensive negotiations with the administrative officers of the army, navy and marine corps, has made arrangements whereby complete routings are now available between points on the Mexican border and military posts and the various ports for the regular army organizations, between home stations and mobilization points for the National Guard, between home stations and cantonments for the National Army, and between cantonment camps and seaports for the National Army. These routings have been arranged with a view to consolidating movements of troops via the most direct and serviceable routes, affording to the government a maximum of facilities and the greatest efficiency in transportation with the special object of avoiding congestion and delays, thereby relieving the government of a vast amount of detail. Routing plans have been approved by the Secretaries of War and Navy and by the Comptroller of the Treasury, and have been distributed among various government departments and the carriers. A total of 221 carriers, including steamship lines, are represented in these routings.

In addition to the sites for army camps mentioned in the *Railway Age Gazette* of June 22, the War Department has announced the following additional concentration camps for the National Guard: Greenville and Spartanburg, S. C.; Fayetteville, N. C.; Macon and Augusta, Ga.; and Anniston and Montgomery, Ala. The government has also announced the following as sites for aviation camps: Belleville, Ill.; Dayton, O.; Mt. Clemens, Mich., and Rantoul, Ill.

COST OF COAL ON SWISS RAILWAYS.—The quantity of coal used yearly by the Swiss Federal railways is as follows: In 1915, 636,298 short tons, or 33 pounds per kilometer of 0.621 mile; in 1916, 652,884 tons, or 34 pounds per kilometer. The average price per ton paid for coal by the Swiss Federal Railways during the past 5 years was as follows: In 1912, \$5.27 per ton of 2,204 pounds; in 1913, \$5.22; in 1914, \$5.17; in 1915, \$5.15; in 1916, \$6.17.

American Society for Testing Materials

A Brief Report of the Proceedings of the Twentieth
Annual Meeting Held Last Week in Atlantic City, N. J.

THE annual meeting of the American Society for Testing Materials was held at the Hotel Traymore, Atlantic City, N. J., June 26-29, 1917. The following is a brief abstract of some of the numerous reports presented at the meeting which are of direct interest to railroad men.

COMMITTEE ON STEEL

The Committee on Steel of which C. D. Young, Pennsylvania Railroad, is chairman, is now composed of 18 subcommittees, the Committee on Cold Drawn Steel having been merged with the Committee on Steel and a new subcommittee on Heat Drawing Steel Stock now being in the course of organization. A special committee has been organized to harmonize the bend test requirements in the various specifications for steel.

The committee recommended a number of revisions in both standard specifications and tentative standard specifications and proposed a new tentative standard specification for carbon tool steel. The standard specifications for which revisions were proposed are those for blooms, billets and slabs for carbon steel forgings; carbon steel and alloy steel forgings; quenched-and-tempered carbon steel axles, shafts, etc.; quenched-and-tempered alloy steel axles, shafts, etc.; lap welded and seamless steel boiler tubes, etc., for locomotives; lap welded seamless steel and wrought iron boiler tubes for stationary service; welded steel and wrought iron pipes, and boiler and firebox steel for locomotives.

CARBON TOOL STEEL

1. These specifications cover carbon tool steel in ten classes and three grades, determined by the chemical composition specified in Section 3.

2. The steel shall be made by the crucible or electric process, with the exception of Grade C, which may be made by the open-hearth process.

3. The steel shall conform to the following requirements as to chemical composition:

Elements Considered	Grade A	Grade B	Grade C
Class No.			
1.....	0.45—0.60	(Same as Grade A)	(Same as Grade A)
2.....	0.60—0.75		
3.....	0.75—0.90		
4.....	0.90—1.05		
Carbon, per cent	5..... 1.05—1.20		
	6..... 1.20—1.35		
	7..... 1.35—1.50		
	8..... 1.50—1.65		
	9..... 1.65—1.80		
	10..... 1.80—1.95		
Manganese, max., per cent.....	0.40	0.45	0.60
Phosphorus, max., per cent.....	0.02	0.025	0.035
Sulfur, max., per cent.....	0.02	0.035	0.04
Silicon, max., per cent.....	0.35	0.35	0.25

4. In case of dispute, the chemical analyses shall be made in accordance with the Standard Methods for Chemical Analysis of Plain Carbon Steel (Serial Designation: A 33) of the American Society for Testing Materials.

5. The permissible variations in the size of the material ordered shall be agreed upon by the contractor and the purchaser.

6. The material shall be free from injurious defects, and shall have a workmanlike finish.

7. The identification marks to be placed on the material shall be agreed upon by the contractor and the purchaser.

8. The contractor shall afford the inspector, free of cost, all reasonable facilities to satisfy him that the material is being furnished in accordance with these specifications.

9. Material which does not conform to the chemical

composition and agreed variations, or which shows injurious defects, will be rejected, and the contractor shall be notified.

SPECIFICATIONS FOR STEEL TIE PLATES

1. The steel may be made by the Bessemer or open-hearth process.

2. The steel shall conform to the following requirements as to chemical composition:

Phosphorus	Bessemer.....	not over 0.10 per cent
	Open-hearth.....	not over 0.05 per cent

3. (a) For steel made by the Bessemer process, the manufacturer shall furnish the inspector daily, carbon and phosphorus determinations for each melt before the tie plates are shipped, and two chemical analyses every 24 hours representing the average of the elements carbon, manganese, phosphorus and sulphur contained in the steel, one for each day and night turn, respectively. These analyses shall be made on drillings taken from the ladle test ingot not less than $\frac{1}{8}$ in. beneath the surface.

(b) An analysis of each melt of open-hearth steel shall be made by the manufacturer to determine the percentages of carbon, manganese, phosphorus and sulphur. This analysis shall be made from a test ingot taken during the pouring of the melt. The chemical composition thus determined shall be reported to the purchaser or his representative, and shall conform to the requirements in Section 3.

4. An analysis may be made by the purchaser from a finished tie plate representing each melt of open-hearth steel, and each melt or lot of 10 tons of Bessemer steel. The phosphorus content thus determined shall not exceed that specified in Section 2 by more than 25 per cent.

5. (a) Except as specified in paragraph (b), the tie plates shall conform to the following minimum requirements as to tensile properties:

Tensile strength, lb. per sq. in.....	64,000
Yield point, lb. per sq. in.....	0.5 tens. str. 1,500,000
Elongation in 2 in., per cent.....	Tens. str.
but in no case less than 18 per cent	
Elongation in 8 in., per cent.....	1,400,000
but in no case less than 16 per cent	Tens. str.
Reduction of area, per cent.....	25

(b) Tie plates in which the material required to be punched is $\frac{5}{8}$ in. or greater in thickness, shall conform to the following minimum requirements as to tensile properties:

Tensile strength, lb. per sq. in.....	55,000
Yield point, lb. per sq. in.....	0.5 tens. str. 1,500,000
Elongation in 2 in., per cent.....	Tens. str.
but in no case less than 20 per cent	
Elongation in 8 in., per cent.....	1,400,000
but in no case less than 18 per cent	Tens. str.
Reduction of area, per cent.....	30

(c) If desired by the purchaser, or if for the reason that the design of the tie plate does not permit proper physical testing, the material may be purchased to chemical composition only; in such case the minimum carbon shall be:

Corresponding Minimum Tensile Strength.....	Bessemer.....	Open-Hearth.....
64,000 lb. per sq. in.....	0.12 per cent	0.20 per cent
55,000 lb. per sq. in.....	0.08 per cent	0.15 per cent

6. (a) The tension test specimens shall be taken from the finished tie plates, or from the rolled bar. They shall be cut so that the sides of the specimens are parallel to the direction in which the tie plates have been rolled.

(b) Tension test specimens may conform to the essential dimensions shown in Fig. 1 or Fig. 2. The 2-in. speci-

men (Fig. 1) shall have filleted shoulders, or threaded ends, to fit into the holders on the testing machine in such a way that the line of action of the force exerted by the testing machine shall coincide with the axis of the specimen.

(c) Or, tension test specimens may be rectangular in section, in which case they shall be not less than $\frac{1}{2}$ in. in width between the planed sides, and shall have two parallel faces as rolled. When the tie plates are of such a design that the rectangular specimens cannot be obtained without projecting ribs, these shall be planed off before the tests are made.

7. (a) One tension test shall be made from each melt of open-hearth steel, and from each melt or lot of 10 tons of Bessemer steel.

(b) If any test specimen shows defective machining, or

Note.—The Gage Length, Parallel Portions and Fillets shall be as Shown, but the Ends may be of any Form which will fit the Holders of the Testing Machine.

FIG. 1.

develops flaws, or if it breaks outside the gage length, it may be discarded and another specimen substituted.

8. (a) If the percentage of elongation of any tension test specimen is less than that specified in Section 5, a retest shall be allowed.

(b) If the percentage of elongation of any tension test specimen is less than that specified in section 5 and any part of the fracture is more than $\frac{3}{4}$ in. from the center of the gage length of a 2-in. specimen or is outside the middle third of the gage length of an 8-in. specimen, as indicated by scribe scratches marked on the specimen before testing, a retest shall be allowed.

9. The tie plates shall be smoothly rolled, true to templet, and shall be straight and out of wind on the surface which

FIG. 2.

will form the bearing for the rail. They shall be sheared to the length and punched to the dimensions specified by the purchaser, with the following permissible variations:

(a) For plates with shoulders parallel to the direction of rolling, a variation of $\frac{1}{32}$ in. in thickness, $\frac{1}{8}$ in. in rolled width, and $\frac{3}{16}$ in. in sheared length will be permitted.

(b) For plates with shoulders perpendicular to the direction of rolling, a variation of $\frac{1}{32}$ in. in thickness, $\frac{1}{8}$ in. in rolled width, and $\frac{1}{4}$ in. in sheared length will be permitted. The distance from face of shoulder to outside end of plate shall not vary more than $\frac{1}{4}$ in., and from face of shoulder to inside end not more than $\frac{1}{2}$ in.

10. The finished tie plates shall be free from burrs and other surface deformations caused by the shearing and punch-

ing; they shall also be free from other injurious defects and shall have a workmanlike finish.

11. The name or brand of the manufacturer, the section and the year of manufacture shall be rolled in raised letters and figures on the outside of the shoulder of the plates, and a portion of this marking shall appear on each finished tie plate.

12. The inspector representing the purchaser shall have free entry, at all times while work on the contract of the purchaser is being performed, to all parts of the manufacturer's works which concern the manufacture of the tie plates ordered. The manufacturer shall afford the inspector, free of cost, all reasonable facilities to satisfy him that the tie plates are being furnished in accordance with these specifications. All tests (except check analyses) and inspection shall be made at the place of manufacture prior to shipment, unless otherwise specified, and shall be so conducted as not to interfere unnecessarily with the operation of the works.

13. Unless otherwise specified, any rejection based on tests made in accordance with Section 4 shall be reported within five working days from the receipt of samples.

(b) Tie plates which show injurious defects subsequent to their acceptance at the manufacturer's works will be rejected, and the manufacturer shall be notified.

14. Samples tested in accordance with Section 4, which represent rejected tie plates, shall be preserved for two weeks from the date of the test report. In case of dissatisfaction with the results of the tests, the manufacturer may make claim for a rehearing within that time.

THE EFFECTS OF GRADING OF SANDS AND CONSISTENCY OF MIX UPON THE STRENGTH OF PLAIN AND REINFORCED CONCRETE

By L. N. Edwards.

This paper describes the methods used in a series of experimental tests undertaken to secure information relating to (1) the influence of the grading of sand, (2) the effect of the consistency of mix upon the strength and physical characteristics of the concrete produced, and (3) the effect of varying the time of mixing.

To give the results observed and the phenomena observed from tests made upon (1) cylinders in which 12 sands of predetermined gradings were used as sand aggregates, (2) cylinders and reinforced-concrete beams in the preparation of which five consistencies of mix were used, and (3) cylinders for which the time of mixing was varied from $\frac{1}{4}$ to 2 min. In the preparation of the test specimens the field conditions accompanying high-grade concrete construction operations were duplicated in so far as practicable.

From a careful consideration of the results obtained and of the phenomena observed, the following conclusions appear to be warranted in regard to the grading of sand.

1. The commonly practiced "visual examination" test of sand aggregate for concrete is generally unreliable, since it gives at best only a superficial knowledge of the cleanliness of a given sand. Its adaptation to the determination of grading could be of value to the observer only after long experience in the granulometric analysis of sands.

2. The generally accepted practice of proportioning a concrete mix by volume, as, for example, 1 part cement, 2 parts sand and 4 parts broken stone is impracticable and unscientific, since it does not take into account the adaptability of the grading of a given sand to the production of a dense, strong and reliable concrete. Proportioning by volume, as commonly used, gives no guarantee of the production of a concrete having a desired strength, hardness, or other physical properties.

3. The strength, toughness and durability of concrete to be secured from the use of a given sand can be determined only by actual test of that sand in a properly prepared concrete.

4. In field operations incident to spading, slicing, or otherwise compacting the concrete, the movement of the water content of the mass is intensified, whenever the sand aggregate contains insufficient fine material to hold the cement in suspension by the formation of an adequate amount of sandy paste. The free movement of the water tends to produce an improper distribution of the cement.

The table below gives the percentage of water used in the tests for consistency of mix expressed in per cent of the total dry weight of the cement and aggregates and to the cement alone. In connection with the data given in this table, it must be borne in mind that all concrete materials were thoroughly dry when deposited in the mixer drum.

PERCENTAGE OF WATER USED IN TESTS FOR GRADING OF SANDS AND CONSISTENCY OF MIX					
Test.	Kind of Specimen.	1:2:4 Percentage of Water to Dry Weight of		1:2½:5 Percentage of Water to Dry Weight of	
		Cement and Aggregates.	Cement.	Cement and Aggregates.	Cement.
Grading of sands.	6.17	41.14	5.99	48.76
Consistency:					
First	{ Beam	6.48	43.36
	{ Cylinder	6.17	41.14	5.99	48.76
Second	{ Beam	7.13	47.70
	{ Cylinder	6.75	45.25	6.59	53.64
Third	{ Beam	7.78	52.03
	{ Cylinder	7.37	49.37	7.19	58.51
Fourth	{ Beam	8.75	58.52
	{ Cylinder	8.28	55.54	8.09	65.83
Fifth	{ Beam	9.72	65.04
	{ Cylinder	9.26	61.71	8.99	73.14

Fig. 1 shows the compressive strengths obtained from the tests of the cylinders, in which the consistency of the mix

Fig. 1—Compressive Strengths of Test Cylinders of Different Consistencies

was varied from a sticky, semi-plastic to a very wet condition. The sand and stone were of limestone origin.

Several conclusions may be drawn from these results. The use of a quantity of water sufficient to produce a concrete, the mortar component of which is of a saturated, sticky, semi-plastic consistency, is for most practical purposes required, in order to facilitate economical and efficient placing. This quantity of water is ample for the development of the proper functions of the cement. An increase in the quantity of water used results in a proportionate decrease in the strength of the concrete. This decrease is in no sense a function of the proportions of the mix.

The results of the test on the influence of time of mixing

are shown in Fig. 2. The abrupt change in the direction of the curve at the location indicating the 1 to 2-minute period of mixing, together with the rapid increase of strength shown for mixing periods of less than 1-minute duration,

Fig. 2—Relation of Time of Mixing to Compressive Strength of Concrete

show conclusively the advantage gained by continuing the mixing operation for a period of from 1 to 2 minutes after all the materials have been placed in the mixer.

METAL PRIMER TESTS

By H. A. Gardner

In previous tests¹ the writer has observed that red lead which has been highly oxidized during production, and which is therefore practically a neutral pigment, is not as well suited for application to metal as red lead which is highly basic in nature and which contains a considerable percentage of litharge, the latter being a highly basic pigment. In the present tests the results obtained have been similar and have demonstrated the superior value of the incompletely oxidized or highly basic red leads. This was shown by an inspection of the paints at the end of 3 years' exposure, the results of which are recorded in Table I.

TABLE I—RATING OF PAINTS AT INSPECTION APRIL 1, 1917, AFTER THREE YEARS' EXPOSURE

10 = Excellent; 1 = Failed.

Panel No.	Pigment	Grade: Lead Tetraoxide Content, per cent	One-Coat Work		Two-Coat Work	
			Coat	Work	Coat	Work
1	Red Lead	86*	7	10		
2	Red Lead	88*	8	10		
3	Red Lead	90*	8	9		
4	Red Lead	93*	7	8		
5	Red Lead	95*	6	7		
6	Red Lead	99*	2	5		
7	Red Lead	98†	4	6		
8‡	Sublimed Blue Lead				
9	Chromated Red Lead	Contains 2 per cent CrO ₃	8	10		
10	Chromated Iron Oxide	Contains 16 per cent CrO ₃	2	10		
11	Iron Oxide	Contains 16 per cent Zinc Chromate	2	9		
12	Iron Oxide	Contains 20 per cent Zinc Oxide	1	9		

* Balance is litharge.
† Special red lead purchased in paste form.
‡ Panel injured when exposed. Removed from test.

As a further result of the tests, it is quite apparent that two coats of the neutral iron-oxide paint (chromated or containing zinc chromate or zinc oxide) are superior to two coats of the neutral red-lead paint. The tests also demonstrate the excellent results to be obtained with one coat of a highly basic red lead. One of the most marked results from the tests was that showing the comparative durability of one and two-coat work on an iron-oxide-zinc oxide paint. This result would indicate that all metal should preferably be given at least two coats of paint when erected.

Storage Problems.—Much has been said regarding the

¹ Proceedings, Am. Soc. Test. Mats., Vol. IX, pp. 488-511 (1910); Vol. X, pp. 409-410 (1910); Vol. XI, pp. 192, 641 (1911); and Vol. XIII, pp. 363, 954 (1913).

hardening of red lead in packages, especially if the red lead should contain any pronounced percentage of litharge. It is interesting to record the condition of the paints used in these tests after standing for three years in half-gallon cans. When the cans were opened, some of the clear oil was removed from each package and asked to determine the amount of pigment that had gone into solution. The results of the tests indicate that red leads high in lead tetroxide are quite as soluble in linseed oil as red leads high in lead monoxide. The condition of the paints observed at the time of opening would seem to indicate that the softness of red-lead paints after aging is due not entirely to the amount of litharge contained therein but also to the settling properties of the red lead. In other words, red leads of high weight per volume will settle down to the bottom of the cans and become hard, whereas red leads of low specific gravity are more likely to be maintained in a bulky form.

The results obtained in the storage tests indicate that some chemical action takes place other than that to be accounted for by the formation of lead linoleate, since the latter is soft rather than hard. The writer is of the opinion that the chemical reactions which are partly responsible for the hardening of red-lead paints, cause the formation of lead glycerinate, a substance that is recognized as one of the hardest and most durable cementing materials. It is obvious, therefore, that linseed oil having a high acid number and often containing a substantial amount of free glycerin, is dangerous to use in making red-lead paints that are to remain in packages for a long period previous to use.

With linseed oil it is probable that a substance having a solvent effect upon lead glycerinate, such, for instance, as certain alcoholic derivatives, could be combined. These would evaporate when the paint was applied and the formation of the valuable lead glycerinate cement might proceed during the drying of the oil. For this purpose, red leads high in litharge would be most active.

PROPOSED TENTATIVE TESTS FOR MOLDED INSULATING MATERIALS

These tests are intended to apply to all solid insulating materials that are formed in molds or between platens by the application of pressure, either with or without heat. The report covers, in considerable detail, a description of the specimens, the apparatus, and the methods for making all necessary tests on molded electric insulating materials. The committee also presents six illustrations of the testing apparatus recommended.

The tests for physical properties are divided between mechanical, electrical and thermal tests. Under the former, detailed directions and specifications are given for determining the tensile strength, compressive strength and transverse strength. Under the electrical tests complete directions are given for determining the dielectric strength. Under several tests directions are given to determine the characteristics of the material under heat. Complete directions for making tests to determine the effect of moisture are also given. Under each one of these tests the specimen is fully described by a drawing and specifications. This is also true of the apparatus. The methods used for making each test are then described in detail. The last item in each test is a report form which specifies how the results of the test shall be reported.

OTHER BUSINESS

In the field of concrete engineering Committee C 2 submitted the final report of the joint committee on concrete and reinforced concrete. This does not differ from the form in which it was adopted by the committee in 1916, a review of which appeared in the *Railway Age Gazette* on January 19, 1917, page 100. Proposed tentative specifications for

mason's hydrated lime were also submitted, as well as proposed tentative specifications for asphalt for waterproofing, for the primer for use with asphalt for waterproofing, for coal tar pitch for waterproofing, and for creosote oil for the priming coat with coal tar pitch for waterproofing.

A brief review was given of the rail situation with brief abstracts of the reports of the investigations published during the year. These included J. E. Howard's report of the investigation of the rail failure at Iser, Tex., on the Galveston, Harrisburg & San Antonio; Dr. P. H. Dudley's report in bulletin No. 195 of the American Railway Engineering Association on induced interior transverse fissures, and H. M. Wickhorst's report in bulletin No. 195 on the rail failure situation.

A. T. Goldbeck presented a paper on the distribution of pressure through earth fills based on carefully conducted tests with specially prepared pressure measuring apparatus. Conclusive results were secured but the range of pressures and applications of the load were designed to cover highway conditions rather than those obtaining under railway tracks.

The following officers were elected for the ensuing year: President, General W. H. Bixby; vice-president, Edward Orton, Jr.; executive committee, J. A. Capp, W. F. M. Goss, W. M. Kinney, and C. D. Young.

THE PENNSYLVANIA'S NEW METHOD OF HANDLING L. C. L. FREIGHT

Plans have been worked out by the Pennsylvania, and will shortly be put into actual operation, for making a complete change in the methods of receiving, loading and forwarding less than carload freight, of all descriptions, on all parts of the Pennsylvania Lines East.

The two most important features of the new plan are:

1. The inauguration of shipping days—or substantially "sailing dates"—on which cars will depart from various points of origin to specified destinations; freight will be accepted on the proper shipping days, only, and the cars will "sail" as specified.

2. The designation of particular stations at which freight will be exclusively received for specified destinations; freight for such points will be accepted at the stations named only.

The new plan represents the results of prolonged investigation, conducted by the transportation and traffic officers.

The primary purposes of the new plan are:

- (1) Elimination of the delay incident to the re-handling of freight, under the present methods of consolidating small shipments into full carloads at transfer stations; this will give the shipper quicker service than is possible under the old method.

- (2) Conservation of car supply by effecting better average loading than is possible under the transfer system; this will increase the cars available for commercial freight, as well as government supplies.

- (3) Reduction in the number of car and train movements required to transport a given volume of freight; this will increase the capacity of the whole railroad plant, and will release trackage and locomotives for the movement of troops, government supplies and commercial freight.

- (4) Improvement in the regularity of the freight service by systematizing and simplifying operation; this will result from the elimination of a large proportion of the complicated re-handling of freight, which is now unavoidable, with the attendant liability to damage.

Under the present method of handling less than carload freight, a shipper having a small consignment to transport from city "A" to city "B" can take his goods to any freight station in city "A," at any time during the ordinary working hours. In the course of the day, or perhaps the next two or three days, the freight will be loaded into a car and run out to a transfer station, which may be a few miles or more

than 100 miles distant. There it will be unloaded and trucked into another car, in which numerous small shipments, from many other points, for city "B," are being consolidated in the effort to make up a full car.

Under the proposed plan, there will be certain days on which less than carload freight for city "B" will be accepted at one or more specified stations in city "A," and such freight will be accepted only on the days, and at the particular station, or stations, named. On the days specified, a car for city "B" will leave the originating station or stations. The service will be daily, tri-weekly, semi-weekly or weekly according to the average volume of the traffic, and freight for city "B" will be taken only in such cars. Under this method there will be no subsequent transferring or re-handling of the freight, and the car will move straight through to city "B," without breaking bulk.

In large cities, where a number of freight stations are maintained, traffic to the various principal destinations will be apportioned between the stations. For example, where conditions permit, very large shipping centers will be subdivided into zones, each embracing several freight stations. From each zone service will be given on specified days to a number of destinations. In such cases, cars for various points will be alternated between the stations in a given zone. If, for instance, a certain zone, containing several freight stations, is to have three cars a week to a certain destination, the car may leave station "A" on Monday, station "B" on Wednesday and station "C" on Saturday. This will equalize drayage distance between shippers in various portions of the zone.

To eliminate the congestion of trucks and teams occurring at nearly all large freight stations in the afternoon, the "sailing hours" of cars for certain destinations will be made earlier than the general closing time of the station. To illustrate—at a station from which several regular cars are operated daily, to sundry destinations, the "sailing time" for the cars to city "B" and city "C" may be fixed at noon, and for city "D" and city "E" at 1 o'clock p. m., while freight for other points may be accepted up to the closing hour.

This will require the delivery of a considerable quantity of freight in the morning hours of the "sailing day." The result will be to distribute the receipts throughout the day, extend the capacity of the station and facilitate the movement of traffic. Shippers will be benefited, as their teams and trucks will not be forced to stand idle for several hours before being able to get to the platform, as is often the case under the present conditions.

The application of the plan at smaller stations—those at which l. c. l. freight would not accumulate into carloads with sufficient frequency to operate through cars to any given point—will be limited to the establishment of shipping days.

It is the intention to continue sufficient local "pick-up" freight service to meet the requirements for that form of service.

One important result which the plan is expected to bring about will be a reduction in loss and damage to freight, owing to the greater promptness with which it will be loaded and despatched. The simplification of railroad operation, as well as the elimination of re-handling of less than carload freight at transfer stations, will also diminish the amount of freight going astray.

The proposed plan is being worked out on scientific lines. A most careful and elaborate study has been made of the movement of less than carload freight to and from all points on the entire railroad and its connections, and the nature and frequency of service to be afforded at each station will be based upon that study. Future changes in the current of traffic will be taken care of promptly, as they become evident.

A conservative estimate shows that the adoption of the proposed plan will result in the saving of at least 1,000 box

cars per day in the handling of l. c. l. freight on the lines East.

The new plan will be put into effect first in the Philadelphia district, where it will become operative in the near future. As soon thereafter as possible it will be applied at New York, Baltimore, Pittsburgh and Buffalo, following which it will be inaugurated at all stations.

When making the new plan effective in any locality, it will be explained, as to its purpose and method of operation, to the local board of trade, chamber of commerce and other trade bodies. This duty will be performed personally by the various division freight agents.

The working out of details for the various stations will be completed on each grand division, under the joint direction of H. C. Bixler, superintendent of stations and transfers, and the proper division freight agent representing, respectively, the transportation and traffic departments. They will be assisted in this work by the staffs of the division superintendents.

ELECTRIC TIE TAMPERS

Electric tie tampers were first used by the New York Central in the electric zone where the power is taken from the third rail and conveyed to the machine through resistance boxes by means of a contact device which is laid across the rail. After being thoroughly tested in this district with satisfactory results, figures were compiled showing the amount of work done by regular track gangs supplied with tampers and by gangs not so equipped. Figures were also compiled showing the cost of doing certain units of work by hand and with the machines. When tamping by hand, it was found that 26 days were required to tamp one mile of track as compared with 15 days with a machine. The cost of the work showed a difference in favor of the machine of \$142 per mile of track.

As one of the results of these tests the use of the tampers was extended to the exterior zone where power is secured

Tamping Track in the Electric Zone

from a generating set mounted on a hand car. In the exterior zone the cost of tamping is less than in third rail territory when it is necessary to employ a man whose sole duty is to watch out for trains.

The machines used are the Vaughn type and weigh 90 lb. complete. The tamper, itself, weighs 80 lb. and the bar 4 lb. The motor is contained in a box on the side of the machine and drives a crank in the back of the casing. The crank moves a reciprocating cylinder within which is a free piston driven back and forth by the air compression in the cylinder and by a solenoid at the lower end of the tamper, the reciprocating cylinder shifting the magnetic field produced by the solenoid. The control is located in a switch mounted in the upper handles which are provided to sup-

port the tool. A specially designed nosepiece holds the tamping bar in place during operation.

As all the space necessary for the operation of the machines is that into which the tamping bar can be driven they are especially useful around switches and other points where the ties are closely spaced. In tamping, two of the machines are operated simultaneously from opposite sides of the tie which necessitates twice as much work as if the work were done by hand where only one side of the tie is tamped. As a result of tamping on opposite sides of the tie, the track will stay up longer and better than any method of hand tamping and the New York Central has track that was tamped in 1914 which has not been touched since.

A tabulation showing the cost of operating the tampers from the generator and from the third rail follows:

TIE TAMPERS OPERATED FROM A GENERATOR

Operation:	
Foreman, 10 hr. @ 27 ct.....	\$2.70
5 men, 10 hr. each = 50 hr. @ 19 ct.....	9.50
Gasoline, 4 gal. @ 20 ct.....	.80
Engine oil, $\frac{1}{2}$ pt. @ 5 ct.....	.03
Fixed Charges:	
Depreciation—generator @ 15 per cent.....	.42
Depreciation—two tampers @ 30 per cent.....	.67
Interest and maintenance—generators @ 10 per cent.....	.28
Interest and maintenance—two tampers @ 15 per cent.....	.33

Total per day.....	\$14.73
Average of 356 ft. tamped per day—total cost per foot.....	\$0.041

TIE TAMPERS OPERATED FROM THIRD RAIL

Operation:	
1 foreman, 10 hr. @ 27 ct.....	\$2.70
6 men, 10 hr. each = 60 hr. @ 19 ct.....	11.40
Power, 96 kw. hr. @ 1 ct.....	.96
Fixed Charges:	
Depreciation—two tampers @ 30 per cent.....	.67
Depreciation—two resistances @ 15 per cent.....	.08
Interest and maintenance—two tampers @ 15 per cent.....	.33
Interest and maintenance—two resistances @ 10 per cent.....	.06

Total per day.....	\$16.20
Average of 356 ft. tamped per day—total cost per foot.....	\$0.046

A PORTABLE CRANE FOR FREIGHT HOUSES

A new departure in freight handling equipment has recently been introduced which is designed to facilitate the moving of heavy articles encountered in l. c. l. freight. Briefly it is a small hand-operated crane mounted on wheels so that it can be moved about easily. It will lift objects

Lifting a Heavy Box

weighing up to two tons. The device consists of a gooseneck or jib crane, made up of a pair of curved cast iron arms bolted together and attached by a flanged base to a cast iron U-shaped platform or carriage. This is mounted on four wheels, one at the end of each arm and two at the base of the "U" where the crane is attached. The loads are raised and

lowered by a chain suspended from the end of the arm which is so placed, relative to the base, that both the crane and its load are always in stable equilibrium. The chain, which supports the load by two strands, passes down the inside of the arm over two rollers to a drum connected by a train of gears to a crank shaft. The latter is operated by either one or two crank handles, and is provided with a ratchet and pawl to hold the load.

The total height of the crane is only 6 ft. 6 in. and the width of base is 3 ft. 8 in. Consequently it can be taken anywhere around a freight terminal or into a car if desired. Because of the "U" shape given to the base, it is possible to place the crane so that the load comes directly under the hook, or to lower the load directly on to the floor or a small truck without interfering with the base.

These cranes have been found useful in a number of railway freight stations. One large road in the east has 25 of

Picking Up a Steel Casting

them at various local and terminal freight houses. One of the pictures shows the crane in use for lifting a steel casting weighing 1,580 lb. The construction of the crane is seen more clearly in the other photograph where a man is raising a large box. At the Wayne Junction transfer of the Philadelphia & Reading at Philadelphia, one of these cranes was used recently to pick up four steel 15-inch I-beams, 15 ft. long, having a total weight of 2,400 lb. The cranes have also been found particularly useful in handling any material that is awkward for men to pick up. One man can operate the crane alone for most purposes. When operated by two men it is possible to handle loads that previously required the assistance of 8 or 10 men. These cranes are manufactured by the Canton Foundry & Machine Company, Canton, Ohio.

LONDON INSPECTION OF ARGENTINE RAILROAD SUPPLIES.—A presidential decree dated March 29, 1917, abolishes the technical office hitherto maintained in London for the inspection of supplies purchased in Europe and the United States for the Argentine State and other railroads and public works. This office was created in 1909, and the reason given for its suppression at this time is that with the marked falling off in railway purchases and the diminished activity in the prosecution of public works there is no necessity for maintaining a separate organization for technical inspection.

Brown's Discipline on American Railroads

Four-Fifths of the Important Roads Have Abandoned the Policy of Suspending Employees for Misconduct

REGULATIONS for the administration of discipline without suspension are now in force on a large majority of the principal railroads of the United States, and the more prominent features of these regulations are shown in the large table given herewith and in the circular of the Chicago & Alton reprinted below. The practice of suspending men from duty as a means of punishment for disobedience or misconduct was formerly, as everybody knows, well nigh universal in American railway service; and the first extensive innovator was the late George R. Brown, of Corning, N. Y., general superintendent of the Fall Brook Coal Company's railroad, now a part of the New York Central. He began, experimentally, about 1886.

To gather the data here shown, inquiries were sent to 120 of the principal railroads of the United States and Canada, and all but a very few of them responded; and 80 of these roads are represented in Table A. Table C, showing roads still adhering to the old practice, contains 27 names.

In Table A some of the headings of the columns are abbreviated. The figures in column 4 refer to individual offenses; for example, on the Atlanta & West Point, no offense is to be assessed less than ten or more than 90 demerits. The figures in column 5 indicate the extent to which an employee may be disciplined by record before the superintendent takes special action. For example, on the Arizona Eastern when a man's record shows 60 demerits action is taken to see whether or not the individual ought to be dismissed; and a record of 90 demerits means that he must be dismissed.

Columns 6, 7 and 8 show typical examples, not a complete record. On some roads satisfactory service for as short a time as three months offsets a certain number of demerits; and on some there are six or eight, or more, different periods, ranging from three months to five years. See the notes against individual roads. The term "train service" includes enginemen and firemen. No specific request was made by us for comments or opinions as to the merits of this method of discipline, as compared with the practice of suspending employees, but opinions, where received, have been noted.

Educational bulletins, to give to all employees the benefits of the lessons derived from the errors of the few, are not dealt with in the table; but it may be said that such bulletins are very generally in use. Some roads issue them regularly, posting copies at employees' headquarters, while others issue them as occasion demands. A bulletin of the Canadian Pacific is reprinted below.

CHICAGO & ALTON

The general theory of the system of discipline herein described is well set forth in the following circular of A. P. Titus, general manager of the Chicago & Alton, which was issued on January 1, 1916.

Commencing January 1, 1916, the enforcement of discipline by suspension will be discontinued and discipline by demerit and merit record will be inaugurated.

Until further notice, this will apply only to employees in engine, train, yard, telegraph and station service.

1. The system is introduced with the belief that it will meet with the co-operation of all concerned and will be of benefit to the employee and company alike:

(a) To the employee in enabling him, by good conduct, to insure permanency of employment.

(b) To the company in increased efficiency of such permanent employee.

(c) To avoid loss of wages and consequent hardships to employees and their families because of being deprived of their regular income.

(d) To promote good conduct and encourage careful and efficient service.

2. Record will be kept by the superintendents of the service rendered by each employee under their respective jurisdictions. Each employee will be notified promptly in writing of entries made against his record and such notice in all cases will show the accumulative record. No discipline will be applied without full investigation.

Employees, if desired, will be given the opportunity for explanation and defense, with employees of their choice present, providing such application is filed with the superintendent within a reasonable time, but in no case to exceed thirty days.

3. An accumulation of demerits showing that an employee is not desirable for the service, will first be given special consideration, but when the service of an employee is so generally unsatisfactory as to unfit him for further service, dismissal will follow.

4. Bulletins showing cases of discipline, omitting name, date, train and location, containing a brief account of the facts in the case, and showing how the offense could have been avoided, will be issued monthly.

5. No employee will be unduly held out of service for investigation or in violation of current working schedules, but when held and found at fault, will not be paid for any time lost.

6. When an employee's demerits have accumulated to the number of eighty, he shall be called in by the superintendent, duly cautioned and advised that when his number of demerits amounts to 100, he will be dismissed from the service.

7. No discipline by record will be made for less than five nor more than thirty demerits.*

8. A perfect record will be one against which no unfavorable entry has been made.

9. A clear record will be one on which unfavorable entries have been cancelled.

10. Cautions, reprimands, and demerits by record will be charged against an employee's record as follows:

(a) A caution will be entered upon the record but will not call for a demerit.

(b) A reprimand will call for one demerit.

(c) One merit will equal and cancel two demerits.

(d) Merits and demerits will be accumulative.

11. Where demerits are given for unsatisfactory service, it is logical that merits should be given for good service, and cancellations upon record will be given as below:

1st. A clear record for six months will cancel 5 demerits.

2nd. A clear record for one year will cancel 10 demerits.

3rd. A clear record for two consecutive years will cancel 35 demerits.

*The most general practice is to assess, for an offense, a number of demerits equal to the number of days that the employee would have been suspended from duty, under the old plan.—EDITOR.

TABLE A AMERICAN RAILROADS ON WHICH EMPLOYEES ARE NOT PUNISHED BY SUSPENSION

Baltimore & Ohio	1913	(See list B)
Bessemer & L. E.	Train, yard, sta., telegraph.	1898 60	10	30	..	Actual suspension in extreme cases. No credits for less than six months.
Boston & Albany	Train, yard	1914	(See list B)
Boston & Maine	Train, yard, station.	1896	90	..	6 ²
Buffalo, R. & Pittsburgh	Train, station, shop.	1912	10	30	..	Brown system for minor offenses only (see list B).
Canadian Gov't	All	1913 60	..	20	..	For every repetition of an offense by an employee the number of demerits is doubled.
Canadian Northern	All	1908 60	..	20
Canadian Pacific (East)	All 60	..	20
Canadian Pacific (West)	All 60	..	20
Carolina, C. & O.	Train	1913	75-100	..	30	..	Supt. writes personal commendatory letter when a man has completed a satisfactory yr.
Central of Georgia	Train, yard, telegraph, M. W. foremen, carpenters	1911	5-30	90	..	5	30	Ninety marks means suspension.
Central New England	Train, yard, agents, telegraph, signalmen
Chesapeake & Ohio	Train, telegraph	1	3	..	One mark assessed for each offense. System in effect many years; satisfactory.
Chicago & Alton	Train, yard, telegraph, station.	1916	5-30	80-100	5	10 ³	N	Actual suspensions in extreme cases. Commendatory letters written for good records.
Chicago & E. Illinois	Train, yard, sta., telegraph.	60-90
Chic. & Burlington	Train, yard (see list B)
Chicago, Mil. & St. P.	All	10-30	No rule
Chicago, R. I. & Pacific	Train, station, telegraph. 65	..	30	..	Actual suspensions may be imposed.
C. R. I. & Gulf	(Same as above)
Chicago, St. P. M. & O.	Train, station
Cin. & Hamilton	(See list B)	1915
Cin., Indianapolis & W.	Train, telegraph 90	..	50
Colorado & Southern	Train, yard, station. 100	10	30	60	Actual suspensions may be imposed.
Copper Range	Train
Denver & Rio Grande	Train, yard, station.	1910 75	..	35	..	Employees "never serve time."
Detroit & Mackinac	Train (see list B)	Records written up every month.
Elgin, Joliet & E.	Train, yard 65	..	20
El Paso & S. W.	All in transportation dept.	1906	10-60	Indefinite	10	30	60
Florida East Coast	Train, yard	Actual suspensions in extreme cases.
Fort Worth & Denver C.	All in operating dept.	1911	10-60	.. 100	..	30	..	Employs both actual and "book" suspensions.
Galveston, H. & S. A.	Train, yd., sta., M. W. foremen	90	..	10	30	Supt. make semi-annual summaries of action taken.
Georgia	Ditto	1915	10-90	90 ⁵	10	30	..	Actual suspensions in aggravated cases.
Great Northern	Train, yard, shop.	Indefinite	Credit mark is given for 6 mos. clear record.
Gulf & Ship Island	All op. depts., M. W. and shops except laborers 90	10	20	30	Actual suspensions for men who do not appreciate the Brown system.
Hocking Valley	1912	Indefinite	..	30
Hudson & Manhattan	All in transportation dept. 60	..	25
Illinois Central	Ditto	1902	5-30	90	..	5	30	60
Lehigh & New England	Train	1913 30	30	90
Lehigh Valley	Train, yard, station ⁴	5-60	75-90	10	30	60	Dismissal for 90 demerits may be appealed to general manager, who may grant 6 months' further probationary period.
Los Angeles & Salt Lake	Train, yard, station, trackmen 90	Four months cancels 10 demerits.
Louisville & Nashville	Train, yard, telegraph, M. W. foremen, car inspectors.	1895	60	Two years cancels 30 demerits; three years, 60 demerits. Bulletins issued weekly.
Maine Central	All except general office	1897 100	..	6	..	Five years cancels all.
Michigan Central	(See list B)
Minn., St. Paul & S. S. M.	Trainmen	7	..	4
Missouri, K. & Texas	All, except laborers 60	10	25	..	Actual suspension may be imposed.
Missouri Pacific	Train, yard 65	..	35
Mobile & Ohio	Train, yard	60 ⁵	..	14	..	Three years cancels 50. Bulletins issued yearly, showing all perfect records.
Nashville, C. & St. L.	Train, yd., sta., M. W. foremen
New York Central	Train, yard, telegraph, signal.	1912	(See list B)
New York, N. H. & Hartford	Train, yard, telegraph	5-45	90-100	..	6	..	Five years cancels all.
Norfolk & Western	All	For one year of satisfactory service 30 merits are entered, but there is no regular balancing of merits and demerits.
Norfolk & Southern	Train, M. W. foremen.	No fixed number	5	30
Northern Pacific	All in transportation dept.	Actual suspension may be imposed.
Oregon Short Line	All in operating dept.
Oregon-Washington	Train, yd., sta., M. W. foremen 90	5	30	60
Pacific Electric	Train, yard, towerman	1912	50 75 15
Quebec Central	Train, yard	1912 100	..	20	..	Bulletins issued every month.
Rutland	Train, yard 60	..	20
St. Louis-San Francisco	Train, yard, station, telegraph.	1902 100	..	20
St. Louis S. W.	All	1917	5	— 90	5	Actual suspensions may be imposed.
San Antonio & A. P.	Train, station, M. W. foremen	1908	5-30	30	Bulletins issued weekly.
Seaboard Air Line	All in transportation dept.	1911	5-60	100-100	5	30	60	Actual suspensions may be imposed.
Southern	Train, yard	1897	90	10	30	10
Southern Pac. (Pac. System)	All in transportation dept.	1896	100	..	30
Toledo & Ohio Central	Train, yard, telegraph
Union Pacific	All in transportation dept.	1900	5-60	.. 90	5	30	60	Bulletins twice a month.
Virginian	(See list B)
Wabash	Train, yard, telegraph	1896	60	10	20	30	Actual suspensions sometimes imposed.
Western Maryland	Train, telegraph	Experimental; applied only in cases where suspension would be for less than 30 days.
Western Pacific	Train, yard, station, telegraph.	75	..	35	..	Treat involvement.
Wheeling & L. Erie	Train, telegraph	75-100	..	10	..	Five years cancels all demerits. Actual suspension sometimes imposed.
Yazoo & Miss. V.	(See Illinois Central)

² Two years, 18 marks; 3 years, 40; 4 years, 75; 5 years, clear.³ Two years, 35; 3 years, 75; 4 years, clear.⁴ And all Southern Pacific lines east of El Paso. Report says "some employees do not take the record seriously; still, the system is much better than suspensions."⁵ In one year.⁶ Also yardmasters, signalmen, engine inspectors, foremen, engine watchmen, car inspectors.⁷ Sixty, within one year, usually means 30 days' actual suspension.

4th. A clear record for four consecutive years will cancel 75 demerits.

5th. A clear record for five consecutive years will equal a clear record.

12. Dishonesty, desertion, immorality, gross carelessness, intoxication, insubordination, incivility, willful negligence, incompetency, or disobedience to the company's rules, will be considered sufficient cause for dismissal.

13. Discipline will start on an even basis, that is, without merits or demerits, except that previous record will be kept on file and taken into consideration in the case of leniency.

14. That the greatest amount of good may be realized, both to the company and employees, uniformity of merits and demerits, after considering all the conditions, will be maintained.

THE BURLINGTON PLAN

Two of the most carefully planned schemes of discipline are those of the Chicago, Burlington & Quincy and the Baltimore & Ohio, described in the *Railway Age Gazette* of June 12 and January 16, 1914. These two descriptive articles embody important testimony to the soundness of the system when it is applied with intelligence and energy. These and seven other roads are listed in the following Table B.

TABLE B.—ROADS USING MODIFIED FORMS OF BROWN'S DISCIPLINE.

Baltimore & Ohio	Detroit & Mackinac
Boston & Albany	Michigan Central
Buffalo Rochester & Pittsburgh	New York Central
Chicago Burlington & Quincy	Virginian
Cincinnati, Hamilton & Dayton	

On the Burlington the chief officers have not only maintained personal oversight of the discipline but have taken care to inform themselves of the feeling of the employees. The switchmen, at first left out, made application to be taken in; which refutes the idea that employees always prefer the old or suspension system.

Our account tells of the Burlington employees' views, and also contains carefully prepared statistical information, covering five years, showing the good results of abolishing suspensions. The operations on all divisions are recorded at a central office in Chicago and carefully co-ordinated. The Baltimore & Ohio plan was copied largely from that of the Burlington, and our description of it gives some particulars not fully elaborated in the Burlington account. On both of these roads "marks" to indicate the degree of importance attached to an offense are unknown, and there is nothing in the shape of a statistical record by which to make mathematical measurements of the good or bad behavior of individual employees.

The New York Central imposes suspensions but defers their enforcement; and if the employee gives satisfactory service thereafter for one year the punishment is not imposed. This has greatly reduced the number of men actually laid off. The Boston & Albany has substantially the same plan, but in the more serious cases does not defer the penalty. The Buffalo, Rochester & Pittsburgh and the Michigan Central have about the same. The Cincinnati, Hamilton & Dayton has the same as the Baltimore & Ohio; and the Detroit & Mackinac a similar plan but with provision for actual suspension in serious cases. On the Virginian the practice is about the same, but the regulations are being changed in some details.

THE L. & N. AND THE UNION PACIFIC

The Louisville & Nashville issues every twelve months a complimentary bulletin giving special credit to employees who have a perfect record for one year. Mention is made at the same time of any unusual acts of heroism and loyalty.

This was one of the earliest of the large roads to abolish suspensions, having adopted the Brown system in 1895. The officers employ this system because it "tends to greater efficiency and assures employees that with proper endeavor they will have regular and continuous work, even if they should make a blunder. The employees take a good deal of pride in maintaining clear records and having their names appear in the complimentary bulletin."

The Union Pacific, which has had the Brown system in use seventeen years, discontinued, several years ago, the entering of specially meritorious acts on records of employees. Under the present arrangement, "where an employee does something out of the ordinary and out of his own line of duty, a letter is usually written to him, complimenting and thanking him for his action." This is believed to be more effective and satisfactory than the common plan of entering a certain number of merits on the book records.

On the Wheeling & Lake Erie an employee whose pay is garnisheed has five demerits entered on his record; for a second garnishee, fifteen demerits and for a third, forty-five demerits. The fourth garnishee brings dismissal.

TABLE C.—RAILROADS NOT USING BROWN'S DISCIPLINE

Alabama Great Southern	Kansas City, Mexico & Orient
Bangor & Aroostook	Kansas City Southern
Central Vermont	Lake Erie & Western
Chicago Great Western	Long Island
Chicago, Ind. & Louisville	New York, Chicago & St. Louis
Cleveland, C. C. & St. Louis	New York, Ontario & Western
Colorado Midland	Pennsylvania, West of Pittsburgh
Delaware & Hudson	Philadelphia & Reading
Delaware, Lackawanna & Western	Pittsburgh & Lake Erie
Duluth, Missabe & Northern	Pittsburgh, Shawmut & Northern
Duluth, S. S. & Atlantic	Spokane, Portland & Seattle
Grand Rapids & Indiana	Texas & Pacific
Grand Trunk	Toronto, Hamilton & Buffalo
International & Gt. Northern	

a. Used Brown system; abolished long since; "actual suspensions much better."

b. Employs "suspended sentences."

c. In some cases suspensions are held in abeyance for one year.

d. In some cases suspensions are "recorded" and not served.

e. "Record suspensions" are sometimes imposed for minor offenses.

AN EDUCATIONAL BULLETIN

In administering the discipline of several hundreds or thousands of railroad employees, scattered throughout scores of towns and cities, adherence to uniform practice can be only partly successful. Even where all of the men to be dealt with are in a single city and are engaged in the same kind of work, the attainment of ideal conditions is difficult, because of the individuality of the men. Human beings who do such varied work, mental and physical, as the railroad service requires, cannot be treated as mechanical structures, all made on one pattern. The information concerning discipline which is shown in the large table is therefore not to be taken as illustrating the methods of the railroads named; it is only a sketch of the framework by which those methods are made as nearly uniform as practicable. Rigid uniformity, no doubt, would hinder rather than promote progress.

"Brown's discipline" is a phrase having a single well-known meaning everywhere; yet the carrying out of the principle involved affords ample scope for individuality. Our table is a mere index. With or without the data there given, the making of precise comparisons between one road and another is likely to be of rather limited value. But concise information about actual experiences in this field is always instructive, and the reader will examine with interest the educational bulletin of one district of the Canadian Pacific which is given below. This bulletin is for the month of January, 1917. On this road a considerable degree of uniformity is attained by the use of a schedule, by all the division superintendents, prescribing a maximum number of demerits for each of a large number of offenses.

CANADIAN PACIFIC RAILWAY.

DISTRICT.

EDUCATIONAL BULLETIN No. 79, FEBRUARY 1, 1917.

Title of Employee; Number of Demerits; Offense.

Asst. Agent, 2.....	Did not have bulletin board dated.
Sec. Foreman (3)—2.....	Did not have switch lamps burning.
Agents (2)—2.....	Delayed wired report of earnings.
Operator, 2.....	Failed to issue telegraph pass when instructed.
Train Clerk, 2.....	Billed a car to wrong destination.
Train Clerk, 2.....	Failed to submit form C S 2 for a red card load.
Asst. Agent, 2.....	Failed to brace a can of oil in car, it upset and contents were lost.
Stower, 2.....	Stowed a shipment in wrong car.
Checker, 2.....	Failed to show car on passing report.
Train Baggage-man, 2.....	Piled milk cans one on top of the other, so that one fell and claim was presented for loss of contents.
Conductor, 2.....	Failed to lift an empty car when instructed.
Agent, 2.....	Held time cheque beyond time limit and delayed correspondence in connection therewith.
Agent, 2.....	Failed to submit monthly time report, form 84.
Train Clerk, 2.....	Called engine for way-freight at 5:45 when train crew had booked rest until 7:00k.
Baggage-man, 2.....	Caused delay to baggage.
Engineer, 2.....	Started train before allowing time for brakes to release, which broke knuckle.
Agent, 2.....	Forwarded empty foreign car without obtaining instructions.
Agent, 3.....	Delayed correspondence by giving incorrect information in connection with leases in effect at this station.
Billor, 3.....	Billed a car under wrong number.
Car Repairer, 3.....	Failed to advise Engineer or Conductor that steam pressure on their train was too low.
Agent, 3.....	Delayed a commercial telegram.
Agents (39) Operators (10) Ticket Clerks (4) Asst. Agent, 5.....	Issued unstamped tickets.
Trucker, 5.....	Left in car shipment that should have been unloaded.
Trainman, 5.....	Did not properly clean snow from switch points, which derailed car.
Train Baggage-man, 5.....	Failed to see that he received all baggage for which he signed, resulting in five pieces being left.
Trainman, 5.....	Gave Conductor proceed signal before all baggage was loaded, resulting in five pieces being left.
Engineer, 5.....	Violated air brake rule 4-A by not cutting off engine when taking water.
Fireman, 5.....	Failed to report for duty on time.
Fitter's Helper, 5.....	Used a wrench that brulch with which he was tightening smoke box rim was properly adjusted. It slipped and he fell off engine, sustaining injury.
Checker, 5.....	Did not properly check and reload shipment, causing delay to destination.
Conductor, 5.....	Did not report having run through a switch.
Trainman, 5.....	Threw switch against engine, with result that it was run through.
Trainman, 5.....	Did not throw derail before allowing train to back up, which derailed car.
Trimmer, 5.....	Caused injury to himself when filling rod cups on engine, by not looking where he was going and falling into pit.
Boilerwasher's Helper, 5.....	Stepped off back of engine when he knew it was separated from tender, thereby injuring himself.
Yard Foreman, 5.....	Failed to give Engineer stop signal before switch was thrown, causing delay to engine derailed.
Car Carpenter, 5.....	Negligence in application of safety appliances.
Freight Clerk, 5.....	Misbilled a car.
Checker, 5.....	Wrongly delivered a shipment.
Baggage Checker, 5.....	Matched checks thereby causing delay to baggage.
Washoutman, 5.....	Failed to see that nozzle was incorrectly adjusted, which caused it to slip and injure him.
Engineer, 5.....	Struck car with sufficient force to cause damage.
Agents (5)—5.....	Violated rule 91 by failing to block a train.
Tender Truck Repairer, 10.....	Did fault work on goose neck of an engine.
Operator, 10.....	Put in overtime ticket to which he was not entitled.
Section Foreman, 10.....	Did not have elevator track in proper condition, resulting in derailment of engine.
Pumpman, 10.....	Allowed water to get low in tank at terminal.
Trainman, 10.....	Delayed a train by not giving notice that he was sick and would be unable to accept call.
Fitter, 10.....	Did poor work on an engine, which resulted in delay to a passenger train.
Trainman, 15.....	Did not properly protect movement of engine of which he was in charge with result that it corched and damaged caboose of another engine.
Engineer, 15.....	Did not have engine under proper control when coupling to train and struck caboose with sufficient violence to cause damage.
Section Foreman, 15.....	Failed to carry out instructions regarding shimming rough track and repairing a switch.
Section Foreman, 15.....	Allowed his hand car to be struck by a train.
Signalman, 15.....	Delayed train at a diamond crossing.
Yard Foreman, 20.....	Poorly supervised switching operations with result that engine and three cars were derailed.
Agent, 20.....	Failed to carry out instructions with regard to telegraph service. (Second offense.)
Pumpman, 20.....	Failed to drain boiler which froze and was damaged.
Yardman, 30.....	Failed to promptly give stop signal when he saw that cars were coming too fast, resulting in derailment.
Engineer, 30.....	Caused damage by starting engine without signal.
Yard Foreman, 30.....	Blocked traffic track during severe weather without giving reasonable warning to approaching train and poor judgment used in choice of track, with result that train struck yard engine and did considerable damage.
Section Foreman, 30.....	Failed to see that his men had proper flagging equipment when changing rail.
Pumpman, 30.....	Allowed pump to freeze.
Engineer, 30.....	Failed to observe signals set against him at interlocking tower, which resulted in derailment.

Engineer, 30.....	and reduced to freight service for twelve thousand miles for striking rear end of a train that was standing at terminal.
Conductor, 30.....	and reduced to permanent yardman for exceeding the speed limit and not clearing a superior train by the prescribed time.

Employees Dismissed.

Agents (3).....	Mishandled the Company's funds.
Operator.....	Refused duty.
Engineer.....	Allowed engine to get short of water causing crown bolts to leak and engine to give up train.
Trainman.....	Threw switch in front of a moving train which resulted in damage to equipment. He later appeared for investigation in an intoxicated condition.
Operator.....	Refused to assist with clerical work at station.
Fireman.....	Failed to report for duty after accepting a call.
Car Repairer.....	Did not properly attend to coach, allowing steam pipes to freeze and burst.
Agent.....	Did not carry out instructions and made false statements at investigation.
Yardman.....	Was convicted of theft in Police Court.
Trainman.....	Violated Rule G.
Trainman and Fireman.....	Failed to produce testimonials.
Trainmen (2), Fireman, Yardman and Operator.....	Previous record.
Fireman and Wiper.....	Deserted the service.

Meritorious Service; Five Merits Each.

Yardmen (3).....	Prompt action taken in preventing fire from spreading.
Engineer.....	Crawled inside ashpans of his engine and fixed grate, thereby avoiding engine failure.
Trainman.....	Fired engine when regular man was injured.
Agent.....	Took prompt action to protect Company's property when elevator burned.
Trainman.....	Discovered broken arch bar.
Engineer and Fireman.....	Took prompt action to get from terminal to a nearby station to protect Company's property when elevator burned.
Trainman.....	Assistance rendered during severe blizzard by passing coal on passenger engine.

Records Cleared by 12 Months' Satisfactory Service.

Agents.....	3	Car Carpenter.....	1	Siv. Boiler Fireman.....	1
Boilerwasher.....	1	Car Inspector.....	1	Sectionman.....	1
Boilermaker.....	1	Engineers.....	5	Signalman.....	1
Car Repairers.....	3	Fitters.....	3	Trainmen.....	3
Checkers.....	3	Firemen.....	2	Wipers.....	5
Clerks.....	3	Fitter's Helper.....	1	Yard Foreman.....	1
Conductors.....	4	Operators.....	2	Yardman.....	1

Employees From Whose Records Twenty Demerit Marks Have Been Deducted for Twelve Months' Satisfactory Service.

Agent.....	1	Engineer.....	1	Operator.....	1
Conductor.....	1	Fireman.....	1	Trainman.....	1
Craneman.....	1	Hostler.....	1	Yardman.....	1

Miscellaneous.

On January 7 during a severe blizzard, Conductor M. found a cart loaded with coal standing foul of the crossing on the opposite track one mile west of P., stopped his train and prayed for a passenger train on the other track, thus preventing possibility of an accident.

We are continuing to have too many injuries on account of shopen, trainmen and others being careless of their personal safety in the performance of their duties, and incurring unnecessary risk.

The prevailing severe weather calls for the utmost care in operating trains and switching; it is much the better course to look ahead and prevent accidents rather than deplore them after they occur.

Trainmen, trackmen and all employees handling or placing torpedoes must use the utmost care in placing or using them. The utmost care and caution must be exercised to prevent torpedoes being left on the ground unexploded.

FRENCH RAILWAY UNIONS.—Subject to final ratification, plans have been made to amalgamate the principal French railway trade unions. If these proposals are carried into effect the result will be the creation of a great and very powerful union, with a distinctly militant policy. The name of the new society is to be the "National Federation of Railway Workers of France, Colonies, and Protectorate Countries," with headquarters at Paris, and it will be affiliated with the notorious "C. G. T." (General Labor Confederation), which provoked the great postal and railway strikes. The weapon of the general strike would also seem to be one on which the new federation is placing considerable reliance. Its proposed articles of association provide for the constitution of a "General Strike Committee" of 24 members, to be elected annually, and immediately after its establishment, this committee is "to elaborate a plan to be ready for any eventuality." No strike is, however, to be declared, save on the votes of five-sixths of the committee. It remains to be added that women are eligible for membership of the National Federation, but at lower subscription rates than their male colleagues.—*Railway Gazette, London.*

DESIRABILITY OF STANDARD LENGTH FOR STOCK CARS

By C. E. Smith

The advisability of adopting a standard length of stock car to facilitate handling at the yards is a matter worthy of some attention, and the description of the recent Santa Fe stock car in the *Railway Age Gazette* of June 1 suggests a consideration of the subject at this time.

At isolated points where stock is loaded in one or a few cars at a time the extra burden of switching cars of various lengths to place the doors opposite the gates of stock pens may not be great, but the extra switching, the time consumed and the general confusion resulting from the handling of trains of stock cars of miscellaneous lengths alongside long loading and unloading chutes at stock yards is a source of trouble and expense. Coordinate with the consideration of a standard length for stock cars consideration must be given to a standard spacing for loading and unloading chutes. If standard dimensions are adopted for future stock cars and also for future stock chutes conditions will gradually reach the point where solid stock trains can be handled at long unloading chutes without the necessity of separating the trains into small cuts.

In the design of new facilities at the Kansas City stock yards the writer after careful investigation adopted a 44-ft. spacing of stock chutes to fit a standard length of car of 40 ft. (inside dimension). The tendency for cars to approach that length seemed also to warrant such a choice. The length chosen is considerably greater than the majority of stock cars now in service, but harmonizes with the length of many of the most recent designs. The 44-ft. chute length was chosen for the additional reason that cars of shorter length than 40 ft. can be separated in cuts of four or five and spread to bring the doors opposite the gate of the chutes. This practice is impossible when the car lengths are greater than the spacing of the chutes.

At the Kansas City stock yards stock loading and unloading facilities will consist of five tracks of about 60 car lengths. The width of each chute is 22 ft., that is, one half the length of a car, coupled, making a total of 120 chutes on each side. The double chute arrangement was chosen in order that both floors of a double deck car might be unloaded into two adjoining chutes at one time, and also in order that a second train of single deck cars might be unloaded in alternate pens before the first pens, filled by a preceding train, had been emptied.

In the table below are given summaries showing the number of each length of stock car between 32 ft. and 41 ft., together with the total number of stock cars of greater or less length.

Summary of stock cars by length and number:

Length	Number
Under 32 ft.	1,365
32 ft.-33 ft.	6,164
33 ft.-34 ft.	2,306
34 ft.-35 ft.	59,688
35 ft.-36 ft.	59,990
36 ft.-37 ft.	37,188
37 ft.-38 ft.	12,130
38 ft.-39 ft.	2,232
39 ft.-40 ft.	8,487
40 ft.-41 ft.	2,775
Over 41 ft.	677
Total	138,472

In each case where the car length is given the dimension is that inside the body. The dimension between the pulling faces of the coupler knuckles will be about 4 ft. greater. The slight variation in this dimension would be compensating and should have but little effect on the spacing of the car. It will be seen that there are quite a number of cars more than 40 ft. long, but the only ones which would cause serious trouble in handling at 44 ft. chutes built for a 40-ft. car are 650 stock cars with an inside length of 44 ft.

owned by the Great Northern. On account of the fact that these cars exceed in length practically all other stock cars and since these cars seldom if ever reach Kansas City, it was not thought necessary to space the stock chutes to accommodate them. However, at points served by the Great Northern or connecting lines, it would not be advisable to build chutes with a spacing adapted to the handling of these cars as the number of shorter cars so far exceeds the longer cars that the extra switching in the handling of the shorter cars at the longer chutes would more than offset the greater facility in the handling of the comparatively few longer cars.

The adoption of a standard length of stock car and a standard spacing of chutes to fit the stock car would be very desirable. From the information at hand it would seem that a length of 44 ft. would be the best to adopt as a standard for stock chutes and 40 ft. inside length for stock cars.

RAILWAY EMPLOYEES NOT EXEMPT FROM DRAFT

Railway employees as a class are not to be exempt from conscription into the National Army. Rules and regulations prescribed by the President for the local and district boards who are to pass upon claims for exemption from the draft were issued on Monday, in a booklet of 84 pages, which makes no mention of railroad transportation service. Under the provisions of the act, the President is authorized to exclude or discharge from the draft, or draft for partial military service only, from those liable to draft "persons engaged in industries, including agriculture, found to be necessary to the maintenance of the military establishment or the effective operation of the military forces or the maintenance of national interest during the emergency," but in the regulations and instructions to the local board, no mention is made of railway service as an industry thus found to be necessary.

The railroads have been endeavoring for some time to ascertain the government policy with regard to railway employees and have been advised that the question as to who shall be exempted, excluded or discharged from the draft is a question for the determination of the federal exemption board, who will operate under the provisions of the selective service act, and will be guided in their determination by the rules and regulations issued by the President. There are practically no exemptions by classes provided in the regulations, except as provided by the law for such classes as government officers, ministers of religion, students of divinity, persons in military and naval service, subjects of Germany and other resident aliens who have not taken out their first papers. These may be exempted by the local boards, who may also discharge county and municipal officers, custom house clerks, persons employed by the United States in the transmission of the mails, artificers and workmen employed in the armories, arsenals and navy yards of the United States, persons employed in the service of the United States designated by the President to be exempted, pilots, mariners actually employed in the sea service of any citizen or merchant within the United States, and those in a status with respect to persons dependent upon them for support which renders such exclusion or discharge desirable.

The government takes the position that the percentage of men selected from any one industry will be so small as not to interfere with the operation of any industry and as it is not the intention to cripple any industry, the exemption boards will have authority to make exemptions in individual cases in industries found to be "necessary."

Exclusive original jurisdiction is conferred upon the district boards to hear and determine all questions or claims for exempting or excluding or discharging persons, arising under the provision of the act authorizing exemption of persons engaged in industries found to be necessary. A

claim for discharge under this provision of the act may be filed with the district board by, or in respect of, any person whose name has been certified to the district board by a local board as one called for service and not exempted or discharged. Claims for discharge must be filed with the district board on a form provided for that purpose on or before the fifth day after the mailing by a local board of notice to such person that his name has been certified to the district board as called for service and not exempted or discharged. The regulations provide that to warrant exemption not only must the particular industry be necessary to the maintenance of the military establishment or to the effective operation of the military forces or to the maintenance of national interest, but that the employee's continuance therein is necessary to the maintenance thereof, and that he could not be replaced by another person without direct substantial material loss and detriment to the adequate and effective operation of the enterprise, and that the particular enterprise is necessary. The President may, however, in his discretion, from time to time ascertain and determine which industries or classes of industries are necessary and certify his findings to the district boards.

It is made the duty of each district board to ascertain by its own methods existing conditions in industries as they may be affected by the draft and to ascertain as near as may be the labor supply available for necessary industries and to take into consideration all such effects in determining claims, and the effect of the efforts of government agents to mobilize and make such labor more efficient.

If in the opinion of the district board the direct substantial material loss to any industrial or agricultural enterprise outweighs the loss that would result from the failure to obtain the military service of any such person, a certificate of discharge may be issued.

B. & O. OFFICERS' ANNUAL MEETING

The annual general staff meeting of the Baltimore & Ohio was held at Deer Park, Md., June 29 and 30. About 500 were present. Vice-president A. W. Thompson presided on the first day and George H. Campbell, assistant to the president, acted in that capacity on the second day, taking the place of Vice-President George M. Shriver, who was unable to be present.

President Daniel Willard delivered a eulogy on the late Chairman Oscar G. Murray, telling of his service to the company and his charity. Mr. Campbell, who is executor of the will of Mr. Murray, said that the sum applicable to the Oscar G. Murray Railroad Employees' Benefit will exceed \$800,000.

Mr. Willard also delivered a stirring address on the war situation. He said, in part:

The success of America and our Allies in the war for liberty and democracy depends largely upon the efficiency of this country's transportation system. Every American stands on the same footing of patriotic citizenship, with every man occupying one of two positions in respect to the war. He is either for his country or he is against it. The aims of effort of every citizen must be brought into play if the goals for which America cast its die in the world war are to be realized. Every phase of the railroad service must be considered with reference to its bearing on the winning of the war. With the potential fighting strength of our Allies, and the moral support of America and its vast resources and military forces, it is inconceivable that our efforts will fail to be crowned with victory. The government rightly expects every man, woman and child to render a faithful account of their citizenship and everything should be subordinated to patriotic action.

The War Board, with full authority to handle troops and articles entering into the manufacture of war supplies in the

best interest of the government, and sitting before a map outlining 262,000 miles of railway lines whose corporate identity has been removed, is directing the movement of food-stuffs required by the American people and our ally fighting forces abroad; and if a shortage of fuel threatens any section of the country the combined facilities of the railroads will be directed towards relief. The service necessary to the winning of the war will require 75 per cent of the capacity of the carriers, leaving but 25 per cent capacity to perform a business service which normally requires twice that effort.

The French railroads are now badly in need of rehabilitation. Russia is badly in need of more and improved railroad service, locomotives and cars. While locomotives are being built here for Russia, France and England, the American railroads have agreed to withhold orders so far as possible. Russia's fuel supply which formerly came largely from England through Archangel to Petrograd—the industrial center of the empire, is now being shipped there from the Caucasian mountains, a distance of 1,500 miles. Vladivostok is now the front door to Russia, it being the terminus of the trans-Siberian railroad.

The acreage under cultivation in America this year is 30 per cent greater than last year. The railroads have co-operated in handling seeds and farming machinery and every effort will be made to move the crops promptly. The Baltimore & Ohio is handling 20 per cent more business with a decrease in the percentage of train miles. This has been accomplished by increasing the average trainload to 800 tons. I believe the people are going to appreciate the situation confronting the carriers when they see how they have come to the front and what they have done to meet the national emergency and there will be a disposition everywhere to give the railroads what they fairly deserve.

J. M. Davis, vice-president in charge of operation and maintenance, presided at the afternoon session. Plans for offsetting the increased expense incident to the Adamson law, relief of freight congestion, car supply and the welfare of employees were discussed.

On the closing day President Willard made a brief address appealing to industrial America to preserve the standards of womanhood during the emergency which has made it necessary to place female operatives in positions formerly occupied by men.

If it should come about that our American womanhood suffered indignities as a reward of the patriotic effort they are making to support the nation in the purposes of this war, we in America would be in a sorry plight for we would thus be confronted with a situation the seriousness of which would be second only to the losing of the war. * * * I have seen women in the various countries of Europe doing the roughest of work in the mines, in the fields and in industrial pursuits; but Americans have prided themselves that women occupied a nobler place in the code under which we live. American women are to be commended for stepping into the industrial gap created by the retirement of men answering the call of the country to arms. These women must be encouraged and the conditions of their employment must be made as agreeable as possible.

The Baltimore & Ohio has more than 1,000 women in its employ filling places vacated by men. "Their entry into the ranks of transportation employees must be taken seriously," said Mr. Willard, "and while it is somewhat early to predict all that women will accomplish we do know that they are rendering a good account to their employers. We shall see to it on the Baltimore & Ohio that they are taken care of, that they have opportunities to live up to their traditions and that their comforts are provided for without the slightest embarrassment." The Baltimore & Ohio Glee Club of 40 voices, under the direction of Hobart Smock, gave a concert at the closing session on Saturday evening.

An Attractive Reinforced Concrete Highway Viaduct

Lackawanna Bridge at Clark's Summit Involves a Number of Interesting Features of Design and Construction

THE Delaware, Lackawanna & Western recently completed a reinforced concrete bridge over its tracks at Clark's Summit, Pa., which has a total length of 390 ft. and a width over all of 31 ft. 9 in. It consists of six 50-ft. and two 45-ft. concrete deck girder spans. Space is provided for a clear roadway of 24 ft., a 5-ft. sidewalk on the west

crete columns which in turn rest on concrete pedestals. The T-beams are stiffened over the bents and at the center of the spans, by transverse struts cast monolithic with them. At every third span a double column bent was used to provide for contraction and expansion of the floor, depending upon the flexibility of the columns to take up the movement. This is a feature of the design and is more satisfactory in long spans than sliding joints, while it eliminates the necessity for transverse beams connecting the columns. Between these expansion joints the girders are continuous over the supports and are designed as continuous beams.

In the T-beam floor, each beam is supported directly on a column so proportioned as to be just within the limits of the ratio of slenderness requiring the diameter of the columns to equal $1/15$ of their height. The beams have a curved soffit, giving a pleasing architectural effect and counteracting the sagging at the center appearance common in beams of long spans when built level or on a straight line. The increased depth of the beams at the columns provides for the diagonal tension and the negative moment at the support where the T-beam effect is lost.

CONSTRUCTION

By referring to the photograph showing the completed bridge it can be seen that the tracks were placed in a cut at this location. In preparing the site for the structure, the knoll between the main line tracks and the westbound slow track was taken out by a steam shovel. The two bents on the left or north are founded on rock that was found close to the surface and the others rest on an earth foundation. In the latter case, the footings were designed for three tons per square foot.

The footings were not placed at the same level and in order to make the column lengths the same for the 50-ft. spans, thus permitting the re-using of forms, pedestals which carry the columns were built up to the proper height. The pedestals on each side of the main track, which act as a

Placing the Reinforcement in the T-Beams and Floor Slab

side and the concrete railings. The bridge spans the three main tracks of the new line recently completed by the Lackawanna as well as the westbound slow freight track and one track of the old line which was left in place as an entrance track to the Clark's Summit freight house.

The bridge floor, which is the T-beam type was designed

The Completed Viaduct

for a live load of 100 lb. per sq. ft. or a 10-ton roller plus 25 per cent impact for both. The girders are 1 ft. 6 in. wide, spaced 4 ft. 6 in. face to face with variable depths and are covered by a floor slab 8 in. thick spanning transversely.

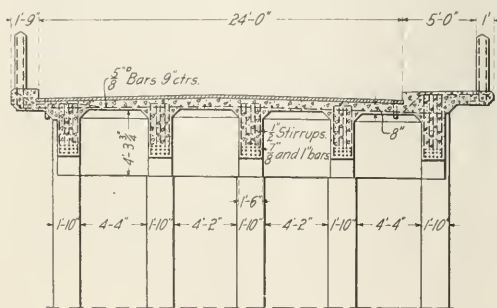

The sub-structure consists of bents built of reinforced con-

crete columns which in turn rest on concrete pedestals. The T-beams are stiffened over the bents and at the center of the spans, by transverse struts cast monolithic with them. At every third span a double column bent was used to provide for contraction and expansion of the floor, depending upon the flexibility of the columns to take up the movement. This is a feature of the design and is more satisfactory in long spans than sliding joints, while it eliminates the necessity for transverse beams connecting the columns. Between these expansion joints the girders are continuous over the supports and are designed as continuous beams.

In placing the falsework during the construction it was essential to span the main tracks without placing a support between tracks. For this reason old steel trusses were

brought in and used to support the centering. The forms for the columns were braced to the bents which carried the trusses. In the double column bents the space between columns is only $1\frac{3}{8}$ in. The columns were poured simultaneously and the form between the two consisted of two beveled boards which were wedged in place. To facilitate the removal of the forms the wedge was started just after the completion of the pouring. With the wedge started no difficulty was encountered in removing the forms.

In placing the concrete floor, the run was continued without interruption for three spans or between expansion joints for one-half the width of the bridge. The bridge is on a 3 per cent grade and the floor is drained through $2\frac{1}{2}$ -in.

Cross Section of the Floor

wrought iron pipes spaced 10 ft. apart. The floor is paved with 3 in. of asphalt which provides the necessary waterproofing.

The concrete plant was located at the track level and a tower was provided for elevating the concrete to the forms. The 45-ft. spans were built first and after their completion were utilized as a site for precasting the concrete fence panels. The concrete railing was erected by placing the panels and pouring the posts in place around the panels which project 3 in. into the posts. The bridge was built by the company's forces under the direction of G. J. Ray, chief engineer of the Lackawanna, and L. L. Tallyn, division engineer. A. B. Cohen was in charge of the design.

THE TRAIN DESPATCHER'S PART IN THE WAR

By C. J. McDonald*

By the organization of the Special Committee on National Defense of the American Railway Association (its "War Board") we have in reality a continental railway system. One railroad, under one management, one set of tracks, one lot of power and equipment, and greater than all, just one purpose. . . . The Commission on Car Service, acting under the War Board, is in continuous session at the Washington headquarters. It is directing the movement of equipment; regulating embargoes and release of cars, and at all times is keeping in close touch with the whole situation, changing as it does from day to day. . . . The Government will not, like that of England or Germany, have a separate branch of its organization conduct the system of transportation, but rather the United States Government has, ready for use, a system of railroads that has become so proficient that it is furnishing the highest class of freight and passenger service in the world.

Will our great American Continental Railroad uphold the honor of the greatest railroad system in the world? It

must and it will. The railroads are keenly appreciative of the opportunity to demonstrate to the country at large the value in time of war of railroads with elastic management. The railroads of this country are on trial. It is up to you, and it is up to me, and it is up to every single individual employee to see that this continental system does not fail. It can not fail; the very life of our nation depends upon the success of the government. The time-worn phrase "An army travels on its stomach" has been brought up-to-date by General Joffre's remark, "An army can progress only as its railroad facilities permit."

What can the train despatcher do? You can do a great deal. Your part in the war is right on your job of handling trains. The train despatcher is the superintendent's lieutenant. You will by far serve your country better and more effectively on your job than you would by actual physical fighting in the trenches. You are going to handle the greatest volume of tonnage in history; every car is going to be of the highest importance. There is only one thing to do, gentlemen; we must change our standards, change the breadth and width of a day's work for a freight car. Instead of handling only 16 tons, one car must carry twice the volume. You must speed up that car so that it will move faster. It moves fast enough when it is moving, but you must cut out lost motion. . . . Get trains moving out of the terminal right on the call, keep them going; figure your meets just a little closer; see that passing tracks and sidings are kept clear, and don't let your trains get caught outside of terminal by the legal limits. Do your part, and do it just a little better than you have ever done it before.

The keynote of success is train loading. You have done well in train loading, very well, but with the future in prospect, you are going to have to materially increase that train load; it simply must be done. None of us have locomotives to spare and there is just one thing to do—increase the day's work for the power we have. I have asked you to see that every engine on your division makes more than 75 miles a day. The nearer you come to actually doubling that daily mileage the better, but your efforts are not going to be very successful unless you accumulate that mileage with tonnage. Increase the train load just as much as it can be done.

Your roundhouses and your shops are going to become more efficient; they are going to give you engines that are steaming better, engines that are not leaking, engines that can do a full day's work any time they show up for call. The shop forces are just as anxious to contribute their efforts as you are. But the work that an engine does is entirely up to you, Mr. Despatcher. You are the one who can handle company material on trains that could not otherwise handle full tonnage; you are the one who will handle the company coal or company oil so as to fill up storage points at odd times without interference with regular traffic.

The War Board may even ask for a number of your engines to be turned over to another railroad. Some of these orders you may not understand, but if you will comply fully and promptly with all of them, you may rest assured that you are helping the whole situation. Suppose you get an order to deliver ten engines to your neighbor, or fifty coaches, or something like that. You know that he already has more equipment than you have; but the thing you don't know is that he may have a great military movement. . . .

. . . You know that our newspapers are not printing troop movements, and realizing the crafty enemy with which we have to deal, you also know how necessary it is to surround troop movements with secrecy. The despatcher must, of course, know all about such movements; the curious public is going to try to find out from you the details. Keep this in mind. Protect the troop movements the way our government wants them protected, by not letting information that may have harmful effects get out. Tell this to your train crews, too; they realize the harm that may come from information on troops getting out and they are glad to help.

* From an address delivered before the Train Dispatchers' Association, at Fresno, Cal., June 20. Mr. McDonald is assistant superintendent of transportation of the Southern Pacific, Pacific System, and also assistant to the chairman of the Western Department of the Railroads' War Board.

RAILWAY BUSINESS ASSOCIATION

"Our committee recognizes that commodities differ and that in some cases cubical capacity and weight capacity of the car are not equal. Shippers who are really interested in our proposed economy will naturally order of each commodity a quantity that is a full load of that commodity in a car of given weight capacity, and test performance by that standard.

"Already car shortage has yielded to co-operation. The authorities at Washington, the Railroad War Board and the National Industrial Traffic League through appeals have aroused the enthusiasm and zeal of shippers. The danger is that preoccupation of executives with other matters and the natural tendency of verbal instructions to fade from the mind of the employee will permit a return of laxity. We hope that by installation of a routine such as we recommend

"'Waste by any one of us in any sphere is aid and comfort to the enemy.'"

SHORT LINE RAILROAD ASSOCIATION OF THE SOUTH

The Short Line Railroad Association of the South of which Bird M. Robinson, receiver, Tennessee Railway, Oneida, Tenn., is president has issued a circular headed "Loading Uppers of Freight Cars." The substance of the circular follows:

There is an enormous waste of car space yet to be corrected and it behooves each member line of this association, not to deliver to its connections any car unless it is loaded to the maximum.

You are urged to impress upon shippers the importance of this matter, and get them in turn to take up with consignees and consumers and get them to order full carloads of commodity regardless of minimum.

You will find it helpful to examine the capacities of cars and check the loading, and by reducing same to percentages see how near you are getting to maximum efficiency in this regard. It is quite possible that the manner in which we load cars to our connections may have a bearing upon the number of cars made available to us.

In the present crisis the passenger departments of trunk lines are agreeing to refuse extra sleeping cars, until all the uppers are sold. Let us fill the "uppers" of freight cars by utilizing every inch of car space available and thereby do our bit to win the war.

TRANSPORTATION FACILITIES FOR FARM PRODUCTS

The Bureau of Markets of the Department of Agriculture has recently issued the following bulletin on the importance of heavy loading: "The U. S. Department of Agriculture daily receives from producers and distributors complaints of inadequate transportation facilities and appeals for assistance in securing cars.

"The Executive Committee of the Special Committee on National Defense of the American Railway Association, under whose direction the operation of all of the railroads of the country is being co-ordinated in an effort to produce a maximum of national transportation efficiency, is endeavoring to secure from the railroads the most efficient use of cars.

"The trade practice of placing an order for the tariff minimum weight of a given commodity is difficult to change in some cases, and it is recognized that small markets in many cases can not take a maximum carload of certain commodities, but there are many ways in which shippers and distributors can get more work out of a car at the present time.

"Shipping associations can pool the output of all their members and load cars of some commodities to full capacity for large markets. Wholesalers and carlot distributors can place orders for carloads of a greater quantity than was customary in the past. Shippers should load and unload cars within the shortest possible space of time, and every individual having to do with the diversion of cars in transit should reduce delay at diversion points to the lowest possible minimum. Against the increased value of a better market found while holding a car in transit must be balanced the loss due to deterioration of the product while the car is held and the sometimes greater loss of another shipper whose product spoils for lack of the car which the first shipper is holding.

"Cars, packages, commodities, time in transit, and seasons are variable, and the department has no accurate data from which rules can be laid down as to the exact quantity of a given commodity of a certain degree of maturity which can be loaded into a given car for a definite haul to a particular market; but potatoes in strong, double-headed barrels loaded in well-ventilated box cars for destinations that can be reached within three or four days could be loaded safely considerably beyond the prescribed tariff minimum weights. Citrus fruits in many cases can be so loaded. Apples, espe-

cially when moving to storage points in the late autumn, should be loaded to the space capacity of the car. Laredo onions normally are loaded 464 crates to the car. Cars were very scarce for the abnormal crop of the present year and they were loaded as high as 800 crates to the car. It is well known, however, that the Texas onion crate is so constructed as to secure the maximum of ventilation in loaded cars. The fact that loading watermelons five deep instead of four would reduce the number of cars necessary to move the crop by one-fifth, makes the experiment worth trying. A liberal use of straw underneath and between the melons, instead of merely sawdust underneath, and placing the larger melons at the bottom of the load would seem to make the plan feasible.

"What has been said relates to perishable commodities. The case is simpler with nonperishables. Association users of fertilizers, packages, and package material should order cars of full maximum capacity loading whenever possible. Buyers and users of cotton could assist by ordering in lots of 100 bales instead of lots of 50 bales.

"The present is a time for the closest co-operation of all interests for the most efficient utilization of cars and not a time to discuss relative responsibility for car shortage. One car used with the risk of damage from overloading is better than total loss of the commodity for lack of the one car in which to ship."

The Bureau of Markets is also co-operating with the railroads by bringing to the attention of shippers the importance of avoiding delays in unloading cars. Last week the bureau sent a telegram to all stations on its eastern and western circuits, embracing 20 important cities, stating that a serious shortage of cars for the handling of the cantaloupe crop is threatening the Imperial Valley in California and other western points where exceptionally large crops are waiting to be moved. It is stated that the loading in Pacific Fruit Express cars from California on June 23 and 24 totaled 897 cars, which is unprecedented, but that Pacific Fruit Express officials advise that the average detention of cars at the principal eastern markets during the month of May, after cars had been placed on the team track for unloading, was four days. There was also some delay caused by shippers holding cars in outer yards for disposition. The bureau stated that receivers in all markets should co-operate with shippers and carriers in this extreme emergency by unloading all cars promptly, thus making them available for further use. Somewhat similar telegrams were sent to the various organizations of fruit jobbers asking them to bring the matter to the attention of their members.

THE SECOND SIMPLON TUNNEL.—It was originally estimated that the second Simplon Tunnel would be opened to traffic on May 1, 1918, when the double track was to have been laid on Italian territory so far as Domo d'Ossola, or even beyond, but the war has so interrupted the work that it is impossible to give an approximate date at the moment. The Swiss military authorities suspended all work at the northern end from August 22, 1914, until February last, and although the works at the southern end have never been interrupted, Italy's entry in the war materially reduced the number of workmen. Moreover, those available are all under 18 or over 42. By the end of last year 6.2 km. (3.85 miles) had been bored at the northern end and 7½ km. (4.66 miles) on the southern section, leaving 4½ km. (2.8 miles) still to be excavated. Assuming the present rate of progress to continue which is largely dependent on external circumstances—the northern section might be finished by the end of the present year and the southern portion at the end of August, 1918. After that a great deal of work would still remain to be done in the shape of track-laying and ballasting, laying the electric cables and telegraph and telephone wires, signalling and lighting.

TRAIN DESPATCHERS' ASSOCIATION

The thirtieth annual convention of the Train Despatchers' Association of America opened on June 19 at the Hotel Fresno, Fresno, Cal. The weather was excessively hot all the week, but it was not unbearable even at the maximum temperature of 107 degrees F. Victor J. Imhoff, chief despatcher of the Santa Fe at Fresno, presided at the opening session. Mayor W. F. Tuomey welcomed the delegates and was responded to by President Frank T. Felter of the association. There were 42 members present at the opening; 26 applications for membership were presented and 23 applicants were elected, most of them being present. The total registration, including wives, was 116, or about half the number usually present, this because of the difficulty of relieving men at this time.

The report of Secretary J. F. Mackie showed total receipts of \$3,091 and disbursements \$3,599. The debit balance from the previous year was \$93, so that the year's operations showed a present debit balance of \$601. The statement of membership showed a large number of lapses. There was some discussion as to the cause of this. Frank N. McPhee (Southern Pacific), attributed it largely to the fact that despatchers generally failed to realize the value to them of the association, which had done much to enhance their important position in the service and to increase the consideration in which they were held; but this is being done quietly and without ostentation and is not appreciated. Mr. McPhee believed that if despatchers could have one day of rest in seven, where now, as a rule, they work continuously, day after day, for 365 days in every year, less two weeks' vacation, in a vocation requiring unusually intense application, with no meal hour within their eight hours of duty, the service would be improved through the superior energy brought to bear on the work, with the recuperative effect of the one day of rest in seven restoring mental and bodily vigor.

C. J. McDonald, assistant superintendent of transportation of the Southern Pacific, who had been delegated to represent President Sproule of that road at the convention, made an address on what train despatchers will be called upon to do during the war crisis. This address is noticed in another column.

On Wednesday Howard Elliott, Inspector of Transportation of the Los Angeles & Salt Lake, addressed the convention on "Taking Railway Legislation by the Forelock," in which he advocated preparedness to combat legislation adverse to railways, by railway men of all ranks, thus creating the public opinion which stands behind all legislation and supports or discountenances it. Mr. Elliott was warmly applauded and was given a rising vote of thanks. His address will be found on another page.

DISCUSSION ON RULES

The Train Rules Committee presented no report, lacking a quorum, but W. T. Quirk, Inspector of Transportation of the Santa Fe Coast Lines, submitted a series of questions for discussion, which discussion occupied the most of the afternoon of Wednesday and the forenoon of Thursday:

(1) Should standard marker lamps on semi-automatic interlocking signals be made purple instead of red, in order that engineers need not have to pass a red signal in automatic territory? Subject left with committee on train rules.

(2) A suggestion has been made proposing co-operation or union between the present joint train rules committee of this and the Superintendents' Association and the like committee of the Electric Railway Association, in order to the production of a code of train rules and order forms which should cover the requirements of both. The opinion of the convention was desired. The convention approved of conference with the Superintendents' Association and the Electric Railway Association on the subject by the train rules committee.

(3) A suggestion that Rules 210 and 211 be revised by requiring operators to underscore each word and figure on the lowest copy as first operator repeats. Mr. Mackie suggested that each operator except the one first repeating be required to give the "Q" response, certifying to the underscoring. The convention approved the suggestions.

(4) Two orders were submitted (A) "Eng 85 run psgr extra leaving A June 18 as follows with right over all trains except first class trains. Leave A 7 am arrive Z 2 pm." (B) "Eng 86 run psgr extra leaving Z June 18 as follows with right over all trains. Leave Z 1 pm arrive A 7 pm." It was decided that these were improper orders as regards the two trains running under them.

(5) The question was asked, "Why was Example 3 of Form G dropped from the Standard Code?" No one knew. This example was by all despatchers considered very useful, free from hazard, if properly used, and in some form practically necessary.

(6) Mr. Quirk said he understood it is becoming the practice of some roads to include in the rules that train men are not required to observe the indication of the train order signal but that that is up to the engineer and fireman.

No member present knew of any such rule. On all roads represented, conductors were held equally responsible with the engineer in the observance of signals.

(7) As to permanent slow order boards: How many lines use permanent slow boards at bad curves, bridges, etc., and if more than one curve or bridge close together, how many are used; one for each curve or bridge or one to cover a series of these or other conditions? Or, is the matter governed by special time-table rules, and, if only one board is used for a series of curves, etc., how would engineers know when they had passed out of the slow territory? Is there a "Resume speed" board in connection with slow board?

Mr. Hughes said the Sunset lines (Southern Pacific) used a permanent slow board placed on engineer's side and a green board indicating "Resume speed" when out of slow territory.

Mr. Felter: The New York Central sometimes places as many as three separate slow orders on one permanent board, prescribing the reduction of speed necessary in each case.

(8) The question was asked "What methods have been adopted by your road to facilitate the movement of trains through yards? Do you relieve conductors of checking car numbers, getting waybills and all that? Responses indicated that many roads have yard clerks to check car numbers and get way bills ready for conductors. Responsibility for error in such cases falls upon the yard force. The Illinois Central and the Southern Pacific use this system. A resolution was adopted and sent to the Superintendents' Association recommending simplification of conductors' reports.

(9) Question: What methods, if any, have been adopted to insure that conductor gets all the orders he signs for? It developed that on some roads the despatcher checks orders, by numbers, with the operator before their delivery. Others check clearance cards, the despatcher giving his O. K. and recording the check. Mr. McPhee said his road (S. P.) required trainmasters, assistant superintendents and superintendents to make tests on engineers and conductors to see that they have orders for every number of order shown on clearance cards.

SUNDAY WORK

Hugh McPhee, commercial superintendent of the Western Union at Los Angeles addressed the convention on Thursday afternoon. Mr. McPhee is a former despatcher and is an honorary member. He told of the Western Union's welfare work. Employees have the eight-hour day, based on 26 days a month, with a vacation week to those in service for one year and of two weeks to those in service for two years or more. Men are relieved of Sunday work in all departments after 1 p. m. wherever possible. Operators have

airy rooms in which to work and the company divides with them all of the funds earned over six per cent in addition to various sick and disability benefits. The Western Union has found it more economical and productive of more efficiency to keep its employees well by shortening hours of work and granting these other privileges. He had no doubt that more liberal rest would materially increase the efficiency of dispatchers.

Adopting the report of a committee appointed to frame resolutions on Mr. McDonald's address, the convention adopted resolutions pledging devotion to the cause of our country and to unremitting effort to attain every possible efficiency in that branch of railway service in which dispatchers are engaged.

Secretary J. F. Mackie, in line with the discussion at the first session, offered a resolution in favor of the establishment of one rest day in each week, as conducive to greater efficiency during the remaining six days. This was adopted, and the officers of the Association were empowered to lay before the managements of the railways of the United States and Canada "such representations as may result in securing for their dispatchers one day of rest in each week without loss of pay."

The following officers were elected for the ensuing year: President, Frank N. McPhee (So. Pacific), Bakersfield, Cal.; vice-president, Lee Rice (Southern), Greensboro, N. C. Grand Rapids, Mich., was selected as the place of meeting next year and June 18 as the date. The following were elected honorary members: G. S. Waid (So. Pacific), J. A. Christie (A. T. & S. F.), C. J. McDonald (So. Pacific), Howard Elliott (L. A. & S. L.), and W. R. Scott (So. Pacific.).

STEEL FOR CARS AND LOCOMOTIVES A WAR NECESSITY

"When the production of railroad cars and locomotives is interfered with because necessary steel is going to industries producing pleasure automobiles, steel furniture, buildings for amusements, etc., the situation cannot continue," says Weddill Catchings, chairman of the United States Chamber of Commerce Committee on Co-operation with the Council of National Defense.

This statement will be found in War Bulletin No. 2 issued last Friday. An abstract of the bulletin follows:

WAR REQUIREMENTS

The requirements of iron and steel in the prosecution of the war can hardly be exaggerated. Figures cannot be given but the broad statement can be made that the utmost which can be produced is below the requirements of the United States government and its allies and of business closely related to the war. This condition will continue; for, on the one hand, no substantial increase in production is anticipated—in fact, even maximum production from existing facilities cannot be expected because transportation, labor and material conditions will interfere with the full operation of plants—and, on the other hand, indications are that the war requirements will continue to increase.

The direct requirements of the government for pig iron are relatively small, but the requirements for steel are enormous and iron is therefore required in corresponding quantities. Steel is needed in the war for ships, railroad cars and locomotives, rails, trucks, containers, etc. Furthermore, there are the requirements for shells and other munitions work—requirements large in tonnage, far beyond what is generally supposed. In addition, business closely related to war, i. e., business producing government materials and supplies, the necessities of life and the materials for producing the necessities of life, require steel in great quantities for buildings, machinery, tools, containers, etc. When all these

requirements are met little if any steel will be left for so-called general business.

SUPPLY OF OTHER MATERIALS

With no other metal is the condition as disturbing as with iron and steel. Even the supply of copper is not nearly so inadequate. Materials which can be used in substitution for steel are plentiful in comparison. Lumber may be expected to meet all requirements and cement may be had in quantity for concrete work. While there may be delays in these cases a hopeless shortage does not exist.

The course for business men to pursue is clear. Iron and steel should be used only when the requirement is unavoidable. Every effort should be made to use wood and concrete in place of steel whenever this can be done, and construction and development work requiring steel should be postponed wherever possible.

OUTSTANDING CONTRACTS

Apparently little will be gained by contracting ahead for steel. Experience today indicates that soon producers of steel must ship their product where required in connection with the war rather than on such contracts as they may have on their order books. When the production of railroad cars and locomotives is interfered with because necessary steel is going to industries producing pleasure automobiles, steel furniture, buildings for amusement purposes, etc., the situation cannot be expected to continue.

PRIORITY IN DISTRIBUTION

Business men will probably make their plans in the expectation that soon there will be established an order of distribution of steel, and that the wild scramble to enter orders for future delivery of steel will be ineffective. In fact it will occur to many, no doubt, that failure to recognize this situation may lead to unfortunate results. In a business requiring steel, if contracts are placed for future delivery, not only for steel but for other materials, the manufacturer may find that he cannot get the steel but can get the other materials. In this case he might find that he had on hand large quantities of materials which he could not use because he had no steel.

LOCAL SOURCES FOR MATERIALS

In purchasing materials and supplies business men will doubtless consider the wisdom of returning, so far as possible, to doing business locally. The extraordinary service being rendered by the railroads in connection with the war will limit general transportation service and put an end during the war to the condition which has developed during the past fifty years through the prompt and reliable transportation facilities afforded by the railroads. No longer can a man in Illinois rely upon Pennsylvania as a dependable source of supply for raw materials and equipment. For many commodities the railroads can no longer spare the equipment to bring distant points into close contact. Purchase must be made near at home wherever this can be done. The preference which must be given to shipments of iron and steel will soon make this situation of daily importance.

INFORMATION FROM STEEL PRODUCERS

For the particular information of those in the iron and steel business it may be said that the Council of National Defense wishes to hear from producers of iron and steel whenever output is limited through transportation difficulties or through business conditions. Furthermore, pending the establishment of some method of distributing steel output according to war needs, producers of steel may render real service by assisting those producing war work to secure their steel requirements. Not only will this help win the war, but will tend toward less disturbance in business when steel supplies are shut off from those industries engaged in unessential production.

Taking Railroad Lawmaking by the Forelock*

Incessant Educational Campaign Necessary to Defeat
Vicious Legislation. Present Efforts in That Direction

By Howard Elliott

Inspector of Transportation of the Los Angeles & Salt Lake.

THE whole gamut of railway legislation is well known to railway men. No feature of the business has escaped the attention of the lawmakers unless it be specifications for track and roadway, or dining car prices. Under "new business" one legislature may be considering a bill new to them, but "the minutes of the last meeting" of a neighboring legislature will undoubtedly disclose it, though perhaps in a different form. Railway bills have been codified by various bureaus and anyone may obtain a list of them, with arguments, so there is no excuse for not being prepared when the bills are presented, or for omitting the missionary work between campaigns.

IMPROVED LEGISLATIVE METHODS

In the last decade railways have changed radically their methods of handling legislative business. Time was, not more than 10 years ago, when the "appearances" before commissions and legislatures were left to the railway attorneys. Now lawyers are popularly presumed to be sharp, and try as they may, they cannot overcome the impression that they rely as much on the "sharp quillets of the law" as on the "rule of reason" to prove their points. It dawned upon a group of railway executives about the year 1907 that the plan of sending practical operating and traffic men to the commissions and legislatures was at least worth trying. So there was organized in Chicago the Special Committee on Relations of Railway Operation to Legislation of the American Railway Association—with a branch in each state—composed of general managers, superintendents of motive power, general freight agents and the like. These committees have done yeoman service in defeating obnoxious laws, hurtful alike to the carriers and the public, they have been able to explain in language that could be understood by the lay mind the complex and intricate matters under discussion, and the prejudice which formerly existed over the manner of conducting this work has, for the most part, disappeared.

NEED FOR FURTHER IMPROVEMENT

But there is yet room for great improvement. I have been a member of such a committee in Utah for two terms, and in order to make the work still more effective, I offer the following suggestions:

Invite into the organization such corporations as light and power companies, street and interurban railways, and perhaps other public utility corporations, having them pay a share of the expense. This will avoid duplication of work on bills in which all such companies are interested. The committee should be formed immediately after the November election. A card index of the legislators should be kept, and the card should show previous education, business affiliations, and names of close friends. It is absolutely necessary that a representative of the committee be at the state house each day to keep track of bills and hearings, so that no bill shall be debated on the floor of the legislature until the railroads have been heard in committee. Committees, however, are not required to hold public hearings and it is essential that they be asked for. It should also be remembered that a perfectly innocent looking bill may be amended to be most vicious.

Don't hand to a legislator any argument more than one page long. No matter how difficult, boil it down until the main facts stand out boldly, and he can digest it while riding from his hotel to the state house. This may be the only time he has.

Don't mention the expense of complying with the law until all other arguments are used. Your opponents are going to say: "The corporations' excuse is the almighty dollar. That's the same objection the railways made to the air-brake, automatic coupler, and all progressive legislation." Which, by the way, is untrue. The railways hesitated to adopt those things until they were sure of getting the best devices, and then they asked for time to install them in order that the expense and inconvenience of removing cars from service might be spread over a number of years.

Don't issue any unsigned statements. Either sign them "Special Committee on Relations of Railway Operation to Legislation," or better yet, in the names of the committeemen.

Don't oppose vigorously any measures that affect others as much as they affect railways. Let the other fellows fight their own battles. We should not lay ourselves open to the charge of being obstructionists.

Don't ask the constituent lines for any data that you can get along without. Our departments are now overworked, and we must avoid calling on them for anything not absolutely needed.

Don't hesitate to call on individuals, chambers of commerce, boards of trade or commercial clubs to communicate with members of the legislature endorsing our position. If our work between campaigns has been effective, they will be glad to do this.

Don't work in the dark. Publish the fact that a committee is at work, tell where it may be found, and invite any legislator or anyone else to use the committee room as a library of information on any topic concerning public utilities. Whenever a statement is handed to members of the legislature, publish it also in the papers as a paid advertisement. That practice has a psychological and moral effect that is astonishing.

EXAMPLE OF ARGUMENTS

In Utah at the last legislative session there was introduced a bill limiting the number of cars in freight trains to 45. On behalf of the Special Committee on Relations of Railway Operation to Legislation, I issued the following statement and sent it to members of the legislature:

CONCERNING HOUSE BILL NO. 12, 45-CAR FREIGHT TRAIN LIMIT

"This bill will not do what it purports to do, prevent accidents. It will do exactly the opposite, increase them. Limiting trains to 45 cars means more trains; more trains more meeting points; more meeting points more accidents; more accidents more personal injuries. Employees failed to show a single accident that was caused by the length of the train. More accidents occur with short trains than with long ones. Records prove it."

"Railway wages are controlled by the brotherhoods and by Congress, railway rates by the commissions. Wages have gone up, rates down. The only flexible method railways have to economize is by cheapening the cost of transportation. This they have done through long trains."

"Millions have been spent by Utah railways in more powerful locomotives, stronger bridges, better cars, and in reducing and straightening grades and curves, to permit handling long trains. This law would make obsolete and of no use these millions which have been spent to do what this law would prevent them from doing."

"This law would work untold hardship on the public. Stock shippers, grain shippers, ore shippers, and wool shippers, would have to hold their shipments until trains with less than 45 cars came along. It would produce locomotive taxia in the commercial system of the state."

* From a copyrighted address before the Train Dispatchers' Association of America at Fresno, Cal., on June 20.

"The advocates of the bill say it would promote the safety of the public. The bill says so, too. Public safety is well cared for now. The Salt Lake Route, for instance, has not killed a passenger in a train accident anywhere on its lines for 10 years, and in Utah, never. The other lines have nearly, if not quite, as good a record. This bill, by making more trains, would increase accidents and loss of life.

"The Interstate Commerce Commission investigates thousands of accidents every year. Not once in their reports do they make this statement or any statement to the same effect: 'If this train had been shorter, the accident would not have occurred.' Employees have never suggested to their superior officers that trains be shortened as a means for preventing accidents.

"If such a regulation promoted safety the railways would eagerly adopt it. None is more anxious to make operation safe than they. If guided by no other consideration than that of avoiding the expense of accidents, they would do everything in their power to prevent them.

"Working on railways in Utah is very much easier than it used to be, and the men are very much better paid than any other workmen of the same class. Some of them draw more than \$300 a month, and the average is far higher than that of the professors in our oldest university, Harvard. This bill should properly be styled: 'An act to increase accidents on railways, to increase the expenses of railways and the public, and to prevent development of the state.'"

The bill was killed.

MISSIONARY WORK BETWEEN CAMPAIGNS

By sending practical railway men, instead of lawyers, to the legislatures, much of the odium against the "railway lobby" has been removed. But legislators still continue to present vicious bills and the remedy for the present plight of the railways is not to be found in legitimatizing or making respectable our legislative efforts. We must go further and take railway laws by the forelock and get back to the atmosphere in which those laws are conceived. By going direct to the people, we can not only explain to them the workings of any proposed law, but we can, in most cases, ascertain the conditions which give birth to the demand for the laws and remedy those conditions before they are made the subjects of legislative action.

WASHINGTON CORRESPONDENCE

WASHINGTON, D. C., July 2, 1917.

INTERSTATE COMMERCE COMMISSION REORGANIZATION BILL PASSED

The House on June 27 passed the bill to increase the membership of the Interstate Commerce Commission from seven to nine members and to authorize it to organize into divisions, but without the amendment added by Senator Smith when the bill passed by the Senate to require the commission to suspend all advances in rates against which a protest is filed. Representative Sims proposed a similar amendment in the House but it was disapproved by the Committee on Interstate and Foreign Commerce and was rejected without a division.

The enlargement of the commission is to be accomplished by the appointment of two additional commissioners, one for a term expiring December 31, 1921, and one for a term expiring December 31, 1922. The commission is authorized by its order to divide its members into as many divisions as it may deem necessary, which may be changed from time to time. Any commissioner may be assigned to and may serve upon such division or divisions as the commission may direct and the senior in service of the commissioners constituting any of the divisions shall act as chairman. In case of vacancy in any division the chairman of the commission or any commissioner designated by him for that purpose may serve temporarily. The commission may by order direct that any of its work, business or functions may be assigned or referred to any of the said divisions for action and may by order at any time amend, modify, supplement or rescind any such direction. The divisions are authorized to act for the commission "subject to review and approval by the commission, and application therefor may be made by any of the parties affected thereby." The language of the bill on this point is as follows:

"In conformity with and subject to the order or orders of the commission in the premises, each division so constituted shall have power and authority by a majority thereof

to hear and determine, order, certify, report, or otherwise act as to any of said work, business, or functions so assigned or referred to it for action by the commission, and in respect thereof the division shall have all the jurisdiction and powers now or then conferred by law upon the commission, and be subject to the same duties and obligations. Any order, decision or report made or other action taken by any of said divisions in respect of any matters so assigned or referred to it shall have the same force and effect, and may be made, evidenced, and enforced in the same manner as if made or taken by the commission as a whole, provided, however, that the action of any division shall be subject to review and approval by the commission, and application therefor may be made by any of the parties affected thereby. The secretary and seal of the commission shall be the secretary and seal of each division thereof."

In all proceedings before any division relating to the reasonableness of rates or to alleged discriminations, not less than three members shall participate in the decision and in all hearings relating to the valuation of railway property not less than five members shall sit in the hearing and participate in the decision. The Senate bill provided that seven members should participate in valuation hearings and also required three members to sit in hearings pertaining to rates. This was amended after Representative Esch had pointed out that it would require the commissioners to travel all over the United States taking testimony which is now taken by examiners, or that most of the hearings would have to be held in Washington.

The provision increasing the salary of the secretary of the commission from \$5,000 to \$7,500 per year was defeated in the House, as it was in the Senate.

In its report recommending the passage of the bill, the House committee presented figures showing the enormous increase in the work of the commission, saying that the work at present is so onerous and diversified that it is impossible for the commissioners to give personal attention to the various cases and complaints filed and that there is occasionally discontent and criticism that the cases cannot receive the personal attention of the commissioners themselves, but have to be heard and passed upon by agents and examiners. It was stated that the idea of the commissioners was that they should have a division on tariffs, a division on safety appliances, a division on accounting, a division on valuation and other divisions.

Referring to the Hoke Smith amendment to make suspension mandatory in case of a protest, the committee said it had considered that general subject several times without being able to conclude that the proposition was wise or practicable. If all advances were to be arrested by act of Congress and the commission were compelled to hold a hearing and investigate every proposed rate it would involve such a deluge of work as to paralyze the commission and nullify all the benefits sought to be derived by adding two members. It was stated that the commission itself has recommended a measure for establishing rates and practices as of a specified date as reasonable for the part with the provision that no change can be made therein subsequent to that date except upon order of the commission. The report suggested that possibly in conference between the two houses an agreement could be reached somewhat in line with this suggestion and a tentative provision to this effect was suggested, providing that rates, rules, practices, etc., as of January 1, 1915, except such as have been subsequently reduced, shall be regarded as just and reasonable and that no change should be made therein except upon order of the commission. The committee said, however, that the subject is too important for hasty action without mature and deliberate consideration.

Chairman Adamson of the committee, Representative Esch and others strongly advocated the passage of the bill and

the principal debate, except as to the Sims amendment, was on minor provisions. In opposing Sims' amendment Mr. Esch called attention to the fact that during 1916 there was filed with the commission 107,057 tariffs, many of them including hundreds of individual rates. Under the proposed amendment anybody feeling himself aggrieved could force a suspension, notwithstanding the fact that the commission as a result of the evidence in its own records, and all prior decisions in similar cases, might almost off-hand determine that the rates should be allowed. If the amendment became a law, he said, there will be many claim attorneys seeking the opportunity by a mere protest to start a formal proceeding. Representative Moore pointed out that the amendment would enable any individual in the United States, possibly some blackmailer, to automatically suspend rates.

In reply to the arguments of Representative Sims and others in favor of making the suspension mandatory, Mr. Adamson said that while he believed the commission would suffer before Congress and before the country if it should permit the proposed 15 per cent advance to go into operation without suspension, he believed it would be a much more severe blow to the commission for Congress to anticipate such action in advance and "strike them this legislative blow." The chief issue presented, he said, is "shall Congress permit the commission to continue to exercise its discretion as to suspending rates or will Congress take that out of their hands and make it mandatory?" Mr. Adamson said he had never doubted that the commission would suspend the rates and that to pass the Sims amendment would be little short of impeachment in advance of action. Mr. Adamson and Mr. Sims made it plain that they were opposed to the freight advance and received considerable applause when they said so. Mr. Adamson pointed out that the bill must go to conference and that the conference could hardly be concluded before the issuance of the rate decision.

The possibility of the discontinuance of the valuation was suggested by Representative Moore, who asked if the commission would not be able to do the necessary work without additional members if Congress were to take away from them the work of valuation. Mr. Adamson suggested that the valuation work probably will be entirely suspended during the war because of the uncertain values. It is impossible to arrive at any permanent value, he said. Mr. Moore said Congress continues to appropriate money for the purpose and the country needs the engineers and trained men who are in the valuation service for military service. To this Mr. Adamson replied that he did not think Congress will continue to appropriate money for the purpose during the war and that, according to his understanding, it is not necessary for Congress to take any action.

At the commission's office it was stated that the commission could no more discontinue the valuation which Congress has ordered and for which it has made appropriation for the ensuing fiscal year than it could discontinue its regular work without a direction from Congress. The commission has received a number of inquiries on the subject, to which it has replied that it knows of no intention to discontinue the valuation.

SENATE PASSES DAYLIGHT SAVING BILL

The Senate on June 27 passed the "daylight saving" bill, providing that at 2:00 a. m. of the last Sunday in April of each year, the standard time shall be advanced one hour and at 2:00 a. m. of the last Sunday in September of each year, the standard time shall be returned to the mean astronomical time of the degree of longitude governing each time zone. The bill also provides for legalizing the present standard time system of the United States, which was adopted at the instance of the railroads in 1883, but which has not had

the authority of law except by action of some state legislatures or local ordinances. It provides for the present five time zones, whose limits shall be fixed by the Interstate Commerce Commission, having regard for the convenience of commerce and the existing junction points and division points of common carriers, and the commission's orders may be modified from time to time. The effective date proposed is January 1, 1918. It was stated that the railroads had made the only opposition to the bill, on the ground of the inconvenience caused by the effect on the schedules of trains en route at the time of the change.

AGREEMENT TO REDUCE BITUMINOUS COAL PRICES

Tentative reductions in prices of bituminous coal, to become effective on July 1, were agreed upon in conferences between the coal operators and government officials at Washington on June 28, but a controversy has arisen which threatens the plan agreed upon. Following the conferences held with the government officials earlier in the week, at which it was decided that committees of coal operators should fix the prices, a question was raised as to the legality of such a plan and a new resolution was adopted providing that committees of seven for each coal producing state and an additional committee of seven appointed by the representatives of the anthracite industry, should confer with the Secretary of the Interior, the Federal Trade Commission, and the Committee on Coal Production of the Council of National Defense, to the end that production be stimulated and plans be perfected to provide adequate means of distribution. These committees were also to report forthwith to the Secretary of the Interior, the trade commission and the coal committee the costs of and the conditions surrounding the production and distribution of coal in each district, and were authorized, in their discretion, to give assent to such maximum prices of coal f. o. b. cars at mines in the various districts, as might be named by Secretary Lane, the trade commission and the coal committee. After the legal question had been raised it was proposed that the responsibility for the actual fixing of prices should be placed on the government. The tentative reduction in prices on July 1 was proposed by Secretary Lane to be effective until the investigation into costs and conditions warrants an increase or reduction in the tentative prices. The tentative prices do not affect contracts or sales made before July 1. In most cases the prices fixed were from \$3.00 to \$3.50 per ton, the price to the government to be 50 cents less. The reductions range from \$1 to \$5 a ton.

The status of the agreement was thrown into uncertainty, however, on June 30 when the Secretary of War, as president of the Council of National Defense, repudiated the agreement, saying that the prices fixed were excessive and that the committee had no power to fix prices.

Tentative maximum prices for anthracite coal had already been made by the anthracite operators in co-operation with the Federal Trade Commission.

Representative Sims of Tennessee has introduced a resolution, H. J. Res. 111, to authorize the President whenever, in his judgment, it shall be necessary for the efficient prosecution of the war, to direct coal and coke producers to sell their produce only to the United States, and also authorizing the President to direct any or all railroads, ships or boats engaged in coastwise or inland lake or river trade and all other common carriers in the United States, to be operated as a unit on government account under direction and control of the Interstate Commerce Commission, under such rules and regulations as the commission shall prescribe. The bill prescribes that the owners shall be paid a compensation equal to the average annual net amount earned for the five-year period prior to June 30, 1916. Such direction and control shall continue for the period of the war and not to exceed one year thereafter.

General News Department

At a meeting of the executive committee of the Railway Equipment Manufacturers' Association at Chicago, June 11, the convention of the association for this year was canceled.

The Nashville, Chattanooga & St. Louis has made an advance of about 10 per cent, taking effect June 15, in the pay of all employees, except general officers, who have not recently received advances. About 4,000 persons will be affected.

In serious riots at East St. Louis, Ill., on July 2, started by the lawless acts of men and women who objected to the importation of large numbers of negro laborers from the south, the freight house of the Southern Railway and 100 loaded freight cars, standing on that company's tracks, were destroyed by fire. Much other property was also burnt up.

Returns for May for 72 roads, operating 103,000 miles, made public by the Interstate Commerce Commission on July 3, show an increase in net revenue per mile from \$457 to \$466, but a decrease for five months from \$2,063 to \$1,949. The western roads show an increase for the month, but the eastern, southern and western districts all show a decrease for the five months.

Reports received by the bureau of construction and repair of the Navy Department, state that the shipments of steel for government uses from the Pittsburgh district for May amounted to 69,112,141 pounds. Of this the Carnegie Steel Company shipped 63,542,930 pounds and other companies 5,569,211 pounds. This is more than the six months' record of such shipments under normal conditions.

The secretary of the Canadian Northern Railway Patriotic Association announced recently that during January, February, March and April this year the association collected and contributed to the Canadian Patriotic Fund \$24,554. The association has now been thoroughly organized throughout the system from Quebec to Vancouver, and it is anticipated that the returns for the next four months will be even more favorable.

The Louisville & Nashville has made arrangements to buy a large quantity of goggles to supply every man in its shops in Kentucky. Now, if the men do not wear the glasses, after the employer furnishes them, they must themselves bear the risk of injuries, which could have been prevented by wearing glasses. Under the Kentucky Workmen's Compensation law credits are given on the basic risk rates on liability insurance where employers adopt safety first measures. One of these credits is in connection with the furnishing of goggles.

In a safety bulletin recently issued by R. C. Richards, chairman of the central safety committee of the Chicago & North Western, an appeal is made to employees not to take chances by violating safety regulations. The circular says in part: "Get after the chance-takers and teach them to be careful or drive them out of the service before, and not after, some one is killed or injured." It may be you. During the six years ending December 31, 1916, 85 per cent of the deaths and injuries to North Western men were caused by dangerous or thoughtless practices."

The United States Civil Service Commission announces examinations, July 25, for the positions of junior mechanical engineer, junior signal engineer, junior structural engineer and junior telegraph and telephone engineer. All of these examinations are for positions in the department of valuation, Interstate Commerce Commission. Applicants must be between 21 and 36 years old. They must have had five years' experience for the first grade and three years for the second grade; and numerous other conditions are imposed. Salaries, for grade 2, from \$720 to \$1,080; and for grade 1, from \$1,200 to \$1,680.

A. J. Earling, president of the Chicago, Milwaukee & St. Paul, has presented a copy of Elbert Hubbard's "Message to Garcia" to each of the members of the St. Paul company of the Third Reserve Engineers, who will leave for France this summer to operate railroads at the front. On the cover of the booklet is a

print of the American flag in colors, under which is the following quotation from President Wilson's war message: "The world must be made safe for democracy. Its peace must be planted upon the tested foundations of political liberty." The text is prefaced by Mr. Earling's own message to the men: "In wishing the officers and employees of the Chicago, Milwaukee & St. Paul God-speed as they depart for the front, it is my sincere wish that each and every one may have the opportunity of delivering that message to Garcia and safely return to the happiness of his home with the consciousness of having been ready and a realization that the hero of the war was the man who delivered the message when called upon."

The Secretary of War, according to an announcement by the War Department, has taken a hand in the controversy between the Louisville & Nashville and Western Union Telegraph Company as to the right of the latter to maintain its line along the right of way of the road. Recently the railroad announced that it would not tolerate the Western Union wires on its road and it was understood that orders had been given to gangs of workmen to chop down the poles. The Secretary of War despatched a message to the heads of the two companies informing them that they would be expected to come to a peaceable and prompt agreement. Otherwise, he intimated, the telegraph line would be taken over and operated by the government in such a way as to make interference impossible.

Priority Bill Passed by House of Representatives

The house on June 29 passed with very little debate the priority bill, giving the President power to direct that such traffic or such shipments as may be essential to the national defense and security shall have preference or priority in transportation by any common carrier. As passed by the House, the bill contains amendments proposed by the Committee on Interstate and Foreign Commerce which will necessitate a conference before the bill goes to the President for his signature. At the suggestion of Representative Sims, an amendment was added to include the provision struck out by the Senate, to provide that nothing in the section prohibiting obstruction of interstate or foreign commerce shall be construed to affect the provisions of the Clayton law applying to organized labor.

Green for Proceed on the Pennsylvania

The Pennsylvania Railroad announces that on June 28 the use of green lights (in place of white) for the proceed indication at night in semaphore signals, and yellow (in place of green) for caution, was made universal throughout the company's lines east of Pittsburgh. Much delay has been experienced in making this change because of difficulty in getting materials. Corresponding changes have been made in the marker lights carried on the rear of passenger and freight trains; in switch lamps, slow signs, hand lamps, etc.

The Western Union on the Pennsylvania

The contract between the Pennsylvania Railroad Company and the Postal Telegraph Cable Company for the handling of commercial messages, which has been in effect since July 1, 1902, expired last Saturday night. The Postal will continue to operate independent public offices with its own forces at certain large stations, including New York, Philadelphia, Baltimore, Harrisburg and Pittsburgh; also at Union Station, Washington, which is controlled jointly by the Pennsylvania and the Baltimore & Ohio. Arrangements have been made by which the Western Union Telegraph Company will also open independent offices to be operated by its own forces in the stations at New York, Philadelphia, Baltimore, Harrisburg and Pittsburgh. A Western Union office already exists at Union Station, Washington.

At other stations on the Pennsylvania Railroad the railroad

company will henceforth act as agent of the Western Union instead of the Postal.

It is not contemplated that the Western Union will erect pole lines on the Pennsylvania's right of way. Such wires and cables as the Western Union may require in connection with the acceptance of commercial messages from the various stations on the Pennsylvania Railroad will be strung on the pole lines, or placed in the conduits of the railroad company. A new agreement is now being negotiated with the Postal Company, by which that company will retain its wires and cables on the poles and in the conduits of the railroad company.

Final Returns on the Liberty Loan

The railways' campaign for subscribers to the Liberty Loan resulted in 241,280 subscribers for a total of \$30,027,966 in bonds, says the report which has just been received by participating roads from the Liberty Loan Committee of Railroads. The list of subscribers by roads follows:

REPORT OF LIBERTY LOAN SUBSCRIPTIONS

	Individuals	Amount
Abilene & Southern	23	\$65,500
Alabama & Vicksburg	36,000
Atlanta, Birmingham & Atlantic	20,400
Atlanta & West Point	200	25,000
Atlantic Coast Lines	1,819	239,350
Atchison, Topeka & Santa Fe	6,827	714,050
Augusta Southern	5	5
Baltimore & Ohio	4,940	397,300
Baltimore & Ohio Chicago Terminal	89	8,450
Bangor & Aroostook	455	40,550
Boston & Maine	6,222	322,250
Buffalo & Susquehanna	299	49,150
Buffalo Creek Railroad	123	7,850
Buffalo, Rochester & Pittsburgh	3,390	275,650
Carolina, Clinchfield & Ohio	695	57,400
Central of Georgia	63,150
Central R. R. of New Jersey	1,050	21,500
Central Vermont	725	45,000
Charleston & West Carolina	191	16,950
Chesapeake & Ohio	3,500	350,000
Chicago & Alton	11,650
Chicago & Eastern Illinois	475	50,000
Chicago & North Western	1,776	128,250
Chicago & Western Indiana	427	38,150
Chicago, Indianapolis & Louisville	1,463	21,500
Chicago, Burlington & Quincy	1,424	152,960
Chicago Great Western	75,000
Chicago, Milwaukee & St. Paul	2,090	217,000
Chicago, St. Paul, Minneapolis & Omaha	44,400
Chicago, Indianapolis & Western	211	25,000
Delaware & Hudson	7,367	514,200
Delaware, Lackawanna & Western	16,886	1,091,336
East Tennessee & West North Carolina	12,800
Florida East Coast	14,103	1,005,870
Fort Smith & Western	436	49,850
Georgia & Florida	19,200
Georgia Railroad	45	4,000

Discouraged and Amazed

Samuel Rea, president of the Pennsylvania, in a statement issued last week regarding the decision of the Interstate Commerce Commission in the 15 per cent advance freight rate case, said:

"I am amazed at the reasoning and discouraged by the conclusions. The Eastern railroads are the great terminals for the whole country, and absolutely require the 15 per cent increase immediately. The Pennsylvania System is indicative of conditions on the railroads in eastern territory, and its operations verify the estimates made for the commission. The five months ending with May show an increase of about 9 per cent in gross earnings, but a decrease of about 27 per cent in net operating income, or nearly \$10,500,000, compared with 1916. Costs of labor and materials are still rising, especially fuel coal, which will be increased by several millions over what was estimated in the rate case.

"Notwithstanding all the railroads are doing in co-operation with the government (and no other interests are doing more), the country will realize that there will probably be more congestion next fall and winter than it has heretofore experienced. We are bending every effort to meet that situation, but instead of putting the railroads in a position where they can give substantial assistance by additional facilities and equipment, their credit will be seriously limited by this decision, and the country at large must of necessity suffer.

"The commission estimates a return of only 4.89 per cent for the year ending June 30, 1917, on the road and equipment provided for public use by the Eastern railroads, and yet declines to grant a reasonable increase in rates. What credit or progress can be based on any such inadequate return? The experience of the weak condition of the railroads for five years prior to 1916, with practically no new mileage constructed, and insufficient terminal facilities, is utterly ignored. I dislike to criticize any governmental decision, but the people should know why it is impossible to provide adequate facilities and service, which are imperatively required for this growing country, and should understand how unjustly the Eastern railroads are being treated."

Investors' View Will Test the Government's Action

A. H. Smith, president of the New York Central Lines, issued a statement on the rate advance decision, saying that until the details could be checked it would be impossible to say what increased revenue will be received by the New York Central Lines. Continuing, he said:

"The application for increased rates as presented was, in our opinion, conservative, and did not nearly meet the added expenditures placed upon us. . . . The railroads of this country require a continuing outlay for betterment and enlargement. The unusual conditions of today are bringing up hourly many problems requiring large expenditures of money on capital account. Such money must be had from the investing public. If the people who have it to invest will accept the judgment rendered by the commission and provide the money, very well. Their action will then support the view of the government's commission. That will be the test. . . ."

One Road Taken by the Government

The War Department announces that the Hoboken Shore Railroad has been taken over by the Government. This road is one mile long, from Hoboken, N. J., north to Weehawken, with about 8 miles of track. It is used exclusively for freight. The War Department proposes to extend the tracks southward a short distance to reach the docks of the German steamship lines. The president of the road is Charles D. Boyles, Hoboken N. J.

War Taxes

The revised war revenue bill carrying the proposed excess profits tax on corporations, including railroads, was completed by the Senate finance committee on Monday and reported to the Senate on Tuesday. The excess profits tax is graduated from 12 to 50 per cent on net income in excess of the average net income for the pre-war years 1911, 1912 and 1913, with an exemption of \$5,000. The 12 per cent rate applies on taxable profits up to 15 per cent of the normal profit. The proportion between the excess profits and the net income in each case is to be determined by the Commissioner of Internal Revenue in accordance with regulations prescribed by him with the approval of the Secretary of the Treasury. If during the pre-war period the net income was less than 6 per cent on the average capital employed the proportion of taxable income may be determined either on the basis of the profits of representative corporations in a similar business or by deducting 6 per cent from the net income during the taxable year, at the option of the taxpayer. Capital is defined as "the fair average value of the assets actually invested and employed" less the "average amount of the liabilities incurred in respect to such trade or business."

In addition to the income taxes imposed by the act of September 8, 1916, as amended, corporations are required to pay an additional tax of 2 per cent and an additional tax of 15 per cent, upon the amount remaining undisturbed 60 days after the end of the year, of the net income except the amount used for the establishment or maintenance of reserves required by law or, with the approval of the Interstate Commerce Commission or state authorities, for extensions, additions and betterments. In assessing the income tax the net income shall be credited with the amount of the excess profits tax.

The bill also provides for a tax of 3 per cent on the amounts paid for transportation by rail or water or by any form of mechanical motor power in competition with carriers by rail or water, a tax of 1 cent for each 25 cents paid for express or parcel post shipments, a tax of 5 per cent on the amounts for passenger transportation, not including commutation or season tickets for trips less than 40 miles or for less than 35 cents and a tax of 5 per cent on amounts paid for seats, berths or state rooms in parlor cars, sleeping cars or vessels. The tax on freight bills does not apply to company material.

Report From American Commission in Russia

A cable despatch of July 4 gives a summary of a report issued in Petrograd by the Stevens Commission on that day to the Russian public, with recommendations for reforms.

The commission has received the full sympathy and support of its Russian colleagues. The Russian railroads are found to have excellent technical personnel, and many roads have a good practical system of management, the extension of which to other roads is desirable. The first necessary reform is in connection with operation and involves the employment of more powerful locomotives and freight cars of larger capacity.

The construction of shops at Vladivostok to assemble locomotives imported from the United States is deemed necessary. In all repair shops work ought to continue uninterruptedly 24 hours a day. The regulation of exchange of cars between the different roads should be improved, and loading and unloading should be quickened.

The creation of a Special State Department, the chief of which will be an inspector general, responsible for seeing that the whole network of roads is supplied with all necessary material, and also for the responsible distribution of such material between the different roads, is recommended by the commission.

The most important problem is declared to be to bring the railroads into a condition which will insure an adequate system of supply for the army and civilian population. Chairman Stevens immediately sent a cablegram to Washington requesting

that the construction of locomotives and cars be undertaken at once. The order, it is said, will require the increase of America's credit to Russia by 750,000,000 roubles.

The report concludes by saying that the commission is still engaged in considering the question of the supply of raw material, rails and machinery for the Russian roads.

Master Car and Locomotive Painters' Association

Owing to the state of war declared and now existing between the United States and Germany, it has been decided by the president and executive board that the forty-eighth annual convention of the Master Car and Locomotive Painters' Association of the United States and Canada will be postponed until further notice.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings and places of meetings:

- AIR BRAKE ASSOCIATION.—F. M. Nellis, Room 3014, 165 Broadway, New York City.
- AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—F. A. Pontious, 455 Grand Central Station, Chicago. Next meeting, July 18, 1917, Asheville, N. C.
- AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—H. C. Boardman, D. L. & W., Hoboken, N. J. Next convention, October, 1917, San Francisco, Cal.
- AMERICAN ASSOCIATION OF FREIGHT AGENTS.—R. O. Wells, Illinois Central, Chicago, Ill.
- AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hope, R. R. of N. Y., 143 Liberty St., New York. Next meeting, October 16-17, St. Louis.
- AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—E. H. Hartman, Room 101, Union Station, St. Louis, Mo. Annual meeting to have been held August 8-10 indefinitely postponed.
- AMERICAN ELECTRIC RAILWAY ASSOCIATION.—E. B. Burrill, 8 W. 40th St., New York. Convention for 1917 abandoned.
- AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOCIATION.—Fred C. J. Dell, 165 Broadway, New York.
- AMERICAN RAILROAD MASTER TINNERS', COPPERSMITHS' AND PIPEFITTERS' ASSOCIATION.—W. E. Jones, C. & N. W., 3814 Fulton St., Chicago. Convention for 1917 postponed.
- AMERICAN RAILWAY ASSOCIATION.—J. E. Fairbanks, general secretary, 75 Church St., New York.
- AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 16-18, 1917, St. Paul, Minn.
- AMERICAN RAILWAY ENGINEERING ASSOCIATION.—E. H. Frisch, 900 S. Michigan Ave., Chicago.
- AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—J. W. Taylor, 1112 Katzen Bldg., Chicago.
- AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—Owen D. Kinsley, Illinois Central, Chicago. Next convention, to have been held August 30-September 1, Hotel Sherman, Chicago, postponed for one year.
- AMERICAN SOCIETY FOR TESTING MATERIALS.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.
- AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 39th St., New York.
- AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, Supt. Timber Preservation, B. & O. Mt. Royal Sta., Baltimore, Md. Next convention, January, 1918, Chicago.
- ASSOCIATION OF AMERICAN RAILWAY ACCOUNTING OFFICERS.—E. R. Woodson, Rooms 1116-8 Woodward Bldg., Washington, D. C.
- ASSOCIATION OF MANUFACTURERS OF CHIEF CAR WHEELS.—George W. Lyndon, 143 McCormick Bldg., Chicago. Semi-annual meeting with Master Car Builders' Association.
- ASSOCIATION OF RAILWAY CLAIM AGENTS.—Willis H. Failing, Terminal Station, Central of New Jersey, Jersey City, N. J.
- ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreucci, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Semi-annual and annual convention postponed indefinitely.
- ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—W. L. Connelly, Superintendent of Telegraph, Indiana Harbor Belt, Gibson, Ind. Next annual meeting, September 11-13, 1917, Washington, D. C.
- ASSOCIATION OF TRANSPORTATION AND RAILWAY ACCOUNTING OFFICERS.—G. P. Conard, 75 Church St., New York.
- BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—Tom Lehon, The Lehon Company, Chicago. Meetings with American Railway Bridge and Building Association.
- CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.
- CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.
- CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual dinner, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.
- CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S ASSOCIATION.—W. R. McMunn, New York Central, Albany, N. Y. Next convention, September, 1917, St. Louis.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 568 Union Arcade Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh, Pa.

FREIGHT CLAIM ASSOCIATION.—Walter P. Taylor, Traffic Manager, R. F. A. P., Richmond, Va.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, C. H. & D., Lima, Ohio. Next annual meeting, to have been held August 21-23, 1917, (Chicago, postponed for one year).

INTERNATIONAL RAILWAY FUEL ASSOCIATION.—J. G. Crawford, C. B. & O. R. R., 702 E. 51st St., Chicago. Next convention, May, 1918, Chicago.

INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 1126 W. Broadway, Winona, Minn. Annual meeting, to have been held September 4-7, 1917. Hotel Sherman, Chicago, indefinitely postponed.

INVESTMENT BANKERS' ASSOCIATION OF AMERICA.—Frederick R. Fenton, 11 W. Monroe St., Chicago. Annual convention, October 1-3, 1917, Baltimore, Md.

MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—F. W. Hager, Fort Worth & Denver City, Fort Worth, Tex. Next convention, October 16-18, 1917, Cleveland, Ohio.

MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 95 Liberty St., New York.

MASTER CAR LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—A. P. Dane, B. & M., Reading, Mass. Next annual meeting, September 11, 1917, Chicago.

MASTER CAR BUILDERS' ASSOCIATION.—J. W. Taylor, 1112 Karpen Bldg., Chicago.

NATIONAL ASSOCIATION OF RAILWAY COMMISSIONERS.—Jas. B. Walker, 120 Broadway, New York City. Next annual convention, October 16, 1917, Washington, D. C.

NATIONAL RAILWAY APPLIANCE ASSOCIATION.—C. W. Kelly, 349 Peoples Park Bldg., Chicago.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meeting, 2d Tuesday in month, except June, July, August and September, Boston.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meeting, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—Geo. A. J. Hochgrebe, 623 Brinsford Bldg., Buffalo, N. Y. Meeting, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.

PACIFIC RAILWAY CLUB.—W. S. Wollner, Assistant to Chief Engineer, Northwestern Pacific R. R., San Francisco, Cal.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—C. C. Stewart, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.

RAILROAD CLUB OF KANSAS CITY.—Claude Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Saturday in month, Kansas City.

RAILWAY BUSINESS ASSOCIATION.—Frank W. Nason, 30 Church St., New York.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Pittsburgh Commercial Club Rooms, Colonial-Annex Hotel, Pittsburgh.

RAILWAY DEVELOPMENT ASSOCIATION.—D. C. Welty, Commissioner of Agriculture, St. L., Iron Mt. & So., 1047 Railway Exchange Bldg., St. Louis. Next annual convention, May, 1918, Houston, Tex.

RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, 1063 Monadnock Block, Chicago. Meetings with Association of Railway Electrical Engineers.

RAILWAY FIRE PROTECTION ASSOCIATION.—C. B. Edwards, Office of the President's Assistant, Seaboard Air Line, Norfolk, Va. Next meeting, October 2-4, 1917, St. Louis, Mo.

RAILWAY REAL ESTATE ASSOCIATION.—R. H. Morrison, Assistant Engineer, C. & O., Richmond, Va. Next convention, October, 1917, Duluth, Minn.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Myers Bldg., Bethlehem, Pa. Next meeting, June, 1917, Hotel McAlpin, N. Y. Next annual convention, September, 1917, Atlantic City, N. J.

RAILWAY STOREKEEPERS' ASSOCIATION.—J. P. Murphy, N. Y. C. R. R., Box C, Collinwood, Ohio.

RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.—J. D. Cowhay, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with Master Car Builders' and Master Mechanics' Association.

RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph Superintendents.

RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—P. J. McAndrews, C. & N. W., Sterling, Ill. Next annual convention, September 18-21, 1917, Hotel Auditorium, Chicago.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

SALT LAKE TRANSPORTATION CLUB.—R. E. Rowland, David Keith Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

SOCIETY OF RAILWAY FINANCIAL OFFICERS.—L. W. Cox, N. & W., Philadelphia, Pa.

SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, A. & W. P. R. R. Atlanta, Ga.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 a. m., Piedmont Hotel, Atlanta.

TOLEDO TRANSPORTATION CLUB.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Boddy House, Toledo.

TRACK SUPPLY ASSOCIATION.—W. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.

TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.

TRAIN DESPATCHERS' ASSOCIATION OF AMERICA.—J. F. Mackie, 7122 Stewart Ave., Chicago.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. & R. R., Cleveland, Ohio. Next convention, September, 1917, Chicago.

WESTERN ASSOCIATION OF SHORT LINE RAILROADS.—Clarence M. Oddie, Mills Bldg., San Francisco.

WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Monday in month, except June, July and August, Hotel Sherman, Chicago.

Traffic News

The Baltimore & Ohio has issued for the benefit of amateur gardeners using the railroad company's lands, and for others interested, a pamphlet giving practical instruction about spraying and other matters useful in killing insects which destroy vegetation.

The National Industrial Traffic League is distributing posters printed in the national colors which read as follows: "You can help win the war by conserving transportation facilities. Transportation is the life blood of the nation. Make one freight car do the work of two. Load and unload cars promptly; load and buy full capacity carloads; order only enough cars to take care of your needs."

The Nebraska State Railway Commission recently issued an order providing for a new scale of demurrage charges with a reciprocal feature, the conditions of which the railroads were required formally to accept on or before July 2. The new rules provide for a charge of \$2 per car per day for the first five days, after two-days' free time, a car is held by a shipper or a consignee, and \$5 for each succeeding day. Under the reciprocal feature the railroads will be fined \$2 per day for each car that they fail to move a distance of 50 miles within 24 hours.

The principal electric street railways of New York state, outside of New York City and Buffalo—29 companies—have petitioned the Public Service Commission, Second district, for authority to make a general increase in fares. These companies have formed a committee, of which Joseph K. Choate is chairman. The reasons adduced in the petition are similar to those which have been laid before the public by the steam railroads, and the most important factor is declared to be the practical impossibility of securing new capital for investment in street railroad properties.

The Department of Agriculture, reporting a shortage of cars in California, and calling attention to the unusually large crop of fruit expected on the Pacific Coast, this month and next month, quotes officers of the Pacific Fruit Express to the effect that the cars of that line were detained at Eastern markets, during the month of May, an average of *four days* after being placed on team tracks. There were also delays caused by holding cars in order yards for advice from the owners as to disposition. Fruit shipped from California in Pacific Fruit Express cars in two days, June 23 and 24, amounted to 897 carloads, an unprecedented movement.

H. I. Smith, vice-president of the Nashville, Chattanooga & St. Louis, has issued a circular to the shipping public discussing the freight car situation and expressing the purpose of the road to secure all reasonable advantages for its shippers from the activities of the committees now sitting at Washington and guiding the movements of freight traffic. Quoting from the latest bulletin of the Commission on Car Service, figures are given to show that the roads in Group 5—that in which the Nashville, Chattanooga & St. Louis is situated—had on their lines on June 1, only two-thirds as many box cars as they own. Mr. Smith expresses regret that it has been impossible to prevent serious disruption of customary practices and the unequal distribution of box cars; and suggests that shippers, in their own interest, make their position known to the government through the proper authorities.

Shippers Co-Operate to Increase Transportation Facilities

Progressive shippers throughout the country are showing their practical patriotism by conscientious efforts to increase the available car supply. Joseph T. Ryerson & Son, Chicago, recently issued a poster urging the prompt loading and unloading of cars, and the purchase and loading of full capacity carloads. The National Fertilizer Association, Chicago, is distributing 100,000 circulars and urging that fertilizers be ordered early to avoid the autumn congestion.

A record kept for the first 10 days in May by the Universal

Portland Cement Company, Chicago, showed an average load of 108.6 per cent of box car capacity, or a waste of only 1.4 per cent of available car space. In an article in the June number of the Universal Dealer, published by that company, Blaine S. Smith, general sales manager, urges heavier loading by all shippers, the construction of necessary warehouses and the purchase of large supplies of raw materials before the demands of the government reduce the car supply. The average freight car now carries only 43 per cent of its possible load, whereas in the majority of instances, it is feasible to increase the present average loading [of bulk freight] by 50 to 100 per cent. A slight quickening in the time of loading and unloading by shippers and consignees will mean a great saving.

Consolidate Shipments!

The Pennsylvania Railroad is distributing through station agents thousands of copies of the circular recently issued by the United States Department of Agriculture, calling for economy in the use of freight cars. The circular will be placed in the hands of farmers, truckers, fruit growers, shippers, consignees, brokers, buyers, boards of trade, chambers of commerce and merchants' associations.

This circular says in part:

"Shipping associations can pool the output of all their members and load cars of some commodities to full capacity for large markets. Wholesalers and carlot distributors can place orders for carloads of a greater quantity than was customary in the past. Shippers should load and unload cars within the shortest possible time. Against the increased value of a better market found while holding a car in transit must be balanced the loss due to deterioration of the product while the car is held and the sometimes greater loss of another shipper whose product spoils for lack of the car which the first shipper is holding. Potatoes in strong, double-headed barrels loaded in well ventilated box cars for destinations that can be reached within three or four days could be loaded safely considerably beyond the prescribed tariff minimum weights. Citrus fruits in many cases can be so loaded. Apples, especially when moving to storage points in the late autumn should be loaded to the space capacity of the car. Loading watermelons five deep instead of four would reduce the number of cars necessary to move the crop by one-fifth. A liberal use of straw underneath and between the melons, instead of merely sawdust underneath, and placing the larger melons at the bottom of the load would seem to make the plan feasible."

Fertilizer Association Urges Conservation of Cars

The soil improvement committee of the National Fertilizer Association, Chicago and Baltimore, has issued a circular appealing to buyers and shippers of fertilizers to co-operate in bringing about efficiency in the use of cars. The circular emphasizes particularly the importance of ordering fertilizers before the fall rush and of loading cars to maximum capacity. The circular reads in part as follows:

"The average carload shipment of fertilizer has been 21 tons. A standard box car will carry 50 tons. When freight cars are loaded to capacity with fertilizers, every car is doing double its ordinary work, and more than three times the work of a car loaded with 15 tons. Our military, industrial, agricultural and national welfare demands that we secure maximum efficiency by using this waste space.

"Shipments of fertilizers have been crowded into the rush seasons both spring and fall. It will be practically impossible for the railroads to move the fertilizer tonnage this fall in the six or eight weeks' period just before wheat and grass seeding begins. Avoid the harvest rush.

"The movement of troops, war supplies and military equipment is increasing rapidly, and the farmer must order early. Order early and order full carloads.

"Five railroad presidents constitute a permanent committee in Washington, and this committee is giving preference to fertilizers, seeds and agricultural implements and doing everything possible to render best service in delivering farm supplies. The willingness and co-operation of the railroads is not alone sufficient. The help of every farmer, dealer, agent and fertilizer company is necessary.

"There may be one objection to maximum loading of fertilizers. The bottom sacks will be compressed by the weight of the sacks above. Damage can be largely overcome, however, by handling the bottom sacks when the car is being unloaded so as to shake apart the compact fertilizer. The point to be remembered is that maximum loading is necessary in order that fertilizers be moved on time this year. There are likewise objections to early ordering by dealers. Storage space is frequently limited; but farmers who understand the conditions will render the dealer a service by hauling fertilizers away promptly on arrival.

"Duty is a bigger thing than right. We have a right to order fertilizer when we please and in such quantities as we please. It is our duty—and likewise our opportunity—to help every one and relieve the serious freight situation."

Passenger Trains Taken Off

The Pennsylvania's reduction in passenger train service, counting the changes on all divisions east of Pittsburgh, aggregates 102 trains, cutting down the passenger movement 2,268,000 train-miles a year, or about 6,500 train-miles every weekday. There is some consolidating of trains, and a number of parlor cars, restaurant cars, sleepers, club and observation cars will be taken off. The suburban service to and from larger cities will be preserved practically undisturbed for the present, and the summer schedules to and from seashore and mountain resorts have been arranged practically on the same basis as in recent years. There is not much freight on these lines and they are not likely to be needed for extensive troop movements.

Four trains between New York and Washington will be withdrawn, and the run of one will be shortened. Between Philadelphia and Washington, six trains will be withdrawn, namely, those leaving Philadelphia at 6:28 a. m., 10:30 a. m. and 1:20 p. m., and those leaving Washington at 10:00 a. m., 12:40 p. m. and 3:00 p. m. Club cars will be withdrawn from the trains leaving New York for Washington at 1:08 p. m., and leaving Washington at 8:00 a. m., and from the Colonial Express, north and south bound; also from some others. One night train from Philadelphia to Buffalo, and one from Buffalo to Philadelphia will be discontinued, reducing the through service between Philadelphia, Baltimore and Washington, and Buffalo, to one day train and one night train in each direction, instead of one day train and two night trains, as at present.

The rest of the changes consist mainly in readjustments and consolidation of trains which followed one another closely, and in the discontinuance of less important sleeping car lines. Among the latter are the New York-Cincinnati car, via Washington and Chesapeake & Ohio; New York-Birmingham car, via Southern Railway; New York-Charlotte car, via Southern Railway; and New York-Charleston and New York-Wilmington (N. C.) cars, via Atlantic Coast Line. The mid-day trains operated in former years during the summer months, between Pittsburgh and Buffalo, and leaving in each direction at 1:10 p. m., will not be placed in service this season, and the through sleeping car between Pittsburgh and Muskoka Lakes, via Toronto and the Grand Trunk, will not be put on.

Extensive changes of the same general character have been made on the Pennsylvania Lines West of Pittsburgh. On the Eastern division of the North West System, ten local trains are taken off, and on the South West System, eleven local trains.

On the New York Central, in the state of New York, the new timetables show about 90 fewer passenger trains than heretofore. This is said to be a reduction in passenger train mileage of about 5 per cent.

The Corporation Commission of North Carolina has approved the reduced passenger train service of the Southern Railway, after a conference and some modifications; and has approved the changes on the Atlantic Coast Line, with the exception of six trains. These six are: Numbers 72 and 73 between Weldon and Kinston, 56 and 57 between Plymouth and Tarboro, and 90 and 91 between Goldsboro and Rocky Mount.

J. H. Elliott, general manager of the Texas & Pacific, in a petition to the railroad commission of Louisiana asking for authority to discontinue the operation of a number of passenger trains, gives the average receipts of these trains; and the figures in some cases are as low as 32 cents a mile. Others are 39 cents, 41 cents, and 62 cents a mile. The commission promises to hold a hearing on the subject at Baton Rouge on July 17.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The Interstate Commerce Commission has further suspended until January 13 the tariffs proposing new reconsigning and diversion rules and charges.

The Interstate Commerce Commission has approved tariffs filed by the lake coal and ore-carrying railroads to restrict the reconsignment of hopper-bottom coal cars.

Embargoes on Grain at Baltimore

Baltimore Chamber of Commerce v. Baltimore & Ohio et al. Opinion by Commissioner Hall:

For the past two years the carriers owning export elevators at Baltimore, Md., have declared embargoes from time to time on grain for export. Two of them have adopted the practice of accepting such grain for transportation only upon assurance that a vessel will be available to receive the grain at the port. The complainant alleges that this practice is unreasonable, discriminatory and preferential; that the defendants' practices with respect to embargoes on shipments of corn are likewise unlawful; that the defendants' practice of declaring, modifying and suspending embargoes without sufficient notice to shippers has subjected certain persons to undue prejudice; and that prejudice also results from the defendants' practice of embargoing shipments of grain from certain territory while accepting grain from other territory.

The commission holds that under the transportation conditions which have obtained for many months, and in view of those which the existing state of war necessarily creates, a practice of accepting shipments of grain in bulk for export only upon satisfactory evidence that arrangements for its immediate exportation have been made is not inherently unreasonable or otherwise unlawful. But the practice complained of, as applied to shipments of grain in bulk to Baltimore for export, does not accomplish the results desired and unduly prefers the persons to whom permits are issued, because the use made of the permits is not adequately policed and safeguarded. If the permit practice is maintained, the defendants should submit within 60 days for the commission's approval rules, which will eliminate the unlawful features of the present practice.

The evidence of record with respect to embargoes on corn is too meager to warrant a definite finding as to the lawfulness of the defendants' practices in that respect.

The allegations that undue prejudice results from the defendants' failure to give advance notice of their embargo bulletins, and also from their practice of embargoing grain shipped from certain specified territory, are not sustained by the evidence. (45 I. C. C., 40.)

COURT NEWS

Discriminating Freight Rates

Back in 1905 a railroad agreed to give a lumber company a bonus equal to one-half the amount of its freight bills, in consideration of which the lumber company built mills which would greatly increase freight business and result in the building of a town. In an action by the lumber company for damages for the railroad's failure to observe the agreement, the Missouri Supreme Court holds that the agreement violated the interstate commerce act. The railroad called itself a promoter and the rebate a bonus, but, says the court, it could not thereby evade the statute. It gave the lumber company an advantage over other shippers. The promotion of town building, which would result in increased freight and passenger transportation, is beyond the legitimate powers of a common carrier. The interstate commerce act is not limited to fraudulent schemes and devices by which freight rates are reduced or rebates received, but covers every case where there is discrimination. The contract was held void and judgment for the plaintiff was reversed.—*Foster Lumber Co. v. Atchison, T. & S. F. (Mo.)*, 194 S. W., 281. Decided April 10, 1917.

Crossing Accident—Automobile Not Under Control

In an action for the death of the driver of an automobile when his car was struck squarely in the center by a train at a crossing, it appeared that the track was open to view 300 feet, in the direction from which the train came, at a point on the highway 48 feet from the crossing. The speed of the train was 37 miles an hour. There were marks on the road showing that the automobile had skidded before reaching the crossing, and indicating that the deceased had applied his brakes, but had approached the crossing at too high a speed. The Nebraska Supreme Court reversed a judgment for the plaintiff. It held that failure of the railroad company to ring the bell or blow the whistle, even though it may have been negligent, would not make the railroad company liable if deceased recklessly failed to have his car under control, and if by looking and listening at the proper time and place he could have seen the train in time to stop, and did not do so.—*Askey v. C. B. & Q. (Neb.)*. Decided May 9, 1917.

Service Provided by Tariff Rates Controls

A shipping contract covering a car of apples was made in the dead of winter, when both parties knew that zero weather was liable to come at any time. The published tariff offered the shipper of such property the opportunity of putting a stove in the car with a man in charge of it under certain conditions, but did not offer to warm or house the car itself. The shipper accepted a bill of lading including the words "owner's risk," so that the railroad's liability was limited to liability for negligence. The car, which was not heated, went through expeditiously, but the apples were badly frozen. In an action for damages the Wisconsin Supreme Court held the railroad not liable, and reversed a judgment for the plaintiff. The tariff, having been approved by the Interstate Commerce Commission, is absolutely controlling, and the railroad company is not permitted to give greater or less service than it provides.—*McGovern v. Ann Arbor (Wis.)*, 162 N. W., 668. Decided May 15, 1917.

Freight-Speed Law Held Legal in Nebraska

In an action to recover damages under provisions of a reciprocal demurrage act, which requires freight to be moved not less than 50 miles in 24 hours under liability for damages of \$1 per car for each day of delay, the Nebraska Supreme Court has sustained the plaintiff. The defendant railroad alleged that a statute prescribing a time limit for the movement of freight is in violation of the constitution of the United States and the constitution of Nebraska and that as Congress has authority over interstate commerce, all regulations of the state of Nebraska affecting the carriage of goods by railroad between states has been superseded; and the trains and cars referred to in the petition were engaged in interstate commerce. The court held that although the statute is inoperative as a regulation of interstate commerce it is valid and enforceable with reference to shipments originating and ending within the state. The defendant also claimed that it had placed the cars in question on a hold track at Omaha for delivery when convenient to the plaintiff at its three yards at Omaha and therefore delivery on the hold track constituted final delivery of the cars. The court held that if delivery on a hold track constitutes final delivery and the railroad refuses to place the cars at one of the plaintiff's own yards, the plaintiff would be remediless. Therefore, the statutory time should be computed up to the time when the cars are placed on the hold track and from the time orders are received from the consignee specifying the yard in which the cars should be placed, not counting the time the cars are on the hold track. To hold otherwise would be to defeat the very object of the statute, to wit: the prompt delivery of cars after arrival at destination. The defendant showed that its average movement of freight cars per day is in excess of the average for all the railroads of the country of about 24 miles and that, therefore, the statute is unreasonable; but the court denied the point, observing that these computations are based upon all freight cars, including those standing upon sidetracks or in yards; in storage at division stations, being repaired and in all other conditions, while the act applies only to freight cars which are in process of transportation, and therefore does not place an undue burden upon the carrier.—*Sunderland Brother Company v. Missouri Pacific Railroad*. Decided April 14, 1917.

Proximate Cause

In an action for personal injuries it appeared that the plaintiff intended to leave Mangum on a train scheduled to start at 6:45 p. m. He was five or six blocks from the station a few minutes before that time, and called the ticket agent over the telephone and asked about the train. He was told that it was late, and would not leave "until about 7:15 or later." He started for the station about 6:50. When he arrived within 75 feet of the station platform he saw the train moving out and ran and attempted to board it. He grabbed the iron railing about the steps with his left hand and the handhold on the gate with his right, and succeeded in getting both feet on the steps when the gate swung out and he fell off and rolled under the car and was injured. The Oklahoma Supreme Court held that, assuming that the agent gave incorrect information as to the time of departure of the train, and that the handhold of the gate was defective, and that these things constituted negligence on the railroad's part, it did not follow that such negligence was the proximate cause of the injury; and as the evidence failed to show that the injury was the proximate result and natural consequence of the negligent acts complained of, judgment for the plaintiff was reversed.—Wichita Falls & N. W. v. Cover (Okla.), 164 Pac., 660. Decided May 1, 1917.

Right to Use Tickets

A common carrier of passengers at common law had the right, independent of any statutory regulation, to impose the condition that only the purchaser of a ticket could use any portion of it, and this right continues under the Interstate Commerce Act, as amended by the Carmack amendment. A private individual sold a return trip ticket containing such a condition at a price less than the single fare. The ticket was validated by the company's agent for the return journey, but another agent found that the holder was not the original purchaser and took up the ticket. In an action against the company for its refusal to allow the plaintiff to return home on the ticket, the Kentucky Court of Appeals held that he had no right to use the ticket, especially in view of the fact that his use would be a violation of the Federal statute requiring uniform rates. The mere fact that the purchaser had the ticket validated by the agent gave him no greater right than had it never been validated, since the agent's validation was secured by fraud of the holder in representing himself to be the original purchaser.—Boston v. Southern Pacific (Ky.), 194 S. W., 814. Decided May 15, 1917.

Giving of Rebates

An interstate railroad company was the owner of coal lands which it leased in 1878 (and by renewals thereafter) to a mining company on a royalty basis. The coal produced therefrom was shipped over the company's road. From 1905 to 1913, and until the matter was called to the attention of the Interstate Commerce Commission, the railroad collected no royalties from the mining company, and made no charges on its books therefor, although the mining company produced above 1,500,000 tons of coal annually, which the railroad transported at the regular published rates. In a criminal prosecution by the government against the railroad for a violation of the interstate commerce law, the Circuit Court of Appeals, Second Circuit, held that if the arrangement made with the mining company constituted a device for effecting a reduction in rates, or for giving an advantage to the shipper, and was so intended, the railroad was guilty of a violation of the statute; and the question whether there was an intention to accomplish such a result was for the jury. As the jury found that such intention did exist, the railroad's guilt was held thereby established.

Hough, C. J., dissented on the ground that there was no evidence of violation of the act or of criminal intent, saying: "Under such a ruling a creditor who is also a carrier subject to the act is indeed between the devil and the deep sea. If all traffic is refused, the functions of a common carrier are abrogated; if traffic as per published tariff is accepted, a crime is said to be committed; if payment of debt is insisted upon as a prerequisite to the transport of goods, the debtor is broken, and both debt and traffic are lost until (at the best) some reorganization emerges from the ruins. The statute does not compel such result."—Northern Central v. United States, 241 Fed., 25. Decided February 27, 1917.

Equipment and Supplies

LOCOMOTIVES

THE CHICAGO, INDIANAPOLIS & LOUISVILLE has ordered 2 super-heater Mikado locomotives from the American Locomotive Company. These locomotives will have 28 by 30 in. cylinders and a total weight in working order of 285,000 lb. each.

FREIGHT CARS

THE FLORIDA EAST COAST is asking prices on 100 fruit cars.

MORRIS & Co. has ordered 20 tank cars from the American Car & Foundry Company.

THE AMERICAN CAST IRON PIPE COMPANY is in the market for 40 to 80 gondola cars.

THE GRAND TRUNK has ordered 1,000 box cars from the American Car & Foundry Company.

THE MARSH REFRIGERATOR SERVICE COMPANY, Milwaukee, Wis., will rehabilitate 675 cars in its own shops.

THE LOUISVILLE GAS & COAL COMPANY, through H. M. Bylesby, has ordered 25 hopper cars from the Pullman Company.

THE CHICAGO & NORTHWESTERN, reported in last week's issue as being in the market for 375 center constructions, has ordered this material from the American Car & Foundry Company.

MISCELLANEOUS

THE PHILADELPHIA & READING has awarded to Roberts & Schaefer Company, Chicago, the contract for the construction of a coaling station of 2,000 tons capacity at Erie avenue yards, Philadelphia. The plant will be of reinforced concrete construction, designed to serve six tracks, with two track hoppers each capable of receiving 125 tons of coal per hour. Facilities are also included for the drying and storage of sand. The contract price is \$205,000.

SIGNALING

THE PENNSYLVANIA is to install at Nanticoke, Pa., a mechanical interlocking, 8 levers, which has been ordered from the General Railway Signal Company.

THE ATLANTIC COAST LINE is to install at Java, S. C., a 12 lever interlocking machine, which has been ordered from the General Railway Signal Company.

THE NEW YORK CENTRAL has ordered from the General Railway Signal Company a mechanical interlocking machine, 40 levers, to take the place of one recently destroyed by a wreck at Dunkirk, N. Y.

THE CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS is to install at Indianapolis an electric interlocking machine having 48 working levers and eight spare spaces, bought of the General Railway Signal Company.

THE LONG ISLAND is to install at Manhattan Beach Junction, N. Y., an electro-mechanical interlocking machine with 16 electrical levers and 7 mechanical. The General Railway Signal Company furnishes the material.

THE MISSOURI KANSAS & TEXAS is to install at Ada, Okla., a mechanical interlocking machine with 19 working levers and five spare spaces. This machine has been ordered from the General Railway Signal Company.

THE HOUSTON & TEXAS CENTRAL is to install automatic block signals on its line near Hempstead, Tex., and has ordered from the Union Switch & Signal Company 23 one-arm and one two-arm low voltage Style "B" ground signals.

THE PITTSBURGH & LAKE ERIE has ordered from the Union Switch & Signal Company the materials for the installation of a c. automatic block signals on the New Castle division. There will be 18 style "T-2," top post signals, 110 volt, 60 cycle.

Supply Trade News

W. P. Steele has been appointed western representative of the American Locomotive Company, with headquarters in the McCormick building, Chicago, effective July 1.

The Steel Car Company, Cleveland, Ohio, has placed a new plant in operation for the repair of wooden cars. The company is planning to put up another building for the repair of steel cars.

The Barrett Company, New York, announces the appointment of T. A. Warton as representative of the railway sales department for the Cincinnati (Ohio) branch, with headquarters at 527 Carr street, Cincinnati.

Samuel Lindsay Nicholson, who has been sales manager of the Westinghouse Electric & Manufacturing Company since 1909, has been promoted to the position of assistant to vice-president, with headquarters at East Pittsburgh. Mr. Nicholson was born in Philadelphia, received his education in the William Penn Charter School of that city and began his business career as an apprentice with the Belmont Iron Works in 1887. He entered the electrical business the following year and served with various electrical companies until 1898, when he became sales representative of the Westinghouse Electric & Manufacturing Company, in New York. He subsequently had charge of the city and industrial division of the New York office. On the reorganization of the sales department in 1904, he was made manager of the industrial department, which position he filled until his selection as sales manager of the company in 1909.

Milton J. Whitson, Seattle, Wash., representative of the Grant, Smith Company, has been appointed construction manager in the quartermaster's department of the United States army for the building of cantonments.

D. B. Mungan, who was formerly in charge of the electrical department of the Illinois Central at New Orleans, La., has been appointed resident manager of the Edison Storage Battery Supply Company, with headquarters at 201 Baronne street, New Orleans.

H. D. Shute, whose election as vice-president of the Westinghouse Electric & Manufacturing Company was recently announced, will have executive charge of the company's commercial organization, both domestic and export, succeeding Vice-president L. A. Osborne, whose headquarters have been transferred to New York.

W. F. Walsh, of the railway export department of the Galen-Signal Oil Company, has received a commission as captain in the Engineer Reserves, United States army. Mr. Walsh was formerly with the Chesapeake & Ohio, and while with that company held a commission as first lieutenant of the Roanoke Blues of the Virginia National Guard.

The Walter A. Zelnicher Supply Company, St. Louis, announces the appointment of W. H. Dayton as city salesman. Mr. Dayton was formerly with the Railroad Supply Company, Chicago, as secretary and purchasing agent, and also eastern representative for five years. He went to St. Louis seven years ago, representing the same firm, and the Chicago Signal & Sup-

ply Company, and the Elyria Iron & Steel Company, manufacturers of signal and track maintenance materials.

The L. B. Stillwell Engineering Corporation has been organized to act as constructing engineer in the design and construction of steam and hydro-electric lighting, railway and power plants; electric transmission, electrification of railroads, the design and construction of steel rolling stock, railroad terminals, steam heating plants and general engineering construction work. The officers are: Lewis B. Stillwell, president; H. St. Clair Putnam, vice-president and general manager; Hugh Hazlton, vice-president, and W. Everitt Rundell, secretary and treasurer. The principal office of the corporation will be located at 100 Broadway, New York City.

L. C. Sprague, formerly general motive power inspector of the Baltimore & Ohio, with headquarters at Baltimore, has been appointed special representative on air brake specialties for the general railroad department of the H. W. Johns-Manville Company, with headquarters in New York. Mr. Sprague has been in railway service since 1899, serving on the Chicago, Burlington & Quincy from that time to 1910 as fireman, engineer and then fuel inspector. In 1912 he became a locomotive and air brake instructor for the International Correspondence schools, following which he was assistant general air brake instructor on the Great Northern at St. Paul. He became general motive power inspector of the Baltimore & Ohio in 1915.

TRADE PUBLICATIONS

AIR COMPRESSORS.—Bulletin 34-Y, recently issued by the Chicago Pneumatic Tool Company, is a catalogue of that company's gas and gasoline driven air compressors.

EXPORT ENGINEERING AND CONTRACTING.—This is the title of a booklet recently issued by the American Steel Export Company, New York. The book explains about the export organization of the company itself, and gives a detailed list of the many kinds of equipment it is in a position to design and supply.

BALL BEARINGS.—"Hess-Bright Ball Bearings—How to Apply Them," is the title of a booklet recently issued by the Hess-Bright Manufacturing Company, Philadelphia, for the purpose of showing what precautions should be taken to preserve the "inherent efficiency and superiority" of Hess-Bright ball bearings. The booklet emphasizes the necessity of clean bearings and proper lubricants, the care that should be taken to prevent overloading, and the necessities of proper mounting. A number of drawings are given to bring out the points in the text. Another and similar booklet issued by the same company deals with the application of ball bearings to the airplane.

PEROLIN.—The Perolin Railway Service Company, St. Louis, Mo., has recently issued a small booklet descriptive of "Perolin—the Boiler Metal Treatment." The catalogue explains that this product is a mechanical rather than a chemical treatment, drawing attention to the fact that "A steam boiler is a steam generator—not a kettle for chemical reactions." It is brought out that Perolin has a high affinity for the hot metal and a high co-efficient of expansion, whereby it works by creeping in between the metal and the scale, and then forces the scale loose. The booklet further shows how the Perolin is used, and quotes the company's guarantee as to its effectiveness.

GRINDING AND POLISHING MACHINERY.—A 120-page catalogue has just been issued by the Gardner Machine Company, Beloit, Wis., covering the line of grinding machines, abrasive material and accessories. The catalogue is a 7-in. by 10-in. book, bound in heavy paper board and printed on an excellent quality of coated paper. The catalogue contains an introduction dealing in a general way with the features of design of the Gardner line, and several pages of value to the user of grinding wheels and materials. The body of the catalogue contains descriptions of the various machines and accessories, profusely illustrated, as well as illustrations of numerous installations in actual service. The usual information covering prices, specifications and code is contained in tables at the back of the book. The machines illustrated include disk grinders for metal, disk grinders for pattern shops, ring wheel grinders, band finishing machines, polishing and buffing lathes, ring wheel chucks, fixtures for disk grinders, abrasive disks, cloth and paper, and other accessories.

S. L. Nicholson

Railway Construction

BALTIMORE & OHIO.—This company, in conjunction with the Cleveland, Akron & Cincinnati, the Akron-Barberton Belt Line and the city of Barberton, Ohio, has completed plans for the construction of a concrete steel viaduct on East Tuscarawas avenue. The structure will cost approximately \$206,000, of which the railroads will pay 65 per cent and the city and county the balance. Bids will be received for the work until noon on July 9.

CHICAGO, INDIANAPOLIS & LOUISVILLE.—This road will make changes in its yards at La Fayette, Ind., involving the shifting of tracks and an expenditure of approximately \$35,000.

CLEVELAND, CINCINNATI, CHICAGO & ST. LOUIS.—This company has let a contract to C. G. Mitchell & Sons, Charleston, Ill., for the erection of a freight house at Middleton, Ohio. The building will be 22 ft. high, 40 and 80 ft. wide and 290 ft. long, with brick walls, wood trusses and Barret specification roof—in short, a slow burning construction with metal laths and plaster in the office portion. Approximate cost \$40,000.

This company has completed plans for the erection of a passenger station at Charleston, Ill., to replace the old building which was destroyed by a cyclone. The new building will be a one-story wood structure, 78 ft. by 38 ft., with an additional canopy and express room 45 ft. by 21 ft. Bids on this work will be asked for shortly.

ILLINOIS CENTRAL.—This company is completing plans for the building of a freight house and office building at Champaign, Ill. The building will be of brick construction with concrete foundation and slate roof, and will cost approximately \$40,000. The total length will be 340 ft., of which 250 ft. will be one story high, and the remaining 90 ft. two stories. In addition to this there will be 130 ft. of covered platform. The road is also drawing preliminary plans for a power house at the same point. It will be 48 ft. wide and 60 ft. long, of brick construction, and will cost about \$15,000. Bids will not be asked on the freight house until the power house plans are completed. The building of a freight house and office building at Kankakee similar to the proposed Champaign structure is contemplated.

NEW YORK CENTRAL.—This company is contemplating track elevation work at South Bend, Ind. As the plans are not yet completed, no data can be given at this time.

This company has ordered that the work on the bridge and connecting railroad crossing the Hudson river at Castleton, N. Y., nine miles south of Albany, be continued. On the passage, last month, of a law, by the New York legislature, which would forbid the construction of a two-span bridge at this point, some of the preliminary operations were suspended. (*Railway Age Gazette*, February 2, 1917, page 192, and June 8, 1917, page 1205.)

NORTHERN PACIFIC.—This company has let a contract to the Clifton, Applegate & Toole Construction Company, Spokane, Wash., for the construction of an extension to the Cowiche branch. The present line extends from North Yakima, Wash., to Weikel. The extension will be seven miles long, beginning at Weikel, and will cost approximately \$200,000.

The engineering department of this company, in conjunction with C. Claussen, city engineer of St. Paul, Minn., is drawing preliminary plans for an ore dock on the Mississippi river below Indian Mounds (St. Paul), Minn. The dock will be 600 ft. long with 1,100 ft. of approach trestle, and will have a capacity of 6,000 tons. The superstructure will be of wood pile trestle, and the distance from the water surface to the track level will be about 30 ft.

UNION PACIFIC.—This company has awarded a contract to the Eberhardt Construction Company for the construction of a new freight depot at Salina, Kan. The building will be of reinforced concrete and absolutely fireproof. In addition, the road will build one new track, which work will be handled by R. L. Huntley, chief engineer, Omaha, Neb. The total cost of improvements will approximate \$100,000.

Railway Financial News

CHICAGO GREAT WESTERN.—E. N. Hurley has been elected a director to succeed John R. Morron, resigned.

CHICAGO, ROCK ISLAND & PACIFIC.—Fred. W. Scott, of Richmond; Beman G. Dawes and James A. Patten have been elected directors, succeeding Seward Prosser, Charles G. Dawes and S. Davies Warfield, resigned. B. G. Dawes, Mr. Patten, E. K. Boist and James E. Gorman were elected members of the executive committee. Mr. Scott and James Speyer were elected members of the finance committee.

CINCINNATI, HAMILTON & DAYTON.—Judge Howard Hollister in the U. S. District Court at Cincinnati has set aside the sales of the Ironton and Delphos divisions on the ground that the court had no authority to order the sale of these two properties in parcels. The sale of the main line is not affected by the court's order as this sale was recently confirmed.

HOUSTON & TEXAS CENTRAL.—See Southern Pacific.

NORTHERN PACIFIC. Howard Elliott has been elected a director and a member of the executive committee. Mr. Elliott was president of this road prior to September, 1913, when he resigned to become president of the New York, New Haven & Hartford. His resignation from the New Haven took place on May 1, 1917. Besides being a director of the Northern Pacific, Mr. Elliott is a member of the executive committee of the American Railway Association Special Committee on National Defense.

SAVANNAH & ATLANTA. The Secretary of State of Georgia, Philip Cook, has granted the petition of this company to amend its charter providing for an increase of capital stock from \$500,000 to \$2,250,000, this issue of securities being for the consolidation of the Savannah & Northwestern, with the Savannah & Atlanta under the name of the latter road. Of the \$2,250,000 capital stock, \$1,250,000 is to be preferred stock, bearing 7 per cent non-cumulative dividends until October 1, 1920, after which date the dividends become cumulative. The remaining \$1,000,000 is to be common stock, privileged to redemption at \$102 at any time upon majority vote of the outstanding common stock. The Savannah & Atlanta was chartered in Georgia, December 8, 1915, to build an extension of the Savannah & Northwestern from St. Clair, Ga., northwest to Camak, 35 miles.

SAVANNAH & NORTHWESTERN.—See Savannah & Atlanta.

SOUTHERN PACIFIC.—In a majority opinion by Judges Ward and Rogers, the United States Circuit Court of Appeals has affirmed the decree of Judge Chatfield requiring the Southern Pacific to deliver to the minority stockholders of the Houston & Texas Central their proportionate share of the stock of the reorganized company and the dividends collected thereon upon the payment of \$26,026 a share and interest from February 10, 1891. The litigation of twenty-five years' standing has been marked by a long series of unsuccessful suits on the part of the minority stockholders to recover their property on the ground that the foreclosure of the mortgage on the various lines of the Houston & Texas Central has been brought about by the Southern Pacific by fraud.

SWEDISH RAILWAY CONSTRUCTION.—An extension is planned by the Göteborg-Säro Railway, extending southeast from the west coast to Landeryd, 122.6 kilometers (76 miles), at an estimated cost of 13,000,000 crowns (\$3,484,000).

ITALIAN STATE RAILWAY RETURNS.—According to figures presented in the daily press, the receipts of the Italian State Railways for the fiscal year 1915-16 amounted to 849,450,715 lire (\$120,622,002), or 229,352,083 lire (\$32,567,996) more than in the preceding year, and expenses totaled 819,964,378 lire (\$116,434,942), an increase of 178,900,548 lire (\$25,412,378). The cost of maintenance was reduced in 1915-16 to 76.78 per cent, from 81.26 per cent in 1914-15.

Railway Officers

Executive, Financial, Legal and Accounting

Oran Perry has been appointed assistant to the receiver of the Evansville & Indianapolis, with office at Indianapolis, Ind.

O. W. Wheelless, auditor of the Warren & Ouachita Valley, has been appointed also freight claim agent, with headquarters at Warren, Ark.

P. J. Riegger has been appointed general auditor of the La Crosse & Southeastern, with office at La Crosse, Wis., vice S. J. Lennon, resigned to accept a position elsewhere.

William M. Jeffers, general manager of the Union Pacific, has been appointed also vice-president, effective July 1. He was born at North Platte, Neb., on January 2, 1876, and entered railway service in June, 1890, as an office boy with the Union Pacific. In 1892 he was promoted to telegrapher, and one year later became a clerk in the maintenance of way department. From 1894 to 1895 he was clerk and telegrapher, and in 1898 he was promoted to train despatcher; in 1900 he was chief despatcher, and in November, 1905, he became trainmaster. On November 11, 1908, he became assistant superintendent of the Utah division, and served consecutively until February 22, 1915, as superintendent of the Utah division, superintendent of the Wyoming division, and superintendent of the Nebraska division. On November 1, 1915, he was promoted to general superintendent, and on June 3, 1916, was appointed general manager, with headquarters at Omaha, which position he will continue to hold in addition to that of vice-president.

W. D. Beymer, controller of the Central of Georgia, with headquarters at Atlanta, Ga., has been appointed controller of the Illinois Central, with headquarters at Chicago, succeeding M. P. Blauvelt, resigned.

C. A. Goodnow, assistant to president of the Chicago, Milwaukee & St. Paul, has been appointed vice-president, with headquarters at Chicago. G. J. Bunting, general auditor at Chicago, has been appointed controller with the same headquarters.

H. A. Osgood, whose appointment as assistant to the vice-president of the Wabash, in charge of operation, was announced in the *Railway Age Gazette* of June 8, was born at Minneapolis, Minn., on April 9, 1885. He graduated from Harvard University in 1906, and in the following year entered railway service with the Wabash, at St. Louis, Mo., in the general freight department. In April, 1911, he became secretary to the manager of the transportation department and of the transportation and maritime affairs' committee of the Boston Chamber of Commerce. In 1912 he was traffic manager of the Keokuk division of the Stone & Webster Engineering Corporation, at Keokuk, Iowa. He returned to the Wabash in the summer of 1912 as statistician in the general freight department, at the same time serving as statistician for the Central Freight Association roads in the 5 per cent case. In January, 1916, he was loaned to the Central Freight Association lines to assist in special cost of service studies made on the Cleveland, Cincinnati, Chicago & St. Louis, and the Pittsburgh, Cincinnati, Chicago & St. Louis. On June 1 he was appointed assistant to the vice-president, with headquarters at St. Louis.

W. M. Jeffers

George Wheeler Feakins, whose appointment as assistant to president of the El Paso & Southwestern, with headquarters at New York, has already been announced in these columns, was born on May 12, 1876, at Cherry Valley, Ill., and was educated in the district school. He began railway work in October, 1892, as a stenographer in the office of the superintendent of machinery on the Atchison, Topeka & Santa Fe, at Topeka, Kan., and the following May resigned to become a clerk in the maintenance and construction department of the Rock Island at Topeka. On March 1, 1895, he was transferred to the general freight office, and in July, 1897, was again transferred to the commercial agency of the Rock Island at Salt Lake City. He was appointed traveling freight agent in March, 1898, and in October of the following year went to the Colorado Midland as traveling freight and passenger agent. On October 1, 1903, he returned to the service of the Rock Island as traveling freight agent at Buffalo, and in May, 1909, became chief clerk to the general traffic manager of the El Paso & Southwestern at Chicago. He was appointed assistant to general traffic manager in January, 1912, and was transferred to St. Louis on February 1, 1913, as general agent, which position he held at the time of his recent appointment as assistant to president of the same road, as above noted.

Operating

J. T. Gillick, assistant to the general manager of the Chicago, Milwaukee & St. Paul, at Chicago, has been appointed assistant general manager, with the same headquarters, effective July 1.

John Downing Bourne, who has been appointed superintendent of the Berkshire division of the Boston & Maine, with headquarters at North Adams, Mass., as has already been announced in these columns, was born on August 13, 1879, at Kennebunkport, Me. He was educated in the common schools and at Pembroke Academy, Pembroke, N. H. He began railway work on June 18, 1896, with the Boston & Maine, and served to 1901 on the Southern, the Concord, the Northern and Worcester divisions of the same road, consecutively as yard clerk, ticket agent, and telegrapher in the train despatcher's office and station agent at different places. From 1901 to 1907 he was train despatcher on the Fitchburg division at Mechanicville, N. Y., and then to 1911 was chief train despatcher at North Adams, Mass. He was promoted to trainmaster of the same division at North Adams, Mass., in 1911, and subsequently served as trainmaster at Boston, Mass., until his recent appointment as superintendent of the Berkshire division of the same road, as above noted.

J. D. Bourne

E. F. Kultechar, roadmaster on the Ottumwa division of the Chicago, Burlington & Quincy, with headquarters at Osceola, Ia., has been promoted to trainmaster on the La Crosse division, with headquarters at La Crosse, Wis.

E. S. Moore has been appointed superintendent of transportation of the Norfolk & Western, with office at Roanoke, Va., vice D. E. Spangler, promoted, and J. R. Talbott has been appointed superintendent of car service, with office at Roanoke.

Charles Marshall, superintendent of the New Orleans & Mobile division, and of the Louisville & Nashville at New Orleans, La., will retire from active service on August 1, 1917, after a connection of 50 years with this road and its predecessors.

G. H. Alexander, superintendent of car service of the New York Central, at New York, has been appointed superintendent of freight transportation, lines east of Buffalo, with headquarters at New York, vice C. H. Ewings; and G. J. Ross, car accountant

at New York, has been appointed superintendent of car service of the lines east and west of Buffalo, with headquarters at New York, vice Mr. Alexander.

J. T. McShane, trainmaster on the Chicago, Burlington & Quincy, at Sheridan, Wyo., has been promoted to superintendent of the Sterling division, with headquarters at Sterling, Colo., succeeding W. G. Dungan, transferred; H. D. Brown, trainmaster at Wymore, Neb., has been transferred to Sheridan, succeeding J. T. McShane; H. J. Hoglund has been promoted to trainmaster at Wymore, succeeding H. D. Brown, transferred, and L. O. Murdock has been promoted to trainmaster at Lincoln, Neb., vice J. G. Dally, transferred. These appointments became effective on July 1.

A. H. Webb, whose appointment as general superintendent of the western district of the Missouri Pacific, with headquarters at Kansas City, Mo., was announced in the *Railway Age Gazette* of June 28, entered railway service with the Missouri Pacific in 1877 as a freight brakeman and conductor. In 1884 he was promoted to trainmaster, with headquarters at Little Rock, Ark., and two years later became assistant superintendent of the Wichita division. In 1894 he was promoted to superintendent of the Wichita division, and continued in that position until his recent appointment as general superintendent, succeeding Albert De Bernardi, resigned.

Carlos Glenn Stevens, whose appointment as superintendent of the Illinois division of the Baltimore & Ohio, with headquarters at Flora, Ill., has already been announced in these

columns, was born on December 16, 1870, at Sumner, Ill. He began railway work on August 15, 1885, as assistant agent on the Ohio & Mississippi, which later became a part of the Baltimore & Ohio Southwestern. From July, 1887, to November, 1889, he served as agent at Claremont, Ill., and then to September, 1893 was operator and despatcher on the Missouri, Kansas & Texas. In March, 1894, he was appointed despatcher on the Baltimore & Ohio Southwestern; in March, 1902, he was promoted to night chief despatcher, and in October, 1904, became chief despatcher. On May 10, 1910, he was appointed assistant trainmaster, and in January, 1911, was promoted to trainmaster, which position he held at the time of his recent appointment as superintendent of the Illinois division of the Baltimore & Ohio, as above noted.

F. I. Ford, superintendent of terminals of the Chesapeake & Ohio at Newport News, Va., has been appointed superintendent of the Newport News terminal division, with headquarters at Newport News, in charge of the territory east of Mile Post 14, including the North Terminal and Hampton branch; W. S. Taylor, superintendent of terminals at Covington, Ky., has been appointed superintendent of the Cincinnati terminal division, with headquarters at Covington, in charge of the territory from Silver Grove, Ky., to Summit, Ohio, including both yards; A. T. Lawmaster, general agent at Chicago, has been appointed superintendent of terminals, with headquarters at Chicago, and his former position has been abolished.

W. E. Fuller, assistant superintendent on the Chicago, Burlington & Quincy, with headquarters at Dayton's Bluff, Minn., and St. Paul, has been appointed inspector of transportation, with headquarters at Chicago; M. B. Lamb, assistant superintendent of the Beardstown division, at Beardstown, Ill., has been transferred to the St. Paul division, with headquarters at Dayton's Bluff, succeeding W. E. Fuller, promoted. J. H. Aydelott, trainmaster at La Crosse, Wis., has been promoted to superintendent of the Hannibal division, with headquarters at

Hannibal, Mo., succeeding Nathaniel L. Howard, who has entered military service as a lieutenant-colonel in the Third Reserve Engineers, now stationed at Chicago. J. D. Farrington, trainmaster at Ottumwa, Iowa, has been promoted to assistant superintendent of the Ottumwa division, with headquarters at Burlington, Iowa, succeeding F. E. Haines, transferred to the Beardstown division.

Albert De Bernardi, whose appointment as general manager of the Kansas City, Mexico & Orient, was announced in the *Railway Age Gazette* of June 22, was born near Independence,

Albert De Bernardi

Mo., on July 28, 1865, and entered railway service in May, 1882, as a laborer in the maintenance department of the Missouri Pacific. In May, 1885, he became a section foreman, following which he was consecutively until September, 1893, foreman of an extra track gang, freight brakeman and foreman of a construction train. On the latter date he was promoted to division roadmaster at Nevada, Mo., and in December, 1899, he became trainmaster at that point. From February, 1900, to August, 1911, he served

successively as division superintendent at Concordia, Kan.; superintendent at Osawatimie; general superintendent of the central district, with headquarters at Coffeyville; general superintendent of the southern district at Little Rock, Ark.; superintendent of the Omaha and northern Kansas divisions at Atchison; and superintendent of the Omaha division at Falls City, Neb. On August 10, 1911, he was appointed general superintendent of the western district, with headquarters at Kansas City, Mo., and he served in that capacity until his appointment as general manager of the Kansas City, Mexico & Orient, as already noted.

D. E. Spangler, superintendent of transportation of the Norfolk & Western at Roanoke, Va., has been appointed general superintendent of transportation, with headquarters at Roanoke. Mr.

D. E. Spangler

Spangler was born on May 31, 1863, at Circleville, Ohio, and graduated from the high school in his native town, in June, 1879. The following August he began railway work as warehouseman and loading clerk on the Scioto Valley railroad, now a part of the Norfolk & Western, and since that time was, consecutively, to June, 1880, in various clerical positions on the same road. He was then to February, 1882, telegraph operator, and from February, 1882, to August, 1883, station agent. From August, 1883, to November, 1891,

he was train despatcher, and then to November, 1897, was chief train despatcher. On November 15, 1897, he was appointed trainmaster, and in December, 1898, became car service agent. He remained in that position until October, 1903, when he was appointed superintendent of transportation, and now becomes general superintendent of transportation of the same road, as above noted. Mr. Spangler's entire railway service has been with the Scioto Valley and Norfolk & Western.

Walter L. Booth, whose appointment as general superintendent of transportation of the Chesapeake & Ohio, with headquarters at Richmond, Va., has already been announced in these columns, was born on October 17, 1880, at Richmond, and was educated in the public schools and at Richmond College (Va.). He began railway work in September, 1897, with the Chesapeake & Ohio, and served in various positions in the accounting and operating departments. In 1910 he was appointed assistant trainmaster, and subsequently served consecutively as trainmaster, assistant superintendent, and then as superintendent on various divisions of the same road, and on the Chesapeake & Ohio of Indiana. He was then appointed superintendent of freight transportation, and on June 1 was appointed general superintendent of transportation of the Chesapeake & Ohio and the Chesapeake & Ohio of Indiana, with headquarters at Richmond, Va., as above noted.

Traffic

Sherman H. Gillette, whose appointment as assistant general freight agent of the Chicago & North Western, with headquarters at Chicago, Ill., succeeding Edward J. Seymour, retired, was announced in the *Railway Age Gazette* of June 15, was born at St. Charles, Ill. He entered railway service with the C. & N. W., as a messenger and studied telegraphy at night school. He was later promoted to night telegraph operator at Milton Junction, Wis., following which he became day operator at the same town. He was next promoted to cashier and agent at Sheboygan Falls, where he remained until appointed traveling freight agent. A short time after he was promoted to chief clerk in the general freight department, which position he held until his promotion to assistant general freight agent, as above noted.

S. H. Gillette

D. A. Story, whose appointment as freight traffic manager of the Canadian Government Railways, with headquarters at Moncton, N. B., has already been announced in these columns, was born on October 26, 1853, at Halifax, N. S., and was educated in the common schools. He began railway work on May 27, 1869, with the Nova Scotia Railway at Halifax, N. S., and in November, 1872, was transferred to Moncton, N. B., as clerk to the general freight agent, with its successor, the Intercolonial. In April, 1876, he was appointed clerk at Halifax; the following year he became accountant; then in July 1, 1894, was appointed agent, and in September, 1898, was promoted to division freight agent at Halifax. In September, 1907, he was appointed general freight agent at Moncton, N. B., and on June 1 became freight traffic manager of the Canadian Government Railways, as above noted.

D. A. Story

Hargrave Henry Muehall, whose appointment as assistant general passenger agent of the Missouri Pacific, with headquarters at St. Louis, Mo., was announced in these columns on June 8, was born in Belleville, Ont. He entered railway service with the

Canadian Pacific as a messenger in the local freight office at Winnipeg, Man. He was later consecutively private secretary to the general freight agent at Winnipeg; stenographer to the general passenger agent of the Duluth, South Shore & Atlantic, at Marquette, Mich.; chief rate clerk on the Minneapolis, St. Paul & Sault Ste. Marie and the D. S. & A., at Minneapolis, Minn.; and rate clerk on the Lake Shore & Michigan Southern, at Washington, D. C. In 1894, he went with the Missouri Pacific as rate clerk and was later, consecutively, assistant chief rate clerk, chief rate clerk and chief clerk until his appointment as assistant general passenger agent, as above noted.

Jonas Waffle, assistant general freight agent of the Chicago, Milwaukee & Gary, at Chicago, has been appointed general freight and passenger agent, with the same headquarters, effective July 1. The office of assistant general freight agent is abolished.

Engineering and Rolling Stock

J. C. Jeffries, roadmaster on the Atchison, Topeka & Santa Fe at Plainview, Tex., has been appointed division engineer, with headquarters at Clovis, N. M., succeeding C. B. Clegg, assigned to other duties, effective June 16.

B. B. Milner, engineer of motive power of the New York Central, at New York, will hereafter also perform the duties heretofore performed by the chief mechanical engineer, R. B. Kendig, deceased. The office of chief mechanical engineer has been abolished.

J. E. Bernhardt, whose appointment as bridge engineer of the Chicago & Eastern Illinois, with headquarters at Chicago, Ill., was announced in the *Railway Age Gazette* on June 8, was born in Terre Haute, Ind., on May 11, 1887. He graduated from Rose Polytechnic Institute in 1908. He entered railway service with the Vandalia in the summer of 1906. From June, 1908, to January, 1909, he was in the employ of Libby & Nelson, contractors, at Minneapolis, Minn. In January, 1909, he returned to the Vandalia, and in July of the same year went to Big Stone Gap, Va., where he was a mining engineer. In April, 1910, he was in the bridge department of the Chicago, Milwaukee & St. Paul, at Chicago. In September, 1910, he went to the Chicago & Eastern Illinois as a draftsman, and was successively chief draftsman and assistant engineer in charge of bridges until his promotion to bridge engineer.

Purchasing

Benjamin S. Hinckley, who has resigned as purchasing agent of the Boston & Maine, at Boston, Mass., to go into other business, as has already been announced in these columns, was born on November 18, 1875, at Charlestown, Mass., and graduated in 1899 from the Massachusetts Institute of Technology. He began railway work on August 1, 1899, with the Northern Pacific, and from April, 1906, to June, 1907, was chief inspector of the test department of the New York, New Haven & Hartford. He then served as engineer of tests on the same road until July, 1911, when he was appointed purchasing agent of the Boston & Maine, with headquarters at Boston, Mass.

August W. Munster, whose appointment as purchasing agent of the Boston & Maine, with headquarters at North Station, Boston, Mass., has already been announced in these columns, was born on July 24, 1882, at Waltham, Mass. He was educated in the Massachusetts Institute of Technology, and in 1904 began railway work with the Northern Pacific, where he served as a machinist and material inspector. In 1909, he went to the New York, New Haven & Hartford as material inspector, and subsequently served as chief inspector and engineer of tests. In 1911 he went to the Boston & Maine as general storekeeper, which position he held at the time of his recent appointment as purchasing agent of the same road, as above noted.

Railway Officers in Military Service

Stuart C. Leake, commercial agent of the Richmond, Fredericksburg & Potomac, at Richmond, Va., has received a commission as captain in the Quartermasters' corps of the United States army, and is now awaiting orders for service.

OBITUARY

John E. Budd, division passenger agent on the Chicago & Eastern Illinois, at Terre Haute, Ind., died recently at his home in that city following an operation.

GENERAL NEWS SECTION

76

The railroads have long realized that grade-crossing accidents cannot be reduced appreciably until full responsibility

A Forward Step in Accident Prevention

is placed not only on the railway companies but on the public as well. Unfortunately, this view has not been so generally held by governmental authorities, with the result that every addition

to the number of grade-crossing accidents has increased the payments of railroad claim departments and swelled the clamor for grade separation. It is, therefore, decidedly encouraging to learn that a Cook County (Ill.) coroner's jury recently rendered a verdict which recognizes that the persons using highway crossings may be entirely to blame for a grade-crossing accident and, when this is the case, should be severely punished. On May 13 an automobile was struck by a Chicago, Rock Island & Pacific passenger train at Midlothian, Ill., with fatalities to six occupants of the motor car and injuries to the driver. The circumstances, described elsewhere in this issue, were such that the coroner's jury found the driver guilty of carelessness equivalent to criminal negligence and manslaughter, and bound him over to the grand jury with a recommendation that he not be released without due process of law. The members of this jury are to be commended on taking a step which will have far-reaching effects in the interests of accident prevention. It is hoped that this verdict will impress upon chauffeurs that prison cells may await those who are recklessly indifferent to danger, even when a railroad is involved.

The following letter has been received from the passenger traffic manager of a large railway system: "I have been interested recently by *Railway Age* editorials on dining car waste of food, and have been wondering why a la carte has been charged with the

A la Carte Versus Table d'hote

fault of food waste and table d'hote credited with saving food, whereas the contrary has been proved in every case. We have experienced both methods, and for many years operated our dining cars on the table d'hote plan, which requires not only the preparation in advance of a lot of food, much of which is not used, but permits the passenger to order many things not wanted,

which are merely tasted, and have to be thrown away, and allows the waiter to bring food not ordered, but which he thinks may assist in obtaining a larger tip. The waste of a steamship on the table d'hote plan is not so great proportionately as in the dining car or in a hotel, for the reason that the crew has to be fed, and owing to the conditions of such service can be fed less expensively than dining car help or hotel help. If in certain dining cars too large portions are served, it is not the fault of the a la carte system, but the fault of the head of the dining car department, who does not arrange to cut down the size of the portions. Our practice has been to serve a reasonable sized portion, but even this method has not kept down the prices, which have had to be raised owing to the great advance in the cost of food." The editorials referred to were not meant to condemn the a la carte system on dining cars as necessarily more wasteful than the table d'hote, but rather the wastes which occur under the a la carte system as it has been operated on most railways. Under the present condition the system which will best conserve foodstuffs is the one which should be used; and experienced railway officers are the best judges as to which will the more effectively further that object.

In many cases it is the receiver of freight who specifies the quantity shipped as a carload. The receiver of freight

The Interstate Commerce Com- mission Can Help

is even harder to reach and to get co-operation from in the matter of heavier carloading than the shipper. A very interesting suggestion has been made by a large shipper in Texas who, while

expressing himself as glad to co-operate with the railroads in using any circulars on heavier carloading and distributing them among receivers of freight, makes the point that any marked activity on the shippers' part will probably be taken as merely an endeavor to increase the size of sales. The receiver of freight even more than the shipper of freight suspects a railroad of merely trying to serve its own ends when heavier carloading is urged by the railroad company itself. It is a well known fact that an impartial outsider can recommend a certain course to one of two parties who have continuous business dealings and get an open-

mind consideration that would not be accorded to the same recommendation made by one of the interested parties. The Interstate Commerce Commission is looked upon by the shippers as impartial, at least, if not actually an ally of the shippers. It has a standing and its recommendations carry a weight with shippers and receivers of freight as well as with the general public that is unique. In the present crisis a strong recommendation made by the Interstate Commerce Commission to shippers and receivers of freight that they co-operate with the railroads in their efforts toward getting heavier carloading would be of immense value; a general appeal by the Interstate Commerce Commission would be heeded by a vast number of receivers and shippers of freight who would look upon the appeal by the railroads themselves simply as a business move, to be met as any other business move would be met. Might it not be possible, feasible and proper for the Interstate Commerce Commission to make such an appeal? The Commission has on some occasions issued circulars, addressed jointly to carriers and shippers, urging prompt loading of cars and prompt movement, but has never, so far as we know, made an appeal for the full use of car space. The question is important enough to the nation to justify such an appeal. Would not this be a constructive piece of work for the Interstate Commerce Commission to undertake?

INCREASED RAILROAD EFFICIENCY REDUCED THE CAR SHORTAGE

THE statistics now available demonstrate that the reduction of the net car shortage from 148,627 cars on May 1 to 105,127 on June 1, or about 30 per cent, was due to increased efficiency in railway operation, because they show that it was accomplished in spite of a large increase in freight traffic in May.

While statistics regarding the volume of traffic handled in May are not yet available in complete form, an indication of the increase in the amount of business for which the railroads were called upon to furnish cars in that month is afforded by the freight earnings of the roads that have already reported their monthly earnings to the Interstate Commerce Commission. One hundred and forty-eight roads in all parts of the country have filed their May earnings reports with the Commission, and these roads showed an increase in freight revenues of 10.14 per cent in May as compared with April. This increase in freight revenue indicates a corresponding increase in the total amount of freight carried, and is the best possible evidence of the results being gained from the work of the Railroads' War Board and its subcommittee, the Commission on Car Service, in co-ordinating the facilities of the railroads for the purpose of increasing their efficiency during the war. It also shows that they are receiving increasing co-operation from shippers in loading cars heavily and in loading and unloading them more quickly. The new car service regulations, under which box cars are virtually pooled, were put into effect by order of the Railroads' War Board on April 26, and since that time the Commission on Car Service has ordered those railroads on which cars have accumulated in congested territories to turn over to roads on which there has been a shortage, cars to the number of over 56,000, which have been sent largely in full trains to the points where they have been most needed.

The Railroads' War Board has also received reports indicating a considerable increase in efficiency on the part of the railroads in April. Figures from 51 per cent of the mileage of the railroads in the United States show that they carried over three billion more tons of freight one mile in April, 1917, than they did in April, 1916, an increase of 16 per cent, and that this was done with an increase of but

4.3 per cent in locomotive miles and with but 5 per cent more freight car miles. The average train load was increased 66 tons—a remarkable achievement—and the average carload was increased 2.4 tons.

These figures for April and May make a very good showing of increased efficiency gained under the greatest difficulties; but they should not cause any misleading optimism. With railway traffic continuing to increase at the rate it is, it is evident that even though the railways and shippers use the transportation facilities available to the best purpose possible, there probably will be another big car shortage and acute congestion this fall.

A UNIFORM DATUM FOR RAILWAY ELEVATIONS

ONE of the most important benefits which the railways are securing from the Federal valuation work is the opportunity to complete and bring up to date their maps, profiles and other records. Previous to the inauguration of this work few roads had complete, accurate records of their properties, but the demand of the government for maps and profiles has forced them to prepare the information which they had long desired but had neglected to collect because of the expense. In view of the large mileage of profiles now being run in connection with this work, a publication just issued by the United States Coast and Geodetic Survey on the advantages of the universal adoption of mean sea level as the datum for all levels is of special interest.

In the earlier periods of development of this country it was natural and in fact necessary to assume elevations to start from. It was in this way that the early railways laid their grade lines and built their roads. As other railroads, each with its individual system of elevations, crossed these lines confusion arose and this has been increased as large communities have developed along the railways, each with its individual system of elevations. The result has been an entire lack of uniformity of elevations in the same locality, leading to confusion and needless duplication of work. To provide a universal and at the same time an accurate basis for elevations throughout the United States the Coast and Geodetic Survey is extending a network of precise level lines across the country with permanent bench marks at frequent intervals. These lines of elevations which have mean sea level for their datum plane, aggregated 35,500 miles in December, 1916, of which about 2,500 miles was added last year and 11,500 miles since 1907.

The advantages of a uniform system of elevations for national, city, railway and other work should be evident to all engineers. Many of the railways have already adopted the basis used by the Geodetic Survey and this action should become universal. It is true that the transition from the old to the new datum will necessitate the careful tying in of old records and elevations to the new basis but once this has been done the benefits resulting from uniformity will far outweigh the temporary disadvantages. Because of the wide areas traversed by single railway systems and the large number of communities which they serve the influence of the railways in adopting this datum plane will be important in securing its acceptance in many communities along their lines.

This will simplify much of the work of the railways in these communities where it is frequently of advantage to them to utilize existing records and elevations established in those cities in the planning of new work, etc. Because of the wide scope of their activities it also frequently becomes necessary for railways to compare elevations between widely separated points, frequently removed from their lines. By uniting with the Coast and Geodetic Survey in the establishment of a uniform datum throughout the country the rail-

ways can lend important aid in this work which will be of increasing benefit in the conduct of engineering work of all kinds from year to year.

THE DRAFTSWOMAN

ONE of the most recent manifestations of war influences is the employment of women in railway drafting rooms, the natural result of the general shortage of draftsmen, which has placed a serious handicap on engineering work for some time. Many of the railway valuation offices have been short of men necessary to draw the right of way maps and profiles required by the government and are far behind their schedules, while structural detailers are now commanding 30 to 40 per cent more than the normal scale of wages. Moreover, these conditions promise to become worse when the selective draft is put into effect, since a very large proportion of the draftsmen come within the prescribed age limits. The conditions seem logically to suggest the use of women in drafting rooms. This offers immediate relief, while promising some economies in certain classes of work. To this end the Santa Fe recently gave employment to 12 girls in its Chicago office, another western road has made a start in this direction and at least one eastern road has the matter under immediate consideration.

A considerable part of the work of the drafting room requires no qualifications other than skill in the use of drawing instruments, an accomplishment depending largely upon natural deftness and neatness which are usually more highly developed in women than in men. Tracing, for instance, offers the most immediate opportunity for employment for women, since it is almost entirely a matter of mechanical skill, and many drafting rooms even now are organized to employ certain members exclusively in the tracing of drawings made by others. The plotting of survey notes, earth work cross sections, lease plats, etc., can unquestionably be learned by a bright girl in a short time. In architectural drafting the ability of women has long been established, although only a few are employed. On the other hand, in the field of mechanical or structural detailing, the preparation of track layouts, and other work requiring technical training or at least a fair knowledge of shop practice or field conditions, the immediate usefulness of the draftsman will be limited.

Judging by conditions in other countries women will be employed throughout the course of the war in as large a measure as they show themselves capable of doing the work. There is also every reason to believe that, once they have become established in a given class of work, they will continue to take the place of men even after the close of the war, since economic pressure is continually bringing about the replacement of men by women in many commercial and industrial activities. The mechanical operations required for the making of drawings are not of such a nature that the greater physical strength or mental training of men is of any particular advantage. Consequently the draftsman must expect continued competition from the draftsman, and except in the case of the real designer or engineer-draftsman, he may possibly be driven from the field. Even the technical man will feel the pressure of this competition, since his superiority in education and training will constantly be measured against the greater wage which he must demand as the head of a family. Up to the present time, women have been excluded from drafting rooms principally because engineers have hesitated to make the necessary changes in organization that would permit the employment of both men and women in the same office. Through the agency of the war they are now compelled to make these changes, and with women once employed, economic laws will assert themselves.

WESTERN RAILWAY CLUB DROPS ADVERTISING

THE Western Railway Club has taken an advanced position among railway organizations by abolishing advertising from its proceedings. This source of revenue is one of the most important financial bulwarks of some associations and clubs in the railway field, and has become so well recognized that probably very few men outside of those who pay the bills have stopped to consider whether the advertising is worth anywhere near what it costs the supply companies. Both the railway and supply men in the Chicago club referred to above, who held membership on an equal basis in all respects, did give such consideration to this question, however, and decided that there was ample ground for changing their long existing policy. The supply men were frank in the opinion that, as an advertising medium, the club proceedings were of little value, and further, that as a method of securing donations from the supply industry for the support of the club, this method is very inequitable. The railway men were quick to see the possibility of decreasing the total expenses for publication very materially by the elimination of advertising, and were entirely willing to take this step if the necessary revenue could be secured in other ways. The decision finally reached in regard to this necessary revenue was to divide the membership into two grades—active and contributing—the former for railway men with dues of \$2 a year, and the latter for supply men with an annual rate of \$5.

The elimination of advertising support is undoubtedly an important step in the right direction, for the dangers of abuse in handling it in association publications are too numerous to be entirely avoided in most organizations. The real problem to be faced in considering such a move is how to make up the loss in revenue. The supply men in the Western Railway Club raised no objection to the assessment on them of a higher rate of dues, on the basis that such a club membership is a business proposition for a supply man, and is well worth this cost. While in this case the action taken may be a fairly satisfactory solution of the problem, it falls considerably short of the ideal arrangement.

Any organization of railway men is either of definite value to the men and to the roads they represent, or it is not. If it is, it deserves adequate financial support. If it is not, the quicker it dies from lack of support, the better. Either the railway men who are members of such an organization are able to support it, or they are not. If they are, the solution of their problem is found. If they are not, the railways ought to support the organization collectively. Either an association has a real place in its membership for the technical men employed by supply companies, or it has not. If it has, these men ought to be admitted to some grade of membership. If it has not, such members should not be accepted. The practice of deriving financial support for a railway organization from supply men, either through advertising which does not bring the advertiser value received, or through high rates of membership, is only in effect passing the cost back to the railways indirectly and they can much better afford to bear it directly.

NEW BOOKS

Poor's Manual of Public Utilities, 2,400 pages, 6 in. by 9 in., bound in cloth. Published by Poor's Manual Company, 80 Lafayette street, New York. Price, \$10.

This book contains an alphabetical list of public utility companies in the United States and Canada, with pertinent facts concerning the physical property of each, the territory served, the capital stock, the funded debt, and the directors and officers. In addition, the Manual shows the "marginal safety" over interest and dividend requirements of individual bonds and stock.

Letters to the Editor

"A PATRIOTIC DUTY"

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

In war it is of the utmost importance that the railroads shall be able to handle a vastly increased traffic in an efficient manner.

In most European countries this principle has long been recognized. The governments have provided the roads with facilities, demanded by defense boards, and have enacted laws in regard to private railroads, regulating how the work shall be done, payments and compensations be made, etc.

This has all been prepared in peace times. Now we are in a great war and the Interstate Commerce Commission practically has denied the increases in freight rates asked for by the railroads to meet the extraordinary demands of the war traffic, also the increases in wages, cost of supplies, etc., to strengthen their credit to cope with any emergency and to give their securities the stability to weather storms.

Moreover, our roads have few of the facilities, etc., required for military purposes and which mostly have no commercial value.

One thing is dead sure—the railroads must be provided with increased revenues to meet existing conditions and above all, they need them at once. In war quick decisions are imperative and fussing about trifles is out of place.

The safety and the commerce of our country demand it. Congress has the power to do this and it should perform this patriotic duty without delay.

GUSTAVE E. LEMMERICH.

THE CANADIAN RAILWAY PROBLEM

LONDON, England.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

I value highly your opinion, and regret that you do not approve of the solution of the Canadian railway problem recommended in the majority report. I do not think it would be proper for me to argue with you. But without arguing I should like to deal with two points in your article.

You think that our proposed board of trustees "would be a clumsy device for management"; you say that "any commercial concern, to be successfully managed, must have its executive work conducted under the direct supervision not of five men but of one man." I agree, and that is what is proposed. We have recommended that there should be three trustees, the best railway men that can be obtained. Let us call the chairman the president, and the two other whole-time trustees vice-presidents. We have recommended this board should be completed by the addition of two other members not required to give their whole time; and we have assumed that they will leave the normal management of the railway to the president and his two vice-presidents. The only difference between our proposed board of trustees and the ordinary railway board of directors is that we have limited the number of non-experts to two. The reason for this is obvious and I will refrain from stating it.

Further, you express yourself in favor of a scheme "under which the ownership and management of the present private railways would be left in private hands" and "the enterprise and efficiency of private management" retained. I agree, but unfortunately am compelled to add the words "if possible."

I invite you to re-peruse pages 49 and 50 of our report. If we have come to a wrong conclusion in saying that a private company certainly could not be formed in Canada, probably could not be formed outside Canada, while in any

case formation outside Canada would be open to the gravest objection, I invite you to put us right. If you will work out in such detail as to permit of fruitful criticism a private company scheme that in your judgment will meet the situation, you will confer an important service on the people of Canada. For my part, six months' study of the question has taught me that to desiccate or even to adumbrate a scheme is one thing, to work it out in practical detail of dollars and cents is quite another. The former is easy and valueless, the latter, I have been reluctantly constrained to believe, is, under the circumstances, impossible.

W. M. ACWORTH.

THE BARREL CARRIES ITS OWN RUNNING GEAR

OAK HARBOR, Ohio.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

I was much interested in the article on page 613 of the March 23 issue of the *Railway Age Gazette*, entitled "Better Freight Containers a Necessity."

This question has been one to which I have given a good deal of thought during my 25 years' connection with my coöperation business.

My deductions from my experience as a manufacturer of packages and as a shipper of various types of packages is that the barrel is the strongest, most portable, most sanitary container; that it has the greatest range of use and that it is the cheapest of all packages, without exception when weight and contents are considered.

Take the transportation question alone. One man will unload a carload of 200 barrels of sugar, weighing an average of 360 lb. each in less than an hour, and not injure a barrel in the slightest way.

On the other hand, no container has ever been produced of a rectangular shape, that could be handled at all with this weight by one or even two men. Even with rectangular containers weighing only 100 lb. each, every one must be lifted bodily and carried or trucked. A barrel can be rolled any distance. In other words it carries its own running gear with it.

The contents of a barrel are protected from damage from leaky car roofs and from rain during loading and unloading or when on platforms, which would be fatal to contents of a fiber container.

Taking the question of a reward for a proper container, or more particularly as to a low rate on its return journey, shipping the barrels empty is not necessary, for the reason that they can be used for any kind of product when empty and always find an eager market, returning full as it were.

The empty barrel itself weighs less than any container ever produced, capacity considered. Metal packages foul in shipping empty, and sometimes rust, while the empty barrel is bright and clean.

The classification on goods shipped in barrels should be lower than on similar goods shipped in rectangular containers for four reasons:

First—There are fewer damage claims.

Second—A freight crew will handle ten times the tonnage in barrels that it will in regular containers.

Third—Cars can be unloaded in one-tenth the time, and under weather conditions that with other containers might prevent the release of the car.

Fourth—The barrel is more sanitary; this is the most important, although it does not enter into the calculation of transportation companies as do the first three.

As a matter of fact, I maintain that in the barrel we have had the best and the cheapest container with us for some time, and that it would be money in everybody's pocket if this were more generally understood.

LACEY Y. WILLIAMS.

Report of University of Illinois Fuel Tests*

Determination of the Relative Value of the Various Grades of Illinois Coal for Use in Locomotive Service

THE tests, the results of which are here set forth, were made by the Railway Engineering department of the University of Illinois in cooperation with the committee on Fuel Tests of the International Railway Fuel Association and the United States Bureau of Mines. Their general purpose was to determine the relative value in locomotive service of various grades of coal.

For this purpose six sizes of coal chosen by the International Railway Fuel Association committee were tested in the locomotive laboratory, on a Mikado type locomotive loaned by the Baltimore & Ohio. These grades were mine

the coal is undercut with electric chain machines. The coal face and the mine itself are quite uniformly dry.

As promptly as possible after its receipt at the laboratory—on the average six days, and in no instance more than 12 days after its arrival—the coal was unloaded into covered bins where it remained protected from the weather until used. The cars were unloaded by hand shovelling about as they would have been at some of the older types of railway coal pockets, and the coal was probably subjected to about the same amount of breakage in this process. The maximum time elapsed between loading the coal at the mine and testing it was 37 days in one instance. Taking the tests as a whole the average time between loading and testing was about 25 days.

Chemical Analyses.—During the progress of each test while the coal was being loaded into the charging wagons to be taken to the firing platform, samples were taken for the purpose of analysis. These samples varied in amount from 500 to 1000 lb., and they were taken according to methods prescribed by the American Society for Testing Materials as set forth in the year book of the society for 1915. The averages of the coal analyses for all tests made with each grade of coal are presented in Table I. An inspection of this table reveals a rather unusual uniformity among the various

Fig. 1—Make-up of the Coals as Received

run, 2-in. by 3-in. nut, 3-in. by 6-in. egg, 2-in. lump, 2-in. screenings, and 1 1/4-in. screenings, all from United Coal Mining Company's Mine No. 1 at Christopher, Franklin County, Illinois.

The general test program involved for each grade of coal six tests, three of which were made at a medium rate of evaporation, and the remaining three at a high rate. The medium rate was chosen to represent an average rate of working the locomotive, in so far as it is possible to define such an average. During tests run at this medium rate about 23,000 lb. of water were evaporated an hour under the prevailing conditions, from 3,100 to 4,300 lb. of coal were fired per hour, and the engine was worked at 33 per cent cut-off and at about 19 miles an hour, developing approximately 1,300 indicated horse power and about 22,500 lb. drawbar pull. During tests when the engine was worked at the high rate of evaporation, about 43,000 lb. of water were evaporated an hour, the hourly coal consumption varied from about 7,000 to 9,300 lb., the cut-off and speed were respectively 55 per cent and 26 miles per hour, while the horse power was about 2,200, and the drawbar pull about 28,500 lb.

THE COAL USED

The coal used is derived from what is designated by the Illinois Geological Survey as bed No. 6 of the Carboniferous Age, Carbondale formation. The bed averages in thickness about 9 ft. 5 in. and carries almost throughout, at from 18 to 30 in. from the floor, a "blue band" variable in thickness and consisting of "bone," shaly coal, or gray shale. The mine is worked under the room and pillar system and

Fig. 2—Make-up of the Coals in the Condition in Which They Were Fired

grades as regards their composition and heating value. The analyses for the two sizes of screenings correspond very closely in all respects and their average heating value, based on dry coal, was only about 2 per cent less than the average heating value of the four larger grades. The uniformity of the analyses and of the heating values make it clear that such differences in performance as developed between the various grades are due chiefly to differences in their mechanical make-up, and only in small measure to differences in their chemical composition.

The Make-up of the Coals.—Due to differences in the nature of the coal, in mining methods, and in methods of preparation, there is frequently much uncertainty about the meaning of such terms as "mine run," "lump," etc. The laboratory has devised a method of screening samples of the coals used during tests for the purpose of separating them into their size elements in order to be able to define and record the actual mechanical make-up of the various grades.

*Abstract of a committee report presented at the 1917 convention of the International Railway Fuel Association.

All the coals used in these tests were thus screened and this process is referred to as the mechanical analysis.

Three carloads each of mine run and lump, and two carloads of each of the other four grades were received at the laboratory. For both the mine run and the lump coals two of the three carloads of each grade were sampled for screening. Samples were taken from each car of nut and each car of egg, whereas the two cars of 2-in. screenings and the two cars of 1½-in. screenings were merged for each grade and one sample only was taken from each size. There were thus taken for mechanical analysis a total of 10 samples, each of which weighed about two tons.

These samples were screened by means of a specially designed shaker screen operated by pulley-driven eccentrics

a considerable proportion of lumps too large for proper firing, the attempt was made to break these two grades down to the extent to which, in the judgment of those in charge of the tests, these grades are generally broken down at the coal chute. These two coals as fired contain, therefore, a smaller proportion of large lumps than when they were received and the extent to which this extra preparation modified the make-up of the coals is defined in Fig. 2.

THE TESTS

The locomotive used during the tests was loaned for the purpose by the Baltimore & Ohio. It is of the Mikado type and was built by the Baldwin Locomotive Works during the summer of 1916. It entered service in September, and upon

TABLE I.—THE CHEMICAL ANALYSIS AND HEATING VALUE OF THE COALS.

Grade of coal	Proximate analysis, coal as fired				Calorific values			Ultimate analysis, coal as fired				Moisture in coal determined from sample taken at mine, per cent
	Moisture, per cent	Volatile matter, per cent	Fixed carbon, per cent	Ash, per cent	Per lb. of coal as fired, B.t.u.	Per lb. of dry coal, B.t.u.	Per lb. of combustible, B.t.u.	Carbon, per cent	Hydrogen, per cent	Nitrogen, per cent	Oxygen, per cent	
Mine run	8.14	34.12	47.92	9.76	11,873	12,926	14,463	66.63	4.28	1.55	8.69	7.82
2-in. by 3-in. nut	8.60	34.83	47.70	8.87	11,957	13,082	14,487	67.50	4.36	1.38	8.42	8.48
3-in. by 6-in. egg	8.82	34.57	48.56	8.06	12,071	13,239	14,523	68.19	4.50	1.51	7.99
2-in. lump	9.27	34.46	47.49	9.07	11,817	13,023	14,469	66.34	4.23	1.49	8.73

1½-in. screenings	9.09	32.34	48.01	10.57	11,557	12,711	14,385	65.49	4.35	1.43	8.10	9.07

running at a speed of 80 revolutions per minute. Five screens were used perforated respectively with 4-in., 2-in., 1-in., ½-in. and ¼-in. holes. In this way the sample was divided into six parts whose size limits were as designated by the headings of columns 2 to 7 in Table II. These parts were then weighed and the ratios of their weights to that of the original sample were calculated.

Table II presents the average values of these ratios and it defines, therefore, for each grade the magnitude of the size elements which went to make up the original coal and thus records definitely its composition.

The facts embodied in Table II may be re-combined to permit graphical definitions of the grades in another form. Considering the 2-in. by 3-in. nut coal, if we add columns 4 to 7 we find that 36.1 per cent of this coal passes through a 2-in. screen. Adding columns 5, 6, and 7 we find that

its arrival at the laboratory, had run approximately 3,400 miles. It arrived at the laboratory in excellent condition. The principal dimensions of the locomotive are as follows:

Total weight, in working order	284,500 lb.
Weight on drivers	222,000 lb.
Cylinders (simple), diameter and stroke, in.	26 by 32
Diameter of drivers	64 in.
Grate area	69.8 sq. ft.
Heating surface, total (fire side)	3,630 sq. ft.
Heating surface, superheater (fire side)	1,030 sq. ft.
Boiler pressure, lb. per sq. in.	190
Tractive effort	54,587 lb.

The boiler was of the wagon-top type with radial stays. It was equipped with a Schmidt top-header superheater consisting of 34 elements, a Street stoker, and a Security brick arch carried on four tubes. The front end was self-cleaning and was equipped with a plain 6-in. round nozzle-tip without bridge or split, which was used throughout all tests. The total air opening through the grates amounted to 17 sq. ft.

TABLE II.—SIZE ELEMENTS OF THE COALS AS RECEIVED AT THE LABORATORY.

Grade of coal	Per cent over 4-in. screen	Per cent through 4-in., over 2-in. screen	Per cent through 2-in., over 1-in. screen	Per cent through 1-in., over ½-in. screen	Per cent through ½-in., over ¼-in. screen	Per cent through ¼-in. screen	Total
1	2	3	4	5	6	7	8
Mine run	29.6	22.3*	16.8*	11.4	7.4	12.5	100.0
2-in. by 3-in. nut	...	63.9	30.3	2.8	1.1	1.9	100.0
3-in. by 6-in. egg	41.0	48.3	5.3	2.0	1.1	2.3	100.0
2-in. lump	61.6	26.4	7.5	1.9	9	1.7	100.0
2-in. screenings	33.2	25.7	14.2	26.9	100.0
1½-in. screenings	4.5	37.9	30.0	37.6	100.0

* Derived from plotted curves (Fig. 1).

5.8 per cent. will pass through a 1-in. screen, etc. Obviously also 100 per cent of this grade passed a 3-in. screen in the original preparation at the mine. The six curves drawn in Fig. 1 are plotted from the percentage values thus obtained for each of these grades. Those portions of the curves drawn with broken lines are not supported by direct experimental data. The scale shown in the upper part of the diagram represents the screen sizes which are commonly used in the mines of southern Illinois.

All grades except the mine run and lump were unloaded into the charging wagons from the bins without further preparation and they were consequently fired in exactly the condition in which they arrived at the laboratory, except for the breakage incident to unloading and the insignificant breakage due to shoveling into the charging wagons. Since, however, the mine run and the lump coals contained as usual

or 24.4 per cent of the grate area. The area of the air inlet to the ash pan amounted to 8.3 sq. ft. or 49 per cent of the air opening through the grates. The locomotive was regularly equipped with a hand-operated door which was replaced during the period of the tests by a Franklin pneumatic door of the butterfly type. This was used during all tests except those with the two sizes of screenings, which were fired by means of the Street stoker.

Throughout each medium rate test, the time of firing the last scoopful of each ton was recorded, together with the levels of the water in the main feed tank and in the boiler glass. During the high rate tests, these facts were recorded at the time of firing the last scoopful of each two tons of coal. This procedure made it possible to control the regularity of the firing process and it also makes available facts which may be used to illustrate the regularity of

feed of both the coal and the water. For this purpose tests 2,405 and 2,416, fairly characteristic of the series, have been chosen. During test 2416, run at a medium rate of evaporation, the time required to fire each of the 10 successive lots of 2,000 lb. varied only from 34 to 36 minutes; and the amount of water fed per minute during these 10 intervals varied only from 390 to 413 lb. During test 2,405 which was run at a high rate of evaporation, the times required to burn each of the five successive lots of 4,000 lb. of coal were respectively 36, 33, 31, 32 and 31 min.; and the water fed per minute during these intervals varied only from 693 lb. to 709 lb.

An inspection of the values of equivalent evaporation per

Fig. 3—Relation Between Equivalent Evaporation per Pound of Dry Coal and the Rate of Evaporation

pond of dry coal as obtained from each test disclosed great uniformity among the values applying to each grade of coal and each rate of combustion. Only in the case of the high rate tests with the 2-in. lump coal is there any considerable variation between the equivalent evaporation values for the individual tests and even in this group the maximum variation from the average is only 5½ per cent. In view of this uniformity we are entirely warranted in using the average values for the various groups and in basing conclusions upon them. These averages of equivalent evaporation per pound of dry coal are therefore assembled in Table III together with the averages of the rate of evaporation per square foot of heating surface per hour.

Grade of coal	2 For the medium rate tests		4 For the high rate tests	
	Equivalent evaporation per lb. of dry coal, lb.	Equivalent evaporation per hour per sq. ft. of heating surface, lb.	Equivalent evaporation per lb. of dry coal, lb.	Equivalent evaporation per hour per sq. ft. of heating surface, lb.
3-in. by 6-in. egg.	10.21	6.78	9.09	12.42
Mine run	10.12	6.40	8.66	12.28
2-in. lump	9.95	6.82	8.32	12.46
2-in. by 3-in. nut.	9.90	6.72	9.11	12.39
2-in. screenings.	9.25	6.95	7.43	12.59
1½-in. screenings.	8.47	7.07	7.06	12.61

In Table III the coals are arranged in the order of the evaporation at the medium rate as given there in column 2. For the high rate tests the nut coal gave the best performance, while the other grades stand in the order in which they are cited in the table. These relations stand out more clearly in Fig. 3 which has been prepared by plotting the values of equivalent evaporation and rate of evaporation given

in the table. In the figure the two points for each coal are connected by a straight line, which implies the assumption that the equivalent evaporation varies regularly and directly with the rate of evaporation. While there are, in this series, no tests at intermediate rates to support this assumption, it is amply warranted by the results of numerous other locomotive boiler tests.

Inspection of Fig. 3 reveals, as usual, for all grades a sharp decrease in evaporation as the rate of evaporation increases. The rate of this decrease is nearly alike for all grades except the 2-in. by 3-in. nut, for which it is roughly one-half of that for the other grades. This change in evaporation with rate of evaporation makes it necessary to reduce the values of evaporation to a common rate before drawing final comparisons between the various grades. To effect this reduction the rates of evaporation for the medium rate tests have been averaged and this average 6.70 lb. per sq. ft. of heating surface per hour—has been represented by the vertical line A-A in Fig. 3. Similarly the average high rate—12.46 lb. per sq. ft. of heating surface per hour—is defined by the line B-B. If we measure off the vertical distances on A-A at the points where this line is intersected by the performance lines for the various grades we obtain six

Fig. 4—The Cinder Losses

values of equivalent evaporation per pound of dry coal, one for each grade, which are rigidly comparable; in like manner the evaporation values defined by the intersections with the line B-B are comparable.

At the medium rate the four larger grades gave nearly the same performance, the maximum difference among them being but four per cent. The steam production per pound of egg coal was two per cent greater than with the mine run, while with the lump and the nut it was respectively one per cent and two per cent less than with mine run. The performance with 2-in. screenings was seven per cent less

and with 1½-in. screenings 15 per cent less than with mine run. If we assume that mine run coal on the tender is worth \$2 per ton the relative worth on the tender of the other grades during the medium rate tests was:

3-in. by 6-in. egg	\$2.04
2-in. lump	1.93
2-in. by 3-in. nut	1.96
2-in. screenings	1.86
1½-in. screenings	1.70

At the high rate the 2-in. by 3-in. nut coal gave the best performance, producing six per cent more steam than the mine run; the 3-in. by 6-in. egg comes next with an evaporation 5 per cent more than that of the mine run; while the 2-in. lump evaporated three per cent less. At this rate of evaporation the 2-in. screenings and the 1½-in. screenings produced per lb. respectively 13 per cent and 18 per cent less steam than the mine run. If we again assume that mine run is worth on the tender \$2 per ton, the relative worth of the other grades during the high rate tests was as follows:

2-in. by 3-in. nut	\$2.12
3-in. by 6-in. egg	2.10
2-in. lump	1.94
2-in. screenings	1.74
1½-in. screenings	1.64

In considering the cinder losses as here presented it should be borne in mind that all of the coal tested was of one kind, that is, it came from one mine. Coals possessing other physical characteristics might show somewhat different results as to cinder losses under the conditions of the tests here considered. It should also be remembered that for a given rate, medium or high, the draft was, for all grades of coal, practically constant.

Fig. 4 shows the amount of the stack losses when the

dry coal. The average heating value of the stack cinders for all medium rate tests was 8,635 B. t. u. and the average value for all high rate tests was 10,854 B. t. u. The heating values of the cinders from the medium rate tests with screenings were higher than corresponding values from other grades of coal.

In Fig. 4 it will be seen that, during the medium rate tests, from two to 14.6 lb. of cinders were collected from the stack for each 100 lb. of dry coal fired; while for the high rate tests from 6.2 to 17.8 lb. were collected for each 100 lb. of coal. The screened coals in all cases produced fewer cinders than the mine run coal; and the screenings produced a materially greater quantity of cinders than any of the larger grades.

When the losses are expressed as B. t. u. percentages, the

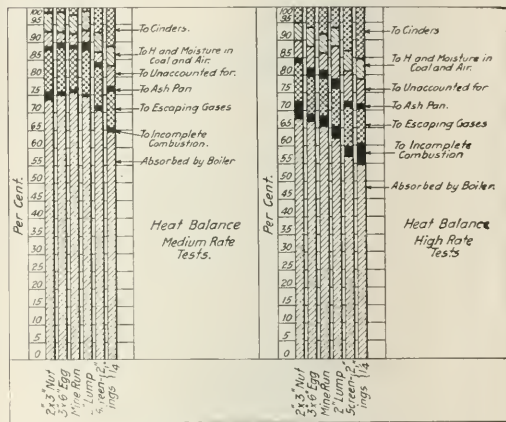

Fig. 6—The Distribution of Heat During the Medium and High Rate Tests

Fig. 5—Relation Between Cinder Loss and Fine Material in the Coal

weight of the cinders collected from the stack is expressed as a percentage of the weight of the dry coal fired, and also the amount of such loss when the heat content of the cinders collected from the stack is expressed as a percentage of the British thermal units in the coal fired. The loss when expressed as per cent of B. t. u. is numerically less than when expressed as per cent of weight of dry coal due to the fact that the cinders do not have as high a heat value per pound as the coal from which they originate. Also, due to the fact that cinders produced at high rates of combustion have higher heating values than cinders produced at low rates of combustion, the differences between percentages for medium rate and high rate tests are greater when expressed in terms of heat units than when expressed in terms of

average loss from the screenings was roughly five times as great as the average loss from the larger coals during the medium rate tests. For the high rate tests the average loss from the screenings was more than twice as great as the average loss from the larger coals.

The data indicates that with very fine coals such as screenings the cinder loss is large even at medium rates of combustion and with comparatively low front-end draft; but that under these conditions the cinder loss is not serious for the larger coals even when they contain a considerable amount of fine material, as in mine run coal. For conditions involving high rates of combustion and strong drafts, however, the stack cinder loss is a serious one for all grades of coal.

Fig. 5 shows the relation existing between the loss due to stack cinders and the amount of ¼-in. or smaller material in the coal as received. The curves in addition to showing the relative magnitude of the cinder losses for the two rates of operation, show that the cinder losses increased quite uniformly with the increase of fine material in the coal. At the medium rate about one per cent of the coal would apparently be lost as cinders if there were no ¼-in. fine material at all in the coal; while at the higher rate and without such material, the loss would be about 5.5 per cent. The curve for the high rate tests shows an increase in the cinder loss of very nearly one per cent for each increase of 3.7 per cent in the amount of ¼-in. material in the coal. The light straight lines show for both rates, a uniform increase of one per cent in cinder loss for each 3.7 per cent increase in the ¼-in. material in the coal. The straight line

represents the plotted points of the high rate tests closely but does not so well represent the points plotted for the medium rate tests.

Fig. 6 presents average heat balances for the tests with each grade of coal for both medium and high rate tests. The figures have been so constructed that the groups are arranged with relation to decreasing values of the per cent of heat absorbed by the boiler during the high rate tests.

Generally speaking, the relations between the various elements of the heat balance for the different grades are nearly the same for the medium rate tests as for the high rate tests. All losses except those due to stack cinders are fairly constant for all grades of coal and the differences in the amount of heat absorbed by the boiler are accounted for, almost entirely by the variations in the losses due to stack cinders.

CONCLUSIONS

It was necessary to use one size exhaust nozzle during all tests, but probably different results on the nut coal at low rate would have been obtained with a larger nozzle. These and other tests we should like to have made had we had the funds and the authorization of the association.

Comparing mine run with 3-in. by 6-in. egg, we find the egg was 2 per cent better at the low rate and 5 per cent better at the high rate. The B. t. u. value of the egg was 2 per cent more than that of the mine run. This accounts for the difference at low rate and brings the high rate difference to 3 per cent; but when it is considered that the stack cinders were 2.2 per cent of the egg fired at low rate and 3.1 per cent of the mine run fired at low rate and 7.2 per cent of the egg fired at high rate and 9.0 per cent of the mine run fired at high rate, it is evident that the increased cinder loss of mine run coal over 3-in. by 6-in. egg is in part offset by the better combustion of the smaller particles of coal which exist in greater percentage in the mine run.

The higher standing of 2-in. by 3-in. nut than mine run at high rate is due to the lesser cinder loss and to the even and uniform condition in which it is possible to keep a fire using 2-in. by 3-in. nut. At the medium rate we believe the lower standing of the 2-in. by 3-in. nut in comparison with mine run was due to the necessity of carrying too thin a fire with the nut. At the low rate the 2-in. lump is one per cent below the mine run and three per cent at the high rate. At the low rate the 2-in. lump is 1 per cent below the mine run and 3 per cent below at the high rate. When firing 2-in. lump it was reduced to such size that about 74 per cent would pass through a 5-in. round opening, whereas all of the mine run as fired would pass through that size opening. The 2-in. lump was cracked to about the same size as it would be at a coal chute where the coal is cracked and passes through breaker bars spaced 5-in. in the clear. There were consequently not the large pieces in the mine run that there were in the lump and the committee concludes that cracking coal to the point where it will pass through a 5-in. round or 6-in. round opening is worth more than it costs. We do not necessarily mean hand cracking, for under many conditions mechanical crushing of the larger size coals will be found very profitable. Many roads prepare elaborate statements showing the cost of operating coaling stations and often as a result of these statements coal is not properly cracked. A coal needing much cracking, when sent to a chute having breaker bars causes the cost of chute operation to go up. The fuel distributor is then told to send this coal to a chute where there are no breaker bars and thus it is only slightly cracked.

Under ordinary circumstances mine run coal from this district can be purchased at from 15 cents to 25 cents less per ton than 2-in. lump, and 2-in. by 6-in. egg or 3-in. by 6-in. egg, and the egg and lump are often considered more economical and satisfactory than Mine Run. Where this

price differential exists, it would pay to increase supervision to the point where mine run can be handled as satisfactorily by all firemen as the lump and egg.

At the low rate the 2-in. screenings were 9.2 per cent better than the 1 $\frac{1}{4}$ -in. screenings, and at the high rate 5.2 per cent better than the 1 $\frac{1}{4}$ -in. screenings. At medium rate the cinder losses are not serious for the four hand-fired grades, but at high rate they are greater than is desirable. At both medium and high rates with the stoker fired grades these losses are very high though not enough to wipe out the ordinary price differential existing between the hand fired and stoker fired grades. This shows the importance of using on stoker engines as large screenings as the price differential will permit. Railway mechanical engineers, locomotive designers and builders, should give this matter serious consideration.

One of the problems which is beginning to confront railroads using stokers is what fuel efficiency will be obtained when using mine run hand fired in comparison with screening this mine run into 2-in. lump for hand fired engines and 2-in. screenings for stoker fired engines. Assuming that the mine run splits into 52 per cent of lump and 48 per cent of screenings, we find that using mine run as 100 per cent the lump and screenings give 96 per cent of the efficiency of mine run at the low rate and 92 per cent at the high rate. This of course applies to both lump and mine run as cracked on these tests.

As a general conclusion addressed to engineers of tests and mechanical engineers we wish to recommend that all tests and data covering locomotive tests and boiler design be accompanied by a complete description of the character and size of the coal, also that when tests are being made care be taken to make sure that the coal fired is an average grade. In using mine run too much care cannot be taken to be sure that the normal percentage of all sizes of coal going to make up the mine run are contained in the coal tested.

The differences between mine run, 2-in. lump, 3-in. by 6-in. egg, and 2-in. by 3-in. nut are such that they could not have been determined by the ordinary road tests where only two or three round trips using each grade of coal would have been made, and the committee wishes to call attention to the fact that a very large number of road tests must be made to get a reliable average.

RECOMMENDATIONS

The Committee recommends:

That this report be placed in the hands of railway fuel men, engineers of tests, locomotive designers, and others who will be able to apply the data herein contained toward reducing operating costs on their lines.

That railways pay more attention to coal preparation and supervision of engineers and firemen with a view to securing better combustion.

That the tests on Franklin County, Illinois, coal be continued to cover: First; (a) 6-in. lump coal cracked to various sizes, (b) mine run coal cracked to various sizes, (c) 2-in. lump coal cracked to various sizes, (d) 6-in. egg run or screenings; Second; Tests at lower speed and higher drawbar pull.

That tests similar to those covered by this report and recommended above be made on coals from other districts, especially on coals having higher ash, higher and lower moisture and coking coals.

The report was signed by J. G. Crawford, chairman, H. B. Brown, W. P. Hawkins, O. P. Hood, L. R. Pyle, W. L. Robinson and E. C. Schmidt.

DISCUSSION

The influence of the mechanical make-up of coal on its evaporative value has not been known heretofore. Tests of this sort should result in economies by bringing about the use of the most economical grades of coal and the proper

sizing of coal for best results. Railroads are sometimes forced to use coal with a rather high percentage of slack on locomotives, and these tests show the probable loss under such conditions. While poor results are obtained from coal high in slack, it was reported that nut coal in some cases had been found unsatisfactory, owing to difficulty experienced in cleaning fires. It was urged that the tests at the locomotive laboratories be continued, testing coals of higher ash contents and coking coal.

WASHINGTON CORRESPONDENCE

WASHINGTON, D. C., July 10, 1917.

PROPOSED WAR TAX ON RAILWAYS

Any railway officer who has not taken the pains to study the complicated provisions of the proposed war tax bill because of any notion that most railways have been immune from any approach to "excess profits" is due for a surprise when he comes to analyze the bill. The word "excess" is by no means synonymous with "excessive," the word "profits" requires some definition, and, in fact, most of the important terms used in the bill, such as capital, income and surplus, have very little relation to the commonly accepted significance of these terms, but are given arbitrary, artificial definitions which vary widely from the standard meanings.

While it is impossible to give any definite idea of what the proposed taxes will amount to, without a calculation for each road separately, figures that have been worked out tentatively for a number of roads indicate that if the bill should become a law some of the eastern roads that will receive increased revenue from the commission's decision in the 15 per cent case will have little of it left, after paying their taxes, to meet the other increased expenses which impelled the commission to allow an advance, while some other roads probably will have to pay much more in war taxes than the rate decision will give them.

The railways are affected by the income tax of 4 per cent, the excess profits tax and the 15 per cent tax on surplus, according to the provisions of the war revenue bill reported to the Senate last week. It was re-referred to the finance committee on Saturday for redrafting in order to raise enough additional revenue to enable the government to buy all the whiskey in the country at cost plus 10 per cent. The principal provisions of the war revenue bill as applied to railroads were briefly noted in last week's issue. A reading of the bill, however, gives little idea of its effect without actual figures, because of the peculiar meaning of the terms employed.

The new excess profits tax as proposed by the Senate Finance Committee applies to net income in excess of the average for the pre-war period of 1911, 1912 and 1913, or in excess of 6 per cent if the pre-war income was less than that amount. Net income as used in the bill means practically the net corporate income less dividend income. The capital on which the 6 per cent exemption is figured is defined as the fair average value of the assets actually invested, less the average amount of the liabilities and is practically the capital stock plus surplus. The proportion between excess profits and net income is to be determined by the Commissioner of Internal Revenue in accordance with regulations prescribed by him, with the approval of the Secretary of the Treasury.

If the average capital is greater or less than that during the pre-war period, allowance is made by deducting from the net income a proportionate amount. The rate of tax imposed on the excess is not a straight percentage of the excess but a graduated percentage, from 12 to 50 per cent, of the amount of the excess above the pre-war income or the 6 per cent exemption. The rates are 12 per cent on excess profits up to 15 per cent of the exemption, 16 per cent on the excess between 15 and 25 per cent, 25 per cent on excess between 25 and 50 per cent, and so on up to 50 per cent on any excess above 250 per cent.

The excess profits tax is in addition to the war income tax, which is increased from 2 to 4 per cent on the net income, which in this case means net corporate income less dividend income. There is also added a new tax of 15 per cent on the amount, remaining undistributed 60 days after the end of the year, of the total net income received during the year, less the amount used with the approval of the Interstate Commerce Commission or state or local authorities for extensions, renewals or betterments, and less the amount of other war taxes.

* * *

The Senate on July 7 disagreed to the House amendments to the priority bill, which has been passed by both Houses of Congress, and Senators Newlands, Smith of South Carolina, and Cummins were appointed members of a conference committee on behalf of the Senate. The bill to increase the membership of and reorganize the Interstate Commerce Commission which has been passed by both the Senate and the House, is still in conference, where an effort will be made to reconcile the differences in the bills as passed by the two Houses.

* * *

The appointment of Frank McManamy, chief inspector of locomotive boilers of the Interstate Commerce Commission, as a member of the commission has been recommended to President Wilson by Senators Hollis, Walsh, Husting and Ashurst.

JURY BLAMES AUTO DRIVER FOR ACCIDENT

After a full investigation of a grade crossing accident which occurred on the Chicago, Rock Island & Pacific at Midlothian, Ill., on May 13, a Cook county coroner's jury recently rendered a verdict which holds the driver of the automobile wrecked in the accident to have been criminally careless to the degree of manslaughter. The jury also recommended that he be held to the grand jury on this charge until released by due process of law. This is one of the comparatively infrequent cases where a railroad is involved in which the blame for an accident has been placed solely upon the other party. The accident occurred about 4:45 p. m. on May 13, at Midlothian, Ill., a station about 25 miles southwest of Chicago, when a Rock Island passenger train, running between 50 and 60 miles an hour, eastbound, struck a Studebaker 7-passenger automobile owned and driven by Guy A. Ferree. Ferree was a real estate salesman, and had in his car six people, five of whom he was taking to some property near Midlothian. These six people were killed almost instantly, while Ferree, the driver of the car, survived, and is now convalescent. The grade crossing was in good condition. Two main tracks and a side track cross the street, and the Midlothian station of the Rock Island is located close by. Two other sidings are located between 80 and 100 ft. west of the main line tracks. The view from the road in the direction from which the train approached is clear and unobstructed, and a train would be in full view when within one-half or three-quarters of a mile from the crossing at any time when an automobile might be within several hundred feet of the tracks.

An inquest was held by a deputy coroner of Cook county at Blue Island, Ill., on June 23 and June 29. After the testimony was taken the jury went to the scene of the accident and viewed the crossing and surroundings. After deliberation the coroner's jury returned the verdict mentioned above. The driver of the machine testified that he did not stop, that he did look, but did not see anything. Outside witnesses testified that they heard the whistle of the train even before they could see the train itself. Had Ferree stopped his machine and looked, at any point within 80 or 100 ft. of where the automobile was struck, the accident might have been avoided.

Heavier Car Loading Is Winning Out

Methods Used by the Pennsylvania Railroad Which Are Proving Successful. Canadian Pacific's Good Work

THE *Railway Age Gazette* will print from time to time accounts of methods which are being pursued to obtain better car loading together with a summary of some of the results being obtained. The following articles describe methods used on roads that are meeting with encouraging results.

MAKE ONE CAR DO THE WORK OF TWO

By H. C. Bixler,

Superintendent Stations and Transfers, Pennsylvania Railroad

"Make one car do the work of two" is the slogan that the Pennsylvania is trying to drive home to every shipper and consignee, every broker and buyer, every farmer's grange,

Car with Only Half a Load of Crates of Onions

manufacturer's association, board of trade and chamber of commerce on its lines. It is the big gun in the battery and represents, we believe, the solution of the car shortage prob-

lems upon the full capacity of the car which is 10 per cent above the marked capacity; by loading cars as soon as they are placed and not taking advantage of the 48 hours' free time allowed under the car demurrage rules; by giving the agent billing instructions in advance so that the car can be moved as soon as it is loaded.

Consignees can help; By increasing the size of their orders for goods to the carrying or cubic capacity of cars instead of ordering goods on the minimum carload basis, which in many instances is only half a carload; by arranging in advance for men and teams to unload cars as soon as placed and not take advantage of the 48 hours' free time allowed under the car demurrage rules; by avoiding use of cars for storage purposes; by instructing their teamsters to finish the unloading of a car at the end of the day when only a small portion of the load remains in the car.

On the Pennsylvania Railroad system the average loaded freight car moves with about half its carrying capacity utilized. What this means may be judged from the fact that on the Pennsylvania alone the unutilized car space is equivalent to the carrying capacity of 120,000 freight cars.

It is realized, of course, that it is not possible now, and probably never will be, to have every freight car move at all times with a full load. That would represent an ideal condition. Nevertheless, we should endeavor, as far as possible, to make 100 per cent capacity our goal in an effort to make every freight car do all the work possible. On the Pennsylvania we have been actively engaged in this campaign for little over a year. We found many difficulties to overcome, both in regard to commercial practices and railroad operation, but feel that we can point to actual and substantial results. Taking our lines east of Pittsburgh and Erie for comparison and using the latest figures available, namely, those for April, 1917, we find that the average load per freight car has been increased nearly three tons as compared with the corresponding month of the year previous. This means a saving of more than 58,000 cars in a month. Measured in value per car to the railroad this

Car Loaded with 1,000 Crates of Onions. Weight, 54,000 lb.

lem. We are doing this as a portion of our share of the work which has been undertaken by all the railroads of the country to raise their operations to the highest practical degree of efficiency, in order that they may in that way render the maximum service to the government in the conduct of the war.

There are a number of ways in which it is conceivable that more work can be gotten out of a freight car.

Shippers can help: By ordering only such cars as are needed for immediate loading; by basing their orders for

would mean a large saving, but measured in car value to shipper and to the country as a whole, a far larger saving has been achieved.

We feel that we have "broken the ice," so to speak, in this work, and our headway this year should be at a more rapid rate, which will be of correspondingly increased benefit to the government, to the shipping public and to the railroad.

It is impossible to make any material progress in the way of increased car efficiency without the full and complete co-

operation of the shipper and consignee, but we cannot expect to have this unless they fully understand the practicability of what we are trying to do.

We have carried on the work chiefly through station agents, furnishing them with material in the series of car utility bulletins, of which six have thus far been issued. The first four bulletins paved the way for our bulletin No. 5 which was prepared in diagram form and with the thought of bringing directly to the attention of the shipper, the extreme waste of car space which results when the trade unit

carrying capacity. Our car utility bulletins have dealt very largely with this subject by pointing out specific instances. Cotton is shipped in 50 bale lots, weighing 25,000 lb., although a car will hold 108 bales, weighing 54,000 lb. In the building trade it is customary to order bricks in 10,000 lots, which is less than half a carload; tomatoes are commonly shipped in units of 550 cases, which weigh about 37,000 lb., while a car will carry 1,500 cases.

The usual shipment of fertilizer, 250 bags, weigh 42,000 lb. The car could be loaded with 600 bags, weighing 100,-

Hampers Loaded to Brace Each Other

672 Hampers of Cucumbers (Size 20 in. by 16 in. by 10 in.) Approximate Weight 27,000 lb.

is the governing factor. In this bulletin we could show through these diagrams plainer than in any words that could be written, the space occupied in car by certain commodities when shipped in trade or selling units. Alongside of the present method of loading we were able to show a plan of a car holding twice, and in some cases, almost three times as much freight as was formerly the practice to load. Bulletin No. 6 closely followed No. 5 and covered the loading of fruits and vegetables. We were able to show in this bulletin by means of diagrams and photographs that increased carloading not only helped to eliminate car shortage but permitted of better stowing and subsequent better condition of

000 lb. A full carload of sugar, in bags, would contain 1,000 bags, weighing 102,000 lb., whereas a car usually consists of only 400 bags, weighing 40,800 lb. Sugar in barrels is ordinarily shipped 100 barrels to the car, while 244 barrels could be placed in the car, and the weight increased from 37,280 to 90,960 lb. In a similar way, the commercial unit in shipping salt is 536 bags, weighing 53,600 lb. A box car will hold 1,100 bags of salt, weighing 110,000 lb. Oil is usually shipped 65 barrels to a car, the weight being

Not Enough Hampers Put Into the Car to Properly Brace Each Other

perishable freight upon arrival at the market. These diagrams brought out in pictures what we had been trying for months to portray in words: the unreasonable waste of car space. Some of the photographs and diagrams are here printed. After the agents understand what we are endeavoring to accomplish, it is not a very difficult matter for them to pass the information on to patrons with whom they come in contact.

One of the greatest problems which confronts us today lies in the trade customs in the various lines under which commodities are shipped in commercial units of so many sacks, bags, and barrels, which, instead of filling or approximately filling the car, take up only about half of the cubical or

Damage Resulting from Only Partly Loading a Car

20,650 lb. There is no reason why 148 barrels of oil, weighing 60,680 lb., could not be shipped in a car.

One of the most encouraging developments we have noticed is the disposition on the part of a number of shippers, some of them very large ones, to get into the campaign themselves, and to individually urge better car loading as a means of increasing their own business.

The Universal Portland Cement Company of Pittsburgh, Pa., and the Alpha Portland Cement Company of Easton, Pa., are showing very remarkable results in increased car loading of cement. The Carnegie Steel Company, the American Sheet & Tin Plate Company, and the National

Tube Company of Pittsburgh, Pa., have inaugurated a systematic method for intense loading, and they have succeeded in utilizing almost the entire car capacity.

The Washburn-Crosby flour mills are conducting a lively campaign for better loading by issuing educational circulars. The Barrett Manufacturing Company at Philadelphia has increased its average loading per car three tons since the first of the year, and has set up as a standard 23 tons to be obtained by September 1.

We are especially glad to notice that the fertilizer trade is taking up similar work and carrying it on in earnest, with the aid of the American Fertilizer Magazine. Willet & Gray's Statistical Trade Journal has given its support to

patriotic impulses have been stirred, and a general appreciation aroused as to the urgent need for making the greatest possible use of freight car facilities.

CANADIAN PACIFIC METHODS

The operating department of the Canadian Pacific has given the problem of increasing the average load per car constant attention for a number of years. During this time various methods have been developed in bringing about the desired improvement in the freight handling performance of the equipment which are of general interest to railway men.

While on certain portions of the line large quantities of

Car Loaded with 256 Crates of Cabbages, Weighing 51,200 lb.

Strips are Nailed to Ends to Give Ventilation

the Pennsylvania Railroad's campaign for heavier loading by reprinting diagrams covering the loading of sugar. The Canner Magazine of Chicago has also taken up the cudgels in the interests of freight car efficiency. Special mention is due to the Railway Business Association for its vigorous campaign covering the entire country. It was a great patriotic act when President George A. Post volunteered to put the powerful machinery of the Railway Business Association behind the full loading of cars.

Lately we have been trying the effect of competition as a means of stimulating better car loading. This has been done in several ways, one being by tabulating each month of

heavy commodities, such as grain, coal and ore are transported, there is also a great volume of manufactured articles, forest products and similar freight cars which cannot be loaded to anything like the weight handling capacity of the cars. It was found on investigation that with shipments of a heavy nature it was customary for shippers and consignees to handle their goods in lots of certain designated sizes without regard to the capacity of the car. Many flour millers, for instance, when calling for wheat ordered a "carload" of 1000 bushels, equal to about 60,000 lb.; purchasers of cement, flour, sugar and similar goods likewise placed orders based on the minimum weights prescribed by tariff or so ordered

Carefully Loaded Car with 630 Crates of Tomatoes

Strips of Not Less Than 1 in. in Thickness Nailed to Both Ends of the Crates Extending from Side to Side are Required to Give Proper Ventilation

the result obtained by every division, thus reflecting the energy with which the station agents and various sections of the railroad are conducting their work. In a similar way we have called to the attention of shippers the relative conditions as to car loading, and we have noticed a gratifying desire on the part of many of our patrons to be leaders in this work of aiding transportation efficiency. This is made possible through a system of reports, whereby each agent is required to furnish the general office with all the data concerning the loading from his station.

Such rivalry, both within and without the railroad organization, cannot fail to have important results, as it shows that

sometimes for no other reason than that they had always secured their freight in that manner. The resulting light loading and waste of equipment has had no small part in the creation of car shortages during seasons of heavy traffic, and also, has, to a certain extent, been responsible for the congestion at such times by forcing into delivery points a greater number of cars than were absolutely needed to move the traffic offering for the various destinations, besides causing the expenditure of engine and man power in moving a large percentage of tare weight that should have been devoted to the handling of actual freight.

The situation naturally received more attention than ever

when, a few months after the beginning of the war, the railway was called upon to move immense quantities of munitions to the seaboard for transportation overseas, to carry thousands of carloads of raw materials to munitions plants and, at the same time, to transport the regular business of the country. Facilities were taxed to the utmost and the time soon arrived when the thousands of cars which had been idle during the season of depression immediately preceding, were all in service, and the demands of the shippers were far from being met. It was impossible to secure more cars, and, in fact, the company had, and still has considerably less than its rightful quota of equipment, owing to congestions existing on other lines, which condition has resulted in serious delay in returning cars to the owners. The obvious method to adopt in relieving the shortage was to load more freight in the same number of cars, and it was plain that there was unlimited room for improvement in that direction. The first step was to ensure capacity loading of all company material, and it was seen to that the existing instructions on this point were strictly observed.

Tests had been made some time previous in connection with the carrying capacity of cars, and it was found that while a 30-ton car might not, with safety, be loaded to more than 33 tons, cars of 40 and 50 tons capacity might be given considerably in excess of the usual 10 per cent over stencilled capacity. It was arranged that 40-ton box cars were to be loaded to 94,000 lb. and certain series of 50-ton open cars to as high as 125,000 lb. Connecting roads were then approached with the suggestion that they permit similar loading of their equipment, or, if they were unwilling to do this, to allow Canadian Pacific cars to be so loaded for passage over their respective lines that benefit might be obtained from the increased load per car in the movement of through as well as local traffic. Various replies were received, but a number of the railways addressed signified their approval of the proposition, and have adopted the practice.

The Canadian Pacific handles an immense volume of grain from terminal elevators in Western Canada, both for export via Atlantic seaports and to flour mills in the east. The effect of the increased capacity of 40-ton box cars in supplying equipment for the movement of this grain has been most marked, and a striking example of this is found in the following:

Between May 1 and December 31, 1916, there were loaded in 40-ton cars from the Canadian Pacific elevator at Port McNicoll 17,769,391 bu. of wheat for export via Montreal, Que., and via St. John, N. B. Up to about the middle of November this wheat was taken to Montreal, a distance of 358.8 miles, and from then until the close of the year to West St. John, a distance of 836.6 miles. The wheat was loaded in 11,366 cars, so that the average load carried was 93,803 lb. or 1,563 bu. The increase in the average load per car beyond 10 per cent in excess of the stencilled capacity authorized by M. C. B. rules, of 5,803 lb. resulted in a saving of 750 cars, and the haulage of dead tare to the extent of approximately 11,932,502 ton miles. It might be added that in the movement of the above large number of cars, and, in fact, in no case on record, did an accident occur that might be attributed to the loading of the equipment in excess of the usual 10 per cent over marked capacity. During the winter just past, a very large quantity of grain has been moved from Fort William and interior points in the west, as well as from Port McNicoll, and the conservation of motive power, cars and labor that has been achieved by insisting on capacity loading is most encouraging.

The handling of grain as above described, however, particularly in the case of export shipments, is something over which the railroad exercises more or less complete control. Some difficulty has been experienced in prevailing upon shippers to load heavily, as in many cases their expense of loading would be increased, and the shortage of labor made

it hard for them to secure men who would undertake the more severe work of loading, say, a car of flour to the roof. In many instances the smaller consignees did not care, or were unable to invest sufficient money to purchase a full carload of goods, preferring to order only sufficient to conform to the weight published in the tariffs. In other cases it was found that loading regulations promulgated by departments of the Government having charge of the handling of munitions prevented shippers from fully using the cars placed at their disposal, even if they were so inclined. These and many similar conditions tended to discount the efforts that were being made by the railways to preserve economy in freight transportation, and it was evident that before the end sought could be obtained it would be necessary to secure the whole-hearted co-operation of the public.

In seeking some striking manner in which heavy loading and its attendant benefits might be placed before the shippers, consignees, trade organizations and others concerned, it was decided to issue in graphic form some figures showing exactly what might be done by the public itself, somewhat similar to a circular issued to employees of the Canadian Pacific in 1914 by Alfred Price, assistant general manager. Figures were drawn from the government statistics indicating that by increasing the average carload by 5 tons during 1917, as compared with the record of 1915, it would be equivalent to placing many thousand additional cars in service. Copies of this circular were mailed to all boards of trade and trade journals, numbers were sent to representatives of the company throughout the country, copies were furnished to connecting roads, a copy was mailed to each shipper and consignee writing to the railway about his freight, and every other opportunity of placing the matter before the public was seized as it presented itself. The response on the part of a large number of the company's patrons was immediate, and not only did they give assurance of their intention to co-operate but issued circular letters on their own account to their customers, impressing upon them the importance of "ordering a carload." Many applications were received for additional copies of the circular, one large shipper calling for 2,500 which were distributed to all concerns having dealings with that company.

Of this circular, or "Bulletin No. 1" 30,000 copies have been distributed. "Bulletin No. 2," which is of a follow-up nature, is now ready for distribution. The third circular is in course of preparation, and it is the intention to issue a series of notices of this kind until it is felt that the subject has been thoroughly advertised. In addition to the bulletins, a printed notice has been prepared which will be in the nature of a particular appeal to consignees, and a small sticker is used for attachment to replies to communications having to do with the supplying of cars and similar matters, this sticker bearing the words, printed in red ink, "Reduce car shortage by filling cars."

The systematic checking of freight waybills and weighing reports is being gone into more vigorously than ever, and where it is found that cars are being lightly loaded, the shipper and consignee are either visited or communicated with by letter, and the suggestion made that they can "do their bit" in helping to cope with the present trying situation by exercising economy in the use of freight cars.

At some of the larger centres inspectors have been placed and these men look over cars as they are opened so that data may be obtained that will enable the railway to get in touch with shippers of light-weight goods who, while they cannot load a car to its full weight-carrying capacity, may be able to use the entire cubic capacity. This has also brought about some good results particularly in the case of such commodities as pulpwood (of which a great quantity is handled in Eastern Ontario, Quebec and New Brunswick) lumber, packing-house products, etc. As the result of an interview with one packing concern, a shipment for which 10 refrigera-

tor cars were about to be used, was placed in 7, and the haulage of 3 cars for a round trip of over 5,000 miles saved. In another instance, a flour milling company, having received an order calling for 16 cars, got in touch with the consignee and was able to arrange for the consignment to be loaded in 10 cars.

In certain localities where a great deal of loading takes place committees have been appointed for the purpose of visiting shippers and soliciting their co-operation, and good results are being obtained from that source. At meetings between the public and representatives of the railway "loading of cars" is invariably introduced, and as opportunity presents itself it is the intention to call meetings of the larger dealers, and tell them at first hand what they can do in the way of assisting the railways to give them better service.

Government bodies such as the Department of Overseas Transport and the Imperial Munitions Board have been approached and asked to lend their assistance in the prosecution of the campaign, and the help received from that direction is most encouraging. Controlling as they do the manner in which goods shipped on their orders shall be loaded, these organizations have been able to issue instructions and to amend orders previously placed so as to ensure capacity loading in a large majority of cases.

In looking over the results of the efforts made thus far we find that during the month of February, 1917, the average weight of carload of export freight moved to West St. John was nearly five tons heavier than was the case a year ago, this increase being equivalent to one more trainload of freight per day in the same number of cars. On another portion of the line where a great deal of light-weight freight is moved, there was an increase of 20.1 per cent in the average load per car during March, 1917, as compared with March, 1916, and that during the same month nearly every division of the railway in Eastern Canada shows a gratifying improvement as against the record of a year ago. The average freight tons per loaded car mile for the entire line east of Port Arthur in March, 1917, eastbound, was 28.6, an increase of 8.3 per cent over the same month for the previous year, and westbound, an increase of 8.8 per cent. Perusal of the current records for April leads to the conclusion that the performance for that month, as shown in the summarized statistics (which have not yet been issued), will far out-strip that of March, and it is felt that as the movement to "increase the load and decrease car shortage" gathers momentum, the result will be far beyond anything that was considered possible a few months ago.

LOADING COMPETITION ON SOUTHERN PACIFIC

Prizes will be awarded to agents on the Southern Pacific, Pacific system, whose stations show the best records for car loading between July 1 and December 31. Only agents at stations handling at least 40 carloads of revenue freight outbound during the period will be eligible for the competition. Awards will be made on the basis of the greatest improvement shown in the loading of 18 separate commodities—number 13 being I.C.L. freight—over the previous records made at the same stations between September 1, 1914, and June 30, 1915, when a similar competition took place. For each commodity a first prize of \$50 and a second prize of \$25 will be awarded, but no station will be considered in the award of first prizes unless at least 10 cars of the commodity under consideration have been loaded at that station during the period. A station loading as many as five such cars will be eligible for second prizes. A separate competition with a first prize of \$50 and a second prize of \$25 for loading I.C.L. merchandise has been arranged for the following cities only: San Francisco, Cal., San Pedro, Los Angeles, Stockton, Oakland, Sacramento, Fresno, San Jose and Portland, Ore. These cities are not eligible for first or second prize for I.C.L. loading

in the general competition. In addition, a prize of \$15 for each commodity will be awarded each month to the station making the greatest improvement for that period when compared with the average per cent of load to car capacity obtained at the station during the 10 months ended June 30, 1915.

FURLOUGHS FOR PENNSYLVANIA EMPLOYEES WITH THE COLORS

Any employee of the Pennsylvania Railroad who responds to the call to arms is granted a furlough by the company for such time as he may be engaged in state or national military or naval service. He is also allowed to retain the same privileges of free transportation to which he was entitled when engaged in the active service of the railroad. Credit will also be given, in computing pension allowances, for such time as the men are engaged in this service. This announcement is given in a general notice to all employees issued on June 27 by General Manager Elisha Lee. The notice follows:

"The board of directors of the Pennsylvania Railroad has taken formal action providing for the retention in the service of any employee of the company for such time as he may be engaged in state or national military or naval service in response to a call to arms in the event of war or other emergency. This applies whether they may be members of the National Guard or not.

"Heretofore the rule of the company has been that a furlough from active service could not be granted for a period longer than nine months. At the time of the Spanish-American war, employees who engaged in military or naval service sacrificed their positions, as the period of enlistment exceeded their furlough, although following the war every effort was made to find places for the men who had left on that account.

"Under the plan now adopted, employees shall be granted a furlough during the time they may be engaged in such military or naval service, and credit for the time absent will be given in computing pension allowances of employees so furloughed.

"Furloughed employees while engaged in military or naval service will be entitled to the privileges of free transportation the same as when engaged in active service of the company.

"The advisory committee of the Voluntary Relief Department also took action on this resolution, and the effect will be that during the continuance of such furlough by the company, a member engaged in military or naval service may continue his membership in the Relief Fund, and, if he keeps up his contributions, will be entitled to the benefits of the fund provided for any member who is on furlough. In cases of disability, in order to be entitled to Relief Fund benefits, employees will be required to advise cause of disability, furnishing name and address of military officer giving medical attention, and have company commander furnish memorandum showing number of days off active duty because of such disability.

"The company is sincerely interested in the welfare of its employees engaged in military or naval service, and has established a special bureau in charge of G. W. Buzby, special agent, with office in room 628 Commercial Trust building, Philadelphia, Pa., to look after their interests. The duties of this bureau will be to keep in communication with such furloughed employees either by personal visits or correspondence, and to act as a medium for the exchange of information between them and their families and friends at home; and to render any assistance consistent with the object of the bureau and the requirements of the men. Furloughed employees are requested to keep this bureau advised of their military addresses."

DENVER & RIO GRANDE SUFFERS HEAVY DAMAGE FROM FLOOD

The recent failure of the Gooseberry creek dam which serves to impound water for irrigation purposes in the vicinity of Price, Utah, resulted in heavy damages to Denver & Rio Grande property and the suspension of traffic between Denver, Colo., and Salt Lake City, Utah, for several days. Those portions of the road affected were the double-track main line which parallels the Price river through a canyon from Helper, Utah, to Colton, a distance of 18 miles, and a branch line running 21 miles south from Colton to serve the coal mines located at Scofield and at Clear Creek. The line of this branch follows in general a tributary of the Price river.

The Gooseberry reservoir is situated on Gooseberry creek, the tributary of Fish creek which, in turn, flows into the Price river. On the afternoon of June 24 telegraphic advice of the failure of the dam was received by D. & R. G. officers. The water courses which generally parallel the

ft. to 750 ft. in length. While this stretch of road is not generally high above the elevation of the normal flow of the Price river, sections of the roadbed, 30 ft. or more in height, were washed out at several places.

A bridge leading to the Panther mine and one on the tracks serving the Spring Canyon Coal Company and the mines of the Standard Coal Company were washed out. The Utah Fuel Company also suffered serious damage, but by dynamiting one of the railroad bridges and using rails to protect the banks, the large tippie used by the company escaped with comparatively light damage. The flood also washed away eight residences and two business houses at Castle Gate, three dwellings at Carbon, a mining camp about two miles to the east of Castle Gate, and five dwellings at Helper.

The Gooseberry dam impounded 11,000 acre feet of water or virtually 17 square miles of water a foot deep. The heavy snows of the past winter did not begin to melt until the arrival of hot weather, which came about six weeks later than usual without the warm spring days which usually pre-

Yard Destroyed at Castle Gate, Utah

Flood Views on Denver & Rio Grande

railroad were not affected until Monday, June 25. At this time the water began to rise rapidly and on the evening of June 25, reached the highest stage at Castle Gate, Utah. About five miles of the Scofield branch was almost completely destroyed so that practically entire reconstruction will be necessary. At numerous points in the Price river canyon between Colton and Helper the roadbed, although very largely of rock construction, was destroyed and two bridges consisting of double-track steel girders on concrete masonry substructures were washed away with practically complete destruction of abutments. Besides these bridges, several others were either destroyed or damaged so badly that heavy repairs were necessary. The greatest amount of damage was concentrated at Castle Gate, where the canyon is particularly narrow. At this point several sidetracks, both main tracks, the depot, a water tank and several cars were destroyed, the station building being completely obliterated. There were 14 washouts on the main line ranging from 350

cede summer temperature. As a result, the water from the snows was unusually great and came all at once. Exactly what caused the dam to give way has not been definitely determined, but a semi-official report of the state engineer states that the temporary spill-way was inadequate to handle so large a volume of water. When it was reported that the dam was breaking, the residents of the towns along the Price river at once moved to nearby mountain sides with their household goods and stock. When the water did come, there was little left in most of the towns except the empty houses. Only one life was lost. After passing Helper, the flood spread into a broader valley and the damage to property was much lighter than in the canyon.

By constructing shoo-fly tracks in some places, swinging the good track over toward the mountainside in other places, and cribbing where both main tracks were down, a single track line was opened for through traffic between Denver and Salt Lake on July 4.

Increasing the Tonnage of Freight Trains

The More Important Principles Emphasized in Six of the Discussions Received in the Contest on This Subject

THE two prize winning papers received in the contest on the subject of Increasing the Train Load, and two other papers were published in the issue of June 22. Six other papers which were received in this contest are included in this article. While the subject of securing full train loading has received very close attention on individual roads during recent years it has never been given as widespread attention on all roads as at present when the demand for the full utilization of all railway facilities is so pressing.

A TONNAGE BUREAU

By M. E. Burke.

Norfolk & Western, Roanoke, Va.

Operating officers have their hands full with the routine duties of operation and with continuous demands to furnish information of various kinds to the different legislative bodies. As a result they have not the time necessary to deal intelligently with this important problem. Every railroad of any considerable size, therefore, should establish a special bureau to deal with the question of train loading.

The field of this bureau is very broad, yet very definite. It can be outlined in this way:

A. To determine the most economical maximum tonnage ratings for each class of locomotives in the different services on each district of the system.

B. To replace gradually the old method of tonnage rating by the new—that of rating according to train resistance or drawbar pull.

C. To ascertain the most economical combination of power to be used in each class of service where more than one locomotive per train is used.

D. To see that each terminal where trains are being made up is furnished with sufficient information in ample time to avoid, when possible, the use of light power in both directions.

E. To be sure that the yard offices are guided by the official ratings and are computing the train tonnage correctly.

The first step in determining economical tonnage ratings does not call for the use of a dynamometer car. I have found it very profitable when entering a new field to make a complete list of all the tonnage ratings existing on the system; to determine the ratio of the tonnage ratings of the different types of locomotives in the same class of service on each district of the system; and to determine the ratio of the tonnage ratings of the same type of locomotives in different classes of service on each district of the system. Such information very often surprised the local officials. In cases where similar classes of locomotives were used on several districts, a variation of from 40 to 50 per cent in the ratio of the ratings would not be uncommon. The following table illustrates the point:

	A	F	C	D
(1)	100%	95%	80%	60%
(2)	100	55	85	70
(3)	100	70	75	55
(4)	100	98	82	59

Classes A, B, C and D are different types of locomotives—all in one class of service. Lines 1, 2, 3 and 4 refer to different districts of the system. Class A is taken as the basis of comparison, or 100 per cent. The relation of the remaining three classes of locomotives to A shows the inconsistency of our present ratings.

Similar results were obtained by tabulating the different percentages of cuts allowed for time freight trains as compared with corresponding slow freights on different districts of the system, special attention being given to the speed re-

quired in each case. Here, too, a surprising variation was detected.

The local officials, having been furnished with this information, have taken the matter up with their trainmasters and chief dispatchers and gradually raised the ratings that fell below the average ratio. Uniformity and gain in ratings were thus obtained over the system. These were very profitable, for in all cases ratings were raised and never lowered.

The next step in getting at the most economical maximum ratings is to go over old train performance sheets for a period of time, pick out those trains with the highest total tonnage hauled and analyze the time made by them in getting over the line. The trains with both average performance and economical time on the road will indicate whether or not the official tonnage ratings are high enough. These steps usually bring the ratings up considerably, even if not to the highest point of economical practice.

Great judgment must be exercised in carrying on this work. It must always be remembered that the road and power conditions are not the most trying features to be considered. The greatest opposition, if any, to be met is that of the men. Human nature, as a rule, opposes anything new. This is especially true in dealing with organized labor. The most important qualifications of the man in charge of the bureau under consideration are those of being a good mixer, of being capable of stirring up enthusiasm in every one connected with the handling of trains, and of cultivating an atmosphere of co-operation instead of an attitude of checker and checked.

Thus all concerned will become accustomed to the term tonnage rating and will be interested in making as good a showing as any other division on the system. The idea of new tonnage tests is no longer foreign. The time is ripe to introduce the latest scientific way of rating trains—that of substituting the resistance of the train for its total actual tonnage. All operating men know that trains with the same total tonnage but with different numbers of cars are not handled with the same ease. They all agree that a train with 50 forty-ton cars is harder to get over the road than a train with 40 fifty-ton cars, all other conditions being equal. To overcome this difficulty the factor of resistance must be introduced on each district in connection with its most economical rating. This factor should be determined by a series of tests with the proper combinations of cars. It should take into consideration the average weight of the cars handled on the district, the controlling grades and their length, position and frequency.

Some roads use the train resistance computer for this purpose, but I am inclined to think that its mechanism is too susceptible of mistakes by the yard clerks. It requires very careful manipulation and even then very often gets out of adjustment. One of the large roads, I believe, is following the method of inserting the average factor of resistance on each table of ratings in both directions for each district on the system. These tables are usually compiled in pamphlets, each pamphlet containing the ratings for one division and the general instructions being given on the first page.

The third phase of the work—that of providing the most economical combination of power to be used in each class of service where more than one locomotive per train is used—is one of the most difficult tasks of the bureau. It requires a thorough knowledge of the physical and climatic conditions of the road and also of the nature of the freight handled. Frequently no iron-clad rule can be applied to any terminal

to be followed in making up trains. The local people must be made to appreciate the absolute necessity of watching and weighing the situation in hand continually. While it is profitable, as a general rule, to haul trains with rated tonnage, it would be quite uneconomical to follow this when it becomes necessary to equalize power. Double-heading trains all the way, using helpers part of the way, pushers over controlling grades, and turn-backs are some of the methods that may be used in solving these problems. Very much can be said pro and con regarding each of these methods, but their merit depends largely upon the local conditions.

In connection with this part of the work it would perhaps be of some value to outline a general policy as a guide for such a bureau in its endeavor to fix economical combinations of power for the most efficient handling of trains. Our railroads are being subdivided continually into new divisions and districts. While this is necessary for efficient operation, it has at least one disadvantage that some of our operating men fail to overcome—they soon become engrossed in their local conditions and lose sight of the very important fact that the districts under their jurisdictions are but links of the one big chain which comprises the entire system. It often holds true that a heavy competitive movement of some one commodity will be either originated or delivered to a road at a point necessitating its passing over several districts of the system before reaching its destination or connecting line. These districts, as a rule, have different physical conditions; necessarily some classes of power would be rated differently on these districts.

The idea is to meet the road conditions, when possible, by changing the combination of power used, instead of by breaking up the train. A train then would be able to pass over the entire line in its original make-up and avoid the greatest part of terminal delays now entailed in breaking up the old and building the new trains. The benefits gained by changing the combination of power instead of the make-up of trains cannot be enumerated so easily. Instances have been known of cars losing their identity, traveling in manifest trains part of the way, in slow trains part of the way, and even experiencing association with local trains. The tracing of delayed cars would be very much curtailed and an all-around better service would be gained which is, after all, the best advertisement a road can have.

The fourth—that of providing the terminals with sufficient information in ample time to avoid unnecessary use of empty power in both directions—is somewhat more complicated than the preceding phases. The problems heretofore were originated and solved within the bounds of one system. We now come to a problem, the solution of which very often depends upon the co-operation of many systems. Most of the waste of running light power in both directions takes place at junction points, owing to the lack of co-operation between connecting lines in exchanging transportation information. The reason given in such cases is usually "unexpected business." Why should there be such conditions? The cars were in transit for some time before they reached the junction point. It was, therefore, not a case of "unexpected business," but that of "unannounced business." There is no question as to the benefit to be derived from such information if it can be made reliable and transmitted in proper time. All realize the value of such co-operation, its feasibility, and comparatively small cost, yet no one has taken the initiative in bringing it about.

The fifth and last phase mentioned is the necessity of ascertaining whether or not the yard offices are guided by the official ratings and are computing train tonnage correctly. It was stated truthfully that every man, no matter what his field of endeavor may be, will do better work when he is being checked and compared with others. Many a good method has been installed on different systems which has gradually lost its effect on account of not being supervised and checked.

Having worked out the proper ratings, and combinations of power, and having provided, as far as possible, the transportation information necessary for the terminals, it remains to provide the necessary means to enable the bureau to be in constant touch with the entire workings. It must arrange for a daily report compiled under the supervision of the chief dispatcher or trainmaster for both directions in each district, showing the following information concerning all through freight trains leaving their terminals during each 24 hours: the train number, the time of departure, the class or number of the locomotive or locomotives, its or their ratings, the actual tonnage at departure, and the change of tonnage, if any, while passing through certain specified points on the district. The report should also include reasons for sending out trains underloaded.

Such a report will enable the bureau to make monthly statements, showing the tonnage lost on any district, as well as its causes. In many cases the management may decide that it will be profitable to undertake to remove the causes of some of the losses, while in others the judgment of the men in charge of the making up of trains may be criticised and new instructions issued. Monthly charts displaying the daily operation of through freights by districts have proved very helpful in maintaining interest in this work. The men in charge of the bureau must have time to get around as often as practicable and discuss the train load situation with individual yard offices. Letters are never as efficacious as personal interviews.

The problem thus resolves itself into the following: The management should organize a special bureau to deal with the "train load." The bureau should have a personnel sufficient to enable the man in charge to leave the office whenever he finds it necessary to make a tour over the system. It is preferable for this man to have a scientific training in addition to a practical knowledge of transportation for his work is largely that of research. He must be able to keep his theories under cover when outside his office, for only then will he succeed in his main task—that of creating and maintaining co-operation. The bureau is to analyze the existing transportation conditions, ratings, combinations and distribution of power used, to standardize practices and to follow applications and effects. It must carry on its work by leading instead of driving. Monthly charts showing operating results and comparisons are to be employed. The charts should be plain, requiring but very little effort on the part of the general and local officials for their analysis. Scientific terms are to be avoided when possible, most especially when they can be replaced by colloquial railroad expressions. The bureau should start on a comparatively small scale and work its way up until it includes all branches affecting the efficient operation of trains.

THE APPLICATION OF SIMPLE PRINCIPLES

By O. S. Beyer, Jr.

Railway Engineering Department, University of Illinois, Urbana, Ill.

The primary object of increasing the train load is to move freight more economically. Before improvements can be made in this direction it is necessary to be able to control the loading and operation of trains in strict accordance with all those elements which have an effect on economical freight train movement. This control can only be secured when it is understood how these elements affect train loading and when a workable system is adopted which takes into account the relation of these elements to train loading.

For the purpose of adopting a train loading system, or checking up and improving it, if one is already in use, the services of a dynamometer car are valuable but not indispensable. Train loading or tonnage tests can be made daily under the supervision of a train master or a road foreman of engines in collaboration with the chief dispatcher if they

understand the principles. Different tonnage trains consisting first of heavy cars and then of light cars should be run over the division, and their performances compared. Results secured thereby, together with calculations based on the profile and locomotive characteristics, should furnish a basis upon which to establish a rational flexible tonnage rating system. This having once been done and a start made in the direction of adjusting train weights scientifically to the hauling capacity of the motive power many chances will immediately crop up to improve the average train load.

First it will be discovered that the question of accurate train weights is of greater importance than ordinarily imagined. Why? If it is not possible closely to determine the actual weight of trains as they are made up in terminal yards it will not be possible to load the motive power uniformly in accordance with its hauling capacity. Thus one train will perform differently than another, overloading, stalling, or consuming excessive time from station to station in one case, and in underloading and loss of engine and train crew efficiency in the other. A distinct economic loss follows exactly in proportion to the degree of inaccuracy which prevails in making up train weights.

Every effort should therefore be made to get individual car weights as correct as possible. Since train weights are almost invariably determined from the car weights entered on the way bills a campaign should be started to have the actual car weights carefully entered on all way bills as soon as they are originated. A close check of this situation on most railroads will reveal a very clear opportunity for improvement. Empty car way bills particularly are offenders. All that is necessary for an agent or a clerk who originates such bills to do is to look at the light weight stencils of the empty cars and enter them on the bills. When train checkers or conductors find such bills they should be instructed to enter the car weights when they check their trains.

Another important matter in this same direction is the proper determination of the weights of cabooses. Freight train cabooses are usually thrown into the whole train weight at 15 or 20 tons each. As a matter of fact they may weigh as much as 30 tons. All cabooses should be weighed with their full equipment on board, their weights clearly stencilled on the sides, and then treated the same as any other car in the train. Guess work and lazy man's work should be discouraged and eliminated by example as well as preachment.

The next thing which will be discovered is the improvement which will follow by loading cars more nearly to their capacity. The greater the individual car weights are, the more tonnage can be hauled in a train, for freight train resistance does not increase in direct proportion to the increase in the weight of cars. A loaded car of 75 tons which is $3\frac{3}{4}$ times as heavy as an empty car of 20 tons only pulls $1\frac{3}{4}$ times as hard as the empty car on a straight and level track at the usual freight train speeds. A knowledge of this fact alone should be a sufficient reason for every one interested in increasing the train load to try and get more load into individual freight cars.

Another very important opportunity for improving the train load lies in the proper making up of trains so that as many loaded or heavy cars as possible are placed into each one, thus avoiding the running of trains composed of empty or light cars. This arrangement will often prevent sending trains out which have had to sacrifice tonnage on account of having reached the car limit. Hence whenever there is a heavy movement of empty cars a great effort should be made to get loads into each train. A little foresight in this direction will go a long way, and alert division officials will find opportunity, when empty car movements are heavy, to protect the tonnage of individual trains by accumulating some heavy cars containing slow freight and distributing them judiciously in light car trains.

The importance of the element of time in train movement

will be appreciated much more than ever before. One of the reasons most frequently advanced regarding the impossibility of loading locomotives to their maximum capacity is that trains so filled out take too long to get over the division. It never seems to occur to those who are responsible for such a statement to make improvements which will save train time for the purpose of making possible greater train loads. Many opportunities present themselves continually in this direction and the first ones to realize their significance should be the train master, the road foreman of engines and the chief dispatcher. Their spirit should be such that they are always on the lookout for a chance to save a few minutes as each train makes its way over the division. They should everlastingly be driving this point home.

Many little physical improvements along the right of way and to the motive power will help accomplish this same object. Telephones should be installed at passing sidings to enable train crews to get into quick touch with tower men or division operators in order to get needed information instead of wasting time to walk a mile or more to ask for it. The lengthening out of passing sidings to prevent trains sawing by not alone saves time, but also permits increasing the car limit. Occasionally the installation of a crossover makes possible the utilization of the opposite main track in order to keep trains moving. Improvements to locomotives such as the application of brick arches and superheaters make it possible to operate trains at higher speeds over the division. The true worth of such betterments becomes doubly significant in the light of saving train time with the ultimate object in view of increasing the train load.

Lastly and above all else it should become apparent to the management of a railway organization that one individual at least should be included in the organization who is the best authority they can secure on this matter of train loading. The discharge of his duties should be confined solely to this field. He should be the pacemaker in all matters seeking to increase the train load. A careful systematic study of all the problems involved should be followed by suggestions, recommendations, and the initiation of such steps as will help effect the desired improvements. He should work with the division officials, getting from them the benefit of their experience which results from their intimate contact with the daily problems of operation, and apply it to his studies of the train-loading question. He should enlighten them on the principles underlying his work, develop in them an appreciation of the importance of the problem, encourage them to co-operate with him, and in general prepare the ground for an active campaign on the part of every one to help increase the train load. As the leading authority of the organization in his field, his assistance should be sought by all who are anxious to improve their loading conditions. He should be consulted on all the questions of physical property and operation improvements which affect the problem. An energetic man with a sound training in the fundamentals of train loading science, having had experience in the practical application of these fundamentals, will prove astonishingly valuable.

SOME OF THE REMEDIES

By C. B. Wildman

Division Superintendent, Missouri Pacific; Jefferson City, Mo.

In order to secure and maintain an increased train load effectively, it is important, and in fact absolutely necessary to proceed along definite lines. It is an easy matter to formulate some plan and issue instructions accordingly, but it is an entirely different matter to have such instructions rigidly complied with; therefore, the success of whatever plan of campaign is decided upon will depend almost entirely upon the manner in which it is followed from day to day. Perfunctory or occasional checking will not secure the desired result, and a definitely fixed train loading can only be maintained by checking carefully the tonnage of each train every

day. A very good plan is to provide space on the train sheet for dispatchers to show each train with light tonnage and the cause. This will also assist in reminding the dispatcher of his responsibility in seeing that this important feature is not overlooked.

The first thing is to establish the maximum rating of the engine definitely. The superintendent, trainmaster and master mechanic or road foreman of engines, should satisfy themselves by actual tests as to what the engine will handle under favorable working conditions, bearing in mind the theoretical rating, and endeavoring, if possible, to reach that or better. Once the maximum rating is established, the engine should be rated accordingly and the division officers and employees should be required to interest themselves sufficiently to see that the rating is maintained, due allowance being made for weather or other adverse conditions. Care should be taken to see that the yardmaster is interested in getting each train out of the terminal with its full tonnage. Too many trains leave the terminals a few tons short. The last car should be put on to bring the tonnage up to, or a few tons over, the rating. If this practice is closely followed it will result in a material saving of train miles in the course of a year.

It is the practice on some roads to run empties in solid trains, giving them the car limit, but not always the train load. This is sometimes necessary in emergency, such as an extreme shortage of certain classes of equipment, but it is important to see that the practice is not indulged in unnecessarily, as it is more desirable from a tonnage viewpoint to handle trains of mixed loads and empties in order to shorten the train and haul the maximum load.

Another cause of loss in tonnage is the indiscriminate handling of short loads and empties on through trains. Such business should be confined to local freights, and where the business amounts to more than the local freight can handle, it should be bunched and handled in one train each day. This train can either be filled out on the line, or turned at some convenient point after it has fulfilled its mission. The handling of short loads on through trains not only results in delay but usually in the train running with light tonnage in the direction of traffic over at least a part of the district.

I believe one of the most practical means of increasing the train load, and one that has probably been given the least attention, is that of increasing the car load, in other words, loading the car to its capacity. Fifty, and perhaps 75 per cent of all the cars handled are only partly loaded. One can readily understand the effect of these partly loaded cars on the train load, and the remedy does not lie altogether with the Interstate Commerce Commission, although, in my opinion, a definite campaign toward the accurate compilation and proper presentation of certain information to that body would, in course of time, bring gratifying results. In the meantime, it is within our power to improve this condition and secure some measure of relief. Our patron, the manufacturer, is a business man. He can see at a glance that it is not good business for a railroad to haul a car 500 or 1,000 miles containing only half a load. He can, and often will, instruct his salesman to sell a heavier load. He is in a position to give his customer a good reason why this is necessary, and the influence of the jobber over his customer should not be underestimated. We should show this patron of ours that we are interested in him and that we are willing to lend our aid to make his business a success. When we do this we can expect his friendship and co-operation, not only in the temporary relief before mentioned, but in the securing of permanent relief which we have a right to expect will be given later on.

Many railroads are operating long freight districts, some of them 150 to 170 miles. It is an impossibility to move trains of maximum tonnage over such districts, because their movement must necessarily be slow. This, together with the

usual unavoidable delays, such as meeting and passing trains, cleaning fires, crews stopping for meals, hot boxes, etc., will, in many cases, prevent the movement of the train over the district within the hours prescribed by law. It is also probably true that the full efficiency either of the engine or the employee cannot be obtained on such districts. Given a freight district of approximately 100 miles, there is no apparent reason why the locomotive and the man should not render efficient service. It is not necessary to provide an elaborate freight terminal every 100 miles to put such a plan in operation. A few tracks will take care of the situation, as no switching or breaking up of trains would be done at these points. The engine's fire should be thoroughly cleaned, a fresh train and engine crew put in charge and the train could proceed with little delay, and its maximum tonnage. The answer would be found in the road's statement of operating expenses.

Another source of lost tonnage is found in the handling of "time freight" schedules. For a number of years the railroads have been in sharp competition with each other in shortening freight train schedules at the expense of tonnage. There does not seem to be any adequate reason why a business man can reasonably expect to purchase an ordinary bill of goods in Chicago and have them delivered to him by freight in St. Louis, about 300 miles away, the following day, nor does there seem to be any good reason why brick, lumber and other such commodities should be symbolized and classed as time freight, except that "they all do it."

Stock, perishable freight and merchandise, properly belong under the classification of time freight, and should, of course, be handled as such, making whatever reduction in tonnage necessary to maintain the schedule. Dead freight trains should be run with as much regularity as possible, bearing in mind the importance of the full train load.

THE USE OF TONNAGE DIAGRAMMS

By J. J. Glass

Chief Draftsman, Chicago Great Western, Chicago, Ill.

Divisions on some roads are too long. On engines with long fireboxes, and firemen nearing the end of a long run and tired out, most of the coal is placed at the rear end of the firebox and not enough at the front end, thereby securing an uneven fire surface, resulting in a drop in the steam pressure and consequently reducing the effective tractive effort of the locomotive and generally the stalling of the train. This seems to be a reasonable explanation why some locomotives will pull a certain load over a hill, while others are required to "double over," both trains consisting of approximately the same tonnage. In such cases, the possibility of giving the firemen more rest between trips or a change in the division points should be considered, or in lieu thereof, a "relief point" for the crew, or the adoption of mechanical stokers, which are no longer an experiment.

Where possible, enginemen should approach the bottom of a hill at a speed which will enable them to acquire sufficient momentum to carry the train over; except in cases where the hill is too long and the momentum acquired would fall to zero before reaching the summit, in which case the tractive effort of the locomotive must alone be depended upon to carry the train over. (The Chicago Great Western operates 1 per cent grades approximately one mile long as velocity grades, passing the bottoms of hills at 25 miles an hour.) Diagrams should be prepared to show the distance in feet that a train's momentum will carry it on various hills for speeds varying from 10 to 40 miles per hour. The profiles should be studied with the help of these diagrams as it may be possible to operate a division or subdivision entirely on momentum grades, even if one hill should be too long, it would pay to double over, considering the excess in tonnage handled.

Some railroads have found in actual practice that the

theoretical engine rating used was inadequate; that the constant of resistance (4-6) used in figuring the rating was too high. In making up trains, yardmasters did not consider whether the cars were fully or partially loaded, or empty. In other words, it was not the practice to equate the rating to the number of cars. Even now some roads use the old practice of loading a train until the engine rating is reached, and they then wonder why the locomotives stall and are compelled to "double over" certain grades. (See Fig. 2.) This is, nevertheless, the everyday experience of most railroad men, and it is attributed to the fact that they have failed to consider the number of cars in the train.

Some roads use adjusted ratings, i. e., adding a certain car factor (5 or 6) to the weight of each car, and then adding together the weights of cars plus the car factors until the adjusted rating is reached. Fig. 3 shows the resultant loss in tonnage.

In order to obtain the maximum tonnage that an engine is capable of handling on ruling grades, the following rules should be observed: Engines should be tested to ascertain

tonnage that the particular class of engine is capable of hauling over a certain district without stalling.

Figure 1 represents an equated tonnage diagram used by the Chicago Great Western under ordinary weather conditions, with the temperature above 32 deg. C represents the point on the tonnage curve ordinarily arrived at in calculating engine rating, using 5 lb. per ton as train resistance. The shaded portion A, C, E, Fig. 2, represents the loss in tonnage if this practice is adhered to, while the unshaded portion C, B, D, Fig. 2, represents the chances of stalling if the train contains more than 84 cars, the engine being rated for 1970 tons. A, F, Fig. 3, is the adjusted tonnage rating, and the shaded portion A, B, F represents the loss in tonnage.

SECURE THE CO-OPERATION OF THE MEN

By Stephen H. Brown

Chief Dispatcher, Great Northern; Melrose, Minn.

One of the first essentials in an endeavor to increase train loading is to inspire trainmen and enginemen with a feeling of pride in their achievements. How best to bring about this desirable result is a problem in itself worthy of the most careful consideration.

Under present methods of operation little or nothing is left to the discretion of conductors and engine drivers. An engine is rated at so many tons, and certain handicaps are permitted such as the deduction of a stated number of tons per car where a given number of empty cars are handled. It is this method of rating trains which puts into the minds of trainmen the mental attitude many of them have acquired.

A practical case in point illustrates what I mean in an illuminating fashion. A heavy movement of empty cars was being made on a transcontinental railway. The engines were rated at 1,500 tons, which they handled successfully. The rating sheet authorized a handicap of 6 tons per car for all empties over 20. The cars were principally box cars, running 17 to 19 tons light. Trainmen and yardmen rated these trains on the basis of 17 tons for the first 20 and 23 tons for the remaining cars, and were handling 69 to 70 cars per train. The performance indicated light-loaded trains. An arbitrary 90-car limit was established, which was later raised to 95, and this brought the performance to correspond with loaded trains.

As a matter of common knowledge among men actively engaged in train operation, and the administration of the problems involved, actual tonnage does not always indicate train resistance. What is needed is a simple formula for the guidance of simple men (and this is not said in derogation). Engine ratings based upon tractive power and other technical data are not entirely satisfactory, nor does a test rating offer a reliable solution of this important problem. Such ratings usually are made under favorable conditions with the supervision of trained officers assisted by selected employees.

"A chain is no stronger than its weakest link," aptly describes the condition which exists upon a railway in its efforts to establish workable train ratings. We all know that Jones, for example, is a more efficient performer than Smith. Therefore, it is up to the railways to establish a minimum standard of efficiency for men before there can be a maximum degree of efficiency for machinery. When railways can rely upon employees to play a straight, fair game, it perhaps will be possible to secure the most profitable returns in train load that can be devised. The tendency now, unfortunately, is for employees in train service and elsewhere to share imaginary grievances with a too susceptible public, which is ever ready to aline itself against oppression. The dissatisfaction it feels is not the result of widespread mismanagement, as it believes, but of universal misunderstanding of the difficulties under which railway managements labor in striving to maintain a grip upon the situation against the

whether they are capable of maintaining the required steam pressure. Levels should be run on all ruling grades or at least on the hardest pull points. It may develop that the profiles are not identical with the present condition of the track. In calculating the tractive power, the mean effective pressure obtained from actual recent tests should be used. After having calculated the tractive power, equated tonnage diagrams should be prepared on graphic sheets as shown in Fig. 1. Each sheet should cover one class of engine over a defined district. In the preparation of the diagrams, the grade (compensated for curvature) should be selected at the hardest pull points, always considering the length of train. Proper and careful consideration should be given to wheel friction and weather conditions. Ordinarily three ratings, giving summer rates above 32 deg., winter rates between 0 and 32 deg., and severe winter rates below 0 deg., should be shown on every sheet.

In making up trains, yardmasters should be instructed to follow the diagrams closely, as they represent the maximum

opposition of those whose intentions, good or bad, serve only to clog the machinery of railway operation.

SOME OF THE ESSENTIALS

By E. J. Worden

Division Superintendent, Chicago, Burlington & Quincy;
Galesburg, Ill.

The first thing that has to be considered in making a tonnage showing is to have the motive power in condition to handle 100 per cent rating at all times. Every case of failure of an engineer or engine to handle full rating should be taken up with the mechanical department immediately to avoid a loss of tonnage on the next trip of that engine or crew. Slow orders over bridges or track at the foot of a hill deserves considerable attention to avoid having to reduce tonnage on trains to enable them to get up the hills after moving over this slow track. The fuel and water supplies should be satisfactory to avoid setting out trains or running light. This is especially true in cold weather.

On lines suitable for heavy power, everything possible should be done to avoid running small power. Short loads on any line should be confined to way freights or one short lead train. On lines where excess tonnage can be handled on either end of the run, cars should be accumulated to be used to fill out through trains.

READING MATTER FOR SOLDIERS

The railways of the United States are being given an opportunity to assist in providing reading matter for the soldiers. The War Department, through the Commission on Training Camp Activities, has asked the American Library Association to assume responsibility for providing adequate library facilities in the 32 federal training camps now being established for the National Guard and the National Army. The association has organized a war service committee, of which J. I. Wyer, Jr., of New York State Library, is chairman, and a sub-committee on transportation, of which R. H. Johnston, librarian of the Bureau of Railway Economics, is chairman. It is proposed to establish libraries at each of the training camps where books collected and donated by libraries, by publishers and by the general public will be housed in charge of two or more trained librarians who will, in addition to supplying recreational and general reading matter, seek out among the young men called to the cantonments and training camps those desirous of continuing courses of study or of undertaking reading to fit them for their occupations after the war.

An important practical problem is the transportation of the material collected under the auspices of the American Library Association to proper centers and this problem has been placed in the hands of Mr. Johnston, who is asking the various railway companies to assist in the work. Several railway companies have already indicated their willingness to transport as railway mail donations from persons on their lines to the most convenient terminals. Provision is made by the American Library Association for the prompt removal of these donations from the terminals by agents who will see that they reach the camps.

Some of the carriers have also arranged to prepare and place a poster notice calling attention to the need of the cantonments for books and magazines and naming places where officers with whom they may be left. They are also issuing orders to employees involved to parcel and ship in to the main terminal, where the books and magazines are removed by the agents of the library association. In a memorandum to the railways regarding this work, Mr. Johnston points out that within a few weeks nearly 1,000,000 men will be in cantonments, training camps or at the front. Among them will be men hitherto dependent upon and trained to

the use of books; men not so dependent and not so trained, who might under the unusual conditions be influenced by books; men taken from occupations or professions in which the books supplied to them would lessen to a degree the loss of opportunity caused by their country's call, and other men for whom merely recreative reading would be a beneficial influence to counteract the tedium and temptations of camp life.

Among the early war innovations in Germany was the organization of traveling libraries for the various army corps. Great Britain adopted a similar plan, by which every fortnight boxes of books are sent to every unit of the expeditionary forces. While the National Guard was encamped on the Mexican border the Y. M. C. A. and various libraries co-operated to furnish reading matter for the soldiers. In Great Britain transportation of books and magazines was handled both by the post office department and by the railways, which conveyed free of charge packages of books and periodicals despatched by properly constituted and recognized organizations. As the work will be in the hands of an organization representing the skilled library profession, the railways may safely be assured that such assistance as they may render will be most efficiently applied.

The Library of Congress has issued a pamphlet compiled under the direction of Herman H. B. Myer, chief bibliographer, on "The United States at War," giving references to the organizations directly and indirectly engaged, and to the literature on the subject, containing many references to commerce and transportation in war. It has also issued a bibliography of recent references on railroads in war. The library of the Bureau of Railway Economics also has available for distribution a special list of references on railroads in war which was originally issued on October 10, 1914, but which has been extended in mimeograph form to August 2, 1915. The bureau has also compiled a list of references relating to employment of women on railroads and street railways.

ELECTRICAL SUPPLIES FOR SWISS RAILWAYS.—In developing the plans for electrification, the government has created a special department, under the management of the Swiss Federal Railways, known as "Direktion für die Einführung der elektrischen Zugförderung der Schweizerischen Bundesbahnen, Berne, Switzerland." This department announces that it is prepared to consider proposals for sale and delivery of such electrical material as may be necessary for equipment in connection with this work, and that bids will be received from all countries. A statement by the management shows that large orders for copper wire already have been placed with certain firms in the United States, and that British and German firms are applying for details in order that they may submit offers.—*Commerce Report.*

FREIGHT CONGESTION IN RUSSIA.—The American Consul at Dairen cables June 6, 1917, as follows regarding shipping conditions in Russia: For Moscow and other cities shipments are long delayed at several places and cars are seldom available. All difficulties are confined to the Russian railroad, which is now taking only 300 tons of through goods daily, and from Dairen less than 120 tons, while there are several thousand tons here awaiting shipment. For through goods arrangements can be made to Harbin, Manchuria, only; for points beyond, arrangements are to be made at Harbin. Local forwarders can get goods through to Russian cities sporadically if the goods are here ready for instant shipment. Dairen is the best port for goods requiring trans-shipment, because there is no duty, insurance is low, storage in private godowns is cheap, and the facilities are superior to the chosen route. No parcel post packages for Russia have been accepted since May 29, and the embargo is indefinite.

View of the Building Before Completion from the Street Side

Pennsylvania Freight House at Indianapolis

New Inbound House and Tracks Are Being Built to Modern Standards. Several Interesting Details Developed

THE Pittsburgh, Cincinnati, Chicago & St. Louis is now completing a new inbound freight house layout at Indianapolis, Ind., which is of modern construction throughout. This structure and its tracks occupy all the land between South Pennsylvania street and the main tracks and extend from South street to McCarty street, with the exception of an area 250 ft. by 140 ft. at the corner of South and Pennsylvania streets. By agreement with the Board of Public Works of Indianapolis, dated August 19, 1912, all streets and alleys within this territory except Merrill street, were vacated, together with a strip 14 ft. in width

ing the driveway, freight house and tracks over this street on steel work. It also required the building of a retaining wall along Pennsylvania street.

This subway and retaining wall were constructed by railroad forces in 1913 in connection with the elevation of the main tracks and the outbound freight house layout. As this work required a number of construction tracks which could be reached from the elevated tracks, excavation for the inbound freight house was started and the material was used as fill. The lead to the ultimate freight house tracks was completed in 1914. The contract for the construction of

Map of the Freight House Layout

along the east side of Pennsylvania street extending 540 ft. north of the north line of Merrill street and a 9-ft. strip from Merrill street to Madison avenue.

It was the original intention to build the freight house on the grade of Pennsylvania street, but the city's plans for track elevation were then being prepared and a subway was required at Merrill street which would extend under the entire layouts for outbound freight, main track and inbound freight facilities. This was secured by depressing Merrill street about 8 ft., building the inbound freight house and tracks on an 0.8 per cent grade north of Merrill street and a 0.6 per cent grade south of Merrill street and carry-

ing the inbound freight house proper was awarded to the Wm. P. Junglaus Company, Indianapolis, Ind., on December 21, 1915.

The general arrangement of the inbound layout is shown on the drawings. The driveway on the west side of the building extends the full length of the house and is 39 ft. in width, being reached from Pennsylvania street at the north end and from Madison avenue and Pennsylvania street at the south end where there is a curved approach 350 ft. long on a 3 per cent grade. The building is 790 ft. long and 70 ft. wide. A basement is provided for storage which is reached from the Merrill street subway, only

25 per cent of which is being finished at present, giving ample room for future development.

The first floor, which is on the track level, provides a large area for all freight handling. On the east side of the house is a 10-ft. platform protected from the weather by a shelter roof suspended from the side of the building. Five tracks and 3 island platforms, each 12 ft. wide, are covered

grade conforms to the grades of the tracks which are 0.6 per cent and 0.8 per cent, while across the building there is a fall of $\frac{1}{4}$ in. to 1 ft. All trucking is down grade from the cars to the teams or trucks.

The fender on the side of the building along the main driveway and also along the basement driveway consists of 8-in. channels, concreted in place and held by countersunk

Cross Section of the Freight Terminal

with sheds of the butterfly type. On account of the track elevation work not yet being completed, only 3,010 lineal feet of platforms are now being built; this gives an unloading capacity of about 115 cars. This will be increased by about 20 cars when the elevation work is completed.

The building is divided into four sections by means of brick fire walls, all openings in which are equipped with metal fire doors; each section is provided with one 4-in. fire hydrant and 100 ft. of hose. A small room is provided in each section for freight checkers, while each section also has one set of beam scales and a hatchway for an elevator to the basement.

The offices in the second story are formed by means of a dormer in the center of the building, the floor being supported on the bottom chords of the roof trusses. The central fire wall divides this second floor into two parts, each of which is again divided by the use of hy-rib partitions, giving four good-sized rooms for the use of the freight

anchor bolts. The tops of these channels are level with the trucking floor, instead of 4 in. to 6 in. below as has been the general practice in the past. Along the trucking platform on the east side of the house, a metal groove, 1 in. wide and 1 in. deep, was placed about 20 in. from the edge

An Interior View of the House

A View During Construction

house foreman and his clerks and for records. These rooms are reached by steel stairs supported on brackets fastened to the fire wall. In the finished portion of the basement a large warming and locker room is located for the use of the freight handlers. A toilet room and a boiler room with coal and ash bins extend under the platform on the east side of the building.

One noticeable feature of the main floor of this building is that it is sloped in two directions. From end to end the

of the platform for the entire length of the building. This groove affords a place in which to hook the steel plates used to bridge over the gap between the cars and the platform.

As mentioned above, the excavation for this building was begun by railroad forces and about one-third was completed, leaving almost 8,000 cu. yd. for the general contractor. This work of excavating and backfilling was handled entirely by teams and wagons, the material being used to fill for the driveway along the west side of the building and to backfill against the building.

The foundations for the inbound freight house were designed in conjunction with the Trussed Concrete Steel Company and consist of an 18-in. concrete wall with a reinforced floor slab supported on beams and columns. All footings were carried down to a sandy gravel capable of supporting four to six tons per square foot.

All bearing walls above the level of the first floor are of brick, the face brick being selected penny pavers with round corners. The backing brick are a common hard brick. All stone copings and chimney caps are of Portage red sandstone, all pieces of which were firmly anchored and embedded in mortar colored to match. Cement mortar was

used throughout in connection with hydrated lime and local sand, while Jamestown black coloring was used with the mortar on face brick.

The steel trusses rest on the brick walls and span the entire width of the building. These trusses are riveted together with channel purlins which serve as a base for

Details of the Freight House Floor

the reinforced cement tile roof. On the ends of these trusses are fastened tee-iron hangers which extend down to a 10-in. channel, forming the outer edge of the roof over the trucking platform. This roof is 10 ft. wide and is formed of 4-in. by 10-in. yellow pine rafters, 32 in. apart on centers, extending from the channels into the brick work. On these rafters is placed yellow pine sheathing 1 5/8 in. thick, beaded

The Track Side

on the under side, making it conform to the city building code for slow-burning wood construction.

The roof over the platform slopes from the outer edge toward the building, and consists of five-ply asbestos felt, made and applied by the H. W. Johns-Manville Company. The flashing against the building is secured by means of a tile raggle block into the recess of which the roofing is carried and sealed. As there is no conductor on the upper tile roof all water, snow and ice drops about 8 ft. onto this

roof, putting it to a severe test. The roof of the freight house is of reinforced, red cement tile, built in sections about 2 ft. by 4 ft. in size, made and applied by the Federal Cement Tile Company, Chicago. Built in with the platform roofing are lead sleeves with 3-in. flanges on top. These sleeves extend down through the roof into 4-in. wrought iron downspouts connecting to the sewers running along both sides of the house and draining into the sewers in Merrill street.

Kinnear type rolling steel doors are placed at all outside driveway and platform doors, these doorway openings being 10 ft. high and 12 ft. wide. Fenestra steel sash are used throughout. As the windows are placed above the overhang, they afford ample light during the day without the use of skylight glass in the tile roof.

The main floor of this building is of 1 1/8-in. maple, with a 2 1/2-in. surface, and end matched. This extends out on the east platform to within about 2 ft. of the edge and is laid on, and blind nailed to, wedge-shaped sleepers cut from

The Driveway and Street Doors

3-in. by 4-in. hemlock and creosoted. These sleepers were laid on the reinforced concrete slab, 16-in. apart on centers, brought to an even surface on top, concreted into place with a lean mixture of concrete, and run parallel with the length of the building, while the maple flooring is laid across the building rather than on the diagonal.

The scales, four sets in all, were made in the railway company's shops at Columbus, Ohio, and are suspended from the concrete beams supporting the floor, which leaves the space below available for trucking. These scales are similar to, and in fact some of the parts were purchased from Fairbanks, Morse & Company, and are of the beam type.

The checkers' rooms are of hollow tile construction with hollow tile roof slabs. One of these rooms, 8 ft. by 12 ft. inside, is located in the center of each section of the building. The outside of these offices is of a plain sand plaster finish, while the inside is finished in white. These checker rooms are located on the track side of the house, the east wall, one-half of which is window, replacing one door. Two 14-in. Reznor heaters of the wall type, supplied with artificial gas, provide ample heat.

Steel and cast iron jamb guards protect the brick work from injury from trucks. The flashing around the dormer windows, the chimney and against the office building at the north end consists of a double copper flashing, well cemented

into the brick work. The wood work and roof trusses throughout the building were given two coats of Pennsylvania light standard building paint made at the Columbus shops. The steel doors were given two coats of standard box car red paint, while the door jambs and the remaining steel work were painted black.

The electrical work in the basement consists of a conduit concealed in the floor slab of the first floor forming the basement ceiling, with outlet boxes and lamps suspended on steam and keyless socket fixtures. On the main floor the conduits are all carried on the bottom chords of the roof trusses and have 25-watt lights with Monax glass reflectors suspended from conduit outlet boxes, one light being provided for every 250 sq. ft. of floor. Key switches on the side walls control 8 lights, 4 on each of the two trusses.

One American Radiator Company's down draft steam heater of 1500 sq. ft. radiation is placed in the basement, furnishing steam heat for the toilet room, the freight handlers' room and the second floor offices, no attempt being made to heat the main floor.

The driveway along the west side of the building was laid on filled ground after it was thought to have been fully settled. This paving is of the monolithic brick type, having a full 6-in. concrete base on which the best grade of hard Martinsville knobstone brick were laid and grouted, allowance being made for expansion along both curbs and about every 30 ft. by the insertion across the driveway of a 1/4-in. strip of "Elastite." A separate contract was given to the American Construction Company of Indianapolis on August 16, 1916, for the grading, curbing, sewers and paving. Work was begun on August 28, and completed November 24.

The three island platforms of the inbound layout consist of concrete piers 10 ft. apart on centers on which 2-in. by 12-in. joists were laid parallel with the tracks, supporting an oak floor of 2-in. by 6-in. and 2-in. by 8-in. boards 16 ft. long, laid at an angle of about 53 deg. This trucking floor is 12 ft. wide, the edge being placed 5 ft. 6 in. from the center of the track and 3 ft. 6 in. above the top of the rail. A shelter shed of the butterfly type is constructed over these platforms using 8-in. by 8-in. posts 20 ft. between centers and set in the center of the platform. Three-inch wrought iron downspouts with Holt leaders, connections and rosettes are placed on every other post. A 4-ply built-up asbestos roof is used. The platforms are lighted by single rows of electric lights with attachments for portable lights that can be carried into cars. These platforms were not included in the original cost or contract for the freight house and separate bids were taken for their construction. The contract was awarded to the Cuthbert Bros. Company, Pittsburgh, on December 16, 1916. Work was started at once and is still in progress.

A three-story brick warehouse stood on the extreme north end of the property purchased for the freight house. It was decided not to wreck this building but to remodel it for an office building for all freight offices and clerks, both outbound and inbound. Separate bids were asked for on this work and a contract was made with the Wm. P. Jungclauss Company in November, 1916. Work was started at once and it was completed about the middle of March, 1917. The basement of the building will be used at present simply as a boiler room and coal room where a new steam heating plant is installed. The first floor contains the freight cashier's office with three windows to serve the public, a 12-ft. by 12-ft. vault, a stationery supply room, toilets, a hot and cold room, and rooms for bonded and astray freight.

The second floor is arranged for three small offices for the freight agent, the cashier and their clerks and is also the main office room in which are all the inbound and outbound clerks, the telephone exchange, the vault and the toilet rooms. A light well has been placed between the second

and third floors and a skylight in the roof. The third floor is at present unfurnished and is to be used for the storage of records. All finished walls and partitions are made of hy-rib metal lath and plaster and the interior windows and doors are fitted with crystalline glass. Provision is made in all rooms for electric lights, electric fans and telephones. It is also the intention to install a pneumatic carrier system connecting each billing booth of the outbound house, each receiving booth of the inbound house, the cashier's room and the freight house foreman's rooms with the central station located in the main office room adjacent to the telephone exchange. A 3-in. tube will be used for this purpose and an air compressor located in the basement.

All plans and specifications for this freight layout were made in the office of W. C. Cushing, chief engineer maintenance of way, Pittsburgh, Pa., J. D. Moffat, Jr., was the engineer in charge at Indianapolis.

DUPLEX LOCOMOTIVE STOKER

The Duplex locomotive stoker has recently been placed on the market by the Locomotive Stoker Company, Pittsburgh, Pa. This stoker is known as the Duplex type D and includes many features of the Street type C stoker. The new Duplex stoker has included in its construction a

Cab View of a Locomotive Equipped with the Duplex Stoker

crusher which will handle lump coal, reducing it to the proper size before delivering it to the firebox. This eliminates the necessity of preparing the coal before it is placed upon the tender. It will handle slack coal as well as lump. The stoker occupies little space in the cab and operates practically noiselessly. Like the Street stoker it does not occupy

any of the grate area of the locomotive, nor does it obstruct the firedoor.

The Duplex type D stoker consists of a conveyor and crushing system, an elevating system and a distributing system, the entire mechanism being driven by a simple slow speed reversing engine. The coal travels through the stoker as follows: The shoveling sheet of the tender is provided with an opening 18 in. wide extending from the coal gates

The conveyor consists of a wrought steel trough in which is the cast steel screw and the crushing plate. The trough is supported under the shovel plate by two angles riveted on each side of the conveyor conduit, which forms bearings for rollers fitted on the arms of the conveyor slide support. This support is permanently secured to the bottom of the trough about 3 ft. from its rear end, thus providing flexibility to take care of the movement between the engine and tender. The lower angle bearings extend almost to the front of the tender and form a track on which the trough rolls when being removed from the tender. The conveyor unit moves with the engine, merely resting on the angle bearings in the tender, but when the engine and tender are parted it can be uncoupled from the transfer hopper and left with the tender. An angle ring fits into and around the top of the trough, preventing dust from blowing into the tender tank and coal from rolling over the sides of the trough.

The crusher is at the front end of the opening in the tender deck, and consists of a heavy plate with projections set in a slide in the trough. The smaller sizes of coal are carried through without crushing or breaking, but the larger lumps are forced against the crusher plate by the conveyor screws and are broken to the proper size for efficient firing, and go on to the transfer hopper. The conveyor is flexibly attached to the hopper by means of a ball joint permanently riveted to the trough and fitting into clamps bolted to the back of the transfer hopper.

The transfer hopper is a large casting secured to the engine frame beneath the cab deck. Secured to the front on a pivot inside the hopper, and dividing the coal coming through the front trough opening, is a dividing rib which

Transfer Hopper and Steam Engine of the Duplex Locomotive Stoker Showing the Vane for Distributing the Coal to the Vertical Screws

to the slope sheet. The opening is covered by slides, each measuring about 20 in. in length. After passing through this opening to the trough beneath, the coal is conveyed by the conveyor screw to the crusher, where it is forced against the crusher plate by the screw and broken to a suitable size. The coal then passes to the transfer hopper, where it is di-

The Duplex Stoker as Applied to a Locomotive

vided equally or unequally according to the position of the adjustable dividing rib between the two elevators. In the elevator casings are screws which raise the coal and allow it to drop into tubes which are fitted into elbows and extend through holes in the backhead on each side of the firedoor. Constant steam jets in the elbows blow the coal through the tubes and distributors located on the inside of the firebox deflect and spread the coal over the entire surface of the fire.

can be operated through an opening in the cab deck. By turning this rib to the left or right the supply of coal to either of the vertical elevators may be controlled.

The spreading of the coal in the firebox is accomplished by means of the two firing points at the openings through the backhead of the boiler. The firedoor is left undisturbed so that it can be used for hand firing at the roundhouse and on sidings or when drifting. Two elbows, in which the firing nozzles are secured, are bolted to the elevator casing.

Distributors and tubes combined are attached to these elbows, the tubes extending through the openings in the backhead and the distributor, being on the inside of the firebox. The distributor tubes serve as a firing plate and the coal

Exposed View of the Duplex Locomotive Stoker Detached from the Locomotive

is blown through the tubes on to the underside of the distributor by jets of steam admitted to the firing nozzle. An intermittent action is secured through a constant steam jet

The driving engine consists of a cylinder of 11-in. bore with a $17\frac{3}{4}$ -in. stroke, being provided with a hollow piston rod and a reverse head. It operates on from 8 to 80 lb. of steam according to the load. In normal operation the piston has a power stroke in one direction only, namely, when the piston is traveling towards the center line of the locomotive. The stroke is cushioned at either end by steam. It is so controlled that it may be stopped and reversed at any point of the stroke by moving the operating rod located on the back head of the boiler. A horizontal and vertical rack which meshes with pinions operating the conveyor mechanism and the vertical elevators, respectively, is connected directly to the piston. The inner cylinder head is cast integral with the housing which carries these racks. The conveyor driving shaft is provided with a universal joint and a slip joint to permit the necessary motion between the engine and tender. The operation of this shaft is controlled through three sets of pawls and a ratchet. In normal operation the horizontal rack driving the pinion operates the conveyor shaft in one direction only; on the reverse movement the pawls slide over the teeth in the ratchet wheel. There are three operations which are controlled by a shifter lever. The first is the drive, or normal operation, the second is neutral, and the third is the reverse operation. Thus the conveyor may be operated in either direction or may not be operated at all while the stoker engine is running. The vertical elevator screws are operated in similar manner. They have a bearing in the bottom of the transfer hopper and in the top of the elevator casing.

The pressure of steam on the steam jet under working conditions varies from 10 to 25 lb. The distribution is regulated by varying the pressure, which is indicated by a steam gage on the backhead of the boiler, and also by changing the position of the dividing rib. The amount of coal fed can be regulated by varying the speed of the engine. Stokers of this type have been operating successfully for several months and a large number have already been ordered for application to locomotives now under construction.

RECONSTRUCTION OF THE ST. JOSEPH BRIDGE

The bridge of the St. Joseph and Grand Island, over the Missouri River at St. Joseph, Mo., is being reconstructed to provide a new substructure and a new draw span. The present bridge is a single track structure with highways supported on brackets outside of the trusses on each side.

The piers of the existing structure were built in 1872 and the superstructure was renewed on these same piers in 1904. It now develops that the substructure must be re-

Elevation of the New and Old Bridges

and the stopping of coal elevation during the return stroke of the driving engine. Peep holes are provided through which the coal supply and the condition of the fire can be observed.

newed and, as a condition for granting authority for the reconstruction, the War Department of the United States Government insisted upon a longer drawspan, giving a clear channel opening of 200 ft. on each side. This necessitates a

new drawspan of greater length and the shifting of the fixed spans to make room for it.

The erection program is briefly as follows: A 70-ft. plate girder span will be modified to operate as a temporary bascule bridge between old pier 3 and new pier 2. When this has been installed underneath the existing drawbridge, the western portion of the old drawbridge steel will be removed and the temporary bascule raised and placed in operation, highway traffic during the reconstruction being carried on the railway track. The new drawbridge will be erected parallel with the stream, being cantilevered each way and the balance being maintained by temporary steel pile bents.

A temporary trestle will be constructed under the three fixed spans which will be supported on jacks resting on standard railway trucks. When the necessary work has been completed the three fixed spans will be rolled about 136 ft. to the west, the temporary bascule dropped, the east half of the old drawbridge moved down stream on temporary supports opposite the piers, and the new drawbridge swung into place. After this, the remaining portion of the old drawbridge will be removed.

The contract for the new substructure has been let to the Missouri Valley Bridge & Iron Company, Leavenworth, Kan., and work has already started. The substructure piers are being installed by the pneumatic-caisson process. The contract for the fabrication of the new drawbridge steel has been let to the American Bridge Company but the contract for its erection has not been awarded although bids have been asked and it is expected that the contract will be let in the near future.

It is expected that the substructure will be completed in the early fall and the entire reconstruction finished early in 1918.

STATE OWNERSHIP FAILS IN SOUTH AMERICA

All the larger republics of South America at some time have tried government ownership of railways. Most of them have abandoned the policy as a failure. Why, is shown in an illuminating analysis of South American railways by Lionel Wiener, now appearing in the *Railway Gazette* of London, which is summarized as follows by the Bureau of Railway News and Statistics.

"One and all have shown the same results, owing mainly to the creeping in of politics in their management; too many employees that it has been deemed unadvisable to discharge; bad service and rolling stock that careless management has allowed to decay; construction of expensive unnecessary lines; costly exploitation, yielding an annual deficit."

Probably no quarter of the world so well as South America enables close comparison between state and private operation under similar conditions, sometimes the comparison being possible on one and the same railway. The Sobral Railway of Brazil, opened by the government in 1883, operated at a steady deficit up to October 31, 1897, when it was taken over by a private company. From the date of the transfer it has shown a handsome profit, the constant deficit having been turned to a profit even in the two months of 1897 remaining after the transfer. The Porto Alegre Railway of Brazil was operated by the government from 1883 to 1891 at a deficit. It was then taken over by a company which by 1904 had reduced the working percentage to 75.42 per cent.

Today the Central of Brazil is the principal Brazilian railway under government operation. For every \$100 of its revenues the expense of operation of this line rose from \$96.70 in 1907 to \$136.90 in 1911, dropping to \$126.20 in 1912. In 1908, while this government railway was spending \$105.50 to earn \$100 gross revenues, the three neighboring private railways spent respectively \$45.90, \$54.20 and \$56.30

for each \$100 revenue. The army of unnecessary employees is blamed for the state railway's persistent and growing deficits. "Such a system as the Central of Brazil is an excellent electioneering instrument in the hands of government," says the author, "and despite the annual deficit, not likely to be relinquished."

Chili has had a similar experience. Operating expenses of the Chilean State Railways rose from \$50 for each \$100 revenues in 1884 to \$164 for each \$100 revenues in 1907, dropping then to \$123 in 1911. Between the same years the Paulista Railway, the leading private company, increased its expenditures from \$41 to \$44 for each \$100 revenues, in one year reaching \$60, the highest attained, and in two other years falling to \$31. In 1907 and 1910 the Chilean state system contrasted as follows with the private railways in the amount spent for each \$100 gross revenues:

	1910	1907
State Railways	\$121	\$163
Tacna Arica	60	68
Iquique	47	47
Antofagasta	67	64
Taltal	54	61
Curanilahue	55	55
Paulista	45	41

Peru's record is even worse. After starting a number of costly lines the government defaulted and handed the system over for operation by the Peruvian Corporation.

Argentina, the only other South American country retaining any considerable mileage under government operation, contemplates leasing the greater portion to a private company. The northern lines cover 3,129 miles of the entire 3,482 miles government operated. A great portion of the country served is rich in sugar, maize, wine, etc., and "economically worked, there is little doubt these systems should yield fair returns. Yet their deficit has been almost continuous, which contrasts strongly with most other lines. Proposals for leasing them have been put forward and the adoption of some such step would be eminently sound."

Individual provinces of Argentina have had identical experiences. Of three provinces which have tried government ownership, two abandoned the system after a few years of deficits and handed the lines over to private companies.

DOMINICAN CENTRAL RAISES FREIGHT RATES.—The Dominican Central Railroad, which connects Puerto Plata with Santiago, a distance of 42 miles, with an extension to Moca of a further 17 miles, has raised its freight rates, effective June 18, from 10 to 25 per cent. The management has given as a reason for the increased freight rates the high cost of coal and other materials required by the railroad company.

AUSTRALIAN RAILWAY FINANCE.—It has been found necessary by the Victorian Government to engage the services of an English expert to investigate the cause of the unfavorable financial condition into which the railways of that state have lapsed. The operations of the New South Wales railways each year, for the past five years, have shown a more alarming set-back, with indications of a greater deficiency in the near future, although the traffic has been above all previous records. The results have been as follows: For the year 1911 810,948,779 ton-miles of freight and 11,915,500 passengers were carried, which realized on the railway transactions a surplus of £553,998 (\$2,692,430). This traffic increased year by year until, by the year 1916, it had reached a total of 1,028,760,504 ton-miles of freight, and 13,941,210 passengers, equivalent to an all-round increase of over 25 per cent, yet a loss of £777,747 (\$3,779,850) resulted, compared with the operations of 1911. During this period capital expenditure was increased by £17,853,698 (\$80,768,972) and £1,500,275 (\$7,291,337) extra was paid in wages—for operating the traffic—for the year 1916 to that paid in 1911.

General News Department

The American Association of Demurrage Officers has decided to hold no convention this year.

The Illinois Central has granted an increase in pay of seven per cent to its clerical employees, effective July 1.

The Missouri Pacific has granted an increase of five cents an hour to members of the shop crafts employed on the road.

The list of roads which reported subscriptions of Liberty Bonds to the Liberty Loan Committee of Railroads, as noted in last week's issue, did not include the name of the Evansville & Indianapolis. On that road 74 individuals subscribed for \$5,750 in bonds.

Edward Chambers, vice-president of the Atchison, Topeka & Santa Fe, in charge of traffic, has been appointed an assistant to H. C. Hoover, food administrator at Washington, and will act in an advisory capacity with reference to transportation matters in connection with the campaign for food conservation.

The New York, New Haven & Hartford, which has taken off 199 passenger trains, is thereby saving, each week, 2,054 tons of coal, equal to an annual saving of 106,828 tons. As two tons of coal will warm a family of five persons a long time, it is estimated that by reason of this economy of train service nearly 270,000 persons could be kept comfortable during the coming winter.

The acute shortage of freight cars has caused the Tennant-Oakland Automobile Company, Pontiac, Mich., to organize the Tennant-Oakland Transportation Company, to provide adequate means of fulfilling delivery contracts, and to supply the demand for Oakland automobiles in Chicago. The company has bought 40 freight cars, which are now being used between the factory at Pontiac and the branch in Chicago.

The Lehigh Valley on postcards mailed to consignees advising them of the arrival of freight, prints on the address side of the card in red type the following: "These are war times. We are doing everything in our power to handle the country's business. You can do your bit by moving the freight referred to in this notice just as soon as possible." Agents will supplement these notices with personal appeals whenever possible.

As the result of a movement instituted by employees of the Chicago Great Western, \$1,640 was recently collected and sent to the Great Western company of the Third Reserve Engineers, now stationed in Chicago, to provide greater comforts for the men. R. B. Parrott, passenger conductor, was chairman of the employees' committee which handled the contributions, and George Bristow, assistant general passenger agent, Chicago, was secretary.

The Chicago Car Interchange Committee has opened an office in the Transportation building, Chicago, with D. I. Forsyth, general car accountant of the Wabash, in charge. The committee is one of a number of bureaus which have been organized in all the large traffic centers of the country to assist the Commission on Car Service of the American Railway Association in bringing about the greatest transportation efficiency possible on the part of both the railroads and shippers.

The University of Louisville (Ky.) announces the opening, July 20, of a school for training telegraph operators for the Government Signal Corps. The Louisville & Nashville Railroad joins with the university in furnishing the equipment, and the school has been established at the request of the War Department. Candidates must be men between 18 and 31 years of age, and they must have no dependents. Women may attend the school for the purpose of preparing themselves to take the place of men who may be called into the national service.

Henry J. Horn, formerly vice-president of the New York, New Haven & Hartford, is one of the 12 members of the Red Cross Commission now on its way to Russia. The commission is carrying with it a quantity of urgently needed supplies and

surgical instruments, and will study conditions so as to ascertain how the American Red Cross can extend most effective relief. In co-operation with the American Railroad Commission already in Russia, the Red Cross Commission will study the problem of transportation, especially with reference to making sure that shipments of relief supplies may reach their destination without delay.

Committee meetings of the American Association of Railroad Superintendents were held at the Hotel Sherman, Chicago, on July 1 and 2. The Committee on Arrangements considered the matter of charges for spotting cars on private sidetracks. The Committee on Membership considered the following subjects: Elimination of overs and shorts; how to develop a more wholesome feeling of the public towards the railroads; and yard operation. The Arbitration Committee discussed the following subjects: How to get a better feeling from the public, thereby obtaining their assistance in loading and releasing equipment; handling of live stock to comply with federal law; railroad and highway grade crossing protection; and the inadvisability of handling carload freight on card billing.

Special Agents Convention Postponed

The International Association of Railway Special Agents and Police, which was to have held its annual convention at Omaha, Neb., on June 25, 26 and 27, did not convene on account of the war emergency. The annual meeting of the American Association of Freight Agents, scheduled to take place at Denver, Colo., on June 19, 20, 21 and 22, was also indefinitely postponed on account of the war.

United Railways of Yucatan

These lines are now a part of the Mexican Government railways, the government having acquired all of the stock of the company.

These railways were some time ago taken over by the government of the state of Yucatan from their private owners, and the name changed to the Constitutionalist Railways of Yucatan. The owners of the property are quoted as saying that they were practically forced to sell their stock to the Federal government. This system of railways covers not only the Peninsula of Yucatan, but extends also to the city of Campeche in the state of that name. It has a total length of about 530 miles.

New Santa Fe Bonus

E. P. Ripley, president of the Atchison, Topeka & Santa Fe, announced on July 1, that employees in the service of the road on December 31, 1917, will be paid an additional compensation equal to 10 per cent of their salary or wages for the second six months of the calendar year. The following employees are excepted: Those working under schedules or contracts made by collective bargaining, those whose pay equals or exceeds \$5,000 per annum, or whose total compensation for the six months in question is over \$2,500; those whose rate has been increased or who are employed during the six months' period, with the understanding that the additional payments will not be made to them.

Sir John A. F. Aspinall

John Audley Frederick Aspinall, general manager of the Lancashire & Yorkshire, is now a knight, that honor having been conferred on him by King George on his last birthday. Mr. Aspinall is a member of the Railway Executive Committee now managing the railways under the war regime. He was born in 1851. He was educated at Beaumont college, Berkshire, and his first railway service was in the shops of the London & Northwestern at Crewe. From 1875 to 1886 he was a shop superintendent on the Great Southern & Western of Ireland. In the last named year he went to the Lancashire & Yorkshire as chief mechanical engineer and he has been with that company ever since. The ex-

tensive shops of that company, at Horwich, were laid out under his supervision. He was appointed general manager in 1899. In 1907 he was chairman of the general manager's conference at the Railway Clearing House, and in 1909-1910 he was president of the Institution of Mechanical Engineers.

Prompt Release of Cars

At the Steelton plant of the Bethlehem Steel Company, Steelton, Pa., in the month of June, 7,690 loaded cars were received from the Pennsylvania and the Philadelphia & Reading railroads, and almost one-half of them were on the tracks of the Steel company less than 24 hours each. This company's demurrage bills are paid under the average agreement, and the record for June shows a surplus of 822 credits. There were no non-cancelable debits. The number of cars unloaded and returned within one day was 3,719. The cars are taken by the engines of the Steel company outside the plant, and these engines do all the spotting. The plant is about $3\frac{1}{2}$ miles long.

The Mexican Railway

This railroad, which is a British-owned property, is to be rehabilitated and placed in full control of the operating company, according to the announcement of B. E. Holloway, of London, England, who has just arrived in the City of Mexico. Mr. Holloway is director general of the railroad, and he has come to Mexico with full authority to act for the stockholders. The road extends from the capital to Vera Cruz, a distance of 264 miles, and has several branch lines with an aggregate length of about 185 miles. Mr. Holloway has held the position of secretary of the company, with headquarters in London, for several years, and his appointment as director general is expected to be followed by his removal to the City of Mexico. This road has suffered heavy damages at the hands of revolutionists and bandits during the last six years, and a large claim for losses has been presented to the government. Some time ago the property was taken over by the Carranza authorities, and it is still operated by the government, with Pauline Fontes as general manager. It is understood that as soon as the road is turned back to its owners, Walter Morcom will resume his former position as general manager. Long stretches of track and many bridges will have to be rebuilt. The rolling stock has also been greatly depleted during the long revolutionary period. The English-built sleeping cars that the line owned and operated are now scattered all over Mexico, a number of them being used as private movable homes of army officers.

I. C. C. Establishes Division on Car Service

The Interstate Commerce Commission announced on Thursday the creation of a division on car service to administer the authority over matters pertaining to car service given to the commission by the Esch-Pomerene law, which was passed by Congress in May. E. H. De Groot, Jr., formerly superintendent of transportation of the Chicago & Eastern Illinois, who will work in the exclusive employ of the Interstate Commerce Commission is to be the chief of the division. With August G. Gutheim, the examiner of the commission, who has been representing the commission in co-operation with the Commission on Car Service, he will take immediate charge of its organization and operation. H. C. Barlow, traffic director of the Chicago Association of Commerce and chairman of the executive committee of the National Industrial Traffic League, will collaborate with the division during its formative period. Chairman Hall, of the Interstate Commerce Commission held a conference with the Commission on Car Service on Wednesday and outlined to them the plans of the commission. The Interstate Commerce Commission has also announced that through the new division it will regulate car service and where occasion requires will issue orders to carriers, but that it will as far as practicable avail itself of co-operative efforts on the part of the railway committee.

The Esch-Pomerene law extends the jurisdiction of the commission over the movement, distribution, exchange, interchange and return of cars, requires the carriers to establish, observe and enforce just and reasonable rules, regulations and practices with respect to car service and the commission is empowered in its discretion to require them to file these rules and regulations in the same manner that tariffs are filed. The commission is also empowered to establish car service rules and, whenever it shall be of the opinion that necessity exists for immediate action, is

given emergency powers to suspend existing rules and to make such just and reasonable directions with respect to car service as it deems in the public interest. The law provides that the directions of the commission as to car service may be made through and by such agents or agencies as the commission shall designate and appoint for that purpose and penalties are provided for non-compliance.

Mr. De Groot was born March 22, 1871, at Galesburg, Ill., and has been in railroad service since May 13, 1886, beginning as office boy in the general freight department of the Chicago, Burlington & Quincy. After holding various positions in the office, train and yard service of the Burlington and the Chicago & Eastern Illinois, he became trainmaster of the latter road in 1902, and has since been successively division superintendent, superintendent and track supervisor, superintendent of the St. Louis division and terminals, and since November 16, 1912, superintendent of transportation of the Chicago & Eastern Illinois at Chicago.

Wires May Be Commandeered

The long pending controversy between the Louisville & Nashville Railroad and the Western Union Telegraph Company, in which the railroad seeks to compel the telegraph company to take its poles off the railroad right of way, was the subject of hearings before the Federal Court at Louisville, Ky., last week. The telegraph company presents evidence to show that the construction of new lines in the state of Alabama—the lines within that state are the ones which are now the subject of controversy—would require a long time, and also that the destruction of the existing poles and wires at this time would seriously interfere with the operations of the government on the Gulf Coast. There is a large volume of government messages to and from Mobile and Pensacola. The railroad company, on the other hand, produces affidavits to show that the telegraph business could be conducted with satisfaction to the government without using the wires along the Louisville & Nashville.

Attorney-General Gregory has written a letter to the judge of the court intimating that the government will not put up with any interruption of service, and it is understood that if there should be a prospect of disturbance of the regular currents of telegraph traffic, the government would seize the lines.

The lawyers for the Western Union asked the court to appoint a commissioner to determine how long the telegraph company could occupy the railroad premises, and what compensation should be paid to the railroad company.

The judge reserved decision and intimated that his opinion would not be handed down until September.

Trolley Car Accidents

In the derailment of a southbound passenger car on the Niagara Gorge Railroad, near Suspension Bridge, N. Y., on the afternoon of July 1, ten passengers and one employee were killed, and 26 persons were injured. A number of the victims fell into the Niagara river, and it is supposed that some were carried down stream and lost. The cause of the derailment was a weakening of the road bed. The car was moving at the rate of about 20 miles an hour.

In a butting collision of trolley cars near Monongahela, Pa., on July 2, making a bad wreck, which was run into within a few minutes by a work car, about 80 persons were injured, four of them fatally.

At Manistee, Mich., on the 4th of July, two persons were killed and 20 were injured, four of the latter fatally, when a street car was run into at a crossing by an excursion passenger train of the Manistee & North Eastern. It is said that the street car approached the crossing at uncontrollable speed, on a descending grade, having attached to it two heavy steel trailers.

In a butting collision of electric cars near Heisley, Ohio, on the 5th of July, eight passengers and a motorman were injured.

Near Youngstown, Ohio, on the 5th, a trolley car was derailed because, it is said, the brakes failed, and one passenger was killed and 20 injured. The wreck caught fire, and some of the passengers were rescued from the flames with difficulty.

At Stryker, Ohio, on the 5th, a rear collision of interurban cars resulted in the injury of 14 persons.

Near Michigan City, Ind., on the evening of the 4th, a trolley car, which was running at high speed, left the tracks on a curve and was overturned. Twenty persons were injured.

REVENUES AND EXPENSES OF RAILWAYS

FOUR MONTHS OF CALENDAR YEAR, 1917

Average mileage operated per period	Name of road	Operating revenues			Maintenance of way and equipment			Operating expenses			Net railway operating income (or loss)	Increase comp. with last year

* Succeeded by Pittsburgh & West Virginia as of April 1, 1917.

Railway Wages in England

The last increase of wages of employees on the railways of Great Britain, which is based on an agreement reached without any stoppage of work, or even a threat of stoppage by any responsible leader, will mean an addition to the payrolls of \$30,000,000 a year. It was understood that the government, which guarantees the railways a certain income, would shoulder the entire responsibility for the additional expense. The wages of male employees over 18 years of age have been increased now four times since the beginning of the war, the first increase having been granted on February 15, 1915. For those earning over 30 shillings a week, the increases have been 2 shillings, 3 shillings 5 and 5 shillings, or a total of 15 shillings. Those receiving under 30 shillings a week, have also received a total advance of 15 shillings, though it did not come in exactly the same installments. Male employees under 18 years have received a total of 7 shillings 6 pence; female employees over 18 years, 5 shillings 6 pence; and under 18 years, 2 shillings 9 pence. The females received no advance until September 16, 1916.

California Petroleum

The committee on petroleum of the California State Council of Defense has made a report to the governor, proposing plans for averting the threatened shortage in California petroleum. These plans include the immediate drilling of wells in disputed territory, the exemption from military service of skilled workmen in the oil fields, the utilization of powdered coal, natural gas, hydro-electric power and other sources of energy wherever possible and improved correlation between the oil companies, the oil pipe lines, the steamship companies and the railroads. The members of the committee (appointed by the governor in May) are: Max Thelen (chairman), Eliot Blackwelder and David M. Folsom. Mr. Thelen is the president of the California Railroad Commission.

The committee finds that production is falling behind consumption at the rate of 35,800 barrels a day, and at the present rate of consumption the entire available storage supply in California will be exhausted by June 1, 1919. Manufacturers of oil well supplies and the railroads are called upon to expedite the production and transportation of oil well casing, drill stems, wire cables and similar material. It is recommended that lands in litigation be developed either through federal receivers or through the claimants to the lands, with due regard to the rights of all parties; and that additional lands be thrown open for development by the federal government.

California petroleum plays a vital part in commerce and industry far beyond the boundaries of the state, and it supplies the Pacific Coast fuel requirements of the United States Navy and Army. The report says:

"At the present rate of production by Kern Trading & Oil Company, the Southern Pacific Company's fuel oil bureau, bearing in mind also the purchases of fuel oil by the Southern Pacific, including 1,000,000 barrels bought from Union Oil Company and not as yet drawn on, and bearing in mind also the Southern Pacific's consumption of fuel oil, the Kern company's storage of fuel oil will be exhausted by December, 1917, unless the recently initiated additional drilling operations shall increase the Southern Pacific Company's production, and unless the Southern Pacific converts to coal those portions of its system which are located in proximity to the coal fields of Washington, the Rocky Mountain states and New Mexico.

"Coal cannot be substituted for California fuel oil to any substantial extent during the war because of present difficulties in the production and transportation of coal. Approximately 1,000,000 barrels of California fuel oil will be saved in the ensuing year in the Northwest by the substitution of coal for California fuel oil by the Oregon Short Line and other industries. The Los Angeles & Salt Lake and the Western Pacific are converting a portion of their systems in Utah and Nevada from California fuel oil to coal produced in the Rocky Mountain states. The Southern Pacific and the Atchison, Topeka & Santa Fe can also gradually convert from fuel oil to coal those portions of their systems which are in proximity to the coal fields of the Northwest, the Rocky Mountain states and New Mexico.

"The legislature of California has declared that oil pipe lines are common carriers, and the question whether the statutes are constitutional has been submitted to the Supreme Court of the state of California. If the legislation is sustained the railroad

commission will have authority to supervise the lines so that they may be operated to their greatest efficiency from the point of view of the entire transportation situation. If the jurisdiction of the railroad commission is not sustained, some other means must be provided, so that the oil pipe lines may be operated to full efficiency in the present emergency.

"A more efficient correlation of the use of oil pipe lines, railroad tank cars and tank steamers would result in the release of a considerable number of railroad tank cars, which are badly needed to serve the industrial needs of California and neighboring states. The Standard Oil Company reports that it is 3,500 tank cars short at its refinery at El Segundo, and that it is accordingly unable to fill urgent orders from the copper mines of Arizona."

The Western & Atlantic

The Western & Atlantic Commission, appointed by the legislature of Georgia, has made a report to the legislature giving its conclusions concerning the Western & Atlantic Railroad, of which the Nashville, Chattanooga & St. Louis has taken a new lease to date from December, 1919. The commission recommends that the State, as owner of the railroad, shall maintain continued engineering supervision of the road and that an engineer be regularly employed. Recommendation is also made for a fixed appropriation for a secretary; and the commissioners have allowed themselves salaries of \$100 a month each, except for two members, the governor and the chairman of the railroad commission, who serve without salary. The special attorney of the commission is allowed \$5,000 salary for the year 1916. The total cost of the road and equipment, from the beginning to the date of the first lease, was \$6,275,000. Since the state first acquired its ownership, 75 years ago, no property additions have been made to the railroad; but, on the other hand, valuable terminal properties have been disposed of, both in Atlanta and Chattanooga; also at other points on the line. It is estimated that to reproduce the road today would cost \$15,508,867. The commission is of the opinion that a second main track will have to be built before the expiration of the new lease, and in connection with that improvement it will also be necessary to revise curves and grades. The estimated cost of the double tracking, bridge work, etc., contemplated by the report, is \$3,775,000. As to certain real estate in Chattanooga not now used by the lessee, the commission is convinced that sooner or later it will all be needed for railroad purposes. Two parcels of this property, worth around \$200,000, have not been included in the new lease. Certain proposals for the acquisition of property and changing location of terminals in Atlanta are rejected.

The commission presents a statement to justify its action in executing a new lease at this time, rather than to incur further delay. The general railroad situation, the prospects of federal legislation of unknown effect, and the reasonable interests of the lessee are the main factors.

The proposal to build an extension of the state road, from Atlanta eastward to the sea, is dismissed as unwise. Such a line would involve economic waste and it would not prove to be a material factor in the control of freight rates.

The Engineering Council

On June 27 was held the first meeting of the Engineering Council. This body is a department of the United Engineering Society, and has recently come into being as a medium of co-operation between the four national engineering societies. The function of the council may perhaps best be described by the following extract from the by-laws of the United Engineering Society: "The council may speak authoritatively for all member societies on all public questions of a common interest or concern to engineers." The council is composed of 24 members, five being appointed by each of the four founder societies, and four by the United Engineering Society.

At the organization meeting held in the rooms of the American Society of Mechanical Engineers on June 27 the following officers were elected: President, I. N. Hollis; vice-presidents, H. W. Buck and George F. Swain; secretary, Calvert Townley; executive committee, the four officers named with J. Parke Channing and D. S. Jacobus.

The council discussed at length ways and means by which the founder societies through the council may be of use to the

nation. The unanimous desire to help the government in the prosecution of this war resulted in a resolution instructing the executive committee to co-operate with the government in procuring the services of engineers, also the appointment of a committee of three consisting of H. W. Buck, A. M. Greene, Jr., and Edmund B. Kirby, to consider the best means of utilizing the inventive ability of members of the founders' societies.

The secretary was instructed to inform all government bureaux that might be interested in the organization of the engineering council and its desire to be of assistance.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—F. A. Pontious, 455 Grand Central Station, Chicago. Next meeting, July 18, 1917, Asheville, N. C.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—W. L. Connelly, Supt. of Telegraph, Indiana Harbor Belt, Gibson, Ind. Next annual meeting, September 11-13, 1917, Washington, D. C.

CANADIAN RAILWAY CLUB.—James Powell, P. O. Box 7, St. Lambert, near Montreal, Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 4th Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual dinner, 4th Thursday in March, Hotel Statler, Buffalo, N. Y.

CHIEF ELECTRICAL CLUB OF DIRECTORS OF RAILROADS.—FOREMAN'S ASSOCIATION.—W. R. McMunn, New York Central, Albany, N. Y. Next convention, September, 1917, St. Louis.

CINCINNATI RAILWAY CLUB.—H. Boulet, Chief Interchange Inspector, Cincinnati, 101 Carver Bldg., Cincinnati. Regular meetings, 2d Tuesday, February, May, September and November, Hotel Sinton, Cincinnati.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 568 Union Arcade Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3rd Tuesday, Pittsburgh, Pa.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

INVESTMENT BANKERS' ASSOCIATION OF AMERICA.—Frederick R. Fenton, 11 W. Monroe St., Chicago. Annual convention, October 1-3, 1917, Baltimore, Md.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meeting, 2d Tuesday in month, except June, July, August and September, Boston.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meeting, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—Geo. A. J. Hochgrebe, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.

PACIFIC RAILWAY CLUB.—V. S. Culler, Assistant to Chief Engineer, Northwestern Pacific R. R., San Francisco, Cal.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—F. C. Stewart, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, New York.

RAILROAD CLUB OF KANSAS CITY.—Claude Manlove, 1608 Walnut St., Kansas City, Mo. Regular meetings, 3d Saturday in month, Kansas City.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Pittsburgh Commercial Club Rooms, Colonial Annex Hotel, Pittsburgh.

RAILWAY FIRE PROTECTION ASSOCIATION.—C. B. Edwards, office of the president's assistant, Seaboard Air Line, Norfolk, Va. Next meeting, October 2-4, 1917, St. Louis, Mo.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Myers Bldg., Bethlehem, Pa. Next annual convention, September, 1917, Atlantic City, N. J.

RICHMOND RAILWAY CLUB.—F. C. Robinson, 100 N. Richmond St., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—P. J. McAndrews, C & N. E. Station, III. Next annual convention, September 18-21, 1917, Hotel Auditorium, Chicago.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grand Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 a. m., Piedmont Hotel, Atlanta.

TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Hotel Astoria, New York.

TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Gen'l Agt. Erie R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings bi-monthly, Pittsburgh.

TRAVELING ENGINEERS' ASSOCIATION.—W. C. Thompson, 1117 C. R. R. Bldg., Cleveland, Ohio. Next convention, September, 1917, Chicago.

UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, 1911 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.

WESTERN CANADIAN RAILWAY CLUB.—Kemp, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Monday in month, except June, July and August, Hotel Sherman, Chicago.

Traffic News

The Southern Railway has already begun running passenger trains daily between Louisville, Ky., and the cantonment which is being established by the War Department south of that city.

The Baltimore & Ohio reports that in the month of May the company's four limited trains between New York and Chicago, Nos. 5, 6, 7 and 8, arrived at final destination on time 98 per cent of their trips. Through freight train, No. 97, between New York and Chicago, arrived on time at destination 25 days during May.

Pending final adjudication of the Illinois passenger fare case, the railroads and the Illinois authorities have come to an agreement, according to which the carriers are collecting 24 cents a mile, at the same time giving coupons representing the difference between the fares at the 2-cent and the 24-cent rates. These coupons will be redeemed by the railroads if the lower rate is sustained.

The Canadian Pacific announces that during the summer season, and up to September 30, open top observation cars will be attached to the rear of four trains between Field, B. C., and Kamloops, and on two trains between Sicomous and Vancouver, for the free use of standard sleeping car passengers. The schedules have been arranged so that the entire trip through the mountains may be made in daylight.

The Public Utilities Commission of New Jersey has issued a statement replying to a complaint that the railroads have been unreasonable in their curtailment of passenger train service. The commission says that most of the complaints have been based on unwillingness to bear inconvenience which is not great. The statement justifies the railroads in diminishing passenger service in order to provide additional facilities for moving the increased freight traffic.

The movement of traffic through the Suez Canal, in 1916, amounted to 12,325,347 tons, a falling off of about three millions from the movement of 15,266,155 tons in 1915—which, in turn, was about four millions less than the total in the year preceding. The toll rates paid by vessels going through have been increased and now are about 36 per cent higher than before the war. The number of vessels passing through in 1916 was 3,110, a decrease from 1915 of 598 vessels.

The Public Service Commission of Maryland has authorized the railroads of the state to file freight tariffs showing increases substantially equivalent to those which have been or may be authorized by the Interstate Commerce Commission, in connection with its recent order, for interstate business. The Maryland commission at the same time has authorized the Pennsylvania and the Western Maryland to make certain increases in charges for storage of iron and steel articles.

The South Dakota Railroad Commission has ordered the adoption in that state of the same demurrage rules that govern interstate business. The Public Utilities Commission of Kansas has issued an order continuing in effect the demurrage rules previously in force, which provide for charges of \$1 a day per car for the first two days after 48 hours' free time, \$2 per car for the next two days, \$3 per car for the subsequent two days, \$4 for the next two days and \$5 per car for each succeeding day.

The commercial development department of the Baltimore & Ohio has begun an agricultural preparedness survey. It will cover each county adjoining the lines of the road and will show the number of acres in 1917 and 1916 planted in potatoes, beans, peas, wheat, buckwheat, oats, other grains and vegetables. It is also intended to show which of the following items has been the limiting factor in the increased production: lack of labor, cost of seed or fertilizer, character of the land, lack of equipment or limited capital.

In the Federal court at Lexington, Ky., June 23, suits were filed by the Amherst Coal Company and the Virginia-Buffalo Coal Company against the Chesapeake & Ohio Railway for

\$550,888 damages for failure to furnish coal cars sufficient to take the shipments which these companies would have sent but could not. The first-named company sues for about one-third of this amount, and the other one for two-thirds. The suits have to do with the period from December, 1915, to April, 1917, the charge being that during this period the shippers lost profits on about 300,000 tons of coal which they could have sold if they could have shipped it. An itemized list is presented showing the amounts of coal which ought to have been shipped each month. Other similar suits have been filed against this road by other coal companies in the same court.

Car Efficiency in Detail

The San Francisco committee of the Car Service Commission has issued an appeal to the public which says in part:

Shippers: Order direct, in writing, from local representatives at points of loading only the number and kind of cars suitable for your needs, together with the amount or weight of shipments. Load and furnish shipping instructions in one day; the earlier in the day the better the opportunity to get car moving. In accepting orders for shipments secure sufficient tonnage to fill completely a 60-, 80- or 100-thousand lb. capacity car, including the 10 per cent which cars may be loaded above marked capacity.

Receivers: Place your orders in quantities to provide a full carload, as above described. . . . Unload cars the day received. Quick release increases the supply available for yourself and others. . . . Loss of car space and capacity is the most serious factor today causing the so called car-shortage.

Curtailment of Passenger Service in West

The withdrawal of passenger trains from service on western roads has not been so general or as far reaching as in the East. Railroad officers state that they are prepared to take off trains as soon as the movement of troops and military supplies reaches the volume which makes such a step necessary. Up to this time the changes that have been made, except on a few roads, affect local service mainly. The Chicago & Alton recently withdrew from service trains aggregating about 1,000 passenger-miles per day. The Chicago, St. Paul, Minneapolis & Omaha removed a number of local trains from service, effective July 8, including six trains each on the eastern, northern and western divisions, and two on the Nebraska division. On July 14 the Illinois Central will discontinue two trains running between Fulton, Ky., and Memphis, Tenn. In April the Chicago Great Western took off a passenger train running between Randolph, Minn., and Mankato; one between Waverly, Iowa, and Sumner, and one between Cedar Falls, Iowa, and Cedar Falls Junction. The Wabash on June 24 discontinued a train between Montpelier, Ohio, and Buffalo, N. Y., and one between Buffalo, N. Y., and Detroit, Mich. The Atchison, Topeka & Santa Fe announces that it expects to run all of its transcontinental trains as heretofore, and orders have recently been placed with the Pullman Company for additional sleeping cars.

Long Island Traffic in Manhattan

The contract under which the Long Island uses the Pennsylvania Station, Seventh avenue, Manhattan, New York City, as its western terminal, expires on July 1, and the New York State Public Service Commission, First district, has been holding hearings on the application of the company for permission to renew the contract for one year. The Long Island pays the Pennsylvania \$810,000 for its accommodations, including track rights from Sunnyside, four miles east of the terminal, and electric current for motive power.

The basis of payment, which is the number of cars run to and from the terminal station, was questioned, but the representative of the road replied that this made little or no difference, as the compensation was much below a reasonable percentage on the cost of the railroad and terminal. The Manhattan terminal has cost the Pennsylvania Railroad \$112,000,000.

The Long Island uses seven of the 24 tracks in the station; and 70 per cent of the passengers using the station are those who leave or take Long Island trains. The Pennsylvania, carrying only 30 per cent of the passengers, brings into the station 70 per cent of all the cars. The number of passengers to and from the terminal in Long Island trains last year was 13,000,000, an increase of about 7,000,000 since 1912.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The commission has issued a memorandum to clear up a misunderstanding as to the interpretation of its decision in the 15 per cent rate case allowing increases in class rates in Official Classification territory. The decision authorizes increases in class rates applying intra-territorially and differences of opinion as to what rates are included in class rates have arisen. The commission holds that rates that are published as class rates or as specific percentages of certain class rates are "class rates," and that rates that are published in the form of commodity rates, and which do not automatically change with a change in the class rate, even if the basis of making them is a percentage of some class rate or rates, are not included in the term "class rates." Rules 25, 26 and 28 in the Official Classification are regarded as respective classes.

Commission Cannot Require Use of Special Equipment

Railroad Commissioners of the State of Florida v. Southern Express Company et al. Opinion by Commissioner Clark:

Upon complaint that the facilities for the shipment of strawberries from Florida points to various destinations in eastern trunk line territory are inadequate and defective and that the rates for transportation and refrigeration are unjust and unreasonable; the commission holds, that following the decision of the Supreme Court of the United States in *United States v. Pennsylvania R. R. Co.*, 242 U. S., 208, the commission is without authority, in the absence of undue discrimination, to order carriers to acquire equipment of a special type or to require the transportation of refrigerator cars in passenger or special trains. The rates and refrigeration charges for the transportation of strawberries from and to points involved, are not shown to be unjust or unreasonable. (44 I. C. C., 645.)

Rate Advances

The commission has given special permission to the western railroads to file supplements to their freight tariffs upon not less than five days' notice increasing rates on coal and coke by not to exceed 15 cents a ton, in accordance with its decision in the 15 per cent rate case. The order provides that such supplements may provide for a horizontal increase in rates, to the extent specified, without specifically publishing the exact rate per ton, and without strict regard to the tariff rules restricting the issuance of supplements, provided that the carriers obligate themselves to file on statutory notice new tariffs to replace such supplements. The carriers have arranged to put the new rates into effect at once.

The commission has also issued an order, in response to an application by a committee representing the carriers in official classification territory, authorizing them to establish the advanced class rates authorized by the findings of the commission in the 15 per cent case, and to continue the general rate relations existing in the present rates, without observing the long and short haul provision of the law. The supplements proposing the general 15 per cent advance, which were suspended by the commission until October 28, were promptly cancelled by the carriers in response to the suggestion of the commission in its decision.

The commission has given permission to the Southern Pacific to change on one day's notice its rates on commodities transported as all water shipments between New York and New Orleans, and between New York and Galveston, in accordance with its application of June 13, to put into effect rates which will meet the findings of the commission under the company's application under the Panama Canal Act in connection with its ownership of Atlantic steamship lines.

The commission has vacated the suspension orders in 60 cases on its investigation and suspension docket in which the carriers have filed tariffs cancelling the schedules under suspension.

C. F. A. Class Scale Rates

The Interstate Commerce Commission, in a decision by Commissioner McChord, given in 45 I. C. C., 254, has allowed the carriers to remodel their scale of class rates in Central Freight Association territory, with a view to putting them on a more consistent and in general on a somewhat higher scale than the present one. A brief abstract of the commission's decision follows:

In the commission's first report in the Five Per Cent Case, 31 I. C. C., 351, the commission found, among other things, that the class rates in C. F. A. territory were on a lower scale than elsewhere in the country and held that the carriers were entitled to the increase sought and probably more. It was pointed out that the existing class rate structure was "honey-combed with inconsistencies," and it was suggested that a general readjustment would be desirable.

The carriers thereupon proceeded to make a general revision of their rates, and after two years' work have submitted a new rate structure. The proposed new system is designed both to yield the carriers greater revenues and remove some of the inconsistencies in the present rate structure. The case, however, has no particular connection with the 15 Per Cent Case, 45 I. C. C., 303. So far as the lines in C. F. A. territory are concerned that increase was asked in addition to and built upon the rates here involved.

Considerable sentiment was manifested among the shippers at the hearing in favor of permitting the carriers the increased revenue which would be yielded by the rates in issue. This was probably why many persons believed that the carriers should have some assurance in view of the unusual conditions confronting them. It is probable; however, that there might have been some opposition had the proposal for the general increase of 15 per cent taken definite shape before the hearings in this case were concluded. The principal objection to the proposed rates was on the part of the localities which now enjoy rates designed to relieve them of some of the disadvantages of location and which are here called upon to pay rates made with a greater regard for distances and transportation conditions generally.

Owing to differences in traffic and transportation conditions, respondents in the first place propose to divide C. F. A. territory into three separate sections or zones, and to use three separate scales of rates. The principal zone embraces all the territory on and south of the line of the Michigan Central from Chicago to Detroit, through Kalamazoo and Jackson, Mich., and will be hereinafter referred to as zone "A." The two other zones are in Michigan and are to be known as zones "B" and "C." Zone B lies immediately north of zone A, and is bounded on the north by a line running from Muskegon, on the east bank of Lake Michigan, eastwardly across the state through Greenville, Edmore, Alma, Saginaw, Midland, Bay City, and Sandusky, Mich., to Lake Huron. Zone C lies directly north of zone B and includes the remainder of the southern peninsula of Michigan. The northern peninsula of Michigan, with the exception of the cities of Menominee and Manistique, is not in C. F. A. territory. Zone C also embraces, via car-ferry routes, the west bank of Lake Michigan north of Milwaukee, Wis. Respondents propose one scale of rates for general use within zone A, but two higher scales for making rates to apply between zones B and C, respectively, on the one hand, and zone A on the other. For instance, the zone A scale is to be applied from Cincinnati to Toledo, Ohio; the zone B scale from Cincinnati to Lansing, Mich., and the zone C scale from Cincinnati to Alpena, Mich. In determining the actual rates between given points, the proposed procedure is as follows: For one-line hauls of distances up to and including 70 miles, the scale is strictly applied; that is, in accordance with actual distance. But actual distance is not applied via one-line hauls of more than 70 miles or for hauls of any length over two or more lines, except between basing points. In the two latter cases rates between the various basing points are arrived at by applying the scale in accordance with actual distance, and the rate to or from any intermediate point is the same as the rate to or from the basing point next beyond—no matter how far beyond. These situations represent what the protestants call "inflations."

The commission in its findings refuses to accept the zone A and zone B scales as proposed by the carriers, but suggests new scales. Concerning these scales and its objections to the carriers'

scales, it says: "While we are convinced that, upon the whole, the proposed system of rates is superior to the present rate structure, we cannot allow it to become effective. The scales must be broken up into smaller mileage blocks, and the so-called inflations reduced by the observance of substantially actual distances on one-line hauls, and by the setting in of additional basing points for hauls over two or more lines, except to and from zone C, wherever the distance between the basing points now used exceeds 20 miles. The proposed rates, like the present rates, are preferential to short-haul traffic. The rates from Cadillac and Jennings, Mich., as applied to lumber, should be placed on the same basis as regards the relationship to sixth class, as may be contemporaneously applied from other Michigan producing points, except where competitive conditions may warrant a departure. The charging of a slightly higher basis of rates to and from zones B and C has our approval. We will not interfere with the groups as proposed, nor with the methods used in applying the scales, except as noted above. To grant the prayer of the cities adversely affected by the removal of preferences, the commission would in effect require what the act to regulate commerce was largely designed to prevent, namely, unlawful discrimination. Rate relationships long maintained may not be lightly disturbed, but where they are not justifiable as a matter of law we cannot require their continuance.

"As fully appears from the consideration discussed in this report a determination of reasonable class rates for application in C. F. A. territory must take into account numerous conditions, such as rate adjustments effective in the past and the rates now applicable to traffic between C. F. A. and trunk line territories, which tend to support a different basis of rates than that which might be found reasonable in the absence of such conditions. We find that respondents have not justified the rates named in the suspended tariffs. We further find that the scales of class rates compiled by the commission and given in Appendices Nos. 9 and 10 of the report are reasonable and may be used in lieu of respondents' scales A and B and in the same manner, subject to the modifications required by the next preceding paragraph. These scales are divided into 5-mile blocks for distances up to and including 100 miles. They then progress by 10-mile blocks up to and including 300 miles. Beyond that, 20-mile blocks are used. The zone A scale begins with 16 cents as the first-class rate for 5 miles and less. One cent is added for each succeeding block up to and including 50 miles. Beyond that, up to and including 100 miles, on the theory that the charge per ton-mile should decrease, it progresses by additions of one-half cent for each mileage block. Thence, up to and including a distance of 200 miles, it progresses by additions of 1 cent per block, or twice as much as for the blocks for the distances from 50 to 100 miles, for the reason that the blocks are doubled in size. On the theory that the charge per ton-mile should further decrease for longer distances, an increase of one-half cent per block is then used up to and including 300 miles. Beyond that, as the blocks have doubled in size, the degree of progression is doubled, 1 cent per block being observed. The rates on the lower classes are in all cases related to first class, according to the following percentages:

1	2	3	4	5	6
100	85	67	50	35	28

"We may say as a matter of information that in the Chicago-New York scale the rates for the lower classes appear to be related to the first-class rate, according to the following percentages:

1	2	3	4	5	6
100	86½	66½	46½	40	33½

"The zone B scale starts with a rate 2 cents higher on first class for 5 miles than does the zone A scale. For use to and from zone C, or subdivisions thereof, respondents may work out scales of differentials to be added to the rates in the zone B scale.

"In publishing the rates the following rule for the disposition of the fractions shown in these scales shall be observed: Fractions of less than $\frac{1}{4}$ or $\frac{2}{5}$, to be omitted; fractions of $\frac{1}{4}$ or $\frac{2}{5}$, or greater, but less than $\frac{3}{4}$ or $\frac{7}{5}$, to be shown as one-half ($\frac{1}{2}$); fractions of $\frac{3}{4}$ or $\frac{7}{5}$, or greater, to be increased to the next whole figure.

"In connection with this case, hearing was had upon applications for continuance of certain existing departures from the long-and-short-haul rule of the fourth section of the act, but they will be disposed of separately."

PERSONNEL OF COMMISSIONS

M. O. Lorenz, assistant statistician of the Interstate Commerce Commission, has been appointed acting statistician, succeeding W. J. Meyers, resigned.

W. M. Lockwood, examiner in the division of statistics and accounts of the Interstate Commerce Commission, has been appointed chief clerk and purchasing agent, succeeding Lester Sisler.

COURT NEWS

A Ten Year-Record

It was in 1907 that the State of New York, under the leadership of Governor Charles E. Hughes, passed its radical and comprehensive law for the regulation of railroads and other public utilities, abolished its old railroad commission and provided for two new commissions, one of which has to do only with New York City. This last-mentioned commission has issued a brief review of its work, which says in part:

"The Public Service Commission for the First district was ten years old on July 1. Under the powers granted by the law the commission is constructing the great dual system of rapid transit involving the expenditure of an amount between \$350,000,000 and \$400,000,000, about one-half of which is being contributed by the City of New York. This work has been properly described as the greatest single municipal transportation achievement in America. This system, including the third tracking of the elevated lines, will add 345 track miles to the existing subway and elevated rapid transit mileage, and will give New York City something more than 600 track miles of such lines, more than is possessed by any other single city in the world, and more, it is said, than all of the other cities of the United States put together. Under its regulatory powers the commission for the First district has exercised jurisdiction over stock and bond issues of corporations, and has effected a great and positive saving of human life by the enforcement of safety precautions and the installation of safety devices. It has handled many thousands of complaints from the patrons of public utilities, and has settled a large proportion of those complaints really justified, to the satisfaction of the complainants.

"The strength of the law has been demonstrated by the fact that during the ten years it has undergone very few amendments. Corporations have always fought the commission, and even today a gas company is questioning its right, in the United States Supreme Court, to direct an extension of its lines for the benefit of persons in an outlying and sparsely settled community. But the majority of the corporations have accepted its jurisdiction in a sportsmanlike spirit, and they have fallen into the habit of yielding gracefully to its orders when they fail to evade them by blandishments.

"Under the unlagging labor of the commission the dual system is nearing completion. There is a prospect that a large proportion of the most important lines will be in operation before the end of the year.

"Important results of the commission were the elimination of horse cars, additional facilities in the subways, such as steel cars, longer platforms, longer trains, new means of ingress and egress, and signal control in subway operation by which the greatest number of trains can be safely operated in the least amount of time.

"Because of the transit bureau maintained by the commission with a large force of inspectors, the public utility corporations find it difficult to maintain for any length of time any method of conducting their business that threatens the public welfare.

"Through its electrical engineer, its gas engineer, and its bureau of gas and electricity the commission has performed extremely important work in connection with the rates charged and the quality furnished. Important reductions in rates have already been made.

"There are in the city some 400 grade crossings on high speed railroads. Their elimination is an extremely costly proposition, but the commission has undertaken the task by beginning the elimination of some of the most dangerous of them, and there are to date eliminated or in process of elimination forty-two of the worst crossings, involving a total expenditure of \$4,211,000."

Excessive Damages for Wrongful Ejection

A passenger boarded a train at Gower, Mo., to go to St. Joseph, 20 miles away, without having had time to buy a ticket. The lawful rate of fare was 2 cents a mile, and he tendered 40 cents to the conductor, who refused it and demanded 60 cents, or 3 cents a mile. The passenger refused to pay this rate and was ejected half or three-quarters of a mile from the station, to which he had to walk back. Some time prior to this the Supreme Court of the United States had dissolved the injunction which the railroad had obtained against the enforcement of the two-cent fare law. In an action against the company the passenger claimed actual and punitive damages grounded on the conductor's manner and conduct towards him. The conductor took the passenger by the arm and led him to the door of the car, but there was no scuffle. The evidence conflicted as to whether the conductor swore. The jury returned a verdict of \$5 actual and \$500 punitive damages. The trial court, accepting the jury's view that some punitive damages should be allowed, thought the award excessive and offered the plaintiff an opportunity to take \$100 punitive damages. This the plaintiff refused, and on appeal the Kansas City Court of Appeals affirmed the judgment of the trial court granting a new trial.—*Smith v. Atchison, T. & S. F.* (Mo.) 194 S. W. 71. Decided April 2, 1917.

Putting Off Passenger at Wrong Station—Excessive Damages

A minor passenger 16 years old was told by a train employee that her station was reached and he assisted her from the train at the wrong station. The train left before she could board it again. The station agent took her to his house, where she spent the night and next day she was carried to her destination by another train. In an action for damages the Mississippi Supreme Court held that an award of \$500 was excessive and reduced it to \$200.—*Yazoo & M. V. v. Duke* (Miss.), 74 So., 693. Decided March 26, 1917.

In another case in the same court it appeared that a female passenger was set down at the wrong place and had to walk something like half a mile to the station in the rain. The court held that a verdict in her favor for \$750 was grossly excessive and should be set aside and a new trial ordered unless the plaintiff consented to a remittitur of \$650, in which case she should have judgment for \$100.—*Case v. Yazoo & M. V.* (Miss.), 74 So., 773. Decided April 9, 1917.

A passenger, a farm hand, who had almost reached his majority, was wrongfully ejected from a train on a dark night in July and compelled to walk 20 miles to his destination next day. He was made sick by a cold and rendered unable to work for about a week. The Springfield Court of Appeals (Mo.), held that a verdict of \$750 was excessive and a new trial was ordered unless the plaintiff would remit \$400 of that amount.—*Davis v. Lusk* (Mo.), 190 S. W., 362.

Proof of Cause of Fire

In an action for damages for the destruction of a shed and certain hay and straw, it was alleged that the property was negligently set on fire by "coals of fire" from the defendant's engine. The plaintiff asserted that all that it is necessary to prove in the jurisdiction of Utah is that the fire was caused by an engine, and from that fact it may be inferred that the fire was negligently set. The Utah Supreme Court, however, held that the question always is, How is the fact established that an engine caused the fire in question? In no case in any court where the matter is not covered by statute has it been held that all that is necessary to prove is that an engine passed certain premises, and that a fire was discovered on those premises a short time thereafter. It is universally recognized that there must be some evidence from which it may legitimately be inferred that the fire in question was caused by the passing engine and not by some other agency. To establish the probability that the engine in question caused the fire, the plaintiff may show that the engine, at the time the fire was set, cast out live sparks, or that it set fire to the dry grasses, or otherwise; and to strengthen the probability that engines do set fires, it may also show that other engines of the defendant did the same thing within a reasonable time both before and after the fire in question. When these facts are shown, the jury may infer that the fire was caused by the engine. It is important to keep in mind, however, that railroad companies are by law

permitted to operate their engines by means of fire; and also that it is possible that engines may cause fire without negligence. It is necessary, therefore, to prove: (1) That the fire in question was caused by an engine of the defendant; and (2) that it was negligently caused. Negligence may be inferred if it is shown that the engine caused the fire, but until that is shown by the exclusion of other agencies, there can be no inference of negligence.—*Gleason v. San Pedro, Los Angeles & Salt Lake* (Utah), 164 Pac., 484. Decided April 4, 1917.

Rebelling Interstate Shipments

In an action for damages for injury to live stock during transportation from West Plains, Mo., to Princeton, Kan., the principal question was whether or not the shipment was interstate. The court stated the facts as follows: "West Plains is a station on the Frisco; Princeton is a station on the Santa Fe. The plaintiff loaded an emigrant car with household goods and horses at West Plains, and billed the car to Kansas City, Mo., over the Frisco. The car was there delivered to the Santa Fe and was rebilled by the Santa Fe to destination. The Santa Fe billing read from Argentine, Kan., to Princeton. Argentine is separated from Kansas City by the line between the two states, but the Santa Fe yards at Argentine extend into Kansas City (Mo.). The car was placed on the Santa Fe tracks by the Frisco. The car, in fact, passed in course of continuous transportation, without unloading, from West Plains to Princeton. The plaintiff testified that the Frisco agent at West Plains would not bill the car to any place in Kansas unless the horses were inspected. In order to avoid inspection the plaintiff billed the shipment to Kansas City, intending to drive the horses from there to Princeton. On the way to Kansas City, or when the car arrived there, he changed his mind, and after inspection, the horses went on in the car with the household goods. The horses were injured while on the line of the Santa Fe. The trial court allowed the jury to determine the character of the shipment, under an instruction that they might find it was not interstate if they found the plaintiff's original intention was to ship the horses by rail to Kansas City and then drive them to Princeton. The jury found the shipment was not interstate." Judgment for the plaintiff was reversed, on appeal, by the Kansas Supreme Court for the following reasons:

The only conflict in the evidence was whether the Frisco, when it placed the car on the Santa Fe tracks, left the car on the Kansas side, or the Santa Fe's switch engine which picked up the car crossed the state line to get it. The court did not regard this matter as material. It is well settled that the essential character of commerce, as disclosed by all the facts, and not its incidents, such as local or through bills of lading, determines its character as interstate or otherwise. In this instance, Kansas City was at no time the destination of the horses any more than it was the destination of the household goods in the same car. All the articles in the car were destined from the beginning for Princeton. To avoid the burden of inspection, the plaintiff at first intended to change the method of transporting the horses on arrival at Kansas City, but with the exception that the horses were to be unloaded there for driving, all the property placed in the car started on a continuous journey, not to Kansas City, but to Princeton. On the way to Kansas City, or on arrival there, the plaintiff concluded not to substitute driving for railroad transportation, and the car with its original contents proceeded uninterruptedly to its previously determined destination. The necessary rebilling was a mere incident to the shipment as to both the horses and the household goods. In taking the car from the Frisco the Santa Fe was apprised of the fact that it was completing a shipment originating on that road. To hold that the Santa Fe billing was an independent, intrastate matter would open the way to evasions which would deprive Congress of control over interstate commerce.

The bills of lading of both railroads required an action to be commenced within six months. This was not done. There was evidence of conduct on the part of Santa Fe employees which under local rules might have amounted to a waiver of the limitation. Since the shipment was interstate, however, the railroad could not waive the provision.—*Easdale vs. A. T. & S. F.* (Kan.), 164 Pac. 164. Decided April 7, 1917.

Equipment and Supplies

LOCOMOTIVES

THE BOSTON & MAINE is reported as contemplating the purchase of locomotives.

THE FORT SMITH & WESTERN has ordered 2 Consolidation locomotives from the Baldwin Locomotive Works.

THE ST. CLAIR REFINING COMPANY, Chicago, has ordered one six-wheel switching locomotive from the American Locomotive Company.

THE ATCHISON, TOPEKA & SANTA FE has ordered 30 Mikado locomotives from the Baldwin Locomotive Works for January delivery, and has reserved space for an additional 70 locomotives for 1918 delivery.

THE KURE NAVAL YARD of the Imperial Japanese Navy has ordered 3 four-wheel tank locomotives from the American Locomotive Company. One of the three locomotives will weigh 97,000 lb., and other two 42,000 lb. each.

FREIGHT CARS

THE SHELL COMPANY, Los Angeles, Cal., is in the market for 50 to 100 tank cars.

PHELPS, DODGE & CO., New York, have ordered 250 gondola cars from the Standard Steel Car Company.

THE UNION RAILROAD has ordered 1,500 70-ton hopper cars for the H. C. Frick Coke Company from the Ralston Steel Car Company. The Union Railroad was also reported in an unconfirmed item in the *Railway Age Gazette* of June 29 as having ordered 1,000 cars from the Greenville Steel Car Company; this item was incorrect.

IRON AND STEEL

THE GREAT NORTHERN has ordered 270 tons of bridge steel from the Wisconsin Bridge Company.

SIGNALING

THE ATCHISON, TOPEKA & SANTA FE has ordered from the Union Switch & Signal Company 49 one-arm signals—three-position double case, 2-phase A. C. Style "S," which will be installed by the railroad company on the Goffs-Bagdad division.

THE PHILADELPHIA, BALTIMORE & WASHINGTON has ordered from the Union Switch & Signal Company an electro-mechanical interlocking machine to be installed by the railroad forces at Harrington, Del. The machine will have 17 mechanical and 6 electric working levers.

THE PHILADELPHIA & READING has ordered from the Union Switch & Signal Company a type "F" electric interlocking plant to be put in at Skillman, N. J. The interlocking machine, model 14 d. c., will have 13 switch and 15 signal levers. The track circuits for this interlocking will be a c.

THE LOUISVILLE & NASHVILLE is to install automatic block signals on its line between Montfort, Nashville and Corbin, and La Follette, Tenn. Thirteen Style "S" low voltage ground signals and auxiliary apparatus will be required and are to be supplied by the Union Switch & Signal Company.

THE BUFFALO, ROCHESTER & PITTSBURGH is to install an electric interlocking machine near DuBois, Pa., with a machine having 11 working levers and 5 spare spaces; also, at other places, three mechanical interlockings. The General Railway Signal Company furnishes the material and will install the electric apparatus.

AERIAL MAIL FROM ITALY TO SICILY.—Aerial mail service was inaugurated on June 27 in Sicily. An airplane which left Naples at 604 a. m. arrived at Palermo three hours later, returning to Naples in the evening with Sicilian mails.

Supply Trade News

Charles B. Yardley has been elected president of Steel & Iron Mongers, Inc., with offices at 796 Broad street, Newark, N. J.

Murray Shipley has sold his entire interest in the Lodge & Shipley Machine Tool Company, Cincinnati, and has severed his connection with that company.

At a meeting of the board of directors of the American Locomotive Company, held June 21, L. A. Larsen was appointed assistant comptroller, effective July 1.

Willard Doud, consulting engineer, Old Colony building, Chicago, Ill., has closed his office temporarily to accept a commission as lieutenant, junior grade, in the United States Naval Reserve. He has been assigned to active service at the Naval Training Station, Great Lakes, Ill.

Charles S. Clark, formerly sales agent of the Pennsylvania Steel Company at Boston, has been elected first vice-president and general manager of the Laconia Car Company, and will make his headquarters at Laconia, N. H., where the business of the company will be transacted hereafter.

Daniel A. Wightman, formerly general manager of the Pittsburgh Locomotive Works, died at Warren, R. I., July 6. Mr. Wightman was born at East Greenwich, R. I., in 1846. He was educated in the public schools of that town, and after a course in an evening school in Providence, entered the employ of the Rhode Island Locomotive Works as a draftsman. In 1876 he went to the Pittsburgh Locomotive Works as superintendent. He later became general manager and held that position when he retired in 1902.

Harrison Arms, president and founder of the Arms Palace Horse Car Company, Chicago, died at his country home at Marshall, Mich., on July 5. While engaged in the livery business at Toledo, Ohio, he conceived the idea of equipping railroad cars to carry horses in a safe and humane way by providing each horse with a separate stall and adequate feeding and watering facilities while in transit. He later invented and patented the "Arms Palace Horse Car," embodying all of these features, and in 1885 organized and incorporated the Arms Palace Horse Car Company, of which he was elected president, which position he actively filled until his last illness.

David A. Munro, formerly manager of the J. N. Johns Manufacturing Company, has accepted a position with the Railway Specialties Corporation, New York, and will take active charge of that company's railroad department. Mr. Munro was born in Scotland. He came to this country in February, 1907, and in October of the same year entered the auditor's office of the Metropolitan Street Railway in New York. He was later assistant to the auditor of the Second Avenue Railroad of New York, and was shortly afterwards appointed purchasing agent to the receiver in addition to his other duties. On December 1, 1916, he resigned to enter the supply field as manager of the J. N. Johns Manufacturing Company.

Oden H. Wharton, formerly assistant to the president of the Crucible Steel Company, has been elected president of the company. Mr. Wharton was born at Easton, Pa., and received his schooling at that place. His first business association was with Park Brothers & Co., Ltd., at that time operating the Black Diamond Steel Works in Pittsburgh. He started as office boy, then became billing clerk and finally a salesman. Later he was connected with the sales department of the Park Steel Company in Cleveland and other cities. He went to Boston for some years as representative of the Park Steel Company, and later of the Crucible Steel Company of America, and was finally appointed general manager of sales of the latter company, with headquarters at Pittsburgh. After holding this position for several years his health failed, and he was succeeded by Renben Michener, the present general manager of sales. Mr. Wharton traveled in Europe for a year or more, and, regaining his health, was appointed assistant to President Charles C. Ramsey, of the Crucible Steel Company, who died recently.

American Car and Foundry Company

The American Car and Foundry Company in the fiscal year ending April 30, 1917, had earnings from all sources of \$17,522,909. After deducting from this \$7,212,037 for renewals, replacements, repairs, new patterns, flasks, etc., and the cost of special equipment for the production of munitions, there was left net earnings of \$10,310,872. The surplus for the year, after the deduction of dividends and reserves, was \$1,010,872, and the total surplus at the close of business on April 30, 1917, was \$26,820,965, as compared with \$25,810,094 on April 30, 1916.

The annual report to the stockholders, submitted by President W. H. Woodin, says in part: "The close of your fiscal year saw the United States at last drawn into the great conflict of nations that for almost three years has been devastating the earth, and witnessed the beginning of that marshaling of our national resources and industries which it is to be hoped will speedily prove the decisive factor in the great struggle.

"Your company was among the first to place its facilities unreservedly at the disposal of the government, to be put to such use as might best suit the national needs. Already some portion of the work which our country has taken upon itself as its part in the righteous war in which we are engaged, has been allotted to your company, and it is a fair assumption that we shall hereafter be called upon to play an increasingly greater part in the struggle that lies before us. Our government, and the stockholders, may be assured that this company will give of its best—in experience, in organization, in production—to insure the making of that lasting peace short of which the United States and its allies will not stop.

"From the viewpoint both of operations and results, the year has been a satisfactory one. The performance of your company in the production of munitions has been gratifying not only as to quality but also with respect to volume and speed of production, and has not been excelled by any other company in the United States. The representatives of the governments for which your company has been producing munitions have been unstinted in their expressions of approval of its organization and methods. The experience acquired in this branch of industry will without doubt prove of very great value to our government, enabling your company quickly and economically to meet what promises to be a very large demand for such supplies.

"A fair share of the year's earnings resulted from the conduct of your company's ordinary business in the manufacture and sale of cars and miscellaneous supplies. Material costs have been high and are likely to continue so. This, together with the increased cost of operating, coupled with an inability to obtain a corresponding augmentation of revenue, makes it growingly difficult for the railroads to finance the purchase of new equipment in quantities sufficient to meet the normal traffic requirements of the country. The need of means of transportation, both for domestic and foreign use, is so great, however, that it is reasonable to expect that, with the advent of more propitious conditions, your company's facilities for this line of production will continue in fair demand.

"At the close of the year your company had on its books for construction a greater number of cars than at the beginning."

The general balance sheet follows:

ASSETS	LIABILITIES
Property and plant acct. \$66,782,533	Preferred stock \$30,000,000
Current assets	Common stock 30,000,000
Materials on hand... 19,211,221	Current liabilities—
Accts. and notes recy. 17,713,438	Accts. payable, etc.... 16,225,942
Stocks and bonds of other companies 968,243	Dividends (pay. July 3, 1917) 625,000
Cash 6,017,220	Reserve accounts
\$110,692,655	For insurance 1,000,000
	For gen. overhauling (m. and mainte.) 2,620,748
	For dividends 2,400,000
	For bup. working conditions of emp.... 500,000
	Surplus account 26,820,965
	\$110,692,655

John Sherman Hoyt and W. C. Dickerman have been elected directors of the company, succeeding Thomas H. West and W. N. McMillan, respectively.

TRADE PUBLICATIONS

BOILER KOTE.—The Boiler-Kote Company, Chicago, in a 16-page booklet, details the advantage of using Boiler-Kote in boilers, and shows how it is used to secure the desired results.

Railway Construction

ALABAMA, FLORIDA & SOUTHERN.—W. S. Wilson, vice-president and general manager of this road, has bought a line running from Cowart, Ala., southwest to Cottonwood about 9 miles, and work is now under way on a connection from this line at Cottonwood east to a point on the Alabama, Florida & Southern about 15 miles. A line is also being built from the present southern terminus of the A. F. & S. at Malone, Fla., south to Greenwood, 6 miles. These new lines will be completed by October 15, and will then be sold to the Alabama, Florida & Southern.

ATCHISON, TOPEKA & SANTA FE.—This company has awarded a contract to the Cresmer Manufacturing Company, Riverside, Cal., for the erection of buildings at its car shops at San Bernardino, including a one-story refrigerator car repair shed, 46 by 1,200 ft.; a one-story blacksmith shop, 50 by 385 ft., and a one-story car repair shop, 46 by 310 ft. The cost of these improvements will approximate \$60,000.

CANADIAN PACIFIC.—This company is spending \$75,000 to re-ballast its line between London, Ont., and Windsor. The road will also spend approximately \$185,000 to lengthen sidings and strengthen bridges between London and West Toronto in order that heavier power may be used on this sub-division.

CHICAGO, MILWAUKEE & ST. PAUL.—This company is drawing preliminary plans for a passenger depot at Tacoma, Wash., the construction of which will not be started this year.

CHICAGO, ROCK ISLAND & PACIFIC.—A contract has been awarded by this company to the Railroad Water & Coal Handling Co. for the construction of a wooden coaling station of 500 tons capacity at Trenton, Mo. The road has also let a contract for the building of a reinforced concrete dam at Kingfisher, Okla.

CHICAGO SHORT LINE.—This road, which serves several industries in the Calumet district of Chicago, has purchased land upon which a roundhouse and coaling station will be erected. No detailed information concerning the construction of these improvements is available at this time.

DALLAS-SOUTH WESTERN TRACTION.—This company will construct an interurban line from Dallas, Tex., west to Irving, and then south to Cleburne, a distance of 59 miles. A contract has been let to the Creek Construction Company, Sapulpa, Okla., for the grading, track-laying and bridge work. The road will soon be in the market for ties, rails and equipment. F. R. Perkins, 303 Gaston building, Dallas, is the engineer in charge.

ERIE.—This company is building yard tracks between a point two miles west of Marion, Ohio, and a point four miles west of Marion. The work will involve the realignment of one main track and the building of one 50-ft. single-track bridge; one 50-ft. four-track bridge; one 45-ft. single-track bridge, and one 85-ft. single-track bridge. A contract has been let to the Robert Grace Contracting Company, Pittsburgh, Pa., for the sub-structures. The work on the super-structures will be carried out by the railroad forces. The total estimated cost of the improvements is \$550,000.

GULF, COLORADO & SANTA FE.—This company, in conjunction with the Southern Pacific Lines, the Galveston & Houston (electric) and the county have awarded a contract to the Larkin & Sangster Company, Buffalo, N. Y., for the construction of concrete arch extensions to be built on both ends of the present Galveston (Tex.) causeway. The total length of the new construction will be about 5,900 ft. From the Galveston end it will cover 2,240 ft., and from the main land at Virginia Point 3,600 ft. The section of the arches, including the draw-bridge, that withstood the storm is 2,446 ft. long. There will be 51 new arches on the main land end, and 28 new arches on the Island of Galveston end, a total of 79 arches, each having a span of 60 ft. The arches will rest on piers supported by concrete piles driven into the clay. The Concrete Steel Engineering Company, New York, which designed the arch portion

of the original causeway that weathered the storm successfully, has been retained to design the extensions. The total cost of the work is not to exceed \$1,725,000.

GULF, PLAINVILLE & NORTHERN.—This company will build a line from Great Bend, Kan., north to Hoisington, Galacia, Hays City, Plainville, Wester, Edmund and Norton, approximately 150 miles. It will also build a branch line from Plainville northeast to Laton, Covert and Osborne, approximately 50 miles. A contract has been let to the Imperial Promotion & Construction Company, Osborne, Kan., who will buy all equipment, and do all sub-letting. Work on grading will commence about June 15.

ILLINOIS CENTRAL.—This company has let a contract to L. J. Smith Contracting Company, Kansas City, Mo., for the construction of a line from Dawson Springs, Ky., to Providence, a distance of 17½ miles. About 600,000 yd. of grading will be necessary, a large portion of which is rock. A contract has also been awarded to the Walsh Construction Company, Davenport, Iowa, for grade reduction and line revision on the road between Scottsburg, Ky., and Dawson Springs, a distance of 11½ miles. The work will involve 700,000 yd. of grading, a large portion of which is rock, and also the construction of a 75-ft. span and approach trestle over the Tradewater river.

MEXICAN ROADS.—J. W. McRae, of Joliet, Ill., owner of a timber tract of 75,000 acres situated in the Sierra Madre mountains of Mexico, about 40 miles southeast of Douglas, Ariz., proposes to build a railroad from Douglas to the scene of the proposed lumbering operations. Mr. McRae expects to find a market for his lumber at the mines and other industries of Arizona and New Mexico.

NORTHERN PACIFIC.—This company is enlarging its division yards at Livingston, Mont., by adding five miles of additional tracks. The increase of the yard necessitates the abandonment of the present storeroom facilities and the construction of a new two-story storehouse 50 by 200 ft., a storehouse platform 70 by 500 ft., and a reinforced concrete oil house 30 by 50 ft. The track work, together with store facilities and other changes, will cost approximately \$110,000. The work is being done by company forces, and is to be completed by September 1.

PENNSYLVANIA LINES WEST.—This company will build an addition to its shops at Columbus, Ohio, consisting of a tank shop, a machine shop, a boiler shop, and a flue shop. The tank shop will be 40 ft. high, 95 ft. wide and 300 ft. long; the machine shop, 60 ft. high, 100 ft. wide and 220 ft. long; the boiler shop, 40 ft. high, 143 ft. wide and 170 ft. long; and the flue shop, 20 ft. high, 83 ft. wide and 108 ft. long. The buildings will be of brick and steel construction, and the cost, including equipment, will be approximately \$1,000,000. Work will not be started until fall.

PENNSYLVANIA RAILROAD.—This company is now building a tank and cab shop at Juniata shops, Altoona, Pa. It is to be a one-story building, 82 ft. by 300 ft., of structural steel and brick construction. The work is being done by the railroad company's forces, the structural steel work having been ordered from L. F. Shoemaker, Pottstown, Pa.

This company has given a contract to A. L. Anderson & Bros., Altoona, Pa., to build about 9 miles of line along Ten-Mile Creek from Champion, Pa. (formerly Besco), southwest towards Waynesburg, to a point just below Jefferson.

PHILADELPHIA & READING.—Plans have been completed for a bridge to be built on Greenwood avenue over the P. & R. tracks at Hopewell, N. J. It is to be a through plate girder highway bridge, with concrete floor paved with asphalt, with a clear width of roadway of 24 ft. and two sidewalks 7 ft. each. The bridge will span four tracks, and the work will be done under the grading and masonry contract with John A. Kelley & Co., which was awarded over a year ago.

VIRGINIAN RAILWAY.—Contracts have been let to the Rinehart & Dennis Company, Charlottesville, Va., for the grading, and to the Virginia Bridge & Iron Company, Roanoke, Va., for steel bridges in connection with double tracking work now under construction, from Bud, W. Va., Mile Post, 371.5, easterly 5 miles. The maximum grade will be 2.07 per cent and the maximum curvature 12 degrees. There will be three steel bridges to have a total length of 1,125 ft. The track laying will be carried out by the railroad company.

Railway Financial News

BOSTON & MAINE.—The \$100,000 first mortgage 4½ per cent bonds of the Peterborough & Hillsborough, a subsidiary of the Boston & Maine, which matured July 1, were technically extended for two years under authority of the United States District Court at Boston. Receiver Hustis of the Boston & Maine was given authority to purchase and hold in the treasury such of these bonds as holders desired to turn in.

CANADIAN NORTHERN.—Wm. A. Read & Co. have sold an issue of \$2,700,000 Canadian Northern one-year secured gold notes. These are to refund an issue of \$3,000,000 notes coming due July 10, and will have the same collateral as under that issue, consisting of first mortgage bonds of the Canadian Northern Railway, guaranteed as to principal and interest either by the Dominion of Canada or the Canadian Provincial governments.

PETERBOROUGH & HILLSBOROUGH.—See Boston & Maine.

TENNESSEE CENTRAL.—At the fourth attempt to sell this road on July 2, no bids were received, and the sale was adjourned until October 22. Judge Sanford, of the U. S. Circuit Court at Knoxville, Tenn., has appointed H. W. Stanley, formerly assistant general manager of the Seaboard Air Line, co-receiver with W. K. McAlister. Mr. Stanley succeeds H. B. Chamberlain, resigned.

TOLEDO, PEORIA & WESTERN.—Judge H. O. Humphrey in the U. S. Circuit Court at Danville, Ill., has appointed E. N. Armstrong receiver. This action was instituted by the Farmers' Loan and Trust Company, of New York City, trustees of the bondholders, on the failure of the railway to pay either interest or principal on the bonds July 1. The company holds \$4,895,000 first mortgage bonds against the railway. The bondholders' committee, consisting of Thomas Denny, Adrian Iselin and Henry K. McHarg, have requested holders of the above-named issue to deposit their bonds with the Farmers' Loan and Trust Company in order that protective measures may be taken by it.

WHEELING & LAKE ERIE.—At a meeting of the board of directors, Carl K. Gray, president of the Western Maryland, was elected chairman of the board, succeeding L. F. Loree, resigned. M. C. Byers and Bertram Cutler were elected directors to succeed H. H. Porter and Johnston De Forrest, resigned.

GERMAN RAILWAYS IN CHINA.—Germany has constructed two railways in China, the Shantung Railway and the northern section of the Tientsin-Pukow Railway, both of which are in the province of Shantung. The first is 284 miles in length, and was built with German capital for a German company, and opened for traffic in 1904. It connects the once-German port of Tsingtau with the capital of Shantung, province Tsinanfu.

SWEDISH RAILWAY DIFFICULTIES.—In order to secure the fullest possible utilization of its rolling stock, a special transport bureau has been set up in Sweden. The duties of this bureau are to allocate cars to consignees, and it has the power to prohibit the supply of cars to persons and firms who have not obtained its official authorization. Special arrangements have also been made to insure the best use being made of the locomotive stock, and to this end a system of close co-operation between the mechanical and operating departments has been introduced. The State Railways administration has also demanded Parliamentary sanction to spend £90,000 (\$4,665,600) for acquiring 60 locomotives and 600 freight cars. But, as in the case of the French and German railways, the Swedish administration has discovered that there is a great difference between giving orders and accepting delivery. Another Swedish difficulty is the serious coal shortage. Drastic remedies have had to be adopted to cope with all these handicaps. There have been temporary suspensions of freight traffic on the State lines, and passenger train-mileage, which was recently reduced by 12,750 km. (7,923 miles) a day, is being cut down still further. The company-owned lines have been asked by the Government to adopt similar measures.

Railway Officers

Executive, Financial, Legal and Accounting

H. G. Kelley, vice-president of the Grand Trunk, has assumed the duties of E. J. Chamberlin, president, who has been granted a three months' leave of absence.

E. D. Hogan, general manager of the Gulf, Mobile & Northern at Laurel, Miss., has been appointed vice-president and general manager, with headquarters at Laurel.

Herbert R. Wheeler has been appointed assistant treasurer of the St. Johnsbury & Lake Champlain, with office at Boston, Mass., vice Charles H. Nowell, resigned.

Marcus L. Bell, general solicitor for the Chicago, Rock Island & Pacific, with headquarters at Chicago, has been elected general counsel, with the same headquarters. Mr. Bell was born at Pine Bluff, Ark., on January 11, 1880, and received his education at the University of Arkansas and the University of Chicago, graduating from the latter school in 1903. He entered railway service on June 27, 1904, as private secretary to the chairman of the executive committee of the Chicago, Rock Island & Pacific, with headquarters at New York. On January 1, 1905, he was promoted to assistant attorney at Chicago, and on November 1, 1906, became local attorney at the same place. On August 1, 1909, he was appointed assistant general attorney, and on April 1, 1910, was promoted to general attorney. On May 1, 1914, he became general solicitor, which position he held until his recent election by the board of directors as general counsel of the same road as above noted.

M. L. Bell

A. G. King, superintendent of the Canton Railroad at Canton, Md., has been appointed vice-president and general manager, and P. B. Luke has been appointed superintendent.

P. L. Fisher, assistant controller of the American Locomotive Company, with headquarters at New York, has been appointed general auditor of the Elgin, Joliet & Eastern, with headquarters at Chicago, succeeding F. W. Sutton, resigned.

Mongin B. Nichols, auditor of traffic of the Central of Georgia at Savannah, Ga., has been appointed auditor; William A. Rooks, auditor of disbursements at Savannah, has been appointed auditor of traffic, and Merle F. Harden, cost accountant at Savannah, has been appointed auditor of disbursements.

E. R. Dickenson, auditor of disbursements of the Denver & Rio Grande at Denver, Col., has been appointed general auditor, vice E. R. Murphy, retired on pension. The office of auditor of disbursements has been abolished, and all communications in connection with that department should in future be addressed to the general auditor.

William B. McKinstry, auditor of the Central of Georgia at Savannah, Ga., has been appointed controller of the Central of Georgia, the Wadley Southern, the Louisville & Wadley, the Sylvania Central and the Ocean Steamship Company, succeeding W. D. Beymer, resigned to go to another company. Mr. McKinstry was born on December 9, 1873, and began railway work in 1888, with the Michigan Central, at Chicago. He subsequently served on the Illinois Central, at Chicago, and in May, 1903, went to the Central of Georgia as a claim investigator.

He later served consecutively as traveling auditor, freight claim agent and then as auditor of the same road, which position he held at the time of his recent appointment as controller, as above noted.

H. W. Stanley, assistant to the chairman of the Commission on Car Service, at Washington, D. C., and formerly assistant to the president of the Seaboard Air Line, has been appointed a receiver of the Tennessee Central, with headquarters at Nashville, Tenn. Mr. Stanley was born on February 13, 1874, at Petersburg, Va., and after a grammar and high school education entered railway service in May, 1890, with the Norfolk & Western. He was consecutively telegraph operator, stenographer and chief clerk, and in 1895 became chief clerk to the superintendent of the Southern at Knoxville, Tenn. In 1897 he became secretary to the general superintendent of the Seaboard Air Line, and was later trainmaster, superintendent, superintendent of transportation, assistant general superintendent, general superintendent of transportation, and assistant general manager. In 1913 he was appointed general manager of the road, and on April 1, 1914, was appointed assistant to the president. He left the Seaboard Air Line on June 1, 1916, to engage in special work for the National Conference Committee of the Railways and the American Railway Association, and for the past several months has been assistant to the chairman of the Commission on Car Service at Washington, D. C.

H. W. Stanley

Charles Allen Goodnow, recently appointed vice-president of the Chicago, Milwaukee & St. Paul, has been in railway service for nearly half a century, and is well known as the man who has been in charge of the greatest railroad electrification project so far undertaken. This work, outlined in considerable detail in the *Railway Age Gazette* of February 2, 1917, is remarkable for the rapid progress made and the results achieved in a relatively short period. The contracts for equipment and material for the first unit of the project, the line between Three Forks, Mont., and Deer Lodge, were awarded in November, 1914. This was the first step in a scheme involving the electrification of 440 miles of main line between Harlowton, Mont., and Avery, Idaho. In November, 1915, overhead construction had been completed for a distance of 200 miles, and the 100,000-volt transmission line, which was erected by the railroad on its own right of way, had been completed for an equal distance, and the lines from the Montana Power Company were ready for service. The first of forty-two 282-ton electric locomotives was placed on a test track in September, 1915, and in February, 1917, steam engines were removed from the entire electrified section. A second section of line from Othello, Wash., to Seattle and Tacoma, is now being electrified, and will be ready for operation about the first of next year. Mr. Goodnow also constructed the Gallatin Valley

C. A. Goodnow

Railway, a subsidiary of the St. Paul, which runs from Three Forks, Mont., to Bozeman, and is now president of that line. In connection with the Puget Sound extension of the St. Paul, he supervised the construction of export terminal facilities at Seattle and Tacoma. Among the other interesting features of his active career were the making of the first time-table for operation through the Hoosac tunnel, the installation of the first interlocking plant in New England, at a point called Vermont; the introduction of two English staff machines for the protection of train movements over the Mississippi river bridge at Savanna, the perfection of the manual block system as now in use on the St. Paul, and the introduction of the floating system of handling freight on Puget Sound, which has since grown to important proportions. Mr. Goodnow was born at Baldwinville, Mass., on December 22, 1853. He entered railway service in 1868 with the Vermont & Massachusetts as a telegraph operator, and by steady application and native ability has won his way to the present executive position. In 1875 he became train despatcher of the Troy & Greenfield, and four years later was made trainmaster on the same road. From 1881 to 1886 he was superintendent of the New Haven & Frampton, and in the latter year went to the Chicago, Milwaukee & St. Paul as superintendent of construction. In 1888 he was promoted to division superintendent, with headquarters at Dubuque, Ia., and then served at Marion, and later was assistant general superintendent and general superintendent of the same road. In April, 1902, he was appointed general manager of the Chicago, Rock Island & Pacific, and in November, 1903, became general manager of the Chicago & Alton. From January 1, 1908, to January 1, 1913, he was assistant to the president of the Chicago, Milwaukee & Puget Sound, and on the latter date became assistant to the president of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, which position he held until his recent appointment as vice-president.

Operating

O. H. Hagerman has been appointed manager of the marine department of the Philadelphia & Reading, with office at Philadelphia, Pa.

J. J. McDonell has been appointed chief despatcher on the Saskatoon division of the Canadian Pacific, with headquarters at Saskatoon, Sask.

H. J. Councilman has been appointed trainmaster of the Lake Superior division of the Northern Pacific, with headquarters at Ironton, Minn., effective July 1.

H. C. White has been appointed trainmaster of the 25th district of the Grand Trunk, with headquarters at Battle Creek, Mich., vice H. E. Bailes, transferred.

R. E. Casey, trainmaster of the Grand Rapids & Indiana at Ft. Wayne, Ind., has been appointed superintendent of the Northern division, with office at Grand Rapids, Mich., vice J. W. Hunter, deceased.

C. F. Strickland, freight agent on the Texas & New Orleans, with headquarters at Beaumont, Tex., has been appointed assistant superintendent with the same headquarters, succeeding A. L. Kuykendall, who has been transferred to Jacksonville, Tex.

D. S. Colby has been appointed trainmaster on the Dakota division of the Northern Pacific, with headquarters at Jamestown, N. Dak., and B. B. Johnson has been appointed terminal trainmaster on the Pasco division, with headquarters at Pasco, Wash.

C. B. Anderson, local agent of the Chicago & Eastern Illinois at Chicago, has been appointed superintendent of transportation, succeeding E. H. De Groot, Jr., resigned to become head of the newly organized division of car service of the Interstate Commerce Commission.

P. W. Sullivan, chief clerk to the general superintendent of the central system of the Pennsylvania, Lines West, has been appointed superintendent of the Akron division, with headquarters at Akron, Ohio, succeeding Nettleton Neff, furloughed for military service.

F. A. Leith, assistant superintendent of the Chicago, Terre Haute & Southeastern, with headquarters at Terre Haute, Ind., has been appointed superintendent, with headquarters at West

Clinton; C. D. Lynch has been appointed assistant superintendent, with headquarters at Bedford, Ind., and E. C. Sappenfield has been appointed chief train despatcher, with headquarters at Terre Haute.

E. M. Alvord has been appointed general superintendent of the Pittsburgh & West Virginia and the West Side Belt, with office at Pittsburgh, Pa., and the office of J. G. Code, general manager, has been abolished. Mr. Alvord was in the service of the Missouri, Kansas & Texas System from 1891 to 1910, first as superintendent of various divisions, and then during the last seven years as general superintendent, of the Northern lines. From 1910 to 1912 he served as vice-president and general manager of the Midland Valley, and then was engaged in private business, until his appointment on July 1 as general superintendent of the Pittsburgh & West Virginia, and the West Side Belt.

J. T. Gillick, who has been appointed assistant general manager of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, as has already been announced in the *Railway Age*

Gazette of July 6, was born at Glencoe, Minn., in June, 1870. He entered railway service with the Chicago, Milwaukee & St. Paul in 1885, and was successively telegraph operator and train despatcher until 1903. In the latter year he was promoted to trainmaster, and three years later was appointed superintendent. In 1913 he became assistant to the general manager, with headquarters at Chicago, which position he held at the time of his recent appointment as assistant general manager, as already noted.

J. T. Gillick

E. H. Martin, assistant superintendent on the Canadian Government Railways, with headquarters at New Glasgow, N. S., has been appointed superintendent with the same headquarters, succeeding L. S. Brown, promoted. W. A. Cowan, division engineer of the Transcontinental division, with headquarters at Cochrane, Ont., has been appointed general superintendent, with the same headquarters. K. Stewart, chief despatcher at New Glasgow, has been appointed assistant superintendent, with the same headquarters. L. S. Brown, superintendent, with headquarters at New Glasgow, has been appointed assistant general superintendent of the eastern lines, with headquarters at Moncton, N. B. J. H. Duff has been appointed assistant superintendent with headquarters at Grant, Ont.

F. E. Sanborn, superintendent of the Portland division of the Maine Central, at Portland, Me., has been appointed general superintendent, in charge of the transportation and car service departments, with office at Portland; F. J. Runey, superintendent of the South Mountain division, at Lancaster, N. H., succeeds Mr. Sanborn, and assistant superintendents on the Portland division have been assigned in charge of territory as follows: F. O. Wood, with office at Portland; Lines Portland to Leeds Junction; Leeds Junction to Lewiston Lower and Brunswick; Rockland branch; Brunswick yard and Brunswick to Royal Junction. T. M. McLaughlin, with office at Waterville; Waterville yard and lines Waterville to Bangor; Skowhegan branch; Belfast branch; Foxcroft branch and Harmony branch. G. H. Foster, with office at Waterville; Lines Waterville to Leeds Junction; Kineo branch; Waterville to Brunswick. E. L. Lovejoy, with office at Rumford; Lines Rumford Junction to Kennebago; Canton branch; Farmington to Leeds Junction, including Leeds Junction yard. J. Asnault, assistant superintendent at Calais, has been appointed superintendent of the Mountain division, with office at Lancaster, N. H., vice F. J. Runey, and the office of assistant superintendent at Calais has been abolished. W. A. Wheeler, chief despatcher at Bangor, has been appointed

assistant superintendent of the Eastern division, with office at Bangor and W. E. Kingston has been appointed chief despatcher at Bangor, vice Mr. Wheeler.

C. B. Brown, whose appointment as assistant general manager, Eastern Lines, and chief engineer of all lines of the Canadian Government Railway, with headquarters at Moncton, N. B., has already been announced in these columns, was born on August 27, 1879, at Ithaca, N. Y., and graduated as a civil engineer from Cornell University in 1901. He began railway work later in the same year with the Canadian Pacific, and served consecutively on that road as draftsman and rodman with the division engineer of construction at Trail, B. C.; assistant engineer in the bridge department, at Montreal, in charge of the erection of the Red River bridge at Winnipeg, Man., also the annexes to elevators at Fort William, Ont. From 1902 to 1904 he was resident engineer, District No. 2, Ontario division at London and Toronto, then became assistant division engineer of the Western division at Calgary, Alta. In 1906 he was appointed division engineer of the Atlantic division at St. John, N. B. Two years later he was transferred as division engineer to the Eastern division at Montreal, and from 1912 to 1913 he was principal assistant engineer of the Eastern lines of the same road at Montreal. He then served from 1913 to 1917 as chief engineer of the Canadian Government Railways at Moncton, N. B., and on June 1 was appointed assistant general manager, Eastern Lines, and chief engineer, all lines, of the Canadian Government Railways, with headquarters at Moncton.

C. B. Brown

Traffic

W. L. McMorris has been appointed assistant general passenger agent of the Seaboard Air Line, with office at Norfolk, Va.

A. T. Weldon, assistant general freight agent of the Canadian Government Railways, with headquarters at Moncton, N. B., has been appointed general freight agent with the same headquarters, succeeding D. A. Story, promoted. M. F. Tompkins, division freight agent at Halifax, N. S., has been appointed assistant general freight agent, with headquarters at Moncton, succeeding A. T. Weldon, promoted. A. J. Gray, division freight agent at St. John, N. B., has been appointed assistant general freight agent with the same headquarters. J. H. Norton has been appointed division freight agent with headquarters at Halifax, succeeding M. F. Tompkins, promoted.

Engineering and Rolling Stock

W. R. Meeder has been appointed master mechanic of the Illinois Southern, with office at Sparta, Ill., succeeding W. F. McCarra resigned.

C. D. Rafferty has been appointed master mechanic of the Algoma Central & Hudson Bay, with office at Sault Ste. Marie, Ont., succeeding Thomas Fraser, resigned.

D. J. McCuaig, acting master mechanic of the Grand Trunk at Toronto, Ont., has been appointed master mechanic of the Ontario lines, with headquarters at Toronto.

F. B. Tapley, assistant engineer of the Canadian Government Railways at Moncton, N. B., has been appointed assistant engineer of maintenance, all lines, and will report to the chief engineer.

J. F. Deimling, assistant chief engineer of the Michigan Central at Detroit, Mich., has been appointed acting chief engineer,

vice George H. Webb, who has been commissioned lieutenant colonel in the Sixth Engineer Regiment, National Army. Effective July 1.

Joseph Slutzker, assistant master mechanic of the Pennsylvania Railroad at the Altoona (Pa.) machine shops, has been promoted to assistant engineer of motive power on the Western Pennsylvania division. Leon A. Starkweather, motive power inspector, has been promoted to assistant master mechanic on the New York division; and H. S. Schum, general foreman of the East Altoona enginehouse, has been appointed assistant master mechanic of the Altoona machine shops.

J. C. Beckwith, engineer of construction on the Canadian Government Railways, has been appointed division engineer, with headquarters at Moncton, N. B., succeeding H. T. Ruhl, resigned, to accept service with another company. A. V. Redmond, resident engineer at Cochrane, Ont., has been appointed division engineer with the same headquarters, succeeding W. A. Cowan, promoted. A. H. Willett, assistant division engineer, with headquarters at Cochrane, Ont., has been appointed resident engineer, with the same headquarters, succeeding A. V. Redmond.

F. G. Grimshaw, assistant engineer electrical equipment, Philadelphia Terminal division of the Pennsylvania Railroad, has been promoted to superintendent of motive power of the New Jersey division at New York, succeeding H. H. Maxfield; R. G. Bennett, assistant engineer of motive power of the Central division, succeeds C. D. Barrett as master mechanic at Sunbury; G. H. Watkins, assistant engineer of motive power of the Western Pennsylvania division, succeeds C. S. Gaskill as master mechanic at Orangeville, and J. H. Thomas, assistant general foreman at Pitcairn shop, succeeds F. S. Robbins as assistant master mechanic at Pittsburgh. Messrs. Maxfield, Barrett, Gaskill and Robbins have been granted furloughs to enter military service as officers of the Ninth Engineers, National Army, the railway shop regiment.

W. D. Warren, who has been appointed maintenance engineer of lines east of the New York, New Haven & Hartford, with office at Boston, Mass., as has already been announced in these columns began railway work as chairman and rodman for the Boston & Maine, and later served on the Pennsylvania Railroad. In 1903 he went to the New York, New Haven & Hartford as transitman, and then served consecutively on the New York Central as chief of party and on the Florida East Coast as resident engineer. He returned to the service of the New Haven in 1907 as division engineer of valuation, later becoming division engineer of the Providence division, which position he held at the time of his recent appointment as maintenance engineer of lines east of the same road, as above noted.

Purchasing

J. L. Feemster, storekeeper of the Kansas City Terminal Railway at Kansas City, Mo., has been appointed general storekeeper on the Chicago Great Western, with headquarters at Oelwein, Iowa.

OBITUARY

William P. Cosgrave, formerly superintendent of the Minnesota division of the Chicago & North Western, died at his home at Winona, Minn., on July 4. Mr. Cosgrave despatched the first train on the Chicago extension of the Chicago, Milwaukee & St. Paul, and in 1872 became assistant superintendent of the Chicago division of that road.

Frank J. Martin, assistant general freight agent of the New York, Chicago & St. Louis, with headquarters at Chicago, Ill., died at his home in Chicago on June 4. He was born at Cleveland, Ohio, on December 26, 1865, and entered railway service as a ticket clerk in the auditing department of the New York, Chicago & St. Louis in 1884. Later he was clerk in various capacities in the general freight department until September, 1905, when he was promoted to traveling freight agent. On September 10, 1905, he became agent of the Delaware, Lackawanna & Western at Chicago, and on April 1, 1907, he returned to the New York, Chicago & St. Louis as chief clerk in the general freight department. On September 14, 1909, he was promoted to assistant general freight agent.

GENERAL NEWS SECTION.....	117
---------------------------	-----

We are witnessing the introduction of a new kind of competition in railway passenger service. This is competition in eliminating needless service instead of

A New Kind of Passenger Competition

in adding to it. It is being brought home to the managements of the railways through more channels than one that their most important duty during the war will be to conserve man power and fuel to the utmost extent practicable and to handle the greatest amount of freight practicable. The elimination of passenger service which is not actually needed for the convenience of the public is one of the most effective means available for accomplishing all these objects. Already many railways have made substantial reductions in their passenger service, and now, instead of advertising that they are increasing it, they are giving publicity to the fact that they are reducing it, and pointing the finger of scorn at lines who do not do their part in this direction. Statistics which have been made public indicate that up to the present time in the efforts to conserve fuel and man power the railways as a whole have taken off passenger trains which are effecting a saving equivalent to about 18,500,000 passenger-train-miles a year. This saving is greater than the total passenger train mileage per year of any railway system in the country except five—the New York Central system, the Pennsylvania system, the Santa Fe, the Southern Pacific and the North Western. It is a remarkable fact that in some communities the railways have been criticised for the reductions in passenger service they have made. Such criticisms are most unjust. The fact is the railways are making the reductions very reluctantly, and in many cases the opposition among their own managers has been so strong that it has been practically impossible to effect any at all. For example, some of the worst duplicated service in the United States is between Chicago and St. Louis, Chicago and Kansas City, and Chicago and the Twin Cities, and yet no curtailments have yet been made between these cities. Instead of criticising railways for doing their patriotic duty, even contrary to their inclinations, the public and press would much better commend those railway manage-

ments which in recognition of the national emergency are taking off service, and condemn those that are standing in the way of the reductions that are needed.

The United States Government has this last week ordered for service in France 300 80-ton Consolidation locomotives,

Big Equipment Purchases by Governments

150 each from the two largest locomotive builders. This news will cap the climax on the fact that cars and locomotives have now become so high in price that almost the only people that can buy them are the governments of the United States, Great Britain, Russia, France and Canada. On another page of this issue are given some interesting figures, adapted from a table in the appendix to the Interstate Commerce Commission's decision in the Fifteen Per Cent Case, showing that the railways of this country are now paying from 50 to 100 per cent more for their cars and locomotives than they did a year or so ago. In the same article it is also shown that of the total purchases of 1,175 locomotives and 24,635 freight cars received by equipment builders since June 1, 1,014 locomotives and 8,435 cars were ordered by governments. In connection with this article three things should be emphasized. One is that the railways cannot buy freight cars at the present high prices. Another is that the recent big purchases of locomotives this year, that is up to June 1, indicate a realization of the necessity for larger trainloads and heavy and efficient power. No road would be willing to pay as high as \$100,000 for a Mallet, \$70,000 for a Santa Fe or \$35,000 for an eight-wheel switching locomotive if it did not expect to make the most of it as an economic transportation unit. The third point is that relating to government purchases. It appears for the moment as if the railways were losing out completely in the competition for space in the car and locomotive plants. The Russian government has just ordered 500 one-hundred ton locomotives at a price stated to be \$56,000 each; the British government will pay \$45,000 apiece, it is said, for its 100 Consolidation locomotives. The Canadian government will pay about

\$2,600 each for 5,000 box cars, and the end is not yet. Both Russia and France want to buy more locomotives and cars. Both the large locomotive plants are filled up with orders for over a year ahead. Where the railroads that have not locomotives now on order, are going to fit in, is a question.

THE INTERSTATE COMMERCE COMMISSION AND CAR SERVICE

IN an editorial in last week's issue it was suggested that a strong recommendation made by the Interstate Commerce Commission to shippers and receivers of freight that they co-operate with the railroads in their efforts toward getting heavier car loading would be of immense value. It now appears that at just about the time the *Railway Age Gazette* was going to press the Commission was doing that very thing. In its announcement of the organization of a Division on Car Service, of which we were able to publish only the principal facts last week, the Commission not only indicated that the new division proposed to co-operate as far as practicable with the work of the Railroads' Commission on Car Service, but it also issued a recommendation to shippers and receivers regarding heavier loading of cars.

The Commission said: "It is expected that shippers and receivers of freight will to the fullest extent aid in promoting car service by promptly loading and unloading carload shipments, by capacity loading, where possible, regardless of carload minimum, by readily adapting themselves to such modifications in the handling of less-than-carload shipments as may be found necessary, and by hearty co-operation in the other methods which have been or may be devised to meet the transportation problems confronting the country."

The editorial in question was in error in stating that the Commission "so far as we know, has never made an appeal for the full use of car space" in the circulars issued jointly to carriers and shippers which the Commission has usually issued at times of threatened car shortage. An examination of our files shows that the *Railway Age Gazette* has on at least two occasions published circulars issued by the commission urging not only prompt loading and unloading of cars and prompt movement of freight, but also full loading. Moreover, since the campaign for intensive loading and conservation of transportation in general was inaugurated by the Railroads' War Board, the Commission has co-operated most heartily in the efforts of the railroads, just as a very large number of shippers have, generally, since the matter has been placed on a patriotic basis and it has been evident that both the nation's war preparations and its business would suffer unless all join in promoting the greatest possible efficiency of the available transportation facilities.

In the article in our recent Patriotic War Number describing the work of the Commission on Car Service, attention was called to the fact that the representatives of the Interstate Commerce Commission who have been meeting with the railroads' commission had made it a practice, in replying to complaints from shippers about car shortage, to insert an argument for capacity loading and the need for prompt release of cars; and the importance of the subject has been brought strongly to the attention of shippers and consignees on many occasions.

This paper has frequently criticized the attitude of the Interstate Commerce Commission in the matter of rates because of a belief that a more liberal policy would have placed the railroads in a better position to cope with the enhanced demands on their facilities, but we do not wish to be understood as failing to appreciate what the Commission has done during the prevalence of acute conditions of car shortage and congestion during the past winter and spring. It readily consented to the railroads' request to be allowed to increase demurrage rates and has given valuable

support to the work of the Commission on Car Service ever since it went to Washington.

The Commission's announcement regarding the Division of Car Service also gives an indication of its intention to continue to work with the roads; and the selection of such an experienced railroad transportation officer as E. H. De Groot, Jr., until recently superintendent of transportation of the Chicago & Eastern Illinois, as chief of the division, should inspire a feeling of confidence in the results to be expected from its establishment.

There has been much speculation as to what the Interstate Commerce Commission intended to do under its new authority over car service, conferred by the Esch-Pomerene law, and as to the effect of its action on the work of the Commission on Car Service. The Commission on Car Service has been given very broad powers over car distribution since the organization of the Railroads' War Board, but the announcement by the Interstate Commerce Commission on July 12 indicates at least the intention that there shall be no unnecessary conflict of authority. Under the new law the power of the commission is, of course, supreme, but that does not necessarily imply interference with the work being done by the railroads themselves as long as the latter are able to manage their own affairs properly. The Commission announces that through the new division it will regulate car service, and when occasion requires it will issue orders or directions direct to the carrier or carriers concerned, but that subject to this fundamental principle it will, as far as practicable, avail itself of co-operative effort on the part of the railroad Commission. The announcement calls attention to the extensive organization of the Commission on Car Service, with its seven members, all superintendents of transportation of different railroads which territorially cover practically the entire United States, and the large force of assistants under its control in Washington and in the field.

Complaints and communications regarding car service received by the Commission will be handled through the new division and the field service will be developed as occasion may require.

Under the law the Commission may require the carriers to file their car service rules as tariffs, it may establish its own rules, on complaint or on its own initiative, and whenever it shall be of opinion that necessity exists for immediate action, it may suspend the existing rules and issue "such just and reasonable directions with respect to car service as in its opinion will best promote car service in the interest of the public and the commerce of the people."

All these things are not required to be done, however, unless it is necessary, and it should be possible to effect a degree of co-operation between the Division of Car Service and the Commission on Car Service which will have very satisfactory results. The Interstate Commerce Commission will naturally seek to protect the interests of the shippers in case it considers that the railroad committee in any case has failed to give them proper consideration, and on the other hand it will be in a position to support the attitude of the railroad committee on some occasions.

The Commission also suggests co-operation between the local committees representing the railroads and those representing the shippers, appointed by the National Industrial Traffic League, stating that where irreconcilable differences arise they may be referred either to the carriers' commission or to the Division of Car Service for adjustment. This apparently indicates a purpose on the part of the Commission to act as a court of appeal rather than to actively regulate the distribution of cars itself; and the idea of co-operation is further carried out by the arrangement by which the Commission has secured temporarily for this work the services of H. C. Barlow, traffic director of the Chicago Association of Commerce and chairman of the executive committee of the National Industrial Traffic League. As at present con-

stituted the division will, therefore, consist of a railroad man, a representative of the shippers, who is an ex-railroad officer of long experience, and A. G. Gutheim, one of the commission's most experienced examiner-attorneys; and the arrangement seems admirably adapted to bringing about the degree of harmony between railroads, shippers and the commission which the occasion so imperatively requires.

COURTESY—A WAR TIME NECESSITY

"I DON'T know who did it," he remarked, "but, honestly, I could hardly believe my eyes. I went over to get the 5:15 the other night, and will you believe me if I tell you that as I walked down along the train, I saw that every window in every car was opened slightly from the bottom; and no one had to fuss and get hot under the collar, the way they sometimes do, trying to open windows to get the air." It is somewhat hard to believe, and it does not necessarily follow that it would be a practical method to follow generally. We do know, however, where the railway that runs that particular 5:15 will find another man who has a kindly feeling towards it.

The railways at present are in a very difficult position, trying to reduce passenger service that they may better handle their more necessary war-time freight traffic, reducing portions in dining cars, getting after shippers to load their freight more heavily and to unload it more promptly and at the same time doing their best to explain deliveries delayed because of congestion and lack of cars. Thus far, as a general thing, the public considers that it has been treated remarkably well, even under the adverse conditions. The public knows that the railways are up against a big proposition. The favorable attitude with which the man in the street has regarded the prompt measures taken to co-ordinate the railways through the Railroads' War Board is a subject of comment. A satisfied public is an asset of great value, and the railways certainly have a great deal to be thankful for in that they have succeeded in encouraging the friendship of their "constituents" at a time like this.

It showed, for example, in the Fifteen Per Cent Case. The commission, to be sure, did not give as much heed to the fact as perhaps it should have, but it surely was considerably impressed by the friendly feeling on the part of shippers and the relative absence of protests against the increases. "These facts are not without significance in so far as they indicate the existing state of the public mind," says the majority opinion. "It may be admitted that facts of this character reflected in the record indicate a somewhat different state of public opinion from that which has heretofore prevailed in connection with similar issues before us."

The railroads are now in the advantageous position where they have the public on their side. Their efforts should be directed to keeping it there.

Let us take a leaf from Europe's experience. Transportation of commercial traffic in the warring countries overseas has not been quite what it should be. Our European correspondent has commented on that again and again. Not once has he failed to draw attention to the fact that the railways are the ones who always get the blame, although in a great many cases conditions at the front, the rulings of the civil authorities and such things, are at fault. In other words, it is easy to blame the railways because they are the nearest things to hand. We do not presume that the American railways are going to be able to render 100 per cent perfect service for the duration of the war. We do know that if the public is treated right it will be more willing to understand that 100 per cent perfect service is not possible in time of war, and it will be more likely to believe that the railways are doing their level best to give the forces in the field and the public at home the best that is in them.

In other words, do not let the strain of war conditions allow us to forget the necessity for courtesy. Emphasize courtesy and fair dealing more than ever so that the new employees—the women, for instance—who take the places of those who join the colors may understand that the good opinion of the public is the thing that counts. And prop up some of the weak points that still exist. Do not emphasize the value of courtesy to your patrons, and then let trainmen insult passengers and freight clerks ruffle the temper of consignees. Do not count on polite train crews alone and then let a surly gateman shut a gate in a passenger's face and cut off his nose almost, and his friendship entirely in the same second. War-time is a time of strain. It is not over-conducive to good temper, and anything that can be done to encourage courtesy and the good feeling of the public towards the railroads is going to be repaid a thousand-fold.

THE FARMER AND THE RAILROADS

THE Interstate Commerce Commission is not a political body. At the same time, it is not, as many persons sometimes say, a judicial body. It is an administrative body created by Congress to perform certain functions delegated to it by Congress, and if it does not perform them to suit its creator, Congress can pass legislation to control its acts, or, indeed, entirely to abolish it.

There is a widespread belief in Washington that the dependence of the Commission on the favor of Congress and the attitude assumed by a number of senators and representatives, were very influential, if not actually controlling, factors, in determining the Commission's decision in the 15 per cent rate case. There were thought to be strong indications in the attitude of the majority of the members of the Commission during the hearings, as there are also in the majority opinion, that they believed the railroads needed larger advances than those granted. Furthermore, practically all classes of shippers in the country, except those in the agricultural communities, favored greater advances than were allowed. On the other hand, the farmers, especially of the middle west, apparently were opposed to any increase of rates. They were the only large interest that appeared by counsel vigorously to oppose any advance. The attitude of the farmers was reflected in that of the senators and representatives from many agricultural districts, especially those of the middle west. Resolutions of various kinds regarding the advances asked for were introduced in Congress. Some of them proposed the prohibition of the advance asked for and others even went so far as to suggest the abolition of the Interstate Commerce Commission.

It is a remarkable fact that while the prejudice and antagonism to the railways which were almost universal ten years ago no longer exist among the business men of the country, they still prevail, and apparently without much diminution, among the farmers, especially of the middle west. This deep-seated antagonism on the part of the farmers is the greatest obstacle to fair treatment of the railways and to the solution of the railway problem. Why should this be the case? The prices of all farm products have greatly increased while railway rates have stood practically still. At the same time the farmer has become one of the greatest sufferers from shortages of cars and congestions of traffic resulting from the fact that the railways have been unable adequately to increase their facilities. It would seem, therefore, that the farmers are not only as able as any other class of the public to pay higher rates, but that it is as much to their interest to do so as to that of any other class.

It is often said that while the prices which consumers have to pay for agricultural products have increased greatly, the farmers have not received the benefit of these increases.

Official statistics on the subject demonstrate the incorrectness of this contention. The Statistical Abstract of the United States shows that between 1910 and 1916 the farm values of the most important agricultural products increased as follows: Wheat, from 88.3 cents per bushel to \$1.00, or $81\frac{1}{2}$ per cent; corn, from 48 cents to 88.9 cents, or 85 per cent; oats, from 34.4 cents to 52.4 cents, or 52 per cent; barley, from 57.8 cents to 88.2 cents, or 53 per cent; rye, from $71\frac{1}{2}$ cents to \$1.22, or 70.6 per cent; buckwheat, from 66 cents to \$1.13, or 70.8 per cent; potatoes, from 55.7 cents to \$1.46, or 162 per cent.

Meantime, railway rates almost stood still. In consequence, whereas in 1910 the freight rate on a bushel of wheat from Chicago to New York was 11 per cent of the farm value of the wheat, in 1916 it was only 6.3 per cent of the farm value of the wheat. Likewise, while in 1910 the freight rate on a bushel of corn from Chicago to New York was 18.6 per cent of the farm value of the corn, in 1916 the rate from Chicago to New York was only 10 $\frac{1}{2}$ per cent of the farm value of the corn.

How much the farm values of agricultural products have increased relatively to the rates which the railways receive is strikingly illustrated by the increases which have taken place in the number of ton-miles and passenger-miles of transportation which can be bought with a given quantity of any farm product. For example, in 1910 a bushel of corn at the average farm value would buy 63 ton-miles of transportation, while in 1916 it would buy 126 ton-miles, an increase of exactly 100 per cent. Likewise, in 1910, a bushel of wheat at the average farm value would buy 117 ton-miles of transportation, while in 1916 it would buy 227 ton-miles, or an increase of 94 per cent. Even more remarkable are the relative changes in the farm value of potatoes and in the average railway rates. In 1910 a bushel of potatoes at the average farm value would buy 74 ton-miles of transportation, while in 1916 it would buy 207 ton-miles, an increase of 166 per cent. Certainly with such increases as have occurred in the prices that the farmer receives he has become able to pay much higher rates than he is now paying.

Furthermore, it would be to his interest to pay higher rates. Good and adequate service is more important to him as well as to all other shippers than the lowest rates that can possibly be obtained. Now, as a matter of fact, the farmer, like other shippers, has not within recent years been receiving adequate service. Why? Because the railways have not been able to increase their facilities as fast as the demands for transportation have increased. They have been unable to increase their facilities sufficiently because, excepting in the abnormal year 1916, their net return has shown a steadily downward tendency and this downward tendency has been due to the fact that they have been unable to secure increases of rates to offset the increases in their expenses. Finally, their inability to secure reasonable advances in rates has been chiefly due to opposition which has come, not only in the 15 per cent case, but in earlier rate advance cases, from the agricultural districts, and especially from those in the middle west.

In thus opposing all advances in freight rates regardless of the great changes which have been and still are taking place in the transportation field, the farmer is injuring himself more than anybody else. He is losing, and will continue to lose, much more money because he cannot get enough cars in which to ship his products when he wants to ship them than he has gained or can gain by freight rates which are so low as to disable the railways from providing sufficient facilities. If the farmer would study the facts about the transportation situation himself and act accordingly, instead of accepting the cooked-up statistics which are furnished to him by a lot of professional agitators against railways and allowing his attitude to be determined by these agitators, the results for all concerned would be much better.

CHICAGO, ROCK ISLAND & PACIFIC

IN April, 1915, when the Chicago, Rock Island & Pacific was put into the hands of receivers at the instance of some of its own board of directors, the proceeding was criticized by N. L. Amster and others as being entirely unnecessary. On the other hand, the controlling interests of the old management claimed that the receivership was inevitable. Now, after two years of operation under the receiver, it has been found possible to reorganize the company without foreclosure, raise enough cash to pay off receivers' debts and unfunded debts of the company, and make a showing of earnings which justify reasonable expectation of dividends on the new preferred stock which was issued to raise the necessary money for the reorganization.

What has happened? Was it some fault of the old management which prevented the property from earning what it was capable of earning, or have railroad conditions changed so for the better as to account for this great change in the prospects of the Chicago, Rock Island & Pacific, or have conditions affecting this particular road changed for the better to a greater extent than on the majority of other roads?

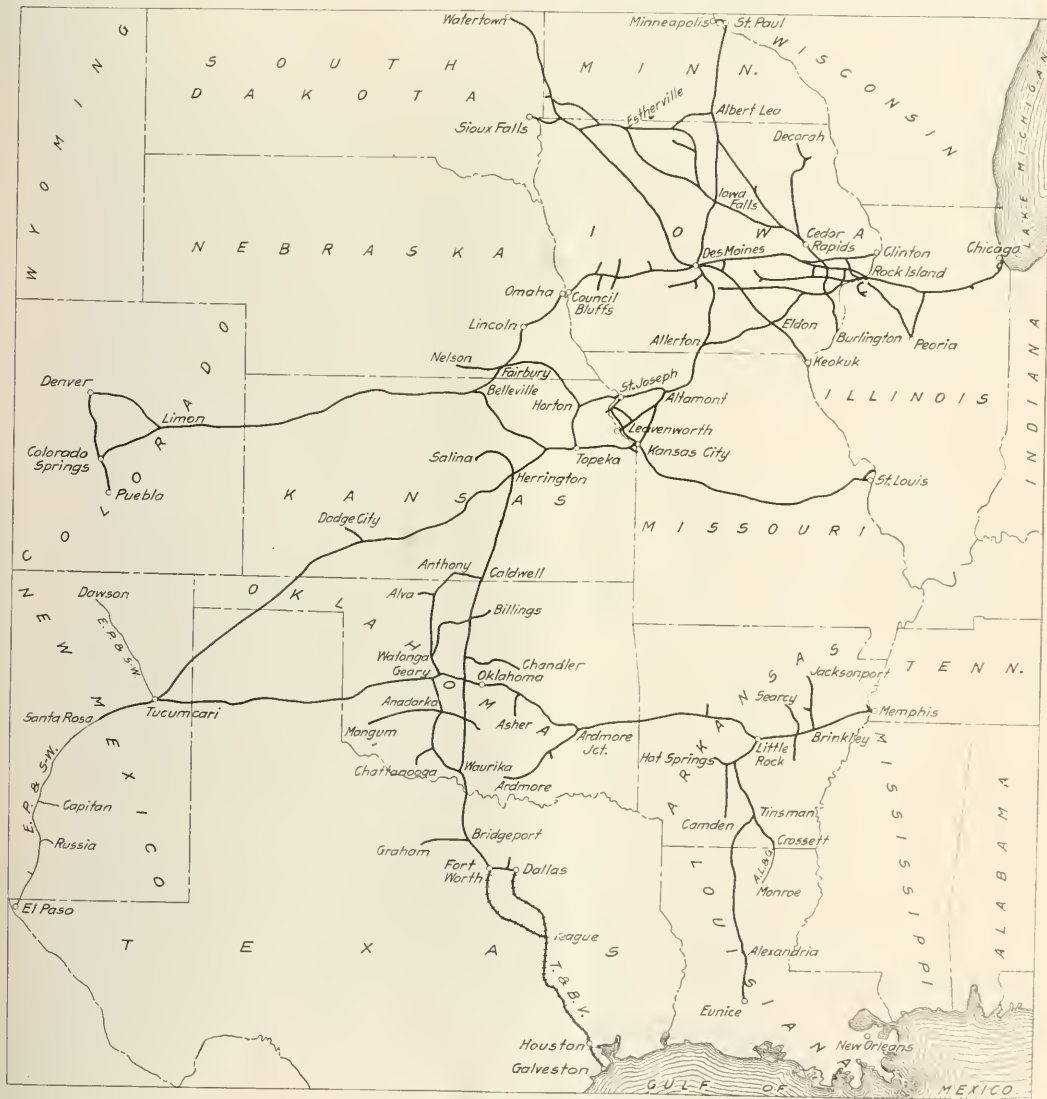

The Rock Island got down to low ebb in the fiscal year ended June 30, 1915. After making charges for interest due there was a deficit for that year of \$735,000, and besides this there was an additional \$870,000 which the accountants who examined the Rock Island's books thought should have been charged for depreciation of equipment in addition to what was charged for depreciation. This would have made a deficit in the neighborhood of \$1,600,000. In the calendar year ended December 31, 1916, after making deductions for approximately the same amount of interest as in 1915, there was a surplus of \$8,078,000, although in the opinion of the accountants large enough depreciation charges are not yet being made. Comparing the calendar year 1916 with the fiscal year ended June 30, 1915, gives the most striking contrasts, but there is a great enough change between the calendar years 1916 and 1915 to indicate that it was during these two years that the prospects of the road were so radically improved. In the calendar year 1915 there was a deficit, after interest charges, of \$386,000, comparing with the more than eight million dollars surplus for last year.

Total operating revenues in 1916 were \$80,889,000, an increase over 1915 of \$9,590,000. Had it not been for a debit for hire of freight cars in 1916 as against a credit in 1915, making a total difference of \$1,179,000, the Rock Island would have held all of the increase in gross for net income. The question now resolves itself into two, namely, was the increase in gross due to the Rock Island's getting more than its share of the increase in freight and passenger business; and, what were the changes in conditions which made it possible to handle the great increase in business at a comparatively very small increase in expenses? The increase in freight revenue was over 16 per cent, but the increase in ton mileage of revenue freight was over 20 per cent. The increase, however, in the number of tons carried was a little over 13 per cent. It is obvious, therefore, that the Rock Island got a much longer average haul in 1916 than in 1915; the average in 1916 was 249 miles.

Of the total tonnage carried in 1915 32.29 per cent was products of mines, 27.14 per cent products of agriculture, 18.67 per cent manufactures, 8.70 per cent lumber and forest products, 6.86 per cent livestock and animal products, and 6 per cent i.e.l., the remainder being miscellaneous. Interestingly enough the tonnage of every single class of commodities, with the exceptions of dressed meat and anthracite coal, which together form less than two per cent of the total tonnage carried, increased in 1916 as compared with 1915. The tonnage of manufactures shows the greatest increase—21.96 per cent. Products of agriculture come next, with an increase of 12.24 per cent, and products of mines next.

with 12.15 per cent; but products of mines include tonnage of coke and of ores, both of which show abnormal increases—94.80 per cent for coke and 46.59 per cent for ores. Some of the Rock Island's competitors are the Union Pacific; Chicago, Burlington & Quincy; Atchison, Topeka & Santa Fe; Missouri, Kansas & Texas, and St. Louis-San Francisco. Compared with most of these, the Rock Island has not shown an abnormal increase in freight traffic. It

and a slight increase in number of passengers carried, there was an increase of only 2.13 per cent in transportation expenses. For one thing, carloading was materially better. The average number of tons per loaded car was 17.62 in 1916 as against 16.34 in 1915. This, together with an increase in the number of loaded cars per train, brought up the average trainload to 427 tons as compared with 382 tons in 1915. This trainload figure includes company freight

The Chicago, Rock Island & Pacific

seems fair to conclude, therefore, that there was no failure in 1915 to get traffic for the Rock Island that it ought to have had, but that the good showing made in increased gross in 1916 was the result of improvement in general conditions.

As to expenses, however, the case is different. With an increase of over 20 per cent in the ton mileage of freight,

as well as revenue freight. Through the increased trainload it was possible to handle 20 per cent more freight business with only 4 per cent increased freight train mileage.

It will be recalled that transportation expenses increased only a little over two per cent. It is hardly possible that transportation expenses per freight train mile on the Rock Island were less in 1916 than in 1915. There was, how-

ever, a considerable saving made in passenger service. Passenger train miles amounted to 16,916,000 in 1916, a decrease of 1,138,000. This would certainly appear to be a step in the right direction, for even in 1916 there was a greater train mileage of passenger trains run than of freight trains, while the revenue from freight was \$55,000,000, and from passengers, less than \$20,000,000. There was, of course, additional revenue from passenger trains and from mail and express, but even counting these two items in, the contrast would be between \$55,000,000 and a little over \$24,000,000.

During the calendar year \$2,670,000 was spent for additions and betterments, exclusive of equipment. With the exception of 28 freight cars and some work cars, no new equipment was added during the year.

Without attempting to pass any final judgment on the Rock Island situation, it would appear that the Rock Island has the organization and the road to handle at least the business of 1916 on a profitable basis, and if gross earnings continue at their present rate, or better, the reorganization plan has a good chance of working out successfully. Expenses, of course, in 1917 will probably be higher than in 1916, the so-called eight-hour law now being in effect and scarcity of labor forcing up wages of many classes of non-union employees, while there have been great advances in the prices of materials and equipment.

The following table shows the principal figures for operation in the calendar year 1916 as compared with the year 1915:

	1916	1915
Average mileage operated	8,088	8,228
Freight revenue	\$35,141,668	\$47,404,207
Passenger revenue	19,674,370	18,500,032
Total operating revenues	80,889,129	71,299,359
Maintenance of way and structures	10,097,734	9,883,148
Maintenance of equipment	13,168,137	12,298,662
Traffic expenses	1,716,087	1,841,640
Transportation expenses	27,769,887	27,191,120
General expenses	1,968,289	1,860,669
Total operating expenses	55,091,717	53,610,457
Taxes	3,766,294	3,516,012
Operating income	21,992,243	14,140,209
Total income	23,428,685	15,469,676
Net income	8,078,189	*386,383

*Deficit.

NEW BOOKS

The Portland Cement Industry, by William Alden Brown. 514 in 1 by 8 3/4 in. 155 pages, illustrated. Bound in cloth. Published by D. Van Nostrand Company, 25 Park Place, New York. Price \$3.

This book is intended for the producer of Portland cement and others who are interested in the details of its manufacture. The viewpoint is essentially English, but American practice is covered to a considerable extent, particularly as to machinery and equipment. The book contains chapters on general considerations, raw materials, design and construction of plants, kilns, power plants, costs, equipment, cement testing, chemical composition, fineness, strength, time of setting and soundness. The greatest amount of space is devoted to the machinery for crushing and grinding the materials and to the kilns for burning them. Power plants are treated in detail and the chapter of costs gives considerable space to methods for collecting cost data.

Pacific Ports, Third edition, 1917. Edited by Wilford Beaton. Bound in limp leather, 400 pages. Size 5 in. by 8 in. Published by the Terminal Publishing Company, Seattle, Wash. Price \$3.

The title page of this book states that it is a commercial geography, commercial dictionary, transportation guide and marine manual of the Pacific ocean with full information for importers and exporters. The book covers the ports of the Pacific, not only from Alaska to Central and South America, but also in Australia, Japan and the east coast of Asia to Siberia. It gives descriptions of the countries and harbors on the Pacific, details as to the steamer routes and information regarding the harbors, harbor dues, shipping regulations and consular documents required.

Letters to the Editor

PSYCHOLOGY IN THE LOCOMOTIVE CAB

SAN FRANCISCO, Cal.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

Letters in the newspapers, especially in the East, where the open-window season seems at last to have arrived, call attention, just now, to noise nuisances of various kinds; and the locomotive whistle, and the troubles which it causes, are once again brought to mind. As some of your correspondents have observed, the slovenly whistler seems to be always with us. He seems to make the blasts of the whistle wholly according to his individual taste, or (more frequently) in a way to show that he has no taste at all. Taste or no taste, the standard signal for road crossings, as prescribed by the American Railway Association, is constantly modified everywhere.

Why not look a bit into what might be called the psychology of the question? In general, the modifications made by these free-minded runners tend towards two long, a short, and one long blast, the last one sustained at will.

The very fact that the modified form of signal tends toward a prolonged last blast, indicates some generally operating reason; and, hence, that possibly an authorized modification of the standard crossing signal in this direction might produce better compliance with the rule than an attempt by discipline to drive the enginemans away from a procedure that apparently is based on some ground more potent than the book of rules.

Perhaps, because the signal is a warning, there arises a desire to emphasize the warning by prolonging the signal, and, carelessly, the last blast is prolonged rather than all, proportionately. This, in turn, suggests the thought that if the signal were reversed so that it would be two short followed by two long blasts, officers in charge of discipline would find it easier to get compliance with the regulations.

It is very easy for railroad managers to decide that certain things are only matters of discipline, and that, therefore, a bulletin or other disciplinary measure may be called upon to produce results; but if the regulation is not directed along common sense lines, the effect is doubly bad, because not only does the regulation break down, but also the discipline following it is merely arbitrary and therefore irritating and ineffective.

ALLEN H. BABCOCK.

SPANISH ROLLING STOCK IN 1916.—According to statistics recently made public, the railroads of Spain possessed at the beginning of 1916 the following rolling stock: 2,683 locomotives, with a capacity of 1,634,520 horsepower; 6,390 passenger cars to accommodate 270,722 persons; and 59,454 freight and cattle cars, with a capacity of 593,540 tons.

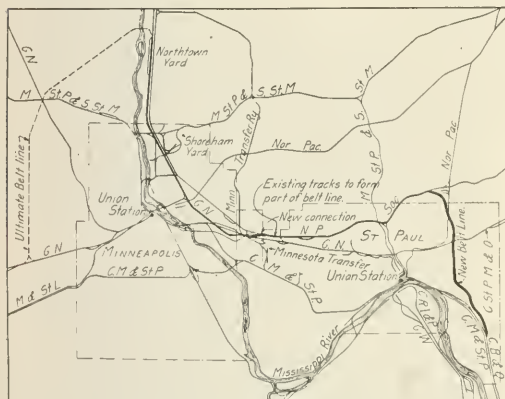

NEW JAPANESE RAILWAY IN MANCHURIA.—Work has been begun on the railway from Ssuningkai to Chengchiatun, in Manchuria, one of the lines granted to Japan for construction under an arrangement concluded between the Chinese government and the Yokohama Specie Bank in October, 1915. The required loan was floated in Japan, and by June, 1916, some \$50,000 had been advanced for survey purposes. The survey was completed in December, 1916. Owing to the present high cost of materials the line is to be built as economically as possible, wooden bridges to be erected temporarily and to be replaced later when the price of steel declines to normal. By the end of this year it is hoped that the road will be open to Sankiangkow from Ssuningkai; and by August, 1918, that it will be completed.

Work Started on New Belt Line Around St. Paul

The Hill Lines Are Undertaking the Construction of a Road Which Will Aid in Handling Interchange Traffic

THE Great Northern, the Northern Pacific and the Chicago, Burlington & Quincy have undertaken the construction of a belt line about St. Paul which will greatly relieve the freight interchange conditions now existing at that point. To carry on this work the Twin City Belt Railway Company has been organized, the stock of which is owned equally by the three roads. The line is intended not only to provide facilities for the interchange of freight between the three owning lines but is also expected

In the plan for the new Union Station prepared two years ago the complete separation of grades at this point was contemplated. The difficulties and the expense involved in this grade separation led to the development of the belt line, which eliminated the necessity for grade separation, and permitted a better trackage arrangement for the Union Depot, as well as reducing the estimated cost of the project about \$4,000,000. The belt line will take over all the business for South St. Paul and practically all of the interchange business. It is also expected that arrangements will be made with the Chicago Great Western for the diversion of its Minneapolis freight over the belt line. The only freight which will then move over the wye will be that of the Omaha from the south and west, and that for the industries and freight houses in the immediate vicinity of the station. This

Map of the Twin City Terminals

to perform the same service for the other roads entering these cities.

Although only the Hill lines are participating in the construction of this belt line it bears a very important relation to the Union station project now being started in which all of the nine roads entering St. Paul are equal owners. The point of greatest congestion in St. Paul is at the wye at the east entrance to the station. Not only do all passenger trains using the tracks of the Great Northern and Northern Pacific to Minneapolis and those of the Burlington,

New Freight House and Team Yard at Eighth Street

will greatly relieve the congestion and simplify operation at this point.

The belt line will start from a connection with the Burlington and the St. Paul tracks at Highwood, four miles south of the union station and will swing to the north, crossing under the Chicago line of the Omaha and the Duluth line of the Northern Pacific and connecting with the main line of the Soo to the east near Lake Phalen. From that point trackage rights have been secured over the Soo line for two miles to a connection with the Northern Pacific which line will be used from there to Minnesota transfer, six miles further west. At the latter point a connection nearly a mile long will provide entrance into the Minnesota Transfer yards and a connection with the main line of the Great Northern.

From the connection with the Great Northern at Minnesota Transfer the latter road now has four tracks to its Northtown yards, although at present only two are reserved

Profile of the Belt Line Between the Burlington and the Soo Connections.

the St. Paul, the Rock Island and the Omaha from the south pass over this wye but the trains of the Burlington and the Omaha reverse directions on it. All through freight from Minneapolis handled by the Omaha road for the south west and by the Chicago Great Western, practically all of the business for the stock yards and other industries of South St. Paul and a heavy interchange movement also pass over this wye. As a result the congestion and the consequent delay to freight movements has become increasingly serious in recent years.

for running track. However, this line is being converted into a four track line which will constitute a further development of the belt line. From Northtown yards the belt line has been projected southwest to a connection with the Great Northern main line to Wilmar at Hopkins Junction, crossing the Great Northern line to St. Cloud and the Soo line to the northwest. Only that portion of the line east of Minnesota Transfer yards is under development at present.

Until last year the Great Northern handled most of its

switching at its Cedar Lake yard a short distance east of Hopkins Junction and its Northtown yard adjacent to the general classification yard of the Northern Pacific was used primarily for storage purposes. In 1910 approximately 30 miles of tracks were laid at Northtown and this year an equal mileage will be built in addition to an engine terminal. When the extension of the belt line to Hopkins Junction is built, a complete mechanical terminal will be constructed at Northtown and it will become the main yard of the Great Northern for the Twin Cities.

Traffic of the Burlington, the St. Paul and its tenant, the Rock Island, will be turned over to the belt line in a small yard at Highwood, where several tracks 5,000 ft. long and a small engine house will be located. The St. Paul Bridge & Terminal Company now owns a line extending north from South St. Paul and crossing the Mississippi river a short distance above Highwood. A connection will be built from the north end of this bridge to the belt line, crossing the Burlington and St. Paul tracks overhead and providing an entrance into South St. Paul over which stock and other traffic will move directly without going through the yard at Highwood.

A small set-out yard and a connection will be provided at the crossing of the Omaha line at which interchange will be made with this road. No connection will be provided at the crossing of the Northern Pacific line to Duluth but a wye will be built between this line and the Soo a short distance further north over which freight will be transferred to the belt line. Through these connections a large portion of the business will be interchanged directly between the three owning roads, and the Omaha, the Soo, the Great Western, the St. Paul and the Minneapolis & St. Louis. Interchange with the other roads and the balance of the interchange of all will be made through Minnesota Transfer yard. It is estimated that about 800 cars will be handled daily over this line at the outset.

The new line from Highwood to the connection with the Soo will be built for double track and will be used exclusively for freight traffic. The portion of the Soo line which will be used is now single track and carries only a small amount of freight traffic. This section of the Soo line probably will be double-tracked almost immediately. The Northern Pacific section is double track. It now carries the passenger and freight trains of the Minneapolis & St. Louis and Northern Pacific freight trains. Thus except for a short distance a double track line eventually will be provided.

The difference in elevation between Minneapolis and St. Paul is approximately 215 ft., 167 ft. of which is overcome on the belt line. Starting at the south end the belt line will rise on a 0.3 per cent grade through the interchange yard at Highwood, changing to 0.8 per cent at the north end and continuing at that rate for approximately four miles. Beyond this point the grade will continue to ascend with short sections of 0.8 per cent grade which can be reduced to 0.4 per cent when desired. The maximum curvature is 6 deg.

With three exceptions all grades with streets will be separated. To accomplish this it was necessary to lay the grade line lower than would otherwise have been done, increasing the excavation materially. Ten over crossings are provided with 32-ft. minimum roadways and 2 6-ft. sidewalks.

The grading will involve the moving of approximately 750,000 cu. yd. of material, most of which is earth although some sand rock will be encountered. The grading is particularly heavy near the center of the line, one cut being over 75 ft. deep on the center line and another one over 100 ft. deep to the top of the upper slope. The roadbed will be excavated to a width of 48 ft. in cuts and will be built 34 ft. wide on embankment with slopes of $1\frac{3}{4}$ to 1 on fills, in accordance with the standard practice of the Great Northern lines east of the Rocky mountains.

LOCAL FREIGHT FACILITIES

The construction of the new station has also forced the Great Northern to relocate its local freight and team track facilities. To secure the desired room for the new station it will be necessary for this road to give up its freight house and the tracks adjacent to it.

To replace the facilities abandoned at this point the Great Northern has acquired property facing on Eighth street between Pine and John streets where a tract one block wide will be occupied with local freight houses and tracks. Team tracks will also be provided on this area while a similar tract will be given over entirely to this service. These tracks will be connected with the main line of the railroad near Mississippi street by a spur approximately one-half mile long.

The entire development will involve an expenditure of approximately \$300,000 excluding real estate and will give the Great Northern local freight facilities adjacent to and at the level of the wholesale district, eliminating the uphill haul now necessary with the inbound freight. It will also give the road larger facilities to handle the increased business offered to it and will open up a new district for industrial development.

The development of the local freight facilities has been carried on under the supervision of Ralph Budd, assistant to the president of the Great Northern, and A. H. Hoagland, chief engineer. Mr. Budd is president of the Twin City Belt Railway and M. A. Butler is chief engineer in direct charge of the construction of this line.

WASHINGTON CORRESPONDENCE

WASHINGTON, D. C., July 17, 1917.

REDUCTIONS IN PASSENGER SERVICE

Fairfax Harrison, chairman of the Railroads' War Board, has authorized a statement that the railroads of the United States, as part of their effort to make available a maximum of transportation energy for the movement of freight, report the elimination of passenger trains aggregating 16,267,-028 miles of train service per year.

"This is done by the railroads to save man power, fuel and motive power for transportation of necessities, Mr. Harrison said.

"Every ton of coal, every locomotive, every mile of track space, every man whose duties are absorbed by an unnecessary passenger train can be put to effective use in freight service, and nothing is more necessary at the moment to insure the safety and prosperity of the country. The railroads gave in April some 15 per cent more freight service with practically the same facilities as in April, last year. The elimination of passenger service already reported will make available for other purposes over 1,120,000 tons of coal. Many railroads, especially west of the Allegheny mountains, are still to be heard from."

The railroad systems in the Eastern department have cut out 8,598,696 miles of passenger train service, thus saving 716,113 tons of coal per year. The Pennsylvania System eliminated 3,300,000 miles of train service, saving 186,876 tons. The New York Central plans to save 126,000 tons. The Erie has cut out 1,600,000 passenger train miles; the Baltimore & Ohio, 1,168,596; the Chesapeake & Ohio, 850,000; roads in New England, 4,847,332 miles with a saving of 256,724 tons. The Boston & Maine cuts out 2,118,948 miles of service; the New Haven, 1,707,004 and the Maine Central, 442,676.

The Pere Marquette and the Wabash, the only roads reporting as yet from the Central department, have eliminated together 846,600 miles of service saving 49,555 tons of coal. The Southern Railway has cut out 1,900,000 miles and will save 97,282 tons of coal.

INCREASE IN EFFICIENCY DURING APRIL

The Railroads' War Board has received reports of freight operations in April from roads operating 184,814 miles of line, showing their freight efficiency as compared with April, 1916. These roads during April handled 46,317,112 freight train miles, an increase of 1,882,000 train miles or 4 per cent. Total freight car miles, loaded and empty, increased 21,328,000 or 14 per cent, while the empty freight car miles decreased 31,206,000. Freight locomotive miles were 54,766,000 as compared with 53,514,000 in 1916, while the ton miles totaled 30,869,000,000 as compared with 26,355,000,000 in 1916, an increase of 17 per cent. In other words, the freight performance of the roads in April was considerably greater than during the same month of 1916 and the increased performance was handled with greater efficiency. The average train load increased from 606 tons to 666 tons, an increase of 60 tons, or 10 per cent; the average carload increased from 23 tons to 26 tons, or nine per cent. The average daily mileage per locomotive increased from 64.6 to 66.9; average per freight car from 27 to 27.2. The ratio of empty to total freight car miles, also an element in increased efficiency of loading, fell from 30.6 to 28.3. Similarly, the proportion of freight locomotives and cars undergoing or awaiting repairs, was reduced, falling from 16.7 per cent in the case of locomotives to 15.3 and from 6.4 to 5.9 per cent in the case of cars. All three of the territorial districts, east, west and south, show gains in performance.

CENTRAL ACCOUNTING BUREAU

The Railroads' War Board recently issued a bulletin to the railroads announcing that the Sub-Committee on Military Transportation Accounting has been authorized and directed to take immediate steps to create and maintain, for the account of all the railroads, a central railway accounting bureau in Washington, through which railroad accounts for the transportation of men and materials shall be centered for submission to and settlement with the several departments of the government. The bureau will be maintained during the period of settlement of accounts occasioned by the existing war and will be under the immediate direction of the Sub-Committee on Military Transportation Accounting. The settlement of railroad transportation accounts against the War Department has heretofore been made through depot quartermasters at various points, but the War Department has under consideration the early concentration and centralization of railroad transportation accounts against it through its head office in Washington. When this change has been made transportation accounts against all government departments, except those of the reclamation service, will be settled through the Washington offices, and according to the circular of the War Board, unanimity in and quicker settlement of transportation accounts should result from the proposed change. It is believed that the railroads can substantially aid in the accomplishment of the ends sought by the War Department by the establishment of such a bureau, to be run in a co-operative way with the several governmental departments; and that its establishment will do much in producing quicker payments for service rendered by the railroads. This means the enlargement of the temporary bureau which was authorized by the War Board recently for the purpose of handling transportation accounts incident to cantonment construction.

EMBARGO ON EXPORT FREIGHT

Pursuant to the proclamation of the President on July 9 barring certain exports except under a federal license, and to prevent as far as possible the acceptance by railroads of such shipments, the Commission on Car Service at Washington on July 12 telegraphed a notice to all railroads in the country directing them to place a telegraphic embargo, effective immediately, against all shipments of coal, coke, feed grain,

flour and meal therefrom, fodder, meat and fats, fuel oils, kerosene, gasolene, pig iron, steel billets, ship plates structural shapes, scrap iron and steel, ferro manganese, fertilizers, arms, ammunition and explosives; consigned, reconsigned, to be reconsigned, or intended for export, except when a bill of lading is presented with federal license number furnished, or authorized by the Export Council at Washington and according to the announcement of the Department of Commerce, together with the permit number authorized by the port delivery road. Arrangements have been made under which all shipments consigned to points in Canada can go forward as heretofore, special licenses covering same having been issued through the customs service. It was suggested that port lines protect themselves against accumulations at ports by placing such embargo as necessary against cars in transit, and that all port lines should immediately inaugurate a permit system covering all export traffic.

CANDIDATES FOR THE INTERSTATE COMMERCE COMMISSION

About forty names of candidates for appointment to the Interstate Commerce Commission have been placed before President Wilson, who is expected to make an announcement shortly of the appointment of a successor to the late Judson C. Clements, and who will also have two additional places to fill when the bill increasing the membership of the commission from seven to nine becomes a law. The bill has been passed by both Houses of Congress and is now in conference. A large proportion of the names recommended are those of state commissioners and the names of several men who have long been associated with the work of the Interstate Commerce Commission are also understood to be under consideration. These include Attorney-Examiners E. J. Watkins, F. B. Dow and H. M. Thurtell, Secretary George B. McGinty, J. M. Jones, chief of the tariff bureau, and Frank McManamy, chief inspector of locomotive boilers. The names of a number of members of Congress have also been suggested, including W. C. Adamson, chairman of the House Committee on Interstate and Foreign Commerce. It has been stated that the President intends to wait until the bill has been finally passed, and make all three appointments at one time.

SOUTHWESTERN LINES INJURED BY RATE DECISION

In a statement recently issued, Charles E. Schaff, receiver of the Missouri, Kansas & Texas, has the following comments to make on the decision of the Interstate Commerce Commission in the advance rate case:

The decision of the Interstate Commerce Commission in the advanced rate case is particularly unfortunate for southwestern railroads. The figures which the commission cites as having largely controlled its determination that the western lines do not need an advance in rates include all lines west of the Mississippi river. Southwestern lines are victims of this grouping, although operating results indicate plainly that railroad conditions in the southwest are not fairly comparable to those in the northwest. The showings made by the Union Pacific, the Burlington, the Northern Pacific and the North Western, and other trans-continental systems, which do not serve the southwest at all, have apparently controlled the commission's conclusions as to the needs of all lines west of the Mississippi river.

In its decision, the Interstate Commerce Commission estimates that the average gross operating revenue per mile of road of Western lines for 1917 will be \$12,597, and that, based on April, 1917, operating costs, their average operating income per mile of road will be \$3,813. Anticipated increases in operating costs, it is conceded, will reduce this latter figure. Just how hard the decision hits southwestern lines is shown by comparison of the gross and net operating

revenues for 1916 of the 11 principal lines, including the Rock Island and the Gulf, Colorado & Santa Fe, which so largely serve the states of Texas, Arkansas, Oklahoma, much of Kansas and all of Missouri south of the Missouri river, with the commission's estimates for all western lines.

For 1916, the average gross operating revenue per mile of road for these 11 Southwestern lines was but \$9,757, and the average net operating revenue per mile was \$2,901. It should be borne in mind, too, that the Adamson law has imposed largely increased operating costs on all lines since the close of 1916, and that there also have been large increases in the cost of fuel, material and supplies. In short, should the 1916 basis of operating costs be effective, and the commission concedes that they will be increased, the gross and net operating revenues of southwestern lines will have to be increased more than 30 per cent each in 1917 in order to reach the averages estimated by the commission for western lines.

Our difficulty in the southwest is that these 11 lines, with approximately 35,000 miles of road, have been regulated as to rates on the basis of a showing made by trans-continental systems serving a western and northwestern territory in which conditions are dissimilar to those under which we operate. Railroads generally have not enjoyed their fair share of the country's prosperity during recent years. Southwestern lines have suffered particularly, as is indicated by the great proportion of southwestern lines now in bankruptcy or just emerging from receivership. This, too, in the face of the fact that the southwest has been conspicuously prosperous, and that nowhere in the nation does commercial and industrial growth demand greater expansion of transportation facilities.

Where the managements are to turn under present conditions, except to the Interstate Commerce Commission and other regulatory bodies, for money with which to expand facilities is a problem for which no solution appears. It is obvious that present revenues will not provide the means of expansion. In his opinion in the rate case, Commissioner Harlan estimates that for the last 16 years the average annual return for western roads on property investment has been 5.04 per cent. It has been shown how far under the averages for all western lines the southwestern lines have fallen, and it is, therefore, apparent that the return on property investment for southwestern lines is well under 5 per cent. Indeed, on the Missouri, Kansas & Texas for the ten-year period ending with 1916 the average has been 3.14 per cent annually.

The Interstate Commerce Commission's figures indicate that, if all its uncertain anticipations are realized in 1917, the railroads of the country will earn less than 6 per cent on property investment. Southwestern roads will certainly earn much less than 6 per cent. I recently saw a statement showing that 104 American industrial companies enjoyed a total net income during 1916 of a billion and a quarter dollars, as against a quarter of a billion dollars in 1914. Eight industrial companies, which dispose of their output almost entirely to transportation systems, with three steel companies which depend largely on the railroad market, in 1916 enjoyed a net income, after all expenses, materially larger than the operating revenues, before taxes and other fixed charges, of the eleven southwestern railroads previously referred to.

It is against such investment opportunity that the railroads must compete when they seek money with which to expand facilities. Naturally, new money is not to be had for railroad purposes under these conditions, however plentiful it may be for other investments. Nor can it be had, particularly for southwestern lines, so long as less than 6 per cent is held to be an adequate return on property investment in prosperous years, without assurance that any return will be possible during periods of depression.

ONLY GOVERNMENTS ARE BUYING CARS AND LOCOMOTIVES AT PRESENT PRICES

Figures given by the Interstate Commerce Commission in the appendix to its decision in the Fifteen Per Cent case show increases of from 50 to 150 per cent in the prices of cars and locomotives in 12 months' time. Furthermore prices have increased about 30 per cent since the first of the year and are still on the upward trend.

A year or two ago a freight car cost about \$1,000 to \$1,500. The Pennsylvania in February paid \$3,742 for a 70-ton hopper car and \$3,555 for an all-steel box car. The Pennsylvania, according to President Rea, wanted to buy 5,000 coal cars. At \$3,742 each the road's reasons for omitting to provide itself with this equipment are apparent.

The railroads of this country up to about the first of

TABLE I—THE ORDERS TO JULY 15 THIS YEAR AND LAST

Locomotives	1916	1917
Domestic	1,750	2,120
Foreign	872	1,608
Total	2,622	3,728
Freight Cars		
Domestic	54,882	50,255
Foreign	20,675	24,650
Total	75,557	74,905

June were buying locomotives on a large scale, 1933 engines in the first five months of 1917 as compared with 1563 in the same period of 1916. They had to pay as high as \$60,000 for Mikado or Santa Fe locomotives, \$35,000 for eight-wheel switching locomotives and \$25,000 for six-wheel switching locomotives. The Norfolk & Western had a chance in May to buy some big Mallet locomotives; but the price asked was too much. The road is now building the locomotives in its own shops. Two other roads are reported to have paid over \$100,000 for Mallet locomotives.

Since the first of June, the domestic orders for locomotives have fallen off considerably. In the six issues of the *Railway Age Gazette* since the last of May, there have been reported only 187 locomotives, 100 of which were ordered by one road, the Atchison. Most of the big locomotive

* TABLE II—ORDERS SINCE JUNE 1

Railroads	Locomotives	Freight Cars
Builders	171	8,435
Company shops	16	5,390
Total	187	13,735
Governments		
For domestic use	...	6,100
For use overseas	1,014	10,100
Total	1,014	16,200

orders now are for engines to be used across the sea, the allies overseas apparently having finally won out in the competition for space in the locomotive plants. Since the first of June, Russia alone has ordered 500 one-hundred ton Decapod locomotives and 68 narrow gage locomotives in this country and it is understood that it has not placed all the orders it has wanted to place. Its negotiations covered the purchases of 2,000 large and from 142 to 400 small locomotives, and it is thought that as soon as the financing is arranged the additional orders may be placed. The British government has ordered 100 more large Consolidation locomotives from the Baldwin Locomotive Works. With the small orders and with the United States government orders last week for 150 80-ton Consolidation locomotives each with the American Locomotive Company and the Baldwin

Locomotive Works, for service in France, this means that the total orders for locomotives for service overseas is 1014 as compared with only 187 for domestic use.

The total orders for cars for domestic use since the first of June have totaled 19,835 and the foreign orders 10,100. The latter included the 10,000 1200-pood (43,200 lb.) capacity, four-wheel cars ordered by the Russian government. The domestic orders included 6,000 cars ordered by the Canadian government for the Canadian government

ery has confined its orders to the Altoona shops and no cars for 1918 delivery have been ordered elsewhere.

The French government is looking for a chance to place an order for possibly 20,000 cars and there is still pending the question as to whether the United States government should buy 100,000 or more cars.

BRITISH RAILWAYMEN'S CONGRESS.—At the recent annual meeting of the National Union of Railwaymen in Eng-

TABLE III—CAR AND LOCOMOTIVE PRICES THIS YEAR AND LAST

CARS—		1916		1917		
Road	Type	Price	Date of Order	Price	Date of Order	
Chesapeake & Ohio	Hopper	\$949		\$1,531	October, 1916	
Chicago, Burlington & Quincy	Box	898	Feb or July, 1915	1,549	November, 1916	
	Gondola	1,637	March, 1915	1,891	November, 1916	
Illinois Central		1,682		2,600		
Northern Pacific	Refrigerator	1,559	(1913)	2,475	January, 1917	
	Gondola	1,042	(1913)	2,175	January, 1917	
Last lots purchased in 1913						
Pennsylvania Lines East	Steel coal	1,466	January, 1916	3,742	February, 1917	
	Steel box	1,500	January, 1916	3,555	February, 1917	
Peerless Transit Line		\$900 to \$1,100		\$3,750 to over \$4,000		
\$900 to \$1,100 shown simply as "former price." The "over \$4,000" is price for immediate delivery.

	Gondola	1,295	February, 1916	1,919	February, 1917	
	Combination baggage and mail	9,786	February, 1916	12,319	March, 1917	
Western Maryland	Coal	1,035	October, 1915	1,529	October, 1916	
Atlanta, Birmingham & Atlantic		(This company has had bid submitted in 1915 of \$42,510 for two combined steel baggage, mail and express cars. This compares with the price paid the same company in 1916 for two units of same equipment of \$23,640.)				
LOCOMOTIVES—		1916		1917		
Road	Type	Weight	Price	Date of Order	Price	Date of Order
Chesapeake & Ohio	2-6-6-2	435,000	\$31,019	October, 1915	\$48,139	June, 1916
Chicago, Burlington & Quincy	Santa Fe	367,850	26,518	March, 1915	46,450	November, 1916
	Mikado		22,017	March, 1915	42,505	November, 1916
Chicago, Indiana & Louisville	Santa Fe	350,000	31,300	March, 1916	59,000	
Delaware & Hudson			Price of a locomotive 25 per cent larger than former ones is 200 per cent higher.			
Illinois Central	Mikado	278,000	22,205	February, 1915	41,661	February, 1917
	6-wheel switching	170,000	12,400	January, 1915	26,756	February, 1917
	Pacific	278,000	27,818	February, 1916	42,935	February, 1917
New York, Chicago & St. Louis	Switching	173,500	19,250	March, 1916	23,375	November, 1916
1917 locomotives bought under option given in open market would have cost \$31,750.						
Norfolk & Western			43,360		77,500	
Quotation not accepted and none bought.						
Northern Pacific	Mallet	456,000	42,035	(1913)	61,200	January, 1917
	Mikado	330,000	27,977	(1913)	42,700	January, 1917
	Mikado	330,000			61,950	April, 1917
Pennsylvania Lines East	Mikado		39,000	Jan. or May, 1916	63,000	February, 1917
Pere Marquette	Santa Fe	320,000	Not shown		56,250	April, 1917
	8-wheel switching	204,000	Not shown		38,900	April, 1917
Southern Railway	Santa Fe	370,000	\$38,400	April, 1916	73,850	May, 1917
	8-wheel switching		25,483		35,850	May, 1917
Toledo, St. Louis & Western	Consolidation	193,000	19,453	December, 1915	24,316	
Union Pacific	6-wheel switching	156,000	14,913	January, 1916	26,780	March, 1917
Western Maryland	2-8-8-2	495,000	37,276	June, 1915	66,531	October, 1916

Note.—The figures in the foregoing table were compiled as follows: The name of the road, the prices given and the type of locomotive or car are given in appendices 3 and 5 of the Interstate Commerce Commission's report in the Fifteen Per Cent Case. The dates of the orders, the weights of the locomotives, etc., have been supplied from the records of the *Railway Age Gazette*.

Railways and 100 for the Temiskaming & Northern Ontario Railway.

In short, the orders from railways the last month and one-half have totaled only 13,735; those of governments, 16,200. Of the 13,735 ordered for use by the railways directly, only 8,435 were ordered from equipment builders; the remainder, 5,300, are to be built in railroad shops. The Pennsylvania, to take one example, has not ordered a single car from equipment builders so far this year. Owing to the extremely high prices of materials, the difficulty of obtaining deliveries, and the scarcity of labor, that road in arranging for the construction of freight cars for 1918 deliv-

land, A. Bellamy, in his presidential address, said that the membership had risen in four years from 132,000 to 340,131. On the second day of the convention, the members passed the following resolution: "That this congress enters its emphatic protest against the release of more railwaymen for military service on the grounds (1) that an undue strain is already being placed on the men, and (2) that substituted labor has already been proved to be inefficient and a serious menace both to the railwaymen and the traveling public; and that should the release of men be continued this congress empowers the Executive Committee to use every means to secure safe working of the railways."

DANIEL WILLARD ON THE RAILROAD SITUATION

Daniel Willard, president of the Baltimore & Ohio and chairman of the Advisory Commission of the Council of National Defense, also chairman of its committee on transportation, has given out at Washington through the Committee on Public Information a statement to the public outlining some of the aspects of the railroad situation with reference to their nationalization under the direction of the Railroads' War Board.

"The essence of the railroad situation," said Mr. Willard, "is that the railroads of the whole United States are nationalized. The 693 railroad companies operating in 48 states and controlling 263,000 miles of road are responding admirably to central direction from the so-called Railroad War Board of railway presidents. They have responded to every suggestion made by the Council of National Defense through the War Board. They have made all transfers of troops on schedule in a manner, so far as I am advised, entirely satisfactory to the War Department, without serious disruption of regular traffic. They have tremendously increased the supply of coal cars, facilitated the transit of grain and met the needs of the government at least as promptly and effectually as if they were under direct government authority."

President Willard explained that last summer the railroads worked out with Colonel Baker, of the Quartermaster's Corps of the Army, a complete scheme for wartime railroad operations and that this scheme, since elaborated and perfected, has worked so well that "during the past two months the railroads of the country, though handling vastly more ton miles than ever before, have been constantly transporting troops in considerable numbers without in the least interrupting regular traffic."

The regular traffic, he explained, has been larger probably than in any previous period in the history of the country. "Traffic was heavy before the United States entered the war," he said, "because of the necessity of moving tremendous quantities of supplies, material and finished products for the Allies, but since April 6 it has increased tremendously. The reports for the month of April show that the railroads of the United States in that month handled over three billion more ton miles than were handled during the same month in 1916—an increase in business amounting to 16 per cent. And the traffic in April, 1916, although there was a strike impending, was heavy compared to almost any year before the beginning of the European war."

Mr. Willard said that, in the judgment of many railroad men who have followed the situation closely, vital congestion would have hindered the transportation of troops, seriously delayed the completion of the cantonnements and aggravated the coal situation if the railroads had not voluntarily made themselves ready to act as a unit in response to the suggestions of the War Board.

"Beginning with April 6," he said, "business activity has been greater than ever before in America, I think. It was stimulated in many directions—by the manufacture of uniforms, clothing, materials for the building of cantonnements, making of ammunition, etc. Then traffic was increased by the withdrawal of many of the lake boats and the roads had to assume that extra burden. Boats were also withdrawn from coast traffic, both on the Atlantic and Pacific, and much of the bulk that has been going through the Panama Canal was turned over to the railroads. And there were other factors. For instance, the farmers of the country responded in fine spirit to the request of the Secretary of Agriculture that they plant more land. They planted 30 per cent more land than a year ago and called upon the railroads to move large quantities of agricultural implements, fertilizer, seed, etc."

Before America's entrance into the war, Mr. Willard said, there was serious railroad congestion, not because the railroads were broken down but because traffic had been extraordinarily heavy and there was no concerted move possible to get greater efficiency. One of the first steps of the War Board was to request the railroads to give preference to the movement of coal, particularly coal for the government, and that the second preference should be given to ore. Means for identifying government shipments were devised and orders were sent out by the railroads to send government freight through to destination whether or not there were through rates and divisions prevailing. Ways were also planned to accelerate allied shipments, after conferences with representatives of the allied nations, and the roads were encouraged and urged to expedite the repair of cars and of locomotives and to load cars to their utmost capacity.

THE ROADMASTERS' CONVENTION

At a meeting of the Executive Committee of the Roadmasters' & Maintenance of Way Association, held in Chicago on July 14, it was decided to hold the annual convention at Chicago on September 18 as planned but to shorten it to three days.

The advisability of postponing the meeting this year was considered carefully and it was decided that the unusual and serious problems confronting track men in the securing of labor and materials made the exchange of information more than usually advisable at this time. The program of committee work was revised radically to enable most of the time to be devoted to the consideration of those problems of particular importance at the present time. The program as outlined is as follows:

TUESDAY, SEPTEMBER 18.

- 9:30 A. M.—Convention called to order.
Reports of president, secretary and treasurer.
Appointment of committees on nominations, resolutions, auditing, etc.
- 10:30 A. M.—Committee report: Recommended methods for the inspection of ties in track and recommendations for renewals.
- 2:00 P. M.—Committee report: The best methods of securing and retaining track labor.
- 4:30 P. M.—Paper: Maintenance of track in large terminals. C. J. Coon, engineer of track, Grand Central Terminal, New York.
- 7:30 P. M.—Paper: Economical methods of maintaining street and highway crossings. M. J. Griffin, supervisor, C. R. R. of N. J., Jersey City, N. J.
- 8:30 P. M.—Building the tracks at the cantonnements. Coleman King, supervisor, Long Island, Jamaica, N. Y., and others.

WEDNESDAY, SEPTEMBER 19.

- 9:30 A. M.—Paper: The present maintenance of way material problem. W. A. Summerhays, assistant purchasing agent, Illinois Central.
- 11:30 A. M.—Paper: The oiling of rails and fastenings to protect them from corrosion. E. T. Howson, engineering editor, *Railway Age Gazette*.
- 2:00 P. M.—Paper: Housing and feeding maintenance of way laborers.
- 3:00 P. M.—Paper: Labor saving devices for track work.
- 4:00 P. M.—Inspection of exhibits, Track Supply Association.
- 7:00 P. M.—Annual banquet given by the Track Supply Association, Thursday, September 20.
- 9:30 A. M.—Discussion of current track problems.
- 10:30 A. M.—The inspection of rails during their manufacture, by Chas. W. Gennett, Jr., manager, rail inspection department, R. W. Hunt & Co.
- 11:00 A. M.—Election of officers.
Selection of meeting place for next convention.
Closing business.
- 1:00 P. M.—Leave for inspection of rail mill of the Illinois Steel Company, Gary, Indiana.

The Track Supply Association will present an exhibit in connection with this convention.

SPANISH RAILWAY CAPITAL.—Of the capital invested in railroads in Spain \$37,000,000 is foreign. France having about \$20,000,000, Belgium \$15,000,000, and England \$2,000,000.

Fuel Department of the Rock Island

The Purchase, Distribution, Handling and Consumption of All Fuel Is Controlled by a Separate Department

THE fuel department of the Chicago, Rock Island & Pacific is unique in that the purchase of the fuel, its distribution, method of handling, and its consumption are in the hands of the mining and fuel department, the manager of which reports direct to the chief operating officer of the road. This brings under one head all questions pertaining to fuel and presents an opportunity for the obtaining of a true fuel economy, cost and consumption considered.

ORGANIZATION

The officers of this department rank as general officers and deal directly with the superintendents of the various divisions. Each superintendent is held responsible to this

Instructions regarding the use of fuel in locomotive service and at stationary plants emanate from the office of the mining and fuel department. They are sent to the division superintendents for distribution to the assistant engineers of fuel economy, the road foremen of equipment, stationary plant engineers, or whoever is affected by them. All questions which arise on the road concerning fuel are submitted through the various division superintendents to the Mining and Fuel Department.

The duties of the superintendent of fuel are the negotiation of contracts and the purchase of fuel, including coal for locomotives and stationary plants, coke, and oil, and such other special fuels as may be required. His staff looks after the inspection of the fuel, the checkweighing of cars, including surprise checkweighing tests to eliminate carelessness, deliberate or otherwise, on the part of the mine weighmaster.

The fuel inspectors advise the main office regularly as to labor matters and any unusual conditions existing at the mines which may in any way interfere with the prompt delivery of coal. Fuel inspectors also send in samples of coal from the various mines for laboratory test, so that from the information available the most suitable coals can always be selected for the respective requirements.

The duties of the coal chute supervisor are to look after the cost of handling fuel and the operations of the 157 chutes on the system. With his two inspectors he sees that the fuel is handled at the lowest possible cost, and where necessary he recommends changes which will reduce the cost, co-operating with the superintendents on their respective divisions.

The duties of the superintendent of fuel economy and his six assistants are to look after the economical use of fuel on locomotives, which consists in the instruction of the engine crews in the best method of firing and the supervision of the condition of locomotives as far as they affect the consumption of fuel. This includes the inspection of engines at terminals to the extent that the boilers are properly cleaned inside and outside; that the required size of nozzle is maintained; that all packings are in a condition for best operation.

The fuel economy staff also holds general meetings at the larger centers, where by moving pictures and lantern slides the essential features of fuel economy are vividly brought to the attention of the men using the coal. These instructions include the prevention of obnoxious smoke and other features which are essential to the best results.

The duties of the supervisor of stationary plants are to look after the fuel consumption of the stationary plants and to generally supervise the steam generating plants used for the operation of shops, pumps and for heating. He sees that the boilers are fired in the proper manner and that boilers, steam and air pipes are maintained to prevent leaks which cause an increase in fuel consumption.

The entire staff co-operates in any method which may bring about the most economical results, and while certain assignments of duties are made, there is a general interchange of work on matters which bring about final results; in traveling over the system every employee is required constantly keep fuel economy before him. The coal inspectors traveling from one mine to the other are required to travel on locomotives in order to note that tanks are not overloaded at fuel stations, which is the particular duty of the coal chute inspectors; in like manner the coal chute

supervisors at terminals check the movement of coal cars, loaded and empty.

DISTRIBUTION

The Rock Island uses coal from approximately 70 coal mines. The most economical grade of coal is determined for each point on the system and daily schedules of delivery are drawn up each week in the general office, and the amount of coal to be delivered during the coming week is determined from the previous week's consumption. A coal report is made up in the office of each superintendent daily, the day ending at 6 p. m.; this is wired to the general office before 3 a. m. the next morning. The information conveyed in this report is as follows: Amount of coal in pockets at the coaling stations and on the chutes in cars; number of cars not placed at the chutes; amount of coal used at each station during the preceding 24 hours; number of cars in transit for this and other divisions and to what stations consigned; number of loaded cars with company coal waiting for train, including the stations at which the cars are held and to what station they are consigned; amount of coal received from each individual mine and from junction points; amount of company coal in cars billed from the mines and junction points and to what stations it is consigned; number of cars of company coal loaded at the local mines; number of empty cars delivered to the local mines for company coal; number of cars of company coal received from local junction points with other roads and the number of empty cars delivered to those points; amount of storage coal loaded or unloaded; together with the amount on the ground at the various stations; amount of fuel oil on hand in storage tanks and in cars, and the number in transit at each station. Also the number of gallons of fuel oil consumed during the preceding 24 hours.

This report gives the general office complete information regarding the amount of coal on hand at each station, shows the location of the cars in transit to other divisions and shows whether or not the mines are keeping up with their daily schedule of output.

Under normal conditions, about 1000 cars are required to keep the stations supplied, and this represents about $\frac{4}{5}$ days' consumption for the system. In addition to this, about one day's supply is kept in the various chutes and fuel station bins. Particular attention is given to the proper utilization of cars, and box cars are frequently used even though the cost of handling is greater, to effect greater car efficiency. Self-cleaning cars are assigned to chutes equipped for mechanical handling and flat bottom cars where unloaded by hand.

Special efforts are made to prevent the mixing of coal and to furnish regularly the same grades of coal for use on a given territory.

LOCOMOTIVE PERFORMANCE

To this time no attempt has been made to check the individual performance of each engine crew, but collective statements showing the performance on each division, divided into freight, passenger and switch service are posted in the round houses which show the performance of each division compared with the same month of the previous year and the loss or gain reduced to dollars and cents and the respective position which each division occupies toward the entire system. These statements are furnished in the shape of graphic charts and in tabulated figures as well. The engine crews are fully informed that these tables do not reflect conditions entirely within the control of the management. There are certain factors, such as the quality of coal available, type and size of engine used, grade conditions, and density, direction and distribution of traffic, which all have an important bearing on coal consumption, but inasmuch as some of these conditions are more or less permanent, any change of conditions is readily observed by the up or

down grade lines on the graphic charts, and considerable competition has been developed in this direction.

It is contemplated in the very near future to adopt an individual performance record, which will be prepared in the office of each division superintendent immediately at the end of each run. The information as to the consumption of coal will be obtained from a slip made out by the engineers showing the amount of coal used on each trip. This fuel consumption slip is a part of the time check and will be handed in at the superintendent's office with the time slip so that the information will be promptly available and enable the immediate compilation of the performance of each engine. This method will obviate the necessity for coal tickets which are now used but from which no satisfactory reports can be compiled.

RESULTS

This organization has been in operation for about a year, and while this period is entirely too short to determine the full possibilities, it may nevertheless be of interest to point to the following comparisons:

For the year ended June 30, 1915, the amount expended for coal for all uses amounted to \$7,168,378.41, and for the year ended June 30, 1916, the corresponding amount was \$6,762,430.88, or a difference of \$405,947.53. This saving was made with an increase in 1000 ton-miles in freight service of 913,866. This indicates a saving of \$826,802.56. In other words, had as much work been done in 1915 as was done in 1916, the fuel bill for 1915 would have been 12.2 per cent greater than it was during the year 1916. It is safe to anticipate that the increased cost of coal due to higher wages calls for intensified work in the direction of fuel economy and that the use of improved mechanical appliances and better firing methods will result in a decided reduction in the quantities consumed, a situation most necessary in view of the rapidly climbing cost of coal at the mines.

CO-OPERATION IN LAND VALUATION

Up to the present time the Division of Valuation of the Interstate Commerce Commission has made its valuations of land entirely independent of the carriers. There have been many objections to this practice and a plan of co-operation has recently been authorized by the Director of Valuation for the determination of the normal or naked land values. The following memorandum has been issued by the Division of Valuation under date of June 25, 1917.

Steps to be taken in order:

1. Blue prints in duplicate are to be furnished by the carriers, one set to become the official maps of the Commission's appraiser, and the other to be marked as hereinafter described and returned to the carrier.

2. The appraisal work will be done by the forces of the Commission and those of the carrier without co-operation, except in the case of fixing zone limits, which, if possible, should be agreed upon. (It is understood that such zone limits are only tentative, and after further information—sales, opinion, etc.—are gathered, may be changed either by the railroad or the Commission.)

All information such as opinions are to be separately gathered and considered, and unit prices are to be set by both the carrier and the Commission without joint discussion. It may be profitable, both in the saving of time and money, that record information such as sales and assessments, ground rents, etc., be exchanged; but this will simply be the *record information* and should not indicate the relative importance set by the appraiser on each such piece. Additional information, such as true considerations, etc., where this is not a matter of record, should not be furnished by the Commission to the carrier; but where the carrier desires

to do so, in a spirit of helpfulness, it will be received by the Commission's representative.

3. Returns to Order No. 7 should be in the hands of the Division of Valuation.

4. When the field appraisal work has been completed by the Commission, the areas will be calculated and marked upon the duplicate maps, together with the zone limits, classification as between carrier and non-carrier, and excluded areas, and returned to the carrier in order that it may have full knowledge of the quantities, etc., upon which the Commission bases its findings.

5. Areas by zones should be checked by the carrier. It will be understood that the Commission's figures have not previously been checked, and may contain errors. The carrier may not agree to some features, such as the exclusion of certain areas, but for the purpose of agreeing as to unit prices it should make its calculations on the same basis—i. e., the same zones and exclusions—as used by the Commission. Differences as to area, and objections to classification, should be furnished by the carrier to the Commission within 30 days after receipt of duplicate maps for a valuation section. The Commission will recompute all disputed areas and advise the carrier so that all disputed questions in this connection may be settled. It will also consider the carrier's objections to classification and advise of any changes in this respect. It will be understood that the district office has no authority to modify classification where the point is distinctly covered by instructions, nor can such cases be modified by the joint conference hereinafter referred to. However, points which depend upon an interpretation of the instructions, or an understanding of the facts, and may under the instructions be modified, may be brought up and discussed at the joint conference. In every case, however, the carrier should, prior to the conference, furnish a written statement to the district office covering each instance of such classification. In passing these points the carrier waives none of its rights to later present them to the director.

6. When the field work has been completed, the carrier will furnish a statement to the supervisor of land appraisals, showing the total area and total value, by valuation sections. By value is meant normal land value only, in terms of adjoining or adjacent similar land.

7. The Division of Valuation will thereupon at once furnish the carrier a statement of its totals, area and value, by valuation sections.

8. Some of these valuation sections will doubtless be accepted by the railroad and no further work need be done on them. Where they do wish to dissent, however, they should then prepare and submit a tabulation, such as shown on the attached form, giving the Commission's zone number; the carrier's corresponding zone or zones; the area agreed upon or the basis of the Commission's methods (it being understood the carrier does not waive any of its rights in this connection to later present its claims to the director for areas in industrial tracks, public streets, etc.); unit price, or prices, with the carrier's average price for the commission's zone, and the total value for each zone.

The other columns on the form will then be filled out with the Commission's figures, so that the comparative values will be clearly shown, and a copy sent to the carrier.

9. After this statement has been prepared a joint conference shall be had between representatives of the carrier, the district office, and the supervisor's office, with a view to harmonizing, where possible, these differences. At this conference all information gathered by the appraisers of both sides should be available and will be offered freely. The carrier will be required to have its supporting information so indexed as to be available for ready reference. The conference will in the first place be held at some convenient point and such differences as can be eliminated disposed

of without the necessity of visiting the property. In some cases, however, it may be necessary to make a personal inspection of the property. In the case of the larger roads, it may be desirable to take the matter up by several convenient divisions rather than to have one conference only for the entire system. It will be understood that the findings of this joint conference will not be binding upon either party until ratified by both the director and the carrier. In addition to the discussion of unit prices at this conference as many differences as possible in classification as between carrier and non-carrier should be eliminated.

INTERSTATE COMMERCE COMMISSION DIVISION OF CAR SERVICE

The announcement of the establishment of the Division of Car Service of the Interstate Commerce Commission was briefly reported in last week's issue. The notice issued by the commission on July 12 describing the organization and purposes of the commission gives some further details as follows:

"The Interstate Commerce Commission has created a Division of Car Service under the authority conferred by the car service act approved May 29, 1917, amending Section 1 of the act to regulate commerce, to deal with the movement, distribution, exchange, interchange, and return of freight cars. E. H. DeGroot, Jr., until recently superintendent of transportation of the Chicago & Eastern Illinois, now in the exclusive employ of the Interstate Commerce Commission, has been appointed chief of the Division and with A. G. Gutheim, attorney-examiner of the Interstate Commerce Commission, will take immediate charge of its organization and operation. The commission has also secured temporarily for this work the services of H. C. Barlow, chairman of the executive committee of the National Industrial Traffic League. During its formative period the division will have the collaboration and advice of Mr. Barlow.

"The Interstate Commerce Commission through this division will regulate car service throughout the United States, and, where occasion requires, orders or directions of the Interstate Commerce Commission will issue under the Car Service Act direct to the carrier or carriers concerned. Subject to this fundamental principle, the Division of Car Service will, as far as practicable, avail itself of co-operative effort on the part of the carriers' Commission on Car Service now located in Washington. This latter body consists of seven members, all superintendents of transportation of different railroads which territorially cover practically the entire United States. The Commission on Car Service has a large force of assistants under its control in Washington and in the field.

"Complaints and communications regarding car service received by the Interstate Commerce Commission will be handled through the new division. The field service will be developed as occasion may require. It is expected that shippers and receivers of freight will to the fullest extent aid in promoting car service by promptly loading and unloading carload shipments, by capacity loading, where possible, regardless of carload minima, by readily adapting themselves to such modifications in the handling of less-than-carload shipments as may be found necessary, and by hearty co-operation in the other methods which have been or may be devised to meet the transportation problems confronting the country.

"The commission is advised that the carriers have appointed local car service committees at some 25 points throughout the country, and that the National Industrial Traffic League has appointed similar committees of shippers at the same points, the aim being to secure harmony and co-operation between shippers and carriers. The

commission suggests that these committees should meet jointly, where necessary, to adjust local affairs; any irreconcilable differences which arise may be referred to the carriers' commission on Car Service or to the Division of Car Service of the Interstate Commerce Commission for adjustment."

A brief account of the life of Edward H. DeGroot, Jr., the chief of the new division, was published in these columns last week.

Mr. Gutheim was born in 1878 at Cambridge, Mass., and entered railway service with the Fitchburg Railroad, now part of the Boston & Maine, in 1896. He was connected with the accounting department of that railroad and of the Boston & Maine until 1906, when he resigned to become a special agent of the Bureau of Corporations of the Department of Commerce and Labor. At the time of his resignation he was chief clerk in the general accounting office and had just been promoted to traveling auditor. He had studied law and had been admitted to the Massachusetts bar and for a time practiced law in Massachusetts. On October 1, 1908, he became connected with the Interstate Commerce Commission as an examiner of accounts and since that time has been special agent, assistant chief of the division of inquiry, attorney for the commission on several in-

the purpose to make a thorough study of the situation in order to ascertain what steps it may be advisable for the commission to take in addition to the work which has been carried on by the Commission on Car Service for several months. Attorney-Examiner Gutheim has been attending the meetings of the Commission on Car Service for the past three months and, therefore, is thoroughly familiar with the work that has been done; and as the representative of the Interstate Commerce Commission he has handled complaints and communications from shippers in regard to matters pertaining to car service. He has co-operated actively with the railroads' committee in its efforts to secure greater efficiency from the existing transportation facilities by promoting heavier loading of cars and prompt loading and unloading, etc. Moreover, the Interstate Commerce Commission has co-operated with the Commission on Car Service and its predecessor, the Committee on Car Efficiency, since the latter went to Washington in November, first through Commissioner McChord and Attorney-Examiner F. B. Dow, who attended the meetings of the railroad committee, and later through Commissioner Hall and Mr. Gutheim. Commissioner Clark also attends meetings of the Railroads' War Board as an ex-officio member and participated in the discussions which led to the adoption of new car service rules on April 26, under which

A. G. Gutheim

E. H. De Groot, Jr.

H. C. Barlow

vestigations, attorney-examiner, and in connection with work for the commission, has been special United States attorney in different districts on numerous cases.

Henry C. Barlow is traffic manager of the Chicago Association of Commerce and has been connected with that association and its predecessor, the Chicago Shippers' Association, since 1904. He was born on August 15, 1850, at Niles, Mich., and entered railway service in 1866 as office boy and clerk for the Illinois Central. He was later telegraph operator for the Chicago & North Western, and later clerk, agent and traveling freight agent for the same road. In 1881 he became division freight agent for the Winona & St. Peter and Dakota Central Railroads and from July, 1882, to November, 1884, was assistant freight agent of the Atchison, Topeka & Santa Fe. In 1883-1884 he was general freight agent of the same road and from 1884 to 1886 was traffic manager of the Mexican Central. From 1887 to 1893 he was traffic manager of the Wisconsin Central Lines, leaving that system in 1893 to become vice-president and general manager of the Evansville & Terre Haute. From 1894 to 1901 he was president of the same road. He was afterward traffic manager for the General Paper Company and in September, 1904, became general manager of the Chicago Shippers' Association, later becoming traffic director of its successor, the Chicago Association of Commerce.

For the present it is understood that the new division does not contemplate any great activity on its own account as it is

the freight car equipment of the country has been practically pooled.

The text of the Esch-Pomerene law, is defined as an amendment to the act to regulate commerce, is as follows:

The term "car service," as used in this act, shall include the movement, distribution, exchange, interchange, and return of cars used in the transportation of property by any carrier subject to the provisions of this act.

It shall be the duty of every such carrier to establish, observe and enforce just and reasonable rules, regulations, and practices with respect to car service, and every unjust and unreasonable rule, regulation, and practice with respect to car service is prohibited and declared to be unlawful.

The Interstate Commerce Commission is hereby authorized by general or special orders to require all carriers subject to the provisions of the act, or any of them, to file with it from time to time their rules and regulations with respect to car service, and the commission may, in its discretion, direct that the said rules and regulations shall be incorporated in their schedules showing rates, fares, and charges for transportation and be subject to any or all of the provisions of the act relating thereto.

The commission shall, after hearing, on a complaint or upon its own initiative without complaint, establish reasonable rules, regulations, and practices with respect to car service, including the classification of cars, compensation to be paid for the use of any car not owned by any such common carrier and the penalties or other sanctions for nonobservance of such rules.

Whenever the commission shall be of opinion that necessity exists for immediate action with respect to the supply or use of cars for transportation of property, the commission shall have, and it is hereby given, authority, either upon complaint or upon its own initiative without complaint, at once, if it so orders, without answer or other formal pleading by the interested carrier or carriers, and with or without notice, hearing, or the making or filing of a report, according as the commission may determine, to suspend the operation of any or all rules, regulations, or practices then established with respect to car service for such time as may be determined by the commission, and also authority to make such just and reasonable directions with respect to car service during such time

as in its opinion will best promote car service in the interest of the public and the commerce of the people.

The directions of the commission as to car service may be made through and by such agents or agencies as the commission shall designate and appoint for that purpose.

In case of failure or refusal on the part of any carrier, receiver, or trustee to comply with any direction or order with respect to car service, such carrier, receiver, or trustee shall be liable to a penalty of not less than \$100 nor more than \$500 for each such offense and \$50 for each and every day of the continuance of such offense, which shall accrue to the United States and may be recovered in a civil action brought by the United States.

ILLINOIS CENTRAL 2-10-2 TYPE LOCOMOTIVES

The Illinois Central has received from the American Locomotive Company three locomotives of the 2-10-2 type which are being used in hump yard service, and which have been giving good results. As it was thought that freight locomotives of this type might be adopted later, the details were worked out to make these engines suitable for road service as well as yard service. As many parts as possible were made interchangeable with the Mikado type locomotives which are now in use in main line freight service. The tenders used for these two classes are identical, as are also the foot plates, driving boxes (except for the main driver), driving springs, crossheads, fire door, valves, certain valve motion parts and the cab.

The boiler is of the wagon top type designed to carry 185 lb. pressure with a factor of safety of 4.5. It has an outside diameter of 96 in. at the dome course and 82½ in. at the front course. The firebox has an unusually large volume; the grate area is 80.4 sq. ft. and the firebox is 82 in. deep at the back and 97½ in. deep at front. It has a combustion chamber 48 in. deep and is equipped with a

The main crank pins are hollow. The crank and crosshead pins are of acid open-hearth steel, while the crosshead keys are chrome-vanadium steel and the piston rods nickel-chrome steel. The pistons and piston rings are of Hunt-Spiller iron and the cylinders have bushings ¾ in. thick of the same material. The piston valves are 15 in. in diameter and have extended valve stems. The valve motion is of the Walschaert type, being controlled by a power reverse gear. All the pins are case hardened and work in brass bushings.

To make the valves on the turret more accessible it is placed on the backhead of the boiler. A special arrangement has also been used to prevent trouble due to pipes being shaken loose by the vibration of the cab. The holes in the cab are made 1 in. larger than the pipes which pass through them and all steam pipes have leather collars which are clamped to the cab by means of metal rings, thus forming a tight joint between the pipe and the cab.

The brake equipment used on these locomotives is the New York Air Brake Company's Type L T, with two No. 5 air compressors. Two 14-in. brake cylinders are provided for the first six drivers and two 12-in. cylinders for the last four drivers. One 14-in. by 12-in. brake cylinder is used on the tender.

The principal dimensions and ratios of these locomotives are as follows:

General Data	
Gage	4 ft. 8½ in.
Service	Yard
Fuel	Bit. coal
Tractive effort	67,173 lb.
Weight in working order	367,000 lb.
Weight on drivers	286,000 lb.
Weight on leading truck	29,500 lb.

Locomotive of the 2-10-2 Type Designed for Yard or Road Service

brick arch. The design is such that the back tube sheet can be removed without disturbing any of the firebox or combustion chamber sheets. An auxiliary dome placed behind the main dome is provided to facilitate inspection. This dome carries the safety valves and also a blow-off valve. The ashpans of the hopper bottom type and has an opening with a separate cover plate for passing grate bars into the firebox. The grates are of the box type shaking in four sections.

The frames are of cast steel. The top rail is 6 in. by 5¾ in., the depth being increased to 7 in. over the pedestals. The bottom rail is 6 in. by 4 in. and the cylinder fit 6 in. by 11½ in. The waist sheet T-bars are not riveted to the boiler but have a sliding fit against the boiler when hot. As the service in which these locomotives will be used made good curving qualities necessary the main tires were made flangeless. An engine truck of the inverted rocker type was applied and 4¾ in. motion each side of the center was provided in the trailing truck. This construction enables the locomotives, in spite of their long wheel base, to take 16-deg. curves.

Weight on trailing truck	51,500 lb.
Weight of engine and tender in working order	537,000 lb.
Wheel base, driving	23 ft. 0 in.
Wheel base, total	41 ft. 2 in.
Wheel base, engine and tender	71 ft. 6 13/16 in.

Ratios

Weight on drivers ÷ tractive effort	4.25
Total weight ÷ tractive effort	5.46
Tractive effort × diam. drivers ÷ equivalent heating surface*	659
Equivalent heating surface* ÷ grate area	79.9
Firchcox heating surface ÷ equivalent heating surface* per cent.	5.70
Weight on drivers ÷ equivalent heating surface*	44.5
Total weight ÷ equivalent heating surface*	57.2
Volume both cylinders	24.4 cu. ft.
Equivalent heating surface* ÷ vol. cylinders	263
Grate area ÷ vol. cylinders	3.29

29.	Louisville & N.....	Eminence.	unx	P.	0	9

The trains in collision near Frackville, Pa., on the ninth were southbound freights. One trainman was killed and one was injured. The leading train had been stopped and was not well protected by flag.

The trains in collision at Cove Run, W. Va., on the 10th were a wrecking train, which had stopped at a water station, and a through freight, the freight running into the rear of the wrecking train. Three trainmen were killed and four were injured. The collision is attributed to insufficient flagging combined with poor judgment on the part of the engineman of the freight.

The trains in collision at Vinita, Okla., on the 18th were a passenger train of the St. Louis-San Francisco and a freight of the Missouri, Kansas & Texas, the passenger running into the freight at the crossing of the two roads. Two passengers were killed. The passenger train had approached the crossing at uncontrollable speed because the engineman had left his cab in order to avoid being scalded by steam from a ruptured pipe.

The trains in collision near Wheelerton, Tenn., on the morning of the 19th, were southbound passenger No. 1, and southbound freight No. 73, the passenger running into the rear of the freight which had been stopped preparatory to entering a side track. The engineman of the passenger train was killed and the fireman injured. Five cars of the freight train and the two leading cars of the passenger train were wrecked. The cause of the collision was failure of the flagman of the freight to properly protect his train.

The trains in collision at Irving, W. Va., on the 22nd were an eastbound wrecking train and an eastbound freight, the wrecking train running into the rear of the freight. One employee was killed and three were injured. The collision was due to some inefficiency or misunderstanding in regard to the flag-protection of the work train.

The trains in collision near Baskett, Ky., on the 29th were westbound freight No. 163 and eastbound engine No. 23 without a train. Engine 23 was wrecked. One engineman and both firemen were killed. The men in charge of the westbound train overlooked an order and ran past the appointed meeting station.

The train derailed at Leetonia, Ohio, on the first about 3 a. m. was eastbound passenger No. 2. The engine and first four cars ran off the rails and the engine was overturned. The fireman was injured. The cause of the derailment was a loose movable point frog, the rod connecting the frog to the interlocking machine having been broken.

The train derailed near Holbrook, Ariz., on the second was westbound passenger No. 7, drawn by two engines. The leading engine was wrecked by the explosion of its boiler and the other engine and the mail car and the baggage car were ditched. One fireman was scalded fatally and one engineman and one fireman were injured. The cause of the explosion was low water.

The train derailed near Arcola, Ill., on the evening of the seventh was an eastbound special passenger train carrying officers of the United States Government and their guests from France, Messrs. Viviani, Joffre and others. The train consisted of two locomotives and five steel cars. The tender of the second engine and the first car ran off, but the cars remained upright except the leading one, a combination car, which lay at an angle of 45 degrees. There were no serious personal injuries. The train was running at moderate speed—about 30 miles an hour, on a straight line—and the derailment was due to a broken rail; a square break, 7 ft. from the end.

The train derailed near Bonfils, Mo., on the 10th was a westbound freight. Four cars were ditched. The conductor of the train was killed and a brakeman was injured. Both of these men were in the cupola of the caboose, which was overturned.

The train derailed at Twin Grove, Ill., on the 12th of May was an eastbound freight, made up of cars of oil, running as No. 94. Five cars of oil were burnt up. The road was blocked 14 hours. The derailment is believed to have been due to the rocking of a car, allowing the flange of a wheel to mount the rail.

The train derailed at Gerlach, Nev., on the 18th was a westbound freight, of 30 cars of oil. The oil took fire and twelve cars were burnt up.

The train derailed at Mineral, Ohio, on the 24th was westbound passenger No. 3. The engine and four cars ran off the rails and one car fell off a bridge into a creek. Eleven passengers and three trainmen were injured, none seriously. The cause of the derailment was a breakage in one of the trucks of the tender.

The train derailed near Eminence, Ky., on the 29th was eastbound passenger No. 16. Two coaches were overturned and nine passengers were injured. The cause of the derailment was an unfastened switch; how it came unfastened has not been determined.

¹ Abbreviations and marks used in Accident List:

rc—Rear collision—bc, Butting collision—xc, Other collisions—b, Broken—d, Defective—un, Unforeseen obstruction—unx, Unexplained—derail, Open derailing switch—ms, Misplaced switch—acc, obst., Accidental obstruction—malice, Malicious obstruction of track, etc.—boiler, Explosion of locomotive on road—fire, Cars burned while running—P. or Pass., Passenger train—F. or Fr., Freight train (including empty engines, work trains, etc.)—Asterisk, Wreck wholly or partly destroyed by fire—Danger, One or more passengers killed.

Some Constructive Thoughts on Car Interchange

Mechanical, Financial and Operating Aspects Should be Considered in a System of Car Service and Interchange

By Samuel G. Thomson*

THE development of a proper system of car interchange and car service is probably one of the most important transportation problems before the country today. Several months ago the customary rules for car service and interchange were modified and greatly intensified through the combined efforts of the Interstate Commerce Commission and the larger railroads. Stringent regulations and a much higher per-diem rate were used to compel vigorous action along the line of individual ownership and prompt return of the car to its owner. This quickly developed the inherent weakness of our present-day interchange and car service system by greatly increasing empty mileage and consequently reducing the car supply at a time when an urgent increase was needed to meet war conditions. A complete reversal of practice was then instituted, entirely abandoning the individual ownership idea and establishing a general car pooling arrangement under centralized control. In this plan which is now in force, all cars are to be used for the best interests of the country regardless of the separate railroads and individual ownership. The question now arises whether or not our former interchange and car service rules, which considered the owner, will again be good enough for normal times after the war, or whether a combination of the individualistic and the pooling system should be developed.

Should we try then to determine how far the car which best serves the country can be made to best serve its owner's business? One might think generally that the best use of the car for the nation would result in its best use for the owner on account of economic laws, and it may be that a general interchange can be worked out in which such an ideal dual function will be approximated. However, the struggle of the separate railroads as individuals in the normal transportation competition of the country will be a force at work in the opposite direction from such an ideal service. The natural tendency will be to drift back again towards the "each-one-for-himself" rule of competitive business and to require the car to make its best showing for its owner as a business investment regardless of the showing that it makes for the country in general. The problem then may resolve itself into a vigorous effort to determine just how far the car can be made to perform its function after the war for the general service of the country, while at the same time performing its maximum service for its owner. Will the system be permitted to develop through normal business channels as a purely economic problem, or will it be determined on an ethical basis and be prescribed by law? This question is closely related to some of the principles of government ownership. Fortunately, however, argument in favor of the latter is rapidly losing force in this country, and it is to be hoped that this waning tendency will be effective in preventing legislators from interfering with the development of a car interchange best suited to all concerned, and also in preventing these same lawmakers from robbing the railroad of an equitable return from its business of selling transportation, the success of which is vital to the best interests of all the people.

An analysis of the practical problem seems to show three main aspects: Mechanical, financial and operating.

Mechanical Aspect.—An ideal interchange would require that all of such classes of cars as are not designed for special

local service or for certain districts, should circulate freely throughout the country regardless of ownership. This, of course, would involve standardization, which in any event and also for economical reasons should be accomplished sooner or later to as great a degree as possible. The railroads already have made some progress through the Master Car Builders' Association in reducing their mechanical practice to standards, and through the American Railway Association in the construction of a few sample standard cars. Little, however, has yet been accomplished in placing standard cars actually in service, such as would aid in the immediate development of a satisfactory interchange system; however, it is quite within the realm of possibility to start such a movement as would quickly lay the foundation for a successful and universal car pooling and interchange service. It is unnecessary to dwell on the various merits of standardization and the savings which would be realized by it in any system. This is probably the greatest fundamental requirement for the mechanical success of car interchange, and the railroads should be making still greater efforts to agree on the designs for several classes or standard types of cars such as could make their home anywhere, and which could be repaired promptly on any railroad without losing much time out of service and without the necessity of sending across the country for special material.

Financial Aspect.—The principle laid down by the American Railway Association—that each railroad is entitled to the possession of cars equal to its ownership—is right because it involves fundamental investment and business principles. That is, a railroad, as any other business concern, is entitled to receive liberal interest and an equitable return on the money which it invests in equipment. In the first place, the operation of a car should yield to the owning railroad interest on a sum equal to the original cost of the car plus the cost of any betterments. And again, the owner is also entitled to receive sufficient return to keep the car in repair and to set aside an adequate reserve fund to replace the car when it becomes obsolete. In addition to these three items, the owning railroad also should be allowed to realize from each car *wherever it happens to be used*, a business remuneration over and above the interest, repair and replacement costs—an amount equal to whatever would be a good average yearly earning for the car extending over prosperous and lean periods when there is a shortage and a surplus of cars. This is the car's contribution to the net earnings of the business enterprise in return for service rendered; and it is from this return in excess of the cost of the car to the road that the road is able to improve its transportation organism, to pay dividends, to keep its credit good and to induce more capital for further growth.

The most successful interchange, therefore, will necessarily return to the owner of the car, *whether he uses or loans it*, this interest on the investment, his cost of maintenance, a reserve for replacement, and a proper yearly earning. If it does not do this, there will be no inducement for railroads to improve or to increase their equipment to meet the growing needs of the country. In fact, a lack of such earnings, particularly when the car is loaned to other roads, might tend to reduce the amount of equipment; since, as now often happens due to certain traffic conditions, many roads would find that it paid better to use the other fellow's cars, thus throwing the burden on the "willing horse," who in turn

* Formerly superintendent of motive power and rolling equipment of the Philadelphia & Reading.

might finally decide that it did not pay to make investments for the benefit of others. This, of course, is on the basis that the cars were operated in a general pool without much penalty requiring their return to their owners.

Operating Aspect.—It would seem to be a desirable feature in car interchange to regulate the per-diem rate so that, when all items are provided for, including sums to cover interest, repair costs, depreciation and net earnings, it would be a slight advantage to the owner to have his car used on a foreign road. This would place a small penalty on the borrower and would encourage increases of equipment by preventing the excessive use of one road's equipment by another. During active periods when cars were in demand there would then be a natural or normal tendency for the car to automatically gravitate towards home, and yet the penalty for borrowing it would not be sufficiently high either to prevent its economical use temporarily on any road or to produce useless empty mileage in speeding it home. Thus, during busy times the owner would have the opportunity to do the greater portion of his rebuilding and extra heavy repairs. At the approach of slack times and during periods of surplus equipment the cars would all find their way home on account of the high cost to the borrower when they were not earning anything for him. In this way both in good and bad times the owner would have ample opportunity to keep his equipment in good order.

Any concrete plan for interchange and car service must naturally be developed by the "trying out" process. The first problem is to establish the proper principles and then to translate them by actual practice into a definite working arrangement controlled by the necessary regulations. A practical start might be instituted by the concerted action of some of the railroads towards standardization, in agreeing actually to put into service some standard cars of the same design. Another practical suggestion might be for the railroads to collect such data concerning the operation of their present equipment as would indicate about how much gross revenue each class or type of car is actually turning in. Perhaps a start might be made by using an average return for all cars, obtained by dividing the gross freight operating revenue by the total number of cars, not including the non-revenue producing equipment. Such an investigation might then be extended to determine the return from each general type of car separately, such as box, gondola, flat, stock, refrigerator, etc., or at least to collect such information as would permit the establishing of approximate ratios of earnings to be assigned to each of these different kinds of cars.

In this connection the railroads might make other practical studies of the cost of car operation and maintenance. The cost of operation might vary somewhat for the different classes of cars according to the nature of the business and the length of the train in which they were usually handled. The cost of maintenance would naturally vary considerably, and it would be an interesting study for the railroads to analyze or separate their freight-car-pool costs sufficiently to give them an estimate of their car costs by classes. Such information should prove interesting to any railroad as an accurate guide in buying new equipment, aside from any question of interchange. In regard to interest and depreciation, it would not be difficult to arrive at a fair valuation by classes, in order to determine the amount to be checked off from the gross receipts for these items. With the above data fairly well in hand, it would not be hard to show earnings to the operating manager in "real figures," which would be over and above interest, depreciation and his operating and maintenance costs. These would be the vital figures to be used in adjusting and setting an equitable per-diem rate.

The collection of such data would be too burdensome to become a part of the regular monthly statistics of the rail-

roads; but such analysis could be extended over certain sections or divisions during different periods so as to give good approximate results. The whole matter of the receipts and expense of a car, either on a general-average basis or by classes, would be a very good field of investigation for a committee of the American Railway Association.

The closer we are able to determine and to establish the correct principles of interchange, and the more carefully the statistical figures of present conditions are determined, the less complicated and the less troublesome will be the operation of the resultant system. The development should be rather towards an automatic than an arbitrary operation, and the car should yield its maximum earnings the year round. An equitable per-diem rate is the practical problem to be determined, based on accurate statistics, so that the car, wherever it might be used, would "earn its feed" and would also make an additional contribution to its owner for net earnings and for its own perpetuation.

The operating conditions of the various railroads, particularly those located in the different sections of the country, are so different and the occasional congestions of traffic are so variable that no system could always be entirely fair; but a system can be developed which will produce good averages and which has sufficient flexibility to meet unusual conditions. If, then, we assume for our proposed system that vigorous car service rules are to be enforced for loading and unloading, and that means have been developed for adjusting properly the per-diem rate applied to borrowed equipment, and that a reasonable amount of standardization had been attained, so that prompt repairs can be made on any railroad, then the car always will be busy turning its wheels with revenue freight during all periods when there is a demand for its service; and it seems that it will not be adding too much optimism to say that this may be accomplished without elaborate rules or expensive distributing and accounting agencies, and in such a way as to minimize empty mileage and to allow the car to be used to advantage wherever it happens to be for the best service of the community and the car owners.

WOOD PRESERVATIVE STATISTICS

The proceedings of the American Wood Preservers' Association for 1917 which have just been issued contain statistics regarding the quantity of wood treated and the preservatives used in the United States during 1916. These statistics were compiled by the Association in co-operation with the Forest Service of the United States Department of Agriculture. In 1916 a total of 150,522,892 cu. ft. of wood was treated by the 117 treating plants which were active during the year. This is 9,664,019 cu. ft., or 6.9 per cent more than was treated by the 102 plants which reported in 1915.

An increase of 383,783, or 2.5 per cent, was recorded in the number of cross ties treated during 1916 over the number reported in 1915, while the quantity of piling treated was more by 3,382,448 lineal ft., or 36.3 per cent. The largest increase occurred in the number of poles treated, which amounted to more than twice the number reported during the previous year. In only two of the seven classes of material covered by the report were decreases registered in the quantity treated. These items consist of construction timber and miscellaneous lumber and the amounts given fall short of the 1915 figures by 3,119,819 and 913,509 ft. b.m. respectively.

The quantity of preservatives used during 1916 amounted to 90,404,749 gal. of creosote and refined water-gas-tar, 26,746,577 lb. of zinc chloride, 5,675,095 gal. of paving oil and 582,754 gal. of miscellaneous preservatives. The amount of creosote and refined water-gas-tar used was 9,545,307 gal. greater in 1916 than in the year previous,

while a decrease of 6,523,027 lb. was recorded in the consumption of zinc chloride.

Approximately 48 per cent of the creosote used was imported as compared with 46 per cent the preceding year and over 60 per cent in all years previous to that date, the cost of the creosote ranging from 7½ to 13½ cents per gal. and that of zinc chloride from 6 to 9½ cents per lb.

A total of 37,469,368 ties were treated, of which 26,499,954 were sawed and 10,969,414 were hewed. Approximately 44.9 per cent of the ties treated were of oak, 28.1 per cent of yellow pine and 8.1 per cent of Douglas fir. The number of ties treated with creosote was 20,858,801 and with zinc chloride was 4,619,676, while the number treated with an emulsion of these two materials was 1,978,414. The average impregnation with creosote and refined water-gas-tar was 8.09 lb. per cu. ft. and with zinc chloride 0.50 lb. per cu. ft. Where the ties were treated with emulsion an average of 2.75 lb. of creosote and refined water-gas-tar and 0.48 lb. of zinc chloride were used.

Approximately 12,690,867 lineal ft. of piling was treated in 1916, mainly of yellow pine and Douglas Fir. Where creosote was used the average injection made was 14.36 lb. per cu. ft. and where zinc chloride was used 0.43 lb. per cu. ft. was injected.

STORAGE OF COAL*

The general breakdown in the system of distributing coal throughout the United States and Canada during the past 10 months emphasizes very forcefully the necessity of taking immediate action to perfect plans and arrangements for stocking coal during the spring and summer months. There is no question but that the practice of stocking coal will be the most effective method of equalizing the output of mines, and if the coal is stored at destination it is the most effective means of equalizing the power and car usage for the carriers.

One railroad in Southern Colorado stocks coal each summer, usually during June, July and August. The coal in that district is affected very little by weather, and ¾-in. bar screenings has been stored for an indefinite length of time, and has never shown signs of heating, although no special care has been taken to ventilate the storage piles or regulate their height. The practice on that road has been to store coal at coaling stations, it being unloaded and recovered with locomotive cranes equipped with grab buckets, and wherever possible the coal is picked up from the storage piles and placed directly on the engine tenders, thereby saving labor expense, as well as breakage, due to subsequent handling.

The extreme shortage which has existed in Canada during the past 10 months has, however, aroused the public to the point of working out better plans for their coal supply in the future. A movement is on foot in Toronto, Canada, to prosecute actively the development of the hydro-electric power in that province. Also a resolution is soon to be placed before the House of Commons at Ottawa, advocating a special inquiry into the possibilities of briquetting lignites for domestic and other purposes.

Not only does it appear that no progress has been made in providing up-to-date facilities for the handling of coal in storage by the great majority of consumers, but the present outlook indicates that consumers who are desirous of storing coal the present year will find extreme difficulty in supplying such needs.

The coal operators of Illinois and Indiana have been giving some thought and attention to the matter of subaqueous storage. The New Kentucky Coal Company has equipped a subaqueous storage plant near Kankakee, Ill. The pit in question is an old abandoned stone quarry that is uni-

form in depth, and the walls being of channel rock, it provides an ideal place for the storage of coal. There is an abundance of water, the quarry being fed by springs, so it is not necessary to pump the water into the pit. The expense for labor and material to equip this plant amounted to approximately \$20,000. Running along one side of the storage pit are the railroad tracks, equipped with two chutes leading down to the edge of the water. These chutes are 40 ft. long, and will accommodate the full contents of a drop bottom coal car. The plant is so equipped that the coal may be flushed out of the car and down the chutes by water pumped out of the pit by means of a large pump, located between the two chutes. The coal flows down into the pit, and as it piles up above water level it may be transferred to another point in the pit by a 10-in. centrifugal pump, operated by a 75-h.p. motor. The pipe line is carried to any desired part of the pit on pontoons, and the coal is forced through these pipes by hydraulic pressure. In reclaiming the coal the action of the pump is reversed, and the coal is transferred by suction from any point in the main pit to a small pit located along one side of the reservoir. This small pit is constructed of concrete walls, and as it fills up with the coal the water is forced over the edge and runs back into the main reservoir. Leading from this pit up to the railroad track is an ordinary flight conveyor elevator, equipped with perforated buckets. As the coal is hoisted out of the pit the water drains off and the coal is in about the same condition as ordinary washed coal when it is dropped into the car. It is estimated that the expense of putting the coal in and reclaiming it will not exceed 10 cents per ton; in fact, they feel confident that the cost will not reach that figure.

As to the absorption of water by reason of the submersion of coal, the following statement by Oscar W. Palmerberg, B. S., analytical and fuel engineering chemist, New York, is of interest: "All coals absorb water to a greater or lesser extent. Anthracite coal, after being dried, may absorb ½ per cent; bituminous 1 per cent or more, and the sub-bituminous and lignite coals as much as 10 per cent and more. This moisture may be called that which is retained by capillary attraction, and is not apparent to the touch, and the coal may appear for all purposes 'bone dry.' The amount of water which the coal will hold as surface water depends upon the physical nature of the coal. The finer the particles, the greater the surface and therefore the larger the amount of water.

"As to the storing of coal under water, the coal does not undergo any change, and the water retained after submersion may not be any greater than before if a reasonable amount of time is allowed for drainage and exposure to air. Here again the physical nature of the coal will determine what amount of water the coal will absorb after submersion and drawing for consumption."

The committee is of the opinion that systematic co-operation and organization, as between the producers, carriers and consumers, is necessary in order to promote the storage of coal, and there is no question but that the carriers will have to start this movement by making permanent arrangements for storing coal at fuel stations.

The report was signed by: C. G. Hall, chairman; Carl Scholz, A. H. Davies, J. B. Hutchinson, R. E. Rightmire, A. P. Wells, Herbert Woods, and S. L. Yerkes.

DISCUSSION

The storage of coal is especially important this year to anticipate any difficulty in securing a supply next winter. Some roads have arranged to use industrial tracks which are now idle for storage purposes. Coal should be stored in dry locations. Large sizes are to be preferred and slack should be screened out if possible. Coals which break up when exposed to weather and those with a high sulphur content are

* Abstract of a committee report presented at the 1917 convention of the International Railway Fuel Association.

dangerous to store. Flues extending to within two or three feet of the bottom of the piles are used to note the temperature of the coal and in case it heats the pile is worked over. Illinois coal is stored to a depth of 15 feet without trouble from spontaneous combustion and Pittsburgh coal has been stored in piles 30 feet high. To get the best results when using coal which has been stored, locomotives should have the draft adjusted especially for the fuel.

KNIFE-EDGE MATERIALS AND STRESSES*

By H. L. Van Keuren

Assistant Physicist United States Bureau of Standards.

In the field of weighing devices there is probably no subject on which so little is recorded as that of knife-edges. It is the purpose of this discussion to call attention to certain requirements of the knife-edges of railroad track scales; the materials that have been employed and the allowable stresses for use in their design. It is hoped that the suggestions offered herein may act as a stimulus toward the collection, preservation and application of more definite data than is now available on the subject.

REQUIREMENTS OF KNIFE-EDGES AND BEARINGS

A prerequisite consideration for a knife edge is that it retain as far as possible its contact edge. To this end it must have a combination of properties among which are high ultimate strength with an elastic limit close to the ultimate strength, a high resistance to penetration and abrasion and a moderate degree of ductility and toughness. A high elastic limit close to the ultimate strength embodies the ability of the material to return to its original shape after having been strained or stretched nearly to its breaking point. A knife-edge or bearing should have the property of hardness in order that the temporary deformation when in a condition of stress below the elastic limit will be small; and in order that it will resist abrasion.

It appears to be the practice to construct knife-edges in accordance with the methods common in making tools for cutting very hard materials and there is a tendency to leave knife-edges glass hard. If the ductility of the material has been thus sacrificed for hardness, it is very apt to crack off at the contact edge when in service. In this connection there has come under observation a case where a glass-hard point bearing would not hold up under a load that was applied practically without impact, but when the temper of the contact point was drawn slightly it held without trouble. Besides the property of hardness, a knife edge should not be so brittle as to fracture as the result of an impact blow, but it must be tough and ductile in order to withstand the shocks occasioned in service.

In connection with the requirements of knife-edges and bearings, it may not be without interest to consider the probable occurrence when a knife-edge and bearing are imposed under load. Referring to Fig. 1, which shows the familiar form of knife-edge and bearing it is self-evident that the knife-edge E cannot sustain on a line contact the load imposed by the bearing B. Fig. 2 shows a hard bearing engaged with a soft knife-edge. Fig. 3 shows a soft bearing engaged with a hard knife-edge. Fig. 4 shows a bearing and its opposing knife-edge of the same material. It appears logical to allow the bearing to be deformed as much as the knife edge, as is indicated in Fig. 4 in order that the elastic properties of both parts may be utilized in the temporary deformation required to support the load. Therefore, the practice of making the bearing of the same material with the same treatment as the knife-edge seems justifiable, and in what follows the data given in regard to knife-edges might well be applied to bearings.

Another requirement that would be desirable, particularly in knife-edges of railroad track scales or other scales that are installed out of doors is that the material be non-corrosive.

KNIFE-EDGE MATERIALS

In the construction of knife-edges and bearings of track scales the choice of materials has been confined practically to steels. Until recently carbon steel was employed almost exclusively, but at present the use of some alloy steels is attracting special attention.

The properties of simple carbon steel depend almost entirely upon the amount of carbon content, which varies from about 0.10 to about 1.5 per cent. According to information furnished by scale manufacturers the practice has been, when carbon steel is used, to employ a steel containing about 1.20 per cent carbon which when annealed will have an ultimate strength of 90,000 pounds per square inch and a Brinell hardness of 170. With heat treatment the ultimate strength is approximately 120,000 pounds per square inch and the hardness 400.

Chromium and chromium-vanadium steels that have been employed in knife-edge construction may be obtained on the market under the name of "special Alloy Knife-edge and Pivot Steel." They are very hard and tough and the com-

The Relation Between Knife-Edge Materials and Deformations.

mercial grades as secured from the manufacturers in the annealed condition and in this state are supposed to have the following properties:

Ultimate strength	100,000 lb. per sq. in.
Elastic limit	70,000 lb. per sq. in.
Per cent elongation in 2 in.	25
Per cent reduction in area.....	50

Heat treatment will approximately double the strength and hardness without altering the ductility.

High speed steel has been used with success as a knife-edge material. There is nothing particular about it that would indicate its superiority over a chromium or a chromium-vanadium steel except the fact that it has been used with success.

A combination of nickel and chromium as alloying elements has apparently not been employed for knife-edges, yet nickel chromium steels have been developed that have, perhaps, combinations of physical properties in a higher degree than almost any other form of steel. In order to show the possibilities of a nickel chromium steel, the following example is cited. When quenched in oil from a temp-

* Abstracted from a paper presented before the last convention of the National Scale Men's Association at Chicago.

erature of 1472 deg. F. A specimen developed the following properties:

Ultimate strength	292,280 lb. per sq. in.
Elastic limit	289,440 lb. per sq. in.
Per cent elongation	9.5
Per cent reduction in area	36.3
Brinell hardness	425.

The extremely high ultimate strength and elastic limit developed in this steel together with an exceptional degree of ductility for a hardened steel suggests that the material is at least worthy of trial as a knife-edge material.

There has recently been introduced commercially a product known as stellite, which appears to offer some unique possibilities in the way of knife-edge construction. Stellite, since it contains iron only as an impurity is not a steel. It is an extremely hard substance, which is practically immune from corrosion, even under the action of most acids; and it would therefore be very desirable for use as knife-edges of scales that are exposed to severe adverse conditions tending to cause corrosion. It requires no heat treatment and is so hard that it cannot be tooled. It is therefore, usually furnished in bars cast to approximately the desired shape and it is brought to the final shape by grinding. Stellite is rather brittle and is not adapted to resisting transverse strains, a fact, that would necessitate a knife-edge of stellite being supported throughout its entire length.

ALLOWABLE DESIGN STRESSES FOR KNIFE-EDGES

In considering the stresses that may be allowed in the design of knife-edges of railroad track scales, the most important consideration is the stress per lineal inch of contact. The allowable stress for the transverse bending of knife-edges is of relatively minor importance as in a well-designed scale the knife-edges are reinforced so as not to be subject to transverse bending, except where the load carried by the knife-edge is relatively small.

In the absence of experimental data, the stress per lineal inch of contact that may be allowed in the design of knife-edges, in order that they may last for a reasonable length of time, can be determined by judging from the performance of knife-edges in scales. In judging the performance of the knife-edges of any installation there are two considerations of prime importance: The actual capacity of the scale and the service required of it. Attention is called to the fact that scales have been greatly over-rated, that is, the nominal capacity as represented by the capacity available on the beam equipment is in nearly every case greatly in excess of the weight of the largest cars normally weighed over the scale.

In addition to the weight of the cars weighed it is necessary to consider the number of cars weighed over the scale. It is evident that the knife-edges and other parts of a scale over which but a few cars per day are weighed, will with proper care and protection have a considerably longer life than a similar scale, which is called upon to weigh several hundred cars per day.

It appears from the data available that a stress of 4,000 lb. per lin. in. of knife-edge contact for carbon steel for scales in heavy service is as high as may safely be assumed at the present time. It seems justifiable, however, that some of the alloy steels might be used at a stress higher than 4,000 lb. per lin. in. However, for scales in heavy service a stress of 6,000 lb. per lin. in. is probably as high a value as could be justified even for the most suitable alloy steels. For scales over which but a few cars per day are weighed, a stress per lineal inch of knife-edge contact of not over 5,000 lb. for carbon steel, and of not over 7,000 lb. for the best of the more suitable alloy steels is probably the upper limit which should be attempted.

A SUGGESTION TO COMMUTERS.—When you stay in the office after hours don't run for that 7:20 train until you have made sure that the railroad hasn't taken it off.

MOBILIZATION OF THE NATIONAL GUARD

The mobilization of the National Guard preparatory to its mustering into the federal service began on Sunday under an executive order in eleven states. The forces ordered out are the first of three increments, of which the others will follow on July 25 and August 5. The first movement of the guardsmen to the number of approximately 125,000 will be from local armories to state mobilization camps, from which they will be sent to training camps located principally in the south, although in some cases they may be sent direct. Transportation arrangements for the movement to state camps will be handled by the local railroads and quartermasters. The later movement to the training camps will be directed from Washington by the War Department and from the railroads' standpoint by the central bureau of the Railroads' War Board. The assignments of the National Guard troops to the training camps were announced by the War Department as follows:

To Charlotte, N. C., division 5, from the States of Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, and Connecticut; to be called into Federal service on July 25.

To Spartanburg, S. C., division 6, from the State of New York; to be called into Federal service on July 15.

To Augusta, Ga., division 7, from the State of Pennsylvania; to be called into Federal service on July 15.

To Anniston, Ala., division 8, from the States of Virginia, Maryland, Delaware, New Jersey, and the District of Columbia; to be called into Federal service on July 25.

To Greenville, S. C., division 9, from the States of Tennessee, North Carolina, and South Carolina; to be called into Federal service on July 25.

To Macon, Ga., division 10, from the States of Alabama, Georgia and Florida; to be called into Federal service on August 5.

To Waco, Tex., division 11, from the States of Wisconsin and Michigan; to be called July 15.

To Houston, Tex., division 12, from the State of Illinois; to be called July 25.

To Deming, N. Mex., division 13, from the States of North Dakota, South Dakota, Nebraska, Iowa, and Minnesota; to be called July 15.

To Fort Sill, Okla., division 14, from the States of Kansas and Missouri; to be called August 5.

To Fort Worth, Tex., division 15, from the States of Texas and Oklahoma; to be called August 5.

To Montgomery, Ala., division 16, from the States of Ohio and West Virginia; to be called July 15.

To Hattiesburg, Miss., division 17, from the States of Indiana and Kentucky; to be called August 5.

To Alexandria, La., division 18, from the States of Arkansas, Mississippi, and Louisiana; to be called August 5.

To Linda Vista, Cal., division 19, from the States of California, Utah, Nevada, Colorado, Arizona and New Mexico; to be called August 5.

To Palo Alto, Cal., division 20 from the States of Washington, Montana, Idaho, Oregon and Wyoming; to be called on July 25.

In addition to the camp sites previously mentioned in these columns, Hattiesburg, Miss., and Alexandria, La., have been selected and Charlotte, N. C., has been substituted for Fayetteville, N. C., making a total of 16 in all.

THE RAILWAYS OF WESTERN AUSTRALIA.—The Government railways of Western Australia comprise 3,352 miles of railway and 334 miles of sidings now open on the 3 ft. 6 in. gauge, the capital cost of which has been £17,118,195 (\$83,194,428), including £3,898,856 (\$18,948,440) for rolling-stock. Of the railway mileage 106 miles are double-track. The first government line opened in the state was that from the coast at Geraldton to Northampton, a length of 34 miles.

REDUCING ERRORS IN HANDLING L. C. L. FREIGHT

During the eight months from April, 1916, to November, inclusive, the number of errors made in the handling of l.c.l. freight chargeable to station performance on the Eastern district of the Northern Pacific was reduced 11 per cent in spite of an increase of 36 per cent in the tonnage of this class of freight. This performance was the result of a campaign inaugurated by the Bureau of Efficiency having for its purpose the reduction of loss and damage claims arising from the handling of this class of business. The campaign was confined to the Eastern district at the beginning, this territory including five operating divisions with 2,530 miles of line and 300 open freight stations, handling a total of over 86,000 tons l.c.l. freight in November. There has been a relative decrease in the number of errors of this class on each division during this period and an actual decrease on all but one division. Likewise the number of errors per 100 tons of l.c.l. freight handled has decreased on all but one division, the net reduction for the district being 36 per cent, as shown in the table. This campaign is now being extended to other parts of the system.

tinuously and checks the loadings and the methods of handling freight at stations and educates the employees regarding proper methods. At the more important stations periodical meetings are attended by the entire force of station and yard employees and also by those from adjacent stations. At these meetings different phases of the subject of claim prevention are discussed and co-operation is encouraged in every practicable manner.

Investigations are confined to shipments valued at five dollars or more; this in the belief that if conditions leading to possible claims on these shipments are corrected the others will be taken care of automatically. Slightly over one-half of all the items exceed five dollars. The damages resulting from defective equipment are brought to the attention of the mechanical superintendent for remedy. All shortages resulting from pilferage and robbery are referred to the chief special agent. Errors on the part of shippers are brought directly to their attention either through the traffic department or representatives of the Western Weighing and Inspection Bureau. In this way action is taken on every inefficiency involving over five dollars in amount.

The report made to the division superintendent each month shows the total number of errors charged to each

21 % Increase in O S & D's Issued

79 % Increase in number of O S & D's Investigated

A Summary of the Freight Claim Performance by Divisions

The fundamental feature of the campaign is the thorough investigation of all errors to determine their cause and to endeavor to eliminate them in the future. An O. S. & D. investigator has been placed in each division superintendent's office. He receives a copy of every O. S. & D. report issued by agents, each of which he investigates to ascertain the cause. When the investigation is complete the file is forwarded to the office of the Bureau of Efficiency at St. Paul, where it is reviewed by an expert and if approved is entered on the work sheets of this bureau.

A monthly report of this work sheet is prepared and sent to all officers concerned. This sheet shows the number and character of the errors charged to each station and also the names and positions of the parties at fault wherever it is possible to place the responsibility. If the error arises from a "man failure," educational methods are applied, while if there is a case of improper methods or inadequate facilities the necessary attention is given to their improvement.

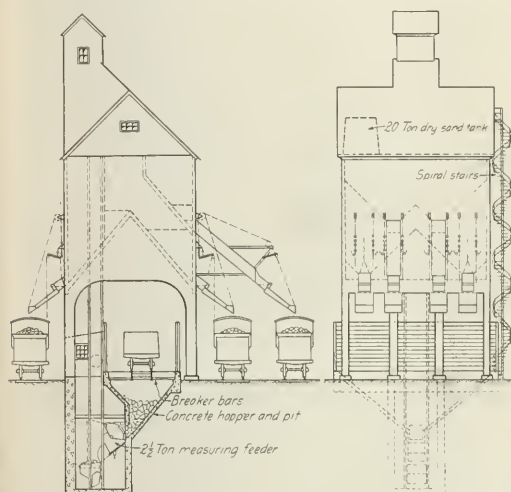

A traveling representative is also employed on each general superintendent's district who rides freight trains con-

station, classified under 11 heads chargeable to stations and 19 classes not chargeable in this way. The stations are also ranked on this report in the order of their performance. After the superintendent has had an opportunity to analyze his monthly reports he writes letters to the agents, trainmen and others interested in his territory informing them of the previous month's performance. Where an employee is charged with an unusual number of errors his attention is called to this fact and he is warned to improve his methods.

In addition to investigating all items of over five dollars all loss and damage claims involving settlements of \$15 or more are referred to the Bureau of Efficiency for review and record and for such further educational action as may be considered advisable. Up to the present time this freight claim preventive work has been confined to l.c.l. shipments, but it is expected that ultimately it will be expanded to include all shipments. As a result of the Bureau's activities a reduction has been effected in the amounts paid for freight claims, which are now but eight mills per dollar of freight earnings as compared with 1.25 cents previously.

A NEW COALING STATION ON THE ILLINOIS CENTRAL

A new reinforced concrete coaling station of 600 tons capacity was recently placed in service at Effingham, Ill., on the Illinois Central to replace an old timber structure of the trestle type. The new coaling station is the first reinforced concrete plant to be installed on the Illinois Central, although several plants of the same type constructed of timber have been in use on that road for some time. While serving as a terminal coaling station for the branch of the Illinois Central extending from Effingham to Indianapolis, it is essentially a way station, serving two main tracks and a passing track on the main line between Chicago and New Orleans, and delivering coal to all freight trains operating on the engine district between Champaign, Ill.,

Side and End Elevation of the Plant

and Centralia. The average daily consumption is from 200 to 250 tons, from which it is obvious that the capacity of the new layout allows for a considerable increase in the traffic.

The plant consists essentially of a bin 33 ft. square, supported on eight columns arranged in two rows along the two sides of the structure. The floor of the bin is shaped like a gable roof to deflect the coal to the outlets along the two sides and is supported on concrete girders spanning from column to column across the width of the bin. As shown in the drawing, the southbound main track cannot be served with coal from the bottom of the bin. To overcome this a separate coal pocket was provided with its bottom at a sufficient elevation to give the extension spouts the necessary pitch to reach the outer track. This upper pocket is 11 ft. 2 in. wide and occupies the full length of the bin. The outlets for this pocket are 12 ft. above those for the main pocket. The lower or main pocket of the bin is not subdivided and occupies the entire bin space except for the hoistway approximately 9 ft. square, through which the coal is hoisted to the top of the structure.

The track hopper to receive the coal from cars is located below the ground level directly under the bin. The bottom of the bin and the columns which support it give sufficient clearance for the operation of cars through the structure on a track passing over the hopper. The coal is delivered from the track hopper into an elevator bucket of 2 1/2 tons capacity

by means of a Schraeder measuring feeder which operates automatically with the movement of the bucket. The operation of a hoist bucket is also automatic. It is raised and lowered by a Rands electric traction hoist which reverses direction when the bucket reaches the top or bottom of a shaft through the agency of a Cutler-Hammer automatic controller.

The arrangement of spouts at the top of the bin is such that the coal falls directly on the partition at the back of the upper pocket. In consequence most of the coal goes into the latter until it is filled, when the heaping up of the coal causes it to fall into the lower pocket.

The plant is built entirely of non-combustible materials. The house covering the top of the bin and the hoist house at the track level have structural steel frames covered with No. 20 gage black corrugated iron. A metal spiral staircase provides means of communication between the ground level and the headhouse. The construction of the new coaling station was started in August, 1916, and was well under way when a fire on November 19 destroyed the old timber coal dock. Temporary coal pockets, filled by a grab bucket, handled by a Brownhoist locomotive crane, were installed to serve until the new station could be completed. Special efforts were made to hurry the work on the new station and it was placed in service about January 15, 1917.

It is expected that the new coaling station will serve coal to locomotives at a material reduction from the cost of operating the old plant which averaged from six to seven

Coaling Station from the Passing Track Side

cents per ton. The new station has not been in use a sufficient length of time to permit of the compilation of cost data, but results secured on the Illinois Central with stations of the same type indicate that the cost of handling coal will not exceed three cents per ton including the cost of breaking up lumps of coal to pass them through the breaker bars covering the track hopper. The plant was built by the Roberts & Schaefer Company, Chicago, under the general direction of A. S. Baldwin, chief engineer of the Illinois Central.

RUSSIA TO SAVE DAYLIGHT.—All clocks in Russia were advanced one hour on July 14 under the daylight saving plan which has been adopted by the provisional government.

KEROSENE AS FUEL FOR RAILWAY MOTOR CARS

The McKean Motor Car Company, Omaha, Neb., has developed a method for using kerosene instead of gasoline as fuel in its railway motor car engines. Cars operating with this fuel have been in use for about two months and the results are reported to be satisfactory in all respects. The use of kerosene effects a saving of 74 per cent of the cost of fuel as compared with gasoline and a reduction in the cost of operation per train-mile of 31 per cent. There is no appreciable increase in the cost of maintenance, a little more attention from the motorman being all that is required.

The successful use of kerosene is the result of a series of

is substituted. The trouble which is sometimes encountered with the lubrication of internal combustion engines when kerosene is used as a fuel has been satisfactorily overcome.

The first car equipped to use gasoline was a steel passenger car weighing 65,000 lb. It has a 200-horsepower, 6-cylinder engine, of the variable speed type. At the present time it is in branch line local passenger service, making an average of 210 miles a day. Since kerosene has been substituted for gasoline on this run there has been an increase of from 25 to 50 per cent in the mileage per gallon of fuel. The power developed on grades is materially increased and the motorman has expressed satisfaction on account of the greater ease in making the scheduled running time. It is felt that the slight additional complication of parts and the increase in

Engine of McKean Motor Car Which Uses Kerosene as Fuel

experiments carried on during the past five years by this company. Various grades of distillate have been used for about two years and the latest developments have made it possible to go a step farther and utilize kerosene. The operation of kerosene carburetors was found to be unsatisfactory. In the present design one carburetor of the multiple jet type is applied to each cylinder. The kerosene is atomized and delivered to the cylinder with a mixture of tempered air, there being eight nozzles for each cylinder. When running light only one nozzle per cylinder is used, the others coming into action when the throttle is opened. Through the use of one carburetor for each cylinder the manifold has been eliminated. The supply of hot and cold air can be regulated and for use on heavy grades water jets are provided. Kerosene does not mix with air as readily as distillates or gasoline, but the use of tempered air and mechanical means of regulating the quantity as well as atomizing the fuel make it possible to secure the proper explosive mixture under all conditions. To avoid undue complications in control the engine is started on gasoline and after it is in motion kerosene

the cost of the apparatus is insignificant as compared with the economy which has been obtained by the use of kerosene.

SYNDICATE MAY BUY CHACO RAILWAY LINE.—According to press despatches, an American syndicate has offered to purchase the Chaco railways from the Argentine government for the sum expended for their construction and to undertake to extend the system into Bolivia. The construction of the Chaco railways was undertaken by the Argentine government to exploit the vast territories of the Chaco and Formosa sections, a large portion of which is still covered with unexplored forests. With that object a comprehensive railway scheme was drawn up in 1905 and the work on the lines begun. They consist of two penetration railways, starting from the banks of the Río Paraná, and running parallel to its larger tributaries. The activity displayed in both Argentina and Bolivia in the extension of railway lines into the Gran Chaco is considered as marking this vast, unsettled territory in the center of the continent as area in which great development will be witnessed within the next few years.

General News Department

According to a recent announcement of the Chicago & North Western, 79 employees have entered army or navy service. There have been enlistments from practically all departments.

Representative Adamson of Georgia, chairman of the House Committee on Interstate and Foreign Commerce, has introduced in Congress a bill to provide for the exchange of railroad transportation for advertising.

The Lower House of Congress on July 13 voted to insist on the House amendments to the freight priority bill, as passed by the Senate; and Representatives Adamson, Sims and Esch were appointed conferees on behalf of the House. The Senate had previously appointed its conferees.

During the conferences between representatives of the steel companies and the government officers in Washington last week Secretary of Commerce Redfield perfected an arrangement with the steel manufacturers by which steel will be more promptly furnished for the completion of railway cars and locomotives now being built, and which have been somewhat delayed because of the preference given to orders of the government for steel.

A meeting of operating officers and watch inspectors of the Missouri, Kansas & Texas lines was held at Dallas, Tex., on June 26 and 27. Matters pertaining to watches of employees subject to time service regulations, the maintenance of watch records, and the rendition of proper reports were considered. Among those who participated in the discussion were Webb C. Ball, general time inspector, and W. F. Hayes, superintendent of time service.

The Baltimore & Ohio announces another anti-spitting day. Slips will be placed in every seat of day coaches, pointing out the menace to public health in the persistence of this practice, and embodying a polite request that public opinion itself put the stamp of its disapproval upon the obnoxious habit. It is not easy for trainmen openly to call offenders' attention to the rule, therefore the slips are adopted as affording the best medium of counteracting the spitting evil.

Alton B. Parker, acting as arbitrator, has decided that the New York, New Haven & Hartford shall pay to Charles S. Mellen, former president of the road, \$95,000 to reimburse him for expenses incurred in law suits growing out of his connection with the railroad. Judge Parker decides that Mellen is not entitled to \$60,000 for two years services as adviser since he retired from the presidency. Soon after Mr. Mellen left the road he wrote a letter saying that he had decided not to accept the directors' offer of \$30,000 a year; and the arbitrator decides that he must abide by this waiver.

An Advisory Committee on Terminal Facilities has been appointed by the general munitions board of the Council of National Defense to promote the orderly, rapid and careful loading of vessels with munitions and supplies required by our armies in Europe and by the Allies. Francis L. Stuart, of New York, formerly chief engineer of the Baltimore & Ohio, is chairman of the committee, which will at once begin consideration of these problems. It is expected that new terminals will be established at the principal ports, especially for the assembling and loading of supplies designed for the overseas forces, and those of the Allies, so as to relieve existing terminals, with a view to preventing freight embargoes and congestion.

A controversy between the railroads and the shopmen employed on the southeastern railroads, involving about 25,000 men, who demanded an increase of 10 cents an hour and an eight-hour day, has been referred to the United States Department of Labor for mediation, with an agreement on the part of both the employers and the men to abide by the decision of the Secretary of Labor in case the conciliators of the department are not able to effect a settlement. The railroads offered increases amounting to six cents an hour, with an eight-hour day, for about 90 per cent of the men involved, but this was not accepted by the men

and a strike had been called, to become effective last Thursday, when the mediation agreement was reached. The wage increase will amount to about \$1,000,000 a year, for the roads involved, for each cent per hour; six cents an hour would mean six million dollars.

Henry W. Hodge, a member of the New York State Public Service Commission, First district (New York City), is going to France as a bridge engineer for the government, having accepted a commission as major in the Engineering Reserve Corps. After a conference with the governor, Mr. Hodge declined a commission as major some weeks ago, but has now yielded to a second request. He has to relinquish important duties in connection with the construction of the subways in New York City. Mr. Hodge, senior member of the firm of Boller, Hodge & Baird, has been a member of the Public Service Commission since January, 1916. He entered the firm of Boller, Hodge & Baird in 1895. This firm has designed many important bridges and other structures, including cantilevers at Pittsburgh, the Municipal bridge across the Mississippi river at St. Louis, three bridges across the Connecticut, for the state of Connecticut, and the Singer and Metropolitan buildings in New York City.

A Correction

In the article entitled "Railway Men Organized for Foreign Service," published in the special war number of the *Railway Age Gazette* on June 22, the former connection of C. M. Anderson, second lieutenant in the First Reserve Engineers, now stationed at New York, was incorrectly given as superintendent of safety of the Nashville, Chattanooga & St. Louis, Nashville, Tenn.

Pennsylvania Electric Locomotive

In the article describing the Pennsylvania's new electric locomotive, which was published in the *Railway Age Gazette* of June 8, on page 1199, the fact that the electrical equipment was supplied by the Westinghouse Electric & Manufacturing Company, Pittsburgh, Pa., was omitted through oversight. This company provided the motors and all electrical apparatus and equipment used on this locomotive.

Car Shortage Again Reduced

That the railroads are providing a much more nearly adequate transportation service for all classes of freight is indicated by the fact that the unfilled car orders, or what is called the "car shortage," show a reduction on June 30 of nearly 50 per cent from the situation on May 1, according to a statement by the Railroads' War Board. The unfilled car orders on May 1 were 148,627; on June 1 they were 106,649, and on June 30 they had been reduced to 77,144.

Reports just compiled by the War Board also show that the railroads, in their co-operative effort to realize the maximum of transportation efficiency, have already effected an extraordinary improvement in the amount of coal handled. As its first important official act, the board directed that railroads should give preference to the movement of coal. Reports to the Geological Survey, just available, show that in June the railroads of the country hauled 750,323 cars of bituminous coal—an increase of 26.2 per cent over June last year.

"In this emergency, when the railroads are making the utmost effort to give the maximum freight service," the statement says, "it is gratifying to the Railroads' War Board to be able to report the fine co-operation they are receiving from regulating bodies and shippers in all parts of the country. The effect of this co-operation and effort is to be seen in the foregoing statement of results."

Meeting of Telegraph Superintendents Postponed

On account of the present international situation the executive committee of the Association of Railway Telegraph Superintendents has postponed indefinitely the annual meeting, which was to have been held at Washington, D. C., on September 18. The committee has also decided to call a special meeting of the association in Chicago for a short session of one or two days during the month of November. This meeting will be strictly a business session free from entertainment. All committees will be expected to continue their work as far as possible, and be prepared to present reports for discussion and action at the proposed meeting in Chicago.

One Hundred Chief Clerks

The chief clerks of departments in the Baltimore and Ohio general offices at Baltimore, Md., have formed an association for closer business and social relations, and will gather at luncheons once a week, on Wednesdays. There are in this building more than 100 chiefs of clerical forces, including representatives of the executive offices and subdivisions of the various departments.

The committee in charge of the organization consists of T. Carroll Roberts, president's office, chairman; C. E. Hanson, controller's office; C. G. Martin, general manager's office; E. W. Murray, freight traffic department; John Peach, motive power department; and E. R. Sparks, chief engineer's office.

Officers of the company will be invited to address the members concerning different phases of railroad operation. No dues will be charged, the intention being to make the gatherings informal. The association is designed to serve as a clearing house through which the chief clerks will be able to work out plans of office organization, employment of assistants and other matters relating to their work.

New York City Subways

The New York State Public Service Commission, First district, expects within 10 days to have the New York Consolidated Railroad Company operating subway trains in Broadway, Manhattan. Local trains will begin running between Canal street on the south and Fourteenth street on the north. The New York Consolidated Railroad Company is the operating company of the New York Municipal Railway Corporation, which operates the Fourth Avenue subway in Brooklyn and the Brooklyn elevated lines. At first operation will be by trains coming from the Fourth Avenue (Brooklyn) subway over the Manhattan bridge, and thence running through the new Canal Street subway to Broadway, and thence north to Fourteenth street. In the fall it is expected that the service will be extended northward to Thirty-fourth street and to Forty-second street; and before the close of the year it may be extended southward from Canal street in Broadway to the City Hall or further south. It will be more than a year before this Broadway subway will be finished to its northern and southern termini, both of which will be in Brooklyn.

Grade Crossing Signs in Connecticut

By a law, No. 373, which has been adopted in Connecticut, all cities, towns and boroughs in that state are required to maintain cautionary signs approaching railroad grade crossings—at a distance of 300 ft. to 500 ft.—the signs, however, to be furnished by the railroad company. Connecticut thus follows the lead of New Hampshire, and the design of sign prescribed is the standard which has been approved by the American Railway Association and by the National Association of Railroad Commissioners. By the same law the Public Utilities Commission is directed to investigate, and where deemed advisable is empowered to designate certain crossings as "stop" crossings, where self-propelled vehicles must be brought to a stop before passing over the tracks; and at such crossings the commission may require the railroad company to erect and maintain signs within the limits of its right of way. The cautionary sign is to bear the letters "RR," and the stop sign is to be lettered STOP. The commission may require the stop sign to be lighted at night or to be accompanied by a red light. The commission, on petition of a municipality, may make reasonable exceptions to the law. The municipality which neglects to comply with the law,

unless released by the commission, is to forfeit one dollar for each day of neglect. Any person damaging a sign or extinguishing a light will be liable to a fine of \$10, or to imprisonment for 30 days, or both.

Labor from Porto Rico

At a recent conference between representatives of the Department of Labor and of the railroads, the fact was developed that there are in Porto Rico a number of men, estimated at 50,000, lacking regular work who could be brought to this country and used for railroad and agricultural purposes, provided ocean transportation could be secured and proper conditions of work could be assured. The Railroads' War Board has issued a circular to the railroads calling attention to this fact, for the purpose of ascertaining whether any railroads desire to avail themselves of this plan of obtaining labor in order that, upon the total number being ascertained, a concrete proposition may be made by the Department of Labor to the other departments interested, to provide the necessary ocean transportation. The representatives of the Department of Labor have named informally the following conditions:

The railroad companies should make their requisitions for labor through the Department of Labor, stating how many workers are needed and where, how long the work will last, and the wages, hours and living conditions. The companies should furnish free transportation for the workers from the point of entry to the place of work, feeding them en route. If engaged to work six months or more and the workers fill their part of the contract, if they then desire to return to Porto Rico they should be given free transportation to the nearest port to Porto Rico; that the workers, or so many of them as so desire, be allowed to work for the farmers along the lines of the companies hiring them in the cultivating and harvesting of the crops; after such harvesting they be allowed to return to work for the railroads; that the workers will not be used in any sense as strike breakers during industrial disputes between employers and employees.

Pooling Cars at Freight Houses

One of the plans introduced by the Chicago committee of the Commission on Car Service, which was recently organized, is a scheme whereby roads in the Chicago switching district can utilize each other's empty cars for loading at freight houses, with the understanding that they will return a like number of empty cars the following week. This method of car equalization saves unnecessary switching and obviates the necessity of refusing freight on account of a lack of available cars. The car balance sheet for the period extending from July 1 to July 7, inclusive, shows that 1,127 empty box cars were exchanged between local freight houses in Chicago territory by 13 of 25 roads operating in that territory. Complete reports from all of the roads are expected to be received as soon as the work of the committee becomes more completely organized. D. I. Forsythe, formerly general car accountant of the Wabash, is vice-chairman in charge of detail work of the Chicago committee, and H. E. Byram, vice-president of the Burlington, is chairman.

The St. Louis committee of the Commission on Car Service intends to inaugurate a similar plan in the St. Louis switching district, and proposes later to extend the plan to cover industries as well as freight houses. A special committee has been appointed consisting of John Fitzgerald, superintendent of the Louisville & Nashville; Robert Rice, general superintendent of the Chicago, Burlington & Quincy, and M. B. Casey, superintendent of transportation of the Wabash, to formulate rules to be followed in the matter of equalizing the box car supply when the pool becomes effective.

The St. Louis committee of the Commission on Car Service is headed by John Cannon, acting general superintendent of transportation of the Missouri Pacific, and has as its other members, M. B. Casey, B. G. Fallis, general superintendent of the Southern; C. S. Millard, superintendent of the Cleveland, Cincinnati, Chicago & St. Louis; Wm. Atwill, superintendent of the Illinois Central; C. W. Woods, assistant to the vice-president of the Pennsylvania Lines, and W. Mosby, assistant to the vice-president of the St. Louis Southwestern.

Courtesy of the Pass Privilege

Elisha Lee, general manager of the Pennsylvania Railroad, has sent to each employee of the road a leaflet on this subject, which says: "In view of the reduction in passenger train service, required as a war measure to aid in the movement of troops, government supplies and freight, all employees riding on passes should be especially careful in observing their courteous obligation not to occupy seats when pay passengers are standing. An employee using a pass is enjoying a privilege of transportation. A passenger holding a ticket has bought and paid for a right of transportation, which must be regarded as in every way superior."

"Under war conditions, trains will at times unavoidably be crowded. It may not always be possible to give every passenger a seat, but certainly none should stand while railroad men, holding passes, are seated. The obligation of an employee in such a case is plain, and rests upon the principles of courtesy and right. It may be performed without embarrassment to anyone, and without attracting needless attention, by simply arising and moving quietly to another part of the car or train."

"The success of the railroads in coping with the great burdens which the war is laying upon them depends very largely upon their ability to retain the confidence and win the co-operation of the public. Every employee who shows courtesy and consideration helps toward this end; every one who fails in these respects hinders it."

"Here is a chance to help!"

Alaska Coal

The Eska Creek coal mine, located in the Matanuska coal fields, Alaska, was bought on June 18 by the Alaska Engineering Commission, and formally taken over from the private concern, which has been operating it for several months. The purpose of the commission in purchasing the mine is to secure an adequate supply of coal for the construction and operation of the government railroad. This object was attainable only through the operation of the mine on a larger scale, and by the installation of proper facilities. The commission will also take steps at once to open the mine in Chickaloon, and the necessary machinery will be installed as soon as the railroad reaches that point, probably in August. It is not the intention of the government to remain in the coal mining business permanently, but when the mines have been opened sufficiently to supply the large tonnage needed by the commission, it is proposed to lease them to private parties in accordance with the provisions of the coal leasing regulations.

A press despatch from Seward, Alaska, July 14, announces the discovery of a four-foot seam of coal, close to the government railroad, at Mile 175.

The Secretary of the Interior on July 14 asked Congress for an additional appropriation of \$4,000,000 for construction on the Alaska Government Railroad in order to close a gap in the main line and to hasten the opening of the Matanuska coal fields. This is in addition to a \$10,000,000 appropriation recently authorized by Congress.

Women on the New York Central

Women have made "a splendid start" on the New York Central, according to a statement made by an officer of the road. A gang of thirty women, under direction of a woman book-keeper, is employed at Collinwood, Ohio, in sorting 3,000 tons of scrap metal. They do the work as well as men, and appear to like it. The woman who does the same work as a man will get the same pay. Those women who are sorting scrap get an average of \$2.50 a day.

The number of women employed in the auditing department has been increased; and there are many in the car record office. Some are being trained in the purchasing department, to sell tickets, and to act as watchmen at railroad crossings. In the shops women are learning to run lathes, drills and other small tools, and women will be employed as assistants in stations. One woman has been in the service as watcher at a railroad crossing for the last ten years.

Vice-president A. T. Hardin says: "Our present work is centered largely in organization and training. The women we are

training are in many instances relatives of our employees. They have taken up railroad work eagerly and energetically. Their contribution to the industrial welfare of the country will be of tremendous benefit to women. Many women have extraordinary energy and power for constructive work, which has never been put to practical use. The war gives them an opportunity to serve their country and themselves. Sir Robert Borden, premier of Canada, was anti-suffrage until the war sent men to the front and put women at work in their places; and in a speech recently he said: 'Canada owes her salvation to her women.'

"The New York Central has about 85,000 employees, but many of them through the nature of their work are exempt from the draft. Many railroad men have volunteered, however. Two hundred of our finest mechanics have volunteered in engineering regiments, which will work on the railways of France. . . ."

Rules for Conservation of Food on Dining Cars

The Railroads' War Board has adopted resolutions pledging the committee and its individual members to put into effect rules for the conservation of food on dining cars, as worked out between Herbert Hoover, United States food administrator, and representatives of the commissary departments of the railroads. The regulations were the result of a suggestion made by President E. V. Baugh of the Railway Dining Car Superintendents' Association and were presented by Mr. Hoover to the members of the railroads' Special Committee on National Defense at a recent meeting in Washington. The food administration rules suggested for dining cars are as follows:

"Your cordial and thoughtful co-operation is earnestly requested in helping to win the war by conserving our food. Each one has a part to play. If we cannot fight we can avoid waste and eat wisely and in accord with our country's needs. All food served on the table and not eaten is wasted."

"1. All wheat bread and butter portions are to consist of not more than two medium sized slices of bread or toast and one pad of butter, and a charge should be made for them. A charge should also be made for all crackers or biscuits. Charge for each extra pad of butter."

"2. Serve no wheat bread, crackers or wheat cakes for lunch or breakfast. Use instead corn bread (baked thin), corn muffins, corn cakes, fried mush, rye bread, oatmeal, oat cakes, buckwheat cakes, rice cakes. Serve honey and syrups with cereal stuffs whenever possible as substitutes for cream and sugar."

"3. Make tarts instead of pie, leaving off bottom or top crust."

"4. AVOID ENTIRELY use of wheat bread, toasted, to be served under chops, squabs, chickens, entrees, game, etc."

"5. Serve beef, mutton or pork not more than once per day. REDUCE SIZE OF ALL MEAT PORTIONS BY ONE-HALF, making same charge for second portion. The average meat portion should not exceed five ounces served. Increase fish and sea food courses and make specialties of them."

"Make special dishes of hashes, cooked-over meats, croquettes, etc., to avoid waste."

"6. Serve chickens, eggs, pigeons, squabs, rabbit, fish."

"7. Serve NO VEAL, lamb, squab-chickens or squab-turkeys."

"8. Serve cottage cheese."

"9. USE NO BUTTER IN COOKING. Fry foods in animal fats or vegetable oils. Serve cream in individual portions with special charge."

"10. Serve liberal portions of all vegetables and fruits in season. Encourage use of potatoes. Make a specialty of baked beans and brown bread."

"11. Avoid waste by serving smaller portions, particularly of bread, butter, meats, milk, cream, sweets."

The rules had previously been submitted to the advisory committee on alimentation and the experts in utilization and conservation associated with the work of the food administration. The war board in its resolutions also expressed hearty approval of the work in which Mr. Hoover is engaged and extended its thanks for his appearance before the committee. Details of the plan to put the rules into effect were to be worked out by a special committee of the Dining Car Superintendents' Association.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—H. C. Boardman, D. L. & W., Hoboken, N. J. Next convention, to have been held October 22-24, 1917, San Francisco, Cal., indefinitely postponed.

AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York. Next meeting, October 16-17, St. Louis.

AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichy, C. & N. W., Chicago. Next convention, October 16-18, 1917, St. Paul, Minn.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—W. L. Connelly, Sup't. of Telegraph, Indiana Harbor Belt, Gibson, Ind. Next annual meeting to have been held September 18, 1917, Washington, D. C., indefinitely postponed.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 1st Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal, Que.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.

CENTRAL RAILWAY CLUB.—D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual dinner, 2d Thursday in March. Hotel Statler, Buffalo, N. Y.

CHIEF INTERCHANGE CAR INSPECTORS AND CAR FOREMEN'S ASSOCIATION.—W. K. Allen, New York Central, Albany, N. Y. Next convention, September, 1917, St. Louis.

CINCINNATI RAILWAY CLUB.—H. Bouthet, Chief Interchange Inspector, Cin't Rys., 101 Carew Bldg., Cincinnati. Regular meetings, 2d Tuesday, February, May, July and November. Hotel St. Clair, Cincinnati.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 568 Union Arcade Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh, Pa.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

INVESTMENT BANKERS' ASSOCIATION OF AMERICA.—Frederick R. Fenton, 11 W. Monroe St., Chicago. Annual convention, October 1-3, 1917, Baltimore, Md.

MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—J. H. Jager, Fort Worth & Denver City, Fort Worth, Tex. Next convention, October 16-18, 1917, Cleveland, Ohio.

NATIONAL ASSOCIATION OF RAILWAY COMMISSIONERS.—Jas. B. Walker, 120 Broadway, New York City. Next annual convention, October 16, 1917, Washington, D. C.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meeting, 2d Tuesday in month, except June, July, August and September, Boston.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meeting, 2d Friday in month, except June, July and August, 29 W. 39th St., New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—Geo. A. J. Hochstetere, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Tribune Bldg., Buffalo, N. Y.

PACIFIC RAILWAY CLUB.—W. S. Wollner, Assistant to Chief Engineer, Northwestern Pacific R. R., San Francisco, Cal.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—F. C. Stewart, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.

RAILROAD CLUB OF KANSAS CITY.—Claude Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Saturday in month, Kansas City.

RAILWAY CLUB OF PITTSBURGH.—H. B. Rogers, 307 P. Atlanta Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Pittsburgh Commercial Club Rooms, Colonial-Annex Hotel, Pittsburgh.

RAILWAY FIRE PROTECTION ASSOCIATION.—C. R. Edwards, office of the president's assistant, Seahound Air Line, Norfolk, Va. Next meeting, October 2-4, 1917, St. Louis, Mo.

RAILWAY REAL ESTATE ASSOCIATION.—R. H. Morrison, Assistant Engineer, C. & O., Richmond, Va. Next convention, October, 1917, Duluth, Minn.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Myers Bldg., Bethlehem, Pa. Next annual convention, September, 1917, Atlantic City, N. J.

RICHMOND RAILROAD CLUB.—F. O. Robinson, 307 P. Atlanta Sta., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—P. J. McAndrews, C. & N. W., Sterling, Ill. Next annual convention, September 18-21, 1917, Hotel Auditorium, Chicago.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

SIGNAL APPLICATION ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grand Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September and November, 10 N. W. Cor. 1917, Atlanta, Va.

TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Waldorf-Astoria Hotel, New York.

TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Gen'l Ag't, Erie R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings bi-monthly, Pittsburgh.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. R. R., Cleveland, Ohio. Next convention, September, 1917, Chicago.

UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, 1111 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.

WESTERN CANAL CLUB.—L. Kon, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Monday in month, except June, July and August, Hotel Sherman, Chicago.

Traffic News

Railroads in Colorado, Florida and Utah have withdrawn their applications for authority to make a 15 per cent increase in intra-state freight rates.

The Mobile & Ohio has taken off its dining cars, and the schedules of through trains are now so arranged that passengers can eat at stations.

Southern Pacific agents, who are now engaged in a carloading contest, are appealing to shippers and consignees to utilize Sundays and holidays in order to release freight cars on their sidings. It is pointed out that a genuine emergency exists, and that emergency measures should be taken.

Shipments of anthracite coal for the month of June established a new record not only for that month, but totaled a figure which is the greatest in the history of the industry. The statement of the Anthracite bureau says that shipments amounted to 7,049,037 tons, an increase over the preceding month of 131,512 tons.

The Lehigh Valley reports that in the six months ending June 30 it carried a total of 4,297,925 tons of the larger or domestic sizes of coal; and the total carried by the road in June, all sizes (1,347,205 tons), was about 35 per cent more than in June the preceding year.

A. G. Thomason, demurrage commissioner for New England, reports that the average detention of freight cars by consignees in that territory in the month of May was 1.60 days per car, as compared with 1.99 days per car in May of last year. The number of cars reported was about the same in both years, a little over 300,000. Mr. Thomason calculates this saving in time as equivalent to an addition of 3,872 cars to the available stock of cars in New England for the month.

The Council of National Defense recommends that the Federal Shipping Board build barges and tow boats, for use on navigable inland waters, the boats to be sold to private parties. The Committee on Inland Water Transportation reports that canal and river boats are scarce; and the present recommendation is made as indicating the only means of carrying out the government's idea of using inland waterways for the purpose of transporting freight to relieve the overburdened railways.

The American Express Company now has a full-fledged "Travel department," and its manager is Ralph E. Towle, 65 Broadway, New York City. A monthly bulletin is to be issued. Ticket counters in charge of experienced tour men are now maintained at the company's city offices in New York, Boston, Albany, Philadelphia, Cleveland, Detroit, St. Louis, Chicago, San Francisco and Los Angeles. At these offices facilities have been provided for ticketing passengers to all parts of the world. Information and tickets from these ticket offices can be quickly secured by other American express offices in the vicinity. Hotel and sightseeing coupons are furnished, and personally conducted tours are offered.

The Southern Railway, as an effective means of releasing a larger proportion of the food and feed stuffs grown in the South for the use of the armies and navies of the United States and her allies, is co-operating with the United States Agricultural Department, and local business men, to promote planting by individual farmers of a "fall food acre." Seed dealers will put up assorted packages of seeds of standard food and feed crops, which can be planted in July, August and September, and which will furnish food and feed for the farmer's family and his livestock in the fall and winter months. These packages will be sold at cost to farmers. But limited supplies of seed are available, and probably it will be impossible fully to supply the demand for these packages.

The final statement concerning the curtailment of passenger service in the Boston & Maine shows that 253 week-day trains were taken off, out of a total of 1,050. These changes, however, affect mainly what may be called all-the-year-round time-tables:

and it appears that a sufficient number of summer trains have now been put on so that the number of passenger train men in the service is more than it was a month ago. Speaking of the reasons for taking off through trains, an officer of the road says that a single passenger train from Troy, N. Y., to Boston, 190 miles, in the week ending May 20, caused the side-tracking of 39 freight trains for a total period of 45 hours and 45 minutes. Assuming that this means the record for six days, the average daily delay was 6 hr. 37 min.

The Nashville Chattanooga & St. Louis has just completed a series of records of the movement of pineapples from Cuba via the Florida East Coast car ferry through Key West, Fla. Seventy-four special trainloads were moved from Atlanta, Ga., to Martin, Tenn. (a junction with the Illinois Central), a distance of 431 miles, in an average running time of 22 hours, 54 minutes. Excluding the necessary delays for changing engines, the average running time was 25 miles an hour. The average time of 22 hours 54 minutes included the movement of one train, which, because of a break in the line, interrupting traffic, took 37 hours and 33 minutes for the trip. The route from Key West to Chicago was over the Florida East Coast, the Atlantic Coast Line, the Central of Georgia, the Nashville, Chattanooga & St. Louis, and the Illinois Central.

M. L. Cooke, chairman of the storage facilities sub-committee of the General Munitions Board, believes that unless the country learns to load, route and handle its freight cars more efficiently, America soon will be in as bad a situation as some of the European nations. "In England," says Mr. Cooke, "many classes of non-military shipments can get the use of the railways only one day in seven. We are going to appeal to manufacturers to help by assembling and shipping stores so as to require the minimum of handling and haulage." In the handling and storage of supplies for the army, Mr. Cooke proposes to establish points of local assemblage at which goods in less than carload lots can be temporarily stored, and full carloads made up for shipment. In the accumulation of such stores motor trucks will be extensively used. In England, he says, any haul under forty miles is considered a motor-truck haul; and it is hinted that a similar rule will be adopted here.

A car conservation luncheon was held on the roof garden of the Hotel La Salle, Chicago, on July 17. The relation of the car supply to the war and means of increasing the available supply of equipment through increased efficiency on the part of both railroads and shippers were the subjects discussed. The speakers included F. B. Montgomery, manager of the traffic department of the International Harvester Company, Chicago; Samuel O. Dunn, editor of the *Railway Age Gazette*, Chicago; W. L. Park, vice-president of the Illinois Central, Chicago; H. C. Barlow, traffic director of the Chicago Association of Commerce, and advisor to the division of car service of the Interstate Commerce Commission; J. F. Porterfield, general superintendent of transportation of the Illinois Central; W. S. Bode, vice-president of Reid, Murdock & Co., Chicago, and D. I. Forsythe, vice-chairman of the Chicago committee of the commission on car service. The luncheon was held under the auspices of the National Industrial Traffic League, the Traffic Club of Chicago, the Chicago Association of Commerce, the Illinois Manufacturers' Association, the Central Manufacturing District of Chicago, and the Chicago committee of the commission on car service of the American Railway Association.

Curtailment of Passenger Service

The Pennsylvania Lines West of Pittsburgh withdrew 34 passenger trains from service on July 1, including 10 Pittsburgh suburban trains. Most of the trains withdrawn were on local runs. The extent of the reductions made approximate 1,200,000 train-miles per annum. The Cleveland, Cincinnati, Chicago & St. Louis on the same date reduced its passenger train mileage to the extent of 2,240 passenger train-miles a day. Among the trains removed were one in each direction between Cincinnati and Chicago; one train between Cleveland and Indianapolis; one between St. Louis and Indianapolis; one train in each direction between Cleveland and Galion; one local train in each direction between Indianapolis and Mattoon; one local train in each direction between Indianapolis and Champaign, and one in each direction between Urbana and Peoria. Observation parlor car

service on one train in each direction between Cincinnati and Chicago has been discontinued. The Michigan Central recently withdrew two trains between Detroit and Ypsilanti; one between Chicago and Detroit, and two between Detroit and Mackinaw. The New York, Chicago & St. Louis has discontinued the running of special excursion trains. The Erie on June 10 removed 47 passenger trains from service. Altogether it effected a general reduction over the system of 3,400 passenger train-miles a day, exclusive of the New York commuting territory, where about 40 trains were taken off on May 6. The Chesapeake & Ohio has discontinued the operation of two trains between Chicago and Cincinnati, and now runs a sleeper between Chicago and Richmond via the Cleveland, Cincinnati, Chicago & St. Louis between Cincinnati and Chicago.

State Coal and Coke Hearings

A hearing on the application of the railroads for an advance of 15 cents a ton in coal and coke rates was held at Chicago by the State Public Utilities Commission of Illinois on July 18. A similar hearing was held before the Public Service Commission of Indiana at Indianapolis on July 16 and 17. The statements of William J. Jackson, receiver of the Chicago & Eastern Illinois, presented before both commissions, is in part as follows:

The war conditions will necessarily further advance the cost of materials, including fuel, labor and taxes, and bring about a scarcity of labor. Operating expenses will necessarily be increased by special service required. The carriers have already created a Special Committee on National Defense, giving it power to subordinate railway traffic and facilities of all roads to meet the present emergency. It will also make it necessary to have the most efficient operating machine possible. Each road must furnish a maximum of power, equipment and transportation effectiveness.

If all the increases in wages to employees that have been granted from January 1, 1917, to May 31, 1917, had been in effect during 1916, it would have resulted in an increased payroll, due solely to increases in rates of wages, on the C. & E. I., to the amount of \$820,000. This amount equals 10.66 per cent of the total payroll of the C. & E. I. for the year ending December 31, 1916. Many of these increases were necessary on account of the increased cost of living and in order to retain employees attracted by higher wages offered by industrial establishments. Had the Adamson law been in effect during the entire year 1916 it alone would have resulted in an increase in wages of \$336,400.

The average price of coal consumed by the C. & E. I. during the year ending December 31, 1916, was \$12.473, whereas the average price of contract coal purchased during the last two weeks of April, 1917, was \$18.291 per ton, or an increase over the year 1916 of 58.18 cents a ton. If the C. & E. I. had been compelled to pay the latter price for coal during the year ending December 31, 1916, its expenditures would have been increased by \$526,500.

The increases in the prices of various materials and supplies, including rails and ties, have been from 20 to 185 per cent. Based upon a study of the present market conditions, the purchasing department estimates that if the prices which shall prevail during 1917 for material and supplies, exclusive of ties, rails and fuel, had been in effect during 1916, it would have resulted in an increased cost of 51.6 per cent. This would have amounted to an increased expenditure of \$1,053,400, to which should be added \$22,400 to cover the increase in the cost of ties.

Rates for the transportation of coal from mines in Illinois and Indiana have been on a lower level than rates on coal in any other section of the country, and coal carrying lines operating in these fields never have been prosperous. The increases in coal rates in this territory have not kept pace with the increased cost of transportation, and the coal-carrying lines have found themselves operating on a very small margin of revenue over actual cost of operation. During the year ended December 31, 1916, the Chicago & Eastern Illinois transported 8,067,903 tons of bituminous coal and 7,725,139 tons of other freight, coal representing 51.09 per cent of the total tonnage. For transporting this coal it received \$4,236,026, or 33.79 per cent of its total freight revenue, while for transporting other freight it received \$8,300,698, or 66.21 per cent of the total freight revenue. This emphasizes the need of those carriers whose tonnage is principally coal for additional revenue.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

Campbell's Creek Railroad

Campbell's Creek Railroad v. Ann Arbor et al. Opinion by Commissioner Meyer:

The Campbell's Creek Railroad Company is entitled to receive a division on coal delivered to the Kanawha & Michigan Railway, figured upon the basis of a mileage prorate of 28 miles, 200 per cent of the actual mileage of its line. (44 I. C. C., 574.)

Coal to Southern California

Independent Ice, Feed & Fuel Company et al. v. San Pedro, Los Angeles & Salt Lake et al. Opinion by Commissioner Harlan:

The present rate of \$5.65 per net ton on coal in carloads from the Castle Gate rate group of Utah and the Rock Springs district of Wyoming to points in southern California, including Los Angeles, has not been shown to be unreasonable.

On lump coal in carloads from mines in New Mexico to points in southern California, including Los Angeles, a rate of \$5.15 per net ton is found to be a reasonable maximum rate for the future. Reparation denied. (44 I. C. C., 666.)

COURT NEWS

Jurisdiction of Action to Recover Overpayments

The Massachusetts Supreme Judicial Court holds that a state court has no jurisdiction of an action to recover back overpayments of demurrage charges claimed to have been collected unlawfully. The construction of the tariffs was involved, and had not been passed upon by the Interstate Commerce Commission.—*Cheney v. Boston & Maine (Mass.)*, 116 N. E., 411. Decided June 1, 1917.

Crossing Accident—Contributory Negligence

In an action for injuries at a crossing the New York Appellate Division holds that defendant railroad's negligence is not a jury question, where 29 of 31 witnesses testified to hearing its engine whistle on approaching a crossing, since it was not bound to anticipate either that plaintiff, a motorcycle rider, was deaf or that his machine prevented his hearing the signals. Plaintiff was guilty of contributory negligence as a matter of law, where he passed buildings obstructing his view at such speed that he could not stop his machine between the point where he first saw the approaching train and defendant railroad's tracks.—*Bowden v. Lehigh Valley*, 165 N. Y. Supp., 454. Decided May 9, 1917.

Trespassing Children

Action was brought in New York for the death of a boy seven years old, run over by a train while sitting on the track. The boy's father rented a house from the railroad company, and the premises abutted on the railroad. The train was running about 40 miles an hour, and the engineman did not see the child until he was within 30 feet of him. The track was unfenced. The United States Circuit Court of Appeals, Second Circuit, held that the railroad was not required to fence against human beings. The New York statute only applies to animals. The child was a trespasser, and the court held that the road was bound only to exercise ordinary care to avoid injuring the child after discovering its peril. There was no reason to expect that persons would be on the track at this place. The evidence conflicted as to whether the engineman blew his whistle when he discovered the child, but it was held that if, in applying the brake, he failed to blow his whistle, his omission under the circumstances would not constitute such negligence as to render the railroad liable. Judgment for the defendant was affirmed.—*McCarthy v. New Haven*, 240 Fed., 602. Decided February 6, 1917.

Frightening Horses by Whistle

In an action for personal injury from the frightening of horses by an unnecessarily loud blast of a locomotive whistle, blown to signal to persons in the rear of the train that it was about to start and to warn pedestrians at a grade crossing, there was no showing that the engineer had seen the horses, or that they were frightened when the whistle was blown. The Pennsylvania Supreme Court held that judgment was properly entered for the defendant, notwithstanding verdict for the plaintiff. The blowing of a whistle by a locomotive engineer is a lawful act, and when negligence is alleged, in that it was very loud, the plaintiff must prove that the act, either as to the time, place or manner, was unlawful.—*Weaver v. Pennsylvania (Pa.)*, 100 Atl., 989. Decided February 26, 1917.

Exclusive Transfer and Express Privileges

The Oregon Supreme Court holds that the state statute prohibiting railroads from giving "undue or unreasonable preference" to any person does not prohibit them from granting exclusive privileges to transfer companies, the legislative intent being merely to prohibit the showing of preference to passengers or shippers. The court followed the Express Cases, 117 U. S. 1, where it was first ruled that railroad companies were not required by usage or the principles of the common law to transport the goods of independent express companies over their lines in the manner in which such commerce was usually carried, nor were they, in the absence of a statute commanding it, required to furnish to all independent express companies facilities for doing an express business on their passenger trains. The Oregon court applied the principle to a contract for the exclusive privilege to solicit passengers on incoming trains at Portland for the transfer of their baggage to points in the city, which it upheld. It also held that an ordinance of the city of Portland prohibiting railroad companies from granting exclusive privileges to transfer companies is invalid as being unauthorized by the city's charter.—*Baggage, etc., T. Co. v. Portland (Ore.)*, 164 Pac., 570. Decided April 17, 1917.

Right to Haul Defective Cars

The Circuit Court of Appeals for the Sixth Circuit, in a suit against the Baltimore & Ohio Southwestern, has sustained the District Court for the southern district of Ohio, western division, in declaring it unlawful for the road to move on its line, for repairs, a defective car received from a connecting carrier in a defective condition. The decision, by Judge Sanford, says:

A defective car cannot be hauled for repairs without liability for the statutory penalty, except by the carrier upon whose line it became defective while being used. The clause "and such equipment shall have become defective or insecure while such car was being used by such carrier upon its line of railroad," thus limits the right.

It becomes necessary for a carrier to which a car . . . has been delivered to inspect it at the interchange point before accepting it, and if found to be defective to refuse to accept it.

Nothing in the safety-appliance acts or in any rule of the common law requires a carrier to accept from a connecting line a car equipped in violation of the safety-appliance act.

The privilege of hauling a defective car for repairs under the specific language of the proviso in section 4 of the act of April 14, 1910, is only granted when the car had, in the first instance, been properly equipped and thereafter became defective while being used.

The proviso in question relates in terms only to the movement of a car for repair after it has been discovered to be defective and does not relieve the carrier from liability for hauling a defective car before the defect has been discovered.

But, in case a defective car is received from a connecting carrier in a string or train of cars, the mere incidental handling of such car by the receiving carrier, refusing to accept it, in such manner as may be necessary to disconnect it from the other cars for redelivery to the connecting carrier and to proceed with the use of the other cars, would not be a use which would incur the penalties of the act; such incidental handling of the car not being in contravention of the purposes of the act, but a necessary step in furtherance thereof.

Equipment and Supplies

LOCOMOTIVES

THE NORFOLK & WESTERN is building 10 large 2-8-8-2 type Mallet locomotives in its own shops.

THE BRITISH WAR OFFICE, which ordered 50 Consolidation and 75 Prairie locomotives from the Baldwin Locomotive Works, has just given that company an additional order for 100 more Consolidation locomotives, at a price, it is said, of \$45,000 each.

THE UNITED STATES GOVERNMENT has placed orders for 300 80-ton Consolidation locomotives for service in France, 150 with the American Locomotive Company and 150 with the Baldwin Locomotive Works. Negotiations were originally for 300 locomotives from each of the builders, but only 150 from each were ordered at this time.

RUSSIAN GOVERNMENT.—The Russian government contracts for 500 Decapod locomotives divided equally between the American Locomotive Company and the Baldwin Locomotive Works, which were held up because of the financing, have now been definitely signed. These orders were first reported in the *Railway Age Gazette* in the issue of June 1. Reports have it that these locomotives will cost \$56,000 each.

FREIGHT CARS

THE DELAWARE & HUDSON is reported as inquiring for 50 steel underframes.

THE CANADIAN GOVERNMENT RAILWAYS have ordered 1,000 box cars from the National Steel Car Company.

THE SHELL COMPANY, Los Angeles, has ordered 50 tank cars from the General American Tank Corporation.

THE ERIE has given an order to the American Car & Foundry Company to repair 250 gondola and 250 box cars.

THE TEMISKAMING & NORTHERN ONTARIO has recently ordered 100 40-ton steel frame box cars from the Canadian Car & Foundry Company.

THE SOUTH BUFFALO RAILWAY has ordered 300 steel hopper cars for the Lackawanna Steel Company from the American Car & Foundry Company.

THE PENNSYLVANIA RAILROAD has placed orders with its Altoona shops for the construction of 2,225 freight cars as replacements, for 1918 delivery, as follows:

- 2,000 all-steel box cars
- 100 steel maintenance of way flat cars
- 100 steel cabin cars
- 25 steel "well-hole" cars

The *Railway Age Gazette* has already reported 1,000 cars of this order in its issue of June 8. This freight car order, together with uncompleted work on previous orders now on hand at Altoona, will keep the car shops there busy until the close of next year.

IRON AND STEEL

THE PENNSYLVANIA RAILROAD has ordered 140 tons of steel from the Phoenix Bridge Company.

SIGNALING

THE MISSOURI, KANSAS & TEXAS has ordered from the Union Switch & Signal Company the material for an electric interlocking plant, on the San Antonio Belt & Terminal, at the crossing of the Kerrville branch of the San Antonio & Aransas Pass. The machine will be type "F," with 14 working levers and 3 spare spaces. The San Antonio Belt & Terminal Railway will install a 24-lever interlocking machine at the crossing of the San Antonio & Aransas Pass, and the Galveston, Harrisburg & San Antonio, at San Antonio, Tex.; 23 working levers and one spare space. The General Railway Signal Company has been awarded the contract.

Supply Trade News

R. C. Fraser, vice-president Buffalo Brake Beam Company at New York, died on July 17 at his home at Suffern, N. Y.

The Bohannon Easer Joint Company, Ensley, Ala., announces a change in the company name to the National Steel Products Company, Inc.

George E. Scott, vice-president of the American Steel Foundries, has become associated with the work of the Red Cross at Washington on the staff of the business manager, H. D. Gibson.

G. A. Cooper, representative in the railroad department of the United States Graphite Company, at Chicago, has been appointed advertising manager of the company, with headquarters at Saginaw, Mich.

W. G. Bee, vice-president and general sales manager of the Edison Storage Battery Company, Orange, N. J., died at his home in that city July 11, aged 48 years. Mr. Bee was born in

W. G. Bee

Hartford, Conn., December 14, 1868. He left school at the age of 15 and enlisted in the United States Navy as seaman's apprentice. After four years' service he received an honorable discharge and returned to Hartford and became associated with the Pope-Hartford Bicycle Company, which later became the Electric Vehicle Company of Hartford. In this way Mr. Bee became one of the pioneers of the electric vehicle industry. In the Spanish-American War, Mr. Bee was a chief gunner's mate on the U. S. S. "Gloucester." J. P. Morgan's yacht, "Corsair." After the war Mr. Bee returned to the Electric Vehicle Company and spent some time in Mexico in its interests and was in charge of its exhibit at the Pan-American Exposition. In 1903, Mr. Bee became associated with Thomas A. Edison, then at Glen Ridge. When the Edison Storage Battery Company was organized in Orange, Mr. Bee became general sales manager, and in 1903 was elected vice-president.

The Lodge & Shipley Machine Tool Company, Cincinnati, Ohio, has elected the following new officers: M. G. Lodge, president; J. W. Carrell, vice-president and general manager, and L. A. Hall, secretary and treasurer.

The American Steel Foundries, Chicago, has purchased the Eclipse cast steel coupler yoke from the National Car Equipment Company. The Eclipse yoke requires neither keys nor rivets, and is in use on a large number of roads.

L. O. Cameron, formerly manager of sales, southern district for the Pressed Steel Car Company, has opened an office in the Munsey building, Washington, D. C., and will hereafter represent the Pressed Steel Car Company, and the Oxweld Railroad Service Company. He will also handle government accounts.

Horace M. Wigney, formerly superintendent of transportation of the Pacific Fruit Express Company, and recently president and general manager of the Dairy Shippers' Despatch Company and the Federal Refrigerator Despatch, has entered the railway supply and equipment business in his own name, with offices at 750 Railway Exchange building, Chicago.

The International Oxygen Company announces the appointment of R. M. Klein as sales manager, with headquarters at

the company's main office, 115 Broadway, New York. Mr. Klein was formerly an engineer in United States government employ. He later served as salesman and sales manager for the Diehl Manufacturing Company, and as manufacturers' representative handling a number of mechanical lines. He entered upon his new duties July 1.

The Mark Manufacturing Company, Chicago, will spend approximately \$14,500,000 in the construction of a steel plant at South Chicago. This is \$9,500,000 in excess of the cost as estimated a year ago. The new plans provide for the construction of a 600-ton blast furnace, with docks, ore and coke-handling machinery, which was not in the original plans, and also an open hearth steel department with a capacity of 250 gross tons of ingots per year.

Herbert Deeming, who has been appointed sales manager of Mudge & Co., with headquarters in the Railway Exchange, Chicago, was born in England on April 16, 1880. He began his business career as a stenographer and clerk in the general passenger department of the Fremont, Elkhorn & Missouri Valley at Omaha, Neb., in October, 1897. From July, 1899, to September he was with the American Express Company at Omaha, and from the latter month until January, 1900, he was employed in the general superintendent's office of the Fremont, Elkhorn & Missouri Valley. He was then promoted to secretary to the general freight agent of the same road, and in July, 1902, went to Chicago, where he was employed in the auditor's office of the Chicago & Western Indiana. In January, 1903, he was promoted to a position in the president and general manager's office. From July, 1903, to February, 1916, he was secretary of the General Managers' Association, at Chicago, and from November, 1907, to February, 1916, was also secretary of the Association of Western Railways. In March, 1916, he became assistant director of the Railway Educational Bureau at Omaha, Neb., and seven months later he became associated with the H. E. Reisman Advertising Company, which position he held until his recent appointment.

H. Deeming

The Walter A. Zelnicker Supply Company, St. Louis, Mo., and affiliated companies are now represented in the Birmingham district by Thomas A. Hamilton, who for the past 14 years has been connected with Crane Company, prior to which he was superintendent of the East St. Louis plant of the Zelnicker Car Works. Mr. Hamilton will have charge of both buying and selling in the southeastern district. His office will be at 1018 Woodward building, Birmingham, Ala.

Frank B. Bradley, vice-president of the Ajax Forge Company, Chicago, died at his home, in Chicago, on July 14. Mr. Bradley was born at Lake Forest, Ill., on May 6, 1866, and entered the service of the Ajax Forge Company in 1884 as an office boy. With the exception of a few years' service with the Morden Frog & Crossing Works, the Buda Foundry Company and Clement Curtis & Co., he has been continuously with the Ajax Forge Company since that time, having special charge of the sales department in recent years. In addition to his sales duties he has invented and perfected several railroad track specialties.

The Western Electric Company announces the opening of three new electrical supply warehouses, one in New Haven, Conn., at 135 Wood street, in charge of Tyler L. Holmes; a second at 425 East Oliver street, Baltimore, Md., in charge of S. Greenfield, and the third in Charlotte, N. C., at 238 West First street, in charge of R. H. Bouligny. In order to take care of the growing demands of the business in the Northwest

adequately, the warehouse and sales office of the Western Electric Company has just moved into new and commodious quarters at 84 Marion street. W. H. Quirk has been appointed manager of the Western Electric house at Cincinnati, Ohio. W. L. Sioussat will succeed Mr. Quick as stores manager in the company's Cleveland house.

J. P. Spining, who has been appointed assistant to the general traffic manager and railway sales manager of the Certain-teed Products Corporation, with headquarters at St. Louis, Mo., was born at Cincinnati, Ohio. He entered railway service with the Chesapeake & Ohio, at Cincinnati, and later served consecutively as joint ticket agent of the Cleveland, Cincinnati, Chicago & St. Louis and the St. Louis, Iron Mountain & Southern at Cairo, Ill.; city passenger agent and assistant to the assistant passenger agent of the Cleveland, Cincinnati, Chicago & St. Louis, at St. Louis; northwestern representative of the Chesapeake & Ohio at Chicago; general agent of the Big Four at Chicago, and later also general agent of the Michigan Central. After leaving the Michigan Central he became associated with Toth Brothers, New York, handling railroad accounts in eastern territory. Upon the reorganization of the Buffalo & Susquehanna he became general freight and passenger agent of that road, with headquarters at Buffalo, N. Y. On December 1, 1916, he was placed in charge of railroad sales for the Certain-teed Products Corporation in the Chicago district, which position he held until his recent appointment.

TRADE PUBLICATIONS

VISES.—The Western Tool & Manufacturing Company, Springfield, Ohio, has recently issued a booklet descriptive of the company's Champion vises.

WRENCHES AND OTHER TOOLS.—One of the latest catalogues issued by the Mechanical Specialties Company, Chicago, is a 16-page booklet illustrating and giving list prices on the company's line of wrenches, chisels, punches and similar tools.

CAR HEATING.—The Gold Car Heating & Lighting Company, New York, has recently issued a catalogue descriptive of the Gold electric thermostatic control of steam heating for passenger train cars. The booklet explains the advantages of this system from the standpoint of uniform heating and economies in the use of steam, and explains how the system secures the desired results.

ELECTRIC HOISTS.—The Sprague Electric Works of the General Electric Company, 527-531 West Thirty-fourth street, New York, have issued bulletin No. 48,923, describing Type W electric hoists, one to six tons. The various sizes and types of these hoists are clearly shown both by photographs, detailed drawings and dimension tables. General specifications for these hoists are also given.

THE STROH PROCESS.—The Stroh Steel-Hardening Process Company, Pittsburgh, Pa., has recently issued a 24-page catalogue descriptive of the Stroh process. This is a method for casting fine alloy steel together with soft steel in one solid piece, this giving a casting with a wear-proof alloy steel stratum upon the wearing surfaces, while the body is composed of any desired steel, and is in no way affected. The catalogue contains a number of illustrations showing gears, wheels, frogs, crossings, etc., of Stroh steel.

A NEW IDEA IN TWIST DRILL CATALOGUES.—The Cleveland Twist Drill Company, Cleveland, Ohio, has incorporated in its newest twist drill catalogue, No. 39, a thumb index and various other features which will distinguish it from the usual twist drill catalogue. The thumb index will enable the drill user to locate any one of the ten sub-divisions, and each index is supplemented further by a detailed index of the particular section. Each of the sections is also prefaced by an illustration graphically portraying some item in the manufacture of Cleveland tools or some unusual sales point in one of these tools. All the regular tools are shown and some of the special tools, but for the sake of brevity a number of other special tools are omitted. The book also has another good feature in that the prices of high speed tools are shown in red, thus making it easier to distinguish the lists of high speed and carbon steel tools.

Railway Construction

BALTIMORE & OHIO.—This company is building a five-mile industrial line at Baltimore, Md., which will be known as the Patapsco Neck branch, from a point near Colgate Creek station to a connection with the Sparrow's Point system, reaching the Penn-Mary plant of the Bethlehem Steel Company. A bridge will be built over Bear Creek, 1,210 ft. long, consisting of a steel draw span 210 ft., with timber trestle approaches 475 and 525 ft., respectively, and a bridge over Colgate Creek and the tracks of the United Railway & Electric Company of Baltimore. Two steel girders will span the railway and adjacent boulevard, 71 and 80 ft. in length, with a timber trestle over the creek. The work is being done by H. S. Kerbaugh, Inc., of Baltimore and New York.

CHICAGO, BURLINGTON & QUINCY.—A contract has been awarded by this road to Ralph Sollitt & Son, Chicago, for the construction of a storehouse, oilhouse, machine shop, power house and office building at Clyde, Ill. The buildings will be one-story high, of brick construction, with concrete foundation. A contract has also been awarded to G. A. Johnson & Sons, Chicago, for the building of an extension to the roundhouse at Beardstown, Ill.

CHICAGO, MILWAUKEE & ST. PAUL.—This company has awarded a contract to the McCarthy Improvement Company, Davenport, Iowa, for the construction of a freight house at Davenport. The building will be 40 ft. wide and the total length will be 409 ft., of which 79 ft. is to be two stories high and the remaining 330 ft. one story high. It will be of reinforced concrete construction and will have a Barrett specification roof. In addition to the building there will be an uncovered concrete platform 319 ft. by 40 ft.

GULF, MOBILE & NORTHERN.—This company has authorized the expenditure of \$1,000,000 for terminal development at Mobile, Ala. The initial unit of the improvement will consist of piers, warehouses and dock facilities, including 4,000 lineal feet of piers, 2,000 lineal feet of warehouses, portions of which will be two stories in height and containing approximately 200,000 sq. ft. of floor space, lumber docks with 2,000 ft. frontage on Mobile Bay, dredging and the installation of cranes and carriers for the handling and storing of cargoes. This work is to cost \$500,000 and will be begun on the completion of the final plans.

MINNEAPOLIS, ST. PAUL & SAULT STE. MARIE.—A contract has been awarded by this company to the Thompson-Starrett Company, Chicago, for the construction of a 1,150,000-bu. grain elevator at North Minneapolis, Minn.

NEW YORK, NEW HAVEN & HARTFORD.—This company contemplates carrying out improvements on the Mystic river bridge. The present bridge is a double-track draw over the Mystic river, with span 178 ft. 7½ in. long. The company plans to construct a new superstructure of the swing draw type. The substructure work will consist of constructing four end pedestals, one at each end of the east and west piers, removing a portion of the present masonry and grillage and constructing the end pedestals at an elevation below the government channel depth. Steel cross girders are to be set on these end pedestals for the support of the ends of the new swing bridge. All the work is to be handled under traffic by supporting the ends of the present bridge on needle beams during the reconstruction.

NORTH DAKOTA ROADS.—The Dickinson, Lefor, Leipzig Construction Company has completed surveys for a railroad from Dickinson, N. D., to New Leipzig, via Lefor, Jordan and Willa, 62 miles. The plans call for stations, roundhouses and three bridges. There are no heavy grades or curves. A. A. Lefor, Lefor, N. D., is president, and N. A. Lefor is secretary and treasurer.

WESTERN PACIFIC.—The engineering department of this company is locating a line from Niles, Cal., down the Santa Clara valley to San Jose, about 13½ miles. Work will be started as soon as plans are completed, and it is expected operation will commence before June 1, 1918.

Railway Financial News

ATCHISON, TOPEKA & SANTA FE.—The Appellate Division of the Supreme Court has affirmed the judgment of the lower court dismissing the plaintiff's complaint in the suit of Francis Sherwood Male, as trustee, against the Atchison, Topeka & Santa Fe, to recover \$120,000 of principal and income of the bonds of the old Atlantic & Pacific Railroad from which the Santa Fe system grew. The prevailing opinion of the court was that the new Atchison organization was not obliged to pay the principal and interest on the bonds of the insolvent Atlantic & Pacific, which had once been sold out under foreclosure.

ATLANTIC & PACIFIC.—See Atchison, Topeka & Santa Fe.

BOONVILLE, ST. LOUIS & SOUTHERN.—George E. Mix, a St. Louis lawyer, has succeeded Walker Hill, president of the Mechanics American National Bank as trustee for the bondholders of a \$500,000 mortgage on this road. Mr. Hill was appointed trustee in 1911. Spitzer, Rorick & Co., of Toledo, O., holders of a majority of the bonds, caused this change in trustees. This firm has applied to the Federal court for an injunction to restrain the Missouri Pacific from proceeding with the foreclosure sale under a mortgage against the Boonville, St. Louis & Southern.

CHICAGO, ROCK ISLAND & PACIFIC.—James N. Wallace, president of the Central Trust Company, has been elected chairman of the finance committee in addition to being elected a director to succeed E. D. Hulbert, resigned.

See also editorial comments elsewhere in this issue.

CHICAGO & WESTERN INDIANA.—J. P. Morgan & Co. and other bankers have purchased \$15,000,000 of Chicago & Western Indiana one year 6 per cent notes, which will shortly be offered to investors. Proceeds from the sale will be used in part to pay off \$13,935,000 of two-year 5 per cent notes maturing September 1, 1917.

DELAWARE & HUDSON.—This company has sold to a strong banking group, headed by Kuhn, Loeb & Co., an issue of \$9,000,000 of three-year notes, which will carry interest at 5 per cent and be offered to investors at or close to par. Out of the proceeds \$5,000,000 will be used by the company to retire a like amount of Pennsylvania division first-mortgage 7s, which mature on September 1. This issue was put out in 1877, when money rates were high, and the company will effect a considerable interest saving annually through its retirement with 5 per cent notes. The remaining \$4,000,000 will be used for improvements and other needs. This financing will take care of all of the company's requirements for this year, and it has no other maturities to meet until 1922, when an issue of \$9,643,000 of 4½ per cent equipment notes falls due. The Delaware & Hudson planned early this year to finance itself through an issue of bonds, but the necessary permission was so long in being granted by the up-State Public Service Commission that the company on May 1 last notified that body that it did not for the present care to sell the \$4,000,000 which had been authorized. W. H. Williams, vice-president, accordingly asked the commission not to set a price for the proposed issue.

MISSISSIPPI EASTERN.—The 17-mile line extending from Quitman, Miss., to Theadville, has been sold to the Long-Bell Lumber Company, of Kansas City, Mo.

PENNSYLVANIA RAILROAD.—This company has announced that it has sold all its anthracite mining properties and collieries to M. A. Hanna & Co., of Cleveland. The terms of the sale have not been made public. The sale is one of the most important transfers of anthracite coal properties in recent years, and is the result of a determination by the Pennsylvania several years ago to divest itself of interests not directly concerned in the transportation service. The greater part of the company's hard coal property was operated by the Susquehanna Coal Company, whose entire capital stock was owned by the Pennsylvania. The company mined about 5 per cent of the entire anthracite production.

Railway Officers

Executive, Financial, Legal and Accounting

Thomas Price, assistant secretary of the Union Pacific, at New York, has been appointed secretary, succeeding Alexander Millar, resigned because of ill health.

Walter D. Beymer, who has been appointed controller of the Illinois Central, with headquarters at Chicago, as has already been announced in the *Railway Age Gazette* of July 6, was born at Clyde, Ohio, on April 10, 1866. He entered railway service in 1886 as a freight clerk with the Baltimore & Ohio, and was later bill clerk and record clerk on the same road. On September 15, 1887, he became chief clerk in the freight accounting department of the Atchison, Topeka & Santa Fe at Topeka, Kan. On March 31, 1897, he became chief clerk in the accounting department of the Central of Georgia and the Ocean Steamship Company, at Savannah, Ga., and on December 31, 1899, he was promoted to freight and passenger accountant. On June 30, 1903, he became controller, which position he held until his recent appointment as controller of the Illinois Central, with headquarters at Chicago, as already noted.

Guy J. Bunting, whose appointment as controller of the Chicago, Milwaukee & St. Paul, with headquarters at Chicago, was announced in the *Railway Age Gazette* of July 6, was born at Portsmouth, Va., on July 14, 1881. He entered railway service on July 1, 1899, with the Cashie & Chowan railroad. On February 1, 1900, he left railway service and went with the Greenleaf-Johnson Lumber Company. From January 16, 1903, to December 31, 1907, he was with the Indiana Audit Company, and from January 1, 1908, to March 1, 1909, he was with the Audit company of New York, specializing in railway auditing. On May 1, 1909, he became examiner of accounts for the Interstate Commerce Commission, and on July 16, 1911, was appointed general accountant of the Chicago, Milwaukee & St. Paul. On February 1, 1913, he was promoted to assistant general auditor, and two years later became general auditor, which position he held until his appointment as controller, as already noted.

F. N. Hallstead, assistant general paymaster of the Delaware, Lackawanna & Western, has been appointed general paymaster, with headquarters at Scranton, Pa., succeeding John H. Bessel, who has retired after a service of 50 years with the Lackawanna and its predecessors.

J. M. Schoonmaker, vice-president of the Monongahela Railway, has been elected president, succeeding J. J. Turner, who becomes vice-president; T. H. B. McKnight has been appointed treasurer, and R. R. Reed has been appointed assistant treasurer, succeeding W. N. Doulin. All with headquarters at Pittsburgh, Pa.

Operating

L. P. Blanchard has been appointed superintendent of car service of the Maine Central, with office at Portland, Me., vice W. B. Drew, who retires at his own request.

C. E. Reynolds has been appointed acting car accountant of the Virginian Railway, with office at Norfolk, Va., vice E. E. Gardner, resigned to accept service elsewhere.

J. B. McKinley, transportation inspector on the Atchison, Topeka & Santa Fe, at Wellington, Kan., has been appointed trainmaster, with headquarters at Cushing, Okla., succeeding C. E. Griggs.

W. Wackher, trainmaster of the Missouri, Kansas & Texas at Sedalia, Mo., has been appointed superintendent of the Missouri, Kansas & Texas Railway of Texas, with headquarters at Greenville, Tex., vice H. E. McGee, who has been appointed transportation officer at the government training camp at Waco.

C. B. Anderson, announcement of whose appointment as superintendent of transportation of the Chicago & Eastern Illinois, with headquarters at Chicago, was made in the *Railway Age Gazette* of July 13, was born at Momence, Ill., on August 7, 1874. He entered railway service with the Chicago & Eastern Illinois as a messenger boy in January, 1891, and several years later became clerk in the same offices. In 1897 he was made assistant cashier, and in March, 1898, became cashier. On June 1, 1907, he was promoted to agent at the Chicago freight station, and while serving in this capacity he has given much attention to methods of increasing the capacity of the present station through the use of motor trucks and similar equipment. He held the position of agent until his appointment as superintendent of transportation, as already noted.

R. E. Farmer has been appointed assistant superintendent on the Evansville & Indianapolis, with headquarters at Terre Haute, Ind., and will take over the duties formerly discharged by R. McNamar, trainmaster at Terre Haute, who has resigned to enter the service of another company.

A. C. Bowen, trainmaster on the Chicago, Milwaukee & St. Paul at Tacoma, Wash., has been appointed superintendent of the Northern Montana division, with headquarters at Lewistown, Mont., succeeding C. L. Whitney, resigned to enter military service, and J. J. Murphy, division superintendent at Three Forks, Mont., has been transferred to Deer Lodge, succeeding F. E. Willard, deceased, and will have charge of the Missoula and Rocky Mountain divisions.

John T. McShane, whose appointment as superintendent on the Chicago, Burlington & Quincy, with headquarters at Sterling, Colo., was announced in these columns on July 6, was born at Lincoln, Neb., on August 12, 1885. He entered railway service with the Chicago, Burlington & Quincy as a call boy, and later served consecutively as operator and dispatcher at Lincoln. On April 15, 1909, he became chief train dispatcher at Omaha, and in April, 1915, was promoted to trainmaster, with headquarters at Sheridan, Wyo., which position he held until his recent appointment.

W. D. Beymer

C. B. Anderson

G. J. Bunting

Frank A. Leith, whose appointment as superintendent of the Chicago, Terre Haute & Southeastern, with headquarters at West Clinton, Ind., was announced in these columns on July 13, was born at Nathan, Ill., on April 27, 1871. He entered railway service with the Illinois Central in July, 1892, and served consecutively until 1899 as telegraph operator, agent and despatcher. In 1899 he became chief despatcher on the Vandalia, and in 1902, was despatcher on the Southern Indiana. On February 1, 1915, he was appointed chief despatcher on the Chicago, Terre Haute & Southeastern, and in December, 1916, was promoted to assistant superintendent, which position he held until his recent appointment.

Fred E. Sanborn, whose appointment as general superintendent of the Maine Central, with headquarters at Portland, Me., has already been announced in these columns, was born on November 15, 1865, at Portsmouth, N. H., and was educated in the common schools. He began railway work on May 1, 1881, with the Maine Central, as office boy in the Portland (Me.) local freight office, and subsequently served as clerk in the office of the general western freight agent. In 1883 he became a train brakeman, and three years later was appointed baggage master. He subsequently served as conductor until 1901, when he was appointed trainmaster, and later became superintendent of the Portland division, which position

F. E. Sanborn

he held at the time of his recent appointment as general superintendent of the same road, as above noted. Mr. Sanborn's entire railway service has been with the Maine Central.

Edward Samuel Moore, who has been appointed superintendent of transportation of the Norfolk & Western, with headquarters at Roanoke, Va., as has already been announced in these columns, was born on September 30, 1880, at Newport, Pa., and was educated in the common schools. He began railway work in 1896, with the Norfolk & Western, as a messenger in the telegraph office at East Radford, Va., and about one year later resigned to continue his school studies. In 1898, he returned to the service of the Norfolk & Western, as stenographer to the car service agent, and was promoted in 1903 to chief clerk, which position he held at the time of his recent appointment as superintendent of transportation of the same road as above noted.

J. R. Talbott, who has been appointed superintendent of car service of the Norfolk & Western, with headquarters at Roanoke, Va., as has already been announced in these columns, was born on August 24, 1874, at Ashland, Ky., and was educated in the grammar schools. He began railway work in May, 1890, as a yard clerk on the Norfolk & Western at Coal Grove, Ohio. In January, 1892, he was transferred to Columbus as a clerk in the car accountant's office, and the following November was again transferred to Roanoke, Va., to the car record office. In April, 1899, he was promoted to traveling car agent, and in May of the following year became chief clerk in the car record office. He was promoted to car accountant in October, 1907, and now becomes superintendent of car service of the same road, as above noted.

James H. Aydelott, whose appointment as division superintendent on the Chicago, Burlington & Quincy at Hannibal, Mo., was announced in the *Railway Age Gazette* of July 6, was born in Jersey county, Ill., on August 13, 1883. He entered railway service with the Chicago, Burlington & Quincy on September 15, 1902, as a clerk in the mechanical department. In February, 1908, he became chief clerk in the superintendent's office at St. Joseph, Mo., and later served successively until March, 1916, as chief clerk in the general superintendent's office at St. Louis, and chief clerk in the general manager's office, at Chicago. In

March, 1916, he was promoted to special inspector on the general manager's staff at Chicago, and in May of the same year became trainmaster at La Crosse, Wis., which position he held until his recent appointment.

George H. Alexander, who has been appointed superintendent of freight transportation of the New York Central, lines east of Buffalo, with headquarters at New York, as has already been announced in these columns, was born on November 8, 1868, at Mobile, Ala., and was educated in the public schools of his native town. He began railway work in February, 1886, as stenographer and bookkeeper in the accounting department of the Mobile & Ohio, and later served as chief clerk in the division and general superintendent's offices. In June, 1894, he entered the service of the New York Central as chief clerk in the superintendent's office at Watertown, N. Y., and from October, 1901, to December, 1906, was traveling auditor at Rochester, N. Y. He was then appointed car accountant, remaining in that position until May, 1911, when he was appointed superintendent of car service at New York, which position he held at the time of his recent promotion, as above noted.

G. H. Alexander

William Spencer Taylor, who has been appointed superintendent of the Cincinnati Terminal division of the Chesapeake & Ohio, with headquarters at Covington, Ky., as has already

been announced in these columns, was born on May 12, 1868, at Lynchburg, Va., and was educated in the public schools. In the spring of 1882 he began railway work as waterboy in work train service on the Virginia Midland, now a part of the Southern system; the following spring he was appointed brakeman on the same road. In the winter of 1884 he went to the Norfolk & Western at Lynchburg, Va., and six months later was promoted to yard conductor. In February, 1880, he went to the

W. S. Taylor

Richmond & Allegheny as night yardmaster at Lynchburg, and later was in the service of its successor, the Chesapeake & Ohio. In December, 1897, he was appointed day yardmaster at Clifton Forge, Va., remaining in that position until June, 1911, when he became general yardmaster at Brighton, Ohio. On September 15, 1911, he was promoted to terminal trainmaster, with office at Summit, Ohio, and in February, 1913, his authority was extended and his headquarters were transferred to Covington, Ky. In February, 1914, he was appointed superintendent of terminals, with headquarters at Covington, which position he held until his recent appointment, as above noted.

Porter W. Sullivan, whose appointment as division superintendent on the Pennsylvania Lines West, with headquarters at Akron, Ohio, was announced in the *Railway Age Gazette* of July 13, was born at Buffalo, N. Y., on September 29, 1873. He entered railway service with the Pennsylvania Lines on June 1,

1890, as a clerk in the local freight office at Columbus, Ohio. On July 1, 1893, he became stenographer and clerk in the office of the superintendent of the Cleveland and Pittsburgh division, and on January 1, 1901, was promoted to chief clerk to the superintendent. On November 1, 1902, he was appointed assistant trainmaster, and in 1904 was assigned to duties in connection with the World's Fair at St. Louis, Mo. In 1907 he was special agent in charge of the Pennsylvania Railroad exhibit at the Jamestown (Va.) exhibition, and on January 1, 1912, became chief clerk to the general superintendent of the central system of the Pennsylvania Lines West, which position he held until his recent appointment.

Traffic

M. J. Beyans has been appointed division freight agent of the Baltimore & Ohio, with headquarters at New York.

J. S. McConnell has been appointed commercial agent on the Louisiana & Arkansas, with headquarters at Houston, Tex.

A. S. Edmonds has been appointed assistant freight traffic manager of the Missouri Pacific, with headquarters at St. Louis, Mo., effective July 10.

L. E. Poley, commercial agent of the Nashville, Chattanooga & St. Louis at Macon, Ga., has been appointed general eastern agent, with office at New York.

A. D. Maxwell has been appointed commercial agent of the Atlanta, Birmingham & Atlantic, with office at Waycross, Ga., vice H. G. Dowling, transferred.

J. J. Rose, Canadian passenger agent for the Union Pacific, with headquarters at Toronto, Can., has been appointed general agent, with jurisdiction over both freight and passenger business, with the same headquarters.

B. W. Herrman, assistant general freight agent of the Norfolk & Western, with headquarters at Columbus, Ohio, has been appointed general freight agent with the same headquarters. The office of assistant general freight agent has been abolished.

M. C. Markham has been appointed assistant to the vice-president in charge of traffic of the Missouri Pacific, with headquarters at Chicago. P. J. McCarthy, assistant general freight agent at Chicago, has been transferred to St. Louis, Mo. The position of assistant general freight agent at Chicago has been abolished.

R. R. Trimble, general agent of the Missouri Pacific, with headquarters at Buffalo, N. Y., has been appointed general agent of the passenger and freight departments, with headquarters at Tulsa, Okla., and the office of general agent at Buffalo has been abolished; P. E. Watson has been appointed general agent of the passenger and freight departments, with headquarters at Pueblo, Colo., succeeding B. E. Sells, deceased.

H. T. Duffy, district passenger agent of the Minneapolis, St. Paul & Sault Ste. Marie, at Moose Jaw, Sask., has been appointed general agent, with headquarters at Toronto, Ont., succeeding F. A. Mancekivell, resigned. R. H. Ziebell, traveling agent with headquarters at Minneapolis, Minn., has been appointed district passenger agent at Moose Jaw, Sask., succeeding Mr. Duffy.

Engineering and Rolling Stock

A. H. Beirne has been appointed master mechanic of the western division of the Atchison, Topeka & Santa Fe, with headquarters at Dodge City, Kan., succeeding Edward Norton.

J. J. Hanlin, master mechanic of the Seaboard Air Line at Howells, Ga., has been appointed assistant superintendent of motive power, with headquarters at Portsmouth, Va., effective July 1.

M. F. Smith, district master mechanic of the Chicago, Milwaukee & St. Paul at Dubuque, Iowa, has been transferred to Milwaukee, Wis., succeeding A. Young, resigned to enter military service.

A. J. Bisbee, assistant engineer on the Chicago, Rock Island & Pacific at Chicago, has been appointed valuation engineer of the Evansville & Indianapolis, with headquarters in the office of the engineer maintenance of way, Terre Haute, Ind., succeeding N. C. Van Natta, resigned to go with another railroad.

E. H. Barnhart, division engineer maintenance of way of the Baltimore & Ohio, at Wheeling, W. Va., has been transferred to Baltimore, Md., succeeding Richard Brooke, resigned to enter military service, and P. A. Beatty, assistant engineer at Baltimore, has been promoted to division engineer maintenance of way, with headquarters at Wheeling, succeeding Mr. Barnhart.

H. T. Ruhl, who has been appointed engineer maintenance of way and structures of the Delaware & Hudson, with headquarters at Albany, N. Y., as has already been announced in these columns, began railway work in 1902 as a rodman on the Canadian Pacific. From 1904 to 1905 he was transitman, and then to 1908 was resident engineer at Toronto, Ont. In 1908 he was appointed senior transitman at North Bay; the following year he became resident engineer at Sudbury, and from 1911 to 1913 was resident engineer at Farnham on the same road. He left the service of the Canadian Pacific in 1913 to become resident engineer on the Canadian Government Railways, at New Glasgow, and in 1915 was promoted to division engineer at Moncton, N. B., which position he held at the time of his recent appointment as engineer maintenance of way and structures of the Delaware & Hudson, as above noted.

Purchasing

S. F. Langton has been appointed division storekeeper on the Atchison, Topeka & Santa Fe, at Seligman, Ariz., succeeding S. C. Fogarty.

Special

George A. Cullen, passenger traffic manager of the Delaware, Lackawanna & Western, with office at New York, has become associated with the work of the food administration at Washington as head of the division of co-operative organizations, food conservation department, and is engaged in co-ordinating the work of various organizations throughout the United States in carrying on an educational campaign for food conservation.

As noted in last week's issue, Edward Chambers, vice-president of the Atchison, Topeka & Santa Fe, has been appointed assistant to H. C. Hoover, food administrator at Washington, and will act as an advisor on transportation matters. Mr. Chambers was born on February 16, 1859, at Waukegan, Ill., and was educated in the public schools. He entered railway service in 1878 as freight handler for the Atchison, Topeka & Santa Fe at Pueblo, Colo.; later agent and commercial agent at various Santa Fe system since that time, principally in the traffic department. He was check clerk, transfer foreman and cashier at Pueblo, Colo.; late agent and commercial agent at various points, assistant general freight agent at Los Angeles, and general freight agent of the lines west of Albuquerque, N. M. In March, 1915, he was appointed assistant freight traffic manager of the Coast Lines, and on June 1, 1913, he was elected vice-president in charge of traffic.

Railway Officers in Military Service

Edgar S. Nethercutt, acting secretary of the Western Society of Engineers, Chicago, has been commissioned major in the Engineer Officers' Reserve Corps.

N. D. Ballantine, assistant to the second vice-president of the Chicago, Rock Island & Pacific, at Chicago, has been commissioned major in the Engineer Officers' Reserve Corps.

Thomas W. Saul, division engineer of the Oregon-Washington Railroad & Navigation Company, with headquarters at Portland, Ore., recently enlisted in the Eighth Regiment of Engineers, United States army, and is now in training at American Lake, Wash.

Richard Brooke, division engineer maintenance of way of the Baltimore & Ohio at Baltimore, Md., has received a commission as captain in the Engineers' Officers Reserve Corps, and has been assigned to duty with the Fifth Engineers, National Army, at Pittsburgh, Pa.

OBITUARY

W. H. Anderson, superintendent of the Kentucky Central division of the Louisville & Nashville, died at a hospital in Paris, Ky., on July 18, at the age of 58.

GENERAL NEWS SECTION

The average employee in a commercial business recognizes that his interests and his company's interests are identical.

Employees As Molders of Sentiment

Unless the business prospers he cannot hope for increased wages, and consequently he promotes the welfare of the concern in every possible way that he can. He is not only energetic in discharging his routine duties but keen to seize opportunities to raise his company in public esteem.

Unfortunately, railroad employees have been lacking in this respect and much can be accomplished if they are properly stimulated. Sometime ago T. J. Foley, general manager of the Illinois Central, discovered what far-reaching results followed a common sense expression of opinion by a conductor favorable to his road. This led him to consider the possibilities of enlisting train service employees as missionaries on public relations in conjunction with their duties in daily contact with the patrons of the company. In a bulletin, summarized elsewhere in this issue, he calls the attention of trainmen and engineers to the good effects of a statement of fact now and then, when in the interests of the road's welfare, and announces that he intends to issue circulars from time to time, setting forth concrete and illuminating statistics concerning the affairs of the Illinois Central and the railroad situation generally. Some of the employees, prejudiced by a tradition of antagonism toward the management, may not be of much assistance in the campaign that Mr. Foley contemplates, but the more intelligent men will be able to accomplish much if they are sufficiently courteous in presenting their ideas to the traveling public. It is obvious that they are not trained debaters and that, should they be too insistent in expressing their views, they might do more harm than good. Therefore, the importance of tact and caution should be strongly impressed on them. The possibilities of a campaign of education through train service employees are indeed great. Perhaps no other one factor could more effectively assist the railroads in securing recognition of their real needs than a general presentation of their side of the case by these employees. No less important than the direct advantages to the railroads accruing from this plan would be the educational benefits to the men which would be derived from a series of circulars such as Mr.

Foley contemplates. When train service employees learn the truth, they will realize that the carriers cannot be milked without end, but must be nourished and fostered if the public is to have satisfactory service and employees better wages.

German Railways as Indemnities

The German railways proved one of Germany's strongest weapons in launching the war; they have proved one of her most dependable weapons for carrying on the war. Are they going to prove one of the means for securing peace? The London Statist in a recent issue observes that the time has now come when the allied governments should begin considering the question of indemnities. The allies, it believes, should be prepared when peace negotiations get under way to say what they will or will not allow if Germany represents that she has already incurred liabilities of five billion pounds sterling (\$25,000,000,000). There should also be carefully studied and considered, it goes on to observe, what possessions of Germany—railroads, banks, mines, shipping, etc.—it is reasonable to look upon as disposable for the payment of indemnities. "There is one very important category of properties which ought to be looked upon as available for paying indemnities; and it is the railways. The German governments, speaking generally, own their railways; and those governments clearly ought to be made to hand over their railways, even if not a single mile is left to them, to make good all the losses inflicted upon countries like France, Belgium and Serbia." Imagine a country having to lose its railways in this fashion! Think of a modern industrial and commercial nation in these days without its railway lines! Surely this is a cold blooded, soulless proposition. But, then, is it so bad, considering the things that Germany has done? "Nobody who has any regard for human justice, or human prosperity," says the Statist, "will seriously dispute that all damage done, say, in the occupied provinces of France, in Belgium, in Serbia and so on, ought to be made good to the uttermost farthing. If Germany is allowed to burn down private houses, to massacre the inhabitants, and to kill their cattle, then future German governments meditating a war of

* Illustrated.

revenge, will feel that they may safely run the risk. If, on the contrary; every penny that can be taken hold of is used to pay to the uttermost all damage done, future governments will think twice before they engage in a fresh war of revenge."

Many of the lessons of the war emergency, as some of us have learned, are different from ordinary lessons mainly in degree, or frequency or intensity, not different in kind. This is illustrated in the last accident report of the British Board of Trade, noticed in another column. In a collision due to an error in

A Little Lesson from Britain

manual block signaling, the operator at one of the stations, Station A, was a woman, and the driver of one of the trains was a boy of 17 years; two abnormal elements in the case due to war conditions. But it is to be noted that the mistake or inefficiency chargeable to the operator was not due to her being a woman, and the driver's mistake was not due to his youth; in both cases it was lack of training. Judging by facts of real life and not by book precepts, one concludes, without doubt, that the trouble was inexperience; the lessons which those two should have learned, but did not, are acquired only by practice. The Board of Trade inspector does not, of course, censure the company for employing women or boys, under the present stress; and it is not for any one else to say that there was any culpable neglect in the training of these novices; but for present or future situations the warning is, simply, to stick to well-settled principles. If a girl needs a year's training the officer in charge must be alert and begin the training, if possible, a year before she is going to be put at work. If a motorman is going to be entrusted with responsibilities requiring varied experience, the experience must be provided, even if it has to be produced artificially. Forethought, inspection, testing and other safeguards are required always; the present demand is for more forethought, more patient inspection, more care to see that no tests are omitted. The War Department, we are told, is going to "learn from England's errors"; let us do the same.

MECHANICAL DEPARTMENT VALUATION

IN view of the difficulties that have been experienced by the mechanical departments of many roads when starting the Federal valuation work, an article by W. R. Maurer, mechanical engineer of the New York, New Haven & Hartford, is printed elsewhere in this issue giving a number of timely suggestions on mechanical valuation work. Mr. Maurer has had considerable experience in various valuations made of the New Haven and having about completed the Federal valuation, is well qualified to make constructive suggestions. It must be remembered, however, that these suggestions apply directly to the work on the New Haven and to the valuation district in which that road is located, and that some of the suggestions made by Mr. Maurer may not be applicable to other districts, as the practices have not been generally standardized.

In the preparation of original cost to date schedules, too much dependence cannot be placed on the figures furnished by the accounting department as to the completeness of the information desired. Many additions and betterments have not been recorded and these in the aggregate will represent a large amount of money. If the mechanical department does not give this most careful attention, the credit for these expenditures will be lost. Many improvements have been made in the shop of which there is no record. The work of ferreting out these items should be started well in advance of the arrival of the government parties for it is a large task. It is necessary that a man thoroughly familiar with the mechanical department equipment be in

charge, or directly connected with the valuation work done in that department.

Some roads use a more comprehensive form of recording the inventory on shop machinery than that shown by Mr. Maurer. This it seems, should be governed by conditions and what the local valuation district board desires. The matter of inventorying the small tools has been the source of some discussion. Some claim that if the work is left entirely in the hands of the local foreman a lot of material will not be recorded due to the workmen being reluctant to show the number of tools they are keeping in their lockers. Some roads have found it necessary to make a very complete search in order to get a correct record of this class of material.

Contrary to the opinion held by some railroad men, the equipment and material under the jurisdiction of the mechanical department forms an appreciable percentage of the physical value of a road. There is so much detail and such a large number of individual items in the mechanical department that the work of valuing the equipment in its charge should be placed in the hands of a man who is thoroughly familiar with that department and with what has been done to the equipment and shops. The mechanical department organization should do its full share of the valuation work and thus protect the interests of the company.

"CAR SHORTAGE" COMMODITY PRICES, AND THE COST OF LIVING

THE Council of Defense of Illinois has been investigating the situation with respect to the production of coal in that state. A number of coal operators who appeared before the council this week testified, as reported in the newspapers, that "increased railroad facilities, especially additional coal cars, would lower the price of coal in Illinois." This view is doubtless correct. Increased railroad facilities would tend to lower the prices of many commodities throughout the United States. The inadequate expansion of the railroads within recent years has been one of the causes of the increases in the cost of living, and, paradoxical though the statement may seem, it has also injured many producers by reducing the prices they otherwise would have received for their products.

To recognize the fact that the inadequacy of railroad facilities has had these effects is not, however, to condemn the managements of the railroads. It is merely to condemn the policy which has limited railway expansion. That policy has not originated with the managements. It has originated partly with the shippers, many of whom now complain that they cannot get enough cars. It is chargeable still more largely to the anti-railway agitators and politicians who have persisted in reducing the profits of the railroads regardless of consequences. If the roads had been allowed to make reasonable profits during the last ten years the prevailing car shortage and congestion of traffic would not exist, or at least would not exist to the degree that they do, and the adverse effect which they have upon the welfare of the country would not be produced.

It is a generally recognized fact that the rates charged for transporting agricultural products, coal and other commodities from the points of production to the points of consumption affect both the prices which the producers receive and those which the consumers pay. Another fact, which is even more important, but which is not so generally recognized, is that the price which the producer can get and the price which the consumer must pay are largely determined also by the adequacy and character of the transportation service rendered in moving commodities from the places where they are produced to the places where they are consumed. Take coal, for example. We need not theorize regarding the effect of the car shortage on the prices received and paid for it. Under the conditions existing for some time we have

had, on the one hand, great industrial centers in which the demand for coal for manufacturing and other purposes has suddenly and enormously increased. On the other hand, we have all over the entire country, and in most cases remote from the great industrial centers, coal mines with a productive capacity far exceeding their maximum past output. The connecting link is the railroad. The railroads have moved more carloads of coal from the mines to the consuming centers within recent years than they ever did before. But the demands of the consuming centers have exceeded the capacity of the railroads. Therefore, the prices at the consuming centers have advanced to unprecedented heights, in spite of the fact that more coal has been delivered at these points than ever before. The mines, on the other hand, in spite of the fact that they have produced more coal than they ever did before, have not been able to get enough cars to move all the coal which they could produce. Since their productive capacity has exceeded the transportation capacity available the prices at the mines have not advanced as much in proportion as they have in the consuming centers, and in consequence relatively the largest profits which have been made in the coal business have been made not by the operators, but by the coal speculators in the large industrial centers. If the railroads had been able to move more coal the operators would have been able to have sold more and made more money from a larger output, while at the same time the consumers would have had to pay less, because the supply would have been nearer equal to the demand.

The same reasoning applies to agricultural products. The farmer will get relatively the best prices for his products, and the consumer in the large industrial centers will pay relatively the least for them when the railway facilities are sufficient to move all the crops of the country when market conditions are favorable and within a reasonable time. On the other hand, when transportation facilities are inadequate the supply moved to the industrial centers is insufficient and prices there go up, while at the same time the tonnage left upon the farms is excessive and in consequence the prices received by the farmer are less than they otherwise would be. In these circumstances, the speculator, through whose hands the products go from the farmer to the consumer, is the man who makes relatively the largest profits.

There is another feature of the situation which often is overlooked. This is that the drastic regulation of railway profits in recent years, by preventing the construction of new railway lines, has hindered the opening up of new territories, and has thus limited the increase in the supply of agricultural products, of forest products, of products of mines and of almost every other class of commodities. This also, of course, has tended to increase the cost of living.

It will be readily understood that if railway transportation suddenly should be entirely suspended there would be a great increase in the prices of all kinds of commodities in the large centers of population and industry and at the same time a sharp decline in the prices of commodities at the points of production. Now, a deficiency of railway transportation differs only in degree from a complete interruption of it and consequently its effects, although less serious, are similar. Our policy of regulation having failed to recognize the fact that the adequacy and quality of the service rendered has just as important an effect upon the prices which producers receive for their commodities and which consumers must pay for them as the rates which the railways are allowed to charge, the result has been that we have got low rates, but not adequate facilities. The main trouble with our entire policy of regulation is that it has been founded upon a false principle. This is that the great object of regulation should be to restrict railways to a net return which will barely avoid confiscation of their proper-

ties. The fundamental principle of regulation should be that the railways should be allowed to earn a net return which will be sufficient, and no more than sufficient, to enable them adequately to develop their facilities and service. We shall make no progress with the solution of the railway problem until our regulating authorities adopt and act upon this principle.

CAR SHORTAGE AGAIN REDUCED

THE rapid reduction of the freight car shortage since the organization of the Railroads' War Board, in spite of a large increase in the volume of traffic at a season which usually shows considerable decrease, is potent evidence of the value of centralized control which was put into effect when the regulation of freight car supply was delegated by the board to its sub-committee, the Commission on Car Service, under new car service rules adopted April 26. On May 1 the car shortage was 148,627, greater than it has ever been before at that time of the year. On June 1 it had been reduced to 106,649, although the amount of freight handled in May was greater than in April, and on July 1 the shortage had been still further reduced to 77,144, a decrease of nearly 50 per cent in two months. The statistics showing the increase in business in June are not yet available, but it has been shown by government reports that the tonnage of bituminous coal handled was 26 per cent greater than in June, 1916. Many methods have entered into the accomplishment of this result. Many of them, such as the unusual efforts that have been made to increase the mileage per car per day, to increase the train load, to get cars loaded and unloaded more promptly, and to have them loaded to capacity, are by no means new, but they have been made more effective by pressure of necessity as well as by the patriotic impulse which has brought about the hearty co-operation of shippers and regulating authorities.

A new factor in the situation has been the fact that the freight equipment of the country has been pooled under the direction of the Commission on Car Service. This commission not only has kept constantly in touch with the requirements of railroads and shippers for cars needed for particular shipments, and has arranged for providing them, but in addition to conducting the campaign for greater efficiency in the use of equipment has freely exercised its power to order the movement of cars in large numbers from roads on which they have accumulated to roads where there was a shortage. These cars have been moved mainly in train-load lots from eastern ports to southern and western lines after a most careful study by the Commission on Car Service of the requirements of the situation. In making these distributions of cars the Commission has not attempted to give each line 100 per cent of its ownership. The principle which it has followed was announced in its first general order, stating that roads having on their lines in excess of 100 per cent of their ownership of equipment must so regulate their car handling as not to exceed the percentage as of April 1, or as may be designated by the commission. The date April 1 was selected as representing in a general way what may be called the normal for prevailing conditions of traffic, after six months of regulation by the Commission on Car Service.

NEW BOOKS

Railroad Valuation and Rates. By Mark Wymond. Published by Wymond & Clark, 909 Rand McNally building, Chicago. 344 pages, 5 in. by 8 in. Bound in buckram. Price \$1.50.

This book is intended primarily as a treatise on the principles of rate-making and their relation to valuation and rate regulation by an author who has had some 30 years of experience in connection with the promotion, construction, operation and valuation of railroads and in making investi-

gations and engineering reports, and has also had considerable experience in the investigation of rate questions. For the purpose of obtaining the proper perspective the first four chapters are devoted to the historical development of the railways with special reference to their promotion, construction and reconstruction and capitalization.

The author also says that these chapters are inserted in order to correct the erroneous impressions of railroad promotion and capitalization which many people have gained from a few notorious instances that have been the subject of public investigation. Methods of railroad construction are described in detail for the purpose of showing the elements which enter into the value and the author contends that while the cost of reproduction new is the fair value of the physical property at the time of valuation, the total commercial value of a railroad does not necessarily bear a direct relation to the cost of reproducing its physical property or the amount of its capitalization. He says, however, that if depreciation, other than deferred maintenance, is deducted from reproduction cost to determine the present value and the amount in which railroads will be allowed to earn a fair return, railroad borrowing for the purpose of providing extensions and betterments of existing railroads will be practically barred. The author finds that the valuation will not definitely fix the proper general level of rates, but will merely establish a line below which the general level of rates may not go without being confiscatory, that the rate of return on value will be greater for some roads than for others, and that as to the adjustment of rates in detail the valuation is not applicable.

The entire work is an interesting and unbiased discussion of a subject on which many people have very hazy ideas and it is well worth the attention of all who are interested in the questions raised by the valuation of American roads now being made under the direction of the Interstate Commerce Commission.

Concrete, Plain and Reinforced. By Frederick W. Taylor and Sanford E. Thompson. 885 pages, illustrated. 6 in. by 9 in. Bound in cloth. Third edition. Published by John Wiley & Sons, 432 Fourth avenue, New York. Price \$5.00.

Since the second edition of this well known treatise was published one of the authors, Mr. Taylor, has died. In consequence this last revision is the work of Mr. Thompson and his collaborators. The new edition brings the book up to date with the latest developments in the design and construction of plain and reinforced concrete. With the more thorough establishment of the fundamental principles and properties of this important building material, 50 less pages have been devoted to the properties of cement, aggregates, the theory of proportioning, methods of mixing, etc. On the other hand more space is given to the theory and design of reinforced concrete. Thus 18 pages are devoted in the third edition to flat slab design as compared with 5½ pages on this subject in the second edition. An improvement has also been made in this section in the sub-division of the subject under three separate heads—principles, tests, and design of reinforced concrete. These three chapters constitute an extensive rewriting of the original material. The chapter on tests in particular shows the benefit of the material available since the last edition. The discussion of the strength of plain concrete has been extensively revised as well as the chapters on the mixing and depositing of concrete. The trend of modern practice is indicated by the smaller space devoted to rammers. Also in the chapter on mixing, where the earlier volume called attention to the advantages of machine mixing, the latest one states that "machine mixed concrete may be about 25 per cent stronger than hand mixed." The chapters on the chemistry of hydraulic cement, the proportioning of concrete, the effect of sea water and arches, all written by special authors, appear substantially in the original form but indicate careful revision as to minor details.

Letters to the Editor

FOLLOW-UP CORRESPONDENCE OVERDONE

ATLANTA, Ga.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

American tradesmen have an objectionable habit of bombarding a man with follow-up correspondence without inquiring whether the person addressed has authority to make purchases for the company he represents. It happens that I am a railroad officer and now have in my files probably 150 catalogs of business firms. It is rare that a requisition on the storehouse is turned down if I send it the catalog number, manufacturer, list price, and such information as can be gleaned from the ordinary catalog.

When writing for catalogs I almost invariably state that they are for my files, and material, if purchased, will be ordered through our storehouse. Of course, my name will not usually appear in the transaction anywhere after I make the requisition, as the material is sent to the storehouse and from there forwarded to such destination as I may state in my requisition. However, invariably a request for a catalog is followed by a series of letters from the firm, usually about four days apart, demanding to know why it has not heard from me, why its goods are not being sold in my territory and asking a thousand other questions. The consequence is, in many cases I consign the correspondence to the waste basket and have nothing more to do with the firm. I believe that the follow-up correspondence business is overdone in this country.

IMPATIENT.

HOW THE ALLIES CAN REDUCE THE TRAFFIC CONGESTION

St. Louis, Mo.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

In my opinion the solution of the present car shortage in the south is largely in the hands of the allied governments in moving their war materials and supplies.

The allies are handling between a million and a million and a half tons of freight per month to the ports for export. The greater part of this movement originates north of the Ohio and Potomac rivers in the section where cars are most plentiful and if it could be arranged to use South Atlantic and Gulf ports, Norfolk to Galveston, inclusive, to a greater extent, it would mean that cars would be moving under load from the territory where they are more plentiful to the territory where freight cars are mostly needed for return loading.

Notwithstanding all that has been done by the Interstate Commerce Commission and various A. R. A. committees, congestion still continues at the North Atlantic seaboard, where lines have on their rails substantially more than the equivalent of 100 per cent of their ownership, whereas southern and southwestern lines continue to suffer from shortage by reason of having percentages of cars on line ranging from 80 down to 50 per cent of ownership.

During this period when there is a load for every car in existence regardless of where it is, it seems to be an economic waste to move cars empty to bring about the proper distribution of available equipment. Therefore, the foregoing suggestion as to more liberal use of South Atlantic and Gulf ports in the handling of export traffic may have some merit. To accomplish this, it would, of course, be necessary to direct a larger number of vessels to South Atlantic and Gulf ports for loading.

TRAFFIC MANAGER.

Queens Boulevard Bridge, Showing the Construction Plant at the Street Level

South End of the New York Connecting Railroad

The Four-Mile Line Being Built for Freight Interchange Between the Pennsylvania and the New Haven

THE New York Connecting Railroad which the New York, New Haven & Hartford and the Pennsylvania are now building jointly on Long Island is nearing completion. When finished, it will materially shorten the car ferry service for the interchange of freight traffic, while the north end which is now completed provides a direct connection between the two railroads for passenger traffic. The northern end of the line, known as the East River Bridge division, leaves the Harlem river branch of the New Haven at 142nd street in the Bronx and extends south, crossing Bronx Kill to Randall's island, then over Little Hell Gate to Ward's island, then across the Hell Gate arch bridge to Long Island and terminates at Fourteenth avenue, formerly

vides a direct connection between the two railroads for passenger traffic and through trains are now operated from Boston to Washington.

The new double-track freight line continues south from Twentieth avenue through Woodside and Winfield, crossing the main line and Montauk division of the Long Island and terminates at Fremont street, about one-quarter mile south of Fresh Pond Junction, where connection is made with the Manhattan Beach division of the Long Island, which has been improved to care for the additional traffic. Freight trains will use the Beach line from Fresh Pond junction to the Bay Ridge terminal where they will be broken up and the cars transferred to the Greenville (N. J.) freight

Map and Profile of the Line Between the Bronx and Fresh Pond Junction

Stemler street, in Astoria. This portion of the line has four tracks, two of which are for freight traffic and two for passenger.

The four-track section continues south from Fourteenth avenue to Twentieth avenue, formerly Bowery Bay road, where the passenger and freight lines diverge. The two passenger tracks extend south and west to a connection with the Pennsylvania line leading through Sunnyside yard and the Pennsylvania tunnels under the East river, Manhattan island and the Hudson river. This portion of the line, which was opened for traffic on April 1, was described in detail in the *Railway Age Gazette* of September 3, 1915. It pro-

vides a direct connection between the two railroads for passenger traffic and through trains are now operated from Boston to Washington.

vide a direct connection between the two railroads for passenger traffic and through trains are now operated from Boston to Washington. The new double-track freight line continues south from Twentieth avenue through Woodside and Winfield, crossing the main line and Montauk division of the Long Island and terminates at Fremont street, about one-quarter mile south of Fresh Pond Junction, where connection is made with the Manhattan Beach division of the Long Island, which has been improved to care for the additional traffic. Freight trains will use the Beach line from Fresh Pond junction to the Bay Ridge terminal where they will be broken up and the cars transferred to the Greenville (N. J.) freight

unfavorable currents. By the new route, the operation of the ferry is simple and its length only slightly exceeds three miles. Contrasted with the present route which requires six hours average time per trip, the new route will effect a saving in ferrying of approximately 11 miles and it is estimated that the time required per trip will be reduced to one hour or less.

While for the present only two tracks will be built from Twentieth avenue south to Fresh Pond junction, provision has been made to widen the cuts and structures for two additional tracks when the traffic warrants the expenditure. On the completion of the two tracks the new line will be placed in service and the old freight transfer route through Hell Gate will be abandoned. Freight originating in New England and destined for points south and west will be routed via the Connecting Railroad and the Manhattan Beach line to Bay Ridge where the trains will be broken up and transferred to Greenville by car floats. The operation of the New York Connecting will be directly in charge of the New Haven to Fresh Pond junction, while from that point to Bay Ridge it will have trackage rights and the New Haven trains will run over the tracks of the Long Island Railroad on this basis.

The agreement for trackage rights for the New York Connecting trains between Fresh Pond junction and Bay Ridge is for through movements only and does not permit local deliveries. Freight to and from Long Island points and from and to points on the New Haven will be interchanged at Fresh Pond junction.

Provision is being made for the electrical operation of the passenger line, but until the completion of the electrification, steam will be employed. The New Haven runs its passenger train with its crews and steam locomotives through to Sunnyside yard. The freight service will also be operated by New Haven crews. The terminal yard and float bridges at Bay Ridge will be in charge of and operated by the Long Island, while the float service between Bay Ridge and Greenville will be performed by New Haven tugs and floats.

CONSTRUCTION FROM TWENTIETH AVENUE TO JUNIPER SWAMP

The construction of the line from the passenger connection south to and across Juniper swamp, a distance of $3\frac{1}{4}$ miles, which is being done by the Wilson & English Construction Company of New York City, is nearing completion. The earthwork on this section which is very heavy, totaling \$28,000 cu. yd. exclusive of that yet to be done through Juniper swamp, required the making of cuts ranging from 50 ft. to 65 ft. in depth and embankments 45 ft. high. The material encountered in the cuts was largely gravel which was moved by steam shovels and loaded into narrow-gauge cars for delivery to the fills. In the larger fills trestles were provided to carry the construction tracks.

Through Juniper swamp the subgrade is to be 10 ft. below the surface, requiring about 800 ft. of special construction through the soft material encountered that extends to a depth of 36 ft. It has been planned to first place a fill by means of a trestle and when the settlement has subsided, to excavate the cut. Many difficulties have been encountered in building the trestle as the force resulting from the settlement has been sufficient to wreck all that have been built to date. To improve the conditions the swamp will be drained by means of pipes and side ditches that will carry the water to a small brook at Winfield about 6,000 ft. north.

The masonry work on this section consists of 22 concrete bridges, including two arches under and three arches over the railroad and a three-span arch structure over Queens boulevard. At Patterson and Burnside avenues the railroad will be carried over the streets on single span, reinforced arch bridges having clear spans of 84 ft. each. The bridges are both of the filled spandrel type with mass section span-

drel walls connected by means of transverse walls. The arch rings are segmental in form with a span of 83 ft. 10 in. and a rise of 19 ft. 6 in. They are about 36 ft. in height and have a length of 220 ft. The structures are thoroughly waterproofed and are founded on Raymond concrete piles, reinforced with twisted rods.

At Woodside, Sinclair and Metz avenues, the streets are carried over the railroad on reinforced concrete arches. The spandrel walls are of the gravity type and the arch ring, which is three centered, is reinforced with steel rods at both the intrados and the extrados. The walls, which have battered backs, are tied to the arch rings with twisted rods. Abutments are provided between the slopes of the excavation. The exposed surfaces are relieved by horizontal scorings and paneled pilasters and the side walls are surmounted by paneled reinforced concrete hand railings.

Location of the New York Connecting Railroad

These three structures are built on gravel foundations, no piling being necessary.

Queens boulevard is the most important thoroughfare crossed by the railroad and is 200 ft. in width. Between curbs the street will be divided into three roadways separated by lines of parking 30 ft. in width. This structure is incomplete at present, but it will consist of three arches of 64-ft. span and 14-ft. 6-in. rise. Here the railroad will be carried over the street. The south abutment is to be carried on Raymond piles while the piers and the north abutment will rest on gravel.

At Jackson and Hayes avenues, the railroad is carried over the streets on deck girder bridges having concrete floors. The floors were poured in four sections and were molded in such a manner that the drainage is toward the center and the water is carried off through 6-in. deep holes placed about 3 ft. center to center. The floors are waterproofed with two coats of asphalt and one ply of tar paper, protected from the stone ballast by concrete. Both bridges are founded

on Raymond concrete piles. At the intersection of Polk and Broadway, the railroad is carried under the street in a subway which consists of an invert or floor and two side walls of reinforced concrete with a roof of 24-in. I-beams, spaced 2 ft. 6 in. apart. At present the subway is built to accommodate only two tracks but is constructed in such a manner that two additional tracks may be placed on the west by removing the short wing walls. The invert and the east side wall are 3 ft. 6 in. thick, but the present west side wall

The Settlement Through Juniper Swamp

is only 2 ft. 6 in. thick and is so placed as to form the middle wall between the two pairs of tracks on the completion of the four-track line.

The subway is reinforced below the roof with steel rods and with wire mesh over the tops of the roof beams where a 5-in. concrete roof is formed by placing concrete between the I-beams. This roof is thoroughly waterproofed and extends 2 in. above the upper flanges of the I-beams. It conforms with the roadbed section of the highway and forms the base of its paving. The spaces between the I-beams

The South Portal of the Tunnel Through the Cemetery

under the roof will be utilized for such pipes and ducts as it is necessary to carry across the subway. The hand railings will be of reinforced concrete, relieved with paneling and rubbed to a finished surface. Wing walls will be provided at the portals, the faces of which will be relieved by horizontal scorings.

At several other streets this same type of construction will be followed and where the subways are long enough to warrant them, refuge niches will be provided about 30 ft. apart. The drainage is effected by a channel 4 in. deep in the in-

vert, covered with perforated steel plates which support the ballast.

The subway that carries Roosevelt avenue over the tracks is also of the same type, but the construction was complicated by the presence of the Astoria, Woodside and Corona elevated line. It was necessary to support the elevated structure during the construction of the railroad and to provide foundations for the steel supports below the level of the tracks. While the foundations of the elevated structure are in the same general line as those carrying the highway, they are in no way connected. To provide sufficient bearing surface these foundations were spread. The structural steel supports of the elevated are carried up through the highway floor in such a manner that there is no contact, the two structures being entirely independent of each other.

THE SECTION SOUTH OF JUNIPER SWAMP

That portion of the line south of Juniper swamp, about one mile in length, is being constructed by P. McManus, Inc., Philadelphia, Pa. The earthwork on this section amounted to 153,000 cu. yd. One of the interesting fea-

The Concreting Plant at Woodside Avenue

tures here is the tunnel and the walled cut now under construction through the Lutheran cemetery. The tunnel extends northward from Metropolitan avenue for a distance of 516 ft. where it joins the walled cut section that extends 650 ft. further northward, terminating at the bridge under Juniper avenue.

The tunnel which is rectangular in section with an invert, sidewalls and roof of reinforced concrete, is being constructed by the cut-and-cover method. A trench is first excavated on both sides in which the sidewalls and a part of the invert are built. The roof is next built, after which the excavation is completed and the remaining part of the invert or floor finished. Because of the narrow width of the trenches this method renders the bracing of the sheeting less difficult and the earth remaining between the sidewalls affords support for the forms of the roof.

The construction of the tunnel was complicated by the necessity of supporting Metropolitan avenue which is an important thoroughfare. The street traffic, including two street car tracks, is supported by eight steel girders that span the excavation. The road surfaces and sidewalks were formed by planking resting on these girders. As a further complication, it was necessary to support one side of a two-

story frame residence. During the excavation this support was accomplished by means of beams resting on bents placed parallel with the house. After the trench was formed vertical posts were inserted that rested on the sheeting. This left the way clear to place part of the invert and the sidewalk beneath the house. As the concrete set, vertical timbers resting on the invert were placed as supports and the first timbers used were removed. The roof of the tunnel was then formed around these vertical timbers and as they are removed the apertures are filled with concrete.

While at present the tunnel is built to accommodate only two tracks, the same general scheme for future extension is followed as was described above. The present west side wall is so placed as to form the middle wall on the completion of the four-track line. Ducts for electrical equipment are provided back of the tunnel walls and within the side walls of the cut. Refuge niches are provided every 50 ft. throughout the tunnel. About 20,400 cu. yds. of concrete and 1,855,000 lb. of steel reinforcement is required for the tunnel and the retaining walls in the cut.

At the intersection of the Montauk and Manhattan Beach divisions of the Long Island, the new line is to be carried overhead on a double-track truss bridge having a span of 175 ft. The bridge will rest on concrete abutments already completed. In addition to the structures mentioned there will be a highway bridge under Firth and Marion streets near Juniper swamp, a railroad bridge over Fremont street and a small bridge will cross the open cut in the cemetery. The abutments of the proposed bridge at Juniper avenue are extensions of the sidewalls of the cut through the cemetery.

CONSTRUCTION METHODS

Because of the location of the line it was not practical to bring the materials to the site of the various structures by rail and instead they were transported by barges up Newtown creek and unloaded into motor trucks for delivery to the job.

Where practical, two or more structures were built from the same construction plant. At Woodside, Sinclair and Metz avenues the materials were unloaded from the trucks and shot down inclines at the various streets where shelters

spouted from the elevator to these cars which were then moved to the proper place and dumped on unloading platforms from which spouts radiated to the forms.

The track laying contract has been awarded to P. McManus, Inc., of Philadelphia. The 26 miles of track is being laid with the Pennsylvania standard 125-lb. rail with screw spike construction, six spikes to each tie plate. The spikes are being driven with an Ingersoll-Rand "Little David" air-driven drill equipped with a special clutch and wrench made in one piece and geared for low speed. Two men are required to operate the device which is controlled at the drill by hand. The air is furnished by an Ingersoll-Rand portable gasoline air compressor that has a capacity for driving three of the drills and a wood-boring machine

The Crossing of Jackson Avenue

for preparing the spike holes at the joints where the plates are not used.

In placing the spikes a gang of trackmen work in advance of the drill and place the spikes in the holes of the tie plates by hand. The spikes are then given a turn by a hand wrench just sufficient to hold them in place when the drill is applied. The spike-placing gangs are then followed by the drill men who permanently seat the spikes.

This project is being carried on under the direction of A. C. Shand, chief engineer, and H. C. Booz, assistant chief engineer of the Pennsylvania. C. S. Bissell, principal assistant engineer of the New York Connecting Railroad, southern division, is in charge of all construction.

Crossing Over the Long Island Tracks at the Cemetery

were provided for the cement. The $\frac{3}{4}$ -yd. mixer was placed on a flat car and a track was built between the three streets to permit the moving of the plant. A locomotive crane delivered the materials to the mixer and the concrete was spouted to the forms from an elevator carried on the flat car. At Queens boulevard, where the street passes under the railroad, the materials were unloaded from the motor trucks at the street level. A stiff-leg derrick delivered the material to the mixing platform which was placed at the level of the tracks, near the south abutment. An elevator was provided at the mixer and the concrete for the south abutment was spouted from this elevator to the forms. To place the concrete in the piers and the north abutment, a train of dump cars and a dinky engine were provided. The concrete was

NO "RIGHT TO STRIKE."—As the result of recent labor troubles on the Swedish State Railways, the Government has now laid it down that the state is unable to recognize that railway employees have the "right to strike" under any conditions, as railwaymen stand in a different category from any other class of employed person. The reason for this decision is rather interesting. Until the beginning of this year there had never been a strike on the Swedish State Railways, but two broke out recently owing to the demands of the auxiliary and temporary employees for higher wages. The strikers were not supported by the regular staff, no doubt because if their demands had been granted the temporary employees, whose numbers have largely increased as the result of war conditions, would actually have received higher wages than the permanent staff. The railway administration informed the strikers that their demands could not be granted, as they had received more than one increase since the beginning of the war, and added that no employee who went on strike would be employed again. Eventually the disturbance was quelled, and the administration effected an alteration in the conditions of payment, but firmly adhered to its refusal to re-engage anyone who had actually gone on strike. In laying down the principle that the "right to strike" cannot possibly be accorded to railwaymen, the Swedish Government has made use of an interesting argument. Such a right, it points out in a manifesto, cannot exist unless the employer has the corresponding right to declare a lock-out, and this cannot be exercised by the management of a railway undertaking, since it would result in paralyzing all transport.—*Railway Gazette*, London.

ACTIVITIES OF THE RAILROADS' WAR BOARD

The Railroads' War Board has addressed a plea to public service commissions and all state, county and municipal authorities throughout the United States, urging co-operation with the railroads in a suspension during the period of the war, of "all efforts not designed to help directly in winning the war."

The specific suggestions are embodied in a letter forwarded by Chairman Fairfax Harrison. In the letter Mr. Harrison said:

"The present emergency has imposed upon the railroads a very unusual strain in transporting men, food, coal, munitions and materials in augmented quantity. This burden, while cheerfully undertaken, requires every ounce of energy, every unit of rolling stock, every dollar of capital, every bit of supplies and coal which the railroads can command.

"It is the opinion of this committee that all efforts not designed to help directly in winning the war should be suspended during the period of the war. Indeed, this is obviously the thought of President Wilson in his appeal to the country on April 16, 1917, which included the following statement:

"It is evident to every thinking man that our industries must be made more prolific and more efficient than ever, and that they must be more economically managed and better adapted to the particular requirements of our task than they have been."

"Therefore this committee earnestly recommends that during the war the railroads be required by the public authorities to make improvements and carry out projects involving the expenditure of money and labor only when they are absolutely essential for war purposes or public safety. The prevailing high interest rate on money, the difficulty of raising money in competition with the tax free issues of the government, the excessive cost of supplies and labor, the delay in obtaining material, the possible blockade of traffic and the diversion of labor all contribute to make non-essential construction undesirable during the war.

"The committee considers that the erection of new stations, elimination of grade crossings, are among the non-essential improvements which should be deferred at this time. We respectfully suggest that the basis for consideration of new projects at this time should be the increase in the capacity of the carriers for national service.

"Furthermore, we urge your co-operation in eliminating all passenger service which is merely convenient and not justified by public necessity during the present emergency situation."

The Railroads' War Board has taken further steps to induce shippers and producers to co-operate with the railroads in protecting the coal supply in the Northwest during the coming winter by urging the railroads engaged in the lake carrying coal and ore trade in the Pittsburgh district to induce all coal operators on their lines having contracts to supply coal to the Northwest via the lake ports, to load during the remainder of the season at least 50 per cent of their daily supply of cars for such ports there to be transhipped to the Northwest.

Chairman Fairfax Harrison of the Railroads' War Board, in a message addressed to the railroads in the Pittsburgh district, said:

"Although the railroads have in recent months been handling from 23 to 30 per cent more coal than in the corresponding months of last year, a smaller proportion has been shipped to the lakes than last year, and, in consequence, there is still uncertainty as to whether the Northwest will be supplied with sufficient coal to meet its requirements next winter.

"We deem it now, as we did at the beginning of the Lake season, of the utmost importance that every effort should be

made by the railroads involved to satisfy the requirements of the Northwest for water borne coal.

"On the statistics of performance so far this season, it is apparent that unless efforts are renewed and coal is moved at a greater rate for the remainder of the season than in the past months, the requirements will not be satisfied. At the same time the situation of ore accumulated at the furnaces in the Pittsburgh district for national requirements is involved."

The Commission on Car Service has issued a circular letter to the chief operating officers of the railroads inquiring whether their companies have organized a special department to promote car efficiency. In the letter the commission says that this subject is worthy of such attention that in its opinion a special organization can accomplish much and effect a saving in operating cost that will far exceed the expense of the organization, and at the same time, make many more cars available for the shipping public. "All railroads have depended upon instructions issued from time to time to all employees to bring about the results desired," the circular says, "but most of the division officers and employees have so many duties that they are unable to specialize on the subject of getting the most out of each car. We consider it of sufficient importance to railroads, that some competent officer be designated to follow up the matter of intensive car loading, making it his special duty and given such help as required. A great many railroads have already organized such departments with most gratifying results."

The circular lists the following as a few of the important points to which this department should give special attention:

OUTBOUND

1. Orders for cars must be based only on the daily capacity of the shipper to produce, load, and ship.
2. Placing of cars for loading should be done at a time of the day to save
 - (a) the least delay to cars;
 - (b) to cause minimum delay to shippers loading arrangements.
3. Careful spotting of cars to avoid extra switching and to permit most expeditious loading.
4. Personal supervision over loading of cars to insure their being loaded to full carrying capacity at the same time to minimize the risk of damage to contents.
5. Prompt delivery of instructions to billing agent after car is loaded.
6. Prompt movement of cars from loading track to train yard and then see that cars are forwarded promptly.

INBOUND

7. Prompt marking of cars received for switching to delivery tracks.
8. Prompt and careful placement of cars for unloading.
9. Personal supervision of and prompt unloading of all cars.
10. Prompt removal of cars when unloaded.

GENERAL

11. Reconsignment of cars should be discouraged at all times and every encouragement made to have cars billed direct to final consignee.
12. When reconsignments are unavoidable, insist upon such orders being received at destination before cars arrive in train yard.
13. Arrange some effective system for prompt handling through direct channels of diversions or reconsignment orders to avoid delaying any cars awaiting disposition, which causes so much extra switching.
14. Arrange for the chief operating officer and the head of the intensive car loading department to be furnished a daily check (preferably at 9 a. m.) of all loaded cars held for any reason at terminals or other stations, classified as between shippers and consignees, and by commodities for the following reasons:
 - (a) Disposition not received
 - (b) No way bill
 - (c) Embargoes
 - (d) Accumulations
 - (e) Disputes over charges
 - (f) Car defects
 - (g) Demurrage
 - (h) Other causes.
15. Prompt repairs for loaded cars, making light repairs with minimum switching and have prompt switching to and from repair tracks.

THE ENGLISH CHANNEL TUNNEL.—Arthur Fell, M.P., Chairman of the House of Commons Channel Tunnel Committee, recently wrote to the prime minister asking him to afford an early opportunity for discussing and ascertaining the opinion of the House on the Channel Tunnel question. The request is signed by over 110 members of all parties.

GRAIN CLAIM HEARING

Following an investigation undertaken on its own initiative, the Interstate Commerce Commission conducted hearings on claims for loss and damage to grain shipped in bulk, before H. C. Wilson, attorney-examiner, at Minneapolis, Minn., from July 9 to 14; at Omaha, Neb., from July 16 to 18; and at Chicago from July 18 to 21. At these hearings the commission itself introduced from 25 to 30 exhibits. The Great Northern, the Northern Pacific, the Minneapolis, St. Paul & Sault Ste. Marie, and the Minneapolis & St. Louis presented evidence at Minneapolis, the Union Pacific at Omaha, and the Chicago grain carrying lines at Chicago. Only a few shippers testified and to give the shipping interests time to prepare their case, the hearing was adjourned until September 18 at Chicago.

Various facts were brought out in the record which indicate the necessity for investigation. Wide disparities were shown between weights taken at country points and at terminals, indicating that losses in grain are a question of scales as well as of defective cars. Other evidence pointing to the same conclusion showed that some loading points were constant sources of claims, whereas adjacent points on the same line rarely claimed loss or damage to their grain. The Minneapolis & St. Louis testified that it had placed 500 new cars with inside lining into grain service as an experiment, and found that more claims resulted than from the use of old or defective equipment.

Among the factors contributing to the origin of claims at country loading points are the various methods of weighing, which are rarely under the supervision of a disinterested party. Track scales are available only at the larger points. Other shippers are required to depend upon automatic, hopper or wagon scales, and in some instances, on estimated weights. The testimony seemed to indicate that the automatic and wagon scales are not sufficiently accurate to be dependable and a large number of roads refuse to consider claims on the basis of estimated weights.

Scale tolerance and natural shrinkage were also urged as proper considerations in settling claims. The states of Missouri, Kansas and Minnesota recognize natural shrinkage and provide for it by statute. The Chicago, Rock Island & Pacific has a tariff which provides for the deduction of $\frac{1}{8}$ of one per cent in the weight of wheat and $\frac{1}{4}$ of one per cent in the weight of corn for shrinkage, and this tariff has been recognized as reasonable by the Interstate Commerce Commission. The United States Bureau of Standards also has placed its stamp of approval on shrinkage as a proper consideration in weighing grain. It was urged by some that scale tolerance should be allowed for in settling claims. It was brought out that a tolerance of $\frac{1}{2}$ lb. per thousand is permitted in some sections to allow for variations in the register of scales.

The question was raised whether it was proper for freight claim agents to report to the traffic department. Competitive considerations, it was suggested, are apt to cause a freight claim officer under traffic jurisdiction to be more liberal in recognizing claims than he would be if in the operating department.

The hearing seemed to indicate that disinterested supervision of weights at country points is highly essential. The Rock Island recommended the plan it uses in Oklahoma as a means of achieving this end. For some time it has had an agreement with the Oklahoma Grain Dealers' Association, under the terms of which inspectors in the employ of the road examine the scales of the shippers periodically at a charge of \$5 for each inspection. The Rock Island also keeps very close records of grain shipments on all of its lines. The shipper is asked to fill out a certificate stating how many pounds of grain he loads, on what kind of a scale it is weighed, how it is loaded, the condition of the car, etc. On the same certificate the forwarding agent re-

cords the name of the shipper, the name of the consignee, the destination, the car initials, the car number, the name of the loading elevator, the number of the seal, and the condition of the car after loading. In addition, an in-transit record is kept by trainmen which states in detail whether leakage is discovered and where, when and why grain is transferred from one car to another, the track scale weight before and after such a removal, whether car seals are broken at any point and why, and the number of the new seal including the name of the employee applying it. On this same form, which accompanies all waybills, the destination agent records the condition of the car as received and other essential information. These records are sent to the office of the general superintendent of freight claims, and if any claims are subsequently made on cars with a clear record, they are not considered. Knowledge of the existence of these detailed records has had a wholesome effect on the shippers, which has been reflected in large reductions in claim payments per car in recent years. In the fiscal year 1915, the average claim payment per car was \$1.54, in 1916 it was \$1.16 and in first seven months of 1917 it was only 61 cents.

COLLISION IN THE GLASGOW SUBWAY

The British Board of Trade has issued the report of Col. J. W. Pringle, on a rear collision which occurred April 26, on the Glasgow subway railroad, which did slight damage but which was of interest because of peculiar circumstances.

This subway encircles the city of Glasgow, Scotland, and traction is by cable, at 12 miles an hour. The cars are lighted by electricity, current being taken from a roadside conductor by means of skids attached to the cars. The block signaling is controlled manual, without any track circuit control. By means of treadles each signal goes to the stop position behind a train and can be cleared only after the train actuates another treadle at the station in advance.

In this case the leading train, consisting of two cars, was stopped because of an accident to its skid, causing the electric lights to fail. Station-mistress Webster, finding herself unable to clear the signal at the entrance of the block, for the following train, assumed that the electrical apparatus was out of order; and she proceeded to ask for a clear signal by telephone; but the operator at the other end, Station master Fulton, did not give a concise and definite refusal and she took his answer to be affirmative; and so she cleared the signal and the second train was admitted to the block section and ran into the first one, which had been delayed by difficulty in starting, because of trouble with the grip.

The inspector blames both operators; the one at Station A for using colloquial terms instead of the phrases prescribed by the rules, and the one at Station B (Fulton) for giving a reply, when, according to his own testimony, he did not distinctly hear the message.

Driver Gibson, in charge of the leading train, a lad of 17 years, allowed his train to stand in the tunnel without a tail light. He had had two months' experience as a gripman and 11 months' experience as conductor. There were no hand lamps on the cars, for use in emergencies. The electric headlights and tail lights had gone out and the oil headlight was also dead; so Gibson gave the conductor the remaining oil tail light, to enable him to walk forward to the next station. Gibson had intended immediately to restore the electric tail light by getting current through the skids on the rear car, but the collision happened before he could complete the necessary connections.

The inspector finds that failures of the treadles occur rather often, the cause, usually, being the low speed of the train; and these irregularities are not properly reported and attended to. These frequent failures have caused station masters to lose confidence in the signal apparatus, and to have too hasty recourse to the use of the telephone, which is not a suitable method of working high frequency traffic.

Rolling Stock and Machinery Valuation

Suggestions for the Benefit of the Mechanical Department Forces in Handling the Federal Valuation Work

By W. R. Maurer

Mechanical Engineer, New York, New Haven & Hartford

ON March 1, 1913, the "Act to Regulate Commerce" was amended requiring the Interstate Commerce Commission, "to ascertain and report in detail as to each piece of property owned or used by a common carrier, the original cost to date, the cost of reproduction new, the cost of reproduction new less depreciation, and an analysis of the methods by which the several costs are obtained."

In carrying out these instructions the Interstate Commerce Commission segregated the work issuing "orders" covering the various subdivisions. Valuation Order No. 8, issued November 21, 1914, stipulates that every steam carrier subject to the act, shall prepare statements in duplicate covering the carriers' equipment and machinery owned or used, giving in the "Register of Equipment" a description of the property in such detail as to enable one to get sufficient information to identify and price it, and in the "Report of Original Cost to Date" not only the first cost but all other elements of cost entering into the final cost of a unit in place.

The accounts covered and the forms to be used for each are as follows:

Account	Register Form No.	Original Cost No.
37 Roadway Machines	70	71
44 Shop Machinery	72	73
45 Power Plant Machinery	74	75
46 Power Substation Apparatus	76	77
51 Steam Locomotives	78	79
52 Other Locomotives	80	81
53 Freight Train Cars	82	83
54 Passenger Train Cars	84-85	86
55 Motor Equipment of Cars	87	88
56 Floating Equipment	89	90
57 Work Equipment	91	92
58 Miscellaneous Equipment	93	94
Memorandum of Additions and Betterments	95	..
Detail Supporting Statement of Original Cost to Date	96

The forms are now printed and can be obtained from the General Secretary of the Presidents' Conference Committee of Federal Valuation of Railroads in the United States, with offices at Philadelphia.

The registers are lists of machinery and rolling stock without prices. They are to be prepared by the carrier, being supervised and checked by the mechanical and electrical sections of the Division of Valuation. The original cost to date schedules are to be taken primarily from the carriers accounting records and are to be verified by the accounting section of the government, which has full charge of this portion of the work. The mechanical men should prepare the registers while the accounting forces should compile the cost returns; the latter department will require help from the mechanical department as described later.

One of the first requisites is an efficient organization. The officer having charge of collecting the data for the register should be thoroughly familiar with the equipment; if, however, he is not, then those next in authority must. If the carriers' records are complete, the clerks can readily prepare the registers for steam locomotives, other locomotives, freight train cars, passenger train cars, floating equipment and possibly roadway machines, but no attempt should be made to compile from office records the registers for the other accounts as much information will overlooked.

It is to be remembered that the registers are to be filed in Washington after which the government will send representatives to the carriers' property to verify them, also to collect additional data not called for by these forms. The railroad

company is required to place with each government mechanical and electrical party a representative called "pilot" who is familiar with the property that is to be inventoried and who is to assist in identifying, measuring and ascertaining facts bearing on its age, wear, decay, maintenance and condition. Therefore the carriers' pilots should be experienced equipment men, capable not only of estimating quantities and petty costs, but also of pointing out special conditions affecting the value as well as accurately judging the state of the maintenance.

The first field men required will be those for shop machinery, power plant machinery and power substation apparatus. With each pilot there should be at least one man to assist in collecting preliminary data for the registers. The pilots for locomotives, cars, floating equipment, etc., are not absolutely required until the arrival of the government representatives for these accounts. Before attempting to prepare the data called for by Order No. 8, every one connected with the work should familiarize himself with the latest pamphlets issued by the government entitled "Classification of Investment in Road and Equipment of Steam Roads" and the "Instructions for Field Work of the Mechanical and Electrical Sections of the Division of Valuation, Interstate Commerce Commission" which can be obtained for five cents a copy from the Superintendent of Documents, Government Printing Office, Washington.

As the registers and original cost to date forms are to be typewritten, requiring typewriters with especially long carriages, it has been found desirable to establish a typewriting bureau where not only the equipment registers but all other large work such as reports of Order No. 11, Order No. 12, etc., can be typewritten. A steady flow of work from the various sources will keep the department busy, while if this large work is done by the departments concerned many more large carriage typewriters will be required as well as more operators. The forms sent to the government are to be "carbon backed." Special care is to be taken to see that the carbon paper is of such quality that the backs are not easily damaged and to save time as well as to insure good impressions "double faced" carbons are used to advantage.

Nothing is to be gained by curtailing the data for the equipment register. Although much of it might be recorded at the time of the joint field inspection, the government field men's time is limited. They are being constantly pressed for greater output or mileage. In their haste, important things might be missed resulting in a loss to the carrier. As it is, the second inspection often corrects errors and omissions.

ACCOUNT 37—ROADWAY MACHINES

All roadway machines should be distinctly numbered so that the register can be readily verified by the field party. For all classes of roadway machines in addition to the data called for on D. V. Form 70, wherever it is possible give in the remarks column the division or district on which the machines are located and all data that will enable them to be readily identified. For instance, on portable boilers give the type, height and length, steam pressure, number, diameter and length of tubes, size of firebox, heating surface, kind of grate, fittings, injectors, etc. Ditching machines, which are ordinarily operated while temporarily mounted upon a

flat car, but which are capable of self propulsion on carriers' tracks, should be included in this account.

D. V. Form 313 is to be used for listing small tools with each machine.

ACCOUNT 44—SHOP MACHINERY

Before the carriers' field party starts out to obtain the data for the Shop Machinery Register, special printed or mimeograph forms called "Carriers' Field Sheets" for each class of machinery should be prepared, on which is to be recorded the data collected. This will insure that nothing is overlooked as on each form there should be a place for all of the items called for by the captions of the register, as well as other necessary items. The following will suggest some of the items to be mentioned:

INVENTORY OF SHOP MACHINERY—Account 44.

Date	Inventory No.
Location	Old Shop No.
Name of Bldg.	Mfrs. No.
Mfrs. Name	Size
Kind	Gears, Kind
Drive, Kind	Safety Guards
Equipment	Foundation, Material
Year Purchased	Quantity
Description of Drive	Inventoried by
Remarks	

*Show details of pulleys, belts, countershafts, etc.

The field force send these carriers' field sheets to the office where the necessary data is drawn off. Provided there are no working drawings, the field force should attach sketches showing dimensions and material of all guards and home made attachments. These sketches should be in such detail as will enable a computer to estimate the quantities of the various material used in the construction as well as the cost, provided the actual costs are not available. Home made machines should be treated in a similar manner. These carriers' field sheets are extremely valuable as reference when the government representative is in the field.

Account 44 (with Account 45—Power Plant Machinery) is the most difficult to handle, not only because the data for the register must be collected in the field but also because the line of demarkation between this and the various other accounts is quite obscure. It is frequently found that one line of pipe will have to be allocated to three different accounts such as No. 20—Shops and Engine Houses, No. 32—Power Distribution System, No. 44—Shop Machinery. Another source of confusion is whether to classify engine and boiler room machinery under Account 44 or 45. If this machinery is located in distinct buildings it is to be included in Account 45, but if it is installed in a shop as part of the shop equipment it is to be included in Account 44.

Departments.—Each department or building should be listed separately, identification numbers being assigned to each machine or unit, no two machines on the road to bear the same number. In renumbering the machines sufficient blank numbers should be left between departments to take care of the growth for at least 10 years. Number the various units in a department in logical order so they may be easily checked on the register.

Power Plant.—For the method of handling power plant machinery, Account 44, see Account 45.

It must be borne in mind that power distribution systems of every description, which convey power from the boiler or engine room to any other building or department are not to be listed under Account 44, except the line shafting. All piping in shop buildings supplying power to the shop machines, including the leads from the mains to the machines should be accredited to Account 20. All wiring in shop buildings, including the leads from the mains to a motor starting device, should be accredited to Account 20. The motor starting device itself and the wires between such device and motor are considered a part of the motor and should be accredited to Account 44.

Machines.—Each machine should be described in such

detail as to give a comprehensive idea of it, mentioning all special constructions and attachments that would enhance its value. Give the builders' number, also a description of all special safety appliances and guards not furnished with the machine. Countershafts need not be described unless they are of special design. All separate cranes should be numbered and a complete description given. Cranes which are furnished with and are a part of a machine are not to be numbered but are to be mentioned in the machine description. Give the name plate data of a motor and control equipment of motor-driven machines.

Main and jack shafts should be tabulated by diameters, the total length of each diameter in a department being listed as one item. A description and quantity of shaft couplings should also be given. Prepare a 11 in. by 17 in. drawing showing the various styles of shaft hangers used, typing each style. On the register show the type, drop, length of the box and the bore. List line shaft pulleys in the order of their size; give the width of the face, the material, and state whether they are solid or split. Give the aggregate length of each width of belt and classify it as to ply and material.

Use D. V. Form 313 for small tools. All small tools of the same size and kind should be listed and priced as one item. The lists are to be made in duplicate. A legend should be inserted on last sheet of D. V. Form 72, stating that the list of small tools has been prepared on a separate form. The gathering of the data for small tools is a tremendous task, but can be lightened somewhat by furnishing to each shop and engine house small blank books, two for each foreman or gang boss, in which they are to list the small tools under their care. These to be checked in the field by the shop machinery pilot, particular attention being given to descriptions and omissions. These books to be sent to the office and copied on D. V. Form 313.

Patterns and templates are to be listed on D. V. Form 313. The lists should show the quantity and cost with a description of them. All patterns or templates at one location are to be grouped.

The following are to be included in Account 44; locomotive boiler washout systems including piping and foundations, boiler front racks, pipe racks, ladder racks, apparatus for drying lumber including blowers and motive power for same, trucks, portable benches, also machinery in oil houses.

The following belong to Account 20; heating coils for blower outfits, blower piping for conveying hot air from the blower to the dry kiln, fire fighting apparatus, fixed benches, and oil storage tanks and their piping located outside of buildings.

ACCOUNT 45—POWER PLANT MACHINERY

Note the cautionary remarks given under Account 44 regarding the proper classification of engine and boiler room machinery.

Boilers, engines, etc., located in detached buildings and used for furnishing power, heat or light to stations, or other buildings are to be classified as Power Plant Machinery, Account 45. Each unit in a power plant should bear a distinctive number which will not be confused with similar numbers at other locations. It is suggested that the first units shown in the registers for this account are the boilers and their appurtenances followed by the other boiler room machinery, after which should be listed the machinery in the engine room.

Boilers.—Give a full description of the boilers including the type, steam pressure; number, size and length of tubes; heating surface; size of drums, if any; material of headers, if any, and small fittings. In the remark column should be shown the amount of excavation in cubic yards and the builder's drawing number. Where drawings are not available prepare sketches of the general arrangement in such

detail as to permit calculations of quantities of material used in the settings.

Stokers.—Numbers should be assigned to each stoker and the company's drawing numbers should be given for reference.

Auxiliaries.—The auxiliaries should be listed separately, giving a complete description of them as well as the catalog reference. All condensers and feed water intake lines from a private water supply to the boiler or engine room should be included in Account 45. Condenser and feed water intake lines from city mains should be noted in Account 45 only from the point where the line enters the power plant building. The line between city main and building should be accredited to Account 29.

Piping.—Measure the piping and classify it according to the material, thickness, service, size and kind of joints. List all valves and all fittings that are four inches and over.

Pipe Covering.—Give the lineal feet of each size of pipe covering, as well as the material, thickness, make, etc. If molded coverings for valves and fittings have been used give the catalog reference. If plastic covering has been used, give the kind, thickness, area, etc.

Engines and Turbines.—Give the name of the manufacturer, show the type, whether condensing or non-condensing, vertical or horizontal, steam pressure, revolutions per minute, cylinder dimensions, style of valve gear and governor, size of fly wheel, and if they are part of the generator, so state. If the engine was built with an electric generator on the same base plate by one manufacturer, it should be considered as one unit and full details of both given in the same record.

Electric Generators.—Give the name of the manufacturer, name plate data and distinctive characteristics, including the number of main poles and interpoles.

Wiring.—List all wire in lineal feet, specifying material, size, whether solid or stranded, kind and thickness of insulation and covering. State whether it is run in conduit, on knobs, or cleats, or a pole line. List the conduit in lineal feet, specifying the material, size and number of bends if the conduit is $2\frac{1}{2}$ in. or over in diameter. List condulets, insulators, etc., with catalog references.

Switchboards.—Give each complete switchboard an identification number. Describe each panel separately, indicating its functions, size, material, kind of finish, and supports. List all instruments, switches and other equipment on the front of each panel, noting at the same time all integral parts such as voltmeter resistances which may be in the rear of the panel, giving distinctive characteristics with the name plate data or catalog references. Give similar data for the apparatus on the back of the switchboard without distinguishing between the panels. List all bus bars, brackets, clamps, insulators, etc., with catalog references.

Miscellaneous.—List the transformers, circuit breakers, switches, switch cabinets and similar apparatus, giving the name plate data, or catalog references. For lightning arrester equipment, add the kind of mountings and insulators. Spare apparatus located in power plants, but not in service nor connected for service is unapplied material and is not to be listed on the register.

ACCOUNT 46—POWER SUBSTATION APPARATUS

This account should be reported in the same manner as Account 45.

ACCOUNT 51—STEAM LOCOMOTIVES

"Date Built" is the original date locomotive was built. If a new boiler was applied, the date the boiler was built should be entered in the remark column. Light weight is the weight of both the engine and tender without coal, water, fire or engine crew. If no records exist regarding this item,

then it will be necessary to weigh a sufficient number of engines having various sizes of boilers and fireboxes, also tenders of various capacities in order to establish an amount to be deducted from the weight in working order, which is the weight usually found in office records. In the remark column list the important betterments such as "equipped with superheater, new boiler," etc. If the locomotive was purchased second-hand, it should be indicated in this column, also the date of acquisition. An additional list should be prepared showing the following data at the date of valuation; number, length and size of tubes, and the length and width of firebox.

A list on D. V. Form 313 should be prepared showing the standard tool equipment for locomotives used in the various kinds of service. This list should show quantities and detail prices as well as an aggregate price of the complete equipment. A list is to be kept of all locomotives scrapped after date of valuation so that government party will not be looking for items which are non-existent. The new locomotives placed in service after the valuation was made should also be recorded.

ACCOUNT 52—OTHER LOCOMOTIVES

This classification covers electric and similar locomotives, but not cars with motor equipment. The suggestions for the steam locomotives and motor cars apply to Account 52 also.

ACCOUNT 53—FREIGHT TRAIN CARS

The cars should be reported in "Lots" or "Series," giving the first and last numbers of the series with the number of units in the series. When certain cars have for any cause been removed from revenue service, the actual live car numbers in that series or the individual numbers of the cars removed should be shown. The capacity and weight of the cars should be shown in pounds, and the length shown should be the length over end sills. The width is the width over the car body. The height is that over running boards on house cars, to the top of the sides on open cars and to the top of the floor on flat cars.

In the remark column show the important betterments, such as draft gear, steel underframe, safety appliances, etc. For tool equipment on caboose cars use D. V. Form 313. If the cars were purchased second-hand, indicate the fact in this column together with the date of acquisition. As in the case of locomotives, etc., keep a list of the freight train cars removed from and those added to revenue service after date of valuation.

ACCOUNT 54—PASSENGER TRAIN CARS

Two forms are used for cars under this classification; D. V. Form 84 for motor cars, trailer cars having multiple unit equipment, and for gasoline and gas electric self-propelled cars. D. V. Form 85 is to be used for steam railroad cars and for trailer cars without multiple unit equipments.

The remark column is to be used for amplifying the description of the underframe and superstructure, also for listing the major betterments. If the cars were purchased second-hand, indicate in this column together with the date of acquisition. Use D. V. Form 313 for tool equipments. Keep a list of passenger train cars removed from revenue service after the date of valuation.

ACCOUNT 55—MOTOR EQUIPMENT OF CARS

D. V. Form 87 should be used for multiple unit equipment either on motor or trailer cars. Also for trailer cars equipped with train wires for power or control and for motor equipment of gasoline or gas-electric, self-propelled cars. Form 87 is not to be used for trailer cars not equipped as before described. The motor equipment is to be shown

for each car or series of cars in the same order as is recorded, the equipment of which it is a part.

ACCOUNT 56—FLOATING EQUIPMENT

On D. V. Form 89, after "Station," give the port of registration. List floating equipment in alphabetical order according to its classification or kind. In the remark column give material of hull. Use form D. V. 313 for tools or other appurtenances.

ACCOUNT 57—WORK EQUIPMENT

Use D. V. Form 91 for rail work equipment and D. V. Form 89 for floating work equipment with the title amended to read Account 57—"Floating Work Equipment." All work equipment should be distinctly numbered so that the register can be readily verified by the field parties. The various types of work equipment should be entered on the register in the same manner as the corresponding revenue equipment covered by Accounts 51 to 56 inclusive. The listing of machinery should follow that for Accounts 37, 44 and 45. If units of work equipment were converted from those of other accounts, the date of transfer and from what it was converted should be shown in the remark column. Electrical motor equipment on cars used in work service belongs in Account 55, while the car bodies and trucks are to be accredited to Account 57. Use D. V. Form 313 for small tools and appurtenances.

ACCOUNT 58—MISCELLANEOUS EQUIPMENT

In this account belong horses, harness, wagons, auto trucks, etc. In describing horses give the height, weight, etc.; of automobiles give the make, age and such other data as will enable one to get a clear understanding of the unit listed.

GENERAL

Upon the arrival of the Government mechanical and electrical field forces, a definite understanding should be reached as to the methods to be followed in checking the carriers' registers and collecting the additional data required for the government field sheets. The carriers' pilots should be instructed to agree upon the record of condition and maintenance, which is to be recorded on the field sheets as "Normal" (N), "Above Normal" (A. N.), or "Below Normal" (B. N.), provided the field sheets show the facts upon which the conclusions were based; but if the pilots should not agree as to "Probable Service Life" nor "Service Condition Percent" both the original and duplicate should be stamped over "Service Condition Percent" to the effect that railroad representative does not agree as to methods or conclusions to enable the carriers' pilot to sign the field sheets.

When actual costs of home-made machinery or accessories are unknown, the carrier's pilot should be instructed to agree, if possible, with the government's representative upon their estimated cost, due allowance being made for material, labor and overhead charges. These costs will then be entered upon the government's field sheets and are final.

Many of the accounts are provided with a special form of field sheet, each adapted to its particular purpose, upon which is printed a list of the more important details of construction, with blank spaces opposite, in which is to be noted the various items which do or do not appear on the unit being inspected and each carrier should determine whether or not the printed list fully covers his equipment. If it does not, then such other items should be added as will give not only a comprehensive idea of the unit, but also cover the principal additions and betterments to be claimed.

ORIGINAL COST TO DATE

In appraising property usually one of two methods is employed as a basis: (a) "Original Cost to Date," being a

summation of all the costs of a unit in place, from purchase to time of appraisal; (b) "Cost of Reproduction New," being the cost based on present prices. The latter method provides for the inclusion of every element of cost and the basis upon which substantially all modern appraisements are made.

The act stipulates that the Interstate Commerce Commission is to ascertain the "Original Cost to Date" and the "Cost of Reproduction New." In turn the Commission asks the carriers to furnish statements showing the Original Cost to Date.

On the older lines, the accounts of many of the constituent roads have been lost or are incomplete. Many conservative paying companies often charged all minor improvements, and at times large ones, to operation. Then, too, the question of additions and betterments is not thoroughly understood by the shops, which are really responsible for addition and betterment costs being properly allocated.

Not one foreman in a dozen appreciates that when a ladder with stiles is substituted for one made of bent hand holds, or a 10-in. brake cylinder replaces an 8-in. one, or a compound pump takes the place of a simple one, that part of the cost of substitution is chargeable to betterments and should be reported. Therefore the accounting records probably do not reflect the true "Cost to Date," which is the only method of appraisal of equipment and machinery to which the carrier is a party.

If the accountants' books do not contain all the costs it behooves the carrier to see that careful estimates are made covering the omissions. It might be well to review the additions and betterments shown in the records to see if they are correct. The mechanical branch is best fitted to make this study. The construction at date of valuation of each engine, car, etc., should be compared with the original detail specifications and the difference noted. These differences constitute some of the additions or betterments for that unit.

Additions are *additional* facilities or devices such as air brakes applied to cars not previously equipped (all labor used in construction and application should be charged).

Betterments are *improvements* of existing facilities such as substitution of steel tired wheels for cast iron wheels. The cost chargeable to the accounts is the excess cost of the new parts over the cost of parts retired. The difference between the labor cost of applying old parts and applying new should be included but not the cost of removing old parts. All prices used should be those current at the time the addition or betterment was made.

For each addition or betterment prepare on 8½ in. by 11 in. sheets a comparative statement showing in parallel columns the costs of the "original" and "final" constructions, giving the quantities, unit prices and costs of both material and labor. To the cost add allowances for overhead charges. The difference between the totals of the two sides is the betterment. It is obvious that if there were no "Original Construction" then the change is an addition, which permits the charging of labor of application. Show the date of the prices, the date the estimate was made and the name of the estimator. From a file of these sheets not only the total additions or betterments applied to any unit may be readily ascertained, but also the correctness of the claim can be verified.

In filling out the original cost to date forms, the units should be reported in the same order as on the registers. The costs to be reported are those contained in the carrier's accounting records. Should these be missing or incomplete, other records or even estimates should be used, indicating the source, name and title of estimator, etc.

Great care should be exercised to see that the costs taken from the accounting records are for the identical units reported in the register as it is sometimes found that a car

or locomotive has been renumbered or replaces another of the same number.

There is quite a diversity of opinion regarding the use of Forms D. V. 95 and D. V. 96. It is suggested that the district accountant be consulted as to the method he desires to be followed in reporting additions and betterments as well as supporting data.

WASHINGTON CORRESPONDENCE

WASHINGTON, D. C., July 24, 1917.

CONSERVATION OF TRANSPORTATION

The Council of National Defense and the various departments of the government are giving a great deal of attention to the transportation problem in connection with the handling of war supplies and are not only co-operating with the railways in many ways to promote the most efficient use of the available facilities, but are also trying to do what they can toward arousing the public to an appreciation of the situation.

The government is extending very effective co-operation in the campaign inaugurated by the Railroads' War Board to utilize the full carrying capacity of equipment. The recommendations which have been sent to shippers on this point by the Interstate Commerce Commission, the Department of Commerce and the Department of Agriculture have already been noted in the *Railway Age Gazette*. The Commission on Car Service has also recently taken this matter up with the Army and Navy and other departments that are ordering vast quantities of munitions and supplies of all kinds, requesting them in placing contracts to specify in the order that cars shall be loaded to full capacity. Very satisfactory replies have been received from the heads of various departments, stating that they have issued orders that the request shall be complied with. Both the Army and Navy and the Shipping Board have issued such orders. The Traffic Executive, located in New York, which handles shipments of supplies for the Allies, is also making it a point to see that its shipments are loaded in full cars and the inspection department of the British Ministry of Munitions of War in the United States has issued a circular to its agents, saying: "The first essential condition is that all cars be loaded to 10 per cent above their nominal capacity and all other conditions must be made subservient to this."

The storage committee of the general munitions board of the Council of National Defense has authorized a statement, saying that the government and every other purchaser of goods must make every effort to buy near the point of utilization so as to make the one necessary railroad haul as short as possible. A number of instances have come to the attention of the storage committee where articles are being manufactured in the East with orders to ship West while the same articles are being made in the West for shipment to the East. This lack of co-operation between buyer, railroad, shipper and consignee, it says, must cease.

As a good example of what grows out of a full understanding, the statement cites the pooling arrangement effected between coal operators, railroads, mines and lake vessels, whereby coal from Lake Erie ports destined for the head of the lakes will be classified and handled so much more efficiently that the equivalent of 53,000 cars will be added to the railway equipment. Some similar co-operative methods will be developed within the next few months to control all government shipments. "It is unthinkable," the committee asserts, "that the present hit-or-miss method should be allowed to continue. Of course, in all shipments, especially of government supplies, nothing less than car lots can be considered satisfactory. There is no way by which the railroad can give preference to, or expedite, a less than a carload lot shipment. Every possible effort must be made to combine

the shipments of different manufacturers, if need be, into full car lots.

"Most industrial establishments are situated so that to make any considerable addition to their storage areas is impossible. At most manufacturing centers, therefore, it will be desirable to create assembly stations for the collection of government freight. Such stations will permit the combination of a number of small shipments into car lots. The accumulation of freight at such local centers will give to the railroad a less fluctuating load, and will make possible the routing each day of a more or less constant number of cars to the several destination points. Thus the freight service will be regularized as is the passenger service, and permit of a more efficient use of rolling stock.

"More and more the motor truck must be used for local deliveries of freight, not only between the plant and freight assembly station, but to consumers at relatively nearby points. This will mean, in many instances, the organization of a joint motor car service by the manufacturers of a given district, to insure that as nearly as possible full motor truck loads may be available for each trip. This motor service will not be in many cases the cheapest method, but motor trucks will probably provide the only means of regularizing the transportation service."

THE STORAGE PROBLEM

The storage committee states that expenditures in excess of \$50,000,000 for terminal storage areas at or near the seaboard will undoubtedly be necessary and that not a moment should be lost in providing these facilities. The equipment which it is necessary to provide for each soldier going overseas amounts to about five and a half tons. This storage load will be put upon the nation before the end of the year and to handle it will require carefully designed and equipped areas, probably 2,000 acres in extent.

The storage policy will provide for four types of storage areas, the term "area" being used as including (1) open spaces such as are required for lumber and the like, (2) partially enclosed spaces such as are used for hay, etc., and (3) fully enclosed spaces, such as warehouses. The types of these storage areas will be (1) at the individual manufacturing plant, (2) at points of assembly within a given manufacturing district to which goods can be hauled by automobile truck or wagon, (3) at points of utilization and of consumption, as at the cantonment or training camp, and (4) at places adjacent to terminal ports and from which goods will be transported to ship by motor truck or lighter.

Dependence must be placed very largely upon local initiative for the provision of ample storage at the point of manufacture, the committee said. Manufacturers making goods for the government, and in fact all manufacturers, no matter what their product or for whom it is made, should be encouraged to expand their storage capacity at once in every possible way.

"We cannot continue to allow manufacturers to dump their products as completed on the railroads without regard to the necessities of the situation," said the committee. "This means more storage for manufactured articles. As the load on the railroads increases, the regularity of deliveries on individual shipments will be interfered with, and if continuity of manufacturing is to be maintained, our manufacturers will have to carry larger stocks of raw material, which will require additional storage."

AVOID TRANSPORTATION WASTE

The general munitions board of the Council of National Defense has also issued a statement calling attention to the importance of conserving railroad facilities.

"The railroad situation is right now the weakest link in the storage problem," according to the board. "Unless we begin at once to take steps to safeguard the railroad situation, by

January 1, 1918, we will have no storage problem, because there will be nothing to store. On account of the car shortage, manufacturers will be unable to secure raw materials or ship their finished products. These facts explain why the railroad factor is strongly emphasized in our statements of policy. A railroad can stagger along for a time under a load far heavier than it is designed to bear. But if this goes too far, signs of congestion begin to appear. And then, if nothing radical is done, an actual tie-up ensues."

The level of efficiency would be reached, the board pointed out, if it could be arranged that each of the myriad articles being purchased by the government for the Army and Navy could be handled once, and only once, by the railroads. To bring this about, nothing should be put into a railroad car except for immediate and direct haul either, first, to a place where it is to be consumed or otherwise utilized, or second, to the seaboard prior to transshipment across seas.

It is quite common military and industrial practice for most munitions to make three, four or more railroad trips before they reach the consumer or the hold of an ocean going ship. Sometimes goods are sent to intermediate distribution points, or to places of assembly, requiring additional, and frequently, unnecessary haul. Sometimes these extra haulings are simply the result of accident or chance. But every extra and avoidable hauling, even where mileage is not increased, will have to be cut out if the railroads are to be an efficient part of our war machine.

"There are some railroad lines in England today, whose entire equipment is being used for army purposes six days out of seven," the statement said. "We may be in a similar situation in this country before the spring of 1918. Unless we rigorously and scientifically conserve railroad facilities, industry's participation in their use will be very meager. We cannot waste and win the war."

POOLING OF COAL SHIPMENTS

On the St. George piers, on Staten Island, New York City, a program to pool all export coal and much of that delivered for the city's consumption was inaugurated on July 23, according to an announcement made by the Tidewater Coal Exchange, which is working in co-operation with the Railroads' War Board and the coal production committee of the Council of National Defense. The St. George piers constitute the shipping terminus of the Baltimore & Ohio and Staten Island railroads.

On August 1, it was said, other piers supplying much of the coal for New York City consumption and for shipment by water from that port, also will put into effect the program for tidewater pooling, in order to hasten boat shipments to New England and other destinations and to release cars as rapidly as possible for other uses. These piers are South Amboy, Port Reading, Elizabeth and Port Liberty.

The Philadelphia piers, on which pooling of coal will take place beginning August 1, are the Port Richmond, Greenwich and Jackson Street piers. The Hampton Roads piers are Lambert's Point, Sewell's Point and Newport News. The Baltimore piers, where pooling likewise will become effective on August 1, are the Canton piers. The program already is in effect on the Baltimore & Ohio and Western Maryland piers, and is said to be working successfully.

In each of these instances coal of like kinds will be run on particular tracks, and each shipper will keep a credit and debit balance with the deputy commissioner of the Tidewater Coal Exchange at each port. Vessels or barges, arriving at port to take on a load of No. 1 coal, for instance, will not have to wait while a particular consignment is extricated from a crowded switchyard, but will take the first cars on No. 1 track.

The total amount of coal likely to be shipped from the four tidewater ports where pooling is to be put into effect—New York, Baltimore, Philadelphia and Hampton Roads—

will amount to 35,000,000 tons. The usefulness of vessels and cars will be greatly augmented thereby.

ORGANIZATION FOR EFFICIENCY ON THE CHICAGO & NORTH WESTERN

The Chicago & North Western has in effect a plan of organization for efficiency which extends from the executive offices to each division of the road. Every second Friday a staff meeting is held in the office of the vice-president of operation at Chicago which is attended by officers of all other departments. Here any matter is discussed which is pertinent to greater economy or efficiency of operation. Similarly, divisional staff meetings are held every Saturday which are called by division superintendents and attended by the division officers, including the division engineer, the trainmaster, dispatchers, roadmasters, master mechanics, etc. The results of these are reported by the superintendents to the general office. In addition, divisional efficiency committees were recently organized, consisting of the division superintendent and the ranking members of the traffic and mechanical departments on each division. Some of the special problems which these committees are required to consider are, maximum carloading, heavier train loads, and the elimination of empty car mileage. These committees meet semi-monthly and report directly to the vice-president in charge of operation.

Although the divisional staff meetings have been taking place for the last two or three years, a special interest has been taken in them recently in view of the critical transportation situation. Typical of the character of these meetings is one recently held at Sioux City, Iowa. Among the subjects discussed were the feasibility of pooling locomotives, increase in prices of materials and equipment, and the possibility, of further economy in the use of materials by all departments.

Among those who spoke at this gathering was Mr. Simmons, a brakeman, who said in part: "There are two ways to get ahead in this world, either increase your income or decrease your expenditures; either accomplishes the same result. Has it ever occurred to you, with the cost of material advancing more than 60 per cent., with the price of coal advancing 30 and 40 per cent., with the cost of gondola cars advancing 110 per cent., and the locomotives we are now using more than double what they were in 1915, that the only thing the North Western has to sell is transportation? With the tremendous advances in the cost of all prices of labor this company is receiving the same price for hauling a carload of hogs from Sioux City to Chicago that it received in 1915, and while the railroad is asking for adequate increases in freight rates, until it receives them it must look to its employees to help meet these increases. By practicing the same methods of economy with the company's material and supplies as we do in our homes (if the price of an article has advanced beyond its worth to try and get along without it or to use just as little of the article as possible) much can be done to meet the situation."

L. Gilbert, roadmaster at Sioux City, stated that in 1913 it cost his subdivision \$390 to relay one mile of track and that in 1916 it cost \$495, or an increase of \$105. Ballast cost \$806 per mile in 1914 and \$1,774 in 1916, or an increase of \$968.

F. H. Lowery, engineer, said that in March, 1917, the total engine mileage on the Sioux City division was 138,000. Had every fireman on the division saved but a single scoopful of coal in each 100 miles fired he would have saved the company more than 12½ tons, computing each scoop as 18 lb. The remarks made by the others who attended the meeting were of a similar character and indicated that officers and employees of the North Western are keenly alive to the pressing necessity for economy and the available means of achieving it.

Decision In Transcontinental Rate Case

Commission Finds Water Competition Temporarily Negligible and Orders Readjustment Until War Is Over

THE Interstate Commerce Commission on July 24 rendered its decision in the various cases involving transcontinental freight rates, in which the commission finds that existing water competition is a negligible factor in affecting the rates by rail between Atlantic and Pacific coast terminals. Rates on commodities from eastern defined territories to Pacific coast terminals lower than the rates on like traffic to intermediate points are found not justified under existing circumstances. The present effective rates on certain specific commodities from all eastern defined territories to Pacific coast terminals are found to be not unreasonably low and not to have been induced by water competition. The present effective rates on other commodities in schedules B and C are found, as a whole, unreasonably low from territories east of the Missouri River to Pacific coast terminals. The rates on barley, beans, canned goods, asphaltum, dried fruits and wine from Pacific coast ports via rail-and-water routes through Galveston to the Atlantic seaboard should be revised to accord with the requirements of the long-and-short-haul clause of the fourth section. The commission's report will be found in 46 I. C. C. 238. A brief abstract follows:

ABSTRACT OF THE COMMISSION'S DECISION

In Reopening Fourth Section Applications, 40 I. C. C., 35, we found that the existing competition by water at the time the report was made, June 5, 1916, between the Atlantic and Pacific coasts, did not justify the relationship of rates then existing. We also found that the maintenance of these low rates on the schedule C commodities named in Commodity Rates to Pacific Coast Terminals, 32 I. C. C., 611, and the maintenance of the rates on barley, beans, canned goods, asphaltum, dried fruits, and wine from California ports, via rail and water, to the Atlantic seaboard, while higher rates were maintained to or from intermediate points, had the effect of unduly preferring the coast points and unduly prejudicing intermediate points. Orders were entered requiring the carriers, on or before September 1, 1916, to readjust the rates on the schedule C commodities in accordance with the terms of our order respecting schedule B commodities. The relief orders which had been issued respecting the rates on barley, beans, canned goods, asphaltum, dried fruits, and wine were rescinded, effective September 1, 1916.

Pursuant to these orders, new tariffs were filed, effective September 1, 1916, containing rates purporting to be in accordance with the requirements. The new tariffs contained many increases in the rates to the Pacific coast on the schedule C items, and in the rates on the California products from California ports to the Atlantic seaboard. Protests were filed with the commission on behalf of a large number of shippers and receivers, representing many localities east of the Missouri River, and on or near the Pacific coast. It was strongly urged that the marked increases would be destructive of certain industries, and would result in material losses on account of unfulfilled contracts, and that some of the new rates were unjust and unreasonable in and of themselves. The commission thereupon suspended the new rates until December 30, 1916.

On September 9, 1916, the Merchants' Association of Spokane, Wash., filed a petition, alleging that there was not at that time and had not been since April 5, 1916, any water competition whatever between the Atlantic and the Pacific coasts of the United States, and that there existed no justification for the maintenance of lower rates from eastern

defined territories to the Pacific coast than to intermediate points.

On October 17, 1916, by appropriate order, we reopened all of the fourth section applications relating to the rates on commodities from eastern defined territories to Pacific coast ports and intermediate points, and all of the applications respecting rates on barley, beans, canned goods, asphaltum, dried fruits, and wine from California ports to Atlantic ports.

Prior to the hearings the carriers sought and obtained authority to cancel the suspended tariffs and to publish new tariffs containing more moderate increases to and from Pacific coast points. These new tariffs were filed to become effective December 30, 1916, on statutory notice and had the effect of increasing the rates on all the schedule C items from nearly all eastern defined territories to the Pacific coast ports by 10 cents in carloads and 25 cents in less than carloads. No increases were made in the rates to intermediate points in any instance in which the resulting rate would be higher than the rate to the Pacific coast ports. The new tariffs also had the effect of increasing by 10 cents the carload rates on barley, beans, canned goods, asphaltum, dried fruits, and wine from California ports via rail-and-water routes through Galveston to the Atlantic ports, and also of increasing the all-rail rate on canned goods from California points to eastern defined territories from 62½ cents to 72½ cents. The effective date of some of the eastbound rates was subsequently postponed by the carriers until March 1, 1917.

THE SITUATION AS TO WATER COMPETITION

The following figures respecting the ships and tonnage moving via the Panama Canal between the Atlantic and Pacific coasts are said to have been taken from the Canal Record:

	Westbound		Eastbound	
	No. of ships	Tonnage	No. of ships	Tonnage
August 14, 1914, to June 30, 1915.	172	951,044	163	895,614
June 30, 1915, to June 30, 1916,	52	227,103	41	217,285
June 30, 1916, to November 1, 1916,	8	26,223	10	12,935

The evidence showed that two Pacific Coast Steamship Company steamers sailed from San Francisco for Atlantic ports during the latter part of August, 1916: that two American-Hawaiian steamers passed through the canal with east-bound cargoes in recent months, and that two steamers sailed from New York for the Pacific coast in July and one in October, 1916. One steamer reached Charleston, S. C., in September, 1916, carrying 17,000 barrels of flour from north Pacific coast points. There are statements in the record of other sailings and expected sailings, but the table of tonnage moved from June 30 to November 1, 1916, shows that this movement is slight and the evidence indicates that the movement has been irregular and uncertain.

A statement offered in evidence on behalf of Pacific coast cities, compiled from data gathered from marine engineering publications, purported to show that on October 2, 1916, there were building in the various shipbuilding plants of the United States a gross tonnage of vessels of all descriptions approximating 1,600,000 tons. An extract from the consular and trade reports on November 18, 1916, showed steel merchant vessels, building or under contract in American shipyards on November 1, 1916, according to shipbuilders' returns to the Bureau of Navigation, Department of Commerce of the United States, numbering 417 vessels,

of 1,479,946 gross tons. During October, 1916, American shipyards are said to have finished 17 steel merchant vessels of 52,941 gross tons and made new contracts for 17 steel merchant vessels of 77,877 gross tons. It is stated that there were under contract in American shipyards on November 1, 1916, 314 merchant vessels of 960,899 gross tons, which the builders of these vessels expected to launch on or before June 30, 1917.

It is clear, however, that the present service by water between the two coasts of the United States is infrequent, sporadic, and irregular. It is inferable that the great ship-building program now being carried forward in the ship-building plants of the United States will result in bringing into this coast to coast trade a number of ships in the not distant future. Testimony on behalf of the merchants on the Pacific coast showed their disposition and capacity to organize and equip steamship lines for this business in the event of radical increases in the rail rates between the two coasts.

The present situation, however, as to the water competition, is beyond dispute. There is no existing competitive necessity by reason of water service between the two coasts which warrants the rail carriers in maintaining under present circumstances lower rates to the Pacific coast than are normal and reasonable or lower than to intermediate points.

ATTITUDE OF THE RAIL CARRIERS

The rail carriers are before us in this proceeding seeking authority to continue lower rates on a large proportion of all commodities to the Pacific coast than to intermediate points and lower rates from the Pacific coast via rail-and-water routes through Galveston on a limited list of commodities than are applied from or to intermediate points. It is urged that the ability of the boat lines to establish and maintain rates on certain of these commodities between the two coasts that are far below the level of normal rail rates on the same traffic has been amply demonstrated by the rates maintained during the first year the Panama Canal was in operation.

It is stated that it has been demonstrated that the boat lines can make and have made rates between the coasts very much below any scale of rates which we could require the rail carriers to maintain and these carriers now urge their right to maintain such an adjustment of rates as will keep their lines in an attitude of preparedness for the boat competition which sooner or later may be expected again to develop. It is earnestly urged that if the carriers under present circumstances are required to readjust their rates between the two coasts to a level not lower than the rates to or from intermediate points, the water lines, when the boats return to the service, will establish rates at a level that will take the traffic away from the rail lines. An application on behalf of the railroads for relief from the provisions of the fourth section as to these rates must be supported by competent proof as to the then existing competition by water alleged to make necessary the relief sought. In the natural and orderly course of procedure, several months may elapse between the time when the water competition manifests itself and the time when the rail carriers can make effective such rail rates as are necessary to meet this competition.

It is asserted that no sooner would these rates be established than the boat lines would make a further reduction sufficient to secure the traffic, whereupon the rail lines would find it necessary to make a second application involving further time during which the rail lines would be deprived of the traffic. This process might have to be repeated several times before the rates reached a level as low as the boat lines cared to make them. The objection to this course of procedure is that the rail lines would be obliged to lose the traffic to the boat lines before being able to present convincing proof of the necessity for reducing the rail rates.

WESTBOUND COMMODITY RATES

The present commodity rates from eastern defined territories to the Pacific coast are divided into three groups, which have been known under the designations of schedules A, B, and C. Schedule A includes commodities which either are not adapted to water transportation or which originate in territory so far removed from the Atlantic seaboard as to make their transportation by water unlikely. This list includes about 100 items, among which are the following: Threshing machines, agricultural implements, vehicles, many furniture items and fragile articles, and various products of the soil, wheat, flour, etc. Upon these items the rates to the Pacific coast points are not lower than to intermediate points, and these rates are not the subject of consideration in this report. Schedule B includes about 350 items comprising articles which are more or less adapted to water transportation and upon which the carriers have been authorized to continue rates to intermediate points higher than to the Pacific coast terminals by the following percentages: 7 per cent from points in zone 2; 15 per cent from points in zone 3, and 25 per cent from points in zone 4. The zones referred to are those described in Commodity Rates to Pacific Coast Terminals. The list of the articles is quite general and includes certain varieties of agricultural implements, baking powder, bottles, brass and bronze goods, candles, certain mixtures of canned goods, carpets and rugs, clothing, dried fruits and vegetables, certain furniture items, and many other articles. The range of rates on the schedule B commodities varies to a large extent with the carload minimum applied. Most of the articles move on rates applicable to minima of from 20,000 to 40,000 pounds.

The great bulk of the articles move under minima of 20,000, 24,000, 30,000, 36,000, and 40,000 pounds. The rates on items which take a carload minimum of 20,000 pounds vary from \$1.10 to \$2.25 per 100 pounds. Two-thirds of these items take rates to the Pacific coast of \$1.50 or less. The articles on which a carload minimum of 24,000 pounds applies take rates varying from 90 cents to \$2.30 per 100 pounds. More than 70 per cent of these rates do not exceed \$1.50 per 100 pounds. The rates on the articles moving under a carload minimum of 30,000 pounds or more vary from 60 cents to \$2.50 per 100 pounds. There is but one item, viz., talc, on which the 60-cent rate applies from the Atlantic seaboard to the Pacific coast, but there are 16 items which move on rates as low as 75 cents per 100 pounds, and 120 items which move on rates of \$1 or less. One hundred and fifteen items move on rates varying from \$1.10 to \$1.25, while 98 items move on rates which are higher than \$1.25.

Schedule C includes articles which originate in large volume on or near the Atlantic seaboard, are particularly adapted to water transportation, and upon which the rates are relatively low. The list includes approximately 90 carload items, among which are the following: Certain mixtures of canned goods, many iron articles, nails, bolts, nuts, washers, bar iron, sheet iron, structural iron and steel, many paper articles, paints, soap, wire rope, and telephone wire. These articles move in carloads varying from 24,000 to 80,000 pounds. Forty per cent of the items are subject to a 40,000-pound minimum, and the present rates range generally from 65 to 95 cents. Thirty per cent of the items are subject to a 50,000-pound minimum, and the rates range from 70 cents to \$1 per 100 pounds. An 80,000-pound minimum applies on 7 per cent of the items, and the rates on these items vary from 65 to 75 cents.

The report then takes up the evidence submitted by the various interested communities. In conclusion the commission says:

The arguments advanced by the representative of the steamship lines and by some, but by no means all, of the representatives of the intermediate territory, urge that the policy of the commission hitherto consistently followed of

allowing the rail carriers to reduce their rates to water competitive points to a level lower than to intermediate points in order to permit the rail carriers to compete for the traffic with water carriers is against the public interest, because it tends to reduce the profits of the water carriers and the number of ships which would otherwise engage in the traffic.

The argument advanced by the water lines, if carried to its logical conclusion, means in effect that all traffic which may be hauled by water carriers should be reserved for their exclusive handling. The rail carriers can not maintain, under ordinary circumstances, a level of rates between the Atlantic and Pacific coasts, between the north Atlantic ports and ports on the south Atlantic or Gulf coast or between points on the Pacific coast that will be successful in securing any considerable amount of traffic in competition with water carriers without fourth section relief. We are of the opinion that the best interests of the public, of the transcontinental carriers, and of these intermountain cities in particular, will be served by a policy that permits the transcontinental carriers to share with the water lines in the traffic to and from the Pacific coast ports. The lower rates to the ports, however, when necessary, must not be lower than the competition of the boats makes necessary, and must be high enough to cover, and that by a safe margin, actual out of pocket costs of securing and handling the traffic. The shippers at the coast are thereby given the benefit of competing routes and competing markets of supply. The railroads are enabled to fill up their trains with traffic which, although not highly profitable, yields a revenue materially greater than the out of pocket costs of securing and handling the traffic, thereby adding to the net revenues of the carriers and to that extent lightening the transportation burden borne by other localities.

These transcontinental railroads can fairly expect such consideration as will permit them to continue to earn a reasonable return upon their property devoted to public use. If governmental control is so exercised as to prevent them from securing any considerable share of the business to and from the terminals and the largest possible return therefrom, such return must be derived from the other communities along their lines. It is perfectly clear that the Pacific coast cities have always paid lower rates than they would have paid were it not for the facilities they have enjoyed for bringing manufactured articles from the eastern manufacturing districts and for sending east the products of the coast states by water. It is also clear that the intermountain section of the country has paid and now pays rates for the transportation of these manufactured articles which are higher proportionately than is paid by the coast cities and probably higher than it would be necessary to maintain if the rates to the coast cities could be maintained at a level more nearly proportionate to the service given.

The situation, however, is one which these carriers can not control. The advantage enjoyed by these Pacific coast cities is in the long run a permanent advantage. A war of unparalleled extent, drawing into its service a great part of the shipping of the world, has for the time being deprived these cities of the advantage of any substantial degree of water service. The present conditions admittedly are not normal. It is very earnestly urged that these abnormal conditions, however, are temporary and that the long standing commercial conditions should not now be disturbed by any material increase in the coast rates. The present conditions may be temporary as measured by the period of years during which these transcontinental railways have been built, but it is not apparent that the conditions are temporary in that within any known period of time they will have passed away. Under the present circumstances the maintenance of these lower rates to coast points and higher rates to intermediate points is unduly preferential to the coast points and unduly prejudicial to intermediate points.

We are of opinion that all these rates in schedules B and C to the Pacific coast should be now realigned to accord with the long-and-short-haul rule of the fourth section. In this realignment regard should be had for the conditions now existing, but the conditions that have existed and may again exist should not be forgotten. The rates to all the interior states of Arizona, New Mexico, Nevada, Utah, Wyoming, Idaho, Colorado, and Montana, as well as to the Pacific coast states of California, Oregon, and Washington, should be adjusted at this time as fully as now can be determined, with especial reference to meeting all the requirements of sections 1, 3, and 4 of the act. The facts before us do not admit of such a finding as is sought by the carriers, the coast cities, and the eastern shippers, namely, that present conditions justify lower rates to the coast cities than to intermediate points. Neither do the facts altogether admit of such a finding as is sought by the representatives of the intermountain states, namely that all of these rates to the Pacific coast cities are in and of themselves reasonable and fully remunerative. Some of these rates from eastern territories to Pacific coast terminals are unreasonably low, judged by the standards of car-mile or ton-mile earnings that have been offered for comparison or the rates which we have established on like commodities on these and other lines in many cases. Some of the rates are not unreasonably low, and no relief should be granted as to the rates on such commodities even under conditions similar to those which existed the year following the opening of the canal. There are, as stated, other commodities upon which the rates as a whole are unreasonably low from some of the eastern territory, particularly from transcontinental groups A, B, C, and D, as evidenced by the car-mile and ton-mile earnings and other comparisons offered. The rates on many of these commodities to the coast cities in the past have been influenced by the rates afforded by the water lines. These water rates have been variable. Under these circumstances some of the rail rates to the coast points are in the nature of things subject to variation. The essential justification for lower rates to a more distant point than to an intermediate point is the existence at the more distant point of depressed rates, which the carrier is powerless to affect, and failure to meet which would prevent the carrier from participating in the traffic to the more distant point. That necessity as to some of these rates has existed in the past and may again exist. While there is good reason for a certain variation in the rates to the coast points there is no necessity or justification for such variation in rates to the points so far inland that they are not affected by combination on the coast. The rates to the greater part of this intermediate territory should not now be made to depend upon or vary with the coast rates. In Railroad Commission of Nevada v. S. P. Co., and City of Spokane v. N. P. Co., we proceeded in the light of the evidence then before us relating to the water competition to authorize the carriers to establish rates from Chicago, Pittsburgh, and New York to intermediate territory 7, 15, and 25 per cent, respectively higher than the rates contemporaneously applied to the coast. The evidence then offered afforded no basis for concluding that it would ever be necessary for the rail carriers to establish such a low level of rates between the two coasts as they have sought authority to establish on many articles since the opening of the Panama Canal. The total tonnage of the schedule C articles that originated in transcontinental groups A and B and moved thence via rail or water to Pacific coast terminals in the calendar year 1915 was 961,768 tons. During the year following the opening of the Panama Canal the westbound tonnage secured by the water lines was 951,044 tons. The range of rates applied by the water lines shown in the preceding pages of this report, the applications and proof offered in their support by the rail lines during 1915 for authority to meet these rates,

and the volume of tonnage secured by the water lines evidence the compelling nature of the competition with which the railroads have been and may be again confronted as to many of the articles that originate in territory contiguous to the Atlantic seaboard. It is apparent from the facts at hand that this entire list of commodities, particularly those embraced within schedule B, should be scrutinized with care, and that all articles upon which the rates that can be secured from the eastern defined territories to the Pacific coast are not unreasonably low should be eliminated from schedule B and conform hereafter to the fourth section. All articles which do not originate on or near the Atlantic seaboard and upon which rates have not been particularly affected by water competition should also be eliminated from schedule B. All of the products of the soil, as well as canned goods from California, Washington, and Oregon, move to eastern territory via all-rail routes on rates that accord with the fourth section. The products of the soil of the central and eastern states, grain, vegetables, seeds, roots and fruits, and canned goods, should also be transported to markets on the Pacific coast under rates that are in accord with the fourth section.

As heretofore stated, there are now in the transcontinental tariffs a considerable number of items on which the rates from groups A to F, inclusive, to Pacific coast ports and intermediate points are in accord with the long-and-short-haul rule. These items we have referred to as schedule A items. The following items*, shown in the tariff of R. H. Countiss, agent, I. C. C. No. 1019, cover articles that either do not originate in large volume on the Atlantic seaboard, or if so, the rates on such articles do not appear to have been materially affected by water competition and these rates should be realigned to conform for the future to the long-and-short-haul rule.

The issues in this case and the evidence offered do not afford a foundation upon which we could properly make a finding as to the reasonableness of each of the rates which should be established on the items named either to the coast or to the intermediate points. This must be done in the first instance by the carriers with due regard for all of the commercial, transportation, and competitive conditions affecting this traffic. In those instances in which the rates that can be secured to the coast points are of sufficient volume to admit of their grading to intermediate points the commodity rates to intermediate points should be graded or grouped in such manner as the varying conditions in the territory served appear to warrant. The commodities not named upon which the rates to coast points are lower than to intermediate points constitute a very important list of articles upon which, under ordinary conditions, some fourth section relief should be granted. We think now that these rates to coast and interior should be realigned to conform with the long-and-short-haul rule. The realignment on these articles probably can not be maintained permanently. While there are many reasons to believe that ultimately some plan of grading the rates on these articles from eastern defined territories to the intermediate points should be effectuated, the issues in this case are not such as to permit us, if we desired to do so, to prescribe such a plan of grading. Furthermore, the time is not opportune. Nothing in this report must be construed as authorizing the carriers to increase any rates to intermediate points except points to which rates are now constructed by the addition of arbitraries or locals to the coast rates.

LESS-THAN-CARLOAD COMMODITY RATES WESTBOUND

There are 117 items of less-than-carload commodity rates in the schedule B list upon which the rates vary from \$1.60 to \$5. There are 90 of these items to which rates apply varying from \$1.60 to \$2.50. Sixty of them take a rate of

\$2 and 14 a rate of \$2.20. Fifty-four of these 74 items are articles which are classified as first class in western classification upon which the class rates to the Pacific coast are \$3 from the Missouri River and \$3.70 from New York. The commodity rate applied to the coast is from 54 to 73 per cent of the class rate on the same articles. Fourteen of the 74 items are classified as second class and the class rates to the coast are \$2.60 from the Missouri River and \$3.20 from New York. The commodity rates on these articles to the coast are, therefore, from 62½ to 84 per cent of the class rates.

There are 90 items in the schedule C list now moving on commodity rates of from \$1.50 to \$2. Two of these are classified as first class, 33 as second class, 29 as third class, and 26 as fourth class. The commodity rates are approximately 80 per cent of the class rates from the Missouri River to the Pacific coast. There are 19 second-class items in this schedule C taking a rate of \$1.75 to the Pacific coast. Where a rate can be secured which is higher than \$2.50 it would appear unlikely that such rates have been affected in any material degree by water competition and such articles should move either on class rates or on rates which accord with the long-and-short-haul rule. It is our opinion that relief should not be afforded on any article taking a commodity rate higher than \$2.50 even under normal conditions or such conditions as existed during the year following the opening of the Panama Canal.

We are of the opinion that the rates upon the other less-than-carload items in these lists are unreasonably low and have been depressed by reason of water competition. The rates on these articles should for the present be realigned to accord with the long-and-short-haul rule. If the carriers desire to continue commodity rates on these articles to the Pacific coast which are less than the class rates applicable thereto, the rates to intermediate points on the same articles should be constructed in such manner that they bear to the class rates to the intermediate points the same proportion as the readjusted commodity rates to the Pacific coast bear to the class rates to the coast. That is to say, if the commodity rate on any article from the Missouri River to the Pacific coast is readjusted and made, for example, 80 per cent of the class rate from the Missouri River to the Pacific coast, commodity rates should also be established from the Missouri River to intermediate points which are approximately 80 per cent of the class rates on the same articles from the Missouri River to these points.

EASTBOUND COMMODITY RATES

By Fourth Section Applications 9813, 10110, 10126, 10155, 10186, and 10189 the Southern Pacific Company-Atlantic Steamship lines and the Atchison, Topeka & Santa Fe in connection with the Mallory Steamship Company, sought and obtained authority from the commission to reduce the rates on barley, beans, canned goods, asphaltum, wine, and dried fruits from California ports, via rail-and-water lines through Galveston, Tex., to Atlantic seaboard ports, while maintaining higher rates from, to, and between intermediate points. These applications were made early in the year 1915, when the boat lines operating via the Panama Canal were actively engaged in building up business via their routes and were in fact transporting a very large percentage of the tonnage of these commodities at rates from 10 to 40 cents lower than the rates which the rail-and-water lines then sought to establish. The order issued in Reopening Fourth Section Applications, rescinded, effective September 1, 1916, the fourth section orders issued responsive to the fourth section applications above named. As before stated, the schedules filed with the commission effective September 1, naming increased rates on these commodities, were suspended until December 30, 1916, and subsequently canceled. The schedules which became effective March 1, 1917, had the

*Here follows a list of about 110 commodities.

effect of increasing the rates on these commodities by 10 cents per 100 pounds. Although it is clearly apparent that there is no necessity on account of existing competition by water for the maintenance of lower rates from the ports on these commodities than the rates from and to intermediate points, the carriers seek authority to continue these rates that they may be prepared for the water competition when it returns. Dealers in these commodities, both on the Pacific coast and in the eastern territory, support the application of the carriers. There was very little offered in evidence by carriers or interveners respecting the level of rates which might reasonably be applied on these commodities. We can see now no justification for the continued maintenance of lower rates on any of these commodities from the Pacific ports to the Atlantic seaboard than are applied from, to, or between intermediate points.

We have considered carefully all of the facts urged by the carriers in support of their applications for authority to continue lower rates to the coast than to intermediate points, the statements made by representatives of shippers and receivers of freight, at the coast cities in the eastern shipping territory, and in the intermountain section. We have stated that the rates, both eastbound and westbound, should be revised at this time in such manner as to bring them into accord with the long-and-short-haul rule. When the water competition will return in force and in controlling amount between the two coasts is uncertain. We are of opinion that the carload rates on all of the commodities in schedules B and C shown in the present transcontinental tariffs, with the exception of those we have above enumerated by item number and caption, have been affected by water competition to such extent as to justify some fourth section relief under normal conditions. We are of opinion that the less-than-carload commodity rates which are less than \$2.50 per 100 lb. have been brought about as the effect of water competition and that some fourth section relief is justified on these commodities under normal conditions. When the water competition again becomes sufficiently controlling in the judgment of the carriers to necessitate the reduction of the rates to the coast cities to a lower level than can reasonably be applied at intermediate points, the carriers may bring the matter to our attention for such relief as the circumstances may justify. Competent proof must be submitted in connection with such applications of a fairly regular water service between the two coasts; the adaptability of the traffic to water competition; principal points of origin of the traffic; range of rates afforded by the water lines; principal points of consumption; and the ports upon the two seaboard at which the water carriers receive and deliver freight.

We are not unmindful of the claims of the carriers concerning the disadvantage under which they labor in being unable to reduce their rates promptly when necessitated by the competition of the water carriers. One of the primary purposes of the act to regulate commerce was to preserve competition between carriers. Competition involves a striving between or among two or more persons or organizations for the same object. There can exist no even-handed striving between two persons when one is bound and the other is free, and the maximum of real and effective competition can not exist between these boat lines and rail lines when one side is free promptly to make any rate it desires, while the other is so restricted by statutory requirement as to be unable to take the necessary steps for the prompt protection of its business. We are, however, also mindful that one of the primary purposes of building the Panama Canal was to assist in the development and maintenance of an active, efficient, and profitable water service between the two coasts. It is not our purpose to put upon these carriers any undue hardship in their attempt to meet such competition as the future holds for them. Such fourth section applications as they may find it necessary to make with reference to this traffic will be disposed of with such celerity as the circumstances may permit.

Neither is it our purpose to permit the maintenance of rates to or from Pacific coast points at a level that will render this service unattractive to the boat lines.

An order will be entered denying the authority sought by these applications to continue lower rates on commodities to more distant than to intermediate points, and rescinding all previous orders entered in regard thereto.

DISSENTING OPINION

Commissioner Harlan, in a dissenting opinion, said in part; that the intermountain territory in the past has labored under unnecessary rate disadvantages sufficiently appears from the commission's reports in various proceedings in which those rates were under consideration; and in so far as the findings of the majority in this proceeding require the correction of any unlawful inequalities against that territory in the present rate adjustments of the defendant carriers, I fully concur.

The readjustment now required by the majority is to continue, as their report indicates, only during the remainder of the war and until commerce again moves through the canal. If the resumption of the water traffic may reasonably be anticipated in the near future, the disruption, coming nearly three years after the war commenced, of the present relations between the Pacific coast and the intermountain territory would seem to be highly unnecessary and undesirable. But even if the war conditions should continue and the resumption of commerce through the canal should not take place for two or three years longer, that would be but a moment of time compared with the period during which the present rate relationship has existed, and compared with the indefinite future during which, so far as we may now see, that general relationship must continue, because of the fixed and lasting character of the controlling natural conditions that we have been considering. The temporary interruption of the present relationship either for a few months or for several years, if the war conditions continue so long, can contribute nothing of substantial or continuing value to the prosperity of the intermountain territory. Its only effect will be to put the two territories temporarily out of line with what must necessarily be the course of their future relationship. During the period of the interruption the merchants of the intermountain cities may have a larger business than they otherwise would, while the merchants of the coast cities may have to pay materially higher rates on their traffic. These advantages, however, will be but temporary; they will not be constructively helpful to the intermountain territory or be of real aid in its future upbuilding; and in the meanwhile the merchants of both the competing territories will be left in perturbation and doubt respecting the contracts and commercial engagements that they may safely make while the purely provisional rate adjustment required under the majority report is in effect.

In my judgment rates and trade relations, based on conditions so permanent and enduring as the coast to coast water route through the Panama Canal, ought to be stable and secure against needless fluctuations, and I see no warrant either in the law or upon the record for now throwing both into sudden and violent confusion because of purely abnormal and temporary conditions.

RELIEVING CAR SHORTAGE IN SPAIN.—Hereafter the Spanish consignee will take his freight within five days or else his goods will be sold at auction. The Spanish government has issued more stringent orders regulating the transportation of merchandise and the better utilization of rolling stock. As platforms and freight depots are overcharged with merchandise, the work of unloading is frequently interrupted, and in order to relieve this congestion the railroad companies have been authorized to sell at auction all the merchandise not withdrawn by the consignees within five days from the date of its arrival at destination.

ELECTRIC INTERLOCKING INSTALLED AT A BUSY CROSSING

The new electric interlocking plant at Corwith (Chicago), Ill., about six miles from the Chicago union station, will eliminate the necessity for stopping about 45 through passenger trains each day on the main line of the Chicago & Alton and the Atchison, Topeka & Santa Fe, and in addition will greatly facilitate the numerous through freight and local switching movements at this point. The plant is located at the crossing of the Illinois Northern with the parallel lines of the Santa Fe and the Alton, and includes, in addition to the double crossing, junctions and wyes on both tracks. This crossing is in the industrial district of the city's southwest side, the Illinois & Michican canal being situated between the Santa Fe and the Alton, and the drainage canal just north of the Santa Fe. There are large terminal and classification yards in all directions and switching moves between these yards are being made over the crossing almost continuously during certain portions of the day. Four switching engines are always in service within the limits of the interlocking and at times 19 trains or engines have been counted waiting to make a move through the plant.

On the Chicago & Alton, the Glenn yard, where all interchange freight from foreign roads is received, is located about three miles west of Corwith, and at Brighton Park, about one-half mile east of the new plant, there is a large engine terminal and yard. The Santa Fe's Corwith yard, its principal freight terminal in the Chicago district, lies immediately south of the double crossing and the Thirty-third street yard of the Illinois Northern is immediately north. While at the crossing the Illinois Northern has only a

& Alton, the Atchison, Topeka & Santa Fe, and the Chicago & Western Indiana.

This double crossing was formerly protected by a mechanical interlocking plant, which was taken out of service in 1910. Since that time the Chicago & Alton has maintained one switch tender at this point, the remainder of the switch-throwing being done by train crews. The decision to build the new plant was made on the double ground of providing desirable protection at this busy point and facilitating train movements.

The tower, as shown in the illustration, is a two-story brick structure on concrete foundation with slate roof. A small one-story addition on one end houses the storage batteries. The ground floor of the main portion of the tower is divided into two rooms, one for the hot water heater and maintainer's quarters, and the other for the relay cabi-

Signal Tower, Corwith, Illinois

Illinois Northern and the Santa Fe Wye

Chicago & Alton Three-Arm Signal

single track and the Santa Fe and Alton each two tracks, the Santa Fe expands to three tracks just east of the plant and to five tracks just west, while the Alton has four tracks on each side of the crossing. The tower, which adjoins the Alton main line, is placed back from the nearest track a sufficient distance to allow the addition of a third track if this becomes necessary in the future. The plant is very much spread out on account of including all of the junctions, there being a distance of about 3,000 ft. from the tower to a five-track bridge on the Santa Fe west of the crossing, about $1\frac{1}{4}$ miles to two outlying switch locks on the Santa Fe to the west and about $1\frac{1}{2}$ miles to the Santa Fe distant signal on the west, which is also the home signal for the interlocking plant at Nerska, used jointly by the Chicago

net and power unit. The second floor of the tower is occupied entirely by the operator's room.

The normal supply of power is obtained at 220 volts a.c. from an adjacent commercial line which supplies a motor-generator set, used normally for charging the storage batteries, and a small transformer with 75-volt and 10-volt taps for locks and lever lights. The emergency power supply is furnished by a Fairbanks-Morse d.c. dynamo, direct-connected to a gas engine. The battery installation consists of 57 cells of 200-a.h. capacity Electric Storage Battery, chloride accumulator type, for switch and derail machines, and high signals, and two sets of five each of 200-a.h. battery of the same type for lever lights, locks and repeating relays. This battery is supported on a wooden rack which is mortised and pinned together without the use of nails.

The interlocking machine is of the G.R.S. unit-lever, model 2 type with 78 working levers in a 104-lever frame. The additional room is provided for additions to the plant that would be necessary if a third track were to be added on the Chicago & Alton. The machine has lever lights, which are lighted when a track circuit is occupied.

A marked difference is noticeable between the signaling standards on the two principal roads in this plant. The Santa Fe uses a one-arm signal with 10 to 12 possible routes, while the Chicago & Alton has three-arm signals for three routes. No distant signals are provided on the Illinois Northern as only switching movements are made over that line. As the normal-danger system is used on the Chicago & Alton west of this plant, a special control circuit was necessary for the first automatic signal to the west. This circuit operates as follows: When a westbound train enters the annunciator circuit, the control of the first two-position automatic signal west of Corwith is cleared by the contact

on the back point of the annunciator, and holds clear on the back points of the track relays between the home signal and the advance signal after the train passes the home signal.

All signals are electrically lighted and a pilot light located over the interlocking machine in the tower is connected in each lighting circuit so that if any one light fails, an immediate indication will be provided. This system has been in service more than a year at another point on the Chicago & Alton, and has given good satisfaction.

Approach, route and sectional locking are provided on both the Santa Fe and the Alton, with annunciators to warn the towerman of the approach of trains. There are no annunciators or track circuit locking on the Illinois Northern. G. R. S. push releases are used for track circuits, and screw releases for signals and switch locks. The operation of the electric switch lock requires the co-operation of the operators at Corwith and Nerska.

All track circuits are d.c. supplied with energy from BSCO batteries located in battery chutes. The battery for operating distant signals is of the same type, located in wells. All relays are of G.R.S. manufacture. Switch machines are G.R.S. model 2, and all signals are G.R.S. 2A upper-quadrant. Okonite insulated wire was used throughout.

This plant was installed by the General Railway Signal Company, under contract with the Chicago & Alton, and will be operated by the Alton. We are indebted for courtesies in securing the above information to G. W. Hulsizer, superintendent of telegraph and signal engineer, and S. U. Rhymer, general signal inspector of the Alton.

LESSONS FROM THE FREIGHT CONGESTION

By J. E. Campbell

Freight Agent, Pittsburgh & Lake Erie, Glassport, Pa.

The congestion which existed throughout the eastern states during the first three months of the present year, which continues to exist in some quarters and which undoubtedly will recur from time to time for some months to come, can only be solved by the exercise of common sense, good judgment and determination. It is not wholly a question of additional facilities, more cars, more engines and greater terminals. It is rather a question of utilizing present facilities to their full capacity and securing the greatest possible results from the existing transportation plant.

During the past winter many traffic men explained the congestion which existed as far west as the Mississippi and south to the Ohio river and Virginia gateways by the rush of export business and the unprecedented total volume of business the railroads were handling. This was true only in part. The export problem had been solved, in large measure, early in 1916 by the permit system. Furthermore the volume of business on some of the worst congested roads was not as heavy as was handled one year previous when there was no congestion. One of the worst things with which the railroads had to contend was a demoralized labor situation. The injection of many new and inexperienced men into all departments and the general restlessness which has prevailed among all classes of labor everywhere was the main factor in the breaking down of many roads. Throughout 1916 the railroads lost many of their old and best men, for industrial concerns did not hesitate to bid a few dollars per month or a few cents per day more than the railroads were paying and thus take many of their employees.

Last winter furnished a good object lesson of what can be done when the effort is made. After dragging along for weeks under demoralized conditions different lines suddenly made the effort and found that order could be restored much quicker than they imagined. The New Haven did some

good work in this direction early in the winter and conditions on that line were improved in an incredibly short time.

The same means used to relieve congestions will, in most cases, prevent them. The first step in applying the remedy is a general stock taking. A careful survey should be made of conditions as they exist upon the road, the situation at different points being studied and analyzed carefully, the relations with connections examined and peculiar conditions at different points that complicate operations ascertained and overcome. The proper officers should at all times have a full and complete record of every load on the line, showing the destinations for local roads and the route for loads going to connections. There should also be full and complete reports showing the number and kind of all empties. These reports should be as simple as possible so as not to be burdensome in making or in use.

With a thorough diagnosis of the situation all over the road it is possible to apply the best remedy. Congestions on most lines are, as a rule, a result of terminal conditions. Such conditions are usually accompanied by a demoralization of the operating forces in the yard. The first step is to restore some measure of order at such places and to get the work organized again with some system. Tracks must be checked carefully and switched properly; all loads for team tracks and industries must be placed and delivered promptly; empty cars should be moved out of congested districts promptly, even though it may be at a sacrifice of new business sometimes, so that it will not be necessary to handle them repeatedly in switching loaded cars; billing should be secured for all "No Bill Cars" for these delinquents are one of the most troublesome and expensive problems in any yard or at any terminal or connection. "Hold" cars should be segregated so as not to entail undue handling with live loads. Outbound loads should be properly and carefully classified and moved at the first possible moment. Classification tracks should be maintained inviolate and not used for storing unswitched trains and "hold" cars. Team, industrial, "hold" and storage tracks should be switched regularly and according to a fixed schedule. There must be co-operation between day and night yard forces in order that any advantage gained during the day may not be lost at night. Shop cars should be placed on shop tracks or moved to shops regularly and without delay.

When order and system have once been restored in terminals and yards a long step has been taken towards improving conditions over the entire line. There are but few instances in which order and system cannot be brought about in a very short time when the necessary effort is made. It is possible to congest a yard when it does not contain more than half the cars its capacity calls for, or to bring business to a standstill when only a small percentage of the maximum traffic that might be taken care of is being handled through a terminal. The details of this work can best be studied by the man on the ground. Yardmasters, trainmasters and other operating officials should spend much time on the scene of action. The details of correspondence and office work should be left, in a large measure, in the hands of their clerks and subordinates. Too many officers are filling the places of clerks at their desks. The best results will be attained when the responsibility is passed down the line to the lowest ranks and each officer holds his subordinates to strict account for results. Unfortunately the reverse of this has too often been true in railroad organizations and each employee has been passing the responsibility for bad conditions up to his superior instead of assuming his own share. When each employee begins to feel that he has a responsibility there can be no question but what greater results will be secured.

Diplomacy can be made an important factor in improving conditions on many roads. There is opportunity for its use between the road and the public; between the various roads

and their connections, especially at junction points; between the several departments and between the officers and their subordinates. There never has been a time when the public has been so ready to co-operate with the railroads; particularly is this true with the more important shippers. Consignees are very ready to speed up their unloading and release loaded cars promptly when placed upon their sidings. Agents and yardmasters will have very little trouble in this direction if they handle their patrons judiciously. The shipping public is fully conscious of the fact that any effort the railroads make to better conditions, to increase the car supply, or give more prompt service is to the benefit of all patrons of the roads. Shippers are also aware that the efforts the railroads may make to take care of the business of the country will be backed up by the Interstate Commerce Commission and the Federal Government. A willingness has been found on the part of shippers to load cars heavier, observe car service rules relative to loading foreign cars, unload and release cars promptly when placed in their plants, furnish advance information as to their shipments to enable the railroads to provide proper equipment and load their cars so as to enable the roads to observe regular schedules. The few shippers who have not co-operated along these lines are fit subjects for diplomacy and if they are approached in the right manner in most cases can be lined up to do their part.

There is special need of co-operation and diplomacy between connections at junction points. There can be no greater factor in the successful operation of the various roads than a free interchange at junction points. Here is where every yardmaster, agent, clerk, train crew, car inspector, as well as officer, can do much to help. There should be a policy of give and take. Each road should meet its connections half way and should accept a car for every one it can deliver. In fact, oftentimes it would be justified in accepting two cars for each one delivered provided such action would help to clear up the general situation. The cars coming to such a road must eventually be accepted and moved to destination, and the sooner this is done the sooner conditions as a whole will mend and the better will the public be served. At junction points even the car inspector can do much to improve conditions. Co-operation between inspectors of connecting lines will often work wonders. They can unite in making light repairs, in issuing defect cards for cars not carrying penalty defects, and in keeping many cars out of the shops and off repair tracks, thus reducing congestion. Yardmasters and their crews should learn the lesson that in helping their connections they are also helping themselves.

The embargo has played an important part in the operation of most of the roads during the past year. It is an instrumentality of great good at times, but one which should not be abused. It is to be feared that the embargo has been used many times when what was needed was an effort and determination to move business and overcome trying obstacles. The embargo should not be used to stop the regular and natural flow of business. It should not be used to interfere with the movement of cars and shipments which the consignee is waiting to receive and accept at once on their arrival at destination. Under such circumstances what is needed is extra effort to meet the unusual conditions and get the business through to destination.

As stated above the conditions that have existed on our railroads were largely the result of a demoralized labor situation. There long has been the need of some plan on the part of the American railroads to bring out the best efforts of all employees. During the past year many industrial concerns have adopted the bonus system to increase production and stimulate their employees to their full capabilities. Some such system is needed on our railroads to reach every de-

partment. A system of this sort does not necessarily mean the payment of large sums of money to attain results, but rather the recognition and encouragement of faithful employees. More sure prospects of promotion, the consciousness that their efforts will in some manner come to the notice of their superior officers, special vacations sometimes, in fact, a multitude of things might be done in this direction that would be as effectual as the payment of cash bonuses have been in the industries.

RAILROAD TRAINMEN AS MISSIONARIES OF PUBLIC OPINION

In a circular recently issued by T. J. Foley, general manager of the Illinois Central, trainmen and enginemen are urged to use such opportunities as present themselves to set forth the railroad side of the transportation question. The extensive possibilities of enlisting these employees as proponents of railway interests in their intercourse with the public, led Mr. Foley to relate the following incident as an example of what can be done:

"One of our conductors discussed the railway situation with a prominent farmer. The conductor knew all about the Illinois Central property and management. He impressed the farmer, who repeated the substance of what the conductor had said to a local merchant. Our superintendent called on the merchant in the usual course of business and found him in the midst of a heated conversation with a politician. The merchant was trying to impress upon the politician that a broad policy toward the railroads benefited everybody, and that a narrow policy injured everybody. The politician left the merchant and the superintendent together. The merchant explained that he had gotten his inspiration and his facts from the farmer. The alert superintendent made it a point to get acquainted with the farmer and learned that he had formerly been very antagonistic to the railroads and had been changed completely by the interview which he had had with the conductor."

The experience described convinced Mr. Foley of the advantages of inaugurating a series of educational circulars to keep trainmen posted on railway affairs, and especially those of his own company. He said:

"The thought occurred to me that perhaps the management was to blame for not giving trainmen and enginemen something to talk about. We would like for them to do a good deal of talking, for we recognize the fact that they are both able and willing to do it. Therefore, I have concluded to give them little bits of information about our company from time to time, and I am going to ask that each trainman and each engineman consider that he has been constituted a committee of one to talk about the Illinois Central to the public. If each should talk with only two or three persons each month about the needs of the railroads, it would do a great deal of good."

In the first circular, introducing the plan, Mr. Foley proceeded to put his scheme into effect by presenting in concise form some essential facts concerning the Illinois Central. Among the points covered are the mileage and location of the line, its capital stock, the number of stockholders, the amount of equipment owned, the number of trains operated, the number of employees and the total of their wages, the company's consumption of coal and the cost of fuel, recent purchases of cars and locomotives and increases in prices in the past two years, operating revenues and expenses for the past six months as well as taxes, interest and dividend requirements; and the need of the company for larger terminals and more equipment to take care of constantly increasing business.

Car Conservation Meeting at Chicago

Instructive Discussion of Details of the Far-Reaching Freight Car Problems Now Pressing for Solution

A CAR conservation luncheon was held at the Hotel La Salle, Chicago, on July 17, at which representatives of the railroads and the shippers presented their points of view on available means of increasing transportation efficiency to the end that the present crisis may be passed without serious injury to the country. F. B. Montgomery, manager of the traffic department of the International Harvester Company, Chicago, acted as toastmaster.

BOTH SIDES OF THE CAR SHORTAGE PROBLEM

H. C. Barlow, traffic director of the Chicago Association of Commerce and advisor to the new Division on Car Service of the Interstate Commerce Commission, spoke on "Both Sides of the Car Shortage Problem." He appealed to railroad men and shippers alike to forget their former differences and join in an earnest co-operative effort to pull the country through its most serious transportation crisis. He said: "It has been said the transportation systems have broken down. That's not true as I see it now. We have flooded them, that's all."

He addressed his remarks first to the carriers and then to the shippers. To the former he advised against further slowing up of freight schedules. He said, in part:

"I have heard it estimated that the lengthening of the schedules that took place about 1911 consumes about 5,000 car days. I know and appreciate your argument for heavier trains but I ask, under present conditions, if that is true economy?"

"A great and successful effort is being put forth to persuade the shippers to buy and load heavier. Are you loading and unloading your companies' coal, material and supplies with the same promptness and despatch you properly require at the hands of the shippers? If not, why not?"

"Under M. C. B. rules a surprisingly large number of cars are seemingly put out of service, an unusual length of time awaiting proper parts with which to make repairs, that is, for just the right brake beam, etc. In the present emergency cannot this be avoided by putting on a safe brake beam, thereby getting the car back into service at once?"

"Referring to full capacity car loading and ordering a survey of the shipments of one of the largest lumber concerns in the South discloses the following for the four months ending April 30, 1917. It shipped 7.72 per cent more cars and 23 per cent more lumber; during the month of May it shipped 27 per cent more cars and 53.5 per cent more lumber. Taking the five months ending May 31, 1917, these mills shipped 12 per cent more cars and 30 per cent more lumber. The average loadings exceeded 60,000 lb., in spite of the fact that they have loaded a large number of stock cars, many of which were of the double deck variety. This is certainly a most excellent showing.

"The president of this company, however, writes: 'Strange as it may seem, we have just received an inquiry from a certain large railroad in which it asks our people to quote prices on three or four minimum cars. The sales department has replied that in view of existing conditions it could not quote on minimum cars but the prices attached were for maximum cars.'

"I know this to be true in the matter of other materials for account of the railroads. Many small lots are ordered because the distribution is to two or more supply shops. I respectfully ask the railway gentlemen, 'Why not double load these cars as the shippers are doing in many instances?'"

To the shippers he put the following pointed questions to impress upon them the importance of action at this time:

"Do you want to help win the war for our country? Do you desire to add very greatly to the amount of equipment in the country that you may be sure of having more cars? Do you desire to increase the terminal facilities of the country, thereby avoiding blockades and embargoes? Do you really want to do these things without expense; in fact, save money by doing it?"

It is the duty of shippers desiring these things, Mr. Barlow said, to conform to the following rules:

1. Unload every car at once. Don't wait for the free time.
2. Load every car promptly. Don't wait for, nor use all the free time.
3. Load all cars to their visible or carrying capacity.

Mr. Barlow emphasized the distinct advantages accruing from an adherence to these rules. He said:

"Remember it costs you more to handle two cars at the plant than one. It costs no more to sell 30 or 40 tons than it does 15 or 20 tons. Big loading cuts down expense at the plant and reduces selling cost. Try it, and in a while you will be surprised at the result. Do it now, it is the only way to save a bad situation. Let's not change the minimum in the tariffs, but ignore them in this great emergency."

He described in considerable detail the functions of the Commission on Car Service of the American Railway Association, the new Division on Car Service of the Interstate Commerce Commission, and the various subcommittees of the railroads and the National Industrial Traffic League recently created to assist in regulating the car supply. He urged the utmost co-operation between the carriers and the shippers to the end that the war may be won. In this regard, he said:

"The Interstate Commerce Commission has, figuratively speaking, placed one hand of the shippers and carriers together and in the other hand the traces and said: 'Now pull together and when you don't quite agree, come to us, but don't stop pulling the right way. Remember when you may be tempted to quit, the very safety of our country may be jeopardized.'

"In full realization of the tremendous responsibility resting upon us I urge shippers' and carriers' local committees to meet together often, to discuss every question fairly, and to forget past differences. Let's fight Germany during the war and Germany only. . . . The plan could not be devised better, the working out of it rests largely in your hands for in the very nature of things it could rest in great measure nowhere else. The successful outcome is fraught with tremendous results. Now every man to his task with a will and a cheer."

ADDRESS BY SAMUEL O. DUNN

Samuel O. Dunn, editor of the *Railway Age Gazette*, emphasized particularly that the transportation crisis now confronting the country threatens to become more acute with the increasing movement of troops and military supplies for the government. On June 1, the net shortage of freight cars reported by the American Railway Association was 105,000. Although this was a decrease of 30 per cent under the shortage reported on May 1, it far exceeds the largest previous shortage reported for the same months, which was 8,000 cars in June, 1907.

Although it must be admitted that railroad facilities are inadequate, it is not a fact that the carriers are failing to perform the work which should reasonably be expected from

them. On the contrary, statistics show that the railways are handling more traffic by far than ever before, indicating that the real reason for a car shortage is the tremendously increased business offered them since the inception of the war. In the fiscal year 1916, they hauled 343,000,000,000 ton-miles of freight, an increase of 66,000,000,000 over the previous year, and 42,000,000,000 over any other year on record. The gross freight earnings for the first four months of 1917 were \$853,000,000 as against \$790,000,000 in the same period of 1916, or an increase of eight per cent. As rates have not increased, these figures truly reflect the increase in freight handled. Statistics for freight traffic moved by American railroads in April, 1917, show an increase of 16 per cent over the same month in 1916. This is a remarkable achievement in the face of a net increase of only 46 locomotives and 11,000 freight cars. Factors contributing to the results attained were an increase in the average trainload from 637 tons in April, 1916, to 703 tons in 1917, or 14.5 per cent, and an increase in the average carload from 24 tons to 26.4 tons, or 10 per cent.

In the fall when the heavy burden of military traffic begins to be felt, the problems of railroads and shippers will become even more complex. What has happened abroad is indicative of what will happen here. In England there has been an increase in freight business of 50 per cent since the beginning of the war, and on the French railroads an increase of 100 per cent. Unless superhuman efforts are made by all concerned, considerable freight business will not be moved at all.

At no time previously have shippers shown a greater disposition to co-operate with the railroads for transportation efficiency, and at no time has such a co-operative spirit been so vitally necessary as now. It is highly essential that those who are fitted by long experience in the actual operation of our carriers be permitted to direct the work of solving the pressing problems confronting the railroads. Five men pre-eminent in the transportation world have been selected to control the operation of the nation's railroads as a unit. They represent the best brains and ability in their sphere, in the estimation of railroad men, and will do the work assigned to them as efficiently as is humanly possible, if they are not interfered with by the government.

ADDRESS BY J. F. PORTERFIELD

J. F. Porterfield, general superintendent of transportation of the Illinois Central, also laid considerable stress on the importance of frequent conferences between the shippers and the railroads in the interests of car conservation. He outlined the work already done in this direction by the Illinois Central, which has effected an increase in average car mileage per day from 26 to 44, an increase in the average carload from 25 to 27 tons, and a decrease of bad order cars in two years from 9.6 per cent to 5.1 per cent. He stated that the Railroads' War Board estimated that by heavier loading and quicker repairs the railroads could further increase car efficiency equal to adding 779,000 cars to the available equipment. An additional saving, equal to the present car shortage, can be made, he said, by eliminating the delay incident to holding cars for reconsignment and surrender of bills of lading. In this regard, he said:

"After years of effort the railroads have finally agreed on filing tariffs covering uniform reconsigning rules and charges, and, while these rules will not prohibit reconsigning, they make a reconsigning charge of \$5 where the movement of the car is interrupted, and a nominal charge of \$2 where the car is reconsigned without being delayed or diverted from the current of traffic. It is thought the \$3 difference in the charge will greatly reduce reconsigning in hold-yards and increase the placing of reconsigning instructions with the railroads sufficiently in advance of the arrival of cars to effect the reconsignment without diverting cars from the current of traffic

to hold tracks. It is probable that the National Industrial Traffic League and the Committee on National Defense of the American Railway Association can prevail upon the Interstate Commerce Commission to permit these reconsigning tariffs, now under suspension, to go into effect at once.

"The practice of billing freight to 'shipper's order, notify' now and always a source of serious loss in car efficiency, is causing additional car delay owing to the present banking system requiring the handling of bills of lading through several banks, resulting in a large number of cars being delayed awaiting surrender of bills of lading; although, of course, the most serious delay is caused by diverting cars from the current of traffic to hold-yards while the party named in the billing is receiving notice, obtaining and surrendering bill of lading. An order should be issued by the commissions having authority, to prohibit this practice during the present car shortage.

"To increase cars available for hauling coal authority should be given by the Interstate Commerce Commission and the Illinois Public Utilities Commission, as recommended by the Illinois State Council of Defense, to permit the railroads, during the present emergency, to reduce the free time for unloading coal from 48 to 24 hours."

ADDRESSES BY MESSRS. FORSYTHE AND BODE

D. I. Forsythe, vice-chairman of the Chicago committee of the Chicago Car Service, outlined the purpose of his committee and others organized in other large traffic centers of the country, and invited the co-operation of shippers in working out the problem of increasing the available supply of cars.

W. S. Bode, vice-president of Reid, Murdock & Co., Chicago, told how at the last annual meeting of the National Wholesale Grocers' Association a War Service Railroad committee had been appointed, with him as chairman, to investigate means of assisting the carriers in conserving cars. Among the recommendations the committee had made are the revision of prices of certain lines of goods now bought and sold in so-called carload units, greatly below the maximum lading, to conform more nearly with car capacity; and more complete co-operation between the merchant and the railroad especially in the giving of prompt information concerning unusual delays, particularly to carload shipments, either in transit or in placing after arrival, or in moving from the shipping track after loading. Some members of the association have submitted the following suggestions to the committee: (1) The elimination of the present delay to sight draft shipments by giving a bond of indemnity to the railroads in advance, thereby insuring the immediate delivery of the car on arrival. (2) Allowance of a slight difference in rates between a maximum loaded car and a minimum loaded car. (Such a reduction is now allowed on all maximum loads of canned goods and dried fruit shipped from Pacific coast points.) (3) The abandonment of all classifications for food products and the adoption of one or at the most two—one classification for raw materials and the other for manufactured products. This would result in an enormous saving to the railroads in the cost of clerk hire, checkers, billers, abstractors and revisors. All bills of lading would have but one entry, viz., food products, giving the number of cases or bags, etc., and the weight.

1,500 MILES VIA TRUCK.—A large tire manufacturer has recently inaugurated the policy of shipping its product all the way from Akron, O., to Boston, Mass., by motor truck. The trucks take about four days to make the trip of 1,500 miles, and are fitted with a sleeping compartment to be used by the two drivers who take turns at the wheel. On the return trip the trucks are loaded with cotton fabrics from mills in Connecticut. The big trucks carry a sign reading "Akron-Boston Express."—*Wall Street Journal*.

THE MECHANICS OF THE CHILLED IRON WHEEL*

Chilled iron possesses inherent qualities which are not found in other metals and its principal characteristics are its ability to carry any load that can be supported by the steel rail without crushing or flowing.

The mechanics of the chilled wheel have never been investigated except in a very superficial way. The fundamental properties of chilled iron, such as specific gravity, modulus of elasticity for varying tensile strengths, action under repeated stresses, relation of operating conditions to temperature stresses, etc., are not established. If the properties of chilled iron were fully understood and properly used in the wheel, a large return on the meager expenditure for investigation would flow in upon the manufacturers in the way of increased profits and to the railroads in the way of reduced costs.

The loads carried by the wheels and rails have been constantly increasing and the question now arises—are we nearing the limit for wheel loads? If so, what is the determining factor? What margin still remains for further increases, in bearing power of the metal of wheel and rail, in flange strength, in web and hub. These are the questions we propose to answer by considering each part of the wheel separately.

Bearing Power.—The bearing power of iron or steel is largely controlled by the carbon content and naturally since the tread of the cast iron wheel contains 3½ per cent of carbon it has a much greater bearing power than the rail which contains less than one per cent of carbon. A 33-in. chilled iron wheel will not perceptibly flatten under a load of 250,000 lb., which is 8 or 10 times the present maximum wheel load. Chilled iron wheels are in common use carrying 100,000 lb. or more under large cranes, unloading bridges, transfer tables, hydraulic locks, etc. To carry these loads wide special flat-top rails are necessary.

The ordinary railroad rail with a 12-in. top radius will develop a permanent set when the indentation of the wheel into the rail amounts to .007 in. If we assume that the maximum load carried in rapidly moving service should not cause when at rest an indentation greater than one-half this amount, the limiting loads from the rail standpoint are readily calculated by the formula $L = 1,500,000 d \sqrt{D}$ in which L equals load, d equals indentation, into the rail and D equals diameter of the wheels. In this formula the pressure per square inch over the area of contact between wheel and rail is taken at 100,000 lb. per sq. inch. The limiting loads for various diameters of wheels are:

42 in. wheels.....	34,000 lb.	33 in. wheels.....	30,200 lb.
36 in. wheels.....	31,500 lb.	30 in. wheels.....	28,800 lb.

As far as the bearing power of chilled iron is concerned there is no indication of nearing the wheel load limit.

The Flange.—The pressure which the flange must resist in guiding the truck around curves is equal to ¾ of the wheel load, provided the track is perfect and the cars are in good condition. The pressure is not influenced by the degree of curve, velocity, centrifugal force or obliquity of traction, but an allowance must be made for impacts originating from irregularities in track and locked side bearings and center plates, which added to the curve pressure will make the total maximum lateral pressure against the flange 1½ times the wheel load, or 18,000 lb. for the 30-ton car and 46,500 lb. for the 85-ton car.

It is unreasonable to suppose that a flange designed for an 18,000 lb. pressure will have the same factor of safety for 46,500 lb. pressure, in fact the thickness of flange was de-

veloped when flange pressure did not exceed 8,000 lb. It is just as necessary to increase the flange section as to increase all other sections of the wheel, when increased duty is imposed. Notwithstanding the fact that the Master Car Builders' Association in its latest report stated that no increased flange width was necessary, this matter is by no means settled as far as other associations are concerned, and a movement is again started to determine whether the hundreds of thousands of flanges that are now in use (which are wider than the present M. C. B. standard flange) are not entirely in harmony with present track standards.

When this question is answered, we will have an opportunity to present to the Master Car Builders' Association a flange with a factor of safety proportional to the load carried, which is not a difficult proposition and which from an engineering standpoint is demanded.

Stresses Within the Plate or Web.—The University of Illinois has undertaken a thorough analysis of the properties of chilled iron and of the stresses within the wheel originating from all conditions that can arise in service as far as they can be duplicated in the laboratory. These items include specific gravity, co-efficient of expansion by heat, modulus of elasticity, tensile and compressive strengths, stresses in the wheel originating from pressing on the axle, from vertical load, from side pressure on the flange, and from difference in temperature between the tread and the plate. Tests are also to be made to discover the probable difference in temperature between the tread and the plate for continuous application of various brake shoe pressures at various velocities. An indication of the magnitude of these stresses already has been determined as follows:

From pressing on an axle having a 7-in. wheel fit at 60-tons' pressure, 18,000 lb. compression per square inch is developed in the single plate; the greatest tensile stress is in the hub. If the machine work is fairly well done these stresses are symmetrical, but if the wheel is irregularly machined, the stresses will be lunched and necessarily greater than normal, being at times sufficient to burst the hub. Under a vertical load of 200,000 lb. the maximum compressive stress occurs on the radial line between the rail and the hub amounting to about 18,000 lb. in the 725 lb. M. C. B. wheel; the tensile stresses in the tangential direction are about 12,000 lb. These stresses alternate at each revolution of the wheel. The maximum stresses are in the front plate. In the back plate the load stresses are practically nil.

The stresses from vertical load within the limits of railway practice are practically negligible.

The greatest stresses, and therefore the most important are the temperature stresses; for example, a 625 lb. wheel was placed in a brake shoe testing machine and operated at various velocities under a continuous shoe pressure of 1,500 lb.; this corresponds to the retardation required for a 50-ton car on a 3 per cent grade when operated at 5 m. p. h. and on a 2 per cent grade when operated at 50 m. p. h. Thermo-couples were placed ½ in. under the surface of the tread, under the rim, at the plate intersection and in the hub. These couples were connected by brushes to a collector ring insulated from the axle so that temperatures could be taken from any part of the wheel at any time without stopping the machine. After running the equivalent of 25 miles, the maximum stresses developed near the intersection of plates were found to be:

5 miles per hour.....	10,000 lb. per sq. in.
10 miles per hour.....	12,000 lb. per sq. in.
20 miles per hour.....	15,000 lb. per sq. in.
30 miles per hour.....	18,000 lb. per sq. in.
40 miles per hour.....	21,000 lb. per sq. in.
50 miles per hour.....	24,000 lb. per sq. in.

Since the above is a greater retardation than is required for controlling 30-ton cars it is evident that if the shoe pressure could be made uniform on all wheels of the train there would be no over-heating of wheels but there are so many

*Abstract of a joint address delivered before the Railway Club of Pittsburgh by George W. Lyndon, president, and F. K. Vial, consulting engineer, representing the Association of Manufacturers of Chilled Iron Wheels.

opportunities for irregularities in service that at least 200 per cent above the theoretical retardation required must be taken into consideration when designing wheels. The test also indicates the great benefit of thermal or cooling stations. Making standards for the car wheel without reference to fundamental principles is absolutely unjustifiable.

We may say frankly that the work which has been done for the past eight years by our association, in conjunction with committees and other associations with which we have had to deal, has not yielded us material results; nevertheless we have gone along in our work, firmly believing that we were on the right track and that sooner or later our recommendations would be endorsed.

RELOCATION OF FREIGHT EQUIPMENT

Reports to the Railroads' War Board from the Commission on Car Service show that orders have been given since May 1 to 36 separate railroads to move immediately 68,814 freight cars to 54 other railroads and that, of the total, 46,682 cars have actually been received by the roads for whose benefit this arbitrary movement was ordered, while 51,795 cars have already been delivered by the initial roads to intermediate lines in the direction of ultimate destination. This has been done by the Car Service Commission under the authority given it in an order of the War Board on April 26 to relocate freight equipment. In the first general order of the Commission on Car Service on the same date it was stated that the commission would undertake to regulate car supply as the exigencies may require and that roads having on line in excess of 100 per cent of their ownership of equipment, treating each classification separately, must so regulate their car handling as not to exceed the percentage on line as of April 1, 1917, or as may be designated by the Commission on Car Service.

The cars have been moved without load and in the quickest possible time, often in train load lots, from roads on which there has been an accumulation to roads on which there has been a shortage or which have had an especial need of cars for important shipments of materials needed by the government. As the principal movement has been from the east to the south and the west the empty haul has been in the direction in which the empty haul naturally accrues because of the preponderance of loaded movement to the east.

About half of the cars have been ordered to western roads and most of the others to southeastern lines.

In a statement announcing the distribution of these orders, Fairfax Harrison, chairman of the Railroads' War Board, says:

"In ordering empty freight cars to be promptly moved from one railroad to another, regardless of ownership, the Railroads' War Board has adopted a policy new to American railroad usage and hopes thereby to solve the problem of rapidly mobilizing in different sections of the country the freight cars necessary to handle the abnormal government and commercial traffic that war conditions have produced.

"Among the immediate and important results of this redistribution of cars will be the increased facilities for the prompt shipment of lumber to the army cantonment sites and the ship-building yards. Lumber for cantonments is to be supplied from the Carolinas, Florida, Alabama, Mississippi, Louisiana, and Arkansas. Thousands of extra cars have been supplied to the lines operating in these States.

"Mississippi and Alabama will supply the bulk of the lumber for new wooden ships that are being built, and the extra cars ordered there assure the movement of lumber to the Atlantic Coast shipyards.

"The movement of lumber for commercial purposes is likewise being facilitated in Mississippi, Alabama and Tennessee.

"In addition to accelerating the lumber movement, the redistribution of cars is expected to assist materially in the transportation of grain from the Middle West to the East. It has already facilitated the shipping of potatoes and other produce from Texas and the Southeast. It has also provided additional facilities for moving live stock from Texas into the Western pasturage territory."

The following table shows the lines to which cars have been ordered from other railroads by the Commission on Car Service:

	No. cars ordered
Alabama, Tennessee & Northern.....	1,012
Alabama & Vicksburg	750
Atlanta, Birmingham & Atlantic.....	1,200
Atlantic Coast Line	4,300
Central of Georgia	800
Chicago Great Western	1,500
Chicago, St. Paul, Minneapolis & Omaha.....	1,500
Cincinnati, Bluffton & Chicago.....	16
Cincinnati, Indianapolis & Western.....	800
Chicago & Alton	700
Chicago, Findlay & Ft. Wayne.....	100
Chicago & Eastern Illinois.....	895
Chicago, Rock Island & Pacific.....	2,000
Carolina, Clinchfield & Ohio.....	200
Delaware & Hudson	48
Georgia	375
Georgia & Florida	200
Gulf Coast Lines	925
Gulf, Mobile & Northern	650
Georgia, Southern & Florida	250
Gulf & Ship Island.....	870
Illinois Central	5,777
International Great Northern.....	159
Kansas City Southern.....	300
Kansas City, Mexico & Orient	300
Louisiana & Arkansas	400
Louisville & Nashville.....	6,737
Louisiana Ry. & Navigation.....	1,400
Meridian & Memphis	250
Missouri, Kansas & Texas.....	1,200
Minneapolis & St. Louis.....	1,500
Missouri Pacific	4,066
Mississippi Central	550
Mobile & Ohio	5,384
Nashville, Chattanooga & St. Louis.....	2,250
New Orleans Great Northern.....	700
Norfolk Southern	1,909
Richmond, Fredericksburg & Potomac.....	100
San Antonio & Aransas Pass.....	250
San Antonio, Uvalde & Gulf.....	185
Seaboard Air Line	1,550
Southern Railway System	2,197
Sunset Central	2,100
St. Louis San Francisco	2,400
St. Louis Southwestern	5,949
Soo Lines	1,400
Texas Mexican	158
Texas Pacific	500
Toledo, Peoria & Western.....	300
Toledo, St. Louis & Western.....	159
Tremont & Gulf.....	100
Union Pacific	300
Vandalia	200
Wabash	500
	68,814

The roads from which the cars were ordered, and the number ordered from each are as follows:

	No. of cars
Acheson, Topeka & Santa Fe.....	100
Ann Arbor	900
Baltimore & Ohio.....	4,900
Boston & Albany	1,550
Boston & Maine	5,692
Chicago & Alton	1,500
Chicago & Eastern Illinois.....	130
Chicago, Burlington & Quincy.....	400
Chesapeake & Ohio	1,600
Central of New Jersey.....	1,950
Cincinnati, Hamilton & Dayton.....	300
Chicago, Milwaukee & St. Paul.....	200
Cleveland, Cincinnati, Chicago & St. Louis.....	45
Colorado & Southern	300
Delaware, Lackawanna & Western.....	1,023
Denver & Rio Grande	300
Erie	1,550
Illinois Central	2,500
Kansas City Southern	100
Lehigh Valley	2,775
Louisville & Nashville.....	450
Michigan Central	2,400
Missouri Pacific	1,000
Missouri, Kansas & Texas.....	100
Mobile & Ohio	200
New York Central	9,163
New York, Chicago & St. Louis.....	2,948
Norfolk & Western	2,754
New York, New Haven & Hartford.....	1,700
Philadelphia & Reading	2,400
Pennsylvania System	18,709
Seaboard Air Line	275
Southern Railway System	2,320
St. Louis San Francisco	50
St. Louis Southwestern	100
Western Maryland	300

General News Department

The Baltimore & Ohio is equipping its locomotives with electric headlights at the rate of 75 engines a month. All of the road engines, 2,500 of them, are to have these headlights.

At the last session of the Tennessee legislature a law was enacted which provides that drivers of automobiles shall stop within 50 ft. on approaching all railroad crossings unprotected by watchmen or gates and that they shall also look and listen before proceeding.

The freight house of the New York Central and the Cleveland, Cincinnati, Chicago & St. Louis, at Cleveland, Ohio, was destroyed by fire July 22, together with a great quantity of merchandise. The building was 880 ft. long, 90 ft. wide and two stories high.

The Philadelphia & Reading has made a general advance in the pay of telegraphers, said to be \$5 a month.

Following negotiations with members of shop men's unions on its lines, the Chicago & Eastern Illinois recently granted an increase of 7½ cents an hour to skilled machinists and various other increases to other shop men.

The Chicago & Alton recently granted various increases in wages to its shopmen. They include 7½ cents an hour for skilled mechanics, 6 cents an hour for helpers of the same class, 2½ cents an hour for apprentices, and 3½ cents to 6½ cents to car repair men.

The Chicago, St. Paul, Minneapolis & Omaha, as well as other lines in northwestern territory, recently revised the wage schedules of its machinists and blacksmiths, and is now revising the schedules of various other crafts employed in the mechanical and car department shops. These negotiations have resulted in increases to the men employed in these occupations ranging from 1 cent to 7½ cents an hour.

The Rock Island has made an increase of 10 per cent in the pay of all unorganized employees, to be effective from July 16. It is estimated that between 3,000 and 4,000 employees are affected. An increase has been granted also to the shopmen, the main points of which are as follows: 8½ cents to machinists, boilermakers and blacksmiths; 7 cents to carmen; 7 cents to machinists', sheet metal workers' and carmen's helpers; 7½ cents east of the Missouri river, and 7 cents west of the river to boilermakers' and blacksmiths' helpers and helper apprentices; 2½ cents to boilermaker and blacksmith regular apprentices, and to machinist, sheet metal work and carmen apprentices. The minimum hour-rate for sheet metal workers will be raised to 52 cents, by increases of one cent each month. Monthly rated men in the car department will receive an increase of \$15, and piece workers an increase of 15 per cent. The increases are retroactive from June 1. The eight-hour day is granted from September 1, except for those employees in the car department whose duties are regulated by the transportation department.

In the yards of the Bush Terminal, Brooklyn, N. Y., one day last week, a large number of stenographers and other women and girls from the offices of the Terminal gave demonstrations, before visitors from a number of large corporations, of their ability to do outdoor work, such as running locomotives and electric motors, managing derricks and other apparatus, and directing the transfer of freight.

To preserve the pension rights of employees of the Chicago & North Western entering military service, R. H. Ashton, president, has issued instructions requiring the head of each department to advise the secretary of the pension board of the names of employees entering the service, together with their positions and the dates when they leave railroad service. When a former employee is discharged from military service and returns to the railroad the head of his department will be required to advise

the secretary of the pension board promptly of the absentee's name, the date of his re-entering the service, and the position he holds.

The Pennsylvania Railroad has decided to suspend, temporarily, the regulation covering the age limit for employment. The rule heretofore in force prohibited the hiring of new employees, in any branch of the service, above the age of 45 years. Under the new rule, which has been adopted to meet war conditions, persons between the ages of 45 and 70 years may be employed during the war and for a period of six months thereafter. Such employment is not to be considered permanent, and it will not carry with it the privileges of the pension department. Numbers of former employees have already been taken into the service.

The Thirtieth Engineers (Railways), United States Army, has moved to the Atlantic seaboard on its way to France. Two companies started on July 18, and the remainder of the contingent on July 21. All of the nine railway regiments organized under the direction of S. M. Felton, president of the Chicago Great Western, were recently renamed and renumbered, ten having been added to each of the former numbers. For example, the regiment until recently stationed at Chicago and formerly known as the Third Reserve Engineers, is now the Thirtieth Engineers (Railways), United States Army. Before leaving their quarters on the Municipal pier at Chicago, the Thirtieth Engineers (Railways), United States Army, were presented with regimental colors by S. M. Felton, president of the Chicago Great Western, and C. H. Markham, president of the Illinois Central.

The Baltimore & Ohio, looking to the highest fitness for the war, has inaugurated a campaign to improve the sanitary and hygienic condition of its employees. Dr. E. M. Parlett, medical officer of the railroad's welfare bureau, has addressed a communication to employees, urging them to devote particular attention to sanitary conditions in their homes and communities. He says: "The water supply, sewage and garbage disposal, milk inspection, fly and mosquito extermination, overcrowding in the home and like subjects in every community are matters of vital concern. We cannot hope to curtail tuberculosis, malaria, typhoid, pneumonia, intestinal diseases, etc., among our employees unless all communities, and our own shops, properties and equipment are maintained to a high standard of sanitation, coupled with the knowledge and practice of personal hygiene on the part of our employees. . . . Make it your duty to become acquainted with the members of your local and state boards of health; become alive to your opportunities for the protection of your own and your family's health and life."

Don't Be a Slacker

O. C. Castle, superintendent of car service of the Southern Pacific Lines in Texas and Louisiana, recently issued an appeal to officers and employees of his road to conserve the car supply. His circular is entitled "Don't Be a Slacker" and reads in part: "The man who is obligated to bear arms, but who shirks his duty is called a 'slacker.' This term may now appropriately be applied to a man who neglects any act which may increase the efficiency of a freight car. The 'spirit of '76'; the heroism and sacrifice of '61, and the spectacular achievements of '98 will not win the present war. Neither will the car performance of last year and last month meet the crisis that confronts us today. A new goal must be set. All precedents which hamper efficiency must be brushed aside and new methods evolved. Pointed appeals have been made to shippers; national and state commissions have approved increases in demurrage charges, and business associations throughout the country are organizing campaigns for improved handling by the public. These, however, must be supplemented by individual action. It is, therefore, the patriotic duty of every officer and employee to check freight car waste.

Do not regret the fact that circumstances prevent you from serving with armed forces on land or sea. You can render just as valuable service by doing your *individual* duty in conserving freight car energy. By the extent that you perform this duty your patriotism will be gaged. If you fail in this duty, you will be a slacker. *Don't Be a Slacker!*"

Lucky "13"

W. E. Johnston, excursion agent of the Washington-Sunset route of the Southern Pacific, has made 938 trips between San Francisco, Cal., and Washington, D. C., covering a period of 17 years and 8 months. He left on Friday 496 times. Moreover, he made one round trip every 13 days, and 13 round trips every 6 months. The total mileage covered during the above period was 3,404,102 miles. Assuming an average of 20 passengers on each trip, Mr. Johnston has accompanied 18,760 passengers across the continent.

Samuel M. Felton Appointed Director-General of Railways

Samuel M. Felton, president of the Chicago Great Western and heretofore adviser to General Black, chief of engineers of the United States army, has been appointed by the Secretary of War director general of railways, with office at Washington, D. C. According to the order announcing his appointment, Mr. Felton is charged under the chief of engineers with the organization and despatch abroad of all railway forces and the purchase of all railway material, both for initial action and for continuous supplies for operation. Mr. Felton has been in charge of the organization of the railway engineer regiments for service abroad, as previously described in the *Railway Age Gazette*, or more particularly in the Patriotic War Number of June 22, page 1274.

New Laws

The legislature of Connecticut has passed a law authorizing railways to clear the brush off from unimproved lands adjacent to their rights of way within 100 ft. of the track. This right must be exercised under the direction of the State Forest Fire Warden, and, under suitable restrictions, inflammable substances may be burnt on the premises under the supervision of the town fire warden.

The legislature of Idaho has passed a law requiring railroads to destroy weeds on their rights of way in accordance with orders issued by officers of the state or county. Another law in Idaho empowers the Public Utilities Commission, on receipt of a complaint and after hearing, to order gates, flagmen or automatic bells at highway crossings.

Appeal for Better Handling of Foreign Cars

E. E. Betts, superintendent of transportation of the Chicago & North Western, has sent a circular letter to all superintendents of the system, calling attention to the loss in time and money resulting from unnecessary delay in the handling of foreign cars. He said in part:

"Our standing instructions provide that any car on which home routing or disposition is desired must be reported when the car arrives at any station or in any yard under load, in order that billing may be in the possession of the proper employee before the car is empty and ready to move. Notwithstanding these instructions . . . about half the time the cars are held at a station until they are empty and ready to move, and then the disposition or home routing is requested. Where this course is pursued the cars are almost invariably delayed one day, which is equal to 60 cents now, and frequently two days, or \$1.20, to say nothing of the loss of utility of the car, which now, and for some time to come, equals at least five dollars a day.

"In the modern game of baseball every player has got to know what to do with the ball before he gets it. If after the ball is in his possession he has to run over to the captain and find out what to do with it, the game will be lost; and any player who would attempt to play the game in this manner would be immediately relegated to the bush league. The handling of foreign cars is not dissimilar. Every player in the game has got to know what to do with the car when it is ready to move."

Railway Revenues for May

The Interstate Commerce Commission has issued its monthly summary of reports of large roads for May, 1917, covering 230,905 operated miles. Railway operating revenues for the month amounted to \$346,775,079, as compared with \$301,045,712 in May, 1916. Operating expenses increased from \$197,410,491 in May, 1916, to \$238,682,279, and the operating income increased from \$90,931,795 to \$92,079,548. For five months of the year operating revenues show an increase from \$1,396,680,987 to \$1,548,033,610. Expenses increased from \$950,606,609 to \$1,118,191,720. Taxes increased from \$62,568,543 to \$72,332,167, and railway operating income was \$357,258,663, or \$1,547 per mile, as compared with \$383,213,498, or \$1,664 per mile in May, 1916. For the five months both the southern and western districts show an increase in operating income, the decrease being attributable to the eastern roads.

A Freight Conductor's Experience

A careful watch of your train, and a proper attention to hot boxes at the right time, will avoid the renewal of brasses to such an extent that the saving will run up into the thousands of dollars. In my 27 years' experience I have found that nineteen times out of twenty, a hot box can be properly cared for in less time than it takes to set the car out, and by giving box attention at usual stopping places, you will be able to get journal to a bearing again. In addition to saving brasses, you are saving delays to freight, and possibly have kept future shipments from consignor from being routed over some other line. Suppose you set out, fifty miles from your terminal, a 70-ton car of coal, you have lost for your engine 50 times 70, or 3,500 ton miles. Take a system like the Illinois Central and you can readily see what a daily loss of earning power of locomotives may occur from hot boxes.—G. S. Rought, conductor, Illinois Central.

War Supplies Handled Promptly

The War Department has authorized the statement that not a hitch has developed in getting supplies to the five divisions of the National Guard called into federal service on July 15, and that each depot quartermaster who had a division to provide for had everything needed by the men before they left for the southern camps where they are to train. The supplies for each depot were ordered two weeks in advance, and each depot quartermaster was instructed to report failure of any portion of his consignment to arrive. No such reports were received, with the exception of a small shipment which had not been started. For the shorter distances supplies were delivered by auto truck, but the guard of Ohio and West Virginia were supplied from Jeffersonville, Ind.; the Michigan and Wisconsin divisions from Chicago and the division made up of the units of Minnesota, Iowa, North and South Dakota and Nebraska was supplied from Omaha by rail. The date when the troops from the several states shall actually begin to move to the southern camps has been left to the department commanders. The second increment of the National Guard to be called into federal service was mobilized on July 25.

How Alabama Great Southern Won Safety Medal

The June Safety Bulletin of the American Museum of Safety contains an article outlining the safety provisions which won for the Alabama Great Southern the E. H. Harriman memorial gold medal. The record for this road during 1916 showed not one passenger killed, no employees killed in train accidents, only one fatality in other than a train accident, and no fatalities and only two injuries among 2,000 industrial workers employed by the company. The number of adverse marks charged against the Alabama Great Southern based on the number of locomotive miles run, the tons of freight and the number of passengers carried one mile during the year was 39.76, as compared with 112.30, the next best accident record submitted in the competition.

The bulletin says that "the entire line from Chattanooga, Tenn., to Meridian, Miss., 309 miles, is equipped with automatic block signals, furnishing protection both to following and to opposing trains. Interlocking plants are installed at railroad

crossings and junction points with other roads, at the ends of double track and at draw-bridges over the Warrior and Tombigbee rivers. Grade crossings at important places have been eliminated, and other highway crossings at grade are protected by gates, bell signals or by watchmen. Bridges and trestles are equipped with foot walks and safety stations for the protection of employees, who must use them. Telephones have been installed at the ends of tunnels for the protection of men who must pass through on handcars. Curves are being systematically eliminated or reduced, and obstructions to view at highway crossings have been removed. Frequent surprise tests are made by local officers to determine the observance of signal indications and the action taken by employees in train, engine and yard service. Daily inspections of track, bridges and other structures are made by section foremen and track walkers, and less frequent periodical inspections are made by higher officers. Before employment or promotion employees are required to pass exacting physical and mental tests. Standard safety devices have been installed in shops and yards, and on cars and engines. Although safety rules are rigidly enforced, in the past few years the extreme penalty of dismissal for their violation has been unnecessary except in a few cases. Safety committees have been organized among the employees, the personnel of which is changed at frequent intervals so that all of the employees of the various departments may have an opportunity to serve. All the company's buildings and passenger cars are equipped with sanitary conveniences of the best modern type, which are maintained in a condition of scrupulous cleanliness."

The Government Railroad in Alaska

The importance of the early completion of the government railroad in Alaska in helping the United States to meet the burdens of war is set forth in a statement issued by the Secretary of the Interior. The railroad, it is pointed out, will hasten the development of Alaska's vast resources; will encourage the production of foodstuffs, thus reducing the territory's dependence upon the United States for supplies; will furnish coal in unlimited quantity for the navy, obviating the necessity for the transcontinental shipment to the Pacific of fuel for government vessels, and thus release thousands of cars for the transportation of war materials and foodstuffs.

The main line of the road is now under construction from Seward, on the Pacific Coast, inland for 470 miles to Fairbanks, on the Tanana river, a large and navigable tributary of the Yukon. There is now in operation 150 miles.

The road taps two large coal fields, the Matanuska and the Nenana. The coal in the Matanuska field has been tested by the navy and found to be excellent for steaming purposes. The Nenana coal was recently tested by the Bureau of Mines and found to be a fair grade of lignite. It is estimated that the supply in both of these fields is practically inexhaustible. By September of this year the branch will be completed to the Matanuska coal field. Dredging is under way at Anchorage, the nearest tidewater port to the coal fields, in order that deep-draft ocean vessels may be loaded at the docks. When the gap, about 25 miles in length, along Turnagain Arm, between Anchorage and Seward, is completed, coal can be shipped from the latter port. It is planned to close this gap early in 1918.

Coal mined from the Matanuska field is now being used in the construction of the railroad. Construction work is being pushed as rapidly as possible, and it is estimated that at the present rate Matanuska coal can be delivered for the needs of the navy and for general use on the Pacific Coast in the early summer of 1918.

The railroad is also being constructed southward from Fairbanks to tap the Nenana field, making the coal here available for the development of such mineral deposits as copper, antimony and gold in this part of the country. Mining here is practically at a standstill, owing to the lack of suitable fuel. The Nenana coal will also be made available for use on the railroad locomotives and on the river steamers of the interior.

The railroad traverses several rich agricultural valleys, the development of which will supply Alaska's needs and obviate the necessity of making shipments of food products from the states. Along the many streams adjacent to the railroad is found a plentiful supply of cottonwood and spruce, from which pulp for paper making can be derived.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings and places of meeting of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

- AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—H. C. Boardman, Di. L. & W., Hoboken, N. J. Next convention, to have been held October 22-24, 1917, San Francisco, Cal., indefinitely postponed.
- AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hope, C. R. of N. J., 143 Liberty St., New York. Next meeting, October 16-17, St. Louis.
- AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichtig, C. & N. W., Chicago. Next convention, October 16-18, 1917, St. Paul, Minn.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Watten Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 2:30 W. 57th St., New York.
- ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—W. L. Connelly, Supt. of Telegraph, Indiana Harbor Belt, Gibson, Ind. Next annual meeting to have been held September 18, 1917, Washington, D. C., indefinitely postponed.
- CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.
- CANADIAN SOCIETY OF CIVIL ENGINEERS.—Eugene H. McLeod, 176 Mansfield St., Montreal, Que. Regular meetings, 1st Thursday in October, November, December, February, March and April. Annual meeting, January, Montreal.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 1st and 3d Tuesday in month, except June, July and August, Hotel L. Salle, Chicago.
- CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual dinner, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.
- CHIEF INTERCHANGE CAR INSPECTORS AND CAR FOREMEN'S ASSOCIATION.—W. R. McMunn, New York Central, Albany, N. Y. Next convention, September, 1917, St. Louis.
- CINCINNATI RAILWAY CLUB.—H. Boutet, Chief Interchange Inspector, Cin'ti Rys., 1000 College Bldg., Cincinnati. Regular meetings, 2d Tuesday, February, May, September and November, Hotel Statler, Cincinnati.
- ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 568 Union Arcade Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh, Pa.
- GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.
- INVESTMENT BANKERS' ASSOCIATION OF AMERICA.—Frederick R. Fenton, 11 W. Monroe St., Chicago. Annual convention, October 1-3, 1917, Baltimore, Md.
- MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—F. W. Hager, Fort Worth & Denver City, Fort Worth, Tex. Next convention, October 16-18, 1917, Cleveland, Ohio.
- NATIONAL ASSOCIATION OF RAILWAY COMMISSIONERS.—Jas. B. Walker, 120 Broadway, New York City. Next annual convention, October 16, 1917, Washington, D. C.
- NEW ENGLAND RAILWAY CLUB.—W. E. Cade Jr., 683 Atlantic Ave., Boston, Mass. Regular meeting, 2d Tuesday in month, except June, July, August and September, Boston.
- NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meeting, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.
- NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—Geo. A. J. Hinchgrebe, 623 Bridge Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.
- PACIFIC RAILWAY CLUB.—W. S. Wells, Assistant to Chief Engineer, Northwestern Pacific R. R., San Francisco, Cal.
- PEORIA ASSOCIATION OF RAILROAD OFFICERS.—F. C. Stewart, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria, Ill.
- RAILROAD CLUB OF KANSAS CITY.—Claude Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Saturday in month, Kansas City.
- RAILWAY CLUB OF PITTSBURGH.—J. R. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Pittsburgh Commercial Club Rooms, Colonial Annex Hotel, Pittsburgh.
- RAILWAY FIRE PROTECTION ASSOCIATION.—C. B. Edwards, office of the president's assistant, Seaboard Air Line, Norfolk, Va. Next meeting, October 24, 1917, St. Louis, Mo.
- RAILWAY REAL ESTATE ASSOCIATION.—R. H. Morrison, Assistant Engineer, C. & O. Richmond, Va. Next convention, October, 1917, Duluth, Minn.
- RAILWAY SIGNAL ASSOCIATION.—C. C. Roehrig, Myers Bldg., Bethlehem, Pa. Next annual convention, September, 1917, Atlantic City, N. J.
- RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O. Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.
- ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—P. J. McAndrews, C. & N. W., Sterling, Ill. Next annual convention, September 18-21, 1917, Hotel Auditorium, Chicago.
- ST. LOUIS RAILWAY CLUB.—R. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.
- SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.
- SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grand Bldg., Atlanta, Ga. Regular meetings, 3d Thursday in January, March, May, July, September, November, 10 a. m., Piedmont Hotel, Atlanta, Ga.
- TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.
- TRAFFIC CLUB OF NEW YORK.—C. A. Swone, 291 Broadway, New York. Regular meetings, 2d Tuesday in month, except June, July and August, Waldorf-Astoria Hotel, New York.
- TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Gen'l Ag't, Erie R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings bi-monthly, Pittsburgh.
- TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. R. R., Cleveland, Ohio. Next convention, September, 1917, New York.
- UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, 1111 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.
- WESTERN CANADA RAILWAY CLUB.—L. K. Kim, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.
- WESTERN RAILWAY CLUB.—I. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 1st Monday in month, except June, July and August, Hotel Sherman, Chicago.

Traffic News

The Railway Commissioners of Canada have granted the request of the railways for an increase on both through and local grain rates from Fort William eastward, and also have made an advance in lake and rail rates.

The International railroad bridge at Brownsville, Tex., is soon to be re-opened for through passenger and freight traffic. As at other frontier points, the freight cars and passenger coaches of the United States railroads will be permitted to go only across the river (to Matamoros), and will not be allowed to proceed further into Mexico.

Attorney General B. F. Looney, of the state of Texas, has filed in the District Court, at Aune, suits against 66 railroads to restrain them from charging differential freight rates on goods moving for distances less than 351 miles between points within Texas. The hearing of the case has been set for July 30. It is alleged by the attorney general that the railroads have not properly construed the order of the Interstate Commerce Commission in the Shreveport case, with respect to differential rates, and that the carriers have been charging rates that are not authorized in that order.

The Montana Railroad and Public Service Commission and the Corporation Commission of Oklahoma issued orders on July 5 and 10, respectively, providing for demurrage rates applicable to intrastate traffic identical with the rates now in force covering interstate traffic. The Oklahoma commission also reduced from 72 hours to 48 hours the free time allowed on cotton at interior presses for compression in transit, carload freight consigned to consignees located more than five miles from a railroad station and carload shipments weighing in excess of 66,000 lb. The Corporation Commission of Oklahoma is the first western commission to shorten the free time on these kinds of traffic.

The express companies doing business in Chicago will on July 31 discontinue the vehicle pick-up of business after 5 p. m. Among the reasons assigned for this action are the great volume of business, which comes to the express companies at and near the close of the day, thereby precluding the possibility of efficient handling; the unusually heavy volume of traffic which has been moving through express channels during the past year, and the program inaugurated by the railroads, under the direction of the Railroads' War Board, contemplating substantial curtailments of passenger train service. This plan is already in successful operation in several important cities, including New York. In order that an avenue may be afforded for expediting emergency shipments which may not be ready for forwarding at 5 p. m., all local offices of the company in Chicago will be open for the receipt of matter up to 6 p. m., and arrangements have been made for the prompt handling of goods brought in after 5 o'clock. In addition, those offices now receiving express matter at all hours of the day and night will be continued. The companies which have joined in adopting the new rule are the Adams, the American, the Great Northern, the National, the Northern, the Wells-Fargo, and the Western.

A. C. L. Food Preparedness Campaign

In response to the request of the Department of Agriculture the Atlantic Coast Line has posted at its stations a poster entitled "Plant Corn." The poster calls attention to the estimated inadequate production of wheat this year, and says: "Plant corn on all suitable land not used for other food or feed crops. If early planting has failed, replant wherever there is a chance for a crop."

The Atlantic Coast Line has also sent circulars to all cottonseed oil mills in Virginia, North Carolina and South Carolina, urging them to grind peanuts and soy beans in addition to cottonseed. This letter points to the success of Texas cottonseed oil mills, which have produced oil from peanuts and soy beans, and calls attention to the fact that it is necessary in many sections of the South to encourage the planting of those crops as

a preliminary step towards defeating the ravages of the boll weevil.

In a recent letter to chambers of commerce in Virginia, North and South Carolina, the Atlantic Coast Line urges bankers and business men to make arrangements to grant farmers advances on their crops. There is some fear on the part of the farmers that if they greatly increase their acreage of food crops the speculator will take advantage of the fact that they have to sell in the fall.

Further Train Service Reductions in the Middle West

The Cincinnati, Hamilton & Dayton recently discontinued two trains between Cincinnati, Ohio, and Dayton; two between Cincinnati and Glendale; two between Cincinnati and Hamilton, and two between Dayton and Lima, aggregating 8,885 train-miles per month. The Pere Marquette on July 17, discontinued ten trains on the Chicago division and four on the Elk Rapids (Mich.) branch, and substituted every-other-day instead of daily, except Sunday, service on two other branch lines. On the Toledo division it eliminated eight trains and inaugurated every-other-day service on two branches instead of six days a week. On the Detroit division it abandoned two daily trains and discontinued Sunday service for two other trains. On the Port Huron-Grand Rapids division four trains were discontinued on July 17, four other trains having been eliminated on May 1. Every-other-day week-day service was substituted for six days a week on two branch lines of this division, effective May 1.

Coal Movement to New England

The New York, New Haven & Hartford reports a large increase in the movement of coal from the mines to points on its lines by rail all the way; this as a result of the high rates by water from New York and other coal shipping ports. The receipts at the New Haven road's stations for the month of May and June (number of carloads) are as below:

	1917		1916	
	All Rail	Total	All Rail	Total
May	17,168	21,850	15,546
June	15,974	20,707	17,466
Average per month for 6 months	13,213	12,377

There is still a considerable movement of coal to New England ports by water. The falling off in this movement has been more than made up by the increase in all-rail shipments.

State Commission Urges Full Car Loading

The Public Service Commission of Washington has issued an open letter, addressed to shippers and railroads in that state, citing the appeal of the Railroads' War Board for the fullest use of all railroad equipment, and explaining the duty of state commissions and intrastate shippers to acquiesce in the plans of the national government, and says:

"Therefore, we insist and direct that all railroad equipment be loaded to its fullest carrying capacity, regardless of minimum, save in such cases as the commodity shipped would be damaged thereby; and we invite the railroads to rearrange their minimums in this state, the same to be in effect during the period of the present war, unless sooner revoked by order of this commission."

Long Island Holiday Traffic

General Manager J. A. McCrea, of the Long Island, reports the average delay to passenger trains on that road for the Fourth-of-July holiday period (five days) as 2 minutes 36 seconds; and the average delay to each train that was late was 7 minutes 7 seconds. Total number of trains, 3,965; number on time, 2,041. The statement gives the following data for the holiday period in this and preceding years:

	1910	1915	1916	1917
Passenger train movements	4,253	5,015	5,361	4,897
Passenger car movements	18,502	29,733	27,321	24,094
Baggage car movements	1,103	1,369	1,508	1,382
Freight and work train movements	430	374	411	356
Freight car movements	9,867	7,939	8,986	8,124
Passengers carried on trains	686,727	917,917	1,029,721	1,023,365
Carloads of express and baggage moved	421	780	1,077	977

The average delay to passenger trains for nine years has been: 1909, 2 min. 22 sec.; 1910, 2 min. 35 sec.; 1911, 3 min. 5 sec.; 1912,

1 min. 44 sec.; 1913, 3 min. 52 sec.; 1914, 3 min. 3 sec.; 1915, 2 min. 45 sec.; 1916, 4 min. 33 sec.; 1917, 2 min. 36 sec.

There were no personal injuries or train accidents.

Excellent Record in Car Conservation

During the month of June the R. T. Crane Company, Chicago, handled 410 cars on the Chicago River & Indiana tracks at Corwith yards, Chicago, with an average detention of only 1.46 days. Out of the 410 cars, 311 were released within the first 24 hours, 44 within the first 48 hours, 33 within 72 hours, 13 within 96 hours, 7 within 120 hours and 2 within 144 hours.

Getting the Passenger's Point of View

Charles S. Fee, passenger traffic manager of the Southern Pacific, is distributing to passengers as they come on the Southern Pacific lines at Ogden, Utah; Portland, Ore., and El Paso, Tex., post cards upon which they are invited to write comments and suggestions relative to the service. The card explains the company's purpose to maintain uniformly high standards, and says: "We are anxious to know how you enjoyed your trip—what scenic points appealed most to you—what feature of Southern Pacific service impressed you—how our trains and service compare with those of other roads. . . . We shall be glad to plan itineraries for you. If you have friends who would like travel information, give us their names. . . . After writing your comments please hand this card to the conductor before leaving train, or mail it from your destination."

Shippers Urged to Reduce Switching Requirements

The National Automobile Chamber of Commerce, New York City, has issued a circular to members of the chamber, offering suggestions looking to conservation of transportation resources in every possible way. At three large plants during the past month the loading of automobiles into cars has been managed so as to test the possibility of reducing the number of switching "cuts" required to place in trains the outbound loads; and it is found that a very considerable amount of time and engine power can be saved. The circular gives the following example of indiscriminate loading:

Car Number	Destination	Direction for train movement
CMPS 207385	Lewiston, Idaho	West
MC 90372	Hartford, Conn.	East
MC 88845	Kansas City, Mo.	West
MC 92458	Boston, Mass.	East
NYC 236434	Chattanooga, Tenn.	South
NYC 251558	Philadelphia, Pa.	East
CR&P 60613	El Paso, Texas	West
MC 95504	Cincinnati, Ohio	South
MC 87584	New York	East
Sou 160208	Atlanta, Ga.	South

The same cars and the same shipments could be loaded as follows:

Car Number	Destination	Direction for train movement
CMPS 207385	Lewiston, Idaho	West
MC 90372	Kansas City, Mo.	West
MC 88845	New York	East
MC 92458	Hartford, Conn.	East
NYC 236434	Boston, Mass.	East
NYC 251558	Philadelphia, Pa.	East
CR&P 60613	El Paso, Texas	West
MC 95504	Cincinnati, Ohio	South
MC 87584	Chattanooga, Tenn.	South
Sou 160208	Atlanta, Ga.	South

The circular, signed by J. S. Marvin, manager of the traffic department, asks all members to adopt the plan of getting from the loading dock a list of car numbers and initials in the order in which the railroad places the cars. By comparing this with the loads to go forward it will be found that loads for the West, East and South can be grouped together to a considerable extent, as shown in the above example. Cars can thus often be classified for road movement by two or three shifts, where, under ordinary practice, they would have to go to classification yards for sorting.

"The automobile industry has done much to relieve the carriers during the prevailing crisis, as compared with the normal manner of shipping automobiles. This is what we and all other shippers should do. The suggestion herein goes a step further, and we trust it will be put into effect at once. You can frequently go further and keep all east-bound shipments out of a string of cars like this, assigning westbound loads to all cars standing between western owned cars."

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The Fifteen Per Cent Case

In allowing the southern and western roads an advance of 15 cents a ton in their rates on coal and coke in connection with the 15 per cent case, the Interstate Commerce Commission said that if some of the rates authorized to be increased were held by unexpired orders of the commission, the carriers might apply for modification of such orders. On July 23 the commission entered an order in 41 coal rate cases, on application of the roads, modifying the previous orders to permit an advance of not more than 15 cents a ton above the rates prescribed, effective on August 4, with the condition that if the relationships prescribed are thereby disturbed, the carriers shall restore the prescribed relationship within 90 days. The advanced class rates in Official Classification territory, allowed by the commission in its discussion in the 15 per cent case, went into effect on July 16, and later dates on five days' notice.

STATE COMMISSIONS

The Railroad Commission of Louisiana, in an order dated July 19, has denied the application of the railroads in that state for authority to make a general advance of 15 per cent in freight rates, holding that the proposition has not been justified. The report of the commission begins with the declaration that the railroads have called upon the commission to "issue them an insurance policy at the rate of 15 per cent above all of their existing freight rates, to secure them against contemplated diminutions in their revenue, during an indefinite period, in order that they may meet what they have termed an emergency." The testimony presented by the railroads as to the emergency is held by the commission to be not at all clear. Gross receipts have improved, and the commission believes that unsatisfactory net earnings on some of the smaller roads have been due to inability to get cars. It is not believed that the 15 per cent advance in freight rates will in any way affect the ability of the railroads to serve the government properly. Conditions are declared to be very prosperous over the entire state. The Interstate Commerce Commission has refused to allow the advance in interstate rates, and as the application for an increase in Louisiana was based largely on the expectation of authority to increase interstate rates, it is decided to allow no advance.

PERSONNEL OF COMMISSIONS

Henry W. Hodge, appointed a bridge engineer to go with the army to France, has resigned his place as member of the New York State Public Service Commission for the First district.

COURT NEWS

Storage Charges on Goods Delivered to Steamship

The Massachusetts Supreme Judicial Court holds that where a railroad has transported to the seaboard goods to be delivered by it to a steamship to be carried to a foreign port, and those goods, as against the shipper, are subject to storage charges for which the railroad has a lien, an implied contract arises whereby the steamship company assumes responsibility for the charges on the goods received by it.

Goods so transported were subject to storage charges, for which the railroad had a lien, and which it was bound to collect. The railroad wrote the steamship company that it was obliged to collect the charges in accordance with the tariff, and if the goods were taken forward by the steamship company the railroad would hold it responsible for the payment of such charges. The steamship company replied requesting a copy of the tariff. This was sent, and thereafter the steamer accepted certain of the goods. It was held that, as a matter of law, an implied contract was made by the steamship company to assume responsi-

bility for the charges on the goods so taken.—*Boston & Maine v. Oceanic Steam Nav. Co. (Mass.)*, 116 N. E., 260. Decided May 23, 1917.

Rate Discrimination

The Massachusetts Supreme Judicial Court holds that the Public Service Commission cannot, under section 24 of the Public Utilities Act, authorizing it, upon finding a carrier's rates to be unduly discriminatory, to determine reasonable rates, require a railroad to eliminate an alleged discrimination by absorbing switching rates, where there is no finding that the resulting rate would be reasonable, and an injunction prevents discontinuance of the alleged preferential switching absorption rate.—*National Dock & S. W. Co. v. Boston & Maine (Mass.)*, 116 S. E., 544. Decided May 29, 1917.

Demurrage or Storage Charges

The Kilby Car & Foundry Company shipped to its own order its cars over the L. & N. and a connecting road. The cars were not sold as anticipated, and were left on the tracks of the connecting carrier for some time, when they were ordered returned. On return the L. & N. paid the connecting carrier demurrage or storage charges, which it afterwards sought to recover from the car company. The connecting carrier's tariff of storage charges filed with the Interstate Commerce Commission provided that freight, except company material, received for delivery or held for forwarding directions, stored in or on railroad premises, is subject to storage regulations as follows: (a) For unloaded freight not removed within 48 hours; (b) carload freight placed on delivery tracks and subsequently unloaded is subject to demurrage rules while in cars, and to storage rules after unloading; (c) for unloaded freight upon which free time allowed has expired while in cars; (d) for freight received if held more than 48 hours after receipt. The Alabama Supreme Court holds that the demurrage or storage charges advanced by the L. & N. to the connecting carrier could not be recovered from the shipper, as the schedule filed was not applicable to demurrage or storage charges on cars standing on their own wheels on side tracks.—*L. & N. v. Kilby C. & F. Co. (Ala.)*, 75 So., 394. Decided April 26, 1917.

Cannot Suspend Rates Below Commission Maximum

The Illinois Railroad and Warehouse Commission was by statute authorized to fix reasonable maximum rates and charges for the transportation of persons or property by rail; to investigate and ascertain whether the provisions of the act were violated and cause suits to be commenced and prosecuted against any railroad companies which might violate the provisions of the act. The act declared that the commissioners should make for each common carrier doing business in the state a schedule of reasonable maximum rates for the intrastate transportation of property which should be deemed prima facie reasonable. In 1913 the railroads filed with both the Interstate Commerce Commission and the Railroad and Warehouse Commission grain tariffs advancing rates above those previously charged an average of about one cent per 100 lb. The rates were suspended by the state commission; and its successor, the Public Utilities Commission, after hearings, disapproved the advances. The Interstate Commerce Commission approved the same advances, as applied to interstate commerce, and these went into effect on January 8, 1914. The state commission in 1906 established maximum reasonable rates governing the transportation of grain, which were higher than those now filed by the carriers. The Illinois Supreme Court holds that, as the powers of the commission were strictly circumscribed by the statute, it had no power on protests of shippers to suspend tariffs filed by the railroads which were less than the maximum rates fixed by the commission. Nor could the Public Utilities Commission, on coming into being, suspend such rates until a determination was made of their property. The petition of the protestants was treated as a protest against the rates filed, and no change would be made in those now charged until the final order of the commission is made. The district court was directed to set aside the order of the commission, and to direct the commission to further proceed with the case in accordance with these views.—*State Public Utilities Commission v. A. T. & S. F. (Ill.)*, 115 N. E., 904. Decided April 10, 1917.

Federal Employers' Liability Act

The Alabama Supreme Court holds that a car repairer injured while working on a car used the previous week in interstate commerce, but which had "drifted" for a week and was not again used, except in intrastate commerce, for several weeks after the injury, could not recover of the railroad under the act.—*Loveless v. L. & N. (Ala.)*, 75 So., 7.

The Circuit Court of Appeals, Fourth Circuit, holds that a trackman, engaged in assisting a surveyor in a survey made to improve the curve in a track used in interstate commerce, is within the act.—*Southern v. McGuin*, 240 Fed., 649.

The Alabama Supreme Court holds that a railroad employee engaged in clearing out ditches along the railroad's main line, which was used for interstate commerce, was engaged in interstate commerce.—*Louisville & Nashville v. Blankenship (Ala.)*, 74 So., 960.

The Kentucky Court of Appeals holds that a railroad employee injured while painting a bridge used for interstate commerce was within the act.—*L. & N. v. Netherton (Ky.)*, 192 S. W., 1035.

A railroad lying wholly within a state, forming a link between interstate carriers, transported both interstate and intrastate freight and passengers, commingled, and the several engines of the road were indiscriminately used in both kinds of service. The Circuit Court of Appeals, Sixth Circuit, holds that an engine devoted to such purposes was an instrumentality of interstate commerce, and one injured in repairing it might sue under the act.—*Chicago, Kalamazoo & Saginaw*, 234 Fed., 1.

Where a brakeman, who was a member of a train crew engaged indiscriminately in handling interstate and intrastate freight, was injured while going from his caboose, which was awaiting assignment to the yard office for supplies for the caboose, the Montana Supreme Court holds that he was not then employed in interstate commerce. It was immaterial that the work had to do with interstate commerce to a greater extent than purely intrastate shipments.—*McBain v. Northern Pacific (Mont.)*, 160 Pac., 654.

The Supreme Court of the State of Washington holds that an employee, injured while building a scaffold to be used by him in painting a freight shed, which is used by a railroad as an instrumentality in interstate commerce, is not engaged in an act so directly and immediately connected with interstate commerce as substantially to form a part or necessary incident thereto, and his injury is therefore not compensatable under the Federal statute.—*Killes v. Great Northern (Wash.)*, 161 Pac., 69.

The California Supreme Court holds that a gateman, in the employ of a railroad using its tracks indiscriminately for both interstate and intrastate commerce, killed by an intrastate train when he started to cross the track to back away a horse and wagon which had come within the range of one of the gates so that he could not lower it, was "engaged in interstate commerce," so that the State Industrial Accident Commission was without jurisdiction to make any award.—*Southern Pacific v. Industrial Accident Commission (Cal.)*, 161 Pac., 1,139.

The Wisconsin Supreme Court holds that a janitor in an interstate railroad's general office in a town, who was struck in the eye with a small splinter flying off when he was breaking up coal for the furnace with an ax, was not engaged in interstate commerce when injured.—*Great Northern v. King (Wis.)*, 161 N. W., 371.

The Circuit Court of Appeals, Second Circuit, holds that a car repairer, employed by an interstate carrier, who was injured while working on a car belonging to another interstate carrier, and which must be returned in interstate commerce, was not engaged in interstate commerce within the act, the car not being then so engaged.—*Central of New Jersey v. Paslick*, 239 Fed., 713.

The Circuit Court of Appeals, Second Circuit, holds that an employee of a carrier, practically all of whose business was interstate commerce, was not engaged in interstate commerce while placing rails in a pit.—*Hudson & Manhattan v. Ioris*, 239 Fed., 855.

The Colorado Supreme Court holds that an employee wrecker or car repairer of a railroad engaged in both intra- and interstate commerce, who was killed while clearing a wreck, was engaged in interstate commerce.—*Denver & R. G. v. Wilson (Colo.)*, 163 Pac., 857.

Equipment and Supplies

LOCOMOTIVES

THE CHICAGO & ALTON is reported in the market for 5 additional Mikado locomotives.

UNITED STATES GOVERNMENT.—As the *Railway Age Gazette* was the first to report last week, the United States Government has ordered 150 80-ton Consolidation locomotives from the American Locomotive Company, and 150 from the Baldwin Locomotive Works. These engines are for the service of the American forces in France, and will be given, it is understood, priority over all other business. The locomotives are of standard gauge. The 150 to be built by the Baldwin Locomotive Works will be similar to the British Government Consolidation locomotives now on order or recently built by that company. An illustration of one of these locomotives appeared in the Patriotic War Number of the *Railway Age Gazette*, June 22, page 1465. The 150 locomotives to be built by the American Locomotive Company will be built to the same designs as the locomotives now on order for the French State Railways.

FREIGHT CARS

THE ALABAMA & VICKSBURG is inquiring for 30 to 40 30-ton steel center sill stock cars.

THE SEMET-SOLVAY COMPANY, Syracuse, N. Y., is in the market for 100 hopper cars.

THE ATCHISON, TOPEKA & SANTA FE has ordered 100 ore cars from the Pullman Company.

THE REPUBLIC IRON & STEEL COMPANY is reported in the market for 50 coke and 50 gondola cars.

THE NEW YORK, NEW HAVEN & HARTFORD is inquiring for 50 refrigerator cars, 25 for freight and 25 for passenger train service.

THE HUDSON BAY COMPANY has given an order to American car builders for 1,200 steel gondola cars, to be shipped to the Dutch East Indies.

PASSENGER CARS

THE LONG ISLAND is asking prices on 25 passenger and baggage cars and 40 coaches.

BRITISH LOCOMOTIVES IN WAR GARB.—The latest locomotives built at Crewe, England, are finished in the "all-black" style adopted as a war time finish in which considerable economy is effected by dispensing with lining out and other decorative work. The engines present a striking appearance in this garb.

LOAN TO BOLIVIA FOR RAILROAD CONSTRUCTION.—Proceeds of the \$2,400,000 issue of 6 per cent bonds purchased by a group of banking houses, consisting of the Equitable Trust Company, Chandler & Co., Inc., and Counselman & Co., of Chicago, are to be used in the construction of a railroad from La Paz, the principal city of Bolivia, into the Yungas Valley. The orders for the materials necessary for the building of the railroad are to be placed in this country. Bolivia entered this market for funds as early as last March. Negotiations for a loan were completed soon after, but a public offering of the issue was delayed until the Liberty Loan had been sold. The Department of State has expressed its satisfaction over the fact that the South American republic was successful in negotiating a loan in the United States, Secretary of State Lansing having written a letter to this effect on May 11, 1917, to the Hon. Ignacio Calderon, the Bolivian minister here. The negotiations on behalf of Bolivia were conducted by the Hon. Adolfo Ballivian, consul general in the United States. Chandler & Co. are the fiscal agents for Bolivia in this country.

Supply Trade News

A. D. Bruce, in charge of purchases and supplies for the Vapor Car Heating Company, Inc., Chicago, has been elected secretary and controller, succeeding Arthur P. Harper, resigned.

H. G. Doran & Co., Peoples Gas building, Chicago, have been appointed selling agents for the Schaefer Equipment Company, Pittsburgh, Pa., manufacturers of the Schaefer truck lever connections.

W. J. Gillingham, who has been identified with the Hall Switch & Signal Company since 1900, successively as general agent, resident manager, and general sales manager, has been elected vice-president of that company, with headquarters in New York.

Roland C. Fraser, vice-president of the Buffalo Brake Beam Company, whose death at Suffern, N. Y., on June 17 was noted in these columns last week, was born at Boston, Mass., April 11,

1865. Mr. Fraser was widely known in the supply trade. He began his business career in the railway supply field by joining the business staff of the *Railroad Gazette* in 1890. After several years' service in that position he was employed, successively, by the Monarch Brake Beam Company, of Detroit; the U. S. Metal & Manufacturing Company, of New York, and the Buffalo Brake Beam Company, of New York. At the time of his death he was vice-president of the last named company and had been in its service for 14 years.

R. C. Fraser

At a meeting of the executive committee of the board of directors of the American Locomotive Company, held July 18, David Van Alstyne was appointed an assistant vice-president, in charge of manufacture, effective July 1, 1917. Mr. Van Alstyne has hitherto held the title of assistant to vice-president.

Aall & Co., of Tokyo, the Japanese agents for the American Steel Export Company, have added B. Orum Andresen to their engineering staff. Mr. Andresen, prior to leaving for Japan, spent several days acquainting himself with the organization and the facilities the American Steel Export Company has for export engineering and contracting.

The C. F. Massey Company, Chicago, placed additional factories in operation at Youngstown, Ohio, and at Los Angeles, Cal., on July 1, making 13 plants now in service. C. Hunsacker has been transferred to Youngstown and placed in charge of the plant at that place, while N. R. Brown, formerly with the Lehigh Portland Cement Company, has assumed charge of the plant at Los Angeles.

Among those in the service of the American Steel Export Company, New York, who have been called to the colors, is K. G. Martin, manager of the service and publicity departments. Mr. Martin was granted an honorable discharge from the 22nd Regiment, Corps of Engineers, N. G., N. Y., in order to be able to accept a commission as captain, Officers' Reserve Corps, Motor Transport Service.

The Walls Frogless Switch & Manufacturing Company, Kansas City, Mo., has leased a building at Twenty-third and Broadway, Kansas City, where it will manufacture the Walls Frogless switch. The device eliminates the old style point frogs and slip switches, and provides for a straight rail at all times. It is ex-

pected that the factory will be in operation by September 1. W. J. Stone Burner has been appointed general manager of the company, with headquarters at Kansas City, Mo., and C. E. Ennis has been appointed assistant secretary.

Seven Chicago railway supply companies recently made a gift of \$385 to the Thirteenth Engineers, United States army, the railway regiment recently quartered at Chicago, and formerly known as the Third Reserve Engineers. Of this amount, \$85 was used to cover the expenses of a band, which furnished music during a review of the regiment on July 12, and the remaining \$300 will be used to provide greater comforts for the men. The companies which contributed to the fund were the P & M Company, Robert W. Hunt & Co., the Railroad Supply Company; Fairbanks, Morse & Co.; the Rail Joint Company, the Galena-Signal Oil Company, and Pratt & Lambert.

The Automatic Straight Air Brake Company

The Automatic Straight Air Brake Company of New York during the next few weeks will send out invitations to many of the leading railroad officers of the country to witness the operation of the automatic straight air brake, on a 100-car test rack at New York, and shortly thereafter to attend the road service trials, which will be conducted by the Division of Safety of the Interstate Commerce Commission.

The company has leased a building in which it has installed a 100-car test rack, which includes the complete car equipment arranged with full length train line and all other piping, just as it would be applied on a 100-car train. The apparatus for each car includes a trainagraph with three recording pens indicating respectively the pressure of the brake cylinder, the auxiliary reservoir and the train line. An observer can thus see at a glance just what takes place on each car in the train.

During the fall of 1915 this brake was tested in road service on the Atchison, Topeka & Santa Fe, under the supervision of the Division of Safety of the Interstate Commerce Commission, and since that time the improvements suggested by the commission in its report to Congress in June, 1916, have been made in the equipment. The principal features of the brake are the use of wing valves, the movement of which is controlled by diaphragms under the action of differential pressures and the use of train pipe air for the service application of the brake, making possible the maintenance of a predetermined brake cylinder pressure indefinitely without the necessity of the release and reapplication of the brakes, and without the aid of retaining valves.

TRADE PUBLICATIONS

CRANES.—Catalogue No. 130, recently issued by the Whiting Foundry Equipment Company, Harvey, Ill., is an attractive and well illustrated book, 8½ in. by 11 in. in size, descriptive of the line of Whiting cranes. The catalogue gives illustrations and descriptions of a large number of cranes of different types, and shows views of typical installations. Many of the cranes given are for special use on railroads, as, for example, at ash pits, for transfer service, for handling freight and in locomotive shops.

ACORN DIES AND HOLDERS.—The Greenfield Tap & Die Corporation, Greenfield, Mass., has recently issued an illustrated booklet describing its Acorn dies and die holders. The Acorn die is adjusted radially by means of an internal cone adjusting cap which fits over the ends of the die lands. This makes possible accuracy of adjustment without interfering with the lead. The die is easily sharpened by grinding, and when once set up may be removed and replaced or reground without disturbing the position of the holder in the machine. The catalogue contains illustrations showing clearly the construction of the Acorn die, the releasing die holder and adapter for applying the Acorn die to machines or holders already in operation. The holders are hollow and there is no limit to the length of thread which they will cut. The booklet contains the usual catalogue information as to prices and specifications.

RAILWAYMEN IN THE BRITISH ARMY.—At the end of April, 1917, 4,359 employees of the London, Brighton & South Coast had gone on active service. Members of the company's pension fund who had gone numbered 2,028, and the company was paying their contributions during their absence.

Railway Construction

DANVILLE, KANKAKEE & CRESCENT TRACTION.—This company will soon begin the construction of a line from Danville, Ill., through Potomac, Ellis, Rankin, Cissna Park, Crescent City, Le Rable and Woodworth to Kankakee, a total distance of 81 miles. Right of way has been obtained on approximately 40 per cent of the proposed route, and surveys made on about half. There is no heavy grading, and only two curves in the entire mileage. A contract for the work has been let to the C. E. Coon Construction Company, Cleveland, Ohio. The road will operate passenger and freight service. E. E. Myer, Crescent City, Ill., is president, and W. K. Woodruff, Kankakee, is chief engineer.

DULUTH, MISSABE & NORTHERN.—This company has completed plans for the double-tracking of its line between Virginia, Minn., and Wolf, a distance of approximately 10 miles. In connection with this project the road will also build additional yard tracks. The total cost of improvements will be about \$150,000.

FREEPORT SULPHUR COMPANY.—This company is contemplating building a line from Freeport, Tex., to Rosenberg, by way of Brozorria and Columbia. The line will be approximately 60 miles long. It is as yet only partly located. W. A. Randle, Freeport, Tex., is chief engineer.

GRAND TRUNK.—Plans for two new stations have been completed by this company. Work is to be started at once on a modern station building at St. Catharines, Ont., and work has already been started on a new station at Berlin, N. H. The latter is to be a brick building with a granite base and tiled roof.

GREAT NORTHERN.—This company contemplates the construction of a bridge 1,600 ft. long over the Musselshell river at Weede, Mont., but does not expect to carry out the work in the immediate future.

GULF, COLORADO & SANTA FE.—This company will erect a freight house and office building at Temple, Tex. The building will be 32 ft. wide and 266 ft. long, with concrete foundations, brick walls and tile roof. The office portion will be two stories high, and the freight house one story high. Bids will be opened in about 30 or 45 days, and construction is expected to start within two months. The estimated cost is \$40,000.

KLAMATH FALLS MUNICIPAL RAILWAY.—This company, which will be the first unit of the Oregon, California & Eastern, is building a line from Klamath Falls, Ore., to Dairy, a distance of 20 miles. A contract has been let to the Robert E. Strahorn Construction Company, Spokane, Wash. The work involves about 250,000 cu. yd. of grading, of which approximately 75,000 cu. yd. is rock. The maximum gradient is 1.25 deg., and the maximum curvature 6 deg. R. E. Strahorn, Spokane, is president, and N. H. Bogue, Klamath Falls, is chief engineer.

MINERAL BELT.—This company is now building about five miles of new line between Sulphur Mine, Va., which is on the Chesapeake & Ohio and Valzinco Mine. The work includes one steel and concrete bridge of 350 ft. and about 100 ft. trestle approach on each side. G. P. Clay, Richmond, Va., is the contractor, and it is expected that the work will be finished before September this year. Berkely Williams, president, Richmond, Va.; Paul S. Morton is resident engineer.

MINNEAPOLIS, ST. PAUL & SAULT STE. MARIE.—A contract has been awarded by this company to the Withee Construction Company for the building of a depot at Stevens Point, Wis. The building will be two stories high, of brick and reinforced concrete construction.

MISSOURI PACIFIC.—To provide for the traffic of the cantonment which is being established by the War Department at Fort Logan, H. Roots, near Little Rock, Ark., this company is building a spur 4.1 miles long, together with three sidings each 2,000 ft. long. There will also be a shelter, and the improvements altogether will cost \$100,000. Also the government is building,

within the camp grounds, about five miles of track. The Missouri Pacific is also laying additional side tracks at Jefferson Barracks, at a cost of about \$9,000.

MOLTZ LUMBER COMPANY'S ROAD.—Work is now under way building a line from Lake Toxaway, N. C., west to Sapphire, and track laying will be started about August 1. The work on three miles will be difficult, and on seven miles involves the handling of about 59,000 cu. yd. The maximum grade will be 4.5 per cent, and there will be one 36-deg. curve. The line is being built to carry lumber and forest products, and the work is being carried out with company's forces. Jerome Moltz, president, Asheville, N. C.; Robert S. Brown, engineer.

NORTHERN PACIFIC.—This company will construct a steel and concrete bridge over the Shields river near Livingston, Mont., to replace the old wooden bridge recently destroyed. The new structure will cost approximately \$200,000.

OSAGE COUNTY & SANTA FE.—This company has awarded a contract to Maney Brothers & Co., Oklahoma City, Okla., for grading, bridge work, track laying and surfacing, fencing and buildings, required for the construction of the line from Bowen to Fairfax.

PENNSYLVANIA-DETROIT.—A contract has been awarded by this company to the W. S. Newkall Company, Detroit, Mich., for 325,000 cu. yd. of grading, and 6,750 yd. of concrete masonry, for a classification yard at Detroit.

PENNSYLVANIA LINES WEST.—This company has awarded a contract to the Alliance Construction Company, Indianapolis, Ind., for the construction of an engine house and annex at Indianapolis. The annex will be 60 ft. wide by 150 ft. long and one-story high; the engine house 110 ft. long, and will have 10 stalls. Both buildings will be of brick construction with reinforced concrete foundations.

PHILADELPHIA & READING.—This company has let contracts for the grading and masonry in connection with the construction of third and fourth tracks between Belle Mead, N. J., and Manville, to Richards & Gaston, Inc., New York. Contracts for bridge superstructures have been let to the Phoenix Bridge Company for bridges east of Belle Mead, N. J.; west of Hamilton and east of Weston, and to the American Bridge Company for a bridge west of Weston. A contract has also been let for grading north and south of Saucon creek, South Bethlehem, Pa., to C. P. Bower, Philadelphia, Pa.

A contract has been given by the Philadelphia & Reading to Seeds & Derham, Germantown, Philadelphia, Pa., for building the new Columbia bridge over the Schuylkill river at Belmont, Philadelphia, on the main line. This will be a four-track concrete arch bridge, with eight arches of about 103 ft. span each.

ST. PAUL UNION DEPOT COMPANY.—A contract has been awarded by this company to Morris, Sheppard & Dougherty, St. Paul, Minn., and the George J. Grant Construction Company, acting as one corporation, for the construction of the new St. Paul passenger terminal. The contract covers the construction of the headhouse, the grading for the elevation of passenger tracks, the building of retaining walls, the relocating of tracks, etc. The estimated cost of the project is \$4,500,000, and the work is being done on a cost plus percentage contract. Work has already been started, and it is expected that the head-house will be finished by the latter part of December, 1918.

WABASH.—This company, the city of Moberly, Mo., and the Missouri, Kansas & Texas, are contemplating the construction of a viaduct over Rollins street, Moberly. The negotiations for the building of the viaduct have extended over a period of several years, and just recently the Missouri Public Service Commission has taken up the matter. Although it is expected that a decision will soon be reached, nothing definite has yet been determined.

YOUNGSTOWN & NILES.—This company has awarded a contract to the Republic Railway & Light Company, engineering department, for the construction of a road between Youngstown, Ohio, and Niles, a distance of seven and one-half miles. The line will be built on private right of way, and will traverse the new town of McDonald, which is being built by the Carnegie Steel Company.

Railway Financial News

BUFFALO, ROCHESTER & PITTSBURGH.—Five per cent equipment trust certificates to the amount of \$1,600,000 have been issued and will shortly be offered to the public by the bankers who have bought them; Tilney, Ladd & Co., of New York; Graham, Parsons & Co., Philadelphia; Colgate, Parker & Co., Philadelphia.

MARSHALL & EAST TEXAS.—This road is to be sold by order of the United States District Court on September 4. The upset price is \$675,000. The sale will be held in Marshall, where the general offices are located. This railroad runs from Wimsboro, Tex., southeast to Elysian Fields, a distance of 92 miles. It is controlled by a syndicate of St. Louis men, headed by A. T. Perkins, of that city. It is expected that it will be bought in, and that, after a reorganization, steps will be taken to extend the line into Louisiana.

PITTSBURGH, SHAWMUT & NORTHERN.—Receiver F. S. Smith has applied to the New York State Public Service Commission, Second district, for approval of receivers' certificates to the amount of \$1,700,000, needed to pay off receivers' certificates about to mature.

SAVANNAH & ATLANTA.—William Morris Imbrie & Co. have announced that the Georgia Railroad Commission has approved the proposed issue of \$2,500,000 6 per cent convertible first and consolidated mortgage bonds of the Savannah & Atlanta Railway, dated July 16, 1917, and due May 1, 1935. The bonds are part of an authorized issue of \$5,000,000. The bonds have been underwritten by a syndicate of New York bankers, and they will shortly be offered to the public.

AUSTRALIAN RAILWAY EMPLOYEES.—The average number of employees in the service of the Government Railways of Western Australia during the year 1916 was 7,703, as against 7,918 for the year 1915. Salaries and wages amounted to £1,247,491 (\$6,062,806), a decrease of £29,969 (\$185,650) compared with the previous year. During the year an increasing number of the staff volunteered for service with the Australian Expeditionary Forces, the total from the railway service being 1,499 up to the date of the latest report. The roll of honor shows that 51 have been killed in action or died of wounds.

RAILWAY DEVELOPMENT IN SPAIN.—Spain commenced to build railroads in 1840, and at the beginning of 1916 there were 8,700 miles of track. Up to 1915 the state had contributed \$139,000,000 for railway construction. The street railways of Spain have about 600 miles of track, of which 460 miles utilize electric power, 95 miles steam power, and the remainder horses and mules. In 1916, 85.62 miles of track were built, a small increase in proportion to the rapid growth of Spain's industrial and commercial activity. The new lines are from Irun to Elizondo, 31.07 miles; from Haro to Ezcarey, 19.88 miles; from Trozas de Orusco to Mondejar, 19.26 miles; a section of the road from Malaga to San Fernando, 8.70 miles; from Sarría to Vallvidrera, 3.11 miles; and a few other short additions.

RAILWAY DEVELOPMENTS IN THE RUSSIAN CAUCASUS.—The British consul at Batum reports that railway construction proceeded apace in the Caucasus in 1916. The Tabriz-Julfa Railway, with its branch from Sofan to Sherefkhani on Lake Urumiah, was completed and opened to traffic about the middle of the year. The Shahtakhti-Maku-Bayazet, or Alashkert Railway was also working as far as Bayazet before the close of the year. This line is now being extended southward in the direction of Lake Van. The Batum-Trebizond Railway was begun about August, 1916, and by the end of the year work on several sections of the railroad was reported to be advancing favorably. The Baku-Julfa, or Araxes Valley Railway progressed fairly rapidly, and much work in connection with earth-works and bridging was completed. Progress was also made during the year with the work on the Novo-Senaki-Sukhum section of the Black Sea Coast Railway, which is to join the Tuapse-Armavir line at Tuapse.

Railway Officers

Executive, Financial, Legal and Accounting

S. G. Lutz, general traffic manager of the Chicago & Alton, has been appointed vice-president in charge of traffic, with headquarters at Chicago, and his former position has been abolished. Effective July 17.

Howard Elliott, formerly president of the New York, New Haven & Hartford, has been elected chairman of the executive committee of the Northern Pacific, with headquarters at New York. Mr. Elliott has been a member of this committee since July 1, as noted in the *Railway Age Gazette* of July 6, page 43. He retains his connection with the New Haven road as chairman of a committee in charge of intercorporate affairs of the New Haven. He also continues as a member of the Railroads' War Board, Washington, D. C.

John Mitchell Johnson, recently elected vice-president of the Missouri Pacific at Chicago, with such duties as may be assigned to him by the president, was born at Cincinnati, Ohio,

on May 13, 1845, and entered railway service as a station agent on the Indianapolis, Cincinnati & Lafayette, at Indianapolis, Ind., on January 1, 1871. On November 1, 1872, he was appointed general freight and passenger agent of the Cincinnati & Martinsville, which was later taken over by the Indianapolis, Cincinnati & Lafayette, and in 1875 became traveling auditor of the latter road. Later he was successively in charge of local freight traffic and assistant general freight agent at Lafayette, Ind. On January 1, 1883, he became associated with

J. M. Johnson

the Cincinnati, Indianapolis, St. Louis & Chicago, being placed in charge of freight traffic originating at Chicago and the Northwest. On February 20, 1884, he became assistant general freight agent of the Chicago, Rock Island & Pacific, and served consecutively until April 1, 1903, as general freight agent, freight traffic manager and third vice-president. From April 1, 1903, to November 1, 1907, he was assistant to the vice-president of the Gould Lines at Chicago. On the latter date he was elected vice-president, in charge of traffic, of the Missouri Pacific and the St. Louis, Iron Mountain & Southern, and later his jurisdiction was extended over the Denver & Rio Grande and the Western Pacific, with the title of vice-president in charge of traffic. His service with the Western Pacific were terminated on March 5, 1915, when that company passed into the hands of the receiver, and with the Denver & Rio Grande in November of the same year. On August 19, 1915, he was appointed chief traffic officer of the Missouri Pacific, and upon the reorganization of that road on June 1, 1917, was appointed director of traffic. On June 11, 1917, at his request, he was relieved of the duties and responsibilities of the traffic department, and was elected vice-president, as already noted.

Operating

J. B. Gorton has been appointed car accountant on the Denver & Rio Grande, with headquarters at Denver, Colo., succeeding E. M. Horton, retired on a pension.

A. W. Woodruff, assistant superintendent of the Union Pacific, with headquarters at Ogden, Utah, has been appointed superintendent of the Wyoming division, with headquarters at Cheyenne, Wyo.; H. L. Bell, superintendent of the Wyoming

division, has been transferred to the western division, with headquarters at Green River. Under a recent arrangement the two divisions between Ogden and Omaha, Neb., have been divided into three; G. E. Stevens, assistant trainmaster at Ogden, has been transferred to Evanston, Wyo.

L. B. Wickersham has been appointed general superintendent of the electric lines of the Norfolk Southern, with office at Norfolk, Va., vice L. D. Mathes, resigned on account of ill health.

C. E. Brooks, assistant superintendent on the Oregon Short Lines at Nampa, Idaho, has been appointed superintendent of the newly created Montana division, comprising that part of the Oregon Short Line from Pocatello to Silver Bow and branches, with headquarters at Pocatello.

W. Van Valkenburgh, general baggage and mail agent of the Long Island Railroad at Long Island City, N. Y., has been appointed camp general agent of the American Railway Association and of the Long Island Railroad, with headquarters at Camp Long Island, Yaphank, N. Y.

F. N. McPhee has been appointed trainmaster of the San Joaquin division of the Southern Pacific, with headquarters at Bakersfield, Cal., succeeding J. C. Muir; J. E. Enger has been appointed trainmaster of the Portland division, with headquarters at Roseburg, Ore., succeeding F. Hanssen, resigned.

M. W. Sullivan, trainmaster of the Delaware & Hudson at Oneonta, N. Y., has been appointed superintendent of the Champlain division, with office at Plattsburg, N. Y., in charge of the territory from the North Yard limit board at Whitehall, N. Y., to and including Rouses Point; also the Baldwin, Ticonderoga, Anasable, Mooers and Chateaugay branches.

W. C. Ennis, trainmaster on the Chicago, Milwaukee & St. Paul at Spokane, Wash., has been appointed assistant superintendent of the Rocky Mountain division, with headquarters at Three Forks, Mont.; T. J. Hamilton, district master mechanic at Tacoma, has been appointed assistant superintendent of the Missoula division, with headquarters at Avery, Idaho; F. C. Dow, assistant trainmaster at Mobridge, S. D., has been appointed trainmaster at Tacoma; A. E. Campbell, trainmaster at Malden, Wash., has been transferred to the Idaho division; J. P. Phelan, trainmaster at Missoula, Mont., has been transferred to Malden, Wash.

Traffic

J. Brinker has been appointed express and mail traffic manager of the Atchison, Topeka & Santa Fe, with headquarters at Chicago.

Harold K. Faye, assistant in the office of the vice-president in charge of traffic, of the Chicago, Burlington & Quincy at Chicago, has been appointed traffic manager of the Western Pacific, with headquarters at San Francisco, Cal., succeeding J. T. Hendricks, resigned to enter private business.

Engineering and Rolling Stock

F. P. McDonald has been appointed master mechanic of the Stockton division of the Southern Pacific at Stockton, Cal., succeeding A. D. Williams, promoted.

G. E. Cessford, district master mechanic on the Chicago, Milwaukee & St. Paul, at Deer Lodge, Mont., has been transferred to Tacoma, Wash., succeeding T. J. Hamilton, promoted.

Samuel R. Parslow, who has been engaged in mechanical valuation work for the Great Northern for the past two years, has been appointed shop superintendent at Great Falls, Mont.

O. H. Mann has been appointed engineer maintenance of way of the Northern division of the Chicago Great Western, with headquarters at St. Paul, Minn., succeeding W. J. Calvin, resigned.

George C. Christy, general foreman at the McComb (Miss.) shops of the Illinois Central, has been appointed master mechanic, with headquarters at Vicksburg, Miss., succeeding C. Linstrom, deceased.

H. L. Needham, general foreman of the locomotive department of the Illinois Central at Twenty-seventh street, Chicago, has been appointed master mechanic of the Springfield division, with headquarters at Clinton, Ill., succeeding William O'Brien,

assigned to other duties. J. Ormsby has been appointed general foreman in the locomotive department at Twenty-seventh street, Chicago, effective July 16.

F. B. Tapley, who has been appointed assistant engineer of maintenance, all lines, of the Canadian Government Railways, with office at Moncton, N. B., as has already been announced in these columns, began railway work in 1903 with the Canadian Pacific as rodman, and later served consecutively as transitman, resident engineer and assistant engineer with the engineer of maintenance of way, and in the general manager's office at Montreal, Que. In July, 1916, he resigned from the Canadian Pacific to become assistant engineer in the office of the chief engineer of the Canadian Government Railways at Moncton, N. B., which position he held until his appointment as assistant engineer of maintenance, all lines. This position was recently created in connection with a re-organization of the engineering department.

F. G. Grimshaw, whose appointment as superintendent of motive power of the New Jersey division of the Pennsylvania Railroad, with headquarters at New York, has already been

F. G. Grimshaw

announced in these columns, was born on November 26, 1878, at Paterson, N. J., and was educated at Cornell University. After serving for one year in the Cooke Locomotive Works, he entered the service of the Pennsylvania Railroad in 1902 as special apprentice in the Altoona machine shops. From 1905 to August, 1906, he served successively as yard clerk and assistant yardmaster on the Pittsburgh division, and then was appointed assistant master mechanic of the Monongahela division. In June, 1907, he was appointed master mechanic on the West Jersey & Seashore, serving in that capacity until September, 1912, when he was appointed assistant engineer of motive power on the Western Pennsylvania division of the Pennsylvania Railroad at Pittsburgh, Pa. In November, 1914, he was transferred to Philadelphia as assistant engineer of electric equipment, and now becomes superintendent of motive power of the New Jersey division of the same road, as above noted.

Railway Officers in Military Service

W. M. Vandersluis, signal engineer of the Illinois Central at Chicago, has been commissioned captain in the Engineer Officers' Reserve Corps, but has not yet been assigned to duty.

H. T. Douglas, Jr., chief engineer of the Chicago & Alton at Chicago, has been commissioned major in the Engineer Officers' Reserve Corps; R. A. Cook, valuation engineer, and J. W. Reid, bridge engineer, have been commissioned captains in the Engineer Officers' Reserve Corps; P. J. Watson, Jr., assistant engineer at Bloomington, Ill., who was granted a leave of absence to enter the officers' reserve training camp at Ft. Sheridan, has been commissioned captain and assigned to Ft. Leavenworth, Kan.

OBITUARY

William R. Morrison, vice-president of the Gallatin Valley and for many years head of the insurance department and the railway mail service of the Chicago, Milwaukee & St. Paul, at Chicago, died at his home in that city on July 20.

Charles E. Kingston, formerly from May, 1912, to December, 1916, assistant general freight agent of the Philadelphia, Baltimore & Washington, at Philadelphia, Pa., and later special agent of the same road, died on July 21 at his home in Ridley Park, Pa., at the age of 59.

GENERAL NEWS SECTION.....

204

One of the questions which is presented to the engineering department frequently when considering the construction of a second track is that of the advisability of reducing the grade at a certain point to the standard prevailing on the remainder of the division or of building the second track on the existing heavy grade and installing helper engine service at this point. This problem is usually susceptible of fairly accurate analysis on the basis of the traffic existing at the time the estimate is made. The cost of reducing the grade on the present location or by means of an alternate line and the increased fixed charge which will result from the improvement can be determined with a reasonable degree of accuracy. One can also estimate the cost of helper engine service on the basis of present traffic and operating conditions so that a comparison of the two methods can be made easily. It is in looking to the future, as one must in planning an improvement of considerable magnitude such as this that difficulty is experienced. No particular trouble is presented in computing the cost of the alternate low grade line, for once the expenditure is made the fixed charges are constant. There is much more uncertainty in estimating the future cost of helper service. In the first place, the cost of this service varies with the amount of business handled until the capacity of the line is approached, when it rises rapidly. It is difficult to predict this future development of traffic, it being under-estimated more frequently than otherwise. Even more careful consideration must be given to tendencies affecting the cost of helper engine service itself. The experience of the past year has illustrated the fact that the demands of train service employees both for higher wages and for more costly working conditions are increasing continually. It is, therefore, safe to assume that the expense of this service, at least insofar as the wages of employees are concerned, will increase more rapidly than the business. These conditions constitute a strong argument for the construction of low grade lines even where the first cost is considerably greater than the capitalized cost of helper service under present conditions. Such construction eliminates the uncertainties which surround the future cost of helper service.

The Increasing Cost of Helper Service

How many mechanical engineers and designers consider the electric lighting equipment when laying out the trucks, brake rigging and underframe of a new passenger car? Very few; yet the axle generator with its accessories certainly plays an important part in the successful operation of the car in service. The most unreliable part of the axle generator equipment is the belt; this is not the fault of the belt itself, but of the makeshift installation because of no provision being made for it and its pulleys when designing the car. The best results can be obtained by using a large axle pulley about 20 in. in diameter with a wide face, about 10 in. This pulley, particularly with body mounted machines, should be located at the center of the axle to reduce belt distortion when on curves. So much for the ideal. In practice it is usually impossible for the electrical department to specify an axle pulley that would give the longest belt life and fewest light failures; it is simply a case of making the best of the situation by specifying a pulley with standard bore and width and with the largest diameter possible. Under these conditions axle pulleys, from 14½ in. to 21 in. in diameter and from 7 in. to 10 in. face have had to be used. The diameter most used is the 17 in., which is 3 in. less than it should be. Both the Master Car Builders' Association and the Association of Railway Electrical Engineers have adopted standard generator pulleys for the two types of axle machines, but because of the common practice of paying no attention to the axle equipment when designing the car, it has been impractical to adopt a standard diameter for the axle pulley. More co-operation between the mechanical and electrical departments will not only make such a standard possible, but will result in better belt performance, fewer light failures and will do away with any friction between the two departments growing out of the lack of such co-operation. It will be to the best interests of the railroad freely to consult the electrical engineer on the design of new cars and to incorporate as many of his suggestions having to do with adapting the trucks, brake rigging, etc., to the electrical equipment as are practicable.

* Illustrated.

THE EMPLOYMENT OF WOMEN

THE steady increase in the employment of women in all kinds of industrial and commercial activities throughout the civilized world in the course of economic evolution has been taken so much as a matter of course by the public in recent years that the sudden introduction of women into lines of work in which they have not previously been engaged has not excited any particular concern, and it has been generally supposed that the change can be made with but small administrative effort. Experience gained thus far has shown, however, that obstacles will be encountered, which, while they may be trivial in most cases, must be disposed of correctly before the step can be taken with success.

The question of compensation is important. While women are commonly paid less than men in classes of work in which their employment has been thoroughly established, it has been the recent experience in Canada that the substitution of women for men as a war measure is less liable to upset labor conditions if women are paid the same scale as the men. The employment of women also has a social aspect which must receive careful study. When engaged as machine operators or day laborers women are thrown into coarser surroundings and into contact with men who are not accustomed to the association of women in the status of fellow employees and instances have been reported where it has been necessary to discipline a few of the men because of a failure to show proper respect.

One feature which may be overlooked is the provision which must be made for toilet facilities before women can be put to work. As an indication of what this means it may be mentioned that estimates made on one road for accommodations for women to be employed in car and locomotive shops demonstrated that expenditures in excess of \$10,000 would be required. It is not alone a question of the amount of money involved but the character of the accommodations necessary deserves careful consideration. Rest rooms must be provided and in general the facilities must be of a higher grade than the crude accommodations which in many cases have been considered adequate for men, for in the words of one railroad president "the standards of womanhood in this country must not be lowered."

This situation presents new problems and therefore should receive careful study before expenditures are made.

TRANSCONTINENTAL RATES

THE Interstate Commerce Commission has again ordered a readjustment of transcontinental freight rates as to the relation between rates to the Pacific Coast terminals and those to the intermediate intermountain territory, but instead of attempting to deal permanently with the situation has based its decision on conditions admittedly temporary, whose change will require another adjustment.

The commission finds that, because of the war, existing water competition with the rail lines for traffic between the Atlantic seaboard and Pacific Coast terminals is a negligible factor and that rates to the Pacific Coast from the east lower than the rates on like traffic to intermediate points are, therefore, not justified under existing circumstances. We thus enter upon another chapter in the complicated history of the controversy between terminal and intermountain communities which has raged for some 25 years. As the cessation of traffic through the Panama Canal because the ships are being used elsewhere on account of the war is the reason for the new order, the chances are that it will continue for at least as long as any of the various previous adjustments, but it seems rather regrettable that the opportunity has been missed to settle on a policy for transcontinental rates based on more permanent conditions.

In a former report dealing with the transcontinental rate situation, although the carriers urged that the prospective opening of the Panama canal and its effect on the rail

rates be taken into consideration, the commission declined to do so, and it became necessary for it to do much of its work over again after the canal was opened. In this case the carriers asked the commission not to confine its consideration to the temporary circumstances, but to look to the future and recognize the permanency of the condition created by the opening of the canal route. The commission does not fail to recognize some force in the argument, but it deals with the situation that exists for the time being.

The carriers will probably profit, at a time when they can make good use of the money, by the temporary advancing of rates to the Pacific Coast required by the order to realine them to accord with the provisions of the long and short haul rule so that they will not be less than the rates on like traffic to intermediate points. In spite of this fact, however, the carriers vigorously opposed such an order at the time of the oral argument on the tentative report, because of the disturbance it would create in the long established relations between the terminal and intermediate points during the meantime.

MAINTENANCE OF WAY CONVENTIONS

AS the time approaches for the fall conventions of three of the maintenance of way associations, there is much discussion of the advisability of holding the meetings this year. Some maintain that, because members will have difficulty in getting away from their work long enough to attend, the attendance will be greatly reduced, and that, therefore, the meetings should not be held. Others contend that because of the new and serious problems which are confronting the members of these associations this year, there is more than the usual value to be derived from the meetings with their opportunities for the exchange of information.

The Roadmasters' Association convention is scheduled to be held in Chicago, beginning September 18. At a meeting of the executive committee of that organization three weeks ago, the opinion prevailed that the convention should be held at the time and place originally agreed on. It was decided to reduce the time from the customary four days to three days, to eliminate practically all entertainment for the members and to revise the program radically to make it of the greatest practical benefit to the members at the present time. Addresses of welcome and other time-consuming formalities have been eliminated. Several reports, which are not of immediate timely interest are to be replaced with papers and reports on various phases of the labor and material situations as they now exist. The executive committee of the Bridge and Building Association held a meeting last week at which similar action was taken regarding the convention of that society, scheduled to be held in St. Paul the third week in October. The place of meeting was changed to Chicago to make it more central for the members and to avoid placing a transportation burden on any one or two railroads. The Maintenance of Way Master Painters' Association has also decided to proceed with its convention at Cleveland the third week in October.

There has been a strong tendency to call off the conventions of the various railway associations since the United States entered the war. In those fields in which few, if any, special problems have arisen this action may be advisable, but in those branches of railway service such as the maintenance of way department in which new and highly important problems have been presented which demand solution, there has never been a greater need for association work with its possibilities for united discussion and the exchange of ideas. Difficult as it may be for a man to leave his work under existing conditions, the very fact that he is so handicapped makes it all the more necessary that he avail himself of the opportunities to learn of better methods whereby he may conserve the forces and materials he has. Many of the problems which are now giving so much trouble

have arisen so recently that there has been no chance for other than individual study. If, therefore, these associations ever had an opportunity to be of real service to their members, this is the time.

By revising the programs to make them more applicable to the present problems, these associations are endeavoring to rise to the occasion. Instead of a smaller attendance at these conventions this year, it should be larger because of the greater demand for the information which will be brought out. Railway officers can do well to encourage their men to attend these meetings, for if a man goes to them with serious intentions, the results will be reflected in his work.

FREIGHT CAR EFFICIENCY

SOME roads have been inclined to complain whenever their percentage of equipment on line has been less than 100 and to point out that they could have served their local shippers much better if their cars had not been scattered on other roads. Many of such complaints entirely overlook the fact that about the only time an originating road ever had 100 per cent of its equipment was at a time of depression when there was a general car surplus. Many roads that have cited figures to show that they have been able to supply only a certain percentage of the requirements of their shippers have actually loaded more cars and done more business than ever before.

To illustrate the fact that the percentage of cars on line is of less importance in indicating the condition of a railroad than has sometimes been attached to it, some interesting figures have been compiled for five typical roads, with a view of determining relative service to the public and of ascertaining what per cent of car ownership produced best operating results as gaged by average miles per car per day. For this purpose figures for two leading railroads in the east, classified as delivering lines, and three leading central western lines, classed as originating or producing lines, were taken, showing the percentage of cars on line and the average car movement per day for a two-year period from April, 1915, to March, 1917, inclusive. From these were selected the average for the six months when the greatest car mileage per day was made for comparison with the six months when the poorest mileage showing was made. The results were as follows:

DELIVERING ROADS			
	Per Cent Cars on Line	Average Miles Per Car Per Day	Increase in Total Car Miles
No. 1	107.5	18.3	28.0%
	133.7	11.5	..
No. 2	135.7	19.7	5.0
	153.4	16.6	..
ORIGINATING ROADS			
No. 3	76.7	38.5	13.4
	96.4	27.0	..
No. 4	94.6	28.4	9.0
	102.4	24.0	..
No. 5	60.4	37.1	3.4 Dec.
	82.4	28.4	..

In each case the greater mileage per car per day was made when the percentage of cars on line was less.

These statistics also give an indication of the often-repeated statement that car shortages are by no means necessarily caused by a lack of cars so much as by a shortage of other facilities for handling freight promptly, including not only railroad facilities but those of shippers and consignees for loading and unloading. The ability of a delivering road to serve the public depends not only on the facilities which it has provided but also on the ability of consignees to promptly dispose of the freight delivered to them, so that cars may be released and that room may be made for others. The figures cited for the two eastern roads show that they were able to make a fair average mileage per day with from 107 to 135 per cent of cars on their lines but that when this percentage increased the movement was slowed up. It is a well-known fact that much of the congestion during the past few months has been due to the inability of eastern consignees, especially at the seaports, to handle the freight deliv-

livered to them, with the result that eastern lines first became congested and the congestion backed up until its effects were felt even west of the Twin Cities.

THE B. OF R. T. STRIKE IN CHICAGO

THE strike in the Chicago terminals last week of switchmen belonging to the Brotherhood of Railroad Trainmen will harm not only that organization but the entire cause of organized labor. Probably it was condemned by the members of labor organizations generally and especially by a majority of the members of the railway labor brotherhoods. It was unwise from the standpoint of organized labor because of the gross disregard of the public welfare which it showed and because those who called it so greatly over-estimated the strength of the strikers that it was practically lost by them when officers of the other three large labor brotherhoods intervened and suggested a plan of settlement which, with some important modifications, finally was accepted by the roads. While, however, the strike doubtless was condemned by most members of the railway brotherhoods, it was entirely consistent with the action taken by the heads of all the four large brotherhoods in calling a strike on all the railways last spring when the Adamson law case was pending in the Supreme Court.

The representatives of the Brotherhood of Railroad Trainmen in Chicago simply seized upon a time when, as they supposed, the railways were in a vulnerable position, to wring from the roads concessions which could not be secured at any other time. All the railways of the country are obliged to exert themselves to the utmost to handle the vast traffic now moving. A large part of this traffic passes through the Chicago terminals, and at present includes much military traffic for the government. The brotherhood leaders in Chicago apparently believed that the railways would concede almost anything to avoid an interruption of traffic through that city and therefore that if a strike were called it would be quickly won. The railways charged that the strikers, in effect, demanded the closed shop on roads with which the Brotherhood of Railroad Trainmen had contracts, and also tried to establish the principle that members of their organization must be promoted to assistant yardmasters and yardmasters in preference to other persons. The spokesmen for the Brotherhood of Railroad Trainmen deny this and say that the demands they made were reasonable; that they were made only to protect members of the organization against discrimination, and could have been granted by the railways without doing any harm.

The demands speak for themselves. One of them was that "in the employment of yardmen the B. of R. T. men shall be given preference." This would not absolutely restrict railways having contracts with the B. of R. T. to the employment of members of this organization, but it is evident that under it they could not employ men not belonging to this organization without constant friction and danger of strikes. The Managers' Conference Committee offered a rule providing that there should be no discrimination against members of the Brotherhood of Railroad Trainmen.

Another rule for which the B. of R. T. asked was that "yardmen discharged can only be reinstated by mutual agreement between officers of the company and the properly authorized committee representing them." Since on a road having a contract with the Brotherhood of Railroad Trainmen the committee of this organization would be the only one representing the men, it is clear that a man who did not belong to this organization would have much difficulty if he were discharged in ever getting back into the service. Under the operation of these two rules it would not be long until on any road having contracts with the B. of R. T. there would be no yardmen in the service not belonging to this organization. There may be a distinction, but there is no substantial difference between such an arrangement and the closed shop.

Finally, it was demanded that "in the employment of yardmasters and assistant yardmasters senior qualified yardmen shall be given preference." This rule would support the other two rules in making effective the closed shop; and it would undermine discipline and efficiency by setting up previous employment and seniority instead of special fitness as the qualifications for official positions. Why should preference be given to yardmen rather than to yard clerks or trainmen, if the latter are considered as fit or more fit than the yardmen?

It was to force the acceptance of these novel and unreasonable rules that the representatives of the Brotherhood of Railroad Trainmen in Chicago on Friday morning ordered a strike to begin at six o'clock on Saturday morning. To call a strike to secure the adoption of such rules when the Managers' Conference Committee already had suggested mediation by federal authorities would have been bad enough in any circumstances. To call it when the country was at war and needed the service of every railroad yard, track, locomotive, car and employee showed a seeming want of regard for the public welfare and a lack of patriotism that are difficult to understand.

The responsibility for the strike does not rest entirely upon the officers of the Brotherhood of Railroad Trainmen. It rests also upon Congress. Congress was warned last September that developments of this kind were likely to occur unless a law to prevent them was passed. Congress was shown beyond question last spring that this warning was well founded, when under still more serious conditions a strike was ordered by the heads of all the four railway brotherhoods. Congress, however, refused to act to protect the public and in consequence we have now actually seen a strike put into effect in Chicago by representatives of one of the brotherhoods. Is any more conclusive demonstration needed of the proposition that this country will not be safe from serious railway strikes during the war unless legislation is passed to prevent them?

STATE REGULATION INTERFERES WITH RAILROAD EFFICIENCY

A FEW days after war was declared the chief executives of the railways met at Washington and formed an organization for the purpose of operating all their facilities in such a way as to help the nation to the utmost in the struggle which it had entered. Those who have during recent years followed closely developments in the field of railway regulation anticipated that some of the most serious obstacles encountered by railway managements in accomplishing this purpose would be interposed by state railway commissions.

Unfortunately, the regulating commissions of some states are justifying the uncomplimentary apprehensions expressed regarding them. E. P. Ripley, president of the Atchison, Topeka & Santa Fe, has written a letter to the Chicago Tribune in which he calls attention to the situation with respect to minimum carload weights, and the attitude which has been assumed regarding it by some state commissions, and especially that of Kansas. The Public Utilities Commission of Kansas has refused the application of the Kansas lines for leave to advance the minimum carload of flour and other grain products from 24,000 to 40,000 lb. "In the western rate advance case in 1915," as Mr. Ripley says, "the Interstate Commerce Commission permitted an advance of this minimum to 40,000 lb. on interstate shipments throughout the states of Illinois, Wisconsin, Minnesota, North Dakota, South Dakota, Colorado, Nebraska, Iowa, Kansas, Missouri, Arkansas, Louisiana, Texas, Oklahoma, and New Mexico. But in the states the carriers have not been able to secure like advances; and this is called to your attention as an illustration of the impossibility in practice of getting anywhere with transportation in this country as long as states are thus able to block the way. Even the load of 40,000 lb.

which the commission in the western advance case authorized the carriers to require for interstate movement, is really only half a load, for it was shown during the trial of that case that flour and other grain products for export load from 70,000 to 85,000 lb. In the interest of efficiency the carriers have increased the power of their locomotives and the carrying capacity of their cars, but their efforts have been balked by the toadying of politicians on state commissions to the selfishness of shippers, who insist upon the privilege, at the expense of the commercial and industrial interests of the United States, of buying only a third of a load of flour at a time."

Mr. Ripley contrasts the minimum weight fixed by the Interstate Commerce Commission with those which have thus far been kept in effect in a number of western states. The figures for ten of these states are as follows:

	Pounds		Pounds
Illinois	24,000	Missouri (flour)	24,000
Minnesota	30,000	Missouri (other products) ..	30,000
South Dakota	30,000	Arkansas	24,000
Nebraska	24,000	Oklahoma	24,000
Iowa	24,000	New Mexico	30,000
Kansas	24,000		

Continuing, Mr. Ripley says: "When it is considered that the average equipment of today will carry about 60,000 and most of it 80,000 lb. and over, the minimum of 24,000 lb. which the state of Kansas refuses to advance is nothing less than an outrage upon investors, a gross discrimination against shippers furnishing large loads, and in this time of war such an 'aid and comfort' to the enemy as to be really treasonable.

"Wisconsin allowed an advance to 40,000 lb. the other day, and recently Minnesota granted a miserly advance from 26,000 to 30,000. Kansas denies any relief. And there you have the conflict and confusion which beset us everywhere."

As Mr. Ripley says, applications for increases in carload minimums are pending in Illinois, Iowa, Nebraska and many other states, but while the need for action is acute and will become much more so within a few months, most of the state commissions seem indisposed to do anything. Their members apparently are thinking more about how some of their influential constituents may feel concerning an advance in minimum weights than they are about the things that need to be done to enable the United States and its allies to win the war.

Mr. Ripley illustrates the great increases in railroad efficiency which might be secured if only the railroads were allowed to adopt the measures necessary adequately to increase carloads. He says: "In the last year the Santa Fe handled 56,512 carloads of flour and other grain products, which loaded on an average about 39,000 lb., the larger load of the interstate movement having been pulled down in the average by the smaller loads in the states. Had this average load of less than 39,000 lb. been increased by 11,000 lb. and made merely a fair load of 50,000 lb., the Santa Fe would thereby have saved for other transportation uses and for other shippers about one car out of four—that is, in moving 56,512 shipments of grain products it employed about 14,000 cars more than were necessary for that transportation. What a stupendous waste for only one carrier on only one commodity! What I say about grain products is true in varying degrees of many other commodities moving in large quantities."

A statement of facts such as that made by Mr. Ripley is the severest indictment that can be drawn against our dual system of regulation of railways. There seems to be little ground for hoping that state regulating authorities will ever become intelligent and public-spirited enough to put the welfare of the country as a whole above the supposed interests of the people of their own states. Apparently the only remedy for the unsatisfactory conditions to which regulation of the railways by both the state and federal authorities gives rise is the abolition of state regulation.

Letters to the Editor

THE NEW IMPACT FORMULA

CHICAGO, Ill.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

The American Railway Engineering Association adopted a new impact formula for the design of railway bridges at its last annual convention. This formula is

$$I = \frac{30000}{30000 + L^2}$$

In which I = the fraction of the live load stress to be added to provide for impact and L = length of the span in feet. The old impact formula, which is a part of the specifications for bridge design adopted by the Association in 1912, and which has been widely used is

$$I = \frac{300}{300 + L}$$

in which I = the fraction of the live load stress to be added to provide for impact, and L = length of loaded track on the span in feet. A comparison of the per cent of live load allowed for impact by these formulas is shown in the diagram for spans from 100 to 400 ft.

An essential difference in these formulas is found in the meaning of L . In the new formula L is the length of span for all main truss members except those whose sole func-

Graphical Comparison of the Formulae.

tion is to support floor beams, while in the old formula L equals the length of loaded track required to produce the maximum live load stress in the various members. Thus, for end posts and chords L is practically the span length in both formulas, but for web members, the value of L in the old formula varies.

The impact produced by rolling loads on railway bridges is not susceptible of vigorous mathematical analysis, and the results of experiments must therefore furnish the principal basis for an impact formula. However, there are certain theoretical considerations which should be satisfied and which are satisfied in the new formula, although its constants are the result of experiments. Theoretically L should be the total span length for all main truss members.

The impact on the trusses does not arise from the jarring effect of the rolling loads but from that part of the deflection of the entire truss caused, in most part, by the rhythmical application of the centrifugal force of the overbalance in locomotive drivers which sets the bridge to swinging in a

vertical direction. If the period of vibration of the entire bridge and its load is the same as the time required for one complete revolution of the drivers, the amplitude of swing of the bridge will reach a maximum, because each application of the centrifugal force, both upward and downward, then tends to increase the total deflection and this condition gives maximum impact on the trusses. Since the impact, causing deflection, produces maximum stress in *all* the members when the deflection is greatest, it follows that the impact is a function of the span length and L should therefore be used as the entire length of the span.

It is to be hoped and expected that this new formula will meet with the approval of engineers generally and that it will be used to an extent justified by its adoption by the American Railway Engineering Association and by the great number of experiments and the large amount of work devoted to its development. It is easy of application, since the same factor applies to all main truss members; and, moreover, it results in a slight economy in the weight of steel in the bridge. The reduction of weights resulting from its use instead of the old formula in a span of 175 ft. designed for Cooper's E-50 loading is about 10 per cent in the trusses and less than 6 per cent for the entire bridge. In longer spans the weight of steel required to provide for dead load increases faster than that required for live load, so that the percentage of economy tends for this reason to decrease as the span length increases. However, by reference to the diagram it is seen that the impact as given by the new formula decreases faster as the span increases than that given by the old, so that the saving in weight tends to increase for that reason. For spans of from about 150 to 400 ft. the economy from using the new formula for the trusses instead of the old will amount to approximately 5 per cent of the entire weight of the bridge.

The experiments upon which this new formula is based and the work of its development was performed by the subcommittee on Impact and Secondary Stresses of the Committee on Iron and Steel Structures of the American Railway Engineering Association of which Prof. F. E. Turneaure is chairman, and to him and to Prof. C. L. Crandall the credit is due in great part.

A. C. IRWIN,
Engineering Department, Chicago, Milwaukee & St. Paul.

TRANSVERSE FISSURES

ST. MARVS, Pa.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

The transverse fissure problem as presented by James E. Howard in the report of the Interstate Commerce Commission, an abstract of which is published in *The Railway Age Gazette* of March 23, and the comments made on the article in the issue of May 25 by John D. Isaacs are very interesting. The examination of rail failures is not carried to a conclusion in many cases. One seldom hears of transverse fissures or broken rails being produced on bridges or perfect foundations where the ties are close together and in perfect surface. The larger percentage of examinations of transverse fissures are made after the rails have broken, causing more or less damage to the road bed from which little, if anything, can be learned after the track bed had been torn up by derailed cars or locomotives.

Much time and money has been expended in trying to solve this problem without taking into consideration the outside influences that bear on the problem; such as flat wheels (of which there are thousands running, some for a very short time and others for days before they are removed, in which time they may do considerable damage when the condition of the track and the flat spot form the proper combination) alternating soft and rigid spots in the track, ties spaced too far apart (irregular spacing) and the cold rolling process that takes place.

There are many bad track conditions of apparently slight significance to the track walker and which he would have

difficulty in finding that can contribute to the transverse fissure condition. It is true that defective material plays an important part in some cases, but not all, or a good deal. Therefore, the logical conclusion is that Mr. Howard's report would be borne out if some of the actual conditions of wheels and track were made a part of the analysis as well as the rail. While it would cost considerable money to make tests under such combined conditions it would probably bring out some valuable data as to the transverse fissure.

E. F. GIVIN,

Mechanical Engineer, Pittsburgh, Shawmut & Northern.

THE VALUE OF RAILWAY CLUB ADVERTISING

SAN FRANCISCO, Cal.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

As one who has for many years been a constant reader of the *Railway Age Gazette*, a contributor of many articles to its pages, and an ardent admirer of its policies, I feel that I should be privileged to criticise your editorial of July 13, entitled, "Western Railway Club Drops Advertising"; and incidentally, as secretary of the Pacific Railway Club, to dispute some of its statements.

When it was decided to establish a forum for the presentation and discussion of subjects relating to construction, operation and maintenance, the executives of the Pacific Coast roads were a unit in expressing the belief that the most good could be accomplished by taking as models the highest types of professional societies: bar associations and medical societies. These societies admit to membership only persons who are actually practicing their professions, and I doubt if there can be found anywhere in this country a bar association that carries law-book salesmen on its membership roll, or a medical society whose roster boasts the presence of patent-medicine manufacturers. The Pacific Railway Club limits its membership to (a) persons actively engaged in railroad service, (b) in the service of a railroad regulatory body and who has had not less than three years' active railroad experience, (c) faculty members of colleges of recognized standing.

You will note that no place has been provided for supply salesmen or manufacturers. But the club membership does include the professors of railroad engineering and economics at our two universities, and we maintain a junior membership for college students in railroading and young men in railroad service who desire the use of the club as an educational adjunct. Thus we are endeavoring to make of our club something more than a mere gathering place for railroad men and supply salesmen.

The members of the Pacific Railway Club pay the highest dues paid by any railway club membership in the United States and Canada. The reason for this is that we have fewer men to draw our membership from and cost of operation is higher in the far West than elsewhere. If the club had to depend upon the dues paid by members for its support it could not afford to continue the publication of its official proceedings. That the contents of these proceedings have a distinct value is proved by the reprinting of some of the papers contained in them in no less an educational journal than the *Railway Age Gazette* itself.

If I may make the comparison: just as the *Railway Age Gazette* could not exist alone on the receipts from subscriptions and continue to provide the railroad world with the high-class service it is now giving, so the Pacific Railway Club could not do its share without advertising support.

As to the advertising value of our "Proceedings." We publish monthly a minimum of five hundred copies, each one of which goes into the hands of a railroad man who either specifies or purchases railway material, or who will at some future time specify railway material. That means 100 per cent circulation efficiency. For a half-page advertisement we charge less than postage on a circular letter;

one and a half cents per unit of circulation. For a full page advertisement, less than the cost of postage and printing of a circular letter; three cents per unit of circulation. The three advertising agencies who place most of your clients' advertising have approved our "Proceedings" as an advertising medium.

In view of the above, I think that you will agree with me that the Pacific Railway Club is asking nothing of the supply people for which it does not give full return. Medical societies carry the advertisements of medicines and appliances in their journals; bar associations advertise law books in theirs; why should not railway clubs take advantage of the value of their journals as advertising mediums and make the most of them?

If I did not know the high standards of your paper and the high type of journalists who operate it, I should be inclined to think that your management objected to the opposition of the club journals to your magazines as advertising mediums. I hope that you will give this communication the same publicity that you gave your editorial; this, in justice to such clubs as the Pacific Railway Club.

WILLIAM S. WOLLNER,
Secretary Pacific Railway Club.

MAN FORCE, CAPITAL AND TRANSPORTATION EFFICIENCY

EAST PITTSBURGH, Pa.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

I have read, with much interest, your analysis and conclusions in the "The Decision in the Fifteen Per Cent Rate Case," published in your issue of July 6.

I would like to suggest that in addition to the matters you cover, showing a tendency toward a slowing down in development, there is another situation, also which the railroad managements cannot control, which may cause some tendency toward slowing down transportation accomplishment. Every manager senses always the delicate poise in which his organization is held, as between initiative and active, efficient endeavor on the one hand and a passive, just making good sort of an effort of the whole organization under him on the other. We are all very proud of the accomplishments of our railroad organizations. A new condition has been forced upon the railroads, however, which cannot do other than, at least in some degree, slow up their past enviable quality in this thing. The war is draining from the railroads large numbers of the "picked," long experienced, most highly efficient, employees. Their places will be filled by new employees. To a great extent a "shift" will be made, and vacancies filled by women. The most serious situation in this, however, is the fact that on account of war draining the country of its best, virile, young manhood, the railroads cannot recruit the same quality of employee as in former times.

The effects of this transition have not yet been felt. The question arises whether under the stressed conditions it will be possible for the managements to keep up the past quality of their organizations. Is it not fair to assume that this may easily affect organization development adversely to such a degree that the resulting difference between the virile, active, strong organization, and the weaker organization, may readily shift results to offset the small degree of net rate advance permitted? To me, the most obvious and the only remaining means of keeping the net organization results high requires placing a better tool, or more of them, in the poorer employees' hands. It would seem, also, that this is one of the legitimate situations that might likewise have been considered by the commission in its decision, but which does not seem to have been done. As man power efficiency comes down, capital requirement must go up, as the substitution to maintain at par the third value—transportation.

Q. M. HERSHEY.

Cantonment at Fort Riley, Kan., in Course of Construction

Railways Active in the Nation's Service

**Moving Government Supplies and Forces, Working on
Cantonments, War Posters, the Draft. Other Matters**

WASHINGTON, D. C., July 31, 1917.

PLANs for the solution of one of the most important transportation problems placed before the railroads by the war have just been adopted by the Railroads' War Board after a series of conferences with the authorized officers of the Army, Navy and the United States Shipping Board. The problem concerns the supply and expedited handling of the thousands of cars required by the government to transport lumber and other supplies to the shipbuilding yards, cantonments and other mobilization points, which movement has already assumed considerable proportions. During the next few months it is estimated that 100,000 cars will be needed for government purposes. The plans agreed upon are described in a bulletin issued by the Railroads' War Board to all railroads.

CAR SUPPLY AND MOVEMENT FOR GOVERNMENT SHIPMENTS

Arrangements have been completed under which advance notice will be given the Commission on Car Service whenever orders exceeding 10 carloads or 250 tons are placed for material or supplies and a form has been prepared for this use. Arrangements have also been perfected under which the authorized officers of the departments and the shipping board will issue car orders on another form to the railroads on which the supplies are to be shipped, instructing them to provide the number of cars ordered within the time specified and at the shipping points designated. These forms are to be furnished only where the ordinary means of securing cars have failed. They will be filed by shippers with the railroad agent at originating point and upon their presentation cars will be promptly furnished in accordance therewith. A record of cars furnished will be maintained on the back thereof. In case of inability to provide equipment promptly the railroad with which they are filed will communicate with the Commission on Car Service, giving date and number of order and by whom consigned.

To prevent shippers from utilizing for their own purposes cars needed for the government service, railroads are instructed that cars furnished on one of these orders must not be used except for the loading specified in the order. The

forms will be supplied to the departments interested and the railroads are directed to instruct all concerned as to their use. To assist further in keeping cars bearing government supplies moving without delay, a form of envelope in which the waybill is to be carried, similar to that shown in the illustration, is to be furnished by authorized officers of the departments and the Shipping Board to persons or firms making shipments of material for the use of the Army, Navy or the Shipping Board. These envelopes will show the following headings in large type: "United States Government," "United States Army Supplies," "United States Navy," "United States Shipping Board." Cars accompanied by these envelopes must be given continuous movement and must not be delayed.

In addition, railroads have been directed to instruct their agents at all points to stamp or write in a permanent place on waybills covering less than carload shipments consigned to officers or agents of the Army or Navy or of the Shipping Board the words "United States freight. Expedite." The stamp for this purpose should preferably be used at all stations of any size.

Railroads to which the car order or the waybill envelope is presented are to furnish cars and handle loaded cars in accordance with the instructions, regardless of the name of the consignee, inasmuch as the forms are only furnished by responsible officers of the Army, Navy and of the Shipping Board, who will undertake to prevent any abuse. If any doubt exists with reference to the propriety of the use of the waybill envelopes, the instructions state that the movement should be accomplished and the matter then taken up for investigation. The bulletin also states that if departments of the government or individual railroads desire to place cards of their own form upon cars to assist in securing continuous movement there is no objection to such practice.

RUSHING CANTONMENT MATERIALS

Over 12,000 carloads of lumber and other building supplies have been delivered by the railroads to the 16 cantonments that are to house the first division of men called to the

colors by the draft within 30 days from the date that the government placed the first orders for cantonment materials. When the cantonment work was first started C. E. Denney, assistant to the president of the New York, Chicago & St. Louis, was assigned as general agent in the office of Col. Littell of the quartermaster's department at Washington during the period of construction. Mr. Denney's work is to co-operate with the quartermaster's department to keep in touch with all phases of the construction work, track building, etc., and furnish advance information to the Commission on Car Service concerning the government's orders and the number of cars required to fill them. From his reports and those of the agents at the cantonments the Commission on Car Service is able to keep informed when and where cars will be needed and to make provision for furnishing them. To insure the prompt delivery of all cantonment supplies, railroads are giving preference to government shipments and the Railroad War Board has assigned an experienced railroad man as a general agent at each cantonment to work in co-operation with the constructing quartermaster. These agents make reports regularly concerning the number of carloads of material received, the number of cars unloaded, etc.

Additional trains, loaded to capacity with lumber, brick, piping, wire, poles, water mains and all the other materials needed to construct cities capable of accommodating 40,000 inhabitants, are arriving daily. These trains are swiftly unloaded and meanwhile other cars are placed at the supply points for new loads.

An indication of the speed with which the materials are being moved, and also the teamwork between the railroads, and the construction forces, is contained in a report from the cantonment at Louisville, Ky. The report states that one of the administration buildings there was built from lumber cut in a Mississippi pine forest the week before. The trees were felled on Saturday, kiln dried on Sunday, loaded on freight cars Monday and delivered at the Louisville site on Wednesday morning. An army of energetic carpenters speedily converted them into an administration building, completing the transformation from forest to government structure just one week from the day they had been felled.

Altogether 1083 carloads of lumber and 149 carloads of other supplies have been delivered at Louisville during the past three weeks, a total of 1232. At Petersburg, Va., 965 carloads of lumber and 431 carloads of other materials have been delivered, a total of 1396, at Ayer, Mass., 807 carloads of lumber, 532 of other materials, a total of 1339; at Fort Sam Houston 934 carloads of lumber, 612 of other materials, a total of 1546.

In order to reach many of the cantonment sites, the railroads have had to build branch lines from the nearest main line, at their own expense. It has also been found necessary to lay anywhere from 4 to 6 miles of additional trackage on each site to supply facilities for the local movement of materials necessary to the rapid progress of construction work.

MOVEMENT OF MILITARY FORCES

The railroads have been handling large numbers of troops and large quantities of supplies to the seaports for transportation to Europe for General Pershing's expeditionary forces and it is understood the various movements have been handled to the entire satisfaction of the War Department authorities. Details regarding these movements cannot, however, be published under the rules promulgated by the Committee on Public Information for the volunteer consorship under which newspapers and other publications have been operated. New regulations have been issued this week containing the general request that there shall be no published mention of the arrival of American troops or supplies at European ports nor information regarding train or boat movements of troops nor information tending directly or indirectly to disclose the number or identity of troops in the expeditionary forces. The rules also cover information of the movement of military

forces towards seaports or of the assembling of military forces at seaports, from which inferences might be drawn of any intention to embark them for service abroad.

RAILWAY EMPLOYEES SUBJECT TO DRAFT

The Railroads' War Board recently issued a circular to the railroads quoting a letter received from the Provost Marshal General, advising that there can be no exemption from the draft by classes, but that each individual case must be

UNITED STATES

Waybill Envelope for Government Shipments

taken up and determined upon its own merits by the federal exemption boards in accordance with the regulations promulgated by the President. The letter states that it is the policy of the administration to so execute the selective service act as not to unnecessarily cripple any industry.

To the railroads the war board suggested that a careful census be taken of the men on the various roads subject to draft, classifying them as to unmarried and married and with reference to dependents, also showing those who may be relieved from this service without embarrassment since they can be replaced either by men experienced in railway

operations or by women. As to those who it is felt should be relieved from military duty, it is suggested that lists should be prepared setting out the facts in detail for each district, with affidavits detailing the facts to be subscribed to by the immediate superior officers and certified to by the superintendent or head of the department, these lists and

the war with Germany. The Nation is counting on you."

Number 3 shows Uncle Sam holding out a copy of bulletin No. 12 issued by the Railroads' War Board outlining methods of increasing the efficiency of the railroads. Below the picture is the following:

"Have you read bulletin No. 12? The War Board direct-

affidavits to be promptly furnished the exemption boards in the various districts.

RAILROAD WAR POSTERS

The Railroads' War Board has now had prepared three of a series of posters to be posted in various places where railway employees congregate, emphasizing the importance of railroad efficiency in war. The first of this series was described in these columns some time ago. The second is headed "Locomotives and Shrapnel" and shows a picture of

ing the operation of all the railroads in the United States during the period of the war, has issued a bulletin—No. 12—telling you how to help your country. Read it! Live up to it! The Nation is counting on you."

* * *

B. A. Enloe, chairman of the Tennessee Railroad Commission, has written a letter to Fairfax Harrison, chairman of the Railroads' War Board, in reply to Mr. Harrison's letter asking for the co-operation of state commissions in the work of conserving transportation. Mr. Enloe says his

Unloading Lumber at the Wrightstown, N. J., Cantonment

Uncle Sam pointing with one hand to a locomotive and with the other to a pile of ammunition. Below the picture is the following:

"Our Nation needs locomotives as much as shrapnel. Ordinarily, 15 per cent of all the locomotives on our railroads are in the repair shop. By reducing that percentage to 10 we can add 3,325 locomotives to the number available for use on our railroads. If we can keep more locomotives in good running order, we will help our country in

commission is making no unreasonable exactions of the railroads and is co-operating in various ways but he protests against the "unjust and unfair discrimination" practiced against the railroads of his state by allowing their equipment to be taken north of the Ohio river and held there instead of being returned. He cited figures to show that on July 1 the southeastern lines controlled 29 per cent less box cars than they owned and urged an increase in the per diem rate. After citing the increased demurrage rate, up

Bridge Work on the Chalco-Yutan Cut-Off

The Structure Over the Platte River on the New Burlington Line Involved Ingenious Foundation Methods

THE Chicago, Burlington & Quincy recently completed a cut-off 12.37 miles long which shortens the distance over its line between Omaha and Sioux City, Iowa, by 15.74 miles and provides a low grade line from Omaha into the Platte river valley. The new line is known as the Chalco-Yutan cut-off as it begins at a point 2.89 miles west of Chal-

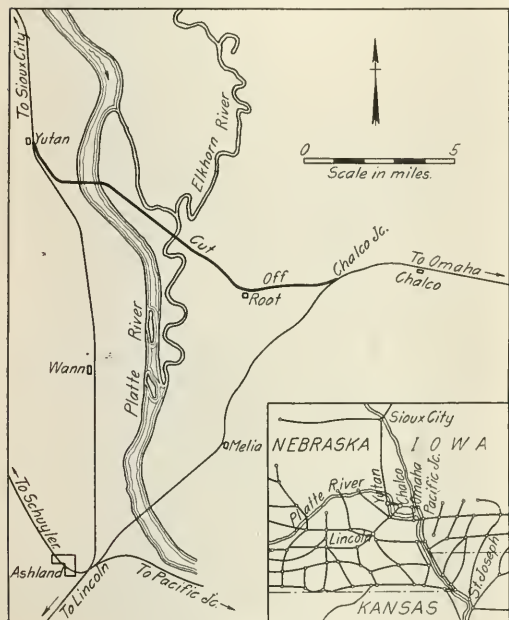

The line involved considerable heavy work for this part of the country. One cut, consisting of about 250,000 cu. yd. of earth, caused trouble because several springs were encountered about 25 ft. above grade. The material was all handled by steam shovel and trains. Excavated material was hauled from three to five miles for use in embankments in the Platte river bottoms. The grade for four miles across these bottoms was built by a drag line outfit and was rather wet work.

The tracks were carried over the Elkhorn river on a temporary pile and frame trestle which was later replaced by a permanent structure consisting of two 50-ft. spans, one 100-ft. span and one 105-ft. span, all deck plate girders. The grade of this bridge is about 40 ft. above the river, necessitating high piers. The foundations for these piers consist of 18-ft. by 40-ft. concrete box cofferdams 15 ft. deep, sunk by excavating the material from within which was handled by a track derrick and an orange peel bucket operated from the track on the temporary bridge. Wooden foundation piling were then driven within these boxes and capped with concrete on which the neat work of the piers was constructed.

The east approach fill to the Platte river bridge is composed of sand excavated from the river by a drag line. Five hundred feet of this approach was built in the river, the drag line working from the new fill and moving forward as it was completed.

THE NEW PLATTE RIVER BRIDGE

The Platte river bridge has a total length of 1,383 ft. and consists of four 75-ft. girder spans on each side of the river with 700 ft. of pile trestle between and short bank spans at the outer ends. The entire bridge is on a tangent on a 0.5 per cent grade. The two girder structures at each end of the bridge cross the main and secondary channels characteristic of the Platte river, necessitating the provision of ample waterway openings close to each shore line. The middle of the river is usually very shallow and in the dry season is a dry sand-bar which seldom or never scours out to any great depth so that deep piers are not necessary there for the safety of the bridge. By building the approach fills out from both sides the river has been narrowed from 2,000 ft. to 1,300 ft., thereby causing the channels to scour out under the bridge and providing deep water which permits the free passage of ice and drift during flood stages.

Location of the New Line

co, Neb., on the Chicago-Denver main line and ends at Yutan, Neb., on the line between Ashland and Sioux City. The most important single feature of the project is the bridge over the Platte river near Yutan, which is the second per-

Elevation of the Bridge

manent structure built by the Burlington over that stream in the last few years.

CONSTRUCTION OF THE LINE

The construction of this line was begun in 1914, but work was suspended at the beginning of the European war. It was again resumed in 1916 and completed early in 1917.

The substructure consists of eight deep piers and two shore piers. The latter are founded on thirty 28- and 24-ft. concrete piles driven to a depth of 6 to 8 ft. below low water. The river piers were originally planned to be sunk by the open dredging method but the pneumatic process was later adopted.

A temporary pile trestle was constructed across the river

from which all material was handled for constructing and sinking the caissons. The trestle was built to grade. Opposite the pier sites it was located 15 ft. up stream from the permanent bridge line, but between the two girder structures it was swung over on the center line and joined the permanent trestle which was driven in time to serve for construction purposes.

THE CAISSONS

The caissons were of concrete construction, 17 ft. square at the cutting edge. This edge consisted of 4-in. by 8-in. fir timbers fastened to the caisson by 1-in. bolts 24 in. long embedded in the concrete. The outside surface of each caisson was perpendicular for 12 ft., then offset to an 11-ft. cylinder. The inside was 15 ft. 8 in. square at the cutting edge and converted to a circle 8 ft. in diameter at a point 9 ft. above, thus forming an 8-ft. well through which dredging was carried on. The base sections were heavily reinforced on both the inner and outer surfaces. The forms for the bases were of wood and so built as to permit their removal and re-use.

Owing to the shallow waters of the Platte, it was possible to place wooden cofferdam boxes at the pier sites and fill them with sand dredged from the river, thus forming a foundation on which the forms for these caissons were

Details of a Pier and Caisson

erected and concreted. The box cofferdams were built 6 ft. high and 24 ft. square, using 4-in. by 10-in. timbers with 6-in. by 8-in. posts or studding. The sides of the boxes were made separate and were bolted together when in use. Before placing these boxes, it was necessary to build a temporary diversion dam up stream from the proposed pier sites in order to deaden the current, causing silt to be deposited below which decreased the depth of the water in some cases 10 to 3 ft.

To take advantage of low water during the summer the

bases of all eight caissons were built in place and sunk to a depth of 12 ft. to make them safer after which it was planned to go back and complete the sinking which could be done regardless of high water. Each base or bottom section of the caisson was 17 ft. high, that is, 12 ft. of the square base and 5 ft. of an 11-ft. cylinder. Additional sections of cylinder were added as the sinking progressed. Forms for the cylinders were of steel for the outside and collapsible wooden forms for the inside.

Test borings taken some time before indicated loose sand

The Caisson for Pier No. 8

to a depth of 27 ft. below the water surface, then a 2-ft. stratum of clay, under which was a hard white sand or sandstone for an additional depth of 9 ft. Under that a yellow sandstone was encountered, into which the caissons were sunk to a depth of 5 ft.

Piers 6 and 7 were sunk first. These were dredged out and sunk at the rate of 10 to 13 ft. per 10-hour day until the clay and sandstone were encountered. At this point it was impossible to get any more settlement, although the excavation was carried down to a depth of 10 ft. below the cutting edges. Owing to the flaring base of the caissons it was impossible to excavate close to the cutting edges with the dredge bucket through the 8-ft. well. Various means were employed to break up the clay and sandstone under the cutting edges but without success. Because of this condition it was decided to use the pneumatic process to complete the sinking.

PNEUMATIC WORK

Up to this time work was carried on by company forces, but the pneumatic work was let to a contractor. The necessary pressure plant was installed and the open caissons were covered and fitted with air appliances. Wooden decks were made of 8-in. by 16-in. timbers to fit the 8-ft. wells in the

cylinders. After each deck was provided with one 3-ft. man shaft and the necessary air, water and blow pipes, it was lowered to the bottom of the 8-ft. well and supported just above the flare inside of the base. The sides of the deck were padded with oakum and covered with burlap to take up any irregularities on the surface of the concrete inside the well. This permitted sealing with concrete under water. From three to five feet of a concrete seal was placed in this manner and when set the caisson was unwatered above the

Rock Filled Cribs and Rip Rap to Protect Embankment

deck and concreted to above the water surface. Sand hogs were then able to continue the excavation and the sinking progressed to a landing without further trouble. In some cases it was necessary to go to a depth of 58 ft. to obtain a suitable foundation.

All concrete work was handled by a 10-cu. ft. Ransome mixer mounted on a flat car and operated by steam from a small upright boiler placed on the car. Bank run gravel was conveyed to the mixer hopper from cars adjacent by

The Concrete Mixer Plant

means of a narrow-gage dump car on rails laid on the deck of gravel and mixer cars. The mixed concrete was handled to the forms by spouting.

THE SUPERSTRUCTURE

The eight spans of 75-ft. girders were placed in two days by a 25-ton track derrick and a 25-ton locomotive crane. The girders were loaded at the storage yard and hauled $\frac{1}{4}$ mile on two flat cars, two girders or one span at a time.

Each girder was placed separately, and they were bolted together after landing them on the piers. The bridge floors consist of 8-in. by 10-in. by 10-ft. creosoted ties with 4-in. spaces between them, covered with a fire-resisting paint.

The timber trestle between the girder bridges is 700 ft. long. Each bent consists of six 44-ft. creosoted piles, sway-braced and box-capped with two 8-in. by 16-in. by 14-ft. timbers. The bents are spaced 20 ft. center to center and the deck consists of 9-in. by 24-in. stringers with 8-in. by 8-in. by 10-ft. ties spaced 14 in. center to center with 6-in. by 8-in. outside guard rails. Each bent is protected on the upstream end with a steel nose rounded to fit the piling, and, in addition the sides of each bent are protected from ice by 4-in. by 10-in. timbers placed horizontally. The deck of this trestle is covered with galvanized iron as a protection from fire. Three hand car refuge platforms are provided at a uniform spacing on the upstream side of the bridge.

The Union Bridge & Construction Company, of Kansas City, Mo., was the contractor for the pneumatic piers. All

Partly Completed Piers

the other work was handled by railroad forces. The construction was under the supervision of G. A. Haggander, bridge engineer of the Chicago, Burlington & Quincy, Chicago, Ill., F. T. Darrow, engineer maintenance of way, Lincoln, Neb., and J. H. Merriam, resident engineer, in direct charge.

JAPANESE OUTPUT AND EXPORT OF COPPER ORE.—The output of copper ore in Japan in 1916 amounted to 111,562 tons, as compared with 83,017 tons in 1915, and 78,700 tons in 1914, while exports amounted to 57,402 tons in 1916, as against 56,528 tons in 1915, and 43,305 tons in 1914. Russia now buys most of Japan's copper ore, her purchases amounting to 60 per cent of the total exports. The United Kingdom takes 20 per cent, while France, the United States and India share the balance, but their dealings are not large. The consumption of copper ore in Japan has increased considerably during the last three years, the consumption of 1916 amounting to 59,690 tons, as compared with 27,723 tons in 1915 and 32,045 tons in 1914.

EMPLOYEES' CO-OPERATIVE FARM ON THE ILLINOIS CENTRAL

Illinois Central employees, on Saturday, July 28, participated in a celebration in recognition of the successful organization and operation of a co-operative farm project on company property between the tracks of the Illinois Central and the Chicago & Eastern Illinois at One Hundred and Thirtieth street, Chicago. This tract, known as the Wildwood Farm, represents a new departure in railway agricultural activities. In response to President Wilson's proclamation urging the most extensive production of food stuffs in the interests of the success of the United States and its allies in the war, W. L. Park, vice-president of the Illinois Central, offered the company's right of way and vacant property to employees for garden purposes. Complying with this offer, employees of the railroad in Chicago under the leadership of Wm. J. Pinkerton, an engine foreman, induced Mr. Park to prevail upon C. H. Markham, president of the company, to set aside the unused right of way near One Hundred and Thirtieth street for the purpose of testing a plan of co-operative farming. This plan was advantageous, because a scheme of allotment to individual employees was not feasible on account of the distance of available land from the homes of the men. On April 15 Mr. Pinkerton organized the Volunteer Agricultural Corps of Illinois Central Employees to finance and direct the cultivation of the right-of-way tract offered by the management. After interested employees had cleared the land of old ties, fences and accumulated litter, two farmers were hired to carry on the work of plowing and seeding the land.

The engineering department sent men to the ground to run levels so that the furrows could be plowed to the lowest point for drainage. A farm house was constructed from two refrigerator car bodies and a stable from a box-car. The compensation of the farmers was fixed at \$8.00 a day, which covers not only their own labor but the services of their teams. Tools, seed and water supply were secured and on May 4 the first seeding was done, when four acres were put

corps who have found it possible to put in some of their spare time on the farm.

PLAN OF ORGANIZATION

Under the terms of the temporary organization effected on April 15, employees and officers of the Illinois Central who took from 2 to 18 shares in the corps were made members of the organization. Each share carries with it the obligation to pay into the treasury of the corps the sum of \$1.00 per month for a period of six months beginning with April 1, 1917. The products of the farm are sold at prevailing commission market prices with no special privilege to members except the first choice of purchase. The proceeds of the sales are paid into the treasury of the corps, and will be utilized to pay the running expenses and provide for a working capital to continue operations in the ensuing year. In case there is a surplus it will be divided among the members in accordance with the number of shares held by each. The officers of the corps consist of a colonel, lieutenant colonel, major, eight trustees, and a general secretary and treasurer, who hereafter will be elected by a majority vote of the outstanding shares of the corps at the annual meeting of stockholders, the next session of which will take place on February 1, 1918. Under the temporary organization Joseph H.

Nash, superintendent of motive power at Chicago, was made colonel and M. P. Blauvelt, until recently controller, general secretary and treasurer.

The official depository of the corps is the Woodlawn Trust & Savings Bank, Chicago. All funds paid into the treasury must be deposited by the general secretary and

Captain William J. Pinkerton

A Field of Cabbages

General View of Farm Towards C. & E. I. Tracks

into yellow dry onions. Since that time 60 out of the 90 acres available have been planted with various vegetables, including beets, carrots, parsnips, cabbage, cauliflower, spinach, radishes, turnips, lettuce, beans, potatoes, tomatoes and corn.

In doing the work the farmers have been assisted by two negro laborers and by those members of the volunteer

treasurer within 24 hours of collection. All settlements of obligations of the corps of whatever amount or character must be made by draft or check upon the official depository, all of which must be signed by the colonel and general secretary-treasurer jointly. Up to date 200 officers and employees of the company of all ranks have taken shares in the corps. For several weeks past the farm has been making regular shipments of vegetables to members and others. According to the present scheme of distribution, the vegetables are shipped by suburban trains from Wildwood to various points on the Illinois Central where those sending in their orders are employed. The success of Wildwood Farm is largely due to the efforts of Illinois Central employees, rather than officers of the road. Foremost among these has been Mr. Pinkerton.

First and Last Stages of a Collision

"The Rule of Reason," a New Motion Picture

Striking Lessons in Safety First (Not Omitting a Forceful Anti-Whiskey Lecture) for New York Central Men

MARCUS A. DOW, general safety agent of the New York Central Lines, has brought out a third "safety film" for use in connection with the work of the safety committees of the roads in the New York Central system, and it was shown at the Rialto theatre in New York City on Tuesday of this week. This picture, entitled "The Rule of Reason," is a finished production, surpassing even the two former excellent works of Mr. Dow in this field, "Steve Hill's Awakening" and "The House that Jack Built." It has no

when working on or about freight trains, which are obvious to any man of sense, when he stops to think; with shop safety and some other things thrown in for good measure. The picture lesson is taken up with these things; but the spectator is taken up also with a love story, beautiful actresses, horseback rides, moonlight walks and the usual "movie" details, which make 50 or 60 minutes pass very quickly. Every detail has been managed with perfect skill, and Mr. Dow evidently has secured the best professional ability in all of his assistants.

The exhibition starts off with a verse—"Little Drops of Water, Tiny Grains of Sand," etc., and continues:

"Thus it is that little things make the joys and sorrows of life. Rules cannot govern every little action, every little deed. But common sense, let us call it the 'rule of reason,' will, if cultivated, bridge many a treacherous stream."

The story tells of the adventures of Bob Tracy, a young man employed as yard brakeman, who because of his unsafe habits is a thorn in the side of his brother-in-law, Jack Foster, the superintendent. Hoping to inculcate safety ideas in the young brakeman's mind, Foster puts him on the safety committee. Bob's sister, who is Superintendent Foster's wife, is horrified to discover accidentally that Bob is in the habit of taking, on the sly, a drink of intoxicating liquor from a flask he keeps in a closet at home, each day before he starts for work. He does not get drunk and even his fellow employees are not aware of his habit, which he has succeeded in concealing from others. Mrs. Foster concludes that Bob's carelessness—of which illustrations are given—is largely caused by the fact that his mental acuteness is impaired because of this secret violation of Rule G; and in a dramatic scene she endeavors to make him see that men engaged in hazardous employment should maintain habits that will insure a perfectly normal physical and mental condition at all times, which, to her mind, is a "rule of reason." Mrs. Foster's appeal to Bob, together with his first experience at the safety committee meeting, make a profound impression upon him. The influence of a little four-year-old girl, Baby Foster, his niece, innocently wielded in a sweet childish way, adds to Bob's concern and his con-

Result of a Collision*

connection with the abstruse reasonings which are to be found in Chief Justice White's celebrated decision, in which a certain "rule of reason" was laid down as the law of the land, but is wholly taken up, so far as the lesson goes, with the simple reasonings concerning the care of one's own bodily safety,

*The first and third stages of this made-to-order collision are shown at the head of the article. The first picture was taken at the moment of impact, and the second one a few seconds afterward; the explosion occurred a little later, in a car bearing an "Explosives" card which had not been heeded.

science finally revolts against his shortcomings. Neglecting to close a switch in the yard after he has let a train in on a yard track, and falling asleep because of his improper indulgence, he dreams that a frightful yard collision occurs through his neglect. His dream is pictured on the screen with vivid realism and the wreck scene is equal to and even exceeds in realism the wreck scene pictured in "The House That Jack Built." Told of the wreck by her young son, who saw it from a nearby embankment and who rides post haste on a bicycle to inform her, Mrs. Foster mounts a horse and gallops to the yard in time to save Bob from the fury of his fellow employees, who are bent on vengeance.

Awakening from his dream with a start and stricken with fear and horror, Bob stumbles forward and throws the switch to proper position, and then to his great relief finds the train still safe and that no collision in reality happened. He has had his lesson, however, and taking a flask from his pocket smashes it against a rail and resolves that both carefulness and abstinence shall be his habits for all time. The love story is intertwined with the other scenes, and in the end Bob's fiancée, Betty, who is a stenographer in the superintendent's office, shows her approval of Bob's reformation.

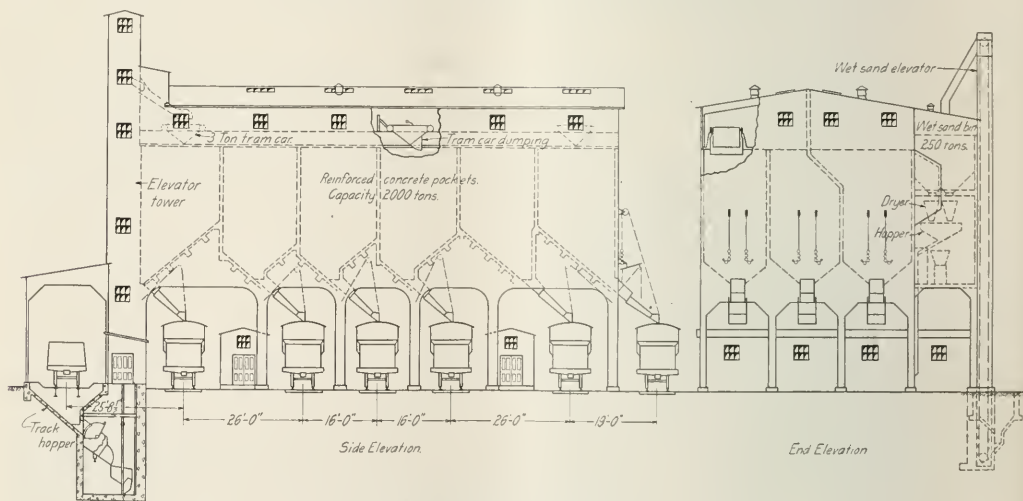

One prominent scene shows the safety committee in session in Superintendent Foster's office and with this a number of accidents due to unsafe practices are cleverly shown on the screen. The chairman of the committee is reading from the accident record book the records of accidents on his division and as the pages are turned each page dissolves into

who was brakeman "Jack Foster" in "The House That Jack Built," is now Superintendent Foster in the new picture, a part which he plays with good taste and ability. Miss Elsie Balfour makes a pretty and winsome stenographer. Mention also should be made of the three children, all of whom are good, but the part played by little Miriam Battista, a clever child actress, who was with Maude Adams in "A Kiss for Cinderella" last season, is one which will have an especial appeal to all. The photography is exceptionally good, the work being done by Irving B. Ruby, camera man for the World Film Corporation.

The "Rule of Reason" will be shown to Central employees in the company's two motion picture cars, which are in reality up-to-date "movie" theatres on wheels. It will also be made the feature of many large safety rallies to be held in important cities during the coming months. The film will also be used, no doubt, by other railroads and industries, as was the case with the other films referred to.

THE LARGEST COALING STATION

Work has recently been commenced on a coaling station for the Philadelphia & Reading at Philadelphia, which will be the largest railway coal handling plant in this country. The capacity will be 2,000 tons; two-thirds of the storage space is reserved for anthracite, and one-third for bituminous coal. The storage will be divided into 18 bins. The plant will be of reinforced concrete and steel construction through-

General Outlines of The Structure

an actual motion picture of the accident described on the page.

The story is a strong one and the production a worthy successor of "The House That Jack Built" now well-known all over the country. As in the former picture, Charles E. Davenport of New York, staged the play with great ability and thoroughness as to detail. A strong cast of professional moving picture stars were assigned to the various roles. Miss Iva Shepard, who had the leading part in "The House That Jack Built," does excellent dramatic work as Mrs. Foster in this new picture. Robert Clugston, a leading man who has appeared in many Fox productions and others, does excellent work as the careless yard brakeman, a difficult part, to which only a finished actor could do justice. Al Thomas,

designed to serve locomotives on six tracks. Two large track hoppers will be provided to receive the coal, each of which will be equipped with elevating machinery capable of hoisting 125 tons of coal an hour.

In addition to the coal handling facilities, the plant will be equipped with sand drying and storage equipment, including a wet sand dump hopper, an elevator, a wet sand storage bin of 250-tons capacity, six Beamer steam sand dryers, and a 125-ton dry sand storage pocket, from which the dry sand can be supplied to locomotives standing on the six tracks. The plant will also be provided with wash houses, hostlers' room, heating appliances and electric lights.

The plant is being constructed by Roberts & Schaefer Company, Chicago, Ill., the contract price being \$265,000.

Denver & Rio Grande 2-10-2 Type Locomotive—The Heaviest of Its Type Yet Built

The Heaviest Santa Fe Type Locomotives

Used in Both Road and Pusher Service on the Heavy Grader of the Denver & Rio Grande Railroad

TEN of the heaviest locomotives of the 2-10-2 type ever built were delivered to the Denver & Rio Grande by the American Locomotive Company about six months ago. These locomotives weigh 428,500 lb. and have a tractive effort of 81,200 lb. Of the ten, five are being used between Denver and Salida, Col., on through freight trains and five are being used between Minturn and Tennessee Pass, Col., which is at the top of the grade between Minturn and Malta, as helpers. The condensed profile of the divisions on which these locomotives are operating is shown and, as will be seen, there are many heavy grades and sharp curves. On the line between Denver and Salida the maximum grade is 1.42 per cent with 6-deg. curves, not compensated, and at one point there is a 12-deg. 30-min. curve.

an increase of 13.4 per cent. While the traffic increased 1.2 per cent as compared with January, 1917, the train-miles decreased 7 per cent and the locomotive-miles decreased 11 per cent. A tabular comparison of these locomotives with the Consolidation and Mallet types, which are used in the same district, is given below:

Type	2-10-2	2-8-0	2-8-2
Service	Through freight and helper	Through freight	Helper
Tractive effort	81,200 lb.	44,000 lb.	95,000 lb.
Weight in working order	428,500 lb.	230,400 lb.	458,000 lb.
Weight on drivers	337,500 lb.	194,100 lb.	394,000 lb.
Weight of engine and tender	624,900 lb.	378,100 lb.	629,200 lb.
Wheel base, driving	22 ft. 6 in.	15 ft. 8 in.	40 ft. 8½ in.

Profile of the Line on Which the 2-10-2 Type Locomotives Operate

Between Minturn and Tennessee Pass the maximum grade is 3 per cent and the westbound track has a maximum curvature of 16 deg. Since the rigid wheel base of these locomotives is only 16 ft. 6 in., no difficulty is experienced in operating on these sharp curves. The locomotives were not designed for helper service, the Mallet type being regularly used for that purpose. Owing to the demands of traffic it was found necessary to use a larger number of helper locomotives and the 2-10-2 type was chosen as best fitted for the work.

In the district between Denver and Salida the traffic amounts to approximately 80,000,000 ton-miles per month. About 25 locomotives are required to handle this tonnage. In January, 1917, when the Consolidation type was being used, the gross tons of freight per locomotive-mile in this district averaged 942. In March, with five of the 2-10-2 type locomotives in service, the average tonnage was 1,068,

Wheel base, rigid	16 ft. 6 in.	15 ft. 8 in.	15 ft. 0 in.
Wheel base, engine and tender	76 ft. 9½ in.	59 ft. 5¼ in.	91 ft. 3¼ in.
Cylinders	31 in. by 32 in.	23 in. by 28 in.	26 in. and 40 in. by 32 in.
Driving wheel diameter	63 in.	57 in.	57 in.
Boiler, working pressure	195 lb. per sq. in.	200 lb. per sq. in.	200 lb. per sq. in.
Heating surface, total	5,369 sq. ft.	3,036 sq. ft.	5,125 sq. ft.
Superheater heating surface	1,329 sq. ft.	998 sq. ft.
Equivalent heating surface	7,362 sq. ft.	3,036 sq. ft.	6,622 sq. ft.
Grate area	88 sq. ft.	49 sq. ft.	80 sq. ft.

In order to make it possible for these locomotives to take 10-deg. curves without trouble, the tires on the first, the main, and the last pairs of drivers were set 53⅜ in. apart. On the second and fourth pairs, the tires are set 53⅜ in. apart. Lateral flexibility in the driving wheel base is secured by the use of the Woodward floating front driving

axle. The front truck has 6½-in. swing either side of the center and the trailing truck 4¾ in.

The boiler has been carefully designed to secure high capacity. It is of the conical type, being 96 in. in diameter at the first ring. An auxiliary dome is provided to carry the safety valves and the whistle. The firebox is fitted with a combustion chamber 50 in. long and has a Security brick arch. The locomotives have Schmidt superheaters and are fired by Street stokers. There are two blow-off cocks on each side of the firebox and one is placed in the front course of the boiler.

The frames are of cast steel, with a top rail 6 in. by 7 in. increasing to 6 in. by 9 in. over the driving boxes. The front frame rails are 6 in. by 13 in. The Commonwealth locomotive cradle is used. The cylinders have bushings of Hunt-Spiller gun iron, and the pistons are fitted with bull rings of the same material. The piston valves are 16 in. in diameter.

A new device which has been applied to these locomotives is the Vincent drifting valve. It consists of a valve attached on the end of the main valve stem and working in a chamber extending out from the valve head. This chamber is connected to the boiler through an automatic shut-off valve and to the steam pipe through a check valve. The operation of the drifting valve is as follows: When the main throttle is opened, superheated steam from the header passes through the pipe shown in the drawing at *T* to the differential valve *B* and closes it against the boiler pressure. When the main throttle is closed, saturated steam from the boiler is admitted through the valve *A* to the differential valve *B*, and thence through a 1¼-in. pipe *C* to the drifting valve connection *D* or *E*. It then passes into chamber *F*, through ports *G* into chamber *H*, and through ports *K* into chamber *L* or *M* according to the position of the valve *J*. When the position of the valve *J* is reversed, steam exhausts through

are of Nikrome steel. The valve motion is of the Baker type controlled by the American Locomotive Company's power reversing gear.

The brake equipment is the Westinghouse E T, with two 8½-in. air compressors. Two 14-in. by 12-in. brake cylinders attached to the frames behind the cylinders are provided

Piping for the Vincent Drifting Valve

for the first three pairs of drivers. The fulcrums for these cylinders are attached to the frames beneath the cylinder saddles. The two rear pairs of drivers are braked by two 12-in. by 10-in. cylinders. The tender trucks are provided with clasp brakes.

Among the specialties applied to these locomotives are the Chambers throttle, Nathan non-lifting injectors, Woodward engine trucks, Cole trailing truck, Chicago flange lubrica-

The Vincent Drifting Valve in Use on the D. & R. G. Locomotives

the ports *K* and *N*, or *P*, into the chamber *Q*, and thence through the pipe *R* into the main steam pipe and steam chest. A check valve *S* prevents steam from the main steam pipe entering the pipe *R*. Drain pipes are provided at the bottom of the chambers *L* and *M*.

The tires on all wheels of these locomotives are flanged. The axles are of carbon vanadium steel, the main axle having bearings 13 in. in diameter and 22 in. long, while the front bearings are 11 in. by 19 in. and all others 11 in. by 13 in. The main crank pins have 9½-in. by 10-in. bearings for the main rods and 10½-in. by 5½-in. bearings for the side rods. The crank pins, side rods and piston rods

tor and Economy radial buffer. The tenders are equipped with Miner friction draft gear, Barber side bearings and lateral rollers, the Lindstrom syphon tank valves and Davis cast steel wheels.

The principal dimensions and ratios of these locomotives are as follows:

General Data	
Gage	4 ft. 8½ in.
Service	Freight

‡Includes combustion chamber heating surface.

PNEUMATIC TUBES IN FREIGHT YARDS

The great length of the modern classification yard introduces a serious problem for the operating force through the difficulty encountered in securing adequate communication between the several parts of these large terminals. Telephones supply the necessary facilities for oral communication but the delivery of way bills and other papers from incoming trains to the main yard office, usually located at

opportunities for serious loss of time, particularly if one or more bills are found missing when a train is ready to leave. Delays from this cause can easily amount to 30 minutes or more in each case.

The employment of messengers for this purpose and the delays incident to messenger service have been done away with at the Gibson yard of the Indiana Harbor Belt and the Clearing yard of the Belt Railway of Chicago, by the use of pneumatic tubes connecting the general offices, situated at the hump, with the offices at each end of the yard. At the Gibson yard the installation consists of lines of 3-in. steel tubing running 4,350 ft. west and 4,650 ft. east of the hump, laid 3 ft. to 4 ft. underground. These tubes are open at both ends. In sending, a carrier is inserted in the terminal, the flapper is closed, and air is admitted behind the carrier by pressing a button, which actuates an automatic control device by means of which the air is delivered from a low pressure storage tank for a predetermined period sufficient to insure the arrival of the carrier at the other end of the tube. This air is supplied to the storage tank from the regular railroad service, having a pressure of 90 lb. to 110 lb. per sq. in. at the compressor. There are three cylindrical tanks, one at each sending point, that is, at the hump office and at the east and west yard offices. The arrangement of the supply pipes and valves is shown in the drawing.

At Clearing the tubes are 4 in. diameter and besides the two main lines, short leads connect with the office of the hump yard master and the switching tower at the hump. As these tubes will deliver a package a distance of about a mile in two minutes there is an obvious saving of time over any form of messenger service. At the Clearing yard this saving is estimated at 10 engine hours a day. That is to say, there is a saving of that amount in the time of the engine and train crews—say five men; and there is a potential saving of the per-diem cost of the cars in the trains, the movement of which is expedited.

At the Gibson plant the maintenance expenses average \$5.97 for three months' time, a figure which is said to be higher than normal. The carriers are handled by the regular clerk so that the expense to be charged for attendance is small. At Gibson the total number of carriers transmitted in a period of 24 hours recently was 220.

The tubes described were installed by the Lamson Company, Boston, Mass. The manufacturer is now recommending the use of motor-driven cycloidal blowers at each terminal, so arranged that they run only when a carrier is in the line. This system is said to operate with a much smaller power consumption than in the case where the air is taken from the regular yard air service.

WESTERN AUSTRALIA'S RAILWAYS FEEL LACK OF SHIPS.—During the year ended June 30, 1916, there was a falling

Pneumatic Tubes at Gibson (Indiana) Freight Yard

the hump, and from the main office to the conductors of departing trains, has been a source of great inconvenience and no small delay. As ordinarily administered conductors must either deliver or call for these bills at the hump office or they are carried by messengers, either method offering op-

portunities for serious loss of time, particularly if one or more bills are found missing when a train is ready to leave. Delays from this cause can easily amount to 30 minutes or more in each case.

Proposed Federal Taxation of Railroads

Railway Executives' Advisory Committee Points Out Objections to Excess Profits and Surplus Taxes

THE Railway Executives' Advisory Committee, of which Frank Trumbull is chairman, and Alfred P. Thom general counsel, last week filed with the Senate finance committee a brief outlining the attitude of the railroads towards the proposed war taxes provided in the bill recently reported to the Senate, which represents many changes from the form in which the bill was passed by the House. The bill has since been referred back to the committee for further consideration.

Revision of the war revenue bill to increase its total from \$1,670,000,000 to about \$2,000,000,000 was undertaken by the Finance Committee on July 30, with the possibility of an increase in the income tax on corporations from 4 to 6 per cent under consideration. Modification or elimination of the 15 per cent surplus tax was also discussed.

No objection is made to the four per cent tax on net income, except as to the method of arriving at "net income." As to the graduated "excess profits" tax, it is contended that railroad charges are regulated by governmental authority and therefore the income therefrom cannot be considered excess profits and that moreover railway profits are not in excess of the needs for improvements and for maintaining credit. Somewhat similar objection is made to the proposed 15 per cent tax on undistributed surplus, and it is suggested that an allowance be made of 3 per cent on the assets as surplus. The brief also calls attention to some examples of the unequal and inequitable results of the proposed methods of taxation. An abstract of the brief follows:

INCOME TAX

It must be borne in mind that "net income" as here used has a special significance and is defined in the revenue bill—it is different from "net income" as defined under the rules of the Interstate Commerce Commission. This tax is common to all corporations, is considered by responsible governmental authority to be necessary because of war requirements, and, although heavy, is not complained of; except that it seems to us that the method of arriving at "net income" is unjust. Under the law as it stands, and under the pending proposal, a part only of the interest which a debtor corporation pays can be deducted. This results in a corporation debtor paying taxes on something which is a part of its debt, namely: the part of the interest which it is not permitted to deduct in arriving at its net income. Individuals are permitted to deduct the whole of their interest payments, and no good reason seems to exist why this prejudicial difference should be insisted on against corporation debtors.

The Income Tax Law of 1916 provides (and the proposed law follows it) that, in arriving at net income, an individual may deduct all the interest he pays, but a corporation can deduct from its gross income only the interest which it has paid on an amount of indebtedness equal to the sum of its capital stock plus one-half of its indebtedness. The New York Central has \$250,000,000 of stock and \$673,000,000 of debt. It has to pay the interest on all of this indebtedness, but in computing its net income it is allowed to deduct the interest only on \$587,000,000 ($\$250,000,000 + \$337,000,000$). Its net income is thus arbitrarily increased beyond what it actually is, by an amount equal to the interest paid on this \$86,000,000 of indebtedness. The Pennsylvania, on the other hand, has approximately \$500,000,000 of stock and \$250,000,000 of indebtedness. It would be allowed to deduct the interest on an amount of debt up to \$625,000,000

($\$500,000,000 + \$125,000,000$). Consequently, in arriving at its net income, that company would deduct the interest on all its debt.

This illustration shows the inequality of the provision, and we earnestly hope that in arriving at net income a deduction of all interest will be permitted. It must be remembered that the capitalization of railroads is now largely, and doubtless soon will be entirely controlled by governmental regulation, and there is consequently no danger of inflated obligations created for the purpose of escaping taxation.

"EXCESS PROFITS" TAX

It is manifest that whether profits are "excess" or not depends upon the definition in the law of the term "excess profits." It is respectfully submitted that railroads, subject to the regulating power of the Interstate Commerce Commission can, in the nature of things, have no excess profits. This is true for two reasons:

(a) *Railroad Charges Are Regulated by Governmental Authority, and Therefore Are Not "Excess."*

The law requires that the charges of railroads be fixed by governmental authority and shall be confined to what is reasonable and just for the service. It must be assumed that the regulating body does its duty, and that no charge of a railroad includes any amount which goes to make up an excess charge. If this be true as to each charge made by a railroad, it must likewise be true of the aggregate of its charges. Bearing in mind that any proper conception of "excess profits" due to the war conditions must be based upon war prices for the things sold, the conclusion seems inevitably to follow that in reality, there is no such thing as excess profits of railroads, because, being subject to governmental regulation, they are not able to take advantage of the economic law that prices are fixed by the relation of supply to demand, and consequently they have not been able to advance their charges, as industries generally have been able to do, to take advantage of war conditions. The revenues of the railroads may be said to be derived from their increased service alone, not from increased service plus increased charges, it being remembered that the recent partial increases in some of the rates to some of the railroads did not nearly suffice to compensate them for their increased expenses. Everything derived from stationary charges and increased service is properly embraced in income and cannot be considered excess profits. The income of the railroads from their increased business is subjected to the four per cent tax, and thus does not escape its due proportion of taxation.

(b) *Profits Are Not in Excess of Needs for Improvements and for Maintaining Credit.*

It is furthermore evident that, in reality, there are no excess profits of railroads when the matter is considered from the standpoint of the vital necessity for them to keep up their facilities to the level of the public needs. The railroads have had such small earnings, as compared with the industrial investments generally, that they have not been able to go into the market, and sell their stocks and bonds to obtain money for the improvement of their facilities. This is universally recognized as a most menacing situation. Profits which are insufficient to maintain credit to the point of enabling the owners of the property to finance wisely or on a sound basis cannot be considered as "excess."

The fact is that, in respect to earnings as in respect to the character of their service and their vital relationship to the public welfare, the railroads are inevitably segregated

into a separate class. This segregation into a separate class was made by law 30 years ago when the importance of the relationship of transportation to the public welfare was recognized as so great that a statute was enacted declaring this relationship and extending governmental control over the prices railroads might charge for their services.

Congress, in dealing with the question of imposing extraordinary tax burdens, is, in considering the railroads, confronted with a subject in respect to which it is recognized in the law and by public opinion that the supreme public interest is that their efficiency in performing their public service shall be assured—certainly not be impaired.

Considered from this point of view, the question which Congress must decide is which is the best for the public, to take from the carriers the amount involved in the excess tax (and the same considerations relate to the surplus tax), or to leave this amount in the treasury of the carriers to be used in the production of increased and improved transportation facilities or as a reserve basis of credit on which the money needed to create the additional facilities may be borrowed.

It is manifest that the answer to this question depends upon whether the facilities of the railroads are already equal to the public needs, and, if not, whether from other sources the railroads can secure the money necessary to provide such additional facilities as are needed.

The evidence on this subject is significant. Without going into a full statement, it seems sufficient to point to the proof which Congress has itself recently given in passing a bill conferring upon the President the right to order priority and preference between shipments. This action was based upon the conviction that the transportation facilities are not now sufficient to move promptly without preference the commerce of the country with the added transportation required by the war needs of the government and its allies. This means that, in the opinion of Congress, the present facilities of the railroads are not sufficient for the extraordinary demands upon them.

Moreover, the action of a distinguished senator, backed as we understand by a not inconsiderable opinion in the Senate, in proposing a governmental appropriation of \$100,000,000 to buy cars to be leased to the railroads is likewise based upon the conviction that more facilities are required.

Congress is, therefore, called upon, in its tax policy, to deal with a subject of taxation, the efficiency and adequacy of which are absolutely vital to the public safety and public welfare, and to determine what is best in the public interest in respect to the use which shall be made by the carriers of their earnings—whether, on the one hand, they shall be taken in the form of taxation, or, on the other, shall be available for use in direct payment for additional facilities or as a basis of credit to get the larger sums needed to create additional facilities admittedly essential to supply the public needs. In this connection, it must be borne in mind that, just to the extent that transportation facilities are inadequate, they impose a limit upon the transaction of business generally, and, thereby impose a limit upon the country's production. Such a check on production will reduce the income available for the use of the Government in the prosecution of the war.

In determining upon a policy, it is likewise essential for Congress to consider what the financial needs of the railroads are under existing conditions and in respect to securing money to improve their facilities. The financial markets of Europe are closed against them. The financial markets of America are absorbed by the war needs of our own government and by the superior inducements offered by industries which promise large and attractive returns.

Under these circumstances what is it wise for Congress, in the public interest, to do? Shall it define profits in such a way as to make a fund "excess profits," which, in reality,

is not excess profits, and to take a part of it in taxation; or shall the railroads be encouraged to use all of the earnings they properly can in the way of new facilities and to accumulate some margin of safety with the view of gradually improving their credit—the latter for the purpose of taking advantage of any easing-up in the general financial situation, and in that event obtaining new capital to supply the facilities which are absolutely essential to the public.

In this connection it might not be improper to recall that one of the purposes of raising money by the American government in its recent war loan is to lend a part of it to France to improve its railroad facilities and a part of it to Russia to improve its railroad facilities. Is it wise to pursue this constructive and liberal course in respect to the railroad facilities of France and Russia, and at the same time to pursue a policy at home which will have a substantial tendency to deprive our own people and our own government of adequate railroad facilities? Not only are our own railroads not the subject of governmental assistance in the way of financial advances, but, in reality, it is proposed to impose upon them extraordinary taxes which will substantially limit their own ability to perform a vital public service, and which will go in part to improve the transportation facilities of France and Russia.

It seems manifest that a wise public policy requires the conservation of railroad earnings—already insufficient for the war and other public demands upon them—to the end that they may be available for use or as a basis for improved transportation facilities, instead of taking these earnings by the imposition of extraordinary taxes on them. They can be more useful to the public in transportation than in taxes.

It follows that no definition should be given of excess profits as to railroads which would not be true in fact, and which, instead of taking an amount which would otherwise go to the private owners in the shape of dividends, would in reality be reducing and crippling the power of the railroads to furnish the transportation facilities which the public absolutely needs. These considerations are respectfully submitted, and seem to justify the exclusion of the railroads from what we have attempted to show is, as to them, erroneously termed an excess profits tax as well as from the surplus tax, hereinafter to be considered.

It may be objected that the argument above presented will apply to all taxation of railroads, and is not confined to "excess" and "surplus" taxes. This view, however, does not seem to us either sound or necessary. The thing to be preserved is the adequacy and efficiency of the railroads. The conclusion to be reached is what exaction, in the shape of taxes, can be made of the railroads without unduly crippling or reducing their adequacy and efficiency as transportation agencies. The line must be drawn between taxes which, according to this test, can properly be imposed and those which it would be injudicious to impose. It seems to us it should be drawn so as to exclude the railroads from the so-called excess profits and the surplus tax, but that, with the lights now before us, it is unnecessary to exclude them from the four per cent income tax.

If, however, it be considered impossible to exclude the railroads as a class from the "excess profits" tax, on the idea that some of them may be such heavy earners as would enable a particular company to provide the proper facilities and at the same time pay the tax, there should be adopted, at least as to the railroads, a definition of "excess profits," which would avoid the taking, in any form of taxes, money which the public interest requires should be retained by the railroads for the purpose of improving their facilities or for the establishment for them of reasonable credit.

It is respectfully submitted that a margin of allowance for this purpose would be an earning power of at least

eight per cent on the value of the assets of the company, whether these assets may have been acquired through borrowed money or by money paid in in the shape of capital contributed by the owners. The proposed act does permit, under certain circumstances, an allowance of six per cent on capital as defined in the act, but the definition of capital is in the act of such a nature as to exclude a very large part of what is really the company's capital.

The definition of capital as proposed in the act is as follows:

... fair average value of the assets actually invested and employed in the trade or business less the average amount of the liabilities incurred in respect to such trade or business.

This would result in imposing an income tax on interest paid out on debts; in the taking of a considerable part of the net income of these companies under the guise of an excess profits tax, as between the various companies, would impose a very different and inequitable burden. For example, if a company be capitalized so that two-thirds of its capital is represented by stock and one-third by bonds, it is manifest that this tax would bear in a very different way on it from the way in which it would bear upon a company where two-thirds of its capital was bonds and one-third stock.

Taking the case of two roads having the same property investment, the same aggregate capitalization and the same net earnings, but having their aggregate capitalization distributed between bonds and stock in the proportions just mentioned, and whose earnings were subnormal in the pre-war period, the amount of the deduction for normal profits, before "excess profits" are ascertained, would be very different in the two cases. In the one case, six per cent would be allowed as a deduction on approximately two-thirds of the asset values; whereas, in the other case, the deduction would be six per cent on approximately only one-third of the asset values. And yet the company which has been able to finance itself so as to have two-thirds of its capital represented by stock, would under this definition, have the smaller "excess profits" tax to pay, which would be clearly inequitable.

"SURPLUS TAX"

The considerations which have been above given in respect to the wisdom of imposing an excess profits tax are equally applicable to the proposed surplus tax. At least, a definition of "surplus" should be given which, while subjecting to taxation a company exceptionally strong and able to keep its facilities up to the public requirements, would avoid taking from other companies, not so fortunately situated, the funds necessary either as a means to protect credit or for the direct purpose of investment in improved facilities.

The tax is applicable only to that part of the net income that remains undistributed at a certain date, thus excluding from the tax all dividend distributions that may be made within the prescribed time. Manifestly the effect of this is to stimulate the distribution of profits in the shape of dividends. However wise this policy may be in respect to companies which have large accumulations of profits, it cannot be considered as having a wise application to the railroads when their relation to their undistributed income is correctly appreciated.

It is a fact which may be stated as almost universally true that there is no hoarding by railroads of their earnings. Where the books of the railroads show a large accumulated surplus, that surplus is not found in the bank in the shape of money subject to check, but in almost all cases has been plowed back into the property in the shape of improved facilities. If a substantial part of this surplus is to be taken under the taxing power, the money to pay it must be either withheld from its accustomed expenditure on the property, or a part of the property in which it has been invested

must be sold to pay it, or money must be borrowed for the purpose.

Credit is not maintained, but is impaired, by a policy which, instead of favoring the accumulation from earnings of an adequate surplus, forces exceptional distribution of such earnings to the owners, because the office of a surplus is to make and keep up credit and to furnish a basis for the improvement of facilities essential to the public needs. It seems, therefore, manifest that the policy of this surplus tax, which is to force large distribution of annual earnings, is not applicable in the case of the railroads.

As regards this tax, it should be borne in mind that it bears proportionately harder on the poorer roads which have not felt able to declare dividends, but resort to the conservative policy of using what earnings they have upon their properties devoted to the public service. In some sections of the country—notably the South—the present standard of transportation facilities has been attained by the adoption of this policy, and would not have been possible if the railroads had distributed their earnings in dividends. It may well be questioned whether any policy of taxation is wise which would discourage such a tendency and would result in a larger tax burden being placed upon roads which, for the purpose of improving their transportation facilities, refrain from declaring dividends.

Whether, therefore, the railroads should be absolutely excluded from this tax, or should be retained within its scope by a definition which would subject to the tax any company whose earnings may happen to be large enough to justify its imposition, is a matter for Congress to decide. If it be determined that the railroads should not be entirely excluded as a class, then they should be encouraged to accumulate, in the shape of a surplus, an amount reasonably adequate for the purpose of improving their facilities, and for the equally public purpose of establishing and stabilizing their credit.

It is submitted that if the railroads are permitted to deduct from their undistributed net income, before the surplus tax becomes applicable to it, an amount of three per centum of the value of their assets, no more would be reserved than sufficient for the essential needs of the company in the way of improving facilities and for the purpose of establishing and stabilizing credit.

This 3 per cent limitation will leave subject to the surplus tax all annual net earnings which are withheld, but which public policy might, as a war measure, require to be declared out in dividends and become subject to tax as part of the income of the stockholders.

It may be safely stated that the suggested annual allowance of 3 per cent on the assets as a surplus would receive the endorsement of the best financial and economic authorities.

UNEQUAL AND INEQUITABLE RESULTS

In a previous part of this memorandum reference was made to the unequal and inequitable results upon different railroads of the system of taxation proposed in the pending bill. As indicative of this inequality and unfairness of burden, attention is respectfully directed to the following cases which are worked out upon the basis of the earnings for the calendar year 1916.

First. Compare the Pennsylvania Railroad with the New York Central:

	Pennsylvania Railroad	New York Central
Total assets, December 31, 1916	\$1,058,826,941	\$1,076,919,058
Outstanding Capital:		
Stock	506,458,948	249,590,460
Funded debt	250,356,844	673,070,217
Total net income	46,558,313	46,374,101
Net income (less dividend income)	9,815,260	38,274,404
Estimated war taxes:		
Normal income tax at 4%	1,192,610	1,410,676
Excess profits tax		2,277,613
Surplus tax at 15%	551,663	2,517,385
Total estimated war taxes	1,744,273	6,205,674

These two railroads are active competitors—their total capitalization is about the same—their total income for 1916

was about the same. The structure of their capitalization, however, is very different. The Pennsylvania having approximately two-thirds stock and one-third funded debt, while the New York Central has approximately one-fourth stock and three-fourths funded debt. Under the proposed tax system the Pennsylvania pays less than two millions in these taxes and the New York Central largely over six millions—the New York Central pays a fraction somewhat under 18 per cent of its net income (less dividend income), while the Pennsylvania Railroad pays less than 6 per cent; the Pennsylvania pays no excess profits tax, while the New York Central pays two millions and a quarter; and the Pennsylvania pays about half a million surplus tax, while the New York Central pays two millions and a half.

Second. Compare the Chicago, Milwaukee & St. Paul and Chicago & North Western:

	Chicago, Milwaukee & St. Paul	Chicago and North Western
Total assets, December 31, 1916.....	\$657,288,991	\$438,633,499
Outstanding Capital:		
Stock	233,287,984	152,606,807
Funded	490,547,155	205,909,500
Total net income.....	14,640,983	19,742,477
Net income (less dividend income).....	14,469,164	18,194,845
Estimated war taxes:		
Normal income tax at 4%.....	578,767	727,793
Excess profits tax.....	99,221	977,377
Surplus tax at 15%.....	99,221	1,286,638
Total	677,988	2,991,808

Thus it will be seen that the Chicago & North Western pays as taxes under this proposal considerably more than 16 per cent of its income (less dividend income), while the Chicago, Milwaukee & St. Paul pays a fraction over 4 per cent. Other inequalities will likewise appear by reference to the foregoing table.

Third. Compare the Chicago, Burlington & Quincy with any of the above-mentioned roads.

	Chicago, Burlington & Quincy
Total assets, December 31, 1916.....	\$544,305,600
Outstanding Capital:	
Stock	110,839,100
Funded	176,487,900
Total net income.....	33,582,610
Net income (less dividend income).....	33,572,610
Estimated war taxes:	
Normal income tax at 4%.....	1,343,304
Excess profits tax.....	1,400,299
Surplus tax at 15%.....	2,377,633
Total	5,121,236

From this it will be seen that the New York Central, which pays in these taxes about 18 per cent of its net income, and the Chicago & North Western, which pays about 16 per cent of its income, and the Burlington, which pays about 15 per cent of its income (less in each case dividend income), are somewhat in the same class, while the effect of the proposed tax on the Burlington contrasts in a very marked degree, and shows marked inequality when compared with the result on the Pennsylvania and Chicago, Milwaukee & St. Paul, the first of which pays a little less than 6 per cent on its net income, and the second of which pays a little over 4 per cent on its net income.

A careful study of the amendment relating to the deduction of dividends received will demonstrate that there is no sound reason for the qualification which excludes from the deduction a portion of the dividends received from other corporations. Since some deduction of dividends is proposed, the principle is recognized that earnings should not be subjected to double, triple and quadruple taxation in the course of their transfer from one corporation to another in the form of dividends. The qualification, as we understand it, is at variance with the fundamental principle which justified the amendment. The qualification necessarily results in double, triple, etc., taxation, of a substantial part of the net income of many corporations.

The provisions in reference to the deduction of dividends in the bill is as follows:

(d) For the purpose of the tax imposed by subdivision (a) of section ten, the income embraced in a return of a corporation, joint-stock company

or association, or insurance company shall be credited with the amount received as dividends upon the stock or from the net earnings of any other corporation, joint-stock company or association, or insurance company, which is taxable upon its net income as provided in this title, less that proportion of such amount which the amount received by the distributing corporation, joint-stock company or association, or insurance company from similar sources bears to the entire net income of such distributing corporation, joint-stock company or association, or insurance company.

This provision operates as follows:

The Union Pacific owns all the stock of the Oregon Short Line, and through that company controls a through line to the Pacific coast, which renders the public a most important service. The Oregon Short Line paid to the Union Pacific, as its sole stockholder, a dividend of \$8,000,000. But as 17 per cent of the entire net income of Oregon Short Line was derived from dividends received from other corporations, the Union Pacific is entitled, under the finance committee's qualifying amendment, to deduct, in computing its own income tax, only 83 per cent of the dividend received from the Oregon Short Line, or \$6,640,000, leaving 17 per cent, or \$1,360,000, to be taxed as part of the net income of the Union Pacific, although it has once been taxed as income of Oregon Short Line.

Another striking example is afforded by the Atchison, Topeka & Santa Fe. Many years ago that company mortgaged its property by instruments which contained after-acquired property clauses. When it became necessary to extend its lines in New Mexico, it was obliged to form a new company for the extension, the Atchison furnishing the capital and taking the stock of the New Mexico company—otherwise the property in New Mexico would have come under the previous mortgages of the Atchison, and would not have afforded a basis of credit necessary for the proposed construction.

It subsequently became desirable to extend the Atchison lines into Texas. The laws of Texas would not permit a foreign corporation to build a road in that state; consequently, a separate corporation was necessary for the purpose. The New Mexico company—a subsidiary of the Atchison—took the stock of this Texas company, and thereby the Atchison became "a holding company in the second degree," but became so as a means of creating a trunk line through New Mexico and Texas.

Under the operation of the proposed amendment, any dividend received by the Atchison from the New Mexico company, any part of which was made up from a dividend from the Texas company, must be reduced proportionately, although the whole transaction was merely a method of furnishing a great through system of railroad, and the form that it took was made necessary by business considerations and by the laws of Texas above mentioned. Inasmuch as the earnings of the Texas company would be taxed in the hands of that company, it would seem highly inequitable, and in violation of the principle of the proposed bill, which allows some deduction of dividends, to tax these earnings again when they reach the Atchison.

We therefore submit that dividends received from other corporations should be deducted in their entirety.

That part of income taken by the Government as "income" and "excess profits" taxes should be deducted in arriving at taxable income, just as the proposed law permits the deduction of all other taxes. Otherwise there will result a tax on taxes. Neither an individual nor a corporation should be required to pay a tax upon money which is required to be surrendered to the government in the form of taxes.

RESTRICTED RAILWAY TRAVELING IN DENMARK.—Owing to lack of coal in Denmark, which has already caused the limitation of railway traveling, the ministry of the interior has now further authorized the state and private railways to make restrictions as to the kinds of goods to be carried.

Women Sorting Scrap on the New York Central at Collinwood, Ohio; the Coil Springs and Other Material in the Foreground is Serviceable Material Picked Out by the Women

Women Well Adapted to Scrap Dock Labor

Their Employment at the Collinwood Shops of the New York Central Has Passed the Experimental Stage

CONDITIONS prevailing on account of the war, make it necessary to resort to many unusual means for the carrying on of the work of various departments of the railroads, the service of which is so essential during these trying times. Many of the male employees have enlisted; the ranks are gradually being depleted and it follows that

paid to men for the same class of labor and undoubtedly will become a regular part of the working force. It has been interesting to see the energy displayed by the women on this work. At the Collinwood scrap dock they have largely displaced colored labor imported from the South, the latter being more or less migratory and unreliable after pay day. They are much more steady and are very apt at learning to sort out usable material from a pile of scrap. They seem to possess a natural instinct for sorting out and saving good material. At times they may be seen criticising each other for discarding a bolt, nut or washer that should have been reclaimed. They respond readily when called upon to unload material from a gondola car. Since the photographs were taken they have adopted bloomers or overalls, thereby greatly

Women Reclaiming Bolts and Other Small Material from the Bins at the Collinwood Scrap Yard

work such as sorting scrap and many other operations must to a certain extent be performed by female labor.

The extent to which women may be used at the scrap docks, sorting and handling miscellaneous material is brought out clearly by the illustrations. The photographs were taken at the New York Central scrap dock at the Collinwood, Ohio, shops. The women have been employed here for some time under the jurisdiction of the general storekeeper of the Lines West. What at first was considered an experiment is now pronounced a success, all things considered, and has grown beyond the experimental stage.

The women are paid at the same rates of wages that were

A Group of Women Who Have Replaced Men as Scrap Handlers at Collinwood

enhancing their ability to climb on and off cars and to get around generally. They find that they can work much more freely and that they are in less danger when wearing overalls, as compared with their customary apparel. A dress often catches on projecting pieces of iron, making their work more or less hazardous.

YARDMEN'S STRIKE AT CHICAGO

A strike of switchmen belonging to the Brotherhood of Railroad Trainmen was called on nineteen roads in the Chicago switching district at 6 A. M. on July 28 and continued until 5:45 A. M. July 30, when, through the intervention of officers of the other three railway brotherhoods, headed by L. F. Sheppard, acting president of the Order of Railway Conductors, a settlement was reached. Although the Managers' Conference Committee of the Chicago roads proposed mediation by the Federal Board of Mediation and Conciliation, and George W. W. Hanger, a member of that board, personally tried to induce the men to submit their case to the body he represented, the switchmen were uncompromising in their insistence upon the demands which they had made. In substance, they wished to establish the closed shop in favor of members of their organization and to deprive the railroad managements of the power to appoint yardmasters and assistant yardmasters.

With reference to the specific demands of the Brotherhood of Railroad Trainmen, the Managers' Conference Committee made the following statement:

"First, 'In the employment of yardmen B. of R. T. men shall be given preference.' If this rule should be adopted the railways would be prevented from employing any but B. of R. T. men when there were any of them available, although more experienced and better qualified men might be available. The railways proposed that the rule should be made to read, 'In the employment of yardmen, experienced men will be given preferred consideration and B. of R. T. men will not be discriminated against.'

"Second, 'Yardmen discharged can only be reinstated by mutual agreement between officers of the company and the properly authorized committee representing them.' On a road having a contract with the Brotherhood of Railroad Trainmen the committee of this organization would be the only one representing the men. Therefore, if a non-union man or a member of the Switchmen's Union, of North America, which classes include 60 per cent of all the yardmen in Chicago, should leave the service for any cause, he could not, under the proposed rules, re-enter the service without the consent of the Brotherhood of Railroad Trainmen committee. For obvious reasons, this consent might be difficult to obtain. In other words, under the first rule the railway would be prevented from employing any but B. of R. T. men and under the second it could be prevented from reinstating any but B. of R. T. men. The managers' committee proposed in place of the second rule that 'Yardmen dismissed will forfeit all seniority rights, unless reinstated within one year.'

"The adoption of the rules proposed by the B. of R. T. would in time eliminate all non-union men and all members of the Switchmen's Union from the service of roads having contracts with the B. of R. T., while members of the B. of R. T. employed on roads having contracts with the Switchmen's Union would be left undisturbed.

"Third, 'In the employment of yardmasters and assistant yardmasters the senior qualified yardman shall be given preference.' On a road having the proposed closed shop for the benefit of the members of the B. of R. T., the senior yardman would, of course, be a member of that organization. The representatives of the Brotherhood of Railroad Trainmen charge that in appointing assistant yardmasters and yardmasters the railways have discriminated against members of their organization. The managements of the railroads have used their discretion in appointing assistant yardmasters and yardmasters, putting into those positions the men regarded as best qualified for them, whether yardmen, yard-clerks, trainmen, or in whatever branch of the service they may have been. The fact that about three-fourths of the assistant yardmasters and yardmasters of Chicago lines having contracts with the

B. of R. T. have been appointed from the ranks of yardmen refutes the charge of unfair discrimination. The rule proposed by the Managers' Conference Committee is that 'in the appointment of yardmasters and assistant yardmasters the senior yardmen will be given full and unprejudiced consideration.'

"The Commission of Eight in New York, representing both the four labor brotherhoods and the railways, decided that there should be a uniform meal hour for all employees in yard service; and the Managers' Conference Committee proposed action in accordance with this ruling. This the representatives of the B. of R. T. yardmen in Chicago declined to accept, thus refusing to abide by the decision of their own representatives on the Commission of Eight."

The demands made by the men were complicated by the fact that the railways had to consider not only the interests of the B. of R. T., who represented about 2500 of the switchmen employed in the Chicago terminals, but also nearly 2500 men belonging to the Switchmen's Union of North America and 1500 who were either non-union men or belonged to other labor organizations. In fact, J. G. Connors, assistant international president of the Switchmen's Union, notified the railroads that if the rules asked for by the B. of R. T. were adopted his organization would have no recourse but to strike.

Four hours after the strike had been declared reports from the various railroads involved indicated that all the way from 25 to 100 per cent of the normal business of the roads was being handled. This was very encouraging in view of the fact that a strike is generally considered won if 25 per cent of the normal business is handled on the second day. Some of the roads found it necessary to place embargoes upon the movements of live stock and perishables. Conditions on Sunday showed continued improvement. In comparison with preceding Sundays recently the percentage of switching crews working varied from 25 to 100 per cent with crews of 75 per cent or over on most of the lines.

Two acts of violence by strikers or strike sympathizers occurred on the Chicago & Alton about one o'clock Sunday morning. Three members of the B. of R. T., namely, Lee Hunt, who has been switching foreman at the Alton's Harrison street yard, C. C. O'Connell and F. T. Payne, switchmen, emptied a wheelbarrow load of bricks from a viaduct on some switchmen at work below. Two were struck on the feet by bricks but were not seriously hurt. An Alton watchman fired his revolver at the men, following which Hunt and O'Connell stopped and threw up their hands. They were turned over to the city police and will be prosecuted. At about the same hour at the Glen yards of the Chicago & Alton a switch was maliciously thrown in front of seven heavily loaded coal cars moving at considerable speed, derailing them and blocking the track for nine hours.

Late Sunday afternoon Mr. Sheppard and other brotherhood leaders arrived at Chicago and called at the offices of the Managers' Conference Committee, asking for a statement of circumstances in connection with the strike. As a result of conferences which ensued the following settlement was agreed to: First, that the men be returned to their positions at once without prejudice or loss of seniority. Second, that the questions at issue be disposed of as follows: (a) The meal period question to be settled by the Commission of Eight at New York; (b) the appointment of yardmasters, the reinstatements and employment of new men to be settled by a board consisting of Messrs. L. F. Sheppard, chairman; W. M. Clark, M. W. Cadle, H. E. Wills, L. J. Griffing, Arthur J. Lovell and S. A. Boone, representing the B. of R. T.; and the Managers' Conference Committee representing the railroads. The rights of all other employees are safeguarded by a clause reading: "It is agreed that the matters at issue are to be settled without the adoption of the closed shop rule or any rule that might fairly be considered as equivalent to such."

2

Outbound Freight, Pier 4, New York City

Electric Tractors at Pier 4, New York

Increasing the Capacity of a Busy Station Where Acquisition of Additional Land Is Out of the Question

A NOTABLE example of economical handling of package freight from wagon to freight car by means of electric tractors is that to be seen in the plant recently installed at the station of the Pennsylvania Railroad, Pier 4, North River, New York City. This station is one of the old-

The outbound platform of this station, fronting the street, is on a level with the tailboard of the wagons which bring merchandise to the station. When a wagon brings a shipment for a single destination which is large enough, the packages are loaded directly on to one of the four-wheel trucks and the truck is run over the scales. Smaller shipments are moved by hand trucks to the scales, thence to the proper four-wheel truck.

From the north to the south side of the station there are nine scales. From the scales freight is taken to one of the four-wheel trucks, a row of which, standing at the "loading

Loading Direct from Dray to Four-Wheel Truck

est in New York, and one in which is done a very large outbound business, and the electric installation now includes 4 tractors and 225 four-wheel "trailers." This improvement has effected a marked increase in the capacity of the station and at the same time it is an important labor-saving proposition, though the distances which freight has to be trucked are not very long. The scheme answers directly the demand from Washington for conservation of man power as a measure to promote the success of the war.

3

A Through Train

wharf," is seen in photograph No. 2. The numbers displayed above these trucks, 45, 43, 166, 41, 40, 1 to 24, 38—indicate the loading numbers of cars for specific destinations.

Forty-one, for instance, may be the Chicago car, and 40 that for Cincinnati. These numbers are for permanent use and the freight handlers familiarize themselves with them. The tractor in the center of this picture, coming down the ramp, is drawing a truck which has been loaded direct from a wagon. The other trucks are on a level 20 inches lower.

The cars into which the freight is loaded stand on floats tied to the dock; and the space between the "wharf" at which the trucks are loaded and the ramp over which they are moved—up or down, according as the tide is high or low—on to the platform in the center of the float, is called the yard. Each float has two tracks with six cars on each track, and a 7 ft. platform between the tracks. The slip affords space for four floats (48 cars). The space between the wharf at which the trucks are loaded and the outer edge of the dock is about 75 ft. wide. In this "yard" the trucks are marshalled into trains of 1, 2, 3, 4, or more trucks. Photograph No. 3 shows a train consisting of a tractor and three trucks. Photograph No. 4 shows a tractor and four trucks going up the incline to the platform on the float. The tractor leaves the trucks opposite their proper cars and they are then pushed into the cars by the stowers, as shown in photograph No. 5. The tractors, as will be seen, occupy but little space and are readily turned on the 7 ft. platform of the float. The leading wheel, by which the tractor is steered, is 6 in. in diameter and the main wheels are 12 in. in diameter. The trucks are 3 ft. wide and 6 ft. long, with 12 in. wheels. It will be noticed that the tongues of those trucks which are at rest are inclined upward but without the ordinary hook or chain to hold them in position. This upward position is maintained by means of a special device in the connection by which the tongue is secured at its lower end, to the body of the truck. The release of the tongue from its upward position and the coupling of the truck to the tractor is effected by a single simple motion. The floors of the trucks are 20 in. high and this is the height of the wharf behind the trucks shown in photograph No. 2.

The man on the platform who directs the outward move-

discouragement and waste of time so common at New York City freight piers—the long line of waiting trucks in the street—has been practically abolished, so far as Pier 4 is concerned. From time immemorial freight stations closing at 4:30 p. m. have been obliged to send a man out on the street at that hour and give tickets to the teamsters, lined up for from one to a dozen blocks, and give them admission tickets. Such tickets show that the holder has done his part toward delivering his load at the freight house before the closing hour. The teamster who has no ticket is shut out. Many schemes have been proposed for curing this trouble.

For the foregoing information we are indebted to H. C.

The Stowers' Part

Bixler, superintendent of stations and transfers of the Pennsylvania Railroad, who gives the credit for the marked success of this improvement in efficiency to M. Townsend, the veteran agent at Pier 4, and to his general foreman, C. M. Sullivan.

CEMENT IN GUATEMALA.—A new cement mill, with a capacity of from 50,000 to 100,000 barrels of cement per year, has just been opened about one mile from Guatemala City by American interests, acting under a special concession of the Guatemalan Government. The plant has been under construction for two years, and involves not only the mill itself, but two miles of railway connecting with the port. Practically all the machinery was manufactured in the United States. The new company is restricted under its franchise to a maximum charge of \$4 a barrel for its product. The managers state that they will be able to manufacture cement at a cost of \$1.25 a barrel.

RESTRICTED TRAVEL IN GERMANY.—Very urgent warnings against all avoidable traveling are now being issued by the German railway authorities, observes The Times (London) in its "Through German Eyes" columns. The public is told that the restrictions are much greater in England and France, that the German measures are very lenient, and that people are wisest to stay at home, where they are certain of food, even if the quantities of food are small. At the same time it is admitted that the Germans now have an unusual need of holidays and sufficient provision of really necessary trains is promised. It is worth noting that, instead of abandoning the reservation of seats, the German authorities have established the rule that all tickets for "holiday trains" must be bought in advance, and every ticket secures a place in the train. The Germans are solemnly assured that as regards coal they are better off than all other belligerent countries, but they are warned that there will be great privations next winter if the weather is not mild.

From Pier to Float; On the Up-Grade

ment of the four wheel trucks is called a despatcher. He sees that the trucks are moved to the proper position in the "yard" and calls for an empty truck to take the place of each loaded truck which goes out. The marshalling of the trucks into suitable trains by the tractors is supervised by a yard master and one assistant.

These tractors and trucks are busy from about 11 a. m. to the closing hour, 6 p. m.; and in the earlier part of the day, before the outbound movement becomes heavy, they are used to some extent for moving inbound freight. In the movement of outbound freight the tractors have given such a good account of themselves that the standing cause of complaint,

How One Road Increased Its Train Load

Ratings Established by Road Tests; Simple Methods Used for Checking Performance of Each Train

By J. Lowell White

Assistant to the General Superintendent of Transportation,
Atlantic Coast Line, Wilmington, N. C.

IN response to a request for information as to how a certain large increase in the trainload had been obtained on his road, one of the best known executives in the United States once wrote:

"The only way to increase your train load is to begin at the station platform and in the yard. See first of all that your car is loaded to capacity, if you can do so. After that see that enough cars are put back of the engine so that you utilize the full tractive power of the engine in the direction of heavy traffic. It is a question of enormous detail and constant watching and pressure all along the line every year and every day of the year."

The importance of securing a maximum car-load in any

maximum car-loading, would have to be hauled in another train at an added expense.

It is the purpose here to deal more with the methods to be employed in seeing that "enough cars are put back of the engine" so that the full tractive power may be used: this being a field in which operating officers have complete control. The methods described are those adopted by the Atlantic Coast Line and have, it is believed, been largely instrumental in increasing the net revenue train load from 235 tons in 1915 to 274 tons in 1916 and to 329 tons for the last six months of the calendar year 1916, a total increase of 94 tons or 39 per cent: during which period the average tractive power of road engines increased but 1.7 per cent.

TABLE 1

campaign for increased train load may be overlooked unless one remembers the indisputable fact that any given engine can pull more tons when its load is concentrated in a short, solid train that it can when the same tonnage is strung out in many cars with hundreds of wheels grinding the rails.

It has been demonstrated in road tests that an engine with 34,000 lb. tractive power can haul as much as 360 tons more over 0.6 per cent ruling grades in 40 cars than in 100. It then follows, since upward of 40 per cent of the gross ton load may be net revenue load (earning from one-half to one cent per ton mile), that the entire "out-of-pocket" expense of operating a given train may be paid by the revenue from this additional tonnage; which, were it not for the

Until November, 1915, the tonnage system had received very limited trial, being restricted to two or three districts and these of lesser importance from a traffic density standpoint. When the decision was reached to give the tonnage system a thorough and extensive trial it was with some doubts as to the wisdom in so doing on account of the large volume of perishable freight hauled; which class of business cannot be held to fill out tonnage trains. The problem presented was therefore: (1) To establish ratings with enough elasticity to permit ready adjustment to the character of train to be hauled. (2) To organize a system at minimum expense for computing the tonnage of each train. (3) To determine what each engine could pull at schedule speeds. (4) To construct a plan for reporting results which would be of value to officers in supervising the work.

* Received in the contest on "Increasing the Train Load." Other papers on this subject were published in the issues of June 22 and July 6.

This was attacked first by the issue of a circular which specified that the weight of "car and contents in tons" must be shown on every way-bill. All way-bill forms were revised to provide a definite space for this purpose. When this work was well begun, another circular was distributed, instructing yard-masters to record the weights of the individual cars in out-going trains on the yard record and conductors to give similar information for cars of in-coming trains on their switch-lists. With these circulars in force a record of every train in and out of terminals was available and enabled those in charge, through a study of the tonnage actually hauled before any ratings had been fixed, to pick a weight for the first test trains which would be somewhere near the weights finally adopted. This saved considerable time in making the tests.

The officer under whose direction this work was carried out had been much impressed by an article by O. S. Beyer, Jr., entitled "Scientific Train Loading: Tonnage Rating" which appeared in the *Railway Age Gazette* of September 17, 1915, and it was decided to make trials to find out whether an adjusted (for length of train) system would secure greater train loads than a flat system. At the time the tests were begun large numbers of empty cars were being

clearly demonstrated. Table No. 1 covering the operation of through freight trains in the direction of traffic on one district for a period of five months will at least give good ground for argument pro and con. There will be those who maintain that, owing to the large proportion of trains having between 55 and 59 cars, a flat rating of 2170 tons should be fixed for practical operation for all trains. Those opposed will answer that in August 43 per cent of all trains had over 60 cars and that, with a flat rating of 2170 tons in effect, while these 53 trains might have gotten over the road without actually stalling, it is probable that the movement would not have been as satisfactory as under the adjusted system.

If one is willing to admit that the load of 2140 tons would be the only safe one to use for a flat rating for a 60-car train, then the figures shown make an actual saving of seven trains for the adjusted system; which for the 172-mile run in question would mean (on a basis of 50 cents per train mile) an actual economy of \$1204 in the five months' period. The opinion of the writer is that the adjusted system makes for smooth operation, costs no more to work than a flat system and may save real money in the long run.

A word of caution may be added for those who have in mind the introduction of an adjusted rating. In establish-

Atlantic Coast Line Railroad Company

STATEMENT OF TRAINS RUN, CARS HANDLED, AND TONNAGE

Form 757

Norfolk

District,

First

Division, 24 Hours Ending 11:59 P. M.,

Jan. 1st. 1917.

Any uncommon train movement should be fully explained, either on face of report or by memorandum attached to report.

Chief Dispatcher

run south, which was also the direction of the movement of company coal, so that it was an easy matter to secure test trains; first of loaded coal cars and then of empty box cars: the two limits of all train operation, between which all other trains of however mixed a character must fall.

The tests demonstrated clearly that in most cases more load could be hauled in a short train than in a long one, but it is interesting to note that several instances were found where, on account of the broken character of the country, the engine was able to haul as much in a long empty train as in a short loaded one, the only assignable reason being that, owing to the "saw-tooth" character of the profile, when the engine was hauling the coal train it would have the whole train on the ruling grade at one time, while with 90 or 100 cars some part of the train would still be running down one hill when the engine was nearing the top of the next one. Adjusted ratings with friction allowances of from 4 to 15 tons per car have accordingly been established on 10 out of 12 operating divisions. How much advantage is being obtained from the adjustment feature has not yet been

ing the rating it will probably be advisable, in order to insure the most successful results, to base the rating on the smaller number of heavily loaded cars and then to make the friction allowance slightly higher than 5, say 7 tons per car; because in mixed trains if many loads are on the rear end it may be found that the allowance of five tons is not enough in a long train, as such a train will pull harder than one where the weight is evenly distributed, as would be the case in the fully loaded or empty test trains.

The tests to fix the ratings were simple in character, being conducted by an observer accompanied by the road foreman of engines and the trainmaster. Two or more weeks were spent on each district until it was determined what was the right load for a given class of locomotive. Tests were then run in order to find out how much reduction from the maximum tonnage would be necessary in order to permit trains to make the schedules of certain fast perishable runs. The results of these tests were designated as "A" (slow) and "B" (fast) ratings and as such were put into effect at the conclusion of the tests on each district.

With the ratings established the problem remained of constructing a report which would show sufficient data to enable officers to check the performance of every train readily. The ideal method would be to compute the gross ton miles of each run which would then be compared with the potential gross ton mileage of which the engine is capable. Such statistics, however can be obtained only at considerable expense. To make this unnecessary the form of record shown was devised. In using this system the conductor reports to the despatcher the number of cars and tons in his train before leaving the yard, which information is recorded on the train sheet in a space provided for the purpose.

The conductor is also required to report the cars and tons which his train takes into and out of the designated intermediate tonnage terminals, which information is also recorded on the train-sheet, so that at the close of the day the record is complete from which Form 787 is prepared. As a result, the performance for the day comes to the office of the general superintendent of transportation with the least possible delay. In that office a stenographer is employed who checks the correctness of ratings, footings, etc., and writes all letters which are sent out having reference to the supervision of the loading. Small adding machines have been placed in the principal yard offices to enable yard clerks to foot the tonnage with speed and accuracy and chief despatchers have been provided with wide carriage typewriters on which to make up the report. Four days after the close of the month a statement is placed before the general manager, giving the results for the preceding 30-day period on each district or division. Outside of the salary and expenses of the supervising officer the whole cost of the system here described is the salary of the stenographer and the price of the adding machines and typewriters furnished to yards and despatchers.

with the "B," or fast rating. An examination of the necessities of the service was made and as a result instructions were issued under which "B" trains could only be run between certain fixed hours each day. Consequently while on one district only 58 per cent of all the tonnage hauled was handled in "A" trains in March, in June 71 per cent was so handled, with a resulting saving of 7 trains.

Indirectly, too, it is hoped that these tonnage figures will be of use in increasing the train load, because they have furnished a definite basis on which to make recommendation for grade reduction. For instance, on the run from A through B and C to D it was found necessary on account of one comparatively short ruling grade between B and C to fix the rating over the tonnage district B-C at a very much lower figure than on either of the districts A-B or C-D. The tonnage figures from Form 787 supplied the data to show that there would be sufficient saving made through reduced train service by the removal of the tonnage restriction between B and C to offset the cost of the grade reduction work.

PASSENGER CAR FLOOR INSULATION

A mineral insulating material for use in passenger car floor construction, which somewhat resembles wool felt in appearance and texture, has recently been placed on the market by the Tuco Products Corporation, New York. This material, which is marketed under the trade name of Tucork, is manufactured from a material secured in rock form, which is melted and blown into a mineral wool. This in turn is mixed with a liquid binder, the mixture being poured into containers of proper depth, depending upon the thickness of insulation desired. These containers have a wire mesh bottom through which the liquid is permitted to drain off, the solid material settling on the screen in sheets, the

Tucork Floor Insulation Applied to a Steel Passenger Car

The above is an outline of the method by which one road has very materially increased its trainload. Corollary to it the tonnage statistics on Form 787 have developed some interesting facts which have directly and indirectly been the pointers toward ways and means of increasing the trainload on certain runs or territory. For instance, on one division it was noted from figures on Form 787 that a certain regular train was always underloaded. Circumstances were such that no more tonnage could be obtained, but the report showed that a smaller engine could handle the regular tonnage of this train, so the large engine was transferred to a point where its full power could be utilized. In another case the reports showed that many trains were being run

thickness of which depends upon the depth of the liquid mixture in the tank. After draining, the material is placed in drying ovens where all the moisture is evaporated, the material in its final form being made up of 85 per cent to 90 per cent enclosed air cells.

As it is of mineral structure, the insulation is fireproof and tests have shown that it is practically waterproof. After being submerged in water for a period of one hour, the material shows a gain in weight of only one per cent. The material is light and is manufactured in the form of blocks or sheets which are quickly and easily applied. A cement is furnished with which the blocks are secured to the sheets on which they rest and with which all joints are sealed.

General News Department

The Baltimore & Ohio, like the Pennsylvania, has called to the service of the company considerable numbers of retired employees.

Governor Brumbaugh of Pennsylvania has vetoed the bill, passed several weeks ago by both houses of the Legislature, to suspend, during the war, the excess crew law of that state.

The Fidelity Plate Glass Insurance Company has sued the Lehigh Valley Railroad for \$47,356, the value of glass, insured by that company, broken by the explosions at Black Tom, New York harbor, in July, 1916.

At Gibson, Ind., on Wednesday last, the freight transfer sheds and office buildings of the Indiana Harbor Belt were destroyed by fire, together with 101 freight cars. Estimated loss, \$250,000. Fire believed to have been started by sulphuric acid leaking from a carboy in a car.

The entire staff of the Oahu Railway & Land Company, Honolulu, Hawaiian Islands, has entered the Quartermaster's Reserve Corps of the United States Army for service on the islands, replacing regular army officers and enabling them to be transferred to the front.

W. E. McGarry, special representative of the Terminal Railroad Association of St. Louis on the St. Louis committee of the Commission on Car Service, has been elected chairman to succeed I. L. Burlingame, who has resigned on account of his heavy duties as general manager of the Terminal Railroad.

In the article entitled "Heavier Car Loading Would Eliminate Car Shortage," published in the June 22 issue of the *Railway Age Gazette*, the Patriotic War Number, the caption of the illustration shown on page 1294 misstated the loading of these cars. The pipe shown in this illustration was steel pipe and not wrought-iron pipe as indicated.

The Secretary of the Treasury has submitted to Congress an estimate of over \$5,000,000,000 additional revenue that will be required by the government this year for war purposes, in addition to the money already appropriated. The estimate includes an item of \$450,490,305 for transportation of the army and supplies.

Near North Tonawanda, N. Y., on the morning of July 21, about 1 o'clock, a local freight train of the New York Central was stopped (by application of air brakes) by ten armed men, who opened a car containing aluminum and carried off in automobiles 200 pigs of the metal, said to be worth \$4,800. The stolen property was subsequently recovered and four of the thieves were caught.

In the July 6 issue of the *Railway Age Gazette* it was incorrectly stated that the freight house of the Southern railway at East St. Louis, Ill., and 100 loaded freight cars standing on that company's tracks were destroyed by fire. As a matter of fact, the Southern's warehouse was not destroyed, nor even injured, and the number of loaded cars destroyed by fire was 26 instead of 100. Fifteen empty cars were also destroyed, and two cars were damaged, but the contents of these were not injured.

Secretary Wilson of the Department of Labor has recently given his personal attention to efforts to reach a settlement between the southeastern railroads and their shop employees who are demanding an eight-hour day and increases in wages. After six months of conference between the railroad managers and representatives of the men, relations were broken off and a strike was averted only by an agreement to refer the controversy to conciliators of the Labor Department with an agreement to abide by the decision of Secretary Wilson in case their efforts failed. The secretary has recently attended the conferences, which are expected to last for several days.

The Interstate Commerce Commission has issued a revision of valuation order No. 3, originally effective July 1, 1914. This order provided for a uniform system of reporting investment in

the physical property of every common carrier as a means of keeping valuation inventories up-to-date. The carriers were required to file reports for each fiscal year on June 30 thereof. The revision of the order, which is effective July 1, 1917, was issued to make the necessary adjustment in consequence of the change in the fiscal year. Following the report for June 30, 1917, carriers will be required to make a report for the six months ending December 31, 1917, and on each December 31 thereafter.

C. W. Egan, general claim agent of the Baltimore & Ohio, announces the appointment of a committee, of which he is a member, which has been organized for the purpose of educating railroad employees who may return from the war disabled. This committee was chosen at a recent meeting of heads of railroad claim departments. Its purpose is to teach men in the work of that department to which they may be best adapted and to provide places for them, so far as practicable, after they have acquired some degree of proficiency; and to endeavor to see that all such men receive pay as nearly as possible on the basis that they would have received had they not gone to war. The committee represents 117 American and Canadian railroads.

P. P. Claxton, United States Commissioner of Education, under the authorization of the Secretary of War, has advised the presidents of technical schools and colleges that students of such schools who are within the age limit of the selective draft should be treated in the same manner as workers in the industries which are devoted to the manufacture of war materials. Under this ruling exemption may properly be urged for students who give promise of special aptitude for the technical and scientific professions until they have finished their courses. As the successful prosecution of war depends in a large measure on the services of technical experts, it is important that the supply of men who have had advanced technical training should not be cut off more than is necessary.

According to a recent statement by W. R. Scott, vice-president and general manager of the Southern Pacific, this road will be forced to discontinue some of its trains within a short time unless the federal government opens up oil fields in the west which have been reserved on the theory that a navy to be built five years from now may need this supply. It is stated that the consumption of crude oil in California is now 60,000 gallons a day above production and that the Southern Pacific is now using from 9,000 to 12,000 more barrels a day than it can buy or produce. The Southern Pacific asks that it be permitted to supply its fuel needs from those of its lands which are under the government ban, to prevent the serious results which would follow a paralysis of a consideration portion of its train service at a time when traffic is exceptionally heavy on account of the war needs of the country.

Railroads Increasing Nation's Food Supply

Fairfax Harrison, chairman of the Railroads' War Board, has authorized a statement in which he says that the railroads of the West and Middle West are leasing at nominal rental for grazing and agricultural purposes millions of acres of lands. Virtually all of the land owned by these roads, which is not being used for operating purposes, is now under cultivation or being used by live-stock owners for cattle grazing.

And also, as heretofore noted, a number of the railroads are offering garden plots, rent free, to families along their right of way. The federal government has been offered 200,000 acres of "cut-over" land in Wisconsin by the Minneapolis, St. Paul & Sault Ste. Marie.

Among the western roads that are leasing all suitable lands in their possession for agricultural and grazing purposes are the Northern Pacific, the Union Pacific, the Southern Pacific, the Great Northern, the Oregon Short Line, the Chicago, Milwaukee & St. Paul, the Northwestern Pacific, and the Atchison,

Topeka & Santa Fe. The Santa Fe has leased every available acre that it owns.

Other roads leasing their idle lands are the St. Louis & San Francisco, the Pere Marquette, the Missouri Pacific, the Missouri, Kansas & Texas, the Chicago, Burlington & Quincy, and the Chicago, Rock Island & Pacific.

A Million Rations Lost

J. H. Elliott, general manager of the Texas & Pacific, has issued a public plea for the enactment of laws in Texas and Louisiana to prohibit live stock from running at large. Mr. Elliott says that his road killed enough live stock in the last fiscal year to provide sufficient meat to feed an army of 100,000 men ten days. The record shows 1,027 cattle, 552 hogs and sheep, and 165 horses and mules killed; an absolute waste. Many of the cattle were milch cows, the loss of which entailed a corresponding loss of butter and milk. Our armies are clamoring for horses and mules, and thousands and thousands of them are required. The road has spent large sums of money in building and repairing fences, and has educated its employees to do their utmost to prevent the killing of stock; but the waste cannot be stopped without the hearty co-operation of the public and the owners of stock. Many of the animals are killed inside station limits, where railroads can not build fences.

Canadian Pacific Men Win Honors in War

A Canadian Pacific bulletin recently issued contains a partial list of officers and employees of the company in military service in Europe to whom King George has awarded decorations and medals for bravery, gallantry and devotion to duty in the field. C. W. P. Ramsey, formerly engineer of construction at Montreal and now lieutenant-colonel in the Canadian army, has been made a Companion of the Order of St. Michael and St. George. Distinguished service orders were granted to G. S. Cantlie, formerly general superintendent of car service at Montreal, Ont., and now lieutenant-colonel; F. A. Gascoigne, formerly superintendent of car service at Montreal and now a lieutenant-colonel, and J. A. Hesketh, formerly assistant engineer at Winnipeg, Man., and now a major. Military crosses were given to thirteen Canadian Pacific men, distinguished conduct medals to ten, military medals to thirty-eight and a meritorious medal to one.

Canada's Railway Plans

The intentions of the government in connection with the proposed nationalization of railways were the subject of a report presented in parliament August 1 by Sir Thomas White, finance minister. He said it was proposed to acquire the entire Canadian Northern system of over 9,000 miles. This system has a common share capital of \$100,000,000, of which the government already owns \$60,000,000. A board of arbitration will be appointed to determine the value of the property.

The government contemplates the eventual acquisition of the Grand Trunk Pacific, but as to this no definite plans were presented. In the meantime, however, the government proposes to assist the G. T. P. with an advance of \$750,000 to be secured by mortgage, for which the Grand Trunk, as well as the Grand Trunk Pacific, would be liable.

War Industries Board

Robert S. Lovett, chairman of the executive committee of the Union Pacific, has been appointed a member of the new War Industries Board, created by the Council of National Defense, which, in addition to other duties, will assume those formerly discharged by the General Munitions Board. It will act as a clearing house for the war industry needs of the government, determine the most effective ways of meeting them and the best means and methods of increasing production; the sequence and relative urgency of the needs of the different government services, consider price factors, and, in the first instance, the industrial and labor aspects of problems involved, and the general questions affecting the purchase of commodities. It will work under the direction and control of the Council of National Defense, and be responsible through it, to the President. The members are: F. A. Scott, chairman; Lieutenant-Colonel Palmer E. Pierce, representing the army; Rear Admiral Frank

E. Fletcher, representing the navy; Hugh Frayne, B. M. Baruch, Robert S. Brookings, and Mr. Lovett, who will give his attention particularly to matters of priority. The various subordinate and co-operative committee of the Advisory Commission of the Council of National Defense, will continue their activities, and those whose work is related to the duties of the War Industries Board will co-operate with it.

Women on the Pennsylvania

Women and girls employed on the Pennsylvania Railroad now number more than 2,000 in the operating department alone; and the greater part of these have been employed within the last two months. There are 11 signal women, six student signal women, four women locomotive dispatchers, 19 station cleaners, 206 car cleaners, two draughtswomen, 104 messengers, 20 student messengers, 10 extra messengers, 23 station agents, one ticket seller, three bureau of information attendants, one pump attendant, 42 block operators, two machine hands, five street watchwomen, five upholsterers, one parcel room attendant, 12 drawbridge tenders and 18 store attendants, a total of 555; and in the lines of work more customarily followed by women there are 433 telephone operators, 84 matrons, 29 janitresses, two stewardesses, 78 stenographers, 1,102 clerks and one cook. The aggregate in all kinds of work is 2,360.

Last May, when the Pennsylvania first proposed to employ women on a large scale, the only women in the service were a few station agents, telegraph and telephone operators, etc., and a limited number of women clerks who had been experimentally employed in one of the large departments in the general office.

Personal Injury Fakir Trapped

One cold day last spring a man on crutches stumbled into the office of Oscar D. Aepli, general claim adjuster of the Chicago, Milwaukee & St. Paul at Chicago. He stated that he had slipped on a banana peel on a step while getting off a St. Paul train and had injured his spine as a result of the fall. Mr. Aepli sent him to a hospital for examination. While his case was something of a puzzle to medical men, he did not flinch when they applied an electrical test and stuck pins into his feet. Subsequently, Mr. Aepli, who scented that something was wrong, had the man shadowed and found that while he painfully picked his way to the street car from the St. Paul offices, as soon as he got inside, he put his crutches under his arm and strolled unconcernedly to a seat forward. Upon investigation it was discovered that he had successfully prosecuted similar claims against three other roads under three different names. He later wrote the St. Paul a threatening letter from Minneapolis under the name of a fictitious attorney, but without success. On May 3, he presented a claim to the Minneapolis & St. Louis for injuries alleged to have been received at Mason City, Ia. That road settled with him, but watched his subsequent activities and discovered him walking out of an alley without his crutches. He was thereupon arrested and is in jail under \$2,500 bonds. The St. Paul has also taken up the matter with federal authorities, who have issued a warrant charging him with attempting to obtain money under false pretenses and for using the mails for fraudulent purposes. In commenting on the case, Mr. Aepli said, "We shall prosecute this man. Our department endeavors to be fair with those who come to it, and we hope to give justice to this imposter."

Informal Railroad Operation

Railroad operations on the New Jersey & Pennsylvania Railroad have been resumed, after a bad wreck that blocked the road for six hours. The New Jersey and Pennsylvania [a line from Morristown, N. J., south, 25 miles, which suspended business four years ago for lack of enough income to pay wages and fuel] was bought at auction a few weeks ago by Frank B. Allen, who has since been making a good profit on the transaction by tearing up the rails of all sidings, and selling them to the Allies for use in France.

Mr. Allen, who is president of the road, was directing operations yesterday from the front seat of his automobile when an accident at one blow disabled 33 per cent of the rolling stock of the railroad. President Allen's motor car is fitted with flanged wheels, and hauls the two hand-cars, which constitute

the company's active "equipment." Suddenly the rear car jumped the track and broke a spring. The train crew had to lug the wrecked car to the blacksmith shop at Brookside station, near where the wreck occurred. The blacksmith and his helper worked over the broken spring for three hours before the car was repaired and the train crew could lug it back to the rails.

Just before the big wreck the train had arrived at Brookside station in response to a rumor that from an old siding overgrown with bushes a profitable lot of rails could be taken. Old rails are worth \$65 to \$80 a ton, depending on whether they are composed of rust or of iron.

About 100 tons of rails have been taken from the roadbed of this line. The rails weigh about 46 pounds to the yard. The removal of the rails does not mean that the company has expired. There is still a single track between termini, with a few turnouts. Two locomotives are being repaired at Paterson. Meantime President Allen has fitted his motor car with flanged wheels for railroad traction purposes. At night the flanged wheels are taken off, pneumatic rubber-tired automobile wheels put on, and President Allen rides home over the macadam.—*New York Evening Post.*

How Increased Prices Affect the Railroads and the Public

In a recent public statement R. J. Clancy, assistant to the general manager of the Southern Pacific, San Francisco, showed how much more oppressive increased prices are on the railroads than on the general public. He said: "The increase in the cost of a Mallet locomotive over what it was two years ago would buy a 160-acre farm at \$125 an acre, build a \$5,000 residence on it, provide for \$2,500 worth of implements and farm machinery, 25 dairy cows at \$75 each, \$700 for teams and wagons, a \$1,500 automobile, and still leave \$150 for incidentals—and this represents the increase in the cost of only one locomotive. Complaint is general among the people regarding the increased cost of living, resulting from increases in the cost of a dozen or so necessities of life, such as bread, butter, meat, potatoes, etc., but how about the railroad menu? The railroad consumes material, just as an individual consumes food, except that instead of a dozen articles, the railroad menu is 85 times that many, and its burdens, therefore, are in relatively greater proportion.

"Where the individual consumes pounds of bread, butter, meat and potatoes which have advanced 50 per cent, the railroad consumes tons of copper, steel, iron and kindred products which have advanced from 100 to 500 per cent. An individual may economize by substituting a cheaper article, such as eggs for meat and rice for potatoes, etc., and in this way neutralize the effect of increased prices, but a railroad is subjected to hard and fast standards which permit of little or no substitution, and cannot, like the individual, economize by substituting a cheaper article. Wage increases in other industries have been added into the cost of material and supplies to the railroad, and this, combined with wage increases to railway employees, increased taxes and a very large increase in the cost of fuel oil, produces an aggregate burden of ominous proportions."

Railway Revenues and Expenses for May, 1917

The net operating income of the railways of the United States for May, 1917, was more than May, 1916, by \$4 per mile, or 1.1 per cent, according to the monthly bulletin of the Bureau of Railway Economics.

Total operating revenues, \$345,773,079, exceeded those for May, 1916, by \$44,727,367. Operating expenses, \$238,682,879, were greater by \$41,272,388. Net operating revenue, \$107,090,200, increased \$3,454,979. Taxes, \$14,959,535, increased by \$2,333,548. Net operating income was \$92,079,548, which is an increase of \$1,147,753.

If spread over the mileage represented, operating revenues averaged \$1,498 per mile, an increase over May, 1916, of 14.7 per cent; operating expenses per mile, \$1,034, were greater by 20.7 per cent; net operating revenue per mile, \$464, shows an increase of 3.1 per cent; while net operating income per mile, \$399, increased 1.1 per cent. Taxes per mile rose 18.3 per cent.

This summary covers 230,905 miles of operated line, or about 90 per cent of the steam railway mileage of the United States.

For the eastern railways, operating revenues per mile were greater than those for May, 1916, by 11.4 per cent; operating expenses rose 22.2 per cent; net operating revenue decreased 9.6

REVENUES AND EXPENSES OF STEAM ROADS, MAY, 1917

d Decrease. * Less than one dollar.

per cent; taxes increased 17.6 per cent. Operating income per mile decreased 12.8 per cent.

For the railways of the southern district, operating revenues per mile exceeded those for May, 1916, by 15.5 per cent; operating expenses rose 22.1 per cent; net operating revenue increased 3.2 per cent; taxes increased 36.7 per cent. Operating income per mile decreased 1.1 per cent.

For the western railways, operating revenues per mile exceeded those for May, 1916, by 18.4 per cent; operating expenses rose 18.5 per cent; net operating revenue increased 18.2 per cent; taxes increased 13.3 per cent. Operating income per mile increased 19.0 per cent.

The five months of the current calendar year, compared with the corresponding period of the preceding year, show changes per mile of line as follows: Operating revenues increased 10.5 per cent, operating expenses increased 17.3 per cent, net operating revenue decreased 3.9 per cent, taxes increased 15.3 per cent, while operating income decreased 7.1 per cent.

Operating income per mile decreased 24.3 per cent in the east, increased 2.7 per cent in the south, and increased 8.9 per cent in the west.

May net operating income per mile was 1.1 per cent greater in 1917 than in 1916, 53.9 per cent greater than in 1915, 104.1 per cent greater than in 1914, and 46.1 per cent greater than in 1913.

Local Committees of Commission on Car Service

As previously announced in the *Railway Age Gazette*, local committees of railroad officers have been organized at various points in the country to assist the Commission on Car Service in expediting the movement of equipment. The names of the cities where committees are located and the chairmen in charge are as follows:

Atlanta, Ga., E. W. Sandwich, superintendent of car service, Atlanta & West Point.
Birmingham, Ala., H. E. Hutchens, inspector of passenger transportation of the Southern Railway.
Boston, Mass., S. E. Miller, acting superintendent of transportation, Boston & Maine.
Buffalo, N. Y., D. B. Fleming, superintendent, New York Central.
Chicago, Ill., H. E. Byram, vice-president, Chicago, Burlington & Quincy.
Cleveland, Ohio, R. K. Rochester, superintendent, Pennsylvania Lines West.
Cincinnati, Ohio, Geo. B. Skeldon, Cleveland, Cincinnati, Chicago & St. Louis.
Columbus, Ohio, I. W. Geer, general superintendent Pennsylvania Lines West.
Detroit, Mich., Henry Shearer, general superintendent, Michigan Central.
Galveston, Tex., J. H. Keefe, assistant general manager, Gulf, Colorado & Santa Fe.
Indianapolis, Ind., J. W. Conely, superintendent, Pennsylvania Lines West.
Kansas City, Mo., O. C. Hill, superintendent, Kansas City Terminal.
Louisville, Ky., W. S. Campbell, manager and chief engineer, Kentucky & Indiana Terminal.
Memphis, Tenn., A. H. Egan, general superintendent, Illinois Central.
Minneapolis, Minn., G. T. Slade, vice-president, Northern Pacific.
Norfolk, Va., C. P. Dugan, superintendent of transportation, Norfolk Southern.
New York, N. Y., F. E. Williamson, superintendent, New York Central.
New Orleans, La., L. A. Downs, general superintendent, Illinois Central.
Philadelphia, Pa., Elisha Lee, general manager, Pennsylvania Railroad.
Pittsburgh, Pa., D. F. Crawford, general manager, Pennsylvania Lines.
Peoria, Ill., R. H. Johnson, general manager, Peoria & Pekin Union.
Richmond, Va., W. D. Duke, general superintendent, Richmond, F. & P.
St. Louis, Mo., I. L. Burlingame, general manager, Terminal Railroad Association.
Seattle, Wash., J. H. O'Neill, general superintendent, Great Northern.
San Francisco, Cal., K. M. Nicoles, superintendent of transportation and superintendent of telegraph, Western Pacific.
Toledo, Ohio, A. B. Newell, president, Toledo Terminal.
Wheeler, W. Va., U. B. Williams, general agent, Baltimore & Ohio.

Railroad Efficiency in Serving Army Camps

In a statement given out on July 25, R. H. Aishton, chairman of the Central Department Committee of the Railroads' War Board, shows how efficiently the railroads are serving the army camps in the 15 states in the Central War Department. There are six cantonment sites, four aviation sites and 21 mobilization and training camps in this district, and at every one of these places, most of which were established after the war began, there has been a strenuous demand for large quantities of a wide variety of material and supplies. In order to reach some of the new military sites it was necessary for the railroads to build miles of track before they could deliver material for the buildings planned. Nevertheless, the records show that up to July 20, 2,298 carloads of materials and supplies had been delivered to the cantonment sites, 3,092 carloads at the aviation sites, and 900 at the mobilization and training camps, or a total of 6,300 carloads. Among the sites where new track has been necessary are Rockford, Ill., where a length of 4.5 miles of track

was built and 2 miles more are being built. Battle Creek, Mich., 1 mile built; Rantoul, Ill., ½ mile built. To ascertain exactly how the railroads were meeting the demands of the war department at these sites, Mr. Aishton sent specific inquiries to each of the military sites, and in every case received the assurance that no complaint could be made as to the furnishing of cars or the moving of material.

Railway and Engineering Work in France

The value of railroad materials and rolling stock alone, now being purchased to provide in advance for the needs of the American army abroad, is about five times that of all purchases made annually in this country for the Panama Canal during the last four or five years, according to a statement authorized by the chief of engineers of the army.

American engineers must undertake large operations in the construction and repair of bridges in France. They must repair and maintain the roads and highways over which supplies will be brought up to the battle line. Much of the latter work will be done within range of the enemy's guns.

Our engineers will equip the wharves and piers in France utilized by American forces with the terminal facilities required by our armies. The lumber for this work will be cut from European forests by regiments of American foresters. This method will save burdening our ships with lumber from the United States. One regiment of foresters is being organized, and several more will be raised. They will carry with them complete lumbermen's outfits, including sawmill equipment.

Material for extensive standard gage and narrow gage railroads will be sent to Europe, to enable the engineers to carry out their task. The lines to be built will both transport our troops to the front and handle all transportation behind the firing line. The lines running up to the front will remove wounded and salvage gathered from the field. Lines of this type are broad-gage, feeding numerous narrow-gage spurs which radiate from the main line and accommodate supply trains, often hauled by gasoline engines.

The Engineers' Corps will carry its own rolling stock to the theater of war. This, in itself, will be a gigantic operation.

The engineers must construct at harbors in the United States wharves, piers and storehouses of sufficient capacity to handle all materials and supplies to be shipped to France. An efficiency system has been worked out to provide against delay in loading and unloading which might interfere in any way with the maximum movement of the shipping available. Ample and up-to-date terminal facilities must be provided in ports on both sides of the Atlantic. Our shortage of ships on the water makes efficiency in docks doubly important, and the speed of the transport service naturally depends upon the number of tons actually moving all the time, and not upon the amount of tonnage available.

U. S. Chamber of Commerce Urges Development of Storage Facilities

A committee of the Chamber of Commerce of the United States has issued a bulletin calling attention to ways in which shippers may promote the most efficient use of railway facilities during the war, and urging the importance of developing storage facilities at points of production to avoid congestion in manufacture, of developing such facilities for finished goods near the point of consumption or shipment abroad in order to minimize the need for railroad cars, and of creating conditions under which railroad cars will not be used for storage purposes. The bulletin describes some of the work of the Storage Committee of the Council of National Defense along these lines.

"Unless adequate preparations are made to store materials or goods on the arrival of railroad cars," the bulletin says, "these cars themselves must of necessity be used for storage purposes. Ocean transportation at best is irregular, and today the conditions are uncertain, to say the least. Often in the past two years shipments for France and England have so accumulated at New York and other ports that many hundreds of cars for months have not only blocked terminal facilities but side tracks all the way to Buffalo and Pittsburgh. The work of the Storage Committee is directed toward avoiding this condition on the enormous shipments to be made by our government."

According to the National Chamber bulletin prepared under

the direction of Waddill Catchings, of New York, baling or compressing products for shipment is developing great possibilities for saving transportation space. Already socks and blankets are being baled and satisfactory progress is being made toward baling uniforms, shoes and even prunes. Bales are covered with a waterproof material, which is later used for sand bags at the front. One advantage of baling is that use can be made of flat cars in shipping merchandise.

"The railroads are doing more than ever before, but the burden is overwhelming, for business in this country is on a scale never before approached," according to the National Chamber bulletin. "On the one hand, the supply of new equipment is restricted by material and labor conditions, and on the other hand, not only is existing equipment being given to our Allies, but the output of many of our car and locomotive plants is given to them because their need is greater than ours. Therefore, with little opportunity of securing new equipment and having to rely upon what they have, using this to the utmost until it wears out, the railroads are called upon for increasingly great efforts as our business everywhere expands.

"The utmost which the railroads are able to do is not equal to the needs of the government and of the great business being done today. In fact, it is said, facilities of transportation are very likely to be the limiting factor on general business unless there is close co-operation between business men and the railroads. Business men will see, therefore, how deep is their concern that no avoidable demand be made upon the railroads either for transportation or for the use of railroad cars for storage purposes.

"The request is made therefore of all member associations of the Chamber of Commerce of the United States interested in this problem to appoint competent and energetic committees to act in this connection, and to send the names of the members of such committees to the committee of which Mr. Catchings is the chairman, and to the Storage Committee of the Council of National Defense at Washington.

"Furthermore, steps should be taken to eliminate less than carload shipment by combining such shipments for many manufacturers in a locality, and by establishing centers for distributing, by truck, shipments received in car lots and for receiving goods in a similar manner for outbound movement in car lots. Effort should also be made to bring about the loading of railroad cars to full car capacity. Where such loading is prevented by trade customs, which establish the unit of an order at less than maximum car capacity, steps should be taken to change these customs so that the use of cars will not be unduly restricted."

Bridge and Building Convention

At a meeting of the executive committee of the American Railway Bridge and Building Association, held in Chicago on July 25, it was decided to transfer the next convention from St. Paul, the place originally selected, to Chicago, to enable more men to attend the meeting with a minimum loss of time. It was also decided to hold a three-day convention and to revise the program radically to enable a large part of the time to be given to the consideration of problems which have assumed primary importance for bridge and building men during the last few months. Special attention will be given to discussions of labor and of materials.

National Association of Purchasing Agents

The annual congress of purchasing agents, under the auspices of the national association, will be held at Pittsburgh, October 9, 10 and 11. The program includes business sessions for the mornings and visitation and inspection of industrial works during the afternoons.

The National Association of Purchasing Agents is composed of the membership of local branches with a present total membership, including all active local associations, of more than 1,000.

The object of the association is to bring together on common ground purchasing agents generally, to gather and to disseminate information and knowledge of benefit to the profession, to foster and promote friendly relations between members, to secure more uniform purchasing routine method and the standardization of specifications and classifications and dissemination

of data relating to the general subject of buying, the improvement of existing methods for the diffusion of information, and to secure generally more definite as well as broader information on topics and problems of importance.

The president of the association is E. L. McGrew, of the Standard Underground Cable Company. The headquarters are at 600 Westinghouse building, Pittsburgh.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings and places of meetings:

- AIR BRAKE ASSOCIATION.—F. M. Nellis, Room 3014, 165 Broadway, New York City.
- AMERICAN ASSOCIATION OF DEMURRAGE OFFICERS.—F. A. Portions, 455 Grand Central Station, Chicago. Next meeting, July 18, 1917, Asheville, N. C.
- AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—H. C. Boardman, 12 L. & W., Hoboken, N. J. Next convention, October, 1917, San Francisco, Cal.
- AMERICAN ASSOCIATION OF FREIGHT AGENTS.—R. O. Wells, Illinois Central, Chicago, Ill.
- AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hope, C. R. R. of N. J., 143 Liberty St., New York. Next meeting, October 16-17, N. Y.
- AMERICAN ASSOCIATION OF RAILROAD SUPERINTENDENTS.—E. H. Harman, Room 101, Union Station, St. Louis, Mo. Annual meeting to have been held August 8-10 indefinitely postponed.
- AMERICAN ELECTRIC RAILWAY ASSOCIATION.—E. B. Barritt, 8 W. 40th St., New York. Convention for 1917 abandoned.
- AMERICAN ELECTRIC RAILWAY MANUFACTURERS' ASSOCIATION.—Fred C. J. Dell, 165 Broadway, New York.
- AMERICAN RAILROAD MASTER TINNERS', COPPERSMITHS' AND PIPEFITTERS' ASSOCIATION.—W. E. Jones, C. & N. W., 3814 Fulton St., Chicago. Convention for 1917 postponed.
- AMERICAN RAILWAY ASSOCIATION.—J. E. Fairbanks, general secretary, 75 Church St., New York.
- AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichy, C. & N. W., Chicago. Next convention, October 16-18, 1917, St. Paul, Minn.
- AMERICAN RAILWAY ENGINEERING ASSOCIATION.—E. H. Fritch, 900 S. Michigan Ave., Chicago.
- AMERICAN RAILWAY MASTER MECHANICS' ASSOCIATION.—J. W. Taylor, 1112 Karpen Bldg., Chicago.
- AMERICAN RAILWAY TOOL FOREMEN'S ASSOCIATION.—Owen D. Kinsey, Illinois Central, Chicago. Next convention, to have been held August 30-September 1, Hotel Sherman, Chicago, postponed for one year.
- AMERICAN SOCIETY FOR TESTING MATERIALS.—Prof. E. Marburg, University of Pennsylvania, Philadelphia, Pa.
- AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.
- AMERICAN SOCIETY OF MECHANICAL ENGINEERS.—Calvin W. Rice, 29 W. 49th St., New York.
- AMERICAN WOOD PRESERVERS' ASSOCIATION.—F. J. Angier, Supt. Timber Preservation, B. & O., Mt. Royal Sta., Baltimore, Md. Next convention, January, 1918, Chicago.
- ASSOCIATION OF AMERICAN RAILWAY ACCOUNTING OFFICERS.—E. R. Woodson, Rooms 1116-8 Woodward Bldg., Washington, D. C.
- ASSOCIATION OF MANUFACTURERS OF CHILLED CAR WHEELS.—George W. Lyndon, 124 McCormick Bldg., Chicago. Semi-annual meeting with Master Car Builders' Association.
- ASSOCIATION OF RAILWAY CLAIM AGENTS.—Willis H. Failing, Terminal Station, Central of New Jersey, Jersey City, N. J.
- ASSOCIATION OF RAILWAY ELECTRICAL ENGINEERS.—Jos. A. Andreucciti, C. & N. W., Room 411, C. & N. W. Sta., Chicago. Semi-annual and annual convention postponed indefinitely.
- ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—W. L. Connelly, Superintendent Telegraph, Indiana Harbor, Belt, Gibson, Ind. Next annual meeting, September 11-13, 1917, Washington, D. C.
- ASSOCIATION OF TRANSPORTATION AND CAR ACCOUNTING OFFICERS.—G. P. Conard, 75 Church St., New York.
- BRIDGE AND BUILDING SUPPLY MEN'S ASSOCIATION.—Tom Lebon, The Lebon Company, Chicago. Meetings with American Railway Bridge and Building Association.
- CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.
- CANADIAN SOCIETY OF CIVIL ENGINEERS.—Clement H. McLeod, 176 Mansfield St., Montreal Que. Regular meetings, 1st Thursday in October, November, December, February, March and April, annual meeting, January, Montreal.
- CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.
- CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual dinner, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.
- CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S ASSOCIATION.—W. R. McMuun, New York Central, Albany, N. Y. Next convention, September, 1917, St. Louis.
- ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 568 Union Arcade Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh, Pa.
- FREIGHT CLAIM ASSOCIATION.—Warren P. Taylor, Traffic Manager, R. F. & P., Richmond, Va.
- GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, Wednesday, preceding 3d Thursday in month, Room 1356, Transportation Bldg., Chicago.

INTERNATIONAL RAILROAD MASTER BLACKSMITHS' ASSOCIATION.—A. L. Woodworth, C. H. & D. L. Line, Ohio. Next annual meeting, to have been held August 21-23, 1917, Chicago, postponed for one year.

INTERNATIONAL RAILWAY FUEL ASSOCIATION.—J. G. Crawford, C. B. & Q. R. R., 702 E. 51st St., Chicago. Next convention, May, 1918, Chicago.

INTERNATIONAL RAILWAY GENERAL FOREMEN'S ASSOCIATION.—Wm. Hall, 1126 W. Broadway, Winona, Minn. Annual meeting, to have been held September 4-7, 1917, Hotel Sherman, Chicago, indefinitely postponed.

INVESTMENT BANKERS' ASSOCIATION OF AMERICA.—Frederick R. Fenton, 11 W. Monroe St., Chicago. Annual convention, October 1-3, 1917, Baltimore, Md.

MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—F. W. Hager, Fort Worth & Denver City, Fort Worth, Tex. Next convention, October 16-18, 1917, Cleveland, Ohio.

MASTER BOILER MAKERS' ASSOCIATION.—Harry D. Vought, 95 Liberty St., New York.

MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—A. P. Dafe, B. & M., Reading, Mass. Next annual meeting, September 11, 1917, Chicago.

MASTER CAR BUILDERS' ASSOCIATION.—J. W. Taylor, 1112 Karpen Bldg., Chicago.

NATIONAL ASSOCIATION OF RAILWAY COMMISSIONERS.—Jas. B. Walker, 120 Broadway, New York City. Next annual convention, October 16, 1917, Washington, D. C.

NATIONAL RAILWAY APPLIANCE ASSOCIATION.—C. W. Kelly, 349 Peoples Gas Bldg., Chicago.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 693 Atlantic Ave., Boston, Mass. Regular meeting, 2d Tuesday in month, except June, July, August and September, Boston.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meetings, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—Geo. A. J. Hochgrebe, 623 Brisbane Bldg., Buffalo, N. Y. Meetings 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.

PACIFIC RAILWAY CLUB.—W. S. Wollner, Assistant to Chief Engineer, Northwestern Pacific R. R., San Francisco, Cal.

PEORIA ASSOCIATION OF RAILROAD OFFICERS.—F. C. Stewart, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.

RAILROAD CLUB OF KANSAS CITY.—Claude Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Saturday in month, Kansas City.

RAILWAY BUSINESS ASSOCIATION.—Frank W. Noxon, 30 Church St., New York.

RAILWAY CLUB OF PITTSBURGH.—J. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Pittsburgh Commercial Club Rooms, Colonial-Annex Hotel, Pittsburgh.

RAILWAY DEVELOPMENT ASSOCIATION.—D. C. Welty, Commissioner of Agriculture, St. L., Iron Mt. & So., 1047 Railway Exchange Bldg., St. Louis. Next annual convention, May, 1918, Houston, Tex.

RAILWAY ELECTRICAL SUPPLY MANUFACTURERS' ASSOCIATION.—J. Scribner, 1063 Maindack Block, Chicago. Meetings with Association of Railway Electrical Engineers.

RAILWAY FIRE PROTECTION ASSOCIATION.—C. B. Edwards, Office of the President's Assistant, Seaboard Air Line, Norfolk, Va. Next meeting, October 2-4, 1917, St. Louis, Mo.

RAILWAY REAL ESTATE ASSOCIATION.—R. H. Morrison, Assistant Engineer, C. & O., Richmond, Va. Next convention, October, 1917, Duluth, Minn.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Myers Bldg., Bethlehem, Pa. Next meeting, June, 1917, Hotel McAlpin, N. Y. Next annual convention, September, 1917, Atlantic City, N. J.

RAILWAY STOREKEEPERS' ASSOCIATION.—J. P. Murphy, N. Y. C. R. R., Box C, Collinwood, Ohio.

RAILWAY SUPPLY MANUFACTURERS' ASSOCIATION.—J. D. Conway, 2136 Oliver Bldg., Pittsburgh, Pa. Meetings with Master Car Builders' and Master Mechanic's Association.

RAILWAY TELEGRAPH AND TELEPHONE APPLIANCE ASSOCIATION.—G. A. Nelson, 50 Church St., New York. Meetings with Association of Railway Telegraph Superintendents.

RICHMOND RAILROAD CLUB.—F. O. Robinson, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—P. J. McAndrews, C. & N. W., Sterling, Ill. Next annual convention, September 18-21, 1917, Hotel Auditorium, Chicago.

ST. LOUIS RAILWAY CLUB.—B. W. Frauenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

SALT LAKE TRANSPORTATION CLUB.—R. E. Rowland, David Keith Bldg., Salt Lake City, Utah. Regular meetings, 1st Saturday of each month, Salt Lake City.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

SOCIETY OF RAILWAY FINANCIAL OFFICERS.—L. W. Cox, N. & W., Philadelphia, Pa.

SOUTHERN ASSOCIATION OF CAR SERVICE OFFICERS.—E. W. Sandwich, A. & W. P. R. R., Atlanta, Ga.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grant Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September, November, 10 a. m., Piedmont Hotel, Atlanta.

TOLEDO TRANSPORTATION CLUB.—Harry S. Fox, Toledo, Ohio. Regular meetings, 1st Saturday in month, Roddy House, Toledo.

TRACK SUPPLY ASSOCIATION.—V. C. Kidd, Ramapo Iron Works, Hillburn, N. Y. Meetings with Roadmasters' and Maintenance of Way Association.

TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.

TRAIN DISPATCHERS' ASSOCIATION OF AMERICA.—J. F. Mackie, 7122 Stewart Ave., Chicago.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. R. R., Cleveland, Ohio. Next convention, September, 1917, Chicago.

WESTERN ASSOCIATION OF SHORT LINE RAILROADS.—Clarence M. Oddie, Mills Bldg., San Francisco.

WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Monday in month, except June, July and August, Hotel Sherman, Chicago.

Traffic News

The Secretary of Commerce has appointed Walter Parker, assistant for Inland Water Transportation. Mr. Parker is general manager of the New Orleans Association of Commerce.

The Kansas Public Utilities Commission rendered a decision on July 20, denying the application of the railroads for an increase in intrastate passenger fares from two to three cents a mile.

The Nebraska State Railway Commission recently granted the railroads of that state a postponement of the date of hearing their application for a 15 per cent increase in freight rates from July 16 to September 10.

An application by the Texas & Pacific to the Railroad Commission of Louisiana for permission to discontinue several local trains, was denied in a decision rendered on July 19, on the ground that local passenger train service in Louisiana is already at the minimum.

The railroads centering in Youngstown, Ohio, in accordance with an agreement with the Chamber of Commerce of that city, have arranged to issue daily bulletins showing embargoes in force on less than carload freight; the purpose being to show, day by day, all changes of importance which may be of interest to Youngstown shippers.

The Baltimore & Ohio is circulating among shippers a number of photographs of cars loaded below their carrying capacity. A statement announcing this policy says that one large shipper on the B. & O. lines could have increased the market output of his plants in one month by 100 carloads if sufficient care had been given to loading cars to their full capacity.

The Santa Fe Lines have arranged to finance the purchase of seed wheat for the coming season for farmers who have located on new lines of the system in southwestern Kansas, northwestern Texas and western Oklahoma. The railroad has deposited approximately \$250,000 with bankers in this region, who will lend the money to the farmers on notes due after the 1918 harvest.

Representatives of railroads and industrial organizations discussed methods of increasing transportation efficiency at a meeting held under the auspices of the Traffic Club of the Chamber of Commerce at Cincinnati, Ohio, on July 20. Hugh M. Freer, chairman of the Traffic Club, was toastmaster, and the speakers included J. A. Morris, superintendent of terminals of the Cleveland, Cincinnati, Chicago & St. Louis, Cincinnati; W. C. Cooder, secretary of the Cincinnati committee of the Commission on Car Service; C. B. Stafford, manager of the traffic department of the Louisville (Ky.) Board of Trade, and Guy M. Freer, president of the National Industrial Traffic League. The latter stated that the transportation situation would be very critical next winter, and that it was the duty of the shippers and consignees to assist the railroads in reducing the shortage of cars by heavy loading and quick unloading.

"Hooverian Principles"

The Baltimore & Ohio announces that "Hooverian principles" of food conservation are to be adopted in its dining car menus, to enable the traveling public to economize as advised by the food administration. The menus have been arranged so as to suggest a liberal use of fish and vegetables, as well as the purchase of meals in quantities sufficient to appease hunger, and the substitution of corn bread for white bread. Unless especially ordered for dietary reasons white bread will not be offered at the morning or mid-day meals. The Baltimore & Ohio will continue to serve cream and butter at meals without extra charge, although it may be found necessary to adopt these suggestions later. Fruits and sweet entrees which do not require the use of pastry will also be featured. The size of portions will remain the same. All such articles as veal, squabs and other unmaturing foods have been discontinued. The service of table d'hôte meals will also be discontinued.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

The Interstate Commerce Commission has suspended from August 1 until November 29 the operation of a Southern Pacific Company-Atlantic Steamship Lines tariff providing for increased rates on cotton and cotton products from New Orleans to New York.

Southern Pacific Company's Ownership of Atlantic Steamship Lines

Opinion by Commissioner Meyer:

The petitioner, having corrected the objectionable practices enumerated in the commission's original report, it finds that the existing service of the Southern Pacific Company-Atlantic steamship lines between New York and New Orleans and New York and Galveston is in the interest of the public and of advantage to the convenience and commerce of the people. (45 I. C. C., 505.)

The Car Peddling Case

Nebraska State Grange et al. v. Union Pacific et al. Opinion by Commissioner Harlan:

During the fall of 1915 certain carriers operating in the Middle West took steps to put an end to the peddling or re-tailing of fruits, vegetables and other commodities from cars in railroad yards.

The commission holds that the view that the use by a shipper of a car on the carrier's tracks at destination as a place for peddling or vending to the public the carload shipment arriving in it as a service of transportation has no sanction at common law or in the act to regulate commerce; and the mere toleration by certain carriers through a period of years of such a use of their property affords no basis for a ruling that the practice has grown into a shipper's right and a carrier's duty.

Tariff items providing free time for unloading and demurrage charges for a further detention of a car for that purpose, do not embrace the use of the carrier's equipment and station grounds as a place where the carload shipper may transact business with the public for his own profit.

The business of a carrier is transportation, and its property may not be subjected against its will to a use not connected with transportation.

Discrimination in according or withholding a car-peddling privilege is condemned, but a distinction is made between car peddling and consolidated shipments to agents of granges and other farmer organizations. (45 I. C. C., 494.)

Milk and Cream Investigation

Milk and Cream Rates to Philadelphia. Opinion by Commissioner McChord:

Rates for the interstate transportation of milk, cream, condensed milk, skimmed milk, buttermilk and pot cheese to Philadelphia, Atlantic City and Cape May, N. J., and points on the New Jersey seacoast between the two latter points from points on the lines of the Pennsylvania Railroad, the Philadelphia, Baltimore & Washington, and the West Jersey & Seashore, and to Philadelphia from points in New Jersey on the Philadelphia & Reading, and from points on the Baltimore & Ohio are found to be unreasonable and prejudicial to producers and shippers from near-by points and preferential to producers and shippers from distant points. Reasonable maximum and non-prejudicial rates are prescribed for the future.

The milk and cream supply of Philadelphia is procured in New Jersey, New York, Delaware, Maryland and Pennsylvania, a large part being produced at points within 100 miles of the city and moving over intrastate routes.

The transportation of milk and cream to Philadelphia has developed from an adjunct of the passenger business. Originally milk and cream were transported in baggage cars in passenger trains. On the Pennsylvania the movement of milk in milk cars in passenger trains has been succeeded by a movement in milk trains, excepting cars brought from branch-line points

in passenger trains and later consolidated into milk trains, and occasional movements to Philadelphia in passenger trains. The volume of the latter traffic on the Pennsylvania is small.

During 1915 the amount of milk and cream transported to Philadelphia by the Pennsylvania was 93,675,462 quarts, by the Philadelphia & Reading, 53,938,435 quarts; and by the Baltimore & Ohio, 11,907,916 quarts. During that year electric lines transported 7,115,605 quarts; express companies, 6,991,480 quarts; and wagons and trucks, 4,800,000 quarts. The total receipts of 178,000,000 quarts compared with 120,000,000 in 1905 and 78,000,000 in 1887.

Milk and cream are sold to Philadelphia dealers on two bases. Under one basis the farmers sell the milk at a price delivered in Philadelphia. The farmers own the cans, clean them, tender the loaded cans at a milk platform owned by the carrier, and pay the transportation charges. The farmers do not own or operate milk-receiving stations. The farmers ship two-thirds of the milk and cream shipments over the Philadelphia & Reading, one-sixth of those over the Baltimore & Ohio, and some of those over the Pennsylvania. Until recent years substantially all shipments to Philadelphia were forwarded by farmers. Under the other basis Philadelphia dealers establish receiving stations at various points and install machinery for cooling the products and cleaning the cans. At a few points receiving stations are operated by independent companies which ship to dealers, the latter paying the transportation charges.

The Pennsylvania and Baltimore & Ohio have milk departments in charge of the milk business. Employees of these departments accompany cars to receive shipments, distribute the empty cans, and attend to billing and checking. The Reading has no separate milk department, but contracts with a dairy company to which it pays 20 per cent of its gross receipts on shipments secured from that company.

The Pennsylvania publishes rates on a zone system, the rates ranging from 20 cents for L. C. L. and 17.4 cents C. L. for 40-quart cans moving from 1 to 30 miles to 36.8 L. C. L. and 31.9 C. L. from 501 miles or more. The L. C. L. rates include icing, and rates include the return of the empty containers. Carload shipments are iced by dealers.

The Pennsylvania presented a careful analysis of the costs of handling this traffic, whereby it was shown that the actual earnings for the year from milk and cream traffic on the Philadelphia division were \$207,455. The expense on account of this traffic, as shown by the above table, was \$182,525, leaving a net revenue of \$24,930, or an operating ratio of 87.98 per cent. The figures do not include taxes. The operating ratio so ascertained for the milk traffic is compared with operating ratio of 76.67 per cent for the year 1914 for all traffic on the Pennsylvania Railroad, and on all traffic on the Philadelphia division for the same period of 72.06 per cent.

From the facts of record the commission is unable to find that the revenue received by the Pennsylvania from the rates on shipments of milk and cream to Philadelphia and the other points involved is unreasonably high.

It finds, however, that the present zone adjustment is unreasonable and prejudicial to producers and shippers from near-by points, and unduly prefers producers and shippers from distant points.

It establishes new L. C. L. rates for milk moving over the Pennsylvania, the Philadelphia, Baltimore & Washington and the West Jersey & Seashore to Philadelphia, Atlantic City and Cape May, and points on the New Jersey coast between the two last named points, in baggage, milk or refrigerator cars, in milk or passenger trains, iced when necessary, such rates to include the return of the empty containers. These rates are for 40-quart cans, and are based on a mileage scale with 10-mile divisions, ranging from 15.5 for 10 miles or under to 35.5 at 300 miles, and 48.5 to over 620, but not over 630. Rates for 20-quart and other cans are to be based on these on prescribed percentages. It is further found that the rates on cream and condensed milk should not exceed those on milk by more than 25 per cent. Carload rates may not exceed 87½ per cent of the less-than-carload rates.

Similar findings are made as to the rates on the Reading and Baltimore & Ohio. (45 I. C. C., 37.)

Ida S. Graustein v. Boston & Maine et al. Opinion by Commissioner McChord:

Reparation of \$30,519 is awarded for violations of the pro-

visions of the act by the Boston & Maine and the Rutland with respect to rates charged, train service and equipment furnished for transportation of milk in carloads from points in Vermont to Boston, Mass. (45 I. C. C., 393.)

Milk and Cream Rates to New York City. Opinion by Commissioner McChord:

Rates for the interstate transportation of milk, cream, condensed milk, skim milk, buttermilk, and pot cheese, in carloads and less than carloads, to Weehawken, Hoboken, and Jersey City, N. J., and New York, N. Y., from points on lines of respondents are found to be unreasonable and prejudicial to producers and shippers from near-by points and preferential to producers and shippers from distant points, and reasonable and non-prejudicial basis of rates prescribed for the future.

The rates prescribed are the same as those in the case above, *Milk and Cream Rates to Philadelphia*.

New York City secures the greater part of its milk from the eastern and central part of the state of New York, from points on and east of the line of the Pennsylvania Railroad extending from Sodus Point to Elmira, N. Y. Some is secured from western New York, northern Pennsylvania and New Jersey, Vermont, and western Massachusetts and Connecticut. All milk originating on the New York Central and on the West Shore west of Albany, N. Y., practically all on the Delaware & Hudson, the New York, Susquehanna & Western, and some on the Rutland and the Central New England, aggregating about 30 per cent of the total, is transported over intrastate routes.

Milk and cream are transported to the New Jersey terminals and to New York City almost wholly in milk cars in milk trains. Some cars are hauled in passenger trains in pick-up service on branch lines. There is practically no movement in baggage cars except some cream by express, which is negligible in quantity. There is no movement in freight trains. The 40-quart can is the standard container on shipments to New York. Rates on 40-quart cans, in less than carloads, are the basic rates in relation to which other rates have been made.

The receipts, reduced to a basis of 40-quart cans, in 1915 were as follows:

Carrier	Delivering point	Number of cans	Percent of total
New York Central.....	Meat House Junction, Bronx; 130th street, Manhattan;		
	33d street, Manhattan.....	6,700,934	33.3
West Shore	Weehawken, N. J.....	884,613	4.4
Total N. Y. C. lines.....		7,585,547	37.7
Erie	Jersey City, N. J.....	2,922,888	14.5
N. Y., S. & W.....	Jersey City, N. J.....	574,565	2.8
Total Erie lines.....		3,497,453	17.3
D. L. & W.....	Hoboken, N. J.....	3,176,246	15.8
N. Y., O. & W.....	Weehawken, N. J.....	2,511,754	12.5
Lehigh Valley	Jersey City, N. J.....	2,123,704	10.5
Pennsylvania	Jersey City, N. J.; Flatbush avenue, Brooklyn	471,458	2.3
N. Y., N. H. & H.....	Harlem River, Bronx	334,165	2.1
Total rail carriers.....		19,700,327	98.2
Other sources		365,000	1.8
Total		20,065,327	100.0

A large proportion of milk and cream shipped to New York is received at stations owned by dealers. The respondents operate trains so as to deliver milk and cream in time for dealers to prepare shipments for morning delivery, the trains generally arriving between 9 p. m. and 1 a. m. Each carrier has one or more terminals for the use of its milk traffic. The Pennsylvania delivers milk at Jersey City and Brooklyn, N. Y., a higher charge being collected for deliveries to the latter point. At each of the terminals a force of men is specially employed to unload the milk and load the empty containers. With each milk train there are sufficient employees to load and ice the cars and unload empty containers.

In 1897 the larger part of milk and cream consumed in New York City was produced in the first and second zones, within 100 miles of New York City. At the present time much of the milk shipped to New York is transported more than 400 miles. During the first week in June and in December, 1915, shipments from points on the New York Central to New York City moved from the following zones: First zone, 1 to 40 miles, none; second zone, 41 to 100 miles, 6,336 quarts; third zone, 101 to 190 miles, 44,636 quarts; fourth zone, but not more than 325 miles from the terminals, 520,280 quarts; fourth zone, from

points 325 to 400 miles distant, 153,482 quarts; and fourth zone, from points more than 400 miles distant, 786,158 quarts. The dealers testified that in the future the supply would be drawn from greater and greater distances.

The commission, as in the Philadelphia case, finds that on the whole the rates are not unreasonable. The present rates are on a zone system established as a result of the commission's findings in 1897. The commission notes conditions have changed materially since that decision was rendered, especially as to the increased distance from which the supply is obtained. It accordingly, as in the other case, holds that the present rates are prejudicial against shippers from the nearer points, and orders a readjustment, as above noted. (45 I. C. C., 412.)

Bituminous Coal to Central Freight Association Territory

Opinion by the commission:

These cases, consolidated for hearing, involve: (1) the reasonableness and non-discriminatory character of rates on bituminous coal from the Ohio mining districts to that portion of central freight association territory which is described and delimited in the report as "affected" territory; (2) the reasonableness and non-discriminatory character of rates from the Ohio mining districts and from districts in Pennsylvania, Maryland, West Virginia, Virginia, Kentucky, and Tennessee, collectively referred to in the report as the "Crescent," to certain interior cities in Michigan; (3) the propriety and reasonableness of increased rates proposed to be made effective from the Crescent to affected territory; (4) the proper relation of the rates, or the measure of the differential, to be observed between the rates from the Ohio and "inner Crescent" districts to affected territory; (5) the proper relation of rates, or the measure of the differential, to be observed between the rates from the Connellsville district in Pennsylvania and the Pittsburgh and other competitive districts in Pennsylvania; (6) the question whether or not the rates from the Pocahontas district in West Virginia to Canton, Ohio, should be the same as to Cleveland, Ohio.

In a comprehensive sense the origin territory from which rates on bituminous coal are here involved comprises (1) all mining districts in the state of Ohio; (2) the districts in an extensive zone embracing substantially all that portion of the Appalachian coal-producing region that extends from western Pennsylvania through Maryland, West Virginia, southwestern Virginia, and into eastern Kentucky and Tennessee. This part of the Appalachian zone is shaped, in its geographical configuration, somewhat like a crescent, presenting toward the Ohio districts and central freight association territory its concave side. Because of this geographical feature, the districts within the zone arc, collectively, and, in the parlance of transportation and the coal trade, commonly referred to as the "Crescent."

The rates from all this territory are made upon the group principle. Differences in the rates from the various districts depend upon fixed differentials. The various individual mining districts in the Crescent from which increased rates are proposed may be classified in two general groups: (1) Certain districts forming the inner or concave side of the Crescent, hereinafter referred to as the "inner Crescent," which take a differential over the Ohio districts to all destination territory here involved, of 25 cents per ton, uniformly; (2) certain other districts from which the rates are higher by fixed differentials than from the inner Crescent. The districts comprising the inner Crescent lie nearest to the destination territory and to the westward of the second group of individual districts which constitute an outer and parallel chain of mining districts that may for purpose of distinction be called the "outer Crescent." From the latter the rates, present and proposed, are differentially higher than from the inner crescent by from 10 to 20 cents per ton. (The term "present rates" refers to the rates complained of and those in effect during the pendency of the proceedings and at the time the cases were submitted upon argument, and not to the rates which by reason of uniform increases in all coal rates have become effective since June 30, 1917.) Midway between the Pittsburgh and the Meyersdale districts in the inner and outer Crescents, respectively, lies the Connellsville district from which the rate westbound is in nearly all instances 15 cents higher than from the Pittsburgh district.

The principal district designations in the inner Crescent group are the Pittsburgh district in western Pennsylvania; the Fair-

mont and Kanawha districts in West Virginia; the Kenova-Thacker district lying partly in West Virginia and partly in Kentucky; the Elkhorn district in eastern Kentucky; and the Jellico district lying in eastern Kentucky and eastern Tennessee. The principal district designations in the outer Crescent are the Meyersdale district in Pennsylvania, the Cumberland-Piedmont district in Maryland and West Virginia, the Coal & Coke Railway, New River and Pocahontas districts in West Virginia, the Clinch Valley district in Virginia, and the Stonega district which lies in the pocket of southwestern Virginia and eastern Kentucky.

The Ohio origin districts are the Hocking, Jackson, Pomeroy and Cambridge in southeastern Ohio; the No. 8 district in eastern Ohio lying just west of the Pittsburgh district of Pennsylvania; and the Middle, or Goshen, and Massillon districts in the northeastern quarter of Ohio. The Middle and Massillon districts are of minor importance, because the volume of coal shipped is insignificant, relatively, and the rates therefrom are always made differentially lower than the general scale from the other Ohio districts.

There are numerous subdivisions of the before-mentioned individual districts.

The territory to which the proposed rates apply is that portion of central freight association territory embraced in the northwestern quarter of Ohio; the northeastern quarter of Indiana; and the entire lower peninsula of Michigan. The territory thus limited is referred to as the "affected" territory in distinction from the nonaffected territory, so called, which comprises that portion of central freight association territory to which no increased rates are proposed in the tariffs here under suspension.

The commission's findings are as follows:

GENERAL.

1. That the rates on bituminous coal from all the territory here involved have long been established upon the group principle and apply from three general rate groups which may be denominated (a) the Ohio group, (b) the so-called inner Crescent group, and (c) the so-called outer Crescent group, which are delimited in the report.

2. That the issues in these cases which appear to affect, directly or indirectly, the general group adjustment, may be resolved, in the final analysis, into questions relating to the measure of differentials or relationship of rates: (a) Between certain of the general groups, e. g., as between the Ohio and inner Crescent group; (b) as between the Connellsville district in Pennsylvania and the Pittsburgh and other competitive districts.

3. That a wider differential between the rates on bituminous coal from the Ohio group and the Crescent groups to that portion of central freight association territory called affected territory than obtains from the same groups to that portion of central freight association territory denominated nonaffected territory, is justified by dissimilar circumstances and conditions.

AS TO OHIO RATES.

1. That the rates under attack from the Ohio group to affected territory are not unreasonable.

2. That the rates from Ohio mines to the interior Michigan cities are not unreasonable in and of themselves, but that the rate of \$1 from Ohio mines to Toledo, Ohio, is, and for the future will be, unduly prejudicial against the interior Michigan cities and unduly preferential of Toledo, Ohio, to the extent and in the amounts specified herein.

3. That the 85-cent rate from the Hocking district to Toledo, Ohio, established since the inception of this proceeding, enhances and intensifies the undue prejudice against the interior Michigan cities that already existed under the \$1 rate to Toledo.

AS TO THE CRESCENT RATES.

1. That the rates from the Crescent groups to affected territory complained of and under investigation in this proceeding are below the level at which maximum reasonable rates might be maintained from the Crescent groups to affected territory.

2. That the rates from the inner and outer Crescent groups to Toledo, Ohio, are unduly prejudicial to the interior Michigan cities and unduly preferential of Toledo, Ohio, to the extent and in the amounts specified.

3. That the proposed rates from the inner and outer Crescent groups to destinations in affected territory have been justified.

4. That the differential of 25 cents per ton between the rates

from the Ohio and inner Crescent districts to affected territory is, and for the future will be, unduly prejudicial to the Ohio districts and unduly preferential of the inner Crescent districts to the extent that the said differential between the said Ohio and inner Crescent districts is less than 40 cents per ton, and that it is, and for the future, will be, unduly prejudicial to the inner Crescent districts and unduly preferential of the Ohio districts to the extent that the said differential is more than 40 cents per ton.

5. That the proposed rates from certain districts in the inner and outer Crescent groups to Columbus, Ohio, have been justified.

AS TO THE CONNELLSVILLE DIFFERENTIAL.

1. That the rates from the Connellsville district to points in Ohio, south of the territory west of the Sandusky-Galion line but substantially equidistant from the Connellsville district as the Sandusky-Galion line, and to all other points in central freight association territory west of the southerly Ohio points aforesaid, and on and west of the Sandusky-Galion line, are, and for the future will be, unduly prejudicial to the Connellsville district to the extent that the said rates from the Connellsville district exceed the rates contemporaneously in effect from the Pittsburgh district.

2. That the rates from the Connellsville district to Youngstown, Ohio, and points taking Youngstown rates, are, and for the future will be, unduly prejudicial to the Connellsville district and unduly preferential of the Pittsburgh district to the extent that the rates from the Connellsville district exceed the rates contemporaneously in effect from the Pittsburgh district by more than 8 cents per short ton.

3. That the rates from the Connellsville district to Cleveland, Ohio, and other points in affected territory in Ohio, east of the Sandusky-Galion line other than points taking Youngstown rates, are, and for the future will be, unduly prejudicial to the Connellsville district and unduly preferential of the Pittsburgh district to the extent that the rates from the Connellsville district exceed the rates from the Pittsburgh district by more than 6 cents per short ton.

AS TO CANTON, OHIO.

That the rates from the Pocahontas district in West Virginia to Canton, Ohio, should not exceed the rates contemporaneously in effect from the Pocahontas district to Cleveland, Ohio, and the proposed rates have been justified.

The respondents will be required to remove the unlawful discriminations found to exist against Ohio and in favor of the inner Crescent districts. They will also be required to remove the undue prejudice against the interior Michigan cities and the undue preference of Toledo. In so far as the unlawful discriminations against the interior cities in Michigan must be removed by reductions in the rates to such cities, the reductions may be made effective on five days' notice to the Interstate Commerce Commission and the general public.

Orders will be entered in accordance with the findings herein. (46 I. C. C. 66)

Lake Cargo Coal Rates

Opinion by the commission:

This proceeding involves the reasonableness and propriety of the rates, rules, regulations, and practices applicable to shipments of bituminous coal in carloads from mines in Pennsylvania, Maryland, West Virginia, Virginia, Kentucky, and Ohio, to Lake Erie ports for transshipment by vessel. The commission holds that

The reasonableness *per se* of the rates can not now be determined because of the abnormal conditions prevailing.

The rate adjustment is found to be unduly preferential and prejudicial; and specific relationships in the rates as between the several originating districts are ordered for the future.

The respondents are required to state separately in their tariffs the charges for the line haul and the dock services, respectively.

The rates considered are those in effect prior to the recent increase of 15 cents per ton.

In one part of the case complaint was made against the reasonableness of the 78 cent rate on lake cargo coal from the Pittsburgh district to Ashtabula via the Pennsylvania and New York Central lines. The complainant asserted that the cost of transporting

lake cargo coal to Ashtabula has been downward since 1911 for the following principal reasons:

- The load per car has increased;
- The number of cars per train and the tons per train have increased;
- The detention of cars at the lake ports is less because of change in the demurrage rules, the result being greater car efficiency.

The carriers, however, also submitted figures showing increases in the costs of equipment, and in costs of operation, whereupon the commission holds that: Considering the increased investment, the increase in wages, and all the other factors affecting the cost of transportation, the conclusion seems to be justified that up to June 30, 1916, there had been but little change since 1911 in the cost per unit of transporting lake cargo coal from the Pittsburgh district or the other districts, but assuming that the cost has been reduced we would not regard it as just and proper to take from the carriers all of the benefits resulting from their increased investments and the introduction of improved methods.

The principal part of the case, however, deals with the rate relationship of the several groups. The rates in issue were as follows:

Originating districts	Rates investigated	Rates now in effect
Ohio No. 8, Hocking, Cambridge.....	75	90
Pittsburgh.....	78	93
Fairmont, Connellsville.....	90	105
Kanawha, Thacker, Kenova.....	97	112
New River, Pocahontas, Cumberland-Piedmont, Meyersdale.....	112	127

As hereinbefore stated, the principal interest of the interveners is in the rate relationship existing as between the several originating districts. Thus, the West Virginia and Kentucky interveners object to any widening of the differential over the rates from the Pittsburgh and the Ohio districts; the Connellsville interveners ask that the Connellsville district be accorded the same rate as the Pittsburgh district; and the Meyersdale district interveners object to being grouped with the New River and Pocahontas districts in southern West Virginia and ask to be grouped instead with the Fairmont and Connellsville districts. The Meyersdale interveners also claim discrimination in their rates as compared with the rates from Fairmont and Connellsville.

The commission after a careful investigation holds that the relationships should be readjusted so that they will be on the following basis:

- Ohio No. 8, Cambridge and Hocking districts, 3 cents under Pittsburgh district.
- Connellsville district, 6 cents over Pittsburgh district.
- Altoona district, 22 cents over Pittsburgh district.
- Fairmont district, 18 cents over Ohio No. 8, Cambridge, and Hocking districts.
- Meyersdale district, 16 cents over Connellsville district.
- Cumberland-Piedmont district, 12 cents over Fairmont district.
- Kanawha, Kenova-Thacker, and Kentucky districts, 28 cents over Ohio No. 8, Cambridge, and Hocking districts.
- New River and Pocahontas districts, 15 cents over Kanawha, Kenova-Thacker, and Kentucky districts.

Because the present rates on cargo coal appear to be regarded both by the shippers and the carriers as being in the nature of emergency rates, made necessary to a large extent by the conditions arising because of the world war, the commission does not attempt to pass upon the reasonableness *per se* of the rates on this traffic.

In the supplemental report in the Iron Ore Rate Cases, 44 I. C. C., 368, the respondents therein were ordered to establish and maintain separate charges for the services performed by them at their ore docks. The situation with respect to lake cargo coal is very similar, except the coal traffic moves in the opposite direction to that of the ore. Since some of the respondents now provide in their tariffs separate charges for the line-haul service and the dock service, respectively, the commission will, in the interest of uniformity, and in order that the shippers of lake cargo coal may know definitely and specifically for what services they are required to pay, and the amount thereof, require that each of the carriers respondent herein owning or operating coal docks at any of the lower Lake Erie ports hereinbefore named state in their tariffs the amount in cents per short ton charged against the lake cargo coal traffic (a) for the line-haul service from the mines to the docks at the lake port, and (b) for the service of transferring the coal from the cars to the vessel at the docks. (46 I. C. C., 159.)

PERSONNEL OF COMMISSIONS

John M. Reifsnider has been appointed a member of the Public Service Commission of Maryland in place of P. D. Laird, resigned.

C. H. Byers has been appointed district engineer of the Division of Valuation, Interstate Commerce Commission, Pacific district; and W. H. Davison is appointed assistant district engineer.

COURT NEWS

Hours of Service Act—Separate Offices

A few hundred feet from a station a railroad company maintained an interlocking tower. An operator worked at the station from 7 a. m. to 7 p. m., when another operator removed the train register and order book to the tower, where all orders and messages pertaining to train movements were received and sent from 7 p. m. until 7 a. m. The Circuit Court of Appeals, Eighth Circuit, holds that the station and tower were not separate offices, but a continuously operated office, within the act, and the statute was violated by keeping such operators on duty longer than is permitted thereby at continuously operated offices.—Illinois Central v. United States, 241 Fed., 667. Decided March 14, 1917.

Workmen's Compensation Act Course of Employment

A yard engine man had turned in his engine about 6 a. m., having completed his work, and had also turned in his slip, showing that his run had been completed. Instead of leaving the yard by one of numerous streets, which he could have used, he walked along the tracks for 1,000 feet, and crossed over another street, and onto an elevated track on its other side, where he was struck and killed by a freight train. His purpose in going on the second track was to catch a passing freight train to ride to a point where he could collect his pay. The New York Appellate Division holds that decedent was not killed in the course of his employment, within the Workmen's Compensation Law.—Ames v. New York Central, 165 N. Y. Supp., 84. Decided May 2, 1917.

Look and Listen Rule in Texas

In a crossing accident case, in which the Texas Court of Civil Appeals reversed a judgment for the plaintiff and rendered judgment for the railroad, because of the contributory negligence of the driver of the automobile, for whose injuries the action was brought, in failing to keep a lookout for a train before driving on the crossing, the court stated the law on the subject as held in Texas to be as follows:

"We agree with the contention of appellees' counsel, to the effect that there is no statute in this state which requires one approaching a railroad crossing to stop, look and listen, or to do either; and we also understand that the appellate courts of this state have never held that a failure on the part of one approaching a railroad crossing to stop, look and listen, or to do either, in order to ascertain whether or not a train might be approaching, would, as a matter of law, constitute contributory negligence. But such is not the point here raised, and which we are discussing.

"We understand it to be the rule in this state that all adult persons, at all times and places, are required to use at least ordinary care for their own protection and safety, and if we correctly interpret the rule as laid down by the Supreme Court of this state in many cases, a person approaching a railroad crossing is required to use ordinary care to ascertain by some means whether a train might be approaching such crossing, with a view of avoiding contact with such train, and if such person about to make such a crossing, by the use of ordinary care in looking for the approach of a train to such crossing, can discover the approach of the train to the crossing in time to avoid contact and injury therewith, and fails to use such care, and the state of the evidence be such that it must follow that such failure must be held to have caused or contributed to the injury sustained, then such person is barred from recovery on the ground of contributory negligence."—St. Louis S. W. v. Harrell (Tex.), 194 S. W., 971. Decided May 9, 1917.

Equipment and Supplies

LOCOMOTIVES

THE TORONTO, HAMILTON & BUFFALO has ordered 6 switching locomotives from the Canadian Locomotive Company.

FREIGHT CARS

THE CHILEAN RAILWAY is inquiring for prices on 400 stock and 600 box cars of 30-ton capacity.

THE YOUNGSTOWN SHEET & TUBE COMPANY has ordered 20 hopper and 20 flat cars from the Pressed Steel Car Company.

THE AMERICAN RAILROAD OF PORTO RICO, through its purchasing agents, the International Supply Company, 30 Church street, New York, is inquiring for 50 20-ton narrow gage flat cars.

UNITED STATES GOVERNMENT. Reports have it that the Government will shortly place orders for about 17,000 cars for service with the forces in France. The cars, it is said, will be four-wheel flat bottom low side gondola cars of 12 metric tons capacity.

IRON AND STEEL

THE UNITED STATES GOVERNMENT is reported as having placed orders for 150,000 tons of rails for use in France.

MACHINERY AND TOOLS

THE DELAWARE, LACKAWANNA & WESTERN is asking bids on a number of machine tools.

THE BALTIMORE & OHIO has ordered 2 26-in. turret lathes for its Newark, Ohio, car shops.

THE UNITED STATES GOVERNMENT is asking for bids on about \$2,000,000 worth of machine tools for use in France, and the Pennsylvania Railroad, acting in behalf of the United States Government, is asking for bids on seven vertical boring and turning mills, two vertical turret lathes, one horizontal boring and drilling machine and a car wheel boring mill, which are required for the use of the regiment of engineers which it recently helped to raise.

TRACK SPECIALTIES

THE WABASH is inquiring for tie plates for 1918 delivery.

THE ANN ARBOR is in the market for 1,500 kegs of spikes for delivery the first half of 1918, and is also inquiring for 300,000 tie plates for delivery in 1917.

MISCELLANEOUS

ILLINOIS CENTRAL.—The road has recently awarded a contract to the Railroad, Water & Coal Handling Company, Chicago, for the construction of a 500-ton coaling station of the automatic bucket type at Lambert, Miss. The structure will have a concrete foundation and timber superstructure. A contract was also awarded to the same company for the construction of a similar station of 300 tons' capacity at Durant, Miss.

BOMBING A TRAIN.—Aeroplanes have descended low enough to bomb trains in motion. During the battle of the Somme, last summer, a train leaving Libercourt was attacked from an altitude of 800 feet near Ostricourt and six bombs were dropped. The engine was hit, became derailed, and two or three front coaches telescoped. A second train, following the first, was also attacked, and the two aviators fired 700 shots at the two trains. Seven aeroplanes immediately joined in the attack and dropped a total of 14 heavy and 34 smaller bombs. Many of the German soldiers were killed and all the machines returned safely.—*New York Tribune*.

Supply Trade News

J. H. Prior, chief engineer of the Illinois Public Utilities Commission, has resigned to open an engineering office in Chicago, Ill.

The Barrett Company, New York, announces the appointment of W. T. Kelley as railroad sales department representative, with headquarters at Pittsburgh, Pa.

The American Steel Export Company has appointed Woodburn's Limited, of Montreal, Canada, as its exclusive agents for the provinces of Ontario and Quebec.

F. P. Huntley, who has been connected with the Gould Coupler Company since its organization, about twenty years ago, has resigned from his position as vice-president and general manager.

William H. Ross has become associated with the Patton Paint Company, Milwaukee, Wis., and will represent the railway sales department as sales engineer, with headquarters at Pittsburgh, Pa.

Howard P. Cook, eastern representative of the Columbia Nut & Bolt Company, Bridgeport, Conn., left July 14 to enter military service with the quartermasters' supply department of the New York National Guard.

F. R. Cooper, formerly superintendent of motive power of the Kansas City Southern, and until recently connected with the Breakless Staybolt Company of Pittsburgh, Pa., has resigned from the latter company to become sales manager of the Gold Car Heating & Lighting Company, with offices at New York.

Jesse Hough, sales representative of the National Lock Washer Company, died at his home in Indianapolis, Ind., on July 23, after a seven months' illness. Mr. Hough had been associated with the National Lock Washer Company since January, 1913, and for 10 years prior to that time was storekeeper in the maintenance of way department of the Indianapolis Traction & Terminal Company.

The Ingersoll-Rand Company announces that at a meeting of the board of directors of the company, on July 25, J. H. Jowett, formerly general sales manager, was elected vice-president of the company, and that L. D. Albin, formerly assistant general sales manager, was appointed general sales manager. Mr. Jowett and Mr. Albin will continue to make the company's new York office, at 11 Broadway, their headquarters.

TRADE PUBLICATIONS

COMPRESSED AIR APPARATUS.—The following new forms have just been issued by the Ingersoll-Rand Company, 11 Broadway, New York: Form 8006, a 20-page catalogue on Imperial motor hoists and stationary motors; form 8212, a four-page bulletin on the Crown coal pick and core breaker; form 8213, a 16-page booklet on "Little David" pneumatic chipping, calking and scaling hammers, and form 9102, an eight-page bulletin on air receivers, pressure tanks and moisture traps. The catalogues are profusely illustrated and show tables of sizes and capacities.

IRON AND STEEL FOR EXPORT.—The English edition of the new 94-page iron and steel catalogue of the American Steel Export Company is now ready for foreign distribution. The Spanish, French, Portuguese, Italian and Russian editions are to be published shortly, now being in process of preparation. This catalogue contains much information, such as weights and measures in English and metric tables, and data covering such products as pig iron, billets, blooms, slabs and sheet cars, plates and shapes, tool steel, merchant bars and agricultural steel, wire products, pipe and tubing, rails and railway supplies, castings and forgings, sheet and tin plate, etc. The object of the catalogue is to inform overseas buyers concerning American sizes, weights, etc. The booklet also includes specifications covering tolerances and other valuable data.

Railway Construction

ATCHISON, TOPEKA & SANTA FE.—This company is contemplating the construction of a terminal at Tulsa, Okla. The plans for this work are as yet in a preliminary stage.

HILLSBORO, CYNTHIANA, BAINBRIDGE & CHILlicothe (ELECTRIC).—This company is contemplating the construction of a road between Hillsboro, Ohio, and Chillicothe, a distance of 42 miles. The right of way for the entire distance has not yet been secured, and construction is not expected to start for some time. J. W. Watts, Hillsboro, is president, and C. F. Clarke is chief engineer.

IBERIA, ST. MARY & EASTERN.—This road has completed plans for the construction of an extension from Shadyside, La., to Patterson, a distance of eight miles. Grading has been started and all material is on the ground. The line is expected to be ready for operation by the early part of November.

MISSOURI PACIFIC.—The contract for grading the four miles of track from the main line of the Central division to the cantonment site near Little Rock, Ark., and for the construction of four additional miles of track on the cantonment grounds, was awarded to J. J. Ball, Little Rock, and the track laying is being done by company forces. (July 27, p. 170.)

NEW YORK, NEW HAVEN & HARTFORD.—Bids have been received by this company, but contracts are not yet awarded for widening the present two-track South Boston cut to accommodate four tracks between South Bay Junction and the Boston freight terminal, a distance of about 2,500 ft.; also for constructing 11 over-head steel bridges. Ten of the bridges will be about 60 ft. long and one 70 ft. long. The improvements also include building a new automatic electrically operated pumping plant.

OREGON SHORT LINE.—This company will build 11 miles of road east of Idaho Falls, Idaho. The construction will be divided into two lines, one from Idaho Falls to a point 4 miles south, and the other from Firth to a point 7 miles north.

PENNSYLVANIA RAILROAD.—This company is building a reinforced concrete bridge to carry two tracks over the new location of Manatawny creek at Pottstown, Pa. The work is being carried out by company forces, and will cost about \$33,437. The course of Manatawny creek will be changed by the Eastern Steel Company to pass under the bridge in its new location.

SOUTHERN PACIFIC.—This company is rehabilitating a portion of one of its car shops at Sacramento, Cal., which was lately injured by fire. The work will cost approximately \$30,000.

SOUTHERN RAILWAY.—A contract has been given to Thomas Worthington, Birmingham, Ala., for the construction of a reinforced concrete viaduct at Twenty-first street, Birmingham, Ala., over the tracks of the Southern Railway System, Seaboard Air Line Railway and Louisville & Nashville. The new structure will be 80 feet wide, and will replace the present structure, which is of wood. It is expected that the work will commence at an early date.

TEXAS & PACIFIC.—This company is contemplating the construction of an eight-stall roundhouse at Texarkana, Tex. The plans, however, are not yet prepared and no definite information can be given for some time.

UNION PACIFIC.—This road will construct a double track line 20 miles long from Manhattan, Kan., to Junction City, for the purpose of improving the transportation facilities to Fort Riley. In addition the company has already put in new stations, freight sidings and enlarged the present facilities at a cost of approximately \$50,000.

WICHITA & WALNUT VALLEY (ELECTRIC).—This company will construct a road from Wichita, Kan., east to Augusta, then north to Eldorado and south from Augusta to Douglas and Winfield, a total distance of about 100 miles. The right of way for the entire distance has not yet been secured, but as soon as it is obtained construction will be started.

Railway Financial News

CHICAGO, MILWAUKEE & ST. PAUL.—The directors have issued a statement of their reasons for reducing the dividend on the common stock from 5 to 4 per cent, in which they say: "The evolution of the transportation industry and the changes in ownership of the railroads of the Northwest rendered it imperative to build to the Pacific Coast. This new line, 3,045 miles, necessitated an expenditure of \$260,000,000; and 658 miles of second main track has cost \$36,000,000. Large additions to the motive power and rolling stock of the company have cost \$61,000,000. To meet these expenditures the company, from time to time, issued its mortgage bonds, amounting to \$234,000,000, and also its capital stock, amounting to \$125,800,000. With the exception of about \$50,000,000 of these bonds, which bear 5 per cent, the interest rates are from 4 to 4½ per cent per annum. No short-time notes or car trust certificates have been issued. The fixed annual charges have been increased approximately \$9,500,000, mainly for the Puget Sound extension. At the time this extension was determined upon the board deemed its construction necessary in order to maintain and insure the future prosperity of the company, and subsequent events have fully confirmed its judgment in that respect. The resources of this vast domain of territory, tributary to this extension, are immeasurable, and have already furnished a large traffic, both freight and passenger, and will continue to furnish an increasingly larger traffic from year to year. And if conditions, such as cost of labor, fuel, material and supplies, had not radically changed, this company would have easily earned its interest charges, its usual dividends and a substantial amount of surplus. The increases in wages alone paid to the employees of this company for the half-year ended June 30 last amount to approximately \$2,000,000. Because of this radical change in operating conditions, the board has deemed it wise to pursue a conservative course. . . ."

CHICAGO & EASTERN ILLINOIS.—The foreclosure sale of this road has been postponed until some time next month.

CINCINNATI, HAMILTON & DAYTON.—The receivers, Judson Harmon and Rufus B. Smith, in a circular announcing the delivery of the principal C. H. & D. lines to the Baltimore & Ohio on July 19, as ordered by the court, say that they continue to operate the line from Dayton to Delphos until further notice, and the line from Berlin to Dean until August 1, 1917.

INTERBOROUGH RAPID TRANSIT COMPANY, NEW YORK CITY.—The New York State Public Service Commission, first district, has approved the application of this company for authority to issue five per cent bonds amounting to \$23,053,000. This money is needed to pay the excess of the cost of cars and motive power for new rapid transit lines, over and above the cost as estimated by the company in its report to the commission in March, 1913. The bonds are to be issued under the company's first mortgage of March 20, 1913, and will mature January 1, 1966. The commission stipulates that they shall be sold at not less than 93½. The Public Service Commission, also, after deferring action for several months, has finally approved the whole of the issue of bonds aggregating \$16,436,000, the proposal for which was laid before the commission last year, for similar expenditures.

PENNSYLVANIA.—The report of revenues and expenses for the month of June and for the six months to June 30, issued this week, and covering the whole of the Pennsylvania System, both eastern and western lines, shows, for the half year, total receipts of \$231,673,083, an increase of \$21,068,034 over the same period in 1916; but the increase in operating expenses and taxes was \$31,729,563, so that the railway operating income, \$39,603,819, is \$10,661,529 less than in the same six months of 1916. For the twelve months ending with this report the return on the property investment was 4.90 per cent, as compared with 6.02 per cent for the year ending June 30, 1916. The latest figure, 4.90 per cent, is, however, higher than that for any of the five years preceding that ending on June 30, 1916.

Railway Officers

Executive, Financial, Legal and Accounting

Arthur Lee, vice-president of the Coal & Coke Railway at Elkins, W. Va., has resigned; A. H. Crane has been appointed treasurer, vice C. M. Hendley, resigned, and the title of Charles Ritter has been changed from paymaster and cashier to assistant treasurer. Effective August 1.

S. G. Lutz, whose appointment as vice-president of the Chicago & Alton was announced in the *Railway Age Gazette* of July 27, was born on December 8, 1868, and was graduated from Western College, Toledo, Ohio, in 1887. He entered railway service in November, 1890, as a stenographer in the traffic department of the Iowa Central, and subsequently filled various clerical positions until September, 1894, when he became chief clerk in the freight traffic department. From January, 1898, to April, 1904, he was assistant general freight agent of that road, and was then until December, 1908, assistant general freight agent of the Minneapolis & St. Louis. He was freight traffic manager of both roads from December, 1908, to December, 1909, when he was appointed general freight agent of those roads, the Chicago & Alton and the Toledo, St. Louis & Western at Chicago. In November, 1910, he was promoted to traffic manager of the Minneapolis & St. Louis, and on August 1, 1915, became associated with the Chicago & Alton as general traffic manager, which position he held until his recent appointment as vice-president, as already noted.

Thomas J. Foley, who has been elected vice-president of the Illinois Central, with headquarters at Chicago, effective August 1, was born at Convo, Ohio, on August 26, 1866, and entered railway service on December 20, 1878, as a telegraph operator on the Pennsylvania Lines West of Pittsburgh. In 1879 he became agent for the same road and later served successively as train despatcher at Ft. Wayne, Ind., chief despatcher, assistant trainmaster and transportation inspector of the Pennsylvania Lines. On June 1, 1901, he became associated with the Baltimore & Ohio as assistant general manager at Baltimore, Md. From 1903 to 1904, he was superintendent of the Chicago division of the same road, and in the latter year became general superintendent of the Wheeling system. In 1906 he became special inspector in the transportation department of the Union Pacific at Cheyenne, Wyo., and later was consecutively yardmaster, chief train despatcher and superintendent of terminals at Omaha, Neb., and assistant superintendent of the Nebraska division. On March

S. G. Lutz

T. J. Foley

15, 1910, he was promoted to assistant to the vice-president of the Illinois Central, and from May 1, 1910, to November, 1912, was assistant general manager of the Illinois Central, the Yazoo & Mississippi Valley and the Indianapolis & Southern. In November, 1912, he was promoted to general manager of the same roads, with headquarters at Chicago, which position he held until his recent election.

James T. Loree, general manager of the Delaware & Hudson at Albany, N. Y., has been granted leave of absence to enter military service, effective July 31, and F. P. Gutelius, vice-president at Albany, has taken over the duties of the general manager, with title of vice-president and general manager.

B. W. Taylor, general agent of the Southwest System of the Pennsylvania Lines West, at Louisville, Ky., has been elected also president of the Louisville Bridge Company in place of C. H. Gibson, deceased. This company is owner of the Louisville Bridge, the Pennsylvania Lines' entrance into Louisville.

Operating

J. W. Deneen has been appointed assistant superintendent of the Coal & Coke Railway, with headquarters at Gassaway, W. Va.

John J. Pelley, who has been appointed general superintendent of the southern lines of the Illinois Central, with headquarters at New Orleans, La., entered the service of the Illinois Central as a track apprentice on August 29, 1900. On August 1, 1904, he was appointed supervisor on the Indiana division, and on November 1, 1905, was transferred to the Memphis division of the Yazoo & Mississippi Valley. On January 15, 1908, he was appointed roadmaster on the Louisiana division of the Illinois Central, with headquarters at New Orleans. On June 6, 1911, he was transferred to the Tennessee division, and on May 10, 1912, was appointed superintendent of that division, with headquarters at Fulton, Ky. On September 15, 1915, he was promoted to superintendent of the Yazoo & Mississippi Valley, with headquarters at Memphis, Tenn., which position he held until his recent appointment as general superintendent of the southern lines of the Illinois Central, as already noted.

J. J. Pelley

O. F. Johnson has been appointed assistant to the general manager of the Minneapolis & St. Louis, with headquarters at Minneapolis, Minn.

Arthur M. Umshler, trainmaster on the Illinois Central, at Chicago, has been appointed terminal superintendent, with the same headquarters, succeeding Walter S. Williams, promoted.

D. E. Nichols, trainmaster on the Northern Pacific, at Staples, Minn., has been transferred to the Lake Superior division, with headquarters at Duluth, Minn., succeeding H. H. Maher, resigned.

W. D. Deakins, assistant trainmaster of the Chattanooga division of the Nashville, Chattanooga & St. Louis, has been appointed trainmaster of the Nashville division, succeeding E. W. Gaynor, promoted.

Harry W. Grenoble has been appointed assistant superintendent of the Cumberland division of the Baltimore & Ohio, with headquarters at Keyser, W. Va., succeeding J. W. Deneen, who has entered the service of another company.

L. A. Downs, general superintendent of the southern lines of the Illinois Central, with headquarters at New Orleans, La., has been transferred to Chicago and will have charge of the northern lines comprising the Chicago terminal, the Illinois, Indiana and

Springfield divisions. The Illinois Central has divided its lines north of the Ohio river into two grand divisions, the western division comprising the Wisconsin, Minnesota and Iowa divisions.

The authority of the following officers of the Pennsylvania Railroad, with headquarters at Philadelphia, Pa., has been extended over the New York, Philadelphia & Norfolk: Frank C. Hoff, assistant to the general manager; J. C. Johnson, superintendent of telegraph; J. B. Fisher, superintendent of freight transportation; D. C. Stewart, superintendent passenger transportation; H. C. Bixler, superintendent of stations and transfers; T. S. Bell, superintendent of car service, and F. L. DuBosque, superintendent of floating equipment.

Walter Scott Williams, who has been appointed general superintendent of the western lines of the Illinois Central, with headquarters at Waterloo, Ia., was born at Quincy, Ill., on November

6, 1866. He entered railway service on October 1, 1888, with the Illinois Central, as a brakeman, and in January, 1889, was transferred to the position of switchman, serving subsequently as engine foreman and yardmaster. In January, 1891, he became conductor, and in July of the following year was made a brakeman on the Amboy division. In January, 1893, he was promoted to conductor on the Springfield division, and in May, 1904, became trainmaster of the same division. On December 20, 1910, he was appointed superintendent

of the Springfield division, and on October 15, 1912, was transferred to the Minnesota division in the same capacity. On July 15, 1913, he became superintendent of the St. Louis division, with headquarters at Carbondale, Ill., and in April, 1917, was promoted to superintendent of the Chicago terminals, which position he held until his appointment as general superintendent, as already noted.

Floyd Mays, trainmaster on the Yazoo & Mississippi Valley at Wilson, La., has been appointed superintendent of the New Orleans division, with headquarters at Vicksburg, Miss. Victor V. Boatner, superintendent of the New Orleans division, has been transferred to the Memphis division, with headquarters at Memphis, Tenn., succeeding John J. Pelley, promoted. Samuel J. Hays, trainmaster at Memphis, has been appointed terminal superintendent, with the same headquarters, succeeding John M. Walsh, resigned to enter military service.

The Baltimore & Ohio announces that the following lines of the Cincinnati, Hamilton & Dayton have been acquired, and will be operated as the Toledo division of the Northwest district of the Baltimore & Ohio, with division headquarters at Dayton, Ohio: Main line from Cincinnati to Toledo and terminals; Dayton to Wellston, with branches to Riverton, Buckeye Furnace, etc.; Ironton Junction to Berlin; Hamilton to East Middletown; Troy to Piqua; Deshler to Findlay; Tontogany to North Baltimore and the Home Avenue Railroad. The following former officers of the C. H. & D. retain the same positions in the new organization: H. B. Voorhees, general superintendent, at Cincinnati, Ohio; F. B. Mitchell, superintendent at Dayton; M. S. Kopp, assistant superintendent at Cincinnati; S. U. Hooper, assistant superintendent at Toledo; R. W. Brown, trainmaster at Dayton; C. W. Havens, trainmaster at Lima, and R. B. Fitzpatrick, trainmaster at Cincinnati. E. J. Correll, division superintendent at Dayton, has been appointed assistant superintendent at the same place. H. W. Brant has been appointed trainmaster at Dayton, and W. H. Crist, W. L. Augspurger and J. J. Fitzmartin, chief train dispatchers, all with offices at Dayton.

John Bose, superintendent of the Louisville division of the Louisville & Nashville, has been appointed superintendent of the New Orleans & Mobile division, vice C. Marshall, retired from active service, and W. F. Sheridan, assistant superintendent of transportation at Louisville, has been appointed superintendent of the Louisville division, vice Mr. Bose; W. J. Haylow, inspector of transportation at Birmingham, Ala., succeeds Mr. Sheridan; J. A. Morrison, assistant superintendent of the Birmingham division at Birmingham, has been appointed superintendent of the Kentucky division, with headquarters at Paris, Ky., succeeding W. H. Anderson, deceased.

Albert E. Clift, who has been appointed general manager of the Illinois Central, with headquarters at Chicago, was born at Urbana, Ill., on October 15, 1869. He entered railway service

A. E. Clift

with the Illinois Central on December 5, 1888, as a brakeman, and on April 8, 1892, was promoted to conductor on the same road. On April 14, 1892, he became conductor on the Cleveland, Cincinnati, Chicago & St. Louis, and on February 19, 1893, returned to the Illinois Central as engine foreman of the Champaign district. From March 7, 1893, to February 22, 1905, he served consecutively as yardmaster, conductor of the Chicago district, passenger conductor Chicago division, acting trainmaster of the Chicago district at Kankakee, Ill., and trainmaster of the Chicago division. On the latter date he became superintendent of the Freeport division at Freeport, and on January 16, 1907, was transferred to the St. Louis division at Carbondale. On June 1, 1910, he was promoted to general superintendent of the southern lines, with headquarters at New Orleans, La., and on May 10, 1912, was appointed general superintendent of the northern and western lines at Chicago, which position he held until his appointment as general manager, as already noted.

Traffic

F. J. Burns has been appointed general agent on the Denver & Rio Grande, with headquarters at Leadville, Colo., succeeding S. M. Brown, retired on a pension.

F. L. Gamble, agent for the Western Pacific at Stockton, Cal., has been appointed general agent of the traffic and transportation departments, with the same headquarters.

W. T. Kyzer, agricultural agent of the Norfolk Southern at Norfolk, Va., having resigned, all matters heretofore handled by his office will be taken care of by E. D. Kyle, traffic manager.

T. T. Webster, chief of tariff bureau of the Michigan Central, has been appointed assistant general freight agent, with office at Detroit, Mich., vice F. H. Thompson, resigned to engage in other business.

G. W. Hibbard, general passenger agent, western lines, of the Chicago, Milwaukee & St. Paul, at Seattle, Wash., has resigned, effective August 1, and A. P. Chapman, Jr., general agent of the passenger department has been appointed assistant general passenger agent, with headquarters at Seattle.

H. R. Judah, assistant general passenger agent of the Southern Pacific at San Francisco, Cal., has retired from active service under the company's pension system. Mr. Judah was born at New York on June 24, 1847, and entered railway service with the Southern Pacific on November 13, 1872. From that date until November 1, 1877, he was successively chief clerk to the freight auditor, ticket auditor and chief clerk to the general passenger and ticket agent. On November 1, 1877, he was promoted to assistant general passenger and ticket agent of the northern division, and on May 1, 1891, became assistant gen-

eral passenger agent, with headquarters at San Francisco, which position he held until his recent retirement.

Harold K. Faye, whose appointment as traffic manager of the Western Pacific was announced on July 27, was born at Aurora, Ill., in January, 1885. Mr. Faye received his early training in traffic matters under the late Darius Miller, formerly president of the Chicago, Burlington & Quincy. He began railway work as a stenographer in the general freight office of the Burlington at Chicago. In December, 1904, he was made secretary to Darius Miller, then vice-president in charge of traffic, and in June, 1909, was promoted to chief clerk in the same office. He was later promoted to assistant in the office of the vice-president, the position he has held until the present time. As traffic manager of the Western Pacific. Mr. Faye will have headquarters at San Francisco, Cal.

H. K. Faye

Albert T. Weldon, whose appointment as general freight agent of the Canadian Government Railways, with headquarters at Moncton, N. B., has already been announced in these columns, was born on March 6, 1876, at Dorchester, N. B., and entered the service of the Intercolonial Railway on August 24, 1890, as car checker at the local freight office at Moncton. In 1901 he became chief clerk to the division freight agent at Halifax, remaining in that position until 1904, and then left the service of the Intercolonial, but returned to that road on November 17, 1907, as division freight agent at Halifax. In 1909 he became general freight and passenger agent of the Black Diamond Steamship Line, owned and operated by the Dominion Coal Company. He went to the Canadian Government Railways as assistant general freight agent at Moncton on October 1, 1914, which position he held until his recent appointment as general freight agent, as above noted.

A. T. Weldon

H. S. Leard, general passenger agent of the Norfolk Southern at Norfolk, Va., has resigned, and J. F. Dalton has been appointed general passenger agent, in addition to his duties as general freight agent, with headquarters at Norfolk.

H. E. Warburton, division freight agent of the Cincinnati, Hamilton & Dayton, at Dayton, Ohio, has been appointed general freight and passenger agent for the receivers of the C., H. & D., lines Dayton to Delphos, Ohio, inclusive, and Berlin to Dean, Ohio.

Engineering and Rolling Stock

The authority of W. D. Faucette, chief engineer of the Seaboard Air Line at Norfolk, Va., has been extended over the Tampa & Gulf Coast.

S. L. Church, supervisor of the Pennsylvania Railroad at Lancaster, Pa., has been appointed division engineer of the Delaware division, with headquarters at Wilmington, Del.

L. C. Frohman has been appointed principal assistant engineer of the Florida East Coast, with headquarters at St. Augustine, Fla.; C. S. Coe, engineer maintenance of way at St. Augustine, having resigned to enter military service, his former position has been abolished.

The authority of J. T. Wallis, general superintendent of motive power of the Pennsylvania Railroad at Altoona, Pa., and of C. D. Young, superintendent of motive power of the Philadelphia, Baltimore & Washington, at Wilmington, Del., has been extended over the New York, Philadelphia and Norfolk.

F. J. Parrish, division engineer of the Cincinnati, Hamilton & Dayton, at Dayton, Ohio, is now division engineer of the C., H. & D. lines, now comprising the Toledo division of the Northwest district, of the Baltimore & Ohio, and H. G. Snyder and W. P. Ball have been appointed assistant division engineers. All with headquarters at Dayton. (See Operating Officers.)

W. D. Johnston, master mechanic of the Cincinnati, Hamilton & Dayton, at Dayton, Ohio, has been appointed master mechanic of the Toledo division of the Northwest district, of the Baltimore & Ohio, with office at the same place; M. P. Hoban has been appointed road foreman of engines at Dayton, and O. R. Stevens has been appointed road foreman of engines at Lima, Ohio. (See Operating Officers.)

The authority of the following officers of the Pennsylvania Railroad has been extended over the New York, Philadelphia & Norfolk: W. G. Coughlin, engineer maintenance of way at Philadelphia; C. H. Niemeyer, assistant engineer of maintenance of way in charge of roadway and track at Philadelphia; G. C. Koons, assistant engineer of maintenance of way in charge of bridges and structures at Philadelphia; J. C. Auten, principal assistant engineer at Wilmington, Del., and A. H. Rudd, signal engineer at Philadelphia.

Arthur N. Davidson, who was recently appointed principal assistant to the district engineer maintenance of way on the Baltimore & Ohio Southwestern at Cincinnati, Ohio, was born at Tippecanoe on November 2, 1880, and was educated at Denison University. He entered railway service with the Baltimore & Ohio in May, 1899, at Cleveland, and later served successively until October 10, 1906, as carpenter, axeman, levelman, chainman and transitman. On June 1, 1907, he was transitman on the Florida East Coast, and four months later he became field engineer for the Wood Harmon Company at Pittsburgh, Pa. On June 1, 1909, he was made deputy county engineer at Newark, N. J., and on June 1, 1910 he became assistant engineer on the Baltimore & Ohio at St. George, S. I., N. Y. On March 1, 1913, he was appointed district bridge inspector on the Cincinnati, Hamilton & Dayton at Cincinnati, after which he served consecutively as division bridge inspector at Indianapolis, Ind., and at Dayton, Ohio, and assistant engineer at Dayton. On September 1, 1916, he was promoted to assistant division engineer, which position he held until his recent appointment as principal assistant to the district engineer maintenance of way on the Baltimore & Ohio Southwestern.

Railway Officers in Military Service

E. W. Crabtree, despatcher on the Tennessee and Coosa branch of the Nashville, Chattanooga & St. Louis, has entered the signal corps of the army, and is in training at Ft. Oglethorpe, Ga.

D. C. Rhysburger, assistant engineer in the valuation department of the Chicago, Milwaukee & St. Paul, at Chicago, has been commissioned captain in the Engineer Officers' Reserve Corps, and has been assigned to Ft. Leavenworth, Kan. Phillip R. Elfstrom, assistant engineer at Chicago, and C. H. Poole, assistant engineer at Milwaukee, Wis., have been commissioned first lieutenants in the Engineer Officers' Reserve Corps. Lieut. Poole has been assigned to Ft. Leavenworth. C. U. Smith, assistant engineer at Milwaukee, is captain of the first battalion, Engineers, Wisconsin National Guard, and is stationed at Camp Robinson, Wis.

OBITUARY

C. M. Anderson, trainmaster on the Minneapolis, St. Paul & Sault Ste. Marie, at Ironwood, Mich., lost his life on July 23, in an effort to save his two sons from drowning.

GENERAL NEW SECTION.....	250
--------------------------	-----

An idea of the magnitude of the operations to be undertaken by the American forces in France is to be gained from the recent government purchase of 150,000 tons of 80-lb. rails for use overseas.

An American Railroad in France

This is equivalent to 600 miles of double track line, and will make up the principal part of the railway to be constructed from the French port to the portion of the battle front to be occupied by the American troops, together with terminal developments, sidings, etc., which will be required to take care of the war traffic. With this order for rails were others for angle bars, track bolts, etc. Still others must be made for the switches and other material necessary to make the complete railroad. There is nothing essentially novel about the shipment of this material to France, since large quantities of all manner of American railway materials and equipment have been finding their way to that country during the last three years. The distinction as to this material, however, is that it will become a part of an American railroad built and maintained by Americans and operated by them with American equipment. What better opportunities have ever been afforded the American manufacturers to demonstrate the merits of their products? It is true that the service will be severe and that maintenance will be reduced to the very minimum that can be permitted without impairing the efficiency of operation, but this disadvantage is more than offset by the fact that the entire road will be in the hands of men thoroughly familiar with the standards of track and rolling stock which they are to handle. French railway men will have an opportunity to compare English and American railway materials and methods under French conditions, and American standards should not suffer by the comparison.

French railway men will have an opportunity to compare English and American railway materials and methods under French conditions, and American standards should not suffer by the comparison.

The controversy between yardmen in the Chicago district belonging to the Brotherhood of Railroad Trainmen and 19 railways having terminals in Chicago, which resulted in a strike from July 28 to July 30, was finally settled by an agreement reached on August 1.

Victory for Railways in Yardmen's Strike

The developments previous to and during the strike, together with the intervention of representatives of the other railway brotherhoods, were covered in the *Railway Age Gazette* for August 3, page 198. The settle-

ment was a complete victory for the railroads. The controversy arose over three demands made by the Brotherhood of Railroad Trainmen. One of these related to the reinstatement of employees who have left the service of the companies, and another to the employment of new men. Both of these demands of the Brotherhood of Railroad Trainmen were formally withdrawn. The other of the three main points in controversy related to the appointment of yardmasters and assistant yardmasters. The Brotherhood of Railroad Trainmen demanded a rule providing that "in the employment of yardmasters and assistant yardmasters the senior qualified yardmen shall be given preference." The Managers' Conference Committee offered a rule providing that "in the employment of yardmasters and assistant yardmasters the senior yardmen will in all cases be given full and unprejudiced consideration." The rule proposed by the Managers' Conference Committee was accepted in the final agreement. In other words, the Brotherhood of Railroad Trainmen withdrew two of the demands which it struck to enforce and accepted the proposal made before the strike by the railways for the settlement of the third point in controversy. The Brotherhood of Railroad Trainmen ordered the strike in Chicago without any substantial cause or justification, and within a few hours after the strike began it was evident that it was lost. The brotherhood gained nothing by its action but an increase of public disfavor.

The "Peanut" Privilege

"Do you know, it gets my goat the way the public everlastingly slams the railroads for the discourtesy and ill-treatment patrons often get at some of the station news-stands, soda fountains and candy counters; and the funny part of it is that the railroads don't run these things at all." But, then, is it so strange? How can any one legitimately expect the average traveler to understand that these stands are not run by the stationmaster, but by concessionaires? They all look alike to him, ticket agents, red-caps, trainmen, train "butchers," and clerks at the candy counters. He has neither time to notice that the clerks wear some name other than the railroad's on their hats, nor does he care. If he receives discourteous treatment he naturally blames it on the railroad; and there goes another potential bit of friendship for the road. The way some of the concessionaires let their em-

ployees treat the public would almost make one think that they were working the peanut privilege at the old-time circus. To be sure, they do not sell bad goods, nor do they give short weight or change, but they do too often act as if it were a case of here today and gone tomorrow; or, in other words, as if courtesy did not count. The railroad must hold itself directly responsible for any ill-feeling this may engender on the part of its patrons. If the owners of the concessions do not realize that plain ordinary courtesy is the best selling argument ever invented, the railway must be just that more insistent. Constant inspection by the stationmaster and insistent jacking-up will do it. Courtesy at the news-stand, at the ticket window and on the train is all the same and always the best producer of good-will on the part of the public; and in these days of threatening wartime stress and strain on the transportation facilities, no railway can take any chances with the good will of the public. Fortunate are those railways in whose stations the concessions make courtesy the most emphasized point of service.

ALL RAILWAY RECORDS BEING BROKEN

ALL previous records of American railways for volume of traffic moved, for earnings made, for expenses incurred and for taxes paid are rapidly being broken. This is shown by statistics of the Class I roads for the five months January to May, inclusive, of the present year, and especially for the month of May, the statistics for which only recently became available. In the five months January to May, 1917, Class I roads—those earning over \$1,000,000 gross each—earned a total of \$1,548,348,314. This was an increase of \$156,000,000, or 11.2 per cent over the same months of 1916; an increase of \$348,000,000, or 29 per cent, over the same months in 1913 and an increase of 48.7 per cent over the same months of 1911. Their operating

Increase 1917 over 1911, per cent....	48.7	49.7	65.9	42.5		
Increase 1917 over 1913, per cent....	29.0	26.1	38.5	37.5		
Increase 1917 over 1916, per cent....	11.2	18.1	16.1	— 6.6		

expenses were \$1,118,300,000, an increase of \$171,400,000, or 18 per cent over the same months of 1916, and of \$232,000,000, or 26 per cent, over the same months of 1913. The increase in total earnings over the same months in 1911 was 48.7 per cent and in operating expenses 49.7 per cent.

Among the largest increases of all is in taxes. In the first five months of 1917 they amounted to \$71,781,362. This was an increase of \$9,900,000, or 16 per cent, over the same months of 1916; an increase of 38½ per cent over the same months of 1913, and an increase of 66 per cent over the same months of 1911.

While the increase in total earnings over 1916 was \$156,000,000, the increase in operating expenses and taxes together was \$181,650,000. In consequence, for handling \$156,000,000 more business the railways in these months received \$25,900,000 less net operating income. As compared with 1913, however, net operating income showed an increase of 37½ per cent and as compared with 1911 an increase of 42½ per cent.

The proportion of total earnings required to pay operating expenses and taxes shows a sharp increase. In the first five months of 1911 it took 76 cents out of each dollar of earnings to pay operating expenses and taxes. In those months of 1913 this increased to 78 cents, and in 1914 it increased to the record-breaking figure of 81 cents. In 1916 it dropped to 72½ cents, but in 1917 it increased to 77 cents. While, therefore, net operating income has thus far been larger than in any previous year except 1916, the increases in operating expenses and taxes have been so great that net operating income has become relatively a much smaller part of the total amount earned.

The bulk of the increase in total earnings is being derived, of course, from the handling of freight. Freight earnings in the first five months of the year were over \$97,000,000 greater than they were in the same months of 1916, an in-

crease of 9.7 per cent, and about \$160,000,000 greater than they were in the same months of 1913, the record year before 1916, an increase of 30.4 per cent.

The month of May was a record-breaker in numerous ways. The total earnings of \$345,773,079 were greater than those ever made in a single month before in the history of American railways. The record was previously held by October, 1916, but earnings in May were \$7,470,000 greater than in October, 1916. The operating expenses incurred in May also broke all previous records for a single month. They amounted to \$238,682,000, which was about \$9,500,000 more than they were last March, in which they reached the previous high record. It is a notable fact, however, that while both operating revenues and operating expenses broke all records in May, the record for net operating income was very far from broken. Net operating income in May was \$92,079,000. There were five individual months in 1916, three in 1915 and one in 1912 when it exceeded this amount. In October, 1916, with total earnings \$7,400,000 less than in May, 1917, the railways had net operating income \$22,000,000 greater than in May. These figures show in a striking manner how much faster, relatively, increases in operating expenses and taxes have been occurring than increases in total earnings. Reports to the Railroads' War Board show that in May, 1917, railways having 173,105 miles of line handled 29,522,870,109 ton-miles of freight, or 16 per cent more than in May, 1916. This undoubtedly is the largest freight traffic ever carried.

The railways of the three large territories, East, West and South, have benefited in widely differing degrees by the increases in total earnings. The eastern lines had an increase of \$50,700,000, or 7.9 per cent in total earnings, in the first five months of 1917 as compared with the same months of 1916, but the increases in their operating expenses and taxes were so large that their net operating income declined \$44,200,000, or 25 per cent. The southern lines, with an increase of 12.2 per cent in total earnings, had an increase of 2.6 per cent in net operating income, and the western lines with an increase of 14.8 per cent in total earnings had an increase of 9.6 per cent in net operating income.

Any presentation of the facts about the increases in railway earnings, operating expenses, taxes and net operating income which did not include some analysis of the increases in operating expenses would be incomplete. It is a truism of railway economics that a railway on which maintenance expenses are large compared with transportation expenses probably is in a healthy condition, while one on which transportation expenses are large compared with maintenance expenses probably is not in a healthy condition. Within the last eighteen months, and especially within the last year, there have been large advances in the wages of labor and

transportation expenses to total operating expenses. In the first five months of 1913 transportation expenses were 51.4 per cent of total operating expenses; in the same months of 1916, 50.9 per cent; and in the same months of 1917, 53.2 per cent. In these months of 1913, maintenance of equipment expenses were 23.9 per cent of total operating expenses; in 1916, 25.5 per cent, and in 1917, 24.2 per cent. In the first five months of 1913, maintenance of way expenditures were 18.3 per cent of the total; in 1916, 17.4 per cent; in 1917 only 15.9 per cent.

The largest increase in transportation expenses relatively

TABLE IV.—RELATION OF MAINTENANCE EXPENSES TO TOTAL OPERATING EXPENSES FOR THE FIRST FIVE MONTHS OF THE CALENDAR YEARS 1911 TO 1917—CLASS I ROADS

also in the prices of all materials and supplies used in operation and maintenance. These advances in wages and prices of materials and supplies would, other things being equal, affect the expenses of all the branches of the operating department—transportation, maintenance of way and maintenance of equipment. The figures show, however, that the increases in transportation expenses have been relatively much larger than those for maintenance of way and of equipment.

In fact, the increases in transportation expenses during the present year thus far have been so great as to be alarming. While the increase in total earnings in five months of 1917 over 1916 was 11 per cent and the increase in total operating expenses was 18 per cent, the increase in transportation expenses was \$120,075,000, or 25 per cent. The importance and ominousness of this increase becomes more apparent when it is realized that it has taken place in spite of unusual increases in the average trainload and the average carload. It reflects chiefly, first, the advance in the wages of train service employees due to the Adamson law, and second, the large advances which have occurred in the prices of fuel. The increase in expenditures for maintenance of equipment over 1916 was 12 per cent and the increase in expenditures for maintenance of way, 8 per cent. The same general tendency is shown when comparison is made between the first five months of 1913 and the first five months of 1917, the increase in the cost of conducting transportation being 30.3 per cent; that of maintenance of equipment, 27.6 per cent; and that of maintenance of way, 9.3 per cent.

The result has been a substantial increase in the ratio of

to maintenance expenses has occurred on the Eastern lines both between 1913 and 1917 and between 1916 and 1917. But while the eastern lines have been in every way the hardest hit by advancing expenses, the general tendency has been the same throughout the country. In other words, the general tendency has been for operating expenses to increase faster in proportion than total earnings, for cost of conducting transportation to increase faster than expenditures for maintenance and for taxes to increase fastest of all. The expenditures for maintenance of way have shown an especially small increase relatively.

The foregoing facts must be left to speak for themselves. While they show that the railways are handling the largest business that they ever did, it cannot be said that the general conditions under which they are handling it are satisfactory. In the course of time the advances in rates that the Interstate Commerce Commission has granted to the eastern lines and

the much smaller advances granted to the southern and western lines will go into effect. These and especially the advances in eastern territory, will moderate the tendency of earnings and operating expenses to converge and will give the railways larger means for maintenance.

While absolutely the increases in expenditures for maintenance, and especially those for maintenance of equipment, have been large, appearances indicate that they have been due entirely to advances in the wages of labor and in the prices of materials and supplies. In fact, the increases in expenditures for maintenance of way and structures have been so small relatively as to suggest forcibly that railway properties are not being as well maintained, on the whole, as is desirable. Probably this is in a large measure due to the inability of the roads to get enough labor for maintenance of way and partly to fear that if they spend any more they may regret it in future.

The statistics afford material for an interesting study, but it is very difficult to draw any satisfactory conclusion from them as to what future developments will be if the traffic handled and total earnings continue to increase. If there should be a sudden and large shrinkage of traffic and total earnings there probably would be serious trouble for many railways, but no such shrinkage of earnings is now in prospect.

GIVING ENGINEMEN A SECOND CHANCE

ONE of the primary reasons for publishing the discussion on the use of the overlap in automatic signaling, which appears in this issue, is to draw operating men into a fuller consideration of the problem of eliminating those collisions which are due to over running signals. Operating men obviously cannot be informed on the technicalities of signaling, but this matter is not a technicality. It is, strictly speaking, more within the province of the operating department than the signal department. Operating men should know exactly the results they desire to obtain in safeguarding train operation. They are the authorities on each road who must decide whether, through some course of discipline, they will compel obedience to a single stop signal and a single caution signal, whether the enginemen shall be given a second chance by the introduction of a second stop or a second caution signal, or whether an automatic device shall be installed to insure obedience to a single indication.

As pointed out in the discussion referred to, opinions as to the overlapping of stop signals vary over a wide scope from the man who considers this practice a necessary factor of safety to the one who regards it as an absolute menace to safe operation. With the exception of the special cases pointed out in the article, however, the preponderance of evidence is certainly against the overlapping of stop signals. Even those who advocate it do not maintain that it strikes effectively at the cause of the trouble. For caution signals, overlapping is more in favor. The arguments under this head, however, resolve themselves into the well-known pros and cons for so-called "simplified signaling."

The suggestions for dealing with the problem without the use of the overlap bring out the usual methods. One man, in effect, tells his enginemen that they cannot trust the signals, and the one representing the opposite view makes no allowance for an engine passing a stop signal at any time or under any circumstances. There are several points which ought to have further discussion by interested operating officers along this line. Among them are the use of signal instructors to accomplish the dual purpose of instructing the men and inspiring confidence in the signals; the course to be taken when a signal goes to the stop position in the face of a train on a road having strict rules against over running signals; and the loss of time resulting from strict observance of caution signals through a long block.

Letters to the Editor

INITIATIVE—ORGANIZATION AND EDUCATION

CHICAGO, Ill.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

We read so much, nowadays about initiative, how it was recognized in a certain man's rapid rise and how the railroads of the country are beating the brush for men with initiative. The writer is, at present, vice-president and director in two manufacturing concerns employing quite a large number of skilled and unskilled workmen, as well as some of the best salesmen in the country. Outside of his business training, he has had 25 years' experience in railroad work, from track laborer to superintendent, and is thus partially qualified to throw some light on this subject.

It requires considerable nerve in present-day railroading, with its reels of red tape, for a junior official to take the initiative and do what he knows to be good railroading, without the sanction of his superior officer—for he is likely to get a curt letter or message from headquarters (not always dictated by his superior) asking why he exceeded his authority. Such communications often come in plain English over the wire, or in the open mail, so that every operator or clerk is fully aware that the boss has been called down by the man higher up. After he gets two or three such documents, they begin to smart, and he, like thousands of others, joins the clearing house brigade and gets the habit of passing important matters up to higher authority—often without a suggestion, in order to avoid any humiliation by having his action or suggestion criticised. Thus, another man capable of development has an iron band put around him which keeps him from expanding, and the railroad practically loses the investment it has made.

There is no business in the world where so much natural initiative is allowed to perish as in the railroad business. Just look around and see the number of railroad men in other lines of activity—talk to them, and find out why they left the service. One will discover, in many cases, that their initiative was checked by some superior who was not big enough to see the worth of practical suggestions or to give credit where it was due, with the consequence that the man who is alive hunts for fields where he can develop, and he finds them in the commercial world. Knowing railroad officials and their line of comment, as I do, I can tell you in advance that many who read this article, will say it is the babbling of a disgruntled railroad man; on the contrary, let me say again, it comes from one who has always been permitted to do pretty much as he pleased in the various jobs he has filled. My statements are actuated only by sympathy for the thousands of railroad officials in the United States who would like to initiate, instead of going to the vice-president in charge of the department before making the simplest decision. How many times have you witnessed the promotion in subordinate offices of some live youngster to the responsible position of chief clerk, and, in a few days, have headquarters inform the man in charge that they have a man in the general office they will send to take the place. When he arrives it is found he is a near relative of the man higher up, or a close friend who is being taken care of at the expense of the subordinate organization. Don't you think that paralyzes initiative? We have all seen such stunts—not so many today as a few years ago—but too many yet for railroads to be run on the cold blooded business basis they must conform themselves to, before they get the absolute confidence of the public.

One of the best general managers I ever knew said to me one time, "The reason so many officials make failures is

because they still want to run the job they were promoted from instead of leaving that task to their successor." I have kept close tab on this bit of philosophy for years—it has been a great check valve to my own "butting in," as well as a source of amusement while observing other over-zealous officials sit up night and day trying to be trainmaster, chief despatcher, road foreman of equipment, fill both roadmasters' shoes as well as run the three most important terminal yards on the division. We sometimes hear some of our keen presidents or vice-presidents say they don't understand what the trouble is with the "River" division—"it ran smoothly when I was superintendent there 20 years ago"; but if he could beat back and compare conditions with 20 years ago, he would find 10 times the correspondence, 2000 ton trains as against 20 loads and 40 empties, inadequate side track facilities, antagonistic labor (made so by our failure to work with labor instead of against it), the Adamson law and hundreds of other state and interstate regulations he must keep posted on in order to avoid violations and consequent embarrassment to the higher officials. Is it any wonder the superintendent neglects some of the minor things in his anxiety to please everybody?

If my vision is not too much in eclipse, the railroads of this country will have during this war and for years thereafter, at least until production overtakes demand, the greatest density of traffic ever known, and their talent and facilities will be taxed to the last ounce of efficiency to keep the good will of the public that they may be allowed sufficient revenues to cover necessary maintenance expenses and to finance additional double tracks, needed terminals, etc. This cannot be brought about by consolidation of divisions to effect economies; new divisions should be created. I know of single-track roads that have as much as 800 miles of busy railroad in one superintendent's division, almost three divisions in one. As a result, the superintendent just hits the high places, never gets a chance to mingle with the businessmen he is serving and exchange ideas with them, and, incidentally, be strong enough to have influence with the public and a voice in sending safe and sane men to our state legislatures and our national congress. I hope to see the day when all the clearing houses between the superintendent and the operating head of the railroad will be eliminated, when there will be closer supervision where the work is done, and the superintendent's office will be what it should—a unit of the operating organization.

In order to obtain or develop initiative and the right kind of organization, real educating must be done. In giving my views to a friend who had just been promoted to an important general superintendency, I told him I heard the agent at one of his most important stations tell the superintendent he could get along without a clerk until the fall rush set in, and the superintendent immediately said, "Don't do it, I would never get authority to put him back." How much better to have permitted the agent to put on and take off help as the business fluctuated, and to have held him strictly accountable for net results. My friend immediately said, "That's my idea of organization, and I shall work accordingly." The very next week he selected a yardmaster for one of his most important terminal stations without even consulting the superintendent, trainmaster or the agent, who were held to strict accountability for the results of that terminal. Then not long afterwards he called a couple of engine foremen from one of his yards into his office and dismissed them for trivial offenses, and the superintendent, trainmaster and yardmaster were not consulted. It took my friend a long time to learn that he could not hold all the subordinate positions under him, and he has since told me that he can't understand why any of his lieutenants stood for it.

Why not start the education of an official at the very beginning of his railroad career, or at least, as soon as he becomes

big enough to be placed in charge of even one man, then he will quickly learn to select the best material and that he is held responsible for their performance? The employee will also understand that he is indebted to no one higher up for his position; more especially should such authority be given agents and yardmasters at stations where business is subject to change. If they are not capable of assuming such responsibility, it will soon show in their records and they will have to seek a lower level. My experience has been, however, that there are few failures where the responsibility is checked squarely up to the man in charge and the proper support given him. My idea of railroad education is to drill all classes in the principles of loyalty and line of duty, which can be done on just one basis, viz.: the golden rule.

The most perfect organization I have ever observed was at a small terminal where only about 200 men were employed. In questioning the boss as to why all seemed so anxious to do his bidding, he replied that it took him 15 years to learn never to allow an employee to follow him from one job to another, not even his secretary. It was his theory that the man who could not build an organization out of what he found on any job, wasn't worthy of the name executive; by this treatment he immediately turned the whole bunch into loyal boosters, giving their best licks and all working together. He would employ no one related to him for fear of instilling distrust in some employee's mind. No one could come back to his organization the second time no matter how well he left the service, whether promoted or accepting service elsewhere. All these seemed severe rules to me, but he explained that it was in fairness to the men who stuck on the job. It was surely working well, for every youngster was on his toes trying to see how efficient he could be, for he well knew that no one was going to step in ahead of him when a vacancy occurred. That kind of an organization creates initiative and teaches correct principles of management.

OBSERVER.

EXPORT MORE FROM SOUTHERN PORTS

COLUMBUS, MISS.

TO THE EDITOR OF RAILWAY AGE GAZETTE:

The Car Service Commission has greatly improved conditions generally by modifying the rules with respect to the interchange of cars. The Southern territory, however, is still suffering because of the outbound traffic being greatly in excess of the inbound, especially in Alabama and Mississippi. Several years ago the loads in each direction were about evenly balanced, due largely to the heavy shipments of feed stuff moving from northern markets into the South, but since the southern farmers have diversified their crops and are now raising all of their feed stuffs and shipping their surplus to the northern markets, the outbound shipments are badly out of balance with the inbound when business is normal. During an abnormal business this condition is further aggravated because of the long haul to northern and eastern points and the delay due to congestion and the burdensome task of handling empty cars 1,500 to 2,000 miles back to the Southern territory.

It seems that the only solution of the problem is to work out a plan whereby certain central states may ship a portion of their export traffic to Mobile and New Orleans. This will equalize the load haul in both directions, shorten the empty haul, relieve congestion and save car delays. All roads will then be able to keep cars on their lines approximately equal to their ownership of equipment. It is almost impossible for any line to control its own equipment at all times without taking a step backward, and during an abnormal business, if each road will take car for car, regardless of individual ownership (with the exception of special equip-

ment), it will expedite the movement of traffic and reduce terminal delays in switching.

After the rush period is over, the cars can be worked back in the home direction, but from the present outlook the heavy service demands will continue for some time and there will be a great many old worn out cars condemned and replaced with standard equipment, which will put each road on an equal footing with the rest, so long as they have in their possession cars equal in number to their ownership.

If a plan can be worked out to divide the export shipping between the various ports, I believe the increase in loaded car miles will more than offset any loss due to the pooling of equipment. Additional grain elevators and other storage facilities can be provided at each of these ports if necessary.

F. E. PATTON,

Superintendent, Southern Railway Company in Mississippi.

THE UNIVERSITY OF EXPERIENCE

TOLEDO, O.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

I have noted with interest the Letter to the Editor entitled, "Give the Engineer a Chance" in the issue of June 29, and would like to refer to the last part of the fourth paragraph, worded as follows: "Surely the engineman, conductor or yardmaster who works up to superintendent is no better fitted for his position than would be an engineer put through the proper course." But the writer destroys an ideal statement of fact by such an absurdity as "there is no magic in railroad operation. When a man learns that the business of a railroad is to move trains, and that no two trains can occupy the same space at the same time, he has mastered the fundamentals." The fundamentals are not as he explains them, but ability to know details which he would pass over so lightly to his subordinates.

A superintendent, to superintend, must be fairly well versed in the thousand and one details which go to make the correct working of a division; ability to recognize inability, practical knowledge of right of way, equipment and working conditions, the art of despatching, methods of accounting and recording, what is and will be required for more efficient management and the knack of meeting sudden increases with present facilities. If his job is only to superintend and secure a capable organization, as he states, how is he to do it if through inability and lacking in actual experience, he is unable to detect flaws, curtail unnecessary movements, and irregular or careless methods or know that his subordinates are co-operating. Figuratively, he may be able to show economy, whereas as an actual fact there will be lost motion and waste.

The trouble with college men is that while well enough versed in the theoretical they are unqualified in the practical details. Should the university require of them at least several years' experience in yards, on the road, at the fire door of a locomotive, along the right of way and at the desks in the different offices, hard work and actual conditions would give them an insight into the many conditions continuously arising and a knowledge of how to meet them. Knowing kinds and working conditions of equipment, transportation rules, methods and details of manipulation and supervision and classes and manners of men, would be the whole basis of his future ability in the application of his theoretical knowledge. To learn such would take several years of his time and he would be young who gains a superintendency at 33.

Railroad men respect a superior who makes every move count and the respect of subordinates is the most important item in co-operation. The superintendent who demands respect because of his title cannot hope to compete with the superintendent who has won respect through ability and

personality, for there is confidence in the latter. The superintendent who is not capable of "cutting the buck" in each and every department under him is at a standstill, to be passed by the practical man. That is perhaps why the majority of men who to-day are controlling these great complicated systems of commerce are not college men, but men who have fought their way up and know the game, realizing that every day there is something new to learn.

H. H. McFILBER.

SOME SUGGESTIONS REGARDING THE FUSEE

ST. LOUIS, MO.

TO THE EDITOR OF THE RAILWAY AGE GAZETTE:

In view of the increasing use of the fusee as a day as well as a night signal for track, bridge, station and train employees, it might be opportune at this time to discuss the improvement and standardization of this important signal. Several roads are now using the five-minute red fusee, some use the 10-minute red, while others use the straight yellow, green, or a combination. This variety of fusees leads to more or less conflict among the men in service as well as the additional expense for store departments to carry so many different kinds in stock.

While the five-minute size recommends itself from the standpoint of lower first cost and less bulk to be carried by trainmen, it seems to be unsatisfactory in spacing trains only five-minutes apart. The straight 10-minute red fusee also has the objection of inflexibly spacing trains 10 minutes apart, requiring a dead stop and waiting until the fusee is burned out. This is quite an item of expense with long, heavy trains, besides the extra five-minute loss of time and additional delay in getting trains started, with the usual accompaniment of drawbars pulled out and air hose burst.

While the most generally-used combination—the red and yellow fusee—is commendable in eliminating the dead stop and consequent five-minute and other delays, after the first five-minute (red) portion is burned out, it seems objectionable, as actual demonstration and observation show that it is difficult and sometimes impossible for an engineman on a swaying engine, with the view often more or less obscured, to distinguish between the yellow and the red portions of the fusee, as the difference between the two colors as now manufactured is not pronounced enough. This fusee would thus often have the very natural effect of the straight 10-minute red fusee with its consequent dead stop and added five-minute delay which this style of a fusee was especially designed to eliminate.

It seems to the writer that a combination five-minute red and five-minute green fusee would give the proper necessary distinctive colors for the instant and certain decision of enginemen, the first half furnishing the following enginemen adequate notice of a train immediately preceding, and the second half being a proceed (green) signal, eliminating the dead stop and consequent delay, while at the same time having the subconscious effect of a cautionary signal without its attendant delay. This proposed fusee might more nearly meet the need where it is desired to space trains only five minutes. It would also more nearly eliminate the necessity and expense of carrying so many styles of fusees in service.

In this connection the writer would like to recommend the 34-in. size wood base fusee, instead of the more generally used 78-in. size. Burning demonstrations of these two sizes of fusee have shown that the 34-in. size will give the same flame and service results as the larger size, with less cost, bulk and weight.

It seems to be generally conceded that the right hand side of track, outside of the rail, is the proper position for a burning fusee. This avoids a danger from leaking oils, etc.

GRANT SELBY.

North End of the Inbound Freight House.

Pere Marquette Freight Station at Chicago

While of Moderate Size It Embodies Several Special Features and Conveniences of Modern Development

THE Baltimore & Ohio Chicago Terminal recently completed a new freight station at Chicago for the use of its tenant, the Pere Marquette. While this is a station of only moderate size, it embodies an arrangement of the facilities and the use of features recently developed which are worthy of attention. The inbound freight house is $280\frac{1}{2}$ ft. by $52\frac{1}{2}$ ft. in area, one-half of which is two stories and the other half three stories in height. The outbound house is 250 ft. by 18 ft. in area and one story high throughout. The location diagram shows the relative positions of the in and outbound houses with respect to the tracks. The inbound house is served by three tracks and the outbound house by a maximum of six tracks and as the outside track is adjacent to a concrete roadway it can be used for team track purposes.

THE INBOUND FREIGHT HOUSE

The first floor of the inbound house is used for regular inbound freight house service. The second floor is used for storage, the space being leased to shippers at rates provided for in the tariff. The third floor is used entirely for freight offices and the space is divided into a general office $49\frac{1}{2}$ ft. by 60 ft., an agent's and a cashier's office, each 18 ft. by 18 ft., toilet rooms, coat rooms, a stationery room 16 ft. by 19 ft. 6 in., and a record room 40 ft. by $49\frac{1}{2}$ ft.

Communication with the street is afforded by means of a stairway at the north end of the building, with a lobby on the third floor giving direct communication with the cashier's office and the agent's private office, as well as with the general office. Other stairways are provided at the extreme south end and at the center of the house, the latter communicating directly with the record room on the third floor.

The transportation of storage material from the first to the second floor and return is facilitated by two inclined eleva-

tors provided by the Otis Elevator Company, Chicago, with provision for the future addition of two similar elevators. These consist of inclined runways on a slope of 16 deg., up which the freight trucks are wheeled with the assistance of an endless chain provided with hooks which engage the axles of the trucks.

Auxiliary facilities on the first floor consist of a cold storage room 18 ft. by 26 ft. in the northeast corner of the building and a "lockup" for the storage of valuables 12 ft. by 18 ft. 6 in., in the northwest corner. The cold storage room is equipped for heating to provide a suitable space for the storage of perishables in winter time. Two platform scales 6 ft. by 8 ft. have been installed with Fairbanks self-recording dials graduated to 1,000 lb.

Structurally the inbound freight house consists of an uncovered steel frame with brick curtain walls and a flat pitch gable roof covered with a composition roofing. It is divided into 20 ft. panels longitudinally, this arrangement controlling the spacing of the steel roof trusses and floor girders. The secondary floor beams in three lines span longitudinally between the girders and support wooden joists spanning transversely. The floors consist of yellow pine subflooring, with a $1\frac{1}{2}$ -in. rock mastic surface on the second floor and a 7/8-in. maple wearing surface on the third floor. The first floor is supported on a fill and consists of 6 in. of concrete covered by $1\frac{1}{2}$ in. of rock mastic.

Except at the north end of the building, where space is taken up by the entrance lobby and the special storage rooms, the two sides of the building are enclosed on the first floor by sliding doors continuous from column to column. These are arranged in groups of three each on a separate runway so that two-thirds of the entire space in each 20-ft. bay can be opened for the transfer of freight. The doors along the team side of the building are protected against the weather by an 8-ft. marquis supported on structural steel brackets.

A transverse fire wall divides the building into two sections and is fitted with automatic tin-clad fire doors.

THE OUTBOUND FREIGHT HOUSE

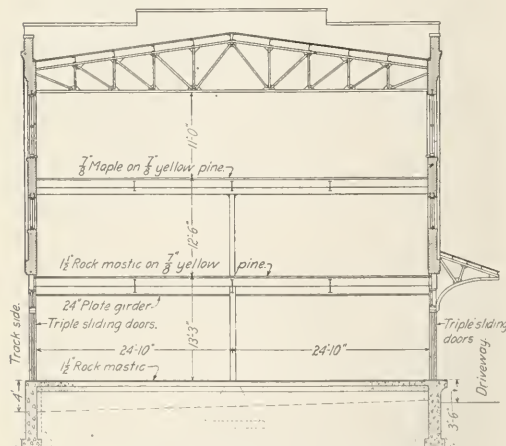

As the outbound freight house is only 18 ft. in width, outside measurement, it is intended purely for the transfer of freight from street vehicles to cars. The doors are arranged the same as in the inbound house and are continuous from end to end. A platform scales and a checking booth, 6 ft. by 5 ft., are provided at every third panel, giving a total of five in all. Four of the scales have 6-ft. by 8-ft.

View from South End of the Outbound House

platforms and the fifth one, in the middle of the building, lengthwise has a 7 ft. by 12 ft. platform. All of these scales are equipped with Fairbanks automatic dials.

The structural design of this house is simple. Columns consisting of 10-in. 25-lb. I-beams are framed into 13-in., 31.5-lb. I-beams over the transoms which carry 13-in. brick walls to the roof line. The roof consists of $\frac{7}{8}$ -in. sheathing covered with a composition roofing and supported on 3-in. joists spaced 24 in. center to center and spanning from wall to wall. These roof joists overhang $2\frac{1}{2}$ ft. on the track side and 8 ft. on the team side, thus affording a shelter

Cross Section of the Inbound Freight House

equivalent to the marquis on the inbound house. The building is stiffened transversely by 3-in. by 3-in. angle irons serving as knee-braces at each panel point.

The outbound house is separated from the inbound house by a rolling steel door arranged for automatic closing by means of a fusible link. At the far or south end of the outbound house a sliding door leads out onto a platform which is used largely for the unloading of automobiles, for which purpose it is provided with an abutting stub track for

end door unloading and an incline for rolling the cars to the roadway level. This platform is also equipped with a crane for unloading heavy machinery and other commodities not readily handled through the freight house.

The teamway along the side of the freight house is graded to give a maximum of convenience in the transfer of freight between street vehicles and the house. Along the outbound

Plan of the Station and Tracks

house where the movement is from the wagons to the house, the roadway is only 3 ft. lower than the floor level so that most of the wagon beds or truck beds would be higher than the floor. Along the inbound house where the movement of freight is from the house to the trucks, the roadway is 3 ft. 6 in. lower than the floor so that the floor would be higher relative to the wagons.

The design and the construction of this house was under the general direction of F. L. Stuart, until recently chief en-

Details of the Outbound Freight House

gineer of the Baltimore & Ohio and the Baltimore & Ohio Chicago Terminal. The design was under the immediate direction of M. A. Long, assistant to the chief engineer of the Baltimore & Ohio, and the construction was under the direction of L. G. Curtis, district engineer of the Baltimore & Ohio Chicago Terminal. The contractor was the Drumm Construction Company, Chicago.

ELECTRIC POWER FOR SWISS LINES.—The total Swiss railway system, Federal and other, amounts to 3,216 miles, of which 1,700 miles are Federal and 1,516 miles are owned by corporations. Of the private lines 622 miles are already electrified, but only about 50 miles narrow gage and other of the Federal railways are operated by electricity. Looking to further electrification, the Federal railways already have acquired numerous water-power properties in the valleys of the Reuss, Levantina, Rhone, and in the Trient, Canton Valais, and elsewhere. In all 10 electric water plants are projected, with 500,000 horsepower efficiency. Two of these, the Amsteg and the Ritom works, produce 152,000 horsepower, designed to supply the Gotthard Railway from Lucerne to Chiasso.

Interstate Commerce Commission Enlarged

Priority Bill Passed; Study of Waterway Problem;
Railway Commissioners' Annual Meeting; Income Tax

WASHINGTON, D. C., August 7, 1917.

THE bills to authorize the President to direct that certain shipments shall have preference or priority in transportation during the war, and to enlarge the Interstate Commerce Commission from seven to nine members and authorize it to reorganize its work by divisions were sent to the President for signature on August 6. The Interstate Commerce Commission bill carries a new provision inserted in conference, that until January 1, 1920, no increased rate may be filed without the approval of the commission. The priority bill also carries a provision to prevent obstruction of interstate commerce.

The conference committees, appointed to reconcile the differences between the House and the Senate in the bills, submitted their reports on August 3 and the compromise bills agreed upon in conference were adopted by the House of Representatives on the following day and by the Senate on August 6.

The priority bill as passed contains the provision inserted in the House authorizing the President to issue priority orders direct or through such person or persons as he may designate or through the Interstate Commerce Commission. It also contains the provision of the Senate bill with some changes, authorizing the carriers, without responsibility or liability on the part of the United States, to establish and maintain in the city of Washington during the period of the war an agency empowered by such carriers as join in the arrangement, to receive notice and service of such orders and directions as may be issued. This, of course, refers to the Railroads' War Board, the Executive Committee of the Special Committee on National Defense of the American Railway Association, whose sub-committee, the Commission on Car Service, has the necessary organization for complying with orders to give preference to commodities or special shipments essential for war purposes. Before the bills were originally passed in the House and in the Senate, the proposed provision for compensating the carriers for loss or damage suffered by reason of complying with a priority order had been eliminated, provision being made, however, for the fixing of rates for transportation in carrying out the orders of the President by the Interstate Commerce Commission. The text of the priority bill as passed is as follows:

TEXT OF PRIORITY BILL

"That section 1 of the act entitled 'An act to regulate commerce,' approved February 4, 1887, as heretofore amended, be further amended by adding thereto the following:

"That on and after the approval of this act any person or persons who shall, during the war in which the United States is now engaged, knowingly and willfully, by physical force or intimidation, by threats of physical force obstruct or retard, or aid in obstructing or retarding, the orderly conduct or movement in the United States of interstate or foreign commerce, or the orderly make-up or movement or disposition of any train, or the movement or disposition of any locomotive, car, or other vehicle on any railroad or elsewhere in the United States engaged in interstate or foreign commerce shall be deemed guilty of a misdemeanor, and for every such offense shall be punishable by a fine of not exceeding \$100 or by imprisonment for not exceeding six months, or by both such fine and imprisonment; and the President of the United States is hereby authorized, whenever in his judgment the public interest requires, to employ the armed forces of the United States to prevent any such obstruction or retardation of the passage of the mail, or of

the orderly conduct or movement of interstate or foreign commerce in any part of the United States, or of any train, locomotive, car, or other vehicle upon any railroad or elsewhere in the United States engaged in interstate or foreign commerce: *Provided*, That nothing in this section shall be construed to repeal, modify, or affect either section 6 or section 20 of an act entitled "An act to supplement existing laws against unlawful restraints and monopolies, and for other purposes," approved October 15, 1914.

"That during the continuance of the war in which the United States is now engaged the President is authorized, if he finds it necessary for the national defense and security, to direct that such traffic or such shipments of commodities as, in his judgment, may be essential to the national defense and security shall have preference or priority in transportation by any common carrier by railroad, water, or otherwise.

"He may give these directions at and for such times as he may determine, and may modify, change, suspend, or annul them, and for any such purpose he is hereby authorized to issue orders direct, or through such person or persons as he may designate for the purpose or through the Interstate Commerce Commission. Officials of the United States, when so designated, shall receive no compensation for their services rendered hereunder. Persons not in the employ of the United States so designated shall receive such compensation as the President may fix. Suitable offices may be rented and all necessary expenses, including compensation of persons so designated, shall be paid as directed by the President out of funds which may have been or may be provided to meet expenditures for the national security and defense.

"The common carriers subject to the acts to regulate commerce or as many of them as desire so to do are hereby authorized without responsibility or liability on the part of the United States, financial or otherwise, to establish and maintain in the city of Washington during the period of the war an agency empowered by such carriers as join in the arrangement to receive on behalf of them all notice and service of such orders and directions as may be issued in accordance with this act, and service upon such agency shall be good service as to all the carriers joining in the establishment thereof. And it shall be the duty of any and all the officers, agents, or employees of such carriers by railroad or water or otherwise to obey strictly and conform promptly to such orders, and failure knowingly and willfully to comply therewith, or to do or perform whatever is necessary to the prompt execution of such order, shall render such officers, agents, or employees guilty of a misdemeanor, and any such officer, agent, or employee shall, upon conviction, be fined not more than \$5,000, or imprisoned not more than one year, or both, in the discretion of the court.

"For the transportation of persons or property in carrying out the orders and directions of the President, just and reasonable rates shall be fixed by the Interstate Commerce Commission; and if the transportation be for the Government of the United States, it shall be paid for currently or monthly by the Secretary of the Treasury out of any funds not otherwise appropriated. Any carrier complying with any such order or direction for preference of priority herein authorized shall be exempt from any and all provisions in existing law imposing civil or criminal pains, penalties, obligations, or liabilities upon carriers by reason of giving

preference or priority in compliance with such order or direction.'"

ENLARGEMENT OF I. C. C.

The differences between the bill for the enlargement of the Interstate Commerce Commission, as agreed upon in conference, and the bill as passed by the House, include a substitute for the amendment added by Senator Smith in the Senate, which would require the commission to suspend an advance in rates whenever a protest was made by anybody in the United States. The Senate conferees insisted on this amendment or something equivalent thereto, but an agreement was finally reached on a provision that until January 1, 1920, no increased rate, fare, charge or classification shall be filed except after approval thereto has been secured from the commission. Such approval may, in the discretion of the commission, be given without formal hearing and in such case would not affect any subsequent proceeding. In explaining this provision in the House, Chairman Adamson of the Committee on Interstate and Foreign Commerce, said that this question had involved considerable heated discussion in conference and twice it had been agreed to report a disagreement, but finally it was suggested that a period of time should be allowed before legislating on such an important change. Before agreeing on the substitute finally adopted, he said, the conferees had called before them a representative of the railroads and members of the Interstate Commerce Commission. The representative of the railroads, he said, had no objection to make and both he and the commissioners agreed that the amendment would be workable, because in proposing an increase of rates the railroads will state to the commission what the proposition is and if the commission is not satisfied either from the record or from what it knows of the situation, it will have hearings and then approve or disapprove the rates. But it was stated, Mr. Adamson said, that the commission in many cases could tentatively allow the increase and give the matter further consideration later, if necessary.

Another amendment was adopted for the purpose of providing for rehearings by the commission on cases decided by subdivisions of the commission, as provided in section 16a of the act itself for rehearing cases decided by the commission.

It was provided that in proceedings before the subdivisions relating to the reasonableness of rates or to alleged discriminations no less than three members shall participate and in proceedings relating to valuation not less than five members shall participate.

The provision in the original bills, as introduced, for an increase in the salary of the secretary of the commission was not adopted and the salary is specifically fixed at \$5,000. The text of the bill as passed is as follows:

"That section 24 of an act entitled 'An act to regulate commerce,' approved February 4, 1887, as amended, be further amended to read as follows:

"Sec. 24. That the Interstate Commerce Commission is hereby enlarged so as to consist of nine members, with terms of seven years, and each shall receive \$10,000 compensation annually. The qualifications of the members and the manner of the payment of their salaries shall be as already provided by law. Such enlargement of the commission shall be accomplished through appointment by the President, by and with the advice and consent of the Senate, of two additional Interstate Commerce Commissioners, one for a term expiring December 31, 1921, and one for a term expiring December 31, 1922. The terms of the present commissioners, or of any successor appointed to fill a vacancy caused by the death or resignation of any of the present commissioners, shall expire as heretofore provided by law. Their successors and the successors of the additional commissioners herein provided for shall be appointed for the full term of seven years, except

that any person appointed to fill a vacancy shall be appointed only for the unexpired term of the commissioner whom he shall succeed. Not more than five commissioners shall be appointed from the same political party.'

"Sec. 2. That section 17 of said act, as amended, be further amended to read as follows:

"Sec. 17. That the commission may conduct its proceedings in such manner as will best conduce to the proper dispatch of business and to the ends of justice. The commission shall have an official seal, which shall be judicially noticed. Any member of the commission may administer oaths and affirmations and sign subpoenas. A majority of the commission shall constitute a quorum for the transaction of business, except as may be otherwise herein provided, but no commissioner shall participate in any hearing or proceeding in which he has any pecuniary interest. The commission may, from time to time, make or amend such general rules or orders as may be requisite for the order and regulation of proceedings before it, or before any division of the commission, including forms of notices and the service thereof, which shall conform, as nearly as may be, to those in use in the courts of the United States. Any party may appear before the commission or any division thereof and be heard in person or by attorney. Every vote and official act of the commission, or of any division thereof, shall be entered of record, and its proceedings shall be public upon the request of any party interested.

"The commission is hereby authorized by its order to divide the members thereof into as many divisions as it may deem necessary, which may be changed from time to time. Such divisions shall be denominated, respectively, division 1, division 2, etc. Any commissioner may be assigned to and may serve upon such division or divisions as the commission may direct, and the senior in service of the commissioners constituting any of said division shall act as chairman thereof. In case of vacancy in any division, or of absence or inability to serve thereon of any commissioner thereto assigned, the chairman of the commission, or any commissioner designated by him for that purpose, may temporarily serve on said division until the commission shall otherwise order.

"The commission may by order direct that any of its work, business, or functions arising under this act, or under any act amendatory thereof, or supplemental thereto, or under any amendment which may be made to any of said acts, or under any other act or joint resolution which has been or may hereafter be approved, or in respect of any matter which has been or may be referred to the commission by Congress or by either branch thereof, be assigned or referred to any of said divisions for action thereon, and may by order at any time amend, modify, supplement, or rescind any such direction. All such orders shall take effect forthwith and remain in effect until otherwise ordered by the commission.

"In conformity with and subject to the order or orders of the commission in the premises, each division so constituted shall have power and authority by a majority thereof to hear and determine, order, certify, report, or otherwise act as to any of said work, business, or functions so assigned or referred to it for action by the commission, and in respect thereof the division shall have all the jurisdiction and powers now or then conferred by law upon the commission, and be subject to the same duties and obligations. Any order, decision, or report made or other action taken by any of said divisions in respect of any matters so assigned or referred to it shall have the same force and effect, and may be made, evidenced, and enforced in the same manner as if made or taken by the commission, subject to rehearing by the commission, as provided in section 16a hereof for rehearing cases decided by the commission. The secretary and seal of the commission shall be the secretary and seal of each division thereof.

"In all proceedings before any such divisions relating to the reasonableness of rates or to alleged discriminations not

less than three members shall participate in the consideration and decision and in all proceedings relating to the valuation of railway property under the act entitled "An act to amend an act entitled 'An act to regulate commerce,' approved February 4, 1887, and all acts amendatory thereof, by providing for a valuation of the several classes of property of carriers subject thereto and securing information concerning their stocks, bonds, and other securities," approved March 1, 1913, not less than five members shall participate in the consideration and decision.

"The salary of the secretary of the commission shall be \$5,000 per annum.

"Nothing in this section contained, or done pursuant thereto, shall be deemed to divest the commission of any of its powers."

"Sec. 3. So much of section 18 of the act to regulate commerce as fixes the salary of the secretary of the commission is hereby repealed.

"Sec. 4. That paragraph 2, section 15, of the act to regulate commerce approved February 4, 1887, as amended, be further amended by adding the following: 'Provided further, until January 1, 1920, no increased rate, fare, charge, or classification shall be filed except after approval thereof has been secured from the commission. Such approval may, in the discretion of the commission, be given without formal hearing, and in such case shall not affect any subsequent proceeding relative to such rate, fare, charge, or classification.'"

COMMISSION FOR COMPREHENSIVE STUDY OF WATERWAY PROBLEMS

The River and Harbor appropriation bill passed by Congress last week contains a provision for a waterways' commission of seven members to bring into co-ordination and co-operation the engineering, scientific and constructive services, bureaus, boards and commissions of the several governmental departments of the United States and commissions created by Congress that relate to the study, development or control of waterways and water resources and subjects relating thereto, or to the development and regulation of interstate and foreign commerce, with a view to uniting such services in investigating with respect to all watersheds of the United States all questions relating to the development, improvement, regulation and control of navigation as a part of interstate and foreign commerce. The investigation is to include the related questions of irrigation, drainage, forestry, reclamation, etc., the co-operation of railways and waterways, and promotion of terminal and transfer facilities. The commission is to secure the necessary data and formulate and report to Congress as early as practicable a comprehensive plan or plans for the development of the water resources of the United States for the purposes of navigation and for other useful purposes, and recommendations for the modification or discontinuance of any project heretofore adopted. The commission is to be appointed by the President and at least one of its members shall be chosen from the active or retired list of the engineering corps of the army. At least one shall be an expert hydraulic engineer and the remaining five may be selected either from civil life or the public service. The commission is authorized to employ experts for its investigation and for its expenses the sum of \$100,000 is appropriated.

STATE COMMISSIONERS TO CONSIDER WAR TIME TRANSPORTATION

The effect of the war on various problems pertaining to railroad transportation and its regulation is to be the principal topic for discussion at the twenty-fifth annual convention of the National Association of Railway Commissioners to be held in Washington beginning on October 16, according to the announcement of the meeting just issued. The

association is composed of members of state railroad and public utility commissions and the Interstate Commerce Commission.

Active co-operation of the association "in the matter of federal control over operation of railroads to meet military and industrial requirements" will be among the subjects to be discussed.

"The time calls imperatively for unified action by all men charged with public responsibility," the announcement said. "At this convention the present vital problem of public utility regulation, including the public utilities' function in serving the nation's need, the requests of railroads and other public utilities for increases in rates and for authority to diminish or discontinue service and the requests of the public for reasonable rates and more adequate service, will be fully discussed with a view to uniform, constructive action by the various states and federal regulatory commissions."

INCREASE IN INCOME TAX PROPOSED

The revised war revenue bill intended to raise \$2,000,000,000 in taxes during the ensuing year was reported to the Senate on August 6 by the Finance Committee, which has been working on the bill since it was passed by the House in May. The provision for a corporation income tax, which the committee expects will raise \$162,000,000 was modified to increase the normal income tax from 4 per cent to 6 per cent on net income. The committee also decided to reduce from 15 per cent to 10 per cent the tax rate on undistributed surplus and to exempt from this tax the undistributed surplus actually invested or employed in business or retained for employment in the reasonable requirements of the business.

PHOTOGRAPHING STANDARD PLANS

By J. G. Wishart

Office Engineer, C. R. I. & P., Chicago, Ill.

Standard plans have been regarded as a necessity by railroad organizations for many years and many economies have been effected by their adoption and use. However, they should be gotten out in a form that can be conveniently handled, and this is generally accomplished by reducing the copies intended for general distribution to a small size. There are several processes of accomplishing the reduction. One method, adopted by several railroads, is the zinc etching process, but there are objections to this method which detract somewhat from its desirability. To obtain a low unit cost a large number of copies of each plan must be purchased and as standards are being revised continually and a change of any kind in a standard destroys the usefulness of all copies made prior to the revision many of the copies may become worthless. Another drawback to this system is the large amount of space required to store a supply of the prints and the zinc plates.

Probably the most economical method of producing the reduced size prints is to photograph the original tracing on a film and make blue line prints from the negative. The initial cost of the negative is low as compared to zinc or other plates, the cost of blue line prints in small quantities is less than that of printed copies from other processes, and only a small amount of filing space is required for storing the negatives and a sufficient number of prints to supply current demands.

To obtain the full economy of the photographic method, the negatives should be made by the regular employees of the engineering department rather than a professional photographer. Anyone with any experience in amateur photography can produce first-class results by following the procedure in use in the engineering department of the Chicago, Rock Island & Pacific, which is outlined below. The prime requisite of the photo method is to obtain clear

cut, fast printing negatives suitable for blue printing in an electric printing machine. It was only after several months of experimenting that the method adopted was worked out successfully.

The size of a standard tracing on the Rock Island is 24 in. by 36 in. and for convenience in handling in correspondence a width of 8 $\frac{1}{4}$ in. was adopted for the smaller prints, making the length 12 in. A special size film 9 in. by 14 in. coated with process emulsion was obtained from one of the large photographic supply companies which reduced the waste on films to the minimum. This film is especially adapted for copying black line drawings and when properly exposed and developed produces a clear cut fast printing negative which can be run through a continuous electric blue printing machine along with ordinary tracings to produce first class prints on the ordinary grade of blue print paper. When printed in this way these negatives can be used to fill in vacant spaces left by odd sized tracings and make use of what otherwise would be waste blue print paper.

Next in importance is the equipment for photographing. Any first class view camera of sufficient size fitted with an anastigmat lens will suffice. The equipment used on the Rock Island consists of an 11 in. by 14 in. Improved Empire State view camera, fitted with a Turner-Reich Anastigmat, F 6.8, series 11, No. 5 lens mounted in a compound shutter. It is mounted on a table to which the illuminating box is attached as shown in the sketch. The latter is designed to

Photographing Table

throw the proper amount of light, evenly distributed, on the tracing during the exposure of the negative and is designed to accommodate the standard size tracings. The back of the box consists of a perfectly flat board reinforced to prevent warping and made removable. The tracings are mounted on this board while being photographed. The opening in the front of the box is just large enough to permit the lens to cover the entire back of the box when in focus for a negative 9 in. wide. The entire inside of the box is painted a flat white. The lights, ten 100-watt tungsten lamps, are mounted inside the box around the opening in the front and reflectors placed behind them give a uniform illumination over the entire surface of the tracings. In consequence all negatives are of equal density from which prints of equal tone can be made with the same length of exposure. The advantage of this can readily be appreciated as it permits a number of negatives being run through the blue print machine at the same speed. The results obtained with this box are so far superior to those with natural light that there is no comparison. The variation in the intensity of natural light is so great at different times of the day and under varying weather conditions that it is next to impossible to get uniform or even satisfactory negatives, unless an expert is employed to do the work.

A necessary adjunct of this work is the darkroom and

owing to a lack of unused space it was necessary to be content with a room 10 ft. square. The camera stand is located in the darkroom, enabling the entire operation of exposing and developing to be completed in the one place. It is equipped with shelves, a cabinet for storing supplies, a built-in table for developing and a sink with running water for washing films and prints. The window is in the north wall and is fitted with a sliding panel to permit daylight printing of photo paper prints when desired. This can also be utilized for lighting the room when not exposing or developing.

Complete equipment is not the only factor in obtaining results. The exposure and development of the film are of equal importance. Focusing for the exposure must be done carefully. It will pay to make frequent use of a magnifying glass to examine the distinctness of the image on the ground glass as each line must show up clear cut. With ten 100-watt Tungsten lamps in the illuminating box, an exposure of 12 sec. through an F-16 orifice has been found sufficient for new and unsoiled tracings, while exposure ranging up to 20 sec. will be necessary for old and soiled tracings, depending upon their condition. With the process emulsion film the following formula for the developer is giving perfect satisfaction:

Sulphite of soda	9	oz.
Carbonate of soda	6	oz.
Hydroquinon	1 $\frac{1}{2}$	oz.
Bromide of potassium	$\frac{1}{4}$	oz.
Water	60	oz.

The above formula is for a stock solution: to develop dilute this with equal parts of water and add $\frac{1}{2}$ oz. of a 10-per cent potassium bromide solution to 8 oz. of the developer when ready for use. With a correct exposure 20 min. development in this solution will produce a film of proper density. After the development is complete the film should be fixed in an acid-fixing bath prepared as follows:

Solution A.		
Pure water	96	oz.*
Hypo (crystals)	2	lbs.
Sulphite of soda	2	oz.
Solution B.		
Pure water	32	oz.
Chrome alum	2	oz.
Sulphuric acid, C. P.	$\frac{1}{4}$	oz.

*Avoiddupois weights.

In mixing the fixing solutions be sure that the chemicals are entirely dissolved, then pour solution B into A slowly while stirring .1 rapidly. This bath will fix a large number of negatives and when exhausted should be discarded. Never attempt to restore it by adding hypo. Negatives left for a long time in this bath harden and are more durable. During development the developing solution should not be permitted to get warmer than 65 deg. F. In a first class negative, the lines should be absolutely clear after fixing and when laid on a sheet of white paper should show white.

Films have the advantage over glass plates that they can be blue-printed in a machine, and occupy only a small space for filing and storing. The filing case in the Rock Island office will accommodate 260 films together with about 30 prints of each and occupies a floor space of only 15 in. by 3 ft. 4 in. The photographer is charged with the duty of keeping a supply of prints of each negative in this case at all times in order that requests for them may be filled as soon as received.

The economy of installing a complete outfit as described above depends on the amount of work to be done. At the present cost of material, the saving on 500 film negatives alone, which would cost about \$2.50 each if made by a professional, should pay for the complete equipment. In addition to this there is the saving in the amount of blue printing as these small sized prints can be made to serve the purpose on a majority of the requests for prints of standard plans. With the normal price of blue print paper this item is well worth consideration.

Operating Men Discuss Use of the Overlap

Provision of Two Stop or Two Caution Signals Behind Trains Not Generally Favored Except for Special Cases

SINCE there is no such organization as the Association of Operating Vice-Presidents, that title will serve as well as any other to designate a group of prominent railway executives who recently discussed in some detail the practice of providing two stop or two caution signals in the rear of a train by the arrangement which in automatic signal control circuits is commonly termed the overlap. In addition to the 45 operating officers in this fictitious organization, the discussion was participated in by several signal engineers in the role of expert witnesses and by one government officer with considerable experience in signaling and the investigation of accidents. On account of its imaginary character, the A. O. V. P. was able to go further than any of the other railway organizations in conducting its work without a meeting, all discussions being submitted in writing to one individual who prepared the proceedings in the form which they might have assumed if the 50 or more men who participated had actually been gathered in one room. While the following, therefore, is the fictitious report of an imaginary meeting, the facts presented are none the less real, and the opinions expressed are from some of the best known operating men in the country.

PRESIDENT.—As the call for this meeting was limited to the representatives of 56 companies which make considerable use of block signals, the large attendance indicates very clearly the importance of the subject announced and the interest you have in it. The chairman of the program committee is responsible for the selection of the subject as he was recently led to investigate the matter very fully in connection with an unfortunate collision on his road resulting from an engineer over-running a stop signal. He convinced the officers of the association that while it may seem a rather technical matter to come before this organization, it is one which, in the interest of safe operation, we should know more about. As I have no doubt the details of the subject are somewhat hazy in your minds, as they were in my own when it was first presented to me, I have taken the precaution to invite a signal engineer, known to many of you, to state briefly the principle of the overlap and its relation to other operating problems.

SIGNAL ENGINEER.—The overlap in signaling simply means the extension of the control of a signal to some point beyond the next signal in advance, or, in other words, the control circuits are overlapped. The principle was very early used in automatic signaling when only two indications, stop and proceed, were given, to render unnecessary the provision of a separate distant signal to warn an engineer that a stop would be required at the next signal in advance. Under this system, a train passing signals A, B and C in the order named would not only hold signal B at stop while in the block from B to C, but it would also hold signal A at stop until it passed C. Thus a following train encountering a stop signal would have a full block length in which to stop after passing the signal.

When automatic signaling came to be applied to single-track lines, the overlap played an important part in providing adequate protection against opposing movements. Also, in recent years, in the signaling of dense traffic lines, on which there are exceptional hazards in case of collision, such as subways, elevated lines, electrified terminals, etc., the overlap has been frequently used in addition to distant signals, and in some cases in addition to automatic stops. Some roads overlap the stop signal under much less exacting conditions than those mentioned, but the majority of

roads are against this practice. Others which oppose the overlapping of the stop signal on the ground that adequate advance information can be provided in the signal system, find occasion sometimes to overlap the caution or distant signal or to use the so-called three-block system of indication which is one of the schemes provided for in the A. R. A. standard code. Under this latter scheme the first signal behind a train indicates Stop; the second, Prepare to stop at next signal, and the third, Approach the next signal at limited speed.

For your purpose the subject can be narrowed down considerably. It may be conceded at once that the overlap is necessary in old installations, a few of which are still in service, where no distant indications are provided, since without such indications the engineer cannot be held strictly responsible for stopping at a stop signal, although there is always the possibility of a train standing immediately ahead of the signal. It is also obvious that the overlap is necessary in single-track automatic signaling where this feature for following movements is secured incidentally in the provision of adequate protection against butting collisions. Further, in subway signaling, or under conditions approaching those of subway operation, every possible special provision is warranted, and there is little ground therefore for argument as to the use of overlaps in such cases. The grounds on which there may be differences of opinion regarding the use of the overlap can be divided into three general parts: First, the overlapping of stop signals to provide at least two stop and one caution signals behind a train on a line of normal traffic; second, the overlapping of caution signals to provide one stop and two or more caution signals behind the train, or the alternative use of three-block indications; and third, means for preventing collisions caused by failure to obey signal indications in the absence of such a precaution as overlapping.

PRESIDENT.—The subject has now been introduced and outlined. In order to get the most out of the discussion, I suggest that it will be best to take up the three general topics in their order.

THE USE OF TWO STOP SIGNALS

V. P. 32.—As a representative of a road using the overlap, I am glad to open this discussion. There are two general conditions under which accidents caused by over-running a danger signal are likely to occur, and which require special attention in the installation of automatic signal protection: First, when dense traffic or adjacent interlocking plants require the spacing of home signals less than braking distance apart; and second, when conditions require the location of a signal a short distance in the rear of a water tank, station, or other point where trains stop. Our first endeavor in such cases is to provide a liberal distance—say 800 to 1,500 ft.—from the signal in advance, or the point to be protected to the next signal in the rear. In addition, we generally provide an overlap and when by both of these measures a safe stopping distance has not been obtained, we add the feature of repeating the caution indication at the next signal in the rear. We have had an entirely satisfactory experience with the overlap. We recognize the necessity for safeguarding against human error. We, therefore, believe in immediate obedience to signal indications, but with a factor of safety to guard against a mistake. The overlap provides such a factor.

V. P. 28.—We all recognize the conditions just mentioned but on our road, we do not meet them in the way that has

just been outlined. Our practice is to locate the home signal a minimum distance of 500 ft. in the rear of the point we desire to provide special protection for, although in some cases conditions are not favorable to obtain this minimum distance and we have to be satisfied when we come as near it as possible. We do not, however, overlap the stop position of our signals, as we admit of no reason for carrying the control of the stop indication beyond the limits of the block over which the signal governs. The men who are to be guided by the signal must be educated that it is imperative to stop before passing a signal at stop. To overlap the stop control is an invitation to the men to regard the stop indication less positively.

V. P. 36.—While we do not use the overlap except on districts where one-arm two-position automatic signals are still in use, it is largely because the expense is not thought to be warranted, as we do not have high-speed passenger trains with the frequency obtaining on some other lines. We consider the overlap an important adjunct, however, on both the home and distant and the three-position systems of signaling on roads with a dense passenger movement and high-speed trains following each other closely.

S. E. 33.—We do not use the overlap except in one large terminal and personally I am strongly of the opinion that it cannot be justified except under conditions of that kind. If the giving of one more chance to an engineman would insure his obeying a second indication, good reasons might be advanced in favor of the overlap. But in many accidents caused by overrunning signals, there was full braking distance between the stop signal and the standing train, thus reproducing the conditions of an overlap, showing that little or no additional safety is secured by its use. Those who advocate the overlap may also fail to take into consideration the complications which are met in interlocking plants and the impracticability of providing complete overlapping protection, especially when it is endeavored to overlap the protection for switches.

V. P. 22.—In our estimation, signaling in territory where the speed is high and train service frequent, requires an overlap to give the maximum degree of safety. This is on the same principle that a space is always provided between a home interlocking signal and the derail ahead of it.

V. P. 37.—I know that our signal engineer has some views in direct contrast to those expressed by the last speaker, and I am going to ask him to say a few words.

S. E. 37.—I think the overlap is not only unnecessary, but dangerous. As stated before, it is impossible to provide it in all cases, and to have overlaps at some places and not at others, would make for unsafe conditions, as it does not take long for engineers to find out that the overlap is used and this has a tendency to cause them to pay less attention to the signal indications than if they knew that the block ends at each signal. If an engineer cannot be made to stop at a home signal, it is a foregone conclusion that he cannot be made to stop at the end of an overlap where there is no indication to mark the point.

V. P. 9.—In general, I would agree with the signal engineer, but our practice is to use the overlap in some special cases. First, on portions of our signal system which are old, and on which no approach information is given, each stop signal is overlapped to a point braking distance beyond the next stop signal. In the second place, we have a few points where a stop signal had to be located at the approach end of a station platform, and in these cases an overlap the length of the platform was installed, this length never being over 500 ft. however.

V. P. 15.—We have a practice on single track somewhat similar to that referred to by V. P. 9. We overlap the control of the second signal on each side of stations for a distance of 800 ft. While the train is in this 800-ft. zone, it is protected from the rear by one caution and two stop signals.

After it passes out of this zone it is protected in the rear by one caution and one stop signal, the same as at other points.

V. P. 7.—In all cases where we do not have distant signals or three-position signals, we use an overlap varying in length from 2,000 to 3,000 ft. depending on local conditions. There are so many places in the country where this is desirable that it does not seem to me the overlap should be condemned. I know that there are many roads which have not been represented by previous speakers on which the overlap is used. The latest block signal statistics of the Interstate Commerce Commission, dated January 1, 1917, show a total of 16,671.2 miles of road, on which automatic signals are overlapped. As this is slightly more than 50 per cent of the total automatic block signal mileage in the country, it would indicate that the overlap is still held in considerable favor by American railways.

V. P. 39.—Replying to the quotation of statistics just made, I would like to correct the impression made. The table referred to also shows 19,403 miles of track on which overlapped automatic signals are in service, or only 2,731.8 miles more than the figures for miles of road. This indicates very plainly therefore that the large mileage of overlapped signals is due to the large mileage of single-track automatic signaling which is in service, and on which, as previously explained, the overlap is essential primarily for head-on protection.

V. P. 13.—There is another possible source of error in the figures referred to. I had occasion recently to check the report from my own road and found that we had reported a considerable double-track mileage as overlapped on the interpretation of the I. C. C. request as covering the clear indication of our three-position signals, the control of which extends beyond the signal in advance. I am now convinced that this interpretation was not correct.

V. P. 39.—As to the favor in which the overlap is held by American railways, I believe the signal engineers of the country are in a good position to speak with authority. A committee of the Railway Signal Association, considering this subject, presented a report to the two stated meetings of that association this year, in which it was stated "Overlaps are undesirable for following movements, as adequate advance information can be provided in the signal system." My personal opinion is that overlaps, whether resulting in two stop signals and a caution signal, one stop signal and two caution signals, or five or six stop signals and five or six caution signals are pernicious, although the committee has not made the statement quite so emphatic. I would also bring to your attention as operating men, the self-evident fact that no signal system can be successfully designed and no set of rules properly formulated which are predicated on disregard of the signal indications and violations of the rules.

PRESIDENT.—It seems evident that the majority of opinion as to the overlapping of stop signals is against the practice. I would suggest that we pass to the overlapping of the caution indication, or the double distant as it is frequently called, and any further facts on the general question can be brought out when we turn to a consideration of substitutes.

THE USE OF TWO CAUTION SIGNALS

V. P. 28.—While, as stated before, we do not overlap the stop position of our signals, we do in special cases overlap the caution position, this being done where there is less than braking distance between home signals or on steep down-grade grades where the alignment is very crooked. As a rule, we do not favor the double-caution indication but there may be special local conditions that make it advisable.

V. P. 9.—We also follow the practice of giving additional approach information when two stop signals are less than braking distance apart, but it is important to explain in connection with such a practice that we never give the in-

dication, "Approach the next signal prepared to stop," at a greater distance from the stop signal than we can reasonably expect a man to remember it. Our established basic distance in high-speed territory is one mile, and the maximum distance is 7,500 ft.

V. P. 13.—Wherever conditions require the spacing of signals less than braking distance apart such as may be necessary at interlocking plants, we carry back the caution indication to the second signal in the rear so that when the signal furthest in advance is at stop, it will be preceded by two caution signals. This arrangement insures stopping distance between the first caution signal and the stop signal.

V. P. 14.—We have recently installed the double-distant system in suburban territory where the blocks are short, and we believe that the caution indication should be carried back to the second block under conditions of this kind.

V. P. 39.—I am personally as much opposed to overlapping the caution indication as the stop indication. Properly designed signal systems provide full braking distance at authorized maximum speeds, either by spacing the signals full braking distance apart, or where this is impossible, providing what is called three-block indications. If the information given by these signals is observed, protection for fast trains and facility for all trains is provided.

V. P. 28.—I rather anticipated some criticism on my former statement that we use double-distant indications on down grade. We know there are arguments against this practice, but we feel that it is justified. The two principal arguments against it are that enginemen will not strictly observe the indication, and that the speed of a train on such a grade should be such that it can be brought to a stop before passing the home signal upon receiving one caution indication. The first reason should not be countenanced at all as it is an admission of weak operating practice. The second is better, but, after all, this is a matter which should be decided according to the operating requirements. Where conditions are favorable to the use of double-caution indications, enginemen may be given valuable information to assist in the proper control of their trains providing they are first taught to observe signal indications strictly.

V. P. 33.—The use of two caution signals is no more consistent than the use of two stop signals. If a caution signal cannot be placed at braking distance from the stop signal, the second signal in the rear should be made to display the indication, "Approach next signal at restricted speed," as covered in the A. R. A. code.

V. P. 1.—While we do not have as large a mileage of automatic signals on our road as many others, I do not recall any instance where the spacing of the home signals is less than braking distance apart, and as a general thing, therefore, I do not see that overlapping is necessary.

V. P. 34.—I am inclined to agree with the previous speaker. In practically all cases the difficult situations which have been referred to can be taken care of by the proper location of signals, and if necessary, the rearrangement of tracks or other facilities. Proper results may not always be obtained by designing a signal system to fit existing facilities, but there is no reason why, in many instances, the facilities cannot be rearranged to fit the desirable signal system.

V. P. 43.—There is undoubtedly truth in the statement that a rearrangement of tracks and facilities will solve some problems in the protection of traffic more easily than adding safeguards in the signal system. It is a very difficult matter to rearrange crowded interlockings in terminal areas, however, and it has been my experience that in such territory there are frequent cases where the first distant signal in the rear of a home is less than braking distance from it. It is our invariable practice in such cases to carry back the distant indication to the second signal in the rear. It would also be impossible to effect any rearrangement on dense-

traffic high-speed suburban lines where the blocks must be kept of a shorter length than braking distance.

PRESIDENT.—We have heard many conflicting opinions, and while it seems evident that the majority do not consider the overlapping of signal circuits to be the ideal system, some hold tenaciously to the view that the overlapping at least of the caution indication is justified under special conditions. It will be interesting to know what measures are relied upon by those who do not admit the necessity of overlapping for the prevention of collisions in case an engineman over-runs a stop signal.

PREVENTING COLLISIONS WITHOUT OVERLAPS

V. P. 4.—We safeguard against rear collisions just beyond home signals by placing the responsibility for such collisions solely up to one man—the engineer. Our rule 505 reads as follows: "An engineer of a train entering a block as provided by block signal rules 504, 505-a and 504-b will be held responsible in case of accidents caused by meeting an opposing or by overtaking a preceding train by an open switch or by obstructed or broken tracks." Our rules make it plain that the train must be stopped before reaching the stop signal. We believe that maintaining strict discipline is better than providing overlaps. We believe further that overlaps are a trap for the engineman, for by their use we say to him when the signal indicates stop: "You must stop before reaching it, but if you do not, nothing will happen because we have provided protection for you in case you run by the signal." With distant signals and no overlaps, we tell the engineman that having the advance information he must stop before reaching the home signal or pay the penalty. Consequently, he stops and there is no penalty to pay.

V. P. 5.—If a following train observes the stop indication it is not material whether the distance between the signal and the rear end of a preceding train is long or short. What is needed is absolute observance of the stop signal. It is not material for what cause the signal appears at stop. It may be due to defective apparatus, and the track may be in perfect condition for the following train to proceed, nevertheless the stop must absolutely be made. The moment you permit trains to ignore the stop indication for any cause or at any speed, you introduce a dangerous condition because it is only a question of time when this bad practice will result in a train passing a signal with a track obstruction close ahead. The theory of overlapping blocks is predicated on trains running by signals in the stop position and in practice the overlap begets that careless condition.

V. P. 19.—In common with many other roads we use surprise tests extensively in insuring the proper observance of signals. Our rule governing the observance of caution signals is as follows: "Enginemen finding a distant signal at caution must immediately bring their trains under control and be prepared to stop before reaching the home signal." In checking them on the observance of signals, we make no exceptions and no allowances for an engine at any time under any circumstances to go beyond the home signal at stop. We undertake to instill thoroughly in the minds of all our engineers that a caution signal means that the train must be immediately brought under control prepared to stop before reaching the next signal.

V. P. 26.—We have a rule which is somewhat special on this point and might be of interest to others. It reads as follows: "Trains must not stand on curves or at a point where the view is obstructed where it can be avoided. When a train enters a block controlled by automatic signals and is stopped for reasons other than signal indication, if it is known that the train cannot be advanced so that the rear end will stand at least 1,000 ft. beyond the home signal, the rear of the train should not be moved clear of the home signal. If, however, the rear of the train is moved clear of

the home signal, it must advance as far as possible in the block."

V. P. 35.—We have also tried to make our rule for the observance of distant signals very concrete. The instructions to the enginemmen and trainmen are as follows: "Reduce speed at once and proceed with caution."

V. P. 9.—The most satisfactory method we have ever found of educating our men in the aspects and indications of the signals, is the use of an instructor. This man, traveling in a signal instruction car, is on the road constantly, informing our men as to how they can and must control their trains to secure the greatest good as well as the greatest protection from the information given by the signals. This education has not only given the men a better understanding of the signals and their meanings than can be obtained either from the book of rules or from the explanations ordinarily given by the officers, but also has given the men absolute confidence in the signals.

V. P. 28.—It is our opinion that the bad wrecks which have occurred on account of over-running home signals at stop are not so much the result of improper signaling, as of the improper observance of the caution indication. The elimination of the "proceed with caution" indication in the recently adopted A. R. A. code rules is a decided step away from safe practice. The retention of this indication and the strict observance of it by enginemmen will effect a cure, and a revision of the code rules to recognize this most important indication in the same simple every-day language that we all have known for many years and that all can understand, is earnestly waited for.

I. C. C.—In the consideration of numerous train accidents brought before the Interstate Commerce Commission, I have given the subject of overlapping automatic signals considerable study. I have been very much interested in the discussion, and as a visitor, would like to say a few things: First, it should be emphasized that the overlap is not a new thing in signaling. It is one of the oldest principles in the art. As has been clearly brought out in the discussion, it has been largely done away with in general practice and is now used principally for special conditions. The roads, as a whole, however, have not entirely eradicated the idea of giving enginemmen a second chance. We are all doubtless agreed on the principle that we should stand firmly on the ground of absolute obedience to signal indications properly given. Any deviation from this course means disaster. I confess, however, that it is somewhat difficult to be inflexible in this position in the face of repeated collisions on roads with good signal installations and with discipline which is apparently as near perfect as it can be made. It should be pointed out further, that the use of the overlap to meet this condition is only a half-way measure. As one officer has stated, there is no assurance that if a man passes the signal at stop he will not also pass the end of the overlap. Whether we are willing to admit it or not, the only remedy which strikes directly at the root of this evil is the automatic stop. I appreciate fully the difficulties of perfecting such automatic devices for general service, but I am convinced that the roads of the country must bend every energy toward an early development of some such device if they are to meet squarely the responsibility resting on them in this matter.

V. P. 33.—With all due regard to the former speaker, I cannot agree with him. From the standpoint of an operating officer it is evident that a greater return may be secured in the elimination of accidents and in safeguarding the movement of trains, by extending automatic block signals rather than by providing overlaps or compelling the introduction of train control devices.

V. P. 2.—In agreeing with the last speaker I would point out that in my opinion if signal systems are properly installed with caution indications at a sufficient braking distance from the stop signals, and if the rules are strictly ob-

served, the results will be as near perfect as human ingenuity can make them.

PRESIDENT.—If there is no further discussion, the subject is closed. As we hoped, many diverging opinions have been brought out. There would be no good purpose gained in taking action on the matter, but I am sure we have all been profited by the exchange of opinions and each of us can form our own conclusions and act upon them.

AN AUTOMATIC AIR DUMP CAR

Among interesting developments in heavy and high capacity dirt and rock handling equipment may be mentioned the automatic air operated steel dump cars built by the Orenstein-Arthur Koppel Company of Koppel, Pa. The illustrations show cars of the Missabe type built for the Oliver Iron Mining Company according to Master Car Builders' and Interstate Commerce requirements. These cars are entirely automatic, being operated by compressed air from pump and operating valves on the locomotive. They may be operated individually from each car and may be dumped all to one side or part to one side and part to the other.

The body of each car is held in its normal load-carrying position by a locking device and supported in this position by bolsters which hold the body securely in four places. There are two dumping cylinders located in the middle of each car, one on each side of the center sill. When air is admitted to the cylinder for dumping, the first few inches

Car in Upright Position

of travel of the piston releases the locking device on one side of the car, and the further travel of the piston dumps the body. A distinctive feature is the automatic air cut-off controlled entirely by the movement of the body. When the load is heaped to one side or when other conditions make the dumping easy, very little air is required to operate this car, and cases have been noted where the car was dumped and the air shut off before the piston made one-half its travel. The saving in air thus afforded eliminates the necessity for individual air reservoirs on the cars.

Another feature is the locking device which projects outside the body bolsters, where it is open to easy inspection and is free from danger of becoming inoperative because of snow, ice, dirt, etc. All valves are standard Westinghouse plug cocks proof against freezing weather, and possibility of accidental dumping from leaky valves is eliminated through a construction which holds the cylinder cocks wide open at all times when the bodies are in the normal load carrying position.

LONDON'S COAL.—The amount of coal brought to London during the first five months of 1914 was: Rail-borne, 3,369,518 tons; and sea-borne, 3,657,090 tons. During the corresponding period for 1917 it was 4,571,306 tons rail-borne, and 2,560,082 tons, sea-borne.

CONVERSION OF CONSOLIDATION TYPE LOCOMOTIVES TO EIGHT-WHEEL SWITCHERS

By F. J. Carty

Mechanical Engineer, Boston & Albany, Boston, Mass.

Because of heavy freight traffic in the early part of 1916, and because of the increase in train loads, it became apparent that more powerful switching locomotives were required on the Boston & Albany to handle quickly and efficiently the heavy trains brought to terminal yards by Mallet and Mikado type locomotives. In order to switch such trains properly, it is essential that the switching locomotive have a tractive effort at least equal to that of the road locomotives, and the design should permit of quick operation.

A study of the governing conditions convinced us that it would be difficult to develop a six-wheel switcher which would satisfactorily meet the requirements of the service, and it was therefore decided to build switchers of the eight-wheel type having adequate tractive effort without excessive axle loads. As the cost of materials entering into the construction of locomotives was much above normal prices, we found that a considerable saving could be made by converting Consolidation type locomotives into 0-8-0 type switchers.

The Consolidation locomotives selected were built in 1901, having a tractive effort of 37,190 lb., 20-in. by 32-in. cylin-

running gear, the driving wheel base was maintained at 17 ft., but it was necessary to cut off the front section of the frames because of the removal of the engine truck.

These changes in design made it necessary to recalculate the "live" loads in order to bring the center of gravity of the locomotive in a vertical plane midway between the main and intermediate drivers. It may be of interest to outline the method followed to determine the correct position of the boiler.

The "dead" loads, consisting of driving wheels, engine truck wheels, boxes, cellars, bearings, axles, crank pins, eccentrics and the proportionate weights of main and side rods, were assumed to be concentrated at each axle. One-third the weight of the main rod, and one-half the weight of the eccentric blades were assumed to be carried at the main driving wheels. Subtracting the dead loads from the known distributed weights gives the live load at each wheel.

By taking any convenient point as an axis of moments, such as the center of the engine truck axle, and multiplying the live load at each wheel by the distance of the load from the selected axis, the location of the center of gravity of all parts of the locomotive, other than those considered as dead loads, is determined. The next step is to find the location of the center of gravity of the live load with the engine truck removed, making the proper allowance for increased weight due to the larger cylinders, the outside valve gear,

Boston & Albany Eight-Wheel Switcher Converted from a Consolidation Type Freight Locomotive

ders and 57-in. driving wheels, and experience had shown that the locomotives were not sufficiently powerful to haul a satisfactory tonnage at scheduled speeds in freight service. Upon inspection, it was found that the frames, rods driving wheels and many minor parts could be utilized in the reconstruction of the locomotives into an 0-8-0 type. The mechanical department was authorized to prepare designs and begin the work of converting 12 locomotives at West Springfield shops.

The elimination of the engine truck with the consequent increase in the weight on driving wheels made it necessary to provide larger cylinders to obtain a properly proportioned and efficient locomotive. It was decided to apply 23-in. by 32-in. cylinders of the outside steam pipe design, a new boiler with a superheater, outside valve gear and Ragouet power reverse gear. A practically new, modern switching locomotive was thus produced adaptable to the requirements of service prevailing in Boston & Albany terminal yards. In order to utilize as much as possible the old frames and

the superheater, changes in the smokebox and bumper castings. In this computation, the entire weight of the superheater header and units was considered as concentrated at the front flue sheet. The center of gravity of the live load was 6 in. ahead of the plane midway between the main and intermediate driving wheels.

After determining the location of the center of gravity of the live load with engine truck removed, the weight of the boiler with two gages of water, and the center of gravity of the boiler and water should be found. In this calculation it is convenient to divide the boiler into four parts: the smokebox, first course, second course, and firebox. The weight of each of the four sections is assumed to be concentrated at the geometric center of each section. By taking moments about any convenient axis, such as the smokebox front, the center of gravity of the boiler and water may be calculated and it will then be possible to determine the weight and location of the center of gravity of what we may term the machinery of the locomotive.

Knowing the weight and location of the center of gravity of the boiler and of the machinery, we can at once compute the number of inches the boiler must be moved towards the rear in order to bring the center of gravity of the locomotive midway between the main and intermediate wheels. It is important that this be done in order to insure correct distribution of the load between the four pairs of driving wheels, and it is also essential that special attention be given to the design of the equalizing rigging. We have used the latest type of equalizer arrangement with transverse equalizer at the forward end of the locomotive.

It was found that in order to compensate for the removal of the engine truck and the changes outlined, the boiler should be moved towards the rear 14 1/4 in. and the new boiler was designed to meet this condition.

Owing to the use of outside steam pipes with the new cylinders, a new single rail front frame section was necessary on the converted locomotives. The old frames were cut at the front pedestal jaws and the new cast steel front sections welded on by the thermit process. The frames are unusually well re-enforced, and on account of the increase in power of the eight-wheel locomotive, as compared with the Consolidation locomotive, we considered it advisable to apply a stronger type of pedestal binder, replacing the old thimble type by cutting off the lower part of the pedestals, and filling up the bolt holes with the aid of the electric welder. A new cast steel front bumper beam has been applied and the foot plate is particularly heavy to compensate, in part, for the increase in weight at the forward part of the locomotive. The driver brake cylinders are supported in a vertical position from the guide yoke cross-tie and new cylinder levers, proportioned to give correct braking power, are connected to the old foundation brake rigging. A wide steel cab substantially braced replaces the old wooden cab, and the air reservoirs and running boards are securely supported by cast steel brackets, bolted to the boiler.

The boiler is of the straight top radial stay type, having a full installation of Tate flexible bolts, Security brick arch, and a single 14-in. by 20-in. fire door opening, designed for a pneumatically operated fire door of the Franklin butterfly type. There are four combustion tubes in each side of the firebox. As the two rear tubes on each side come within the cab, we have protected the enginemen by covering over the outer ends of the combustion tubes with 2-in. pipes which extend down to and through the cab running board and are arranged so that the air flowing into the combustion tubes is drawn from outside the cab.

Two sand boxes are located on top of the boiler and the

The tender tank has been remodelled so as to interfere as little as possible with the view of the enginemen when the locomotive is operated with tender leading. The longitudinal channel sills of the tender underframe have been re-enforced by plating and new cast steel end sills have been applied. The coupler and pocket at the rear of the tender are of the latest Sharon type, with a 3-in. pin.

The first of the 12 locomotives to be converted has been in service a short time, and the results obtained are entirely satisfactory. The locomotive handles the cars without difficulty, starts and stops quickly, and the performance is fully up to expectations. The cost of labor and materials has advanced rapidly since work was begun, and while therefore the cost of converting the locomotives may exceed the estimates, the apparent saving compared with the cost of new locomotives of similar type is greater than was estimated on account of present abnormal prices.

A comparison of the principal characteristics of the Consolidation and the eight-wheel switcher is given below:

	CONSOLIDATION 20 in. by 32 in.	EIGHT-WHEEL SWITCHER 23 in. by 32 in.
Cylinders, diameter and stroke, in.....	195	180

CAR FOR B. & O. MEDICAL DEPARTMENT

The Relief Department of the Baltimore & Ohio, which includes the medical department, has recently had car No. 4178 fitted up for the convenience of traveling examiners in making physical examinations of telegraph operators. The plan and arrangement of the interior of the car are shown in the drawing. Its length is 58 ft. over the end sills and it is carried on eight wheels. The main compartment of the car, 29 ft. long, is called a coach section and is fitted with double seats, as shown in the drawing. The central space in this compartment has a table and a number of chairs. Next to the transverse partition at the right is the sleeping room in which are two double deck single iron beds; and beyond the next partition is the lounging room, 11 ft. 3 3/8 in. long. The shelves, F, G, in the four corners of this

Baltimore & Ohio Medical Examiners' Car

locomotive has the usual specialties: Pneumatic sanders, bell ringer, cylinder cock operating mechanism, Hancock type E injectors, Consolidated safety valves, Everlasting blow-off valve, King type packing and a special type of exhaust pipe which modifies the noise of the exhaust. The Radial buffer is provided between the locomotive and tender to facilitate the removal of drawbar for inspection and the power reverse gear is supported from the boiler by means of brackets made up of boiler plate.

room are fitted with curtains in the front and also at the ends.

The lamps fixed along the center of the car, overhead, as indicated by the circles, are gas, and five of the bracket lamps at the sides of the room are gas; the other four brackets support oil lamps, put in for emergency use.

The doors as well as the windows are screened to keep out flies. Other features of the car are indicated in the notes beneath the drawing.

Steam Railway Statistics to June 30, 1916

Interstate Commerce Commission's Annual Abstract
of the Year's Operations. Large Increases in Traffic

THE Interstate Commerce Commission has issued its abstract of statistics of railway operation for the fiscal year ended June 30, 1916, based on compilations for its twenty-ninth annual statistical report. Returns of switching and terminal companies are not included. Advance figures given in this abstract may be slightly modified by revision before final publication. Class I roads are those having annual operating revenues above \$1,000,000; Class II roads are those having annual operating revenues from \$100,000 to \$1,000,000; and Class III roads are those having annual operating revenues below \$100,000.

MILEAGE

On June 30, 1916, the roads covered by this abstract represented 259,210.86 miles of line operated, including 11,856.42 miles used under trackage rights. The aggregate mileage of railway tracks of all kinds covered by operating returns for these roads was 394,944.26 miles, classified as follows:

Item	Roads			
	Class I	Class II	Class III	Total
Miles of road.....	331,263.98	18,913.68	9,033.20	259,210.86
Miles of second main track.....	38,732.50	195.84	6.87	38,935.21
Miles of third main track.....	2,725.58	5.04		2,730.62
Miles of fourth main track.....	1,960.00			1,960.00
Miles of all other main tracks.....	238.34			238.34
Miles of yard track and sidings.....	97,198.95	3,716.75	953.53	101,869.23
Total, all tracks.....	362,119.35	22,831.31	9,993.60	394,944.26

The increase in mileage of all tracks for the year was 3,802.75 miles. Of this 1,641.54 miles were in single or first track, and 1,959.07 miles in yard track and in sidings.

EQUIPMENT

There were 63,862 locomotives in service on June 30, 1916, as follows:

Kind of locomotive	Roads			
	Class I	Class II	Class III	Total
Steam.....	60,790	1,928	860	63,578
Other.....	267	14	3	284
Total.....	61,057	1,942	863	63,862

The total number of cars was 2,478,159, including

Item	Class I roads		Class II roads		Class III roads		Total	
	Number	Aggregate capacity Tons	Number	Aggregate capacity Tons	Number	Aggregate capacity Tons	Number	Aggregate capacity Tons
Box cars.....	1,014,219	36,582,648	9,015	276,252	1,184	28,205	1,024,418	36,887,105
Flat cars.....	120,393	4,505,486	12,783	386,396	3,543	99,405	136,719	4,991,377
Stock cars.....	82,123	2,652,574	1,204	36,752	1,307	43,307	83,457	2,690,633
Coal cars.....	873,316	41,244,672	22,904	998,558	1,418	56,057	899,638	42,299,287
Tank cars.....	9,462	360,092	249	7,156	117	3,928	9,828	391,176
Refrigerator cars.....	51,610	1,669,462	130	3,355	6	150	51,746	1,672,967
Other freight-train cars.....	83,189	3,731,160	6,826	232,703	2,412	49,127	92,427	4,012,990
Total.....	2,236,312	90,766,094	53,201	1,941,172	8,750	238,269	2,298,263	92,945,535

passenger service, 54,664; freight service 2,326,987; company service, 96,508. These figures do not include so-called private cars.

Of the cars in freight service, exclusive of caboose cars, 2,298,263 were classified as shown in the table.

EMPLOYEES

Class I, Class II, and Class III roads, operating 258,669.75 miles of line, reported 1,054,075 as the average number of employees in their service during the year. The total compensation reported was \$1,403,968,437. Because of a change in classification, the figures for 1916 are not comparable with figures relating to 1915.

CAPITALIZATION OF RAILWAY PROPERTY*

On June 30, 1916, according to reports of operating roads and their nonoperating subsidiary lines, the par value of railway capital was \$21,092,372,245. This includes capital securities held by the railway companies concerned, as well as by the public. Of the total there existed as stock, \$9,058,982,733, and as funded debt, \$12,033,389,512.

Capital Actually Outstanding on June 30, 1916

* As covered by these statements, "Actually issued" securities are those which have been sold for a valuable consideration to bona fide purchasers who hold them free from control by the issuing company. Securities actually issued and not reacquired by or for an issuing company are considered to be "actually outstanding." "Nominally issued" securities are those which have been signed and sealed and placed with the proper officers for sale and delivery or are pledged or otherwise placed in some special fund of the issuing company. "Nominally outstanding" securities are those reacquired by or for the issuing company and held alive.

Of the total capital stock actually outstanding for the roads under consideration, \$3,581,434,810, or 40.96 per cent paid no dividends. The amount of dividends declared during the year (by both operating and nonoperating companies represented in this statement) was \$411,975,955, being the equivalent to 7.98 per cent on dividend-paying stock. The average rate of dividends paid on all stocks actually outstanding, pertaining to the roads under consideration, was 4.71.

INVESTMENT IN ROAD AND EQUIPMENT

The figures include returns for operating roads of Class I and Class II, and their subsidiary nonoperating roads. The expenditures for additions and betterments, as well as the expenditures for new lines and extensions, during the year, are analyzed in the following statement:

Investment to June 30, 1916 (239,392.31 miles of line represented).....	\$17,525,576,908
Investment to June 30, 1915 (238,162.14 miles of line represented).....	17,267,119,423
Increase, 1916 over 1915.....	\$258,457,485
Investment during the year:	
In new lines and extensions.....	\$41,885,894
In additions and betterments:	
On owned lines \$222,794,554	
On leased lines 16,454,252	
239,249,206	
Total investment during the year.....	\$281,135,100
Adjustments.....	\$1,104,672
Difference between record value of grantor and purchase price of grants in cases of roads sold, merged, consolidated, etc.....	23,782,287
Total during the year.....	22,677,615
Net increase during the year.....	\$258,457,485

PUBLIC SERVICE OF RAILWAYS

The following table gives comparative figures for 1916 and 1915 pertaining to public service of railways and covers returns for roads having operating revenues above \$100,000 for the year:

Item	Year ended June 30—	
	1916	1915
Number of passengers carried.....	1,005,683,174	976,303,602
Number of passengers carried 1 mile.....	34,213,596,127	32,384,247,563
Number of passengers carried 1 mile per mile of road.....	137,818	131,165
Number of tons of revenue freight carried, including freight received from connections.....	2,225,943,388	1,802,018,177
Ton-mileage, or number of tons carried 1 mile.....	343,099,937,805	276,830,302,723
Freight density, or number of tons carried 1 mile per mile of road.....	1,380,349	1,121,059
Average number of ton-miles of revenue freight per train-mile.....	534.95	474.45
Average receipts per passenger per mile—(cents).....	2.006	1.985
Average receipts per ton per mile.....(cents)	0.716	0.732
Passenger-service train revenue per train-mile.....	\$1.38619	\$1.30858
Freight revenue per train-mile.....	\$3.82828	\$3.46995
Operating revenues per train-mile.....	\$2.80074	\$2.51895
Operating expenses per train-mile.....	\$1.83279	\$1.77641
Ratio of operating expenses to operating revenues.....(per cent)	65.44	70.52

REVENUES AND EXPENSES

The operating revenues for the year ended June 30, 1916, of the railways in the United States herein presented (average mileage operated, 257,982.45 miles) were \$3,472,641,941, or \$13,461 per mile of line operated; their operating expenses were \$2,277,202,278, or \$8,827 per mile of line operated. The following tables present a statement of the operating revenues in detail and a statement of the operating expenses assigned to the eight general classes:

OPERATING REVENUES—(a) RAIL; (b) WATER; (c) INCIDENTAL

Item	Roads

INCOME ACCOUNT AND PROFIT AND LOSS ACCOUNT

The income present for the year ended June 30, 1916, the condensed income account and the profit and loss account of the operating roads and of their subsidiary nonoperating roads. The figures include such intercorporate payments as may be involved in the items stated. Returns for a few small roads have been omitted because of incompleteness. The accounts of the operating roads include both operating and financial transactions, while the accounts of the nonoperating roads are confined for the most part to receipts and payments under leases, contracts, and agreements. For a number of items, such as dividends, taxes, etc., figures for all roads must be taken into consideration in order to learn the aggregates of such items for the classes of railway companies represented.

WORKMEN'S COMPENSATION LAWS

The National Industrial Conference Board, M. W. Alexander, secretary, 15 Beacon street, Boston, has issued a pamphlet of 60 pages, 6 in. x 9 in., summarizing a study which has been made of workmen's compensation laws throughout the country, and making recommendations on the legal phase of the subject. The National Industrial Conference Board represents textile manufacturers, metal trades and other large interests.

The vital principle of workmen's compensation is defined as "the substitution of a definite and certain measure of relief for the former uncertainties of redress through litigation." The new method ignores the question of fault of anyone except where it is clearly wilful, and classes industrial accidents as necessarily incidental to industrial activity. Compensation acts thus aim to meet a public necessity, not to redress a private wrong.

Thirty-seven states and four territories of the United States now have compensation laws, and a federal compensation act for civilian employees was adopted last September.

The compensation principle now applies to more than two-thirds of the wage-earners in the United States. The laws of the various states reveal curious and glaring inconsistencies. West Virginia, Michigan and California exclude traveling salesmen from compensation benefits; Minnesota includes them only if employed by a Minnesota employer; New Jersey includes them while in the state, even though they are not residents. Domestic and casual laborers are usually excluded. In numerous industries, particularly agriculture, compensation acts do not apply to the small employer. Agricultural labor is specifically included under compensation legislation by only one state, New Jersey; in 23 states it is specifically excluded.

In 8 states workmen's compensation acts are compulsory upon the employer. In 24 states he has an election, but if he does not accept, he must forfeit some or all of his common law defenses in any action brought by an injured employee. In 25 states the employer affected by compensation acts must either insure his liability or demonstrate his financial capacity for self-insurance. In several states contribution to a state insurance fund is obligatory.

Classification of "hazardous" occupations is very uncertain, and the term "accident" is variously defined. The Ohio Industrial Commission awarded compensation to the dependents of a stenographer because, while taking dictation from her employer, she was murdered by a jealous suitor; the New York Industrial Commission awarded compensation for the death of a street-railway process server from gangrenous diabetes alleged to have resulted from having his toes trodden upon by a fellow passenger in a street-railway car of the company which employed him.

In this country "occupational diseases," as a rule, are not included under the term "accident" in workmen's compensation acts, but in the administration of these acts an increasing tendency to include many forms of diseases contracted during employment is evident.

The report gives the decisions of the Supreme Court of the United States in three important cases involving workmen's compensation acts. This court has maintained the power of a State to compel contributions by employers to a state accident fund.

The report recommends that all states immediately undertake to establish a permanent, scientific, and uniform system of compiling accident statistics, and to make a clear distinction in statutes between the terms "occupational disease," "accident" and "injury." Direct settlement of claims between employer and employee is advocated. An exclusively compulsory system of compensation is endorsed on the ground that it would eliminate many technical uncertainties.

This report on the legal phase of workmen's compensa-

tion acts is to be followed by other reports on the medical, economic and administrative phases. The price of the pamphlet is one dollar.

ANTIQUATED PORT FACILITIES*

A marked lack of modern facilities for the expeditious and economical transfer of freight from cars and vessels to docks and from docks to vessels and cars, is one of the chief causes of the present congestion of freight at New York harbor, and the installation of modern cranes is an imperative duty; a duty which should be taken up by the federal government if the state and municipal authorities and the railroad and steamship lines continue to neglect to give it proper attention.

This is the conclusion of H. McL. Harding, president of the Society of Terminal Engineers, in an article published recently in the New York Journal of Commerce.

To enforce his points, Mr. Harding presents the result of comparisons which have been made at three French ports, showing the freight-transfer capacity of the docks at those ports before and after adequate apparatus had been installed. His statement, showing the annual average transferring capacity per linear yard, is as follows:

	Average of the whole port per linear yard.	Average of portion equipped.
Havre	385 tons	1,430 tons
Rouen	483 tons	1,121 tons
Marseilles	665 tons	1,694 tons

These figures are understood to cover a period in which the whole of each port was fully occupied by vessels, a part of the waterfronts having been improved and other parts left unimproved.

Some of the piers in New York are so old and poorly designed that not much improvement would be possible, but Mr. Harding thinks that on the North river water-front, from Twelfth street north to Seventy-second street, improvements might be made within a short time which would double the capacity of these piers for handling freight. The controversy between the New York Central Railroad and the city of New York over the proposed improvements on this water-front might be quickly settled, as regards the territory south of Seventy-second street; and this ought to be done. The question at issue north of Seventy-second street has to do with the permanence and the beauty of a pleasure park and can be treated as a separate problem.

Suitable improvements would not only increase the capacity of the docks in the element of celerity but would also reduce the cost per ton. The present facilities are antiquated to such an extent as to be objects of ridicule. The capacity of the piers per linear foot is not over 150 tons a year. It is easily demonstrable that, with suitable apparatus, freight can be transferred expeditiously at 18 cents a ton, as compared with a present minimum of 54.85 cents a ton; this latter figure being the result of experiments made by the United States Government at New Orleans. It is only by the use of modern cranes that the full storage capacity of piers can be utilized; suitable cranes make it practicable to pile freight higher.

FUEL ON THE RUSSIAN RAILWAYS.—The central administration of the railways has presented the Ministry of Trade and Industry with a report, according to which the demands of the Russian railways for fuel in 1917 are as follows:—Donetz coal, 23,148,000,000 lb.; Russian Asiatic coal, 7,128,000,000 lb.; petroleum, 6,624,000,000 lb.; timber, 11,900,000 cu. ft. However, as it will hardly be possible to satisfy these demands to their full extent as regards coal and liquid fuel, it has been decided to cover the deficiency by an additional supply of 17,500,000 cu. ft. of timber.

*The conditions described by Mr. Harding are well known as regards a large part of the New York water front, but it should be borne in mind that in New York harbor may be found also the great modern, Bush Terminals, which are among the largest and best equipped docks in the world.

Roads Speed-Up 20 Per Cent with Less Equipment

The Railroads Are Handling from 16 to 20 Per Cent More Business With Fewer Freight Cars Than in 1915

WITH only one and four-fifths per cent more cars, railroads operating 173,105 miles of line handled 16.1 per cent more freight in May, 1917, than in May, 1916. Going back a year further it develops that the railroads of the country handled about 30 per cent more freight in May, 1916, than in May, 1915. In the year 1916 as a whole they handled 20 per cent more business than in 1915. Records of 67 of the larger roads given on the following pages show that to handle this 20 per cent more business they had not more, nor even the same, but actually 16,701 less freight cars.

Details concerning the increase in business—May, 1917, over May, 1916—are given in a statement issued last Saturday by Fairfax Harrison, Chairman of the Railroads' War Board. Mr. Harrison said:

"Gratifying indication of the extent to which the railroads of the United States are making effective their effort to produce greater transportation efficiency to aid in winning the war, is afforded by reports just received by the Railroads' War Board of freight operations during May.

"The first meeting of the War Board was held on April 23. Figures for May, the first full month following, show that the railroads rendered about 16 per cent more freight service with practically the same number of cars and locomotives as last year.

"New railroad equipment which can be made in America is now being sent to our Allies in Europe. The problem of our railroads is to handle a very great increase in freight with virtually no increase in cars, locomotives or tracks. In that effort they are not only co-operating among themselves, but are receiving splendid support from the public and the shippers.

"Actual returns now compiled are from railroads operating 173,105 miles of line. The reports show that these lines in May last year gave service equivalent to carrying 25,426,845,011 tons of freight one mile, while this year they carried 29,522,870,109 tons one mile, an increase of exactly 16.1 per cent.

"This increase in service was rendered with a very light increase in the amount of equipment used. The number of freight locomotives in service in May last year was 24,362, while this year the number was 24,483, an increase of one-half of one per cent.

"Last year in May there was 1,800,842 freight cars in service, while this year the number was 1,833,921, an increase of one and four-fifths per cent.

"A distinct mark of progress is the great reduction in the number of freight cars in the shop or awaiting repairs. Last year in May there were 113,147 cars under, or awaiting repairs, while this year only 104,061 were in that condition. Locomotives in repair, or awaiting repairs last year were 4,006 and in May this year 3,593, a reduction of 10.3 per cent.

"Last year, railroad locomotives ran an average of 65.6 miles per day, while this year they made 71.3 miles per day.

"Freight cars made an average of 28.3 miles a day in May last year, and this year 29.6 miles, an increase of five per cent. In the same period, the mileage of cars moving empty was reduced by five per cent, while the mileage of cars moving under load was increased by 9.5 per cent.

"The foregoing figures will appear all the more remarkable when it is realized that May, 1916, was itself a month of heavy traffic."

THE DETAILED FIGURES FOR 67 ROADS

The 67 roads, mentioned above, operating 200,000 miles of line handled about 20 per cent more freight in the year 1916 than in 1915, but to do it they had not more freight cars, but actually 16,701 less cars than in 1915. The figures showing the freight equipment on these important roads will emphasize how the railroads have increased their efficiency, and they will also emphasize what has been noted so many times previously, namely, that the acquisitions of freight cars by the railroads have not been keeping pace with the demands upon them for increased service.

These comparative summaries of freight cars in service on these same railroads have been published annually in the *Railway Age Gazette* and its predecessor the *Railroad Gazette* since 1905. From 1906 to 1914 the totals always showed an increase in freight cars of from 15,000 to 115,000 annually, good times and bad, an average increase of 63,332 a year. In 1915, however, they showed for the first time a decrease of 14,367, but this year, the decrease is 16,701.

THE FREIGHT CARS OF 67 ROADS

	Freight cars	Inc. or dec. over preceding year
1905	1,461,158
1906	1,554,012	92,854
1907	1,669,504	115,492
1908	1,730,533	61,029
1909	1,715,358	15,175
1910	1,817,705	102,347
1911	1,845,951	28,246
1912	1,900,497	54,546
1913	1,967,411	66,914
1914	2,000,800	33,389
1915	1,986,433	-14,367
1916	1,969,732	-16,701

One of the two tables, it is true, does show an increase of 862,014 cars or 77.82 per cent over 1900, but it is worth

Increases or Decreases in Freight Cars Owned by 67 Important Roads

observing that this increase of 77.82 per cent compares with an increase of about 200 to 250 per cent in freight traffic in the same period.

The *Railway Age Gazette* has noted again and again in its columns that the railways have not been buying freight cars in as great quantities as they would like. For many months both before and after the beginning of the European War the reason was the lack of funds and the inability to raise them. The railways now have the funds, but prices have become so high that no railway can well afford to buy cars at the present figures. The best authorities agree

COMPARATIVE SUMMARY OF FREIGHT CARS IN SERVICE ON RAILROADS OF THE UNITED STATES—1915 AND 1916

Note.—Narrow-gauge cars excluded. Non-revenue cars excluded. Company freight excluded.	Miles	Freight equipment			Per cent change	Freight cars per mile of road			Per 1,000 rev. ton miles			Rate per \$1,000 frt. earnings

NOTE. (1) 1916 operations of Iowa Central R. R. included in Minneapolis & St. Louis R. R. (2) Before consolidation with other companies. (3) 1916 figures are for year ended June 30th—December 31st not available. (4) 1916 figures are for year ended December 31, 1916.

that all the railways need about 200,000 new freight cars yearly, 100,000 for replacements and 100,000 to take care of the normal increase of business. Statistics compiled by the *Railway Age Gazette* have shown that from 1901 to 1915 the number of cars ordered by all the roads in this country and Canada averaged 174,895 yearly. From 1901 to 1907 the average was 205,361 yearly. From 1908 to 1915 it was but 148,238. In 1916 the orders totaled 170,054, but in the first six months of the present year, they were only at the rate of 90,000 for the year.

These figures are the things that emphasize what the Railroads' War Board has been doing, for it is with this deficiency of equipment that the car shortage is held down to only 77,000 despite the shipments of the cantonnements and all the other business that is now being offered to the carriers.

THE INTERSTATE COMMERCE COMMISSION'S FIGURES

The Interstate Commerce Commission's figures for the fiscal year ended June 30, 1916, will also bear out the remarks made above as to the decreases in quantity of equipment on the American railroads. They will also be found of interest because they indicate that there has been even a more pronounced decrease in the number of locomotives than of freight cars. The figures are to be found in the abstract of Statistics of Steam Railways issued early in the week and given elsewhere in this issue. The totals given, inasmuch as they are for the fiscal year 1916, are for a period back of the one included in the two large tables, but they are repeated here in part, because they include all the railways of the country and because they bear the stamp of authority of the Interstate Commerce Commission.

It appears from the annual reports submitted to the commission that there were 63,862 locomotives in their service on June 30, 1916, as compared with 65,099 on June 30, 1915:

Kind of Locomotive	Total 1916	Total 1915
Steam	63,578	64,835
Other	284	264
Total	63,862	65,099

The total number of cars of all classes in service on June 30, 1915, was 2,507,977 assigned as follows: Passenger service, 55,705; freight, 2,356,338 and company service, 95,934. On June 30, 1916, the total was only 2,478,159, assigned: Passenger service, 54,664; freight service, 2,326,987; company service, 96,508. These figures do not include so-called private cars of commercial firms or corporations.

The cars in freight service, exclusive of caboose cars, 2,298,263 in 1916 and 2,327,562 in 1915, were classified as follows:

Item	Total, 1916		Total, 1915	
	Number	Aggregate capacity Tons	Number	Aggregate capacity Tons
Box cars	1,024,418	36,887,105	1,041,030	36,978,004
Flat cars	136,719	4,991,377	145,191	5,225,995
Stock cars	83,487	2,690,633	86,312	2,759,536
Coal cars	899,638	42,299,287	900,780	41,287,823
Tank cars	8,828	391,176	9,512	379,415
Refrigerator cars	51,746	1,672,967	55,443	1,681,212
Other freight-train cars	92,427	4,012,990	92,294	3,913,556
Total	2,298,263	92,945,535	2,327,562	92,225,541

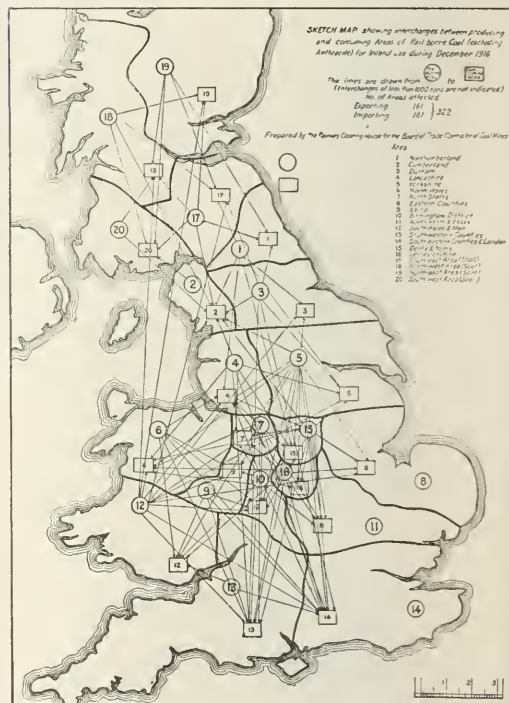

It will be noted that there have been decreases in all kinds of cars except tank and other "freight train cars," and that there have been increases, but only slight ones, in the aggregate capacities.

ANOTHER BIG RAILROAD JOB.—According to figures recently published, some six million shells were used in the operations that resulted in the capture of Messines. Reckoning these at an average weight of slightly over 100 lb.—probably the average was higher—this would represent a consumption of about 300,000 tons of steel, says the Ironmonger.

ENGLISH RAILWAYS WILL STOP "CARRYING COALS TO NEWCASTLE"

The railways in England on September 8 will put into effect a new scheme for coal handling by which it is expected that they will secure a saving of 700,000,000 ton-miles in coal transportation.

The comptroller of coal mines of the Board of Trade has recently issued an order that, effective at 6 p. m., September 8, 1917, all coal contracts are to be abrogated. Thereafter,

Official Map Indicating Effect of New Restrictions on Coal Sales

each coal-producing district may sell coal only for delivery in certain stipulated areas. It is stated that this is done:

1. "That consumption of coal should take place as near the producing point as possible."
2. "That in view of the supply facilities afforded by the main trunk lines, the movement of traffic should follow these routes wherever possible."
3. "That the movement of coal should, as far as possible, be in well defined directions; viz.: north to south, north to southwest, north to southeast, east to west."
4. "That an area producing less coal than suffices for its own need should not send any portion of its coal to other areas. That an area producing more coal than it requires for the consumption within the area itself, should distribute the balance to adjacent or convenient areas."

The comptroller of coal mines estimates that this arrangement will effect a saving of 700,000,000 ton-miles in the transportation of coal by the railways.

GERMAN CROWN PRINCE'S SPECIAL TRAIN.—A Hanover Socialist paper expresses anger at the fact that the Crown Prince, when called to Berlin, used a special train, whereby the line from Hanover to Berlin was blocked for a whole night. A number of Reichstag Deputies had to wait the night inside Hanover Station to let the special pass. Such a fact, the paper declares, must be considered by the Socialists of the German Empire as a slap in the face of democracy.

By-Products of an Apprenticeship System

The Tremendous Value of These Is Fast Becoming Apparent on the Atchison, Topeka & Santa Fe

By John H. Linn

A SUCCESSFUL manufacturing plant is established, equipped and manned for the purpose of producing a certain definite product. The principal effort of each management is directed towards the perfection and marketing of this primary product; but in every case certain opportunities arise whereby with but little additional effort or expense other secondary products, known as by-products, may be produced, thus greatly augmenting the net profits of the plant and making it possible to produce a better primary product at much less expense than if the material going into these by-products were allowed to accumulate as waste. For example, in the manufacture of steel such by-products are produced as ammonium sulphate, benzol, naphtha and slag. The primary purpose of a packing house is to produce edible meats, but to these are added such by-products as leather, pepsin and other medicines, glue and glycerin, oleo, axle grease, soap, shoe polish, hair for mattresses and plaster, combs, hair pins, violin strings and fertilizer.

The by-product may be very much unlike the primary product. One of the by-products of carborundum, the hardest abrasive made, is graphite, very valuable as a lubricant. In many cases, were it not for the income derived from these by-products, the primary product would be unable to meet its competitors in the open market. In this age of business thrift and industry everything must count, must be conserved, must be made to produce results; every atom must be utilized and devoted to some useful purpose. Today we have so many and such important by-products that we really do not think of them as by-products, and fail to realize that they are made from material which would otherwise be wasted, from opportunities which would otherwise be lost.

So, too, in the developing and training of skilled mechanics other results are produced, which, like the by-products of the manufacturing concerns, greatly augment the net profits arising from the scheme. The *Railway Age Gazette* has often referred to the modern apprenticeship system of the Santa Fe and the remarkable results obtained under the guidance of the supervisor of apprentices, F. W. Thomas. Since this road has given such attention to its human element, particularly the young men being trained for the mechanical department, it is interesting to know more of the results actually obtained. First let us consider the purpose of the apprentice organization, the primary product to be produced.

PRIMARY PRODUCT

On the first page of the first edition, and also of the latest edition, of the pamphlet which the supervisor of apprentices has issued describing the apprenticeship system of this road, we find these words, taken from remarks by Mr. Purcell: "Our object is not to make mechanical engineers, but to make first-class skilled mechanics, to recruit our shop forces with men—trained, educated, 'Santa Fe way.'" This positive statement from the founder of our apprenticeship system, the present head of the mechanical department of the road, leaves no doubt as to the purpose of the apprentice organization, no doubt as to the primary product the apprentice instructors are employed to produce—first-class skilled mechanics, trained and educated "Santa Fe way." Whatever else they may be able to do; whatever other results they may accomplish, they never lose sight of this primary purpose for which the department was organized—the developing and locating of the skilled mechanic for the shops.

During the past decade, through its apprentice department, the Santa Fe has greatly improved both the quality and quantity of this product. Over 700 skilled apprentice graduates are at present working in its shops, at points where they are most needed. At its largest shop, in spite of the present demand all over the country for mechanics and the high wages offered them, it has not been necessary to employ a mechanic from the outside for over 2½ years. This condition is due to the intense loyalty of these apprentice graduates, evidenced by the large per cent remaining in service. The value of this product alone would more than justify the expense and effort of the apprentice department. The mission of this article, however, is not to discuss this primary product, but instead, the by-products which are produced in connection with the work of this modern apprenticeship system.

Just as the manufacturing industries have long since learned that in the production of the primary product certain opportunities arise whereby with little additional effort or expense, secondary products known as by-products may be produced, so in the developing of these skilled mechanics opportunities arise for producing other valuable results, a few of which I shall mention here. No attempt will be made, however, to discuss them in the order of their importance, nor shall I be able to mention them all. Moreover, many of them will overlap and be intertwined or interwoven with each other, or with the primary product, so as to be hardly distinguishable.

THE PROMOTED GRADUATE

Let us first consider the promoted graduates, very rapidly increasing in number. As the system of apprentice instruction has been broadened in scope and rendered more efficient; as the increased opportunities given the apprentices have attracted a better class of boys with which to start; as the apprentice boards have studied more closely the fitness of each boy and weeded out the undesirable material at an early date, thus making room for more and better boys; as the apprentice instructors have entered more closely into the real life of each of their boys and learned more of their ability and capacity, more of their talents, active and dormant; as they have passed on to their local officers and to the central apprentice organization the knowledge they have thus gained—more and more of these graduates have been given positions of trust and responsibility. These young men have made good and justified the confidence placed in them, and proved to the management the value of the apprentice instruction and the reliability of the recommendations of the apprentice organization.

Today there are over 150 of these graduates occupying official positions, some of them of no little responsibility. All of these young men completed their apprenticeships within the past decade. Only those who were graduated during the past five years received the benefit of full four years of the modern apprentice instruction. None of them received the full and complete instruction and training and experience given the apprentices today, for the department is constantly improving its courses. What may not be expected of these boys in another ten years, to what heights may not some of them climb, what great things may they not do for the Santa Fe and the community in general?

When you think of all this, can you conceive the magni-

tude of this work, or realize to the full extent the value of the by-product of this organization? Surely it must be a source of great pleasure and satisfaction to the management to know that whenever a man is needed for this, that, or the other position, someone, by nature endowed, and by training fitted, is ready to fill this particular position, and better still, another is ready to step right into the place thus vacated.

Furthermore, the production of this by-product, instead of interfering with the production of the primary product, the skilled mechanic, really increases both the quality and the quantity of the primary product, for more and better boys are attracted to the apprenticeship system, and more of them remain with the company after graduation, knowing that no one else could offer them better treatment. They realize that if they are to receive promotion they must prove their ability by taking full advantage of the opportunities offered them. Just as the college graduate is loyal to his alma mater, and has a feeling of fellowship for the graduates and underclassmen of his school, just so these promoted graduates are loyal to the apprentice department, and have a feeling of fellowship and friendly interest in all other graduates and in all apprentices, and take pleasure in striving to better their condition.

PREPAREDNESS AND WATCHFUL INTEREST

The next by-product is closely related to the one just mentioned, in that it gives evidence not only of the ability of these young men, but also of the full interest taken in them by the department. I refer to the last three Ryerson scholarships awarded by the Master Mechanics' Association having been won by Santa Fe apprentices. These scholarships, which by the way are sufficient to pay necessary expenses for a four-year college course in mechanical engineering, were open to all young men in the United States, particularly those having a high school education and at least two years of shop training. The fact that Santa Fe apprentices have won this coveted prize three times in succession, is no small honor.

But proud as the company should be of these winners, still prouder should we be of the conditions which brought about those victories. Without a doubt there were many capable young men on other roads. It is possible some of these may have been as talented and possibly as fully prepared as were the winners, but the Santa Fe apprentice boys were not only capable, talented, and prepared, but through the apprentice organization and its constant watchfulness for good things for its young men and for the company, they learned that these scholarships were to be awarded, and not only received full information regarding the contest, but the instructors took pains to pick out the most promising and get them lined up for the examination. This same spirit of preparedness and ever-watchfulness is in evidence in many other phases of this work, and is giving the Santa Fe returns which, though difficult to estimate, are of such value as to make this by-product worthy of consideration.

TECHNICAL WORK OF SCHOOL INSTRUCTORS

Another by-product worthy of mention is the technical work of the school instructor. As one of the few technically educated men in the shop, he is called upon for advice or suggestions on matters of great importance. His special duties vary from making a design for a new shop whistle, to determining how many cars a new type of locomotive will pull over Tehachapi. The apprentice school rooms are fast becoming emporiums of mechanical information, to which everyone in search of mechanical or technical information, of no matter what nature, is urged to come and partake of the waters that flow freely. The fact that more and more are constantly taking advantage of this invitation proves that the fountain is by no means dry. It must be a source of great pleasure to the master mechanics to have on their staffs school instructors who can be trusted with matters of a con-

fidential nature and depended upon to work out a solution of all technical questions that may arise. In addition to his special duties the school instructor generally has charge of all the shop drafting, and looks after all the shop blueprints. His entire salary is charged to the apprentice department, but were it not for him, someone else would have to be employed to look after much of this work. It does not require much of a calculation to realize something of the value of this by-product.

WORK OF SHOP INSTRUCTORS

There is also a by-product from the work of the shop instructor. Since he works in harmony with the foreman, he is thoroughly familiar with his duties. If for any reason the foreman is absent, the shop instructor is ready to take his place. Furthermore, since the shop instructor is held responsible for the thorough instruction of the apprentices, and for all work spoiled by the apprentices, the foreman has more time to devote to other duties. Since the shop instructor knows what boy is best fitted for performing any job that arises, and also knows what boy needs the experience offered by the job in question, and can best give the instruction when the boy first starts on the job, the foreman usually assigns the work to the apprentices through the shop instructor, thus being relieved of any further trouble in the matter.

Every one likes to do what he can do well. No school is disorderly wherein the pupils are interested in their work. Just so in the shop. Through the work of the shop instructor the apprentices are kept interested in their work, and as a result little effort is needed to keep them busy, and as they are constantly busy the other mechanics get the fever, for industry like idleness is contagious, and thus the foreman is relieved of the necessity of devoting so much time to driving his men. If it were not for these shop instructors it is needless to say there would be need of greater supervision in most of the shops. As has been stated, the salary paid the shop instructor should be considered not an expense, but the most profitable investment that can be made. He is the most necessary part of the apprentice organization.

SHOP OUTPUT OF APPRENTICES

The shop output of apprentices is perhaps the most visible by-product of the department. The systematic instruction given an apprentice boy from the day he enters his apprenticeship until his graduation produces a much greater output than one would expect. On many jobs his output exceeds that of the ordinary mechanic. He would excel the latter in a baseball game or football game, in a track meet, or in any physical contest requiring strength, agility or quickness of muscle and mind. He is more ambitious and more desirous of outdoing the other fellow than is a man of maturer age. Is it any wonder then that when properly instructed, and properly interested in his work, he can often turn out more work and better work than the ordinary mechanic? Moreover these apprentices are taught the latest and most up-to-date methods of performing each class of work, and from the start are not only taught habits of industry, but also made to realize that time is fully as important as material, and thus made to do their work with the minimum waste of either material or labor. The results have shown conclusively that the extra work turned out by these boys while apprentices, more than justifies the entire cost of their instruction.

PRESENT INDUSTRIAL SITUATION

Thanks to its apprenticeship system the Santa Fe is unusually well prepared to meet the drain which the present war situation is making on the shop forces of all the railroads and manufacturing concerns in the country. Should it be necessary to employ raw recruits to fill the places of those entering government service, the system of instruction already in vogue in training its apprentices can be used to

give necessary instruction to other men who may be employed.

EFFECT ON OTHER EMPLOYEES

Another by-product of the department is the improvement in the general moral tone of the shop. Many of the requirements made of the apprentices have had a very wholesome effect on the other shop men. They are more regular and prompt in reporting for work, more particular about the quality of the work they turn out, more desirous of learning the latest and best methods of performing their work, more willing to pass on to others the benefits of their experience, more confident in the management, and more loyal to the Santa Fe. From the fair treatment at all times demanded for the apprentices, there has gradually come about a better treatment of all the men in the shop. There is less of the old time raw-hiding spirit and more recognition that "a man's a man for a'that, the rank is but the guinea stamp, the man's the gowd for a'that."

EFFECT ON LIVES OF APPRENTICES

In conclusion I wish to mention one other by-product, one more important than any of the others, yet closely intertwined with all the others, and very necessary to the full enjoyment and development of each of the other products. I refer to the influence exerted by these fatherly and companionable instructors upon the lives of the young men in their charge. The instruction and counsel given them, the example set before them by their own conduct and daily life, has a large influence in molding the habits and ideals, the am-

son a Marconi, a Thomas Edison, or a Matthias Baldwin. What a glorious thing to have a part in the development of such a life; what an awful thing to feel that the possibilities of any life have been blighted by any act or shortcoming of ours. You have similar boys working with you. Are you giving them the best that is in you? Do you not owe this to them and to the company by whom you are employed? Surely, there is no greater opportunity for usefulness than the development and improvement of the human element. Does not modern apprenticeship pay? Is it not well worth the effort?

RAILROADING BIG GUNS INTO FIRING POSITIONS

By Our Special European Correspondent

The use of guns greater than ever dreamed of before this war, has given rise to the problem of handling them effectively, of transporting them from factory to army front and of transporting them from place to place on the front according to battle conditions. A big gun is a white elephant if you can't handle it. It is a "tank" that won't roll. If the enemy breaks through your trench lines two, four or six kilometers, and does the job in a smashing, hurry-up fashion, he is sure to take these guns that are the very life and heart of modern defense unless you have some way of getting the guns away quickly.

Because of its difficulty, it has become more of a railroad

Official Photograph from the Italian Navy Department

Unloading 255 Mm. Guns at the Front

bitions and aspirations of these young men just entering into manhood.

Someone has said that the greatest thing one human being can do for another is to help that individual become an independent self-sustaining member of society, that the ability to make a good living and to support those near and dear to us, is the beginning of all virtue. The apprentice department of the Santa Fe is doing this, not for one, but for many. Moreover, they do not stop at this. They are helping to mold the characters of the boys and increasing their desire and capacity for service to others. The work really brings the instructors very close to each boy. Unless they can win his confidence, and inspire the best that is in him, their work will be in vain.

What a world of opportunity for achievement in the army of over a thousand boys now in these apprentice schools. Who knows which of them will develop into a future Steven-

son an artillery task to save heavy guns, or to rush them forward to new positions if the enemy is being beaten back. In the old days before this war the handling of artillery pieces was done by strong horses or mules, but in those days a five-ton gun was considered the heaviest possible weight of a piece intended for field operations, and the field guns averaged two, two and a half to three tons.

Today there are thousands of guns on every army front of the various nations ranging in weight from 50 to 50 tons, and many dozens of the giants that weigh from 50 to 75 tons. The projectiles of some of these guns weigh a short ton. During the worst month of the fighting at Verdun no less than 500 trains composing 25,000 cars carrying 10 tons each of projectiles were required by the French. The Germans are estimated to have used there 3,000 cannon of a total weight of 60,000 tons, and the position of many of these cannon had to be constantly shifted to prevent their destruction by

French artillery fire or to answer the changes of the battle line, covering at first a gradual advance of 12 miles and later a retreat over the same ground.

In the early part of the war, because of the lack of proper facilities for handling rapidly even the heavy guns then existing, it would take months to get guns into position, particularly during rainy weather when the roads were deep with mud. In the French and Italian mountains the so-

Official Photograph from the Italian Navy Department.

Building a Gun Base with Railroad Connection—the First Stage

called mountain howitzer, strapped to the back of a mule, was about the only rapidly moving gun used. I have seen in the Italian mountains guns of 149 millimetres calibre placed on summits of 2,000 to 2,500 metres which had required three months of time and a big gang of 1,800 men, working in relays of 600 each, to move the gun from a valley some 15 miles distant.

In this same early war period the biggest guns available and those of the longest range—15 to 24 miles—were the long-barrelled marine guns of the French and the Italians.

Official Photograph from the Italian Navy Department.

The Second Stage

But while they were sorely needed, there were no facilities to carry the guns within close firing distance of the enemy, or at least there was the constant danger that if the guns were carried forward and their location discovered by the enemy artillery, the guns would be lost because of the lack of means to shift them to new positions. For this reason the marine guns of the Italians, their 240 millimetre ones weighing upwards of 15 tons, had to be kept in reserve far behind the front for defensive purposes.

At this period of the war, before the present vast network of railway lines was built purely for war uses, the flat cars used for artillery transportation were of the most primitive description. Due to the European principle of building flat cars of a uniform type, different types of cars being objected to as obstacles to the rapid and economical handling of freight, the average car was not fitted for big gun transportation. The very old cars averaged 18 feet in length and were just strong enough to carry from 8 to 10 tons. One of the exceptions in recent years to this car type was that found on the Northern Railway of France, where the ore cars were 50 feet long and built to carry 40 tons of weight. It was such cars as these that the French used in railroading their marine guns during the fighting along the Yser and the Meuse some 18 months since.

When it was gradually discovered that big guns were not intended merely for battle ships and forts, that the Allies would have to use them as the Germans were using them, quantities of these heavier guns were built, and the problem of transporting them was solved.

Formerly the body of the gun was wholly dismantled from its carriage and laid flat on a separate car. At present and for some time past, it has been the practice to load the 20-ton guns on a single flat car of the strongest type avail-

Official Photograph from the Italian Navy Department.

The Gun Base Nearing Completion

able, with extra supporting trucks, and the guns of 30 to 40 tons on two separate cars, fastened together by a single overhead steel platform on which rest the gun and gun truck. The same system is used with the 50-ton guns, though in this case all-steel frame cars are being specially constructed for this particular use. The use of two different short cars hooked together appears to help in the turning of curves. One of the most imposing sights witnessed by civilians is that of these big guns as they pass along the railway. At stations where halts are made great crowds gather, and little children clamber upon the gigantic pieces to thrust immense bouquets of flowers into the 15-inch cannon mouths.

When the train carrying such pieces arrives near the front, the process of placing the jumbo in position begins. This is generally carried on at night and with the utmost secrecy. The men of the railroad corps must accompany the gun to its final position, building a permanent track thereto. The way the job is done on the Italian front is shown in the photographs that accompany this article. After the revolving turn-table bed for the gun is prepared, the gun is slid on strong hand cars into position. While the job of removing the gun to a new position is not a light one, it is no longer an impossible one, thanks to the rails.

SCALE TEST CARS

The Louisville & Nashville has placed five scale testing cars in service, each of which is provided with an auxiliary car to afford living and working quarters for the scale testers while on the line. These cars have been assigned to scale testers, each of whom is responsible for the accuracy of the scales on a certain defined district of the railroad.

The scale cars are of the modern two-axle, short wheel-base type, and weigh 60,000 lb. The length of the body is 12 ft. 6½ in., the wheel base is 6 ft. 6 in., and the height from top of rail to top of the running board is 5 ft. 4¾ in.

End Elevation and Section of the Car

The car is entirely of iron and steel. The body consists of four box-shaped cast iron members which were accurately machined and drilled to be bolted together on the longitudinal and transverse center lines of the car. To insure good alignment and proper stiffness the body is reinforced, along the longitudinal center line just above the steel center sill by a steel bar 12 in. high by 4 in. wide extending the entire length of the car and fitting into a recess formed by offsets in the adjoining faces of the cast iron sections.

These four cast iron boxes forming the body of the car are designed to hold 108 50-lb. weights. The car is covered by a roof made of 3/16 in. steel plates arranged to provide

The Test Car with Its Auxiliary Car

a running board along the longitudinal center line of the car and also to provide for trap doors opening into the compartments of the car body for the removal of the test weights.

The interior of the auxiliary or quarters car is divided into three compartments, a kitchen and living room at the platform end, a bedroom in the middle, and a workshop at the far end. The cars are supplied with all necessary appurtenances for the living quarters and the workshop is equipped with a work bench, a forge and anvil, a box for extra test weights and other tools and equipment of use to the inspector.

These scale and auxiliary cars are being used by the in-

spectors in making regular trips over the assigned territory for the periodic inspection and test of all track scales of the railroad and also the track scales of private owners adjacent to the line in all cases where weights are accepted by the railroad for billing. By following a regular route it is anticipated that the inspectors can cover the territory every 60 to 90 days. In addition to the testing and inspection of these scales the inspectors are instructed to make all adjustments and repairs on company scales except when they are in need of a general overhauling. Inspectors are also required to examine and test all freight house and baggage scales at least once each year. The condition of each scale tested is reported on a form designed for the purpose, one copy of each report going to the superintendent, one to the superintendent of machinery and one to the chief scale inspector.

Special instructions are given to the trainmen for the proper handling of this special equipment. These cars must always be hauled just in front of the caboose and on arrival at terminals must be set off where they will not be subjected to unnecessary switching. Under no circumstances are they to be handled in switching other cars in the train.

LOCK FOR VESTIBULE TRAP DOORS

In the June 14, 1916, issue of the *Daily Railway Age Gazette*, was published a description of the Universal trap door which was manufactured by the Transportation Utilities Company, in connection with which was shown a special type of door latch and wedge lifter. A new type of door latch, which performs the same functions of latch and lifter, has recently been developed, for use with this and the National trap door, by the Tuco Products Corporation, New York, successors to the Transportation Utilities Company.

Foot-Operated Vestibule Trap Door Latch and Starting Device

This latch is much simpler than the one previously described, being foot operated and self contained.

By referring to the drawing it will be seen that the moving parts consist of the foot release lever, the latch and two springs. The release lever, which is pivoted at *A*, contains the latch and latch spring *D*. The latch is pivoted at *B* and when the trap door is closed, is forced back to permit the door to pass, against the tension of the latch spring. As soon as the door closes, the spring again forces the latch out to the position shown in the drawing. In opening the door, the latch itself is not moved. By stepping on the foot lever it is forced down against the tension of spring *C*, carrying back the latch with it, the whole moving about the pivot *A*. As the upper end of the lever is forced down by the foot, the lower end of the lever, which extends under the edge of the trap door, moves up, thereby starting the door. This serves to insure ready operation of the door, should it become frozen in place or stick from any other cause.

The design of the foot lever is such that no special care is required in its operation as a downward pressure exerted on it with the foot, no matter at what angle it may be applied, serves to operate it. The operator is thus enabled to so place himself that his leg will not be struck by the edge of the door as it swings up.

General News Department

The Baltimore & Ohio has installed telephone train despatching between Wheeling, W. Va., and Holloway, Ohio.

The Gulf Coast Lines have granted bonuses, amounting to about ten per cent, to employees not connected with labor unions. The bonus will be paid quarterly beginning October 1.

In the Federal Court at Fort Smith, Ark., the United States district attorney has filed suit against A. L. Mills, receiver of the Fort Smith & Western, alleging six offenses against the provisions of the Adamson "eight-hour" law.

Thomas F. Molloy, of the accounting department of the Baltimore & Ohio, has been transferred temporarily to the department of food administration, at Washington, to assist in formulating a system of accounts for the food control board.

In a fire at Northampton, Mass., August 6, the freight house of the New York, New Haven & Hartford and the Boston & Maine was destroyed, together with 12 loaded freight cars and a large quantity of merchandise; estimated loss, \$75,000.

The United States Civil Service Commission announces examinations, September 5, for junior civil engineer and for junior architect, to fill places in the Division of Valuation, Interstate Commerce Commission. Applicants must be between 21 and 36 years old, and the salaries are from \$1,200 to \$1,680.

The twenty-fifth annual meeting of the Society for the Promotion of Engineering Education was held in Washington, D. C., on July 6 and 7. The program was devoted to the general topic: "The Relation of Engineering Schools to the Government During the War." Among the speakers were Hon. Newton D. Baker, secretary of war, and Gen. W. M. Black, chief of engineers, United States army.

Investigation as to the cause of the conflagration, which destroyed the freight house of the Cleveland, Cincinnati, Chicago & St. Louis and the New York Central at Cleveland, Ohio, mentioned in the *Railway Age Gazette* of July 27, has failed to develop the origin of the fire. The loss on account of the building has been placed at \$21,398, and the estimated loss on account of the contents which were destroyed is \$25,000.

The management of the Constitutional Railways of Mexico (the National Railways) has established a general purchasing agency at Houston, Tex. The work of building new cars is progressing rapidly in the shops at Agnas Calientes and the City of Mexico. It will be necessary, however, to buy in the United States large quantities of iron and steel fittings for the cars, including wheels. An enormous tonnage of new rails will be needed to place the 8,000 miles of track that comprise the Constitutional Railways in fit condition for traffic. The Mexican government has placed a large order for rails with the Monterey Steel & Iron Company.

Press despatches from Bainbridge, Ga., report that no trains are running on the Georgia, Florida & Alabama Railway, every engineman, conductor and brakeman having resigned. Threats of a strike were made some time ago, and an injunction had been granted in which all employees were enjoined from striking or taking a strike vote; or from reporting to their national organizations, or any other persons or corporations, the statement that any strike had been called; but the men are claiming that they have not disobeyed the order of the court; they are simply resigning as individuals. This road, extending from Richland, Ga., southward to Tallahassee, Fla., 132 miles, with an extension 50 miles farther to Carrabelle, runs two passenger trains daily each way over the greater part of its line. For 26 miles on the north end, the 50 miles on the south end, there is only one passenger train a day, each way. A later despatch reported the resumption of train service.

The value of efficient co-operation between the War Department and the railways in the handling of troops is illustrated by the facts, regarding the way the men in the officers' training

camp at Fort Sheridan were brought to Chicago last Saturday for the parade of Chicago's quota of registered soldiers. The bringing of the men from Fort Sheridan involved the movement over the Chicago & North Western of 4,000 troops a distance of 26 miles; and the whole number were handled the entire distance in one hour and twenty minutes. The North Western's heavy regular suburban business was moved over the same tracks meantime, without any disturbance of its schedules. The men were carried in five trains, making an average of 800 per train. The first train left Fort Sheridan at 6:45 a. m., and was in the station in Chicago at 7:26 a. m. The second left Fort Sheridan at 6:58, thirteen minutes after the first, and was in Chicago at 7:58. The third left at 7:09, only eleven minutes behind the second, and reached Chicago at 7:57. The fourth started at 7:21 and arrived at 8:09, and the fifth started only seven minutes behind the fourth, at 7:28, and arrived at 8:23. The trains were loaded one at a time; and the fact that only seven to thirteen minutes elapsed between their times of departure indicates how expeditiously the loading was done. The cars in every train were so numbered as to show exactly what companies were to use them; and the men, who were marched to the trains in military formation, were all advised in advance as to what the numbers of their cars would be.

Increase in Coal Consumed by Railways

According to a report issued by the United States Geological Survey, the American railroads in 1916 used 135,000,000 tons of bituminous and 6,735,000 tons of anthracite coal. This is an increase of 14,000,000 tons, or 11½ per cent in bituminous, and of 535,000 tons, or 8½ per cent in anthracite. The western roads consumed 6,500,000 more tons than in the year before, an increase of 15 per cent., and the increase for the eastern and southern roads was 11 and 5.1 per cent, respectively. The coal consumed by railroads was 27 per cent of the production of bituminous coal in the country, and 7.7 per cent of the anthracite production.

Railroads to Help Army Cantonments

Fairfax Harrison, chairman of the Railroads' War Board, has authorized the following statement: "To facilitate the movement and prompt delivery of materials for the construction of army cantonments the Railroads' War Board has assigned C. E. Denney, assistant to the president of the Nickel Plate, to the Quartermasters' department in Washington. During the period of construction Mr. Denney will make his headquarters in the office of Colonel Littell, where he will keep in touch with all phases of the construction work, and furnish advance information to the commission on car service of the Railroads' War Board concerning the government's orders and the number of cars required to fill them."

Further Increases in Pay

The International & Great Northern recently granted wage increases to approximately 1,000 shop employees, which will add \$140,000 annually to the company's payroll.

The Great Northern has granted wage advances to employees in its mechanical department, most of which were retroactive in their effectiveness. In the car department monthly employees received a 10 per cent advance, effective May 1, and men employed by the hour a 3-cent increase, effective May 1, and 2 cents additional, effective July 1. Machinists at Minot, N. D., and east, received a 7½-cent increase, effective May 1, and west of Minot 5½ cents, effective May 1, and 1 cent additional, effective June 20. Machinist apprentices were granted 2 cents an hour additional, and machinists' helpers a minimum wage of 27 cents an hour, effective May 1. Boiler shop employees were awarded a 5½-cent increase, effective May 1, and 1 cent an hour additional, effective June 1; tank and paint shop employees, 3-cent increase, effective May 1, and 2 cents additional,

effective July 1; shop laborers, an increase in wages of 2½ cents, effective June 1; clerical help, 25 per cent, effective May 1; tin shop employees, first-class, 5½ cents, effective May 1, and 1 cent additional, effective June 1; second-class, 3 cents, effective May 1; shop superintendents, \$20 per month, effective June 1; blacksmiths, 5½ cents to 10½ cents per hour, effective June 1; and various shop foremen, approximately \$20 a month, effective May 1. About 7,130 men are affected by the increases.

Railway Returns for June

The Interstate Commerce Commission's partial summary of railroad revenues and expenses for the month of June, 1917, based on returns for 153 roads, operating 186,000 miles, shows an increase in net revenue per mile from \$433 in June, 1916, to \$474 in June, 1917. Increases in net operating revenues are shown by the roads in eastern, southern and western districts. For the six months ending with June the same roads show an increase in operating revenues from \$1,326,187,000 to \$1,489,248,000, an increase in expenses from \$905,687,000 to \$1,065,281,000 and an increase in net operating revenues from \$420,499,000 to \$423,966,000. The increase in net revenue per mile was from \$2,264 to \$2,275. The roads of both the southern and western districts show increases in net revenue per mile for the six months, while the eastern roads show a decrease.

The Union Pacific Will Relocate Ames Monument

On account of a change in the line built for the purpose of shortening the road and for cutting down the grade, the monument erected 37 years ago to the memory of Oakes Ames and Oliver Ames, the builders of the Union Pacific, was left standing nearly five miles from the new tracks. The monument is built of granite in the form of a pyramid 60 ft. sq. at the base and 60 ft. high. It will be taken down a stone at a time and carried on wagons and stone-boats across the five miles of mountain to its new site just east of the station at Sherman, Wyo. On one side is a bronze medallion of Oliver Ames, and on the other a medallion of Oakes Ames. At the same time that the monument is being moved to a new pedestal the road is now driving a second tunnel under the mountain at the top of Sherman Pass as a part of the project to complete the double-tracking of the Union Pacific.

1,898 Miles in 24 Hours

At the Sheephead Bay trotting course, New York City, August 1 and 2, a Chalmers six-cylinder automobile was run around the two-mile course 949 times, 1,898 miles, in 24 hours, equal to 79.083 miles an hour, including stops. No human being has ever traveled so many miles in that length of time on the face of the earth, and no aviator has made any record at all for any such long distance. This distance is about equal to that from New York to Denver by the Lincoln highway. In the first hour this car traveled 83 miles, and in the twenty-fourth hour over 81 miles. All former records for 100 miles were beaten, this distance having been made in 70 min. 46 sec.

The car was driven by Messrs. Dawson and Cardham; Dawson for about 19 hours, and Cardham 5 hours. Twenty-two stops were made, consuming 35.6 minutes.

The motor which made this remarkable record is a regular stock Chalmers motor, 3¼-in. bore by 4½-in. stroke, with a piston displacement of 224 cu. in.

War Service Census of Railroad Workers Taken

Under the direction of the Railroads' War Board, every road in the United States is taking a census of the men employed by it, with a view to assisting the government in determining who should and who should not be exempted from military service. The regulations of the war department provide that "there can be no exemptions by classes, but each individual case must be taken up and determined upon its own merits, having, of course, consideration for the maintenance of the national interests as provided by law." The Provost Marshal General has advised the Railroads' War Board, however, that "it is the policy of the administration to so execute the 'selective service act' as not to unnecessarily cripple any industry."

The census being taken by the railroads will show the men who are married and those who are not, with details as to those dependent upon the married men. A second classification

will show those who can be replaced either by men inexperienced in railroad operation, or by women, and who therefore may be relieved from the service without embarrassment. The railway lists of those, who, it is believed, should be released from military duty are to be prepared in detail for each district. With the lists will be affidavits setting out the facts in detail subscribed to by the immediate superior officer, and certified to by the superintendent or head of the department in which the individual is employed. The railroads will make direct application to the exemption board for the exemption from military service of all employees who, as shown by the list and affidavits, should be released from military duty under the terms of the selective service law.

Southern Pacific Wage Negotiations

The strike order of train and engine men on the Pacific system of the Southern Pacific has been withdrawn, and the road is in conference with grand officers of the brotherhoods. The prospects of settlement are said to be good. The more important contentions are: (1) Claims for continuous time at certain terminals; this is a technical interpretation of the engineers' schedules and involves points previously considered. (2) Application of seniority rules. (3) Restricting use of crews en route in road service and under pay from helping trains at established helper terminals where helper crews have a daily guarantee. (4) Claim for full time when not available for duty on account of the operation of the sixteen-hour law. (5) Placing all extra men at helper terminals and other outside points on a daily guarantee. (6) Switching restrictions for crews in road service. (7) Duplicate payments and minimum day feature. (8) Full crews on engines with steam in boiler when being towed in trains.

Wage Increase for Southeastern Shop Employees

The wage controversy between the southeastern railroads and their 25,000 federated shop employees, which has been in progress since February 20, has been settled, except for the adjustment of a few details, by a decision of Secretary of Labor William B. Wilson, to whom it was referred, after mediation by a representative of the department had failed. Secretary Wilson's decision provides for an increase of 8½ cents an hour to mechanics and specialists, and 6½ cents for all other men represented. The railroads had previously agreed to give the eight-hour day and 6 cents an hour. Car inspectors and repairers, train car repairers, train air brake repairers, safety appliance maintainers, oilers and packers and all others employed in the car department, and for whom an eight-hour day had not already been agreed to, under the decision will have their basic day reduced two hours per day, but in no case shall the basic day be less than eight hours nor more than ten hours a day, and they shall be paid time and one-half for overtime as per overtime rules already agreed to.

The secretary's decision also included the following:

"None but mechanics or apprentices, employed and paid as such, will be assigned to do mechanics' work as per special rules of each craft, except at small outlying points where unimportant emergency jobs are required. Helpers will not be advanced to the detriment of mechanics. This rule shall not apply to foremen.

"It shall be definitely understood that the adjustment of claims for injuries received is one of the grievances that may be taken up for adjustment under the rules governing grievances.

"The request of the men that one sheet metal worker be employed to every five machinists shall be investigated by the management, and where there is sufficient work at any point to keep one employed a reasonable amount of time, a sheet metal worker will be employed without reference to the number of machinists employed.

"The request of the men that all electricians be paid on an hourly basis is denied. The offer of the managers to establish a minimum rate of 42 cents an hour for men employed on the hourly basis is accepted, and the increase for men employed on a monthly basis will be \$15 a month."

He also denied certain other requests of the employees.

The railroads were represented in the negotiations by a managers' committee, of which John R. Gould, superintendent of motive power of the Chesapeake & Ohio, was chairman.

REVENUES AND EXPENSES OF RAILWAYS

MONTH OF JUNE, 1917—CONTINUED

Average mileage during period.	Name of road.	Operating revenues.			Operating expenses.			Net railway operation.	Railway accruals.	Operating income (or loss).	Increase (or decrease) comp. with last year.		
		Freight.	Passenger.	Total (inc. misc.)	Traffic.	Trans- portation.	Miscel- laneous.					General.	Total.

Public Service Commissions Pledge Co-operation

Letters received from public service commissions in all parts of the country indicate that a most encouraging response is being made to the recent plea of the Railroads' War Board, urging, on the part of public authorities, co-operation with the railroads in a suspension during the period of the war "of all efforts not designed to help directly in winning the war." Many public service commissions have also pledged their support to the railroads' campaign "to make one car do the work of two" by urging shippers to load cars to capacity and reduce delays in loading and unloading.

The states whose public service commissioners have replied to the appeal are Louisiana, Texas, Kansas, Indiana, Tennessee, New Jersey, Virginia, Massachusetts and Michigan.

The Railroad Commission of Texas, through its chairman, Allison Mayfield, said: "We thoroughly agree with all you have to say and pledge such co-operation as lies within our power."

From Indiana, E. I. Lewis, chairman of the public service commission, sent this message: "We already are frowning on requirements of railroads which are not absolutely necessary for national service or public safety. We hope that you will call on us at any time when we may be of service in the work that you have in hand. Permit me to say at this time that the railroad men in Indiana have been co-operating in the most exceptional and exemplary way in trying to solve the severe coal problem."

The Railroad Commission of Louisiana has sent circulars out urging shippers to co-operate in every way possible.

The Tennessee Railroad Commission is also co-operating with the railroads to eliminate unnecessary passenger trains.

Lo, the Poor Farmer!

A merchant in a Missouri town showed a farmer a buggy priced at \$90, and the farmer kicked because twenty years ago his father bought one just like it for \$60.

Then the merchant looked up the record of sale and found that the father had turned in 300 bushels of corn for that buggy, and he told the farmer's son to deliver to him 300 bushels of corn and he would give him:

1—\$90 Buggy.	1—\$ 3 Box of cigars.
1— 75 Wagon.	10 Worth of sugar.
1— 20 Suit of clothes.	10 Worth of tea.
1— 20 Dress.	100 Worth of lubricating oil.
1— 5 Baby dress.	
1— 5 Crib.	

The total figures \$365, as the value of 300 bushels of corn, and it is needless to say that the high cost of living disappeared from the farmer's mind and he bought the buggy.—St. Louis Lumberman.

Adamson Says His Law Not Being Complied With

Congressman Adamson, chairman of the House Committee on Interstate and Foreign Commerce, has issued a statement charging the railroads with failure to comply with the spirit of the Adamson "eight-hour" law. He said in part:

"The railroads by the connivance of the trainmen seem to be proceeding in the same old way. They are running heavy, long trains, letting them lie over at stations, for other trains to pass, when they break down, averaging 10 miles an hour, including stops and paying the men for time over eight hours a day, entirely ignoring the letter and spirit of the law.

"If the railroads would properly enforce the law, they would run an average of 12½ miles instead of 10 miles an hour, thereby without additional cost covering a division of 80 per cent of the cases in eight hours where 10 are now required. In the 20 per cent of cases where a division is more than 100 miles, overtime would be required as now, but no more overtime than now, and there would be no more cost for overtime.

"I think if the railroad and trainmen rely on the hope that any report of the Goethals commission made by observing present practices will ever be credited by the commission or by Congress, they will be woefully disappointed. The Goethals commission is required to observe the operation of the law for not less than six months, nor more than nine months. But it is impossible for such operation to begin until the railroads begin to enforce the law.

"If the railroad officials do not make reforms there will probably be other legislation. It may be that either the length and

speed of trains will be directly regulated or authority will be conferred on the commission to control both; and the language of the law may be so plain that nobody can cavil or dispute it, in court or out, that men who operate trains involving the safety of life, limb and property shall not work over eight hours a day, except in cases of real emergency, which emergency does not grow out of collusion or regular practice, but arrives in spite of efforts to enforce the eight-hour day."

Railway Signal Association

Secretary C. C. Rosenberg announces that the board of direction has decided that the annual meeting of the association, to be held at the Hotel Traymore, Atlantic City, N. J., shall be confined to a two days' business meeting, Tuesday and Wednesday, September 18 and 19.

The business to be transacted is to deal with the conclusions of the several committees, on the subjects which have been presented by them, and which have been discussed at the last two meetings—Chicago in March and New York in June. The session each day will be from 9:30 a. m. to 6 p. m., with an intermission for luncheon.

National Association of Railway Commissioners

The twenty-ninth annual convention of the National Association of Railway Commissioners will meet in the hearing room of the Interstate Commerce Commission in the new building at the corner of Pennsylvania avenue and Eighteenth street N. W., Washington, D. C., on October 16, 1917, at 10 a. m., and will continue in session for four or five days.

Reports will be submitted by the following standing committees:

- Executive Committee, Charles E. Elmquist of Minnesota, chairman.
- Express and other contract carriers by rail, J. Prince Webster, Rate Expert, Georgia, chairman.
- Safety of railroad operation, C. C. McChord, Interstate Commerce Commission.
- Railroad service accommodations and claims, C. B. Garnett, Virginia.
- Grade Crossings and trespassing on railroads, James B. Walker, Secretary, New York, First District.
- Railroad rates, A. E. Helm, Commerce Counsel, Kansas.
- Statistics and accounts of railroad companies, Arthur A. Lewis, Washington.
- Car Service and demurrage, Frank H. Funk, Illinois.
- Public utility rates, Thomas W. D. Worthen, New Hampshire.
- Service of public utility companies, M. H. Aylesworth, Colorado.
- Safety of operation of public utility companies, Frank R. Devlin, California.
- Statistics and accounts of public utility companies, James O. Carr, New York, Second District.
- Valuation, Charles E. Elmquist, Minnesota.
- Capitalization and intercorporate relations, Alonzo R. Weed, Massachusetts Board of Gas and Electric Light Commissioners.
- State and federal legislation, Joseph L. Bristow, Kansas.
- Publication of commissions' decisions, Ledyard P. Hale, Counsel, New York, Second District.
- Special committee—Public ownership and operation, E. O. Edgerton, California.

On Wednesday evening, October 17, the members of the convention will attend a banquet at the New Willard Hotel.

In the call for the convention the association's officers emphasize the importance of the meeting as follows: "The time calls imperatively for united, patriotic action by all men charged with public responsibility. At this convention the present vital problems of public utility regulation, including the public utilities' function in serving the nation's need, the requests of railroads and other public utilities for increases in rates and for authority to diminish or discontinue service, and the requests of the public for reasonable rates and more adequate service, will be fully discussed with a view to uniform, constructive action by the various state and federal regulatory commissions."

The Traveling Engineers' Association

The executive committee of the Traveling Engineers' Association has decided that, owing to war conditions, the association will not hold its annual convention this year. The executive committee, however, will meet and will issue an annual report containing all information as to what has happened during the year.

The committee reports and papers will be printed and new subjects will be sent out and committees appointed for next year's business.

MEETINGS AND CONVENTIONS

The following list gives names of secretaries, dates of next or regular meetings and places of meetings of those associations which will meet during the next three months. The full list of meetings and conventions is published only in the first issue of the Railway Age Gazette for each month.

AMERICAN ASSOCIATION OF DINING CAR SUPERINTENDENTS.—H. C. Boardman, D. L. & W., Hoboken, N. J. Next convention to have been held October 22-24, 1917, San Francisco, Cal., indefinitely postponed.

AMERICAN ASSOCIATION OF PASSENGER TRAFFIC OFFICERS.—W. C. Hope, C. R. R. of N. J., 43 Liberty St., New York. Next meeting, October 16-17, St. Louis.

AMERICAN RAILWAY BRIDGE AND BUILDING ASSOCIATION.—C. A. Lichty, C. & N. W., Chicago. Next convention, October 16-18, 1917, St. Paul, Minn.

AMERICAN SOCIETY OF CIVIL ENGINEERS.—Chas. Warren Hunt, 220 W. 57th St., New York. Regular meetings, 1st and 3d Wednesday in month, except July and August, 220 W. 57th St., New York.

ASSOCIATION OF RAILWAY TELEGRAPH SUPERINTENDENTS.—W. L. Connelly, Supt. of Telegraph, Indiana Harbor Belt, Gibson, Ind. Next annual meeting to have been held September 18, 1917, Washington, D. C., indefinitely postponed.

CANADIAN RAILWAY CLUB.—James Powell, Grand Trunk, P. O. Box 7, St. Lambert (near Montreal), Que. Regular meetings, 2d Tuesday in month, except June, July and August, Windsor Hotel, Montreal, Que.

CAR FOREMEN'S ASSOCIATION OF CHICAGO.—Aaron Kline, 841 Lawlor Ave., Chicago. Regular meetings, 2d Monday in month, except June, July and August, Hotel La Salle, Chicago.

CENTRAL RAILWAY CLUB.—H. D. Vought, 95 Liberty St., New York. Regular meetings, 2d Friday in January, May, September and November. Annual dinner, 2d Thursday in March, Hotel Statler, Buffalo, N. Y.

CHIEF INTERCHANGE CAR INSPECTORS' AND CAR FOREMEN'S ASSOCIATION.—W. R. McMunn, New York Central, Albany, N. Y. Next convention, September, 1917, St. Louis.

CINCINNATI RAILWAY CLUB.—H. Boutet, Chief Interchange Inspector, Cinti Rys., 101 Carew Bldg., Cincinnati. Regular meetings, 2d Tuesday, February, May, September and November, Hotel Sinton, Cincinnati.

ENGINEERS' SOCIETY OF WESTERN PENNSYLVANIA.—Elmer K. Hiles, 568 Union Avenue Bldg., Pittsburgh, Pa. Regular meetings, 1st and 3d Tuesday, Pittsburgh, Pa.

GENERAL SUPERINTENDENTS' ASSOCIATION OF CHICAGO.—A. M. Hunter, 321 Grand Central Station, Chicago. Regular meetings, 2d Wednesday preceding 3d Thursday in month, Room 1856, Transportation Bldg., Chicago.

INVESTMENT BANKERS' ASSOCIATION OF AMERICA.—Frederick R. Fenton, 11 W. Monroe St., Chicago. Annual convention, October 1-3, 1917, Baltimore, Md.

MAINTENANCE OF WAY AND MASTER PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—F. W. Hager, Fort Worth & Denver City, Fort Worth, Tex. Next convention, October 16-18, 1917, Cleveland, Ohio.

MASTER CAR AND LOCOMOTIVE PAINTERS' ASSOCIATION OF THE UNITED STATES AND CANADA.—F. Dane, B. & M., Reading, Mass. Next annual meeting, September 11, Chicago.

NATIONAL ASSOCIATION OF RAILWAY COMMISSIONERS.—Jas. B. Walker, 120 Broadway, New York City. Next annual convention, October 16, 1917, Washington, D. C.

NEW ENGLAND RAILROAD CLUB.—W. E. Cade, Jr., 683 Atlantic Ave., Boston, Mass. Regular meeting, 2d Tuesday in month, except June, July, August and September, Boston.

NEW YORK RAILROAD CLUB.—Harry D. Vought, 95 Liberty St., New York. Regular meeting, 3d Friday in month, except June, July and August, 29 W. 39th St., New York.

NIAGARA FRONTIER CAR MEN'S ASSOCIATION.—Geo. A. J. Hochgrebe, 623 Brisbane Bldg., Buffalo, N. Y. Meetings, 3d Wednesday in month, New York Telephone Bldg., Buffalo, N. Y.

PACIFIC RAILWAY CLUB.—W. S. Wollner, Assistant to Chief Engineer, Northwestern Pacific R. R., San Francisco, Cal.

PEORIA ASSOCIATION OF RAILROAD OFFICIALS.—J. Stewart, 410 Masonic Temple Bldg., Peoria, Ill. Regular meetings, 3d Thursday in month, Jefferson Hotel, Peoria.

RAILROAD CLUB OF KANSAS CITY.—Claude Manlove, 1008 Walnut St., Kansas City, Mo. Regular meetings, 3d Saturday in month, Kansas City.

RAILWAY CLUB OF PITTSBURGH.—H. B. Anderson, Room 207, P. R. R. Sta., Pittsburgh, Pa. Regular meetings, 4th Friday in month, except June, July and August, Pittsburgh Commercial Club Rooms, Colonial Annex Hotel, Pittsburgh.

RAILWAY FIRE PROTECTION ASSOCIATION.—C. R. Edwards, office of the president's assistant, Seaboard Air Line, Norfolk, Va. Next meeting, October 2-4, 1917, St. Louis, Mo.

RAILWAY REAL ESTATE ASSOCIATION.—R. H. Morrison, Assistant Engineer, C. & O., Richmond, Va. Next convention, October, 1917, Duluth, Minn.

RAILWAY SIGNAL ASSOCIATION.—C. C. Rosenberg, Myers Bldg., Bethlehem, Pa. Next annual convention, September, 1917, Atlantic City, N. J.

RICHMOND RAILROAD CLUB.—P. O. Richmond, C. & O., Richmond, Va. Regular meetings, 2d Monday in month, except June, July and August.

ROADMASTERS' AND MAINTENANCE OF WAY ASSOCIATION.—P. J. McAndrews, C. & N. W., Washington, D. C. Next annual convention, September 18-21, 1917, Hotel Duffield, N. Y., Chicago.

ST. LOUIS RAILWAY CLUB.—B. W. Fraelenthal, Union Station, St. Louis, Mo. Regular meetings, 2d Friday in month, except June, July and August, St. Louis.

SIGNAL APPLIANCE ASSOCIATION.—F. W. Edmunds, 3868 Park Ave., New York. Meetings with annual convention Railway Signal Association.

SOUTHERN & SOUTHWESTERN RAILWAY CLUB.—A. J. Merrill, Grand Bldg., Atlanta, Ga. Regular meetings, 3d Thursday, January, March, May, July, September and November, 10 m., Piedmont Hotel, Atlanta.

TRAFFIC CLUB OF CHICAGO.—W. H. Wharton, La Salle Hotel, Chicago.

TRAFFIC CLUB OF NEW YORK.—C. A. Swope, 291 Broadway, New York. Regular meetings, last Tuesday in month, except June, July and August, Waldorf Astoria Hotel, New York.

TRAFFIC CLUB OF PITTSBURGH.—D. L. Wells, Gen'l Ag't, Erie R. R., 1924 Oliver Bldg., Pittsburgh, Pa. Meetings bi-monthly, Pittsburgh.

TRAVELING ENGINEERS' ASSOCIATION.—W. O. Thompson, N. Y. C. R. R., Cleveland, Ohio. Next convention, September, 1917, Chicago.

UTAH SOCIETY OF ENGINEERS.—Frank W. Moore, 1111 Newhouse Bldg., Salt Lake City, Utah. Regular meetings, 3d Friday in month, except July and August, Salt Lake City.

WESTERN CARBON & LUMBER CO.—L. Roy, Immigration Agent, Grand Trunk Pacific, Winnipeg, Man. Regular meetings, 2d Monday, except June, July and August, Winnipeg.

WESTERN RAILWAY CLUB.—J. W. Taylor, 1112 Karpen Bldg., Chicago. Regular meetings, 3d Monday in month, except June, July and August, Hotel Sherman, Chicago.

Traffic News

The Public Utilities Commission of Maine has suspended until September 1 proposed increases in passenger fares filed by the Maine Central.

All of the principal railroads in Missouri have filed application with the State Public Service Commission for authority to increase freight rates on coal and coke 15 cents a ton.

Reports from Frankfort, Ky., August 3, tell of further suits by coal companies in the Federal courts against the Chesapeake & Ohio, alleging damages by reason of the railroad's failure to furnish cars for coal. In these suits the aggregate amount of damages claimed is about \$800,000.

The Kansas Public Utilities Commission has authorized the Missouri Pacific to discontinue 14 passenger trains in that state principally on branch lines, substituting therefore mixed train service. This action is in accordance with the general plan outlined by the Council of National Defense.

William P. Kappes, receiver of the Evansville & Indianapolis, announces that on the recommendation of the Council of National Defense he has discontinued the operation of two daily passenger trains making a reduction of 160 passenger train miles a day, or approximately 5,000 miles a month.

Representatives of the various railroads in Nebraska met in Omaha and organized the Omaha branch of the Railroad War Board Department of Information. The board will conduct a campaign to induce western shippers to load all cars to maximum capacity, to load and unload cars quickly, and to conserve freight cars in every possible manner.

The Public Service Commission of Massachusetts has ordered a general reduction in the rates for the transportation of milk by passenger train or special train, the new rates being based, it is said, on the standard which has been established by the Interstate Commerce Commission for the interstate transportation of milk to Boston. Rates for carloads are made 12½ per cent less than the standard tariff and shipments by freight train 25 per cent less.

The railway war board has announced a curtailment of passenger service that will doubtless surprise the traveling public inasmuch as probably not one passenger out of ten has been at all inconvenienced. The elimination of passenger service will make available for other purposes over one million tons of coal, which will provide three billion ton miles. It is remarkable that this change has been brought about without noticeable criticism. —American Express Co.'s Bulletin.

Domestic Travel by rail and inland waterways for both commercial and tourist purposes is assuming normal summer proportions. The feeling of uncertainty on account of war conditions seems to have disappeared. Tourist traffic to the National Parks and other pleasure grounds both East and West is reported off about 25 per cent as compared with the summer of 1916. Alaska tourist traffic is off about 50 per cent. Commercial travel shows an increase, and the large movement of United States troops has helped to place the total volume of railway passenger traffic well beyond the figures for the corresponding summer period of 1916.—American Express Co.'s Bulletin.

A meeting of shippers and railroad officers was held at the assembly room of the Atlanta (Ga.) Chamber of Commerce on August 3, to consider ways and means for the most economical use and utilization of the freight car supply. Hon. C. Murphy Candler, chairman of the Railroad Commission of Georgia, presided, and the following signed the call for the meeting: Harry T. Moore, secretary of the Atlanta Freight Bureau, and chairman of the Atlanta regional committee of the National Industrial Traffic League; Ivan E. Allen, president of the Atlanta Chamber of Commerce; H. G. Hastings, president of the Georgia Chamber of Commerce; and E. G. Hitt, general secretary of the Atlanta district sub-committee of the Commission on Car Service.

Appeal by the Illinois Central

Under the caption "Many Are Doing Their Bit, Are You?" the Illinois Central has issued a poster, printed in red and blue on a white background, bearing the following:

HELP YOUR COUNTRY.

Eliminate car-destroying trade units.
Load cars to full capacity.
Persuade your men to co-operate.

When practicable, load two carloads in one car.
Insist on prompt loading and unloading.
No cars to be used as warehouses.

Take no orders less than full carload.
Have billing furnished early.
Eliminate reconsigning; bill to unloading point.

Where absolutely necessary to reconsign, do it while car is in motion.
A car-day lost is economic waste.
Remember, efficient transportation service is vital to our army and navy.

Twenty Thousand Tons of Tobacco

In the present stress it may come about that water transportation is profitable, on occasion, even if the cost is greater than it would be, normally, by railroad. According to a Louisville (Ky.) paper James M. Buckner, of that city, who sold 40,000,000 pounds of tobacco to the French government, was faced with a disastrous loss, being unable to get cars for shipping the tobacco to the sailing port, New Orleans; but he finally secured several river packets and delivered the tobacco at the Gulf. But then he was unable to hire or charter a vessel to carry it to France. He asked the French Commissioner what his government would pay for transporting the tobacco, which is sold in that country, at huge profits, by the government. The commissioner agreed to pay \$5.10 per 100 lb. Mr. Buckner then procured \$300,000 with which to buy three sailing vessels. One of these vessels has departed for France with tobacco, and another will leave shortly. The third will contain a cargo of cotton.

Mr. Buckner manifested his disappointment at not getting cars by taking photographs while the hogsheds of tobacco were being loaded on packets and mailing a copy to each of a number of railroad presidents. He wrote underneath, "James M. Buckner shipping tobacco by packets because of inability to get freight cars."

N. Y. Central Proposes Increased Fares

The New York Central has filed with the Public Service Commission of New York state new passenger tariffs, making a large number of advances in single trip fares. The commission for the First district (New York City) has suspended the rates for 20 days—from September 1, the date announced by the railroad, to September 20—and has ordered a hearing August 15; while the commission for the Second district announces that the increases cannot be approved so far as they relate to rates west of Albany, because the franchise of the company, granted many years ago, limits local rates on that part of the road to two cents a mile. The new tariffs propose to make these rates 2½ cents a mile, and also propose to advance thousand-mile tickets, which are sold for two cents a mile, to 2¼ cents. Examples of the proposed changes are given below (rates from New York):

	Old rate	Proposed rate
To Albany	\$3.10	\$3.58
To Utica	5.00	5.93
To Syracuse	6.06	7.25
To Rochester	7.68	9.28
To Buffalo	9.25	10.98
To Yonkers30	.38
To Peekskill90	1.03
To Poughkeepsie	1.58	1.83
To Mt. Vernon30	.35
To White Plains50	.58
To Mt. Kisco88	.93
To Brewster	1.28	1.30

The Public Service Commission for the Second district has before it applications from most of the electric roads in the state asking for authority to make general increases in fares; and it is understood that in the case of the electric roads, as with the New York Central, broad investigation will be made into the extent of the powers of the commission to authorize deviations from the original franchise requirements.

Commission and Court News

INTERSTATE COMMERCE COMMISSION

Uncompressed Cotton to Memphis and St. Louis

City of Memphis et al. v. Chicago, Rock Island & Pacific et al. Opinion by Commissioner Daniels:

Upon rehearing, differentials proposed by defendants in rates on uncompressed cotton from points in Arkansas and Missouri on lines of the St. Louis, Iron Mountain & Southern Railway, St. Louis Southwestern Railway, and St. Louis & San Francisco Railroad to Memphis and St. Louis, respectively, are, with certain exceptions, approved. (45 I. C. C., 487.)

Rates to Mitchell, S. D.

Commercial Club of Mitchell, S. D., et al. v. Ahnapee & Western et al. Opinion by Commissioner Daniels:

Class rates to and from Mitchell, S. D., from and to points east or south of Sioux City, Iowa, and Sioux Falls, S. D., are found unreasonable and prejudicial. Reasonable maximum rates are prescribed for the future, including proportional rates from the upper Mississippi River crossings.

Commodity rates to Mitchell constructed in relation to the corresponding commodity rates to Sioux Falls are recommended.

Fourth section relief is denied. (46 I. C. C., 1.)

COURT NEWS

Proof of Defective Car Door

In a cattle shipper's action for injuries from a door of the car hired, which fell upon him while he and others were attempting to open it, the Missouri Supreme Court holds that the burden was on the shipper to show that the defendant railroad's car door was defective, and that the injury resulted therefrom, the doctrine of *res ipsa loquitur* not being applicable.—*Deister v. Kansas City N. W. (Mo.)*, 195 S. W., 499. Decided May 29, 1917.

Application of Safety Appliance Act

The Circuit Court of Appeals, Sixth Circuit, holds that under the provision of the Safety Appliance Act, as to the use of air brakes, a number of bad-order cars, fastened together by chains, together with an engine, tender and caboose, constituted a train, even though it would be highly inconvenient to apply the train-brake provision to such cases, and might necessitate limiting the number of chained-up cars hauled to 15 per cent of the cars in the train, the train-brake provision being absolute and mandatory.—*Pennsylvania Co. v. United States*, 241 Fed., 824. Decided May 8, 1917.

Unused Transit Credit

A milling in transit rate is an entirety, and must be accepted and carried out in its entirety or not at all. The Nebraska Supreme Court holds that a shipper cannot maintain an action in the courts of that state for unused transit credit on shipments of grain made from various points in Nebraska, destined to points outside of Nebraska, and to one point in Nebraska, where parts of each car were forwarded indiscriminately to the points of destination, and where the rules and regulations of the tariff have not been complied with.—*Fremont Milling Co. v. Chicago & N. W. (Neb.)*, 163 N. W., 331. Decided May 19, 1917.

Switching Service

The Minnesota Supreme Court holds that where a Minnesota railroad corporation was required by its franchise to construct and operate a complete railroad system in the state, including switching yards and tracks, and where it acquired a switching road as a part of its system, and the switching company held the

legal title to the property as a mere convenience, the Railroad and Warehouse Commission, even in anticipation of an abandonment, might order the railroad to continue its operation.—*Minneapolis C. & C. Assn. v. Great Northern (Minn.)*, 163 N. W., 294. Decided June 15, 1917.

Anti-Pass Law and Deed to Right of Way

The Kentucky Court of Appeals holds that section 196 of the State Constitution, providing that passenger transportation shall be regulated to prevent unjust discrimination, and section 197, prohibiting free passes, render void as against public policy a railroad's agreement to give free transportation in return for right of way deeded it, especially as the Kentucky Anti-Pass Law of 1916, enacted pursuant to section 196, specifically prohibits transportation except for a money consideration. It is held that the Anti-Pass Law does not impair the obligation of an existing contract by a railroad to furnish passenger transportation in return for right of way deeded it, since the contract was made in view of section 196, and because the Anti-Pass Law is merely a police regulation within the legislature's constitutional powers. The court in its opinion reviewed the prior Anti-Pass Law decisions.—*Kentucky Traction & Terminal Company v. Murray (Ky.)*, 195 S. W., 1,119. Decided June 22, 1917.

Passengers Leaving Seats Before Train Stops

When the name of the next station is called two or three times by the conductor while the train is slackening for the station, the conductor does not request or invite a passenger to get up and go to the door while the train is moving; his language amounts merely to an emphatic announcement of the near approach to the station, and is a notice to passengers who desire to disembark there that the train is so approaching. A woman 40 years old, weighing 172 lb., having children with her, left her seat in a car when the conductor announced the approach to a station and stood by the door. The Arkansas Supreme Court holds that her acts should be viewed in the light of all the surrounding circumstances, and if under them her act was that of an imprudent person, she could not recover for an injury received by her in a fall, although it was the result of an unusual movement of the train.—*Lashlee v. Bush (Ark.)*, 195 S. W., 375. Decided May 21, 1917.

Change in Location of Station

A railroad is a quasi public highway, and, at least to the extent permitted by statute, the company may change the location of its tracks and stations. A legislative enactment being the supreme declaration of the public policy of the jurisdiction, the Kentucky Court of Appeals holds that when, under the provisions of a statute, the Railroad Commission has consented to and authorized a change of location of a station, it has but carried out the expressed public policy of the legislature upon the subject, which public policy is paramount to all inconvenience which may follow from an execution of the statutory provisions.—*Beatty v. L. & N. (Ky.)*, 195 S. W., 487. Decided June 5, 1917.

The Texas Court of Civil Appeals holds that a judgment restraining a railroad company from removing a station from a tract of land in violation of a covenant in the deed under which it obtained title to the land will not prevent the removal of the building in obedience to an order of the Railroad Commission when the public benefit requires such removal and the Railroad Commission orders it.—*San Antonio & A. P. v. Mosel (Tex.)*, 195 S. W., 621. Decided June 6, 1917.

Condemnation—Public Necessity

While the decisions of the courts of other jurisdictions are not uniform upon the subject, the California District Court of Appeal holds, in condemnation proceedings by a railroad, that the law in that state seems to be settled in favor of the view that, when the legislature has declared that railroad corporations shall have the right to condemn lands of private persons for their uses, the question whether there is a present public need for the construction and operation of the particular railroad seeking to exercise that right is no longer a judicial question to be litigated in the condemnation proceedings, except to the extent that a private person whose lands are sought to be taken

may put in issue the good faith of the railroad corporation in seeking to acquire his land for uses which are not public, but really to subserve some private interest or end.—*Castro Point Ry. & Terminal Co. v. Anglo-Pacific Development Co. (Cal.)*, 165 Pac., 544. Decided June 14, 1917.

Contributory Negligence of Passenger Crossing Tracks

A passenger attempted to cross the tracks near a station about midnight in front of an approaching freight train that he supposed was a passenger train, which would slacken speed at the station and give him time to cross. He tripped over a spike projecting about 3 inches from a tie and was run over by the train. The Texas Court of Civil Appeals holds that he was guilty of contributory negligence as a matter of law, and could not recover from the railroad.—*Schaff v. Combs (Tex.)*, 194 S. W., 1,159. Decided May 3, 1917.

Inspection of Cars

The Texas Court of Civil Appeals holds that the ultimate carrier of a car, although it made no inspection, was not liable for injuries to a consignee's servant, who, while unloading a carload of automobiles, loaded by the consignor in a foreign car, was injured by a loose casting falling from over the door on the inside of the car, the defect being one not discoverable from the outside of the car. The duty of such a carrier on receiving a car is held to extend only to a reasonable inspection of its condition with reference to its fitness for transportation.—*Kansas City, M. & O. v. Pysker (Tex.)*, 195 S. W., 981. Decided June 7, 1917.

Interstate Shipments

Bills of lading of shipments from Argenta, a point in Illinois, to New York, contained a notation to stop at Chicago for weight and inspection. The Illinois Supreme Court holds that, in the absence of evidence to sustain the consignee's contention that they were billed to New York merely to obtain a reduction in the freight rate, and were not intended to go beyond Chicago, they were interstate shipments.—*Shellabarger Elevator Co. v. Illinois Central (Ill.)*, 116 N. E., 170.

Merchandise was shipped from Oklahoma to Ft. Worth, Texas, transportation to be continued to some other point in Texas thereafter to be determined. There was no delivery at Ft. Worth, but delivery was made at the ultimate destination, Abilene. The goods, however, remained some time in Ft. Worth, and were shipped on a new bill of lading to Abilene. Action was brought by the shipper against the railroad company to recover the penalties provided by the Texas statute for refusal to deliver freight upon the payment or tender of the freight charges, as shown by the bill of lading, the railroad having refused delivery except on payment of an additional sum. The Texas Court of Civil Appeals holds that the shipments from Ft. Worth to Abilene was an interstate shipment, and as the state statute does not apply to such shipments, no recovery could be had.—*G. C. & S. F. v. Mathis (Tex.)*, 194 S. W., 1,134. Decided March 29, 1917.

Recovery by Initial Carrier from Connecting Carrier

In an action by the initial carrier against the terminal carrier for reimbursement for damage to an interstate shipment, the Iowa Supreme Court holds that the Carmack amendment, making initial carriers liable for loss to interstate shipments, and allowing recovery from the connecting carrier, makes the initial carrier's recovery dependent on a showing of injury to the shipment while in the connecting carrier's possession, and not upon the shippers' judgment against the initial carrier, although sum recovered by the shipper is conclusive as to the amount of damage, thus making the initial carrier the representative of all connecting carriers. In such an action the record of proceedings and judgment in the shipper's action are admissible, in view of the provision of the statute making the judgment proper evidence, and the record being necessary to show the scope of the adjudication. Although the statute does not require notice of the shipper's suit, to be given connecting carriers, the giving of such notice is proper practice. A reason for this is that

ordinarily, if a third person, having notice of an action against the defendant in which he is liable to the defendant, ignores such notice, he will be held to indemnify the defendant to the extent of the judgment rendered against the latter on the ground of estoppel, the purpose of the rule being to avoid a multiplicity of suits.—*St. Joseph & G. I. v. Des Moines Union* (Iowa), 162 N. W., 812. Decided May 16, 1917.

Construction of Grant of Right of Way

An instrument granted a right of way across certain lands, reserving the use of all of such lands except that portion actually used and occupied by the railroad. The company laid a single track, but cut grass and willows on the entire statutory width, used substantially all the ground within such width for erecting telegraph poles and storing materials, and for 32 years returned it for taxation and paid taxes thereon, while the grantor never availed himself of the right to use even those portions not occupied by the company. In a suit by the successor of the grantor against the railroad to establish title to the right of way and to enjoin the railroad from laying a track, in addition to its main track, on the strip of ground, the Circuit Court of Appeals, Eighth Circuit, held that the grant was of a right of way 100 ft. wide, the maximum width allowed by statute, and not merely a strip sufficient in width for a single track; the provision as to the right to use parts not occupied by the company constituting a reservation and not an exception. An "exception" is a withdrawal from the effect of a grant some part of the thing granted which is in existence and included under the terms of the grant; while a "reservation" is something arising out of the thing granted not then in existence, or some new thing created or reserved, issuing out of the thing granted and not a part of the thing itself. The reservation in the grant in this case would not extend beyond the grantor's own lifetime, in the absence of words of limitation and inheritance.—*Iowa Ry. & Light Co. v. C. M. & St. P.*, 241 Fed., 581.

Delegation of Power to Fix Rates

In 1905 the Missouri legislature passed an act establishing maximum intrastate rates, and in 1907 another establishing maximum passenger rates. In 1913 it passed the Public Service Commission Act, section 47, of which conferred upon the commission the power and duty of establishing reasonable maximum intrastate rates. The next year fourteen railroads applied for a revision upwards of freight and passenger rates, and following an investigation were granted certain modified measures of relief by the commission, to take effect January 1, 1916. A citizen brought the case into the County Circuit Court for review. That court reversed the finding of the commission, and the case was appealed to the state Supreme Court. The two questions involved are purely questions of law, namely, (a) Does section 47 of the Public Service Commission Act confer authority upon the commission to raise railroad rates above the maximum fixed by the legislature unless prohibited by the Constitution? (b) If the section has this effect, is it invalid because in violation of section 14, art. 12 of the State Constitution? The Supreme Court answered the first question in the affirmative. Section 14, art. 12, provides that the legislature shall from time to time pass laws establishing reasonable maximum rates of charges for the transportation of passengers and freight. The court mentioned seven states which have constitutions containing a provision wholly or substantially similar to that of Missouri, viz., Illinois, West Virginia, Nebraska, Washington, Alabama and Georgia; and cited cases from these states recognizing the authority of the legislatures to delegate to public service commissions the right to ascertain and determine reasonable rates. The court said that by section 47 of the Missouri Public Service Commission Act the legislature did not delegate to the commission the absolute power of fixing maximum rates, but only the power to ascertain and determine what rates are reasonable; and provided by other sections of the act for a judicial review of the fact of reasonableness, which is only *prima facie*, and while the commission may order the observance of these rates so found by it to be reasonable, under penalties for violation fixed by the legislature, such observance endures subject to a review by the courts. The judgment of the Circuit Court was reversed, with directions to affirm the order of the commission.—*State ex rel. Rhodes v. Public Service Commission* (Mo.). Decided April 9, 1917.

Equipment and Supplies

LOCOMOTIVES

THE MAINE CENTRAL is getting prices on 10 locomotives.

THE MORGANTOWN & KINGWOOD has ordered one Consolidation locomotive from the Baldwin Locomotive Works.

THE CENTRAL RAILWAY OF BRAZIL has ordered two Consolidation locomotives from the Baldwin Locomotive Works.

PANAMA CANAL LOCOMOTIVES SOLD.—Over 100 of the locomotives used in the construction of the Panama Canal have been disposed of by Governor Harding, of the Canal Zone, according to reports to Secretary of War Baker. Ten locomotives have been transferred to the Alaska engineering commission; two were sold to the Chile Exploration Company, and 95 were sold to the A. B. Shaw Company, which does a contracting business in New York.

FREIGHT CARS

THE DONNER STEEL COMPANY is inquiring for prices on 25 gondola cars.

THE RUSSIAN GOVERNMENT is about to place orders for an additional 10,000 1,200 pood (43,200 lb.) capacity four-wheel box cars. This is the second lot of 10,000 cars on this order on which 40,000 cars have been authorized. It is understood that Canadian car builders may receive this lot.

COPENHAGEN'S NEW UNDERGROUND RAILWAY.—As the result of the difficulty in getting the materials for rails, telegraphs and signals, it has been found impossible to complete a proposed new underground railway in Copenhagen.

EARNINGS OF SWISS RAILWAYS.—The earnings of the Swiss Federal railways for the past three years have been: In 1914, \$9,264,000; in 1915, \$10,808,000; in 1916, \$11,580,000. These profits, however, have been absorbed in amortization and betterments.

WAR TIME TRANSPORTATION.—One of the hardest things for a soldier to relish is railroad travel in war time. When a few men are moved at a time sleeping cars can be provided, but when an army must be moved in a hurry then day coaches and even freight cars come into play. During our late Mexican trouble there was considerable grumbling because our soldiers lacked Pullmans to travel in, and it is said that when German soldiers heard of this they quit fighting a whole day in order to give vent to their merriment. They are glad to travel in box cars with a little straw in the bottom. Our soldier boys "Somewhere in France" have perhaps had a taste of traveling in cars marked "Eight Horses or Forty Men," where they draw lots in order to see who lies down and who sleeps standing up. But the American boys are not the ones to kick at a hardship they know cannot be avoided.—*Wall Street Journal*.

RAILWAY DEVELOPMENT IN SOUTH RUSSIA.—The British vice-consul at Kherson reports, under date March 13, that the road bed of the railway between Merefa and Kherson is in complete order, and as soon as rails can be obtained they will be laid. This line will be very important for the export of grain and ore from Kherson, and it is expected that the line will be in full working order by the time foreign exports will again be possible. The government has officially confirmed the project for constructing a railway from Saratov to Alexandrovsk. The carrying out of this project will enable goods from the Saratov district to reach the port of Kherson via the River Dnieper, and vice versa, thus considerably increasing the volume of exports and imports at Kherson. Progress is being made with the construction of the railway between Kherson and Djanikoi, which will join Kherson with the Crimea-Kertch line. The government has sanctioned the building of a bridge over the Dnieper, which will be sufficiently high not to impede river traffic; the building of the bridge will be begun this year.

Supply Trade News

On August 1 the Kewanee plant of the National Tube Company, located at Kewanee, Ill., was sold to the Walworth Manufacturing Company, Boston, Mass., and on that date the National Tube Company retired from the fittings business.

The Acar Manufacturing Company, 30 Church street, New York, manufacturers of the Blue Signal Safety Device, announces the appointment of Leland T. Johnson as special representative, with headquarters at the Hotel Sherman, Chicago, and Burt E. Dana, New York salesman, with headquarters at 30 Church street, New York.

F. A. Molitor, consulting engineer, 35 Nassau street, New York, and major in the Engineer Officers' Reserve Corps, has recently been ordered from the Engineers' Training Camp to duty in Washington on the staff of S. M. Felton, the director-general of railways. This office is an adjunct of the chief of engineers, U. S. A., and has to do with the military railway and transportation problems in France.

The American Steel Export Company announces the appointment of Walter R. Morris as assistant traffic manager, with headquarters in the Woolworth building, New York City. Because of suspended service for an indefinite period of American-Hawaiian steamers via Panama Canal, Mr. Morris resigned his position as assistant traffic manager of the American-Hawaiian Steamship Company, to accept employment with the American Steel Export Company. Prior to his connection with the Panama Canal Line in 1910, then known as the Tehautepec Route, Mr. Morris was for a great many years associated with the Southern Pacific and Pacific Mail companies in their traffic departments at both San Francisco and New York.

Railway Equipment Forms Large Share of Year's Billion Dollar Steel Exports

Exports of iron and steel manufactures in the fiscal year ending June 30, 1917, were four times as great in value as in the fiscal year 1914. According to a compilation by the National City Bank of New York, in the fiscal year 1915 exports of iron and steel manufactures reached \$226,000,000, against \$251,000,000 in 1914. They were worth \$621,000,000 in 1916, and approximately \$1,120,000,000 in 1917, these being official figures for 11 months and an estimate for the closing month of the year.

Most of this increase in exportation in 1916 and 1917 went to Europe. The total value of iron and steel manufactures exported to Europe in the fiscal year 1915 was but \$92,000,000, in 1916, \$354,000,000 and in 1917 approximately \$700,000,000.

The following table shows the total exports of iron and steel and manufactures in the last four years, and also the exports of some of the important classes of railway material. The total for June, 1917, is estimated:

Total Iron and Steel and Manufactures

Year	Value
1917.....	\$1,117,831,000
1916.....	621,209,000
1915.....	225,861,000
1914.....	251,480,000

Locomotives

Year	Number	Value
1917.....	1,290	\$16,037,000
1916.....	799	12,665,000
1915.....	228	2,115,000
1914.....	383	3,692,000

Steel Rails

Year	Tons	Value
1917.....	611,000	\$26,632,000
1916.....	540,000	17,687,000
1915.....	159,000	4,537,000
1914.....	338,000	10,250,000

Railway Track Material

Year	Value
1917.....	\$8,164,000
1916.....	5,261,000
1915.....	2,407,000
1914.....	2,534,000

Railway cars are not separately divided in the National City Bank's compilation.

Railway Construction

ATCHISON, TOPEKA & SANTA FE.—This company is preparing preliminary plans for the construction of a two-story brick head-house, 36 by 70 ft., and a frame freight-house, 36 by 200 ft., at Newton, Kan.

The company is also contemplating the construction of a freight transfer station at Kansas City, Kan. The plans at present provide for a frame structure, 30 by 1,000 ft., with about 400 ft. of platform. Part of the building will be two stories high, and will be used to house the office force.

CANADIAN PACIFIC.—This company will build a three-span reinforced concrete bridge at London street, Windsor, Ont. It will consist of three 35-ft. spans, with reinforced concrete abutments, piers and dock.

CHESAPEAKE & OHIO.—The Chesapeake & Ohio Northern was opened for traffic on July 30, from the main line of the Chesapeake & Ohio at Edgington, Ky., north to Waverly, Ohio, 30 miles. The work included the construction of a steel bridge, 3,450 ft. long over the Ohio river at Sciotoville; also a steel viaduct 1,080 ft. long over the Little Sciotoville river, two miles north of Sciotoville. A description of this line was published in the *Railway Age Gazette* March 3, 1916, page 397.

CHESAPEAKE & OHIO NORTHERN.—See Chesapeake & Ohio.

GULF & EAST TEXAS.—Incorporated in Texas with general offices at Hicks to build a railroad from Hicks to Wursbaugh, about 10 miles. The incorporators include E. R. Campbell and A. E. Ammerman, Houston; S. B. Hicks, J. T. Wursbaugh, M. F. Johnson and T. H. Scovill, Shreveport, La.

KANSAS CITY TERMINAL.—This company is drawing preliminary plans for the construction of two passenger stations at Kansas City, Kan. Details of the plans are not available at present, but the estimated cost of each station, with its approaches and platforms, will be approximately \$100,000. Construction is expected to be started this summer so that stations will be ready for service next spring.

MAHONING & SHENANGO (ELECTRIC).—This company, in conjunction with Lawrence county, Pa., is planning the construction of a bridge over Neshannock Creek at New Castle, Pa. The estimated cost of the structure is about \$66,000, but construction is not expected to start immediately.

MUSCLE SHOALS TRACTION.—A contract has been given by this company to the Central Construction Company, Indianapolis, Ind., to build a 64-mile interurban line. The projected route is from a connection with the Louisville & Nashville and the Southern Railway, at Florence, Ala., east via St. Florian, Bailey Springs, Killen, Center Star, Rogersville and Athens to Huntsville, where connection is to be again made with the Southern Railway and with the Nashville, Chattanooga & St. Louis. A branch line is also to be built north to Lexington, 12 miles. S. L. Whitten, president; T. W. Pratt, vice-president and treasurer; T. H. Allen, secretary and general manager, Florence, Ala.; E. M. Wilkins, chief engineer; and M. S. Bingham, consulting engineer.

PENNSYLVANIA-DETROIT.—A contract has been awarded by this company to Iliff Brothers, London, Ohio, for the construction of a bridge over the Huron river at a point two miles above Flat Rock, Mich. The bridge will be of reinforced concrete, and will have three 14-ft. spans.

PENNSYLVANIA LINES WEST.—A contract has been awarded by this company to P. T. Clifford & Son, Valparaiso, Ind., for the construction of a third track between Trimmer Junction, Ind., and Boone, 6.4 miles. The work will involve a change in grade extending over a distance of two miles and the building of six small bridges. The work has already been started, and will cost approximately \$625,000.

SALT LAKE, GARFIELD & WESTERN.—This company has completed plans for the electrification of its line and work on the project has already been started. The approximate cost of the work will be \$250,000.

Railway Financial News

BUFFALO, ROCHESTER & PITTSBURGH.—This company has applied to the New York State Public Service Commission, Second district, for approval of equipment agreement, series J, with the Guaranty Trust Company, of New York, as trustee dated July 1, 1917, and for permission to issue \$1,000,000 five per cent, series J equipment bonds, pursuant to said agreement, at not less than 90 per cent of their par value, and interest.

CHICAGO, BURLINGTON & QUINCY.—The Illinois State Public Utilities Commission has authorized this company to issue \$25,455,000 of general mortgage bonds at four per cent, payable March 1, 1958.

CHICAGO, ROCK ISLAND & PACIFIC.—Permission has been given by the Illinois State Public Utilities Commission to issue \$12,500,000 of general mortgage gold bonds at four per cent.

Clarence H. Venner, of New York City, has filed in the Sangamon County Circuit Court of Illinois an appeal from a decision of the Illinois State Public Utilities Committee authorizing the issuance of \$65,000,000 in preferred stocks at six and seven per cent by the above company. Mr. Venner, who is a stockholder, contended that the company should not issue preferred stocks in such large amounts, and objected to the plans for reorganizing the company. The appeal will be heard at the September term of court.

ST. LOUIS & HANNIBAL.—Charles W. Cox and C. Ledyard Blair, of New York, have filed a plan for the reorganization of this company with the Missouri Public Service Commission. The company operates between Hannibal, Mo., and Perry, a distance of 104 miles. The plan of reorganization provides for a new company, the waiving of all old claims, assumption of the floating debt, a new issue of preferred stock of \$250,000, and the issue of \$370,000 of new common stock.

SALINA NORTHERN.—This road, operating 81 miles between Salina, Kan., and Osborne, has been sold at auction to P. W. Goebel, president of the Commercial National Bank of Kansas City, Kan., for \$693,000.

WAUPACA-GREEN BAY.—This 10-mile line, extending from Waupaca, Wis., to Green Bay, has gone into the hands of a receiver because the interest due on \$75,000 was not paid in June. Frank B. Seymour, general manager of the Green Bay & Western, has been named receiver. The Wisconsin State Railroad Commission, in its 1916 report, valued the productive cost of the Waupaca-Green Bay, less depreciation, at \$95,777. The total indebtedness is now \$86,000. The company has until September 1 to liquidate its indebtedness or be sold under receivership.

BUDGET OF SOUTH AFRICAN RAILWAYS.—The estimates of the expenditures of the main services of the South African railways during the year ended March 31, 1918, are given at \$50,815,000, and the revenues at \$66,927,000. The expenditures of the subsidiary services are estimated at \$2,431,000, and the revenues at \$2,361,000. In the main services the revenue from freight and minerals other than coal is estimated at \$29,177,000; from coal, \$15,574,000; from live stock, \$2,372,000, and from the passenger service, \$16,310,000.—*Commerce Report.*

NEW LAW OF RAILWAY CONCESSIONS IN VENEZUELA.—The new law of railway concessions passed the Venezuelan congress, and was signed by the provisional president June 12. The principal difference between this law and the former one is that the provision by which all railways constructed under concessions became the property of the government after a specified term of years is changed, and railways to be built under the new law will be fully and perpetually the property of the parties constructing them except that such ownership may not be transferred in whole or in part to any foreign government. It is hoped that under the more liberal terms of this new law foreign capital may undertake the construction of railways, which the country so badly needs for its internal development.—*Commerce Report.*

Railway Officers

Executive, Financial, Legal and Accounting

John G. Walsh has been appointed assistant to vice-president of the Erie, with headquarters at New York.

W. A. Corkill has been elected treasurer of the Carolina & North Western, with office at Chester, S. C., vice F. Wolfe, resigned.

Dameron Black has been appointed auditor of the Atlanta, Birmingham & Atlantic, with office at Atlanta, Ga., vice R. K. Slaughter.

G. F. Moore has been appointed assistant to the president of the Pittsburgh & West Virginia, with office at Pittsburgh, Pa., vice G. G. Early.

Operating

E. A. O'Donnell has been appointed assistant superintendent of the El Paso division of the Galveston, Harrisburg & San Antonio.

M. H. McEnry has been appointed assistant trainmaster of the Delaware & Hudson, with office at Carbondale, Pa., vice A. T. Cushing, resigned.

D. C. Smith has been appointed manager for the receivers of the Georgia Coast & Piedmont, with headquarters at Brunswick, Ga., vice A. do Sola Mendes.

H. M. Gargan, assistant trainmaster of the Delaware & Hudson at Oneonta, N. Y., has been appointed trainmaster on the Susquehanna division, vice M. W. Sullivan, promoted.

Clarence R. Smith, trainmaster on the Illinois Central, at Fordham, Ill., has been appointed trainmaster of freight service, with the same headquarters, succeeding A. M. Umshler, promoted. Thomas Whitty has been appointed trainmaster at Fordham, succeeding C. R. Smith.

George F. Dickson, superintendent of the Georgia & Florida, with office at Douglas, Ga., has been appointed superintendent also of the Augusta Southern, succeeding J. A. White, resigned to accept an appointment as military transportation officer, Camp Wadsworth, Spartanburg, S. C.

S. A. Stockard, superintendent of car service of the Atlantic Coast Line, at Wilmington, N. C., has been appointed assistant general superintendent of transportation, with office at Wilmington, and his former position has been abolished; E. M. Dewey has been appointed car accountant, with office at Wilmington.

A. E. Boughner, superintendent of the St. Louis district of the Missouri, Kansas & Texas, at Sedalia, Mo., has been appointed superintendent of terminals at St. Louis; J. F. Hickey, superintendent at Muskogee, Okla., has been transferred to Sedalia; W. M. Whittenton has been appointed superintendent of the McAlester district, with headquarters at Muskogee, Okla., succeeding Mr. Hickey.

Richard E. Casey, who has been appointed superintendent of the Grand Rapids & Indiana, with headquarters at Grand Rapids, Mich., was born at Union City, Ind., on October 6, 1868. He entered railway service with the Grand Rapids & Indiana on November 12, 1888, as a telegraph operator. Two years later he was promoted to ticket agent at Kalamazoo, Mich., and in April, 1893, became traveling passenger agent, with headquarters at Grand Rapids. In December, 1897, he was appointed trainmaster at Ft. Wayne, Ind., which position he held until his recent appointment as superintendent of the Northern division.

A. E. Brown, trainmaster of the Sacramento division of the Southern Pacific at Sacramento, Cal., has been appointed assistant superintendent of the Tucson division, succeeding T. H. Kruttschnitt, resigned to enter military service; C. F. Donnatin, trainmaster of the Los Angeles division at Los Angeles, has been appointed assistant superintendent of that division, with the same headquarters; F. J. Berry, trainmaster at Truckee, has been transferred to the Sacramento division, with headquarters

at Sacramento; C. A. Collins succeeds Mr. Berry as trainmaster at Truckee; J. C. Muir, trainmaster at Bakersfield, has been transferred to the Los Angeles division, with headquarters at Los Angeles.

Edward F. Blomeyer, whose appointment as general manager, in charge of the operating and traffic departments, of the Ann Arbor and the Manistique & Lake Superior, was announced in the *Railway Age Gazette* on June 29, was born at Farmington, Mo. He entered railway service with the St. Louis, Iron Mountain & Southern as a telegraph operator, and later served successively as agent and train despatcher. He afterward became auditor of the Southern Missouri & Arkansas, following which he was promoted to freight and passenger agent. Several years later he was promoted to vice-president and general manager of the St. Louis, Memphis & Southeastern, which position he held until he became president and general manager of the Pere Marquette Steamship Company, and the Manistique, Marquette & Northern. Following this he was for several years vice-president and general manager of the Tennessee, Alabama & Georgia, and for a short time was vice-president and traffic manager of the San Antonio, Uvalde & Gulf, which position he held until his appointment as general manager of the Ann Arbor and the Manistique & Lake Superior.

Traffic

Dexter M. Denison, general freight agent of the Minneapolis & St. Louis, has been appointed freight traffic manager, with headquarters at Minneapolis, Minn., effective August 1. He was born at Hamlet, N. Y., on July 24, 1866, and entered railway service in July, 1882, as a night telegraph operator, with the Minneapolis & St. Louis. He was later promoted to local freight agent, and served in this capacity at various stations until his appointment as traveling freight agent. He next became commercial agent at Minneapolis, following which he served successively as assistant general freight agent and general freight agent, with headquarters at Minneapolis. On August 1, 1917, he was promoted to freight traffic manager, succeeding F. C. Townsend, who has been promoted to vice-president in charge of traffic.

D. M. Denison

Wallace Smith has been appointed commercial agent of the Ocilla Southern, with office at Ocilla, Ga.

R. L. Butt has been appointed general freight agent of the Carolina and North Western, with office at Atlanta, Ga.

E. B. Leavitt has been appointed industrial agent of the Southern Pacific, with headquarters at San Francisco, Cal.

A. W. Saunders, assistant general freight agent of the Carolina, Clinchfield & Ohio, at Johnson City, Tenn., has resigned, and his former position has been abolished.

G. G. Early, assistant to president of the Pittsburgh & West Virginia at Pittsburgh, Pa., has been appointed general freight and passenger agent, with office at Pittsburgh, vice S. P. Woodside.

J. W. Hunter, general freight agent of the Southern Railway at Atlanta, Ga., has been appointed general freight agent, with office at Charlotte, N. C., succeeding Walter Shipley, who has entered the service of the American Railway Association.

I. K. Dye, traffic manager of the Coal & Coke Railway at Elkins, W. Va., having resigned to engage in other business, W. Trapnell, superintendent, is now in charge of the traffic and industrial development department, with office at Elkins, W. Va., and W. E. Leith has been appointed acting general freight and passenger agent, with office at Elkins.

B. F. Moffatt, assistant general freight agent of the Minneapolis & St. Louis, has been appointed assistant freight traffic manager, with headquarters at Minneapolis, Minn.; W. M. Hardin, assistant general freight agent, has been promoted to general freight agent, and C. A. Werlich, chief of the tariff bureau, has been appointed assistant general freight agent, with headquarters at Minneapolis, effective August 1.

A. B. Cutts, general passenger agent of the Minneapolis & St. Louis, has been appointed passenger traffic manager, with headquarters at Minneapolis, Minn. He was born at Lillington, N. C., on October 23, 1866, and entered railway service with the Chicago & Alton on December 1, 1884. In 1887 he became chief ticket clerk for the Chicago, St. Paul, Minneapolis & Omaha, and from 1890 to 1892 he was chief rate clerk for the Great Northern. On the latter date he became chief rate clerk to the general passenger agent of the Minneapolis & St. Louis, and in August, 1894, was promoted to general passenger agent, which position he held until his appointment as passenger traffic manager, as above noted.

Engineering and Rolling Stock

A. G. Nutting has been appointed supervisor of signals on the Northern Pacific, with headquarters at Livingston, Mont., succeeding E. A. Allen, resigned, effective August 1.

W. C. Hawkins has been appointed engineer maintenance of way of the Coal & Coke Railway, with office at Gassaway, W. Va., vice F. D. Cosner, resigned to engage in other business.

A. D. Williams, master mechanic on the Southern Pacific at Stockton, Cal., has been appointed superintendent of motive power of the Northern district, with headquarters at Sacramento, succeeding D. P. Kellogg, resigned to accept service with another company.

J. H. Barber, resident engineer of the Canadian Pacific at West Toronto, Ont., has been appointed engineer in charge of double tracking, North Toronto, and H. R. H. Silcox has been appointed resident engineer, Toronto Terminals, in place of Mr. Barber, both appointments being only temporary.

W. M. Post, inspector of signals on the Pennsylvania, at Philadelphia, Pa., has been appointed assistant signal engineer, with the same headquarters, succeeding C. C. Anthony, resigned. W. N. Spangler, inspector of signals at Philadelphia, succeeds Mr. Post. E. L. Watson, supervisor of signals at Philadelphia, has been appointed inspector of signals, succeeding W. N. Spangler. Guy Toft, acting supervisor of signals of the Pittsburgh division, has been appointed supervisor of signals of the same division. H. N. Stump, acting supervisor of signals of the Williamsport division, has been appointed supervisor of signals of that division. E. G. Bauman, acting supervisor of signals of the Allegheny division, has been appointed supervisor of signals of the Allegheny division.

W. H. Bradley, master mechanic on the Chicago & North Western at Clinton, Ia., has been appointed assistant to the general superintendent of motive power, with headquarters at Chicago, Ill., succeeding E. C. Hall; W. E. Dunham, supervisor of motive power and machinery at Winona, Minn., also has been appointed assistant to the general superintendent of motive power, with headquarters at Chicago; J. W. Anderson, master mechanic of the West Iowa division at Boone, Ia., has been appointed supervisor of motive power and machinery at Winona; L. Chapman, division master mechanic at Belle Plaine, Iowa, has been transferred to the West Iowa division, with headquarters at Boone; H. L. Harvey, road foreman of engines on the Wisconsin division, with headquarters at Chicago, has been appointed master mechanic of the Iowa and Minnesota division, with headquarters at Belle Plaine.

Railway Officers in Military Service

W. J. Leahy, general passenger agent of the Chicago, Rock Island & Pacific, at Chicago, who received a commission as major in the Quartermasters' Officers' Reserve Corps, has been released from active service in the army.

John Lawrence Maher, assistant engineer in the office of the district engineer maintenance of way, Northwest district, of the Baltimore & Ohio, has been commissioned a captain in the Officers' Reserve Corps, U. S. A., and is waiting instructions from the adjutant general to report.

GENERAL NEWS SECTION.....	297
---------------------------	-----

We publish elsewhere two very interesting and important addresses on the part of the railways in the war. One is

Two Addresses on the Railways in the War

by Daniel Willard, president of the Baltimore & Ohio, and chairman of the Advisory Commission on National Defense. The other is by E. E. Clark, a member of the Interstate Commerce Commission. Both Mr. Willard as chairman of the Advisory Commission and Mr. Clark as the representative of the Interstate Commerce Commission have been sitting with the Railroads' War Board and participating in its deliberations. No other man in the United States is better informed regarding the war problems confronting the people of the country or the part which the railways ought to and must play in the solution of those problems than Mr. Willard, and it is to be wished that his address could be read not only by every railway officer and employee, but also by every citizen. It is a very able and remarkable document and coming from such a source it ought to stimulate every reader of it to help the railways in every way practicable to do their bit. No other public officer is so well informed regarding what the railways are doing under the supervision of the Railroads' War Board to perform their duty to the country as is Mr. Clark, and therefore his cordial endorsement of the objects being sought and the methods being used is gratifying and full of promise as to the prospects of the close co-operation which doubtless will be needed in future between the war board and the Interstate Commerce Commission.

Such railroads as have adopted modern apprenticeship methods in their mechanical departments (and the number

Intensive Training of New Employees

is discouragingly small) have looked largely to the future for results, rather than for any immediate returns. The facts that were marshalled by John H. Linn in the article on "By-Products of an Apprenticeship System," which was published in the *Railway Age Gazette* of August 10, 1917, indicate that the Santa Fe received many concrete returns from the very beginning of the installation of the new apprenticeship system; in-

deed, these by-product returns in the aggregate were probably sufficient to justify the movement on a strictly business basis, without reference to the main result which it was desired to accomplish. Passing reference only was made to one advantage which is of special importance at this time. Railroads generally have had to employ many new hands in the mechanical department, and whether these are mature men, or girls and women, the apprenticeship organization can readily be adapted to give them intensive practical training and rapidly fit them for the efficient performance of their duties. Moreover, it should be comparatively easy to adapt and extend methods of training which have proved successful in the mechanical department to other departments. Unless immediate and adequate steps are taken to train new employees in all departments the effectiveness of the railroads at large may be greatly hampered. It is unfortunate that so few roads have awakened to their full responsibilities in this direction, and it is sincerely to be hoped that those which have lagged behind will make a prompt and decided effort to catch up with the leaders.

The average freight rate per ton per mile received by the railways of the United States in 1916, 7.16 mills, was the

Lowest Average Freight Rate on Record

lowest on record. This fact, indicated by the preliminary summary of returns for roads earning over \$1,000,000 a year issued by the Bureau of Railway Economics in February and commented upon in these columns at the time, is now officially confirmed by the abstract of statistics for the fiscal year ended June 30, 1916, just issued by the Interstate Commerce Commission. For the million dollar roads the average receipts per ton mile were 7.07 mills, as compared with 7.22 for the previous year. The commission's figures cover all roads in the country having total operating revenues of over \$100,000 a year. The average of 7.16 mills in 1916 compares with 7.32 in 1915, 7.33 in 1914, and 7.29 in 1913. Never before, since the Interstate Commerce Commission began publishing railway statistics, has the average revenue per ton mile been below 7.24, which was the figure for 1899. In 1891, the earliest year for which the commission has the

record, the average was 8.95 mills. Until 1899 there was a general decline and from that year until 1904 there was an increase to 7.80 mills. Since that year the average has pretty steadily declined. The average revenue per ton per mile for freight for each year from 1891 to 1916 as reported by the commission has been as follows:

1891..... 8.95 mills	1900..... 7.29 mills	1909..... 7.63 mills
1892..... 8.98 mills	1901..... 7.50 mills	1910..... 7.53 mills
1893..... 8.78 mills	1902..... 7.57 mills	1911..... 7.57 mills
1894..... 8.60 mills	1903..... 7.63 mills	1912..... 7.44 mills
1895..... 8.39 mills	1904..... 7.80 mills	1913..... 7.29 mills
1896..... 8.06 mills	1905..... 7.66 mills	1914..... 7.33 mills
1897..... 7.98 mills	1906..... 7.48 mills	1915..... 7.32 mills
1898..... 7.53 mills	1907..... 7.59 mills	1916..... 7.16 mills
1899..... 7.24 mills	1908..... 7.54 mills	

The decrease in 1916 is probably attributable mainly to the increase in the proportion of low-rated commodities during the year, principally of coal and other products of mines. The commission's report also shows that the average operating expenses per train mile increased from \$1.77 in 1915 to \$1.83 in 1916. The fact that the railways were able to show the largest gross and net earnings in their history in the face of such an increase in operating costs while receiving a lower average rate than ever before is therefore attributable to a remarkable increase in efficiency of operation. How this was accomplished is illustrated in the commission's report by the fact that the average number of tons of freight carried in each train was increased from 474.45 in 1915 to 534.95 in 1916.

THE BURLINGTON'S EXTRA DIVIDEND

THE declaration by the Chicago, Burlington & Quincy Railroad Company of an extra dividend of 10 per cent will be the subject of much discussion. Whether those who discuss it will approve or disapprove of the action taken will depend on the relative amounts of stress that they put on a railway's function as a business concern and its function as a public service concern.

A railway, the courts have held, is private property affected with a public use. There was a time when railway owners entirely subordinated the public duties of the railway to the object of making money out of it as private property. More recently not only the regulating authorities, but even the owners and the managers of the railways, have to a large extent subordinated the purely business or money-making side of the railroad to its function as a public utility.

The case of the Burlington is a good illustration of the extent to which for some years the railway as private property has been subordinated to the railway as a public servant. The road was laid out and has been developed with great strategic skill. It has been managed with almost unsurpassed progressiveness and ability and it has been conducted financially with great conservatism. Although it has always been one of the most important of the granger systems, its average capitalization per mile on the basis of mileage owned at the end of the year 1916 was only \$31,854, and on the basis of mileage operated it was only \$30,600. Its total earnings, its operating efficiency and its net earnings have steadily increased, while there has been practically no increase in its funded debt. The percentages earned by it on its stock—after the payment of interest on funded debt, of course—in the eight fiscal years ending with June 30, 1916, were as follows: 1909, 11.74 per cent; 1910, 12.6 per cent; 1911, 15.79 per cent; 1912, 13.32 per cent; 1913, 18.12 per cent; 1914, 16.97 per cent; 1915, 17.18 per cent; 1916, 26.93 per cent. The fiscal year was changed last year to correspond with the calendar year, and in the year ended on December 31, 1916, the earnings on the stock were almost 29 per cent.

An extra dividend of 6 per cent was paid on October 1, 1907, but since then, in spite of the large earnings made, the same dividend—at the rate of 8 per cent—has been paid on the same amount of stock. What has been done with the

rest of the money? From \$655,000 to \$1,817,000 a year has been applied to sinking funds and from \$2,268,000 to \$7,648,000 a year has been appropriated for additions and betterments. Meantime, the property has been so maintained that it has been getting into better and better condition.

Certainly any concern in any other line of business which could show such a record for efficient management and financial conservatism over a long period of years would not be criticised on business or any other grounds for declaring an extra dividend of 10 per cent.

But what of the public policy involved? Will not the management of the Burlington be criticised for declaring this extra dividend, and will not it tend to arouse a popular antagonism to railways which will do them all harm? The Burlington is a granger road operating in a territory where popular hostility to railways is and always has been greater than in any other section of the country, and undoubtedly its action in declaring this extra dividend under present conditions will draw criticism upon its management and will also be made a ground for attacking the managements of railways generally.

But, as a matter of fact, the large earnings which the Burlington has been making have constantly over a long period of years been used by critics of the railways to show that the railways generally were more prosperous than they admitted that they were and that therefore their rates ought to be reduced instead of increased. Perhaps there will be no more criticism because the Burlington has declared this dividend than there has been because it has been earning enough money to declare it.

Meantime, the facts should be pointed out that the Burlington is not a typical railroad in any respect whatever. Its capitalization per mile is so small in relation to the total traffic handled, to its total earnings and to its net operating income that if the rates in its territory were so regulated as to restrict its net operating income to 6 or 7 per cent, it would soon be about the only solvent railway left in the territory. It may be said, however, that even though this is the case it should use the earnings on its stock in excess of its 8 per cent dividend to develop its property in order that it may render more and better public service. But this is precisely what it has been doing for ten years, and this extra dividend spread over that period makes an average of only 9 per cent that it has paid.

So long as the public does not fix a minimum return which railways will be allowed to earn and pay, it has no moral right to fix a maximum return which they may earn and pay. As a matter of business policy the action of the Burlington in declaring the extra dividend is perfectly sound and defensible. As a matter of railroad public policy, having in mind the railroad situation of the country as a whole, it is questionable if it was expedient.

ANOTHER HEAVIEST ENGINE

THE gradual increase in the weight of locomotives is ever a matter of vital concern to the bridge engineer. He is not only responsible for the safety of bridges under the loads imposed by new locomotives purchased by his road and by new engines in transit to other roads, but he has ever before him the perplexing problem of the designing load for new bridges. This must be great enough to insure adequacy of the structures for many years to come and yet not so great as to result in extravagance for which he may later be criticized not unjustly.

Unfortunately there is no direct relation between the weight of the locomotive and its capacity to produce stress in a structure. Even an expression of the average weight of the engine per foot of track is of little value. The only reliable criterion is a determination of the actual bending moments and shears for spans of varying length and a com-

parison of these with the equivalent results secured with the arbitrary Cooper's loading commonly used in designing. For the design of shorter spans or the floor systems of bridges, the magnitude of the individual axle loads together with the dynamic augment of the over balance are the determining factors rather than the weight of the entire locomotive, but these also involve analyses along the lines outlined above which are withal tedious and expensive.

Results of such analyses show that the Santa Fe type locomotives produce generally higher loading effects on spans under 60 ft. in length than locomotives of the Mallet class. A monograph by A. C. Irwin, in the proceedings of the American Railway Engineering Association for 1915, showed that 2-10-2 locomotives purchased by the Burlington in 1912 gave a classification equivalent to Cooper's E-66 for a span of 50 ft., higher than that obtained for any span with any locomotive other than the Erie triplex and the 2-10-10-2 Mallet of the Atchison, Topeka & Santa Fe, both of them exceptional engines in special service. In view of this, particular interest is attached to the Santa Fe type locomotives now in service on the Denver & Rio Grande, the heaviest of this class built thus far, which were described in the *Railway Age Gazette* of August 3, page 189. These locomotives produce loading effects equivalent to Cooper's E-68 for spans of 30 ft. to 60 ft. inclusive.

This is not a phenomenal increase for a period of five years, but it demonstrates clearly that while the general tendency is toward an increase in the length of locomotives to attain greater power, the limit of the weight to be applied within the limits of one set of coupled wheels has not yet been reached. What this limit will be, how much greater the load to be placed on a single driving axle and what reduction can be made in the dynamic augment are the questions which perplex the bridge engineer today, rather than the ultimate total weight to be secured in some multiplex locomotive of extended length.

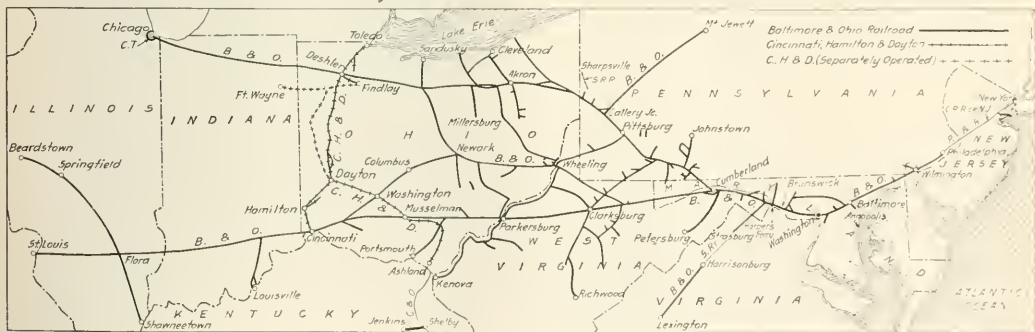

BALTIMORE & OHIO

IF a man had a business that was earning \$90,000 a year in 1910 and bringing him in a net income of well over \$16,000 a year, and between 1910 and 1917 borrowed, at 5 per cent interest, \$145,000 for improvements to his plant, besides putting in some of his own money each year, and for the calendar year 1916 did a gross business of \$117,000

000. In the calendar year 1916 it earned \$116,969,000 gross, but had only \$12,563,000 available for dividends. During this period the company had borrowed, through the issue of bonds and equipment trust notes, in round numbers \$146,000,000, and the fact that it was able to get this money at approximately 5 per cent on the average, shows how good the credit of the company was. In all, the company's investment increased during these years \$157,400,000. The difference between \$146,000,000 and \$157,400,000 is accounted for by surplus invested in the property and accrued depreciation charged out in expenses and spent for additions and betterments.

When Daniel Willard went to the Baltimore & Ohio as president he found a contract requiring the taking over by the Baltimore & Ohio of the Cincinnati, Hamilton & Dayton. This was a transaction which, although closely connected with the actual operation of the Baltimore & Ohio, is not, strictly speaking, railroading. Up to the present this transaction has not proved profitable to the Baltimore & Ohio, and of the total \$157,400,000 investment made in 1910-16, \$25,000,000 stands on the books as the amount charged against the Cincinnati, Hamilton & Dayton transaction and on which amount the Baltimore & Ohio is not earning any return. Except for this Cincinnati, Hamilton & Dayton left over contract no one, probably, not excepting Clifford Thorne, would say that under the management of Mr. Willard the Baltimore & Ohio has engaged in any transactions other than the most conscientious production of transportation at the lowest cost of which the plant and organization was capable.

In one sense the operation of the Baltimore & Ohio in the years 1910 to 1916 inclusive has been successful. The additions and betterments which have been made during these years were absolutely essential both to the continued solvency of the Baltimore & Ohio and to its ability to handle the business offered and to perform the service absolutely required from it by its patrons. Even, however, if it had been possible to disregard the necessities of the shipping and traveling public, if \$6,000,000—approximately the increase in costs due to higher wage scales—\$1,500,000—the increase in taxes—and \$6,500,000—the increase in costs of material—had been imposed on the operation of the plant as it stood in 1910, bankruptcy would have been the result sooner or later. The company has, however, actually raised \$146,000,000 at 5 per cent and is earning today its 5 per cent on

The Baltimore & Ohio

but had profits in that year of only \$12,500, we would be inclined to say that there was something wrong either with the business or the management of it. This is exactly analogous to what happened to the Baltimore & Ohio in the period 1910-16, inclusive. In 1910 the company earned \$90,163,000 gross and had available for dividends \$15,832,-

this new money and sufficient to pay 5 per cent on its common stock, with a small surplus—\$2,612,000. Other railroads have been going along somewhat the same path as the Baltimore & Ohio; but there is one particular in which the Baltimore & Ohio, if not unique, at least very unusual.

The expenditures for additions and betterments are di-

vided approximately as follows: Improvement of the existing railroad, \$58,700,000; equipment, \$62,000,000; construction of a 3.5-mile road in Kentucky, \$5,700,000; construction of an 8-mile road in West Virginia, including purchases of real estate and terminals, \$6,000,000; and the Cincinnati, Hamilton & Dayton investment standing now at \$25,000,000. The Cincinnati, Hamilton & Dayton, although it has added something to the traffic of the Baltimore & Ohio and in the future may add much more, besides of itself proving profitable, may be considered as negligible in making for economies of operation of the parent system in the period 1910-16. The Kentucky and West Virginia lines developed new sources of traffic, but did not make for operating economies. The expenditure of \$58,700,000 for improvement to the existing railroad was nearly all for improvements which eliminated congestion, permitted of the possibilities of better service, or permitted the use of heavier locomotives. Very little of this amount was spent for grade reduction. Of the \$62,000,000 spent for equipment the greater part would have had to be spent to handle the business and only the smaller part may be said to have been spent for the purpose of achieving operating economies. In other words, none of the Cincinnati, Hamilton & Dayton expenditure, none of the short line construction expenditures, little of the additions and betterments expenditures and only a part of the equipment expenditures were for improved facilities permitting of operating economies. Nevertheless, it has been through operating economies that the Baltimore & Ohio has been able to pay its great increase in interest charges, its great increase in labor costs and costs of materials, and remain a sound, dividend-paying property.

Before attempting to describe some of the methods which have been used to accomplish this remarkable result it is proper to summarize the important improvements and additions which have been made to the railroad, and from the following summary it will be seen that what has been said about the comparatively small expenditures for grade reduction to lower the cost of operation is literally true.

MORE IMPORTANT CONSTRUCTION AND IMPROVEMENTS TO ROAD

1910

A double-track bridge over the Susquehanna river was completed January 6, 1910.
Connection with bridge over the Monongahela river between Haywood, W. Va., on the Monongah division, and Lumberport, W. Va., on the Ohio River division (to relieve the Wheeling division), was opened June, 1910.
A double-track bridge over the ship canal at Indiana Harbor was built. New stations were built at four places.

1911

Changes of line and grade reduction were made, Concord to Wilmington.
A third-track was laid on the Cumberland division for 43 miles.
Tunnels were converted to open cuts at Everett's, McGuire's, Rodemer and Murray.
A 7-mile third-track was laid on the Connellsville division.
The Quemaoming branch was extended 9 miles.
Interlocking was built at eight places.
Automatic signals were installed on 105 miles.
New handling machines were erected at 14 places.
Station facilities were enlarged or built at 14 places.
A drawbridge over the Cuyahoga river at Cleveland was built.

1912

Grade was reduced at the east end of the Susquehanna river bridge.
A single-track tunnel at Bakerstown, Pa., was eliminated.
Grade revision and construction of a double-track tunnel was completed between Blanes and west end of the Kingwood tunnel, W. Va. (Gives three tracks over this summit and shortens haulage grade four miles.)
A classification and receiving yard was built at Lorain, Ohio.
Additional yard facilities were built at 20 places.
There were 42 miles to second track and 9 miles to third track and 6 miles to fourth track laid.
New stations at nine places and station buildings at Baltimore and Cumberland, Md., were extensively remodelled.
There were 12 new interlocking plants built and 7 rebuilt.
Automatic signals were installed on 19 miles of double track and 20 miles of single track.
Electro manual block signals were installed on 23 miles.

1913

Transfer bridge and float were installed at the Canton terminal.
Additional tracks with 700 cars capacity were laid at the Curtis Bay (Md.) classification yard.
A tie and timber treating plant was put up at Green Springs, W. Va.
An interchange yard was built at Cumbo, W. Va.

Form 3-2-11

The Chicago division was double tracked (work was begun in previous years and completed in following years).

A double-track tunnel between Sand Patch and Manila was completed, giving a double-track line from Philadelphia to Chicago, with the exception of one section of double-track work on the Chicago division. Two new stations were built and three were enlarged. There were 17 new interlocking plants built and 13 rebuilt. Automatic signals were installed on 65 miles and line control block system installed on 23 miles.

1914

A third track between Green Springs and Little Cacapon, W. Va., 7.6 miles, was built, giving a three-track line from Little Cacapon to Patterson Creek, 14.4 miles, where the track density even in 1913 was 20,000,000 ton-miles per mile of road.

At South Cumberland new engine facilities were built.

Two new stations were built and one was remodeled. There were nine new interlocking plants built, one rebuilt and six rearranged.

Automatic signals were installed on 176 miles.

A new concrete warehouse with 155,000 sq. ft. of available storage space was built at New York City.

An open pier for handling ore at Locust Point was reconstructed and extended.

A new yard for assembling coal at Somerset, Pa., was completed.

1915

The new double-track line and relocation of the old line between Okonoko and Orleans Road, W. Va., known as the Magnolia cut-off, was completed, permitting an increase in eastbound slow freight trainload of 36.36 per cent and shortening the distance 5.78 miles. This gives a three-track road all the way from Patterson Creek to Cherry Run, W. Va., 57 miles, where by 1911 traffic density amounted to 24,000,000 ton-miles per mile of road.

Two new stations were built.

There were three interlocking plants built and four reconstructed.

Automatic signals were installed on 18 miles.

Various grade crossings were eliminated.

Bridges at various points were strengthened.

1916, to June 30.

A new outbound freight house was built at New York.

A new export pier was built at Locust Point, Baltimore, and three open piers were reconstructed.

A fireproof coal pier with a capacity of 6,000 tons per hour was built, although not completed, at Curtis Bay, Baltimore.

The Pittsburgh passenger station was remodeled and four new stations were built at various points.

Automatic signals were installed on 48 miles of road.

Two interlocking plants were built.

1916, June 30 to December 31

A new yard was built at Somerset, Pa.

The last of the double tracking of the Chicago division was almost completed.

Automatic signals were installed on 82 miles.

A part of the \$62,000,000 spent for equipment was for passenger service equipment and so added little to the possibility of operating economies, and a part was for freight cars which only to a limited extent afforded greater possibilities for operating economies. It was in the purchase of heavier and more effective freight locomotives that the Baltimore & Ohio got a part of its increase in operating efficiency. The following is a list compiled from records of the *Railway Age Gazette* showing the type and number of locomotives bought in the years 1910-16, inclusive:

Year	Number	Weight	Type	Builder
1910	203	220,300	Consolidation	A. and B.
	10	260,000	Pacific	B.
	40	270,000	Mogul	B.
	5	457,000	Mallet	B.
	5	460,000	Mallet	A.
	26	214,700	American	B.
1911	10	164,750	Mogul	B.
	10	461,000	Mallet	A. s
	10	271,040	Pacific	B.
	30	277,190	Pacific	B. s
	140	276,050	Mikado	B.
	10	282,200	Mikado	B. s
	10	282,200	Mikado	B. s
1912	50	282,200	Mikado	B. s
	4	120,000	4-Wheel Switcher	B.
1913	10	471,000	Mallet	A. s
	30	248,600	Pacific	B. s
	110	284,500	Mikado	B. s
1914	1	407,060	Santa Fe	B. s b
	30	410,200	Santa Fe	B. s b
1915	15	485,000	Mallet	A. s b
	15	485,000	Mallet	A. s b
1916	50	281,900	Mikado	B. s b
	30	Mallet	B. s b
	10	Pacific	B. s b
	10	178,500	Mogul	L. s b

A, built by American Locomotive Company.

B, built by Baldwin Locomotive Company.

s, equipped with superheater.

b, equipped with brick arch.

The total tractive effort of freight locomotives at the beginning of 1910 was 46,300,000 lb.; the total tractive effort

at the end of 1916 of freight locomotives was 79,189,000 lb. This is an increase of 71 per cent.

In 1910 the Baltimore & Ohio carried 12,024,600,000 ton-miles of revenue freight and total revenue freight train mileage amounted to 27,182,000. In 1916 the road carried 16,199,800,000 revenue ton-miles and the revenue freight train mileage was 21,573,000. In other words, the road is furnishing more than a third as much more transportation for freight in 1916 than in 1910 and is performing this service with a fifth less train mileage.

Here, then, in a nutshell is the explanation of how the Baltimore & Ohio has won through in the struggle to make both ends meet during the period 1910-16. By the purchase of heavier freight locomotives it has placed at the disposal of the operating forces of the road a means of greatly increasing the trainload. By supervision and good management it has made actual the heavier trainloads which the larger engines made possible. The average trainload in 1910 was 442 tons; in 1916, 751 tons.

There appears to be a consistently pursued policy in the relation between President Willard and his staff of officers and between the management and employees. The keynote of this policy appears to be an attempt to lead rather than to drive. In the relations between the management and employees this policy is manifest in the adoption of the Brown system of discipline; in the organization of frequent meetings of various classes of employees under the auspices of the employees themselves for free discussion of grievances and suggestions for improvements, and is typified by President Willard's address to the officers of the Baltimore & Ohio at the annual meeting at Deer Park on June 29, 1917, one sentence from which may well be quoted: "If we could only get all the 60,000 employees of the Baltimore & Ohio to look at this thing in the right way—not necessarily my way, but what seems in our common minds to be the right way—if all can only appreciate how much is involved, and the extent to which the railroads can and must help, the things that the employees of the Baltimore & Ohio alone can do toward creating a better state of mind, a better public opinion behind the government carrying on the war—the good that they can do in that respect would be immeasurable."

There have been examples, especially among the older generation of railroad men, of a road being run very successfully by the driving process. Officers knew that if a bad showing was made the consequence to them would be serious. It was left largely to the officer himself, however, to devise ways and means for making a good showing. An important factor in the results of operation of the Baltimore & Ohio in the years 1910-16 has been the method of supervision adopted over the work of the superintendents.

The general management's supervision over the division superintendent's work aimed at stimulating the superintendent, and through him his officers and the division employees, to the greatest interest and resourcefulness in their work; helping the superintendent analyze his own conditions so as to discover the places where improvement was possible; checking waste before it got fairly started, and providing a means of comparing divisional performance day by day with a standard of what could be done.

The initial step in the adoption of a standard by which to measure wage cost per ton-mile on the Baltimore & Ohio was the keeping of an accurate record of individual train performance over each district. Fig. 1, with the last three columns omitted, shows the form used to keep this record. All of the information on this form is supplied by the train sheets, supplemented in the case of local freight by a special report made by the conductor showing set-outs and pick-ups.

Supplemental to these reports for each division the general officers of the Baltimore & Ohio made in conference with the division officers a first-hand study of the conditions which effected operation over each freight district. Each point of

delay was studied and the causes for the delay at this point analyzed. After a great deal of thought had been given the matter a time card was drawn up for each district showing the time which could be consumed at each point of delay and the necessary speed between these points to insure getting over the district without overtime. These cards were distributed to engine and train crews and to division officers. The time schedules and the tonnage rating of the locomotives in service gave a basis on which to determine ton-mile cost for engine and train crew wages over each district. This cost was then adopted as standard and the actual performance of each train could then be measured in a per cent of standard or perfect operation. In this way the last three columns on Fig. 1 were added. Each division superintendent also was furnished with cards on which he could keep the average record for slow freights for each day on each of the districts under his jurisdiction.

In-so-far as engine crews and train crews are concerned, the standard schedule gives them an object toward which they can work and an incentive and interest in attaining this object which is real and valuable, notwithstanding the fact that it is largely psychological. In-so-far as the superintendent and his officers are concerned, the daily reports of ton-mile costs, with the comparison which they afford with the standard or theoretical minimum costs, give an incentive for the most careful supervision over the performance of each and every train, and furthermore do not tend to diminish the value of initiative and ingenuity in handling traffic. For instance, the standard schedule is based on making no overtime. A given train, however, may make a certain proportion of overtime and because it is hauling a greater tonnage than its rating requires still make a perfect record and a showing of ton-mile cost as low as the standard minimum.

After standards for each division had been established, each superintendent's record was kept on a form similar to that shown in Fig. 2. This has been the basis of the management's supervision over division officers, and it is thought that these records have contributed much to success obtained in economical operation.

The Baltimore & Ohio's outlook for the future is dependent on the general railroad situation. The economies which can be effected by increased trainloading without quite impossible expenditures for grade reduction have apparently almost been reached. If increased cost cannot be offset in this way the question arises as to how they can be offset. The limitations of improved supervision and management have pretty surely not been reached; better carloading by shippers is a possibility; but there seems to be a very slight chance that any such great percentage of increased efficiency can be made in the next six and a half years as was made in the period 1910-16. On the other hand, the percentage of increase in costs of operation, due to higher wages and higher costs of materials, are mounting at a far greater rate than they did in the 1910-16 period. The future prospects of the Baltimore & Ohio are, it would appear, largely dependent on the Interstate Commerce Commission.

Although these comments have dealt almost entirely with the comparison between the beginning and end of the period 1910-16, the usual table showing the principal figures for operation in 1916 as compared with 1915 is given in order that uniformity may be preserved with the reviews of this company's annual reports in previous years.

The following table shows the principal figures for operation in the calendar year 1916 as compared with the calendar year 1915:

	1916	1915
Mileage operated	4,545	4,533
Freight revenue	\$91,891,921	\$79,255,266
Passenger revenue	16,169,173	13,982,463
Total operating revenue	116,968,882	100,717,666
Maintenance of way and structures	14,825,302	10,472,891
Maintenance of equipment	23,569,581	18,755,014
Traffic expenses	2,113,268	1,908,552

Transportation expenses	40,564,932	33,584,941
General Expenses	2,624,870	2,359,812
Total operating expenses	84,460,293	67,652,602
Taxes	4,002,736	3,404,943
Operating income	28,465,597	29,633,210
Gross income	34,555,277	34,937,607
Net income	12,652,675	15,575,410
Dividends	9,951,753	9,951,753
Surplus	2,611,608	3,664,463

ST. LOUIS SOUTHWESTERN

GOOD as was the showing which the St. Louis Southwestern made for the calendar year 1916, it was by no means as good as it would have been if the road had not been seriously handicapped by car shortage; nor was it as good as that which will be made in 1917 if present indications are to be trusted. The St. Louis Southwestern is getting back on its feet, but there may be danger that in enthusiasm over the present earnings and prospects for the immediate future, stockholders may lose sight of how much has to be done to entirely rectify a situation which two years ago was rather serious. For the calendar year ended December 31, 1916, the company had \$2,222,000 available for dividends, but the board of directors very wisely, it would appear, did not resume dividends on the preferred, although there is only \$20,000,000 preferred stock.
